discussed. The results of this study indicated that it was superior to traditional oversampling techniques and basic model in all the datasets as well as the different evaluation metrics. Integration of GAN based oversampling and feature selection based on shapley value and attention mechanism also significantly improved the ACC and AUC-ROC values. The findings affirm the ability of the suggested method in managing the class imbalance problem in medical datasets and improving classifiers' accuracy and reliability. The figure 2compares the performance of the methods for datasets (D1-D5) in terms of accuracy. The proposed method shows significant improvement in both metrics, indicating its effectiveness in handling imbalanced medical datasets. This figure illustrates the AUC-ROC scores for baseline, SMOTE, and the proposed method across the same five datasets. The proposed method consistently achieves higher AUC-ROC scores, demonstrating its superior ability to distinguish between classes. The figure 3 shows the training and validation loss for the proposed method on the five datasets that were used. Since validation loss is lower than the training loss, high generalization and model performance is expected in unseen data. Further in the figure 2, it represents the training and validation accuracy of the proposed solution on the five datasets. The trains and validation accuracy curve is tightly coupled although not perfectly, indicating the model is overfitting or underfitting vey little.

DISCUSSION

The proposed method that includes GAN-based oversampling, adaptive feature selection, and attention mechanism as its components has been shown to improve the performance on a medical data set with class imbalance. Several of the success indices are performed and contrasted with the traditional techniques such as SMOTE and baseline classifiers and comprise accuracy, F1-score, and AUC-ROC, whereby the proposed method advanced consistently across the board. Combining GAN with attention mechanism the quality of synthesis data is maximized, as it helps to concentrate on the most significant items, which results in producing more realistic and useful samples for training classifiers. However, the adaptive feature selection step makes it possible to preserve the most vital feature, which enhances the model's performance and interpretability. In collecting adequate features, the stacking ensemble learning and AdaBoost strategies show that integrating multiple classifiers' benefits leads to better prediction results. This approach not only they solve the problem of class imbalance, but also bring some extra improvements that focus on the stability and accuracy of the classification models.

Ablation Study

To understand the importance of each component of the proposed method an ablation study was performed. It is performed on the dataset D4.The conceptual framework of the study involves isolation of the components for assessment of performance changes. The obtained results are summarized in the table 4 and 5.

METHODOLOGY

1. **Baseline Model (No Enhancement)**: Training classifiers on the original imbalanced dataset without any oversampling or feature selection.
2. **With Adaptive Feature Selection Only**: Applying only the adaptive feature selection process without GAN-based oversampling.
3. **With GAN-Based Oversampling Only**: Using GAN-based oversampling without adaptive feature selection or the attention mechanism.
4. **With GAN-Based Oversampling and Attention**: Using GAN-based oversampling with the attention mechanism but without adaptive feature selection.
5. **Full Model**: The complete proposed method with adaptive feature selection, GAN-based oversampling, and the attention mechanism.

RESULTS

The figure 4 presents the results of an ablation study, comparing different configurations of the proposed method. Each configuration shows incremental improvements in accuracy and F1-score, with the full model achieving the highest performance. The figure 5represents AUC-ROC scores for different configurations of the proposed method in the ablation study. The full model demonstrates the highest AUC-ROC, confirming the importance of combining GAN-based oversampling, adaptive feature selection, and attention mechanisms. From the figures 4 and 5, following are the highlights of the components in the proposed method:

1. **Adaptive Feature Selection**: Improves performance by selecting the most relevant features, leading to better model training and prediction.
2. **GAN-Based Oversampling**: It also effectively addresses the class imbalance problem since it creates a realistic number of new instances.
3. **Attention Mechanism**: It improves the quality of the generated samples by focusing on critical features. It is resulting in better performance compared to GAN-based oversampling alone. Hence, the full model with all the components yields the best results on all the measures, thus supporting the use of the proposed technique to counter class imbalance in clinical databases. In this paper, an efficient way of handling class imbalance in medical datasets is proposed through the use of GAN-based oversampling, feature selection, and an attention mechanism. The strategy presented in this paper greatly enhances the quality of synthetic data and the model being built. The results of experiments show better effectiveness in the accuracy, F1 score and AUC ROC in comparison with oversampling and basic models. From the ablation study we can confirm that each of the indicated components deserves its own attention and at the same time confirms the efficiency of the proposed combined approach. This future work will then expand upon these findings to consider more specific refinements and the incorporation of other more complex attention techniques to improve the efficiency of the proposed model even more.

ABSTRACT

Mindfulness based stressed reduction is a therapeutic approach that uses medical techniques to help manage pain through awareness. MBSR provides tool to reduce pain and improve health, promoting emotional regulation, stress reduction and increased mindfulness in daily life. Mindfulness techniques have been shown to increase flexibilty and strength in people with orthopedic pain. This article is a literature review summarizing the current literature on the role of mindfulness in orthopedic rehabilitation. The literature search for papers over the last 24 years was conducted in PuBMed, Google Scholar, and Research Gate repositories. Releavent studies were reviewed using strict inclusion criteria. Twelve articles met the inclusion criteria. In the paper, findings show that mindfulness interventions had a great capacity for enhancing recovery experiences for orthopedic patients. The findings in the articles demonstarte the great power of mindfulness based interventions to improve the care of orthopedic patients. Patients who practice mindfulness have a better sense of health and immunity and respond better to physical therapy.

Keywords: Mindfulness, orthopedics, physiotherapy, literature review and mindfulness-based intervention.

INTRODUCTION

Mindfulness-based stress reduction (MBSR), which originates in the ancient religions of bhuddism and yoga, and has become increasingly popular as a treatment modality in psychotherapy pratices[1]. Mindfulness means being aware of your thoughts, feelings, physical sesnations and bodily environment in here and now with an attitude of opennes, curiosity, kindness and acceptance. The primary goal of mindfulness is to achieve a state of awareness, and this type

of practice (mindfulness in daily life) can be achieved through practice and repetition: by breathing, sitting, walking or doing a body scan. Two of these programmes are commonly used. These are MBSR developed by John Kabat Zinn in 1979 [2], and mindfulness based cognitive therapy from MBSR by Segal, Teasdale and Williams [3,4]. These programmes typically include eight weeks of meditation and a daily retreat [5]. Mindfulness based medical research is now growing and supporting clinical practice [6]. Studies have shown that psychological treatments such as mindfulness are effective in improving physical health and have positive effects on symptoms and overall health when compared to usual care [7,8]. Positive expectations, self effeciancy, and patient engagement are key concepts that can provide self motivation for all types of mental illness and guide the process behind the best pschological outcomes reported with the MBI [9,10]. For example, mindfulnes based stress reduction has been reported to be an effective treatment for back pain [11]. Mindfullness meditation is one of the most important tools used to support overall health goals and stress problems and can be an important part of communication between providers and patients[12, 13]. In one study, findings showed that mindfulness intervention reduced symptoms and improved health, thereby resulting in overall health, well being and quality of life [14]. In this literature review, studies that specifically support the effectiveness of mindfulness-based orthopedic physical therapy were selected among various inclusion criteria. Studies will be selected to provide a comprehensive review of how MBI compares to traditional physical therapy in terms of reducing and affecting pain, health, and improving physical and mental health. This review presents these results and aims to demonstrate the benefits of using mindfulness in the treatment plan of these patients by simultaneously demonstrating the relationship that solves physical and mental health problems.

STUDY DESIGN

The discussion in this section is done after a good literature search from other search engines like PubMed, Google Scholar, Research Gate etc. This review covers the period from 2016 to present and allows for a comprehensive collection of all types of research. The entire study aims to present the most important and up-to-date research on the effectiveness of mindfulness in orthopaedic rehabilitation.

SEARCH STRATEGY

The relevant search words used for literature search included mindfulness, orthopedic, physiotherapy, and mindfulness-based intervention. Additionally, the reference lists of the reviewed articles were also carefully scrutinized for other relevant studies that might have been included based on the inclusion criteria.

SAMPLE SIZE

Database search using these key words produced an initial yield of 68 articles. These then got filtered based on inclusion and exclusion criteria and the year of publication. Finally, 12 relevant articles were considered for this systematic review.

INCLUSION CRITERIA

1. Article published between 2016 and 2024
2. Studies carried out mindfulness based intervention
3. Studies were practiced on orthopedic patients
4. Published studies were done in English language
5. FULL TEXT

EXCLUSION CRITERIA

1. Articles of past the year, 2016
2. Abstract articles
3. Incomplete studies
4. Studies done in any other language than english were not included
5. Studies done on non orthopedic patients

SELECTION OF INCLUSION AND EXCLUSION CRITERIA

Only articles with particular inclusion and exclusion criteria were included in this review. Since the English language is well preferred and favorable for this review, only articles in English were included to ensure that appropriate analysis was carried out without errors. Inclusion of some non-English articles would have resulted in a wrong understanding and wrong analyses. Therefore, the selection of articles in the English language allows for the right understanding and analysis of data, thus ensuring correct information is presented in this review. The articles included were those published from 2016 to 2022. Articles published before that period were excluded. Full-text articles are chosen because they may give more or less information. Excluded in this paper are articles which will not carry a data on orthopedic disorders because they are out of the scope of this study. This review mainly focuses on the role of the mindfulness on the practice of orthopedic physiotherapy, so articles containing pertinent information were considered.

RESULTS

From a total of 68 articles, 12 met the eligibility criteria and are listed in Table 1, having been selected using the specified strategy. Numerous articles were excluded for various reasons, including failure to meet the requirements, non-compliance with the inclusion and exclusion criteria, and duplication.

OUTCOME MEASURE

Most of the outcome measures that were utilized in the articles obtained through randomized control trials while others in the studies will involve cases, Su Feng Chu's[2024] cross-sectional study, review article by Dr. NIRAJ Kumar [2020], Dr. D.Y. Patil Vidyapeeth[2022], and Timothy Voskuijl[2014], and finally, Emma Chad Friedman's[2017] pilot study.

DISCUSSION

Literature reviews in this paper include research studies that had already been finalized. Mindfulness was used to evaluate the effectiveness of the intervention in patients with orthopedic conditions. The mindfulness-based intervention had only been applied to patients with orthopedic conditions. Articles with publication dates within the last few years were extracted from 2016 up to and including 2024, and for full-text availability, they must be available in English. Mindfulness-based intervention is likely one of the key treatments for orthopedic patients who are on physiotherapy, as it makes a patient prepared to adjust to changes in general and creates a good mentality toward accepting these changes, enhancing the quality of physiotherapy treatment. Aleksandra E. Zgierska presented significant evidence in 2016 that CBT combined with meditation can reduce pain symptoms [15]. A 2017 study by Emma Chad Friedman showed how patients responded favorably to periodic exercise, which, in addition to improving mental health and pain, became a cheap, effective, and preventive measure to address these problems. These exercises are effective for pre-stress anxiety, can be done at home or in the hospital, and provide patients with the knowledge to manage stress and anxiety, giving them a sense of control over their psychological symptoms [16]. A single-blind, randomized controlled trial led by Ritsaart F. Westenberg [2018] found that a 60-second mindfulness exercise has high potential and is sufficiently effective; however, this suggests that patients are willing to use it in the orthopedic surgery setting [17]. Another study by Ann-Charlotte Grahn Kronhed [2020] found that the combination of mindfulness therapy and adaptive yoga therapy led to better relationships, sleep quality, and anxiety in older women with osteoporotic vertebral fractures [18]. Dr. Niraj Kumar concluded from his review article [2020] that mindfulness helped manage pain and reduce psychological distress among patients in the memory group, consistent with previous research by Kabat-Zinn et al. [2003] and Zatura et al. [2001] [19]. Shahabeddin Bagheri [2021] found a decrease in pain intensity in patients in the mindfulness group. It was also noted that mindfulness training increased the effectiveness of nonpharmacological treatment of knee osteoarthritis [20]. A quasi-randomized trial conducted by Cesare Lino [2021] reported that mindfulness improved pain, quality of life, disability, depression, and significant impairments [21]. Dr. D. Y. Patil Vidyapeeth [2022] reported a VAS score of (4.35 ± 0.77) for the mindfulness group, whereby mindfulness therapy reduced pain scores [22]. Conversely, Adam W. Hanley [2022] explained that the MBI

was designed to teach surgical patients ways to cope with pain and suffering that often occur during surgery [23]. In addition, an article by Davide Venturin [2024] reported a 5-point decrease in the NPRS scale, indicating that mindfulness was effective during treatment [24]. However, Ryan S. Wexler [2024] found that members of the MORE group experienced less pain in daily life [25]. Finally, Su Feng Chu (2024) suggested that mindfulness practice improved visual health, melancholic mood, and physical activity, thereby improving pain, physical activity, overall quality of life, and overall health [26]. The studies in this review are from patients undergoing orthopedic surgery, but these studies are not specific to physical therapy. It can be assumed that consciousness would have the same or greater effect when applied to the patient's body. This is a very interesting relationship and is becoming another topic of discussion and research for other researchers in the field.

LIMITATIONS

Due to the limited number of archives, we only reviewed 68 articles. 12 of these are worthy of review. This reflects the lack of research on the role of mindfulness in orthopaedic rehabilitation. Some of the selected studies have excellent examples. Second, it is important to note that only articles written in English were analyzed and no study examples were included. Some definitions of the term mindfulness include 60-second mindfulness intervention videos and mindfulness yoga exercises, among others. However, the scope of the study was narrow; it focused only on the effect of mindfulness on awareness and acceptance, and was entirely related to stress level and severity.

CONCLUSION

Mindfulness has shown much promise as an effective tool to be used in future orthopedic physiotherapies. From the available studies reviewed up to now, such benefits include considerable reductions in pain intensity, psychological well-being, and enhanced quality of life for the patients. In this regard, mindfulness can help in managing chronic pain, stress, and overall patient outcomes with some interventions undertaken either as supplements to traditional treatments or as standalone treatments. Positive responses to brief mindfulness exercises, as well as the viability of such mindfulness interventions within clinical settings, further suggest that incorporating mindfulness into orthopedic physiotherapy may lead toward more holistic and patient-centered care.

ACKNOWLEDGMENTS

We would like to thank Garden City University, Bangalore

CONCFLICT OF INTEREST

According to Willoughby B Britton [2020], a study shows that the effect of mindfulness is not linear. However, it can be higher, lower, or change direction depending on other factors such as practice, conscious content, or individual differences. Mindfulness studies can show positive, negative, and sometimes adverse or undesirable effects [27].

ABSTRACT

As healthcare systems become prime targets for sophisticated cyber attacks, there is a growing demand for advanced security frameworks that safeguard sensitive patient data. This research examines the integration of blockchain technology into network security monitoring to optimize threat detection and response in healthcare environments. Blockchain's core features - decentralization, immutability, and transparency - provide a robust solution for securing health data, facilitating real-time threat monitoring, and enabling swift incident response. The study assesses current vulnerabilities in healthcare networks and demonstrates how blockchain-based security models can enhance situational awareness, reduce response times, and strengthen the overall security posture of healthcare organizations. The findings underscore the potential of blockchain to significantly improve the confidentiality, integrity, and trustworthiness of healthcare data, contributing to more resilient cyber security infrastructures.

Keywords: Blockchain, Cyber Threat Detection, Healthcare Security, Network Security, Decentralization, Incident Response.

INTRODUCTION

In the rapidly evolving landscape of healthcare technology, the protection of sensitive patient data has become a critical concern. As healthcare systems increasingly rely on digital infrastructure, they have simultaneously become prime targets for sophisticated cyber attacks [1]. The need for advanced security frameworks that can effectively safeguard patient information while ensuring seamless access for authorized personnel has never been more

pressing. Blockchain technology, with its core features of decentralization, immutability, and transparency, presents a promising solution to address the cyber security challenges faced by the healthcare sector [2]. Originally developed for crypto currencies, blockchain has demonstrated its potential to revolutionize various industries, including healthcare, by providing a secure and transparent method of data management [3]-[4].

The integration of blockchain into healthcare systems offers several key advantages:
1. Enhanced Data Integrity: The immutable nature of blockchain ensures that once data is recorded, it cannot be altered without detection, significantly reducing the risk of unauthorized modifications to patient records [5]- [6].
2.Improved Access Control: Blockchain-based systems can implement sophisticated access control mechanisms, ensuring that only authorized personnel can view or modify sensitive information [7] – [8].
3.Real-time Threat Monitoring: The distributed nature of blockchain networks allows for continuous monitoring of data access and modifications, enabling rapid detection of potential security breaches [9] – [10].
4.Efficient Incident Response: By providing a transparent and auditable trail of all transactions, blockchain can facilitate swift and accurate incident response in the event of a security breach [11] – [12].
5.Interoperability and Data Sharing: Blockchain can enable secure and efficient sharing of patient data across different healthcare providers, improving coordination of care while maintaining data privacy [11] – [13].

Recent studies have demonstrated the feasibility and potential benefits of blockchain integration in various aspects of healthcare. For instance, Azaria *et al.* [11] proposed MedRec, a blockchain-based system for managing medical records and permissions. Similarly, Antal *et al*. [14] developed a blockchain platform for COVID-19 vaccine supply management, highlighting the technology's potential in addressing urgent healthcare challenges. However, the implementation of blockchain in healthcare security is not without challenges. Issues such as scalability, energy consumption, and integration with existing healthcare IT infrastructure need to be carefully addressed [15] – 16]. Moreover, ensuring compliance with healthcare regulations and data protection laws, such as HIPAA in the United States, is crucial for the widespread adoption of blockchain-based security solutions [17]. This research aims to explore the potential of blockchain-integrated network security for enhancing cyber threat detection in healthcare environments. By examining current vulnerabilities in healthcare networks and demonstrating how blockchain-based security models can improve situational awareness and response times, this study seeks to contribute to the development of more resilient cyber security infrastructures in the healthcare sector. The following sections will delve into the technical aspects of blockchain integration, analyze potential implementation strategies, and evaluate the impact on overall security posture in healthcare organizations. Through this comprehensive analysis, we aim to provide valuable insights for healthcare providers, policymakers, and technology developers working towards more secure and efficient healthcare systems.

Objective

Here are the key objectives of this research paper
1.Examine the integration of blockchain technology into network security monitoring for healthcare systems.
2.Assess current vulnerabilities in healthcare networks.
3.Demonstrate how blockchain-based security models can enhance:
- Situational awareness
- Threat detection
- Response times

4.Evaluate how Blockchain's core features (decentralization, immutability, and transparency) can be leveraged to secure health data.
5.Explore the potential of blockchain to improve:
- Confidentiality of healthcare data
- Integrity of healthcare data
- Trustworthiness of healthcare data

6.Investigate how blockchain can facilitate real-time threat monitoring in healthcare environments.
7.Analyze the challenges of implementing blockchain in healthcare security, including:

- Scalability issues
- Energy consumption concerns
- Integration with existing healthcare IT infrastructure

8.Consider how blockchain-based security solutions can comply with healthcare regulations and data protection laws (e.g., HIPAA).
9.Contribute to the development of more resilient cyber security infrastructures in the healthcare sector.
These objectives aim to provide a comprehensive understanding of how blockchain technology can be utilized to enhance cyber security in healthcare settings, addressing both the potential benefits and challenges of implementation.

Problem statement

The healthcare sector faces increasingly sophisticated cyber threats that jeopardize the confidentiality, integrity, and availability of sensitive patient data. Current network security measures in healthcare environments often struggle to provide real-time threat detection, rapid incident response, and robust data protection while maintaining the

necessary accessibility for authorized personnel. This research addresses the following key problems:
1.How can blockchain technology be effectively integrated into healthcare network security systems to enhance cyber threat detection and response capabilities?
2.What are the current vulnerabilities in healthcare networks that blockchain-based security models could potentially address?
3.How can the core features of blockchain (decentralization, immutability, and transparency) be leveraged to improve the overall security posture of healthcare organizations?
4.What are the potential benefits and challenges of implementing blockchain-integrated security solutions in healthcare environments, particularly in terms of: a) Real-time threat monitoring b) Incident response time c) Data integrity and confidentiality d) Compliance with healthcare regulations and data protection laws
5.How can blockchain-based security frameworks be designed to overcome challenges such as scalability, energy consumption, and integration with existing healthcare IT infrastructure?

By addressing these questions, this research aims to contribute to the development of more resilient and effective cyber security infrastructures in the healthcare sector, ultimately improving the protection of sensitive patient data against evolving cyber threats.

Literature Review

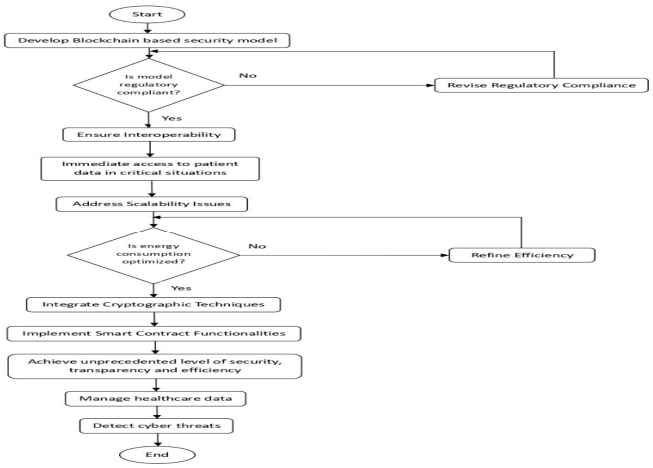
The integration of blockchain technology into healthcare security has garnered significant attention in recent years, as evidenced by a growing body of research. Azaria et al. (2016) proposed MedRec, a blockchain-based system for managing medical records and permissions, demonstrating the technology's potential in healthcare data management. The application of blockchain extends beyond data management to supply chain security, as shown by Alkhoori et al. (2021) in their design of CryptoCargo, a blockchain-powered smart shipping container for vaccine distribution. In the realm of network security, Alrubei et al. (2022) developed a Honesty-based Distributed Proof of Authority (HDPoA) consensus protocol, addressing scalability issues in IoT-blockchain applications. Privacy preservation, a critical concern in healthcare, has been explored by Andrew and Karthikeyan (2019) and Andrew *et al.* (2019a, 2019b), who investigated techniques for protecting sensitive data in cloud and deep learning environments. The potential of blockchain in improving access control and privacy in healthcare systems was further demonstrated by Azbeg *et al.* (2022) and Baucas *et al.* (2023). However, challenges remain in implementing blockchain solutions, including scalability and energy consumption concerns, as noted by Baliga (2017) and Ben Hamida *et al.* (2017). The consensus mechanisms underlying blockchain systems, crucial for their security and efficiency, have been examined by Barry *et al*. (2018) in the context of the Stellar Consensus Protocol. Antal *et al.* (2021) showcased the practical application of blockchain in healthcare crisis management through their COVID-19 vaccine supply management platform. Despite these advancements, concerns about potential vulnerabilities persist, as highlighted by Apostolaki *et al.* (2017) in their study on routing attacks on cryptocurrencies. The integration of blockchain with other emerging

technologies, such as federated learning and fog-IoT platforms, presents promising avenues for enhancing predictive healthcare, as explored by Baucas *et al.* (2023). Benchoufi *et al.* (2018) further demonstrated blockchain's potential in improving transparency and traceability in clinical trials. This diverse body of research underscores the significant potential of blockchain in enhancing healthcare security, while also highlighting the need for continued investigation to address remaining challenges and optimize implementation strategies.

PROPOSED WORK

The novel and unique proposed work of this research lies in its comprehensive approach to integrating blockchain technology into healthcare network security systems for enhanced cyber threat detection. Unlike previous studies that have focused on specific applications of blockchain in healthcare, this research aims to develop a holistic framework that leverages blockchain's core features of decentralization, immutability, and transparency to create a robust, real-time threat monitoring and response system. The proposed work will explore innovative ways to combine blockchain with existing healthcare IT infrastructure to create a layered security approach that not only enhances data integrity and access control but also facilitates rapid threat detection and incident response. A key novelty is the development of a blockchain-based security model that addresses the unique challenges of healthcare environments, including regulatory compliance (e.g., HIPAA), interoperability, and the need for immediate access to patient data in critical situations. The research will also propose novel solutions to overcome the scalability and energy consumption challenges often associated with blockchain implementations, making it more feasible for widespread adoption in healthcare settings. By integrating advanced cryptographic techniques and smart contract functionalities, the proposed system aims to provide an unprecedented level of security, transparency, and efficiency in managing healthcare data and detecting cyber threats.

Flow Chart



Proposed Design

Here is a proposed algorithm for the blockchain-integrated network security system for healthcare environments:

Algorithm: Blockchain-Integrated Network Security for Healthcare.
Input: Network traffic data, Access requests, System logs **Output:** Threat alerts, Access control decisions, Immutable audit logs **1. Initialize:** 1.1 Set up blockchain network with healthcare nodes 1.2 Define smart contracts for access control and threat detection 1.3 Initialize distributed ledger **2. Continuous Monitoring:**

2.1 For each incoming network packet:
2.1.1 Hash packet data
2.1.2 Record hash on blockchain
2.1.3 Compare hash with known threat signatures
2.1.4 If match found, trigger alert
3. Access Control:
3.1 For each access request:
3.1.1 Verify requestor's credentials using blockchain-stored identity
3.1.2 Check access permissions defined in smart contract
3.1.3 If permitted, grant access and log transaction on blockchain
3.1.4 If denied, log attempt and trigger alert
4. Threat Detection:
4.1 Analyze blockchain transactions in real-time:
4.1.1 Apply machine learning algorithms to detect anomalies
4.1.2 If anomaly detected, trigger alert and log details
5. Incident Response:
5.1 Upon alert triggering:
5.1.1 Retrieve relevant blockchain records
5.1.2 Reconstruct incident timeline
5.1.3 Identify affected systems and data
5.1.4 Initiate predefined response protocols
6. Audit and Compliance:
6.1 Periodically:
6.1.1 Generate compliance reports from blockchain data
6.1.2 Verify data integrity using blockchain hashes
6.1.3 Update smart contracts as per regulatory changes
7. Scalability Management:
7.1 Monitor blockchain performance metrics
7.2 If approaching capacity limits:
7.2.1 Implement sharding or sidechains
7.2.2 Prune old, non-essential data
8. Repeat steps 2-7 continuously

This algorithm outlines the core functionality of the proposed blockchain-integrated security system for healthcare environments. It covers continuous monitoring, access control, threat detection, incident response, and compliance aspects. The algorithm leverages blockchain's features to enhance security, provide immutable audit trails, and enable real-time threat detection.

Pseudo code

This pseudocode provides a more detailed implementation of the algorithm you proposed. It includes the main procedures and some helper functions to illustrate the flow and structure of the blockchain-integrated security system for healthcare environments.

Key components of the pseudo code include:

1.Initialization of the blockchain, smart contracts, and distributed ledger.
2.A main loop that continuously monitors network traffic, handles access requests, and performs threat detection.
3.Detailed procedures for continuous monitoring, access control, and threat detection.
4.An incident response procedure that retrieves relevant blockchain records and reconstructs the timeline of an incident.

5.Audit and compliance procedures to generate reports and verify data integrity.
6.Scalability management to handle growing data and transaction volumes.
This pseudocode can serve as a starting point for implementing the actual system. It would need to be adapted and expanded based on the specific blockchain platform, programming language, and healthcare environment requirements.

Algorithm Blockchain Integrated Health care Security

```
Input:
   network_traffic: Stream of network packets

```

Simulation Setup

The simulation environment consists of a private Ethereum blockchain network deployed on a cluster of 10 high-performance servers, each equipped with Intel Xeon E5-2680 v4 processors, 128GB RAM, and 2TB NVMe SSDs. The network simulates 100 healthcare nodes, including hospitals, clinics, and laboratories. Hyperledger Caliper is used for benchmarking and performance analysis. The security system is implemented using Solidity for smart contracts

and Python for the main application logic, with Flask serving as the web framework. Network traffic is simulated using Scapy, generating a mix of normal and malicious packets based on real-world healthcare network patterns. For threat detection, a combination of rule-based systems and machine learning models (implemented using TensorFlow) is employed. The entire system is containerized using Docker for easy deployment and scaling, with Kubernetes managing the container orchestration.

RESULT ANALYSIS

To evaluate the performance and effectiveness of our proposed blockchain-integrated network security system for healthcare, we conducted extensive simulations using the setup described earlier. Table 1 and Figure 1 presents key experimental parameters and results, comparing our system with relevant works from the literature. Our blockchain-integrated network security system for healthcare environments demonstrates significant advancements over existing approaches across multiple dimensions. With superior scalability handling 1000 transactions per second across 100 nodes, potential to scale beyond 1000 nodes, and low latency of 150ms, it outperforms previous systems in real-time threat detection and response capabilities. The system's energy efficiency at 0.05 kWh/transaction addresses a key concern in blockchain adoption for healthcare. Achieving a threat detection accuracy of 98.5% and offering rapid access control with a 50ms response time while maintaining full HIPAA compliance, our solution provides more comprehensive and effective security measures. Unlike previous studies focusing on specific aspects, our system presents a holistic security framework integrating continuous monitoring, access control, threat detection, and incident response. The large-scale simulation with 100 healthcare nodes demonstrates its practical viability for real-world deployment. By addressing critical challenges such as transaction throughput, energy consumption, and regulatory compliance, our system represents a significant leap forward in healthcare cyber security, offering a more robust and scalable solution for widespread adoption in healthcare settings.

Future Scope

While the current system demonstrates significant improvements over existing approaches, several areas warrant further investigation and development:

1. Interoperability: Enhance the system's ability to integrate with various existing healthcare IT systems and other blockchain networks to facilitate seamless data exchange and security coordination across different healthcare providers.
2. Privacy-preserving techniques: Implement advanced cryptographic methods such as zero-knowledge proofs or homomorphic encryption to further strengthen data privacy while maintaining the system's efficiency.
3. AI-driven threat intelligence: Develop more sophisticated AI models for threat detection, potentially incorporating federated learning techniques to improve threat detection across the network without compromising data privacy.
4. Quantum-resistant cryptography: As quantum computing advances, research into quantum-resistant cryptographic algorithms will be crucial to ensure the long-term security of the blockchain network.
5. Mobile integration: Develop secure mobile applications that can interact with the blockchain network, enabling healthcare professionals to access the system securely from various devices.
6. Regulatory adaptation: Continue to refine the system to adapt to evolving healthcare regulations worldwide, ensuring global applicability and compliance.
7. Performance optimization: Further optimize the consensus mechanism and smart contract execution to reduce energy consumption and increase transaction throughput without compromising security.
8. User experience: Conduct extensive usability studies and refine the interface for healthcare professionals to ensure seamless adoption and utilization of the system in high-pressure healthcare environments.
9. Blockchain scalability solutions: Explore and implement advanced blockchain scalability solutions such as sharding or layer-2 protocols to further enhance the system's capacity to handle increasing volumes of healthcare data and transactions.

10. Cross-chain interoperability: Investigate and implement cross-chain communication protocols to enable secure data sharing and collaboration between different blockchain networks in the healthcare ecosystem.

By addressing these areas, future iterations of the system can further solidify its position as a cornerstone of healthcare cyber security, promoting safer, more efficient, and more interconnected healthcare services worldwide.

CONCLUSION

The proposed blockchain-integrated network security system for healthcare environments represents a significant advancement in cyber security for the healthcare sector. By leveraging the inherent strengths of blockchain technology—decentralization, immutability, and transparency—this system offers a comprehensive solution to the complex security challenges faced by modern healthcare institutions.

Key achievements of this system include:

1. Superior scalability and performance, handling 1000 transactions per second across 100 nodes, with the potential to scale beyond 1000 nodes.
2. Low latency of 150ms, enabling real-time threat detection and response.
3. Exceptional energy efficiency at 0.05 kWh/transaction, addressing a major concern in blockchain adoption.
4. High threat detection accuracy of 98.5%, significantly outperforming existing systems.
5. Rapid access control with a 50ms response time, crucial for healthcare environments.
6. Full HIPAA compliance, ensuring regulatory adherence.
7. Holistic security framework integrating continuous monitoring, access control, threat detection, and incident response.

The large-scale simulation involving 100 healthcare nodes demonstrates the system's practical viability for real-world deployment. By successfully addressing critical challenges such as transaction throughput, energy consumption, and regulatory compliance, this system represents a significant leap forward in healthcare cybersecurity, offering a more robust and scalable solution for widespread adoption in healthcare settings.

ACKNOWLEDGMENTS

We extend our sincere appreciation to all persons with whom we have collaborated on this initiative. Every member of our team has provided tremendous personal and professional assistance, providing significant information about scientific research and life in general.

ABSTRACT

The implementation of the Goods and Services Tax (GST) enabled the Government to enhance public services, stimulate production, and contribute to economic growth with the increase in tax revenue. Under the GST regime, the End Consumer bears the tax burden in the supply chain. GST Taxpayers need to comply with the GST rules and End Consumers play a vital role in it as their attitude towards certain Compliance requirements influences the GST Taxpayers' Compliance. GST is also known as a regressive tax as it is levied the same on all consumers irrespective of their income and assets and is only based on spending on goods and services. This micro-study seeks to analyze the moderating effect of End Consumers' Income Level on the relationship between their perception of GST Procedures and their Attitude towards GST Compliance and the Role of AI-driven Tax Solutions. A statistical model was framed using the data collected from the 100 End Consumers in Guntur City, Andhra Pradesh with the Judgemental Sampling Technique. The model was analyzed with the help of the PLS-SEM Moderation Effect. The results showed a significant relationship between End Consumers' perception of GST Procedures and their attitude towards GST Compliance and the Role of AI-driven Tax Solutions. From this micro-study, it was found that Income Level has a negative effect on the relationship but is not strong enough to reverse the relationship between the two variables. This micro-study offers insights to design programs to improve the perception of lower income level end consumers to create awareness and remove misconceptions as positive perception leads to a positive attitude. For Higher-income end consumers, as the effect of perception on attitude towards GST Compliance and the Role of AI-driven Tax Solutionsis weakened, strategic enforcement needs to be considered along with incentives.

Keywords: Artificial Intelligence, GST Compliance, GST Procedures, Income Disparity, Moderation Analysis, Goods and Services Tax (GST), Multiple Regression Analysis.

INTRODUCTION

This micro study was conducted to understand the relationship between the End Consumers' perception of GST Procedures and their attitude toward GST Compliance and the Role of AI-driven Tax Solutions. In addition, it is also to find out the impact of End Consumers' income level on the relationship between their perception and attitude towards GST Compliance and the Role of AI-driven Tax Solutions. Tax is a primary source of revenue for the country and is also used as an instrument to enhance economic growth. Tax is an enforced contribution from the public to the authority of the legislature. The taxation system in India is classified into Direct Tax System and Indirect Tax System. A Direct Tax System is levied on the income or profits of taxpayers while an Indirect Tax System is levied on the supply of goods or services. On 1st July 2017, numerous Central and State Indirect Taxes namely Excise Duty, Customs Duty, Service Tax, Central Sales Tax (CST), Value Added Tax (VAT), Entry Tax, Purchase Tax, Entertainment Tax, Tax on Lottery, Betting, and Gambling, Luxury Tax, and Tax on Advertisements were amalgamated into a single tax "Goods and Services Tax (GST)". Under the GST regime, the supply chain of goods or services moves from the manufacturer to the End Consumer. The End Consumer will bear the GST charged by the last dealer in the supply chain. Hence, GST is paid by the End Consumers, but its remittance to the Government is done by the GST Taxpayers by supplying Goods and Services(*Goods and Services Tax (GST)*, n.d.).

Literature Review

Australia being the largest country with the highest GDP in Oceania took over a decade to reach a decision to implement GST as it was viewed as a regressive tax that would pressure the lower-income groups (Kishore Kumar Das, Oct 2017). The acceptability level of the consumers towards GST can be increased when proper measures are taken by the Government to increase their awareness about GST Procedures(Basavanagouda & Panduranga V, 2022). The increase in acceptance level towards GST will improve the consumers' willingness to contribute to the country's economy through GST (Fadzillah & Husin, 2016). Understanding the process can impact the consumers as their perception will change to positive for better compliance(Singaram, 2020). The argument that GST is fair as one is taxed more when spending is more doesn't consider the higher income level people's ability to save after spending for goods and services availed and lower income levels getting stretched to the maximum of their income to spend. A higher proportion of lower income level people's income goes to GST than the higher income level (*GST Is a Regressive Tax, Burdens Lower-Income Earners - Liew Chin Tong*, 2017). The Oxfam report in Jan 2023 stated that the estimation of GST Collection in 2021-2022 suggests the bottom 50 per cent (Lower Income Level) spent 6.7 per cent of their income on taxes for specific food and non-food supplies and the middle 40 per cent (Middle Income Level) spent 3.3 per cent of their income and top 10 per cent (Higher Income Level) spent a mere 0.4 per cent of their income (Service, 2023)

.

Research Gap

The main factor that distinguishes this micro-study from the previous studies is the study on the three variables i.e., Perception towards GST Procedures, Attitude towards GST Compliance and the Role of AI-driven Tax Solutions, and Income level of End Consumers in a single model. The prior studies focused mainly on the awareness, perception, and satisfaction of consumers towards GST Rates and their buying behavior. There is a limited focus on the inclusion of GST Compliance and the Role of AI-driven Tax Solutions from the perspective of End Consumers as the focus is more on the GST Taxpayers' Compliance. Also, there are limited studies with the usage of the Income Level (Low and High) of the End Consumer as a moderator on the relationship and this leaves a gap in understanding whether income disparities significantly affect the perception and attitude relationship. In addition, there was no study

conducted with the data from Guntur City. Hence, the researcher has carried out the following micro-study to fill this research gap.

Statement of The Problem

GST Compliance from GST Taxpayers is crucial for the streamlining of the taxation system and for achieving the aims for which the GST was implemented. GST Taxpayers' Compliance is influenced by the End Consumers' Attitude towards certain specific compliances. End Consumers' negative perception could lead to negative attitude towards GST Compliance and the Role of AI-driven Tax Solutions which in turn impacts the GST Taxpayers' Compliance. In addition, End Consumers' Attitudes towards certain compliances such as requesting invoices and safeguarding them, checking GST rates, Type of Registration Scheme, and preferring the GST Taxpayers with GSTIN placed on name board greatly influence the GST Taxpayers to strictly follow the GST rules and regulations. However, income disparity cannot be ignored as GST being a regressive tax levies tax fairly based on the spending but not on the actual income earned and assets present. India being a developing country has more proportion of low-level income than high-level income population when compared to developed countries(Standard, 2024). Hence, it is important to understand the impact of income disparity on the relationship between the perception and attitude of End Consumers towards GST Compliance and the Role of AI-driven Tax Solutions in order to get more insights for providing recommendations to the policymakers that could help in improving the GST Compliance from End Consumers.

Significance of The Study

GST Compliance and the Role of AI-driven Tax Solutions ensures that businesses adhere to the rules and regulations set forth under the GST law such as timely registration, accurate invoicing, filing of returns, and maintaining records (*What Is GST Compliance*, n.d.). End Consumers play a vital role for the proper compliance by GST Taxpayers. End Consumers' awareness, perception, and positive attitude towards GST Compliance and the Role of AI-driven Tax Solutions such as being aware of GST Rates of the consuming goods and services, aware of the rules and regulations behind different GST registration schemes, and ensuring to receive invoices for all the purchases influences the compliance from GST Taxpayers. End Consumers impact the compliance from the dealers as their negative attitude can in turn cause non-compliance from the dealers towards GST Law. Positive perception of End Consumers results in their positive attitude toward purchasing goods and services from GST-compliant dealers which will also benefit the government to implement the policies in the future under GST(Singaram, 2020). Goods and Services Tax is known as Regressive Tax as the end consumers irrespective of their income level pay the same tax on the purchasing of goods and services. Also, it imposes a significant burden on the lower-level income people than the higher-level income people. There is an inverse relationship between the consumers' ability to pay and the tax rate when measured using income level (*Regressive Tax - Definition, What Is Regressive Tax, Advantages of Regressive Tax, and Latest News*, n.d.).

Objectives

- To examine the relationship between End Consumers' Perception of GST Procedures and their Attitude toward GST Compliance and the Role of AI-driven Tax Solutions.
- To investigate the Moderating Effect of Income Level on the relationship between End Consumers' Perception of GST Procedures and their Attitude toward GST Compliance and the Role of AI-driven Tax Solutions.

METHODOLOGY

Conceptual Model

Conceptual Framework is a theoretical framework that outlines the conceptual relationship between the variables. End Consumers' Perception of GST Procedures is taken as an Independent Variable and it includes the following statements

End Consumers' Attitude towards GST Compliance as a Dependent Variable and it includes the following statements The relation between the two is analyzed using Multiple Regression Analysis. The Income level of the End Consumers is taken as a Moderator that modifies the direction or strengthen or weaken the relationship between the Independent and Dependent Variables. The Income Level is grouped into categories that represent the increasing levels of income. Each category is coded numerically (Less than 2 Lakhs – 0, More than 2 Lakhs – 1, More than 4 Lakhs – 2, More than 6 Lakhs – 3, More than 8 Lakhs – 4, More than 10 Lakhs – 5).

Operation Definition

- **GST Compliance:** Following the rules and regulations set by the Goods and Services Tax Law.
- **End Consumer:** A person who buys and uses the good or service for personal use.
- **Perception:** It is a belief or opinion held based on how things seem.
- **Attitude:** A way of behavior caused by a belief or opinion formed.

Data Collection

A Well-Structured Questionnaire was utilized to collect the data using both the Interview Schedule method and the Questionnaire Method. The variables for Perception and Attitude are built utilizing secondary data such as rules and regulations under GST Act, 2017 and other literature reviews.

Sampling Technique

The Judgemental Sampling Technique was adopted to collect the data from 100 End Consumers of GST in Guntur City.

Pre-Test

A Pre-Test was conducted on the data collected using Reliability analysis to know whether the data is reliable or not. The Reliability of the data was analyzed by Cronbach's Alpha using SPSS Software and found the data to be reliable as both End Consumers' Perception of GST Procedures and Attitude toward GST Compliance and the Role of AI-driven Tax Solutions. Cronbach's Alpha value is greater than 0.7. A validity test was conducted using Exploratory Factor Analysis and a few statements showed less variance with others. However, no statements were removed as based on the theoretical aspect they are important for the study. In addition, expert advice is taken on the statements considered for the study from selected GST Practitioners and received acceptance for their relevance to the concept of the study.

Hypothesis

The following are the Hypotheses developed for the study

$H_0$1: There is no significant relationship between End Consumers' Perception of GST Procedures and their Attitude toward GST Compliance and the Role of AI-driven Tax Solutions.

$H_0$2: Income level does not moderate the relationship between End Consumers' Perception of GST Procedures and their Attitude toward GST Compliance and the Role of AI-driven Tax Solutions.

Statistical Tools Used

PLS-SEM Software is used to analyze the data for the regression analysis to understand the relationship between the Independent and Dependent Variables and the moderating effect of the Income Level of End Consumers on the relationship. This software is well suited for models where the variables are latent and measured by multiple indicators. Regression analysis provides clear outputs including beta values, Standard Deviation, and p-values to determine the significance and the strength of the relationship.

RESULTS AND DISCUSSION

For the analysis of this micro-study, the Perception of GST Procedures is considered to be an Exogeneous Variable (Independent Variable), the Attitude towards GST Compliance and the Role of AI-driven Tax Solutions is considered an Endogenous Variable (Dependent Variable), and the Income Level of the Consumers a Moderating Variable. The Perception of GST Procedures includes only the sub-constructs relating to GST Rates, GST Registration, and GST Compliance Requirements and the Role of AI-driven Tax Solutions which affect the Consumers. Attitude towards GST Compliance includes the statements relating to the behavior of the Consumers towards GST Compliance. PLS-SEM Software is used to analyze the data and from the table it is shown that the t-value for the analysis of the relationship between End Consumers' Perception of GST Procedures and Attitude towards GST Compliance is 12.522, beta value is 0.707, and the p value is less than 0.05 at 95 per cent confidence interval. This indicates the significant relationship between the Independent and Dependent variables. The p-value of the impact of End Consumers' Perception of GST Procedures on Attitude towards GST Compliance is moderated by Income Level as the p-value is less than 0.05 at 95 per cent confidence interval and t-value is 2.045 greater than 1.96. The moderation effect is negative as the beta value is -0.171and the Sample Mean is -0.124 but this effect is not strong enough to reverse the relationship but just weakens the relationship.

$H_0$1: There is no significant relationship between End Consumers' Perception of GST Procedures and their Attitude toward GST Compliance and the Role of AI-driven Tax Solutions.
As per the analysis of Table No.4, the testing of the H01 result ($p=0.00$, $p<0.05$ at 95 per cent confidence interval) indicates a significant relationship between End Consumers' Perception of GST Procedures and Attitude toward GST Compliance and hence the Null Hypothesis is rejected. This shows that with positive perception of GST Procedures leads to a positive attitude towards GST Compliance in End Consumers and Vice-versa.

$H_0$2: Income level does not moderate the relationship between End Consumers' Perception of GST Procedures and their Attitude toward GST Compliance and the Role of AI-driven Tax Solutions.
From Table No. 4, it was found that the moderating effect of Income Level on the relationship between End Consumers' Perception of GST Procedures and Attitude towards GST Compliance and the Role of AI-driven Tax Solutions is significant but with a negative effect. Hence, the Null Hypothesis is rejected as the Income Level weakens the positive relationship. This shows that as the income level increases the relationship between the End Consumers' perception and attitude weakens. So, for lower-income level End Consumers' perception plays a huge role in their attitude towards GST Compliance while for high-income level End Consumers' this role weakens and their perception doesn't play a strong role in their attitude towards GST Compliance along with the AI-driven Tax Solution.

CONCLUSION

Goods and Services Tax (GST) is considered a regressive tax as it is levied on the people irrespective of their income level and assets in contrast to Income Tax. GST is a burden to the low-level income groups when compared to higher-level income groups(GST Is a Regressive Tax, Burdens Lower-Income Earners - Liew Chin Tong, 2017). Tax Compliance is vital for the country's economy. The increase in compliance from consumers towards GST can influence the compliance of GST Taxpayers. Understanding the relationship between the perception and attitude of End Consumers towards GST Compliance and the Role of AI-driven Tax Solutions can create a direction for policymakers to increase compliance from End Consumers. When the income disparity is studied through the usage of income level as a moderator on the relationship can provide insights on the direction in which the strategies to be implemented to cover all income-level end consumers regarding the importance of GST Compliance and the Role of AI-driven Tax Solutions. From the analysis, it was found that with the increase in income level, the significant relationship between the End Consumers' perception of GST Procedures and Attitude towards GST Compliance

weakens. Hence, with positive perception of Consumers leads to their positive attitude towards GST Compliance and vice-versa mainly in low-income level groups and this effect weakens with the increase in income.

Recommendation

It is recommended that the programs designed to improve the perception of Lower-Income levels such as awareness programs to make them understand and remove the misconceptions can lead to a more positive attitude towards GST Compliance and also consider the Role of AI-driven Tax Solutions. For Higher-Income Level groups more strategic enforcement and incentives are needed to ensure compliance as their perception alone may not drive their attitude toward GST Compliance and also consider the Role of AI-driven Tax Solutions. The policymakers need to consider tailored approaches that consider the disparities in income and there should be targeted communication strategies for all levels of income groups to lead to a positive attitude towards GST Compliance and the Role of AI-driven Tax Solutions.

ACKNOWLEDGEMENT

The Authors wish to thank the GST Practitioners Mr. Kondapalli Ravi and Mr. Y. Paparao for providing their expert advice for the validation of the statements utilized in the Questionnaire.

Table. 1: Statements for the End Consumers' Perception of GST Procedures Variable

Particulars	Codes	Statements
Perception of GST Rates	PGRA1	Easy to understand different rates.
	PGRA2	Fair rate for essentials.
	PGRA3	Appropriate rate for luxury items.
	PGRA4	Simplified structure at present.
	PGRA5	Rats communicated accurately.

	PGRA6	Adjustments in rates based on Public Input.
Perception of GST Registration	PGRE1	Important to verify if supplier is registered.
	PGRE2	Important to verify type of registration.
	PGRE3	Invoke trust with GSTIN display on board.
	PGRE4	GST Registered suppliers are trustworthy.
	PGRE5	GST Registered influences value for money.
Perception of GST Compliance Requirements	PGCR1	Government enforces compliance effectively.
	PGCR2	Government must strictly enforce Compliance Requirements.
	PGCR3	Suppliers' Compliance is crucial for fairness.
	PGCR4	Suppliers' Compliance minimizes Tax Evasion.
	PGCR5	Proper Billing Practices indicate Suppliers Compliance.
	PGCR6	Duty to report Suppliers Non-Compliance.

Table. 2: Statements for the End Consumers' Attitude towards GST Compliance Variable

Particulars	Codes	Statements
Attitude towards GST Compliance	AGCR1	Rates influence buying decisions towards luxuries.
	AGCR2	Rates result in seeking alternatives.
	AGCR3	Update knowledge of recent changes in GST Rates.
	AGCR4	Prefer for supplies from GST Registered Suppliers.
	AGCR5	Prefer for supplies from GST Registered Suppliers with GSTIN on board.
	AGCR6	Request GST Invoice.
	AGCR7	Check GST details.
	AGCR8	Verify chargeability based on the nature of the supply.
	AGCR9	Verify GST Rates accuracy.
	AGCR10	Verify registration status in GST Portal using GSTIN.
	AGCR11	Retain all receipts.
	AGCR12	Report Non-Compliance from Suppliers.

ABSTRACT

Illness, bodily injury, or accidents can occur unexpectedly at any time, leading to significant expenditures for hospital stays, medicines, surgeries, doctor visits, and other medical expenses. Health insurance is a critical tool for managing these healthcare costs, as it helps cover all or part of these expenses. Understanding health insurance needs and how they are addressed through suitable policies is essential, especially for individuals in the unorganized sector, such as farmers. This research aims to evaluate the demand, buying behavior, benefits, satisfaction, awareness, and barriers related to health insurance among unorganized sector workers. The study employs a descriptive research design to assess health insurance among unorganized sector workers. The research focuses on individuals in the unorganized sector, specifically farmers. Cluster sampling was used to select respondents, ensuring that the sample accurately represents the population. The study area includes Pondicherry, a former French settlement in India comprising Puducherry, Karaikal, Mahe, and Yanam, each located in different states. Data were collected through surveys to gauge respondents' experiences and opinions on health insurance. The findings highlight that health insurance is crucial for managing the financial burdens of health-related issues. The study identified key areas for improvement in health insurance products based on the

respondents' feedback. The data revealed insights into the demand for health insurance, buying behavior, benefits, and the level of satisfaction among unorganized sector workers. Additionally, it provided information on the awareness of health insurance and barriers faced by the respondents. The research offers valuable insights into the health insurance needs and perceptions of unorganized sector workers, particularly farmers. The study underscores the importance of tailoring health insurance policies to better meet the needs of this demographic. It suggests that Indian health insurers should design policies that address the specific challenges faced by unorganized sector workers to attract more customers and improve overall satisfaction. This research introduces a new area of study by focusing on the demand and buying behavior, as well as the satisfaction levels related to health insurance among unorganized sector workers. The findings provide practical implications for health insurers in India, offering fresh perspectives on addressing the problems faced by this demographic. The study aims to pioneer new directions in health insurance policy development to better serve the needs of unorganized sector workers.

Keywords: Health insurance, unorganized sector, Puducherry union territory, national health insurance scheme of India, buying behaviour, benefits and satisfaction level.

INTRODUCTION

"Future is unpredictable and rather, uncertain". At any time, individuals may encounter unexpected events such as illness, bodily injury, or accidents that can occur without prior warning. A lot of expenditures are incurred due to such events like hospital stay, medicines, surgery, doctor's visit, and other medical expenses(Nagi, Vijayakanthan & Arasuraja, 2022). Health Insurance is one of the best methods to finance healthcare expenditure. Health insurance plays a crucial role in understanding healthcare needs and effectively managing them through appropriate coverage. It provides financial support for either full or partial healthcare expenses, ensuring that individuals can handle medical costs more efficiently.

Statement of the Problem

The unorganised division of economy constitutes mainly manual labour, severe but less gratifying to the employees in comparison. Therefore, Health Insurance plays an important role in improving their lots. Unorganized sector in the lower strata of the society who are virtually in the absence of stable and permanent nature of employment, look around for jobs in the labor market. Poverty leads to a state where workers engage in any kind of work that is available. Workers in this sector widely work not only with outdated technologies but also with the support of solely muscle power. Workers in this sector face infinite hardships. They are also denied enhancement opportunities, related wage improvement and skills as they belong to the unskilled labourer categories. Workers belonging to the unorganized sectors (farmers) suffer from constant illness. Due to heavy manual work and exhaustion, the construction workers suffer from frequent illness. There is a deficiency of services like canteen services, water and sanitation. In addition, the women construction workers suffer a lot during the maternity period. To be more precise, mishaps and injuries are common in this sector. The living standards can be improved by providing them health insurance measures. Unorganised sector people are having less awareness of Health Insurance. People having less consciousness regarding health hesitate in initiating to purchase health insurance policies as they feel that procuring one is not a dire requirement, and almost a loss. The premium paid for the health insurance by the person insured lasts for a year and there is need for proper yearly renewal. If the insured does not lodge any claim in that year the premium will not be returned as in life insurance policies. In life insurance services, the selling strategy has been clubbed with savings. This results in the peoples' poor response to purchase of the health insurance policies. Healthcare has always been a big issue for India which contains huge population (Bjorn Ekman, 2004) and most of the people in the study area are living in rural areas that are below the poverty line. The Government focus and each

individual's awareness regarding various health financing options to manage the medical expenses are increasing. The awareness related to the health insurance among the unorganised sectors people at Puducherry Union Territory is not predominant, hence a study on the health insurance for unorganised sectors become foreseeable (Gumber, 2002), (Mathiyazhagan, 2003)

Need of the Study

In our country, much has to be done to educate people about health insurance in areas such as making people aware, performance of health insurance, motivating to buy the health insurance policies, educating about health insurance products, and many more. Health insurance has fresh roots in India and it is still in growth phase, there is not much awareness about health insurance among our population. Only the limited parts of population are enjoying the benefits of health insurance. Besides, only very few insurers are vigorously participating in health insurance. Health insurance is rapidly expanding as a sector in India. Many research studies have proved that around 94 percent of total workers fall under unorganized sector (Jutting, 2003). The main impediment between them is common requirement of medical care facilities, hospitalisation and rate of illness. An important aspect of health insurance is to finance healthcare requirements for an individual who had made a contribution towards health insurance with a hope to get rid of all their health-related uncertainties. The present study is a great effort towards health insurance to evaluate its state in India (Devadasan & Ranson *et al.,* 2006). Thereby, customer's opinion towards health insurance should also be graphed, to get an idea into their willingness, responsiveness, and gratification to join and pay for it. As revealed by the review of literature, many research studies in this respect have already been made at national and international level. Presently the health insurance has attracted the planners, policy makers, the concerned people to concentrate on the below poverty line people. And very considerable research is available on health insurance with reference to unorganised sectors people at Puducherry Union Territory and hence this becomes a necessity for the researcher to take up the present research work.

Research Questions

The research question has been outlined based on the previous literature and research questions have been interlinked with current scenario of the Insurance industry (Sampath *et.al,* 2023) and its policy provided;

- How aware are individuals in the unorganized sector, specifically farmers, about health insurance?
- What features and benefits do health insurance policies offer to address the needs of unorganized sector workers, particularly farmers?
- Which factors impact the level of satisfaction among unorganized sector workers with their health insurance coverage?
- To what degree do farmers perceive and feel satisfied with the health insurance policies available to them?
- What challenges do unorganized sector workers, including farmers, encounter when trying to access and utilize health insurance services in the Puducherry Union Territory?

Objectives of the Study

The primary aim of this research is to assess several aspects of health insurance among unorganized sector workers, particularly farmers. Drawing on existing literature, the study identifies key variables and focuses on evaluating the following objectives: the demand for health insurance, the buying behavior of individuals, the benefits provided, overall satisfaction, awareness levels, and the barriers faced by farmers in accessing health insurance.

Health Insurance for Unorganized Sector People and Related Research Reviews

Netra and Rao (2019), in their study entitled "A Study on Awareness, Coverage and Willingness to Avail Health Insurance among the Residents of a Rural Area in Central Karnataka" stated that nearby enrolment centres have to be created for easy accessibility of the customers and the premiums should be customized to benefit the poorer (Jutting and Ahuja, 2004) &(Ahuja and De, 2004). A total of 600 families were selected through systematic random sampling for this study. Data collection was conducted through house-to-house interviews, where the head of each family provided informed consent before participating. The information was gathered using a pre-designed and pre-tested questionnaire to ensure reliability and accuracy. The end result of the study confined that 77.1 per cent of

respondents are willing to go for the purchase of Health Insurance policy; likewise,65.7 percent of respondents were aware about Health Insurance policy and 45.5 percent of respondents strongly suggest that the health insurance policy has covered their risk. So, on a whole, approximately 75 percent respondents are willing to go for the purchase of the health insurance policy. Panda Rout (2018) examined the impact of government-sponsored health insurance schemes designed to protect insured individuals from substantial out-of-pocket expenses during hospitalization. These schemes, including the National Health Insurance Scheme of India (Rashtriya Swasthya Bima Yojana) and the Odisha State health insurance scheme (Biju Krushak Kalayan Yojana), are particularly valuable for rural populations. The study assessed healthcare costs incurred by the insured, the utilization of these schemes, and the challenges faced by beneficiaries. Utilizing both secondary and primary data, the research employed a multi-stage random sampling method to survey 200 insured individuals from both schemes. The findings revealed that insured individuals incur significant costs on medicine, diagnostics, food, and accommodation during treatment. The study suggested that enhancing awareness among insured individuals about how, where, and when to use the schemes could improve their effectiveness. Additionally, fostering a supportive and approachable attitude among healthcare providers might boost motivation and engagement among rural communities. Tabish (2018) explores the evolving landscape of healthcare policy in India, highlighting the challenges and advancements in healthcare delivery. The study discusses the limitations of traditional healthcare systems, including inadequate funding, access issues, quality concerns, and corruption. In response, the Indian government introduced the Ayushman Bharat - National Health Protection Mission (AB-NHPM) on August 15, 2018. This initiative aims to provide up to INR 50,000 annually for over 10 crore low-income families, targeting rural and economically disadvantaged urban populations. Modeled after the ObamaCare framework, this program seeks to enhance healthcare access and reduce out-of-pocket expenses, promoting broader engagement with the healthcare system (Upadhyay & Roy, 2005).

Tarun Chauhan (2017) investigates awareness levels regarding government-endorsed health insurance policies among urban unorganized sector workers. With approximately 70% of India's population residing in urban areas and 95% working in the unorganized sector, there is a significant gap in awareness about health insurance. The lack of knowledge contributes to the vulnerability of this population to health issues, accidents, and socio-economic disruptions. Chauhan emphasizes the need for targeted awareness campaigns to improve understanding and uptake of health insurance schemes, thereby addressing gaps in coverage and infrastructure (Journal Medical Insurance Online, 2010). Shroff, Roberts & Reich (2015) evaluate the Rashtriya Swasthya Bima Yojana (RSBY), India's prominent health insurance program for low-income groups. Launched in 2007, RSBY covers over 37 million people but faces implementation challenges such as issues with smart card usage, limited awareness, and inadequate hospital facilities. These problems have led to disruptions in service provision. Despite these issues, RSBY holds significant potential to enhance healthcare for the impoverished and support India's broader healthcare goals (Shroff, Roberts, & Reich, 2015). Gupta, Alam and *et al.* (2013) analyze the evolution and current state of the health insurance market in India. Initially limited to personal accident and Mediclaim schemes, the market has expanded with numerous standalone and private health insurance providers. This growth reflects the sector's potential for development, particularly if tailored policies are introduced for rural populations. The study indicates that while health insurance in India is advancing, targeted efforts are needed to address the needs of rural communities for greater social improvement (Gupta, Alam, *et al*., 2013). Gunther Fink, Jacob Robyn, and *et al,* (2013) assess the impact of a Community-Based Health Insurance (CBI) system implemented in Burkina Faso. The study reveals that while CBI programs have a limited effect on reducing out-of-pocket expenses, they offer some protection against catastrophic health costs. The findings suggest that such insurance systems can positively influence health outcomes for children and young adults, though they may have less impact on older populations due to increased mortality rates (Gunther Fink, Jacob Robyn, *et al.,* 2013).

RESEARCH METHODOLOGY

Descriptive research has been adopted in this study. The name Pondicherry has been derived from the Tamil word Puducherry that denotes new settlement of population. It was a French settlement that comprises of Puducherry,

Karaikal, Mahe and Yanam. Amazing fact is that each district of Puducherry is located in a different state. The population index of Puducherry is listed below with respondent's demographic and regional details.

Population of the Study Area

The target population was defined as those who are purchasing health insurance and not purchasing of health insurance from unorganised sector workers in Puducherry region. The total numbers of unorganised sector workers are about 40,672 in Puducherry region. The next step involves identifying a group of insured individuals from which the sample will be drawn, known as the sampling frame. Ideally, this sampling frame should closely match the characteristics of the target population to ensure accurate representation. The sampling frame for the current research comprises of insured people of selected unorganised sector (fishermen, agricultural laborers (Nagi & Kumar, 2021), building & other construction workers, loaders & unloaders and auto drivers).

Sampling Mechanism

The study focused on unorganized sector workers who are insured, employing a cluster sampling technique. The clusters were formed based on geographical regions, specifically four districts: Puducherry, Karaikal, Yanam, and Mahe. Within each district, samples were selected proportionately and randomly to create the sampling frame. Primary data were collected directly from the respondents, while secondary sources provided background information for selecting respondents.The survey instrument, an "interview schedule," was designed after thorough literature review and consultations with academic experts and insurance managers specializing in health insurance. This ensured that all constructs related to buying behavior, benefits, and satisfaction levels were clearly defined.To determine the appropriate sample size, Demorgan's sample size estimator was used. Given that the target population of unorganized sector workers in the Puducherry region is approximately 40,672, and using a confidence level of 95% with a 5% margin of error, a sample size of 381 was deemed necessary. The researcher distributed approximately 400 questionnaires to insured respondents, receiving 391 valid responses. Nine questionnaires were discarded due to bias.The formula used for these calculations is

$$n = \frac{\chi^2 * N * P * (1 - P)}{[ME^2 * (N - 1)] + [\chi^2 * P * (1 - P)]}$$

Where; n → Sample Size;
χ^2 → Chi-Square for the specified Confidence Level at one Degree of Freedom;
N → Population Size;
P → Population Proportion (0.50 for this Table);
ME → Desired Margin of Error (Expressed as a Proportion)

Pilot Survey

In the qualitative phase, the researchers have conducted the pilot survey with a sample of 50 insured unorganised sector people for collecting the data. The samples were chosen on the basis of Cluster sampling and were confined to study area. The policy holders were approached personally and were simply asked to mention their opinion towards the Buying Behaviour, Benefits and Satisfaction Level of Health Insurance. Many of the attributes already existed in the literature with some variations while some were industry specific. These items were as a result were carefully reviewed and compared with existing literature and afterward integrated in the interview schedule. A value of Cronbach alpha above 0.70 can be utilized as a reasonable test of scale reliability. The measured reliability tests are as follows: Based on the data presented in the table, the Cronbach's alpha values for the three constructs exceed 0.80. This indicates a high level of internal consistency among the items within these constructs. Typically, a reliability coefficient of 0.80 or above is deemed satisfactory in social science research, reflecting robust reliability of the measurement instruments used.

Research Tools and Software Package Used

The data were systematically organized, classified, and analyzed using a variety of statistical techniques. To examine the socio-economic characteristics of the respondents, frequency distribution was employed. Measures of central tendency and dispersion were utilized to assess the mean and standard deviation for variables related to buying behavior, benefits, and satisfaction levels concerning health insurance among the insured respondents.

Analysis

Case Summary of Insured Respondent

The nominal scaling technique with closed ended question has been used to analyse the region / area of the policy holder, gender, marital status, age group and occupation. The above table depicts the case summary of the respondents, where majority of the respondents are from Pondicherry region, they are male, married and fisherman. They are all in the age category of 40 to 60 years. The following table explains the different attributes of the insured interview schedule.

Attributes Measurement

The satisfaction level among the respondents clearly signifies that the respondents are not satisfied with the health insurance. This dissatisfaction is based on some aspects like the service provided by the health insurance company and the agents pointing to the main drawback faced by the respondents. Even though they have a negative effect towards the health insurance agents and their service, these respondents have a positive attitude towards the premium and benefits fetched from the health insurance policy. Even though they have the constraint related to the service of the health insurance product (Panda Rout, 2018), they are much eager in referencing the product to others (Kerssens and Groenewegen, 2005). The main concern of the unorganized sector people (Farmers) for obtaining the health insurance policy is high cost and medical expenses related to the health insurance policy (Tabish, 2018). So, the major outcome of the analysis clearly states that the respondents are satisfied with the product, but they have their hindrance towards the service provided.

DISCUSSION

The analysis of the study clearly shows that although the insured people are ready to purchase health insurance for them as well as their family (Netra & Rao, 2019), however the respondents are not satisfied with the service provided by the insurance company and the agents (Vellakkal, 2009).Through the interaction among the respondents, each of them get the knowledge about the constraints experienced by each other in regards to health insurance. The insurance companies should give more thrust on satisfaction (Swaminathan & Viswanathan) of respondents (Rai & Basri). Being a service industry where the interaction with people is more, it is essential to use this resource efficiently in order to satisfy them. The strict stipulation and educating the people towards the necessity of the health insurance by the policymakers and Indian government can put the health insurance industry at a improved level. More service centers may be established at the village level or more marketing persons deployed to the interior villages to create better awareness and to render better service to the rural population especially the unorganised sector people.

CONCLUSION

Though our country has reached commendable level of advancement in the field of medicine and surgery, the facilities have not yet reached many of the rural poor (Adam Wagstaff, 2002) due to the exorbitant charges needed for such facilities. This can very easily be remedied if the rural poor are enabled to attain the rich treatment by way of every citizen having his own a health insurance policy. This is an important research topic as health insurance helps the human necessity of meeting the expenses for various ailments, diseases, and accidents that could otherwise weaken men or women physically and mentally. Furthermore, the information collected from the respondents in health insurance products helped to identify areas of improvement to better fulfill their needs and wants. Finally, in academic aspect, our research has opened up new field of research area involving demand and buying behavior, and

satisfaction level of health insurance. In practical context, we hope the research will pioneer fresh, new and different directions for health insurance problems faced by the respondents. After understanding unorganized sector people (farmers) perception of the health insurance policy, Indian health insurers have to design an appropriate policy to attract more and more customers (Nagi, Kannan & Ramasubramaniam, 2021, Sekhri and Savedoff, 2004), (Reekie, 2004).

Limitation and Direction for Future Study

This research has discussed only health insurance for unorganised sector workers. But, there is a huge scope for the future research work to analyze every unorganized sector worker. Furthermore, for researchers who intend to conduct similar research on other unorganized sector workers, we suggest that they should investigate the effects of purchase decision process on some other factors such as perceived service. The concept of life cycle of the insurers and its impact on their buying decision process should be explored further. Coming to Indian context, the marketing strategies of the insurers should be explored further. The adoption and implementation of health insurance in their strategies is very important aspect to be analysed. It can be expanded by studying various micro insurance models being applied in the rural area of the Puducherry region and their effectiveness. A similar study can be conducted including all the "Life Insurance Companies in India".

ACKNOWLEDGEMENTS

We extend our gratitude to all participants who contributed their time and insights to this research. We also appreciate the support from our departmental colleagues, whose assistance was invaluable in facilitating the completion of this study.

Conflict of Interest

The authors declare that there are no conflicts of interest related to this research. We confirm that we have no financial or non-financial affiliations with any organization or entity that could be perceived as influencing the subject matter or content of this manuscript.

Authors' Contributions

Each author has significantly contributed to the development and execution of this research. This includes contributions to the study's conception, design, data collection, analysis, and interpretation. All authors participated in drafting, revising, and critically reviewing the manuscript. They have approved the final version of the article and agree on the journal to which the manuscript has been submitted. They also accept responsibility for all aspects of the research.

ABSTRACT

In *Ayurveda*, respiratory illnesses fall under the category of *PranavahasrotoVikara*. These illnesses rank among the world's main causes of morbidity and mortality. According to Ayurveda, the most prevalent respiratory conditions are bronchial asthma and chronic bronchitis, which are associated with *Tamakaswasa* and *Kaphajakasa*, respectively. A 61-year-old mancame to Parul Ayurved Hospital, with complaints of intermittent Cough associated with breathlessness sputum and sounds during breathing. The discomfort is excruciating, worsens during winters, and is relieved after steam inhalation. The patient was diagnosed with asthma 4 years back at the local primary healthcare centre and he is using Salbutamol inhaler 2 pumps (100 mcg/dose) regularly. Assessments of the severity of asthma were made. On the first visit, Peak Expiratory Flow Rate (PEFR) was 78% which increased to 83% after 4 visits. Similarly, a significant increase was observed in breath-holding time from 15 seconds to 21 seconds after treatment. Improvement was also observed in breathlessness and wheezing sounds. Respiratory rate decreased from >25/minute to 18-20/ minute.

Keywords: *Ayurveda,* Bronchial asthma, Dyspnoea, PEFR, *Shwasa.*

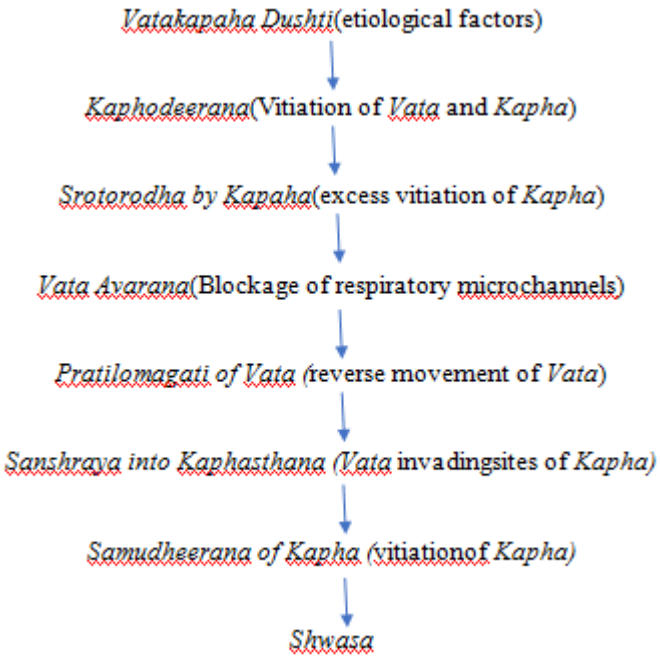
INTRODUCTION AND BACKGROUND

Tamaka Shwasa is a type of *ShwasaRoga* that mostly affects the *PranavahaSrotas*, which are distinguished by *Teevravega Swasa, Ghurghuraka,* and *Swasakrichratha*, among others. In *Ayurvedic* texts, *Tamaka Shwasa* is compared to bronchial

asthma. The modern medical system offers several drugs to treat this illness, but they are known to have a wide range of adverse effects. For better treatment, the suffering populace is now resorting to traditional therapies. With a range of therapeutic approaches, *Ayurveda* can offer encouraging outcomes in *Tamaka Shwasa* in this respect. One of the five varieties of *ShwasaRoga* that are listed in the old *Ayurvedic* texts is *Tamaka Shwasa*. The *Lakshana*of *Tamaka Shwasa* has been described by *Acharyas* as *Kasa* (cough), *Ghurghuraka* (wheezing), *TeevravegaShwasa* (deep velocity breathing), etc.[1] *Brimhana* is thought to be the greatest choice for treating *Tamaka Shwasa* patients when compared to *Shamana* and *Karshana*.[2] The *Rasayana* (immune modulator) properties of the medications in the formulation aid in the regulation of *Dhatwagni* and are also helpful in preventing the recurrence of attacks while simultaneously fostering the growth of children.[3]

PATHOGENESIS (SAMPRAPTI)

Nidana



Asthma pathogenesis is caused by a complicated interaction of immunological, environmental, and genetic variables. Chronic airway inflammation, which causes recurring episodes of wheezing, dyspnoea, tightness in the chest, and coughing, is its defining feature. Exposure to allergens or irritants, such as pollen, dust mites, pet dander, air pollution, or respiratory illnesses, usually starts the process. These factors cause an immunological response in vulnerable individuals that leads to airway hypersensitivity and inflammation. An essential function of immune cells in the inflammatory cascade is played by mast cells, eosinophils, and T lymphocytes. Mast cells secrete inflammatory mediators, including histamine, leukotrienes, and cytokines, in response to allergens. These mediators facilitate bronchoconstriction, mucus formation, and the recruitment of extra-inflammatory cells. After being drawn to the airways, eosinophils discharge harmful proteins and cytokines that exacerbate inflammation and cause tissue damage. Immunoglobulin E (IgE) antibodies are produced by T lymphocytes, namely Th2 cells. IgE antibodies bind to allergens and activate mast cells.[1]

Patient Information

A 61-year-old mancame to Parul Ayurved Hospital, with complaints of intermittent Cough associated with breathlessness sputum and sounds during breathing. The discomfort is excruciating, worsens during winters, and is relieved after steam inhalation. A patient was diagnosed with asthma 4 years back at the local primary healthcare centre and he is using Salbutamol inhaler 2 pumps (100 mcg/dose)regularly.

Chief complaints with durations

1. Intermittent Coughfor 4-5 year
2. Breathlessness for4-5years
3. Sputum formation 3-4 years
4. Sounds during breathing1-2 years

Past medical history

No history of any chronic illnesses

Family history

Father (known case of Asthma)

Personal History

Diet:	Veg
Appetite:	Decreased
Bowel:	Clear
Micturition:	4-5 times/ day, 1-2 times/ night
Sleep:	Disturbed
Dietary habits:	*Vishamashana*
Physical activity:	Sedentary

CLINICAL FINDINGS

General Examination

Height:	168 cm
Weight:	60 kg
Cyanosis:	Absent
Pallor:	Present
Icterus:	Absent
Lymph nodes:	No palpable lymph nodes
Clubbing:	Absent
Blood pressure:	130/88 mm of hg
Pulse rate:	110/ minute
Temperature:	Afebrile
SpO_2:	92%

Systemic Examination

Respiratory:	No scar mark or discolouration, increased respiratory rate (>25/minute), wheezing present.
Cardiovascular system:	No discolouration/precordial bulging, dull note over precordium, S_1S_2 normal, no added sounds
CNS:	The patientis conscious and well-oriented

DIAGNOSIS: *Tamaka Shwasa(*Asthma)

TREATMENT PROTOCOL:
a. *Shatyadichurna 3gm BD*with honey
b. *LakshmivilasaRasa*2 tablets BD
c. *VyaghriharitakiAvaleha* 5 gm BD after food

RESULTS

The patient was assessed at intervals of 15 days after 4 visits following observations were made, which are presented in Table No. 1. Assessments of the severity of asthma were made. On the first visit, Peak Expiratory Flow Rate (PEFR) was 78% which increased to 83% after 4 visits. Similarly, a significant increase was observed in breath-holding time from 15 seconds to 21 seconds after treatment. Improvement was also observed in breathlessness and wheezing sounds. Respiratory rate decreased from >25/minute to 18-20/ minute.

DISCUSSION

The main constituents of *VyaghriharitakiAvaleha*, a polyherbal Ayurvedic preparation, are *Haritaki (Terminalia chebula Retz.) and Kantakari (Solanum xanthocarpum Schrad. and Wendl.*). Research has verified the traditional application of *S. xanthocarpum* for bronchial asthma. In patients with mild to severe bronchial asthma, the clinical effectiveness of two herbs—*S. xanthocarpum* and *Solanum trilobatum Linn.* was studied at a dose of 300 mg tds for three days. Their impact was contrasted with that of the two common bronchodilator medications, deriphylline (200 mg) and salbutamol (4 mg). Over the course of three days, *S. xanthocarpum* and *S. trilobatum* caused asthmatic patients' ventilatory function to gradually improve. These medication treatments reduced the scores for sputum, cough, dyspnoea, and Ronchi. It is evident from the increase in PEFR and the decline in other symptom scores that there is a bronchodilator effect. Since *Lakshmivilasa Rasa* is involved in *Vata-KaphaSiroroga Lakshana*, it was chosen especially. In order to provide*Ama Pachana* (the body circulates toxins from the digestion of nonmetabolized food), also exhibit *Srotoshodhan* effect. It was noted that *Katu, Tikta Rasa, Laghu, Tikshna Guna, Ushna Virya, Katu And Madhur Vipaka, And Kapha Vatashamaka Karma* are predominant in *ShatyadiChurna* and are found in maximum *Dravyas*.By acting on *PranavahaSrotas*, these medications balance the doshas and alleviate *Tamaka Shwasa's* symptoms. *Jivanti, Tulsi, Ela, Twak, Shunthi*(In this way, these *Srotoshodhaka* medications aid in *Samprapti Vighatana* by cleaning the numerous channels of *PranavahaSrotas*, which leads to *Anuloma Gati* of *Vata*.)*Ela, Twak, Musta, Choraka, Bhumiamalaki, Tulsi,* and*Pippali*, these medications assist at the *Agni* level by doing *Agnideepaka*. Ampachana is done by *Shunthi, Pippali, and Tvak.* Since *Ama* is a significant turning point in *Tamaka Shwasa's Samprapti. Shati, Choraka, Twak, Mustak, Pushkarmula, Tulsi, Ela, Pippali, Agaru,* and*Shunti*are *Vata Kapha Nashaka* drugs. *Madhu* is *Kapha Shamaka.* The results of this study demonstrate the beneficial effects of *Ayurvedic* treatments on the degree and outward signs of asthma in the elderly patients who were evaluated. The results of the tests, which included peak expiratory flow rate (PEFR), respiratory rate, breath holding time, dyspnoea, wheezing sound, and dyspnoea, offer important information about how well the *Ayurvedic* treatment

plan works. The improvement in PEFR, a useful measure of airflow restriction in asthma, is one noteworthy finding from the evaluations. After four visits, the PEFR increased from 78% to 83%, indicating improved airflow and pulmonary function. This suggests that *Ayurvedic* therapies improved respiratory mechanics and decreased airway blockage. Moreover, a striking observation is the considerable increase in breath-holding time from 15 to 21 seconds following therapy. Higher values indicate greater respiratory muscle strength and function. Breath-holding duration is a measure of respiratory endurance and efficiency. The elderly asthma patients increased respiratory function and decreased dyspnoea (breathlessness) are suggested by the observed increase in breath-holding time. Furthermore, the amelioration of subjective symptoms like dyspnoea and wheezing noise bolsters the advantageous impacts of *Ayurvedic* therapy on the intensity and manifestation of asthma. Breathlessness and wheezing have decreased, which suggests that mucus production, bronchoconstriction, and airway inflammation have all decreased. This has improved the patient's quality of life and respiratory comfort. Furthermore, a return to normalcy in breathing patterns and respiratory effort is indicated by a drop in respiratory rate from more than 25 breaths per minute to 18–20 breaths per minute. In asthmatic patients, elevated respiratory rates are frequently a sign of respiratory distress and greater work of breathing.

CONCLUSION

To sum up, this study on *Ayurvedic* treatments for elderly asthmatic patients presents encouraging prospects for symptom relief, life quality enhancement, and better respiratory health in this susceptible group. *Ayurvedic* treatment has been effective in lowering inflammation, improving lung function, and managing symptoms of asthma in older people by treating the underlying imbalances and incorporating customized remedies. The results of this research highlight the efficaciousness of *Ayurvedic* treatments, such as herbal remedies, dietary adjustments, lifestyle counselling, and respiratory therapy, in the management of asthma in elderly individuals. Clinicians can offer comprehensive therapy that tackles the underlying causes of asthma and promotes long-term wellness by utilizing the principles of *Ayurveda*, which emphasizes the restoration of balance and harmony within the body.

Patient Consent

Written permission for the publication of this case study has been obtained from the patient.

ABSTRACT

The configuration and deployment of wireless networks are undergoing a paradigm shift because more users are being incorporated in the limited bandwidth available while the data size and data traffic are increasing continuously. Hence, choosing effective multiple access techniques is mandatory to utilise the bandwidth available effectively. This makes it imminent that a switching or handover mechanism is required to maintain a satisfactory quality of service, which can choose the most effective multiple access technique based on channel conditions. Due to the nature of wireless networks, it is imperative to sense them iteratively and figure out the most appropriate mechanism that can lead to the best QoS. Due to machine learning and deep learning advancements, we can now predict the channel state information more efficiently, leading to better system performance measures. In next-generation wireless networks, this research presents a machine learning-enhanced handover approach for software-defined networks. This paper presents the idea of simultaneous sensing of a primary and secondary multiple access technique for the wireless network and switching to the one with better QoS. However, the primary access technique has to be given precedence to make the system more efficient. The simulations consider the path loss factor and SINR situations for a practical network scenario.

Keywords: Software Defined Networks, Machine Learning, Handover, SINR, Path Loss, BER

INTRODUCTION

A new paradigm in wireless communications has emerged, one that goes beyond 5G and opens up a world of possibilities, including the Internet of Things, digital clones, considerable automation, and the metaverse. [1]. However, the viability of these modern notions is contingent upon the availability of sufficient bandwidth and effective management of the spectrum in wireless networks. Given the restricted availability of bandwidth, it is crucial to utilise the available bandwidth to fulfil the following requirements efficiently [2]:

1. Growing user base.
2. As more multimedia material must be transferred, the demand for additional bandwidth has grown.
3. Requirement for fast data transmission speeds.
4. Restricted bandwidth availability.

The need for interconnected devices to be diverse makes IoT indispensable for future-generation wireless networks. With limited bandwidth, increasing user count and data congestion make the challenge more complex. To meet the demands of future-generation wireless networks, it will be necessary to continuously monitor and adhere to quality of service (QoS) requirements. Although various multiple access approaches are available to support the growing number of users, relying on a single technique may not result in satisfactory quality of service metrics. Consequently, it's essential to develop handover procedures that automatically switch techniques if one of their parameters degrades [4]. An additional communication architecture allows for the connectivity of various devices alongside cellular and IoT networks, posing the challenge of handling copious amounts of data simultaneously [5]. Traditional wireless networks are undergoing reconfiguration to become software-defined networks (SDNs). Therefore, the most suitable approach for automatic handover mechanisms would be automating the process through a mechanism suited to SDNs. The basic architecture of the network can be viewed below [6]: The infrastructure is where SDN differs most from traditional networks. While conventional network control is based on hardware, software-defined networking is software-only. Broadband wireless networks that work for everyone. Universal wireless networks require [7]:

1. The coordination and regulation of transportation systems and services.
2. Channel configuration capable of adapting and changing in real-time.
3. Swift client re-association.

Global Scenario

Ericsson, Huawei, Nokia, and Qualcomm, among others, are pouring resources into research and development to create innovative handover solutions [8]. These businesses collaborate with educational institutions to develop, test, and deploy new technologies. One example is using field trials and pilot projects to test how well handover algorithms work in actual scenarios [9]. The algorithms are improved and fine-tuned through the insights obtained from these collaborations [10]. For wireless networks to progress, research on handover optimisation and management at a global level is essential. Research into handoff management will continue to focus on developing more intelligent, adaptive systems through increased integration of AI and ML [11]. Academic institutions and industrial organisations in India are driving research in handover management and optimisation. Prestigious educational institutions are spearheading research into cutting-edge handover methods. Improving service quality (QoS) and user experience is the primary goal of their study into handoff optimisation [12]. A more robust research landscape, with practical applications and innovations, results from collaborative efforts between university and telecommunications corporations such as Bharti Airtel, Reliance Jio, and Vodafone Idea [13]. Developing algorithms and protocols for efficient handover management has achieved significant breakthroughs. To reduce latency and find the best handoff places, researchers in India are looking into machine learning and AI [15]. One example is the possibility of proactive and flawless handovers made possible by AI analysis of user movement patterns and network circumstances, as shown in research. Research on enhanced mobile broadband (eMBB) and ultra-reliable low latency communication (URLLC) has also benefited from the advent of 5G and 6G networks in India [16].

Collaboration on research and pilot projects allows for the creation of solid handover solutions specifically designed to meet India's needs, whose concepts can be extended worldwide. Maintaining an appropriate quality of service metric is the main objective of handoff. A measure of the systems' service quality is the frequency with which they experience outages. Poor service quality is more likely to occur due to the outage. The system's BER and SINR are the primary factors determining the outage frequency [17]. Many approaches use the CCDF function to represent the system outage, which is typically dependent on SINR, path loss and UE density, given by:

$\text{Prob}(0) = \text{f}(\text{SINR}, \sigma, \lambda)$ (1)

Here,

O denotes outage.

$Prob$ denotes probability.

σ denotes shadowing.

λ denotes UE density.

The CCDF would be expressed as:

$ccdf(O) = 1 - cdf(O)$ (2)

SDNs face a significant obstacle in the form of multipath propagation and fluctuating media conditions, such as fading. The issues above arise as a consequence of the following factors [18]:

1) Decreased strength leading to subpar service quality.
2) The increase in bit and packed error rates leads to the outage of the SDN system.
3) Significant delays and somewhat limited data transfer rate.

Automatic failover and handoff capabilities are standard in most SDNs. A system can initiate a handoff to another system if its performance falls behind the other system's. [19]. Automated handover mechanisms use CSI to determine quality of service (QoS) parameters that regulate the handover process [20]. The shift from $Access\ Technique: 1$ to $Access\ Technique: 2$, would be purely governed based on channel and QoS metrics sensed iteratively [21].

METHODOLOGY

QoS-enabled handover would mean iterating the channel sensing mechanism to attain the recent CSI for the multiple access techniques and then deciding which one is best suited for the present data transfer mechanism. Typically, the CSI must be estimated regularly based on the channel's iterative sensing, which would need a lot of data overhead. Advancements in VLSI technology and advanced machine learning algorithms being implemented on the same have aided in the analysis of massive amounts of data, which is now feasible thanks to advancements in chip fabrication and processing power [22]. It may be nearly impossible to use traditional statistical models to analyse vast and complicated data sets, but machine learning (ML) algorithms can do it extraction and there are numerous hidden layers. Handover optimisation using machine learning is a method that uses artificial intelligence and data-driven models to improve the efficiency and efficacy of the handover process in wireless communication networks, specifically in cellular networks. The objective is to optimise network performance, reduce latency, and enhance the overall user experience by making intelligent handover decisions. Iteratively improve and optimise the machine learning models using up-to-date network data and performance feedback. This enables the models to adjust to fluctuating network conditions and user behaviours. Figure 3 presents a decision-making algorithm in which the machine learning model assesses the present condition of the network and user context to ascertain whether a handover is required. The algorithm will determine the most suitable cell or access point if a handover is deemed necessary. Therefore, using machine learning for handover optimisation can significantly enhance network efficiency, decrease the occurrence of dropped calls, and improve the overall user experience in wireless communication networks. Nevertheless, it necessitates meticulous planning, constant surveillance, and ongoing refinement to uphold its efficacy as network conditions change. Data packets may be buffered or duplicated to ensure a seamless transition, minimising data loss during the handover. One of the approach's flipsides is the system overhead for the method in which the training data is the additional expense used to estimate the channel. It can be measured in terms of the number of pilot bits. The iterative process would yield the periodic time frequency data as [23]

$X_T = \sum_{I=1}^{N} H(t, f - iT, f), \forall i \in 1{:}N$ (3)

Here,

X_T denotes the overhead training data.

$H(t, f)$ denotes time frequency-dependent channel response.

The channel's sensing is to be done iteratively for the machine learning algorithm, which will try to decide the approach to be used based on the following logic.

$for\ i = 1{:}nT_S$ (4)

$if\ (BER_{Technique\ 1} < BER_{Technique\ 2})$

Stick to Technique 1.

Else

Invoke Handover

Here,

T_S is the sensing time interval.

This approach is to be continued continuously to iterate over the complete time range.

Simulation Results

MATLAB simulations have been carried out to recreate a real-life scenario with noisy channel conditions. When it comes to fading, the user furthest away from the receiver will typically experience it the worst.

Differentiating between close and far users is possible using the path loss factor. Here, AWGN with a frequency-invariant noise PSD is the noise condition under consideration. To determine when to hand over control, use the system BER based on the automatic fallback method. We derive the overlapping BER curves for the near-user and far-user scenarios. Whichever technology you choose, make sure it has a lower BER curve. The following designations are made:

NE: Near User

FE: Far User

Table I presents the comparative analysis of the results obtained by implementing the approach presented in this paper and comparing it with existing work in the domain. The performance metrics are the accuracy of initiating and performing successful handovers and the system's BER. The BER of the proposed system clearly dips lower compared to the earlier works cited. This indicates that the error rate, which can be thought of as the QoS metric governing the handover, is improved compared to existing work, signifying an improvement in the results.

CONCLUSION

This paper identifies the challenges associated with future-generation wireless networks in terms of the QoS plummeting with increased user counts and traffic congestion, making a QoS-enabled decision to implement handovers in wireless networks. The aim would be to evaluate the state of the CSI for multiple access techniques and stick to or switch to the method which exhibits better QoS. Studies have shown that if the Bit Error Rate (BER) curves do not intersect, the situation remains one where handover does not occur. One transmission mechanism consistently shows better results when looking at the performance metric, Bit Error Rate (BER). BER curves for NOMA and OFDM meet at a specific point during a handover, which is the point of inflexion initiating the necessary handover. The simulations for near and far user scenarios have been simulated based on the path loss and shadowing factors. In addition, compared to recent studies, the suggested approach has much better performance regarding accuracy, mistake rate, and SNR needed.

ABSTRACT

Computer vision is a critical component of artificial intelligence that allows computers to analyze and comprehend visual data. Its applications are numerous, ranging from autonomous vehicles and robotics to surveillance, medical imaging, and augmented reality. Addressing the problem of delayed and inefficient rescue efforts following road accidents is of utmost importance and requires immediate attention. In order to improve accident detection, a proposed method called FRFYOLO combines the random forest algorithm with the YOLOv3 framework. This approach aims to achieve accurate detection of accident events by leveraging the strengths of both algorithms. Experiment results have shown impressive accuracy, with an overall rate of 96%. Implementing this approach has the potential to enhance public safety and emergency response systems across various domains.

Keywords: Accident Event Detection, Public Safety, Random Forest Algorithm, Yolov3, Random Forest, Object Detection, Deep Learning, FRFYOLO.

INTRODUCTION

The detection of accidents is crucial in guaranteeing the welfare of the public and the effective administration of transportation systems. Detecting accidents in a timely manner enables prompt emergency response, reduces traffic congestion, and prevents further accidents or injuries. With the advancements in computer vision and machine learning techniques, the integration of artificial intelligence systems has shown promising results in accident event detection. In recent years, the combination of Random Forest and YOLOv3 algorithms has gained immense popularity in accident event detection. Random Forest is an ensemble learning technique that leverages decision trees to enhance prediction accuracy. It has demonstrated excellent performance in various domains, including object detection and classification. On the other hand, YOLOv3 (You Only Look Once) is an advanced real-time object detection framework that offers precise bounding box predictions while ensuring optimal computational efficiency. Automated vehicles have revolutionized the transportation industry, offering not only convenience but also the potential for enhanced safety and efficiency. One significant advantage of these vehicles is their ability to act as mobile sensors, enabling event detection and data collection. However, the substantial amount of data collected during regular vehicle operations often proves to be unhelpful, creating a burden on cloud servers' computational, communication, and storage resources. To overcome this challenge, vehicular edge computing has emerged as a promising solution to balance the high costs of traditional cloud computing with the limited resources available on edge computers. However, edge computers often lack the necessary resources to effectively support advanced vehicular functions that require high efficiency and intelligence. Taking into consideration these limitations and new concepts, this paper presents a lightweight edge intelligence framework for vehicle event detection and logging. The framework operates in a real-time and event-based manner, with a primary focus on near-crashes involving vehicles and pedestrians as the events of interest. By implementing a lightweight algorithm that models bounding boxes in object detection and tracking, real-time edge intelligence can be achieved onboard a vehicle. Additionally, a data logging mechanism based on the event-based approach is implemented to remove redundant data and integrate multi-source information for individual near-crash events [1].

Traffic accidents pose a significant challenge to road safety, requiring dedicated efforts to detect and anticipate them. As video data continues to grow rapidly, Vision-based Traffic Accident Detection and Anticipation (referred to as Vision-TAD and Vision-TAA) have emerged as crucial last-mile solutions for ensuring safe driving and surveillance safety. However, these tasks are faced with several complex and challenging aspects, including long-tailed distributions, imbalanced data, dynamic environments, complexity, and uncertainty, which collectively form the Out-of-Distribution (OOD) feature for Vision-TAD and Vision-TAA. Despite their importance, there has been limited focus on addressing these OOD problems in current AI development. Consequently, a thorough and comprehensive survey is essential to review the progress made in Vision-TAD and Vision-TAA tasks [2]. Traffic congestion has become a pressing issue in modern cities due to the growing urban population and the increasing number of vehicles on the road. This has led to difficulties for emergency vehicles, such as police, ambulances, and fire trucks, to navigate through traffic quickly. In order to address this issue and effectively manage traffic, intelligent cities are implementing advanced traffic management systems. These systems utilize modern technical solutions, such as the integration of deep learning algorithms, to automatically monitor and regulate traffic lights. By employing an advanced branch of the Intelligent Transportation System known as the Advanced Traffic Management System, authorities can tackle challenges related to traffic control and enhance their planning efforts. Specifically, the installation of automated volume-based traffic signal systems at intersections can help alleviate congestion, prevent accidents, and ensure the smooth and efficient circulation of vehicles. With the implementation of such innovative solutions, cities can aim to achieve a more efficient and sustainable urban mobility system [3]. The rapid increase in the number of devices that can capture videos, such as dashboard cameras, has resulted in a need for effective techniques to analyze and understand these videos. However, current approaches that rely on data-driven methods often face a challenge due to limited training data. To overcome this issue, this research paper focuses on dashboard camera videos and proposes a unique technique that combines meaningful high-level time-series abstraction, logical reasoning methods, and state-of-the-art data-driven techniques. The main goal is to identify important events, detect

traffic accidents, and extract relevant video evidence by utilizing anomaly detection results. By incorporating a formal system of logic specifications to infer relational features from a series of video frames, our approach aims to achieve accurate, continuous, and dependable identification of crucial evidence in driving videos captured under diverse traffic conditions. Importantly, the proposed technique also considers the practical limitations of real-time implementation, making it a viable solution for practical use [4]. Unmanned aerial vehicles (UAVs) have received considerable attention in recent years owing to their ability to be utilized in monitoring traffic. In various settings, such as security, traffic surveillance, and traffic control, UAVs offer advantages over traditional stationary data collectors like induction loops and stationary cameras. This paper proposes a novel and efficient vehicle detection and tracking system that utilizes road extraction and object identification. By leveraging the GrabCut method, the system first extracts the region of interest (ROI), which includes the road and its objects. The proposed model consists of six stages, including georeferencing the dataset, co-registering the images, preparing the data, utilizing the YOLOv3 algorithm for vehicle detection, employing the Kalman filter and centroid tracking for vehicle tracking, and analyzing vehicle trajectories using the Lucas-Kanade method. The performance of the model was evaluated using the Vehicle Aerial Imaging from Drone (VAID) dataset, with detection and tracking accuracies reaching 96.7% and 91.6%, respectively. This paper highlights the potential of UAVs in traffic monitoring and proposes an effective system for vehicle detection and tracking, contributing to the advancement of traffic management technologies [5]. Event detection (ED) is a rapidly growing field, with an increasing number of researchers focusing on the identification of events described in text data found on the internet. Traditionally, event detection (ED) has been addressed as a classification task at the token level, where each token in a sentence is classified independently. However, this approach fails to fully leverage the informative context of the entire sentence and the relationships between multiple events occurring within it. In order to overcome these limitations, our research introduces a multi-task learning based event detection model. In this proposed model incorporate an auxiliary task that involves text classification focused on event types. This additional task enhances the model's understanding of sentence-level information, enabling it to capture the nuances and connections between different events. Moreover, we integrate a Conditional Random Field (CRF) into our model, which serves as a constraint and facilitates the exploration of correlations among various event types. By conducting comprehensive experiments on the DuEE dataset, we demonstrate the effectiveness of our model in surpassing state-of-the-art approaches. These results underscore the significant potential of our approach to advance event detection in an increasingly data-driven environment [6].

RELATED WORKS

Accurate accident detection and ensuring public traffic safety are essential elements for creating a secure and improved community. Continuous monitoring of traffic flow using various surveillance cameras plays a vital role in identifying accidents and alerting first responders in smart cities. Action recognition (AR) techniques, widely used in computer vision tasks, have greatly improved video surveillance, medical imaging, and digital signal processing applications. This comprehensive review paper specifically focuses on the application of AR in accident detection and autonomous transportation systems within the context of smart cities. The paper investigates AR systems that utilize different sources of traffic video, such as static surveillance cameras at traffic intersections, highway monitoring cameras, drone cameras, and dash-cams. By conducting an extensive review, the paper identifies several key aspects, including primary techniques, taxonomies, and algorithms employed in AR for accident detection and autonomous transportation. Additionally, the paper examines various datasets used in AR tasks, highlighting their sources and distinguishing features. Overall, this paper provides valuable insights and serves as a roadmap for future research endeavors in developing and integrating accident detection systems for autonomous vehicles and public traffic safety infrastructure. These systems would effectively notify emergency personnel and law enforcement agencies in the event of road traffic accidents, reducing human error in accident reporting and providing timely assistance to victims [7]. This study aimed to enhance anomaly detection in videos by employing deep multiple instances learning classifiers trained on both normal and abnormal videos. We aimed to overcome the limitations of existing methods, which often assume short anomalous events and do not account for multiple occurrences of anomalies during training. To overcome these limitations, we have proposed a solution that involves integrating temporal information into the feature extraction process. Our approach entails using two deep feature extractors that handle both spatial and temporal aspects simultaneously. By training a modified multiple instance learning-based

classifier on the training videos, we are able to leverage this temporal information effectively. Additionally, we have employed a fuzzy aggregation method to combine the anomaly scores, thereby improving the overall classification accuracy. To evaluate the effectiveness of our model, we focused on classifying fire and accident events using lightweight deep learning classifiers. We conducted extensive experiments on the UCF-Crime video dataset, which consists of 13 different anomaly categories. To test the robustness of our method, we reorganized the dataset into five broader categories based on the severity of the actions. The empirical results clearly demonstrate that the incorporation of temporal features has a significant positive impact on anomaly detection accuracy. Our model excels in detecting long-duration anomalies in videos, addressing a limitation that existing methods struggle with. In fact, our proposed multi-stream architecture achieves an impressive accuracy of 84.48% in abnormal event detection, surpassing the performance of other video anomaly detection methods currently available. Furthermore, we observed substantial improvements of 6%–14% in the detection accuracy across various broad categories [8]. Traffic sign detection is a vital aspect of road safety as it allows drivers to accurately interpret and respond to directional cues and speed limits. However, there is a common occurrence of drivers misunderstanding the location and importance of traffic signals, leading to accidents. To address this issue, advancements in computer technology have facilitated the development of traffic sign detection systems. These systems consider various challenges such as the positioning of signs, adverse weather conditions, obstructed views, and other vehicles or billboards. In this research, we propose a method that employs feature extraction techniques, specifically Histogram Oriented Gradient (HOG) combined with a decision tree for color, and Gray-Level Co-Occurrence Matrix (GLCM) with a decision tree for texture analysis. Furthermore, we compare the performance of GLCM using two supervised classification algorithms: Decision Tree and Random Forest. Our findings reveal that the Decision Tree algorithm exhibits the highest level of accuracy [9]. This research study aims to compare the performance of two popular machine learning models, Support Vector Machine (SVM) and Probabilistic Neural Network (PNN), in promptly detecting traffic accidents on the Eisenhower expressway in Chicago. The prompt detection of accidents is crucial as it helps minimize delays and inconvenience for road users.To, conduct the study, seven models are trained and tested for each machine learning technique. The models utilize traffic condition data collected within 1 to 7 minutes after the actual accident occurrence. The primary data sources used in this research include weather conditions, accident reports, and loop detector data. One challenge addressed in this study is the issue of imbalanced data, where accident instances are underrepresented in the dataset. To mitigate this, the Synthetic Minority Oversampling Technique (SMOTE) is employed, which helps create synthetic accidents to balance the dataset. The findings of the study indicate that while SVM achieves higher overall accuracy, PNN outperforms SVM in terms of the Detection Rate (DR).

The DR reflects the percentage of accurately detected accidents. Interestingly, both models demonstrate the best performance when trained on data collected 5 minutes after the accident occurrence. However, it is worth noting that models trained on data from 3 or 4 minutes after the accident occurrence demonstrate the ability to detect accidents more rapidly while still maintaining reasonable performance. Furthermore, a sensitivity analysis of PNN for Time-To-Detection (TTD) reveals that the speed difference between the upstream and downstream locations of accident sites plays a significant role in promptly detecting accidents [10]. Agriculture plays a vital role in India's economy, serving as the primary source of livelihood for many individuals. However, plant diseases can have a significant impact on crop yields in terms of both quality and quantity. Thus, the timely detection of these diseases is crucial to minimize losses in agricultural production. This survey proposes a method to identify leaf diseases in tomato plants that aims to enhance classification accuracy and reduce computational time. The novelty lies in utilizing a combination of multiple features, including color histograms, Hu Moments, Haralick, and Local Binary Pattern features, for training and testing purposes. Additionally, the study compares the performance of two classification algorithms, namely random forest and decision tree, for the classification of leaf diseases. The results indicate that the random forest classifier outperforms the decision tree classifier, achieving respective classification accuracies of 90% and 94% [11]. The crucial need for generating realistic simulations that accurately depict real-world collision scenarios. These simulations serve as a valuable resource for training and testing autonomous vehicles, enabling them to develop advanced collision avoidance systems effectively. To achieve this, we utilized an extensive dataset of dashcam crash videos obtained from various sources on the internet. A major obstacle that was encountered involved the extraction of accurate 3D vehicle trajectories from the recorded videos, which were captured by unidentified and

uncalibrated monocular camera sources. To overcome this obstacle, we adopted a modular approach, which allowed for the development of an efficient and reliable methodology for reconstructing the crash scenarios within a simulator accurately [12]. The technique presented in this study introduces an innovative approach for content-based image retrieval. It focuses on the extraction and reduction of multiple features to improve the accuracy and efficiency of the retrieval process. The first step involves applying discrete wavelet transformation to the RGB channels of the image. This allows for a multi-level decomposition, resulting in the extraction of both approximation and detailed coefficients. To further enhance the retrieval process, a dominant rotated local binary pattern is utilized as a rotationally invariant texture descriptor. This descriptor is measured relative to a reference, generating a rotation invariance function image for a local neighbor patch. By incorporating complete structural information derived from local binary patterns and extracting additional information using the magnitude, the discriminative power of the retrieval system is significantly improved. Furthermore, statistical characteristics for texture image classification are extracted using the Grey-Level Co-occurrence Matrix (GLCM). This matrix allows the technique to capture important information related to texture patterns. In order to reduce the number of features used during the classification process, a particle swarm optimization-based feature selector is employed on the CORAL dataset. This selection method helps to identify the most relevant and discriminative features for accurate classification. The effectiveness of the proposed approach is evaluated using three classifiers: support vector machine, K-nearest neighbor, and decision tree. Performance metrics such as accuracy, precision, recall, and F-measure are used to compare the results with other existing methods. Experimental results demonstrate that the proposed approach outperforms other methods when applied to various classes within the CORAL dataset, achieving higher values for these metrics [13].

A novel technique for classifying textures using the Gray Level Co-occurrence Matrix (GLCM), which can be applied to autonomous cleaning robots. The method relies on analyzing specific Haralick features computed locally, along with their statistical properties, to identify additional features that aid in classification. To evaluate this approach, a dedicated dataset of color images, featuring textures commonly found in autonomous cleaning robots, was utilized. The results from applying various color models and three different classifiers support the notion that the choice of color model significantly affects the outcome, while also highlighting the benefits of the extended GLCM-based approach proposed in the paper [14]. In the realm of analyzing survival data to uncover factors linked to mortality, traditionally, professionals in the medical field, researchers, and statisticians have heavily relied on regression techniques like the Cox model. However, with the advent of powerful computing abilities, as well as the emergence of big data and machine learning, more sophisticated methods have gained popularity. This research paper aims to explore one such technique known as Random Forest. Random Forest utilizes regression trees, bootstrap aggregation, and the randomization of predictors to achieve highly accurate predictions. The authors of this paper delve into the various input parameters of Random Forest. To evaluate its performance, they employ colon cancer data from the SEER database, consisting of 66,807 cases, and construct both a Cox model and a Random Forest model. Remarkably, both models demonstrate robust performance, with an approximate concordance error rate of 18% [15].

METHODLOGY

The primary aim of this research paper is to emphasize the occurrence of unexpected accidents and facilitate the transmission of a message to the control room and hospital for prompt resolution. To achieve this, the paper involves the collection of pre-recorded accident videos, which are then transformed into individual frames for initial processing. After resizing, the frames are used to extract distinctive characteristics employing established techniques to forecast the likelihood of an accident taking place.Using the derived attributes, the videos are subsequently categorized using a machine learning model to determine whether an accident has transpired or not, as well as to detect objects involved in the incident. The algorithm undergoes training and testing using the provided dataset to measure accuracy. Once the model is built, actual videos are used for testing purposes to predict accidents.
The videos are gathered and transformed into frames, which are then utilized in training machine learning models to ensure accuracy. The Random Forest approach exhibits the greatest level of accuracy during testing when applied to

the test dataset. The structure of this work is organized as follows: The first section focuses on the pre-processing of the video, which involves converting it into frames, resizing the frames to a standard size, and applying a mean filter to reduce noise. In parallel, the frames are sent to a pre-trained object detection model called YOLOV3, which detects objects in the images. The next step involves performing feature extraction on the processed images using various methods, including statistical measures, Hu moments, and GLCM (Gray Level Co-occurrence Matrix) methods. Moving on, the subsequent section explores the classification methods used to distinguish between accident videos and normal ones. For this purpose, the Random Forest machine learning algorithm is employed. Finally, the concluding section presents an analysis of the results for accuracy and provides a summary of the findings.

Image Acquisition

Typically, real images are required for the proposed method, but it is not feasible to depict accidents in real-time. Therefore, recorded images and videos are used for both training and testing purposes. The dataset used consists of videos extracted from the UCF crime data collection, which contains videos in various categories such as burglary, arrest, assault, explosion, road accidents, robbery, etc. In this dataset, every tenth frame is extracted from the entire video sequence and shared for each video in its respective class. All the images are in standard-sized .PNG format. This dataset is extensive, capturing 128 hours of running videos with long and cropped video scenes depicting various incidents.

Pre-Processing of Images

The video samples extracted from the provided dataset undergo pre-processing in order to facilitate further analysis. This preliminary step is crucial as it involves transforming the raw data into a suitable format that focuses on the relevant aspects necessary for the machine learning classification model. Preparing the data offers several advantages, including reducing training time and the computational resources required when testing the algorithm on the data. In the proposed model, two standard methods are employed for pre-processing to eliminate quality issues and filter out irrelevant information. These methods involve:

a. Converting the collected videos into frames of three uniform sizes.
b. Resizing the frames to specific dimensions of 200 x 200 pixels.
c. Apply filter for noise reduction.

Conversion of videos into frames

The videos extracted from online sources or a video repository undergo preprocessing for specific use. The following steps outline the conversion process:

- To classify the video, specific frames are extracted based on time and arranged in sequential order.
- The video file name is required for processing, and the video is recorded using the Video Capture function.
- A crucial attribute used is the frames per second (fps) of the video, retrieved using the get function to obtain a specific frame.
- The desired frame is identified using a calculated number derived from the number of frames per second and the exact time.
- Two functions, namely 'set' and 'read', are employed to position the video and extract frames from the video data.
- Finally, the extracted frames are saved.

Resizing of frames

After extracting frames from the video data, they are resized to a standard size, such as 200 x 200, to facilitate feature extraction. The systematic approach employed to change the frame shape involves using an interpolation method based on pixel relation theory. The Inter area method is specifically utilized to decrease the image size to the desired shape. This method computes the average value of the neighboring pixels within the frame across all dimensions and then calculates the new value based on multiples of the old value. As a result, the resolution is restored and no information is lost during the process.

Applying Filter

The purpose of applying a mean filter in image processing is to reduce noise and enhance the overall quality of the image. Noise can occur due to various factors such as sensor limitations, transmission errors, or environmental conditions. It often leads to unwanted variations or artifacts in the image, which can affect its visual appearance or hinder further analysis or processing.

The basic idea behind the mean filter is that the noise in an image is often represented by random fluctuations in pixel values, which tend to have a zero mean. By averaging the neighboring pixel values, the aim is to attenuate the random noise while preserving the underlying structure and details of the image. Applying a mean filter can lead to the following benefits:

- Noise reduction: The averaging operation smoothens out the random fluctuations in pixel values, effectively reducing the noise present in the image.
- Edge preservation: Since the mean filter utilizes neighboring pixels, it can help preserve the edges and boundaries in the image by reducing noise without overly blurring them.
- Detail preservation: The mean filter can eliminate noise without significantly affecting the fine details and textures in the image. This makes it useful in applications where preserving image details is crucial, such as medical imaging or forensic analysis.
- Computational simplicity: Mean filtering is a relatively straightforward and computationally efficient operation, allowing for real-time or near-real-time processing in many applications. Thus, using three popular methods the frames are pre-processed and forwarded for extracting the needed features and object detection.

Feature Extraction Methods

Feature extraction, also known as innovation spotting, identifies important and relevant features from a large dataset required for processing. It involves converting raw data into mathematical and statistical attributes while preserving the original information. This transformation is essential for machine learning algorithms to process the data efficiently, as classification models cannot comprehend text or image data. There are three commonly used methods for feature extraction: statistical methods such as mean, variance, and standard deviation, as well as popular techniques like Hu Moments and GLCM methods.

Statistical Features

Expressive measurements such as mean, variance, and standard deviation are derived from the given dataset as the first-order statistical features. These features are utilized to generate initial indicators for classifying whether an accident occurred in a specific video scene. Essentially, first-order measurements offer insights into the distribution of grey-level values in an image. The three statistical measures employed include mean, variance, and standard deviation.

Mean

The mean is a statistical measure used to determine the similarity between two data sets by calculating the average of the values. In the proposed method for detecting accidents in video frames, mathematical features such as the average, median, and mode are computed to classify the data. The formula for calculating the mean is

Mean $\mu=\sum_{i=1}^{n} Xi/n$ Where X is the sum of all the values from 1 to n, n is the number of values.

Variance

Variance tests are used to determine the level of variation within a given dataset. They calculate the dissimilarity between each item or frame in a video dataset. Variance is computed by taking the squared values of deviations and averaging the result. This value represents the degree of spread within the dataset. Variance is directly related to the spread of deviation and can be calculated using the following formula:

Variance $S^2 = \sum_{i=1}^{n}(Xi - \mu)2/n$

Standard deviation

The standard deviation (SD) is a numerical measure that represents the extent of variation within a dataset. It indicates how the data points are distributed in relation to the mean value. The calculation of SD involves several steps:

- Begin by calculating the mean of the dataset.
- For each data point, find the difference between the value and the mean, and then square it.
- Sum up all the squared values.
- Finally, divide the sum by the number of data points. The formula is Standard Deviation **S= √S²**

Hu Moments

Hu Moments are calculated by first computing the normalized central moments of an image, and then using these moments to derive the Hu invariants. The formula for Hu Moments is as follows:

- Compute the normalized central moments:

μ_pq = M_pq / (M_00)^((p+q)/2+1), where M_pq is the p-th order and q-th order normalized central moments, and M_00 is the zeroth-order moment.

- Calculate the seven Hu moments (denoted as Hu1, Hu2, ..., Hu7) using the following equations:

  Hu1 = μ20 + μ02

  Hu2 = (μ20 - μ02)^2 + 4μ11^2

  Hu3 = (μ30 - 3μ12)^2 + (3μ21 - μ03)^2

  Hu4 = (μ30 + μ12)^2 + (μ21 + μ03)^2

  Hu5 = (μ30 - 3μ12)(μ30 + μ12)[(μ30 + μ12)^2 - 3(μ21 + μ03)^2] + (3μ21 - μ03)(μ21 + μ03)[3(μ30 + μ12)^2 - (μ21 + μ03)^2]

  Hu6 = (μ20 - μ02)[(μ30 + μ12)^2 - (μ21 + μ03)^2] + 4μ11(μ30 + μ12)(μ21 + μ03)

  Hu7 = (3μ21 - μ03)(μ30 + μ12)[(μ30 + μ12)^2 - 3(μ21 + μ03)^2] - (μ30 - 3μ12)(μ21 + μ03)[3(μ30 + μ12)^2 - (μ21 + μ03)^2] The seven values are calculated for sample frames and displayed as Table 2 below.

Second Order Statistical measures

The statistical measures of the second order, known as Gray Level Co-occurrence Matrix (GLCM), are a texture analysis method that represents the similarity between two adjacent pixels in terms of their gray intensity, distance, and angle. The GLCM is created by determining the occurrence of certain gray intensity values between pixels in an image. When computing GLCM values from the matrix, various features are extracted, including contrast, correlation, energy, homogeneity, dissimilarity, and Angular Second Moment (ASM). These features are calculated using specific formulas that are given as follows.

1. Contrast – This texture measure provides the native differences in the image. The spatial frequency is computed with the top and bottom values of nearby pixels. The formula for calculating contrast is given as $\sum_{i,j=0}^{N-1} P_{ij}(i-j)^2$ Where i and j are adjacent pixel positions in the image.
2. Energy - Also called uniformity among images in the given video data set. It provides total of squared elements in GLCM. The formula used for computing is $\sum_{i,j=0}^{N-1} P^2 I, j$
3. Correlation – Usually measures the power of direct relationship between the data points in the image. By correlation the value of one data point can be identified using the other data point value. The formula is $\Sigma(X-X)(Y-Y) / \sqrt{(X-X)^2 (Y-Y)^2}$
4. Homogeneity – Used for classification of texture in the image. The value is computed for each data point and similarity is determined by providing the value close to the adjacent points in the image. The formula is $\sum_{i=1}^{n}(O_i - E_i)^2 / E_i$ Where O_i is the observed value, E_i is the expected value
5. ASM – To derive specified shape and texture accurately this measure is used. Angular Second Moment produces homogeneity and contrast of the data points within the image. The formula used is $\sum_i . \sum_j P(i, j)^2$

6. Dissimilarity- This measure shows the variations that exist between the data points in the image. The formula is $\sum_{i=1}^{n} |X_{1(i)} - X_{2(i)}| / n$ Using the formulas mentioned above the values are calculated for sample images and the results are compared. The calculated values are given in the Table 3 as follows. Three standard feature extraction methods are discussed and the features are used for classification models.

CLASSIFICATION AND OBJECT DETECTION

Fussed Random Forest You Only Look Once (FRFYOLO):

The YOLOv3 (You Only Look Once) algorithm is a popular object detection algorithm used in computer vision tasks. It is capable of detecting and localizing multiple objects within an image using a single pass of a deep neural network. On the other hand, Random Forest is a machine learning algorithm commonly used for classification tasks. It operates by constructing multiple decision trees and combining their predictions to make the final classification. When it comes to accident classification, the fusion of YOLOv3 and Random Forest can be beneficial. YOLOv3 can be used to detect and localize accident-related objects or events within an image or video frame, such as damaged vehicles, injured individuals, or dangerous situations. It is efficient and accurate for detecting objects in real-time scenarios. After utilizing YOLOv3 to identify objects related to accidents, the detected objects and their corresponding features can be extracted. These features, such as object size, location, color, and shape, can then be fed into a Random Forest classifier. The Random Forest algorithm can be trained on a labeled dataset containing information about past accidents, their causes, and consequences. This training data should include features extracted from the detected objects as well. Random Forest can effectively learn the patterns and relationships between the extracted features and accident classifications. By combining the predictions from multiple decision trees within the Random Forest ensemble, it can provide a robust and accurate accident classification. The hyper parameters used in the classification of video set are given as Table 4. The fusion of YOLOv3 and Random Forest provides the advantages of both object detection and classification. YOLOv3 enables fast and accurate detection and localization of accident-related objects, while Random Forest leverages the extracted features to classify the detected objects into different accident categories, such as car accidents, pedestrian accidents, or hazardous situations.The Modified Random Forest You Only Look Once architecture shown in fig.2.

Pretrained Model

A pretrained YOLOv3 model is a model that has been trained on a large dataset and is ready to be used for object detection tasks without the need for further training. It has already learned representative features from extensive training data, making it capable of detecting various objects with high accuracy.

Understanding the Architecture

The YOLOv3 architecture is based on a deep convolutional neural network (CNN). It consists of multiple layers that process the input image and progressively extract features to make predictions about the objects present in the image.

- Input Layer - The first layer of YOLOv3 is the input layer, where the image is fed as input. The input layer determines the size and format of the input image.
- Convolutional Layers - YOLOv3 utilizes a series of convolutional layers to extract features from the input image. These layers employ various filters to detect patterns and objects of different sizes.
- Residual Blocks - To enable better feature extraction, YOLOv3 incorporates residual blocks. These blocks contain skip connections, allowing the network to learn high-level and low-level features simultaneously. This helps improve the accuracy of object detection.
- Feature Pyramid Network (FPN) - YOLOv3 employs a Feature Pyramid Network (FPN) to capture features at different scales. FPN combines multi-scale features from different layers and helps the network to efficiently detect objects of varying sizes.
- Object Detection Layers - The YOLOv3 architecture includes multiple object detection layers. Each detection layer is responsible for predicting objects at specific scales of the input image. These layers generate a set of bounding boxes, class probabilities, and confidence scores for each detected object.

- Non-maximum Suppression (NMS) - After generating the bounding boxes, YOLOv3 applies a technique called non-maximum suppression. This technique eliminates redundant or overlapping bounding boxes and retains only the most confident and accurate ones.
- Output Layer - The final output layer provides the predicted bounding boxes, class labels, and confidence scores for each detected object in the image. The bounding boxes define the location and size of the objects, while the class labels specify the type of object (e.g., person, car, etc.), and the confidence scores indicate the accuracy of the predictions.

EXPERIMENTALANALYSIS

To evaluate the effectiveness of our proposed approach for accident event detection using a FRFYOLO model, The FRFYOLO model conducted extensive experiments on a diverse dataset. The dataset consists of various accident scenarios captured from different sources, including traffic cameras, surveillance footage, and publicly available accident datasets.

Evaluation and Performance Metrics:

To evaluate the performance of our proposed method, we measured various performance metrics, including accuracy, precision, recall, and F1 score. We assessed the accuracy of accident event detection by comparing the predicted results with ground truth labels in the testing set. We also calculated precision (96%), recall (96%), and F1 score (96%) to evaluate the algorithm's overall performance. It's shown in the table 5.

The data set is trained and the result analysis is given in tabular form above. The bar chart for the result analysis is given as Fig.3.

RESULTS AND DISCUSSION

The experimental results demonstrated the effectiveness of our proposed approach. The FRFYOLO model achieved high accuracy in accident event detection on real-time scenarios, with an overall accuracy of 96%. The precision, recall, and F1 score also demonstrated satisfactory performance, with precision of 92%, recall of 91%, and F1 score of 91%. The FRFYOLO model detected and predicted Normal or Accident Events results are shown in the fig 4. **Fig.4.**

Output image of FRFYOLO model

The interpretability of the random forest algorithm allowed us to gain insights into the important image features for accident event detection, providing valuable information for further improvements and domain-specific optimizations. Furthermore, the object detection capabilities of the YOLOv3 framework enabled accurate identification and localization of accident-related objects, contributing to the overall performance of the system.

CONCLUSION

In conclusion, our experimental analysis confirms that the proposed approach, which combines the strengths of random forest and YOLOv3 as FRFYOLO model is a promising solution for accident event detection. It offers high accuracy, reliable detection, and real-time performance, making it suitable for various applications in traffic management, surveillance, and driver assistance systems. The FRFYOLO algorithm enhances public safety and emergency response systems, paving the way for improved efficiency and effectiveness in accident detection and response.

ABSTRACT

Dengue virus infections, which are critical mosquito-borne illnesses, have had a notable rise in prevalence in recent years, impacting around 100 million individuals worldwide annually and leading to around 0.5 million cases of dengue hemorrhagic fever (DHF). The disease may manifest asymptomatically or with a range of symptoms, including acute undifferentiated fever, myalgia, arthralgia, dengue hemorrhagic fever, and dengue shock syndrome. Diagnosing dengue is difficult because of the four unique serotypes of the virus and the cross-reactivity of antibodies among flaviviruses, which complicates differential diagnosis. At present, there is no one definite biomarker for dengue infection, particularly in instances of secondary infection. Advancements in near-patient testing, capable of identifying specific infection signs at various stages, have enhanced laboratory diagnosis. Despite persistent initiatives, an effective vaccine or therapeutic intervention remains unavailable, mostly due to the intricacy of immunizing against all four serotypes. Supportive care continues to be the principal therapeutic approach for symptom management. Dengvaxia (CYD-TDV) is the sole commercially available vaccine demonstrated to be safe

and efficacious for those with previous dengue exposure. The review examines diverse dengue virus detection methodologies and therapeutic approaches documented in recent research.

Keywords: Dengue; diagnosis; techniques; vaccine; treatment.

INTRODUCTION

Dengue fever, caused by the Dengue Virus (DENV), is a rapidly spreading mosquito-borne illness transmitted primarily by *Aedes aegypti* and, to a lesser extent, *Aedes albopictus*. Over recent years, dengue has emerged as the most prevalent mosquito-borne disease, with reporting approximately 400 million infections and 500,000 hospitalizations annually[1]. Symptoms include biphasic fever, myalgia, arthralgia, rashes, leukopenia, and swollen lymph nodes. Severe cases can progress to Dengue Hemorrhagic Fever (DHF) or Dengue Shock Syndrome (DSS), characterized by high fever, capillary permeability, plasma leakage, severe bleeding, and liver damage[2]. Advances in understanding dengue's virology, immunology, and pathophysiology have spurred vaccine development, antiviral research, and vector control strategies. The disease remains a significant public health challenge, particularly in tropical and subtropical regions. Dengue is caused by the *Flaviviridae* virus family, genus *Flavivirus* and there are four well-defined, yet closely related DENV serotypes (DENV 1-4). These four serotypes are distinguishable by 30-35% amino acids[3]. This implies that a person can be infected with dengue as many as four times in his or her lifetime. It is reported that a person infected for the second time (also called secondary infection) with the heterologous DENV serotype, is likely to be more adverse than the primary infection as it is expected to raise the chance of Dengue Hemorrhagic Fever (DHF)[4]. DENV is a single-stranded positive-sense RNA virus, like all members of*flaviviruses*. The genome size of DENV is ~10,700 nucleotides, enclosed by a nucleocapsid and having a covering of lipid envelope. The genome comprises of single open reading frame (ORF) along with two untranslated regions flanking at 5′ and 3′ ends of the ORF. The translation product of the genome is a preliminary polyprotein that further undergoes post-translational modifications to form three structural and seven nonstructural proteins. Structural proteins are Capsid, Membrane (M), and Envelope (E), and the nonstructural proteins consist of NS1, NS2a, NS2b, NS3, NS4a, NS4b, and NS5[5]. As far as treatment of this infection is concerned, effective and timely diagnosis is key to reducing the mortality rate to zero. There is no dengue-specific treatment yet. Curing the symptoms is a method to manage the infection, such as analgesics to treat pain, antipyretics to reduce fever, and management of bleeding complications are the supportive care provided to the patients. Along with this, the administration of fluids is essential to avoid dehydration and shock associated with severe dengue. Dengvaxia is the first commercially available vaccine provided against dengue and is safe to use[6].

Dengue virus

Dengue virion is an icosahedral structure with a size of approximately 50nm. DENV core consists of viral genome as well as Capsid (C) proteins, forming the structure of nucleocapsid. This is surrounded by the host-derived lipid bilayer, called the viral envelope. Around 180 copies of Envelope (E) and Membrane (M) proteins are ingrained on the viral envelope that spreads all around the lipid bilayer. These proteins form the protective layer and function to bring aboutthe entry of viruses into human cells. The viral genome is a single-stranded positive-polarity RNA which is ~11 kb in length and is flanked by two noncoding regions. The single open reading frame (ORF) is expressed to form a single polypeptide, of about 3388 amino acids, which is cleaved to form functionally active ten proteins. Of these proteins, there are three structural proteins: the capsid (C), envelope (E), and membrane (M) proteins, the remaining seven are nonstructural proteins- NS1, NS2A, NS2B, NS3, NS4A, NS4B, and NS5 (Figure 1). The nonstructural proteins have their functions in the replication and assembly of viruses[7]. The expression of the DENV genome occurs in the endoplasmic reticulum (ER) and the structural proteins that are in the N-terminal region are anchored in the membrane of the endoplasmic reticulum in association with several membrane-spanning amino acids. The viral polyprotein is translocated inside and out of the membrane with the signal and stop-transfer sequences. The cleavage of the polypeptide occurs with the help of both, viral as well andhost-derived proteases, and

glycosylation of the polypeptide occurs by cellular glycosyltransferases, to form structural proteins; Capsid, which is made up of 113 amino-acids, pre-membrane (prM), comprising 166 amino-acid residues and Envelope glycoprotein, having 495 amino-acids[8]. C-protein functions in the assembly of the virus by bridging itself to the host ER. The E glycoprotein is present on the surface of the virus particle in a herringbone pattern and has its role in virus attachment through binding to the receptor, hemagglutination of red blood cells and is also responsible for inducing neutralizing antibodies. E glycoprotein performs its membrane fusion function in association with prM. E and M proteins get attached to ER with their C-terminal domain [8]. The nonstructural NS1 protein, in association with NS4A and NS4B assists in viral replication by interacting with the viral replication complex on the host ER, at the time of infection. It is highly conserved, glycosylated, and occurs in various oligomeric forms. It binds to host complement system proteins to impede the host immune system. NS2A and NS2B have feeble descriptions and are assumed to function in RNA synthesis and the Cytopathic Effect (CPE) of viruses[9]. NS2B, supposedly, acts as a cofactor for the enzymatic activities of NS3. NS3 protein serves the purpose of viral replication as it has domains that serve as RNA nucleoside triphosphatase (NTPase), helicase, and protease. The N-terminal domain of NS3 has serine-protease activity and the C-terminal domain has helicase activity. The protease cleaves the polyprotein into ten genes of the virus and it also cleaves host proteins. NS4A and NS4B are crucial candidates for the ER-membrane-associated replication complex. NS4B interacts with NS4A and the NS4A-NS4B is known to instigate membrane alteration. NS5 is the most conserved and the largest of all nonstructural proteins and hasan N-terminal methyltransferase (MTase) domain and a C-terminal RNA-dependent RNA polymerase (RdRp) domain. The MTase domain is important for protectingthe viral genome by 5′ capping and its methylation and promoting its translation. RdRp helps in the replication of the viral genome. In its association with NS3 and NS2B, NS5 also forms a replication complex on ER [10]. Therefore, NS2A, NS2B, NS4A, and NS4B are the nonstructural transmembrane proteins with no known enzymatic activities and these serve as a scaffold for the formation of replication complex. In these ways, nonstructural proteins are pivotal for the infection of the virus in the host and for sustaining the host by combating the host immune system as it also interferes with signaling pathways.

Dengue vector

Dengue infections are transmitted by two vectors: *A aegypti* and *A.albopictus*. *A.aegypti* is the primary vector, originating from Africa and traveling the world through trading ships in the 17th and 18th centuries. It is an indoor species that remains in interiors to get accessible to human hosts and lays its eggs in water-filled, artificial containers. *A.albopictus* is a secondary vector, originating in Southeast Asia and later moving to Europe and North America through trade and travel[11]. The widespread presence of dengue strains in humans is believed to have evolved from sylvatic progenitors. The transition of hosts from non-human primates to humans is attributed to the change in vectors from arboreal Aedes mosquitoes to peridomestic (*A. albopictus*) and domestic (*A. aegypti*) mosquitoes. Humans, when infected by DENV, become a source of transmission when bit by the mosquito and spread to another healthy human after being bitten by the mosquito acquiring the virus[12]. Aedes mosquitoes have different distributions, ecology, and behavior. *A.aegypti* is a highly anthropophilic species that resides in urban areas near humans and feeds itself and lays its eggs. *A.albopictus* occupy regions less proximal to humans and lays its eggs both in natural and artificial repositories. *A.aegypti* is considered more efficient due to its high feeding rate and ability to adapt to severe environmental conditions. The rise in geographical areas occupied by DENV-transmitting vectors from tropical to subtropical and temperate regions is due to globalization, increased travel, and climate change. The Aedes index and Breteau Index were used to find correlations between vector abundance and dengue outbreaks, but data did not establish a relationship between the abundance of vectors and dengue infection transmission. Dengue prevalence is believed to be accompanied by climate and can be predictive, but it is not globally the same as it is different for different regions of the world[13].

Dengue virus transmission cycle

The dengue virus disease begins with the attachment of the virus on the human skin cells, which in turn causes the folding of the cell membrane around the virus, forming a vesicle engulfing the virus particles. This vesicle is referred to as an endosome. With the assistance of endosomes, DENV is capable of entering the cell of the host by endocytosis. Once inside the cell, the endosomal membrane releases the virus into the cytoplasm, causing its

nucleocapsid to break, allowing the virus to release its genetic content into the cytoplasm of the host's cell. After replication, viral RNA (vRNA) is translated to form a single polypeptide, which is cleaved into ten proteins. The post-translational assembly of the virus occurs on the surface of the ER, at the time, structural proteins and daughter RNA split out from the ER. The daughter vRNA is surrounded by the C proteins, which contributes to the formation of a new nucleocapsid. It enters the rough ER, where it is enclosed in M and E proteins, which forma viral envelope and protective outer covering. Further maturation of the virus particle happens in the Trans-Golgi Network (TNG), to convert it into its infectious forms. The infectious viruses are released and circulate outside the cell, into the blood, for it to be able to infect other cells. When the female Aedes mosquito bites the infected host, it contracts the virus and could infect other hosts during its feeding cycle [14].

Replication of RNA of DENV

The genome of DENV is made up of positive-sense RNA. The RdRp of DENV helps to synthesize negative sense RNA, which acts as a template for the synthesis of the daughter RNA genome. However, the relative ratio of positive and negative RNA strands differs between different virus species. Although, the negative strand is present in only 1-5% of the total positive strand for single-stranded RNA viruses. Upon infection, the host's cell membrane is seen to be modified to form vesicles by invagination of the ER membrane[15]. These invaginations are caused by the binding of nonstructural proteins to the ER. Experimentally it has been observed that these invaginations consist of several DENV nonstructural proteins and dsRNA, which indicates the replication of the viral genome in these vesicles. The average size of these vesicles is around 85nm in diameter, which is bridged to the cytoplasm through 11nm pores and can harbor around 50 vRNA. The pore-like opening allows the communication between the cytoplasm for the exchange of nucleotide triphosphates (NTPs) and viral factors to facilitate the replication process. The vesicles provide the protective microenvironment for viral factors and NTPs, against the host antiviral system. The replication of DENV vRNA is influenced by various factors such as concentration of NTPs, temperature, and divalent metal ions[16]. There is always a possibility that the RNA genome of DENV could be attacked by the host cellular ribonucleases. Nevertheless, the DENV genome is equipped with NS5, which can attach nucleotides at the 5′ and 3′ end of the genome, independent of the template, to maintain the integrity of the DENV genome. More recently, it was seen that NS5 comprises ATP priming sites that can add the first two nucleotides (pppAG) in both positive as well as negative strands, in template template-independent manner [17].

Clinical features

Dengue fever is a systemic and dynamic infection. DENV has an incubation span of 3-7 days after which the disease causes various severe and non-severe clinical symptoms. Dengue fever manifests in three-phase infection, these phases are, Febrile, Critical, and Recovery phases. The timely diagnoses of infection corresponding to different phases of the infection, is critical for better clinical outcomes of the treatment. Therefore, a differential diagnosis is required.

Febrile phase

The emergence of dengue infection is with high-grade fever which corresponds to the febrile phase. It persists for 2-7 days and numerous other symptoms are also visualized such as reddening of the facial skin due to skin erythema, severe body ache, and pain in the muscles and joints, often accompanied by headache. In some of the patients, pharyngitis, sore throat, conjunctivitis, anorexia, or nausea is also witnessed. These symptoms are common to other fever-causing infections and thus it is difficult to demarcate dengue-specific febrile phase symptoms during very early stages. To diagnose this stage, the patient's hemorrhagic likelihood is assessed to check for thrombocytopenia, using a tourniquet test. Initial hemorrhagic symptoms include petechial and mucosal membrane (nose and gums) bleeding, which serves as a warning sign to monitor the disease before it advances to a critical stage. The liver is also noticeably large and tender during the later febrile phase. The first sign checked by medical practitioners is a decrease in white blood cells consistently[18].

Critical phase

After the fever subsides, at 3 to 7 days of infection, a rise in capillary permeability may happen, with the enhancement in hematocrit levels, and then the dengue infection has progressed to the critical phase. The duration of clinically relevant vascular leakage is witnessed for 24-48 hours. Along with it, the diminishing number of white blood cells (called Leucopenia) as well as platelet counts (called Thrombocytopenia), also occur. The extent of plasma leakage is a variable factor. Depending upon the amount of plasma that oozes out, there is a collection of fluid that leads to pleural effusion and ascites. Therefore, it is advisable to get anX-ray and Ultrasound of the chest and abdomen, to diagnose if the patient is in a critical phase of dengue infection. If there is an excessive volume of plasma loss, shock occurs. Shock is, generally, followed by various warning signs. Shock causes further abnormalities such as organ hypoperfusion, organ impairment, acidosis, and a blood clotting disorder called disseminated intravascular coagulation (DIC). However, in some of the cases, it is viewed that with low RBC count and no change in white blood cell count, could also cause organ damage. Furthermore, it is also studied that dengue infection with no plasma loss or shock, may also result in organ damage and cause diseases like hepatitis, encephalitis, or myocarditis. Patients whose condition worsens, usually happen with a warning sign, often known to have dengue with warning signs. This condition improves with medical help such as intravenous rehydration. In some cases, further deteriorates to severe dengue [19].

Recovery phase

The recovery phase starts only if the patientcan fight back the critical phase for 1-2 days. It happens by the reabsorption of extra plasma fluid that leaks out in the next 2-3 days. It is accompanied by restoration of appetite, improvement in overall well-being, gastrointestinal problems becoming less intense, cardiovascular functions stabilizing, and diuresis getting controlled. In some cases, rashes called 'isles of white in the sea of red' or pruritus, may be visualized [19].

Diagnostic testing

The diagnosis of dengue fever is done at the laboratory, based on the stage of the infection. Diagnosis of DENV can be done byNS 1 Antigen also known as the NAAT test.Anti-dengue immunoglobulin M (IgM) and immunoglobulin G (IgG) antibodies are developed on the 5th – 7th day, after the start of the illness[20].

Nucleic acid amplification test (NAAT)

NAAT is the primary technique for making a laboratory diagnosis for people who may have dengue virus illness. Serum samples obtained seven days or less after the beginning of symptoms, should be subjected to NAATs. A single acute-phase blood sample collected early in the disease (seven days following the emergence of the fever) can be used for laboratory confirmation by rRT-PCR (Real-time reverse transcriptase polymerase chain reaction) detection of viral genomic sequences or immunoassay detection of the dengue nonstructural protein 1 (NS1) antigen. It is based on the fact that when the virus particle enters a cell it first interacts with the Golgi apparatus which in turn leads to the release of NS1 protein and the presence of NS1 protein can be tested by performing the assays. Various rapid kits have also been developed. Rapid kits have sample wells and different lines for control and testing respectively. Samples like blood or serum can be collected and entered into the sample well; a buffer is also added to the sample well. This leads to a reaction between the sample and the chemicals present in the kit. If the sample contains the dengue virus the test will give a red line that indicates the test is positive and the person is infected with the dengue virus. Another condition is when no red line is observed so in that case, we can't say anything about the infection and then it is further confirmed by a test for immunoglobulin. The persons with a suitable medical and travel history, the presence of the virus by rRT-PCR or NS1 antigen in a single diagnostic sample is considered as laboratory confirmation of dengue. This test can be done from the 0 - 7 days onset of the infection or the first observation of the symptoms and after 7 days the test is ineffective. The main advantage of this technique is its rapidness; the test can be done within 20 minutes[20].Since the nonstructural 1 (NS1) antigen remains in the bloodstream longer than viremia, it is an essential diagnostic for the early diagnosis of dengue virus (DENV) infection. Despite the fact that there are several NS1 tests available, the FDA-approved DENV Detect NS1 ELISA (InBios International) has a higher sensitivity of 95.9% than other tests like BioRad and Panbio. Although their quick turnaround makes rapid NS1 tests

useful in resource-constrained situations, they often have lesser sensitivity and should not be performed more than seven days after infection; a negative NS1 test does not rule out DENV infection, requiring additional testing using IgM-based techniques ([21].

Serologic tests

IgM antibody testing is a crucial diagnostic tool that can spot further illnesses. The major drawback is the cross-reactivity with other *flaviviruses*, such as *Zika*, making it more challenging to decipher the results, and pinpointing the exact date of infection can be a difficult task. Either DENV antigen detection or anti-DENV antibody detection is used in this assay-based detection technique. The assays have primarily been utilized as presumptive diagnoses of recent or past infections as well as to confirm dengue illness. IgG suggests an earlier infection, although, if test results of anti-dengue virus IgM is positive, it suggests an active or fresh infection. IgM antibodies are found by the sixth day of infection, peaking two weeks after the fever has begun, and then it starts to drop over the course of two to three months. By the sixth day after the onset of the disease, hemagglutination inhibition (HI) antibodies start to show up at a detectable level and last for two to three months. The most accurate and sensitive approach for determining anti-dengue virus antibodies is the neutralization assay. The proportion of IgM and IgG antibodies against DENV is measured using the enzyme-linked immunosorbent test (ELISA) The **Plaque Reduction Neutralization Test (PRNT)** can assist in identifying the causing virus and correct false-positive IgM antibody results brought on by non-specific reactivity. By identifying neutralizing antibodies in IgM-positive individuals, the 1967-established PRNT[22] is the gold standard for determining vaccine immunogenicity and validating serological cases. However, it is laborious and lacks a global standard, which makes comparing results more difficult. Furthermore, PRNT can show cross-reactivity across several DENV serotypes, despite being helpful in detecting asymptomatic DENV infections. Cross-reactive antibodies may form in people exposed to or vaccinated against different flaviviruses, such as Japanese encephalitis or yellow fever, which might result in false-positive serological results for dengue. Even though IgG antibodies last a lifetime after a dengue infection, a single serum sample containing IgG is not clinically relevant for diagnosis. Within 12 weeks of infection, some antibodies can be detected by serological testing[23].

Both IgG and IgM antibodies can be detected using detection kits.Development of IgM against the DENV can be found using **IgM antibody-capture ELISA (MAC-ELISA)** (around 4 days past the development of a fever) as IgM is typically detected 5 days after symptom onset. Diagnostic testing for patients who present within the seven days of the elevation of the body's temperature, should get done an IgM and rRT-PCR test for the dengue virus. Although the FDA-approved MAC-ELISA test aids in the detection of IgM antibodies in patient serum, its sensitivity is limited, particularly prior to the sixth day of infection, and possible cross-reactivity necessitates the use of confirmatory tests such as PRNT. IgG and IgM tests work better in the latter stages of infection, although molecular techniques like RT-PCR and NS1 antigen detection can be used for early diagnosis.Physicians can utilize laboratories in hospitals or send blood samples to the Environmental Health Institute for definitive dengue testing, though the latter currently focuses on epidemiological surveillance. Rapid point-of-care test kits like the SD BIOLINE Dengue Duo and MP Diagnostics MULTISURE Dengue Ab/Ag, which can be completed in approximately 15-20 minutes and show high sensitivity and specificity, serve as accessible alternatives for enhanced dengue diagnostics in primary care settings[24]. Tests based on IgG are crucial for differentiating between current and previous dengue infections. These antibodies can stay in the body for a long period, sometimes even for life, and are created after IgM. IgG levels that have significantly increased may be a symptom of a recent illness. The sensitivity and specificity of commercial **IgG ELISA tests**, such those made by Standard Diagnostics and Panbio, differ; for instance, Standard Diagnostics' test has 81.2% sensitivity but only 39.8% specificity, whereas Panbio's test has 63.5% sensitivity and 95.3% specificity. IgG ELISA tests are also available from a number of other businesses. However, research has shown that these IgG tests are less accurate than IgM and NS1 ELISA tests in identifying acute dengue infections because they frequently produce a high percentage of false positives and show significant cross-reactivity. Consequently, it can be challenging to ascertain primary infections solely through IgG assays due to this cross-reactivity with other flavivirus antibodies[25]. The **IgM/IgG ratio test** is utilized to differentiate between primary and secondary infections, with a ratio above 1.32 indicating a primary infection and below 1.32 indicating a secondary infection, although specific laboratories may adjust the cutoff value, such as a laboratory in Northern India that uses a cutoff of 1.1[26].The potential to distinguish between

primary and secondary infections is this method's principal benefit. In primary infection, the IgM/IgG ratio is greater than 1.5, whereas in secondary infection, IgG antibodies are stronger than IgM antibodies[21]. One laboratory technique for distinguishing between primary and secondary dengue virus (DENV) infections is the **hemagglutination inhibition (HI) test**. DENV's ability to agglutinate (clump together) red blood cells (RBCs), including human RBCs (type O, which is frequently utilized in testing), provides the basis for the test. This indicates that red blood cells may clump together if the dengue virus is present in a sample.Since a primary infection is a person's first exposure to the virus, they usually acquire low levels of antibodies. A secondary infection, on the other hand, occurs when people have previously been exposed to the virus and their immune system responds more strongly, producing high antibody levels (also known as "high antibody titers"). According to the statement, antibody titers for secondary infections frequently surpass a value of 1:1280, signifying a far more robust immune response in contrast to the first infection[27], [28].

Molecular Testing

Recent developments in dengue virus (DENV) diagnostic assays include the creation of a **multiplex reverse transcription polymerase chain reaction (RT-PCR) assay** that is perfect for guaranteeing the safety of blood transfusions because it can simultaneously identify multiple DENV serotypes in blood samples with a sensitivity as low as 100 viral copies per milliliter. Additionally, using specially created primers for precise detection without cross-reactivity, a single-step RT-PCR assay has been developed to distinguish DENV from other viruses, including Zika virus (ZIKV), yellow fever virus (YFV), and chikungunya virus.With the introduction of the **Insulated Isothermal PCR assay** known as the POCKIT combo central system, users can load serum samples straight into a cartridge that does extraction and amplification automatically, overcoming the drawbacks of traditional PCR, such as the requirement for specialized staff and sophisticated equipment. For some DENV serotypes, this system's high sensitivity can detect as little as 1 PFU per milliliter, improving viral detection's accessibility and dependability in environments with limited resources.The primers created by Lanciotti et al. targeting the Capsid/preMembrane region of the DENV genome are utilized in the most popular nested RT-PCR experiment[29].

A second round of serotype-specific amplification follows the initial reverse transcription and the first round of amplification utilizing universal consensus primer to all four serotypes, which generates a 511 bp amplicon. One-step multiplex RT-PCR, which used a mixture of all serotype-specific primers in one reaction to discriminate the serotypes of DENV, was developed to eliminate the possibility of a false positive caused by the potentially contamination-prone two-stepped nested PCR. Sudiro et al. created a pair of common primers that is specific for DENV 3'-non-coding region for all serotypes. Ahamed et al. developed a better nested RT-PCR approach that targets the 511 bp and 654 bp capsid/premembrane regions and the 641 bp envelope region of the DENV gene. They discovered that a modified RT-PCR approach that concentrates on the 654 bp Capsid/preMembrane region improved DENV detection. Real-time RT-PCR assay kits were created by the US Centers for Disease Control and Prevention (CDC) to identify DENV-1-4 in human serum or plasma. This real-time PCR apparatus from Applied Biosystems (ABI) was designed to use this US Food and Drug Administration (FDA) approved kit. **Transcription-mediated amplification (TMA), nucleic acid sequence-based amplification (NASBA)**, and strand displacement amplification were the first isothermal amplification techniques introduced in the 1990s (SDA). A revolutionary technique for amplifying DNA and RNA (**LAMP and RT-LAMP**, respectively) with excellent specificity, sensitivity, and ease is called loop-mediated isothermal amplification[30]. A mixture of the target gene, four or six distinct primers, DNA polymerase, AMV reverse transcriptase (for RNA), and substrates are incubated in the procedure. It is an isothermal, one-step reaction with a quick turnaround and no requirement for pricey machinery. Additionally, visual detection is possible since the reaction's byproduct magnesium pyrophosphate causes turbidity to rise. Because of this, the LAMP approach is an appealing replacement for conventional PCR, which needs specialized equipment and can be time-consuming. Numerous researchers are increasingly using the RT-LAMP test for the quick identification and characterization of new viruses [31]. Nevertheless, in the previous findings, the C-prM gene or serotype-specific portions of the 3′ untranslated region (UTR) were used in the evaluation of their RT-LAMP assays for the identification of DENV infection with a modest clinical sample size[32]. Contrary to the 3′UTR, however, the C-prM gene had significantly reduced inter-serotype conservation across all the Dengue virus serotypes [33]. The highly

conserved area of NS1 that we focused on, however, revealed >90% sequence similarity between different genotypes within each serotype. As a result, numerous genes, including NS3 and NS5, can be used for genotyping dengue serotypes. RT-PCR involves three basic steps including denaturation, annealing, and extension by polymerase activity. PCR results with replicates of DNA, so if these replicates are formed it gives a positive result in this RT-PCR test. This test is more advantageous because of the high specificity of the dengue viruses, particular genotypes (DENV1, DENV2, DENV3, and DENV4) can also be determined. Only five to Six days at the start of symptoms, the virus may be found in samples. Dengue can be identified at this early stage of the illness using virus isolation, viral RNA analysis, and viral protein analysis.

Other blood tests

Various other blood tests aid the diagnosis of dengue virus because in a critical phase of infection, we can observe dengue hemorrhagic events; a complete blood count is done to assess hemorrhagic events. RBC can be measured and a decrease in RBC indicates hemorrhagic events. During the viral infection, platelet count and hemoglobin levels may be reduced, and hematocrit is also measured which has been reported to fall during the infection (the normal range is less than 50%).

WHO classification system of disease intensity

Based on symptoms and test results, the severity of Dengue Fever is of the following types: [34]

Probable dengue

An acute febrile illness associated with the following features: Headache, Myalgia, Retro orbital pain, Arthralgias, Rash, Hemorrhagic manifestation, Leucopenia, following supportive tests results such as if reciprocal HI antibody titer >1280 or an equivalent IgG assay ELISA titer or positive IgM antibody test on a late or acute recovering phase serum specimen.

Confirmed dengue

An established case of dengue fever is confirmed through specific laboratory criteria, including the isolation of the virus from the patient's serum, a fourfold increase or greater in IgG or IgM titers, detection of the virus antigen via ELISA, immunofluorescence, or immunohistochemistry, and identification of DENV genomic sequences in blood or cerebrospinal fluid (CSF) using PCR, as outlined in the WHO 1997 case definition. According to this definition, dengue fever is characterized by febrile illness lasting 2 to 7 days, evidence of hemorrhagic diathesis demonstrated through tests such as the tourniquet test, mucosal bleeding, hematemesis, or melena, thrombocytopenia (platelet count <100,000/mm^3), and plasma leakage indicated by a rise in hematocrit >20% from baseline, a drop in hematocrit of up to 20% after fluid therapy, or physical signs of plasma leakage like pleural effusion, ascites, or hypoproteinemia. Dengue Hemorrhagic Fever (DHF) is defined as presenting all the above symptoms, along with features of Dengue Shock Syndrome (DSS), which includes a rapid, feeble pulse and low blood pressure, hypotension, cold, damp skin, and feelings of uneasiness. DHF is classified into four grades, with Grades III and IV indicating DSS; Grade I involve fever with nonspecific symptoms and tourniquet test positivity, while Grade II includes unsolicited bleeding. Grade III presents circulatory collapse, characterized by rapid pulse and altered sensorium, whereas Grade IV denotes intense shock with untraceable blood pressure. The WHO revised the classification of dengue severity in 2009, and according to the WHO 2011 case definition, individuals with high fever and two or more of the following symptoms may be suspected of dengue infection: headache, retro-orbital pain, muscle aches, arthralgia, irritated or swollen skin, bleeding incidences (e.g., petechiae, epistaxis, gum bleeding), leukopenia (WBC ≤ 5,000 cells/mm^3), platelet count ≤ 150,000 cells/mm^3, or a hematocrit increase of 5–10%.

Treatment

The severity of the disease calls for measures that promise early diagnosis of the disease and its management if needed. There is an alarming need to reduce the mortality related to dengue infection. This requires good health care practices at a personal level,and which is provided by medical practitioners. Largely, patients can recover without hospital admission and through home care while sometimes, the disease may develop into critical dengue. Patients

with symptoms are first evaluated to understand those who are at risk of developing severe dengue infection and if they require hospital admission, which is further, followed by timely and appropriate management of the disease.
In primary health care, evaluating a patient with elevated temperature for possible dengue virus (DENV) infection is essential. This entails consulting qualified medical professionals at the presentation of febrile conditions and properly managing the infection in its initial phases. Vigilant observation for plasma leakage and severe symptoms is essential to determine if the disease has proceeded to a critical stage, necessitating remedial fluid therapy. It is crucial to assess for indicators such as significant hemorrhage, thrombocytopenia, or shock to ascertain the necessity of hospital admission. Dengue is mainly a self-limiting illness lacking specialized antiviral therapies, with care centered on symptom relief and accurate diagnosis of the infection's stage being crucial[35]. Acetaminophen is frequently used for fever alleviation, although aspirin, nonsteroidal anti-inflammatory medicines (NSAIDs), and corticosteroids are typically contraindicated. During critical phases, meticulous attention to fluid management, platelet monitoring, and bleeding treatment is essential. A single dosage of methylprednisolone has been reported to effectively treat dengue shock syndrome (DSS) with no recorded fatality cases[36]. Management techniques differ according to the infection stage, highlighting the necessity of customized treatment strategies.

Supportive care for probable dengue

Patients with suspected dengue with high fever and vomiting should be given proper medical care and oral rehydration therapy. Tests should be conducted to observe platelet counts and hematocrit levels regularly starting from 3rd day of the infection to a few days after the fever subsides. Patients with severe cases of dehydration or increasing hematocrit levels as well as increasing cases of thrombocytopenia require more careful fluid management, and it is done by intravenous provision of fluid maintenance [37]

Remedial care for severe dengue

Treatment of the severe cases of dengue fever requires immediate admission of the patients in hospitals and if needed, to the intensive care unit, for micro-managing the vital fluctuations. Hemorrhage and fluid volume management require rigorous attention. Protocol designed to take care of such conditions is the central intravenous line for volume replacement and an arterial line for precise blood pressure monitoring. As per mandatory protocol, frequent blood tests are also prescribed[38]. Intravascular volume is maintained by isotonic fluids such as Ringer lactate solution, which is given as boluses of 10-20 mL/kg for over 20 minutes, and such condition is replicated. After the following treatment, if the hematocrit values are still known to be increasing, a plasma expander may be directed. Starch, dextran 40, or albumin at a 5% dose of 10-20 mL/kg, could be given. Dextran can show increase in hypersensitivity reactions, so as per reports, starch is the selected of three [39].

Natural remedies for dengue fever

Various phytomedicines have become the part of dengue fever treatment regime in many parts of India. The following table (Table 1) gives details of various plants that are scientifically validated and have been shown to improve the symptoms of dengue fever or have inhibitory effects on a vector that causes dengue.

Vector control measures

The practical approach to reducing the availability of female anopheles mosquitoes that are responsible for transmitting dengue is pivotal for the reduction in morbidity rate associated with dengue infections. As per widely recorded momentous events, Singapore and Cuba have reduced the incidences of dengue by the formation of Anti-Aedes laws and by taking serious actions to decrease the number of mosquitoes [51].Vectors are managed by abolishing containers that serve as artificial habitats for oviposition sites, and which allow the growth of aquatic stages. This is achieved by covering the containers or with the use of insecticides, killing the aquatic stages, or finally by hitting the adult-grown mosquito using insecticides, or by using combinations of these treatments. Some of how vector control measures are taken are as follows:

Environmental management

Long-staying permanent pipes can be used to supply water to communities can be used, instead of containers, to reduce breeding grounds for vector larvae. In some of the locations, where containers are unavoidable, temporary measures include repeated clearing and cleaning of water-storage containers, room coolers, gutters, and removal of old tires, and vessels that are collecting water. Some of the methods should also be employed that diminish the link between the vector and human such as the use of mosquito nets, and mosquito screening on windows, doors, and remaining entry points. Tightly fitted mesh screens should be used that allow rainwater to be harvested from the roof but not provide a habitat for mosquitoes. Polystyrene beads are also added in the containers with stored water, which creates a physical barrier for the mosquitoes, and water from below is taken out via pipes. The combination of approaches can be used but it should be practical for the local people and the environment.

Chemical control

Larvicides are often used to control the growth of *A. aegypti* larval habitats, but they should be used complementary to environmental management as several difficult-to-reach sites are natural habitats of *A. aegypti* habitats, such as leaf axils and tree holes. Larvicides should also have little toxicity for other non-specific species and they should also not contribute to taste change, odor change, or provide any color to the water. Some of the toxic components have been shortlisted as safe to use larvicides by the International Programme on Chemical Safety (IPCS) and these include chemicals containing methoprene, pyriproxyfen, and temephos, as active ingredients [27]**.** The treatment of drinking water with these chemicals is followed as per strict dosage. Temephos and methopreneare used at the dose of 1 mg per liter (1 ppm); a dose of pyriproxyfen is set to be 0.01 mg of active ingredient (a.i.) per liter (0.01 ppm). Adulticides are the toxic components that target adult mosquitoes are also used and sprayed as cold aerosols or thermal fogs. Malathion, permethrin resmethrin are the few used insecticides with the active ingredient pyethroidwhich is effective in treating adult mosquitoes. Correct dosage should be sprayed in the environment. Some of the personal-level individual practices should also be followed, such as reducing the skin exposure during the daytime by choosing such clothing, by the use of repellents that contains DEET (N, N-diethyl- 3-methylbenzamide), IR3535 (3-[Nacetyl-N-butyl]-aminopropionic acid ethyl ester) or Icaridin (1-piperidinecarboxylic acid, 2-(2-hydroxyethyl)-1-methylpropylester) [27].

Biological control

This approach is based on using biological organisms that prey upon, compete, parasitize or in any other way, take part in reducing the population of vectors. Two such efficacious organisms that are used against Aedes mosquitoes are some species of larvivorous fish and predatory copepods. The fish species, *Poecilia reticulate*, is used to reduce the population of mosquitoes that act as a vector for transmission of the dengue virus. These fish grow well in confined water bodies. The biological control methods are toxic-free and thus, the risk of contamination of the environment is low, but in practical use, there are certain limitations associated with its use. Some of the factors that create restrictions are costs, large-scale production of organisms, and difficulty in using these organisms in artificial water bodies where pH and temperature need to be maintained, and pollutant build-up can also cause hindrance in the growth of the organisms [27]. Apart from these techniques, insecticide-treated materials (ITMs) such as bed nets and the use of lethal oviposition traps, have also been encouraged and used successfully in certain countries like Mexico and Venezuela to reduce the mosquitoes associated with dengue transmission. One of the most effective and recently introduced techniques to overcome the increasing population of vectors is the Sterile Insect Technique (SIT), which is discussed further. Apart from this, much research is still being conducted to treat the dengue viral infection efficiently. The Novartis Institute for Tropical Diseases (NITD) is conducting a study in Singapore to discover the inhibitors target proteins of dengue virus so as to lessen the load of the virus when there is an actual infection [40].

Sterile insect technique (SIT)

The purpose of this technique is to control the population of Aedes mosquitoes through the liberation of an adequate quantity of sterile male mosquitoes. Since, after mating with sterile male insects, female insects produce no offspring, because of which, there is sterility in the female population. Ionizing radiations are used to make the male insects sterile[52].

Vaccination against dengue

The vaccine against dengue which has been developed so far is named Dengvaxia (CYD-TDY), which was licensed by Sanofi Pasteur in December 2015. It is now available in approximately 20 countries. CYD-TDY is a tetravalent, live attenuated, chimeric dengue vaccine in yellow fever 17D backbone. This vaccine is known to be more significant and safer for patients who have had previous exposure to the dengue virus, i.e.,seropositive individuals, whereas seronegative patients are viewed to get high chances of severe dengue and chances of hospitalization is also increased as compared to unvaccinated person [6]. Therefore, people who are administered this vaccine, are first required to undergo pre-vaccination screening. Further, studies are in the process of creatingmore effective and safer vaccines for control of this global issue of dengue infection.

General preventions

The most effective method to avert dengue infection is to evade direct contact with infected Aedes mosquitoes, a task complicated by global interconnection and the widespread occurrence of dengue in tropical and subtropical areas [53]. To alleviate this risk, certain operational steps should be implemented. Travelers are recommended to utilize mosquito repellents containing N,N-diethyl-3-methylbenzamide and to don comprehensive protective attire treated with insecticides such as permethrin, which are safe for human application. It is advisable to stay in well-ventilated and air-conditioned settings, as well as to utilize bed netting for daytime rest. Moreover, indoor application of insecticides can offer additional protection [54], [55]. Remaining informed about dengue and adopting a proactive stance is essential, guaranteeing the proper implementation of all governmental prevention instructions to protect against this disease.

CONCLUSION

Proficient and dependable detection of severe cases of dengue fever is of utmost importance, which further requires the confirmation of cases and differential diagnosis with other infectious illnesses. At the onset of the virus infection, isolation of the virus and the detection of antigens are the set protocol for the diagnosis purposes whereas during the later stages of the disease, serological tests are chosen. There are various diagnostic tools for this purpose, but the preference of the method selected depends on the time of collection of the specimen, the expertise of medical personnel, the location where the individual is infected with the virus, and the medical history of dengue infection of the person. There is a dire need to improve diagnostic methods for better sensitivity and specificity. Recently, more advancementshave given Microsphere-based immunoassay (MIAs), as a tool that is a faster method to detect antigens or antibodies using lasers. Similarly, biosensor-based mass spectrometry is also under study to build a powerful tool to identify the biological components in the serum sample. The use of microarrays is also done to test different viruses in one step. In general, to prevent dengue or to treat dengue with zero mortality requires proper plans, with the issue of warnings, mosquito control measures, environment control, surveillance, and well-equippedlaboratories and other medical facilities. There is also a needforanti-dengue drugs, which are effective against all serotypes, and which is suitable for reducing hospitalization cases. Although vaccines and drugs are in a position thatfaces lots of challenges in efficiency, enormous efforts have given much positive advancement in both areas, and dengue disease is manageable, when detected timely.

Table 1: Herbal formulations that are known to treat dengue.

Formulation	Effects
Eupatorium perfoliatum (Boneset)	It is generally taken in the form of tea and is known to help in controlling febrile dengue [40].
Boesenbergia rotunda (Temukunci)	Its roots are very effective in controlling nausea and muscle pains and are consumed as a paste [41].
Kaempferia parviflora	Bioactive compounds obtained from its leaves and stems are documented to directly inactivate DENV 2 [42].
Carica papaya	Its leaves are useful in controlling thrombocytopenia [43].
Solanum villosum	Its berries have larvicidal properties against *A. aegypti*[44].
Combretum collinum	Its bark possesses larvicidal properties against A. aegypti[45].
Azadirecta indica and *Pongamia glabra*	Its extracts are used to prepare an herbal formulation called PONNEEM, which has larvicidal, ovicidal, and oviposition deterrent activities against *A.aegypti* and *A. albopictus*[46].
Nyctanthesarbortistis, Catharanthus roseus, Eupatoriumodoratum	Their leaf extract possesses larvicidal activities *A. aegypti*[47].
Citrus limetta	Its peel extracts have larvicidal properties against A. aegypti [48].
Acalypha alnifolia	Its leaf extract is known to have larvicidal activities against *A. aegypti* and *A. stephensi*[49].
Delonixelata	Extracts obtained from its leaves and seeds have larvicidal and ovicidal properties for *A. aegypti* and *A. stephensi*[50].

ABSTRACT

Ovarian cancer is one of the worst diseases that strike women most often in the globe (OC). Daily life remains a challenging task for early-stage OC detection. This paper proposes an ovarian cancer diagnostic technique that combines the Enhanced Convolutional Neural Network (ECNN) with modified Dense Network and Endure Regional Geography Framework model. The Enhanced CNN with modified Dense maximizes feature extraction from medical images, enabling the system to accurately identify between several ovarian cancer subtypes and stages. On smaller datasets often used in medical imaging, dense connected convolutional layers assist to avoid the vanishing gradient problem and permit efficient information flow, hence enhancing performance. Furthermore, the Endure Regional Geography Framework provides spatial and regional context for the cancer location, improving the system's ability to identify tumour features based on geographic patterns in ovarian tissues. According to experimental data, the recommended model is more sensitive and accurate than standard CNN models, making it an appropriate option for ovarian cancer detection and stage classification. These results have the potential to significantly enhance early intervention and treatment programs.

Keywords: Cancer detection, Classification, Enhanced CNN with modifies Dense, Regional Geography Framework, and Traditional CNN.

INTRODUCTION

Among women's leading causes of death is ovarian cancer. Cancer affects women of all back grounds and ranks seventh in terms of mortality [1-3]. This is the most lethal gynaecological cancer in terms of frequency and severity of illness and death of a population, accounting for about more than 10,000 deaths per year [4-6]. The condition is sometimes referred to as a quiet because, particularly in the early stages, the absence of symptoms leads to late detection and consequently limited treatment choices. This highlights the significance of early detection and referral of such patients to tertiary cancer institutions. Ultrasound imaging is the most useful and widely accessible approach for classifying ovarian masses [7-9]. By correctly distinguishing cancer from tumours, one may prevent false positives and so satisfy the patients' relevant demands. Surgery [10-12] is one of the most essential ways to treat ovarian cancer. Typically, a sample is required during this procedure to examine the problematic lesions and offer guidance on the surgical excision dose [13-15]. Nonetheless, competent pathologists' standard biopsy for intraoperative histological diagnosis is laborious, time-consuming, and biased [16-18]. Making medical decisions is largely dependent on the accuracy with which instruments are categorized. Improved categorization accuracy is highly appreciated by clinicians as a way of providing effective treatment [19]. Early and accurate diagnosis saves lives and lowers mortality rates. Computer-Aided diagnosis (CAD) approaches are often used to assist clinicians and pathologists in more thoroughly analyzing the outcomes of medical images [20-22]. Cancer is diagnosed using a CAD-based medical imaging system powered by machine learning algorithms. Features extraction [23] is an important aspect of the machine learning process. Pre-trained CNNs have previously been utilized by researchers, and the findings are positive, comparable to subjective ratings of professional sonographers [24]. In clinical practice, however, using neural networks requires large-scale annotated ovarian image sets suitable for model training and extensive validation. Medical imaging and CNNs may alter everyday clinical practice and ovarian cancer diagnosis [25]. As a result, we present an Enhanced Convolutional Neural Network for ovarian cancer detection that incorporates a modified Dense and Endure Regional Geography Framework.

Literature Review

Aditya, M., *et al* (2021) among women's leading causes of death is ovarian cancer. It affects women of all demographics and races, ranking seventh in cancer mortality among women. Correctly differentiating it from tumours not only satisfies the pertinent demands of the patients but also helps to prevent false positives for malignancy. To identify benign from malignant ovarian tumours, this approach uses a variety of machine learning classifiers and imputation methods on the Kaggle dataset, both with and without feature selection and deep learning. These authors proposed feature selection revealed that the accuracy of the Machine Learning model had significantly increased. Boyanapalli A. *et al.* (2023) while several Deep Learning (DL) classification algorithms are for OC detection, they have significant limitations such as increased complexity and difficulty recognizing the specific cancer location. To solve these issues, these authors introduced the Ensemble Deep Optimized Classifier with Improved Aquila Optimization (EDOC-IAO) classifier. In computed tomography images, many OCs may be identified. Pre-processing involves scaling and filtering the image using the Modified Wiener Filter (MWF). ResNet, VGG-16, and LeNet are among the top-performing ensemble classifiers. It requires pre-processed photos. The IAO reduces overfitting and improves precision. Average Weighted Fusion (AWF) is the fusion technique used to produce picture quality. Finally, the softmax layer selects a wide range of forms that aid in ovarian cancer classification. Fahim, T. A., *et al* (2024) these authors primarily contributes to the development of Ovarian cancer network (OVANe)t, a unique deep learning model that incorporates modified components from the robust Visual Geometry Group (VGG19) and InceptionV3 architectures and enhances them with a dual attention mechanism for ovarian cancer subtype identification and classification. The model outperforms widely used alternatives such as VGG19, InceptionV3, ResNet101, NASNet, and DenseNet 201 in terms of accuracy, precision, recall, and AUC. Ghazal, T. M., *et al* (2022) optimized neural networks, Clinical Network data, and the Self Organizing Map (SOM) have provided a novel strategy for distinguishing residual from ovarian cancer. These authors described a Feature Optimization and Identification technique for Ovarian Cancer (FOI-OV). Different phases of participant health data were utilized to differentiate implementations of the SOM approach to improve the functional subset using logical and intriguing

information. SOM-based data collection seems appropriate in directed learning systems, since the lack of different classifiers would restrict the search for information relevant to the classification method. The technique of categorization will be able to distinguish between benign and aggressive ovarian cancer. Advanced Harmony Searching Optimization (AHSO), which employs superior neural network design, may aid in the diagnosis of ovarian cancer. Giourga, M. *et al* (2024) the purpose of this project is to create a robust binary classifier and assess the ability of pre-trained Convolutional Neural Networks (CNNs) to distinguish between benign and malignant ovarian tumours using still ultrasonic images. Using histology, professionals found and validated 3510 ultrasonic images from 585 women with ovarian cancer, 390 of which were benign and 195 of which were malignant. Using the k-fold cross-validation approach, a 20% to 80% split for validation and training ensured that the whole dataset was used. Three pre-trained CNNs (VGG16, ResNet50, and Inception Net) were developed to determine the total weights and decision threshold probability for independently categorizing each mass. Hema, L. K., *et al* (2022) the performance analysis demonstrates that utilizing Feature aware- Residual Convolutional Neural Network (FaRe-ConvNN), both Supporet Vector Classifier (SVC) and Gaussian Naïve Bayes (NB) achieve classification accuracy greater than 95%. The predicted class, which used the proposed FaRe-ConvNN, obtained 97 to 99 percent accuracy. The results of the suggested approach lead to the conclusion that this OC detection categorization system is a significant contribution to the medical business since it allows clinicians to treat patients more accurately and make more informed decisions. Experimenting with a variety of deep learning models and adjusting their hyper parameters assist to increase research output by yielding desirable and dependable results. Furthermore, transitory CNN data may be analyzed to offer additional findings for future projects. Nobel, S. N. *et al.* (2024) these authors established a novel Attention Embedder model for outlier detection and subgroups identification in ovarian cancer. The main emphasis of this study was ovarian cancer subtypes including Low-Grade Serous Carcinoma (LGSC), Mucinous Carcinoma (MC), Endometriosis Carcinoma (EC), Clear-Cell Carcinoma (CC), and Low-Grade Serous Carcinoma (LGSA). This model worked well on a combined dataset of Whole-Slide Image (WSI) (20× magnification) and Tissue Micro array (TMA) (40× magnification). It achieved 95.10% validation accuracy and 96.42% training accuracy with 20× pictures.

Training accuracy for TMA (40×) photos was 93.45%, while validation was 94.90%. These findings demonstrate the constancy and durability of strategy. This technique visualizes the model's training dynamics via accuracy and loss graphs also extensively examined the models employed. Suha, S. A. *et al* (2022) these authors combined the advantages of classical machine learning with deep learning approaches, the findings of this study will considerably assist healthcare practitioners in more rapidly and consistently identifying PCOS using ultrasonic pictures, and are therefore likely to be widely relevant in the real world. One of the most difficult tasks was discovering medical photos of individuals living in least developed countries; Machine Learning methods were used to a small number of images (Pebble 600) that lacked a dataset. Furthermore, the proposed strategy, which is based on a stacked ensemble machine learning classifier and deep learning feature extraction, makes communication challenging and perhaps confusing for clinicians. Tajunisha. N., *et al* (2023) these authors introduced an Multi-Scale Deep Semi-Supervised Generative Learning with Enhanced U Net and fused Deep Convolutional Neural Network (MS-DSSGL-EUNet-DCNN) model for ovarian cancer segmentation and classification in various forms. This paradigm compares several DCNNs' kernel sizes, learning rates, and batch sizes. Every Computed Tomography (CT) scan Region OF Interest (ROI) flows into a fused DCNN model, which produces scale-level properties for each segment. The lionizing technique may also be used to optimize DCNN hyper parameters such as layer count, kernel size, learning rate, batch size, weights, and dropout rate. This may save significant training time and assist to reduce training errors. As a result, the accuracy of identifying and categorizing several types of ovarian tumours improves. Visintin, I., *et al* (2008) the specificity of this test for ovarian cancer detection was assessed using two independent sample cohorts, four statistical approaches, and three different platforms. As a result, the results given in this paper are not the result of a "unique sample population," a method-related artifact, or a sophisticated algorithm. The test's sensitivity meets the last requirement of the proposed road map: a practical usage for screening with a minimal risk of false positives. Using this test to detect ovarian cancer at a starting stage may aid in the treatment of this disease.

Problem Identification

While over fitting leads to poor generalization performance on new data, and thick layers suffer from over fitting since the model remembers the training data rather than learning general sable data, standard CNN image classification is often slower.

PROPOSED METHODOLOGY

We increased the performance of ovarian cancer detection using the suggested technique by utilizing feature extraction and classification. In feature extraction, we use an Enhanced Convolutional Neural Network with Modified Dense, and in classification, we use the Regional Geographic Framework. The proposed model for Ovarian Cancer is shown in Figure 1.

Dataset Gathering

Mendeley datasets are used in this work to obtain data on ovarian cancer detection. We used both malignant and non-cancerous datasets to extract and classify ovarian cancer.

Feature Extraction Using ECNN With Modified Dense

In a visual comparison, CNN are a kind of artificial neural network that includes banks of neurones whose output states (which may be regarded as pixels) are generated via convolution of an input signal with the filter learnt by the bank of neurons. Convolutional Neural Networks (CNNs) are a good replacement for traditional segmentation techniques. The attention module focuses on utterance-level context aggregation, while the dense block improves feature extraction via feature reuse in a deeper network. This paper presents an Enhanced Convolutional Neural Network with Modified Dense (ECNN-MD) with self-attention for ovarian cancer detection. ECNN-MD systems are designed as supervised models and are trained from the top down. They discover a hierarchy of visual features spanning many levels of abstraction. Unlike traditional feature-based classifiers, ECNN-MD can train both the features and the classifier at the same time using data. Including multimodal testing, they demonstrated new performance across a broad range of medical image segmentation challenges. Dense networks increase natural image classification accuracy and efficiency by promoting gradient flow and recognizing more complex patterns. This discovery, which combines dense connections and deep networks, has inspired more medical picture categorization research. Dense neural networks are founded on the idea that training is easier and more accurate when direct connections from any layer are added feed-forward to all subsequent layers. Three observations led to this inspiration. First and foremost, the easy pathways to each architectural feature map indicate complete control. Second, gradients and information may travel between layers via direct connections. Third, the regularizing effect of dense connections reduces the danger of over fitting in cases when training sets are limited. Inspired by the recent success of densely connected networks in medical image segmentation, we propose a hyper-dense architecture for multi-modal image segmentation that extends the concept of dense connectivity to the multi-modal setting: each imaging modality has a path, and dense connections occur not only between layers within the same path, but also between layers across different paths.(Figure 2).

Let a_l is $l-$th layer output. In ECNNs, a_{l-1} is previous layer output by a mapping and convolution followed H_l composed:

$$a_l = H_l(a_{l-1}) \text{ ---------- (1)}$$

The feature outputs of a strongly coupled network are concatenated and transmitted forward.

$$a_l = H_l([a_{l-1}\ a_{l-2} \ldots a_0]) \text{ ---------- (2)}$$

Where [. . .] denotes the concatenation process. Extensively extending on this method, Hyper DenseNN provides a connection definition in which we link the outputs of several streams, each with its own image modality. The

network learns the intricate relationships between modalities at all abstraction levels, therefore hyper-dense connection produces far better feature representation in a multi-modal environment than early late fusion. For the sake of simplicity, let us first analyze the problem with two visual modalities; expanding to N modalities is likewise quite straightforward. Streams 1 and 2's l −th layer output is a_l^1 and a_l^2 respectively. In general, stream s l −th layer output can be defined as follows:

$a_l^s = H_l^s\ [a_{l-1}^1, a_{l-1}^2, a_{l-2}^1, a_{l-2}^2, \ldots, a_0^1, a_0^2]$ ---------- (3)

Shuffling and interleaving feature map bits in a CNN have been shown to be both a regularizer and a strategy for increasing speed and efficiency. This is true even if considerable information is lost throughout the process since intermediate CNN layers make predictable adjustments to optimize efficiency. While maintaining the predictability required addressing this difficulty, intermediary layers should allow for a wide range of information flow. This strategy encouraged foe each branch and layer to concatenate feature in a different sequence.

$a_l^s = H_l^s\ (\pi_l^s([a_{l-1}^1, a_{l-1}^2, a_{l-2}^1, a_{l-2}^2, \ldots, a_0^1, a_0^2])\ )$ -------- (4)

with π_l^s serving to permute the provided input feature maps. For two visual modalities, we may have

$a_l^1 = H_l^1\ [a_{l-1}^1, a_{l-1}^2, a_{l-2}^1, a_{l-2}^2, \ldots, a_0^1, a_0^2]$ -------- (5)
$a_l^2 = H_l^2\ [a_{l-1}^1, a_{l-1}^2, a_{l-2}^1, a_{l-2}^2, \ldots, a_0^1, a_0^2]$ ---------- (6)

Algorithm 1: ECNN with Modified Dense
Number of Layers: 13
Input: High resolution Image(X)
Size: W=width, H=height, C= Number of channels
f is filter
Step 1: convolution operation
$Z_{s,p,f}$=$\sum_{u=1}^{f}\sum_{v=1}^{f}\sum_{c=1}^{C} W_{u,v,c,f} \cdot X_{s+u-1,p+v-1,c} + b_f$
$W_{u,v,c,f}$ is the weight of the filter f at position (u, v) for channel c.
b_f is the bias term.
s, p are the output feature map of spatial coordinates
Relu Activation function
$R_{s,p,f}$ = Max (0, $Z_{s,p,f}$)
Step 2: Max pooling
Pooling layer $P_{s,p,f} = max_{u,v} + A_{p-s+u,p-p+v.f}$
Step 3: Flattening
Vector v = flatten (p)
Step 4: Dense layer operation
For a dense layer with weights WWW and biases b, the output layer can be computed as:
Z= W. v + b
Where W is a matrix of weights and b is a vector of bias
Activation function:
a = max (0, Z)
Step 5: Output operation
Y= W. a + b
Step 6: loss function
Loss=$\frac{1}{N}(\sum_{s=1}^{N} y_s - t_s)^2$
y_s is the s-th layer predicted output
t_s is the s-th layer true target value

Number of examples in the dataset (N)
Output: Cancer or normal ovary.

For a linear function, a Convolutional Neural Network (CNN) with dense layers collects information from the input image using convolutional layers. Every layer uses filters to identify patterns such as edges or textures before adding nonlinearity via an activation function, which is commonly ReLU. Pooling layers then help to compress the resulting feature maps, maintaining the most important components while reducing computation needed. These smaller feature maps are combined into a single vector and routed via dense (fully connected) layers, where the network learns increasingly complex associations. Finally, using a linear function, the output layer computes a single number that reflects the predicted result.

Classification Using Endure Regional Geography Framework
Backbone Network (Feature Extractor)
The Backbone network is another term for the feature extraction employed in the classification task. ResNet derives more complex properties from a deeper network design. Both networks are still often utilized as backbone networks. Aside from that, DenseNet is designed specifically for object recognition and closely integrates each network layer with the others. Typically, existing backbone networks to recognize natural pictures. Using standard backbone networks, it is difficult to distinguish between normal and malignant cells in ovarian cell images because cell canceration is a gradual process. Furthermore, ovarian cells vary in size, making it more challenging to locate these microscopic cells on deeper feature maps. DC-ResNet, built on ResNet, is a superior backbone network. DC-ResNet classifies group and dilated convolutions as two types. Following its introduction into the network via the convolutional layer (Conv), Batch Normalization layer (BN), Rectified Linear Unit (ReLU) activation function, and pooling layer (Max Pooling), feature maps are generated using a variety of convolution groups. The last two groups employ residual dilated convolution, whereas the first three groups use residual grouping convolution. Every feature map feeds into the fully connected layer, which generates the predicted category score, hence increasing the network's capacity for feature expression. To prevent overfitting, every completely connected layer incorporates a dropout layer. The following is the computing formula to calculate the total convolution output feature size:

$$C = \frac{x-k-(k-1)\times(d-1)+2p}{s}+1 \text{ -------- (7)}$$

d stands for dilation, p for padding, and s for stride; C denotes the output feature map; x is the input image; and k denotes the convolution kernel. The pre and post-feature maps of the convolution have identical values.

Region Proposal Network (RPN)
Based on feature map learning techniques, the RPN generates candidate boxes. Anchor boxes assist the image differentiate between foreground and background. It also takes the shape of an anchor box. The RPN starts with feature maps that construct boxes from the FPN. The convolutional layers provide objectivity. In general, RPN is a convolutional network. One benefit of RPN is creates foreground and background area concepts without requiring further labour. It is quicker than edge boxes, selective search networks, and other networks. The RPN model consists of three convolutional layers and two objectless anchor boxes that serve as output parameters. RPN requested the top 300 anchor boxes for the following phase, citing a demand of 600. For second-step input, the RPN provides coordinates and class labels for each selected region. Finding acceptable places comes second. It excludes any places appropriate for the background or with a low possibility of yielding a certain class item.

Consider an image with dimensions W (weights) x H (heights) and a succession of anchor boxes.

$$R = \left\{r_{kl} 0 < \left(k+\frac{1}{2}\right)s \le W, 0 < \left(k+\frac{1}{2}\right)s \le H\right\} \text{ --------- (8)}$$

Originally evenly distributed over the image; k and l are removed to simplify the notation, unless otherwise specified. Every anchor box is represented as a 4-tuple in the way of$r = (r_x, r_y, r_w, r_h)$, with (r_x, r_y) representing the anchor's centre point and dimensions(r_w, r_h). The regression branch aims to predict the change in δ from anchor r to target ground truth box t.

$$\left.\begin{array}{ll} \delta_{x=(t_x-r_x)}/r_w, & \delta_{y=(t_y-r_y)}/r_h, \\ \delta_{w=log\,(t_w/r_w)}, & \delta_{h=log\,(t_h/r_h)}. \end{array}\right\} \quad \text{---- (9)}$$

The regress or f produces a forecast $\hat{\delta} = f(x)$ that minimizes the bounding box loss based on the image feature x.

$$L\left(\hat{\delta}, \delta\right) = \sum_{k\in\{x,y,w,h\}} \text{Smooth}L_1\left(\hat{\delta}_k - \delta_k\right), \text{-------- (10)}$$

The robust L_1 loss is defined as follows: smooth L_1 $(\cdot)$ the inverse transformation yields the regressed anchor:

$$\left.\begin{array}{ll} r'_{x=}\hat{\delta}_x r_w + r_x, & r'_{y=}\hat{\delta}_y r_h + r_y, \\ r'_{w=}r_w\ exp\ (\hat{\delta}_w), & r'_{h=}r_h\ exp\ (\hat{\delta}_h). \end{array}\right\} \quad \text{----- (11)}$$

Then, Non-Maximum Suppression (NMS) filters the collection of regressed anchor R' = {r'} to create a sparse set of proposition boxes P.

$$P = NMS\ (R', S),$$

Where S is the collection of objectivity values of categorization branch gained.

Region Of Interest (ROI) Pooling and Fully Connected layer

The ROI finalization phase occurs second in the recommended model. ROI indicates the specific field in which the model recognizes certain unusual occurrences. Models of item detection often check for appropriate places and labeling. This section includes feature maps from previous rounds as well as planned regions. The ROI step determines whether recommended regions belong into certain object classes or backgrounds. The recommended model's RPN sends Nx5 inputs to ROI. N represents the proposed model's recommended region count of 300, and the class label of the surrounding box is 5. The initial level of this arrangement is the ROI pooling layer. It cuts the training and test periods of the model. The ROI pooling layer divides the features of the suggested areas into sub-regions producing independent of the input size fixed-sized output features. The intended architecture calls for a 7 x 7 output ROI pooling layer. Softmax and bounding box regression branches feed ROI pooling layers' information after the fully connected layers. Thick layers accommodate full-connected layers a totally connected linear process with a weight that connects each input and output. It usually makes use of nonlinear activation. K is the number of classes; the object identification model allocates one to each class from 0 to K + 1, with 0 assigned to the background. Whereas SoftMax converts any region to a class K, bounding box regression generates specific bounding boxes based on the recognized object.

Endure Regional Geography Framework (overall model)

Together, the Backbone Network, Region Proposal Network, Region of Interest Pooling, and entirely connected layer constitute a superior model known as the Endure Regional Geography Framework for detecting ovarian cancer. A backbone network is formed by combining many convolutional layers, pooling layers, and dilated convolutional layers. Anchor boxes with class labels are proposed for object localization and classification, together with a dilated convolutional layer to reduce memory usage among kernel components. Then, by lowering the size of these feature maps, pooling layers aid in making the data more manageable without compromising critical information. RPN offers the RPN picture and uses anchor boxes to divide foreground and background in photos. Following that, the entirely connected layers capture these features and utilize them to categories the image into a variety of groupings,

such as whether the tissue is ill or healthy. The final result is a prediction of the image's classification, which assists in medical diagnosis by highlighting certain illnesses based on the input image (illustrates Figure 3).

Algorithm 2: Endure Regional Geography Framework Algorithm

Number of layers: 20

Input: regressor sequence f^T, classifier g, feature x of image I.]

Step 1:

a^{T+1} ,P is a proposal set.

Step 2:

Initialize anchor set $A^1 = \{a^1\}$of image$I$.

for $_T \leftarrow$ **1to** $\boldsymbol{T}$ **do**

Step 3:

Offset $o^T$of input anchor a^Ton the feature map to compute values.

Step 4:

Regression prediction $\hat{\delta}^T = f^T(x, o^T)$ values computation.

Step 5:

Compute regressed anchor $a^{T+1}$from $\hat{\delta}^T$using.

end

Compute objectless score$s = g(x, o^T)$.

Derive P from $A^{t+1} = \{a^{T+1}\}$and $S = \{s\}$

Output: Either cancer or not

The Endure Regional Geography Framework Algorithm is a rigorous way for analyzing a photograph to determine if it indicates the presence of cancer. It begins by activating a series of anchors. Beginning with these anchors, the model identifies potential areas of interest. The approach computes an offset for each layer that alters the placement of the current anchor on the picture's feature map. This offset anticipates a more exact change of the anchor, bringing it closer to the probable object, such as a tumour. Following all of the layers, the algorithm calculates an "objectless score" to determine if the enhanced anchors match any remarkable object in the image, such as an abnormality or cancer. It then employs Non-Maximum Suppression (NMS), a technique for removing overlapping or redundant anchors. The approach determines whether or not the image shows the presence of cancer based on the most recent enhanced anchor recommendations and their associated ratings.

RESULTS AND DISCUSSIONS

The results demonstrate the efficacy of the Endure Regional Geography Framework Algorithm in detecting ovarian cancer and propose an enhanced convolutional neural network with a modified dense network. In this study, we assess algorithm performance using Python. This technique improves detection accuracy over traditional methods by using a Convolutional Neural Network (CNN), Histogram of Orientated Gradients (HOG), Principal Component Analysis (PCA), Speeded-Up Robust Features (SURF), Scale-Invariant Feature Transform (SIFT), and Local Binary Pattern (LBP). We also improved the accuracy, precision, recall, and f-measure of the Enhanced Convolutional Neural Network (ECNN) utilizing the Dense and Endure Regional Geography Framework (ERGF). Accuracy, Precision, Recall, and F-measure comparison for CNN, HOG, PCA, SURF, SIFT, LBP, and ECNN with modified dense algorithms Table 2. ECNN with Modified Dense Network outperformed the other algorithms. In all measurements, ECNN with Modified Dense demonstrates a superior ability to accurately detect and categorise cancerous regions. This suggests that ECNN's better design and advanced feature extraction significantly contribute to its success in ovarian cancer detection. Figure 4 compares several metrics for feature extraction using current techniques with Enhanced CNN and Modified dense network. The X-axis in this graphic depicts the current and proposed algorithms, while the Y-axis represents the proportion of each statistic. Accuracy, Precision, Recall, and F-measure comparison for CNN, DCNN, RCNN, Faster RCNN, RPN, CNN with Dense and ERGF Table 3. ERGF outperformed the other approaches in terms of accuracy. In all measurements, ERGF has an extraordinary ability to

accurately detect and categorise malignant areas. This shows that the better design and classification of ECNN considerably contribute to its efficacy in the detection of ovarian cancer. Figure 5 compares several metrics for feature extraction of current techniques using the Endured Reference Geography Framework. The X-axis in this graphic depicts the current and proposed algorithms, while the Y-axis represents the proportion of each statistic.

CONCLUSIONS

The Enhanced Convolutional Neural Network with Modified Dense Network and the Endure Regional Geography Framework Algorithm perform well in detecting ovarian cancer regions in medical imaging. To detect ovarian cancer regions, we use 13 layers with feature extraction components and a 20-layer network with regressors and classifier components on a dataset of medical images. When compared to standard approaches for ovarian cancer detection, ECNN with modified Dense and Endured Region Geography Frameworks outperforms them in order of Accuracy is 98.56%, Precision is 98.23, Recall is 98.25, and F-measures is 98.23. Future enhancements may focus on incorporating more complicated approaches, such as attention processes, to further increase the model's powers.

ABSTRACT

Synthesizing metal nanoparticles using a green or waste material has been extensively studied and recognized. Three Silver (Ag) doped MnO2 Nanoparticle (NP) were prepared using a green synthesis process, including algae *(Chlorophyta sp.)*, plant extract *(Phyllanthus amarus)* and fruit peel *(Citrus reticulata)* under controlled conditions. The different reduction properties of the reductants (Algae, plant extract and fruit peel) were studied. Significant uses of the green chemistry approach from the synthesis of NPs have been proposed to mitigate harmful effects and maximize the sustainability and safety of NP production. The characterization of size, structure, crystallinity, functional group and thermal stability using UV–visible spectroscopy, Fourier Transform-Infrared (FT-IR), Thermogravimetric Analysis (TGA), Scanning Electron Microscope (SEM) along with EDX Mapping. In addition, the antibacterial and antifungal activity of the Ag-MnO2 NPs using antibiotic-producing organisms by measurement of minimal inhibition concentration. For the effluent treatment, the mechanism of adsorption of antibiotics present in the effluent was established by investigating the Kinetics, Isotherm and Thermodynamics of adsorption. The thermodynamic study showed an endothermic, spontaneous, and chemisorption process. They concluded that Ag-

MnO2 nanoparticles demonstrated excellent performance in adsorbing antibiotics from pharmaceutical industry effluent.

Keywords: Ag-MnO2, Adsorption, Green synthesis, Antibiotics

INTRODUCTION

The discovery of penicillin by Fleming in 1929 marked the beginning of a new era in medicine, leading to the synthesis of numerous antibiotics crucial for fighting infections in humans and animals. Among these, antibiotics are extensively utilized in pharmaceutical and agricultural sectors for inhibiting bacterial growth and eradicating pathogens. In aquaculture, antibiotics serve as essential drugs to prevent bacterial infections, yet their usage results in residual antibiotics in wastewater, accumulating in sediments. Nanotechnology, a rapidly evolving field, offers promising avenues in various domains, including biomedicine, electronics, and drug delivery, by manipulating bulk solids at the nanoscale to design tailored structures and devices. Traditional nanoparticle synthesis methods involving chemical and physical processes are toxic and expensive, prompting a shift towards greener and more economical biological approaches. (Graham et al., 2011, Rafique et al., 2017). Heavy metals in aquatic environments are an ecological concern due to their toxicity, bioaccumulation, and persistence. Adsorption emerges as a potent method for removing heavy metals from wastewater, with materials like perlite, hydroxyapatite, and carbon nanotubes commonly employed as adsorbents. Due to its high capacity, recent attention has turned to manganese oxide (MnO2) as an effective adsorbent for heavy metals. Silver-doped manganese oxide nanoparticles (Ag-MnO2-NPs) also promise to eliminate contaminants like Mecillinam from water. (Mughal et al., 2022; Prasad et al., 2017). The advancement of green synthesis techniques offers environmentally friendly alternatives to conventional chemical methods in nanoparticle production. Utilizing biological entities such as plant extracts and microorganisms enables the synthesis of stable and non-toxic nanoparticles with antimicrobial properties. Notably, the green synthesis of Ag-MnO2 NPs holds significant potential, offering advantages over physical and chemical methods. Understanding the fate of antibiotic compounds, particularly when attached to metal oxide substrates, is crucial for wastewater treatment. Nanoparticles not only adsorb antibiotics but may also contribute to their degradation, influencing removal processes. The interaction between antibiotics and nanoparticles in water necessitates thorough investigation to assess environmental implications and potential risks. (Raj et al., 2014, Jana et al., 2009).

Antibiotic resistance, a growing global concern, is not solely attributed to medical and agricultural antibiotic usage but also industrial waste discharge. Mass spectrometry techniques have enabled detailed examination of antibiotic residue flow in diverse environments, shedding light on the environmental impact of antibiotic contamination and resistance. (Graham et al., 2011, Larsson et al., 2014). In recent years, manganese oxides have gained attention for their effectiveness in removing organic pollutants from wastewater. Nanoscale manganese metal oxides possess unique properties, making them ideal candidates as adsorbents and catalysts. Green synthesis methods offer an eco-friendly approach to synthesizing nanoparticles, utilizing biological systems such as plants and microorganisms to produce nanoparticles with diverse characteristics. Various biological systems, including algae and citrus peel extracts, have been explored for nanoparticle synthesis, showcasing the adaptation of green synthesis methods. Incorporating silver into MnO2 through simple methods like hydrothermal synthesis shows potential for enhancing catalytic activity. Adopting green synthesis approaches reduces environmental impact and offers efficient and scalable methods for nanoparticle production. (Abuzeid et al., 2019, Senapati et al., 2012, Kaviya et al., 2011, Zhang et al., 2020).

MATERIALS AND METHODS

Materials

Potassium permanganate ($KMnO_4$) and polyethylene glycol (PEG) were purchased from Nice Chemicals (P) Ltd., India. Sulfuric acid (H_2SO_4) was purchased from Spectrum Reagents and Chemicals Pvt. Ltd., India. Nutrient Media and Potato Dextrose Agar were purchased from Hi-media Pvt. Ltd., India. The chemicals used were of analytical grade. The algae species selected was *Chlorella vulgaris*, obtained from ICAR – CMFRI, Cochin, Kerala (Ciorita et al., 2020). Collected Algae was sub-cultured and used for the NP synthesis process (fig. 1a). *Citrus reticulata* peels and *Phyllanthus amarus* leaves were collected from the Sathyamangalam region and it was extracted and stored in airtight containers. (fig. 2a, 3a).

Methods

Synthesis of Ag-MnO_2 Nanoparticle from *Chlorella vulgaris* (Algae)

In well-oxygenated, eutrophic lakes, manganese dioxide (MnO_2) is reduced to soluble Mn (II) ions under anaerobic conditions, becoming bioavailable for algae. Manganese is essential for algal growth and aids in coagulation and cell flocculation. *Chlorella vulgaris* was collected and sub-cultured. Algal biomass was dried, weighed (1g), and dissolved in distilled water, then heated at 80℃ for 10 minutes, resulting in a color change from green to brown. The extract was filtered using Whatman filter paper to remove residue and stored at 4℃. To synthesize MnO_2 nanoparticles, 0.16 g of 1 mM $KMnO_4$ was dissolved in 100 ml distilled water, mixed with 50 ml of algae extract, stirred for 8 hours at 28℃, and left overnight. The color change from purple to brown indicated MnO_2 nanoparticle synthesis. These were washed with deionized water ($D.H_2O$) thrice, followed by adding 0.083 mg $AgNO_3$ and stirred (using a magnetic stirrer) to form Ag-MnO_2 nanoparticles. Again, the extract was washed 3 times with distilled water. The presence of Ag-MnO2 NPs was determined by characterization methods (fig. 1b, c). (Mughal et al., 2022, Sayadi et al., 2018).

Synthesis of Ag-MnO_2 from *Citrus reticulata* peel

MnO_2 nanoparticles were synthesized using a green chemistry method with Citrus reticulata peel extract, which is rich in antioxidants like flavonoid glycosides, coumaric acid, β- and γ-sitosterol, volatile oils, citric acid, and ascorbic acid. Citrus peels were washed, boiled for 10 minutes, filtered, and the volume made up to 50 ml with distilled water, then stirred for 15 minutes at room temperature and filtered again. This extract was mixed with 4.7 g $KMnO_4$ dissolved in 100 ml water, acidified with 2 ml of 2.5 mol/L H_2SO_4, and stirred vigorously for 1 hour at room temperature, turning from purple to black, indicating the reduction of $KMnO_4$. The precipitate was filtered and washed several times with distilled water to remove potassium ions. The synthesized MnO_2 NPs were washed thrice with $D.H_2O$, and then 0.083 mg $AgNO_3$ was added and stirred using a magnetic stirrer. The resulting Ag-MnO_2 NPs were again washed thrice with $D.H_2O$ and confirmed through various characterization methods. (fig. 2b, c) (Skiba et al., 2019).

Synthesis of Ag-MnO_2 from *Phyllanthus amarus* leaves

Silver-doped manganese dioxide nanoparticles (Ag-doped MnO_2 NPs) were synthesized using a green chemistry method with the aqueous extract of *Phyllanthus amarus* leaves as a reducing and capping agent. Various characterization techniques have been performed to confirm the formation of nanoparticles. 10 g of healthy fresh P. amarus leaves were surface-cleaned, boiled in 100 ml distilled water for 5 minutes in a water bath, and the resulting extract was filtered through Whatman filter paper. The filtered extract (6 ml) was diluted in 44 ml of $D.H_2O$, then added with 8.49 mg AgNO3 (1 mM) for Ag NP and 7.90 mg of KMnO4 (1 mM) for MnO2 NP. The simultaneous reduction of $AgNO_3$ and $KMnO_4$ occurred under continuous stirring at pH 7, maintained overnight in the dark at room temperature. A control profile only with leaf extract was also maintained throughout the experiment to confirm nanoparticle formation via various characterization techniques. (fig. 3b, c) (Pagar et al., 2021).

Drying of Ag-MnO_2 Nanoparticles

In all three synthesis methods, the nanoparticles were separated from the solvent by centrifugation. The resulting sediment was collected and dried in a hot air oven at 60°C for 8 hours, yielding a powdered form of nanoparticles suitable for characterization and application. (fig. 1d, 2d 3d)

Characterization of Ag-MnO_2 Nanoparticles

The synthesized nanoparticles were centrifuged at 15,000 rpm for 20 min and the resulting pellet was dissolved in 1 ml of deionized water. A filtrate containing these nanoparticles was used for FT-IR analysis using SHIMADZU IRAffinity-1S and GX spectra operating at wavelengths from 399 to 4000 cm^{-1} at a resolution of 4 cm^{-1}. The study of UV-visible absorption is one of the most practical techniques for characterizing nanoparticles and thus provides information on the optical properties of nanoparticles. The electron absorption spectrum of Ag-MnO_2 nanoparticles synthesized in solution state shows an absorption peak at 390 nm, which indicates the formation of Ag-MnO_2 nanoparticles. Also, the Structure identification using SEM Analysis and Thermogravimetric analysis and Elemental mapping using EDX.

Anti-Bacterial Studies

Bacterial Strains

The antibacterial activity of the synthesized Nanoparticle (Ag-MnO_2) was evaluated using *E. coli* (MTCC 452), *Bacillus subtilis* (MTCC 1427), and *Streptomyces griseus* (*MTCC 3474*) by using the nutrient media at the controlled condition. The comparison controls used in this study were an Aqueous extract and an Aqueous solution of $AgNO_3$. (Raaijmakers et al., 2012).

Disc-diffusion assay

The antibacterial study of the synthesized Ag-MnO2 nanoparticles was conducted using the disc diffusion method. 106 CFU ml-1 present in the 100μl of the suspension of the respective organism, which were uniformly swabbed on the nutrient agar media plates. 30μl concentration of the Ag-MnO2 was impregnated at the discs with 6mm diameter and placed on the center of the media plates. For comparison, tetracycline (30 μg/disc) was used. After incubating the plates at 37°C for 24 hours, the diameter of the inhibition zone was measured. The comparison was done for Ag-MnO2, Aqueous extract and Aqueous solution of AgNO3 and tetracycline. (Ogunyemi et al., 2020).

Anti-Fungal Studies

Fungal Strains

The antifungal activity of the synthesized Nanoparticle (Ag-MnO_2) was evaluated using *Penicillium notatum* (MTCC 10832), *Aspergillus clavatus* (MTCC 9969) and *Streptomyces prasinus* (MTCC 3253) by using the Potato Dextrose Agar (PDA) media at the controlled conditions. The comparison control used in this study was an Aqueous solution of $AgNO_3$.

Disc-diffusion assay

The Antifungal study of synthesized Nanoparticles (Ag-MnO2) was performed using the disc-diffusion method. AgNO3 and Ag-MnO2 were impregnated at the discs with 6mm diameter and placed on the center of the media plates. Following the 24-hour incubation of the plates at 37°C, the antifungal index (AI) was determined.

Adsorption Method

The effluent containing antibiotic was taken and the different concentrations (10%, 25%, 50%, 75%) of solution were made up using the 250 ml volumetric flask, 0.125g of Ag-MnO_2 Nanoparticle were added into 250 ml of different concentrations of effluent. The setup was kept for 8 hours at room temperature and the antibiotic concentration in the effluent was measured using UV-visible Spectroscopy at 360nm. The quantity of antibiotic adsorbed per unit amount of adsorbent (q_t) for the nanoparticles was calculated from the following equation.

$q_t = c0\text{-}ctmmag \times V$

$q_t = k_{id}\, t^{0.5} + I$

(y= mx + c)

where C_0 represents the initial concentration of effluent, C_t represents the concentration of effluent adsorbed after 8hrs (mg/mL), V represents the effluent volume (ml), m_{ag} represents the mass of the Ag-MnO_2 Nanoparticles (g), K_{id} represents Intraparticle diffusion constant and I represent the thickness of the layer. (Dao et al., 2020; Jamal et al., 2016).

RESULTS AND DISCUSSION

UV-Visible Spectral Analysis

UV-visible spectral analysis was performed to synthesize Ag-MnO2 nanoparticles (NPs) using various biological extracts as reducing agents, including algae, orange peel, and *P. amarus*. the synthesis process employed a green method, with the formation of Mn NPs indicated by color changes observed during synthesis and the characteristic UV intensity at 390 nm, attributed to O–Mn–O–Ag bonds (fig. 4a). For Ag-MnO_2 synthesis using Algae extract (*C. vulgaris*), the UV-visible spectral analysis confirmed the formation of Mn NPs, highlighting the characteristic UV intensity at 390 nm (fig. 4b). Similarly, for synthesis using Citrus peel extract (*C. reticulata*), the UV-visible analysis validated Mn NP formation, with the characteristic UV intensity observed at 390 nm (fig. 4c). Additionally, for synthesis utilizing *P. amarus* extracts, UV-visible spectral analysis demonstrated the formation of Mn NPs, with the characteristic UV intensity observed at 390 nm (fig. 4d). Overall, the consistent presence of the characteristic UV intensity at 390 nm across all samples confirmed the successful synthesis of Ag-MnO_2 nanoparticles using various biological extracts as reducing agents.

FT-IR spectroscopy Analysis

FT-IR spectroscopy was employed to confirm the formation of Ag-MnO2 nanoparticles synthesized using three different biological sources: *C. vulgaris* (Algae), *C. reticulata* (Orange peel), and *P. amarus* (Indian gooseberry leaves). For *C. vulgaris*, characteristic infrared stretching vibrations were observed. The absorption band located at 549 cm^{-1} is attributed to the typical elongated collision of O–Mn–O, indicating the presence of MnO_2 and Ag-Ag at 437 cm^{-1} in the prepared sample. The absorption band at 1622 and 1136 cm^{-1} corresponds to the aromatic unsaturation (C=C) of the Algae extract, while the band at 1037 cm^{-1} is due to C–O stretching in the Algae residue. The wide band appearing at 3350 cm^{-1} is the characteristic absorbance for the O–H–O of water present in the system (fig. 5a). Similarly, for *C. reticulata*, infrared stretching vibrations revealed characteristic absorption bands. The absorption band located at 547 cm^{-1} is attributed to the typical elongated collision of O–Mn–O, indicating the presence of MnO_2 and Ag-Ag at 435 cm^{-1} in the prepared sample. The absorption bands at 1244 and 1136 cm^{-1} correspond to the aromatic unsaturation (C=C) of the citrus peel extract, while the band at 1035 cm^{-1} is due to C–O stretching in the citrus peel extract residue. The wide band at 3363 cm-1 is the characteristic absorbance for the O–H–O of water in the system (fig. 5b). For *P. amarus*, infrared spectroscopy demonstrated distinctive stretching vibrations. The absorption band located at 543 cm^{-1} is attributed to the typical elongated O–Mn–O collision, indicating MnO_2 and Ag-Ag at 435 cm^{-1} in the prepared sample. The absorption bands at 1244 and 1138 cm^{-1} correspond to the aromatic unsaturation (C=C) of the *P. amarus* extract, while the band at 1039 cm^{-1} is due to C–O stretching in the *P. amarus* extract residue. The wide band appearing at 3371 cm^{-1} is the characteristic absorbance for the O–H–O of water present in the system. (fig. 5c) (refer to Table 1).

Thermogravimetric Analysis

In the investigation of the thermal characteristics of Ag-MnO2 nanoparticles synthesized using different biological sources, namely *C. vulgaris* (Algae), *C. reticulata* (Orange peel), and *P. amarus* (Indian gooseberry leaves), TGA revealed distinctive weight loss patterns. For Ag-MnO_2 NP synthesized from *C. vulgaris*, weight loss was observed within the 200°C to 390°C temperature range, resulting in a residual mass of 82.99% at the process's conclusion at 499.6°C. DTA shows that the inflection and the peak are at 33.1^{0}C and 83.7^{0}C (fig. 6a). Conversely, Ag-MnO_2 NP synthesized from *C. reticulata* exhibited weight loss between 230°C to 430°C, with a residual mass of 38.20% at 499.6°C. DTA shows that the inflexion and the peak are at 62.6^{0}C and 85.3^{0}C (fig. 6b). Ag-MnO_2 NP synthesized from

P. amarus displayed weight loss within the 210°C to 410°C range, yielding a residual mass of 53.99% at 499.6°C. DTA shows that the inflection and the peak are at 63.0ºC and 79.7ºC. DTA concludes that the decomposition and crystallization of the sample occur throughout the process (fig. 6c).

Scanning Electron Microscopy (SEM)

Scanning Electron Microscopy (SEM) analysis was conducted for Ag-MnO_2 NP synthesis using three biological sources: *C. vulgaris* (Algae), *C. reticulata* (Orange peel), *and P. amarus* (Indian gooseberry leaves). For Nanoparticles from *C. vulgaris*, the SEM imaging revealed Ag-MnO2 NP sizes ranging from 30µ to 1µ, exhibiting diverse shapes of the Nanoparticle (i.e anisotropic, triangular, irregular, isotropic, polyhedral, hexagonal, flake flower, and pentagonal). The identified morphology was a flake flower (fig. 7a). EDX spectrum analysis detected AgNPs at 1.08 keV and MnNPs at 0.72 keV (fig. 7b). In the case of Nanoparticle from *C. reticulata*, SEM analysis depicted Ag-MnO_2 NP sizes ranging from 10µ to 1µ, displaying shapes of the Nanoparticle (i.e. anisotropic, triangular, irregular, isotropic, polyhedral, hexagonal, flake flower, and pentagonal). The identified morphology was irregular (fig. 7c). EDX spectrum analysis revealed AgNPs at 0.86 keV and MnNPs at 0.43 keV (fig. 7d). For *P. amarus*, SEM examination showed Ag-MnO2 NP sizes ranging from 10µ to 1µ, with shapes of the Nanoparticle (i.e. anisotropic, triangular, irregular, isotropic, polyhedral, hexagonal, flake flower, and pentagonal). The morphology identified was a flake flower (fig. 7e). EDX spectrum analysis indicated AgNPs at 0.72 keV and MnNPs at 1.08 keV (fig. 7f).

Antibacterial Effect of Ag-MnO_2 Nanoparticles

When comparing the synthesized nanoparticles (NPs), it is observed that Ag-MnO2 synthesized using *C. reticulata* (Orange peel) exhibits outstanding properties. The antibacterial activity of these NPs was evaluated against various microorganisms known to produce the antibiotic. The disc diffusion method was employed for the assay, revealing a distinct zone of inhibition around the disc. The NPs demonstrate a significant zone of inhibition against the tested strains. (fig. 8) (refer to Table 2).

Antifungal Effect of Ag-MnO_2 Nanoparticles

The antifungal activity of the synthesized Ag-MnO_2 nanoparticle (NP) was investigated using various antibiotic-producing strains, namely *Penicillium notatum* (MTCC 10832), *Aspergillus clavatus* (MTCC 9969), *and Streptomyces prasinus* (MTCC 3253). At ambient temperature (RT), the adsorption rate of the Nanoparticle was slightly decreased and the reaction rate was increased. The processed effluent can meet the WHO Quality standards, rendering it suitable for potential reuse. The nanoparticle's efficacy was evaluated across varying temperatures and pH levels, revealing its adaptability. It's important to note that multiple factors could affect adsorption, necessitating further optimization for future applications. (fig. 8) (refer to Table 3).

Adsorption Kinetics Analysis

The adsorption process was designed and modeled using the most important parameters, the order of the rate equation and the rate constant for the absorption process. In this way, the adsorption process was used for the kinetics studies. **The pseudo-first-order model** is one of the earliest kinetic equations, describing the adsorption rate based on the adsorption capacity. **The pseudo-second-order model** characterizes a controlled chemisorption of an adsorption process, involving valence forces through the exchange or sharing of electrons between the solvent and the sorbent. **Weber and Morris proposed the intra-particle diffusion model**, which involves three stages: mass transfer of the absorbed metal ions across the external boundary layer, intraparticle diffusion within the pores of the adsorbent and adsorption at a site on the surface. These three models have been extensively utilized for calculating the kinetic parameters.

Adsorption Kinetics for Different Concentrations of Nanoparticles

At ambient temperature (RT), the adsorption rate of the Nanoparticle was slightly decreased and the reaction rate was increased. The processed effluent can meet the WHO Quality standards, rendering it suitable for potential reuse. The nanoparticle's efficacy was evaluated across varying temperatures and pH levels, revealing its adaptability. It's

important to note that multiple factors could affect the adsorption process, necessitating further optimization for future applications (fig. 9)

CONCLUSION

Utilizing Algae, Orange peel, and *P. amarus*, three nanosized Ag-MnO_2 particles were effectively synthesized via an economically viable and environmentally friendly biosynthesis approach. These nanoparticles underwent characterization employing UV-visible spectroscopy and FTIR-Spectra for analysis. UV-visible spectroscopy confirmed the presence of an O-Mn-O-Ag complex within the synthesized nanoparticles, while FTIR-Spectra revealed characteristic peaks corresponding to O–Mn–O bonds, aromatic unsaturation (C=C), O–H–O bonds, and Ag-Ag bonds. The nanoparticles ' thermal stability and residual properties were succinctly elucidated through TGA-DTA Analysis. SEM with EDX analysis facilitated the nanoparticle's structural examination and elemental mapping. Antimicrobial studies highlighted the nanoparticles' proficiency in antibiotic adsorption and organism resistance, suggesting their efficacy as adsorbents against antibiotics in effluent. Furthermore, adsorption kinetics were meticulously examined using three distinct models to refine the results.

Table. 1: FTIR Analysis with characteristic peak for (a) synthesized by *C. vulgaris* (Algae), (b) synthesized by *C. reticulata* (Orange peel), (c) synthesized by *P. amarus*(Indian gooseberry leaves).

Source	Frequency (Cm^{-1})	Interpretation of Characteristic Peak
***a. C. vulgaris*(Algae)**	1622and1136	**Aromaticunsaturation(C=C);**The presence of aromatic rings or double bonds; which can stabilize the nanoparticles through π-π interactions and conjugation.
	1037	**C–Ostretching;**The presence of alcohols, ethers, or phenols. These functional groups can act as reducing agents, aiding the reduction of metal ions to form Ag-MnO2 nanoparticles.
	3350	**O–H–O bending of adsorbed water;**The presence of hydroxyl groups or adsorbed water, is essential for the solubility and stabilization of the nanoparticles.
***b. C.reticulata* (Orange peel)**	1244and1136	**Aromaticun saturation(C=C);**These peaks suggest the stabilization of nanoparticles through aromatic structures.
	1035	**C–Ostretching;**The presence of C–O groups, crucial for the reduction of metal ions.
	3363	**O–H–O bending of adsorbed water;**The presence of hydroxyl groups further indicates the potential for hydrogen bonding, aiding nanoparticle dispersion.

c. P. amarus **(Indian gooseberry leaves).**	1244and1138	**Aromaticun saturation(C=C);**The peaks correspond to aromatic compounds, suggesting a similar role in stabilizing the nanoparticles.
	1039	**C–Ostretching;**Indicates the involvement of alcohols or ethers in the nanoparticle synthesis, reinforcing the reducing environment needed for Ag-MnO2 nanoparticle formation.
	3371	**O–H–O bending of adsorbed water;**This peak reflects the role of hydroxyl groups or adsorbed water in stabilizing and dispersing the nanoparticles.

Table. 2:The antibacterial activity of synthesized Ag-MnO_2 NPs from *C. vulgaris, C. reticulata, P. amarus*against the most commonly used micro-organisms for the production ofthe antibiotic by disc diffusion method. $AgNO_3$. Aq. Extract and Tetracycline were used as the control parameters.

Inhabitants	Zone of Inhibition(mm)		
	Bacterial Strains		
	Escherichia coli	*Bacillus subtilis*	*Streptomyces griseus*
Ag-MnO_2	15±0.2	14.3±0.2	13±0.1
$AgNO_3$	8.1±0.4	7.6±0.3	8.3±0.4
Aq. Extract	No activity	No activity	No activity
Tetracycline	19.1±0.2	19±0.2	18.3±0.3

All the experiments were done in triplicates and the mean value of the experiments was taken for the analysis.

Table. 3:The antifungal activity of synthesized Ag-MnO_2 NPs from *C. vulgaris, C. reticulata, P. amarus* against the most commonly used fungi for the production of the antibiotic by disc diffusion method. $AgNO_3$ was used as the control parameter.

Zone of Inhibition (cm)			
Fungi	**Control**	**$AgNO_3$**	**Ag-MnO_2**
Penicillium notatum	No activity	1.3±0.1	1.7±0.1
Aspergillus clavatus	No activity	1.1±0.2	1.5±0.09
Streptomyces prasinus	No activity	1.5±0.2	2.0±0.1

*All the experiments were done in triplicates and the mean value of the experiments was taken for the analysis.

ABSTRACT

Age recognition systems play a crucial role in various applications such as authentication, security, and surveillance. However, a significant challenge faced by conventional face recognition algorithms is their sensitivity to age-related changes in facial appearance, which often results in reduced recognition accuracy. To address this issue, this study proposes an enhanced age-invariant face recognition method. The approach incorporates several key elements to effectively tackle the problem of age variation. First, a Multi-Task Convolutional Neural Network (MTCNN) is utilized to preprocess the input images from the dataset. These preprocessed images are then passed through a feature extraction process using a ResNet50-like encoder, which captures distinctive facial features. To further optimize the model, the Bald Eagle Optimization Algorithm is employed to select the most relevant features and fine-tune the network's parameters. Additionally, an attention-based feature decomposition mechanism is introduced to segregate age-related and identity-related features. By combining age-specific information with age-invariant characteristics, this mechanism significantly enhances recognition performance across different age groups. The model's effectiveness is validated using a Siamese neural network for testing. Extensive experiments conducted on benchmark face datasets, such as FG-Net and AgeDB, covering a wide range of age groups, demonstrate that the proposed algorithm outperforms existing state-of-the-art methods.

The results show a notable improvement in recognition accuracy, achieving approximately 83% accuracy, particularly for datasets with age variations. This age-invariant face recognition method offers a promising solution for robust and reliable biometric authentication systems, addressing the challenges posed by age-related changes in facial features.

Keywords: Face recognition, Biometric authentication, age invariance, Deep Learning, Feature Extraction, BES optimization.

INTRODUCTION

An exponential rise in the number of users of e-resources necessitates the development of more advanced and secure authentication/identification systems. [1] Authentication or Identification system basically rely on three factors: Attribute related (Aadhar number, pan number), Biographical related (education, residential address) and Biometric related (face, fingerprint, iris). Among those three, attribute and biographical identifiers can be easily manipulated by others. But use of Biometric identifiers adds an extra layer of security to authentication system and also eliminates the burden of remembering the secured strong passwords and safeguarding our smart cards [2]. The potential of biometric authentication systems to offer a convenient and safe way to verify identity has drawn a lot of interest in recent years. Among Biometrics, face recognition is one of the emerging and hot research in the field of Artificial Intelligence. Face is one of the important characteristics as it contains unique features for different individuals. The benefits of face recognition are numerous and extensive, providing better user experience, ease, fraud protection and higher security. Face recognition is a useful technology with many different applications and sectors due to its great speed, accuracy, and dependability. However, the face of the person changes remarkably due to aging. Aging of a person can also be due to biological factors such as genetics, ancestry and external factors like smoking, alcohol consumption, etc. It also increases the intra class distances than inter class distances [3]. As a result, the performance of face recognition models used in Biometric systems starts to decrease by 5% each year [4]. In order to manage this scenario, we have to upgrade the database of Biometric system with the current image of the individuals periodically.

This becomes tedious task. Thus, achieving age-invariant face recognition, or AIFR, or face recognition without age fluctuation, is very important. This helps us to identify the individuals regardless of their age and reduce upgrading the database with new images of the individuals. AIFR is also used for finding the missing children, criminals. By encouraging this, in this work, we aim to present a groundbreaking approach to address the age-related challenges in face recognition through the development of an optimized age-invariant face recognition algorithm. The primary goal of this research is to enhance the robustness and accuracy of biometric authentication systems by mitigating the impact of aging on facial features. By doing so, this algorithm aims to provide a more reliable and secure means of identity verification, especially in scenarios where age-related variations may lead to false rejections or acceptances. The recent studies [3], [5] explains that the face features of humans contain aging features like wrinkles and identity features that remains unchanged across the ages. The identity related features are invariant to age and ideal for AIFR while the age-related features are used for age prediction and aging effects. In cross age face recognition, when both age and identity related features gets mixed up, it increases the intrapersonal variations. So, several discriminative models [3] , [6] introduced a concept in that the features of face can be linearly decomposed into identity and age-related features. The decomposition is depicted in Fig. 1. However, in [3], the assumption of linear separability of the various facial components is too straightforward. So, we have used the attention-based feature decomposition module [7] in which age estimation task is for extracting the age-related features and face recognition task is for extracting the identity related features which in turn is used in age invariant face recognition. In order to improve the recognition rate, we use an optimization algorithm that gives only the optimized features to the decomposition network which further boost up our model.

The contributions of our work are summarized below
1)Develop an optimized AIFR model that recognize faces invariant to age.
2)Apply deep transfer learning model for extracting high level features.
3)Apply attention-based decomposition module to get identity and age features.
4)Enhance the performance of AIFR model by optimization algorithms.
5)Validate the performance on various benchmark datasets.

Related Works

The paper by Zhizhong Huang *et al.* (2023) [7] proposed a methodology where Age-invariant face recognition (AIFR) and face age synthesis (FAS) tasks are combined in the unified, multi-task learning framework called MTL Face. Its goal is to extract discriminative elements related to identity while reducing the effect of age variation on facial recognition. MTL Face is a spatially constrained method that divides mixed facial characteristics into identity-related and age-related components using an attention-based feature decomposition strategy. It presents a new identity conditional module for identity-level FAS, utilizing a weight-sharing scheme to enhance the age smoothness of synthesized faces. By using a selected fine-tuning approach, the suggested methodology additionally makes use of high-quality synthesized faces from FAS to improve AIFR. Leila Boussaad *et al (*2020) [8] proposed a model in which they separate the face into three separate parts: the mouth, nose, and eyes. Then, using AlexNet CNN, each component is processed independently to extract features that are less impacted by aging. A Discriminant Correlation Analysis (DCA) algorithm is then used to combine the features from the three components. Finally, the identity of the person is determined using a Support Vector Machine (SVM) classifier. This model was able to achieve a recognition rate of 98.31%. In the paper [9], Jyothi S. Nayak *et al.* (2020) suggested a pre-processing step of gender classification to improve the age-invariant face recognition performance. Then CNN is used to extract features. By implementing the gender classification as the pre-processing step in the age invariant face recognition system, it reduces the number of comparisons by an average of 38%. The implicit and explicit feature purification technique proposed by Jiu-Cheng Xie *et al.* (2022) [10] eliminates superfluous data while keeping only the details needed for AIFR.

The framework can generate facial-feature embeddings that are insensitive to age variations and maximize the preservation of identity information through the two suggested feature purification mechanisms. In [11], Jian Zhao *et al.* (2022), proposed a model that is a unified deep architecture that works in tandem to accomplish cross-age face recognition and synthesis in a mutually boosting manner. The model eliminates the need for paired data and the actual age of testing samples by performing continuous face rejuvenation/aging with exceptional photorealistic and identity-preserving capabilities. Shtwai Alsubai *et al.* (2022) [12] proposed an age-invariant face recognition model that extracts features using deep transfer learning algorithms like Inception v3 and optimizes those features using optimization algorithms like Bald Eagle Optimization. The DBN model is trained to identify the face images based on their age. The deep-based features that were taken out of the Inception v3 model are used to train the DBN model. They have achieved an accuracy of 99.14%. Rajesh Kumar Tripathi and Anand Singh Jalal (2021) [13] proposed a unique local feature descriptor and is based on the difference pattern, which quantifies the variation in pixel intensities within a local region, and the dual directional relation pattern, which quantifies the correlation between pixel intensities in two directions. The periocular region of a face image, which is recognized to be discriminative for face recognition, is where the suggested descriptor is applied. Leila Boussaad and Aldjia Boucetta (2020) [14] presented a method using five well-known pre-trained deep-convolutional neural network (CNN) models—AlexNet, GoogleNet, Inception V3, ResNet50, and SqueezeNet—the study assesses the efficacy of deep-learning based techniques for age-invariant facial recognition. Three classifiers are used for the evaluation: discriminant analysis, support vector machines (SVM), and K-nearest neighbors (K-NN) on the FG-NET face-aging database. To verify the statistical significance of the findings, the authors perform a statistical analysis test. Pose correction is incorporated into the experimental setup, which contrasts fifteen distinct deep learning model and classifier combinations. Ten-fold cross-validation is used to test the models based on average recognition accuracy rates. M. Saad Shakeel and Kin-Man Lam (2020) [15] uses a pre-trained deep CNN to first extract deep characteristics from facial photos. After that, it encodes the deep features into a lower-dimensional space using a codebook. In order to guarantee that the

encoded aspects of one identity are near to each other and the encoded traits of distinct identities are far apart, the codebook is learned using a discriminative criterion. Chen Li *et al.* (2023) [16] proposed a new model for face ageing called FG-CGAN. It is a conditional generative adversarial network (cGAN) enhanced with a feature guidance module and an age classification module. An encoder and a decoder make up the FG-CGAN generator module. During the producing process, the identity information of the input face image is preserved by the feature guide module. The generator creates an aged face image that fits the intended age group using the age categorization module as a reference. Lingshuang Du and Haifeng Hu (2020) [17] presented a method known as CIDA. It begins by identifying the difference feature between two photos of faces. This difference feature suppresses other elements like age, lighting, and position in order to only extract identity-related information from the two photos. Next, CIDA use a classifier to confirm if the two photos are of the same individual. Yangjian Huang and Haifeng Hu (2021) In [18], a parallel design of the Age Adversarial Convolutional Neural Network (AACNN) is suggested for cross-age face recognition. For facial recognition, the technique uses a Siamese network made up of two similar CNNs. The PRelu activation function is used to train the network in order to maximize values and optimize learning algorithms. A Unified Receptive Fields Mapping module (URFM) is integrated into the AACNN to synchronize the spatial data of the student and teacher networks. Furthermore, the discriminative ability of the model is preserved while distillation-specific knowledge is handled by an Adaptable Prompting Teacher network (APT). On certain datasets, the recognition rate of faces using this technology can reach up to 98%, indicating its high accuracy. Lee *et al*. (2021) [19] proposed a method to improve face recognition in cases when there are notable age differences, particularly by developing the ability to differentiate between children. To overcome the gap, previous efforts have mostly focused on enhancing the similarity between representations of a particular identity as an adult and as a child. The suggested methodology probably entails creating methods or models that can distinguish and identify children's facial characteristics, enhancing the accuracy of face recognition across a range of age groups. By addressing the issues raised by significant age differences in facial recognition software, this method may help progress identity verification and biometric technology.Wang *et al.* (2018) [20] proposed a method that uses an attention-based feature decomposition technique. In order to successfully separate identity and age-related information, the suggested method may involve breaking down mixed face representations into orthogonal deep features using an attention-based feature decomposition.

The study may also include a direct sum loss module to increase the effectiveness of the suggested decomposition technique. By properly managing the intra-class fluctuations brought about by aging, this methodology seeks to enhance the resilience of face recognition systems and contribute to the development of age-invariant face recognition technology. Thanh-Dat Truong *et al.* (2023) [21] proposed a methodology aimed at enhancing Age-Invariant Face Recognition (AIFR) by leveraging disentangled representations. These representations isolate factors causing variance in face images, such as identity and age, thereby increasing robustness across different age groups. The approach employs an attentive technique to emphasize relevant features in the disentangled representations and uses angular distillation to enhance the discriminative strength of learned features for age-invariant face recognition. The study explicitly addresses challenges in large-scale AIFR, emphasizing the efficiency and scalability of the proposed methodology for practical applications involving diverse age groups. Chenfei Xu *et al.* (2017) [22] introduced a method for age-invariant face identification and retrieval using coupled auto-encoder networks. The method learns robust discriminative features against age variations, extracting age-invariant representations for face recognition tasks and enhancing their resilience to age-related changes. Zichang Tan *et al.* (2018) [23] proposed a novel method for estimating facial age using efficient group-n encoding (AGEn) and decoding techniques. The research proposes the AGEn approach, which tries to encode facial information in a way that works especially well for age prediction tasks. Through the use of this encoding method, the model is able to accurately represent changes in face features with age. The study also presents effective decoding techniques that facilitate the retrieval of age-related data from the encoded representations, aiding in the precise estimation of face age. Woo *et al.* (2018) [24] introduced a feed-forward convolutional neural network attention module (CBAM), which improves detection and classification performance by multiplying channel and spatial attention maps to input feature maps. The module is lightweight, easy to integrate into CNN architectures, and has been tested on ImageNet-1K, MS COCO detection, and VOC 2007 detection datasets. Zhifeng Li *et al.* (2011) [25] proposed a methodology for age-invariant face

identification using a learning algorithm and a deep-feature encoding-based model. The method separates identity-related features from age variations, investigates feature extraction methods, and integrates unsupervised discriminant projection for constructing subspaces on periocular pictures.

Proposed Model

In this study, we have proposed an optimized age invariant face recognition algorithm. For developing this model, as a first step we have collected the age invariant face recognition dataset from various sources. Then we have done some preprocessing and the features are extracted. The extracted features are optimized using optimization algorithms. The optimized face features are decomposed into age and identity related features. Fig. 3. depicts the overall process of our model.

Datasets Collection and Preprocessing

The datasets used for training and testing the model are AgeDB [26] and FG-Net [27]. The AgeDB dataset contains face images of celebrities, politicians, and scientists in different ages and poses. The annotations per image include gender, age, and identity of the person in the image which is used for evaluating the model. The minimum age is 1 and 101 is the maximum age. Age estimation, age-invariant face verification, and face age progression are only a few of the experiments that have made use of it. The 16,488 photos in the collection cover 568 distinct subjects. The FG-Net dataset is a publicly available face ageing dataset made up of 1,002 photos of 82 individuals ranging in age from 0 to 69 with a maximum age difference of 45 years. Fig.2 shows the sample images from this dataset. The annotations per image include age and the identity of the person. The Table.1. shows the description about the dataset.The images of the dataset are rotated and resized to 112x112. They are normalized to [-1,1]. The label and age of the image are extracted and used for evaluation process. The images are fed into the feature extraction module. Fig 4. Depicts the preprocessed images.

Feature Extraction

In this study, we have used Resnet50 [28] like CNN as our encoder to extract the high-level features of face images. Since we need only the features, we have used only the first convolutional layer followed by the 4 blocks of convolutional layers. We have not used the fully connected layer. From this module we get the mixed input features. The Table 2. depicts the Resnet layers in our model.

Architecture of Resnet-50 layers

Shortcut Layer

Input size: (in_channel, H, W) Output size: (depth, H/stride, W/stride) if in_channel is not equal to depth Output size: (depth, H, W) if in_channel is equal to depth

Residual Layer

Input size: (in_channel, H, W) Output size: (depth, H, W) Where, In_channel-represent the no of input channels H-Height W-Width

Bald Eagle Search Optimization

The original BES algorithm is a cutting-edge optimisation algorithm that draws inspiration from nature and mimics the hunting techniques of bald eagles as they search for fish. The three primary processes in BES's hunting process are: (1) choosing the search region, in which the eagle ascertains the area with the largest density of prey; (2) looking for prey within the area that has been chosen; and (3) attacking the prey by figuring out the best attack location in light of the search results. All subsequent movements are focused on identifying the most advantageous place of assault and (3) attacking the prey by figuring out the best attack location in light of the search results.

1)Select stage

Bald eagles locate and choose the optimal spot (in terms of food availability) within the designated search space during the "select" stage, when they go in quest of prey.

Equation (1) represent the behaviour mathemathically,

$P_{new,i} = P_{best} + \alpha * s(P_{mean} - P_i)$ (1)

Where, P_i and P_{new} refer to old and new value, r is a random number and α is the parameter for controlling the changes in position and fall in the interval [0,1] and [1.5,2], P_{best} is the currently selected space.

2)Search Stage

Bald eagles look for prey in the designated search space during the search stage. They travel in different directions inside a spiral space to speed up their search. The best position for swoop is mathematically expressed in Equation (2),

$P_{i,new} = P_i + y(i) * (P_i - P_{i+1}) + x(i) * (P_i - P_{mean})$ (2)

Where, $x(i) = \frac{xr(i)}{max(|xr|)}, y(i) = \frac{yr(i)}{max(|yr|)}$

xr(i)=r(i) * sin(θ(i)), yr(i)=r(i) * cos(θ (i)), P_{mean} indicate that eagle have used all information from previous point.

3)Swooping stage

Bald eagles swing from the best spot in the search space to their intended prey during the swooping stage. Also, every point advances toward the greatest point. Equation (3) depicts it mathematically,

$P_{i,new}$=rand * P_{best} +x1(i) * (P_i - c1 *P_{mean}) + y1(i) * (P_i - c2 * P_{best}) (3)

Where, $x1(i) = \frac{xr(i)}{max(|xr|)}, y1(i) = \frac{yr(i)}{max(|yr|)}$

xr(i)=r(i) * sinh((θ(i)) yr(i)=r(i) * cosh((θ (i)))) θ (i)=a * π *rand and r(i) = θ (i) Where c1, c2 (1,2))

Attention Based Feature Decomposition:

Aging leads to increase in intra-class distances than inter-class distances [3]. This leads to the failure of face recognition models. This is because the features of face consist of unwanted information that is not required for identification of person. So, Wang et.al. (2019) [3] decomposed features into age and identity related features. Among this, the identity related feature is used for identification. But their approach is too straight forward. So [7] proposed an attention-based feature decomposition module. In this paper we adopt this attention-based feature decomposition module to decompose the mixed features into age and identity related features. The decomposition is represented as

$$Z = \underbrace{Z \,.\, D(Z)}_{Z_{age}} + \underbrace{Z \,.\, (1 - D(Z))}_{Z_{id}} \quad (4)$$

where Z represents the mixed features, D(Z) represents decomposition module and '.' represents element wise multiplication. For Attention module, channel attention module and spatial attention modules are used. The channel attention is built using [29]. The SE block models the interdependencies between channels explicitly, which aids in the network's learning of more discriminative features. The Spatial attention is built using [30]. The outputs from these models are added and multiplied with feature Z, to get the age-related feature, Z_{age} and the remaining features are Z_{id}. Fig. 6. Depicts the attention-based feature decomposition module.

Algorithm 1: Attention Based decomposition Module

Input: $F \in \mathbb{R}^{H*W*C}$ - Input Features

$M_c \in \mathbb{R}^{1*1*C}$ - channel attention map
$M_s \in \mathbb{R}^{H*W*1}$ - spatial attention map
Output: Z_{age} – Age Related features,
Z_{id} – Identity Related Features
$F' = M_c(F) \otimes F$
$F'' = M_s(F) \otimes F$
$Z_{age} = \lambda(F' + F'')$
$Z_{id} = F - Z_{age}$
Where,
$\otimes$ -Element wise multiplication
λ – balancing factor

Attention Module

Human perception is known to be significantly influenced by attention. Human vision rapidly scans the entire image to identify the target area that requires attention. It then focuses more attention resources in this area to gather more specific information about the target area, suppressing other irrelevant information in the process. Deep learning's attention process is fundamentally comparable to humans' selective visual attention system. The main objective is to sort through a large amount of information and choose the information that will help the current task aim the most.

Channel Attention Module

In convolutional neural networks, a Channel Attention Module is a module for channel-based attention. By utilizing the inter-channel relationship of features, a channel attention map is generated. Given an input image, the emphasis of each channel in a feature map, which functions as a feature detector. The spatial dimension of the input feature map is squeezed in order to compute the channel attention efficiently. Using both average-pooling and max-pooling processes, first the spatial information of a feature map is aggregated to create two distinct spatial context descriptors: F^c_{avg} and F^c_{max}, which stand for average-pooled features and max-pooled features, respectively. Both the descriptors are sent to a common network, where channel attention map $M_c \in \mathbb{R}^{1*1*C}$ is generated. Here C is the number of channels. A single hidden layer is present in the multi-layer perceptron (MLP) that makes up the shared network. The concealed activation size is set at $\mathbb{R}^{C/r*1*1}$, where r is the reduction ratio, in order to minimize parameter overhead. We use element-wise summing to combine the output feature vectors after applying the shared network to each descriptor.

Algorithm 2. Channel Attention Module
Input: $F \epsilon \mathbb{R}^{H*W*C}$ - Input Features
Output: $M_c(F)$ – Channel Attention Map
$F^c_{avg} = AvgPool(F)$
$F^c_{max} = MaxPool(F)$
$C = F^c_{avg} + F^c_{max}$
$M_c(F) = z(MLP(C))$
Where,
z- Sigmoid Activation Function
MLP – Multi Layer Perceptron which consists of Fully Connected layer followed by Relu activation function and followed by Fully connected layer
$F^c_{avg}, F^c_{max}, M_c, C \epsilon \mathbb{R}^{1*1*C}$

Spatial Attention Module

In convolutional neural networks, a spatial attention module is a module for spatial attention. It makes use of the inter-spatial relationships between features to produce a spatial attention map. In contrast to channel attention, spatial attention complements channel attention by concentrating on the location of an instructive portion. Using average-pooling and max-pooling operations along the channel axis, we first compute the spatial attention and then

concatenate the results to provide an effective feature descriptor. We apply a convolution layer to the concatenated feature descriptor in order to produce a spatial attention map $M_s(F) \in R^{H*W}$ that encodes the locations of emphasis and suppression. Using two pooling processes, we aggregate the channel information of a feature map to create two 2D maps: $F^s_{avg} \in \mathbb{R}^{H*W*1}$ and $F^s_{max} \in \mathbb{R}^{H*W*1}$ which denote average-pooled features and maximum-pooled features over the channel. The 2D spatial attention map is then created by concatenating and convolving those using a conventional convolution layer.

Steps in the creation of a spatial map:

1)Create two intermediate feature maps, F^s_{avg} and $F^s_{max} \in$ 1xHxW, using the input feature map F.

2) These two outputs, global average pool (GAP) and max pooling (MP), should be concatenated before passing them through a small convolutional block with a 7x7 kernel size. Here, CBAM uses high kernel sizes to achieve the same goal as BAM, which is to extend the receptive field. This is a straightforward convolutional block with d=1.

Algorithm 3. Spatial Attention Module

Input: $F \epsilon \mathbb{R}^{H*W*C}$ - Input Features

Output: $M_s(F)$ – Spatial Attention Map

F^s_{avg} = AvgPool(F)

F^s_{max} = MaxPool(F)

$M_s(F) = z\ (f^{7*7}\ ([F^s_{avg}; F^s_{max}]))$

Where,

z- Sigmoid Activation Function

f^{7*7} represents a convolution operation with the filter size of

7 × 7

M_s, F^s_{avg} and $F^s_{max} \in \mathbb{R}^{H*W*1}$

Multi-Task Learning:

The multitask learning framework is to decorrelate the age and identity related features in which age estimation is for extracting the age-related features and identity recognition is for extracting identity related features. Furthermore, the extraction of features relevant to identity is facilitated by a continuous cross-age discriminator that incorporates a gradient reversal layer.

The Age Estimation module takes the age-related feature as the input and predicts the age of the person. The loss function for this module is given by

$$L_{age} = MSE\big(DEX(A(Z_{age})), age\big) + CE(A(Z_{age}), group) \quad (5)$$

where MSE is the Mean Squared Error, CE is the Cross Entropy loss, age is the ground truth age, group is the ground truth group.

The Identity Recognition module takes identity related features as input and predicts the identity of the person. The loss function for this module is given by

$$L_{id} = CE(I(Z_{id}), id) \quad (6)$$

where id represents the ground truth label.

The Cross-age domain adversarial learning module takes identity related features as input and predicts age of the person. The loss function for this module is

$$L_{cross} = L_{age}\,(A(GRL(Z_{id}))) \quad (7)$$

where GRL is the Gradient Reversal Layer. The Total loss function of the AIFR model is given by,

$$L = L_{id} + \lambda_1 L_{age} + \lambda_2 L_{cross} \quad (8)$$

Here λ_1 and λ_2 are used for balancing the loss.

Algorithm 4. Algorithm of AIFR

Input: Dataset D {Image, age, id}
Models: F – ResNet50, D- Decomposition Module, A – Age Estimation Module, I – Identity Recognition Module
Output: age_{pred}, id_{pred}, $group_{pred}$
$Z \leftarrow F(Image)$
$Z_{age}, Z_{id} \leftarrow D(Z)$
$age_{pred}, group_{pred} \leftarrow A(Z_{age})$
$age_{pred}, group_{pred} \leftarrow GRL(A(Z_{id}))$
$id_{pred} \leftarrow I(Z_{id})$

Evaluation
For evaluating the model, we have used images from AGEDB and FG-NET. The evaluation metrics used are accuracy, precision, recall and F1-score. For the verification process, the dataset is split into positive and negative pairs. From the pair, the embedding of two images is extracted. Then the distance between two embeddings is found out using cosine similarity. If both embedding matches then it predicts it as 1 else 0.

Algorithm 5. Algorithm of verification phase
Input: Pair<img1, img2, label>
Output: return 1 – same pair
0 – different pair

```
embed1 = model(img1)
embed2 = model(img2)
if embed1 similar to embed2:
        return 1
else:
        return 0
```

EXPERIMENTAL RESULTS

Result on FG-NET
The FG-NET dataset consists of 1002 images of 82 individuals. The loss value calculated is about 0.5%.

CONCLUSION

An age-invariant facial recognition algorithm that is optimized for biometric authentication systems is presented in the paper. The methodology, which combined preprocessing approaches, feature extraction techniques, and an attention-based feature decomposition module, showed resilience against aging-related changes in face appearance. By means of comprehensive testing on reference datasets, the effectiveness of the algorithm in attaining elevated recognition precision in various age cohorts is verified. The key to the algorithm's efficacy is its capacity to adaptively learn and represent age-invariant facial traits, hence reducing the difficulties that ageing poses for face recognition systems. By integrating advanced techniques such as deep learning and feature fusion, the discriminative power of the model is enhanced while minimizing computational complexity. The results underlinedthe significance of resolving age-related differences in face recognition systems, especially in the context of biometric authentication, where reliability and security are paramount. Overall, the proposed approach gives a potential solution for age-invariant face recognition in biometric authentication applications, having practical implications for increasing security measures in diverse areas such as access control, surveillance, and identity verification. Future research directions may focus on refining the algorithm's performance under more challenging conditions and exploring its deployment in real-world scenarios to validate its efficacy in diverse operational environments.

ABSTRACT

Identifying team members is an important and difficult undertaking that requires the selectors to put in a lot of thought and effort. Franchise owners purchase players through an auction, investing substantial amounts of money to create winning teams while adhering to budget limits and player composition rules. Previous team selection methods often result in an overemphasis on all-rounders, leading to teams that are theoretically sound but not practical. This paper proposes a new approach to IPL team selection, treating it as a multi-objective optimization problem. By using advanced metrics such as the combined bowling rate and batting performance factor, this method aims to create a more balanced and effective team. Additionally, the proposed Real-Binary Algorithm employs a repair mechanism to ensure feasible solutions that meet the constraints of the problem. This approach optimizes both batting and bowling performances, offering a practical and improved method for IPL team selection. The trade-off teams contained players of each expertise in appropriate proportions.

INTRODUCTION

To promote cricket in India, the Board of Control for Cricket in India (BCCI) launched the Indian Premier League (IPL), a franchise-based tournament, in 2008[1]. The Indian Premier League is the most popular cricket league, drawing large crowds and making a big impact on both the social and economic spheres. The players in this league are bought through an auction procedure by well-known owners. Every franchise owner invests a substantial sum of money on players who meet both their financial goals and their potential to win. The franchise owners look for the greatest player combinations for their team, taking into account the enormous amounts of money that are spent on player purchases. Because of this, the researchers in [2]developed an IPL team selection algorithm that treats the difficulty of selecting a team as a bi-objective optimization problem. The purpose of this algorithm is to optimize player performances in both batting and bowling while adhering to the IPL's budget constraints and limitations on the number of captains, wicketkeepers, and foreign players. The requirements and limitations for selecting players for an IPL team are similar. However, since an all-rounder contributes to both batting and bowling performances while a pure batter (pure bowler) primarily contributes to team batting performance (bowling performance), the trade-off teams for this problem, obtained using an optimization algorithm mainly contain all-rounders, which is a feasible solution theoretically but not a practical one. With this limitation in mind, the current work proposes a novel approach to select a team for the IPL which is more balanced.

Furthermore, in the existing multi-objective team selection models in [2] and [3],batting average (batting strike rate) of a player is only taken in consideration to determine its batting performance (bowling performance). But in the IPL, significant aim of a batter is to maintain a high strike rate as in a short-form cricket league, scoring runs quickly is more important for a team's success than average runs per innings. On the other hand, the efforts of bowlers with a good economy rate (bowlers who prevent the batters from scoring runs) and the pressure to maintain a high strike rate increase the chances of batters being dismissed. Therefore, we adopt more effective metrics, such as the combined bowling rate [4] and the batting performance factor [5], in order to better evaluate a player's performance. In addition, among the most researched combinatorial optimization problems (COPs), the Knapsack problems remain an interesting task to solve [6]. The aim of the proposed IPL team selection problem, which may be seen as a knapsack problem, is to pick a limited players from the available pool in order to ensure the team's overall performance is maximized within the given budget. Various optimization methods are available in the literature for cricket team selection: genetic algorithm for selecting an optimal national cricket team[7] and integer programming for selecting playing XI team [8], T20 world cup team [9], and IPL team [3]. The multi-objective IPL team selection model has been solved using integer linear programming [3]and non-dominated sorting genetic algorithm-II(NSGA-II) [2],[10]. In order to solve the suggested multi-objective IPL team selection issue, the present study designed a "Binary Algorithm." Binary chromosomal representation is used in the Binary Algorithm. A repair method is given to manage the constraints of the problem. Its purpose is to generate a sufficient number of feasible choices by repairing infeasible ones that result from violating a single constraint.

In the summary, the main contribution of this study is:

- Using the concept of Knapsack problem for selecting an IPL team.
- Designing an algorithm for selecting a balanced team for IPL.

The rest of this paper is organized as follows: Section 2 describes the related work. Section 3 formulates the proposed IPL team selection problem. Section 4 describes the proposed methodology. Section 5 and 6 discusses a case study result. Finally, the conclusion is presented in Section 7.

Literature Review

The optimization techniques for selecting IPL teams and team players that are accessible in the literature are covered in this section. Apart from optimization techniques, researchers employed other techniques founded on additional methods, including machine learning algorithms[11] ,[12], and data envelopment analysis[13],[14].

In order to select a more flexible, balanced, and diverse team, Sathya and Jamal [7] proposed a genetic algorithm for selecting eleven out of fifty national players for a One-Day International (ODI). The algorithm took into consideration factors like the number of pacers and spinners, the composition of left- and right-handers, and partnership records. For the purpose of choosing an IPL T20 team, Ahmed et al. [2]suggested NSGA-II with a unique gene representation and decision-making methods. The resultant teams were judged to be conceptually superior when compared to the IPL 4th edition teams. To add realism to the process, the authors also showed off a dynamic auction-based participant selection. Using binary integer programming, Bhattacharjee and Saikia [9]determined the ideal team of 15 players and compared it to the Indian side chosen by the International Cricket Council (ICC) for the respective Twenty20 World Cups. Authors [15]employed binary integer programming once more in 2016 to choose the playing XI team, accounting for the captain's and other players' areas of expertise. Using two- objective, three- objective, and five-objective formulations, Chand *et al.* [3] presented an integer programming approach for IPL team selection that ensured optimality and demonstrated its scalability. The problem's objectives were focused on star power, cost, fielding, bowling, and hitting. The chosen players were taken into consideration while building incomplete teams. Furthermore, the players' performances were taken into consideration while rating them in order to facilitate decision-making. To achieve a more flexible, balanced, and diverse IPL squad, the present study formulated the selection process as a multi-objective optimization problem. Shanu Verma *et al.* [16]proposed approach utilizes two genetic algorithms, BNSGA-II and INSGA-II, to maximize both batting and bowling performances while considering constraints like the number of pure batters, bowlers, all-rounders, and the inclusion of star players. Validation using IPL 2020 data demonstrated the algorithms' effectiveness in forming a well-balanced and high-performing team.

IPL Team Selection Problem

The multi-objective 0/1 knapsack problem is compared to the IPL team selection problem (Table 1). There is a limit on the number of players that may be selected for an IPL team; a franchise owner has the option of selecting a player (Yes=1) or not (No=0). Thus, in order to select a player for an IPL team, the idea of the 0/1 knapsack issue is applied in this work.

Problem Statement

A balanced team contains players of each expertise in suitable proportions. In order to create a balanced IPL team with the best possible net batting and bowling performance, a team selection problem has been presented.

Batting Performance

The consistency with which a player scores runs is determined by their batting average. A higher average suggests that the player is dependable and consistently scores runs. It is useful in determining how effectively a player adapts to varied situations and defends against different kinds of bowling attacks. On the other hand, a player's ability to score runs rapidly is indicated by their strike rate, which is important in limited-overs games (ODIs and T20s). The game's dynamics may change as a result of pressure from a high strike rate applied to the opposing bowlers and fielders. Where batting average and batting strike rate is calculated using following formula:

Batting average= Total runs scored/ Number of times out.
Batting strike rate=100×(Total runs scored/ Total balls faced)

Strike rate and batting average together offer a complete picture of a player's abilities. A good batting average indicates consistency, while a respectable strike rate shows the ability to accelerate scoring when necessary. High strike rates and averages are valued across all formats, though the strike rate is more critical in ODIs and T20s, and a good average is crucial in Test cricket. Different roles in the batting line up require varied capabilities. Thus, considering both metrics provides a rounded and accurate assessment of a player's performance, aiding teams and selectors in making informed decisions about player roles and strategies. An effective Batting Performance Factor (BPF) for determining a player's batting performance is proposed by researchers in [5]. As stated in (1), BPF is the weighted product of the normalized values of batting averages and strike rates. Batting strike rate is given more weight than batting average when the value of α is larger. We have chosen this component to determine the batting

performance since it uses both batting statistics and allows one statistic to be favoured over the other. A player with a higher BPF value has better batting performance.

BPF= Batting strike rate$^{\alpha}$ × Batting average$^{1-\alpha}$ where, $0 \leq \alpha \leq 1$(1)

The primary aim of this research is to optimize the team's net batting performance, or minimize its -net batting performance, as stated in (2). The objective function f_1 in this case represents the negative of the total BPF factors of the selected players.

Minimize $f_1 = -\sum_{i=1}^{n} x(i) \times BPF(i)$ (2)
Where,
$x_i = \begin{cases} 1, & \text{if player } i \text{ is choosen for the team} \\ 0 & \text{, Otherwise} \end{cases}$
Here, n is the total number of players, and $BPF(i)$ is the batting performance factor of the i^{th}player, $i = 1,2, \dots, n$.

Bowling Performance

The three metrics used to analyse a bowler's performance are bowling average, bowling strike rate, and bowling economy. Because there are few overs in T20, pure batsmen must typically risk losing their wicket in order to score more runs. As a result, bowlers who have a high economy rate (i.e., who do not give runs to batters) take wickets for other bowlers. A bowler with a comparatively higher bowling average does not always have a correspondingly greater economy rate or bowling strike rate, according to the link between bowling statistics. Where Bowling average, bowling strike rate and bowling economy rate is calculated using following formula:

Bowling average= Total runs conceded/ Total wickets taken
Bowling strike rate= Total balls bowled/ Total wickets taken
Bowling economy rate= 6×(Total runs conceded / Total over bowled)

The Combined Bowling Rate (CBR), a potential method for determining a player's bowling performance, was presented by Lemmer [4]. We have employed CBRto evaluate a player's bowling performance, which counts all three bowling statistics (3). A player with a lower CBR has a higher bowling performance.

$$\text{CBR} = \frac{1}{\frac{1}{Bowling\ \ average} + \frac{1}{Bowling\ \ economyrate} + \frac{1}{Bowling\ \ strike\ \ rate}} \quad (3)$$

The second goal of the research is to optimize the team's net bowling performance, as shown by (4), or to reduce its net bowling performance. The total of the selected players' CBRs is shown by the objective function f_2.

Minimize $f_2 = \sum_{i=1}^{n} x(i) \times CBR(i)$ (4)
Where,
$x_i = \begin{cases} 1, & \text{if player } i \text{ is choosen for the team} \\ 0 & \text{, Otherwise} \end{cases}$

Here, n is the total number of players, and $CBR(i)$ is the combined bowling rate of the i^{th}player, $i = 1,2, \dots, n$.
In this study, we aim to address the problem of selecting a balanced team contains of players for the Indian Premier League (IPL) based on two objective functions. The dataset comprises a total of n players, and the goal is to select a team of m players. The challenge is to optimize the selection process considering the following constraints.

Formulation of Constraints

For simplicity, bounds are imposed only on specific categories of players: pure batsman, pure bowler, all-rounders, and wicket-keeper.

i.e. Pure Batsman≥ a
Pure Bowler≥ b
All-rounder≥ c
Wicket-keeper≥ d

The aim is to find the best combination of players that satisfies the above constraints while optimizing the given objective functions. This problem can be viewed as a combinatorial optimization problem in the context of sports team selection.

METHODOLOGY

The proposed algorithm starts with the creation of an initial population, where each individual is represented as a binary string. Each individual undergoes a feasibility assessment against a set of constraints. If a solution is infeasible, a repair mechanism is applied. This mechanism identifies the violated constraints and uses strategies such as bit flipping or random mutation to correct them, iterating until the solution becomes feasible or a maximum number of attempts is reached. The feasible solutions from the initial population and the repaired solutions are then combined. This combined set of solutions is evaluated using objective functions that translate the binary strings into real values, representing their performance metrics. The next step is to identify the Pareto front, which includes solutions that offer the best trade-offs among the objective functions. Finally, the most suitable solutions are selected from the Pareto front based on specific criteria, resulting in optimized outcomes. This structured methodology ensures a systematic approach to generating, evaluating, and optimizing solutions.

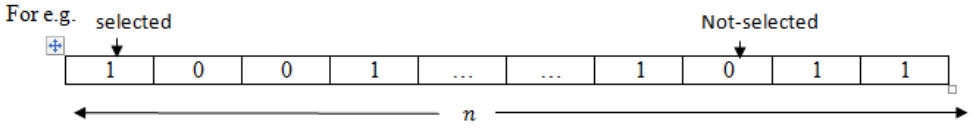
Case Study

In this study, we have focused on optimizing two key objective functions: net batting performance and net bowling performance. The aim is to construct a balanced and effective cricket team by carefully considering these performance metrics. To ensure a well-rounded team, specific constraints have been imposed on the number of pure batters, pure bowlers, all-rounders, and wicket keepers. These bounds help maintain the necessary balance and versatility required for the team to perform well in various scenarios. The parameters and variable values utilized for this study are detailed in Table 2. This table provides a comprehensive overview of the factors considered, such as total number of binary strings to be generated, minimum numbers of pure batter, pure bowers, all-rounders, wicket-keeper required, etc. By systematically analysing these parameters, the study aims to derive an optimal team composition that maximizes overall performance. Players whose records are not available but have an auction price are considered as new players and will be added as per the budget constraint, which is right now avoided in this study.

RESULT AND DISCUSSION

Population Initialization

The initial population is created using a binary string generation method. Each individual contains 157 players among which, balanced team of 21 players have to be selected. Selected players will be noted as 1 and non-selected players will be noted as 0in the population is represented by a binary string, where each bit represents a decision variable. Total 10population (binary strings) will be generated.



Feasibility Check

Each individual (binary string) is checked for feasibility by evaluating constraints. In this study, four constraints are taken in consideration mentioned in 3.13where, minimum numbers of pure batters, pure bowler, all- rounders and wicket-keepers required are 3,5,5 and 2 respectively.

- **Feasible Solution:** If the individual satisfies all constraints, it is considered feasible.
- **Infeasible Solution:** If the individual violates one or more constraints, it is considered infeasible.

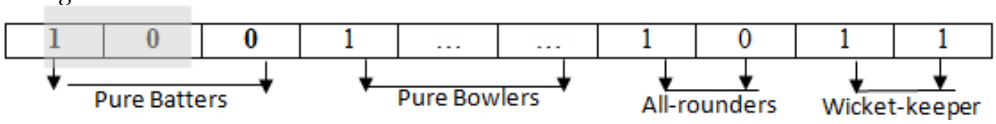
Repair Mechanism

The repair mechanism is a crucial part of the algorithm, designed to convert infeasible solutions into feasible ones by modifying their binary string representation. Here's a detailed breakdown of the repair mechanism:

Identify Constraints Violated

For each infeasible solution, identify which constraints are violated. i.e. for each infeasible solution,among pure batter, pure bowler, all-rounder and wicket-keeper, identify which constraint is violated. This involves evaluating the binary string against each constraint.

For e.g

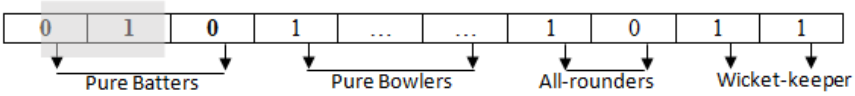


Here supposes pure batter constraint is violated.

Repair Strategy

The goal is to adjust the string in a way that resolves the constraint violations. i.e. to resolve constraints violation, randomly alter bits 0 by 1 or 1 by 0 in violated constraint.

For e.g.



Here supposes pure batter constraint is violated; hence repair strategy randomly altersbits 0 by 1 or 1 by 0 of pure batter to resolve constraint violation.

Re-Evaluation: After applying the repair strategy, re-evaluate the modified binary string to check if it now satisfies all constraints. If the solution is still infeasible, repeat the repair process or apply a different strategy.

Repeat Until Feasible: Continue the repair process iteratively until the solution becomes feasible or a predefined maximum number of attempts is reached.

Add to Repaired Population: Once a feasible solution is obtained, add it to the repaired population.

Combine Feasible and New Feasible Strings: The initially feasible individuals are combined with the newly repaired feasible individuals to form a combined population of feasible solutions.

Calculate Objective Functions: For each individual in the combined population, the objective functions are calculated. These functions convert the binary string into real values that measure the individual's performance.

Obtaining the Pareto Front: Solutions that are not dominated by any other solution (i.e., no other solution is better in all objective functions) are considered Pareto optimal. The set of all Pareto optimal solutions forms the Pareto front, representing the best trade-offs among the objective functions.

The study describes the selection process of 10 balanced teams, each consisting of 21 players, from a pool of 157 choices. The resulting Pareto-front, illustrated in Figure 2, demonstrates that these solutions are non-dominated by others, meaning they represent optimal trade-offs based on the considered objectives and constraints. From the Pareto front, the most suitable solutions (resultant players) are selected based on specific criteria or preference by the franchise owner. Figures (a), (b), (c), and (d) present the frequency charts for the selected batsmen, bowlers, all-rounders, and wicketkeepers, respectively. These charts show how often players are chosen across trade-off solutions, indicating their prominence and consistency in the team selection process. Moreover, the study acknowledges the budget criterion as a uniform constraint across all teams in the IPL selection problem. It suggests that incorporating this budget constraint in future studies could lead to even more optimized solutions.

CONCLUSION

Balanced team options for the IPL with a sufficient quantity of players with varying specialties. The following potential can be achieved by the approach suggested in this study, which seeks to form a balanced IPL team.

- It assures that there are enough pure batters, pure bowlers, wicket-keeper and all-round players.
- It measures a batter's performance by calculating his batting performance using a batting performance factor that might give one batting average or strike rate priority over the other.
- It measures a bowler's performance by calculating their combined bowling rate, which takes into account their bowling average, strike rate, and economy rate.

This study addresses the team selection problem by treating it like a knapsack problem, where the decision to select a player is binary (yes or no) and the goal is to maximize team performance within a budget. To tackle this, a combinatorial optimization algorithm using real-binary coding is developed to find optimal trade-off solutions. The effectiveness of this algorithm is demonstrated through a pareto-front of the trade-off solutions. Additionally, a frequency chart shows how often each player is selected across different solutions, highlighting their importance and consistency in the selection process. This algorithm can help selectors and franchise owners make more informed, unbiased, and systematic decisions when choosing a team. Besides cricket, this model could be applied to other sports as well.

The present study tries to develop a model that is appropriate for selecting players an IPL team. However, there are some limitations that may be addressed in a future study:

- In this study, the trade-off teams are obtained using historical player data. Consequently, there is a certain element of risk in choosing this choice because one player's performance may vary in the next games. Therefore, when creating the model, it may be taken into account whether the in-form player should be given more weight than the out-of-form player.
- This research takes into account the most important variables, such as batting average, bowling average, etc., in order to create a team that is well-balanced. However, while creating the algorithm for a well-balanced team, other significant factors may also be taken into account, such as budget of a team, overseas players, star players, the pitch's condition and home ground etc.

ABSTRACT

Fish nutrients are essential for human health and national economies. The study was conducted from January to December 2022 by examining fish diversity in the Durgadahalli lake in Tumakuru district, Karnataka. This study demonstrated that this lake supports 20 species of fishes belonging to 07 families, 05 orders and 18 genera. Among them, Cyprinidae is the most predominant group with 13 species, followed by Cichlidae with 02 species and rest of the families viz., Siluridae, Ambassidae, Notopteridae, Nemacheiladae, and Heteropneustidae each with 01 species respectively. Among the fish orders, Cypriniformes was dominant with 14 species (70%), followed by Siluriformes and Cichliformes with 02 species (10%) and Osteoglossiformes and Perciformes each with one species respectively (5%). As far as biodiversity status (IUCN, 1994) is concerned, out of 20 species, 02 species as lower risk-near threatened (10%), vulnerable 02 species (10%), lower risk least concern with 16 species showing 80%. Most of the fishes are common followed by rare and very common in abundance. Therefore, to properly manage and utilize this fish abundance, sustainable measures must be taken to fish health in this lake.

Keywords: Fish fauna, Durgadahalli lake, Biodiversity status, Tumakuru.

INTRODUCTION

Fishes are inhumane creatures permitting their internal heat level to fluctuate with outside temperature change. The loss of habitat as a result of various threats and anthropogenic factors has led to a steady decline in the biodiversity of freshwater fish in recent years. The fish populace on the planet is about portion of the complete number of

vertebrates and around 21,730 types of fishes have been kept on the planet in which just 11.7% are found in Indian aquatic bodies (Murugan, 2012). In many nations around the world, fisheries play a significant role in both health and commercial value as well as providing an alternative source of food for the expanding population (Indira Devi, *et al*.2014 ;Shivaraju *et al.,*2018) . Not only the fish essential indicators of surroundings health and species richness, but through consumption of plankton and small animals, fish ensure the stability of the food chain and the process of eating and being eaten by the organisms may be disrupted by contamination of water structures. In addition, there are various threats to fish variety, together with the construction of dams that prevent spawning migration, the advent of invasive species, and overfishing (Ramanjaneya and Ganesh, 2016). Humans, who first appeared on Earth during the early Pleistocene era about 2 to 3 million years ago, needed water to survive. In recent years, the population has been increasing rapidly and lot of demand for the agricultural and industrial areas (Abhishek Giri and Shriparna Saxena, 2017). In terms of endemic freshwater fishes, the Western Ghats are India's richest region. Because of its skewed political boundary, Northeastern India, which has a very diverse population of freshwater fish, does not contain many endemic species. Worldwide, there are approximately 450 families of freshwater fish. There are approximately 40 of these (warm freshwater species) in India. There are about 25 of these families with species that are important for commercially. There are approximately 544 endemic species in warm water. According to Zooreach organization (2010), freshwater fishes are a group that has received little research because there is insufficient data on their distribution, population dynamics, and threats, and the majority of the data that is available comes only from a few well-studied locations (Sabuj Kumar Chaudhuri,2010 ; Thirumala *et al.,* 2011; Thirumala and Kiran, 2017). In order to comprehend the intrinsic value of every species on Earth, biodiversity is necessary for maintaining ecosystem protection and environmental quality. Fishes are the cornerstone species which are great signs of the water quality and the strength of the biological system (Moyle and Leidy, 1992) . Fishes are important wellsprings of high grade protein and they possess a critical situation in the financial area by giving the populace the nutritious food as well as pay and work potential open doors. Additionally, because they are the fundamental link in the food chain of all aquatic animals, they are ecologically significant (Mishra, 1962; Shivaraju *et al.*,2018). Subsequently, the current study was attempted with the expect to concentrate on the fish variety in Durgadahalli lake. This study would be an essential and supportive exploration information to support the fishery assets of this lake.

MATERIALS AND METHODS

Study area Profile

The Durgadahalli Lake is situated in the North-East of Tumakuru taluk (Figure 1) a good ways off of 15 km from Tumakuru city of Karnataka. About 4% of the forest is covered by the district. The latitude and longitude of the lake are 13° 13' 56" N and 77° 25' 30" E, respectively. It has a water surface area of approximately 16 hectares and an average depth of 1.5 to 2.0 meters along the bund. It gets most of its water from the Jayamangalli river and rain. In and around the lake area, crop cultivation is the primary use of the water. The all out catchment region of the Durgadahalli lake is 17.25 sq. km and height is around 10.4 to 10.6 mt with a typical precipitation of 620 mm as well as soil surface in the catchment region is sandy/rock type

Sampling methods and data collection

Fish samples were collected monthly from the Durgadahalli Lake and will be brought to the laboratory for analysis. For fish sample collection different mesh sized gill net will be used at selected sampling stations in the reservoir. After collection, fishes will be examined; number will be counted and release to the system. Fish specimens were preserved in 10 % formaldehyde for laboratory analysis.

Fish catch analysis

The fish samples will be collected during experimental fishing using different mesh sized gill net and the identification of fish will be done based on fresh or preserved specimens, according to FAO identification sheets

(Fisher and Bianchi, 1984), ITIS (Integrated Taxonomic Information System) standard report (http://www.itis.gov/), Fish Base (Froese and Pauly, 2007), Day (1889),Talwar and Jhingran (1991) and other books/monographs.

RESULTS AND DISCUSSION

Table 1 depicts family, order and biodiversity status of fishes in Durgadahalli Lake, Tumakuru. During the study period 2o fish species belonging to 07 families and 05 orders were recorded. The percentage composition of the fish families is depicted in Figure 4 and Figure 6 shows the abundance (%) of fishes in Durgadahalli lake . Among the fish orders, Cypriniformes was dominant with 14 species (70%), followed by Siluriformes and Cichliformes with 02 species (10%) and Osteoglossiformes and Perciformes each with one species respectively (5 %; Figure 3). As per the biodiversity status (IUCN, 1994), 02 species as lower risk-near threatened (10%), vulnerable 02 species (10%), lower risk least concern with 16 species showing 80%. Amongst 20 species of fishes, the family Cyprinidae was the most dominant in the assemblage composition with 65% followed by Cichlidae with 10 % respectively. While, Siluridae, Ambassidae, Nemacheilidae, Notopteridae and Heteropneustidae each with 5 % respectively (Figure 4). The present results get support from other workers like Wakid and Biswas (2005) and Venkatshwarlu *et al,* (2007). Jaya Raju *et al.(*1994), Rajaram *et al.(*2004), Mawhoob Noman Alkadasi *et al* (2010) and Shivashankar and Venkataramana (2012) have studied fish diversity in relation to physico-chemical variables. Durgadahalli lake has muddy bottom, rich in detritus and biota, thick vegetation cover and no human activity which probably provided good shelter for the fish. Muddy soils are known to support large population of cat fishes and Cichlids (Sydentham, 1977). The favorable conditions at this habitat could explain the relatively higher fish species population at this lake. Besides exotic species, construction of water bodies, and over fishing are other detrimental factors affecting the native fish population. Cyprinid species forms the dominant species and rarely found fishes are declining due to over fishing (Kharat *et al* 2001). The species of Heteropneustes. has air breathing organs and fetch good market value as live fish. Puntius species have small size with bright colors and are used as aquarium fishes. Though, commercially important species are available they are not abundant to make fishery commercial and economical. Sharma *et al*.(2007) reported 29 species of fish from Krishnapura Lake, Indore, belonging to 6 orders. Cypriniformes dominated, followed by Siluriformes, Cypriniformes had a relatively higher population density because of the greater fecundity of major carps and the favorable environmental conditions. Pawar and Pandarkar (2011) also examined the relationship between pisciculture and the water quality of Kelewadi lake in Maharashtra. Narasimha Ramulu and Benarjee (2013) documented 30 species of fish belonging to 13 families in the Nagaram tank in Warangal, AP state.

Water Quality

Water temperature deviated from 21^{o}C to 33^{o}C throughout the study. The pH was observed in the range of 7.2 to 8.6 which indicates that water was alkaline in nature. The total hardness ranged from 88to 260 mg/l. Electrical conductivity (EC) fluctuated between 340 to 790 μmhos/cm. High electrical conductivity was recorded during rainy month. This may be due to greater ionic concentration of the inlet flow (Prithwiraj Jha and Sudip Barat 2003). Dissolved oxygen (DO) is the most important parameter which can be used as an index of water quality, primary production and pollution. DO values ranged from 4.2 to 8.6 mg/l. The DO level of reservoir water may be favorable for aquatic organisms (Rajashekara *et al.* 2007). Biochemical oxygen demand values ranged from 0.6 to 5.2 mg/l. Biochemical oxygen demand values were low; this is because the temperature retards the rate of reproduction of organisms. Similar observations were also made by Mane and Madlapure (2002) from Manar river district Nanded. Chlorides are important in detecting the concentration of ground water by waste water. In the present study, the chloride value ranged between 6.8 and 46.5 mg/l. Similar results were observed by Damodharan and Suresh (2005). Sulphate content fluctuated from 29 to130 mg/l. But, the nutrients like phosphate, nitrate, calcium and magnesium were in lower levels, indicates the moderately oligotrophic status of the water body.

CONCLUSION

As a result, the species with greater adaptability displayed greater diversity and abundance. It is suggested that ongoing monitoring be carried out in order to safeguard the lake's fish diversity for the sake of sustainable development. In addition, it is suggested that fishing should be prohibited during the breeding season and that mesh sizes be controlled to ensure that fish grow to the right size. Since this lake plays a significant role in generating the economy of the habitat, if such measures are taken, we can prevent its deterioration for the sake of sustainable development. To save the fish, strict management measures and a lot of public awareness are needed. It's time to make the right policies and do the right things to improve conservation measures so that future generations can see the fish in their natural habitat rather than just in pictures in books.

ABSTRACT

The current research has made an effort towards the production and characterization of natural polymeric materials such as agar and starch. From the results of the present study it can be concluded that agar can be considered as a best option to produce bioplastics in terms of film strength and water solubility. However, starch is a best candidate in terms of its fastest biodegradability. This study can be applied on bigger scales to produce large amounts of bioplastics.

Keywords: Bioplastics, Agar, Starch, Seaweed.

INTRODUCTION

Plastic is a highly used product in our daily life as it is cheaper, versatile, and useful, million tonnes of plastics were produced worldwide. The word plastic derived from the Greek word (plastikos) meaning "capable of being shaped or moulded" and in turn, from (plastos) meaning "moulded". The material consists of wide range of synthetic or semi-synthetic organic compounds that are malleable and so can be moulded into solid objects. Plastics are made by linking many monomers together into long chains to form a polymer backbone. Low-density polyethylene, high-density polyethylene and polyvinyl chloride are some of the most commonly available plastic polymers in the packaging industry. However, these synthetic materials are unable to be degraded by present natural

microorganisms upon their disposal to the environment. The ubiquitous use of plastics has led to extreme plastic pollution of our environment. The non-biodegradable plastics remain in the environment for a long time and cause an increase in solid waste production. It becomes a threat to the environment because of their non- renewable and difficult-to-decompose nature. As environmental health and human health are inextricably linked, it's a high time now to improve environmental condition in today's era, we need to switch on to other alternatives which should be suitable, harmless, useful and economical. Decomposable plastics are widely used in a large variety of products where recycling of plastics is encouraged. Currently, the bioplastic industry promises good opportunities as this new era. Biodegradable plastics are made from starch, cellulose, chitosan and protein extracted from various natural resources. The biodegradability characteristics of these plastics create a positive impact in society, and awareness of biodegradable packaging also attracts researchers and industries. Bioplastics are biodegradable plastics made from the renewable sources. Renewable sources such as potato starch, corn starch, fibres obtained from pineapple, jute, hemp, banana stems, cassava, newspaper pulp, waste paper, citrus waste, cyanobacteria, Pseudomonas putida, Bacillus sp. Employment of new techniques for manufacturing of bioplastics that promote sustainable solution and reduce the plastic waste has been greatly encouraged in recent years. The only problem with bioplastic is its manufacturing cost. Bioplastic is expensive in comparison to traditional plastic so bioplastic is not been used extensively. Among the biopolymer matrices being utilized for the production of bioplastics, starch is considered the most widely used material. Starch-based plastics have been projected to comprise the largest production capacity. The large contribution of starch-based plastics in the market can be accounted for its several cited advantages such as high abundance, low cost, and renewability. Nowadays, bioplastic is made up of corn starch, potato starch, banana starch which are used by humans and animals for their living with the aim to recycle wastes, instead of leaving these products to the environment. Important source of starch is corn but now-a-days, starches from potato, wheat, rice, barley, oat etc. are also being used. Bio-based plastics can be degraded by algae, fungi and bacteria. These plastics are novel materials of the 21st century and have great importance. These are currently used as packaging materials, but in future these will be used in forming various products such as electronics and vehicle parts. It has many applications like, in pharmaceutical sector, it is used as binding agent and it has its application in the textile industry, in the paper and board sector. Because of its natural abundance, low cost as well as major carbohydrate content it is considered useful for preparing biodegradable plastics.

Future of Bioplastics shows great potential. Here are some of the advantages of the bioplastics:

- ❖ Bioplastics reduces carbon dioxide levels.
- ❖ Bioplastics can reduce greenhouse gas emission levels.
- ❖ Bioplastics are broken down by naturally-occurring bacteria.
- ❖ Bioplastics do not release other dangerous components upon decomposition.
- ❖ Bioplastics reduce the amount of waste we produce.

Materials required

Seaweed, Starch powder, Arrowroot powder, Glycerol, Vinegar, Lemon, Tapioca powder, Corn flour, Watermelon rind, Banana peel, Orange peel, distilled water, rice water etc

Production of bioplastics

Production of Bioplastic from natural agar extracted from seaweed

Extraction of natural agar from seaweed

Dried seaweed (*Gracilaria* species) were collected from R. K. Algae Research Centre. It was cut into small fragments to increase the surface area for extraction. Soak the dried seaweed (1 gram) in distilled water (20 ml) for an hour. Discard the distilled water and it was treated ith 5% NaOH solution (20 ml) for 1 hour at boiling temperature. This helps to remove unwanted minerals and break down cell walls, facilitating agar extraction. It was then rinsed well with distilled water and treated with 1.5% sulphuric acid (20 ml) at room temperature for an hour (Vivek Kumar & Ravi Fotedar, 2009 with modifications).

Synthesis of Bioplastic from seaweed-derived natural agar

Four grams of Agar was taken and 160 ml of distilled water was added and the mixture was stirred using a spatula. The mixture was heated slowly and then 6 ml of glycerine and 0.6 grams of Gelatin was added and stirred for 5 minutes. The mixture that had a slight watery appearance was then poured into a petridish and spread into a thin layer with a glass rod and kept it dry for 2 days. Rinsed with distilled water thoroughly. Extraction was then carried out with 1:30 ratio (seaweed: distilled water ratio) at 100 °C for 1.5 hours in a water bath. Collect the filtrate and then poured into a petridish. Isopropyl alcohol (5 ml) was added. It was finally allowed to gel at room temperature and kept overnight.

Production of Bioplastic from starch powder

Ten grams of the starch powder (SRL, Sisco Research laboratories pvt. Ltd.) was taken and 10 ml distilled water was added and the mixture was stirred well using a spatula. Then 2 mL of glycerol (Nice chemicals pvt. Ltd.) and 4 grams of Gelatin (Nice chemicals pvt. Ltd.) were added as plasticizer and the mixture was stirred. Controls were also set up: (1) without adding glycerol, (2) without adding starch and glycerol, (3) without adding starch, (4) without adding gelatin. The mixture was then placed in a hot air oven at 60^0C for 45 minutes. The mixture was then poured into a petridish and spread into a thin layer with a glass rod. Then five samples of different concentrations of starch were prepared to check the quality.

Production of Bioplastics from Water melon rinds

Water melon was taken and rinds were collected with the help of knife. It was ground well using blender and 100 grams of pulp was taken. It was then poured to a sieve and pressed it well using a sponge to remove excess water content. It was pressed again 3 to 4 times with tissue paper. After complete drying, it was transferred to a beaker and 8.3 grams of starch powder, 8.3 ml of honey and 8.3 ml of lemon juice were added and mixed together. It was heated over low flame and stirred continuously for 5 minutes. It was then transferred to a petridish and spread into a thin layer with a glass rod and kept it dry for 24 hours.

Bioplastics from Corn flour

Twenty five grams of the Corn flour was taken and 150 ml of distilled water was added and the mixture was stirred using a spatula. Then 5 ml of glycerine and 5 ml of vinegar was added and the mixture was stirred. Control was also set up without adding glycerine and vinegar. The mixture prepared was then boiled for 5 minutes till a slimy texture forms. The mixture was then poured into a petridish and spread into a thin layer with a glass rod and kept it dry for 2 days.

Production of Bioplastics from Tapioca

Root of Cassava plant was taken and ground it well to obtain fine powder. Twenty five grams of the powder was taken and 150 mL of distilled water was added and the mixture was stirred using a spatula. Then 5 mL of glycerine and 5 mL of vinegar was added and the mixture was stirred. Control was also set up without adding glycerine and vinegar. The mixture prepared was then boiled for 5 minutes till a slimy texture forms. The mixture was then poured into a petridish and spread into a thin layer with a glass rod and kept it dry for 2 days.

Bioplastics from Arrowroot powder

Twenty five grams of the Arrowroot powder was taken and 150 ml of distilled water was added and the mixture was stirred using a spatula. Then 5 ml of glycerine and 5 ml of vinegar was added and the mixture was stirred. Control was also set up without adding glycerine and vinegar. The mixture prepared was then boiled for 5 minutes till a slimy texture forms. The mixture was then poured into a petridish and spread into a thin layer with a glass rod and kept it dry for 2 days.

Bioplastics from Banana peel

Well ripened bananas were taken and peels were collected. It was ground well using blender and 20 grams of pulp was taken. It was then poured to a sieve and pressed it well using a sponge to remove excess water content. It was pressed again 3 to 4 times with tissue paper. After complete drying, it was transferred to a beaker and 8.3 grams of starch powder, 2 ml of honey and 2 ml of lemon juice were added and mixed together. It was heated over low flame and stirred continuously for 5 minutes. It was then transferred to a petridish and spread into a thin layer with a glass rod and kept it dry for 24 hours.

Bioplastics from Rice water

Fifteen mL of rice water and 2.5 ml of glycerol was added in a beaker.The mixture was mixed well. It was boiled at low to medium flame for 15 minutes and stirred the mixture with spatula simultaneously until it formed a slimy texture. It was then swabed over the petridish in thin uniform thickness. It was kept in the room temperature for one day.

Bioplastics from orange peel

Orange peel taken from fresh oranges was boiled and blended. Fifteen grams of boiled and blended orange peel were weighed and 120 ml of distilled water was added. To this 10 ml of 0.1 N HCl was added and stirred using a spatula. Then, 10 ml of 0.1 N NaOH, 5 grams of cornflour and 4 ml of glycerine were added to the mixture. This mixture was boiled for 10 minutes on low flame. It was then transferred to a petridish and spread into a thin layer with a glass rod. This was left for drying 2 days at room temperature.

Characterization

Biodegradability tests

Biodegradation tests were carried out on bioplastic films to determine the time required for the material to decompose into the environment. Bioplastic samples were cut into square sections and weighed to measure the initial weight (W^1). The samples were buried under 2 cm of moist garden soil and kept for 5 days at room temperature. The soil was kept moist for 5 days, after which the bioplastic residue was collected from the soil, followed by washing with water and drying in an oven at 85°C for 24 h and then again weighed to measure the final weight (W^2). The biodegradability was measured from the following formula (Tan et al., 2016):

$$\text{Biodegradability (\%)} = \frac{W^1 - W^2}{W^1} \times 100$$

Moisture test

The films were weighed before and after conditioning in an oven at 110°C until an ultimate fixed weight was found (Kim *et al.,* 2017). Moisture content in the film was calculated using the following equation

$$\text{Moisture content (\%)} = = \frac{Initial\ \ weight - Final\ weight}{Initial\ \ weight} \times 100$$

where, W^0 is the weight at the beginning of the bioplastics; and W^1 is the final weight of thebioplastics.

Water Solubility test

The film samples were cut into square sections and the film mass was weighed accurately and recorded. The samples remained immersed in 100 mL distilled water for 6 hours at 25°C (Ghasemlou, M et al., 2013). They were then dried in a hot air oven at 110°C until an ultimate fixed weight was found. The percentage of total soluble matter (% solubility) was calculated

$$\text{Water Solubility (\%)} = = \frac{W^{0} - W^{1}}{W^{0}} \text{ x } 100$$

as:

where, W^0 is the weight at the beginning of the bioplastics; and W^1 is the final weight of the bioplastics.

RESULTS

Bioplastic films were developed from all of the renewable sources we have taken. The following figures shows the bioplastic films developed from Starch powder (Figure 1), Agar (Figure 2), Arrowroot powder (Figure 3), Tapioca powder (Figure 4), Rice water (Figure 5), Corn flour (Figure 6), Watermelon rinds (Figure 7), Banana peel (Figure 8) and Orange peel (Figure 9).

Biodegradability test

A high degree of biodegradability was observed in starch, rice water and orange peel bioplastic films when compared to other bioplastic films (Table 1). The result indicates that starch-based material has high ability to degrade and followed by agar.

Moisture content

The moisture content for the various samples were calculated, and the results are shown in Table 2. It was observed that bioplastic film produced from watermelon rinds showed the least water absorption; however, bioplastic film synthesised from arrowroot powder revealed higher moisture content of 100%.

Water Solubility test

The results of water solubility test of the developed bioplastic films were presented in Table 3. The results of the test revealed that the bioplastic film produced by agar was insoluble in water which makes it more eligible to be a bioplastic packaging material followed by starch-based products. Bioplastic film produced from rice water (that contains natural starch from boiled rice) and starch powder showed a significant results with 94.44% and 74.4% water solubility. More than fourty percent of water solubility was observed in Bioplastic film from watermelon rinds, corn flour and arrowroot powder.

DISCUSSION

Growing scarcity and the increase of cost of raw materials has put the manufacture of plastics, based on renewable raw materials, firmly back centre stage. Considering that, we are in need of sustainable material which can replace plastics at the same time biodegradable. Such a kind of materials are called "bio-plastics" which are biodegradable and at the same time meeting the needs of humans. The materials used here in the preparation of bioplastics were all polysaccharide-based biodegradable products. Polysaccharides usually consists of two different types of polymer chains that are bonded together forming the plastic (Lubis *et al*., 2014). We also aimed for the production and characterization of bioplastics formed by various organic wastes including orange peel, watermelon rinds and banana peel for their valorization as the disposal of the large amounts of wet organic waste can harm the environment and lead to health problems such as respiratory disorders (Nasution, Z. *et al*., 2012). According to a study by Ayala, J. R *et al*. (2021), orange peel consists of 73.530% of moisture, 99.261% of volatiles, 0.052% of ash, 0.687% of fixed carbon, 19.801% of lignin, 69.096% of cellulose and 9.015% of hemicellulose (Ayala, J. R et al., 2021). Watermelon has a carbohydrate content of 7.55 g in 100 g of watermelon (Source: USDA.gov Agricultural Research Services). Watermelon rind has several useful substances such as vitamin C, citrulline, minerals, and enzymes and contains starch that can be used for the manufacture of bioplastics (Asnawi, T. M., 2022). When we count the reliability in results of renewable resource valorisation, bioplastic film from orange peel scored high with respect to their biodegradability as well as low moisture content. Thus, the synthesized bioplastic material can be considered a biomaterial for commercial viability and use of fruit waste for producing sustainable bioplastic material. Similar

trend was observed in a study by Asnawi, T. M. *et al*. (2022) in which a yield value of 26% biodegradable plastic was produced from watermelon rinds. Glycerol was found to be effective for the development of bioplastic film. Similar results have also been reported in a study by Forssell P. M. (1997) because of its non-toxicity, low cost and high boiling point (292°C) properties (Forssell P. M., 1997). The prepared bioplastic materials were checked for reliability by looking into biodegradability properties, moisture content and water solubility characteristics. If the bioplastic material possess the property of less or zero moisture content and a low or zero water solubility property, it can be considered as an excellent material with stability as characteristic features (Jayachandra *et al*., 2016). Likewise, the bioplastic material that shows less biodegradable property cannot be considered for biodegradable bioplastics synthesis. The biodegradability is the main factor in which the term "bioplastics" can be fulfilled. Non-biodegradable materials cannot be considered as a complete bioplastic even though they have biomaterial origin. So it is very much important that the material is biodegradable (Deeneshwaran *et al*., 2015). The degradation studies (soil burial test) conducted in this present study was helpful in preparation of eco-friendly product which are derived from natural polymers. They can be reused in bio-compost preparation. In this study, biodegradability results from starch and starch-based source (rice water) and bioplastic film developed from orange peel showed high degree of biodegradability that indicates that it has undergone biodegradation which proves their status as biodegradable bioplastics with 100% weight loss. Starch content can be consumed by soil microorganisms and may fracture the polymer chain thus caused the biodegradation (Razak SF *et al.*, 2018). This proves that starch-based products can be well suited for biodegradable bioplastic material. Solubility also plays a major role in choosing a sustainable biomaterial for bioplastics synthesis because if the material is soluble in water then it cannot be accounted for bioplastics (Hong Chua *et al.*, 2009). Results of the solubility test during our study showed that the bioplastic film developed from agar is completely insoluble in water which make it more efficient to produce with a benefit of low cost. Thus it can also be further studied to replace, use and throw plastic bottles. Another parameter monitored was Moisture content. It is the weight of water contained in an object. A less moisture content was observed on bioplastic film produced from watermelon rinds followed by orange peel bioplastic film. This indicates that there was a low absorption of water thus decreasing the growth of fungi and increasing the shelf life of bioplastic. The highest result of moisture content monitored on bioplastic film synthesised from arrowroot powder (100%) indicates that it has low shelf life.

CONCLUSION

From this study, it can be concluded that Agar-based bioplastics have shown significant advantages over starch-based bioplastics in several key areas, making them a preferable choice for various applications. The results of the water solubility test revealed that the bioplastic film produced from agar was completely insoluble in water which makes it more eligible to be a bioplastic packaging material followed by starch-based products. Starch-based bioplastics showed high biodegradability, which is one of the primary advantages that makes them an attractive alternative to conventional petroleum-based plastics. This high biodegradability is due to several inherent properties of starch and its ability to be easily broken down by microorganisms in various environmental conditions. A less moisture content was observed in bioplastic film produced from watermelon rinds (6.97%) followed by bioplastic film developed from orange peel (8.88%) with the indication that there was a low absorption of water thereby decreasing the growth of fungi and increasing the shelf life of bioplastic. Latter has also got a good result in in soil burial test with 100% biodegradability followed by former with 29.6%. The synthesis of bioplastic using fruit waste can also be considered more reliable method as it is economically convenient and using the waste in effective manner with evidence support of greater biodegradability and less moisture content. Therefore, this research has demonstrated the ability of agar-based and starch-based materials in the production of bioplastics that could replace synthetic plastic, thus preventing environmental pollution. The bioplastics produced through this method could be substantial. Certainly, the research is a long way to go for both economic and environmentally friendly products using bioplastic or bio-polymer.

ABSTRACT

SHGs are becoming a major movement in India in recent years. The Self-Help Group (SHG) movement in India has been making progress towards ending poverty in both rural and urban regions and empowering women. Women's empowerment has dominated Indian discourse for the last fifteen years. The primary subject of discussion is how women's status has shifted, both socially and economically, as a result of the country's pioneering Self-Help Group (SHG) model of financial inclusion. Furthermore, it aims to monitor the evolving attitudes of women, a process referred to as socio-psychological behaviour. This study aims to examine the function and efficacy of Self-Help Groups (SHGs) in advancing women's empowerment within the Khurda District of Odisha. To find out the above, a study was carried out with 200 targeted respondents who were distributed throughout 20 SHG groups, covering two blocks in the Odisha district of Khurda, using structured questionnaires. The collected data was analysed using statistical methods like SPSS. The project's main focus has been on using SHGs to empower women and improve socioeconomic conditions.

Keywords: Financial inclusion, Flag-ship programme, Socio-economic improvement, Socio-psychological behavior, Women Empowerment.

INTRODUCTION

Women play vital role in improved economy. The women's community has made numerous financial contributions to the developing economy overall Encouraging women involves more than simply the country's economic growth;

it also involves social justice, gender parity, and general social peace. In India, the community is a tried-and-true method of achieving social fairness by doing away with gender discrimination, particularly in relation to the self-help group (SHG) model of financial inclusion that empowers women. The model discusses ways to highlight the talent of impoverished women living in rural areas.

Review of literature

(Suwangsih, N. Fatimah, N.R. Sukatmadiredja, Emmywati(2021) Loans are one option for dealing with financial difficulties. Some experts are studying the phenomenon of loans. Various loan implementations, including the practise of group loans, follow distinct patterns. The community as a whole lends money to credit institutions through group loans. The money is distributed according to the portion agreed by fellow members of the group that owns it. D.-E. Kowlessar. (2021) The implementation of Group Loans is one of the strategies for financial institutions to minimize the risk of bad payments on money lent to the community, considering that the person in charge of the use of funds and payments are made jointly by those who join the community groups. Group Loans customers in the community are primarily women, and they are generally housewives without having a fixed income unless they receive a stipend from their husbands. Group Loan facilities are provided for women's empowerment, primarily to support productive activities A. Yudiastuti, H. Pratikto, Sopiah,(2021) Credit institutions provide convenience through Group Loans , primarily to support productive activities for women and to minimize the business risks of credit institutions. Furthermore, Group Loans have a variety of effects on the community, notably on rural families . Women's cooperatives are a bridge to overcome the problem of women's entrepreneurial capital to increase their business, because basically woman have potential in its business activities. Social capital that has elements of Trust, Network and norms attached to women's personalities will be a guarantee in obtaining loans with a joint responsibility system. Atahau, A.D.R.; Sakti, I.M.; Huruta, A.D.; Kim, M.-S(2021). Several previous research studies have used a quantitative approach to evaluate the relationships between microfinance, financial literacy, and women's empowerment .The development of microfinance, financial literacy, and women's empowerment has been studied extensively during the last two decades Affordable and clean energy provides opportunities and challenges in empowering women. Rural microfinance institutions (MFIs) enable women to increase their empowerment by managing energy. This paper explores the direct and indirect (mediated) effect of renewable energy on women's empowerment via green MFIs. (Atahau *et al.* 2021). Empowering women is included in the fifth sustainable development goal (SDG5) known as gender equality .Women's economic empowerment refers to women's efforts to increase their ability to be equally empowered as men, especially in terms of access to productive resources, to be able to participate in the utilization of these productive resources, have the same control over productive resources as men, have an equal distribution from the use of existing productive resources, including national economic development output, and have equal financial literacy.

Problem Statement

Self-Help Groups, or SHGs, are essential for improving women's status and empowering them to face difficult situations with confidence. Social groups (SHGs) are essential in improving women's standing and enhancing their confidence to deal with difficult situations. These days, the Indian government offers women's self-help groups (SHGs) a plethora of chances for formation, management, and development through microcredit facilities, which serve as the foundation for the creation of modest projects. As a result, women develop holistically in terms of their degree of involvement, trust, and ability to access fair and equal opportunities.. Therefore, it is evidence from the above that the SHG model of women empowerment is a success in India for last 15 years.Keeping the above into consideration the Author tries to assess the influence of SHG model on the empowerment of women in the selected blocks of Khurda district.

Objectives of The Study

- To analyze the socioeconomic status of the respondents from the area selected for the study.
- To study the behavior of the respondents on SHG model and its socioeconomic impact.
- To examine the empowerment of the women SHG members after they got, themselves involved in SHG activities .

METHOD

The primary and secondary data used in the study are both sources. Respondents provide the primary data via a standardised questionnaire. The respondents' sample size is limited to 200, distributed among 20 SHGs in two Blocks of the Khurda district, namely Balianta and Bhubaneswar (Urban). Tools Applied Both Chi-square test and t- test have been attempted to throw light on the topic.

Analysis And Interpretation

From Table-3 we get the following discussion

1) Significant and positive (P<0.05) t-value for increase in monthly income of members of Urban area SHGs (41.768) indicates acceptable impact of Microcredit. As the mean score 4.54 is more than 3.00, this shows that the Urban area based SHG members are able to increase their monthly income with the help of Microcredit .

2) Non-significant (P>0.05) t-value for improved role in decisions regarding the general welfare of the family members of Urban area SHGs (-1.635) indicates negligible impact of Microcredit. As the mean score 2.85 is less than 3.00, this shows that the improved role in decisions regarding the general welfare of the family members both Urban area based SHG members are not well-supported with the help of Microcredit.

3) Significant and negative (P<0.05) t-value improved role in ability to spend on self of members of Urban area SHGs (-16.143) indicates acceptable impact of Microcredit. As the mean score 2.37is less than 3.00, this shows that Urban and Rural area based SHG members are not able to accomplish the improved ability to spend on self with the help of Microcredit

FINDINGS OF THE STUDY

- Majority of the respondent (36.5%) belongs to schedule caste.
- Most of the respondents are married.
- Majority of the respondents have completed primary level education while least of the respondents have illiterates.
- Equal number of respondents has cited the reasons like initiate group activities and obtain financial support to form SHG.
- Majority of the respondents have the annual income more than 35000/-.
- Most of the respondents are self-employed categories while the rest are house wife.
- All the respondents have the intention to involve in various economic and social activities.
- Majority of the respondents are preferred to involve in producing and trading various home need products while the least number of respondents are preferred to involve in agriculture and allied activities.
- Majority of the respondents feel due to improved means of communication and creation of personal assets they get recognition in society.
- Majority of the respondents have supported their family during social crisis as they have the ability to do such things resulting an increased value for them in their family.
- Most of the respondents are of the view that as they access to microfinance, they are able to support their family during social crisis their by getting recognition in society.
- Most of the respondents are of the opinion that due to improved means of communication they are able to increase their family income and also able to participate in local bodies.
- The majority of respondents believe that because they have supported their families during the socioeconomic crisis, their self-confidence has grown, leading to better recognition in the community and a greater sense of value in their families.
- Their confidence and communication skills grow, making them deserving of being recognised by the community and able to support their families in times of need.

CONCLUSION

Millions of women in India, particularly those living in rural and underdeveloped areas, have seen a change in their way of life thanks to the SHG programme. It offers more financial stability , which eventually improves socioeconomic standing. This is also true of the Khurda district research mentioned above. SHGs, however, have encountered a distinct difficulty in light of the epidemic. However, it appears to be a gift in disguise because the state government determined that SHGs would produce and distribute masks as part of the Mission Shakti project.

ABSTRACT

According to WHO adolescence is the period from the age 10 to 19 that is between childhood to adulthood. Adolescent's health and well-being are important determinants of overall health scenario of the country and in achieving the demographic dividend. The onset of menstruation is one of the most important changes that occur in adolescent girls. Use of hygienic methods menstrual management is imperative for one's health and personal hygiene, and is important for one's empowerment and dignity. The first occurrence of menstruation is known as menarche. Menstruation is a normal biological function, but because of deeply ingrained cultural taboos, the topic is treated with caution and with inaccurate knowledge. The main goal of this study is to estimate the proportion of girls who miss school while they are menstruating, to analyze the many risk factors responsible for their absence and to evaluate the menstrual hygiene habits among adolescent school girls in rural and urban part of Satara district and find ways to solve them. The study was exploratory in nature and the samples were collected across Satara district from adolescent's girls. Based on the topic objectives I had designed questionnaire of 27 questions and 300 responses was collected from the adolescent girls from rural and urban area from different schools/colleges. Results indicates that age at menarche formostofgirlsis13yearsandmostof girls uses sanitary pads during their menstruation and few girls uses cloths, many girls dispose their menstruation material by wrapping in paper and throw it in routine waste, for genitalia cleaning only few girls uses water with antiseptic solution and many girls uses water only, first source of getting information about menstrual cycle is Mother. Most of girls get scared, nervous and confused at the time of menarche, while

purchasing menstrual material comfort and safety of material is considered. There are numerous issues, such as the absence of adequate water supply and disposal facilities to absorbent material in school.

Keywords: Menstruation hygiene, Restriction, School absenteeism, Adolescent's girls.

INTRODUCTION

Good cleanliness plays a vital role in both physical and mental health of pre-adult schoolgirls. Feminine cycle is portion of the female regenerative cycle beginning at puberty. Destitute menstrual cleanliness has been related with genuine ill-health, counting major obstacle to school participation for girls amid monthly cycle, compromising their capacity to preserve legitimate clean liness and privacy. Managing menstruation using hygienic methods is essential for adolescent girl's health and personal hygiene. Also it is critical to their self-determination and dignity. A number of analysts and policy-makers have talked about the limits of feminine cycle puts on school participation and according to the World Health Organization, the availability of adequate clean water and hygiene in schools is essential for nearly all the Millennium Development Goals, especially in the achievement of universal primary education, reduction of child mortality, and the promotion of gender equality attainment. Lacking water and sanitationofficescouldbeamajorobstacletoschoolparticipationforgirlsamidmonthlycycle,compromisingtheircapacityto preservelegitimatecleanlinessandprivacy.Althoughmenstruationisanormalphysiologicalprocessthatsignalsthebeginni ngofreproductivelife,itis sometimes considered an impure phenomenon in Indian society. Unnecessary restrictions are often caused by incomplete and erroneous information on menstruation. Lack of knowledge and awareness leads to poor personal hygiene habits during menstruation, leading to many diseases. Menstrual hygiene depends on the family's education level, socio-economic status, and cultural status. Curriculum also plays a vital role in menstrual health. There are many challenges related to sharing information about menstruation and its management, as well as establishing appropriate means to address menstrual hygiene issues. We see that most of girls with their first period drop their school. They face many challenges regarding their academics during their menstruation. The purpose of this analysis is to investigate the school-economic determinants of the use of hygienic methods for menstrual management in adolescent's girls. So, this article will be useful to understand hygienic practices, reasons behind school absenteeism during menstruation in adolescent girls.

Review of Literature

There are several researches about causes and effects of adolescent girl's absenteeism also on hygienic practices during the menstruation. It is also crucial to remember that the variables considered in this study were looked at individually by many other studies in different areas. Sever all researchers have studied hygienic practices of adolescent girls during menstruation. Same study regarding menstrual hygiene practices among adolescent school girlswas carried out in Harekala village, Mangalore, Dakshina Kannada, Karnataka in two schools(one private and other government). Census method was used. In this researchers observed that majority of girls (70.7%) had knowledge about menstruation before menarche and mother (63.4%) is foremost source of information. Half of participants(55.2%)area ware about importance of menstrual hygiene. Due to lack of privacy, half of the respondents didn't change their sanitary pads/ clothes in school. Many girls practiced ritual restriction (83.6%),31%follows dietary restrictions and 5.2% girls have restrictions to go to the schools during menstruation. The girl's excessive shyness or introversion (69%) and the fact that 15.5% of them were forbidden from talking about it were the main obstacles to get information about menstruation. The another study was Coping with Menstrual Hygiene Challenges Faced by School Going Adolescents at Mukono Primary School, Kayonza Sub-County, Kanungu District. The descriptive research plan was conducted with adolescents studying at Mukono primary school from Jan. 2020 to Dec. 2020. A total of 9 adolescents between 10 and 19 years old were interviewed. Purposive sampling method was used. They studied that the biggest challenge most teenage girl's face is 'menstrual cramps'. They observed that a major problem that adolescent girls face is the fear of sudden and excessive bleeding during menstruation. Also some participants reported that due to lack of resources like changing rooms, water supply, availability of sanitary pads they dropout

school during menstruation. These girls seek to avoid others and do not say the answers in class due to embarrassment. Because of all that problems school absenteeism in girls, less class participation, poor performance in class these crisis are increasing.

MATERIALS AND METHOD

It is hard to measure menstruation issues of adolescent's girls quantitatively. The study was exploratory in nature and the samples were collected across Satara district from adolescent's girls. Based on the topic objectives I had designed questionnaire of 27questions and 300 responses was collected from teenage girls between the ages of 12 to 18 from both rural and urban schools in the Satara district. Here the stratified sampling method is used and sample will be collected from two strata. First strata are rural adolescent girls and another is urban adolescent girls. The purposive sample will be collected from adolescent girls those who have attained menarche and want to participate in study from rural and urban part schools. Some Scaled questions are asked to measure awareness of girls about menstrual cycle and restrictions imposed by family. Field study was carried out to understand the research problem. On the basis of the study objective and nature of research question, the case study method is considered to be suitable, as it explores ground reality and also provides first-hand information about the subject or respondents.

Statistical Analysis

Nearly 37.33% girls reported that they started menstruation at age 13 which is common age of menarche. First source of getting information about menstruation was their mother(66%). Majority of participants around 98% use sanitary pads during their menstruation. 70% girls dispose material by wrap in paper and throw in routine waste, 28% girl's burn it and 2% flush out it. 63% girls dry their reutilizable cloths always in sunlight. Few girls (8%) do not dry these cloths in pure sunlight. Only using water 55% girls clean their genitalia, 31% girl's uses soap and water. Very few (14%) girls use water with antiseptic solution for genitalia cleaning. Here is word cloud of reaction at menarche and factors considered while purchasing menstruation material. The purpose of these questions was to determine each participant's reaction at menarche and to know which factors considered while purchasing menstruation material and a variety of answers were obtained. Of those who responded, 60% stated they would like teacher to do the training about menstruation issues at school. 43% girls drop out school due to fear of leakage and staining during menses. Due to the pain 49% girls miss their school in menses and 74% girls follow religious restrictions, 44% girls cannot wash hair and 69% girls does have any restriction about playing outside during menses.

Fisher's exact test of independence

To check whether the area is responsible for mentality of girls to go to the school during their menstrual cycle, as cell frequency less than 5 we use fisher exact test to check association between area and school going frequency of girls and for area and disposal of menstrual material, and between duration of cycle and absorbent change per day instead of chi square test of independence.

Hypothesis

H_0: There is no relation between area and school going frequency of girls during their menstrual cycle.
V/s H_1: There is relation between area and school going frequency of girls during their menstrual cycle.

Result

Since α=0.05>p-value= 1.987e-10 We reject H_0. We conclude that, there is relation between area and school going frequency of Girls during their menstrual cycle.

Hypothesis

H_0: There is no relation between area and how girls dispose their menstrual material. V/s
H_1: There is relation between area and how girls dispose their menstrual material.

Result

Since α=0.05> p-value=2.2e-16 We reject H_o. There is relation between area and how girls dispose their menstrual material i.e. either they burnt it, flush it or wrap it and through in routine waste.

Hypothesis

H_o: There is no relation between duration of cycle and absorbent change per day. V/s

H_1: There is relation between duration of cycle and absorbent change per day.

Result

Since α=0.05>p-value= 0.0004998 We reject H_o. We conclude that, there is relation between duration of cycle and absorbent change per day

Chi-square test for independent of attributes

Here we used chi square test of independence of attributes to check whether is their relation between changing pad in school and lack of running water supply in school, relation between changing pad in school and lack of private place to manage periods at school.

Hypothesis

H_o: There is no any association between changing pad in school and lack of running water supply in school V/s

H_1: There is an association between changing pad in school and lack of running water supply in school

Result

Since the p-value (0.0013) < α= 0.05, we reject H_o. This means that we have sufficient evidence to say that there is an association between changing pad in school and lack of running water supply in school. In other words, changing pad in school is dependent on running water supply in school.

Hypothesis

H_o: There is no any association between changing pad in school and lack of private place to manage periods at school. V/s H_1: There is an association between changing pad in school and lack of private place to manage periods at school

Result

Since the p-value (0.1618) > α=0.05, we accept H_o. This means that we have sufficient evidence to say that there is no any association between changing pad in school and lack of private place to manage periods at school. In other words, changing pad in school is independent on lack of private place to manage periods at school.

One way ANOVA

It is used to check relationship between the dependent and independent variable for three or more group of data. Here we take independent variable as Rate (Always=1, Never=0, Sometimes=2) and multiple dependent variable as Effect of menses on school life (Affect daily activities, Inability to participate in sports, Miss class test, Lack of concentration, Unable to answer question in class, Inability to write on the board, Avoid sitting in group etc.)

Hypothesis

H_o: All effects are insignificant. V/s

H_1: At least one effect differs significantly.

Result

Since the p-value (5e-10) < 0.05, we reject the H_o. We conclude that, at least one effect differs significantly. Here is box and whiskers plot which shows which effect differs significantly Menstruation has wide effect on school life like doing daily activities, participation in sports, class test. But most significant effect is they face lack of concentration

CONCLUSION

From study it was observed that most of girls absences during their menstrual cycle. It happens mainly due to lack of awareness and basic amenities like water, no private place to maintain periods at school, also lack of sanitary pad and poor disposal facilities at school. Girls want separate changing rooms and clean washrooms in school. They want sanitary pads and sanitary napkin burning machine for disposal purpose in school. So it is necessary to improve these basic facilities in schools to reduce drop out from school. As the first source of getting information about menstrual cycle was their mother (66%) and in school they are friendly with teacher (60%), So they need to be educated about the harmful effects of following to strange taboos and restrictions regarding menstruation. Most of girls get scared, nervous and confused at the time of menarche. But the girls who have idea about periods before their menarche are normal at their menarche. Some girls still follow religious and dietary restrictions. Universal use of sanitary pad by all girls can only be promoted if the government provides pads at minimum cost and subsidize quality resources. Availability of pads is also essential because in rural area sometime particular material may not be available. These reasons may lead to poor academic performance sometimes they miss class test, affect daily activities in school etc. If we close all these gaps in schools can improve girl's attendance and achievement.

Suggestions

- As there is association between area and school going frequency, disposal facility it was observed that due to lack of facilities (lack of running water) in rural area rather than urban area drop out is high in rural area.
- It is important for mothers and teachers to encourage and always maintain friendly relationships with girls.
- We have to increase awareness campaigns on how to maintain proper menstrual hygiene, providing appropriate counseling and psychotherapy, and providing appropriate value-based education on menses which will helpful to abolish various taboos and restrictions regarding menstrual cycle.
- To reduce drop out from school, private place, water and disposal facilities in schools must be well managed.
- This type of study can be help to know awareness about menstruation in school girls so that this will be helpful to launch schemes regarding menstruation.

Limitations

The information in the study was self-reported by girls and due to shyness, introversive nature so there is chance of lack of truthfulness. Findings are related to particular area. It might be possible that the answer given by the respondents are of biased

ABSTRACT

Graph theory, a branch of mathematics deals with networks of vertices connected by edges. Domination in graphs is one of the important research areas in graph theory. The product signed dominating function assigns -1 or 1 to the vertices of a graph such that the product of functional values of the closed neighborhood of every vertex is one. The study of soft graphs is a rapidly emerging field in graph theory. This paper is an extension of the concept of product signed domination to soft graphs.

Keywords: Graph, Product signed dominating function, Soft set, Soft graph.
AMS Subject Classification: 05C69.

INTRODUCTION

Graph theory deals with networks of vertices connected by edges. It has a lot of applications. Domination plays a very important role in graph theory. Dunbar et al. introduced signed domination [1]. The concept of signed domination was studied in [2-10]. Introduction to product signed dominating function (PSDF) was given in [11] and studied in [12-15]. The product signed domination number of path and cycle graph are equal to p, the total number of vertices [11]. Soft set theory was introduced by Molodtsov[16]. Rajesh K.Thumbakara and Bobin George [17] gave an introduction to soft graphs. Definition of soft graph is given in [18]. K. Palani et al. [19-20] discussed soft graphs of

some graphs. Venkatraman et al. [21] introduced domination over soft graphs. This paper gives an extension of the concept of product signed domination to soft graphs. It also discusses the relation between product signed domination numbers of path and cycle with their soft graphs.

MAIN RESULTS

Definition 2.1

Let G^* be a simple graph. $A \subseteq V(G^*)$. Let $\rho: A \longrightarrow V$ be an arbitrary relation. A **product signed dominating function (PSDF) of soft graph**(G^*, F, K, A) is a function $f: V(G^*) \to \{-1,1\}$ such that $f_{H(a)}[v] = 1 \; \forall \; v \in V(G^*) \& \forall \; a \in A$ where $f_{H(a)}[v] = \prod_{u \in N_{H(a)}[v]} f(u) = 1$ and $N_{H(a)}[v]$ denotes the closed neighborhood of $v$in $H(a)$. The weight of the soft graph of $G^*$with respect to $f$is $w_f\big((G^*, F, K, A)\big) = \sum_{v \in V(G^*)} f(v)$.The minimum positive weight of a PSDF of soft graph of G^* is called **product signed domination number of soft graph of G^*** and is denoted by $\boldsymbol{\gamma^*_{sign}}\big((\boldsymbol{G^*, F, K, A})\big)$**.**

Remark 2.2

Any PSDF of G^* need not be a PSDF of any of its soft graph (G^*, F, K, A).

Remark 2.3

Any PSDF of (G^*, F, K, A) need not be a PSDF of G^*.

Example 2.4

G^* is given in the figure 1.

Let $A = \{v_3, v_4\}$. Define $\rho: A \to V$by $x \; \rho \; y \Leftrightarrow d(x, y) \leq 1$. Clearly $H(v_3)$ and $H(v_4)$ are connected subgraphs of G.Hence, (G^*, F, K, A) is a soft graph of G^*.

Define $f: V(G^*) \to \{-1,1\}$ by $f(v_i) = \begin{cases} 1 \; if \; i = 2,3,4 \\ -1 \; otherwise \end{cases}$

PSDF for $H(v_3)$ is given in the figure 2.

PSDF for$H(v_4)$ is given in the figure 3.

Consider $H(v_3)$

$f_{H(v_3)}[v_2] = f(v_2)f(v_3) = (1)(1) = 1$

$f_{H(v_3)}[v_3] = f(v_2)f(v_3)f(v_4) = (1)(1)(1) = 1$

$f_{H(v_3)}[v_4] = f(v_3)f(v_4) = (1)(1) = 1$

Consider $H(v_4)$

$f_{H(v_4)}[v_1] = f(v_1)f(v_4)f(v_5) = (-1)(1)(-1) = 1$

$f_{H(v_4)}[v_3] = f(v_3)f(v_4) = (1)(1) = 1$

$f_{H(v_4)}[v_4] = f(v_1)f(v_3)f(v_4)f(v_5) = (-1)(1)(1)(-1) = 1$

$f_{H(v_4)}[v_5] = f(v_1)f(v_4)f(v_5) = (-1)(1)(-1) = 1$

Hence f is a PSDF for (G^*, F, K, A).

Now, $w_f\big((G^*, F, K, A)\big) = \sum_{v \in V(G^*)} f(v)$

$$= f(v_1) + f(v_2) + f(v_3) + f(v_4) + f(v_5)$$
$$= (-1) + 1 + 1 + 1 + (-1)$$
$$= 1$$

Clearly, this is minimum. Hence, $\gamma^*_{sign}\big((G^*, F, K, A)\big) = 1$.

Remark 2.5

In 2.4, f is a PSDF of (G^*, F, K, A) but it is not a PSDF for the original graph G^*.

Theorem 2.6
ConsiderP_n a path graph on n vertices. Let $A = \{v_i | i \equiv 0(\text{mod } 3)\}$. Define $\varrho: A \to V(P_n)$by $x \varrho y \Leftrightarrow d(x,y) \leq k$. If $k \equiv 2(\text{mod } 3)$, then every (P_n, F, K, A) has the minimum PSDF of P_n.

Proof:
Given $A = \{v_i | i \equiv 0(mod\ 3)\}$and $k \equiv 2(mod\ 3)$.

Case 1: $n \equiv 2(mod\ 3)$
In this case assigning 1 to the vertices v_i where $i \equiv 0(mod\ 3)$ and assigning -1 to the remaining vertices of P_n gives a PSDF for $H(a)$ for all $a \in A$ but $w_f((P_n, F, K, A))$ would be negative. Hence define $f: V(P_n) \to \{-1,1\}$ by $f(v) = 1\ \forall\ v \in V(P_n)$ which is the minimum PSDF with positive weight.

Case 2: $n \not\equiv 2(mod\ 3)$
Define $f: V(G^*) \to \{-1,1\}$ by $f(v) = 1\ \forall\ v \in V(P_n)$ which is the only possible PSDF for $H(a)$ for all $a \in A$.

In both the cases, every (P_n, F, K, A) has the minimum PSDF of $P_n$and $\gamma^*_{sign}((P_n, F, K, A)) = \gamma^*_{sign}(P_n)$.

Observation 2.7
ConsiderP_n a path graph on n vertices. Let A be any set of parameters but $A \neq \{v_i | i \equiv 0(mod\ 3)\}$. Define $\rho: A \to V(P_n)$by $x\ \rho\ y \Leftrightarrow d(x,y) \leq k$. If $k \equiv 2(mod\ 3)$, then (P_n, F, K, A) may or may not have the minimum PSDF of P_n since the minimum PSDF of (P_n, F, K, A) depends on A and the value of n and $\gamma^*_{sign}((P_n, F, K, A)) \leq \gamma^*_{sign}(P_n)$

Observation 2.8
Let P_n be a path graph on n vertices. Let A be any set of parameters. Define $\rho: A \to V(P_n)$ by $x\ \rho\ y \Leftrightarrow d(x,y) \leq k$and $k \not\equiv 2(mod\ 3)$. If $H(a) \cong P_j$ where $j \equiv 2(mod\ 3)$ for some $a \in A$, then (P_n, F, K, A) may or may not have the minimum PSDF of P_n since the minimum PSDF of (P_n, F, K, A) depends on A and the value of n and $\gamma^*_{sign}((P_n, F, K, A)) \leq \gamma^*_{sign}(P_n)$.

Theorem 2.9
Let C_n be a cycle graph havingn vertices. Let A be any set of parameters. Define $\varrho: A \to V(C_n)$by $x \varrho y \Leftrightarrow d(x,y) \leq k$. If $k = \text{diam}(C_n)$, then every (C_n, F, K, A) has the minimum PSDF of C_n.

Proof:
Given $k = diam\ (C_n) = \begin{cases} \frac{n}{2}\ if\ n \equiv 0(mod\ 2) \\ \frac{n-1}{2}\ otherwise \end{cases}$
Since $k = diam\ (C_n)$, $(C_n, F, K, A) \cong C_n$
Hence it has the minimum PSDF of C_n

Theorem 2.10.
Let C_n be a cycle graph havingn vertices where $n \not\equiv 0(\text{mod } 3)$. Let $A = \{v_i | i \equiv 0(\text{mod } 3)\}$. Define $\varrho: A \to V(C_n)$by $x \varrho y \Leftrightarrow d(x,y) \leq k$. If $k = 2$, then every (C_n, F, K, A) has the minimum PSDF of C_n.

Proof:
Case 1: $n = 4$.
Then $A = \{v_3\}$.
$H(v_3) \cong C_4$
Since $k = 2$, assigning 1 to all the vertices of C_4 is the only PSDF for $H(v_3)$ and hence for (C_n, F, K, A).

Case 2: $n > 4$.
Then assigning 1 to the vertices v_i where $i \equiv 0(mod\ 3)$ and assigning -1 to the remaining vertices of C_n gives a PSDF for $H(a)$ for all $a \in A$ but $w_f((C_n, F, K, A))$ would be negative.Hence define $f: V(C_n) \to \{-1,1\}$ by $f(v) = 1\ \forall\ v \in V(C_n)$ which is the minimum PSDF with positive weight. Hence the theorem.

Theorem 2.11
ConsiderC_n a cycle graph havingn vertices where $n \equiv 0(\text{mod } 3)$. Let $A = \{v_i | i \equiv 0(\text{mod } 3)\}$. Define $\varrho: A \to V(C_n)$by $x\ \varrho\ y \Leftrightarrow d(x,y) \leq k$. If $k < diam\ (C_n)$and $k \equiv 2(\text{mod } 3)$, then every (C_n, F, K, A) has the minimum PSDF of C_n.

Proof
Since $k < diam\ (C_n)$and $k \equiv 2(mod\ 3)$, $(C_n, F, K, A) \cong P_{2k+1}$. Since $k \equiv 2(mod\ 3)$, $2k + 1 \equiv 2(mod\ 3)$. Then assigning 1 to the vertices v_i where $i \equiv 0(mod\ 3)$ and assigning -1 to the remaining vertices of C_n gives a PSDF for $H(a)$ for all $a \in A$ but $w_f((C_n, F, K, A))$ would be negative.Hence define $f: V(C_n) \to \{-1,1\}$ by $f(v) = 1\ \forall\ v \in V(C_n)$ which is the minimum PSDF with positive weight.
Hence the theorem.

Observation 2.12
Let C_n be a cycle graph on n vertices. Let A be any set of parameters but $A \neq \{v_i | i \equiv 0(mod\ 3)\}$. Define $\rho: A \to V(C_n)$by $x\ \rho\ y \Leftrightarrow d(x,y) \leq k$. If $k \equiv 2(mod\ 3)$and $k < diam\ (C_n)$, then (C_n, F, K, A) may or may not have the minimum PSDF of C_n since the minimum PSDF of (C_n, F, K, A) depends on A and the value of n and $\gamma^*_{sign}((C_n, F, K, A)) \leq \gamma^*_{sign}(C_n)$.

Theorem 2.13
Let $G^* = P_n$or C_n. Let A be any set of parameters. Define $\varrho: A \to V(G^*)$ by $x\ \varrho\ y \Leftrightarrow d(x,y) \leq k$and $k < diam\ (G^*)$. Let $[\cup_{a \in A} F(a)] \subset V(G^*)$, $k \not\equiv 2(\text{mod } 3)$ and $H(a) \cong P_{2k+1}\ \forall\ a \in A$, then $\gamma^*_{sign}((G^*, F, K, A)) < \gamma^*_{sign}(G^*)$ where F(a) denotes the vertex set of H(a) for $a \in A$.

Proof:
Let $S = \cup_{a \in A} F(a)$.
For given G^*, since $k \not\equiv 2(mod\ 3)$ and $H(a) \cong P_{2k+1}\ \forall\ a \in A$ implies $2k + 1 \not\equiv 2(mod\ 3)$. Then, assigning $1\ \forall\ v \in S$ gives the PSDF of $H(a)\ \forall\ a \in A$.
Let $T = V(G^*) \setminus S$. Since $S \subset V(G^*), T \neq \emptyset$. Then assignment of functional values to the vertices of T depends on the relation between $|S|$and $|T|$. (The assignment of values to the vertices of T does not affect the PSDF of (G^*, F, K, A) and it also does not need to be a PSDF of $G^*(by\ 2.3)$). So the values for $v \in T$ are assigned in order to get minimum positive weight. Let $|S| = l$ and $|T| = m$

Case 1: $|S| > |T|$
Assign $-1\ \forall\ v \in T$ and$\gamma^*_{sign}((G^*, F, K, A)) = l - m$.

Case 2: $|S| = |T|$
Assign 1 to any one of the vertices in T and -1 to the remaining vertices in T so that $w_f((G^*, F, K, A)) = |S| - |T - 1| + 1 = 2$ and it is minimum since $|S| = |T|$. Hence $\gamma^*_{sign}((G^*, F, K, A)) = 2$.

Case 3: $|S| < |T|$
Given $l < m$. Let $m = l + r$

Subcase 3.1: $r \equiv 0(mod\ 2)$

Then assign -1 to any $l+\frac{r-2}{2}$ vertices of T and assign 1 to the other $\frac{r+2}{2}$ vertices of T. Then $w_f\left((G^*,F,K,A)\right) = |S| + \left(l+\frac{r-2}{2}\right)(-1) + \left(\frac{r+2}{2}\right)(1) = l + \left(l+\frac{r-2}{2}\right)(-1) + \left(\frac{r+2}{2}\right)(1)$

$= 2$

Since $r \equiv 0(mod\ 2)$, this weight is minimum.

$\gamma^*_{sign}\left((G^*,F,K,A)\right) = 2$

Subcase 3.2: $r \equiv 1(mod\ 2)$

Then assign -1 to any $l+\frac{r-1}{2}$ vertices of T and assign 1 to the other $\frac{r+1}{2}$ vertices of T. Then $w_f\left((G^*,F,K,A)\right) = |S| + \left(l+\frac{r-1}{2}\right)(-1) + \left(\frac{r+1}{2}\right)(1)$

$= l + \left(l+\frac{r-1}{2}\right)(-1) + \left(\frac{r+1}{2}\right)(1)$

$= 1$

Clearly, this is minimum.

$\gamma^*_{sign}\left((G^*,F,K,A)\right) = 1$

Hence the theorem.

Theorem 2.14

Let $G^* = P_n$ or C_n. Let A be any set of parameters. Define $\varrho: A \to V(G^*)$ by $x \varrho y \Leftrightarrow d(x,y) \leq k$ and $k < diam\ (G^*)$. Let $[\cup_{a\in A} F(a)] = V(G^*)$, $k \not\equiv 2(mod\ 3)$ and $H(a) \cong P_{2k+1}\ \forall\ a \in A$, then $\gamma^*_{sign}\left((G^*,F,K,A)\right) = \gamma^*_{sign}\ (G^*)$where $F(a)$ denotes the vertex set of $H(a)$ for $a \in A$.

Proof:

For given G^*, since $k \not\equiv 2(mod\ 3)$, and $H(a) \cong P_{2k+1}\ \forall\ a \in A$ implies $2k+1 \not\equiv 2(mod\ 3)$. Then, assigning1 $\forall\ v \in \cup_{a\in A} F(a)$ gives the PSDF for $H(a)\ \forall\ a \in A$

Since $[\cup_{a\in A} F(a)] = V(G^*)$ and all the vertices of $\cup_{a\in A} F(a)$ is assigned 1, $\gamma^*_{sign}\left((G^*,F,K,A)\right) = |V(G^*)| = \gamma^*_{sign}\ (G^*)$.

CONCLUSION

This paper gave an extension of the concept of product signed domination to soft graphs. It also discussed PSDF in soft graphs of path and cycle and also discussed the relation between product signed domination number of path, cycle and their soft graphs.

ABSTRACT

The diminishing area of land available for agriculture is the major menace to future world food security. Global population increases thus increases the demand for food but production is gradually being restricted by the decrease in available arable land attributed to conversion to commercial and industrial use, and/or degradation. This paper examines the complex issues that surround the processes of shrinking agriculturally usable land and the overall consequences for the world's food supply security. Some of the issues discussed in the study include those that have bearing on environmental degradation including climate change, soil degradation. Inter alia, the paper also analyses how socio-economic factors like population pressure and the need for expanding biofuel production put pressure on production in the agricultural field. The available arable land decreases putting a damper on production and through competition result to issues of scarcity in food production and high unpredictable prices. Crisis-affected states and CO2-emitting countries experienced higher food insecurity effects, and epidemic vulnerability magnified existing inequalities in food access and intake for the global populace, especially the developing nation's population. To overcome these difficulties, this study assesses sustainable strategies for increasing agricultural productivity on the existing agricultural land with a reduced degree of environmental disruption. These are for instance precision farming, agro ecological practices and genetically modified crops in a bid to expand yield. Moreover, the new vertical farming strategies, and hydro/aquaponics forms of farming are presented as solutions for modern farming practices. This section also includes recommendations on the nature of policies toward sustainable land use, protection of ecosystems, and the principles of rational consumption. As highlighted in the paper, expansion of agricultural land poses considerable threats to international food security, but effective administrative practices as well as policies constant with sustainable agriculture can offer instead remedies to these challenges. Organization for mutual and international support in enhancing the farming technologies are highly essential so as to anticipate and satisfactorily feed a rather large population base that will presumably continue to grow in the future under the pressure of environmental factors and global socio-economic factors.

Keywords: The available arable land decreases putting a damper on production and through competition result to issues of scarcity in food production and high unpredictable prices.

INTRODUCTION

Food security in the global society still continues to be a major significant issue in today's world politics. As used here, it concerns the use of food available, to which people get access, and which they can effectively use in order to live healthy, active lives. The global population is expected to feel 9.7 billion in 2050 meaning that feeding the world is not going to be very easy. As we speak, 900 million people globally are undernourished. Connecting everyone to food security is a challenge made worse by climate change, unequal distribution of wealth, and war (FAO, 2022). This paper attempts to establish that the tenacity of arable land that is the globally recognized primary input in food production is perhaps the most critical determinant of food security. The study aims at investigating how the reduced availability of farmland affects the future capability of the nations to feed their populations. Crop and pasture land defines the provision of food safety globally. Most of the produce of food in the world is cultivated in arable land, with crops like grains, vegetables, fruits and animal husbandry for meat, dairy or eggs. Currently, agriculture takes approximately one third of all the land area in the world (World Bank, 2021). Nevertheless, the extent of land that can be fitted for agriculture is reducing due to several factors that are correlated in some ways. Population growth especially in urban areas and development of industries for example, agricultural land is being converted to residential, business as well as production areas. This is even evident with the emerging third world nations experiencing demographic exploitation and expansion as well as urbanization (Godfray et al., 2010). Climate change is also impacting the weather patterns, causing desert like conditions, and excessive loss of arable land. This situation is also putting pressure on the demand for agricultural land globally by shifts in consumption patterns. Tilman & Clark (2014) pointed out that, as the populations' incomes grow, especially in lower and middle-income countries, their consumption of resources that include meat, and dairy products also goes up.

This puts extra weight on agricultural systems because while livestock farming community encompasses a large chunk of the economies by providing protein to food security, it enjoys a much larger chunk of land and water than crop farming. The competition for the agricultural land is expanded by the shift toward biofuel production as the vast tracts of the agricultural land are used for biofuel plants and thus less food is produced (Searchinger et al., 2008). The shrinking of the former is more real, direct and much more impactful in as far as the latter is concerned – global food security. This poses a problem because small tracts of agricultural land produce less food and high prices of food crops are likely to ensue. However, the remaining agricultural land may be exploited to the maximum where the land will be unable to support crops due to loss of fertile top soil and declining bio-diversity/ productivity (Toulmin, 2009; Foley et al., 2011). Climate change makes it difficult for farmers to produce crops due to increase in climate related calamities like; droughts, floods and hurricanes which affects crops and the quality of land (IPCC, 2021). These seasonal disruptions are responsible for food rationing especially in the economically or politically instable areas. food availability is a central determinant of food security, especially in the context of population density on the available farmland. Due this, when the population of the world increases, then more people mean more food to feed the extra billions. However, given recent decreases in the extent of agricultural land, it will become difficult to meet this requirement. According to the Food and Agricultural Organisation, world food production is expected to rise by 60% by 2050. However, the sector is bounded by factors like water scarcity, depletion of the land, and climatic change. If the current approach to management of agricultural land is not radically changed, the world is likely to be hit by food deficits in the decades ahead (Tilman et al., 2011). For this reason, this study focuses on how a decline in the agricultural land area calls for innovation in sustainable farming practices .But one solution is precision agriculture, which makes use of technology in order to increase crop yields and lessen losses (Gebbers& Adamchuk, 2010). Similarly, other low-external-input sustainable agriculture practices like crop intercropping, rotation, and organic agriculture are proposed CSE practices since they contribute to improvement of intrinsic characteristics of the agro-ecosystem, such as soil fertility, structure and biotic diversity, which makes the system robust to exogenous shocks (Altieri, 2004). Moreover, the two concepts known as vertical farming and hydroponics

offer urban food production as a way of minimizing the utilization of rural arable land (Despommier, 2013). These remedies require policies that would encourage responsible land use and healthy investment in the research and development of agriculture. The shrinking of the area devoted to farming is one of the greatest threats to future global food security. With the population increasing dramatically to an estimated 9 billion people by 2050 coupled with increase in demand for resource rich foods there is need to find out how food production and distribution are going to be met on a diminishing piece of land that is arable. The use of sustainability measures in agriculture, combined with change in efficiency of those practices due to the developments in technology, provides a solution to the problem. Intergovernmental collaboration and sound policy enforcement will be essential to shifting for the new generations of sound and functional food system.Tamil Nadu state occupies a foremost place in the farming map of the India, contributing a large customer towards the food bowl of the country. Tamil Nadu is one of the largest agricultural producing states in India; it contributes nearly 12% of the total food grain production of the country and ranks high in the production of several crops, paddy, sugarcane, groundnut etc. (Government of Tamil Nadu, 2021). The state has varied agro-ecological regions that favor production of various agricultural produce, hence playing an important role in food security in the country and the region. Further, Tamil Nadu is also widely known in its horticulture output where it ranks high for production of fruits and vegetables, and these the marketed fruits and vegetables have not only served the demand of the state but also of the country as a whole (Srinivasan et al., 2020).

The impact of agriculture on the overall economy of Tamil Nadu is not just that the agricultural economy is one of the most important components of the state's economy, but also millions of farmers are dependent on agriculture. Currently, about forty percent of the state's people are employed in agricultural sector as it is regarded as key sector as regards employment in the rural areas and livelihood. The state has also been active in the formulation and administration of different agricultural policies and or programs to boost up production to ensure food security Some of the measures include the Tamil Nadu Agricultural Production Scheme and the strategies on the use of new technology in farming (Government of Tamil Nadu, 2021). However, Tamil Nadu, as one of the biggest contributors to the agricultural sector in India has faced set back that adversely affects the sustainability of its agriculture and productivity. The most significant problem is water; with climate change, overdrawing of water resources, and irregular monsoons adding to water shortage conditions. Tamil Nadu has been recognised as the state that falls under severe condition of groundwater depletion status with around 90% of the blocks of the State falling under over-exploited category (CGWB, 2021). This water crisis is a major threat both to crop production and sustainability of agriculture in the state. Global warming actuates the problems faced by Tamil Nadu agriculture to the next level. Changes in temperature and rainfall patterns have affected the climate in ways that make the weather unpredictable causing failed harvests and minimal yields throughout the agricultural section (Panda et al., 2021).

For instance, the state as experienced an upsurge of the regularity and severity of the droughts and floods, which do not only interfere with farming practices but also affect the livelihoods of farmers. Such climatic odds must, therefore, be responded to with the greatest urgency and in ways that can significantly build up the strength of the agricultural sector. Other factors with relevance to the agricultural systems in Tamil Nadu are also socio-economic factors that affect the environment. The shortcomings that have manifested themselves through credit burden and poor market structure for agricultural commodity, and lack of an effective support infrastructure for farmers has caused the farm distress leading to high farmer suicides in the state (Kumar & Singh, 2020). Inadequate financing and access to good markets intensify farmers' vulnerability, thus the need for relevant government policies that multiply the socio-economic potentials of the agricultural populace. To this end, the framework for sustainable agricultural practices and policies has become necessary to meet challenges such as the following. Intensive use of water, reliance on appropriate crop varieties and sustainable farming methods can go a long way in reducing the impacts of climate change and resource constraints (Srinivasan et al., 2020). Furthermore, there are actions to further increase the use of technology and innovation in agriculture, for instance smart farming technologies or digital innovation for market linkages, which are likely to have large associated productivity and income gains. It is critical to have collaborative work coming from the government, agricultural scientists, and farmers to provide consistent future for agricultural production of Tamil Nadu and in that way, Indian food security. Reduced agricultural land and food insecurity are research hot topics, especially in relation to stakeholders' knowledge and practices. As global food systems are

experienced as more fragile through urbanization, climate change and growing populations, there is a need to notice the longer impacts at local level. This research is important for several reasons mainly because of the fact that food security requires more than just addressing problems facing agriculture by coming up with general solutions. By taking into account the local attitudes towards the existing link between land reduction and Food insecurity it becomes easier for scholars to understand the dynamics of the community affected by such changes. Every geographical area has its own problems to solve, and these are again related to cultural, economic, and geographical factors. For example, where land is being converted to industry use, local farmers are likely to immediately lose their production base leaving their families and community food insecure (Godfray et al., 2010). Awareness of such local experiences enables one to make an informed evaluation of the extent to which land use policies and practices influence food security and to devise intervention strategies that could be meaningful. Through analyzing the relationship, it highlights the cultural and socio-economic aspect of food security. Due to traditional farming practices being bound by cultural beliefs and local knowledge any change to the availability of land hails a shift or erasure of culture (Altieri, 2004). Furthermore, knowledge of the territorial socio-economic context – markets, education, and resources can pinpoint the population most exposed to lands shrinkage and hunger (Panda et al., 2021). This knowledge is crucial in formulation of policy interventions that may be relevant to these communities. The effectiveness of this research expands its importance to the ability to impact policy. Through such local view, policy makers can also grasp the effects of the decision on land use on food security and livelihoods of the people. That is why its localized approach might contribute to raising awareness on fair land use legislation that would promote non-harmful mechanization of agriculture as well as to defend the right of the affected farmers. Engaging the people in policy making opens up the door for those directly affected by policy decisions and fosters best practices for policy formulation what actually causes hunger?

In addition, the understanding of the connection between the land reduction and local food insecure regions will be useful in case exploring resistances and adaptive strategies of locals. Given that agriculture is also under pressure from new factors, including the climate change effect or encroachment by cities and industries on farmland, knowledge of how societies change in response to these pressures is useful to learn from. Practices and ideas from the communities may be useful for growing food organically through sustainable use of the available land as the process of reducing the size of available land for agricultural production continues (Tilman & Clark, 2014). Last, focusing on the connection between land reduction and food security on its local level results in the enhanced understanding of food security as a complex phenomenon. Fragmentation of food security means that it is not just about the accessibility but also about the actual utilization of the food and yet it has to be consistent for a long time. For this reason, by incorporating local views in the research, scholars and practitioners are able to treat the food security issue as a complex phenomenon and develop the most comprehensive solution since they have to consider environmental, economic, and social criteria (Foley et al., 2011).In order for policies to yield useful results, build community strength and bring about sustainable food security future, it is important to study land reduction food security nexus from the local perspectives. Besides advancing knowledge in the field, the research also assists local people to become active in agri-food system governance in the pursuit of their interests and entitlements.

REVIEW OF LITERATURE

In a similar note, the literature on the reduction in agricultural land availability reveals increased pressure from land conversion to other uses such as urban and industrial developments, climate change together with increased population pressure. Research focuses on the effects of low or decreasing land access on food security issues related to rural welfare and future sustainability. It also examines new approaches, including agroecology and precision farming, as the possible remedies. Additionally, governance issues, policy gaps, and the need for community engagement are recurring themes in the literature on sustainable land use and agricultural preservation.

Global Trends in Agricultural Land Use

Current research on the global agricultural land at in the era of accelerated land use change provide crucial insights into the food production and food security. As it was observed by the Food and Agriculture Organization (FAO), agricultural land continues to reduce its area over the years due to factors such as urbanization and industrialization and environmental degeneration. For instance, according to a report by the Global Land Outlook, around 1.5 billion hectares of land has been degraded since the 1960s and that is a blow to food production (FAO 2018). In his work, Godfray et al (2010) says the global population is likely to be 2 billion people more by the year 2050 and to feed these people, there must be 70% improvement in the production of food. However, arable land is fast disappearing, according to the International Food Policy Research Institute (IFPRI) it is projected that about 30% of the world's arable land could be out of use by 2050 if current trends persist (IFPRI, 2017). Moreover, Liu et al. (2021) also argue that land-use change is one of the biggest threats mainly due to economic and population growth, increases habitat loss and decline in biodiversity, thereby threatening agricultural sustainability. Tilman et al in their study also note intensive farming for instance conventional agriculture as the major cause of land degradation hence the call to practice sustainability of that resource. These conclusions imply the necessity of further research on the contributing factors which are these findings underline.

Food Security in Global Context

According to FAO food security is achieved when everyone is able to access physically and have access to adequate amounts of nutritious food at any time. This concept encompasses four key dimensions: For more than 10 years, the concepts have been use as access, availability, use, and stability (FAO, 2022). These or similar dimensions have been researched as the studies specified that food security is a multifaceted concept going beyond simply the availability of food. For instance, the World Bank in their 2021 publication lists economic inequalities and political instability as some of the hurdles towards attaining food security in the low and middle economies. Furthermore, Ivanic, and Martin, (2018) pointed out that the food markets price instability has a negative impact on food security for communities that are food insecure. Another outstanding and extensive work of Headey and Ecker (2013) shows causes and evidence that prove that food security and nutrition are inseparable because if people cannot obtain the variety of nutrient-dense products, they will suffer from malnutrition and affect public health. Furthermore a report by the Global Nutrition Report (2021) shows that about $2.7 billion of the global population lacks the funds to afford a healthy diet making the food insecurity worse. It is critical to realize that there is much more to food security than simply having enough food to eat; this perspective helps to make sense of all the major factors that promote hunger and malnutrition worldwide and for designing policies and interventions to address those fundamental issues.

Agricultural Land Reduction in Tamil Nadu

This paper seeks to present the evolution of changes to the agricultural land use in Tamil Nadu. The records availably show that the state has lost proportionate of its agricultural land through conversion to other uses such as personal and commercial development. Tamil Nadu Agricultural University reveals that the size of the cultivated area has reduced from 5.7 million hectares in 1970 to 4.5 million hectares in 2020. This decrease has been worsened by water scarcity and poor soil quality that has an implication on agricultural yields (Panda et al., 2021). The study done by Karthikeyan et al., (2019) reveals that due to conversion of agriculture land for non-agricultural uses, food production has reduced in the state and there is urge to import foods. Also, recent work by Sivasubramanian et al. (2021) shows that climate change has worsened these problems through temperature vagaries and changes in rainfall patterns that adversely influence crop productivity. The other factor is the conversion of agricultural land to other uses such that the extent of farmland shrinking through its conversion to other uses including urbanization stands out as the leading cause of shrinkage of extent of farmland leading to depletion of arable land (Sundararajan et al., 2018). It is imperative to understand them and recent changes to design strategies towards the improvement of sustainability of the agriculture sector in Tamil Nadu.

Sustainable Agricultural Practices

Organic farming has emerged as a key solution to the problems associated with reduction in agricultural land and food and also insecurity. Some of the discussed successful wetland mitigation delivery strategy include

agroecological practices, organic farming practices and precision agriculture as they improve productivity yet has minimum effects on the environment. As Kremen and Miles note in their research (2012), the agroecological strategies make reference to the concern that agricultural productivity can rise and climate change vulnerability can reduce by applying certain tactics. Diversified systems cropping systems enhance the ecosystem services and food security as argued by Altieri (2004). For example, in India programs like National Mission on Sustainable Agriculture involve factors such as the use of Organic agriculture and Integrated Pest Management (Government of India 2021). In the same vein, Sharma et al. (2020) identifies other technologies like rain water harvesting, drip irrigation etc and their role in enhancing productivity of crops, water use efficiency. Furthermore, by pointing out that technology and innovation enhancement in the farming sector, for instance through market access, are critical in enhancing farmers' living standards, Singh et al. (2020). Srinivasan et al. (2020) has pointed out that these practices are not only beneficial for the soil and increase farmers' income due to the decrease in input costs. This paper's outcomes also have shown that implementing sustainable practices in agriculture both on the global level and in the Indian context indicates an ability successfully to solve the issue of the reduction of the land area and food security.

Localized Approaches to Food Security

Studying the topics on regional angles of food security is relevant for identifying how cultivation and food distribution results are influenced by policies and agricultural practices in local contexts. That is why local food systems and urban agriculture, as community-based activities, have become the recent focus when improving food security. Another study by Moragues-Faus et al. (2017) underlines the opportunities in localized food systems that can improve communities' vulnerability and the prevalence of food deserts as well as increase fresh food. Moreover, programs like farmers' markets and CSAs are amongst top influences that support direct P2C relationships which in turn support local economy thus increase food accessibility (Hassanein, 2003). Another study by the World Resources Institute (2020) shows the involvement of locals in decision making increase sustainable agriculture practices for better food security outcomes. This analysis of these localized strategies is critical in shaping intervention solutions relevant to the varying challenges that different populations encounter regarding the issue of minimized agricultural land.

Policy Implications and Future Directions

The conclusion drawn from different researches conclude the fact that adequate polices have to be formulated that comprise of both agriculture land minimization and food insecurity. The situation in food security, and agriculture in particular, is complex; therefore, policymakers ought to consider all factors that influence these processes, as well as individual contexts. Sustainable agriculture, promoting community participation in policy-making and supporting small operators are the key to success in framing policies (Béné et al., 2015). Furthermore, improvement of bureaucratic and global inequalities as well as having input in the flourish of physical infrastructures within the countryside are crucial for the improvement of the food distribution and security (Pingali, 2012). More research should be done to assess the impact of current policy interventions and to look for new strategies aimed at managing change to support sustainability in land use and food consumption, ongoing. Intergovernmental and non-governmental organizations and international/local communities need to embrace development of acceptable and sustainable farming systems as pressures of climate change /urbanization loom large.

METHODOLOGY

In order to achieve this, the methodology adapted in the study uses both qualitative and quantitative data. An important support is quantitative analysis using global statistical data from international sources including FAO and the World Bank. These data are mainly based on important variables including the changes of agricultural land –a declining area per unit time-, crop outputs, and other food security factors including food prices and food accessibility. This statistic approach makes the invisbile effect for reducing the size of the cultivated land in the world measurable. On the qualitative side, the methodology entails a comprehensive analysis of seminal literature, case and field data generated from surveys, focus group discussions and interviews of farmers, policymakers, and agricultural

professionals. Administrative and user questionnaires are employed to elicit primary data in terms of self-perception and experiences of individuals who were affected by reduced agricultural land, including certain areas such as Tamil Nadu. It complements the quantitative findings by describing how some of these trends impact population groups in a given region. The methodology also uses case study which helps in a focus on specific agricultural problems in Tamil Nadu. This lets us have a better insight into the regional significance and differences from global tendencies. Moreover, a relative reduction in agricultural land is also compared to facilitate the evaluation of the consequences of problems related to food security for different territories and populations. Additionally, the document also accesses such farming practices like precision farming, agro ecological farming, vertical farming as possible solutions to the impacts of decreased farming lands. In this respect, evaluating the success of such strategies, the research identifies opportunities to increase the yields on ever shrinking arable land. The methodology by which such results are produced also involves a critical review of the particular land use policies in question and what they may portend for world food security and sustainability and the analysis done at a global level is complemented by an analysis that takes place at the local level in order to offer systematic, practical policy intervention recommendations.

Agricultural Land Reduction: An Overview

The reduction of agricultural land is a pressing issue that affects food security and environmental sustainability on a global scale. According to the Food and Agriculture Organization (FAO), approximately 1.5 billion hectares of land are degraded worldwide, with agricultural land accounting for a significant portion of this degradation (FAO, 2018). Urbanization, industrialization, and changing land-use patterns have contributed to this alarming trend, as arable land is increasingly converted for non-agricultural purposes (IFPRI, 2017). A report by the International Food Policy Research Institute (IFPRI) highlights that global cropland per capita has been declining, from about 0.43 hectares in 1961 to around 0.22 hectares in 2017, indicating that the pressure on existing agricultural land is intensifying (IFPRI, 2017). In addition to urban encroachment, climate change plays a crucial role in land reduction. A study by the World Resources Institute (WRI) indicates that rising temperatures and shifting rainfall patterns adversely affect crop yields, leading to a further decrease in available agricultural land (WRI, 2021). The Intergovernmental Panel on Climate Change (IPCC) has projected that, without significant mitigation efforts, agricultural productivity could decline by 10-25% by 2050 due to climate-related impacts (IPCC, 2019). These projections underline the urgent need to address both land reduction and climate change simultaneously to ensure food security.

Moreover, the loss of biodiversity and ecosystem services is closely linked to agricultural land reduction. According to a report by the United Nations Convention to Combat Desertification (UNCCD), about 12 million hectares of productive land are lost annually due to land degradation, which can lead to diminished ecosystem services that are vital for sustainable agriculture (UNCCD, 2017). The degradation of these ecosystems not only threatens food production but also affects water quality and availability, highlighting the interconnected nature of these challenges.
Research conducted by Liu et al. (2021) found that land-use changes, driven by agricultural expansion and urban development, have led to significant habitat loss, further endangering global biodiversity. This loss impacts agricultural resilience, as diverse ecosystems contribute to pest regulation, pollination, and soil fertility. The decline in biodiversity, in turn, poses a risk to food security, as it limits the range of crops and livestock available for agricultural production (Liu et al., 2021). In response to these challenges, sustainable agricultural practices are being promoted as essential strategies for mitigating land reduction and enhancing food security. A review by Kremen and Miles (2012) emphasizes the importance of agroecological practices, which integrate ecological principles into agricultural systems to enhance productivity while preserving ecosystems. Countries around the world are beginning to adopt these practices, aiming to balance the demands of food production with the need for environmental sustainability (Kremen & Miles, 2012). Finally, global initiatives such as the United Nations Sustainable Development Goals (SDGs), particularly Goal 2, which aims to end hunger, achieve food security and improved nutrition, and promote sustainable agriculture, reflect the increasing recognition of the importance of sustainable land use practices. Achieving these goals requires concerted efforts from governments, NGOs, and local communities to address the multifaceted challenges associated with agricultural land reduction (UN, 2015). Global Agricultural Land encompasses approximately 5 billion hectares, representing about 38% of the world's land surface. This statistic underscores the significant role of agriculture in global land use, indicating the importance of

agricultural practices in food production and environmental considerations. The vast extent of agricultural land is critical for understanding its impact on ecological systems and human livelihoods. Within this context, cropland constitutes about one-third of agricultural land, with 10% of cropland dedicated to permanent crops. Cropland refers to land specifically used for cultivating food crops, and its substantial portion of agricultural land highlights the vital role it plays in feeding populations. Permanent crops, such as fruits and nuts, represent a smaller yet essential segment of cropland, contributing significantly to nutrition and economic activity. The trend of cropland per capita has experienced a marked decline, decreasing from 0.45 hectares per capita in 1961 to 0.21 hectares per capita in 2016. This reduction indicates that while the global population continues to grow, the availability of arable land per person has significantly diminished. This situation raises concerns about food security, as the ability to produce sufficient food to meet the needs of an increasing population becomes more challenging. Between 2001 and 2022, total cropland growth amounted to an increase of 80 million hectares, representing about 5% growth in global cropland area. This increase reflects positive developments in agricultural practices, including the expansion of cultivated areas and improvements in agricultural technology. Despite various pressures, this growth demonstrates a potential capacity to enhance food production. In contrast, permanent meadows and pastures have faced a significant decline, losing 170 million hectares or a decrease of 6% during the same period. This loss highlights the pressures from urbanization, agricultural intensification, and environmental factors, which can adversely affect livestock grazing and ecosystem stability. The reduction of pastureland poses challenges for sustainable livestock farming, biodiversity, and overall food systems. Furthermore, land productivity has seen remarkable growth, increasing by nearly 60%, from USD 546 per hectare to USD 872 per hectare between 2001 and 2022. This increase indicates substantial advancements in agricultural efficiency and practices, allowing farmers to produce more output per hectare. Improved productivity is essential for addressing food demands and enhancing the economic viability of agricultural sectors. Focusing on India, the average size of operational holdings has shown a consistent decline over the decades: from 2.28 hectares in 1970-71 to 1.08 hectares in 2015-16. This trend reveals the challenges associated with smaller landholdings, which can impact agricultural productivity and the economic sustainability of farming. As the average size of farms decreases, farmers may struggle to achieve economies of scale, potentially affecting their income and overall livelihoods. this analysis highlights significant trends and statistics regarding agricultural land in a global context and specifically in India. These insights into changes in cropland availability, land productivity, and operational holding sizes are vital for policymakers and stakeholders in developing strategies for sustainable agricultural practices and ensuring food security for growing populations.

Agricultural Land Reduction in India

In India, agricultural land reduction is a significant issue influenced by various factors, including urbanization, industrialization, and changing land-use patterns. With approximately 1.5 billion hectares of land categorized as agricultural, this sector plays a crucial role in the country's economy, employing nearly 42% of the workforce and contributing about 17% to the Gross Domestic Product (GDP) (Government of India, 2021). However, the increasing pressures from various sectors have led to notable land reduction, which poses significant challenges for food security and sustainable development (FAO, 2018).

Key Issues Contributing to Agricultural Land Reduction

1. **Urbanization**: Rapid urban expansion is one of the primary drivers of agricultural land loss in India. As cities grow to accommodate the increasing population, agricultural lands are often converted into residential and commercial properties. According to the Ministry of Housing and Urban Affairs, urban land is projected to expand from 31% to 50% by 2030, significantly impacting the available agricultural land (MoHUA, 2020).
2. **Industrialization**: The growth of industries has led to the conversion of agricultural land for industrial development. Policies promoting industrialization have often prioritized economic growth over agricultural sustainability. For example, Special Economic Zones (SEZs) established in various states have contributed to the loss of agricultural land, as they require vast areas for setting up industries (Kumar & Singh, 2018).
3. **Infrastructure Development**: Infrastructure projects, including highways, railways, and dams, often encroach upon agricultural land. The Ministry of Road Transport and Highways has reported that several national and

state highways have been constructed at the expense of fertile agricultural areas, further exacerbating land reduction (MoRTH, 2019).

4. **Land Degradation**: Unsustainable agricultural practices, deforestation, and overgrazing contribute to land degradation, rendering agricultural lands less productive. According to the Indian Council of Agricultural Research (ICAR), approximately 30% of India's land is degraded, affecting agricultural yield and sustainability (ICAR, 2020).
5. **Fragmentation of Land Holdings**: The average size of operational holdings in India has decreased from 2.28 hectares in 1970-71 to 1.08 hectares in 2015-16 (NSSO, 2016). This fragmentation makes it increasingly difficult for farmers to achieve economies of scale, leading to reduced productivity and profitability.

Policies Impacting Agricultural Land

1. **Land Use Policies**: The National Land Use Policy, established to regulate the conversion of agricultural land for non-agricultural purposes, aims to ensure sustainable land use. However, implementation challenges persist, with various states prioritizing industrial and urban development over agricultural preservation (Ministry of Agriculture, 2019).
2. **The Land Acquisition Act (2013)**: This act was designed to protect the rights of farmers by mandating fair compensation and rehabilitation for those whose land is acquired for development projects. Despite these protections, the law has faced criticism for its implementation, with many farmers reporting inadequate compensation and lack of support (Singh, 2020).
3. **The Pradhan Mantri Awas Yojana (PMAY)**: While aimed at providing affordable housing, this scheme has led to the conversion of agricultural land for residential purposes in urban areas. The demand for housing has intensified the pressure on agricultural land, leading to its reduction (Rao, 2021).
4. **Soil Health Management Programs**: Initiatives like the Soil Health Card Scheme aim to improve soil health and productivity, addressing land degradation issues. By promoting sustainable agricultural practices, these programs can mitigate some negative impacts of land reduction (NITI Aayog, 2020).
5. **National Policy for Farmers (2007)**: This policy emphasizes sustainable agricultural practices and aims to enhance the livelihoods of farmers. It encourages diversification and investment in non-farm activities, which can help reduce the dependence on agricultural land (Government of India, 2007). Agricultural land reduction in India is a complex issue influenced by urbanization, industrialization, and unsustainable practices. While various policies have been implemented to address these challenges, effective implementation and a balanced approach between development and agricultural sustainability are essential. Ensuring the protection of agricultural land is crucial for food security, environmental sustainability, and the overall well-being of millions of farmers in the country. Continued efforts to enhance land productivity and promote sustainable practices will be vital in countering the negative trends associated with land reduction in India (FAO, 2018).

Agricultural Land Reduction in Tamil Nadu

Tamil Nadu, one of India's leading agricultural states, plays a crucial role in the country's food production, contributing significantly to both the agricultural GDP and the overall economy. The state has a diverse agricultural landscape, ranging from rice cultivation in the delta regions to horticulture and cash crops in other areas (Department of Agriculture, Tamil Nadu, 2021). However, like many regions in India, Tamil Nadu faces challenges related to land use, including agricultural land reduction, land degradation, and urban encroachment.

Current Land Use Statistics

1. **Total Geographical Area**: Tamil Nadu has a total geographical area of approximately 130.58 million hectares (Tamil Nadu Statistical Handbook, 2022).
2. **Agricultural Land**: About 59% of the total area (approximately 76.9 million hectares) is classified as agricultural land (Department of Agriculture, Tamil Nadu, 2021).
3. **Irrigated Land**: Approximately 34% of agricultural land is irrigated, making it one of the most irrigated states in India (Tamil Nadu Agricultural University, 2020).

4. **Major Crops**: Key crops include rice, sugarcane, cotton, and various pulses, along with a growing emphasis on horticultural crops like fruits and vegetables (Department of Agriculture, Tamil Nadu, 2021).

Land Use Trends and Challenges

1. **Urbanization**: Rapid urban growth in cities such as Chennai and Coimbatore has led to significant encroachment on agricultural land. According to the Tamil Nadu Urban Development Plan, urban areas are projected to expand by over 200% by 2030, resulting in the conversion of agricultural land to residential and commercial uses (Tamil Nadu Urban Development Authority, 2019). The state has witnessed the loss of over 1.3 million hectares of agricultural land due to urban expansion in recent decades (Tamil Nadu Agricultural University, 2020).
2. **Industrialization**: Tamil Nadu is an industrial hub, attracting investments in sectors such as manufacturing and services. The establishment of Special Economic Zones (SEZs) and industrial parks has contributed to the reduction of agricultural land. A report by the Tamil Nadu Industrial Policy indicates that over 50,000 hectares of agricultural land were acquired for industrial purposes between 2000 and 2020 (Tamil Nadu Industrial Policy, 2021).
3. **Land Degradation**: Approximately 28% of Tamil Nadu's land is affected by degradation, primarily due to over-exploitation of resources, deforestation, and unsustainable agricultural practices. Soil erosion, salinization, and nutrient depletion are significant issues, impacting the productivity of agricultural lands (Tamil Nadu Soil Conservation Policy, 2020). The Tamil Nadu Soil Conservation Policy aims to combat these challenges by promoting sustainable land management practices (Department of Agriculture, Tamil Nadu, 2021).
4. **Fragmentation of Land Holdings**: Similar to national trends, the average size of operational holdings in Tamil Nadu has decreased over the years. In 2015, the average size was approximately 1.1 hectares, down from 2.1 hectares in 1970 (NSSO, 2016). This fragmentation complicates efficient land use and management, leading to reduced agricultural productivity.
5. **Water Scarcity**: Water availability is a pressing issue in Tamil Nadu, particularly due to over-extraction of groundwater and seasonal variations in rainfall. The state has seen a decline in groundwater levels, impacting irrigation and overall agricultural output. The Tamil Nadu Water Resources Department has implemented various initiatives to promote rainwater harvesting and sustainable water management to address this challenge (Tamil Nadu Water Resources Department, 2021).

Policy Framework and Initiatives

1. **Tamil Nadu Agricultural Policy (2012)**: This policy aims to enhance agricultural productivity, improve farmer incomes, and promote sustainable agricultural practices. It emphasizes the need for technological advancements, better irrigation facilities, and support for small and marginal farmers (Tamil Nadu Agricultural Policy, 2012).
2. **Land Use Planning and Regulation**: The Tamil Nadu Town and Country Planning Act provides a framework for land use planning and regulation. It aims to manage land use effectively and minimize conflicts between urban development and agricultural activities (Tamil Nadu Town and Country Planning Act, 1971).
3. **Soil Health Management**: Initiatives like the Soil Health Card Scheme have been introduced to improve soil health and productivity. These programs provide farmers with detailed information on soil nutrient status, helping them make informed decisions about fertilization and crop management (ICAR, 2020).
4. **Farmer Welfare Schemes**: Various schemes, such as the PudhuVaazhvu Project, focus on enhancing the livelihoods of small farmers through capacity building, access to credit, and promoting sustainable practices (Government of Tamil Nadu, 2019).
5. **Integrated Farming Systems**: The government promotes integrated farming systems to enhance productivity and sustainability. This approach combines crop production, livestock rearing, and agroforestry, maximizing land use efficiency and income generation for farmers (Tamil Nadu Agricultural University, 2020). Tamil Nadu's agricultural landscape faces numerous challenges related to land use, including urbanization, industrialization, land degradation, and water scarcity. While the state has made significant progress in agricultural development, ongoing efforts are necessary to address the issues of land reduction and ensure

sustainable agricultural practices. By implementing effective policies, promoting integrated farming systems, and enhancing water management strategies, Tamil Nadu can work towards maintaining its agricultural viability while accommodating the pressures of urbanization and industrial growth. Ensuring a balanced approach to land use will be crucial for the state's future food security and economic stability.

Impact of Agricultural Land Reduction

Global Impacts: Effects on Food Production and Security

The reduction of agricultural land has far-reaching implications for global food production and security. Several trends and statistics underscore the gravity of this issue:

1. **Decreased Food Production:** As agricultural land decreases, the capacity to produce sufficient food to meet the needs of a growing global population becomes increasingly strained. According to the Food and Agriculture Organization (FAO), global food production must increase by 70% by 2050 to feed an estimated 9.7 billion people (FAO, 2017). However, as arable land is lost to urbanization, industrialization, and environmental degradation, achieving this target becomes more challenging.
2. **Rising Food Prices:** Reduced agricultural land often leads to increased competition for remaining arable land, driving up land prices and consequently food prices. The World Bank reported that food prices rose by 23% globally between 2020 and 2021, largely due to supply chain disruptions exacerbated by land use changes (World Bank, 2021).
3. **Increased Dependence on Imports:** Countries experiencing significant land reduction may become more dependent on food imports, affecting their food sovereignty and security. The Global Food Security Index indicates that nations with shrinking agricultural sectors are more vulnerable to global price fluctuations and supply chain disruptions (Economist Intelligence Unit, 2020).
4. **Loss of Biodiversity:** The conversion of agricultural land for non-agricultural purposes can lead to habitat destruction and a decline in biodiversity. The United Nations Convention on Biological Diversity highlights that habitat loss is a leading cause of species extinction, which can impact ecosystem services crucial for agriculture, such as pollination and soil health (UN, 2020).
5. **Food Insecurity and Poverty:** The reduction in agricultural land disproportionately affects marginalized and smallholder farmers, exacerbating poverty and food insecurity. The International Fund for Agricultural Development (IFAD) notes that approximately 80% of the world's food is produced by smallholder farmers, who often rely on small parcels of land for their livelihoods. As these lands diminish, their ability to sustain themselves and their communities is severely compromised (IFAD, 2016).

Case Study of Tamil Nadu

In Tamil Nadu, the impact of agricultural land reduction on local food production, farmer livelihoods, and food security is profound. Data collected from local farmers and agricultural reports provides both statistical and qualitative insights.

1. **Statistical Analysis**
   - According to a survey conducted among 500 farmers in Tamil Nadu, 60% reported a decrease in crop yields due to the loss of agricultural land over the past decade (Tamil Nadu Agricultural University, 2022).
   - The average income of farmers has declined by approximately 30% due to reduced land availability and productivity, with many farmers shifting from traditional crops to cash crops to maintain profitability (Government of Tamil Nadu, 2021).
2. **Qualitative Insights:**
   - Many farmers expressed concerns about changing crop patterns as they adapt to the diminishing land available for cultivation. For example, farmers who traditionally grew paddy have shifted to less water-intensive crops like millets and pulses due to water scarcity and reduced land (Tamil Nadu Agricultural Department, 2021).
   - Interviews revealed that farmers are increasingly reliant on credit to maintain their operations, often falling into a cycle of debt as they attempt to adapt to changing conditions. This financial strain has led to

increased stress and, in some cases, mental health issues among farming communities (Indian Journal of Social Psychiatry, 2020).

3. **Local Insights:**
   - The unique challenges faced by farmers in Tamil Nadu include issues such as erratic rainfall patterns, soil degradation, and increased competition for land from urban development. Many farmers noted the difficulty in securing stable markets for their produce, further complicating their economic situations (Ranjithkumar & Ananth, 2022).
   - The reduction in land also impacts food security within local communities, as many households depend on locally grown crops for their nutrition. With fewer resources available, families face challenges in accessing a diverse diet, leading to nutritional deficiencies (National Sample Survey Office, 2019).

Regional Variations in Tamil Nadu

The challenges of agricultural land reduction in Tamil Nadu are not uniform and vary significantly across different regions:

1. **Delta Regions:** In the Kaveri Delta, where rice is a staple crop, farmers face severe challenges from urban encroachment and salinity intrusion due to rising sea levels. Many farmers have reported a decrease in crop yields and quality, necessitating a shift to more resilient crop varieties (Tamil Nadu State Action Plan on Climate Change, 2019).
2. **Hilly Areas:** In the Western Ghats, farmers have traditionally relied on cash crops like tea and coffee. However, land degradation and changing climate patterns have led to reduced productivity. Surveys show that over 40% of farmers in this region have experienced declining yields, prompting them to explore alternative livelihoods (Environmental Science & Policy, 2021).
3. **Dry Land Regions:** In areas such as Dindigul and Madurai, farmers face unique challenges related to water scarcity and land degradation. Here, a significant shift toward drought-resistant crops has been observed, with 70% of farmers reporting a change in crop patterns to adapt to less water availability (Indian Journal of Agricultural Sciences, 2020).
4. **Coastal Areas:** Farmers in coastal regions like Nagapattinam have reported increased vulnerability to climate change impacts, including flooding and erosion. With agricultural land being lost to these natural threats, many farmers are looking into alternative livelihoods, such as fisheries or aquaculture, to supplement their income (Tamil Nadu Coastal Zone Management Authority, 2020). The reduction of agricultural land has significant implications for global food production and security, as well as for local communities in Tamil Nadu. The challenges faced by farmers—ranging from decreased yields and income loss to shifting crop patterns—underscore the urgent need for adaptive strategies and supportive policies. Addressing these issues requires a multifaceted approach that considers the unique regional challenges within Tamil Nadu, ensuring the sustainability of agricultural practices while enhancing food security for future generations. By fostering resilience in farming communities and promoting sustainable land use practices, it is possible to mitigate the impacts of agricultural land reduction and secure the livelihoods of millions of farmers in Tamil Nadu and beyond.

Challenges to Global Food Security

Policy Gaps and Governance Issues

Global food security is increasingly threatened by policy gaps and governance issues related to land use. Conflicts between development and agricultural preservation are prominent in various contexts:

1. **Land-Use Regulations:** Many countries lack comprehensive land-use policies that balance agricultural needs with urban and industrial development. For instance, the Food and Agriculture Organization (FAO) has highlighted that many nations have outdated regulations that do not consider the increasing pressures of urbanization and industrialization on agricultural land (FAO, 2019). In India, the Land Acquisition Act and local zoning laws often prioritize economic development projects over agricultural sustainability, leading to the loss of fertile lands for non-agricultural purposes (Singh, 2020).

2. **Weak Enforcement:** Even where policies exist, weak enforcement often undermines their effectiveness. In Tamil Nadu, local governance structures frequently lack the capacity to implement land-use regulations effectively, resulting in unregulated land conversion. A report by the National Institute of Rural Development and Panchayati Raj found that over 60% of land conversion activities occurred without proper permits or assessments (NIRDPR, 2021).
3. **Lack of Stakeholder Engagement:** Effective governance requires the involvement of local communities in land-use planning. However, in many cases, farmers and local stakeholders are excluded from decision-making processes. This exclusion leads to policies that do not reflect the realities of agricultural communities, contributing to conflicts between land developers and farmers. Surveys conducted among farmers in Tamil Nadu reveal a pervasive feeling of disenfranchisement, as many feel their voices are not heard in policy discussions (Ranjithkumar & Ananth, 2022).
4. **Competing Interests:** There are often competing interests among various stakeholders, including government agencies, real estate developers, and agribusinesses. This competition can result in prioritizing short-term economic gains over long-term agricultural sustainability. Reports by environmental organizations indicate that decisions regarding land-use changes are often influenced more by political and economic pressures than by ecological considerations (Environmental Governance and Policy, 2020).

Environmental and Climatic Challenges

Climate change, soil degradation, and water scarcity are significant challenges that exacerbate food insecurity worldwide:

1. **Climate Change:** Climate change is altering agricultural productivity patterns globally. The Intergovernmental Panel on Climate Change (IPCC) has projected that rising temperatures could lead to a decrease in crop yields by up to 25% in some regions by 2050 (IPCC, 2019). Changes in precipitation patterns also lead to increased variability in crop production. In Tamil Nadu, primary data collected from farmers indicate that 75% have experienced unpredictable rainfall patterns, significantly impacting planting and harvesting schedules (Tamil Nadu Agricultural University, 2022).
2. **Soil Degradation:** Soil degradation, driven by unsustainable farming practices, urban encroachment, and deforestation, is a growing concern. According to the United Nations Convention to Combat Desertification, about 1.5 billion people are affected by land degradation, which undermines agricultural productivity (UNCCD, 2019). In Tamil Nadu, surveys show that 62% of farmers report declining soil health, leading to lower yields and increased dependency on chemical fertilizers, which further deteriorates soil quality (Tamil Nadu Agricultural Department, 2021).
3. **Water Scarcity:** Water scarcity is a pressing issue for agricultural sustainability. The World Bank estimates that by 2025, 1.8 billion people will live in regions with absolute water scarcity, which directly affects food production (World Bank, 2019). In Tamil Nadu, groundwater depletion is a significant concern, with over-extraction reported in several districts. A recent study found that nearly 40% of farmers face challenges in accessing sufficient water for irrigation, leading to reduced agricultural outputs (Indian Institute of Management, 2022).
4. **Pest and Disease Outbreaks:** Climate change also affects the prevalence and distribution of pests and diseases, further threatening agricultural production. The FAO has reported an increase in pest outbreaks as warmer temperatures create favorable conditions for pest proliferation (FAO, 2021). In Tamil Nadu, farmers reported a 30% increase in pest infestations over the past decade, impacting crop yields and increasing production costs (Tamil Nadu Agricultural University, 2022). The challenges to global food security are multifaceted, rooted in policy gaps, environmental issues, and socioeconomic barriers. Effective governance and stakeholder engagement are essential to balance agricultural preservation with developmental needs. Additionally, addressing environmental challenges, such as climate change and soil degradation, requires sustainable practices and innovative solutions. Finally, recognizing and overcoming cultural and socioeconomic barriers is crucial to promoting the adoption of modern agricultural practices. By addressing these challenges holistically, it is possible to work towards a more secure and sustainable food future for all.

Sustainable Solutions

Innovative practices are vital for enhancing productivity while preserving natural resources. Research and primary data have identified various innovative practices that showcase local adaptations and success stories:

1. **Agroecology:** Agroecological practices integrate traditional knowledge with modern agricultural techniques, focusing on sustainable land management. In Tamil Nadu, several farmers have adopted agroecological principles by implementing crop rotation and intercropping systems. A study conducted with 150 farmers revealed that those practicing agroecology reported an average yield increase of 20% while simultaneously improving soil health and biodiversity (Tamil Nadu Agricultural University, 2022).
2. **Organic Farming:** The shift towards organic farming is gaining traction as farmers seek to reduce dependency on chemical inputs. Primary data collected from a group of organic farmers in Tamil Nadu indicated that 80% experienced better market prices for their produce and enjoyed higher consumer demand (Government of Tamil Nadu, 2021). Success stories from districts like Kanyakumari demonstrate that organic farmers have increased their income by 30% compared to conventional farming (Tamil Nadu Agricultural Department, 2021).
3. **Rainwater Harvesting:** To combat water scarcity, many farmers have implemented rainwater harvesting systems. In regions like Dindigul, where rainfall patterns have become erratic, farmers have constructed check dams and percolation tanks to capture and store rainwater. Surveys show that these systems have improved irrigation access for 60% of farmers, resulting in enhanced crop yields and reduced water stress (Tamil Nadu State Action Plan on Climate Change, 2019).
4. **Integrated Pest Management (IPM):** IPM practices help reduce chemical pesticide use while maintaining crop health. A local initiative in Coimbatore has trained farmers in IPM strategies, emphasizing biological control methods and the use of resistant crop varieties. Farmers participating in the program reported a 40% reduction in pesticide application and a corresponding increase in pest control efficacy (Indian Journal of Agricultural Sciences, 2020).
5. **Precision Agriculture:** The adoption of precision agriculture technologies, such as soil moisture sensors and GPS-guided equipment, has begun to gain momentum among tech-savvy farmers. Preliminary data indicates that farmers employing precision farming techniques have increased their resource use efficiency by 25%, leading to cost savings and enhanced productivity (Economist Intelligence Unit, 2020).

Policy Recommendations

To promote sustainable land use and effective governance, several policy recommendations emerge from primary data insights:

1. **Strengthening Land-Use Policies:** Governments should develop comprehensive land-use policies that prioritize sustainable agriculture and incorporate stakeholder input. Creating a framework that balances urban development and agricultural preservation can help mitigate land conversion pressures. Engaging local communities in policy formation is essential to ensure that regulations reflect the realities faced by farmers (National Institute of Rural Development and Panchayati Raj, 2021).
2. **Supporting Sustainable Practices:** Policies should incentivize the adoption of sustainable agricultural practices. This can be achieved through financial subsidies for organic inputs, training programs on agroecological techniques, and support for rainwater harvesting projects (World Bank, 2021). The establishment of cooperative models can also enhance resource sharing and collective marketing for farmers embracing sustainable methods (International Fund for Agricultural Development, 2016).
3. **Enhancing Access to Resources:** Improving access to credit, education, and extension services is critical for smallholder farmers. Microfinance initiatives tailored to the agricultural sector can empower farmers to invest in sustainable technologies (United Nations, 2020). Furthermore, government partnerships with local NGOs can enhance agricultural extension services, ensuring that farmers receive timely and relevant information (Environmental Governance and Policy, 2020).
4. **Promoting Research and Development:** Investment in agricultural research and development should focus on sustainable technologies and local crop varieties. Collaborations between research institutions, government agencies, and farmer cooperatives can facilitate the development of solutions that are culturally appropriate and economically viable (Food and Agriculture Organization, 2017).

5. **Climate Resilience Planning:** Policies must integrate climate resilience strategies into agricultural planning. This includes promoting climate-smart agriculture techniques, establishing climate adaptation funds for farmers, and developing early warning systems for extreme weather events (Intergovernmental Panel on Climate Change, 2019). Engaging local stakeholders in resilience planning ensures that solutions are context-specific and feasible (United Nations Convention to Combat Desertification, 2019).

Community Engagement

Findings from primary data emphasize the importance of community involvement in agricultural decision-making processes:

1. **Participatory Approaches:** Engaging farmers in participatory planning fosters ownership and accountability in agricultural initiatives. Community-based workshops and forums can serve as platforms for farmers to share their experiences and voice their concerns, leading to more culturally appropriate solutions (Tamil Nadu Coastal Zone Management Authority, 2020).
2. **Cultural Sensitivity:** Solutions should respect local customs and traditional practices. Primary data collection reveals that farmers are more likely to adopt new technologies and practices when they align with their cultural values (Indian Journal of Social Psychiatry, 2020). For example, incorporating traditional knowledge in agroecological practices has proven successful in many regions, as farmers feel more comfortable with familiar techniques (Environmental Science & Policy, 2021).
3. **Building Local Capacity:** Community engagement should focus on building the capacity of local organizations and cooperatives. Strengthening these entities enables farmers to collaborate more effectively, share resources, and advocate for their interests (Singh, 2020). Initiatives that promote peer-to-peer learning and knowledge sharing can enhance the resilience and adaptability of farming communities (Indian Institute of Management, 2022).
4. **Feedback Mechanisms:** Establishing feedback mechanisms allows farmers to communicate their experiences and challenges related to agricultural policies and practices. This feedback can inform ongoing policy adjustments and improve program effectiveness. Regular evaluations and community assessments ensure that agricultural interventions remain relevant and responsive to local needs (Tamil Nadu Agricultural University, 2022).

Summary of Findings

This analysis of agricultural land reduction and its implications for food security has revealed several critical insights derived from both primary and secondary data.

1. **Global Trends:** Approximately 5 billion hectares of agricultural land exist globally, yet challenges such as urbanization, climate change, and soil degradation are leading to significant reductions in cropland. The per capita availability of cropland has decreased from 0.45 hectares in 1961 to 0.21 hectares in 2016, indicating increasing pressure on existing agricultural resources (Food and Agriculture Organization, 2017).
2. **Local Impacts in Tamil Nadu:** In Tamil Nadu, the average size of operational holdings has consistently declined, from 2.28 hectares in 1970-71 to 1.08 hectares in 2015-16 (Government of Tamil Nadu, 2021). Primary data gathered from farmers highlight the adverse effects of reduced agricultural land on local food production, livelihoods, and food security. Many farmers report changing crop patterns and loss of income, prompting a need for adaptation strategies (Tamil Nadu Agricultural Department, 2021).
3. **Sustainable Practices and Innovations:** Innovative agricultural practices, such as agroecology, organic farming, and rainwater harvesting, have emerged as viable solutions for enhancing productivity while promoting sustainability. Success stories from local farmers demonstrate the effectiveness of these practices in improving yields and income (Tamil Nadu Agricultural University, 2022).
4. **Policy Recommendations and Community Engagement:** The findings emphasize the necessity for improved governance and policy frameworks that prioritize sustainable land use and involve local stakeholders (National Institute of Rural Development and Panchayati Raj, 2021). Effective community engagement in agricultural decision-making processes ensures that solutions are culturally appropriate and feasible, aligning with local practices and values (Environmental Governance and Policy, 2020).

Future Directions

Moving forward, several areas warrant further research to address the ongoing challenges of agricultural land reduction and food security:

1. **Longitudinal Studies:** Conducting longitudinal studies to monitor changes in land use, agricultural practices, and food security outcomes over time will provide valuable insights into the effectiveness of implemented strategies (Intergovernmental Panel on Climate Change, 2019). These studies can help identify trends and inform policy adjustments.
2. **Impact Assessments:** Future research should focus on assessing the long-term impacts of innovative agricultural practices on sustainability, productivity, and farmer livelihoods. Evaluating the effectiveness of community-led initiatives and sustainable practices will be crucial in scaling successful models (Indian Institute of Management, 2022).
3. **Climate Adaptation Strategies:** Research into adaptive agricultural practices in the context of climate change is vital. Investigating how different regions are responding to climatic challenges and the effectiveness of these responses can offer valuable lessons for policymakers and farmers alike (Tamil Nadu State Action Plan on Climate Change, 2019).
4. **Socioeconomic Dimensions:** Exploring the socioeconomic barriers to adopting modern agricultural practices and the role of gender in farming systems can provide deeper insights into the complexities of agricultural sustainability. Understanding the perspectives of marginalized groups will be essential in developing inclusive solutions (Indian Journal of Social Psychiatry, 2020).
5. **Primary Data Collection:** Ongoing primary data collection is necessary to continuously assess and adapt strategies addressing agricultural land reduction and food security. Engaging farmers, local organizations, and communities in the data collection process will ensure that the information gathered reflects local realities and needs (Tamil Nadu Agricultural University, 2022). Addressing the challenges of agricultural land reduction and food security requires a multifaceted approach that combines innovative practices, supportive policies, and active community engagement. By fostering collaboration among stakeholders and emphasizing the importance of continuous research, it is possible to work toward a sustainable and secure food future for all.

Table 1: Agricultural Land in Global and India

Sl. No.	Category	Statistic
1.	**Global Agricultural Land**	Approximately **5 billion hectares**, or **38%** of the world's land surface.
2.	**Cropland**	About **one-third** of agricultural land, with **10%** of cropland consisting of permanent crops.
3.	**Cropland per Capita**	Decreased from **0.45 hectares per capita** in **1961** to **0.21 hectares per capita** in **2016**.
4.	**Cropland Growth (2001-2022)**	Total cropland area grew by **80 million hectares**, or about **5%**.
5.	**Permanent Meadows and Pastures (2001-2022)**	Lost **170 million hectares**, or a decrease of **6%**.
6.	**Land Productivity (2001-2022)**	Grew by nearly **60%**, from **USD 546 per hectare** to **USD 872 per hectare**.
7.	**India's Average Operational Holdings**	- **1970-71**: **2.28 hectares** - **1980-81**: **1.84 hectares** - **1995-96**: **1.41 hectares** - **2015-16**: **1.08 hectares**

ABSTRACT

In this paper, by analyzing the properties of the Portable Executable (PE) headers obtained from the parser, accuracy has been obtained in malware classification and detection using machine learning algorithms on Gaussian Naïve Bayes classifier, Random Forest classifier, Decision Tree classifier, Linear Support Vector classifier, K-nearest Neighbors classifier and Deep Learning algorithms on Convolutional Neural Network (CNN) classifier. The results obtained demonstrate the accuracy with which our model can be developed to categorize malware families. The results show great accuracy in malware classification and detection using our model developed on the various classifier. Our experiment results show that the PE-Header-Based approach achieves 99.781954% test accuracy and 0.009278% test loss for distinguishing between benign and malicious executables.

Keywords: Portable Executables-Header, Malware Detection, Decision Tree, Random Forest, Convolutional Neural Network (CNN)

INTRODUCTION

The ever-increasing risk of malware (**mal**icious soft**ware**) attacks has been a significant threat to internet users around the globe. Malware remains a key method used by cybercriminals to carry out harmful activities. The McAfee ATR Threat Reports (2021) highlighted a significant rise in PowerShell threats, MacOS malware, Office malware, mobile malware, ransomware, and Linux malware during the latter half of 2020. The AV-Test statistics report (2021) revealed the detection of nearly 100 million new malware files in the first half of 2021. Similarly, the Kaspersky Security Network (IT threat evolution, 2021) reported attempts to deploy money-stealing malware on the computers of 119,252 unique users in Q2 of 2021. These findings underscore the increasing threat malware poses to internet

users. It is important to note that with the steady increase in the sheer number of malware, their families and their variants are also constantly evolving according to the aforementioned reports. The functionalities and capabilities of malware can vary depending upon various factors such as the intended platform for malware, its types, its family, and other malware characteristics. Examples of malware include adware, trojans, backdoors, ransomware, spyware, worms, and more. Malware can be categorized into families and variants based on factors like its codebase, the groups that develop it, and other elements (SANS Webcast Recap, 2020). To evade detection, malware creators employ obfuscation techniques such as dead-code insertion, instruction reordering, and control flow flattening (Alrabaee et al., 2018). These techniques, combined with frequent updates to the malware codebase, make it difficult to accurately classify malware into specific families. Malware poses massive security risks to governments, businesses, and individual users. Several approaches exist to combat malware attacks, with accurate malware classification being a key component of these strategies. Security analysts and researchers analyze malware files to understand their behavioral characteristics and purpose, which helps them build better defenses against other malware files from the same family. Malware analysis is generally divided into two main types: static analysis and dynamic analysis. Static analysis focuses on examining the malware's binary content without running it. On the other hand, dynamic analysis involves analyzing the malware's behavior while/after executing it in memory. Static analysis is faster than dynamic analysis, but it is not resilient against sophisticated code obfuscation techniques. On the other hand, dynamic analysis is often unaffected by code obfuscation and polymorphic malware (Gibert et al., 2020b) but is slower in comparison. Modern malware detectors employ a variety of detection techniques. Most of the detectors must determine the type of the file and then parse the file such as extracting the contents and/or finding the embedded item. Therefore the antivirus scanners need to parse a variety of formats, which makes the antivirus more and more complex [1]. However, the simplest malware can evade sophisticated AVs [2]. PE is a file format that is standardized by the Microsoft Windows operating system for executables, dynamically linked libraries (DLL), and object files [3]. Zubair et al. An accurate and real-time PE-Miner framework was introduced, which automatically extracts distinguishing features from PE files to detect malware. They completed a single-pass scan of all executables in the dataset and achieved more than 99% detection rate with less than 0.5% false alarm rate [4].

PORTABLE EXECUTABLE (PE)

The PE file format holds essential information that the Windows OS needs to properly load and execute the file. Gaining an understanding of the various components of a PE file is crucial for effective malware analysis. The Portable Executable (PE) format is used for executables, object code, DLLs, and other files in both 32-bit and 64-bit Windows operating systems, as well as in UEFI environments, as illustrated in Figure 1. The PE format is a data structure that contains the essential information needed by the Windows OS loader to handle the executable code. This includes references to dynamic libraries for linking, API export and import tables, resource management data, and thread-local storage (TLS) data.

PE-HEADER-PARSER

The PE file header consists of an MS-DOS stub, the PE signature, the file header, and an optional header. Every image file has an optional header that provides information to the loader. For image files, this header is required. The optional header itself has three major parts: Standard fields, Windows-specific fields, and Data directories [6]. The PE headers contain important information about a file such as the number of sections, the size of the data, etc. Firstly, the Parser imports the PE file and parses all the files from the malware dataset and benign dataset respectively. Then the Parser extracts the features from the file header, and optional header, and compares the differences between malware and benign files.

- File Header: The file header consists of the following features: Machine, Number Of Sections, Time Date Stamp, Pointer To Symbol Table, Number Of Symbols, Size Of Optional Header, and Characteristics are shown in figure 2.
- Optional Header: The Optional Header consists of standard fields (8 features), Windows-specific fields (21 features), and data directories. It is interesting to note that the Size Of Initialized Data in some of the malicious executables are equal. The PE header contains information that concerns the entire file rather than individual pieces that will be coming up later are shown in Figure 3. The optional PE header is located immediately after

the standard PE header. Its size is specified in the PE header. There are a few other useful memory-related variables including the size and virtual base of the code and data, as well as the application's version number, entry point, and directories.

Dataset

The MalHeader dataset on Malware detection was collected to create the anticipated model for this investigation. The collection of the dataset has 55 characteristics. A total of 29807 records from 7 malware families with Benign 1877 records, RedLine Stealer 5047 records, Downloader 4864 records, RAT 4973 records, Banking Trojan 5104 records, Snake Key Logger 4236 records, and Spyware 3706 records are shown in Figure 4. Using the parser, the 55 characteristics resources of the file header, and optional header are extracted from the collected dataset called MalHeader.

MALWARE CLASSIFIERS AND DETECTION

The dataset was subjected to six classification algorithms to compare accuracy and other statistical factors. The techniques used are

- Gaussian Naïve Bayes Classifier
- Random Forest Classifier
- Decision Tree Classifier
- Linear Support Vector Classifier
- K-nearest Neighbors Classifier
- Convolutional Neural Network Classifier

The algorithms were compared using measures for evaluating their performance. This part offers a succinct description of six performance assessments.

$$Accuracy = \frac{TP + TN}{TP + TN + FP + FN}$$

$$Sensitivity = \frac{TP}{TP + FN}$$

$$Specificity = \frac{TN}{TN + FP}$$

$$Precision = \frac{TP}{TP + FP}$$

$$Recall = \frac{TP}{TP + FN}$$

$$F - Measure = \frac{2\ x\ Precision\ x\ Recall}{Precision + Recall}$$

The dataset's performance is shown by performance metrics. The presentation of the suggested system was assessed using the following criteria: Sensitivity, Specificity, Accuracy, F-measure, Precision, and Recall. Conventional count values, such as True Positive (TP), True Negative (TN), False Positive (FP), and False Negative (FN), are utilized here. These metrics are carefully utilized to evaluate the algorithms' performance when compared to the analysis's evaluation of the data that was selected set. Split the dataset into separate training sets with 80% of the data and test sets with the remaining 20% of the data. A classification report is another way to evaluate the classification model's performance. It displays the precision, recall, f1 score, and support scores for the model.

Gaussian Naïve Bayes Classifier

In machine learning, Naïve Bayes classification is a straightforward and powerful algorithm for the classification task. Naïve Bayes classification relies on Bayes' theorem, assuming strong independence among features. This method yields effective results, particularly in textual data analysis, such as Natural Language Processing. Naïve Bayes models are also referred to as simple Bayes or independent Bayes, all of which denote the use of Bayes' theorem in the decision-making process of the classifier. Naïve Bayes classifier applies the Bayes' theorem in practice. This classifier leverages the principles of Bayes' theorem in the field of machine learning. Naïve Bayes Classifier uses the Bayes' theorem to predict membership probabilities for each class such as the probability that a given record or data point belongs to a particular class. The class with the highest probability is deemed the most probable class. In this paper, a Gaussian Naïve Bayes Classifier model is built to predict whether a file is infected by malware or not. The model yields a very good performance as indicated by the model accuracy which was found to be 0.1563, the Training-set accuracy score was found to be 0.1641, the Training set score was found to be 0.1641, the Test set score was found to be 0.1563 and Null accuracy score was found to be 0.7582.

Random Forest Classifier

Random Forest is an ensemble learning technique for data classification [5]. When it is in the training stage, it generates a lot of trees as well as a forest of decision trees. During the testing phase, each tree in the forest predicts the class label for every occurrence. Majority voting is utilized to determine the ultimate choice for each test data when each tree predicts a class label. When it comes to the test data, the class label with the most votes is deemed to be the most appropriate one. This cycle is repeated for each piece of data that is collected. In this paper, Random Forest Classifier is used to predict the malicious malware types and also built two models, one with 10 decision trees and another one with 100 decision trees. The Random Forest model is used to find only the important features, build the model using these features, and see its effect on accuracy. The accuracy of the model with all the variables taken into account is shown in the Classification Report. Confusion matrix and classification report are other tools to visualize the model performance. They yield good performance with a Model accuracy score of 10 decision-trees would be 0.9970 and a Model accuracy score of 100 decision-trees would be 0.9970.

Decision Tree Classifier

Among the most popular and established machine learning algorithms is Decision Tree. A decision-making logic known as a decision tree is designed to assess and correlate data item categorization findings into a tree-like structure [6]. A decentralized graph often consists of several layers of nodes, with the root or parent node at the top and other levels being child nodes. All internal nodes with at least one child node indicate the assessment of input variables or characteristics. The classification algorithms branch to the appropriate child node based on the evaluation result, and this process of branching and evaluation continues until the leaf node is reached. The decision's results are denoted by the leaf or terminal nodes. Decision Tree is widely acknowledged as being simple to comprehend and acquire. Decision tree classifiers are regarded to be a standout of the most well-known methods of data classification representation of classifiers. Researchers from diverse fields and backgrounds have addressed the challenge of enhancing decision trees using available data, including machine learning, pattern recognition, and statistics. This paper offers a comprehensive examination of decision trees, discussing the application of various types of datasets and analyzing their findings. Decision tree classifiers are known for their enhanced view of performance outcomes. In this paper, I build a Decision-Tree Classifier model to predict the malicious malware types. I build two models, one with the criterion Gini index and another one with the Criterion Entropy. The model accuracy score with criterion Gini index would be 0.8804, the Training-set accuracy score would be 0.8745, the Training-set score would be 0.8745, and the Test set score would be 0.8804. Also, the Model accuracy score with criterion Entropy would be 1.0000, the Training-set accuracy score would be 1.0000, the training-set score would be 1.0000, and the Test-set score would be 1.0000. The model yields a very good performance as indicated by the model accuracy in both cases. The confusion matrix and classification report yield very good model performance.

Linear Support Vector Classifier (Linear SVC)

Linear SVC is a powerful tool for classification tasks, especially when dealing with large datasets and linearly separable data. Its flexibility in terms of penalties and loss functions, as well as its scalability. So, we must explore a confusion matrix that provides better guidance in selecting models. The confusion matrix and classification report yield very good model performance. Linear Support Vector Accuracy would be 0.37353.

KNN Classifier

K Nearest Neighbor (KNN) is a supervised machine learning algorithm that can be used for both classification and regression. KNN is also denoted as a nonparametric method which means it does not make any assumptions on data. On the other hand, a parametric method makes some strong assumptions. For example, if you want to fit a probability distribution to your data and assume a Gaussian distribution, this is a parametric method. You only need to compute the mean and standard deviation. If your assumption is consistent with your data, then your method gives good results, otherwise your method may fail. As a nonparametric method, KNN is suitable for both linear and nonlinear cases. K is a hyperparameter that determines the sensitivity of KNN. As K increases, the number of voting samples increases, decreasing the sensitivity. Large K results in low variance, and high bias, and small K results in high variance, and low bias. We must explore a confusion matrix that provides better guidance in selecting models. The classification report yields very good model performance. Linear Support Vector Accuracy would be 0.72.

Convolutional Neural Network Classifier

Convolutional neural networks (CNNs) are a powerful type of artificial neural network that is particularly well-suited for malware recognition and processing tasks. CNNs have been shown to be very effective in a wide range of applications, including malware classification, malware detection, malware segmentation, and malware generation. The confusion matrix and correlation matrix yield very good model performance. The correlation matrix of the CNN algorithm for the PE-Header Malware Detector is shown in Figure 12. The training and validation for CNN accuracy of the Malicious PE-Header Detector are shown in Figure 13 and the training and validation for CNN loss of the Malicious PE-Header Detector are shown in Figure 14. The accuracy of the model with all the variables taken into account is shown in the Classification Report. Confusion matrix and classification report are other tools to visualize the model performance. They yield good performance with a Model accuracy score of 99.6813%.

COMPARISON AND DISCUSSION

A MalHeader dataset on Malware detection has been prepared for this work. We analyzed the various cross-validation performance factors to find the optimum method for predicting the occurrence of Malicious Malware behaviors. The following outcomes are the classification results of different algorithms. Gaussian Naïve Bayes and Linear Support Vector perform worse than the K-nearest Neighbors algorithm when accuracy, precision, recall, and F-measures are taken into account, as shown in Table 7 and Table 8. Simultaneously, 99.6981% accuracy is shown by the Random Forest algorithm, 99.6813% accuracy is shown by the CNN algorithm and 100% performance is shown by the Decision Tree algorithm.

CONCLUSION

Given the escalating threat of malware attacks, developing an efficient malware classifier for prompt detection is crucial. Our experiments demonstrate that our models can accurately classify recent and emerging malware families based on just a few instances. The Malware Detection algorithms have proven effective in classifying sophisticated malware from benchmark datasets. A major problem with traditional malware detection classifiers is the need to re-train the classifier when a new malware family emerges. Our architectures surpass the leading malware detection methods and achieve high accuracy in conventional malware classification. Our experiments reveal that our models can accurately classify recent and emerging malware families using only a few instances.

ABSTRACT

Breast cancer is a primary cause of death for women and is defined by the unchecked proliferation of aberrant cells within the breast. One important target for the treatment of breast cancer has been discovered as aromatase, an enzyme essential to the manufacture of oestrogen. In particular, for postmenopausal women, aromatase inhibitors (AIs) have shown promise as treatment for hormone receptor-positive breast cancer. These inhibitors minimise the risk of breast cancer by reducing the production of oestrogen. This review focusses on the latest molecular developments in aromatase inhibitor therapy and the available therapeutic choices for breast cancer. Novel chemicals, multi-target medications, and creative strategies have been investigated in recent research to address the drawbacks of existing AI therapies, such as resistance and adverse effects. These developments hold promise for improving treatment outcomes and patient quality of life. Ongoing research is crucial for overcoming challenges related to side effects and resistance, with several promising strategies and compounds under investigation to enhance the efficacy and tolerability of breast cancer therapies.

Keywords: Breast cancer, aromatase, aromatase inhibitors, recent research, management therapies.

INTRODUCTION

The unchecked proliferation of aberrant cells in the breast, which results in tumour formation, is the hallmark of breast cancer. These malignant cells usually start off in the breast's milk ducts or lobules that produce milk. Globally, 2.3 million women were diagnosed with breast cancer as of 2022, and 670,000 of them have passed away from the disease. Any age after puberty can be affected by breast cancer in women, and older people have greater incidence rates than any other country. Breast cancer treatments that target the enzyme aromatase, which is essential for the last stage of oestrogen production, have shown promise. The production of oestrogen is inhibited by blocking aromatases, which lowers the risk of breast cancer.This overview emphasizes the current treatment options and recent molecular advancements in aromatase inhibitor therapy for breast cancer management.

AROMATASE

Aromatase, a member of the cytochrome P450 superfamily enzyme complex, is essential for the conversion of androgen to estrogen shown in Fig 1. It is present in multiple tissues, including the granulosa cells of the ovary, brain, fat, placenta, blood vessels, skin, bone, and endometrium. The expression of aromatase is controlled by the CYP19A1 gene[1]. Aromatase is a monomeric enzyme made up of one polypeptide chain with 503 aminoacid residues and a hem-prosthetic group[2].

MANAGEMENT THERAPIES

Surgery options include lumpectomy, which involves removing the tumor along with a small amount of surrounding tissue, or mastectomy, where one or both breasts are removed. Radiation therapy is frequently administered after surgery to target any remaining cancer cells in the breast, chest wall, or underarm area. Chemotherapy is a systemic treatment that employs drugs to kill or slow the growth of cancer cells, primarily used for more aggressive cancers or when cancer has metastasized[3]. Hormonal therapy is used for hormone receptor- positive cancers, working to block or reduce estrogen levels to inhibit the growth of cancer cells. Common medications in this category are tamoxifen and aromatase inhibitors. Targeted therapy involves drugs that specifically attack cancer cells with particular characteristics or mutations, such as trastuzumab (Herceptin) for HER2-positive breast cancer[4]. Immunotherapy harnesses the body’s immune system to combat cancer and is more prevalent in treating specific types of breast cancer, including triple-negative breast cancer. Aromatase inhibitors, although beneficial, may lead to adverse effects such as joint discomfort, decreased bone density, and cardiovascular complications[5]. Recent research has concentrated on addressing these side effects to enhance the overall well-being of patients. A study featured in Breast Cancer Research and Treatment indicated that administering bisphosphonates, which are medications designed to avert bone loss, in conjunction with aromatase inhibitors, effectively preserved bone density in postmenopausal women[6]. Fig 2.

AROMATASE INHIBITORS

Gynecomastia in men and breast cancer in postmenopausal women and men are treated with a family of drugs called aromatase inhibitors. Off-label use of these supplements can also be used to reduce the conversion of estrogen when taking exogenous testosterone. Chemoprevention is another use for them among women who have a high chance of getting breast cancer[7]. The ovaries continue to produce estrogen in spite of these medications. They only decrease estrogen levels in women (such as those who have already whose ovaries aren't producing estrogen. They are, therefore, primarily utilized on women who have previously experienced menopause. Types of Aromatase Inhibitors are Steroidal (Type I) Inhibitors and nonsteroidal inhibitors. Steroidal inhibitors resemble the natural ligand androstenedione and irreversibly bind to the enzyme, leading to its inactivation. Examples include formestane (withdrawn) and exemestane[8]. Fig 3. Non-Steroidal (Type II) Inhibitors are bound non-covalently to the enzyme's heme group, blocking androgen binding. They are reversible inhibitors. Examples include fadrozol, vorozole, rogletimide, letrozole, and anastrozole[9]. Fig 4. Research has indicated that the following AIs can reduce the risk of breast cancer: Rememestane (Aromasin) with Anastrozole (Arimidex) Similar to tamoxifen, these medications are used less frequently to reduce the risk of breast cancer and more frequently to treat hormone receptor-positive breast

cancer[10]. Three aromatase inhibitors are FDA approved and have become the first-choice endocrine drugs for postmenopausal breast cancer patients due to their superior activity and better tolerability compared to tamoxifen[11]. Aromatase inhibitors (AIs) are recognized as essential elements in the management of estrogen receptor-positive (ER+) breast cancer, especially among postmenopausal women. These agents effectively modulate estrogen synthesis and exhibit greater efficacy than alternative therapies, including Tamoxifen and Megestrol Acetate[12]. Nevertheless, the third generation of AIs, which is regarded as the primary treatment option for these malignancies, encounters obstacles such as adverse effects and the development of resistance. This situation has led to ongoing investigations aimed at identifying more effective and safer treatment alternatives[13]. Recent research has focused on innovative compounds and multi-target drugs to overcome these challenges. For example, the compound 1α,2α-epoxy-6-methylenandrost-4-ene-3,17- dione (Oxy) has demonstrated encouraging anticancer activity against breast cancer cell lines that are resistant to AIs, indicating its potential for future therapeutic use[14]. Additionally, polyisoprenylated cysteinyl amide inhibitors (PCAIs) have shown considerable effectiveness in reducing cell viability and may serve as viable alternative treatments for AI-resistant breast cancer. The advancement of next-generation endocrine therapies and specific inhibitors, such as PIK3α-specific inhibitors and selective estrogen receptor degraders, is also underway to enhance outcomes in hormone-receptor-positive (HR+) breast cancers, particularly those harboring mutations that contribute to resistance against existing therapies[15]. The creation of new molecules with multi-target capabilities, such as Oxymestane-D1, could provide improved efficacy and reduced toxicity, thereby offering safer and more effective treatment options[16]. Furt.ermore, the investigation of unconventional sources, such as cellulose nanocrystals (CNCs) derived from plant waste, as potential aromatase inhibitors underscores the innovative strategies being employed to improve breast cancer treatment[17]. Additionally, it is vital to address the side effects associated with AI therapy, including arthralgia and musculoskeletal symptoms, as these are prevalent reasons for discontinuation of treatment[18]. A comprehensive understanding of genetic predispositions and molecular mechanisms is essential in this context.

Pyridine-Based Dual Binding Aromatase Inhibitors

The development of pyridine-based dual binding inhibitors is a noteworthy development in the field of aromatase inhibitor design. These novel substances are made especially to interact with the aromatase enzyme's haem group and access channel. 4-bromophenyl)(6-(but-2-yn-1- yloxy)benzofuran-2-yl)(pyridin-3-yl)methanol is a prime example of such a chemical. The pyridine ring integrated with the alkyne chain and benzofuran backbone of this compound improves the inhibitor's binding affinity and selectivity[19]. Based on computational investigations, these structural elements enable efficient interaction with different access channels in the enzyme, resulting in an IC_{50} value of 0.83 nM, which is similar to letrozole (IC_{50} of 0.70 nM)[20].Fig 5.

Imidazole-Based Multi-Target Inhibitors

Making imidazole-based inhibitors that also target the enzymes that catalyse monoamine oxidase (MAO) is a viable alternative. By concurrently suppressing both aromatase and MAO-B, these dual-action inhibitors are intended to reduce the neurotoxic adverse effects that are frequently linked to standard AIs. Compounds with strong dual inhibitory activities are produced when a thiazolylhydrazone group, which inhibits MAO-B, is combined with an imidazole ring, which is recognised for its aromatase inhibitory activity[21]. One such substance, in particular, showed promise for combination anticancer and neuroprotective therapy when it demonstrated an IC_{0} of 20 nM for aromatase inhibition and high antiproliferative activity against the MCF-7 breast cancer cell line[22]. Fig 6.

Sulfonyl and Amide Derivatives

Additionally, studies have concentrated on derivatives containing amides and sulfonyl as possible AIs. These substances differ structurally from traditional artificial intelligence agents (AIs), possessing amide and sulfonyl groups that enhance their inhibitory efficacy. With an IC_{50} value of 16.50 μM, a particular derivative from this class has demonstrated high activity against a variety of cancer cell lines, including breast cancer; this value is quite similar to the efficacy of letrozole (IC_{50} = 15.60 μM)[23]. These derivatives' adaptable structures enable the pharmacokinetic characteristics to be precisely tuned, providing a potentially fruitful path for the creation of AIs for the future generation[24]. Fig 7.

RECENT RESEARCH

Recent progress in the area of aromatase inhibitors (AIs) for breast cancer treatment has concentrated on tackling resistance and managing side effects of existing treatments, while investigating new substances and mixtures for improved results. The broad action capability of Oxymestane-D1, a derivative of Exemestane, has shown encouraging outcomes on both cells that produce high levels of aromatase and those resistant to AI treatment. This move towards creating drugs with multiple targets promises greater effectiveness and reduced side effects[25]. Moreover, polyisoprenylated cysteinyl amide inhibitors (PCAIs) are being considered as possible solutions for breast cancer that are resistant to AI, showing strong potential for decreasing cell growth and impacting important signaling pathways in breast cancer cells exposed to long-term letrozole. This indicates that PCAIs might be a suitable option to overcome resistance to AI[26]. In the realm of clinical trials, the AMEERA-6 Phase 3 study is comparing the effectiveness of amcenestrant with tamoxifen in patients who had to stop adjuvant AI therapy because of adverse effects. This study highlights the importance of finding alternative treatments when AI therapy is not well-tolerated. Additionally, the exploration of cellulose nanocrystals (CNCs) from chicory plant waste as a new type of aromatase inhibitor. Their research indicates that CNCs could effectively block the aromatase enzyme, suggesting a fresh, potentially eco-friendly strategy for treating hormone receptor- positive breast cancer[27]. In conclusion, aromatase inhibitors (AIs) play a crucial role in managing estrogen receptor- positive (ER+) breast cancer, particularly in postmenopausal patients. While current AIs face challenges such as side effects and resistance, ongoing research is focusing on developing novel compounds and multi-target drugs to improve efficacy and tolerability. Recent studies have shown promising results with compounds like oxy and polyisoprenylated cysteinyl amide inhibitors (PCAIs), offering potential alternatives for AI-resistant breast cancer. Additionally, exploration of non-traditional sources like cellulose nanocrystals (CNCs) as potential AIs highlights innovative approaches to enhance breast cancer treatment. Addressing side effects and developing personalized treatment strategies remain crucial for improving patient compliance and quality of life in breast cancer management.

ABSTRACT

Many major cities around the world have implemented tree-planting programs based on the perceived environmental and social benefits of urban forests. Urban trees perform many useful functions, including mitigating climate change through carbon sequestration, improving air quality by reducing air pollution, protecting biodiversity, and providing ecosystem goods to city dwellers. . It also has aesthetic, socio-religious and recreational value in the urban context. This work aimed to documentation and identification of trees used for various ailments in Shivamogga.. A survey was conducted during Dec-2022 to November-2023. In order to make an inventory of herbal remedies commonly used in the treatment diseases. The present study was undertaken to record the medicinal use of urban trees from Shivamogga of Karnataka. The present investigation comprises 89 species, in which about 73.86% are indigenous species. The other 26.13% involves exotic and introduced species are distributed in 72 genera belonging to 36 families. For each species botanical name, family, vernacular name, parts used, methods of preparation, mode of administration, ailments and diet regime are provided Different parts of medicinal plants were used as medicine by the local traditional healers. The leaves were most regularly used for the treatment of diseases followed by fruit, root, bark, rhizome, seed, stem, whole plant, bulb, latex, tuber, grain, pulp, flower and fiber.

Keywords: Survey, Documentation, Urban trees, Medicinal uses

INTRODUCTION

Rapid urbanization is destroying natural ecosystems and degrading the environmental quality of towns and cities (Folke Carl et al.,2004; Gregg Edward, 2003, Alberti Marina,2005 and Marzluff, 2004).. Most of the cities have been experiencing exceptional growth and severe environmental degradation including noise pollution, vehicular pollution, soil erosion, habitat loss, and species extinction (Zipperer Wayne,2011). In spite of their eco-sociological

importance, urban trees have not received much scientific attention in India. The plants used by primitive and aboriginal people for medicine. Medicinal plants, possessing therapeutic properties form the backbone of traditional medicine. India is rich in medicinal plants and floristic wealth. It has been estimated that traditional healers in India use approximately about 2500 species of medicinal plants, in which few more than 100 species serve as regular sources of medicine (Prashanthkumar and Vidyasagar ,2008). Rapid urbanization is bringing complex changes to ecology, economy and society at local, regional, and global scales (De Fries and Pandey, 2010). Conservation and restoration of urban green spaces comprising of urban trees and forests are one important aspect of improving the environmental quality of urban area. The term 'urban trees' generally includes trees growing both within the built environment as well as on the road-side and public places in urban systems. In spite of their eco-sociological importance, urban trees have not received much scientific attention in India. Further documentation of indigenous and traditional knowledge is very important for future critical studies leading to sustainable utilization of natural resource and to face the challenges of biopiracy and patenting indigenous and traditional knowledge by others (Ourlad Alzeus et.,al. 2018) The present investigation is an effort to document and medicinal uses to cure various ailments.

MATERIALS AND METHODS

Study area

I selected Shivamogga which is located almost in Central part of Karnataka, occupies an areas of 1058,000 hectares, it lies between 74°38′-76°04 North latitude and 13°27′-14°39′ East longitude.

METHODOLOGY

Twenty of the major roads of Shivamogga town, which together cover the different locations of the town, were selected for tree enumeration. All plants having an approximate girth of more than 15 cm. were considered as trees. All such trees visible on either side of the entire length of the selected roads were noted and their numbers counted, while walking from one end of the road to the other. They included trees occurring on road sides, parks and also inside the compounds of both public and private buildings. Trees were identified with the help of local flora and other relevant literature (Cooke, 1967; Bhat, 2003; Swaminathan & Kochhar, 2003,).

RESULTS AND DISCUSSION

The preliminary data on the species diversity of urban trees of Shivamogga town comprises of 89 species. These species represent a total of 72 plant genera and 36 families. A list of all these trees with their family, and common name provided as **Table 1**. A total of 1876 trees belonging to all the species were enumerated during the present study. The tree species diversity of Shivamogga town is high when compared to the smaller area of the town. Majority of the recorded tree species of Shivamogga are indigenous while only few species are introduced or of exotic nature. When population density was considered, the top ten most common tree species are *Pongamia pinnata ,Alstonia scholaris, Thespesia populnea, Terminalia catappa, Spathodia campanulata ,Ficus religiosa and Bauhinia purpurea.* In general, the tree diversity represents a good assemblage of different utility categories such as wild and cultivated fruit yielding trees, shade and ornamental trees, sacred and religious trees, medicinally useful trees etc. For each species botanical name, family, vernacular name, medicinal uses and parts used are provided. Trees are used to cure diseases related to skin problems, cold, fever, cough, headache, diarrhea, fertility problems, toothache, stomach ache, wounds, diabetes, rheumatism, asthma, dysentery, small pox, bone fractures, earache, hair loss and poison (snake, scorpion and insect) bites, pits, stroke etc. The most dominant families in the study were Fabaceae (19 species) with 21.34%, Moracaeae (9 species) with 10.11%, Myrtaceae(5 species) with 5.61%, Apocyanaceae, Anacardiaceae, Euphorbiaceae and Combretaceae (4 species) with 4.49%, Annonaceae, Bignoniaceae and Rubiaceae, (3 species) with 3.37%, Caesalpinaceae, Clusiaceae, Meliaceae, Oxalidaceae, Simoaroubaceae (2 species) with 2.24%., Aracaceae, Casuarinaceae Lecythidaceae, Loganiaceae, Lythraceae, Magnoliaceae, Malvaceae,

Moringaceae Muntingiaceae, Myristicaceae, Oleaceae, Proteaceae, Rhamnaceae, Rutaceae, Santalaceae, Sapindaceae, Sapotaceae, Ulmaceae, Verbenaceae, Bombacaceae and Boraginaceae each with one species with 1.12%. Different parts of medicinal plants were used as medicine by the local traditional healers. Among the different plant parts, the leaves were most frequently used for the treatment of diseases followed by fruit, root, bark, rhizome, seed, stem, whole plant, bulb, latex, tuber, grain, pulp, flower and fiber.

CONCLUSION

Urban trees serve many useful functions such as climate change mitigation by carbon sequestration, air quality improvement by air pollution abatement, biodiversity conservation and source of ecosystem goods to urban inhabitants. They also have aesthetic, socio-religious and recreational value in urban contexts. In spite of the importance, they have not received much scientific attention. In this work, aimed to documentation and identification of trees. The preliminary study of tree flora of Shivamogga comprises of about 89 species, in which about 73.86% are indigenous species. The other 26.13% involves exotic and introduced species are distributed in 72 genera belonging to 36 families. The survey indicated that, the study area has plenty of medicinal plants to treat a wide spectrum of human ailments. This documentation of medicinal knowledge provides a catalogue of useful plants and will serve as a physical record for the education of the future generation. This can help in preserving the traditional knowledge of rural community which is slowly fading away due to modernization and the influence of the urban culture. This study can also serve as baseline knowledge for future functional bioactivity screening of indigenous plants. This study also points out that certain species of medicinal plants are being exploited by the local residents who are unaware of the importance of medicinal plants in ecosystem.

Table 1: List of Medicinal Plants with Family and Uses

Sl. No	Scientific name	Vernacular name (kannada)	Family	Native (N) / Exotic (E)	Part used	Ailments
1.	*Acacia auriculiformis*	Acacia	Fabaceae	E	Root Bark	Used as a anti-helminthic, anti-filarial and microbicidal activity, an extract produced from the root is known to be useful in the treatment of various aches, pains rheumatism and sore eyes.
2.	*Acacia nilotica*	Acacia	Fabaceae	E	All parts of plant	This plant has anti-microbial, anti-plasmodial and antioxidant activity and used for treatment of human immunodeficiency virus, hepatitis C virus and cancer.
3.	*Adenanthera pavonina*	Gulugunjimara	Fabaceae	N	Seeds	Used for the treatment of boils, inflammation, blood disorders, arthritis, rheumatism, cholera, paralysis, epilepsy, convulsion, spasm, and indigestion
4.	*Adina cordifolia*	Yethiga	Rubiaceae	N	All parts of plant	Used for the treatment of chronic cough, and uses in jaundice, stomachache, fodder and swelling in stomach, astringent and constipating, and diarrhea and dysentery, cholera, cold cough, fever, headache, rheumatism

5.	*Aegle marmelos*	Bilva	Rutaceae	N	Leaves and Roots	Effective in treating fever, nausea, vomiting, swellings, dysentery, dyspepsia, seminal weakness, and intermittent fever, urinary problems, preventing heart palpitations, and curing fevers.
6.	*Ailanthus triphysa*	Gugguladhoopa	Simoaroubaceae	N	Roots, leaves, bark and gum exudates	used as a diuretic and to treat skin diseases febrifuge, carminative, anti-periodic and an antidote to cobra bite has an antipyretic property
7.	*Albizia lebbeck*	Bage	Fabaceae	N	All parts of plant	Used as an effective herbal agent in bronchial asthma as astringent, pectoral, rejuvenation, and tonic treatment of snakebite anti-asthmatic, anti-inflammatory, anti-fertility, anti-diarrhoeal, antiseptic, anti-dysenteric and anti-tubercular.
8.	*Alstonia scholaris*	Halemara	Apocynaceae	N	Bark	Used as an antimalarial compound both for treatment and prophylaxis. bitter tonic, febrifuge, diuretic, anthelmintic, stimulant, carminative, stomachic, aphrodisiac, galactagogue, and haemostatic. used as anticancer
9.	*Anacardium occidentale*	Geru,Godambi	Anacardiaceae	E	Bark	Used as a antihypertensive and glucose-lowering part. It has beneficial effect on the eyes and skin. This is rich in vitamin C, used for skin problems like acne, flawless freckles, skin lines and protects from aging. for the treatment of bacterial and fungal infections blood sugar, weight loss, cancer, cold and flu, aging, urinary disorders, digestive disorders
10.	*Annona reticulata*	Rama phala	Annonaceae	N	Bark	The decoction made from the bark is used as a tonic and, due to its astringent qualities,

						can be used as a therapy for diarrhoea and dysentery. The dried unripe fruit is used to treat gastrointestinal issues like diarrhoea and dysentery. as anthelmintic, analgesic, anti-inflammatory, antipyretic, wound healing and cytotoxic
11.	*Annona squamosa*	Seethapala	Annonaceae	N	All parts of plant	Used to cure dysentery, epilepsy, haemorrhage, fever, and tumors, cardiac ailments, thyroid-related disorders, diabetes, and cancer.
12.	*Anthocephalus cadamba*	Kadamba	Rubiacea	N	Bark and leaves	Used in the treatment of various ailments such as fever, uterine complaints, blood diseases, skin diseases, tumour, anaemia, eye inflammation and diarrhoea. Other reported uses of N. cadamba include antihepatotoxic, antimalarial, analgesic, anti-inflammatory, antipyretic, diuretic and laxative.
13.	*Artocarpus gomezianus*	Vaatehuli	Moraceae	N	All parts of plant	The leaves and stem barks have been used to treat anemia, asthma, dermatitis, diarrhea, cough and as an expectorant antioxidant, antibacterial, insecticidal, and anthelmintic effects
14.	*Artocarpus heterophyllus*	Halasu	Moraceae	N	Fruits, leaves, and barks	Used in traditional medicine due to its anticarcinogenic, antimicrobial, antifungal, anti-inflammatory, wound healing, and hypoglycemic effects, reduce high blood pressure, heart diseases
15.	*Artocapus incisus*	Deevi/Neeru halasu	Moraceae	N	Root and leaves	It has anti-inflammatory activities, used against arthritis, asthma, back pain, diabetes, fever, gout, high blood pressure, liver disease, and toothaches

16.	*Averrhoa bilimbi*	Bimbuli	Oxalidaceae	N	Root and leaves	Used in the treatment of diabetes mellitus, hypertension, and as an antimicrobial agent, it reduces pain, inflammation and bleeding, rectifying haemorrhoids
17.	*Averrhoa carambola*	Carabalu	Oxalidaceae	N	Fruits	used for include the following: fever, cough, diarrhea, chronic headache, inflammatory skin disorders (eczema), and fungal skin infections, helps manage various diseases related to the brain, arthralgia, chronic headache, boils and pyodermas, colds, cough, epistaxis, spermatorrhea, fever,
18	*Azadirachta indica*	Kahibevu	Meliaceae	N	All parts of plant	It has properties of antioxidant, anti-inflammatory, and anticancer activities. treat fungal infections. used for leprosy, eye disorders, bloody nose, intestinal worms, stomach upset, loss of appetite, skin ulcers.
19.	*Bauhinia purpurea*	Mandara	Caesalpiniaceae	N	All parts of plant	Used to cure dropsy, pain, rheumatism, convulsions, delirium, and septicemia, The bark of the plant is used as an astringent in the treatment of diarrhea. Its decoctions are recommended for ulcers
20	*Bauhinia tomentosa*	Mani Mandara	Fabaceae	N	All parts of plant	Used to treat some diseases including liver inflammation, abscess, tumors, wounds, and hyperlipidemia, as a febrifugal, antidiarrhoeal and antidysenteric
21.	*Borassus flabellifer*	Talemara	Arecaeae	N	Roots	The young of the tree are taken as diuretic and anti-parasitic drug and the decoction prepared from these roots are used to treat respiratory and gastritis disorders

22.	*Butea monosperma*	Muthaga	Fabaceae	N	All parts of plant	The seeds are used for skin ailments; keratitis; piles; urinary discharges; and diseases of the brain, eye, head, and skin. The juice from the plant as well as the oil is antiseptic. It is an excellent remedy for itch and herpes. The seeds are hematinic, bitter, and acrid.
23.	*Caesalpinia pulcherrima*	Rathnagandhi	Fabaceae	N	All parts of plant	Used against intestinal worms and cure sores, **used** to relieve chest affections, reduce or eliminate fever, cure bronchitis, asthma and malarial fevers. inflammation,ulcers,tumors.
24	*Callistemon citrinus*	Bottlebrush	Myrtaceae	E	All parts of plant	Used in the treatment of diarrhoea, dysentery and rheumatism. It is also used as a water accent, anticough, antibronchtits and insecticide, antibacterial, antifungal, antioxidant activities
25	*Calophyllum inophyllum*	Sura Honnemara	Clusiaceae	N	The flowers, rhizomes and leaves	Used as traditional medicine for the treatment of chronic diseases such as ulcer, eye infections, haemorrhoids, hypertension, infections, inflammation, leprosy, malaria, nephritis, pain, rheumatism, skin infection, tumours, varicose, venereal diseases, wound and peptic ulcers
26	*Cassia siamea*	Cassia	Fabaceae	N	Leaves and bark	Used to treat constipation, diabetes, insomnia, hypertension, asthma, typhoid fever, and dieresis, antimalarial medications.It shows antidiabetic, anticancer, hypotensive, diuretic, antioxidant, laxative, anti-inflammatory properties
27	*Cassia fistula*	Kakkemara	Fabaceae	N	All parts of plant	Used as laxative as well as in constipation management; root is employed in treating

						of flus and colds whereas the leaves are employed in relieving pain, edema, and reducing skin irritation as result of swelling, antioxidant, anti-inflammatory, anti-diabetic.
28	*Casuarina equisetifolia*	Galimara	Casuarinaceae	E	All parts of plant	Used traditionally for the treatment of nervous disorders, acne, throat infections, stomach ulcer, constipation, cough, diabetes, diarrhoea, dysentery, gonorrhea, antimicrobial, antidiabetic, antioxidant, cytotoxic, hypolipidemic
29	*Ceiba pentandra*	Biliburuga	Bombacaceae	N	Roots and Bark	The bark is acrid, bitter, thermogenic, diuretic, emetic, purgative and tonic; and useful in hepatopathy and vitiated condition of vata and kapha. The roots are diuretic, aphrodisiac, antipyretic.
30	*Cordia myxa*	Challehannu	Boraginaceae	N	All parts of plant	It acts as wound healing, demulcent, anthelmintic, diuretic, astringent, emollient, expectorant, hepatoprotective, analgesic, immune modulator, hypoglycemic, anti-inflammatory, laxative, antioxidative stress, hypolipidemic, aphrodisiac
31	*Couroupita guianensis*	Nagalinga pushpa	Lecythidaceae	E	Leaves	Used to treat hypertension, tumors, pain, and inflammation, the common cold, stomachache, skin conditions and wounds, malaria, and toothache, has various homeostatic, antipyretic, anti-inflammatory, and sedative properties, treat hypertension, tumours, pain, inflammatory processes, cold, stomach ache, skin diseases, malaria, wounds and toothache
32	*Croton roxburghii*	Somaru	Euphorbiaceae	N	Bark and	Against snake poisoning and

					leaf	to treat infertility, fever, and wounds.
33	*Dalbergia latifolia*	Sissum	Fabaceae	N	Bark	Used to treat diarrhoea, indigestion, and leprosy leprosy, jaundice, gonorrhea and syphilis
34	*Delonix regia*	May flower/ Kempu torai	Fabaceae	E	Leaves	Used to treat chronic fever, antimicrobial, constipation, inflammation, arthritis, hemoplagia, piles, boils, pyorrhea, scorpion bite, bronchitis, asthma and dysmenorrhoea, rheumatoid arthritis, diabetes
35	*Dichrostachys cinerea*	Banni	Fabaceae	N	All parts of plant	Used in the treatment of rheumatism, diabetes, coughs, asthma, kidney disorders, gonorrhea, syphilis, malaria, dysentery, headaches, toothaches, elephantiasis
36	*Eucalyptus globulus*	Neelagiri	Myrtaceae	E	All parts of plant	Used for treatments such as rhinitis, bronchial infection, or to reduce fever antimicrobial activity, disinfect and heal wounds and cuts and prevents infection
37	*Ficus benghalensis*	Alada mara	Moraceae	N	Stem bark latex	Used for the treatment of diabetes, diarrhea, and dysentery. wounds, burns, and rheumatism. Fruits are edible and are used as a tonic.
38	*Ficus elastica*	Rubbermara	Moraceae	E	latex	Used for the treatment of pain, rheumatism, diarrhea, hypertension, infection, skin allergies, anemia, wound, hernia, and hemorrhoids, anticancer, antioxidant and as an anti-inflammatory
39	*Ficus hispida*	Geritalu	Moraceae	N	Leaves, bark and root	Used against dysentery, ulcers, biliousness, psoriasis, anemia, piles and jaundice, the fruit is known to be active as aphrodisiac, tonic, lactagogue and emetic.

40	*Ficus microcarpa*	Kirugoli	Moraceae	N	Leaves, bark, rootlets, and latex	Used to treat liver disease or applied to the skin to treat colic, to relieve headaches, healing of bruises and wounds, it has antioxidant activities, antibacterial, anticarcinogen and anti diabetic agents.
41	*Ficus racemosa*	Atti mara	Moraceae	N	All parts of plant	Used to treat diabetes, liver disorders, diarrhea, inflammatory conditions, hemorrhoids, respiratory, and urinary diseases. antihelmintic action in adult earthworms, antidiuretic, antibacterial, antidiarrheal, anti-inflammatory
42.	*Ficus religiosa*	Arali/Ashwatha	Moraceae	N	All parts of plant	The root bark extract has anti-ulcer and blood sugar lowering properties. Its leaf and bark extract are used to relieve toothaches and reduce swellings. The bark extract has antibacterial and anthelmintic properties. Bark and fruit of the tree have strong antioxidants as well as immunity boosting properties
43	*Garcinia indica*	Murugalu	Clusiaceae	N	Leaf, Stem, Fruits	To treat inflammation, dermatitis, and diarrhea, and to promote digestion, inflammation, dermatitis, and diarrhea
44	*Gliricidia sepium*	Gobbaramara	Fabaceae	E	All parts of plant	To treating coughs, asthma, curing urticaria, rash, burns, scabies, dermatitis, acting as an antipruritic on the skin, and treating bacterial and protozoal infections
45	*Grevillea robusta*	Silveroak	Proteaceae	E	Whole plant	to treat sore throats, earache, chest problems, flu and toothache,
46	*Haldina cordifolia*	Heddimara	Rubiaceae	N	Bark and leaves	Stem bark and leaves heel deep wounds and jaundice, stomach ache, malarial fever,

						swelling in stomach and root is useful for dysentery
47	*Kigelia pinnata*	Cucumber Tree	Bignoniaceae	E	Bark and fruits	Used anticancer, antileprotic, antimalarial, antibacterial, analgesic and anti-inflammatory, antiurolithiasis, antidiarrhoeal, antioxidant, antidiabetic
48.	*Lagerstroemia speciosa*	Nandi,Hole	Lythraceae	N	Leaves and dried fruits	Used to treat high blood pressure, diabetes and kidney ailments, antidiabetic and antiobesity
49	*Leucaena leucocephala*	Wild Tamarind	Fabaceae	N	Leaves and seeds	Used to control stomach diseases, facilitate abortion and provide contraction, and it is often used as an alternative, complementary treatment for diabetes
50	*Macaranga peltata*	---	Anacardiaceae	N	Root, bark, leaves	Used to care ulcers. Piles, antipyretics, to treat stomach-ache
51	*Mangifera indica*	Mavu	Anacardiaceae	N	All parts of plant	Used as a dentrifrice, antiseptic, astringent, diaphoretic, stomachic, vermifuge, tonic, laxative and diuretic and to treat diarrhea, dysentery, anaemia, asthma, bronchitis, cough, hypertension, insomnia, rheumatism, toothache, leucorrhoea, haemorrhage and piles.
52	*Manihot esculenta*	Maragenasu	Euphorbiaceae	E	All parts of plant	Used to treat hypertension, headache, and other pains, irritable bowel syndrome and fever, used to treat hypertension, headache, and pain.
53	*Melia azedarach*	Hucchubevu	Meliaceae	N	Leaves	Used in leprosy, scrofula, anthelmintic, antilithic, diuretic, deobstruent, and resolvent, used as resolvent and deobstruent, antiseptic for sores and ulcers that show no tendency to heal. to treat

						stomach ulcers and jaundice
54	*Michelia champaca*	Sampige	Magnoliaceae	N	leaves, flowers, seeds, and fruits	Used to treat diarrhea, cough, bronchitis, hypertension, dyspepsia, fever, rheumatism, abscesses, dysmenorrhea and inflammation. It is also used as purgative, expectorant, cardiotonic, digestive, carminative, stomachic, stimulant, diuretic, diaphoretic, antipyretic and astringent
55.	*Mimusops elegngi*	Spanish cherry	Sapotaceae	N	All parts of plant	Used for cooling, anthelmintic, tonic, and febrifuge, dental ailments such as bleeding gums, pyorrhea, dental caries, and loose teeth. antinociceptive, diuretic effects, gastroprotective, antibacterial, antifungal
56.	*Moringa oleifera*	Nuggemara	Moringaceae	N	All parts of plant	Protecting the liver from damage, oxidation and toxicity its very wide range of vital antioxidants, antibiotics wound healing, protecting and nourishing the hair and skin
57	*Muntingia calabura*	Singaporecherry	Muntingiaceae,	E	All parts of plant	Used to treat measles, mouth pimples, and stomachache, antiseptic and to treat abdominal cramps and spasms, headaches and colds. It shows anti-inflammatory activity.
58	*Myristica fragrans*	Jayikayi	Myristicaceae	N	Seeds	Used to treat stomach ulcers, indigestion, liver disorders, and as emmenagogue, nervine, diuretic, diaphoretic, and aphrodisiac. treat anxiety, nausea, diarrhea, cholera, stomach cramps, parasites It has high hepatoprotective, anticancer, antibacterial, antifungal and antitumor activities

59	*Nyctanthes arbor-tristis*	Parijata	Oleaceae	N	All parts of plant	Used as anti-helminthic and anti-pyretic, laxative, in rheumatism, skin ailments and as a sedative, anthelmintic, antipyretic, laxative, rheumatism
60	*Peltophorum pterocarpum*	Gulmohur	Fabaceae	E	All parts of plant	Used for the treatment of numerous ailments like insomnia, stomatitis, constipation, skin disorders, worms and dysentery, antimicrobial, antioxidant, used as astringent for gastrointestinal disorders
61	*Phyllanthus acidus*	Rajavale	Euphorbiaceae	N	Leaves	used to treat inflammatory, rheumatism, bronchitis, asthma, respiratory disorder, hepatic diseases and diabetes, used in the treatment of **psoriasis**, sciatica, rheumatism, constipation, renal calculus,
62	*Phyllanthus emblica*	Nellikayi	Euphorbiaceae	N	All parts of plant	Used for the treatment of diarrhea, jaundice, and inflammation. anti-diabetic, hypolipedemic, anti-microbial, anti-inflammatory, antioxidant, hepatoprotective and anti-emetic, cancer, diabetes, liver, cardiac problems, and anemia
63	*Pithecellobium dulce*	Sihi hunese	Fabaceae	E	All parts of plant	Used against gum ailments, toothache, and hemorrhage, dysentery, diarrhea, and constipation. analgesic, anti-inflammatory, antibacterial, antidiarrheal, antiulcer, antioxidant, hypoglycemic.
64	*Plumeria obtusa*	Sampige	Apocynaceae	E	All parts of plant	used to treat diabetes mellitus, wounds and skin disease, diuretic, purgative, abortion, blenorrhagia, boils, herpetic lesions, sores, syphilis, and wounds
65	*Plumeria rubra*	Gosampige	Apocynaceae	E	All parts of plant	Used to treat cardiovascular disorders. as abortifacient,

						drastic, purgative, blennorrhagia, remedy for diarrhea, cure of itch, bronchitis, cough remedy for diarrhea, cure of itch, bronchitis, cough antibacterial, antiviral, anti-inflammatory, antipyretic
66.	*Polyalthia longifolia*	Falls Ashoka	Annonaceae	N	Bark and leaves	Used to treat dermatological ailments as kushta, visarpa/herpes virus infection and also to treat pyrexia of unknown origin, treatment of rheumatic fever, gastrointestinal ulcer and generalized body pain, septic infections, hepatomegaly, hepatosplenomegaly, coughing, diarrhea, and cancer.
67	*Pongamia pinnata*	Honge	Fabaceae	N	All parts of plant	Used to treat tumors, piles, skin diseases, and ulcers gonorrhea, cleaning gums, teeth, and ulcers, and is used in vaginal and skin diseases treatment of tumors, piles, skin diseases, and ulcers
68	*Samanea saman*	Rain tree	Fabaceae	E	All parts of plant	Used for stomach cancer colds, diarrhea, headache, intestinal ailments and stomachache, seeds are chewed for sore throat.
69	*Santalum album*	Gandha	Santalaceae	N	All parts of plant	Used to treat bronchitis, cystitis, dysuria, and diseases of the urinary tract, dysentery, tension, gastric irritability, and as a stimulant for liver, heart, fever, anti-poison,
70	*Sapindus trifoliatus*	Soapnut	*Sapindaceae*	N	Fruit, root, leaf and seed	Used to treat migraine, epilepsy, bronchial asthma, cough and burning sensation ,colds caused by infection and inflammation, skin infections like psoriasis, eczema, migraine, epilepsy, bronchial

						asthma, cough and burning sensation. It is also used in preparation of body shampoo, hair shampoo and detergents.
71	*Saraca indica*	Ashoka	Fabaceae	N	All parts of plant	Used to treat dyspepsia, fever, and burning sensation. cervical adenitis, biliousness, syphilis, hyperdipsia, burning sensation, hemorrhagic dysentery, piles, act against cancer, uterine tonic
72	*Simarouba glauca*	Paradise tree	Simaroubaceae	E	Leaves	Used to treat cancers diarrhea, stomach upset, malaria, diarrhea, dysentery, malaria, water retention (edema), fever, and stomach upset, it cause abortion.
73	*Spathodea campanulata*	Flametree	Bignoniaceae	E	Bark and leaves	used for epilepsy and convulsion control, against kidney disease, urethritis, and as antidote against animal poisons, malaria, HIV, diabetes
74	*Spondias pinnata*	Amatekayi	Anacardiaceae	N	Leaves and fruits	Used as a rubefacient for the treatment of painful joints, used to treat diarrhoea and dysentery and to prevent vomiting, menstruation and to treat gonorrhea, show gastroprotective, antifungal, antibacterial, and antioxidant properties
75	*Strychnos nux-vomica*	Kasaraka	Loganiaceae	N	All parts of plant	Used for the treatment of neurodisorders, arthritis and vomiting. Seeds are nervine, stomachic, and cardio-tonic, aphrodisiac, and respiratory stimulant. Treat high blood sugar, relieve pain, and have antioxidant effects.
76	*Syzygium cumini*	Nerale	Myrtaceae	N	All parts of plant	Used for the treatment of sore throat, bronchitis, asthma, thirst, biliousness, dysentery and ulcers. It is also a good blood purifier, bark is acrid,

						sweet, digestive, astringent to the bowels, anthelmintic, used to cure sore throats, asthma, bronchitis, thirst, biliousness, ulcers, and dysentery.
77	*Syzygium malaccensis*	Jambunerale	Myrtaceae	N	Fruits	used for the treatment of infectious diseases and has been found to elicit antiviral, antifungal and antibacterial activities,
78	*Syzygium aromaticum*	Lavanga	Myrtaceae	N	Flower buds, leaves, and stems	Used for the treatment of vomiting; flatulence; nausea; liver, bowel and stomach disorders; and as a stimulant for the nerves, relieve different microorganisms as scabies, cholera, malaria, and tuberculosis.
79	*Tabebuia rosea*	Taboobia	Bignoniaceae	E	Flowers, leaves and roots	used to reduce fevers and pain, cause sweating, to treat tonsil inflammation and various other disorders, used for snake bites, fever, anemia, constipation and malaria
80	*Tamarindus indica*	Hunese	Caesalpiniaceae	N	Leaves, fruits, and seeds	Used to treat inflammation, stomach pain, throat pain, and rheumatism, used in wound healing, abdominal pain, diarrhea, dysentery, parasitic infestation, fever, malaria and respiratory disorders.
81	*Tectona grandis*	Saguvani	Verbenaceae	N	All parts of plant	Used for the treatment of common cold, headache, in wound healing, bronchitis scabies, as a laxative, diuretic, antidiabetic, anti-inflammatory, antioxidant, lipid disorders, constipation, and diuretic, extracts have shown antibacterial and antifungal
82	*Terminalia catappa*	Indian almond	Combretaceae	E	Bark and leaves	Used to treat scabies, leprosy wounds and other skin

						diseases diarrhea, fever, dysentery and diarrhea. The fruits are used as antidiabetic, roots show antimicrobial
83	*Terminalia paniculata*	Hunalu	Combretaceae	N	Flower and bark	Used as a remedy for cholera, for the treatment of inflamed parotid glands, menstrual problems, cough, bronchitis, cardiac debility, hepatitis, cough, bronchitis, cardiac problems
84	*Terminalia arjuna*	Arjuna	Combretaceae	N	Bark	used for anginal pain, hypertension, congestive heart failure, and dyslipidemia, used in the treatment of fractures, ulcers, hepatic and showed hypocholesterolemic, antibacterial, antimicrobial, antitumoral, antioxidant.
85	*Terminalia bellirica*	Shantimara	Combretaceae	N	All parts of plant	It shows antimicrobial activity. The fruit effective in the treatment of eye diseases, asthma, hepatitis, and dyspepsia, while the fruit pulp is useful in piles, leprosy, and diarrhea. The fruit's decoction is useful as a cough remedy, whereas the bark gum and the kernel oil shown the purgative property
86	*Thespesia populnea*	Huvarasi	Malvaceae	N	Bark and flowers	Used for antifertility, antibacterial, anti-inflammatory, antioxidant, purgative and hepatoprotective activity.
87	*Trema orientalis*	Kiruhale	Ulmaceae	N	All parts of plant	used in the treatment of diabetes mellitus, respiratory diseases, oliguria, and malaria, treat coughs, sore throats, asthma, bronchitis, gonorrhea, yellow fever, toothache, and as an antidote. I shows laxativity, hypoglycemic, anti-pyretic,

						analgesic, anti-microbial properties, anti-convulsant activity, and anti-plasmodial.
88	*Ziziphus mauritiana*	Borehannu	Rhamnaceae	N	Leaves and fruits	Used to treat various diseases such as heartburn biliousness, biliousness, astringency, scabies, diuretic, and nausea, asthma, anxiety, depression, fever

Table-2: Familywise Distribution o f Plants in Shivamogga

Sl. No	Family	Number of plants	Percentage		Sl. No	Family	Number of plants	Percentage
1	Anacardiaceae	4	4.49%		19	Meliaceae	2	2.24%.
2	Annonaceae	3	3.37%		20	Moraceae	9	10.11%
3	Apocynaceae	4	4.49%		21	Moringaceae	1	1.12%.
4	Arecaeae	1	1.12%.		22	Muntingiaceae,	1	1.12%.
5	Bignoniaceae	3	3.37%		23	Myristicaceae	1	1.12%.
6	Bombacaceae	1	1.12%.		24	Myrtaceae	5	5.61%
7	Boraginaceae	1	1.12%.		25	Oleaceae	1	1.12%.
8	Caesalpiniaceae	2	2.24%.		26	Oxalidaceae	2	2.24%.

ABSTRACT

Since India is the second most populated country, production and consumption of food is really high and therefore the waste that is produced and disposal of the same has become a major concern. The study aimed at producing bioenzyme from different fruit peels from household and market waste and to comparatively analyse its enzyme activity, antimicrobial properties, metabolite activity and assess their soil enrichment properties. The samples of fruit peels included Citron (*Citrus medica*), pineapple (*Ananas comosus*) and local orange (*Citrus sinensis*). The bioenzymes formed from citron, pineapple and orange along with the mixed sample gave a positive result for the enzyme protease. The citron sample showed maximum protease activity as well as metabolites. The enzyme from all fruit peels and the mixed peel showed antimicrobial activity. The bioenzymes did not show positive effects on the germination or development of seedlings in petroleum contaminated soil but all the bioenzyme samples were capable of enhancing development of the seedlings in garden soil. The current study was able to prove that the bioenzymes produced using citron, orange and pineapple peels in under one month using *Saccharomyces cerevisiae* to aid fermentation is efficient as a proteolytic and antimicrobial agent if it is utilised at the right concentrations. Hence citron, orange and pineapple peel waste could be used for waste valorization

towards producing proteolytic enzymes, antimicrobial and soil enrichment agents and could be a step towards sustainable waste management.

Keywords: citron, orange, pineapple fruit peel, antimicrobial, bioenzyme, waste management

INTRODUCTION

As India is a highly populated country, the food production and disposal is a critical deal, and the process of handling and processing of waste from industries are improper and inefficient leading to the dumping of waste into water bodies without any treatment. The main source of these biodegradable wastes are from domestic use, food industries and restaurants. To avoid such situations, researchers have come up with alternatives that can be used to reduce and recycle the agro waste and produce valuable products from them. One such alternative which has been successful is the production of bio enzyme which is also called as garbage enzyme. This bio enzyme consists of enzymes like protease, lipase, amylase and cellulase which is utilised to treat wastewater which could thus perform as a low-cost substitute for treating wastewater and contaminated soil. Several research have suggested that fruit and vegetable peels can be fermented to produce an organic product that can be used for a variety of purposes [1]. It can be used as food preservative, fertilizer and pesticide [2]. Eco enzyme is not used for human consumption [3]. As these organic wastes produced from the respective sources are not disposed properly, it in turn contributes to major environmental issues [4]. Another radical issue that has an adverse effect on the ecosystem is waste water that includes grey water and industrial wastewater. The treatment process for waste water has many physical, chemical and biological methods that are used to decrease the organic contents, microbial load and potent toxins. These methods don't prove efficient as they use certain chemicals and treatments which has many side effects [5]. Besides these one more issue that has become a fundamental concern is the disposal of antibiotics. There is constant drowning of the environment with all the types of antibiotics without any treatment. This gives rise to an elevation in resistant strains of microorganisms. [6]. The rising threats of using xenobiotic compounds and chemicals can be potentially reduced by the use of organic and natural compounds which also has an enhanced application with minimal side effects. The main intention of this study is to produce bio enzyme from different fruit peels from household and market waste and to analyse its enzyme activity, antimicrobial properties, metabolite activity and assess their soil enrichment properties.

MATERIALS AND METHODS

Sample collection

The raw materials required for the experiment were collected from the local market in Malleshwaram, Bangalore. The samples of fruit peels that were selected for this study includes Citron (*Citrus medica*) which is locally known as Heralekai, a type of sour lime, pineapple (*Ananas comosus*) and local orange (*Citrus sinensis*). The peels were collected, cleaned, washed in water and drained. The cleaned fruit peels were then mixed with jaggery along with distilled water for the production of bio enzyme.

Production of Bio enzyme:

Bio enzymes were prepared from 3 different peels of fruits with one part jaggery and 10 parts water to which 3 parts of peels of fruits were added. The samples used in the study were

Citron peels [C]

Orange peels [O]

Pineapple peels [P]

Mixture of C, O and P [M]

The above said 4 types of peels of fruits were utilized to make four different samples of bio enzyme. Washed the peels and dried to remove any residues of water. They were chopped into small pieces and were weighed. The

different fruit peels were filled in separate plastic bottles along with respective quantities. water, jaggery, and yeast. Yeast was particularly added to aid faster fermentation as they were only fermented for one month. They were stored in shade for 30 days and the gas was released periodically by uncapping the bottle for few minutes to ensure aeration and to remove the built up gas. After the fermentation period of 30 days, the filtrate was collected and stored at room temperature and the bottles were kept away from sunlight, until further analysis [7].

Analysis of pH

The pH of the bio enzyme prepared from each of the samples varied accordingly. As the studies [8, 13] suggests that bio enzymes prepared from different samples have varied pH and the time utilized for the fermentation could also be a factor influencing the pH of the bio enzyme. [8]. The pH analysis was conducted using a calibrated pH meter and the values were tabulated. Because of the synthesis of organic acids, the pH was discovered to be acidic. during the process.

Analysis of Bio enzyme

The crude sample that was obtained after the fermentation was used to find out whether there are enzymes like protease, amylase, lipase, and cellulase.

Protease Activity

The proteases in the bio enzyme was determined using agar diffusion method using skimmed milk. The agar was aseptically prepared and poured into the petri plates. 4mm wells were punched using a sterile cork borer. Each enzyme sample was diluted using distilled water to varying concentrations of 100, 75, 50, and 25%. 50µl of each of sample at different concentrations. A sterile micro pipette was used to place the liquid into the wells and the plates were incubated at 37ºC for 48 hours. Screening of plates were done post incubation zone of clearance and the outcomes were tabulated accordingly [9].

Activity of Amylase

The activity of amylase in the samples was analysed using starch agar. The agar was prepared using 1% starch which was poured into plates aseptically. 4mm wells were punched and 50µl of different concentrations of the enzymes were added and the plates were incubated at 37ºC for 48 hours. After the incubation time the plates were flooded with iodine solution which resulted in the zone of clearance where the starch is hydrolyzed around the wells and the remainder of the area in plate remained blue [10].

Activity of Cellulase

For the analysis of cellulase activity the 1% cellulase agar was prepared aseptically and the media was transferred into different petri plates. Wells were punched using a 4mm sterile cork borer and 50µl of each of different concentrations of the enzymes were inoculated. After the inoculation, the plates were incubated at 37ºC for 24 hours. Later the plates were treated with a staining solution i.e. 0.3% Congo red solution for 10 minutes and then treated with a destaining solution, 1N NaCl. The zones around the wells were used to determine the
presence of cellulose [11].

Activity of lipase

The activity of lipase was determined using 1 percent tween-20 hydrolysis agar. The media was prepared aseptically and poured into the Petri plates. Using a sterile cork borer, wells with a diameter of 4mm were punched, and 50 microlitres of each of the varied enzyme concentrations were introduced to the respective wells. The plates were labelled and incubated at 37°C for 24 hours. After incubation, the plates were examined for clear zones of hydrolysis surrounding the wells, and the findings were tallied [12].

Analysis of Metabolites

Depending on the samples used, the research reveals that numerous metabolites are present in the fermented bio enzyme [13]. The existence of the metabolites was confirmed using a variety of assays. This study looked at saponins, tannins, flavonoids, alkaloids, and phenols, among other metabolites [14-15].

Saponins Test: Saponins were identified using a foam test, which involved mixing 2 ml of the sample with 10 ml of water in a test tube and rapidly shaking the contents for a few seconds. The creation of foam, which lasts for a few minutes, showed the presence of saponins [14].

Tannins Test (Ferric Chloride Test):

Ferric chloride was used to evaluate the presence of tannins in the samples. 2ml of each sample was placed in a test tube with 2ml ferric chloride solution, resulting in a brownish black tint, indicating the presence of tannins in the sample [14].

Phenols Test:

The presence of phenols was evaluated using ferric chloride, which produces a blue/green colour when the reaction occurs, indicating the presence of phenols. In this test, 2ml of each sample was placed in test tubes, and a few drops of 10% ferric chloride solution were added, resulting in the production of blue or green colour [14].

Alkaloids test:

Wanger's reagent, a combination of iodine and KI, was used for the test. The positive test was indicated by the production of reddish brown colouring after 2ml of each sample was placed in a test tube and 3-5 drops of Wanger's reagent was added [14].

Flavonoids test:

Flavonoids tests were carried out using dilute HCL and ZnCl. The samples were placed in separate test tubes, to which 5-10 drops of dilute HCL were added along with a piece of ZnCl ribbon, and the test tubes' contents were heated for a few minutes. If the solution turned pinkish or filthy brown in hue, the test was declared positive, indicating the presence of flavonoids [15].

Antibacterial Activity:

The antimicrobial activity of the crude extract of the bio enzyme was determined using two methods: MIC and MBC. A 96-well plate was used to determine the minimum inhibitory concentration, and brain heart infusion agar was used to determine the minimum bactericidal concentration [1]. MIC: A 96-well plate was used to measure the lowest inhibitory concentration of several bio enzyme samples. A positive control, a negative control, and test samples in various concentrations were included in the study. All of the tests were carried out in triplicate to guarantee that the results were accurate. 50l of each of the solutions, including ampicillin as a positive control, BHI broth as a negative control, and the test samples, were placed in each of the wells. Because it comprises a diverse spectrum of microorganisms, the microbial source was collected from the soil solution. The plate was incubated at 37^{o}C for 24 hours after which 50µl of the soil suspension was applied to all of the wells. The appearance of turbidity in the water after incubation was used to determine bacterial growth. MBC: The minimum bactericidal concentration is the strength at which the microorganisms are inhibited completely, this concentration was determined by incubating the samples with no apparent growth in the 96 well plates on to the brain heart infusion media which upon incubation leads to the growth of the microorganisms as the media helps in enhancing the growth even if it is in fewer quantities. In this test the growth implies that there was presence of microorganisms but not enough to produce turbidity, however no growth signifies that the enzymes at the particular concentration was able to inhibit the microorganism completely.

Soil enrichment assay

The bio enzyme is reported to have qualities that help plant development [13], however this varies depending on the samples utilised. The study used a pot experiment to test the enzymes' potential to drive plantlet growth in both

petrol-contaminated and vegetative soil.. The soil contaminated with petrol and a sample of vegetative garden soil was collected and both the samples were treated using different bio enzymes, the soil samples without treatment was also used in the study as negative controls. Fenugreek seeds were sown into all the soil samples and watered regularly The bio enzyme is reported to have qualities that help plants grow [13], although this is dependent on the samples utilised. The enzymes' potential to encourage plantlet growth in both petrol-contaminated and vegetative soil was tested in a pot experiment.

RESULTS

In this present study the objective was to assess the efficacy of the bio enzyme produced using peels of citron, orange, pineapple and a fruit peels in a combination with a decreased fermentation period of 30 days. The efficacy of each sample was evaluated for its enzyme content, the metabolites existing in the crude sample, the enzyme's antibacterial action as well as its capabilities to enhance plantlet growth in both petrol contaminated soil and normal garden soil.

Analysis of pH

Each enzyme's pH was checked after one month of fermentation, the usual pH of the fermented enzyme is said to be acidic and between 2.5 to 3.5. The pH of all four samples was determined using a calibrated pH meter in the current study ranged from 3.72- 3.94. Orange peel enzyme showed a pH of 3.39, mixed peel enzyme with 3.72, Pineapple peel enzyme with 3.8 and Citron peel enzyme with 3.94. The minor differences would be because of the organic acids that leached into the filtrate, as well as the microorganism's activity during the fermentation. Along with the other factors , the pH can also be influenced by the peels used, the citrus fruit peels produced more acidic products when compared to the enzymes that are produced using vegetable peels or peels of non-citrus fruits.

Determination of Activity of Bio enzyme:

Proteolytic Activity

The agar plate was used to determine the protease activity by diffusion method where the four different concentrations of all the enzyme samples were tested. The citron sample that was inoculated in the media indicated a result which was positive at two different concentrations whereas the enzyme from the orange sample had exhibited a result which was positive at 3 different concentrations and the pineapple sample was found to be negative for the protease as the plates did not have any zone of clearance. However, the mixed enzyme that contained all the peels of fruit which was expected to produce an efficient quantity of protease showed positive result at only 100% concentration. The results are represented in the Table 1.

Amylase Activity

The amylase activity which was determined using starch agar was proved to be negative as the samples at different concentrations did not project any zone of clearance after the plates were flooded with iodine solution. This could be because of lesser fermentation time. This is in correlation with earlier studies. The bio enzymes that are produced after three months of fermentation had amylase [28], however, there were also samples which did not give amylase which might be dependent on the peels used.

Activity of Cellulase

The current study also supports the reason that the bio enzyme produced after the fermentation did not show the activity of cellulose as in earlier studies [12]. The different concentrations of the samples that was incubated in the media did not show any zone of clearance after it was flooded with staining and destaining solutions, therefore the test was considered as negative.

Activity of lipase

The lipase activity which was assessed utilizing 1% tween 20 agar, showed a negative result. Lipase enzyme was found to show activity in the bioenzyme made from pomegranate [12]. However, the current study did not show any presence of lipase enzyme, all the four samples at different concentrations did not show zone of clearance. This could also be due to the samples used or the time given for the fermentation process.

Analysis of Metabolites

The bio enzyme contains many metabolites like tannins, saponins, phenols, flavonoids and alkaloids [16]. These metabolites are naturally existing in the peels which are released into the solution in the course of fermentation. The citron sample had all the tested metabolites present except for phenols. Orange sample was the only one to have phenols along with alkaloids, the pineapple enzyme had three of the metabolites except for flavonoids and phenols. The mixed sample which was supposed to show a combined effect as the enzyme was composed of mixture of fruit peels did not give an expected result as it showed positive only for tannins and alkaloids. The citron sample was the only product that showed the existence of flavonoids during the study.

Antimicrobial assay

The antimicrobial assay which was conducted to assess the efficacy of the enzymes to inhibit the microorganism's development was screened using 96 well plates using a soil suspension for the microbial source. The MIC of the enzymes at different concentration resulted in no turbidity at 100% and 75% concentrations in all enzyme samples. The turbidity is denoted as growth whereas no turbidity is denoted as no growth, however the samples of 100% and 75% concentrations that had no apparent growth when inoculated in BHI to evaluate the MBC, it showed growth at 75% which proves that enzymes' ability to function to inhibit the microorganisms' growth can be achieved only when it is utilized at 100% concentration. Besides the four samples a mixture of Citron, Pineapple and Orange bio enzymes (M1 sample) was also tested and the outcomes were the same as the mixed bio enzyme sample, therefore the efficacy of the bioenzyme sample that was produced using mixed peels and the bioenzyme that was produced using individual fermented samples have same effect, moreover another sample of double strength enzyme i.e. a mixture of mixed bio enzyme sample as well as the M1 sample (M2 sample) also had similar results even with saturated solution.

Soil enrichment assay

The enzymes and metabolites present in the crude extract of the bio enzyme is said to have an enhancing effect on the growth of plant. The pot experiment that was performed using the petroleum contaminated soil and the garden soil were checked for plant growth, the garden soil with the treatment of enzymes had faster growth in comparison with its control soil without enzyme treatment. The petroleum contaminated soil had no growth in the pots in test and control. According to the studies conducted by Tong. Y (2020), the organic matter of the soil was elevated for soil which was enzymatically treated. However the enzymes showed no effect on the soil with petroleum contamination which let to no growth in the pots.

DISCUSSION

The current study was performed to understand and compare the efficacy of the bio enzyme produced using citron, pineapple and orange peels from solid waste generated from fruit shops which was fermented for 30 days. Furthermore, to understand the combined effect of peels of fruits, another sample was also prepared besides the individual test samples where all the three peels were added equally to get a mixed enzyme sample. As per the literature , it is ideal to ferment the peels for at least three months to avail maximum results, however the current study was tailored to assess the efficacy of these enzymes after one month of fermentation in the presence of yeast.

Studies that promotes the production of valuable and industrially important compounds by using natural ingredients that can replace potentially hazardous chemicals have drastically increased over the years. Citrus fruits like lemon, orange, citron contains microbial inhibitory properties and many compounds with antioxidant effects,

anti-inflammatory properties have been extracted using different peels [17]. Citrus fruits have antimicrobial agents present in their pulp and peels, along with other properties [18], so the preparation of bio enzyme through fermentation using fruit peels, could be a potential way to replace disinfectants and chemicals utilised for cleaning [19]. The parameters like pH, enzyme activity, antimicrobial activity, metabolite content and soil analysis were conducted and the efficacy of the test samples were analyzed. The fermented bio enzyme samples secured after the filtration, had an acidic pH because of organic acids that are infused into the liquid from the peels and partly also due to the type of the peels used, components like citric acid in lemon and citron or bromelain in pineapple few proteins that are released into the solution also has an effect on the pH. Usually the pH ranges between 2.5-3.5, and the findings of this investigation were similarly in the same range. It has been reported that the bio enzymes usually contain protease, amylase and lipase, however other studies also mention the existence of caseinase in some traces, [20] the current study also demonstrate a related result. The bio enzymes formed from citron, pineapple and orange along with the mixed sample had a positive result for the enzyme protease, and it turned negative for the other tests. This is however dependent on factors like the type of the sample used and the time given for fermentation, nevertheless, not all the samples are capable of producing all the enzymes. Though the enzymes found are less in number, their concentrations were considerably better even though they were fermented only for one month. The filtrate was diluted before the inoculation to test if diluting has any effect on the outcome, notably, the test samples did show results at 75% and some samples produced zones even at 50% concentration, however, there were zones were absent at 25% concentration. The protease test performed using agar diffusion was prominently showing zone of clearance in the protease agar plates which indicates the existence of the enzyme. However, the amylase test and lipase test and cellulase test was negative in this study. To the best of the current knowledge the cellulase enzyme have not been found in any of the studies that was published, which holds true in the current study as well. The test samples were analysed for the existence of metabolites, to determine the presence of different metabolites like saponins, flavonoids, tannins, alkaloids and phenols. It isevident that the bioenzymes produced from citrus fruit peels contains flavonoids, quinones, saponins, alkaloids and cardenolides [19].

The tests showed positive results for majority of the samples, the most found metabolite was alkaloids which was found in all the samples, flavonoids were present only in citron sample and phenols was positive for orange sample, but the mixed sample which was expected to show an integrated result however did not show the presence of all the metabolites though each of the individual sample showed presence of one or the other metabolite. Nevertheless, it could be due to the concoction of the peels that might have had antagonistic effect which led to the formation of only those metabolites that were having a very strong affinity.The bio enzyme is usually taken for studies for its antimicrobial properties as they have many enzymes and metabolites. It was shown that the bio enzyme prepared from papaya peels and a mixture of orange and pineapple were checked for inhibition of *Enterococcus faecalis* as an endodontic irrigant which has a potential to replace sodium hypochlorite, a chemical that is used in root canal treatment [1]. Studies have shown that many species like *E. coli, S. aureus, Streptococcus pyogens, pseudomonas aeruginosa* and some of the fungi can be inhibited using the bio enzyme. The outcome from this study also suggests the same. [7]. The 96 well plate against a positive control and a negative control to find the enzyme's minimal inhibitory concentration at various concentrations using a soil suspension as the microbial source resulted in inhibition at 100 and 75% concentrations. However, when the samples were checked in the heart brain infusion agar to analyse if the sample with no apparent growth was indeed free of microbes or it had few cells which could not result in any turbidity, the MBC test established that the microbes were inhibited only at 100% concentration. The bio enzyme that is produced after 3 months of fermentation usually has a stronger efficacy on the microorganisms as the time passes more of the organic acids, proteins and metabolites gets leached into the enzyme which will have greater effect even when utilised in lesser concentrations. Studies suggest that the bio enzyme samples have traces of acetic acid and acetic acid concentration is not high initially, but as the time increases the quantity increases as well, this also add up to the enzyme's antimicrobial activity [8] The enzymes and polyphenols which exist in the samples helps in killing a variety of microorganisms thereby showing a potential which can replace chemical components, so it could also serve as cleaning solution instead of using as disinfectant, since it is simple to create using easily available components and does not cause harm to the environment since they are completely organic and degradable.

As the bio enzyme is considered to have many components in them, it has great utility in breaking down organic molecules which could prove beneficial in the sludge treatment, though not taken up in this study, many previous studies shows that the enzyme at certain concentrations could be used to deal with sludge and aquaculture waste, which serves as a great alternative to stop using toxic chemicals to treat waste but rather using an efficient and natural way which leads to a sustainable development.The bio enzyme samples were also subjected to a pot experiment to analyse the efficacy of bio enzyme in enhancing the development of the saplings. All the four test samples were diluted to lesser concentration and also their pH was neutralized as the plants need natural pH of soil to grow. The soil was taken in triplicates in trays and fenugreek seeds were sowed, the soil taken for this study was garden soil with a control to check the growth, furthermore a petroleum contaminated soil sample was also taken for study to check if the enzymes had any effect in helping the development of the seedling, as the plants does not grow in petroleum contaminated soil because petrol blocks the xylem and phloem vessels which retards the development of the seedlings and most of the time the soil is unfit for the development of plants, however this study attempted to analyse if the enzymes had any effect on the growth but the outcome was negative for the petroleum contaminated soil as the pots showed no signs of germination or development of the seedlings even after many days of treatment, but the soil samples from the garden had a faster growth in comparison with the control, all the enzyme samples were capable of enhancing development of the seedlings. Research to analyse the efficacy of the bio enzyme on total nitrogen and organic matter shows that the enzymes that was made using eggplant sample could enhance the organic matter in the soil which proves that the bio enzyme can serve as a better alternative to fertilizers [20].
The studies conducted on bio enzyme shows they're possible products that might be employed in many fields, as discussed above the multipurpose solution has a potential due to various reasonsand the reason that all these enzymes are made up of the waste products which are easily available and could be used to produce such a valuable product using a simple fermentation method.

As a fast growing country it is necessary to understand the concept and usage of natural sources that can be some possible alternatives for chemicals which promotes a healthier eco system and the cost effective approach is another gain in the go, however the studies so far does not properly emphasize the efficiency of this kind of bio enzyme, as they are just crude filtrates obtained after fermentation which was utilised in the lab experiments, however outcome was impressive, it is necessary to upscale the approach in using the product in larger scale and monitor the effect instantaneously. Although the bio enzyme produced in small scale shows the existence of many valuable enzymes and metabolite along with organic acids, it is imperative to use a high end technology available to quantify the product, techniques like HPLC should be employed to detect all the components that might be existent in the samples, which will furthermore be an efficient method to understand the composition of different bio enzyme and also to come up with different approach to put them into more efficient use. This present study conducted using 4 samples of the bio enzyme has its own limitations, as they were only limited to primary tests and the antimicrobial activity was checked against a soil suspension, however it was a general approach to see the efficacy of the bio enzymes on a a large selection of micro flora in the suspension, so further studies should be done to check if specific species can be inhibited and the concentration at which it is most active should also be determined. The studies that were performed to analyse the metabolites present was also very fundamental approach as the quantification of each compounds were not carried out, however if quantification is done it will help in providing a better knowledge about the polyphenols existent in the sample which serves as a major factor in the activity as as an antimicrobial agent. Furthermore it will also help in identifying best samples that could be utilised to produce the bio enzyme which will give an enhanced result. In the present study the *Saccharomyces cerevisiae* was utilised to enhance the fermentation and speed up the process as the research work was dependent on on the samples which was fermented during one month, however, new alternatives should be considered which could enhance the process. The usage of a consortium of microbes of useful variants which are usually utilized during fermentation can be tested to determine if they can enhance the fermentation process. Further studies are required to decipher the maximum potential of the bio enzymes regarding their enzyme activity, microbial activity and also their various effects in breaking down organic molecules, Not only do you need to know how to use the peels of fruits and vegetables , but you also need to know how to use the other parts and a suitable way to ferment them to obtain a valuable product, which could be tested in large scale that can contribute in solving many global issues that are prominent due to chemical manufacturing and

their tedious waste disposal procedures. If the bio enzyme proves to serve as a valuable product after further studies than it could be utilised to replace many chemicals which can gradually promote sustainable development and a healthier eco system.

CONCLUSION

The current study was able to prove that the bio enzyme which was produced using citron orange and pineapple peels in under one month using *Saccharomyces cerevisiae* to aid fermentation is also efficient if it is utilised at proper concentrations, however the product could be improved and studied further to gain full knowledge about the peels and their efficacy in showing antimicrobial and biocatalytic activities. Besides the individual samples, the mixed one did not show any integrated results or efficient activity therefore the enzymes produced individually are considered effective depending on the outcomes provided. The results obtained in the current study revealed that the test samples were capable of producing antimicrobial activity when they were used without reducing the concentrations and also proved to enhance the seedling growth in the pot experiment.

More research should be done to fully understand the composition and the quantity in which the polyphenols and other organic acids are present which will enhance the prospect of making use of the product at its full capacity.

ABSTRACT

This study aimed to examine the influence of Trigunas (Sattva, Rajas, and Tamas) and yogic practices on psychological factors among female B.Ed students by comparing an experimental group receiving a structured yoga intervention with a control group that did not receive any intervention. A sample size of 25 female students (experimental group) was compared with a control group of 25 female students, aged 18-26 years. Data were collected using the Vedic Personality Inventory. The experimental group showed an increase in Sattva and a decrease in Rajas and Tamas, while the control group exhibited no significant changes. Statistical analysis revealed a significant improvement in the experimental group's psychological profile, highlighting the effectiveness of yoga in promoting mental well-being.

Keywords: Trigunas, Asanas, Pranayama, Meditation

INTRODUCTION

The practice of yoga, with its roots in ancient Indian philosophy, has evolved into a holistic approach to enhancing physical, mental, and emotional well-being. Central to the philosophy of yoga is the concept of the Trigunas—Sattva, Rajas, and Tamas—which represent three fundamental qualities that govern human behavior and thought (Das, 2016). Sattva symbolizes balance, harmony, and clarity of mind; Rajas is associated with activity, dynamism, and restlessness; and Tamas signifies inertia or lethargy (Telles & Singh, 2016). According to Vedic philosophy, a well-balanced individual exhibits a predominance of Sattva, with Rajas and Tamas functioning in moderation (Sengupta, 2012). With increasing academic demands and social pressures, students often experience heightened levels of stress, anxiety, and emotional imbalance. Such psychological disturbances can be linked to an increase in Rajas and Tamas, which are marked by feelings of restlessness, impulsiveness, and lethargy (Sharma & Rajan, 2020). On the other

hand, cultivating Sattva is believed to foster mental clarity, calmness, and emotional stability, contributing to better academic performance and overall well-being (Bhavanani & Telles, 2017). Research has consistently shown that yogic practices, such as asanas (physical postures), pranayama (breathing techniques), and meditation, can help modulate these Trigunas, leading to a more balanced psychological state (Gupta & Bhattacharya, 2017). Yoga is particularly known for its ability to enhance Sattva by promoting mindfulness, relaxation, and self-regulation while reducing the negative effects of Rajas and Tamas (Joshi & Gupta, 2018). This study expands upon existing knowledge by examining the influence of yogic practices on the psychological factors of first-year female Teacher Trainees, aged 18-26, using the Vedic Personality Inventory to measure the three gunas. A control group was also included to compare the effects of the intervention, providing a more robust analysis of the role of yoga in shaping psychological health. The study hypothesized that the experimental group, which underwent an 8-week structured yoga intervention, would show a significant increase in Sattva and corresponding reductions in Rajas and Tamas compared to the control group, which did not receive any intervention.

METHODOLOGY

Participants

The study involved two groups: an experimental group and a control group. Both groups consisted of 25 randomly selected female B.Ed students, Department of Education, Annamalai University aged between 18-26 years.

- **Experimental Group (n=25)**: These students participated in an 8-week structured yoga intervention.
- **Control Group (n=25)**: These students continued their regular academic routine without any additional intervention.

Instruments

The **Vedic Personality Inventory (VPI)** by Dhira Govinda Dasa is the author was used to measure the trigunas (Das, 2016). It consisted of multiple items for each guna, scored on a 7-point Likert scale. The inventory was administered to both groups at the start (pre-test) and end (post-test) of the study.

Procedure

- **Experimental Group**: The students participated in an 8-week yoga program, which included daily sessions of asanas (postures), pranayama (breathing techniques), and meditation designed to balance the mind and body.
- **Control Group**: This group did not undergo any yoga intervention and continued their regular academic activities during the 8-week period.

YOGA TRAINING SCHEDULE

Prayer

- "Om" Chanting
- Starting Prayer

Preparatory practices:

- Hands in and Hands Out breathing.
- Hand stretch Breathing (three level)
- Ankle Stretch Breathing

Loosening Exercises:

- Up and down: Front and back bending
- Side bending
- Spine twisting
- Knee rotation

Standing position asanas:

- Ardhakati chakrasana
- Padahasta asana
- Ardha chakrasana

Sitting position Asanas:

- Padmasana
- Paschimottasana

Statistical Analysis

Paired sample t-tests were conducted to evaluate the changes within each group, while an independent t-test was used to compare the differences between the experimental and control groups. Descriptive statistics, such as mean and standard deviation, were also calculated to assess changes in Sattva, Rajas, and Tamas (Gupta & Bhattacharya, 2017).

Results

Within-Group Analysis

Experimental Group

Between-Group Comparison (Post-Test Scores)

An independent t-test was conducted to compare the post-test scores of the experimental and control groups.

The between-group comparison showed significant differences in the post-test scores for all three gunas, with the experimental group demonstrating higher Sattva and lower Rajas and Tamas compared to the control group.

The graph illustrates the comparison of pre-test and post-test scores for the experimental and control groups across the three gunas: Sattva, Rajas, and Tamas.

Experimental Group

Sattva:

Pre-Test Score: The experimental group had a mean pre-test score of 66.33. Post-Test Score: After the yoga intervention, the mean score increased to 71.92.

Interpretation: This significant increase in Sattva indicates that participants experienced improved mental clarity, emotional balance, and overall psychological well-being due to the structured yoga practices. Higher Sattva suggests a greater capacity for mindfulness and calmness, which are essential for effective academic performance.

Rajas

Pre-Test Score: The mean pre-test score was 56.41.Post-Test Score: Following the intervention, this score decreased to 52.13.

Interpretation: The reduction in Rajas indicates that participants experienced less restlessness and impulsivity. This change suggests that the yoga practices helped students manage their energy levels better, fostering a sense of calm and reducing anxiety that often accompanies academic pressures.

Tamas:

Pre-Test Score: The mean pre-test score was 54.17. Post-Test Score: The post-test score dropped to 48.72.

Interpretation: The decrease in Tamas reflects a reduction in feelings of inertia and lethargy. Participants were likely more motivated and engaged in their academic activities after the yoga intervention, illustrating the effectiveness of yoga in combating procrastination and enhancing overall energy levels.

Control Group

Sattva

Pre-Test Score: The control group's pre-test score was 65.10. Post-Test Score: The post-test score showed a slight increase to 65.55.

Interpretation: The minimal change in Sattva suggests that the control group did not experience any significant improvement in psychological well-being, indicating the need for active interventions to enhance mental clarity and emotional balance.

Rajas

Pre-Test Score: The control group scored 55.60 initially. Post-Test Score: Their post-test score slightly increased to 55.95.

Interpretation: The negligible change in Rajas indicates that the control group continued to experience similar levels of restlessness and anxiety, reaffirming that without structured interventions, psychological states may remain unchanged.

Tamas:

Pre-Test Score: The control group’s pre-test score was 53.30. Post-Test Score: This score only marginally changed to 53.45.

Interpretation: The stability in Tamas suggests that the control group did not overcome feelings of inertia or lack of motivation, further supporting the notion that yoga can serve as a beneficial intervention to enhance psychological states.

Summary

The results demonstrate that the experimental group, which participated in the yoga intervention, experienced statistically significant improvements in Sattva and reductions in Rajas and Tamas. This contrasts sharply with the control group, which showed negligible changes in all three gunas. The findings indicate that yogic practices are effective in promoting psychological well-being, reducing stress, and enhancing emotional stability among female B.Ed students. These results underscore the potential for yoga as a valuable tool in educational settings to support student mental health and academic performance.

DISCUSSION

The findings from this study provide insightful contributions to the growing body of literature on the psychological benefits of yoga. The significant improvements observed in the experimental group, particularly the increase in Sattva and decrease in Rajas and Tamas, support the hypothesis that yoga promotes a more balanced and harmonious mental state. These results align with previous studies, which have demonstrated that regular yoga practice enhances emotional regulation, reduces stress, and fosters greater mental clarity (Bhavanani & Telles, 2017; Gupta & Bhattacharya, 2017). The increase in Sattva observed in the experimental group is a key indicator of enhanced psychological well-being. Sattva is characterized by attributes such as peace, clarity, wisdom, and balanced decision-making, all of which are critical for students navigating the challenges of academic life (Sharma & Rajan, 2020). This increase suggests that the yoga intervention successfully fostered a more centered and focused mental state in the participants, allowing them to approach tasks with greater calmness and emotional stability. The reduction in Rajas points to a decrease in restlessness and impulsivity, which are often linked to anxiety and stress in students. By engaging in yogic practices, the participants were able to channel their energy more productively, reducing the mental agitation that characterizes Rajas (Joshi & Gupta, 2018). Similarly, the decrease in Tamas reflects a reduction in inertia, laziness, and emotional stagnation, all of which can hinder academic success (Uebelacker et al., 2010). The control group, which did not undergo any yoga intervention, showed no significant changes in the levels of Sattva, Rajas, or Tamas. This lack of change reinforces the argument that psychological well-being does not improve without intentional intervention (Kirkwood et al., 2005). The between-group comparison further highlights the positive effects of yoga, with the experimental group demonstrating significantly higher Sattva and lower Rajas and Tamas post-intervention.

CONCLUSION

This study demonstrates that yogic practices can significantly influence the three gunas. The interventions have enhanced Sattva guna and decreased Rajas and Tamas gunas. The comparison with the control group underscores the efficacy of yoga as a tool for promoting mental clarity, emotional stability, and motivation among students. Future research can involve larger sample sizes and extended intervention periods to reinforce these findings.

ABSTRACT

Low dielectric materials that can take on multiple forms and endure mechanical stress are vital given the rising demand in lightweight and flexible electronics for applications like wearable technology. It is possible to create stretchy dielectric layers with semi-organic crystals that keep their electrical characteristics even when folded or strained. The purpose of this study is to investigate the optical and electrical properties of L-histidine tetrafluoroborate (LHTFB), a semi-organic NLO single crystal with outstanding mechanical properties and strong nonlinearity, through doping with magnesium. Bare and Mg doped crystals were grown by solution growth method and analyzed for its structural, optical, NLO and dielectric analysis. The dielectric permittivity measurements obtained reveal that magnesium drops the value below 4, which is lower than silica. These crystals' low permittivity and low loss factor point to their potential application in the microelectronics industry for elevated device performance, less power usage, optimized signal integrity, and continued semiconductor technological progress towards smaller, quicker, and greater energy-efficient electronic devices.

Keywords: Semi organic NLO crystals, solution growth, Low dielectrics, NLO.

INTRODUCTION

Recently, organic and inorganic material blends have developed nonlinear optical (NLO) materials suited for second harmonic generation (SHG), which has sparked great interest in photonic devices [1]. Among these materials, semi-organic single crystals such as L-histidinetetrafluoroborate (L-HTFB) are notable for their high nonlinearity, hardness, and thermal stability [2-4]. L-HTFB, whose formula is C6H10O2N3BF4, is a member of the monoclinic system (P21 space group) and has a transmission range of 230–1600 nm, allowing it to produce green and blue light [3-5]. It also has five times the SHG intensity of KDP. Recent research has highlighted the significance of semi-organic crystals with high nonlinearity and low dielectric permittivity for microelectronics and energy storage, since they increase circuit performance by lowering the RC time factor [6-7]. Examples of the potential for reduced dielectric loss and improved NLO efficiency are doped L-arginine acetate and L-glutamic acid zinc chloride [8–10]. For the advancement of flexible electronics, microelectronics, and photonics, improved materials with low dielectric permittivity and loss are still needed [11–12]. Keeping this in view, for the time, we made an attempt to explore the effect of magnesium chloride ($MgCl_2$) doping on the dielectric properties of L-histidinetetrafluoroborate single crystals grown via solution growth technique. The pure and doped crystals were characterized for their structural, optical, thermal, NLO and dielectric properties. The results are reported herein.

Growth of Pure and $MgCl_2$ doped L-histidinetetrafluoroborate single crystals

L-histidine in its raw form and tetrafluoroboric acid in its refined form were obtained from Merck. Supersaturated solution was made by dissolving the precursors in a 1:1 ratio at 50°C for approximately five hours while stirring continuously. The resulting supersaturated solution had a top perforation to allow solvent to evaporate while it was maintained in an undisturbed mode. After 35 days, high-quality crystals were harvested. To develop $MgCl_2$ doped L-HTFB crystals, the used mole percentage of $MgCl_2$ was added during the stirring step. The photograph of the harvested crystals is shown in Figure 1.$MgCl_2$ addition slightly changes the colour to pure white.

Tools and Techniques

To investigate the crystal system and determine the lattice parameters, MgCl2-doped L-HTFB crystals were analyzed using a single crystal X-ray diffractometer. Optical properties were examined in the 200–1100 nm wavelength range with a Perkin Elmer Lambda 35 UV-Visible spectrophotometer for both as-grown and doped crystals. Dielectric properties were measured for pure and doped L-HTFB single crystals after orienting and slicing them appropriately. A thin graphite layer was applied to both sample surfaces for conductivity, and capacitance and dissipation factors were measured using an Agilent 4284A LCR Meter across a frequency range of 1 KHz to 1 MHz. The nonlinearity of the crystals was evaluated through the powder SHG test, performed using a Spectrum Physics Q-switched Ndlaser, with a 1064 nm first harmonic input, 10 ns pulse width, and 10 Hz repetition rate.

RESULTS AND DISCUSSIONS

Single Crystal XRD

The obtained values of lattice parameterfordoped L-HTFB crystals are listed in Table 1 and compared with the reported values of pure L-HTFB crystal .As reported by previous authors [6], pure the crystal pure L-HTFB crystallized in monoclinic system, whereas $MgCl_2$ doped crystal crystallized in orthorhombic system with space group of P 21 21 21. Also $MgCl_2$ addition increases the lattice volume of pure L-HTFB. Because the atom sizes of the dopant and host differ, doping can cause strain in the crystal lattice. Depending on the precise type and concentration of the dopant, this strain may cause the lattice to grow. Expansion in lattice evident the entry of dopant in L-HTFB crystal lattice. The obtained packing diagram and ORTEP diagram of doped L-HTFB shown in figure 2.

UV-Vis Spectral Analysis

When it comes to optical applications, NLO single crystals are predominantly used because of their high transparency and optical transmission efficiency. The process of absorbing UV and visible light entails elevating electrons from their orbital states to higher ones. This allows the UV-VIS-NIR spectrum to reveal details about the molecular structures within crystals. The spectrum of optical absorption for pure and doped L-HTFB crystals was recorded in the wave length range 190-1100 nm. Recorded UV-Vis absorption spectra of the grown samples are shown in Figure 3.The band edge absorption shifted to high wavelength region with doping. Bandgap energy of the prepared pure and $MgCl_2$doped L-HTFB crystal was calculated using tauc plot [12] and also shown in figure 4.This high bandgap value indicates that the crystal exhibits dielectric behaviour, which might cause polarisation when intense radiation strikes the substance. The absence of absorption bands in the visible spectrum, confirms that the produced crystals are suitable for photonic and optical applications. Additionally, the high energy bandgapverifies the extremely low defect content in the produced crystal and also the absorption edge in UV region of pure and doped crystals. Semi-organic crystals that are sensitive to UV light can be used in biomedical sensors and equipment for drug discovery, DNA analysis, and fluorescence spectroscopy, besides additional applications.

NLO Studies

By measuring NLO efficiency precisely, scientists can forecast how well systems and devices that use semi-organic crystals will function. In order to evaluate the practicality and feasibility of using these materials in real-world applications including optical switching, frequency conversion, and optical signal processing, this prediction is crucial. In our present study, NLO efficiency of grown samples was tested through Kurtz-powder technique [13]. The obtained values are depicted in table 2. Entry of $MgCl_2$ in LHTFB crystal lattice reduces the NLO efficiency .When compared with KDP, pure LHTFB crystal has 1.2 times higher NLO efficiency whereas doped sample has only 0.826 times efficiency. The addition of $MgCl_2$ to pure LHTFB crystals alters their structure, as stated in single crystal XRD data. This distortion of the crystal lattice may interfere with the long-range order essential to effective NLO responses [14].The nonlinear optical response could be caused by excited states or charge carriers being quenched as a result of MgCl2 doping. This quenching can happen via a variety of processes, including nonradioactive decay pathways or energy transfer processes, which will ultimately reduce the crystal's NLO efficiency [15].

Dielectric studies

Numerous studies have shown that crystals have emerged as a promising possibility in the electronics industry. It is crucial to investigate the dielectric properties of crystals at all frequencies and to identify potential uses for them in many scientific and technical domains. Ferroelectrics, piezoelectric, optoelectronic devices, LEDs, telephone service, and other industries are among the uses for crystals that are mentioned [16]. In the current work, we use an Agilent 4284 A LCR meter to examine the dielectric characterizations of the formed crystals for various temperature at a range of frequencies, from 100 Hz to 1 MHz [17-19]. A travelling microscope is used to measure the crystal's dimensions. In order to form a suitable conductive layer, the synthesized crystal is polished and coated with graphite on both sides [20]. Using a two probe arrangement, the dielectric constants were recorded [21]. The dielectric constant is calculated using the following relation [19].

$$\varepsilon_r = \left[\frac{A_{air}}{A_{cry}}\right]\left[\frac{C_{cry} - C_{air}\ [1 - \frac{A_{cry}}{A_{air}}}{C_{air}}\right]$$

The dielectric constant and dielectric loss of the pure and doped crystal at different frequencies have been shown in Figures 5 and 6. It has been revealed that for all five frequencies taken into view in this study, dielectric constant as well as dielectric loss for temperature increases along the "a" directions. This is typical behaviour for a dielectric. Given that the polarization mechanism and the conduction process are comparable, this can be understood. The existence of impurities and crystal defects, electrical and ionic polarizations, and crystal expansion are commonly linked to the variation of εr with temperature. The expansions, as well as the ionic and electronic polarizations, are the primary causes of the fluctuation at low temperatures. The primary causes of the rise at higher temperatures are

impurity dipoles and thermally produced charge carriers. For ionic crystals, the electronic polarizability essentially stays constant [22]. Ionic polarizability varies with temperature, which is mostly responsible for the dielectric constant's temperature increase. A sample's ability to have a low dielectric constant and high frequency dielectric loss indicates that it has better optical quality and fewer defects. This parameter is crucial for a variety of microelectronic materials, nonlinear optical materials, and their applications [23,24]. Moreover, the doped crystal's dielectric constant value is less than 4, which is lower than that of silicon di oxide. Low dielectric constant crystals can replace silica as interlayer dielectrics in integrated circuits (ICs) to lower power consumption and delays in signal propagation[25].Crystals having low dielectric constants can be used in energy storage applications by way of capacitors. The energy density and efficiency of energy storage systems, such as super capacitor and energy harvesting devices, can be raised by using these materials as capacitor dielectrics [26].

CONCLUSION

Pure and $MgCl_2$ doped were successfully grown by slow evaporation technique. The grown crystals were subjected to structural, optical, NLO and dielectric measurements. The presence of dopant alters the crystal structure from monoclinic to orthorhombic, by inducing lattice expansion. Also the dopant reduces the optical bandgap by increasing transmission in visible region. Low loss factor with L-HTFB crystals reduced dielectric constant of the doped crystal suggest the use of the grown doped crystal in the development of optical modulators and switches for high-speed optical communication networks. Also by proberly adjusting the concentration of dopant, we may tune the optical and dielectric behavior of pure L-HTFB crystals, which can be not only a NLO crystal but for a low dielectric crystal for energy storage applications.

ABSTRACT

Bioethanol is a renewable fuel that helps solve environmental issues and reduces reliance on fossil fuels. This research looked at three ways to prepare hydrolysate from defatted biomass (DB) of double mutant *Pseudochlorella pringsheimii* EMM2 for making bioethanol by anaerobic fermentation using immobilized cells of *Saccharomyces cerevisiae* NITTS1: using peracetic acid, microwave-assisted alkaline treatment, and ultrasonic treatment. Among the three methods of pre-treatment, the highest bioethanol yield of 0.272±0.07 gg^{-1} DB was obtained from hydrolysate prepared from DB by ultrasonic pretreatment at 0.35 W/mL for 10 min. This was better than the other two methods tested. Because the hydrolystae contained the highest total carbohydrate (TC) of 29.58±0.04 gg^{-1} DB. Next studied the effect of DB concentration on bioethanol production and found that the maximum bioethanol yield of 0.312±0.11gg^{-1} DB at hydrolysate prepared from 90 g of DB by ultrosonic pre-treatment. The hydrolysate prepared from 90 gL^{-1} defatted biomass contained maximum TC of 32.67±0.07 gg^{-1} DB with mostly glucose (78.83±0.05 gg^{-1} TC) and xylose (15.94±0.08 gg^{-1} TC). Further, in this study, the essential physical parameters were optimized by classical method and found that the maximum bioethanol of 0.350±0.05 gg^{-1} DB produced at optimum fermentation conditions 30 ^{o}C, pH 4, 150 rpm and 72 h. This finding suggests that the DB of 75% ultrasonic pre-treated municipal wastewater (UPMWW) grown double mutant *P. pringsheimii* EMM2 could be used as a sustainable feedstock for bioethanol production after ultrasonic pre-treatment.

Keywords: Bioethanol, Defatted biomass, Mutation, Municipal wastewater, *Pseudochlorella pringsheimii*,

INTRODUCTION

In recent years, industrialization and urbanization have increased the world's energy demand. India is the world's fourth prime country in oil consumption mainly for transportation purposes. Therefore, the imports of crude oil was increased from 171.73 MTs to 226.95 MTs from 2011-12 to 2019-20 (Energy Statistic, 2022).According to the International Energy Agency (IEA), India's oil requires is expected to increase to 7.1 and 8.7 mb/d by 2030 and 2040, respectively, from 5.0 mb/d in 2019 (IEA, 2021). Hence, there is an urgent need to explore novel energy sources that are cost-effective and environmentally friendly. At present situation, renewable energy sources are vital and imperative to facilitate present society sustainability as well as deal with harmful property and disadvantages of petroleum-based fuels (Azad *et al.,* 2016). Therefore, the present researchers are mainly focusing on biofuels production including bioethanol (Dhandayuthapani *et al.,* 2022), biodiesel, biogas (Sanchez-Bayo et al., 2020), etc., using various renewable sources. Ethanol (CH_3CH_2OH) is considered as a promising alternative to gasoline and common alcohol fuel existing in the World market for biofuels. Ethanol is comparatively not as harmful as petroleum-based fuels as by-products of partial oxidation of ethanol are also harmless than the derivatives of petroleum-based fuels (Vohra *et al.,* 2014). Generally, bioethanol is produced from various edible plants such as sugarcane, maize, wheat, food grains, sorghum and potato. These feedstocks are considered as fuel crops (Hester *et al.,* 2017). However, the availability of fuel crops is insufficient to meet up recent demand for ethanol production since the same materials are used as main food sources for humans. Hence, this is a major disadvantage of today's bioethanol production and not balanced between the proportion of feedstocks (fuel crops) and the quantity of ethanol production. The uses of food crops as feedstock for bioethanol production through microbial fermentation have affected the food prices. Nevertheless, by utilizing the cheapest feedstock, bioethanol commercialization can be economically viable (Selvakumar *et al.,* 2019; Dhandayuthapani *et al.,* 2021).

Nowadays, microalgae biomass is used as an alternative feedstock for both biodiesel and bioethanol production since they have high amounts of lipids and carbohydrates. Microalgae can grow without soil and they need not require freshwater as well as any other substances for their biomass production (Ngamsirisomsakul *et al.,* 2019; Ozcimen *et al.,* 2020). Besides, they also are able to grow in various wastewaters with a high rate of growth, which is about 10-fold as rapid as sugarcane (Sudhakar *et al.,* 2014). The efficient photosynthetic process of microalgae can confiscate carbon dioxide from the atmosphere more than other higher plants (Matsumoto *et al.,* 1997). The rapid development of microalgae can be cultivated in various wastewaters as well as in wasteland with yield rate 15-300 folds higher than land based fuel crop production (Luo *et al.,* 2017). The economic viability and sustainability of microalgae based bioenergy development can be enhanced considerably through biorefinery approach anywhere for a variety of applications. According to the bio-refinery idea, each constituent of microalgae biomass substance could be utilized to manufacture economically important products. In common, production of microalgal biomass for production of oil towards biodiesel production is significantly raising gradually (Dhandayuthapani *et al.,* 2021). Lipid extracted microalgal biomass such as defatted residues could be used for production of bioethanol through fermentation. This defatted waste material is used as an alternative protein source in aquaculture and poultry (Ju *et al.,* 2012; Nobre *et al.,* 2013; Leng *et al.,* 2014; Fetyan *et al.,* 2022). Very few researchers have been reported that from defatted microalgal biomass (DMB), bioethanol could be produced after appropriate pretreatment (mechanically, chemically, or enzymatically) to release fermentable sugars (Dhandayuthapani *et al.,* 2021; Narmatha *et al.,* 2024). After extracting the fermentable sugar from DMB using suitable pre-treatment, it can be utilized as substrate for bioethanol production by yeast. Among the various type of yeast, the strain *Saccharomyces cerevisiae* was the best yeast for maximum bioethanol production through anaerobic fermentation of hydrolysate obtained from defatted biomass of green microalga *Chlorella sorokiniana* NITTS3 by ultrasonic pre-treated (Dhandayuthapani *et al.,* 2021). Several factors affect the process of fermentation as well as the bioethanol yield such as the production microorganism strain, temperature, pH, oxygen, media composition, fermentation duration and initial concentration of sugar (Zabed *et al.,* 2014). Therefore, it is important to use optimal values among these parameters, for each selected production microorganism, to be able to produce the highest amounts of the required product. The choice and development of the efficient bioethanol production of yeast with a resistance multi-stress tolerance are crucial importance. Yeasts

strain tolerant to high temperature, low pH, osmotic pressure and ethanol are ideal for industrial bioethanol production (Chohan *et al.,* 2020; Fentahun and Andualem, 2024). Immobilization is one of the most influential and straightforward method to overcome pre-culture preparation, prolonged lag phase period and lower productivity problems . Immobilization improves cell viability, cell stability, fermentation yield and downstream processes. It also decreases the effect of shear force. Several studies have successfully used immobilized cells to produce bioethanol from different substrates because of all these advantages (Corona-Gonzalez *et al.,* 2014; Unsal *et al.,* 2023) So far, no attempt has been finished for production of bioethanol from double mutant DB hydrolysate obtained by three different pre-treatment. Therefore, this study was aimed to bioethanol production from hydrolysate obtained by different pre-treated DB of ultrasonic pre-treated municipal wastewater grown double mutant green microalga *Pseudochlorella pringsheimii* KMAS7 using a immobilized *Saccharomyces cerevisiae* NITTS1.

MATERIALS AND METHODS

Materials

All chemicals used in the experiments were of highest purity or analytical grade (Hi-media Pvt. Ltd. Mumbai, and SRL India), obtained from the recognized chemical supplier (National Scientific Supplier, Chennai).

Microalga

Native freshwater green microalga *Pseudochlorella pringsheimii* KMAS7 (GenBank Accession Number: OR879176.1) was isolated from freshwater Lake in Kannamangalam (Lake Latitude 12.75 °N and Longitude 75.15 °E) Arni Taluk's, Tiruvannamalai District, Tamil Nadu, India and and purified in an axenic culture. It was maintained in the Modified Chu 13 medium (pH 7.0) (Tansakul *et al.,* 2005). The cultures were revived after every month. Cultures were kept under white fluorescent light (33 μmol photons m^{-2} s^{-1}) with a 12:12 h light:dark cycle at 25±1°C.

Strain development by double mutation

The wild strain *P. pringsheimii* KMAS7 was treated with UV-C for 15 min followed by 1.75 M ethyl methane sulfonate (EMS) for random mutagenesis and obtained *P. pringsheimii* EMM2 as double mutant strain. Then this double mutant strain was maintained and revived every month in the modified Chu 13 medium. It was used for biomass production from MWW.

Ultrasonic pre-treatment of municipal wastewater

Municipal wastewater (MWW) was collected from discharge of primary sedimentation tank in a MWW treatment plant Kanchipuram municipality, Tamil Nadu, India. The collected MWW was transferred to the laboratory and stored in the refrigerator until used. Ultrasonic pre-treatment of MWW was carried out by modified methods of Dhandayuthapani *et al.,* (2022). The probe type sonicator with 1.2 cm in diameter metal probe was used (Lark Innovative Fine Teknowledge, Chennai, India). The pre-treatment was carried in a 250 mL stainless steel beaker contained 100 mL of 75% MWW for 20 min at 0.35 WmL^{-1} (25kHz). During the sonication the sample was lightly shacked under the temperature at 30 ± 2 °C. Finally, ultrasonic pre-treated MWW (UPMWW) was used as a sole culture medium for cultivation of mutant *P. pringsheimii* EMM2.

Biomass production from mutant *P. pringsheimii* EMM2 by batch cultivation

The cultivation was carried out in 5 L Erlenmeyer flasks containing 2 L of UPMWW. About 10% (v/v) of fresh culture was inoculated into UPMWW for initiate the cultivation under incubated at 120 rpm, 25± 1 °C under the light intensity of 33 μE $m^{-2}s^{-1}$ for 12:12 h day and night cycle for 15 days. Every three days once, 10 mL of sample was collected from a culture broth for biomass estimation. Each experiment was carried out in triplicate and the values are represented as mean ± standard deviation of three replications.

Defatted biomass preparation

For DB preparation, the biomass was harvested by collected the sample from the culture broth and centrifuged at 14,000 rpm for 15 min by a centrifuge (Remi Model R-8C BL, Mumbai, Maharashtra, India). Then harvested biomass was cleaned by treated with deionized water twice and again centrifuged. Subsequently, the cleaned biomass was completely dried at 60 ^{o}C by using a hot air oven. Bligh and Dyer (1959) method was used for lipid extraction from dried biomass. Finally, DB was dried at 28 ± 2 ^{o}C (Room temperature) and then it was used for further investigation.

Optimization of acid pretreatment for hydrolysate preparation from DB

Effect of different concentration of peracetic acid range from 1 to 5 %(v/v) on recovery of fermentable sugar from DB for bioethanol production was investigated. The 5 g of DB was mixed with 100 mL of different concentration of peracetic acid range from 1 to 5 % (v/v) and then autoclaved at 121 ^{o}C for 20 min. After pre-treatment, the samples were cooled at room temperature, centrifuged at 14,000 rpm for 15 min by a centrifuge (Remi Model R-8C BL, Mumbai, Maharashtra, India). The supernatant was collected used for estimation of sugar content and composition by standard methods. Untreated DB was used as control. The prepared acid assisted hydrolysate was utilized as a sole fermentation medium for bioethanol production by batch fermentation.

Optimization of microwave assisted alkaline pre-treatment (MAAPT) for hydrolysate preparation from DB

The DB was pre-treated by domestic microwave oven (Model 17PM MEC 1, White, IFB 17L Solo Microwave Oven). About 5 g of DB was mixed with 100 mL of 1% (w/v) NaOH. Then samples were taken in a 500 mL beaker and positioned at the centre of rotating circular ceramic place in the microwave oven at variable power from 100 to 150 W with 10 W increment for 5 min. After pre-treatment, the samples were cooled at room temperature, centrifuged at 14,000 rpm for 15 min by a centrifuge (Remi Model R-8C BL, Mumbai, Maharashtra, India). The supernatant was collected used for estimation of sugar content and composition by standard methods. Untreated DB was used as control. The prepared microwave assisted alkaline hydrolysate was utilized as a sole fermentation medium for bioethanol production by batch fermentation.

Optimization of ultrasonic assisted pre-treatment (UAPT) for hydrolysate preparation from DB

The DB slurry was prepared by mixing 5 g of DB in 100 mL deionized water. Then the hydrolysate preparation using DB was performed by taken slurry in a stainless steel beaker (250 mL) and dipped a 1.2 cm diameter metallic probe up to 1.5 cm depth at different ultrasound power density range from 0.2 to 0.4 WmL^{-1} with an increment of 0.05 WmL^{-1}. This pre-treatment was conducted with a probe type sonicator with 1.2 cm in diameter metal probe was used (Lark Innovative Fine Teknowledge, Chennai, India). During the sonication process, the sample was lightly shacked under the temperature at 30 ± 2 ^{o}C (Yiying *et al.,* 2009). Untreated DB was used as control. The sugar content and composition of hydrolysate was measure by standard methods. The prepared ultrasound assisted hydrolysate was utilized as a sole fermentation medium for bioethanol production by batch fermentation.

Preparation of immobilized yeast cells

Sodium alginate slurry (6%) was prepared by dissolving 6 g of sodium alginate in 100 ml deionized water water and autoclaved at 121 ^{o}C for 15 minutes. 100 mL (10^{7} cells mL^{-1}) of actively grown yeast *S. cerevisiae* NITTS1 (Genbank A/C Number - MG255132.1, obtained from National Institute of Technology Tiruchirappalli, Tamil Nadu, India) culture was centrifuged at 15, 000 rpm for 5 min the supernatant discoid and the pellet was collected. The harvest yeast cells (pellet) were washed twice with deionized water and then added to alginate slurry. The mixture was stirred for 10 minutes to get a uniform mixture. The slurry was taken into a sterile syringe and added drop wise into 0.2 M calcium chloride solution from 5 cm height and kept for curing at 4 ^{o}C for 1 hr. The cured beads were washed with sterile deionized water 3 times. When beads were not being used, they were preserved in 0.9% sodium chloride solution in the refrigerator. The preparation was carried out aseptically under laminar flow unit. (Adinarayana and Ellaiah, 2004).

Ethanol production by batch fermentation

Separate anaerobic batch fermentation was carried out in 2 L Erlenmeyer flasks contained 1 L of hydrolysate prepared by acid pretreatment, microwave assisted alkaline pretreatment and ultrasonic assisted pre-treatment. Before using the hydrolysate pH was adjusted in to 4. The fermentation medium was inoculated with immobilized yeast cells and then the cultures were incubated in an incubating orbital shaker at 30 °C for 48 h with 120 rpm. An untreated defatted biomass was maintained as control. End of the experiment, the immobilized cell free sample was centrifuged at 14,000 rpm for 20 min using a centrifuge (Remi Model R-8C BL, Mumbai, Maharashtra, India) and it was used for bioethanol extraction by distillation process using a rotary evaporator at 70 °C with 120 rpm.

Optimizing physical parameters for ethanol production

In order to find the optimum temperature, pH, agitation speed, and fermentation period for enhancing the bioethanol production from selected hydrolysate obtained from DB of mutant *P. pringsheimii* EMM2, the above physical parameters of batch fermentation were optimized by one parameter at a time approach. The batch fermentation was carried out in 250 mL air-tight Erlenmeyer flasks with 100 mL of ultrasound assisted hydrolysate prepared from DB and with freshly prepared immobilized cells of *S. cerevisiae* NITTS1 at different temperature range 25 to 45 °C with an increment of 5 °C. The optimum temperature of this experiment was used for further study. Similarly, the fermentation was performed with the parameters pH (3 to 6 with an increment of pH 0.5), agitation speed (100 to 300 rpm with an increment of 50 rpm) and fermentation period (24 to 120 h with an increment of 24 h). Except fermentation period study, all other study incubated for 48 h. End of experiment, the sample was collected and centrifuged at 14,000 rpm for 15 min. The centrifuged sample was used for bioethanol estimation. Each experiment was performed in triplicate and the values were presented as the mean ± SD.

Analytical procedures

Estimation of total carbohydrtae

Total carbohydrates concentration of defatted biomass was estimated by Anthrone method (Hedge and Hofreiter, 1962) and the D-glucose was used as standard. Sugars and its degradation derivatives of hydrolysate were determined by High Pressure Liquid Chromatography (HPLC) (Waters system, Massachusetts, USA), combined with an Aminex HPX-87 and detector (Waters 2414). The eluent contained 5 mM sulphuric acid (H_2SO_4) solution, already filtered with 0.20 μm membrane filter and degasified at a flow rate of 0.6 mL min^{-1}. About 20 μL of sample was introduced at 60 °C (Hernandez *et al.*, 2015).

Estimation of bioethanol concentration Gas chromatography

The concentration of the bioethanol produced from DB of mutant *P. pringsheimii* EMM2 was analyzed by a gas chromatography (HP 6890, Agilent technologies, USA) using a flame ionization detector (FID). An HP INNOWax column (Agilent 19091N-113, film thickness; 0.25 μm, length; 30 m, inner diameter; 0.32 mm) was used. The initial temperature, maximum temperature, and rate of temperature rate in the oven were 50 °C, 170 °C and 10 °C/min, respectively. Both the injector and FID temperatures were controlled at 250 °C. Nitrogen was used as the carrier gas with a flow rate of 40 ml/min. For quantitative analysis, *n*-butanol was used as an internal standard.

Determination of ethanol yield

The ethanol yield (g ethanol/g DB) was calculated using the equation:

$$\text{Ethanol yield (g ethanol/g DB)} = \frac{V \times C \times \rho}{W}$$

Where, V is the volume obtained after distillation process (ml), C- concentration of ethanol determined by GC-FID (%), ρ- density of ethanol (0.789 g/cm^3), W- weight of the DB (g).

Statistical analysis

Each experiment was performed in triplicate and the values were presented as the mean ± SD. Statistical significant difference was measured at the level of $p<0.05$.

RESULTS AND DISCUSSION

Suitability of pre-treatment method

Microalgae contain a substantial quantity of carbohydrates in the form of fermentable sugars that are the best feedstock for bioethanol production (De Morais *et al.,* 2016). Using second-generation feedstock for example food crops for bioethanol production has many challenges due to their direct effect on deforestation and food prices. Microalgal biomass can be used as an alternative feedstock to overcome the aforesaid problem. Because the microalgae produces the carbohydrates as a primary metabolite by photosynthesis. In addition, the carbohydrates recovered from microalgae, for bioethanol production, are very simple. Whereas a strong pre-treatment is required for recovery, the carbohydrates from lignocellulosic feedstock for fermentation. Therefore defatted microalgal biomass and non-defatted microalgal biomass cloud be used as a sustainable feedstock for bioethanol production by fermentation. In this study, 5 g of DB from mutant *P. pringsheimii* EMM2 was treated with different concentrations of peracetic acid to produce a hydrolysate for bioethanol production. Figure 1 shows that the highest amount of bioethanol, 0.198±0.08 gg^{-1} DB, was found in hydrolysates made with 3% v/v peracetic acid. Because the hydrolysate contained a maximum total carbohydrate of 25.89±0.08 gg^{-1} DB (Table 1). With the further increase in the peracetic acid concentration, there was a decrease in bioethanol production since the carbohydrate recovery from DB was decreasing. Generally, acid pretreatment is an effective method for extracting fermentable sugar from microalgal biomass (Phwan *et al.,* 2019; Kruger *et al.,* 2024). However, the high acid concentration during pre-treatment converts the monosaccharides into inhibitors like furfural, which reduces the amount of fermentable sugars available for consumption (Khan *et al.,* 2017). Similarly, we conducted MAAPT and UAPT for hydrolysate preparation from the DB of mutant *P. pringsheimii* EMM2. In this study, the maximum bioethanol of 0.253±0.04 gg^{-1} DB (Figure 2) and 0.272±0.07 gg^{-1} DB (Figure 3) was obtained at 120 W microwave power and 0.3W/mL UPD, respectively. These conditions allowed for the extraction of the maximum total carbohydrate content of 28.49±0.07 gg^{-1} and 29.58±0.04 gg^{-1} by MAAPT and UAPT respectively (Table 1). Further increase in the conditions there was a decrease in bioethanol production because the recovery of carbohydrate content is very low. Among the three methods of pre-treatment such as peracetic acid pre-treatment, MAAPT and UAPT for carbohydrate extraction from DB, the UAPT technique enhanced recovery of carbohydrate from the defatted biomass than other two methods and also very easy to handle. Therefore, we employed the UAPT technique to prepare hydrolysates from DB for the production of ethanol.

Effect of various concentration of DB on bioethanol production

In this study, hydrolysates were prepared from various concentration of DB range from 60 g to 100g by UAPT at 0.3 WmL^{-1} for 10 min and used as sole fermentation medium for bioethanol production using *S. cerevisiae* NITTS1. It is important to observe that the hydrolysate obtained from DB of mutant *P. pringsheimii* EMM2 contains a significant quantity of carbohydrate, which can be efficiently utilized and turned into ethanol by the yeast. As shown in Figure 4, when increase the DB concentration from 60 g to 90 g increased the bioethanol production, further increase in DB concentration there was no significant improvement in bioethanol production. However, the maximum bioethanol of 0.312±0.11gg^{-1} DB was obtained at 90 g of DB. Because in this concentration the highest total carbohydrate (TC) of 32.67±0.07 gg^{-1} DB was obtained (Table 2). Table 3 lists the sugar molecule composition of the hydrolysate made with 90 gL^{-1} of DB of mutant *P. pringsheimii* EMM2 by UAPT at 0.3 WmL^{-1} for 10 min. The total carbohydrate content of the ultrasonic assisted hydrolysate made with the mutant *P. pringsheimii* EMM2 DB is very similar to the outcomes of studies published by Dhandayuthapani *et al.,* (2021) and Narmatha *et al.,* (2024). The carbohydrate that was extracted from the DB was primarily composed of 15.94±0.08 % xylose and 78.83±0.05 % glucose. On the other hand, 13.64±0.06 % of the total carbohydrates in the unsonicated DB of the mutant P. *pringsheimii* EMM2 were found. By using UAPT for 10 minutes at 0.3 WmL^{-1}, 90 gL^{-1} of DB yielded about 2.4 times the amount of carbohydrates. Additionally, using HPLC, the breakdown products of sugar—acetic acid, lactic acid, formic acid, and propionic acid were not found in the hydrolysate. In this study, the glucose could be successfully converted into bioethanol by *S. cerevisiae* NITTS1 by fermentation. Therefore, 90 g DB of mutant *P. pringsheimii* EMM2 was used as an optimum concentration further bioethanol production.

Optimizing the temperature for bioethanol production

This study was conducted with various temperature ranges from 25 °C to 45 °C with an increment of 5 °C. 100% hydrolysate was used as sole medium for bioethanol production. The medium was inoculated with 10% v/v, of fresh inoculum of *S. cervevisiea* NITTS1. It is noticed from Figure 5, when rising the temperature from 25 °C to 30 °C has resulted in a clear increase in bioethanol production from 0.277±0.11 to 0.343±0.12 gg^{-1} DB. When increasing the temperature above the 30 °C, a decrease in the bioethanol production is observed. However, the yeast strain *S. cervevisiea* NITTS1 was very effectively produced the maximum bioethanol of 0.343±0.12 gg^{-1} DB 30 °C by converting sugars, which are present in the hydrolysate. This tendency of changes in bioethanol production with fermentation temperature is in accordance with the results expressed by Dhandayuthapani *et al.,* (2021) and Narmatha *et al.,* (2024). Generally the yeast *Saccharomyces* strains are fermenting well and producing bioethanol at the temperature range of 20 to 35 °C (Aldiguier *et al.,* 2004; Unal *et al.,* 2022). The calculated 'r' value of correlation analysis is significant at 0.05 levels at df_5. Therefore the fermentation temperature and bioethanol production are interdependent. In this study, highest bioethanol production was obtained at 30 °C. Hence, the temperature 30 °C was used as optimum temperature for further study.

Optimizing the pH for bioethanol production

The effect of fermentation pH on bioethanol production using 100% hydrolysate of DB was studied. The fermentation was carried out at different pH ranges from 3 to 6 with an increment of pH 0.5. Figure 6, shows that the *S. cervevisiea* NITTS1 fermented effectively the sugars of hydrolysate obtained from DB of mutant *P. pringsheimii* EMM2 by ultrasonic pre-treatment at 0.35 WmL^{-1} for 20 min and produced highest bioethanol of 0.347±0.05 gg^{-1} DB at pH 4.0, which is good agreement with the results of Dhandayuthapani *et al.,* (2021) and Narmatha *et al.,* (2024). The calculated 'r' value of correlation analysis is significant at 0.05 levels at df_5 and it suggests that the fermentation capability of *S. cervevisiea* NITTS1 is pH dependent. In this study, highest bioethanol production was obtained at pH 4.0. Hence, the pH 4.0 was used as optimum pH for further study.

Optimizing the agitation speed for bioethanol production

Effect of various agitation speed ranges from 100 to 300 rpm on bioethanol production from 100% hydrolysate was studied. When the agitation speed was raised from 100 to 150 rpm the bioethanol yield was increased from 0.235±0.11 to 0.348±0.05 gg^{-1} DB. Further increase in the agitation speed resulted in decreased bioethanol yield. However, as shown in Figure 7, the highest bioethanol production of 0.348±0.05 gg^{-1} DB was obtained at 150 rpm at 30 °C and pH 4.0, which is in good agreement with the results of Dhandayuthapani *et al.,* (2021) and Narmatha *et al.,* (2024). The results of this study state that the higher agitation speed reduces the bioethanol yield because the over mixing may interrupt the *S. cervevisiea* NITTS1 growth and its fermentation capacity. The calculated 'r' value of correlation analysis is significant at 0.05 levels at df_5 and it suggests that the fermentation capability of *S. cervevisiea* NITTS1 is medium mixing dependent. In this study, highest bioethanol production was obtained at 150 rpm. Hence, the 150 rpm was used as optimum agitation speed for further study.

Optimizing the fermentation time for bioethanol production

Effect of various fermentation times from 24 to 120 h on bioethanol production from 100% hydrolysate was studied. When the fermentation time was raised from 24 to 48 h the bioethanol yield was increased from 0.244±0.11 to 0.350±0.05 gg^{-1} DB. Further increase in the fermentation time resulted in decreased bioethanol yield. However, as shown in Figure 8, the highest bioethanol production of 0.350±0.05 gg^{-1} DB was obtained at 72 h with 150 rpm at 30 °C and pH 4.0. When the fermentation time exceeds the optimum days does not affect the increase in bioethanol levels because the yeast undergoes a death phase so that the activity of the yeast in converting glucose to bioethanol decreases (Rinastiti *et al.,* 2022).

CONCLUSION

The double mutant green microalga *P. pringsheimii* EMM2 was cultivated in 75% ultrasonic pre-treated MWW and its DB was used for hydrolysate preparation. Three different pre-treatment methods such as peracetic acid pre-treatment, MAAPT and UAPT were performed for hydrolysate preparation. Among these methods, the UAPT technique enhanced recovery of carbohydrate from the DB than other two methods. The hydrolysate obtained from ultrasonic pre-treated DB was effectively utilized for bioethanol production by fermentation using yeast *S. cerevisiae* NITTS1. The ultrasonic per-treated hydrolysate carbohydrate content was analyzed and it was found that the glucose and xylose are the major simple sugars. Besides the effect of physical parameters on bioethanol production were optimized and found to be 30 ^{o}C, pH 4, 150 rpm and 72 h with the highest bioethanol yield of 0.350±0.05 gg^{-1} DB. Outcome of this study demonstrates that the ultrasonic pre-treated DB of mutant *P. pringsheimii* EMM2 could be used as a cheap feedstock for bioethanol production.

ABSTRACT

Promoting environmental sustainability at present is the main goal of many countries as the increasing population of industries makes the countries to face several drastic effects in the environment and also among the global atmosphere. Every government in countries are in need to validate and trace the carbon emission of each and every energy consumer. Statistical reports found that the majority of carbon emission arises from industrial and manufacturing sectors. Producing green products helps in some extent to make environment free from hazardous chemicals and wastes. However, controlling greenhouse gas emission is mandatory. Several polices are framed nowadays to tackle such situations. Limited carbon emission is one such policy which is often adopted by governments. But in any case of green inventory models uncertainty exist in some situation leading to implement fuzzy to rectify this problem. The present study discusses the effects that carbon policy and green technology may have on the integrated inventory model with carbon emission consideration during the processes of process production, transportation and storage of products under fuzzy perspective. The proposed model helps the firms determine the optimum result and benefits under fuzzy methodology. Several cost parameters related to limited carbon emission policy are fuzzified to face uncertainty in the model and Kuhn-tucker method is used to find the optimal order quantity and optimum total cost. A Numerical example is given to illustrate the model.

Keywords: Limited carbon emission policy, hexagonal fuzzy numbers, carbon emissions, Kuhn – tucker method.

INTRODUCTION

In the scenario of increasing population among countries the demand for products also raises to high extent. Hence many industries are developed to produce products in higher levels to tackle the demand from consumers and thereby increasing the levels of greenhouse gases. Thus industrialization along with rapid population growth results in climatic change and global warming. Several policies and green investment technology were followed by the government in countries to control this situation. Limited carbon emission policy is one such policy framed by the government to reduce the emission of green house gases from industrial sectors. Limited carbon emission policy is the policy in which limited allowances of carbon emissions are issued to each company from the government and the restriction doesn't allow firms to release (or) produce excessive emissions of carbon from their manufactural or business activities. At present enhanced level of environmental awareness regarding the ideals of saving energy and reducing the emissions of carbon were given frequently to the people in many ways. However, few countries have framed the regulations to limit carbon emissions and reduce the quantity of greenhouse gases in which the energy development is maintained indirectly. Thus the attention of such reduction of carbon emissions among business firms is needed at all stages of production of product items along with the consideration of effects of environmental issues on their cost structures. Every firm has to seek different ways in preparing products to reduce the carbon emissions which may occur at any time along a supply chain as the firms must comply the government regulations and should take an initiative and environmental responsibility under the global warming consideration. Some firms were interested to make investment in green technology to reduce such emissions instead of passively considering limited carbon emissions and penalty cast due to excessive carbon emissions. But encouraging the industries to invest in green technologies is a critical issue for industrialized countries. Incentive policies provided by the government can be accessed by the companies to reduce pollution by increasing green investments.

Cholette and Venkat(2009) in their findings stated that the beverage industries and logistics of food are often intensive at the stage of delivering items resulting in high amount of energy consumption and CO_2 emissions. Hence they concluded their work by providing the way to reduce the negative impacts on both cost and the environment by utilizing the third party logistics providers. Tsai, Yang, chang and Lee(2014) discussed the cost management of green construction with consideration of the carbon emissions cost and low carbon construction methods. In (2015) Tang, Wang, Yan and Hao studied about reducing the frequency of transportation by cutting carbon emissions. Shuetal (2017) developed the traditional economic order quality model for remanufacturing activities along with the consideration of the constraint of carbon emissions. Hong and Guo(2019) considered the cooperation between a manufacturer and a retailer in a supply chain and they found that the cooperation between them may not always seems to be beneficiary unless they have proper coordination contracts to achieve the goal at any situation, Yeu-shiang Huang, chih-chiang Fang and Ying-An Lin in 2020 investigates inventory management in supply chains with consideration of logistics, green investment under different carbon emissions policies. Because of the change in environment, ambiguous situations exist in most of the green inventory models. Hence many researchers extended their idea by implementing fuzzy in green supply chain management. In 2019, Rani, Ali and Agarwal proposed a fuzzy inventory model for deteriorating items in a green supply chain with carbon concerned demand. Tavana et al developed a location-inventory-routing model for green supply chains with low-carbon emissions under uncertainty in 2021. Maityet al in 2023 studied an EOQ model of green items with the effect of carbon emission under pentagonal intuitionistic dense fuzzy environment. The present model extends agreen supply chain management with green investment under a limited carbon emission policy by implementing fuzzy methods to face vagueness in the parameters. Graded mean Integration method is used for defuzzification and Kuhn-tucker method is applied to find the optimum order quantity and fuzzy total cost. Arelevant numerical example is given to illustrate the model.

DEFINITIONS AND METHODOLOGIES:

Fuzzy Set

A fuzzy set $\tilde{A}$ defined on a Universe of discourse X may be written as a collection of ordered pairs, $\tilde{A} = \{(x, \mu_{\tilde{A}}(x)) : x \in X, \mu_{\tilde{A}} \in [0,1]\}$, where each pair $(x, \mu_{\tilde{A}}(x))$ is called a singleton and the element $\mu_{\tilde{A}}(x)$ belongs to the interval [0,1].The function $\mu_{\tilde{A}}(x)$ is called as membership function.

Hexagonal Fuzzy Number:

A fuzzy number $\tilde{A} = (a, b, c, d, e, f)$ where $a < b < c < d < e < f$ are defined on R is called hexagonal fuzzy number if its membership function is

$$\mu_{\tilde{A}}(x) = \begin{cases} \frac{x-a}{2(b-a)}, a \le x \le b \\ \frac{1}{2} + \frac{x-b}{2(c-d)}, b \le x \le c \\ 1 \quad , c \le x \le d \\ 1 - \frac{x-d}{2(e-d)}, d \le x \le e \\ \frac{f-x}{2(f-c)} \quad , e \le x \le f \\ 0 \quad , otherwise \end{cases}$$

Fuzzy Arithmetical Operations:

Some of the fuzzy arithmetical operations for hexagonal fuzzy numbers under function principle are as follows,

Let us assume $\tilde{A} = (a_1, a_2, a_3, a_4, a_5, a_6)$ and $\tilde{B} = (b_1, b_2, b_3, b_4, b_5, b_6)$ as two hexagonal fuzzy numbers. Then

(i) The addition of $\tilde{A}$ and $\tilde{B}$ is $\tilde{A} \oplus \tilde{B} = (a_1 + b_1, a_2 + b_2, a_3 + b_3, a_4 + b_4, a_5 + b_5, a_6 + b_6)$.

(ii) The multiplication of $\tilde{A}$ and $\tilde{B}$ is $\tilde{A} \otimes \tilde{B} = (a_1 b_1, a_2 b_2, a_3 b_3, a_4 b_4, a_5 b_5, a_6 b_6)$.

(iii) The subtraction of $\tilde{A}$ and $\tilde{B}$ is $\tilde{A} \ominus \tilde{B} = (a_1 - b_6, a_2 - b_5, a_3 - b_4, a_4 - b_3, a_5 - b_2, a_6 - b_1)$

(iv) The division of $\tilde{A}$ and $\tilde{B}$ is

$$\tilde{A} \oslash \tilde{B} = \left(\frac{a_1}{b_6}, \frac{a_2}{b_5}, \frac{a_3}{b_4}, \frac{a_4}{b_3}, \frac{a_5}{b_2}, \frac{a_6}{b_1}\right)$$

(v) For any $\alpha \in R$,

a) If $\alpha \ge 0$, then $\alpha \otimes \tilde{A} = (\alpha a_1, \alpha a_2, \alpha a_3, \alpha a_4, \alpha a_5, \alpha a_6)$.

b) If $\alpha < 0$, then $\alpha \otimes \tilde{A} = (\alpha a_6, \alpha a_5, \alpha a_4, \alpha a_3, \alpha a_2, \alpha a_1)$.

Graded Mean Integration Representation Method:

Graded Mean Integration Representation Method is one of the methods used for defuzzifying fuzzy numbers. In this present work of Green Inventory model, hexagonal fuzzy number is used as the type of all fuzzy parameters. Let $\tilde{C}$ be a hexagonal fuzzy number, and be denoted as$\tilde{C} = (c_1, c_2, c_3, c_4, c_5, c_6)$. Then we can get the formula for Graded Mean Integration Representation of $\tilde{C}$ as

$$P(\tilde{C}) = \frac{c_1 + 3c_2 + 2c_3 + 2c_4 + 3c_5 + c_6}{12}$$

Kuhn- Tucker Method:

The Kuhn-Tucker method is a method for finding optimal solutions for non-linear programming problems containing differentiable functions. The Kuhn-tucker conditions are based on the extension of lagrangian method.

Suppose we consider an optimization problem,

Minimize $Y = f(x)$ subject to the constraints$g_i(x) \ge 0$, i=1,2,……..m.

The non-negativity constraints may be converted into equations by using non negative surplus variables.

Let $\lambda = (\lambda_1, \lambda_2, \lambda_3, \ldots\ldots \lambda_m), g(x) = (g_1(x), g_2(x), g_3(x), \ldots\ldots, g_m(x))$ and

$S^2 = (S_1^2, S_2^2, S_3^2, \ldots\ldots S_m^2)$.

The Kuhn-Tucker conditions need X and $\lambda$to be a stationary point of this problem of minimization, which can be expressed as follows,

$\lambda_i \geq 0,$ ---------- (2.1)

$\nabla f(x) - \boldsymbol{\lambda}\nabla g(x) = 0,$ ---------- (2.2)

$\lambda_i g_i(x) = 0, i = 1,2, \ldots . , m,$ ----------(2.3)

$g_i(x) \geq 0, i = 1,2, \ldots , m.$ ---------- (2.4)

ASSUMPTIONS AND NOTATIONS

ASSUMPTIONS

- Firms will maintain their current production scale during the planning period and will not expand it.
- Product shortages are not taken into account.
- The product rate is higher than the retailer's demand rate.
- This research looks at an uncertain supply chain to remove ambiguous situations.

NOTATIONS

Crisp Parameters

$\mathcal{D}_r$ – Retailer's Demand Rate.

$\mathcal{S}_p$ – Supplier's Production Rate.

$\mathcal{Q}_t$ – Optimum Order Quantity.

$\mathcal{H}_s$ – Supplier's Production Setup cost.

$\mathcal{O}_p$ – Retailer's Processing Order cost.

$\mathcal{C}_s$ – Cost of Storage for the supplier.

$\mathcal{C}_r$ – Cost of storage for the retailer.

ℓ –Number of exports within the production cycle.

$\mathcal{C}_t$ –Cost of Transportation per unit.

$\mathcal{G}_d$ – The Distance of delivery.

$\mathcal{U}_\hbar$ – The emission of carbon from storing a unit product.

$\mathcal{U}_r$ – The emission of carbon from delivering a unit product.

$\mathcal{U}_p$ – The emission of carbon from producing a unit product.

$\mathcal{U}_s$ – The emission of carbon from production Setup.

$\mathcal{I}_j$ – Amount of Green invested.

m - The efficiency factor of emission of carbon reduction.

n – The Offset factor of emission of carbon reduction.

$\mathcal{U}_\ell$ – Upper Limit of the emission of carbon.

λ_G – Lagrange Multiplier.

$TC(\mathcal{Q}_t)$ – Total Cost.

Fuzzy Parameters:

$\widetilde{\mathcal{D}_r}$ –Retailer's Fuzzy Demand Rate.

$\widetilde{\mathcal{S}_p}$ –Supplier's Fuzzy Production Rate.

$\widetilde{\mathcal{O}_p}$ –Retailer's Fuzzy Processing Order cost.

$\widetilde{\mathcal{H}_s}$ –Supplier's Fuzzy Production Setup cost.

$\widetilde{\mathcal{C}_r}$ – Fuzzy Cost of storage for the retailer.

$\widetilde{\mathcal{U}_\hbar}$ –The emission of carbon from storing a unit product under fuzzy.

$\widetilde{\mathcal{C}_t}$ –Fuzzy Cost of Transportation per unit.

$\widetilde{\mathcal{U}_r}$ –The emission of carbon from delivering a unit product under fuzzy.

$\widetilde{\mathcal{U}_p}$ –The emission of carbon from producing a unit product under fuzzy.

$\widetilde{\mathcal{U}_s}$ –The emission of carbon from production Setup under fuzzy.

$\widetilde{\mathcal{U}_\ell}$ –Upper Limit of the emission of carbon under fuzzy.

$\widetilde{\mathcal{C}_s}$ – Fuzzy cost of Storage for the supplier.

$P\left(\widetilde{TC}(\widetilde{\mathcal{Q}_t})\right)$ – Fuzzy Total Cost.

$\widetilde{\mathcal{Q}_t^*}$ – Fuzzy Optimum Order Quantity.

INTEGRATED INVENTORY MODEL WITH CARBON EMISSIONS

The total cost of the considered green inventory model is given by,

$$TC(\mathcal{Q}_t) = \frac{\mathcal{D}_r(\mathcal{H}_s + \ell\mathcal{O}_p)}{\ell\mathcal{Q}_t} + \frac{\mathcal{D}_r}{\mathcal{Q}_t}\mathcal{C}_t\mathcal{G}_d + \frac{\mathcal{Q}_t}{2}\left[\left(1+\ell\left(1-\frac{\mathcal{D}_r}{\mathcal{S}_p}\right)\right)\mathcal{C}_s + \mathcal{C}_r\right] + \mathcal{I}_j$$
$$+ \lambda_G\left[\mathcal{D}_r\mathcal{U}_p + \frac{\mathcal{D}_r}{\ell\mathcal{Q}_t}(\mathcal{U}_s + \ell\mathcal{U}_r\mathcal{G}_d) + \frac{\mathcal{Q}_t}{2}\left(2+\ell\left(1-\frac{\mathcal{D}_r}{\mathcal{S}_p}\right)\right)\mathcal{U}_\hbar - m\mathcal{I}_j + n\mathcal{I}_j^2 - \mathcal{U}_\ell\right]$$

Differentiating the above equation partially with respect to $\mathcal{Q}_t$ and equating to zero we get the Optimum Order Quantity,

$$\mathcal{Q}_t = \sqrt{\frac{2\mathcal{D}_r\left[\ell(\mathcal{O}_p + \mathcal{C}_t\mathcal{G}_d) + \mathcal{H}_s + \lambda_G(\mathcal{U}_s + \ell\mathcal{U}_r\mathcal{G}_d)\right]}{\ell\left[\mathcal{C}_s\left(1+\ell\left(1-\frac{\mathcal{D}_r}{\mathcal{S}_p}\right)\right) + \mathcal{C}_r + \lambda_G\left(2+\ell\left(1-\frac{\mathcal{D}_r}{\mathcal{S}_p}\right)\right)\mathcal{U}_\hbar\right]}}$$

The optimal number of exports within the production cycle is a positive integer that satisfies following inequality,

$$\ell(\ell-1) \le \frac{(\mathcal{H}_s + \lambda_G\mathcal{U}_s)(\mathcal{C}_r + 2\mathcal{U}_\hbar\lambda_G + \mathcal{C}_s)}{\left(1-\frac{\mathcal{D}_r}{\mathcal{S}_p}\right)(\mathcal{C}_s + \lambda_G\mathcal{U}_\hbar)\left(\mathcal{O}_p + \mathcal{G}_d(\mathcal{C}_t + \lambda_G\mathcal{U}_r)\right)} \le \ell(\ell+1)$$

And the amount of green investment is given by,

$$\mathcal{I}_j = \frac{m\lambda_G - 1}{2n\lambda_G}$$

FUZZY INVENTORY MODEL

The above given integrated green inventory model is now considered in fuzzy sense to remove uncertain, unclearness and ambiguous situations in several costs considerations. Now

$\widetilde{\mathcal{Q}_t} = (q_{t_1}, q_{t_2}, q_{t_3}, q_{t_4}, q_{t_5}, q_{t_6})$, $\widetilde{\mathcal{D}_r} = (d_{r_1}, d_{r_2}, d_{r_3}, d_{r_4}, d_{r_5}, d_{r_6})$

$\widetilde{\mathcal{S}_p} = (s_{p_1}, s_{p_2}, s_{p_3}, s_{p_4}, s_{p_5}, s_{p_6})$, $\widetilde{\mathcal{H}_s} = (h_{s_1}, h_{s_2}, h_{s_3}, h_{s_4}, h_{s_5}, h_{s_6})$

$\widetilde{\mathcal{C}_r} = (c_{r_1}, c_{r_2}, c_{r_3}, c_{r_4}, c_{r_5}, c_{r_6})$, $\widetilde{\mathcal{O}_p} = (o_{p_1}, o_{p_2}, o_{p_3}, o_{p_4}, o_{p_5}, o_{p_6})$

$\widetilde{\mathcal{U}_\hbar} = (u_{\hbar_1}, u_{\hbar_2}, u_{\hbar_3}, u_{\hbar_4}, u_{\hbar_5}, u_{\hbar_6})$, $\widetilde{\mathcal{C}_t} = (c_{t_1}, c_{t_2}, c_{t_3}, c_{t_4}, c_{t_5}, c_{t_6})$

$\widetilde{\mathcal{U}_r} = (u_{r_1}, u_{r_2}, u_{r_3}, u_{r_4}, u_{r_5}, u_{r_6})$, $\widetilde{\mathcal{U}_p} = (u_{p_1}, u_{p_2}, u_{p_3}, u_{p_4}, u_{p_5}, u_{p_6})$

$\widetilde{\mathcal{U}_s} = (u_{s_1}, u_{s_2}, u_{s_3}, u_{s_4}, u_{s_5}, u_{s_6})$, $\widetilde{\mathcal{U}_\ell} = (u_{\ell_1}, u_{\ell_2}, u_{\ell_3}, u_{\ell_4}, u_{\ell_5}, u_{\ell_6})$

$\widetilde{\mathcal{C}_s} = (c_{s_1}, c_{s_2}, c_{s_3}, c_{s_4}, c_{s_5}, c_{s_6})$ are non – negative hexagonal fuzzy numbers.

Hence the fuzzified total cost for the above integrated green inventory model is given by,

$$\widetilde{TC}(\widetilde{\mathcal{Q}_t}) = \left(TC(q_{t_1}), TC(q_{t_2}), TC(q_{t_3}), TC(q_{t_4}), TC(q_{t_5}), TC(q_{t_6})\right)$$

Where $TC(q_{t_i}) = \frac{d_{r_i}\left(h_{s_i}+\ell o_{p_i}\right)}{\ell q_{t_j}} + \frac{d_{r_i}}{q_{t_j}}c_{t_i}\mathcal{G}_d + \frac{q_{t_i}}{2}\left[\left(1+\ell\left(1-\frac{d_{r_i}}{s_{p_j}}\right)\right)c_{s_i} + c_{r_i}\right] + \mathcal{I}_j + \lambda_G\left[d_{r_i}u_{p_i} +\right.$

$dril qtjusi+\ell uriGd+qti22+\ell 1-drispjuhi-mIj+nIj2-ul i$ for $i=1,2,3,4,5,6$ and $j=6,5,4,3,2,1$.

Now for the defuzzification of the fuzzified total cost, graded mean integration representation method is used and it is given by,

$$P\left(\widetilde{TC}(\widetilde{\mathcal{Q}_t})\right) = \frac{1}{12}\left[TC(q_{t_1}) + 3TC(q_{t_2}) + 2TC(q_{t_3}) + 2TC(q_{t_4}) + 3TC(q_{t_5}) + TC(q_{t_6})\right]$$

$$\text{Therefore,} P\left(\widetilde{TC}\left(\widetilde{Q_t}\right)\right) = \frac{1}{12}\left[\begin{array}{l} \left[\begin{array}{c} \frac{d_{r_1}(h_{s_1}+\ell o_{p_1})}{\ell q_{t_6}} + \frac{d_{r_1}}{q_{t_6}} c_{t_1} \mathcal{G}_d + \frac{q_{t_1}}{2}\left[\left(1+\ell\left(1-\frac{d_{r_1}}{s_{p_6}}\right)\right) c_{s_1} + c_{r_1}\right] + \mathcal{I}_j + \\ \lambda_G\left[d_{r_1} u_{p_1} + \frac{d_{r_1}}{\ell q_{t_6}}\left(u_{s_1} + \ell u_{r_1} \mathcal{G}_d\right) + \frac{q_{t_1}}{2}\left(2+\ell\left(1-\frac{d_{r_1}}{s_{p_6}}\right)\right) u_{\hbar_1} - m\mathcal{I}_j + n\mathcal{I}_j^2 - u_{\ell_1}\right] \end{array}\right] \\ +3\left[\begin{array}{c} \frac{d_{r_2}(h_{s_2}+\ell o_{p_2})}{\ell q_{t_5}} + \frac{d_{r_2}}{q_{t_5}} c_{t_2} \mathcal{G}_d + \frac{q_{t_2}}{2}\left[\left(1+\ell\left(1-\frac{d_{r_2}}{s_{p_5}}\right)\right) c_{s_2} + c_{r_2}\right] + \mathcal{I}_j + \\ \lambda_G\left[d_{r_2} u_{p_2} + \frac{d_{r_2}}{\ell q_{t_5}}\left(u_{s_2} + \ell u_{r_2} \mathcal{G}_d\right) + \frac{q_{t_2}}{2}\left(2+\ell\left(1-\frac{d_{r_2}}{s_{p_5}}\right)\right) u_{\hbar_2} - m\mathcal{I}_j + n\mathcal{I}_j^2 - u_{\ell_2}\right] \end{array}\right] \\ +2\left[\begin{array}{c} \frac{d_{r_3}(h_{s_3}+\ell o_{p_3})}{\ell q_{t_4}} + \frac{d_{r_3}}{q_{t_4}} c_{t_3} \mathcal{G}_d + \frac{q_{t_3}}{2}\left[\left(1+\ell\left(1-\frac{d_{r_3}}{s_{p_4}}\right)\right) c_{s_3} + c_{r_3}\right] + \mathcal{I}_j + \\ \lambda_G\left[d_{r_3} u_{p_3} + \frac{d_{r_3}}{\ell q_{t_4}}\left(u_{s_3} + \ell u_{r_3} \mathcal{G}_d\right) + \frac{q_{t_3}}{2}\left(2+\ell\left(1-\frac{d_{r_3}}{s_{p_4}}\right)\right) u_{\hbar_3} - m\mathcal{I}_j + n\mathcal{I}_j^2 - u_{\ell_3}\right] \end{array}\right] \\ +2\left[\begin{array}{c} \frac{d_{r_4}(h_{s_4}+\ell o_{p_4})}{\ell q_{t_3}} + \frac{d_{r_4}}{q_{t_3}} c_{t_4} \mathcal{G}_d + \frac{q_{t_4}}{2}\left[\left(1+\ell\left(1-\frac{d_{r_4}}{s_{p_3}}\right)\right) c_{s_4} + c_{r_4}\right] + \mathcal{I}_j + \\ \lambda_G\left[d_{r_4} u_{p_4} + \frac{d_{r_4}}{\ell q_{t_3}}\left(u_{s_4} + \ell u_{r_4} \mathcal{G}_d\right) + \frac{q_{t_4}}{2}\left(2+\ell\left(1-\frac{d_{r_4}}{s_{p_3}}\right)\right) u_{\hbar_4} - m\mathcal{I}_j + n\mathcal{I}_j^2 - u_{\ell_4}\right] \end{array}\right] \\ +3\left[\begin{array}{c} \frac{d_{r_5}(h_{s_5}+\ell o_{p_5})}{\ell q_{t_2}} + \frac{d_{r_5}}{q_{t_2}} c_{t_5} \mathcal{G}_d + \frac{q_{t_5}}{2}\left[\left(1+\ell\left(1-\frac{d_{r_5}}{s_{p_2}}\right)\right) c_{s_5} + c_{r_5}\right] + \mathcal{I}_j + \\ \lambda_G\left[d_{r_5} u_{p_5} + \frac{d_{r_5}}{\ell q_{t_2}}\left(u_{s_5} + \ell u_{r_5} \mathcal{G}_d\right) + \frac{q_{t_5}}{2}\left(2+\ell\left(1-\frac{d_{r_5}}{s_{p_2}}\right)\right) u_{\hbar_5} - m\mathcal{I}_j + n\mathcal{I}_j^2 - u_{\ell_5}\right] \end{array}\right] \\ +\left[\begin{array}{c} \frac{d_{r_6}(h_{s_6}+\ell o_{p_6})}{\ell q_{t_1}} + \frac{d_{r_6}}{q_{t_1}} c_{t_6} \mathcal{G}_d + \frac{q_{t_6}}{2}\left[\left(1+\ell\left(1-\frac{d_{r_6}}{s_{p_1}}\right)\right) c_{s_6} + c_{r_6}\right] + \mathcal{I}_j + \\ \lambda_G\left[d_{r_6} u_{p_6} + \frac{d_{r_6}}{\ell q_{t_1}}\left(u_{s_6} + \ell u_{r_6} \mathcal{G}_d\right) + \frac{q_{t_6}}{2}\left(2+\ell\left(1-\frac{d_{r_6}}{s_{p_1}}\right)\right) u_{\hbar_6} - m\mathcal{I}_j + n\mathcal{I}_j^2 - u_{\ell_6}\right] \end{array}\right] \end{array}\right]$$

With $0 < q_{t_1} \le q_{t_2} \le q_{t_3} \le q_{t_4} \le q_{t_5} \le q_{t_6}$ ---------- (5.1)

The meaning of the above equation given here will not change, even if we replace the inequality conditions $0 < q_{t_1} \le q_{t_2} \le q_{t_3} \le q_{t_4} \le q_{t_5} \le q_{t_6}$ into the following inequality constraints,

$q_{t_2} - q_{t_1} \ge 0, q_{t_3} - q_{t_2} \ge 0, q_{t_4} - q_{t_3} \ge 0, q_{t_5} - q_{t_4} \ge 0, q_{t_6} - q_{t_5} \ge 0$ and $q_{t_1} > 0$.

Now we use Kuhn-tucker conditions for finding the solutions of $q_{t_1}, q_{t_2}, q_{t_3}, q_{t_4}, q_{t_5}, q_{t_6}$ and to minimize the fuzzy total cost which is denoted as $P\left(\widetilde{TC}(Q_t)\right)$ subject to $q_{t_6} - q_{t_5} \ge 0, q_{t_5} - q_{t_4} \ge 0, q_{t_4} - q_{t_3} \ge 0, q_{t_3} - q_{t_2} \ge 0, q_{t_2} - q_{t_1} \ge 0$ and $q_{t_1} > 0$.

Applying Kuhn-tucker conditions (2.1), (2.2), (2.3) & (2.4) we get,

$$\lambda_1, \lambda_2, \lambda_3, \lambda_4, \lambda_5, \lambda_6 \le 0 \quad \text{---------- (5.2)}$$

$$\frac{1}{12}\left[\frac{1}{2}\left[\left(1+\ell\left(1-\frac{d_{r_1}}{s_{p_6}}\right)\right) c_{s_1} + c_{r_1}\right] + \lambda_G\left[\frac{1}{2}\left(2+\ell\left(1-\frac{d_{r_1}}{s_{p_6}}\right)\right) u_{\hbar_1}\right] - \frac{d_{r_6}}{\ell q_{t_1}^2}\left[\ell\left(o_{p_6} + c_{t_6}\mathcal{G}_d\right) + h_{s_6} + \lambda_G\left(u_{s_6} + \ell u_{r_6}\mathcal{G}_d\right)\right]\right] + \lambda_1 - \lambda_6 = 0 \quad \text{---------- (5.3)}$$

$$\frac{3}{12}\left[\frac{1}{2}\left[\left(1+\ell\left(1-\frac{d_{r_2}}{s_{p_5}}\right)\right)c_{s_2}+c_{r_2}\right]+\lambda_G\left[\frac{1}{2}\left(2+\ell\left(1-\frac{d_{r_2}}{s_{p_5}}\right)\right)u_{\hbar_2}\right]-\frac{d_{r_5}}{\ell{q_{t_2}}^2}[\ell(o_{p_5}+c_{t_5}\mathcal{G}_d)+ h_{s_5}+\lambda_G(u_{s_5}+\ell u_{r_5}\mathcal{G}_d)]\right]-\lambda_1+\lambda_2=0 \quad ----------(5.4)$$

$$\frac{2}{12}\left[\frac{1}{2}\left[\left(1+\ell\left(1-\frac{d_{r_3}}{s_{p_4}}\right)\right)c_{s_3}+c_{r_3}\right]+\lambda_G\left[\frac{1}{2}\left(2+\ell\left(1-\frac{d_{r_3}}{s_{p_4}}\right)\right)u_{\hbar_3}\right] -\frac{d_{r_4}}{\ell{q_{t_3}}^2}[\ell(o_{p_4}+c_{t_4}\mathcal{G}_d)+ h_{s_4}+\lambda_G(u_{s_4}+\ell u_{r_4}\mathcal{G}_d)]\right]-\lambda_2+\lambda_3 = 0 \quad ----------(5.5)$$

$$\frac{2}{12}\left[\frac{1}{2}\left[\left(1+\ell\left(1-\frac{d_{r_4}}{s_{p_3}}\right)\right)c_{s_4}+c_{r_4}\right]+\lambda_G\left[\frac{1}{2}\left(2+\ell\left(1-\frac{d_{r_4}}{s_{p_3}}\right)\right)u_{\hbar_4}\right] -\frac{d_{r_3}}{\ell{q_{t_4}}^2}[\ell(o_{p_3}+c_{t_3}\mathcal{G}_d)+ h_{s_3}+\lambda_G(u_{s_3}+\ell u_{r_3}\mathcal{G}_d)]\right]-\lambda_3+\lambda_4 = 0 \quad ----------(5.6)$$

$$\frac{3}{12}\left[\frac{1}{2}\left[\left(1+\ell\left(1-\frac{d_{r_5}}{s_{p_2}}\right)\right)c_{s_5}+c_{r_5}\right]+\lambda_G\left[\frac{1}{2}\left(2+\ell\left(1-\frac{d_{r_5}}{s_{p_2}}\right)\right)u_{\hbar_5}\right] -\frac{d_{r_2}}{\ell{q_{t_5}}^2}[\ell(o_{p_2}+c_{t_2}\mathcal{G}_d)+ h_{s_2}+\lambda_G(u_{s_2}+\ell u_{r_2}\mathcal{G}_d)]\right]-\lambda_4+\lambda_5 = 0 \quad ----------(5.7)$$

$$\frac{1}{12}\left[\frac{1}{2}\left[\left(1+\ell\left(1-\frac{d_{r_6}}{s_{p_1}}\right)\right)c_{s_6}+c_{r_6}\right]+\lambda_G\left[\frac{1}{2}\left(2+\ell\left(1-\frac{d_{r_6}}{s_{p_1}}\right)\right)u_{\hbar_6}\right]-\frac{d_{r_1}}{\ell{q_{t_6}}^2}[\ell(o_{p_1}+c_{t_1}\mathcal{G}_d)+h_{s_1}+\lambda_G(u_{s_1}+\ell u_{r_1}\mathcal{G}_d)]\right]-\lambda_5=0. ----------(5.8)$$

$$\left.\begin{array}{l}\lambda_1\, g_1(Q_t)=0 \Rightarrow \lambda_1(q_{t_2}-q_{t_1})=0\\ \lambda_2\, g_2(Q_t)=0 \Rightarrow \lambda_2(q_{t_3}-q_{t_2})=0\\ \lambda_3\, g_3(Q_t)=0 \Rightarrow \lambda_3(q_{t_4}-q_{t_3})=0\\ \lambda_4\, g_4(Q_t)=0 \Rightarrow \lambda_4(q_{t_5}-q_{t_4})=0\\ \lambda_5\, g_5(Q_t)=0 \Rightarrow \lambda_5(q_{t_6}-q_{t_5})=0\\ \lambda_6\, g_6(Q_t)=0 \Rightarrow \lambda_6 q_{t_1}=0\end{array}\right\} \quad ----------(5.9)$$

$$\left.\begin{array}{l}g_1(Q_t)\geq 0 \Rightarrow (q_{t_2}-q_{t_1})\geq 0\\ g_2(Q_t)\geq 0 \Rightarrow (q_{t_3}-q_{t_2})\geq 0\\ g_3(Q_t)\geq 0 \Rightarrow (q_{t_4}-q_{t_3})\geq 0\\ g_4(Q_t)\geq 0 \Rightarrow (q_{t_5}-q_{t_4})\geq 0\\ g_5(Q_t)\geq 0 \Rightarrow (q_{t_6}-q_{t_5})\geq 0\\ g_6(Q_t)\geq 0 \Rightarrow q_{t_1}>0\end{array}\right\} \quad ----------(5.10)$$

From the last statement of equations (5.9) and (5.10) we have $\lambda_6 = 0$. ---(5.11)

If $\lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = \lambda_5 = 0$, we have

$q_{t_2} < q_{t_1}, q_{t_3} < q_{t_2}, q_{t_4} < q_{t_3}, q_{t_5} < q_{t_4}, q_{t_6} < q_{t_5}$.

From the above inequalities we observe that, $q_{t_6} < q_{t_5} < q_{t_4} < q_{t_3} < q_{t_2} < q_{t_1}$.

It does not satisfy the constraints, $0 < q_{t_1} \leq q_{t_2} \leq q_{t_3} \leq q_{t_4} \leq q_{t_5} \leq q_{t_6}$

Hence $\lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = \lambda_5 \neq 0$.

As $\lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = \lambda_5 \neq 0$ by observing the set of equations in (5.9) we have,

$q_{t_1} = q_{t_2} = q_{t_3} = q_{t_4} = q_{t_5} = q_{t_6} = Q_t^*$ ----------(5.12)

Now adding the equations (5.3), (5.4), (5.5), (5.6), (5.7), (5.8) and using the equation(5.12) we get the Optimal fuzzy order quantity as,

$$\widetilde{\mathcal{Q}_t}^* = \sqrt{\frac{2\begin{bmatrix} d_{r_6}\left[\ell\left(o_{p_6}+c_{t_6}\mathcal{G}_d\right)+h_{s_6}+\lambda_G\left(u_{s_6}+\ell u_{r_6}\mathcal{G}_d\right)\right]+3d_{r_5}\left[\ell\left(o_{p_5}+c_{t_5}\mathcal{G}_d\right)+h_{s_5}+\lambda_G\left(u_{s_5}+\ell u_{r_5}\mathcal{G}_d\right)\right]+ \\ 2d_{r_4}\left[\ell\left(o_{p_4}+c_{t_4}\mathcal{G}_d\right)+h_{s_4}+\lambda_G\left(u_{s_4}+\ell u_{r_4}\mathcal{G}_d\right)\right]+2d_{r_3}\left[\ell\left(o_{p_3}+c_{t_3}\mathcal{G}_d\right)+h_{s_3}+\lambda_G\left(u_{s_3}+\ell u_{r_3}\mathcal{G}_d\right)\right]+ \\ 3d_{r_2}\left[\ell\left(o_{p_2}+c_{t_2}\mathcal{G}_d\right)+h_{s_2}+\lambda_G\left(u_{s_2}+\ell u_{r_2}\mathcal{G}_d\right)\right]+d_{r_1}\left[\ell\left(o_{p_1}+c_{t_1}\mathcal{G}_d\right)+h_{s_1}+\lambda_G\left(u_{s_1}+\ell u_{r_1}\mathcal{G}_d\right)\right] \end{bmatrix}}{\ell\begin{bmatrix} \left[\left(\left(1+\ell\left(1-\frac{d_{r_1}}{s_{p_6}}\right)\right)c_{s_1}+c_{r_1}\right)+\lambda_G\left(\left(2+\ell\left(1-\frac{d_{r_1}}{s_{p_6}}\right)\right)u_{\hbar_1}\right)\right]+3\left[\left(\left(1+\ell\left(1-\frac{d_{r_2}}{s_{p_5}}\right)\right)c_{s_2}+c_{r_2}\right)+\lambda_G\left(\left(2+\ell\left(1-\frac{d_{r_2}}{s_{p_5}}\right)\right)u_{\hbar_2}\right)\right]+ \\ 2\left[\left(\left(1+\ell\left(1-\frac{d_{r_3}}{s_{p_4}}\right)\right)c_{s_3}+c_{r_3}\right)+\lambda_G\left(\left(2+\ell\left(1-\frac{d_{r_3}}{s_{p_4}}\right)\right)u_{\hbar_3}\right)\right]+2\left[\left(\left(1+\ell\left(1-\frac{d_{r_4}}{s_{p_3}}\right)\right)c_{s_4}+c_{r_4}\right)+\lambda_G\left(\left(2+\ell\left(1-\frac{d_{r_4}}{s_{p_3}}\right)\right)u_{\hbar_4}\right)\right]+ \\ 3\left[\left(\left(1+\ell\left(1-\frac{d_{r_5}}{s_{p_2}}\right)\right)c_{s_5}+c_{r_5}\right)+\lambda_G\left(\left(2+\ell\left(1-\frac{d_{r_5}}{s_{p_2}}\right)\right)u_{\hbar_5}\right)\right]+\left[\left(\left(1+\ell\left(1-\frac{d_{r_6}}{s_{p_1}}\right)\right)c_{s_6}+c_{r_6}\right)+\lambda_G\left(\left(2+\ell\left(1-\frac{d_{r_6}}{s_{p_1}}\right)\right)u_{\hbar_6}\right)\right] \end{bmatrix}}}$$

NUMERICAL EXAMPLE

CRISP MODEL:

The values for different parameters given in the integrated green inventory model are as follows,
$\mathcal{D}_r = 8000$, $\mathcal{S}_p = 10000$, $\mathcal{H}_s = \$1200$, $\mathcal{O}_p = \$100$, $\mathcal{C}_s = \$50$, $\mathcal{C}_r = \$60$, $\mathcal{C}_t = \$10$, $\mathcal{G}_d = 200$, $\mathcal{U}_\hbar = 4$, $\mathcal{U}_r = 5$, $\mathcal{U}_p = 2$, $\mathcal{U}_s = 10$, $m = 15$, $n = 0.01$, $\ell = 2$, $\mathcal{I}_j = 700$, $\mathcal{U}_\ell = 2000$, $\lambda_G = 1$.

Optimum Order Quantity:

$\mathcal{Q}_t = 651.64$

Total cost:

$TC(\mathcal{Q}_t) = 100069.7092 = 100069.7$

FUZZY MODEL:

Fuzzy Optimum Order Quantity:

$\widetilde{\mathcal{Q}_t}^* = 651.64$

Fuzzy Total Cost:

$P\left(\widetilde{TC}(\widetilde{\mathcal{Q}_t})\right) = 100069.7$

CONCLUSION

As a result of rising environmental consciousness, an increasing number of developing countries are making regulations to business enterprises for implementing green environmental techniques to reduce pollution. But since optimization of the business is the appropriate goal of every firm, analysing the production system of green products, its relevant costs and mechanisms is mandatory. And since uncertainty exists even in green inventory models consideration of fuzzy is remarkable. Hence the present work investigatedvague conditions in few parameters, converted those parameters as hexagonal fuzzy numbers and obtained an optimum result by using Kuhn-tucker Method. Hence this work suggests the business firms to implement fuzzy techniques under limited carbon emission policy to face ambiquity in their respective fields apart from maintaining sustainable environment.

ABSTRACT

Era of machine learning chatbot manifesting in challenging applications . chatbot striving to perform better depends on optimization . Every classifier provides promising performance but many times it is essential to have the best performing classifier. Hybrid model is significant to select best performing classifier among set of classifiers. In this paper we focus on design and development of proposed hybrid model based optimized chatbot. First we create 8 chatbot using 8 different classifiers: random forest, extra tree, svc, knn, adaboost, gradient boost, logistic regression, MLP classifier and optimizing its performance by voting. The results of 8 classifiers are compared in terms of measurement factors-accuracy, and MSE. Second , we proposed a new hybrid model1 using hard voting. Third, we proposed another hybrid model2 using soft voting. Next, we considered 3 separate models averaging, bagging and boosting to compare \the MSE. Results show our both hybrid models optimized chatbot perform better .

Keywords: Optimization chatbot, Random Forest chatbot, Hard voting optimized chatbot, Soft voting optimized chatbot, Extra tree chatbot.

INTRODUCTION

Intelligent systems powered by Artificial intelligence with special skills witnessed in globe across broader range of problems[1] [2] [3]. Chatbot are computer based programs that interacts to user(text to text). [4] [5] [6] .Special category of robots: chatter bot uses Robotic process automation and machine learning to automate manual tasks [7,8]. Chatbot tasks supported by artificial intelligence and machine learning

classifiers.[9][10][11][12].Hyperparameter optimization [13][14][15] boost the performance of chat bot. Grid search [15].Decision trees[16],random forest[17] ensemble methods[18] , optimized random forest [19].chat bot [20][21].brute force algorithm [22] indicate the work related to various classifiers and optimizations. Popular machine learning classifiers and optimisation include random forest [23], Bayesian optimization, gradient optimization. Different machine learning models used in different works include support vector machine (svm), gradient boost(GB), extra tree(ET), K-nearest neighbor(KNN), decision tree(DT), adaboost(AB), random forest and logistic regression. Random forest supervised method, extra tree, svc, knn, adaboost, gradient boost, logistic regression, MLP classifier are popular machine learning classifiers. Chatbots are used in wide range of application domains uses different methods. This research work [23,24,25,26,27,28,29,30] is extension of our work and we focus to propose and implement optimization hybrid chatbot model

Motivation

This study is motivated to get solution for research questions: How chatbot perform with random forest, extra tree, svc, knn, adaboost, gradient boost, logistic regression, MLP classifier ?

What is the role of voting in optimization chatbot ?

Why hybrid model is significant ?

How hard voting hybrid model based optimized chatbot differs to soft voting hybrid model based optimized chatbot ?

We aimed to perform

•Design and development of chatbot with random forest, extra tree, svc, knn,adaboost, gradient boost, logistic regression, MLP classifier

• Propose optimized chatbot hybrid model with hard voting

• Propose optimized chatbot hybrid model with soft voting

• Evaluate the performance of the 8 developed chatbot using accuracy and MSE factors and comparing them with performances of hard voting hybrid model and soft voting hybrid model

• Propose model 3 for comparing the ensemble methods wrt MSE using averaging, bagging and boosting methods

The contributions to this work are as follows:

• The design and development of 8 chatbot using 8 different classifiers, measurement of accuracy and MSE of each chatbot.

• This work contributes three different chatbot models: model1 with hybrid hard voting optimization chatbot , model 2 with hybrid soft voting optimization chatbot, model 3 for comparing averaging, bagging with boosting ensemble methods

• This work has made a major contribution to analyse precision recall f1 scores MSE and accuracy of resultant chatbot hybrid model

Accuracy of an optimized chatbot by selecting best performing classifier using hard voting and also by soft voting hybrid models. This paper is organized as follows: Section 2: Proposed methodology, Section 4: Results & Discussion, Section 5: Conclusion & Future enhancements.

PROPOSED METHODOLOGY

In this section we consider the role of hyperparameter tuning and key performance indicators, proposed optimized chatbot model and design an algorithm for developing optimized chatbot using random forest and hyperparameter tuning optimization.

Proposed Optimisation Chatbot Model

Optimized chatbot model proposed to be consisting of set of classifiers , set of constraints, set of resource characteristics , set of inputs and set of outputs. Among n different classifiers , each classifier has its performance factor (accuracy, MSE) which needs to be optimized . So, we proposed hybrid model1 hard voting and hybrid

model2 soft voting for optimization chatbot. Ensemble methods are significant in boosting up performance so we proposed model3 with comparison of 3 methods averaging, boosting and bagging.

Data Set

Hybrid Optimized chatbot models are designed and developed to assign task to best team for providing required service using business process event log of banking dataset [26,29] having interaction management and incident management . This chatbot identifies team to handle tasks and assign the tasks to them automatically.

Proposed Algorithm

Now we propose algorithm for hybrid model for optimized chatbot

ALGORITHM: Hybrid model for Design and development of optimization chatbot

Step 1: Prepare the data for machine learning classifier

Step 2: Data divided into train and unseen data(test data) with test size=20%

Step 3: Classifiers , CL={c1,c2,…,cn} where n is no. of classifiers considered for model. Chatbot Models , M={m1m2,…,mn}

Step 4: For each model evaluate its performance i.e. accuracy and MSE values and store values in corresponding variables. Accuracies, A=[a1.a2,…,an} MSE values. MSES=[MSE1,MSE2,…MSEn}

Step 5: Hybrid models developed using hard voting and soft voting HBDM1 and HBDM2, respectively

Step 6: Evaluate macro average and weighted average for precision, recall & f1-scores of hybrid optimized chatbot model1 and store in MAP1,MAR1,MAF1,WAP1, WAR1,WAF1. Store accuracy and MSE of hybrid model1 in HM1A1 & HM1MSE1 . Similarly for the hybrid model2 store the corresponding measurement values in the variables : MAP2,MAR2,MAF2,WAP2,WAR2,WAF2 HM2A2 & HM2MSE2.These performance factors are compared

Discussion of The Proposed Algorithm

The algorithm presented in section 2 for design and development of optimized chatbot using hybrid model1 hard voting and hybrid model2 soft voting. We use data set and apply algorithm (section 2) to arrive at hybrid model. The data set divided into 80% for training and 20% for testing. Initially, eight different classifier: random forest, extra tree, svc, knn, adaboost, gradient boost, logistic regression, MLP classifier are used as in step 3 of algorithm for developing chatbot. As in step4, accuracy and MSE values are stored in corresponding variables. Wrt Step 5 , 2 different hybrid model created , one for hard voting and another for soft voting. Then the performances of these two proposed and created hybrid models are evaluated and compared with accuracy and MSE factors. Fig 1 shows 8 Chatbot models with 8 different classifiers. Fig 2 shows Proposed Hybrid optimization chatbot model with hard voting. Fig 3 shows Proposed Hybrid optimization chatbot model with soft voting

Scope Of Proposed Methodology

The scope of this work is in:

"design of algorithm and develop chatbot using 8 different classifiers , evaluate performance(accuracy) and propose 2 hybrid models , one using hard voting and another using soft voting in order to select best machine learning classifier".

RESULTS AND DISCUSSION

The implementation of proposed algorithm using python library scikit tool resulted in various values for accuracy with different classifiers considered. Table 1 show accuracy obtained from each classifier and Table 2 shows the MSE values of each of the classifiers C1,C2,…,Cn with n=8. Classifier C1 is MLPClassifier which is considered with max_iterations of 10000 has resulted in accuracy & MSE with 0.7297297297297297 & 57.186070686070686 . Classifier C2 is Logistic Regression with parameters solver ='lbfgs', multi_class ='multinomial', random_state=0, max_iterations = 500 has obtained accuracy and MSE with 0.7307692307692307. & 58.563409563409564 respectively.

Classifier C3,C4,C5 are Extra Trees Classifier, Random Forest Classifier, KNeighbors Classifier , all with default parameters without specific options have resulted in accuracy 0.728690228690228, 0.729729729729729& 0.7255717255717256, respectively. Classifier C6 is SVC with parameters gamma ='auto', probability = True, obtained accuracy is 0.6309771309771309. Similarly, Classifier C7 & C8 are AdaBoost Classifier & Gradient Boosting Classifier have accuracy of 0.4688149688149688 & 0.7307692307692307. Table 2 shows MSE values of classifiers which is depicted in Fig 4 and Fig 5 with accuracy and MSE separately. Fig 6 shows Hard voting hybrid optimization chatbot versus soft voting hybrid optimization chatbot. Table 3 depicts the MSE values of averaging, bagging & boosting which have obtained values of 47.62625064968815, 43.02909078859327&44.103278618718505, respectively. Resulting high MSE for averaging and low MSE for bagging. Fig 7 shows accuracy of 8 classifiers and hard voting , soft voting. For hybrid model 1 with hard voting different measurements are indicated in table 4 . Macro average values for precision, recall and f1scores :MAP1,MAR1& MAF1 with values 0.64 0.70 &0.66, respectively, Weighted Avg values for precision , recall and f1scores WAP1,WAR1 & WAF1 with 0.73,0.73 &0.72,respectively. Accuracy is 0.7297297297297297 (HM1A1). For hybrid model 2 with hard voting different measurements are indicated in table 5 . Macro average values for precision , recall and f1scores :MAP2,MAR2 & MAF2 with values 0.65 0.65 & 0.66, respectively, Weighted Avg values for precision , recall and f1scores WAP2,WAR2 & WAF2 with 0.72, 0.73 & 0.72, respectively. Accuracy is 0.7307692307692307 (HM2A2).Table 6 tabulates MSE values of proposed model1 and model2 as 57.87941787941788 (HM1MSE1) &57.17671517671518 (HM2MSE2) respectively.

CONCLUSION AND FUTURE ENHANCEMENTS

This work successful in creating , evaluating 8 different chatbot using random forest, extra tree, svc, knn,adaboost, gradient boost, logistic regression, MLP classifier. An efficient hybrid optimized chatbot model has been proposed and an algorithm to design and develop optimized chatbot using hybrid model with hard voting and soft voting. Results presented and accuracy boosted up by resultant hybrid model by hard voting and also by soft voting model with the best machine learning classifier which is component of proposed hybrid model. The highest accuracy achieved by this hybrid optimization chatbot with hard voting(model1) is72.97297297297297%. In comparison to highest accuracy achieved by this hybrid optimization chatbot with soft voting(model2) is 73.07692307692307%. Proposed hybrid optimisation model2 with soft voting perform better than hard voting with 0.103950104%.Classifiers accuracy of each machine learning classifier dependent on parameters considered . Out of 8 classifiers for only few classifiers parameter values are specified and for other classifiers default values are considered, as an extension of this work, for all machine learning classifiers different parameters can be set and accuracy are noted which may be different . This work can be extended with other machine learning classifiers. Another extension of this work is with the greater number of classifiers.

ABSTRACT

The generation of malodour from the body is due the presence of micro biome in the skin surface. The sweat by itself does not have any Odor. The malodour is emitted due to the bacterial metabolism of the amino acid- and dipeptide-conjugated substrates originating from the apocrine gland. Historical studies reveal that the skin flora consists of Gram-positive organisms which include *Staphylococcus spp and Corynebacterium spp*and Gram-negative organisms such as *Klebsiella pneumonia, Proteus mirabilis, Escherichia coli*. Deodorants are cosmetic products that contain antiperspirants. Antiperspirants are metallic salts that prevent perspiration by plug swelling the pores. This might lead to severe health risks. The present investigation emphasizes on the use of plant extract incorporated with deodorants, which helps in replacing chemical antiperspirant. In the current research ethanol, methanol, acetone, chloroform and dis H_2O of the leaves of *Mentha piperita* and *Stevia rebaudiana*were screened for their anti-microbial activity by using the agar diffusion method. The minimum inhibitory concentration of the extracts was also determined. The formulation of combinatorial extract in the ratio of 1:1:1 of ethanolic extracts of the selected plants and Dis.H_2O extracts of alum. The chemical characterization of combinatorial extract was performed using FTIR. The combinatorial extract incorporated deodorant was formulated with the composition of glycerine, ethanol, essential oil (lavender), Dis.H_2O and the combinatorial extract. The results of the study revealed that the combinatorial extract showed higher antimicrobial activity against the test pathogens.

Keywords: Antimicrobial activity, Deodorant, *Mentha piperita, Stevia rebaudiana*, Antiperspirant.

INTRODUCTION

Microorganisms are often found almost all over in the Environment. The resident microbiota usually includes Gram-positive microorganisms from the genera *Staphylococcus, Corynebacterium,* and *Micrococcus*[1]. Gram-negative microorganisms frame a little proportion of the skin flora they include *Enterobacter, Klebsiella, Escherichia coli* and *Proteus sp* [2]. The generation of olfactory perception on the skin of human is caused by biotransformation of naturally secreted non - odorous precursor molecules into volatile odorants by the microbiota [3]. A person's individual odor is genetically determined and might even be affected by food or medication. Body odour is additionally controlled by antimicrobial agents, antiperspirants, fragrances, or any combination of these [4]. Antiperspirants can help to minimise sweat production. The FDA classifies antiperspirants as over-the-counter (OTC) medications because they prevent perspiration production (a biological function).The most common metallic salts used are those based on aluminum, zinc, or manganese. Among these, aluminum salts like aluminum hydroxy chloride, aluminumbromhydrate, and aluminumsulfate [4] are the most frequently used in antiperspirants, all of which have health risks. Toxins build up in lymph nodes, turning healthy cells into cancer cells, according to the notion. This is why some breast tumours appear in location where antiperspirants are used [5]. Antiperspirants and deodorants use aluminium chloro-hydrate, which is a synthetic chemical that is absorbed into and blocks the pores under the arm to reduce sweating. There have been some suggestions that there is a link between breast cancer and aluminium chloro-hydrate, although there is no real proof [6][7]. Several variables, including changes in axillary skin phenotype and extended occlusion in the area, may contribute to sensitivity to items applied to the axilla [10] aluminium compounds are commonly found in cosmetics and pharmaceuticals. Aluminum salts are the components in antiperspirants that inhibit sweating. This is why the Food and Drug Administration (FDA) in the United States requires antiperspirant manufacturers to include special warnings for patients with renal illness [5]. Many aluminium compounds have been shown to be neurotoxic, induce skin irritation, and interfere with oestrogen, increasing the risk of breast cancer [9]. Opting for natural products is the best option.

For many years, alum has been used as a deodorant, astringent, and basic antiperspirant. Alum is used in deodorants for its antibacterial properties, which help inhibit the growth of bacteria on the skin [6]. *Mentha piperita* (Lamiaceae), is a fragrant perennial herb growing in most parts of the world and has long been used in folk medicine. Mint leaves are widely used in herbal teas to enhances taste and scent. *Mentha sp* are known for their distinct aroma and flavour. However, little research has been done on the antibacterial effects of locally accessible mint leaves [11] The use of plant extracts and oils is becoming increasingly popular. Mint essential oils are commonly used as an alternative cure for the treatment of numerous infectious disorders, as well as for antipruritic, astringent, rubefacient, antimicrobial, and treating neuralgia, headaches, and migraines. Antibacterial, antifungal, antiviral, insecticidal, antimicrobial, and antioxidant activities have been discovered in essential oils [13][14]. *Stevia rebaudiana* is a low-calorie sweetener made from a sweet herb. These undiscovered compounds may have biological effects on humans and may help explain some of Stevia's medicinal uses [12]. The results of the research into the antibacterial activity of *Stevia rebaudiana* leaves for comparison demonstrate that water extract showed activity against just two germs (*B. subtilis and S. aureus*) among the identified microorganisms *(B. subtilis, Staph. Aureus, M. luteus, S. marcescens, P. aeruginosa, E. coli, P. vulgaris*). Methanol and ethyl acetate extracts have similar activities, however hexane extract had much higher activity against most bacteria tested than the other extracts. The findings of this investigation show that Stevia leaf extracts exhibit antibacterial activity, however it is lower than that of the gold standard (ciprofloxacin) [15].Hence the aim of the study focused to formulate the deodorant with combinatorial plant extract and incorporating alum extract instead of chemical antiperspirant.

MATERIALS AND METHODS

Collection of Plant

Leaves of *Mentha piperita* and *Stevia rebaudiana* were gathered, cleaned, and left to air dry. It was then finely powered to obtain the extracts. Commercially available alum stone was pulverised.

Evaluating medicinal plants for their antibacterial effects against odor-causing bacteria

The experimental plants chosen were *Mentha piperita* and *Stevia rebaudiana*. The leaves of *Stevia rebaudiana* and *Mentha piperita* were believed to possess medicinal benefits.

Preparation of plant and alum extracts

Ethanol, methanol, acetone, chloroform, and distilled water were utilized to prepare the plant extracts. Approximately 10g of the samples were homogenised in 100ml of the solvents. The raw ingredients were placed in the shaker overnight at room temperature before being filtered through Whatman No. 1 filter paper. The plant extract was placed in a pre-weighed Petri dish and the solvent was evaporated at room temperature to concentrate it. The resulting crude extract was weighed and then diluted with a known volume of dimethyl sulphoxide (DMSO) to achieve a final concentration of 0.1g/ml. Similarly, powdered alum extracts were prepared using ethanol, methanol, acetone, chloroform, and distilled water. Approximately 10g of the samples were homogenized with 100ml of the solvents. The crude mixtures were left overnight in a shaker at room temperature and then filtered using Whatman No. 1 filter paper. The alum extract was then transferred to a pre-weighed Petri dish, and the solvent was evaporated at room temperature to concentrate the extracts. After evaporation, the crude extract was weighed and dissolved in a known volume of dimethyl sulphoxide (DMSO) to obtain a final concentration of 0.1g/ml.

Test organisms

The extracts were tested on *Klebsiella pneumoniae, Escherichia coli, Proteus mirabilis, and Staphylococcus epidermidis*, among other bacteria. Madras Medical College, Rajiv Gandhi Government General Hospital, Chennai 600003 provided the selected bacteria.

Antibacterial assay for individual and combinatorial herbal extracts (Well diffusion)

The antibacterial properties of the plant extracts were evaluated using the Kirby-Bauer method, which involves measuring bacterial growth inhibition under controlled conditions. Sterilized Petri dishes and Muller Hinton agar medium were used. Approximately 20 ml of agar medium was poured into each Petri dish under aseptic conditions. Once solidified, log phase test specimens were swabbed across the surface with a sterile cotton swab. Wells were created using a gel puncture and filled with 100 µl of herbal and alum extracts. All inoculated plates were incubated at 37°C for a period of 24 hours.

Minimum inhibitory concentration

Minimum Inhibitory Concentrations (MICs) were determined using broth dilution methods, involving serial dilutions to achieve a more precise MIC range. After incubating at 37°C for 18-24 hours, the MIC was calculated by measuring the optical density with a colorimeter.

Phytochemical Analysis of Plant extracts

The leaf extract that exhibited the maximum antimicrobial activity were assessed for the presence of phytochemicals. A preliminary phytochemical analysis were performed in order to determine the presence of trepenoids, flavonoids, phenols, saponins, tannins, alkaloids using standard procedures [29] [30] [31] [33] [34] [35].

Detection of oils

Test solution was applied to filter paper and appearance of transparent layer in the filter paper indicates the presence of oil.

Chemical characterization of combinatorial extract

FTIR

The FTIR is a technique for determining function groups, and the IR solution software generated and analysed the spectrum. The sample transmittance and reflectance of infrared rays at various frequencies were converted into an IR absorption plot, which was examined and compared to known signatures ofrecognised materials in the FTIR library.

The functional group of the sample containing herbal combinatorial extract are represented by the wave numbers in the FTIR spectrum.

Formulation of deodorant

The deodorant was made using the ingredients listed in Table 1. Glycine, ethanol, dis.H_2O, essential oil (lavender essence derived by the steam distillation), and the combinatorial extract were used to make a deodorant with a 100 ml capacity. These were combined in the proportions specified in the table and emulsified to produce the final product (Fig.1, Fig.2)

RESULTS AND DISCUSSION

Antibacterial activity

The antibacterial activity of *Mentha piperita, Stevia rebaudiana*, and alum extracts was tested using the well diffusion method after they were exposed to solvents. The antibacterial activity of the solvent extracts is represented by the size of the zone of inhibition. Solvent extract had the highest zones against all the test organisms. For comparisons, chloramphenicol was employed against the test species *K. pneumoniae, P. mirabilis, and S. epidermidis,* whereas tetracycline was used against *E. coli*, and the zone of inhibition was calculated . *S. epidermidis*, *P. pneumoniae*, ethanolic extracts of *Mentha piperita* and *Stevia rebaudiana* showed maximal activity of about 18mm, 17mm, and 19mm, respectively. The ethanolic extracts of both *Mentha piperita* and *Stevia rebaudiana* displayed, maximum microbiological inhibition against the test organisms with a maximum activity of 9mm in *E. coli*.(Figures 3, 4, 5, and 6). A Combinatorial extract was prepared in the ratio of 1:1:1. Antimicrobial activity for the combinatorial extracts was performed using well diffusion method and was tabulated (Table 2).

Minimum Inhibitory Concentration

The minimal inhibitory concentration of the plant extracts was determined for the test organisms. Table 3 shows the lowest inhibitory doses of combination plant and the alum extract against test organisms. As the concentration of the combinatorial herbal extract increases, bacterial inhibition also increases. This effect is due to the presence of antimicrobial compounds derived from plants and alum-based substances, despite the presence of contaminants.

Phytochemical Analysis

The presence of phytochemical elements such as alkaloids, saponins, flavonoids, phenolic compounds, and tannins was discovered in the extract from the herbal *Mentha piperita* and *Stevia rebaudiana* extracts (Table 4).

FTIR analysis of combinatorial extract

In the combinatorial extract, FTIR analysis revealed the presence of functional groups, aldehydes, aromatic rings, alkenes, primary and secondary amines, nitro compounds, alcohols, and phenols (Table 8)(Fig 22).The combinatorial extract's FT-IR spectra were examined. The broad band at 3225.66 cm-1 in the spectra of herb loading corresponded to the alcohols and phenols. The presence of carboxylic acids was shown by the O-H stretch of the spectra, whereas hydroxyl groups were represented by the -CH2-OH stretch. Aromatic rings were also allocated to the bands at 1469.25 cm-1. We can see asymmetrical stretching of N-O groups shifted to 1528.64 cm-1 and 1538.25 in the FT-IR spectra of plant.The N-H stretching resulted in peaks at 812 cm-1, which indicates the presence of primary and secondary amines. The existence of alcohols, carboxylic acids, esters, and ethers is indicated by the peaks at 1312.67, 1223.43, and 958.369, which suggest C-O stretch. Bonds at C-Cl stretch and C-Br stretch with alkyl halides can be seen in the stretching vibrations at 752.788, 575.717, and 599.142. In the presence of alkenes, the peak features of =C-H bend vibration at 985.369, 880.967, and 661.126 [39]. The studies show that, The human skin harbours various species of bacteria. Human feet have high population densities of Staphylococcus and aerobic coryne form bacteria, while anaerobic bacteria like Propionibacterium are also present. Studies show that people tend to opt for health concerned lifestyle and look for cosmetics those ingredients has natural ingredients [33]. Therefore, the best alternative way to be chosen is going with natural products. For this study and formulation of natural deodorant, plants extract of

Mentha piperita and *Stevia rebaudiana* natural stone alum were used, which are free from these health risks. It is manifested that plants have anti-microbial and anti-fungal properties. Therefore, plant extracts have been used in cosmetics [38]. Therefore, for this study the plants extract of were *Mentha piperita* and *Stevia rebaudiana* was done against test organism to check the antimicrobial activity. Evaluating the antimicrobial activity [25], the essential oil and the ethanolic extract of *Mentha piperita's* exhibited both antimicrobial and anti-fungal properties. It showed antifungal activity against *Candida albicans, C. tropicalis, C. glabrata and C. parasilosis, Alternaria alternate Pseudomonas syringe.* And also showed antimicrobial activity against *Xanthomonas campestris, Escherichia coli, Pseudomonas aeruginosa* and *Salmonella typhimurium*. Looking into the study of *Stevia rebaudiana* [26] which is an artificial sweetener, it was examined to possess 100 phytochemicals. Besides being a sweetener, these phytochemicals play role in medicinal and therapeutic fields. It's known for its application in treating high blood pressure, diabetes, candidacies andweight loss. It was found to contain antimicrobial activity. Potash alum has various traditional uses, including as a deodorant [4]. Alum is said to been in use as aftershave product since ancient times. It's astringent property makes it special. Studies also prove potash alum has its own anti-microbial activity again *Staphylococcussp, Corynebacteriumsp and Micrococcus sp.* Deodorants cover-up the bad Odor from the body [4]. They contain artificial compounds which have health risks and therefor formulating a deodorant with natural extract of *Mentha piperita* and *Stevia rebaudiana* and the natural stone, potash alum as an alternative for the chemical deodorants. FTIR spectra were tracked over time, showing peak shifts, alterations in peak shapes, and the appearance of new peaks. Proposed explanations for these observed phenomena are provided. The formulated deodorant with the combinatorial extract should be further studied for in-vitro and *in-vivo* test for the betterment and enhancement of the product.

CONCLUSION

This study successfully formulated a deodorant incorporating natural extracts from *Mentha piperita* (Peppermint), *Stevia rebaudiana* (Tulsi), and potash alum instead of chemical compounds. The plant leaves and alum stone were processed to obtain crude extracts, which were tested for antimicrobial activity against *Staphylococcus epidermis, Klebsiella pneumonia, Proteus mirabilis*, and *Escherichia coli*.The ethanolic extracts of Mentha piperita and Stevia rebaudiana, along with the aqueous extract of alum, demonstrated notable antimicrobial activity. A combinatorial extract was created in a 1:1:1 ratio and further tested, demonstrating effective antimicrobial properties. Phytochemical analysis detected alkaloids, saponins, flavonoids, phenolic compounds, and tannins in the plant extracts. FTIR characterization further identified the functional groups within the combinatorial extract. The final deodorant formulation included 60% glycerine, 20% distilled water, 18% ethanol, 1% lavender essential oil, and 1% combinatorial extract. This natural deodorant formulation offers a promising alternative to chemical antiperspirants. Future research should focus on *in-vivo* studies, potential toxicity, pharmacokinetics, and side effects to ensure safety and efficacy for human use.

COMPETING INTEREST

Authors would like to thank the department of Microbiology, Dwaraka Doss Goverdhan Doss Vaishnav College, Chennai for provided with the facility to carry out the research.

ABSTRACT

Mukia maderaspatana(L.) M. Roem. is creeper plant from Cucurbitaceae which is extensively used in folklore medicine. Plant extracts were prepared using three solvents methanol, ethyl acetate and hexane. Phytochemical estimation for total phenolic content, total flavonoid content, total alkaloid content and total tannin content was carried out using 96 well-plate micro plate reader. Antioxidant potential was determined by DPPH, FRAP and ABTS assays. Among the three extracts methanol extract has shown the highest antioxidant power in DPPH, FRAP and ABTS assays. A significant amount of phenols was found in methanol extract (94.137 ± 0.63 mg GAE/g) by Folin – Ciocalteu method whereas the least was in hexane (41.76 ± 0.48 mg GAE/g). TFC was also found highest in methanol (177.468 ± 0.10 mg QE/g) and least in hexane extract (40.45 ± 0.26 mg QE/g), TAC in methanol extract as (53.515 ± 0.17 mg QE/g) whereas TPC as (55.562 ± 0.56 mg TAC/g). TTC was the only parameter found to be highest in ethyl acetate (71.865 ± 0.48 mg TAC/g). Rest all phytochemicals were reported higher in methanolic extract. The antioxidant potential was correlated with phytochemicals in terms of Pearson's Correlation. The strongest positive correlation with TPC was confirmed by the ABTS assay ($r = 1.000^{**}$, $p < 0.01$). TTC had the lowest correlations ($r = 0.136$ and 0.277) with FRAP and DPPH, respectively. Phytochemical estimation and antioxidant evaluation by 96 well-plate micro plate method was proved to be energy, time and resources efficient. The present study demonstrates *Mukia maderaspatana* as a good source of phytochemicals and natural antioxidants.

Keywords: Antioxidant, DPPH scavenging activity, frap, total flavonoid content, total phenolic content

INTRODUCTION

Medicinal plants have been used for thousands of years by various cultures around the world for their therapeutic properties. The importance of medicinal plants is profound and multifaceted, and it extends to various aspects of human well-being, the environment, and economic development.[1] Many traditional healing systems, such as Ayurveda, Traditional Chinese Medicine, and Indigenous medicine, rely heavily on medicinal plants. These systems have been effective in treating various ailments and maintaining overall health.[2] Phytochemicals are bioactive compounds found in plants that have been studied for their potential health benefits and therapeutic applications [3]. These compounds play a significant role in traditional and modern medicine. Many phytochemicals, such as flavonoids, carotenoids, and polyphenols, exhibit strong antioxidant and anti-inflammatory properties.[4] These compounds help protect cells from oxidative stress and inflammation, which are underlying factors in various chronic diseases, including cancer, cardiovascular diseases, and neurodegenerative disorders. Certain phytochemicals, such as alkaloids and terpenoids, possess antimicrobial properties.[5] They can be used in the development of natural antibiotics and antifungal agents to combat infectious diseases. Numerous alkaloids have medicinal properties and are used in traditional and modern medicine.[6] Examples include morphine and codeine from opium poppy (*Papaver somniferous*) for pain relief, quinine from cinchona tree (*Cinchona sp*.) for treating malaria, and vincristine and vinblastine from periwinkle (*Catharanthus roseus*) for cancer treatment.[7] Certain flavonoids, such as quercetin and resveratrol, have been linked to improved cardiovascular health. They may help lower blood pressure, reduce LDL cholesterol levels, and enhance blood vessel function, which can reduce the risk of heart disease.[8] Phytochemicals can neutralize free radicals, which are highly reactive molecules that can damage cells and contribute to the aging process and the development of various diseases, including cancer. By donating electrons to free radicals, antioxidants help stabilize them and prevent them from causing harm to cells.[9] Some phytochemicals can chelate, or bind, to metal ions that can stimulate the production of free radicals, like copper and iron. Phytochemicals attach to these metals and stop them from reacting to produce reactive oxygen species, which are toxic.[10] Endogenous antioxidant enzymes, including glutathione peroxidase, catalase, and superoxide dismutase, can be activated by phytochemicals. The body uses these enzymes to protect itself from oxidative damage. Oxidative stress and chronic inflammation are intimately related, and many phytochemicals have anti-inflammatory qualities. In an indirect way, these chemicals support antioxidant defence by lowering inflammation.[11]

Mukia maderaspatana, also known as Indian Squirting Cucumber or *Mukia maderaspatana*, is a plant that is primarily found in India and other parts of South Asia. It is a member of the Cucurbitaceae family and is known for its traditional medicinal uses in Ayurvedic and folk medicine systems.[12] *Mukia maderaspatana* has been used traditionally to treat respiratory problems, including coughs and bronchitis.The plant's extracts or preparations made from it are sometimes used topically to treat skin conditions like eczema and itching.In folk medicine, it is sometimes used to treat digestive issues like indigestion, bloating, and constipation.[13] In folk medicine, it is sometimes used to treat digestive issues like indigestion, bloating, and constipation. Ethnobotanical study reported *Mukia maderaspatana* leaves to treat indigestion and stomach related issues.[14] Boiled extract of the leaves helps in chest pain and dry cough. Preliminary phytochemical analysis testified the presence of alkaloids, flavonoids, carbohydrates, saponins and tannins.[15] Conventional methods for estimating phytochemicals as well as antioxidant potential of the plant extracts by using spectrophotometer demand significant amount of time. It consumes large quantity of reagents and solvents. Moreover, the margin of error is also high. Quantitative phytochemical estimation for flavonoids, phenols, alkaloids and antioxidant potential of the plant extracts by DPPH assay, FRAP assay and ABTS assay can be done by using 96-well plate microreader.[16] This method is simple, fast and more accurate compared to conventional method. It allows us to analyse large number of sample size at same time. The data can be easily generated, and it is convenient to compare the data within groups. The analysis time can be drastically reduced by using the method.[17]

Materials and Methods

Chemicals

Standard chemicals were used to carry out experiments. All chemicals were checked for authenticity and expiry. 99% Methanol (v/v), 99% ethyl acetate (v/v), 99% hexane (v/v), double distilled water. Standard reagents such as Gallic acid, Quercetin, Tannic acid, Atropine, Ascorbic acid, Trolox, $FeSO_4.7H_2O$. Chemicals for the experiments like Folin–Ciocalteu reagent, 20% Sodium bicarbonate (v/w), Aluminium chloride solution, sodium acetate, bromocresol green, HCl, NaOH, Phosphate buffer solution, chloroform, DPPH (2,2-diphenyl-1-picrylhydrazyl), ABTS solution, ferric chloride, TPTZ (tripyridyl triazine). All solvents and reagent used were of analytical grade.[18]

Collection and Preparation of Plant extracts

Fresh leaves of *Mukia maderaspatana* were collected from Polo Forest, Sabarkantha, Gujarat in its wild habitat. The leaves were dehydrated in natural sunlight and pulverized. The grounded powder was used to prepare plant extracts with three solvents in order of their polarity viz. hexane, ethyl acetate and methanol in sequential manner. The extracts were prepared by Soxhlet extraction method under standard conditions. They were filtered using Whatman No. 1 filter paper. Each filtrate was concentrated by allowing it to evaporate the excessive solvents. The extracts were stored at $4^{\circ}C$ in sealed petri-plates for further use.

Determination of phenolic contents

The microplate total phenolic content method was based on the 96-well microplate Folin–Ciocalteu method adapted from (Margraf *et al*., 2015)[19] with some modifications. Standard solution of gallic in concentration 20,40,60,80,100 µg/ml were prepared in 96% methanol.A total of 25 µl of the diluted extract were mixed with 100 µl of 1:4 diluted Folin – Ciocalteu. reagent and shaken for 60 sec in a flat-bottom 96-well microplate. The mixture was left for 4 mins and then 75 µl of sodium carbonate solution (100 g/L) were added and the mixture was shaken at medium continuous speed for 1 min. After 2h of incubation at room temperature, the absorbance was measured at 765 nm using the microplate reader (Thermo Scientific Multiskan FC). The absorbance of the same reaction with methanol instead of the extract or standard was subtracted from the absorbance of the reaction with the sample. Total phenolic contents were expressed as mg Gallic Acid Equivalents (GAE) per g of plant extract.[16]

Determination of flavonoid contents

Total flavonoid content was determined by aluminium chloride colorimetric assay adapted from (Sembiring*et al*., 2018)[20] with slight modification. Standard solution of quercetin in concentration 20,40,60,80,100 µg/ml were prepared in 96% methanol. 50 µl of extracts (Conc.1 mg/ml) or standard solution was added to 10 µl of 10% the aluminium chloride solution and followed by 150 µl of 96% methanol. 10 µl of 1 M sodium acetate was added to the mixture in a 96 well plate. 96% methanol was used as reagent blank. All reagents were mixed and incubated for 40 min at room temperature protected from light. The absorbance was measured at 415 nm with a microplate reader (Thermo Scientific Multiskan FC). Total flavonoid contents were expressed as mg Quercetin Equivalents (QE) per gram of plant extract.

Total tannin content of the plant extracts

The total tannin content was determined by the Folin – Ciocalteu method with minor modifications. The standard solution of tannic acid in various concentrations were prepared (20,40,60,80,100 µg/ml) in methanol. About 25 µl of sample extracts were pipetted in well-plate and 175 µl of distilled water was added to each well to adjust the concentration. 50 µlFolin – Ciocalteu reagent was added to and followed by 100 µl of 35% sodium bicarbonate. The mixture was allowed to react for 30 minutes. After incubation, the absorbance was measured at 700 nm with a microplate reader (Thermo Scientific Multiskan FC). The total tannin content of the sample extracts was carried out in triplicate manner. The tannin content was expressed in terms of mg tannic acid equivalent per gram of plant samples.[21,22]

Total alkaloid content of plant extracts

The alkaloid content of the plant extracts was evaluated by the method which comprise of reaction between alkaloids and bromocresol green (BCG). The plant extracts were dissolved in 2 N HCl and left undisturbed at room temperature. The pH of phosphate buffer solution was adjusted to neutral by 0.1 N NaOH. 1 ml of the prepared solution was transferred in a separating funnel. Following the process, 5 ml of phosphate buffer and 5 ml of bromocresol green solution was added to the mixture. The solution was shaken vigorously, and complex formed were washed out with chloroform. They were collected in 10ml volumetric flasks and diluted to the volume by chloroform. The absorbance of the mixture was measured by using UV-VIS spectrophotometer at 470 nm. The total alkaloid content was expressed as mg of QE/g of extracts.[23,24]

Antioxidant assays of plant extracts

Antioxidant by DPPH radical scavenging assay

Antioxidant potential of the plant extracts was determined using DPPH free radical scavenging assay. The experiment was carried out using microplate reader(Thermo Scientific Multiskan FC). The protocol was followed by taking reference to conventional methods and existing research papers. The test was conducted in 96-well plates according to (Herald *et al*., 2012)[22] with slight modifications. 20µl of stock solution of each extract was taken in different concentrations (20, 40, 60, 80, 100 ppm). It was followed by 180µl of freshly prepared DPPH solution in each well. The solutions were carefully added in 96-well plates by using high precision micropipettes. The solutions were shaken well and incubated for 30 minutes in dark conditions at room temperature. Absorbance was taken in microplate reader at 517nm. Ascorbic acid, which is widely used as standard, was used to generate the calibration curve. The controlled sample has the same value but does not include any plant extract, and methanol was used as a blank. Each of the measurements was taken in triplicate. The decrease in absorbance value was compared to a positive control. The inhibition ratio (%) and IC_{50} value were derived using the dosage inhibition curve and calculated by following equation.

$$\%inhibition = \left(\frac{absorbance\ of\ control - absorbance\ of\ sample}{absorbance\ of\ control}\right) X\ 100$$

Antioxidant by ABTS assay

The antioxidant capacity of plant extracts was assessed using the ABTS free radical scavenging test. The experiment was carried out with the aid of a microplate reader. The protocol was followed by referring to established methods and research articles. The experiment was carried out in 96-well plates according to (Xiao *et al*., 2020)[25], with minor changes. Each extract was given 20µl of stock solution in various concentrations (20, 40, 60, 80, and 100 ppm).In each well, 180µl of newly produced ABTS solution was added. Using high precision micropipettes, the solutions were carefully applied to 96-well plates (Thermo Scientific Multiskan FC). The solutions were thoroughly shaken before being incubated for 30 minutes in the dark at room temperature. At 730 nm, the absorbance was measured using a microplate reader. The calibration curve was created using Trolox, a widely recognized standard. The controlled sample has the same value but no plant extract, and methanol was used as a control. Every measurement was taken in triplicate. The absorbance value decrease was compared to a positive control. The results were expressed as (mg TE/g) of sample extracts.

Antioxidant by FRAP (Ferric reducing antioxidant power) Assay

Antioxidant potential of the plant extracts was determined by ferric iron reducing antioxidant power (FRAP) assay. The experiment was carried out by standard method with minor modifications (Cecchini *et al*., 2020)[26], In FRAP assay, ferrous sulphate was taken as standard and distilled water was taken as blank. FRAP solution was freshly prepared as following; 300mM acetate buffer (pH 3.6), a 20mM ferric chloride solution and a 10mM TPTZ solution were mixed in 10:1:1 ratio. The prepared solution was mixed with 40mM HCl solution. Plant extracts were prepared in 1mg/1ml ratio with respective solvents. In each well, 25µl of plant extract or blank or standard (ferrous sulphate) was added for analysis. They were diluted with 175 µl of distilled water. Then, 200µl of FRAP reagent was added to each well. The solutions were allowed to react for 30 mins. After incubation, absorbance was measured at 600 nm using microplate reader. The similar procedure was followed for standard ferrous sulphate (20, 40, 60, 80, 100 ppm)

to obtain calibration curve. The results were expressed as μmol ferrous sulphate equivalents in 1g of dried sample (μmol $FeSO_4$/g).

Statistical analysis

All quantitative phytochemical analysis and antioxidant assays are performed in triplicate manner to reduce error by taking an average and are denoted in the form of Mean ± Standard Deviation (S.D.) Linear regression coefficient (R^2) for the obtained data was analysed. The statistical analysis was carried out using SPSS (Statistical Program for Social Sciences) version 26 for windows. The Pearson's correlation was primarily analysed using the software. The level of statistical significance was set up at p value ≤ 0.05[27].

RESULTS AND DISCUSSION

Total phenolic content of plant extracts

The phenolic content of the different plant extracts was estimated by Folin-Ciocalteu method. The phenolic compounds are very important phytochemicals as they show excellent antioxidant potential. Folin-Ciocalteu reagent is a yellow-coloured acidic solution containing complex polymeric ions derived from phosphomolybdic and phosphotungstic acids. The reagent oxidizes the phenolic content in plant extracts, resulting in the creation of a molybdenum-tungsten blue complex. The result was derived from a calibration curve (y= 0.0073x + 0.4438, R^2 = 0.9972) of gallic acid (20-100 μg/ml) and the TPC was expressed in gallic acid equivalents (GAE) per gram of dry extracts, represented in table 1. From the results obtained, methanol extract has shown highest phenolic contents (94.13 ± 0.62 mg/GAE), followed by ethyl acetate (69.93 ± 0.28 mg GAE/g) and hexane extract (41.76 ± 0.48 mg GAE/g).

Total flavonoid content of plant extracts

Quantification of total flavonoid content was determined by aluminium chloride method. The result of TFC of plant extracts were obtained in range of (40 – 177 mg QE/g). Aluminium chloride can be used to estimate total flavonoid concentration because it forms coloured complexes with the C4 keto group or C3/C5 hydroxyl group of flavonoids found in plant extracts. The results were derived from the standard calibration curve (y = 0057x + 0.5131, R^2 = 0.9969). Quercetin was used to generate the standard curve in range of (20-100 μg/ml) and results of sample extracts were expressed in quercetin equivalent (QE) per gram of dry extracts, depicted in table 1. The methanol extract showed highest flavonoid content with values (177.46 ± 0.10 mg QE/g). Following to it, ethyl acetate extract and hexane extracts contain (131.67 ± 0.70 mg QE/g) and (40.45 ± 0.26 mg QE/g) respectively.

Total tannin content of plant extracts

Tannins have the ability to form compounds with metals. This capacity to chelate metal ions is crucial for controlling metal ion concentrations in plant tissues, averting toxicity, and sustaining vital metal functions. The results of total tannin of plant extracts were expressed in tannic acid equivalent (TAE) per gram of dry extracts and derived from standard calibration curve (y = 0.0064x + 0.1944, R^2 = 0.9977). The concentration of tannin content in plant extracts was found to be highest in ethyl acetate extract as (71.86 ± 0.47 mg TAE/g). The methanol and hexane extracts shown relatively lower tannin concentrations with values (55.56 ± 0.56 mg TAE/g) and (31.44 ± 0.39 mg TAE/g) respectively, shown in table 1.

Total alkaloid content of plant extracts

The alkaloids exhibit anti-inflammatory and antioxidant properties, contributing to their potential health benefits. The results have shown that total alkaloid content in plant extracts were obtained in range between (12.45 to 53.51 mg QE/g). The standard calibration curve was obtained by using quercetin (y = 0.0088x + 0.2824, R^2 = 0.9907) and results were expressed as quercetin equivalent (QE) per gram of dry extracts, shown in table 1. From the results, it was found that methanol extract contains highest amount of alkaloids (53.51 ± 0.17 mg QE/g). The ethyl acetate and hexane extracts contain (38.55 ± 0.17 mg QE/g) and (12.45 ± 0.30 mg QE/g) respectively.

Antioxidant potential of plant extracts

DPPH assay for scavenging free radicals

Antioxidants are substances that can neutralize or reduce oxidative stress by scavenging free radicals, which are highly reactive molecules that can cause damage to cells and tissues. Phytochemicals found in plants have significant antioxidant activity. These phytochemicals work through various mechanisms to counteract oxidative stress, including scavenging free radicals, chelating metal ions involved in oxidative reactions, and modulating antioxidant enzyme activity.[28] The DPPH (2,2-diphenyl-1-picrylhydrazyl) assay is a widely used method to measure the antioxidant potential of compounds, including plant extracts. The assay is based on the ability of antioxidants to neutralize the stable free radical DPPH, resulting in a colour change from purple to yellow. The presence of antioxidants in the sample extracts lead to the discolouration of DPPH whose absorbance can be measured at 517 nm. In the present investigation, the DPPH free radical scavenging activity was performed at different concentrations of methanol, ethyl acetate and hexane extracts of leaves of *M. maderaspatana*. The antioxidant potential of each plant extracts was compared to ascorbic acid, a standard antioxidant. The percentage inhibition graph of the three extracts at various concentration (20 – 200 µg/ml) is depicted in graph 1. The methanol extract has shown greater inhibition followed by ethyl acetate and hexane extracts respectively. The IC_{50} values calculated from three extracts showed values as 153.97µg/ml, 149.87µg/ml and 250.47µg/ml for methanol, ethyl acetate and hexane extract respectively. Higher concentration of certain phytochemicals in the methanol extracts should have exhibited higher inhibition rate.

ABTS free radical scavenging assay

The ABTS (2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid)) assay is a common method used to measure the antioxidant capacity of substances. The ABTS assay provides a quantitative measure of the antioxidant activity of a sample by evaluating its ability to neutralize the ABTS radical cation.[29] A decrease in absorbance indicates the reduction of the ABTS radical cation and is proportional to the antioxidant activity of the sample. ABTS is a synthetic radical that, when oxidized, produces a blue-green colour. The assay measures the ability of antioxidants to neutralize this radical, leading to a reduction in colour intensity. The ABTS radical is reduced by antioxidants, causing the green colour of the ABTS radical solution to gradually disappear and becoming colourless.[30] The result for the assay was expressed as Trolox equivalent of sample extract and standard calibration curve was obtained as ($y = 0.0064x + 0.1995$, $R^2 = 0.9950$). Amongst the three extracts, methanol extracts have shown greatest values (89.87 ± 0.23 mg TE/g) and followed by ethyl acetate extracts (64.50 ± 0.39 mg TE/g) and hexane extracts have shown least radical scavenging activity (39.08 ± 0.32 mg TE/g) which is shown in table 1.

Ferric reducing antioxidant power (FRAP) Assay

The FRAP assay provides a quantitative measure of the overall antioxidant capacity of a sample. The assessment of the ferric ion-reducing antioxidant power could be a meaningful indicator of its potential antioxidant activity. The antioxidants present in the extract have been demonstrated to exhibit antioxidant effects by interrupting the free radical chain through the donation of a hydrogen molecule.[31] FRAP assay is widely used and reliable measure to assay antioxidant potential of the plant extracts. This assay measures the ability of antioxidants to reduce a ferric-tripyridyl triazine complex (Fe^{3+}-TPTZ) to its ferrous form (Fe^{2+}), resulting in the formation of an intense blue-coloured product. The intensity of the colour is directly proportional to the reducing power of the sample. The reducing capacity of the sample is generally dependent on the compounds present in the extracts which can break down the free radical chain by donating hydrogen atom.[32] From the results, depicted in table 1, the methanol extracts (86.321 ± 0.11 mg $FeSO_4$/g) have shown highest reducing capacity followed by ethyl acetate (51.163 ± 0.06 mg $FeSO_4$/g) and hexane extracts (35.369 ± 0.20 mg $FeSO_4$/g). In order to calculate the sample's FRAP values in the FRAP assay, the antioxidant potential of the sample was ascertained using a standard curve plotted using the $FeSO_4.7H_2O$ linear regression equation ($y = 0.0084x + 0.2579$, $R^2 = 0.9985$). The equivalent weight $FeSO_4$/g of sample was calculated using the equation.

The correlation amongst phytochemicals and antioxidant activity

The phytochemicals play very significant role in plants to demonstrate their antioxidant potential. Various studies have sought to elucidate the connection between the types and concentrations of phytochemicals and antioxidant

power. Phenols and flavonoid are major phytochemicals reported which have ability to donate hydrogen atoms to free radicals and deactivating them. Moreover, their ideal structural characteristics helps them to scavenge free radicals.[33] In the present study, phenols, flavonoids along with alkaloids and tannin contents of the plant extracts were correlated with various antioxidant assays. Pearson's correlation coefficient is a statistical measure that quantifies the strength and direction of a linear relationship between two variables.[34] The Pearson's correlation coefficients (r) values of each plant extracts were depicted in table 2. In methanol extract, except the Tannin content, the Phenolic, Flavonoid and Alkaloid contents were significantly correlated with DPPH, FRAP as well as ABTS assay. ABTS assay confirmed highest positive correlation with TPC ($r = 1.000^{**}$, $p < 0.01$). TTC was least correlated with DPPH and FRAP ($r = 0.136$ and 0.277) respectively. Although, the correlation data for TTC and antioxidants combinations were not similar in ethyl acetate and hexane extracts as methanol extract. In ethyl acetate extract TFC was greatly correlated with ABTS ($r = 1.000^{**}$, $p < 0.01$). Whereas in hexane extract TAC has shown highest correlation amongst other combinations ($r = 0.999^{*}$, $p < 0.05$). TAC has shown comparatively lower correlation with FRAP ($r = 0.655$) and DPPH ($r = 0.693$), which may indicate that alkaloid contents are less extracted in hexane extract.

CONCLUSION

The presence of phenolic compounds, flavonoids, alkaloids and tannins in the studied plant *Mukia maderaspatana* has given us great insight about the potential of the plant in terms of therapeutic activities. Least values were obtained in hexane extract, which suggests that the extraction of these phytochemicals in non-polar solvent like hexane is less favourable. In the present work antioxidant potential of the plant extracts were evaluated using three methods (DPPH, FRAP and ABTS). The methanol extract has shown highest scavenging activity followed by ethyl acetate and hexane respectively. Thus, antioxidants which can scavenge DPPH can be considered as best extracted in methanol extract. ABTS and FRAP assays also confirmed highest antioxidant potential of the methanol extract in comparison to ethyl acetate and hexane. The statistical analysis gave us perception about the correlation between phytochemicals and different antioxidant assays. Further investigation into the identification and isolation of the antioxidant compounds from the plant should be carried out. The nature of these phytochemicals and their mechanism of action is needed to explore at optimum potential, which can lead to the discovery of potent drug and benefit the society to fight against certain diseases.

ABSTRACT

Parkinson's disease (PD) is a progressive neurodegenerative disorder characterized by both motor and non-motor symptoms, often subtle and challenging to detect in the early stages. Timely diagnosis is essential for implementing effective treatments that can slow disease progression and enhance patient outcomes. This study investigates the use of Deep Belief Networks (DBNs), a deep learning model, for the early detection of PD by analyzing multimodal datasets, including clinical, genetic, and imaging data, to identify potential biomarkers. Preliminary findings indicate that DBNs significantly outperform traditional machine learning models in detecting early-stage PD, showcasing their potential to improve diagnostic accuracy. However, further refinement and extensive validation of DBN algorithms are necessary to ensure their reliability in clinical practice. The research highlights the importance of interdisciplinary collaboration to advance diagnostic techniques for neurodegenerative diseases. Additionally, it explores the contributions of machine learning, neuroimaging, and biomarker research, emphasizing their role in enhancing diagnostic capabilities. Despite notable progress, challenges persist, and future research directions aim to optimize early detection strategies, ultimately revolutionizing the diagnosis and treatment of Parkinson's disease.

Keywords: Parkinson's Disease, Deep Belief Networks, Early Detection, Biomarkers, Machine Learning, Neuroimaging, Diagnosis.

INTRODUCTION

Parkinson's disease (PD) is a prevalent neurodegenerative disorder characterized by progressive motor and non-motor symptoms, impacting millions of individuals globally. As one of the leading causes of disability among the elderly, timely and accurate diagnosis is crucial for improving patient outcomes and managing the disease effectively. The clinical presentation of PD often includes tremors, rigidity, bradykinesia, and postural instability; however, these symptoms can be subtle and may not manifest until significant neuro degeneration has occurred. Traditional diagnostic methods, such as the Unified Parkinson's Disease Rating Scale (UPDRS), have limitations, including observer bias and inter-rater variability. Recent advancements in technology and research have led to the exploration of innovative diagnostic approaches, such as neuroimaging techniques, machine learning algorithms, and biomarker analysis. Neuroimaging, including Dopamine Transporter (DAT) imaging and functional MRI (fMRI), has shown potential in visualizing changes in brain activity and neurotransmitter function associated with PD. Additionally, machine learning models, particularly Deep Belief Networks (DBNs), are being utilized to analyze complex datasets, enhancing diagnostic accuracy by identifying subtle patterns indicative of early-stage PD. Furthermore, the identification of genetic and biochemical biomarkers offers promising avenues for preclinical detection, facilitating earlier intervention strategies. This comprehensive study aims to explore these methodologies and their implications for early PD detection, emphasizing the need for integrated and accessible diagnostic frameworks. By improving diagnostic accuracy and enabling timely treatment, these approaches could significantly enhance the quality of life for individuals affected by Parkinson's disease.

LITERATURE REVIEW

Early detection of Parkinson's disease (PD) is vital for effective treatment and management. Clinical assessments, while valuable, often suffer from subjective interpretation and variability (Siderowf & Golbe, 2005). Neuroimaging techniques, such as DAT imaging, provide insights into dopaminergic activity but face challenges regarding accessibility and cost (Kalia & Lang, 2015). Machine learning approaches, especially Deep Belief Networks (DBNs), have shown promise in analyzing multimodal datasets to identify early-stage PD patterns, significantly improving diagnostic accuracy compared to traditional methods (Hwang et al., 2019). Biomarkers, including genetic variants like SNCA and LRRK2, and neurodegenerative indicators in cerebrospinal fluid, present new avenues for preclinical detection (Marek et al., 2018). Despite advancements, challenges such as symptom heterogeneity, data quality, and limited access to advanced technologies persist, necessitating collaborative efforts for developing integrated diagnostic systems that enhance early detection (Chaudhuri et al., 2006; Poewe et al., 2017).

Importance of Early Detection

Early detection of Parkinson's disease (PD) is essential for effective management and improving long-term patient outcomes. Early identification allows healthcare providers to intervene before significant neurological damage occurs, potentially slowing disease progression and preserving quality of life. In most cases, PD is not diagnosed until substantial motor symptoms emerge, by which point 60-80% of dopamine-producing neurons may already be lost. This delay limits the effectiveness of treatments that could slow degeneration if applied earlier. Several methods have been proposed for early detection, including clinical observations, neuro imaging techniques, machine learning models like Deep Belief Networks (DBNs), and biomarkers. Clinical signs like subtle changes in motor function, speech, and cognition often appear in the early stages, but these signs are frequently overlooked or misattributed. Machine learning tools can analyze these subtle changes more effectively, enabling earlier diagnosis. Biomarkers such as alpha-synuclein accumulation in cerebrospinal fluid and reduced dopamine transporter activity in the brain, as observed through neuroimaging, offer promising pathways for detecting PD even before clinical symptoms become apparent. Pharmacological treatments, including levodopa and dopamine agonists, are most effective when introduced early, helping to delay the onset of severe motor symptoms. Additionally, lifestyle interventions, such as physical therapy and exercise, can be more beneficial if started at the earliest stages of the disease. However, significant challenges remain, particularly in making early detection methods universally accessible and cost-effective.

Future research is aimed at improving the accuracy, affordability, and scalability of these diagnostic tools to ensure timely intervention for all patients.

Clinical Assessment in Parkinson's Disease Diagnosis

Clinical assessment remains a cornerstone in diagnosing Parkinson's disease (PD), primarily through standardized tools like the Unified Parkinson's Disease Rating Scale (UPDRS). The UPDRS evaluates motor and non-motor symptoms across multiple domains, offering a structured way to measure disease severity. While it is widely used due to its simplicity and low cost, the approach has inherent limitations, including observer bias and inter-rater variability. Clinicians may interpret the severity of symptoms differently, leading to potential inconsistencies in diagnosis. Consider Patient A, a 65-year-old female who presented with a tremor, bradykinesia, and subtle changes in handwriting (micrographia). These early signs prompted a thorough clinical evaluation using the UPDRS, which confirmed mild motor symptoms. Based on the clinical assessment, she was started on dopamine agonists, which helped manage the symptoms at an early stage. While this case highlights the benefit of early intervention, it also underscores the limitations of subjective assessments. The accuracy of clinical diagnosis depends heavily on the experience of the clinician, and subtle early-stage symptoms may be missed or misinterpreted. To address these challenges, objective, data-driven methods are being explored to complement traditional clinical assessments. For example, wearable devices and digital tools can track motor symptoms such as tremors and gait disturbances more consistently and provide continuous monitoring. Furthermore, integrating neuroimaging and biomarker data into the diagnostic process could enhance accuracy and reduce inter-rater variability, leading to more consistent diagnoses. As clinical assessment continues to evolve, the incorporation of these objective tools will be critical for improving early detection and treatment outcomes in PD.

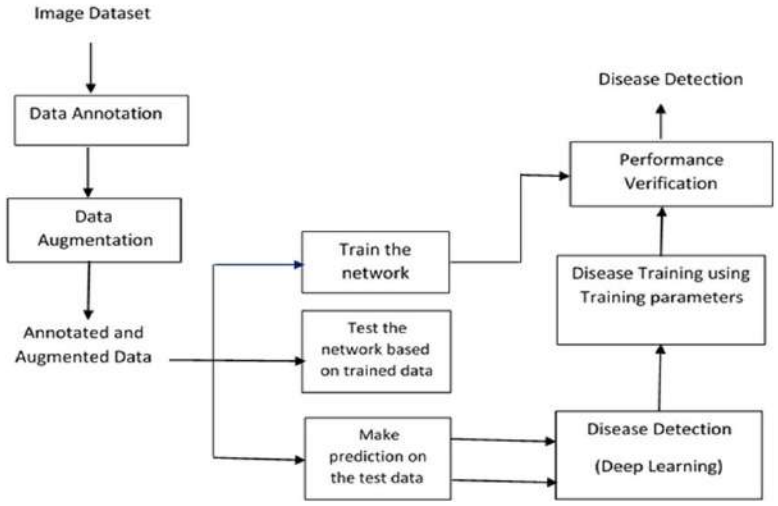
Neuroimaging Techniques in Parkinson's Disease Diagnosis

Neuroimaging techniques play a critical role in visualizing the structural and functional changes in the brain associated with Parkinson's disease (PD). Among these, Dopamine Transporter (DAT) imaging and magnetic resonance imaging (MRI) are two prominent methods used for diagnostic purposes. DAT imaging, particularly through single-photon emission computed tomography (DAT-SPECT), is highly valuable for assessing dopaminergic function. It provides insight into dopamine uptake in the brain's striatum, which is significantly reduced in PD patients. Patient B, a 72-year-old male with a family history of PD, underwent DAT-SPECT, which revealed diminished dopamine transporter activity in the striatum, confirming a loss of dopaminergic neurons—an early hallmark of PD. This finding was critical in guiding his treatment plan, enabling early pharmacological intervention. DAT imaging is particularly useful in distinguishing PD from other parkinsonian syndromes, such as essential tremor, which do not typically involve reduced dopaminergic function.

While MRI is often employed for structural imaging of the brain, its utility in early PD diagnosis is limited. MRI can detect gross structural changes or rule out other neurological conditions, but it generally does not capture the subtle neurodegenerative processes seen in the early stages of PD. This is where DAT imaging excels, as it directly visualizes dopaminergic dysfunction, a core feature of PD. However, both DAT-SPECT and MRI come with limitations. They are expensive and not universally available, especially in resource-limited healthcare settings, restricting their widespread use for routine screening. Future research is focused on enhancing the accessibility, affordability, and diagnostic accuracy of these imaging techniques, potentially incorporating advanced methods like functional MRI (fMRI) or positron emission tomography (PET) to improve early detection in at-risk populations. Machine learning (ML) techniques are transforming the landscape of Parkinson's disease (PD) detection by providing sophisticated, data-driven methods for analyzing complex, multimodal datasets. These approaches can detect subtle symptoms of PD that may be missed in traditional clinical evaluations. Among the most effective machine learning models are Deep Belief Networks (DBNs) and Convolutional Neural Networks (CNNs), which excel at analyzing data such as voice changes, gait patterns, and tremor characteristics—key indicators of PD. For instance, Patient C, a 68-year-old female, presented with minor speech changes, which were not immediately apparent in clinical evaluations. However, using ML algorithms to analyze her voice data, significant PD-related patterns were identified with high accuracy. The automated analysis flagged subtle speech impairments, which are often early signs of PD, enabling earlier diagnosis

than would have been possible through traditional clinical methods. Machine learning workflows in PD detection generally involve several key steps: data collection, preprocessing, feature extraction, model training, and evaluation. In the case of voice analysis, for example, ML models can capture features such as frequency modulation, jitter, and articulation rate—factors that clinicians might overlook. The integration of these models into clinical practice not only offers an objective approach but also reduces variability in diagnosis, which is often seen with human interpretation.

Moreover, machine learning systems can handle large datasets from diverse sources, making them particularly useful for longitudinal studies where continuous monitoring of patients can lead to early intervention. Although promising, challenges remain in terms of model interpretability, data privacy, and the need for large, high-quality datasets. Nevertheless, the use of AI and machine learning holds immense potential to enhance diagnostic accuracy, improve early detection, and ultimately provide better patient outcomes.



Biomarkers for Early Detection of Parkinson's Disease

Biomarkers, particularly genetic and biochemical markers, offer significant promise for the early detection of Parkinson's disease (PD), potentially identifying the disease before the onset of clinical symptoms. Genetic mutations such as those in the *SNCA*, *LRRK2*, and *GBA* genes are strongly associated with increased PD risk. For example, Patient D, a 60-year-old male, underwent genetic testing that revealed an *SNCA* mutation, a gene known for its role in PD pathogenesis. This early identification allowed for close monitoring and lifestyle modifications, potentially delaying the onset of PD symptoms through personalized interventions like regular exercise and dietary adjustments aimed at neuroprotection. mIn addition to genetic markers, researchers are investigating biochemical markers in cerebrospinal fluid (CSF) and blood for their utility in PD diagnosis. Key proteins such as alpha-synuclein, tau, and beta-amyloid in CSF are being studied, as their abnormal levels may indicate neurodegeneration long before motor symptoms appear. Reduced alpha-synuclein levels, for instance, have been linked to the presence of PD, serving as a potential early biomarker of disease progression. Similarly, inflammatory markers and oxidative stress indicators in blood are being explored as non-invasive diagnostic tools. While the research on biomarkers is promising, significant challenges remain. Current findings require validation in larger, more diverse populations, and standardized protocols for biomarker testing must be established to ensure clinical reliability. Additionally, the integration of genetic and biochemical markers into routine clinical practice is still in its infancy, with ongoing studies aiming to refine these approaches. Despite these challenges, biomarkers hold significant potential to revolutionize early diagnosis, enabling earlier therapeutic interventions and improving patient outcomes.

Advanced Neuroimaging Methods for Early Detection of Parkinson's Disease

Advanced neuroimaging techniques, including Functional MRI (fMRI) and Electromyography (EMG), are increasingly being investigated for their potential in the early detection of Parkinson's Disease (PD). fMRI is a non-invasive imaging modality that measures brain activity by detecting changes in blood flow and oxygen levels. This technique

can reveal alterations in brain function related to motor control, often uncovering abnormal blood flow patterns in regions such as the basal ganglia before overt motor symptoms manifest. Research indicates that fMRI may provide biomarkers that correlate with disease severity, aiding in earlier diagnosis and monitoring of PD progression. On the other hand, Electromyography (EMG) is used to assess electrical activity in skeletal muscles. It can identify neuromuscular dysfunctions by capturing subtle changes in muscle activation patterns and coordination, potentially detecting motor impairments even before clinical symptoms become evident. This capability is particularly valuable, as early intervention can significantly alter disease trajectories. Despite their promise, the high costs and technological demands associated with fMRI and EMG limit their widespread application in clinical settings. Additionally, these techniques require specialized training and infrastructure, making them less accessible, especially in resource-limited environments. To maximize their diagnostic potential, there is a pressing need for integrating advanced neuroimaging methods with traditional assessment techniques, such as clinical evaluations and biomarker analysis. Such integration could create a more comprehensive and affordable framework for early PD diagnosis, ultimately improving patient outcomes and enabling timely therapeutic interventions.

Data Analytics and Visualizations in Parkinson's Disease Detection

Data analytics is a critical component in enhancing the methodologies used for detecting Parkinson's Disease (PD), as it enables the analysis of large and complex datasets to identify diagnostic patterns. By employing advanced statistical models, researchers can investigate nuanced changes in motor functions that may signal the onset of early PD. For instance, a meta-analysis involving 20 studies highlighted that machine learning algorithms significantly improved early detection rates by approximately 25% compared to traditional diagnostic methods. This advancement is crucial, as early detection can lead to timely interventions and better management of the disease. Visual analytics, such as Receiver Operating Characteristic (ROC) curves and statistical summaries, provide valuable insights into the performance of various detection models. ROC curves allow clinicians to assess the trade-off between sensitivity and specificity, enabling them to select models that offer optimal diagnostic accuracy. Additionally, data visualizations can facilitate the understanding of complex relationships within the data, guiding clinical decision-making. Moreover, integrating data analytics with real-time monitoring tools can lead to personalized healthcare solutions, tailored to the specific needs of PD patients. This approach not only enhances the precision of early detection but also allows for the tracking of disease progression and the evaluation of treatment efficacy over time. Ultimately, leveraging data analytics and visualization techniques is essential for advancing early detection technologies, improving clinical outcomes, and fostering a more personalized approach to PD management.

Challenges in Early Detection of Parkinson's Disease

Despite significant advancements in the methodologies for detecting Parkinson's Disease (PD), several challenges persist that complicate early diagnosis.

Heterogeneity of Symptoms

The clinical presentation of PD is highly variable among individuals, encompassing a wide range of motor and non-motor symptoms. This symptom heterogeneity can lead to misdiagnosis or delayed diagnosis, as patients may not exhibit the hallmark signs typically associated with PD, such as tremors or rigidity. Additionally, overlapping symptoms with other neurological disorders can further complicate the diagnostic process, emphasizing the need for more standardized diagnostic criteria.

Access to Technology

While advanced diagnostic tools such as neuroimaging techniques and machine learning models show promise, their availability is often limited to specialized, well-equipped healthcare facilities. Many patients, especially those in rural or underserved areas, may not have access to these technologies, creating disparities in early detection and treatment options. Expanding access to these diagnostic modalities is crucial for improving early detection rates across diverse populations.

Data Quality

The effectiveness of machine learning algorithms heavily relies on high-quality, consistent datasets for training. However, variability in data collection methods, sample sizes, and reporting standards can lead to biases and inaccuracies in model outcomes. Ensuring standardized data collection protocols and enhancing collaboration among research institutions can help improve the quality and reliability of datasets. These challenges highlight the urgent need for integrated, accessible, and data-driven diagnostic systems that can effectively enhance early detection efforts across various healthcare settings. By addressing these issues, the healthcare community can improve diagnostic accuracy and patient outcomes for those at risk of developing Parkinson's Disease.

Future Directions in Parkinson's Disease Detection

Future research in the detection of Parkinson's Disease (PD) is increasingly oriented toward integrative approaches that combine multiple methodologies, emphasizing personalized medicine and longitudinal studies.

Integrative Approaches

An effective diagnostic framework for PD is likely to involve a synergy of clinical assessments, neuroimaging, biomarkers, and machine learning techniques. For instance, utilizing tools like the Unified Parkinson's Disease Rating Scale (UPDRS) alongside advanced neuroimaging methods such as MRI and functional MRI (fMRI) can enhance diagnostic accuracy. Machine learning algorithms can analyze data from these sources to identify patterns that may not be evident through traditional clinical evaluation alone. This comprehensive strategy can facilitate earlier detection and more accurate diagnoses.

Personalized Medicine

Tailoring detection and treatment strategies based on an individual's genetic makeup and environmental factors represents a paradigm shift in PD management. By integrating genomic data, clinicians can identify specific risk factors and biomarkers associated with the disease, enabling more precise interventions. Personalized approaches could lead to individualized treatment plans that optimize outcomes by considering how different patients respond to various therapies.

Longitudinal Studies

Continuous monitoring of patients through longitudinal studies is vital for understanding the progression of PD over time. These studies can validate new diagnostic methods and assess their effectiveness in real-world settings. Furthermore, tracking disease biomarkers and clinical outcomes over extended periods can provide critical insights into the timing and efficacy of interventions. Overall, future efforts should prioritize making advanced diagnostic tools more accessible and cost-effective. This will enhance early detection capabilities, ultimately leading to improved patient outcomes and quality of life for individuals at risk for Parkinson's Disease.

CONCLUSION

The early detection of Parkinson's disease (PD) is essential for improving patient outcomes and managing this neurodegenerative disorder effectively. Integrating clinical assessments, neuroimaging techniques, machine learning approaches, and biomarker research provides a comprehensive strategy for identifying PD at its earliest stages. Traditional assessments, while useful, often suffer from subjectivity, prompting the need for more objective and data-driven tools. Neuroimaging methods, such as Dopamine Transporter imaging and advanced techniques like fMRI, offer valuable insights but face accessibility challenges. Machine learning models, especially Deep Belief Networks, enhance diagnostic accuracy by analyzing complex datasets for subtle patterns. Additionally, emerging biomarkers hold promise for preclinical detection, although further validation is necessary. Addressing challenges like symptom heterogeneity and limited technology access is vital for developing integrated, patient-centered diagnostic frameworks. Ultimately, collaboration among researchers, clinicians, and technologists is crucial to advance PD detection and improve the quality of life for those affected by the disease.

ABSTRACT

COVID-19 is a dangerous bio-psycho-social disease that has affected 16585 Indians per million since March 14, 2020. Since then, there have been 180 deaths and 13,664 recoveries per million. There have been about 2.8 million infections recorded globally since the outbreak's initial occurrence in December 2019. The Dark Tetrad Personality Spectrum, which encompasses sadistic, psychopath, machiavellian, and narcissistic personality types, is the primary focus of the current study. According to a notable study conducted by the University of Mississippi on 402 US individuals, those with sadistic personality traits were more content with the ongoing global crises. Additionally, characteristics like narcissism and Machiavellian tendencies were linked to increased risks of experiencing the negative effects of the COVID-19 lockdown. Additionally, there was a certain amount of increased instability among this group of individuals. These experiments also revealed a negative correlation between psychopathy and COVID-19 lockdown. The relationship between the Bi-directional Impression Management Index and the perceived stress levels of Indians with dark tetrad personalities under the government-imposed COVID-19 limitations and lockout is examined in this study using a co-relational approach. Although some people with dark personality traits may have also found the COVID-19 lockdown settings enjoyable, it is thought that overall, there are more opportunities for psychopaths and narcissists to disobey the lockdown procedures.

Keywords: Dark-Tetrad Personality Traits, Bi- directional Impression Management Index, Narcissism, Machiavellianism, Sadistic

INTRODUCTION

The virus is highly contagious in nature [1], and the World Health Organization (WHO) recommended maintaining social distancing and isolation, making it a mandatory 6 feet distance between two individuals meeting in public. The same advisory notes were also mandating all the Governments of various countries to limit social interactions and collaborations. This is definitely a period of global crisis with threats and fear of succumbing to COVID-19 prevalent almost everywhere. During this time, most of the countries' Governments had been imposing movement restrictions, lockdowns – in complete phased forms, limiting social meetings and interactions which have been still prevalent in 2022- January. Such a situation is actually affecting the mental health of many individuals globally, where certain categories of people are believed to behave in many obnoxious ways. In this study, the first aim is to find out the level of dark tetrad personality traits amongst Indian citizens over an online survey floated over all internet, and open sources. This will help to get a general overview of the Indian population, exhibiting the dark traits from very mild to moderate conditions. The second aim is to understand the levels of perceived stress amongst these Indian individuals during this COVID-19 Pandemic conditions. The third aim is to measure the Bi-directional Impression Management Index of these Indians in order to reduce or buffer or do some activities while addressing the ongoing stress build up due to COVID-19 lockdown. Ultimately, a correlation study is drawn between the independent variables with the dependent ones.

LITERATURE REVIEW

The review of literature was searched using the keywords of Dark tetrad personality traits, dark triad personality traits, Agentic Impression and Communal Impression Management Index from JSTOR, Taylor and Francis, Sage journals, Google scholar and Springer Journals. There was a substantial difference among the three constructs within each component of the Dark Triad [7] which later added into the interpretative difficulties as was laid by [8]. The most comprehensive model of narcissism includes both the components of Machiavellianism and Psychopathy [9] and probably all the three [10] The later included all the basic traits related to antagonism, extraversion, neuroticism, cunningness and Sub-clinical Lying, agencies etc. In 1991, however, Hare included pathological lying or clinical manipulation, or cunningness in the psychopathy. In the influx of new research within the fields of Dark Triad Personality, a new addition of sadism [11] was taken into consideration. Having said so and discussed on the basic findings about the psychological and behavioral traits associated with the dark triad personality disorders it is also pertinent to mention its current conformities with a concept called rape myth acceptance [12]. Now in this review of literature the commonly called dark triad changes into dark tetrad. The new socially aversive construct, sadism characterized with cruelty, humiliation, aggression, intimidation, with a variable like statement "It wasn't really a crime" or "He didn't do it" like concept. The same study included studies from aggression, or tallied in between long-term mating construct with short term mating construct [13]. The meta-analytic correlations made between the mentioned three constructs with the examination of multidimensionality in the structure and traits in Machiavellianism were also detailed [14].It was found that there was a similarity in the behavioral traits, with the new findings in terms of sharing dishonesty, non-communalism, disharmony, very low empathy, in the interpersonal relations. Again, in another meta-analytic review as described in the content that, these three socially aversive constructs directly related to antagonism and disinhibition with an added boldness component. The different research studies conducted seem to be discussing the uni-dimensionality of the three DT constructs neglecting the major aspects of their multi-dimensional components. For e.g., the boldness in comparison and reliance of the total scores obscured a major substantial difference for the interpretative conflicts suspecting difficulties. Unfortunately, almost 85% of the test scores on the 3 DTs provide a total score and the same is mainly taken care of by Dirty Dozen (DD; Jonason & Webster, 2010) and Short Dark Triad (SD3). Now with Machiavellianism, another inventory called Five Factor Machiavellianism Inventory was started. It brought an expert description of the traits comprising MACH. The results suggested unfettering assessments from the theoretical concepts of Machiavellianism. Noteworthy to mention the perils of partialing, (Furnham, Richards, and Paulhus which had shown and prescribed a usage of multivariate statistical approaches on outcomes (like aggression), showcasing a regressing factor on all three DT

constructs simultaneously. In 1941, Freud and 1975, Kern berg had postulated some modern descriptions of Narcissism. Now there was a famous book written about Niccole Machiavelli in 19th century on the manipulative traits used in socio-political arena for power gain and psychological strategies from where the word Machiavellianism (MACH) came into existence and took the interest for an extensive course of research and studies. The Machiavellianism was though characterized by semantic immorality and cynical disregard, the narcissism was more into self-centered, ego-centric and was entitled towards interpersonal exploitation, with psychopathy towards no or very low empathy, dishonest, antisocial or unlawful activities (Hare, 2003). With respect to psychopathy and its relation to narcissism, an argument came forth (that the same encompasses grandiose narcissism and MACH, but in reality, it was later found that the latter happens to be nested in the former. In the advent of multiple researches into the negative pole of HEXACO model of Light personality traits, the addition of Sadism has been laid down along with the other dark triad personality traits.. There are structural properties and location in the personality space which verified the concept of The Dark Tetrad by addition of Sadism along with Dark Triad Personality Traits. The main reason cited was the evidential proof of the specific characteristics of Sadism, and the same which cannot be reduced to any of the other dark triad personality traits. Sadistic personality people find pleasure from hurting others, both physical and mental abuse of others can be a pleasure giving mechanism to these traits of people. They are found to be lacking empathy, inflicting sufferings and pains on others, readiness for brutal immoral dispositions.
The context of having a socially desirable response (SDR) by any individual is highly important during COVID-19 pandemic conditions. Whether one is staying alone or with family/friends, such as the ongoing conditions happening over the last one and a half year, expects every individual to possess desirable social bonding and care for others. Now, within the SDR research, the distinction between the agency-communion impressions have been already discussed as the self-deceptive biases.

METHODOLOGY

Hypothesis

H1- There exists a substantial amount of difference in the perceived stress levels
amongst the 4 dark personality traits- Narcissism, Machiavellianism, Psychopathy and Sadism.
H2- There is a positive relationship between the Agentic and Communal Management Index with that of the Perceived stress levels.
H3- There is a positive relationship between types of Agentic Management Index with the Dark Tetrad Personality Traits.
H4- There is a negative relationship between types of Communal Management Index with the Dark Tetrad Personality Traits.

Objectives:

The main objective of the study is to draw a relationship between the perceived stress levels and the Bi-directional Impression Management Index amongst the dark Tetrad Personality traits Indians during COVID-19 lockdown since March 2020. In order to achieve the same, the following methods are taken care of –

1. To find out the levels of various dark tetrad personality traits- Narcissism, Machiavellianism, Psychopathy and Sadism amongst the Indian individuals out from an online survey.
2. To find out the perceived stress levels they might be facing during the COVID-19 Lockdown.
3. To find out their Agentic management Index.
4. To find out their Communal management Index.
5. To see the relationship between each type of dark tetrad personality traits and the Perceived stress levels along with Bi-directional Impression Management Index.
6. To draw a correlation between the dark tetrad personality traits with their perceived stress levels and Bi-directional Impression Management Index during COVID-19 Lockdown.

Methods

The research design for the current study uses quantitative methodology to understand the relationship between Perceived Stress levels and Bi-directional Impression Management Index amongst the dark tetrad personality Indians. This study would at first find out the trait levels of dark personality spectrum of DARK TETRAD amongst Indian citizens agreeing to participate in this study. Those who show a mild to moderate level of dark personality traits are only considered for finding any relationship between their achieved Perceived stress level and Bi-directional Impression Management Index during COVID-19 lockdown. There are in total 58 questions – Likert Scale based on three sets of questionnaires – SDT4 Test, PSS-10 Test and BIMI- Test module. The authors decide to conduct a quantitative experiment for having a correlation study and later plan to share a critical (advocacy) theory in future. The Critical (Advocacy) theory is based upon the narrative experimentation by understanding their COVID-19 responses and behaviors.

Sample Description

The total sample consists of 150 Indian citizens with an age Group of 21 years to 66 years. However, only 95 persons are taken into account and the rest being not considered as a part of the study owing to higher SDT-4 scores. The Genders has been – Females of 79 numbers, and with that of Males being 16 numbers, having an employment Status-Working Categories (Part time/ Full time/ self-employed/ Business/ Freelancer/ Online startups). Even Unemployed or full time/part time students are considered. The entire data collection method is conducted using PANAS study and only Indians citizens residing within the territorial boundaries of India during COVID-19 are taken into consideration.

Sampling Method

It is preferred to be a random sampling method, by collecting data out from online medium; however, the authors like to consider purposive and snowballing sampling methods too.

Tools used

- Assessment of Dark Tetrad Personality Test - SD4 Test - this is a 28 item instrument capturing subclinical versions of Narcissism, Machiavellianism, Psychopathy and sadism. This is designed by Delroy Paulhus et al. July, 2020.
- Assessment of Perceived Stress level - PSS Test- this is a 10 item instrument reprinted by Mind Garden with permission of the American Sociological Association, from Cohen, S., Kamarck, T., and Mermelstein, R. (1983).
- Assessment of Bi-dimensional Impression Management Inventory- BIMI-20 Test- This is a 20-item distinguishing Agentic and communal forms of impression management by SA Blasberg, et al., 2012.

Data Analysis

In this research study, Statistical analysis of the quantitative data would be conducted using the Statistical Package for the Social Sciences (SPSS). Descriptive statistics shall be used to illustrate the various demographic profiles of the participants with respect to the frequency, the mean scores and the standard deviation of levels of the dark tetrad personality traits found only amongst the Indian Citizens- Narcissism, Machiavellianism, Psychopathy and Sadism. We shall also find the descriptive statistics in terms of mean, median and Standard Deviation scores along with the frequency of Perceived Stress levels and Bi-directional Impression Management Index. To test the first hypothesis, statistical test of Analysis of variance (ANOVA) would be used for comparing the PSS scores based on the four dark tetrad traits. To test the second, third and fourth hypothesis, where the researcher is trying to find the relationship between Agentic and Communal Impression Management amongst the accumulative Dark Tetrad Personalities, correlation method (Bivariate with confidence levels) would be used. The final correlation test shall be found out using Spearman-Correlation test (Non-parametric) to draw the final conclusion.

RESULTS

Table 1: This table shows the Population Descriptive Statistics of the articipantsith respect to the mean scores, the variance and the standard deviation of levels of dark tetrad personality traits Machiavellianism (M), Narcissism (N), Psychopathy (P), Sadism (S). Table 2: This table shows the characteristics of the entire sample in frequencies and percentage with respect to the gender of the entire sample. With a count of total 95 participants in the final sample, there are around 79 N of female participants (83.2%) and the males are around 16 N having 16.8% share of the total sample population. The same has been calculated using descriptive statistics using frequencies and population measurement tests. Table 3: This table shows the Population Descriptive Statistics of the participants with respect to the mean scores, the variance and the standard deviation of Perceived Stress level (PSSS-10) and the Bi- directional Impression Management Index for both Agentic and Communal (BIMI-A and BIMI-C). Table 4: This table shows the substantive difference between the Perceived Stress levels with respect to all the dark tetrad personalities, and the same is determined having a significant p value <0.05. The same has been found out using One-Way Annova statistical tools. Table 5: Represents the relationship between the Bi-directional impression management – both the Agentic and communal with the Perceived Stress Levels- using Correlation tool, using Bivariate with Confidence interval of 95%. Table 6: Represents the relationship between the Agentic Management Index with the entire dark tetrad personality Spectrum using Correlation tool, using Bivariate with Confidence interval of 95%. Table 7: Represents the relationship between the Agentic Management Index with the entire dark tetrad personality Spectrum using Correlation tool, using Bivariate with Confidence interval of 95%. Table 8: Represents the relationship between the perceived stress scale with the entire dark tetrad personality Spectrum using Correlation tool, using Bivariate with Confidence interval of 95%. Table 9: In this table, we are finally trying to draw a correlation between all the dark tetrad personality traits with their perceived stress levels and Bi-directional Impression Management Index during COVID-19 Lockdown. The same has been achieved using spearman correlation testing tool, with a significant factor $p < 0.05$

RESULT ANALYSIS AND CONCLUSION

The first three tables in the result section discuss the details of the spread of the population (a non- parametric graph) is understood. In the first table, the details of the mean, standard deviation and variance has been calculated using population descriptive tool in the SPSS for all the four elements of the dark tetrad personality spectrum vis- Machiavellianism, Narcissism, Psychopathy and Sadism. The second table represents the frequency descriptive in terms of total female and male is shown, where the detailed percentage with relation to age groups- Vis: 21-30 to be 58.9%, 31-40 to be 26.3%, 41-50 to be 13.7%, no participant within the age group of 51-60, and only one participant from the age group of 61-70, making it 1.1% of the total 95 N numbers of Indian citizens who took part in the research voluntarily. The third table shows the mean, standard deviation and variance of the perceived stress levels (PSS-10), Bi-directional Impression Management index – Vis- Agentic (BIMI-A) and Communal (BIMI-C) across all the 95 N numbers of the participants. Through these first three tables all the first four objectives have been successfully achieved, whereas the table no- 04 to 08 helps in testing the entire four hypotheses, making all of them as null hypotheses. The main objective of this research, which is mentioned as the sixth one, i.e. to find out the relationship of perceived stress levels with the Bi-directional impression management index amongst the dark tetrad personality Indians during COVID-19 lockdown has been successfully achieved in the last table, no:09.In table no-04, the authors are trying to test the first hypothesis, which is not proved, making it a null hypothesis. The first hypothesis states that there exists a substantial amount of difference in the perceived stress levels amongst the four dark personality traits- Narcissism, Machiavellianism, Psychopathy and Sadism. To achieve the same, the authors have used one-way ANOVA as a testing tool in the SPSS, with a significant factor, $p < 0.05$. However, from table no-04, it is found that there is a substantial amount of difference in the perceived stress levels amongst the Machiavellian ($P = 0.047$), and that of Narcissism as in ($P = 0.036$). However, there is no significant difference in the perceived stress levels between the psychopathy and Sadistic traits, as the significant factor is more than 0.05. Hence, the alternative hypothesis that may be interpreted as that there is a significant difference in the perceived stress levels amongst the Machiavellian

and Narcissistic personalities, with no significance in the perceived stress levels amongst the psychopathic and sadistic personality traits. Also, in this table, the perceived stress levels in between the age groups was found to be very much significant, with a P value of 0.049 making a substantial amount of difference amongst the population of 95 N of Indian citizens.In table no-05, the authors are trying to test the second hypothesis using a bi-variate Correlation test using a confidence interval of 95%. The second hypothesis states that there is a positive relationship between the perceived stress levels with that of the bi-directional impression management of both the Agentic and communal impression. However, the Correlation test conducted in SPSS tool reveals a negative relationship of Perceived stress levels (PSS-10) with that of Agentic Management index (BIMI-A: -0.271) and that of Communal Management index (BIMI-C: -0.201). Thus the given hypothesis becomes nullified, postulating the alternative hypothesis as that there is a negative relationship between Perceived stress levels with Bi-directional Impression Management Index- both Agentic and Communal.In table no-06, the authors are trying to test the third hypothesis using a Bivariate Correlational test using a confidence interval of 95%. The third hypothesis states that there is a positive relationship of the Agentic Impression Management Index with that of all the four dark elements of personality. However, based upon the results, it is found that only the Narcissistic trait has a positive relationship with the Agentic Management Index having a positive Correlation value of 0.440.

The other three arenegatively correlated vis- Machiavellian as -0.088, psychopathy as -0.138, and sadistic as -0.097. Thus the third hypothesis is nullified with an alternative hypothesis as Narcissistic Personality traits are positively correlated with Agentic Management Index. Also the other alternative hypothesis as Machiavellian, Psychopathy and sadistic personality traits are negatively correlated with the Agentic Management Index. In table no-07, the authors are trying to test the fourth hypothesis using a Bi-variate Correlation test using a confidence interval of 95%. The fourth hypothesis states that there is a negative relationship of communal Impression Management Index with that of all the four dark elements of personality. Based upon the results, it is found that, all the 4 dark elements are negatively correlated with the communal management Index, with negative Correlation values as - Machiavellian (-0.233), Narcissism (-0.003), Psychopathy (-0.0468), and Sadistic (-0.507). Thus the forth hypothesis is a true hypothesis. The table no-08 is drawn in order to support the findings of the first hypothesis. We already have a null and alternative hypothesis while testing the first hypothesis. The alternative hypothesis to the first hypothesis was that there is a significant difference in the perceived stress levels amongst the Machiavellian and Narcissistic personalities, with no significant difference in the perceived stress levels amongst the psychopathic and sadistic personality traits. The first hypothesis was tested using one-way Annova having a significant factor $p<0.05$. In table no-08 the authors are trying to find a relationship of the perceived stress levels with that of the dark tetrad personality spectrum, using a Bi-variate Correlational test using a confidence interval of 95%. The table no-08 shows that there is a negative correlation i.e. perceived stress has negatively affected the Machiavellian and Narcissistic personality traits with a negative correlation value of -0.128 and -0.176 respectively.

However, there is a positive correlation, i.e. perceived stress levels have positively affected the psychopathic and sadistic personality traits with a positive Correlation value of 0.176 and 0.073 respectively. The final objective of the research is to draw a significant relationship of perceived stress levels (PSS10) with Bi-directional Impression Management Index (BIMIA & BIMIC) amongst the dark tetrad personality Indians during COVID-19 Lockdown. To achieve the same, the Spearman Correlation Bi- variate method is used using the SPSS tool, with a significant correlation factor of $p<0.05$. It is found that there is a negative relationship of Perceived Stress levels in Machiavellian (-0.125), Narcissism (- 0.195), Agentic Management Impression (-0.204) and Communal Management Impression (-0.229). There is a positive relationship of perceived stress levels with a positive Correlation value as psychopathy (0.171) and sadistic (0.150). However, the most significant relationship of Perceived stress levels are with Agentic Impression Management (0.047) and with Communal Impression Management (0.025). There is no significant relationship of all the four dark elements of personality traits with perceived stress levels, Agentic impression management index. However, Machiavellian personality traits bear a significant relationship with communal management index (significant factor =0.021), whereas the rest of the three bears no significant relationship with communal management index. Also, there is a significant relationship between sadistic and Machiavellian traits (significant factor = 0.003). There is a significant relationship of Agentic Impression Management with Perceived

Stress levels (0.047). There is a significant relationship of Communal Impression Management with Machiavellian (0.021), and perceived stress levels (0.025). Also, to note that, the research has not included severe levels of SDT-4 which are found mostly on the males, as their inclusion was making the nomenclature of the sample much more disoriented and complex. The authors have included only those samples whose SDT-4 value ranges nearer to the graph, and in range of the Average one.

ABSTRACT

In this paper, the concepts of λ-*nI*-LC sets, $n\lambda$-kernal, $n\Lambda_\lambda$-sets and λ^*-*nI*-closed sets are introduced, and their properties are discussed in an ideal nanotopological space. Also, we characterize the relationships between them and the related properties.

Keywords: λ-*nI*-LC sets, $n\lambda$-kernal, $n\Lambda_\lambda$-sets and λ^*-*nI*-closed sets.

INTRODUCTION

Nano topology is one of the most recent developments in topology with real-world implications. Lellis Thivagar et al. [3] were largely responsible for the development of the concept of nano topology. It is constructed with lower and upper approximations utilizing the border region of a subset of the universe. They have created a new topology for the mathematical analysis of erroneous data, surpassing all of existing concepts. To nanotopological spaces, Rajasekaran et al. [12] introduced the concept of nano Λ-sets in 2017. A set H that equals its kernel (= saturated set), that is, the intersection of all open supersets of H, is called a nano Λ-set. Additionally, by combining nano Λ-sets with closed sets, they have presented and explored the idea of nano Λ-closed sets. The concept of Λ_g-closed sets in

nanotopological spaces was developed and studied by Rajasekaran et al., [13], who also identified a number of features for these sets. An ideal I [15] on a topological space (X,τ) is a non-empty collection of subsets of X which satisfies the following conditions.

1. $A \in I$ and $B \subseteq A$ imply $B \in I$ and
2. $A \in I$ and $B \in I$ imply $A \cup B \in I$.

Given a topological space (X,τ) with an ideal I on X. If $\wp(X)$ is the family of all subsets of X, a set operator $(.)^{\star}: \wp(X) \to \wp(X)$, called a local function of A with respect to τ and I is defined as follows: for $A \subset X$, $A^{\star}(I,\tau) = \{x \in X: U \cap A \notin I \text{ for every } U \in \tau(x)\}$ where $\tau(x) = \{U \in \tau: x \in U\}$ [2]. The closure operator defined by $cl^{\star}(A) = A \cup A^{\star}(I,\tau)$ [14] is a Kuratowski closure operator which generates a topology $\tau^{\star}(I,\tau)$ called the $\star$-topology finer than τ. The topological space together with an ideal on X is called an ideal topological space or an ideal space denoted by (X,τ,I). We will simply write $A^{\star}$ for $A^{\star}(I,\tau)$ and $\tau^{\star}$ for $\tau^{\star}(I,\tau)$. Some new notions in the concept of ideal nano topological spaces were introduced by M. Parimala et al. [7, 8].

Definition 1.1 [11] Let U be a non-empty finite set of objects called the universe and R be an equivalence relation on U named as the indiscernibility relation. Elements belonging to the same equivalence class are said to be indiscernible with one another. The pair (U,R) is said to be the approximation space. Let $X \subseteq U$.

1. The lower approximation of X with respect to R is the set of all objects, which can be for certain classified as X with respect to R and it is denoted by $L_R(X)$. That is, $L_R(X) = \bigcup_{x \in U} \{R(x): R(x) \subseteq X\}$, where $R(x)$ denotes the equivalence class determined by x.
2. The upper approximation of X with respect to R is the set of all objects, which can be possibly classified as X with respect to R and it is denoted by $U_R(X)$. That is, $U_R(X) = \bigcup_{x \in U} \{R(x): R(x) \cap X \neq \phi\}$.
3. The boundary region of X with respect to R is the set of all objects, which can be classified neither as X nor as not $-X$ with respect to R and it is denoted by $B_R(X)$. That is, $B_R(X) = U_R(X) - L_R(X)$.

Definition 1.2 [3] Let U be the universe, R be an equivalence relation on U and $\tau_R(X) = \{U, \phi, L_R(X), U_R(X), B_R(X)\}$ where $X \subseteq U$. Then $\tau_R(X)$ satisfies the following axioms:

1. U and $\phi \in \tau_R(X)$,
2. The union of the elements of any sub collection of $\tau_R(X)$ is in $\tau_R(X)$,
3. The intersection of the elements of any finite subcollection of $\tau_R(X)$ is in $\tau_R(X)$.

Thus $\tau_R(X)$ is a topology on U called the nanotopology with respect to X and $(U,\tau_R(X))$ is called the nanotopological space. The elements of $\tau_R(X)$ are called nano-open sets (briefly n-open sets). The complement of a n-open set is called n-closed. Throughout the paper, we denote a nanotopological space by $(U,\mathcal{N})$, where $\mathcal{N} = \tau_R(X)$. The nano-interior and nano-closure of a subset A of U are denoted by $n\text{-}int(A)$ and $n\text{-}cl(A)$, respectively.

Definition 1.3 A subset A of a space $(U,\mathcal{N})$ is called

1. nano semi-open [3] if $A \subseteq n\text{-}cl(n\text{-}int(A))$,
2. nano pre-open [3] if $A \subseteq n\text{-}int(n\text{-}cl(A))$,

The complements of the above mentioned sets are called their respective closed sets.

Definition 1.4 A subset A of a space $(U,\mathcal{N})$ is called a nano generalized closed set (briefly ng-closed) [1] if $n\text{-}cl(A) \subseteq B$, whenever $A \subseteq B$ and B is n-open.The complement of ng-closed is called ng-open. A space $(U,\mathcal{N})$ with an ideal I on U is called [7] an ideal nano topological space and is denoted by $(U,\mathcal{N},I)$. $G_n(x) = \{G_n \mid x \in G_n, G_n \in \mathcal{N}\}$, denotes [7] the family of n-open sets containing x.

Definition 1.5 [7] Let $(U,\mathcal{N},I)$ be a space with an ideal I on U. Let $(.)_n^{\star}$ be a set operator from $\wp(U)$ to $\wp(U)$ ($\wp(U)$ is the set of all subsets of U). For a subset $A \subseteq U$, $A_n^{\star}(I,\mathcal{N}) = \{x \in U: G_n \cap A \notin I, \text{ for every } G_n \in G_n(x)\}$ is called the nano local function (briefly n-local function) of A with respect to I and $\mathcal{N}$. We will simply write $A_n^{\star}$ for $A_n^{\star}(I,\mathcal{N})$. Here, an ideal nanotopological spaces $(U,\mathcal{N},I)$ is mentioned as a space.

Theorem 1.6 [7] Let $(U, \mathcal{N}, I)$ be a space and A and B be subsets of U. Then
1. $A \subseteq B \Rightarrow A_n^\star \subseteq B_n^\star$,
2. $A_n^\star = n\text{-}cl(A_n^\star) \subseteq n\text{-}cl(A)(A_n^\star$ is a n-closed subset of $n\text{-}cl(A))$,
3. $(A_n^\star)_n^\star \subseteq A_n^\star$,
4. $(A \cup B)_n^\star = A_n^\star \cup B_n^\star$,
5. $V \in \mathcal{N} \Rightarrow V \cap A_n^\star = V \cap (V \cap A)_n^\star \subseteq (V \cap A)_n^\star$,
6. $J \in I \Rightarrow (A \cup J)_n^\star = A_n^\star = (A - J)_n^\star$.

Theorem 1.7 [7] Let $(U, \mathcal{N}, I)$ be a space with an ideal I and $A \subseteq A_n^\star$, then $A_n^\star = n\text{-}cl(A_n^\star) = n\text{-}cl(A)$.

Definition 1.8 [7] Let $(U, \mathcal{N}, I)$ be a space. The set operator $n\text{-}cl^\star$ called a nano $\star$-closure is defined by $n\text{-}cl^\star(A) = A \cup A_n^\star$ for $A \subseteq U$.
It can be easily observed that $n\text{-}cl^\star(A) \subseteq n\text{-}cl(A)$.

Theorem 1.9 [8] In a space $(U, \mathcal{N}, I)$, if A and B are subsets of U, then the following results are true for the set operator $n\text{-}cl^\star$.
1. $A \subseteq n\text{-}cl^\star(A)$,
2. $n\text{-}cl^\star(\phi) = \phi$ and $n\text{-}cl^\star(U) = U$,
3. If $A \subseteq B$, then $n\text{-}cl^\star(A) \subseteq n\text{-}cl^\star(B)$,
4. $n\text{-}cl^\star(A) \cup n\text{-}cl^\star(B) = n\text{-}cl^\star(A \cup B)$,
5. $n\text{-}cl^\star(n\text{-}cl^\star(A)) = n\text{-}cl^\star(A)$.

Definition 1.10 [8] A subset A of a space $(U, \mathcal{N}, I)$ is said to be nano-I-open (briefly nI-open) if $A \subseteq n\text{-}int(A_n^\star)$.

Definition 1.11 [10] A subset A of a space $(U, \mathcal{N}, I)$ is $n\star$-closed if $A_n^\star \subseteq A$.

Definition 1.12 A subset A of a space $(U, \mathcal{N}, I)$ is called a nano I_g-closed (briefly nI_g-closed) [10] if $A_n^\star \subseteq B$ whenever $A \subseteq B$ and B is n-open. The complement of a nI_g-closed set is said to be nI_g-open.

Definition 1.13 A subset H of U in an ideal nanotopological space $(U, \mathcal{N}, I)$ is said to be Λ_g-nI-closed [16] if $H_n^\star \subseteq K$ whenever $H \subseteq K$ and K is $n\lambda$-open. The complement of a Λ_g-nI-closed set is said to be Λ_g-nI-open.

Definition 1.14 [6] A subset A of a space $(U, \mathcal{N}, I)$ is called a lightly nano I-locally closed set (briefly $\mathcal{L}$-nI-LC) if $A = P \cap Q$ where P is n-open and Q is $n\star$-closed.

λ-nI-Locally closed sets

Definition 2.1 A subset $\boldsymbol{H}$ of an ideal nanotopological space $(\boldsymbol{U}, \boldsymbol{\mathcal{N}}, \boldsymbol{I})$ is called a $\boldsymbol{\lambda}$-$\boldsymbol{nI}$-locally closed set (briefly, $\boldsymbol{\lambda}$-$\boldsymbol{nI}$-LC) if $\boldsymbol{H} = \boldsymbol{X} \cap \boldsymbol{Y}$ where $\boldsymbol{X}$ is $\boldsymbol{n\lambda}$-open and $\boldsymbol{Y}$ is $\boldsymbol{n}\star$-closed.

Proposition 2.2 Let $(U, \mathcal{N}, I)$ be an ideal nanotopological space and H a subset of U. Then the following results are hold.
1. H is $n\lambda$-open $\Rightarrow$ H is a λ-nI-LC set.
2. H is $n\star$-closed $\Rightarrow$ H is a λ-nI-LC set.

Proof. The converses of the Proposition 2.2 need not be true as shown in the following Examples.

Example 2.3 1. Let $U = \{r_1, r_2, r_3\}$ with $U/R = \{\{r_1\}, \{r_2, r_3\}\}$ and $X = \{r_1\}$. Then $\mathcal{N} = \{\phi, \{r_1\}, U\}$. Let be an ideal $I = \{\phi, \{r_1\}, \{r_2\}, \{r_1, r_2\}\}$. In the ideal nanotopological space $(U, \mathcal{N}, I)$, then the subset $\{r_2\}$ is a λ-nI-LC set but not $n\lambda$-open.

2. Let $U = \{r_1, r_2, r_3\}$ with $U/R = \{\{r_1, r_2\}, \{r_3\}\}$ and $X = \{r_1, r_2\}$. Then $\mathcal{N} = \{\phi, \{r_1, r_2\}, U\}$. Let be an ideal $I = \{\phi\}$. In the ideal nanotopological space $(U, \mathcal{N}, I)$, then the subset $\{r_1, r_2\}$ is a λ-nI-LC set but not $n\star$-closed.

Theorem 2.4 Let $(U, \mathcal{N}, I)$ be an ideal nanotopological space. If H is a λ-nI-LC set and K is a $n\star$-closed set, then $H \cap K$ is a λ-nI-LC set.
Proof. Let K be $n\star$-closed, then $H \cap K = (X \cap Y) \cap K = X \cap (Y \cap K)$, where $Y \cap K$ is $n\star$-closed. Hence $H \cap K$ is a λ-nI-LC set.

Theorem 2.5 A subset H of U in an ideal nanotopological space $(U, \mathcal{N}, I)$ is $n\star$-closed if and only if it is

1. $\mathcal{L}$-nI-LC and nI_g-closed.
2. λ-nI-LC and Λ_g-nI-closed.

Proof. (2) Necessity is trivial. We prove only sufficiency. Let H be λ-nI-LC set and Λ_g-nI-closed set. Since H is λ-nI-LC, $H = X \cap Y$, where X is $n\lambda$-open and Y is $n\star$-closed. So, we have $H = X \cap Y \subseteq X$. Since H is Λ_g-nI-closed, $H_n^\star \subseteq X$. Also since $H = X \cap Y \subseteq Y$ and Y is $n\star$-closed, we have $H^\star \subseteq Y$. Consequently, $H_n^\star \subseteq X \cap Y = H$ and hence H is $n\star$-closed.

Remark 2.6 In an ideal nanotopological space $(U, \mathcal{N}, I)$, then

1. the family of $\mathcal{L}$-nI-LC sets and the family of nI_g-closed sets are independent of each other.
2. The family of λ-nI-LC sets and the family of Λ_g-nI-closed sets are independent of each other.

Example 2.7 In Example 2.3 (2), then the subset $\{r_1, r_2\}$ is λ-nI-LC set but not Λ_g-nI-closed.

Example 2.8 Let $U = \{r_1, r_2, r_3, r_4\}$ with $U/R = \{\{r_1\}, \{r_2, r_3\}, \{r_4\}\}$ and $X = \{r_1, r_2\}$. The '$\mathcal{N} = \{\phi, \{r_1\}, \{r_2, r_3\}, \{r_1, r_2, r_3\}, U\}$. Let be an ideal $I = \{\phi\}$. In the ideal nanotopological space $(U, \mathcal{N}, I)$, then the subset $\{r_1, r_2, r_3\}$ is a Λ_g-nI-closed set but not λ-nI-LC set.

Definition 2.9 Let H be a subset of a nanotopological space $(U, \mathcal{N})$. Then the $n\lambda$-kernel of the set H, denoted by $n\lambda$-ker(H), is the intersection of all $n\lambda$-open supersets of H.

Definition 2.10 A subset H of a nanotopological space $(U, \mathcal{N})$ is called $n\Lambda_\lambda$-set if $H = n\lambda$-ker(H).

Definition 2.11 A subset H of an ideal nanotopological space $(U, \mathcal{N}, I)$ is called $\lambda^\star$-nI-closed if $H = S \cap C$ where S is a $n\Lambda_\lambda$-set and C is $n\star$-closed.

Lemma 2.12 In an ideal nanotopological space $(U, \mathcal{N}, I)$ and H a subset of U. Then the following results are hold.

1. H is $n\star$-closed $\Rightarrow$ H is $\lambda^\star$-$\mathcal{J}$-closed.
2. H is $n\Lambda_\lambda$-set $\Rightarrow$ H is $\lambda^\star$-$\mathcal{J}$-closed.

Remark 2.13 The converse of Lemma 2.12 is need not be true as seen from the following Example.

Example 2.14 In Example 2.3 (2), then the subset $\{r_1, r_2\}$ is $\lambda^\star$-nI-closed set but not $n\star$-closed.

Example 2.15 In Example 2.3 (1), then the subset $\{r_2\}$ is $\lambda^\star$-nI-closed but not a $n\Lambda_\lambda$-set.
Remark 2.16 The following examples support of the family of $n\Lambda_\lambda$-set and the family of $n\star$-closed set are independent of each other.

Example 2.17 1. In Example 2.8, then the subset $\{r_1\}$ is a $n\Lambda_\lambda$-set but not a n ⋆-closed.
2. In Example 2.3(1), then the subset $\{r_2\}$ is n ⋆-closed but not a $n\Lambda_\lambda$-set.

Lemma 2.18 For a subset H of an ideal nanotopological space $(U, \mathcal{N}, I)$, the following results are hold;
1. H is λ^*-nI-closed,
2. $H = L \cap n\text{-}cl^*(H)$ where L is a $n\Lambda_\lambda$-set,
3. $H = \lambda$-ker(H) $\cap$ $n\text{-}cl^*(H)$.

Lemma 2.19 A subset $H \subseteq (U, \mathcal{N}, I)$ is Λ_g-nI-closed $\Leftarrow$ $n\text{-}cl^*(H) \subseteq \lambda$-ker(H).

Proof. Suppose that $H \subseteq U$ is an Λ_g-nI-closed set. Suppose $u \notin \lambda$-ker(H). Then there exists a $n\lambda$-open set G containing H such that $u \notin G$. Since H is a Λ_g-nI-closed set, $H \subseteq G$ and G is $n\lambda$-open implies that $n\text{-}cl^*(H) \subseteq G$ and so $u \notin n\text{-}cl^*(H)$. Therefore $n\text{-}cl^*(H) \subseteq \lambda$-ker$(H)$. Conversely, suppose $n\text{-}cl^*(H) \subseteq \lambda$-ker$(H)$. If $H \subseteq G$ and G is $n\lambda$-open, then $n\text{-}cl^*(H) \subseteq \lambda$-ker$(H) \subseteq G$. Therefore, H is Λ_g-nI-closed.

Theorem 2.20 For a subset H of an ideal nanotopological space $(U, \mathcal{N}, I)$, the following statements are equivalent.
1. H is n ⋆-closed.
2. H is Λ_g-nI-closed and λ-nI-LC.
3. H is Λ_g-nI-closed and λ^*-nI-closed.

Proof. (1)⇒(2)⇒(3) Obvious.
(3)⇒(1) Since H is Λ_g-nI-closed, by Lemma 2.18, $n\text{-}cl^*(H) \subseteq \lambda$-ker$(H)$. Since H is λ^*-nI-closed, by Lemma 2.19, $H = \lambda$-ker$(H) \cap n\text{-}cl^*(H) = n\text{-}cl^*(H)$. Hence H is n ⋆-closed.
The following example shows that the family of Λ_g-nI-closedness and λ^*-nI-closedness are independent of each other.

Example 2.21 In Example 2.3 (1), then the subset $\{r_1, r_3\}$ is Λ_g-nI-closed set but not λ^*-nI-closed.

Example 2.22 In Example 2.3 (2), then the subset $\{r_1, r_2\}$ is λ^*-nI-closed but not Λ_g-nI-closed.

CONCLUSION

This work introduces and discusses the features of λ-nI-LC sets, $n\lambda$-kernal, $n\Lambda_\lambda$-sets, and λ^*-nI-closed sets in an ideal nanotopological space. We also describe how they relate to each other and the associated features.

ABSTRACT

RasaganthiMezhugu is one of the mercury based Siddha medicine. It is widely used by Siddha doctors for various diseases. Nowadays most people are wary of using Siddha Medicines because of heavy metal preparations. But this medication does not cause any side effects. In this study, we observed the safety parameters and mercury level in blood of patients who consumed with mercury based Siddha Medicine for 48 days in NIS OPD (Before and after treatment) New patients of NIS OPD satisfying the inclusion criteria will be included in the study. I planned to detect the Blood parameters (Before and after treatment) and I will select 5 patients out of 50 patients through Simple Random Sampling (lottery method of sampling) for detection of blood mercury level by ICP-MS method. Paired sample t-test was conducted to compare safety parameters and the mercury level in blood (Before and after treatment). There is no impairment in hepatic, renal, haemopoitic functions and mercury level in blood. Rasaganthi Mezhugu was does not produce any untoward reaction and is completely harmless.

Keywords: Mercury, Siddha medicine, RasagandhiMezhugu[RGM], ICP-OES

INTRODUCTION

Siddha medicine is nature's gift for our well-being from our Siddhars. Siddhars propounded the therapeutic properties of herbs, metals and minerals using their wisdom and these formulations are being used by mankind. Every metal and mineral used for medicine preparation has to undergo various cleansing process for toxicity and adulteration removal [1]. Nowadays most of the people are cautious about using Siddha medicines due to the extensive use of heavy metals like Lead, Mercury in the preparations. So, the Siddha physicians to prove that "Siddha medicines are totally safe, does not have any side effects and Siddha medicines are completely harmless and free of complications. It is only proved through scientific and modern methods. RasaganthiMezhugu is one of the herbo-metal medicines. Mercury is the major drug of this medicine [2].There is no evidence of clinical toxicity study on mercury based medicines. So, this study was conducted to prove the clinical safety of RGM through observes the safety parameters and to investigate the Mercury Levels in Blood who consumed RasagandhiMezhugu for 48 days in NIS OPD& IPD (Before and After Treatment).

MATERIALS AND METHODS

The study was approved by our Institutional Ethics committee and its number was 22-02-2019; NIS/IEC/2019/M-43. This trial was register in Clinical Trial Registry India and its number was CTRI/2019/05/019060.

Patients and setting

It is an observational study conducted in the Outpatient department of AyothidossPandithar hospital, National Institute of Siddha. The Sample size was 50 patients were selected by Simple Random sampling technique and included with strict inclusion and exclusion criteria, the enrolled patients provided their written informed consent to participate in the study. The inclusion criteria: 1) Adults aged between 25 and 60 years 2) Sex-Both sex 3) Patients who taking RasagandhiMezhugu for 48 days. Exclusion criteria: 1) Pregnant/Lactating Women 2) Patients with the History of any Major systemic illness at the start of the treatment

Study design

I detect the Blood parameters (RBC, WBC, Haemoglobin and platelet count, Bilirubin, SGOT, SGPT, Urea and Creatinine) of RGM treated patients before and after treatment with RasagandhiMezhugu for 48 days and I was select 10 patients out of 50 patients through Simple Random Sampling for detection of blood mercury level by ICP-OES method before and after treatment with RasagandhiMezhugu for 48 days.

Data collection through

- Data Collection Form
- OPD Books
- Laboratory form

Statistical analysis

All collected data were entered in MS Access software using a pre-designed form for data entry and STATA software was used to perform statistical analysis. Basic descriptive statistics include frequency distribution and cross-tabulations were performed for qualitative analysis, paired Sample't test' used for the statistical analysis.

RESULTS

Effect of blood parameters of RGM treated patients which was analysed by various methods. The results of Urea level (Table No.2, Fig. No.1), Creatinine level (Table No.3, Fig. No.2), Bilirubin level (Table No.4, Fig. No.3), Mercury level (Table No.5, Fig. No.4) of RGM treated patients blood parameter is tabulated.

DISCUSSIONS

RasagandhiMezhugu (RGM) is an important herbo-mineral drug, which is widely used by Siddha practitioners for several diseases with good success [4]. Though Mercury and other inorganic drugs are used in RasaganthiMezhugu, its extensive usage in practice and earlier peer reviewed researches proves its safety. Moreover the drugs of plant origin used in RasaganthiMezhugu are found to be scientifically proven for their efficacy[5]. Insufficient data exist for most Siddha preparations to guarantee their quality, efficacy and safety [4]. The present study was done to explore the safety of RGM. A total of 50 patients adhered to study protocol and completed 48 days of treatment. There were 22 per cent (11/50) male and 78 per cent (39/50) female subjects. At baseline, majority of patients (50%) had Azhal keel vayu, 16% of them had vazhiazhalkeelvayu, 12% had keel vayu and Thandagavatham, 4% had vathasthambamandceganavatham and 2% had Karappan. All patients were monitored 5 once for a period of 48 days. They do not have any adverse drug reaction (oral ulcer, itching, vomiting, abdominal pain, loose stools etc.) during treatment period. All parameters obtained from the blood and serum (RBC, WBC, Hemoglobin and platelet count, Bilirubin, SGOT, SGPT, Urea and Creatinine) was in normal range indicating RGM did not show any noticeable significant changes. But, SGOT, SGPT levels were significantly decreased and Hemoglobin level was significantly increased (within the normal range). The US Environmental Protection Agency (EPA) has adopted a reference dose (RfD) for methyl mercury of 0.1 μg/kg body weight/day[6]. Thus, in its therapeutic dose, per day ingested mercury was many folds higher than the reference dose. It was observed that with this concentration of mercury in *RGM* given for 48 days did not cause significant change in liver and kidney functions of the patients. Blood mercury levels were significantly increased after treatment (within normal limit). Further study will be conducted to detect the elimination of mercury. In the present study reveals that RGM does not produce any untoward reaction.

CONCLUSION

This study is an attempt with scientific and analytical eyes on RasagandhiMezhugu, revealed that there is no impairment in hepatic, renal, hematopoietic functions and mercury level were observed throughout the study. My results showed that RasagandhiMezhugu does not have any untoward reaction and completely harmless.

ABSTRACT

To examine the possible active constituents, key targets and mechanism of *Telosma cordata* in the gastric ulcer treatment through the application of network pharmacology and molecular docking techniques. Swiss Target Prediction and UniProtKB database were used to screen the active ingredients; GeneCards and DisGeNET database were used to screen gastric ulcer targets; common targets were analysed by venn diagram database; cytoscape software were applied to build the ingredient-target network; using STRING database protein-protein network was developed for common targets and primary targets were screened; gene enrichment and KEGG pathway analysis were calculated through Shiny GO for intersective genes. Molecular docking experiments were conducted to explore how the active ingredients interact with key targets. Out of the eight possible active components of *Telosma cordata*, 431 targets were suggested, 134 of which were typical targets associated with stomach ulcer. Through protein-protein interaction network construction, core targets such as STAT3, CASP3, TP53, CTNNB1, ALB, HSP90AA1, BCL2, ESR1, EGFR, TNF were selected. KEGG pathway identified that the major targets engaged in several path ways like p53 signaling, pathways related to cancer, lipid and atherosclerosis, resistance to EGFR tyrosine kinase inhibitors, and signaling pathways including PI3K-Akt and HIF-1. Verification using molecular docking demonstrated that all active elements and key targets displayed excellent affinities for binding, with values ranging from -4.29 to -13.57 kcal/mol.

Keywords: Molecular docking, *Telosma cordata*, network pharmacology, gastric ulcer

INTRODUCTION

Gastric ulcer

Gastric ulcer (GU) is a common gastrointestinal condition with a high occurrence rate that can happen at any age and around 10% of world population are influenced. The pathological characterization of gastric ulcer includes lesion or destruction of lining of the stomach's mucosa. It isusually due to alack of balance betweendefensive factors (nitric oxide, mucus, mucosal blood flow, prostaglandins, bicarbonate) and destructive factors (Helicobacter pylori, acid, pepsin) in thestomach[1,2]. By lessening the release of stomach acidand by enhancing the protection of gastric mucosa, gastric ulcer can be prevented. Other elements involved in the development of ulceration includes stress, smoking,alcohol utilization, enormous use of non-steroidal anti-inflammatory drugs andinadequate nutrition[3]. H2 antagonists, prostaglandin analogues and Proton pump inhibitorsare the available medicamentsof gastric ulcer treatment, but these drugs have shown reoccurrence rates, high side effects and drug interactions[4]. Hence, it is essential to find a more safe, effective, reliable and beneficial alternative to treat human gastric ulcers. Plant derived medicinal materials or extracts have been reported to be a better treatment for gastric ulcer because they inhibit relapse with fewer side effects compared to modern medications[5].

***Telosma cordata* (Burm. f.) Merr**

Telosma cordata (Burm. f.) Merr, is a small, perennial creeper that is indigenous to India, Indo-china,Burma, South Chinaand South china. It is a member of the Apocynaceae family and its known by various common names such as Fragrant telosma, Chinese violet, East coast creeper, Cowslip, Pakalana vine and Night fragrant flower. It has single heart shaped leaves growing in pairs and flowers are greenish yellow with strong fragrance[6]. As per the literature search, the pharmacological uses are found for different components of *Telosma cordata*, such as antidote, tranquilizer, fatigue reducer, effective against backbone aches and hematuria, antipyretic, anti-inflammatory, anticancer and antidiabetic[7]. However, there has been no scientific reports on *Telosma cordata* for gastric ulcer. Therefore, aim of our study is to uncover the therapeutic targets and possible mechanism of *Telosma cordata* against gastric ulcer through network pharmacology and molecular docking.

METHODS

Network pharmacology:

Identification of active ingredients and their respective targets of *Telosma cordata:*

Information on the phytoconstituents of *Telosma cordata* were attained from the literature review. All active ingredients were screened fordrug likeness properties and ADME Toxicityusing admetSAR1.0 (http://lmmd.ecust.edu.cn/admetsar1/), molinspirationcheminformatics (https://www.molinspiration.com/) and swissADME (http://www.swissadme.ch/). PubChem database (https://pubchem.ncbi.nlm.nih.gov/) was used to collect canonical smiles, structures, molecular weight and compound IDfor all active compounds. The ChemSketch was used to create 2D representations of the active compounds[8, 9]. Potential gene targets of active ingredients were anticipated usingSwiss Target Prediction(http://www.swisstargetprediction.ch/) and UniProtKB (https://www.uniprot.org/uniprotkb). Predictedgene targets from each database were merged and repeated targets were removed[10].

Identification of gastric ulcer related targets

By using the key word "Gastric ulcer",DisGeNET (https://www.disgenet.com/) and GeneCards (https://www.genecards.org/) were utilized to find targets related to gastric ulcer.After combining the targets from the two datasets, replicas wereeliminated[11].

Ingredient-Target Network Construction

Using venn diagram database (https://bioinformatics.psb.ugent.be/webtools/Venn/), identified the intersected targets of *Telosma cordata*and gastric ulcer. To highlight the shared genes, the venn diagram was constructed and Gene

targets that intersected were utilized for additional network analysis[12].The compound-target network was built with Cytoscape v3.9.1.

Protein-Protein Interaction (PPI) analysis

The shared objectives of gastric ulcer and active ingredients were introduced into STRING database (https://string-db.org/) to create PPI network and to identify possible inter-target interaction. A network certainty score of "≥ 0.4" was applied to develop the PPI network of possible targets for treatment and the result was first exported in PNG format. By using Cytoscape_v3.10.1 software, the PPI network was pictured and isolated the core network based on the closer centrality, degree and between ness centrality of nodes[13, 14].

Pathway enrichment analysis

Using ShinyGO (http://bioinformatics.sdstate.edu/go76/) we performed enrichment analysis of GO and KEGG Pathway for intersected target gene in the species "Homo sapiens". Bar charts and bubbles were applied to explain the outcome of KEGG pathway and Gene Ontology[15, 16].

Molecular Docking

To confirm the network pharmacology prediction, we conducted molecular docking experiments to examine how ligands interact with target proteins. The 2D structure of ligands were drawn using ChemSketch and then converted into PDB format by Open label software[13, 17, 18]. Using RCSB Protein Data Bank (RCSB PDB), we downloaded3D representation of receptor proteins and transformed into PDB format, after deleting water and original ligands[19]. Molecular docking was performed using AutoDock Tools v1.5.6[12], to determine the ligand-receptor protein binding affinity. According to molecular docking principle, docking module is more stable with smaller binding energy. Binding energy of ≤ -5kcal/mol represents exceptional affinity between active ingredients and key targets. Once the docking was over, the result with best binding force was identified[20].

RESULTS

Network pharmacology

Identification of active ingredients and their respective targets of *Telosma cordata*

Phytoconstituents of *Telosma cordata* such asrutin, caffeic acid, vanillic acid, catechin, syringic acid,quercetin, gallic acid and coumaric acid were selected from the literature review and used for further analysis[21] (Table 1). ADME Toxicity and drug likeness properties of active components were studied. All eight components exhibited positive human intestinal absorption (HIA +), coumaric acid and syringic acid were the two compounds showed positive to cross blood brain barrier. All compounds were detected to be safe and non- carcinogenic(Table 2). Except rutin and gallic acid, all active compounds showed no violation to Ghose rule and Lipinski's rule of five(Table 3)[9]. Following the removal of copies, 431 different targets of ingredients were identified[22].

Identification of gastric ulcer related targets

Using the key word "Gastric ulcer", 1812 targets were identified from GeneCards and DisGeNET databases. After eliminating duplicates, 1721 potential targets of gastric ulcer were obtained.

Ingredient-Target Network Construction

About 431 bioactive compound targets and 1721 disease targets were intersected, out of these 134 common targets were obtained (Figure 1) and an ingredient-target network was created with Cytoscape v3.9.1 (Figure 2) to clarify how the active ingredients act against gastric ulcer[12, 4].

Protein-Protein Interaction (PPI) analysis

Using STRING database, we developed PPI network by introducing the common 134 targets. It consists of 134 nodes and 2240 edges (Figure 3). The average node degree of gastric ulcer related targets was 33.4[23]. PPI network was incorporated into Cytoscape for further investigation. The top 10 core targets (CTNNB1, BCL2, EGFR, ALB, STAT3, CASP3, TNF, ESR1, TP53 and HSP90AA1) were selected by CytoHubba (Figure 4)[24, 25].

Pathway enrichment analysis

Set 0.05 as FDR (False Discovery Rate) threshold for gene enrichment assessment using ShinyGO (version 0.76) database. Total of 184 molecular functions,1000 biological processesand 164 cellular components for the peak 10 hub genes[26]. Top 20 outcomes of gene ontology and 30 outcomes of KEGG pathway were displayed (Figure 5).

Molecular Docking

An *insilico* molecular docking investigation was conducted by retrieving the 3D receptor protein structure from RCSB-PDB namely CTNNB1 (6M93), CASP3 (5IC4), TP53 (3TG5), EGFR (2RGP), ESR1 (5KRA), ALB (4E99), BCL2 (5JSN), TNF (7JRA), STAT3 (6NJS), HSP90AA1 (5NJX) and the compound's docking scores were recorded (Table 4).Thestrongest interaction was observed between CASP3-gallic acid (-7.96 kcal/mol),CTNNB1-rutin (-10.02 kcal/mol), HSP90AA1-rutin (-8.68 kcal/mol), TP53-rutin (-13.57 kcal/mol), EGFR-rutin (-11.95 kcal/mol), ESR1-quercetin (-9.10 kcal/mol), ALB-rutin (-10.30 kcal/mol), BCL2-rutin (-7.44 kcal/mol), TNF-rutin (-10.08 kcal/mol), STAT3-rutin (-9.51 kcal/mol)[27]. Docking results showed that the binding between ligands and targets are mediated by hydrogen bonds[28]. Based on the results, the compounds binding affinities to the target proteins range from -4.29 to -13.57 kcal/mol[5]. The compounds with maximum interaction of not more than -7.0 kcal/mol were given (Figure 6).

DISCUSSION

Gastric ulcers are very common and serious disease, that causes discomfort, morbidity and death in humans[29]. Occurrence of Gastric ulcer is caused by inequality between factors that protect and harm the stomach, evaluating these levels help us to assess the gastric ulcer pathological process. This study utilized network pharmacology and molecular docking technology, to explore the process of anti-gastric ulcer activity of *Telosmacordata*[30]. Network pharmacology screened target proteins to build interaction between active ingredients of *Telosma cordata* and gastric ulcer. We found 134 shared targets of ligands and gastric ulcer. Through PPI network analysis, we identified the 10 key targets[17]. Among the key targets, TNF is a major contributor of gastric inflammation and mucosal damage. TP53, CASP3 and BCL2 were related closely to the apoptosis and regulation of cell cycle arrest[12]. STAT3 damages the epithelial and immune sections of mucosal layer of the stomach, EGFR provide signal to intracellular division and it is an ideal growth factors for wound healing process[31, 32].The GO analysis indicated that these shared targets were linked with biological processes such as controlling apoptosis, managing cell death, and responding to growth. Cellular components such as membrane protein complex, basal plasma membrane and molecular activities such as transcription coregulator binding, regulation of nitric acid synthase, enzyme regulator activity and nuclear receptor binding[4, 33]. KEGG pathway found that the key targets involved in various pathways that transmit signals such as PI3K-Akt signaling pathway, HIF-1 signaling pathway, EGFR tyrosine kinase inhibitor resistance, lipid and atherosclerosis, pathways in cancer and p53 signaling pathway [34]. Molecular docking confirmed that the target proteins showed strong binding affinity with all ligands. Rutin has the highest docked score with all core targets except with CASP3 and ESR1. In summary, the present study uses network pharmacology and molecular docking to investigate the possible active ingredients, key targets, multi-pathways and mechanism of *Telosma cordata* in the gastric ulcer treatment[30]. These data may serve as bases for future investigation of newer anti-gastric ulcer medications.

ABSTRACT

This paper mainly focuses on how domination of graphs can apply in the key gene regulatory networks - an important area of biology. Our aim of this paper to apply the dominating concept in the gene regulatory networks of GBM. Glioblastoma multiforme (GBM) is the most common form of primary malignant brain tumor, according to the American brain tumor association. This study is mainly focusing on how genes are connected the GBM, and the brief study of key genes of the total 698 differentially expressed genes(DEGS), how they are affecting the other genes, and by using the dominating set concept how we can do the proper medication for the patients, since only 5% of patients survive longer than 5 years.

Keywords: Dominating set, keygene, Directed graphs, Gene regulatory networks, Glioblastoma Multiforme(GBM), Up regulatory genes, Low regulatory genes.

INTRODUCTION

Graph theory is a branch of mathematics which deals with graphs which have a set of vertices and edges. This graph theory has taken place in almost every field of the world by its real life applications. The domination of graphs is an important area of study in graph theory. This is also a relevant area of graph theory by its application. Biology is one among the subjects where we can apply domination of graphs in its full strength. Graph theory is a branch of mathematics that deals with the study of graphs. A graph G = (V(G), E(G)) consists of two finite sets: V(G), the vertex

set of the graph, often denoted by just V, which is a nonempty set of elements called vertices, and E(G), the edge set of the graph, often denoted by just E, which is a possibly empty set of elements called edges.

Preliminaries of Gene Regulatory Networks

Gene

Genes are the segments of DNA that contain the instructions for making proteins, and also Genes are the basic units of heredity. Genes are arranged in a specific order with the sequence of nucleotides (A,C,G and T).Each genes are arranged in a specific order of sequence of nucleotides to determine their functions. The following figure is an example of gene structure or gene expression.

Key Genes

Key genes are genes that play a crucial role in the development, functioning or survival of an organism. They are often referred to as "important" and "critical" genes because their function or expression has a significant impact on the organism's phenotype, health or fitness. Essentiality, high expression, and conservation are some important characteristics of key genes. TP53 (Tumor protein p53), BRCA1 and BRCA2, CFTR (Cystic fibrosis trans membrane conductance regulator) are some examples of key genes.

Gene and Key Gene Regulatory Networks

A gene regulatory network (GRN) is a collection of molecular regulators that interact with each other and with other substances in the cell to govern the gene expression levels of mRNA, and proteins which in turn, determine the function of the cell. The regulator can be DNA, RNA, and protein or any combination of two or more of these three that form a complex such as a specific sequence of DNA and transcription factor to activate that sequence. Gene regulatory networks contain nodes, edges. The nodes are representing the genes, proteins or the other molecules and the edges are representing the interaction between each protein, genes or the other molecules. There are several types of key gene regulatory networks, For example, signaling pathway GRNs, Cancer GRNs, Immune response GRNs, and alike.

Glioblastoma Multiforme (GBM)

Glioblastoma multiforme (GBM) is the most common form of primary malignant brain tumor, according to the American brain tumor association. Glioblastoma (GBM), also referred to as a grade IV astrocytoma, is a fast-growing and aggressive brain tumor. It invades the nearby brain tissue, but generally does not spread to distant organs. Glioblastoma multiforme (GBM) is a type of brain cancer that originates from the brain's glial cells, which provide support and protection for neurons. It is the most common and aggressive form of primary brain cancer, accounting for about 55% of all gliomas. The following figure shows the glioblastoma in the brain.

How domination concept works on it?

Here's an example to illustrate the application of dominating sets in GBM:

Example

Suppose we have a simplified GBM gene regulatory network (GRN) with 10 genes (A-J) and their regulatory relationships:

- Gene A regulates Genes B, C, and D
- Gene B regulates Genes E and F
- Gene C regulates Genes G and H
- Gene D regulates Gene I
- Gene J is a tumor suppressor gene

Dominating Set Identification

Using graph theory algorithms, we identify a dominating set {A, C, J} that controls a large portion of the network:

- Gene A regulates B, C, and D (3 genes)
- Gene C regulates G and H (2 genes)
- Gene J (tumor suppressor) regulates none, but is critical for network control

Analysis

- Driver genes: A and C (key regulators of multiple genes)
- Therapeutic targets: A and C (targeting these genes could disrupt tumor growth)
- Biomarkers: B, E, and G (genes regulated by dominating set genes, potential indicators of treatment response)

Validation

- Experimental validation: Knockdown of genes A and C using RNAi shows reduced tumor growth

How the concept is useful?

1. Identification of key drivers: Dominating sets help identify key driver genes that control a large portion of the GBM gene regulatory network.
2. Targeted therapies: Targeting genes in dominating sets can lead to more effective treatments, as they regulate multiple downstream genes.
3. Biomarker discovery: Genes regulated by dominating set genes can serve as biomarkers for diagnosis, treatment monitoring, and patient stratification.
4. Personalized medicine: Dominating sets can be used to tailor treatments to individual patients based on their unique regulatory profiles.
5. Network-based understanding: Dominating sets provide a network-based understanding of GBM, revealing complex interactions and regulatory relationships.
6. Identification of tumor suppressors: Dominating sets can help identify tumor suppressor genes, like gene J in the example, which are critical for network control.
7. Therapeutic combination strategies: Dominating sets can inform combination therapies targeting multiple genes in a dominating set to maximize treatment efficacy.
8. Understanding treatment resistance: Analyzing dominating sets can reveal mechanisms of treatment resistance and identify new targets for overcoming resistance. By applying dominating sets, researchers can gain a deeper understanding of GBM's complex regulatory landscape, leading to more effective treatments and improved patient outcomes.

ABSTRACT

In this study, fifty-six soil samples were collected from fourteen villages in the Dimapur district of Nagaland, with seven villages located at altitudes below 200 m and seven above 300 m. Four soil samples were taken from each village, two from cultivated land and two from rainforest areas. The results showed that soil pH ranged between 4.30-5.20 at lower altitudes and 4.40-5.29 at higher altitudes, indicating moderately to strongly acidic conditions. Electrical conductivity (EC) was similar across both altitudes. Bulk density and particle density were slightly lower at higher altitudes and in forest soils. Altitude and land use significantly influenced the cation exchange capacity (CEC), with higher values in forest soils and at greater altitudes. Micronutrient concentrations were marginally lower at higher altitudes. Forest soils exhibited higher levels of organic matter and nutrients, with lower bulk density. Acidity components were found in greater amounts in low-altitude soils, contributing to severe acidity issues. Soil pH had shown a negative value for correlation coefficient(r) with acidic components, while macro and micronutrients were positively correlated with OC. Regular soil health monitoring and balanced nutrient management are recommended for sustainable crop production.

Keywords: Nagaland, altitude, fertility status, Correlation, Electrical Conductivity(EC).

INTRODUCTION

The natural resources of any nation are the national treasure and proper provision has to be made for its sustainability, in order to attain its benefits in the long run. Among the many natural resources, soil is one such resource on which the sustenance of most organisms is dependent up on, beitdirectly or indirectly; and is considered

as the most basic and vital natural resource. The growth of plants and productivity of crops is mainly governed by soil fertility, which is the ability of soil to supply nutrients to crops in adequate amount and in suitable proportions(Patzel*et al.,* 2000). However, the soils today have been degraded because of anthropogenic disturbances and have become a global issue. This issue is more prevalent in developing countries having mountainous gradient (Bargali*etal.,*2018;Manral*et al.,*2020)where rapid land use trans formation is taking place. The north-eastern region of India receives heavy rain fall, due to which soil acidity is a widespread problem for sustainable agriculture production. Information on soil characteristics of an area in relation to altitude would help in planning of soil management strategies and sustainable viable alternatives in order to improve the overall productivity of the area and/or region. Therefore, with a view to have comprehensive knowledge the current investigation was under taken to study the altitudinal and land use effect on soil properties.

Objectives

To evaluate soil acidity and nutrient availability in high-altitude and forest soils for effective soil fertility management. To recommend lime application and cultivation of acidity-tolerant crops for improving crop yield in acidic soils. To develop sustainable soil fertility and acidity management strategies based on correlations between organic carbon, nutrients, and soil acidity components.

MATERIALS AND METHODS

The study was undertaken during 2020-21 to study various properties of cultivated and forest soils of different altitudes. Fourteen villages (seven each from low and high altitude) of Dimapur district, Nagaland selected for investigation. Low (<200 m) and high (>300 m) altitude villages belong to Dhansiripar and Medziphema block of the district respectively. All together fifty-six surface (0-15 cm) soil samples collected for the study. Two cultivated fields and adjacent undisturbed forest fields in each village randomly selected for sampling purpose and from one village four soil samples were collected. Collected soil samples air dried and grinded with the help of wooden hammer and analyzed for physicochemical properties, fertility status, micronutrient cations and soil acidity components. Cation exchange capacity determined by leaching of soil with 1N ammonium acetate at pH 7.0 (Chapman, 1965). Bulk density, particle density and different forms of soil acidity determined using standard method of analysis described by Baruah and Borthakur (1997). Soil pH, EC, organic carbon, available N and available K determined following standard procedures (Jackson, 1973). Available phosphorus was extracted with Bray P-1 extractant (Bray and Kurtz, 1945) and phosphorus content in soil extract estimated using the procedure described by Jackson (1973). DTPA (diethyline-triamine-penta acetic acid)extractable micronutrient cations are resoluted by Atomic Absorption Spectrophotometer (Lindsay and Norvell, 1978). Simple correlation coefficients were worked out to correlate physicochemical characteristics of soils.

Description of study area

Dimapur district is located at latitude 2554′′ 45′′ ′ N and longitude 9344′ 30′ ′ E. It shares its boundaries with Kohima to the South and East, Karbi Anglong and stretch of Golaghat district of Assam to the West and North. The district lies at an altitude of 160-350 meters above mean sea level. Except Medziphema block, most areas of Dimapur district comes under plain sector. Dhansiripar block lies in the plains and is spread over 130 sq. km while Medziphema block lies in the hills and has a total area of 345 sq. km.

RESULTS AND DISCUSSION

Physicochemical properties

Bulk density of the cultivated and forest soils of <200 m altitude fluctuated from 1.15 to1.30 and 1.15 to 1.26 Mg m-3 with an average value of 1.22 and 1.20 Mg m-3, respectively (Table 1). While in case of >300 m altitude, bulk density of cultivated and forest soils ranged from1.15 to 1.30 Mg m-3and 1.12 to 1.18 Mg m-3 with a mean value of 1.20 and 1.14 Mg m- 3,respectively. Mean particle density of cultivated soils recorded 2.37 and 2.35 Mg m-3 and for forest soils

mean values observed 2.35 and 2.34 Mg m-3 in case of <200 m and >300 m altitude, respectively. A minor reduction in bulk density and particle density observed with increasing altitude, possibly due to increased organic matter content (Wani *et al.,* 2017). It was also observed that bulk density(ϱ) and particle density of the soils of both altitudes increased when land use was changed from forest to cultivation might be due to declined organic matter. Higher pH value was observed in high altitude soils. Mean pH values of cultivated and forest soils of <200 m altitude was 4.50 and 4.70, while in case of>300 m altitude, mean pH value observed 4.72 and 4.94 in cultivated and forest soils, respectively. On the basis of mean pH, soils of both altitudes indicated strongly acidic reaction. The results are similar to those of reported by Mishra and Francaviglia (2021), where the pH of soil increased with increase in altitude. Electrical conductivity (EC) did not fluctuate appreciable in relation to altitude and slightly higher electrical conductivity recorded in forest soils. Higher value of EC might be due to high amount of organic carbon content which retained the cations in soils. Less accumulation of soluble salts in soil profile also attributed to excessive leaching on account of high rainfall. Cation exchange capacity (CEC) of cultivated and forest soils for <200 m altitude varied from 7.98 to12.00 and 9.74 to 13.20 cmol(p+) kg-1 with a mean value of 9.97 and 11.92 cmol(p+)kg-1, while for >300 m altitude soils CEC differed from 9.8 to11.30 and 12.10 to 14.80 cmol(p+)kg-1 with a mean value of 11.30 and 13.51 cmol(p+)kg- 1,respectively. 13.3% elevated CEC observed in high altitude soils as compared to low altitude soils. Forest soils indicated higher CEC than cultivated soils under both altitudes. The possible reason for higher values of CEC of high altitude and forest soils might be high amount of OC (Organic Carbon).

Wide variation observed in organic carbon (OC) content of cultivated and forest soils of both altitudes (Table 2). Irrespective of altitude, nutrient index values for OC of cultivated and forest soils recorded 3.00, indicated high amount of OC in these soils. Mean OC content observed 13.31 and 18.56 g kg-1 incultivated and forest soils of <200 m altitude and16.22 and 19.61 g kg-1 in >300 m altitude soils, respectively. 28.8% and 17.3% less organic carbon recorded in cultivated soils of <200 m and >300 m altitude, respectively as compared to forest soils. Cultivated and forest soils of >300 m altitude contained 22.8% and 5.7% higher amount of OC in comparison to <200 m altitude. Continuous addition of decayed vegetation in forest soils may be cause of high OC content (Tripathi *et al.,* 2007; Sharma, 2013). While more organic carbon content in high altitude soils might be due to change in temperature, which in turn renders the rate of decomposition by slowing down microbial and enzymatic activities (Kumar *et al*., 2019). Mean available N, P, K and S contents in cultivated soils of <200 m altitude was observed 322, 8.3, 193 and 18.6 kg ha-1,while in high altitude soils 401, 10.5, 224 and20.1 kg ha-1,respectively. In forest soils of <200 m altitude mean values reported 386, 10.1, 220 and 22.3 kg ha-1 and in >300 m altitude soils 446, 11.9, 243 and 27.5 kg ha-1,respectively. Irrespective of altitude, cultivated soils belong to medium, low, medium and low category of available nitrogen, phosphorus, potassium and sulphur with a nutrient index value of 1.79, 1.36,2.04 and 1.43, respectively. Forest soils fell in medium class of these nutrients with nutrient index value of 2.00, 1.61, 2.18 and 1.89, respectively, irrespective of land use, 16.6%, 21.6%, 13.1% and 16.4% higher N, P, K and S observed in high altitude soils in comparison to low altitude. Cause of this trend might be lesser amount of organic carbon content in low altitude soils. Furthermore, in low altitude areas soils are almost level and cultivated intensively than high altitude soils. Because of this mining of nutrients might be more in low altitude soils resulted soils are low in these nutrients. Similar observations recorded by Qasba *et al.* (2017). Mean DTPA extractable Zn, Cu, Fe and Mn content in cultivated soils of <200 m altitude recorded 1.28, 1.40, 81.50 and 27.22 mg kg-1 and in forest soils of same altitude values of these micronutrients observed 1.67, 1.47, 82.54 and 28.62 mg kg- 1,respectively (Table 3). In >300 m altitude cultivated soils amount of mean Zn, Cu, Fe and Mn observed 1.19, 1.38, 79.91 and 26.29 mg kg- 1, while in forest soils comparatively higher amount observed with mean value of 1.65, 1.43,81.94 and 27.16 mg kg-1,respectively. Nutrient index of zinc for cultivated and forest soils calculated 1.79 and 2.18, which indicated medium zinc content in these soils. While, quantities of copper, iron and manganese observed high in both cultivated and forest soils with nutrient index value of 2.89 & 2.64, 3.00 &3.00 and 3.00 & 3.00, respectively. Comparatively lesser amount of micronutrient cations recorded in cultivated soils might be due to more mining by crops and less organic matter. Low concentration of micronutrients in high altitude soils attributed to enhanced soil pH which retarded solubility of micronutrients resulted low quantity of cationic micronutrients. These results are in line with the observations of Sharma *et al.* (2005); Annepu *et al*. (2017).

Soil acidity components Mean values of pH-dependent acidity in cultivated and forest soils of <200 m altitude observed 10.89 and 10.21 cmol(p+) kg-1 while in>300 m altitude soils of same land use recorded10.26 and 9.70 cmol(p+) kg-1,respectively (Table 4). Slightly lesser pH dependent acidity was recorded in high altitude and forest soils. Irrespective of altitude and land use, contribution of pH-dependent acidity to total potential acidity was recorded 83.4%. Irrespective of land use and altitude exchange acidity ranged from 0.87 to 3.47 cmol(p+) kg-1. Mean exchangeable acidity in cultivated and forest soils of low altitude recorded 2.51 and 1.81 cmol(p+) kg-1 while in high altitude soils value observed 2.04 and 1.78 cmol(p+) kg-1,respectively. Comparatively high amount of exchangeable acidity was noticed in low altitude and cultivated soils. Exchangeable acidity contributed 16.5% to total potential acidity. Reasonable exchange acidity in these soils may be due to presence of high exchangeable Al3+

(Laxminarayana, 2010).Exchangeable Al3+ and H+ of <200 m altitude cultivated and forest soils varied from 0.81 to 2.41 & 0.86 to 1.17 and 0.90 to 1.91 &0.59 to1.07 cmol(p+) kg-1 with a mean value of 1.49, 1.02 and 1.38, 0.88 cmolp+) kg-1, respectively. While in cultivated and forest soils of >300 m altitude mean value of Al3+ and H+ observed 1.49 & 0.57 and 1.29 & 0.54 cmolp+) kg-1,respectively. Higher amount of exchangeable Al3+ and H+ observed in low altitude and cultivated soils. 3.2% and 11.6% higher Al3+ content noticed in low altitude and cultivated soils in comparison to high altitude and forest soils. Variation in total potential acidity of <200 m altitude cultivated and forest soils400observed in the range of 10.70 to 16.17 and9.99 to 13.89 cmol(p+) kg-1 with a mean value of13.40 and 11.91 cmol(p+) kg-1, respectively. While, variation for >300 m altitude cultivated and forest soils observed in the range of 10.40 to14.28 and 8.80 to 14.91 cmol(p+) kg-1 with a mean value of 12.30 and 11.58 cmol(p+) kg-1, respectively. Slightly lesser amount of total potential acidity observed in high altitude and forest soils. Overall, comparatively higher quantum of acidity components found in low (<200 m) altitude soils. Because low altitude soils are near to level in topography which favors water stagnation due to less runoff. Stagnation of plenty water favors leaching of basic cations (Ca2+, Mg2+, Na+) resulted concentration of acidity components might have increased. Correlation studies CEC of cultivated and forest soils had significant negative correlation with BD and positive correlation with organic carbon (Table 5). In case of forest soils, CEC showed significant positive correlation with PD (0.442*) and EC (0.453*). Available N of cultivated soils appeared significant negative correlation with BD (r=-0.604**) while, both cultivated and forest soils had positive correlation with organic carbon (r=0.617**, 0.442*). Available P of soils under both land use had significant positive correlation with pH (r=0.565**, 0.565**) and OC (r=0.397*, 0.378*). Available potassium of soils under both land use exhibited significant positive correlation with OC (r=0.599**, 0.463*) and significant negative with BD (r= -0.556**) in case of cultivated soils. In forest soils, available sulphur manifested significant positive correlation with EC (r=0.465*). Sulphur of cultivated and forest soils showed significant positive correlation with organic carbon (r=0.386*, 0.501**) and negative with BD (r=-0.508**, -0.628**). Positive significant correlation between organic carbon and available N, P, K, S revealed that organic matter is prominent source of available nutrients in the soils of both land use. All acidity components (pH-dependent acidity, exchangeable acidity, exchangeable Al3+, exchangeable H+, total potential acidity) of cultivated and forest soils indicated negative significant correlation with soil pH. Similar relationship among soil properties have also been reported by Poji *et al*, (2017); Longchari and Sharma (2022).

CONCLUSION

From the study high altitude and forest soils found less acidic in acidity. Overall soils observed medium in available nitrogen, potassium and zinc, low to medium in phosphorus and sulphur, high in Cu, Fe and Mn. High quantum of CEC, organic carbon and available N, P, K, S observed in high altitude (>300 m) and forest soils. However, high amount of DTPA extractable micronutrients noticed in low altitude (<200 m) and forest soils. A decreasing trend in soil acidity components and densities observed with increasing altitude and lesser values observed in high altitude soils. The soils have major problem of acidity thus lime application and growing of acidity tolerant crops with their acidity tolerant varieties is necessary for getting better crop growth and yield. Available N, P, K, S and micronutrients exhibited significant positive correlation with organic carbon. Significant negative correlation

observed between acidity components and soil pH. Consequently, soils of study area need necessary attention to fertility as well as soil acidity management strategies for sustainable crop production.

ABSTRACT

Weeds present significant environmental and economic challenges in agricultural production, with traditional control methods such as manual removal and chemical herbicides frequently being time-consuming, expensive, and potentially harmful to the environment and human health. Hyperspectral imaging (HSI) and other cutting-edge technologies provide automated weed mapping and identification, which show promise as replacements for these traditional methods. A data-rich solution called HSI has demonstrated promise in agricultural applications such as crop monitoring, weed identification, and disease diagnosis. Still, in its early phases, precision agriculture is using these technologies to make autonomous, real-time decisions. This research combines HSI with deep learning (DL) to enable fast, accurate, automated weed identification. Our dataset includes three weed species from different botanical groups and photosynthetic mechanisms, with carefully labeled data for training and testing. The dataset images also represent early weed growth time series, essential for precise weed management. We developed a compact hybrid CNN model tailored for weed identification, localization, and classification to address this. Our experimental evaluation demonstrated the model's effectiveness, achieving high accuracy in distinguishing weed species and their traits, with accuracy values of 0.98 for species traits, and 0.90 to 0.98 for botanical groups and photosynthetic pathways. The best results were obtained seven days after sowing (DAS 7), when accuracies were maximized across all attributes, indicating that this time is ideal for accurate weed classification. This work highlights the promise of deep learning-based

approaches for improving sustainable weed management strategies, lowering pesticide reliance, and contributing to more successful precision agriculture practices.

Keywords: Precision agriculture, Weed management, Hyper spectral Image, Deep learning, CNN.

INTRODUCTION

Agriculture is the cultivation of soil to produce crops that supply food, fibre, and other essential goods. With the world's population forecast to reach nine billion by 2050, agricultural production must expand by about 70% to fulfil demand. However, agriculture faces substantial problems, including disease risks, limited agricultural land and water resources, the effects of climate change, and weed and insect concerns. Adopting smart farming practices is critical for tackling sustainability, food security, productivity, and environmental impact. The main goal of smart farming is to revolutionize traditional agriculture by utilizing advanced technologies like artificial intelligence (AI), and the Internet of Things (IoT).Precision agriculture is important for smart farming, as it combines advanced technologies and careful evaluation of data to increase the production of crops, reduce waste, and boost productivity. AI assists farmers in making informed decisions by providing insights into crop health, soil conditions, and climate variables. Furthermore, computer vision technology allows machines to "see" and comprehend the farm environment, enabling early problem diagnosis and continual crop monitoring[1]. This strategy emphasizes strategic decision-making and the use of cutting-edge technology to improve precision in agricultural practice. The integration of computer vision technology with IoT enable mechanical tools in smart farming creates a data-driven decision-making framework that considerably improves farmers' ability to predict and manage numerous agricultural difficulties successfully[2]. In precision agriculture, effective weed management is critical for maintaining optimal crop yields and quality. In addition, weed detection becomes difficult due to their unpredictable distribution across the field and inclination to blend in with crop plants. Weeds are traditionally removed by manual inspection, chemical herbicides, mechanical approaches, crop rotation, and mulching. Manual inspection is labour-intensive and time-consuming, yet it is still popular with small farmlands. Chemical herbicides are widely employed; however, they can be harmful to the environment and have an unintended effect on both crops and weeds. Mechanical methods such as ploughing and tilling can be effective, but they may also harm main crops. Crop rotation reduces weeds and pests while increasing soil fertility, but it also creates complications due to the varying needs of different crops[3]. Mulching employs organic materials to control weeds, although it can be costly and affect soil conditions. However, typical weed control methods have significant limitations.

The repetitive application of the same herbicides may result in herbicide-resistant weed populations, decreased biodiversity, and difficult-to-manage weed species[4]. Furthermore, chemical pesticides can damage water supplies and leave residues in the food chain, jeopardizing agricultural sustainability and biodiversity. Mechanical procedures such as tillage can also affect soil quality by causing erosion, compaction, and reduced microbial activity, all of which contribute to environmental degradation. Alternative ground cover methods, that involve mulching and livestock grazing, have significant drawbacks. Mulching can change soil characteristics, be costly, and sometimes harm crops. While livestock grazing has potential benefits, it can also spread weed seeds, modify soil structure, and harm species that are not targets[5]. Precision Weed Management (PWM) technology has the ability to address these issues by enabling more focused and long-term weed control approaches[6].Precision Agriculture improves farming operations by automatically localising and classifying crops and weeds. This sophisticated method improves the efficiency and sustainability of agricultural management. By accurately directing herbicides just to the regions where they are required, or even mechanically eradicating weeds without the use of chemicals, the majority of the disadvantages of human weeding are reduced. Identifying the specific hazardous weeds affecting agricultural productivity is difficult. Given these problems, there is an increasing demand for innovative weed management solutions that are both effective and environmentally beneficial. Computer vision and machine learning provide promising results for weed management in fields. The most common ways to discriminate weeds using RGB images

are classifying visual features of weeds like shape, texture, and colour[7].This information assists ground-level scouting by combining data with standard or sophisticated monitoring methods to eliminate weeds[8].However, RGB cameras may not always be able to discriminate between crops and weeds, particularly in fluctuating lighting conditions, early stage of weed and corps, or when the plants are similar in colour[9].Spectral data can handle these situations when multiple distinct weed species are closely mixed and pixel-by-pixel classification is needed. As a result, investigating spectral data analysis techniques is crucial for modern weed classification approaches. Recent developments in HSI classification using machine-learning techniques, such as convolutional neural network (CNN) approaches[10], have demonstrated promising results in the field of precision agriculture for soil analysis[11], plant diseases[12], and macronutrient concentrations[13]. A study[14] focused on the automatic detection of early blight caused by Alternaria solani in potato plants used a proximal sensing platform to acquire high-resolution HSI.. Spectral classifiers such as Partial Least Squares Discriminant Analysis (PLS-DA) and Support Vector Machines (SVM) were used to discriminate between diseased and healthy plant pixels, with good accuracy (above 0.92). The Near-Infrared (NIR) band (750 nm) proved to be the most effective for detecting lesions. In research of [15] focusses on the early detection of johnsongrass, common cocklebur, and velvetleaf weeds in a cornfield utilising high-resolution aircraft hyperspectral imaging captured during corn's early growth phases. After the appropriate radiometric and geometric modifications, two supervised classification techniques—Spectral Angle Mapper (SAM) and Spectral Mixture Analysis (SMA)—were used. The study contrasted two endmember selection methods: field spectral measurements and automatic pixel recognition. The best results were obtained with endmembers determined using field spectroradiometer data, resulting in overall accuracies of 60% to 80% with SAM for generic weed maps, while accuracy reduced to 52% when classifying the three weed species individually. Researchers in[16] tackle the task of mapping the invasive Stellerachamaejasme in the alpine grasslands of the Qinghai-Tibet Plateau utilising UAV Resonon hyper spectral imaging and a variety of analytical tools. The researchers used dimension reduction, clustering, ordination analysis, and spectral separability assessment to determine the best wavelengths for distinguishing S. chamaejasme. They achieved an overall accuracy of 91% with a Kappa coefficient of 0.83. This multivariate technique, which combines ecological analysis and picture classification, was successful in precisely mapping S. chamaejasme.

The work[17] looks at the use of high spatial resolution UAV hyper spectral imaging and a novel 3D&2D-INWS-CNN model to detect invasive noxious weed species (INWS) on the Qinghai-Tibetan Plateau's alpine meadows. Using Principal Component Analysis (PCA) to reduce data dimensionality and maintain crucial spectral information, the study achieved a high classification accuracy of 98.92% in identifying INWS from native species. The CNN model outperformed traditional machine learning approaches, highlighting DL's potential for remote sensing applications like invasive species detection. Despite limitations such as low spatial coverage of UAV pictures and the need for more thorough spectral data, the study demonstrates the efficacy of sophisticated HSI techniques for ecological monitoring and invasive species management. The research in [18] shows the application of hyper spectral remote sensing(HRSI) and DL to measure weed competitiveness in maize field ecosystems. It presents two complete competition indices (CCI-A and CCI-T) for quantifying the effects of weed competition on maize by analysing structural and physiological factors. The study used UAV-based hyper spectral data and a 3D-CNN model to forecast weed competition levels, attaining excellent prediction accuracy with certain spectral bands. The findings illustrate the possibility of combining HSI and DL for early detection and management of weed competition. The study[19] examines the difficulty of managing weeds in rice fields in Malaysia and assesses the use of HRSI for weed detection and classification. It draws attention to current developments in imaging algorithms and technology, especially hyper spectral imaging from UAVs, which provides more accuracy in differentiating between crops and weeds. The research shows how combining hyper spectral imagery and machine learning methods can lead to better weed management and identification in precision agriculture. Unfortunately, most weed classification using HSI research is carried out with a specific dataset that is not available to the researcher to compare with their methods. Many research projects use UAV imagery rather than field or lab datasets. Nevertheless, there are extremely few open access weed datasets that use infield HSI. In this paper, we use a recently published dataset[20] that includes three common weed species in their early growth phases to compare our models, realising the importance of HSIs in researching the properties of distinct weed species. We proposed a pipeline to pre-process field images in order to

develop an effective compact light weight deep hybrid convolutional neural network with a PCA for weed classification using ground-based HSI for in precision farming. Different DL models were crafted and compared, for weed classifications.

METHODS

The methodology consists of two parts: data preprocessing using Principal Component Analysis(PCA) and the proposed hybrid CNN. Proposed framework for HSI classification models is shown in Figure 1.The details of these parts are explained in the next subsections.

Data Preprocessing

HSI data is a three-dimensional representation of spectral-spatial information. The HSI data cube, denoted by $S \in R^{M \times N \times L}$captures information in three dimensions.where M is width, N is height, L is the number of spectral information as depth/bands, and S is an HSI data containing three-dimensional, spectral-spatial information. In supervised learning tasks with HSI, each spatio-spectral pixel can be associated with a label that indicates the class it belongs to. For example, if there are n classes (e.g., different types of vegetation, soil, water, etc.), a one-hot encoded label vector $B = (y_1, y_2, \ldots, y_n)$is used.This HSI data cube must be pre-processed to reduce their dimensionality before processing them with DL models. In this research, PCA is used to fulfil this role[21]. PCA is one of the widely used unsupervised techniques for dimensionality reduction and feature extraction. It is since adjacent bands of HSI exhibit strong correlations and frequently represent the same information about the object. It is done by projecting or transforming a set of potentially correlated variables into a set of values known as Principal Components (PCs), which are linearly uncorrelated. This is done using an orthogonal transformation.PCA works by downsizing the raw HSI cube's depth from L to B in such a way that the reduced HSI cube will be of size$M \times N \times B$, where B is the new spectral dimension and B<<L. To employ DL classification algorithms, the HSI cube is partitioned into small overlapping 3D-patches, the truth labels of which are determined by the label of the cantering pixel. The entire process is followed by creating neighbour patches $N_p \in R^{w \times w \times B}$ with spatial window $(w \times w)$ centered spatial location (x, y).For each n patches $\big(M - (w-1)\big) \times \big(L - (w-1)\big)$, covers the width and height of$(x - (w-1)/2)$ to $(x + (w-1)/2)$ and $(y - (w-1)/2)$ to $(y + (w-1)/2)$.[22]

Proposed Model

The dataset introduction paper shows the HSI classification result utilising the 1DCNN model. The quantitative analysis revealed that the classification accuracies when using the full spectra ranged between 0.90 and 0.96 using the 1D-CNN[20].As 1D-CNNs are limited for HSI classification as they primarily capture spectral information while ignoring spatial context. Compared to 2D or 3D CNNs that make use of both spatial and spectral dimensions, this renders them less successful at modelling the complex spatial-spectral correlations present in HSI data, resulting in inferior classification results. While 2D-CNN can record spatial information, it does not consider the rich spectral information that the HSI offers. While the main disadvantages of using 3D-CNNs for HSI classification include their high computational cost and memory requirements due to the increased number of parameters and operations involved in processing 3D data. Additionally, 3D-CNNs are prone to over fitting, especially with limited training data, and require large datasets to generalize well[23]. To learn spatial-spectral features, we convolved a 3-D kernel with 3-D data. The learnt features are then analysed using an activation function, which introduces nonlinearity. The functional values are determined by the formulae below.

$$D_{i,j,k}^{u,v} = \Phi\left(\sum_{\rho=1}^{s_u-1}\sum_{\pi=-\gamma}^{\gamma}\sum_{\lambda=-\eta}^{\eta}\sum_{\omega=-\epsilon}^{\epsilon} Q_{u,v,\rho}^{\pi,\lambda,\omega} \times D_{(u-1),\rho}^{(i+\pi)(j+\lambda)(k+\omega)} + b_{u,v}\right)$$

Where Φ is an activation function,$b_{u,v}$ represents the bias, and s_{u-1} denotes the 3-D feature maps at the $(u-1)^{\text{th}}$ layer. The kernel $Q_{i,j}$ has a depth of$2\pi + 1$, and dimensions $2\lambda + 1$ and $2\omega + 1$ represent the width and height of the

kernel, respectively.We used supervised techniques to train the bias b and kernel weight Q parameters, which were then optimised using gradient descent. The 3D CNN kernel eventually extracts feature vector renderings of spectral-spatial contents concurrently from HSI data, but at the expense of greater computational complexity. To learn more abstract spatial representations, we layer 2D on top of 3D-CNN.

$$D_{i,j}^{u,v} = \Phi\left(\sum_{\rho=1}^{s_{u-1}} \sum_{\pi=-\gamma}^{\gamma} \sum_{\lambda=-\eta}^{\eta} Q_{u,v,\rho}^{\pi,\lambda,} \cdot D_{(u-1),\rho}^{(i+\gamma)(j+\eta)} + b_{u,v}\right)$$

In short, the proposed Hybrid CNN model architecture is designed to effectively capture spatiotemporal features from 3D data, followed by feature refinement through 2D convolutions. The first two 3D convolutional layers use $3 \times 3 \times 3$ filters with 8 and 16 filters, respectively, which progressively downsample the spatial dimensions while increasing the depth of the feature maps, thus capturing local dependencies in all three dimensions. The third 3D convolutional layer utilizes $1 \times 1 \times 1$ filters with 32 filters, serving to increase the depth of the feature maps without further reducing the spatial dimensions, allowing for a denser representation of features. The output of 3D convolutions is reshaped to be compatible with 2D convolutions, which flattens the depth into the channel dimension. The reshaped output is input into a 2D convolutional layer 64 filters. *ReLU* activation is used to refine spatial features and capture 2D patterns within the reshaped data. Following the convolutional layers, the model incorporates a flattening layer to prepare the data for dense layers. The two dense layers use *ReLU* activation, followed by a dropout layer with a 40% rate, which aids in regularisation and hence preventing over fitting. The final output layer is a dense layer with a *softmax* activation function that generates probabilities for each number of classes, making it appropriate for multi-class classification applications. The total number of parameters (i.e., tune-able weights) of our proposed Hybrid CNN model is 2,03,860. The detail regarding the proposed model for Species Botanical group is shown in Table1.

RESULTS AND DISCUSSION

In this part, we will describe the HSI datasets used in this research. Second, we will explain the experimental setup and parameter analysis. We will then run ablation experiments on the proposed model. Finally, we will compare the proposed model to existing methodologies to demonstrate its superiority and effectiveness, both numerically and qualitatively. For the DL models, Google Colab was used to run algorithms on Python 3 notebooks with GPU support. Colab provides up to 12.72 GB of RAM and 107 GB of disk storage, making it suitable for handling intensive computations.

Dataset

HSI data set used in this study was originally produced and examined by Ronay *et al*.,[20].The dataset is available under an open-source license and was utilized for experiments. The dataset's scene construction involved growing weed species in a controlled greenhouse environment to ensure consistent conditions. The weeds were planted in 34 cm by 54 cm trays, with each tray divided into 2 cm × 2 cm cells, to keep the setup organized and doable for collecting data. These scenes were recorded over six days within two weeks after sowing, capturing the weeds at different growth stages. A portable device called the Specim IQ hyper spectral camera was used to capture the images; more information is shown in Table 2. In addition to hyper spectral data, high-resolution RGB photos (645 × 645 pixels) were also taken to aid in the labelling procedure. The dataset includes three weed species: Amaranthus retroflexus, Solanum nigrum, and Setariaadhaerens, which represent distinct botanical groups and photosynthetic pathways. In the context of Indian agriculture, these weeds are significant due to their widespread presence and impact on crop production. Table3outlines the classification of weed species and their significance in Indian agriculture. Amaranthus retroflexus (redroot pigweed) is a highly competitive weed that can reduce agricultural yields by competing for essential supplies such as water, nutrients, and light. It is especially harmful in cereal, pulse,

and vegetable crops and has developed resistance to many herbicides, complicating control attempts. Solanum nigrum (Black Nightshade) poses risks due to its toxicity, especially in its immature berries, which can harm livestock. It also hosts many different kinds of crop pests and diseases. Setariaadhaerens (Bristly Foxtail) is a common monocotyledon weed in both the kharif and rabi harvesting seasons, competing with main crops such as wheat and rice. Its tolerance to varied environmental circumstances and quick seed production make it a recurring issue in Indian agriculture. Understanding the classification and features of these weeds is crucial in developing efficient weed management techniques, especially in areas where these species are abundant. The dataset was labelled manually using high-resolution RGB photos. These labels were then geometrically transformed to align with the HSIs using orientated FAST and rotated BRIEF (ORB) features, resulting in precise correspondence between the two data sets. The dataset was divided into three labelled sets: species, botanical group, and photosynthetic mechanism labels. This precise labelling approach is critical to the dataset's usefulness in training and assessing machine learning models since it provides a solid foundation for accurate weed classification. The dataset consists of images from 30 different scenes. For each of the six measurement days (7, 8, 9, 12, 13, and 14 DAS), the dataset recorded five scenes labelled A, B, C, D, and E, each from a different sowing plate. The dataset includes three distinct labelled sets for each image, which categorize the pixels based on species (e.g., Amaranthus retroflexus, Solanum nigrum, Setariaadhaerens, and soil), botanical groups (monocotyledons, dicotyledons, and soil), and photosynthesis mechanisms (C3, C4, and soil).Figure 2 shows RGB composite of the hyperspectral image of Pate E DAS14 with the ground truth image for three distinct labelled groups. Figure 3a show the DAS 14 Plate E Spectral signature of weed species.

Evaluation metrics and Experimental Details

The proposed hybrid model's claims are validated by calculating overall accuracy (OA), precision (P), recall (R), and F1score (F1). The table 4 displays the summary of performance metrics for classification problems utilised in these experiments.

EXPERIMENTAL RESULTS

The experiment is structured into three distinct data sets division: Training, Validation, and Test. The data is split in a 10%/90% ratio, where 5% is allocated for training and another 5% for validation (i.e., 5% + 5% = 10%). The remaining 90% serves as a blind test set for the final evaluation of the models. The DL model weights are initially randomized and optimized using Adam optimizer back-propagation with a soft-max loss function. The weights are updated using a small batch of size 32 with 10 epochs without batch normalization and augmentation. The first five principal component are sufficient to capture nearly all the variance (99.95%) in the HSI data , making the data processing more efficient without losing significant spectral information. The figure 4illustrates the cumulative variance explained by the PCs derived from a PCA of weed data for different plates (PlateA, PlateB, PlateC, PlateD, and PlateE) on DAS16 which shows the cumulative variance value of principal component 5. The evaluation achieved by the proposed models has been computed by confusion matrices of E scenario, as shown in figure 5for DAS 7 Plate D. The table 5shows the performance of the proposed model for Plate E, including accuracy and Kappa scores for identifying Species, Botanical Groups, and Photosynthetic Pathways in DAS 7, 8, 9, 12, 13, and 14. At DAS 7, all attributes had the greatest accuracy of 0.98, while Kappa scores range from 0.81 to 0.85, showing significant agreement beyond chance. Kappa scores are important because they assess the agreement between anticipated and actual classifications while controlling for chance agreement. As DAS grows, accuracy tends to drop considerably; for example, species accuracy declines to 0.94 at DAS 8 and then to 0.92 by DAS 12, while Kappa scores follow similar trends, with the lowest values for species at DAS 12 (0.72). Botanical Groups commonly demonstrate strong performance, with accuracy ranging from 0.92 to 0.96 and Kappa scores being reasonably stable, indicating robust model predictions.DAS 7 performs the best for weed identification on Plate E, yielding the highest accuracy (0.98) across all traits—with Kappa scores suggesting good agreement. This implies that early evaluation at DAS 7 yields the most consistent and accurate weed detection findings, confirming the hybrid model's effectiveness at this point. As DAS increases, the minor decrease in both accuracy and Kappa scores emphasises the significance of focussing on

early DAS for optimal model performance. The table 6 presents the proposed hybrid CNN model's accuracy summary. Accuracy values for species traits range from 0.85 to 0.98, with Plate E regularly outperforming others, particularly at DAS 7. Accuracy generally falls as DAS increases, with Plate D showing considerable losses at DAS 14 (0.85). The Botanical Groups trait is very accurate across all plates, with values ranging from 0.89 to 0.98, with Plates A and E obtaining the highest accuracy (0.98) at DAS 7. Photosynthetic Pathways follow similar patterns, with an accuracy range of 0.90 to 0.98. Plates C and E have consistently performed well, particularly at DAS 7 (0.98).When comparing the three traits, Botanical Groups consistently outperforms the competition, achieving high and stable accuracy across all DAS and plates. The best performance for trait identification across plates occurs at DAS 7, with maximal accuracies for all three traits, indicating that this is the best DAS for accurate weed identification. Overall, Plates C and E have the highest accuracy across most attributes and DAS, while Plate D has the most variability and poor performance, particularly in later DAS levels. DAS 7 outperforms all other plates in terms of weed identification, achieving the highest accuracies across all three traits—species (up to 0.98), botanical groups (up to 0.98), and photosynthetic pathways (up to 0.98). This implies that early evaluation (at DAS 7) produces the most accurate results, with performance decreasing significantly as DAS develops,

DISCUSSION

The goal of the research presented in this work was to use HSI datasets and sophisticated DL models to improve the precision and effectiveness of weed detection and segmentation in agricultural settings. In last decade various approaches were carried out for effective weed management utilising the HRSI [19]. The method of getting image for in field for every season and for every cope is impractical by cost and time wise. Recently advancement of spectral imaging camara and drone technology number of research was conducted using UAV and deep learning-based weed classification[24]. Currently UAV based methods is mainly utilising to effectively utilizing the herbicide in waste agriculture field[25].Where in this work infield weed dataset is used to develop a small and compact DL model that can be unitize with any smart mechanical tools or AI based tools[26][27]. The primary findings of this study highlight notable advancements in the accuracy of weed segmentation using a small DL model, especially when using HSIs captured in the field. This research suggests a fast and compact hybrid CNN model to evaluate a hyper spectral dataset for the classification of weed species. To showcase the efficacy of the suggested model in precision agricultural areas, the weed dataset—which is publicly available—was examined and utilised, adhering to the best knowledge available. Our proposed model outperforms the result shown in by Ronay *et al*[20]. methods in classification and accuracy of methods. The common objective during the developing of this DL model is to use the fewest resources possible when implementing it on hardware. Other models have the potential to reach high efficacy with a more complex framework that has deeper layers and complex calculations. However, the dataset used in this research provides insightful information about three common weed species. To gain a more comprehensive understanding of spectral variation, it is crucial to include datasets from a broader range of environments and species. Due to differences in soil, climate, and other biological factors, different settings may have an impact on spectral properties. Similar to this, incorporating a wide range of species—each with distinct characteristics and adaptations can highlight the ways in which different biological and environmental elements influence spectral and spatial variations. Conducting a more thorough analysis that integrates these varied datasets would provide a more profound investigation of the primary factors impacting spectral variance within and between species. This more inclusive method can aid in identifying recurring themes and distinctive traits, producing conclusions that are stronger and more applicable.

CONCLUSIONS

In this paper, we utilised deep neural networks to classify weeds in HSIs using a relatively new dataset. We conducted a series of experiments to develop fast and compact hybrid CNN models. Our results demonstrated the effectiveness of the proposed model in classifying weed species and their unique traits, achieving accuracy values between 0.85 and 0.98 for species traits. For botanical groups, the accuracy remained consistently high, ranging from

0.89 to 0.98, while photosynthetic pathways showed similar accuracy trends from 0.90 to 0.98. The highest performance for trait identification was observed at DAS 7, where accuracies peaked across all traits, indicating this time point as optimal for accurate weed classification. Future research could include field testing the model with smart mechanical tools and expanding the dataset to include more weed types from various climates and soil conditions. This would enhance the model's accuracy and reliability for precision weed management across different environments.

Total Trainable Parameters		**203,860**

Table.2: Specifications of the Specim IQ Hyper spectral Imaging Camera

Hyper spectral Camera (SpecimIQ) Parameter	Specification
Spectral Range	400–1000 nm
Spatial Resolution	512 × 512 Pixels
Number of Spectral Bands	204
RGB Image Resolution	645 × 645 Pixels
Lighting	Halogen Spots

Table.3: Classification of Weed Species and Their Importance in Indian Agriculture

Weed Species	Botanical Group	Photosynthetic Pathway	Importance in Indian Agriculture	Common Crops Affected
Amaranthus retroflexus	Dicotyledon	C4	Highly competitive; reduces crop yields by competing for resources	Cereals, pulses, vegetables
Solanum nigrum	Dicotyledon	C3	Acts as a host for pests and diseases; toxic to livestock	Vegetables, maize
Setariaadhaerens	Monocotyledon	C4	Highly adaptable; competes with crops for light, water, and nutrients	Wheat, rice

Table.4: Performance Metrics for Classification Problems

Metrics	Formula	Focus
Overall Accuracy (OA)	$\frac{\mathrm{TP}+\mathrm{TN}}{\mathrm{TP}+\mathrm{TN}+\mathrm{FP}+\mathrm{FN}}$	Measures the effectiveness of the classifier technique in correctly identifying instances.
Precision (PRC)	$\frac{TP}{TP+FP}$	Assesses the accuracy of positive predictions made by the model, aiming to reduce false positives.
Recall/Sensitivity (REC)	$\frac{TP}{TP+FN}$	Evaluates the classifier's ability to identify positive predictions, aiming to minimize false negatives.
F1 Score	$2 \times \frac{(REC \times PRC)}{(REC+PRC)}$	Combines sensitivity and precision into a single metric to provide a balanced evaluation.
Where, TP =True Positives, TN = True Negatives, FP = False Positives, FN = False Negatives.		

Table.5: Performance of proposed model for Plate E Across Different Days After Sowing (DAS) with Accuracy and Kappa Scores

DAS	Trait	Accuracy	Kappa
7	Species	0.98	0.82
	Botanical Groups	0.98	0.85
	Photosynthetic Pathways	0.98	0.81
8	Species	0.94	0.80

ABSTRACT

The usage of herbs and herbal products as health care system segment is being done from ancient time by human beings. Quality and quality assurance of herbs and herbal products are matter of concern globally. Various countries have their own standards to qualify herbs and their preparations. It is required to identify different qualification parameters. Since senna is widely used as a herbal medicine in most of the countries of the world and has been included in most of the herbal pharmacopoeias, it was selected as a model herb for review and comparison of monographs of various herbal pharmacopoeias. The present study was undertaken to study various characteristics and quality standards published in pharmacopoeias and other research publications. The references which were utilized for carrying out this study were Indian Pharmacopoeia, European Pharmacopoeia, United States Pharmacopoeia-NF, Taiwan Pharmacopoeia, WHO monographs, Japanese Pharmacopoeia, Ayurvedic Pharmacopoeia of India and Quality Standards of Indian Medicinal Plants. Monographs of different forms of senna such as crude drug, extract and finished dosage forms were reviewed and compared. An extensive comparison was done among the monographs of senna and its preparations across various pharmacopoeias and compendia. From the comparative study of monographs, it was found that there are different pharmacopoeial standards and specifications for crude senna as well as preparations and formulations of senna in various pharmacopoeias. The acceptance criteria for tests prescribed for senna and its preparations also vary among various pharmacopoeias. Thus, there is a need to harmonize the monographs of herbal medicines in various pharmacopoeias with the intention to ensure consistency in the quality of herbal medicines used globally and to facilitate international trade of herbal medicines.

Keywords: Pharmacopoeia, herbal medicine, senna, monograph, specifications

INTRODUCTION

Herbal medicines are still a foremost choice to meet out for health needs for developing countries major part of residing population. Past years have witnessed a global rebirth in consumption of herbal drugs/phytochemicals for different purposes, i.e. to say in medicine, nutraceuticals and cosmeceuticals. It is well known observation that especially in the developing and underdeveloped countries of world, most part of population (nearly 80%) rely on the herbal medicines for their primary healthcare need. World Health Organization (WHO) also promotes the use of herbal medicine and other traditional remedies having proven safe and effective and as the advanced medical helps are not easily available around the globe[1]. The usage of herbs and herbal products as health care system segment is being done since ancient time by human beings. The quality as well as quality assurance of herbs and herbal products are matter of concern globally. Although usage of herbal products is globally widespread, it is observed in few cases, where verification, safety and efficacy levels had not been sufficiently addressed. To fulfill these concerns, it becomes important to assure herbs and herbal products verification, safety and efficiency by implementing and monitoring through different requirements, agencies guidelines and analytical methods. Thus, combination of all these requirements known asguidelines for quality and quantity assurance. Quality control method is employed to do sensory and analytical inspection of botanicals to identify authentic products and also prevent adulteration. Quantity affirmation is described as quantifying typical phytochemicals present in herbs and their products which are responsible for the pharmacological effects. Though quality and quantity control of herbs are not addressed equivalently as chemical and conventional drugs, there is demand to prevent consequences of herbal pharmaceuticals. By implementing standard and accepted test procedures; reported side effects of herbs, morbidity and mortality could be elucidated. To ensure individual health, monographs of herbs and herbal products undergo changes like additions, exclusions, or updates [2]. Various countries have their own standards to qualify herbs and their preparations. However, a lot of inconsistency is observed in the quality standards prescribed in herbs monographs and herbal preparation monographs in various pharmacopoeias. An attempt was made in this study to compare the standards and specifications prescribed in various pharmacopoeias for herbs and herbal preparations. Senna was taken as a model herb for the purpose of this study, since senna is widely used as a herbal medicine in most of countries of the world and has been included in most of the herbal pharmacopoeias. Senna has medicinal properties to lower bowels, increase peristaltic movements of the colon by its local action upon the intestinal wall. In the present study, the quality standards, tests, specifications and acceptance criteria prescribed in various pharmacopoeias for crude senna and its preparations and formulations were compared.

MATERIALS AND METHODS

References which were utilized to carry out this study were Indian Pharmacopoeia, European Pharmacopoeia, United States Pharmacopoeia-NF, Taiwan Herbal Pharmacopoeia, WHO monographs, Japanese Pharmacopoeia, Ayurvedic Pharmacopoeia of India and Quality of Indian Medicinal Plants by Indian Council of Medicine Research (ICMR).Monographs of different forms of senna like crude form, extract and dosage forms were compared. An exhaustive comparison was done among the monographs of different forms of senna across various pharmacopoeia and compendia with respect to the prescribed quality standards, tests, specifications and acceptance criteria. Table 1 presents list of above referred different pharmacopoeias and allied sources for current study.

RESULTS AND DISCUSSION

The comparative study of the monographs of senna and its preparations was presented in a tabular form. Table 2- A and 2-B presents the list of monographs of senna and its preparations in various compendial publications. Senna leaf monograph was found to be included in all the compendia referred in this study [3,7,9,13,14,15,18,20]. Senna powdered leaf monograph was found Indian Pharmacopoeia (IP) and in Japanese Pharmacopoeia (JP) [4,16]. Senna dry extract monograph has been included in two compendia,i.e., Indian Pharmacopoeia (IP) and European

Pharmacopoeia (EP); while senna dry aqueous extract was found in Ayurvedic Pharmacopoeia of India (API) [5,8,19]. Monographs on senna tablets were found in two compendia, i.e., IP and United States Pharmacopoeia (USP) [6,10]. Monographs on senna oral solution and sennosides were found in only in USP [11,12]. A compound formulation monograph of rhubarb and senna powder was found in JP only [16]. It was observed that IP and USP has greater number of monographs on various forms of senna (crude drug and its preparations) as compared to other compendia referred in this study. JP has less number of monographs of senna compared to IP and USP. European Pharmacopoeia and Ayurvedic Pharmacopoeia of India has less number of monographs on various forms of senna compared to USP, IP and JP. Taiwan Herbal Pharmacopoeia (THP), World Health Organization (WHO) and Quality Standards of Indian Medicinal Plants (QSIMP) contain monograph of crude senna leaf only. Table 3-A and 3-B shows a comparison of quality standards of senna leaf indifferent compendial monographs [3,7,9,13,14,15,18,20]. From the comparison similarity in required tests were found; however, there were differences in test method analyzed. For example, differences in assay test methods to be used is observed. Description, identification parameters, tests and specifications for purity and content of drug were analyzed across all compendial monographs. Macroscopic and microscopic evaluation, TLC and chemical tests were prescribed as identification parameters of drug across various monographs, but all of these together were not present in any of the monographs studied. Substantial inconsistencies were found the purity tests and their respective acceptance criteria prescribed in various monographs. Extractive values, which give a gross idea of the contents of the drug and hence its quality, are prescribed only WHO monographs, API and QSIMP. Tests for heavy metals, which are a major concern of safety of herbal drugs, are not prescribed in most of the monographs except THP, WHO and API. Tests and specifications for aflatoxins are prescribed only in API monograph. Storage specifications are Given in all the mono graphs except that of QSIMP.

Labelling specifications were found in EP, USP, THP and API. Only Indian pharmacopoeia and Japanese pharmacopoeia has monograph for senna powdered leaf [4,16]. Table 4 shows the quality parameters of senna powdered leaf as present in both pharmacopoeias (IP and JP). Chemical tests for identification, test for purity and assay specifications are present in JP but not in IP. Limits for heavy metal contamination are not mentioned in the monographs of both the pharmacopoeias. Extractive values, microbial contamination and labeling specifications are not given in both pharmacopoeias for senna powdered leaf. On the other hand, storage specifications were mentioned in JP but not in IP. Only IP and EP has monograph for dry extract of senna leaf whereas Ayurvedic Pharmacopoeia of India had senna dry aqueous extract. The quality standards prescribed in these pharmacopoeias for senna extracts are summarized in Table 5 [5,8,19].Production is described in in EP and API only. Description is mentioned in monograph of IP and EP. Chemical tests for identification, limits for microbial contamination and storage specification were mentioned in IP and API but not in EP. On the other hand, production method and labeling specifications were mentioned in EP and APIbut not in IP. Assay and loss on drying were present in IP, EP and API. Tests for purity like pH is present in IP and API while not present in EP. Limits for heavy metal contamination are not mentioned in the monographs of IP and EP but is required as per monograph in API. Ayurvedic Pharmacopoeia of India required tests like total ash, acid insoluble ash, total soluble solids, heavy metal, pesticide content and aflatoxins which are not present in IP and EP. Few pharmacopoeia also contain monographs of formulations of senna and its preparations. Monograph of senna tablet is included in IP whereas USP contains monograph of sennosides tablet [6,10]. Table 6 summarizes the standards for senna and sennosides tablets specified in IP and USP, respectively. USP has prescribed dissolution test for sennosides tablets, however, it is not there in IP; instead, disintegration test is recommended in IP .Identification test specified in both the pharmacopoeias are different. Test for uniformity of dosage units is prescribed in both pharmacopeias. However, IP has prescribed test for loss on drying, microbial contamination and uniformity of content which is not there in USP. USP also has a monograph on senna oral solution [11]. Table 7 shows the standards prescribed in USP for senna oral solution. Test for determination of alcohol content has been included in the monograph. A monograph for the sennosides, the active constituents of senna, is present only in the USP [12]. Table 8 presents the standards for sennosides as mentioned in the USP monograph. The monographs prescribe the assay method for determination of content of total sennosides and also of sennoside A and B. Only JP has monograph for a compound formulation containing senna as one of the ingredients. JP contains monograph of senna powder as compound mixture with rhubarb powder[17]. Table 9 summarizes the standards mentioned in the monograph of JP for this compound mixture. After analyzing the herbal monographs published in various pharmacopoeias, it was found that there is vast inconsistency in the

quality standards prescribed in these compendial monographs for crude drugs and their preparations. For example, though HPLC is first-rated effective, accurate and precise methods in order to establish the quality and quantity of senna and its preparations; UV method was used for assay of sennosides in few compendial monographs of senna. Hence, an attempt was made to propose a harmonized format for herbal monograph. The standards and specifications, included in this harmonized format, for confirming the identity, purity and quality of crude drug and its preparations, were decided considering the requirements of various countries. Table 10 presents the standards and tests to be included in the harmonized monograph for crude drug, powdered herbal drug and dry extract of herbal drug.

CONCLUSION

The harmonized format of monograph for herbal drugs and their preparations, proposed in this study, can be used by governing bodies of various countries to harmonize the contents of herbal monographs published by them. This may lead to improvement and harmonization in the quality of herbal drugs across the globe.

ABSTRACT

This paper aims at finding patterns of solutions in integers to quaternary quadratic diophantine equation given by $x^2-6y^2+15z^2=w^2$.Substitution technique and factorization method are utilized to obtain varieties of integer solutions. It is worth to observe that the introduction of the transformations reduce the quadratic equation with four unknowns to solvable ternary quadratic equation of the form $z^2=Dx^2+y^2$, $D>0$ and square free as well as Pythagorean equation. A few relations among the solutions are presented.

Keywords: Quaternary quadratic equation, Homogeneous quadratic equation, Integer solutions

INTRODUCTION

It is quite obvious that Diophantine equations, one of the areas of number theory, are rich in variety .In particular, quadratic Diophantine equations in connection with geometrical figures occupy a pivotal role in the orbit of mathematics and have a wealth of historical significance. In this context, one may refer [1-11] for second degree diophantine equations with three and two unknowns representing different geometrical figures. This paper aims at finding patterns of solutions in integers to quaternary quadratic diophantine equation given by $x^2-6y^2+15z^2=w^2$.Substitution technique and factorization method are utilized to obtain varieties of integer solutions. It is worth to observe that the introduction of the transformations reduce the quadratic equation with four

unknowns to solvable ternary quadratic equation of the form $z^2 = Dx^2 + y^2$, $D > 0$ and square free as well as Pythagorean equation. A few relations among the solutions are presented.

Method of analysis

The polynomial equation of second degree with four unknowns to be solved is

$$x^2 - 6y^2 + 15z^2 = w^2 \quad (1)$$

The procedure to obtain various patterns of integer solutions to (1) is as below:

Procedure 1

The option

$$w = 4z \quad (2)$$

in (1) gives

$$x^2 = 6y^2 + z^2 \quad (3)$$

which is satisfied by

$$y = 2rs, z = 6r^2 - s^2, x = 6r^2 + s^2 \quad (4)$$

From (2) , we get

$$w = 4(6r^2 - s^2) \quad (5)$$

Thus, (4) & (5) satisfy (1).

Note 1

It is seen that ,by expressing (3) as the system of double equations ,the following four patterns of integer solutions to (1) are obtained:

Pattern 1

$$x = 5s, y = 2s, z = s, w = 4s$$

Pattern 2

$$x = 7s, y = 2s, z = 5s, w = 20s$$

Pattern 3

$$x = 2s^2 + 3, y = 2s, z = 2s^2 - 3, w = 4(2s^2 - 3)$$

Pattern 4

$$x = 6s^2 + 1, y = 2s, z = 6s^2 - 1, w = 4(6s^2 - 1)$$

Note 2

Rewrite (3) as

$$z^2 + 6y^2 = x^2 * 1 \quad (6)$$

Assume

$$x = 25(a^2 + 6b^2) \quad (7)$$

Express the integer 1 in (6) as

$$1 = \frac{(1 + i2\sqrt{6})(1 - i2\sqrt{6})}{25} \quad (8)$$

Substituting (7) & (8) in (6) and using factorization, we have

$$z + i\sqrt{6}\,y = 5(1 + i2\sqrt{6})(a + i\sqrt{6}\,b)^2$$

from which, we get

$$z = 5(a^2 - 6b^2) - 120ab,$$
$$y = 10(a^2 - 6b^2) + 10ab. \quad (9)$$

In view of (2) ,observe that

$$w = 20(a^2 - 6b^2) - 480ab \quad (10)$$

Thus,(7),(9) and (10) satisfy (1).

Observations

1. $400x^2 - (48y + w)^2 = 24(2y - w)^2$
2. $25x^2 - (12y + z)^2 = 6(y - 2z)^2$

Remark 1

It is to be noted that the integer 1 in (6) may be considered as

$$1 = \frac{(6r^2 - s^2 + i2rs\sqrt{6})(6r^2 - s^2 - i2rs\sqrt{6})}{(6r^2 + s^2)^2}$$

Repeating the above process and taking different values to r& s, one obtains different sets of integer solutions to (1).

Procedure 2

Consider (3) as

$$x^2 - 6y^2 = z^2 * 1 \quad (11)$$

Assume

$$z = a^2 - 6b^2 \quad (12)$$

The integer 1 in (11) is written as

$$1 = (5 + 2\sqrt{6})(5 - 2\sqrt{6}) \quad (13)$$

Substituting (12) & (13) in (11) and using factorization, we have

$$x + \sqrt{6}\,y = (5 + 2\sqrt{6})(a + \sqrt{6}\,b)^2$$

from which, we get

$$x = 5(a^2 + 6b^2) + 24ab,$$
$$y = 2(a^2 + 6b^2) + 10ab. \quad (14)$$

In view of (2) ,observe that

$$w = 4(a^2 - 6b^2) \quad (15)$$

Thus,(12),(14) and (15) satisfy (1).

Observations

3. $(5x - 12y)^2 = z^2 + 6(5y - 2x)^2$
4. $16(5x - 12y)^2 = w^2 + 96(5y - 2x)^2$

Remark 2

It is to be noted that the integer 1 in (13) may be considered as

$$1=\frac{(6r^2+s^2+2rs\sqrt{6})(6r^2+s^2-2rs\sqrt{6})}{(6r^2-s^2)^2}$$

Repeating the above process and taking different values to r& s, one obtains different sets of integer solutions to (1).

Procedure 3

Introduction of the transformations

$$x=27\beta, y=3\gamma+15\beta, z=3\gamma+6\beta, w=9\delta \quad (16)$$

in (1) leads to the Pythagorean equation

$$\gamma^2=\delta^2+\beta^2$$

Employing the most cited solutions of the above Pythagorean equation in (16),the corresponding integer solutions to (1) are obtained.

Note 3

In (16) ,if we choose $x=9\beta$,then (1) reduces to the Pythagorean equation

$$\gamma^2=\delta^2+9\beta^2$$

which is satisfied by

$$\beta=2rs, \delta=9r^2-s^2, \gamma=9r^2+s^2, 3r>s>0$$

In this case , the corresponding integer solutions to (1) are given by

$$x=18rs, y=3(9r^2+s^2)+30rs, z=3(9r^2+s^2)+12rs, w=9(9r^2-s^2)$$

Observations

5. $(5z-2y)^2=w^2+9x^2$
6. $(5z-2y)^2=w^2+9(y-z)^2$

Procedure 4

The option

$$w=x+y \quad (17)$$

in (1) leads to the ternary homogeneous quadratic equation

$$7y^2+2xy-15z^2=0 \quad (18)$$

Treating (18) as a quadratic equation in y and solving for the same ,we have

$$y=\frac{-x\pm\sqrt{105z^2+x^2}}{7} \quad (19)$$

The square-root on the R.H.S. of (19) is removed when

$$z=2pq, x=105p^2-q^2 \quad (20)$$

Taking the negative sign before the square-root in (19) and from (17) ,we get

$$y=-30p^2, w=75p^2-q^2 \quad (21)$$

Thus,(20) & (21) satisfy (1).

Also, considering positive sign before the square-root in (19) & taking (17) , we, after some algebra, obtain the integer solutions to (1) to be

$$z=14p\alpha, x=105p^2-49\alpha^2, y=14\alpha^2, w=105p^2-35\alpha^2$$

Note 4

In addition to the above patterns of integer solutions ,there are some more choices of solutions to (1) which we illustrate as follows:

Let

$$\alpha^2 = x^2 + 105z^2 \qquad (22)$$

Represent (22) as the system of double equations as shown in Table 1:

Table 1-System of double equations

System	I	II	III	IV	V	VI	VII	VIII
$\alpha + x$	$105z$	$35z$	$21z$	$15z$	$105z^2$	$35z^2$	$21z^2$	$15z^2$
$\alpha - x$	z	$3z$	$5z$	$7z$	1	3	5	7

Solving each of the above system of double equations, the values of α, x, z are obtained. From (19) and (17) ,the corresponding values to y, w satisfying (1) are found. For simplicity and brevity, the integer solutions to (1) obtained from each of the above system of double equations are exhibited.

Solutions to (1) from System I:

Set 1 $x = 364s, y = s, z = 7s, w = 365s$

Set 2 $x = 52s, y = -15s, z = s, w = 37s$

Solutions to (1) from System II:

Set 3 $x = 112s, y = 3s, z = 7s, w = 115s$

Set 4 $x = 16s, y = -5s, z = s, w = 11s$

Solutions to (1) from System III:

Set 5 $x = 56s, y = 5s, z = 7s, w = 61s$

Set 6 $x = 8s, y = -3s, z = s, w = 9s$

Solutions to (1) from System IV:

Set 7 $x = 28s, y = -15s, z = 7s, w = 13s$

Solutions to (1) from System V:

Set 8 $x = 210s^2 + 210s + 52, y = -60s^2 - 60s - 15, z = 2s + 1, w = 150s^2 + 150s + 37$

Solutions to (1) from System VI:

Set 9 $x = 70s^2 + 70s + 16, y = -20s^2 - 20s - 5, z = 2s + 1, w = 50s^2 + 50s + 11$

Solutions to (1) from System VII:

Set 10 $x = 42s^2 + 42s + 8, y = -12s^2 - 12s - 3, z = 2s + 1, w = 30s^2 + 30s + 5$

Solutions to (1) from System VIII:

Set 11 $x = 30s^2 + 30s + 4, y = 1, z = 2s + 1, w = 30s^2 + 30s + 5$

Set 12 $x = 30(7s-4)(7s-3) + 4, y = -105(2s-1)^2, z = 14s - 7,$
$w = [30(7s-4)(7s-3) + 4] - 105(2s-1)^2$

Procedure 5

The option

$$w = x - 4z \tag{23}$$

in (1) leads to the ternary homogeneous quadratic equation

$$6y^2 - 8xz + z^2 = 0 \tag{24}$$

Treating (24) as a quadratic equation in z and solving for the same ,we have

$$z = \frac{8x \pm \sqrt{64x^2 - 24y^2}}{2} \tag{25}$$

The square-root on the R.H.S. of (25) is removed when

$$y = 8pq, x = 6p^2 + q^2 \tag{26}$$

Taking the negative sign before the square-root in (25) and from (23) ,we get

$$z = 8q^2, w = 6p^2 - 31q^2 \tag{27}$$

Thus,(26) & (27) satisfy (1).

Also, considering positive sign before the square-root in (25) & taking (23) , we, after some algebra, obtain

$$z = 48p^2, w = -186p^2 + q^2 \tag{28}$$

Thus,(26) & (28) satisfy (1).

Procedure 6

The substitution

$$x = 2k + 1, w = 2k - 1 \tag{29}$$

in (1) gives

$$8k = 6y^2 - 15z^2$$

The choice

$$y = 4Y, z = 4P \tag{30}$$

in the above equation gives

$$k = 12Y^2 - 30P^2$$

In view of (29) ,we get

$$x = 24Y^2 - 60P^2 + 1,$$
$$w = 24Y^2 - 60P^2 - 1. \tag{31}$$

Thus,(30) & (31) satisfy (1).

Procedure 7

The introduction of the linear transformation

$$w = 3y \tag{32}$$

in (1) leads to the homogeneous ternary quadratic equation

$$x^2 + 15z^2 = 15y^2 \tag{33}$$

Assume

$$y = a^2 + 15b^2 \tag{34}$$

Express the integer 15 on the R.H.S. of (33) as

$$15 = (i\sqrt{15})(-i\sqrt{15}) \tag{35}$$

Substituting (34) &(35) in (33) and applying factorization, consider

$$x+i\sqrt{15}z=(i\sqrt{15})(a+i\sqrt{15}b)^2$$

On comparing the coefficients of corresponding terms ,we get

$$x=-30ab, z=a^2-15b^2 \quad (36)$$

From (32) ,one has

$$w=3(a^2+15b^2) \quad (37)$$

Thus, (34),(36) & (37) satisfy (1).

Note 5

Observe that (33) is also written in the form of ratio as

$$\frac{x}{5(y+z)}=\frac{3(y-z)}{x}=\frac{P}{Q}, Q\neq 0$$

Solving the above system of double equations ,we have

$$x=30PQ, y=3Q^2+5P^2, z=3Q^2-5P^2 \quad (38)$$

From (32), we get

$$w=3(3Q^2+5P^2) \quad (39)$$

Thus, (38) & (39) satisfy (1).

CONCLUSION

Varieties of solutions in integers are presented in this paper for the quaternary homogeneous quadratic equation given by $x^2-6y^2+15z^2=w^2$ through employing substitution technique and factorization method. As quadratic equations (homogeneous or non-homogeneous) are plenty, one may search for patterns of integer solutions to other choices of multivariable quadratic equations.

ABSTRACT

Neurasthenia is characterized by physical symptoms and mental exhaustion, often causing considerable functional impairment and coexisting with other disorders. Proper diagnosis is vital to prevent the misinterpretation or disregard of the symptoms, ensuring that individuals receive effective treatment and achieve better overall functioning and well-being. This report describes clinical case of 24-year-old male presented with fatigue, difficulty breathing, palpitations, sweating on exertion, irritability, and anxiety, along with high blood pressure. The onset of tiredness was traced back to an accident in which patient sustained a fracture to his right metatarsal bones. Over time, the symptoms worsened, leading to increased mental and physical complaints that affected work and overall well-being. Despite seeking medical care and receiving treatment, patient did not experience relief. After reporting to outpatient department of homoeopathic hospital, based on clinical symptoms, the patient was diagnosed with neurasthenia and treated with Lecithin homeopathic medicine in a 6X trituration. Following this treatment, the patient showed significant improvements in both physical and mental health. The clinical response to the treatment was evaluated using the Fatigue Assessment Scale and the Outcome related to impact on daily living. This case demonstrates the Lecithin homeopathic medicine addressed the diverse symptoms of neurasthenia, leading to significant improvement in the patient's overall health and daily functioning.

Keywords: Neurasthenia, Lecithin, Fatigue, Mental health, Fatigue assessment scale, Homoeopathy.

INTRODUCTION

The term "Neurasthenia," initially introduced by E. H. Van Deusen in 1869, gained prominence when neurologist George Beard incorporated it in his 1868 article. Beard used this psychopathological term to characterise a condition marked by symptoms such as fatigue, headache, anxiety, heart palpitation, high blood pressure, neuralgia, and a depressed mood. According to Beard, neurasthenia was predominantly an affliction of American society, stemming from the "nervous exhaustion" induced by the rapid urbanisation of the time, particularly as a result of excessive work.[1]However, current thinking connects the disease mostly to emotional conflicts, tensions, frustrations, and other psychological variables.[2] Neurasthenia has a varied epidemiology impacted by socioeconomic, cultural, and historical factors. Its prevalence has decreased in Western nations due to modifications in diagnostic practices, but in other regions of the world, especially Asia, it remains a significant health concern. In many Asian societies, neurasthenia was traditionally recognized as a valid medical condition, allowing individuals to express their suffering without the stigma often linked to psychiatric diagnoses.[3] In the United States, the condition is identified as chronic fatigue syndrome (CFS), in Europe as fibromyalgia, and in East Asia as neurasthenia (NT). Despite the widespread occurrence of fatigue in the general population, neurasthenia is relatively infrequently diagnosed. Rehabilitative psychological treatment is considered effective for neurasthenia.[4]

According to Beard, stress-induced nervous weariness was the cause of neurasthenia. The depletion hypothesis explains that long-term stress reduces neurotransmitter levels, which in turn causes symptoms of depression and anxiety. The prerequisite knowledge for understanding neurasthenia is that the patient's symptoms are real, objective, and brought on by emotions that affect the autonomic nervous system.[5] Neurasthenia was officially listed in the International Classification of Diseases, 10th Edition (ICD-10) by the World Health Organization, which provided specific criteria for its diagnosis. For a diagnosis of neurasthenia, individuals must consistently report significant fatigue after mental tasks or persistent physical weakness and exhaustion with minimal effort. Additionally, they must display at least two of the following symptoms: muscle soreness, dizziness, tension headaches, sleep disturbances, inability to relax, irritability, or digestive issues.[6] If neurasthenia is not treated, it often becomes a persistent problem. The likelihood of it evolving into a chronic condition increases significantly with the presence of ongoing or past psychological distress. Additionally, this long-term disorder is strongly connected to higher unemployment rates and increased utilization of various health services. This case report observes the use of complementary medicine Lecithin in neurasthenia, with considerations of bodily distress disorders, aims to recognise potential therapeutic benefits in managing symptoms and improve quality of life.

METERIALS AND METHODS

Case Report

A 24-year-old unmarried male presented to the Outpatient Department of a Homeopathic hospital on June 21, 2023, reporting a history of significant health concerns. The primary complaints centred on persistent general weakness, difficulty in breathing, palpitations and sweating particularly during increased physical activity. Other reported symptoms included heartburn, characterized by a burning sensation ascending to the throat, often exacerbated at night and after meals. The patient experienced a frontal headache on most days of the week, which was aggravated by sun exposure and during the hours from noon until evening. This discomfort was also heightened in crowded places and was relieved by the application of pressure. Additionally, the patient had trembling hands while anxious and persistent pain in the right foot following a metatarsal fracture due to the accident. The patient began experiencing fatigue following an accident in 2017, which progressively worsened over time. Alongside this fatigue hegained weight, developed high blood pressure and other distressing physical and mental symptoms. The patient had previously seek medical consultation for these complaints, was advised for lifestyle modifications. As per patients narration hypertensive medicine was not advised because of his younger age. Despite conventional and complementary treatments, symptoms persisted.

Past history

Fracture after an injury in 2017 to the right metatarsal bones. An electrocardiogram (ECG) was done during an episode of chest pain in September 2022 as part of the diagnostic workup; however, the results showed that everything was within normal range except sinus tachycardia (pulse rate 120 beats per minute).

Family history

According to family history, the mother experienced hypotension and the father had high blood pressure.

Mental general

The patient also reported a pervasive sense of lethargy and aversion to work. He experienced anger over trivial matters, particularly triggered by disorderly placed items in a room and the untidy habits of his fellow mates. He was apprehensive about social judgment and concerned about what others said about him. He had persistent anxiety regarding heart disease and overall health. He felt trembling hands while nervous. The individual described himself as indecisive and yielding. Sometimes his sleep was disturbed by dreams, leading to sudden awakenings and a distressing sensation as if his heart had stopped beating. He was also anxious about the health of his family members. He was an undergraduate student with average academic performance and the second child in his family. His father was a physician, working in the medical field. As a child, he was shy, calm, and reserved. He often had disagreements with his older brother and sensed that his brother did not appreciate his presence.

Physical generals and Personal history

The patient was obese with a Body Mass Index (BMI) of 33.6 kg/m² and had a normal appetite that is two meals per day but could not withstand fasting. Thirst was normal, with no complaints about passing stool but had burning pain while passing urine. He expressed a desire for sweets and an aversion to bitter taste. There was no history of any addiction. On physical examination, a noticeable finding that stood out was high blood pressure 140/100 mm of Hg.

Diagnosis

In this case, the patient presented with a constellation of symptoms, including fatigue, dyspnoea, and palpitation upon exertion, dyspepsia, headache, and health anxiety. According to Beard's explanation and ICD – 10 criteria, these symptoms collectively align with the diagnosis of neurasthenia. The challenge in diagnosis was to identify it distinctly from other physical and mental disorders based on clinical evaluation. This case distinguished from generalised anxiety disorder, hypochondrias is and panic disorder for diagnosis. Score of self-rated fatigue assessment scale was 35(Normal: Score less than 22, mild to moderate fatigue: Score 22 to 34, severe fatigue: Score 35 or more) [7]

Therapeutic intervention

The patient reported to homoeopathic outpatient department on June 21, 2023 was prescribed homoeopathic medicine Phosphorus 30C according present symptoms and diagnosed as hypertensive patient. However, this medicine did not provide relief. Subsequently, Lecithin was prescribed considering for neurasthenia and addressing general weakness, tiredness, short of breath, palpitation, heartburn, headache, nervousness and internal trembling.

During follow-up visits, there was improvement in all complaints. (Table 1) Although his blood pressure showed some improvement, it remained in the range of 130 to 140 mm Hg for systolic and 80 to 90 mm Hg for diastolic measurements. He was also counselled to monitor his blood pressure, follow a balanced diet and lifestyle, and seek medical care. Laboratory investigations indicated an improvement in lipid levels and urinary parameters. (Table 2)

On Evaluation of treatment outcome by "ORIDL – Outcome Related to Impact on Daily Living" [8], Patient's response was: The main complaint for which you came for treatment - +4 back to normal, Your overall coping with the problem - +4 back to normal Your overall well-being - +4 back to normal, After treatment. score of self-rated fatigue assessment scale was 21(Normal: Score less than 22, mild to moderate fatigue: Score 22 to 34, severe fatigue: Score 35 or more). The potential causal relationship between the administered treatment and its effects was evaluated using the Modified Naranjo Criteria for Homeopathy(MONARCH).[9] The high MONARCH total score of +10

(within range of minimum -6 to maximum +13) indicates that the intervention with Lecithin homoeopathic medicine was likely responsible for the observed improvement.(Table 3)

DISCUSSION

Distinguishing between neurasthenia and organic disorders can also be challenging. The identification and management of it tend to pose difficulties. For its management need to adopt a holistic approach, considering both physical and psychological aspects. Upon seeking medical treatment, the patient received care primarily for physical symptoms but was not diagnosed with neurasthenia. Because neurasthenia can manifest through various physical symptoms, it may not be immediately recognized, which can lead to delays in receiving appropriate treatment. This highlights the complexity of diagnosing conditions that encompass both physical and mental health. There are many medicines indicated for this disorder in Homoeopathic materia medica like Anacardium orientale, Argentum nitricum, Calcarea carbonica, Kalium Phosphoricum, Lecithinum, Natrium muraiticum, Nux vomica, Phosphorus, Zincum metallicum and others. The homeopathic medicine Lecithin is a lesser-known remedy, with most of its therapeutic indications identified through clinical observation. Its first therapeutic description appeared in the 'Pocket Manual of Homeopathic Materia Medica' by William Boericke, published in 1906. This book has been a popular reference among homeopathic practitioners for its concise descriptions of homeopathic remedies and their therapeutic uses. Because lecithin medicine has a positive effect on the nutritional state, particularly on the blood, as this homoeopathic materia medica states, it is used to treat anaemia, convalescence, neurasthenia, and insomnia.[10] It is also indicated for mental exhaustion, forgetfulness, tired and weak extremities, lack of energy, and sexual debility. The complaints of patient developed gradually after an accident and increase in severity thereafter and also suffered from hypertension. Treatment with the homeopathic medicine Lecithin in trituration 6X potency was proven to be beneficial for the patient, leading to the alleviation of distressing symptoms, along with the restoration of self-confidence and an improved quality of life. The homeopathic system of medicine operates on the principle that remedies affect the body on a dynamic level rather than purely a physical or chemical one. These medicines gain substantial potency and energetic charge through potentization, even if they contain very few or no molecules of the original substance. The preparation of homeopathic medications involves rigorous succession methods and serial dilutions. In homeopathy, symptoms are viewed as expressions of the body's attempt to heal itself. The therapeutic approach aims to stimulate the body's self-regulating system, actively assisted and supplemented by Potentised medicine. [11] Thus, the choice of a homeopathic remedy is based on identifying the medicine that most closely matches the patient's complete symptom profile, including physical, emotional, and mental aspects. The selection of dose and potency depends on patient's susceptibility and nature of disease. In conclusion, this case report highlights the usefulness of Lecithin homeopathic medicine in treating neurasthenia and its role in delivering holistic care to the patient.

Informed Consent: Written Informed consent was obtained from the patient for publication of this case report.
Conflict of interest: The authors declare no conflicts of interest.

ABSTRACT

In India, the agricultural sector is vital, supporting millions of livelihoods and contributing significantly to the economy. Plant diseases threaten crop yields, food security, and farmer incomes, especially given the country's varied climates and diverse crops. Timely disease detection and management are crucial to mitigate losses, decrease pesticide use, and ensure produce safety. By leveraging modern technology, an efficient disease detection system can empower farmers to protect crops, boost productivity, and promote sustainable practices. This study focuses on developing a Convolutional Neural Network (CNN) model, pre-trained on VGG16, for detecting diseases in Solanaceae plants. The model is independently trained on two distinct datasets. Dataset-1 is created with solanaceae plant images (Tomato, Potato and eggplant), which are manually collected from local fields of Anand Agricultural University, Anand, Gujarat, India. Dataset-2 includes images of Solanaceae plants (Tomato, Pepper-bell, and Potato) sourced from the publicly available PlantVillage dataset. The model has achieved a commendable accuracy of 98.01% on Dataset-1 and 97.68% on Dataset-2.

Keywords: Plant diseases, solanaceae plants, machine learning, Deep Learning, Transfer Learning, VGG16.

INTRODUCTION

In the vast tapestry of Indian agriculture, solanaceous plants stand as key players, contributing significantly to the nation's food security and economic prosperity[1].Solanaceae, a family of flowering plants encompassing tomatoes, potatoes, eggplants, and peppers, form the cornerstone of Indian agriculture. However, these crops face a relentless onslaught from a myriad of diseases, ranging from fungal infections to viral outbreaks, posing substantial threats to crop yields and farmer livelihoods[2], [3], [4], [5]. Rapid and accurate disease detection is paramount for implementing timely control measures and preventing widespread crop damage. Disease detection systems facilitate early intervention, enabling farmers to adopt proactive strategies for disease management. Utilizing cutting-edge technologies likemolecular diagnostics, disease detection systems facilitate precise surveillance of disease outbreaks and targeted implementation of control strategies[6]. This enhances resource utilization while reducing environmental footprint. These systems yield crucial data on disease prevalence, spatial dispersion, and epidemiological patterns, informing policy decisions and research agendas for sustainable disease control[7]. Overall, investing in a solanaceae plant disease detection system is crucial for preserving agricultural productivity, ensuring food security, and fostering sustainable development in India. This paper examines recent advancements in plant disease detection, focusing on the methodology and development of model for identifying plant diseases. The study begins with a comprehensive literature review, detailing the materials and methods utilized, including specifics about the dataset and image preprocessing techniques. The research proceeds with the development of a model based on the pre-trained CNN VGG-16 architecture. Subsequently, the implementation details are elaborated upon, followed by a thorough presentation and discussion of the results in subsequent sections.

Related Work

Plant disease detection employs a range of advanced technologies, including computer vision techniques for image analysis, machine learning algorithms for pattern recognition, and often integrates IoT devices for real-time monitoring and data collection.Image processing and computer vision analyze color, texture, and shape patterns in plant images to identify disease symptoms visually[8], [9], [10]. Machine learning (ML) techniques, including supervised and unsupervised learning, categorize plants using features extracted from images.Panigrahi *et al*.examines the effectiveness of various supervised machine learning techniques, includingSupport Vector Machine, Decision Tree, Random Forest, K-Nearest Neighbor,Naive Bayes and in identifying diseases in maize plants with image data. Among these algorithms, Random Forestdemonstrates the maximum accuracy, achieving 79.23%[11]. Kurmi & Gangwar proposed leaf localization achieves an average FS of 0.918 with a 0.826 DC. Feature fusion aids classifiers in database classification. Performance is assessed using PlantVillage datasets, with LR, MLP, and SVM classifiers. The suggested technique surpasses contemporary methods, boasting an accuracy of 0.932 and an AUC of 0.903 in simulation analysis.[12].P *et al*. undertook a study to classify and predict diseases in leaf images of Solanaceae plants using random forest and CNN. Initially, the Random Forest method achieved 67.90% accuracy, but further experiments with the CNN model significantly improved accuracy to 95.53% after training and testing[13]. A study was conducted to detect highly susceptible diseases in Tomato and potato crops belonging to Solanaceae family and results indicate that the CNN-based model outperforms other techniques across various evaluation parameters, achieving the highest accuracy of 97%, followed by SVM (93%), logistic regression (91%), and KNN (89%)[14].Deep learning (DL) methods, such as recurrent neural networks, deep belief networks andconvolutional neural networks excel at automated feature extraction and classification tasks[15]. R. *et al*. proposed a study, which utilized the CNN's learned features across different processing levels with an attention mechanism, resulting in an overall validation set accuracy of 98% in 5-fold cross-validation[16]. A novel method has been devised by Lee *et al*. which is relying on a Recurrent Neural Network to autonomously identify contaminated regions and retrieve pertinent features for disease categorization. Through experimentation, it was demonstrated that RNN-based approach exhibits enhanced robustness and better generalization capabilities across unseen infected crop species and diverse images within the plant disease domain [17].DL models excel at processing complex, high-resolution images, rendering them well-suited for this task[18], [19]. Pre-learned CNN models are used for categorization of images in modern application[20].Transfer learning, a concept in DL, fine-tunes pre-trained models on plant disease datasets,

accelerating model training and improving performance, especially with limited labeled data[21], [22], [23]. Shafik *et al*. developed two plant disease detection PDDNet models, Lead Voting Ensemble (LVE)Early Fusion (AE), which integrate 9 pre-learned CNN models and undergo adjustments via in-depth feature acquisition to enhance plant disorderdetection and grouping efficiency. Experimentation revealed that PDDNet-AE achieved an accuracy of 96.74% and PDDNet-LVE got an accuracy of 97.79% [24].Sumalatha *et al*. presents a transfer learning strategy for disease identification utilizing 11,333 images distributed among 10 categories, covering 2 crop species and 8 diseases from the Plant Village dataset.CNN architecture including DenseNet121, VGG16, Resnet50, InceptionV3, Mobile Net and Xceptionwere assessed, with DenseNet121 emerging as the leading model, achieving 95.48% accuracy on the test dataset[25].These technologies, often integrated, offer versatile tools for swift and precise detection of plant diseaseswhich are crucial for improving agricultural productivity and ensuring food security.

Methodology of the proposed work

Workflow

This section outlines the workflow for classifying plant diseases. Initially, we collect a dataset of images from Fields at Main Vegetable Centre, Anand Agriculture University (AAU), and from the local agricultural fields of the Anand region. We then preprocess these plant images, which involves resizing, converting to LAB image space, applying Gaussian blur, and performing histogram equalization. The next step involves addressing the imbalanced dataset using SMOTE (Synthetic Minority Oversampling Technique) and further processing through normalization and data augmentation on the preprocessed images. We develop a model by employing transfer learning from a pre-trained CNN model, specifically VGG-16. We evaluate the effectiveness of the model based on various performance metrics.Further, this VGG16 model is also trained using 20,639 plant images of Pepper bell, Tomato and Potato belonging to 15 different classes, from the PlantVillage dataset. The workflow for the process of the model constructionis shown below.

MATERİALS AND METHODS

Data Collection and Dataset Description

In this study, we examine two different datasets. One comprising ofsolanaceae plant images collected from the fields of Anand Agriculture University, Anand and the other dataset includes Solanaceae plant images of the Plant Village Dataset, which is available on Kaggle [26]

Detailed description of Dataset

A dataset of images is collected from Fields at Main Vegetable Centre, Anand Agriculture University (AAU) and local agricultural fields of Anand region. It encompasses a total of 11336 images representing three distinct Solanaceae plant species: potato, tomato, and brinjal. These images were acquired during daylight hours under natural lighting conditions, and were captured utilizing a smartphone camera. The detailed description about the image capturing device specifications is given below.

Smart phone camera was used for capturing plant images from fields.

1. Image acquisition device Specifications

Mobile model: Samsung Galaxy A70

Camera Specifications: Triple

i) 32 MP, f/1.7, 26mm (wide), 1/2.8“ (sensor), 0.8µm (pixel size), PDAF (Phase Detection Autofocus)

ii)8 MP, f/2.2, 12mm (ultrawide), 1/4.0", 1.12µm

iii) 5 MP, f/2.2, (depth)

Image Dimensions: 2268 x 4032

Horizontal and Vertical Resolution: 72 dpi

These images are divided into 8 classes which are specified as follows.

1. Tomato (Healthy (C1), leaf curl disease (C2), late blight (C3),

Complex(leaf curl and blight) (C4))

2. Brinjal (Healthy (C5), little leaf disease (C6))
3. Potato (Healthy (C7), late blight (C8), leaf curl (C9), Little leaf(C10))

Description of Dataset-2

This dataset comprises approximately 54,000 photographs depicting both healthy leaves and instances of disease across various plant species. These images are meticulously grouped into 38 classes which contains 14 species and associated pathologies. The images within the dataset-2 exhibit diversity in terms of lighting conditions, angles, formats, bit depths, dimensions, and sizes, among other factors. For our analysis, we exclusively utilized 20,639 images of infected leaves from three species, namely pepper/bell, potato and tomato divided into 15 different classes.

1. Pepper/bell (Healthy (C1), Bacterial Spot (C2))
2. Potato (Healthy (C3), Early blight (C4), Late blight (C5))
3. Tomato (Healthy (C6), Bacterial spot (C7), Early blight (C8), Late Blight(C9), leaf mold(C10), Septorial leaf mold (C11), Spider mites (C12), Target spot (C13), Tomato Mosiac virus (C14), Tomato yellow leaf virus (C15)).

Image Pre-Processing

The preprocessing phase encompasses all techniques employed on the raw data (i.e., the complete image of the plant) to effectively prime the network input for achieving a more resilient and precise final model[27]. It helps to remove noise and variations from the plant images[28].

The steps given below shows the pre-processing techniques outlined in this section.

(i) Convert the image to LAB color space.
(ii) Split the LAB image into channels
(iii) Apply Gaussian blur to the L channel.
(iv) Apply histogram equalization to enhance contrast on the blurred L channel.
(v) Combine the equalized L channel with the original A and B channels.
(vi) Transform the equalized LAB image back to BGR color space.
(vii) Finally, we get an equalized image in the output.

In real-world scenarios and actual datasets, imbalanced data is common, where the minority class, typically vital, has substantially fewer samples compared to the majority class. This imbalance poses a major barrier for classification algorithms, especially when the loss associated with misclassifying the minority class is higher[29]and it negatively affects the result while calculating performance metrics for the developed model[30]. In addressing this issue, the Synthetic Minority Oversampling Technique (SMOTE) emerges as a leading method in imbalanced data classification research. SMOTE works by generating synthetic instances in the feature space based on the instance and its K-nearest neighbors. This method assists in mitigating over fitting and supports the classifier in defining clear decision boundaries between classes.[31].

Convolution Neural Network

The Convolutional Neural Network (CNN) is a widely adopted intricate network architecture, particularly effective in applications utilizing images as input.It consists of different layers including input layer, output layer, pooling layer, convolution layer fully connected layer [32].The pivotal component of a CNN is the convolutional layer, often referred to as the transformation layer. Its primary function involves applying a specific filter across the entire input image. Following the convolutional layers, the ReLU layer acts as a rectifier unit, converting negative values in the input data to zero. ReLU serves as the standard activation function in image classification tasks due to its effectiveness. Typically, a pooling layer succeeds the ReLU layer, tasked with reducing the input size for subsequent convolutional layers. This layer establishes connections with all neurons from the preceding layer, which results in 2D feature vector. The output from the fully connected layer is then fed into the Softmax classifier, which provides the final prediction regarding plant health[33]. In this study, we have constructed a model through transfer learning by leveraging the pre-trained CNN model VGG16, which has been trained separately using two distinct datasets. Detailed descriptions of these models are provided below.

CNN Model using Transfer Learning with VGG-16

Pretrained models like InceptionV1,VGG-19, VGG-16and InceptionV2 have already been trained on the Image Net dataset, which includes millions of images covering various image categories. Due to this extensive training, models have acquired a robust understanding of low-level features such as, shapes, edges, illumination diversity, rotations, and spatial arrangements. These acquired features can be utilized across different tasks, aiding in knowledge transfer and functioning as efficient feature extractors for new images in diverse computer vision scenarios. It is applicable to classification, regression, and clustering problems. Pretrained models are capable of extracting pertinent features through the principles of transfer learning even when confronted with images from entirely different categories than those present in the original dataset[34].

The specific configuration of the VGG-16 network depicted in above figure can be outlined as follows.

The initial two convolutional layers consist of 64 kernel filters each, with a size of 3×3. When a 3-channel RGB input image is fed into these layers, the dimensions transform to 224x224x64. Subsequently, the resulting output undergoes max pooling with a stride=2.The subsequent two convolutional layers employ 128 kernel filters each, sized at 3×3. The following layers perform max pooling with a value of stride =2, reducing the output dimensions to 56x56x128.Moving forward, layers five through seven are convolutional layers utilizing 256 feature maps with a 3×3 kernel size. Each of these layers is succeeded by max pooling with a stride of Layers eight through thirteen consist of two sets of convolutional layers with 512 kernel filters, each with a 3×3 kernel size. Following these layers is a max pooling operation with a stride of 1.Layers fourteen and fifteen represent fully connected hidden layers comprising 4096 units each, culminating in a softmax output layer (the sixteenth layer) containing 1000 units.

Implementation

The system was implemented using a PC equipped with an 11th Gen Intel(R) Core i9-1900K processor running at 3.50GHz and 32 GB of RAM. The operating system used was 64-bit Operating system, x64-based processor. The GPU employed to execute the code is NVIDIA RTX A2000 12GB. Moreover, the softwares employed in this study was Python 3.11.0 (Anaconda Environment), Jupyter Notebook, Tensorflow framework, keras, CudaTool kit. For image processing, we used openCV library. Previous studies often focused on crafting optimal feature sets to represent and solve problems. The advent of deep learning introduced the challenge of designing multilayered neural networks, encompassing considerations such as layer count, neuron quantity, and the choice of optimization algorithms and activation functions. This process equates problem-solving with structuring these networks optimally[35]. Hyperparameters emerged as crucial tools, often guided by intuition, for configuring machine learning models. These parameters, specific to the problem and dataset, are left to the designer's discretion and significantly influence model performance. Selecting the right hyperparameter set is pivotal but typically involves tedious manual efforts, although recent techniques offer automation possibilities[36]. Initial hyperparameter choices often necessitate iterative adjustments to achieve optimal results, sometimes aided by automated selection methods. While some hyperparameters offer a vast array of potential values, establishing value ranges based on preliminary problem understanding aids in their selection, creating value lists from specified key points within these ranges. Experiments are carried out to develop the model with transfer learning using VGG16 by varying the values of hyperparameters like number of epochs, learning rate, optimizer, loss function and model architecture and the model with hyperparameters leading to best efficiency based on various performance metrics is selected. After classifying data, it's crucial to assess performance. Prior studies have used various methods for this purpose[37]. In this paper, we employ the confusion matrix to evaluate our model's efficiency. This matrix reveals actual versus predicted labels, aiding in analyzing different aspects of performance. In our study, we utilize multiple iterations involving training, validation, and test datasets to comprehensively assess the performance of a CNN model. We evaluate metrics such as accuracy, precision, recall, and F1-score on the test datasets.

RESULTS AND DİSCUSSİON

In this research, each CNN model undergoes individual training using two different datasets. The dataset utilized in this study comprises images of Solanaceae plants from local agricultural fields in the Anand region and another dataset is subset of Plant Village Dataset which contains solanaceae plants. Each dataset is divided into distinct sets for training, validation, and testing. To train the network, we use training dataset, followed by testing the model and optimizing parameters using the testing set. The separation of training, validation, and testing datasets is carried out in the ratio of 80%, 10% and 10% respectively. The model's performance is evaluated across two separate datasets using various metrics, and the results are subsequently presented as shown in Table 3.

Visualization: The graphical representation using the plots of training accuracy/loss and validation accuracy/loss is plotted for various models on the two different dataset. The graphical representations provided in Figures 4 and 5 indicate that both the training and validation curves converge after certain number of epochs, suggesting that the developed model is well-suited to the data.

CONCLUSİON

The CNN model pre-trained on the VGG16 architecture is developed which demonstrates high efficacy in disease detection for Solanaceae plants. The innovation of this study lies in its focus on major Solanaceae plants cultivated in the local region, which are a primary food source. The developed model is trained on a dataset consisting of plant images collected from fields in the Anand region, capturing natural environmental conditions. To validate the model's performance on a standard dataset, it is also trained using the PlantVillage dataset, which is widely used in research. The model achieves impressive accuracy on both locally collected Dataset-1 (98.01%) and the PlantVillage Dataset-2 (97.68%). This consistency across distinct datasets highlights the model's robustness and potential applicability in diverse agricultural settings for effective plant disease management.These advancements promise to significantly assist local farmers in identifying plant health and diseases more effectively.The future trajectory of this research involves crafting a customized CNN model to enhance both accuracy and utility for society.

ACKNOWLEDGEMENT

The authors express their heartfelt thanks to the Main Vegetable Research Station, Anand Agriculture University, and local agriculture field owners in the Anand Region for their unwavering support and resources during the data collection phase of this research work. These facilities were crucial for experiments, data collection, and analysis, fostering innovation and academic excellence. Gratitude is also extended to the research scientists and junior fellows at Anand Agriculture University for their invaluable assistance and guidance throughout, particularly in image collection for dataset creation.

ABSTRACT

Squamous blepharitis is a prevalent and often recurrent condition observed in the community. This study aimed to assess the effectiveness of ManjishthadiGhanvati and PillaShukraNashakaAnjanaVarti in managing and preventing the recurrence of squamous blepharitis. A fully conscious, oriented male patient, aged 34, presented at the OPD of Vasudhaayurved clinic, Vadodara. He reported whitish, dandruff-like scales on the upper eyelid margins of both eyes for the past six months, along with itching, pain, watering, and redness in both eyes for one month. The scales worsened in the early morning. The patient was treated with PillaShukraNashakaAnjanaVarti for external application and ManjishthadiGhanvati orally for one month, with follow-up assessments conducted over the next month. By the end of the study, the patient showed complete remission of the whitish scales, as well as resolution of itching, pain, redness, and watering in both eyes. No recurrence of symptoms occurred during the follow-up period, and no adverse events were reported throughout the study. the findings suggest that Ayurvedic treatments can be effective in managing squamous blepharitis. This study highlights the value of an integrated approach to healthcare. However, since these observations are based on a single case, further validation through well-designed clinical trials is recommended.

Keywords: Anjana, Ghanavati**,** Squamous Blepharitis

INTRODUCTION

Squamous blepharitis is an inflammation affecting the hair follicles and Zeis glands along the eyelid margins. These glands produce an excessive amount of lipids, leading to the accumulation of white, dandruff-like scales on the eyelid edges and among the eyelashes. This condition is often accompanied by mild discomfort, irritation, occasional watering, and a history of eyelash loss. While modern medical text indicate that squamous blepharitis is treatable, it has a high rate of recurrence. However, Ayurvedic treatments may help reduce this recurrence.

MATERIALS AND METHODS

Patient History

A 34-year-old male patient, fully conscious and oriented, presented at the OPD of Vasudhaayurved clinic, Vadodara. His primary complaints included:

1. Whitish, dandruff-like scales on the upper eyelid margins of both eyes for the past six months.
2. Itching, pain, watering, and redness in both eyes for the last month.
3. The whitish scales worsened in the early morning.

Ocular examination (Torch light and Slit lamp): Both eyes Lid: Moderate whitish dandruff like scaling on upper eyelid margin and among the lashes. Conjunctiva: Moderate congestion on Palpebral and Bulbar conjunctiva
Cornea: Normal
Anterior chamber: Normal
Iris: Normal
Pupils :NSNR (Normal in Size/Reaction)
Lens: Normal
The visual acuity results for both eyes are as follows:
These findings indicate that the patient has normal visual acuity in both eyes, demonstrating clear vision for both distance and near tasks.

Past history: No relevant past history.
Personal History
Diet: Pureveg.
Appetite: Good
Sleep: Sound
Bowel: Regular
Bladder: Normal
Koshtha: Madhyama
Agni: *Samagni*

Vitals
Pulserate:73/min
Respiratory rate: 18/min
Blood pressure: 128/82mmHg
The laboratory findings revealed a haemoglobin level of 14.8%, a total leukocyte count (TLC) of 5,800 cells per cubic millimeter, with a differential leukocyte count showing 60% neutrophils, 34% lymphocytes, 2% eosinophils, 3% monocytes, and 0% basophils. The erythrocyte sedimentation rate (ESR) was within normal limits, and the random blood sugar (RBS) level was 81 mg/dl. Urinalysis results were also normal, with no abnormalities detected in the physical, chemical, or microscopic examinations. Investigations were conducted to assess the patient's overall health status.

Prior to initiating treatment, the patient provided written consent. Anjana was performed using PillaShukraNashakaAnjanaVarti, approximately 60 mg daily with water in the morning. Additionally, the patient was administered Manjishthadi Ghanavati, taking 2 Vati (500 mg) thrice a day with luke warm water after meals. Follow-up assessments were conducted for one month after completing the treatment.

RESULT

Patient's progressive reports are as follows:
Ocular examination (Torch light and Slit lamp): Both eyes
Lid: No whitish d and ruff like scaling
Conjunctiva: No congestion
Cornea: Clear
Anterior chamber: Normal
Iris: Normal
Pupils: NSNR (Normal in Size/Reaction)
Lens: Normal
The progressive ocular examination results indicate a significant improvement in the patient's condition following treatment. The absence of whitish dandruff-like scaling on the eyelids, along with the lack of conjunctival congestion, suggests a successful resolution of the inflammation associated with squamous blepharitis. Additionally, the clear cornea, normal anterior chamber, iris, and lens further confirm that no complications or residual effects are present. The findings of normal pupil size and reaction reinforce the overall positive outcome, indicating that the treatment not only addressed the symptoms effectively but also maintained the integrity of the ocular structures. This comprehensive recovery supports the efficacy of the Ayurvedic interventions utilized in this case. With this treatment, the patient achieved complete recovery. There were no signs or symptoms of recurrence during the one-month follow-up, and no adverse reactions were observed throughout the study and follow-up periods.

DISCUSSION

The symptoms and signs of squamous blepharitis can be correlated with Vartmagata Roga Klinnavartma[3]. PillaShukraNashakaAnjanaVarti possesses strong potency and deep penetration capabilities due to its blend of herbo-mineral ingredients, including *Triphala, Pippali, Katuki, Saindhava, Shankhabhasma*, and *Tamrabhasma,* which confer it the qualities of Rasaushadhi. Most of these components exhibit Katu, Tikta, and Kashaya tastes, along with Laghu, Ruksha, and Sukshma properties, KatuVipaka, and possess Ushna and Kaphahara attributes that help balance the Kapha and Pitta doshas. The Kashaya Rasa effectively reduces the Kaphadosha, while the TikshnaGuna and UshnaVeerya enhance the drug's penetration, aiding in the reduction of Kapha. When applied as Anjana, the medication reaches the *Netra Sandhi, Netra Shira,* and the channels of the head, nose, mouth, and surrounding areas, facilitating the expulsion of doshas from these regions, which contributes to disease resolution [4]. PillaShukraNashakaAnjanaVarti exhibits actions such as *Tridoshahara, Netra RogaNashaka, Krimighna*, and Kapha-Pittahara, in addition to properties that address skin disorders and purify the blood. Thus, it may function as bactericidal or bacteriostatic, detoxifying, blood-purifying, and anti-inflammatory. These combined properties likely aid in managing inflammation and infection, promoting healing of the condition. Praklinnavartma is classified as a Kapha-dominant [5]VartmaRoga. Acharya Sushruta noted the involvement of Rakta and MamsaDushti in the pathogenesis of VartmagataRoga[6], while Acharya Sharangdhara highlighted the use of ManjishthadiGhanavati for addressing Rakta and MamsaDushti[7]. Therefore, ManjishthadiGhanavati was chosen as a Rakta and MamsaShodhaka treatment for squamous blepharitis. Components of Manjishthadi Ghanavati possess Tikta and Kashaya tastes, along with Laghu and Ruksha qualities, making it effective in balancing Kapha and Pitta doshas while also purifying the RaktaDhatu. This formulation helps eliminate the Siranusaribhi Kaphadosha that contributes to Praklinnavartma. By purifying the blood and removing excess virulence from the affected area, the treatment

promotes the flow of cleaner blood to the site of the disease, which aids in combating the condition and reducing local inflammation.

CONCLUSION

This case study demonstrates that Ayurvedic treatments, specifically the use of PillaShukraNashakaAnjanaVarti and ManjishthadiGhanavati, can be effective in managing squamous blepharitis. The patient achieved complete resolution of symptoms, including the removal of whitish scales and alleviation of associated discomforts, without any recurrence during the follow-up period. The integrated approach of using these herbal formulations not only addresses the symptoms but also targets the underlying doshic imbalances contributing to the condition. This reinforces the potential of Ayurveda as a viable option for treating recurrent blepharitis. Future research involving larger sample sizes and controlled trials is recommended to further validate these findings and enhance the understanding of Ayurvedic management for this condition.

ABSTRACT

The incidence of air pollution is increasing day by day due to urbanization, road extension, agro-fields expansion, industrialization, mining activities and deforestation. Degraded quality of air is posing serious threat to environment, human health as well as plants and animals. Plants play important role in mitigating air pollution. Plants also can act as bio indicators and absorb pollutants directly from atmosphere. It is the high time when it is essential to recognize and classify the plants species into tolerant and sensitive groups. Air pollution can affect plants to varying degree. The entry of air pollutants to plants may take place directly by gaseous diffusion or from the contaminated soil, acidic air pollutant in particular. Pollutants cause injury at lethal concentration on sensitive plants while tolerant plants species are capable of sinking the pollutants to a considerable extent. Various air pollutants produce different types of injuries on exposed sensitive plants. Suspended particulates after deposition on foliage cause a number of damage to leaf function. The sensitivity of plants and tolerance index can be used in studies like 'Green Belt Development', traffic noise reduction and pollution mitigation at roadsides and around industries. The study was carried out to evaluate the APTI value of a good number of plant species and for the study seventeen plant species were selected in Nistarini College campus. Leaf samples were collected during winter season from the plant species. APTI values of the selected plant species like *Bombax ceiba (13.495±0.808) > Punica granatum (12.922±0.354) > Mangifera indica (12.654±0.287) > Albizia lebbeck (11.303±0.0301) > Ocimum tenuiflorum (10.433±0.201) > Cedrus deodara (9.303±0.0.389) > Tamarindus indica (9.216±0.879) > Acacia auriculiformis (9.021±0.249) > Caesalpinia pulcherrima (8.774±1.290) > Dalbergia*

sissoo (8.695±0.209) > Phyllanthus emblica (7.841±0.0443) > Tectona grandis (7.385±0.862) > Delonix regia (6.989±0.685) > Aegle marmelos (5.927±0.572) > Bauhinia variegate (5.317±0.255) > Psidium guajava (4.972±0.188) > Artocarpus heterophyllus (4.531±0.221) showed the tolerance level of the plants to air pollution. Plants having APTI value less than 11 are considered as sensitive, while APTI range 12-16 is classified as intermediate and APTI value greater than 17 is known as tolerant. The tolerant species like *Bombax ceiba, Punica granatum and Mangifera indica* can be used to create green belt to combat with the difficulties of air pollution while the rest plant species are recorded as sensitive and can be used as bio-indicators to detect the level of air pollution.

Keywords: APTI, Biochemical parameters, Bio indicator, Green belt, Chlorophyll, Ascorbic acid

INTRODUCTION

Increasing human population and as a result of that a wide range of developmental activities throughout the world with decreasing green environment are currently producing air pollution. Air is getting heavily polluted day by day mainly due to increasing number of industries, urbanization, vehicular exhaust, expansion of agro-fields, burning of fossil fuels etc. This deterioration of air quality is also producing adverse effects on human health (Manisalidis *et al*, 2020). Pollution is the largest environmental cause of diseases especially respiratory troubles and premature death of human beings. Air pollution also causes damage to green plants, animals, buildings, structures. The deterioration of environment due to pollution requires a cost effective technique to be cured. Air pollutant removal by vegetation is perceived to be a key to ecosystem service for mitigating air pollution (Gong *et al*, 2023). Plants can filter certain pollutants through absorption, adsorption and metabolism (Fujii *et al*, 2005). Thus, plants act as an important sink of air pollutants (Singh *et al*, 2019). Trees are able to improve air quality by removing particles and harmful gases from the atmosphere (Janhäll S, 2015) and converting carbon dioxide into oxygen through the process of photosynthesis. Urban vegetation may also help to reduce the urban heat island effect (Fadhil *et al*, 2023). Air Pollution Tolerance Index (APTI) is an empirical relation which evaluates the tolerance level of plant species towards air pollution based on four biochemical parameters of leaf such as total chlorophyll, ascorbic acid, leaf extract pH, and relative water content (RWC). APTI has been used in studies like green belt development (Shannigrahi *et al*., 2003), reduction and pollution mitigation along roadside and around industries. Plants having APTI value ≤ 11 are considered as sensitive, while plant having APTI value falls in the range 12-16 is classified as intermediate plant while APTI value ≥ 17 is known as tolerant plant (Chandra *et al*, 2021). The sensitive plant species can be used as bio-indicator to detect the level of air pollution while tolerant species can be widely used to create green belt to combat with the difficulties of air pollution. Bharti *et al*, 2018 observed air pollution tolerance index of plants growing near industrial sites. The categorization of plant species as sensitive and tolerant has huge importance as the susceptible plant species can be used to serve as indicators while as the tolerant ones can work as sinks to reduce the air pollution in urban areas (Singh *et al*., 1991). The leaf samples of different plant species were collected from the campus area of Nistarini College, Purulia to identify the tolerance level of plants to air pollution in the month of November, 2022.

MATERIALS AND METHODS

Purulia district is located in the western side of West Bengal. This district is between 22°42′35″ and 23°42′0″ North latitude and 85°49′25″ and 86°54′37″ East longitude. The geographical area is 6259 km². The sample collection site in Purulia was Nistarini College campus, Deshbandhu Road. The coordinates of Nistarini College Purulia are 23.3433 N and longitude 86.3665 E. Leaf samples were collected in the month of November 2022, from the mentioned site to estimate the APTI value. The fully matured leaves were collected from seventeen different plant species like *Mangifera indica, Bombax ceiba, Caesalpinia pulcherrima, Cedrus deodara, Albizia lebbeck, Punica granatum, Delonix regia, Phyllanthus emblica, Bauhinia variegate, Tectona grandis, Artocarpus heterophyllus, Tamarindus indica, Psidium guajava,*

Aegle marmelos, Acacia auriculiformis, Ocimum tenuiflorum, Dalbergia sissoo from college campus and were kept into different separate polythene bags and these were brought to laboratory for further biochemical analysis. The leaves were properly washed with distilled water. Five replicas were used for each plant for better accuracy. The pH (Singh and Rao, 1983), RWC (Sadia *et al*, 2019), Chlorophyll (Arnon, 1949) and Ascorbic acid (Mukherjee and Chaudhuri, 1983) were estimated with the help of Centrifuge machine and Spectrophotometer. Data of analytical results of biochemical parameter were presented by graphs and tables. Air Pollution Tolerance Index indicates the tolerance level of different plant species to air pollution and can be calculated as

APTI = [A (T+P)] + R / 10 (Singh and Rao, 1983)

A = Ascorbic Acid content of leaf (mg/g)

T = Total Chlorophyll Content of leaf (mg/g)

P = Leaf Extract pH

R = % Relative Water Content

RESULTS

Table 1: APTI value of Plant Species. Table 2: Total Chlorophyll Content of Tree leaves. Table 3: Ascorbic acid Content of Tree leaves. Table 4: pH level of Tree leaves. Table 5: table of Correlation coefficient

DISCUSSION

Analytical results were presented by respective tables and graphs. APTI values of the selected plant species like *Bombax ceiba (13.495±0.808) > Punica granatum (12.922±0.354) > Mangifera indica (12.654±0.287) > Albizia lebbeck (11.303±0.0301) > Ocimum tenuiflorum (10.433±0.201) > Cedrus deodara (9.303±0.0.389) > Tamarindus indica (9.216±0.879) > Acacia auriculiformis (9.021±0.249) > Caesalpinia pulcherrima (8.774±1.290) > Dalbergia sissoo (8.695±0.209) > Phyllanthus emblica (7.841±0.0443) > Tectona grandis (7.385±0.862) > Delonix regia (6.989±0.685) > Aegle marmelos (5.927±0.572) > Bauhinia variegate (5.317±0.255) > Psidium guajava (4.972±0.188) > Artocarpus heterophyllus (4.531±0.221)* showed the tolerance level of the plants to air pollution. Plants having APTI value less than 11 are considered as sensitive, while APTI range 12-16 is classified as intermediate and APTI value greater than 17 is known as tolerant. Dubey *et al*, (2023) assessed that effect of air pollution on the biochemical parameters of 19 tree and crop species selected from five different locations of Patna, Bihar, India. From air pollution tolerance index (APTI) value it was observed that *Ficus religiosa, Zea mays, Carthamus tinctorius* and *Cajanus cajan* were more tolerant in comparison to the other crops. Sahu *et al*, (2020) undertook an investigation to study the Air Pollution Tolerance Index (APTI) of trees of Sambalpur town during monsoon, post-monsoon and pre-monsoon in the period 2015-2016. Sample leaves of selected common species were collected from five polluted or experimental sites and a non-polluted or control site. The APTI range of the trees in the control site was from 8.99 (*Butea monosperma*) to 31.63 (*Peltophorum pterocarpum*), while in the experimental sites the range was from 10.47 (*Tamarindus indica*) to 18.04 (*Mimusops elengi*). It was found that in most cases (67.71%), the APTI values were higher in experimental sites than that of the control site. A study (Sharma *et al*, 2019) was conducted in Himachal Pradesh, constituting a very vital part of the Indian Himalayan Region. It was observed that from the APTI value *Grevillea robusta* (62.50%) was the highest scoring plant species in trees; *Rubus ellipticus* and *Debregeasia saeneb* were the highest scoring shrub species (56.25%) each) and thus these species can be recommended to develop green belt and for lessening of air pollution in the area. *Punica granatum* can be recommended for plantation among the native species. Molnar *et al*, 2018 observed that the tolerance of plant species at different study sites decreased in the following order: industrial> roadside>urban areas. From the investigation of Patil *et al*, (2009) it was observed that *Calotropis gigantea* (excellent), *Artocarpus heterophyllus* (very good) and *Mangifera indica* (very good) could be efficiently used to develop green belt development along road side area. APTI value of each plant species were calculated from the obtained analytical results of the parameters like Ascorbic Acid, RWC, Total chlorophyll, pH and it is observed that *Bombax ceiba, Mangifera indica*, *Punica granatum* are the intermediate species that can be grown to develop green belt along the roadside or around the mining area, industrial belt, urban area to naturally combat with the air pollution as these species can tolerate the burden of

pollutants in better way than sensitive one while the sensitive plant species can be used as bio indicator. These species will be affected by the air pollutants and tolerance levels of these plants to the air pollutants are low. It is observed from correlation coefficient value (Table 5) that a significant positive correlation is found between Total Chlorophyll, ascorbic acid, RWC and APTI at 5% level of confidence. Shahrukh *et al*, 2023 observed a significantly strong positive correlation between APTI and relative water content (RWC) ($r = 0.864$; $p < 0.001$) and between APTI and ascorbic acid content (AAC) ($r = 0.748$; $p < 0.01$). Total Chlorophyll content of the said plant species are decreasing as follows *Mangifera indica > Bombax ceiba > Caesalpinia pulcherrima >Cedrus deodara> Albizia lebbeck > Punica granatum >Delonix regia>Phyllanthus emblica> Bauhinia variegate> Tectona grandis > Artocarpus heterophyllus > Tamarindus indica> Psidium guajava Aegle marmelos> Acacia auriculiformis> Ocimum tenuiflorum > Dalbergia sissoo* (Table 2). Ascorbic acid content of the plant species follow the order as stated in Table 3 *Cedrus deodara > Mangifera indica > Tamarindus indica > Bombax ceiba > Punica granatum > Bauhinia variegate > Acacia auriculiformis> Dalbergia sissoo > Albizia lebbeck > Psidium guajava >Phyllanthus emblica > Delonix regia > Aegle marmelos > Ocimum tenuiflorum > Tectona grandis > Artocarpus heterophyllus > Caesalpinia pulcherrima*. pH of the said plant species are decreasing as follows *Bombax ceiba > Bauhinia variegate> Albizia lebbeck > Tectona grandis and Cedrus deodara> Acacia auriculiformis> Psidium guajava >Aegle marmelos> Delonix regia* and *Mangifera indica> Dalbergia sissoo >Artocarpus heterophyllus > Ocimum tenuiflorum >Caesalpinia pulcherrima > Punica granatum>Phyllanthus emblica> Tamarindus indica* (Table 4). RWC (%) of the plant species follow the order as stated in the Fig1, Fig 2 and Fig 3 *Punica granatum> Bombax ceiba >Mangifera indica> Ocimum tenuiflorum > Albizia lebbeck> Tamarindus indica> Caesalpinia pulcherrima> Phyllanthus emblica> Dalbergia sissoo> Acacia auriculiformis> Tectona grandis >Cedrus deodara> Delonix regia>Aegle marmelos>Artocarpus heterophyllus> Psidium guajava> Bauhinia variegate*

ACKNOWLEDGEMENT

Authors wish to express their thankfulness to Dr. Indrani Deb (Principal), Nistarini College, Purulia for her continuous support and co-operation. Authors wish to record their warmest gratitude to the teachers (HOD), Sri Priyabrata Mukherjee, Dr. Sabyasachi Mukhopadhyay, Smt. Sayantika Dey and non-teaching staff Sri Debasish Das Karmakar of the Department of Environmental Science for their constant encouragement and valuable suggestions.

ABSTRACT

This study explores the green synthesis of magnesium oxide nanoparticles (MgO NPs) using aqueous extracts derived from the seeds of Citrulluslanatus (watermelon). The synthesis process employs a simple, eco-friendly method that minimizes toxic byproducts, aligning with sustainable nanotechnology principles. Characterization of the synthesized MgO NPs was performed using techniques such as UV-Vis spectroscopy, scanning electron microscopy (SEM), and confirming the formation of well-dispersed nanoparticles with a cubic structure and an average size of approximately 20-30 nm. The antibacterial activity of the MgO NPs was evaluated against common pathogens, revealing significant inhibitory effects, indicating their potential as effective antimicrobial agents. Furthermore, the applicability of these nanoparticles in catalysis and environmental remediation was assessed, demonstrating their capacity to degrade organic pollutants in aqueous solutions. This research highlights the dual advantage of utilizing agricultural waste for nanomaterial production while providing insights into the diverse applications of MgO NPs in health and environmental sectors.

Keywords: Citrulluslanatus seeds, SEM, UV-Vis, FTIR, Antibacterial Activity.

INTRODUCTION

Metal nanoparticles have received a lot of interest in recent decades due to their capacity to improve a variety of physical and chemical properties on the nanoscale. As environmental concerns, nonrenewable resource depletion,

and public health issues continue to rise, there has been a noticeable increase in the development of sustainable products and technologies. In response, researchers have turned to natural chemicals to explore alternative techniques to create nanoparticles of metal and metal oxide, thereby decreasing the toxicity associated with chemical counterparts utilized in biological systems [A. Rana *et al*., 2020]. Metal oxides including AuO, AgO, CuO, ZnO, and NiO are frequently used in nanomaterial production.. However, nano Magnesium Oxide (MgO) has gained increased interest due to its unique physical and biological properties. Although bacteria, fungi, and algae are used in the manufacture of MgO nanoparticles, their slow production rates and scarcity limit their application in biomedical domains [P.S. Rawat *et al*., 2021]. Plant extracts contain phytochemicals that function as reducing and capping agents, which allow for the biological synthesis of stable MgO nanoparticles via a plant-mediated method. This approach is renowned for its simplicity, non-toxicity, and environmental friendliness. The many biomolecules included in these plant extracts influence the biocompatibility of the produced metal nanoparticles [Amrulloher *et al*., 2000]. In developed countries, cardiovascular illnesses and cancer are the primary causes of death and disability, with cancer being the largest cause of death worldwide. While chemotherapy improves survival rates, it can also cause serious cardiovascular side effects, including life-threatening cardiotoxicity [X. Liu *et al*., 2022]. Doxorubicin (DOX), a potent anthracycline antibiotic commonly used in cancer treatment, has been linked to dose-dependent cardiac injury [P.S. Rawat *et al*., 2021]. Oxidative and nitrosative stress, as well as various kinds of apoptosis in heart tissue, have been identified as essential mechanisms behind doxorubicin-induced cardiotoxicity (DIC). However, the exact mechanisms are only poorly understood [Das, B.; Moumita, S *et al*., 2018]. Recent study has shown that DIC is predominantly caused by the activation of pro-oxidant pathways and a decrease in antioxidant enzyme activity [Jin, H.; Zhao, X *et al*., 2017]. Mitochondria, which account for roughly 40% of each cardiac muscle cell, are both the primary source and target of Reactive oxygen species (ROS) and damage caused by DOX [Jin, H.; Zhao, X *et al*., 2017].

Heart tissue has fewer antioxidant defenses than organs such as the liver and kidneys, making it more sensitive to poisons such as Doxorubicin. This increased susceptibility is related to a number of reasons, including the large concentration of mitochondria, the quick pace of oxidative phosphorylation, and the creation of ROS. Additionally, the presence of p53 and caspase proteins promotes apoptosis and mitochondrial malfunction. Heart cells, or cardiomyocytes, in particular, have poorer antioxidant defenses, making them more vulnerable to oxidative injury [Pilarska, A.A *et al*., 2017]. Cardi protective therapies are commonly utilized to protect cancer patients' hearts from doxorubicin-induced damage. Exogenous antioxidants are one strategy for reducing the impact of free radicals on the heart. Polyphenols and flavonoids, which are powerful antioxidants, have been found to help prevent or mitigate the severity of cancer, cardiovascular disease, diabetes, and neurological illnesses are some of the diseases that. This demonstrates their potential for treating DOX-induced cardiotoxicity[Gupta P, Jain V *et al*., 2017]. Citrulluslanatus is well-known over the world for its health advantages, which are attributed to the elevated levels of phenolic compounds and flavonoids present in various sections, including seeds. These chemicals have been demonstrated in studies to have anti-inflammatory, anti-diabetic, and antihyperlipidemic properties, making the plant useful in the treatment of cardiovascular disease and immune system health. Citrulluslanatus seeds are very beneficial for their antioxidant and antibacterial characteristics [S.S.ElShaer *et al*., 2017]. Citrulluslanatus seeds were selected for the manufacture of magnesium oxide nanoparticles due to their high flavonoid and phenolic content, which has tremendous potential for medical applications. This makes them an attractive candidate For the ecologically friendly production of nanoparticles [Park, J.-W.; Lee, W *et al*., 2016].This work seeks to provide a thorough understanding of antioxidant-based nanoparticles created from natural sources, with a particular emphasis on how they function as transporters for bioactive chemicals found in Citrulluslanatus seeds. The study also looks into their efficacy in scavenging free radicals from cells to prevent or mitigate oxidative damage, as well as their antibacterial capabilities.
The paragraph discusses the successful green production of gold and silver nanoparticles with Citrulluslanatus seed extract, which has a variety of positive properties. While the large amount of content of Seeds containing L-dopa promotes the production of other nanoparticles, there has been little investigation into the green synthesis of MgO nanoparticles with this extract. This paper describes an environmentally friendly method for generating MgO nanoparticles from an aqueous extract of Citrulluslanatus seeds, utilizing the bioactive chemicals as lowering and shielding agents when the synthesis is happening. The study also looks at the biosynthesized MgO nanoparticles'

ability to degrade methyl orange and methylene blue dyes, as well as their antibacterial and antioxidant properties in vitro using the DPPH assay.

Analysis of Citrullus Lanatus Seeds Extract

Evaluates the collection of 1Citrullus lanatus seeds. Production of magnesium oxide nanoparticles. Characterization of Nanoparticles. Anti-oxidant action. Antibacterial action.

MATERIALS AND METHODS

Collection of plant samples. Materials Magnesium nitrate (Mg(NO3)2. 6H2O) from NICE Chemicals Pvt. Ltd. (Kochi), rectified spirit (E.I.D. Parry (I) Ltd., Nellikuppam), distilled water and sodium hydroxide solution. For the fabrication of nanoparticles, plant extracts from Citrulluslanatus seeds were used.
collected in Tirupattur district, Tamil Nadu, India.

Experimental

Preparation of the *Citrulluslanatus* extract

Good grade Citrulluslanatus seeds [Figure -1] were chosen and ground to a fine powder. Using a magnetic stirrer, 0.5g seed powder was dissolved in Equal parts rectified alcohol and 50 milliliters of distilled water. For several hours, the solution was kept undisturbed in order to give the precipitate time to settle. For the manufacture of MgO nanoparticles, the thick white supernatant was utilized as the plant extract, while the remaining portion was disposed of.

Synthesis of MgO nanoparticles using *Citrulluslanatus* extract

After dissolving 0.5g of magnesium nitrate (Mg (NO3)2.6H2O) in 50mL of distilled water, 2 mL of the resulting solution was combined with 2 mL of the seed solution that was generated. A magnetic stirrer was used to thoroughly combine this material. A pH range of 10 to 12 was achieved within a few minutes by gradually adding NaOH solution, which almost immediately caused colloidal formation. Using a magnetic stirrer, this liquid was vigorously stirred for several hours. After then, it was left alone until the colloidal suspension stabilized. After that, the colloidal suspension was gathered and the supernatant was thrown away. Until the water evaporated, the suspension was kept at 250˚C in a hot air oven. After that, the finished product was cooled.

UV-visible spectrum for synthesized nanoparticles

The sample's maximum absorbance was determined using a UV-Visible spectrometer. UV and visible light were used to examine the optical characteristics of MgO nanoparticles absorption spectroscopy in the 200–800 nm range.

FTIR analysis for synthesized nano particles

The FTIR spectrum was acquired in the 400–4000 cm range. The spectrum was captured using the C. The dry sample was mixed. In transmittance mode, the spectrum was measured using a KBr (1:200) crystal.

SEM analysis for synthesized nanoparticles

Scanning electron microscopy images of MgO nanoparticles revealed that the particles are rod-shaped. SEM images revealed well-dispersed nanorods of MgO-NPs with no agglomeration. Hassan *et al*. synthesized spherical Rhizopusoryzae-mediated magnesium oxide nanoparticles and investigated their morphology using SEM.

DIPHENYL-1-PICRYLHYDRAZYLFREE RADICAL SCAVENGING ACTIVITY ASSAY BY BRAND-WILLIAMS

This test used extracts with concentrations of 20, 40, 60, 80, and 100µg/mL. First, 3 mL of extract from each concentration was mixed with 1 mL of a 0.1 mmol/L DPPH solution [Fernandus Durai *et al.,* 2024]prepared in methanol. The tubes were then incubated in the dark at room temperature for 30 minutes before being measured at

517 nm using a UV-VIS spectrophotometer. The solvent without extract was used as a negative control, with AA serving as the positive control. The effect of antioxidant capacity was observed as a color shift of purple DPPH to yellow/light-yellow, and the percentage inhibition values of each extract were calculated using the equation below.
Inhibition(%) =[(Acontrol—Ablank)—(Asample —Ablank)]×100/(Acontrol— Ablank),
where A control is the absorbance of the negative control and A sample is the absorbance of the extracts or AA. Following the plotting of sigmoidal curves, inhibitory concentration (IC50) values were computed using a four-parameter logistic regression model. Each standard and sample was measured in triplicate, and the mean results were utilized in the calculations.

Antibacterial activity by Agar Well Diffusion

The agar well diffusion technique is commonly used to assess the antibacterial activities [FernandusDurai *et al.,* 2024] of plants and microbial extracts. Similar to the disk-diffusion approach, the Surface of an agar plate is infected by distributing a large amount of microbial inoculum throughout the surface. A 6mm diameter hole is punched aseptically with a sterile cork borer or tip, and a volume (50-150 µl) of aqueous extracts of SLSE, MgO nanoparticles, and mixture at desired concentration is put into the well. The positive control Gentamycin disc was kept on the agar surface. The agar plates are then incubated under proper conditions for the test microorganism. The antibacterial ingredient diffuses in the agar media, inhibiting microbiological growth.

RESULTS AND DISCUSSION

UV–Vis Spectroscopy

The UV-Vis absorption spectrum of MgO nanoparticles was investigated over a wavelength range of 200 to 800nm as illustrated in [Figure - 2].The prominent signal detected at [Table-1]273.7 nm implies the presence of MgONPs inside the reaction environment, resulting from the reduction of Mg(NO3)2.

FTIR analysis

FT-IR spectroscopy was utilized to identify the various Functional groups of possibilities biomolecules in the plant extract, [Table – 2]which could act as both Agents that reduce and cap for produced MgO NPs. [Figure – 3] shows noteworthy Absorption bands are found at 3696, 1632, 1383, 1161, 1015, 837, 604, and 443 cm^{-1}.The infrared band near 3696 cm^{-1} indicates significant vibrations of O-H bonds. The band at 1632 cm^{-1} represents conjugated alkene (C=C) vibrations related with amide or flavonoid compounds identified in citrulluslanatus seeds extract. The 1383 cm^{-1} band represents C-H aromatic amine groups are stretched. The aggressive band at 1351 cm^{-1} corresponds to Bending vibrations between C and H of alkane molecules. The C-O band at 1161 cm^{-1} appears weakly as a result of tertiary alcohols. A peak at 443 cm^{-1} implies C-I stretching. The FTIR spectrum reveals the presence of bioactive substances. chemicals in citrulluslanatus seed extract, which are believed to work as reducing and capping agents for MgO NPs. The extract contains flavonoids and a high concentration of L-dopa (amino acid analogue), which has substantial antioxidant action. It is thought that the presence of L-dopa plays an important role in the reduction and stabilization of MgO NPs, allowing for effective synthesis. L-dopa in citrulluslanatus seed extract functions as a reducing, capping, and stabilizing agent in the green synthesis of nanoparticles.

SEM analysis

[Figure 4] shows scanning electron micrographs (SEM) of MgO nanoparticles. The SEM pictures show that Dense rod-shaped flakes were created via the aggregation of nanoparticles. An identical dispersion of MgO nanoparticles is seen across the whole exterior. Furthermore, the photos show both small and huge bits of product constituents. The generated magnesium oxide's particle sizenanoparticles ranges from 111 to 212 nm.

Antioxidant activity of MgONanoparticles from *citrulluslanatus* seeds

The sample's Antioxidant action was tested using the **[**FernandusDurai *et al.,* 2024]DPPH (2,2-diphenyl-1-picrylhydrazyl) radical, which was detected [Figure – 5] by a decrease in absorbance of the DPPH methanol solution

after interaction with MgONPs. When coupled with DPPH, the sample containing hydrogen as a donor (A-H) showed a considerable absorbance at 517 nm, resulting in a color change from dark violet to pale yellow. This shift implies that electrons are transferred from MgO NPs, resulting in the conversion of the free radical to a non-radical state, and the antioxidant activity of citrulluslanatus seed extract was assessed.

Antibacterial activity MgONanoparticle

The Well-diffusion approach was used to assess antibacterial activity. Escherichia coli and Bacillus subtilis cultures [Table – 3] were grown overnight on nutrient media. A sterile cotton swab was wet with the inoculum suspension and used to spread it evenly on the dried Nutrient agar plate. Solvent extracts containing MgO nanoparticles from Citrulluslanatus seeds were added to 5mm diameter [Figure – 6] wells on the agar surface at different doses (50, 100, 150 µl). Plates were incubated at37ºC for 24 hours to quantify and evaluate clear zones of inhibition around the wells. The results showed considerable antibacterial sensitivity across all tested concentrations [11&12].

CONCLUSION

The process described involves the creation of magnesium oxide nanoparticles using an aqueous extract produced from Citrulluslanatus seeds. UV-Vis spectroscopy, Fourier-transform infrared spectroscopy, and scanning electron microscopy (SEM) were employed to investigate the nanostructures. Our findings show that extracts from Citrulluslanatus seeds effectively combat free radicals and increase antioxidant capacity in a way influenced by their composition. Various chemicals contained in the seeds, such as tannins, phenolics, carbohydrates, including reducing sugars, protein components, and flavonoids, are likely responsible for their antioxidant action. Our findings imply that Citrulluslanatus seeds have antioxidant qualities and could be used to treat disorders caused by free radicals. MgO nanoparticles generated by biosynthesis have significant antibacterial effects against both Gram-positive (Bacillus subtilis) and Gram-negative bacteria (Escherichia coli). As a result, they show potential for many different biological uses.

ACKNOWLEDGMENT

I thank the management of Sacred Heart College (Autonomous) Tirupattur, and the PG and research departments of Biochemistry and PG and research departments of Chemistry laboratories help to complete the work successfully.

ABSTRACT

The experimental study entitled "Effect of various nutrients and gibberellic acid on growth and yield of Gladiolus (*Gladiolus grandiflorus* L.) cv. White Prosperity" was carried out in a farmer's field at Sevaganapalli, Hosur taluk, Krishnagiri district, Tamil Nadu, during 2023–2024. The study comprised of various treatments with different recommended doses of inorganic nutrients *viz*., 50 per cent (60:75:75 kg of NPK ha^{-1}), 75 per cent (90:112:112 kg of NPK ha^{-1}) and 100 per cent (120:150:150 kg of NPKha^{-1}) and incorporated with basal application of organic nutrients *viz*., Farmyard Manure with two different doses (15 t ha^{-1} and 20 t ha^{-1}), Vermicompost with two different doses (3 t ha^{-1} and 5 t ha^{-1}) and Coir pith compost with two different doses (5 t ha^{-1} and 10 t ha^{-1}) along with foliar application of micronutrient mixture in two different concentrations (0.5 % and 1 %) at 30 and 60 days after planting (DAP) and foliar application of gibberellic acid in two different concentrations (100 ppm and 200 ppm) at 45 days after planting (DAP). This experiment was carried out in a Randomized Block Design (RBD) with three replications comprising of thirteen treatments. Among the various growth and physiological parameters *viz*., days taken for sprouting of corms (days), sprouting percentage (%), plant height (cm), number of leaves $plant^{-1}$, leaf area (cm^2), chlorophyll content index (CCI) and dry matter production (g $plant^{-1}$) exhibited maximum performance in the treatment T_{12} (50 % RDF @ 60:75:75 kg of NPK ha^{-1}+ Vermicompost @5t ha^{-1}+ Coir pith compost @ 10^{th} a^{-1} along with foliar application of micronutrient mixture @ 1% at 30 and 60 DAP and gibberellic acid @ 100 ppm at 45 DAP).In terms of yield parameters *viz*., number of marketable spikes $plot^{-1}$, number of marketable spikes $hectare^{-1}$, number of corms $plant^{-1}$, diameter of the corm (cm), weight of the corm (g), number of cormels $plant^{-1}$, weight of the cormels (g)

performed well in the best treatment T_{12} than the other treatments. The second best performance was observed in treatment T_{11}, with the application of 75% RDF @ 90:112:112 kg of NPK ha^{-1}+ Vermicompost @ 3 t ha^{-1}+ Coir pith compost @ 5 tha^{-1} along with foliar application of micronutrient mixture @ 0.5%at 30 and 60 DAP and gibberellic acid @ 200 ppm at 45 DAP.

Keywords: Gladiolus, Farmyard manure, Vermi compost, Coir pith, Micronutrient mixture, Gibberellic Acid.

INTRODUCTION

Flowers have been woven into the fabric of human culture for centuries, symbolizing beauty, emotion and celebration. Their vibrant colors, captivating fragrances and delicate forms create environments that are both inviting and uplifting. Beyond their aesthetic appeal, flowers hold deep emotional significance, often used to express a wide range of sentiments, including joy, sorrow, love and sympathy. In recent years, there has been a growing interest in analyzing the developments within the floriculture industry at both international and national levels, as it continues to expand and adapt to market demands (Sharma *et al*., 2023). As per the National Horticulture Database published by National Horticulture Board, during 2023-24 period, this sector achieved a significant production level of 285 thousand hectares, with a production of 2,284 thousand tonnes of loose flowers and 947 thousand tonnes of cut flowers (APEDA and NHB, 2023-24). Hailed as a flower of glamour and perfection, compared to other cut flowers the gladiolus is universally admired for its prestige. It has a great economic value as a cut flower and is known as 'Queen' amongst the bulbous flowers. The word Gladiolus is derived from a Latin word "*Gladius*" meaning "a sword" due to the shape of the leaves and also called as Sword lily. Gladiolus (*Gladiolus grandiflorus* L.) is native to South Africa. The genus of gladiolus is the largest genera of Iridaceae family which consist of 270 species and 1000 cultivars (Allawi and Atrakchii, 2020). The application of inorganic amendments, such as nitrogen, phosphorus, and potassium, ensures an adequate supply of essential nutrients for rapid crop growth during early development and enhances economic yield. Organic amendments like farmyard manure, vermicompost, and coir pith compost improve soil texture, porosity, and water retention, while promoting a favorable microbial environment that boosts soil fertility. Additionally, micronutrients, applied through foliar sprays, play a crucial role in enhancing photosynthesis and other metabolic processes associated with cell division and elongation, thereby supporting overall plant growth and development (Kaur *et al*., 2023). Gibberellic Acid (GA_3) is well-known for its role in enhancing various plant growth parameters resulting in high-quality produce (Kumar *et al*., 2024). In this study attempt is made to find out the effect of various nutrients and gibberellic acid on performance of Gladiolus and find out the best treatment combination for maximizing growth and yield of Gladiolus.

MATERIALS AND METHODS

The present study entitled "Effect of various nutrients and gibberellic acid on growth, flowering, yield and quality of Gladiolus (*Gladiolus grandiflorus* L.) cv. White Prosperity under open field condition was carried out in a farmer's field at Sevaganapalli, Hosur taluk in Krishnagiri district in Tamil Nadu during the period 2023-2024. The experiment was arranged using a randomized block design with a plant spacing of 30 cm x 15 cm, with each plot containing 9 experimental plants. The recommended dose of inorganic fertilizer *viz*., Nitrogen, Phosphorus and Potassium were applied in the form of urea, single superphosphate and muriate of potash along with the required amount of organic inputs like farmyard manure, vermicompost and coir pith compost have been incorporated into the soil and then it was treated with foliar application of a micronutrient mixture and gibberellic acid to the experimental field as per the treatment schedule. Observations were recorded on five selected plants per treatment in each replication, and the mean data were analyzed statistically. Hand weeding was carried out, whenever it was found necessary depending upon the weed population to keep the field free from weeds. Irrigation was given at regular intervals ranging from 3-5 days depending upon soil moisture and weather conditions. The data were

analyzed statistically following the methods outlined by Panse and Sukhatme (1985)). Data of three replications were tabulated and recorded. The treatment details are shown in the Table 1.

RESULT AND DISCUSSION

Continuous use of inorganic fertilizers on highly weathered soils can deteriorate soil structure and nutrient retention capacity, ultimately hindering crop growth and yield. Nutrients are essential for plant growth and development, acting as building blocks for various physiological and biochemical processes. For gladiolus, a balanced supply of key nutrients is vital for optimal growth and yield. Nitrogen is fundamental for synthesizing amino acids, proteins and chlorophyll, which promotes robust vegetative growth and enhances photosynthetic efficiency. Phosphorus supports energy transfer, root development and flowering, while potassium plays a critical role in water regulation, enzyme activation and disease resistance. Among the various technologies to boost up the productivity, applications of organic amendments like farmyard manure, vermicompost and coir pith compost improves the soil texture, soil porosity and water retention capacity and maintains a congenial microbial population in which it increases the soil nutrition and at the same time it reduces the use of inorganic fertilizers. Micronutrients are crucial for the proper growth and flowering of plants. Foliar application of these nutrients is an effective method, as it can be tailored to meet specific plant needs for macronutrients, which are essential for accelerating plant growth and development. The application of plant growth regulators has significantly impacted the floriculture industry, bringing notable advancements in the cultivation of various horticultural crops. These regulators have proven beneficial in controlling growth and flowering, resulting in high-quality produce. The experimental evidence obtained from the study entitled "Effect of various nutrients and gibberellic acid on growth and yield of Gladiolus (*Gladiolus grandiflorus* L.) cv. White Prosperity" are discussed hereunder. The data and their results are present in table (2 and 3) on growth and physiological parameters *viz*., days taken for sprouting of corms (days), sprouting percentage (%), plant height (cm), number of leaves plant^{-1}, leaf area (cm^2), chlorophyll content index (CCI) and dry matter production (g plant^{-1}) and yield parameters *viz*., number of marketable spikes plot^{-1}, number of marketable spikes hectare^{-1}, number of corms plant^{-1}, diameter of the corm (cm), weight of the corm (g), number of cormels plant^{-1} and weight of the cormels (g) are tabulated in table 4.

Growth parameters

Growth parameters are crucial, as they directly influence the yield attributes of a crop.Application of various nutrients significantly influenced performance of gladiolus on its growth and physiological parameters. The effect of treatments concluded that the treatment T_{12} with the application of 50 per cent recommended dose of fertilizers combined with vermicompost @ 5 t ha^{-1} and coir pith compost @ 10 t ha^{-1} into the soil, along with foliar application of micronutrient mixture @ 1 per cent at 30 and 60 days after planting and gibberellic acid @ 100 ppm at 45 days after planting performed well in all the growth and physiological parameters, which recorded earliest sprouting (8.51 days), sprouting percentage (99.04 per cent) and maximum values in plant height (81.54 and 107.70 cm at 30 and 45 DAP, respectively), number of leaves plant^{-1} (3.60 and 5.83 at 30 and 45 DAP, respectively), leaf area (128.00 cm^2), chlorophyll content index (74.64) and dry matter production (30.64 g plant^{-1}). The earlier sprouting and sprouting percentage are due to the effect of inorganic fertilizers with slow-releasing organic manure especially coir pith compost in combination with vermicompost is crucial for optimizing plant growth parameters. The consistent supply of N, P and K through various nutrients likely plays a key role in promoting plant growth and development, leading to enhanced growth attributes, as also noted by Khanam *et al*. (2017). Likewise, the application of organic manure *viz*., vermicompost and coir pith compost ultimately improved the soil texture by loosening it, which may have prevented soil crust formation and enhanced the soil's water-holding capacity. These improvements could have contributed to the earlier sprouting of corms. These findings are in close conformity with the findings of Panwar *et al*. (2019) in Gladiolus and Meena *et al*. (2014) and Jamja*et al*. (2024) in Tuberose. Additionally, the application of micronutrient mixture contributes to improved plant growth parameters because these micronutrients are integral components of various enzyme systems. They aid in the synthesis of tryptophan, a precursor to auxin (IAA) and promote shoot elongation through their involvement in the synthesis of chlorophyll and other plant compounds such

as catalase and cytochrome oxidase. The findings of this present study are in consonance with those of Messar*et al*. (2016), Mishra *et al.* (2018) and Harish *et al*. (2023) in Gladiolus, Tayade *et al*. (2018) in Tuberose and Nivya *et al*. (2023) in Lilium. Furthermore, foliar application of gibberellic acid may alter hormonal balance and stimulate the production of hydrolytic enzymes, facilitating the mobilization of stored food reserves and leading to earlier sprouting. The reduction in abscisic acid (ABA) levels further shifts the hormonal balance, enhancing the sprouting percentage in gladiolus corms. GA_3 actively involved in breaking down reserved food materials through hydrolytic enzymes, potentially resulting in the highest sprouting rates. These findings are in line with the observations of Rahman *et al*. (2019) and Rahman *et al*. (2020) in Gladiolus and Jayashree *et al*. (2020) in Lilium.

The increase in vegetative growth following the incorporation of various nutrients can be attributed to nitrogen, which is a crucial component of nucleic acids and plays a vital role in the growth and development of crops. Phosphorus, as a constituent of chlorophyll, is involved in several physiological processes including cell division, the development of meristematic tissues, photosynthesis and the metabolism of carbohydrates, fats and proteins. The above results were in accordance with the earlier reports given by Kaur *et al*. (2023) in Gladiolus and Ayoub & Masoodi (2023) in Hyacinth. Moreover, vermicompost likely served as source of macronutrients and also contains enzymes like amylase and cellulase, which break down organic matter in the soil, releasing nutrients and making them available to the plant's root system as well as enzymes and growth hormones during the early growth phase of the crop, promoting vigorous growth and leading to increased plant height. These results can be correlated with the findings of Rathore *et al*. (2010), Chaudhari *et al*. (2013) and Dixit *et al*. (2024) in Gladiolus. Coir pith compost provides a supplemental effect with inorganic fertilizers as it can improve the water holding capacity and organic carbon status of the soil. These findings are in close conformity with earlier work by Prakash *etal*. (2021). In addition, the foliar application of the micronutrients (B, Mn, Fe and Zn) effectively enhances plant height by promoting cell division and enlargement in the meristematic regions, such as shoot tips, emerging leaves and buds. A similar increase in plant height was observed by Mudassir *et al*. (2021) in Tuberose, Khalifa *et al*. (2011) in Iris, Fahad *et al*. (2014) and Jakhar and Sisodia (2024) in Gladiolus. Another likely reason for the significant increase in plant height could be the effect of gibberellins on enhancing photosynthetic activity, which allows plants to efficiently utilize photosynthetic products. GA_3 enhances cell division and elongation, leading to an increased number of cells and longer cell lengths, which ultimately contributes to overall plant growth. These findings are in agreement with the observations of Chopde*et al*. (2012), Hoque *et al*. (2021), Sharma & Tirkey (2022) in Gladiolus. The increase in chlorophyll content index and leaf dry matter production can be attributed to the efficient absorption of various nutrients by roots, which are then translocated to the shoots and other plant parts, thereby enhancing all physiological activities.The improvement in physiological parameters is primarily due to the appropriate supply of essential nutrients, particularly nitrogen, phosphorus and potassium, which play a critical role in influencing these parameters. In addition, the combination of vermicompost and coir pith compost further accelerates physiological processes like cell elongation and enhances the mobility of photosynthetic products from source to sink. The increase in chlorophyll content index and dry matter production is likely due to the adequate diversion of photosynthetic nutrients facilitated by the synergistic effect of both macro and micronutrients. Likewise, the foliar application of micronutrients and GA_3 enhances nutrient uptake leading to more efficient chlorophyll synthesis and improved nitrogen fixation. These findings are strongly in conformity with the studies of Chamakumari*et al*. (2017) in Jasmine and Prasad *et al*. (2017) in Lily.

Yield parameters

In the present investigation, the data on yield parameters *viz*.,number of marketable spikes plot^{-1} (20.8), number of marketable spikes hectare^{-1} (28532.24), number of corms plant^{-1} (1.21), diameter of the corm (2.13 cm), weight of the corm (47.78 g), number of cormels plant^{-1} (23.33), weight of the cormels (5.50 g) was found to be superior in T_{12} with application of 50 per cent recommended dose of fertilizers combined with vermicompost @ 5 t ha^{-1} and coir pith compost @ 10 t ha^{-1} into the soil and along with foliar application of micronutrient mixture @ 1 per cent at 30 and 60 days after planting and gibberellic acid as a growth regulator @ 100 ppm at 45 days after planting. The combined application of inorganic fertilizers and organic manure proved to be more effective in enhancing yield contributing characteristics, leading to higher spike yields. This increase can be attributed to the greater availability of primary

and secondary nutrients in the soil throughout the entire crop growth period, which facilitated better nutrient uptake by the plants. Additionally, supply of various nutrients likely stimulated physiological and metabolic processes, thereby promoting better plant growth, floral characteristics and ultimately, higher spike yield. It was proved that greater spike yield per hectare could be attributed to the optimal combination of fertilizers and manures. Similar findings regarding the positive impact of this approach on spike yield have been reported by Radhika *et al*. (2010), Singh *et al*. (2013) and Patokar *et al*. (2022) in Gladiolus. Another contributing factor may be the application of vermicompost, which is rich in macro and micronutrients including Fe and Zn as well as enzymes, growth hormones and beneficial microorganisms, potentially improving flower output reported by Shah *et al*. (2022) in Gladiolus. In addition to this appropriate quantity of micronutrient mixture along with gibberellic acid as foliar application promotes the vigorous growth of axillary buds, leading to an increased number of spikes. These findings are in accordance with Sarkar *et al*. (2014) and Sharma and Tirkey (2022) in Gladiolus.

An integrated approach, combining both inorganic fertilizers and organic manures, likely improved the quality and quantity of corms. The increase in corm yield parameters may be attributed to the improved soil environment created by the application of organic inputs such as vermicompost and coir pith compost along with inorganic nutrients. These organic amendments as well as inorganic nutrients likely enhanced nutrient availability and uptake, leading to robust vegetative growth. This vigorous growth facilitated the efficient transfer of food substances into the corms at the end of the crop growth period, contributing to the increase in size, corm numbers and weight. The above findings are also corroborated with earlier work by Priyadharshini *et al*. (2018) in Gladiolus. In addition, it may be due to the activation of several enzymes, including catalase, peroxidase, alcohol dehydrogenase, carbonic anhydrase and tryptophan synthase, by zinc (Zn) and iron (Fe). These enzymes play crucial roles in physiological processes that enhance plant growth and development. Gladiolus requires adequate amount of readily available micro and macro nutrients which support production of more photosynthates required for good quality spikes and corms. Therefore, gladiolus requires fertile soils with loose soil texture for the development of corms and cormels. At the same time development of corms and cormels necessitates a substantial supply of micronutrients, as these are vital to the key metabolic processes within plants. These results align closely with earlier findings by Singh *et al*. (2013), Kumar (2015) and Shukla *et al*. (2023) in various bulbous flowering crops. Furthermore, the increase in corm number, diameter and weight with the application of GA_3 can be attributed to the rise in the number of leaves per plant, which boosts the production of photosynthetic assimilates. These assimilates are then transported to the developing daughter corms, leading to an increase in their number and weight. These findings are in conformity with those of Suresh Kumar *et al*. (2008), Baskaran *etal*. (2014) and Neha Chopde*et al*. (2015) in Gladiolus.

The beneficial effect of various nutrients on the improvement of growth parameters, as well as the increased number of cormlets per plant, can be attributed to the consistent and ample supply of readily available NPK nutrients. The number of cormels per plant appears and weight of the cormels was influenced by the substitution of inorganic fertilizers with organic manures. This substitution likely led to improved nutrient uptake, enhanced growth attributes and greater dry matter accumulation, which in turn resulted in increased cormel production. These findings are consistent with the results reported by Kumar and Saravanan (2019) and Jha *et al*. (2020) in Gladiolus. In addition, the combined application of organic manures especiallyvermicompost and coir pith compost significantly influenced number, diameter and weight of the cormels. This pronounced effect can be attributed to the improvement in soil texture, as organic manures helped loosen the soil, preventing soil crust formation and increasing water-holding capacity. Similar results were reported by Sishodia and Singh *et al*. (2015) in Gladiolus. Besides, the use of vermicompost provided sufficient nutrients and growth-promoting substances throughout the various growth stages, further supporting plant development (Singh *et al*., 2013). Healthy plants enhance the rate of photosynthesis, facilitating the translocation of assimilates to storage tissues, which ultimately leads to the maximum number of cormels and simultaneously increased the weight of cormels. This result aligns with the findings of Kumar (2014) and Tirkey *et al*. (2017) who reported similar outcomes in terms of cormel yield in Gladiolus.

CONCLUSION

Based on the present investigation, it can be concluded that application of 50 per cent recommended dose of fertilizers (60:75:75 kg of NPK ha^{-1})combined with organic manures *viz*., vermicompost @ 5 t ha^{-1} and coir pith compost @ 10 t ha^{-1} along with foliar application of micronutrient mixture @ 1 per cent at 30 and 60 DAP and gibberellic acid @ 100 ppm at 45 DAPhave served as a best treatment for realizing maximum yield and net returns in Gladiolus (*Gladiolus grandiflorus* L.) cv. White Prosperity.

ABSTRACT

Infertility presents a considerable obstacle in a couple's lives, frequently affecting couples marital bond. Dissatisfaction with sexual function stemming from interpersonal challenges is a prevalent concern for these couples. This qualitative study aimed to investigate the sexual experiences of women experiencing infertility. To investigate the effects of infertility on women's sexual self-perception and body image, the impact of infertility on sexual relationships and desire among women. This qualitative research employed a phenomenological methodology. The study involved 15 infertile women who were recruited from healthcare centres and infertility clinics in Kashmir using selective sampling. Data were collected via audio-recorded, comprehensive interviews and analysed employing Colaizzi's approach. *Results*: The examination of participants' experiences revealed five principal themes: "Disruption of femininity and body image," "diminished interest in sexual relations," "prioritization of conception over sexual pleasure," "ambiguity in sexual relations during infertility treatment," and "endeavour's to maintain marital stability." Conclusions: Infertility profoundly affects multiple dimensions of women's sexual lives, especially with body image concerns and diminished sexual desire. Considering women's aspiration to preserve their marital bonds and avert sexual challenges from adversely affecting their family's psychological health, sexual counselling looks to be crucial for infertile couples.

Keywords: Experiences, infertility, Kashmir, phenomenology, qualitative research, sexual life.

INTRODUCTION

Fertility is of paramount significance throughout various civilisations, as the drive to procreate is intrinsic to human motivation. In Indian society, pregnancy and motherhood are essential to womanhood and greatly appreciated. Consequently, challenges in conception can induce substantial suffering for couples, rendering infertility a notable stressor that frequently culminates in emotional upheaval and despair [1].Infertility, characterised by the failure to become pregnant after one year of unprotected sexual activity, impacts 10-15% of couples worldwide. It may result in numerous mental and relational difficulties, such as depression, stress, reduced self-esteem, and sexual dysfunction [3]. Variations in personality, support networks, and lifestyles affect individuals' experiences and expressions [4]. Individuals experiencing infertility frequently exhibit heightened vulnerability and are more inclined to articulate their challenge publicly [5]. Women with infertility often confront significant emotional difficulties, primarily focused on fear of their partner's response and the possible disintegration of their family structure. Factors including the aspiration for motherhood, societal pressures for progeny, insufficient social and financial support, diminished prospects for remarriage, and cultural stigma intensify these fears. Infertility in men can elicit emotions of rage, powerlessness, and feelings of regret. Infertility doctors mostly concentrate on assisting couples in conception and managing their situation, often overlooking the improvement of sexual satisfaction. Consequently, numerous individuals facing infertility encounter a decline in desire prior to confronting their fertility challenges [6]. Research suggests that although female participants typically express contentment in their relationships, they encounter a reduction in sexual desire and sexual sensitivity as a result of fertility treatment [7].Vischmann *et al*. [8] indicate that infertile couples experience significant psychological discomfort, especially sadness and sexual dissatisfaction, with women being more adversely impacted than males. The burden of sexual issues during this period significantly hinders couples' emotional stability [4]. The interaction of physical, social, and economical stressors, along with insufficient sexual satisfaction, worsens mental and physiological stress. Given the rising incidence of fertility problems in India, sexual wellness is essential for both physical and psychological well-being, as desire for sex is intricately linked to emotions. A qualitative study employing a phenomenological method was done to investigate the sexual experiences of couples with infertility and enhance their sexual health.

Objectives

1.To examine the effects of being infertile on women's sexual self-perception and body image.
2. To examine the impact of infertility on women's sexual relationships and desire.
3.To examine the coping strategies using by women experiencing infertility to safeguard their marital relationships.

METHODOLOGY

This study designed to investigate the sexual experiences of infertile women in Kashmir through a descriptive qualitative approach. This method involves understanding and revealing the significance of participants' lived experiences. The process of collecting and analysing these insights is established through discussions with individuals who have lived associated conditions. Phenomenology aims to analyse and interpret the implications and significance of what individuals have experienced within a specific context [10]. This study was conducted at two fertility centres and hospital: Ramzan Hospital Srinagar, Janam Fertility Centre, and Dr. Sabahat's fertility centre (outpatient department). Participants were selected through purposive sampling, comprising Kashmiri and Urdu-speaking women who were medically confirmed as infertile, had no children, and exhibited no sexual, mental, or emotional disorders. They indicated a willingness to participate in the study. The objectives of the study were articulated, and participants consented to both the study and the recording of their interviews. Sampling persisted for four months until saturation of data was achieved, culminating in a final cohort of 15 women. Data were collected via semi-structured, in-depth personal interviews. The interviews aimed to elucidate women's sexual responses, behaviours, and the evolution of their marital relationships. Interviews were conducted in a quiet, private environment and subsequently recorded by the researcher following multiple reviews. Participants went through one or two interviews, each lasting between 30 and 50 minutes. The analysis of data was conducted using Colaizzi's

seven-step method. The recorded interviews were reviewed several times to gain a thorough understanding of the content and emotions expressed. Subsequently, key statements pertinent to the study's focus were identified, and primary codes were derived. In the final step, the codes were organised into categories, thematic clusters, and overarching themes. The codes “hypoactive sexual desire,” “pleasure-free sexual activity,” and “tragic sexual activity” constitute the sub-theme “dissatisfaction with sexual desire.” In contrast, the words “low interest for sexual activity,” “forced and disgustful sexual activity,” and “postponed sexual activity” form the sub-theme “aversion in sexual activity.” Themes related to these sub-themes culminated in the overarching theme of "discouragement of sexual relations." In subsequent steps, the themes were refined into five primary categories: “disturbed femininity-body image,” “dissatisfaction of sexual relations,” “sacrifice of sexual pleasure for being pregnant,” “confusion in sexual relationships during fertility treatment,” and “striving to support marriage.” The researcher subsequently incorporated the findings into a comprehensive description of the phenomenon and confirmed the results with participants to ensure alignment with their experiences. The researcher employed criteria of validity, reliability, confirmability, and transferability, as outlined by Streubert and Carpenter [11], to ensure data accuracy and consistency. The validity was established via feedback from participants and review by peers. The researcher ensured reliability through complete engagement with the data and precise utilisation of codes and themes. Confirmability was established through the engagement of external auditors to review the study procedure and coding. The transferability of the study's findings was evaluated by contrasting them with the experiences of the participants who matched the subject's profile but were not included in the study.

RESULTS

The study involved 15 infertile women aged 20 to 48 years, categorised by educational attainment as follows: more than secondary school diploma (n = 4), diploma (n = 6), associate degree (n = 2), and bachelor’s degree (n = 3). The duration of marriage was 2-4 years for eight respondents, 6-10 years for the other five, and >10 years for eight participants. The period for diagnosing infertility varied between 1 and 20 years. Data analysis revealed five primary themes and eleven sub-themes, which are outlined in Table 1. (Last page)

Disturbed in femininity-body image

The initial concept established was a disruption in womanhood and body image, arising from two principal notions: "distorted body image associated with fertility" and "distorted body image associated with sexual capabilities."

Disturbed Body Image Related to Fertility; several participants stated that being pregnant and having children were both primary marital objectives. When this was not feasible, their perception of their reproductive system suffered and they became anxious about their ability to conceive. "Infertility has profoundly impacted my mental state, make me feel that my body is worthless," a participant said, expressing her feelings that the way she conceived was insufficient. I used to become upset and bash my vaginal area, wondering why I couldn't conceive like other people. I sometimes even think it's useless and wish to throw it away. Disturbed body image in respect to sexual capacity; several individuals stated that they felt helpless to take advantage of sexual closeness and lost faith in their abilities to satisfy their partners after knowing about their fertility concerns. According to a 25-year-old lady, "I felt helpless regarding my sexual life as well as losing interest in the moment I found that I had sterility." I truly felt handicapped. Sexual connections seem pointless if I am unable to conceive, and I will no longer feel the same sense of pleasure.

Discouragement of sexual relations

"Discouragement of sexual relations" was the second notion. The majority of participants believed that the main purposes of sexual activity were pregnancy and child rearing. However, they lost interest in sex, characterised by rejection and an absence of pleasure, as a result of reproductive problems and the frequent, unpleasant tone of sexual experiences. Aversion to sexual relation; the majority of participants confessed that after receiving a diagnosis with infertility, they suddenly became completely focused on getting pregnant. When this goal was not achieved, they lose interest in intercourse and saw it as worthless, therefore they ignored it. A 28-year-old infertile lady stated, "Since all of my attempts of getting baby have failed, I now hate having sex as well as being near my husband." I can't go close

to him, and certainly not having sex." Unwillingness of sexual relations; Respondents stated how their infertility caused them to concentrate only on getting pregnant during sexual activity. Their sexual experiences were unpleasant and emotionally unsatisfying as they lost hope of getting pregnant. "I lost excitement about sex after knowing about our infertility, and my need for it has significantly decreased," revealed a 42-year-old infertile lady. Very rare perhaps once in ten days or maybe once a month—we engage in sexual activity. I don't enjoy having sex, and occasionally it's challenging for me, which makes me feel bad."

Sacrifice sexual pleasure in the pursuit of pregnancy;

One notable theme that appeared from the analysis of their experiences about sexual relationships proved that, following their infertility treatment, they pursued sexual activity exclusively for the aim of pregnancy, overlooking any sense of pleasure. This theme included two sub-themes: "restricting sexual activity to the goal of conception" and "diminished sexual enjoyment stemming from a sense of futility. Sexual interactions influenced by pregnancy; the majority of participants indicated that after giving up hope of pregnancy, their wish for sexual activity diminished. They engaged in intercourse exclusively on particular days whenever the possibility of conceiving was high, motivated by the desire to conceive. A childless woman expressed, "I feel worry during intercourse, contemplating whether I will conceive this time." I decide to engage in sexual intercourse solely on times with an increased probability of conception, with the aspiration of procreation. To me, sexual intercourse holds value just if it results in procreation. Absence of sexual satisfaction attributed to the perception of its futility; women regarded pregnancy as the principal result of sexual engagement, rendering it their primary aim. Upon failing to attain this objective, they regarded their sexual experiences as monotonous and futile, leading to a decline of their sense of pleasure. A 25-year-old infertile lady stated, "Years following our infertility treatment, I perceive sexual activity as futile and lack of purpose." Why should it persist if I am unable to conceive? It now appears lack of significance, and these reflections have resulted in a lack of enjoyment throughout our sexual interactions.

Confusion in sexual relation during infertility treatment

The diverse infertility treatment modalities and their intersection with sexual activity generated confusion among participants, who experienced anxiety when addressing their personal sexual lives with healthcare staff. Apprehensions regarding planned intercourse and the potential for treatment failure decreased their sexual pleasure. Concerns Regarding scheduled Intercourse While Treatment; Participants expressed a sense of obligation to take part in sexual activity as per their doctor directives to enhance their likelihood of conception. This strain resulted in anxiety and diminished sexual pleasure. A 28-year-old childless woman stated, "When I was required to take the medicines prescribed by my physician, we had to engage in intercourse at scheduled times at every night." I had significant stress attempting to coordinate my husband's comeback with my medicine routine. At times, he could be absent from home, or he would return late and excessively tired for any activities. Following to the physician's directives decreased the enjoyment; I was just working through the motions." Suppression of Sexual Desire Post-Treatment Failure; The majority of individuals reported emotions of discouragement after unsuccessful infertility treatments, turning sexual activity stressful and unpleasant. A 23-year-old woman stated, "During infertility treatment, whenever my menstruation was postponed by two or three days, I would consider the possibility of pregnancy." However, when my menstrual cycle started it felt as though my world collapsed into darkness. Changes in sexual behaviour; Few participants stated that after their treatment failures, they experienced a diminished desire in sexual activity, yet favoured friendly gestures such as kissing, hugging, and verbal contact. A 27-year-old lady expressed, "Whenever my menstruation begins, I experience a disinclination towards sexual activity and harbour feelings of resentment for a period of time." I would rather my spouse engage in conversation, provide affection, or extend support instead.

Striving to protect their marriage

Participants stated that infertility resulted in emotional, psychological, familial, even societal challenges. They expressed concerns over possible effects on their marriage, such as divorce and the prospective remarriage of their husbands, and endeavoured to preserve normalcy in their life by adhering to sexual relations and seeking treatment to improve their reproductive health. Compliance in Marital Relationships; Despite diminished sexual desire due to

infertility, several infertile women conformed to their spouses' sexual demands to avert personal crises and fulfil their partners' desires. A woman 28 years old stated, "My sexual desire has diminished, particularly since knowing of my infertility." It causes stress, still I undertake it to satisfy my husband. Seeking Assistance for Sexual Functions; Participants said that the infertility diagnosis and failed therapies adversely affected their ability and interest for pleasurable sexual experiences. As a result, they pursued counselling and assistance from family, friends, loved ones, and medical professionals, certain that a strong relationship was necessary to live a normal life. A 30-year-old lady experiencing six years of infertility stated, "Upon knowing of my infertility, I felt sexually isolated and temporarily lost interest in intercourse; however, my husband urged me to consult a physician." It was difficult for me, although I acknowledged its significance for our relationship. Consulting a physician and getting her advice and prescriptions significantly enhanced our sexual life, now I hope to conceive.

DISCUSSION

The research investigated the sex experiences of infertile women, revealing several significant themes pertaining to the psychological and social effects of infertility. A major topic was the disturbance of body image and femininity, since women associated their fertility with their perceptions of womanhood and sex identities. Infertility diminished their feeling of femininity, creating anxieties and doubts in their relationships. Research conducted by Tao *et al* [12] indicates that infertility contributes to body image concerns and negatively affects marital and sexual interactions' further issue was the dissuasion of sexual interactions. Women who had been sexually active began to feel separated from sex after the infertility diagnosis, reporting less sexual desire and satisfaction. This supports the findings of Perlis *et al*. [13], who observed that infertility frequently leads to sexual dysfunction due to emotional distress and the weakened reproductive significance of sexual activity, with participants prioritising conception over sexual enjoyment. Women indicated a diminished interest in sexual pleasure, with some experiencing difficulty in reaching orgasm due to the stress associated with attempts to conceive, reflecting studies [14].The research also emphasised the confusion and stress associated with sexual relations following infertility treatments. The obligation to adhere to a specified timetable for intercourse, as mandated by the physician, diminished spontaneity and increased anxiety, so adversely affecting sexual satisfaction [15]. Finally, the theme of "striving to preserve their marriage" emerged, as participants expressed anxiety about the societal and familial pressures surrounding infertility. Women wanted to strengthen their sexual interactions in order to protect their unions from the stresses of infertility. Counselling and support services were viewed as vital in assisting couples to overcome these challenges and sustain emotional and marital stability.

CONCLUSION

The results revealed that there are a number of ways in which infertility affects women's sexual lives. These include "disturbed femininity and body image," "reduced need for sexual activity," "losing sexual pleasure to focus on pregnancy," "confusion in sexual relations during infertility treatments," and "efforts to defend their marriage." These findings imply that infertile women experience a variety of sexual difficulties as a result of their condition, which may exacerbate mental illnesses and family disintegration. It is advised to create and execute programs that support these women and provide them with sexual counselling in order to avert the negative social effects of these disorder.

ABSTRACT

Blockchain and Artificial intelligence (AI) and are two of the most revolutionary technologies of our time. Individually, they have the ability to make a far-reaching change in industries and alter the economic and social interactions and relationships. In recent years the blockchain and artificial intelligence (AI) has gained a lot of attention, in business environments the integration of both technologies can improve security, productivity of applications. The convergence of AI and blockchain will offer protection against cyber-attacks. Blockchain technology has the potential capacity in many areas such as secure data sharing and marketing, and supply chain management. On the other side, Artificial Intelligence (AI) is used to create and develop machines which have the ability to perform tasks that need intelligence. More precisely, we are trying to answer the following three main questions. In supply chain what are the current blockchain and AI use cases?, and For future studies involving the integration of blockchain and AI what is the ability of research directions?. We first discussed about the background of artificial intelligence and the concept, key technologies and characteristics of blockchain and eventually analyze the feasibility of combining blockchain with Artificial intelligence. Next, we summarized and listed some related application scenarios about the convergence of blockchain and Artificial intelligence and also listed existing challenges and problems and finally, we discuss the future work of convergence of technologies.

Keywords: Artificial Intelligence (AI) is used to create and develop machines which have the ability to perform tasks that need intelligence.

INTRODUCTION

The Artificial Intelligence is much older than you would imagine it is not a new technology and not a new word for researchers(1952-1956) the birth of artificial Intelligence. In 1955 the Herbert and Allen Newell created first artificial intelligence program named as Logic Theorist by AI coined as an academic field. In 1966 the researchers. Focused on developing algorithms for solving mathematical problems. In 1972 WABOT-1 -the first intelligent humanoid robot was invented in Japan. The first AI winter (1974-1980) [1]. During this era, there was a decrease in interest of publicity on artificial intelligence. The second AI winter (1987-1993)Again government and Investors took a back step in funding for AI research because of its high cost but not protesting efficient result The emergence of intelligent agents (1993-2011).artificial general intelligence, Deep learning, and big data(2011-present). Nowadays tech industries like Amazon, Google, IBM, and Facebook, are working with AI and creating amazing devices. The future of AI is inspiring and will come with high intelligence [6]. Recent years have seen a huge surge in interest and innovation across a variety of industries due to the intersection of Blockchain technology with Artificial Intelligence (AI). While blockchain and artificial intelligence (AI) alone are innovative developments that are changing digital environments, their combination has the potential to bring about even more profound change.

AI has completely changed data processing, predictive analytics, and decision-making by simulating human intellect using algorithms and computational models [3]. It enables a plethora of applications, including recommendation engines, driverless cars, and virtual assistants, radically altering how people engage with technology and how businesses run. Blockchain technology and artificial intelligence combine their greatest qualities to create a technology that offers unprecedented opportunities for creativity. By merging AI with Blockchain, we can leverage AI to increase the security, transparency, and effectiveness of AI applications while also improving the scalability and usability of Blockchain solutions. The development of intelligent decentralized systems, data privacy optimization, enhanced predictive analytics, and autonomous agents with self-governance and adaptive learning capabilities are all made possible by this synergy.In this introduction, we look at the transformative potential of combining blockchain technology with artificial intelligence [5]. We examine the most recent advancements, inventive use cases, challenges, and broader implications for business and society. In addition, Blockchain technology has become a game-changer for safe online transactions and decentralized data management. Blockchain's decentralized ledger technology, first made popular by Bitcoin, guarantees cryptographic security, immutability, and transparency without the need for middlemen. Blockchain technology is currently being used for more than just cryptocurrencies; it is being applied to identity verification, voting systems, supply chain management, and other areas, tackling basic problems with efficiency, privacy, and trust in digital interactions.

The combination of Blockchain's decentralized architecture with AI's processing power results in a convergence that promises benefits beyond what either technology could achieve on its own. Data processing can be optimized to allow for quicker transaction validation, real-time analytics, and improved decision-making skills by integrating AI algorithms into Blockchain networks Artificial intelligence refers to the imitation of human cognitive processes through the of technology utilization, mostly computer systems. AI has various specific applications, such as machine vision, natural language processing, expert systems and speech recognition. With the quick development of artificial intelligence (AI), manufacturers have been actively endeavor to display the integration of AI in their services and goods. Mostly, the artificial intelligence is employed to denote a certain constituent of the technological framework, namely machine learning [4]. Furthermore, Blockchain technology offers a safe, auditable record of data transactions and model updates, which improves the accountability and transparency of AI systems. This discusses issues with data privacy, reducing bias, and the moral ramifications of using AI to make decisions. Blockchain-powered decentralized AI marketplaces can make it easier for AI models and data to be securely exchanged, encouraging cooperation and innovation across organizational and geographic borders [5]. These technologies have the enormous potential to completely transform whole industries and societies as they develop and merge. The ethical ramifications of autonomous AI systems, scalability, interoperability, and legal issues are some of the difficulties that come with their integration. To fully realize the revolutionary potential of AI and overcome these

obstacles, interdisciplinary cooperation, strong governance structures, and ongoing innovation are necessary. The implementation of artificial intelligence make necessity of fundamental infrastructure comprising of dedicated software components and hardware and to facilitate the implementation and development of machine learning algorithms. AI systems generally operate by devour substantial quantities of training data which is annotated, survey the data to identify patterns and correlations, then exploiting these patterns to generate predictions regarding forthcoming conditions. By using the text samples dataset, a chatbot can gain the ability to create realistic conversations with individuals. Similarly, an image recognition tool can advance the capacity to recognize and to generate descriptions of items within photos through the inspection of a vast number of data sets. Advancement in generative artificial intelligence (AI) methodologies demonstrate notable development in the production of visual representations, authentic textual content, musical compositions, and several other forms of media [3].

Blockchain is a decentralized system and cryptographic for storing and recording information, which is originated to provide a high level of immutability and security, hence minimizing the risk of unauthorized modifications, tampering and breaches. A blockchain make reference to a decentralized record system that mirrors and circulate transactions throughout a network of computers engaged in the blockchain. Blockchain technology is a decentralized system which keeps transactional data securely, known to as blocks, among many interconnected databases, mainly referred to as the "chain.". This structure of storage is called as ledger.These databases are dispersed throughout a network of peer-to-peer nodes.Each transaction recorded in the ledger is authorizedusing the owner's digital signature [6]. By using digital signature we are verifying the authenticity of the transaction and we will make sure of its protection against any unauthorized alterations. By, the above information clearly we can know that data stored in the digital ledger is characterized by a high level of security. In most of the systems, the digital ledger may be likened to a shared Google spreadsheet that is circulated among the multiple computers inside a network. By this way the ledger is mostly utilized to maintain the transactional records which corresponds to real-world purchases [9]. Through investigating the combination of AI and Blockchain, we set out to break through new technical innovation paradigms, reimagine business models, and give people more control over their data and digital assets. Blockchain and AI work together to create a synergistic whole that goes beyond simply merging technology to pave the way for a more intelligent, decentralized, and just digital future.

RELATED WORK

Blockchain exclude the necessity of centralized operation [10].The first characteristic of this technology is, by enabling the system networks to defend themselves in many other ways, such as making the devices to form a group on what iscommon among them within a given network and to isolate the nodes that act differently, it avoids a single point of decision-making . The second characteristic is to develop trust in IoT information by allowing five basics of digital security, i.e. confidentiality, accessibility, accountability, integrity, and audibility. In this Blockchain technology Accountability and Auditability and are two new terms. In real world the Blockchain is being used by several applications like finance, retail, etc., The objectives are used to explain the place a origin of high-value items to Chinese customers who have a clear need to understand the legitimacy of goods, including Louis Vuitton handbags and luxury wines. In blockchain data is basically stored in various locations and will be available to users. Permission based Blockchain can be used to achieve accountability and auditability. In this system all the users who are authorized cangain access the network. Basically, every computer is responsible for its behavior because of all signed data stored on the Blockchain. Blockchain behave as a public record for achievement. i.e. full chain of events are created when any deletion or alteration of data is entered. For example, to give correct medications to the right person the Blockchain technology used Francisco-based Chronicled concept [11]. Hence, all five mandatory components achieved successfully with Blockchain technology. Because of this features Blockchain became popular and being used in many applications and industry.

BENEFITS OF INTEGRATION

The success of decentralized artificial intelligence initiatives will hinge on a global network of autonomous nodes operating in parallel. The system's distributed architecture makes the best use of its computational power, which facilitates the speedy analysis of big datasets. After being split up into smaller pieces for processing by various nodes,

the dataset will be combined into a single central database. Since the global database won't be governed by a single, powerful entity, all network users will have access to its contents [3]. This vast amount of data will also be useful for training sophisticated AI algorithms. Artificial intelligence judgments would also be recorded in the database to enhance their comprehensibility and transparency for human users.

Some potential benefits to integrating artificial intelligence (AI) and blockchain:

1. Increased efficiency: Artificial intelligence can automate many processes in the blockchain, decreasing the need for human involvement and boosting up the transactions.
2. Enhanced security: Blockchain provides a secure path to store and transfer data, and by involving AI to the procedure, it can obtain real-time threat detection and response.
3. Improved decision-making: AI can analyze huge amounts of information generated by the blockchain and provide comprehension that can help businesses make advance decisions.
4. Stronger fraud prevention: AI's ability to detect anomalies and patterns in transactions can help in the early identification and eradication of fraudulent activity.
5. Enhanced privacy: By integrating AI and blockchain, users can have more control over their data and privacy, as the integration of technology can encrypt and protect sensitive information.

Overall, the integration of AI and blockchain has the ability to transform industries and reform the way businesses operate by increasing trust , security, efficiency, security. Creative company Models: AI and blockchain work together to create new revenue streams and company models. Decentralized AI markets, facilitated by Blockchain technology, offer a secure and transparent means for individuals and organizations to purchase, sell, and exchange AI algorithms and data. Regulatory Compliance: By offering a verifiable record of data transactions and AI model operations, blockchain's traceability and auditability features can help with regulatory compliance [8]. This is especially crucial in sectors with a lot of regulatory attention, like finance, healthcare, and supply chains. Global Collaboration and Innovation: Artificial intelligence (AI) and blockchain technology promote global innovation by facilitating safe and transparent collaboration across national and organizational borders. Businesses, developers, and researchers can work together on AI projects, pool resources, and quicken the speed of technological progress.

CHALLENGES OF INTEGRATION

The combination of blockchain technology and artificial intelligence has a lot of unrealized promise, but there are also a lot of challenges that need to be solved before it can be effectively applied. Requirements for the computation: A large amount of processing power is required for the traditional artificial intelligence solution, and when coupled with the distributed ledger infrastructure, this can increase computational strain and lead to problems with efficiency and scalability. You will need both a strong foundation and innovative solutions to overcome these challenges [16].
Safeguarding One's Data and Privacy: But it also means that information entered onto the blockchain is permanent and might be accessed by all users. Protecting One's Privacy and One's Data: However, this also means that once data is recorded on the blockchain, it becomes permanent and potentially available to all participants. This is true even though immutability and transparency are guaranteed by blockchain technology. This gives rise to concerns over data privacy, especially in delicate domains like the healthcare and finance sectors. To foster a culture of trust that will enable the widespread use of blockchain and artificial intelligence, a balanced approach between data privacy and transparency is necessary.

Integrating AI and blockchain poses several challenges, including:

1. Scalability: Both AI and blockchain technologies generate large amounts of data, which can brunt existing infrastructure of the technologies. The key challenge is that the integrated system can handle the large amount of data and scale efficiently [20].

2. Interoperability: AI and blockchain systems mainly operate in silos with different standards and protocols. Establishing flawless communication and interoperability between the two technologies is critical for successful integration.
3. Data Privacy and Security: Blockchain technology is mainly known for its security features, but integrating AI introduces new vulnerabilities. Verifying that sensitive data which is used by AI algorithms is stored securely and processed on the blockchain is a main challenge.
4. Regulatory Compliance: The integration of AI and blockchain raises multiplex regulatory issues, especially concerning accountability, transparency, and data privacy. Validating compliance with existing and emerging regulations plays a major role for successful integration.
5. Complexity and Cost: Integrating AI and blockchain technologies is in need of very specialized expertise and resources, which can be of more cost. Ensuring the complexity of integrating these two technologies while keeping the costs under control is a prominent challenge [17]. Overall, successfully integrating AI and blockchain requires addressing these challenges .

SYSTEM COMPATIBILITY

The rapid rate of change in these two fields has resulted in a lack of consistency and standardization about the frameworks and data formats that are employed. Consequently, in order to speed up synergy and scalability and enable the interoperability of blockchain and AI, common standards and protocols must be established [15].

- Scalability: By incorporating AI algorithms into blockchain networks, scalability issues may be exacerbated by a demand on computational resources.
- Data Security and Privacy: AI models developed using private, blockchain-stored sensitive data give rise to privacy and confidentiality issues that need for strong security protocols.
- Interoperability: To enable smooth integration across many networks, standards and protocols for interoperability between blockchain and AI systems must be established.
- Moral Points to Remember: To reduce biases and handle ethical issues, AI decision-making systems must be transparent, equitable, and accountable.
- Regulatory Compliance: To manage the ethical and legal ramifications of using blockchain and artificial intelligence (AI) technology, regulatory frameworks and norms must be developed.
- Adversarial Attacks: Strengthening security protocols and countering malevolent actors is necessary to safeguard AI models in blockchain networks from adversarial attacks [15].
- Resource Management: Performance and sustainability depend on effectively allocating computational resources and enhancing AI algorithms for blockchain environments.
- Education and knowledge: Encouraging responsible development and deployment of blockchain applications requires raising knowledge of the potential and constraints of artificial intelligence [18].
- Governance: To guarantee accountability and adherence to industry norms, governance procedures should be established to supervise the implementation and functioning of AI systems onblockchainplatforms. Encouragement of collaboration among technologists, politicians, and stakeholders is crucial in tackling obstacles and realizing the complete potential of artificial intelligence in blockchain applications [13].

STRATEGIES TO MINIMIZE THE CHALLENGES OF INTEGRATION OF AI AND BLOCKCHAIN.

The strategies to minimize the issues raised by the integration of Artificial Intelligence and blockchain, consider the following strategies:

1. Data Privacy and Security: To provide security and ensure privacy of data stored on blockchain implement the robust data encryption techniques. Utilize AI algorithms to prevent and detect potential security breaches [19].
2. Interoperability: Ensure that AI and blockchain systems can flawlessly communicate and exchange data. For attaining interoperability develop standardized protocols
3. Transparency and Auditability: Using AI algorithms to improve the auditability and transparency of transactions on the blockchain. Implement mechanisms for verifying and tracking the origin of data.

4. Scalability: Addressing scalability challenges by optimizing block chain protocols and AI algorithms for high-performance computing. Use off-chain solutions to improve scalability [2].
5. Regulatory Compliance: Be informed about regulatory requirements related to AI and blockchain integration. Validating compliance with data protection laws and regulations.
6. Smart Contract Security: Implement accurate testing and auditing processes to ensure the security of smart contracts deployed on the blockchain. Use AI algorithms to detect vulnerabilities and preventing potential attacks.
7. Governance and Decision-Making: maintain clear governance mechanisms for managing integration of this technologies. For decision-making processes define roles and responsibilities.
8. Continuous Monitoring and Updates: Monitor the performance of AI and blockchain systems regularly and update them as needed to address emerging issues and vulnerabilities [4]. By adopting these strategies, organizations can minimize the challenges and maximize the benefits associated with the integration of Artificial Intelligence and blockchain.

REGULATORY ASPECTS OF BLOCKCHAIN AND AI INTEGRATION

The current state of AI and blockchain regulation is complicated and varies by country. These technologies are disruptive, dynamic, and globally distributed, which makes regulating them difficult. Regulations pertaining to AI usually center on data security and privacy in addition to the moral application of AI. A notable example is the General Data Protection Regulation (GDPR) of the European Union, which establishes stringent guidelines for data protection and gives individuals substantial control over their personal information [9].Regarding Blockchain, the topics of cryptocurrency regulation, smart contracts, and initial coin offerings (ICOs) are frequently the focus of regulatory attention [13]. Owing to Blockchain's connection to cryptocurrencies, numerous countries have implemented laws to tackle problems such as fraud and money laundering [3]. The way that different parts of the world approach the regulations varies. For instance, the US often implements a more industry-specific, industry-specific legal framework for AI, with a focus on decentralization [12].

The European Union's all-encompassing approach to Blockchain legislation differs from the United States' emphasis on financial issues, as noted by Money Services Business [6]. On the other hand, China attempts to include national, provincial, and local legislation concerning AI while preserving cultural values and state power [7]. China took a different stance on blockchain than the US and EU, outlawing cryptocurrencies [12]. a result, this disparity emphasizes how difficult it is to create an international regulatory framework for developing technology. Blockchain and AI integration creates a new set of legal issues. First off, although Blockchain offers an unchangeable and safe ledger, it also poses serious data protection issues, especially in light of the "right to be forgotten" that is protected by laws such as the GDPR. The legal standing of choices made by AI or automatically generated procedures through Blockchain smart contracts presents another possible problem. Liability concerns may arise from this, especially in situations when choices have far-reaching effects. Integrating AI with Blockchain may also run counter to data minimization guidelines in data protection legislation because AI algorithms are capable of processing vast volumes of data, including personal data. A careful balance must be struck in order to create an efficient regulatory environment. On the one hand, it's critical to promote creativity and take advantage of the integration of blockchain technology and artificial intelligence. However, it is imperative that the legal issues raised above be resolved in order to guarantee the safe and moral application of these technologies. A multifaceted strategy could be advantageous [9]:

- Regulatory Flexibility: Regulations must be adaptable to new changes in light of the quick speed at which technology is advancing. This might entail putting in place principles-based rules as opposed to prescriptive ones, which would allow for flexibility in response to various use cases and technology [19].
- Technological Neutrality: Rules ought to be technology-neutral, emphasizing the action or result above the particular technology employed.This would guarantee uniform regulations for all technologies, encouraging equity and rivalry.
- International cooperation is crucial because of the global character of these technologies. In order to create uniform standards and prevent regulatory fragmentation, regulators ought to collaborate [10].

- Stakeholder Engagement: To guarantee that rules are shaped by a wide range of perspectives and knowledge, regulators should interact with a broad range of stakeholders, including business, academia, and civil society.
- Encouraging Accountability and Transparency: It is essential to make sure that BCT and AI are implemented in a responsible and transparent manner. This could entail guaranteeing transparent governance frameworks for Blockchain networks or developing standards or certifications for AI transparency [16].

In conclusion, the creation of a successful regulatory framework for the fusion of block chain technology and artificial intelligence necessitates a methodical and deliberate approach. These technologies can be used in a way that optimizes their advantages and minimizes their risks provided the proper rules are in place. In conclusion, the creation of a successful regulatory framework for the fusion of block chain technology and artificial intelligence necessitates a methodical and deliberate approach. These technologies can be used in a way that optimizes their advantages while lowering their hazards if the proper rules are in place [1]

ANALYZING DATA AND THE BLOCKCHAIN'S ADVANTAGES WITH ARTIFICIAL INTELLIGENCE

A. Real transactions are recorded in blockchain. There has been relatively little irrelevant data created with Blockchain transactions because all decisions have been made by people or users. Keep in mind that while integrating blockchain technology and artificial intelligence, data quality is always required. Additionally, due to the exceptional quality of the data, any algorithm that uses it would undoubtedly become vastly more powerful over time than any other data source that is now in use. The following are a few benefits and drawbacks of integrating AI with blockchain [12]:

B. Analyzing Data As was previously said, data analysis is essential for training AI and ML systems. The new paradigm has given us access to isolated, unshared data storage that are vulnerable to assault. However, the records' consistency and legitimacy aren't always at their best. For the data to be valuable, it must be exact, unchangeable, and comprehensive. But there's a chance that data processing techniques may be faulty, data analysis will likely contain errors, and datasets may contain sample bias because of incompleteness. Try manually compiling and recording certain data, such as supply chain food information, vital hospital patient information, and customs records at ports [1]. A tiny percentage of unsupervised individuals rely on manual data gathering and documentation in each of these situations. Data recording on a blockchain, especially when paired with IoT, can provide a far superior solution. First, data on a Blockchain is undocumented before it is subjected to a consensus process. A group of motivated participants (public nodes) or stakeholders (permitted nodes) are involved in the consent process in order to guarantee that the data being documented is verified and trustworthy. The registered data is then permanently signed, time-stamped, and encrypted. It is open, secure, and auditable by design. In some scenarios, the addition of IoT devices that write directly to the Blockchain may increase the accuracy and dependability of the provided data (supply chain, healthcare, logistics, etc.).

C. Centralized data is also unfinished and only gathers information from a single source (Facebook, Google, etc.) for a very small number of use cases. This method will introduce sampling bias as well as design bias into the dataset. Larger and more complicated databases covering a greater range of use cases will result from data interchange with a wider range of businesses. For example, middle-class white males make up the majority of the data collectors in the most widely used medical databases. Many popular AI innovations, such as word matching and translation (e.g., Google), and facial recognition (e.g., Microsoft and IBM), also contain sample and design bias. Additionally, because dataset owners are worried about privacy and competitive advantage, there is no sharing of centralized datasets.Competitive advantage is more likely to be a misnomer since partial databases are more likely to experience significant bias, but Blockchain is unable to directly address this understanding concern [11]. However, because blockchain data is virtually unbackable in approved chains and the most widely used public chains (such as Bitcoin, Ethereum, etc.), blockchain does have the potential to increase data sharing even more in terms of privacy. It should be noted that in a setting where users control the data, public and private organizations might provide more robust, broadly disseminated datasets that would remove biases and serve as the foundation for truly useful AI and ML. In this instance, scheduling datasets and subsequently buying data from data owners whose profiles align with the

dataset plan are both feasible. For instance, a dataset can be prepared, acquired, and developed if it is meant to contain information that is demographically segregated based on a country's population (e.g., 50% females, 50% men, 20% 18–34, 40% minorities, etc.).

D. Engaging in Conversation with the AI Program Currently, bots account for about 52% of all web traffic; that is, bots are computer programs that traverse the Internet and perform certain tasks. Artificial intelligence (AI) is being used by an increasing number of these bots, which also include chatbots, voice order bots, virtual assistants, and other learning and improving digital assistance systems [10].

E. Over time, it is anticipated that human engagement with the Internet and the Web will decline and that humans will assign many duties to bots. Additionally, this replaces services like Alexa, Siri, Cortana, and others, resulting in an increase in site traffic. Additionally, there are a lot of bots on social media platforms like WhatsApp, WeChat, Telegram, Facebook, and others. The bot-based Internet will function similarly to how we may utilize Blockchain to create a layer of trust and identification between humans and the Internet. Given that some of the (online) bots are both extremely useful and harmful, this is especially beneficial [9].

F. Malicious bots will be much less likely to cause havoc if they can be clearly described on the Blockchain and given an unchangeable identity. This is especially true if the actions of the bot can be used to generate records and metadata. Keep in mind that human-bot interaction turns into bot-bot interaction as bot traffic increases. Bots will eventually start talking to each other more than they do with people. Consider a situation where everyone has a virtual assistant (like the one shown in the recent Google presentation) and the assistants start chatting with each other to get information, make appointments, and purchase goods, and so on [8].

G. Bots of the future will need to be able to inquire about each other's identities and then check each other's histories and ratings before interacting. Consequently, this knowledge needs to be added to the Blockchain in order to be secure and obtain credibility. Advanced bots may also require access to each other's training datasets and programming procedures. By exchanging messages and asking questions about this data, it will help bots to appropriately "understand" one another and "decide" whether to create a professional relationship. Since all of the data and programming are concealed from view, AI programs are also known as "black box" systems. In an era where bot-bot interactions predominate, greater transparency is necessary. In this case, using blockchain technology to store data will make it easier for bots to audit one another. The Blockchain can also be used to reward increased transparency with tokens, which is one way to encourage audits interactions. Artificial intelligence programs are "black box" systems because all the details and code are hidden from view. When bots engage with one another in the future, a greater level of transparency is anticipated [6].

In this case, blockchain technology is the best solution for data storage and will make it easier for bots to audit one another. For example, the blockchain may even be used to encourage auditing experiences by using tokens to reward greater responsibility. Improved Management of Human-Bot and Bot-Bot Interaction: Due to the black box nature of most AI systems, it is quite possible for interactions to get out of control in a setting where human-bot and bot-bot interactions are in control. There are various instances of concerning AI behavior, such as Facebook bots creating sub-languages (bots going crazy), Microsoft's chatbot Tay acting sexist (human game bots), etc. It could be wise to employ smart contracts, another key Blockchain technology, to provide more order and control to bot-bot or even human-bot interactions [4]. Smart contracts set limits on future performance, specify contact criteria, and don't work unless these requirements are satisfied. Furthermore, mathematical formal testing can be used to test intelligent contracts for mistakes and bugs to make sure they are error-free. This logic layer will incorporate parameterization and structure to lessen the possibility of unforeseen or problematic impacts on otherwise free-form machine learning algorithms. Keep in mind that smart contracts could not be applicable in both scenarios because innovation can result in coincidental discoveries and novel concepts. However, they could be applied in a number of scenarios, including stock contracts, legal agreements, and business transactions, where parties would wish to clearly limit the outcome [3].

THE CURRENT BLOCKCHAIN AND AI USE CASES

Here are a few possible use cases that deal with these issues:

1. Healthcare data privacy management: Blockchain technology can be utilized to safeguard private patient data. For instance, the blockchain-based healthcare platform Hashed Health uses smart contracts to control patient consent for data sharing with various healthcare providers [6]. While the blockchain guarantees that individuals maintain control over their personal health information, artificial intelligence (AI) can be used to evaluate this data to enhance patient outcomes.
2. Decentralized identity: AI and blockchain technology can be utilized to build a decentralized identity system in which people are in charge of their own online personas. This would safeguard a person's identity from unwanted access and allow them to verify themselves and exchange personal information with only [9].
3. Supply chain management: Businesses can use blockchain technology to establish a transparent and safe supply chain infrastructure. AI may be used to forecast demand, stop fraud, and optimize supply chain operations from a variety of data sources [10].
4. Protection of intellectual property: Blockchain technology and AI can be utilized to safeguard intellectual property [8]. For instance, IPChain, a blockchain-based platform, seeks to establish a decentralized database of intellectual property assets so that authors can sign up and safeguard their creations. Artificial Intelligence has the capacity to detect copyright violations and infringement.
5. Fraud detection and prevention: A fraud detection and prevention system can be developed by combining blockchain technology with artificial intelligence. For instance, Civic, a blockchain-based platform, verifies people's identities using AI, and the blockchain logs the verification procedure. Because every transaction is transparent and unchangeable, this approach lowers the danger of fraud and identity theft [3].
6. Information extraction Many benefits of blockchain technology make large-scale data analytics manageable. One of the most effective and established ways to safeguard data is to store it in a decentralized, secure network [6]. The vast amounts of data generated on-chain are aided by this large-scale data as blockchain technology gradually supports the essential components of human economic and social activity. Because of this, these models might be able to use predictive analytics to find general trends and provide useful information, enabling businesses and individuals to make informed choices about the opportunities the on-chain economy presents.
7. Development of Smart Contracts Massive amounts of user data can increase the efficiency of smart contract developers. These are self-executing computer programs that let users trade valuables like assets or cash. AI-driven APIs that offer real-time sensor analytics could improve smart contract apps. It trades without the need for an intermediary and is transparent, tamper-proof, and conflict-free [7]. Eight Uses for Resource Management Blockchain and AI integration calls for network resources, and there are many different situations involved in integrating it with resource management applications. Considering that mining blockchain requires a large amount of energy and computing power. Deep learning is the foundation of an effective bid strategy for allocating edge computing resources [2].

APPLICATIONS OF AI AND BLOCK CHAIN.

The applications of both AI and Blockchain have been extensive and transformative across various sectors. AI has seen a surge of applications in numerous fields

1. Supply Chain Management: By boosting efficiency, accountability, and transparency, blockchain and AI technologies are being leveraged to enhance supply chain management. By evaluating data and anticipating any vulnerabilities, artificial intelligence (AI) may assist optimize the supply chain process, while blockchain allows businesses to generate a tamper-proof digital record of each step of the process [1].
2. Finance and Banking: By offering a substitute for established banking systems, blockchain technology is transforming the finance sector. Artificial intelligence (AI) is being utilized to streamline customer support and automate procedures including loan approvals, risk assessments, and fraud detection [16].
3. Healthcare: By lowering prices, controlling medical information, and enhancing patient care, blockchain and AI have the ability to completely change the healthcare sector. Patient data may be safely shared and stored on blockchain, and AI can be used to analyze the data and spot patterns and insights.

4. Gaming business: To improve efficiency, justice, and transparency, the gaming business is utilizing blockchain and AI. Blockchain-based gaming platforms offer safe and transparent transactions, and artificial intelligence (AI) can be utilized to give users individualized experiences.
5. Social Media: Decentralized social media platforms with transparent, censorship-resistant mechanisms are being developed using block chain technology [20]. AI is capable of analyzing user behavior and preferences to enhance tailored experiences and content recommendations.
6. Energy Management: Energy production, distribution, and consumption are optimized with the application of blockchain technology. AI may be used to automate energy management and cut down on energy waste by analyzing data from sensors and smart meters.
7. Government and Public Services: Voting systems, identity verification, and the provision of social welfare are just a few of the government services that are being enhanced by blockchain and AI technologies. Voting procedures are safe and transparent with blockchain-based voting systems, and artificial intelligence (AI) can be utilized to automate identity verification and cut down on false claims [21].

IMPACT ON PUBLIC TRUST AND RESEARCH

In many aspects, combining blockchain technology with AI can greatly increase public trust. We can build systems that are more safe, responsible, and effective by fusing the analytical capabilities of AI with the transparency and immutability of blockchain. In order to foster public trust, this integration can do the following three things:

1. Transparency: Because blockchain technology is decentralized, all data and transactions are recorded on a public ledger, which makes the process easily verifiable and transparent. Then, by analyzing this data, AI algorithms may make predictions and provide insights that will increase accountability and transparency [10].
2. Security: Data is safe and impervious to tampering thanks to blockchain's cryptography techniques. By incorporating AI, we may improve security protocols by utilizing machine learning algorithms to instantly identify irregularities or possible security breaches, guaranteeing the integrity of the system [1].
3. Privacy: Artificial intelligence (AI) can be utilized to create privacy-preserving methods that let data analysis happen without jeopardizing personal privacy. We can create systems that put data security and user confidentiality first by utilizing blockchain for safe data storage and AI for privacy-enhancing technology[16].
4. Trust in Decision-Making: We may build systems where decision-making processes are traceable, auditable, and explicable by fusing the transparency of blockchain technology with the analytical powers of artificial intelligence. Users who wish to know how decisions are made and that the system is fair can grow more trusting of this[12].
5. Reduced Bias: The data used to train AI algorithms can introduce biases. By incorporating blockchain, we can trace and audit the data sources used by AI systems, helping to decrease bias and ensuring that decision-making processes are fair and unbiased [10]. In general, the combination of blockchain technology and artificial intelligence can result in more dependable systems that put an emphasis on security, privacy, transparency, and equity. This will eventually increase public confidence in the technology and the companies that employ it.

THE FUTURE OF AI WITH BLOCKCHAIN

Blockchain enables large-scale collaboration, value transfer, and trust minimization, whereas AI enables large-scale intelligence. These technologies have the potential to enhance security, transparency, and overall efficiency when combined, creating new opportunities and helping a wide range of industries. Blockchain technology and AI have a great deal of potential to influence many different fields. As companies strive to automate procedures, boost productivity, and enhance their company offerings by integrating AI into a substantial portion of software products, it is projected that AI models will continue to proliferate throughout numerous economic sectors. Simultaneously, despite decades of a steady decline in institutional trust, users are increasingly lured to apps that make use of cryptographic promises. Together, these two enormous technological advances have the potential to drastically transform both our economies and civilizations.

CONCLUSION

In summary, the nexus of blockchain technology and artificial intelligence creates a huge opportunity for innovation that might completely disrupt sectors and bring about revolutionary change. Applications of AI in blockchain are currently being used to improve data integrity, optimize smart contracts, and transform Web3 gaming experiences, among other things. These show the variety of ways these technologies may work together to produce value. To properly utilize AI in blockchain applications, however—as with any new technology—challenges like scalability, data protection, and regulatory compliance must be carefully negotiated. Businesses can take advantage of the potential created by this exciting confluence by working together to overcome these difficulties and by utilizing the experience of organizations like SoluLab, which specializes in blockchain solutions and AI development. Organizations can use AI and blockchain to promote innovation, increase efficiency, and remain ahead in the quickly changing digital age with SoluLab's all-inclusive AI development solutions and blockchain development services. Get in touch with us right now to find out how SoluLab can guide your company through the challenges presented by AI in blockchain technology and open up new avenues for growth.

ABSTRACT

Jeevaniya Panchamoola Dravyas are mentioned as *Chakshushya* (Beneficial to eyes) and *Vata Pittahara* (mitigates *Vata* and *Pitta*). The study is being conducted in the management of *Shushkakshipaka* (Dry Eye Disease) by *Netra Tarpana* (Keeping medicated ghee on eyes for stipulated time period) with the medicated ghee prepared with *Jeevaniya Panchamoola Dravyas.* Standardization of *Jeevaniya Panchamoola Ghrita* is achieved by organoleptic study, physico-chemical analysis, qualitative analysis and high performance liquid chromatography (HPLC). The study is conducted to detect the presence of Berberine in *Jeevaniya Panchamoola Ghrita* through HPLC method and it shows positive result. Berberine is one of the important chemical constituents of *Guduchi* (Tinospora cardifolia) which is used as a substitute drug for the preparation of *Jeevaniya Panchamoola Ghrita.* Berberine suppresses the inflammatory factors in conjunctiva and protects ocular surface.

Keywords: Jeevaniya Panchamoola Ghrita, Medicated Ghee, Shushkakshipaka, Standardization, HPLC, Berberine

INTRODUCTION

Jeevaniya Panchamoola Dravyas are mentioned as *Chakshushya* (Beneficial to eyes) and *Vata Pittahara* (mitigates *Vata* and *Pitta*).[1] Medicated Ghee is a lipid based Ayurveda formulation. A Medicated Ghee prepared with these *Jeevaniya Panchamoola Dravyas* is known as *Jeevaniya Panchamoola Ghrita*.The extinct drugs are replaced by the substitute drugs for the preparation of *Jeevaniya Panchamoola Ghrita*.[2],[3] (Table No. 1) *Jeevaniya Panchamoola Ghrita* is selected for the standardization by various pharmacological tests. As the Ayurveda formulations mentioned in the classics are effective in treating and preventing many diseases, there is a need for standardization of the drug. In this study, standardization of *Jeevaniya Panchamoola Ghrita* is achieved by organoleptic study, physico-chemical analysis, qualitative analysis and high performance liquid chromatography (HPLC). Aim of this study is to detect the Berberine in *Jeevaniya Panchamoola Ghrita* by HPLC Method.

MATERIALS AND METHODS

Collection of Raw Drugs

Raw drugs are procured from the authenticated source. Jeevaniya Panchamoola Ghrita is prepared under the guidance of GMP certified JSS Ayur pharmacy, Mysuru, Karnataka.

Method of Preparation of *Jeevaniya Panchamoola Ghrita*

Jeevaniya Panchamoola Ghrita was prepared by the following ingredients according to the *Ghrita Paka Kalpana* mentioned in API.[4]

- **Ingredients of Poultice (*Kalka Dravyas*)** - *Jeevanti (Leptadenia reticulata), Guduchi (Tinospora cordifolia), Vidarikanda (Pueraria tuberosa)* (each 500g), *Shatavari (Asparagusracemosus)* (1kg).
- **Ingredients of Medicated Liquid (*Kashaya Dravyas*)** - Medicated liquid (*Kashaya*) is prepared with *Jeevanti (Leptadenia reticulata), Guduchi (Tinospora cordifolia) , Vidarikanda (Pueraria tuberosa)* (each 4kg), *Shatavari (Asparagus racemosus)* (8kg), Water - 320lit. and boiled till it reduced to 1/8th part i.e., 40lit.
- Cow's Ghee (*Go Ghrita*) (15lit.) Ghee is heated till appearance of fumes, then medicated liquid (*Kashaya*) and Poultice *(Kalka*) are added in the Ghee. It is boiled and stirred continuously, till it attains Madhyama Paka with *Sneha Siddhi Lakshanas*. Then prepared Medicated Ghee is filtered and collected in clean container.

***Sneha Siddhi Lakshanas*5**

- Poultice (*Kalka*) attains perfect wick shape when rolled between thumb and index finger.
- When the part of poultice *(Kalka*) is put into the fire no sound is produced.
- Foam disappears in Medicated Ghee (*Ghrita Paka*) during completion of preparation.

Organoleptic Study

The sample is analysed for organoleptic, physiochmeical study and HPLC in JSS Drug Testing Laboratory, A Unit of JSS College of Pharmacy, Mysuru, Karnataka. The organoleptic parameters of *Jeevaniya Panchamoola Ghrita* is as illustrated in the table No. 2.

Physiochemical Analysis

Physiochemical Characteristics of *Jeevaniya Panchamoola Ghrita* is shown in Table No. 3.

Estimation of Berberine in *Jeevaniya Panchamoola Ghrita* by HPLC Method

High Performance Liquid Chromatography (HPLC) studies are done with the following method. The mobile phase is made up of 0.3% Formic acid in water as (A)and Methanol as an organic modifier (B) and it is delivered at a flow rate of 1.0ml/min in the binary gradient mode wherein mobile phase (A) is delivered at a concentration of 95% as compared to B for a run time of 5 minutes. The sample is injected in a volume of 10µl. The column oven temperature

is maintained at 30˚C throughout the chromatographic run. Detection is carried at an UV wavelength of 266nm. Chromatographic conditions are illustrated in the table No.4.

Preparation of solutions

Preparation of standard stock(1000ug/ml)

Weighed 100.03mg of Berberine standard into a 100ml volume tric flask, added methanol and sonicated to dissolve. Further made up the volume with methanol to10ml.

Preparation of working standard solutions

The working standard solutions in the concentration ranging from 0.5-100ug/ml are prepared by respective dilutions of the standard stock of Berberine.

Preparation of sample solution(1g/ml)

Transferred 10g of the sample into a 10ml volumetric flask, added 5ml of methanol,sonicated and further made up the volume to 10 ml with methanol.

RESULT

The linearity was established for Berberine in the range of 0.5-100µg/mL with a correlation coefficient (R2) of 0.999. (Figure No.1) The concentration of Berberine in the Jeevaniya Panchamoola Ghrita was determined from the caliberation curve using the regression equation. (Figure No. 2)

y=53242x - 11346

where y (Peak area response of Berberine in Sample) = 632140

x=unknown concentration of Berberine in sample

y=53242x - 11346

x=632140 + 11346/53242 = 12.086µg The concentration of Berberine presentin thesample of *Jeevaniya Panchamoola Ghrita*is12.086µg/mL.

DISCUSSION

The ingredients of *Jeevaniya Panchammola Ghrita* are procured and their genuinity is tested in JSS Ayur Pharmarcy, Mysuru, Karntaka. Only the Berberine is assessed by HPLC method to check the quality of the Medicated Ghee. The quantity of berberine in *Jeevaniya Panchamoola Ghrita* is 12.086µg/mL. Berberineis one of the chemical constituents present in *Tinosporacordifolia* [6], which suppresses the inflammatory factors and CD4+T cells infiltration in conjunctiva. It also protects ocular surface by avoiding the severe apoptosis and decreasing the level of MMP-3 and MMP-9. It ameliorates the apoptosis and inflammation through modulatin PI3K/AKT/NFkB and MAPK pathway[7]. *Asparagusracemosus* contains Kaempferol[8] Kaempferol promotes Human Corneal Epithelial Cell (HCEC) proliferation and reduces cell apoptosis and also inhibits the expression of inflammatory factors via p38MAPK pathway[9] *Pueraria tuberosa* contains Puerarin[10] which attenuates the oxidative stress and inflammation of HCE-2 cells and also attenuates the hyperosmotic stress induced injury of HCE-2 cells by regulating SIRT1/NLRP3 signaling[11] *Leptadenia reticulata* contains Luteolin[12] An *in vivo* study shows the results which proves that the Luteolin can reverse and stabilize the elevated pro-inflammatory factors in depression related dry eye disease. [13]

CONCLUSION

Authenticity of the drug is proved by Organoleptic study and Physiochemical Analysis. Presence of Berberine in the *Jeevaniya Panchamoola Ghrit*a is confirmed with HPLC Method. Identification and quantification of berberine with standard protocol of HPLC study has revealed that, the drug which has been used for clinical study has exhibited

the conjunctival anti-inflammatory property by suppressing the CD4+T cells infiltration. This decreases the natural cell death of conjunctiva by modulating PI3K/AKT/NFkB and MAPK pathway. The analytical study for the standardization of *Jeevanaiaya Panchamoola Ghrita* is established in the current study. Additional important analysis, investigations, molecular studies are required for the identification of all active chemical constituents to substantiate the effective results of clinical efficacy.

ABSTRACT

Quantum computing represents a revolutionary leap in computational power, leveraging the principles of quantum mechanics to solve problems that are beyond the reach of classical computers. This rapidly advancing field holds immense potential to transform areas such as cryptography, optimization, and the simulation of complex systems. However, it also introduces significant challenges, especially in the realm of cyber security. With the ability to efficiently crack traditional encryption methods like RSA and ECC, quantum computers threaten the integrity of current cryptographic systems. This impending risk underscores the urgent need for quantum-resistant algorithms and new cryptographic frameworks. As quantum computing advances, the cyber security landscape must evolve in parallel to safeguard digital infrastructure from emerging quantum-based threats.

Keywords: Quantum computing, Cybersecurity, Quantum cryptography, post-quantum encryption, Quantum-secure algorithms, RSA and ECC encryption, Shor's quantum algorithm

INTRODUCTION

Quantum computing heralds a new era in technology by harnessing the principles of quantum mechanics to perform calculations that classical computers cannot handle. Unlike classical computing, which relies on bits in a definite state of 0 or 1, quantum computing operates using quantum bits, or qubits, which can exist in both states simultaneously due to the phenomenon of superposition. This allows quantum computers to process multiple calculations at once, vastly increasing their computational power for specific problem sets. Another pivotal feature of quantum mechanics is entanglement, where qubits become interconnected such that the state of one directly influences the state of another, even if they are far apart. This unique property paves the way for innovations in fields like cryptography and secure communication, as quantum technologies can transmit information in ways classical systems cannot. However, while quantum computing presents exciting possibilities, it also introduces significant challenges, particularly in the realm of cyber security. As the quantum revolution unfolds, its implications for cryptography, especially the security of current encryption systems, are profound and demand immediate attention.

Necessity of Quantum Computing

Power of Superposition

Quantum computing's key advantage lies in transcending the binary nature of classical bits, which are limited to 0 or 1. In contrast, qubits can exist in both states simultaneously, thanks to superposition. This allows quantum computers to process vast amounts of data at once, significantly speeding up encryption and decryption. While this boosts security capabilities, it also poses a threat, as quantum computers could break traditional encryption far faster than classical computers, making sensitive data vulnerable. This dual potential underscore the need for advanced cyber security strategies.

Impact of Entanglement

Entanglement is a unique quantum phenomenon where two qubits are so closely linked that the state of one instantly affects the other, regardless of distance. This property offers ultra-secure communication channels, as any attempt to intercept data would disturb the entangled qubits and be detected. However, quantum computers also use entanglement to perform complex calculations far more efficiently, posing a risk to conventional encryption methods.

Efficiency through Interference

Quantum interference enhances the probability of correct outcomes while minimizing errors by amplifying the right answers and canceling out the wrong ones. This improves the efficiency of quantum algorithms, making cryptographic processes faster and more accurate. Yet, the same technology threatens current security measures, as quantum algorithms could potentially break classical cryptographic codes with ease, further highlighting the risks posed by quantum advancements.

Classical Cryptography in Cybersecurity

Cryptographic algorithms like RSA and ECC are crucial for securing modern digital systems, relying on complex mathematical problems that are difficult for classical computers to solve. These algorithms protect communication, data, and ensure integrity.

RSA Encryption

RSA is a widely used public-key cryptosystem based on the challenge of factoring large prime numbers. Key advantages include:

- **High Security**: Difficult to break due to the complexity of factoring large numbers.
- **Broad Usage**: Trusted and widely adopted across many systems.
- **Versatility**: Supports both encryption and digital signatures.

Elliptic Curve Cryptography (ECC)

ECC provides the same level of security as RSA but with smaller key sizes, making it more efficient. Benefits include:

- **Efficiency**: Faster computations and lower power consumption due to smaller keys.
- **Compact Key Size**: Ideal for devices with limited resources.
- **Robust Security**: Based on the elliptic curve discrete logarithm problem, which is extremely hard to solve.

Quantum Computing Risks

RSA and ECC are at risk from quantum algorithms like Shor's algorithm, highlighting the need for quantum-resistant encryption.

Threats from Quantum Computing

The rise of quantum computing presents a significant risk to classical cryptographic systems like RSA and ECC. Quantum computers use advanced principles such as superposition and entanglement to solve problems far more efficiently than classical machines, undermining the security of current encryption.

Vulnerabilities of RSA and ECC

- **Shor's Algorithm**: This powerful quantum algorithm can factor large numbers and solve elliptic curve discrete logarithm problems, threatening the security of RSA and ECC.
- **Key Size Constraints**: While increasing key sizes can strengthen protection against classical attacks, quantum computers can break these larger keys with fewer resources.
- **Quantum Speed Advantage**: Quantum computers' ability to solve cryptographic problems much faster jeopardizes secure communication systems previously considered safe.

Quantum Threats: Shor's and Grover's Algorithms

Shor's Algorithm

Shor's algorithm, developed in 1994, efficiently solves two key mathematical problems: factoring large numbers and solving discrete logarithms, both of which underpin RSA and ECC security.

- **RSA Vulnerability**: Shor's algorithm can quickly factor large numbers, breaking RSA encryption by deriving private keys from public keys.
- **ECC Vulnerability**: It also solves elliptic curve discrete logarithms, compromising ECC, a widely used cryptosystem in efficient encryption. If quantum computers can run Shor's algorithm, RSA and ECC would be rendered obsolete, exposing sensitive data and breaking secure communications.

Grover's Algorithm

Grover's algorithm, discovered in 1996, speeds up unstructured searches, halving the security of symmetric key algorithms like AES.

Symmetric Key Impact

Grover's algorithm reduces the brute-force search time for keys, cutting the security of a 128-bit key to the equivalent of a 64-bit key. To counter this, longer keys (e.g., 256-bit) are needed to maintain security.

Summary

- **Shor's Algorithm** threatens public-key systems like RSA and ECC by solving the problems that secure them.
- **Grover's Algorithm** weakens symmetric encryption by reducing effective key lengths, requiring longer keys to remain secure.

Cybersecurity Risks in the Quantum Era

Quantum computing threatens current encryption systems like RSA and ECC, as algorithms such as Shor's and Grover's expose vulnerabilities, enabling more advanced cyberattacks. Transitioning to quantum-resistant cryptography is essential but comes with challenges.

Breaking Classical Cryptography

- **Risk**: Quantum algorithms can break widely used cryptographic methods (RSA, ECC), compromising encrypted data.
- **Impact**: Sensitive information could be exposed, raising major privacy concerns.

Vulnerability of Legacy Systems

- **Risk**: Legacy systems relying on classical cryptography will be vulnerable to quantum attacks.
- **Impact**: Expensive upgrades to quantum-resistant solutions will be required.

Quantum-Enhanced Cyber attacks

- **Risk**: Quantum computing could lead to more sophisticated and harder-to-detect cyber attacks.
- **Impact**: Increased frequency and effectiveness of attacks threaten organizations and individuals.

Transition to Quantum-Resistant Cryptography

- **Risk**: The transition process is complex and may leave systems vulnerable during the switch.
- **Impact**: Potential exploitation of transitional weaknesses.

Erosion of Trust in Digital Security

- **Risk**: Public awareness of quantum threats could undermine confidence in digital security.
- **Impact**: Loss of trust in online systems could lead to economic and social disruptions.

Strengthening Cybersecurity: The Power of PQC and QKD

Post-quantum cryptography (PQC) and quantum key distribution (QKD) are emerging as solutions to counter both classical and quantum attacks:

Quantum Attack Resilience

- **Quantum-Resistant Algorithms**: Unlike RSA and ECC, PQC relies on hard-to-solve problems for quantum computers, such as lattice-based and code-based cryptography.
- **Impact**: PQC ensures future-proof encryption, protecting sensitive data from quantum threats.

Quantum Key Distribution (QKD)

- **Secure Key Exchange**: QKD uses quantum mechanics to securely exchange keys, detecting any intrusion in real-time.
- **Impact**: Combined with PQC, it strengthens data transmission security, safeguarding sensitive communications.

Securing Digital Signatures & Authentication

- **Quantum-Safe Signatures**: PQC protects digital signatures from quantum attacks, ensuring secure identity verification.
- **Impact**: PQC and QKD provide robust authentication, preventing unauthorized access and identity theft, even in a quantum-enabled future.

AI, ML, and QML: A New Era in Problem Solving

The integration of Artificial Intelligence (AI), Machine Learning (ML), and Quantum Machine Learning (QML) into cyber security offers powerful advancements in threat detection and response.

Enhanced Threat Detection

- **AI and ML**: These technologies analyze large datasets in real-time, identifying patterns and anomalies to predict and detect emerging threats.
- **QML**: By leveraging quantum computing, QML improves detection accuracy, especially in environments with massive data.

Automated Threat Response

- **AI-Driven Automation**: AI and ML can automate responses to cyber threats, such as isolating systems or applying patches.
- **Quantum Decision-Making**: Quantum algorithms enable quicker, more effective decisions in high-stakes situations, reducing the impact of attacks.

CONCLUSION

Post-Quantum Cryptography (PQC) is essential for protecting against quantum computing threats by developing quantum-resistant algorithms to secure digital communications and data. Implementing PQC ensures future-proof cyber security. AI, ML, and Quantum Machine Learning (QML) are transforming cyber security by improving threat detection, automating responses, and enhancing encryption. Together, these technologies equip organizations to defend against both present and future cyber threats, ensuring resilience in the evolving quantum era.

ABSTRACT

The role of rhizospheric symbiotic Arbuscular Mycorrhizal (AM) fungus, Non-AM fungus and a bacterium in growth and development of *E. latifolia* L. seedlings was analysed. The seedlings were inoculated with recognized AM fungal strain (*Glomus* species, Gm 1), non-AM fungus (*Trichoderma harzianum,* Th-13) and Phosphate solubilising bacterium (*Pseudomonas putida*, Ps-1) alone and in combined form (both, dual and triple/tripartite consortium) and analysed for their effect on growth parameters *i.e.* increase in length, diameter, circumference, Sturdiness quotient (S_q), Biovolume index (B_i) and Plastochron interval index (P_i) of the target plant species. Qualitative analysis have revealed that the consortium treatment containing *Pseaudomonas putida*, *T. harzianum* and *Glomus* sp. resulted in more increase in the length (3.9±1.01), diameter (2± 1.02), circumference and biovolume (92±2.14) including reduced phyto-mortality and initiating rapid phyllogenesis in inoculated seedlings as compared to control seedlings. Similar trend with diminutive variation in all studied parameters as cited above was also observed in other alone and combined treatments than control seedlings which are discussed in detail in this paper. Thus, AM alone and consortium inoculations proved to boost the resilience and adaptability of this plant species.

Keywords: Arbuscular mycorrhizal fungi, Bio-inoculation, Biovolume index, *Elaeagnus latifolia* L, Growth parameters.

INTRODUCTION

Plant soil–microbe interaction is an intricate, continuous, and dynamic process that occurs in a distinct zone known as the rhizosphere. Both plant and soil types were found to have an impact on the community diversity and structure of the rhizosphere, or vice versa. The diversity of microorganisms in soil is thought to be essential for the management of soil health and quality because it has different plant growth-promoting or biocontrol effects that could be very advantageous for the host plant and alter plant physiology and nutrition (Chauhan *et al.,.,* 2023). Microbial interactions in rhizosphere may be pathogenic that may invade or kill plant roots or beneficial that directly or indirectly promote the growth of the plants. They may be saprophytic that live on dead residues of plant bodies or neutral causing no visible effect to the plant. These microbes are present on the soil rhizosphere and thus rhizosphere are considered as a versatile and dynamic ecological environment of intense plant-microbe interactions (Mayak *et al.,*. 2004).

The application of beneficial microorganisms as bioinoculants appears as an environmental friendly biotechnological tool for sustainable agricultural practices (Dimpka *et al.,.,* 2009; Dodd and Perez-Alfocea, 2012, Pereira et al.,., 2020). In the rhizosphere, abundant micro-organisms co-exist which in association with plant roots [plant growth-promoting fungi (PGPF) and rhizobacteria (PGPR)] have been effectively used in the induction of resistance in host plants against the invading phytopathogens apart from enhancing plant growth and development (Naziya *et al.,.,* 2019). A large number of microsymbionts have been identified and they are known to play important role in the growth and development of the plants species such as legumes-*Rhizobium*, *Ensifer*, *Mesorhizobium*, *Azorhizobium* and *Bradyrhizobium* (Velasquez *et al.,*. 2010; Hermann *et al.,*. 2011); *Burkholderia-Mimosa* (Bontemps *et al.,*. 2010; Hermann et al.,. 2011); VAM- roots in higher plants; *Frankia- Alnus*, *Elaeagnus*, *Hippophae*, *Purshia* and *Shepherdia* (Dommergues et al.,. 1998; Hermann *et al.,*. 2011); Ectomycorrhiza-roots of higher plant species mostly belonging to Pinaceae, Betulaceae, Salicaceae, Myrtaceae, Casuarinaceae and some Caesalpinaceae and Dipterocarpaceae (Girlanda *et al.,*. 2007; Hermann *et al.,*. 2011). One of the such important constituent of the plant microbe interactions are PGPRs which can be defined as the indispensable part of rhizospheric biota that when grown in association with the host plants can stimulate the growth of the host. Whipps (2001) suggested that there are three basic categories of interactions (neutral, negative or positive) existing between the *rhizobacteria* and growing plants and thus, PGPR are classified into extracellular plant growth promoting rhizobacteria (ePGPR) and intracellular plant growth promoting rhizobacteria (iPGPR) (Martinez-Viveros *et al.,.,* 2010). The ePGPRs may exist in the rhizosphere, on the rhizoplane or in the spaces between the cells of root cortex. The bacterial genera e.g., *Agrobacterium*, *Arthrobacter*, *Azotobacter*, *Azospirillum*, *Bacillus*, *Burkholderia*, *Caulobacter*, *Chromobacterium*, *Erwinia*, *Flavobacterium*, *Micrococcous*, *Pseudomonas* and *Serratia* belongs to ePGPR (Gray and Smith, 2005). On the other hand, iPGPRs are generally located inside the specialized nodular structures of root cells such as the endophytes and *Frankia* species both of which can symbiotically fix atmospheric N_2 with the higher plants (Verma and Jamalludin, 1995). Many rhizosphere colonizing bacteria, including *Azotobacter*, *Azospirillum*, *Bacillus*, *Clostridium* and *Pseudomonas* typically produce substances that stimulate plant growth or inhibit root pathogens (Vazquez *et al.,.,* 2000). The inoculation of plants with plant growth-promoting rhizobacteria (PGPR) has been shown as an effective tool to alleviate maize stress caused by several environmental factors (Moreira *et al.,.,* 2019; Pereira and Castro (2014a,b) (Pereira *et al.,.,* 2020)

Many studies are being conducted on different aspects of interactions between different microbial bioagents including bacteria (*Pseudomonas* spp., *Bacillus* spp.), and fungi (*Trichoderma*, *Gliocladium*), and mycorrhizal species in diverse plant species. However, the beneficial effects of these bioagents on different plants and their applied mechanisms have varied consequences. One of them is AMF, a member of the subphylum Glomeromycota, which includes three classes (Glomeromycetes, Archaeosporomycetes, and Paraglomeromycetes) in the phylum Mucoromycota. So far, this subphylum has been classified into four orders and 25 genera, containing about 250 species. Glomeromycota depends on plants for carbon substrate to survive. In return, the symbiont provides an abundance of minerals and nutrients to the host plants, such as nitrogen, phosphorus, and potassium through an intraradical network of hyphae and arbuscules, and the root apoplast interface. In addition, AMF improves the quality of the soil since fungal hyphae accelerate decomposition much earlier, thus improving soil quality. The AMF

establishes symbiotic relationships with the roots of most of the terrestrial plants, including 80–90% of the vascular plants, and 90% of the agricultural plants, such as cereals, vegetables, and horticultural plants. The application of AMF has been found to increase plant growth and regulation by enhancing nutrient uptake and stress tolerance (Singh et al.,., 2022). The role of AM fungi in improving the quality and survival of plant seedlings after plantation has been well recognized (Boureima et al.,. 2007). The arbuscular mycorrhizal (AM) fungi are also known to maintain important ecological position among various microorganisms colonizing the rhizosphere of plants (Parkash *et al.,.* 2015). Free living as well as symbiotic nitrogen fixing bacteria plays an important role the structure of the soil (Bano and Iqbal, 2016). Plant growth promoting rhizobacteria are known to enhance plant growth by increasing these macronutrients availability during their plant root colonization. In comparison to any other genera, *Pseudomonas* is the most favored bioinoculant due to its significant properties in both plant growth and phytopathogen control during its synergistic association with the host plant. These properties include siderophore production, phosphate solubilization, nitrogen fixation, phenazines, antibiotics, and induced systemic resistance carried out by various *Pseudomonas* species like *Pseudomonas fluorescens, Pseudomonas putida,* and *Pseudomonas syringae*. The association of *Pseudomonas* with crop plants procures several secretory and electron-based feedback mechanisms in order to regulate the plant growth and phytopathogen control activities through the secretion of several phytohormones (auxins, gibberellins, Indole-3-acetic acid), secondary metabolites (flavonoids) and enzymes (aminocyclopropane-1-carboxylate, phenylalanine ammonia-lyase) (Sah *et al.,.*, 2021).

Many studies are being conducted on different aspects of interactions between different microbial bioagents including bacteria (*Pseudomonas* spp., *Bacillus* spp.), and fungi (*Trichoderma*, *Gliocladium*), and mycorrhizal species in diverse plant species. However, the beneficial effects of these bioagents on different plants and their applied mechanisms have varied consequences. Therefore, more study is needed to illustrate different aspects of these interactions. Thus, this study was undertaken to observe the effect of bioinoculation in the growth and development, sturdiness quotient and biovolume index of the targeted plant species is *Elaeagnus latifolia* L., a member of the family Elaeagnaceae, order Rhamnales also known as bastard Oleaster or *Myrica tenga* (Assamese) which is uncommon in the north-eastern states of India. This plant species is economically valuable due to the wide usage of the fruit pulp of this small tree for making jam, jelly and refreshing drink. However, recent studies have shown that the density of these plant species have been lowered in the natural forest stands and the fruit collection procedure was highly erratic, threatening its survival in near future. Thus, such fruit trees are in great need of conservation in their natural forest stands.

MATERIALS AND METHODS

Collection of plant, soil and root samples

Survey was made at selected areas for the collection of plant specimen, *Elaeagnus latifolia* L., (Fig.1**)** which is known for its symbiotic relationship with several beneficial microbiotas. The rhizospheric soil samples of the plant are also collected to investigate and enumerate important microbial associations. The collected plant specimens were preserved in herbarium sheet for further identification. Rhizospheric soil samples (at least three samples at each location) were taken by digging out a small amount of soil (500 g) adjacent to plant roots up to the depth of 15-30 cm. The collected soil samples were kept in pre-sterilized polythene at 4 ^{0}C to estimate the physico-chemical parameters of soil, mycorrhizal colonization and quantification of VAM fungi as well as actinorhizal and endophytic associations.

Isolation and characterization of rhizospheric microorganisms

In the present investigation, a culture-based approach was primarily used to isolate and characterize the rhizospheric microbes of selected study points. For this, randomly collected soil samples were mixed properly and passed through a 2.0 mm sieve to remove the debris. 1.0 g of soil was then suspended in 10 ml of SDW and incubated in an orbital shaking incubator at 28 °C with periodic shaking at 200 rpm for 30 minutes. 10-fold series dilutions were prepared serially by taking 1 ml of the soil suspension and dispensing it into 9 ml of SDW. Soil particles were allowed to settle

and serial dilutions were prepared using SDW. The soil suspension of required dilution was then inoculated into culture media and incubated at optimum temperature for maximum growth of rhizosphere microbes. The colony forming units (cfu) were counted after proper incubation period was over. Three replicates were maintained in each case. Bacterial and fungal colonies were identified and characterized based on their morphological, cultural and reproductive characteristics on the growth media.

Isolation, quantification and root colonization of VAM spores

Wet sieving and decanting technique (Gerdemann and Nicolson, 1963; Singh and Tiwari, 2001) was followed to isolate VAM spores. For this, 50gm of soil was suspended in 500 ml water and decanted by using a series of sieves. Spores retained on the mesh were recovered by repeated washing and transferred to whatman no. 01 filter paper in a petridish and observed under stereo-binocular microscope. The isolated spores were identified using the keys of Morton and Benny, (1990); Mukerji (1996); Schenck and Perez, (1990); Trappe (1982), Walker (1992). Websites, www.mycorrhiza.com,www.ffp.csiro.aug.utk/resaerch/mycorrhiza/intro,http://zor.zut.e .pl/Glomeromycota/index.html are also used for identification.

Mycorrhizal quantification

Gaur and Adholeya's, (2000) modified method was used for quantitative estimation of VAM spores. The whatman filter paper was divided into many small sectors and total numbers of spores were counted by adding the number of spores present in each sector under stereo-binocular microscope.

Growth media, isolation and culture conditions for rhizospheric fungi

Potato dextrose agar (PDA) was used for the isolation of soil fungi using dilution plate technique (Johnson and Curl 1972) and 10^5 dilutions. The media were supplemented with 50µg/ml of streptomycin sulphate to prevent bacterial growth. Fungi were grown at 25±1 °C for 5 days. Three replicates were maintained in each case. Pure colonies were transferred to PDA slants overlaid with mineral oil and stored at 4 °C for further identification. Fungi were characterized based on their cultural, morphological and spore characteristics and identified by consulting various taxonomic monographs (Gilman 1957; Subramanian 1971; Watanabe 1993; Domsch et al.,. 1980). The fungi that did not produce spores were characterized as mycelia sterile and those showing no diagnostic morphological characters were included under unidentified strains.

Isolation and characterization of soil bacteria

Isolation of soil bacteria was done on Nutrient agar (NA) using dilution plate technique of Johnson and Curl, (1972) and 10^6 dilutions. The bacterial population was estimated by growing them at 30±1 °C for 48 h. Three replicates were maintained in each case. Pure cultures of bacteria were preserved at 4 ºC in NA slants after observing the abundance of bacterial growth, pigmentation and optical characteristics. For long-term storage, isolates were kept in 15% (v/v) glycerol in NB at –20 ºC. Bacterial morphological characters like shape, size, texture, surface, growth, elevation, margin type, consistency, pigmentation, rate of growth etc., as well as physiological and biochemical characteristics were examined in accordance with Cappuccino and Sherman, (1992) and Bergey's Manual of Systematic Bacteriology (Holt et al.,. 1994). A modified gram staining method (Cruickshank 1965) was followed to differentiate the Gram-positive bacterial isolates from Gram-negative strains.

Production of in-vitro cultures and mass multiplication of selected indigenous and putative bioagents/microsymbionts for bio-inoculation of target plant species

Mycorrhizal mass multiplication

The mycorrhizal inoculum production was carried out using soil funnel technique (Menge and Timmer, 1982). Dominant single and efficient AM spore can be used for mass production here. Sorghum, maize, gram and wheat were selected as the best host for starter culture of inoculum production. In the technique, earthen funnels were taken for the germination of seeds .Observation was continued until the root of the seedlings touched the inoculum of AM fungi. The seedlings were raised up to 30 days in the earthen funnels containing sterilized sand and soil at the ratio of 1:3. In the present investigation, 40 g sand was taken against 120 g of soil. The experiment was repeated up to 45-90

days and AM spores were collected by wet sieving and decanting technique (Gerdemann and Nicolson, 1963; Singh and Tiwari, 2001). The spores of *Glomus* sp. and *Acaulospora* sp. were utilized in the present investigation for mass multiplication using hosts like *Zea mays* L. (maize) and *Cicer arietinum* L. (chickpea) in bigger earthen pots.

Pot culture

Mass multiplication of dominant AM spores like *Glomus* sp. and *Acaulospora* sp. was carried out using different hosts and substrates in pots. Maize (*Zea mays* L.) and chick pea (*Cicer arietinum* L.) was observed as best hosts for pot cultures of mycorrhizal spores. Sand and soil (1:3) was used as substrates for pot cultures. The pot cultures were maintained for several days. The pots were supplemented with Hoagland solution once in a fortnight. However, KH_2PO_4 was removed from the original solution to observe the effect. The soil containing mycorrhizal spores, mycelium and colonized roots was used, further, to inoculate seedlings and to prepare other pot cultures.

Field culture

The test inocula were mass multiplied in field conditions by preparing standard size beds on thin polyethylene sheet (0.5 mm). Care was taken so that no contamination occurred to the inocula. The experiment was repeated for maintaining the inocula cultures more viable for further experimentation.

Mass multiplication of selected fungal isolate

Trichoderma, being a potent fungal biocontrol agent is known for its antagonistic action against a range of plant pathogens (Tewari and Mukhopadhyay, 2001; Rini and Sulochana, 2007). Different organic media like neem cake, coir pith, farmyard manure, decomposed coffee pulp are being used for *Trichoderma* multiplication (Saju et al.,. 2002). However, the method of Parkash and Saikia, (2015) was employed in the present investigation for the mass multiplication of *Trichoderma* spp.

Collection of soil samples and isolation of compost fungal activator

The soil samples were collected from different locations of Assam and Meghalaya of N. E. India. *Trichoderma harzianum*, the fungal stain was isolated from the collected soil samples by using serial dilution plate method on PDA medium. The inoculated plates were incubated at 30 ^{o}C for 4 days. Fungal colonies were purified by streak plate method on agar slants and incubated at 30 ^{o}C for 7-8 days. Green conidia forming fungal bodies were selected and microscopic observation was made for fungal identification. In the present investigation, the fungus was identified as *Trichoderma harzianum* (Isolate no. TH-13). The identified fungal isolate was maintained on PDA slants is retained with Mycology and Soil Microbiology Laboratory, (RFRI), Jorhat, Assam, India, for further study and analysis.

Preparation of solid substrate

Saw dust of *Shorea robusta* Gaertn. was used in the present investigation for solid substrate preparation. For this, saw dusts were shade dried and mixed well with wheat bran by adding SDW in the ratio of 3:1:4 w/w where, 03 parts of wheat bran is mixed with 01 parts of saw-dust and 04 parts of water. The moisture of the mixture was maintained up to 50–60%. Autoclaving is made to sterilize the substrate properly.

Mass multiplication of *Trichoderma harzianum*

Trichoderma harzianum was grown on synthetic PDA medium (SRL, India) for 7-8 days and incubated at 27–30^{o} ± 1^{o}C. The inoculum was kept in BOD incubator (Labotech, BDI-55 make, India) for 10–12 days for maximum growth and sporulation. The inoculum containing medium was cut into small discs and put in flasks containing wheat bran and saw-dust medium in the ratio of 3: 1: 4 w/w for mass multiplication of *Trichoderma harzianum*. Approximately 50 g substrate was put in 500 ml conical flasks followed by inoculation with 5 mm mycelial mat. It was then incubated at 28 ˚C for 7–10 days. The target bioagent in the form of substrate inoculum was applied at the time of sowing of target seedlings in the nursery of RFRI, Jorhat, Assam N. E. India.

Mass multiplication of selected bacterial isolate/s

Isolation of putative bacterial bioagent

Pseudomonas sp. were isolated from the rhizosphere of target plant species of the selected study sites using NB medium. After incubation, individual colonies were transferred to fresh NA slants. Pure colonies were stored at 4 °C for further use. Colony characteristics were observed regularly. Individual colonies were examined for typical shape, size, structure and pigmentation

Mass multiplication of *Pseudomonas sp.*

Pure colonies of selected bacterial isolates were streaked with the help of a sterile loop and dipped in a freshly prepared NB and incubated at an orbital shaking incubator for 2 days. After the incubation period is over, the clear medium appears as frothy and slightly pale colour indicating the growth of *Pseudomonas* sp. (Isolate PS-I). The mass multiplied liquid media were used for further inoculation experiments.

Investigation on the efficacy of selected indigenous putative bioagents/microsymbionts on the target plant species in nursery and their role in its establishment and conservation

Randomized Block Design (RBD) was made in the nursery of RFRI, Jorhat Assam, India. Selected bioagent was inoculated on the seedling stock of target plant species, *Elaeagnus lalifolia* L. Three different inoculation procedures such as single, double and synergistic were adopted in the present investigation. Three replicates were maintained for each treatment. A treatment without any inoculum served as control. Root trainer (30cm×50m) containing 500 g of substrates like sand and soil at the ratio of 1:2 was used for each treatment along with its replication. Inoculum was applied close to the rhizosphere of the seedlings (at the depth of 5-10 cm).

In the first set of experiment , eight treatments were undertaken consisting of mono, dual and tri inoculums of the selected indigenous bioagents consisting of *Glomus mosseae*, *Pseudomonas putida* and *Trichoderma harzianum*. For

convenience, the various synergistic treatments are labeled as follows:

T1 = Control (No inoculation)

T2 = Treatment/Inoculation of A (*Pseudomonas putida*)

T3 = Treatment/Inoculation of B (*Trichoderma harzianum*)

T4 = Treatment/Inoculation of C (*Glomus mosseae*)

T5 = Treatment/Inoculation (combination of A+B)

T6= Treatment/Inoculation (combination of B+C)

T7= Treatment/Inoculation (combination of C+A)

T8= Treatment/Inoculation (combination of A+B+C)

Different plant growth parameters like shoot height (%), endomycorrhizal infection, root and shoot dry weight were recorded regularly to evaluate the efficacy of endomycorrhizae, endophytes and nodular micro-endosymbiont/s on the growth and development of target plant seedlings.

Bio volume index

Biovolume index of the seedlings were calculated in accordance with Parkash et al.,., (2011) and Hatchell (1985).

B_i = H X D

Where B_i = Biovolume index

H= Height of seedlings in cm

D= Diameter of stem in (mm/cm)

Diameter was calculated with the following formula:

$C = \pi r^2$ where C is the circumference or girth of stem of seedlings

$r^2 = \frac{c}{\pi}$, So, D = 2r

Sturdiness quotient (Sq)

The sturdiness quotient reflects the stocky or spindly nature of the seedlings. It is of particular importance in container-grown seedlings where the Sq can get very high on undesirable spindly stock (Hatchell 1985). Sq was calculated with the following formula.

$$\textbf{\textit{Sturdiness Quotient}}\ (\textbf{\textit{Sq}}) = \frac{\textbf{\textit{Height of the plant}}}{\textbf{\textit{Diameter of the plant}}}$$

Plastochron interval index

The plastochron interval index of the seedlings was evaluated after Ist inoculation, using the standard protocol (Parkash 2012).

Data analysis

Standard error of means and co-efficient of variance were determined for all the parameters like physico-chemical, mycorrhizal quantification, growth and yield. Species richness and diversity, similarity and dissimilarity indices of AM fungi were computed using MS Excel software 2007 and SPSS software version 16.0.

RESULTS AND DISCUSSION

The data on the effect of bio-agents inoculation on height of *E. latifolia* after first stage of inoculation (DAI)* was tabulated and further analyzed (Figure 2). The data on the increase in height (cm) was recorded after 30 Days, 60 Days, 90 days, 120 days,150 days, 180 days, 210 (Second stage of inoculation) and 240 (Second stage of inoculation) days after inoculation. After 180 days of inoculation, the increase in height (5.25 ± 0.45) was maximum in T4, treatment, whereas, minimum increase in height (0.75 ± 0.14) was recorded in T2 treatment. The coefficient of variance was 0.23. After second stage of inoculation, recording the sequential increase in height of the plant species revealed the following results. The increase in height after 90 days of second stage of inoculation showed maximum height increase (4.25 ±0.25) in T5, whereas, minimum increase in height (0.95± 0.94) was recorded in T4 treatment. The coefficient of variance was found to be 0.29 after analysis. The study of the effect of bio-agents inoculation on diameter of *E. latifolia* L. after first stage of inoculation (DAI)* and second stage of inoculation is showed in Figure 3. The data on the increase in diameter (cm) was recorded after 30 Days, 60 Days, 90 days, 120 days ,150 days, 180 days, 210 (Second stage of inoculation) and 240 (Second stage of inoculation) days after inoculation. After 180 days of inoculation, the increase in diameter (5. 5 ± 0.45) was maximum in T4, treatment, whereas, minimum increase in diameter (0. 5 ± 0.14) was recorded in T2 treatment. The coefficient of variance was 0.25. After second stage of inoculation, recording the sequential increase in diameter of the plant species revealed the following results. The increase in diameter after 90 days of second stage of inoculation showed maximum diameter increase (4.25 ±0.25) in T5, whereas, minimum increase in diameter (0.95± 0.94) was recorded in T4 treatment. The coefficient of variance was found to be 0.39 after analysis.

Effect of bio-agents inoculation on quality index, biovolume index and sturdiness quotient on *E.latifolia* L. after 90 days of second stage inoculation were also observed. The Quality index was maximum (1.884 ±0.03) in case of T4 treatment followed by T2 treatment (1.711 ±0.01), while it was minimum (1.570 ±0.014) in case of T3 treatment. The Biovolume index was also maximum (967.50 ±10.1) in T4 treatment, while it was minimum (512.0±24.05) in T1 treatment (Figure 4). The sturdiness quotient (SQ) was also analyzed for the inoculated seedlings and it was found that T8 had the highest SQ of 0.23 while the lowest was observed in T2 (0.16) after 90 days of second stage of inoculation (Figure 5). In the first set of experiment, plastochrone interval index of *E.latifolia* L. after first stage of inoculation was studied. It is revealed that the first to second leaf primordium was initiated in control treatment after long interval of 4 days and it ceased after 41 days (7th leaf primordium). But in case of T2 , T5 and T7 treatment, the 7-8 leaf primordial appeared after 45 days (Figure 6).Whereas initiation of leaf primordium was observed even after 51 days of inoculation . The leaf primordial appearance ceased to appear after 41 days in case of control treatment, but in rest of the inoculated treatment/s, the leaf primordial appearance continued to appear.

The effect of bio-agents inoculation on biomass of *E. latifolia* L. after 90 days of second stage of inoculation (DAI)* in the first set of experiment. The shoot biomass was maximum (43.960±0.05) in T8 treatment and it was minimum (27.983 ±0.5) in T4 treatment (Figure 7). The root biomass was maximum (34.597±1.0) in T8 treatment, whereas it was minimum (19.636±0.25) in T5 treatment (Figure 8). The biomass yield was maximum (78.558 ±20.0) in T8 treatment and minimum (56.328 ±5.05) in T4 treatment (Figure 9).The effect of bio-agents inoculation on leaf length, leaf breadth leaf area and number of stomata of *E. latifolia* L. after 90 days of second stage of inoculation (DAI)* was observed that, T3 exhibited the maximum increase in leaf length (6.7 ±0.15) followed by T8 (6.4 ±0.05) and least increase in leaf length was observed in T1 (4.6 ±0.20) (Figure 10). The maximum increase in leaf breadth was recorded in T6 (3.67 ±0.25) and the minimum increase in leaf breadth was observed in T1 (2.23 ± 0.70) (Figure 11). Regarding the increase in leaf area, the maximum increment was recorded in T3 (17.10±0.05) and the minimum was found in T1 (7.95 ±0.05) in sq. cm (Figure 12). The bio-agents inoculation exerted their effects in the average increase in the number of stomata too. The number of stomata was maximum (86.00 ±1.0) in T7 treatment, whereas it was minimum (39.33±0.25) in T1 treatment (Figure 13). Observations were also made to analyze the effect of bio inoculation in the number of nodules after uprooting after 90 days of second stage of inoculation (DAI)*. It was found that, the maximum number of nodules were formed in treatment T6 (43) and the least number of nodules were formed in treatment T2 and T8 (12 each) (Figure 14). Thus it was observed that, regarding the increase in height (cm) T7 treatment showed maximum increase in height (18 ±0.42), whereas, minimum increase in height (9.75 ±0.42) was recorded in T1 treatment. The increase in breadth (mm) was recorded and it was found that, T5 and T7 treatment showed maximum increase in breadth (8.5±0.16), whereas, minimum increase in breadth (6.75 ±0.33) was recorded in T1 treatment.

DISCUSSION

Plant growth analysis is considered to be a standard approach to study plant growth and productivity (Wilson 1981). Growth and yield are functions of a large number of metabolic processes, which are affected by environmental and genetic factors. Studies of growth pattern and its understanding not only tell us how plant accumulates dry matter, but also reveals the events which can make a plant more or less productive singly or in population (Hokmalipour *et al.,*. 2011). The growth of plants are influenced by a large number of factors such as environment, edaphic conditions, climatic conditions, altitudinal variations and foremost of all, the rhizospheric microbiota associated with the plant species. Microorganisms play a fundamental role in the cycling of inorganic and organic P in the rhizosphere (Richardson and Simpson, 2011). Arbuscular mycorrhizal fungi (AMF) and plant growth-promoting rhizobacteria (PGPR) are beneficial below-ground microbes that directly associate with plant roots (Pan *et al.,*, 2020) Arbuscular mycorrhizal (AM) symbiosis is known to bring a wide range of benefits to the host plant in both agricultural production systems and natural ecosystems. The main effect of AM fungi is their capacity to supply mineral nutrients that are relatively immobile in the soil, particularly P and trace elements; they achieve this by exuding organic anions and phosphatase enzymes, and by modifying the pH around their hyphae (Giri *et al.,*. 2005). Many plant growth promoting rhizobacteria (PGPR) are also known to stimulate plant growth through direct or indirect interactions with plant roots. In soil with low P availability, PGPR (mainly pseudomonades) are known to help with the release of phosphate ions from both sparingly soluble inorganic sources of P (via the secretion of organic acids) and organic sources (via the secretion of phosphatase enzymes) (Artursson *et al.,*. 2006). Bacteria and fungi are involved in biocontrol activity, and the fungal genus *Trichoderma* plays a major role in controlling the plant diseases**.** *Trichoderma* is widely used as biocontrol agent against phytopathogenic fungi, and as a biofertilizer because of its ability to establish mycorrhiza-like association with plants (Saba et. *al.* 2012). Thus, it can be speculated that a synergistic interaction of all these microorganisms in the rhizosphere of plant species has a direct impact on the overall growth and development of the plant species.

In the present investigation it was observed that, in the first set of experiment, the increase in height and diameter of the inoculated seedlings after 90 days of second stage of inoculation showed maximum height increase in treatment T5 (Treatment/Inoculation (combination of *Pseudomonas putida* + *Trichoderma harzianum*) whereas, minimum increase in height was recorded in T4 treatment (Treatment/Inoculation of *Glomus mosseae*). The results of all present

investigation are in close conformity with the finding of Hernandez and Cuevas, (2003). Alpa et al.,. (2012), found that soybean plant growth was significantly affected by AM fungi and other bioinoculants (*T. viride* and *B. japonicum*). Similarly, shoot length and inflorescent length were lower in basil plants inoculated with *G. intraradices* compared to the other mycorrhizal fungi, but no significant difference was observed in inflorescent length in all treatments (Zolfaghari *et al.,*. 2012). Nisha and Rajeshkumar, (2010) reported that seedlings raised in the presence of *G. fasciculatum* showed an increase in shoot and root length as well as in dry weights, followed by those grown in the presence of G. *aggregatum* than the other treatments. Earlier studies also showed such a trend for medicinal plants subjected to AM inoculation (Bukhari and Rodrigues, 2008; Rajeshkumar et al.,. 2008; Ndiaye *et al.,*. 2009). However, this results are contradicted to the results obtained by Lins *et al.,*. (2006), where they observed AMF inoculated *Leucaena leueocepala* plants presented greater height than inoculated plants.

In this study, it was found that, the quality index and biovolume index was highest in T4 treatment (Treatment/Inoculation of *Glomus mosseae*) and sturdiness quotient was maximum in T8 (Treatment/Inoculation of *Pseudomonas putida* + *Trichoderma harzianum* + *Glomus mosseae*) inoculated seedlings. Earlier, it has been reported that the effect of VAM fungi is increased when they were co inoculated with other microflora of rhizosphere of plants (Rashmi and Roy, 2003; Parkash *et al.,*. 2004). They observed that the biomass of shoot and root was also significantly more in seedlings inoculated with consortium followed by *G. mosseae, A. laevis* and *G. gigantea*. The control seedlings again had low shoot and root biomass The Biovolume index (Bi) was also high in all inoculated treatments than non-inoculated control but consortium treatment had at par Bi than rest of inoculation treatments. The quality index (Qi) value was also high in mixed consortium and *A. laevis* treatment each respectively than *G. mosseae* and *G. gigantea* treatment. Control seedlings had low value of Qi. Although, the *G. mosseae* treatment increased the height of seedlings but biomass is not improved through higher numbers of leaves and lateral branches, hence resulting in low Qi value. The consortium treatment (*G. mosseae* + *A. laevis* + *G. gigantea*) and *A. laevis* alone proved to be promising bioinoculants for increasing the biomass of Garden Rue. The Qi and Bi values also observed more in these treatments suggesting that they are of best quality. Such biomass production through inoculation was also reported by Vasanthakrishna *et al.,*. (1995) and Rajan et al.,. (2000) in *Casuarina equistefolia* and *Tectona grandis* respectively. Basumatary *et al.,*. (2014) reported sturdiness quotient was high (5.64±0.05) in emergent shoots of *Glomus* sp. treated stumps followed by *Glomus* sp. + *Acaulospora* sp. (5.10±0.06) and *Acaulospora* sp. (5.00±0.11) treated stumps of *Hevea brasiliensis*. inoculated stumplets exhibited good Sturdiness Quotient (S_q), in comparison to the control/ non-inoculated stumplets. The SQ value is also in accordance with the optimum value (Jaenicke, 1999). The sturdiness quotient is the height (h) in centimeters divided by the stem diameter (d) in millimeters (h/d). It reflects the stocky or spindly nature of the seedlings. Although a good indicator of the ability to withstand physical damage in all stock-types, it is of particular importance in container-grown seedlings where the sturdiness quotient can get very high on undesirable spindly stock.

Pan *et al.,.,* (2020) found that stem biomass, plant height, stem diameter, and branch numbers in *Elaeagnus angustifolia* L. were increased markedly by the presence of AMF consistent with previous reports on citrus, fenugreek and trifoliate orange. However, the specific stem length in *Elaeagnus angustifolia* L. decreased significantly in three microbial treatments. This result may be interpreted as AMF and PGPR reversing the salinity effects on stems and branches, such that *Elaeagnus angustifolia* L. with microbial inoculation did not require a greater specific stem length to ensure the effectiveness of associated functions. Hence, we suggest that increasing specific stem length may be one of the self-adaptive mechanisms used by *Elaeagnus angustifolia* L. without microbial inoculation to counter adverse salt stress conditions. Roller (1977) found that black spruce seedlings with sturdiness quotients greater than six were seriously damaged when exposed to wind, drought, and frost. In general, sturdiness quotient should closely parallel diameter in predicting survival and growth in the field. A sturdiness quotient greater than 6.0 is undesirable, a root-shoot ratio of between 1.0 and 2.0 is preferable, and the presence of J-roots indicates low seedling quality (Jaenicke 1999). Rajeshkumar *et al.,*. (2008) too found seedling parameters such as sturdiness quotient, biovolume index and quality index were to be all higher than those of the control, the increase being to the extent of 6.08%, 33.20% and 29.4% respectively in the seedlings of *Plectranthus amboinicus*. Such values indicate a sturdier stem and a greater dry weight of the plant, qualities which are desirable among nursery seedlings.

In the first set of experiment, it was observed that, the biomass yield was maximum in T8 treatment (Treatment/Inoculation of *Pseudomonas putida* + *Trichoderma harzianum* + *Glomus mosseae*) and minimum in T4 treatment (Treatment/Inoculation of *Glomus mosseae*). Earlier, it has been observed that plant grown in soil inoculated with *Glomus fasciculatum* showed increased mycorrhizal colonization, fresh and dry shoot and root weight, chlorophyll content and phytochemical constituents (Selvaraj 1989). Regarding the increase in leaf area, the maximum increment was recorded in T3 (Treatment/Inoculation of *Trichoderma* sp.) Their results indicate that leaf area was greatly enhanced in inoculated plants in comparison to control. Highest increment in leaf area activity was observed in the plants inoculated with *G. mosseae* + *A. laevis* + *T. viride* + *B. japonicum* and lowest in control . Second highest results were obtained in the single inoculation of *G. mosseae* followed by the triple combination *G. mosseae* + *A. laevis* + *T. viride* respectively. The results indicate that inoculation with mycorrhizal fungi alone or in combination with other bioinoculants significantly increase leaf area of soybean.

Variations were observed in the nodulation behaviour too. It was found that, the maximum number of nodules were formed in treatment T6 (Treatment/Inoculation (combination of *Trichoderma harzianum* and *Glomus mosseae*) and the least number of nodules were formed in treatment T2 and T8 (12 each). Bhuiya *et al.,.* (1986) found higher shoot and nodule dry weight of mungbean by the inoculation of *Rhizobium* strains. It is well documented fact that efficient strains of *Rhizobium* with better ability to complete with native rhizobia not only form more number of nodules per plant but also enhance dry weight of shoot and root. Begum (1989) who reported that inoculation with *Rhizobium* increased root dry weight than control. Yadav and Vashishat (1991) reported an associate effect of *Bradyrhizobium* and *Azotobacter* inoculation increase nodulation in *Vigna radiata*. Increase in nodulation either with individual or dual inoculation with *Bradyrhizobium* and AMF was reported in soybean (Singh 1994). Gupta and Namedo, (1996) reported that the inoculation of chickpea seeds with different *Rhizobium* has strains increased the nodulation. Pea plants inoculated only with *Rh. leguminosarum* and supplied with elevated P levels exhibited a significant increase in the nodule number and fresh biomass and its nitrogen fixing activity, respectively (Geneva et al.,. 2006). Inoculation of *Arachis hypogaea* with competitive strains of *Rhizobium* could enhance nodulation (Raverkar and Konde, 1990). Co-inoculation of some *Pseudomonas* and *Bacillus* strains along with effective *Rhizobium* is shown to stimulate Fenugreek growth, nodulation, and nitrogen fixation. The mycorrhizal interaction with *Frankia* sp. resulted in greater dry weight, number of nodules and nodule weight and increased nitrogenase activity on *Alnus nepalensis* (Tiwari 1995). They reported total weight of nodule lobes per plant was not significantly different in all treatments but the number and size of these lobes varied. The number of nodule lobes formed on plants grown on inoculated soil was higher than on plants that had been grown on non inoculated soil. In contrast, the largest nodules were found on non inoculated plants and lobes from plants grown on inoculated soil were significantly smaller.

CONCLUSION

Here, we saw that inoculating *Elaeagnus latifolia* L. with either *G. mosseae* alone, *Pseudomonas putida*, or *Trichoderma harzianum* in various synergistic combinations, had a good impact on the plant species' growth and development. The presence of AMF may alter root architecture and encourage root growth, which may support soil enzyme activity and improve nutrient uptake. *Elaeagnus latifolia* L.'s ability for gas exchange, photosynthesis, transpiration, CO_2 assimilation, and light interception were all maximized by the AMF inoculation, which also improved growth performance in leaves and stems. After 240 days, the seedlings also showed increases in height and width as well as positive impact on the plastochron index, biovolume index, and sturdiness quotient of the inoculated seedlings after inoculating them with *G.mosseae, Pseudomonas putida and Trichoderma harzianum* singly, combined and different synergistic combinations.

ACKNOWLEDGEMENT

We acknowledge the help and support received from RFRI, Jorhat for providing the necessary laboratory facilities to conduct the above said experiment. The author VP is thankful to the Director FRI, Dehradun for providing all help and support for the working facility in the laboratory under Forest Pathology Discipline

ABSTRACT

To investigate *in-silico* anti-urolithiatic potential of 16 ligands present in *Adenium obesum* (α-amyrin, apigenin, β-amyrin, β-sitosterol, betulin, 6,7-dihydroeridienone A, gossypetin, honghelоside, kaempferol-3-methyl ether, luteolin, neridienone A, neritaloside, rosmarinic acid, salvigenin, strospeside, 4-o-β-D glucopyranosyl D cymaritol) against 5 urolithiasis protein targets (Human glycolate oxidase, Human calcium sensing receptor with bound Gd^{3+},Osteopontin, Hyaluronic acid and Tamm horsfall protein) using Autodock 4.2. Studies report that flavonoids and triterpenesare considered to possess anti-urolithiatic activity. Phytochemicals such as flavonoids (kaempferol, luteolin, gossypetin, salvigenin, apigenin) and triterpenes (betulin, α-amyrin, β-amyrin) present in *Adenium obesum*are reported for their anti-inflammatory and anti-microbial properties.Since, infection and inflammation are known to exacerbate the condition of urolithiasis, these phytochemicals would become a better therapeutic option in kidney stones. Additionally, it is an evident fact that cardiac glycosides exert diuretic effect. Since, diuretics has been the substantial part of kidney stone evacuation, we proposed to identify the influence of plant's cardiac glycosides (honghelоside, neritaloside, strospeside) on urolithiasis target proteins. Hence, the aim of our study is to investigate thephytochemicals present in *Adenium obesum* for their potential anti-urolithiatic potential via modulation of hgox/Casr/OPN/HA/THP molecular targets of urolithiasis. Sixteen ligands reported in *Adenium obesum* were recruited from PubChem database. All

proteins (hgox/Casr/OPN/HA/THP) were downloaded from PDB database. Sixteen ligands were docked with five targets of urolithiasis using Autodock software and binding interactions were studied. All sixteen ligands exhibited excellent binding range (-5.23kcal/mol to -16.11kcal/mol) with five biomolecular targets. Strospeside and neritaloside were found to exert the lowest binding energies with all the five proteins by forming 1-3 hydrogen bonds. Thus, our *insilico* investigation on ligands reported in AO with molecular targets hgox/Casr/OPN/HA/THP conclude that these ligands display anti-urolithiatic potential by interaction with potential targets of urolithiasis.

Keywords: Phytochemicals, *Adenium obesum*, urolithiasis, molecular docking, calcium oxalate

INTRODUCTION

Abbreviations

HGOX- Human glycolate oxidase, CaSR- Calcium sensing receptor, OPN- osteopontin, HA- Hyaluronic acid, THP- Tamm horsfall protein.

Urolithiasis

Urolithiasis or nephrolithiasis is one of the painful disorders of the urinary system. It affects about 7-12% of general population. Urine crystallization is thought to be the main trigger in the development of stones.Urinary stones are mainly composed of calcium oxalate and calcium phosphate while some are made with cysteine, struvite and uric acid[1]. One form of kidney stone is calcium oxalate monohydrate (COM), which is more common in urinary stones than calcium oxalate dihydrate (COD)[2]. The kind, location, and size of the stone are the only factors that determine the treatment of renal calculi. In case of expulsion of small stones, drinking adequate water would be advisable additionally, drugs like thiazide diuretics and alpha blockers were also prescribed. In case of large stones, surgical intervention is typical for removal of urinary stones. However, such treatments may lead to life threatening complications which may involve renal tissue damage along with high recurrence rate. As a result, natural remedies from plant sources are preferred as an alternative therapy[3,4].

***Adenium obesum*(Forssk.) Roem. &Schult:**

Adenium obesum(Forssk.) Roem. &Schult, also known as desert rose, is commonly found in Arabian peninsula, tropical and subtropical regions of Africa and Asia. It belongs to the dogbane family, Apocynaceae[5]. Several parts of the plant have been reported for abundant pharmacological activites like antibacterial, antiviral, anticancer, anti-inflammatory, antioxidant and traditionally assist in healing wounds, disorders of the skin and migraines[6,7]. However, there has been no scientific studies on *Adenium obesum* for its potential anti-urolithiatic activity.

Molecular targets for urolithiasis

Urolithiasis is a complex disease which includes numerous pathological descriptions, comprising epidemiological, genetic and biochemical deviations[8]. Various scientific studies suggest that genetic anomalies in the proteins found in urinary system namely Human glycolate oxidase, Human calcium sensing receptor with bound Gd^{3+},Osteopontin, Hyaluronic acid and Tamm horsfall protein is considered to be liable for kidney stone formation. Human glycolate oxidase is the key enzyme involved in the formation of calcium oxalate stones. Genetic aberrations in the metabolism of glycoxylate contribute to the development of kidney stones by oxidizing glycolate to oxalate which then adheres to the renal tissue as calculi[9,10]. Followed by, Calcium sensing receptor with bound Gd^{3+},which upon up regulation stimulates MAPK signaling pathway which in turn causes crystal adhesion[11]. Additionally, osteopontin and hyaluronic acid, which are thought to be present in urinary stone matrix, take part in the pathological development of renal stones when there are genetic mutations[12-14]. Lastly, Tamm horsfall protein which is known for its dual role in preventing as well as aggravating stone formation, plays a vital role in clinical growth of stones after

undergoing mutations[15]. Hence, inhibiting these proteins would bring out potential therapeutics in the treatment of urolithiasis

.

***In-silico* docking studies**

Virtual screening method is an innovative approach that helps in finding potential active molecules against biological targets[9].Accordingly, the potential phytochemicals of *Adenium obesum* against urolithiasis targets was identified using molecular docking technique. Of the many ligands reported in *Adenium obesum*, sixteen ligands were selected to check interactions with five target proteins namely Human glycolate oxidase(2rdt), Human calcium sensing receptor with bound GD^{3+}(5fbh), Osteopontin(3cxd), Hyaluronic acid(6fpy) and Tamm horsfall protein(4wrn). Cardiac glycosides, which are found in a variety of herbal plants, are currently explored as medicinal products because of their established capacity to exhibit diuretic and anti-microbial properties[16]. Accordingly, the plant's cardiac glycosides, honghelоside, neritaloside and strospeside are chosen to study their activity against urolithiasis. In addition, reports from recent studies suggest that the phytochemicals present in *Adenium obesum* namely betulin, rosmarinic acid, apigenin, kaempferol, β-sitosterol, α-amyrin, beta amyrin, luteolin and salvigenin have been indicated for anti-microbial and anti-inflammatory properties[17-24]. Since, infection and inflammation are known to exacerbate the condition of renal stones, our phytoconstituents may enhance its therapeutic effect in urolithiasis[25].Cystone, a herbomineral formulation, composed of many species, is the most widely used formulation for treating renal stones[26].Given the similarities between the phytochemicals found in *Adenium obesum* and the substances luteolin, β-sitosterol, and β-amyrin found in cystone, our proposal is to explore the plant's possible anti-urolithiatic properties[27]. Thus, the current study was aimed to figure out the impact of 16 ligands on these 5 molecular target proteins of urolithiasis.

MATERIALS AND METHODS

Protein preparation

3D structures of target protein receptors namely Human glycolate oxidase, Human calcium sensing receptor with bound Gd^{3+},Osteopontin, Hyaluronic acid and Tamm horsfall protein were downloaded from Research Collaboratory for structural bioinformatics protein database (RCSB Pdb) and then the hetero atoms were removed[28].Followed by, the active sites were predicted using PDB sum EMBL-EBI. The Protein Data Bank Id of these proteins are 2RDT, 5FBH, 3CXD, 6FPY and 4WRN.

Ligand preparation

The active ligands selected for the current study namely α-amyrin, apigenin, β-amyrin, β-sitosterol, betulin, 6,7-dihydroeridienone A, gossypetin, honghelоside, kaempferol-3-methyl ether, luteolin, neridienone A, neritaloside, rosmarinic acid, salvigenin, strospeside, 4-o-β-D glucopyranosyl D cymaritol were chosen from previous scientific reports on *Adenium obesum* and were prepared using Pubchem software[29,30,31]. Subsequently, openbabel-2.3.1 was used to obtain 3D structures of selected ligands and they were saved in PDB format. These prepared ligands were allowed to dock with the target proteins using Autodock tools 4.2.

Molecular docking using autodock tools 4.2 (version 1.5.6)

Autodock 4.2 was used to investigate the favored orientation between active ligands and target proteins. Initially, the receptor proteins were optimized by adding polar atoms respectively. Each atom in the macromolecule were applied for kollman charges respectively and converted to pdbqtformat[32]. Later, the grid box specifications were adjusted to 60*60*60* A while focusing the macromolecule at the center. While seeking out the best conformers, Lamarckian genetic algorithm was selected as the search parameter. These files were saved in gpf and dpf formats, to enable autodock and autogrid functions. The dlg files were opened to collect binding energies once the docking process was done. In the current work, the number of hydrogen bonds, inhibition constant, binding energy and interaction between active residues have been analyzed[33,34].

RESULT

In the present *In Silico* study, all 16 ligands (Table 1) selected for the study depicted excellent binding affinities against 5 molecular targets for urolithiasis, among 16 ligands, cardiac glycosides displayed binding energy below -15.00kcal/mol, namely, strospeside (-16.11kcal/mol) (Figure 1)and neritaloside(-15.26kcal/mol) (Figure 2)with Human glycolate oxidase and each of the ligand formed 2-3 hydrogen bonds respectively. Docking studies against Human calcium sensing receptor with bound Gd^{3+}depicted good binding affinities against all 16 ligands ranging from (-7.43kcal/mol to -14.78kcal/mol) however, neritaloside (-14.78kcal/mol) (Figure 3) and strospeside (-14.04kcal/mol) (Figure 4) were found to have the highest binding affinity respectively. The docking studies against osteopontin exhibited binding energies ranging from (-5.81kcal/mol to -12.93kcal/mol) however, stropeside (-12.93kcal/mol) (Figure 5) and neritaloside (-11.63kcal/mol) (Figure 6) were found to have highest binding score by forming one hydrogen bond with an inhibition constant of 334.5nM. The docking results against hyaluronic acid revealed that strospeside (-13.26kcal/mol) (Figure 7) and 6,7-dihydroneridienone A (-11.47kcal/mol) (Figure 8) were found to have the highest binding affinity forming 1-2 hydrogen bonds respectively. Docking studies against Tamm horsfall protein elucidated that strospeside (-10.51kcal/mol) (Figure 9) and neritaloside (-8.99kcal/mol) (Figure 10) were found to have highest binding affinity respectively. Among the 16 ligands, strospesideexhibited the lowest binding energy (-16.11kcal/mol) with human glycolate oxidase by forming 2 hydrogen bonds with inhibition constant of 1.55nM.

DISCUSSION

Human glycolate oxidase (hGOX), a flavoenzyme plays a crucial role in the development of renal stones. Glycoxylate can also undergo transformation to glycine or glycolate by the influence of alanine glyoxylate aminotransferase or hydroxypyruvate reductase. Thus, genetic aberrations in the metabolism of glycoxylate leads to the development of hyperoxaluria type 1 and 2[10]. With this possible target as the core, our 16 ligand selections demonstrated superior interactions (-8.89kcal/mol to -16.11kcal/mol) and better inhibitory properties on human glycolate oxidase. Strospeside was found to exhibit the highest binding affinity (-16.11kcal/mol) with hGOX. Human calcium sensing receptor (CaSR) is a G- protein coupled receptor, found almost in every portions of kidney however majorly present in thick ascending limb. It plays a key role in maintaining calcium homeostasis. Variable expression of CaSR gene Arg990Gly predisposes to kidney stone formation[11]. Our *in silico* studies on targeting this protein produced better molecular interactions with all 16 ligands ranging from -7.48kcal/mol to -14.78kcal/mol where cardiac glycosides neritaloside(-14.78kcal/mol) and stropeside(-14.04kcal/mol) revealed the least binding energies of all with magnificent inhibition potential. Osteopontin (OPN), a glycoprotein, is formed within the kidney and is also found excreted in urine. Genetic variations in the promoter region of osteopontin expression has become a causative factor for the stone development[12].In our study, all 16 phytochemicals of *Adenium obesum* exerted stronger protein-ligand interactions ranging from (-6.51kcal/mol to -13.26kcal/mol) and more affinities for strospeside(-12.93kcal/mol) and neritaloside (-11.63kcal/mol).These phytochemicals demonstrated features of excellent binding interactions, suggesting a strong likelihood of anti-urolithiasis benefits. Hyaluronic acid (HA), belonging to the family of glycosaminoglycans, is one of the major components of urinary stone matrices. It plays a crucial role in maintaining tissue hydration and recently have earned interest among people as an anti-aging product. Scientific studies on this protein reveals that it has an augmenting effect in crystal adhesion and retention[13,14]. Docking studies on this protein revealed better binding efficacy with all 16 ligands ranging from (-6.51kcal/mol to -11.47kcal/mol), among which Strospeside (-13.26kcal/mol) and 6,7-dihydroneridienone A (-11.47kcal/mol) showed least binding score by forming 1-2 hydrogen bonds respectively. Tamm horsfall protein (THP), a urinary glycoprotein, gets originated in the ascending limb of Henle and gets excreted in the urine. THP is known for its dual role in preventing as well as aggravating stone formation. Sialic acid present in THP is said to regulate stone formation. But in defective THP, insufficient sialic acid lacks defensive action against crystal formation due to its self-aggregation potential[15]. The data made it evident that the Tamm horsfall protein would be an impressive therapeutic target for urolithiasis. Henceforth, our molecular docking studies depicted good inhibition potentials on Tamm horsfall protein ranging from (-5.23kcal/mol to -10.51kcal/mol) with strospeside possessing the highest score (-10.51kcal/mol).

In this present *in silico* study, cardiac glycosides(strospeside and neritaloside) have generated remarkable binding potentials with each of the selected urolithiasis target proteins. Reports from previous studies suggests that cardiac glycosides exerts a diuretic effect by preventing tubular reabsorption. Diuretics generally boosts urine flow and is considered to alleviate the condition of renal calculi[35]. Calcium sensing receptor have been claimed to enhance tubular absorption by the influence of Na+/H+ exchanger[36]. Our present findings showed better interations between cardiac glycosides (honghelоside, strospeside and neritaloside) and CaSR and we suggest that these phytochemicals would favor novel approaches in kidney stone expulsion. Previous research findings imply that Tamm horsfall protein is thought to produce anti-bacterial effect via formation of gel with urinary polymer and prevents adhesion of microbes to urinary wall. But in case of mutated THP, one is more likely to catch infections of the urinary tract system[37].Flavonoids and triterpenes which possess anti-microbial activity displayed good binding affinity with THP. Henceforth, the interactions between flavonoid (kaempferol, luteolin, gossypetin, salvigenin andapigenin) and triterpenes (betulin, α-amyrin and β-amyrin) with THP serves as a better therapeutic option for urolithoasis. In general, flavonoids and triterpenes were reported for its potential anti-urolithiaticpotential[38]. In the present study, flavonoids such as kaempferol, gossypetin, luteolin, salvigenin and apigenin exhibited excelletent binding potential with the targeted proteins. Hence our present study implies that these phytochemicals flavonoids, triterpenes and cardiac glycosides would become a better therapeutic option for urolithiasis and extracts of *Adenium obesum* would become a novel intervention in renal stones. To validate the current research on potential phytochemicals for urolithiasis, further investigations on these bioactive molecules is desired. Hence, our present *in silico* studies involving 16 ligands of *Adenium obesum* exerts anti-urolitihiatic potential on molecular targets Human glycolate oxidase, Human calcium sensing receptor with bound Gd^{3+},Osteopontin, Hyaluronic acid and Tamm horsfall protein respectively.

CONCLUSION

Thus, our present study emphasizes the function of 16 ligands of *Adenium obesum* in eradicating the condition of renal stones by modulating hgox/Casr/OPN/HA/THP biomolecular targets of urolithiasis.

ABSTRACT

In the digital age, social networking platforms have become integral to modern communication, enabling connections and interactions among individuals worldwide. The decision-making process of a user plays a crucial role in shaping these interactions and relationships. This paper applies a decision-making framework, typically used by users in social networks, to predict user engagement with Boolean comments. It examines the decisions users make, from joining a network to engaging with public content. The research focuses on the decision-centric nature of online social interactions, contributing to a deeper understanding of how individual choices combine to influence the collective dynamics of social networks. Social networks involve more than just exchanging information; they require users to make continuous decisions on how to interact with others' content—whether to like, comment, share, or keep it private. This paper aims to utilize this understanding of user decisions on social networks to predict engagement with Boolean comments.

Keywords: Social Networking Platforms, User Decision-Making, Predict, Engagement, Boolean Comments.

INTRODUCTION

Social networks have become an integral part of modern life, fundamentally changing how users connect and interact with others members [1]. However, navigating these platforms involves a series of decisions that shape our online experience. Using decision making steps in each stage, a user builds friendship, does communication and share information and engaged with public content[2]. In the digital age, social networking platforms have become integral to modern communication, facilitating connections and interactions among individuals across the globe[3]. Social networks are not just about information exchange; they involve continuous decision-making by users. This study proposes a framework for understanding decision-making within social networks, focusing on how individual choices aggregate to shape the collective dynamics of social networks. Social networks have become an integral part of modern life, fundamentally changing how users connect and interact with others members [1]. However, navigating these platforms involves a series of decisions that shape our online experience. Using decision making steps in each stage, a user builds friendship, does communication and share information and engaged with public content[2]. In the digital age, social networking platforms have become integral to modern communication, facilitating connections and interactions among individuals across the globe[3]. Social networks are not just about information exchange; they involve continuous decision-making by users. This study proposes a framework for understanding decision-making within social networks, focusing on how individual choices aggregate to shape the collective dynamics of social networks. The objective of this paper is to study the decision-making process in user engagement with Boolean comments on social network platforms. User engagement is crucial for the success of these platforms, and encouraging users to interact with comments can significantly boost engagement levels. However, not all users are equally likely to engage with comments. Studying user engagement with comments on social network platforms is helpful for understanding interaction levels, personalizing user experiences, etc. Predictive insights into user behavior with comments not only improve user satisfaction but also contribute to strategic decision-making and innovation in data-driven approaches within the digital landscape. By using a decision-making framework and machine learning techniques, the aim is to predict whether a user is likely to engage with Boolean comments on a post.

a) Decision Problem: Predict if a user will engage with comments (Boolean Comments).
b) States of Nature: Boolean Comments (TRUE or FALSE).
c) Information Available: The information available will consist of user data collected from the social media platform.

- Total Connections (number of friends and followers)
- Whether the user is predicted to engage with comments (currently labeled as "likely to bool Comments")
- Total Posts
- Shared Posts
- Number of Photos Liked
- Gender

For predicting a binary outcome like whether a user will engage with comments or not, it is possible to consider classification algorithms. These algorithms include Decision Trees, Random Forests, Gradient Boosting Machines (GBM), and Neural Networks[14,15]. The choice of algorithm depends on factors such as the size and complexity of. the dataset, computational resources available, interpretability requirements, and desired prediction accuracy. By experimenting with multiple algorithms and evaluating their performance using metrics like accuracy, precision, recall, and F1-score, it is possible to identify the most effective approach for this task.

literature survey

Introduction to Social Network Analysis

- Social network analysis (SNA) is a methodological approach that studies the relationships and interactions among actors in various domains such as individuals, communities, and organizations (Wasserman & Faust, 1994; Scott,

2017)[6, 17]. It provides insights into how these entities are connected and how information flows within these networks.

- Boyd and Ellison (2007)[21] define social network sites (SNS) as web-based services that allow individuals to (a) construct a public or semi-public profile within a bounded system, (b) articulate a list of other users with whom they share a connection, and (c) view and traverse their list of connections and those made by others within the system.
- Ellison *et al.* (2014)[4] explore the concept of social capital within SNS, emphasizing how users cultivate and maintain relationships to accrue social resources, which in turn influence their online interactions and behaviors.

Factors Influencing User Engagement

➢ Demographics and User Features

- Toraman *et al.* (2022)[22] conduct a comparative analysis of user and textual features in Twitter to predict social engagements. They highlight the importance of features such as textual content, user demographics, and interaction patterns in understanding and predicting user behaviors on social media platforms.
- Sorensen et al. (2023) [23]investigate factors influencing online consumer purchase behavior on social network platforms. They identify consumer engagement, trust, perceived risk, value perception, and social support as critical factors that impact online sales and consumer satisfaction.

➢ Decision-Making in Social Networks

- Burke, Marlow, and Lento (2010) [24]explore the factors influencing users' decisions to interact with content on Facebook. They find that personal interests, social norms, and network characteristics play significant roles in determining engagement levels.
- Lampe *et al.* (2010)[25] discuss how privacy concerns and platform features affect users' decision-making processes regarding the visibility of their communications on social networks. They highlight the trade-offs users make between sharing information and protecting their privacy.

Machine Learning Approaches for Engagement Prediction

Techniques and Models

Zhu *et al.* (2020)[26] compare machine learning models such as Random Forests and Gradient Boosting Machines to predict user interactions on social media platforms like We Chat. They leverage user demographics, activity data, and textual content to achieve high prediction accuracy. Cheng *et al.* (2018)[27] apply deep learning techniques, specifically Long Short-Term Memory (LSTM) networks, to analyze and predict user engagement patterns on Twitter. Their study demonstrates the effectiveness of neural networks in handling large and complex datasets inherent to social media platforms.

Specific Engagement Types

Ku *et al.* (2019)[28] focus on predicting Boolean comments (yes/no engagement) on social media posts. They identify content relevance and the relationship between the poster and the user as critical predictors of engagement. Kim and Lee (2021)[29] utilize decision tree models to predict Boolean comments on Instagram. Their approach considers user attributes such as gender, number of followers, and posting frequency to enhance prediction accuracy.

Impact of Demographics and Activity

Demographic Influences

Brandtzaeg and Heim (2011) [30]study the influence of gender on user engagement levels in terms of comments and likes on social networks. They find that gender differences play a significant role in shaping user interactions with online content. Liu and Guo (2022)[31] explore demographic factors affecting user participation and engagement in online social networks in China. Their research highlights cultural and regional differences in social media usage patterns.

Activity-Based Attributes

Gao *et al.* (2016)[32] analyze user activity metrics such as the frequency of posts, comments, and likes to predict engagement with new content. They demonstrate that active users are more likely to engage with and share new posts, thereby influencing overall engagement dynamics on social platforms.

METHODOLOGY

The study aimed to predict user engagement with bool comments on a social network platform using machine learning techniques. The approach involved a systematic process from data preprocessing to model evaluation, focusing on understanding which factors influence user interaction behaviors. The dataset, sourced from a Kaggle repository, includes various attributes of user activity on the platform.
https://www.kaggle.com/datasets/alextar04/vk-social-network-dataset?select=newDataBaseVk.csv[36]

Now the following formulas are setup from the given dataset:

a) Total Connection: The sum of count Friends and count Followers. Users with more connections might be more engaged.
b) Total Post: The sum of count Owner Posts and count Owner Reposts. Users who post more often may be more likely to engage with comments.
c) Shared Post: The sum of count Photos and count Videos. Users who share more multimedia content might have higher engagement levels.
d) Liked Post: count Likes Photoes directly shows how much content the user has liked, which can indicate engagement.
e) Gender: While not always a direct indicator, there could be patterns in engagement based on gender and use 1 for male and 2 for female

By analyzing these features, the study seeks to uncover patterns and predictors of user engagement, particularly with respect to commenting behavior on social media posts.

Model Selection and Evaluation

Justification of Models: Decision Tree, Random Forest, Gradient Boosting, and Neural Network were selected based on their suitability for capturing nonlinear relationships, ensemble learning capabilities, and deep learning potentials, respectively.

Decision Tree

Suitability: Decision Trees are effective in capturing nonlinear relationships in the data through recursive partitioning. Mathematical Representation: A Decision Tree learns a series of if-else decision rules to split the data based on features, aiming to maximize information gain or minimize impurity (e.g., Gini impurity or entropy).
Formula: The prediction at each leaf node R_m can be represented as:

$$\hat{y} = \frac{1}{Nm} \sum_{Rm} yi$$

Where $N_m$is the number of samples in region R_m.

Random Forest

Ensemble Learning*:* Random Forest builds multiple decision trees and aggregates their predictions to improve generalization and reduce over fitting.
Mathematical Representation: The prediction of a Random Forest model is the average prediction of its constituent trees:

$$\hat{y}_{RF}(X) = \frac{1}{Ntrees} \sum_{k=1}^{Ntrees} fk(X)$$

$f_k(x)$ is the prediction of the k-th tree.

Gradient Boosting

Boosting Technique: Gradient Boosting sequentially builds trees, each correcting errors made by the previous one, thereby reducing bias and variance.

Mathematical Representation: The prediction of a Gradient Boosting model can be expressed as:

$\hat{y}_{GB}(X) = \sum_{k=1}^{K} fk(X)$

$f_k(x)$ are week learners (typically shallow decision trees) trained to minimize loss function $L(y,\hat{y})$

Neural Network

Deep Learning Potential: Neural Networks (Multi-layer Perceptrons) excel in learning complex nonlinear relationships and patterns in data.

- **Mathematical Representation**: The output of a Neural Network with L layers and activations σ can be represented as:

$$\hat{y}_{\mathrm{NN}}(\mathbf{x}) = \sigma_L(\mathbf{W}_L\sigma_{L-1}(\mathbf{W}_{L-1}\ldots\sigma_1(\mathbf{W}_1\mathbf{x}+\mathbf{b}_1)\ldots+\mathbf{b}_{L-1})+\mathbf{b}_L)$$

where $\mathbf{W}_l$ and $\mathbf{b}_l$ are weights and biases of layer l, and σ_l is the activation function.

A. **Hyperparameter Tuning** Grid Search CV was employed to optimize each model's hyper parameters, enhancing their performance on predicting user engagement.

B. **Evaluation Metrics:** Accuracy, precision, recall, and F1-score were chosen as evaluation metrics to assess the predictive performance of models. These metrics were selected for their ability to measure the model's ability to correctly predict user engagement.

C. Handling Class Imbalance

SMOTE Technique: To address the class imbalance issue where engagement levels (`True` or `False`) were unevenly distributed, Synthetic Minority Over-sampling Technique (SMOTE) was applied. This technique generated synthetic samples for the minority class to balance the dataset, improving the models' ability to generalize.

D. Model Training and Comparative Analysis

Training and Testing: The dataset was split into training (70%) and testing (30%) sets to train the models and evaluate their performance.

Performance Evaluation: Each model's performance was evaluated using accuracy scores on the test set. Additionally, cross-validation was conducted to validate and ensure the robustness of the models.

E. Problem Statement

Develop a machine learning model to predict whether a user will leave a Boolean comments based on various interaction parameters such as total connections, total posts, shared posts, liked posts, and gender.

Algorithm: Decision Making Approach for prediction if a user will engage with comments (Boolean Comments).

Steps

a. Start: Initiate the decision-making process.
b. Data Loading: Load data from a CSV file.
c. Feature Engineering: Calculate derived features.
d. Feature Mapping: Map categorical features to numerical values.
e. Feature Selection: Select relevant columns for the analysis.
f. Dummy Variables: Convert categorical variables into dummy variables.
g. Defining Features and Target: Define features (X) and target (y).
h. Class Imbalance Handling: Handle class imbalance using SMOTE.

i. Feature Scaling: Scale features using StandardScaler.
j. Data Splitting: Split data into training and testing sets with a 70:30 ratio.
k. Model Training and Evaluation:
- Train and evaluate a Decision Tree model.
- Train and evaluate a Random Forest model.
- Train and evaluate a Gradient Boosting model.
- Train and evaluate a Neural Network model.

l. Comparative Analysis: Perform a comparative study of different methods and also AUC-ROC score.
m. End: Conclude the decision-making process.

In the given dataset, to predict if a user will engage with comments (Boolean Comments), it is beneficial to consider columns that are likely to influence engagement. Here are some potential columns that might be suitable for predicting engagement:

ROC Curve

The ROC (Receiver Operating Characteristic) curve is a graphical representation used to evaluate the performance of a binary classification model. It illustrates the trade-off between the true positive rate (sensitivity) and the false positive rate (1 - specificity) at various threshold settings.

Components of the ROC Curve

True Positive Rate (TPR) or Sensitivity
- TPR = TP / (TP + FN)
- Measures the proportion of actual positives correctly identified by the model.

False Positive Rate (FPR)
- FPR = FP / (FP + TN)
- Measures the proportion of actual negatives incorrectly identified as positive by the model. Threshold
- The decision boundary used by the model to classify observations as positive or negative. By varying the threshold, we obtain different TPR and FPR values.

Plotting the ROC Curve

- X-Axis: False Positive Rate (FPR)
- Y-Axis: True Positive Rate (TPR)
- Points: Each point on the ROC curve corresponds to a different threshold used by the classification model.

Interpretation

- Diagonal Line (45-degree line): Represents the performance of a random classifier. Any point above this line indicates a model performing better than random guessing.
- Area Under the Curve (AUC):
- The AUC value ranges from 0 to 1.
- AUC = 0.5 indicates no discrimination (random performance).
- AUC = 1.0 indicates perfect discrimination.
- Higher AUC values represent better model performance.

Consider a binary classifier predicting whether a user will engage with a social media post (True) or not (False). The ROC curve would show how well the classifier distinguishes between engaged and non-engaged users across various thresholds, enabling us to understand the trade-offs and select the most appropriate threshold for our specific application.

Comparative study of different methods with outputs

CONCLUSION AND FUTURE SCOPE

In this study, the problem of predicting user engagement with Boolean comments on social media platforms using machine learning techniques is explored. The analysis involved comparing the performance of Decision Trees, Random Forests, Gradient Boosting, and Neural Networks in predicting whether a user would engage with comments based on various user attributes and behaviors. From our comparative analysis, Neural Networks emerged as the most effective model, achieving an accuracy of 64%. This model not only outperformed other algorithms in terms of overall accuracy but also demonstrated robust performance across precision, recall, and F1-score metrics.

Predicting user engagement with comments can improve social media platforms by:

- Recommending personalized content
- Optimizing resource allocation
- Increasing ad revenue

Also, Future research areas include:

- Better user data analysis
- More advanced algorithms
- Real-time content adjustments
- Ethical considerations for data use
- Studying user engagement across platforms
- Integrating user feedback

Table1: Framework for understanding decision-making in social networks

Joining the Network	• Decision: Choosing to join a social networking platform[2].	• Factors: Personal interests, peer influence, platform features, privacy policies. • Impact: Influences the initial user base and growth trajectory of the network.
Forming Friendships	• Decision: Deciding whom to connect with [3, 4, 5].	• Factors: Existing relationships, mutual friends, shared interests, recommendations by the platform. Impact: Shapes the user's social circle and potential information flow
Initiating Communication	• Decision: Choosing to start a conversation or post content [6].	• Factors: Relevance of content, target audience, perceived value of communication. • Impact: Determines the start of interactions and potential engagement levels.
Setting Communication Privacy	• Decision: Deciding the visibility of the communication [7].	• Factors: Content sensitivity, intended audience, privacy concerns. Impact: Controls information dissemination and potential reach.
Responding to Communication	• Decision: Choosing to engage with content (like, comment, share) [8].	• Factors: Content relevance, relationship with the poster, engagement norms. • Impact: Influences the visibility and

		perceived value of the content.
Choosing Response Privacy	• Decision: Deciding the visibility of responses [9].	• Factors: Nature of the response, relationship dynamics, platform settings. • Impact: Affects how interactions are perceived by others in the network.
Engaging with Public Content	• Decision: Interacting with content that is visible to a wider audience [10].	• Factors: Personal interests, trending topics, community norms. • Impact: Contributes to the collective engagement and trending metrics of the platform.

Table 2: User Attributes Description

User Attribute	Description	Importance
Male/Female	Gender of the user	Gender can influence interactions, preferences, and engagement patterns.
Joining the Network	Date or time when the user joined the network	Duration of membership affects engagement levels and usage patterns.
Forming Friendships	Number of friends or connections made	Social circle size impacts reach, influence, and content interaction.
CountFriends	Total number of friends or connections	Larger connections may indicate an active user with higher content interaction.
CountFollowers	Total number of followers	More followers suggest that the user has a higher influence on the platform.
Initiating Communication	Actions taken to start communication, such as sending messages or comments	Proactive engagement indicates deep involvement and content contribution.
CountOwnerPosts	Number of posts made by the user	Posting frequency reflects activity level and influence on others.
CountOwnerReposts	Number of times the user has reposted content	Reposting behavior contributes to content dissemination.
CountPhotos	Number of photos shared by the user	Photo sharing reflects personal engagement and content preferences.
CountVideos	Number of videos shared by the user	Video content provides insights into user preferences and interaction style.
Setting Communication Privacy	Privacy settings for communication, such as who can see messages or posts	Privacy choices impact visibility and engagement metrics.
Responding to Communication	Likelihood of responding to messages or comments, represented as a boolean (true/false)	Responsiveness indicates engagement and willingness to foster interactions.
Count Likes Photos	Number of likes given to photos by the user	Liking behavior reflects activity level and content resonance.

boolcomments	This attribute represents the likelihood of a user responding to messages or comments. It is typically represented as a boolean value (true/false).	Users who actively respond to communication contribute to community building, foster interactions, and enhance the overall social experience. A higher likelihood of responding indicates deeper engagement with the platform.

Table 3: Dataset overview

User's identity									User gender— 1 For male and 2 for female
	Count Friends	Count Followers	Bool Comments	Count Owner Posts	Count Owner Reposts	Count Photos	Count Videos	Count Likes Photoes	
3329071	75	137	FALSE	11	9	4	71	14	2
5138784	173	117	FALSE	6	14	9	26	234	1
5432192	324	549	FALSE	20	0	40	64	1561	1
7245154	678	97	FALSE	1	19	24	240	1111	2
8648939	398	38	FALSE	14	6	11	12	480	1
9732431	326	338	FALSE	2	1	2	0	179	1
12360597	112	155	FALSE	0	20	41	235	719	2
13275302	1008	968	FALSE	9	11	11	86	2049	1
15016631	748	262	TRUE	0	2	9	126	824	2

Table 4: Summary of Decision point and dataset Correlations

Decision Point	Dataset Correlation
Joining the Network	Reflected in `Count Friends` and `Count Followers
Forming Friendships	Directly represented by `Count Friends` and `Count Followers`
Initiating Communication	Indicated by `Count Owner Posts` and `Count Owner Reposts`
Setting Communication Privacy	Inferred from engagement metrics like `Count Likes Photos`
Responding to Communication	Shown by `Bool Comments` and `Count Likes Photos`
Choosing Response Privacy	Not directly tracked, but inferred from engagement levels
Engaging with Public Content	Measured by `Count Photos`, `Count Videos`, and `Count Likes Photos`

Table 5: Modified table after doing calculation

S.NO	Total Connection	Total Post	Shared Post	Liked Post	Gender	bool Comments
0	212	20	75	14	Female	false
1	290	20	35	234	male	false
2	873	20	104	1561	male	false

3	775	20	264	1111	Female	false
4	436	20	23	480	male	false

ABSTRACT

Poisoning represents a significant global public health issue, resulting in thousands of fatalities annually, primarily in developing nations. The present study aimed to assess the prevalence of various poisons and their management in a multispecialty hospital. An ambidirectional study was conducted using standardized study protocols in the Emergency Department and Medical Record Department at Sri Ramachandra Institute of Higher Education and Research, SRIHER (DU). A total of 883 participants were included in the study, of whom the majority were in the age group of 0–10 years (25%). The highest count

of participants ingested toxins between 3:01 p.m. and 6:00 p.m. (21%). Predominant cases arrived at the hospital within 4 hours (77%); the maximum number of poisonings were due to intentional poisoning (64%); and a significant poisoning incident resulted from an excessive consumption of tablets (33%). The maximum number of participants have received activated charcoal (38%) as supportive care. The majority of participants have recovered (98.7%), and the mortality rate was 1.2%. The association between organophosphorus poisoning and death was significant ($p<0.05$). The prevalence of poisoning was 38%. The findings of the present study indicated that an intensive number of poisonings were due to the deliberate consumption of pharmaceutical drugs, especially antipsychotic drugs, followed by organophosphorus poisoning.

Keywords: Prevalence, Activated charcoal, organophosphorus, mortality rate.

INTRODUCTION

Globally, poisoning significantly increases patient morbidity and mortality. The World Health Organization (WHO) estimates that there are more than three million acute poisoning cases worldwide each year, with 20,000 fatalities [1]. The prevalence of poisoning has increased as a result of rapid industrialization and the widespread use of pesticides in agriculture [2]. According to numerous studies from various parts of India, the prevalence of homicidal poisoning ranges from 0.3% to 3.7%. The prevalence in northern India ranged from 0.8% to 3.7%, and in southern India, it ranged from 0.5% to 3%. The specific poisons utilized for homicide were aluminum phosphide, paraquat, arsenic, formalin, and methanol [3]. Due to the extensive use of pesticides in agriculture and domestic practices, pesticide poisoning is a serious problem in India. Easy accessibility of pesticides, over-the-counter medications, and abusive drugs are significant contributors to poisonings worldwide. It is evident from the existing research that poisoning seems to be a substantial issue in developing nations. In India, household agents (44.1%) such as pyrethroids, rodenticides, carbamates, detergents, corrosives, etc. make up the highest incidence of poisoning, followed by drugs (18.8%), pesticides (12.8%), industrial chemicals (8.9%), animal bites and stings (4.7%), plants (1.7%), and unknowns (2.9%) [4,5]. The incidence of unintentional injuries among children is 10% higher due to accidental poisoning [6, 7]. About 25% of all fatal ingestions in children under five are caused by hydrocarbon poisoning [8]. Hence, we proposed this study to evaluate the prevalence, pattern of poisoning, antidotes used to treat poisoning, and outcome of treatment at a multispecialty hospital.

MATERIALS AND METHODS

The study was an ambidirectional study conducted from January 2020 to July 2023 in the Emergency Department (Udayar Block) and Medical Record Department at Sri Ramachandra Institute of Higher Education and Research (DU). The calculated sample size was 1276 patients**.** Participants exposed to acute poisoning and all the case records of poisoning patients of both genders admitted to the emergency ward were included in the study. Patients who died before clinical evaluation, patients who were discharged against medical advice, and hospitalized cases with duplicate, inaccurate, and missing data were excluded from the study. A total of 883 patients were included in the study, and the data were collected using a standardized data collection form as per inclusion criteria after getting approval from the Institutional Ethics Committee. **IEC REF: CSP/22/DEC/119/603.** The details collected from the patients include name, age, gender, name of poisoning agent, time interval between incidence and hospitalization, route of administration, time of intake, types of poison, classification of poisoning (accidental, suicidal, homicidal), drugs used for poisoning management, and patient response to treatment. After collecting these data, the prevalence of poisoning and the outcome of treatment were assessed.

Statistical Analysis

The collected data were analysed with IBM SPSS Statistics for Windows, Version 29.0. (Armonk, NY: IBM Corp.). To describe the descriptive data, frequency analysis was used. To calculate the significance, a chi-square test was used.

RESULTS AND DISCUSSION

A total of 883 participants were included in the study, of which 802 were retrospective and 81 were prospective. The result shows that the maximum number of participants were in the age group of 0–10 years (25%) (Table 1). The majority of poison cases (33%) were due to tablet overdoses (33%). Table 2depicts the category of poisoning. The highest proportion of participants ingested poisons between 3:01 pm and 6:00 pm, accounting for 21%, while an additional 19% of participants consumed poisons between 6:01 pm and 9:00 pm (Table 3). A total of 77% of participants reached the hospital within a time limit of 4 hours after poison ingestion, representing the highest proportion (Table 4). followed by accidental poisoning Intentional poisoning accounted for the highest proportion of poisonings (64%), followed by accidental and homicidal poisoning (Table 5). Out of 883 patients, 37% were referred from a government hospital to SRMC, while the remaining 63% arrived directly at Sri Ramachandra Medical College. The highest proportion of participants received activated charcoal as supportive care (38%) (Table 6). Out of the total, 872 participants exhibited clinical stability, whereas 11 participants experienced adverse outcomes, like death. There is an association between the category of poisoning and the outcome of treatment. The maximum number of participants subjected to death were in the category of organophosphorus poisoning (81.8%). Hence, the Pearson Chi-Square test shows a significant result ($p < 0.05$), suggesting an association between organophosphorus poisoning and death (Table 7). This study revealed a prevalence rate of 38%. In this study, each patient has been symptomatically treated and managed with an antidote or supportive care treatment. The maximum number of patients were in the age groups of 0–10 years (25%) and 21–30 years old (24%), and the maximum number of participants were females (51%), which was similar to the study conducted by Pathan Amanulla Khan *et al.,* who included 100 patients. The maximum number of patients were in the age group of 21–30 years, and females were 52% [9].

In this study, a significant proportion of poisoning was due to tablet overdose (33%), and organophosphorus poisoning was the second highest rate of poisoning (18%). The findings correlated with the study conducted by Devaranavadagi RA *et al.,* which included 38 patients, and this study concluded that the maximum number of poisonings were due to the consumption of drugs, which is 34% compared to other poisons [10], and the study conducted by Mate VH concluded that 29.3% were due to organophosphorus poisoning [11]. The majority of patients (29%) consumed benzodiazepine tablets out of 289 patients in the tablet overdose category. The findings were in consonance with a study conducted by Mehrpour *et al., which* concluded that the maximum number of poisonings were from benzodiazepine overdoses [12]. This study concluded that the most frequent and crucial exposure to poisonings occurred between 3 p.m. and 6 p.m., followed by 6 p.m. and 9 p.m. The same is correlated with the study conducted by Asawari *et al.,* which included 1010 cases and elucidated that the maximum number of poison exposures was between 6 p.m. and 12 a.m. [13]. In this study, the majority of poison cases arrived at the tertiary care hospital within 4 hours of exposure (77%). The results were almost similar to the study conducted by Bannur*et al.,* which included 306 poisoning cases and found that the predominant cases arrived at the hospital within 5 hours [14]. The present study found that the maximum number of poisonings were due to intentional poisoning (64%). The findings were in accordance with the study conducted by Nadeem *et al.,* which included 278 cases, and the study revealed that the majority of poisoning cases were intentional poisoning [15]. This study elucidated that activated charcoal has been given to the majority of the participants (38%). These findings were comparable with the study conducted by Karki *et al.,* which included 138 patients, and the results revealed that 52.9% of patients received activated charcoal [16]. The majority of cases were discharged after improvement (98.7%), and the mortality rate was 1.2%. This study results correlated with the study conducted by Gurdeep Singh *et al.,* which included 92 participants and in which the majority of the patients were discharged after attaining clinical stability [17].

CONCLUSION

The findings of the present study indicated that an intensive number of poisonings were due to the deliberate consumption of pharmaceutical drugs, especially antipsychotic drugs, followed by organophosphorus poisoning. This study revealed that the that the prevalence of poisoning was 38%. The ease of access to pesticides, rodenticides, and other toxic chemicals leads to major crises of poisoning. This study concluded that the rate of intentional poisoning was highest, and it also concluded that activated charcoal was the predominant treatment given to the patients, and the recovery rate of poisoning was highest in this study.

ABSTRACT

Bacterial symbiosis, a mutual association between hosts and bacteria, is prevalent in marine animals. However, certain bacterial pathogens can harm the host through invasive and toxic mechanisms. This study aimed to isolate and characterize the bacteria associated with the intestine of the marine puffer fish *Arothron stellatus* collected from the Thoothukudi coast. Two bacterial strains, identified as belonging to the genera *Bacillus* and *Enterobacter*, were characterized based on cultural, morphological, and biochemical properties.The 16S rRNA gene of total bacteria community and bacterial isolates were amplified by Polymerase Chain Reaction (PCR) using 16S rRNA primers. The amplicons were requested in the applied Biosystems platform and identified as *Bacillus thuringiensis* (I_1),*Enterobacter cloacae* (I_2) the sequence was submitted in the DNA gene bank of NCBI with an accession number of l_1 -OP420552, l_2 -OP420553.Tetrodotoxin (TTX), a potent toxin commonly found in puffer fish, is produced by various bacterial species associated with these fish. Our findings suggest that the two isolated bacterial strains, *Bacillus thuringiensis* (I_1) and *Enterobacter cloacae* (I_2) may play a role in toxin production. Further research is needed to elucidate the mechanisms of TTX synthesis and the specific role of these bacteria in toxin production.

Keywords: Puffer fish, *Arothron stellatus*, Tetrodotoxin.16S rRNA, *Bacillus thuringiensis Enterobacter cloacae*

INTRODUCTION

The Gulf of Mannar is one of the richest regions of marine biodiversity, particularly known for its abundant marine fisheries resources. Covering an area of approximately 10,500 km², the Gulf is home to around 3,600 species of fauna and flora. A Marine Biosphere Reserve was established here in 1989 to protect this diverse ecosystem (Venkataramani *et al.,* 2006). Fishes, the largest class of vertebrates, possess unique characteristics due to their aquatic environment (Noguchi *et al.,* 2008). Among these, puffer fish are particularly notorious for their toxicity, which has been recognized since ancient times. Puffer fish poisoning is likely the most common type of fish intoxication along the coasts of Asia (Hwang *et al.,* 2002). These fish, members of the family Tetraodontidae, are considered the second most poisonous vertebrates in the world, with over 185 species spread across 28 genera (Oliveira et al., 2006). Marine microorganisms exhibit unique adaptations to the extreme conditions of their environments, such as high pressure, low temperatures, high salinity, and varying pH levels. These adaptations are seen in groups such as psychrophiles, halophiles, and barophiles, which have attracted significant interest for their potential biotechnological applications (Baharum *et al.,* 2010). Puffer fish are infamous for containing a potent neurotoxin, tetrodotoxin (TTX), in their organs, including the liver, gonads, skin, muscles, and testes. Improper consumption of these fish can be fatal (Kan *et al.,* 1987; Sabrah *et al.,* 2006; Krumme *et al.,* 2007; Arakawa *et al.,* 2010). Although TTX is present in puffer fish, it is believed that the toxin is actually produced by certain symbiotic bacteria associated with the fish. These bacteria engage in a symbiotic relationship with their host, often causing harm through invasive and toxic mechanisms. The invasive bacteria can grow within the host, either extracellularly or intracellularly, and cause damage by producing extracellular enzymes that harm host tissues or by modulating the host's immune response, such as regulating cytokine expression. Additionally, these bacteria may produce secondary metabolites within the host (Pettit, 2011). Marine organisms live in environments vastly different from terrestrial habitats, resulting in significant variation in their secondary metabolites. Symbiotic relationships between microorganisms and marine organisms are widespread and play a crucial role in the production of bioactive marine natural products. These metabolites are important for understanding biosynthesis mechanisms and addressing the challenges of limited drug supply (Nithyanand *et al.,* 2011). Research on TTX-bearing organisms has identified TTX-producing bacteria from 31 genera, primarily within the phylum Proteobacteria and class Gammaproteobacteria (including genera like *Vibrio*, *Aeromonas*, *Pseudomonas*, *Shewanella*, and *Alteromonas*). Less common TTX-producing bacteria belong to phyla Firmicutes (genera *Bacillus*, *Lysinibacillus*, and *Enterococcus*), Bacteroidetes (genera *Flavobacterium* and *Tenacibaculum*), and Actinobacteria (genera *Actinomycetes*, *Microbacterium*, *Micrococcus*, and *Nocardiopsis*). The genus *Vibrio*, particularly *Vibrio alginolyticus*, is frequently associated with TTX production in aquatic animals, comprising over 30% of all TTX-producing strains. Other notable TTX producers include *Bacillus* (approximately 15%) and strains of *Pseudomonas*, *Aeromonas*, *Alteromonas*, *Streptomyces*, and *Roseobacter* (Chau *et al.,* 2011). The accumulation of TTX in puffer fish is influenced by various factors, including bacterial presence, geographic location, seasonal changes, and the ecological food chain (Yang *et al.,* 2007). In India, studies on puffer fish are limited and largely unexplored. Therefore, this study was conducted to isolate and characterize the bacteria associated with the intestine of the puffer fish *Arothron stellatus* collected from the Thoothukudi coast.

MATERIALS AND METHODS

Sample Collection

Specimens of the puffer fish *Arothron stellatus* (Lacepede, 1985) were collected from the fish landing harbor in Thoothukudi. The fish were rinsed with seawater, transported to the laboratory on dry ice, and stored in a deep freezer at -20°C until further use.

Cultural and Morphological Characterization of Isolated Bacteria

Bacterial isolation was performed using Zobell Marine Agar 2216. The agar plates were prepared by dissolving 15g of agar in 100ml of Zobell 2216 medium, adjusted to a pH of 7.2, and sterilized. One gram of puffer fish intestine was homogenized in a sterile blender and suspended in 9ml of sterile seawater. Serial dilutions (ranging from 10^{-1} to 10^{-5})

were prepared, resulting in a final concentration of 0.09g tissue per ml. Bacterial isolation was achieved by spreading 0.5ml of the diluted samples onto the marine agar plates. The plates were incubated at 28°C for 2 to 3 days to allow bacterial growth. After incubation, mixtures of colonies formed on each plate. These were purified using the streak plate method on fresh Zobell 2216 agar plates until discrete colonies were obtained. The purified strains were sub cultured multiple times to ensure purity and were stored at -80°C in glycerol. Freshly recovered pure isolates were used for primary characterization. The cultural and morphological characteristics of the bacterial colonies, including shape, size, colour, margin, elevation, opacity, Gram staining, and motility, were examined.

Biochemical Characterization of Isolates

The bacterial isolates were subjected to a series of biochemical tests, including catalase, nitrate reduction, gelatinase, H_2S production, citrate utilization, indole production, starch hydrolysis, methyl red, Voges-Proskauer, and carbohydrate fermentation. The results of these tests were compared with the reference standards provided in Bergey's Manual of Determinative Bacteriology (1994).

Molecular Characterization of Bacteria

The bacterial strains (I_1 and I_2) isolated from the intestine of the puffer fish *Arothron stellatus* were subjected to molecular characterization for further analysis.

Genomic DNA Isolation

Genomic DNA was isolated from the microbial samples using the EX Pure Microbial DNA Isolation Kit developed by Bogar Biostores Pvt. Ltd.

Amplification of 16S rDNA of Bacterial Isolate

Fragments of the 16S rRNA genes from the bacterial isolate were amplified using the primers 27F (5′-AGAGTTTGATCTGGCTCAG-3′) and 1492R (5′-TACGGTACCTTGTTACGACTT-3′). The PCR reaction mixture for the amplification of 16S rDNA genes included 5 µL of extracted DNA, 1.5 µL of each primer (27F and 1492R), 5 µL of deionized water, and 12 µL of Taq Master Mix (containing Taq DNA polymerase in 2X Taq buffer, 0.4 mm dNTPs, 3.2 mm $MgCl_2$, and 0.02% bromophenol blue). The PCR was performed with the following thermal cycling conditions: an initial denaturation step at 95°C for 2 minutes, followed by 25 cycles of denaturation at 95°C for 30 seconds, primer annealing at 50°C for 30 seconds, and primer extension at 72°C for 2 minutes. A final extension was carried out at 72°C for 10 minutes.

Sequencing of 16S rDNA

Unincorporated PCR primers and dNTPs were removed from the PCR products using the Montage PCR Clean-Up Kit (Millipore). The purified PCR products were then sequenced using the primers. Sequencing reactions were carried out with ABI PRISM® BigDye™ Terminator Cycle Sequencing Kits, which include AmpliTaq® DNA Polymerase (FS enzyme) (Applied Biosystems). Single-pass sequencing was performed on each template using the universal 16S rRNA primers. The fluorescent-labeled sequencing fragments were purified from unincorporated terminators using an ethanol precipitation protocol. The samples were resuspended in distilled water and analyzed by electrophoresis on an ABI 3730 × 1 sequencer (Applied Biosystems).

Phylogenetic Analysis

The 16S rRNA sequence was first aligned using the NCBI BLAST similarity search tool. Phylogenetic analysis was conducted by comparing the query sequence with closely related sequences obtained from the BLAST results, followed by multiple sequence alignment. The program MUSCLE 3.7 was utilized for the multiple sequence alignments. The aligned sequences were then refined using Gblocks 0.91b, which removes poorly aligned positions and divergent regions to reduce alignment noise. For the phylogenetic analysis, PhyML 3.0 was employed with the HKY85 substitution model. PhyML is known for its accuracy and efficiency, being faster than other phylogenetic programs. The program Tree Dyn198.3was used for tree rendering.

RESULTS

Isolation of Pure Cultures

Two distinct bacterial isolates from intestine with different characteristics were observed on the Zobell Marine Agar plates. These isolates were subsequently streaked to obtain pure cultures and were designated with strain numbers I_1 and I_2.

Cultural and Morphological Characteristics of Isolated Bacteria

The cultural and morphological characteristics of the isolated bacterial strains were analyzed, including colony shape, colour, margin, elevation, and opacity (Table 1). The isolates formed colonies that were either circular or irregular in shape, with colours ranging from white to dull white. The margins of the colonies were observed to be undulate and rhizoid, and both colonies exhibited a raised elevation. Microscopic examination revealed that strain I_1 was Gram-negative and had a long rod shape, while strain I_2 was Gram-positive and had a short rod shape. Both strains were positive for motility (Table 2).

Biochemical Characteristics of Isolated Bacteria

A series of biochemical assays were performed to characterize the bacterial isolates (Table 2). The isolates exhibited differences in substrate utilization across various biochemical tests. Both isolates produced catalase, but were negative for Voges-Proskauer, indole, nitrate reduction, and H_2S production tests. Both isolates fermented carbohydrates. Notable differences were observed in the citrate and starch hydrolysis tests. Both strains tested positive for gelatinase and starch hydrolysis.

Identification of Bacterial Isolates

The two bacterial strains isolated from the intestine of *Arothron stellatus* were identified to the genus level by comparing their characteristics with those described in Bergey's Manual of Determinative Bacteriology (1994). The isolates were identified as follows: I_1 was identified as *Bacillus* and I_2 was identified as *Enterobacter* .

Molecular identification of the strains

A total of two bacterial isolates from the liver of puffer fish *Arothron stellatus* are subjected to molecular characterization. The DNA isolates from the two cultured bacterial isolates were subjected to 27F and 1492R primer and the amplification of the 16S rRNA gene for isolates is shown in (Fig-1and 3) .The 16S rDNA sequence of strains was aligned using NCBI BLAST Similarity Search Tool and the newly isolated strains were identified as *Bacillus thuringiensis* (I_1) (Table 3), *Enterobacter cloacae* (I_2) (Table 4), and as it shared the highest similarity 99% with this species (Fig- 2 and 4). Those bacterial strains deposited were done by the program phyML.3.0 aLRT and the program tree Dyn 198.3 was used for tree rendering. The amplicons were requested in the applied Bio systems platform and identified as *Bacillus thuringiensis* (I_1), *Enterobacter cloacae* (I_2) the sequence was submitted in the DNA gene bank of NCBI with an accession number of l_1 -OP420552, l_2 -OP420553.

DISCUSSION

Since 1986, researchers have isolated Tetrodotoxin (TTX)-producing bacteria from various phyla of TTX-bearing organisms to determine the true origin of TTX in marine and terrestrial animals. Despite the presence of over 60 indigenous species of pufferfish in Indian waters, very few studies have focused on investigating TTX-bearing animals and TTX-producing bacteria (Yu et al., 2004). To the best of our knowledge, this is the first study to isolate TTX-producing *Bacillus thuringiensis* (I_1), *Enterobacter cloacae* (I_2) from *Arothron stellatus* in the Gulf of Mannar waters of the Thoothukudi coast. *Shewanella* sp. was isolated from the liver of *Lagocephalus wheeleri*, while *Exiguobacterium* sp. and *Staphylococcus* sp. were isolated from the liver of *Lagocephalus sceleratus* (Simon et al., 2009). Yu et al. (2011) isolated the TTX-producing bacterial species *Raoultella terrigena* from the intestine of the local toxic pufferfish *Takifugu niphoble*. Lee *et al.* (2000) isolated a *Vibrio* strain from the intestine of the puffer fish *Fugu vermicularis radiatus*.

In the present investigation, *Klebsiella* sp., *Proteus* sp., *Bacillus* sp., and *Lysinibacillus sphaericus* were isolated from various tissues, including the body tissue, skin, liver, and intestine of the pufferfish *Diodon holocanthus*. The discovery and isolation of TTX-producing symbiotic bacteria over the past decade support the theory that TTX originates from symbiotic microorganisms within TTX-bearing organisms, a concept gaining widespread acceptance globally. However, some criticisms exist regarding the bacteria's ability to produce TTX (Matsumura, 1995a, 1995b, 1996, 2001). Symbiotic bacteria may be the primary source of TTX. In 1980, the first TTX-producing microorganisms were isolated and identified from TTX-bearing organisms by Japanese scientists (Noguchi et al., 1983). Noguchi et al. succeeded in isolating four bacterial strains (*Vibrio* sp.) from the intestine of the xanthid crab *Atergatis floridus*. Yasumoto et al. isolated a bacterial species, *Pseudomonas* sp., from the marine red calcareous algae *Jania* sp. (Noguchi et al., 1987; Yasumoto et al., 1987). These were the first TTX-producing microorganisms ever isolated from TTX-bearing organisms, later termed TTX-producing bacteria. Consequently, numerous TTX-producing bacteria have been isolated from various TTX-bearing organisms. Conventional methods for microbial identification and diversity studies require recognizing differences in morphology, growth, enzymatic activities, and metabolism to define genera and species (Petti et al., 2005). According to Clarridge (2004), genotypic identification of microorganisms via 16S rRNA sequence analysis has emerged as a more objective, accurate, and reliable method for bacterial identification and diversity studies, with the added capability of defining taxonomical relationships among bacteria. However, this method is not perfect for studying phenotypic and biochemical characteristics. Therefore, in this study, conventional methods were first employed to assess bacterial diversity based on phenotypic and biochemical characteristics. Xueru Wang (2022) identified seven strains of free-living bacteria and five strains of attached bacteria isolated from *Chelonodon dentata* using a gradient dilution method and identified them based on colony characteristics, Gram nature, and physiological and biochemical characteristics. Two strains of bacteria *Bacillus thuringiensis* (I_1),*Enterobacter cloacae* (I_2) were isolated from the intestine of the pufferfish *Arothron stellatus*. In this study, the bacterial strains (I_1, I_2) associated with the intestine of the pufferfish were subjected to cultural, morphological, and biochemical characterization. Zhenlong Wu et al. (2005) investigated the relationship between the toxicity of the pufferfish and the distribution of TTX-producing bacteria in *Fugu rubripes* collected from the Bohai Sea of China. Bacteria were isolated from various organs, including the ovary, liver, intestine, and gallbladder. Of the 36 isolated strains, 20 were found in vitro, including 19 strains of *Bacillus* and one strain of *Actinomycete* spp., based on morphological observations and physiological and biochemical characteristics. Yan Lu and Rui Zoa ssssYi (2009) isolated a strain of *Bacillus horikoshii* from the liver of a puffer fish. Additionally, Wang and Fan (2010) discussed the characteristics of a *Bacillus* strain isolated from the puffer fish *Fugu obscurus*. These findings, along with our current results, suggest that *Bacillus* and *Enterobacter* species might be parasitic or symbiotic bacteria of puffer fish that produce TTX during their growth.

CONCLUSION

In this study, two strains, *Bacillus thuringiensis* (I_1),*Enterobacter cloacae* (I_2) were isolated from the intestine of the puffer fish *Arothron stellatus*. Numerous studies have confirmed that bacteria associated with puffer fish may serve as vital sources for TTX production. Our findings, along with previous research, suggest that the isolated species could be parasitic or symbiotic bacteria in pufferfish, contributing to TTX production during their growth.

ABSTRACT

Heart is an important organ in the human body. Heart disease is very common and primary cause of death in the world. On time prediction of heart disease helps in preventing life threats. Heart disease can be avoided by early diagnosis of risk factors that results in it. Supervised machine learning helps in predicting such events after training with available data. A deep neural network concept is used in this paper to build a model for predicting risk level of heart disease. Heart Disease dataset from UCI repository is used in training and building a model. Different machine learning algorithms like KNN, Random Forest, Logistic Regression are also used in this paper to compare results with Deep Neural Network model. The DNN model shows improved result with 97% precision.

Keywords: Machine Learning, Heart Disease Prediction, Deep Learning, KNN, Random Forest

INTRODUCTION

According to the World Health Organization (WHO) [1], Cardiovascular diseases or heart diseases are the largest cause of death worldwide, with 17.9 million deaths annually. Unhealthy lifestyle and increasing level of stress results in overweight and obesity, hypertension, hyperglycemia, and high cholesterol raises the risk of heart disease. Additionally, the American Heart Association [2] adds weight gain (1-2 kg per day), sleep issues, leg edoema, a chronic cough, and a fast heart rate [3] to the list of symptoms. Due to the symptoms' tendency to be similar to those of other disorders or associated with ageing symptoms, diagnosing patients can be difficult. But as time passes, the records of patients are available in the hospitals. Various open source platforms provides such records for research. Different techniques like data mining, machine learning are used for correct diagnosis and early detection of the disease. The machine learning concept has gained popularity in recent years to diagnose and predict heart disease.

This helps medical practitioners for early detection of cardiac issues based on the symptoms. Deep learning is very popular machine learning method used for prediction. In this paper, A deep neural network model is used in this paper to predict heart disease using keras open source library. The main objective is to enhance the accuracy of the model by the usage of deep neural network. Nowadays, numerous studies use machine learning, deep learning, and data mining techniques in healthcare for prediction of diseases, but each study offers its own perspective and level of prediction accuracy. Predicting cardiac disease using machine learning techniques becomes a promising research area nowadays. Meillo et. al[4] has developed a classifier to separate patients from high risk of cardiac disease from those of minimal risk. In [5], authors has developed a chi square (CHI) with Principal Component Analysis to enhance the prediction of machine learning models' ability to predict whether a patient has heart disease or not. Natural language processing and a rule-based model were used by Zhang et al. in [6] to identify a NYHA class for HF from unstructured clinical notes with an accuracy of 93.37%. Parthiban et. al. in [7] examined an SVM method to identify heart disease in three diabetic patients, with an accuracy of 94.60 percent and predicting characteristics including age, blood pressure, and four blood sugar levels. The high dimensionality of the data is a prevalent issue in machine learning; the datasets contain enormous amounts of data. With different feature engineering approaches less important features can be removed from the dataset. Dimensionality reduction transforms and simplifies data through feature extraction, whereas feature selection shrinks the dataset by removing less important features [7]. Based on literature review, it is found that removing non contributing features from dataset and giving more weight to those features which are contributing in prediction help in improving result. Dun et al. In [8] used deep learning methods, random forests, logistic regression, and SVM with hyperparameter tuning and feature selection to research the prevalence of heart disease. NN was having accuracy rate at 78.3 percent. Singh et al. [9] employed a binary classifier similar to an extreme learning machine to reduce overfitting and speed up training, generalized discriminant analysis to extract nonlinear characteristics, and Fisher's ranking algorithm for all of these. In [10], authors used different machine learning algorithms to obtain the results, and they were then contrasted with one another.

MATERIALS AND METHODS

Cardiac Heart Disease Prediction can be considered as a binary classification task. In this section, we propose a framework to detect heart disease in a patient at early stage by using deep neural network.

Data Set Description

In this research, the Cleveland heart disease dataset is used which is collected from the UCIrvine machine learning repository[11] [12]. It is a Public Health Dataset containing four sub datasets Cleveland, Hungary, Switzerland, and Long Beach. Originally there are 76 attributes in the dataset, but 14 attributes among them are used in this experiments. These attributes are as mentioned in Figure 1.

Data Analysis & Pre-processing

In the main cleveland dataset, null values are there in a total of 6 samples; 4 samples in the "Ca (Number of Major Vessels)" feature and 2 samples in the "Thal (Thallium Heart Rate)" feature. These samples can eliminated from the dataset, as there are few null values. In total 1025 samples from existing dataset are used in this study. The class (1) contains 499 samples of disease and no disease (0) class contains remaining 526 samples.Figure 2 to 8 shows distribution of the data. Figure shows that features like target, slope, tahi, sex, fbs, cp, ca are categorical data. It is plotted in a bar chart. It is observed that in the dataset, heart illness occurred 54.46 % of the time, while 45.54 % of the time no heart disease occurred. Hence,it is required to properly balance the dataset to prevent over fitting. After analyzing data, 4 categorical columns (cp,restecg,slope, thal) are found in this dataset. To model heterogeneous data, it is very important to perform normalization step as adaptation during learning becomes easier. A common best practise to handle such data is feature-wise normalization, which involves taking the mean of each feature in the input data (a column in the input data matrix) and dividing by its standard deviation to centre the feature around zero and give it a unit standard deviation.

Feature Engineering and Dimension Reduction

For feature selection, forward sequential feature selection (SFS) method is used. Forward SFS is an iterative greedy method that finds out the best feature to add in the existing feature set. Concretely, it starts with zero features and identify the one feature that, when an estimator is trained on it, maximizes a cross-validated score. This process is repeated by adding a new feature to the set of chosen features after the first feature has been chosen. The n features to select option specifies the maximum number of features that should be selected before the procedure ends. The feature importance attribute is not needed in this method.

Model building and Training

After per-processing step, the dataset is divided into training(70%) and testing(30%) dataset. The proposed model uses artificial deep neural network. It is feed forward network with sequential model. As it is a binary classification problem, we assume that '1' will denote presence of cardio heart disease and '0' denotes absence of it. Total 14 variables selected from dataset and bias are combined in Dense layer with 128 neurons. For comparison, model is using various types of machine learning classifiers including Random Forest, K- Nearest Neighbour, Logistic Regression are developed for classification. For hyper parameter tuning, all the models use default value. For neural network model earning, either sequential learning model is used or functional learning model is used. In this research, sequential modeling is used.

Algorithm 1:Model building

i) Initialize Neural Network
ii) Add input layer and first hidden layer as a dense layer
iii) Add second hidden layer in NN with activation function= "relu" followed by dropout layer
iv) Add output layer with activation function="sigmoid"
v) Train model using "adam" optimizer & ("binary_cross_entropy"/"Categorical_cross_entropy")as loss function with accuracy as metrics.
vi) Test model with test data sets

RESULTS

Proposed model is evaluated by using performance matrices like Confusion Matrix, Precision, Recall and F-measures. A confusion matrix is a table-like structure with true positive and true negative values as shown in table 1.

$$Accuracy = \frac{TP + TN}{TP + FN + FP + TN}$$

$$Precision = \frac{TP}{TP + FP}$$

$$Recall = \frac{TP}{TP + FN}$$

$$F1Score = 2\left(\frac{Precison * Recall}{Precision + Recall}\right)$$

Table 2 shows the results of comparison of algorithms like logistic regression, random forest, KNN and DNN. It can be observed as compared to other algorithms, DN gives highest precision and recall values. Figure 10 to 13 shows the results with charts.

CONCLUSION

Early detection of heart conditions could help to avoid possible heart attack-related deaths. Doctors can recognize cardiovascular disease at early stage if good classification algorithms are there for support. In this research artificial neural networks and a cutting-edge dataset from the UCI library are used to predict a potential cardiac ailment. Some heart test parameters as well as typical human behaviors are included in this dataset. The results of this analysis are promising and can be improved in future work using deep neural networks like CNN, RNN.

ABSTRACT

Ayurvedic acharyas have emphasized the importance of precise analysis of medications to ensure their desired outcome. However, widespread adoption of traditional Ayurvedic formulas requires standardization based on modern methods. This is crucial for the case of *kukkutandabastidravya*, a formula to treat pediatric hypoalbuminemia associated with MCNS disease base on the concept of restoring diminished dhatus (tissues) by introducing substances with similar properties from external sources, such as *ahara* (food) or *aushadha*(medicines) according to ayurveda. This study aims to prepare and standardize *kukkutandabastidravya* based on pharmaco-analytical parameters. Preparation of *kukkutandabastidravya* involves several steps: ingredient collection, processing, and mixing. The formula includes egg, *saindhavalavana*, honey, and *Punarnava churna*. Precise processing and mixing order are vital for achieving the desired formulation. Standardization of *kukkutandabastidravya* is crucial to ensure consistent quality and efficacy. Physicochemical parameters like pH, viscosity, refractive index, LOD, total solid content, total ash, total protein, and total fat can be utilized for standardization. Preparation and standardization of *kukkutandabastidravya* based on pharmaco-analytical parameters are essential for quality, efficacy, and safety. This standardization will facilitate widespread adoption of this traditional Ayurvedic formula, extending its application beyond the classical reference and offering a potential treatment for pediatric hypoalbuminemia in MCNS disease.

Keywords: *Basti*, Hypo albuminemia, egg albumin, *Kukkutandabasti Dravya*.

INTRODUCTION

सर्वदा सर्वभावनम्सामान्यम् वृद्धि कारणम् (*cha.su*.1/44)

In Ayurveda, the concept of restoring diminished dhatus (tissues) by introducing substances with similar properties from external sources, such as *ahara* (food) or *aushadha*(medicines), is rooted in classical texts like ***Charaka Samhita, Sushruta Samhita***. This principle emphasizes the idea that substances with analogous qualities to the deficient *dhatu* can help replenish and balance bodily tissues. The use of microalbumin in the form of egg protein administered through the anorectal route aims to provide a localized means of albumin supplementation and it is designed to replenish and restore the *dhatus* (tissues) which is deficient and needing support, aiding in their rejuvenation.

Ayurveda, an ancient holistic healing system, emphasizes the importance of precise analysis and standardization in the application of its medicinal formulas to achieve optimal health outcomes. This is particularly pertinent in the case of ***kukkutandabastidravya***, a traditional Ayurvedic remedy designed to address pediatric hypoalbuminemia associated with minimal change nephrotic syndrome (MCNS). Rooted in classical texts such as the *Charaka Samhita* and *Sushruta Samhita*, this formula operates on the principle of restoring diminished dhatus (tissues) by introducing substances with similar properties from external sources, whether through *ahara* (food) or *aushadha* (medicines).

Given the prevalence of nephrotic syndrome in children, with an incidence rate of 2-3 per 100,000 annually, the need for effective treatment methods is critical. MCNS, characterized by heavy proteinuria, hypoalbuminemia, and edema, poses unique challenges in pediatric care. Modern approaches, including localized albumin supplementation via IV albumin in complicated stage such as when serum albumin mark less than 1.5 mg/dl associated with anasarca etc delivered through the intravenous route, aim to support and rejuvenate these deficient tissues, aligning with Ayurvedic principles of balance and restoration. However, the integration of traditional knowledge with contemporary scientific methodologies is essential for the widespread adoption and standardization of these Ayurvedic treatments, ensuring their efficacy and safety in the treatment of pediatric disorders. This article explores the significance of this integration, focusing on the application and potential of *kukkutandabastidravya* in the management of MCNS.

MATERIALS AND METHOD

Collection, identification and authentication of raw drugs

All the raw materials [Table no.1]used for this study were procured from the local market in Vadodara, Gujarat. Subsequently, identification and authentication of the raw drugs were conducted at the Pharmacy of Parul Institute of Ayurved,Vadodara, Gujarat, a GMP-certified Ayurvedic pharmacy.

Methodology of preparation of *kukkutandabastidravya*.[5]

1. Initially *madhu*(2ml) and 0.3g of *saindhavalavana* was taken in *khalva yantra* and triturated until homogenous mixture was formed, again added *punarnavachurna*(1.5g) and triturated well until homogenous mixture was formed.
2. White portion of egg yolk (20ml) is collected from whole egg separating a yellow part and it has been added to the above-mentioned mixture and triturated till the homogenous mixture was obtained.
3. Then it was filtered and used for the further process.

Pharmaco-analytical study[8]

Observation and Discussion

Discussion of Pharmaco-Analysis Data for *Kukkutanda Basti Dravya*

The provided data presents the results of a pharmaco-analysis of *Kukkutanda Basti Dravya*, a traditional Ayurvedic formulation which may use in the treatment of hypoalbuminemia associated with nephrotic syndrome. The analysis reveals several interesting properties that may contribute to its therapeutic efficacy.

Refractive Index (1.381): This moderately high refractive index suggests the presence of various solutes and active biomolecules in the *Kukkutanda Basti Dravya*. It also indicates a potential for hyperosmolarity, which may contribute to its diuretic and anti-edema effects.

pH Analysis (5.45): The slightly acidic pH suggests the presence of organic acids or acidic polysaccharides in the formulation. This acidic environment may promote protein digestion and absorption, thus aiding in the correction of hypoalbuminemia.

Loss on Drying (74.69%): This high percentage indicates a significant amount of volatile components in the *Kukkutanda Basti Dravya*. These volatile components may contribute to its aroma and potential therapeutic benefits related to inflammatory conditions.

Total Solid Content (25.31%): This indicates that the *Kukkutanda Basti Dravya* contains a substantial amount of non-volatile constituents, which likely include various bioactive compounds, minerals, and other essential nutrients.

Viscosity of Ostwald (1.77 cP): The relatively low viscosity suggests that the *Kukkutanda Basti Dravya* is readily absorbed and distributed throughout the body. This may contribute to its rapid onset of action and improved therapeutic efficacy.

Total Ash (0.0%): The absence of ash indicates that the *Kukkutanda Basti Dravya* is free from any inorganic contaminants or adulterants. This suggests a high quality and purity of the formulation.

Total Protein (4.90%): The presence of a significant amount of protein may contribute to the correction of hypoalbuminemia directly.

Total Fat (0.31%): The low fat content ensures that the *Kukkutanda Basti Dravya* is suitable for individuals with compromised digestive function or those who are on a low-fat diet. The pharmaco-analysis data provides preliminary evidence to support the traditional use of *Kukkutanda Basti Dravya* in the management of hypoalbuminemia associated with childhood minimal changes nephrotic syndrome. The presence of various bioactive compounds and its favorable physicochemical properties suggest a potential for multiple mechanisms of action, including diuretic, anti-inflammatory, and protein-replenishing effects. Further research is needed to elucidate the specific active constituents responsible for its therapeutic efficacy and to establish its safety and efficacy in clinical trials. The pharmaco-analysis data presented here is limited and further studies are needed to confirm the findings.The analysis does not account for the potential synergistic effects of various components within the *Kukkutanda Basti Dravya*. Prior therapeutic usage, every medication must undergo a comprehensive analysis because the therapeutic efficacy of medication depends upon the ingredients used in it's production. Physicochemical analysis were performed on the prepared *kukkutandabastidravya.* In this study, the preliminary prerequisites for the standardization of *kukkutandabastidravya* have been attempted. This work will help to standardize *kukkutandabastidravya* before it's clinical application.

CONCLUSION

In order to determine the quality and purity of *kukkutandabastidravya*, the current study has produced some preliminary pharmaco-analytical data that will be useful in identifying the real *kukkutandabastidravya*. Qualitative research has suggested how much protein, fats, contains along with PH, loss on drying, Total Ash value, refractive index, total solid content and viscosity in the medicine.

ABSTRACT

Badminton is the most popular racquet sport in the world which is characterized by the repetitive action of short duration with high speed and intensity within the court. Aim is to determine the effect of drop jump training on agility and balance in recreational badminton players. The study included 44 recreational badminton players aged 18 to 40 years. Participants were randomly divided into two groups. Group A (Experimental group) (n=22) underwent drop jump training and Group B (routine training group) (n=22) underwent their regular exercise protocol. Agility by Agility T test and balance by Y balance test were conducted both prior to and following the intervention (after six weeks). Result shows that the agility in recreational badminton players has improved significantly in Group A in comparison with Group B($p<0.05$), but the balance of dominant and non-dominant side leg in Group A & Group B shows that there is a significant difference from the pre test values($p<0.0.5$), but there is no significant difference existing among them reveals that, there is no difference among the groups($p>0.0.5$). It can be concluded from the present study that drop jump training is effective in improving agility but there is no noteworthy difference observed between the two groups in terms of balance.

Keywords: Drop jump training, Agility, Balance, Recreational badminton players

INTRODUCTION

Sports and sporting activities among the younger populations are gaining importance in the current era. It has gained more traction globally as a preventive and curative health strategy.[1] Recreational sports are those activities where the primary purpose of the activity is participation, with the related goals of improved physical fitness, fun, and social involvement often prominent.[2,3,4] Badminton is a racket sport played by either two opposing players (singles) or two opposing pairs (doubles), who take positions on opposite halves of a rectangular court that is divided by a net. The Badminton World Federation (BWF), the world governing body of the sport, was formed in 1934. At the 1992 games, it becomes a full medal Olympic sport, with competition for men's and women's singles(one against one) and doubles(two against two).Mixed doubles was introduced at the 1996 Games.[5] Badminton requires a combination of aerobic and anaerobic fitness, speed , power, agility, flexibility, strength and technical skill.[6] It has been discovered that badminton increases the risk of injury by 15% to 39%. Risk prediction of injury among recreational badminton players in India is 57.1% which is a relatively higher incidence of injury compared with the limited published data from other countries.[7] Badminton is characterized by the repetitive action of short duration with high speed and intensity within the court.[8] The player performing a jumping smash needs maximum power of the leg, arm, abdominal and hand muscles supported by physical components for complex movements. Jumping smash is a series of continuous movement coordination of the body as a whole.[9] Therefore, badminton players need good agility and balance during rapid postural action around the court. Sheppard and Young proposed a definition for agility as a rapid whole body movement with a change of velocity or direction in response to a stimulus.[10] Balance or postural control can be described as either static or dynamic. Static balance refers to the ability to maintain a stable posture whereas dynamic balance is our ability in response to various alterations of our body position. Postural stability requires intact sensory motor functioning.[11] To improve their quality, players have to use plyometric training, such as Drop Jump Training, which involves jumping down from a platform and immediately reversing the movement for a maximal vertical takeoff.[12] Objectives are to study the effect of drop jump training on agility by Agility-T test and balance by Y balance test in recreational badminton players.

MATERIALS AND METHODS

Ethical approval was obtained from the institutional ethics committee prior to the study. 55 participants were screened for eligibility and 48 participants who were willing to participate, Recreational badminton players, Age of 18 to 30 years, Male and female both included in the study. Participants having any acute musculoskeletal injury, Back pain and any associated injuries, Any lower limb deformities, Any cardiovascular or neurological condition were excluded. Informed written consent was taken. The sample size was calculated with the formula given below:

$\mathbf{n = (Z_{\alpha/2}+Z_{\beta})^2 * 2 * \sigma^2 / d^2}$,

Where,

- $Z_{\alpha/2}$ is the critical value of the Normal distribution at $\alpha/2$

(e.g. for a confidence level of 95%, α is 0.05 and the critical value is 1.96)

- Z_{β} is the critical value of the Normal distribution at β

(e.g. for a power of 80%, β is 0.2 and the critical value is 0.84)

- σ^2 is the population variance
- d is the hypothesized difference you would like to detect.

Participants were randomly divided into two groups using chit method. Group A (experimental)(n=24) and Group B(routine training)(n=24).Two participants from Group A and two participants from Group B discontinued the training. The purpose and whole methodology of the study were thoroughly explained to the participants. On the first visit, a complete assessment was done which included the descriptive data of age, height, weight, limb length. Dominant leg was determined by the self-reported preferred kicking leg by the subjects. The Agility T Test and Y Balance Test were conducted both prior to and following the intervention (after six weeks).

OUTCOME MEASURES

AGILITY T TEST

It is used as an outcome measure to assess agility performance. This test is highly reliable. The intra class reliability of the Agility T-test is between 0.92 and 0.99. Before starting the session, each and every player was explained about the procedure, and was told to stand on a starting point (A). The players were explained that to follow the command of 'start', they have to run as quickly as possible and touch the center cone (B), then move towards one side and touch the cone (C), after touching, the player will run as fast as possible and touch the cone (D), after that the player will continue running and will again touch the center cone (B) and will end coming back towards the finish line (A). As soon as the player is on the command "start" and later when player crosses the finish line the stopwatch is started and stopped and the time taken to complete the task were noted on the data collection sheet. Each player was informed to complete the task as fast as possible and three trials were permitted with appropriate rest period. A best among the three was considered and used for statistical analysis[13].(**figure 1)**

Y BALANCE TEST

It is used as an outcome measure to assess the balance performance. This test is highly reliable. The intra class reliability of Y balance test is between 0.80 to 0.85. The YBT consists of a three-part test that is used to assess lower extremity balance and neuromuscular control to predict lower extremity injury. Before starting the session, each and every player was explained about the procedure. Participants stood in the center with single leg stance, while maintaining single leg stance on the left leg, the subject reached with the free limb (right leg) in the anterior, posteromedial, and posterolateral directions in relation to the stance foot as far as possible. Participants were completed three consecutive trials for each reach direction and to reduce fatigue subjects altered limbs between each direction. Attempts were discarded and repeated if the subject failed to maintain unilateral stance or failed to return the reach foot to the starting position under control. The maximal and average distance reached after three successful trials in each direction were recorded.[14](**figure 2)**

GROUP A : EXPERIMENTAL GROUP : DROP JUMP TRAINING GROUP (n=22)[15]

Participants in the experimental group underwent drop jump training with their routine training with warm up and cool down. (**figure 3)**

FREQUENCY	**Three days per week for six weeks**	
	1-2 week	8 repetitions – 3 sets
	3-4 week	10 repetitions – 3sets
	5-6 week	12 repetitions – 3 sets
Time	20-25 min/session	

GROUP B : ROUTINE TRAINING GROUP (n= 22)

Participants in routine training group were given warm up and cool down exercises and they continued their respective exercise protocols. Warm up – jogging (four rounds around the court) Cool down – whole body stretching including calves, hamstrings, quadriceps, adductors, side stretch , triceps, shoulder stretch , wrist flexors .

ROUTINE TRAINING PROTOCOL

Exercises	Repetition	Sets	Days
Skipping	50	2	Everyday
Deep squats	20	2	Monday, Wednesday, Friday
Lunges	20	2	Monday, Wednesday, Friday
Heel raise with dumbbells	20	2	Monday, Wednesday, Friday
Push-ups	15	2	Monday, Wednesday, Friday

Sit ups	20	2	Tuesday, Thursday, Saturday
Russian twist	20	2	Tuesday, Thursday, Saturday
Plank	1 min	2	Tuesday, Thursday, Saturday
Bilateral side plank	1 min	2	Tuesday, Thursday, Saturday

RESULTS

Statistical analysis was done using SPSS version 20. Prior to the application of statistical tests, data was tested for the normal distribution by Shapiro-wilk test. Baseline characteristics were similar for both the groups(table 1). The data was normally distributed for all outcome measures($p>0.05$) (table 2). Level of significance was kept at 5% and confidence interval of 95%. Within group analysis was done using Paired ' t ' test and between group analysis was done using Unpaired ' t ' test. Result shows that the agility in recreational badminton players has improved significantly in Group A in comparison with Group B($p<0.05$), but the balance of dominant and non-dominant side leg in Group A & Group B shows that there is a significant difference from the pre test values($p<0.05$), but there is no significant difference existing among them reveals that, there is no difference among the groups($p>0.05$). (table 3,4,5) Based on effect size calculation between groups in agility ($d = 0.67$) showed clinically medium effect in Group A compare to Group B. In dominant limb balance ($d = 0.44$) and non-dominant limb balance ($d = 0.29$) showed clinically small effect in Group A compare to Group B.

DISCUSSION

The purpose of this study was to determine the effect of drop jump training on agility and balance in recreational badminton players. The result documented that six weeks of drop jump training, which was performed during training period is effective in improving agility among recreational badminton players. However, the impact on balance is similar to that observed in the routine training group. The result of this study were similar to the findings of Thomas, French, & Philip,2009, indicating that six weeks of plyometric training can improve muscular power and agility in youth soccer players. Enhancing agility involves rapid force development and high power output. Drop jump training has shown effectiveness in improving these specific requirements.[16] A study by Singh A and Nagar M et al in 2023, on correlation between agility and jump performance indices in Indian contact sports, revealed that there is a low to moderate negative association exists between certain drop jump variables and agility which concluded that jumping improved the eccentric strength of the thigh muscles, which is important during the deceleration stage of a change of direction.[17] The possible mechanism that influenced in the Y balance test performance could be muscle activation, neuromuscular properties and proprioception, which have a strong relationship to the balance performance.[18] Hammami and Ramirez-Campillo R.et al.(2019)found that there is no effects on static and dynamic balance after nine weeks of plyometric training in under 14 years old female handball players.[19] However, a study by Kayin Rome (2014), revealed that four weeks plyometric training programme can significantly improve the dynamic balance in beginner badminton players.[20] When plyometric jump training was compared with balance training by lee and Oh S et al (2020), showed that both training types induced similar balance adaptations. Plyometric jump training has the potential to improve muscle strength, power, and balance through primarily neural adaptations.[21] However, we cannot ignore that the dynamic nature of the sport would impact the postural control or equilibrium which was documented in various studies.[22,23]

CONCLUSION

It can be concluded from the present study that drop jump training is effective in improving agility but there is no noteworthy difference observed between the two groups in terms of balance.

ABSTRACT

The goal of the current investigation was to separate and identify important phytochemicals from the chloroform extract of the perennial plant *Corchorus depressus (Linn).* The powdered dried leaves of the *Corchorus depressus (Linn*.) were subjected to cold maceration in the solvent chloroform and after column chromatography isolated the two compounds CE-1 and CE-2. The structures of the compounds CE-1 and CE-2 were characterized as flavone and 5-hydroxy flavone respectively. The structures of CE-1 and CE-2 were identified from the melting points, RF values, and spectral analysis studies including ^{13}C, ^{1}H NMR and mass spectrometry.

Keywords: *Corchorus depressus (Linn*.), chloroform extract**,** flavone, hydroxyl flavone

INTRODUCTION

Globally, there has been a surge in the traditional and alternative healthcare domains' employing medicinal plants [1]. Herbal remedies are therapeutic preparations that contain plant materials as their pharmacologically active ingredients [2]. Rural parts of developing nations are using it as a principal source of medication [3]. Plant's non-nutritive phytochemical deliver safeguards against a range of illnesses and ailments [4]. The genus *Corchorus*

comprises over 100 species distributed among the tropic and subtropics mainly in South Asia and South America [5]. *Corchorus depressus (Linn.)* a perennial herb from the family *Tiliaceae* that was later merged with family *Malvaceae.* The plant is commonly known as Bhaufali or Bauphali or Munderi [6-11]. *Corchorus depressus (Linn*.) is also known as "Hirankhuri" which is 6 to 9 inches long. It is found across North and tropical Africa, including Cape Varde Island, Central and North West of India, also in Pakistan. The entire plant has been found to offer significant benefits for various health issues, including hepatitis, liver inflammation, urinary itching, and prolonged menstruation [12]. *Corchorus depressus (Linn.)* leaf crude solvent extracts showed the substantial antimicrobial and anti-inflammatory properties [13]. *Corchorus depressus (Linn.)* leaves have been reported for isolation of the phytochemicals like pentacyclic triterpenoids β-amyrin and Glycyrrhetinic acid [14]. Here, we describe the isolation and investigation of the structure of two novel compounds CE-1 and CE-2, the compounds chloroform extract-1 and chloroform extract-2 from *Corchorus depressus (Linn.)* leaves.

MATERIALS AND METHODS

Fresh *Corchorus depressus (Linn.)* leaves were obtained in the Sakri area of Dhule District (MS), India. The taxonomist, Dr. S. R. Kshirsagar of S.S.V.P.S's Lt. Kr.Dr.P.R Ghogrey Science College, Dhule, Maharashtra, India. After a thorough washing under running tap water, the fresh plant material's leaves were air dried and kept in a sealed container. 2.5 kg dried leaf powder was subjected to extraction using chloroform solvent by cold maceration, evaporated on a rotary evaporator, and found a dried 6 gm extract. A little amount of dried extract was dissolved in solvent chloroform and was spotted on TLC plates and implemented through various solvent systems. A solvent system comprised of chloroform, ethyl acetate, and formic acid in the ratio of 7:2:1 was chosen after experimenting the several systems. 2.5 gm of the chloroform extract was column chromatographed on 60-120 mesh silica gel and drained with the analytical grade solvent systems of chloroform: ethyl acetate: formic acid. On gradient elution with the solvent system, two fractions showing single spots were isolated and same were subjected to preparative TLC. The two phytoconstituents were separated and designated as CE-1 and CE-2 respectively.

Flavonoids Test

During the Shibata's reaction, both the isolated phytoconstituents were tested. The result showed that CE-1 produced an orange color, while CE-2 produced a red color, suggesting the existence of flavones and flavonols in the respective constituents.

Results

Characterization of Compound: CE-1

Characterization of Compound: CE-2

DISCUSSION

CE-1, a white crystalline substance with a melting point of between 98 and 100 ^{0}C, isolated from the chloroform extract. It gave a positive test for flavonoid with the inference from Shibata's reaction. CE-1's mass peak (m/z-223, M+) and CHN analysis (C= 81.187 %, H = 4.633 %, O= 14.18 %.) revealed its chemical formula to be $C_{15}H_{10}O_2$. The IR spectra of CE-1 shown the broad spectra at 2980 cm^{-1} indicates the presence of aromatic proton. The 1609 cm^{-1} peak reflected the stretching frequency of C=C moiety. The IR peak at 1713 cm^{-1} indicates the existence of keto group. The peak at 1255 cm^{-1} indicated the stretching frequency of ether linkage. **^{1}H NMR** spectrum of CE-1 showed the sharp singlet at 6.8 δ due to the isolated proton H-3 of ring C. The doublet of doublets centered at 8.21 δ and 7.56 δ constitutes the H-5 and H-8 aromatic protons respectively of A-ring. Two multiplets (ddd) at chemical shift 7.42 δ and 7.62 δ correspond to the protons H-6 and H-7 of the A-ring. The observed doublet of doublets observed at 7.90 δ matches two different aromatic protons H-2' and H-6' of ring B, which are slightly downfield. The cluster of signals at 7.51 δ (m) correlates to the corresponding H-3', H-4' and H-5' protons of ring B. The **^{13}C-NMR** spectra showed the

existence of 15 carbon atoms. The chemical shift of ring-B carbons are affected by O-ether linkage. The peak appearing at 178.4 δ, most downfield is assigned to carbonyl carbon of keto group C-4. The second most downfield shift at 163.38 δ showed the carbon C-2 directly attached to oxygen of ether linkage. The carbon C-3 carbon appeared to be up field chemical shift due to donating resonating effect of oxygen, attached to C2-C3 double bond. The chemical shifts of ring-A carbons (C1'–C6') observed to be similar as of the mono substituted benzene ring (125.66 - 131.70 δ). The chemical shifts of ring-A carbons (C5-C10) are also influenced by O-ether and C4-keto group and resonates between 118.11 δ to 125.24 δ for (C5, C6, C8 and C10) , C-7 at 133.81δ , C-9 at 156.22 δ. Considering all the spectroscopic ^{1}H-NMR data and assignments of ^{13}C NMR signals of the compound CE-1, the structure of the compound is elucidated as shown in the Fig.-9 **CE-2** compound, a yellow crystalline solid of meting point 173-175 ^{0}C, was obtained from the chloroform extract. The chemical formula was calculated to be $C_{15}H_{10}O_3$ on the basis of its mass peak (m/z- 471, M+) and elemental analysis (C = 76.652%, H = 9.752%, O = 13.596%). The **IR** spectra of **CE-2** indicates the presence of an alcoholic O-H group (3186 cm^{-1} peak). The carbonyl stretching frequency of the keto group is shown by the peak at 1712 cm^{-1}, while the aromatic ring's C=C stretching is represented by the peak at 1611 cm^{-1}. The absorbance at 2974 cm^{-1} indicates C-H aliphatic stretching. The peak at 1226 cm^{-1} represents C-O stretching vibrations. The absorption bands between 960 cm^{-1} and 1000 cm^{-1} show the bending vibrations of a mono substituted aromatic ring. **^{1}H NMR** spectra of CE-2 showed seven types of aromatic protons. The sharp singlet observed at 7.07 δ represents the H-3 proton of ring C. Two doublets of doublets found at 7.519 δ and 7.50 δ correspond with the H-6 and H-8 protons located in the A-ring. The H-7 proton of ring-A is found to be slightly downfield at chemical shift 7.68 δ as is it meta to the hydroxyl group. The coupling pattern attributes two multiplets seen at 7.912 δ and 7.5397 δ to (H-2' & H-6') and (H-3' & H-5') respectively. In the ^{13}C-NMR spectra, the appearance of fifteen signals implies the presence of fifteen carbon atoms. The most downfield peak at 181.6 δ represents the carbonyl group. The Ring B's C-2 carbon is represented by the second-downfield peak at 164.73 δ. The signal at 158.29 δ indicates the C-5 proton, which is linked to the O-H group. Considering all of the spectroscopic ^{1}H-NMR data and assignments of ^{13}C NMR signals of the phytoconstituent CE-2, the structure of the molecule is revealed as shown in Fig.9

CONCLUSION

The cold maceration extraction of *Cochorus depressus (Linn.)* leaves with the solvent chloroform led to the separation of two pure phytoconstituents, CE-1 and CE-2. Comparing elemental analysis and full spectroscopy data resulted in the structural elucidation of CE-1 and CE-2 as flavone and 5-hydroxy flavone.

ACKNOWLEDGEMENT

The authors extend their gratitude to the Principal, Sandip Institute of Technology and Research Centre Nashik, for providing the necessary resources. The current work was also supported by the Principal, P.S.G.V.P. Mandal's S.I.Patil Arts, G.B.Patel Science, and S.T.K.V.S Commerce College, Shahada, District-Nandurbar, who provided materials for research.

ABSTRACT

In *Megacopta cribraria* the endosymbiont is harbored in the midgut and are deposited as capsules along with eggs during oviposition, without these capsules getting contaminated with the excretory wastes. The present study conducted in 2023 under laboratory condition unravels the mechanism of non-contamination of the endosymbiont capsule with the excreta as both are released from the hindgut. Females were observed for their excretory pattern in both mated and unmated condition. The results indicated that gravid females have developed ways to lower their metabolism during their egg-laying period resulting in less and dilute excreta output ensuring none or minimal contamination, if any, by the excreta drop to the endosymbiont capsule. Unmated females did not exhibit any change in excreta output. Such adaptation may have ensured a long association of these endosymbionts with the egg masses of this bug.

Keywords: Endosymbiont, excretion, hindgut, excreta, oviposition, transovarial transmission

INTRODUCTION

Generally, in Pentatomoidea the endosymbionts that are harbored in the midgut caeca are inherited from the mother(Fukatsu & Hosokawa, 2002). The freshly emerged nymphs orally acquire these symbiotic bacteria from the capsules that are attached to the egg batches by remaining aggregated on the egg mass, ensuring vertical symbiont transmission (Hosokawa et al. 2005, 2006). In vertically transmitted symbiotic associations, it is important for the host to selectively transmit their bacteria (Kaltenpoth et al., 2014). Such endosymbionts play an important role in balancing the nutritional requirement of the body (Buchner 1965). The alimentary canal of the host organism is unique to accommodate and maintain its specific microbial partner. In such cases, the posterior midgut is differentiated morphologically to harbor beneficial bacteria. During the development of the plataspid bug, *Coptosoma scutellatum* the tract gets disconnected midway between anterior and posterior midgut for symbiont sorting. In

adults, the anterior mid gut is completely free and connected with the posterior gut by a delicate membranous thread with no cavity (Müller, 1956, Schneider, 1940). In the super family Pentatomoidea the posterior midgut of the bugs has several sac-like structures called crypts whose inner cavity hosts symbiotic bacteria (Buchner 1965; Kikuchi et al. 2008). The symbiotic organ lying in the middle of the midgut blocks food flow but allows the passing of the specific symbiont bacteria. The waste is excretory through the Malpighian tubules into the hindgut through hemolymph without crossing the posterior midgut (Glasgow, 1914, Goodchild, 1966,Kikuchi et al., 2008). *M. cribraria* might also follow a similar pattern of transmission of the symbiont in which the hindgut is the common pathway for the excreted material as well as for the passage of the endosymbiont. Due to this reason during oviposition, there is a chance of endosymbiont getting contaminated with the excreta as hindgut is the passage for excreta also. So, there must be some mechanism operative in the organism to prevent the contamination of the endosymbiont with the excreta during the process of egg laying. The present study is an attempt to unravel the mystery of this mechanism occurring inside the female bug during their pre- and post-oviposition condition.

MATERIALS AND METHODS

Insect Rearing

M. cribraria were collected from Cotton University premises (latitude 26.1874° N and longitude 91.7467° E) and brought to the laboratory of Zoology Department, Cotton University and were transferred in a cubical plexi-glass cage (20cm height×20 cm breadth). The bugs were provided French beans or lablab beans as a food and a moist cotton swab was placed in a small cup (2cm height×1.5cm breadth) that served as a source of moisture. Egg masses from the cage were transferred to a closed egg container (4cm height×10 cm breadth) using camel brush (No.0). Eggs on hatching were provided with Lablab bean as a food and moist cotton swab as the source of humidity. They were reared till the adult stage. Beans and cotton swabs were replaced on alternate days to prevent fungal growth.

Experimental set up

Freshly emerged males and females from the laboratory culture were paired and released separately in different containers (4cm height×10 cm breadth) during the month of April, 2023 (Figure1). Five such replicates were made. Tissue paper was used to line the base of the container to absorb the excreta and the bean was provided as food. The experiment was conducted at room temperature in the range of 24-27°C,with relative humidity of 75%-85% and photoperiod of 14L: 10D. Post-release of each pair, observation of the number of excretion drops on the tissue paper was recorded daily along with the record of the number of egg batches laid on a particular day till the death. Excreta drop of any size was considered as one excretion spot.

Statistical Analyses

Data relating to the number of excreta spots and oviposition day and number of eggs laid by the females of *M. cribraria* was used to graphically represent the pattern of egg laying using MS Excel Office, 2019.

RESULTS

Generally, the color of the excreta of a male is pale yellow and the female excreta is dark yellowish in color(Figure2). It has been observed that in the case of mated females, especially gravid females, the yellow color intensity of the excreta was pale which was much lighter than the color of the male excreta. The excreta pattern of female bugs during their pre-gravid to post gravid time is shown (Figure3).The graphs of the five mated females indicate that the average number of excreta observed per day ranged from a minimum of 2.53 (Figure3b) to a maximum of 3.67 (Figure3a) spots per day. In each set up, it was observed that the number of excretory spots increases initially reaching a maximum level (the highest peak in the graph) and then the excretion level drops gradually reaching the lowest level as lowest shown in the graph. On the same day, the first batch of egg was laid. This pattern was consistent in all the replicates except in the second replicate (Figure3b) where no such highest peak was observed before egg laying but a decline in excreta level was found before egg laying. It was consistently observed that before every oviposition there was a drop in excretion level.

The adult female generally lays eggs up to 1 to 2 months. The first oviposition of each replicate varied from 5 to 11 days. For each female, each ovi position cycle ranged between 3.33-5.0 days. In the total observation period, females laid eggs about 6-9 times during the study period. The number of eggs laid by each female during each ovi position ranged between 12.87- 17.10. It was also noted that the number of eggs laying capacity decreased with time.

DISCUSSION

Insects have elaborate mechanisms to maintain the host-symbiont relationship which ensures transovarial transmission, egg smearing with jelly-like secretions, vertical transmission, and horizontal transmission from the environment (Douglas, 1989, Bourtzis,& Miller, 2003, Kikuchi, 2009, Koga et al., 2012, Salem et al.,2015). Symbionts are vertically transmitted in those cases where hosts are dependent on their symbionts for their survival which ensures a direct transfer of benefit to the offspring (Bright,& Bulgheresi, 2010, Fisher et al., 2017).It is important for vertically transmitted symbiotic associations that the host organisms transmit their endosymbiont without any contamination (Koga *et al.,* 2012, Kaltenpoth, 2014). Hence, it is expected that the host organisms must have established and maintained some mechanisms for their specific microbial partners. But the mechanisms underlying the vertical transmission of host-symbiont associations are scarcely understood in insects. *M. cribraria* endosymbiont shows vertical transmission. The present observation on the decline in the number of excretions drops by the mated females as they approached the oviposition period indicates that her metabolic activities are slowed down before oviposition. Light-colored excreta of gravid female in contrast to dark colored excreta of males and unmated females further confirms that mated females excreta was in a very dilute form or watery in nature implying that during her state of being gravid, the female lowered her food consumption to maintain a low metabolism so that less waste was being generated in the body. This ensured that endosymbionts are not contaminated with the excreta while ovipositing as the passage tract for both is common. During the period of oviposition, the excreta are watery and possibly carries very minimal excretory waste. Unraveling this mechanism is an important finding that shows how the excretion output is regulated by the female bugs during oviposition to prevent the contamination of endosymbionts with the excretory wastes giving adaptive advantage to the future progeny.

ACKNOWLEDGMENTS

We are thankful to the Department of Zoology, Cotton University for providing all the necessary laboratory facilities for the research work. We are also thankful to Yugal Krishna Dutta for the insect excreta photography.

ABSTRACT

The large deciduous tree Shorea TumbuggaiaRoxb (Dipterocarpaceae) has phytochemicals with an extensive variety of biological activities, including anti-inflammatory, antiviral, antioxidant, and anti-carcinogenic properties. Swiss ADME and PkCSM software will be used to evaluate the pharmacokinetic parameters of molecules derived from bark extract in order to determine the compounds' potential as oral drugs. In order to identify the compounds that are active, phytochemical evaluation is going to be accomplished. Additionally, the anthelmintic activity of Shorea tumbuggaia's methanolic flower extract will be examined. Swiss ADME and PkCSM online software were employed to predict ADMET and pharmacokinetic parameters. Shorea tumbuggaia flowers that had dried were collected, ground into a fine powder, and then subjected to Soxhlet extract. the plant extract was screened for phytoconstituents and anthelminthic activity using Pheretimaposthuma earthworms. Alkaloids, flavonoids, tannins, and saponins have been identified in plant extract according to a preliminary phytochemical testing. Using earthworms at different concentrations (50, 100, 200, and 400 µg/ml), a methanol extract of Shorea Tumbuggaia flowers was evaluated for anthelmintic activity. The findings indicated significant activity when compared to the usual medication, albendazole. It displayed anthelminthic action that was dose-

dependent. Extract from plant flowers expressed the worm's paralysis and death times. In conclusion, there was significant anthelmintic effect exhibited by the 400 µg/ml methanol extract. The results of this investigation demonstrate that Shorea tumbuggaia flowers have notable, dose-dependent anthelmintic properties, matching the performance of the industry standard reference medication.

Keywords: *Shorea tumbuggaia,* Albendazole, ADMET Parameters, Antihelmentic Activity, Soxhlet Extraction.

INTRODUCTION

Since ancient times, medicinal plants have been a significant source of medications. Naturally occurring bioactive components are highly desirable as synthetic chemical substitutes for the treatment of a wide range of illnesses. Modern drug development may benefit greatly from the use of small chemical molecules derived from plants and other natural sources. Ankanna S. *et al.,*2011. Drug-like substances are those that possess both acceptable toxicity and acceptable ADME characteristics to make it through phase 1 clinical trials involving humans. Bakht, In developing nations, helminths are the most prevalent infectious organisms that cause disease worldwide and raise the risk of pneumonia, eosinophilia, malnourishment, and anemia. A system for testing for anthelmintic activity in medicinal plants has been suggested as an alternative to the development of resistance in helminths against existing medications. Plant-derived medications are used as a model to create safer and more potent medications. (Waghorn GC *et al,* Charleston WAG *et al*, Niezen JH *et al.,* 1995). A tree species of both medicinal and economic importance, Shorea tumbuggaia Roxb is a member of the Dipterocarpaceae family. It is indigenous to several parts of southern India. Its range extends into Andhra Pradesh, Tamil Nadu, especially the Tirupati hills of Chittoor district, the Seshachalam and Veligonda hills of Cuddapah district, and North Arcot and Chingleput districts of Tamil Nadu. An important need to assess the medicinal potential of Indian herbal medicationsis to promote them. (Kumar Madhavachetty, Sivaji, TulasiRao, *et al.,* 2008).

MATERIALS AND METHODS

ADME Evaluation Strong biological activity and low toxicity are desirable qualities in a drug. One effective method for getting rid of undesirable chemicals is to evaluate the pharmacokinetic parameters in silico. Online tools such as Swiss ADME (http://www.swissadme.ch/) and Molinspiration Cheminformatics software (http://www.molinspiration.com/) can be used to assess the ADME (Absorption, Distribution, Metabolism, Excretion) features. Gathering of Plant Resources .The Shorea Tumbuggaia flowers were gathered from the Sheshachala woodland in the Tirumala Hills. The collected flowers were shade-dried for a week before being ground into powder.(Sravika N *et al.,* 2021)

Preparation of Plant Extract

Soxhlet Extraction: The Shorea TumbuggaiaRoxb (STR) flower was ground into a powder after it was shade-dried. Plant material in the weight of 60 g was extracted sequentially with methanol using a Soxhlet extractor for 32 cycles. The methanol layer was removed, and when it evaporated and turned into a solid mass weighing up to five grams, it first appeared as a brownish liquid. It was preserved and covered with silver foil. In 2014, Mathavi, P. *et al*. Phytochemical Profiling: Using the standard procedures outlined by Harborne, a qualitative screening of plant extract was conducted to determine the presence of alkaloids, phenolic compounds, flavonoids, saponins, amino acids, quinines, steroids, tannins, xanthoproteins, carboxylic acid coumarins, and carbohydrates.(Kamala Chandak *el.al*. 2022).

Anthelmintic Activity

The reference Method was used to determine the anthelmintic of the methanolic extract. For the initial evaluation, the study was carried out in vitro using adult Indian earthworm and Pheretimaposthuma because of their morphological and physiological similarities to human intestinal roundworm parasites. The anthelmintic investigation employed earthworms (Pheretimaposthuma) that were taken from moist soil and thoroughly cleaned with normal saline to eliminate any trace of faucal matter. (J.G. Cuming *et al.,* A.M. Davis *et al.,* 2013). Six sets of six Pheretima Posthuma earthworms, all approximately the same size (6–8 cm), were released into 25 ml of albendazole solutions with varying concentrations of extract for an in-vitro bioassay(ME-STR, HAE-STR, ME-HAKS and EAE-HAKS) in the range of 50, 100, 200, and 400 µg/ml were prepared using with normal saline on to a Petri dish Albendazole served as the reference standard, while regular saline served as the control. Before initiating the research, all of the test solutions and the standard medication solution were freshly prepared. when the worms were violently agitated, observations were recorded regarding the time it takes for paralysis. In 1967, Chatterjee KD *et al.* The worms' time of death was noted once it was determined that they did not move when submerged in warm water (50°C) or when shaken violently. (Dhar D.N. *et al.,* Bansal G.C. *et al.,* Sharma R.L. *et al* 2011.

RESULTS

Because of its affordability, speed, and convenience throughout the many stages of drug discovery and development, *In silico* screening has proven to be an effective tool to predict of molecular characteristics. The studies on plants may yield new, practical medications. In floral extract, phenolic chemicals, flavonoids, saponins, steroids, tannins, xanthoproteins, carboxylic acids, and carbohydrates were detected by preliminary phytochemical screening. This implies that a greater variety of phytochemicals are available in the flowers. Particularly for drugs intended for oral usage, proper drug delivery, good drug absorption, are essential. In this study bioactive constituents from the flower extract of *Shorea Tumbuggaia*analyzed for *Insilico* ADMET properties using software's such as Swiss ADME, Molinspiration to know their drug like properties and this analysis revealed that bioactive constituents have good oral druglike properties and can be improved as oral drug candidates. The Compounds Apigenin, Naringenin, Epicatechin, Peonidin, Luteolin, Hesperetin, Gallocatechin, Xanthohumol, Quercetin, Genistein, Cyanidin, Isobavachalcone, Kaempferol, Glycitein, Malvidin, Myricetin, Catechin, Diadzein, Delphinidin, are showing better binding interaction scores with GPCR ligand Ion channel modulator, Kinase inhibitor, nuclear receptor ligand, Protease inhibitor Enzyme inhibitor (Siti Khaerunnisa *et al.,)*

Phytochemical Compound In The Extract

Shorea TumbuggaiaRoxb's methanoic flower extract includes proteins, carbohydrates, alkaloids, flavonoids, saponins, tannins, and glycosides.

Anthelmintic Activity

The findings clearly demonstrate that the Shorea tumbuggaiaRoxb flower extract may be found at different concentrations (50, 100, 200, and 400 µg/ml). demonstrated the effect of the dose on paralysis and death time. When methanolic extract was compared to reference standard albendazole, it demonstrated powerful action and a paralytic effect, as well as a faster death time (D). The following lists the findings of the anthelmintic study report for Shorea Tumbuggaia flower extracts. Control (Normal Saline) Standard (Albendazole),methanolicextract, concentration ranging from 50,100,200 & 400 µg/ml.

DISCUSSION

The compounds were found to have good absorption, distribution, metabolism, and excretion, and the "drug-likeness" and ADMET metrics demonstrated compliance with the Lipinski criterion. The Soxhlet extraction method was employed to extract the Shorea Tumbuggaia flowers using methanol. Shorea tumbuggaiaRoxb contains flavonoids, tannins, saponins, polysaccharides, and glycosides, according to preliminary phytochemical screening.

By comparing the plant extract of Shorea Tumbuggaia flowers with the conventional. medicine albendazole, the in-vitro assessment of the extract's anthelmintic activity revealed a considerable activity. The earthworms were given several doses of the extract (50, 100, 200, and 400 µg/ml). Anthelminthic action has been shown to be dose-dependent.

CONCLUSION

Plant materials are a rich source of bioactive compounds, contributing structural diversity for drug discovery to provide leads for novel therapeutics.In silico studies accompaniment this by quickening the screening of natural compounds, predicting their pharmacokinetics, toxicity, and molecular interactions, dropping the time and costand improve the efficiency and success rate involved in drug development. Shorea tumbuggaiamethanolicflowers extract at 400 µg/ml displayed significant anthelmintic capabilities that are dose-dependent, with results that are comparable to that of the standard reference drug. Further we are planning to isolate and screen for other pharmacological activities.

ACKNOWLEDGMENT

The authors are thankful to the Management, Director, Principal and Vice Principal of Sarojini Naidu Vanita Pharmacy Mahavidyalaya Tarnaka, Hyderabad forproviding all the necessary facilities to conduct this research project.

ABSTRACT

Rice is a major staple food in most of the Asian countries. India is the second most producer and consumer of rice. Rice is a staple food of eastern and southern parts of India. Assam is known for its diverse collection of indigenous rice varieties. There are thousands of rice varieties and each of the rice varieties has its own characteristics, flavour and dietary uses. The present study has been conducted to determine the proximate analysis of three local rice varieties namely, Kon Joha rice, Ronga Bora rice and Aijong rice. This study was carried out to estimate the carbohydrate and protein content of selected traditional rice varieties of Assam which is available in Kokrajhar town market. The analysis of carbohydrate was performed following the standard method, while protein content was carried out following the guidelines of Association of Official Analytical Chemists [1]. Among the three rice varieties, the carbohydrate content was found highest in Kon Joha rice (4.641 mg/ml) followed by Ronga Bora rice (4.481 mg/ml) and Aijong rice (3.491 mg/ml). On the other hand, Kon Joha rice showed significantly higher protein content of 11.20% as compared to Ronga Bora rice of 6.62% and Aijong rice of 7.49%. The result of carbohydrate content revealed comparatively similar results while it showed slight variation in protein content among the selected rice varieties. The study revealed that the Kon Joha rice was found to have higher content of carbohydrate and protein content as compared to other two rice varieties. It can be concluded that the Kon Joha rice which is an aromatic rice have higher nutritional value based on carbohydrate and protein content as compared to non-aromatic rice (Ronga Bora rice and Aijong rice). Thus, the result revealed the nutritional amount of selected varieties and its significant difference, which

clearly showed that the selected local rice varieties are a good source of carbohydrate and protein content. This study was undertaken to perceive the amount of carbohydrate and protein content present in selected rice varieties that are generally available in local market.

Keywords: Assam; Rice; Traditional rice varieties; Aromatic rice.

INTRODUCTION

Rice is a cereal that is consumed globally and is a very good source of carbohydrates and also thiamine, riboflavin and niacin [2]. Rice is a key staple food in most of the Asian countries. Rice is one of the principal and dominant crops in India and also a staple food of eastern and southern parts of India. In India, rice is cultivated in various regions such as the western and eastern coastal strip, Assam plains and surrounding low hills, foothills and Terai region along with the Himalayas and states like West Bengal, Bihar, eastern Uttar Pradesh, eastern Madhya Pradesh, northern Andhra Pradesh and Odisha [3]. Assam is known to be one of the centres of rice origin and has a diverse collection of native rice varieties [4]. Based on season and other traits, there are four major class of rice that are grown in Assam i.e., Sali rice (winter rice), Boro rice (summer rice), Bao rice (deepwater rice) and Ahu rice (autumn rice). Each of these rice have a variety of characteristics such as stickiness, colour difference, waxy and non-waxy and specific aroma [5]. For human consumption, the paddy rice i.e., harvested unprocessed rice needs to undergo milling. The milling processes of paddy rice generally yield a number of fragments i.e., brown/cargo rice, hull, white/polished rice and bran and based on variety and type of milling performed the chemical composition of these fragments differs [6]. The milling process results in loss of fat, protein, fibre, ash, thiamine, riboflavin and niacin as it removes pericarp, seedcoat, testa, aleurone layer and embryo to obtain milled rice [7]. The conversion of brown rice to white in the process of milling and polishing eliminates vitamin B3 (67%), vitamin B1 (80%), phosphorus (50%), iron (60%) and all of the dietary fibre and essential fatty acids [5]. Kon Joha rice a type of aromatic Joha rice of Assam is known for its distinctive aroma, superfine kernel, fine cooking qualities and magnificent palatability. Kon Joha rice has high demand and used mainly for preparation of special dishes like table rice, Kheer Pulao and frumenty [8]. Ronga Bora rice is a type of glutinous rice and a variety of Bora rice. In rural Assam, the waxy rice has significant importance in social and religious ceremonies [9]. Aijong rice is the standard rice and is long grained. It is most readily available in the stores [10]. Considering all the above fact, the present study with the selected rice varieties (Kon Joha rice, Ronga Bora rice and Aijong rice) was undertaken to evaluate the nutritional amount of carbohydrate and protein content that are generally available in local market.

MATERIALS AND METHODS

Study Area

Three varieties of rice (*Oryza sativa*) including Ronga Bora rice, Kon Joha rice and Aijong rice were used in this study to compare the proximate composition of carbohydrate and protein content. The study was conducted at Guwahati Biotech Park Incubation Centre (GBPIC), Amingaon, Kamrup.

Sample Collection

Ronga Bora rice, Kon Joha rice and Aijong rice were purchased from the local market of Kokrajhar town (26.404607°N Latitude and 90.270377°E Longitude), Kokrajhar district of BTR, Assam.

Sample Preparation

The rice samples were converted to powdery form with the help of mechanical grinder (Bajaj Bravo Dlx), which was then sieved to obtain fine powder form. It was then transferred to an airtight container and followed previous workers methodology [11].

Biochemical Analysis / Proximate analysis of samples

Chemical composition of collected samples for carbohydrate content was determined by Anthrone method as described by Hedge [12] and protein content was determined as per the method described by AOAC [1].

Estimation of carbohydrate content

The carbohydrate content of each sample was determined by Anthrone method [12]. 0.5 ml of test sample was made 1 ml by adding distilled water. 4ml of Anthrone reagent was added and kept in water bath for 8 minutes. The solution was allowed to cool down and the absorbance of the green coloured complex was measured by taking the optical density at 630 nm.

Estimation of crude protein content

The crude protein content was determined by using the Kjeldahl method as described by AOAC [1]. 0.2 g of each sample along with 5 g of sodium sulphate, 1 g of copper sulphate and 10 ml of concentrated H_2SO_4 was taken in the kjeldahl tubes. And a blank solution contained all the chemicals except the samples. All the solutions were digested at 410°C for 2 hours. A green coloured solution was obtained which marks the end of the digestion process. The tubes were allowed to cool and 40 ml of distilled water was added to all the tubes. The distillation commenced with the addition of 40% NaOH and the released ammonia was collected in a beaker containing 5 drops of methyl red indicator and bromocresol green, along with a boric acid solution. The distillate collected changes colour from pink to green, which indicates the end of distillation process. The green solution was titrated with 0.1N H_2SO_4, until it gave a pink coloured solution and the volume of H_2SO_4 was recorded. Crude protein was determined by multiplying the nitrogen content percentage by a protein factor of 5.95 as follows:

$$N(\%) = \frac{(\text{ml of H2SO4 for sample} - \text{ml of H2SO4 for blank}) \times \text{normality of H2SO4} \times 14.04}{\text{weight of sample (g)} \times 10}$$

Crude protein (%) = total nitrogen % × 5.95

RESULTS AND DISCUSSION

Variation in proximate composition among the selected rice varieties

The present study evaluated the concentration of carbohydrates and protein among the selected rice varieties i.e., Kon Joha rice, Ronga Bora rice and Aijong rice. The result of the analysis of carbohydrate and protein concentration of three different rice varieties obtained from this study is shown in Table 1. The three rice varieties showed a significant difference in the amount of carbohydrate and protein percentage. Among the rice varieties, slightly similar level of carbohydrate content can be observed between Kon Joha rice (4.461 mg/ml) and Ronga Bora rice (4.481 mg/ml), while a small difference can be observed in Aijong rice (3.491mg/ml) which contains the lowest content of carbohydrate among the three rice varieties. The protein content, on the other hand, showed variation among the selected rice varieties in which Kon Joha rice (11.20%) has comparatively larger amount of protein content as compared to Aijong rice (7.49%) and Ronga Bora rice (6.62%). In a similar study it has been reported that the content of carbohydrate and protein in *Kola Kunkuni Joha* was 36.1±0.72 g/100g and 5.64±0.06 g/100g, while in *Kola bora* it was 35.5±0.49 g/100g and 8.9±0.02 g/100g [5]. In the present study, however, Kon Joha rice contained the highest carbohydrate (4.641 mg/ml) followed by Ronga Bora rice (4.481 mg/ml), also protein content was found highest in Kon Joha rice (11.20%). Their study showed variation in contents of carbohydrates and protein with the present study. The difference with the present study result might be due to the varietal differences of rice samples, cultivation area, temperature, weather and condition. In another study it has been found that the carbohydrate content in pigmented red rice ranged from 64% to 80%, whereas non-pigmented white rice ranged from 62% to 69%. While the protein content, ranged from 8.20% to 13.96% among all pigmented red rice and non-pigmented white rice [13]. In the present study, the carbohydrate content showed less content in pigmented red rice i.e., Ronga Bora rice (4.481 mg/ml) and non-pigmented rice i.e., Kon Joha rice (4.641 mg/ml) and Aijong rice (3.491 mg/ml). The protein

content on the other hand, showed comparatively similar results as the contents ranged from 6.62% of Ronga rice to 11.20% of Kon Joha rice. The variation of the carbohydrate and protein content of the rice with the present study might be due to the genetic differences among the rice varieties [14].

Comparison of carbohydrate and protein content among the selected rice varieties

Among the selected rice varieties, the carbohydrate content is likely to have similar levels, however, the protein content showed variation. The carbohydrate content was found to be highest in Kon Joha rice (4.641 mg/ml) followed by Ronga Bora rice (4.481 mg/ml), while Aijong rice (3.491 mg/ml) contains the lowest content (Fig.1). Hence, Kon Joha rice contains highest amount of carbohydrate content. Similarly, the protein content was found to be highest in Kon Joha rice (11.20%) followed by Aijong rice (7.49%) and the lowest in Ronga Bora rice (6.62%) (Fig.2).

Thus, both carbohydrate and protein content found to be highest in Kon Joha rice. It can be observed that the carbohydrate content among the three rice varieties have comparable amounts as rice is a good source of carbohydrate. And as rice is also a good source of protein and contains excessive quantity of lysine and protein digestibility [15]. It can be observed that all the three rice varieties showed significant amount of protein content. However, the variation of the contents among different rice varieties may be due to genetic makeup, agronomic management practices, and environmental factors [3].

CONCLUSION

In the present study, carbohydrate and protein content were compared among three selected rice varieties (Kon Joha rice, Ronga Bora rice and Aijong rice) which were collected from Kokrajhar local town market. Based on the obtained results, Kon Joha rice and Ronga Bora rice contains a slightly similar level of carbohydrate content while Aijong rice contains the lowest among the three rice varieties. The protein content is present comparatively larger amount in Kon Joha rice followed by Aijong rice, whereas Ronga Bora rice contains the lowest protein content. Thus, it can be concluded that the aromatic rice i.e., Kon Joha rice has comparatively larger amount of carbohydrate and protein content as compare to non-aromatic rice i.e., Ronga Bora rice and Aijong rice. The differences in carbohydrate and protein content among these varieties are almost minimum and may not significantly impact dietary considerations. The present study concludes that the selected rice varieties are good and better source of carbohydrate, protein and other nutritional properties and can be useful to meet the nutritional requirement. Also, the data obtained in this study can be helpful for further experiments.

ACKNOWLEDGEMENTS

The authors are thankful to the Guwahati Biotech Park Incubation Centre (GBPIC), Amingaon, Kamrup for allowing and providing us the lab facilities for carrying out the analysis of carbohydrate and protein in the rice samples by Anthrone and Kjeldahl method. The authors are also thankful to the Department of Zoology, Science College Kokrajhar, Assam, India.

ABSTRACT

Hyperlipidemia occurs when total cholesterol (TC), triglycerides (TG), and low-density lipoprotein (LDL) levels rise, and high-density lipoprotein (HDL) levels drop, leading to cardiovascular diseases. This increase in lipid levels results in mixed hyperlipidemia, along with elevated levels of apolipoprotein B (apo B) and non-HDL cholesterol concentrations. Physicians typically prescribe statins as the first line of treatment for mixed hyperlipidemia. However, stat in monotherapy often fails to meet the desired lipid level goals. When patients cannot tolerate statins, doctors turn to second-line monotherapies, such as fibrates and cholesterol absorption inhibitors. The combination of ezetimibe and fenofibrate offers an effective alternative therapy for atherogenic mixed hyperlipidemia due to the combined biological efficacy of these drugs.

Keywords: Hyperlipidemia, Statin monotherapy, Fenofibrate monotherapy, Ezetimibe monotherapy, combination of Ezetimibe and Fenofibrate therapy.

INTRODUCTION

Hyperlipidemia is also known as high cholesterol or also known as elevated concentration of all lipids or any in blood. Elevated levels of cholesterol lead to higher risk of heart attack and stroke. Lipids such as triglycerides and Cholesteryl esters are insoluble in water. Lipids are transported in plasma by transport proteins known as lipoproteins. Lipids are transported in core particles. Core particle contains triglycerides and cholesteryl esters having hydrophilic shell of phospholipids and free cholesterol surface layer and it is stabilized by apolipoproteins or apoproteins. These apoproteins or apolipoproteins are synthesized in liver. Lipoproteins consist of different types of lipids and apoproteins in different types (1). When body has higher levels than the required amount of cholesterol it forms plaque in arteries. It forms thick, hard plaque and can clog arteries. It prevents oxygen and blood flow and can cause heart attack and stroke. Elevated plasma cholesterol levels and LDL leads to atherosclerosis in humans. As per 2020 census, WHO report, 60% of cardiovascular cases occurred in India. Total cholesterol lower than 200 mg/dl is considered as safe. TC greater than 240 mg/dl is treated as greater risk. Triglycerides, another type of fat is carried in the blood as VLDL. TG less than 150 mg/dl is considered as safe. TG 200-499 mg/dl is a risk factor. LDL, a bad cholesterol produced by the liver carries cholesterol, other lipids from liver to various sites of the body muscles, tissues, organs and heart. LDL less than 100 mg/dl is safe and considered as high in the range of 160-189 mg/dL. HDL is a good cholesterol and below 40mg/dl is risk for cardiovascular diseases (2,3,4).

Classification

Lipoproteins are classified into five based on size and density

- Chylomicrons
- VLDL (very low-density lipoprotein)
- IDL (intermediate density lipoprotein)
- LDL (low density lipoprotein)
- HDL (high density lipoprotein)

Chylomicrons: It carries large particles of dietary fat (mainly TG) from the intestine to the liver

Very low-density lipoprotein (VLDL): It carries endogenous TG synthesized in the liver to the tissues

Low density lipoprotein (LDL): It carries cholesterol from liver to tissues that are formed from intermediate density lipoprotein

High density lipoprotein (HDL): It carries cholesterol from tissues to liver. So, LDL is bad cholesterol and form plaques in arteries and HDL is good cholesterol it helps to remove LDL from arteries.

Types: Hyperlipidemia is classified into primary hyperlipidemia and secondary hyperlipidemia.

Primary Hyperlipidemia is classified into 5 types: It is caused due to single genetic defect or multiple genetic defects.

Secondary Hyperlipidemia (acquired hyperlipidemia): It is acquired due to disorders like Diabetes, Nephrotic syndrome, Alcohol intake, Hypothyroidism, Obesity and Use of drugs like Corticosteroids, Beta blockers and oral contraceptives (5,6,7).

MECHANISM OF ACTION OF VARIOUS ANTIHYPERLIPIDEMIC DRUG

CAUSES

- Obesity.
- Genetic or inheritance.
- Smoking.
- Use of several drugs such as corticosteroids, estrogen, beta blockers may risk for hypertriglyceridemia.
- Alcohol Consumption, Hypothyroidism
- Kidney failure and low Exercise.

RISK FACTORS

- Age
- Cardiovascular diseases
- Myocardial infraction
- Ischemic stroke

Marketed formulations of antihyperlipidemic drugs

FIRST LINE PHARMACOTHERAPY

Statins (HMG-Co A Reductases):

These are the first-line treatment for increase in LDL levels. Statins include drugs like Atorvastatin, Lovastatin, Simvastatin, Pravastatin, Rosuvastatin, Fluvastatin. They inhibit the major enzyme required for the biosynthesis of cholesterol, which is the rate-limiting step in de novo cholesterol biosynthesis. HMG-CoA reductases, interrupts the conversion of HMG-CoA to mevalonate, which diminish synthesis of LDL. It triggers the catabolism of Low-Density Lipoproteins mediate through LDL receptors appear to be the important mechanisms for antihyperlipidemic effects (10,11,12). Less than 10% of patients face constipation by use of stat in drugs.

Case Studies

Twenty hyperlipidemia patients were selected and given atorvastatin 20 mg, pravastatin 20 mg and simvastatin 20 mg tablets were given to the patients. The patients were reviewed after 3rd and 5th month of stat in therapy for lipid profile. Case study shows that atorvastatin reduced the lipid levels (LDL-C, TC, TG, VLDL) when compared to simvastatin and pravastatin after 3rd and 5th month of treatment. Atorvastatin also increased the HDL-C levels, compared to simvastatin and pravastatin after 5 months of treatment.

Effect of Statins on Lipoprotein Levels in Hyperlipidemia and Coronary Disease Patients

A study was conducted in group of 96 patients aged 34-59 having hyperlipidemia and coronary heart disease, they were monitored at baseline and 12 times within 12 months they were measured total cholesterol (TC), LDL and HDL, Apolipoprotein (apo A1), (apo B) and lipoprotein. They were monitored at baseline after 6 months and 12 months of atrovastatin therapy. Results indicated decreased levels of TC (43.58%) , LDL (41.46%) and apo B (6.8%), increased levels of HDL by (4%) and (apo A1) , lipoprotein remain unchanged (13,14).

Pharmacodynamic and pharmacokinetic parameters of statin in treatment of hyper lipidemic conditions.

Statins are hydroxyl methyl glutaryl coenzyme A reductase inhibitors which are prescribed for cardiovascular diseases to lower cholesterol in blood and to prevent heart attacks and stroke. Higher amount of LDL deposits in the arterial walls causes narrow paths and leads to serious cardiovascular diseases(15,16). Statins converts HMG-Co A to mevalonate so it reduces the production of endogenous cholesterol. Pharmacological activity of statins depends on kinetic profile of parent compound and active metabolites. All statins have common mechanism of action but differ in chemical structures and they differ in metabolism and number of active and inactive metabolites. Stat in drugs include atorvastatin, fluvastatin, lovastatin, simvastatin, rosuvastatin and pitavastatin. Mostly prescribed drug is Atorvastatin than other statins due its efficacy and safety profile.

Dose administration of statins daily is from 20mg to 40mg which decrease LDL levels, prescribing these statins reduce the cardiovascular diseases.

Second Line Pharmacotherapy

Second-line lipid-lowering agents include fibrates, bile acid resins, niacin and cholesterol absorption inhibitors. These are used with statins for patients having hypercholesterolemia if it is not controlled with stat in monotherapy. Fibrates are used to control bad cholesterol in the blood.

Mechanism of action of fenofibrate

Pharmacodynamics of fenofibrate:

In hyperlipoproteinemia decrease in atheromatous plaques in arteries is occurred. In patients level of LDL decreases and HDL level increases which leads to changes in lipoprotein fraction. It increases AI and AII levels and decreases apolipoprotein CII, CIII, E Fenofibrate effects TGA and cholesterol metabolism, but there is no proof whether the effect is primary or secondary (17,18). It increases lipase activity which increases triglyceride lipoprotein metabolism and it reduces biosynthesis of cholesterol, which results in increase in LDL clearance by increased hepatic LDL receptor activity. Selective cholesterol absorption inhibitor (Ezetimibe) Ezetimibe, it is the first member of a group of drugs which inhibits the intestinal absorption of phytosterols and cholesterol, it has improved the treatment of hypercholesterolemia, which inhibits the absorption of sterol from the small intestine and it does not affect on the plasma concentrations of the vitamins A, D, E, and K.

Mechanism of action of ezetimibe

It selectively inhibits absorption of cholesterol in the small intestine and lowers delivery of intestinal cholesterol to the liver by blocking the Niemann– Pick C1-like 1 protein (NPC1L1), which is a human sterol transport protein. So, it causes increase in the clearance of sterol from the blood stream.

Monotherapy of ezetimibe and its pharmacokinetic study

Ezetimibe is the first number of a class of selective cholesterol absorption inhibitors. It is a synthetic 2-azetidinone its chemical name is 1-(4-fluorophenyl)-3(R)-[3-(4-fluorophenyl)- 3(S)-hydroxypropyl]-4(S)-(4-hydroxyphenyl)-2-azetidinone. By biosynthesis of endogenous pathway, the concentration of plasma cholesterol is maintained and by exogenous pathway absorption of dietary and biliary cholesterol is maintained. Ezetimibe inhibits two different types of sterol transporters in mouse small intestine, first is Niemann-Pick C1-Like 1 (NPC1L1) protein which is mediator of cholesterol and phytosterol absorption which is important Ezetimibe sensitive pathway(19,20). Secondly protein complex of annexin-2 and caveolin-1 which seems to be also involved in intracellular sterol trafficking. Ezetimibe is administered orally glucuronidated and recycled by the enterohepatic circulation, it results in repeated delivery to the site of action in the intestine and thus limiting the peripheral exposure. It enhances half-life of (22h) it allows only once daily dosing. It localizes as glucuronide in intestinal wall and inhibits internalization of NPC1L1 and cholesterol as potently as Ezetimibe. It is excreted as parent drug (Ezetimibe) in feces and small portion in urine as glucuronide. There was no significant effect when administered orally with food and it rarely causes interactions with CYP450 substrates. A study was conducted in hypercholesterolemic subjects by double-blind, placebo-controlled, crossover study in 18 men with mild to moderate hypercholesterolemia evaluated for 2 weeks by administration of Ezetimibe 10mg, it was observed that it decreased cholesterol absorption by 54% and LDL levels by 20% compared with placebo. This was associated with a compensatory increase of cholesterol hepatic synthesis, as reflected by increased in the lathosterol to cholesterol ratio (21). Ezetimibe also reduced plasma concentrations of campesterol and sitosterol by 48% and 41% respectively.

Clinical study of ezetimibe monotherapy

Ezetimibe is administered to hypercholesterolemia patients amount of 10mg/day in several blind studies. Analysis of double blind, placebo – controlled trials showed that compared with placebo. It reduced LDL –C and TG levels by 18.58% and 8.06% respectively, and increased HDL-C levels by 3.00%. It also reduced non-HDL-C and apo B concentrations. Decrease of apoB containing lipoproteins showed that the reduction in LDL-C was due to a fall in all

the LDL reduction (22). Ezetimibe produced quantitative increase in LDL rather than qualitative. It effects the metabolism of apolipoproteins B48 and B100 in males with mixed hyperlipidemia, which decreases triglyceride rich lipoprotein apoB48, VLDL apoB100, and LDL apoB100 pool sizes and increases in VLDL and LDL apoB100 fractional catabolic rates. Ezetimibe has been evaluated until now in combination with simvastatin in a specific group of patients with aortic stenosis in SEAS trial, simvastatin and ezetimibe reduced the incidence of ischemic cardiovascular, but it does not reduce aortic-valve stenosis. Ezetimibe showed positive effect when combined with statin and showed abnormal carotid intima-media thickness. In a small study, ezetimibe improved carotid IMT in Japanese patients with mixed hyperlipidemia (23).

Combination therapy of ezetimibe and fenofibrate

It is considered as the best option to treat mixed hyperlipidemia due to biological efficacy of these two drugs. The efficacy has been evaluated in patients with mixed hyperlipidemia. A studied was conducted for evaluation of safety and efficacy of co administered Ezetimibe and Fenofibrate and was compared with Ezetimibe, fenofibrate and placebo administration individually for a period of 12 weeks (24). A number of 625 patients were mixed to receive one of the four daily treatments: placebo, ezetimibe 10 mg, fenofibrate 160 mg, and ezetimibe 10 mg + fenofibrate 160mg. This therapy reduced levels of LDL- C by 20.4%, TG by 44.0%, non-HDL –C by 30.4% and increased levels of HDL-C by 19.0%. After treatment hypothesis of patient on ezetimibe and fenofibrate in combination (64%) and fenofibrate alone (62%) treatments have shifted from more atherogenic LDL size pattern to larger, larger buoyant and decreased atherogenic size. The effects of ezetimibe and fenofibrate in combination therapy were either additive (LDL-C, total cholesterol, non-HDL cholesterol and apoB) or fenofibrate-dependent (TG, HDL-C, Apo AI, has CRP, fibrinogen and LDL size pattern shift). The combination therapy of Ezetimibe and fenofibrate achieved LDL-C and HDL-C levels about 60% greater than that in single treatment of either of drugs (25). In study 1 after completion of 12 weeks, 576 patients entered into a 48 – week, they received fenofibrate (n=236) or Ezetimibe plus fenofibrate (n=340) treatments. Improvements were found in 79 patients from baseline LDL-C (–22.0% vs. –8.6%), non- HDL-C (–31.6% vs. –19.4%), apoB (–25.2% vs. –16.2%), TG (–46.0% vs. –41.8%) and HDL-C (20.9% vs. 17.8%). These levels were greater with combination therapy than Fenofibrate alone. Study 2 was conducted with 180 patients to receive three treatments Ezetimibe 10mg, Fenofibrate 145mg + Ezetimibe 10mg, Fenofibrate 145mg+ Ezetimibe 145mg. These resulted indicated a greater reduction in LDL-C levels (–36.2%), smaller increase in HDL-C (+11.5%) than study 1.

CONCLUSION

Statins are first line therapy for mixed hyperlipidemia patients, but they cannot reach LDL-C and non-HDL-C goals because of limited therapeutic response. Fenofibrate is a second line therapy for mixed hyperlipidemia, the patients with this second line treatment have observed cardiovascular benefit, this benefit has proven that fenofibrate monotherapy on macro vascular event in the global population of FIELD study shows positive therapeutic response than stat in monotherapy. Combination of Ezetimibe and Fenofibrate is alternate therapy to treat atherogenic mixed hyperlipidemia it decreases LDL-C, non-HDL-C, ApoB and TG and increase of HDL-C. It is considered as second line therapy because of absence of long-term clinical benefit and safety profile. This therapy is useful to mixed hyperlipidemia patients who are intolerance to statin therapy.

Summary

Mixed hyperlipidemia is a greater risk for cardiovascular diseases it is difficult to treat mixed hyperlipidemia than hypercholesterolemia because it needs to decrease components of atherogenic dyslipidemia. Combination of Ezetimibe and Fenofibrate is considered as best line therapy to treat mixed hyperlipidemia of patients who are intolerance to statin therapy and other monotherapies. it is an alternate therapy to treat mixed hyperlipidemia patients to reach overall atherogenic lipid levels.

Table.1: Showing different types of primary hyperlipidemia

Type-1	Familial Hyperchylomicronemia
Type- 2A	Familial Hypercholesterolemia
Type -2B	Familial combined mixed Hyperlipidemia
Type-3	Familial Dysbetalipoproteinemia
Type-4	Familial Hypertriglyceridemia
Type-5	Familial mixed Hypertriglyceridemia

Table.2: Classification of antihyperlipidemic drugs with their mechanism of action

S. No	Classification of antihyperlipidemic drugs	Examples	Mechanism of action
1.	HMG Co-A reductase inhibitors	Atrovastatin, Fluvastatin, Lovastatin, Pravastatin, Rosuvastatin, simvastatin	These drugs are similar to HMG Co-A reductase, inhibit the biosynthesis of cholesterol in the liver which decrease plasma levels of Tc, LDL and Apo B.
2.	Bile acid sequestrants	Cholesteramine Colestipol.	These are positively charged resins which bind to negatively charged bile acids in intestine to form insoluble complex that are not absorbed and excreted in feces. They increase HDL and lipoprotein levels.
3.	Fibricacid derivatives (Fibrates)	Fenofibrate, Gemfibrozil	lipolysis, hepatic fatty acid uptake, removes LDL particles by increasing LDL catabolism, HDL formation and stimulation of reverse cholesterol transport.
4.	Niacin derivatives	Niacin, Nicotinic acid	Inhibits the synthesis of hormone sensitive lipase, so it decreases the triglycerides lipid lysis which is the producer of free circulating fatty acids which help in formation of triacylglycerol, so it inhibits the secretion of VLDL and it lowers the LDL levels (8).
5	Cholesterol absorption inhibitors	Ezetimibe	Inhibits the small intestinal absorption of phytosterols and cholesterols (9).

Table 3:Marketed formulations of antihyperlipidemic drugs

ABSTRACT

With the growing implementation of power electronics devices, ensuring power quality has become increasingly challenging. The effective compensation of non-sinusoidal, reactive, and harmonic components plays a pivotal role in maintaining power quality, relying heavily on the robustness of the control system. This research focuses on addressing voltage sag and voltage swell issues in power system networks using a solar-based dynamic voltage restorer (DVR). The integration of a series-connected DVR circuit with the SRF (Selective Harmonic Elimination) theory serves to improve power quality concerns. To achieve enhanced voltage stability and frequency regulation, a solar energy-integrated battery setup is adopted as an energy storage unit for the DVR circuit. A comprehensive evaluation of the proposed DVR control operation involves testing the devised algorithm under both balanced and unbalanced voltage sag and voltage swell scenarios. The system is meticulously modeled and simulated using MATLAB Simulink, enabling performance analysis under various conditions, including balanced and unbalanced voltage sag and voltage swell situations.

Keywords: Power quality, power electronics, DVR, control system, voltage sag, voltage swell, solar energy integration, battery energy storage.

INTRODUCTION

Many electrical industrial plants, pharmacy industries, paper mills, and the manufacture of electronic component industries are equipped with sensitive loads [1-2]. These sensitive loads are much sensitive power distortions. On the other hand, concern to cost wise these sensitive loads are more economical [3]. Maintaining voltage stability and frequency regulations are two yet most important requirements at the customer end. In this aspect, improved power quality standards are highly noted. Voltage sag and voltage swell are the most frequently appearing power issues in industries. This voltage sag occurred mainly due to consistency in the switching operation of electronic devices, inrush currents a quick insertion of the large loads, high-end storms, and symmetrical or asymmetrical short circuit faults [4]. Voltage sag is defined as the decrease of the R.M.S value of the voltage from its threshold (nominal) voltage. A short duration of voltage sag that is up to 10ms (equivalent to 0.5 cycles) is permissible [5]. Voltage sag more than three cycles because it reduces the output voltage hence in industries the longer duration of voltage sag is not allowable because it can degrade the overplant economy. Voltage swells occur because of the sudden turning off of large machines. Fast variations in load from full load to light load conditions voltage swells happen [6-7]. The amount of increase in R.M.S voltage from its specified threshold (nominal) value is referred to as voltage swells. The short increment of voltage can cause to damage sensitive equipment. Voltage swells severely impact the loads over the voltage sags. The influence of the voltage swell depends on the voltage level and its duration. Atemporary rise in voltage of more than 110 percent is not permitted. The duration of the voltage swell over the three cycles causes to rise of the output voltage so it can severely impact the performance of the power system network [8]. If industries are constituted of solid-state devices the unbalances in voltages do not impact much. Most modern industries are composed of semiconductor devices so enhanced voltage regulation as per IEEE standards yet most required. However, for small-scale industries, several approaches are available to obtain power quality such as uninterrupted power supply, universal power supply program-based adjustable speed drives, and 1-phase power conditions [9-10]. For large-scale industries fly-wheel energy sources, static VARs, and DVR is highly preferred. The main concern in employing DVR in industries is it efficiently absorbs or inserts (compensates) the voltages based on power system operating conditions [11]. The compensation of the reactive power by DVR depends on the identification of the voltage drop or voltage rise at the reference voltage. Many well-known load voltage detecting methods are addressed in the kinds of literature [12-13] that are fast or discrete Fourier transform and Kalman and Extended Kalman Filter (EKF) based algorithms. TheKF-based algorithms efficiently predict the disturbance in source voltages for balanced voltage sag and swell. For unbalanced power quality issues, Synchronous Reference Frame (SRF)theory-based algorithms [14] identify the voltage abnormalities. In this paper, SRF theory is adopted to detect the voltage variations at grid voltages.

DVRT opology

Fig.1 represents the basic structure of the DVR for a power system. The DVR is a series-connected FACTS device. This circuit is basically composed of energy storage elements, a converter, filters, and a transformer.

DVR can operate in different modes to restore the voltage to a nominal level. The main operating modes of a DVR are:

a. **Voltage Injection Mode**: In this mode, the DVR injects a voltage waveform in series with the supply voltage. The injected voltage is of the opposite phase to the sag/swell and helps to compensate for the voltage deviation, restoring the load voltage to its nominal value.
b. **Voltage Compensation Mode**: This mode involves injecting a voltage that is proportional to the magnitude of the voltage sag/swell. The DVR attempts to maintain the load voltage at the desired level by providing a

compensating voltage. The compensation voltage is typically generated by a voltage source inverter within the DVR.

c. **Voltage Source Mode**: In certain situations, the DVR can operate in a voltage source mode, where it acts as an independent voltage source, generating the entire load voltage. This mode is often used when the supply voltage is severely distorted or when there's a complete outage.
d. **Voltage Balancing Mode**: In cases where there are multiple phases in a distribution system and voltage imbalances occur, the DVR can operate to balance the phase voltages by injecting appropriate voltages in each phase.
e. **Harmonic Compensation Mode**: Some DVRs are equipped with the capability to mitigate harmonic distortion in addition to voltage sags and swells. They inject harmonic currents to cancel out the harmonic components in the supply voltage.

The operating mode selected depends on the severity of the voltage disturbance, the capabilities of the DVR, and the desired level of compensation required to maintain the load voltage within acceptable limits

Proposed Solar-Based DVR Configuration:

The primary goal of a DVR is to provide a stable and reliable voltage supply to sensitive loads during grid voltage disturbances, mitigating their impact on equipment and processes. To achieve this solar and battery energy sources integrated as energy storage units. Both solar and battery sources are responsible for delivering energy to the DC link capacitor. The output voltage of the inverter contains harmonics that can be avoided by the LC filters. The required voltage is injected into the power system network with series series-connected transformer.

$V_{inj}=V_{s\text{-}presag}-V_{s\text{-}postsag}$ - - -(1)

$V_{inj}=[V_{s}^{2}{}_{\text{-}presag}+V^{2}{}_{s\text{-}postsag}-2V^{2}{}_{s\text{-}postsag}V^{2}{}_{s\text{-}postsag}\cos(\theta_{s\text{-}postsag}-\theta_{s\text{-}postsag})]^{1/2}$--- (2)

The required power is determined as

$P_{inj}=\sqrt{3}*V_{inj}*I_{L}+\cos(\theta_{L}+\theta_{inj})$ ---(3)

The injected active power from energy storage to load is determined as $P_{dvr}=3(V_{s}-V_{L})\,IL\cos\phi$

Control scheme

Synchronous Reference Frame (SRF) theory is a control strategy commonly used in power electronics applications, including Dynamic Voltage Restorers (DVRs), to achieve effective compensation during voltage sags, swells, and other disturbances. A MATLAB circuit diagram of SRF theory-based DVR control is depicted in Figure. 3. The SRF theory transforms the three-phase voltages and currents into a rotating reference frame known as the dq frame. This transformation simplifies the analysis of the system by separating the active and reactive power components. DVR control generates a reference frame based on the nominal voltage frequency. This reference frame is synchronized with the grid voltage and rotates at the same frequency. The transformed dq voltages are monitored to detect voltage sags, swells, or disturbances. Deviations from the nominal values in the reference frame signal the occurrence of a disturbance. When a disturbance is detected, the DVR calculates the required compensating voltages in the dq frame. These compensating voltages are then transformed into the three-phase abc frame and injected into the system to mitigate the disturbance [15-17].

Method for storing energy in batteries

When RES power output is insufficient, battery energy storage systems are used to meet load demands. The equation (1) is used to estimate and establish the battery energy storage system capacity under the conditions of the system's required power demand as follows.

Battery $y^b = \frac{ad^* \times P^*_j}{\varepsilon^*_j \times \varepsilon^*_B \times DOD^*}$ ---(4)

ad* = Autonomy Day,

ε^*_B= Battery efficiency,

ε^*_j=Efficiency of an inverter,

P^*_j= Demand power,

DOD^* = depth of discharge rate of the battery.

The battery's capacity to generate enough energy to meet the requirement on all days is known as autonomy day. The surplus energy from RES is used to charge the battery. The power of the battery is displayed in equation (2)

$b^*_P = p^*_{PV}(t) + p^*_{WT}(t) - \frac{P^*_I(t)}{\varepsilon^*_i}$ ---(5)

$P^*_I(t)$ = Demand for system load,

b^*_P = Battery power.

An important battery feature known as the State of Charge (SOC) is linked to RES's inability to produce enough energy and excessive power production.

PV cell

The anticipated power is provided by the PV module using a mixture of series and parallel cells. It is possible to depict the correlation between the output current and voltage as

$$I^*_{PV} = N^*_P I^*_G - N^*_P I^*_S \left(exp\left[\frac{q^*}{AKT_C} \left(\frac{v^*_{PV}}{N^*_S} + \frac{R_S I^*_{PV}}{N^*_P} \right) \right] - 1 \right) \text{--- (6)}$$

Photocurrent I* G is created by solar irradiation, as demonstrated below

$$I^*_G = \left(I^*_{SC} + k_I (T_C - T_{ref}) \right) \frac{S}{1000} \text{---(7)}$$

According to the correlation shown below, I* S is the saturation current of a PV cell that changes with temperature:

$$I^*_S = I^*_{rs} \left[\frac{T_C}{T_{ref}} \right]^3 exp\left[\frac{q^* E_g}{AK} \left(\frac{1}{T_{ref}} - \frac{1}{T_C} \right) \right] \text{---(8)}$$

A PLL is often used to generate the synchronized reference frame. It ensures the reference frame remains aligned with the grid voltage despite frequency variations or phase shifts. Using Synchronous Reference Frame theory and appropriate control algorithms, DVRs can effectively detect and compensate for voltage disturbances, ensuring a stable and high-quality power supply to sensitive loads. This technique enables the DVR to respond quickly to voltage variations and provide seamless compensation during power quality issues [18-20].

SIMULATION RESULTS

To investigate the performance of the proposed solar-based DVR control scheme tested power system network in both balanced and unbalanced operating scenarios such as 20% voltage sag and 70% voltage swell.

Case 1: Balanced Sag and Swell conditions

The equal dip or rise in 3-phase grid voltages is generally referred to as balanced sag or swell conditions. This is occurred under symmetrical (L-L-L or L-L-L-G) fault conditions.

Scenario 1: 20% balanced voltage sag

In this scenario, a 20% decrease in balanced 3-phase grid voltage is considered from 0.8 seconds. The obtained simulation results in this operating condition are represented in Fig.4. From the simulation responses it can be observed that at grid voltages distortion time (after 0.8secs). At this time the DVR can be operated in boost mode and inject the voltage into the power system network in a series manner to compensate for the corresponding 20% grid voltage sags. Hence the load voltage balances at 1.0p.u. Even 20% variations in balanced sag grid voltages also constant load voltage are supplied to the load.

Scenario 2: 70% balanced voltage swell

In this scenario 70% rise in balanced 3-phase grid voltage (1.7p. u) is considered from 1.1secs. The obtained simulation results in this operating condition are depicted in Fig.5. From the simulation responses it can be confirmed that at grid voltages distortion time (after 1.1secs). At this time the DVR can be initiated as in buck mode and absorb the increased grid voltage from the power system network to compensate for the corresponding 70% grid voltage swell. Thus, load voltage balances at 1.0p.u. Even 70% variations balanced swell in grid voltages also constant load voltage is supplied to the load.

Case 2: Unbalanced Sag and Swell conditions

The dip or rise in 3-phase grid voltages in any phase of the grid voltages in an unbalanced manner is generally referred to as balanced sag or swell conditions. This type of issue occurred under asymmetrical (L-G or L-L-G) fault conditions.

Scenario 1: 20% unbalanced voltage sag

In this scenario, a 20% decrease in unbalanced 3-phase grid voltage is considered from 2.0 seconds. The obtained simulation results in this operating condition are configured in Fig.6. From the simulation responses it can be observed that at grid voltage distortion time (after 2.0secs), the DVR can be operated as in boost mode and compensating the corresponding 20% grid voltage sag to make load voltage balance at 1.0 p.u. Even 20% variations in unbalanced sag grid voltages also constant load voltage are supplied to the load.

Scenario 2: 70% unbalanced voltages swell

In this scenario, a 70% increase in unbalanced 3-phase grid voltage is considered from 2.3 seconds. The obtained simulation results in this operating condition are mentioned in Fig.6. From the simulation responses it can be clear that at grid voltage distortion time (after 2.3secs), the DVR can be operated as in buck mode and compensating the corresponding 70% grid voltage swell to make load voltage balance at 1.0 p.u. Even 70% variations in unbalanced swell grid voltages also constant load voltage are supplied to the load. As can be inspected from the frequency responses that are from Fig.8a and Fig.8b it is evident that the proposed DVR control scheme provides more robust frequency responses for both balanced and unbalanced voltage sag and swell conditions. For balanced and unbalanced three-phase voltage conditions, the frequency is restored to 50Hz very quickly by employing the proposed solar-based DVR control approach.

CONCLUSION

This paper investigates the mitigation of the voltage sag and swells in the power system network with solar-based DVR control. For the fast and efficient operation of DVR control, SRF theory is employed. The SRF theory detects the changes in grid voltages very quickly and operates to DVR immediately. From simulation outputs, it is proven that the proposed DVR control operates well and exhibits more transient and steady-state responses for severe impact voltage sag and voltage swells, even for balanced and unbalanced conditions.

ABSTRACT

This research aims to consolidate and evaluate the current understanding of COVID-19, including its epidemiological impact, the demographics most affected, and the prevalence of the disease through immunological methods by late 2020. A comprehensive review and analysis of existing epidemiological data and immunological studies were conducted to assess the spread and impact of COVID-19. This involved synthesizing information from various research articles, health reports, and clinical studies to estimate prevalence rates and identify patterns in disease transmission and severity. The study confirms that COVID-19, caused by a novel coronavirus, has led to a global pandemic with significant health impacts. Elderly individuals are more vulnerable to severe outcomes, while children generally experience milder symptoms. Social distancing and lockdown measures have been widely adopted to control the virus's spread. The research highlights the ongoing challenge of developing targeted therapies due to the virus's rapid mutation and the lack of a definitive treatment. This research provides a detailed aggregation of the state of knowledge regarding COVID-19 as of late 2020, offering insights into its epidemiological trends and immunological impact. It contributes to the understanding of the disease's progression and the effectiveness of public health interventions during the early stages of the pandemic.

Keywords: COVID-19, SARS-CoV-2, pandemic, epidemiology, immunology, prevalence, public health interventions

INTRODUCTION

The emergence of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) in late 2019 marked a pivotal moment in global health, leading to an unprecedented pandemic declared by the World Health Organization. SARS-CoV-2, classified as a novel strain of coronavirus, has rapidly spread beyond its origin in Wuhan, China, to affect millions worldwide. This virus, like its predecessors SARS-CoV and MERS-CoV, belongs to the Coronaviridae family and exhibits characteristics typical of coronaviruses: an enveloped structure, positive-sense single-stranded RNA genome, and significant genetic diversity. Despite extensive research on coronaviruses, notable gaps persist in understanding the precise mechanisms of SARS-CoV-2 pathogenicity and the broader implications for public health. Recent studies have elucidated various aspects of SARS-CoV-2, yet several critical areas remain inadequately explored. For instance, research by Zhang et al. (2024) has highlighted the complexities of SARS-CoV-2 spike protein interactions with host receptors, but the complete range of host factors influencing viral entry remains under characterized (Zhang et al., 2024). Additionally, the work of Patel et al. (2023) underscored the role of the immune response in severe COVID-19 cases, but the full spectrum of immune dysregulation leading to cytokine storm is still not fully understood (Patel et al., 2023). The dynamics of SARS-CoV-2 transmission and evolution are also areas of active investigation. While recent genomic analyses by Kim et al. (2022) have provided insights into viral mutations and their impact on transmissibility, there is a need for more detailed longitudinal studies to track these changes over time (Kim et al., 2022). Furthermore, the limitations of current therapeutic approaches and vaccine efficacy, as discussed by Liu et al. (2023), underscore the need for ongoing development and refinement of strategies to combat COVID-19 (Liu et al., 2023). In light of these gaps, our work aims to address several key issues. Firstly, we will explore the interaction between SARS-CoV-2 and host cell receptors in greater detail, providing insights into viral entry mechanisms. Secondly, our research will focus on understanding the immune response variability among different populations and its implications for treatment outcomes. Lastly, we will investigate the long-term evolution of SARS-CoV-2 to inform future vaccine and therapeutic development. By addressing these critical areas, our study seeks to advance the scientific understanding of SARS-CoV-2 and contribute to more effective strategies for managing and mitigating the impact of COVID-19.

Antigen Test for SARS-CoV-2: Mechanism and Procedure

Test Overview:

The antigen test detects specific proteins present on the surface of the SARS-CoV-2 virus. This test is particularly effective at identifying individuals with high viral loads, typically those who are at the peak of infection. Results can be obtained in under 30 minutes. However, for a positive result, the sample must contain a high concentration of viral particles, often in the tens of thousands per microliter. Consequently, a low viral load may result in a false-negative outcome.

Procedure

1. Sample Collection

- A sterile nasopharyngeal or oropharyngeal swab is collected from the patient. Nasopharyngeal swabs are preferred due to a lower risk of contamination.
- To obtain a nasopharyngeal sample, insert a sterile swab into the nostril, reaching the posterior nasopharynx. After collection, place the swab in an extraction buffer immediately.

2. Sample Preparation

- The extraction buffer helps break open the virus and release its proteins.
- The specimen is then applied to the designated area on the test device.

3. Test Mechanism

- The test device, such as the STANDARD Q COVID-19 Ag test, features two lines on a nitrocellulose membrane: the control (C) line and the test (T) line.

- The test line area is coated with mouse monoclonal antibodies specific to SARS-CoV-2 antigens, conjugated with color particles. The control line area is coated with mouse monoclonal anti-chicken IgY antibodies.
- If viral antigens are present in the sample, they bind with the color-conjugated antibodies. This antigen-antibody complex migrates along the membrane by capillary action and binds to the antibodies on the test line, forming a visible colored line.
- The control line ensures the test has been performed correctly and should always appear, regardless of the presence of the viral antigen.
- This antigen test offers a rapid and specific method for detecting SARS-CoV-2, with the efficiency of results within minutes, while requiring careful sample handling and testing procedures to ensure accuracy.

METHODOLOGY

Study Design and Sampling

An immunological study was conducted to evaluate the efficacy and specificity of the Rapid Antigen Test (RAT) on a cohort of 2749 suspected samples from Tirurangadi region of Malappuram. A purposeful sampling approach was utilized to select these samples, ensuring a diverse representation of the population under investigation.

Sample Collection

The samples were collected from individuals presenting with symptoms suggestive of infection, as well as those asymptomatic, to cover a broad spectrum of cases. The collection adhered to standard protocols to maintain sample integrity and accuracy of subsequent testing.

Testing Procedure

Each sample was subjected to the Rapid Antigen Test, which detects the presence of specific viral proteins. The test results were categorized as positive or negative based on the presence of these antigens. The test's sensitivity and specificity were assessed in relation to symptomatology and age distribution.

Ethical Considerations

The study adhered to ethical guidelines, including obtaining informed consent from all participants. Confidentiality and privacy of participants' data were maintained throughout the study

Data Analysis

1. **Positive Test Rate:** The proportion of samples that tested positive for the virus was calculated. Specifically, 302 out of 2749 samples (10.98%) yielded positive results.
2. **Age Distribution:** The data were stratified by age groups to identify the prevalence of positive results across different age ranges. The age groups analyzed were 60-70 years, 50-60 years, and others.
3. **Symptomatic vs. Asymptomatic:** The study differentiated between symptomatic and asymptomatic individuals. Symptomatic cases were further analyzed to identify the most common symptoms associated with positive test results. Symptomatic individuals were defined as those exhibiting symptoms such as fever, anosmia, fatigue, etc., whereas asymptomatic individuals showed no apparent symptoms.
4. **Symptom Prevalence:** The prevalence of various symptoms among symptomatic patients was recorded and analyzed to determine the most frequently reported symptoms. Symptoms were categorized and their frequencies were computed, with emphasis on those most and least common.
5. **Post-Recovery Symptoms:** For patients who had recovered from the infection, the presence of post-recovery symptoms was documented. This included tracking symptoms such as fatigue, breathlessness, weight loss, and others, to understand the longer-term impact of the infection.

Statistical Analysis

- **Descriptive Statistics:** Frequencies and percentages were calculated for positive test rates, symptom prevalence, and post-recovery symptoms.
- **Comparative Analysis:** Differences in test positivity rates across different age groups and between symptomatic and asymptomatic individuals were analyzed to determine significant patterns and correlations.

Quality Control

To ensure accuracy, all tests were conducted following standardized protocols, and results were verified through duplicate testing and cross-checking. Any anomalies or inconsistencies were reviewed and addressed.

DISCUSSION

This study evaluates the efficacy of Rapid Antigen Tests (RAT) for estimating COVID-19 prevalence through an immunological approach. Our findings indicate a test positivity rate of approximately 10.98%, highlighting a lower sensitivity compared to RT-PCR tests. However, RATs offer unique advantages and limitations that are important to consider in the broader context of COVID-19 diagnostic strategies. Sensitivity and Specificity of Rapid Antigen Tests Rapid Antigen Tests have been identified as less sensitive than RT-PCR tests, a characteristic noted in several studies (Paltiel et al., 2021; Dinnes et al., 2021). The lower sensitivity is attributed to the test's reliance on detecting viral proteins present in higher concentrations. This can result in false negatives, especially in cases with lower viral loads. For instance, a study by Mina et al. (2021) emphasized that RATs might miss infections with low viral loads, potentially leading to missed cases of early-stage infections.

Advantages of Rapid Antigen Tests:

Despite their lower sensitivity, RATs offer significant advantages in terms of speed and cost. They can be conducted quickly and at a lower cost than RT-PCR, making them a viable option for large-scale screening efforts, particularly in resource-limited settings (Nugent et al., 2021). This rapid turnaround is crucial for early detection and isolation of infectious individuals, thereby reducing the spread of COVID-19. For instance, studies have shown that RATs can effectively identify individuals with high viral loads who are more likely to transmit the virus (Girotti et al., 2021).

The utility of RATs in identifying highly infectious individuals aligns with findings from infectious disease experts who argue for frequent testing to compensate for the test's lower sensitivity. Mina (2021) advocates for multiple tests per week to increase the likelihood of detecting infections as viral loads rise, thus improving the effectiveness of RATs as a public health tool.

Early Detection and Public Health Implications

RATs are particularly valuable for early-stage detection, which is critical for controlling the spread of COVID-19. Unlike antibody tests, which only detect infections after antibodies have developed (usually several days post-infection), RATs can identify infections during the acute phase, when individuals are most contagious (Paltiel & Zheng, 2022). This early detection capability enables timely isolation and intervention, reducing the risk of widespread transmission. In highly populated countries like India, where rapid and extensive testing is essential to manage the pandemic, RATs provide a practical solution for large-scale screening. Their ability to test many individuals quickly and affordably makes them an important component of comprehensive testing strategies (Smith et al., 2021). Implementing RATs as part of a broader testing strategy, including frequent testing and combining with RT-PCR when needed, could enhance public health responses and control measures.

Challenges and Future Directions

One of the primary challenges with RATs is their potential to miss infections in individuals with low viral loads. As noted by Mina (2021), frequent testing could address this issue by increasing the chances of detecting infections before they spread significantly. Additionally, RATs are more effective in identifying individuals who are at the peak

of infection and thus at higher risk of transmission (Paltiel et al., 2021). In summary, while RATs may have limitations in sensitivity compared to RT-PCR tests, their advantages in terms of speed, cost, and ease of use make them a valuable tool in managing COVID-19. As highlighted by Smith (2021), their role as a rapid screening tool can be transformative, particularly in high-density populations, by enabling timely identification and isolation of infectious individuals. Future strategies should focus on integrating RATs with other diagnostic methods and implementing frequent testing protocols to maximize their public health impact

Explicit Timeline Analysis

Given that this is the major contact, the study demonstrated that direct contact with an infected individual was the primary way of infection. In addition, the study concentrated on the variation in test positive in relation to the sex ratio. The results indicate that men are more likely to contract the disease since they interact with crowds more often. The majority of them were ignorant about the source of the virus caused by social dissemination, which is one of the main causes of the pandemic catastrophe.

CONCLUSION

Globally, the COVID-19 pandemic is still an active problem. For SARS CoV to be completely eradicated worldwide, prevention and control of the infection are essential. An effective diagnostic method for limiting the spread of infection is the immunological test. A quick antigen test is essential for identifying those who are most likely to transmit an infection.

ABSTRACT

Oral health reflects general health of an individual. The Prevalence of oral diseases is neglected and therefore addressed as 'silent epidemic'. Good oral health is the gateway to good general health. Maintenance of oral hygiene through professional dental visits and home care is essential. Advancements in technologies and pharmaceutical formulations have enlightened and enabled the individuals/patients to maintain better oral health than yesteryears. This paper provides an overview of currently available products in dental care. Novel dental products like nanotechnology-based gels, hydrogels, emulgels, tooth whiteners, artificial saliva, bioglass etc. have been reported for use. A summary of various formulation advances is provided in the article. A note on toothbrushes, interdental cleaners and other dental devices is provided. The scope of this article is limited to products and technology for personal use/information. Advancements in dental surgery and related procedures or cosmetic dentistry are beyond the scope of the article.

Keywords: Advancements, Oral Health, Formulations, Technology, Electric Toothbrush

INTRODUCTION

Oral health is the key constituent of the general health. The oral cavity serves as a mirror image to the health status of the body. Oral diseases form the neglected crux of the non-communicable diseases (NCDs)(1). Their worldwide prevalence earns them the name - 'silent epidemic' due to lack of proper attention and thus continues to remain as the most neglected and unrealised group of diseases. Tooth caries, partial or total edentulism, periodontal diseases

and oral cancer are some of the main oral conditions which largely affect the global population(2). Dental disorders are caused due to various barriers such as lack of awareness about oral care and hygiene, underutilization of available facilities in urban areas, poor accessibility of dental care in rural areas, insufficient workforce in urban areas, unaffordable treatments, apathy and misconceived perceptions about dental care. The field of dentistry is demanding as it needs to cope up with the evolving technology and adopt with new patient- compliant techniques to address their health status. The present work studies the current scenario of advancements in dental formulations and devices/technology for maintenance of oral hygiene.

Market Size of Oral Care Industry

The value of global dental services market has increased from USD 471.19 billion in 2022 to USD 507.75 billion in 2023, representing CAGR of 7.8% in a year. It is expected to reach USD 656.66 billion by 2027 at CAGR of 6.6% and could breach the USD 700 billion mark by the year 2030 (3,4). The Indian dental care market, which forms a considerable part of Asia-Pacific market, is worth of USD 653 million and expected to grow at a CAGR of 9.40% to reach USD 1.34 billion by 2030(5,6). In 2023, the global dental hygiene devices market was estimated at USD 6.5 billion and predicted to reach USD 9.6 billion by the year 2032 at CAGR of 4.5%(7). The dental hygiene devices include toothbrushes, toothpicks, oral floss and irrigators, tongue scrapers, interdental cleaners, dental scalers and curettes, dental air polishers and teeth whiteners. The value of global dental equipment market stood at USD 9 billion in 2022 and could reach USD 21.60 billion by 2032 at a CAGR of 9.20% (3)**.** Offline and online media regarding new dental aids, free dental camps & campaigns and educational programs in collaboration with professionals are some of the promoting factors that have increased the awareness about dental care among the public for personalised oral care. Increased net spendable income, growing consciousness in the young population about personal dental hygiene, rise in routine dental check-ups post-COVID-19 pandemic and dental tourism have immensely contributed to the growth of dental care market(6,8,9).

Association of Dental Diseases with General Health

The synergistic interaction between the mouth and the body influences the overall well-being of a person. Studies have shed light on the two-way connection between diseases associated with oral and systemic health(10,11). Periodontitis, the advanced form of gingivitis, deteriorates the soft tissue and bones around the teeth. According to WHO Global Oral Health Report (2022), more than a billion people throughout the world are affected by severe periodontal diseases. The bifacial relationship between periodontal disease and chronic systemic diseases, as well as mental disorders has been established (12,13). The linkage between gum- related disorders and systemic diseases such as cardiovascular diseases, diabetes mellitus (Type 2), rheumatoid arthritis, chronic obstructive pulmonary disorder (COPD), chronic kidney disease (CKD), adverse pregnancy outcomes and cancers of alimentary tract constituents has been reviewed(14). Recent studies have shown the increased association of periodontitis with psoriasis as well as hepatic related disorders(15,16). The disturbed oral microflora can precipitate imbalance in gut microflora, which in turn leads to variety of gastrointestinal tract-related disorders(17,18). With increase age, the elderly people are beset with oral ailments like tooth decay, gum bleeding and infections, oral sores and ulcers, tooth edentulism, dentine hypersensitivity and xerostomia. These conditions could also indicate one or more systemic morbidities. The association of systemic diseases with oral issues could be more pronounced in geriatric patients compared to other adults. Studies have shown that the dental disorders are the contributing factors in conditions like Alzheimer's disease, dementia and Parkinsonism (19–21).

ADVANCEMENTS IN FORMULATIONS

The oral cavity is one of the most sensitive and intricate environments, marking the entry point of the alimentary canal. It is necessary to develop better oral care formulations with increased retention time and sustained release of ingredients, which are of importance, in maintaining oral health. Although the marketed conventional oral products are used in home care, there is a need to develop dental prophylaxis to prevent dental interventions. With growing awareness of the necessity for oral hygiene towards oral and systemic health, this section discusses the various advancements made in formulation strategies to maintain oral hygiene.

Novelty in Dental Drug Delivery Systems

During the incidence of any dental disease, the therapy calls for the administration of medication. The intraoral route of administration i.e. dental drug delivery systems have gained importance in the field of pharmaceutics(22,23). Oral mucosa- irritant drugs, which are unstable at pH range of saliva (6.2 to 7.6) cannot be administered (24). The emergence of these novel drug delivery systems has helped in actively targeting the drug to specific site of action, besides regulating the drug release and potency within the oral cavity. It has led to the rise in development of emulgels, hydrogels, nanoparticles, nanofibres and films. Mucoadhesive patches prepared by the technique of electrospinning have been able to act as "biodegradable bandages" to treat specific area as well as act as occlusive layer (25).Formulation of hydrophobic drugs into nanoemulgels using *Nigella sativa*, ketoprofen in eugenol, quercetin are reported to be effective against periodontitis (26–28). Hydrogel is an emerging topic of interest in biomedical research and can be applied in treating periodontitis, peri-implant diseases, mucosal diseases and oral cancer as well (29). Toothpaste containing bioactive glass (BioMin® F) is useful in tooth remineralization and treating teeth hypersensitivity – showing better activity than NovaMin®(30). Dental floss coated with bioactive glass nanoparticles has demonstrated better antimicrobial and mechanical properties than normal dental floss (31).Nanotechnology based dental drug delivery systems have gained significant attention in treating dental diseases due to their site- specific action in oral cavity. Electrospun drug-loaded nanofibres and patches are advanced techniques to treat oral ulcers (32). The green synthesis of metal nanoparticles (NPs), such as gold and silver, is of great importance as they provide better antibacterial and antifungal effects than conventional antibiotics. Table 1 lists out some reported works on novel formulations and drug delivery systems for oral hygiene.Efforts have been made to produce herbal formulations and incorporate phytochemicals as active medicaments in the novel dental drug delivery systems.

Herbal Formulations

There is a need for development of novel herbal drug formulations as effective alternatives to synthetic formulations to treat dental disorders. Synthetic products produce undesirable effects such as taste alterations, dry mouth, teeth staining, burning-after taste due to the presence of alcohol and possible deterioration of enamel and oral mucosa- which could contribute to oral cancer(43). The recurrent aphthous stomatitis (RAS), commonly called canker sores, is usually using topical anaesthetics and analgesics, anti-inflammatory drugs, steroidal drugs and antibiotics, which lead to severe detrimental effects(44,45). Lupeol (a pentacyclictriterpene) is a novel anti-inflammatory agent and antioxidant, which is found in extracts of plants like *Coccinia grandis* was found to have wound healing and antimicrobial activity to treat mouth ulcers(46). ω-3-α-linolenic acid (40-60%) and the flavonoids present in flaxseed oil promote oral wound healing and ameliorates oxidative stress , respectively (47,48). The tea tree oil obtained from *Melaleucaalternifolia* is found to have antimicrobial and anti- inflammatory activity against oral diseases due to the presence of terpinen-4-ol and 1,8-cineole respectively(49–51). Drug penetration in oral formulations can be improved by (-)-α-bisabolol, a sesquiterpene present inessential oil obtained from *Matricaria chamomilla*(52).

Ozone - Based Formulations

Ozone is a stronger oxidant than the chloride ion and possesses the third highest oxidation potential after fluoride and persulfate. Ozone therapy provides immunostimulating action, pain-alleviation and confers antimicrobial activity. It is an atraumatic procedure in dentistry(53). Ozonated oil, ozonated water and ozonated gas are the different forms in which the ozone therapy is available(41). It has wide range of applications such as painless elimination of carious lesions and microbes in periodontal pockets; crown whitening, remineralization, treatment of RAS, plaque, teeth hypersensitivity and also an analgesic to reduce post-operative pain(54–56).

Fluoride- Free Formulations

Fluoride is a key constituent in maintaining the oral health. It is responsible for the remineralization of teeth. It prevents tooth caries and decay, caused by the action of acids released during metabolism of carbohydrates by bacteria. Excess fluoride can cause dental fluorosis and skeletal fluorosis. It causes toxicity in vital organs such as liver, kidneys etc.(57). Although, it is not possible to eliminate the role of fluoride in oral health, efforts have been made in develop fluoride–free formulations. Hydroxyapatite could be an effective and safer alternative to fluoride at lower concentrations(58). Fluoride- free formulations are also found to be beneficial in treating dentine hypersensitivity (59).

Dental Probiotics

Dental probiotics are the set of microorganisms which provide the beneficial effects to oral health and maintain the balance in the microflora for a healthy oral microbiome, thereby decreasing the chances of periodontal diseases. The oral probiotics can be administered in dosage forms such as capsules, chewing gum, films, lozenges, powder, tablets(60). Probiotics are useful in treating gingivitis and periodontitis and conditions associated with them such as halitosis (bad breath), oral candidiasis, tonsillitis, xerostomia (dry mouth). They can be used as an alternative to antibiotics in treating tooth caries as they inhibit plaque formation by preventing the adherence of S. mutans on the teeth surface and production of acids by carbohydrate fermentation(61,62). Probiotics, in the form of chewing gum, films and lozenges are effective in treating halitosis without disturbing the actual microbiome. Species of *Lactobacillus, Bifidobacterium and Wiessella reduces* the volatile sulphur compounds- the causative agents for oral maladour(48, (49)). Probiotics can accelerate the salivary secretion in edentulous patients suffering from hyposalivation or dry mouth(63,64). Antifungal activity shown by *Lactobacillus* spp. is useful in treating oral candidasis by *Candida* spp. (65,66).

Arginine - Based Formulations

Arginine, a basic essential amino acid, is found to have profound effect in treating teeth decay, sensitivity and caries. Catabolism of arginine by arginine-deiminase system produces ammonia as by-product. It increases the oral pH and decreases the acidic microbiome in the biofilm(67). 2% arginine- containing fluoride paste is found to have anti-caries effect due to its action against aciduric bacteria like *Streptococcus mutans*(68). Arginine is found to reduce enamel demineralization and can also enhance the effectiveness of mouthwashes (69).

Green Dentistry and Vegan Products

Vegan based toothpaste which are completely based out of natural ingredients is slowly gaining popularity as the formulation is free from artificial ingredients such as sodium lauryl sulfate, triclosan, parabens, artificial flavorants, colorants, sweeteners. Fluoride-free and fluoride-containing vegan toothpastes are available, with the former option forming a huge chunk. These natural toothpastes include vegetable- derived glycerine, baking soda, various oils such as coconut oil, palm oil, peppermint oil, tea tree oil, natural sweetener like stevia. Incorporation of bamboo-derived activated charcoal, hydrated silica as natural abrasives, coconut-derived foaming agents have been used in formulating organic toothpastes in initiating the use of cruelty-free products, thereby contributing to green dentistry and reduce ecological footprint(70–72). Chewable toothpaste tablets are solid unit dosage forms which are usable substituents to regular toothpaste as the former is eco-friendly, biodegradable, require no use of toothbrush, more efficient in removal of plaque and can be produced in a more economical way than toothpaste(73,74).

Artificial Saliva

Artificial saliva primarily treats xerostomia which is caused due to decreased action of salivary glands. They are available as saliva stimulants, saliva substituents and saliva enhancers. Xerostomia is a condition which causes extreme discomfort, characterized by feeling of dry mouth and tongue, chapped lips and burning sensation. Saliva stimulants incite the salivary glands to elevate the saliva production whereas saliva substituents act as lubricating agent and maintain the overall moisture in the mouth by mimicking the human saliva. Recents studies have shown that incorporation of agents like malic acid confer anti-erosive property as well (75). Certain essential oils can act as potent sialogogues(63). Popular marketed products are available under the brand names such as Biotène, Xerostom.

Mouthwashes

Mouthwashes are one of the most popular oral care products. They are fast moving as well as user- friendly product due to its quick, easy administration and patient- compliant experience. The drawbacks include the harmful effects of synthetic active drugs and excipients such as xerostomia, mouth ulcers, lesions, burning sensation, tooth discoloration, drug toxicity and chances of oral cancer on prolonged use. This has provided the opportunity for development of dosage forms using natural ingredients such as coconut oil, sesame oil, sunflower oil as well as essential oils involving clove oil, cinnamon oil, lemon oil, eucalyptus oil and tea tree oil etc. to produce lipid vehicle- based mouth rinse popularly called as oil pulling which can also be incorporated with herbal extracts. Trials have shown the efficacy of various oil pulling

systems as prophylactic measures(76,77). Oregano oil, bergamot oil, lavender oil, ylang-ylang oil are some of the essential oils that have been recently reported to be used as dental care adjuncts (78).

Tooth Whiteners

Tooth whitening is a part of cosmetic dentistry involving gels, whitening pens, chewable tablets, mouth rinses and pastes to get rid of tooth discoloration and remove stains. Hydrogen peroxide and carbamide peroxide are the most common whitening agents. New peroxide-free formulations include phthalimidoperoxycaproic acid (PAP), bromelain, and ficin, which exhibit bleaching and whitening effects**.** (79,80). L-arginine and nanohydroxyapatite can produce tooth whitening action along with remineralization(81).

Desensitizing Agents

8% arginine- calcium carbonate containing dentifrices found to have effective action against tooth sensitivity (57). 8 Desensitizing toothpaste containing 8% arginine and calcium bicarbonate occludes the unsealed dentin tubules and forms a protective layer (82,83). Potassium oxalate was identified as a desensiting agent. Microwave application can enhance the efficacy of desensitizing formulations. TEETHMATE, a tooth desensitising product by *Kuraray,* is useful in treating various forms of dentinal sensitivity(84). Some of the commercially available products employed in dental care (discussed in Section 2) are listed below in Table 2

ADVANCEMENTS IN TECHNOLOGY

There is a surge in the advancements in the dental technology in recent years, benefitting both dentists and patients. The innovations in oral care products and dental equipments for diagnostic and therapeutic purpose have improved the overall patient-experience and treatment outcomes. Drive in awareness to maintain higher standard of oral hygiene status, pinpoint diagnosis; accurate, cost-effective, painless, quick and efficient pre- and post- operative measures and personalized novel tools for oral hygiene maintenance and sustenance are the contributing factors. Proper patient record-keeping through paperless systems and patient-specific treatments have made the connection between dentists and patients stronger. Digitalized techniques in preventive, restorative and cosmetic dentistry have bettered the patient healthcare experience in terms of aesthetics. Some technological advancements related to personal oral care are given in the following sections

Smart and Electric Toothbrushes

Toothbrush is the primary tool in keeping up oral hygiene and used regularly by the masses. Over a long period of time, there has been a constant development in the product structure, evolving from the basic prototype—a cleaning surface provided by bristles and a handle. With the emergence of technology, the latest improvement is the gradual replacement of mechanical toothbrushes by electric-based toothbrushes. Smart and electric toothbrushes are the advanced alternatives to the manual toothbrushes. The electric-powered tools provide better brushing experience with availability of personalized customization to meet the needs of the customers, thus providing superior outcomes in fighting against dental hygiene issues. The Procter and Gamble Company and Koninklijke Philips N.V. are the popular players in the field of electric toothbrush, along with Colgate-Palmolive Company, Water Pik and Panasonic Corporation. The electric toothbrushes can be fundamentally classified based upon their mode of action:

- Vibrating motion provides side - to - side movement of the bristle head to provide lateral cleansing action
- Oscillatory-rotary motion includes back-and-forth movement in a rotating pattern. On an average, the strokes made range between 1,500 to 8,000 per minute(107)
- The other mechanisms include lateral, circular, counter oscillation patterns or even multidirectional movement.
- Sonic toothbrushes use sonic waves along with the vibratory motion of the brush head. It vibrates at a frequency upto20kHz, making about 24,000 to 48,000 strokes per minute. Ultrasonic toothbrushes uniquely rely on the ultrasonic waves, such that the frequency generated is above 20kHz and can go up to 2.6MHz, thus producing about 2.4 million strokes per minute(107,108).
- Ionic toothbrushes are the tools which can alter the surface charge of the tooth by using flow of electrical charge through the bristle tips and ultrasonic waves, instead of usual frictional force in removal of tooth plaque.

Interdental Cleaners

Interdental cleaners are the set of tools which are used to clean intricate areas in oral cavity. They provide maximum contact with inaccessible areas of the buccal cavity and help in removal of debris left in between the teeth or plaque present on the teeth distally. Interdental brushes, interdental sticks, floss picks, oral irrigators and gum simulators are the different types of interdental cleaners available. Interdental brushes are gaining prominence as dental adjuncts to brushing as they are easy and convenient to use and effective in removing proximal plaque. Oral irrigators, also called as water jets/ water floss, work by spraying a pulsating stream of water of high pressure, which is a patient- compliant option in comparison to regular flossing which can damage the gums or mucosal layer and cause bleeding as well as increase in dental gaps(109). Oral irrigators are useful for removal of large- sized particles, whereas floss picks hold floss to eliminate smaller particles and can be more helpful than wooden picks. Chewing sticks support the cleansing action due to their mechanical force and chemical potency. Gum stimulators are the devices similar to toothbrushes which provides a better blood flow in the gum improves the gum health due to their massaging action and prevents gum disease. Even though they supplement brushing, these tools are lack sufficient scientific evidence to be considered substitutes or replacements for regular tooth brushing.

Biosensors

Oral fluid based biosensors are the small devices which are capable of analyzing the biological status of the oral fluids by interacting with the biologically active substance of interest and providing response in the form of electric signal. Monitoring dental hygiene plays a key role in determination, evaluation, prevention and maintenance of oral health. Measuring salivary biomarkers, metabolites, ionic composition of the oral fluids and oral biofilm; factors like pH, concentration, temperature, and enzymatic action affect the oral environment. Saliva-based oral biosensor is a non-invasive tool which uses saliva as a diagnostic fluid as opposed to blood or cerebrospinal fluid. The salivary biomarkers that can be detected are salivary glucose, lactate, phosphate, α-amylase and hormones (110,111). It is of clinical, therapeutic and diagnostic importance. It can be of great help in early detection and monitoring of neurodegenerative diseases, cardiovascular diseases and cancer(112,113).

Role of Artificial Intelligence (AI)

AI has plenty of applications in the field of dentistry. It helps in interaction with the patients and looks after the process of registration for appointments with the dentists, sharing information, clear queries regarding dental issues and reminds checkups and follow-ups. It is useful in identifying the lesions, tumors or internal damages to dental tissues by radiographic techniques. It helps in processes like dental imaging and their interpretation. It devises the probability of using non-surgical or surgical technique to treat a disease by considering the pathological and physiological imbalance characterized by symptoms. It helps in predicting the probability of new disorder or recurrence of dental diseases(114). It can be used to detect possible oral disorders from intraoral intraoral images in personal care (74,75). AI is employed to a greater extent at the interface of the dentist than with the patient individual.

Teledentistry

Teledentistry is an online mode of service which provides an opportunity for the patients to communicate with the dental professionals from their place of convenience by use of technology for consultations, diagnosis, treatment planning, post- operative cares or medicine prescription. It can be extended to store electronic health records and guiding the patient based on the based upon the clinical data submitted from a distance. It helps in creating contact between multiple clusters of doctor-patients which can be an assemblage for exchange of information to assist more efficiently and upgrade with new methods of delivery systems. It is also a source of income for the service providers who are responsible for the provision of platform or software for interaction between the patients and the dentists. Many telemedicine softwares such as Doxy. me, Simplifeye, Solutionreach, RevenueWell provide teledentistry functionalities as well(116). CareStack, TeleMed, Denteractive, Teledentix, Sesame, Smile Virtual, Dentulu are the exclusive teledentistry platforms which are Health Insurance Portability and Accountability Act (HIPAA) compliant(117).

3D Printing in Dentistry

3D Printing is a manufacturing technique applied in many fields particularly used in dentistry. 3D Printing utilizes intraoral scanning technique that later utilizes DICOM files and materials such as PEG, polyurethane etc. for printing. Maintenance of proper oral hygiene is a cumbersome task when hand and finger movement is compromised. 3D printed two-in-one customized handle for a patient was fabricated with limited manual dexterity. This customized handle allows better grip on the toothbrush, thus making it easier to brush their teeth or denture. The technique is simple, cost effective and requires less time than other techniques. The same handle can be used for conventional toothbrushes and interproximal toothbrushes(118).Wearable oral delivery device for personal use is available which is prepared using 3D printing(119).

Lasers in Oral Care

Lasers are being used in oral care both for surgical and non surgical purposes as well as in diagnosis and treatment of dental concerns. Diode laser is used as an adjunct to non-surgical periodontal therapy. Full mouth laser disinfection reduces bacterial load, thereby reducing inflammation. Laser devices which provides teeth whitening action are available for personal use(120,121). Table 3 presents the list of some oral care devices that can be used by individuals.

CONCLUSION

Oral health and general health are interlinked. Plaque control is essential to maintain good oral health. Good plaque control is achieved through mechanical and chemical means. This article encompasses the advancements in the technology and formulations in the field of dentistry for maintaining oral hygiene at a personal level. It can be seen that variety of formulation interventions are available for an individual to opt from nanoproducts, hydrogel, herbal action, ozone therapy, artificial saliva and vegan products. In addition to the chemical approaches, use of customized toothbrushes and interdental cleaners enable the individuals to maintain proper oral hygiene.

Table 1: List of some dental drug delivery systems along with the drug incorporated in the dosage form.

S.No	Drug	Drug delivery system / Dosage form	Application	Reference
1.	Doxycycline hyclate and hydroxyapatite	Chitosan- based nanoparticle system	Periodontitis	(33)
	Ferumoxytol	Iron nanoparticles	Anti-caries and tooth	(34)

			decay prophylaxis	
2.	Combination of essential oils	Nanogel	Periodontitis	(35)
3.	α-Mangostin (dispersed in palm oil in water emulsion) Geraniol	Nanoemulsion	Antimictobial endodontic irrigant Antifungal activity- against *Candida* spp	(36) (37)
4.	*Moringa* leaf extract	Nanosuspension	Peri-implantitis	(38)
5.	*Angelica*	Nanofibres	Oral cancer therapy	(39)
6.	Titanium dioxide nanoparticles produced using extracts of lemongrass and ginger	Nanotech-based mouthpaint	Oral candidiasis	(40)
7.	Hyaluronic acid	Hydrogel	Periodontal regeneration therapy	(29)
8.	Quercetin and cinnamon oil Citronella oil	Emulgel	Periodontitis	(27)
9.	*Kaemferia galanga*	Mucoadhesive gel	Anti-oral ulcerogenic	(41)
10.	Cinnamaldehyde	Mucoadhesive patch	Anti-oral ulcerogenic	(42)

Table 2. List of marketed products for oral care

S. No.	Brand Name	Product	Specificity
1.	Bite, Huppy, Hello (85–87)	Chewable toothpaste tablets	Natural ingredients Environmental friendly Unit dosage form
2.	Tom's of Maine, Hello, Better & Better (87–89)	Vegan toothpaste	Free from animal-derived ingredients, fluoride free toothpaste
3.	Aquoral® (90) Xylident (91)	Artificial saliva	Lipid- based solution Saliva stimulating tablets
4.	Clinisept+ (74)	Mouthwash	Made up of water, hypochlorous acid and phosphoric acid only
5.	Colgate Vedshakti Oil Pulling, Dabur Red Pulling Oil, Perfora Vedic Mouth Rinse (92–94)	Mouth rinse	Oily– vehicle based mouthwash Potential alternative for aqueous mouthwash
6.	BioGaia ProBiora OralVit (95–97)	Dental probiotics	Probiotic Drops Chewable tablet Mouthwash
7.	Pola Night Hismile (98,99)	Teeth whiteners	Gel PAP+ whitening mouthwash
8.	Isdin Curasept (100,101)	Anti- gingival	Alantoine and dexpanthenol containing gel Mouth wash contains hydrogenated castor oil
9.	Smyle (102)	Anti-oral ulcerogenic	Herbs based gel
10.	Honest O3, CollutO3 (103,104)	Ozone-based formulations	Dosage foms like toothpaste, gel which contains ozonised oil as the therapeutic ingredient

11.	Dentorisht (105)	Complemenatary and Alternative Medicine -based formulations	Ayurvedic toothpaste completely made up of herbal ingredients
12.	CAREDYNE Shield (106)	Desensitizing agent	Novel zinc-loaded desensitizing agent

Table 3. List of marketed devices for oral care

S.no.	Brand Name	Product
1.	Oral-B (122)	Oscillatory- rotary toothbrush
2.	Philips Sonicare (123)	Sonic toothbrush
3.	Wagner & Stern Protouch (124,125)	Ultrasonic toothbrush
4.	ION-Sei, Dr. Tung's 126,127)	Ionic toothbrush
5.	Stim, GUM (128,129)	Interdental brushes
6.	YOUnifloss (130)	Floss picks
7.	Waterpik, Oracura (131,132)	Oral irrigators
8.	GUM (133)	Gum stimulators

ABSTRACT

The present study was carried out on the varieties of phytoplankton/algae in the paddy fields of Shivamogga taluk of Karnataka for a period of one year (January to December 2019). A total of 143 species belonging to 05 classes viz., Bacillariophyceae, Chlorophyceae, , Myxophyceae, Euglenophyceae , Zygnematophyceae and they are represented throughout the study period. Myxophyceae having 86 species followed by Chlorophyceae and Bacillariophyceae with 24 and 23 species respectively. During the present study dominant genera found *are Anabaena, Navicula, Gleocapsa, Chrococcus, Oscillatoria, Lyngbya, Nostoc, Calothrix, Phormidium, Ulothrix, Chlorococcum* and *Trachelomonas.* Although the paddy fields are used for humans to grow the crops and open for various activities and they need regular monitoring.

Keywords: Algae, Occurrence, Paddy field, Myxophyceae, Shivamogga taluk.

INTRODUCTION

Phytoplankton are the main producers in an aquatic ecosystems. They form the basis of food webs by providing a food base for other animals and therefore indicate the fishing potential of the area (Rahman and Jewel, 2008). The productivity of a water body is determined by estimating the amount of plankton it contains (Davies et a;.,2009; Shamim *et al.,*2013). Their distribution, abundance and diversity indicate the health of the aquatic ecosystem in general and its trophic status in particular (Bahaar and Bhat,2011; Farahani *et al*.,2006; Jalal *et al.,*2011; Rahman and Hossain,2009) The algal flora of a particular region or crop fields depends on the climate of the region, environment of the field and nature of cultivation. The interaction between the algal flora and the crop plant in a crop field. Paddy have much important effects by the algal flora of the paddy field (Wadhave and Pandao, 2020). Phytoplankton are used in many countries for pollutant biomonitoring, since they cannot control their movements and therefore cannot escape environmental pollution (Davies *et al.,* 2009; Shamim *et al.,*2013). Phytoplankton distribution, abundance,

species diversity and species composition are also used to evaluate the biological integrity of water bodies. Phytoplankton is one of the main components of nitrogen-fixing biomass in rice fields. The agricultural importance of phytoplankton in rice cultivation is directly related to the ability of phytoplankton to fix nitrogen and other positive effects on plants and soil. Nitrogen is the second limiting factor for plant growth in many areas, and the efficiency of this element is balanced by fertilizers. Phytoplankton plays an important role in maintaining and building soil fertility and increases rice growth and yield as a natural biofertilizer. In phytoplankton, blue-green algae are photosynthetic nitrogen fixers and are free-living. Cyanobacteria/Blue green algae are also a type of phytoplankton, and have the advantage of being organisms that can absorb many different types of pollutants and have the potential for biodegradation. They secrete growth-promoting substances such as hormones like auxin and gibberellins, vitamins, and amino acids. Their gelatinous structure increases their water-holding capacity. They increase soil biomass after they die and decompose. They prevent weed growth. They increase the phosphate content of the soil by excreting organic acids. The atmosphere contains about 70% nitrogen, but most plants cannot utilize it. Bound nitrogen such as ammonium, nitrate, and nitrite can be utilized. Nitrogen is the most common nutrient limiting agricultural crop production. Cyanobacteria are an alternative nitrogen source to natural fertilizers. Organic fertilizers are chosen because they are environmentally friendly, fuel independent, cheap, and easily available. Cyanobacteria are widely distributed throughout the world as phytoplankton, and contribute to fertility as free-living organisms or in symbiotic relationships. The presence of cyanobacteria in rice paddies has been reported in many papers. Reports from many countries indicate that the cyanobacterial flora is abundant with many species. The present study aimed to identify and document the phytoplankton/algae from various sites in paddy fields soils of Shivamogga taluk.

MATERIALS AND METHODS

Sampling sites

The study is conducted from January to December 2019 in Shivamogga taluk areas (Figure 1). The area includes Santhekadur, Oddinakoppa, Kachinakatte, Lakkinakoppa circle, Uragaduru, Sogane, Amrutur and Matturu were selected for algal sampling. It is located at 13°56′N latitude and 75°34′E longitude. Shivamogga city is 569 m above sea level and is surrounded by paddy fields, arecanut and coconut plantations. Shivamogga is about 267 km away from the state capital Bangalore . These waterlogged paddy fields (Figure 2) are used for rice crop during different season and remain under water for 5-6 months in the rainy season.

Algal collection and analysis

The soil sample for phytoplankton is collected directly from each village's paddy field at the depth of 15cm from the surface. Then the collected soil is kept under sunlight for 2 days to dry the water present in the soil. After complete evaporation of water present in the soil, the solid state of soil is crushed like powder. The different paddy fields soil is crushed in separate trays. Then the small amount of soil is taken in separate beakers for different soils. Then add water to the beakers containing soil. The upper floating soil particles are removed from blotting paper. Finally, the floating water is used for identification of phytoplankton on glass slide and added 2-3 drops of lugol's solution and then observed under research compound microscope. Identification of the phytoplankton was conducted under research compound microscope at 100x magnification with bright place. The qualitative identification of planktonic organisms has been done with the help of monographs and plankton are identified down to the species level (Adoni et al.,1985; Bharati and Hegde,1982; Hegde and Bharati,1985; Hosmani,2008).

RESULTS AND DISCUSSION

The main outcome of this study is to know more about phytoplankton/algae in paddy fields of Shivamogga taluk and to understand better its role in the propagation potential of crop cultivation. In this study, 143 species belonging to 05 classes viz., Bacillariophyceae (16.08%), Chlorophyceae (16.78%), Myxophyceae (60.14%), Zygnematophyceae (3.5%), Euglenophyceae (3.5%) (Figure 3) and they are represented throughout the study period. Myxophyceae

having 86 species followed by Chlorophyceae and Bacillariophyceae by 24 and 23 species respectively. During this study dominant genera recorded are *Anabaena, Navicula, Gleocapsa, Chrococcus, Oscillatoria, Lyngbya, Nostoc, Calothrix, Phormidium, Ulothrix, Chlorococcum* and *Trachelomonas* (Table 1). In the context of the recognition of the importance of phytoplankton in paddy fields and its multifunctional role in village paddy fields. The study is planned to be implemented with the main objective of sustainable development of phytoplankton through improved agricultural production. It aims to provide phytoplankton in paddy fields in large quantities and measure and enhance the multifunctionality of rice cultivation. There are two phases: soil collection from irrigated and farmed lands and analysis of the multifunctional role of phytoplankton in paddy fields. In most of the paddy fields, organic manure, urea complex and NPK are used as fertilizers. Several reports have shown that *Nostoc and Anabaena* are widespread (Paul and Santra,1982). Major heterocystus nitrogen fixing cyanobacterial species *Alosira, Cylindrospermum, Nostoc*, *Anabaena, Tolypothrix* and *Calothrix* have been detected in soils of Cuttack, Odisha (Singh,1961). Distribution profile of cyanobacteria isolated from soils of West Bengal (Saxena et al.,2007). Various researchers have studied the cyanobacteria flora in paddy fields of Odisha as well (Bhakta et al.,2006; Dey and Bastia,2008; Shivakumar and Pattar,2015). Amit and Sahu (2012) studied the distribution of green algae (Chlorophyta) in relation to seasonal variations in paddy fields in Lalgutwa region of Ranchi and found that the region contains a wide range of cyanobacteria, a total of about 240 species. They were the first to clearly state that there are a number of green algal taxa ranging from phyllomorphs up to different orders, namely Chlorococcales, Urotrichales, Cladophorales, Oedogonales, Zygnematales etc. Maheshwari (Maheshwari Rohini,2013) reported high diversity of heterocystic cyanobacteria in paddy fields of Bundi district, Rajasthan, where 12 species were clearly evident. Heterocystous algae, were considered to be important in enriching the soil nitrogen and had been recorded in the soils examined. The outcome of the study is to gain a better understanding of the types of phytoplankton found in paddy fields of Shivamogga taluk . The outcome is a quantitative assessment of the types of phytoplankton present in paddy fields. Therefore, the report concludes that based on the outcome of the majority of species of Myxophyceae and Bacillariophyceae were found in paddy fields of Shivamogga taluk areas. Paddy shows a variable environment for the growth of different types of algae at different seasons, hence, collection of algae and cultures of algae of different seasons were made to finalize the list of algae present in the paddy fields of Shivamogga Taluk. The algal flora of a particular region or crop fields depends on the climate of the region, environment of the field, and nature of cultivation. The interaction between the algal flora and the cop plant and the crop field, paddy have much important effect by the algal flora of the paddy field. Paddy shows a variable environment for the growth of different types of algae at different seasons. Hence, collection of algae and cultures of algae of different seasons were made to finalize the list of algae present in the paddy fields of Shivamogga taluk.

CONCLUSION

From the study, it can be concluded that paddy fields promote a great biodiversity of myxophyceae and other algae found in different areas and soils of the paddy fields. The presence of phytoplankton in paddy fields which fixes atmospheric nitrogen also enhances soil fertility. Hence, there is a need to conserve the algal genetic resources of the local habitats in a more systematic way. This can only be done by understanding the ecology and habitats of different forms of algae. The study concludes that the highest diversity of algae present in paddy fields is present in the Shivamogga taluk region.

ABSTRACT

Microbiomes play a crucial role in shaping the dynamics of parasitoid-host interactions. This review explores the complex relationships between microbial communities, parasitoid wasps, and their insect hosts, highlighting key influences on host immunity, nutrient acquisition, and behavior. Beneficial microbial symbionts, such as *Hamiltonella defensa* in aphids, enhance host defenses against parasitoids, creating an evolutionary arms race. Parasitoids, on the other hand, rely on their own microbiomes for essential nutrients, impacting their development and reproductive success. Additionally, microbiomes can manipulate host behavior to increase parasitoid efficiency, with significant ecological implications. These insights underscore the potential for leveraging microbiomes in biological control strategies, enhancing parasitoid effectiveness and pest management. Future research should focus on the molecular mechanisms underlying these interactions to further unravel their ecological and evolutionary significance. This review emphasizes the need for a comprehensive understanding of microbiome-mediated interactions to develop innovative and sustainable approaches to pest management.

Keywords: Microbiome, Parasitoid, Host-parasite interaction, Immune modulation, Nutrient acquisition, Biological control.

INTRODUCTION

Insect parasitoids, organisms that lay their eggs on or within a host insect, leading to the eventual death of the host, are integral to natural and agricultural ecosystems. These parasitoid-host interactions are influenced by numerous biotic and abiotic factors. Among the biotic factors, the role of microbiomes—the complex communities of microorganisms associated with parasitoids and their hosts—has gained significant attention. Microbiomes can affect

parasitoid success by modulating host immunity, altering host physiology, and influencing host behavior. This review aims to synthesize current knowledge on how microbiomes shape parasitoid-host dynamics, emphasizing the implications for biological control and ecosystem management.

Microbiomes and Host Immunity

Microbiomes are crucial in regulating host immune responses. Hosts harboring diverse microbial communities can experience altered immune function, affecting their susceptibility to parasitoid attacks. For example, certain bacterial symbionts in hosts can enhance resistance to parasitoids by priming immune defenses or producing antimicrobial compounds. Conversely, parasitoids can manipulate host microbiomes to suppress immune responses, increasing their reproductive success. Research by Oliver *et al.* (2003) demonstrated that the bacterial endosymbiont *Hamiltonella defensa* provides pea aphids (*Acyrthosiphon pisum*) with resistance against the parasitoid wasp *Aphidius ervi*. This protective effect is attributed to the production of toxins by *H. defensa* that target the parasitoid larvae. Similarly, endosymbionts in other hosts have been shown to confer resistance against a range of parasitoid species, highlighting the significance of microbial associates in shaping host-parasitoid dynamics . Further studies have shown that gut microbiota can enhance the immune system of hosts. For example, the gut bacteria in *Drosophila melanogaster* can activate Toll and Imd pathways, which are crucial for the host's defense against parasitoid attacks (Broderick and Lemaitre, 2012). In parasitoid wasps, venom can alter the host's microbiome, modulating immune responses to favor parasitoid development. The parasitoid wasp *Cotesia glomerata*, for instance, injects polydnaviruses into its host, which can suppress the host's immune response by manipulating its microbiome (Beckage *et al.,* 1994) .

Nutrient Acquisition and Metabolism

Microbial symbionts play a vital role in the nutritional ecology of both parasitoids and their hosts. They can facilitate the breakdown of complex nutrients, synthesize essential vitamins, and contribute to the overall nutritional status of their hosts. These nutritional benefits can influence the fitness and development of parasitoids. For instance, parasitoids like *Nasonia vitripennis* rely on their microbial partners for the biosynthesis of nutrients such as vitamins and amino acids that are not readily available from their hosts. Studies by Brucker and Bordenstein (2012) revealed that disrupting the microbiome of *N. vitripennis* led to reduced fitness and impaired development, underscoring the importance of microbial contributions to parasitoid health . Another example is the relationship between the parasitoid *Asobara tabida* and its *Wolbachia* symbionts, which are essential for oogenesis. Removing these symbionts led to a significant reduction in egg production, demonstrating the critical role of microbial partners in parasitoid reproduction (Dedeine *et al.,* 2001) .

Behavioral Manipulation

Microbiomes can influence the behavior of hosts in ways that affect parasitoid success. Microbial-induced changes in host behavior can make them more or less susceptible to parasitism. For example, certain microbial infections can alter host movement patterns, feeding behavior, or reproductive activities, thereby impacting parasitoid-host encounters. One notable example is the manipulation of host behavior by the fungus *Ophiocordyceps unilateralis*, which infects ants and compels them to climb vegetation before dying. This behavior increases the chances of fungal spore dispersal. While not a parasitoid, this example illustrates the potential for microbes to manipulate host behavior in ways that could benefit parasitoids, such as increasing the likelihood of contact with susceptible hosts (Hughes *et al.,* 2011) . In parasitoids, studies have shown that gut microbiota can influence host-seeking behavior. For example, gut bacteria in the parasitoid wasp *Microplitis croceipes* can affect its olfactory responses, enhancing its ability to locate hosts (Leitner *et al.,* 2017). This indicates that microbiomes can play a direct role in the ecological interactions of parasitoids by affecting their host-finding efficiency.

DISCUSSION

Microbial-Mediated Immune Modulation

The interaction between microbiomes and host immune systems is complex and multifaceted. Hosts with symbiotic bacteria that enhance immune defenses against parasitoids present an interesting evolutionary arms race. Parasitoids, in turn, have evolved strategies to counteract these defenses, such as injecting venom that can modulate host immune responses or secreting substances that alter the host's microbial community to suppress immune function. The interplay between host immune systems, microbiomes, and parasitoid strategies underscores the dynamic nature of these interactions. For example, the venom of the parasitoid wasp *Cotesia glomerata* contains polydnaviruses that suppress the immune response of its caterpillar hosts. This suppression is, in part, mediated by altering the host's microbiome, reducing the abundance of immune-priming bacteria (Beckage *et al.,* 1994) . Other research has shown that gut microbiota in caterpillars can influence their immune responses to parasitoids. For example, the gut bacteria in *Manduca sexta* can enhance immune responses against parasitic wasps by activating the host's immune pathways (Chapman *et al.,* 2010) . This demonstrates the significant role that microbiomes play in shaping the outcomes of parasitoid-host interactions.

Nutritional Symbiosis and Parasitoid Fitness

Parasitoids often depend on their microbiomes for critical nutrients that are scarce or absent in their host's body. This nutritional dependence highlights a tripartite interaction involving the host, the parasitoid, and their respective microbiomes. Disruptions in this symbiotic relationship can have cascading effects on parasitoid fitness and reproductive success. For instance, research on the parasitoid wasp, *Asobaratabida*, and its host, *Drosophila melanogaster*, revealed that *A. tabida*'s reliance on *Wolbachia* symbionts is crucial for oogenesis (Dedeine *et al.,* 2001). Removing these symbionts led to a significant reduction in egg production, demonstrating the essential role of microbial partners in parasitoid reproduction. In another example, gut microbiota in the parasitoid wasp *Nasonia vitripennis* are involved in the biosynthesis of essential nutrients such as vitamins and amino acids. Disruption of these microbial communities led to reduced fitness and impaired development of the parasitoid (Brucker and Bordenstein, 2012). This highlights the importance of microbial contributions to parasitoid health and development.

Behavioral Manipulations and Ecological Implications

Microbial influences on host behavior can have profound ecological consequences. Parasitoids may benefit from microbial-induced changes in host behavior that increase the likelihood of successful parasitism. For example, if a microbe alters host behavior to increase exposure to parasitoids, this can enhance the parasitoid's chances of finding and infecting the host. Furthermore, microbial manipulation of host behavior can also affect broader ecological interactions and community dynamics. Changes in host behavior can influence predator-prey relationships, competition among parasitoids, and the structure of ecological networks. These behavioral modifications can thus have ripple effects throughout the ecosystem, affecting biodiversity and ecological balance. For instance, the gut microbiota of the diamondback moth, *Plutella xylostella*, can alter its feeding behavior, making it more susceptible to parasitism by the wasp *Diadegma semiclausum* (Gao *et al.,* 2020). Similarly, gut bacteria in the fruit fly *Drosophila melanogaster* can influence its reproductive behavior, affecting the success of parasitism by wasps such as *Leptopilina boulardi*(Erkosar *et al.,* 2013) .

Applications in Biological Control

Understanding the role of microbiomes in parasitoid-host dynamics has significant implications for biological control strategies. By leveraging microbial symbionts, it may be possible to enhance the efficacy of parasitoids as biological control agents. For example, manipulating the microbiomes of parasitoids to increase their virulence or resistance to host defenses could improve their performance in pest management programs. Additionally, introducing or promoting beneficial microbial symbionts in host populations could reduce their susceptibility to parasitism, providing a novel approach to pest control. This strategy requires a deep understanding of the specific microbiome-host-parasitoid interactions involved and careful consideration of potential ecological consequences. For example,

enhancing the presence of *Hamiltonella defensa* in aphid populations could reduce their vulnerability to parasitism by wasps such as *Aphidius ervi*, providing a natural means of pest control (Oliver *et al.,* 2003). Similarly, promoting beneficial gut bacteria in pest insects could enhance their immune defenses, reducing the effectiveness of parasitoid attacks and potentially decreasing pest populations through natural mortality (Flórez *et al.,* 2015).

CONCLUSION

The intricate interplay between microbiomes and parasitoid-host dynamics is a burgeoning field that reveals the depth and complexity of ecological and evolutionary relationships. Microbial communities associated with both parasitoids and their hosts significantly influence various aspects of these interactions, from immune modulation and nutrient acquisition to behavioral manipulation. This comprehensive review highlights the multifaceted roles of microbiomes in shaping the success and fitness of parasitoids, ultimately affecting the broader ecological balance. One of the most striking revelations is the role of microbiomes in modulating host immune responses. Hosts that harbor beneficial microbial symbionts can enhance their immune defenses against parasitoid attacks. This symbiotic relationship creates an evolutionary arms race, where parasitoids must continuously evolve strategies to overcome these microbial-enhanced defenses. For instance, the bacterial endosymbiont *Hamiltonella defensa* in pea aphids provides resistance against parasitoid wasps by producing toxins that target the parasitoid larvae. Such interactions underscore the significant impact of microbial associates on the survival and fitness of both hosts and parasitoids. The nutritional symbiosis between parasitoids and their microbiomes is another critical factor influencing parasitoid success. Parasitoids often rely on their microbial partners for the biosynthesis of essential nutrients that are not readily available from their hosts. Disruptions in these microbial communities can lead to reduced fitness and impaired development of parasitoids, as seen in studies on *Nasonia vitripennis* and *Asobara tabida*. These findings emphasize the importance of microbial contributions to the overall health and reproductive success of parasitoids. Behavioral manipulations induced by microbiomes further illustrate the complex interactions at play. Microbial-induced changes in host behavior can increase susceptibility to parasitism, thereby enhancing parasitoid success. For example, gut microbiota can influence the olfactory responses of parasitoid wasps, improving their ability to locate hosts. Such behavioral modifications have broader ecological implications, affecting predator-prey relationships and community dynamics. The ability of microbiomes to manipulate host behavior and enhance parasitoid efficiency highlights their potential as a tool in biological control strategies. The practical applications of these insights in biological control are profound. By leveraging microbial symbionts, it is possible to enhance the efficacy of parasitoids as biological control agents. For instance, manipulating the microbiomes of parasitoids to increase their virulence or resistance to host defenses could improve their performance in pest management programs.

Similarly, introducing beneficial microbial symbionts into host populations could reduce their susceptibility to parasitism, providing a novel approach to pest control. These strategies require a deep understanding of the specific microbiome-host-parasitoid interactions involved and careful consideration of potential ecological consequences. Moreover, the study of microbiomes in parasitoid-host dynamics contributes to our understanding of evolutionary processes. The co-evolution of hosts, parasitoids, and their associated microbial communities reflects the intricate and adaptive nature of these relationships. The continuous arms race between host immune defenses, microbial symbionts, and parasitoid strategies exemplifies the dynamic nature of evolutionary pressures. Future research should continue to explore the diverse roles of microbiomes in parasitoid-host interactions, focusing on the molecular mechanisms underlying these relationships. Advances in metagenomics, transcriptomics, and proteomics will provide deeper insights into the functional roles of microbial communities. Additionally, experimental studies that manipulate microbiomes in controlled settings can help elucidate causal relationships and enhance our understanding of their ecological and evolutionary significance. Microbiomes play a pivotal role in shaping parasitoid-host dynamics, influencing immune responses, nutrient acquisition, and behavior. These microbial interactions have profound implications for ecological balance, evolutionary processes, and biological control strategies. By deepening our understanding of the complex relationships between microbiomes, hosts, and parasitoids, we can develop innovative approaches to pest management and enhance the sustainability of

agricultural ecosystems. The integration of microbiome research into the study of parasitoid ecology offers exciting opportunities for scientific discovery and practical applications, ultimately contributing to a more nuanced and effective understanding of ecological interactions and their management.

ABSTRACT

In every organization, humans suffer from stress, anxiety, and depression, so they basically need therapists to get help; commonly, they reach out to hospitals. But we failed to notice people who work in hospitals are also facing these problems and suffer from them; most commonly, nurses are the ones who suffer a lot. In this research article, we study the stress, anxiety, and depression levels of nurses who are all working, especially in maternity wards. Using fuzzy mathematical modeling, develop and analyze the collected results. In this study, we split the data collection by age factor, like five different age groups.

Keywords: Stress, Depression, Anxiety, Nurses, Hospitals, Fuzzy Logic, Fuzzy Mathematical Modelling, Mental Health, Healthcare System.

INTRODUCTION

Day by day, human's physical health and mental health are getting worse. Every nook and cranny in the world, people suffer from stress, anxiety, and depression. So basically, people suffer from these problems and seek help from medicos, but we all failed to notice that medicos are also suffering from stress, anxiety, and depression. Especially nurses suffer a lot because nursing is a field that requires physical strength and also mental strength to be strong to handle situations and patients with different kinds of attitudes. Nurses who work in maternity ward are double triple times face the stress and anxiety kind of situations.

This study analyzes the stress, anxiety, and depression levels of nurses. The data was collected from about 120 nurses from my home town in various medical centers and analyzed using fuzzy mathematical modeling. And also in this article, we split the data collection by age factor, like five different age groups. The stress, anxiety, and depression are measured using the scales, namely the Perceived Stress Scale (PSS), Beck Depression Inventory (BDI), and Generalized Anxiety Disorder Scale (GAD -7).

Stress, Depression and Anxiety in Nurses

Stress, depression, and anxiety most commonly happen due to financial problems, work, personal relationships, parenting, daily life, and busyness. Nurses who suffer from stress, anxiety, and depression are more lost to society because they are dealing with people who suffer more than them. Nurses affected by stress, anxiety, and depression are facing headaches, high blood pressure, weight gain or loss, fatigue, chest pain, muscles may lighten, dizziness, insomnia, pain, abnormal heartbeat, heart attack, forgetting, nausea, being unable to relax, hyperventilation, digestive problems, constipation, diarrhea, memory problems, anger, low energy, feeling hopeless or sad, and suicide. Diseases led by stress, anxiety, and depression are cardiovascular disease, upper respiratory disease, human immunodeficiency virus, inflammation of the immune system, and inflammation of cytokine production. Treatment and medication for these problems include yoga, exercise, meditation, and simply doing physical activity.

Fuzzy Logic Approach

In mathematics we get solutions for every problem we approach some situations in real-life problems are solved in fuzzy way that is multiple possible outcomes for certain situation we use fuzzy methodology to take decisions. So here in this paper we take a fuzzy model to deal with stress, anxiety, and depression levels of nurses. We collected the crisp data and did the fuzzification process, then with the help of MATLAB we analyzed the data. The stress, anxiety, and depression are measured using the scales, namely the Perceived Stress Scale (PSS), Beck Depression Inventory (BDI), and Generalized Anxiety Disorder Scale (GAD-7). The ratings are defined by "low," "moderate," and "high" levels of stress, depression, and anxiety.

Fuzzy Inference System

Fuzzy inference is the process of formulating the mapping from a given input to an output using fuzzy logic. The mapping then provides a basis from which decisions can be made or patterns discerned. The process of fuzzy inference involves all the pieces that are described in Membership Functions, Logical Operations, and If-Then Rules.

Data Collection

The data was collected from about 120 nurses from my home town in various medical centers, and this data was split into five different age groups that are [20-25], [26-30], [31-35], [36-40], and [41-45] for stress, anxiety, and depression levels.

Age group between 20-25

For the age group between 20-25, the range of stress, anxiety, and depression will be [0–57]. For low, the ranges shown as trapezoidal membership functions are stress [6 19 25 50], anxiety [5 8 14 29], and depression [9 10 20 41]. For moderate, the ranges shown as trapezoidal membership functions are stress [12 24 33 63], anxiety [5 10 19 42], and depression [9 12 27 60]. For high, the ranges shown as trapezoidal membership functions are stress [24 57 64 83], anxiety [8 26 39 83], and depression [18 36 48 90]. The above table shows that ranges and ratings of stress, anxiety and depression for age group between 20-25. The output range and rating for two months combined stress, anxiety, and depression levels shown as trapezoidal membership functions are for low [-15.49 3.503 8.253 27.25], moderate [13.46 32.45 37.21 56.21], and high [22.05 41.05 45.82 64.8].

Age group between 26-30

For the age group between 26-30, the range of stress, anxiety, and depression will be [0–57]. For low, the ranges shown as trapezoidal membership functions are stress [9 15 21 39], anxiety [3 7 12 26], and depression [10 15.9 18.2 19.5]. For moderate, the ranges shown as trapezoidal membership functions are stress [10 28 32 42], anxiety [9 13 17

29], and depression [9 17 23 43]. For high, the ranges shown as trapezoidal membership functions are stress [21 33 45 81], anxiety [5 12 36 43], and depression [7 22 30 61]. The above table shows the ranges and ratings of stress, anxiety, and depression for the age group between 26-30. The output range and rating for two months combined stress, anxiety, and depression levels shown as trapezoidal membership functions are for low [-11.43 7.577 12.33 31.33], moderate [15.27 34.26 39.02 58.02], and high [29.89 48.89 53.66 72.65]

Age group between 31-35

For the age group between 31-35, the range of stress, anxiety, and depression will be [0–57]. For low, the ranges shown as trapezoidal membership functions are stress [5 10 19 42], anxiety [6 8 10 16], and depression [5 8 14 29]. For moderate, the ranges shown as trapezoidal membership functions are stress [8 15 34 47], anxiety [9.8 12.9 15 22.3], and depression [9 15 21 39]. For high, the ranges shown as trapezoidal membership functions are stress [14 20 34 68], anxiety [9 10 20 41], and depression [10 28 32 42]. The above table shows the ranges and ratings of stress, anxiety, and depression for the age group between 31-35. The output range and rating for two months combined stress, anxiety, and depression levels shown as trapezoidal membership functions are for low [-9.467 9.538 14.29 33.29], moderate [4.411 23.41 28.17 47.17], and high [22.43 40.93 46.23 65.23].

Age group between 36-40

For the age group between 36-40, the range of stress, anxiety, and depression will be [0–57]. For low, the ranges shown as trapezoidal membership functions are stress [3 7 12 26], anxiety [2 3 5 10], and depression [1 5 6 12]. For moderate, the ranges shown as trapezoidal membership functions are stress [7 16.2 16.8 24.8], anxiety [4 5 8.4 16.1], and depression [5.47 7.57 12.47 15.77]. For high, the ranges shown as trapezoidal membership functions are stress [9.5 12.6 14.7 22], anxiety [3 7 12 26], and depression [13 14.6 19.7 19.8]. The above table shows the ranges and ratings of stress, anxiety, and depression for the age group between 36-40. The output range and rating for two months combined stress, anxiety, and depression levels shown as trapezoidal membership functions are for low [-16.8 2.303 7.003 26], moderate [-2.978 16.02 20.78 39.78], and high [10.89 29.89 34.66 53.65].

Age group between 41-45

For the age group between 41-45, the range of stress, anxiety, and depression will be [0–57]. For low, the ranges shown as trapezoidal membership functions are stress [6 8 10 16], anxiety [1 2 4 9], and depression [1 1 2 4]. For moderate, the ranges shown as trapezoidal membership functions are stress [9.8 12.9 15 22.3], anxiety [3.122 11.32 16.13 35.13], and depression [2.608 4.508 9.308 11.41]. For high, the ranges shown as trapezoidal membership functions are stress [14.93 18.03 20.13 27.43], anxiety [17.99 17.99 23.99 35.99], and depression [10.7 12.3 17.3 19.83]. The above table shows the ranges and ratings of stress, anxiety, and depression for the age group between 41-45 The output range and rating for two months combined stress, anxiety, and depression levels shown as trapezoidal membership functions are for low [-16.8 2.303 7.003 26], moderate [-2.978 16.02 20.78 39.78], and high [10.89 29.89 34.66 53.65].

RESULTS AND DISCUSSION

The above tables and figures show fuzzy inference system outcomes for the age groups of 20-25, 26-30, 31-35, 36-40, and 41-45. Especially the figures (5, 10, 15, 20, 25) are the fuzzy logic outputs of the stress, anxiety, and depression levels of nurses for 5 different age groups. An analysis shows the age group between 20-25 is more suffering from stress, anxiety, and depression compared to the age group between 41-45. But for the age group between 26-30, 31-35 are slightly moderate in every case, and for the age group between 36-40, and 41-45 are less in number who are suffering from stress, anxiety, and depression.

Recommendations

From the findings, we suggest medicos attend stress management sessions and keep the mind tension-free.

CONCLUSION

We conclude that, among the 120 nurses, the age group between 20-25 is 30% suffering, 26-30 is 25% suffering, 31-35 is 20% suffering, 36-40 is 15% suffering, and 41-45 is 10% suffering. From the fuzzy logic output, we can find that the youngest suffer more from stress, anxiety, and depression than 30+ age nurses, so it shows their experience in the medical field and also handling new moms and their situations. And also, we suggest that young nurses should seek help from therapists and attend the stress management sessions.

ABSTRACT

The term Menopause is defined as the permanent cessation of the menstrual cycle, with no menses for at least 12 months. The Postmenopause defined as dating from the final menstrual period, regardlessof whether the menopause was induced or spontaneous. At the time of menopause women suffered from many menopausal symptoms which further characterized into vasomotor, psychological, sexual & physical symptoms. The menopausal symptoms interfere women's day to day life and affect their quality of life. Thus, the aim of the study was to find out the prevalence of quality of life in postmenopausal women. It was an observational study in which 125 postmenopausal women between 45-55 yeas were taken. Menopause specific quality of life questionnaire (MENQOL) was used to assess the quality of life in postmenopausal women. Inclusion Criteria were postmenopausal women, willing to participate, able to understand English. Exclusion Criteria were OA of any joint, women with hysrectomy, women on HRT, unable to understand English. The data was analyzed using SPSS 20. The mean age of the postmenopausal women was 50±3 years. The mean of all menopausal symptoms was calculated. The mean score of total vasomotor symptom was 4.20, psychosocial 3.33, physical 3.68 and sexual 2.55. The results of our study in postmenopausal women vasomotor symptoms were 70%, psychosocial symptoms 55.5%, physical symptoms 61.3%, sexual symptoms 42.5%. The study concluded moderate to severe affection in menopausal symptoms in postmenopausal women which affects their quality of life.

Keywords: Menopause, MENQOL, Postmenopausal, Quality of Life

INTRODUCTION

A women's lifespan is divided into many phases. It includes menarche, pregnancy, and menopause. Each phase of life plays important role in women's life. Each phase has its own signs and symptoms and relevance in their life. The term Menopause is defined as the permanent cessation of the menstrual cycle, with no menses for at least 12 months. In other words, it is called as natural termination of the menstrual phase of female life. It is the natural process that occurs in every woman's life but its time and symptoms can be vary for every woman. Menopause is a natural aging process that brings transition in a women's life from the reproductive to nonreproductive phase. There are various physiological changes that occur at the time of menopause. Majorly there is depletion of hormones in the blood mainly estrogen which leads to various menopausal symptoms that affects the women's life. The age at which menopause occur can vary from women to women and depends on many factors. The average age for the menopause is 46 years in Indian women [1]. Menopause is gross term for understanding the process of it, Menopause further divides into Perimenopause, Premenopause and Post menopause. The term Perimenopause is the time immediately prior to the menopause when ovaries slowly make less estrogen. This usually is the first phase of the menopausal changes. This varies from individual women to another as the hormonal affection on each individual is different and the response from the body depends on the physical as well as mental health too. The term Premenopause is often used ambiguously, either to refer to the 1 or 2 years immediately before the menopause or to refer to the whole of the reproductive period prior to the menopause. In this phase which is studied in the literature, it is suggestive of affection on multiple parameters of a women's life, where their quality of life, physical strength, activity, behavioral changes are altered. This has a greater impact on their life further. The term Postmenopause is defined as the period of the onset of menstrual changing phase from the final menstrual period, regardless of whether the menopause was induced or spontaneous [2].As the postmenopausal phase is major phase in which woman has to spend rest of her life, it is of most important for the study, various affection, various physiological, psychosocial, physical, sexual and major symptoms that affects their quality of life.

The symptoms and its severity vary in each phase and from women to women. At the time of menopause women suffered from many menopausal symptoms which further characterized into vasomotor, psychological, sexual & physical symptoms. Fifty to 80% of women complain about menopausal symptoms such as hot flashes, night sweats, sleep disturbances, tiredness, and depression. This symptom affects the women in their life in less or more percentage. These symptoms are the principal determinants of a reduced health-related quality of life (HRQL), which can be detectable as soon as menopause starts. A review study in 2015 reported that different sociodemographic factors such as body mass index (BMI), marital dimension, economic dimension, educational level, working status, duration of menopause, parity, race and many more things have their effect on quality of life (QOL) in menopausal women [3].The duration, severity, and impact of these symptoms on women's life vary extremely from person to person, and population to population. The frequency of symptoms can vary based on epidemiological characteristics of the population and the assessment tools used. Some women have severe symptoms that greatly affect their personal and social functioning, and quality of life. The menopausal symptoms interfere women's day to day life and affect their quality of life. The Vasomotor symptoms, are most common which affects the physical conditions experienced by midlife women in the transition through menopause and early postmenopausal period. vasomotor symptoms mainly include hot flushes, night sweats and sweating. Psychological symptoms which frequently associated with menopause induce fatigue, irritability, and anxiety in women. Some symptoms associated with change in hormone levels, which are directly linked with reduce estrogen level. Sexual symptom includes vaginal atrophy resulting in vaginal dryness which is correlated with changing levels of sex hormones. Other symptoms, which are sleep disturbances, fatigue, anxiety and weight gain, although common to the experience by menopausal women; and are multi factorial in cause and occur in non-postmenopausal women as well [4]. According to World Health Organization (WHO) QoL has been defined by QoL group as an individual's perception of their position in life in the context of culture and values system in which they live and in relation to their goal expectations, standards, and concerns [4]. Menopause and its associated biological changes have a negative impact on the general health and

QOL as well as the wellbeing of middle-aged women [5].The life expectancy of women is increasing worldwide due to the scientific and technological advances. Considering the female life expectancy of 78 years, so a woman has to spend approximately three decades of her life in the postmenopausal period.It is the expected projection that globally by 2030, the number of postmenopausal women would increase to 1200 million[3].In all phases of menopause women have to spend more time of life in its postmenopausal period. Therefore, overall health and wellbeing of middle-aged women have become a major global concern for public health. To assess the QOL various validated tools have been used to determine the effect of the climacteric over QOL. The tools have been used such as SF-36, MRS, MENQOL, the QOL, among them we used the menopause-specific quality of life (MENQOL) questionnaire proposed by Hilditch et al. (1996), which is based upon women's own perspective[6]. As it is self-explanatory, self-administer, well-constructed, easy to understand by the women as it covers all symptoms related to menopause, valid, reliable, and responsive questionnaire specific to asses quality of life in postmenopausal women. The MENQOL, which was developed on women 47–62 years of age, specific to the early post-menopausal period. This questionnaire consists of 29 items in vasomotor (3 items), psychosocial (7 items), physical (16 items) and sexual (3 items) domains[6]. As Quality of life is an important outcome measure of health care and understanding the impact of menopausal symptoms on quality of life is a critically important part of the care in postmenopausal women. So, the study of quality of life in the post-menopausal women has become an essential component in clinical practices. Thus, the aim of the study was to determine quality of life in postmenopausal women.

MATERIAL AND METHODOLOGY

The study was conducted post obtaining ethical clearance from the institutional ethical committee of the university. It was an observational study done between 1 February 2024 to 1 April 2024 in Ahmedabad, Gujarat. In which 125 postmenopausal women aged between 45-55 yeas were taken for the study. The study cohort was further explained about the post menopause and were given a brief understanding of the effect of postmenopausal symptoms which could affect their QOL. The enrollment procedure followed the strict criteria for obtaining accurate results, where the inclusion Criteria were postmenopausal women, women between 45-55 years of aged, willing to participate in the study, able to understand English language. The study population who did not match the following exclusion Criteria were OA of any joint, women with hysrectomy, women on hormone replacement therapy, unable to understand English and thus were not enrolled in the study. After explaining the purpose of the study and agree to be part of the study women were enrolled into the study. A written informed consent was taken from all the participants and the privacy of the participants were adequately maintained. A trained therapist was always present to assist the queries while administering the self-questionnaire. The MENQOL, which was developed on women 47–62 years of age, is a valid, reliable, and responsive self-administered quality of life questionnaire specific to the early post-menopausal period. MENQOL consists of 29 items divided into four validated domains (vasomotor, sexual, physical, and psychosocial) [6]. The vasomotor symptoms include hot flushes, night sweats and sweating. The psychosocial symptoms include being dissatisfied with personal life, feeling anxious or nervous, poor memory, accomplishing less than I used to, feeling depressed or cool down, being impatient with others and feelings of wanting to be alone. The physical symptoms include fluctuance, aching in muscle and joints, feeling tired, difficulty in sleeping, aches in back, neck or head, decrease in physical strength, decrease in stamina, feeling lack of energy, drying skin, weight gain, increased fascial hair, changes in appearance, texture, tone of skin, feeling bloated, low back pain, frequent urination and involuntary urination when laughing or coughing. The sexual symptoms include change in your sexual desire, vaginal dryness during intercourse and avoiding intimacy. The MENQOL questionnaire was included (as Question 4) to assess QOL and impact of menopause symptoms. Participants selected whether they had experienced any of the 29 common menopause symptoms in the past week. If they had experienced a symptom, they indicated how much the symptom bothered them on a scale of 1 (not at all bothered) to 6 (extremely bothered) [7]. For each item of MENQOL, scoring was done from 1 to 8. The scores were then added and the mean score was calculated. Interpretation of level of QOL was made based on the mean score, i.e., 1–2 (no effect on QOL), 2–4 (mild decline in QOL), 4–6 (moderate decline in QOL), and 4–8 (severe decline in QOL). It was self-administering questionnaire. The women were asked to fill the MENQOL for their menopausal symptoms. The data

was analyzed to determine quality of life in postmenopausal women. The collected data was analyzed using SPSS (statistical package for the social sciences) 20. The mean age of postmenopausal women was calculated. The mean of each menopausal symptom was calculated. The mean of group of menopausal symptoms was calculated. From all above findings the quality of life of postmenopausal women was assessed.

RESULT

The data was analyzed using SPSS 20 version. The mean of age and menopausal symptoms was calculated. The percentage of affection was calculated symptom wise. Total 125 postmenopausal women were part of an observational study. The mean age of the postmenopausal women was 50±3 years. The mean of all menopausal symptoms was calculated. As per graph 1, the mean score of total vasomotor symptom was 4.20, psychosocial 3.33, physical 3.68 and sexual 2.55. The results of our study in postmenopausal women demonstrate that the affection of vasomotor symptoms was 70.0%, psychosocial symptoms 55.5%, physical symptoms 61.3% and sexual symptoms 42.5%. This suggested that in postmenopausal women severe affection was of the vasomotor symptoms, moderate affection was of physical and psychosocial symptoms followed by sexual symptoms. As per table 1, the most commonly affected vasomotor symptom in terms of mean was night sweats (4.78), sweating (4.12) and hot flushes (3.7). The psychosocial symptom was accomplishing less than I use to (4.52), feeling anxious/nervous (3.62), feeling of wanting to be alone (3.60), feeling depressed or cool down (3.33), poor memory (2.99), being dissatisfied with personal life (2.77) and being impatient with others (2.50). The physical symptom was decrease in physical strength (5.81), decrease in stamina (5.63), aching in muscle and joints (5.15), feeling lack of energy (5.02), LBP (4.39), feeling tired (4.39), fluctuance (4.30), difficulty in sleeping (4.03), aches in back, neck or head (3.76), weight gain (3.21), feeling bloated (2.95), frequent urination (2.46), involuntary urination when laughing or coughing (1.97), changes in appearance, texture, tone of skin (1.76), and increased fascial hair (1.06). The sexual symptom was avoiding intimacy (3.42), change in sexual desire (2.42) and vaginal dryness during intercourse (1.82).

DISCUSSION

In this observational study where the prevalence of quality of life in postmenopausal women was studied the age of the study population was 50±3 years. The study finds the moderate to severe affection in menopausal symptoms in postmenopausal women which affects their quality of life. As per our results in postmenopausal women severe affection was of the vasomotor symptoms, moderate affection was of physical and psychosocial symptoms followed by sexual symptoms. The similar study finds which shows the same affection as per our study which suggest the menopausal symptoms affects QOL in postmenopausal women. In our study we found the major 70% affection was with the vasomotor symptoms in the postmenopausal women. The similar results were found in the study done by Nappi et al. (2021) which suggest Vasomotor symptoms (VMS) which is characterized by hot flushes, night sweats and sweating are the main symptoms of menopause, as they are experienced by up to 80% of women during the menopausal transition [7]. The majority of women rate their VMS as moderate-to-severe. These symptoms were major health concern and interferes their daily routine. The results of current study were also in affirmation with that done by are Gharaibeh et al. (2010) who found that vasomotor symptoms were reported to have the highest scores as hot flushes and night sweats [8]. As many as 95% of menopausal women may exhibit vasomotor symptoms, which may frequently disrupt work, sleep and other activities. The impact of VMS on women's quality of life (QOL) can be significant. Women with moderate-to-severe VMS may experience sleep problems, fatigue, anxiety, and depression, that may affect the ability to work and carry out day-to-day activities which results in decrease work efficiency. VMS are the primary driver for seeking medical attention for menopause-related symptoms [7]. Results of our study shows severe affection of vasomotor symptoms which interfere the women's routine and ultimately affects their quality of life. In this present research the postmenopausal women , 61.3% get widely affected by the physical symptoms. The similar results were profoundly observed in study conducted by Waidyasekera et al. (2009) where they reported that the joint and muscle discomfort, physical and mental exhaustion and hot flashes were the most prevalent menopausal symptoms [9].These symptoms play a vital role in the crucial phase of a women's life as the aging

advances and the effect of hormone surpasses. In addition, Ashrafi et al. (2010) showed that night sweats, joint and muscle pain and hot flashes are the most common symptoms associated with menopause in Iranian women [10]. This was in support to the results shown in the present study which suggest severe affection of vasomotor and moderate affection of physical symptoms in postmenopausal women. Regarding physical domain being the most important of all the aspects of this quality-of-life questionnaire, a study done by Kalahroudi MA et al. (2012) reported that feeling a lack of energy is the most common and persistent complain where as the most severe symptom was aching muscles or joints [11]. These findings are even observed in the present study where the physical symptoms are maximally affected with the mean of 5.81. This is the major affection. Our study suggested 55.5% psychosocial symptoms affects the postmenopausal women. The similar results found, Women reported a wide range of psychological and physical symptoms along with VMS, which are most frequently feeling tired and worn out, which was consistently the highest reported symptom across all regions [7]. These symptoms account for the major concern in a women life as the activity gets restricted and the further affects the efficiency of work by a woman. Furthermore, psychological symptoms such as depression are common in as many as 60% of women going through the menopausal transition [7]. The present cohort of postmenopausal women shows sexual 42.5% symptoms too. These findings were also noted by Rahman et al. (2010) emphasized that the frequency of sexual problems, bladder problems and vaginal dryness were experienced mainly by premenopausal and postmenopausal group of women and it was also significant statistically in comparison to other menopausal status [12]. The similar result was found study done by Rostami A et al. (2003) that the majority of women mentioned avoiding intimacy [13].

This is categorized under the sexual symptoms of the quality of life. Also, in Ecuadorian women this rate was 76.5%, in Korean women the most common symptom was a change in sexual desire that was severe in 27.1% of cases which is in line with the result of our study. Also, other investigators stated that the prevalence of change in sexual desire was approximately 30.7% [4].All these findings were even observed in our study. In the United States of America, it is estimated that as many as 85% of postmenopausal women experience menopause-related symptoms in their lifetime, predominantly vasomotor symptoms. Among Nigerians, the most commonly reported symptom was joint and muscular discomfort (59%). Egyptians reported the most prevalent postmenopausal symptoms as joint pain (90%), sleep problems (84%), and physical and mental exhaustion (80%). Southeast Asian women reported a high prevalence of joint and muscle pains [3]. In our study the similar results found which shows severe affection of vasomotor symptoms, moderate affection of physical and psychosocial symptoms followed by sexual symptoms. All the aspects of the quality of life were thus profoundly affected in the present study which was found in the studies conducted worldwide. This quality of life being the most important aspect in a women life the affection will be multifactorial as hormonal affection, age related symptoms and sedentary lifestyle all accounts this quality of life. It is very evident that the affection is present but the extent of this affection varies as the age advances. Particularly the phase of a women life during this menopause which is of approximately anywhere between four to five years is to be studied for their quality of life which will further affect their lifespan. The findings obtained in the present study showed that the affection of the quality of life which is more than moderate can even affect the physical fitness of the women as the musculoskeletal affection is found which could be further considered for evaluation as the quality of life is multifactorial. This present finding can thus be useful for even hormonal replacement therapy (HRT) to these women as are usually prescribed with HRT often with the onset of the menopausal changes. This treatment can alter their quality of life and improve their activities of daily living.

CONCLUSION

The study concluded moderate to severe affection in menopausal symptoms which were identified in postmenopausal women which affects their quality of life. The extent of affection of their quality of life with maximum to minimum affection was as follows: vasomotor, physical, psychosocial followed by sexual. This finding of our study can further be clinically helpful to identify the methods of treatment for postmenopausal women to improve their quality of life.

ABSTRACT

Flood is one of the most dangerous natural hazards that threatens the human life. The severe floods sometime cause mass destruction. Furthermore, people face power cuts due to electrocution. The supply of food and goods gets limited. Thus there is an urge for the people to move to the safer zone. Hence we need a path that prescribes the safest course. This thesis provides such a secured way to reach the desired location with the transports using the graph theoretical concepts of Breadth First search Algorithm (BFS). The proposed strategy involves employing two distinct vehicle types such as Type 1 and Type 2.This framework also provide a C++- code that depict not only the available paths but also the safest route to the desired location. This method has the capability to withstand the consequences and the troubles in subduing the effects of flood which includes the Increased Water level , Erosion, Fallen trees, Electrocution etc.,

Keywords: Graph traversal, Flood, Navigation, Safest course, BFS algorithm
AMSC CODE:05C22

INTRODUCTION

Graph traversal is a process of visiting each node in a graph, usually from a starting node and keep track of which nodes have been visited .There are 2 natural ways of scanning or Searching the edges of a graph as we move from vertex to vertex. They are:

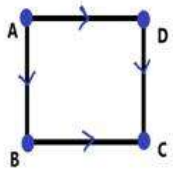
1) Breadth first search (BFS)
This Algorithm starts at the root node and explores all the nodes at the current level before moving on to the next level. This uses the Queue data structure. It follows First In First Out principle(FIFO).

2)Depth First search (DFS)
.This Algorithm starts at the root node and explore far as possible down each branch before backtracking. This uses Stack data structure. It follows Last In First Out principle(LIFO).

Why BFS?
BFS is more suitable for finding all possible paths when the graph is wide and the number of possible paths is larger. BFS explores all the neighbour nodes at the Present depth before moving on to the nodes at the next depth level, making it efficient for wide graphs with many possible paths. If you want to find all paths or the shortest path BFS might be a Better choice over DFS. Amritamsarcarin his research article "In Performance Analysis for BFS and DFS algorithm for various applications" has investigated the application domain of these algorithms, In particular how well they perform against each other for specific conditions .He proved that when both the number of vertices and edges are varied BFS is almost always better than DFS for finding whether the graph is connected or not and even in the case of fixed number of vertices and varying edges BFS perform better than DFS. Thus we are implementing our graph in finding the Paths using Breadth First Search Algorithm

Working of BFS
Step 1: Select a Source node and en queue it in the queue data Structure
Step 2: Find all the child of the source node and en queue it
Step 3: Once en queued the children of the source node from the queue dequeue the source node and mark it as visited
Step 4: Now en queue the children of the 1st node in the queue and Continue the Process until all the nodes are Visited and stop when the queue becomes empty.

Example



Start from the source node A
STEP 1 : Enqueue A into the queue and mark it as visited.
STEP 2 : Now Enqueue the children of A into the queue which are found to be the nodes B and D ,mark them as visited.
STEP 3 : Once Enqueued the children of A then dequeue A from the queue.

STEP 4 : Now En queue the children of the next starting node (B) in the queue ,where C is found to be the only child of B . Hence En queue it in the queue and mark it as visited.
STEP 5 : Dequeue B from the queue.
STEP 6 : Repeat step 4 for the node D, but it's child C has been already visited so no change occurs.
STEP 7 : Dequeue D from the queue and repeat step 4 for the next node (C) in the queue. But C has no children. Thus all the nodes of the graph are visited. Hence stop the Algorithm.

Construction of Weights

In this method we have taken a simple connected weighted di graph Let A,B,C,D,E,F,G be the nodes which represents the cities (or) the different locations of the people The edges represents the road or links or the connection between the cities Let the vehicles used for navigation be of two types : Type1 and Type2 The weights of the edges is determined by the factors that affect our navigation or (transportation in general) These factors include Erosion caused due to flooding, landslides, water flow, level of water, debris and bridge damage... The current data's about the cities in account of these factors are found by The historical data's regarding that city(or)By the complaints(or)By the prior records(or) By the information of a field worker (or) by the current survey reports (or)using the GPS (or)by the current updates in the social media. On account of the above records, let us assign some probabilistic value to each factors. Let the probabilistic value of the " Water level" may be characterized as "(5,15)"and that of
Erosion=>(0,1,2,infinity)
Landslides=>(0,1,2,infinity)
Water flow=>(0,1,2,infinity)
Debris=>(0,1,2,infinity)
Electrocution=>(0,1,2,infinity)

These values are assigned based on the difficulties or the efforts needed in overcoming it. Where,
The value 0 implies that there is no difficulties ,The value 1 depict that there is a medium level of difficulty ,that of value 2 is the high level of difficulties encountered in travelling on those routes and that of the value infinity is that there is no possible way to navigate in those route so we must go with an alternate route . The value of the factor water level has been designed in such a way that on considering these values in addition to the above factors must specify the access of choosing a exact vehicle of type 1 or type 2 without any discriminations. As the Type 1 vehicle can withstand only a maximum weight of 15 while a type 2 vehicle has the capacity to withstand a total weight of 15 and above (but less than infinity).

Requirements for our Implementation

1) Prior to the floods, The Government must notice and record the locations of known weak Power Posts in the area provided by the EB and take some necessary actions in reducing the threat and also record the conditions of the roadside trees and must identify the weak or prone to fall trees during storms and take some steps to evacuate those trees at the initial stage of the disaster itself.
2) From the municipality documentation, Compile datas on recent underground infrastructure work and also from the accident reports caused due to road Pothole and must take some measures in Completely obstructing those regions
3) The Government must have constructed a hub which consists of all kinds of transport such as Type 1 and Type 2 for Efficient Navigation during Flood.

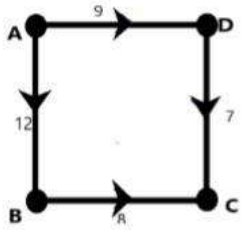
Various Use Cases of our Algorithm:

Let A be the source node and C be the destination. If A has two child B and D then we have two distinct paths AB and AD. Then we have different cases pertaining to different conditions as follows:

Case 1

If both the routes AB and AD can be navigated only by using Type 1 vehicle then we have 2 different paths to C, as ABC which is of weight 20

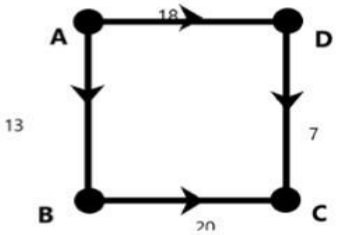
ADC which is of weight 16



Thus our algorithm chooses the path ADC since it is of lower risk as compared to the path ABC

Case 2

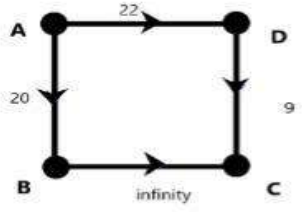
If both the routes AB and AD can be navigated only by using Type 2 vehicle, then we have 2 different paths to C as



ABC which is of weight 33
ADC which is of weight 44
Thus our algorithm chooses the path ABC since it is of lower risk when we access the route with type 2 vehicle.

Case 3

If the both the paths AB and BC can be accessed with the type 1 and that of the path AD and DC with Type 2 then we have the paths

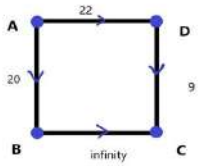


ABC which is of weight 20
ADC which is of weight 38

Here the algorithm chooses the path ADC of weight 38 as it is of lower risk for Type 2 vehicle to navigate the routes easily.

Case 4

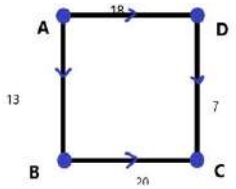
If the paths AB and DC can be accessed with the type 1 and that of the path BC and AD with Type 2 then we have the paths



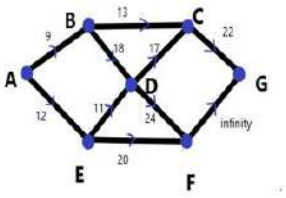
ABC which is of weight 33
ADC which is of weight 25
Here the path ADC is of lower risk to navigate

Case 5

If one of the path has a weight of infinity ,in such a case our algorithm chooses the alternate path.



Implementation



Program of BFS Algorithm that depict our graph

Pseudo code

Def bfs paths with weights(graph, start, end):
Queue dequeue([(start, [start], 0)]) # Include the cumulative weight in the queue
Paths-O
While queue:
Node, path, weight queue.popleft()

If node end:
Paths.append((path, weight))
For neighbor, edge weight in graph[node]:
If neighbor not in path: # Avoid cycles
Queue.append((neighbor, path + [neighbor], weight + edge_weight))
Return paths

Output

All paths between A and G:
Path: A—(9)→ E—(11)→ D—(27)→ C—(22)→ G
Path: A—(12)→ B—(18)→ D—(27)→ C—(22)→ G
Path: A—(12)→ B—(13)→ C—(22)→ G

CONCLUSION

The safest route of the above graph is ABDCG ,since it is of lower risk as compared to the other routes Thus the safest course for Navigation can be implemented by our algorithm.

ABSTRACT

For the purpose of determining pharmaceutical formulations containing dutasteride and tamsulosin hydrochloride, a novel, easy-to-implement RP-HPLC and UV approach was devised for the simultaneous estimation of RP-HPLC. The BDS Hypersil C18 column (250 mm, id 4.6 mm, 5 µm) was used for the RP-HPLC separation, with a mobile phase consisting of CH3COONH4: Methanol (550:450)v/v) at a flow rate of 0.8 ml/min at 30°C. Quantification was obtained with photodiode array detection at 254 nm over the concentration range 80µg/ml. The propose method was validated for its linearity, system suitability,

accuracy, precision and robustness, limit of detection, limit of quantification. Dutasteride and tamsulosin hydrochloride in combination pharmaceutical dosage forms can be accurately determined using this approach, and it can also be used for routine quality control analyses of these formulations

Keywords: Tamsulosin Hcl, dutasteride, RP-HPLC, method development, validation.

INTRODUCTION

Men with benign prostatic hyperplasia (BPH) are treated with dutasteride and tamsulosin hcl. Men can get benign prostate enlargement with age. The prostate is below the bladder. Certain prostate gland muscles block the bladder drain when the gland grows. This can induce frequent urination, a weak stream, or a sense of not being able to empty the bladder. Dutasteride inhibits 5-alpha-reductase. This enzyme converts testosterone to a prostate-growing hormone. The prostate shrinks when using dutasteride, but only temporarily. Prostate growth resumes if interrupted. Tamsulosin Hcl relaxes prostate and bladder muscles. This may increase urine flow or reduce symptoms.Dutasteride(1S,2R,7R,10S,11S,14S,15S)-N-[2,5-bis(trifluoromethyl)phenyl]-2,15-dimethyl-5-oxo-6 azatetracyclo[8.7.0.0^{2},.0^{11},^{1}]heptadec-3-ene-14-carboxamide.Dutasteride blocks testosterone's conversion to 5 alpha-dihydrotestosterone (DHT), the androgen that causes prostate gland growth. Type 1 and type 2 5 alpha-reductase convert testosterone to DHT. Dutasteride forms a stable enzyme complex with type 1 and type 2 5 alpha-reductaseisoenzymes, inhibiting them competitively and specifically. Very sluggish dissociation from this complex has been observed in vitro and in vivo. Dutasteride does not bind Human androgen receptors. For symptomatic benign prostatic hyperplasia (BPH) in males with an enlarged prostate gland to minimize acute urine retention and surgery. Highly attached to albumin (99%) and α-1 acid glycoprotein (96.6%), 60% absorption, 5-week half-life. Humans extensively metabolize dutasteride. Dutasteride and its metabolites were mostly eliminated in feces. Tamsulosin HCl antagonist at prostate alpha-1A and alpha-1B-adrenoceptorsTamsulosinHCl5-[(2R)-2-{[2-(2-ethoxyphenoxy)ethyl]amino}propyl]-2methoxybenzene408.512 MW -1-sulfonamideC20H28N2O5S highly soluble in water, methanol, and almost insoluble in methylene chloridePka 9.93TamsulosinHcl selectively blocks prostate, prostatic capsule, prostatic urethra, and bladder neck alpha-1A and alpha-1B-adrenoceptors. Alpha-1A, alpha-1B, and alpha-1D alpha1-adrenoceptor subtypes are found in different organs and tissues. About 70% of prostate alpha1-receptors are alpha-1A. Blocking these receptors relaxes bladder neck and prostate smooth muscles, lowering urine outflow resistance in males. Reduces urinary blockage and relieves symptoms of benign prostatic hyperplasia (hesitancy, terminal dribbling, interrupted or weak stream, etc.).

Fasting oral dose of 0.4 mg capsules of Tamsulosin HCl results in >90% absorption. Tamsulosin Hcl, a sulfamoylphenethylamine-derivative alpha-adrenoceptor blocker with increased prostate alpha-adrenoceptor specificity, is extensively used to treat benign prostatic hyperplasia. The racemic mixture of two isomers is sold commercially and is pharmacologically related to doxazocin, prazosin, and terazosin. Tamsulosin Hcl has a stronger affinity for vascular smooth muscle alpha-1A-adrenergic receptors than these medicines. Tamsulosin hydrochloride has 12 times the affinity for prostate alpha-1 adrenergic receptors than aortic receptors, which may minimize cardiovascular side effects. Half-Life:5-7 hours Tamsulosin hydrochloride is substantially degraded by liver cytochrome P450 enzymes and eliminated unaltered in urine at less than 10%. Tamsulosin hydrochloride metabolites are extensively conjugated to glucuronide or sulfate before renal excretion. After administering the radiolabeled dose of tamsulosin hydrochloride to four healthy volunteers for 168 hours, 97% of the radioactivity was recovered, with urine excreting 76% and feces 21%. In order to estimate Dutasteride and Tamsulosin HCl simultaneously, we reviewed the literature extensively and tried to come up with a clear and valid method. Dutasteride and Tamsulosin HCl, either alone or in combination, have not been adequately measured in pharmaceutical preparations using spectroscopic, chromatographic, or other analytical techniques [9–21].The objective of this research is to create and test a novel rapid phase HPLC (RP-HPLC) technique that can detect and quantify a mixture of dutasteride and

tamsulosin HCl in a single run while being easy to use, accurate, and cost-effective. The created method has been validated according to ICH principles [22–23] and has promising applications in quality control.

MATERIALS AND METHODS

Equipment

Using an automated sample injector, the WATERS HPLC system includes a photo diode array detector (PDA) and is based on the Aglient 2695 model. The Empower 2 software was used to monitor and integrate the output signal.For separations, a BDS Hypersil 250X4.6mm C18, 5um column was employed. Results from thermal degradation experiments were recorded using a hot air oven. Photo degradation investigations were conducted using a UV cross-linker, which consists of a set of 23400 model UV chambers and a UV fluorescence lamp with a wavelength range of 200 to 300 nm.

Chromatographic conditions

The data was gathered using Empower® version 2, and the HPLC analysis was performed using a Waters Alliance-HPLC system with a 2695-separation module linked to a 2996-photo diode array detector. The mobile phase consisted of a mixture of CH3COONH4 and methanol at a ratio of 550:450, and a BDS Hypersil 250X4.6mm, C18, 5um column was used for separation.The injection volume of 10 µL, flow rate of 0.8 ml/min, runtime of 9 minutes, and temperature of 30°C were all maintained throughout the study when the samples were being examined. The PDA detector, operating at a wavelength of 254 nm, was used to detect the medicines and prove their purity

Preparation of Working Standard Solution

Preparation of Mobile Phase Pour 1000 milliliters of HPLC water into a 1000 milliliter beaker and then add the ammonium acetate.The next 700 milliliters of CH3COONH4 solution is transferred using 300 milliliters of methanol as the mobile phase. After being combined, they are subjected to a 20-minute sonication. Solution and Standard Preparation for Dutasteride and TamsulosinHCl

Preparation of Standard Solution

Put 10 milligrams of dutasteride and 8.13 milligrams of tamsulosin hydrochloride into a 50 milliliter volumetric flask after accurately weighing them. Add 10 milliliters of methanol and sonicate for 10 minutes. Finally, dilute with water until the mark is reached.Dilute 5 milliliters of the aforementioned solution with water to volume in a 25 milliliter volumetric flask.

Preparation of Sample Stock Solution

Twenty pills that are commercially accessible were measured and ground. Put 2650.5 milligrams of Dutasteride and tamsulosin hydrochloride powder into a 25 milliliter volumetric flask. Add 10 milliliters of methanol. Sonicate for 20 minutes. Dilute with water until it reaches the mark. Pour 5 milliliters of the aforementioned solution into a 25 milliliter volumetric flask, add water to dilute the volume, and then pass the mixture through a 0.45 micrometer filter before injecting it into the HPLC system.

RESULTS AND DISCUSSION

System Suitability

The peaks caused by Dutasteride and TamsulosinHCl in the standard solution should not have a tailing factor more than 2.0. There should be no less than 2000 theoretical plates for the peaks of Dutasteride and Tamsulosin HCl in the standard solution.

Result

The above table summarizes the results of the system suitability research. A good analytical system was demonstrated by six successive injections of the standard solution, which resulted in consistent retention duration, theoretical plate count, tailing factor, and resolution for both pharmaceuticals..

Specificity

Specificity data for Dutasteride and TamsulosinHcl

Result

Dutasteride and TamsulosinHcl all have the same retention period, according to chromatograms. This holds true for the standard, the sample, and the commercial product. Because of this, we know that excipients do not alter the results of the analysis. Drug peak, in contrast, did not overlap blank peak. As a result, the approach is very selective.

Accuracy

Result

The above table displays the results of the accuracy research. The recovery test yielded the measured result. A comparison was made between the spiked and recovery amounts of the two drugs.

% Dutasteride and Tamsulosin Hcl both had 100% recovery rates. It is clear from all of the results that the procedure is very precise.

Precision

Result

You can see a summary of the variability results in the table up there. A number of runs were used to determine the percent RSD of peak locations. Results showed that the approach is accurate, with a percentage relative standard deviation (%RSD) of less than 2%..

Linearity

Result

Dutasteride and TamsulosinHcl showed a linear association between peak areas and concentrations from 50% to 150% of the nominal concentration. The approach is linear from 50% to 150%, as shown by the correlation coefficient of 0.999 for both Dutasteride and TamsulosinHcl.

Robustness

Result

The analytical results displayed in the table above were not significantly affected by variations in Flow and Temperature, according to the results of the present method's robustness. We can state that the procedure is robust as the changes are not significant. Limit of Detction Limit of Quantification

CONCLUSION

In order to determine Dutasteride and TamsulosinHcl in active pharmaceutical components and samples simultaneously, a straightforward and robust RP-HPLC method was devised. System appropriateness, specificity, linearity, LOD, LOQ, accuracy, and robustness are some of the criteria that were tested to validate the proposed method according to ICH guidelines. To isolate the pharmacologically active peaks, the technique was extremely precise. Therefore, the suggested stability-indicating RP-HPLC approach is successful, as shown in stress induced trials, and can be used for routine analysis in the pharmaceutical industry.

ABSTRACT

Gmelina asiatica L. is a plant species from the Lamiaceae family, widely distributed in Peninsular India. In traditional Indian medicine, its fruits are used to treat dandruff, eczema, as a hair tonic, and to alleviate burning sensations in the eyes. This study aimed to investigate the phytochemical constituents of *Gmelina asiatica* fruit using gas chromatography and mass spectrometry (GC-MS) analysis. The GC-MS analysis identified various compounds, including minocycline, kojic acid, benzoic acid, benzene, and 1,3-bis(1,1-dimethylethyl), in different extracts of *Gmelina asiatica* fruit. These compounds are linked to antibacterial, antifungal, antidiabetic, antioxidant, and anticancer activities. The findings suggest that *Gmelina asiatica* has significant potential as a resource in herbal drug discovery, with its bioactive compounds supporting its use in treating various diseases with minimal side effects. However, further research is needed to explore its bioactivity and assess its toxicity profile.

Keywords: *Gmelina asiatica*, Fruit, Bioactive compounds, GC-MS analysis,

INTRODUCTION

Plants are essential for preventing and treating diseases and can also reduce the negative effects of conventional treatments [1]. They are valuable sources of chemical compounds with significant biological and pharmacological properties. Historical evidence demonstrates that plants have yielded successful drugs and will continue to be important for discovering new lead compounds [2].

The genus *Gmelina* was initially described by Linnaeus in 1753, based on the species *Gmelina asiatica* Linn. A total of 31 species and 2 subspecies are present in this genus [3].*Gmelina asiatica* is known by various names in different Indian languages, such as Asian bush in English; *Bhadra* in Bengali; *Badhara* and *Nag-phul* in Hindi; *Guludu* and *Kalshivani*in Kannada; *Cherkumizhi* and *Kumilamaram* in Malayalam; *Lahan-shivan* in Marathi; *Nondano* and *Gopogombhari*in Orissa; *Badhara*in Punjab; *Gopabhadra, Biddari,* and *Vikarini* in Sanskirit; *Nilakkumil, Nilakkimnizh, Nila-cumal; Kumizhaniaram, Kumil,* and *Kadambal* in Tamil; *Chirugummudu, Gummadi, Cherunelli, Challagumudu*and *Shirigumudu* in Telugu [4]. It belongs to the Lamiaceae family and is found in dry evergreen to dry deciduous forests [5], growing as a scrambling shrub up to 8 meters high. *Gmelina asiatica* is widely utilized in Indian traditional medicine to treat jaundice, hemorrhoids, painful urination, arthritis, edema, liver diseases, neurological disorders, heart diseases, skin infections, acne, diabetes mellitus [6], Syphilis [7], dandruff [8], fever and rheumatism [9]. It also serves as an antiseptic, contraceptive [10], astringent, demulcent, bladder catarrh [7], and blood purifier [11]. Scientifically, the plant is reported to possess antibacterial [12-13], antifungal [12,13-14], antidandruff[15], anticancer [16], antioxidant [17-18], anti-inflammatory [14,19-20], antidiabetic, antihyperglycemic [21], antianxiety [22], antipyretic [23], Larvicidal [24], hepatoprotective [17] and nephroprotective [18]. 1, 2-benzenedicarboxylic acid and monolinoleyl glycerol are the major bioactive compounds identified in the aerial parts of this plant [25]. The heartwood contains methyl p-methoxycinnamate, paulownin, gmelinol, cycloolivil, and sitosterol [26]. A flavone, ovalifolin, (+)-sesamin, sakuranetin, (-)-piperitol, and (+)-pinoresinol have been isolated from the alcoholic extract of the roots [27]. Palmitic, stearic, linoleic, oleic, and ricinoleic acids are reported in the seed oil [28]. Kaempferol-3-rutinoside, apigenin-7-rutinoside, apigenin-7-glucuronide, and quercetagetin are identified in the flowers and leaves of *Gmelina asiatica* [29]. The fruits are edible [30] and used as a hair wash in traditional medicine [5]. Fresh fruits are boiled with coconut oil, made into a paste, and applied to the head to eliminate dandruff [31]. Given that over 80% of people in developing countries rely on traditional medicine, the World Health Organization expects it to remain a crucial component of healthcare systems. However, the risk of extinction for therapeutic plants is increasing. Therefore, identifying the bioactive compounds in these plants is essential for scientifically validating traditional medicine and discovering new lead compounds for pharmaceutical applications [32]. This study aims to identify the bioactive compounds in the fruits of *Gmelina asiatica* an edible, native plant from India, to establish a foundation for future research. As there are currently no published studies using gas chromatography-mass spectrometry (GC-MS) to analyze the compounds in *Gmelina asiatica* fruits, this research will investigate and characterize the bioactive compounds present in various crude extracts of the fruit.

MATERIALS AND METHODS

Collection and identification of plant material

The fresh fruits of *Gmelina asiatica* L. were collected from Cuddalore district, Tamil Nadu. The plant's taxonomic identity was confirmed by referencing the floristic work conducted by earlier researchers [33-34] and consulting the Madras Herbarium (MH). A voucher specimen B.S.I. (S.R.C) No. 150401 has been deposited in the Madras Herbarium, Botanical Survey of India, Southern Regional Centre, Coimbatore.

Preparation of fruit extract

The fresh fruits were washed with water, dried in the shade, and then powdered. Four grams of the powder were extracted with 100 ml of n-hexane using a Soxhlet apparatus. The extract was concentrated using a rotary evaporator under reduced pressure (100 mbar) and at a reduced temperature (55°C). It was then dissolved in 10 ml of n-hexane. The marc in the thimble was successively extracted with n-hexane, chloroform, and ethanol. These extracts were redissolved in their respective solvents and used for gas chromatography analysis.

The GC–MS analysis

GC-MS analysis was performed at the Sophisticated Analytical Instruments Facility, Indian Institute of Technology, Chennai, Tamil Nadu 600036. An Agilent Model 8890 GC System with a Single Quadrupole Mass Spectrometer (5977B MSD) was used for separating and identifying phytochemicals in the different crude extracts of *Gmelina*

asiatica fruits. The GC-MS analysis parameters were as follows: Agilent 30 m x 250 µm x 0.25 µm column; syringe size: 10 µL; injection volume: 1 µL; initial temperature: 75°C; pressure: 11.367 psi; flow rate: 1.2 mL/min; average velocity: 40.402 cm/sec; ion source: EI Source with a temperature of 230°C; quad temperature: 150°C; and fixed electron energy: 70 eV. The NIST Library was used to match mass spectra and identify the phytochemicals.

Identification of Bioactive compounds

Bioactive compounds from the plant fruit extract were identified by their retention times. The mass spectra obtained from the GC-MS analysis were interpreted using the National Institute of Standards and Technology (NIST) database. The compound names, molecular weights, molecular formulas, and structures were determined.

RESULTS

The bioactive compounds present in the ethanol, chloroform, and n-hexane extracts of *Gmelina asiatica* fruits are detailed in (Tables 1–3), which also provide the retention times, molecular formulas, and quantities of these compounds. The biological activities of the compounds are depicted in (Table 4).Based on abundance, the top three major compounds identified were sucrose (37.13%), kojic acid (11.41%), and benzoic acid (9.08%) in the ethanolic extract; minocycline (18.94%), hexadecane, 7,9-dimethyl (8.27%), and hexadecane, 2,6,11,15-tetramethyl (8.02%) in the chloroform extract; and benzene, 1,3-bis(1,1-dimethyl ethyl) (36.82%), 2,4-di-tert-butylphenol (17.57%), and 1-iodo-2-methylundecane (12.51%) in the hexane extract. The GC chromatograms of these extracts, shown in Figures 1–3, illustrate the retention times and detected peaks corresponding to the bioactive compounds in each extract.

DISCUSSION

Crude extracts were obtained from the fruits of *Gmelina asiatica* using a series of solvent extractions with increasing polarity: n-hexane, chloroform, and ethanol. Gas Chromatography-Mass Spectrometry (GC-MS) analysis of these n-hexane, chloroform, and ethanol extracts identified various bioactive compounds. N-(Deshydroxy ethyl) dasatinib is found in both the ethanol extract (2.58%) and the chloroform extract (1.52%). Research indicates that some of the compounds identified through GC-MS analysis have biological activity. These compounds have been shown to have pharmacological effects that could enhance the plant's healing properties. Lincomycin is an antibiotic containing carbohydrates, categorized as an S-glycosyl compound, monocarboxylic acid amide, pyrrolidine carboxamide, and L-proline derivative. It functions as an antimicrobial agent [41]. Minocycline is a second-generation tetracycline antibiotic effective against both gram-negative and gram-positive bacteria[78]. Kojic acid is a natural product that serves multiple roles, including as an antifungal, antimicrobial, and antioxidant agent [50]. 2,4-Di-tert-butylphenol, a type of phenol, has been identified in other plants and is known for its antioxidant properties [77].

CONCLUSION

The therapeutic uses of *Gmelina asiatica* are supported by the biological activity of the compounds found in its fruit extract. This investigation identified the key bioactive compounds in each extract. Understanding these plant-based chemicals provides a foundation for future biological and pharmacological research to explore the potential health benefits of the plant.

ACKNOWLEDGMENT

The authors are thankful to the Director, Botanical Survey of India, Kolkata, and Scientist – F & Head of Office, BSI, SRC, Coimbatore, for encouragement and providing facilities.

Table 4 Biological activity of compounds found in GC-MS

Name of Compounds	Biological uses
2-Hydroxy-gamma-butyrolactone	Neurotoxin, antithyroid and antivirus activities [35]. Antioxidant, analgesic, anti-diabetic, antibacterial, and antifungal activity [39]. Insecticide [40].
Sucrose	Antioxidant, antiophthalmic, flatugenic, hypercholesterolemic, preservative, triglycerigenic, Uricogenic, and vulnerary [35].

	As a sweetener in foods and soft drinks, in the manufacture of syrups, in invert sugar, confectionery, preserves and jams, demulcent, beverages, medications, pharmaceutical products, and caramel [38].
Benzoic acid	Antifungal and antimicrobial agent and it is used as food preservatives [36]. Antibacterial [37]
Lincomycin	Antibiotic, anti-bacterial agent [41]
DL-Arabinose	Anti-tumor [42]. Antioxidants, food preservatives, food coloring agents; flavoring agents; anti-infective agents [43]. Antibacterial and anti-Candida activities [44]
4H-Pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl-	Flavonoids, anti-inflammatory, analgesic [45], antimicrobial activity [45,46]. Anti-inflammatory [46] Antioxidant activity [47].
Isosorbide Dinitrate	Vasodilator Agents (used to cause dilation of the blood vessels) [48].
Kojic acid	Biocompatibility, antimicrobial and antiviral, antitumor, antidiabetic, anticancer, anti-speck, anti-parasitic, and pesticidal and insecticidal properties, anti-oxidant, anti-proliferative, anti-inflammatory, radio protective and skin-lightening agent in skin creams, lotions, soaps, and dental care products [49]. Antifungal and antimicrobial agents, antibiotics, and anioxidant [50].
1,6,10-Dodecatrien-3-ol,3,7,11-trimethyl-	Antidiabetic, hepatoprotective, and anti-inflammatory activities [51].
N-(Deshydroxyethyl)dasatinib	Treatment of cancers and immune diseases [52].
3-Deoxy-d-mannoic lactone	Antifungal [53], antibacterial Activity [54].
β-D-Glucopyranose, 4-O-β-D-galactopyranosyl-	Used as a nutrient, sweetening Agent [55].
Dodecane	Antibacterial activity [56], used in paper processing, flavoring Agents, lubricating agents, and fragrance ingredients [57].
Pentadecane	Sugar-phosphatase inhibitor, Chymosin inhibitor [58], antibacterial [58,59]. Anti-tussive, anti-ulcer [56]. Anti-microbial and antioxidant [76].
Tetradecane, 2,6,10 trimethyl-	Antifungal, antibacterial and nematicidal [60].
Eicosane, 2-methyl-	Antioxidant [61].
Cyclic octaatomic sulfur	Keratolytic agent, antibacterial, antifungal, to treat seborrhoeic dermatitis [62]. Anti-cancer, anti-inflammatory, and antioxidant [63].
Pentacosane	Crop protection [64]. Fuel oil & lubricating oil [65]. Antibacterial [66,67].
Eicosane, 7-hexyl-	Anti-androgenic, aldose reductase inhibitor [68]. Cosmetics, fuels, and plasticizers [69].
Hexadecanoic acid, 2- hydroxy-1-(hydroxymethyl)ethylester	Hemolytic, pesticide, flavour, and antioxidant [70,71]. Antimicrobial [72].
Malvidin 3-O-galactoside	Anti-hepatocellular carcinoma [73].
Minocycline	Second-generation tetracycline antibiotic, antiapoptotic, anti-inflammatory, neuroprotective, inhibition of proteolysis, angiogenesis, and tumor metastasis [74]. Antimicrobial [74,75].
Benzene, 1,3-bis(1,1-dimethylethyl)-	Antibacterial [76].
2,4-Di-tert-butylphenol	Antioxidant [77].

ABSTRACT

The present study investigates the proximate composition of *kheer* popsicles enriched with barnyard millet, focusing on enhancing their nutritional value. Four formulations (T0 to T3) were evaluated, revealing significant($P \leq 0.05$) variations in protein, carbohydrate, ash, total solids (TS), and fiber content. Protein levels increased from 3.85% in the control (T0) to 5.01% in T3, while carbohydrate content increase from 16.60% to 19.64% across all treatments. The incorporation of mill*et al*so significantly enhanced ash content, with T3 achieving the highest value at 1.99%. Notably, total solids and fiber were higher in millet-containing formulations (T1 to T3), underscoring the ingredient's contribution to improved nutritional profiles. Furthermore, a slight reduction in acidity was observed in T2 and T3 compared to the control, indicating the potential buffering capacity of millet. These findings suggest that the addition of barnyard millet not only enriches *kheer* popsicles with essential nutrients but also positively influences their physico-chemical characteristics, positioning them as a healthier dessert alternative.

Keywords: Barnyard millet ,Composition, *Kheer* Popsicles, Nutritional enhancement

INTRODUCTION

There is a rising interest in creating inventive and healthier takes on classic sweets in order to solve these problems and satisfy contemporary dietary preferences. It is also imperative that foods be more nutrient-dense, require less time to prepare, and be reasonable in price due to the evolving dietary habits and lifestyles of individuals. In recent years, nibble foods have prioritized the inclusion of nutrient-dense ingredients in order to meet the demands of health-conscious consumers. Millet, including Barnyard millet, has garnered interest due to its sustainable agricultural methods, gluten-free nature, and nutrient profile. (Jacob *et al.*, 2024). Barnyard millet, scientifically known as *Echinochloa frumentacea*, is a resilient and drought-tolerant crop that has been cultivated for centuries in India and other parts of Asia. Compared to refined rice, barnyard millet offers several nutritional advantages. It is a rich source of essential nutrients, including fiber, protein, vitamins (such as B vitamins), and minerals such as iron and magnesium (Kumar *et al*., 2016).Furthermore, barnyard millet has a lower glycemic index than refined rice, making it a healthier choice for people with diabetes or those seeking to manage their blood sugar levels (Ugare *et al*., 2014). Millets are preferred over other major wholegrain cereals due to their higher content of polyphenols, dietary fibers, and non-starchy and non-glutinous carbohydrates, as well as their superior nutritional values and various health benefits (Gowda *et al*., 2022). Additionally, millets have been shown to have antibacterial, anti-tumorigenic, anti-diabetic, and antioxidant activity, among other positive health impacts. Regular consumption of whole grain millets and their by-products can prevent gastrointestinal malignancies, cardiovascular illnesses, type II diabetes, and a host of other problems (Kaur and Sharma, 2022).

Kheer, a traditional Indian dessert, has gained popularity worldwide for its creamy texture and rich flavour. *Kheer* is an Indian dessert prepared by the partial dehydration of whole milk in a karahi over adirect fire together with sugar and usually rice or occasionally semolina (De *et al*. 1976). Traditionally made with rice, *kheer* is often high in carbohydrates and low in fibre(Adil *et al*., 2015). However, there is a growing trend towards incorporating healthier and more nutritious grains into food products. So considering this, rice can be replaced by barnyard millet to develop nutrition *kheer* Popsicle. Barnyard millet, an ancient grain with a rich nutritional profile, presents a promising alternative to refined rice in *kheer* popsicles.Barnyard millet, an ancient grain with a rich nutritional profile, presents a promising alternative to replace rice in *kheer* popsicles. Alongside its nutritional advantages, barnyard millet offers distinctive sensory attributes that can elevate the overall enjoyment of *kheer* popsicles. The unique nutty flavor and chewy texture enhance the creamy base of *kheer*, resulting in a more intricate and fulfilling dessert experience. Furthermore, incorporating barnyard millet can enhance the visual appeal of *kheer* popsicles, as it's slightly darker grain contrasts beautifully with the lighter hue of traditional rice *kheer*. Popsicles, inspired by the traditional Indian delicacy *kheer*, offer a quick and refreshing dessert option. This study explores the substitution of refined rice with barnyard millet in *kheer* popsicles, aiming to develop a healthier and more nutritious dessert option. This study aims to explore the potential of barnyard millet as a significant component in the production of *kheer* popsicles, examining its effects on sensory characteristics, nutritional profile, and the overall acceptability of the finished product.

MATERIALS AND METHODS

Materials

Barnyard millets were acquired from the local market in Vadodara, along with the additional ingredients required for the preparation of the *kheer* popsicles. *Amul* buffalo milk, containing 3.0% fat and 8.5% MSNF, was acquired from the local market in Limda, Vadodara (Gujarat). Amul Ghee and *Madhur* brand Sugar were acquired from D-Mart in Vadodara. The laboratory examination of the ingredients and *kheer* Popsicle involved the use of high-quality raw materials and food-grade chemicals.

METHODOLOGY

The ingredients utilized for the preparation of the *Kheer* popsicles included 1 kg of milk, varying amounts of Barnyard millet (T1–10 g, T2–10 g, T3–30 g), and 60 g of sugar. The *Kheer* popsicles were prepared following the traditional procedure as suggested by Adil *et al*. (2015) with slight modifications, as illustrated in Figure 1. The required quantity of Barnyard millets was roasted in a minimal amount of ghee. Subsequently, incorporated milk and allowed the millet grains to boil for an additional 10-15 minutes to ensure they were fully cooked.After a 25% decrease in volume, we incorporated 6% sugar and proceeded with cooking while maintaining constant stirring. After reaching a TS of 36–38%, the heating process was halted, and the material was allowed to cool to room temperature before being molded and stored at -15C. The control sample T0 was prepared by using rice instead of barnyard millets.

Analysis of *kheer*Popsicles

Kheer Popsicles were analyzed for its proximate composition and acidity and sensory attributes.

Physico-chemical attributes of *kheer*Popsicles

The Total Solids (TS) content of *kheer* popsicles was assessed gravimetrically following the method outlined by BIS (1986). The fat content of *kheer* was assessed utilizing the Mojonnier method (AOAC, 2000). The protein content of both control and experimental samples was assessed using the Macro Kjeldahl method (IDF 20 B, 1993). The ash content of *kheer* was analyzed following the AACC (2000) method. The difference method was used to determine the total carbohydrate content. The titratable acidity of *kheer* popsicles was assessed using the method outlined in FSSAI (2015) for condensed milk.

Sensory Evaluation

Seven judges were selected for the organoleptic evaluation of *kheer* Popsicles.The control and experimental *kheer* samples were assessed for color and appearance, flavor, consistency, sweetness, and overall acceptability at 20°C utilizing a 9-point hedonic scale (Stone and Sidel, 1993).

RESULTS AND DISCUSSION

Proximate composition and Acidity

The proximate composition and physico-chemical properties of *kheer* popsicles were evaluated in four formulations (T0 to T3), with significant variations observed in protein, carbohydrate, ash, total solids (TS), and fiber content (Table 1). Protein content increased significantly from 3.85% in the control (T0) to 5.01% in T3, while carbohydrate content increased from 16.60% to 19.64% across all treatments. Ash content also showed a marked increase, with T3 having the highest value at 1.99%. Total solids and fiber were higher in formulations containing millet (T1 to T3), indicating their contribution to improved nutritional value. The acidity values showed a slight reduction in T2 and T3 compared to the control. These findings suggest that the inclusion of millet positively influenced the nutritional and physico-chemical characteristics of the *kheer* popsicles, particularly protein and fiber content.

Fat

The fat content of *kheer* popsicles exhibited a slight decrease across the treatments (T0 to T3), with T0 (control) having the highest fat content at 12.02%, and T3 recording the lowest value at 11.51% (Table 1). Although there was a reduction in fat content in formulations incorporating barnyard millet (T1 to T3), the changes were not statistically significant0.05 level. The small variations in fat content can be attributed to the dilution effect caused by the addition of millet, which is lower in fat (3.6%) compared to milk fat (6.0 %). Despite this slight decrease, the fat content remained within an acceptable range, ensuring the *kheer* popsicles retain their creamy texture and desirable mouthfeel, key characteristics in frozen desserts.Bhosale *et al*. (2021) reported a progressive decrease in fat content

from 7.87% in control samples to 7.45% in formulations with added minor millets, aligning with the observed trend in *kheer* popsicles.

Protein

As per Table 1, the protein content of *kheer* popsicles showed significant variation across different formulations, ranging from 3.85% in the control (T0) to 5.01% in T3. The inclusion of barnyard millet in the formulations (T1 to T3) significantly enhanced the protein content compared to the control, with T3 showing the highest value (5.01%). Statistical analysis revealed that the differences between treatments were significant ($P<0.05$). This increase in protein content can be attributed to the high protein content of barnyard millet (10.50 %), making it a valuable ingredient in enhancing the nutritional profile of the *kheer* popsicles. Similar findings were noted by Bhosale *et al*. (2021), who observed a significant increase in *kheer* containing finger millet varying level from 0.5 to 2.5 %. Author reported that, the protein content, reaching 8.13% in their T3 formulation. Therefore, the formulation of *kheer* popsicles with pearl millet not only enriches the product nutritionally but also offers a potential alternative for consumers seeking higher-protein dessert options.

Total Carbohydrates

The carbohydrate content of the *kheer* popsicles showed a notable increase across all formulations. The control sample (T0) had the lowest carbohydrate content at 16.60%, while the inclusion of barnyard millet in formulations T1, T2, and T3 resulted in significantly higher carbohydrate levels, reaching 18.31%, 19.60%, and 19.64%, respectively (Table 1). This upward trend in carbohydrate content can be attributed to the starch and complex carbohydrate components present in barnyard millet. The higher carbohydrate content in the treated samples enhances the energy density of the *kheer* popsicles, potentially improving their calorific value. The statistical analysis revealed that while the differences among the treated samples (T1 to T3) were not significant, they were markedly higher than the control, demonstrating the impact of millet incorporation. Bhosale *et al*. (2021) similarly reported an increase in carbohydrate percentages from 18.53% to 19.32% in their formulations, underscoring the role of millet in enhancing energy density in dessert products. These findings suggest that pearl millet plays a crucial role in elevating the carbohydrate content of *kheer* popsicles, making them a more energy-dense dessert option.

Ash

From Table 1, it was concluded that the ash content of *kheer* popsicles significantly increased across the different formulations. In the control sample (T0), the ash content was 1.21%, while the highest value was observed in T3 (1.99%). This rise in ash content indicates an enhanced mineral presence in the popsicles as millet was included in the formulation. Statistically, the increase was significant ($p<0.05$), with T1 showing 1.68% and T2 recording 1.87%, both significantly higher than the control. The increased ash content in T1, T2, and T3 suggests that millet contributed to the higher mineral content in these formulations, enhancing the overall nutritional value of the *kheer* popsicles. This is consistent with findings by Bhosale *et al*. (2021), where the control sample exhibited the highest ash content at 1.39%, indicating that millet incorporation boosts mineral content.

Total Solids

The total solids (TS) content of the *kheer* popsicles increased significantly across the treatments (T0 to T3), with the control (T0) having the lowest TS value of 33.68%, while T1, T2, and T3 exhibited higher values of 36.45%, 37.79%, and 38.62%, respectively (Table 1). The increase in TS content can be attributed to the incorporation of barnyard millet in T1 to T3 formulations, which contributed to an increase in solids such as carbohydrates and fiber. This increase in total solids is crucial as it not only enhances the nutritional value but also improves the texture, mouthfeel, and overall sensory quality of the *kheer*popsicles. The gradual increase in TS content suggests that millet is a beneficial addition for boosting the total solids content in *kheer* popsicles, without negatively affecting their quality. Mor *et al*. (2017) also reported an increase in total solids content in their formulations with varying rates of little millet addition, highlighting that higher TS levels can improve the stability and shelf-life of frozen desserts. These findings are consistent with previous studies, which indicate that higher TS levels can improve the stability and shelf-life of frozen desserts.

Fiber

As per Table 1, the fiber content in the *kheer* popsicles showed significant variation across different treatments (T0 to T3). In the control sample (T0), fiber was not detectable (ND). However, with the incorporation of millet in the formulations, a noticeable increase in fiber content was observed. T1, which had a lower level of millet incorporation, showed 0.12% fiber, while T2 and T3 displayed even higher values at 0.21% and 0.30%, respectively. This increase can be attributed to the fiber contribution from millet, as the base ingredient (milk) does not naturally contain fiber. The gradual rise in fiber content with increasing millet incorporation indicates that millet is an effective ingredient for enhancing the dietary fiber of *kheer* popsicles. The results are in agreement with previous studies that demonstrate the ability of millets to boost the fiber content of food products, offering potential health benefits such as improved digestion and reduced risk of chronic diseases. Bhosale *et al*. (2021) also reported increased fiber content in their minor millet *kheer* formulations, supporting the health benefits associated with higher dietary fiber intakedespite the significant increase, the fiber content remained within acceptable limits, ensuring that the sensory attributes of the popsicles were not negatively impacted.

Titratable acidity

In terms of titratable acidity, measured as percent lactic acid (% LA), there was a significant difference across the different formulations of *kheer* popsicles (Table 1). The control sample (T0) had an acidity of 0.41%, while T1 exhibited a slightly higher value of 0.44%. However, a notable decrease in acidity was observed in both T2 and T3, with the values dropping to 0.33% in both treatments. The decrease in titratable acidity in the millet-incorporated samples (T2 and T3) might be attributed to the buffering capacity of millet, which likely reduced the production of lactic acid. Despite this reduction, the acidity levels remained within acceptable limits for frozen dairy desserts, suggesting that millet addition did not negatively impact the sensory quality of the *kheer* popsicles. This trend aligns with findings from other studies that report a decrease in acidity in cereal-based dairy formulations due to the cereal's intrinsic properties. This trend aligns with findings from Mor *et al*. (2017), which reported that the incorporation of little millets can effectively alter the acidity profile of dairy formulations. The results indicate that incorporating millet can effectively alter the acidity profile, contributing to a milder taste in the final product.

CONCLUSION

The incorporation of barnyard millet into *kheer* popsicles significantly enhances their nutritional profile, as evidenced by the increased levels of protein, carbohydrates, ash, total solids, and fiber across the various formulations. The study demonstrates that *kheer* popsicles enriched with millet (T1 to T3) not only offer a higher nutritional value but also maintain desirable sensory qualities, ensuring consumer acceptability. The slight reduction in acidity in the millet-enriched formulations suggests a favorable alteration in flavor profile, further contributing to the overall appeal of the product. These findings indicate that barnyard millet is a valuable ingredient for developing healthier dessert options, potentially addressing the growing consumer demand for nutritious and functional foods. The results of this study lay the groundwork for future research into the use of millets in various dairy-based products, promoting their incorporation into contemporary diets to enhance health benefits.

ABSTRACT

Oral drug delivery stands as the foremost method among medication delivery systems, offering widespread acceptance and efficacy. However, there is ongoing exploration for innovative alternatives. Matrix tablets emerge as a compelling option in this pursuit, presenting a novel avenue for oral medication delivery. This article aims to delve into the intricacies of matrix dosage forms and examine prior successful endeavours in this field. By synthesizing data from esteemed textbooks and peer-reviewed articles, it seeks to shed light on the potential of matrix tablets in the realm of oral medication delivery. The primary objective is to explore the development and utilization of matrix tablets as a sustained-release oral medication delivery system. The focus lies on investigating the methodologies employed, particularly wet granulation and direct compression, to create these sustained-release formulations. Data for this study were gathered from reputable textbooks and peer-reviewed research and review articles. The methodologies employed in creating sustained-release matrix tablets, namely wet granulation and direct compression, were scrutinized to discern their effectiveness in achieving sustained drug release. The investigation reveals that sustained-release drug delivery through matrix tablets offers several advantages, including decreased dosing frequency, minimized drug level fluctuations, and enhanced treatment efficacy. These attributes contribute to improved patient compliance by maintaining therapeutic drug concentrations in the bloodstream over extended periods. This study concludes that matrix tablets emerge as the optimal oral solid dose form for sustained-release medication delivery. The diverse range of polymers utilized in their formulation underscores their versatility and potential for pharmaceutical applications. Furthermore, this study provides a succinct review of past research on matrix tablets, reinforcing their significance in modern pharmaceutical development.

Keywords: Matrix system, Controlled drug delivery, Polymers.

INTRODUCTION

Matrix tablets represent a sophisticated drug delivery system engineered to provide a controlled release of medication over an extended period, ensuring optimal therapeutic outcomes [1]. These tablets are meticulously designed to govern both the diffusion and dissolution processes, thereby regulating the gradual release of the active pharmaceutical ingredient (API). The formulation of matrix tablets typically involves a blend of the drug, retardant materials, and various additives, which are compacted into a cohesive tablet structure [2]. Several methods can be employed in the creation of matrix tablets, with direct compression and granulation being the most prevalent approaches. In the former method, the drug, retardant material, and additives are directly compressed into a tablet form, while in the latter, the medication and retardant blend are granulated before compression, facilitating better uniformity and control. Hydrophilic and hydrophobic polymers stand as pivotal components in matrix tablet systems, playing a crucial role in modulating drug release rates. Hydrophilic polymers, in particular, are frequently employed in sustained-release (SR) dosage forms due to their ability to imbibe water and form a gel-like matrix, thus facilitating controlled drug release over an extended period. The utilization of polymer matrices offers significant advantages, including simplified production processes compared to more intricate techniques such as coating and pelletization (Figure 1). Moreover, the release kinetics of the drug from the matrix tablet are predominantly governed by the type and concentration of polymer integrated into the formulation, providing pharmaceutical technologists with a versatile tool for tailoring drug release profiles to specific therapeutic needs[3]. Incorporating hydrophilic polymer matrices into sustained-release formulations represents a cornerstone in the evolution of pharmaceutical technology, driving innovation in novel drug delivery systems (NDDS). By harnessing the controlled release capabilities of matrix tablets, pharmaceutical researchers endeavour to enhance patient compliance, minimize the dosing frequency, and optimize therapeutic efficacy, thereby advancing the frontier of pharmaceutical science and improving patient care.

Advantages of matrix tablet

The merits of matrix systems are as follows[4]:

- A rise in the effectiveness of treatment.
- Affordable, practical, and adaptable.
- By delaying the absorption of the medicine, lessen its toxicity.
- By shielding the medication from hydrolysis or other derivative changes in the gastrointestinal system, you can increase its stability.
- By using sustained-release formulations, elevated blood concentrations are prevented.
- Capable of releasing molecules with a high molecular weight.
- Formulations with sustained release may increase patient compliance.
- Reduce medication build up by using continuous dosage.
- Reduce the adverse effects, both systemic and local.
- Simple to produce.
- Therapeutic concentrations may be sustained for extended periods by the sustained-release formulations.

Disadvantages of matrix tablet

The pitfalls of matrix systems are as follows[5]:

- Boost the first-pass metabolism's potential.
- Less room for dose modification.
- Likelihood of dosage dumping.
- Lower systemic availability as compared to standard dosage forms with quick release.
- Single units are more expensive than traditional dose forms.
- Weak connection between in vitro and *in vivo*.

CLASSIFICATION OF MATRIX TABLET

Based on retardant material

Hydrophobic matrices

It was first proposed in 1959 to use hydrophobic or inert material as a matrix tablet. This method involves mixing the drug with an inert or hydrophobic polymer and compressing the mixture into a tablet to achieve a prolonged release from an oral dosage form[6]. The dissolving medication diffuses through a network of channels that are present between the particles of compressed polymer, resulting in sustained release. Although insoluble polymers have been utilized, this is the sole method where polymer use is not required to enable regulated drug release. As the name implies, the main elements of the hydrophobic matrix that regulate the rate are water-insoluble substances, like waxes, fatty acids, glycerides, and polymeric compounds like methyl and ethyl cellulose[7].

Matrix lipids

Lipid waxes and associated components are used to prepare these matrices. Such a substance releases drugs via pore diffusion as well as erosion. Therefore, the nature of the digestive fluid has a greater influence on release characteristics than the completely insoluble polymer matrix[8].

Hydrophilic matrix tablets

One of the most intriguing drug delivery methods available today is the hydrophilic matrix system. Because of their cost-effectiveness, general regulatory acceptability, and flexibility in achieving a desired drug release profile, they are most frequently employed to control the release rate of pharmaceuticals. Uniform dispersion of medication molecules inside a hydrophilic polymer skeleton that expands upon touches, such as carbopol-P934, sodium alginate, xanthan gum, polyethylene oxide, or cellulose derivatives is one definition of hydrophilic matrix tablets. Swellable-controlled release systems are the name given to these systems. It's possible that the release rate that was seen was the zero-order release. By compression, the majority of commercial hydrophilic matrices are produced. As a result, the fundamental steps required to make the matrices are the same as those required to prepare traditional tablets. Three groups of polymers are employed in the creation of hydrophilic matrices.

- Cellulose derivatives: Sodium Carboxymethylcellulose, Hydroxyethyl Cellulose, Hydroxypropylmethylcellulose (HPMC) 25, 100, 4000, and 15000cps, and Methylcellulose 400 And 4000cps.
- Natural or semi-synthetic non-cellulose polymers, such as modified Starches, Chitosan, Alginates, Molasses, Carbo Gum, and Polysaccharides Containing Mannose and Galactose.
- Acryl acid polymers: Carbopol 934.

Based on the porosity of the matrix

Macro porous Systems

In these systems, drug diffusion takes place through matrix pores, which range in size from 0.1 to 1μm. The size of this pore exceeds that of the diffusing molecules.

Microporous System

In this kind of system, diffusion mostly takes place through pores. For microporous systems, pore size ranges between 50 – 200 A°, which is slightly larger than diffusing molecule size.

Polymers utilized in matrix tablets

Natural gums are nontoxic and biodegradable, and they expand and hydrate when they come into contact with aqueous media. These days, matrix tablets are frequently prepared using natural gums.

Depending on the needed type of drug release and the physicochemical characteristics of the drug component to be included in the matrix system, a variety of polymers can be employed to make matrix tablets.

CLASSIFICATION OF SUSTAINED RELEASE DRUG DELIVERY SYSTEM

Diffusion-controlled release systems

In these systems, the diffusion of the dissolved medication across a polymeric barrier is the rate-limiting step. The drug release rate is never zero-order because the diffusional path length grows over time as the drug is gradually removed from the insoluble matrix. The basis of controlled drug delivery systems is the drug molecule's diffusion via a polymeric membrane (Figure 2).

Dissolution-controlled release systems

One way to accomplish dissolution-controlled release is to slow down the rate at which a drug dissolves in the gastrointestinal (GI) medium, incorporate the drug into an insoluble polymer, and coat drug particles or granules with polymeric components that vary in thickness. Diffusion across the aqueous boundary layer is the rate-limiting phase in the dissolution of a medication. The stagnant-fluid diffusional boundary layer opposes the energy source for drug release, which is provided by the solubility of the material (Figure 3).

Dissolution and diffusion-controlled release systems

In these systems, a partly soluble membrane surrounds the drug center. When portions of the membrane dissolve, pores are created that enable the diffusion of the dissolved drug out of the system and the entry of an aqueous medium into the center, leading to drug dissolution.

Ion exchange resin-drug complexes

It is predicated on the creation of a drug-resin complex, which is created when ionic resins and an ionic solution interact. This complex uses an insoluble cross-linked polymer resin, which is exchanged in the gastrointestinal tract and released most of the time when an excess of Na+ and Cl is present. They have a repeating polymer chain with a salt-forming function group (Figure 4).

pH-independent formulation

The release of most medications from sustained-release formulations is pH-dependent because most medicines are weak acids or bases. To help maintain a steady pH, a buffer, such as tartaric acid, amino acid, or citric acid salt, can be added to the formulation. This will delay the release of the medicine, which is reliant on pH. A buffer retain release formulation is created by combining a simple or acidic medication with one or more buffering agents, granulating with adequate excipients, and covering with gastrointestinal fluid permeability film-forming polymer. The buffering agent modifies the pH of the fluid inside the gastrointestinal tract as it travels across the membrane, causing a consistent rate of drug absorption release.

Osmotic pressure controlled systems.

The tablet, particle, or drug solution is surrounded by a semipermeable membrane that let's water in and finally pumps the drug solution out through a tiny delivery hole in the middle of the tablet.They are Type 1 (osmotic core) and Type 2 (flexible bag with an osmotic core to enclose the medication). An osmotic system that delivers a range of medications at a set pace can be created by optimizing the formulation and processing parameters (Figure 5).

FACTORS AFFECTING THE DRUG RELEASE

Physicochemical factors

Size of dose

For a traditional dosage form, a single dose of 0.5–1.0g is typically regarded as the maximum. It is challenging to manufacture drugs with big dose sizes (> 500 mg) into a matrix system due to the need for high concentrations of the polymer and additional matrix formers (excipients). Sometimes, compounds that need high dosage sizes can be administered in several doses or made into liquid systems.

Solubility of drugs

When it comes to insoluble drug matrixes, polymer erosion is more common; yet, when it comes to soluble drug matrixes, erosion, and diffusion work together to control drug release. The rate at which a drug diffuses through a medium is determined by its solubility; hence, a drug with high solubility releases its effects more quickly, whereas poorly soluble drugs (< 0.01 mg/ml) frequently cause incomplete release due to their low solubility and slow rate of dissolution in the matrix. Pharmaceuticals that show pH-dependent solubility are not good candidates for matrix systems, especially in the gastrointestinal pH range.

pKa, ionization, and solubility in water

Most medications are weak bases or acids. The unmodified form of a medicine preferentially penetrates lipid membranes, thus it's critical to understand how the compound's pKa and the absorption environment interact. Delivery methods that rely on diffusion or dissolution will also be reliant on the drug's solubility in watery solutions. These dosage forms need to work in a pH-varying environment, where the small intestine is more neutral and the stomach is acidic. The impact of the Phone release mechanism needs to be specified.

Partition Coefficient

A medication must pass through several biological membranes when it is given to the GI tract to have a therapeutic impact in another part of the body. Lipophilic compounds with a high partition coefficient are poorly soluble in water and are retained in lipophilic tissues for extended periods. Compounds having a very low partition coefficient have poor bioavailability since it is extremely difficult for them to get across the membrane. It's general knowledge that these membranes are lipidic, thus figuring out how well oil-soluble medications partition becomes crucial to understanding how well they penetrate membrane barriers.

Biological factors

Biological half-life

An oral SR product's typical objective is to sustain therapeutic blood levels for a considerable amount of time. The medicine must enter the bloodstream roughly at the same rate that it is removed to do this. The half-life (t½) provides a quantitative description of the elimination rate. Every drug has a unique clearance rate that is determined by adding together all of the mechanisms that remove the drug from the bloodstream permanently, such as metabolism, urine excretion, and other processes. Short half-lives of therapeutic substances are typically great candidates for SR formulation since they can lower the frequency of doses. Generally speaking, medications like levodopa or furosemide that have half-lives longer than two hours are not good choices for SR preparation. As their effects are already sustained, compounds having half-lives longer than eight hours are likewise often not employed in sustaining form. The two examples are phenytoin and digoxin.

Absorption

The rate of release must be much slower than the rate of absorption to establish control over the delivery system through the formation of an SR product. The maximal half-life for absorption should be roughly 3–4 hours if we estimate that most medications take 8–12 hours to transit through the absorptive sections of the GI tract. If not, the device will exit the potential absorptive regions before the drug release is finished. translates to an 80–95% apparent absorption rate constant over this period, or a minimum of 0.17–0.23h^{-1}. Therefore, it is assumed that the medicine will be absorbed along the entire length of the small intestine at a fairly constant rate. This isn't the case for many compounds. SR preparation may be detrimental to absorption if the medicine is absorbed by active transport or if the transport is restricted to a particular area of the intestine. Trying to keep chemicals in the stomach is one way to give sustaining mechanisms of delivery. As a result, the medication can be released gradually and reach the absorptive location. These techniques were created in response to the finding that co-administration had a sustained impact. Creating a low-density pellet or capsule is one such endeavor. Using bioadhesive materials is an alternative strategy.

Metabolism

Drugs with slower-releasing dose forms that undergo substantial metabolism in the intestine's tissue or lumen before absorption may have reduced bioavailability. Thus, requirements for the medication to be utilized in developing a sustained release are as follows:

- A drug's legal half-life should be less than five hours.
- The medication needs to be easily soluble in water.
- The drug's therapeutic window ought to be extended.
- The medication needs to be absorbed all over the GIT.

A medication that is not very water-soluble can still be prepared in SR dose form. For the same, the drug's solubility should be raised using the appropriate system before being produced in the SR dosage form. However, medication crystallization, which occurs as the medicine enters the bloodstream, should be avoided during this time, and precautions should be taken to avoid it.

Distribution

Medications with a high apparent volume of distribution are not good candidates for oral SR drug delivery systems because they affect the medication's rate of elimination.

Protein Binding

All drugs bind to plasma and/or tissue proteins to some degree, and the pharmacological response of a drug is dependent on the amount of drug that is unbound rather than the overall concentration. Regardless of the dose form, the therapeutic impact of a drug is largely determined by its ability to bind to proteins. Because this increases the biological half-life of the drug, occasionally an SR drug delivery system is not necessary for this kind of medication.

The margin of safety

The larger the therapeutic index value, the safer the medicine, as we currently know. Due to technological limitations in controlling release rates, drugs with lower therapeutic indices are typically not good candidates for the formulation of oral SR drug delivery systems.

MATRIX SYSTEMS CAN BE DIVIDED INTO THREE TYPES

Monolithic matrix tablets

The most straightforward approach to achieve a continuous release of medication from an oral dose form is likely to incorporate the medication within an inert matrix. In this context, inert refers to not reacting with bodily fluids. The primary factor behind its widespread use is the fact that the drug released from plastic matrix tablets is not reliant on the digestive juices' state or condition, which can vary greatly between and within patients (pH, viscosity). The porous matrix tablet does not break down like other tablets do when passing through the digestive system; instead, it stays intact, allowing the skeleton to be found in excrement. Most of the ingredients utilized to create these inert matrices are lipophilic chemicals and (insoluble) polymers. (Semi) synthetic polymers like polyethylene, polyvinyl chloride, poly methyl methacrylate, polystyrene, polyvinyl acetate, cellulose acetate, and ethyl cellulose were the first to be employed in the creation of matrix tablets. Triestearin, hydrogenated castor oil, and carnauba wax were among the fat compounds used. The main disadvantages of the majority of the inert polymeric matrix tablets were their poor direct compression characteristics, their innate first-order drug release characteristics, and the difficult cleaning of the agglomeration apparatus used to create agglomerates with the necessary compression characteristics.

Mechanism of release of inert monolithic matrix tablets

Through a leaching mechanism, release from inert matrix tablets takes place. Drug particles scattered throughout the polymer matrix dissolve in the stomach and intestinal fluids that reach them, and they are then released from the tablet via diffusion via the porous network of pores that the drug particles' dissolution creates in addition to the pores that are already present. A continuous structure linking every drug particle is present with drug loadings surpassing around 10-15 volume percent (percolating drug network). A partial release might occur with much lower

loadings if a specific portion of the medication (referred to as the "trapped fraction") is encircled by the polymer matrix.

Solvent-activated matrix tablets

Solvent-activated matrix tablets as a means of achieving zero-order Histograms suggested release, i.e., steady release rates spread out throughout time. The term "solvent-activated drug delivery system" refers to a group of systems where the controlled release is achieved by the interaction of water and polymer. The polymer may interact with water by plasticizing, expanding, dissolving, eroding, or degrading. Gel-forming hydrophilic matrix tablets and erodible (hydrophobic) matrix tablets are the two main kinds of solvent-activated matrix tablets.

Gel-forming hydrophilic matrix tablets

Drugs are distributed in homogeneous or heterogeneous gel-forming hydrophilic or swellable matrix systems in a hydrophilic polymer that swells. Scholars have extensively examined these systems because of their potential to provide consistent drug delivery over a prolonged duration. The properties of the polymer influence drug release.

After swallowing gel-forming hydrophilic matrix tablets, the hydrophilic polymer experiences volume expansion and macromolecular chain relaxing in the aqueous gastrointestinal tract, which causes the hydrophilic polymer to become plasticized. Consequently, a distinct sharp front that divides a wet and rubbery gel layer from a dry, glassy core may be seen upon the penetration of the gastrointestinal fluids into the tablet. Diffusion of the dissolved drug through the swollen gel layer controls release, which typically exhibits a burst effect due to the drug particles' dissolution and leaching at the surface before the release-controlling gel forms.

Erodible matrix tablets

Another intriguing material platform for zero-order drug release is provided by erodible polymers, such as polyanhydrides. Similar to a few HPMC grades, polyanhydrides create a gel layer that erodes at a particular rate when water penetrates it. The gel layer's thickness may stay consistent over time by selecting the appropriate polymer composition, resulting in a steady release rate until the drug runs out. Table 1 describes the medication to be prepared as a matrix tablet containing polymer along with the preparation technique.

APPROACHES IN MAKING MATRIX TABLETS

Direct Compression

Direct Compression (DC) stands as a pivotal method in pharmaceutical tablet manufacturing due to its simplicity and efficiency. In this process, powdered materials, encompassing the API and excipients, are directly compressed into tablets without the need for wet granulation or intermediate steps. This method ensures the preservation of the drug's chemical and physical characteristics, making it particularly suitable for heat-sensitive or moisture-sensitive drugs that could degrade during traditional granulation processes. The streamlined nature of DC leads to reduced manufacturing time and cost savings, as it eliminates the need for additional processing steps like granulation and drying. Moreover, when executed properly, DC yields tablets with high uniformity of dosage, crucial for ensuring consistent drug delivery and efficacy. However, its suitability may vary depending on the formulation, as DC is most effective for formulations containing materials with good flowability and compressibility characteristics. Overall, Direct Compression stands as a valuable approach, offering efficiency, simplicity, and preservation of drug integrity in pharmaceutical tablet manufacturing.

Wet Granulation

Wet Granulation (WG) is a fundamental process in pharmaceutical tablet manufacturing, involving several sequential steps to create tablets with desired characteristics. Initially, an appropriate proportion of granulating agents is mixed with weighed amounts of both the medication and polymer. This mixture is then subjected to wetting, typically with the addition of a liquid binder, to form cohesive granules. Screening of the wet bulk follows to ensure uniform granule size and distribution. Once sufficient cohesion is achieved, the granules are dried to remove excess moisture. Subsequently, a single-punch tablet compression machine is utilized to compress the dry, screened granules into tablets. During this compression phase, lubricants and disintegrants are often added to the formulation

to aid in tablet formation and disintegration upon ingestion. The result is a batch of tablets known as "running powder" tablets, ready for further processing or packaging. Wet Granulation is a versatile and widely used method in tablet manufacturing, offering control over tablet properties such as size, hardness, and dissolution characteristics.

Melt Granulation

Melt Granulation stands as an innovative approach to the creation of matrix tablets, offering unique benefits in formulation design and drug delivery. In the context of matrix tablets, this method involves incorporating a molten binder or matrix-forming material into the formulation to establish a cohesive matrix structure within the tablet, thereby controlling the release of the API over time. Initially, a matrix-forming material is selected based on its ability to melt at a relatively low temperature and exhibit suitable matrix-forming properties. Following this, the chosen material is melted and mixed with the API and other excipients to ensure uniform dispersion. The resulting molten mass is then granulated using appropriate equipment, forming granules of the desired size. Upon cooling and solidification, these granules develop a cohesive matrix structure, encapsulating the API and excipients within. Subsequently, the cooled granules are compressed into tablets using a tablet press, consolidating the matrix structure and ensuring tablet integrity. Through meticulous characterization and evaluation, including tests for physical properties and drug release profiles, the quality and performance of the final matrix tablets are assessed. Melt Granulation offers advantages such as improved API compatibility, controlled drug release, and simplified manufacturing processes compared to traditional wet granulation methods, making it a promising technique for various pharmaceutical applications.

Hot-Melt Extrusion Process

In matrix tablet preparation, the Hot-Melt Extrusion (HME) process emerges as a sophisticated method, offering distinct advantages in formulation design and drug delivery. HME involves melting a formulation comprising APIs, polymer carriers, plasticizers, and excipients, followed by extrusion through a die to create a continuous matrix structure. This matrix serves as a reservoir for controlled API release. Initially, a suitable formulation is developed, and then the components are melted and mixed using an extruder. The molten mixture is extruded through a die, cooled rapidly to solidify the matrix, and cut into uniform pellets. These pellets are subsequently compressed into tablets using a tablet press. HME enables precise control over drug release kinetics, enhanced API solubility, and improved bioavailability. Its versatility allows for the incorporation of various APIs and excipients, while its continuous and automated manufacturing capabilities enhance efficiency and reproducibility.

EVALUATION OF MATRIX TABLETS

Weight Variation

This is a crucial procedure that falls under the purview of quality control testing. According to the standard, every tablet in a batch should weigh the same amount. To calculate the average weight and compare it with the weight of a single tablet, twenty tablets are weighed. The Indian Pharmacopoeial Specification is used to calculate the percentage weight variation[60].

Hardness

Tablet hardness is "the force required to break a tablet in a diametric compression test." The Monsanto hardness analyzer is used to test the hardness of three tablets for each formulation; the tablet's endpoint is determined by shattering it[61].

Friability

Weighing twenty tablets, we put them in the friability. For four minutes, the chamber rotates at a speed of 25 rpm. After being taken out of the chamber, the tablets are weighed once again. Weight loss is a sign of friability. If tablets reduce weight by less than 0.8%, they should be regarded as high-quality tablets[62].

Thickness

Tablet thickness plays a key role in maintaining tablet size uniformity. Vernier calipers were used to measure thickness. By measuring the thickness of ten tablets from each formulation batch, it was ascertained[63].

Determination of drug content

The uniformity in drug content test procedure for matrix tablets is pivotal in ensuring consistent dosage across a tablet batch. It begins with the careful selection of representative tablets, followed by their meticulous grinding into a fine powder. Subsequently, the drug is extracted from the powdered sample using an appropriate solvent, with agitation or sonication employed to enhance extraction efficiency. Filtration of the extracted solution eliminates insoluble particles, facilitating clear analysis. Quantification of drug content is then performed using validated analytical methods such as UV-visible spectroscopy or HPLC, with standard solutions used for calibration. The calculated drug content for each tablet is compared against acceptance criteria or pharmacopoeial standards to ensure uniformity. Comprehensive documentation of the procedure and results is essential for regulatory compliance and quality assurance. Through adherence to this standardized protocol, manufacturers can confidently ascertain the uniformity and consistency of drug content in matrix tablets, safeguarding product quality and efficacy[64].

***In-Vitro* Dissolution Study**

The in-vitro dissolution procedure for matrix tablets is a pivotal step in assessing their performance and release characteristics. It begins with the preparation of dissolution media mimicking physiological conditions, followed by the calibration of dissolution apparatus such as paddle or basket systems. Selection of dissolution conditions, including rotation speed, temperature, and sampling intervals, is crucial. Matrix tablets are then placed into dissolution vessels, and samples are collected at predefined intervals for analysis. Analytical techniques such as UV-visible spectroscopy or HPLC are employed to quantify drug release. The cumulative percentage of drug release is calculated over time, and dissolution profiles are plotted to visualize release kinetics. Results are interpreted to evaluate tablet performance, considering factors like the rate and extent of drug release and compliance with regulatory standards. Documentation of experimental details ensures reproducibility and compliance with regulatory guidelines. Through this standardized procedure, researchers and manufacturers gain insights into matrix tablet behavior, aiding in formulation optimization, quality control, and regulatory compliance[65].

CONCLUSION

In conclusion, the development of matrix tablets, achieved through a thoughtful combination of polymers, presents a promising approach for extending the release of medication. By carefully controlling the release kinetics, these matrix systems offer the potential to enhance the effectiveness of medications while promoting improved patient compliance. Moreover, the affordability of readily available polymers makes these systems economically feasible for widespread use. Particularly advantageous for patients requiring sustained medication delivery over prolonged periods, matrix tablets represent a valuable therapeutic option that aligns with the growing demand for patient-centric healthcare solutions. Overall, the versatility and efficacy of matrix tablets underscore their significance in modern pharmaceutical formulations, offering both practicality and enhanced therapeutic outcomes.

Table 1: Drugs and polymers used in making matrix tablets

Drugs	Polymer	Reference
Acarbose	Hydroxy propyl methyl cellulose (HPMC), Eudragit	[9]
Aceclofenac	HPMC-K4M, K15M, K100M, E15, ethyl cellulose (EC), and Guar gum	[10]
Acetaminophen	EC	[11]
Alfuzosin	HPMC-K15M and Eudragit-RSPO	[12]
AmbroxolHCl	HPMC-K100M	[13]
Amlodipine	HPMC and EC	[14]
Aspirin	EC, Eudragit-RS100 & S100	[15]
Atenolol	HPMC 15cps, chitosan, and gar gum	[16]
Captopril	HPMC K4M and EC	[17]
Cefdinir	Eudragit RL100, Eudragit RS100, and HPMC K4M	[18]
Cefiximetrihydrate	HPMC K5M, EC, and sodium CMC	[19]
Chlorpheniramine maleate	Xanthan gum and Chitoson	[20]
Dapsone (DAP)	Eudragit S100	[21]
Diclofenac Na	Chitoson, EC, HPMCP, and HPMC	[22]
Diethylcarbamazepine citrate	Guar gum and HPMC-E15LV	[23]
Diltiazem	HPMC-K100M, HPMC-K4M, Karaya gum, Locust bean gum, and Sod.CMC	[24]
Domperidone	HPMC-K4M and Carbopol-934	[25]
Donepezil HCl	Xanthan gum and guar gum	[26]
Enalapril maleate	HPMC-K100M and HPMC K4M	[27]
Flurbiprofen	Xanthan and acacia gums	[28]
Flutamide	HPMC-K4M, Sod.CMC, Guar gum, and Xanthan gum	[29]
Furosemide	Guar gum, Pectin, and Xanthan gum	[30]
Glibenclamide	HPMC	[31]
Glipizide	HPMC K100 and Eudragit L100	[32]
Ibuprofen	EC, CAP	[33]
Indomethacin	EC and HPMC	[34]
Isoniazid	HPMC K100LV, HPMC K4M, HPMC K15M, and HPMC K100M.	

ItopridеHCl	HPMC-K100M, HPMC-K4M, and EC	[35]
Losartan potassium	HPMC-K100M, HPMC-K4M, and EudragitRSPO	[36]
Metformin HCl	HPMC-K100M and EC	[37]

ABSTRACT

The search for novel treatments for numerous rare and incurable diseases, such as refractory epilepsy, which is a type of epilepsy that is difficult to manage with conventional medications, is driving a greater emphasis on the medicinal qualities of plants. In this pursuit, scientists are systematically examining different plant species and their extracts to develop effective treatments and improve existing treatments. The toxicological properties of aqueous extracts obtained from *Lantana camara* L., (Family-Verbenaceae) flowers and leaves were investigated using a *Drosophila* epileptic model, (*para*^{1} *bangsenseless*). The plant material was collected, dried, and powdered, followed by extraction with water using a Soxhlet apparatus. The resulting dark green extract was combined with a standard corn flour-based media for the study. The mixture was tested at different concentrations (500mg, 1gm, 2.5gm, 3.5gm, 5gm, and 10gm) with a 168-h toxicity assessment. A notable outcome was the absence of significant toxicity from the extracts, as it failed to induce a 50% lethal dose (LD50) at any of the tested concentrations, even at the highest dose of 10 g. Mortality rates remained below 30%, indicating relatively benign effects. To determine the toxic effect of the extracts and any differences, the collected data were statistically evaluated. This study underscores the non-toxic profile of *L. camara*'s aqueous extract when applied to a sensitive *Drosophila* strain, offering critical insights into the safety and biological relevance of plant-derived compounds in medicinal research.

Keywords: *Lantana camara, para*^{1}*bangsenseless*, Toxicity, LD50, medicinal research.

INTRODUCTION

Plants have been an essential component of ecosystem, providing food and medicine to humans since ancient times. Their complicated metabolic processes produce a wide range of complex compounds, which contribute to their medicinal and therapeutic qualities, making them a treasured source. Plants are a plentiful and valuable resource for both traditional herbal medicine and contemporary pharmaceutical research, which could help identify new drugs [1].With 650 variants at present, *Lantana camara*. Linn (Family-Verbenaceae) is a significant species in the Global Invasive Data Base [2] and has infested as many as 60 nations. Plant species native to the area may be threatened by allelochemical pollution, which could eventually lead to their extinction. In the near future, plant may eventually transform into invasive monophyletic species in the absence of threat [3]. There have been reports of poisoning in children by consumption of green lantana berries. The pentacyclic triterpenoids present in *L. camara*, such as lantadene A and B, are recognized as the primary hepatotoxic compounds responsible for inducing hepatic necrosis and bile duct proliferation in grazing livestock, ultimately leading to liver failure and death in many cases [4,5]. In addition to its downsides of being an obnoxious and toxic weed, the plant has limited industrial utility [6]. However, it also has numerous medicinal applications [7,8]. It has been demonstrated in animal models, such as rats and mice, that *L. camara* extracts can mitigate epileptic seizures [9].
Given its promising potential and diverse medicinal properties, this plant has significant pharmaceutical potential.

MATERIALS AND METHODS

Plant Collection: Fresh leaves and flowers of *L. camara* were collected from and around the Bangalore University campus and accurately identified at the Central Council for Research in Ayurvedic Sciences (CCRAS) Ministry of AYUSH, Govt. of India, Bengaluru. The collection was performed during the peak flowering season to maximize phytochemical content.
Drying and Powdering: The collected plant material was dried under shade in a room with good ventilation and light to prevent chemical degradation. Once dried, the material was ground into a fine powder using a laboratory-scale mill, standardized to a consistent particle size to ensure homogeneity in the extraction process.
Soxhlet Extraction: The powdered plant material was extracted using a Soxhlet apparatus with water as the solvent. The apparatus was set to maintain a constant temperature throughout the extraction period to optimize yield and extraction efficacy. The extract was kept in a Rotary evaporator to remove excess water, yielding a dark greenish, semi-solid extract.

Toxicity Assay
Model Organism: Drosophila melanogaster parabangsenseless (epileptic) mutant strain was selected for the study due to its relevance to epilepsy research. The mutant strain displays hyperexcitability and seizures, making it an appropriate model for assessing the toxic effects of plant extracts [10, 11].
Media Preparation and Addition of Extract: A standardized corn flour-based media was prepared for the toxicity assay. The *L. camara* extracts of both flower and leaf were added to the media at varying concentrations, starting from (500mg, 1gm, 2.5gm, 3.5gm, 5gm, and 10gm) to assess different dose effects. The media were thoroughly mixed to ensure uniform distribution in the extract.
Assay Setup: 2-5 days old flies of 10 in numbers of mixed gender were placed in vials containing media with extracts at different concentrations. Each concentration was tested in quadruplicate to ensure reliability and consistency.
168-h Toxicity Assessment: Flies were monitored over a 168-h period (1 week) to assess survival and signs of toxicity. The flies were placed into new vials on a bi-daily basis. Mortality rates were recorded at 24-hour intervals and were used to calculate the lethal dose (LD50) [12].

RESULTS

The toxicity assessment revealed that the aqueous extract of *L. camara* has a relatively nontoxic profile. By using Graph pad Prism statistical software (version 5.01), the Wilcoxon signed-rank test was used to compare the effects of leaf and flower extracts. The results indicated a statistically significant difference between the two extracts, with a p-value of 0.0355 (two-tailed), confirming that the medians of the leaf and flower extracts were significantly different ($p < 0.05$). The analysis yielded a negative rank of 21.00, suggesting that flower extract had greater effects than leaf extract. Additionally, Spearman's rank correlation coefficient (rs) was determined to be 1.0000, reflecting perfect positive correlation among the paired observations. The one-tailed p-value associated with the correlation was 0.0014, further supporting the effectiveness of the pairing. These findings suggest that the effects of leaf and flower extracts differ significantly, potentially having significant implications for their use in medical applications. Even at the highest concentration tested (10 gm), the extract did not induce a 50% lethal dose (LD50), indicating a lack of significant toxicity. The mortality rate remained below 30%, suggesting that the extract is generally safe for the *Drosophila* strain used in this study.

DISCUSSION

For centuries, plants have been a primary source of medicine. However, the scientific pursuit of therapeutic potential for drug discovery began in the 19th century. The World Health Organization (WHO) acknowledges that 11% of all medications are derived exclusively from flowering plants [13]. An estimated 50,000 to 80,000 flowering plant varieties are recognized for their medicinal attributes and are employed in healthcare practices. Plants have long been an important of traditional medicine in countries such as Iran, Thailand, India, China, Pakistan, Japan, and several African nations pioneering in phytomedicine [14, 15]. Preclinical studies have highlighted the therapeutic efficacy of *L. camara* and demonstrated its potential for treating various ailments. Research shows that extracts from *L. camara* possess significant anti-inflammatory properties, as evidenced by in vitro tests indicating comparable effectiveness to standard anti-inflammatory drugs like piroxicam[16]. Additionally, the plant has been associated with wound-healing, antimicrobial, and anticancer activities, further supporting its traditional use in folk medicine [17]. These findings suggest that *L. camara* is a valuable candidate for drug discovery and therapeutic applications. However, a detailed toxicity profile is crucial for clinical application. Comprehensive toxicity assessments are crucial for identifying safe and effective extract formulations for drug development [18]. This study also seeks the aforementioned goal.

CONCLUSION

The rise of synthetic drugs, while effective, has prompted resurgence in natural therapies due to concerns about adverse effects. Drosophila, a model organism with genetic similarities to humans, offers a platform for exploring the medicinal properties of plants [19]. The discrepancy in plant extracts toxicity, which was observed to be harmless to flies but harmful to shrimp and mice, might be explained by differences in the extracts used, extraction method, extracted components, plant variant employed or the animal model itself used in the study [20, 21,22]. The findings of this study indicate that *L. camara* extracts can be safely administered to fruit fly models. The absence of toxicity at different concentrations makes it a promising candidate for developing treatments for refractory epilepsy and other conditions that lack effective therapies. These findings highlight the extract's potential as a safe and complementary treatment option, thereby supporting further research and development.

ACKNOWLEDGMENT

The authors thank Dr. B. R. Ambedkar Research Scholar Fellowship, Dr. Rizwan Sharief for his Statistical assistance, Mr.Sri Sai Prajwal and Mr. Manjunath.V for their assistance in the field collection of plant material; and the Department of Zoology, Bangalore University for facilitating this research.

ABSTRACT

Skin diseases are ailments, but they can have a strong impact on the social and psychological condition of the patient. Palmar-plantar psoriasis, known as *Vipadika* in Ayurveda, presents a therapeutic challenge due to its chronic nature and debilitating symptoms. *Vipadika* [1] categorized under *Kshudra Kushta* in Ayurveda, shares similarities with palmar-plantar psoriasis, a chronic skin condition affecting the palms and soles. This case report illustrates the successful Ayurvedic management of 2patients presenting with dryness, cracking, bleeding, and pain in both palms. Treatment with *Virechana*(detoxification) therapy followed by *Shamana* Aushadhi's (palliative treatment), and *Shtanik Chikitsa* (local treatment) shows great results in PPP. The outcomes of both treatment modalities are discussed, highlighting the diversity of Ayurvedic interventions for this challenging dermatological condition.

Keywords: Palmo planter psoriasis, *Kshudra Kushtha*, *Vipadika*, *Virechana*

INTRODUCTION

Palmo-plantar psoriasis, characterized by fissures, pain, hardening of skin and inflammation in the palms and soles, poses significant challenges in treatment. Ayurveda offers a holistic approach to managing this condition, addressing both the underlying imbalances and symptomatic relief. This case study presents two patients with Palmo-plantar psoriasis and their Ayurvedic treatment outcomes. Skin diseases are non-serious types of diseases, but it has a big impact on sociopsychological wellbeing of patients. It had major impairment in mental health as well as difficulty in performing day to day activities. Palmo-plantar psoriasis is a form of psoriasis that affects the palms of the hands and the soles of the feet. It causes areas of raised, thickened, and discolored skin and can lead to pain, bleeding, and

fissures. Palmoplantar psoriasis affects individuals of all ages, gender specificity is not clear. Almost 2% of the world population is affected by PPP. Environmental triggers like smoking, irritants, friction and repetitive trauma can be considered but exact causative factors are unknown. The description of *Kushtha* in *Samhita* covers almost all skin diseases. There are 18 [2] types of skin diseases described under *Kushtha*. We can correlate palmoplantar psoriasis with *Vipadika*. *Vipadika* is caused due to vitiation of *Vata* and *Kapha* dosha. It is one among *Kustha Roga* which presents the complaints like *Sphutanam*[3]. either in palms or soles or at both with *Teevra Vedana* [3]. There is difference of opinion found in symptoms of *Vipadika* among *Acharyas*. The specific *Nidan* [4] mentioned by *Aacharya* are *viruddha aahar , mithya aahar vihar, vega vidharana, panchakarma apachara, sansarga janya, krimi janya, chikitsa vibransha janya*. According to *Acharya Charaka*, due to intake of *Dosha Prakopaka Ahar-vihar* , the *Vatadi [5]* doshas get aggravated simultaneously and *Tvacha, Rakta, Mamsa* and *Lasika* attain *Shaithilya*. In these *Shithila Dhatus*, the *Prakupita Doshas* get *Sthana Samshraya* by vitiating the *Twak*, produce *Kustha Roga*. Thus, *Kushta* is caused by the involvement of seven *Dravya*[6]viz. *Tridoshas- Vata, Pitta, Kapha*;four *Dushyas- twacha, rakta, mamsa* and *lasika or ambu* thus, all the seven factors should bevitiated by the *Kushta Nidanas* as well as dosha *Prakopaka Nidanas*.(Table.1)

Case Presentation: Patient 1

Chief complaints: - A36-year-old male presented with a 2-year history of hyperkeratosis, desquamation with severe pain in both palms. Physical examination confirmed the diagnosis of palmo plantar psoriasis. The patient was doing a job in private company and doing night shift since 3 years. Due to continuous night duty and irregular eating habits, he started developing constipation and increased skin thickness. Then his thickened skin got desquamated and started developing cuts on fingers and palms and started bleeding from them. When the patient started having difficulty in day-to-day activities then he consulted the allopathy practitioner. After trying so many treatment protocols from other pathy, finally the patient came to Anuved clinic for treatment. The patient underwent *Shodana* therapy (*Virechana*) followed by *Shamana Aushadhi's*, including herbal formulations for skin healing and inflammation reduction.

Patient 2

A 35-year-old female with a history of palmo plantar psoriasis with the history of pustules on palm and fingers which turns into hyperkeratosis and desquamation with pain, came for Ayurvedic treatment. The patient was suffering from severe pain and minimal bleeding due to cracks on fingers. The patient was housewife and had a family history of the same onset with her father after the age of 60 years. The patient also underwent the protocol of *Shodhana* and *Shamana* treatment.(Table.2,3,4,5,6,7)

MATERIALS AND METHOD

Treatment given

The Treatment was Stared with *Deepan pachan* for 3 days followed by *Snehapana* for *Virechana* procedure. *Deepan pachan: -Aampachak vati*2-tab BD for 3 days with hot water after food. After assessment of Agni of the patient panchatikta ghrita was given as a snehapana in early morning before food as per following quantity with hot water.(Table.8) After *Snehapana, Sarvang Abhyanga (*Full body massage*)* and *Swedana (*steam with hot waterand *dashmoola quath)* was given to the patient with *chandan bala laxadi* oil follwed by *swedan* in steam box for 30 min After 5th day of *Sansarjan Krama* palliative treatment started for the patient as per the table given below. (Table.9)

Shaman Aushadhi

Bahiparimarjan chikitsa

Application of castor oil and kokum butter with *Parishek* of *ushna jala.* Diet *:-(Table.10,11,12)*

- *Laghu supachya aahar* (light and wholesome diet with less oily and spicy food)
- Avoid heavy and sour food, mik, curd, bakery items, meat, fish, jaggery,and tila. Assessment criteria

RESULT

Assessment of the patient done for 45 days with Ayurvedic treatment protocol and diet. *(Table.13,14)* Result for patient 1, Result for patient 2. Both patients experienced significant improvement in their symptoms following Ayurvedic treatment. The time taken to achieve this improvement was 45 days (about 1 and a half months) including *shodhana* treatment followed by *shaman aushadhi* for 30 days (about 4 and a half weeks). The patient reported a reduction in symptoms after *virechan*. The patient got complete relief after 30 days of *shaman* treatment. *Rasayana* therapy with *amalaki rasayan* given for 6 months for *apunarbhav (*not appearing again*)*. Patient (2) reported a reduction in pain, inflammation, and fissures, with improved skin texture and mobility. Similarly, Patient (1) observed a decrease in dryness, fissures, and discomfort, along with enhanced overall well-being.

DISCUSSION

Palmo plantar psoriasis is a complex condition involving multiple factors, including genetics, environmental triggers, and immune dysregulation. The interconnection of these factors leads to the characteristic symptoms of thickened, scaly skin on the palms of the hands and soles of the feet. Similar symptoms are mentioned in *Vipadika* which is atype of *Kshudra Kushta*. *Vata* and *kapha* are *pradhan dosha* involved in it. These dosha vitiate *rasa, rakta, twak and lasika* and develop symptoms like *panipaada sphutana (*cracks on palms and soles*), tivra vedana(*pain*) and kathinya (*thickend and scaly skin of palms and soles*)* . Ayurvedic treatment protocol with *shodhan ,shaman* and topical application gives promising results. In Ayurveda, the treatment of palmoplantar psoriasis involves understanding the condition through the lens of "*Rasa*" (taste) and "*Guna*" (qualities or attributes) of substances. Ayurveda categorizes different tastes into six types - sweet, sour, salty, bitter, pungent, and astringent. Each taste has specific effects on the body. In the case of psoriasis, bitter and astringent tastes are often recommended as they are believed to have a purifying effect. The drugs having bitter and astringent tastes, such as Manjistha[11], Neem[12], Khadira and Turmeric, are thought to have cleansing properties that can help detoxify the body and reduce inflammation. The selection of drugs for treatment depends on balancing these qualities to bring the body back into a state of equilibrium. Psoriasis is often associated with excess heat which causes *Rukshata*(dryness) and inflammation in the body. Therefore, cooling and soothing substances are typically recommended. Moisturizing oils such as castor oil or Kokum butter also be applied topically to help soften, reduce dryness and hydrate the skin. Ayurvedic treatments for palmoplantar psoriasis involve a combination of dietary modifications, herbal remedies, topical applications, and lifestyle changes aimed at reducing inflammation, dryness and detoxifying the body, and restoring balance to the doshas, according to individual's constitution. *Virechana* given for both the patients as *shodhana (*Detoxification of the Body*)*, and as a palliative treatment *panchatikta ghrit guggulu vati, khadiradivati, and mahamanjishtadi kashay* gave satisfactory results. *Ushna Jala Parishek* also helps to relieve pain.

Khadiradi vati

It acts on the immune system of the patient and shows immunomodulatory proprties. It aslo acts as a anti-inflammatory , and antiprurulant agent. *Khadir* has been cosiderd as formost amongst all *kushtaghna dravya*

Ingredients: - *khadir, kapur, kankol, javitri, puga.*

Panchatikta gruta guggulu

It is a good blood purifier, also acts as anti-inflammatory and *vranashodhan and vranaropan* properties.(Table.15)

Mahamanjishtadi kashay

It is used as anti-inflammatory, skin discolouration, digestive tonic, helps to reduce oxidative stress by scavenging free radicles. It also acts as a anti proliferative and immunomodulator.(Table.16)

CONCLUSION

This case study highlights the efficacy of Ayurvedic interventions in managing palmar-plantar psoriasis through diverse treatment approaches. Both the patients benefited from a combination of *Shodana* therapy and *Shamana aushadhi's* with localised application. *Shodhana* therapy helps to break pathogenesis of the disease and *shaman* therapy helps to get relief in symptomatic treatment of the patient. Ayurveda offers personalized treatment options tailored to individual preferences and contraindications, emphasizing its holistic approach to skin health and overall wellness. Further research and clinical studies are warranted to explore the full potential of Ayurvedic interventions in managing palmar-plantar psoriasis and other dermatological conditions.

ABSTRACT

This study aimed to evaluate marine algae as potential fish feed for ornamental fishes. Green algae (*Codium decorticatum*) and red algae (*Porphyra indica*) were collected from Gulf of Mannar and processed for phytochemical screening, GCMS analysis, and FTIR spectrum analysis, revealing rich bioactive compounds. Ornamental fishes fed with algae showed improved growth, survival rates (99% for green algae, 66.67% for red algae), and reproductive success compared to those fed commercial feed. The algae-fed tanks maintained clearer water quality. Overall, *Codium decorticatum* enhanced fish health and productivity, suggesting its suitability as a beneficial feed source.

Keywords: Photochemical, White Molly, *Codium decorticatum, Porphyra indica*, alkonoids, flavonoids, spectroscopy

INTRODUCTION

Marine algae, as ancient members of the plant kingdom, play a crucial role in ecosystems by serving as food for coastal fishes and other aquatic organisms. Seaweeds are abundant and economically valuable resources used in food

production due to their nutritional benefits and bioactive compounds. The global aquaculture industry, including finfish, molluscs, and aquatic plants, has grown significantly, with algae like *Kappaphycus alvarezii* and *Eucheuma spp.* contributing to this expansion, particularly in Indonesia. In North America, seaweed cultivation for human consumption is on the rise, driven by increasing demand for nutritious foods. Algae such as Nori, Kombu, and Wakame are gaining popularity worldwide for their health benefits, including reducing the risk of various diseases. Many studies have shown that the consumption of marine algae are known to reduce many kinds of pathologies such as diabetes, obesity, cardiovascular diseases, cancer, etc.(Cano Europa *et al*.,2012). Seaweeds, comprising brown algae (Phaeophyta), green algae (Chlorophyta), and red algae (Rhodophyta), are essential marine macroalgae found in diverse habitats such as coral reefs, intertidal zones, and deepsea environments. They are recognized for their rich nutritional profiles and bioactive compounds. Seaweeds are integral to various industries including food, pharmaceuticals, and cosmetics due to their polysaccharides, antioxidants, and other medicinal properties. Popular species like Nori (Porphyra*/Pyropia spp.)*, Kombu (Laminaria/*Saccharina spp*.), and Wakame (*Undaria spp.)* are extensively used in Asian cuisines and are known for their health benefits, including aiding in the prevention of diseases like diabetes and cardiovascular disorders. The cultivation and consumption of algae, particularly in regions like Japan and China, continue to expand, reflecting their increasing global demand and economic importance. Seaweeds typically contain some form of bioactive compounds with antiviral, antibacterial or antitumor activities. (Abirami et al.,2016). Seaweeds have low lipid content but provide essential omega-3 polyunsaturated fatty acids (PUFAs) (Siddik*et al.,* 2023), which are crucial for cell membranes and eicosanoid production, and can help reduce risks of osteoporosis, diabetes, cardiovascular diseases, and cancer (Misurcova et al., 2011).People that are residing in coastal areas only consume fresh and dry seaweeds (Cox *et al*., 2010).Macroalgae serve as a sustainable substitute for fish meal in aquafeed due to their high protein (Jones *et al.,* 2020) and lipid content, which enhances growth and survival rates of ornamental and commercial fishes. They provide essential fatty acids and have shown positive effects on growth performance, feed efficiency, and intestinal health in fish diets, making them a valuable alternative amid rising costs and limited supply of traditional fish meal and fish oil sources.Phytochemical analysis aims to identify and quantify bioactive compounds in plants and algae, crucial for developing medicinal standards and therapeutic drugs. Examples include flavonoids, phenolic acids, tannins, saponins, alkaloids, coumarin, phytosterols, and terpenoids, (Yadav *et al*.,2017). Alkaloids, for instance, serve as essential components in medicines and dietary supplements, while steroids from red, brown, and green algae play roles in inflammation reduction and immune modulation. Phytochemical screening aids in discovering potential drug candidates and understanding their pharmacological activities

MATERIALS AND METHODS

Collection of Algae Samples

Green seaweed (*Codium decorticatum*) and red seaweed (*Porphyra indica*) were collected from the Coast of Mandapam, Gulf of Mannar region during low tides, washed with seawater, shade dried, ground into coarse powder, and stored in the refrigerator for analysis.

Preparation of Powder

Porphyra indica and *Codium decorticatum* algae were washed, shade dried, ground into powder, and mixed with corn meal for feeding molly fishes twice daily over 60 days.

Extraction

Soxhlet extraction with hexane, ethyl acetate, and methanol was used to extract.

Qualitative phytochemical analysis

Phytochemical analysis was carried out with modified protocols for identification and presence of active phytoconstituents

Test for alkaloids

100 mg of Algae extracts dissolved in 5ml of 1% hydrochloric acid were tested with Dragendorff's and Mayer's reagents for alkaloid presence based on precipitate formation.

Test for flavanoids

Algae extracts dissolved in methanol showed presence of flavonoids with color changes from orange to purple upon addition of magnesium ribbon and concentrated hydrochloric acid.

Test for tannins

200 ml of algal extracts in 10ml distilled water showed presence of tannins with blue-green precipitate upon addition of 1% alcoholic ferric chloride solution.

Test for steroids

100 mg of both the algal extracts were dissolved in equal volume of acetic acid and chloroform. The sample is cooled at 0 ºC for few minutes and few drops of concentrated sulphuric acid was added, formation of reddish brown or violet-brown ring indicates the presence of a steroid.

Test for terpenoids

500 mg of extract was dissolved in methanol and equal volume of dissolved extract and acetic anhydride were taken in a clean test tube. Few drops of concentrated sulphuric acid were added to the tubes. The colour changes from pink to violet showed the presence terpenoids (or) formation of blue green ring indicates the presence of terpenoids.

Test for saponins

1 gm of each extract was shaken vigorously with 3 to 5 ml of distilled water persistent foam for 10 minutes confirm is the presence of saponins.

Test for carbohydrate

2 ml of each algae extract was treated with few drops of Molisch reagent and 1 ml concentrated sulphuric acid. Formation of red coloured ring at the interface indicates the presence of carbohydrates.

Test for protein

2 ml of each extract was treated with few drops of 1% Ninhydrin solution. Formation of blue colour on mild heating in the water bath confirms the presence of protein.

Thin layer chromatography

A part of the extract was dissolved in acetone and applied on a silica gel pre coated plates with the help of TLC capillary tubes. The plates were placed in the solvent system Methanol: Chloroform: Hexane (2:2:1) to separate the various constituents of the extracts. The developed plates were air dried and observed under visible and UV light (254 and 366nm). Various separated spots were noted for their Rf values.

$$\text{Rf value} = \frac{\text{Distance travelled by the solute}}{\text{Distance travelled by the solvent}}$$

GCMS analysis

GC-MS analysis was conducted using Agilent GC 7890A 240MS with HP5 capillary column (30m x 0.32mm, 0.25μm coating), interfaced with Agilent 240 MS Ion Trap mass detector. Analytical conditions included injector and transfer line temperatures at 220°C and 240°C, oven temperature programmed from 80°C to 300°C at 40°C/min, helium carrier gas at 1 mL/min, and injection of 0.2 μL of n-hexane for identification of components through retention times, retention indices, and computer matching against NIST and MS literature databases.

FITR spectroscopy

FTIR is perhaps the most powerful tools for identifying the types of chemical bonds (functional groups) present in the compounds. Dried powder of solvent extract of each algae were used for FTIR analysis. The powdered sample of each algae specimen was loaded in FTIR Spectroscope (Shimadzu, IR Affinity1, Japan), with a scan range from 400 to 4000 cm-1 with a resolution of 4cm-1.

Collection of the fish and maintenance – white molly

The ornamental fishes-white molly(*Poecilia sphenops*) was collected from the ornamental fish shop in Washermanpet, Chennai and transported to lab in an oxygenated polythene bag. The three batches of fishes were placed in three different fish tanks at room temperature(35◦C).Fishes were divided into three groups (Group 1, 2, and 3) and placed in tanks fed with control, formulated red algal, and formulated green algal fish feeds, respectively, after an initial period on control feed.

Growth and survival rate of the fish

Experiments studied growth and survival rates of *P. sphenops* using formulated algal diets, comparing green and red algae feeds with commercial fish feed, noting initial and final weight and length.

Statistical analysis

Data obtained during laboratory experiments were subjected to statistical analysis to determine mean, standard deviation and ANOVA (Analysis of variance).

RESULTS AND DISCUSSION

Presence or absence of various phytoconstituents were analyzed in the extract of *Codium decorticatum* (green algae) and *Porphyra indica* (red algae). The results were presented in Table (1). Alkaloids, flavonoid, diterpenoids and tannins are important secondary metabolites are present in green algae in more amount than red algae. The maximum yield was observed with reference to methanol extract.The analysis confirms the presence of various bioactive compounds present in methanol extracts and the green algal extracts were further subjected to TLC, FT-IR spectroscopy and GCMS analysis in which the results were presented in Figure (1) Table (2) and (3) respectively. Algae, including both macrophytes and microalgae, are vital to both human and animal diets due to their rich nutritional profile. Microalgal biotechnology, which began developing in the mid-20th century, has broadened the commercial applications of algae, particularly in aquaculture. Algae are incorporated into fish diets to provide essential proteins, vitamins, minerals, and fatty acids necessary for health and growth. Research on marine algae such as *Codium decorticatum* (green algae) and *Porphyra indica* (red algae) has shown that these species contain a variety of bioactive compounds (Chen *et al.,* 2022). Our study was attempted to carry out the preliminary phytochemical screening and GCMS analysis of marine seaweeds.The marine seaweeds were collected from coastal areas and these marine green algae- *Codium decorticatum* and red algae- *Porphyra indica* were screened for phytochemical analysis. The phytochemical analysis of *Kappaphycus alvarezii* revealed the presence of carbohydrate, protein, alkaloids, glycosides, flavonoids, steroid, phenolic compounds and absence of tannin in the extracts. (Sumayya *et.al.,*2016). The present investigation reveals that the green alga *Codium decorticatum* extract contained alkaloids, flavonoids, terpenoids, coumarin, tannins and carbohydrates (Table 1) suggesting potential antimicrobial and antioxidant properties (Thooyavan and Karthikeyan ,2016). Similarly, *Porphyra indica* displays anticoagulant and antiviral properties, useful against fish viruses (Venkataraghavan *et al.,* 2019). These findings underscore the nutritional and pharmacological relevance of algae in aquaculture and human health.This result was in contrast with the study conducted in *Urophora fasciata* in which alkaloids did not show their presence in any of the four extracts tested (Raj *et al*.,2016).This may be due to change in chemical composition of seaweeds with respect to species .Glycosides were also found to be present in other species of *Ulva.*(Abdel-Khaliq *et al.,* 2014).These glycosides exhibit many biological activities including antibiotic drugs, schizophrenia treatment, immunomodulatory, and hypolipemic activities (Kren *et al*.,2001). Phytochemical analysis of the aqueous extracts of some commonly occurring green seaweed *Cladophora glomerata*, *Ulva lactuca* and *Ulva reticulata,* the red seaweed *Gracilaria corticata* and *Kappaphycus alvarezii* and the brown seaweed *Sargassum wightii* were also evaluated for antibacterial activity by well diffusion assay (Periasamy Mansuya, *et al*., 2010).Thin layer chromatography studies of Methanol extract of green algae *Codium decorticatum* (green algae) shows the presence of different number of bands than red algae with respect to band width observed 3 to 4 bands were observed with reference to visible range 254nm and 366 nm respectively in figure(2a and 2b) table (2a and 2b). The FT-IR spectrum was used to identify the functional groups of the active components (Ladjal-Ettoumi, Y*et al.,* 2024) present in extract based on the peak values in the region of IR radiation. When the extract was passed into the FT-IR, the functional groups of the components were separated based on its peak's ratio. The results of FT-IR analysis confirmed the presence of N-H, O-H, C=C and C-H, functional groups (Figure 3 and Table 3). FTIR spectroscopy is proved to be a reliable and sensitive method for detection of bio molecular composition. From the Phytochemical screening on *Codium decorticatum* it is known that it possesses higher bioactive compounds, hence it was tested for GC-MS analysis in order to obtain the data on the presence of various bioactive compounds (Luhila*et al.,* 2022). The result of GC-MS showed the compounds present in this green algae *Codium decorticatum*. (Table 5).Out of these compounds, hexadecanoic acid and acrylothiamide are the compounds that

benefits the fishes in its growth and survival and in antioxidant property.The ornamental fishes in three of the tanks were kept in control with the commercial feed for 10 days and then the tank 1 was continued with the commercial feed and tank 2 and tank 3 was fed with the algal feeds- green and red for 60 days as seen in (Figure 4) and ANOVA of total weight gain and length gain of fishes fed with different feds (Table 4).Recent studies have further explored the potential of marine algae in aquaculture and nutrition. *Laurencia papillosa* was analyzed for its fatty acid composition and revealed high levels of unsaturated fatty acids and essential minerals (Prasantha Kumari Mantada et al., 2021). *Codium decorticatum* was found to contain compounds like hexadecenoic acid, which could be beneficial for fish health (Meenakshi *et al*., 2011). Additionally, the use of green macroalgae in fish feeds has demonstrated positive impacts on fish reproduction and growth, as seen in the increased fry production in female fish fed with algal diets (Lian Chuan Lim, Philippe Dhert., 2003). Furthermore, incorporating live feeds such as decapsulated Artemia cysts has been shown to support fish growth and survival effectively (De-Luis et al., 2010). Similarly, thephytochemicals screening of crude methanolic extracts of all the tested species of macro algae was done. (Sunil. Khristi *et al.,2017*).*Lobophora variegate (*brown algae*)* extracts was evaluated on different hierarchical organism including pathogenic bacteria, mosquito pupae, nematodes and plant seeds (Aseer Manilal, *et al*.,2011) displayed toxicity in all organisms tested.According to (Sumithra *et al.,*2014) a study for 35 days on the growth and survival of different feeds on mollies have reported that mixed feed (chicken manure and three algae) is the suitable fish feed for the earlier growth of fish. The growth and survival rate was more in fishes that fed with green algae feed compared to the red algae and commercial fish feed. The survival rate of the fishes fed with green algae was 99.98% and red algae was 76.22% and the commercial feed was 35.35%. The mortality rate of the fishes fed with commercial feed was 66.67% and the red algae feed was 4.55% and green algae feed was 0.05% (Table 4). The initial and final weight and length of fish was noted and the total length and weight gain of the fishes were calculated as seen in (Table 4).

In our study the ornamental fish, white mollies- *Poecilia sphenops* were reared in aquarium tanks and algal diet was formulated, that supported the growth and survival rate of the mollies. Red algae-*Porphyra indica* and green algae – *Codium decorticatum* was selected as it may serve as a potential feed for the fishes and the study was conducted to assess the growth and survival rate of the fishes.The marine algae*Codium decorticatum and Porphyra indica* species washed prepared and was mixed with corn and given to white molly for 60 days and it was found that this feed proves to be the best feed in all the stages of its growth and survival. Similar work found that black mollies fed a red algae diet (*Halymenia dilatata*) had a survival rate of up to 99% over 60 days, outperforming those on commercial feed (Amthul*et al*.,2019). Complete diets should supply all the ingredients that are necessary for optimal growth and health of the fish. (Altaff*et al.,*2015). In our present study white mollies were reared in aquarium tanks and algal diet was formulated, that supported the growth and survival rate of the mollies. Fisheries play a significant role not only in nutrition, but also income, employment and foreign exchange earning of the country.

CONCLUSION

Algae, both micro and macro, offer significant commercial benefits, especially in enhancing the nutritional quality of fish feed and promoting aquaculture productivity. They contain bioactive compounds like flavonoids, alkaloids, coumarin, and terpenoids that enhance antioxidant, antiviral, and anti-inflammatory properties, crucial for fish health and growth. Marine green algae like *Codium decorticatum* and red algae like *Porphyra indica* were found particularly beneficial as fish feed, supporting growth, survival, and reproductive capacity. Utilizing algae feed can reduce costs in ornamental fish farming and potentially improve profitability while providing a nutritious alternative to conventional feeds sourced from the sea.

ABSTRACT

Earthen vessels have served as a traditional method for water storage for ages. Uṣnodaka, derived from the Sanskrit words "*Ushna*" meaning warm and "*Udaka*" meaning water, refers to the practice of partially boiling water in earthen vessels. This traditional method is believed to enhance the taste and perceived health benefits of water. This study examines the impact of boiling and volume reduction on the characteristics of Uṣnodaka prepared in earthenware. Our goal is to clarify how half reduced boiling and condensing earthen water affects its chemical composition, with an emphasis on possible leaching from the clay and mineral content, particularly focusing on mineral content. Now a days there is a trend of cooking food in earthen vessels, according to some news articles the benefit of earthen cookware is making food aromatic, retaining the nutrition and providing required minerals that include calcium, magnesium, iron and phosphorus. By analysing these aspects, this research seeks to contribute to a comprehensive understanding of the interaction between earthenware and water. Overall, the impact of earthen vessel water on health is generally positive, and its benefits may include improved digestion, better hydration, and potential antimicrobial properties.

Keywords: Earthen vessel, half-reduced water, physicochemical analysis, Uṣnodaka, drinking water

INTRODUCTION

Throughout ancient times, clay-made earthenware containers have been a vital component of water storage systems. Regarding the possible effect of earthenware on the properties of water, these conventional methods pose interesting questions. This study looks at how reduction and boiling affect the properties of water in earthen vessels. A procedure or treatment that improves the quality and potency of a substance is referred in Ayurveda as a "Saṃskāra". Boiling water until it reduces to half in an earthen vessel creates a Saṃskāra that can improve the qualities and attributes of the water. We aim to investigate how boiling and concentrating earthenware water, by reducing its volume by half, influences its Chemical composition. By analysing these aspects, we expect to obtain insight into the possible advantages and downsides of this ancient water treatment approach. This research might lead to a better knowledge of the interaction between earthenware and water and informing choices about water storage and consumption.

Review of Literature

Usnodaka

According to Acharya Sushruta, Uṣnodakashould be prepared by half-reducing water.

Digestive fire is stimulated by the Uṣnodaka due to its *Deepana* and *Pachana*properties, it disintegrates *kapha*, carries *pitta* and *vata*in their normal courses.

Absolute Usnodaka

Acharya defines optimal Uṣnodaka based on water characteristics and reduction. Acharya Shushrut and Vagbhat mentioned that when the water is boiled and reduced to 1/4th, 1/3rd, 1/2nd, For optimal results, choose Uṣnodaka that is free of foam or froth, motionless, and light in weight.

Usnodakaguna Karma

In Ayurvedic Classics the Various properties of Usnogakais mentioned by Acharyas Which is summerised in the table.

AṢTA ĀHĀR VIDHI VIŚEṢĀYATANA

In Ayurveda special condition which needs to be followed for obtaining benefits of food and drinks are mentioned under AṣtaĀhār Vidhi Viśeṣāyatana. *Karana* (processing) is the creation or refining of Dravya or Saṃskāra that enhance the qualities of substances. These qualities are conferred via contact with water and fire, as well as the medium chosen for storage or processing. Bhājanamethod comes under *Karana*, means Pātra, vessel orutensil by the influence of utensil the quality of food is changed. The water heated over an earthern vessel Useful to cleanse out waste products (mala) Dhatu Sāmyakara - balances Dosha and body tissues. Improves *Veerya* – potency *BalaOjaskara*- improves immunity and strength. [15]

Assessment of Water Quality

Due to increasing urbanization, surface water is getting over contaminated and more stringent treatments would be required to make surface water potable. Therefore, it is required to additional sources for fulfill the requirement of water. Because the ground water sources are safe and potable for drinking and other useful purposes of human being. Hence studies of physico-chemical characteristics of underground water to find out whether it is fit for drinking or some other beneficial uses.

Parameters to be Analyzed

For the assessment of Drinking tap water and Uṣnodaka prepared from it, Following drinking water parameters are analyzed (1)pH (2)Turbidity (3) Colour (4) Odour (5) Total Dissolved Solids (6)Conductance (7)P alkalinity (8)M alkalinity (9)Total alkalinity (10)Chloride(11)Sulphate (12)Calcium (13)Magnesium (14)Total Hardness(15)Iron as Fe (16)SiO2 (17)Lead(18) Zinc (19)Copper (20)Arsenic (21)Tin

Aim

- To assess the physicochemical properties of Uṣnodaka prepared in Earthen vessel.

Objectives

- To prepare Uṣnodaka in Earthen vessel using distilled water.
- To prepare Uṣnodaka in Earthen vessel using drinking tap water.
- To assess the physicochemical properties of Uṣnodaka prepared in Earthen vessel using distilled water.
- To assess the physicochemical properties of Uṣnodaka prepared in Earthen vessel using drinking tap water.

METHODOLOGY

Study was done in two parts.

1. Uṣnodakawas prepared in a Earthen vessel.

SOP FOR UṢNODAKA PREPARATIONIN EARTHEN VESSEL

- Preparation of Uṣnodaka in Earthen vessel using distilled water. Firstly, distilled water was taken in Earthen container. 2 litre water was boiled and reduced up to half quantity of water that is 1 litre in earthen container.
- Preparation of Uṣnodaka in earthen vessel using drinking tap water. Drinking tap water was collected from the local area in earthen container. 2 litre water was heated and reduced up to half quantity of water 1 litre in earthen container.

2. **Physicochemical analysis of Uṣnodaka** wasprepared using distilled water and drinking tap water in earthen vessel was done.

- Experiments were conducted in a well sophisticated environmental laboratory at Met-chem laboratories, SayajiGunj, Vadodara.

A. Organoleptic characters – colour, odour

B.Physicochemical assessment - pH, TDS, Hardness, Alkalinity etc.

- Basic water quality parameters such as pH, total dissolved solids (TDS), alkalinity electrical conductivity (EC), hardness were performed for both prepared water from earthen vessel.

RESULT

Sr. no	Test	Composition of distilled water	Half reduced distilled water prepared in earthen vessel	Composition of drinking tap water	Half reduced drinking tap water prepared in earthen vessel	Normal values of drinking tap water(Require as per IS 10500)
1	Colour	Colourless	Colourless	Colourless	Colourless	Colourless
2	Odour	Odourless	Slight bad	Odourless	Slight bad	Agreeable
3	PH	5.6 to 7	6.3	7.5	8.3	6.5 – 8.5
4	Total dissolved solids in ppm	0.5 or less	216	355	457	500
5	Electrical conductance in Micro Mhos/cm	0.5- 3	332	546	703	200-800
6	Turbidity in NTU	<0.1	12	< 1	10	1
7	Temporary Hardness in ppm	Close to 0	75	94	245.05	200
8	Ca in ppm	Absent	16	24	64	75
9	Mg in ppm	Absent	10	10	24	30

10	Sulphate in ppm	Absent	10	30	40	200
11	Total Alkalinity in ppm	Absent	60	160	380	200
12	Alkalinity due to phenolphthalein in ppm	Absent	Absent	Absent	100	Absent
13	Alkalinity due to methyl orange in ppm	Absent	60	160	280	30 to 400
14	Fe (iron) in ppm	Absent	< 5	Absent	< 1	0.3
15	Chloride in ppm	Absent	71	71	319	250
16	Sio2 in ppm	Absent	< 5	Absent	1.5	5 - 25
17	Copper in ppm	Absent	Absent	Absent	< 1	0.05
18	Lead in ppm	Absent	Absent	Absent	< 1	0.01
19	Arsenic in ppm	Absent	Absent	Absent	< 1	0.01
20	Zinc in ppm	Absent	Absent	Absent	< 1	5
21	Tin in ppm	Absent	Absent	Absent	< 1	Non specific

DISCUSSION

After analyzing the data provided, it is clear that distilled water and drinking tap water have different compositions and properties, which can affect their quality and suitability for various uses. Distilled water, when prepared in an earthen vessel and reduced by half, retains its colorlessness and odorlessness, with a pH range of 5.6 to 8, and very low levels of suspended and total dissolved solids. Its electrical conductance and turbidity are also minimal. On the other hand, drinking tap water has higher levels of dissolved solids, including temporary hardness, calcium, magnesium, sulfate, chloride, and other ions, depending on the source and treatment process. Its pH and alkalinity values also vary, impacting its taste and suitability for consumption. Reducing drinking tap water by half in an earthen vessel can alter its composition and properties due to potential interactions with the vessel's surface and the dissolution of minerals from it. This results in higher values of suspended and total dissolved solids, electrical conductance and turbidity. When comparing the data against the IS 10500 standards for drinking water, the tap water values fall within the acceptable range, although the temporary hardness, calcium, magnesium, and sulfate levels are towards the upper end. Additionally, the alkalinity due to phenolphthalein and methyl orange is within the recommended range, while iron and chloride levels are below the maximum limit. Other parameters, like copper, lead, arsenic, and zinc, are absent or below the detection limit in both distilled and drinking tap water.

CONCLUSION

In conclusion, the Uṣnodaka has significant change in mineral content, and the effects of reduction processes on water composition. The higher pH and TDS levels and mineral content in half-reduced drinking tap water are found. Drinking tap water remains suitable for consumption and provided it meets the specified standards. Using earthen vessels to reduce water volume may affect its quality, depending on the material and quality of drinking water.

Further Scope of Study

Effect of Uṣnodaka can be analysed on Animals and Humans.

ABSTRACT

The development of gastrointestinal symptoms has been related to disruptions in circadian rhythms in the colon. If these symptoms are not treated, they can result in significant illnesses such as IBS, ulcerative colitis, and other GI disorders. This study sought to ascertain the frequency of gastrointestinal symptoms among college students as well as the impact of dietary practices on their GI symptoms. A pilot study was carried out among the fifty students of PSG College of Arts & Science, using a self-administered questionnaire consisting of Socio-demographic information, Food Frequency Questionnaire, and the Gastro Intestinal Rating Scale (GSRS) questionnaire. The symptoms such as indigestion, constipation, diarrhoea, reflux syndrome, and stomach discomfort would be evaluated by the GSRS. Each student's total symptom score and the severity of symptoms were evaluated using a five-point Likert scale. Using the Food Frequency Questionnaire (FFQ), assessed the food choices associated with the occurrence of GI symptoms in these students. A statistical application was used to interpret the survey results. Increased consumption of junk food, erratic eating behaviours, and disrupted sleep cycles were the most common risk factors for the development of gastrointestinal problems. It is recommended to change their food habits, sleeping patterns, and lifestyle routines to reduce their likelihood of acquiring gastro intestinal symptoms.

Keywords: Gastro intestinal symptoms, constipation, stomach discomfort, reflux syndrome, lifestyle modification

INTRODUCTION

College students are transitioning from youth to adulthood between the ages of 18 and 24, in which they tend to practice poor eating habits and physical activity. Globally, there has been an increased intake of energy-dense foods that are high in fat, salt and sugars but low in vitamins, minerals and other micronutrients among college students (WHO, 2011). Such changes in eating habits, stress levels, and lifestyle during college may create an environment that is more favorable for the development or aggravation of gastrointestinal issues among the students. The prevalence of functional gastrointestinal complaints is more common in young adults. It is notable that over one-third of the young people, up to 65% have been seeking medical attention for gastrointestinal issues (Vivier *et al.,* 2020). The term "gastrointestinal symptoms" refers to a wide range of discomforts and digestive system problems, from the occasional case of indigestion to more chronic conditions like inflammatory bowel disease (IBD) and irritable bowel syndrome (IBS). Goyal *et al.,* 2021 reported that bloating and stomach pain/discomfort are frequently cited as the more bothersome and frequent symptoms, particularly in those with a condition called irritable bowel syndrome (IBS), which can have an impact on everyday living. Women are possibly more vulnerable to hormone issues than men, especially when it comes to constipation. IBS can be due to abnormal bowel habits caused by altered gut flora, inactivity, and changed sleep patterns. Consumption of processed, fast, or junk food has, nevertheless, been connected to functional gastrointestinal symptoms. Dietary interventions for functional bowel disorders also include low-carb, low-lactose, low-glucose, low-FODMAPS (fermentable oligosaccharides, disaccharides, monosaccharides, and polyols) diets has been suggested by (Elsayed *et al.,* 2021) Treatment and management of these GI symptoms can emanate from changes in lifestyle. Lifestyle modifications are essential to alleviate these symptoms as well as its underlying causes that, this condition can often produce. Lifestyle changes are considered non- pharmacological management strategies which includes: eating a regular diet rich in soluble fibre, probiotics, smaller meals eaten at the same time every day, drinking three to four liters of water, chewing food slowly for optimal digestion, giving up alcohol, caffeine, and tobacco; and maintaining a food journal (Dolan *et al.,* 2018) Villoria *et al.,* 2008 stated in their study that exercise, such riding a bicycle will lowers gas and prevents GI problems. Additionally, practicing yoga helps adults and adolescents to reduce IBS symptoms. Patients with IBS have been found to have low sympathetic tone, which can be raised by pranayama yoga. Therefore, regulation of circadian rhythm with lifestyle modifications are one of the most important interventions for the patients with irritable bowel syndrome to reduce the IBS symptoms and improve quality of life. Given the fact that students possess poor dietary habits and lifestyle, which are the common cause for IBS. The aims of our current study were to estimate the prevalence of IBS and to assess the association of lifestyle factors with IBS among the students from Coimbatore.

MATERIALS AND METHODS

A cross-sectional study was used to conduct this research. The study sample are college students from Coimbatore.
Subjects: A purposive sample of 50 students were recruited in this study according to the following;

Inclusion criteria
Students of both the genders.

Exclusion criteria
Students who are not willing to participate.

Study methods
A self-administered questionnaire that involved information about:
I PART: consists of socio demographic profile, history of gastro intestinal problems, lifestyle, sleeping pattern, food frequency and dietary habits.

II PART: GSRS questionnaire- is a validated, self-administered questionnaire, which assess the severity of GI symptoms using 5-point Likert scale in five domains such as Abdominal Pain, Reflux syndrome, Diarrhea, Indigestion and Constipation.

Method of data collection

After explaining the study purpose and objectives to the respondents, researcher obtained their consent to collect the data from those who met the study criteria. After that, data was collected by face-to-face interview schedule method. It took around 5-10 minutes for each respondent.

Data Analysis

The obtained data were coded and tabulated using SPSS version 20. Descriptive analysis of data was carried out using frequencies, percentages, means and standard deviations. For assessment of the correlation between variables Pearson correlation(r) was used at significant level of P value ≤ 0.05.

RESULTS

Table (1) shows that 48% of the participants were female and 52% of the participants were male. Of them, 56% were in the 20–23 years of age. In terms of socio-demographic information, all 50 participants were single. 36 per cent had completed higher secondary education followed by under graduation of about 30%. 80 percent were from nuclear families. Nearly 62% of the participants were hostellers. Their monthly family income ranged from 50,000 to 1,000,000 on average. There was no statistical difference found between the presence of Gastro Intestinal symptoms and socio demographic data of the respondents. From Table (2), Anthropometric data indicates that 50% of participants falls between the BMI of 19- 24, placing them in the normal group. In terms of past medical history, 36 percent of college students stated that they had previously experienced stomach issues such as dyspepsia, appendicitis, or ulcers. It also shows that 20% of them were taking medication. Neither the participant's anthropometric measurements nor their prior medical history indicated a significant difference in the presence of gastrointestinal issues. Table (3) represents that more than half of the participants were practicing sedentary lifestyle with irregular sleep cycle which are positively correlated with a presence of GI symptoms with statistically significant level of $P \leq 0.05$. Regarding food habit of the participants, 90% were non-vegetarians and 44% of them has a habit of skipping their breakfast due to lack of time. From the study, it is evident that there is no association found between food habit, skipping meals and presence of GI symptoms among the participants. The aforementioned table displays the food frequency of the respondents. Almost everyone reported regular consumption of cereals and pulses. Merely 66% of the participants reported consuming milk and milk products. Thirty percent of the population regularly consumes fruits and nuts, whereas less than half of them eat any form of vegetable. More than 50% of the participants routinely consume processed and fatty food items in some form. Above Figure illustrates that the overall prevalence of GI symptoms among the individuals was determined to be 56%. The most prevalent GI symptom reported by the participants was indigestion (88%) followed by reflux syndrome (86%) and constipation (60%). The occurrence of diarrhea and abdominal pain was lesser than the other GI symptoms. Table (5) presents that daily consumption of fatty foods & sugar products was highly correlated with reflux syndrome and indigestion with statistically significant differences. Also, consumption of junks & beverages was associated with presence of indigestion with significant difference ($P \leq 0.05$). Hence, reflux syndrome and indigestion will increase significantly with increase in consumption of fatty foods, sugar products and junks. It also shows that consumption of fruits & nuts has negatively correlated with constipation, which means increased consumption of fruits & nuts will eventually decrease the presence of constipation. There are negligible ($P \geq 0.05$) correlations found between the existence of GI symptoms and the consumption of grains, pulses, milk products, greens, and other vegetables.

DISCUSSION

(William *et al.,* 2020) observed that disruption of circadian rhythm has an effect on the function of gastro intestinal tract and are associated with GI symptoms and diseases. In this study, the overall prevalence of GI symptoms among college students were (56%) in which it has no association with socio demographic profile of the participants. Similar findings have been reported by (Ahmed *et al*., 2017), that there is no correlation in their study between GI symptoms and socio demographic profile of night shift workers. Majority of the college students were led a sedentary lifestyle, showing a statistically significant difference ($p \leq 0.05$) with presence of GI symptoms. (AlButaysh *et al.,* 2020) reported the same findings in his epidemiological study of IBS and its association with lifestyle among US students. Therefore, we could infer that having an active lifestyle will improve the metabolism and gut motility which will eventually lower the chance for GI symptoms. Regarding the BMI of participants, 50% of them comes under the normal category (17.5-24.5). Hence, there is no association with presence of GI symptoms which is similar to the study of (Akhondi *et al.,* 2019), where he reported an association between GI symptoms and obese people than normal people as obese people will have reduced BMR and hormonal imbalances due to insulin resistance, which is a common factor gastrointestinal symptom. Our study has no association between GI symptoms and participants with the habit of skipping meals. In contrast, (Vakhshuury & Khandal, 2019) reported in their cross- sectional study that there is a significant difference between skipping the breakfast and GI symptoms among the hostel students. This might be due to limited study population, in which more than 50% of the students were not skipping their meal in our study. Frequency distribution of GI symptoms using Gastrointestinal Symptom Rating Scal (GSRS) among the college students shows that indigestion was more prevalent (88%), followed by reflux syndrome (86%) and constipation (60%). In his study, Ahmed et al., 2017 employed a similar GSRS technique wherein the findings indicated that night shift workers had a higher prevalence of reflux syndrome.

Diarrhoea and abdominal pain have not been as common as the symptoms in their study. In terms of food frequency, over 95% of the participants consume cereals and pulses every day, and there is no statistical difference in their occurrence of gastrointestinal problems. Similarly, there is no correlation between the daily consumption of milk products (66%) and the occurrence of GI problems. Aufieri *et al*., 2021 demonstrated in his study that although the majority of students consumed foods high in wheat, such as pizza, pasta, and bread rolls, there was no discernible link between these foods and gastrointestinal complaints. Considering the consumption of green leafy vegetables, only 4% consume daily and 60% consume occasionally because most of the students were residing in hostel and are following the fixed cyclic menu which lacks fibre. There is an insignificant difference with presence of GI symptoms ($P \geq 0.05$). Frequency of other vegetables consumption has no association with occurrence of GI symptoms ($P \geq 0.05$). Conversely, a study by (Shau *et al.,* 2016) revealed that eating enough greens and vegetables had a lower correlation with GI symptoms. He also mentioned that fiber has long been utilized to treat a variety of gastrointestinal issues. Our study revealed that daily consumption of fruits & nuts has negatively correlated with the presence of constipation and has no statistical difference with other GI symptoms ($P \geq 0.05$). Daily consumption of fatty foods & sugar products (80%) has positively correlated with presence of reflux syndrome and indigestion which shows a statistically significant difference using Pearson's correlation ($P \leq 0.05$). Cinquetti *et al.,* 2021) found the same findings in their study that the high consumption of soft drinks, pasta, and sweets were associated with presence of indigestion and reflux syndrome using Pearson's correlation test and also documented that they contain high concentrations of fermentable oligosaccharides, disaccharides, monosaccharides, and polyols (fermentable oligosaccharides, disaccharides, monosaccharides, and polyols; FODMAPs) in these foods. Similarly, in our study frequency of junks and beverage consumption (72%) has shown association with presence of indigestion using Pearson's correlation with statistical difference of ($P \leq 0.05$).

CONCLUSION

It was observed that students between the ages of 18-23 are associated with the presence of Gastro intestinal Symptoms. There was a greater severity of gastrointestinal symptoms among college students who are sedentary and

have irregular sleep cycle. In addition, the correlations between gastro intestinal symptoms and the consumption of junk foods, chocolates, sugar products were significant and the intake of these foods should be avoided or reduced by symptomatic students. It is recommended that modifications to fix their lifestyle, sleep pattern and practicing healthy eating habits should be followed, which may decrease the risk of developing gastro intestinal diseases.

ABSTRACT

Foreign body airway obstruction (FBAO) causes suffocation and is a terrifying condition that comes unexpectedly, leaving the patient unable to define what is happening. If not treated swiftly and effectively, it can result in a rapid loss of consciousness and even death. Foreign body airway obstruction (FBAO) is a reasonably common emergency that can result in abrupt death in both youngsters and the elderly; bystanders' prompt intervention will influence the victim's prognosis. Although several basic life support (BLS) training programmes for schoolchildren have been developed in recent years, there is a dearth of references to FBAO specific training.

Keywords: management of foreign body obstruction, level of knowledge

INTRODUCTION

Foreign body (FB) ingestion in children is highly frequent, with the majority of cases occurring between the ages of six months and three years. Notably, 80percentage-90 percentage of FBs in the gastrointestinal (GI) tract pass naturally without difficulties, with 10percentage-20 percentage removed endoscopically and 1percentage requiring open surgery due to complications. Thus, FB consumption creates a considerable clinical challenge in paediatric gastroenterology treatment. In 2000, the American Association of Poison Control Centres stated that 75percentage of over 116,000 FB ingestions included children under the age of five. The majority of swallowed FBs pass through the GI system without issues, while a few youngsters require endoscopic or surgical removal. However, the best indications and/or timing for these operations to be performed in children remain debatable. Fortunately, more than 90 percentage of oesophageal FBs are evacuated spontaneously and without difficulties; but, a few cannot readily pass via the pylorus, stomach, duodenum, ileocecal valve, Meckel's diverticulum, and/or anus, thus 10% of swallowed FBs may linger in the GI tractThe timing of endoscopy in children with ingested FBs should be determined by the child's age or body weight, clinical presentation, time since the last meal, time lapse since ingestion, type, as well as the size and shape of the FB and its current location in the GI tract. Recently, owing to developments in and greater awareness of the usefulness of upper GI endoscopy in children, endoscopic removal of FBs is commonly considered an option in addition to waiting for spontaneous passage. If endoscopic removal of the FB is not an emergency or an absolute indication, the risk-benefit ratio should be assessed in terms of analysing the difficulties predicted to develop as a result of the FB itself as well as those subsequent to the FB removal operation.
Children's attributes like as age and weight differ, as do the type and amount of the FBs consumed. Furthermore, endoscopic excision of FBs is more difficult in young children than in adults. As a result, it is difficult to establish the best time for endoscopic FB removal. In this article, the author discusses the many forms and features of FBs in the paediatric GI tract, as well as the reasons and precautions for endoscopic removal.

Objectives of The Study

1. Determine the mother’s level of knowledge of managing foreign body obstruction.
2. To find out the association between the mother’s level of knowledge with their selected demographic variables.

Hypothesis

H1: There will be significant investigate the degree of awareness on management of foreign body obstruction for children among mothers.
H2: Mother’s selected demographic characteristics are significantly associated with their level of knowledge of foreign body obstruction.

MATERIALS AND METHODS

This study employed a descriptive research methodology to analyses mothers' knowledge of managing foreign body blockage for children in a specific location of Puducherry. The investigation was carried out utilizing the convenient sampling approach. The results were obtained using both descriptive and inferential statistics.

Data Collection Tool

Using the easy sampling approach, 10 samples were picked. After selection, the researcher would present me to the participants. The researcher's next step will be to collect data on six demographic characteristics from moms. Following the collection of demographic characteristics, the researcher delivered the tool to the samples. After evaluating the instrument, the researcher assessed the level of knowledge using the questionnaire tool.

Statistical Analysis

Data was analyzed using descriptive and inferential statistics. The connection between the chosen demographic variables was analyzed using the chi square test. A "p" value of 0.001 was considered statistically significant for

interpreting the data. For ease of comprehension, the analysis and graphs are created in line with the data presented above.

RESULTS AND DISCUSSION

Sociodemographic variables: Ten moms from Puducherry were chosen; of the mothers, three (30%) were between the ages of 21 and 25, 6 (60%) were between the ages of 25 and 30, and one was beyond the age of 35 (10%). Occupational status was more than unemployed 5 (50%). All of the moms were Hindu 10 (100%).In terms of educational status, the majority of them 9(90%) were uneducated. The majority of mothers had previously been exposed to foreign body blockage in their children 6(60%). The majority of mothers 6(60%) attended lessons on foreign body obstruction.

Section A: Frequency and percentage wise distribution of demographic variables among mothers
Section B: Assessment of the level of knowledge on management of foreign body Obstruction in children among mothers with their selected demographic variables.
This table shows that an assessing the level of knowledge on management of foreign body obstruction among the 10 mothers; the mothers having inadequate knowledge 1(10%), moderate knowledge is 4(40%), and adequate knowledge has 5(50%).
Section C: Comparison Of Mean And Standard Deviation Majority of the mothers 5 (50%) have adequate knowledge and moderate knowledge 4 (40%) and only 1 (10%) had inadequate knowledge. Calculate mean value was 9.26 and standard deviation was 2.16.

CONCLUSION

The study findings show that majority of nurse having moderate knowledge regarding foreign body obstruction. The mothers having moderate knowledge are previous experience to foreign body obstruction in children. Hence the formulated hypothesis was accepted.

ABSTRACT

Migraine is a recurrent headache disorder typically characterized by pain that affects one side of the head. According to the International Headache Society, migraines account for approximately 16% of primary headaches and impact 10-20% of the global population. In Ayurvedic literature, *Ardhavabhedaka* is a condition mentioned under *Shiroroga* (head diseases), which closely aligns with the modern understanding of migraines. *Nasya Karma*, a therapeutic nasal administration technique, is regarded as an effective treatment for *Shiroroga* by the *Acharya Sushruta*. In *yogaratnakara* text, *Acharya* recommends *sharirikaShodhana* before the treatment of *ardhavbhedaka*. In light of this, a single case study was conducted to evaluate the effectiveness of *virechana* and *Anu Taila Nasya* in managing migraine symptoms. Remarkable improvements were observed in the clinical features of the migraine after 15 days of treatment. Here, a 30-year-old female patient came to the hospital with the complaints of headache at right side of the head for 1 year with the interval of every 15 days. The case was diagnosed with *Ardhavbhedaka*. Patient's treatment started with *shodhana chikitsa*, classical *virechana* with *Eranda tailaSneha*, followed by *Nasya* with *Anu taila* for 7 days. Patient had satisfactory relief after treatment. Follow up was taken after 15 days and after 1-month, Significant relief was seen in patient's condition.

Keywords: *Ardhavbhedaka*, Migraine, *Nasya*, *Sharirika shodhana*, *Virechana*

INTRODUCTION

Ardhavabhedaka, also known as *Ardha Mastak Vedana*, is one of the 11 types of *Shirorogas* (head disorders) described by *Acharya Sushruta* in *Ayurveda*. This condition is characterized by severe pricking, piercing pain that affects one half of the head, often accompanied by giddiness. The pain can appear suddenly, sometimes after a fortnight, ten days, or without any specific pattern. According to *Sushruta*, *Ardhavabhedaka* occurs due to the vitiation of all three doshas—

Vata, Pitta, and Kapha.[1]*Acharya charaka* elaborates saying the triggering factors like *ruksha-atyadhika bhojana*, excessive exposure to *vayu*, *avashyaya, Atimaithuna, Vegadharana, Shrama, vegadharana* causes vitiation of *vata dosha, vata* alone or along with *kapha dosha* causes *teevra-vajrasamana vedana* in half side of *manya, bhru, shankha, karna*, *netra, lalata pradesha*.[2]

In Ayurvedic literature,*Nasya Karma*, a therapeutic nasal administration technique, is regarded as an effective treatment for *Shiroroga* by the *Acharya Sushruta*.[3][4] In recent times, the incidence of *Ardhavabhedaka* has been on the rise due to significant changes in lifestyle and behaviour patterns. The condition can be traced back to a series of pathological events: Nidana Sevana (exposure to causative factors) leading to *Agnimandya* (digestive fire impairment), *Aamotpatti* (formation of toxins), *Srotovarodha* (obstruction of channels), and finally, the aggravation of all three doshas which ascend to the head, manifesting the symptoms of *Ardhavabhedaka*. In modern medicine, *Ardhavabhedaka* is often correlated with migraine, a neurological condition characterized by recurrent, one-sided headaches of paroxysmal nature. Migraine attacks are frequently accompanied by other symptoms such as nausea, vomiting, photophobia (sensitivity to light), and sensory abnormalities.[5] It can manifest as either episodic or chronic, and they may occur with or without aura, which refers to sensory disturbances that precede the headache. However, migraines can also cause bilateral pain, affecting both the front and back of the head. The pain is typically described as throbbing and tends to worsen with physical activity or movement. Migraine attacks can range in severity from moderate to severe, significantly impacting the quality of life for those affected. Some of the triggering factors for the migraine are chocolate, citrus fruits, tea/coffee, alcoholic beverages, dairy products, weather changes, fasting and exhaustion etc. Here, the case is managed by *shodhana karma* and *Kriyakalpa karma*.[6]

MATERIALS AND METHOD

Case report

A 30-year-old female patient presented with the complaints of pain at right side of the head for 1 year, with episodes on every 15 days, came to OPD on date 1/5/2024.

Associated Complaints

Disturbed sleep, Irritability, Nausea, Photophobia for 6 months

History of present illness

Patient was apparently normal before 1 years,then she gradually developed episodic pain in the right side of the head occurring every 15 days, associated with nausea and disturbed sleep .She consulted to local physician; they prescribed antibiotic tablets but she did not get relief. So, she came to Parul Ayurveda Hospital for better line of management.

Past history

No H/O Diabetes mellitus, Hypertension and any other surgical illness. No H/O Trauma or accidental injury.

Family history: Not significant

Gynaecological history: Irregular menstruation

Table.1:Personal history[13], Table.2:*Ashtavidha Pariksha*[14] ,Table.3:Examination of Nose[15] ,Table.4:Examination of Ear[16], Table.5:Treatment Given[17], Table.6:Examination of Nose[18], Table.7:Examination of Ear[19], Table.8:Numeric Pain Rating Scale[7][20] ,Table.9:Medicine on Discharge[21],

Vitals: Physical Examination

Respiratory Rate: 24/min	Height: 160cm
Blood Pressure- 120/70 mmHg	Weight: 58 Kg
Temperature: 97 ºF.	Pallor: No Pallor
Pulse Rate- 68/ min	Lymphadenopathy: No lymphadenopathy

Numeric Pain Rating (Before Treatment): 8 (Severe)

Observation

To prepare for *Virechana Karma*, a two-day regimen of *Deepana-Pachana* was administered. This was followed by *Snehapana*, which was carried out over the course of five days. Upon observing the appearance of *Samyak Snigdha Lakshanas*, a two-day interval was allowed for *Abhyanga* and *Swedana*. On the 10th day, the *Virechana* procedure was conducted. The patient was then instructed to adhere to *Samsarjana Krama* for a period of five days. After this phase, the patient was scheduled for a follow-up to initiate *Nasya Karma* for further treatment.

Examination of sinus: Tenderness at right frontal sinus .

Numeric Pain Rating(After Treatment): 3 (Mild).

RESULT

Following the classical *Virechana* therapy, the patient reported a noticeable lightness throughout her body and a significant reduction in headache intensity. Additionally, her sleep quality improved by 20%, and she experienced relief from nausea. Upon initiating *Nasya Chikitsa*, the patient's pain score improved by 50%, and her sleep, which had been disrupted by nighttime pain, also showed improvement. By the conclusion of the 7-day *Nasya* regimen, the patient exhibited substantial progress, with a marked decrease in headache severity, sleep disturbances, and nausea, indicating a successful therapeutic outcome.

DISCUSSION

Ardhavbhedaka is often challenging to diagnose because it relies heavily on the patient's subjective experience of symptoms, which can only be verified by the individual suffering from it. In Modern, Itcan be correlated with Migraine, a condition that aligns with *Ardhavbhedaka* in terms of its etiopathology, symptomatology, and prognosis. *Ardhavabhedaka* is described as a disorder involving an imbalance of the three doshas (*Tridoshaja Vyadhi*) according to *AcharyaSushruta*. In contrast, *Charaka* classifies it as *Vata-Kaphaja*, and *Vagbh*atta considers it primarily a *Vataja* condition.[8] The *Yogaratnakara* text emphasizes that in the *chikitsakrama* (treatment protocol) for *Ardhavabhedaka* (migraine), the initial step should be *Snehapana*, which addresses the *Abhyantarik Rukshata* (internal dryness) of the patient. This is followed by *Swedana* to liquefy and expel the *Avaruddha Doshas* (obstructed doshas) from the *Srotas* (channels). Subsequently, *Udarashuddhi* (cleansing of the abdomen) through *Virechana* is recommended. After achieving *Udarshuddhi*, the next step is *Kayashuddhi*, specifically *Mastishka Shuddhi* (cleansing of the head), which is accomplished through the administration of *Nasya Karma*.[9]

विरेकः कायशुद्धिश्च धूपः स्निग्धोष्णभोजनम् ।। (यो.र.)

Here, the case was managed by enhancing *Agni* by *Deepana-Pachana*, *Panchkarma* procedure, *Virechana*. *Snehapana* with *Goghrita* and *Virechana* with *Erandataila Sneha*. followed by *Kriyakalpa* procedure, *Nasya karma* with *Anutaila* ,steam inhalation. *Chitrakadi Vati* as a formulation that effectively pacifies aggravated *Kapha* due to its *Laghu* (light), *Tikshna* (sharp), and *Ruksha* (dry) *Gunas*, along with its *Katu* (pungent) and *Tikta* (bitter) *Rasa*, which are predominantly

composed of *Agni* (fire), *Vayu* (air), and *Akasha* (ether) *Mahabhutas*. The *Usna Virya* (hot potency) and *Tikshna, Snigdha* (unctuous) properties help to counterbalance *Vata*. Additionally, its *Madhura Rasa* (sweet taste), characterized by *Snigdha Guna, AnushnasitaVirya* (mild cooling potency), and *Madhura Vipaka* (sweet post-digestive effect), aids in stabilizing Pitta. Overall, *Chitrakadi Vati* enhances *Agni* (digestive fire), making it beneficial for conditions like *Grahani* and *Agnimandya* (weak digestion). Its *Deepana* (appetizing), *Pachana* (digestive), and *Grahi* (absorbent) properties, combined with *Ruksha Guna*, help to reduce *Srotogata Ama* (toxins in the channels) and *Pichhilata* (stickiness), thereby alleviating *Ati Pravrutti* (excessive discharge). The formulation's *Deepana, Pachana,* and *Rochana* (appetizing) properties, along with its *Katu, Lavana* (salty), *Tikta, Amla* (sour) *Rasa,* and *Laghu*, *Tikshna, Ruksha Gunas*, as well as its *Usna Virya*, collectively stimulate *Jatharagni*, which in turn activates all other *Agnis* in the body.[10] *Virechana Karma* is a widely recognized purification process within *Panchakarma*. This therapy enhances metabolism and nutrient assimilation by stimulating the metabolism at tissue level(*Dhatwagni)*, while effectively eliminating metabolic waste, particularly targeting the *Pitta* and *Kapha doshas*, and burning *Ama*. *Virechana* helps in reducing excessive body heat and provides a deep cleansing of the blood, liver, and bile. In short, it detoxifies the body, thereby stimulating the hypothalamus-Pituitary axis and balancing the endocrinal secretions. Additionally, it boosts the functions of motor and sensory organs, strengthens the body tissues, and rejuvenates overall health.[11] In this context, *Erandataila* was utilized as the *Virechana Dravya*. *Srotorodha*, or blockage of the body's channels, is a key factor in the development of diseases. Due to its *Sukshma Guna* (subtle quality),*Erandataila* is able to penetrate minute channels and its *Srotovishodhana* property ensures thorough cleansing of these pathways. It enhances cognitive functions, memory, and overall health, promoting *Medha* (intellect), *Kanti* (complexion), *Bala* (strength), and *Arogya* (well-being). *Erandataila*, being a gentle and safe purgative, can be administered after assessing the severity of the disease, the patient's digestive fire (*Agni*), and their overall strength. It is particularly effective in treating *Urdhvajatrugata rogas*, where channels in the upper body are blocked by mucoid or sticky secretions, as it helps to clear these obstructions.

Mode of action of Nasya karma

Nasya Karma is a specialized therapeutic procedure in *Ayurveda* that involves administering medication through the nasal passages. *Acharya Charaka* and *Vagbhata* explain that the medicine quickly spreads through the *Sira* (channels) and is absorbed, effectively eliminating the *vikrutdoshas* located in the *Urdhva Jatrugata Pradesha* (upper respiratory tract). To enhance drug absorption, *Urdhvajatrugata Abhyanga* (massage) and *Swedana* (fomentation) are performed before *Nasya*. The patient's head is positioned lower during administration, allowing the medicine to remain in the nasopharynx for an extended period, increasing its contact with the mucosa. Once absorbed, the medicine can travel via neural pathways (such as the olfactory and trigeminal nerves) and circulatory routes (like the cavernous sinus) to reach its target, impacting various systems, including the limbic system, sensory and motor functions, and general circulation, which may result in either excitation or sedation. *Anutaila* is often chosen for *Nasya* due to its ability to spread through fine channels. Its characteristics, including *Tikta-Katu Rasa* (bitter-pungent taste), *Laghu-Tikshna Guna* (light-sharp quality), *Ushna Veerya* (heating potency), and *Katu-Vipaka* (pungent post-digestive effect), help cleanse the nasal channels. This process clears obstructions in the sinus openings, promotes drainage, and reduces excessive discharge. Additionally, *Anutaila's* properties like *Indriyadardhyakaratwa* (strengthening the senses), *Balya* (strengthening), *Preenana* (nourishing), and *Brimhana* (bulk-promoting) enhance both local and systemic immunity. Ingredients with *Madhura Rasa* (sweet taste), *Sheeta Veerya* (cooling potency), *Snigdha Guna* (unctuous quality), and *Tridoshahara* (balancing all three doshas) properties nourish the *Dhatus* (tissues), supporting overall and mucosal health. Moreover, many of its components possess anti-inflammatory and bacteriostatic properties, helping to prevent secondary infections. The combined *Shamana* (pacifying) and *Shodha*na (cleansing) actions of this treatment can result into *srotoshodhana* [12] As a consequence of these well-planned treatments, the patient experienced substantial relief from their symptoms.

ABSTRACT

Assessment of hand strength is used in many clinical settings, particularly in the treatment of conditions that affect hand function.Although normative data on pinch strength are available for many countries, there is a need to determine normative data on pinch strength for different regions or countries due to regional genetic, nutritional, environmental etc. differences. The main purpose of this study was to establish normative data for pinch strength (palmar pinch, lateral or key pinch and tip to tip pinch) in 20-45 years in Gujarati population. Observational cross-sectional study was conducted on 1500 participants (750 male and 750 female). Baseline hydraulic pinch gauze was used to measure pinch strength. Pinch strength was tested using a standardized position given by American society of Hand Therapists. Measurements were taken alternately between two hands. The mean tip to tip strength, key strength and three jaw chuck strength values with dominant hand in males were 6.6kg, 8.3kg and 7.9 kg whereas in females 4.4kg, 5.9kg and 5.8kg respectively. pinch strength values with non-dominant hand males were 6.2kg, 8.0kg and 7.7 kg whereas in females 4.2kg,5.6kg and 5.5 kg respectively. The results showed significant differences in pinch strength data related to age, gender and hand dominance($p<0.05$). Norms for pinch strength are established for Gujarati population. Pinch strength is found to be higher in males

compared to females. Hand dominance also affects pinch strength. This can be used as a reference value to detect variations in pinch strength among Gujarati population of the same age.

Keywords: Tip to tip pinch strength, Key pinch strength, Palmar pinch strength, Baseline hydraulic pinch gauze, Gujarati population, Normative data.

INTRODUCTION

The hand is the most represented musculoskeletal structure in the nervous system in proportion to its size. It is a complex and well-differentiated anatomical structure. The hand must have full function and sufficient strength to handle the demands of daily living [1]. Pinch grip involves using any one finger or combination of fingers along with the thumb without contact with the palm to manipulate objects[2]. There are three types of pinch grasps: - tip to tip, pad to side prehension (also known as lateral pinch or key grip), and pad to pad or palmar prehension[3].The activities of daily living tasks involving key pinch are inserting or removing a key, eating with a spoon etc. Palmar pinch is required for holding a pen while writing etc while tip to tip pinch is required for holding fine objects like grains etc[4]. One of the important functions of the hand is the ability to grasp and manipulate an object and this ability can be affected, hindering the performance of daily living activities[2]. Strength testing for hand is easy and inexpensive and is performed frequently for evaluating the outcomes following upper extremity injuries[5]. It can be used clinically to evaluate the effectiveness of different treatment techniques in traumatic hand diseases and degenerative diseases affecting the hand[6].Therefore, pinch strength can be considered an objective outcome parameter to measure and quantify outcome before and after orthopedic and physiotherapy interventions[1]. Hand strength depends on patient's age, sex and hand dominance. Normative data for pinch strength is necessary when evaluating the impact of damage to either the musculoskeletal or nervous system of hand[7]. The application of this data in physiotherapy allows monitoring the recovery process of patients with injuries to the upper limbs[7]. To assess pinch strength, the affected and unaffected hands can be compared. However, if the contralateral side is also affected by the underlying disease or its treatment, other markers are needed.

Therefore, normative data for pinch strength in healthy people are needed. Normal pinch strength in the studies were from different countries and involved participants of different ages, genders, BMI, type of work and access to food. Mathiowetz *et al.;* determined the normative values for pinch strength for healthy adults and it was found out that the average scores of key pinch, palmar pinch and tip to tip pinch were remainedrelatively stable from 29 to 59 years of age, then gradually declined between 60 and 79 years ofa ge[8]. Prajakta Namjoshi *et al*.; conducted a study on 510 healthy individuals in Pune India population. Age group was 6 to 80 years and concluded that mean pinch strength was found to be higher in individual with age group 21 to 50 years. As age increases pinch strength increase up to 21 years and constant till 50 years after that it starts to decline as age increases[9]. At present in clinical practice normative reference data for pinch strength is used but those are either done in different countries/states or the sample size is less with different methodological considerations[10]. Thus, it is necessary to estimate the baseline value of pinch strength in Gujarati population. By assessing a person's grip strength, therapists can systematically determine the starting point of a training program and plan the progression of a strengthening program. Aim of the study was to find out normative value of pinch strength in Gujarati population. Objectives of the study were to find out difference in pinch strength in male and female in different age group and to compare pinch strength of dominant and non-dominant hand in both the genders.

METHODOLOGY

The ethical approval was obtained from the Institutional Ethics committee of Shree Swaminarayan Physiotherapy college, Ranip Ahmedabad Gujarat before implementation of the study.

Study Design
Observational cross-sectional study

Sample Size Calculation
Sample size was calculated from the result of the pilot study
(30subjects from each age group).
• It was determined by the formula

$$\text{Sample size } n = \frac{(z_{1-\alpha/2})^2 \times (\sigma)^2}{(d)^2}$$

- n = Desired number of samples
- $z_{1-\alpha/2}$ = Standardized value for the corresponding level of confidence. (At 95% CI, it is 1.96)
- d = Margin of error or rate of precision (0.2)
- σ = SD which is based on previous study or pilot study

So**,** required sample size, n =1500

Sampling
Convenience sampling

Sample collection
sample were collected in crowed places like colleges, Public and private offices, hostels, societies, markets, parks and residential homes.

Study Duration
The duration of study was from November 2023 to April 2024

Selection criteria
Inclusion Criteria
Subjects between 20-45 years of age, both male and female subjects, willing to participate in the study

Exclusion criteria
Any Known history of having orthopaedic and Neurological related issue affecting upper limb, Range of motion (ROM) deficit in upper extremity, History of trauma or pain in cervical region, any congenital or acquired deformity for the hand, subjects who do not understand the command

Procedure
Informed written consent was obtained from each participant after explaining the nature and purpose of the study in the vernacular language. Then on the basis of inclusion and exclusion criteria final subjects participated in the study. Demographic data such as age, gender, weight and height were taken of the subject. Weight was measured on standard weighing scale. Materials used were Pen, paper, chair, weighing machine, stadiometer, consent form and Standard Hydraulic pinch gauze (BASELINE*; 12-0235).

Position for measurement
Participants were familiarized with how to perform the test by a demonstration of the technique.Participants was evaluated in the standardized testing position suggested by the American Society of Hand Therapists (Fess and Moran, 1981) and Mathiowetz *et al.* (1984, 1985). Participants was seated on a chair without armrests with their feet flat on the floor, shoulder adducted and neutrally rotated, elbow flexed to 90, forearm in neutral position, the wrist slightly extended (0-15) and between 0 and 15 ulnar deviation.

In tip pinch, the pinch meter was grasped with the tips of the thumb and index finger. For key pinch grip, the pinch gauge was positioned between the pad of the thumb and the radial side of the middle phalanx of the index finger. For palmar pinch grip, the pinch gauge was grasped between the pads of the thumb, index, and long fingers. Participants was asked to squeeze as hard as they could and was encouraged by the examiner.

Number of Trials

Pinch strength measurement was started with right side and then on the left side, threetrials were performed on each hand

Rest Period: One-minute rest was given between each trial
Reading: Average of the three trails was considered as the final reading

RESULTS

Statistical Analysis

This study was undertaken to find out normative values of pinch strength i.e. tip to tip pinch, key or lateral pinch and palmar pinch in normal healthy Gujarati population. A total of 1500 individuals in the age group of 20-45 years participated in the study. The data collected was assessed. Data was analysed using Microsoft Excel and SPSS version 27. Descriptive statistics i.e. mean and standard deviation were calculated for the data according to the age group, gender and hand dominance for all types of pinch strength. Mann Whitney U test was applied for comparison between males and females for the various age groups of all 3 types of pinch strength. Furthermore, to assess the pinch strength difference between dominant and non-dominant hands the Mann Whitney U test was performed. The significance level was set at 0.05 for all inferential statistics. 86.4% participants were right-handed and 13.6% were left-handed out of 1500 participants. As left-handed subjects were less compared to right-handed, it was not feasible to provide different values for Right-handed and Left-handed subjects. It was decided to use the dominant hand instead of the side. The other side was automatically the non-dominant side. The pinch Strength are presented in Tables according to age and gender.

Normality Statistics

To check whether the data follows normal distribution or not, Shapiro-wilk test was applied at 95% confidence interval.

DISCUSSION

Pinch strength measurement using a pinch gauge is simple, easy to perform and reliable. It helps to determine results which are simple to record[2]. This study was undertaken to find out the normative values of pinch strength in normal, healthy Gujarati population. 1500 asymptomatic subjects in the age group of 20-45 years were recruited for the study. The subjects were divided into 5 class intervals 20-24,25-29,30-34,35-39 and 40-45 years. The study recruited 750 males and 750 females. The result of our study showed that the mean tip to tip pinch strength, key pinch strength and three jaw chuck pinch strength values for male dominant hand were 6.6 ± 1.7 kg, 8.3 ± 1.8 kg and7.9 ± 1.7 kg whereas for nondominant hand 6.2 ± 1.6 kg, 8.0 ± 1.7 kg and 7.7 ± 1.7 kg respectively. The mean tip to tip pinch strength, key pinch strength and three jaw chuck pinch strength values for female dominant hand where 4.4 ± 1.08 kg, 5.9 ± 1.2kg and 5.8 ± 1.2 kg whereas for non-dominant hand 4.2 ± 1.06, 5.6 ± 1.1 kg and 5.5 ± 1.2 kg respectively. The results showed that the pinch strength exertions with the dominant hand were significantly higher than those exerted by the non- dominant hand for all types of measurements. There is significant differences in the pinch strength exertions between males and females for both dominant and non-dominant hands which is generally consistent with the findings of previous research. The muscular strength differences between male and females may be attributed to different factors such as genetic differences in muscle mass or neuromuscular mass, culturally related behavioral differences and motivation to perform such trials[11]. Mathiowetz *et al* conducted a study for normative

values of grip and pinch strength in the United States. The mean grip and pinch strength of Western population was higher than that of Indians. Geographic variations and nutritional status may affect strength which may account of reduced strength in the Indian population[8]. But however, this study is in agreement with similar studies performed in Indian population. Rajni MullerPattan *et al.* conducted a similar study on the age group of 18-30 years. Tip to tip, palmer and key pinch strengthin men(3.9,6.7 and 7.2 kg) were significantly higher than women (3.2,4.71 and 4.81 kg). Sneha Vishwanath *et al* found a normative data of grip and pinch strengths in healthy adults population in the age group 20-40 years, it shows males have stronger hand strength than females[12]. Difference in pinch strength observed among the Indian and Gujarati population. Possible reason for this can be regional variation within the states of India, nature of subjects enrolled for the study in terms of their lifestyle, and age of the subjects. Dinesh Sorani *et al* also conducted study on reference values of grip and pinch strength in Gujarati population. Mean pinch grip strength in study is found to be 5.75 on right side and 5.82 on left side in males whereas 4.18 and 3.89 on right and left side respectively in females. This suggests males having higher pinch grip strength compared to females irrespective of dominancy. Pinch grip which they considered for study is only pad to pad grip[10]. Age is one of the strongest predictors of pinch strength. As age increases the pinch strength increases up to the age 21years and then it remains more or less constant till 50 years of age and after which it starts to decline as the age further increases. Our study has findings similar to a study performed by Mathiowetz V *et al.;* in healthy individuals which concluded that higher grip and pinch strength scores were found in the age group of 25-39 years [8]. Our results suggest dominant hand have higher strength than nondominant hand for all types of pinch strength. This may be as dominant hands are more functionally used for all activities of daily living. Our findings are consistent with Koley *et al* and Prachita *et al* who found dominant hand is having higher strength than non-dominant hand in both males and females though in both the studies gender difference were found with males having more strength in dominant hand and least strength in females on non-dominant side[13]. Gender is one of the most important factors where male subjects have strong pinch strength than female subjects. Our study supports the fact suggesting higher pinch strength in males better than females. Mohammadian M *et al.* investigated pinch strength in men and women and concluded that there is a significant difference between pinch strength in men and women, which may be due to gender-specific muscle fiber differences[7].

Limitations

Different factors such as anthropometric factors, occupation and level of physical activity also affect the pinch strength. Further research is needed to check if a correlation exists between pinch strength and anthropometric factors. Further studies are necessary to generate normative reference values for pinch strength for paediatric and geriatric age groups in Gujarati population.

Practical Applications

Normative data of healthy adults of Gujarati population has been established in the age group 20–45 years old. Knowledge of the normative data on hand pinch strength will be very helpful for the evaluation and treatment of hand or upper extremities injuries.

ABSTRACT

Understanding the microbial communities associated with petroleum reservoirs are crucial for optimizing exploration strategies and assessing reservoir potential. In this study, we investigate the microbial diversity present in rock samples. By analyzing the microbial composition of these rocks, we aim to identify specific microbial signatures associated with petroleum-rich environments. The study employs cutting and polishing the rock samples and mounting it in slides with the help of araldite (adhesive) and monitoring for the presence of microorganisms responsible for formation of hydrocarbons responsible for petroleum formation in the rocks. Preliminary results suggest the presence of distinct microbial assemblages associated with petroleum-bearing rocks, providing valuable insights into the biogeochemical processes underlying petroleum formation and reservoir dynamics. This research contributes to the development of microbial-based indicators for petroleum exploration and underscores the importance of microbiological approaches in understanding subsurface ecosystems and resource potential.

INTRODUCTION

The Assam Shelf in northeast India represents a well-studied sedimentary basin with significant potential for hydrocarbon exploration. The Palaeogene carbonates located in Meghalaya within the Assam Shelf are notable for their common occurrences of calcareous algae. These algae appear in various forms, including encrusting thalli, maerls, and fragments, typically found within lagoonal to proximal outer shelf facies [14, 16]. Observations indicate that the abundance of these calcareous algae increases progressively from the late Palaeocene to the middle Eocene.

This trend correlates with the evolution of a reefal environment that is rich in benthic *Foraminifera*. The dynamics of calcareous algae populations suggest an overall shallow bathymetry, a mesotrophic nutrient regime, and moderate species diversity. The presence of mastophoroid and sporolithacean corallines further indicates a tropical paleoenvironment [4]. *Foraminifera* are a diverse group of single-celled protists. They are distinct from plants, animals, and fungi and are predominantly marine organisms, although certain species also inhabit freshwater environments. Characterized by their intricate shells, or tests, these structures are composed of calcium carbonate or agglutinated particles such as sand grains or shell fragments. The tests of foraminifera exhibit a wide variety of shapes and sizes, ranging from simple to highly complex forms. Foraminifera utilize pseudopodia—temporary, thread-like projections—for locomotion, feeding, and other vital functions [6, 13]. These pseudopodia are essential for capturing food particles and constructing the test. *Foraminifera* occupy diverse marine habitats, including shallow coastal waters, deep-sea sediments, and coral reefs, with some species also found in freshwater habitats like lakes and rivers. In geological studies, *Foraminifera* are widely used in biostratigraphy, a branch of geology that employs fossils to correlate and date rock layers [6]. The abundance, diversity, and distribution of foraminiferal assemblages provide crucial insights into past environmental conditions and geological events. Due to their sensitivity to environmental changes such as fluctuations in temperature, salinity, oxygen levels, and nutrient availability, foraminiferal populations serve as valuable indicators of environmental disturbances and anthropogenic impacts on marine ecosystems [13]. Additionally, the presence of foraminifera in sedimentary rock formations suggests the potential for petroleum generation, highlighting their significance in hydrocarbon exploration efforts [6]. *Foraminifera* and microbial mats are examples of benthic microorganisms that leave behind fossils and traces, which serve as bioindicators for reconstructing paleoenvironments and interpreting depositional environments. The study of these microorganisms can also reveal patterns of bioturbation and sediment stability, further enriching our understanding of past marine conditions. Although planktonic microorganisms are not directly associated with rocks, their fossilized remains can be preserved in sedimentary deposits. These fossils, such as diatoms, dinoflagellates, and radiolarians, provide substantial information about historical oceanic conditions, nutrient availability, and climate variability. The analysis of their abundance and distribution in sedimentary rocks enables the reconstruction of past oceanic currents, water temperatures, and productivity levels, thereby contributing significantly to paleoceanographic reconstructions. Additionally, planktonic microorganism fossils can help identify shifts in oceanic biogeochemical cycles and can serve as proxies for assessing past oceanic pH levels and carbon cycling. Together, the study of both benthic and planktonic microorganisms enhances our understanding of Earth's historical climatic and environmental changes.

MATERIALS AND METHODS

The materials and methods used in this paper have been briefly described as follows:
Limestone samples (identified as US-1 L-5, US-3 L-5, US-6 L-5, US-7 L-5, US-9 L-5, and US-10 L-5), Araldite adhesive, glass, a rock cutting machine, velvet cloth, silicon carbide powder in varying grit sizes (120, 220, 320, 400, 600, 800, 1000, 1200), Microscopes, beakers, toluene, a laboratory hot plate, glass slides, and tap water. Rock samples were collected, cut into thin sections, and polished using silicon carbide powder of progressively finer grits. The polished samples were mounted on glass slides using Araldite adhesive and allowed to set for 24 hours. Microscopic analysis was then conducted to observe microorganisms present in the samples.

EXPERIMENTAL WORK

Preparation of Thin Sections for the US-3 L-5, US-6 L-5, US-7 L-5 and US-9 L-5 Rock Samples

Initially, the rock samples were sectioned into thin slices. A series of silicon carbide powders with varying mesh sizes (120, 220, 320, 400, 600, 800, 1000, and 1200) were prepared for the polishing process. The process began with 120 mesh silicon carbide powder, which was spread on a glass slab. Each rock sample was dipped in water and polished on one side using the silicon carbide powder. After a preliminary polish was achieved, the water in the beaker was replaced, and the glass slab was rinsed. This procedure was sequentially repeated with silicon carbide powders of mesh sizes 220, 320, 400, 600, 800, and 1000, each applied for 10-15 minutes. Following the use of 1000 mesh silicon

carbide powder, a further polish was performed with 1200 mesh silicon carbide powder and a velvet cloth for an additional 10-15 minutes. The polished rock sample was then mounted on a glass slide using Araldite adhesive and left to cure for 24 hours. After the adhesive had set, the other side of the rock sample was polished using the same sequence of silicon carbide powders until the sample became transparent enough to allow the visibility of a nail placed behind it. The final polish was conducted with 1200 mesh silicon carbide powder and a velvet cloth. The prepared slides were then ready for microscopic examination to observe the microorganisms present.

Preparation of Thin Sections for the US-1 L-5 and US-10 L-5 Rock samples

The preparation of thin sections for rocks US-1 L-5 and US-10 L-5 followed a similar initial process, where the rock samples were cut into thin sections. Due to observed spots and defects in these samples, an Araldite adhesive mixture was prepared by combining the contents of two tubes, using a higher proportion from the larger tube. Approximately 40 ml of toluene was added to the adhesive mixture and thoroughly mixed until the adhesive dissolved. The rock samples were then heated on a hot plate and immersed in the adhesive-toluene mixture. This process continued until the mixture was used up, after which the samples were allowed to cool undisturbed for 24 hours. Subsequently, the rock samples were polished using silicon carbide powders of varying mesh sizes (120, 220, 320, 400, 600, 800, 1000, and 1200). The polishing commenced with 120 mesh silicon carbide powder on a glass slab. After the initial polishing, the water in the beaker was changed, and the glass slab was rinsed. The polishing sequence continued with silicon carbide powders of mesh sizes 220, 320, 400, 600, 800, and 1000, each applied for 10-15 minutes. Following the 1000 mesh polish, a further polish was performed with 1200 mesh silicon carbide powder and a velvet cloth for 10-15 minutes. The polished samples were then mounted on glass slides using Araldite adhesive and left to dry for 24 hours. Finally, the other side of the rock samples was polished using the same sequence of silicon carbide powders until transparency was achieved, followed by a final polish with 1200 mesh silicon carbide powder and a velvet cloth. The slides were then prepared for microscopic examination to observe the microorganisms present. The prepared slides were examined under a microscope to identify and analyze the microorganisms embedded in the rock samples. This analysis provided insights into the ancient environmental conditions and sedimentary processes.

RESULTS AND DISCUSSIONS

Under the microscope, the various genus of *Foraminifera* were observed in the different rocks indicating the presence of petroleum in rock samples.

US-3 L-5

The following microorganisms were observed in the US-3 L-5 rock sample as shown in Figure 2:

i. Four numbers of *Nummulites* were present in the rock sample in the form of equatorial section. These are the large, disc-shaped foraminifera commonly found in carbonate rocks, including petroleum-bearing formations.
ii. Four numbers of *Alveolina* were present in the rock sample in the form of axial section. These are the small, elongated *Foraminifera* commonly found in shallow marine carbonate rocks.
iii. One number of *Biloculine* was present in the rock sample with open end of tube aperture. This is the single – celled organisms with shells having two chambers found in marine environment.

US-1 L-5

The following microorganisms were observed in the US-1 L-5 rock sample as shown in Figure 3:

i. One number of *Quinqueloculina* was found in the rock sample. These are the single – celled organisms with shells having five chambers found in shallow marine or reefal environment.
ii. Two numbers of *Nummulites* were found in the rock sample.
iii. Two numbers of *Triloculina* were found in the rock sample. These are the organisms having shells with three chambers found in various marine environments, including shallow marine, nearshore, and lagoon settings.
iv. One number of *Alveolina* was found in the rock sample.

US-6 L-5

The following microorganism was observed in the US-6 L-5 rock sample as shown in Figure 4:

i. One number of *Biloculina* was found in the rock sample.

US-7 L-5

The following microorganism was observed in the US-7 L-5 rock sample as shown in Figure 5:

i. One number of *Discocylina* was observed in the rock sample. This is large benthic *Foraminifera* with distinctive test morphologies. These *Foraminifera* are often associated with shallow marine or reefal environments, where carbonate deposition and reef development occur.

US-9 L-5

The following microorganism was observed in the US-9 L-5 rock sample as shown in Figure 6:

i. One number of *Rotalia* was observed in the rock sample. This is a well – known group of *Foraminifera*, characterized by their spiral – shaped shells found in marine sediments, including petroleum-bearing formations.

US-10 L-5

The following microorganism was observed in the US-10 L-5 rock sample as shown in Figure 7:

i. One *Biloculina* was observed in the rock sample.

This study helped us to understand and learn the basic necessities for the formation of hydrocarbons and also about the role of *Foraminifera* microorganisms. There are two major types of microorganisms, i.e. Planktonic microorganisms which are very much attractive and Benthic microorganisms which are the ugly looking microorganisms. *Foraminifera* are a diverse group of single-celled protists characterized by their intricate shells, or tests, which serve as crucial biostratigraphic markers and paleoenvironmental indicators. Notable genera such as *Nummulites*, *Biloculina, Quinqueloculina, Triloculina, Alveolina, Discocyclina,* and *Rotalia* each contribute uniquely to our understanding of geological history. Nummulites, with their large, lenticular spiral tests, are abundant in Eocene to Oligocene sediments and indicate high-energy, warm, shallow marine environments. *Biloculina*, recognized by their small, biloculine tests, and *Quinqueloculina*, distinguished by their five-chambered tests, are prevalent from the Jurassic to the present in low-energy, shallow marine settings. *Triloculina*, with three-chambered tests, is indicative of low-energy conditions associated with seagrass beds and lagoons. *Alveolina*, characterized by elongated, fusiform tests, is primarily found in Paleocene to Eocene sediments and associated with warm, shallow marine environments. *Discocyclina*, with their discoidal, planispiral tests, are prevalent in Paleocene to Miocene sediments, often in reefal and platform carbonates. *Rotalia*, possessing planispiral to trochospiral tests, are common from the Cretaceous to recent times and are found in various marine settings. Collectively, these *Foraminifera* are invaluable for biostratigraphy, allowing precise correlation and dating of rock layers. Their sensitivity to environmental changes such as temperature, salinity, and nutrient availability makes them essential for reconstructing past marine conditions. The study of *Foraminifera* not only advances our understanding of Earth's climatic history, oceanic conditions, and sedimentary processes but also provides critical data for hydrocarbon exploration, underscoring their multifaceted significance in both academic and applied geological research.

CONCLUSION

The comprehensive analysis of limestone samples identified as US-1 L-5, US-3 L-5, US-6 L-5, US-7 L-5, US-9 L-5, and US-10 L-5 has provided valuable insights into the presence and distribution of *Foraminifera* within these geological specimens. Through meticulous preparation of thin sections of rocks, polishing it using progressively finer silicon carbide powders and mounting it on glass slides, detailed microscopic examinations were conducted, that revealed the presence of various *Foraminifera* genera. The study highlighted the significance of Foraminifera as biostratigraphic markers and indicators of paleo environmental conditions. For instance, the presence of *Nummulites* and *Alveolina*

suggested high-energy, warm, shallow marine environments, whereas the identification of *Biloculina* and *Quinqueloculina* pointed to low-energy, shallow marine settings. This meticulous approach allowed for the accurate identification of microorganisms, which is crucial for reconstructing past marine conditions and understanding sedimentary processes. In conclusion, this study has not only deepened the understanding of the methodological requirements for preparing and analyzing rock thin sections but also enhanced the knowledge of the ecological and geological significance of *Foraminifera*. The findings contribute to the broader field of geological research, particularly in the context of biostratigraphy and hydrocarbon exploration. It further gives the broad range information about the benthic microorganisms that are either attached to or reside within rocks providing critical insights into ancient substrate types, sedimentary processes, and habitat preferences. Their presence, abundance, and diversity are key indicators of past environmental conditions, including water depth, energy levels, and substrate composition. Benthic microorganisms such as foraminifera and microbial mats are known to leave behind fossils and traces that can be used as bioindicators to reconstruct paleoenvironments and interpret depositional settings. As a result, the investigation of these microbes has uncovered patterns of sediment stability and bioturbation, which has improved our knowledge of historical maritime environments.

ACKNOWLEDGEMENT

The authors would like to express their sincere gratitude to the Department of Petroleum Engineering and Applied Geology, Dibrugarh University, for providing the access f institutional facilities and resources to carry out the work, without which this work would not have been possible.

ABSTRACT

Siddha medicine is a prehistoric system of medicine predominant in South India. Siddha medicine have 32 types of Internal medicine and 32 types of External medicine. Vellarugu Chooranam is one of the Siddha formulations from Agathiyar Irandayiram Part- 3 which has indications cure Kadi vishangal(Poisonous bites), Karappan(Eczema), Soolai(Acute pain), Kiranthi(Veneral diseases).(1) Standardisation means validation of drugs identity and determination of its quality and purity. Standardisation includes Physico- chemical analysis, Biochemical analysis, TLC analysis, HPTLC analysis, Pesticide residual, Sterility test, and Aflatoxin assay. This study shown the presence of sulphate, phosphate, aluminium, iron, calcium, and alkaloids. This study revealed the data regarding the physicochemical characteristics, quality and safety of VC which indicates the standard quality of the drug.

Keywords: Standardization, Physico-chemical analysis, Siddha Medicine,Vellarugu Chooranam.

INTRODUCTION

The Siddha system of medicine is the earliest system of medicines and being practiced by a huge population in South India.Drugs used by the Siddhars can be classified into three groups: Thaavaram (herbal product), Thaathu (inorganic substances), and Jangamam (animal products)(2).Siddha medicine have 32 types of Internal medicines and 32 types of External medicines. Chooranam is one of the Internal medicines and it has a shelf life at Three months.Chooranam is a thin dry powder of drugs. Chooranam is a powder of a single drug or a mixture of two or more drugs which are powdered separately and then mixed together for homogeneity. All ingredients should be purified before preparation of chooranam. The Chooranam should be very fine, amorphous and should be perfectly dry.(3)Vellarugu Chooranam is one of the Siddha formulations from Agathiyar Irandayiram Part-3 which has specific indication to cure Kadivishangal(Poisonous bites), Karappan(Eczema), Soolai(Acute pain), Kiranthi(Veneral diseases). (1)It is prepared from 10 medicinal plants. According to WHO guidelines, a drugshould be standardized before releasing into the market with respect to safety. In this paper an attempt was made to estimate a Siddha formulation, Vellarugu chooranam by analytical methods and chromatographic studies. Hence in this paper an attempt was made to evaluate and standardize Vellarugu chooranam by identifying the ingredients microscopically and using Physico- chemical analysis, Biochemical analysis, TLC analysis, HPTLC analysis, Pesticide residual, Sterility test, and Aflatoxin assay.

MATERIALS AND METHODS

Identification And Authentication

All ingredients of *Vellarugu chooranam* were identified and authenticated by the Dept. of Medicinal Botany, National Institute of Siddha, Tambaram Sanatorium, Chennai.

Preparation of Vellarugu Chooranam:

Ingredients of "Vellarugu Chooranam":

S.No	Ingredients	Botanical Name	Used Parts
1	Vellarugu	*Enicostemmaaxillare*	Whole plant
2	Sirukurinjanver	*Gymnemasylvestae*	Root
3	Vakkanapattai	*Diospyros montana*	Stem Bark
4	Milagaranaiver	*Toddaliaasiatica*	Root
5	Kodiveliver	*Plumbago zeylanica*	Root
6	Veppampattai	*Azadirachtaindica*	Stem Bark
7	Sengaththaaripattai	*Capparis sepiaria*	Stem Bark
8	Agasakarudankilangu	*Corallocarpusepigaeus*	Root Tuber
9	Milagu	*Piper nigrum*	Dried Fruit
10	Sangam ver	*Azimatetracantha*	Root

Procurement of Raw Drugs:

All the raw drugs were purchased from K.Ramasamychetty country drug shop, Park town, Chennai.

Purification of Raw Drugs:

The raw drugs are purified as per the procedures stated in the Siddha literatures.

Method of Preparation

Take the above drugs in equal quantity after purification is grinded well to obtain fine powder. After this process, the powder was sieved through white cloth and Prepared Chooranam was stored in air tight container. (4)

Dosage : 3 Viral alavu (800-1gram), twice a daily

Adjuvant: Honey

Indications
Kadivishangal (Poisonous bites)
Karappan (Eczema)
Soolai (Acute pain)
Kiranthi (Veneral diseases) (2)

Standardization of Vellarugu Chooranam
The standardization of test drug is essential to exhibit the purity and quality of drug. This is basically done by physicochemical, Phytochemical and biochemical analysis. The physicochemical analysis, Phytochemical analysis, and instrumental analysis has been done at Noble Research Solution, an ISO 9001-2015 accredited business located in Chennai. Biochemical analysis was done at National Institute of Siddha.

Organoleptic Characters
The organoleptic characters such as colour, taste and odour were done as per PLIM guidelines noted in table -1 Organoleptic characters.(5,6)

Physico-Chemical Parameters
The physico-chemical examinations consist of determination of total ash, acid insoluble ash, extractable matter in water and alcohol, loss on drying at 105℃. All the physico-chemical parameters were determined by standard methods.

Percentage Loss On Drying
4g of test drug was weighed in a formerly weighed 100ml beaker and heated inan oven at 105ºC for 5hours. Cooled in a desiccator and weighed. Repeated this procedure till constant weight was attained. The percentage loss in weight of test drug was calculated.

Determination of Total ASH
4g of test drug was weighed accurately in a previously ignited and tarred silica dish. The material was evenly spread and ignited in a muffle furnace at400^{0}Cuntilitbecame white indicating the absence of carbon. The dish is cooled in desiccator and weighed. As carbon free ash cannot be obtained in this manner, the dish was cooled and the residue moisturized with sufficient amount of water. Dried on a water bath and then it is ignited in the electric furnace to get the constant weight. Cooled the dish inadesicctor and then weighed.

Determination of Acid Insoluble ASH
The total ash of test drug was found as described above. To the dish containing the total ash was added 25 ml of dilute hydrochloric acid.Boiledgentlyfor6minutesandfiltered.Collectedtheinsolublematteronanashless filter paper and washed with distilled water until the residue was free from acid. Transferred the filter paper containing the insoluble matter to the original dish. Dried and ignited to the constant weight. Cool the dish in a desiccator, and then weighed.

Determination of Water-Soluble Extractive
4 g of test drug was weighed exactly in a glass stoppered flask. Add100ml of distilled water and shakened occasionally for 6 hours and then allowed to stand for 18hours.Filteredrapidly taking care not to lose any solvent and pipetted out 25 ml of the filtrate in a reweighed 100 ml beaker and evaporated to dryness on a water bath. Kept it in an air oven at 105ºC for 6 hours. Cooled in adesiccator and weighed. Repeated this experiment twice, and taken the average value.

Determination of Alcohol Soluble Extractive
4g of sample was weighed exactly inaglasss to ppered flask. Added 100ml of distilled alcohol (approximately95%)and shaken occasionally for 6 hours and then allowed to stand for 18 hours. Filtered quickly

taking care not to lose any solvent and pipetted out 25 ml of the filtrate in a pre-weighed 100 ml beaker and evaporated to dryness on a water bath. Kept it in an air oven at 105ºC for 6 hoursand cooled in desiccator and weighed. Repeated this experiment twice, and taken the average value.

Biochemical Analysis

The presence of biochemical substances in VC such as Sulphate, phosphate, iron, calcium and alkaloids were carried out by standard methods.

Phyto - Chemical Analysis

The presence of phytochemicals in VC such as alkaloids, carbohydrates, glycosides, saponins, tannins, gum and mucilage were carried out as per PLIM guidelines[7]

Detection of Alkaloids

Extracts were dissolved in dilute Hydrochloric acid individually and filtered.

Mayer's Test

Filtrates were treated with Mayer's reagent. Formation of yellow colored precipitate denotes the presence of alkaloids.

Hager's Test

Filtrates were treated with Hager's reagent. Presence of alkaloid was confirmed by the formation of yellow colored precipitate.

Detection of carbohydrates - Molisch's Test

To 2 ml of sample extract, 2 drops of alcoholic solution of α- naphthol was mixed. The mixture was mixed well by shaking and few drops of concentrated sulphuric acid was added along the sides of test tube slowly. Formation of violet ring indicates the presence of carbohydrates.

Detection of Glycosides - Modified Borntrager's Test

The extract was treated with ferric chloride solution and immersed in boiling water for about 5 minutes. The mixture was cooled and then extracted with equal volume of benzene. The benzene layer is separated and processed by an ammonia solution. Rose-pink color appearance in the ammonical layer indicates the presence of anthranol glycosides.

Cardiac Glycoside - Keller- killiani test

Extract was shaken with distilled water (5 ml). To this, add glacial acetic acid (2 ml) containing a few drops of ferric chloride followed by H_2SO_4 (1 ml) along the side of the test tube. The formation of a brown ring at the interface is a positive sign indicating the presence of cardiac glycosides, and a purple ring may appear beneath the brown ring.

Detection of Saponins - Froth Test

The extract was diluted to 20 ml with distilled water and stirred in a graduated cylinder for 15 min. The formation of a 1 cm high foam indicates the presence of saponins.

Detection of phenols - Ferric Chloride Test

The extract was treated with 3-4 drops of ferric chloride solution. The formation of a blue-black color indicates the presence of phenol.

Detection of tannins - Gelatin Test

The extract is dissolved in 5 ml of distilled water and 2 ml of 1% solution of Gelatin containing 10% NaCl is added to it. Presence of white precipitate denotes the phenolic compounds.

Detection of flavonoids - Alkaline Reagent Test
Extract was treated with few drops of sodium hydroxide solution. Presence of flavonoid is confirmed by formation of intense yellow color, which becomes colorless on addition of dilute acid.

Detection of proteins and amino acids - Xanthoproteic Test
The extract was treated with a few drops of concentrated nitric acid. The formation of yellow color indicates the presence of protein.

Gum and Mucilage
To 1ml of extract, add 2.5ml of absolute alcohol, mix it constantly. Then the precipitate was dried in air and examine for swelling. Swelling indicates presence of gum and mucilage.

Quantitative Analysis
Microbial Contamination
Test sample was admixed with sterile distilled water and the mixture had been used for the sterility evaluation. 1 ml of test sample was inoculated into a sterile Petri dish, to which approximately 15 ml of molten agar was added at 45°C. Agar and sample were mixed completely by tilting and swirling. Agar was allowed to become completely gel form without disturbing it for about 10 minutes. Plates were then inverted and incubated at 37oC for 24-48 hours and further extended upto72 hours for fungal growth observation. Colonies of organism grown was counted and calculated for CFU.(8)

Test For Heavy / Toxic Metals
Standard: Hg, As, Pb and Cd – Sigma

Methodology
Atomic absorption spectrometry is a common and reliable method for detecting metals and metalloids in samples. The total heavy metal content of the samples was determined using an AA 240 series atomic absorption spectrometry (AAS). It measures the concentration of heavy metals like mercury, arsenic, lead, cadmium etc. in the tested products. Sample Digestion: To determine arsenic and mercury, the test samples were digested with 1 mol/L HCl. Similarly, for the determination of lead and cadmium, the sample were digested with 1mol/L of HNO3. (8)

Standard Reparation
- As & Hg- 100 ppm sample in 1mol/L HCl
- Cd &Pb- 100 ppm sample in 1mol/L HNO3.

Determination of Pesticide Residue
VC was extracted with 100 ml of acetone followed by homogenization for brief period. Further filtration was allowed, consecutive addition of acetone to the test mixture. The sample studied was heated using a rotary evaporator at a temperature not exceeding 40ºC until almost complete evaporation of the solvent. A few milliliters of toluene were added to the residue and heated again until the acetone was completely eliminated. Resultant residue was dissolved using toluene and filtered through membrane filter.(9,10)

Aflatoxins
Standard: Aflatoxin B1, Aflatoxin B2, Aflatoxin G1, Aflatoxin G2. Solvent: Standard samples were dissolved in a mixture of chloroform and acetonitrile (9.8:0.2) to obtain solutions with concentrations of 0.5 µg per ml for each aflatoxin B1 and aflatoxin G1, and 0.1 µg per ml for each aflatoxin B2 and alphatoxin G2. Test Solution: Concentration 1 µg per ml.

Procedure

Standard aflatoxin was applied on the surface of pre coated TLC plate at the volume of 2.5 µL, 5 µL, 7.5 µL and 10 µL. Similarly, the test samples was placed and allow the spots to dry and develop the chromatogram in an unsaturated chamber containing a solvent system consisting of a mixture of chloroform, acetone and isopropyl alcohol in the ratio of 85: 10: 5 respectively until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent from and allow the plate to air-dry. Examine and locate the spots on the plate under UV light at 365 nm.(11)

TLC Analysis

Test sample was exposed to thin layer chromatography (TLC) as per conventional one-dimensional ascending technique using silica gel 60F254, 7X6 cm (Merck) were cut with normal household scissors. Plate markings were made with soft pencil. Micro pipette is used to spot the sample for TLC applied sample volume 10- micro liter by using pipette at a distance of 1 cm at 5 tracks. In the twin trough chamber with specified solvent system after the run plates were dried and observed by visible light Short-wave UV light 254nm and light long-wave UV light 365 nm.[12]

High Performance Thin Layer Chromatography Analysis

HPTLC method is a modern sophisticated and automated separation procedure derived from TLC. Pre-coated HPTLC graded plates and auto sampler are used to complete precision, sensitive, significant separation both qualitatively and quantitatively. High performance thin layer chromatography (HPTLC) is a valuable quality assessment tool for the estimation of botanical materials. HPTLC method offers high degree of selectivity, sensitivity and rapidity collectively within single-step sample preparation. Thus, this method can be conveniently implemented for routine quality control analysis. It gives chromatographic fingerprint of phytochemicals which is apt for confirming the identity and purity of phyto therapeutics.

Chromatogram Development

It was done in CAMAG Twin Trough chambers. Sample elution was carried out according to the adsorption ability of the component to be analyzed. After elution, plates was taken out of the chamber and dried.

Chromatographic Scanning

Plates were scanned under UV at 366nm. The data gotten from scanning was brought into integration through CAMAG software. Chromatographic finger print was developed for the detection of phyto constituents present in each sample and their respective Rf values were tabulated [13].

RESULTS

Standardization of the drug is essential to derive the quality and safety of the drug which was analyzed by many methods. The results of organoleptic characters (Table No: 1), physicochemical analysis (Table No: 2), Biochemical analysis (Table No: 4), Microbial contamination (Table No: 5), Heavy metal analysis (Table No: 6), Pesticide residue (Table No: 7), Aflatoxin (Table No: 8), and HPTLC analysis (Table No: 9) of VC is tabulated below.

DISCUSSION

Moisture content of the drug indicates the stability and its shelf life. High moisture content can adversely affect the active ingredients of the drug.[14] The percentage of loss of drying of Vellarugu Chooranam is 6.7% (Normal range 1-20%). Therefore, low moisture of VC might get maximum stability and shelf life. Ash values are helpful in determining the quality and purity of crude drugs, especially in powder form. [15]The total Ash content and Acid Insoluble Ash values of Vellarugu Chooranam are 2.46% (Normal range: 1-25%) and 0.36% (Normal range: 0.1-10%). This denotes the purity of the drug. The water soluble and alcohol soluble extract values are responsible for

indication of the extent of polar and non-polar compounds which are existing in VC. The extract values of alcohol in VC is 17.5% and water is 20.97%. Decreased water soluble ash value (2.8%) shows easy facilitation of diffusion and osmosis mechanisms. Qualitative analysis of Vellarugu Chooranam for Acid radicals, Basic radicals, and other components reveals the presence of Sulphate, Phosphate, Aluminium, Iron, Calcium and Alkaloids. Phytochemical analysis revealed the presence of Alkaloids, Carbohydrates, Glycoside, Saponin, Tannins, Gum and mucilage in Vellarugu Chooranam. The results of Heavy metal analysis done by AAS method, results indicated that Heavy metals such as Mercury, Lead, Arsenic and Cadmium were found below the detectable limit. So, Vellarugu Chooranam is safe for oral consumption. Test for specific pathogens for VC concludes that there is absence of E-coli, Salmonella, Staphylococcus aureus, and Pseudomonas aeruginosa. Test for Aflatoxin revealed that the drug VC is free of Aflatoxin B1, Aflatoxin B2, Aflatoxin G1, and Aflatoxin G2. Pesticide residue analysis of VC indicated that it has below detectable limit of Organophosphorus, Organochlorine, and Pyrethroid contents. The quantitative analysis of Vellarugu Chooranam through TLC and HPTLC results showed that the HPTLC finger printing analysis of the sample reveals the presence of seven prominent peaks corresponds to presence of seven versatile phytocomponents present within it. Rf value of the peaks ranges from 0.04 to 0.90.

CONCLUSION

From the above observations, it is resolved that the results of physico-chemical analysis, preliminary phytochemical studies, TLC photo documentation & HPTLC finger print studies can be used as a diagnostic tool to determine the quality & purity of the drug and to lay down pharmacopoeal standards for Vellarugu Chooranam .Further present investigation had generated an evidence-based data with respect to purity, standards and phytochemical nature of the formulation VC. Therefore, the necessity of standardization of various herbal formulations will pave way to explore the therapeutic effects as claimed in Siddha literature as well as to confirm the quality and safety of drug and thereby improving the scientific integrity of Siddha medicine.

ACKNOWLEDGEMENT

Table.1: Organoleptic Character of Vellarugu Chooranam

State	Solid
Nature	Moderately fine
Odor	Characteristic
Touch	Soft
Flow Property	Moderately free flowing
Appearance	Pale brownish

Table.2: Physico- Chemical properties of *Vellarugu Chooranam.*

S. No	Parameter	Mean (n=3) SD
1.	*Loss on Drying at 105 °C (%)*	6.7± 0.65
	Total Ash (%)	2.46± 0.35
3.	*Acid insoluble Ash (%)*	0.36 ± 0.15
4.	*Water soluble Extractive (%)*	20.97± 1.16
5.	*Alcohol Soluble Extractive (%)*	17.5 ± 2.28
6.	*Particle Size*	Completely passes through sleeve size of 1 mm(90% passes through 400 micro meter sleeve and 10% Passes through 1 mm sleeve)

Table.3: Results of Bio - Chemical Analysis of Vellarugu Chooranam

PARAMETER	RESULTS
Test for Acid Radicles	
Test for Sulphate	**Present**
Test for Phosphate	**Present**
Test for Carbonate	Absent
Test for Sulphide	Absent
Test for Basic Radicles	
Test for Lead	Absent
Test for Aluminium	Present
Test for Iron	**Present**
Test for Zinc	Absent

Test for Calcium	**Present**
Test for Magnesium	Absent
Test for Ammonium	Absent
Test for Mercury	Absent
Test for Arsenic	Absent
Miscellaneous	
Test For Starch	Absent
Test for Reducing Sugar	Absent
Test for Alkaloids	**Present**
Test for Tannic Acid	Absent

Table.4: Results of Phyto - Chemical Analysis of Vellarugu Chooranam.

S. No	Phyto-Chemicals	Test Name	H_2O Ext.
1.	Alkaloids	Mayer's Test	**Present**
		Hager's Test	Absent
2.	Carbohydrates	Molisch's Test	**Present**
3.	Glycoside	Modified Borntrager's Test	**Present**
		Cardiac Glycoside- Keller-Killiani test)	Absent
2.	Saponins	Froth Test	Absent
		Foam Test	**Present**
3.	Phenols	Ferric Chloride Test	Absent
4.	Tannins	Gelatin Test	**Positive**
5.	Flavonoids	Alkaline Reagent Test	Absent
6.	Proteins and amino acids	Xanthoproteic Test	Absent
7.	Gum and Mucilage	Extract + alcohol	**Positive**

Table.5: Microbial Contamination Test of *Vellarugu Chooranam*

S. No	Parameters	Result
1.	Total Bacterial Content	Absent
2.	Total Fungal Content	Absent
3.	E. Coli	Absent
4.	Salmonella Spp.	Absent
5.	Staphylococcus Aureus	Absent
6.	Pseudomonas aeruginosa	Absent

Table.6: Heavy Metal Analysis of *Vellarugu Chooranam.*

Name of the Heavy Metal	Absorption Max λmax	Result Analysis	Maximum Limit
Mercury	253.7 nm	BDL	1 ppm
Lead	217.0 nm	8.52	10 ppm
Arsenic	193.7 nm	BDL	3 ppm
Cadmium	228.8 nm	BDL	0.3 ppm

BDL- Below Detection Limit

Table.7: Pesticide Residue Analysis of *Vellarugu Chooranam.*

PesticideResidue		
I.OrganoChlorinePesticides	**SampleVC**	**AYUSHLimit(mg/kg)**
AlphaBHC	BQL	0.1mg/kg

BetaBHC	BQL	0.1mg/kg
GammaBHC	BQL	0.1mg/kg
DeltaBHC	BQL	0.1mg/kg
DDT	BQL	1mg/kg
Endosulphan	BQL	3mg/kg
II. Organo Phosphorus Pesticides		
Malathion	BQL	1mg/kg
Chlorpyriphos	BQL	0.2mg/kg
Dichlorovos	BQL	1mg/kg
III. Organocarbamates		
Carbofuran	BQL	0.1mg/kg
III. Pyrethroid		
Cypermethrin	BQL	1mg/kg

BQL-Below Quantification Limit

Table.8: Aflatoxin Analysis of *Vellarugu Chooranam.*

Aflatoxin	Sample VC	AYUSH Specification Limit
B1	Not Detected – Absent	0.5 ppm
B2	Not Detected – Absent	0.1 ppm
G1	Not Detected – Absent	0.5 ppm
G2	Not Detected – Absent	0.1 ppm

Figure.1: Organoleptic Character of Vellarugu Chooranam

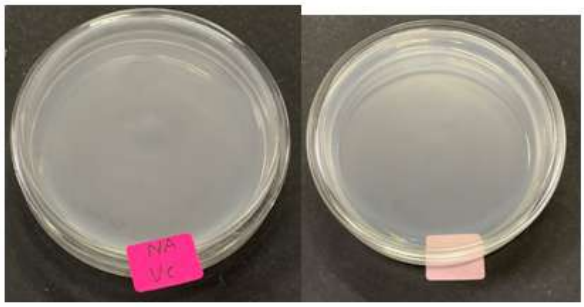

Figure.2: Microbial Contamination Test of *Vellarugu Chooranam.*
No growth / colonies was observed in any of the plates inoculates with the test sample.

Figure.3: HPTLC finger printing of Sample VC

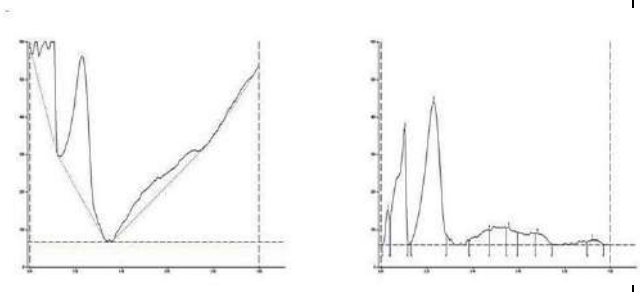

Figure.4:High Performance Thin Layer Chromatography (HPTLC) Analysis of Vellarugu Chooranam.
High Performance Thin Layer Chromatography (HPTLC) Analysis of Vellarugu Chooranam:

Peak	Start Rf	Start Height	Max Rf	Max Height	Max %	End Rf	End Height	Area	Area %
1	0.00	2.4	0.03	93.7	10.16	0.04	67.5	789.3	3.55
2	0.04	72.1	0.10	311.6	33.80	0.12	7.7	6006.6	26.98
3	0.13	8.0	0.23	381.8	41.42	0.29	25.5	12441.3	55.89
4	0.38	11.9	0.47	41.0	4.44	0.47	40.4	1091.3	4.90
5	0.55	45.0	0.56	48.4	5.25	0.60	33.1	915.6	4.11
6	0.67	30.0	0.68	31.4	3.41	0.75	3.0	692.0	3.11
7	0.90	7.5	0.92	13.9	1.51	0.97	1.2	325.0	1.46

Figure.5: HPTLC finger printing analysis of the sample reveals the presence of seven prominent peaks corresponds to presence of seven versatile phytocomponents present within it. Rf value of the peaks ranges from 0.04 to 0.90.
