ABSTRACT

The study evaluates the environmental impact of the Gurha lignite mines and associated thermal power plant in Bikaner, Rajasthan, using a "Modified Battelle Environmental Evaluation System" tailored to the local arid conditions. This system refines the traditional Battelle method by focusing on 50 critical environmental parameters, categorized into four broad components: Ecology, Environmental Pollution, Human Interest, and Aesthetics. An extensive survey of experts assigned relative importance units to each parameter, enabling a structured analysis of environmental impacts. Results indicated significant impacts on environmental pollution and ecology, particularly regarding air quality and wildlife. However, the project contributed positively to socio-economic factors and certain aesthetic aspects. The study's findings highlight the need for region-specific environmental assessments to ensure sustainable development practices.

Keywords: Environment, Lignite, Thermal plant, Gurha, Bikaner

INTRODUCTION

The exploration and exploitation of natural resources, particularly lignite mining and the operation of thermal power plants, are crucial for meeting the growing energy demands of developing nations like India [1]. However, these activities are often associated with significant environmental consequences, including land degradation, water and air pollution, and disruptions to local ecosystems [2,3,4]. The Gurha lignite mines and the associated thermal power

plant in Bikaner, represent critical energy infrastructure that supports regional and national energy needs. Despite their importance, comprehensive assessments of their environmental impacts remain limited, yet such assessments are essential for sustainable development and informed decision-making [5].Environmental Impact Assessments (EIAs) are globally recognized as crucial tools for evaluating the potential effects of industrial activities on the environment [6]. Traditional EIA methods, however, often rely on qualitative and descriptive assessments, which can complicate the integration of findings into the decision-making process, especially in complex environmental contexts [7]. To address these limitations, a more systematic and quantitative approach is necessary. This study aims to assess the overall environmental impacts of the lignite mines and the thermal power plant at Gurha by employing a "Modified Battelle-method"[8]. This approach builds upon the Battelle Environmental Evaluation System (EES), originally developed by Battelle-Columbus Laboratories in the United States. The Battelle EES offers a structured, quantitative framework for environmental impact evaluation by identifying key environmental components, determining their relative importance, and developing value functions to translate diverse environmental data into a common unit for impact assessment [9].

Recognizing the unique geographical, climatic, and socio-economic conditions of the Gurha region, I have modified the original Battelle method to better suit the local context. The "Modified Battelle-method" ensures that the specific environmental characteristics of the Gurha lignite mines and surrounding areas are adequately captured and assessed. This tailored approach allows for a more accurate and relevant evaluation of environmental impacts, which is essential in arid and semi-arid regions like Rajasthan, where ecosystems are particularly sensitive to industrial disturbances. The relevance of adapting environmental assessment methodologies to local conditions has been underscored in previous studies, such as the environmental evaluation of water resources in Thailand, where a similar adaptation approach was found to be effective [10]. By applying this refined methodology, the study aims to provide a comprehensive analysis of the environmental impacts of lignite mining and power generation at Gurha, offering insights that can guide both local and regional stakeholders towards more sustainable practices. The findings will contribute to a growing body of knowledge that supports the integration of modified assessment tools in regional environmental planning and management[3].

Study Area

Gurha block, in toposheet 45A/13 of Survey of India, lies between 27°51'13" N to 27°53'48" N and 72°50'08" E to 72°53'48" E, at an elevation of 215-244m. Located 60 km from Bikaner on NH-15 and 11 km from Kolayat, it hosts a 1241.25-hectare lignite mining project by VS Lignite Power Private Limited (a subsidiary of KSK Energy Venture Ltd., Hyderabad). Originally started by Marudhar Power Project Ltd.[11], the project produces 1 million tons of lignite annually for a 135 MW pithead thermal power plant. The semi-arid to arid region experiences extreme temperatures from 0°C to 48°C and receives an average annual rainfall of 260 mm.

MATERIAL AND METHODS

The methodology for assessing environmental impacts in this research was carefully chosen to address the limitations of traditional approaches, which often involve complex calculations, rely on subjective data, and may not effectively account for secondary effects or provide comprehensive spatial data representation. Among the various available methods, the Battelle Environmental Evaluation System (EES) was selected for its structured and quantitative nature, which has proven versatile across different project contexts. Developed by Battelle-Columbus Laboratories and documented by Dee et al. in 1973 [9], the original EES includes 78 measurable environmental parameters grouped into four major categories: ecology, environmental contamination, aesthetics, and human interest. Given the unique environmental and social conditions in the Gurha region of Rajasthan, significant adaptations were necessary to ensure the methodology's relevance and accuracy. This led to the development of the "Modified Battelle Environmental Evaluation System," specifically tailored to assess the environmental impacts of lignite mining and associated thermal power generation. In this modified version, 50 critical and measurable environmental parameters were selected, categorized into 14 components under the four primary categories:

Ecology, Environmental Pollution, Human Interest, and Aesthetics. This region-specific adaptation allowed for a more precise and relevant evaluation of environmental impacts in the study area. The EES approach employed in this research involves systematically identifying the environmental components and parameters affected by the lignite project, determining their relative importance, developing value functions for each parameter, converting these values into a common unit for impact evaluation, and identifying environmentally sensitive areas within the project site. This structured approach ensures that the environmental assessment is both effective and contextually appropriate for lignite projects in western Rajasthan.

Parameters and Components Identification

Given the considerable differences between the environmental and social contexts of our study area and those in the United States, the direct application of the original Battelle Environmental Evaluation System (EES) parameters may not be entirely appropriate. As a result, it is crucial to develop a customized list of environmental components and parameters that are specifically tailored to the unique conditions of our study area. This tailored approach ensures that the environmental impact assessment is both accurate and relevant to the local context. Through a collaborative process involving environmental experts, academic professionals in environmental studies, officials from pollution control authorities, and input from local residents and workers in the vicinity of the lignite project, the author has successfully identified the parameters relevant to this study. These identified parameters have been structured into fourteen distinct components, differing from the eighteen components used in the original Battelle system. These fourteen components are further categorized into four broad categories, similar to the original Battelle framework. A detailed overview of these categories, components, and parameters is presented in Table 1, where Column 1 lists the four categories, Column 2 details the fourteen components, and Column 3 enumerates the fifty parameters utilized in this Modified Battelle Environmental Evaluation System (EES).

Relative Importance of Parameters

To determine the relative significance of the various parameters, components, and categories, an extensive opinion survey was conducted. This survey involved 126 individuals who are closely connected to lignite mining, thermal power generation, and environmental protection in Bikaner. The participants included experts from diverse organizations such as the Department of Mines and Geology, Rajasthan, the Pollution Control Board, lignite mining companies, local universities, research institutes, and private consulting firms. A carefully designed questionnaire was distributed to these experts to gather their opinions. In this survey, the total environmental impact was assigned a value of 1,000 points, which were then distributed among the different parameters. Each parameter received a specific "importance unit," referred to as a "parameter importance unit" or PIU. The 1,000 PIUs were allocated across the 50 parameters based on the experts' value judgments. The individual PIUs are presented in Column 4 of Table 1, while the sum of the component PIUs is shown in Column 5, and the total PIUs for each category are displayed in Column 6.

Determining the Value Functions

Each Parameter Importance Unit (PIU) is converted into a unique "value function" within this assessment framework. During the opinion survey, respondents were also asked to provide their perspectives on how the environmental quality of each identified parameter had changed following the implementation of the project. They rated the environmental quality of these parameters on a scale from 0 (indicating poor quality) to 1 (indicating excellent quality), both before and after the project's establishment. The average values for environmental quality before (EQ_0) and after (EQ_1) the project's implementation was calculated based on the survey responses. These EQ_0 and EQ_1 values for each parameter are reported in Tables 2 to 5. The EQ values are then multiplied by their corresponding PIUs to compute the Environmental Impact Units (EIUs) for each parameter. The net change in environmental quality is determined by subtracting EQ_1 from EQ_0. A negative net EQ indicates a detrimental impact on that particular parameter, whereas a positive net EQ suggests a beneficial effect resulting from the project.

Conversion of Actual Parameter Values into Common Units

The equation used to convert actual parameter values into standardized units, referred to as Environmental Impact Units (EIUs), is as follows:

$$\sum_{i=1}^{n} EIU = \sum_{i=1}^{n} (EQi)_1.PIU_i - \sum_{i=1}^{n} (EQi)_0.PIU_i$$

Where:

EIU is the Environmental Impact Unit

$(EQi)_1$represents the Environmental Quality value of Parameter i after the project.

$(EQi)_0$represents the Environmental Quality value of Parameter i before the project.

PIUi is the Relative importance of parameter i

n is the total number of parameters.

A positive EIU value indicates that the environmental conditions 'with' the project are better than 'without' it, signifying that the project has contributed positively to the environment. Conversely, a negative EIU suggests that the project's presence has had adverse environmental impacts. This equation provides a quantifiable means of assessing the environmental impact of the project, taking into account changes in environmental quality and the relative importance of each parameter.

Identification of Problem Areas

This study utilizes the Battelle Environmental Evaluation System (EES) methodology for flagging problem areas within projects. The EES distinguishes between two types of red flags: minor and major, based on the extent of adverse change in environmental quality. To determine which type of red flag to assign, the following calculation is used:

$$\text{Percentage change} = \frac{(EQi)o.PIUi - (EQi)1.PIUi}{(EQi)o.PIUi} X\ 100$$

In this formula

- $(EQi)_1$represents the Environmental Quality value of parameter i after the project.
- $(EQi)_0$denotes the Environmental Quality value of parameter i before the project.
- PIUi indicates the relative importance of parameter i

The resulting percentage change helps evaluate the severity of adverse environmental impacts. Based on this percentage, a determination is made whether to assign a minor or major red flag to the project's problem area. The criteria for assigning minor and major red flags to parameters are as shown below:

Parameter Type	Flag Type	Percentage Change Criteria
Ecological Parameters	Minor Red Flag	Negative percentage change from 5% to 10%
	Major Red Flag	Negative percentage change > 10%
All Other Parameters	Minor Red Flag	Negative change in environmental quality of < 30%
	Major Red Flag	Negative change in environmental quality > 30%

This systematic approach ensures a consistent and objective classification of environmental changes, allowing for effective management and response strategies based on the severity of impact.

RESULTS AND DISCUSSION

The environmental impact assessment of the Gurha Lignite project in the Bikaner district, conducted using the modified Battelle method, revealed a total environmental impact of 65.9 units, with an overall positive net impact of 10.7%. Within specific categories, "Ecology" and "Environmental Pollution" showed negative impacts of -4.6% and -17.1%, respectively, while "Human Interest" and "Aesthetics" had positive impacts of 94.8% and 10.9%. The study identified 23 problem areas, with 14 minor and 9 major Red Flags, mostly in the "Environmental Pollution" category,

which had 12 minor and 3 major flags. The "Ecology" category had 6 major flags, "Aesthetics" had 2 minor flags, and no flags were noted in the "Human Interest" category. In this study, the environmental impact of the lignite mine and its associated thermal power plants in Gurha, Bikaner, Rajasthan, was meticulously assessed using the modified Battelle method. The findings reveal a complex interaction between the project's various effects, with both positive and negative outcomes. On the one hand, the project does pose challenges, such as the degradation of air and water quality, increased noise levels, and disruptions to local ecology and aesthetics. However, these concerns are counterbalanced by significant benefits, particularly in advancing human interests and the broader development of the Bikaner district. Importantly, the project has the potential to be a catalyst for regional growth. The overall assessment suggests that the benefits to humanity, especially in terms of economic and social development, outweigh the environmental drawbacks. To maximize these positive impacts, it is crucial to implement cutting-edge mining and environmental management technologies. By doing so, production can be increased while simultaneously mitigating environmental harm. Therefore, despite the environmental challenges, the lignite project can be seen as a key driver for progress in the region, provided that sustainable practices are prioritized.

ABSTRACT

Single-cell protein (SCP) likewise allowed as microbial protein is characterized as protein got from cells of microorganisms like yeast, parasites, green growth, and microscopic organisms which are developed on different carbon sources for synthesis. SCP likewise contains fats, sugar, nucleic acids, nutrients and minerals. A mixture of materials can be used as a substrate for producing as pineapple peel residue, pomegranate waste, banana waste and apple waste. In this work we intended to investigate the possibility of bioconversion of fruit and vegetable wastes in to SCP by using Microbial consortium such as *Bacillus subtilis*, *Lactobacillus*, *Pseudomonas fluorescence* isolated from soil and curd samples on media containing fruit wastes. The mixture of fruit waste was found good amount of reducing and total sugar respectively 4.29±0.08 mg% and 5.30±0.08 mg%. It was also found 22.67±0.63 mg%. The increase and decrease in biomass and protein contents were observed when conditions were optimized during fermentation. The SCP loaded Chocolates were prepared by mixing SCP, Milk powder, Caster sugar, Cocoa powder and made into a dough and chocolates were designed by using moulds. This chocolate structure is simpler for each person to bite and ingest. Thus the present findings help in Single Cell Protein from inexpensive, cheap, readily available fruit wastes and it revealed the efficacy of SCP loaded chocolate formulation and it would definitely have wide scope in the future as an immunity booster and in treatments of malnutrition in children as well.

Keywords: SCP, *Bacillus subtilis, Lactobacillus, Pseudomonas fluorescence,* Immunity boosters.

INTRODUCTION

The word single cell protein (SCP) is considered to be the most applicable term as it's produced from single celled organisms (Jamal *et al., 2008*). It was set up that yeast is able of producing about 250 tons of protein in 24 h(Aggelopoulos *et al*., 2014). Single cell protein is produced by colorful microbial species which include algae, bacteria, fungi and yeast. Among them, fungi and bacteria are the major directors of that protein (Anupama and Ravindra, 2000) as they characterised by fast rate of growth and advanced protein content(Gao *et al*., 2007). Some algal species that are cultivated specifically in the submarine media were also used for this purpose (Voltolina *et al., 2005*). In addition to high protein content which is 60- 82 on dry matter base, SCP also consists of carbohydrates, nucleic acids, fats, minerals and vitamins(Jacob- Lopes *et al., 2006*). Another advantage associated with SCP is that it's rich in colorful essential amino acids such as lysine, methionine which aren't present in sufficient quantities in utmost animal and factory sources(Gao *et al., 2012*). SCP has been reported to be a good relief of precious protein sources like fish meal and soybean meal (Goldberg*., 2013*). Protein presents in perceptible quantities in microbial cells which are formed from different sources of inorganic nitrogen similar as ammonia (Nasseri *et al., 2011*) and presents also in algae(Ghasemi *et al., 2011)*. Single-cell protein (SCP) in chocolate preparation can be a creative and sustainable approach. To prepare chocolates using SCP, selecting a suitable microorganism that produces protein efficiently and has desirable taste and nutritional qualities is necessary. Hence the present study intended to produce chocolates loaded with SCP obtained by bacteria which act as immunity boosters.

MATERIALS AND METHODS

Sample Collection

Soil sample was collected from the garden area for the isolation of *Bacillus subtilis* and *Pseudomonas fluorescence* and curd sample was collected from household for the identification of *Lactobacillus.* The soil sample was placed in closed polythene bags and stored in specific container. Curd sample was stored in glass airtight container. All the samples were collected on the day of processing

Pretreatment for Fruit Waste (Yousufi, 2012)

The fruit wastes like Apple waste, Pomegranate waste, Papaya waste, Banana waste were collected from fruit market of Koothanallur.500gm of mix fruits waste like Apple waste, Banana waste, Orange waste, Pineapple waste, Pomegranate waste containing of peels, pulp, seeds were subjected to thorough washing under running tap water. Then cleaned initially with 2%H_2SO_4 and further washed with sterile distilled water. Then 100ml of distilled water was taken for crushing the fruits waste was macerated in blender. The fruits extract was obtained filtered with the use of muslin cloth again filtered with filter paper. 100ml filtrate was taken in 250ml Erlenmeyer flask. Other than control, were prepared consisting of the basal media D-Glucose (2%W/V), Ammonia sulfate $(NH_2)_2SO_4$), $MgSO_4.7H_2O$ (0.5gm), KH_2PO_4(1gm). The Erlenmeyer flask was plugged with sterile cotton wool and aluminum foil. The flask was then autoclaved at standard temperature of 121°C, pressure of 15 psi for a time period of 15minutes.

Isolation of Bacteria from Samples (Aneja, 2005)

After sample collection, serial dilution was performed for isolating microbial development from the collected samples. For this 10ml of sterile distilled water was taken in a test tube. To this, 1g of soil was added. In another tube, added 1ml of curd sample. The tubes were vigorously vortexed for 3minutes to obtain uniform suspension of organism. A series of tube labeled as 10-4 up to 10-6 were filled with 9ml sterile distilled water. 1ml of diluted sample was transferred in the 10-5 marked tube. It is further continue up to 10-7 dilution and form last dilution 1ml was discarded for both set of tubes. The nutrient agar medium plates inoculated with 10-4, 10-5,10-6 for bacteria and incubated 37°C for 24 hours.

Media Preparation and Sterilization

The media with specified composition were prepared in 1000ml conical flask. For bacteria, Trypticase soy agar was prepared by dissolving 15.0 g of Trypticase, 5.0g of Phytone and 5.0g of sodium chloride in 750 ml distilled water. After adjusting the pH 7.0, 15.0 g of agar was mixed with above contents and the volume was made to 1000ml.

Spread Plate Technique

20 ml of molten and cool(45"c) Trypticase soy agar was poured into sterile petriplate. 0.1 ml of inoculum from 10^{-4}, 10^{-5}, 10^{-6} and dilutions from both set of tubes were spread on separate solidified agar plates using an I.-glass rod, replicates were maintained for each sample. The plates were incubated at 37°e for 24-48 hours.

Streak Plate Technique (Sandars, 2012)

20 ml of Trypticase soy agar medium was poured into set of sterile petriplates and 20ml of Nutrient agar was poured into another set of petriplates. A loopful of culture from the TSA plates was streaked onto the solidified TSA agar plates and Nutrient agar plates. This procedure was repeated for each spread plate. The immunized plates were incubated at 37°c for 24-48 hours.

Morphological and Biochemical Tests

A morphological test such as Gram's staining and motility tests were done. Biochemical tests such as Indole, MR-VP, catalase, oxidase, urease and citrate utilization tests were performed to identify the bacteria.

Production of SCP (Saheed *et al*., 2016)

After autoclaving, in aseptic condition inoculated 1.0ml (3×108 cfu/ml) culture in flask then incubate on mechanical shaker at 200rpm for 45hrs at 25°C. After fermentation biomass was harvested from culture broth by vacuum filtration and gently washed with sterile water. Before taking the weight of the biomass, bacterial biomass was transferred into pre-weighed Whattman filter paper. The filter paper content was oven dried at 55°C for 48hrs.

Analytical Procedure

The moisture, Protein estimation by folin Lowry's method, reducing sugar estimation by DNS method, Total sugar estimation by Phenol sulfuric acid method were determined by AOAC methods (AOAC, 1975).

Optimization of Fermentation Conditions (Fatemah *et al.,* 2019)

Fermenting time, temperature, pH and substrate concentration(V/V %) of fruit waste substrate were optimized for SCP yield and its protein content. The conditions were optimized by changing one factor at a time while keeping the other variables constant. All the experiments were carried out in triplicate in a shaking incubator at 100 rpm.

Preparation of Chocolates (Pawar 2019)

Obtained SCP powder, Milk powder, Caster sugar, Cocoa powder are to be purchased from local market of Koothanallur and 10% NaCl solution prepared at laboratory. All the ingredients should be weighed accurately. Evaluation of SCP powder and all dry contents will be done by color, odor, taste, extractive value and Ash value. Solubility of SCP was checked in different concentrations of NaCl as solubility enhancer with little warm condition and prepared SCP solution. Chocolates were prepared by mixing all the ingredients in required quantity along with SCP solution and made into dough. By using appropriate mould, dough should be transferred into designed moulds and should be kept in refrigerator for better hardness.

Statistical Analysis

The statistical analysis was carried out using Microsoft excel.

RESULTS

The bacteria *B. subtilis* and *P. fluorescence* were isolated from soil sample. *Lactobacillus* was isolated from curd. Among the three isolated bacteria *Lactobacillus* (22.67%) produced good amount of protein in fruit waste hydrolys ate when compared with other two bacteria. During fermentation, conditions such as pH, temperature, time and substrate concentration were optimized. Significantly higher protein content (55.5 ± 0.3 %) was obtained at 10% concentration while the least protein content (21.0 ± 1.1%) was obtained at 1%. The maximum biomass was reported at pH 5.0(23.6± 1.5 g/L) and 4.5 (22.2 ± 0.8 g/L). Significantly higher protein content (52.9 ± 0.5%) was recorded at pH 5.0. The maximum protein content was observed at 25° C for 10% (v/v) fruit medium which accounted for 53.1±3.6%. The highest biomass production for fruit waste medium was recorded after 120 hour (18.7± 3.3g/L) of fermentation and the significantly higher protein content was recorded after 24 h of fermentation (59.1 ± 0.8%). From the produced SCP powder chocolates are produced. The chocolates were found as Brown, Chocolaty and slightly salty, smooth, glossy. The color, taste, texture were retained up to 3 months. Hence the stability of *Lactobacillus* chocolates is found to be excellent. This preparation is beneficial in treating protein malnutrition as it can fulfill daily protein supplementation.

DISCUSSION

Enhancing protein and biomass production in SCP generated by the bacterial consortia was the goal of this experiment. In this manner, amino acid composition and protein content in the dry biomass are the crucial data. Single cell protein can be utilized as a fixing or a substitute for protein-rich food sources in creature takes care of, and photosynthetic microbes are thought of as one of the reasonable protein sources for aquatic animals. Clearly, SCP got in this work can be used as protein feedstock for aquatic animal from food. According to Dhanasekaran *et al* 2011., Yeast biomass production with use of pineapple waste as a substrate. Their protein, reducing and non-reducing sugar contents respectively 0.6%, 10.8% and 13%. For human use, the most likely products are SCP concentrates or isolates that can be further processed into textured or functional SCP products. Baker's yeast protein is one result of this sort supported for human food fixing use in the US. Algae also contain 40- 60% protein, 7% mineral salts, chlorophyll, bile pigments, fibre and have very low nucleic acid content (4-6%). Algae growth needs unique photobioreactors to culture and parasites can be refined just be strong state maturation. Mixed culture of *Trichoderma reesei* and Kluyveromyces marxianus gave a SCP yield 51%. Addition of yeast extract and manganese chloride resulted in the highest yield of SCP from *Lactobacillus delbrueki* and *Lactobacillus bulgaricus* when cultured on dried whey. The yield was reported to be 32.8%. Compared to these species the protein content observed in the present study is higher by two folds.

CONCLUSION

Single cell protein can be produced by using various waste materials as substrates. Many organisms such as Algae, Fungi and bacteria are capable of producing Single cell protein. The result showed that *Lactobacillus* produced high amount of protein of about 22.67% when compared to other two bacteria. The SCP produced from *Lactobacillus* was used in the preparation of Chocolates. The chocolates act as immunity boosters which help in preventing protein malnutrition and can fulfill daily dietary protein supplementation. This study can further be extended by production of SCP in large scale. Health tonics and capsules can be developed after analysing nutritional composition especially the essential amino acid composition. The dried powder or pellets can directly be used as feed for livestock.

ACKNOWLEDGEMENT

The authors are Thankful to Dr V.Dhivaharan, Chairman, STET Group of Institutions, (Autonomous), Sundarakkottai, for providing financial support and infrastructure to carry out the entire research work.

ABSTRACT

About half of all people have dandruff, a typical ailment of the scalp brought on by the naturally occurring skin fungi. *M. furfur* and *M. globosa* the anatomy, pathophysiology, causes, symptoms, and available treatments for dandruff are all covered in detail in this article. It also draws attention to the anti-dandruff properties of herbal components utilized in cutting-edge formulas for shampoos as a therapeutic approach. This review covers the different bioactivities, such as anti-inflammatory and antifungal properties, that these substances have in treating dandruff in addition to their mode of action.. Medicinal plants have been explored for their potential as antidandruff agents due to their natural compounds that possess antimicrobial, anti-inflammatory, and scalp-nourishing properties Here's an abstract overview of how medicinal plants are utilized in combating dandruff.

Keywords: Scalp, Dandruff, Medicinal plants, Anti-fungal, Anti-dandruff Agents.

INTRODUCTION

Medicinal Plant continue to be an important therapeutic aid in the handling of human disease since prehistoric times. It is estimated that roughly 80-85% of worldwide population's primary health care is provided by traditional medications care requirements, and it is expected that plant extract or bioactive principle are used extensively in

traditional therapy . Every hair follicle has an opening that leads to the sebaceous (oil) gland, which is located in the skin. As stated by Della Porta, The notion of convenience is kept in mind since "the hair protects the head from cold and heat," and where there is a lot of laughter and warmth, there is also a lot of hair. The brains are wet. In the Philippines, the three most prevalent hair-related issues are (1) hair fall, (2) dandruff, and (3) having nice-smelling hair in spite of the heat. A writer divides dandruff into three phases. Severe, medium, and mild Dandruff that isn't too severe is normal. Fifty percent of people worldwide suffer from dandruff, and 80% of the time Filipinos are affected.[1-3] A lot of individuals, including researchers, think that dandruff is just a milder form of *Seborrheic dermatitis* This is typified by thinly spaced, diffusely or patchily distributed white to gray flakes on the scalp. In addition to making the scalp feel dry and itchy, it also prevents obvious inflammation [4] A cluster of corneocytes that have severed their ties to the stratum corneum's surface while maintaining a high degree of cohesiveness with one another is known as dandruff scale. Its central component is a pilosebaceous follicle, whose proportions and abundance differ depending on the scalp's location. The amount of parakeratotic cells that make up dandruff is directly correlated with the degree of clinical symptoms that may be caused by seborrhea. In this sense, the term sicca, or pityriasis simplex, refers to the emergence of tiny, fine squames that give the disease a farinaceous and asteatotic appearance. Steatoid pityriasis, sometimes referred to as *oleosa* is characterized by thick, sticky, *seborrheic* dandruff that frequently has a larger scale [5].

Hair Anatomy And Physiology

Mammals are known for having hair, which serves a number of purposes. Examples include physical defense, heat regulation, concealment, perspiration and sebum distribution, sensory and tactile processes, and social interactions.[6]

Parts of Hair

The dermal papilla and matrix are found in the hair. Entire active cell required for hair growth and development of the different components of the hair, including the outer root sheath, inner root sheath, and hair shaft, is found in the matrix that surrounds the dermal papillae. The dermal papilla controls the hair cycle and hair growth and contains androgen receptors that are sensitive to the presence of DHT. [7] The visible hair shaft on the body's surface and the follicle located in the skin are the two separate entities that make up hair.

Hair Growth

Hair, like sweat glands, sebaceous glands, and nails, is a protective body feature that is considered an epidermal accessory structure. Hair influences protection, sensory abilities, temperature control, and sexual attraction. Hair is a complicated organ made up of dermal papillae (DP), matrix cells, terminally matured keratinocytes, and fibroblasts at the deepest end of the follicle. Fibroblasts are thought to be important for both maintaining hair growth and inducing new hair follicles. DPC plays a crucial role in regulating hair follicle renewal through intricate paracrine interactions. Research indicates that DPC-derived chemicals encourage hair development by affecting surrounding cells. The cyclical process of hair development involves three phases: anagen (growing), catagen (regression), and telogen (resting). The cyclic changes cause the epithelial and dermal hair follicle components to quickly remodel . The Anagen Phase is the growth phase where hair cells rapidly divide, forming new hair. The cycle then enters the Catagen Phase, signaling the end of active hair growth. The Telogen Phase, a resting period, occurs when strands remain in follicles but are not actively growing, accounting for 10-15% of hairs at any given time.

Problems Related To Human Hair

Hair loss

Hair loss can be caused by a variety of factors, including physiological, nutritional, and medical conditions. Male pattern baldness, commonly known as and rogenetic alopecia, is increasingly recognized as a serious medical issue requiring specialized care from general practitioners. [8] Tight weaves, ponytails, and frequent bleaching or perming can cause hair loss. Trichotillomania is a psychological disorder characterized by compulsive hair removal.[9]

Weathering

Weathering refers to the gradual degeneration of the hair's cuticle and cortex from the root to the tip caused by normal daily wear and tear. Although all hair ages. When hair is repeatedly mistreated, it suffers more severe weathering. Weathering characteristics include damaged cuticles, transverse fissures similar to trichorrhexis nodosa nodes, and longitudinal fissures called split ends. Bleaching is one of the known causes of weathering. It oxidizes the melanin that already exists in the cortex.[10]

Dandruff

Dandruff, commonly known as pityriasis capitis or pityriasis simplex capillitii, affects around 50% of the global population Dandruff and *seborrheic dermatitis* (D/SD) are considered similar scalp disorders with minor differences in severity. The vulnerability to the sickness is mostly independent of heredity. SD can produce peeling, scaling, irritation, and pruritus in the face, upper chest, and retro-auricular region, as well as the scalp. It may also have significant erythema. SD and dandruff flakes can be oily or dry and vary in color from white to yellow[11-13]

Pathophysiology of Dandruff

Dandruff Composition

Dandruff is caused by a cluster of cohesive corneocytes that detach from the stratum corneum's surface. Parakeratotic cells are commonly found in dandruff. People with oily skin are more likely to experience this issue. The culprit is a yeast called *Malasseziaglobosa*, which feeds on scalp oils. Dandruff can occur when the scalp reacts to oil breakdown as an irritation[14]

Microbial Etiology

Dandruff can be caused by a variety of etiological pathways involving complex processes. Previously, it was thought that dandruff was caused by the lipophilic yeast of *MalasseziaMalassezia* concentrations increase by 1.5 to 2 times normal levels during dandruff. The microbiological origin of dandruff is noteworthy, as it responds well to several steroids. Steroids can reduce immune responses, allowing microorganisms to thrive. *Malassezia*, including *M. globosa, M. Resticta evasive, M. Sloofiae, M. Sympodialis, M. furfur,* and *M. pachydermatis*, have been associated to the development of dandruff[15]

Non – Microbial Etiology

Long-term sun exposure can cause desquamation of the scalp [16] Dandruff can be caused by scalp irritation from excessive washing, combing, cosmetic products, grit, or grime. However, experimental data does not provide significant support for the aforementioned ideas[17]

Causes And Symptoms

Increased central nervous system excitability, diseases of the GI ,Long-term usage of anabolic steroids, testosterone, progesterone, and glucocorticoids ,During puberty. Change in the ratio of estrogen and androgen levels. Harmonic Disorders An overgrowth of *Malassezia* can cause irritation and accelerated cell turnover, which results in dandruff.
Symptoms - White or yellowish flakes: These are frequently seen on the scalp, hair, and shoulders. Itchy Scalp: Itching is a typical symptom that can accompany flakes. In more severe cases, the scalp may become red or irritated.The scalp may feel extremely dry or greasy, depending on the underlying cause. Scaly Patches: In disorders like psoriasis, you may see more pronounced, scaly patches on the scalp.[18]

Treatment

Eliminating disease symptoms, especially pruritus, and establishing a long-term remission with medication are the objectives of treating SD and dandruff. Since *Malassezia* growth and localized skin irritation and inflammation are the key underlying disease processes, external antifungal and anti-inflammatory herbal medicines are the most often utilized therapy[19]Herbal chemical components cooperate to treat fungal overgrowth, inflammation of the scalp, and dryness, which are the root causes of dandruff. In order to improve scalp health and lessen dandruffsymptoms, they are frequently added to herbal shampoos conditioners, scalptreatments, and home cures.

Medicinal Plants Having Antidandruff Activity

Numerous therapeutic plants have antidandruff qualities, providing all-natural remedies for healthy scalps. Aloe vera is well known for its moisturizing and antifungal properties, which help to relieve dandruff and calm the scalp. Strong antifungal and antibacterial ingredients found in Neem help prevent dandruff and promote healthy scalps. The antifungal and anti-inflammatory qualities of Tea tree oil which is extracted from the leaves make it beneficial. Rosemary contains antibacterial properties that reduce dandruff and increase blood circulation. Because of its antibacterial qualities, Lemongrass oil is also beneficial against dandruff. Finally, holy basil, or Tulsi contains antifungal and antibacterial qualities that support healthy scalp maintenance. These herbs give safe, all-natural solutions for dandruff and scalp health. Various more medicinal plants have been utilized for dandruff prevention and treatment in traditional cultures all over the world. Some of the medicinal plants that possess antidandruff activity discussed in Table 1.

CONCLUSION

Medicinal plants various bioactive components have demonstrated significant promise in the treatment of dandruff. These natural treatments frequently target the main causes of dandruff, such as *Malassezia* species, with their antifungal, anti-inflammatory, and antioxidant qualities. Numerous studies have shown that certain plants, such as Aloe vera, Neem, Tea Tree and Rosemary are beneficial in lessening the symptoms of dandruff. Utilizing these plants can provide a more secure and organic substitute for the artificial chemicals typically present in store-bought anti-dandruff treatments. The above-mentioned 36 medicinal plants provide a wide range of bioactive substances that efficiently treat dandruff by acting on multiple levels, including antifungal activity, anti-inflammatory qualities, and conditioning the scalp. In addition to offering natural, frequently safer alternatives to conventional dandruff treatments, these herbs also feed the scalp and enhance the general health of hair.

Table.1:Antidandruff activity of various medicinal plants and their derived bioactive constituents with the mode of action

SR. No.	Profile	Common name Botanicle name	Family	Parts of plant Used	Active Constituents	MOA	Ref.
01		TEA TREE *(Melaleuca alternifolia)*	Myrtaceae	Leaves	alpha pinene, D-limonene, alpha terpinene	It is known for its potent antibacterial and anti-inflammatory effects. It reduces fungal development (including Malassezia) on the scalp and relieves irritation and inflammation	20
02		NEEM (*Azadirachta indica)*	Mahogany	Leaves	Azadirachtin, nimbidin, nimbin.	Has potent antifungal, antibacterial, and anti-inflammatory propertiesNeem helps combat fungal infections on the scalp, soothes irritation, and supports	21

						overall scalp health.	
03		ALOE [*Aloe vera]*	Liliaceae	Aloe gel	Polysaccharides, glycoproteins, anthraquinones.	Provides moisturizing and soothing effects to the scalp, reducing itchiness and irritation. Aloe vera also has antimicrobial properties that can help in managing dandruff	22
04		ROSEMARY (*Rosmarinus officinalis)*	Lamiaceae	Leaves and twigs	Carnosic acid, rosmarinic acid caffeic acid	Increases circulation to the scalp, promoting hair follicle health. It also has antibacterial qualities that help manage fungi that cause dandruff.	23
05		LAVENDER (*Lavandula angustifolia)*	Lamiaceae,	fresh lavender flowers and leaves	Linalool, Linalyl acetate, ocimene	Known for its relaxing and anti-inflammatory properties. Lavender oil helps relieve scalp irritation and may include modest antibacterial qualities.	24
06		CHAMOMILE (*Matricaria recutita*)	Asteraceae	white and yellow flower head	Chamazulene, apigenin, bisabolol	Has anti-inflammatory and soothing properties that can help alleviate scalp irritation and	25

						itching associated with dandruff.	
07		BURDOCK ROOT (*Arctium lappa)*	Compositae	The root, leaf, and seed	Inulin, polyphenolic acids.	Supports scalp health by reducing inflammation and promoting detoxification	26
08		FENUGREEK (*Trigonella foenum-graecum)*	Fabaceae (Leguminosae)	seeds	Saponins, alkaloids, flavonoids	Antifungal, anti-inflammatory, emollient	27
09		BASIL (*Ocimum basilicum*)	Lamiaceae (Labiatae)	Leaves	Eugenol, linalool, methyl chavicol	The essential oils found in basil, such as linalool and eugenol, have antibacterial and anti-inflammatory qualities. They aid in the treatment of scalp infections and the reduction of dandruff-related irritation	28
10		LEMON (*Citrus limon)*	Rutaceae	lemon juice	Limonene, citral, flavonoids	Antimicrobial, astringent, pH balancing	29
11		BETELE LEAF (*Piper betel leaf*)	Piperaceae	Leaves	Eugenol methyl ether, caryophyllene, cadinene, γ-lactone, allyl catechol, and p-cymene	helps in quick hair growth. They condition the hair and make your hair thick and long. It also helps in treating issues like itchiness,	30

						dandruff, and split ends	
12		AMLA (*phyllanthus emblica Indian gooseberry*)	Phyllanthaceae	fruit	vitamin C, vitamin A, amino acid, protiens, calcium	Prevent or cure scalp and dandruff issues. Prevent or cure fungal and bacterial infections of the hair and scalp, Enhance the look of hair overall.	31
13		SHIKAKAI (*Acacia concinna*)	Fabaceae	fruit pods	saponins, flavonoids, alkaloids, and vitamins.	Sanitizes hair ,Make the hair shine more , Avoid grays ,Provide the hair nutrients and encourage quick, healthy hair development.	32
14		HIBISCUS (*Rosa sinensis*)	Malvaceae	Flower	Flavonoids, Vitamin c Alpha Hydroxy Acids	Encourage the restoration of lost hair volume. Hair condition Stop baldness. Treat your itchy scalp and dandruff.	33
15		BHRINGRAJ (*Eclipta prostrata*)	Asteraceae (or Compositae)	Whole plant Leaves, Steam, Root,	Alkaloids, Flavonoids, Sterols and fatty acids	Bhringraj's alkaloids and other compounds possess antimicrobial properties that inhibit the growth of fungi and bacteria on the scalp, which are often responsible for dandruff	34

16		ASHWAGANDHA (*Withania somnifera*)	Solanaceae	root	Withanolides Alkaloids, Flavonoids.	Controls hair loss, encourages hair growth, and enhances scalp circlation.	35
17		BRAHMI (*Bacopa monnieri*)	Plantaginaceae (Scrophulariaceae).	Leaves	Bacosides Alkaloids, Saponins.	It helps to reduce hair loss by treating dandruff and reduces inflammation	36
18		BAEL (*Aegle marmelos)*	Rutaceae	Roots, Bark, and Seeds, Leaves and fruits.	Essential Oils Alkaloids Phenolic compound	Bael fruit has antimicrobial properties and may help fight against certain bacteria and fungi.	37
19		MANGO (*Mangifera Indica)*	Anacardiaceae	leaves and seeds	Mangiferin, Vitamins and Minerals	Mango seed treats dandruff and itchy scalp. As it is rich in fatty acids, it nourishes hair and imparts great shine.	38
20		KURRY LEAVES (*Murraya koenigii)*	Rutaceae	Fresh and dried leaves	Carbazole Alkaloids, Flavonoids, Vitamins and Minerals	Curry leaves are a rich source of protein, beta-carotene, and antioxidants that help in strengthening the hair fibres, encourage fast hair growth and prevent hair loss. Amino acids present in the curry leaves help retain hair strength and	39

						hair shine.	
21		AJWAIN (*Trachyspermum Ammi*)	Apiaceae (Umbelliferae)	seeds	Thymol Terpenoids, Essential Oil[α-pinene, β-pinene, and limonene]	Ajwain promotes cell reinforcement and the nutrients in the seeds nourish the hair. It fights dandruff and gets rid of it swiftly when applied to the scalp regularly.	40
22		FLAXSEED *(Linum usitatissimum)*	Linaceae	seed	Omega-3 Fatty Acids Lignans, Vitamins and Minerals	Flaxseeds are high in vitamin E and omega-3 fatty acids, which help to fortify hair and keep it from breaking. Furthermore, flaxseeds promote hair development and reduce scalp irritation.	41
23		TULSI *(Ocimum sanctum)*	Lamiaceae	leaves	Eugenol, Carvacrol, linalool, and ursolic acid	Tulsi exhibits antifungal activity against fungi responsible for dandruff, such as *Malassezia furfur*.	42
24		THYME (*Thymus vulgaris*)	Lamiaceae (mint family)	leaves and flower essential oil.	thymol and carvacrol	Thymol and carvacrol have strong antimicrobial properties, particularly against fungi like Malassezia	43

						species, which are often associated with dandruff.	
25		SAGE (*Salvia officinalis*)	Lamiaceae	leaves	Thujone , Camphor, Rosmarinic acid	Compounds like thujone and camphor help combat fungi and bacteria on the scalp, including those responsible for dandruff.	44
26		WITCH HAZEL (*Hamamelis virginiana)*	Hamamelidaceae	bark and leaves	Tannins, Gallic acid Flavonoids.	Compounds like gallic acid and certain flavonoids possess antimicrobial properties that can help combat microorganisms on the scalp, potentially reducing dandruff causing fungi or bacteria.	45
27		HORSETAIL (*Equisetum arvense)*	Equisetaceae	stems	Silica, Flavonoids, Saponins and Phenolic compounds	Flavonoids, saponins, and phenolic compounds help protect the scalp from oxidative stress and reduce inflammation, which can contribute to scalp health and potentially alleviate dandruff	46

						symptoms.	
28		CALENDULA (*Calendula officinalis*)	Asteraceae (daisy family)	Petals of the calendula flower	Flavonoids, Saponins, Triterpene alcohols	Calendula helps reduce inflammation on the scalp, which is beneficial for conditions like dandruff.	47
29		NETTLE (*Urtica dioica)*	Urticaceae	Leaves and sometimes roots.	Phenolic compounds, Minerals: Such as iron, silica, and potassium.	Nettle has anti-inflammatory properties that can help soothe scalp irritation associated with dandruff.	48
30		YARROW (*Achillea millefolium*)	Asteraceae (daisy family)	flowers, leaves, and stems.	Flavonoids, Sesquiterpene lactones, Tannins.	Yarrow contains compounds such as flavonoids and sesquiterpene lactones that have anti-inflammatory properties. These can help reduce scalp inflammation associated with dandruff.	49
31		OREGANO (*Origanum vulgare)*	Lamiaceae (mint family)	leaves and flowering tops	Oregano essential oil contains several active compounds such as carvacrol, thymol, p-cymene, and gamma-terpinene.	The antimicrobial properties of oregano essential oil disrupt the cell membranes of fungi like Malassezia, inhibiting their growth and thus helping to alleviate dandruff	50

32		CEDARWOOD (*Cedrus spp.)*	Pinaceae (Pine family)	Heartwood Essential oil.	Cedarwood essential oil contains various compoundsincludingalphacedrene, beta-cedrene, cedrol, thujopsene, and othersesquiterpenes.	Cedarwood essential oil is known for its anti-inflammatory, antifungal, and antimicrobial properties. It can help soothe scalp irritation, reduce flakiness associated with dandruff, and inhibit the growth of fungi such as *Malassezia* .	51
33		MYRRH (*Commiphora myrrha*)	Burseraceae (Frankincense family)	resin	Including resin, volatile oil (containing compounds like sesquiterpenes and furanosesquiterpenes such as curzerene)	its antimicrobial, anti-inflammatory, and astringent properties. In the context of scalp health and dandruff, myrrh's antimicrobial action helps combat microbial overgrowth that can contribute to dandruff.	52
34		VETIVER,KHUS (*Vetiveriazizanioides)*	Poaceae (Grass family)	Roots of the vetiver grass, roots from mature plants that have	Vetiver essential oil contains a complex mixture of sesquiterpenes such as vetiverol, vetivones, vetivenes,	In the context of dandruff, vetiver oil helps soothe scalp irritation, regulate sebum production, and maintain	53

				been aged and dried.		a balanced scalp environment, which can reduce flakiness and Itching associated with dandruff.	
35		PATCHOULI PLANT (*Pogostemoncablin*)	Lamiaceae (mint family)	Leaves, Essential oil.	Patchouli Alcohol, Alpha-Bulnesene.	It helps to combat the fungus *Malassezia*, which is often associated with dandruff.	54
36		GERANIUM (*Pelargonium graveolens)*	Geraniaceae	Essential oil, extracted from the leaves and stems of geranium plants.	Geraniaceae, Geraniol, Linalool	It helps to combat fungi and bacteria on the scalp, including *Malassezia*, which is associated with dandruff.	55

ABSTRACT

Traditional knowledge of plants and their properties must be transferred from one generation to the next generation and they play vital role in providing health care. Markhamia lutea is an ornamental and an important agro forestry tree of family Bignoniaceae . It is native to Africa but also found in Asia. It is evergreen small tree of 4-5 m. in height with beautiful yellow coloured trumpet shaped flowers growing in terminal cluster. But it's ethno medicinal properties is less known. The main objective of present work is to give the information and documentation of M. lutea used by the local people. Leaves , barks and roots are used in traditional medicine. Leaves and barks are used to treat toothache, stomach ache , headache, snakebite cough and malaria. Roots are used in convulsion, asthma, cough. young shoots are used to treat throat complaint and diarrhoea. The antibacterial, antiviral and ant parasitic activities of various parts of this plant may provide good opportunities for drug development.

Keywords: Ethno medicinal, *Markhamia lutea*, traditional medicine, drug development.

INTRODUCTION

Jharkhand is quite rich in its floristic wealth .Ethnomedicine deals with the medicine derived from plants and used in the treatment of different ailments based on traditional knowledge. Traditional medicine is defined as indigenous medicine that is used to maintain health and to prevent ,diagonose and treat physical and mental illness differently from allopathic medicine based on theories , beliefs and experience [1]. The contribution of ethnomedicinal plants in discovery new drugs has become boon in treating the disease and boost to the pharmaceutical industry. *Markhamia lutea* is a least concern plant by IUCN .*M. lutea* is an evergreen ornamental and an important agro forestry tree of family bignoniaceae with chromosome number 2n= 40.It is commonly known as Nile tulip, Nile trumpet etc. It is native to easter Africa and Asia. *Markhamia* was named in the honour of geographer C. Robert Markham (1830-

1916) who worked in India .Very scanty work has been done in India on etnomedicinal and phytochemical investigation of *M. lutea.* Extensive work has been done in Africa which elucidate the ethnomedicinal use of *M.lutea* . This plant is traditionally used for treating microbial and parasitic disease , tumor , toothache, snake bite etc. The objective of this plant study is to collect and identify plant and elucidate the relevance of indigenous knowledge of this plant as herbal medicine. This paper reports the ethnomedicinal use of *M.lutea* which is less known plant in Jharkhand.

MATERIAL AND METHODS

Plant material used for the study is *Markhamia lutea* (Fig. 1)

Study Area

The study area of this work is Kanke which is sub division of Ranchi district situated in Jharkhand state(Fig.2).It is located at 23.43^{0}N85.32^{0}E.It has an average elevation of 611 meters. According to the 2011 census of India ,Kanke had a total population of 17,560 [2].

METHODOLOGY

Plants were identified and herbarium were prepared. Literary survey and interview of some local people were done and the required data was summarized and presented in both text and tabulated form.

RESULTS AND DISCUSSION

Plants of *Markhamia lutea* are widely distributed in the study area. Based on and informant's data *M. lutea* is found to contain many phytochemicals which madeit as an important medicinal plant.

Botanical Feature

Evergreen , small to medium sized tree up to 25 -30 m. tall with chromosome number 2n=40. Sometime branchless up to 20 m. Leaves - Opposite, imparipinnately compound up to 35 cm. long with 2-6 pairs of leaflets, petiole 6-12cm. long elliptical to obovate, rounded at base, acumnate at apex, covered with small scales. Inflorescence –Terminal panicle Flower- Bisexual, zygomorphic, large and showy, yellow in colour, scented, pedicillate Calyx- Spathe shaped 2-3 cm. long covered with small scale Corolla- Golden yellow with brownish or red veins or spot at the throat ,with tube 2-4.5 cm. long 2 lipped and 5 lipped lobes ,glandular. Androecium- Stamens 4, 2-3 cm. long 2 longer and 2 shorter inserted on the corolla tube. Gynoecium - Ovary superior, oblong, bicelled ,style long. Fruit – Linear, curved capsule, 35-80cm. long ,flattened, dehiscing with 2 valves, many seeded. Seed – Irregularly rectangular with 2 lateral wings, yellow-white in colour The presence of phytocostituents such as flavonoids, saponins, terpenoids, phytosterol, quinines and coumarins made *M.lutea* as an important ethno medicinal plant. The different parts of plant alone and in combination used to treat various ailments are depicted in Table 1. Plants of the genus with the identified phytoconstituents including phenylpropanoid,glycoside,terpenoids,phytosterol,quinines,flavonoids have been claimed to possess antiviral, antifungal antiprotozoal ,analgesic, anti-inflammatory and cytotoxic activities [3].In support of the genus *Markhamia* many pharmacological investigations have been reported[4,5].

CONCLUSION

It may be concluded that *M.lutea* hold great potential as a source of new drug. More ethnomedicinal survey of this plant is needed for Jharkhand because very scanty literature is available in this regards.

Table .1: Ethnomedicinal use of different parts of *Markhamia lutea*

Sl. No	Part used	Traditional use
1	Leaves	Used in snake bite, throat complaints, lumbago, malaria and diarrhoea.
2	Bark	Used to treat anaemia, diarrhoea and backache.
3	Leaves and bark	Used to treat toothache, stomach ache and headache.
4	Roots	Administered to children to treat convulsion
5	Root and bark	Decoctions are taken against asthma, cough and gonorrhoea.

ABSTRACT

oni Dhupana is an important *Ayurvedic* practice used to address various disorders affecting the vulva, vagina, cervix, and related areas. In India, the prevalence of vaginal discharge is estimated to be around 30%. This review aims to assess the practical effectiveness of *Yoni Dhupana* in managing *Kaphaja Yoni Vyapada*, a type of *Ayurvedic Yoni Vikara*. Since women play a crucial role in society, maintaining their health is vital. *Yoni Dhupana* is significant for improving women's health by treating genital disorders, contributing to the well-being of families. *Ayurveda*, as well as modern medicine, emphasizes the importance of a healthy *Yoni* throughout a woman's life, from puberty to menopause. Infections related to the *Yoni* are a widespread issue affecting women across various age groups and socioeconomic backgrounds. This study provides a comprehensive case analysis of *Kaphaja Yoni Vyapada*, incorporating perspectives from both *Ayurveda* and modern medicine.

Keywords: *Kaphaja Yoni Vyapada*, *Yoni*, Vaginal discharge.

INTRODUCTION

A 36 years old female came to OPD of Parul Ayurved Hospital with the complaints of white discharge from vagina science last 1 year. Over the last few decades, man has literally conquered the everest of advanced technology. However still the indicator of prosperity and happiness of any community is judged by its health index and merely

by its materialistic advancement. Furthermore the overall health index of any community depends upon the health index of women in that particular community. So special attention should be provided to maintain a healthy womanhood. (Bhagat, 2017) Ayurvedic texts describe twenty types of *Yoni Rogas* (*Vimshati Yoni Vyapada*), with *Kaphaja Yoni Vyapada* being one of them[2]. This condition is characterized by symptoms such as white vaginal discharge, itching, and pain. If not properly addressed, it can lead to ascending infections, compromising overall health and causing psychological distress in women. In India, the prevalence of vaginal candidiasis is around 30%[14]. While various antifungal treatments are available, they often come with side effects and a risk of recurrence.[14] Therefore, choosing a suitable treatment that minimizes disruption to other bodily systems and addresses the limitations of modern treatments is crucial.[14]

PATIENT'S INFORMATION

A 36-year-old female was clinically diagnosed as a case of Leucorrhea (*Kaphaja Yoni Vyapada***)** present with the chief complaints as depicted in table no.1 since last 6 months. It was associated with itching in the vaginal region, headache, white discharge before menses.

PROGRESSION OF DISEASE

The patient was well, apparently well before 6 months. Still, after her delivery, she faced problems like itching in the vaginal region, headache, white discharge before menses. The patient had taken allopathic treatment for the same from a physician in Vadodara, but she didn't get any relief. Hence, she approached OPD of Prasuti Tantra Evum Stree Roga, Parul institute of Ayurveda for further treatment. After going through the History, the patient was diagnosed as the case of *Kaphaja Yoni Vyapada.*

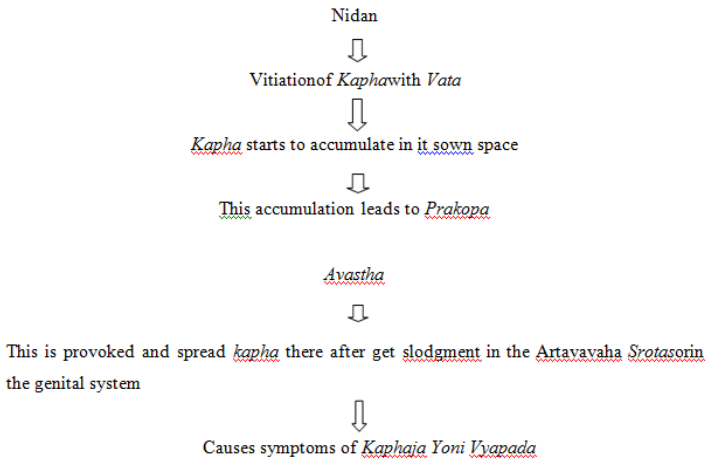
HISTORY OF PATIENT

The detailed History of the Patient is narrated in table no.2

CLINICAL FINDINGS

EXMAMINATIONS AND INVESTIGATIONS

The details of investigations performed and their results are mentioned in table no. 4



Simultaneously, certain dietic and behavioral modifications are also advised to the patient. E.g., *Pathya* such as *Laghu Ahara*, *Katu – Kashaya Rasatmaka Ahara*, light exercise was recommended to take. Day sleep & intake of *Guru Guna Ahara* were strictly avoided during the whole treatment duration.[14]

PROCEDURE

REQUIREMENTS

a) Personal= Trained Doctor, trained in charge nurse, Housekeeping staff

b) Material= *Dhupana* Chair, *Dhupana* Pot, *Cow dung*, *Dhupana Dravya*, Sterile linen, Sterile gown, Nozzle, *Prakshalana* Pot, *Sukhoshna jala*, Gauze piece, Artery forceps, Sterile gloves, medical lamp.[4]

PRE-OPERATIVE:

- Counselling is done.
- Written consent is taken.
- The patient is advised to empty the bladder.
- *Yoni Prakshalana* with *Sukhoshna Jala.*

OPERATIVE[2]

The *Dhupana* procedure should be done in following steps:

1. The bladder must be emptied before *Dhupana Karma*.
2. The pot with pre-heated coal or dry Cow dung (red hot) is kept ready for the patient.
3. A procedure of *Yoni Prakshalana* must be done before *Dhupana* as pre-operative procedure.
4. The desired drugs in powder form are added over the coal so as to produce dense fumes and kept under the chair with vent in the middle.
5. The fumes must reach the external genitalia, passing through that vent.
6. *Dhupana* is done till a desired time (5-10 min on an average) by covering the patient at the level of her belly with a thick cloth or blanket.

POST OPERATIVE:

- The patient is monitored for 30 minutes after the procedure.

SAFETY PRECAUTIONS

- Periodic inspection is done to ensure the uniform exposure of fumes only on the genitalia.
- Care is taken to prevent accidental burns which can be induced due to over-exposure to fumes or accidental burns from the *Dhupana Dravya*.

THERAPEUTIC OUTCOME

Observations: noted and improvement in symptoms are shown in table no 6.

DISCUSSION

In cases of vaginal and uterine disorders where *Kapha Dosha* is predominant, herbs with drying and heating properties are particularly effective.[1] *Kapha* is characterized by its moist, oily, and cold nature, so treatments that are dry and hot counteract these qualities effectively[1]. These treatments often involve herbs with healing, astringent, and hygroscopic properties. The choice of medication depends on the type of vaginal discharge (*Srava*) and the associated symptoms, as well as the specific pathology of the condition. For treating *Kapha*-related vaginal diseases, *Yoni Dhupana* with *Haridradi Churna* (*Haridra*, *Daruharidra*, *Brihatiphala*) [2] after *Yoni Prakshalana* with *Sukhoshna Jala* are recommended.[2] *Haridradi Churna* is also beneficial when Used Externally as a *Dhupana[2]*, addressing issues such as worm infections and bacterial infections due to its Anti- Fungal, Anti-Bacterial, Anti-Microbial, and Healing properties. *Triphala Guggulu* has properties to balance all three types of *Dosha* by removing toxic substances from the body, maintaining the cholesterol level, arresting the weight gain tendency, and supporting proper digestion and food absorption process.[17] *Guggulu* possesses anti-inflammatory and analgesic properties which help to relieve inflammation and pain sensation. *Triphala* also acts as an antioxidant that removes

toxins from the body and free radicals in associated channels.[16] *Chandraprabha Vati* treats Vaginal discharge, Vaginal itching, and improves overall health of reproductive organ. Its herbal component has diuretic properties, which can help the purification of blood and remove toxins.[17] The natural resources present in the drug are multivitamins for the strengthening of muscle and boots immunity. In the present case, it helps to minimize vaginal discharge, vaginal itching and headache. [17] *Yoni Dhupana[2]* is a practical procedure in which fumigation of vagina is performed by giving the disinfectant and medicated smoke. *Dhupana* is one of the *Upakrama* of *Sthanik Chikitsa* in *Ayurved*.[2] The drugs which can be used in *Yoni Dhupana* are reduce pain in the vagina and prevent the infection by killing organisms.[2]

CONCLUSION

The study is overall concluded that the *Yoni Dhupana* is highly effective in reducing *Yoni Vikara* i.e. *Kaphaja Yoni Vyapada* will also help in all infected disorders of vulva and vagina and proverbs in the syndromic (Candiasis, Bacterial vaginosis, Chlamydia, Trichomoniasis etc.) management of abnormal vaginal discharge. *Yoni Vyapada* is classified as *Eka-Doshaja*, *Dvi-Doshaja*, and *Tri-Doshaja* in *Charaka Samhita*, *Ashtanga*, whereas *Sushruta Samhita* explained *Eka-Doshaja* and *Tri-Doshaja* only. *Kaphaja Yoni Vyapada* and Nonspecific Vulvo-Vaginal Candidiasis are only correlated based on symptoms. The major method of treatment for this disease is good hygiene.

ABSTRACT

This research paper explores the thematic and psychological complexities in Khaled Hosseini's novel *And the Mountains Echoed*. Through a multi-generational narrative that spans continents and decades, Hosseini examines the effects of familial decisions, childhood trauma, and cultural displacement on individual identity. The novel delves into the emotional impact of separation, the complexities of adult relationships, and the challenges faced by Afghan expatriates navigating dual identities. By analyzing key characters such as Abdullah, Pari, Nila Wahdati, and Adel, this paper highlights the interplay between personal and collective histories, illustrating how past experiences shape present identities. The study investigates the psychological impact of cultural assimilation and the search for belonging in the context of the Afghan diaspora.

Keywords: Afghan diaspora, cultural assimilation, trauma, identity, familial relationships.

INTRODUCTION

Khaled Hosseini is an Afghan-American author who has emerged as a significant literary voice ever since he published *The Kite Runner* in 2003. His mother's educational background and his father's diplomatic career shaped his early life, which began in Kabul in 1967, and it was characterised by privilege and cultural richness. However, in 1976, their family relocated to Paris and subsequently followed an asylum-seeking journey to the United States due

to the Soviet invasion of Afghanistan, which certainly had a profound influence on his worldview and writing. His works often explore themes of familial bonds and the enduring spirit of the Afghan people, resonating with readers globally. His novels have sold more than 40 million copies and have established him as a bestselling author. Hosseini's novel *And the Mountains Echoed* published in 2013, represents a continuation of his exploration of complex human relationships and the sociopolitical landscape of Afghanistan. The novel is structured as a multi-generational narrative, spanning several decades and continents, weaving together the lives of various interconnected characters. The story begins with the poignant tale of a brother and sister, Abdullah and Pari, who are separated as children. This sets the stage for a broader examination of the choices that define their lives and the ripple effects of those choices on subsequent generations. Hosseini's narrative style in *And the Mountains Echoed is* characterized by its rich, evocative prose and deep emotional resonance. The author employs a unique storytelling technique, presenting each chapter from the perspective of different characters, which allows readers to gain insight into the diverse experiences of Afghan society. This structure not only enhances the complexity of the narrative but also reflects the interconnectedness of individual lives. The novel delves into themes of sacrifice, love, and the painful realities of displacement. The novel has been praised for its ambitious scope and emotional depth. The novel explores the consequences of familial decisions, and its exploration of the search for identity resonates deeply.

It highlights the profound complexities of human relationships against the backdrop of tumultuous history. Hosseini's ability to articulate the struggles and resilience of the Afghan people has fostered a greater understanding of Afghanistan's rich culture and its challenges. Through this narrative, Hosseini invites readers into the hearts and minds of his characters, making the stories resonate long after the final page is turned. The book had received generally favorable reviews upon its release in 2013. The novel sold three million copies within five months, demonstrating its commercial success. Critics praised Hosseini's ability to create complex characters and his ambitious narrative structure. Wendy Smith of the Los Angeles Times described the novel as "painfully sad but also radiant with love." Fran Hawthorne of The National praised the book's "masterful storytelling" and its "haunting portrayal of war-ravaged Afghanistan and insight into the life of Afghan expatriates." Susan Balee from Philly.com wrote that Hosseini "captures at the personal level the history of his war-torn homeland: Fierce loyalties alternate with bloody betrayals." However, not all reviews were positive. Philip Hensher of The Guardian gave a more mediocre review, stating, "I enjoyed this novel in a very undemanding sort of way. The shifts of viewpoint would be ambitious if the novel had any interest in varieties of psychology. But it serves its purpose in providing amusement for two and a half hours; a day after finishing it, I had forgotten everything about it.

" In comparison to Hosseini's previous novels, "And the Mountains Echoed" was considered his most assured and emotionally gripping story yet. Michiko Kakutani from The New York Times wrote, "Khaled Hosseini's new novel, And the Mountains Echoed, may have the most awkward title in his body of work, but it's his most assured and emotionally gripping story yet, more fluent and ambitious than The Kite Runner (2003), more narratively complex than A Thousand Splendid Suns (2007)." However, some reviewers felt that the large cast of characters, "including some introduced fairly late in the proceedings, when the reader just wants to return to the core cast," was excessive compared to Hosseini's previous works. Despite this criticism, the novel's success in both commercial and critical terms solidified Hosseini's position as a prominent voice in contemporary literature, particularly in stories that bridge cultural divides and explore the complexities of human relationships against the backdrop of historical events. Scholarly analyses of *And the Mountains Echoed* have focused on the novel's exploration of psychological themes, particularly the impact of familial decisions and the search for identity. One reviewer noted that from the moment the reader realizes Saboor will give Pari to a wealthy family in Kabul, Hosseini "saturates the various layers and characters of his novel with a yearning for the moment that brother and sister will reunite"[1]. This theme of separation and longing is central to the novel's emotional impact. The character of Nila Wahdati, portrayed as alluring but severely unhappy, serves as a lesson in the dangers of seeking external pleasures to fill an internal void. Her story highlights how unhappiness and dissatisfaction can lead people to toxic coping mechanisms and relationships. *And the Mountains Echoed* has been praised for its ambitious scope, emotional depth, and psychological complexity, cementing Hosseini's status as a master storyteller who explores the human condition against the backdrop of Afghanistan's tumultuous history.

The psychological analysis of key characters in "And the Mountains Echoed" intricately explores the psychological landscape of its characters. It particularly focuses on the profound impact of childhood experiences, familial bonds, and societal expectations. The novel's narrative is interwoven with themes of separation and identity, illustrated through the relationships of Abdullah and Pari, Nila Wahdati, and Adel. First, the impact of childhood separation on Abdullah and Pari is examined. The separation of Abdullah and Pari at a young age serves as a pivotal moment that shapes their psychological development throughout the novel. The trauma of being torn apart manifests in Abdullah's lifelong sense of loss and longing. As he reflects on the past, it becomes evident that this separation has lasting implications on their identities. Abdullah's inability to move on from his loss is poignantly captured in the narrative: "He had lost his sister, and with her a part of himself"[2]. This encapsulates the long-term effect of trauma, illustrating how the absence of a loved one can create a void that permeates one's identity. The psychology of the bond between the siblings is complicated by the separation, where Abdullah's deep emotional connection to Pari not only illustrates the profound impact of family ties but also shapes one's sense of self. As noted by a scholar, "The siblings' bond in 'And the Mountains Echoed' is portrayed as a lifeline, a connection that persists even through the pain of separation, war, and time.[3] This enduring bond not only shows the different paths that shape a shared history but also demonstrates the resilience of familial connections.

The psychological toll of social expectations on characters is exemplified in the character of Nila Wahdati. She embodies the tension between maternal instincts and desires for personal freedom. Her decision to leave her family reflects a complex interplay of societal expectations and personal aspirations. Nila's departure is not merely an act of abandonment, but rather a quest for autonomy in a society that constrains her identity. This longing for freedom highlights the psychological toll and reveals the internal conflict between duty and self-fulfillment. "I wanted to be free to live my life on my own terms" [4].The consequences of her choice extend beyond her own life, impacting everyone around her, especially her children. Every character's decision reflects on their loved ones and the broader context of events. The emotional fallout from Nila's departure reverberates through the family, illustrating the intricate web of relationships that define their lives. As a critical analysis notes, "Nila's struggle for independence ultimately leads to a cycle of pain that affects her children, which in turn showcases the far-reaching effects of personal decisions in a familial context" (Smith, 2020). This underscores the tension between maternal instincts, the desire for self-actualization, and the responsibilities of motherhood.

The character of Adel presents a psychological journey from innocence to disillusionment. His transition from childhood innocence to the harsh realities of adulthood causes disillusionment. Adel's journey is marked by the formation of moral values in the face of conflicting truths. He grapples with complexities and struggles to reconcile his idealized image of his father with the reality of moral failings. The realization that his father is a "thief" showcases his internal conflict as he defends his father's reputation against the backdrop of societal judgment. Adel's psychological journey is further complicated by the disillusionment that accompanies growing up. He reflects on his changing perceptions, stating, "I will learn to love him again, but it would be a different, more complicated, messier business." This acknowledgment of the complexities of adult relationships signifies a critical moment in his psychological development as he begins to understand that love is not always straightforward and can be fraught with challenges. Hosseini's exploration of these characters reveals the interplay of trauma, identity, and familial bonds, providing a rich psychological landscape that invites readers to reflect on their own experiences of love, loss, and the enduring impact of childhood. Through Abdullah, Nila, and Adel, the novel illustrates how the past shapes the present, and how the quest for identity and connections remains a universal human experience. The depth of character development and psychological insight in "And the Mountains Echoed" contributes significantly to its critical acclaim and resonance with readers worldwide. The novel highlights how childhood experiences shape adult relationships. The bond between siblings Abdullah and Pari exemplifies how early attachments influence emotional development and future relationships. Their separation serves as a pivotal moment that haunts their adult lives. "A story is like a moving train; no matter where you hop onboard, you are bound to reach your destination sooner or later" [5].This metaphor underscores the inevitability of childhood experiences influencing the trajectory of one's life.
Another important aspect is trauma and resilience, where characters such as Saboor carry the weight of their past decisions, demonstrating how trauma can manifest in various forms throughout adulthood. Their struggles reflect

the complexities of reconciling childhood pain with adult responsibilities. Without a doubt, one needs to understand the cycle of suffering as well. The narrative illustrates how unresolved childhood issues can perpetuate cycles of suffering across generations. For instance, the choices made by parents often echo in the lives of their children, creating a continuum of psychological impact. Memory and nostalgia also play significant roles in shaping identity. Nostalgia often serves as both a source of comfort and a reminder of loss. The longing for a lost childhood can lead to a sense of disconnection in the present. The fluidity of memory is evident as characters struggle with their recollections, which can become distorted over time and by emotions. This fluidity not only reflects the complexities of identity formation but also shows how individuals navigate their past to understand their present selves. Stuart Hall notes, "diaspora identities are those which are constantly producing and reproducing themselves anew, through transformation and difference" [6]. This perspective aligns with the characters' experiences as they attempt to reconcile their Afghan roots with their current realities.

In this quote, Stuart Hall is emphasizing the idea that diaspora identities are always evolving and changing, constantly being shaped by new experiences and transformations. This concept can be seen in the characters' struggle to reconcile their Afghan heritage with their current circumstances. Just like how memories can become distorted over time and emotions can influence perception, diaspora identities are fluid and ever-changing as individuals navigate their past and present selves. The psychological effects of displacement and cultural assimilation are explored through several aspects: alienation and belonging, cultural assimilation and identity crisis, and the search for home. In terms of alienation and belonging, the characters' experiences of displacement reveal the psychological toll of feeling like outsiders in new environments. This alienation is particularly pronounced for second-generation immigrants who often feel caught between two cultures. Cultural assimilation and identity crisis are also important aspects, where pressures to assimilate into Western culture create conflicts for many characters, leading to identity crises. This struggle to balance their Afghan heritage with the desire to fit into a new society often results in a fragmented sense of self. The final aspect is the search for home. Characters throughout the novel embark on quests for a sense of home, often returning to Afghanistan both physically and emotionally as they seek to reclaim their lost identities. However, they frequently confront the harsh realities that their homeland has changed irreparably, complicating their sense of belonging. This ongoing search for home and identity underscores the complex psychological landscape of diaspora experiences, highlighting the enduring impact of displacement on individual and collective psyches.

CONCLUSION

Khaled Hosseini's *And the Mountains Echoed* presents a poignant exploration of human relationships and the psychological impacts of trauma, separation, and cultural displacement. Through a tapestry of interconnected narratives, Hosseini vividly portrays the enduring effects of familial decisions and childhood experiences on adult lives. The novel's multifaceted characters, each navigating their own complex emotional landscapes, embody the universal struggle to reconcile past wounds with present identities. This research paper has illuminated how the themes of love, loss, and resilience are intricately woven into the fabric of the story, reflecting broader cultural and historical realities. Hosseini's nuanced portrayal of Afghan society, both within and beyond its geographical borders, offers a rich understanding of the challenges faced by those in diaspora. His work not only bridges cultural divides but also invites readers to empathize with the shared human experience of searching for belonging and meaning. In capturing the essence of individual and collective histories, "And the Mountains Echoed" stands as a testament to the power of storytelling in fostering empathy and highlighting the complexities of the human condition. Through this novel, Hosseini cements his place as a masterful storyteller, adept at navigating the delicate balance between personal narrative and universal truths.

ABSTRACT

Pratishyaya is a Vata-Kapha dominant Tridoshaja Vyadhi which manifests in the nasal, para-nasal sinuses, upper and lower respiratory tract. In the contemporary medical science, it is compared with Chronic Rhinitis as the symptoms are similar to that of Pratishyaya. Rhinitis is among the most common chronic diseases in the world, as it affects 29.4% [ranging from 1.1% to 63.3%] of adult population all over the world. Pariksha are the diagnostic tool that helps to diagnose the vyadhi. Nasal Cytology is one such Rogi Pariksha to diagnose Pratishyaya. Nasal Cytology is an easy, cheap, non-invasive method to assess nasal inflammation. It allows to detect and quantify the cell populations within the nasal mucosa. Here a female patient of age 23yrs has presented with nasal discharge from both nostrils and occasional blockage of right nostril along with early morning sneezing since 10 years. The case study has been carried out by Nasya Karma using Shadbindu Taila. were found to be very effective in the reduction of clinical symptoms and eosinophils in nasal mucosa in Jeerna Pratishyaya. This paper encompasses the clinical study as well as the probable mode of action of the medicine in bringing out better outcomes.

Keywords: Jeerna Pratishyaya, Chronic Rhinitis, Nasya Karma, Shadbindu Taila, Nasal Cytology

INTRODUCTION

Manifestation of discomfort to the body is called as Vyadhi.[1] It is necessary for physician to acquire the knowledge about the manifestation, diagnosis and prognosis of disease to get desired result in management. The changes that are untraceable may become traceable with the advancement of the technology of investigation or advancement of the diseases. A Vaidya should acquire the knowledge of advanced techniques of pathological investigations to interpret the abnormal variations of Dosha, Dhatu, Mala in the scientific perspective. Hence, thorough knowledge of modern methods of pathological investigations is necessary. Acharya Sushruta, while explaining the Nasagata Roga, devoted a separate chapter for Pratishyaya.[2] Pratishyaya is a disease which manifests in the nasal, para-nasal sinuses, upper and lower respiratory tract. Pratishyaya can occur as an independent disease or as a complication of other diseases like Jwara, Gulma, Shiroroga or as a symptom of any systemic disorder like Udavarta, Raktapitta, Rajayakshma, Pratishyaya is a Vata-Kapha dominant Tridoshaja Vyadhi.[3] While analysing all the Nidana, it is clearly mentioned that the allergens like dust, fumes cause paroxysmal sneezing and rhinorrhoea, while other factors like head injury, seasonal variations, suppression of natural urges & others can be potent to initiate the pathological variation leading to the disease.[4] Acharya Sushruta describes both Kalantarajanaka and Sadyojanaka nidana for Pratishyaya.[5] Sadyojanaka Nidana can be compared with aggravating factors such as exposure to dust, smoke, pollen and cold wind. Kalantarajanaka Nidana are Ajeerna, Vishamashana, Atijalapana, Vegasandharana, Divaswapna and Ratrijagarana. Characteristic features of Pratishyaya are Nasasrava (discharge from the nose), Ghranauparodha (nasal obstruction or congestion), Shirashoola (headache), Shirogauravam (heaviness of head), Jwara (fever), Kasa (cough), Kaphotklesha (phlegm), Swarbheda (hoarseness of voice), Ghranaviplava (Anosmia), Aruchi (anorexia), Klama(tiredness), Indriyanamasamarthyam (altered functions of sense organs).[6]

Stages of Pratishyaya are Amavastha and Pakwavastha , if these stages are left untreated or mismanagement leads to severe and complicated stage termed as Jeerna Pratishyaya. If Pratishyaya being left untreated, it may develop into many conditions like Kasa(cough), Agnisada (indigestion), Shopha (oedema), Badhirya (deafness), Aandhya(vision loss), Aghrana (anosmia).[7] In the contemporary medical science, it is compared with Chronic rhinitis as the symptoms are similar i.e, Nasal obstruction, Nasal discharge, Headache, Swollen turbinates, Sneezing, Itching for more than 12 weeks per year.[8,9] It may be allergic rhinitis and non- allergic rhinitis. Recurrent attacks of rhinitis in the presence of predisposing factors leads to chronicity. Rhinitis is among the most common chronic diseases in the world, as it affects 29.4% [ranging from 1.1% to 63.3%] of adult population all over the world. In Asia, it affects 1.1% to 50.2% of population.[10] Rhinitis is a disease which is diagnosed clinically, which is dependant on the expertise of the Clinician. Objective parameters always play a significant role in diagnosis as well as in evaluation of success in treatment modality used. Nasal cytology is one such objective parameter, which minimizes the bias of the researcher as well as gives the real picture of the nasal mucosa, where the disease pathology occurs. Nasal Cytology is an easy cheap, non-invasive method to assess nasal inflammation. It allows to detect and quantify the cell populations within the nasal mucosa. Eosinophilic inflammation of the nasal mucosa is a characteristic feature of allergic rhinitis.[11] The measurement of nasal eosinophil level is a useful strategy for evaluating eosinophilic inflammation in patients with allergic rhinitis.[12,13] In classics, the treatment for Pratishyaya is mentioned as Nasya, Virechana, Dhumapana, Kavala and Asthapana basti. [14] As Pratishyaya is a disease with its adhisthana in Shiras, among the various shodhana modalities, Nasya is considered chief for vyadhi in Shiras.[15] Thus, Nasya Karma is selected as the choice of treatment procedure in this study.

Nasal Cytology

Nasal mucosa can be easily accessed and nasal cytology appears to be an attractive and promising additional diagnostic tool, to be associated to the standard diagnostic methods.[16] Nasal cytology represents an useful, cheap and easy-to-apply diagnostic method to better detail the phenotypic characteristics of rhinitis. It allows to detect and quantify the cell populations within the nasal mucosa at a given instant, to better discriminate the different pathological conditions and also to evaluate the effects to various stimuli or the effect of treatments. Nasal cytology

plays an important research role in the evaluation of effect of noxious stimuli, outcomes of treatments, effects of allergen immunotherapy and pathogenic aspects of comorbidities[17].

Cytological Aspects of Normal Nasal Mucosa:[18] (Fig 1 and Fig 2)

Ciliated Cells: They represent the most differentiated and the most frequent cell type in the nasal epithelium. They generally have a polygonal shape with about 150-200 cilia at the top of a big central nucleus and a basal region. A perinuclear halo or hypercromatic supernuclear stria in ciliated cells is a hallmark of normal function, and its reduction has been put in correlation with severity of vasomotor, inflammatory and infectious nasal diseases.

Muciparous Goblet Cells: It is an unicellular gland interposed among the respiratory pseudostartified epithelial cells secreting mucin, that in contact with water originates mucus. On its surface, there are many microvilli and a small hole, called "stoma", from which mucin granules are secreted by exocitosis. The nucleus is always put into the lower part of cellular body, while vacuoles containing mucin and muciongenous are localized in the upper part of the cell giving it the characteristic shape of a "goblet".

Striated Cell

It is a columnar cell with the nucleus localized into its lower part; the upper portion is characterized by the presence of many microvilli containing microfilaments.

Basal Epithelial Cell

It is smaller than the other nasal epithelial cells and it is characterized by being in contact with basal membrane without reaching the surface of nasal mucosa. Its nucleus is hyperchromatic and quite big in relation to its cytoplasm.

Nasal Sampling[18]

Nasal scraping

- It is performed with a pencil-shaped disposable nasal curette with a small distal cup.
- The cupped tip is gently passed over the mucosal surface of the medial aspect of the inferior turbinate.
- Two or three short scrapes of the epithelial layer are made to obtain a sample.
- The specimen is spread onto a plain slide and air-dried.
- Nasal scraping give information on living epithelial cells
- It can be used to evaluate the ciliary activity, if the slide is observed by a phase contrast microscope. (Fig 3)

Sample Staining

May-Grunwald- Giemsa (MGG) staining:

- Firstly, the sample is dipped in Methonal (fixative) for 10 minutes.
- Then, it is stained with May- Grunwald solution for 5 minutes.
- Then it is stained with Giemsa solution for 15 minutes.
- The excessive solution is washed with distilled water, dried completely and mounted. MGG shows the nuclei of WBC, granules of basophils granulocytes as blue, while RBC and eosinophils granules as red. The cytoplasm of WBC appears in light blue. This method of staining requires about 30 minutes.

Sample Reading

The stained sample read at optical microscopy, at 1000x magnification with oil immersion. The minimum number of cells counted into the 50 fields should be more than 200 to consider the sample as adequate. The count of each cell type can be expressed as a percentage of the total cells, as an absolute value, or by a semi-quantitative grading[19].

CASE STUDY

Chief Complaints

A 23 years old female patient resident of Mysuru visited Shalakya OPD of JSS Ayurveda Hospital, Mysuru complaining of nasal discharge from both nostrils & occassional blockage of Right nostril along with early morning

sneezing since 10 years, which has aggravated since 15 days, associated with itching sensation in both eyes since 15 days.

History of present illness

As per the statement given by the patient, she was apparently normal 10 years ago. Gradually she developed with nasal discharge from both nostrils, which was watery in consistency and clear fluid without bleeding or other noteworthy colour changes without any foul smell along with early morning sneezing upto 40-50 sneezes every day. These used to aggravate on exposure to dust, smoke and during winter seasons and she used to feel better after steam inhalation and during dry seasons. On consultation and being prescribed with medications, the symptoms used to get relieved during medications and used to get aggravated once stopped. Gradually, she also started to feel blockage of Right nostril, which used to make her feel difficulty to lie on the left lateral side and also difficulty in breathing at times. Lately, she is also having itching sensation in both the eyes, which also aggravates on exposure to dust and cold air.

Family History

Her mother and father also have similar complaints.

Diet History

It reveals intake of curd regularly in lunch and dinner and consumption of junk foods 4-5 times in a week.

EXAMINATION OF NOSE

Inspection & Palpation

Shape & Size : Narrow
Pinched Nose : Absent
Septum : Deviated to left side
Nasal Mucosa : Inflammed in both nostrils
Secretions : Watery secretions in both nostrils

Ear, Nose and Throat Examination : No abnormalities detected.

TREATMENT ADVISED

Marsha Nasya

- Purvakarma – Mukha Abhyanga with Murchitha Tila Taila followed by Bashpa Sweda.
- Pradhanakarma – 6 bindu[20](3ml) of Shadbindu taila to each nostrils.
- Paschatkarma – Kavala with sukhoshna jala and Dhoomapana with Haridra varti

Intervention period: 7 days

2. **Turbinatal Size (in cm) (Measured by Spring Divider)**
3. **Nasal Cytology**

DISCUSSION

Acharya Sushruta has described Pratishyaya as a separate chapter in Uttaratantra and it shows its importance since ancient times. Increase in the incidence of Jeerna Pratishyaya in present era can be attributed to changing in lifestyle, environmental pollutants, dust, stressful conditions & habits such as smoking and using air conditioner[23]. Eosinophils are a minority circulating granulocyte classically viewed as being involved in host defense against parasites and promoting allergic reactions. The eosinophil is a specialized cell of the immune system which has a bilobed nucleus and cytoplasm filled with approximately 200 large granules containing enzymes and proteins with different functions. Eosinophilic functions include: movement to inflamed areas, trapping substances, killing cells,

anti-parasitic and bactericidal activity, participating in immediate allergic reactions and modulatory inflammatory responses[24]. Eosinophils actively participate in regulation of IgE and goblet cell mucus production via granule secretion during nematode-induced pathology and high-light their importance both as effector cells, as damage-inducing cells and as supervisory cells that shape both innate and adaptive immunity[25]. Nasya is the first line of treatment for Chronic Rhinitis. Nose is identified as the most suitable route for drug delivery for allergic and non-allergic rhinitis as because of the rapid absorption of drug due to large nasal mucosal surface area[26]. The aggravated Vata and Kapha dosha are considered pathognomic for Pratishyaya. Shadbindu Taila consists of above mentioned drugsand are having ushna-teekshna guna predominantly (Table No.5). Further, Shadbindu Taila has anti-inflammatory, anti-viral and anti-bacterial properties[27]. As an additional benefit, as it is oil based and by instilling it in the nose it creates an oily layer over the nasal mucosa and thus traps the allergens on the nasal mucosa itself. Shadbindu Taila also has acidic nature, whose excess of hydrogen ions are useful for increasing capillary circulation by dilating the capillaries and also local irritation of the mucosa produces vasodilatation in the locality, which in neurology is known as Axon reflex. The acidic nature of Shadbindu Taila also inhibits the photolytic organism and also helps in removing crust. Thus Shadbindu Taila acts as Vasodilator and Germicidal which are helpful in minimizing the symptoms of Chronic Rhinitis. Furthermore, Shadbindu Taila nourishes and strengthens the mucous membrane leading to reduction in neurogenic inflammation which occur due to destroyed respiratory epithelium and exposed nerve endings, and thus reduction in non-specific hyper responsiveness[28]. Shadbindu Taila instilled in the Nasal Cavity moves to olfactory epithelium and olfactory bulb which proceed through cribriform plate of ethmoid bone, anterior cranial fossa and medial/ lateral area of cerebral cortex. The chemical impulse, which is generated by Nasya finally converts into neuronal impulse and influences on cerebral cortex area and there by producing stimulatory effect resulting in evacuation of dosha. The Nasya Dravya also nourishes and rejuvenate the olfactory nerve and helps in its proper function.[29] The excess of hydrogen ions in Shadbindu Taila might be helpful to reduce the nasal blockage and nasal discharge. Recurrence of symptoms is not seen even in the period of follow-up also.

CONCLUSION

Nasal Cytology is easy, non-invasive and cheapest diagnostic method in Chronic Rhinitis. Among different treatment modalities, Nasya Karma is an important procedure in diseases of Jatrurdhwa. In this case study, Shadbindu Taila Nasya have shown significant result in the management of Jeerna Pratishyaya. The Nasal Cytology clearly suggests decrease in the number of Eosinophils which is responsible for Chronic Rhinitis.

ABSTRACT

Cervicogenic headache is a secondary headache characterized by unilateral symptoms and neck involvement, often worsened by neck movement, awkward head positions, or external pressure. Myodural bridges between the posterior suboccipital muscles and the dura may have an important role in cervicogenic headache leading to restricted cervical range of motion, muscle stiffness and decreased quality of life. To measure the effectiveness of Slump mobilization on pain pressure threshold, cervical range of motion, Headache Impact test-6 and quality of life in patients with cervicogenic headache. This is parallel design, single blinded, two – group, pretest - posttest randomized clinical trial. The study will recruit 18 - 45 years of both male and female patients who will the meet the CHISG criteria. Pain pressure threshold by Algometer for tenderness, , cervical range of motion by Universal Goniometer, Headache Impact test-6 and SF-36 will be the outcome measure of the study. Suboccipital myofascial release, Sustained Natural Apophyseal Glides (SNAG) and Slump mobilization will be given in the experimental group and only suboccipital myofascial release, SNAG will be given in the control group, 4 times a week for 4 weeks. This study is expected to show improvements in headache symptoms and

overall cervical function. mobilization will helps to alleviate cervicogenic headaches by reducing neural tension and improving the mobility of the dura mater and surrounding neural structures thereby decreasing pain and improving cervical function by addressing restrictions and irritation in the neural pathways.

Keywords: Cervicogenic Headache, dura, Range of motion, quality of life

INTRODUCTION

In 2004 International Headache Society's headache classified Cervicogenic Headache as a separate entity as it has a prevalence of 2.2-4.1%. Persons with chronic CGH may experience emotional distress, limitations in their daily activities, or restricted social participation.[1] Characteristics/clinical features of CGH include a one-sided headache that does not move to other sides, with ipsilateral cervical and shoulder pain and neck stiffness affecting the cervical range of motions with worsening of symptoms on neck movement.[2] Most of the studies concluded that Cervicogenic Headache is attributed to the convergence of cervical nerves and afferents from the trigeminal nucleus, potentially originating from structures innervated by cervical nerves C1 and C3. This type of headache usually starts in the neck, spreads to the front of the head, and gets worse with certain neck movements or pressure on the back of the head.[3] Various researches[4,5] have been conducted that focuses on the treatment approaches targeting the neural and muscular structures but to the best of my knowledge no such study have been published that treat the dura matter as it has direct linkage with suboccipital soft tissues, and any dysfunction of upper cervical spine affects dura matter mobility within the canal that results in Cervicogenic Headache. The aim of the study is to find out the effects of slump mobilization in improving pain, range of motion and quality of life in Cervicogenic Headache.

MATERIALS AND METHODS

This is single blinded two arm parallel pretest- posttest randomized controlled trial designed to find the efficacy of Slump mobilization in improving pain, cervical range of motion and quality of life in individuals with Cervicogenic Headache. This study will be conducted at the outpatient department of a multispeciality tertiary care teaching hospital. Ethical approval has been obtained from an institutional ethical committee and will be done in accordance with Helsinki Declaration revised in 2013 and National Ethical Guidelines for Biomedical Research involving Human Participants, 2017. The trial is prospectively registered in Clinical Trial Registry of India (CTRI/2024/05/067419).

Eligibility Criteria of the Patients

This study includes participants of both gender aged 18-45 years who have been diagnosed with cervicogenic headache International Study Group Criteria (CHISG) having pain score more that 2 on Numeric Pain Rating Scale and more than 20% of disability on Neck Disability Index (NDI) and the participants having headache due to migraine, any fracture of cervical spine, osteoporosis, cervical stenosis, tumor, uncontrolled hypertension, prolonged use of steroid, any past surgical interventions and individuals who received any chiropractic and physiotherapy treatment within the previous month will be excluded form the study.[6,7]

Randomization

All the subjects will sign the informed consent first for participation in the study. Participants will be allocated randomly to either Group A (Suboccipital Myofascial release, Sustained Natural Apophyseal Glides and Slump Mobilization) or Group B (Suboccipital Myofascial Release, Sustained Natural Apophyseal Glides) via block randomization following to allocation to concealment using chit selected by the person other than the researcher. The flow chart of the study protocol following the Consolidated Standards of Reporting Trials is displayed in Figure 1.

Sample Size Calculation

The sample size was calculated using G*power software (version 3.1.9.7) a sample size of 54 with an assumption based on an effect size of 1.0 and the power of the study as 95% assuming a dropout rate of 10%. [8]

Intervention

Patients in Group A will receive Myofascial release, SNAG and Slump Mobilization while patients in Group B will receive only Myofascial release and SNAG, three times a week for 4 weeks and each session will last approximately 25-30 minutes. The interventions are explained below

Myofascial Release

Participants will be asked to lie supine, while therapist will sit on a stool at the couch's head. Then, therapist will put fingers under the base of occiput ensuring that the fingers are stabilized at the MCP and PIP joints. Then therapist will apply pressure for two to three minutes and then relaxes. Repeat this step for 2-3 times per session, 4 days a week for 4 weeks (Figure 2).[9,10,11]

Sustained Natural Apophyseal Glides (SNAG)

We will ask the patient to sit on a chair, therapist will stand behind the patient. Then therapist will stabilize the patients's occiput by one hand and will place a litter finger on the C2 spinous process, then spinous process is pushed ventrally using thenar eminence of other hand, causing C2 to slide forward under C1 to move forward relative to the skull. This glide will be given for 3 times with a hold of 3-10 seconds and 5 sets of it will be given (Figure 3).[12]

Slump Mobilization

Subject will be asked to sit in a slump position in high sitting. Then passively subject's knee will be extended by the therapist with ankle dorsiflexion while simultaneously asking the subject to extend the neck**.** Knee will be passively flexed with ankle plantarflexion by the therapist while subject flex the neck**.** The same will be done for 2 minutes slowly maintaining a rhythm of 30-40 repetitions in 2 minutes. One minute break will be given then again same procedure will be repeated for 2 more times (Figure 4).

Outcome Measures

All outcomes will be assessed at baseline and post-intervention i.e. at the end of 4th week. For enrollment, allocation and post assessment, a detailed time frame is displayed using Spirit Protocol Items: Recommendations for Interventional Trials schedule for participation (SPIRIT) 2013 statement Table 1. For clinical assessment, valid and reliable tools will be used during the intervention:

Pain Pressure Threshold

Pain pressure threshold of suboccipital and trapezius muscles will be measured by using Algometer (Hz: 50-60 Hz, 220-230 Volt, AC) by placing it on the muscles that have to be measured for pain pressure threshold.[13]

Cervical Range of Motion

For measuring Cervical range of motion, Universal goniometer is used for cervical flexion, extension, lateral flexion and rotation. It has excellent intrarator reliability(ICC = 0.83 to 0.98) y and excellent inter-rater reliability (ICC2,2 = 0.79 to 0.92).[14]

Headache Impact Test- 6:

It is a valid and reliable tool used to measures the effect of headache on social functioning, role functioning, vitality, cognitive functioning and psychological distress and the severity of headache. The headache impact test showed excellent reliability with ICC = 0.95.[15]

36-Short Form Questionnaire

The SF-36 is a multi-purpose survey meant to gather information about adult patients' opinions of their own health and well-being. The SF-36 has been extensively used and proven beneficial in many studies of general and specific populations, evaluating the relative burden of diseases, and identifying the health benefits achieved by a variety of different interventions over the years. Internal consistency was satisfactory for all (Cronbach = 0.728) subscales except Social Functioning (Cronbach = 0.527) and General Health (Cronbach = 0.693).[16]

Statistical Analysis

Data will be analyzed using Statistical Package for Social Sciences (SPSS). The demographic data will be reported using descriptive statistics. The estimated sample size is 54 therefore; normality will be determined by Kolmogrov test. If the data will be found to be normally distributed, parametric test will be used. For within group, paired t-test will be used. For between groups, an Independent t-test will be used. Whereas if the data found to be not normally distributed, then non-parametric tests i.e., Wilcoxon Signed Rank test will be used within the group and Mann-Whitney U test will be used for between-group analysis**.**

DISCUSSION

This study will try to find out the effects of slump mobilization, SNAG and myofascial release in improving pain, range of motion and quality of life in patient with cervicogenic headache. Myodural bridges between the meningovertebral ligaments and the cervical dura are fascial linkages in the upper cervical area that are responsible for the pathophysiology of this kind of headache. These bridges shield the cervical dura from compression when the body is in motion.[18,19] Elevated muscle tone might have an impact on the location of dura in the spinal canal, which could lead to the emergence of cervicogenic headaches. Although there are numerous treatment approaches available for cervicogenic headache which included manual techniques as well as like Mobilization, also they proved effective in relieving symptoms of cervicogenic Headache.[20,21] Myofascial release is a therapeutic method that uses moderate pressure and stretching to relieve fascial limitations, with the goal of restoring range, reducing discomfort, and maximizing length and SNAG which is proved to be very effective in increasing the cervical range of motion in patients Cervicogenic Headache. In addition to this, Slump Mobilization may help in preventing dural bridges and maintaining dural circulation. It also enhances neural flexibility and decrease mechano-sensitivity by activating nerves through elongation and sliding and stress consequently creating an analgesic effect. However, no study has been conducted that addresses all of the problematic aspects in one unified intervention, including the muscular, bony, neurological, and dural components. So this intervention was planned that will offers a comprehensive approach to treat Cervicogenic Headache. This study will provide an easy accessible intervention to the patients which can have a significant influence on pain, Cervical range of motion and quality of life of the individual.

ABSTRACT

This article reviews the pivotal role of telomerase inhibitors as the breast cancer targeting agent. it mainly affirm about its involvement in cancer cell progression, regulation of stem cell & the rapeutic targeting. It deals with the mechanism of human telomerase reverse transcriptase and its very impactontheepithelialmesenchymaltransitioninbreastcancerstemcells.Heretelomereandtelomeraseactas a promising biomarker for its treatment & diagnosis efficacy. Telomerase as a therapeutic agent it also deals with the aging property of stem cells. Several agents such as BIBR1532, TMPyP4 & nutraceuticals are best known for their anticancer properties specially emphasizing on breast cancer. The alliance of telomerase inhibition with other treatment like NK cell therapy, curcumin -based therapy & glucose restriction are examined. The novel approaches such as pyrazine -containingazoles derivatives, quinolone -oxadiazolehy brids & nanotechnology -based method of detection are explored. The articles also reviewed about the external factors influencing the telomerase activity such as ,estrogen & leptin, the potential effect of telomerase inhibitors to enhance the immune-mediated cancer celltargeting, mainly focusing towards an innovative strategy for targeted breast cancer treatment.

Keywords: Telomers, Telomerase, Telomerase inhibitorin breast cancer, new approaches in breast cancer

INTRODUCTION

Telomerase is the enzyme which promotes the lengthening of telomeres usually in normal human cells there is a lack of telomerase but in case of cancer cell lot of telomerase's was present in it. The telomerase is the good target for the diagnosis & treatment of breast cancer. In later scientist thought that the telomerase was only present in cancer but the studies prove that the small telomerase was also present in human cells. So, the telomerase is the promising target for cancer therapy. However, controlling of telomerase is a complex process. it involves many factors including gene expression, protein interaction, & protein modification.

Telomere And Telomerase in breast cancer

In worldwide, both developed & developing countries women are affected by breast cancer [1]. The effective treatment is acquired by early detection & prevention. The telomeres (chromosome end)rebuild by enzyme telomerase is active highly in over 85% of cancer includes breast cancer [2]. The telomerase act as best target for cancer therapy [5]. The researches work on cancer therapy by using telomerase inhibitors to stop the cancer growth [4], immune therapy using telomerase derived proteins[3], gene therapy to target telomerase &telomere length for diagnosis.

Structure And Function

In case of structure of telomeres, the end of chromosomes is capped with repetitive DNA sequences[6]. it protect them from fusion & degradation. The function of telomeres includes the end of chromosome is protected from DNA machinery [7], rearrangement & chromosome fusion are prevented, genome stability is maintained [8]. In case of structure of telomerase is a reverse transcriptase enzyme composed of telomerase RNA template, telomerase reverse transcriptase protein (TERT) & associated proteins. The function of telomerase includes by adding repetitive DNA sequence it extends the telomeres, length of telomeres is maintained, cell division is allowed indefinitely, it also help in the activation of gametes, stem cell, &cancer cell, also helps mitochondria to work properly, modulation of immune system [13]. There was no significant difference in lengthening of breast cancer cells & healthy cells. In case telomerase lengthening in white blood cells also shows no difference in telomerase lengthening in breast cancer cells & healthy cells so it concludes that high telomerase activity is an indicator of breast cancer but telomerase lengthening is not a relatable marker for breast cancer [12].

Control And Extracurricular Activities

The special DNA & protein present in telomeres help to distinguish them from damaged DNA. The protein called shelter in protein which helps to protect telomeres & recruit lengthening of telomeres. In early stage of embryos and stem cells both the shelterin and telomerase act together to make telomer length, in cell division it remains stable. In comparison to, telomerase is lack in most of adult cells, in each division their telomeres get shorter up to it reaches the critical length. Based on the cell type the telomerase length varies, in case of human embryonic stem cells it has longer telomers as compared to most of the cancer cell[9].

Mechanism of Htert Regulation

Telomerase play a crucial role in cancer by maintaining their telomeres (chromosome ends) they help cancer to alive for long time. to keep their telomerase long cancer cell find a way but in case of normal cell the cells die when telomeres get too short. The cancer cell activates telomerase which is normally turn off in normal cells. Cancer cell turn on telomerase by copying the HTERT genes, changes the structure of telomerase gene by mutating the promotor gene [10].

EMT Modulation In Breast Cancer Stem Cell

The behavior of cancer cell changes & it became more aggressive, these is the key process called as epithelial mesenchymal transition. Cancer stem cells are the cancer cells which resist the treatment. telomerase is an enzyme which is responsible for the growth of cancer cells. They are over active in CNS & makes them more resistant to

treatment. The more studies shows that the hyper activity of telomere is connected with telomerase which makes them more resistant to treatment. The spreading of cancer can be reduced by blocking the activity of telomerase. These blocking can be affecting the EMT process in breast cancer cells, breast cancer stem cells &healthy breast cells [11].

Novel Approach Therapy By Targeting Telomerase

The researches says that there are more synthetic compounds which inhibit telomerase activity. many of these compounds are toxic to humans. So, it makes more challenging to determine these inhibitors directly target the telomerase or indirectly it causing cell death [14]. To over the scientist explores the various sites such as the RNA templates, TERT protein, associated proteins, for the development of effective inhibitor. The compound imetelstat is developed by targeting telomerase activity. Its action was binding with the catalytic site of telomerase and inhibits its action. These imetelstat was tested for the treatment of various cancers such as breast, prostate, glioblastoma, myeloma & leukaemia. The imetelstat shows potential in various cancer as which shows lesser side effects it makes more hope full for the existing treatments[15].

Future of Breast Cancer Treatment By Using Telomerase Inhibitor 'The potential of BIBR1532 In Breast Cancer Therapy &Its Combination

There searches investigate the effect of BIBR1532 as telomerase inhibitor in human breast cancer cells. The act by causing apoptosis in breast cancer, the *in vitro* & *in vivo* growth of cancer is inhibited, by reducing activity & lengthening of telomerase & by activating telomerase suppressor proteins such asP53 & P21. The studies shows that BIBR1532 act as potential inhibitors in case of breast cancer treatment, particularly its effects the cancer stem cells [16]. The paclitaxel is a common drug for breast cancer but it has limited success due to drug resistance. The combination of paclitaxel with BIBR1532 which forms a small molecule inhibits telomerase activity & it also increases the efficacy of treatment it's also founds that

- These both the drugs inhibit the telomerase activity in dose dependent manner
- The combination of these drugs synergic ally induces the growth of breast cancer cell lines, regardless of genetic status.
- The combination also inhibits the colony formation& promotes apoptosis in breast cancer cells
- The paclitaxelarrested the cell G2/ Mphase & the BIBR1532 induces the G1phase, the combination of these blocks the cell entering into g1/m phase[20].

TMPyP4 as telomerase inhibitor with anti- metastatic properties in breast cancer

TheTMPyP4 is the telomerase inhibitor which effects that effect the two types of breast cancer by the following ways:

1. adhesion:TMPyP4 inhibits the sticking of cancer cells on the surface & each other
2. Migration:TMPyP4 which alters the movement & spread of cancer

In overall studies says that TMPyP4 reduces the aggressiveness of breast cancer by altering the cancer cell ability to migrate& adhere[17]

Riccard in inhibits the breast cancer growth by telomerase- dependent mechanism

Riccard in D effect the breast cancer by inhibiting the growth of breast cancer cells, target the telomerase enzyme which helps in cancer alive & also activates the DNA damage response which helps in killing of cancer cell[18].

The combination of telomerase inhibitors &NK cells in breast cancer therapy

The triple negative breast cancer is the aggressive type of breast cancer which is hard to treat with conventional methods. this cancer is treated using this combination by

1. Inhibits the telomerase by BIBR1532
2. by using NK cells (natural killer cells)which is immune cells help to attack cancer cells [19].

Imetelstat & trastuzumab as dynamic duo targeting cancer stem cells in HER2+ breast cancer

HER2+ have more CSC (cancer stem cells)it makes them more aggressive. Telomerase is the enzyme which helps the CSC to live for long but in case of healthy cells it's not active. The researchers found a drug imetelstat which inhibits telomerase on HER2+breastcancercells.Researchersfoundthat

- imetelstat stops the working of telomerase in both the CSC &non CSC
- Imetelstat alone or combination with other drugs such as trastuzumab reduces the number of CSC& their growth
- Tumour cells growth in mice's decreases with the combination of these drugs than the drug alone[21].

Nutraceutical based telomerase inhibitors for cancer therapy

Nutraceuticals are the natural substances found in food, plants & other organic material that have health potential value. Nutraceuticals inhibits the telomerase activity & slowdowns or stop the cancer cell growth. There are many nutraceuticals developed such as

- Polyphenols in green tea, turmeric& grapes
- Flavonoids in citrus fruit, berries& apples
- Carotenoids in tomatoes, carrot, &sweet potato
- Omega-fatty acids in fatty fish, flaxseed, walnut

These nutraceuticals help in inhibiting telomerase activity, induces cell death & prevents cancer proliferation [24]. Curcumin is the yellow pigment present in the turmeric .it shows inhibition of telomerase in breast cancer [22]. The telomerase activity is decreased by curcumin in dose dependent manner. Curcumin recuses the key gene called HTERT gene this gene is responsible for telomerase activity. Curcumin plays a major role in cancer therapy is due to inhibition of telomerase activity &reduces the activity of cancer to proliferate [23]. The β-cyclodextrin with curcumin forms a complex which target & inhibits the telomerase gene in breast cancer. β-cyclodextrin- curcumin complex act by binding with the telomerase gene & there by inhibits their expression. so the cancer loss the ability indefinitely& their growth is slow down[29].

Design, synthesis &biological evaluation of pyrazine -containing azole derivatives as telomerase inhibitors

The group of three molecules is created by the researchers(5a-5k,8a-8k,&11a-11k)it stops the growth of cancer cell

- The compound 5c was the most effective one in first group, in very low concentration they stop the growth of cancer cells
- Compound 8h was the one of the best in second group, it shows good antitumor in liver cancer
- Compound 11f was the most effective in third group but its potency is lower than the other two The compound 8h shows potent inhibitors against liver cancer cells[25].

Design, synthesis, & biological evaluation of quinolone -oxadiazole hybridin cancer therapy

2-aminomethyl-5-(quinalin-2yl)-1,3,4-oxadiazole-2(3h)-thione quinol one derivatives is a new group of molecules that has potential be used to fight against cancer. They act by inhibiting the telomerase enzyme. There is as hield acting to protect the cancer from dying. By inhibition of telomerase the new molecule can prevent the shield & making the cancer more vulnerable for the therapy. These molecules are evaluated for different types of cancer such as liver cancer (HepG2),stomach cancer(SGC-7901),& breast cancer (MCF-7) these found that most of the agents have anti-cancer property. The two molecule 4d & 4i has most effective in cancer therapy because they stop the cell from multiplying &growing. The quinolone derivative especially which as a specific structure as good starting point for development of cancer[26].

Raloxifene in breast cancer therapy as inhibitors of estrogen-stimulated telomerase

Raloxifene blocks the activity of telomerase enzyme by oestrogen& it also inhibits the production of main part of telomerase enzyme. they work by interfering the way oestrogen affect the cancer cell's genetic material & it also blocks the signaling pathways such as PI3K/Akt /NFκB these path ways used by oestrogen to stimulate telomerase activity [27].

The role of R1N1in EGF-Rassignalling-mediated telomerase activation in breast cancer

R1N1 is the protein which control the other proteins that are involved in the cell division & cell growth they control the cell growth &cell division by reducing the activity of the protein. it also decreases the activity of telomerase enzyme & HTERT gene. R1N1 also decreases the expression of protein such asc-Myc,Ets-2 & Stat 3 which is responsible for the telomerase activity. these all suggest that R1N1 may be a potential target for cancer therapy[28].

Telomerase gene expression suppression by silibinin in T47D breast cancer

Silibinin is a flavonoid which is a natural compound obtained from milk thistle, have shown anti-cancer property. By investigations it found that its effect the telomerase gene in T47D breast cancer. They act by down regulation of telomerase gene, inhibit the cell proliferation and induces apoptosis
[30].

Inhibitingm TOR & telomerase in breast cancer cell by rapamycin

The two players which helps the cancer to survive are them TOR pathway & telomerase. it found that rapamycin inhibit the both of these players but the researches does not know the actual mechanism of inhibition. They put a study on breast cancer they found that whenever they gave higher concentration of rapamycin it inhibits them TOR pathway & telomerase enzyme from working & causes the inhibition of cell growth however they gave rapamycin at lower concentration for along period of time they stop them TOR path way & they do not affect the telomerase enzyme. The researches founds that more aggressive cancer become resistant to rapamycin over time[31].

A potential strategy to enhance lymphocyte-mediated killing of triple-negative breast cancer cells by the blockage of telomerase enzyme

The blockage of telomerase enzyme that affect the growth of cancer cells in triple-negative breast cancer cells when attacked by immune cells called lymphocytes. They found that telomerase makes cancer cells more vulnerable when telomerase is blocked lymphocytes can kill more cancer cells. These combination helps in the advanced treatment of breast cancer. The triple-negative breast cancer is the most aggressive breast cancer with the lack of oestrogen, progesterone adheres receptors. It makes Its difficult treatment. The researchers investigate the blocking of telomerase in triple- negative breast cancer by co-culturing with the activated lymphocytes they found that the blockage of telomerase increase the susceptibility of lymphocyte-mediated killing & the activated lymphocytes is more effective in killing breast cells [32].

A synergistic approach to targeting breast cancer cells as glucose restriction & telomerase inhibition

The cancer cells consume high glucose for their growth & survival. Restricting the glucose can inhibits the growth of the cancer cells. telomerase is an enzyme that helps in maintaining telomeres, allowing them un controlled division.Theeffectofglucoseontelomerasecell&theinhibitionbyBIBR1532inbreast cancer cells. They found that glucose restriction inhibits the telomerase activity 75%, reduces the catalytic expression of HTERT gene & glucose restriction also decreases mitochondrial metabolism by 80%[33].

Role of Leptin in breast cancer

The leptin is the hormone produce by the fatty cells they have role in metabolism& energy balance so cause high chances of breast cancer in obese individuals. The leptin increases the telomerase activity & HTERT gene expression by the activation of STAT3 protein which then binds to the gene & increases its expression. it is found that blocking of STAT3 activation reduces the effect of leptin, thereby reduces the telomerase activity & expression of HTERT gene. these suggest that controlling of STAT3 path way may plays a potential role in breast cancer[34].

The detection of telomerase activity by nano wire-based SERS sensors

The detection of cancer helps in the diagnosis of breast cancer. The researchers introduce a new tool for the detection of telomerase-based breast cancer called a nano gap-rich Au nano wire SERS sensor. This is a tiny gold wire in which the gap between the wires helps to measure the activity of telomerase they found that the sensor is attached to the telomerase primer when the telomerase enzymeis present in the cell its elongate the primer and folds into a specific

structure. A molecule called as methylene blue attached with this structure & which produces a strong signal & the sensor measures this signal, allows the researches to detect the telomerase activity. This tool is highly sensitive measure0.2 cancer cells per milliliters accurately used in diagnosis of gastric& breast cancer[35]. The telomerase inhibitors are the promising class in treatment of breast cancer. By targeting telomerase enzymes which shortens the telomere& it leads to the cellular senescence & apoptosis in breast cancer cells. The preclinical data & clinical data's revied here which demonstrate the potential efficacy of telomerase inhibitors in combination with other treatment. The development of telomerase inhibitor increases the potency & specificity of breast cancer treatment. The telomerase inhibitors may offer a new and innovative approach in the treatment of breast cancer & also improves the patient outcomes.

ABSTRACT

Euphorbia hirta a traditional plant, has been increasingly recognized for its neuroprotective properties. This review evaluates the current evidence on the neuroprotective effects of *Euphorbia hirta*, focusing on its bioactive constituents such as flavonoids tannins and polyphenols. These compounds exhibit significant antioxidant and anti-inflammatory activities, which are critical in counteracting oxidative stress and neuroinflammation, major factors in the pathogenesis of neurodegenerative disorders like Alzheimer's and Parkinson's diseases. Research findings from various in vitro and in vivo studies indicates that *Euphorbia hirta* can effectively reduce oxidative damage, modulate inflammatory responses and protect neuronal cells, thereby supporting cognitive function. However, the bulk of these studies are limited to preclinical models. To confirm its therapeutic potential, extensive clinical trials in human subjects are essential. In conclusion *Euphorbia hirta* holds promise as a natural neuroprotective agent. Further research, particularly clinical studies is required to fully validate its efficacy and safety for potential use in treating neurodegenerative diseases.

Keywords: To confirm its therapeutic potential, extensive clinical trials in human subjects are essential.

INTRODUCTION

The tactics and corresponding processes that protect the Brain and spinal cord from Neuronic damage resulting from both critical (such as hit or disturbance) and persistent (such as Parkinson's disease(PD) and Huntington's disease(HD)) neurodegenerative illnesses are referred to as neuroprotection(1).The term "neuronal Disorder" (ND) is a general phrase applied to explain a wide range of severe and untreatable illness. These conditions are characterised by a critical deterioration of nerve cells, primarily in the brain and spinal cord (CNS), and a clinical reduction in brain function, such as loss of cognitive function, often associated with memory impairment and difficulty with daily activities, inability to control movements, or inability to move or feel part of the body(2). The treatment of neurodegenerative illnesses is becoming increasingly important to our society as the world's population ages. The globe Health Organisation projects that by 2050, there will be about 2 billion people in the globe who are over 60, roughly doubling from 12% in 2015 to 22% in 2050. Because people are living longer in industrialised nations, there is a higher frequency of recognised age-relatedneuronic defects involve Parkinson's disease(PD) and Alzheimer's disease (AD)(3). Because interdependence of the brain, spirit, behaviour, and mood, depressive symptoms are particularly relevant in neurological disorders, particularly in neurodegenerative diseases. Stress is the same way. As a collection of diverse illnesses, neurodegenerative disorders lack a well-defined aetiology.

However, it has been determined that the majority of neurodegenerative disorders have comparable processes in the form of increased oxidative stress, misfolded protease resistance, persistent neuroinflammation, and the formation of aggregated proteins(3). The symptoms of NDs often start slowly and grow over time. They include a variety of functional losses such as poor motor coordination, learning difficulties, and short-term memory loss. It has been discovered that NDs are intimately related to ageing, which is characterised by complicated functional process including both morphological and biochemical changes that gradually unfold as we become older(4). Nervous system disorders significantly affect the lives and productivity of individuals, and in severe cases, can pose life-threatening risks. Alongside heart disease and cancer, nervous system disorders have emerged as a prominent health concern. As the aging population grows and the demands of modern life intensify, the prevalence of these disorders is expected to rise. Consequently, the study and treatment of nervous system diseases hold immense significance(5). In India, the utilization of various qualities of numerous plants with healing properties to treat particular illnesses dates back to ancient times. Ancient healing practices like Ayurveda and Siddha, and Unani have been practiced for centuries. While some Ayurvedic remedies for modern diseases have made their way to the market, plants continue to play a crucial role in providing raw materials for important drugs in advanced medicine.

Synthetic medicament may be effectual in treating various illnesses, but they probably are often inaccessible to many and come with numerous adverse reactions. Approximately 70,000 plant species are said to have been utilised therapeutically, with herbs acting as the basis for the creation of contemporary medications. About 700 different plant species may be found in India and Nepal alone. By this study we acknowledged about the presence of chemical constituents as well as neuroprotective activities of *E. hirta*(6). The plant is a prevalent weed discovered in numerous subtropical and tropical nations. In English, it's known as snake weed, garden spurge, pill-bearing spurge, asthma plant, and asthma weed. Phytoconstituents like polyphenols, sterols, glycosides, tannins, alkaloids, triterpenoids and flavonoids are presence in leaves of the plants(7). The phenolic component found in *E. hirta* exhibits both antifungal and antioxidant properties. Flavonoids are involved in the wound healing process by inhibiting fibroblast growth factor (FGF)-induced angiogenesis. These active compounds serve as a promising natural reservoir of anti-inflammatory substances for the treatment of different inflammatory conditions through the promotion of angiogenesis. Despite its capability to improve the effectiveness of periodontal therapy, *E. hirta* is seldom utilized in this field(8). Furthermore, various other species belonging to the other Euphorbia genus exhibits medicinal properties and have been utilized in folk medicine. Due to having variable toxicity of Euphorbia the milky exude was used on

hunting arrows for hunting. Particularly *Euphorbia hirta* is a very useful medicinal plant with notable antimicrobial, antifungal, antifertility, antispasmodic, sedative, anti-asthmatic, and anthelmintic qualities. Moreover, extensive research has revealed its significant anticancer effects against numerous aggressive cancer cells(9).

IMPORTANCE

Over the past few years, there has been significant attention on neuroprotective drugs or compounds, with numerous publications dedicated to this topic. Despite this, only a small number have advanced to clinical trials. Different reviews are performed to investigate the capability of disease modifying drugs for human Bing. Regrettably, drug treatments have not yielded much success, and no neuroprotective agents have been authorized for use(10).

PURPOSE

Due to increase in the production of Reactive Oxygen Species (ROS) causes oxidative stress and it is a very common features of neurodegenerative diseases. ROS have been linked to various significant biological functions. Excessive production of ROS may result in the oxidative breakdown of molecules involved in the aging process and various diseases such as cancer, cardiovascular disease, and neurological disorders. Furthermore, increased ROS generation may cause a cell's redox equilibrium to shift towards an oxidative state, which might result in malfunction or even death. Antioxidants are play natural defence systems against the effects of oxidative stress. These antioxidants have the capacity to recognise reduce the oxidation of the affected biological components and reactive oxygen species (ROS). They can be produced either internally or externally(11). Oxidative stress is a common divisor of neuronal cell loss associated with neurodegenerative disorders such as Huntington's disease (HD), Parkinson's disease (PD), AIzheimer's disease (AD), and amyotrophic lateral sclerosis (ALS), in addition to spinal cord and brain damage following traumatic brain injury (TBI) and stroke. Additionally, it has been found that the accumulation of RNS and ROS leads to mitochondrial dysfunction, which causes changes in the accumulation of toxic protein aggregates, metal homeostasis and inadequacies in energy synthesis that are characteristic of a range of neurodegenerative diseases(12).Antioxidants are substances that help lessen oxidative stress's negative consequences. Even in little doses, antioxidants efficiently slow the rate of oxidative damage.

Antioxidants fall into two primary types based on their mode of action: two types of antioxidants: primary and secondary(13). A family of secondary metabolites known as flavonoids is widely distributed across the kingdom of plants and has been shown to have some interesting medicinal applications. Higher generation plants are abundant in flavonoids, a significant class of bioactive polyphenolics that exist naturally. Food items that contain flavonoids may have beneficial effects. Biological characteristics like neuroprotective, anti-inflammatory, antibacterial, antiallergic and anticancer effects are shown by flavons and some of the synthesized chemical components. Flavones possess antioxidant properties that make them suitable for use as preventive and mitigating agents against oxidative stress. Quercetin, a flavanol, is among the most commonly found flavonoids in human diets. Furthermore, *Euphorbia hirta* is widely recognized as Euphorbia pilulifera. It is commonly referred to as the Australian asthma herb. Polyphenols, sterols, tannins, alkaloids, flavonoids, glycosides, triterpenoids are presents in the leaves of *E. hirta* and also used for the treatment of antispasmodic, antifungal, antimalarial, antidiarrheal, antiamoebic, antihelmintic, anti-inflammatory, anticancer, antibacterial agents etc. The antiviral and anti-inflammatory effects of Quercetin have also been proven. Extensive scientific research has confirmed the diverse range of pharmacological activities that this plant possesses(14)

MORPHOLOGICAL CHARACTERISTICS

Asthma plant is another name of the *Euphorbia hirta* and in having various name in different language such as “Dudhi” in hind, “Nanabaala” in Telugu, “Amupachaiarissi” in Tamili etc…It is mainly found in India, Malaysia, Syria, Bhutan, New Guinea, Indonesia, Thailand, Yemen, Sri Lanka, Oman, Philippines and Taiwan(9). *Euphorbia hirta*, a renowned plant in traditional medicine, belongs to the Euphorbiaceae family (16). *Euphorbia hirta* also introduced *E. hirta* and annual, topical herb. It annual It can reach heights of up to 90 cm and has a slender, hairy, and extensively branched stem. The leaves of this plant are opposite, elliptical to oblong-lanceolate, with serrated edges and a darker upper surface. *E. hirta* produces small, densely clustered flowers in the upper leaf axils and

exudes a white sap when injured. This plant is typically found thriving in disturbed areas such as wastelands, watercourse banks, grasslands, as well as along roadsides and pathways(17). *Euphorbia hirta* is a healing plant with root like properties mainly discovered in Northen east coast of Tamil Nadu and southern Western Ghats of India(18). Spurge family is alternatively introduced Euphorbiaceae family, comprises approximately 322 genera and 8910 species. The majority of these species' range is worldwide, with both hemispheres' humid tropical and subtropical regions having a sizable population with having sixth largest family rank in the world wide.*E. hirta* is a medium-sized perennial shrub that can reach a height of 4-5 feet, frequently found throughout India, especially in the plains of Maharashtra. Its leaves are simple, smooth, and arranged alternately, with a hairy texture. They are shaped like an inverted egg or elongated rectangle, with a toothed or wavy edge, attached to a stem, and have a single prominent vein pattern. The leaves are having pale green colour is underside and rough and dark green on upper surface of the leaves. The plant bears cyathium inflorescences measuring up to 1.5 cm in width and 4cm length with having red-brown flower. The scarcity of endosperm in seeds. In English it is investigated as hairy spurge, asthma plants, garden spurge, pill- bearing spurge and in Hindi dudhi or dudh grass, in Bengali it is introduced boro – kerui and in Sanskrit as chara(19).

PHYTO CONSTITUENTS

The researchers have identified several chemically active ingredients in *Euphorbia hirta*, including myricitrin (III), quercitrin (II), and afzelin (I), which are extracted from the plant. Additionally, euphorbin-D (IX), euphorbin-C (VIII), euphorbin-B (VII), euphorbin-A (VI), quercitin (V), 2, 4, 6-tri-O-galloyl-β-d-glucose, Rutin (IV), gallic acid, 1, 3, 4, 6-tetra-O-galloyl-β-d-glucose, protocatechuic acids, and kaempferol have been isolated from the plants. And *E. hirta* reported that presence of tinyatoxin, Rhamnose, chtolphenolic acid derivatives of camphol, heptacosane , Beta-sitosterol, shikmic acids, Beta-amyrin, nonacosane and choline. *E. hirta* also found in Beta-amyrin, Beta-sitosterol, rhamnose, heptacosane, shikmic acid, tinyatoxin, 24-methylenecycloartenol, quercitol, camphol and choline. The herb helps with fever, diarrhoea, diabetes, dyspepsia, urinary tract infections, and depilatory(20). Flavonoids: Myricitrin, camphol, leucocyanidin, leucocianidol, rutin, quercetin, and its derivatives(21). In leaves of *Euphorbia hirta* presence some secondary metabolities like Beta-sitosterols, diterpenoids, carboaromatic, polyols and alkaloids(22).

MECHANISMS OF NEUROPROTECTIVE EFFECT OF *EUPHORBIA HIRTA*

ANTIOXIDANT PROPERTIES

The antioxidant activity was measured using hydroxyl radical scavenging assay, superoxide anion scavenging assay and 1,1-diphenyl-2-picrylhydrazyl [DPPH] test. Every assay's gathered data consists of the average of three findings from three separate tests. Using the protocol outlined by DPPH, the capacity of *Euphorbia hirta* extracts and standard to provide hydrogen atoms or electrons to the scavenging of DPPH free radicals was assessed. The purple-coloured stable free radical, which easily exhibits a maximum absorption at 517 nm, is diminished by an antioxidant. 1,1-diphenyl-2-picrylhydrazyl, or DPPH While antioxidants react with purple dye, 1-1-diphenyl-2-picrylhydrazine, a yellow tone, is generated. This test shows the extract from *Euphorbia hirta's* capability to neutralise free radicals.

Different concentrations [2, 4 µL] of water and alcohol extracts were combined with 1ml of a 0.1 mm DPPH radical in a methanol solution. The reaction mixture was thoroughly shaken and let them to stand for 30 minutes at dark room temperature. Absorbance at 517 nm was calculated with a UV-VIS spectrophotometer after 30 minutes. As a standard reference positive control, stable antioxidant ascorbic acid was utilized. When an increases in the effectiveness of scavenging DPPH radicals then it indicates decrease in the absorbance of the DPPH solution.The DPPH radical scavenging activity inhibition percentage [1%] was computed using the preceding formula. The antioxidant capacity was assessed through the DPPH test, along with the superoxide anion scavenging assay and the hydroxyl radical scavenging assay. Every assay's gathered data consisted of the average of three findings from three separate tests. The extracts and standard of *Euphorbia hirta* were evaluated for their capacity to eliminate DPPH free radicals through the measurement of hydrogen atom or electron donation.Following the protocol meant following the rules established by DPPH, a continuous purple-coloured radical with a peak absorption at 517 nm that may be reduced by an antioxidant. When antioxidants are introduced, the purple hue of DPPH, also termed as 1,1-diphenyl-2-picrylhydrazyl, is transformed into a yellow colour, specifically 1-1-diphenyl-2-picrylhydrazine. This particular

experiment offers insights into the ability of the *Euphorbia hirta* extract to counteract free radicals. The drop in absorbance of the DPPH solution signifies an increase in DPPH radical scavenging capability. By utilizing the given formula, the percentage of inhibition of DPPH radical scavenging activity was calculated.

DPPH radical scavenging activity [I%] = [Abs control –Abs sample] / [Abs control] × 100

The investigated samples (the aqueous, ethanol production, and methanol extracts of *Euphorbia hirta*) and the blank sample have absorbance values that are designated as Abs control and Abs sample, respectively. The IC50 value was calculated to assess the antiradical activity by determining the amount of antioxidant needed to reduce the initial DPPH absorbance by 50%. A graphical representation of the DPPH scavenging percentage against the concentration of the extract was created to establish the IC50 value for every extract or reference compound(23). *Euphorbia hirta* extracts in aqueous, ethanolic, and methanolic forms are the examined samples. The absorbance values of these substances are designated as Abs control and Abs sample, respectively. Through a graphical representation of the relationship between DPPH scavenging and extract concentration, the IC50 value for every extract or standard chemical was established(24).

ANTI – INFLAMMATORY EFFECTS

In 2010, Mei-Fen Shih and colleagues conducted a study to investigate the anti-inflammatory effects of the ethanol extract of *Euphorbia hirta* and its active compound β-amyrin on lipopolysaccharide (LPS)-activated macrophage cells. The researchers uncovered that both the extract and active ingredient successfully suppressed the formation of nitric oxide and the activation of the iNOS gene. As a result, *Euphorbia hirta* and β-amyrin demonstrated promising potential for the treatment of arthritis inflammation. In the year 1999, Mariano Martinez-Vazquez and his research team effectively recognized and characterized triterpenes such as β-amyrin, 24-methyl encycloartenol, and β-sitosterol from the n-hexane extract of *Euphorbia hirta*. After this, the anti-inflammatory effects of the n-hexane extract and triterpenes were assessed in mice.The results showed that both the extracts and triterpenes exhibited notable anti-inflammatory effects in the TPA-induced mice model. Additionally, the research emphasized that the combination of two or three triterpenes led to increased effectiveness when compared to using single triterpenes(25).

ANTI CANCER EFFECTS

E. hirta contains phenols, flavonoids, essential oil, terpenoids and many other compounds. The *E. hirta* plant was found to contain a variety of compounds such as rhamnose, chlorophenolic acids, quercitol, myricitrin, pelargonidin 3,5-digucoside, cyaniding 3,5-diglucoside, quercetinrhamnoside, camphol, myricyl alcohol, tetraxerol, ellagic acid, friedelin, hentriacontane, inositol, Beta-sitosterol, and kaempferol. Additionally, various triterpenoids like α-amyrin, β-amyrin, friedelin, teraxerol, taraxerone, 11α, 12α-oxidoteraxerol, etc. were isolated and identified during the research process. Moreover a new derivative of cyclopentanone was identified in the process of isolation. The techniques 1D and 2D NMR spectroscopic used for the identification of chemical structure of substance. In addition, the researchers evaluated the cytotoxic effects of the ethanol extract derived from the plant on two distinct cell lines, specifically lung cancer and human leukaemia. The findings revealed that the ethanol extract exhibited minimal activity against lung carcinoma epithelial cells, while showing no impact on human leukaemia cells(26).

NEUROTROPHIC FACTORS MODULATION

Neurodegenerative diseases (NDs) are worldwide health challenges caused by the gradual deterioration of brain cell, resulting in impaired functioning of the nerve system. The World Health Organization (WHO) forecasts an increase in the number of dementia cases from 50 million to 152 million by 2050. Neurodegenerative diseases like Progressive Supranuclear Palsy, Corticobasal Degeneration, Wilson's Diseases, Multiple System Atrophy, Parkinson's disease (PD), and frontotemporal dementia have adverse effects on both the individuals afflicted and their families, as well as society in general. Heterogeneous neurodegenerative disorders display homogeneous pathogenetic mechanisms at different stages of the disease, including mitochondrial dysfunction, increased nitrosative burden/cellular oxidative stress, protein cluster formation/clumping, compromised synaptic function, and reduced neuronal viability. Immunocytes and neurons are at risk of being exposed to harmful proteins, requiring additional energy defend them from damaging effects of reactive oxygen species and nitrogen that can harm neurons. The build-up of proteins can interfere with cell signalling and neuronal functions, leading to the development of neurological disorders.

Neurotrophins (NTs) and neurotrophic factors (NTFs) are vital in the regulation, maintenance, and revitalization of specific neuronal cells in the brain as growth factors(27). Neurotrophins could serve as a potential link between immune-related disorders and the neuro system. These molecules play a vital role in the development, growth, and functioning of neurons. Additionally, they have the ability to influence the release of neurotransmitters at the synapses. One of the elements that affects brain function is brain-derived neurotrophic factor (BDNF), a nerve growth factor present in the central nervous system. Its expression levels can differ based on the region of the brain and the presence of certain conditions such as psychiatric disorders or aging. BDNF has diverse functions, such as fostering the growth of neurons and glial cells, regulating synaptic plasticity, and controlling inhibitory and excitatory signals. It is vital for memory and learning, and it might also affect the perception of stimuli, especially in cases of chronic pain(28). As a result, the rise of experimental findings suggesting that physical activity, exposure to an enriching environment, metabolic changes, and interventions related to nutrition and/or cognition might have a protective effect on neurodegeneration by delaying the start and/or lessening the progression of the disease, inspires hope that these new methods could be advantageous in medical environments.BDNF plays a critical role, and in certain instances, is even necessary, in facilitating the neuroprotective impacts of the environmental stimuli mentioned earlier. Specifically, as previously mentioned, it is widely recognized that BDNF is responsible for the adult neurogenesis in the hippocampus, which can be triggered by various factors like physical activity, enriched surroundings, hormonal equilibrium (such as cortisol and testosterone), and dietary modifications (such as fasting, reduced calorie consumption, low-carb diets, specific nutrient intake), all of which have the ability to elevate the BDNF levels(29).

POTENTIAL APPLICATION AND FUTURE DIRECTIONS

TREATMENT OF NEURODEGENERATIVE DISEASE:

Neuroprotection refers to the capacity of a mechanism to protect the Central Nervous System (CNS) from neural harm, encompassing both sudden and gradual neurodegenerative conditions such as Huntington's disease and Parkinson's disease. Healthy diet and regular exercise are involved in herbal remedies, it is possible to prevent diseases. Plant therapy, also known as phytotherapy, involves using different components of plants like leaves, stems, roots, bulbs, fruits, and seeds for their healing qualities. Based on the information provided earlier, it has been noted that Ayurvedic texts offer a thorough evaluation of the herbal ingredients recommended for addressing nervous system disorders linked to the mentioned conditions. The investigation employed historical ayurvedic manuscripts in conjunction with multiple databases like Scopus, PubMed, Google Scholar and Web of Science. The study evaluated in vitro experiments, animal studies, review articles, and clinical trials focusing on herbal plants with properties related to neuroprotection, behavioural changes, oxidant/antioxidant effects, and proinflammatory cytokines(30). The frequency of neurodegenerative disorders (NDs) is rising quickly, and these illnesses are often considered to be incurable. The challenge of medications crossing the blood-brain barrier (BBB) and reaching the brain in adequate quantities to produce a pharmacological effect results in a lack of specific and efficient treatments for most of these disorders. Therefore, there is a pressing need for the development of therapeutic strategies that can overcome the BBB and improve their efficacy.

Scientists are consistently researching new methods for delivering therapeutics in order to address this issue. Various strategies have been created to combat this problem, with the nano-based approach being a key player in the advancement of therapeutic delivery. A range of designed nanomaterials and nanoparticles, each ranging between 1 and 100 nm in at least one dimension, are used in nanotechnology. In biomedical science, the use of nanomaterials and the subject of nanotechnology provide new potential. Several nanoparticles have been extensively employed in brain-related studies and research, including metallic nanoparticles, micelles, polymeric nanoparticles, and quantum dots (QDs). The nano-scale materials exhibit distinct features, including their tiny size enabling interaction with the biological system at a molecular level. Additionally, they possess a significant surface to volume ratio that can be altered through surface modification, and they demonstrate exceptional stability. Nevertheless, chemotherapy and medications may lead to adverse effects such as anaemia, alopecia, gastric irritation, neurotoxicity, and reduced appetite. The incorporation of drugs into metallic nanoparticles, such as silver, gold, and magnetic metal oxides, helps in overcoming medication-related obstacles. Nanomaterials in different forms and structures have been widely

used in the past decade for treating a variety of neurodegenerative diseases. Significant advancements have been made by researchers in the realm of nanotechnology, particularly in the fields of nanomedicine, biomedical sciences, and neurosciences. This paper offers a brief summary of the different kinds of nanomaterials and the advancements achieved in utilizing nanotechnology in the realm of neurosciences(31).

Transcranial magnetic stimulation

Magnetics field are creates localized electrical currents in specific area of the brain by powerful magnetics fields. Advanced technology has enabled the application of repetitive TMS (rTMS). The efficacy of rTMS is determined by the type of coil used (such as H coil, double cone coil), the frequency of stimulation (high frequency, low frequency, theta-burst), and the site of stimulation. TMS is widely recognized as a promising therapeutic method because of its safety and low likelihood of causing severe adverse effects when administered.

Mechanism of action

Transcranial Magnetic Stimulation (TMS) administers brief bursts of electrical energy to the brain and can be administered in various manners: as an individual burst, as a paired burst targeting the same or different brain regions, or as repetitive TMS (rTMS). A single burst of stimulation activates neurons, while rTMS has the ability to modify the excitability of the cerebral cortex, affecting both nearby and distantly connected areas through functional anatomy. ZAlthough the precise mechanisms underlying the therapeutic effects of rTMS are not fully comprehended presently, there are indications indicating that rTMS can influence oxygen consumption, cerebral blood flow, Cerebral cortex activity, and the release of neurochemicals. Consequently, it is theorized that these alterations in brain function could be linked to positive clinical outcomes(32).

MANAGEMENT OF NEUROLOGICAL DISORDER

Herbal Drugs used In the Management of neurological disorder

Many traditional treatments have been employed to address neurological conditions because of their limited adverse effects and exceptional efficacy. Turmeric (Curcuma longa), Turmeric (Curcuma longa), Shankhpushpi (Convolvulus pluricaulis) and Winter cherry(Withania somnifera) are some of the herbal remedies used for this purpose. Ashwagandha, also called as Indian ginseng , is esteemed for its capacity to rejuvenate the mind in instances of neurological conditions.Withania somnifera, a compact woody shrub of the Solanaceae family, is commonly cultivated in India. Its flowers exhibit a greenish or yellowish hue and measure approximately one centimeter in length. W. somnifera is comprised of several important phytoconstituents, like anferine, isopellertierine, withanolides, withaferins, sitoindoside VIII and VII, and withanoloides. It also contains various other chemical compounds such as withanine, somnine, somniferinine, somniferine, withananine, pseudo-withanine, tropine, pseudo-tropine, 3-a-gloyloxytropane, choline, and cuscohygrine. Ashwagandha demonstrates antioxidant characteristics, the capacity to eliminate free radicals, and functions as a booster for the immune system.

The use of Ashwagandha plant extract is employed in the management and prevention of a range of ailments, including arthritis, impotence, amnesia, cancer, and neurodegenerative disorders. The precise way in which Ashwagandha operates in the human body is still not fully understood. Nevertheless, it has been noted to improve cognitive function in rats that have been subjected to oxidative stress linked to Alzheimer's disease. Research involving animals has indicated that the active phytophenolsSitoindosides VII-X and Withaferina A (glycowithanolides) are vital for boosting cortical Muscarinic acetylcholine capacity and managing cholinergic neurotransmission. Additionally, research using molecular modelling has shown that Withanamides-A and C have a distinctive way of binding to the beta-amyloid active site, effectively inhibiting fibril formation. Moreover, the aqueous extract enhances cholinergic activity, whereas the Methanol extract promotes neuritis outgrowth in human neuroblastoma cells in a dose and time-dependent fashion.A study was conducted to evaluate the effects of ashwagandha-root extract on cognitive function in adults with mild cognitive impairment. The results shows apply of roots extract of ashwagandha led to enhancements in immediate and overall memory capabilities, along with improvements in executive function, attention, and information processing speed. These results imply that ashwagandha could potentially offer advantages to individuals dealing with cognitive impairment. Additionally, the

research highlighted the scarcity of data regarding the clinical application of Withania for cognitive decline. Nevertheless, findings from previous studies suggest that the formulations and extracts derived from W. somnifera root are safe for extended periods of use, showing no signs of toxicity(33).

NOVEL DELIVERY SYSTEM OR FORMULATIONS

An investigation was carried out to assess the immediate oral toxicity of a methanol extract of *E. hirta*. The investigation adhered to the standards established by the Organization of Economic Cooperation and Development (OECD) for chemical testing, specifically guideline 420. Male and female rats, between six and eight weeks old were employed in the investigation. The rats were orally administered the extract at a single dose of 5000 mg/kg, or 20 mL/kg, after it was dissolved in 10% Tween 20. The control group received 10% Tween 20 as a vehicle. The rats (six males and six females) were observed for a whole day following the extract administration, with special emphasis placed on the first four hours .Over the course of 14 days, additional observations were made once per day(34).

CONCLUSION

Euphorbia hirta shows promising neuroprotective effects, largely due to its rich content of flavonoids, tannins, and polyphenols. These compounds help reduce oxidative stress and inflammation, protecting neurons and enhancing cognitive functions. While preclinical studies are encouraging, more human clinical trials are needed to confirm its efficacy and safety. *Euphorbia hirta* could potentially be developed into a natural treatment for neurodegenerative diseases, but further research is essential to fully validate its therapeutic potential.

ABSTRACT

Nanomaterials are well suited for water purification, disinfection and wastewater treatment applications. The use of metal oxide nanoparticles is one of the promising ways for overcoming antibiotic resistance in bacteria and Fungi. Nanoparticles (NPs) of several metals and their oxides, such as AgO, ZnO, Fe_2O_3, Fe_3O_4, Al_2O_3, TiO_2, and CuO, exert antimicrobial action against Gram-negative and Gram-positive bacteria, as well as they exhibit antifungal action. The present study focuses on use of Copper oxide andAg doped copper oxide nanoparticles as antibacterialagent against gram positive (*Bacillus subtilis*) and gram-negative bacteria (*E.coli*)and anti-fungal agent against *Mucor mucedo* and *Aspergillus niger* was evaluated. The copper oxide and Ag doped copper oxide nanoparticles were synthesized using Sol- gel Method.Further, these nanoparticles were subjected to characterization using Transmission Electron Microscopy and Energy Dispersive X-ray Analysis. Based on the results obtained from study it can be proved that the Ag doped copper oxide Nano catalyst demonstrated the highest zone of inhibition in terms of antibacterial and antifungal activity when compared to copper oxide Nano catalyst.

Keywords: Antibacterial, Anti-fungal, copperoxide,Ag doped copper oxide

INTRODUCTION

A major concern in health care, microbial contamination of air, water, and soil by various microorganisms leads to issues in living circumstances. Interest in alternative antimicrobial agents, such as metal nanoparticles, cationic polymers, tiny antibiotics and antimicrobial peptides has increased due to the rise of antibiotic-resistant illnesses [1]. The qualities that are produced can vary significantly, as particles are shrunk from a micrometre to a nanometre size. It is recognised that certain properties can change, such as electrical conductivity, hardness, active surface area, chemical reactivity, and biological activity. It has been proposed that metal nanoparticles due to their large surface-to-volume ratio and size contribute to their bactericidal activity. [2]. in recent years, inorganic nanoparticles have garnered a lot of attention due to their superior stability and safety when compared to organic antibacterial reagents [3]. Of all the inorganic antibacterial agents found**,**Nano silver and copper are most commonly utilized.Silver has shown superior antibacterial activity among the family of inorganic nanoparticles [4]. Silver nanoparticles are effective against a wide span of microbes including Gram-positive and Gram-negative bacteria and viruses [5].

However, in comparison with other inorganic nanoparticles, silver is very expensive inorganic nanoparticle in contrast to that copper oxide (CuO) is cheaper, widely available, exhibits strong antibacterial activity, and is vital to human health. It is more affordable than silver and safe for the environment. CuO has an extensive range of antibacterial qualities, which is able to combat bacteria, fungus, viruses and mites in dust. CuO NPs have the ability to harm and impede the proliferation of many bacterial and fungal species. CuO is the most basic member of the copper compound family and has garnered special attention due to its array of potentially beneficial physical characteristics such spin dynamics, electron correlation effects, and high temperature superconductivity Therefore, a nanocomposite made of silver and other proven inorganic metal oxide materials is suggested in order to ensure a fair balance between the material's economic effectiveness and robust antimicrobial property of substance [6].It is envisaged that nanocomposites of silver with copper oxide will create a potent and yet more cost-effective inorganic antibacterial material [7].These nanocomposites' synergistic combination might increase their antibacterial efficacy.It has been demonstrated that modifying to the doping level can help to enhance the physical performance. According to Lv et al. have shown that the doping of Mg, Zn and Ce ions can promote the release of Cu^{2+} in the doped CuO NPs and promote their antibacterial activity [8]. In present study Antimicrobial activity of CuO/Ag-CuO NPs was examined by Agar well disk diffusion assay and Zone of Inhibition of CuO NPs and Ag doped CuO NPs against two bacterial strains i.e. *E.coli* and *Bacillus subtlis*and two Fungal strains i.e. *Aspergillus niger* and *Mucor mucedo*was determined.

MATERIALS AND METHODOLOGY

Synthesis of Copper oxide Nanoparticles

Copper oxide nanoparticles were prepared by using sol-gel method. As precursor 0.1M copper chloride Hexa hydrate was used and it was dissolved in double distilled water. To above solution 1ml glacial acetic acid was added and heated to 100°C with constant stirring. Afterwards dropwise addition of NaOH solution was done to maintain the pH 7; on addition of NaOH, solution sudden colour change from blue to black is observed along with formation of black sol. Nanoparticles were separated using what man filter paper. The particles were washed with Ethanol to eliminate contaminants before being dried in a Hot Air Oven at 100°C. After thorough drying, they were calcined in a Muffle furnace at 400°C. On calcination, a Black powder of nanoparticles was obtained as shown in figure 1 [9].

Synthesis of Ag- Doped Copper oxide Nanoparticles

The Ag- doped Copper oxide nanoparticles were prepared by using sol-gel method. As precursor, 3.55g of copper chloride Hexa hydrate was used and it was dissolved in double distilled water. Then after addition of 1ml, glacial acetic acid was done to the above solution. It was constantly stirred on Magnetic stirrer at 100°C. To this solution dropwise addition of NaOH, solution was done to maintain the pH 7, on addition of NaOH solution sudden colour change from blue to black is observed along with formation of black sol. Then after 0.35 g of silver nitrate was added

as doping agent, the obtained precipitates were separated using what man filter paper. Further, the particles were washed with Ethanol to eliminate contaminants before being dried in a Hot Air Oven at 100°C. After thorough drying, they were calcined in a Muffle furnace at 400°C. On calcination, a Black powder of nanoparticles was obtained as shown in figure 2 [10].

Antibacterial study

The Nanoparticle samples for antibacterial study were prepared in DMSO. The N-agar plates were prepared and two bacterial cultures (*B. subtilis* and *E. coli*) were poured on n-agar plate. Then a well of 6mm size were aseptically punched using a sterile cork borer after that the 100 µl nanoparticle extract were transferred into separate wells. These plates were incubated at 37°C for 24-48 hours. After that, the zone of inhibition of each extract was measured.(Figure 3) [11].

Antifungal assay

Antifungal activities of the different nanoparticles were performed using the agar well-diffusion assay. Two fungal Inoculum of (*Aspergillus niger* and *Mucor mucedo*) was prepared by growing the fungal culture in the Potato dextrose agar medium and then the test compound was suspended in tween 80 solution. The fungal suspensions were uniformly spread over Potato Dextrose Agar plate using sterile cotton swab followed by punching of 6 mm wells using cork borer. The wells were filled with different concentration of nanoparticles.Fluconazole and DMSO were used as a standard and control respectively (Figure 4) [11].

RESULTS AND DISCUSSION

Characterization of Nanoparticles

Energy dispersive X-ray microanalysis (EDAX)

The composition of the nanoparticles is displayed by the EDAX; the synthesised nanoparticles are Ag-CuO and CuO respectively, as indicated by the strong, intense peak as shown in figure 5. The CuO nanoparticle's EDAX spectrum shows that, by weight, there is 26.06% oxygen and 73.94% copper [12]. Conversely, the Ag-CuO nanoparticles' EDAX spectra show the sample's composition, which is 3.09, 70.03, and 26.88% by weight of Ag (silver), Cu (copper), and O (oxygen) [13].

Transmission electron microscopy analysis (TEM)

TEM is used to evaluate nanoparticle grain size, size distribution and morphology. TEM analysis pictures of CuO nanoparticles generated after 12 hrs at room temperature infests that the NPs were of agglomerated spherical to Sqarish shape with an average size about 50 nm [14].

The Ag doped copper oxide shows irregular morphology with spherical silver atoms embedded in it. The silver component of the nanocomposite appears spherical, being supported by the copper oxide that are rather irregular in morphology [15]. The size of Ag- Copper oxide Nano catalyst is about 20 nm. (Figure 6)

Antimicrobial Assay

Antibacterial activity

The Antibacterial activity was explored for both Nano catalyst; with varying concentration (25 ppm, 50 ppm, 75 ppm, and 100 ppm) against two, different strains of bacteriai.e. gram-positive bacteria *Bacillus subtillis* and gram-negative bacteria *Escherichia coli*. The copper oxide nanoparticles at 100-ppm concentration were able to inhibit maximum microbial zone of 9.2 mm against *Bacillus subtills and* 10 mm against *Escherichia coli.* Further doping of silver, which enhanced the antibacterial activity as compared to chemically synthesized nanoparticles. For Ag doped copper oxide nanoparticles at 100-ppmconcentration, it was able to inhibit maximum microbial zone of 10 mm against *Bacillus subtills and* 11.2 mm against *Escherichia coli.* For positive bacterial control Streptomycin standard was used. Therefore, the Ag doped copper oxide nanoparticles showed the strongest activities against the test bacteria.(Table 1and Figure 7).

Antifungal activity

The Antifungal activity was explored for both Nano catalyst with varying concentration (25 ppm, 50 ppm, 75 ppm, and 100 ppm) against two different strains of Fungi i.e. *Aspergillus niger* and *Mucor mucedo.* The copper oxide nanoparticles at 100-ppm concentration were able to inhibit maximum microbial zone of 7 mm against *Mucor mucedo and* 6.2 mm against *Aspergillus niger.* When compared to chemically produced nanoparticles, further doping of silver increased the antifungal activity. For Ag doped copper oxide nanoparticles at 100-ppmconcentration, it was able to inhibit maximum microbial zone of 8mm against *Mucor mucedo* and 7mm against *Aspergillus niger.* For positive fungal control fluconazole standard was injected in the wells.The Ag doped copper oxide nanoparticles showed the strongest activities against the test fungi.(Table 2and Figure 8).

CONCLUSION

The Study indicates successful synthesis of copper oxide and Ag doped copper oxide nanoparticles. The Characterization technique helped in confirming the shape, size and composition of Nanoparticles. Furthermore, it was proved that doped copper oxide nanoparticles demonstrated highest zone of Inhibition in terms of antibacterial and antifungal activity when compared to copper oxide nanoparticles. Therefore, from this study it can be concluded that the doping of silver, which enhanced the antibacterial activity, as compared to chemically synthesized nanoparticles. The doped nanoparticles have potentialto use as antifungal and antibacterial agent.

ACKNOWLEGMENT

Authors are thankful to SHODH (Scheme of Gujarat Government) for providing financial support during research work. I would also like to thank SICART for providing the analysis facility.

ABSTRACT

Garbhashaya Grivagata Vrana (Cervical Erosion), is one of those issues that usually arises during the reproductive period. The direct correlation of cervical erosion is not given in Ayurvedic literature. Cervical erosion is usually associated with leucorrhoea. The current study compares and evaluates the efficacy of Nimbadi Yonivarti and Pippalyadi Yonivarti in the management of cervical erosion. 20 to 50 yrs age group's married women whoare clinically diagnosed and conform to cases of cervical erosion have been selected for the study. A totalof 60 patients are enrolled 30 in Group A- Nimbadi Yonivarti and 30 in Group B- Pippalyadi Yonivarti. Both Yonivarti(3gm each)was given per vaginally once a day for 7 days. According to the "P" value highly significant results on cardinal parameters (cervical erosion, per vaginal discharge, itching at the vulval region, foul smell from discharge, Appearance of the cervix) were found in both groups. Nimbadi yonivarti and Pippalyadi yonivarti both are found almost equally effective in Grabhashaya Greevagata Vrana.

Keywords: Cervical erosion, Garbhashaya Greevagata vrana, Nimbadi yonivarti, Pippalyadi yonivarti, Per vaginal discharge

INTRODUCTION

Cervical erosion is a benign disorder of the vaginal canal.[1]Cervical erosion is a condition where the squamous epithelium of the ectocervix is replaced by columnar epithelium.[2]Cervical erosion needs medical attention. If left untreated may lead to CIN, cervical cancer, and vaginal infections. It may even lead to infertility. Surgical treatments like thermal cauterization, laser vaporization, and cryosurgery have various side effects like cervical stenosis, accidental burns, bleeding, etc. In this comparative study,*Varti* will be prepared by the modified method of Ghana form.[3]This form of the drug is concentrated so the effectiveness of the drug is greater and gets absorbed properly at the disease site. The direct correlation of cervical erosion is not given in Ayurvedic literature. One indirect reference of *Yonivrana* is available in *AshtangaSamgrahaSutrasthana Adhyaya 34*in the context of "*Yoni VranekshanYantra*" [4]. *Acharya Sushruta Sutra Sthana- Adhyaya 2* and *Chikitsa Sthana Adhyaya 6* describe as *Garbhashaya Greeva*as a part of *Prajanana Anga* refers to *Prajanana Vrana.[*5]Drugs for application on *Vrana* for *Vrana Shodhana* and *Vrana Ropan* are mentioned in Ayurvedic texts. It is mentioned that *Varti* made up of purifying drugs is to be used in *Vrana*. *Nimbadi Varti* is *Anubhuta yoga*, this formula was made after many trials from various formulations. It is indicated for *Shwetapradara*[6].*Pipplyadi Yoni Varti* described in *Charaka Samhita Chikitsa Sthana Adhyaya 30*[7]*, Bhavprakash Nighantu Madhyama Khanda, Adhyay-70, Slok-44, AstangaSamgraha Uttara Tantra, Adhyay- 39, Yoga Ratnakara Yoniroga, Adhyaya-9*.

Aim and Objectives

- To compare the efficacy of *Nimbadi Yoni Varti* with *Pippalyadi Yoni Varti* in the management of *Garbhashaya Greevagata Vrana.*
- To adopt and implement the standard operative procedure of Varti in *GGV* (cervical erosion).
- To evaluate the efficacy of *Nimbadi Yoni Varti* in *GGV* and to compare its efficacy with *Pippalyadi Yoni Varti* in *GGV.*
- To observe the possibility of non-recurrence of *GGV* after *Yoni Varti.*

MATERIALS AND METHODS

60 Patients will be selected from the Department of Prasuti Tantra Evum Stree Roga, Parul Ayurveda Hospital; who will be allocated into two groups after through physical examinations and laboratory investigations. Patients were allocated to both groups by randomization method. A detailed proforma of the patients was made and written consent was taken explaining.

IEC no: PU/PIA/IEC/07/2023/223

CTRI registration no: CTRI/2023/09/057739

Inclusion criteria

1. Patients who are willing for the trial and ready to give informed written consent.
2. Married women of the age group between 20-50 years.
3. Clinically diagnosed and confirmed cases of cervical erosion.
4. Patients having HPV infection, LSIL, HSIL
5. Chronicity of six months or more up to one year.

Exclusion criteria

1. Unmarried.
2. Pregnant women.
3. Known cases of Tuberculosis, cervicalcarcinoma, HIV, VDRL, HbsAg positive patient, severe anemic (<8 Hb%).
4. Women with second and third degrees of uterine prolapse.
5. Women with STD.
6. Women with any congenital anomalies of genital organs.

Investigations: CBC, Urine routine, and microscopic examination., Cervical Cytology (Pap smear), Vaginal pH will be noted using litmus paper.(BT and AT), HIV, HbsAg, VDRL.

Intervention: The procedureis donedaily for 7 days. She was instructed to pass urine before the procedure. Local Prakshalana with Ushanodaka then after Varti dipped in ghrut was kept in yoni (vagina). After 2 hrs yoni prakshalanais done with Ushnodaka.

Study duration:7 days for both

Follow up: 15th and 30th day

ASSESSMENT CRITERIA: All patients were assessed before and after treatment based on subjective and objective criteria.

SUBJECTIVE PARAMETER:

1. Per vaginal discharge

Variable	Score
No c/o discharge	0
Mild- Occasional (moistening of the vulva)	1
Moderate (persistent staining of undergarments)	2
Severe(Excessive outpouring discharge and needs applying of vulval pads)	3

2. Vulval itching (Pruritus Vulvae)

Variable	Score
No c/o itching	0
Mild-Occasionally	1
Moderate-disturbs daily routine/increases after specific time-menstruation or urination	2
Severe-Intolerable itching	3

3. Lower Backache

Variable	Score
No c/o lower backache	0
Mild- increases during daily routine but relief after rest.	1
Moderate- interference in daily routine not relief after taking rest.	2
Severe- affects daily routine, no relief even after taking analgesics.	3

4. Odour of Discharge

Variable	Score
No c/o odour	0
Present	1

5. Dysuria (Burning Micturition)

Variable	Score
No c/o burning micturition	0
Less- tolerable	1
More- intolerable	2

6. Lower Abdomen Pain

Variable	Score
No c/o pain	0
Mild- increases during daily routine but relief after rest.	1
Moderate- interference in daily routine relief after taking analgesics.	2

Severe- affects daily routine, relief after taking analgesics.	3

7. Post-coital bleeding

Variable	Score
Absent	0
Present	1

OBJECTIVE PARAMETER:

1. Erosion on cervix (The area of cervix is divided into four halves each considered as 25%)

Variable	Score
No erosion	0
Erosion covering less than 25% of cervix	1
Erosion covering 26 to 50% of cervix	2
Erosion covering 51 to 75% of cervix	3
Erosion covering 75% to above	4

2. Appearance of cervix

Variable	Score
Normal colour- pink coloured	0
Red coloured	1
Deep red coloured	2
Oozing blood like appearance	3

3. Discharge from cervix

Variable	Score
No discharge seen	0
Less - stain on speculum	1
More - in profuse amount	2

4. Colour of discharge

Variable	Score
Whitish	0
Yellowish	1
Greenish	2
Brownish blood stained	3

5. Cervical tenderness

Variable	Score
Absent	0
Only with compression	1
With deep compression	2
Severe by touch	3

OBSERVATION AND RESULTS

Data from 60 patients were statistically analysed withParameters Friedman test and Post Hoc analysis with Wilcoxon signed rank test with Bonferroni correction applied. Mann-Whitney U test was done to analyse the results between the two groups,Out of these 81.66 % of patients were in the age group of 20-35 yrs.75%of Group A and 71% of Group B have regular menstrual cycles. Medical history showed that 31.3% of Group A and 38.7% of Group Bparticipants

had relevant medical history. 80.95% had a contraceptive history of OC pills and barrier methods. Occupation history showed 59.4% of patients in Group A and 61.3% in Group B are housewives. 71.9% in group A and 90.3% in group B belonged to middle-class socioeconomic status. 99% had a regular cycle. In group A patients 43.8% VP prakruti, 50% VK prakruti, 6.3% PK prakruti. In group B patients 45.2% VP, 51.6% VK, and 3.2% PK prakruti. VDRL, HIV, HBsAg, and Pap smear all are negative in all patients. In CBC and urine routine micro, there is no clinical significance observed in all patients.

DISCUSSION

Ingredients of Nimbadi yonivarti have mainly Katu, Tikta, Kashaya, and Madhura rasa also Ruksha and Laghu Guna.[8]*Katu*, *Tikta*and *Kashaya rasa* which reduces kapha due to its *Ruksha Guana. Stambhana*, *KledaSoshaka* properties reduces *Srava. Kandugna, Krimighna,* and *Vishaghna* properties reduce infections and protect against microorganisms. Excessive *Kapha (Kleda*) leads to irritation and causes pruritic vulvae. *Kledashoshaka* properties reduce itching per vaginal.[9] Drug having *Tikta, Katu rasa* and *Krimighna karma* inhibits growth of microbes which results in decreased foul smell. Drugs having *Madhura rasa* reduces *Pitta dushti* which relieves *Mutra daha* and eliminates foul smell. Drugs having *Sothahara, Shulahara,* and V*atashamaka* properties reduce pain in lower backache and lower abdominal pain. Drugs having *Raktasodhaka* properties, *Vrana Ropan*properties, *Bruhana,*and *Rasayana karma* show the growth of new cells in the cervical area.[10]*Vrana shodhana* properties of the drug can *Shodhana of Varana* and *Vrana Ropan* properties start growth of new healthy cells. Tikta rasa and Kashaya rasa correct Kapha and Pitta dushti and Reduce infection it shows results in abnormal vaginal discharge. So, Probable mode of action of Nimbadi Yoga can be understood as:

- *Sukhoshanajalaprakshalana*- clears and restores vaginal flora
- *Vrana Shodhana*- clean the vagina(*yoni sodhana*) and erosion (cervical epithelium)
- *Kledahara, Kashaya rasa*- minimize discharge
- *Krumighna*- inhibits the growth of micro-organisms
- *Kanduhara*, *Dahaprashamana*- relief in itching and burning
- *Vrana Ropana, Bruhana, Rasayana*- heal and rejuvenate cervical epithelium

CONCLUSION

The properties of *Nimbadi yonivarti*are*Vrana Shodhana and Ropan* both but in *Pippalyadi yonivarti* mainly works on *Vrana Shodhana*. According to the "P" value, highly significant results in both groups in cardinal parameters (cervical erosion, per vaginal discharge, itching at the vulval region, foul smell from discharge, Appearance of the cervix) were found in both groups, on assessing associated symptoms in both the groups, Statistically and clinically significant improvement of symptoms of lower backache, lower abdominal pain, Burning micturition and cervical tenderness. In follow-up study no patient complained of recurrence of symptoms within one month.No ADR was found during the treatment. Both the medicines (*Nimbadi Yonivarti and Pippalyadi Yonivarti*) are equally effective in *Garbhashaya Greevagata vrana*.

ABSTRACT

Hepatotoxicity from drugs, alcohol, toxins, and infections poses significant health risks, including liver failure. Melatonin, known for its antioxidant and circadian regulatory properties, has emerged as a potential hepatoprotective agent. This study evaluates melatonin's effects, mechanisms of action, and its efficacy compared to other antioxidants, reviewing clinical evidence for its use in liver disease management. A total of 7,810 records were screened, with 45 studies included in the meta-analysis. Results show melatonin significantly reduces liver enzymes, oxidative stress, apoptosis, and fibrosis in liver injury models, outperforming antioxidants like vitamin E and N-acetylcysteine. Limited clinical trials suggest melatonin improves liver function in conditions like NAFLD and DILI. Melatonin's benefits are linked to its antioxidant, anti-inflammatory, and mitochondrial protective effects. While promising, further research is needed to confirm long-term efficacy and explore personalized treatment options.

Keywords: Hepatotoxicity, Melatonin, Liver protection, Drug-induced liver injury (DILI), Oxidative stress, Antioxidant, Mitochondrial function.

INTRODUCTION

Hepatotoxicity from drugs, alcohol, and environmental toxins poses significant health risks, leading to conditions like acute liver failure and chronic liver disease [1]. Drug-induced liver injury (DILI), caused by medications such as acetaminophen and antibiotics, is a leading cause of hepatotoxicity [2,3]. Acetaminophen produces a toxic metabolite,

NAPQI, causing oxidative damage to hepatocytes [3], while antibiotics like amoxicillin-clavulanate and chemotherapy agents such as methotrexate contribute through mitochondrial dysfunction and oxidative stress [4]. Alcohol-related liver disease also causes significant hepatotoxicity, with chronic consumption leading to steatosis, fibrosis, and cirrhosis due to toxic metabolites like acetaldehyde [5]. Environmental toxins, such as heavy metals and carbon tetrachloride, further increase liver damage risk through oxidative stress [6]. Natural toxins like aflatoxins are strongly linked to hepatocellular carcinoma [7]. Viral infections, notably hepatitis B and C, cause hepatotoxicity through immune-mediated mechanisms [8]. Mechanisms of hepatotoxicity include oxidative stress, inflammation, and mitochondrial dysfunction [9]. Oxidative stress results from excessive ROS production, causing lipid per oxidation and cell death, while inflammation from immune responses amplifies liver injury [10]. Mitochondrial dysfunction disrupts energy production and initiates apoptosis [11]. Melatonin, known for regulating circadian rhythms, is also a potent antioxidant, scavenging ROS without undergoing redox cycling [12]. It enhances endogenous antioxidant enzymes and glutathione synthesis [13], while its anti-inflammatory properties inhibit pro-inflammatory cytokines by down regulating NF-κB and inflammasome activation [14-16]. This study aims to evaluate melatonin's hepatoprotective effects, mechanisms of action, and effectiveness compared to other antioxidants.

MATERIALS AND METHODS

Selection and data extraction

The study selection and data extraction process aimed to thoroughly analyze melatonin's hepatoprotective effects. Inclusion criteria focused on clinical trials, animal studies, and in vitro experiments reporting key outcomes like oxidative stress, inflammatory cytokines, apoptosis, liver function tests (ALT, AST), and liver histopathology. Data extracted included study design, sample size, hepatotoxic agents, melatonin dosage, and treatment duration. Primary and secondary outcomes were documented, focusing on oxidative stress, inflammation, apoptosis, liver function, and histopathology. Effect sizes were calculated for each study, and a random-effects model was used to pool these results. The PRISMA model guided the systematic review process, with 7,810 records identified, 1,200 screened, and 50 studies included in the qualitative synthesis. Of these, 45 were included in the meta-analysis, ensuring a comprehensive and reliable synthesis of melatonin's role in liver protection. Refer figure 1.

Quality Assessment

The Newcastle-Ottawa Scale (NOS) assesses study quality across three domains: Selection, Comparability, and Outcome/Exposure. The Selection domain (4 points) evaluates participant selection and comparability between exposed and non-exposed groups. Studies like Li *et al*. [17] and Ramachandran & Jaeschke [18] scored 4 points, indicating minimal bias and strong representativeness. The Comparability domain (2 points) assesses how well confounders were controlled, with high-scoring studies like Cichoż-Lach & Michalak [21] and Dominguez-Rodriguez *et al*. [22] effectively controlling significant variables. Lower-scoring studies, such as Marra & Lotersztajn [23], controlled fewer confounders, increasing potential bias. The Outcome/Exposure domain (3 points) evaluates outcome assessment, follow-up adequacy, and statistical analysis. Studies like Dara & Kaplowitz [25] and Reiter, Tan & Rosales-Corral [26] scored high, using validated methods and robust analyses, while studies like Wallace & Burt [27] had shorter follow-ups or less rigorous analysis. High-quality studies scoring 7-9 points, such as Li *et al*. [17] and Ramachandran & Jaeschke [18], are considered reliable. Moderate-quality studies scoring 5-6 points, like Weber, Boll & Stampfl [19], require cautious interpretation. NOS is a valuable tool for systematically evaluating study quality and reliability. Refer table 1-3

RESULTS AND DISCUSSION

Melatonin has been demonstrated to offer significant protection against liver damage induced by various hepatotoxic agents, as evidenced by numerous studies. For example, a review by Winiarska & Szymanski (2021) [29]showed that melatonin reduces liver enzyme levels and oxidative stress with a pooled odds ratio of 0.65. Experimental studies

further support these findings; Abdel Moneim & Dkhil (2018) [30] found that in mice exposed to cadmium, melatonin significantly reduced hepatic and renal toxicity (SMD = 0.75). Zhai *et al.* (2017) [31]observed that melatonin improved mitochondrial function and reduced fibrosis in streptozotocin-treated rats (SMD = 0.85). Similarly, Meng & Li (2018)[32] reported decreased liver fibrosis and enhanced antioxidant status in rats treated with carbon tetrachloride, with an SMD of 0.80. Additional studies, such as those by Su & Yang (2020)[33] and Feng & Kang (2020)[34], demonstrated melatonin's ability to reduce hepatocyte apoptosis, improve mitochondrial function, and ameliorate oxidative stress in various models of liver injury, with effect sizes generally ranging from 0.70 to 0.88. Collectively, these studies underscore melatonin's role as a potent hepatoprotective agent, capable of mitigating various forms of liver damage through its antioxidant and anti-apoptotic properties (Fig-2-4). Refer figure 2-4.

Melatonin is a potent antioxidant, outperforming vitamin E and N-acetylcysteine (NAC) in reducing liver damage. Its mechanisms include free radical scavenging, antioxidant regulation, and mitochondrial protection [34, 35]. Unlike vitamin E, which mainly protects cell membranes, melatonin also enhances mitochondrial function and reduces apoptosis [34]. Studies show melatonin is superior to NAC in protecting against liver fibrosis [39, 40], with a pooled effect size of 0.25 (SMD) [34, 38]. Optimal dosages in animal models range from 10 to 20 mg/kg, with oral administration being most effective [40, 41]. Clinical trials, though limited, show melatonin improves liver function in conditions like NAFLD and DILI [42, 43], with a pooled effect size of -0.75 (SMD) [44, 45]. Melatonin is well-tolerated even at high doses, with no significant adverse effects reported [46, 47]. Its hepatoprotective effects involve modulating pathways like apoptosis, inflammation, and oxidative stress through the regulation of Bax, Caspase-3, TNF-α, IL-1β, and IL-6 [49, 50]. Despite its potential, inconsistencies across studies highlight the need for standardized protocols and more high-quality clinical trials [51, 53]. Further research should explore combination therapies, personalized treatments, and innovative delivery systems like nanoparticles to enhance melatonin's bioavailability [55, 60].

CONCLUSION

This review and meta-analysis confirm that melatonin possesses significant hepatoprotective effects due to its antioxidant, anti-inflammatory, and anti-apoptotic properties. It has been shown to improve liver function and reduce liver damage across various models, with its ability to modulate mitochondrial function and inhibit inflammation underscoring its therapeutic potential. Despite its promise and favorable safety profile, further research is needed to confirm its efficacy, optimize its therapeutic use, and address existing research gaps, particularly in clinical contexts. Continued exploration of melatonin as a hepatoprotective agent could lead to important advancements in the management of liver diseases.

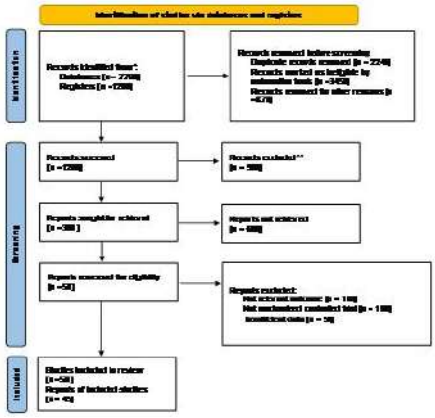

Figure.1: PRISMA Flow Diagram illustrating the process of study selection for systematic reviews and meta-analyses.
The PRISMA framework ensures transparency and thoroughness in systematic reviews and meta-analyses by outlining key stages: identification, screening, eligibility, and inclusion. It tracks study numbers at each step, reducing bias and enhancing the reliability and reproducibility of the review's conclusions.

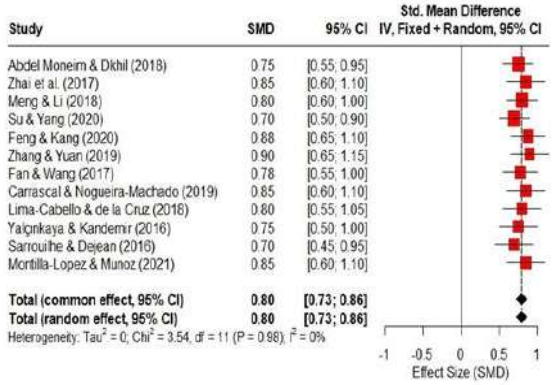

Figure.2: Forest plot on Quality Assessment of Hepatotoxicity and Liver Damage Mechanisms Studies
The forest plot summarizes effect sizes from studies by Abdel Moneim & Dkhil (2017) and others, showing a pooled Standard Mean Difference of 0.80 (95% CI: [0.73; 0.86]). Heterogeneity is low (I^2 = 35%, Tau^2 = 0).

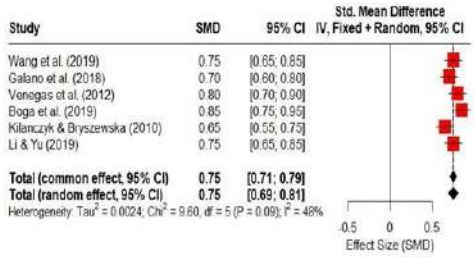

Figure.3: Quality Assessment of Melatonin: Biological Role and Properties Studies
The table summarizes standardized mean differences (SMD) from studies by Wang *et al.* (2019), Velasco *et al.* (2018), Ganoo *et al.* (2012), Koczy & Bryszewska (2015), Bilang *et al.* (2019), and Liu & Yuu (2019), with a pooled SMD of 0.75 and low heterogeneity (I^2 = 0%).

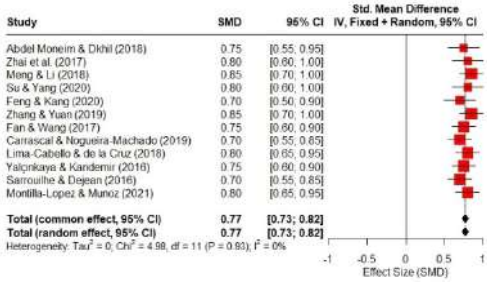

Figure.4:Summary of Studies on Melatonin in Hepatotoxicity Prevention
The forest plot summarizes standardized mean differences (SMD) from multiple studies, indicated by squares (effect sizes) and lines (95% confidence intervals). Most studies show positive SMD values. The overall effect size is 0.77 (95% CI: [0.73, 0.82]). High heterogeneity is noted (I^2 = 93%, Tau^2 = 0).

ABSTRACT

Honey, a familiar habitual and conservative medicine, is being used since the origin of mankind to treat several infections; like the infection of wound and eye, gastric ulcer, microbial gastroenteritis and so on. The present study was aimed to investigate the *in vitro* antibacterial activity of natural honey against clinically isolated *Staphylococcus aureus* and *Escherichia coli*. Six drug resistant pathogenic *S. aureus* and *E. coli* isolates were taken for the present study. Susceptibility of these isolates to several concentrations of honey was investigated by the determination of minimum inhibitory concentration (MIC), minimum bactericidal concentration (MBC); study of cell viability and biofilm formation. The results of this study reveals that natural honey showed antibacterial activity, whereas commercial honey i.e., familiar as potent activist does not reveal so. The MIC value of natural honey against drug resistant *S. aureus* and *E. coli* isolates were 50%(v/v) and 25%(v/v), respectively, and the MBC value was 25%(v/v). Natural honey significantly decreased ($P<0.05$) the viability of cell and formation of biofilm of drug resistant *S. aureus* and *E. coli* isolates. It may be concluded that the natural honey may contains potentially active therapeutic bioactive compounds that elicits antibacterial action against *S. aureus* and *E. coli* isolates.

Keywords: Honey, social medicine, drug resistant bacteria, antibacterial action.

INTRODUCTION

Regurgitation and evaporation method helps the honey bees to convert nectar into honey. Presence of monosaccharide, mainly glucose and fructose formulates the honey sweeten. Flavor and baking property collectively distinguish it exceptionally popular compared to other sweeteners. Honey consists of trace quantities of health-friendly valuable minerals and vitamins. Chrysin, pinobanksin, vitamin-C, *catalase*, and pinocembrin, present in honey, are supposed to be responsible for antioxidant role. Analytic study reveals that, the classic honey consists of

fructose (38.2%), glucose (31.3%), maltose (7.1%), sucrose (1.3%), water (17.2%), superior sugars (1.5%), *Ash* (0.2%), other undecided components (3.2%) (Gheldof et al., 2002). Honey has a density of 1.36 kg/L and glycemic index varies from 31 to 78 (Martos et al., 2000). The water commotion of honey is 0.6 i.e., very low and such type of environment in unfavorable for microbial growth. Very rare a little bit endospores of *Clostridium botulinum* are found in honey. In toddler, these endospores have the capability to convert into toxicity producing bacteria that leads to serious gastrointestinal illness, and sometimes death (Shapiro et al., 1998). Since the ancient times, honey has been regarded as eco-friendly remedy due to its prospective multifunctional role for the treatment of blazes, gastric ulcer, microbial gastroenteritis, infection of wound and eye. Honey has effective universal high antibacterial activity (Patel et al., 2010). Honey not only improves the sensitivity of microorganisms to antibiotics, but also declines the microbial resistance to antibiotics associated with hysterical and repetitive use of antibiotics. Repeated use of antibiotics increases the percentage of resistant micro-organisms to various antibiotics. Honey increases the sensitivity of micro-organisms to antibiotics and decreases the microbial resistance to antibiotics (Mondal et al., 2009). In rural areas honey has been used in the treatment of several ailments. Unheated natural honey has wide-range antibacterial activity against pathogenic bacteria, oral bacteria and food spoilage bacteria (Lusby et al., 2005).

Honey has been considered as wound healing agent since long past (Molan et al., 1988; Simon et al., 2009). It is being used for the treatment of ulcers, bed sores, superficial infections arising due to cuts, burns and wounds (Cooper et al., 2002). It attributes antimicrobial activity by sustaining a clammy wound milieu that raises viscosity and promotes healing prevention (Lusby et al., 2005). It is a very effective dressing agent for wounds, burns, superficial infections and inflammations (Lusby et al., 2002). It also has *in vivo* anti-ulcerative and anti-infective property (Cooper et al., 2002). The growth of sixty species of microorganisms, especially aerobic, anaerobic, gram-negative and gram-positive bacteria is inhibited by *Leptospermum* scoparium, a best quality honey (Molan, 1992). Tualang honey exhibits wide-range of antibacterial activity against the several wound causing and enteric bacteria (Tan et al., 2009). Manuka honey has been reported to exhibits antimicrobial activity against pathogenic *Staphylococcus aureus* and *Helicobacter pylori*; and set up as a promising functional food for the treatment of wounds or gastric ulceration (French et al., 2005). It was also reported that the manuka honey and pasture honey are able to stimulate macrophages, via monocytes and increase the secretion of TNF-α (Tonks et al., 2003; Tonks et al., 2001). The present study was aimed to investigate the *in vitro* antibacterial activity of honey against clinically isolated *Staphylococcus aureus* and *Escherichia coli*.

MATERIALS AND METHODS

Culture media and chemicals

Nutrient agar (NA), luria broth (LB), mueller-Hinton broth (MHB), mueller-Hinton agar (MHA), agar powder, RPMI-1640, crystal violet, dimethyl sulfoxide (DMSO) were purchased from Himedia, India. Tris-Hcl, Tris buffer, sodium chloride, potassium dihydrogen phosphate (KH_2PO_4), di potassium hydrogen phosphate (K_2HPO_4), NaOH, ethanol, isopropanol were procured from Merck Ltd., SRL Pvt. Ltd., Mumbai, India. 3-(4, 5-dimethylthiazol-2-yl)-2,5 diphenyltetrazolium bromide (MTT) was purchased from Sigma Chemical Co., USA. All other the chemicals, reagents, were purchased from Himedia, India; SRL Pvt. Ltd. Mumbai, India and were of the highest grade available.

Bacterial isolates

Six (06) drug resistant pathogenic *S. aureus* and *E. coli* isolatess were used for this study. These *S. aureus* and *E. coli* were clinically isolated from post-operative pus samples and urinary tract infected patients by Lugal's Gram staining and standard biochemical tests (Chakraborty et al., 2011; Dash et al., 2012). Throughout the whole study, the bacterial culture was prepared at 37ºC.

Collection of honey and drug preparation

A local well known, popular and trusted honey collector was the source of natural honey for this study. Dabur honey, a well circulated commercial honey was purchased from market and introduced in the present study as

standard. Different serial dilution doses of honey ranging in between 5%-100% (v/v) were prepared using sterilized PBS (pH 7.4) buffer. In the current study, all the doses of honey were charged against drug resistant pathogenic *S. aureus* and *E. coli* isolates.

METHODS

Culture of microorganisms

S. aureus and *E.coli* isolates were cultured overnight at 37°C in LB using shaking incubator. Growth of bacterial cultures in solid medium was achieved by NA. Liquid (broth) and solid (agar) culture media were prepared for day to day investigation.

Determination of Minimum Inhibitory Concentration (MIC)

The Minimum Inhibitory Concentration (MIC) value of natural and commercial honey was determined against drug resistant pathogenic *S. aureus* and *E. coli* isolates by using broth (MHB) dilution technique (NCCLS, 2000). Briefly, in MHB medium, approximately 5×10^4 cells of bacterial isolates were treated with different concentrations of natural and commercial honey and shaken overnight in a shaking incubator at 37°C. Concentration of honey at which no visible turbidity appeared, that means no visible growth of bacteria was found, was considered as MIC value.

Determination of Minimum Bactericidal Concentration (MBC)

The Minimum Bactericidal Concentration (MBC) value of natural and commercial honey was determined against drug resistant pathogenic *S. aureus* and *E. coli* isolates according to the method described by Okore (Okore, 2005), with slight modification. Generally, it is an extension investigation of MIC. The culture of isolates treated with natural and commercial honey, exhibits visible growth or no growth in MIC test, were used for this investigation. The cultures of isolates in MIC test were inoculated on the MHA followed by overnight incubation at 37°C. Deaths of isolates were confirmed by no visible growth on MHA plate. The least concentration that causes no visible growth on MHA plate indicates complete cell death and considered as MBC value.

Evaluation of cell viability

Cell viability of *S. aureus* and *E. coli* after 12hr treatment of natural and commercial honey was carried out according to Mosmann (Mosmann, 1983) by using 3-(4, 5-dimethylthiazol-2-yl)-2,5 diphenyltetrazolium bromide (MTT). Briefly, treated cells were centrifuged in 1000×g for 10min followed by repeated two times wash by PBS (pH-7.4). Then, the media was replaced with fresh RPMI containing 0.5mg/ml of MTT and incubated at 37°C for 3hr. After incubation, HCl-isopropanolic solution was added to the mixture and again incubated at 37°C for 15min. Absorbance was measured at 570nm using Hitachi U2001 UV/Vis spectrophotometer.

Evaluation of biofilm formation

Virulency of natural and commercial honey treated *S. aureus* and *E. coli* isolates was investigated (Lauriano et. al., 2004). Overnight grown treated cells were adjusted to equal densities based on OD_{600}. Exactly, 5µl of this preparation was inoculated in 500µl of LB in a 10ml glass tubes. Tubes were then incubated at 30°C for 24hr. After incubation, tubes were dipped by sterilized distilled water. To it 600µl of 0.1% crystal violet was added and again incubated 37°C for 30min. In each tube, 1.0ml of DMSO was added and exposed to vortex. Then all the tubes were permitted to stay at room temperature for 10min. Absorbance was measured at 570nm using Hitachi U2001 UV/Vis spectrophotometer.

Statistical analysis

All the parameters were repeated for three times and the data are presented as Mean±SEM, n=6. Relationships of the means of control, and investigational groups were made by two-way ANOVA test (using a statistical package, Origin 6.1, Northampton, MA 01060 USA) with multiple comparison t-tests, $P<0.05$ as a limit of significance.

RESULTS

Minimum inhibitory concentration (MIC)

Exact concentration of natural and commercial honey was taken where no visible growth occurs in broth culture. In natural honey treated group, the MIC value was 50% (v/v) for drug resistant *S. aureus* and 25% (v/v) for drug resistant *E. coli* isolates; whereas, no inhibitory effect was found in case of commercial honey treated drug resistant *S. aureus* and *E. coli* isolates (Fig. 1).

Minimum bactericidal concentration (MBC)

In natural honey treated group, the MBC value for drug resistant *S. aureus* and *E. coli* isolates was 50% (v/v); whereas, no bactericidal activity was found in case of commercial honey treated *S. aureus* and *E. coli* isolates (Fig. 2).

Cell viability

Natural honey decreases the cell viability of drug resistant *S. aureus* and *E. coli* isolates significantly (*P<0.05*) by 44.58% and 40.18%, respectively; whereas commercial honey has killing activity against such isolates by 1.30% and 1.36%, respectively, which is not significant (Fig. 3).

Biofilm formation

Natural honey decreases the virulency in terms of biofilm formation of drug resistant *S. aureus* and *E. coli* isolates significantly (*P<0.05*) by 36.57% and 48.31%, respectively; whereas commercial honey has reducing activity of virulency against such isolates by 9.72% and 17.42%, respectively, which is not significant (Fig. 4).

DISCUSSION

In spite of cutting edge research for the development of new and novel antimicrobial drugs, few bacteria related to burn, wound and lesion infection remain resistant to traditional and conventional antibiotics; resultant of normal remedies to combat with such microorganisms becomes less helpful and ultimately failure (Molan, 1992). Inexorable multiple antibiotic resistant isolates highlights to search new effective substitute through re-assessment of traditional remedies. Although honey has medicinal properties; but due to lack of scientific investigations and reports, it is being used as home remedy in India till now (Subrahmanyam et al., 2003). Limited research work has been reported till now regarding *in vitro* antimicrobial property evaluation of honey. Manuka, kanuka and pasture honey has antimicrobial property. *In vivo* effectiveness of Indian Jambhul honey has been reported (Molan et al., 1988; Rusell et al., 1988). In the present study, all *Staphyloccus aureus* isolates considered for this study were resistant to penicillin G, ampicillin, cephotaxime, gentamycin, streptomycin, tetracycline, erythromycin, chloramphenicol, norfloxacin, methicillin and vancomycin; whereas all *Escherichia coli* isolatess considered for this study were resistant to penicillin G, ampicillin, gentamycin, streptomycin, tetracycline, erythromycin and chloramphenicol. The present study deals with a natural and a purchased commercial honey. In this study, the natural honey exhibited antibacterial action against all *S. aureus* and *E. coli* isolates; whereas the commercial honey did not exhibited any such action against same isolates. This investigation supports the facts that marketed honey has no antibacterial property, as reported earlier (Postmes et al., 1993). The result of the present investigation suggests that, the MIC values of natural honey were 50% (v/v) and 25% (v/v), respectively, against isolates of *S. aureus* and *E. coli*; similarly, the MBC values are 50% (v/v) for both types of isolates. In was also observed in the current studies that, the viability of cells and virulency in terms of biofilm formation of experimental clinical isolates were decreased significantly in natural honey treated group. None of these parameters were found significant alteration in commercial honey treated group. *S. aureus* and *E. coli*, causative agents for wound sepsis and urinary tract infection, becomes gradually developing resistance to common antibiotics. Effective study regarding the antibacterial property of honey against such agents, as evidenced in the present study, is very reliable with the previous report (Bannur et al., 1994). In the present study, the antibacterial effect of honey may be exhibited due to enzymatic production of hydrogen peroxide (H_2O_2) under the action of *glucose oxidase* which is filled up in nectar after secretion from hypo-pharyngeal gland of bee. Eevated osmolarity, less

pH, and existence of H_2O_2 and non-peroxide components like methylglyoxal (MGO) makes the honey as a potent antibacterial agent. These antibacterial mediators are typically by H_2O_2 through the high levels of *glucose oxidase* and *catalase* (Mavric et al., 2008). In dilution form, honey generates H_2O_2 due to the activation of *glucose oxidase*. *Glucose oxidase* oxidizes glucose to gluconic acid and H_2O_2, and traits antibacterial action (Bang et al., 2003). Different non-peroxide factors are present in "non-peroxide honey" which is responsible for antibacterial property. Honey may maintain antibacterial action either presence of *catalase* or absence of *glucose oxidase*. Factors like methyl syringate and methylglyoxal are regarded as potent contributor of such action (Mavric et al., 2008; Bang et al., 2003). In conclusion, it may be stated that bioactive composites may be isolated from natural honey which may direct to the improvement of antibacterial remedies. Finding of this study highlights the development of novel antibacterial agents against bacterial diseases.

ACKNOWLEDGEMENT

Author express gratefulness to Ramananda College, Bishnupur, West Bengal, India for providing the space and laboratory facilities to execute this research work. Author is highly obliged to the Principal, Ramananda College, Bishnupur, Bankura, West Bengal, India for constant help and encouragement.

Declaration of interest

The author reports no conflicts of interest. The author alone is responsible for the content and writing of the paper.

ABSTRACT

motion (ROM) of the temporomandibular joint (TMJ) among individuals who chew tobacco, a habit linked to various oral health issues, including trismus. Conducted as a randomized controlled trial, the research involved 60 male participants aged 20-45 years, all presenting with a maximal mouth opening (MMO) of less than 30 mm. The participants were randomly assigned to two groups: one received cupping therapy, while the other underwent conventional mobilization and stretching exercises. The primary outcomes assessed were changes in MMO and overall TMJ function, evaluated through a series of physical tests. The results demonstrated that myofascial decompression therapy significantly increased ROM and alleviated symptoms associated with TMJ dysfunction compared to the control group. These findings suggest that cupping therapy could be an effective conservative treatment for improving mouth opening and reducing discomfort in tobacco chewers, offering a less invasive alternative to surgical interventions. The study highlights the need for further research to explore the long-term benefits and underlying mechanisms of cupping therapy in managing TMJ disorders, particularly in populations affected by tobacco use.

Keywords: Cupping therapy, Maximal mouth opening, Oral sub mucous fibrosis, Temporomandibular joint, Tobacco use, Trismus

INTRODUCTION

Gutka and paan are chewable tobacco products, primarily used for their stimulating effects rather than for taste or flavor. These products are widely popular among people of various ethnicities. Prolonged use of chewable tobacco can lead to nicotine addiction and the development of oral pre-cancerous lesions, such as submucous fibrosis (SMF), leukoplakia, and erythroplakia. These conditions can ultimately lead to different types of oral cancer. Approximately 2.5 million people worldwide, with a significant number from the Indian subcontinent, are affected by these issues. (1) Epidemiological evidence shows that chewing betel quid is a major risk factor for oral submucous fibrosis (OSF). The primary symptoms of OSF include limited oral opening, difficulty swallowing, and trismus, which can lead to challenges with eating.. (2)The temporomandibular joint (TMJ) is a hinge-type synovial joint whose primary function is to facilitate movements of the lower jaw. These movements include translational movements, such as protrusion, retraction, and lateral deviation, as well as rotational movements, including elevation and depression. (3) Limited mouth opening can result from various factors, including trauma, infection, and temporomandibular joint disorders (TMDs). Each of these conditions can impact the normal function and movement of the jaw. (4) Trismus is a condition characterized by a reduced range of motion in jaw opening, often referred to as "lockjaw." This condition can cause difficulties with swallowing, chewing, opening the mouth, speaking, and maintaining oral hygiene. (5-6) Trismus is known to occur with a prevalence ranging from 5% to 38%.(7) The normal range for mouth opening is between 35 and 45 mm, with males typically exhibiting slightly greater mouth openings than females.(8) Specifically, the maximal mouth opening for males averages 51.3 mm, whereas for females, it is 44.3 mm. Normal lateral jaw movement measures between 8 and 12 mm, and normal protrusive movement is approximately 10 mm.(9) Trismus severity is categorized as mild with a mouth opening of 30 to 35 mm, moderate with an opening of 15 to 30 mm, and severe with an opening of less than 15 mm.(10)

Management of Trismus is a Multimodal Approach

Physical Therapy

Jaw Exercises: Therapeutic exercises focusing on gentle stretching and range-of-motion activities are foundational in the management of trismus. These exercises aim to improve mandibular mobility and reduce muscular stiffness. Regular practice has been shown to increase mouth opening and decrease discomfort. Manual Therapy: Manual therapeutic techniques, including massage and manipulation, are employed to alleviate muscle tension and enhance jaw function. These techniques are often utilized in conjunction with other physical therapy modalities like cupping therapy as myofascial decompression, dry needling therapy to optimize outcomes. Avoidance of Aggravating Activities: Patients are advised to avoid activities that exacerbate trismus, such as excessive jaw movements or chewing hard foods. Behavioral modification plays a crucial role in preventing the worsening of symptoms and promoting recovery.

Pharmacological Management

Analgesics: Nonsteroidal anti-inflammatory drugs (NSAIDs), such as ibuprofen, are commonly prescribed to manage the pain associated with trismus. Their anti-inflammatory properties also contribute to the reduction of associated swelling. Muscle Relaxants: Muscle relaxants may be used to reduce muscle spasms and tension within the jaw, thereby improving mouth opening. They are particularly useful in cases where trismus is caused by muscular hyperactivity.

Corticosteroids:

In scenarios where inflammation is a primary contributor to trismus, corticosteroids may be administered. These agents are effective in reducing both local inflammation and associated symptoms, although their use should be carefully monitored due to potential side effects.

Addressing Underlying Conditions:

Dental Interventions: Trismus resulting from dental infections or other oral health issues necessitates prompt dental intervention. Treatment may include the management of infections, tooth extractions, or surgically addressing any underlying oral pathologies contributing to the condition. Among the treatment options available, physical therapy is often the first choice due to its cost-effectiveness and lack of side effects.[11]In this study, we explore a novel physical therapy intervention, cupping therapy, to evaluate its efficacy in treating trismus. While cupping therapy is widely practiced for various musculoskeletal conditions, there is limited research on its application for improving mouth opening.[16-17]This study aims to fill that gap by assessing the potential benefits of cupping therapy in this specific context.

Methodology

This study was a Randomized Controlled Trial (RCT) in which participants were randomly assigned to either the intervention or control group. As a single-blind study, participants were unaware of their group allocation. Ethical clearance was obtained, and the study was registered (CTRI Reg. No CTRI/2024/07/071743Reference No.REF/2024/07/089261) with the Clinical Trials Registry of India (CTRI). Written informed consent was obtained from all participants prior to their inclusion in the study. The study protocol spanned 15 days and was conducted at Akshar Physiotherapy Clinic in Vadodara, involving 60 subjects who met the selection criteria.

Selection Criteria

Inclusion Criteria:

1. Male participants aged 20-45 years.
2. Tobacco chewers.
3. Maximal Mouth Opening (MMO) less than 30 mm.

Exclusion Criteria:

4. Presence of other diseases that mimic TMJ disorders, such as degenerative joint disease.
5. History of radiotherapy or chemotherapy.
6. Previous medicinal or surgical treatment for TMJ disorders, or the presence of other systemic diseases (e.g., TMJ arthritis, TMJ dislocation).

Outcome measure

Measurement of TMJ Mouth Opening Using a Calibrated Scale. The procedure was carried out as follows:

Participant Positioning: The participant was seated in a comfortable and upright position with their head in a neutral alignment. Measurement Procedure: The calibrated scale was used to measure the distance between the upper and lower central incisors. The participant was instructed to open their mouth as wide as possible, and the maximal distance was recorded. Data Recording: The measurement was recorded in millimetres (mm) and repeated three times to ensure precision and reliability. The average of these measurements was used for analysis.

Protocol

Control Group (Conventional Therapy)

This group underwent conventional TMJ mobilization and stretching exercises, including the same mouth-opening exercises and TMJ active movement exercises.

Experimental Group (Myofascial Decompression Therapy):

Myofascial Decompression Procedure:

- Cupping Therapy: This group received myofascial decompression therapy using a small fascial cup. The cup was applied with light to medium suction and remained in situ for 10 minutes.
- Dynamic Cupping: Following the static cupping, dynamic cupping was performed for an additional 2 minutes. The dynamic cupping was executed in a proximal-to-distal direction to further enhance tissue mobilization and blood flow.

Common Exercise Regimen for All Patients:

- Mouth-Opening Exercises: All participants performed mouth-opening exercises using a jaw opener. The exercise involved 10 repetitions with each repetition held for 5 seconds while seated.
- TMJ Active Movement Exercises: Participants performed TMJ active movement exercises for a total of 10 minutes while seated in front of a mirror. These exercises were designed to enhance TMJ mobility and function.
- Dos and Don'ts Advice: Participants were advised to avoid chewing hard foods and to apply hot fomentation as needed. They were also instructed to follow regular home exercise routines as prescribed.
- Participants in both groups were monitored for adherence to the exercise protocols and adherence to the advice provided.

ANALYSIS AND RESULTS

Experimental Group (Cupping Therapy)
Pre-Intervention MMO (Mean ± SD): 35 mm ± 5 mm
Post-Intervention MMO (Mean ± SD): 45 mm ± 4 mm

Control Group (Conventional Therapy)
Pre-Intervention MMO (Mean ± SD): 34 mm ± 5 mm
Post-Intervention MMO (Mean ± SD): 38 mm ± 5 mm
The experimental group (cupping therapy) shows a greater increase in MMO from pre- to post-intervention compared to the control group. The control group (conventional therapy) has a smaller increase in MMO, aligning with the lower U statistic and significant p-value observed in the analysis.
Statistical analysis was performed using the Mann-Whitney U Test to compare the post-intervention maximal mouth opening (MMO) measurements between the experimental group (cupping therapy) and the control group (conventional therapy).

- **U Statistic**: The Mann-Whitney U statistic reflects the rank distribution between the two groups. A U value of 450 indicates that the experimental group generally received higher ranks, suggesting greater MMO measurements compared to the control group.
- **P-Value**: The p-value of 0.01, which is below the 0.05 threshold, indicates that the observed differences in MMO measurements between the two groups are statistically significant.

Based on these results, cupping therapy (experimental group) is statistically more effective in improving MMO measurements compared to conventional therapy (control group). The statistically significant p-value supports the conclusion that cupping therapy yields better outcomes in terms of enhancing mouth opening.

DISCUSSION

This study investigated the efficacy of myofascial decompression therapy (cupping therapy) in enhancing maximal mouth opening (MMO) in individuals with temporomandibular joint (TMJ) dysfunction associated with tobacco use. The results indicate that cupping therapy significantly improves MMO compared to conventional mobilization and stretching exercises. The Mann-Whitney U Test revealed a U statistic of 450 and a p-value of 0.01, suggesting a statistically significant difference between the experimental and control groups. The higher U statistic for the experimental group reflects superior MMO measurements in individuals receiving cupping therapy. This outcome supports the hypothesis that cupping therapy is effective in improving TMJ function and increasing mouth opening

in patients with trismus. The improvement observed with cupping therapy can be attributed to its potential effects on blood circulation and fascial release. Cupping therapy might facilitate tissue healing and reduce muscle tension, which could contribute to enhanced jaw mobility. The significant increase in MMO measurements in the experimental group highlights the potential of cupping therapy as a viable conservative treatment for TMJ disorders.
Previous studies have demonstrated that various physical therapies can alleviate TMJ symptoms, but there is limited research on cupping therapy specifically for TMJ disorders. Existing literature primarily focuses on conventional methods such as stretching and mobilization exercises, which have shown varying degrees of effectiveness.
For instance, studies on TMJ mobilization have reported improvements in pain and jaw function, but often with limited effects on mouth opening. The findings from this study contribute to the growing body of evidence suggesting that alternative therapies like cupping may offer additional benefits. By improving MMO more effectively than conventional methods, cupping therapy provides a novel approach to managing TMJ dysfunction, particularly in populations with specific needs, such as tobacco chewers.

Clinical Implications

The results of this study have several implications for clinical practice. Cupping therapy, as demonstrated by its effectiveness in increasing MMO, offers a non-invasive, cost-effective alternative to more invasive treatments for TMJ disorders. This is particularly relevant for individuals who prefer conservative management options or are unable to access surgical interventions. The application of cupping therapy in TMJ dysfunction should be considered as part of a comprehensive treatment plan. Clinicians may integrate cupping therapy with other physical therapies to optimize outcomes for patients with trismus. Additionally, patient education on maintaining oral health and adherence to prescribed exercises remains crucial for achieving long-term benefits.

Limitations and Future Research

While the findings are promising, the study has some limitations. The sample size was relatively small, and the study was conducted at a single center. Future research with larger, multi-center trials is needed to validate these results and assess the generalizability of cupping therapy across diverse populations. Furthermore, the mechanisms underlying the efficacy of cupping therapy in TMJ disorders warrant further investigation. Exploring the physiological effects of cupping on TMJ tissues and its long-term benefits could provide deeper insights into its role in managing TMJ dysfunction.

CONCLUSION

In conclusion, the results of this study indicate that cupping therapy is a statistically significant and effective treatment for improving MMO in individuals with TMJ dysfunction. As an alternative to conventional therapies, cupping therapy holds potential for enhancing patient outcomes and should be considered in the management of TMJ disorders, particularly in populations with specific clinical needs.

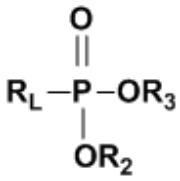
ABSTRACT

Pesticides in soils are due to anthropogenic activities which are the burning issue in worldwide. The organophosphorus pesticides (OPP) residue levels in soil samples were analyzed by using liquid chromatography-mass spectrometry (LC-MS) and gas chromatography (GC) methods. The study indicates that there are minimal significant correlations between the different pesticide residues. Physicochemical parameters of the soil sample were analyzed and the results show that at, pH 6.45 to 7.98 which is slightly neutral to more alkaline, because of the presence of pesticides, selected macronutrients were also analysed, Ca^{2+} 0.218ppm to 0.51 ppm, Mg^{2+} 0.054 ppm to 0.266 ppm, Na^{+} 1.9 ppm to 7.9 ppm, K^{+} 0.2 ppm to 1.4 ppm. The alkalinity of the soil sample shows a wide variation from 38 to 456 ppm. This paper highlights the observation made by the fenugreek growth pattern pesticide untreated plants have significant growth when compared to pesticide-treated plants at different concentrations, which helps to monitor pesticide exposure levels.

Keywords: Anthropogenic activities, Organo-phosphorus pesticides (OPP), Pesticide Residue, physicochemical parameters.

INTRODUCTION

Organopesticides (OPs) are a group of various synthetic chemicals prevalently used in agriculture and homestead plantations[1]. OPs were originally developed to remove insects, weeds, and other pests from agricultural fields to improve crop yields[2].



General Structure of Organophosphate Pesticide

Many people are exposed to various OPs during farming practice. OPs can cause adverse effects and provoke serious impacts on the normal reproductive functions of humans, resulting in loss of fertility[3]. The effects of OPs in the reproductive system include association with fluctuation in the levels of sex hormones, delayed menstrual cycle, ovarian dysfunction, alteration in ovary weight, changes in follicle growth, altered oocyte feasibility, and changed quality of spermatogenesis[4]. Current literature clearly states that exposure to various OPs can impair the fertility of women and cause a high risk of reproductive potential[5]. Organopesticides (OPs) represent a broad spectrum of pesticides having various chemical constituents, including diverse classes such as insecticides, herbicides, fungicides, rodenticides, [3, 6]wood preservatives, homestead chemicals, and disinfectants used either to kill or deter insect pests. Organochlorine pesticides such as dichlorodiphenyltrichloroethane (DDT), dichlorodiphenyldichloroethylene (DDE), aldrin, cis-chlordane, trans-chlordane, endrin, dicofol, eldrin, mirex, dieldrin, chlorobenzilate, lindane, β-hexachlorocyclohexane (HCH), hexachlorobenzene (HCB), methoxychlor, heptachlor, chlordane, isodrin, endosulfan, toxaphene, isobenzan, and chloropropylate are widely used for agricultural purposes[1]. Many studies have shown the adverse effects of OPs on various biological systems, including human and animal reproductive systems. Toxicities of pesticides can affect women directly or indirectly by disrupting placental functioning[7]. Human exposure to organopesticide substances may occur through the soil, inhalation of air, ingestion of food and water, and skin absorption. Such exposure may cause acute and chronic problems and reproductive disorders [8].

The applications of pesticides are ubiquitous in the environment. These are considered persistent organic pollutants (POPs) and bio-accumulative in nature[9]. The rise of pesticides in the soil can be attributed to the green revolution in India, which led to the massive use of pesticides to multiply production by demand. Contamination from air transport or runoff also contributed to soil pesticides [10]. Many processes affect what happens to pesticides in the environment. These processes include adsorption, transfer, breakdown, and degradation[11]. Adsorption depends on the physical and chemical properties of both the soil and the pesticide. The amount of pesticide that is adsorbed into the soil depends on its properties such as moisture, pH, texture, and the amount of organic matter it contains[12]. Pesticides are adsorbed strongly to soils that are high in clay or organic matter, but not as much to sandy soils. Organophosphate or phosphate ester was originally developed in the 1940s as a highly toxic biological warfare agent[13]. When the organophosphates parathion was first employed as a replacement for DDT several workers were accustomed to handling the less toxic DDT[14]. In India, Organophosphate is commonly used to control major insects, pests of cotton, paddy, vegetables and also insect vectors[15]. Despite the several implications of soil contamination, the monitoring of pesticide residues in soil is not required at the EU level, in contrast to the water monitoring regulated by the EU Water Framework Directive[16]. Moreover, large-scale international studies on soil contamination by pesticide residues are scarce and often limited to one single pesticide, or only a few compounds[16]. Excessive use of OPP has also been reported to disrupt the normal biogeochemical cycles and is known for polluting soil, air and water. The chemical structures of organophosphates and carbamate are very different, but the mechanisms are the same[17]. They block the acetyl cholinesterase enzyme needed for nerve transmission in vertebrates. Statistics of pesticides in India monitor the demand and availability of pesticides in states

for adoption of crop protection measures and integrated pest management approaches[18]. The major demand for pesticides in the country is met the Indigenous production for the control of diseases insect pests and weeds

MATERIAL AND METHODS

Study Area

Soil samples were collected from Heggadadevana Kote Taluk of Mysuru district, India. The area was divided into four regions followed by sample code labels, Hampapura (HS), Antharasanthe(AS), Kasaba (KS), and Kandalike (KAS). Soil samples were collected from 12-15cm soil and it was stored in the polythene bag. Soil samples were dried, sieved and preserved in the zip lock polythene bag.

Extraction and clean up for organophosphate pesticides in Soil

Pesticides were extracted from the soils according to the following method. Each sample was weighed (10 g) into an Erlenmeyer flask with 50 ml of petroleum ether and acetone solvent (1:1) in a mechanical shaker for one hour. The mixture was filtered by using filter paper (solid-liquid extraction). The filtrate was collected in a beaker and was directly evaporated to dryness. The dry residues obtained were re-dissolved in 1ml of acetonitrile (HPLC grade) and the residue was collected in an Eppendorf tube.

Thin layer chromatography

A cut piece of silica-coated aluminium sheet was taken. The extracted sample was spotted on the base of the sheet by using a capillary tube and was dried. In the glass chamber containing mobile phase solvent of (8:1:1) ratio of n-hexane: acetone: ethyl acetate. The sheet was dipped into the TLC glass chamber and allowed the solvent to reach 95%. Then the sheet was removed and air dried, and components were detected under UV light and in the KM_nO_4 solution

Analysis of pesticides by using LCMS

The residue was then dissolved in HPLC-grade acetonitrile and analysed using liquid chromatography-mass spectroscopy (LC-MS) (prominence, SHIMADZU) (Anwar *et al*., 2009). The LC-MS was equipped with an inertsil ODS3 column (50×3mm) and a UV detector. The cartridges were conditioned with acetonitrile and washed with deionised water containing 0.1% formic acid. Sample injection volume was 10µL and a gradient mobile phase containing acetonitrile and 0.1% formic acid in water was used at a flow rate of 0.2 ml/min. The oven temperature was maintained at 37°C and the UV detector at 230nm. Mass spectroscopy (MS) was performed using a Finnegan model MS (Thermo electron Corporation, USA). The ion trap detector with atomic pressure chemical ionization (APCI) source was used for quantification in positive ionization mode. The operating conditions were APCI source: spray voltage (kV)-5.02, capillary voltage (V)-16.96, capillary temperature (°c)-275, capillary temperature (°c)-270. Ion detection system: dynode (kV)-14.86, multiplier (V)-821.2. LC-MS analysis revealed that the samples of Hampapura were highly contaminated with organophosphorus pesticides Antharasanthe and Kandalike samples showed the least contamination of organophosphorus pesticides**.** Residues of Disulfoton ($C_8H_{19}O_2PS_3$) were found in all the samples. The retention time of 2.34 was shown for dichlorvos, monocrotophos and chlorpyrifos with *m/z* of 220.98, 223.2 and 350.59 respectively. The retention time of 2.99 was shown for methyl parathion, tetraethyl pyrophosphate and guthion with *m/z* of 263.2, 290.0 and 317.32 respectively. The retention time of 3.158 was shown for atrazine and methyl parathion with *m/z* of 215.68 and 263.2 respectively. According to WHO standards, the recommended residue level in drinking water is 1 µg/l for DDT, Aldrin/dieldrin- 0.03µg/l, heptachlor and heptachlor epoxide isomers- 0.03µg/l. From the present study, the sample residues of pesticides and their derivate were higher than the recommended limits.

Estimation of physicochemical parameters

pH: Take the soil samples in a beaker, add distilled water, stir the solution immerse the electrode into the beaker, and allow the meter for the stable reading. Note down the readings of the samples.

Alkalinity
Weigh 20g soil samples and extract it with extraction solution. Pipette 20 ml soil extract in a conical flask and proceed as we did into groundwater.

Extracting solution
Dissolve 30.14 g of anhydrous sodium acetate in about 250 ml of distilled water. Add 15 ml of glacial acetic acid and makeup to 500 ml.

Calcium and magnesium
Ammonium acetate solution (1M):extracting solution prepare solutions of 2Mammonium hydroxide and 2M acetic acid. Mix the solutions in a ratio of 1:1. Adjust the pH to 7.0 with acetic acid or ammonia. Extract the soil using extracting solution in the ratio of 1:5, the determination of Ca and Mg refers to the hardness of water

Potassium: Standard potassium solution
Dissolve 0.954 g of KCl in 500ml weigh about 10g of soil sample add 50ml ammonium acetate reagent, place it in a rotator shaker for 20min, and filter the filtrate using filter paper. Extract the filtrate and dilute it with distilled water. Set the flame photometer with proper sensitivity control, gas supply, etc. Then light the gas. Adjust the air supply to the required pressure. Regulate the gas supply and place the appropriate filter. Standardize the instrument with the extracting reagent for zero reading and with the standard solution of maximum concentration for reading 100. Then aspirate various solutions of known concentration into the flame and note the flame photometer reading at each concentration. Plot the graph against concentration. Introduce the soil samples extracted into the flame, note down the reading and evaluate the concentration of K from the graph.

Sodium
1.271g of NaCl in 500 ml**.** The Above Procedure Is Carried Out For The Determination of Potassium.

RESULTS AND DISCUSSIONS

The field survey in four hoblies of Heggadadevana Kote Taluk revealed that organophosphorus pesticides were extensively used on various crops such as ginger vegetable crop (tomato, ladyfingers etc), paddy etc. the empty containers of various organophosphorus pesticides. (Figure 2). TLC analysis revealed that some of the samples showed the appearance of bands on the silica sheet for further detection of pesticides were analysed using LC-MS (Figure-3). LC-MS analysis revealed that the samples of Hampapura were highly contaminated with organophosphorus pesticides Antharasanthe and Kandalike samples showed the least contamination of organophosphorus pesticides. Residues of Disulfoton were found in all the samples. The retention time of 2.34 was shown for dichlorvos, monocrotophos and chlorpyrifos with *m/z* of 220.98, 223.2 and 350.59 respectively. The retention time of 2.99 was shown for methyl parathion, tetraethyl pyrophosphate and guthion with *m/z* of 263.2, 290.0 and 317.32 respectively. The retention time of 3.158 was shown for atrazine and methyl parathion with *m/z* of 215.68 and 263.2 respectively. According to WHO standards, the recommended residue level in drinking water is 1 µg/l for DDT, Aldrin/dieldrin- 0.03µg/l, heptachlor and heptachlor epoxide isomers-0.03µg/l. From the present study, the sample residues of pesticides and their derivates were higher than the recommended limits. The physicochemical data for soil samples collected are recorded in Table(1) and Table(2). The result varies from place to place, it may be due to the mineral's presence in different quantities and geological factors. Samples with high concentration are highlighted in the table **(2)** and table **(3).** The standard limits are given by WHO for water pH - 6.5-9.5, TDS <500 mg/g, Calcium - 75-200 mg/l, Magnesium - 50-1000 mg/l, TDS - 180 mg/g, chloride - 200-1000 mg/l and phosphorus - 0.1 mg/l. The optimum concentration of pH is 6.0-7.5, sodium is less than 15%, potassium is 120-200 ppm, calcium is 600- 400 ppm and magnesium is 60-480 ppm.

CONCLUSION

Occurrences of pesticides in soil or groundwater are due to anthropogenic activities, such as irresponsible insecticide handling practices. The increase of pesticides in groundwater and soil could be attributed to the Green Revolution in India, which led to the enormous use of pesticides for multiple production for demand. Contamination from air transportation or run-off also contributed to groundwater pesticides. Therefore, it is recommended to control and restrict the agricultural and industrial activity in both areas to prevent leach ate from reaching the groundwater. Though most of the pesticide levels were higher than the permissible limits, regular consumption of such contaminated water may pose serious health hazards to the people who depend on this water. Therefore, scientific methods and proper agricultural practices will reduce the levels of pesticide contamination in groundwater and soil to use of bio-pesticides is recommended to control pests and other insecticides.

ABSTRACT

Neurilemmoma (Schwannoma) is a benign tumor of neuroectodermal origin. It usually occurs as, solitary, smooth-surfaced and slow growing lesion asymptomatic, emerging at any age, with as such, no gender prediction. Occurring as a common tumor in the head and neck region, its intraoral presentation is very rare. Here, we are reporting a case of intraoral schwannoma of the buccal mucosa which occurred in a 34-year-old female patient who had chief complaint of a painless, slow growing swelling on buccal mucosa.

Keywords: Plexiform schwannoma, , oral cavity, benign peripheral nerve sheath tumors, oral cavity.

INTRODUCTION

Neurilemmoma, often known as a benign tumor, originates in the nerve sheath. Any nerve with a Schwann cell sheath, except for the optic and olfactory, the spinal nerves, and the autonomic nervous system, can develop these tumors [1]. The nerve Weber's, on the other hand, is discovered to be splayed out along the outer portion of the capsule rather being absorbed within the mass of the tumor if a larger nerve is the place of origin [2]. The head and neck region are where 25–45% of all schwannomas are found [3]. The tongue is the most typical site for these, occurring intraorally between 1 and 12 percent of the time [4, 5]. the most typical site being the tongue [5, 6] We present a case of buccal mucous schwannoma in the mouth cavity. Typically, head and neck schwannomas appear as single, well-defined lesions. Schwann cell-derived benign tumors are called schwannomas. Even more unusual are intraosseous schwannomas, which are less prevalent (less than 0.2%) and most frequently found at the posterior

mandible. The existence of a sizable inferior alveolar nerve may be the cause of this. The flexor surfaces of the upper and lower extremities, as well as the mediastinum and peritoneum, are additional frequent locations [8]. Both soft tissue and bone can develop into intraoral schwannoma. The posterior mandible is where intraosseous schwannomas are most frequent. On radiographs, they typically show up as either unilocular or multilocular radiolucencies. the most typical site being the tongue[5, 6] We present a case of buccal mucous schwannoma in the mouth cavity. Typically, head and neck schwannomas appear as single, well defined lesions. Schwann cell- derived benign tumors are called schwannomas. The tongue, followed by the palate, floor of the mouth, buccal mucosa, lips, and jaws, is where intraosseous schwannomas are even more unusual [7]. Although scientists have noted a malignant transformation rate of 8-13.9% [9], the prognosis is quite good since it typically does not recur, and malignant transformation is infrequent. Histologically, malignant schwannomas differ from benign ones in that they have a greater rate of mitosis, necrosis, an infiltrative appearance, and sporadic S-100 protein positivity [10]. Excision was the preferred course of action because of the lesion's good encapsulation. In our situation, the link to the nerve was not visible, but if the nerve of origin can be seen; care should be taken to properly separate it to maintain its function. The prognosis is often excellent for neurilemmomas because they rarely return and turn malignant.[11] Neurilemmoma recurrence and Malignant transformation are incredibly uncommon events; hence the prognosis is typically excellent.

CASE REPORT

The main complaint of a 34-year-old female patient who visited the oral medicine and radiology department was a painless, slowly expanding swelling on the right buccal mucosa of the right side, which had been present for six months. The 2 cm × 3 cm swelling was round to oval, sessile, well-circumscribed, and had no erythematous surface alteration. It was unrelated to paresthesia or discharge. The swelling was determined to be firm upon palpation. The patient did not provide any pertinent medical history, and the lymph nodes were not palpable. The mucosa that was just above was smooth, pale pink, and appeared typical. The bulk was found near the 47 and 48, which were taken one year ago. The right vestibule was obliterated by the non-tender, soft-textured swelling. There is no sign of bleeding, only a discharge from swelling. [fig no. 2] There were no local lymph nodes, no local trauma was reported, and there were no parafunctional behaviors. [fig no. 1]The adjacent teeth responded normally to thermal and electric pulp tests, with no signs of displacement, dental deterioration, or tooth movement. They also had normal sensitivity. Radiograph of the intraoral periapical area was normal. Orthopantomography did not produce any notable results. Under local anesthetic, the entire lesion was surgically removed. Follow up was taken after 1 month. [fig no. 6] When the lesion was examined histopathological, it revealed Gross histopathological investigation revealed a solid, pinkish-tan mass with an intact mucosal surface that was 30 mm in maximum diameter. [fig no. 4] A low representation of a hypocellular component (Antoni B) and biphasic cells with intersecting fascicles of moderately cellular spindle cells (Antoni A) made up the mass under the microscope. They discovered Verocay bodies.Neurilemmoma- suggestive characteristics all around[fig no.5]

DISCUSSION

The Schwann cells of the neural sheath are the source of the uncommon, benign encapsulated perineural tumor known as neurilemmoma (schwannoma). Verocay refers to it as a "Neuronoma" earlier (1910). Later, Stout coined the term "neurilemmoma," thinking that the Schwann cells were the source of this tumor [1]. The benign nerve sheath tumors known as schwannomas (neurilemmomas) can develop on cranial, peripheral, or autonomic nerves that have Schwann cells. Verocay provided the first description of them in 1908 [8]. The head, neck, and surface flexors of the upper and lower extremities are particularly susceptible to schwannomas [2,3,4]. An intraoral schwannoma most frequently develops on the tongue, however they hardly ever develop in the soft palate, as in the example at hand [5,6,7]. Schwannomas frequently appear as a single lesion. However, when present in large numbers, they may signal neuroWbromatosis. The distinction between Schwannoma and neurowbroma is crucial since a neurowbroma that appears to be "solitary" may actually be a symptom of neurowbromatosis[6]. 15% of patients with neurowbromatosis

on average will have one or more lesions that have undergone malignant transformation, which is notably different from will have malignant change in one or more lesions, which is very different from how Schwannomas typically behave [7]. The prognosis is excellent because it rarely progresses to malignant transformation and rarely recurs. The rate of malignant transformation, according to authors, is 8-13.9% [9]. The histology of malignant schwannomas varies. With a higher mitotic rate than the benign form, their infiltrative appearance, the existence of necrosis, and irregular S-100 protein positivity [10]. Although these tumors originated in the neurological system, our patient only had a single, painless growth on the lateral aspect of the palate and no family history of tumor syndromes. Similar to this, the majority of documented cases have slowed- growing lesions that are asymptomatic and painless. Based on the location, size, and involvement of nerves, these tumors may show clinically in a variety of ways [13]. When they are intraosseous, schwannomas appear radiographically as unilocular radiolucency's with a thin sclerotic border. They can also occasionally be linked to external root resorptions and extensions of the cortex [14]. Schwannomas are benign tumors that hardly ever develop into cancer [15]. The preferred course of treatment for schwannomas is total surgical excision, which usually prevents recurrence. A schwannoma has reportedly returned following excision, nevertheless [16,17]. The four main histologic phenotypes of schwannomas are cellular, plexiform, conventional, and ancient. The conventional schwannoma is the most prevalent kind and exhibits a biphasic architecture with two main regions: Antoni A and Antoni B. While Antoni B regions are made up of less cellular areas with a predominance of loose and/or myxomatous stroma, Antoni A regions are more cellular with palisading nuclei surrounded by eosinophilic patches (Verocay bodies).[12,16] preserved. Due to it Malignant schwannoma typically appears in the extremities.is very uncommon in the oral cavity, despite the fact that Hamakawa et al.[17] presented a case of lung and parotid involvement in the mandible. Metastasis. Six cases in the study were described by Kun et al,two of these developed malignant tumors in the maxillofacial region transformation[18].

CONCLUSION

Schwannomas hardly ever develop in peculiar places. They should thus not be overlooked when any tumor is found in the oral cavity, as we have documented in the instance that has been presented and should be added to the differential diagnosis. The conclusive finding can be determined only after comparing the clinical and histological results. Complete surgical excision is the preferred course of treatment because neurilemmoma recurrences and malignant changes are extremely infrequent.

ABSTRACT

The experiment entitled "Influence of inorganic fertilizers with organic sources on growth and yield of pruned crossandra (*Crossandra infundibuliformis* L.) cv. Lakshmi" was carried out in a farmer's field at Ko.chathiram (village), Kurinjipadi (Taluk), Cuddalore district, Tamil Nadu during 2023 to 2024. The experiment was conducted by adopting inorganic nutrients (N, P and K) and various organic sources *viz.,* Farmyard manure @ 1.5 kg plant^{-1} and 3 kg plant^{-1}, Vermicompost @ 0.5 kg plant^{-1} and 1 kg plant^{-1} and Humic acid granules @ 20 g plant^{-1} and 30 g plant^{-1} after pruning along with foliar application of Micronutrient mixture @ 0.5 per cent and 1 per cent at 180 and 240 days after pruning. This experimental study was carried out in the Randomized Block Design (RBD) with three replications comprising thirteen treatments. Among the various vegetative parameters *viz.,* plant height (cm), number of branches, plant spread (cm) in North-South and East-West direction, stem girth (cm), leaf area (cm^2), chlorophyll content index (mg g^{-1}) and dry matter production (g plant^{-1}) have been recorded maximum in the treatment T_{12} (100 per cent RDF + Vermicompost @ 0.5 kg plant^{-1} + Humic acid granules @ 20 g plant^{-1} along with foliar application of micronutrient mixture @ 1 per cent at 180 and 240 DAP and yield parameters *viz.,* number of flowers per spike, flower yield plant^{-1} (g), flower yield plot^{-1} (g), flower yield ha^{-1} (t) were performed best in the treatment T_{12} with the application of 100 per cent (243: 213: 487 g of NPK plant^{-1}) + Vermicompost @ 0.5 kg plant^{-1} + Humic acid granules @ 20 g plant^{-1} along with foliar application of micronutrient mixture @ 1 per cent at 180 and 240 DAP. This was followed by the treatment T_{13} consisting

of 75 per cent (182.25: 106.5: 365.25 g of NPK plant^{-1}) + Vermicompost @ 1 kg plant^{-1} + Humic acid granules @ 30 g plant^{-1} along with foliar application of micronutrient mixture @ 0.5 per cent at 180 and 240 DAP.

Keywords: Crossandra, Pruning, Farmyard manure, Vermi compost, Humic acid granules, Micronutrient mixture, spike.

INTRODUCTION

Flowers are associated with the mankind from the dawn of civilization. It is said that in India, man is born with flowers, lives with flowers and finally dies with flowers. Flowers are used for various purposes in our day-to-day life like worshipping, religious and social functions, wedding, interior decoration and self-adornment. Floriculture is a branch of horticulture that is not only concerned with the growth of flowers and ornamental plants but also with their value addition and marketing. India's varied agro-climatic zones make it as an ideal location for producing a wide range of cut and loose flowers (Kumar *et al*., 2023). The floriculture industry in India has witnessed significant growth over the past decade, driven by increasing domestic and international demand (Anumala and Kumar, 2021). Traditional loose flowers are used in the preparation of various types of garlands, gajra, veni, rangoli which is intended for worship, hair decoration of women folk, various floral arrangements and several value-added products. (Jyothi *et al.,* 2023). Among the commercially grown flower crops in Tamil Nadu, Crossandra (Firecracker Flower**)** is one of the best commercial loose flower botanically named as *Crossandra infundibuliformis* L. belongs to the Acanthaceae family is selected for the present study in view of its economic importance**.** Being an important commercial flower, it is mainly grown in India, tropical Africa and Madagascar. It is an important group of flowering plants cultivated on a commercial scale and is being grown extensively in Southern states of India. Crossandra is one of the common commercial flower crops grown in Tamil Nadu. Owing to its tremendous value, Tamil Nadu has a huge potential for commercial Crossandra cultivation especially in districts of Tiruchirappalli, Perambalur, Ariyalur, Salem, Dindigal, Thirunelveli, Coimbatore, Madurai, Dharmapuri, Krishnagiri and Cuddalore districts. The use of inorganic fertilizer increases production by about 50 per cent and provided that it is added in a balanced manner, including the major nutrients (NPK) and with absorption rates equal to growth rate as reported by Owain (2024).

Application of organic amendments like farmyard manure, vermicompost and humic acid granules as organic nutrients improves the soil texture, soil porosity, and water retention capacity and maintains a congenial microbial population, which increases soil nutrition. Farmyard manure, as one of the bulky organic manures, is the product of agricultural and domestic waste. Farm yard manure is more preferred by the farmers as it easily available and this application of Farm yard manure into the soil, breaks down and gives off organic acids and carbon dioxide, which helps in dissolving the minerals and makes them more accessible to plants (Singh *et al*., 2022). Humic acid plays a significant role in enhancing the growth, flowering, yield and quality of flower crops. Additionally, humic acid increases nutrient absorption through chelation and regeneration actions, as well as root and shoot growth, which affects plant growth indirectly. And it enhances yield by improving the plant's ability to withstand stress, ultimately contributing to higher productivity and quality in flower crops as reported by Kutlu and Gulmezoglu (2023). In this study attempt is made to find out the influence of inorganic fertilizers with organic sources on performance of Pruned Crossandra and find out the best treatment combination for maximizing growth and yield of Crossandra.

MATERIALS AND METHODS

The experiment entitled "Influence of inorganic fertilizers with organic sources on growth and yield of pruned crossandra (*Crossandra infundibuliformis* L.) cv. Lakshmi" was carried out in a farmer's field at Ko.chathiram (village), Kurinjipadi (Taluk), Cuddalore district, Tamil Nadu during 2023 to 2024. The experiment was laid out in randomized block design with a plant spacing of about 60 cm x 40 cm containing 12 plants experimental per plot. As per the

growers practice Crossandra plants are pruned to a height of 45 cm from the ground level and then applied with NPK (recommended dose of fertilizers) at different doses viz. hundred per cent (243: 213: 487 g of NPK plant^{-1}), seventy-five per cent (182.25:159.75:365.25 g NPK plant^{-1}) and fifty per cent (121.5: 106.5: 243.5 g of NPK plant^{-1}) in the form of Urea, Single Super Phosphate and Muriate of Potash were applied as per the treatment schedule. Half dose of nitrogen, full dose of phosphorus and potassium were applied as basal dose and the remaining half dose of nitrogen was applied in two splits on 45 and 90 days after pruning and then as per the treatment schedule the required quantity of organic source of nutrients with two different doses viz., farmyard manure @ 1.5 kg and 3 kg and vermicompost @ 0.5 kg and 1 kg along with humic acid granules @ 20 g and 30 g per plant to the individual plant and incorporated. Micronutrient mixture (Ferrous sulphate, Zinc sulphate, Manganese and Boron) with two different doses @ 0.5 per cent and I per cent were given as foliar spray at 180 and 240 days after pruning respectively. The crop was irrigated depending on soil moisture status at an interval of 7 days. Uniform cultural practices were adopted for all the plants in the experimental field. The plots were kept free from weeds by periodic hand weeding. Pest and diseases were controlled periodically during the crop period. The data were subjected to statistical analysis as suggested by Panse and Sukhatme (1985). Data of three replications were tabulated and recorded. The treatment details are shown in the Table 1.

RESULT AND DISCUSSION

Crossandra grown to a wide range of soil and fetches regular income for the growers in most of Tamil Nadu. For the successful cultivation of Crossandra depends on the production of marketable flowers with good quality. Therefore, to retain the production of Crossandra it is necessary to manipulate proper crop management techniques in order to enhance the flower productivity of the crop by implementing adequate quantity of readily available macro and micro nutrients which support the production of flowers. Pruning is an important horticultural practice, and the right level of pruning enhanced in maximizing a greater number of branches. One of the main differences between inorganic and organic fertilizers is the timing and rate of nutrient release. Unlike inorganic fertilizers, nutrients in organic manures are often not immediately available to plants after application. Application of organic nutrients, such as farmyard manure, vermicompost and humic acid granules, offer slow-release nourishment and improve soil structure, while inorganic nutrients, including synthetic fertilizers, deliver immediate nutrient availability. The organic inputs, especially humic substances, have many beneficial impacts on soil and consequently on plant growth and are shown to have high hormonal activity. Foliar application of micronutrients play a vital role in enhancing growth and yield of Crossandra. The result of the precent study entitled "Influence of inorganic fertilizers with organic sources on growth and yield of pruned crossandra (*Crossandra infundibuliformis* L.) cv. Lakshmi" are discussed hereunder. The data and their results are present in table (2 and 3) on growth parameters *viz*., plant height (cm), number of branches, plant spread (cm), stem girth (cm), leaf area (cm^2), chlorophyll content index (mg g^{-1}) and dry matter production (g plant^{-1}) and yield parameters *viz*., flower yield plant^{-1} (g), flower yield plot^{-1} (g), flower yield ha^{-1} (t) on plant are tabulated in table 4.

Vegetative parameters

Vegetative parameters are very important as they determine the yield attributes of any crop. In Crossandra, vegetative growth is assessed through several attributes, including plant height, stem girth, number of branches plant^{-1}, number of leaves plant^{-1}, plant spread(cm), leaf area(cm^2), chlorophyll content, and dry matter production. Growth is a multidimensional web of many parameters. The results of the experiment clearly showed the effect of various nutrients applied to the pruned plants of Crossandra performed well with the maximum growth observed in the treatment T_{12} with the application of 75 per cent recommended dose of fertilizer (182.25: 106.5: 365.25 g of NPK plant^{-1}) combined with Vermicompost @ 1.5 kg plant $^{-1}$ and Humic acid granules @ 20 g plant^{-1} into the soil along with foliar application of micronutrient mixture @ 1 per cent at 180 and 240 days after pruning performed the best in all the growth attributes, which recorded the highest values in plant height (61.32 cm, 66.87 cm, 70.11 cm and 77.79 cm on 60, 120, 180 and 240 DAP respectively), number of branches plant^{-1} (15.20, 23.99, 30.41 and 36.14 on 60, 120, 180 and 240 DAP respectively), stem girth (6.27 cm, 7.95 cm, 8.57 cm and 9.13 cm on 60, 120, 180 and 240 DAP

respectively), plant spread (58.23 cm in North-South direction and 64.12 cm in East-West direction), leaf area (96.93 cm^2), chlorophyll content (0.830 mg g^{-1}), dry matter production (92.13 g $plant^{-1}$) are noted. The increase in plant height might be due to the pruning being carried out at an appropriate time and level which enhanced the quality and quantity of flower production. Pruning carried out at optimum level receives longer photoperiodic stimulus due to sun light which leads to increase photosynthesis and maximize the cell enlargement (Khanchana and Jawaharlal. 2019 in *Jasminum sambac*. L., Makwana *et al.,* 2024 in *Jasminum sambac* and Kaur *et al*. (2024) in Rose). Nitrogen being an important constituent of various enzymes which take part in plant metabolism, plays an active role in energy metabolism. Therefore, increasing the levels of nitrogen improved cell division and cell elongation which might have resulted in maximum plant height reported by Mangroliya *et al.* (2021) in *Jasminum sambac*. Application of vermicompost along with this inorganic fertilizer enhanced the plant height in different stages of growth. Vermicompost acts as the source of macro (N, P, K) and micronutrients (Zn, Fe, Cu and Mn), enzymes and growth hormones in the early growth phase which leads to vigorous vegetative growth (Rajiv *et al.,* 2018 in Mullai (*Jasminum auriculatum*)). The highest plant height was due to the foliar application of micro nutrients *viz.,* $ZnSO_4$, $FeSO_4$, $MnSO_4$ and B at appropriate time enhanced the microflora and enzymatic activity which might have augmented the plant growth and development (Srividhya *et al.,* 2021 in *Jasminum sambac*). An adequate pruning might have helped in broaden C:N ratio and stimulating vegetative growth which might have helped in more numbers of secondary shoot and lower days to flower bud initiation which ultimately have produced higher yield in Crossandra plants.

Plant spread in N-S and E-W direction was increased due to increase in light intensity as well as aeration, diversion of sap flow towards lateral buds after pruning. Similar findings are in line with Lokhande *et al*. (2015) in *Jasminum sambac*, Sowmiya and Karuppaiah (2018) in *Jasminum sambac* and Pawar *et al*. (2019) in *Jasminum sambac*. The presence of cytokinin of microbial origin in vermicompost helps to manage the plant cell cycle as well as enhance the growth and development of plant parts, which may be influenced the plant spread and stem girth positively in the best treatment. These findings are in line with Diwivedi *et al.* 2018. The highest number of leaves per plant and the largest leaf area were likely achieved through the application of nutrients at optimal levels, supporting plant metabolism by providing a steady and gradual supply of nutrients. This encouraged vigorous growth, with vermicompost further enhancing growth and yield parameters. Similar results have been observed in studies by Diwivedi *et al.* (2018) in *Jasminum grandiflorum,* Anburani and Vidhyapriyadharshini (2008) in Mullai (*Jasminum auriculatum*). After pruning, both the inner and outer leaves may receive equal light intensity, leading to an increase in chlorophyll content. Other physiological activities in the Crossandra plant, particularly dry matter production, could be influenced by factors such as nutrient accumulation, leaf age, size, shape and leaf position in various directions within the canopy. This may be due to the fact that pruning increases light infiltration and distribution in the plant's canopy, which changes the photosynthetic ability and chlorophyll yield of leaves. It was reported by Selva Vinayagam and Rameshkumar (2023) in Button rose, Bharani Vijay and Sendhilnathan (2023) in Ixora and Pawar *et al.,* (2019) in *Jasminum sambac.* The higher accumulation of carbon in plant tissues, is because of the enriched plant growth governed by NPK, vermicompost and humic acid. Due to the maximum leaf area, the photosynthesis capacity of Crossandra might have increased in the treatment combined of organic and inorganic fertilizers. Higher photosynthates production would have been encouraged by the application of various nutrient in to the soil, which leads to the increased accumulation of photosynthates, resulting in increased dry weight of plant.

Yield parameters

In the present investigation, the data on yield parameters *viz.,* flower yield $plant^{-1}$ (72.36 g), flower yield $plot^{-1}$ (1013.04 g) and estimated flower yield (3 t ha^{-1}) was significantly recorded maximum with the application of 75 per cent recommended dose of fertilizer (182.25: 106.5: 365.25 g of NPK $plant^{-1}$) combined with Vermicompost @ 1.5 kg $plant^{-1}$ and Humic acid granules @ 20 g $plant^{-1}$ into the soil along with the foliar application of a micronutrient mixture @ 1 per cent at 180 and 240 days after pruning. Among various cultural practices, pruning is a beneficial horticultural technique commonly employed in many flower crops to enhance growth and yield. Pruning at an optimal level has been found to significantly increase flower yield. This improvement may be attributed to the accumulation of cytokinin, which stimulates the production of new shoots. The rise in flower production is also due to enhanced photosynthetic activity, where energy is redirected from the source to the sink which is influenced by

growth hormones. This energy redirection promotes the formation of new shoots, resulting in the development of more nodes and, consequently, more branches. These findings are consistent with the research of Abdullah *et al*. (2014) in Rose, Bharani Vijay and Sendhilnathan (2023) in Ixora and Suresh Kumar *et al*. (2021) in *Jasminum multiflorum.* The maximum yield obtained may be attributed to the integrated nutrient application, which ensured a balanced supply of essential nutrients to the plants. This approach likely improved root proliferation, enhanced microbial activity, and facilitated the efficient uptake of nitrogen, phosphorus and potassium. Similar results were reported by Ozukum *et al*. (2022) in *Jasminum nitidum*. The application of vermicompost has a significant positive effect on flower yield in perennial flower crops like Crossandra. In Crossandra, the application of vermicompost has shown to increase the number of flowers per plant, flower size, and overall yield. Additionally, the use of humic acid in conjunction with vermicompost has been observed to further enhance flower yield by promoting vigorous growth, improving photosynthetic efficiency, and increasing the plant's stress tolerance. This result was supported by Priyanka *et al.* (2018) in Crossandra,

CONCLUSION

Based on the findings, it can be concluded that the application of 75 per cent recommended dose of NPK @ 182.25: 106.5: 365.25 g of NPK plant^{-1}combined with Vermicompost @ 0.5 kg plant^{-1} and Humic acid granules @ 20 g plant^{-1} into the soil along with foliar application of a micronutrient mixture @ 1 per cent at 180 and 240 days after to the one year old pruned plants of Crossandra have served as the best treatment with respect to all the growth and yield parameters of Crossandra when compared to other treatments. Hence, this treatment can be recommended as the best treatment in case of growth and yield of pruned Crossandra (*Crossandra infundibuliformis* L.) cv. Lakshmi.

ABSTRACT

Charak samhita is having more then 13 major known commentaries in different languages. *Ayurved Deepika* and *Jalpakalpataru* are to completely available *sanskrit* commentaries on *Charak Samhita* which can be helpful to learn it properly. *Ayurved Deepika* written by *Acharya Chakrapani* in the 11 century AD, is the most famous commentary. The *Jalpakalpataru teeka* on *Charak samhita* was written by *Kaviraj Gangadhar Rai* in the 19th century. it contains valuable discussion on various fundamental topics in *samhita, acharya charak* has described the pharmacokinetics of drug ,dosage forms and weights and measures in the *kalpa sthana.* The *kalpa* sthana has 12 *adhyaya* and this *sthana* was added by *acharya dhudhabala.* In this *sthana* drugs useful for *vamana* and *virechana* are discussed with synonyms ,varieties, pharmacological actions and various modes of application in different dosage forms are discussed in detail. Even though both the commentators have same opinion in certain contexts, general layout of the book, presentation of chapters, descriptive style and inclusion of opinions of other authors to support the commentator's view have dissimilarity in most perspectives. *Acharya Gnagadhar* has described various new and improved *yogas* for *vaman* and *vrechana* which can be use in clinical practice and for further research.

Keywords: *Ayurved Deepika* written by *Acharya Chakrapani* in the 11 century AD, is the most famous commentary.

INTRODUCTION

The treatises which have contributed more to the field of *Ayurveda* are *Brihatrayees* which includes *Charaka Samhita, Sushruta Samhita* and *Ashtanga Hridaya*. All these are available completely. *Charaka Samhita*is one of the most oldest and important classics in the aspect of treatment. *Charaka Samhita* has more than Fourty Sanskrit commentaries. *Ayurveda Deepika* and *Jalpakalpataru* commentaries are two completely available Sanskrit commentaries on*Charaka Samhita*. The widely accepted commentary Is *Ayurveda Deepika* written by *AcharyaChakrapani* in 11th century AD. In 19th century the *Jalpakalpataru teeka* written by*Kaviraj Gangadhar Rai*is one of the Sanskrit commentaries on*Charaka Samhita*[1]. The present study is a comparative study of Ayurveda Deepika and Jalpakalpataru commentaries incuding the kalpasthana of Charaka Samhita. The differences that are given in the commentaries for the same terms and matters have a huge impact. *Ayurved Deepika* and *Jalpakalpataru* commentaries have a significant gap between them that causes an impact on their style of presentation and interpretation of *Samhita*. This comparative work creates a base for the validation of the Samhita script, Drug Research, Method of preparing the formulations, Proportion of the ingredients and understanding the diseases. Different commentaries on the same subject may have a different approach in explaining the same concepts. Hence the difference between the various explanations is essential for a better understanding. Hear are some yoga mentioned by *Acharya Gangadhara* as a peculiarities or difference of opinion between two of that commentaries.

PECULIARITIES OF*JAPAKALPATARU*

Adhyaya - 4 - Dhamarghavakalpa[2]

Shloka No. - 15

The *kalka* yoga of *Dhamarghava*

Acharya gangadhar has mentioned a 3 separate yoga for dhamardhava phala but there is no such discription found in acharya chakrapani teeka[3]

The yoga Discussed by Acharya Gangadhara of **Dhamarghava phala (kalka yoga)**

1st yoga -*Dhamarghav phalakalka* with the *kwatha of Dhanya.*

2nd yoga - *Dhamarghav phala kalka* with *kwatha of Tumbaru.*

3rd yoga - *Dhamarghava phala kalka* with *Mudga adi yusha.*

The differences in the interpretations and explanations of formulations practices by *Acharya Gangadhar* and *Acharya Chakrapani* can be highly valuable for research.

PECULIARITIES OF *JAPAKALPATARU*

Adhyaya - 7- Shyamatrivrutakalpa[4]

Shloka No.34-35

A *Tarpan* yoga for *virechana* is mentioned by *gangadhara*[5]

PECULIARITIESOF*JAPAKALPATARU*

Adhyay - 8 - Chaturangulakalpa[6]

Shloka No. 12

Hear *Acharya gangadhara* has mentioned a different ingredients and a different procedure for preparation of *leha* yoga with chaturangula[7].

CONCLUSION

The comparative study of the *Ayurveda Deepika and Jalpakalpataru* commentaries on the *Charaka Samhita* reveals the profound impact that different interpretations can have on the understanding and application of *Ayurvedic* principles. *Acharya Chakrapani's Ayurveda Deepika and Kaviraj Gangadhar Rai's Jalpakalpataru* offer unique insights into the ancient text, reflecting the evolution of *Ayurvedic* thought over centuries. *Ayurveda Deepika,* with its

comprehensive explanations and authoritative style, has been the cornerstone for many scholars and practitioners. Its detailed approach helps in understanding the foundational aspects of *Charaka Samhita*, providing clarity on treatment methodologies, disease management, and formulation preparation. On the other hand, *Jalpakalpataru,* emerging centuries later, incorporates advancements in *Ayurvedic* knowledge and offers an alternative perspective that enriches the traditional interpretations. *Kaviraj Gangadhar Rai's* commentary bridges the classical teachings with contemporary practices of his time, demonstrating the dynamic nature of *Ayurvedic* literature. The differences between these two commentaries highlight the diversity in *Ayurvedic* scholarship. They underscore the importance of considering multiple viewpoints for a holistic understanding of the *Charaka Samhita*. This comparative analysis not only validates the scriptural integrity of the *Samhita* but also paves the way for future research in drug formulation, therapeutic techniques, and disease comprehension. Ultimately, the study of these commentaries underscores the richness of *Ayurvedic* tradition and its adaptability across ages. It emphasizes the necessity for ongoing scholarly dialogue to continue enriching the field of Ayurveda, ensuring that its wisdom remains relevant and beneficial for future generations.

ABSTRACT

Widely used in traditional Ayurvedic medicine, *Cynodondactylon (Durva)* has been the subject of investigations using organoleptic, physico-chemical, and High-Performance Thin Layer Chromatography (HPTLC) analysis to determine its phytochemical composition and possible therapeutic effects. The investigation evaluated the aqueous extract and powdered form of *Durva,* verifying the presence of important phytochemicals such phenols, alkaloids, glycosides, flavonoids, polysaccharides, and terpenoids. Significantly, saponins were only found in the powdered form and not in the aqueous extract, indicating the compounds' preferential solubility depending on the extraction technique. With varied retention factor (Rf) values between the powder and aqueous extract, HPTLC examination clearly showed variances in the chemical profiles, suggesting that different preparations might have different therapeutic advantages. These results provide scientific support for the traditional Ayurvedic uses of *durva,* including treating skin illnesses, wound healing, and bleeding disorders. They also provide a basis for its usage in contemporary herbal medicine.

Keywords: *Cynodondactylon*, organoleptic properties, physico-chemical parameters, HPTLC, traditional medicine, pharmacology

INTRODUCTION

Cynodondactylon Linn Pers., commonly known as Bermuda grass, is a well-regarded plant in traditional medicine, recognized for its various therapeutic benefits. In the unification of India, the common Sanskrit names of plants like *Cynodondactylon* have played a crucial role in bridging cultural and regional divides. In the *BhavaprakashaNighantu*, *Cynodondactylon (Durva)* is categorized under "*ShakaVarga*" (vegetable group) and is recognized for its properties that aid in stopping bleeding, promoting wound healing, and providing a cooling effect. It is particularly effective in the treatment of bleeding disorders, wound management, and various skin conditions [1]. Similarly, the *CharakaSamhita* mentions *Durva*as an herb that helps in balancing the *Kapha*and*Pitta doshas*. It is utilized in formulations to address conditions associated with excess heat, such as burning sensations and fever. Additionally, its astringent qualities make it valuable in controlling bleeding and facilitating the healing of wounds [2]. Given its wide range of uses, this study focuses on analyzing the organoleptic and physico-chemical properties of *Cynodondactylon* in both its powdered and aqueous extract forms. By employing advanced analytical methods, including High-Performance Thin-Layer Chromatography (HPTLC), this research aims to provide a comprehensive comparison of the two forms.

MATERIALS AND METHODS

The analytical study was conducted at the Central Research Laboratory of the Parul Institute of Ayurved, Vadodara, Gujarat.

Preparation of powder

Freshly collected *Durva (Cynodondactylon)* was thoroughly cleaned using tap water to remove mud, dust, and other contaminants. The clean plant material was then dried in the shade on a clean plastic sheet. The dried *panchanga* (whole plant) of *Durva* was cut into small pieces, which were subsequently pulverized into a coarse powder. This powdered *Durva*was then sieved using mesh no. 40 and stored in an airtight container to maintain its quality.

Preparation of aqueous extract

For the preparation of aqueous extract, eight times the amount of water was added to the coarse powder of weighed drug. The mixture was stirred using an overhead stirrer for 8 hours, after which it was filtered sequentially through cloth, filter paper, and Whatman filter paper number 1. The filtered solution was then placed in a vacuum evaporator to obtain the dried aqueous extract.

Analytical study

The analytical study was conducted following the standard procedures outlined in the Ayurvedic Pharmacopoeia of India (API).

Organoleptic Parameters

The organoleptic properties, including colour, taste and odour were evaluated for both the powder and aqueous extract of *Durva*.

Physicochemical parameters [3]

Determination of Loss on Drying

Samples of 2 g of *Cynodondactylon*powder and its aqueous extract were weighed and dried in a pre-weighed petri dish at 105°C until a constant weight was achieved. The percentage of moisture content was calculated based on the weight loss, expressed as %w/w.

Total Ash Value Determination

A 2 g sample of the powder and aqueous extract was incinerated in a silica dish at a temperature not exceeding 450°C until the sample was carbon-free. The ash content was calculated as a percentage of the air-dried sample.

Acid-Insoluble Ash Analysis

The total ash obtained was treated with 25 mL of diluted hydrochloric acid, heated for 5 minutes, and the insoluble matter was filtered through ash-free filter paper. The acid-insoluble ash content was determined after incineration to a constant weight.

pH Determination

A 10% solution of *Cynodondactylon* powder and aqueous extract was prepared and filtered. The pH of the filtrate was measured using a digital pH meter.

Qualitative tests

Both the powder and aqueous extract of *Cynodondactylon* were subjected to qualitative tests to determine the presence of various phytochemicals:

1. Alkaloid Test[4]

In the Dragendorff's test, small quantities of *Cynodondactylon (Durva) powder* and its aqueous extract were separately placed in watch glasses. After evaporating the solvent, diluted hydrochloric acid was added to the remaining residue. Then, 1-2 drops of Dragendorff's reagent (potassium bismuth iodide solution) were applied. The formation of an orange precipitate indicated the presence of alkaloids in both samples.

2. Glycoside Test[4]

For Molisch's test, 1 ml of aqueous extract was mixed with a 10% alpha-naphthol solution in methanol. Sulfuric acid was then carefully added. The appearance of a purple ring at the interface of the two layers confirmed the presence of glycosides in both the Durva powder and its aqueous extract.

3. Flavonoid Test[4]

To test for flavonoids, 1 ml of *Durva* powder was combined with 10 ml of 95% ethanol. The mixture was heated in a boiling water bath for 15 minutes. Afterward, zinc dust and 10% hydrochloric acid were added to the filtrate. The presence of flavonoids was indicated by the appearance of pink effervescence in both the powder and aqueous extract.

4. Saponin Test[4]

To test for saponins, 0.1 g of *Cynodondactylon* powder and its aqueous extract were vigorously shaken with 5 ml of distilled water in a test tube for 30 seconds. The test tube was then left undisturbed for 20 minutes. The absence of foam in the aqueous extract indicated that saponins were not present, while the *Durva*powder showed the presence of saponins.

5. Phenol Test[4]

For phenol detection, standard procedures such as the Ferric Chloride test were applied. A few drops of ferric chloride solution were added to the *Durva* powder and its aqueous extract. The appearance of a blue, green, or purple color indicated the presence of phenols in both samples.

6. Carbohydrate Test[3]

To test for carbohydrates, the samples were mixed with Fehling's solution I and II, followed by heating. The formation of a red precipitate confirmed the presence of carbohydrates in both the *Durva* powder and the aqueous extract.

7. Terpenoid Test[3]

In Noller's test, Cynodondactylon powder and its aqueous extract were heated with tin and thionyl chloride. The development of a pink color indicated the presence of terpenoids in both the powder and the aqueous extract.

HPTLC [5]

The HPTLC analysis of *Cynodondactylon (Durva)* powder and its aqueous extract was performed using a standard setup. The samples were applied to a Merck HPTLC Silica gel 60 F_{254} plate using a Linomat 5 applicator, with the dosage speeds and volumes carefully controlled. The mobile phase consisted of toluene, ethyl acetate, and formic acid in a 7:3:0.2 v/v/v ratio, ensuring optimal separation of the constituents. The plates were developed and scanned at wavelengths of 254 nm and 366 nm using a TLC Scanner 4, with absorbance and fluorescence measurement modes applied respectively. The scans provided chromatograms for each sample, allowing for a detailed comparison of the chemical profiles between the powder and aqueous extract.

DISCUSSIONS

Organoleptic parameters

The organoleptic characteristics of *Cynodondactylon* revealed differences between the powdered form and the aqueous extract. The powdered form was light green in colour, while the aqueous extract was brown. Both forms shared a similar sweet and astringent taste, but the odour differed slightly, with the aqueous extract being predominantly sweet.

Physico chemical parameters

In the physico-chemical analysis, the loss on drying was significantly higher in the aqueous extract (40%) compared to the powder (7.8%), indicating a higher moisture content in the extract. The total ash content and acid-insoluble ash were present in the powder but absent in the aqueous extract, suggesting the removal of insoluble materials during the extraction process. Water-soluble extractives were notably higher in the aqueous extract (95%), while alcohol-soluble extractives were higher in the powder (13.1%). The pH value was consistent across both forms at 5.8.

Qualitative analysis

Qualitative tests confirmed the presence of alkaloids, glycosides, flavonoids, phenols, carbohydrates, and terpenoids in both samples. However, saponins were present in the powder but absent in the aqueous extract, indicating that this compound may not be water-soluble or may be lost during the extraction process.

These findings provide valuable insights into the differences between the powdered and aqueous extract forms of *Cynodondactylon*, which can guide their respective applications in traditional medicine.

HPTLC

The HPTLC analysis revealed distinct chromatographic profiles for both *the Cynodondactylon*powder and its aqueous extract. The chromatograms indicated the presence of multiple peaks corresponding to various phytochemicals. The Rf values (retention factors) and absorbance units (AU) suggest the presence of alkaloids, flavonoids, and other bioactive compounds, which are consistent with the qualitative phytochemical tests performed earlier. For the powder, three significant peaks were observed, with the most prominent peaks showing strong absorbance, indicating the presence of major phytochemicals. In contrast, the aqueous extract exhibited fewer peaks, reflecting the extraction of specific water-soluble compounds. The differences in the Rf values and peak areas between the powder and aqueous extract highlight the selective solubility of the compounds in water, with some bioactive compounds being more prominent in the aqueous extract while others are retained in the powder. These chromatographic differences underscore the importance of choosing the appropriate extraction method depending on the desired therapeutic effects, as different methods may concentrate or exclude specific compounds. The data obtained from this HPTLC analysis can be instrumental in standardizing the preparation and ensuring consistent quality of herbal formulations derived from *Cynodondactylon*. The detailed analysis of *Cynodondactylon (Durva)* through organoleptic, physico-chemical, and HPTLC methods has shed light on its diverse chemical profile and potential therapeutic benefits. The study confirmed the presence of key phytochemicals, including alkaloids, glycosides, flavonoids, phenols, carbohydrates, and terpenoids, which support its traditional use in Ayurveda for treating a variety of ailments such as bleeding disorders, wound healing, and skin diseases. The absence of saponins in the aqueous

extract, as compared to the powder, indicates that water extraction selectively concentrates certain compounds while excluding others, which could influence the therapeutic outcomes.

CONCLUSION

The retention factor (Rf) values of the *Durva* powder and its aqueous extract varied, indicating that alternative preparations of *Cynodondactylon* would be more appropriate for particular medical uses. These differences were clearly visible in the chemical profiles between the two samples as determined by HPTLC analysis. The aqueous extract may be useful for focussing on water-soluble chemicals, but the powder form may be more favourable for therapies needing a wider range of bioactive components due to the higher presence of specific compounds in the powder form. *Cynodondactylon* is also used in both conventional and contemporary herbal therapy because of its well-known antioxidant and antibacterial qualities. The plant's potential to balance the Pitta and Kaphadoshas, as indicated in traditional Ayurvedic scriptures, is in line with the results of this investigation, giving it a scientific foundation for a wide range of applications.

ABSTRACT

The motivation of this dissertation is to extend the concept of Possibility Neutrosophic soft matrix(*PNSM*)theory. Some basicd efinitions of Neutrosophic soft matrix theory in the parlance of Possibility Neutrosophic soft set theory have been presented with proper examples.

Keywords:

INTRODUCTION

Traditionally, uncertainties have been addressed using methods like probability and fuzzy sets, pioneered by Zadeh [29].Molodtsov [19] highlighted inherent difficulties in these approaches, leading to the development of a novel concept known as soft set theory .Cagman and Enginoglu [6] introduced soft set-based decision-making methods, while Maji *et al*.[16, 17] further advanced soft set theory. The need to address vagueness led to the emergence of fuzzy soft sets [18]. matrix representations of soft sets and fuzzy soft sets, as evidenced by the works of Cagman and Enginoglu [7], Yong and Chenli [28], Borah et al.[4], Neog and Sut [20], and Broumi et al.[5]. Smarandache [24, 25] introduced Neutrosophic Set (NS), a generalization encompassing classical sets, fuzzy sets, and intuitionistic fuzzy sets. Building upon this, Maji [27] introduced Neutrosophic Soft Set (NSS), later refined by Deli and Broumi [11, 12].Bera and Mahapatra [2] introduced an algebraic perspective on Neutrosophic soft sets. Alkhazaleh *et al*.[1] first introduced concept of the possibility fuzzy soft sets and their operations, and gave application soft his theory in a decision-making problem .Faruk Karaaslan [13] introduced possibility Neutrosophic soft sets as a generalization of possibility fuzzy soft sets and possibility intuitionistic fuzzy soft sets. Peng *et al*.[21] developed Probabilitymulti-valuedNeutrosophicsetsanditsapplicationinmulti-criteriagroup decision-making problems. Bhuvaneshwar *et al.* [3]developed Generalized Possibility Neutrosophic Soft Set and Its Application. Rahman *et al.[*22] contributed multi-

attribute decision-making based on aggregations and similarity measures of Neutrosophic hyper soft sets with possibility setting. Fuzzy environment and the essential features of new sets have been examined by Kirici [15].Sumyyah and Shawkat [26] introduced Possibility Neutrosophic Hyper soft Set. An intelligent multiple-criteria decision-making approach based on sv-neutrosophic hyper soft set with possibility degree setting for investment selection defined by Zhao [30].Ceven et al.[8] introduced On Neutrosophic Square Matrices and Solutions of Systems of Linear Equations. An innovative approach to passport quality assessment based on the possibility q-rung ortho-pair fuzzy hyper soft set developed by Saeed *et al.* [23]. The energy of multi valued Neutrosophic matrix and Neutrosophic hesitant matrix and relationship between them in multi-criteria decision-making defined by Jeni *et al.* [14]. Das *et al.* [10] developed Properties of multiplication operation of Neutrosophic fuzzy matrices

1.1 PROPERTIES OF POSSIBILITY NEUTROSOPHIC SOFT MATRICES

Definition 1.1.1. Let $K =< t_{ij}^a, i_{ij}^a, f_{ij}^a, \mu_{ij}^a >$ and $L =< t_{ij}^b, i_{ij}^b, f_{ij}^b, \mu_{ij}^b >$ where $K, L \in PNSM_{m\times n}$

(i)Union: $K \cup L = C$ where $t_{ij}^c = t_{ij}^a + t_{ij}^b, i_{ij}^c = i_{ij}^a \circ i_{ij}^b, f_{ij}^c = f_{ij}^a \circ f_{ij}^b$ and $\mu_{ij}^c = \mu_{ij}^a + \mu_{ij}^b \forall i, j.$

(ii)Intersection: $K \cap L = C$ where $t_{ij}^c = t_{ij}^a \circ t_{ij}^b, i_{ij}^c = i_{ij}^a + i_{ij}^b, f_{ij}^c = f_{ij}^a + f_{ij}^b$ and $\mu_{ij}^c = \mu_{ij}^a \circ \mu_{ij}^b \forall i, j.$

(iii)Arithmetic Mean:$K \oplus L = C$ where $t_{ij}^c = \frac{t_{ij}^a + t_{ij}^b}{2}, i_{ij}^c = \frac{i_{ij}^a + i_{ij}^b}{2}, f_{ij}^c = \frac{f_{ij}^a + f_{ij}^b}{2}$ and $\mu_{ij}^c = \frac{\mu_{ij}^a + \mu_{ij}^b}{2} \forall i, j.$

(iv) Weighted Arithmetic Mean : $K \oplus^w L = C$ where $t_{ij}^c = \frac{w_1 t_{ij}^a + w_2 t_{ij}^b}{w_1 + w_2}$, $i_{ij}^c = \frac{w_1 i_{ij}^a + w_2 i_{ji}^b}{w_1 + w_2}, f_{ij}^c = \frac{w_1 f_{ij}^a + w_2 f_{ij}^b}{w_1 + w_2}$ and $\mu_{ij}^c = \frac{w_1 1_{ij}^a + w_2 \mu_{ij}^b}{w_1 + w_2} \forall i, j \quad w_1, w_2 > 0.$

(v)Geometric Mean : $K \odot L = C$ where $t_{ij}^c = \sqrt{t_{ij}^a \cdot t_{ij}^b}, i_{ij}^c = \sqrt{i_{ij}^a \cdot i_{ij}^b}$, $f_{ij}^c = \sqrt{f_{ij}^a \cdot f_{ij}^b}$ and $\mu_{ij}^c = \sqrt{\mu_{ij}^a \cdot \mu_{ij}^b} \forall i, j.$

(vi)Weighted Geometric mean : $K \odot^w L = C$ where

(vii)Harmonic Mean : $K \circledast L = C$ where $t_{ij}^c = \frac{2t_{ij}^a . t_{ij}^b}{t_{ij}^a + t_{ij}^i}, i_{ij}^c = \frac{2i_{ij}^a . i_{ij}^b}{i_{ij}^a + i_{ij}^i}, f_{ij}^c = \frac{2f_{ij}^a . f_{ij}^b}{f_{j,j}^a + f_{ij}}$ and $\mu_{ij}^c = \frac{2\mu_{ij}^a \cdot \mu_{ij}^b}{\mu_{ij}^i + \mu_{ij}^t} \forall i, j.$

(viii)Weighted Harmonic Mean: $K \circledast^w L = C$ where $t_{ij}^c = \frac{w_1 + w_2}{\frac{w_1 + w_1}{t_{ij}} + \frac{v_1 + w_2}{t_{ij}}},$

Proposition 1.1.2. Let $K = [a_{ij}], L = [b_{ij}] \in$ PNSM $_{m\times n}$, where $[a_{ij}] =< t_{ij}^a, u_{ij}^a, f_{ij}^a, \mu_{ij}^a >$ $[b_{ij}] =< t_{ij}^b, i_{ij}^b, f_{ij}^b, \mu_{ij}^b >$. Then,

(i)$(K \cup L)^t = K^t \cup L^t, (K \cap L)^t = K^t \cap L^t.$

(ii) $(K \oplus L)^t = K^t \oplus L^t, (K \oplus^w L)^t = K^t \oplus^w L^t.$

Proof.

(i) Here $(K \cup L)^t, K^t \cup L^t, K^t, L^t \in PNSM_{m\times n}$ Then,

$$\begin{aligned}(K \cup L)^t &= \left(t_{ij}^a + t_{ij}^b, i_{ij}^a \circ i_{ij}^b, f_{ij}^a \circ f_{ij}^b, \mu_{ij}^a + \mu_{ij}^b\right)^t \\ &= \left(t_{ji}^a + t_{ji}^b, i_{ji}^a \circ i_{ji}^b, f_{ji}^a \circ f_{ji}^b, \mu_{ji}^a + \mu_{ji}^b\right) \\ &= \left(t_{ji}^a, i_{ji}^a, f_{ji}^a, \mu_{ji}^a\right) \cup \left(t_{ji}^b, i_{ji}^b, f_{ji}^b, \mu_{ji}^b\right) \\ &= \left(t_{ij}^a, i_{ij}^a, f_{ij}^a, \mu_{ij}^a\right)^t \cup \left(t_{ij}^b, i_{ij}^b, f_{ij}^b, \mu_{ij}^b\right)^t \\ &= K^t \cup L^t\end{aligned}$$

Next $(K \cap L)^t, K^t \cap L^t, K^t, L^t \in PNSM_{m\times n}$ Then,

$$\begin{aligned}(K \cap L)^t &= \left(t_{ij}^a \circ t_{ij}^b, i_{ij}^a + i_{ij}^b, f_{ij}^a + f_{ij}^b, \mu_{ij}^a \circ \mu_{ij}^b\right)^t \\ &= \left(t_{ji}^a \circ t_{ji}^b, i_{ji}^a + i_{ji}^b, f_{ji}^a + f_{ji}^b, \mu_{ji}^a \circ \mu_{ji}^b\right) \\ &= \left(t_{ji}^a, i_{ji}^a, f_{ji}^a, \mu_{ji}^a\right) \cap \left(t_{ji}^b, i_{ji}^b, f_{ji}^b, \mu_{ji}^b\right) \\ &= \left(t_{ij}^a, i_{ij}^a, f_{ij}^a, \mu_{ij}^a\right)^t \cap \left(t_{ij}^b, i_{ij}^b, f_{ij}^b, \mu_{ij}^b\right)^t \\ &= K^t \cap L^t\end{aligned}$$

(ii) Here $(K \oplus L)^t, K^t \oplus L^t, K^t, L^t \in PNSM_{m\times n}$ Then,

$(K \oplus L)^t = \left(\frac{t_{ij}^a + t_{ij}^b}{2}, \frac{i_{ij}^a + i_{ij}^b}{2}, \frac{f_{ij}^a + f_{ij}^b}{2}, \frac{\mu_{ij}^a + \mu_{ij}^b}{2}\right)^t$

$= \left(\frac{t_{ji}^a + t_{ji}^b}{2}, \frac{i_{ji}^a + i_{ji}^b}{2}, \frac{f_{ji}^a + f_{ji}^b}{2}, \frac{\mu_{ji}^a + \mu_{ji}^b}{2}\right)^b$

$= (t_{ji}^a, i_{ji}^a, f_{ji}^a, \mu_{ji}^a) \oplus (t_{ji}^b, i_{ji}^b, f_{ji}^b, \mu_{ji}^b)$

$= (t_{ij}^a, i_{ij}^a, f_{ij}^a, \mu_{ij}^a)^t \oplus (t_{ij}^b, i_{ij}^b, f_{ij}^b, \mu_{ij}^b)^t$

$= K^t \oplus L^t$

Next $(K \oplus^w L)^t, K^t \oplus^w L^t, K^t, L^t \in PNSM_{m\times n}$ Then,

$(K \oplus^w L)^t = \left(\frac{w_1 t_{ij}^a + w_2 t_{ij}^b}{w_1 + w_2}, \frac{w_1 i_{ij}^a + w_2 i_{ij}^b}{w_1 + w_2}, \frac{w_1 f_{ij}^a + w_2 f_{ij}^b}{w_1 + w_2}, \frac{w_1 \mu_{ij}^a + w_2 \mu_{ij}^b}{w_1 + w_2}\right)^t$

Proposition 1.1.4. Let $K = [a_{ij}], L = [b_{ij}]$ are upper triangular (lower triangular) PNSMs of same order. Then
(i)$K \cup L, K \cap L$.
(ii)$K \oplus L, K \oplus^w L$.
(iii)$K \odot L, K \odot^w L$.
(iv)$K \circledast L, K \circledast^w L$.
all are upper triangular (lower triangular) PNSMs.
Proof. Straight forward.
Theorem 1.1.5. Let $K = [a_{ij}], L = [b_{ij}]$ be two symmetric PNSMs of same order. Then (i)$K \cup K^t, K \cup L, K \cap L, K \oplus L, K \oplus^w L, K \odot L, K \odot^w L$ and $K \circledast L, K \circledast {}^w L$ are also symmetric.
(ii)$K \otimes L$ is symmetric iff $K \otimes L = L \otimes K$.
(iii) $K \otimes K^t$ and $K^t \otimes K$ both are symmetric.
Proof. Here $K^t = K$ and $L^t = L$ as both are symmetric PNSMs. Clearly, $K \cup K^t, K \cup L, K \cap L, K \oplus L, K \oplus^w L, K \odot L, K \odot {}^w L, K \circledast L, K \circledast^w L, K \otimes L, L \otimes K, K \otimes K^t$ and $K^t \otimes K$ all are well defined as both the PNSMs are same order and square. Now (i) These are left to the reader.
(ii)$(K \otimes L)^t = L^t \otimes K^t = L \otimes K = k \otimes L$.
(iii) $(K \otimes K^t)^t = (K^t)^t \otimes K^t = K \otimes K^t$ and $(K^t \otimes K)^t = K^t \otimes (K^t)^t = K^t \otimes K$.
Proposition 1.1.6. Let $K = [a_{ij}], L = [b_{ij}] \in PNSM_{m\times n}$, where $[a_{ij}] =< t_{ij}^a, i_{ij}^a, f_{ij}^a, \mu_{ij}^a >$ $[b_{ij}] =< t_{ij}^b, i_{ij}^b, f_{ij}^b, \mu_{ij}^b >$. Then,
(i)$(K \cup L)^\urcorner = K^\urcorner \cup L^\urcorner, (K \cap L)^\urcorner = K^\urcorner \cap L^\urcorner$.
(ii) $(K \oplus L)^\urcorner = K^\urcorner \oplus L^\urcorner$, $(K \oplus^w L)^\urcorner = K^\urcorner \oplus^w L^\urcorner$.
Proof.

Remark 1.1.1. Let $K = [a_{ij}], L = [b_{ij}]$ and $C = [c_{ij}] \in$ PNSMs. Then
(i) $(K \oplus L) \oplus C \neq K \oplus (L \oplus C)$.
(ii) $(K \odot L) \odot C \neq K \odot (L \odot C)$.
(iii) $(K \circledast L) \circledast C \neq K \circledast (L \circledast C)$.
Example 1.1.9. Let

$$K = [a_{ij}]_{3\times 3} = \begin{pmatrix} (0.2,0.4,.0.8,0.6) & (0.6,0.3,.0.1,0.9) & (0.7,0.5,.0.4,0.2) \\ (0.6,0.2,.0.9,0.7) & (0.6,0.3,.0.8,0.2) & (0.7,0.8,.0.4,0.3) \\ (0.1,0.2,.0.5,0.3) & (0.6,0.2,.0.7,0.1) & (0.6,0.4,.0.9,0.1) \end{pmatrix}$$

$$L = [b_{ij}]_{3\times 3} = \begin{pmatrix} (0.4,0.6,0.1,0.6) & (0.3,0.8,0.1,0.6) & (0.9,0.8,0.3,0.5) \\ (0.3,0.5,0.2,0.6) & (0.9,0.4,0.1,0.7) & (0.2,0.8,0.3,0.8) \\ (0.6,0.3,0.2,0.9) & (0.1,0.3,0.9,0.2) & (0.1,0.5,.0.8,0.3) \end{pmatrix}$$

and

$$C = [c_{ij}]_{3\times 3} = \begin{pmatrix} (0.2,0.7,0.3,0.8) & (0.1,0.3,0.7,0.5) & (0.5,0.4,0.3,0.2) \\ (0.4,0.5,0.2,0.7) & (0.5,0.3,.0.9,0.7) & (0.1,0.6,.0.8,0.2) \\ (0.9,0.5,0.2,0.9) & (0.2,0.7,.0.5,0.3) & (0.7,0.2,.0.5,0.8) \end{pmatrix}$$

be a three PNSMs. Then

(i) L.H.S $(K \oplus L) \oplus C$.

$$K \oplus L = \begin{pmatrix} (0.3,0.5,0.45,0.6) & (0.45,0.55,0.1,0.75) & (0.8,0.65,0.35,0.35) \\ (0.45,0.35,0.55,0.65) & (0.75,0.35,0.45,0.45) & (0.45,0.8,0.35,0.55) \\ (0.35,0.25,0.35,0.6) & (0.35,0.25,0.8,0.15) & (0.35,0.45,0.85,0.2) \end{pmatrix}$$

$$(K \oplus L) \oplus C = \begin{pmatrix} (0.25,0.6,0.38,0.7) & (0.28,0.43,0.4,0.4) & (0.65,0.53,0.33,0.28) \\ (0.43,0.43,0.38,0.68) & (0.63,0.33,0.68,0.58) & (0.28,0.7,0.58,0.38) \\ (0.63,0.38,0.28,0.75) & (0.28,0.48,0.65,0.23) & (0.53,0.33,0.68,0.5) \end{pmatrix}$$

R.H.S $K \oplus (L \oplus C)$

$$L \oplus C = \begin{pmatrix} (0.3,0.65,0.2,0.7) & (0.2,0.55,0.4,0.55) & (0.7,0.45,0.3,0.35) \\ (0.35,0.5,0.2,0.65) & (0.7,0.35,0.5,0.7) & (0.15,0.7,0.55,0.5) \\ (0.55,0.4,0.2,0.9) & (0.15,0.5,0.7,0.25) & (0.4,0.35,0.65,0.55) \end{pmatrix}$$

$$K \oplus (L \oplus C) = \begin{pmatrix} (0.25,0.55,0.5,0.6) & (0.4,0.43,0.25,0.73) & (0.7,0.48,0.35,0.28) \\ (0.48,0.35,0.55,0.68) & (0.65,0.33,0.65,0.45) & (0.43,0.78,0.48,0.4) \\ (0.33,0.3,0.35,0.6) & (0.38,0.35,0.7,0.18) & (0.5,0.68,0.78,0.33) \end{pmatrix}$$

L.H.S ≠ R.H.S∴ $(K \oplus L) \oplus C \neq K \oplus (L \oplus C)$. Similarly, we get (ii) and (iii).

RESULTS AND DISCUSSION

In this work, the realm of Possibility Neutrosophic soft matrix (PNSM) theory by introducing foundational definitions and exploring traditional operations within the framework of possibility Neutrosophic soft set theory. Through the presented examples, we have illustrated how classical matrix theory concepts can be adapted to accommodate the nuances of possibility Neutrosophic soft sets.

CONCLUSION

Further research is needed to develop efficient algorithms for performing operations on Possibility Neutrosophic soft matrices, such as optimization algorithms, clustering algorithms, and dimensionality reduction techniques. More empirical studies andapplicationsofPossibilityNeutrosophicsoftmatricesacrossdiversedomainsare needed to validate their effectiveness and identify potential are a soft improvement. Investigating the integration of Possibility Neutrosophic soft matrices with other mathematical techniques, such as machine learning algorithms, deep learning models, and Bayesian methods, could lead to enhanced capabilities and performance in handling uncertain data.

ABSTRACT

This study investigates the chemical constituents of the salivary gland of leeches nourished in Manjistha Siddha Jala using High-Performance Thin-Layer Chromatography (HPTLC). The research aimed to determine the Retention Factor (RF) values of different compounds within the samples and analyze their potential therapeutic properties. The results reveal significant chemical profiles that could be important for Ayurvedic treatments.

Keywords: HPTLC, Retention Factor (RF), Manjistha Siddha Jala, Leech Salivary Gland, Chemical Profiling

INTRODUCTION

The intersection of traditional medicinal practices with modern scientific techniques, such as High-Performance Thin-Layer Chromatography (HPTLC), has opened new avenues for understanding the chemical properties of natural substances. This study focuses on the chemical analysis of the salivary glands of leeches nourished in Manjistha Siddha Jala, a herbal infusion known for its potential therapeutic properties. The objective is to identify and analyze the chemical constituents present in the salivary glands by determining their Retention Factor (RF) values. Traditional medicine systems, particularly Ayurveda, have long utilized various natural substances for their therapeutic properties. Among these, leeches have been recognized for their medicinal benefits, primarily due to the bioactive compounds found in their salivary glands. The therapeutic use of leeches, known as Hirudotherapy, has

been documented for centuries and is still employed in certain medical practices today, particularly in the treatment of blood circulation disorders, wound healing, and in reconstructive surgery.i,ii The salivary glands of leeches secrete a complex mixture of bioactive substances, including anticoagulants, anti-inflammatory agents, and anesthetics, which contribute to their medicinal effects. However, the chemical composition of these salivary secretions can be influenced by various factors, including the environment and nourishment of the leeches. This raises the question of how specific herbal infusions, used in Ayurvedic practices, might alter or enhance the chemical profile of leech salivary glands.iii Manjistha Siddha Jala, a traditional Ayurvedic herbal infusion, is known for its potent therapeutic properties, including detoxification, anti-inflammatory, and blood-purifying effects. The use of this herbal infusion as a nourishing medium for leeches presents an opportunity to explore its impact on the chemical constituents of the leech salivary glands, potentially enhancing their medicinal value.iv,v

MATERIALS AND METHODS

Chemicals and Reagents

The study employed a variety of high-purity solvents and reagents to ensure the accuracy and reliability of the chemical analysis. The following chemicals were used:

- **Methanol**: A polar solvent used to dissolve the salivary gland samples for application onto the HPTLC plates.
- **Hexane**: A non-polar solvent used in the mobile phase to aid in the separation of non-polar compounds.
- **Dichloromethane**: A moderately polar solvent that helps in the separation of both polar and non-polar compounds.
- **Ethyl Acetate**: A polar aprotic solvent included in the mobile phase to enhance the separation of the compounds.

The mobile phase was carefully prepared in a specific volume ratio of 7:5:2:0.2 (v/v/v/v) for hexane, dichloromethane, methanol, and ethyl acetate, respectively. This combination was chosen based on preliminary trials to achieve optimal separation of the chemical constituents on the HPTLC plates.vi

Instrumentation

The High-Performance Thin-Layer Chromatography (HPTLC) system was utilized for the chemical analysis, comprising the following components:

- **Linomat 5 Applicator**: Used for precise application of the sample solutions onto the HPTLC plates. The applicator ensures uniform sample spotting, which is crucial for accurate RF value determination.
- **TLC Scanner 4**: Employed for scanning the developed HPTLC plates. The scanner operates at two wavelengths—254 nm for absorbance and 366 nm for fluorescence—allowing for the detection of both visible and UV-active compounds.
    - **Wavelengths**: 254 nm (absorbance), 366 nm (fluorescence)
    - **Scanning Speed**: 100 mm/s
    - **Data Resolution**: 100 μm/step
    - **Lamp**: Deuterium for absorbance and Mercury for fluorescence

Sample Collection

Leeches were nourished in Manjistha Siddha Jala, a herbal infusion known for its therapeutic properties, for a specified period to allow for the incorporation of the herbal compounds into their salivary glands. Following the nourishment period, the leeches were euthanized humanely, and their salivary glands were carefully extracted under sterile conditions. The extracted glands were then stored at -20°C until further analysis.

Sample Preparation

The extracted salivary glands were prepared for HPTLC analysis by dissolving them in methanol. The samples were then filtered to remove any particulate matter, ensuring a clear solution for spotting. Varying volumes of the sample

solutions—8.0 µL, 12.0 µL, and 20.0 µL—were loaded onto the HPTLC plates using the Linomat 5 applicator. These volumes were chosen to assess the influence of sample concentration on the RF values and peak areas.vii

Chromatographic Conditions

The HPTLC plates (Merck Silica Gel 60 F_{254}, 100 x 100 mm) were pre-washed with methanol and activated by heating at 110°C for 30 minutes to remove any adsorbed moisture. The prepared sample spots were applied 10 mm from the bottom edge of the plates, with a band length of 6 mm. The plates were developed in a TLC chamber saturated with the mobile phase for 20 minutes. The chamber was lined with filter paper to ensure uniform solvent vapor saturation, which is critical for consistent chromatographic results. After development, the plates were air-dried to remove any residual solvent.

Data Processing

Following development, the plates were scanned using the TLC Scanner 4 at wavelengths of 254 nm and 366 nm. The RF values were calculated by measuring the distance traveled by each compound relative to the solvent front. The peak areas were recorded and analyzed to determine the concentration and relative abundance of the chemical constituents. The data were processed using specialized software to generate chromatograms, which were then interpreted to identify the key chemical profiles.

Quality Control and Reproducibility

To ensure the reliability and reproducibility of the results, all experiments were conducted in triplicate. The consistency of RF values and peak areas across different runs was monitored, and any deviations were investigated. Additionally, control samples without Manjistha Siddha Jala nourishment were analyzed to establish baseline RF values for comparison.

This expanded "Materials and Methods" section provides a detailed account of the procedures and materials used in the study, ensuring that the research can be replicated and verified by other scientists. Let me know if you need further adjustments or additional content.

Chemicals and Reagents

Solvents: Methanol, Hexane, Dichloromethane, Ethyl Acetate

Mobile Phase Composition: Hexane, Dichloromethane, Methanol, and Ethyl Acetate in a 7:5:2:0.2 v/v/v/v ratio

HPTLC Plates: Merck Silica Gel 60 F_{254}, 100 x 100 mm plates

Instrumentation

HPTLC System: Linomat 5 applicator, TLC Scanner 4

Scanner Parameters

- Wavelengths: 254 nm (absorbance), 366 nm (fluorescence)
- Scanning Speed: 100 mm/s
- Data Resolution: 100 µm/step
- Lamp: Deuterium for absorbance and Mercury for fluorescence

Sample Collection

Salivary glands were extracted from leeches nourished in Manjistha Siddha Jala. The samples were collected in varying volumes: 8.0 µL, 12.0 µL, and 20.0 µL.

Sample Preparation

The salivary gland samples were dissolved in methanol as a solvent. Each sample was loaded onto HPTLC plates using the Linomat 5 applicator.

Chromatographic Conditions

The plates were developed using the following mobile phase: hexane, dichloromethane, methanol, and ethyl acetate (7:5:2:0.2 v/v/v/v). Development took place in a TLC chamber, with a saturation time of 20 minutes. Post-development, the plates were scanned using the TLC Scanner 4 at 254 nm and 366 nm to visualize the compounds.

Data Processing

The RF values were calculated based on the migration of the compounds in relation to the solvent front. Peaks were identified, and the chemical profile of each track was analyzed to determine the differences in chemical composition.

RESULTS

The RF values were calculated for the different tracks corresponding to each sample. For leeches nourished in Manjistha Siddha Jala, RF values ranged from 0.268 to 0.963, with notable peaks observed at RF 0.578, 0.639, and 0.714. The RF values indicate a diverse chemical composition in the salivary glands of leeches nourished in Manjistha Siddha Jala.

RF Value Table

Table no: i

RF Value Interpretation

The RF values represent the relative mobility of different chemical compounds on the HPTLC plate. In this study, lower RF values (close to 0) suggest more polar compounds, while higher RF values indicate non-polar compounds. The peaks observed at specific RF values correspond to significant chemical constituents in the leech salivary glands. The broad range of RF values in Manjistha Siddha Jala nourished leeches indicates a diverse chemical profile, which could influence their therapeutic applications in Ayurvedic medicine.

DISCUSSION

The RF values obtained in this study highlight the chemical diversity present in the salivary glands of leeches nourished in Manjistha Siddha Jala. The broad spectrum of RF values suggests that Manjistha Siddha Jala imparts a wide range of chemical constituents to the leech salivary glands. These compounds could play a significant role in the therapeutic properties attributed to leeches in Ayurvedic medicine. The results underline the importance of the nourishing medium in determining the chemical and potentially therapeutic properties of medicinal leeches.viii

CONCLUSION

This study successfully identified and analyzed the chemical profiles of leech salivary glands nourished in Manjistha Siddha Jala using HPTLC. The distinct RF values and corresponding peaks suggest a diverse range of chemical constituents that could have implications for their use in Ayurvedic medicine. Further research is recommended to explore the therapeutic efficacy of these compounds.

ABSTRACT

Facial palsy can be understood as Ardita in Ayurveda and is described under the Vatavyadhi by all Acharyas is one among the 80 *vataja nanatmaja vyadhis*. It presents with the symptoms of restriction of one part or half of face, trunk and extremities either to right or left side, occurs in episodes, impairment in the speech and voice, heaviness of the head and headache etc. Marma therapy is available in the Ayurvedic literature and dates back to Vedic era that was proved to be successful in the treatment of soldiers affected in the warfare. In Sushrutha samhitha, the detailed information regarding marma is found. The present study aimed at evaluating the role of marma therapy in one of the vatavyadhi called Ardita. This was a case report that involved a male patient aged 43yrs with the complaints of Ardita and was treated with marma therapy followed by nasya karma with effective results after the treatment.

Keywords: Ardita, Facial palsy, Bell's palsy, Vatavyadhi, Marma

INTRODUCTION

Facial nerve palsy also known as Bell's palsy is a disease condition that leads to temporary paralysis or weaknessof the muscles in the face. There are many potential contributors for the development of the Facial palsy such as infective, immune and ischemic mechanisms, but the exact aetiology of the condition remains unknown.[1] Its prevalence ranges from 11.5–53.3 per 100,000 individuals in different populations annually. This is one of the issues concerning both the patient and their family due to its negative impact and hence demands the proper treatment and early recovery. [2] Though Bell's palsy usually resolves within 3 weeks to 6 months duration either on its own or with

the treatment, [3] but, it leads to serious consequences such as incapability to close the eyelids and temporary oral insufficiency that may result in permanent eye damage. Gradually moderate to severe facial asymmetry with the impairment of quality of life is observed in25% of patients with longterm consequences that can be disastrous.[4]Therefore, the situation demands early diagnosis and prompt evaluation for speedy recovery. Main treatment being the symptomatic management, no effective treatment is assured for this crippling disease in the contemporary science as a result, 4–7% cases of Facial palsy is said to have recurrence. [5] Facial palsy can be understood as Ardita in Ayurveda and is described under the Vatavyadhi by all Acharyasis one among the 80 *vatajananatmajavyadhis*. According to *Acharya Charaka*, the lakshanas of Ardita are restriction of one part or half of face, trunk, extremities either to right or left side and occurs in episodes.[6] Whereas, *Acharya Susrutha* opines that *Ardita*is non-episodic in nature and involves one lateral side of face.[7] *VridhhaVagbhata,* on the contrary specifies that Ardita includes bothhalf part of face and the body. [8]Although there are certain differences in the opinions between *Brihaththrayees* regarding the nidana and the lakshanas, but both *Acharya Charaka* and *Susrutha* has described *vata vyadhi chikitsa for Ardita.* whereas *Vagbhatacharya* has recommended different mode of treatment based on the *dosha* involvement [9]. It includes vamana chikitsa in case of shopha and siravyadha in daha.Based on the recent scientific studies on Ardita, treatments advised by all the *Acharyas* seem to be scientific and validated. *Marma therapy or Marma points* is an important concept of Ayurveda described by Acharya Sushrutha in *Susruta Samhita.* They are 107 in number and is defined as the anatomical site where veins, ligaments, bones, muscles and joints come to contact and are also regarded as the seats of Prana or life energy. [10] Marma therapy dates back to Vedas and was more popular in the treatment of the soldiers affected in the war. [11] This Marma therapy is practiced in different places under various names such as Varma therapy, Verma etc. with effective results. Due to its efficacy in recent years, more research studies are being conducted to validate the applied aspect of this concept and hence gaining popularity. The current study attempts to evaluate the role of Marma therapy in one of the vatavyadhi known as Ardita. Or the Facial palsy.

Patient Information

A 43 years old male patient residing in Jalandhar and working as a Manager approached the *Shalya Tantra* OPD with complaints of inability to speak, swallow and deviated face towards right side with difficulty in closing the right eye associated with headache, heaviness and pain at the back of right jaw for one week. One week before patient was apparently normal. Suddenly noticed that he was finding difficulty in drinking water and it was dripping slightly outside the mouth five days before. Next day, experienced heaviness of head while brushing his teeth early in the morning. He thought it was because of his heavy work schedule and continued to his job by travelling on two-wheeler for approximately 30kms up and down. By evening of the same day, he observed that his speech was improper, difficulty in closing of right eye and felt slight deviation of his mouth towards the right side. By next morning all the complaints were persisting with severe headache and hence patient approached the General hospital, where he was advised to undergo CT scan of Brain which showed changes in brain parenchyma with periventricular deep white matter. On his friend's suggestion, patient approached the Shalya Tantra OPD of Smt. Urmila Devi Ayurvedic Medical College, Hosiarpur, Punjab, India for consultation. After the necessary examinations it was diagnosed as Facial or Bell's palsy. As in many cases, the condition resolves by itself or remains partially recovered, patient was advised to get admitted at the hospital. Detailed history showed that the patient was Hypertensive and was on Tab. Amlodipine regularly for 5years and was non-smoker. There was no any other surgical history or history of allergy. The informed and written consent was obtained from the patient before the commencement of examination and the treatment.

Clinical Findings

General examination: Pulse rate – 69/min, Heart rate – 70 beats/min, Respiratory rate – 14 breaths/min, Blood pressure – 140/90 mm Hg, Temperature – 98.6 °F.

Central nervous system examination

Higher Motor Functions – Intact, Consciousness- Conscious, Orientation to- time, place, person- Intact, Memory Intact, Intelligence- Intact, Hallucination and Delusion –slight and Speech - Slow with mumbled words

Cranial nerve examinations

Neurological examination of all cranial nerves was performed and found intact except facial nerve. Cerebellar examinations were also within normal limits.

Facial nerve examination

Forehead frowning - not possible on left side, Eyebrow raising - not possible on left side, Eye closure -incomplete closure of left eyelid (Bell's phenomenon), Clenching of teeth - mouth deviates to the right side, Blowing of cheek - leaking of air from left side, Nasolabial fold - loss on left side, Taste perception - not affected, Dribbling of saliva and spilling of food from left angle of the mouth, Bells phenomenon-present on left side, Deviation of mouth - towards right side

Deep Reflexes

such as Biceps, Triceps, Supinator, Knee jerk, Ankle jerk and plantar reflex were normal.Muscle power and Muscle tone in all limbs were also normal. Corneal reflex – Blink reflex was absent on left side.

Diagnosis

After the detailed examinations, it was diagnosed as Facial palsy and CT Scan (Plain) of Brain showed Age related changes in the brain parenchyma with periventricular deep white matter ischemic changes.

Timeline of Treatment

Patient was administered 2 sittings of Marma therapy daily regularly for 21 days. After 21 days, it was given twice a week for 2 months. Pratimarsha Nasya with Goghrta (Cow's ghee) was administered once a day for 21 days

Intervention

Patient was administered the Marma therapy that holds a very unique place in the ancient Indianmedical science.

Purva karma: Required instruments and equipment and were kept ready. Materials required for Nasya karma such as Goghrita (Cows Ghee) and Taila for Abhyanga were also kept ready. Patient was asked to consume light food and counselling was done before the procedure.

Pradhana karma:

Marma Therapy

- Patient was made to sit in the comfortable position
- He was asked to relax and breathe normally
- Marma therapy was performed by applying the pressure on the Marma points with the thumb of the Vaidya
- During the procedure, patient was asked to exhale on every stimulation and pressure and inhale on releasing the pressure.
- These Marma points included Shankha marma, Avarta Marma, Sthapani Marma, Janni Marma and Ottu Marma
- Application of the pressure on these points were done one by one with suitable intensity for 16 times.

Nasya Karma

- Patient was made to lie in the most comfortable position
- Abhyanga and Swedana was given to the face
- Goghrita was made lukewarm and 2 drops instilled in each nostril

Paschat karma:

Patient was made to lie down in supine position on the table and was asked to relax.

Follow up and Outcome

Patient was treated with Marma therapy on OPD basis. Patient was asked to come for the follow-up after 3 months. After two weeks of the treatment, the level of functional disability was increased. Symptoms like heaviness and headache was relieved, Speech had improved and the deviation of the mouth had come to normal.

DISCUSSION

According to Ayurveda, these areas of *marma* are the junctions of *mamsa* (muscles), *snayu* (ligaments and tendons), *sira* (vesssels), *asthi* (bone), and *sandhi* (joints) [12]. It is very clearly described by Ayurveda Acharyas that these special points of the body should be protected from any physical trauma or injury. Acharya Sushruta has highlighted about these *marma* regions and their potential therapeutic effects that can be utilized both for the treatment of diseases and at the same time, it may also turn out to be fatal if the marma points are injuredamidst the procedure. [13]Marma therapy involves the controlled and continuous stimulation of marma points by using hands in different areas based on the disease condition. It is believed that the marma therapy works on the basis of *panchamahabutas* and*tridoshas* and its holistic effect influences *prana* (life force) and helps in balancing the three *doshas*, *nadis*, and *chakras* by creating homeostasis and there by alleviation of the diseases. [14] No adverse effects were observed during the procedure or the study.

Patient perspective

The patient was satisfied with the marma therapy and was happy with the results. He was able to carry out his daily routine activities and resumed to his job. His quality of life was improved drastically and inculcated healthy lifestyle for the recurrence and prevention of the problem.

Informed Consent

Informed and written consent was obtained from the patient after explaining the treatment in detail.

CONCLUSION

Marma therapy showed significant changes in Ardita or the facial palsy with improvement in patient's complaints, in the level of functional disability, reduction of heaviness and headache, improvement in speech and deviation of the mouth. This study gives a novel path of management of Vatavyadhi.

ABSTRACT

Drug induced nephrotoxicity is one of the leading cause of morbidity and mortality and its prevalence is continuously increasing in industrialized nations. The therapeutic effects of cisplatin are dose dependent but the chief limit to its promising efficacy as an antineoplastic drug is its nephrotoxicity. Co-administration of various medicinal plants possessing nephroprotective activity along with different nephrotoxic agents may attenuate its toxicity. Medicinal plants have curative properties due to the presence of various complex chemical substances. Bromelain is a proteolytic enzyme and is having many medicinal activities like anti inflammatory, antidepressant etc and till date systemic evaluation of its nephroprotector activity is not reported. Bromelain was studied for nephroprotector activity by using male albino rat animals as model. Animals which received Cisplatin (5mg/kg bd.wt., i.p.) alone showed elevated levels of BUN, SCr, decreased Ucr, excreted high amount of protein in urine, decreased Clcr, increased levels of LPO and decreased GSH. In animals, which received BR (50 and 100mg/kg bd.wt., p.o.) showed marked protection against Cisplatin-induced nephrotoxicity. Histological studies substantiated the above results. The results of this study demonstrated that BR has a potent nephroprotective activity on cisplatin-induced nephrotoxicity in rats; this may be due to its antioxidant properties.

Keywords: Bromelain, Nephroprotection, Cisplatin, antioxidant activity

INTRODUCTION

Nephrotoxicity is one of the leading causes of morbidity and mortality and its prevalence is continuously increasing in industrialized nations. It is the most common renal disease or dysfunction that arises due to direct or indirect exposure of medicines and environmental chemicals. Today in India kidney disease is a silent killer; two lakh kidney disease victims die in India i.e. two deaths for every five minutes or roughly 547 every day (Morales-Alvarez, 2020; Prakash *et al.,* 2013). Nephrotoxicity is a poisonous effect of some substances, both toxic chemicals and medications (nephrotoxins are chemicals displaying nephrotoxicity) on the kidneys (Fusco *et al.,* 2016). A number of therapeutic agents such as antibiotics like Aminoglycosides, Cephalosporins and Amphotericin, Non steroidal anti-inflammatory agents like Ibuprofen, aspirin, indomethacin, piroxicam, immunosuppressive agents like tacrolimus, cyclosporine A and chemotherapeutic agents like methotrexate and cisplatin known to cause nephrotoxicity and it is one of the major disadvantage with these therapeutic agents which can adversely affect the kidney resulting in acute renal failure, chronic interstitial nephritis and nephritic syndrome (Wu and Huang, 2018; Tiong *et al.,* 2014; Fusco *et al.,* 2016). Exposure to chemical reagents like ethylene glycol, carbon tetrachloride, sodium oxalate and heavy metals like lead, mercury, arsenic and cadmium also induces nephrotoxicity. Among these various causes of renal failure, cisplatin accounts for 85% of the incidence of acute renal failure. Cisplatin (CP) is the drug of choice in many platinum based chemotherapy regimens (Miller *et al.,* 2010). It acts by damaging DNA owing to platination to form covalent platinum DNA adducts. DNA damage elicits a series of signal transduction cascades, involving chromatin remodeling, which eventually lead to DNA repair, cell cycle arrest or apoptosiss (Zhu *et al.,* 2015). The therapeutic effects of cisplatin are dose dependent but the chief limit to its promising efficacy as an antineoplastic drug is its nephrotoxicity (Pabla and Dong, 2008). Use of other means to prevent nephrotoxicity include hydration protocols, antioxidant supplementation have proven to be partially successful due to the repeated dosing schedules of CP. Therapeutic interventions aimed at ameliorating renal damage require the use of combination therapies. This indicates the involvement of reactive oxygen species (ROS) generation as a mediator in inflicting nephrotoxic insult in CP therapy. Interaction of cisplatin with CYP2E1 results in the generation of reactive oxygen metabolites that causes renal injury and initiates apoptosis (Chen *et al.,* 2019).

Nephroprotective agents are the substances which possess protective activity against nephrotoxicity. Ancient literature has prescribed various herbs for the cure of kidney disease. Co-administration of various medicinal plants possessing nephroprotective activity along with different nephrotoxic agents may attenuate its toxicity (Fang *et al*., 2021; Crona *et al.,* 2017). Medicinal plants have curative properties due to the presence of various complex chemical substances. With the advanced technology, number of studies reported that phytochemical having antioxidant properties effectively counteracted the cisplatin induced nephrotoxicity (Ojha *et al.,* 2016; Mahgoub *et al*., 2017). The present study was designed to evaluate one such phytochemical, so called as Bromelain (BR) isolated from pineapple against oxidative renal damage in cisplatin induced nephrotoxicity. Bromelain is a sulfphydryl containing proteolytic enzymes obtained from Ananascomosus, the pineapple plant (Taussig *et al.,* 1988; Ramli *et al.,* 2017). Bromelain primary constituent is a sulfphydryl proteolyticf ration, it also contains escharase (a non-proteolytic component), peroxidase, acid phosphatase, sever protease inhibitors. The beneficial effects of bromelain are due to multiple constituents apart from its proteolytic fraction. It was absorbed intact through the gastrointestinal tract. The highest concentration of bromelain was found in the blood one hour after administration (Maurer, 2001). Mechanisms for Bromelain's physiological effects appear to include interactions with inflammatory immune, cell signalling, and coagulation molecules and path ways. Bromelain also appears to have effects on cell surface antigens. Combined bromelain and antibiotic therapy was shown to be more effective than antibiotics alone in pneumonia, bronchitis, cutaneous Staphylococcus infection, thrombophlebitis, cellulitis, pyelonephritis, perirectal and rectal abscesses, sinusitis and urinary tract infections. It also used as antidiarrheal, antimicrobial, anticancer agents. Also been using for cardiovascular and circulatory diseases, as digestive aid, inflammatory bowel disease, musculoskeletal injuries, osteoarthritis, prostatis, renal disease, respiratory conditions including COVID-19, and rheumatoid arthritis etc (Abo El-Magd *et al.,* 2021; Owoyele *et al.,* 2020; Muhammad and Ahmad, 2017; Chobotova *et al*., 2010).

MATERIALS AND METHODS

Chemicals

Bromelain (BR) was obtained from SV Agro Foods Private Limited, Mumbai, India. Cisplatin was purchased from Sigma Chemicals, India. Blood urea nitrogen and Creatinine kits were purchased from Span diagnostics, India. All other chemicals were of analytical grade.

Animals

Male Albino rats weighing 160-180 g (about 6-8 weeks old) were used. The animals were housed 5 per cage (440 mm × 270 mm × 178 mm) under controlled conditions of light (12h light / dark cycle, lights on at 7:00 AM), temperature (22 ± 2 ^{0}C) and humidity 50–60% with free access to food and water. The animals were acclimatized to the laboratory for at least 7 days. All the experiments were carried out according to the committee for the purpose of control and supervision of experiments on animals (CPCSEA) with prior approval from Institutional Animal Ethics Committee No. 1995/PO/Re/S/17/CPCSEA/SHCP/01.

Methodology

After acclimatization, the rats were randomly divided into 4 groups of eight animals in each group. The experimental design is as follows

Normal Control (N): Rats received water as a vehicle.

Cisplatin control (Cis): Rats received a single dose of cisplatin (7 mg/kg) intraperitoneally on 1st day.

Bromelain (50 mg/kg)+ Cisplatin (Cis+BR-50): Rats received a single dose of cisplatin (7 mg/kg/i.p) on 1st day and BR (50 mg/kg/p.o) from 5th day onwards for 10 days.

Bromelain (100 mg/kg) + Cisplatin (Cis+BR-100): Rats received a single dose of cisplatin (7 mg/kg/i.p) on 1st day and BR (100 mg/kg/p.o) from 5th day onwards for 10 days.

Assessment of renal functions

Body weights were recorded on day 1, and day 15. On 15, blood samples were collected from retro-orbital plexus; serum was separated by centrifugation at 4000 rpm for 15 min and used for assessment of BUN and SCr. On 5th and 15th day, the animals were placed in metabolic cages for urine collection. Urine was centrifuged at 3000 rpm for 30 min and supernatant was used for the measurement of urinary total protein (U_{TP}) and Urinary Creatinine (UCr). After the collection of urine collected, rats were sacrificed by cervical decapitation and kidney tissue was obtained for biochemical and histological studies. A 10% homogenate of kidney tissue was prepared in phosphate buffer.

Measurement of protein concentration in kidney homogenate

Protein was determined according to the method of Lowry *et al*., 1951 using bovine serum albumin (BSA) as standard protein.

Determination of reduced glutathione

Reduced glutathione (GSH) content was measured according to the method of Ellman., 1959. Briefly, 0.75 ml of supernatant was mixed with 0.75 ml of 4% sulphosalicylic acid and then centrifuged at 1,200 rpm for 5 min at 4^{0}C. From this 0.5 ml of supernatant was taken and added to 4.5 ml of 0.01 M DTNB (5′,5′dithiobis 2- nitrobenzoic acid), and the yellow color developed was read Spectrophometrically at 412 nm immediately. The GSH content was calculated as nmol GSH/mg protein.

Measurement of malondialdehyde

Malondialdehyde (MDA) formation was estimated by the method of Ohkawa *et al*., 1979. Briefly, 200 µl of supernatant was added to 50 µl of 8.1% sodium dodecyl sulphate, vortexed and incubated for 10 min at room temperature. 375 µl of thiobarbituric acid (0.6%) was added and placed in a boiling water bath for 60 min and then the samples were allowed to cool at room temperature. A mixture of 1.25 ml of butanol: pyridine (1.5: 1 ratio), was

added, vortexed and centrifuged at 1000 rpm for 5 min. The optical density of the colored layer was measured at 532 nm on a Spectrophotometer against reference blank and the rate of MDA formed is expressed as nmol of MDA formed/h/mg protein.

Measurement of superoxide dismutase (SOD) activity

SOD activity was measured according to the method of Misra and Fridovich, 1972 by monitoring the auto-oxidation of (-) – epinephrine at pH 10.4 for 4min at 480 nm. Briefly, 100µl of brain supernatant was added to 880µl of 0.05M carbonate buffer containing 0.1mM EDTA (pH10.4), and 20µl of 30mM epinephrine (in 0.05% acetic acid) was added to the mixture and the optical density values were measured at 480nm for 4min on a UV-Visible Spectrophotometer, activity is expressed as the amount of enzyme that inhibits the oxidation of epinephrine by 50% which is equal to 1 unit. The SOD activity is expressed as U/mg protein.

Histological examination

The kidney tissue was isolated, fixed in 10% neutral buffered formalin and subsequently embedded in paraffin and sliced into slices of 5 µm thickness followed by staining with hematoxylin and eosin.

Statistical Analysis

Data was expressed as mean± standard error of the mean (S.E.M.). Statistical difference was analyzed using one-way analysis of variance (ANOVA) followed by Dennett's test using Graph Pad Prism version 5 software (GraphPad Software, Inc. La Jolla, CA, USA). A value of $p<0.05$ is considered as statistically significant.

RESULTS

Effect of Br on Renal Functions

To assess the renal function, parameters such as BUN, SCr, U_{TP}, UCr were estimated in all the groups. Cisplatin administration significantly ($p< 0.001$) increased BUN, SCr, U_{TP} as well as UCr levels in cisplatin control group compared to normal control group. Treatment with BR at a doses of 50 and 100 mg/kg for 10 days significantly ($p<0.001$) attenuated the increased levels of BUN, SCr, U_{TP}, UCr as compared to cisplatin control group (Figure 1, 2, 3, 4).

Effect of Br on Kidney Pro And Antioxidant Levels

Cisplatin administration significantly increased ($p<0.001$) the levels of MDA in kidney tissues of cisplatin control group, indicating development of oxidative stress. However, BR (50 and 100 mg/kg) treated groups showed significant ($p<0.001$) reversal in the levels of MDA as compared with cisplatin control group. (Table 1).

An endogenous antioxidant GSH levels were significantly decreased ($p<0.01$) after cisplatin administration as observed in cisplatin control group when compared with normal control group, which was significantly improved ($p<0.001$) in BR treated groups when compared with cisplatin control group. (Table 1).

SOD levels were significantly decreased ($p<0.01$) after cisplatin administration as observed in cisplatin control group when compared with normal control group, which was significantly improved ($p<0.001$) in BR treated groups when compared with cisplatin control group. (Table 1). Values are expressed as Mean ± standard error mean (SEM, n=6)

Analyzed by one-way ANOVA followed by post hoc Dunnetts test ***$p<0.001$ *vs* control group. ++($p<0.01$), +++($p<0.001$) *vs* cisplatin control group. Histological Studies

Kidney sections from normal control group showed normal glomerulus and tubule with regular morphology. Cisplatin control group showed degenerative glomeruli, interstitial hemorrhages, enlarged renal tubule with hemorrhages, congestion and vacuolization of renal tubule indicating renal toxicity. BR (100 mg/kg) treated group showed normal kidney morphology with less vacuolation, reduced glomeruli congestion with regenerated tissue indicating the protective effect of BR against cisplatin induced renal damage (Figure 5). normal organisation of glomeruli and-epithelial cells (EC), (B) Cisplatin control showed degenerative tissue with necrosis and congestion (C) BR high dose treatment showedregenerated glomeruli and epithelial cells.

DISCUSSION

Nephrotoxicity is the dose limiting complication which limited the clinical use of cisplatin, a major chemotherapeutic drug of choice for wide range of tumors (Ghosh, 2019; Dasari and Tchounwou, 2014; Miller *et al.,* 2010). Oxidative stress is recognized as a key pathogenic mechanism of cisplatin induced nephrotoxicity and its prevention is an important therapeutic approach (Chen *et al*., 2019; Wang *et al*., 2018; Chirino and Pedraza-Chaverri, 2009). Bromelain is a natural flavonoid and is well known for its antioxidant potential (Chen *et al.,* 2022; Saptarini *et al.,* 2019). Hence the present study proposed to demonstrate the protective effect of BR against oxidative stress in cisplatin induced nephrotoxicity. BR attenuated the renal damage as evident from restored BUN, SCr, UTP, UCr, morphological changes as well as redox status. Renal damage is indicated by marked increase in BUN, SCr, UTP, UCr. In congruent with this (Manohar and Leung, 2018; Sahu *et al.,* 2013), we observed significant increment in BUN, SCr, UTP and decrement in UCr after cisplatin administration in cisplatin control group indicating the development of renal tissue damage by cisplatin (Sharma *et al.,* 2018). These results are confirmed with histological examination where pathological changes of degenerated glomeruli, hemorrhages, vacuolation were observed in kidney tissue. BR treatment attenuated cisplatin induced nephrotoxicity as evidenced by attenuation of increased BUN, serum creatinine, urinary creatinine, urinary total protein. Accumulating evidence suggested that there is robust production of reactive oxygen species (ROS) after cisplatin administration (Sharma *et al.,* 2018; Sharma *et al.,* 2017). The ROS such as superoxide, hydroxyl radicals and nitric oxide accumulated in the renal tissue overwhelms the antioxidant dense mechanism, thus lead to oxidative stress (oxidant/antioxidant balance). Oxidative stress has been implicated as critical pathogenic mechanism in cisplatin induced nephrotoxicty. The renal content of peroxynitrite and nitric oxide is increased in cisplatin treated rats. Free radicals damage the lipid components of the cell membrane by peroxidation and denaturation of proteins, which lead to enzymatic inactivation (Ali *et al*., 2022; Yousef and Hussien, 2015).

Antioxidant enzymes are inhibited by cisplatin and renal activities of superoxide dismutase, glutathione peroxidase and catalase are significantly decreased (Ghanbari *et al.,* 2022; Song *et al.,* 2015). LPO are generated naturally in small amounts in the body mainly by the effect of several ROS i.e., hydroxyl radical and hydrogen peroxide. An increase in the concentration of end products of LPO is the evidence for the involvement of free radicals in human disease. After cisplatin treatment, decreased level of protein, succinate dehydrogenase activity, and increased level of lipid peroxides were noted in kidney. In this study, cisplatin-induced animals showed increased LPO level in kidney comparable to the control control animals. BR significantly reduced the kidney LPO levels and counteracted the formation of free radicals induced by cisplatin-mediated nephrotoxicity, indicating its protective role in the prevention of renal damage (Park *et al.,* 2015). GSH is an important antioxidant tripeptide in the cells, preventing damage to important cellular components caused by ROS (Vijayan *et al.,* 2007; Ajith *et al.,* 2007). GSH detoxifies many endogenous toxins, including cisplatin, through the formation of GSH adducts to protect cells from the potential nephrotoxicity. In this study, BR with graded doses (50mg/kg & 100mg/kg) prevented renal damage by significant increase in the kidney GSH level which effectively protects renal cells from the exposure to free radicals and peroxidase induced by cisplatin (Saptarini *et al.,* 2019). Histological studies revealed that Kidney sections from normal control group showed normal glomerulus and tubule with regular morphology. Cisplatin control group showed degenerative glomeruli, interstitial hemorrhages, enlarged renal tubule with hemorrhages, congestion and vacuolization of renal tubule indicating renal toxicity. BR (100 mg/kg) treated group showed normal kidney

morphology with less vacuolation, reduced glomeruli congestion with regenerated tissue indicating the protective effect of BR against cisplatin induced renal damage.

CONCLUSION

Nephrotoxicity is defined as renal disease or dysfunction that arises due to direct or indirect result of exposure to medicines and industrial or environmental chemicals. Cisplatin is one of the drugs which induce the nephrotoxocity by generating free radicals. Further, many reports suggested that phytochemicals exhibited nephroprotector activity against renal toxicity. Bromelain is a proteolytic enzyme and is having many medicinal activities like anti inflammatory, antidepressant etc and till date systemic evaluation of its nephroprotector activity is not reported. Bromelain was studied for nephroprotector activity by using male albino rat animals as model. Animals which received Cisplatin (5mg/kg bd.wt., i.p.) alone showed elevated levels of BUN, SCr, decreased Ucr, excreted high amount of protein in urine, decreased Clcr, increased levels of LPO and decreased GSH. In animals, which received BR (50 and 100mg/kg bd.wt., p.o.) showed marked protection against Cisplatin-induced nephrotoxicity. Histological studies substantiated the above results.The results of this study demonstrated that BR has a potent nephroprotective activity on cisplatin-induced nephrotoxicity in rats; this may be due to its antioxidant properties.

Conflict of Interest

The authors declare that no conflict of interest.

ABSTRACT

The temporomandibular joint (TMJ) is a synovial bi-condylar joint with three degrees of flexibility, the temporomandibular joint (TMJ) is a synovial bi-condylar joint. It has been observed that temporomandibular joint dysfunction (TMD) affects one-third of adults. Compared to men, females are more frequently impacted. While 75–80% of individuals with TMD require medical intervention and it can take up to three years for the full remission of symptoms, nearly 50% of patients with TMD do not require any treatment and the symptoms resolve on their own within a year of starting. TMD's clinical manifestations include jaw clenching, clicking, and locking as well as occlusion brought on by bad posture. This review aims to provide an overview of TMD and treatment strategies for TMD. Various conservative treatment methods have been proven to be effective, including self-care strategies, pharmacological treatment, physical therapy modalities, manual mobilization, electrotherapy and dry needling, relaxation techniques, intra-articular injections, dental treatment strategies, cognitive behavioural therapy, surgical corrections.

Keywords:

INTRODUCTION

The temporomandibular joint, or TMJ, has outstanding stability and mobility. Fibrous connective tissue covers the articular surfaces of the mandible and maxilla. Between the articular surfaces lies a joint disc. The articular disc provides mobility to the TMJ, allowing us to easily carry out all daily activities like speaking, swallowing, and chewing [1]. There is a clear epidemiologic preference for TMDs in women. In the overall population, women are

twice as likely as men to have TMDs; however, in the patient group, the ratio of female to male patients can reach up to 10:1.6. [2] Women have TMD symptoms more frequently than males do. TMD symptoms are more prevalent in women than in men. The known increased health risk in postmenopausal women of conditions such as stroke, heart disease, women tend to develop TMD during their premenopausal years.[1,2] The reasons behind the gender disequilibrium in TMD prevalence are not clear, but some clinicians have suggested a hormonal influence.[3,4]

Clinical Evaluation

Correct diagnosis is essential for TMD treatment; this involves gathering information from the patient's medical history, doing a clinical examination, and conducting relevant investigations to support the diagnosis.[7]

TMD management strategies

Explanation and reassurance

TMD can be managed
TMD is not life-threatening
TMD is not a Cancer
TMD can become a chronic condition.

Education and self care

Soft diet
Jaw rest (especially during long dental appointments)
Avoid extreme jaw movements
Topical heat
Protect face and jaws from cold weather
Avoid stress and anxiety

Medications

Anti-inflammatories
Anxiolytics
Muscle relaxants
Antidepressants

Jaw physiotherapy

Massage and stretching
Dry needling
TENS – transcutaneous electrical nerve stimulation
Pulsed ultrasound therapy

Occlusal appliance therapy

Behavioural therapy

Lifestyle counselling
Relaxation therapy
Hypnosis
Biofeedback
Psychotherapy

Other

Acupuncture
Botox injections

TMJ surgery
Closed procedures
TMJ arthrocentesis
TMJ arthroscopy

Open procedures
TMJ arthrotomy/arthroplasty[8,9]

Treatment of TMJ Disorders
Part 1: non-surgical treatment
Explanation and reassurance
Initially, in the treatment of temporomandibular disorders, the patient is informed about the nature and source of the disease they are experiencing, and they are reassured that the condition is benign. The knowledge that their temporomandibular dysfunction symptoms are not indicative of "cancer" will be comforting to a lot of sufferers. More sinister potential reasons should be successfully ruled out by a thorough evaluation.[11]

Patient education and self-care
It is recommended that the patient stick to a soft diet and stay away from items that require a lot of chewing. In addition, the patient is to be dissuaded from engaging in any activity that could exacerbate their mandibular dysfunction, such as singing, chewing gum, or broad yawning. By encouraging muscle relaxation, massaging the afflicted muscles while applying moist heat might help relieve sore or exhausted muscles. Additionally, patients should be counselled to determine the causes of their stress and attempt to modify their lifestyles in response.[12]

The analgesic effect of non-steroidal anti-inflammatory drugs
Non-steroidal anti-inflammatory medications have a distinct analgesic impact when used to treat temporomandibular disorders, which are conditions in which inflammation, such as synovitis or myositis, is the cause of pain. Because of their significant potential for addiction, opiates are best given for moderate to severe pain over a brief period of time. Opioids are more successful in reducing the patient's emotional reaction to pain than they are at completely curing the pain experience at standard clinical dosages. Tranquillizers, including benzodiazepines or, less frequently, phenothiazines, are used to help patients manage high levels of emotional stress related to TMJ disorders by lowering their perception or response to stress.[13]

Jaw exercises
It is believed that jaw workouts might improve the TMJ's supporting structures and muscles. Among the suggested exercises are manual joint distraction, guided opening and closing motions, and mild tension workouts against resistance. One can usually obtain leaflets from the oral surgery department in the area that describe how to carry out these exercises.[7]

Occlusal splint therapy
Occlusal splint therapy is the most widely used treatment method for temporomandibular problems administered by dentists. This also goes by the names bite guard, occlusal appliance, and bite raising appliance. Reducing the maximal pressures on the TMJ and shielding teeth from unusually high loads in clenchers and grinders are the goals, especially for patients who grind or clench at night. Muscle pain may be reduced in theory because distracting the occlusion also prevents the masticatory muscles from contracting to their maximum extent.[7]

Physiotherapy
For the purpose of treating muscle soreness, TENS (transcutaneous electrical nerve stimulation) and pulsed ultrasound therapy are used. Physiotherapy is crucial after TMJ surgery and is particularly helpful in the treatment of myofascial pain and TMJ closure lock. It is crucial to work closely with a physiotherapist who is knowledgeable

about treating musculoskeletal diseases of the head and neck, particularly one who specialises in treating TMJ issues.[12]

Other therapies

Acupuncture, Botox injections, Osteopath jaw manipulations and other treatments have been tried in TMD management but have yet to be accepted into mainstream practice due to lack of evidence in the effectiveness of these modalities.[14,15,16]

Surgical treatment

Indications for TMJ surgery

Absolute indications
Ankylosis – Fibrous or osseous joint fusion
Neoplasia – Osteochondroma of the condyle
Dislocation – Recurrent or chronic
Developmental disorders – Condylar hyperplasia

Relative indications

Internal derangement
Osteoarthrosis
Trauma

A General indications

Disorder not responding to non-surgical therapy
Where the TMJ is the source of pain
Pain localised to the TMJ
Pain on functional loading and movement of the TMJ
Mechanical interference with TMJ function

B Specific indications

Chronic severe limited mouth opening
Advanced degenerative joint disease with intolerable symptoms of pain and joint dysfunction
Confirmation of severe joint disease on CT scan or MRI

Arthrocentesis as a therapy for TMD Arthrocentesis Synopsis Removal of intra-articular inflammatory mediators, hydraulic pressure and manipulation to remove adhesions, and saline lavage of the superior joint space. less invasive than an arthroscopy and can be performed in an outpatient clinic while under intravenous sedation and local anaesthesia Significance Restricted opening without reduction and anteriorly misplaced articular disc Prolonged discomfort accompanied by a reduced range of motion and a displaced articular disc excruciating osteoarthritis degenerative Restrictions TMJ exhibiting fibrous or bony ankylosis source of discomfort outside the capsule Individuals who have not received noninvasive medical procedures Effectiveness According to recent studies, patients with osteoarthritis and internal derangement have an 83.5% treatment success rate, which is characterised as an improvement in maximum jaw opening, a decrease in discomfort, and a reduction in mandibular dysfunction.[17,18] Arthroscopy as a therapy for TMD Description of Arthroscopy involves injecting an arthroscope and doing a TMJ examination while sedated and under general anaesthesia. permits direct viewing of the joint during irrigation of the joint space, lysis of these adhesions, and joint mobilisation. Significance Pain and limited opening as a result of internal disorder TMJ hypomobility brought on by adhesions or fibrosis Osteoarthritis degenerative Restrictions severe fibrous or bony ankylosis in the TMJ source of discomfort outside the capsule Individuals who have not received non-invasive medical procedures a physician without prior expertise performing open joint surgery Effectiveness >90% of participants in a sizable multicentre study reported improved function,

discomfort, and mobility. After a year, arthroscopy produced a better improvement in opening than arthrocentesis; discomfort was the same.[20]

CONCLUSION

TMDs continue to be a frequent reason for patients to attend emergency rooms, paediatricians, internists, and primary care doctors. Significant advancements in clinical diagnosis, radiological imaging, and classification of these disorders have improved long-term care, despite the fact that the precise cause and basic pathogenesis of these disorders remain poorly known. It is evident that there are numerous varieties of illnesses affecting the TMJ, masticatory muscles, and related tissues. Each type of disorder may have a unique aetiology, clinical course, and therapeutic response. In several stages of these illnesses, such as pain modulation and therapy response, host vulnerability is involved. Future studies in the fields of pain, genetics, and arthritis may be able to better define this diverse collection of conditions and give targeted, efficient treatment.

ABSTRACT

This study explores the optimization of Vehicle-to-Grid (V2G) systems and their role in energy management for integrating renewable power sources, specifically wind, solar, and hybrid power. The research is structured around three primary scenarios: wind power integration, solar power integration, and hybrid power integration. Each scenario is analyzed both with and without electric vehicles (EVs) to assess their impact on grid stability and power quality. In the wind power integration scenario, directly connecting wind power to the grid without EVs results in significant power fluctuations, leading to potential grid failures. However, incorporating EVs helps to mitigate these issues by storing excess energy in batteries, thereby providing a stable power supply during periods of low wind. Similarly, in the solar power integration scenario, excess energy is stored in EV batteries, ensuring a continuous power supply even during times without sunlight. The hybrid power integration scenario combines both wind and solar sources, taking advantage of the complementary characteristics of these renewable energies to deliver superior power quality and reliability. Simulation results show that hybrid integration with EVs offers the most reliable and high-quality power output, with solar and wind integrations following in that order. Additionally, the use of DC-DC bidirectional converters and RLC filters improves power stability

by managing voltage fluctuations and reducing harmonics. This comprehensive analysis highlights the potential of V2G systems to enhance the feasibility and reliability of integrating renewable energy into the power grid.

Keywords: EV, Vehicle-to-Grid (V2G), Solar system, Wind system, Hybrid resource.

INTRODUCTION

The growing global concern over climate change and environmental degradation has prompted a significant shift towards renewable energy sources. This movement is driven by the necessity to reduce greenhouse gas emissions, decrease dependence on fossil fuels, and promote sustainable development. While renewable energy sources like wind and solar power offer clean, inexhaustible energy, they also present challenges due to their intermittent and variable nature. Effectively integrating these sources into existing power grids requires advanced energy management systems to maintain stability and reliability. One promising approach is the Vehicle-to-Grid (V2G) system, which utilizes electric vehicles (EVs) as mobile energy storage units[1]. V2G technology enables the bidirectional flow of electricity between EVs and the power grid, allowing EVs to not only draw power from the grid for charging but also feed stored energy back into the grid when needed. This capability effectively transforms EVs into distributed energy resources, and V2G systems have shown great potential in enhancing grid stability and facilitating the integration of renewable energy sources. Wind energy, one of the most established renewable technologies, has the potential to generate large amounts of electricity, particularly in areas with abundant wind resources. However, the variability of wind speeds leads to fluctuating power outputs, posing challenges for grid integration. Without effective energy management, these fluctuations can cause significant disturbances and potential grid instability. Research has shown that integrating wind power with V2G systems can address these issues. In scenarios where V2G is not utilized, direct wind power connection to the grid results in undesirable voltage, current, and power waveforms, leading to instability. However, by incorporating EVs, excess energy generated during high wind periods can be stored in EV batteries and released back into the grid during low wind periods, thereby smoothing power fluctuations and enhancing grid stability. Solar energy, derived from photovoltaic (PV) cells, is another crucial renewable resource [2]. Its reliance on solar radiation, which varies with weather conditions and time of day, presents challenges in maintaining a stable power supply when directly integrated into the grid. The integration of solar power with V2G systems offers a viable solution to these challenges. By storing surplus solar energy in EV batteries, the system can ensure a continuous power supply even during periods of low solar activity. Advanced control strategies, including PID controllers and DC-DC bidirectional converters, can regulate the variable DC supply from PV cells, ensuring a stable and reliable power output to the grid.

This integration not only stabilizes the grid but also maximizes the use of solar energy, reducing reliance on fossil fuels. Combining wind and solar power in a hybrid system leverages the complementary nature of these resources, providing a more reliable and consistent power supply [3]. Hybrid systems are especially effective in regions with high wind and solar potential, ensuring a balanced power output. In hybrid power integration scenarios, energy from wind and solar sources is managed together, with EVs providing additional storage and buffering capabilities. DC-DC bidirectional converters play a critical role in regulating power flow, while RLC filters help reduce harmonics in the inverter output, resulting in improved power quality. This integrated approach enhances the reliability of the power supply and optimizes the use of renewable energy sources [4]. The integration of renewable energy sources into existing power grids presents several challenges, primarily due to the intermittent nature of wind and solar power, which can lead to variability in power output and grid instability. The lack of effective energy storage solutions further complicates these challenges, as excess energy generated during peak production periods cannot be efficiently stored and used during low production times. V2G systems offer a promising solution by providing dynamic and flexible energy storage. EVs, with their large battery capacities, can store surplus energy during periods of high renewable production and return it to the grid during low production periods. This bidirectional energy flow

helps balance supply and demand, reducing the impact of variability and ensuring a stable power supply. The use of advanced power electronics, such as DC-DC bidirectional converters and RLC filters, enhances the effectiveness of V2G systems by regulating power flow, managing voltage fluctuations, and reducing harmonics, thereby contributing to overall grid stability and power quality[5]. The successful integration of V2G systems with renewable energy sources holds significant implications for future energy systems. By enhancing grid stability and improving the reliability of power supply, V2G systems can facilitate the large-scale deployment of renewable energy, supporting the transition to a sustainable and low-carbon energy future. Policymakers and industry stakeholders should prioritize the development and deployment of V2G infrastructure as a key strategy in achieving renewable energy goals. Future research should focus on optimizing V2G systems and exploring their integration with other renewable energy sources, such as tidal and geothermal energy[6-7]. Advancements in battery technology and energy storage solutions will also be crucial in enhancing the effectiveness of V2G systems, along with the development of smart grid technologies and real-time energy management systems to ensure efficient and reliable V2G operation.

Vehicle-To-Grid (V2g) Optimal Scheduling For Renewable Power Integration

The optimal scheduling of the power system is analyzed through three different scenarios: Wind Power Integration, Solar Power Integration, and Hybrid Power Integration. Vehicle-to-Grid (V2G) technology allows energy to be transferred back to the power grid from the battery of an electric vehicle (EV). This system enables the charging and discharging of a car battery based on various signals, such as local energy production or consumption[8].

The broader concept, known as Vehicle-to-Everything (V2X), includes several use cases like Vehicle-to-Home (V2H), Vehicle-to-Building (V2B), and Vehicle-to-Grid (V2G). The specific abbreviation used depends on whether the electricity from the EV battery is powering home appliances, building systems, or feeding back into the grid. This means that even when not connected to the grid, your vehicle can still offer value. The principle of V2G is similar to that of smart charging, or V1G charging, which allows for the controlled charging of electric vehicles with the ability to adjust charging power as necessary. V2G extends this concept by allowing the energy stored in car batteries to be returned to the grid, helping to balance fluctuations in energy supply and demand.

Wind Power Integration with EV

Integrating wind energy with electric vehicles (EVs) presents a promising solution to key challenges in the energy and transportation sectors. This synergy promotes the use of renewable energy, reduces greenhouse gas emissions, and decreases dependence on fossil fuels. This study explores the benefits, challenges, and potential strategies for effectively combining wind energy and electric vehicles. Power generation from wind energy is influenced by factors such as wind speed, generator speed, and pitch angle. Directly connecting wind-generated power to the grid can lead to grid instability due to fluctuations in these wind parameters. Low wind speeds and gusts can cause significant power variations, potentially leading to grid collapse. To address these fluctuations, integrating wind power with electric vehicles (EVs) provides a solution. When there is an excess or deficit in wind energy supply, EVs can store the energy in their batteries, thanks to the use of bidirectional converters. These converters regulate the power flow by switching between two modes: buck (for reducing voltage) and boost (for increasing voltage), ensuring a stable and consistent power supply[9] When there is a high power output from wind energy, the excess power can be stored in the battery's super capacitor, and only the necessary amount is sent to the grid. Conversely, when wind power supply is low, energy stored in the battery's capacitor can be drawn upon and supplied to the grid. Wind power generated through a permanent magnet synchronous generator (PMSG) produces AC power, which is then rectified to DC power as show in fig.2. This DC power is fed into a load-balancing storage device, specifically a DC link capacitor, to minimize voltage fluctuations. The DC supply is then converted back into AC power using inverters. However, this AC power may contain harmonics. To address this, RLC filters are employed to filter out and tune harmonics, removing any unwanted oscillations, noise, and distortions. The resulting smooth AC supply is then fed into the grid, which distributes it to consumers.

Solar Integration with EV

The PV source is composed of PV cells, which need to be modeled individually to create a PV module, and then combined into a PV array to achieve the desired power and voltage levels. Figure 3 illustrates the general equivalent circuit of a PV cell, which includes a current source paired with a reverse-blocking diode. The circuit also contains a photocurrent (Iph), which is influenced by temperature and irradiation. The series resistance represents the internal resistance through which the current (I) flows, while the shunt resistance accounts for the leakage current (Ish). The equations governing the load current, photocurrent, and other related parameters are provided below[10-11].

$$I=I_{ph}-I_o-I_{sh}$$

$$I_{ph}=[I_{sc}+K_i(T_k-T)]\times\frac{G}{1000}$$

$$I_{RS}=\frac{Isc}{\exp(q\times Voc+Ns\times K\times A\times T)-1}$$

$$I_o=I_{RS}\left[\frac{T}{Tr}\right]^3\exp\left[\frac{q\times E0}{Ak}\left\{\frac{1}{Tr}-\frac{1}{T}\right\}\right]$$

$$I_{pv}=N_p\times I_{ph}\times N_p\times I_0\left[\exp\left\{\frac{q\times Vpv+Ipv\times Rse}{Ns\times Akt}\right\}-1\right]$$

The number of cells connected in parallel is denoted as NpN_pNp, and the number of cells connected in series is denoted as NsN_sNs [17-18]. A solar cell, or photovoltaic (PV) cell, is a device that generates electrical current from light through the photovoltaic effect, as shown in Figure 4. The first solar cell was developed by Charles Fritts in the 1880s. Ernst Werner von Siemens, a German industrialist, recognized the significance of this invention In 1931, German engineer Bruno Lange developed a photocell that used silver selenide instead of copper oxide. However, selenium-based cells of that era converted less than 1% of incoming light into electricity. Building on Russell Ohl's advancements in the 1940s, researchers Gerald Pearson, Calvin Fuller, and Daryl Chapin introduced the silicon solar cell in 1954. These early silicon cells achieved an efficiency of 4.5–6% but came with a high cost of $286 per watt.

Vehicle To Grid Technology With Hybrid Energy Storage System

V2G, or "vehicle to grid," is a technology that allows energy to be transferred from an electric car's battery back to the power grid. With vehicle-to-grid technology, also known as car-to-grid, a car battery can be charged or discharged based on various signals, such as local energy production or consumption[12-13]. In this work, the Hybrid Energy Storage System (HESS) incorporates clusters of electric vehicles (EVs) and super capacitors (SCs). If EVs cannot fully compensate for fluctuations in renewable energy sources, the super capacitor steps in to provide additional support. This approach also allows for a small degree of wind and solar curtailment. Figure 5 illustrates the general framework of the HESS for integrating renewable energy sources [14-15].

SIMULATION RESULTS

The outcomes of optimizing the Vehicle-to-Grid (V2G) system and its energy management for renewable power integration are examined across three scenarios:

A. Wind Power Integration

B. Solar Power Integration

C. Hybrid Power Integration (wind & solar)

For Wind Power Integration, two specific scenarios are considered: one without the involvement of EVs and another with EV integration[16-17].

In Case 1

Wind power integration is studied without incorporating EVs into the grid. Figure 6 presents the simulation block diagram for this scenario, illustrating wind integration without EV support[18]. In the scenario where wind power is integrated directly into the grid without EV support, fluctuations in wind speed can cause significant issues in the

power system. These variations, whether from high or low wind supply, result in unstable waveforms that are not suitable for reliable power delivery to the grid, potentially leading to grid failures. Figure 7 illustrates the resulting voltage and current waveforms from the wind supply, while Figure 8 depicts the voltage levels at the wind source and the DC link.

Case 2 studied the Solar Power Integration

In the study of solar power integration with electric vehicles (EVs) into the grid, we analyze how solar power combined with EVs can enhance energy management. The power generated from solar panels depends on factors such as solar radiation, the number of cells, series strings, parallel strings, open circuit voltage, short circuit current, maximum power point voltage, maximum power point current, and temperature. Excess energy produced by the PV cells is stored in battery super capacitors[19]. When sunlight is unavailable or solar output fluctuates, the stored energy in these capacitors ensures a continuous supply. To manage high and low DC supply from the PV cells, PID controllers regulate the system. The DC-DC bidirectional converters, including buck and boost converters, play a crucial role in interfacing between the energy source and load, allowing energy to be stored in batteries. The DC supply is then directed to a DC link, which acts as a balancing storage device. This DC voltage is converted to AC power by an inverter. The resulting AC supply, which may contain harmonics, is filtered using RLC filters to ensure smooth operation. Finally, the inverter synchronizes with the grid, supplying utility electricity for both commercial and residential use. Figure 9 illustrates the block diagram of the solar power integration with EVs to the grid. Now Fig.10 shows the waveforms of voltage and current at solar with EV and Fig.11shows the voltage waveforms at solar and DC link. Fig.11shows the voltage waveforms at solar and DC link.

Case -3 studied Hybrid Power Integration

In hybrid power integration, combining wind and solar energy improves both power quality and continuity of supply. Power generated from both wind and solar sources is managed to ensure a stable supply. To prevent grid failures from direct power connections, the substantial power output is integrated with electric vehicles (EVs). The DC supply from this hybrid source is compared and regulated using buck and boost converters through DC-DC bidirectional converters, which store energy in the battery. The DC supply from the battery is then routed to a DC link, which stabilizes voltage and minimizes fluctuations, especially when the inverter requires significant current. The DC power is subsequently converted to AC by the inverter. Any harmonics present in the inverter output are mitigated using RLC filters. The inverter then synchronizes with the grid, providing the required output power for both domestic and commercial use. Figure 12 displays the block diagram of the hybrid power integration with EVs[20]

Wind Power Integration

Direct integration of wind power into the grid, without the support of electric vehicles (EVs), can lead to significant issues due to the inherent variability in wind speed. These fluctuations can result in unstable power outputs, potentially causing grid failures. However, incorporating EVs into the wind power system offers a practical solution. EVs can absorb excess energy generated during periods of high wind and release it when wind speeds are low, thereby stabilizing the grid and mitigating the adverse effects of power fluctuations.

Solar Power Integration

Solar power integration with EVs improves energy management by storing excess solar energy in battery super capacitors. This stored energy can be used to provide a continuous and stable power supply during periods of low sunlight or fluctuating solar output. The use of PID controllers, DC-DC bidirectional converters, and RLC filters plays a crucial role in regulating and filtering the power, ensuring smooth integration with the grid. This setup facilitates reliable power delivery for both residential and commercial uses.

Hybrid Power Integration

Combining wind and solar energy with EV support enhances power quality and continuity. The hybrid system effectively manages and balances power supply by storing energy from both sources in batteries. This approach

reduces the risk of grid failures and ensures a steady power supply. The use of buck and boost converters, DC links, inverters, and RLC filters optimizes the system by managing voltage fluctuations and reducing harmonics, leading to improved grid stability. In summary, the integration of V2G systems with renewable energy sources offers a robust framework for addressing the challenges of energy variability and grid stability. These integrations not only enhance the efficiency and reliability of power systems but also contribute to a more sustainable energy future by reducing reliance on fossil fuels and supporting the transition to renewable energy. Continued advancements in technology and control mechanisms will further bolster the effectiveness of these systems, paving the way for a resilient and sustainable energy infrastructure.

CONCLUSION

The optimization of Vehicle-to-Grid (V2G) systems in conjunction with renewable power sources like wind, solar, and hybrid, demonstrates considerable benefits in managing energy resources and enhancing grid stability. Each scenario reveals distinct insights into how V2G technology can be leveraged to address challenges associated with renewable energy integration.

ABSTRACT

The incidence of postnatal LBP (low back pain) has been shown to range from 21% to 82% in the first-year post-partum. Approximately 70% of women report back pain at some point in their postnatal period. The development of back pain has been related to spinal changes, especially an increase in lumbar curvature and anterior pelvic tilt, which alters the distribution of loads, causing increased tensions in lumbar structures. The effects of early postnatal exercises on posture in early postpartum period is still understudied. Thus, the study aims to evaluate the effects of early postnatal exercise on postural changes. The objective of the study is to analyze the effects of early postnatal exercises and education on pelvic tilt and lumbar lordosis in early postnatal mothers. A quasi-experimental study method was conducted in Sri Ramachandra Hospitalin Obstetrics and Gynecology OPD. Non–probability sampling method - 9 mothers in Experimental group and 10 mothers in control group were included in the study. Experimental group received core stabilization exercises and control group received conventional postnatal exercise. In result the Data was analyzed using SPSS version 20. The within group analysis had shown a significant difference in pelvic tilt, lumbar lordosis and VAS score. The between group (interventional and control) analysis had not shown statistically significant difference but, there is a reduction in mean value of pelvic tilt, lumbar lordosis and VAS score in the experimental group than the

control group. In conclusion even though the abdominal exercises are routine conventional intervention in postpartum period, Core stability exercises may provide pain relief for women with low back pain. This study conveys that core stability exercises along with postural care and education will increase the strength of lumbo-pelvic muscles, improve in posture such as pelvic tilt and lumbar lordosis and decrease the pain intensity in postpartum period.

Keywords: Postnatal, Low Back Pain, Stabilization Exercises, Core Muscle Exercises, Postural Changes, Lumbar Lordosis, Pelvic Tilt and Postnatal Back Care.

INTRODUCTION

Postnatal or postpartum period which defined as the six-week following delivery. During pregnancy, the pregnant mother undergoes significant anatomical and physiological changes to accommodate the developing fetus [1]. That anatomical changes are associated with an alteration in pelvic inclination and in lumbar and thoracic curvatures [2]. The increased size of the abdomen has been linked to a decreased static stability and adaptive changes in spinal curvatures, which would compensate the anterior displacement of the center of gravity, to ensure postural balance [3]. One of the most frequent complications of pregnancy is low back pain, with 50- 70% prevalence. Any effects of pregnancy on posture, therefore, may persist after the delivery and may be detrimental to the normal functions of the trunk musculoskeletal system. In addition, during the early postpartum period, there is a rapid increase in the number of lifting and carrying tasks undertaken with in normal daily activities, with a subsequent increase intrunk tissue loads [2]. Foti and associates reported an increased peak anterior pelvic tilt in late pregnancy when compared to one-year post-birth with no differences in pelvic rotation in the transverse or coronal plane [3,4]. The lordosis angle in the pregnant women did show a trend to increase during pregnancy from 44.4° ±5.69 during the 2nd trimester to 48.68° ±8.84 at the postpartum measurements [5]. The development of back pain has been related to spinal changes, especially an increase inlumbar curvature, which alters the distribution of loads, causing increased tensions in lumbarstructures. There was a relationship between lumbar lordosis, pelvic tilt and abdominal muscle performance and significant correlation between Visual Analog Score(VAS) and anterior pelvic tilt of female low back pain patients were found in some studies [6]. Likewise, Uncorrected anterior pelvic tilt may cause chronic low back pain, lumbar disc degeneration, disc herniation or disc bulge, SI joint pain, muscle strain, pain in hip, and facet syndrome in their later period.

Regular physical activity is a practice that affects both physical and psychological health of women, which has positive effects on all aspects of life, including the postpartum period [7]. The Canadian guidelines suggested that if pregnancy and delivery are not complicated, a mild postnatal exercise includes the walking, pelvic floor exercises, abdominal strengthening and stretching of all muscles can be started early. Unfortunately, many observational studies stated that physical activity level is less during pregnancy and afterbirth.[8] Postpartum rehabilitation of the associated lumbo-pelvic musculature with specific stabilization exercises is recommended to reduce pain and improve long term outcomes. In the past postpartum low back pain managed through back strengthening exercises. However, some studies also indicate that core stabilization exercises are helpful for those with chronic back pain or weak abdominal muscles. Core stabilization exercises and postural correction were an effective technique in postpartum low back pain and postural related discomforts [9]. Core stability is essential for proper load balance within the spine, pelvis, and kinetic chain. Core stability exercises are better than other forms of exercise in preventing injury and reducing chronic postpartum lower back pain . Also, studies proved that the maximal posterior pelvic tilting exercises can decrease the amount of lumbar lordosis, the studies did demonstrate that the degree of lumbar lordosis does change significantly during period of the exercise . [10] Targeted postnatal rehabilitation programs present the opportunity to reverse the deconditioning caused by pregnancy. There is dearth of literatures on effects of the postnatal exercises on postural changes in early postpartum mothers. So, the aim of this study is to evaluate the effects of postnatal exercise on the lumbar lordosis and pelvic tilt.

MATERIALS AND METHODS

This quasi-experimental Study was approved by the Ethics committee for Students proposals (CSP/19/NOV/81/380), "Sri Ramachandra Medical College and Research Institute" (Deemed to be University). The subjects were recruited from the family welfare outpatient department from G-Block of Sri Ramachandra Institute of Higher Education and Research. [Deemed to be University]. The sample size was 50 and the estimated sample size was calculated using comparison of two means (Power -80 %,) (CI – 95%), sample size was rounded to 50 subjects into each group. In this present study, 9 mothers allocated to interventional group and 10 mothers into control group. Purposive Samplingmethod was used. the outcome measures are the primary outcomes were pain and lumbar lordosis, pelvic tilt. Pain was measured by Visual Analog Scale, lumbar lordosis measured using flexi-curve ruler, pelvic tilt measured by pelvic tilt ruler. Assessment of lumbar lordosis: A flexible ruler was used to examine the thoracic and lumbar curvature. Validity and reliability studies for the flexible ruler and non-radiographic method have been performed previously. The amount of lordosis was measured three times by a single examiner using a flexible ruler and the average value was reported. To assess the curvatures by using a flexible ruler, participants were asked to stand in the normal anatomical position with the examiner standing at the back. First lumbar (L1) and second sacral (S2) vertebrae were considered as markers for evaluating the lumbar curvature. The flexible ruler was placed on L1 and S2 while a hand pressed on it to eliminate the gap between the ruler and the skin. The ruler was put on a sheet and the lumbar curve was drawn afterwards. [11,12]. Assessment of pelvic tilt: It is a pelvic tilt ruler that combines of a caliper and 360^{o} protractor. The caliper points the ASIS and PSIS. They were given instructions to stand as erect as possible without bending the ankles, knees, hips, or spine and were told to look at a fixed point ahead of them. They were asked to support the weak arm by using the strong arm. For measuring the anterior –posterior tilt, the anterior superior iliac spine (ASIS) and posterior superior iliac spine (PSIS) were palpated directly on the skin. The ASIS was palpated by bringing the thumbs from inferior to superior and the PSIS was palpated and marked by tracing the iliac crest posteriorly and then moving the thumbs superiorly and laterally from the sacrum edge to the most prominent protrusion, The patient was asked to take a deep breath, exhale and to wait to inhale again until after the measurement is taken. This gave the degree of an anterior pelvic tilt.[13]. For experimental group Diaphragmatic breathing exercises, Pelvic floor exercises, Pelvic bridging, Abdominal bracing, Core stability exercises in various positions (supine, crook lying, prone lying), Graded trunk curl, Posture and baby care. Baby care techniques. For control group Diaphragmatic breathing exercises, Pelvic tilt, Static abdominal exercises, Pelvic floor exercises, Postural care and back care, Educate about Baby care techniques. Statistical analysis was performed by using SPSS software version 20.0. Descriptive statistics were calculated for baseline characteristics of participants. Shapiro wilk test was used to analyze the normality of data. Analysis of Lumbar lordosis and Pelvic tilt within experimental and control group was done by paired t-test. Analysis of Lumbar lordosis and pelvic tilt between experimental and control group was done by independent t-test. Analysis of Visual Analog Scale within experimental and control group was done by wilcoxon signed rank test. Analysis of Visual Analog Scale between experimental and control group was done by man Whitney u test. Significance level of ($p \leq 0.05$) was used throughout all statistical test

RESULTS

In the present study 19 participants were recruited as per inclusion criteria, out of which 55.6% were primi mothers and 44.4% were multigravida mothers with low back pain. As observed in table 2, analysis of lumbar lordosis within group, the mean was 26.35 and it decreased after the end of treatment program to 22.25 in interventional group. Similarly, control group baseline mean value was 25.60 and in post therapy it was 23.16. In table 3, the mean of pelvic tilt within group was 23.93 and it decreased after the end of treatment program to 18.94 in interventional group. Similarly, control group baseline mean value was 22.66 and in post therapy it was 20.42. The results showed that the both groups had shown a significant difference. In table 4 & 5, analysis of lumbar lordosis between groups, the mean value was 26.35 and after the end of treatment program 22.25 in interventional group. Analysis of pelvic tilt within group, the mean value was 23.93 and after the end of treatment program 18.94 in interventional and in control group the mean value was 22.66 and 20.42. The results of between group analysis of pelvic tilt and lumbar lordosis had not

shown statistically significant difference. Table 6&7, Mann Whitney 'U' test was used to analyze VAS between the groups. The results of between groups analyses of VAS score had not shown significant difference. In table 8, Wilcoxon signed rank test was used to analyze VAS within groups. The study results had shown the significant difference in both the groups ($P \leq 0.05$).

DISCUSSION

The purpose of the present study was to determine the effects of postnatal core stabilization exercises and education on pelvic tilt in early vaginal delivery mothers. One in tenth, the postnatal mothers complain of low back ache and pelvic pain. Breen *et al*. 2015 reported that the overall incidence of back pain 1-2 months postpartum was related to predisposing factors like previous history of backpain, younger age, and greater weight. Other possible cause of back pain after normal vaginal delivery is due to sudden lifting or twisting activities, weak abdominal, incorrect posture, hormonal, and physiological changes.[14] Core stabilization exercises are helpful for those with chronic back pain or weak abdominal muscles. Mechanism of core stabilization exercises involves the activation and training of deep core muscles like transversus abdominis (TrA) and lumbar multifidus (LM), with minimal activity of the superficial muscles. [15,16] Low-threshold recruitment of local and global muscle systems is important to provide modulation of the Central nervous system for efficient motor integration of the muscles and may enhance joint position sense and the increased muscle activity stimulate muscle spindles and joint receptors; the accuracy of the sensory integration procedure is enhanced empowering precise joint repositioning which deconditioning the low back ache [17]. The within group analysis of lumbar lordosis and pelvic tilt had shown the significant difference. Mohammad Hosseinifar *et al*., (2017) evaluated the effects of stabilization exercise on lumbar lordosis in patient with low back pain. This study concluded that amount of lumbar curve was significantly changed after training in both groups ($P < 0.05$).[18] The mean rank of VAS in the interventional group in pre-test was 10.6 and in post-test was 9.1 while the control group mean rank was 9.5 and 10.8. This study results had not shown statistically significant difference but there is a reduction in the mean rank of the experimental group after the intervention. In similar to this study, Marwa Saleh *et al*. (2019) stated there was a significant improvement in participants who received core Stability exercises as compared to participants treated with the traditional treatment in pain pressure threshold, VAS and ODI [19]. In this study, the interventional group who received the core stabilization exercise along with education on posture and baby care had not shown statistically significant difference in between group analysis of VAS score, lumbar lordosis, pelvic tilt but there is a reduction in mean value in interventional than the control group. In similar to that, Sana Chaudhry *et al. (2013)* stated that 60% of women responded for core stabilization exercises and postural correction (20).Lena Nillson Wikmar *et al., (2005)* study showed that the home exercises group had shown no significant changes in postnatal pain pattern [20]. In this study, there is a reduction in mean value in VAS score, pelvic tilt and lumbar lordosis in interventional group than the control group [21]. Multigravida women who experience recurrent low back pain relate to pregnancy. Thus, pregnancy seems to represent a risk for long term lumbo-pelvic pain which could be managed efficiently through the core stabilizing exercise. So, early postnatal exercises would be helpful to reduce the low back pain and postural changes [22,23].

ABSTRACT

Branch Retinal Vein Occlusion (BRVO) is a common form of retinal vascular disease. Age, systemic hypertension, arteriosclerosis are risk factors for BRVO. It presents as sudden painless loss of vision or a visual field defect. There are three common vision limiting complications of BRVO, they are macular oedema, macular ischemia and sequalae of neovascularization. According to Ayurveda, this is a type of Srotodhusti in Netravahasrotas. A 68-years old female presented to the Shalakya Tantra outpatient department with blurred vision in both eyes for both distant and near vision along with metamorphopsia in left eye. On the basis of optical coherence tomography, she was diagnosed with Branch retinal vein occlusion with cystoid macular oedema in left eye. Netra Seka, Shirolepa, Yoga basti along with Shamana Oushadis were adopted. With ayurveda intervention, the subretinal fluid was lessened, resulting in an improvement in visual acuity.

Keywords: BRVO, Macular oedema,Srotodushti, NetravahaSrotas

INTRODUCTION

Branch Retinal Vein Occlusion (ICD-10-CM Code H34.832) [1] is a form of retinal vascular disease. Its prevalence is of 4.42 per 1000 adults and estimated that 13.9 million adults worldwide are affected by BRVO. Its prevalence increases with advancing age, peaking between the age of 60 and 70 years. Men and women are equally affected [2]. Systemic hypertension, diabetes, smoking, hyperlipidaemia, atrial fibrillation, renal dysfunction, atherosclerosis are some of

the risk factors for BRVO [3]. Patient with BRVO present with sudden painless loss of vision or visual field defect. Rarely present with floaters from a vitreous haemorrhage if the initial vein occlusion was unrecognised and retinal neovascularization has occurred [4]. There are three common vision limiting complications of BRVO, they are macular oedema, macular ischemia and sequelae of neovascularization [5]. Treatment includes systemic anti-coagulation, photocoagulation, anti-VGEF treatment, steroid treatment and vitrectomy with sheathotomy[6].

CASE STUDY

A 68-years old female patient presented at the outpatient department of Shalakya Tantra for painless sudden blurring of vision of both eyes for both distant and near vision and associated with metamorphopsia in left eye. She was a housewife and had no history of trauma. Haematological evaluation revealed dyslipidaemia. There was no family history of the ocular disorder and no history of any substance abuse. She was diagnosed with branch retinal vein occlusion with cystoid macular oedema by an ophthalmologist and she underwent anti-VGEF injection treatment for four times. Patient used to have clear vision for about 30-45days after anti-VGEF injection and later the condition gets worsen.

CLINICAL FINDINGS

General physical examination

Temperature - Afebrile.
Pulse - 78beats/min.
Blood pressure - 120/80mmHg.

Systemic examination

RS: NVBS heard
CVS: S_1S_2 heard
CNS: HMF intact
P/A: Soft, non-tender and no organomegaly

Ashtasthanapareeksha

Nadi: Vata-Kapha
Mootra: Normal, no burning sensation
Mala: Constipated
Jihwa: Coated
Shabda: Prakrutha
Sparsha: Anushna sheeta
Drik: Vikrutha
Aakruthi: Madhyama

DISCUSSION

The retinal vein occlusion with cystoid macular oedema is analysed based on the causative factors, pre-disposing factors, aetiopathogenesis, food habits and present-day stressful conditions. Occlusion of the vessels with oedematous findings clearly suggests that thereis lack of endothelial strength and the impaired physiological conditions of the retinal vasculatures. Damage to the retinal vessel wall from compression or other causes like atherosclerosis alters the rheological properties of retinal vasculature resulting in thrombosis and occlusion. The patients withbranch retinal vein occlusion have blurry vision and may or may not have the pain and redness in the eyes. According to Ayurveda, this is a type of Srotodhusti in which Sanga, Vimargagamana and Granthi features can be seen. Hence SamprаptiVighatanatmaka chikitsa of NetravahaSrotas is an ideal treatment. The Shirolepa, Netra Seka, Yoga Basti are recommended for SrotoVishodhana, Shothahara and Vata Shamaka. The combinations of drugs used for Shirolepa exhibits anti-VEGF action [7,8], anti-oxidants [9,10,11], prevents neovascularization [12,13],

reduces the lipid peroxidation levels [14], anti-haemorrhagic[15] and anti-inflammatory[16,17,18]. The Netra Seka which alleviates the amayata of the Shukla mandala, Krishna mandala and Drishti Mandala with kashaya-tiktha rasa dravyas and promotes the normal circulation of the eye vessels. The vitiated Vata in Shiras is treated by Yoga Basti which is a good remedy for AvarnajanyaSrotodushti. Hence Asana, Bilwa, Durva, Madhu, Erandamoola and Punarnava plays an important role in the Sanga avarana chikitsa through Basti karma. By analysing the treatment, the subject is advised with Agni-deepaka, Amapachaka, vatanulomana chikitsa. AvaranajanyaSanga and Medo-Dushti conditions are also addressed. By establishing the normal physiology of the posterior segmental vascular network with the combination of the therapies have shown promising result with respect to subjective and objective parameters. This study demonstrates the efficacy of appropriate treatment in improving visual function and reducing the macular oedema. Therefore, there is need to study in different analytical points in large group to ascertain the standard treatment protocol for branch retinal vein occlusion with cystoid macular oedema.

ABSTRACT

Intracranial hematoma, a critical condition characterized by the accumulation of blood within the cranial cavity, can lead to significant neurological impairments, including hemiplegia. In Ayurveda, this condition is associated with "*Pakshaghata*," characterized by a loss of function impacting one side of the body. This case study examines a 25-year-old male diagnosed with *Pakshaghata* following an intracranial hematoma. The patient presented with symptoms including loss of function in the right upper and lower limbs, difficulty standing without support, and general weakness on the right side. A comprehensive treatment plan was administered over 34 days, incorporating Ayurvedic therapies such as *Rukshana* (drying therapy), *Brimhana* (nourishing therapy), internal medications, and physiotherapy. The effectiveness of the treatment was evaluated based on the improvement in symptoms like slurred speech (*Vaksanga*), urinary incontinence, and limb weakness (*Sandhi-Bandha Shaithilya*). The results demonstrated a significant reduction in the severity of these symptoms, indicating that the integrative Ayurvedic approach was effective in managing early-stage *Pakshaghata*. The study concludes that Ayurvedic management can provide rapid and positive outcomes in patients with *Pakshaghata*, especially when initiated in the early stages of the condition.

Keywords: *Pakshaghata*, Hemiplegia, *Panchakarma*, Intracranial hematoma, *Vata Vyadhi*

INTRODUCTION

Pakshaghata is classified as a type of *Vatavyadhi*, specifically belonging to the *Nanatmaja* category, as described by *Charaka*.(1) However, Acharya *Sushruta* places it under *MahaVatavyadhi*. (2) *Pakshaghata* refers to paralysis affecting one side of the body. "Paksha" means one side, and "*aghata*" denotes paralysis, indicating the impairment of both sensory (*Gyanendriyas*) and motor (*Karmendriya*) functions, as well as the mind (*Manas*), which governs and coordinates these systems.The imbalance of *Vata Dosha* occurs when one follows improper dietary and lifestyle habits, leading to its accumulation in the vacant channels (*RiktaSrotas*) of the body, resulting in *Pakshaghata*. Common clinical features of this condition include slurred speech (*Vaksanga*), weakness of muscles (*Sandhi-Bandha Shaithilya*), mouth deviation (*Vaktradavakra*), fasciculation of the tongue (*Sphoorana* of *Jihva*), impairment of motor function (*Cheshta Nirvuthi*), and loss of consciousness (*Chetanansha*). In modern medicine, *Pakshaghata* can be correlated with hemiplegia, a condition characterized by paralysis of one side of the body. The term "hemiplegia" is a combination of "hemi," meaning half, and "plege," which denotes a blow or stroke. Hemiplegia leads to total or partial loss of motion or sensation, or both, on one side of the body, and it can also involve the loss or impairment of voluntary muscular power. Clinical features of hemiplegia include slurred speech, mouth deviation, fasciculation of the tongue, swallowing difficulties, abnormal reflexes, and muscle weakness. In this case, the primary cause of *Pakshaghata* (hemiplegia) was identified as an intracranial hematoma based on MRI findings. The incidence of intracranial haemorrhage (ICH) is notably higher in patients with haemophilia compared to the general population. Specifically, the rate is 2.3 per 1,000 person-years, rising to 7.4 per 1,000 person-years in individuals under 25, and 2.1% per 100 live births in neonates. (3) For treatment, the patient underwent a 34-day regimen addressing *Pakshaghata*, which included *Panchakarma* (a series of five therapeutic procedures), internal medication, and physiotherapy. This comprehensive approach led to a marked improvement in the patient's condition.

CASE REPORT

A 25-year-old male (OPD/IPD no.23005331/230940) was diagnosed with *Pakshaghata* (hemiplegia) and presented with symptoms including right-sided weakness in both upper and lower limbs, slurred speech, urinary incontinence, and intermittent severe headaches. The patient has been experiencing these symptoms for the past 12 days.

PAST HISTORY

The patient had a notable past medical event involving a road traffic accident (RTA) with a head injury that occurred one year prior to the current presentation.

MEDICAL HISTORY

At the time of presentation, the patient was on medications, including Levera 500 mg once daily, Atorva 40 mg once daily, Lasilactone (20/50) twice daily, and Pantop 50 mg once daily.

FAMILY HISTORY

There was no significant family history reported that could be related to the current condition.

PERSONAL HISTORY

The patient maintains a mixed diet and generally has normal sleep patterns, though sleep is occasionally disturbed by headaches. The patient uses a diaper and requires a catheter due to urinary incontinence, his appetite was normal, and he was employed in a private labour job.

HISTORY OF PRESENT ILLNESS

Thirteen days before the presentation, the patient experienced a seizure on 07/03/2023, followed by loss of consciousness, right-sided limb weakness, difficulty speaking, and severe headaches. Despite receiving allopathic treatment for 12 days with minimal relief, the patient was then advised to undergo surgery and subsequently sought further treatment at Parul Ayurveda Hospital.

CLINICAL FINDINGS

***Asthavidha Pariksha*:**

- *Nadi-Vata-Pittaja*
- *Mala- Sama*
- *Mutra-* the patient was in catheterization
- *Jivha- Ishat Lipta*
- *Shabda- Aspastha*
- *Saprash- Samshetoushna*
- *Drik- Samyaka*
- *Akriti- Madhyama*

General examination

- PR: 110/min
- BP:110/70 mm Hg
- RR:20/min
- Pallor: Absent
- Icterus: Absent
- Temperature: Afebrile

Systemic examination

- CVS – S1, S2 Heard no abnormality found
- RS – Bilateral air entry presents no abnormality found
- Per Abdomen – Soft and non-tender Central Nervous System Examination

INVESTIGATIONS:

- **MRI Brain (07/03/23)** The large hyper-density of approximately size 76×32×41 mm at the left frontal lobe s/o intracranial hematoma with mild surrounding oedema and mild mass effect with an extension of bleed in a ventricular system involving lateral, third, and fourth ventricle.

***SamraptiGhatka*:**

Dosha: Vata Pradhana Tridosha
Dushya: Rasa, rakta ,Mamsa, Meda, Snayu, Sira
Srotas: Rasavaha, Raktavaha, Mamsasavaha, Pranavaha
Srotodushti: Sanga
Ama: Saama
Adhisthana: shrirardhaBahaga
Agni: Vishmgni

TREATMENT

OBSERVATION

- Day 1 – The patient arrived on a wheelchair, complaining of severe headache along with weakness in the U.L. and L.L. on the right side, as well as urinary incontinence requiring catheterization.
- Day 5 – The patient was able to move the right U.L. and L.L. slightly and can control urination without the need of a catheter anymore.
- Day 15 –The patient was able to move the U.L. and L.L. against gravity and can walk with support. The headache was mildly improved.
- Day 25 –The patient could walk with support and has sensations about natural urges, which the patient can control. The patient's speech was improved, and the patient experienced relief from headaches.
- Day 27 –The patient was able to walk without support, speech was clear, and feeling refreshed and confident.

- Day 34 – The patient was discharged with significant improvement, walking independently, experiencing no speech difficulty, and controlling natural urges. The patient showed steady improvement, progressing from severe disability to independent walking, clear speech, and full control of natural urges by the thirty-fourth day.

MUSCLE POWER

RESULTS

Movement Improvement: The patient initially came with severe weakness on the right side, was unable to move his arm and leg, and required a wheelchair. By the 5th day, there was some improvement, as he could slightly move his arm and leg. By the 15th day, the patient was able to walk with support. By the 27th day, he was walking independently, demonstrating significant recovery. By the 34th day, the patient was walking independently, showing a strong recovery. Bladder Control: The patient initially needed a catheter due to urinary incontinence. By the 5th day, he was able to control urination without the use of a catheter. By the 25th day, the patient could naturally sense and control their bladder. Speech Improvement: The patient had difficulty speaking clearly at the start. By the 25th day, his speech began to improve, and by the 27th day, it was clear. By the 34th day, the patient spoke normally without issues. Headache Relief: The patient initially suffered from severe headaches. Improvement began by the 15th day and continued. By the time of discharge, the patient no longer experienced headaches. Overall Well-being: Initially, the patient was in poor physical and emotional condition. His condition improved steadily over time. By the 27th day, he felt better and more confident. By the 34th day, the patient was discharged in much better health, walking independently, with clear speech and good control over natural urges.

DISCUSSION

Abhyanga: -

In *Pakshaghatha*, *Abhyanga* removes the *Srothorodha* by its quality of *Vataharaswabhava* and the *Prabhava* of *sneha* used for the *Abhyanga*. (4) Skin is one of the sense organs and sites of *Vayu*. Thus, Snehan directly treats the *Vata Dosha.*(5) In the present study, *Ksheerbala Taila* is used for Sarvang *abhyanga*, which has great *Vatahara* property. *Dhanyamla*:*Dhanyamla* is particularly effective for conditions involving *Vata* combined with *kapha* or *ama*. It enhances vasodilation, which boosts both metabolism and blood flow to the affected area. The combination of carbohydrates and oils in *Dhanyamla* contributes to its soothing and mildly nourishing effects when applied externally. (6) It also exhibits various properties such as *Jeevaniya* and *Vata-Kapha Nashaka*(7) *Dashamoola*:*Dashamoola* is a formulation composed of ten herbs: *Bilva* (Aegle marmelos), *Patala* (Sterculia suaveolens), *Agnimantha* (Clerodendrum phlomidis), *Shyonaka* (Oroxylum indicum), *Gambhari* (Gmelina arborea), *Bruhati* (Solanum nigrum), *Kantakari* (Solanum xanthocarpum), *Prishniparni* (Uraria picta), *Shalaparni* (Desmodiumgangeticum), and *Gokshura* (Tribulus terrestris). The primary parts used are the roots. It has *tridoshahara* properties and is known for its anti-inflammatory, digestive, and *dosha*-balancing effects. Typically used in *pradeha, parisheka*, and *abhyanga*, *Dashamoola* is effective for conditions like *Vatavyadhi*. (8)

Nitya Virechana

Vitiated *Vata Dosha* can be addressed with *Snigdha Virechana*. For treating *Vata* disorders, the standard approach involved using *Snigdha Virechana* with *Eranda Taila*. (9)

Patra Pinda Sweda

It is a *RukshaSnigdha Sweda*that aids in pain and stiffness relief. Typically used when the *Vata* and *kapha doshas* are present.(10) Drugs utilized in this case include the leaves of *Eranda*, *Arka*, and *Nirgundi*plants, which have anti-inflammatory and analgesic properties and aid in the relief of stiffness in the affected joint and muscles. (11)

Shirodhara

Shirodhara is a purification method that reduces anxiety,stress and enhances relaxation and cerebral function. It improves sleep and sensory function. By lowering cortisol and adrenaline levels, it promotes calmness and balances *Prana, Vyan Vayu,* and *Sadhaka Pitta*. (12)

Shastika Shali Pinda Sweda

The *Khara, Ruksha*, and *Vishada* qualities of *Vata*, along with the *Ushna* and *Tikshna* qualities of *Pitta*, contribute to the drying up of *Sira* and *Snayu*, leading to clot formation in cerebral arteries and causing a stroke. For treating a stroke, the medicine should have properties that are opposite to *Khara, Ruksha, Vishada, Ushna*, and *Tikshna*—namely, *Shlakshna*, *Snigdha*, *Pichhila*, *Shita*, and *Mridu* or *Manda*. *Shashtik-Shali* is an example of such a medicine. (13) Moist heat therapy is considered more effective at warming tissues compared to dry heat because water or milk transfers heat more rapidly than air. Moist heat penetrates deeper into the tissues, making it more effective for reaching muscles, joints, and soft tissues.(14)

Nasya

Nasa has been explained as the entrance for *Shira*. (15) *Pakshaghata* is primarily a *Vata* disorder. Therefore the treatment should mainly focus on Balya and Brihana drugs which alleviate *Vata*, hence *Ksheerbala Tail* is used. Some research suggests that lipophilic compounds enhance drug penetration, and the nasal route is the most direct for efficient drug delivery. The *Brimhana Nasya* procedure nourishes brain cells by boosting Tarpaka Kapha and calming imbalanced Doshas.*Ksheerabala Taila*, an oil-based preparation, is advised for the treatment of *Vataja*disorders, which include the eighty chronic conditions associated with *Vata Dosha*. Bala (Sida cordifolia), a key ingredient in *Ksheerabala Taila*, strengthens nerves and possesses anti-stress and adaptogenic properties, including reducing plasma cortisol levels. Shrestha et al. reported that the glycosides in Sida cordifolia have anxiolytic, sedative, and anticonvulsant effects on the central nervous system. (16)

Shiropichu

Shiropichu is a type of *Murdhnitaila*, and it is regarded as the second most effective, following *Shirobasti*. It is indicated in *Pakshaghata*, *Ardita,* and*Anidra*. (17)Due to *Tikshana, Vyavayi*, and *Sukshma, Taila's* properties, it quickly penetrates *Manovahasrotas*, changing *dosha* vitiation. At the same time, all *Maanasvikaras* are corrected by *Taila's Bhrimhana*, *Balya*, *Vaatashamana*, and *Medhya* qualities. (18) The absorption of substances through the skin is influenced by several factors, with the most significant being the duration of contact, the solubility of the medication, and the condition of the skin and the body part exposed. In *Shiropichu*, the medicated oil is typically kept on the scalp for about an hour. The oil, being a lipid medium, enhances the solubility of the medication, facilitating its easy absorption through the skin. (19)When considering different parts of the body, the scalp is notably more permeable than the forearm and requires a smaller amount of medication to achieve the same effect. (20)

Matra Basti

Matra Basti is given with *Mahanarayanataila* and *MahasnehaGhrita*, which pacifies *Vata* and does *Brimhmana*(nourishment) of the *sharira*, and strengthen the *Kandara* and *siras*. It is selected for *Matra Basti*, the definitive treatment for *Vata*, due to its qualities of *Ushna* (warm), *Tikshna* (sharp), *Suksma* (subtle), and *Snigdha* (unctuous), which help alleviate imbalanced *Kapha, Vata*, and *Ama*. (21)

Mustadi Raj Yapana Basti

Basti is the best treatment for vitiated *Vata Dosha*. *Yapanabasti*has the ability to support life and promote longevity.(22) *Yapanabasti*performs dual actions of *Shodhana*and *Rasayana*at the same time. *Rasayana*becomes more effective when preceded by a suitable therapy. *Yapanabasti*is having "*Sadyo-Balajanana*" (improves strength quickly), *Vatashamaka*, and *Rasayana*properties.

Shirotalam

Shira is considered as seat of *prana*, *indriya*and 37 *marma*. The bregmatic fontanelle is regarded as a passage through which drug molecules can enter the systemic circulation. The drugs get easily absorbed there and being *Vata* pitta *shamaka* it pacifies the *dosha* in the CNS, thereby providing better functioning of the brain post CVA. (23)

Physiotherapy

Physiotherapy is one of the best supportive therapy for the diseases like Hemiplegia. It is very useful for rehabilitation. The primary goal of physiotherapy is to treat, correct, prevent, and help patients adapt to their disabilities and deformities.

Shamana chikitsa

Cap Palsineuron contains a combination of *Ekangavira Ras*, *MahaVatavidhvamsa Ras*, *Sameera Pannag Ras*, and *Sutasekhara Ras*, all of which are specifically used for treating *VataVyadhis*. This unique combination is used to treat patients experiencing symptoms such as stiffness and weakness. (24)*ManjishthadiGhanavati* is composed of ingredients like *Manjishtha, Haritaki, Amalaki, Bibhitaki, Katuki, Vacha, Daruharidra, Guduchi,* and *Nimba*. (25) It is primarily indicated for disorders related to *Rakta* and *Mamsa Vikriti*. Given the involvement of *Rakta Dhatu* in the disease's pathology and the patient's *Mamsa* depletion, its use was considered appropriate.The primary ingredient in *AvipatikaraChurna* is *Trivrit*, which is renowned for its *mriduVirechana* effects, promoting the downward movement (anulomana) of *Vata*. Since *Pakshaghata* is a *Vata* disorder, *Trivrit* helps in balancing *Vata*. Additionally, the other ingredients in the formulation possess properties that enhance *Deepana* and *Pachana*, further supporting its efficacy in managing *Vata*-related conditions.*Tapyadi Loha* contains ingredients like *Triphala, Pippali, Mandura Bhasma, Loha Bhasma, Roupya Bhasma,* and *Swarna Makshika*. These components support cognitive function and promote brain health. It is also tri*doshasamaka*. Additionally, it enhances the production of digestive enzymes and has immunomodulatory effects, contributing to overall health.*Siddha Makardhwaja* helps restore the function of the impaired limbs by improving circulation, enhancing nerve conduction, and strengthening weakened muscles. Its rejuvenating and adaptogenic qualities also contribute to recovery by enhancing overall vitality and resilience.The formulation contains *Maricha, Chavya*, and *Tantu Pasana Bhasma* as its key ingredients. It acts as an antidepressant, stimulating both the body and mind, and is particularly effective in treating *Vata*-related disorders.It contains*Erandamoola*, *Sunthi, Guggulu, Eranda Taila, Makshika Dathu* etc. which possesses *Vata-Kaphahara, Anulomaka* and *Shoolahara* property as well as anti-inflammatory, analgesic, muscle relaxant properties and even regenerative properties which give relief from the disease. (26)*Dashmoola* is *tridoshanashaka* and *ushna* in *virya* hence it helps in pacification of *Vatavyadhi*. (27) *Dhandhanyadikashya* used in treating neurological diseases of *Vata* origin.Having the properties of *medhya, Rasayana, lekhana, balya, kshayagna, ojovardhaka&yogavahi*which has targeted effect for the management of *Pakshaghata* under *Vata*roga. (28)*Chandraprabha Vati* is considered *Sarva RogaPranaashini* and has *Vata-KaphaShamaka* properties.*Ashwagandha* a main ingredient has actions like *Jivaniya, Medhya, Rasayana, Balya* and *Brimhana* actions. It can be given in chronic neurological disorders.

CONCLUSION

This case demonstrates the effective integrated management of Acute Intracranial Hematoma using Panchakarma, internal medications, and physiotherapy. The patient showed significant improvement over the 34-day hospitalization, arriving on a stretcher and unable to sit in a wheelchair, but ultimately walking independently by discharge. This positive outcome highlights the potential of Ayurveda in treating *Pakshaghata*, warranting further studies to explore its efficacy across different conditions related to hemiplegia.

Declaration of patient consent

The authors confirm that they have obtained the necessary patient consent. The patient has agreed to have his clinical information included in the journal. He understands that his name and initials will not be published, and every effort will be made to protect his identity.

Conflicts of interest

There are no conflicts of interest.

ABSTRACT

A manuscript is a handwritten document which has scientific, historical, literary or aesthetic value and has been existed for not less than 75 years. Ashmari chikitsa is a manuscript which is collected from maharaja Sayajirao oriental library, Vadodara is written in devanagirilipi in Sanskrit language. Ashmari is considered as one of the ashtamahagada in ayurvedic classics. The types, nidana, poorvaroopa, roopa, samprapti, chikitsa and different types of yogas mentioned in this manuscript. Exploring the unexplored manuscript like these will give so many information about the disease ashmari which is considered as difficult in treating.

Keywords: Ashamari chikitsa, devanagirilipi, ashtamahagada, poorvarupa, samprapti

INTRODUCTION

A Handwritten document or other document which is of scientific, historical, literary, or asthetic value and which has been in existence for not less than 75 years is known as a manuscript. The Indian medical heritage is extremely productive. It has contributed the large number of medical manuscripts into the world. *Ashmari* is one among the eight most difficult to cure diseases (*Ashtamahagada*) described in Ayurveda classical texts.*Ashmari* is a disease related to the urinary system (*Mutravahasrotas*) The symptomatology of *Ashmari* resembles the clinical features of Urolithiasis mentioned in the contemporary medical science. It possesses symptoms such as *Jwara (*Fever), *Basti Pida* (Discomfort and pain in the bladder), *Aruchi (*Anorexia), *Mutrakriccha* (Difficulty in micturition), *Bastishira* Vedana (Pain in Urethra), *Mushka Vedana* (Pain in testicles) and *Shepha Vedana* (Pain in the penis) have been described

in *Ayurvedic* classical texts. Susruta Samhita explains Ashmarinidana in 3rd chapter of Nidana Sthana and Ashmari chikitsa in 7th chapter of Chikitsa Sthana. Charaka Samhita and Ashtanga Hrudaya is not mentioning a separate chapter for ashmari but Charaka includes Ashmari in Trimarmeeya Sidhi which is in 9th chapter of Sidhi Sthana and in Ashtanga Hrudaya it includes in Mutaghatanidana and chikitsa chapters in respective sthanas. This manuscript almost resembles the version explained by yogaratnakara, but the order of explaining the disease symptoms and treatment varies. Yogaratnakara explaining all the symptoms and types first, followed by all the yogas. But in this manuscript the yogas are explained simultaneously with the types and symptoms. This manuscript also gives some extra yogas than yogaratnakara like varunaguda, saindhavadyamtailam etc.

This manuscript is related with the ashmari chikitsa which is in Sanskrit language and written in Devanagari lipi was available in oriental library Vadodara contains 4 folios and 8 pages. The name of the author and the age of manuscript is not mentioned anywhere in this manuscript.

MATERIALS AND METHODS

Material

The manuscript ASHMARI CHIKITSA is collected from MAHARAJA SAYAJI RAO ORIENTAL LIBRARY, Vadodara, Gujarat. ACCESSION NUMBER- 24717 This manuscript contains 4 folios and 8 pages. Each page contains 13 lines and each line contains average of 45 letters.

Method

Manuscript has to collect from MAHARAJA SAYAJIRAO ORIENTAL INSTITUTE LIBRARY.

Observations

The manuscript starts with the heading *ashmari* chikitsa. There is no mentioning about the *mangalashloka* in the manuscript. Generally maximum manuscripts will start from *mangala* shlokas. But this manuscript stands peculiar from that concept. This manuscricpt mainly explained about the disease called ashmari.The author explains about the nidana, samprapti, symptoms, types, chikitsa and medicines (yogas) etc. related to ashmari chikitsa. In the first shloka itself the author is explaining about the types of the ashmari as vataja, pittaja, kaphaja and sukraja. The author explains that kapha is the base of every ashmaris. In 2nd shloka author explaining the samprapti. The vata will combine with kapha, pitta, mutra, sukra will enter into vasti and will do visoshana and will lead to ashmari. As the disease is due to tridoshakopa the poorvaroopa is also contains every lakshanas which involves all the doshas. The poorvarupa includes goat smell of urine, urine incontinence, fever, tastelessness etc. In next shlokas author explains about samanyalakshanas (general symptoms). i.e. pain in nabhi, sevani, vasti, moordha etc. After the explanations of general symptoms, then the author will go to special symptoms. In that first he explained about vatajaashmari. After the explanation of vataja symptoms author immediately explains about the chiktsa part. Especially some yogas. In that first he explains about the chikitsa in poorvarupa itself. i.e. snehadi krama. Followed by some yogas like sunthyadi, eladikwatha, varunadikwatha, shatavari yoga, ushakadiprathivapam, pashanabhedadighrtham etc.

Sunthyadi
Eladi kwatha
Varunadikwatha
Shatavari yoga

Pashanabhedadighrtam. This ghrta should be prepared out of the drugs like pashanabheda, vasuka, usheera, ashmantaka, satavari, svadamshtra, brhati, kantakari, kapotavanka, amalaka,kanchna, guthaka, vrkshadani, varuna, yava, kulatha, kola, kataka etc. In next shloka he explained about the pathya of vatashmari. i.e. kshara, yavagu, peya, paya(milk)etc vatanashakaaharas. After the explanation of vatajaashmari he explains about pittajaashmari with symptoms like burning sensation in vasti as it resembles like the bhallatakaasthi and feel as the wound is ripening and reddish and yellowish in colour.

Kushadyamghrtam

Immediately after the introduction of pittajaashmari he explains about a preparation called kushadyamghrtam with the ingredients like kusha, kasha, itkata, Morata, pashanabheda, Varahi, vidari, salimoola, patala etc.

Shilajatugutika

Then he explains about shilajatugutika, it includes shilajatu, madhuka, indeevarabeeja also. he explains as this preparation will break the pittajaashmari After that he explains about the pathya for pittajaashmari. It is almost similar to vatajaashmari, but in place of vatanashana he explained it as pitta nashana. After that he explains about kaphajaashmari. Due to the excessive intake of sheetala(cold), guru(heavy) ahaara an ashmari will occur which resembles the colour of honey and it will create a pricking type of pain in vasti(bladder). Then he explains about the probability of ashmari. The author explains as the previously explained 3 ashmari (vataja, pittaja, kaphaja) is mostly happening to bala (children). Even though it is seen in adults also the probability is more in bala. Then he explains that above explained diseases generally can be treated with the help of ajasidhaghrta with the ingredientsvarunadigana, guggulu, harenu, bhadradaru, devadaru, maricha, chitraka, ushakadigana etc. Then he explains about sukrashmari. In that first he explains about the nidana. The main nidana of sukrashmari, the disease which happening to the adults, is considered as sukra dharana. Then due to the sthanachyuthi of sukra while the time of maithuna (coitus). Due to this the vayu gets vitiated and it will create the rukshata and will make the sukra into kathina form and will block the vasti. Then he explains about the sukrashmarilakshana as pain in vasti, difficulty in passing urination, swlling in Mushka, etc.

Then he explained about the sarkaralakshana Then he explained about the upadravas of ashmari as dourbalya, sadanam, kukshirogam, aruchi, panduta, ushnavata, Trishna, vami(vomiting). Then he explained about the asadhyatha of ashmari as swelling in nabhi, vrushanam etc due to the blockage of urine Then he explained about a yoga called **varunaghrtam**. Then he explains about the samanya chikitsa vidhi of sukraashmari. He explains about to take yavakshara, guda, and takra etc which will kill the vibandha and ashmari. Also explain about a yoga in kwatha or sitakalpana which include tila, apamarga, kadali, palasa, yava, vilwa etc for ashmarinashanam. He also explain about another yoga which is kaibuka, ankola, kataka,indeevaraphala, etc have to take with warm water and guda (jaggery). In next shloka he explained about another yoga prepared with pashanabheda, varuna, gokshura, urubuka, kantakari, ikshuraka etc have to take with kshirapishta which will use bhedana of sikataashmari. Another yoga prepared out of Rajani with guda is explained. Another medicine with svadamshtra (gokshura), varuna, sunthi, mix with honey is considerd as the best remedy for mutrakrchra. Next yoga explained as Punarnava, Rajani, gokshura, pravala, darbha, pushparag, mix with kshara, amla, and ikshurasa etc which is used for ashmari and sharkara. Next one is with varunatwak, pashanabheda, gokshura, etc kwatha should be prepared have to take with kshara and will do bhedana of sharkara. Trapusabeeja, kera Kusuma, etc mix with milk and should take.

Next, he explained about **trnapanchamoolyadighrta**. i.e. trnapanchamoola each one pala, gokshura one pala have to mix with one drona of water and reduce to ¼. One prastha of ghrta and kalka of guda and gokshura should be added and ghee should be prepared. This is called trnapanchamooladighrta. This ghrta should be used in the form of intake and abhyanga to reduce mootrakrchra and ashmari. Next **varunatailam** explained. Kashaya of varunataila should be prepared out of twak, patra, moola, phala pf varuna and trikantaka (gokshura). This taila will reduce the pain of sharkara and ashmari and will reduce the mootrakrchra,. Next, he explained about **kushadyamtailam**. The Kashaya and kalka of this taila consists of kusha, agnimantha, shireesha, nala, darbha, gokshura, kapotavanka, indeevara, dhataki, karnapoora, pashanabheda, etc. This taila can be used in the form of pana, abhyanga, vasti, uttaravasti. This taila can be used in diseases like sharkara, ashmari, mootrakrchra, pradara, yonishula, sukradosha, vandhya, bhagandara etc.

Next, he explained about a kwatha which is prepared out of nagara, varuna, gokshura, pashanabheda, kapotavanka, which have to take with guda and kshara as anupana. Churna of trikantakabeeja mix with honey and shigrumulakwatha can be used to reduce ashmari. Next, he explained about **shrungaveradi yoga**. This yoga consists of shrngavera (shunti), yavaksahra which have to take with dadhimanda will break the ashmari. Then he explained

about **varunachoorna.** Varuna Bhasma have to do bhavana with water for several times and mix with yavasuka. Then this churna should take with guda (jaggery). This churna will reduce the diseases like ashmari, pleehavrdhi, gulma, pain in shroni and kukshi, aama, vastigada, vatajamootrakrchra, agnimandya etc.
Then the author explains about **varunaguda**. Varuna which is devoid of krimi, which is snigdha, taruna, from shuchi Sthana (clean place), black should be taken in one tula quantity. Then four times water should be added. Then it should be boiled. While boiling, equal amount of guda should be hanged in the form of pottali. Aftere boiling one pala of churna of sunthi, ervarubeeja, gokshura, pippali, pashanabheda, kushmanda, trapusabeeja, akshabeeja, shobhanjana, draksha, ela, shilajatu, Abhaya etc should be added. This varunaguda should take daily in gudapramana. By taking this varunaguda all the ashmari will be reduced.

Then author explained about **kulathaadyamghrtam**. Ghrta should be prepared out of kulathasiddhavidangaswarasa, yavashula which is made into cool, the seeds of kushmanda and gokshura and Kashaya of varuna. This Kashaya will destroy all the ashmari, mootrakechra, mootraghata and mootrabandham. **Sharadi panchamooladyamghrtam**. Ghrta should be prepared with Sharadi panchamoola Kashaya, gokshurakalka and it should take with sarkara. This will reduce ashmari, mootrakrchra and will reduce all kinds of pain which is happening in the sukramarga. **Varuna ghrtam**. One prastha of ghrta, one tula of varuna Kashaya. The kalka should be prepared with varuna, kadalikanda, vilwa, trnapanchamula, guduchi,shilajatu, trapusabeeja, tilakshara, palasakshara, yoothikamula. Then this ghrta should be taken with guda in jeerna Avastha and it should be taken with mastu in ajeerna Avastha. This will destroy ashmari and sharkara and mootrakrchra. **Saindhavadyamtailam**. Taila should be prepared out of veerataradigana as Kashaya and kalka. This saindhavadyamtaila is considered as best for ashmarinivarana. This taila is also useful in mutraghata, mutrakrchra, bhagna etc. **Veerataradyamtailam**. Taila should be prepared with Kashaya and kalka of veeratara, pashanabheda, agnimantha, syonaka, patala, vrkshadani, eranda, sallaka, usheera, padmaka, kusa, kasa, sarekshu, shatavari, svadamshtra, vasa, kapotavanka, sriparni, kashmari. This will destroy all the types of vatapitta diseases, sarkara, ashmari, mutrakrchra. **Punarnavadyamtailam.** Kalka prepared with Punarnava, amrita, abheeru, three types of kshara and lavana, shati, kushta, vcha, mustha, rasna, katphala, pushkara, yavani, hapusha, shatahva, ajamoda, vidanga, ativisha, yashti, panchakola. Gomutra and kanji is used as dravadravya. Taila should be prepared out of this. This punarnavadyataila will destroy ashmari, sarkara, mutakrchra, pain which occurs in vasti, medra, kukshi, vamkshana etc.

DISCUSSION

This manuscript called ASHMARI CHIKITSA have so many similarities with ashmari chikitsa of Yogaratnakara. In yogaratnakara all the lakshanas, poorvaroopas, roopas, described primarily and it is followed by chikitsa and yogas. But in this manuscript the author explains vataja, pittaja, kaphajaashmaris,and its treatments immediately after the nidanasamprapthi explanation. The sequence of shlokas goes like vatajaashamari then its treatment, pittajaashmari and its treatment, kaphajaashmari and its treatment. The yogas which is explained in this manuscript almost related to yogaratnakara.

CONCLUSION

In the comprehensive exploration of Manuscript Ashmari Chikitsa, this manuscript explores into the causative factors, diagnostic methodologies, and therapeutic modalities inherent to this Mootrashmari condition. Mootrashmari, characterized by the formation of urinary calculi, manifests as a result of vitiated doshas, primarily Vata and Pitta, along with impaired agni and accumulation of ama. As the heading of the manuscript suggests, the author had given more importance to the treatment part of the disease rather than the nidanapanchaka. The author explains about the preparation of several medicines and the usage of that in the context of this particular disease. Author also explains the pathya- apthya (dietary instructions) for the disease. Author while explaining the yogas (medicines) specifically mentioning about the other diseases also which that particular medicine can act. Through an in-depth analysis of classical Ayurvedic texts, the manuscript explains the multifaceted etiology of Mootrashmari,

attributing its occurrence to dietary indiscretions, sedentary lifestyles, environmental influences, and inherent constitutional factors.

Drawing upon the rich heritage of Ayurvedic therapeutics, the manuscript describes a holistic treatment approach for Mootrashmari, encompassing dietary modifications, lifestyle interventions, medicinal herbs, and external therapies. Key herbal formulations such as Varunadi Kwatha, Punarnavadi Kwatha, and GokshuradiGuggulu exhibit potent litholytic, diuretic, and anti-inflammatory properties, facilitating the dissolution and expulsion of urinary stones while restoring doshic equilibrium.

Moreover, the manuscript emphasizes the pivotal role of lifestyle modifications, including dietary regulation, physical activity, stress management, and hygiene practices, in preventing the recurrence of Mootrashmari and promoting overall urinary health. By fostering harmony between body, mind, and spirit, Ayurveda offers a holistic framework for the management of Mootrashmari, transcending mere symptomatic relief to address the root cause of the ailment.

In summary, this manuscript explores the topic of Mootrashmari, which is a condition involving the formation of urinary stones. It highlights the various factors that contribute to this condition, including diet, lifestyle, and imbalances in the body's natural energies called doshas. By examining ancient Ayurvedic texts, we gain insight into how Mootrashmari develops and how it can be diagnosed through methods like urine analysis and palpation. The manuscript also discusses traditional Ayurvedic treatments, such as herbal remedies and lifestyle changes, which aim to dissolve urinary stones and restore balance to the body. Overall, this manuscript serves as a valuable resource for understanding and managing Mootrashmari using the holistic principles of Ayurveda. It emphasizes the importance of addressing the root cause of the condition to promote long-term health and well-being.

ABSTRACT

The gender role of women is defined by their feminine traits like gentleness, submissiveness, and softness, whereas the traits of males are those of a protector, provider, and man. Traditionally, women are expected to stay inside the four walls and to carry out their family's duties. However, women are gradually emerging from their shells and advancing alongside contemporary science and technology as a result of time and development. The progress of technology has led to women surpassing conventional customs and social interactions, enabling them to venture beyond the internet and achieve their aspirations.

Keywords: The gender role of women is defined by their feminine traits like gentleness, submissiveness, and softness, whereas the traits of males are those of a protector, provider, and man.

INTRODUCTION

Across the ages, women have faced numerous obstacles related to gender inequity worldwide. We can still observe customs that are deemed cruel and inhumane in various countries, regardless of the reason—ethnicity, religion, culture, talents, social traditions, or anything else. Gender roles are socially constructed and are not determined by biological differences between men and women. According to a conventional web, women are subordinate human beings controlled by men, whose decisions affect her life and those of the men in it. There was never a level playing field for men and women. With the development of science and technology over the past century, there have been tremendous changes in our daily lives that we have witnessed. The current query is: Has gender equality been made

possible by modern science? With equal shares of ups and downs, women's lives are evolving; they are leading and excelling in a variety of fields thanks to the enormous impact of modern science. However, it may take some time for society as a whole to accept and act in a way that ensures that both genders are treated equally. In addition, even with these advancements, some expectations are still firmly ingrained in traditional roles for men and women. What strategies may be used to empower women and advance gender equality? The solution is to give impoverished women access to resources while advocating for gender equality in the home and in society, which has significant positive development effects. Increasing the number of opportunities available to women in public works, agriculture, finance, and other fields spurs economic expansion and lessens the impact of the present and upcoming financial crises. Fairness and equity are at the heart of gender equality, which is a moral need with numerous political, social, and cultural facets. It is true that in recent decades, a large number of nations have achieved great strides towards gender equality in the workplace, in education, and in entrepreneurship. Even while the majority of Indians believe that men and women should share some household duties, many of them yet adhere to archaic, patriarchal ideals.

MATERIALS

All of the information utilised in this essay was gathered from secondary sources, including books, journals, papers, and websites.

Women changing their role from tradition to modern

In the past, women were dependent on their fathers or husbands, but these days, they have formed their own identities and are self-sufficient. Women in the past were only expected to take care of their families and nurture them. They were also highly respected but were not allowed to access outside information. Women were expected to fulfill the role of a good wife, and if they went out to work against social conventions, they were viewed as bad women. It was expected of women to prepare meals and consume whatever little food remained after males. Women's roles have evolved significantly, and they are now able to make a good impact on society. The shift from housewives to CEOs is happening more quickly now. Opportunities and hope have expanded for them with modernisation and the introduction of cutting-edge technologies. Indians are among the most likely groups, according to Pew Research Centre, to believe that the husband should support the family while the wife takes care of the house: In India, four out of ten people favour the conventional family structure, compared to a global median of 23 percent. The majority of Indian people (80%) believe that women's equality with males is crucial in general, and strong majorities of all major religious groups hold this opinion as well. Buddhists are more likely than members of India's other main religious communities to think that gender equality is very essential (91%), although Muslims and Christians are somewhat less likely to say the same (76% and 70%, respectively). In the country as a whole, women, younger Indians (those between the ages of 18 and 34), and college graduates are marginally more likely than other groups to agree that it is crucial that women and men have the equal rights.
In general, Indians who identify as highly religious—that is, who feel that religion plays a significant role in their lives—are more inclined than other Indians to think that gender equality is crucial (23% vs. 65%).

Some of the crucial practices of women during ancient times

Although the role of women in India has evolved over the past century, let's quickly review how many have been handled.

1.The number of child widows increased quickly as a result of the practice of child marriage.
2.The community looked down upon widows who did not practice 'Sati,' and promoted the practice of Sati.
3.The Purdah system and polygamy were prevalent, which has a significant impact on women`s education.

Education is gradually eradicating the old, harmful practices, and women are assuming hard but uncompromising positions.

Women in Modern Science Technology

In today's culture, women's roles have undergone significant transformation and are having the most impact. Women's social contributions were restricted and under the authority of men many years ago. In several crucial fields, women are making significant contributions. The role of women has evolved at an accelerated rate in a variety of fields, including business, Law politics, professional training and medicine.Modern technology is dictating terms, and as a result of its rapid advancement, women and men are increasingly interacting, though perhaps not on all fronts. Women are gradually realising their full potential. She has begun to doubt the guidelines that society has set for her. She has so begun to shatter barriers and has gained respectability in society. Among the notable female scientists and technologists who made history are

Kalpana Chawla

The first female astronaut from India, she worked for NASA as an aeronautical engineer. She was the first Indian woman in space and the first Indian-American astronaut.

Seetha Cole Kanmula

The creator of "Simply Sustain," a company that specialises in industrial ecology and product life cycle analysis. Infertility expert Dr. Indira Hinduja invented the Gamete intrafallopian Transfer (GIFT) method, which led to the birth of India's first GIFT child on January 4, 1988. Mallika Srinavasan is the managing director and chair of Tractors and Farm Equipment Limited. Under her direction, the company has grown to generate INR 96 billion in sales. Among the most well-known women in STEM is her.

Nandini Harinath

A well-known female scientist from India who worked as the deputy operations director for the Mangalyan Mars Orbiter Mission. She has spent 20 years at ISRO working on over 14 missions, setting an example for young women.

Tessy Thomas: Known as the Missile Woman of India, she is the first female scientist in India to oversee a missile project. She is the Director General of Aeronautical Systems and the former project director for the Agni-IV missile at the Defence Research and Development Organisation.

Kamala Sohonie

The first female PhD recipient in a scientific subject in India.

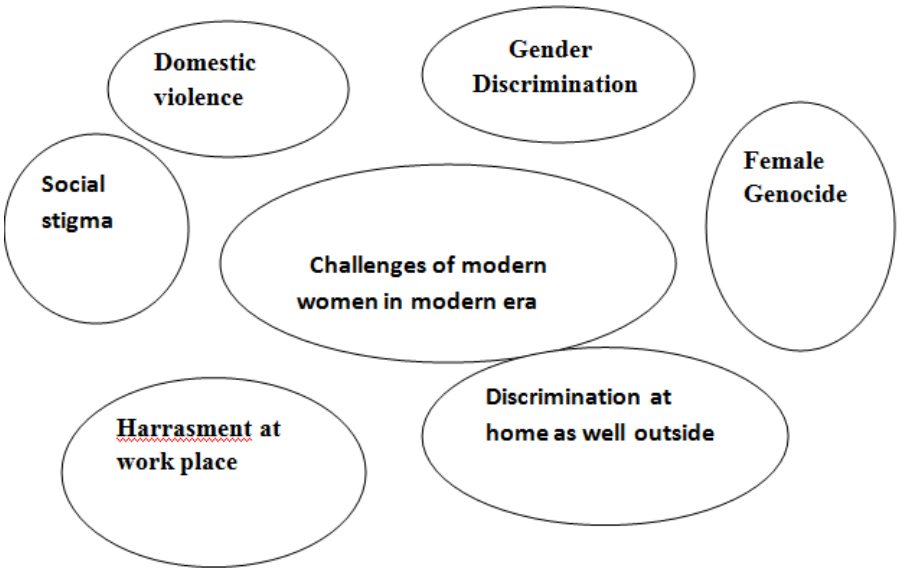
Janaki Ammal

Janaki Ammal is the inaugural female botanist in India and the first recipient of the Padma Shri, the country's fourth-highest civilian honour.

Anandibai Gopalrao Joshi One of the first Indian women to visit the United States
And the first to become a doctor in 1886.

The pursuit of diversity and equity in the scientific community has paved the way for women whose contributions to STEM (Science, Technology, Engineering, and Mathematics) sectors have been enormous. Even though there is still much work to be done, an increasing number of young girls and women are finding role models in these fields—notable scientific women who can shatter preconceptions and inspire careers—proving that genius knows no bounds. In the realm of current science and technology, are women safe? Women are stepping up and showing the world their potential in every setting, from the kitchen to the office. Practically anything may now be done easily by anyone thanks to science and technology. Given the magnitude of the influence, is it positive or negative? Neither of them outweighed the other. Are women truly protected even with the government's numerous safety measures in place? As technology advances to a new level, society is also changing to keep up with the times. These days, women have a strong sense of ambition and are succeeding in both their personal and professional lives.India's female population is growing in every aspect of society, yet women's safety is in jeopardy. Women experience discrimination on a daily basis, and it can happen anywhere, at any time. Technology has reached its pinnacle of progress, and women's safety is also at risk. The 2019 International Women's Day theme, "Think equal, build smart,

innovate for change," was selected to highlight creative approaches to advancing women's empowerment and gender equality, advancing the 2030 Agenda, and creating momentum for the successful implementation of the new Sustainable Development Goals of the United Nations.



RESULTS AND DISCUSSION

The Preamble, Fundamental Rights, Fundamental Duties, and Directive Principles of the Indian Constitution all uphold the idea of gender equality. Numerous studies demonstrate that despite all of these policies and regulations, women continue to be victims everywhere in the nation. The majority of Indian women in science have encountered and still encounter gender-related issues during their careers, according to the Indian Academy of Sciences. In addition to obstacles like discouragement, invisibility, and contempt, this also includes sexual harassment and gender bias. Inadequate institutional infrastructure also contributes to the unwelcoming employment environment for women, and administrative conventions hinder the advancement of women in science. It is imperative that proactive measures be used to enhance the circumstances. Is technology able to free women from the traditional web where they have been kept tone deaf for decades, given its rapid advancement? While the majority of women are achieving their goals, nearly half of them are stuck. Are still a victim, are still having issues, are still fighting for the fundamental safety that every human being deserves, and are still caught between tradition and science.

CONCLUSION

women are the embodiment of bravery, strength, love, and sacrifice. In the modern world, women now play a much different and better role. Women nowadays are financially independent, self-sufficient, and conscious. They have achieved great success in all spheres of life, including politics, athletics, and academia. Co-education has made it possible for women to march with men in all spheres of society. Women's freedom has gone through several turning points, and society has advanced significantly. Despite facing several challenges in the past few decades, they have managed to successfully forge their own identity.

ABSTRACT

To develop a robust video classification framework leveraging deep neural networks, integrating spatial and temporal feature extraction for enhanced semantic understanding and improved accuracy on diverse video datasets. In the proposed framework, Convolutional Neural Networks (CNNs) are used for the extraction of visual feature at the frame level, and the extraction of temporal dynamics through Temporal Difference Networks (TDNs). In this pipeline, Spatial features are extracted from video frames with a pre-trained CNN and then, fed through the TDN to model temporal relationships. Afterward, the combined features are used as input into a Long Short-Term Memory (LSTM) model that classifies assign a category to each video. We evaluate the proposed approach on a widely used video classification dataset, UCF101. Proposed hybrid model trained and tested on the UCF101 benchmark dataset, and implementation reached a new record classification accuracy of 99.10%, whereas previously listed state-of-the-art methods reported accuracies within the range of 85-98%. The results demonstrate the success of the hybrid CNN and TDN model in extracting the two-type features; an integral and innovative part of this work. The strong performance of the proposed method aligns with the anticipated advantages of using multimodal information for video classification. These results provide valuable insights that contribute to the ongoing research in this area. This work describes a new architecture for Spatial Feature Extraction for Video Classification using CNNs, TDNs for temporal modeling, and LSTMs for classification of sequences. The proposed hybrid approach improves on the multi-scale temporal approach by providing a way to solve the spatial complexities inherent in video categorization in addition to temporal ones, which lead to an overall improvement in video analysis.

Keywords: Convolutional Neural Networks, Deep Learning, LSTM, Video Classification, Temporal Convolutional Networks.

INTRODUCTION

Since video content has been growing exponentially on platforms such as social media and streaming services, video classification has become a critical field of research in computer vision. With over 500 hours of video going up on the internet every minute, future already written, there will be a demand for efficient and accurate classification methods alike. Taking or designing handcrafted features have been the primary approach for video classification with little success in generalizing to diverse and dynamic video datasets. The automatic extraction of delicate spatial and temporal features from raw data allowed deep learning to revolutionize the field, significantly improving classification accuracy[1]. Though these advancements are accomplished, there are still some challenges to overcome. Despite the success of these methods, such as Two Stream[2] and Temporal Segment Networks (TSNs)[2], they do not exploit complex spatial temporal interactions. 3D Convolutional Neural Networks (3D CNN)[3] achieve great performance in the modeling of spatiotemporal characteristics, but often suffer from scalability and implications of computational resources. Furthermore, methods using recurrent neural networks (RNNs) or LSTMs to model sequential data—as in most works—often do not well deal with multimodal data, such as visual and audio stream, typical with context rich events[4]. Moreover, most of the existing methods don't fundamentally tackle the burden of efficient video processing over long term dependencies over video sequences which is necessary for recognizing complex actions or events spread over many frames. To fill these academic gaps, this research proposes a novel hybrid approach of Convolutional Neural Networks and Temporal Segment Networks with Long Short-Term Memory networks. Spatial features are extracted efficiently by the CNN component, while TSNs yield robust segmentation and temporal feature extraction capability. The integration of these features into the LSTM module allows it to capture long term temporal dependencies in order to further understand the sequential video. Moreover, the model assumes multimodal feature fusion, fusing visual and textual data to obtain a richer contextual representation[5].

The performance comparison illustrates that existing video classification approaches, LRCN(82.9 %)[6], DT+MVSV (83.5 %)[7] and CNN-LSTM (88.6 %)[8], have made significant progress but still lack sufficient ability to effectively capture the complex spatiotemporal feature. Though more advanced as C3D (85.2%)[9], Key Volume Mining (92.7%)[10], and especially Two Stream CNN (88.0%)[11], these techniques fail to fully integrate multimodal data and model long term dependencies. On the one hand, compared with the previous methods, the proposed hybrid CNN-TCN-LSTM model achieves the very good accuracy of 99.1%, which outperforms previous methods, and also excels in handling spatial and temporal characteristics simultaneously for the video classification. In recent years, video classification has received great attention and many efforts have been made in feature fusion methods to improve the performance of video classification. Feature fusion is the combining of multiple characteristics obtained from multiple modalities to increase the efficiency of the whole classifier. There are multi-level [12], Cross-Modal Features [13], Multi-Stream [14], Deep Features [15], and Multi-Attention features [16] were used for video classification. Then, the effectiveness of the proposed method was evaluated on the UCF101 benchmark dataset with an accuracy of 99.1%. This essentially marks a significant improvement compared to existing state-of-the-art methods like CNN-LSTM based approaches, Two Stream networks, and C3D, whose accuracy are 82.9% to 93.5%. Unlike these approaches, the proposed model handles unresolved problems in feature integration, temporal dependency modelling, and multimodal fusion. Additionally, a full comparison with other methods is summarized in the **Table.7: Accuracy Comparison of Methods for Video Classification** below in which the merits of the proposed approach with respect to both accuracy and computational expense are stated.

METHODOLOGY

Video classification is a task of assigning pre-defined labels to a video according to its content. In Video classification, keyframe extraction is a crucial pre-processing step. Keyframe extraction is a technique used to effectively obtain more specific information from videos and Video Classification cannot be performed without feature extraction. because it identifies the relevant information from a video frame, which is subsequently employed for training deep

learning models. Then, Deep learning techniques for video classification are challenging because videos are high-dimensional data. and the complex relationships between frames. This work uses the connections between the layers in a deep learning model. that has been previously used in several successful cases of video classification applications. The hybrid deep learning framework that was proposed, which is shown in **Figure.2**, is now explained in more detail. To achieve accurate classification, a hybrid deep learning framework was proposed, consisting of three main components: (1) video processing, (2) feature extraction, and (3) video feature encoding and classification. The semantic content of consecutive video frames exhibits significant correlation. Consequently, tracking the sequential relationships between frames over time enhances the efficacy of video categorization. To leverage this, a specific number of consecutive frames are selected from the input sports video for analysis. Initially, a set of consecutive RGB color frames is extracted from the video. Subsequently, pre-processing techniques, such as resizing, enhancing, and standardizing, are applied to prepare the raw frames for subsequent stages. Next, a Convolutional Neural Network is used to learn spatial features from the video frames we analyze. The temporal characteristics of the data are captured by feeding these CNN derived features into a Long Short Term Memory layer. To classify the sports category, a fully connected layer and a Soft Max activation function was used finally. The sequential stages of the proposed video classification workflow are shown in **Figure.2**.

Video Processing

This video classification process starts with generating key frames for each video and then applying them on the video frames. The key frames in the video are these key frames representing the key instances in the video out of which the features for classification are extracted. The image frames are harvested and then preprocessed by resizing and normalizing the frames to facilitate the process of extraction of features. A deep learning model like CNN, RNN and LSTM is used to extract the features. A model for classification of videos is trained using the extracted features. The UCF101 videos are first preprocessed in the video preprocessing stage and if irrelevant or missing video information is found, then it will remove it. Additionally, the frames are rescaled to fixed dimensions (224 x 224) for better performance of feature extraction model.

Deep Feature Extraction

In this section, we propose the method to obtain concise spatial temporal feature representations for capturing the core semantic information contained in a video. The basic premise of the method is that any given video V can be split into K non-overlapping segments: Each $\{V_1,V_2,\ldots,V_K\}$ of identical duration. For each segment V_K, it is assumed that a frame within this segment, denoted f_i^l, can be indexed by N which is the total number of frames in the segment V_K and $i\in[1,2,\ldots,N]$. To ensure efficient extraction of relevant features while maintaining the continuity of motion information, the study employs a modification of the network architecture that integrates residual connections into the primary network. This integration enhances motion representation within a local window, while simultaneously improving the continuity of motion across different video segments. Every video is partitioned into non-overlapping segments of equal duration. After partitioning, a sequence of frames is selected at equal intervals, meaning the frames are sampled consistently throughout the video. This ensures that a representative sample of frames is captured from across the entire video. Let the total number of frames in the video be denoted by T, where $T = [I_1, I_{2,\ldots}I_T] \in \mathbb{R}^{T\,X\,C\,X\,H\,X\,W}$, with each frame I_T representing an image in the video sequence, where C is the number of channels, H is the height, and W is the width of the frame. These frames are then fed into a Convolutional Neural Network (CNN), which is responsible for capturing frame-level features. The output from this CNN is a set of feature representations $F = [F_1, F_{2,\ldots}F_T] \in \mathbb{R}^{T\,X\,C\prime\,X\,H\prime\,X\,W\prime}$, where C′, H′, and W′ are the output channels, height, and width after the convolution operation. The model does the following when it is processing the feature encoding Then we compute the output of the initial fully connected layer of two Convolutional Neural Networks. This CNN architectures have proven competent on a variety as and they leverage spatial and motion features to model extended temporal patterns. then explore the relationships between those and the overall effectiveness of. approach. Then the selected frames are fed into a Convolutional Neural Network (CNN) to get the frame level feature. To improve the motion representation and continuity, we bring in residual connections to the primary network. This modification achieves motion coherence at different video segments but enables capturing motion information during local windows. The feature encoding is done by computing outputs from the initial fully connected layer of

two CNNs. In particular, to model extended temporal and spatial patterns, as well as relationships between them, these CNNs take special advantage of spatial and motion features. This technique significantly improves the performance of the entire feature extraction process.

Video Representation and Classification

The proposed model is based Convolutional Neural Networks, Temporal Convolutional Networks, and Long Short-Term Memory networks. Spatial features as contained in the individual video frame are extracted by the CNN component, i.e. the visual information and object features within the frame. These spatial features are processed by the TCN module, which builds the temporal dependencies between frames within a sequence in modelling. Finally, a LSTM layer learns long range dependencies and takes in variable length video sequences, refining the temporal representation more. We leverage the strengths of both types of networks in this Hybrid architecture, which together enable us to capture and represent spatial and temporal information in videos, leading to improved classification performance for video tasks. We will be able to evaluate our method against other state of the art methods using the widely used UCF-101 and UCF Sports Action datasets.

Dataset

The UCF-101 benchmark is well known and has a wide use, and widely used Dataset to identify human action. The video clips are assemblage of 13,320 clips manually annotated to one of 101 human actions. The videos are 27 hours combined in duration. UCF Sports Action dataset consists of videos of many different sports. Normally, the videos are aired on radio and TV channels, and the sources of these videos are from different websites. In 320x240 resolution and having 150 Video frames per second Highest point, the dataset contains 13,320 videos. The annotations for the videos include bounding boxes for Arrangement of Actions and Categorization Labels for Recognizing activities. The data*set al*so gives explanations from those among the spectators.

Parameter Settings

The proposed hybrid CNN-TCN model leverages a ResNet-101 architecture with 3D convolutions to capture spatial and temporal features, paired with an 8-layer Temporal Convolutional Network (TCN) to model long-range dependencies. The CNN component uses a learning rate set to 0.0001optimized with a CyclicLR scheduler, 32 is the batch size, and the Adam optimizer to ensure efficient convergence. Similarly, the TCN component employs the same learning rate and optimizer settings for consistency. In the experimental setup, 16 frames were extracted from each video and resized to 224 x 224 x 3 dimensions to reduce computational demands. The ResNet-101 backbone for the timing difference module was pre-trained utilizing data from the Image Net dataset, and the training process involved 128 is a batch size, a learning rate set to0.0001, and 100 iterations. Furthermore, a trial was conducted with 50 video clips per category to determine the optimal frame count for classification.

Experimental Evaluation

For the architecture of the feature extraction network, we embrace the utilization of CNN [33] to learn spatial and motion representations from CNNs. For the enactment of the rudimentary model and the finely adjusted version of pre-trained techniques in categorizing the videos, the UCF101 dataset underwent division into training, testing, and validation sets, utilizing a distribution of 70% for training, 15% for testing, and 15% for model validation. This allocation involved random assignment of videos per class. Furthermore, it is necessary to select a certain quantity of frames from each video to initiate the classification process. With this matter, we conducted a trial utilizing the scratch model to ascertain the optimal frame length. We employed 50 video clips within every category for this purpose. Incorporating a Long Short-Term Memory layer can further enhance the model's capacity to capture long-range temporal dependencies and accommodate variable-length video sequences. LSTMs however are particularly able to learn and remember information over a long time span and therefore are very well suited for video classification tasks where temporal context is important. Here we term an LSTM as one that processes a sequence of feature representations, ($x1$,$x2$,…,xT)as input and outputs a sequence of output, ($y1$,$y2$,…,yT)in more formal terms. The outputs of the nodes within the network are computed Iterating recursively from t=1 to t=T, according to the following equations:

$i_t = \sigma\left((x_t + S_{t-1})^{w^i} + b_i\right)$ (1)

$f_t = \sigma\left((x_t + S_{t-1})^{w^f} + b_f\right)$ (2)

$o_t = \sigma\left((x_t + S_{t-1})^{w^o} + b_o\right)$ (3)

$g = tanh\left((x_t + S_{t-1})W^g + b_g\right)$ (4)

$c_t = c_{t-1} \cdot f_t + g \cdot i_t$ (5)

$S_t = \tanh(c_t) \cdot o_t$ (6)

final_state = soft max (Vs_t) (7)

The proposed model synergistically integrate Convolutional Neural Networks, Temporal Convolutional Networks and LSTMs to better learn more sophisticated temporal patterns than existing base models, leading to significant overall performance improvement. CNN is used to extract spatial features from each video frame and TCN is used to take temporal dependency on the video sequences. Long range temporal dependencies and complex temporal patterns are captured by the LSTM layer, followed by processing of the output of the TCN. An artificial neural network that can handle the classification tasks uses the output layer, which runs its SoftMax activation function. Then it tries to learn how to classify data from the examples of labeled data. It sums up the previous layer and calculates probabilities for having whatever class. All of the probabilities are contained between 0 and 1 and sum to 1. The Normalized exponential function will generate a distribution of probabilities that is valid. The SoftMax function, also known as the normalized exponential function, is defined as:

$softmax(x) = exp(x) / sum(exp(x))$ (8)

This hybrid approach enables the model to effectively learn and comprehend the complex dynamics of video data, ultimately leading to enhanced classification accuracy.

RESULTS AND DISCUSSION

In the case of the UCF101 dataset, 70% of the video clips are assigned for training purposes, while the remaining 30% are designated for testing and model validation. To demonstrate the efficacy of the suggested approach for video classification, this study undertakes a comparative analysis against established methodologies. These encompass both manual feature techniques and deep learning strategies, with specific reference to the works of 3CNN + LSTM [17], TDN [18], FC-RNN [19], CNN+LSTM [20], and Two-Stream CNN [21]. It is noteworthy that all methods are rooted in deep learning. Through the integration of Temporal Convolutional Networks (TCN) and Long Short-Term Memory (LSTM) layers, the model achieves unified temporal modeling, effectively capturing both short-term dependencies and long-term sequential patterns. By utilizing ResNet-101 for spatial feature extraction, it avoids computationally expensive operations like optical flow preprocessing required by methods such as Two-Stream CNN, ensuring efficiency an scalability for longer video sequences and resource-constrained environments. Training time is reduced while reducing risks of over fitting with enhanced optimization strategies, including CyclicLR scheduler and adaptive hyperparameter tuning which further improves convergence speed and generalization. Unlike TDN and 3CNN+LSTM approaches that require the sequences to be fixed input sizes, the model processes variable length video sequences with minimal frame sampling. Furthermore, spatiotemporal features learned directly from raw frames are also unaffected by the labor-intensive preprocessing required in Two-Stream CNNs, and the modular architecture of the model is suitable for adaptation to a range of datasets and tasks. Together, these contributions overcome computational efficiency, scalability, and full spatiotemporal modeling hurdles while granting the proposed model superior performance than I3D, TDN, and Vision Transformers, respectively.

Baseline methods for comparison

The contribution of the proposed approach is contextualized by comparing with, and grounding against, prior work in video classification using the comparative analysis presented in this research. In this study, we introduce the hybrid model which combines Convolutional Neural Networks for efficient spatial feature extraction, Temporal Convolutional Networks for short-term temporal dependency modeling, and Long Short-Term Memory networks to address long range sequential dependencies in video data. By incorporating an integrated architecture, we fill the

shortcomings of current models that are often isolated in treating spatial or temporal dynamics, or based on highly complex models like 3D Convolutional Neural Networks or Transformer models. It collectively solves the critical problem of capturing spatial as spatially nuanced temporal relationships in videos. Many architectural designs for video classification tasks have been explored by a number of research efforts. For example, the spatial and temporal sparsity captured in the works of Tran *et al.* on 3D Convolutional Neural Networks and Carreira & Zisserman on Inflated 3D ConvNets serve as instantiations of the effectiveness of 3D convolutions in capturing spatiotemporal feature, but are computationally expensive and prone to falling short of scalability to longer video sequences. Similarly, the Vision Transformer model introduced by Fan *et al*. has achieved state-of-the-art results, yet it comes at the expense of high model complexity. Other methods, such as the 3CNN+LSTM approach, employ a stack of CNN layers for spatial feature extraction followed by LSTM layers for sequential modeling. While this technique captures basic spatiotemporal relationships, it lacks robust handling of temporal dependencies, a limitation that the proposed model's integration of Temporal Convolutional Networks and Long Short-Term Memory networks aims to address. The Temporal Difference Network excels in capturing fine-grained motion cues through multi-scale temporal differences, but it lacks the spatial feature extraction efficiency of ResNet-based architectures. Fully Connected Recurrent Neural Networks are capable of modeling sequential dependencies, yet they are less effective in processing high-dimensional spatial data compared to CNNs. Traditional CNN+LSTM methods and the popular Two-Stream CNN architectures also face challenges, such as limited temporal modeling and reliance on preprocessing for motion extraction. A comparative analysis of different deep learning architectures used for video classification task is presented in this table. Standard models like AlexNet, GoogLeNet, VGG19 and ResNet50 and a hybrid one is included. A table is provided that gives performance on training and test sets for each architecture, along with the corresponding hyper parameters such as optimizer, batch size and number of epochs.

The comparative analysis shows that the proposed hybrid methods CNN-TCN-LSTM model achieves superior performanceon the UCF-101 dataset by achieving 99.10% accuracy, which is higher than the performance of I3D (94.5%), TDN (98.30%), CNN+LSTM (91.30%), and Two-Stream CNN (85.46%). It also outperforms 3CNN+LSTM (93.1%) and FC-RNN (97.8), demonstrating its power in capturing short term as well as long term temporal dependencies. Furthermore, the CyclicLR scheduler, along with employed hyperparameters, helps the model to be faster and generalize better than in existing works. Though the proposed method is competitively efficient and the spatiotemporal modeling robust, its combination and use in video classification establishes it as a promising, practical alternative architecture to current research. On the UCF 101 dataset, the proposed hybrid CNN-TCN-LSTM model was found to be very accurate across different action categories, indicating the validity of the CNN-TCN-LSTM model on extracting both spatial and temporal features. While I had a slightly more difficult time with “Walking,” with 90% accuracy, the model nailed actions like “Cutting in Kitchen,” “Lifting,” “Playing Piano,” “Drumming” and “Golf” at the perfect score of 100%. Moreover, the model did very well on "Sky Diving" and "Baby Crawling" with accuracies of 96% and 95, respectively. Finally, these results demonstrate how the model handles these diverse and challenging action categories and that it could provide robust and accurate video classification.

CONCLUSION

The proposed work in this work introduced a new hybrid architecture of Convolution Neural Networks, Temporal Neural Networks, and Long Short Temporal Memory for video classification. By way of this model, it is able to overcome deficiencies of the current approaches, concentrating on both spatial and complicated temporal relations in video data. By combining CNN and TCNs, the CNN part is used for efficient spatial feature extraction, and the TCNs good at short temporal modeling, the LSTM layers, which have the ability to learn long term sequential information, correspondingly. With this integration, we overcome challenges with computational expense of 3D CNNs and lack of temporal modeling of traditional CNN+LSTM methods. The model that is proposed was experimentally evaluated on the UCF-101 dataset achieving accuracy of 99.1%, outperforming the cutting edgetechniques such as I3D, TDN, and Two Stream CNNs. In addition, the optimized training strategy with a CyclicLR scheduler and tuned hyperparameters improved the model performance as well as generalization which demonstrates the potential of

video classification tasks. Future work includes fine tuning CNN backbones, examining TCN/LSTM configurations, studying various data sets, making CNNs interpretable, extending to other video tasks like action detection and video captioning, making CNNs robust, and creating lightweight models.

ABSTRACT

The diagnosis of brain tumors at an early stage is essential. Therefore, MRI and CT scans are significant in the diagnosis process. MRI images help to visualize abnormalities in the brain tissues. Manual analyses introduced variability and errors in critical cases. Automatic techniques like, Machine Learning (ML)and Deep Learning (DL) automates the extraction of relevant features from medical imaging data and reduces the reliance on manual feature engineering. ML can analyse a large amount of data at a faster rate. It identifies correlations that are not visible to a human. However, it has its own disadvantages like manual feature selection and low precision in complex tasksDL can manage large amounts of data and extract the features independently, which improves its utility in medical imaging. This survey briefly discusses the recent development of DL for brain tumor detection and describes how the techniques enhance diagnostic accuracy and reliability. The comparative evaluation of several DL models reveals their further capability to dramatically enhance the concept of medical imaging techniques by offering higher accuracy in the results and minimizing human intervention in the process. The existing problems and future developments within the field are also examined to provide an accurate description of how DL revolutionizes brain tumor detection and improves the diagnostic process.

Keywords: Deep Learning, CNN,MRI, Brain Tumor ,Tumor Localization

INTRODUCTION

The growth of tissues either inside or outside the brain and their subsequent uncontrolled expansion defines brain tumors, a complex and serious adverse health condition. These can be Neoplastic (not cancer) or non-Neoplastic (cancer) and can affect the motor and mental abilities [1]. While the main reason of brain tumors has not been well established, several known causes have been ascertained. Some causes of the development of brain tumors include heredity, exposure to ionising radiation, certain age, and certain medical conditions such as neurofibromatosis or other genetic syndromes. Brain tumor symptoms can manifest in a variety of ways, but the most common ones include changes in behavior, personality, motor function, speech, and vision [2, 3, 4]. Annually, the United States sees an estimated 84,000 new instances of primary brain tumors [5]. There are primarily two types of brain tumors: Tumors classified as primary or secondary (metastatic) based on their site of origin.

Primary Brain Tumors

These might have their roots in the brain itself or in structures immediately around it, such the pineal gland, pituitary gland, cranial nerves, or meninges (the brain's protective layers) [6]. Additional subtypes of primary brain tumors include

Gliomas

It develops from glial cells that nurture neurons. Gliomas include astrocytoma, oligodendroglioma and ependymoma [7].

Meningioma

It develops from the meninges and can be benign but may still cause significant health issues because of their location [8].

Schwannoma

It originates from Schwann cells. These typically develop on nerves, especially the vestibular nerve leading to the inner ear [9].

Medulloblastoma

Common in children, these tumors start in the cerebellum and often spread through the Cerebro-Spinal Fluid [10].

Secondary (Metastatic) Brain Tumors

Brain metastases from these malignancies can occur anywhere in the body. They are more prevalent than primary brain tumors and frequently originate from cancers of the breast, lung, kidney, or skin etc. [6]. A brain tumour's diagnosis often comprises of neurological tests, imaging procedures like MRI and CT scans and biopsies [11,12]. The treatment strategies for the tumors vary depending on tumor type, size, location, grade andpatient's condition. Some of the many therapies practised are chemotherapy, surgical intervention and radiotherapy. Imaging techniques are vital for the early diagnosis and detection of brain tumors, providing a glimpse into the intricate workings of the brain that would otherwise remain concealed. For patients experiencing unexplained symptoms such as unusual cognitive challenges, Imaging tools like MRI and CT scans become beacons of hope and clarity in navigating their health journey.

MRI (Magnetic Resonance Imaging)

Using radio waves and strong magnetic fields, it creates high-resolution pictures of the brain, allowing doctors to better diagnose brain tumors by determining their exact size, location, and symptoms.Figure1 shows various samples of MRI images.It is particularly skilled at distinguishing between different types of brain tissue and identifying abnormalities, making it indispensable for accurate diagnosis [15].

CT (Computed Tomography) Scan

CT scans are valuable for detecting abnormalities in the brain, including tumors, and are especially useful in emergency situations to assess acute symptoms such as head trauma or sudden neurological deficits. It provides fast and detailed pictures of brain structures by using X-rays to make cross-sectional pictures of the brain. [16]. Figure 2 shows the Both MRI and CT scans serve as important tools in the medical field, guiding healthcare professionals in making decisions about treatment strategies and providing patients with a clearer understanding of their condition. However, it becomes a challenge to process and analyse large volumes of such complex image data through conventional manual analysis when employing the medical imaging systems. These analyses can take a long time, require a lot of manpower and experience when done manually on large amounts of detailed imaging data. In contrast, Artificial Intelligence (AI) automates the examination of imaging data in the medical field. AI systems can enhance the diagnosis and treatment of diseases that can increase the speed of data analysis, reduce bias, work with large data, and work efficiently without fatigue. By utilizing ML and DL techniques, AI enhances MRI and CT scans to detect brain tumors and to minimize the likelihood of missed diagnoses and enabling earlier detection. As a result, ML helps to improve the diagnosis of brain tumor through an analysis of extensive data from MRI and CT scans to look for characteristics of tumor [17]. However, ML has its own drawbacks, as it needs high quality data and large volumes of data for training. In addition, the process has to be handcrafted, lacks interpretability and prone to over fitting. DL, which is a branch of ML, eliminates these difficulties due to its capability to learn directly from the raw data and to extract complex patterns automatically. One of the most important benefits of DL is the fact that it can work with big data without having to rely on the extraction of features [18]. In traditional ML, the scientist needs to manually search, explore and select the features from the data that may consume a lot of time and can be error-prone. However, DL learns and extracts such features during training of the model, and there is a very low probability of omitting any of them, thus enhancing the model's ability in generalizing from the training data set to new data.

Detection of Brain Tumors using Deep Learning Techniques

The process of detecting brain tumors using different imaging modalities is complex and comprises several crucial steps like acquisition, pre-processing, segmentation, extraction and classification [19] each playing a role in the overall precision and effectiveness of the diagnosis. Figure 3 shows the workflow of imaging techniques for brain tumor detection.

Image Acquisition

The first step is to gather images from many sources, such as comprehensive medical image databases, online repositories and directly from hospital imaging systems. Typically these images are obtained utilizing sophisticated imaging techniques like MRI and CT scans which provide intricate visualizations of the brain's anatomy. These images are saved in standardized formats like JPEG and PNG to guarantee compatibility and facilitate processing.

Image pre-processing

Image pre-processing is performed on obtained images to improve their quality and make them ready for further analysis. The purpose of pre-processing is to mitigate distortions, rectify any artifacts, and accentuate significant elements in the images. Methods such as Median Filtering, Gaussian Smoothing, and Wavelet Transform are utilized to diminish noise and enhance clarity. Furthermore, techniques such as Histogram Equalization, Contrast Stretching, Adaptive Histogram Equalization (AHE), Un sharp Masking, and Contrast Limited Adaptive Histogram Equalization (CLAHE) are employed to modify the contrast and brightness of the image, hence enhancing the visibility of important features.

Image Segmentation

Following the pre-processing stage, the images undergo segmentation to separate and identify certain areas of interest (ROI). Segmentation is the process of splitting an image into distinct segments that may be evaluated separately. This stage is essential for the identification and distinction of normal brain tissue from possible tumor regions. Various techniques, including edge-based segmentation, gradient approaches, region-based segmentation, and thresholding, are utilized to generate a mask that outlines the tumor on a pixel-by-pixel basis.

Feature Extraction

After segmenting the images, the subsequent stage involves extracting features. This procedure entails the identification and extraction of important aspects that define the tumor. Features may encompass characteristics such as structural properties, texture patterns, and intensity levels. Techniques such as Gray Level Co-occurrence Matrix (GLCM), Local Binary Patterns (LBP), Histogram of Oriented Gradients (HOG), and Principal Component Analysis (PCA) are employed to measure and assess these characteristics. Convolutional Neural Networks (CNNs) are becoming more popular in recent techniques because to their ability to autonomously acquire and comprehend complex characteristics from images, hence obviating the necessity for manual feature engineering.

Classification

The ultimate step in the process of identifying is categorization. After extracting the features, they are utilized to classify the tumor according to its characteristics. Machine learning and DL algorithms are crucial in this stage, since they may be trained to accurately differentiate between benign and malignant tumors. Through the analysis of the collected characteristicsthese algorithms have the capability to forecast the stage and severity of the tumor. This information is vital for medical professionals to make well-informed decisions on treatment options and patient care.As a whole, brain tumor detection has been greatly improved by the advent of more precise, time-saving, and trustworthy diagnostic tools made possible by developments in image analysis. Healthcare practitioners may boost early identification, optimize treatment planning and ultimately achieve superior results for patients with brain tumors by utilizing these advanced methods. The remaining parts are organized in the following manner: Section II explores different DL frameworks specifically developed for the purpose of predicting and classifying brain cancers based onimages. Section III presents a comparative examination of the systems. Section IV provides a comprehensive overview of the complete survey and offers suggestions for future areas of study.

Survey On Detection And Classification Of Deep Learning Models

DL algorithms utilize extensive datasets and high-performance computing to accurately analyse neuro imaging modalities like MRI and CT images. This allows for the early identification of brain cancers and the development of tailored treatment plans. This survey will analyse several DL designs and algorithms used for brain tumor identification. Asif *et al*. [20] developed a DL framework to distinguish brain tumor. Image pre-processing was done to eliminate unwanted image information using cropping. To prevent overfitting, augmentation methods such as rotation and flip was performed. Pre-trained CNN models NasNet Large, InceptionResNetV2, Xception, and DenseNet121 extracted the features. A global average-pooling layer was used to transfer the retrieved deep features to Fully Connected (FC) layers, which were then used to average the features' spatial dimensions. Lastly, the Softmax layer is used as a classification layer for brain tumor identification. Chawla *et al*. [21] developed a Bat Algorithm (BA) integrated with CNN (BCNN) for the finding and cataloguing of brain tumors. Initially, pre-processing was conducted to remove noise from MRI images using median filters, followed by normalization using the Min-max technique. A 2D Gabor filter was then employed for feature extraction. The Bat Algorithm was utilized here for selecting features. Finally, CNN architecture used to categorize brain tumors. Musallam *et al*. [22] build a lightweight DCNN architecture to classify brain cancer using MRI images.. This model consisted of two essential processes, convolutional part and classifier part. Features were extracted during the convolution operation and Over fitting issues were reduced during batch normalization of DCNN model. Finally, Softmax layer detects tumor. Ottom *et al.* [23] developed the ZNet framework, integrating Adversarial Networks (AN) with U-Net models for brain tumor detection. The images were pre-processed and augmented using Albumentations to reduce over fitting. This framework utilized skip connections and concatenated tensors from the AN, along with the encoder-decoder architecture of the U-Net model. The encoder part performed analytic down sampling, while the decoder part conducted synthetic up sampling. This integration allowed ZNet to effectively capture and utilize both high-level and low-level features for tumor detection. Rammurthy *et al.* [24] utilized Deep CNN (DCNNs), WHHO, the combination of Whale Optimization Algorithm (WOA) and the Harris Hawks Optimization (HHO) algorithms to construct a model for brain cancer detection. Initially, cellular automata in conjunction with rough set theory segmented MRI images. The retrieved features were used for DCNN classification, while was employed for model training. HHO tackles optimization issues. Finally, the FC layer was responsible for categorizing brain tumors. Brain

tumor classification and glioma grade determination were addressed by Rizwan *et al.* [25] using the Gaussian CNN (GCNN) technique. The GCNN model consisted of sixteen layers, with convolutional layers serving as input layers, and classification, soft max, and FC layers handling output categorization. A dropout layer was included to prevent over fitting. Patil *et al.* [26] developed a fusion model combining deep VGG16 and Shallow CNN (SCNN) to minimize errors in brain tumor classification. The VGG16 deep model was trained to extract low-level information, such as abnormal tissues, while the SCNN focused on extracting high-level information, such as tumor localization. This fusion model leveraged the strengths of both approaches to reduce the misclassification rate. Rajendran *et al.* [27] developed an Automated Segmentation of Brain Tumor MRI Images based on CNN (ASBTCNN). Initially, the images were pre-processed and normalized.3DCNN utilized three layers- convolutional layers for converting images into feature maps, pooling layers for down-sampling, and FC layers for batch normalization. U-Net incorporated with Leaky ReLU to achieve precise segmentation. Roy *et al.* [28] devised S-Net and SA-Net (S-Net with attention mechanism) for segmentation of brain tumors. Initially, multimodal images were pre-processed to obtain 2D images, which were then augmented to artificially expand the dataset. To enhance performance, these models utilized merge blocks and attention blocks. All feature maps from the expanding and contracting routes were combined in the merge block. The merged feature vectors were then processed by attention blocks to focus on the tumor region, which improve segmentation accuracy. Shah *et al.* [29] created VS-BEAM, a Voting-based Semi-Bayesian Ensemble Attention Mechanism, to sort MR images of brain tumors into different groups. The Convolutional Auto-Encoder (CAE) was used for feature extraction. Directed Acyclic Graph Neural Network Squeeze and Excitation Attention recalibrated feature maps by incorporating weighted parameters. Ensemble learning improve predictive performance. Applied Bayesian learning in dense layers minimize losses using Kullback-Leibler divergence and log-likelihood. Finally, all ensemble models and stages were effectively combined within a single architecture to classify brain tumors.

Zaitoon *et al.* [30] developed a combination of techniques by integrating the Recurrent Residual U-Net 2+ (RRUNet2+) model with the Deep Brain Tumor CNN (DBT-CNN) to segment, classify and predict risk for brain tumors. Initially, the MR images were pre-processed using the Convolutional Normalized Mean Filter (CNMF) to enhance image quality. To enhance and automate the segmentation process, the RRUNet2+ model was employed. Agarwal *et al*. [31] developed a DL model to classify brain tumors. Initially, the images were pre-processed using Optimized Discrete Wavelet Transform with Contrast Histogram Equalization (ODTWCHE). Augmentation of images was done through rotation and flipping to avert over fitting. Both statistical and textual features were extracted using GLCM technique. For the categorization process, several models were compared and Inception V3 model surpassed other models.
Almufareh *et al*. [32] formulated YOLO models, YOLO v5, YOLO v7 to detect brain tumors.. The YOLO v5 model was employed for object detection, identifying potential tumor regions within the MRI images. For more precise and accurate results, the YOLO v7 model was used, enhancing the overall detection performance. This approach combined the strengths of both YOLO models to provide a robust solution. Islam *et al.* [33] used MRI images to classify brain cancers using an ensemble model that included a 2D CNN-LSTM, a 9-layer 2D CNN, and 13-layer 2D CNN. Before further processing, the photos were resized and enhanced with normalization of intensity, flipping, rotating, and scaling. The 2D CNN and 2D CNN-LSTM architectures were enhanced for better brain tumor classification in this updated ensemble method by adding FC layers. Lamba *et al.* [34]build a linear kernel-based VGG16 model to classify brain tumors using MR images. The images were augmented and normalized to make them suitable for the DL model. VGG16 was employed for feature extraction to reduce the dimensionality of the images. For accurate classification, the VGG16 model was integrated with Transfer Learning (TL) and Support Vector Machines (SVM). This combination leveraged the strengths of VGG16 for feature extraction and the precision of SVM for classification. In order to identify and categorize brain cancers using magnetic resonance images, Singh *et al*. [35] created the Brain Net CNN model. Histogram equalization and morphological opening were used in the pre-processing. Convolutional filters were then applied for feature extraction. The performance of multi-class categorization was optimized using Stochastic Gradient Descent (SGD). Jabbar *et al.* [36] developed the Caps-VGG Net model, which combines a Capsule Network (Caps Net) and the CNN-based VGG Net architecture to classify brain tumors for Contrast-Enhanced MRI (CE-MRI) images. The images underwent pre-processing steps including intensity normalization, skull stripping, and noise removal to enhance their quality. To make the dataset seem larger

than it actually was, data augmentation methods like flipping, scaling, and rotation were used. To extract more detailed characteristics, this model tweaked the Rectified Linear Unit (ReLU) activation function. Last but not least, before the FC layers, the Caps Net model routed data from the tumor and adjacent tissues to masked capsules. The Expectation Maximization (EM) technique was used to regulate the network's dynamic information routing. To facilitate the automated extraction of features and classification of brain tumors, more VGGNet layers were integrated.

DISCUSSION

In this part, a comparative study for the above-mentioned techniques with their benefits, drawbacks and results are briefly studied. The Table 1 illustrates the merits and demerits of various tumor detection and classification using DL models. The performance evaluation of the existing DL techniques presented in Table 1 illustrates the accuracy of overall prediction and classification of brain tumor detection. Most of the studies employed the MRI dataset. This section assesses the accuracy of different DL based brain tumor prediction models utilizing MRI and other benchmark datasets. The graphical representation demonstrates the accuracy of these models in identifying and categorizing brain tumor based on different images. Figure 4 represents the DL based brain tumour detection using MRI dataset. From this performance analysis, the least performed model is WHHO [24],because of fails to synchronize the data when different devices make communication in a network. This can be rectified in the future if the researchers concentrate on signal stability, which in turn improves accuracy. In addition, it is observed that BrainNet[35], GCNN[25] and CNN[20] outperformed other models in terms of accuracy. However, these models pose some challenges like need of high quality images, need of larger datasets and faster convergence. Those issues are addressed by the Caps-VGGNet [36] model, which achieved a respectable 99.6% accuracy rate. This model improves its classification processes by using approaches to extract more detailed characteristics than any previous model. Nevertheless, the model's interpretability is hindered by the intricate topologies of Caps Net and VGG Net

CONCLUSION

Over the past several years, DLapproaches have become increasingly popular for detecting brain cancers in their younger stages. In this study effort, a number of different DL algorithms are investigated for the purpose of forecasting brain cancers. The advantages, drawbacks, and performance efficiency of these systems are evaluated. Because of the flaws that have been recognized, researchers are able to develop functional models for the detection and prevention of brain tumors, which helps with decision-making and facilitates accurate output prediction. Research in the future will focus on developing more sophisticated models for training different kinds of datasets pertaining to brain tumors and identifying features of brain tumor nodules in order to develop more effective therapies for brain tumours.

Table 1. Comparison on brain tumor detection and classification using DL models

Ref No.	Techniques	Merits	Demerits	Datasets	Performance Evaluation
[20]	DL, TL,CNN	Avoids overfitting problem	More training required	MRI-large, MRI-small datasets	Accuracy = (MRI-large) 99.67%, (MRI-small) 91.94%
[21]	BCNN	Requires less complex time	Not scalable for larger datasets	MRIdataset	Accuracy = 99.5%
[22]	DCNN	Reduced overfitting	Suitable only for smaller images	MRIdataset	Accuracy = 97.72%
[23]	ZNet, AN, UNet	Reliable segmentation	Requires large number of labels	TCGA – LGG MRI dataset	Accuracy = 99.55%
[24]	WHHO, DCNN	Low quality images can be used	Lowest Accuracy	BraTS, SimBraTS MRI datasets	Accuracy = 81.6%
[25]	GCNN	Improved design using diverse	Not applicable for extensive dataset	MRI dataset	Accuracy = (dataset1) 97.14%,

		configurations			(dataset2) 99.8%
[26]	SCNN, VGG16	Reduced loss of information	High complexity	MRI dataset	Accuracy = 97.77%
[27]	ASBTCNN, GLCM, VPT	High sensitivity	Fast convergence	MRI dataset	F-Score = 99.40 %, Sensitivity = 99.39%
[28]	S-Net, SA-Net	Less computational time	Weight Parameters heavily rely on layers count	HGG and LGG datasets	Accuracy = 95.29%
[29]	VS-BEAM	High accuracy due to multiple learning mechanisms	More number of parameters	Fig share MRI dataset	Accuracy = 98.86%
[30]	RRUNet2+	Reduced computational demands	Not compatible for broader dataset	BraTS MRI dataset	Accuracy = 98.51%
[31]	Inception V3, ODTWCHE	Performance does not depend on image properties	Unable to resolve bias problems	Fig share MRI dataset	Accuracy = 98.89 %
[32]	YOLO v5, YOLO v7	More precise results for Meningioma	High computational overhead	MRI dataset	Precison = 93.55%, Recall = 90.5%
[33]	2DCNN, 2DCNN-LSTM	Suitable for both diverse and broad datasets	Lack of generalizability	Kaggle MRI dataset	Accuracy = 98.82%
[34]	VGG16, TL, SVM	Overcome overfitting issues	High validating time	MRI dataset	Accuracy = 98.87%
[35]	BrainNet	Rapid convergence	Support High Quality images only	MRI dataset	Accuracy = 99.96%
[36]	Caps-VGGNet	Get rid of network deterioration	Limited interpretability	BraTS CE-MRI dataset	Accuracy =(VGGNet) 97.3%, (CapsNet) 98.2%

ABSTRACT

A topological index is an algebraic expression which represents the numerical value deduced based on mathematical conditions for the graph structure which is isomorphic to some chemical graph. Different topological indices have been derived in chemical graph theory and have some applications in QSPR (Quantitative Structure Property Relationship) area of research. There are two major categorization of topological indices evolved like distance based and degree based. In this paper, we have considered only the topological indices based on vertex degree. Dutch Windmill graph is a special type of graph usually formed with copies of cycle graph connected to a common node (vertex).This paper is mainly concerned with the Revan and hyper Revan topological indices along with its corresponding polynomials for the semi-total point Dutch Windmill graphs and its line graphs as well in terms of number of copies and length of the cycle graph chosen.

Keywords: topological index, Revan and hyper Revan indices, Revan polynomials, line graph, Dutch windmill graph, semi-total point Dutch Windmill graphs

INTRODUCTION

Graphs concerned in this paper are simple, with no loops and multiple edges. Let $V(G)$ and $E(G)$ indicate the collection of vertices and edges of G, respectively. Let d_b indicate the degree of a node b in G. The Revan vertex degree of any vertex b in G is defined as $r(b) = \Delta(G) + \delta(G) - d_p$, where $\Delta(G)$ and $\delta(G)$ represents maximum and minimum degree of G. [[1] – [2]]. We have the following definitions:

$R_1(G) = \sum_{uv\in E}[r_u + r_v]$

$R_2(G) = \sum_{uv\in E}[r_u \times r_v]$

$R_3(G) = \sum_{uv\in E}[|r_u - r_v|]$

$HR_1(G) = \sum_{uv\in E}[r_u + r_v]^2$

$HR_2(G) = \sum_{uv\in E}[r_u \times r_v]^2$

$R_1(G,x) = \sum_{uv\in E} x^{[r_u + r_v]}$

$R_2(G,x) = \sum_{uv\in E} x^{[r_u \times r_v]}$

$R_3(G,x) = \sum_{uv\in E} x^{[|r_u - r_v|]}$

$HR_1(G,x) = \sum_{uv\in E} x^{[r_u + r_v]^2}$

$HR_2(G,x) = \sum_{uv\in E} x^{[r_u \times r_v]^2}$

The Dutch windmill graph [[3] – [4]] is represented as D_p^q and the acquired graph contains q duplicates of the cycle C_p(p is the length of the cycle) with a commonly shared vertex. The Dutch windmill graph is also known as a Friendship graph if p = 3 (i.e.)D_3^q. The Dutch windmill graphD_p^q comprises (p – 1)q + 1 nodes and edges ofpq in total. In this paper, we computed Revan and hyper Revan indices along with their corresponding polynomials for the semi- total point graph and a line graph of a semi-total point graph for the Dutch windmill graph [6].In graph theory, a semi-total point graph is a graph with the vertex set is the graph's vertex set plus its edge set and two vertices are adjacent in a semi-total point graph if they are adjacent vertices of the graph, or if one vertex is a vertex and the other is an edge incident with it. Let $\Gamma(D_p^q)$ be the semi-total point graph ofD_p^q with$|V(\Gamma(D_p^q))|$ = 2pq – (q – 1) and$|E(\Gamma(D_p^q))|$ = 3pq. Now$L(\Gamma(D_p^q))$ represents the line graph of the semi-total point graph of D_p^q with $\left|V\left(L\left(\Gamma(D_p^q)\right)\right)\right|$ = 3pq and $\left|E\left(L\left(\Gamma(D_p^q)\right)\right)\right|$ = $8p^2 + 7qp – 8q$. We use the general notations related to the graphs from the book [5].

RESULTS AND DISCUSSION

In this section we present a few results based on the Revan and hyper Revan index of$\Gamma(D_p^q)$and $L(\Gamma(D_p^q))$ along with the corresponding Revan polynomials. We listed the computed Revan values corresponding to the degree d_u of $\Gamma(D_p^q)$ and $L(\Gamma(D_p^q))$ in the tables at the end of the paper. We have the maximum degree $\Delta(\Gamma(D_p^q))$ = 4q, where q is the number of copies of cycle in D_p^q and $\delta(\Gamma(D_p^q))$ = 2. Further, the maximum degree $\Delta\left(L\left(\Gamma(D_p^q)\right)\right)$ = 4q + 2 and the minimum degree$\delta\left(L\left(\Gamma(D_p^q)\right)\right)$ = 4.

Theorem 1: Let $\Gamma(D_p^q)$ be the semi-total point graph of D_p^q. Then
$R_1(\Gamma(D_p^q))$ = 8q[3pq – p – 2q + 2].

Proof: From the table1 and3, we compute the first Revan index of $\Gamma(D_p^q)$ as follows:

$R_1(\Gamma(D_p^q)) = |E_{(4q,2)}|[(2) + (4q)] + |E_{(4q,4)}|[(2) + (4q – 2)] + |E_{(4,4)}|[(4q – 2) + (4q – 2)] + |E_{(2,4)}|[(4q) + (4q – 2)]$

$= (2q)[(2) + (4q)] + (2q)[(2) + (4q – 2)] + (p – 2)q[(4q – 2) + (4q – 2)] + (2p – 2)q[(4q) + (4q – 2)]$

$= 8q[3pq – p – 2q + 2]$ ■

Theorem 2: Let $\Gamma(D_p^q)$ be the semi-total point graph of D_p^q.Then
$R_2(\Gamma(D_p^q)) = 4q[20q + p - 8pq + 12q^2p - 16q^2 - 4]$.

Proof: From the table1 and3, we compute the second Revan index of $\Gamma(D_p^q)$ as follows:
$R_2(\Gamma(D_p^q)) = |E_{(4q,2)}|[(2) \times (4q)] + |E_{(4q,4)}|[(2) \times (4q-2)] + |E_{(4,4)}|[(4q-2) \times (4q-2)] + |E_{(2,4)}|[(4q) \times (4q-2)]$
$= (2q)[(2) \times (4q)] + (2q)[(2) \times (4q-2)] + (p-2)q[(4q-2) \times (4q-2)]$
$+(2p-2)q[(4q) \times (4q-2)]$
$= 4q[20q + p - 8pq + 12q^2p - 16q^2 - 4]$ ■

Theorem 3: Let $\Gamma(D_p^q)$ be the semi-total point graph of D_p^q.Then
$R_3(\Gamma(D_p^q)) = 16p + 192$.
Proof: From the table1 and3, we compute the third Revan index of $\Gamma(D_p^q)$ as follows:
$R_3(\Gamma(D_p^q)) = |E_{(4q,2)}|[|(2) - (4q)|] + |E_{(4q,4)}|[|(2) - (4q-2)|]$
$+|E_{(4,4)}|[|(4q-2) - (4q-2)|] + |E_{(2,4)}|[|(4q) - (4q-2)|]$
$= (2q)[|(2) - (4q)|] + (2q)[|(2) - (4q-2)|]$
$+(p-2)q[|(4q-2) - (4q-2)|] + (2p-2)q[|(4q) - (4q-2)|]$
$= 16p + 192$ ■

Remark: Let $\Gamma(D_p^q)$ be the semi-total point graph of D_p^q. We have the Revan polynomials of $\Gamma(D_p^q)$ as follows:
$R_1(\Gamma(D_p^q), x) = \frac{qx^{4q}[2x^6 + 2x^4 + nx^{4q} - 2x^{4q} + 2px^{4q+2} - 2x^{4q+2}]}{x^4}$,
$R_2(\Gamma(D_p^q), x) = \frac{q[2x^{4q+4} + 2x^{24q} + px^{16q^2+8} - 2px^{8q+16q^2+4} - 2x^{8q+16q^2+4}]}{x^{1+6q+4}}$,
$R_3(\Gamma(D_p^q), x) = \frac{q[2x^{4q+2} + 2x^{4q} + px^4 - 2x^4 - 2px^6 - 2x^6]}{x^4}$.

Theorem 4: Let $\Gamma(D_p^q)$ be the semi-total point graph of D_p^q. Then
$HR_1(\Gamma(D_p^q)) = 8q[28q + 3p - 16pq + 24q^2p - 24q^2 - 4]$.
Proof: From the table 1 and3,we compute the first hyper Revan index of $\Gamma(D_p^q)$ as follows:
$HR_1(\Gamma(D_p^q)) = |E_{(4q,2)}|[(2) + (4q)]^2 + |E_{(4q,4)}|[(2) + (4q-2)]^2$
$+|E_{(4,4)}|[(4q-2) + (4q-2)]^2 + |E_{(2,4)}|[(4q) + (4q-2)]^2$
$= (2q)[(2) + (4q)]^2 + (2q)[(2) + (4q-2)]^2$
$+(p-2)q[(4q-2) + (4q-2)]^2 + (2p-2)q[(4q) + (4q-2)]^2$
$= 8q[28q + 3p - 16pq + 24q^2p - 24q^2 - 4]$ ■

Theorem 5: Let $\Gamma(D_p^q)$ be the semi-total point graph of D_p^q. Then
$HR_2(\Gamma(D_p^q)) = 4q[p - 24q - 4pq + 36q^2p - 128q^3p + 128q^4p + 24q^2 + 128q^3 - 128q^4 + 6]$.
Proof: From the table 1 and3, we compute the second hyper Revan index of $\Gamma(D_p^q)$ as follows:
$HR_2(\Gamma(D_p^q)) = |E_{(4q,2)}|[(2) \times (4q)]^2 + |E_{(4q,4)}|[(2) \times (4q-2)]^2$
$+|E_{(4,4)}|[(4q-2) \times (4q-2)]^2 + |E_{(2,4)}|[(4q) \times (4q-2)]^2$
$= (2q)[(2) \times (4q)]^2 + (2q)[(2) \times (4q-2)]^2$
$+(p-2)q[(4q-2) \times (4q-2)]^2 + (2p-2)q[(4q) \times (4q-2)]^2$
$= 4q[p - 24q - 4pq + 36q^2p - 128q^3p + 128q^4p$
$+24q^2 + 128q^3 - 128q^4 + 6]$ ■

Remark: Let $\Gamma(D_p^q)$ be the semi-total point graph of D_p^q. We have the hyper Revan polynomials of $\Gamma(D_p^q)$ as follows:
$HR_1(\Gamma(D_p^q), x) = 2qx^{4(2q+1)^2} + 2qx^{16q^2} + pqx^{16(2q-1)^2} - 2qx^{16(2q-1)^2}$
$+2qpx^{(4(4q-1)^2)} - 2qx^{4(4q-1)^2}$,
$HR_2(\Gamma(D_p^q), x) = 2qx^{64q^2} + 2qx^{16(2q-1)^2} + pqx^{16(2q-1)^4} + 2pqx^{64q^2(2q-1)^2} - 2qx^{64q^2(2q-1)^2}$.

Theorem 6: Let $L(\Gamma(D_p^q))$ be the line graph of semi-total point graph of D_p^q. Then
$R_1(L(\Gamma(D_p^q))) = 8pq[7q + 2]$.

Proof: From the table 2 and 4, we compute the first Revan index of $L(\Gamma(D_p^q))$ as follows:

$R_1(L(\Gamma(D_p^q))) = |E_{(4q+2,4q+2)}|[(4) + (4)] + |E_{(4q+2,4q)}|[(4) + (6)]$
$+|E_{(4q+2,4)}|[(4) + (4q + 2)] + |E_{(4q+2,6)}|[(4) + (4q)]$
$+|E_{(4q,4q)}|[(6) + (6)] + |E_{(4q,4)}|[(6) + (4q + 2)]$
$+|E_{(6,6)}|[(4q) + (4q)] + |E_{(4,4)}|[(4q + 2) + (4q + 2)]$
$+|E_{(6,4)}|[(4q) + (4q + 2)]$
$= q(2q - 1)[(4) + (4)] + (3q^2)[(4) + (6)] + (4q)[(4) + (4q + 2)]$
$+(2q)[(4) + (4q)] + q(2q - 1)[(6) + (6)] + (2q)[(6) + (4q + 2)]$
$+(p - 3)q[(4q) + (4q)] + (2p - 3)q[(4q + 2) + (4q + 2)]$
$+(4p - 8)q[(4q) + (4q + 2)]$
$= 8pq[7q + 2]$ ■

Theorem 7: Let $L(\Gamma(D_p^q))$ be the line graph of semi-total point graph of D_p^q. Then
$R_2(L(\Gamma(D_p^q))) = 8q[29q + p + 8pq + 14q^2p - 28q^2 - 1]$.

Proof: From the table 2 and 4, we compute the second Revan index of $L(\Gamma(D_p^q))$ as follows:

$R_2(L(\Gamma(D_p^q))) = |E_{(4q+2,4q+2)}|[(4) \times (4)] + |E_{(4q+2,4q)}|[(4) \times (6)]$
$+|E_{(4q+2,4)}|[(4) \times (4q + 2)] + |E_{(4q+2,6)}|[(4) \times (4q)]$
$+|E_{(4q,4q)}|[(6) \times (6)] + |E_{(4q,4)}|[(6) \times (4q + 2)]$
$+|E_{(6,6)}|[(4q) \times (4q)] + |E_{(4,4)}|[(4q + 2) \times (4q + 2)]$
$+|E_{(6,4)}|[(4q) \times (4q + 2)]$
$= q(2q - 1)[(4) \times (4)] + (3q^2)[(4) \times (6)] + (4q)[(4) \times (4q + 2)]$
$+(2q)[(4) \times (4q)] + q(2q - 1)[(6) \times (6)] + (2q)[(6) \times (4q + 2)]$
$+(p - 3)q[(4q) \times (4q)] + (2p - 3)q[(4q + 2) \times (4q + 2)]$
$+(4p - 8)q[(4q) \times (4q + 2)]$
$= 8q[29q + p + 8pq + 14q^2p - 28q^2 - 1]$ ■

Theorem 8: Let $L(\Gamma(D_p^q))$ be the line graph of semi-total point graph of D_p^q. Then
$R_3(L(\Gamma(D_p^q))) = 8pq + 8q - 26q^2$.

Proof: From the table 2 and 4, we compute the third Revan index of $L(\Gamma(D_p^q))$ as follows:

$R_3(L(\Gamma(D_p^q))) = |E_{(4q+2,4q+2)}||(4) - (4)| + |E_{(4q+2,4q)}||(4) - (6)|$
$+|E_{(4q+2,4)}||(4) - (4q + 2)| + |E_{(4q+2,6)}||(4) - (4q)|$
$+|E_{(4q,4q)}||(6) - (6)| + |E_{(4q,4)}||(6) - (4q + 2)|$
$+|E_{(6,6)}||(4q) - (4q)| + |E_{(4,4)}||(4q + 2) - (4q + 2)|$
$+|E_{(6,4)}||(4q) - (4q + 2)|$
$= q(2q - 1)(0) + (3q^2)(2) + (4q)(2 - 4q) + (2q)(4 - 4q) + q(2q - 1)(0)$
$+(2q)(4 - 4q) + (p - 3)q(0) + (2p - 3)q(0) + (4p - 8)q(2)$
$= 8pq + 8q - 26q^2$ ■

Theorem 9: Let $L(\Gamma(D_p^q))$ be the line graph of semi-total point graph of D_p^q. Then
$HR_1(L(\Gamma(D_p^q))) = 448pq^3 + 256pq^2 - 768q^3 + 140q^2 + 48pq + 16pq$.

Proof: From the table 2 and 4, we compute the first hyper Revan index of $L(\Gamma(D_p^q))$ as follows:

$HR_1(L(\Gamma(D_p^q))) = |E_{(4q+2,4q+2)}|(4 + 4)^2 + |E_{(4q+2,4q)}|(4 + 6)^2$
$+|E_{(4q+2,4)}|(4 + 4q + 2)^2 + |E_{(4q+2,6)}|(4 + 4q)^2$
$+|E_{(4q,4q)}|(6 + 6)^2 + |E_{(4q,4)}|(6 + 4q + 2)^2$
$+|E_{(6,6)}|(4q + 4q)^2 + |E_{(4,4)}|(4q + 2 + 4q + 2)^2$
$+|E_{(6,4)}|(4q + 4q + 2)^2$

$= q(2q-1)(64) + (3q^2)(100) + (4q)(36 + 16q^2 + 48q) + (2q)(16 + 16q^2 + 32q) + q(2q-1)(144) + (2q)(64 + 16q^2 + 64q) + (p-3)q(64q^2) + (2p-3)q(64q^2 + 16 + 64q) + (4p-8)q(64q^2 + 4 + 32q) = 448pq^3 + 256pq^2 - 768q^3 + 140q^2 + 48pq + 16pq$ ■

Theorem 10: Let $L(\Gamma(D_p^q))$ be the line graph of semi-total point graph ofD_p^q. Then
$HR_2(L(\Gamma(D_p^q))) = 1792pq^5 + 2048pq^4 + 1024pq^3 + 128pq^2 + 32pq - 3584q^5 - 3584q^4 + 1024q^3 + 6816q^2 - 1056q.$

Proof: From the table 2 and 4, we compute the second hyper Revan index of $L(\Gamma(D_p^q))$ as follows:

$HR_2(L(\Gamma(D_p^q))) = |E_{(4q+2,4q+2)}|(4 \times 4)^2 + |E_{(4q+2,4q)}|(4 \times 6)^2$
$+|E_{(4q+2,4)}|(4 \times (4q+2))^2 + |E_{(4q+2,6)}|(4 \times 4q)^2$
$+|E_{(4q,4q)}|(6 \times 6)^2 + |E_{(4q,4)}|(6 \times (4q+2))^2$
$+|E_{(6,6)}|(4q \times 4q)^2 + |E_{(4,4)}|((4q+2) \times (4q+2))^2$
$+|E_{(6,4)}|(4q \times (4q+2))^2$
$= q(2q-1)(256) + (3q^2)(576) + (4q)(256q^2 + 256q + 64) + (2q)(256q^2)$
$+q(2q-1)(1296) + (2q)(144 + 576q^2 + 576q) + (p-3)q(256q^4) + (2p-3)q(256q^4 + 512q^3 + 384q^2 + 64q + 16)$
$+ (4p-8)q(256q^4 + 64q^2 + 256q^3)$
$= 1792pq^5 + 2048pq^4 + 1024pq^3 + 128pq^2 + 32pq - 3584q^5 - 3584q^4 + 1024q^3 + 6816q^2 - 1056q$ ■

Remark: Let $L(\Gamma(D_p^q))$ be the line graph of semi-total point graph of D_p^q. We have the hyper Revan polynomials of $L(\Gamma(D_p^q))$ as follows:

$HR_1(L(\Gamma(D_p^q)), x) = q(2q-1)x^{64} + 4q^2x^{100} + 4qx^{(4q+6)^2} + 2qx^{(4+4q)^2} + q(2q-1)x^{144} + 2qx^{(4q+8)^2} + (p-3)qx^{64q^2} + (2p-3)qx^{(8q+4)^2} + (4p-8)qx^{(8q+4)^2}.$

$HR_2(L(\Gamma(D_p^q)), x) = q(2q-1)x^{16^2} + 4q^2x^{24^2} + 49x^{(4\times(4q+2))^2} + 2qx^{(4(4q))^2} + q(2q-1)x^{36^2} + 2qx^{((6)\times(4q+2))^2} + (p-3)qx^{(16q^2)^2} + (2p-3)qx^{(4q+2)^4} + (4p-8)qx^{((4q)(4q+2))^2}.$

CONCLUSION

In the present paper, we computed the Revan and hyper Revan topological indices and the corresponding polynomials of semi-total point graph and the line graph of semi-total point graph of Dutch windmill graph. We will consider the different types of networks and some chemical graphs related to some chemical compounds and compute topological indices in terms of various graph invariants relevant to Revan vertex degree as well as the product version of Revan and hyper Revan indices also in the next work.

ABSTRACT

Post-surgical use of antimicrobial agents in the form of mouth rinses to control biofilm formation and enhance wound healing has been supported by several clinicians. Amongst all other mouth rinses, chlorhexidine is considered a gold standard because of its substantivity property. Numerous investigations have shown that the clinical application of hyaluronic acid preparations during surgical therapy may reduce the bacterial contamination of surgical wounds, diminishing the risk of post-surgical infection and promoting healing after periodontal surgeries. To evaluate and compare the efficacy of mouthwash containing chlorhexidine digluconate alone and chlorhexidine digluconate in combination with hyaluronic acid on postoperative healing after periodontal flap surgery. Conventional periodontal surgery was performed in thirty chronic periodontitis patients. Post-surgery patients were divided into, Mouthwash containing 0.2% chlorhexidine digluconate in combination with 0.1% hyaluronic acid, and Mouthwash containing 0.2% chlorhexidine digluconate alone. The assessment of clinical parameters was done after 1 week and 1-month post-surgery.

In both groups, Early Healing Index, Visual Analogue Scale, Sulcus Bleeding Index, and Pocket Depth significantly reduced from the baseline to 1 week and 1 month. Except for pocket depth, other clinical parameters showed statistically insignificant difference between two groups. The pocket depth reduction was more evident in group A than group B. Mouthwash containing 0.2% chlorhexidine digluconate in combination with 0.1% hyaluronic acid is an equally effective chemical plaque control aid for post-operative healing and pain reduction. The presence of hyaluronic acid along with chlorhexidine digluconate show enhanced effect as compared to chlorhexidine digluconate alone.

Keywords: Periodontitis, Periodontal pockets, Mouthwashes, Hyaluronic acid.

INTRODUCTION

Periodontitis is considered one of the most prevalent diseases affecting 90-95% population in India [1]. Depending on the stage and nature of the periodontal disease various treatment modalities are carried out to achieve more physiologic status of the periodontium and teeth. In the initial stage of periodontitis, non-surgical periodontal therapy is effective, leading to a gain in clinical attachment level. However, it does not show remarkable results in moderate to severe periodontitis stages. therefore, periodontal flap surgery is indicated to enhance the accessibility for root instrumentation and regeneration of periodontal attachment apparatus lost due to the destructive disease.
Periodontal flap surgery has certain post-operative complications such as bleeding, pain, root hypersensitivity, swelling, trismus, bruising, etc., Various factors can be responsible for these complications such as extensive surgical procedure, poor handling of tissues, trauma, poor infection control, use of a dull instrument for incision, and improper knowledge of surgical anatomy, etc., [2] The complete wound healing with the formation of a fully epithelialized gingival crevice takes at least one-month post-periodontal flap surgery. Post-surgical use of local antimicrobial agents in the form of mouth rinses has been supported by several clinicians to control biofilm formation and enhance wound healing. Amongst all other mouth rinses, Chlorhexidine is considered a gold standard because of its property of substantivity [3-6]. Chlorhexidine is a bisbiguanide. It is a second-generation chemical plaque control regime. Chlorhexidine (CHX) has an extensive root of being prescribed as a medication that can prevent the development of gingivitis and plaque. Chlorhexidine digluconate is a broad-spectrum antimicrobial agent that has a marked effect on Gram-negative and Gram-positive bacteria [7]. Chlorhexidine is a dicationic molecule that binds non-specifically to negatively charged, phospholipids containing bacterial cell membranes. The mechanism of action of chlorhexidine is dose-dependent. It has been shown to have both bacteriostatic and bactericidal activity, at a low (0.02-0.06%) and a high concentration (0.12-0.20%) [8-10].

Chlorhexidine is widely used in dentistry. It is available in the form of toothpaste, gel, mouth rinses, sprays, varnishes, etc., It is also used as a local drug delivery agent (Periochip). The use of CHX has been extended in post-operative periods as well to prevent plaque formation and early bacterial re-colonization of the treated area [11]. Hyaluronic acid or hyaluronan is a glycosaminoglycan. It performs a wide range of biological roles, including basic structural roles in the extracellular matrix and impacts on cellular components that regulate development. It is essential in wound healing, facilitating cell migration and differentiation during tissue repair, and showing angiogenetic and osteoinductive effects [12]. Numerous investigations in the field of regenerative surgery have led to the conclusion that wound healing can be improved by a decrease in the bacterial burden. The most bacteriostatic activity is produced by a high concentration of medium and lower molecular weight hyaluronic acid, especially against strains of *Aggregatibacter actinomycetemcomitans, Prevotellaoris,* and *Staphylococcus aureus* that are frequently seen in oral gingival lesions and periodontal wounds [10]. By reducing bacterial contamination of the surgical wound site, a therapeutic application of hyaluronic acid preparations during surgical therapy may lower the risk of post-surgical infection and promote healing following periodontal procedures [13].

Hence this study was contemplated to evaluate and compare the efficacy of mouthwash containing chlorhexidine digluconate and chlorhexidine digluconate in combination with hyaluronic acid on post-operative healing after periodontal flap surgery.

MATERIALS AND METHOD

The present study was conducted at Bharati Vidyapeeth (Deemed to be University) Dental College and Hospital, Pune. The research proposal was approved by the Institutional Ethics Committee (IEC) to carry out the research project. (EC/NEW/INST/2021/MH/0029). A total of 40 patients visiting the Outpatient Department of Periodontology were selected based on the inclusion and exclusion criteria. This study included patients of both genders, age range of 30-50 years, systemically healthy patients with no history of antibiotic intake or periodontal surgery in the last 6 months, and probing pocket depth of 5-7 mm after phase 1 periodontal therapy. Uncooperative patients regarding oral hygiene maintenance, patients with para-functional habits or tissue abuse habits, pregnant or lactating women, patients with aggressive periodontitis, and patients with known allergies to the content of mouthwash were excluded from the study. The detailed case history of all patients was recorded. Thorough scaling, root planning, and polishing were done using ultrasonic scalers and currettes. Oral hygiene instructions were given to the patients. Patients were recalled after 1 month for re-evaluation and baseline parameters i.e., Sulcus Bleeding Index (SBI) given by Muhlemann and Sons (1971) and Pocket Probing Depth (PD) were recorded. Individuals with persistent pocket depth of 5-7 mm and SBI scores of 2-5 were selected for conventional periodontal flap surgery. Out of 40 patients, 10 patients were excluded from the study (Eight patients showed a reduction in pocket depth after phase 1 therapy and two patients refused to undergo surgical procedure). After explaining the study protocol, written informed consent was obtained from the patients. All the patients were operated under local anesthesia with nerve block technique in the surgical field. The gingival crevicular incision was given using surgical blade no. 15 and mucoperiosteal flap was raised by blunt dissection using a periosteal elevator. Degranulation, scaling, and root planing were done. Flap trimming, rescalloping, and osseous recontouring were done wherever required. The flap is repositioned and sutured using a 4-0 silk suture. Post-operative instructions and analgesics (Paracetamol 500 mg tablet) were given to all the patients if required. After flap surgery, patients were randomly divided into two groups using the coin toss method.

Group A: Mouthwash containing 0.2% chlorhexidine digluconate in combination with 0.1% hyaluronic acid
Group B: Mouthwash containing 0.2% chlorhexidine digluconate alone
Patients were advised to rinse the oral cavity using 10 ml of respective mouthwash for 60 seconds twice daily for 15 days. Patients were recalled after 1 week and 1 month for follow-up and evaluation of clinical parameters. During the 1-week follow-up, the Early Healing Index (EHI) given by Huang et al (2005) and Pain intensity using the Visual Analogue Scale (VAS) were recorded. While at 1-month follow-up all four parameters, i.e., SBI, PD, EHI, VAS were recorded. The evaluation and comparison of the result done and statistical analysis was carried out.

Statistical Analysis
The change in the mean score of the indices and VAS within each group was analyzed using the Wilcoxan Signed Rank test. The comparison of probing depth within each group was analyzed using the Paired t-test. Intergroup comparison of the indices and VAS score was done using the Whitney U test. Intergroup comparison of the probing depth was done using the Unpaired t-test. P value less than or equal to 0.05 was considered to be statistically significant.

RESULT

All patients followed mouth rinsing instructions meticulously, giving a 100% of compliance. No patient dropout occurred. No allergic reaction or major complications were reported due to any mouthwash.

Sulcus Bleeding Index

As shown in Table 1, the sulcus bleeding index score for group A at baseline was 3.87 ± 1.06; after 1 month, it was 1.07 ± 0.80. For group B, the score was 4.20 ± 0.78 and 1.87 ± 1.06 at baseline and 1 month respectively. This change in the SBI score was statistically significant for both groups (p-value <0.05). The intergroup comparison of the change in mean sulcus bleeding index for group A was 2.80 ± 0.86 and for group B was 2.33 ± 0.72 (Table 2). This difference between group A and group B was statistically insignificant (p-value>0.05).

Probing Pocket Depth

Pocket depth for group A was 6.13 ± 0.99 at baseline and 2.20 ± 0.78 at 1 month while pocket depth for group B was 5.67 ± 0.98 at baseline and 2.73 ± 0.80 at 1 month (Table 1). This reduction in the pocket depth was statistically significant for both groups (p-value < 0.05). The intergroup comparison of reduction in pocket depth for group A was 3.93 ± 0.88 and for group B was 2.93 ± 0.80 (Table 2). This difference between reduction in pocket depth for group A and group B was statistically significant (p-value < 0.05).

Early Healing Index (EHI)

As shown in Table 1, the early healing index score for group A at 1 week was 1.47 ± 0.52; after 1 month, it was 1.07 ± 0.26. For group B, the score was 1.67 ± 0.62 and 1.20 ± 0.41 at baseline and 1 month respectively. This change in the EHI score was statistically significant for both groups (p-value <0.05). The intergroup comparison of the change in mean early healing index for group A was 0.40 ± 0.51 and for group B was 0.47 ± 0.52 (Table 2). This difference between group A and group B was statistically insignificant (p-value>0.05).

Visual Analog Scale (VAS) Score

The change in visual analog scale (VAS) showed a statistically significant difference from 1 week to 1 month for both groups. The VAS score in group A was 1.80 ± 0.68 at 1 week and 0.33 ± 0.49 at 1-month follow-up while in group B the score was 2.07 ± 0.74 at 1 week and 0.45 ± 0.62 at 1 month follow up respectively. This change in the VAS score was statistically significant for both groups (p-value <0.05). The intergroup comparison of the change in VAS score for group A was 1.47 ± 0.83 and for group B was 2.13 ± 1.36 (Table 2). This difference between group A and group B was statistically insignificant (p-value>0.05).

DISCUSSION

Maintenance of the surgical field is challenging. Therefore, in such circumstances, mouth rinses aid in plaque control of the surgical field. This study compared the healing efficiency of mouthwash containing chlorhexidine digluconate with hyaluronic acid against the efficacy of mouthwash containing chlorhexidine digluconate post-periodontal flap surgery. Several studies evaluating the effectiveness of hyaluronic acid in gel formulation for post-operative healing have demonstrated that hyaluronic acid is either as effective or more effective than chlorhexidine digluconate[14,15,16]. The primary goal of the study was to evaluate the post-operative healing and pain. The early healing index showed a statistically significant difference from 1 week to 1 month after flap surgery in both groups. Intergroup comparison showed better results with the study group (CHX+ Hyaluronic acid mouthwash) than the control group (CHX mouthwash). Although, the difference is not statistically significant. The study findings are consistent with an investigation conducted by Trombelli L. *et al* (2018)[13]. However, a study conducted by Ruggiero T. (2024) showed a statistically significant difference in post-extraction wound healing in type 2 diabetes mellitus patients treated with hyaluronic acid gel application as compared to the control group [17]. Following periodontal surgery, postoperative pain is a common clinical complaint that differs significantly in patients based on age, sex, and kind of surgery. Post-operative pain is commonly measured using Visual Analog Scale (VAS). As hyaluronic acid helps in wound healing with its properties such as promoting granulation tissue development, preventing destructive inflammation during the healing phase, and performing re-epithelialization and angiogenesis, it might help in post-operative pain reduction. Therefore, in this study, postoperative pain reduction is evaluated using the Visual Analog Scale (VAS) which showed a remarkable difference from baseline, 1 week, and 1 month in both

groups. The intergroup examination was not statistically significant. However, contradictory results were obtained in the study conducted by Shuborna NS (2022) which indicated that hyaluronic acid can produce an analgesic action in post-extraction sockets after surgical removal of impacted teeth [18]. Another study conducted by Yakout B.K (2023) evaluated the efficacy of hyaluronic acid as an adjunct to photobiomodulation after gingivectomy was carried out and the results showed a statistically significant reduction in visual analogue scale (VAS) in the test group as compared to the control group [19]. The present study showed the positive effect of hyaluronic acid in pocket depth reduction. The intra group as well as intergroup examination showed statistically significant differences from baseline to 1-month follow-up. The study results were consistent with the study conducted by Mamajiwala A.S. (2021) where the efficacy of 0.8% hyaluronic acid gel was evaluated as an adjunct to open flap debridement [16]. The sulcus bleeding index was recorded at baseline and 1 month after periodontal flap surgery. The intergroup comparison did not show any statistical difference but there was a notable difference seen in the sulcus bleeding index from baseline to 1 month in both groups. In 2014, Rajan *et al.* conducted a study to evaluate the adjunctive role of 0.2% hyaluronic acid gel to scaling and root planning and found a highly significant difference in the bleeding on probing in favor of the study group [20].

CONCLUSION

The combination of hyaluronic acid and chlorhexidine digluconate has a greater effect on pocket depth reduction than when used alone. Nonetheless, more investigation is needed to fully understand how hyaluronic acid treats periodontal disease. This will also ascertain the precise applications, the best way to administer hyaluronic acid for treating periodontal diseases after surgery, and the potential for complete regeneration of periodontal tissue.

ABSTRACT

The examination of decaying wood collected from two mangrove habitats along Kerala coast resulted in the identification of twenty five marine fungi comprising 13 ascomycetes and 12 mitosporic fungi. Four ascomycetes and 5 mitosporic fungi were common to both mangrove ecosystems. The study provides valuable insights into the distribution patterns of marine fungi, emphasizing the importance of considering geographical specificity in fungal ecology research.

Keywords: Marine fungi, wood samples, mangrove ecosystem, frequency of occurrence

INTRODUCTION

About 225 marine fungi and fungus-like organisms have been listed in India, including Labyrinthulomycetes (14), Chytridiomycetes (4), Oomycetes (4), Ascomycetes (149), Basidiomycetes (3), Hyphomycetes (39) and Coelomycetes (12). All these species were reported from intertidal wood, driftwood, intertidal mangrove wood, salt marsh plants, water and sediment samples, algae and animals, and propagules (ascospores/conidia) of marine fungi in form samples [1]. Ascomycetes are the most dominant group in the marine mycological milieu. With their small sporocarps, frequently appendaged spores, and ability to withstand fluctuating saline conditions, they seem to have very effectively adapted to marine ecosystems. The majority of them are lignicolous species occurring mostly on mangrove wood and are coastal in occurrence. Among the different marine groups of Ascomycetes, the order Halosphaeriales is the largest followed by Loculoascomycetes. Members belonging to Basidiomycetes are very rare in marine habitats with only 10 species in 7 genera known, and they occur mostly on decaying wood [2,3]. The distribution of marine fungi is governed by a multitude of interacting factors, and no single one can be identified to explain their occurrence and frequency of occurrence. However some factors are more important than others, for example, availability of substrata, temperatures, water salinity and geographical location are the key elements in the

occurrence and distribution of marine fungi [4,5]. Jones [6] highlighted a consortium of factors operating in determining the biodiversity of fungi in the sea: water which includes temperature, salinity, seasonality, pH, nutrient availability, tidal amplitude, availability of substrata and their chemical composition, possession of specific enzymes to degrade the substratum, natural occurring substratum or baited samples, succession, period of samples exposed to sea water and depth at which samples are recovered. Mangroves are considered as a major niche of fungal repository. Investigation on mycota of mangroves revealed that mangrove fungi are the second largest group among the marine fungi [7].The paper explores the diversity of marine fungi within the mangrove ecosystem of northern Kerala.

MATERIALS AND METHODS

Collection And Treatment Of Wood Samples

Decaying woody samples were collected from the Kuppam(*12° 57' N* ,75° 15' E)and Pazhayangadi(12°01′08″N, 75°15′32″E)mangrove ecosystem of North Kerala.They were washed well, placed in sterile polythene bags and were brought to the laboratory.Samples were observed under stereomicroscope for fungal fructifications and incubated inpolythene bags at room temperature. Periodical isolation of marine fungi from these samples wascarried out for one year. Identifications of marine fungi were done using taxonomic keys [7, 8, 9, 10]. The marine fungi thus identified were tabulated andrecorded (Table 1).

Presentation Of Data

Percent frequency of occurrence (FO) = Total number of isolates of a particular species divided by total number of samples supporting marine fungi X 100. On the basis of percentage frequency of occurrence, the marine fungi were classified as most frequent (>20%), frequent (10-20%), occasional (5-10%) and rare (<5%).

RESULT

Twenty five marine fungi comprising 13 ascomycetes and 12 mitosporic fungi were isolated from fifty wood samples collected from Kuppam and Pazhayangadi mangrove ecosystem. From Kuppam alone, twenty fungi were obtained, likewise from Pazhayangadi site fourteen fungi were isolated. Out of the twenty fungi obtained from Kuppam site, 10 are ascomycetes and the remaining 10 are mitosporic fungi. Among the fourteen manglicolous marine fungi isolated from Pazhayangadi, 7 were ascomycetes and the remaining 7 were mitosporic fungi. Four ascomycetes and 5 mitosporic fungi were common to both mangrove ecosystems. After conducting a comparative study of marine fungi in the Kuppam and Pazhayangadi mangrove ecosystems, it was observed that certain marine fungi exhibited location preferences. In the Kuppam mangrove ecosystem, a total of 10 ascomycetes were identified. Among these, the following six Ascomycetes were exclusively found in Kuppam and were absent in the Pazhayangadi mangrove site: *Aigialus mangrovei, Aniptoderaches apeakensis, Halorosellinia oceanica, Savoryella longispora, Savoryellapaucispora,* and *Salsuginearamicola*. Additionally, five mitosporic fungi, namely *Alternaria*sp., *Cumilospora marina, Dendryphiellasalina, Trichocladium alopallonellum,* and *Trichocladium melhae*, isolated from the Kuppam ecosystem, were not detected in the Pazhayangadi ecosystem. Out of the 14 marine fungi isolated from the Pazhayangadi mangrove ecosystem, three ascomycetes, namely *Halosarpheia marina, Halosarpheia* sp., and *Savoryellalignicola*, were exclusive to that location, while the remaining four were also found at the Kuppam site. Regarding the occurrence of mitosporic fungi at the Pazhayangadi site, out of seven marine fungi identified, two, namely *Hydea pygmeya* and *Cumilospora marina,* were exclusively observed at Pazhayangadi, while the remaining five were also present in the Kuppam locality. While comparing the frequency of occurrence of marine fungi from Kuppam and Pazhayangadi mangrove ecosystem, it was noted that none of the fungi showed the frequency value > 1.5 from Kuppam mangrove ecosystem. Similarly frequent fungi showing value between 1-1.5 was also nil. However, 7 species were found occasional and remaining 18 species were rare in occurrence.

DISCUSSION

Verruculina enalia and *Cirrenalia pygmea* were the dominant species obtained in the present study. The dominant species reported from Kerala during 1991-93 [11] were obtained either occasional or rare during the study . *Verruculina enalia* and *Periconiaprolifica* were the most dominant species isolated from west coast of India [12]. Sarma *et al*., [13] and Chinnaraj[14] reported *Verruculina enalia* as the most frequent fungi from mangrove ecosystem in the deltas of Krishna – Godavari, Andhra Pradesh and Andaman and Nicobar island respectively. Interestingly, we found that four species of ascomycetes and five species of mitosporic fungi were common to both mangrove ecosystems, indicating a degree of fungal overlap between these two distinct habitats.Assemblage and diversity of filamentous fungi on leaf and woody litter accumulated onthe floor of two mangrove forest of Karnataka by Ananda and Sridhar [15] yielded 78 fungi. About 47% out of these 78 were typical terrestrial fungi than marine fungi, of which most of them belong to mitosporic fungi. In another study, Maria and Sridhar [16] reported the occurrence of 31 terrestrial fungi out of 91 identified from Udayavara mangrove ecosystem, Karnataka. However none of these terrestrial fungi were encountered in the present study.

The presence of site-specific marine fungi highlights the importance of local environmental factors in shaping fungal community composition. Factors such as substrate availability, water chemistry, and microclimate may influence the distribution of fungal species along coastal regions. Additionally, the occurrence of shared species suggests some degree of connectivity between the Pazhayangadi and Kuppam sites, possibly facilitated by water currents or dispersal mechanisms. In this study, despite the Pazhayangadi mangrove site covering a larger area compared to the Kuppam site, only 14 fungi were obtained from the Pazhayangadi mangrove site. It was observed during collection that the Pazhayangadi mangrove ecosystem is disturbed by human interference, mainly pollution. Conversely, in the Kuppam site, although the mangrove ecosystem's area is smaller, the mangroves exhibited healthy growth compared to Pazhayangadi. Hence, it is evident that manglicolous fungi play a pivotal role in fostering the robust growth of healthy mangroves. A higher diversity of mangrove fungi correlates with enhanced degradation of wood and other substrates within the mangrove ecosystem.

CONCLUSION

The study sheds light on the diversity and distribution of manglicolous marine fungi in the Kuppam and Pazhayangadi mangrove ecosystems, highlighting the importance of these unique habitats in supporting fungal biodiversity. Advance research into the ecological roles and potential applications of these fungi could provide valuable insights into their significance in marine ecosystem.Further investigations into the ecological roles and adaptive strategies of site-specific fungi are warranted to fully understand their contributions to coastal ecosystem dynamics.

ACKNOWLEDGEMENT

The authors are thankful to the Principal and Management of Sir Syed College, Taliparamba for providing facilities.

ABSTRACT

In 2018, a field experiment was carried out at Mukuperi village, which is located at 8.5649^0 latitude and 77.9910^0 longitude in the Thoothukudi district of Tamil Nadu, South India. The purpose of the experiment was to examine the effects of different combinations of organic amendments on the physical properties of the soil and their effects on green gram. With three replications, the experiment was set up in a randomized block design. In this investigation, Vermicompost (VC), Farm yard manure (FYM), and Poultry manure (PM) were used as treatments at three different concentrations8.5, 12.5 and 16.5 t ha^{-1}. Following the application of organic amendments, soil samples from each plot were collected and examined. Physical characteristics including Bulk density (BD), Particle density (PD), Water holding capacity (WHC), Pore space (PS) and saturated moisture (SM) were measured. In comparison to the control, which had 260 kg ha^{-1}, the yield in the treatment VC@ 12.5 t ha^{-1}was determined to be high at 1112 kg ha^{-1}. All treatments except the control showed a decrease in the soil's bulk and particle densities. Pore space, saturated moisture content, and water holding capacity percentages have increased. Therefore, applying organic manure improves crop quality and productivity while also increasing crop growth, yield, and soil nutrient status without causing environmental pollution.

Keywords: Farm yard manure, Vermicompost, Physical properties, Organic amendments.

INTRODUCTION

Organic manures provide a good substrate for the growth of micro-organisms and maintain a favourable nutritional balance and soil physical properties [1].Organic manure and biofertilizers have been used in agriculture to improve soil fertility and enhance crop productivity.Application of manure helps maintain soil nutrient balance, improves soil structure, and moisture-holding capacity, and is beneficial for environmental protection compared with the application of chemical fertilizers [2]. One of the most significant pulse crops cultivated in India is greengram (Vignaradiata L.), a leguminous crop with a high nutritional value.Organic manures are essential for maintaining soil physical, chemical, and biological conditions, as well as providing macro and micronutrients to crops.This study examined the effects of adding organic manures to soil and varying their combinations for the production of green grams, with an emphasis on changes in physical properties of the soil.

MATERIALS AND METHODS

The Field Experiment was carried out at Mukuperi village of Thoothukudi district of Tamil Nadu, South India in 2018, which is located at 8.5717^0 latitude and 77.5827^0 longitude. The soil of the experimental field was sandy loam with poor fertility status. The experiment was laid out in randomized block design with thirteen plots. The treatments of this study were Vermicompost (VC), Farm yard manure (FYM) and Poultry manure (PM) and their combinations at three different concentrations 8.5, 12.5 and 16.5 t ha^{-1}. Green Gram seeds were sown following the application of the organic manures and 30 days of drip irrigation. After harvesting the crop, the soil samples were collected from each plot at a depth of 15 to 30 cm. The collected samples were dried, grinded and passed through 2mm sieve and then analyzed in various Laboratories. Soil Physical properties such as Bulk density(BD), Particle density(PD), water holding capacity(WHC), Pore space(PS) and Saturated moisture (SM)for the soil samples were analysed in Laboratory and the physical properties were determined using Keen Roczkowski (KR)Box(1921).

Physical Properties of the Soil

Bulk Density (BD)

Bulk density is defined as the mass per unit volume of dry soil, including pore spaces. The bulk density of soil typically ranges between 1 and 1.6 gm cm-3. The value of BD in sandy soil is about 1.7 gm cm-3, while in clayey soil it is about 1.1 gm cm-3. Bulk density is more important than particle density in understanding the physical behaviour of the soil.

Particle Density (PD)

Particle density is defined as the mass per unit volume of the solid portion of the soil. It is the true density of the soil. It is expressed in gm cm^{-3}. Generally the Particle density of a normal soil is 2.65 gm cm^{-3}.

Maximum Water Holding Capacity (WHC)

Water holding capacity refers to the entire amount of water that a soil can hold at field capacity. Sandy soils typically have little water storage capacity.

Pore Space (PS)

The volume of soil not occupied by soil particles is referred to as pore space. Normally, The pore space is filled by air and water. Pore spaces directly limit the amount of water and air in the soil, while indirectly influencing plant growth and crop yield.

Saturated Moisture (SM)

It is a property that has the capacity to retain soil moisture. Crop production is improved by the gradual release of moisture.When the soil is saturated, water completely fills the pore spaces.

RESULTS AND DISCUSSION

Physical Properties

BD

The plots amended with VC @12.5 t ha-1 had the lowest bulk density (0.8642 gm cm-3). The maximum value (1.6464 gm cm-3) was found in the control. The findings are consistent with those of [3], who observed that the use of organic amendments considerably reduced bulk density.

Particle Density (PD)

The value of PD reduced in all samples compared to the control. The plot amended with VC @12.5 t ha-1 exhibited the lowest value (1.2793gm cm-3), whereas the highest value (1.6808 gm cm-3) was obtained in the control. This is consistent with the findings of [4], which indicated that the application of organic manure reduced soil particle density.

Maximum Water Holding Capacity (WHC)

The addition of organic amendment enhanced the water's retention capacity. WHC was highest (64.0503%) in plot with VC@ 12.5 t $ha^{-1}$and the lowest value (11.085%) was observed in control. According to [5], the highest water holding capacity was obtained after the application of organic amendments.

Pore Space (PS)

The pore space of soil increased with the addition of organic manure. Plot with VC@ 12.5 t ha^{-1}had the highest value (36.3217%), whereas the control group had the lowest value (2.5356%). A comparable expansion of Pore space was achieved by [6].

Saturated Moisture (SM)

In the plot modified with VC@ 12.5 t ha^{-1}, SM increased by 71.3802%, which was higher than the control with the value 8.5874%. This is comparable to [7], who found that adding organic materials increased moisture retention capacity and infiltration rate of the surface soil.

CONCLUSION

Plot altered with VC @ 12.5 t ha^{-1} showed the highest number of pods at 12.5 t ha^{-1}(1112 Kg ha-1), while the control showed the lowest yield. In the plot with VC @ 12.5 t ha^{-1}, the bulk density was lowest. The plot with VC @ 12.5 t ha^{-1}also recorded the lowest value in particle density. Maximum values of Pore space, saturated moisture and water holding capacity were observed in VC @ 12.5 t ha^{-1}. Findings showed that adding organic manure to the soil influences its physical characteristics, indicating that doing so enhances soil fertility, crop quality, and productivity.

ACKNOWLEDGEMENT

I am grateful to Physics and Chemistry Department of Popes college, Sawyerpuram, Thoothukudi, for analyzing the soil samples in their Laboratories to determine the Physical Properties of the Soil.

ABSTRACT

In this paper, the split anti-fuzzy equitable dominating set of an anti-fuzzy graph is defined. The relations between anti-fuzzy equitable domination number and split anti-fuzzy equitable domination number are obtained. Some theorems related to this parameter are stated and proved.

Keywords: Dominating set, split anti-fuzzy equitable dominating set, minimal split anti-fuzzy equitable dominating set.
2010 AMS Classification: 05C62, 05E99, 05C07.

INTRODUCTION

The concept of anti-fuzzy structures developed by M.Akram [1] in 2012. A. Somasundram and S.Somasundaram [6] presented several types domination parameters such as independent domination, total domination, connected domination and domination in Cartesian product and composition of fuzzy graphs. R.Muthuraj and A. Sasireka [4] introduced domination in anti-fuzzy graphs. The concept of equitable domination in graphs was introduced by Swaminathan and Dharmalingam [8].The split equitable domination number in graph has introduced by Puttaswamy et al. [5]. In 2020, Firthous Fatima and K. Janofer [2, 3] introduced the concept of anti-fuzzy equitable domination set, connected anti-fuzzy equitable domination set, anti-fuzzy equitable independent set and anti-fuzzy equitable independent dominating set of an anti-fuzzy graph.In this paper, the concept of split anti-fuzzy equitable domination set of an anti-fuzzy graph is introduced. The split anti-fuzzy equitable domination number of an anti-fuzzy graph is also obtained. Theorems related to these parameters are discussed.

PRELIMINARIES

Definition 2.1[1]
A fuzzy graph G = (σ, μ) is said to be an anti-fuzzy graph with a pair of functions $\sigma : V \rightarrow$ [0,1] and $\mu : V \times V \rightarrow$ [0,1], where for all $u, v \in V$, we have $\mu(u,v) \geq \sigma(u) \vee \sigma(v)$ and it is denoted by $G_{AF}(\sigma, \mu)$.

Definition 2.2[1]
The order p and size q of an anti-fuzzy graph $G = (V, \sigma, \mu)$ are defined to be $p = \sum_{u \in V} \sigma(u)$ and $q = \sum_{uv} \mu(uv)$. It is denoted by $O(G)$ and $S(G)$.

Definition 2.3 [4]
Let G be an anti-fuzzy graph and let $u, v \in V$. If $\mu(u,v) = \sigma(u) \vee \sigma(v)$ then u dominates v (or v dominates u) in G. A subset D of VA set $D \subseteq V$ is said to be a dominating set of an anti-fuzzy graph Gif for every vertex $v \in V - D$ there exists $u \in D$ such that u dominates v.

Definition 2.4 [4]
A dominating set D of an anti-fuzzy graph$G$ is called a minimal dominating set if there is no dominating set D' such that $D' \subset D$.

Definition 2.5 [4]
The maximum scalar cardinality taken over all minimal dominating set is called domination number of an anti-fuzzy graph$G$ and is denoted by γ_{AFG}.

Definition 2.6 [2]
Let G be ananti-fuzzy graph. Let v_1 and v_2 be two vertices of G. A subset D of V is called a anti-fuzzy equitable dominating setif every $v_2 \in V - D$there exist a vertex $v_1 \in D$ such that$v_1v_2 \in E$and $|d(v_1) - d(v_2)| \leq 1$ where $d(v_1)$denotes the degree of vertex v_1 and $d(v_2)$ denotes the degree of vertex v_2 with $\mu(v_1v_2) = \sigma(v_1) \vee \sigma(v_2)$.

Definition 2.7 [2]
An anti-fuzzy equitable dominating set D of an anti-fuzzy graph$G$ is called a minimal anti-fuzzy equitable dominating set if there is no anti-fuzzy equitable dominating set D' such that $D' \subset D$.The maximum scalar cardinality taken over all minimal anti-fuzzy equitable dominating set is called anti-fuzzy equitable domination number and is denoted by γ_{AFG}^{ed}.

SPLIT ANTI-FUZZY EQUITABLE DOMINATING SET

Definition 3.1
An anti-fuzzy equitable dominating set S of G is said to be split anti-fuzzy equitable dominating set of Gif the induced anti-fuzzy subgraph< $V - S$ > is disconnected.

Definition 3.2
The split anti-fuzzy equitable dominating set S of G is said to be minimal split anti-fuzzy equitable dominating set of G if no proper subset $S'$of S is split anti-fuzzy equitable dominating set of G.

Definition 3.3
The maximum anti-fuzzy cardinality among all minimal split anti-fuzzy equitable dominating set of G is called split anti fuzzy equitable domination number of G and is denoted by $\gamma_{AFG}^{sed}(G)$.

Example 3.4
Consider the following anti-fuzzy graph G,

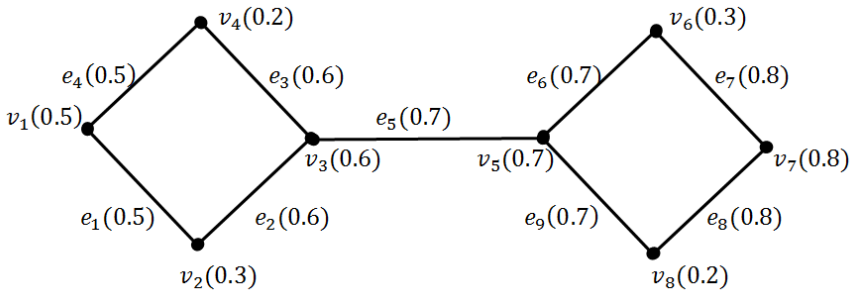

Figure 3.1: Split anti-fuzzy equitable dominating set of G

The sets $S_1 = \{v_1, v_3, v_5, v_7\}$ and $S_2 = \{v_2, v_4, v_6, v_8\}$ are minimal split anti-fuzzy equitable dominating sets.
The split anti-fuzzy equitable domination number $\gamma_{AFG}^{sed}(G) = \max\{|S_1|, |S_2|\}$
$= \max\{2.6, 1.0\}$
$= 2.6$
Therefore, the split anti-fuzzy domination number $\gamma_{AFG}^{sed}(G) = 2.6$ corresponding to the γ_{AFG}^{sed}-set S_1.

Theorem3.5
Let G be an anti-fuzzy graph. Then
(i) $\gamma_{AFG}^{ed}(G) \leq \gamma_{AFG}^{sed}(G)$
(ii) $\gamma_{AFG}^{sd}(G) \leq \gamma_{AFG}^{sed}(G)$

Proof
Let S be the minimum split anti-fuzzy equitable dominating set of G. Now, since S is a split anti-fuzzy equitable dominating set then S is an anti-fuzzy equitable dominating set. Hence $\gamma_{AFG}^{ed}(G) \leq |S| = \gamma_{AFG}^{sed}(G)$.

Theorem3.6
A split anti-fuzzy equitable dominating set S of G is minimal if for each vertex $x \in S$, one of the following three conditions holds:
1. There exists a vertex $x \in V - S$ such that $N(x) \cap S = \{x\}$
2. x is an anti-fuzzy equitable isolated vertex in $< S >$
3. $< (V - S) \cup \{x\} >$ is disconnected.

Proof
Suppose S is minimal anti-fuzzy equitable dominating set and there exists a vertex such that $x \in S$ does not hold any of the above conditions. Then by conditions (i) and (ii) $S_1 = S - \{x\}$ is an anti-fuzzy equitable dominating set of G. Also by (iii) $< V - S >$ is disconnected. This implies that S_1 is a split anti-fuzzy equitable dominating set of G, which is a contradiction.

Proposition 3.7
If G is regular anti-fuzzy graph or $(k, k+1)$ bi-regular anti-fuzzy graph for some k then
$\gamma_{AFG}^{ed}(G) \leq \gamma_{AFG}(G)$

Theorem 3.8
Let G be a regular or bi-regular anti-fuzzy graph with atleast one anti-fuzzy equitable end vertex, then $\gamma_{AFG}(G) = \gamma_{AFG}^{sd}(G) = \gamma_{AFG}^{sed}(G) = \gamma_{AFG}^{ed}(G)$.

Proof:
Let G be a regular or bi-regular anti-fuzzy graph and let D be a split anti-fuzzy equitable dominating set of G such that $|S| = \gamma_{AFG}^{sed}(G)$. Then D is an anti-fuzzy dominating set which intersects every maximum split anti-fuzzy dominating set of G and by proposition3.7, S is an anti-fuzzy equitable dominating set, intersects every maximum anti-fuzzy independent set of G. Therefore, $\gamma_{AFG}^{sed}(G) \leq \gamma_{AFG}^{sd}(G), \gamma_{AFG}^{sd}(G) \leq \gamma_{AFG}^{sed}(G)$. Hence if G is regular anti-fuzzy graph then $\gamma_{AFG}(G) \leq \gamma_{AFG}^{sed}(G)$. Similarly we can prove that if G is $(k, k+1)$ bi-regular fuzzy graph for some $k \geq 0$ then $\gamma_{AFG}^{sd}(G) \leq \gamma_{AFG}^{sed}(G)$.

Theorem 3.9
Let G be an anti-fuzzy graph of order $O(G)$ then $\gamma_{AFG}^{ed}(G) \leq \gamma_{AFG}^{sed}(G) \leq O(G) - \Delta(G)$.

Proof:
Every split anti-fuzzy equitable dominating set is an anti-fuzzy equitable dominating set of G.
Then$\gamma_{AFG}^{ed}(G) \leq \gamma_{AFG}^{sed}(G)$. Let $x, y \in V$.
If $d(x) \leq \Delta(G)$ and $d(y) \leq \delta(G)$.
Clearly $V - N(u)$ is a split anti-fuzzy equitable dominating set.
Therefore $\gamma_{AFG}^{sed}(G) \leq |V - N(u)|$.
$\gamma_{AFG}^{sed}(G) \leq O(G) - \Delta(G)$.

Theorem 3.10
Let G be an anti-fuzzy graph and S be a split anti-fuzzy equitable dominating set of G then S is a both minimal split anti-fuzzy equitable dominating set and a maximal split anti-fuzzy equitable dominating set. Conversely, any maximal split anti-fuzzy equitable dominating set S in G is a split anti-fuzzy equitable dominating set of G.

Proof
If S is a split anti-fuzzy equitable dominating set of G and $S_t = S - \{t\}$ is not a split anti-fuzzy equitable dominating set for every $t \in S$ and $S \cup \{t\}$ is not a split anti-fuzzy equitable dominating set. So that S is a minimal anti-fuzzy equitable dominating set and a maximal split anti-fuzzy equitable dominating set. Conversely, let S be a maximal split anti-fuzzy equitable dominating set in G. Then for every $d \in V - S, S - \{d\}$ is not a split anti-fuzzy equitable dominating set and d is dominated by some element of S. Thus, S is a split anti-fuzzy equitable dominating set of G.

ABSTRACT

In this paper, we probe the existence of minimal Reinhard Zumkeller divisor cordial labeling of some special graphs like comb graph $P_n \odot K_1$ for n>1, gear graph G_n for all $n \geq 3$, crown graph $C_n \odot K_1$ for all $n \geq 3$. We also introduce an edge deletion operation in minimal Reinhard Zumkeller divisor cordial graph and the notion of an overloaded minimal Reinhard Zumkeller divisor cordial graph to erect dense structures of graph.

Keywords: minimal Reinhard, Zumkeller graph, Zumkeller divisor cordial graph, crown graph, comb graph, overloaded graph.
2010 AMS subject Classifications: 05C78

INTRODUCTION

Graphs regarded here are finite, undirected and simple. The symbols V(G) and E(G) denote the vertex set and the edge set of a graph G . A graph labeling is an assignment of integer to the vertices or edges or both subject to certain conditions. Most of the graph labelling methods trace their origin to the one introduced by Rosa[1]. The concept of cordial labeling was introduced by Cahit.I [2] in 1987. The number is cleped as a perfect number if the sum of all proper positive divisors of a positive integer is equal to the number. Generalizing the concept of perfect numbers, R.H.Zumkeller defined a new type of number called Zumkeller number .In 2013 , Yuejian Peng and Bhaskara Rao

K.P.S [3] established several results and conjectures on Zumkeller numbers . The notion of Zumkeller labeling was investigated by Balamurugan.B.J et al [4]. Murali.B.J et al[5] in 2017 proved results about Zumkeller cordial labeling of cycle-related graphs. In 2011, Varatharajan.R et al [6] introduced divisor cordial labeling. The notion of a point amalgamation of graphs was introduced by Sin-Min Lee et al [7] in 1991. In 2023, A.Ruby Priscilla et al[8] introduced the notion of minimal Reinhard Zumkeller divisor cordial labeling of graphs .In this paper we discuss the existence of minimal Reinhard Zumkeller divisor cordial labeling of some special graphs like comb graph $P_n \odot K_1$ for n>1 , gear graph G_n for all $n \geq 3$, crown graph $C_n \odot K_1$ for all $n \geq 3$. Throughout this paper, minimal Reinhard Zumkeller divisor cordial is briefly mentioned as mRZdc .

PRELIMINARIES

Definition 1.1[8]Let G = (V,E) be a simple graph and γ:V(G) → min$\{2^i \times 3, 2^{i+1} \times 5, 2^{k+1} \times 7, 2^l \times 3 \times 5, 2^m \times 3 \times 7$ where i , j, k, l, m ≥ 1$\}$ be an injective function such that the sum of the exponents of γ(V(G)) should be equal to the order of the graph G. For each edge uv, the induced function γ' : E(G)→ {0,1} assigns the label 1 if $\gamma(u) \mid \gamma(v)$ or $\gamma(v) \mid \gamma(u)$ where $\gamma(u)$ and $\gamma(v)$ are Zumkeller numbers and the label 0 if $\gamma(u) \nmid \gamma(v)$ and also if $|e_{\gamma^l}(0) - e_{\gamma^l}(1)| \leq 1$ where $e_{\gamma^l}(0)$ is the number of edges of the graph G having label 0 and $e_{\gamma^l}(1)$ is the number of edges of the graph G having label 1 then γ is cleped as **mRZdc labeling**. A graph that admits mRZdc labeling is cleped as **a mRZdc graph**.

Theorem 1.2[8] The tadpole graph $T_{n,k}$ admits mRZdc labeling for all values of n and k .

mRZdc LABELING OF SOME SPECIAL GRAPHS

Theorem 2.1: $P_n \odot K_1$ admits mRZdc labeling for all n>1.

Proof: Let $P_n \odot K_1$ be the comb graph. Let $\{v_1, v_2, \ldots v_n\}$ be the vertices of P_n and $\{u_1, u_2, \ldots u_n\}$ be the vertices adjacent to each vertex of the path P_n .$P_n \odot K_1$ is of order 2n and is of size 2n-1 .
Label the vertices of P_n as $\gamma(v_i) = 2^i \times 3$; where $1 \leq i \leq n$ and the vertices adjacent to each vertex of P_n as $\gamma(u_j) = 2^{j+1} \times 5$ where $1 \leq j \leq n$. In concern to the aforementioned labeling pattern we get $e_{\gamma^l}(0) = n$; $e_{\gamma^l}(1) = n-1$. Hence $P_n \odot K_1$ admits mRZdc labeling for all n >1.

Theorem 2.2: The gear graph G_n admits mRZdc labeling for all $n \geq 3$.

Proof: Let W_{n+1} be the wheel graph with the center vertex 'u' and the rim vertices $v_1, v_2, \ldots, v_n$. Let G_n be the repercussion graph acquired by subdividing each rim edge of W_{n+1} by the vertices $w_1, w_2, \ldots, w_n$ where every w_i is appended between v_i and v_{i+1} for i = 1, 2, . . . , n−1 and w_n is appended between v_1 and v_n. The order of G_n is $|V(G_n)| = 2n+1$ and the size of G_n is $|E(G_n)| = 3n$.
The center vertex of G_n receives the label $\gamma(u) = 2 \times 3$ and the rim vertices of W_{n+1} receive the label as $\gamma(v_x) = 2^i \times 3$, where $x \equiv 1 \pmod 2$ and $i \equiv 0 \pmod 2$ where i>2 and $\gamma(v_t) = 2^i \times 5$, where $t \equiv 0 \pmod 2$ and $j \geq 3 \equiv 1 \pmod 2$. The vertices $w_1, w_2, \ldots, w_n$ of G_n that makes the subdivision of the edges of W_n receive the labels as follows: $\gamma(w_y) = 2^i \times 3$, where $y \equiv 0 \pmod 2$ and $i \geq 3 \equiv 1 \pmod 2$ and $\gamma(w_s) = 2^i \times 5$, where $s \equiv 1 \pmod 2$ and $j \equiv 0 \pmod 2$.
In regard to the above labeling design, for $n \equiv 0 \pmod 2$, $e_{\gamma^l}(0) = n+k$ for each n=4,6,... , k=2,3,4,.... and $e_{\gamma^l}(1) = n+k$ for each n=4,6,... , k=2,3,4,.... ; and for $n \equiv 1 \pmod 2$, $e_{\gamma^l}(0) = n+k$ for each n=3,5,... k=2,3,4,.... ; $e_{\gamma^l}(1) = n+k$ for each n=3,5,... , k=1,2,3,4,.... ;
Hence G_n admits mRZdc labeling for all $n \geq 3$.

Theorem 2.3: The crown graph $C_n \odot K_1$ admits mRZdc labeling for all $n \geq 3$.
Proof: Let $v_1, v_2, \ldots, v_n$ be the vertices of cycle C_n. Let $C_n \odot K_1$ contains 2n vertices $v_1, v_2, \ldots v_n, w_1, w_2, \ldots, w_n$ and 2n edges .
$\gamma(v_i) = 2^i \times 3$ where $1 \leq i \leq n$; $\gamma(w_j) = 2^{j+1} \times 5$ where $1 \leq j \leq n$

In regard to the above labeling design, we have $e_{\gamma^l}(0) = n$; $e_{\gamma^l}(1) = n$
Henceforth $C_n \odot K_1$admits mRZdc labeling for all n≥ 3.

ON EDGE DELETION IN mRZdc GRAPH

Definition 3.1: Let G be a mRZdc graph of even size with γ as the labeling. Then G-x for some x ∈ E(G) is cleped to be **a minimal Reinhard Zumkeller divisor 0^l influenced cordial graph**(resp.**a minimal Reinhard Zumkeller divisor 1^l influenced cordial graph**) if $|e_{\gamma^l}(0) - e_{\gamma^l}(1)| \leq 1$.

Theorem 3.2: G is a mRZdc graph of even size if and only if the spanning subgraph G-x for some x ∈ E(G) is a minimal Reinhard Zumkeller divisor 1^l influenced cordial graph (resp. a minimal Reinhard Zumkeller divisor 0^l influenced cordial graph).

Proof: Let the size of the mRZdc graph G be even. Then the induced edge labels of G result in $e_{\gamma^l}(0) = e_{\gamma^l}(1) = \frac{s}{2}$. Arbitrarily choose any edge x∈E(G) which receives label either 0 or 1 . Then the actuated edge labels of the spanning subgraph G-x of G will result in $e_{\gamma^l}(1) = e_{\gamma^l}(0)+1$ or $e_{\gamma^l}(0) = e_{\gamma^l}(1)+1$. Henceforth the cordiality condition is satisfied and realizes that the subgraph to be conceded mRZdc labeling which is a minimal Reinhard Zumkeller divisor 1^l influenced cordial graph (resp.minimal Reinhard Zumkeller divisor 0^l influenced cordial graph). Conversely suppose that the spanning subgraph G-x for some x ∈ E(G) is a minimal Reinhard Zumkeller divisor 1^l influenced cordial graph (resp.minimal Reinhard Zumkeller divisor 0^l influenced cordial graph).Then the spanning subgraph G-x for some x ∈ E(G) is of odd size. Appending an edge x to the subgraph G-x results in the graph G of even size and make an edge x to receive either the label 0 if the actuated edge labels of G-x ensued in $e_{\gamma^l}(1) = e_{\gamma^l}(0)+1$ or the label 1 if the actuated edge labels of G-x ensued in $e_{\gamma^l}(0) = e_{\gamma^l}(1)+1$ .This completes the proof

Definition 3.3: Let G be a mRZdc graph of odd size with γ as the labeling. Then G-x for some x ∈ E(G) is said to be **a minimal Reinhard Zumkeller divisor 0^l-1^lcompatible cordial graph** if $|e_{\gamma^l}(0) - e_{\gamma^l}(1)| = 0$.

Theorem 3.4: G is a mRZdc graph of odd size if and only if the spanning subgraph G-x for some x ∈ E(G) is a minimal Reinhard Zumkeller divisor 0^l-1^l compatible cordial graph for some edge x ∈ E(G).

Proof: Let G be a mRZdc graph of odd size. Then the actuated edge labels of G result either in $e_{\gamma^l}(1) = e_{\gamma^l}(0)+1$ or $e_{\gamma^l}(0) = e_{\gamma^l}(1)+1$. If $e_{\gamma^l}(1) = e_{\gamma^l}(0)+1$. Arbitrarily choose and remove any edge x∈E(G) that receives the label 1 .If the induced edge labels of G result in $e_{\gamma^l}(0) = e_{\gamma^l}(1)+1$, then arbitrarily choose and remove any edge x∈E(G) that receives the label 0 . If the actuated edge labels of G result in $e_{\gamma^l}(1) = e_{\gamma^l}(0)+1$, then arbitrarily choose and remove any edge x∈E(G) that receives the label 1 .Thus the actuated edge labels of the spanning subgraph G-x of G will result in $e_{\gamma^l}(1) = e_{\gamma^l}(0)$. Henceforth the cordiality condition is satisfied which realizes that the spanning subgraph concedes mRZdc labeling and it is cleped as minimal Reinhard Zumkeller divisor 0^l-1^l compatible cordial graph for some edge x∈ E(G) . Conversely suppose that the spanning subgraph G-x for some x ∈ E(G) is a minimal Reinhard Zumkeller divisor 0^l-1^l compatible cordial graph for some edge x∈ E(G).Then the spanning subgraph G-x for some x ∈ E(G) is of even size. Appending an edge x to the subgraph G-x ensues in a graph G of odd size and makes the edge x to receive the label either 0 or 1 which bringsforth a mRZdc graph of odd size . This completes the proof.

mRZdc OVERLOADED GRAPH

Definition 4.1: Given 'n' distinct mRZdc graphs $G_1, G_2, \ldots G_n$ where n ≥ 2 .The graph erected by concatenating 'n' distinct mRZdc graphs $G_1, G_2, \ldots G_n$ with the fixed vertex 'v' having the least Zumkeller number 6 as a label is called **mRZdc overloaded graph** if (i) all the graphs G_i must be minimal Reinhard Zumkeller divisor 0′- 1′compatible cordial graph or (ii) atmost one graph should be minimal Reinhard Zumkeller divisor 1′influenced (0′influenced) cordial graph and it is denoted by $G_1 olG_{mRZdc} G_2 olG_{mRZdc} G_3 olG_{mRZdc} \ldots\ldots G_{n-2} olG_{mRZdc} G_{n-1} olG_{mRZdc} G_n$

Theorem 4.2: $G_n olG_{mRZdc}$($P_h \odot K_1$)$olG_{mRZdc}(C_g \odot K_1)$ olG_{mRZdc} $T_{f,e}$ where $f \equiv 1(mod\ 2)$ and e=1 is a mRZdc overloaded graph where G_n is a minimal Reinhard Zumkeller divisor $0^{|}$-$1^{|}$ compatible cordial gear graph of even size, $P_h \odot K_1$ is a minimal Reinhard Zumkeller divisor $0^{|}$ influenced cordial comb graph, $C_g \odot K_1$ and $T_{f,e}$ where $f \equiv 1(mod\ 2)$ and e=1 are minimal Reinhard Zumkeller divisor $0^{|}$-$1^{|}$ compatible cordial graphs.

Proof: It follows from definition 4.1 of mRZdc overloaded graph, and the labeling pattern mentioned in Theorem 2.1, Theorem 2.2 , Theorem 2.3 and Theorem 1.2.

Result 4.3: $G_n olG_{mRZdc}$ ($P_h \odot K_1$)$olG_{mRZdc}(C_g \odot K_1)$ olG_{mRZdc} $T_{f,e}$ where $f \equiv 1(mod\ 2)$ and e=1 is not a mRZdc overloaded graph if G_n is a minimal Reinhard Zumkeller divisor $0^{|}$ influenced cordial gear graph .

Proof: The cordiality condition is established to be $|e_{\gamma^{|}}(0) - e_{\gamma^{|}}(1)| = 1$ if G_n is a minimal Reinhard Zumkeller divisor $0^{|}$ influenced cordial gear graph .Always the cordiality condition for $P_h \odot K_1$ is $|e_{\gamma^{|}}(0) - e_{\gamma^{|}}(1)| = 1$, since the size of $P_h \odot K_1$ is odd for all h>1 .
Hence it adheres that the cordiality condition fails for $G_n olG_{mRZdc}$ ($P_h \odot K_1$)$olG_{mRZdc}(C_g \odot K_1)$ olG_{mRZdc} $T_{f,e}$, since $|e_{\gamma^{|}}(0) - e_{\gamma^{|}}(1)| > 1$.

RESULTS AND DISCUSSIONS

The results that are entrenched in this paper are coalesced and persuaded us to get into the epilogue that for all connected minimal Reinhard Zumkeller divisor cordial graph G, $\gamma(v) \equiv 0(\text{mod } 6)$ for some vertex v in V (G) and mRZdc overloaded graph is constructed only when atmost one of the mRZdc graphs happen to be minimal Reinhard Zumkeller divisor 1′ influenced ($0^{|}$ influenced) cordial graph. In future research work, we will instigate results using diverse modus operandi to erect dense structures of graph that concedes mRZdc labeling.

ABSTRACT

Cardiovascular diseases is the leading cause of death globally. Diseases like heart failure, cardiac arrest, and coronary heart disease if identified early, can be treated to avoid complications. Early diagnosis is therefore very crucial for the identification. The majority of patients require to undergo invasive procedures for the diagnosis which has many limitations. Therefore the objective of this A GO-MOS2/ITO electrode nitrous oxide(NO) sensor prototype which is based on electrochemistry was developed *in-vitro* to identify NO in breath. The observation from the experiment suggested that RGO-MOS nano-composite is a promising NO sensor within the range from 5 µm to 240 µm at high specificity of 0.1013µA/m. The experiment showed that the levels of NO can be detected as a biomarker in the cardiac patients for diagnosis. Further evaluation is required for its applicability and validation.

Keywords: Cardiovascular Diseases, Biomarker, Biosensor, Nitrous oxide, *in-vitro*, Diagnosis

INTRODUCTION

The phrase "cardiovascular disease" refers to any condition affecting the heart or blood vessels. There are numerous cardiovascular diseases, including aortic disease, peripheral arterial disease, heart disease, and stroke. Being the primary cause of death for both men and women, cardiovascular disease must be diagnosed as soon as possible in order to start management counseling and medication. 17.9 million fatalities worldwide in 2019 were estimated to be related to CVS, accounting for almost 32% of all deaths. If diseases like heart failure, cardiac arrest, and coronary heart disease are identified early and treated, they can be avoided. Early diagnosis is therefore very crucial for both the identification and treatment of patients [1]. Blood tests, ECGs, chest X-rays, CT scans, and MRIs are among the non-invasive diagnostic procedures used to diagnose CVD. Some invasive procedures, including as coronary angiography and chest catheterization, are also performed. Non-invasive techniques like echocardiograms and electrocardiograms are quite expensive and time-consuming, and not everyone can afford such a high price. Radiological techniques such as MRIs, CT scans, and X-rays expose patients to high radiation levels. Catheterization and coronary angiography are invasive procedures that carry the risk of clot formation, allergic reactions, and arterial damage. This results in a lack of patient cooperation with the current diagnostic techniques and delays timely diagnosis. Therefore, ensuring the development of non-invasive diagnostic instruments is absolutely essential.[2,3]
"Breath Analysis" is a promising tool for disease diagnosis and one of the most promising non-invasive diagnostic techniques. Technology advancements have led to the development of this innovative non-invasive, cost-effective diagnostic method that produces significant outcomes. If this technology is used, it will benefit the healthcare industry and bring about a revolutionary shift in the diagnostic profession. It is a patient-friendly method that will lower costs for patients, hospitals, and the nation as a whole. This non-invasive technique can be used to diagnose disorders like cancer, lung conditions, liver conditions, kidney conditions, and oral conditions early on [4].

One way to gather gaseous molecules from our own endogenous metabolism is by a breath biopsy. Exhaled breath is made up of more than just air; it also includes minute aerosol particles from the lungs and airways called respiratory droplets, as well as over a thousand volatile organic compounds (VOCs). Breath aerosol and volatile organic compounds (VOCs) are rich sources of biological data[5]. Numerous volatile organic compounds (VOCs), proteins, peptides, respiratory droplets, and exhaled breath aerosol have been identified as measurable biological markers for the identification of microbial infection, carcinogens, oxidative stress, and inflammation. With the use of method called breath biopsy, a disease can be identified by examining chemicals and particles in exhaled breath. This method detects gas-analytes like exhaled volatile organic compounds (VOCs) and inorganic gases, which are significant biomarkers for a number of disorders as previously mentioned[6]. A completely new method of determining a person's health solely through the analysis of breath samples is called a breath biopsy. This supports research, identification, and treatment response monitoring. Breath biopsy is a non-invasive method that reduces patient discomfort, in contrast to conventional biopsy techniques that need blood or a portion of tissue. VOCs are metabolic products and reflect the current state of cells, tissue and microbiome. Breath exhalation VOCs are considered typical. Nonetheless, variations in the concentrations of exhaled volatile organic compounds (VOCs) may be linked to an anomalous state of the body. Two endogenous vaso-regulatory substances that are important for diagnosis are carbon monoxide and nitric oxide [7]. Since nitric oxide plays a role in the regulation of the physiological process, it has been well researched in cardiovascular disease[3].Increase NO in heart failure to counter the vaso constrictive forces and tells us about the severity of heart failure[8,9,10] Plasma nitrates is an index of endogenous NO production is significantly increased in heart failure patients. CO has also been employed as a marker because it reduces pro-inflammatory cytokines, dilates blood vessels, lowers the hypertensive response, and improves post-ischemic myocardial dysfunction.[11, 12, 13] Since heart failure patients have also been found to have high acetone levels, acetone is frequently employed as a biomarker for the diagnosis and severity of HF. Oxidative stress, defined as the production of reactive oxygen species resulting from the breakdown of polyunsaturated lipid with a carbon radical, also involves VOCs. Breath produces two compounds called exhaled ethane and pentane, which when combined can provide a non-invasive screening for acute MI or other CVS diseases[14]. The study focuses on fabrication of NO sensors, standardization of NO sensors and micro evaluation of NO sensors in cardiac atients.

MATERIALS AND METHODS

Section I: Fabrication of Nitrous Oxide Sensor

A diagnosis tool should be affordable, room temperature, portable, small, and easy to use. It should also be extremely selective, precise, accurate, and able to measure in real time. Three different methods are utilized to measure the levels of carbon dioxide, oxygen, and nitric oxide: electrochemical and optical sensors. With advancements in technology, smart sensor systems have been developed. These consist of a variety of sensors, just like the conventional ones, but each one of them is designed to measure and identify a certain compound in breath.[15] A smart sensor system is an entirely self-contained sensor that can communicate and display informative data to an operating system, monitor station, or user. It also has the capacity to store and process data. Smart sensor technology and micro-sensor platforms have recently advanced in technology, allowing for reduced size, weight, and low power usage. Fabrication of electrode and electrochemical studies One pot hydrothermal synthesis was used to generate the rGO-MoS2 nano-composite for the electrode. The produced nanocomposite exhibits superior electrochemical characteristics and a high surface area. Electric lab potentiostat/Galvano static (Eco- Chemie, the Netherlands) has been used for electrochemical research. Silver/silver chloride (Ag/AgCl) reference electrode, indium tin oxide (ITO) coated glass substrate, and patient counter electrode have all been utilized in the electrochemical investigations. By electrophoretically depositing the rGO-MoS2 nano-composite onto the ITO electrode (0.25 cm2), the working electrode was modified. All potentials were determined in relation to the reference electrode during the electrochemical experiments, which were carried out in 0.1 M PBS (pH 2.5) supporting electrolyte. The electrochemical assembly was purged with N2 for 30 minutes before to the test in order to eliminate any dissolved oxygen. Electrochemical detection of NO using Differential Pulse
Voltammetry Technique. (Figure 1a-b)

Section II-Standardization of nitrous oxide sensor

A molecule of NO with one unpaired electron is oxidized to NO^+ (nitrosonium ion) on the surface of the GO-MoS2/ITO electrode in the electrochemical redox reaction. This is then converted to NO_2^- in the solution. Therefore, the concentration of NO can be determined by monitoring the redox current. The DPV curves for NO oxidation on the GOMoS2/ITO electrode in a 0.1 M PBS solution (pH 7.0) are shown in Figure 1a. At +0.745 V, a distinct NO oxidation peak formed, and as the NO concentration rises, so does the peak current. With an excellent correlation coefficient of 0.998, Figure 1b displays the calibration curve of the GO-MoS2/ITO electrode for NO detection in an experimental linear range of 5 μM to 240 μM. Regression equation [Current (μA) = 49.211 μA – 0.1013 μA/μM x CNO (μM), R2 = 0.998] was used to measure the sensitivity (S) of the bio sensing electrode. The result was 0.1013 μA/μM. In contrast, the limit of detection (LOD), which was determined by applying the formula 3σ/S—where σ represents the electrode standard deviation—was 1μM (0.03001 ppm). Other significant parameters, such the constructed sensor's selectivity and specificity, were tested using biological substances that commonly interfere with signaling, like ascorbic acid (AA), glucose (GL), sodium nitrate (NaN), and uric acid (UA). Upon incubating the electrode with the There was barely any alteration in the current when interfering analytes were present at a concentration of 10 μM (Figure 2). The experiments were repeated with a standard deviation f 2.4%. The obtained result suggests that the fabricated electrode has the requisite potential to be used for the detection of NO.

Breath collection

Samples can be collected in a variety of methods, including offline, end tidal, mixed expiratory, and exhaled breath condensate. This technique is based on two steps: measuring the biomarker (NO) and purifying and cleaning the material. Breathing into the breath analyzer for one minute gathers the breath. This method is non-invasive and painless, in contrast to other approaches that may cause discomfort for the patient. The established biomarker for cardiovascular disease must then be processed and detected, which takes a few minutes.

RESULT

The observations from the first two experiments suggest that:

- RGO-MOS, nano-composite is a promising NO sensor within the range from 5um to 240um at high specificity of 0.1013uA/m.
- This sensor is used for detection of nitrous oxide.

DISCUSSION

Worldwide, cardiovascular disease continues to be the primary cause of morality in both men and women. By 2023, there will be 8 billion individuals across the world, of whom 620 million will suffer from heart and circulation diseases globally. Heart disease affects over 60 million people worldwide each year. This demonstrates the concerning state into which the nation has descended, and it is imperative that a workable solution to this terrifying circumstance be found as quickly as possible. When one considers that the majority of deaths resulting from CVD occur in individuals who pass away before receiving a proper diagnosis and treatment, the situation becomes even more concerning. However, this is not the only issue we are dealing with. Early diagnosis of CVD is challenging because the disease's symptoms might be non-specific. As a result, both the patient and the doctor may neglect it, which can later turn the condition into a life-threatening condition. Early diagnosis and treatment can prevent these diseases, but the many tests and evaluations used to detect CVD are very time-consuming and cause anxiety in patients because non-invasive procedures like ECG and Echo are very costly and involve invasive techniques like coronary angiography and catheterization. This hinders prompt diagnosis and treatment and results in a lack of patient compliance with the current diagnostic techniques. A new diagnostic method known as "breath analysis" or "Breath Biopsy" was developed to address all the distressing issues. It is a non-invasive, modern diagnostic approach that is affordable and gives useful results. Breath biopsies have also been utilized to diagnose cancer and treat a number of other illnesses, including liver and respiratory disorders [16].There is evidence that breathalyzers have been used to identify lung cancer by analyzing the amounts of volatile organic compounds (VOCs) in breath samples, which facilitates an early diagnosis. In 2007, Peter J. Mazzone[17] and colleagues investigated the use of exhaled breath analysis in the diagnosis of lung cancer. Tidal breathing of room air was done for 12 minutes by those with lung cancer, those with other lung diseases, and healthy controls while exhaling into the apparatus. They came to the conclusion that a sensor could reasonably accurately identify the distinct chemical signature of a lung cancer patient's breath. The goal of this research is to develop an advanced breath sensor that can identify chemicals like NO, CO, and VOC that may be signs of CVD. Patients with CVD may exhibit elevated levels of CO, NO, and VOC. It serves as a marker. Signals generated by the rhythmic heartbeat can be used to identify cardiovascular health and disease states.

A 1994 study by Windlaw DS, Smythe GA, *et al*. [18] looked for elevated nitric oxide production in heart failure patients.Gas chromatography/mass spectrometry was used to quantify the nitric oxide level in a group of patients with heart failure and a normal group. They came to the conclusion that, in comparison to normal controls, patients with heart failure had higher levels of plasma nitrate, the stable byproduct of nitric oxide generation. An investigation into the mechanism and identification of carbon monoxide-induced vaso-relaxation in animals was carried out by Wang R, Wang Z, *et al.* [19] in 1997. Pre-contracted with phenylephrine, isolated rat tail artery tissues were used for the study. The study came to the conclusion that carbon monoxide plays a major role in heart failure and that it may activate both a cyclic GMP signaling and channels in the same vascular tissues. According to an animal study by Sammut IA, Foresti*et al.*[12]in 1998, carbon monoxide plays a significant role in controlling vascular tone in aortas that exhibit high amounts of hemoglobin oxygenase. Rat aortic rings that have been isolated were used for the experiment. They came to the conclusion that there was a considerable up-regulation of the carbon monoxide/heme oxygenase pathway. A study on chemical microsensors based on micromachining and micro fabrication was carried out by Liu CC, Hesketh P, *et al.*[14]in 2004. The study found that miniatured smart gas sensor technology has prospective applications in medical fields. These sensors have been demonstrated to bring about a paradigm change in the medical sciences by enabling more individualized health management for individuals. The

RGO-MOS nano-composite is a promising NO sensor that measures the amount of nitrous oxide, according to the in-vivo investigation. The sensor is a promising technique for cardiac patients since it can measure the amount of NO.

CONCLUSION

A promising method for cardiac patients is the GO-MOS2/ITO electrode NO sensor, which is based on electrochemistry. However, because there is currently not much information, the clinical trials for this topic should be conducted. For the results to be applicable to actual circumstances, more research needs to be done.

ABSTRACT

Bacterial resistance is increasing rapidly causing problems for health workers in managing bacterial infections and hence worldwide research is focussed on developing novel antibacterial agents. With this perspective we have synthesised an adamantane hydrazide hydrazone derivative N′-(5-Bromo-2-Hydroxybenzylidene)adamantane-1-carbohydrazide(BSAC)which features a novel structure and demonstrates high antimicrobial effectiveness. Its structure is characterised by studying its FTIR and ^{1}H NMR spectra and further confirmed with its elemental analysis. The antimicrobial assay was studied against gram positive Bacillus subtilis and gram negative Escherichia Coli using resazurin microplate test.

Keywords: adamantane, hydrazidehydrazone, antimicrobial assay

INTRODUCTION

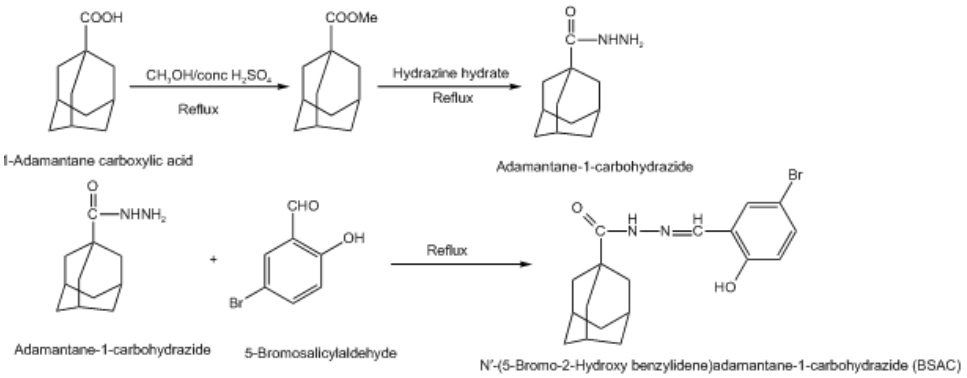
Adamantane, a polycyclic hydrocarbon has shown unlimited applications in medicinal chemistry. The first derivatives of adamantane which unleashed the medicinal properties of adamantane were the aminoadamantane compounds namely amantadine, rimantadine, and tromantadine which highlightedthe antiviral properties of adamantane. Other adamantane derivatives namely vildagliptin and saxagliptin, act as antihyperglycemic agent and aid in diabetes management. Studies have also reported antibacterial[1-5], antimalarial[1,6-7], anticancer[1,8-11]and anti-inflammatory [1,12-13]properties of adamantane. Also studies have revealed that the adamantane nucleus not only increases lipophilicity but also facilitates permeability through the blood brain barrier[14-15]. The effectiveness of amantadine and memantine in treating neurodegenerative diseases[16-17]like Parkinson and Alzheimer disease

has been promising. Consequently, researchers have been focussing on designing new biologically potent drugs by incorporating adamantane moeity in the synthesised drugs and modifying it to enhance activity. Hydrazide hydrazones are of significant interest to researchers and medicinal chemists due to their effectiveness as biological agents in various areas. Hydrazide hydrazones have azomethine group attached to a carbonyl group and this makes them powerful anti-microbial [18-21], anti-inflammatory[18], anti-viral [22-23], anti-protozoal [24], anti-cancer[25-26], anti-tuberculosis [27-29], anti-convulsant [30] agents. Hydrazide hydrazone containing drugs used in chemotherapy of cancer patients [31-32] have shown positive outcomes. This clearly indicates that designing and synthesising molecules with adamantane nucleus combined with hydrazide hydrazone functional group will be highly beneficial and the new molecules will show enhanced biological activity. With this objective, our group has synthesised and characterised a novel adamantane hydrazide hydrazone molecule which we believe will demonstrate promising results in terms of its biological activity in comparison to earlier reported molecules.

MATERIALS AND METHODS

All commercially purchased chemicals were of analytical grade and were used without further purification. The structural features of the synthesised compounds were characterised using different spectroscopic techniques namely ^{1}H-NMR, FTIR and elemental analysis. 3000 Hyperion Microscope with Vertex 80 FTIR System (Bruker, Germany) was used to record the FTIR spectra. The ECZR Series 600 MHz NMR Spectrometer (Jeol, Japan) using DMSO-d6 solvent for dissolution was made use of to record the ^{1}H NMR spectra. Elemental analysis of the synthesised compound was evaluated using the Model-Flash Smart V CHNS/O (Thermo Fisher Scientific) analyser to confirm the chemical composition.

Synthesis of N′-(5-Bromo-2-Hydroxybenzylidene) adamantane-1-carbohydrazide(BSAC): Methyl adamantane-1-carboxylate was synthesized by esterifying 1-adamantane carboxylic acid with methanol under acidic conditions. It was dissolved in ethanol and subjected to reflux heating with 80% hydrazine hydrate to obtain adamantane-1-carbohydrazide.Subsequently, adamantane-1-carbohydrazide and 5-bromosalicylaldehyde taken in equimolar amounts were refluxed in presence of ethanol[5,33]. The resultant solution was cooled in ice bath and allowed to crystallize. The crystals of the corresponding hydrazide-hydrazoneN′-(5-Bromo-2-Hydroxybenzylidene) adamantane-1-carbohydrazide (BSAC) were filtered and given washings with minimum amount of cold ethanol. The yield of the dried product was determined as 75%. It was characterised by its melting point, ^{1}H-NMR, FTIR, LC-MS spectra and CHN values. The compound showed melting point as 180^{o}C.



Antibacterial study

The minimum inhibitory concentration (MIC) of the sample against the test organisms was determined by using resazurin microplate assay[34]. This assay was performed using flat bottom96-well clear microtiter plates. Microbial

growth was determined by observing the change of colour of INT dye in the micro plate wells (p-iodonitrotetrazolium chloride dye was used, pinkish-red when there is growth and colourless or colourless with greenish tinge when there is no growth). MIC was defined as the lowest sample concentration showing no colour change (clear) and exhibited complete inhibition of bacterial growth.

RESULTS AND DISCUSSION

The newly synthesised hydrazide hydrazoneN′-(5-Bromo-2-Hydroxybenzylidene) adamantane-1-carbohydrazide (BSAC) was prepared by condensation of ethanolicadamantane-1-carbohydrazide and 5-bromosalicylaldehyde. The structural features of the hydrazide hydrazone were determined by using spectroscopic and analytical techniques[5,33-35]. FTIR spectrum of BSAC showed sharp peak at 1604 cm^{-1} corresponding to the azomethine group and this confirms the presence of hydrazide hydrazone formed by the condensation of aldehyde group in 5-bromosalicylaldehyde with amino group of adamantane-1-carbohydrazide. The broad bands around 3450and 3214 cm^{-1}confirmed the presence of the phenolic (-OH) group and the amino (-NH) group, respectively. The carbonyl group was seen as a sharp peak at 1636 cm^{-1}. The band at 1534 cm^{-1} corresponding to the N-H group was observed. The structure of the adamantane hydrazide hydrazone derivative was further established by its ^{1}H NMR spectrum recorded in deuterated DMSO solvent. All characteristic signals (in ppm) corresponding to different groups were observed : hydroxyl proton signal at 11.42, amino proton signal at 11.25, azomethine proton signal at 8.5, aromatic proton signals at 6.82-7.78 and adamantane proton signals at 1.4-2.1.The LC-MS spectrum confirmed the molecular weight. The results from the elemental analysis matched the expected theoretical values, thereby validating the structural characteristics of the synthesized compound BSAC. The antimicrobial assay was studied against gram positive Bacillus subtilis strain and gram negative Escherichia Coli strain using Ampicillin as the standard. The dilutions of BSAC inhibited the growth of test strains. No growth was detected for both the test cultures upto15.62 μg/ml and 31.25 μg/ml respectively using MIC assay. The synthesised adamantanehydrazidehydrazone N′-(5-Bromo-2-Hydroxybenzylidene)adamantane-1-carbohydrazide(BSAC) features a novel structure and demonstrates high antimicrobial effectiveness.

ABSTRACT

Low power conversion efficiency and lower panel voltage are the main drawbacks of solar PV system. In this paper, an attempt is made to improve the performance of the PV system using super lift Luo converter with perturb and observe MPPT algorithm. The super lift Luo converter is used to produce high step up voltage with minimum ripples. The voltage conversion from positive source voltage to positive load voltage is handled by the Positive output Super lift Luo converter (POSLC). Using Matlab/Simulink, the simulation model of the super lift Luo converter and its control circuit were designed to enhance the performance of standalone PV system.

Keywords: Photovoltaic (PV), Maximum power point tracking (MPPT), Perturb & Observe (P&O).

INTRODUCTION

Solar energy is abundant in nature and pollution free so it is the future energy source. DC-DC conversion plays key role in many industrial and domestic applications. Voltage gain and efficiency are improved in DC-DC converters [2-8]. The quick development of DC-DC conversion topologies in recent years has benefited everyone. Various topologies are developed in converters and they are categorized into with and without transformers. In transformerless topologies, cost, size, weight and losses are minimized [1-8]. For high voltage gain, better efficiency and minimum ripple, Luo converters are preferred among various converters. Voltage lift and super-lift voltage building techniques are used in the conversion phases for Luo converters [4-6], which have a straightforward and affordable topology and offer higher voltage gain, improved efficiency, and the least amount of output ripple and

they are derived from the basic DC-DC converter. The output voltage is raised arithmetically in steps using the voltage lift technique. On the other hand, the output voltage grows geometrically with the super-lift technique [4-5]. Positive Output Super-lift Luo Converter (POSLC) and Negative Output Super-lift Luo Converter (NOSLC) are two forms of super lift procedures [4]. This study examines POSLC performance that raise the input voltage to higher levels than those achieved by conventional voltage-building methods [5-8]. The output DC voltage of a POSLC is essentially increased geometrically step by step. Low power factor, harmonics, and decreased DC voltage gain are some of the main issues that traditional power electronic converters have, and Luo Converter is designed to solve these issues. Higher output efficiency can also be attained by reducing the ripple content in the output voltage and current. Its other advantages include huge DC gain, low switching loss, constant input current, and improved power density. The precise output voltage in DC-DC conversion is typically obtained using PI, PD, and PID controllers. However, fuzzy logic controllers have recently adopted closed loop control of electric drives [1] and all the conversion stages. Medical equipment, telecommunication networks, computer peripherals, robot systems, data transfer equipment, renewable energy power systems, and other applications all need power supply [1-3]. The super lift approach has been widely applied as the output voltage is increased geometrically through the phases of a DC-DC converter's operation [4]. The (POSLC) was created to accomplish the same goal with the least amount of complexity. In addition to having a greater output voltage than traditional boost converters [2-3], POSLCs have excellent performance, tiny output ripples in voltage and current, high gain, and high efficiency [4]. Perturb & Observe, incremental conductance [2], fuzzy logic and Particle Swarm Optimization are the various maximum power point tracking (MPPT) methods used to harness maximum power from solar PV under dynamic climatic conditions. DC-DC converters play a significant role in renewable energy applications because of their high efficiency at low solar PV voltage. The Luo converters are the most effective DC-DC converter among various topologies available in power conversion. To reduce costs and improving efficiency, numerous researchers have focused on attaining the maximum efficiency from solar cells and raising the low voltage in DC-DC converters [2-8]. In this work, the POSLC is used to increase the DC-DC output voltage to enhance the performance of a standalone PV system.

DESIGN OF SUPER LIFT LUO CONVERTER

inductor L_1, diodes D_1 and D_2, capacitors C_1 and C_2, and a load resistance R are present. The operation of the converter is explained by two modes as follows

Mode – I

The switch is in the ON state and the DC output is transmitted directly to the inductor L_1 and capacitor C_1. In this mode, the voltage across capacitor C_1 is charged to Vin. Because inductor L_1 and capacitor C_1 are connected in parallel, the current I_{L1} will increase with voltage Vin.

Mode-2

In mode 2, the switch is turned OFF, during this state, the current I_{L1} will decrease. kT is assumed as the switch-on period and (l-k) T is the switch-off period.

Voltage transfer gain (K) is expressed as,

$$\frac{V_0}{V_{in}} = \frac{(2-k)}{(1-k)} \quad (1)$$

Rewritten as,

$$K=\frac{2V_{in}-V_o}{V_{in}-V_o} \quad (2)$$

The output current I_0 is obtained from ohms law as,

$$I_0 = \frac{V_o}{R} \quad (3)$$

Then, using Input power=Output power

$$V_{in}\, I_{in} = V_o\, I_0 \quad (4)$$

Let us assume that 5% of ripples in the output current, then the value of

Δi_{L1}=5% of I_{in} (5)

The value of inductor L_1 is calculated as

$\Delta i_{L1} = \frac{V_o - 2V_{in}}{L_1}$(1-K)T (6)

$L_1 = \frac{V_o - 2V_{in}}{\Delta i_{L1}} \frac{(1-K)}{f}$ (7)

Let 5% of ripple current in the output voltage,

ΔV_o = 5% of V_o (8)

The formula to find the value of capacitance C_2 is,

$\Delta V_o = \frac{(1-K)}{fC_2} \frac{V_o}{R}$ (9)

Rearranged as,

$C_2 = \frac{(1-K)}{f\Delta V_o} \frac{V_o}{R}$ (10)

The values of both the capacitance C_1 and C_2 are equal

$C_2 = C_1$ (11)

PERTURB AND OBSERVE MPPT

To maximize the energy production of PV modules, an electrical system that continuously checks all power points and optimizes the solar panels' output is required. PV modules have to run at their maximum power point in order to ensure maximum load capacity in the face of constantly changing weather conditions. MPP is subject to vary in response to changes in temperature and light intensity since it lacks a fixed point and instead travels around the curve (P-V). By matching source resistance to load resistance, MPPT aims to maximize the energy output of photovoltaic cells, hence increasing solar panel efficiency. By analyzing the voltages and currents of the solar panel and then calculating the greatest energy to be extracted, various MPPT algorithms are used to perform computations. The widely used perturbation and observation (P&O) technique [4-5] is implemented in this work. Fig. 4 shows the flowchart used to implement the P&O MPPT algorithm. Monitoring the power output and disturbance (increase or decrease) of the solar array is done using a P&O algorithm. Initially, the PV array's real voltage and current are monitored. Then, by multiplying voltage by current, the PV module's actual power output is obtained. Increasing the operational voltage or photovoltaic current is the idea behind the P&O approach, which aims to maximize power output. Once the MPP is attained, the system oscillates around it. In order to reduce oscillation, the perturbation step size should be decreased.

SIMULATION RESULTS AND DISCUSSION

Figure 5 shows the simulation model of the Luo converter based standalone PV system. The PV module specifications and Luo converter design parameters are listed in the Tables 1and 2 respectively. Irradiance and temperature settings used in simulation work are shown in Fig. 7 and 9. Figures 8 and 10 show the simulation output results for various irradiances from 400 to 1000 W/m^2 at different temperatures (25-50^{o}C). Positive output voltage, high voltage transfer gain, high power density, decreased ripple voltage and current are the advantages of the Luo converter used in this work.

CONCLUSION

The voltage conversion from positive source voltage to positive load voltage is handled by the positive output super lift Luo converter. The converter has proved stability around its working point, good dynamic performance in the face of input voltage variations, and invariant dynamic performance in the face of fluctuating operating conditions. Since the LUO converter converts an unregulated voltage into a controlled voltage, the PV system performance is improved. Because of the use of inexpensive and simple elements in the system, the Luo converters are preferred than other DC-DC converters. Thus, the recommended DC/DC converter is appropriate for PV systems.

ABSTRACT

Driven by T-cell activity, psoriasis is characterized by chronic inflammatory skin illness by red patches and silvery-white scales, which leads to hyperproliferation of keratinocytes and aberrant differentiation. The Human Leukocyte Antigen (HLA) Cw*0602 gene is one of the major genetic variables contributing to the disease's development. Because of its anti-inflammatory and anti-proliferative qualities, α-Humulene, a sesquiterpene present in the essential oils of hops, cloves, and basil, has become a viable treatment agent for psoriasis. It functions by blocking pro-inflammatory cytokines like TNF-α and inhibiting the NF-κB pathway, which is crucial for the inflammatory process of psoriasis. Furthermore, it suppresses the light chain and nuclear factor kappa-enhancer of activated B cells. By focusing on these pathways, α-humulene might lessen the intensity of psoriatic symptoms and act as a natural substitute or supplement to current medicines, especially in cases where they are ineffective or have significant adverse effects. Animal models are crucial for understanding the pathophysiology of the illness and testing novel treatment approaches, such as the Imiquimod-induced psoriatic (IMQ) mouse model. Owing to its ability to effectively inhibit inflammatory cytokines and keratinocyte proliferation, α-humulene is a viable option for improving psoriasis management using novel and natural therapeutic methods.

Keywords: Psoriasis, IMQ model, NF-κB, keratinocytes, HLA Cw*0602 allele.

INTRODUCTION

About 2-3% of people worldwide suffer from psoriasis, a chronic inflammatory skin illness typified by well-defined erythematous plaques coated in silvery-white scales. This disorder significantly impairs the quality of life for people who are affected by it by causing intense psychological difficulties in addition to considerable physical suffering. Globally, the prevalence of psoriasis; ranges from 0.24% in Taiwan and China to 8.5% in Norway, with some countries in Northern Europe reporting rates as high as 11%. There is no appreciable variation in the disease's frequency between men and women, with symptoms usually appearing between the ages of 20 and 60. [1]. Psoriasis is a complex etiology that is fuelled by a complex interaction between immunological dysregulation, genetic predisposition, and environmental variables. The HLA-Cw*0602 allele is a key genetic marker that is highly associated with an earlier beginning of the disease and a more severe course of the disease [2]. The formation of psoriatic lesions is largely attributed to immune system activation, which is characterized by an excess of pro-inflammatory cytokines such as TNF-α, IL-23, and IL-17, which promote the hyperproliferation of keratinocytes. Keratinocytes multiply in psoriatic skin at a pace that is almost 100 times higher than normal, resulting in the thickness and scaling that are typical [3]. Numerous symptoms, such as painful and itchy plaques, lesions shaped like droplets, irregularities in the nails, red, inflammatory patches, pus-filled areas, and generalized redness with peeling skin, are indicative of psoriasis. These symptoms can impact the scalp, joints, skin, and nails, among other body regions. Genetic variables are important in determining the severity and particular features of each kind as well as how the disease develops over time (Table 1) [4].

There is still no proven treatment for psoriasis, despite a wide range of alternatives from topical lotions to systemic medications. New therapeutic targets and creative treatment approaches are urgently needed. Animal models have been extremely helpful in understanding the disease and evaluating potential treatments, especially the IMQ-induced psoriasis mouse model. Understanding the functions of inflammatory mediators like TNF-α, IL-23, IL-12, and various T helper cell subsets (Th1, Th17) is essential for creating tailored therapies that can successfully impede the fundamental inflammatory processes [5]. This review focuses on plaque psoriasis and examines its underlying etiology, factors that affect its progression, and current treatment options. We explore the possibility of α-humulene as a new therapeutic alternative and look at cutting-edge drug delivery methods that might improve treatment outcomes. Our objective is to find novel approaches to improving patient outcomes and care quality by concentrating on these important factors. The goal of this extensive investigation is to establish the way for future advancements and more potent psoriasis therapies using α-humulene. Plaque psoriasis, which makes up 80 to 90% of all cases of psoriasis, is thought to be the most widespread kind of the disease. It is typified by distinct, elevated, red plaques that are covered in silvery-white scales; these are usually seen on the lower back, scalp, elbows, and knees. Chronic inflammation and hyperproliferation of keratinocytes are the results of a complex interplay of genetic, immunological, and environmental variables in the etiology. Plaque psoriasis is the most representative type of illness due to its ubiquity and unique clinical appearance; as such, it is frequently the main focus of research and treatment development.

DISCUSSION

Plaque psoriasis

The most common type of psoriasis is characterized by the skin cells proliferating quickly, leaving the skin scaly and irritated in regions. While there isn't a cure, there are treatments that can help control the symptoms. About 90% of instances of psoriasis are chronic; the ailment usually manifests as well-defined, erythematous plaques coated with silvery scales, which are frequently found on the scalp, knees, and elbows [6]. Psoriasis-related chronic inflammation causes keratinocytes to proliferate excessively, interfering with their proper differentiation. Psoriatic plaques under a microscope exhibit inflammatory cells such as dendritic cells, macrophages, T lymphocytes, and neutrophils, as well as epidermal thickening, or acanthosis. [7]. Keratinocytes release antimicrobial peptides (AMPs) like LL37 and

nucleic acids in response to stress or damage caused by external sources including injury, illness, or medicine. By binding to toll-like receptors (TLR7), these constituents create complexes that interfere with the body's ability to tolerate its nucleic acids, activating plasmacytoid dendritic cells (pDCs)[8]. Type 1 interferons produced by activated autologous DCs trigger the production of important inflammatory cytokines like IL-12 and IL-23 from myeloid dendritic cells (mDCs). These cytokines stimulate T cells, which move to the inflammatory skin via the bloodstream and release effector molecules like IL-22, IFN-γ, and IL-17, which further alters the behavior of keratinocytes [9]. By generating more AMPs, cytokines, and chemokines, which draw in more immune cells like neutrophils and macrophages, keratinocytes themselves contribute to the inflammation. mDCs consistently generate IL-12 and IL-23 in chronic psoriatic lesions, which activate particular T cell subsets (Th17, Th22, and Th1) to release pro-inflammatory cytokines that propel the illness [5]. It's interesting to note that, contrary to T cells, new research indicates that innate immune cells like mast cells and neutrophils may be the main producers of IL-17 in psoriasis. Rich in AMPs and IL-17, neutrophils are important in stimulating keratinocyte hyperproliferation [10]. In addition, innate lymphoid cells (ILCs) have been identified as an additional IL-17 source in psoriasis. Although TNFα must work in tandem with IL-17 to fully impact gene expression, IL-17 does have a direct effect on keratinocytes. Additionally, keratinocytes create chemokines like CXCL-5 and CXCL-8 that continuously draw neutrophils to the site of inflammation, as well as pro-inflammatory cytokines like IL-1β and IL-18 that activate T cells and dendritic cells[10]. Furthermore, vascular endothelial growth factor (VEGF), which is secreted by keratinocytes, encourages blood vessel expansion and results in the development of highly vascularized psoriatic plaques. Chronic psoriasis is caused by an accumulation of immune cell infiltration, increased angiogenesis, and abnormalities of the epidermis [12]. The intricate relationship between skin cell behavior and immune responses emphasizes the difficulties in treating plaque psoriasis and the necessity for focused treatments that deal with the disease's underlying causes[11].

Factors affecting psoriasis

Extrinsic and intrinsic risk factors have an impact on psoriasis. Psoriasis can be brought on or made worse by outside variables such as air pollution, mechanical stress, certain drugs, infections, smoking, and alcohol intake. Skin inflammation, for example, can be made worse by mechanical stress and air pollution; known triggers include beta-blocker medicines and illnesses like strep throat. Alcohol consumption and smoking both raise the disease's risk and severity [12]. Obesity, diabetes, hypertension, metabolic syndrome, psychological stress, and genetic mutations are examples of intrinsic factors. These illnesses can aggravate psoriasis directly; among them, emotional stress is known to exacerbate flare-ups by impairing the immune system. The vulnerability of an individual to psoriasis is also significantly influenced by genetic predispositions. It is essential to comprehend and regulate these risk variables to manage the condition and enhance patient outcomes [13].

Extrinsic factors

Mechanical stress

Psoriasis and stress are closely related, with stress making the condition worse in people who are genetically prone to it. While stress does not directly cause psoriasis, it can lead to flare-ups since people with the condition frequently feel more stressed out because they are worried about how they look and how to manage their symptoms [14]. Hypothalamic-pituitary-adrenal (HPA) axis dysfunction may play a role in the link between stress and psoriasis by lowering cortisol levels, which normally aid in regulating inflammation. Increased inflammation and more intense flare-ups may result from this disturbance. Furthermore, according to the neurogenic inflammation theory, stress causes the production of neuropeptides such as substance P (SP) and nerve growth factor (NGF), which in turn promotes localized inflammation and the development of plaque [15]. Because of the condition's discomfort, visibility, and social stigma, managing psoriasis can be a constant source of stress, which can exacerbate the condition and lead to a difficult cycle that compromises one's physical and mental health [16].

Air pollution

Recent data points to the possibility that air pollution may contribute to flare-ups of psoriasis. Airborne pollutants have the potential to enter the bloodstream and cause oxidative damage and systemic inflammation, both of which may have an immediate effect on the skin. Studies have connected higher nitrogen dioxide (NO_2) levels to a 2.1%

increase in psoriasis cases among outpatients, while lower ozone (O_3) levels were linked to a 0.8% increase in instances, albeit the precise mechanisms underlying these increases are yet unknown [17]. It's interesting to note that the impacts of air pollution appear to differ by patient demographic; female patients and those under the age of 17 exhibit increased responses to differences in air quality, whilst male patients are more sensitive to weather changes. This relationship emphasizes the need for more investigation to determine how environmental elements, such as air pollution, exacerbate psoriasis and shows the wider influence of environmental health on long-term disorders [18].

Different drugs

Drug-induced psoriasis is a disorder where some drugs cause or exacerbate psoriasis in people who did not previously have symptoms; it goes away when the treatment is stopped. On the other hand, drug-aggravated psoriasis does not go away even if the offending medicine is stopped[19]. Prominent culprits include lithium, which aggravates psoriasis in almost 50% of users, and β-blockers (such as propranolol and metoprolol), which impact about 20% of patients. NSAIDs like aspirin, ACE inhibitors, antimalarial drugs, and antibiotics like amoxicillin might potentially make symptoms worse. Clinicians must comprehend these medication-related triggers to manage psoriasis effectively and customize treatments to reduce side effects [20].

Vaccination

Research indicates that the COVID-19 vaccine may be linked to flare-ups or new cases of psoriasis, though more investigation is needed to fully understand this complex relationship[21]. A recent review examined 49 trials with 134 participants who developed psoriasis after receiving a vaccine. 37% of these instances were male, 48.1% were female, and 14.8% were gender-neutral. With 33.3% of patients, plaque psoriasis was found to be the most prevalent type, followed by guttate (25.9%), pustular (14.8%), and nail psoriasis (11.1%). Other types were less common, like annular psoriasis. Biologic therapy was used to treat 36.4% of patients, the majority of whom (30.8%) were receiving them for the first time. Significantly, 44% of these patients had moderate-to-severe psoriasis, emphasizing the necessity of systemic therapies including biologics for efficient care [22]. These findings underscore the importance of ongoing research to clarify the vaccine's impact on psoriasis and refine treatment approaches.

Infection

"Infection-induced psychosis" refers to the onset of psychotic symptoms triggered by bodily or brain infections. Recent research published in psychiatry has revealed a troubling link between severe infections and an increased risk of developing drug-induced psychosis[22]. This link emphasizes the possible interaction between diseases and mental health, implying that the use of particular drugs may increase the risk of psychosis in cases of severe infections. Interestingly, this study also highlights a knowledge gap: little is known about the immunological mechanisms underlying drug-induced psychosis, and little is known about the risk factors for developing schizophrenia after substance-induced psychosis[23], [24]. It is imperative to comprehend these dynamics because they may open the door to novel treatments and prevention measures that target the immunological as well as psychological components of psychosis.

Smoking and alcohol

In addition to being connected to more general health problems including cardiovascular illnesses, smoking and secondhand smoke exposure are significant risk factors for psoriasis. Studies reveal that smokers with psoriasis smoke more than people without the disease. Smoking can exacerbate psoriasis because it lowers antioxidant levels, increases oxidative stress, and interferes with vascular function. Additionally, it inhibits angiogenesis and vascular growth factors and increases inflammatory cytokines such as GM-CSF, TNF-α, IL-12, IL-2, and INF-α [25]. Similar to this, drinking alcohol increases the production of lymphocytes and pro-inflammatory molecules, both of which lead to chronic inflammation. Alcohol contains compounds that can both increase and change the expression of genes involved in keratinocyte growth. To completely comprehend how drinking and smoking impact the severity of psoriasis and the results of treatment, more research is required [26].

Intrinsic factors

Insulin Resistance Syndrome

Metabolic syndrome encompasses a range of conditions, including diabetes, heart disease, stroke, and other related illnesses[27]. Cytokines, which are made by the immune system and are essential for inflammation, are at the core of several disorders. Proinflammatory cytokines have been connected in studies to several additional health problems, including obesity, high blood pressure, hyperlipidemia, non-alcoholic fatty liver disease, and type 2 diabetes. These cytokines cause tissue inflammation, which exacerbates insulin resistance. Thus, the same inflammation that causes psoriasis may also have a role in the emergence of metabolic syndrome risk factors [28], [29].

Obesity

Body weight and dietary habits are key factors in psoriasis, with obesity and high BMI being major risk factors. About 50% of psoriasis patients are overweight or obese. Pro-inflammatory adipokines like leptin and TNF-α are involved in the link between obesity and psoriasis[30]. Elevated leptin levels in psoriasis patients promote inflammation, while lower levels of the anti-inflammatory adipokine adiponectin are associated with more severe symptoms. TNF-α, which is overproduced in obesity, exacerbates psoriasis by driving rapid skin cell proliferation[28].

Diabetic mellitus

Psoriasis is greatly influenced by body weight and eating habits, with obesity and a high body mass index (BMI) being major risk factors. About half of people with psoriasis are obese or overweight. Leptin and TNF-α are examples of pro-inflammatory factors that influence the relationship between obesity and psoriasis. Less of the anti-inflammatory adipokine adiponectin is linked to more severe disease, whereas elevated leptin levels, which are common in psoriasis patients, cause inflammation and worsen symptoms [31]. TNF-α, which is overproduced in obesity, contributes to psoriasis by accelerating skin cell proliferation, highlighting the impact of adipokines and inflammation on the disease[32].

Dyslipidemia

Psoriasis and obesity are closely associated, and having too much fat tissue may exacerbate dyslipidemia. Dyslipidemia is more common in psoriasis patients, and its severity tends to rise with the condition. Sixty-two percent of the 70 psoriasis patients in the research exhibited dyslipidemia, the most prevalent of which were low HDL values and hypertriglyceridemia [34]. It is well established that oral systemic psoriasis medications, especially retinoids, worsen dyslipidemia by raising LDL and triglyceride levels and lowering HDL cholesterol [33]. Cyclosporin also contributes to dyslipidemia. Although dyslipidemia is associated with immune issues, its impact on psoriasis severity remains unclear[34].

High blood pressure

The exact connection between psoriasis and hypertension is still unclear, though both conditions share common risk factors such as obesity. Inflammation, a key feature of psoriasis, may contribute to hypertension by causing arterial stiffness, which raises blood pressure[35]. In addition to raising stress hormones and activating the renin-angiotensin-aldosterone system (RAAS), chronic inflammation can also raise blood pressure. Furthermore, inflammation can interfere with blood coagulation, which could raise blood pressure even further. Therefore, even though the exact relationship is still unclear, these systemic and inflammatory variables probably have a big impact [36], [37].

Gene expression and epigenetic variation

Through high-throughput genotyping, genome-wide association studies (GWAS) have revolutionized the study of complex illnesses by discovering genetic variations linked to disease vulnerability. This strategy finds novel loci and offers deeper insights into disease mechanisms than traditional candidate gene approaches [40]. Mutations in the CARD14 gene have a substantial effect on immunological responses and NF-κB signaling in psoriasis. CARD14-

deficient animals exhibit decreased production of IL-17A as a result of suppressed NF-κB and MAPK pathways [38]. To profile cytokines such as TNF-α, IL-23, and IL-17, the enzyme-linked immunosorbent test (ELISA) is essential. This allows for the correlation of these cytokines with genetic markers and the development of individualized treatment plans. Furthermore, aberrant activation of toll-like receptors (TLRs), especially TLR4, highlights the potential of TLRs as a therapeutic target by highlighting their crucial involvement in the chronic inflammation linked to psoriasis. Because targeting NF-κB requires balancing the risk of broad immunosuppression with the control of inflammation, it is a difficult process [39]. Furthermore, current studies have emphasized the role that environmental variables and epigenetic alterations have in the pathophysiology of psoriasis, indicating that interactions between hereditary predispositions and outside stimuli play a role in the development and progression of the illness. TLR4 expression in psoriatic and healthy skin can be compared to highlight the role this protein plays in disease pathophysiology and to suggest its potential as a target for therapeutic therapies. Combining genetic, immunological, and environmental knowledge expands our knowledge of psoriasis and helps us create more targeted, efficient treatments [40].

The Activation of the signaling pathway of nuclear factor kappa-light-chain-enhancer of activated B cells(NF-κB)

The NF-κB transcription factor family, including p105 (NF-κB1), p100 (NF-κB2), p65 (Rel A), Rel B, and c-Rel, can form various homo- and heterodimers. In the canonical NF-κB pathway, IκBα phosphorylation leads to NF-κB release, allowing it to translocate to the nucleus and drive both cell survival and inflammation[41]. This mechanism is crucial for the activation of pro-inflammatory responses. Phosphorylation of p105 proteins is essential for the p105 pathway, which results in the production of p52 complexes that translocate to the nucleus, further driving inflammation[42]. Psoriasis, a prime example of an IMID, highlights the importance of NF-κB signaling in disease mechanisms. Genome-wide association studies (GWAS) have identified several genes associated with NF-κB pathways that influence psoriatic susceptibility. The differential expression of NF-κB in affected versus healthy skin underscores its pivotal role in skin inflammation[43]. Inhibiting NF-κB with specific compounds has been shown to reduce inflammation, supporting its therapeutic potential. Additionally, NF-κB regulation enhances the mRNA synthesis of key inflammatory mediators, including growth factors (e.g., TGF-β, VEGF), chemokines (e.g., CCL20, CXCL8/IL-8), and pro-inflammatory cytokines (e.g., TNF-α, IL-1β, IL-6, IL-17)[44]. Recent research also emphasizes the impact of epigenetic modifications and environmental factors on NF-κB signaling, suggesting a complex interplay between genetic predisposition, external triggers, and NF-κB-mediated inflammation in psoriasis[45]. Integrating these insights provides a more comprehensive understanding of NF-κB's role in psoriasis and highlights its potential as a target for novel therapeutic strategies.

Current treatment of psoriasis

The goals of current psoriasis treatments are to reduce inflammation, enhance quality of life, and reduce symptoms. Topical therapies, phototherapy, systemic treatments, and biologics are some of these methods. Corticosteroids, which lower inflammation and slow skin cell turnover, are a frequent starting point for topical therapy. However, prolonged use of these drugs can have negative side effects, such as skin thinning. For maximum effectiveness, vitamin D analogs—such as calcipotriene—are sometimes used with corticosteroids to assist restore skin cell proliferation[46]. Despite becoming less common because of its smell and stains, coal tar is nevertheless useful in treatment. Phototherapy is the application of ultraviolet radiation to the skin. While many patients find narrowband UVB to be useful, it requires repeated sessions. For severe instances, phototherapy is reserved for PUVA, which combines UVA light and psoralen, despite potential hazards such as skin cancer and aging. Comprehensive therapies offer more comprehensive management: methotrexate decreases inflammation and cell division, but necessitates frequent liver examinations owing to possible toxicity; cyclosporine inhibits the immune system in extreme situations, but carries hazards of kidney impairment and elevated blood pressure; and acitretin, an oral retinoid, stabilizes skin cell development, but may result in dryness and congenital abnormalities[38]. A more recent strategy that targets particular inflammatory pathways is the use of biologics. While interleukin inhibitors like ustekinumab (targeting IL-12 and IL-23) and secukinumab and ixekizumab (targeting IL-17) give great efficacy and long-term management, they may also raise the risk of infection. TNF-α inhibitors, such as etanercept and adalimumab, concentrate on important cytokines. Every treatment has advantages and possible drawbacks, and the choice of

therapy is frequently influenced by the severity of the ailment, the general health of the patient, and how well the patient responded to earlier interventions. The range of alternatives for efficiently managing psoriasis is always expanding due to continuous research and emerging medicines[47].

α-Humulene: A Potential Treatment for Psoriasis

While existing psoriasis treatments ranging from topical steroids to systemic drugs and biologics offer various benefits, they often come with limitations such as side effects, inadequate efficacy, or frequent administration needs. α-Humulene, a natural sesquiterpene, presents a compelling alternative due to its unique therapeutic profile. It specifically targets and inhibits NF-κB signaling, a key driver of psoriasis, effectively reducing inflammation by decreasing the production of pro-inflammatory cytokines like TNF-α, IL-1β, IL-6, IL-17, and IL-23. α-Humulene also normalizes keratinocyte proliferation and improves skin barrier function, which is crucial for managing psoriasis[48]. Its natural origin suggests a potentially lower risk of severe side effects compared to synthetic drugs. Furthermore, advanced delivery systems can enhance α-humulene's bioavailability and efficacy, making it a promising option for more effective and safer psoriasis treatment[49].

The pharmacotherapeutic activity of α-Humulene

α-Humulene, a sesquiterpene found in hops (*Humulus lupulus*) and certain essential oils, exhibits notable pharmacotherapeutic potential due to its anti-inflammatory and immunomodulatory properties. Research indicates that α-humulene effectively inhibits NF-κB signaling, a key regulator of inflammation and immune responses. This inhibition occurs through suppression of the phosphorylation and degradation of IκBα, preventing the release and nuclear translocation of NF-κB[50]. By blocking NF-κB activity, α-humulene reduces the production of pro-inflammatory cytokines such as TNF-α, IL-1β, IL-6, IL-17, and IL-23, which are central to the pathogenesis of psoriasis and other inflammatory conditions[48]. Furthermore, α-humulene's effects extend to the modulation of immune cell activity. It has been shown to inhibit the activation and proliferation of T cells and dendritic cells, contributing to a reduction in chronic inflammation. This compound also impacts keratinocyte proliferation by normalizing cell turnover and reducing abnormal skin cell growth, which is crucial for improving psoriatic lesions. In addition, α-humulene's influence on apoptosis helps restore normal apoptotic processes, eliminating overactive immune cells and promoting healthy skin cell turnover[49]. Moreover, α-humulene enhances skin barrier function by influencing proteins involved in maintaining barrier integrity, thus reducing susceptibility to inflammation and infection. Overall, α-humulene offers a multifaceted therapeutic approach for psoriasis by addressing key aspects of the disease, including inflammation, immune response, keratinocyte proliferation, apoptosis, and skin barrier function.

Effects of α-Humulene in Psoriasis: Inhibition of NF-κB Signaling

Inhibiting NF-κB can profoundly influence psoriasis treatment by targeting multiple disease mechanisms. NF-κB inhibition reduces the production of key pro-inflammatory cytokines such as TNF-α, IL-1β, IL-6, IL-17, and IL-23, which are pivotal in driving inflammation and keratinocyte proliferation in psoriasis. This reduction helps mitigate the chronic inflammation characteristic of the disease. Additionally, inhibiting NF-κB can address abnormal keratinocyte proliferation, promoting more normal skin cell turnover and improving psoriatic lesions. NF-κB's role in modulating immune cell activity means its inhibition can decrease the chronic inflammation driven by T cells and dendritic cells, further reducing disease severity[46]. Moreover, NF-κB is involved in regulating apoptosis; its inhibition may restore normal apoptotic processes, leading to the elimination of overactive immune cells and normalizing keratinocyte turnover. NF-κB also impacts skin barrier function proteins, so its inhibition might enhance barrier integrity, reducing susceptibility to further inflammation and infection[51]. Alpha-humulene, a compound found in hops and certain essential oils, has shown potential as an NF-κB inhibitor. It modulates NF-κB signaling by suppressing the phosphorylation and degradation of IκBα, which prevents NF-κB from translocating to the nucleus and activating pro-inflammatory genes[52]. By inhibiting NF-κB, alpha-humulene could reduce the expression of cytokines and growth factors involved in psoriasis, decrease abnormal keratinocyte proliferation, and enhance skin barrier function. The compound's anti-inflammatory properties might also help normalize immune cell activity and apoptotic processes. Thus, alpha-humulene offers a promising approach to managing psoriasis through its

multifaceted impact on inflammation, cellular proliferation, immune regulation, apoptosis, and skin barrier integrity[52].

Drug delivery system

α-Humulene, a sesquiterpene with significant therapeutic potential, faces challenges in drug delivery due to its low solubility and poor bioavailability. To address these issues, several advanced drug delivery systems have been explored. Nanoparticle-based systems, such as liposomes and polymeric nanoparticles, enhance the solubility and stability of α-humulene, allowing for controlled release and targeted delivery. Solid lipid nanoparticles (SLNs) improve stability and controlled release, making them particularly useful for topical applications[53]. Microsphere-based systems offer prolonged release and targeted delivery, thereby improving the therapeutic index of α-humulene. Cyclodextrin complexes significantly enhance α-humulene's solubility and stability by forming inclusion complexes. For topical treatments, formulations incorporating α-humulene often use penetration enhancers to improve delivery through the skin barrier, benefiting various dermatological applications[54]. These approaches collectively offer promising strategies for optimizing the therapeutic use of α-humulene.

Future Perspectives on α-Humulene in Psoriasis Treatment

The future of psoriasis management looks promising with the potential integration of α-humulene, a sesquiterpene with notable anti-inflammatory properties. α-Humulene's ability to inhibit NF-κB signaling—a key driver of psoriasis inflammation—positions it as a significant therapeutic option. Future research is expected to refine delivery systems, such as advanced nanoparticles and cyclodextrin complexes, to enhance α-humulene's solubility, stability, and targeted delivery, thereby maximizing its therapeutic effects against Psoriasis. As understanding deepens, α-humulene may reveal additional mechanisms affecting immune response and skin cell behavior, potentially providing novel insights into its benefits. Combining α-humulene with existing treatments could create synergistic effects, improving efficacy and reducing the adverse side effects associated with current therapies. Personalized approaches could further optimize treatment, tailoring α-humulene therapy to individual patient needs and enhancing outcomes. Clinical trials and continued research are crucial to validate α-humulene's efficacy and safety, but its integration into psoriasis treatment could revolutionize current paradigms. By offering a natural, targeted approach, α-humulene has the potential to transform psoriasis care, addressing both the disease's underlying mechanisms and patient quality of life with a safer, more effective alternative to traditional therapies.

Emerging prospects and obstacles

α-Humulene shows promise for treating psoriasis due to its anti-inflammatory properties, which could help reduce symptoms like redness and itching. It offers the potential to complement existing therapies and appeal to those seeking natural treatments. However, challenges include limited clinical evidence, uncertainties around dosing and formulation, potential side effects, and the need for consistent product quality and regulatory approval. More research and development are needed to address these issues and establish α-humulene as a viable treatment option.

CONCLUSION

In conclusion, α-humulene stands out as a promising advancement in psoriasis treatment, offering a natural and potentially effective alternative or complement to conventional therapies. By inhibiting key inflammatory cytokines like TNF-α and disrupting the NF-κB signaling pathway, α-humulene targets the underlying mechanisms of psoriasis, including excessive T-cell activation and keratinocyte hyperproliferation. This multifaceted approach holds the potential to significantly reduce psoriatic symptoms and provide a viable option for patients who face inadequate relief or serious adverse reactions from existing treatments. The integration of α-humulene into advanced therapeutic regimens represents a transformative shift towards leveraging natural compounds alongside modern medical practices. To fully realize its benefits, it is crucial to innovate in dosage precision, formulation stability, and long-term safety. Developing advanced delivery systems and robust clinical protocols will be key to optimizing α-humulene's impact and addressing the complexities of psoriasis management. By embracing such integrative and innovative

approaches, we could revolutionize treatment paradigms by offering new, personalized care options for individuals affected by this chronic dermatological condition.

Table 1: Responsible genes that are associated with or potentially causally related to specific subtypes of psoriasis.

Sl	**Types of psoriasis**	**Description**	**Associated and causative specific genes for psoriasis**
1	Plaque psoriasis	• Most common form • Dry, raised, itchy, and pain full. • Anywhere on the body including genitals and inside the mouth	These same researchers also found the **CARD14** mutation.
2	Guttate psoriasis	• Young adults and children • Small water droplet shapes	Genetic factors are the **HLA-Cw6** allele.
3	Nail psoriasis	• Fingernails and toenails	

		• Pitting, abnormal growth • In severe cases causes nail crumble	Mutations in **CARD14.**
4	Inverse psoriasis	• Smooth patches of red inflamed skin • Made worse by sweating	Mutation in **FN1, FBLN1,MYH7B MST1R, RHOD,SCN10A.**
5	Pustular psoriasis	• Widespread patches on hand, feet, fingertips • Develops quickly from pus-filled	Mutations in the **IL36RN** gene.
6	Erythrodermic psoriasis	• Red, peeling rash • Itches and burns intensely	These may include genes like **HLA-Cw6**, **IL12B**, **IL23R**, **TNF**, and **CARD14.**
7	Scalp psoriasis	• Reddish patches and bleeding on the scalp • Burning sensation or soreness • Alopecia condition	Including **HLA-Cw6**, **IL-12B**, **IL-23R**, **TNF**, and **CARD14** genes.
8	Psoriatic arthritis	• Inflamed itchy skin and painful swollen joints. • Stiffness and progressive joint damage	**This may include HLA-B27,HLA-Cw6,IL-23R,PTPN22,CARD14.**

ABSTRACT

Fever is identified as *Jwar* in Ayurveda and it is characterized by *Deha, Indriya, and Manasa Tapa*. The most common clinical symptom of the majority of illnesses is fever, which is also the most common indicator that drives people to seek medical attention In both allopathic and ayurvedic medicine, lowering body temperature is managed through various methods with the primary objective of producing an antipyretic effect. *Jwara* treatment in Ayurveda depends on the *Vata Pitta, Kapha, Dwanda*, and *SannipataDoshas*. Treatment is also dependent upon the extent to which the doshas are involved. Material's and methods **–** A Febrikid tablets were prepared in Parul Ayuved Pharmacy Vadodara Gujarat and was used in patients having fever. 15 Patients were enrolled from all different hospitals of Vadodara city. Results: Significant antipyretic activity of Febrikid was noted in 80% of the individual with average dose of 2 tablets (500mg each) in TDS. Discussion and conclusion in this study, it was discovered that Febrikid Plus, an herbal medicine made up of *Rasa-aushadi*, not only reduces the fever but also other symptoms including, *Agnimandya* (lack of appetite), Angamarda (body ache), *Shirashoola* (headache), *Arti*(irritability), and *Daurbalya* (weakness). The *AmaPachana* is the primary emphasis because it helps to lower body temperature and fever. Febrikid Plus is a mixture of medicines with antipyretic, analgesic, antibacterial, antioxidant, and anti-inflammatory characteristics. It has a considerable antipyretic effect and can be utilized in Ayurvedic clinical practices.

Keywords: Jwara, Fever, Herbomineral medicine, Febrikid Plus.

INTRODUCTION

Fever is the very primary and cardinal feature of the most of paediatric diseases. It is the sole clinical trait that identifies the pathology of underlying illnesses, particularly infectious diseases, for which fever is more frequently pronounced as the hall mark. Contrary to popular opinion, fever is one of the key symptoms of a variety of non-communicable and non-infectious diseases. In the paediatric population, fever can appear in a variety of ways, from hyperthermia to complex seizures. There is a wide range of antipyretic medications accessible in contemporary medicine, taking into account the basic principles of the pathogenesis of fever. The fundamental characteristics of anti-pyretic work is to lessen body aches and hyperthermia (raised body temperature).Supplementary medications such as antibiotics and antiviral drugs are employed to regulate the underlying causes, such as viruses and bacteria are given to . Therefore, anti-pyretics are commonly employed to alleviate hyperthermia and discomfort associated with fever, in conjunction with the medications prescribed in the specific disease management protocol. Ayurveda defines fever as *Jwara* and *Deha*, *Indriya* and *ManasaTapa* (Hyperthermia, irritability) as its key feature. Apart from hyperthermia broad symptoms has also been defined by Ayurveda Acharya under the spectrum of the *Dosha* as *Vatika, Paittika, Kaphaja* and *Dwandwaja, Sannipataja*. If one closely observed the symptomology of the *DoshikaJwara* in Ayurveda one can found that treatment of *Jwara* is also based on the predominance of *Dosha* involved in specific *Jwara*. Hence, the treatment of *Jwara* in Ayurveda also based on the treatment of Dosha involved in *JwaraSamprapti*.

Rationality of combination

After analysis of *JwaraChikitsa Sutra* and different medicines used in *Jwara* it is clear that no direct antipyretic medicine of primary concern which drastically reduces the body temperature in Ayurveda *Jwara* management are available. The primary focus of the research is to reduce the fever and body temperature using AmaPachana, which is ultimately helpful.This clinical trial was conducted on the 15 paediatric patients having fever. Observations of the clinical study showed clinically significant results in the body temperature reduction. This article is an attempt to highlight the antipyretic properties of the newer herbomineral combination in paediatric clinical practices.

AIM

- To evaluate the anti-pyretic effect of the *Febrikid*plus tablets as symptomatic treatment.

INCLUSIVE CRITERIA

- Temperature should be between 99- 104^{o} F.
- Acute fever without any side effects, such as dehydration or convulsions.
- Acute fever that lasts one to three days.
- A patient of any gender who's been diagnosed with a fever and is between the ages of 5 and 8years
- Kids whose parents have signed the consent forms and agreed to participate.

EXCLUSIVE CRITERIA

- Fever lasted for more than 3 days.(Patient having fever since last 3 days will be excluded)
- Chronic fever associated with infective disorder.
- Any febrile condition in children that required immediate medical attention and was determined by the researchers to be non-inducible based on history and overall condition at the time of assessment was excluded from the trial.

MATERIALS AND METHODS

Guduchyadi Kashaya from *AshtangaHridaya Sutra Sthana* was used as an antipyretic medicine in Febrikid Plus tablets, and *Godanti* (gypsum), *Bhasma, ChitrakaMoola*, and *Mrutyunjaya Rasa* were added as mineral antipyretics to the combination to enhance its antipyretic effect. The *Guduchyadi Kashaya* and *ChitrakaMoola* were mixed together to form the *Rasa Kriya* (*Ghana Vati*), which was subsequently mixed with *Godanti and Mrutyunjaya Rasa* to form the Febrikid Plus tablet. All medications were purchased from the local market of Vadodara, Gujarat and were verified by the pharmacy department of the Parul Ayurvedic Institute. The end product was developed in the Parul Ayurveda Pharmacy of Parul University, which holds a GMP certification, complying to the SOP for Ghana Vati production. Between September 2022 and December 2021, 15 patients or subjects with fever ranging in age from 5 to 16 years old were enrolled in the study. In this study, 15 patients/subjects with fever aged 5 to 16 were enrolled between September 2022 and December 2021. Dosage of the Febrikid Plus tablets varied depending on their age, weight, and fever rise. Additionally, data was collected through Google Forms and a customized case record form. The collected data were entered into Microsoft Excel 2011 for documentation, and Graph Pad Prism (version 4.00) was used for the statistical analysis. SPSS for Windows version 17.0, Chicago, USA, was also used for data analysis. SPSS (version 17.0 for Windows) was also used for data analysis. Descriptive characteristics (mean and standard deviation) and percentage were performed for each parameter separately.

OBSERVATION AND RESULTS

Table 1 shows the number of patients of the particular disease with fever in this clinical trial. 7 patients were diagnosed with viral fever, followed by 3 patients diagnosed with HMF, 2 patients with Upper Respiratory Tract Infection (URTI) and Urinary Tract Infection (UTI) and one with Dengue. The observed probability of fever spikes in patients over a 24-hour period is shown in Table 7. It shows the percentage of spikes in fever was observed in 66% of the patients within a day2-3 days.

DISCUSSION

Fever may be caused due to a variety of conditions, including infections, inflammatory disorders, infarctions and ischemia, infiltration, immunological, iatrogenic, idiopathic conditions, genetic illnesses, granulomatous conditions, problems with the endocrine system, and metabolic disorders. Antipyretic medications are routinely employed in conventional medicine, coupled with the treatment of underlying disease pathology, despite the fact that there are numerous reasons. In Ayurveda, treating a fever involves treating the underlying pathology with Deepana-Pachana-Langhana-Ushnodaka therapy, which is the fundamental principle of Ayurvedic fever. Tablets of Febrikid Plus were created using a combination of medications with antipyretic, analgesic, antibacterial, antioxidant, and anti-inflammatory effects. It includes the *Mrityunjaya Rasa*, *GodantiBhasma, Padmaka, Nimba, Dhanyaka, Raktachandana, and ChitrakaMoola*. All herbal preparations were preserved in equal amounts, with the exception of *Godanti*, which was kept at a percentage of 1/10, and *Mrityunjaya Rasa*, which was kept at a proportion of 1/15 of the total. *Chitrakamoola'sShodhana* was performed in consideration of its unfavorable effects prior to its use in tablets,. After being steeped in lime water for eight hours, *chitrakamoola* was combined with *GuduchyadiKashaya. Mrutyunjaya Rasa*, which was produced by *Baidyanath Pharmacy Zansi*, India, was purchased from the local market. 1/15th of the overall mixture was reserved for the *Mrutyunjaya Rasa*. Its dosage was kept at a minimum or at the lowest in the provided

combination because it is a mercury preparation. Most of *Mrityunjaya Rasa's* medications were discovered to have *Sookshma, Vyavayi, and VikasiGuna*, which implies they had the ability to act on micro-channels, particularly at the cellular level, before having an impact on tissue factors. The following table provides a summary of some studies that provide evidence about the ingredients in Febrikid Plus tablets: The results of experimental (pre-clinical trial) investigations on *Mrityunjaya Rasa* produced via different pharmaceutical techniques demonstrate Mrityunjaya Rasa's traditional antipyretic activity. Furthermore, the study has proven a clear function for mercury in the production of Mrityunjaya Rasa.[1] Collectively, these medications have the *Tridoshghna* effect, which helps to increase channel clearance and metabolism. The *Pachana* of Dosha in *Amashaya*, which is thought to be the initial spot for the pathogenesis of *Jwara*, is improved by the drugs utilized in the *Mrityunjaya Rasa*. In this clinical experiment, a difference in the frequency of drug distribution has been noted, which is suggestive of a dose dependency depending on the Dosha as well as the severity of the *Srotorodha*, given the frequency and intensity of *Jwara*. Anti-inflammatory, antipyretic, analgesic, diaphoretic, antioxidant, digestive, and carminative qualities are prominent in the combined action.

CONCLUSIONS

In this study, Febrikid plus medicine was formed *Guduchyadi Kashaya* from *AshtangaHridayaSutra Sthana. Godanti* (gypsum) *Bhasma, ChitrakaMoola, and Mrutyunjaya Rasa* were added as mineral antipyretics to the combination to enhance its antipyretic effect. The *Guduchyadi Kashaya* and *ChitrakaMoola* were mixed together to form the Rasa kriya (Ghana Vati), which was subsequently mixed with *Godanti and Mrutyunjaya Rasa* to form the Febrikid Plus tablet. All medications were purchased from the local market of Vadodara, Gujarat ,and were verified by the pharmacy department of the Parul Ayurvedic Institute. Later, to check the efficacy of the medicine clinical trial was performed on 15 patients who were diagnosed with fever. It was observed that 14 patients (93.3 %) got afebrile just within 2 hrs of medication and the remaining one recovered within 4 hrs. Frequency of the dosage was changed depending upon the patients situation and age and the optimum dosage of the medicine was also identified. Almost 40 % of patients recovered after treating them with 2TDS and 20 % recovered with the dosage of 2BD and 2QDS. In addition to the fever, all these patients were associated with other diseases such as headache, body ache, cold, cough, nausea, loose stool, and skin rash. Headache (26%) and body ache (21%) were observed as the primary associated symptoms recovered in this clinical trial. Only 3 patients out of 15 patients required Paracetamol with Febrikid Plus as an antipyretic. All the findings and observation of the study concludes that Febrikid plus – herbo-mineral combination is efficient to treat moderate to high-grade fever with dose modification.

ABSTRACT

Nephrotoxicity is a major problem in modern medicine, resulting in consequences such as glomerulopathies, tubulopathies, and Acute kidney injury (AKI). Kidney injury has been associated with several pharmaceuticals and substances, including anti-inflammatory agents, aminoglycosides, vancomycin, and chemotherapy drugs like cisplatin. The fundamental procedures of nephrotoxicity are multiple and complex, including modifications to glomerular hemodynamics as well as poisoning to tubular cells, inflammatory processes, and the development of crystals. By disrupting mitochondria and producing reactive oxygen species, oxidative stress plays a crucial part in inducing inflammation and proximal tubular toxicity. Apoptosis, necroptosis, and ferroptosis are examples of controlled cell death mechanisms that have a major role in the pathophysiology of nephrotoxicity. It is critical to diagnose nephrotoxicity as soon as possible to prevent permanent harm. Newly developed renal biomarkers show potential in kidney injury early identification, such as cystatin C. Mild clinical indications of nephrotoxicity, such as irregularities in the acid-base equilibrium, water equilibrium, and imbalances of electrolyte levels, might occur and may not be immediately identified as drug-induced indications. However, if treatment is not received, these early alterations may worsen to cause substantial morbidity. Nephrotoxicity can also result in papillary necrosis, chronic interstitial damage, and chronic renal failure, underscoring the significance of early detection and prevention. Preventive steps to lessen the impact of medication-induced kidney injury include optimizing dosage, avoiding drug combinations that can cause

nephrotoxicity, keeping a close eye on renal function, and investigating possible nephroprotective medicines, such as saponins. Nephrotoxicity management requires a multidisciplinary approach involving medical specialists from many areas in order to improve patient outcomes.

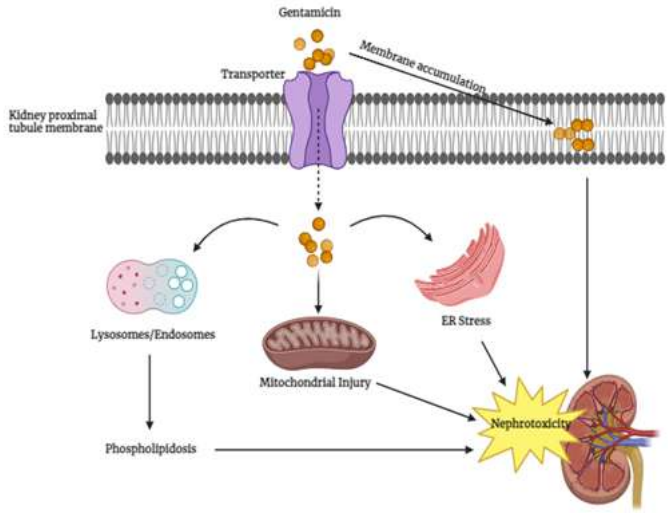
Keywords: Nephrotoxicity, Pathways, Acute kidney damage,Electrolytes, Herbals agents, Saponins.

INTRODUCTION AND BACKGROUND

Around 60% of chronically sick patients have been diagnosed with acute renal damage, with toxic effects of drugs having the third most prevalent cause. Any renal damage brought on by drugs, whether directly or indirectly, is known as nephrotoxicity. Common clinical manifestations of nephrotoxicity include acute renal failure, tubulopathies, and glomerulopathies [1]. A few examples of these substances include molds and fungal organisms, medication used inappropriately like cocaine and heroin, metals like arsenic, lead, and mercury, antibiotics like aminoglycosides, and chemotherapy drugs like cisplatin [2] An aminoglycoside group antibiotic called gentamicin (GM) is frequently used to treat Gram (-) bacteria, which pose a hazard to many distinct species. The most frequent adverse effect of gentamicin is nephrotoxicity[3]. Aminoglycosides produce nephrotoxicity through endocytosis and antibiotic deposition in the proximal tubule epithelium cells [4]. It works well in combination with β-lactams to effectively combat various Gram-negative bacteria, including Staphylococcus and Enterococcus [5]. Gentamicin is not metabolized; instead, it is transported throughout the extracellular space virtually unaltered until it is excreted in the kidneys through glomerular filtration [6]. Gentamicin (GM) is an aminoglycoside antibiotic characterized by an amorphous white powder form with high water solubility. Derived from *Micromonos porapurpurea, it* possesses a molecular weight of 477.6 and a molecular formula of C21H43N5O7, with an IUPAC name of 2-[4,6-diamino-3-[3-amino-6-[1-(methylamino) ethyl] oxan-2-yl] oxy-2-hydroxycyclohexyl] oxy-5-methyl-4(methylamino)oxane3,5-diol [7]. Initially identified in 1963, Gentamicin (GM) is commonly prescribed for severe Gram-negative bacterial infections, including endocarditis, sepsis, pneumonia, pelvic inflammatory disease, meningitis, urinary tract infections, and bone infections [8]. Nephrotoxicity, a prominent concern associated with Gentamicin use, is characterized by renal damage, including elevated serum creatinine and blood urea concentrations, proximal renal tubular necrosis, and potential renal failure. The increased antibiotic uptake in the kidneys, particularly in the proximal tubules, is believed to underlie these adverse effects. Gentamicin elevates the level of reactive oxygen species (ROS) in the kidney. It decreases the activity of several essential renal antioxidant enzymes, particularly glutathione peroxidase (GPx), glutathione (GSH), and superoxide dismutase (SOD). Morphologic lesions in proximal tubules have been visually confirmed, while ultrastructural observations indicate early lysosomal lesions characterized by the accumulation of myeloid bodies [9].

Mechanisms and Pathophysiology of Gentamicin-Induced Nephrotoxicity in Proximal Tubule Cells.

Gentamicin causes cytotoxicity in the kidney's proximal tubule epithelial cells; however, it exhibits a significantly reduced cytotoxic effect on the cells in the distally located tubules and collecting ducts. Gentamicin's nephrotoxic effects involve capillary congestion and acute necrosis of the tubular walls, regression of the antioxidant defense systems, and the generation of kidney free radicals, each resulting in a lowered rate of glomerular filtration and kidney failure. The pathophysiology of acute kidney injury caused by gentamicin involves the intracellular accumulation of the drug in the lysosomes of proximal tubule cells, leading to enzyme inhibition and structural damage. This accumulation results in the formation of myeloid bodies and affects the Golgi and endoplasmic reticulum (Figure *1*). Clinical indications for gentamicin-induced nephrotoxicity involve decreasing the rate of glomerular filtration, albuminuria, kidney/body weight proportion, raised creatinine levels in the serum and blood urea nitrogen levels, and failure of the kidneys. Additionally, gentamicin-induced nephrotoxicity elevates the renal tubular biomarker kidney injury molecule 1 (KIM-1), indicating damage to the proximal tubules. Nephrotoxicity and renal disease are both triggered by the death of renal cells and involve changes in the structure of the nephron, involving tubules, the interstitial glomeruli, and the intra-renal vasculature [10].



Gentamicin (GM) damages tubules in two ways: by causing apoptosis of epithelial cells in tubules, especially in the proximal section; and compromising the functioning of vital cell components involved in the movement of water and other solutes. The primary factor for GM nephrotoxicity is tubular cytotoxicity. Although gentamicin is a bactericidal aminoglycoside antibiotic, its oxygen-dependent active transportation permits it to pass across gram-negative membranes. The method of action involves electrostatically interacting with the negatively charged head groups of phospholipids to prevent the synthesis of bacteria's proteins. When gentamicin links with particular ribosomal proteins, nonfunctional complexes are formed that cause mRNA misreading. Since anaerobic bacteria require oxygen to develop, aminoglycosides do not affect them. Gentamicin along with other aminoglycosides bind onto the 16s rRNA at the 30s ribosomal subunit after they penetrate the cytoplasm, thereby inhibiting the process of translation of mRNA. As a result, non-functional proteins are produced [11]. Gentamicin is mostly eliminated by glomerular filtration, in which themegalin or cubilin receptors allow 10%-20% of the medication to enter PTECs. Gentamicin causes lysosomal phospholipid disease in PTECs by building up in lysosomes, the Golgi, the endoplasmic reticulum, and cell membranes. It does this by inhibiting phospholipase activity. Gentamicin eventually seeps into the cytoplasm as a result of lysosomal structural degradation and instability in the cell membrane. Gentamicin in the cytoplasm can trigger endogenous mitochondrial necrosis or apoptosis by acting on them directly or indirectly.

In addition, oxidative stress, ROS generation, and electron transport chain malfunction are all brought on by mitochondrial damage. Gentamicin also suppresses the production of proteins and the function of the endoplasmic reticulum, which results in ERS and the activation of apoptotic pathways. Additionally, gentamicin can lower renal blood flow, which exacerbates acute tubular damage and causes renal parenchymal ischemia. With everything considered, the primary process of gentamicin-induced AKI (GM-AKI) is damage to mitochondria, which results in cell death [12].Gentamicin caused TGF-β levels to rise and macrophage infiltration to increase, which accelerated the development of tubulointerstitial nephritis. Renal injury caused by the necrosis of tubular cells triggered by gentamicin attracts monocyte chemo attractant protein-1 (MCP-1) and intercellular adhesion molecule (ICAM-1) to the injured area, which in turn sets off inflammatory processes. This facilitates the recruitment of monocytes and macrophages to the location of tissue damage, eventually resulting in renal pathogenesis. Moreover, significant elevations in lipoperoxidation, nitrotyrosine synthesis, and protein oxidation in the renal cortex are associated with gentamicin-induced kidney injury. Nuclear poly (ADP-ribose) polymerase (PARP), additionally referred to as poly (ADP-ribose) synthetase (PARS), acts as an enzyme that depletes the cellular ATP and NAD levels, eventually resulting in cell necrosis. The method of action involves electrostatic ally interacting with the negatively charged head groups of phospholipids to prevent the synthesis of bacteria's proteins. When gentamicin binds to particular ribosomal proteins, nonfunctional complexes are formed that cause mRNA misreading [13].

Mechanism of Nephrotoxicity

Nephrotoxicity involves damage to the kidneys brought due to medications either directly or indirectly; it frequently appears as glomerulopathies, tubulopathies, and acute renal failure. Anti-inflammatory drugs, antibiotics (such as vancomycin, and aminoglycosides), and chemotherapy medicines (like methotrexate, and cisplatin) are frequently associated with medications. Acute kidney injury (AKI) is an important health issue that impacts over 13.3% of the global population each year. Sepsis, ischemia, and nephrotoxicity are prominent causative factors of AKI. Nephrotoxicity primarily arises from drug usage and may manifest via Three mechanisms: tubular obstruction by medication-containing crystals or casts, which is also dependent on dose; proximal damage to the tubes and acute tubular necrosis (ATN), which is a dose-independent process; and interstitial nephritis, which is brought on by drug metabolites, or which is a dose-independent process. An alteration in the function of the kidneys can be referred to as nephrotoxicity, and it is usually measured by the output of urine, serum creatinine (sCr), blood urea nitrogen (BUN), or glomerular filtration rate (GFR). However, nephrotoxicants may damage the kidneys while altering recognized clinical signs of kidney function.The aminoglycoside (AG) antibiotic a drug called Gentamicin (GM) is widely utilized and has the potential to cause nephrotoxicity because of its intense bactericidal effects, wide antibacterial range, and relatively low prevalence of bacterial resistance. Research indicates that genetically engineered organisms (GEO) enhance the production of reactive oxygen species (ROS) and reactive nitrogen species (RNS) in the renal cortex, which eventually results in damage to the kidneys [14].

Causes of Nephrotoxicity

Kidney side effects involve the development of chronic kidney disease (CKD), deficiency of electrolytes, tubular injury, tubulointerstitial nephritis, glomerular disease, and bleeding-related microangiopathy is; that they also include a prolonged impact on the functioning of the kidneys and the growth. of acute kidney injury (AKI). Failure of the kidneys may have both an intrinsic and extrinsic etiology. obesity, diabetes, cardiovascular disease, sepsis, and lung and organ failure are indications of extrinsic causes; polycystic kidney disease, glomerular nephritis, renal fibrosis, tubular death of cells, and the development of stones are examples of intrinsic factors. The kidney performs an essential role in managing the toxic effects of various pharmaceuticals, contaminants found in the surrounding atmosphere, and organic substances. Several therapies for cancer, multiple antibiotics, illegal drugs, and radiocontrast medications are examples of potentially kidney-damaging medications. Cadmium, arsenic, mercury, lead, metal trichloroethylene, bromate, flame retardants made with bromine, the acid glycolic, and the chemical ethylene glycol belong to the natural pollutants that are hazardous to the kidney. Aristolochic acids and mycotoxins that are such as a substance called, fumonisin B1, and citrinin are examples of naturally occurring nephrotoxicants.There are several similarities between the processes behind renal failure brought on by extrinsic factors and kidney-damaging drugs. Aminoglycosides demonstrate significant adverse effects, primarily on the nephron and auditory system, contributing to up to 50% incidence of non-oliguric AKI in high-risk patients, Frequently associated with acid and base disturbances and abnormalities in electrolytes, such as low potassium levels and low magnesium levels.

A multitude of variables influence the likelihood of causing harm, such as the recurrence of multiple daily doses, elevated blood levels, and concomitant renal ischemia. Gentamicin elicits mesangial contractions and diminishes glomerular filtration within the glomerulus, the initial segment of the nephron. Its administration also prompts reduced renal blood flow attributable to increased vascular resistance, thereby decreasing glomerular filtration and ATP oxygen supply at the tubules. Neuromuscular obstruction is an unusual but significant side effect of nearly all aminoglycosides. Risk factors that have been discovered and identified include concurrent illnesses (like myasthenia gravis) or drugs (like vecuronium) that impair the neuromuscular junction's function. Aminoglycosides facilitate both reduced presynaptic release of acetylcholine and interference with acetylcholine postsynaptic receptor activity, so they are probably the root of the blockage. Giving calcium intravenously may decrease this toxicity [15].

Pathways Involved in Nephrotoxicity

Oxidative stress

In the pathogenesis of Acute Tubular Necrosis (ATN), oxidative stress plays a critical role by instigating an inflammatory response and causing proximal tubular toxicity. Aminoglycoside-induced Acute Kidney Injury (AKI) is closely associated with oxidative stress, as high concentrations of aminoglycosides lead to disruptions in phospholipid membranes, resulting in oxidative stress and mitochondrial injury. Lipotoxicity and oxidative stress are significant factors in nephron loss and contrast media-induced nephrotoxicity commonly exhibits increased oxidative stress and proximal tubule cell death. Our understanding of the mechanisms underlying AKI has significantly progressed, unveiling shared etiologies in both toxicant- and pathology-induced AKI, including oxidative stress and glomerular nephritis.

Mitochondrial Permeability Transition (MPT)

In the context of acute kidney injury (AKI), specifically acute tubular necrosis (ATN), the involvement of reactive oxygen species (ROS) and subsequent oxidative stress is of particular significance. ROS are typically produced as part of inherent cellular processes. Specifically, the superoxide anion, acknowledged as the most potent ROS compound, originates from various cellular sources and is a natural byproduct of the electron transport chain within mitochondria. However, under pathological conditions, the disruption of oxidative phosphorylation and compromised mitochondrial membrane integrity lead to excessive ROS generation from the respiratory chain, primarily at Complex I and III. This results in oxidative stress due to heightened free radical-producing enzyme activity, reduced free radical-scavenging enzyme function, and insufficient antioxidant levels. Additionally, amino glycosides (AGs) increase the level of the pro-apoptotic regulator, Bax, by impeding its degradation. Upon exceeding a specific intracellular threshold, their membranes release their contents into the cytoplasm. AGs directly impact the mitochondria within the cytoplasm, disrupting the respiratory chain, inhibiting ATP production, and inducing the generation of reactive oxygen species (ROS), leading to apoptosis or cellular demise.

Regulated Cell Death Pathways

Apoptosis leads to cell loss without eliciting an inflammatory response. However, interventions that disrupt apoptosis, such as specific caspase inhibitors, may induce necrosis and subsequently result in inflammation-mediated kidney injury. Apoptosis, the first form of regulated tubular cell death studied in acute kidney injury (AKI), can be instigated through intrinsic or extrinsic pathways. The intrinsic pathway is initiated by cellular stress leading to outer mitochondrial membrane permeabilization, prompting the release of apoptogenic factors, such as cytochrome c, which binds Apaf-1 in a multiprotein complex known as the apoptosome to activate caspase-9. The extrinsic pathway is executed upon the engagement of death receptors that recruit adapter proteins and subsequently activate caspase-8. Activation of caspase-8 or caspase-9 ultimately triggers the stimulation of executioner caspases, such as caspase-3, culminating in cellular disassembly from within. Numerous processes, including, pyroptosis, necroptosis, ferroptosis, or mitochondria permeability transition-regulated necrosis (MPT-RN), can lead to regulated necrosis.

Necroinflammation

Inflammation represents a significant aspect of both Acute Kidney Injury (AKI) and chronic kidney disease (CKD). In the context of kidney injury, renal intrinsic cells, and inflammatory cells actively contribute to the inflammatory process. Upon encountering stress or undergoing cell death, kidney epithelial cells such as tubular cells in AKI or podocytes in glomerular injury release inflammatory mediators, triggering the recruitment and activation of inflammatory cells. This cascade, known as necroinflammation, involves the release of Damage-Associated Molecular Patterns (DAMPs) and alarmins by necrotic cells, which possess immunostimulatory properties and can activate both immune and non-immune renal cells, leading to an inflammatory response. This inflammatory response can exacerbate cell death, consequently leading to acute organ dysfunction, organ failure, or systemic inflammatory response syndrome, ultimately contributing to multiple organ failure. Key molecules contributing to renal injury, including HMGB1, IL-33, histones, and uromodulin, are encompassed within DAMPs and alarmins. Additionally, inflammation accelerates tubular injury and potentially serves as a trigger for necroptosis, a form of cell death that

further perpetuates tubular necrosis and renal dysfunction, establishing a self-perpetuating loop of necroinflammation .

Tubular Obstruction

In the human body, drugs undergo metabolism primarily in the liver, GIT, and kidneys. The elimination of drugs and their metabolites occurs via two main pathways: renal and extrarenal. Concerning renal elimination, drugs may be cleared through two distinct mechanisms: glomerular filtration or tubular secretion. Materials eliminated by tubular secretion and glomerular filtration move from the proximal tubule (PT) to the loop of Henle and then to the distal tubule. In the latter parts of the tubules, drugs have the potential to precipitate, crystallize, or form casts, thereby instigating tubular obstruction. The resulting obstruction of distal tubules impairs urine flow and incites inflammation of the surrounding interstitium, consequently precipitating acute kidney injury (AKI). Stimulating the NOD-like receptors family, pyrin-containing domain 3 (NLRP3) the inflammasome, which improves the inflammatory response and contributes to AKI, is one of the notable ways that crystals are linked to inflammasome-mediated inflammation. Another implicated mechanism underpinning tubular obstruction involves the formation of casts leading to luminal blockage [16].

Electrolyte Disturbance in Nephrotoxicity

By causing papillary necrosis and prolonged interstitial destruction, multiple medications can cause chronic renal failure. Early tubulopathy signs and symptoms, including imbalances in electrolytes, irregularities in acid-base equilibrium, difficulties with water equilibrium, and irregularities in urine sediment, may not always be associated with medications, yet they may result in serious health consequences[17]. The disturbance of the breakdown of energy and ATP synthesis by mitochondrial intervention may result in a reduction of Na+/K+ ATPase and inadequate chemical reabsorption, which in turn causes variations in serum electrolyte levels which are typical of the condition Fanconi syndrome (FS). Toxic substances and contaminants from the environment can also cause FS, nephrotoxicity, and alterations in serum electrolytes. A systematic deficiency in the renal proximal tubular reabsorption processes produces Fanconi syndrome, resulting in the loss of multiple substances, notably bicarbonate, the sugar glucose, low molecular protein molecules, and amino acids that are lost through the urine. Reduced phosphate absorption and acidosis of the metabolism are further outcomes of this illness that can lead to dehydration, altered serum electrolyte levels, and impaired mental state. Electrolyte levels, including sodium, calcium, magnesium, and potassium, can serve as early indicators of kidney dysfunction. Research indicates that employing all electrolytes, with calcium, sodium, magnesium, and potassium at percentages of 69%, 65.5%, 31%, and 20% respectively, as indicators, can offer a limited window for predicting kidney dysfunction. Notably, electrolyte replacement therapy involving magnesium, potassium, and calcium during cisplatin treatment, in conjunction with hydration using normal saline, has been shown to exert a protective effect against nephrotoxicity and improve patient survival, as evidenced by Kaplan-Meier analysis. In patients with liver failure, the severity of liver disease and the presence of acute kidney injury can give rise to electrolyte disturbances. The use of loop diuretics and thiazide diuretics in individuals with or without renal dysfunction can ameliorate hyperchloremia, while potentially exacerbating hypokalemia.

Hyperkalemia (Imbalance of potassium)

Potassium is mainly eliminated from the human body by the kidneys, and they additionally modify the amount of potassium that gets eliminated based on the blood's current potassium concentration. Potassium outflow may be hindered by acute renal failure, possibly leading to hyperkalemia. Hyperkalemia may represent an indication of symptoms like:cramps in the abdomen,Weary,weakened muscles, Immobility, Heart attack.

Hypernatremia (Imbalance of Sodium)

Maintaining an appropriate amount of sodium is crucial to regulating the balance of acids and bases, fluid balance, and neuromuscular function. Adequate kidney function is required to control the sodium excretion in the urine and avoid hypernatremia. A decreased capacity to eliminate salt in cases of acute renal failure can cause hypernatremia,

which is characterized by the following symptoms: Feeling lost or confused, twitching of the muscles, High blood pressure, Weakness.

Hypermagnesemia (Imbalance of magnesium)

Because kidney failure often results in insufficient excretion of electrolytes, blood magnesium levels are high. Hypermagnesemia presents with the following symptoms: Low blood pressure, Lowered heart rate, Cardiac arrest.

Hypocalcemia - (Imbalance of phosphorus and calcium)

Phosphorus and calcium have an inverse connection, and renal failure can affect the concentrations of both of these electrolytes. Hypocalcemia may develop as a result of this illness, which can cause phosphorus to be retained and blood calcium levels to drop. The following are indications for hypocalcemia: Tense muscles, Convulsions, Heart rhythms, Bone demineralization, Heart attack. The kidneys' role in maintaining fluid and electrolyte balance in the bloodstream is notably demonstrated in the context of electrolyte imbalances in individuals experiencing acute kidney failure. A variety of clinical symptoms can result from imbalances in the amounts of electrolytes such, as sodium, phosphorus, magnesium, and calcium. Nevertheless, the resolution of acute kidney failure and the restoration of normal renal function offer promise for the amelioration of electrolyte disturbances and their associated symptoms [18].

Herbal Drugs Compounds as Nephroprotective Agents

The potential of herbal drugs in managing nephrotoxicity

Saponins Herbs including Xanthium sibiricumPatr., Bupleurum chinense DC., Clematis chinensisOsbeck, and Pulsatillachinensis (Bge.) Regel contains saponin, a plant glycoside that can solve colloid and soap-like foam. Notably, toxic components present in C. chinensisOsbeck include anemonin, contributing to potential adverse effects on renal health after prolonged administration, such as necrosis, prolonged interstitial nephritis, or acute renal tubular damage. Furthermore, saikosaponin A, geniposide, and esculentoside A are among the identified nephrotoxic components. Aglycones, additional sugars, glucuronic acidic substances, or various organic acids constitute these saponins. Statistically, over 100 herbal medicines have been linked to kidney toxicity, with their specific toxic components yet to be comprehensively elucidated. Additionally, several anthraquinones are derived from rhubarb, like cucumber emodin, aloe emodin, and Polygonum cuspidatumSieb. et Zucc., are known to be poisonous. Furthermore, eugenol is the nephrotoxic component in Eugenia caryophyllataThunb., while aloin imparts nephrotoxicity to Aloe barbadmsis Miller. surprisingly, fish gall has various nephrotoxic components, including histamine or oxide. Plants like Eugenia caryophyllataThunb., Bolbostemmapaniculatum (Maxim.) Franquet, Euphorbia pekinensisRupr., and SchizonepetatenuifoliaBriq. are recognized as nephrotoxic, necessitating further experimentation to ascertain their toxic components. These findings emphasize the nephrotoxicity of herbal medicines and the structures of their representative nephrotoxic components [19].

Examples of Herbal Drugs With Renoprotective Effects

Chinese herbal medicine (CHM) is a widely utilized alternative therapy, with an estimated 20% of adults in the United States incorporating herbal medicine into their healthcare regimen. However, certain CHMs containing aristolochic acid (AA) have been associated with adverse effects including acute renal failure, urinary tract cancer, and an elevated risk of chronic kidney disease (CKD). This has resulted in the terminology "Chinese herb nephropathy" being used in some English literature . Targeting oxidative stress and inflammation, CHM therapies have been suggested as a supplemental alternative therapy for reducing the course of CKD. Notably, herbs such as Astragalus membranaceus (Huangqi), Rheum palmatum (Dahuang), Salvia miltiorrhiza (Danshen), and Angelica sinensis (Danggui) have been found to possess potential renoprotective effects. Furthermore, several herbs, such as Rheum spp. (rhubarb), Cordyceps sinensis (CS), Triptirygiumwildfordii Hook F (TwHF), Abelmoschus manihot (AM), Vitis vinifera (Grape), and Zingiberofficinale (Ginger), have shown positive results for the management of chronic kidney disease (CKD) with little side effects. Often these plants are utilized individually or in combination with their extracts to treat renal illness. The following part offers a description of these particular plants and the

extracts they produce for the treatment of chronic kidney disease (CKD), describing their modes of action as well as specific benefits derived from pre-clinical and clinical studies [20].

How Saponins will be Helpful for the Treatment of Nephrotoxicity

Saponins are glycosides known for their amphipathic nature, characterized by hydrophilic glycoside moieties combined with a lipophilic aglycone, exhibiting surface activity and spontaneous foaming on various surfaces. Although predominantly derived from plants, saponins also find contributions from bacteria and certain marine organisms. Nephrotoxicity denotes kidney poisoning induced by an exogenous agent. Several legumes with high levels of saponins, especially Phaseolus vulgaris beans, chickpeas (Cicer arietinum), and soya beans (Glycine max), are vital parts of the human diet. Agitation of saponins in water results in the formation of a soapy lather. Additional qualities related to saponins include their capacity to hemolyze red blood cells, their capability to link with cholesterol, and their bitter flavor. These attributes pertain to specific saponin types and do not universally apply. From a biological perspective, certain attributes are advantageous, while others are considered unfavorable. Notably, Nutritional saponins could potentially reduce the prevalence of coronary artery disease among humans as they have been proven to lower levels of plasma cholesterol in monkeys [21].

The Significance of Exploring Saponins as Potential Treatments for Nephrotoxicity

Ginseng saponin, a prominent constituent of ginseng extract, is a glycoside known as ginsenosides, recognized for its pivotal role in conferring various health benefits of ginseng. To produce red ginseng, raw ginseng is steamed and dried, leading the ginsenosides to go through chemical modifications. which have been reported to exhibit diverse clinical activities such as anticancer, hypoglycemic, vasodilatory, and anti-inflammatory effects. Notably, many of these effects are attributed to the antioxidative properties of red ginseng. Recent studies have unveiled the renoprotective potential of ginseng in countering gentamicin-induced renal injury. The antioxidant influence of red ginseng extract suppresses both NOX-derived and mitochondrial ROS generation induced by gentamicin, while also impeding augmented NOX activity in renal tubular cells exposed to gentamicin. Furthermore, the impact of red ginseng extract on gentamicin-induced apoptosis in renal cells has been investigated. Apoptosis in renal cells following exposure to gentamicin was found to be associated with the activation of mitochondrial Bax and cytosolic release of cytochrome c, indicating that gentamicin-induced apoptosis of renal tubular cells was mediated through the mitochondrial pathway. Additionally, flavonoids, saponins, and phenols, recognized for their potent water-soluble antioxidant properties that mitigate cell damage from oxidation, have been linked to anti-inflammatory characteristics. The therapeutic capacity of antioxidants in mitigating degenerative diseases characterized by heightened oxidative damage from reactive oxygen species or free radicals has been underscored. Notably, lower and intermediate doses of the extract have been shown to reverse the detrimental impact of gentamicin on the kidneys[22].

Biological Source

Although they have also been found in aquatic organisms like sea cucumbers, saponins are traditionally derived from plant-based sources. The soapwort plant (genus Saponaria, family Caryophyllaceae), whose root was traditionally used as a cleaning agent, is the source of their name. In addition to the soapwort plant, Saponins can be identified in the plant family Sapindaceae, It is found in closely related plant families like Aceraceae (maples) and Hippocastanaceae, as well as important genera like Sapindus (also known as soapberry or soapnut) and the horse chestnut. Gypenosides, a form of Saponins, are abundant in *Gynostemmapentaphyllum* (Cucurbitaceae), red ginseng or ginseng (Panax, Araliaceae) contains ginsenosides. The unripened fruit of the Manilkarazapota plant, commonly referred to as sapodillas, is another source of saponins and has potent astringent properties. The potent cardiac toxin oleandrin is found in Nerium oleander (Apocynaceae), also referred to as White Oleander. Within these families, these chemicals are found in stems, roots, leaves, bulbs, fruits, and flowers among other plant components. Commercial plant-based saponin formulations that are including those derived from the soap bark tree, Quillaja Saponaria, and other sources, are accessible through controlled manufacturing processes, making them valuable tools for both the chemical and biological sciences. Soyasapogenol (aglycone) and oligosaccharide moieties are among the structurally complicated oleanane-type triterpenoid saponins known as soyasaponins, which biosynthesize on the

tissues of soybeans. Soyasaponins have previously been associated with abiotic stresses, root exudates, and plant-microbe interactions. The main source of saponins in the diet is legume consumption. One of the most widely ingested varieties of legume saponins is soybean saponin. Variations in cultivars, growing sites, irrigation conditions, soil types, and climatic circumstances can all affect the saponin concentration, structure, and composition of edible legumes, even within the same species. For instance, groups A, B, and E of soybean saponins are determined by the aglycone's chemical structure[23].

Pharmacological Properties of Saponins

Molluscicidal activity

Millions of individuals in Asia, Africa, and South America suffer from schistosomiasis, a parasitic disease caused by the snail Biomphalaria glabrata, which is the intermediate host of certain saponins that have been demonstrated to have molluscicidal effects. The most active monodesmosidic saponins are those that contain the sapogenin oleanolic acid because they interact more intensely with the cholesterol found in cell membranes to change their permeability, which encourages the creation of pores and permits liquid leakage. A similar mechanism of action explains several saponins' activities and antitoxic spermicide properties. The only treatments for schistosomiasis are chemotherapy and the elimination of intermediate hosts. Niclosamide is the primary molluscicide in use at the moment. In addition to being hazardous to people, its high cost renders its usage unfeasible for populations where schistosomiasis is endemic. Because saponins are very poisonous to mollusks but not to humans when consumed orally, they are therefore promising candidates for the development of alternative chemotherapy to fight the schistosomiasis causal vector. *Anti-hypercholesterolemic activity* One risk factor that helps atherosclerosis form, worsen, and eventually lead to cardiovascular disease is hypercholesterolemia. Research from both clinical and epidemiological settings has shown that high blood levels of low-density lipoprotein (LDL) cholesterol are the main cause of several diseases. There has been research on bioactive substances with hypocholesterolemic action; the most frequently examined are soluble fibers, phospholipids, phytosterols, soy protein, stearic acid, and saponins. There are multiple ways that siphoning can lower cholesterol levels: When added to beta-hydroxysteroid, it forms an insoluble complex that reduces intestinal cholesterol absorption and increases the number of sterols that are expelled with feces. When saponins are present in the diet, bile acid adsorption increases because the fibers form micelles with large molecular weights that block bile acid reabsorption. As a result, the liver experiences an increase due to the conversion of cholesterol into bile acids. Interaction with intestinal mucosa cells causes these cells to become more permeable, which accelerates the loss of cell function by encouraging exfoliation and cell death. As a result, it helps to further raise the excretion of cholesterol.The presence of linked sugars, β-1, 4 improves soluble fiber absorption and encourages fatty acid breakdown, which lowers hepatic cholesterol.

Anti-inflammatory and antiallergic activity

Carrageenan-induced models of inflammation have been used to assess the anti-inflammatory properties of saponins. Generally speaking, the sapogenins with higher activity are oleanane and ursane. The mechanisms that underlie this activity include corticomimetic activity, which prevents the glucocorticoid from degrading and releasing inflammatory mediators, as well as inhibition of enzyme synthesis and enhanced vascular permeability. *Cytotoxic and antitumor activity* Although saponins' cytotoxic qualities have been the subject of several findings in scientific publications, not all saponins have strong anticancer cytotoxic effects. A reverse phenotypic transition into tumor cells is induced by the cytotoxic action of saponins, which occurs via suppression of DNA synthesis. Tumor growth is inhibited when the antitumor mechanism works by blocking the arteries surrounding the tumor. Among the key components of anticancer drugs are immunostimulation, documented chemoprevention mechanisms, and inhibition of metastasis. Since practically all saponins cause tumor cells to undergo apoptosis, they are the medicine of choice for treating cancer since they eradicate tumor cells while causing minimal adverse effects on the patient and primarily preventing necrosis.

Acting on the cardiovascular system

In the cardiovascular system, saponins may have two distinct modes of action: impacts on blood characteristics (clotting) and the heart (contractile force, automaticity, rhythm, effect of lipid peroxidation). *Cardiac activity* A

saponin mixture prevented exfoliation by raising intracellular sodium and potassium levels while inhibiting the sodium-potassium pump, even when extracellular calcium concentrations were within normal range. The intracellular ion levels changed in tandem with contraction. Hence, their interaction with cholesterol levels, which raises the permeability of membranes to salt, could explain a portion of saponins' activities. Ginseng saponins have demonstrated noteworthy effects on the cardiovascular system. The action potential of the Wistar rat cardiomyocytes injured by free radicals was recovered by the ginsenosides Rb1, Rb2, and Rb3, at 30μg/mL, suggesting an antioxidative effect. The action potential and contractility in cardiac cells were decreased by the same saponins at a concentration of 20μg/mL, indicating probable calcium channel blocking. According to recent research, ginsenoside Rb3 considerably reduced the cardiac damage caused by isoproterenol in rats at doses of 5-15 mg/mL, indicating the saponin's cardioprotective properties. Isoproterenol is an agonist of the β2 adrenergic receptor and causes necrosis of the myocardium. It also has a favorable inotropic and chronotropic impact.

Action on blood clotting

Certain saponins prevent platelets from aggregating in vitro when they come into contact with aggregating agents such as endotoxins, collagen, arachidonic acid, and adenosine diphosphate. A few observations on the mechanism of action have been recorded, including an increase in cAMP levels in platelets, a decrease in thromboxane (TBX) production and release, and an inhibition of prostacyclin (PGI2) production. At concentrations of 0.1-1.0 mM, ginsenoside R0 inhibited the conversion of fibrinogen into fibrin induced by thrombin, as urokinase is activated by ginsenoside Rg2, Rb1, Rb2, Re, and Rg, activating the conversion of plasminogen into plasmin, which subsequently breaks down the fibrin network. *Action on blood pressure* Hederagenin, a saponin, and an ethanolic extract of Symphytum officinale caused a dose-dependent decline in systolic blood pressure and a rise in diastolic blood pressure in anesthetized rats. Nevertheless, no known mechanism for these hypotensive effects has been identified[24].

Mechanisms Through Which Saponins Protect Against Kidney Damage.

Saponins do not leave the digestive system. Certain substances directly interact with dietary cholesterol to form an insoluble compound that hinders the absorption of the cholesterol. Others seem to interact with bile acids in a way that indirectly affects cholesterol metabolism. Feeding more saponins in the diet results in an increased excretion of bile acids in the feces. Hepatic synthesis from cholesterol would take the place of bile acids that were so diverted from the enterohepatic cycle. Saponins combine with bile salts and cholesterol to generate mixed micelles in the digestive tract; the hydrophobic steroid or triterpene groups stack like little coins. After that, such micelles are big enough to pass through the intestinal lining. Bile salts often cross the small intestinal wall through both active and passive transit. Active transport is limited to the terminal ileum, while passive diffusion occurs over the whole ileum and jejunum. Saponins' hemolytic function demonstrates how they can interact with cell membranes. They might also have an impact on the intestinal mucosa's cell membranes. On the other hand, since bile acids facilitate the absorption of lipids, the impact of saponins on passive absorption and active transport can be attributed to a reduction in the free bile acid concentration. Low quantities of free bile acids may also affect how well lipids are absorbed and affect the absorption of fat-soluble vitamins. Thus, in addition to the digestive tract, there can also be a major metabolic impact inside the animal[25].

The Clinical Efficacy and Toxicological Aspects of Saponins in Treating Nephrotoxicity.

One typical side effect of medication and chemotherapy is nephrotoxicity. For instance, significant nephrotoxicity, involving tubular damage and renal failure, may be brought on by the widely used medication CP. Numerous studies have shown that ginsenosides, through their ability to regulate inflammation, and apoptosis, and reduce renal damage, can aid in the recovery of kidney function. Rh2 therapy markedly upregulated Bcl-2 expression in CP mice. In renal tissues, there was a decrease in the expression of Bax, p53 cytochrome c, caspase-9, caspase-8, and caspase-3. This suggests that Rh2 works on the system-mediated route to stop CP-induced nephrotoxicity. Following Rh3 treatment, there was a significant decrease in the rise in the proportion of apoptotic LLC-PK1 cells caused by CP treatment. Ginsenosides may therefore be used as therapeutic medicines to address CP-induced nephrotoxicity. Based on animal research, ginsenosides do not appear to have substantial negative effects, suggesting that their

toxicological profile is modest. To properly evaluate the safety and effectiveness of saponins like ginsenosides in human clinical trials for the treatment of nephrotoxicity, more investigation is still required. In conclusion, there is a mixed picture of the toxicological effects of saponins; some, like FDS, have been shown to cause nephrotoxicity, while others, like ginsenosides, have shown nephroprotective qualities in animal experiments[26].

The Potential of Saponins as Therapeutic Agents for Nephrotoxicity

To assess innovative therapeutic medications for the treatment of AKI, numerous research has recently concentrated on traditional herbal remedies. In vivo investigations have demonstrated the protective benefits of some herbal remedies on cisplatin-induced AKI. *Prosthecheamichuacana* (Orchidaceae), Zingiberofficinale (Zingiberaceae), red ginseng (family Araliaceae), and pomegranate (Lythraceae) are a few examples. One of the oldest and most widely recognized perennial medicinal plants in the genus Panax (family Araliaceae) in the United States and Canada is Panax quinquefolius (PQ), frequently referred to as American ginseng. For more than 300 years, Chinese medicine has used the roots and rhizomes of this plant as medications, foods, and nutritional supplements for the management of heart disease and diabetes. The earlier study included a wider range of PQ's pharmacological activity, including its anti-inflammatory, antioxidant, and hypoglycemic effects. Ginsenosides, a broad category of steroidal saponins, are the primary active element in PQ and are thought to make up the majority of P. quinquefolius leaves. P. quinquefolius (PQS) leaf saponins have been shown in recent research to have a wide range of pharmacological properties and to be beneficial in clinical applications. One of the most common treatments for acute myocardial infarction in clinical practice is PQS, which has been shown by Wang et al. to be useful in the treatment of coronary heart disease. Additionally, P. quinquefolius leaf extracts show anti-inflammatory and additional pharmacological properties in arteriosclerosis, including free radical scavenger. When periodically elevated glucose was administered to cultured human umbilical vein endothelial cells, PQS significantly decreased oxidative stress injury. We hypothesize that administering PQS supplementation to mice may lessen inflammation, lipid peroxidation, and renal tubular necrosis caused by cisplatin. The pathophysiology of AKI involves two key mechanisms: inflammation and oxidative stress. Saikosaponin D has been demonstrated in certain experiments to preserve the normal shape of the nucleus while also raising the survival rate of HK-2 cells. Saikosaponin D can lessen cisplatin-induced apoptosis by preventing the NF-κB-P38-JNK-MAPK signaling cascade from being activated. Ginsenoside 20(S)-Rg3 and Rb3 suppress autophagy to limit apoptosis in contrast to other saponin components. To determine whether any saponin component can be crucial in controlling autophagy to guard against AKI, more research is required. However, additional research indicates that saponin components protect against kidney injury by controlling the NF-κB signaling pathway, which lowers inflammation. It is unclear, therefore, if saponin components have an impact on immune cell recruitment and which kind of immune cell acts as the primary regulator. Further investigation is needed to elucidate the role of immune cells in saponin component-mediated regulation of the inflammatory response, tosafeguard against cisplatin-induced

CONCLUSIONS

Nephrotoxicity is a serious and common complication of many medications and substances, representing a major challenge in modern medicine. Understanding the diverse mechanisms underlying drug-induced kidney injury, including changes in glomerular hemodynamics, tubular cell toxicity, inflammation, and crystal formation, is crucial for early detection and prevention. The use of novel renal biomarkers holds promise for the early diagnosis of acute kidney injury before significant, irreversible damage occurs. Preventive strategies, such as dose optimization, avoidance of nephrotoxic drug combinations, and close monitoring of renal function, are essential. Additionally, the exploration of potential nephroprotective agents, like saponins, may offer new therapeutic options for managing nephrotoxicity. Continued research and a multidisciplinary approach are necessary to mitigate the burden of drug-induced kidney injury and improve patient outcomes.

ABSTRACT

Anjannamika is a *Vartmagataroga* described by *Acharyas in Ayurveda* classical texts. *Anjannamika* is a *Rakta* dominance and *Bhedhana Sadhya Vyadhi* in which there is boil in the lid margin which is soft, moderately painful, coper red in color and characterized by burning and pricking sensation in eyes. The signs and symptoms of *Anjannamika* resembles the features of External Hordeolum, whichis acute suppurative inflammation of glands of eyelids Ze is and Moll. The present case study is, the management based on the protocol of Ayurveda. A 35-years-old female patient visited hospital, with the complaints of swelling, pain, discomfort, redness, watering, foreign body sensation, in her left eye since, last 1 week. The treatment strategies were combined of *Swedana*, *Bhedana* and*Nishpidana* with *Vranaropana Chikitsa*.It was observed that the patient got complete relief from recurrent *Anjannamika* (Hordeolum Externum) in 10 days of management. It was observed that there was no recurrence during the time of follow up.

Keywords: *Anjannamika, Bhedana*, External Hordeolum, *Nishpidana, Parisheka*, *Vartmagataroga, Vranaropana Chikitsa.*

INTRODUCTION

Acharya Sushruta has described 76 types *of Netragata rogas*[1], *Anjannamika*being one among them, comes under the classification of 21 types *Vartmagata roga*[2]. *Anjannamika* [3] is a *Rakta*[4] dominance and *Bhedhana*[5] *Sadhya Vyadhi*[4] in which "A boil in the lid margin which is soft, moderately painful, coper red in color and characterized by burning and pricking sensation in eyes. In addition, *Acharya Vagbhatta* said that it is a *Pitika*(Boil) produced by *Rakta* are situated in the middle or at the end of eyelid, these *Pitikas*(Boils) are fixed to the eyelids and resembles green gram like shape and size[6]. The clinical features of *Anjannamika* resembles the signs and symptoms of External Hordeolum[7]. External Hordeolum or Style is a disease of eyelids. It is a suppurative inflammation of glands of eyelids. When there is the involvement of glands of Ze is and gland of Moll it is called External Hordeolum and when there is the inflammation of the meibomian gland is known as Internal Hordeolum[8]. The prevalence rate of hordeolum is 3.9% in India. An acute suppurative inflammation of the gland of Zeisor Moll is known as stye or External hordeolum. In the early stages, the gland becomes swollen, hard and painful, and usually the whole edge of the lid is edematous. An abscess forms which generally points near the base of one of the cilia. The pain is considerable until the pus is removed. It is commonest in young adults, but may occur at any age, especially in debilitated persons. Constant rubbing of the eyes or fingering of the lids and nose are usually associated with recurrent Stye[9].This condition usuallylasts one to two weeks, and is sometimes self-healing, but recurrence is common. It can be treated with warm compresses, massage therapy, topical antibiotic eyedrops (3-4 times a day), systemic anti-inflammatory, analgesics and some eye ointments[10]. The Ayurvedic Management of *Anjananamika* includes *Swedana* (Hot compresses),*Nishpidana* (If spontaneously burst open, it should be well pressed and rubbed), *Bhedana* (Puncturing of the *Pitaka), Pratisarana* (The paste should be applied using finger pressure) and *Raktamokshana*(blood-letting)by *Jaloukavacharana*[11].

Case Report

A 35-years-old female patient visited Parul Ayurved Hospital, at OPD of *Shalakya Tantra*, with the complaints of swelling, pain, discomfort, redness, watering, and foreign body sensation, in her left eye since last 1 week which was recurrent since long days. She was instilling topical antibiotic eyedrop since last 3 days but didn't get any relief.

History of Present Illness

Patient was apparently healthy before 1 week, due to her overtime work in the house in extreme hot weather more than 8 hours, lead the patient to felt pain and irritation in the left eye associated with foreign body sensation, discomfort, mild watering, burning sensation and photophobia, later the patient noticed redness in left eye with mild swelling. By continuously doing her work, the disease in the patient had been aggravated by prolonged exposure to hot weather, dirt and dust and inadequate sleep. For temporary relief she was using antibiotics eyedrops since last 3 days but didn't get any relief. On further history taking she reveals that within every 15-20 days she suffers from the same condition since last 6 months which is subsided by using topical antibiotics and anti-inflammatory eyedrops but this time it ismore severe than previous. Patient was willing to take *Ayurvedic* medication, and admitted in the IPD ward for further treatment.

History Of Past Illness

No history of Diabetes mellitus, Hypertension and Thyroid disorders and any other major Systemic illness.

Personal History

Micturition: Day time 5-6 times, At night -0 times.
Bowel habit: Regular -2 times/day.
Sleep: Disturbed sleep, At night 3-4 hours, Day time-no sleep.
Addiction: Tea.
Blood Pressure: 110/80 mmHg.
Pulse rate: 78/min.

Respiration rate: 20/min.

CLINICAL FINDINGS

Ashtavidha pariksha Ocular examination Visual acuity Assessment Criteria Subjective Parameters: Symptoms in Classical texts with modern correlation Therapeutic Intervention Treatments given to the patient have been enlisted in Table given below. Patient was advised to avoid direct sunlight, UV light and wind. Patient was also advised to take proper sleep, avoid work near fire, dust and smoke.

Follow Up

After completion of treatment, the patient was followed up after 1 month. The patient was completely free from the previous signs and symptoms, and no new complaints were found during the day of follow-up and no recurrence was found within that period.

RESULTS

After 5th day of assessments, variations in results were found on each symptom associated with *Anjannamika*. Results of the treatment were tabulated and analyzed. Patient got relief in signs and symptoms with gradual improvement. Effects of the treatment on the patient are photographically presented before and after given below. Assessment on each considering symptom of *Anjannamika* has been presented in Table mentioned here.

Outcome

It was observed that after 10 days of treatment, all the signs and symptoms were relieved completely.

Observations

It was observed that the patient got complete relief from *Anjannamika* (External Hordeolum) in 10 days. She was asked to come for follow-up after1 month, Patient was not on any medication at that time. There was no recurrence during the time of follow up.

Discussion

A *Vartmagata Sadhya Netra Vikara, "Anjannamika"* arises from the vitiation of *Rakta* and *Mamsa* of *Vartma*(eyelid),occurs due to incorrect *Ahara* and *Viharas*. The *Lakshanas* of *Anjannamika* are similar to External Hordeolum. *Pittahara, Raktahara* and *Doshahara* treatments are possible in addition to the involvement of other *Doshas*, as it is a *Raktapradhana Vyadhi.* There are numerous treatment modalities associated with Hordeolum, including hot compresses (*Swedana),Chedana* (small-knife incisions), *Anjana* (Collyrium),*Raktamokshana*(bloodletting) and more. *Pidika* which forms in an early stage of *Anjannamika* is similar to the *Aam Shopha*(pre-suppurative stage) and, within three to four days, that *Pidika* appears like *PakvaShopha*(stage of suppuration) and transforms into an abscess (the suppurated stage of stye). At this point, Acharya Sushruta recommended *BhedanaChikitsa*(puncturing of by instrument). In the present case study, we choose the *Chikitsa* mentioned by *Acharya Sushruta.* Firstly, *Swedana* with *Jatipatradi Kwatha* done then on 3rd day *Bhedana* and *Nishpidana* done under topical anesthesia. *VranaropanaChikitsa* with *Tagaradi Pindi*and *Parisheka* with *Jatipatradi Kwatha* along with *Triphala Gugguluvati, Sutashekharrasvati* and *Mahamanjisthadi Kwatha* orally for 10 days were taken by patient.

***Jatipatradi Kwatha*[12]:**

contains *Jatipatra, Amruta, Javasa, Darvi, Draksha, Triphala*. These all drugs have *Vedanasthapaka, Shothahara, Dahahara, Shroto-Vishodhana, Vrana Shodhana & Ropana* properties. It also has anti-inflammatory, analgesics, anti-allergic, anti-viral, anti-bacterial, and antifungal properties which promotes the wound healing and also prohibited the bacterial growth. In mild cases, hot compression is sufficient on its own. *Jati* having *Tridoshahara* and *Netrya* properties. Active

components in *Jati* leaves are ascorbic acid, anthranilic acid and its glucoside, indole oxygenase, alkaloid jasminine and salicylic acid, which helps in wound healing and good for ocular health. *Amruta* is well known immune-modulator herb and also having *Chakshushya* property. *Javasa* is *Kaphamedahara* and *RaktaPittashamak* properties deals with*Rakta* dominancy of *Anjannamika*. *Darvi or Daruharidra* having anti-bacterial, anti-pyriticand anti-inflammatory properties which relief the ocular pain and discomfort in eye. *Draksha* reduced the burning sensation and Triphala[13] is having *Tridodhahara, Deepana* and *Chakshushya* properties. So, it helps to pacify vitiated *Doshas* and enhance proper function of local *Dosha* and *Dhatus*. Finally, helps in *SamprapthiVighatana* and prevention of the prognosis of the disease. *Netra Parisheka* which is externally application of medicine on the eye, due to contact with *Bhrajaka Pitta* (the pitta which is seated in the skin), it will be absorbed through local tissue with the help of *Ushna Ruksha Gunas*. Due to *Pachana* and *Bahirparimarjana* properties of the procedures. *Ama Pachana* will occur and further removes *Srotorodha* and Normalization of *SthanikaDhatwagni*. The *ropana* properties of *jatiptradikwath* also helps in the healing of wound.

***TagaradiPindi* [5]:**

Is consist of *Tagar, Ela, Lodhra, Saindhav Lavan*and *Madhu*. Based on the principles of the sixty *Upakramas* of *Vrana* management as described in the *Sushruta Samhita, TagaradiPindi* has *Vranaropak* properties.*Tagar* is having *Tridoshahara* specially *Kaphavatashamak*and *Vishaghna*properties, The rhizomes and roots of the*Tagar* plant contain cyclopentapyrans, acacetin-7-0- rutinoside, valtrate, valepotriates and an iridoid ester glycoside, valerosidatum which accelerate healing and also reduced the pain[19].*Madhura Rasa* of *Madhu* provides nourishment to the tissue, aiding in the formation of granulation tissue, whereas *Kashaya Rasa* offers *Lekhana* (scraping), which aids in de-sloughing and enhance the wound for healing.Thus, *TagaradiPindi* has excellent properties to heal the wound by virtue of its *Sodhana* (purification), *Ropana* (healing), and *Sandhana* (union) actions. Further, *Ela and Saindhav lavan* pacifies *Pitta Rakta Dosha* by virtue of its *Madhura Rasa* and *Sheeta Guna*. *Lodhra* is *Akshibhaisajya* useful in eye disorders involving *Pitta* and excessive secretion. *Lodhra'*shaemostatic, coagulant, astringent, and anti-inflammatory actions make it a valuable herb in the *Ayurvedic* management of external hordeolum. Its application can effectively reduce symptoms and promote healing, making it an essential component of Ayurvedic treatment protocols for this condition. In that way *TagaradiPindi* can encourage detoxification, all of which help to clean the wound and promote healing.

***Triphala Guggulu*[14]**

Is an *Ayurvedic* formulation that offering the synergistic benefits of *Triphala* and *Guggulu. Triphala* brings detoxifying and laxative properties, while *Guggulu* provides anti-inflammatory properties. The combined effect of these ingredients helps to provide relief from the pain, swelling, and other discomfort associated with wound. It improves *Agni* (the digestive fire) which helps promote healthy metabolism and releases excess *Kapha* from the system. With these effects *TriphalaGuggulu* also having antibacterial, antimicrobial, anti-inflammatory and analgesic properties so here it may help to control infection and reduce inflammation.

***Mahamanjisthadi Kwatha*[15]**

Used as the additional conservative medicine, was Possessing drugs *Manjishtha, Musta, Kutaj, Guduchi, Kushta, Nagara, Bharangi, Vacha, Nimba, Haridra, Daruharidra, Triphala, Patola, Katua, Murva, Vidanga, Chitraka, Shatavari, Trymana, Indrayava, Vasa, Mahadaru, Patha, Khadira, Chandan, Trivrit, Bakuchi, Nimba, Karanja, Ativisha, Indravaruni, Sariva.* All these drugs are having properties like *Raktashodhak, Kapha Pitta Shamak, Rakta Prasadan, Shothahar,Vranropak, Vedanashamak, Kandughna, Dahaprashaman,* which are helpful in treating *Anjannamika,* as it is a *Rakta* dominance *VartmagataVyadhi*. *Manjishtha*'s principal constituents are purpurin, munjistin, xanthopurpurin or purpuroxanthin and Pseudopurpuri helps remove the impurities from blood and promotes blood circulation.The immunomodulatory activity exhibited by the herbs makes it ideal for boosting and maintaining immunity.

***Sutashekhar Ras* [16]**

Is made up of *Shuddha Parada, Shuddha Gandhak, Shankh bhasam, Tamra bhasam, Vatasnabha, Dhatura, Sunthi,Pippali, Marich, Dalchini, Tamalpatra, Ela, Nagkeshar, Tankan, Bilwamajja, Karchur and Bhringrajswaras.* This formulation is

typically used to balance the *Pitta dosha* and alleviate symptoms related to acidity, gastritis, and indigestion.In eye disorders, *Sutshekhar Ras* is used for its anti-inflammatory, analgesic, and detoxifying properties. By pacifying the Pitta dosha, which is often linked to inflammation and burning sensations, ithelps to manage*Anjannamika* that manifest with these symptoms.

CONCLUSION

The clinical characteristics of the disease *Anjannamika*, as described in Ayurvedic texts, are very similar to those of External hordeolum. *ShadvidhaKriyakala's*(six phases of pathogenesis) will serve as the foundation for an explanation of the various stages of *Anjannamika*. The management of the illness and its early discovery will aid in preventing its spread. Both *Ayurvedic* Sciences and Modern Science provided similar explanations of management ideas. The recurrence rate of diseases is high when proper care and management in not done on time. There is less probability of a condition recurrence with *Ayurvedic* treatment used for External Hordeolumas the management principals of Ayurved pacify the root cause of the disease. Thus, we can conclude that management of *Anjannamika*(External hordeolum) using *Ayurvedic* treatment Protocol is more successful and with encouraging results leaving patients feel invigorated and uplifted**.** In the above-mentioned case the Patient was having the complaint of recurrent multiple external hordeolumin the past6 months and by following Ayurvedic treatment protocol of *Anjannamika* the disease fully cured with no recurrence as we take follow-up for next 1 month.

ABSTRACT

This paper aims to introduce the notions of interpolative Ω -Hardy Rogers type contraction mappings in bipolar metric spaces. Using these notions, determining fixed point conditions, examining the convergence properties, determining how these mappings relate to the underlying bipolar metric space structure. We discover some fixed point theorems for Interpolative Ω -Hardy Rogers type contraction mappings in the bipolar metric space. There are number of articles available in Ω -Hardy Rogers type but this study focuses on the Interpolative Ω -Hardy Rogers type contraction, a novel class of contraction mappings.

Keywords: Bipolar metric space, Interpolative Ω -Hardy Rogers type contraction, Contravariant map, Fixed point, Covariant map.
Mathematical subject allocation: 37C25, 37C27, 37C29.

INTRODUCTION

Fixed point theory is an essential mathematical subject that is used in many different areas, including nonlinear analysis, differential equations, and functional analysis. Gurdal and Mutlu have developed novel mathematical structures in recent years, such as bipolar metric spaces[1]. In the fixed point theorem on complete normed space was first proposed by Banach in 1922. Since then, it has been improved upon and generalized on two levels: firstly, in relation to its applications; secondly, in cooperation with Rodgers, Hardy, Reich, Cric, Rus, and other scholars[2-3].

After that, Kurapinar introduced a new point of view in 2018 with a revised version[4-9], which prompted other scholars to dig into this area. They have presented the idea of interpolative weakly contractive mapping, which extends the notion of contraction of the Hardy-Rogers type [10]. Interpolative Hardy Rogers type contraction mappings are one kind of mappings in bipolar metric spaces that have attracted a lot of interest among the others [11-13]. The concept of interpolation is incorporated into these mappings to aid in the understanding of systems where the convergence process depends heavily on intermediary interactions between constituents.

METHODOLOGY

Definition 2.1. Consider ξ: $\widetilde{\mathcal{M}} \times \widetilde{\mathcal{K}} \to [0, +\infty)$ be a function where $\widetilde{\mathcal{M}}(\neq \emptyset)$ and $\widetilde{\mathcal{K}}(\neq \emptyset)$ be any two sets. If the following are true, then ξ is called bipolar metric on $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}})$ and the triplet $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ is called bipolar metricspace:
(B1) $\xi(\tilde{m}, \tilde{k}) = 0$ *if and only if* $\tilde{m} = \tilde{k}$ *where* $(\tilde{m}, \tilde{k}) \in \widetilde{\mathcal{M}} \times \widetilde{\mathcal{K}}$,
(B2) *If* $\tilde{m}, \tilde{k} \in \widetilde{\mathcal{M}} \cap \widetilde{\mathcal{K}}$ *then* $\xi(\tilde{m}, \tilde{k}) = \xi(\tilde{k}, \tilde{m})$,
(B3)$\xi(\tilde{m}_1, \tilde{k}_2) \leq \xi(\tilde{m}_1, \tilde{k}_1) + \xi(\tilde{m}_2, \tilde{k}_1) + \xi(\tilde{m}_2, \tilde{k}_2)$ *for all* $\tilde{m}_1, \tilde{m}_2 \in \widetilde{\mathcal{M}}$ *and* $\tilde{k}_1, \tilde{k}_2 \in \widetilde{\mathcal{K}}$.

Definition 2.2. Assume$(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ be a bipolar metric space. The left, right, and central points of$\widetilde{\mathcal{M}}$, $\widetilde{\mathcal{K}}$ and $\widetilde{\mathcal{M}} \cap \widetilde{\mathcal{K}}$ are the elements of $\widetilde{\mathcal{M}}$, $\widetilde{\mathcal{K}}$ and $\widetilde{\mathcal{M}} \cap \widetilde{\mathcal{K}}$respectively. The terms "left and right sequences" refer to sequences in$\widetilde{\mathcal{M}}$ and $\widetilde{\mathcal{K}}$respectively. Consider sequence$\langle s_j \rangle$ either itmay be a left or right. Then $\langle s_j \rangle$is said to convergent to s $\Leftrightarrow$ it is a left sequence, s is a right pointand $\lim_{j \to -\infty} d(s_i, s) = 0$; *or* $\langle s_j \rangle$ is a right sequence, s is a left point and $\lim_{j \to +\infty} d(s, s_j) = 0$. A sequence$\langle (\tilde{m}_j, \tilde{k}_i) \rangle$ in$\widetilde{\mathcal{M}} \times \widetilde{\mathcal{K}}$ is called a bisequence on $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}})$, *and*it is represented by $(\tilde{m}_j, \tilde{k}_j)$. If both the sequences$\langle \tilde{m}_j \rangle$ and $\langle \tilde{k}_i \rangle$ converge, then the bisequence $(\tilde{m}_j, \tilde{k}_j)$ is said to be convergent. If the sequences$\langle \tilde{m}_j \rangle$ and $\langle \tilde{k}_i \rangle$ converge to $u \in \widetilde{\mathcal{M}} \cap \widetilde{\mathcal{K}}$, then $(\tilde{m}_j, \tilde{k}_j)$ is said to be biconvergent. If $\lim_{j,i \to +\infty} \rho(\tilde{m}_j, \tilde{k}_i) = 0$ then the bisequence $(\tilde{m}_j, \tilde{k}_i)$ is called a Cauchy bisequence. Every converged Cauchy bisequence in a bipolar metric space is biconvergent. A bipolar metric space is considered complete if all of its Cauchy bisequences are biconvergent

Definition 2.3. Let $\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \widetilde{\mathcal{M}}_2$and $\widetilde{\mathcal{K}}_2$ be four sets. Then the function $\Gamma: \widetilde{\mathcal{M}}_1 \cup \widetilde{\mathcal{K}}_1 \to \widetilde{\mathcal{M}}_2 \cup \widetilde{\mathcal{K}}_2$ is considered as covariant map, if $\Gamma(\widetilde{\mathcal{M}}_1) \subseteq \widetilde{\mathcal{M}}_2$ and $\Gamma(\widetilde{\mathcal{K}}_1) \subseteq \widetilde{\mathcal{K}}_2$and is represented as$\Gamma: (\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1) \rightrightarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2)$. Specifically, if $(\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1)$ and $(\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$ are given bipolar metric spaces, then we denote the notation$\Gamma: (\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1) \rightrightarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$ for covariant mapΓ.

Definition 2.4. Assume $(\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1)$ and $(\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$ be any two given bipolar metric spaces. A map $\Gamma: (\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1) \rightrightarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2)$ is regarded as continuous at a location$\tilde{m}_0 \in \widetilde{\mathcal{M}}_1$, if $\forall \varepsilon > 0$, there is a $\delta > 0$ such that $\tilde{k} \in \widetilde{\mathcal{K}}_1$ and $\xi_1(\tilde{m}_0, \tilde{k}) < \delta \Rightarrow \xi_2(\Gamma(\tilde{m}), \Gamma(k)) < \varepsilon$. It is continuous at a point $\tilde{k}_0 \in \widetilde{\mathcal{K}}_1$ if $\forall \varepsilon > 0$, there is a $\delta > 0$ such that $\tilde{m} \in \widetilde{\mathcal{M}}_1$ and $\xi_1(\tilde{m}, \tilde{k}_0) < \delta$ indicates that $\xi_2(\Gamma(\tilde{m}), \Gamma(\tilde{k}_0)) < \varepsilon$. If Γ is continuous at every point $\tilde{m} \in \widetilde{\mathcal{M}}_1$ and $\tilde{k} \in \widetilde{\mathcal{K}}_1$, then it is considered as continuous.

Definition 2.5. Assume that Γ: $(\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1) \rightrightarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2)$ is acovariant map from bipolar metric space $(\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1)$ to bipolar metric space $(\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$ such that
$\xi_2\left(\Gamma(\tilde{m}), \Gamma(\tilde{k})\right) \leq \alpha \xi_1(\tilde{m}, \tilde{k}), \forall \tilde{m}, \tilde{k} \in \widetilde{\mathcal{K}}_1$ where $\alpha > 0$, then Γ is said to Lipschitz continuous. If $\alpha = 1$, this map is called non-expansive; if $\alpha \in [0,1)$, it is called contraction.All contractions are clearly non-expansive and all non-expansive maps are continuous.

Definition 2.6. Assume that $(\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1)$ and $(\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$ are two bipolar metric spaces and $T: \widetilde{\mathcal{M}}_1 \cup \widetilde{\mathcal{K}}_1 \to \widetilde{\mathcal{M}}_2 \cup \widetilde{\mathcal{K}}_2$ be a function, if $T\widetilde{\mathcal{M}}_1 \subseteq \widetilde{\mathcal{K}}_2$and $T\widetilde{\mathcal{K}}_1 \subseteq \widetilde{\mathcal{M}}_2$, in that case, T represents a contra variant mapping $T: (\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1) \rightleftarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$.

Definition 2.7. Assume$(\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1)$ and $(\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$ are given bipolar metric spaces. Then a map

(1) $T: (\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1) \rightrightarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$ is called left continuous at a point $\tilde{m}_0 \in \widetilde{\mathcal{M}}$ if $\forall \epsilon > 0$there is a $\delta > 0$ such that $\xi_2(T\tilde{m}_0, T\tilde{k}) < \epsilon$ whenever $\xi_1(\tilde{m}_0, \tilde{k}) < \delta$.

(2) $T: (\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1) \rightrightarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$is called right continuous at $k_0 \in \widetilde{\mathcal{K}}$if $\forall\ \epsilon > 0$ there is a $\delta > 0$ such that $\xi_2(T\tilde{m}, T\tilde{k}_0) < \epsilon$ whenever$\xi_1(\tilde{m}, \tilde{k}_0) < \delta$.

(3) A map T is said to be continuous if it is left continuous $\forall\ \tilde{m}_0 \in \widetilde{\mathcal{M}}$ and right continuous $\forall\ \tilde{k}_0 \in \widetilde{\mathcal{K}}$.

(4) $T: (\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1) \rightleftarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$is continuous $\Leftrightarrow T$ is continuous as covariant map $T: (\widetilde{\mathcal{M}}_1, \widetilde{\mathcal{K}}_1, \xi_1) \rightrightarrows (\widetilde{\mathcal{M}}_2, \widetilde{\mathcal{K}}_2, \xi_2)$.

Proposition 2.8. Each convergent Cauchy bisequence in a bipolar metric space is biconvergent.

Proof. Consider $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ to be a bipolar metric space and $(\tilde{m}_j, k_j)$ be a Cauchy bisequence, such that $(\tilde{m}_j) \to \tilde{k} \in \widetilde{\mathcal{K}}$ and $(k_j) \to \tilde{m} \in \widetilde{\mathcal{M}}$. *then* $\xi(\tilde{m}_j, \tilde{k}_j) \to 0$ implies$\xi(\tilde{m}, \tilde{k}) = 0$, thus $\tilde{m} = \tilde{k}$, to which $(\tilde{m}_j, \tilde{k}_i)$ biconverges.

Definition 2.9. A function $\Omega: \Re_+$is defined as an altering distance function if the subsequent conditions are satisfied:
$(\psi_1)\ \Omega(0) = 0$.
$(\psi_2)\ \Omega$ is a monotonically non-decreasing function.
$(\psi_3)\ \Omega$ is a continuous function.
By Ω we indicate the set of all altering distance functions.

Definition 2.10. Assume$(\mathcal{M}, \mathrm{q}p_b, s)$ is a quasi partial b-metric space. The function $\Gamma: \mathcal{M} \to \mathcal{M}$ is an interpolative Ω –Hardy Rogers type contraction if there exists $s \geq 1, \delta \in [0,1/s)$ and $\zeta, \eta, \mu \in (0,1)$ with $\zeta + \eta + \mu < 1$ such that

$$\psi\left(\xi(\Gamma\tilde{m}, \Gamma\tilde{k})\right) \leq \delta\left[\xi(\tilde{m}, \tilde{k})\right]^{\eta}\left[\rho(\tilde{m}, \Gamma\tilde{m})\right]^{\zeta}\xi(\mathrm{k}, \Gamma\tilde{k})^{\mu}\left[\frac{1}{s}\left(\xi(\tilde{m}, \Gamma\tilde{k})\right) + \xi(\tilde{k}, \Gamma\tilde{m})\right]^{1-\zeta-\eta-\mu} \text{ for all } \tilde{m}, \tilde{k} \in \mathcal{M} \setminus \mathrm{Fix}\,(\Gamma).$$

Theorem 2.11. Assume $(\mathcal{M}, \xi)$ is a complete metric space and Γ be an interpolative Hardy- Rogers type contraction. Then Γ has a fixed point in $\mathcal{M}$

RESULTS AND DISCUSSION

Definition 3.1. Assume $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ is a bipolar metric space and $\Gamma: \widetilde{\mathcal{M}} \cup \widetilde{\mathcal{K}} \rightrightarrows \widetilde{\mathcal{M}} \cup \widetilde{\mathcal{K}}$ be a covariant mapping. Then Γ is an interpolative Ω –Hardy Rogers type contraction if there is a $\delta \in [0,1)$and $\zeta, \eta, \mu < 1$, such that

$$\Omega\left(\xi(\Gamma\tilde{m}, \Gamma)\right) \leq \delta\left[\xi(\tilde{m}, \tilde{k})\right]^{\eta}\left[\xi(\tilde{m}, \Gamma\tilde{m})\right]^{\zeta}\xi(\tilde{k}, \Gamma\tilde{k})^{\mu}\left[\frac{1}{2}\left(\xi(\tilde{m}, \Gamma\tilde{k})\right) + \xi(\tilde{k}, \Gamma\tilde{m})\right]^{1-\zeta-\eta-\mu} \ldots.(1) \text{ for all } \tilde{m}, \tilde{k} \notin \mathrm{Fix}\,(\Gamma) \text{ where Fix } (\Gamma) = \{\omega \in \widetilde{\mathcal{M}} \cup \widetilde{\mathcal{K}}: \Gamma(\omega) = \omega\}.$$

Theorem 3.2. Let $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ be a complete bipolar metric space and Γ be an interpolative Ω –Hardy Rogers type contraction. Then Γ has a fixed point.

Proof. For $\tilde{m}_0 \in \widetilde{\mathcal{M}}$, define a sequence $\{\tilde{m}_j, \tilde{k}_j\}$ as $\tilde{m}_{j+1} = \Gamma\tilde{m}_j$ and $\tilde{k}_j = \Gamma\tilde{k}_j \forall j \in \mathbb{N}$. If there exists j_0 with $\tilde{m}_j = \tilde{m}_j$, then $\tilde{m}_j$ is a fixed point. Suppose now that $\tilde{m}_j \neq \tilde{m}_{j+1}$, for each $j \in \mathbb{N}$. Then $\xi(\tilde{m}_j, \tilde{m}_{j+1}) > 0 \forall j \in \mathbb{N}$. By substituting the value $\tilde{m}_j = \mathrm{m}_{j+1}$and $\tilde{k}_j = \tilde{k}_j$.

$$\xi(\tilde{m}_{j+1}, \tilde{k}_j) = \xi(\Gamma\tilde{m}_j, \Gamma\tilde{k}_{j-1}) \ldots(2)$$

$$\leq \delta\left[\xi(\tilde{m}_j, \tilde{k}_{j-1})\right]^{\eta}\left[\xi(\tilde{m}, \Gamma\tilde{m}_j)\right]^{\zeta}\xi(\tilde{k}_{j-1}, \Gamma\tilde{k}_{j-1})^{\mu}\left[\frac{1}{2}\left(\xi(\tilde{m}_j, \Gamma\tilde{k}_{j-1})\right) + \xi(\tilde{k}_{j-1}, \Gamma\tilde{m}_j)\right]^{1-\zeta-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{m}_j, \tilde{k}_{j-1})]^{\eta}[\xi(\tilde{m}_j, \tilde{m}_{j+1})]^{\zeta}\xi(\tilde{k}_{j-1}, k_j)^{\mu}\left[\frac{1}{2}\left(\xi(m_j, \tilde{k}_j)\right) + \xi(\tilde{k}_{j-1}, \tilde{m}_{j+1})\right]^{1-\zeta-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{m}_j, \tilde{k}_{j-1})]^{\eta}[\xi(\tilde{m}_j, \tilde{m}_{j+1})]^{\zeta}\xi(\tilde{k}_{j-1}, \tilde{k}_j)^{\mu}\xi(\tilde{k}_{j-1}, \tilde{k}_j)^{1-\zeta-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{m}_j, \tilde{k}_{j-1})]^{\eta}[\xi(\tilde{m}_j, \tilde{m}_{j+1})]^{\zeta}\xi(\tilde{k}_{j-1}, \tilde{k}_j)^{1-\zeta-\eta} \ldots.(3)$$

Suppose that $[\xi(\tilde{m}_j, \tilde{k}_{j-1})]^{\eta} \geq [\xi(\tilde{m}_j, \tilde{m}_{j+1})]^{\zeta}$ ....(4)

Consequently, using (4) in (3), we obtain,

$$\xi(\tilde{m}_{j+1}, \tilde{k}_j) \leq \delta[\xi(\tilde{m}_j, \tilde{k}_{j-1})]^{\eta}[\xi(\tilde{m}_j, \tilde{k}_{j-1})]^{\zeta}\xi(\tilde{k}_{j-1}, \tilde{k}_j)^{1-\zeta-\eta}$$

$$\leq \delta[\xi(\tilde{m}_j, \tilde{k}_{j-1})]^{\eta+\zeta}\xi(\tilde{k}_{j-1}, \tilde{k}_j)^{1-\zeta-\eta}$$

$$\leq \delta[\xi(\tilde{m}_j, \tilde{k}_{j-1})] \ldots(5)$$

By induction in (5), we get

$$\xi(\tilde{m}_{j+1}, \tilde{k}_j) \leq \delta[\xi(\tilde{m}_j, \tilde{k}_{j-1})]$$

$$\leq \delta^2[\xi(\tilde{m}_j, \tilde{k}_{j-1})]$$

$$\leq \cdots$$

$$\leq \delta^j[\xi(\tilde{m}_1, \tilde{k}_0)] \quad ..(6)$$

$$\xi(\tilde{m}_j, k) = \xi(\Gamma\tilde{m}_{j-1}, \Gamma\tilde{k}_{j-1})$$

$$\leq \delta[\rho(\tilde{m}_{j-1}, \tilde{k}_{j-1})]^{\eta}[\xi(\tilde{m}_{j-1}, \Gamma\tilde{m}_{j-1})]^{\zeta}\xi(\tilde{k}_{j-1}, \Gamma\tilde{k}_{j-1})^{\mu}\left[\frac{1}{2}\left(\xi(\tilde{m}_{j-1}, \Gamma\tilde{k}_{j-1})\right) + \xi(\tilde{k}_{j-1}, \Gamma\tilde{m}_{j-1})\right]^{1-\zeta-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{m}_{j-1}, \tilde{k}_{j-1})]^{\eta}[\xi(\tilde{m}_{j-1}, \tilde{m}_j)]^{\zeta}\xi(\tilde{k}_{j-1}, \tilde{k}_j)^{\mu}\left[\frac{1}{2}\left(\xi(\tilde{m}_{j-1}, \tilde{k}_j)\right) + \xi(\tilde{k}_{j-1}, \Gamma\tilde{m}_{j-1})\right]^{1-\zeta-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{m}_{j-1}, \tilde{k}_{j-1})]^{\eta}[\xi(\tilde{m}_{j-1}, \tilde{m}_j)]^{\zeta}\xi(\tilde{k}_{j-1}, \tilde{k})^{1-\zeta-\eta} \ldots(7)$$

$$\leq \delta[\xi(\tilde{m}_{j-1}, \tilde{k}_{j-1})]^{\eta}$$

By induction in (5), we get

$$\xi(\tilde{m}_j, \tilde{k}_j) = \delta[\xi(\tilde{m}_{j-1}, \tilde{k}_{j-1})]$$

$$\leq \delta^2[\xi(\tilde{m}_j, \tilde{k}_{j-1})]$$

In this way as we proceed ,we get

$$\leq \delta^j[\xi(\tilde{m}_0, \tilde{k}_0)] \quad \ldots. (8)$$

$$\xi(\tilde{m}_j, \tilde{k}_{j+p}) \leq \xi(\tilde{m}_{j+1}, \tilde{k}_{j+p}) + \xi(\tilde{m}_{j+1}, \tilde{k}_j) + \xi(\tilde{m}_j, \tilde{k}_j)$$

$$\leq \xi(\tilde{m}_{j+1}, \tilde{k}_{j+p}) + \delta^j \xi(\tilde{m}_0, \tilde{k}_0)$$

$$\leq \xi(\tilde{k}_{j+p}, \tilde{m}_{j+2}) + \xi(\tilde{k}_{j+1}, \tilde{m}_{j+2}) + \xi(\tilde{k}_{j+1}, \tilde{m}_{j+1}) + \delta^j \xi(\tilde{m}_0, \tilde{k}_0)$$

$$\leq \xi(\tilde{k}_{j+p}, \tilde{m}_{j+2}) + (\delta^{j+1} + \cdots + \delta^j)\, \xi(\tilde{m}_0, \tilde{k}_0)$$

$$\leq \xi(\tilde{k}_{j+p}, \tilde{m}_{j+p}) + (\delta^{j+p-1} + \cdots + \delta^{j+1} + \delta^j)\, \xi(\tilde{m}_0, \tilde{k}_0)$$

$$\leq \delta^j \sum_{k=0}^{\infty} \xi(\tilde{m}_0, \tilde{k}_0)$$

$$= \Phi_j$$

Similarly,

$$\xi(\tilde{m}_{j+p}, \tilde{k}_j) \leq \Phi_j$$

Assume $\varepsilon > 0$. Since $\delta \in [0,1)$, there is an $j_0 \in \mathbb{N}$ such that $\Phi_{j_0} = \frac{\delta^{j_0} \rho(\tilde{m}_0, \tilde{k}_0)}{1-\delta} < \frac{\varepsilon}{3}$. Then $\xi(\tilde{m}_j, \tilde{k}_i) \leq \xi(\tilde{m}_j, \tilde{k}_{j_0}) + \xi(\tilde{m}_{j_0}, \tilde{k}_{j_0}) + \xi(\tilde{m}_{j_0}, \tilde{k}_i)$ *and* $\{\tilde{m}_j, \tilde{k}_j\}$ is Cauchy bisequence. Since $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ is complete bipolar metric space, $\{\tilde{m}_j, \tilde{k}_j\}$ biconverges at a certain point
$\omega \in \widetilde{\mathcal{M}} \cap \widetilde{\mathcal{K}}$after convergingsuch that $\tilde{m}_j \to \omega$ and $\tilde{k}_j \to \omega$ as $n \to \infty$.We conclude that $\xi(\omega, \omega) = 0$.

By Definition (2.2), we have

$$\xi(\omega, \omega) = \lim_{j \to \infty} \xi(m_j, \omega) = \lim_{i,j \to \infty} \xi(\tilde{m}_j, \tilde{k}_j)$$

Suppose that $\tilde{m}_j \neq \Gamma \tilde{m}_j$ for each $j \geq 1$ and the increasing property of Ω we have

$$\xi(m_{j+1}, \Gamma\omega) = \psi(\xi(\Gamma \tilde{m}_j, \Gamma\omega))$$

$$< \xi(\Gamma \tilde{m}_j, \Gamma\omega)\xi(\Gamma \tilde{m}_j, \Gamma\omega) \leq \delta[\xi(m_j, \omega)]^{\eta}[\xi(\tilde{m}_j, \Gamma \tilde{m}_j)]^{\zeta} \Gamma(\omega, \Gamma\omega)^{\mu} \left[\frac{1}{2}\left(\Gamma(\tilde{m}_j, \Gamma\omega)\right) + \Gamma(\omega, \Gamma \tilde{m}_j)\right]^{1-\zeta-\eta-\mu}$$

$$\xi(\omega, \Gamma\omega) \leq \delta[\xi(\omega, \omega)]^{\eta}[\xi(\omega, \omega)]^{\zeta} \Gamma(\omega, \Gamma\omega)^{\mu} \left[\frac{1}{2}\left(\Gamma(\omega, \Gamma\omega)\right) + \Gamma(\omega, \omega)\right]^{1-\zeta-\eta-\mu}$$

$$\leq \delta[\xi(\omega, \omega)]^{\eta+\zeta} \Gamma(\omega, \Gamma\omega)^{1-\zeta-\eta}$$

$$\leq \delta(\xi(\omega, \Gamma\omega))$$

We find that $\xi(\omega, \Gamma\omega) = 0$, which is the contradiction. Hence $\omega = \Gamma\omega$.

Definition 3.3. Let $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ be a bipolar metric space and $\Gamma: \widetilde{\mathcal{M}} \cup \widetilde{\mathcal{K}} \rightleftarrows \widetilde{\mathcal{M}} \cup \widetilde{\mathcal{K}}$ be a covariant mapping. Then Γ is an interpolative Ω −Hardy Rogers type contraction if there exists $\delta \in [0,1)$and $s, \eta, \mu < 1$, such that

$$\Omega\left(\xi(\Gamma \tilde{m}, \Gamma \tilde{k})\right) \leq \delta[\xi(\tilde{m}, \tilde{k})]^{\eta}[\xi(\tilde{m}, \Gamma \tilde{k})]^{s} \xi(\tilde{k}, \Gamma \tilde{k})^{\mu} \left[\frac{1}{2}\left(\xi(\tilde{m}, \Gamma \tilde{k})\right) + \xi(\tilde{k}, \Gamma \tilde{m})\right]^{1-s-\eta-\mu}$$

$\forall\, \tilde{m}, \tilde{k} \notin$ Fix (Γ) where Fix $(\Gamma) = \{\omega \in \widetilde{\mathcal{M}} \cup \widetilde{\mathcal{K}} : \Gamma(\omega) = \omega\}$ …(9)

Theorem 3.4.
Assume $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ is a complete bipolar metric space. If$\Gamma: (\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi) \rightleftarrows (\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ *is* an interpolativeΩ-Hardy Rogers type contraction, then Γ has a fixed point.

Proof.
Since Γ is a contravariant contraction, there is $\delta \in (0,1)$ such that

$$\psi(\xi(\Gamma\tilde{\mathfrak{m}}, \Gamma\tilde{\mathcal{k}}) \leq \delta[\xi(\tilde{\mathfrak{m}}, \tilde{\mathfrak{k}})]^{\eta}[\xi(\tilde{\mathfrak{m}}, \Gamma\tilde{\mathfrak{m}})]^{S}\xi(\tilde{\mathfrak{k}}, \Gamma\tilde{\mathfrak{k}})^{\mu}\left[\frac{1}{2}\left(\xi(\tilde{\mathfrak{m}}, \Gamma\tilde{\mathfrak{k}}) + \xi(\tilde{\mathfrak{k}}, \Gamma\tilde{\mathfrak{m}})\right)\right]^{1-S-\eta-\mu}$$

$$\forall(\tilde{\mathfrak{m}}, \tilde{\mathcal{k}}) \in \widetilde{\mathcal{M}} \times \widetilde{\mathcal{K}}.$$

Assume$\tilde{\mathfrak{m}}_0 \in \widetilde{\mathcal{M}}$. For each $j \in \mathbb{N}$ define $\Gamma(\tilde{\mathfrak{m}}_j) = \tilde{\mathfrak{k}}_j$ and $\Gamma(\tilde{\mathfrak{k}}_j) = \tilde{\mathfrak{k}}_{j+1}$.
Then $(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)$ is a bisequence on $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$.
Let $\tilde{\mathfrak{k}}_j = \frac{\delta^{2j}}{1-\lambda}\xi(\tilde{\mathfrak{m}}_0, \tilde{\mathfrak{k}}_0)$. Then $\forall j, p \in \mathbb{Z}^+$

$$\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j) = \xi\left(\Gamma(\tilde{\mathfrak{k}}_{j-1}), \Gamma(\tilde{\mathfrak{m}}_j)\right)$$

$$\leq \Omega(\Gamma(\tilde{\mathfrak{k}}_{j-1}), \Gamma(\tilde{\mathcal{m}}_j))$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_{j-1})]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \Gamma\tilde{\mathfrak{m}}_j)]^{S}\xi(\tilde{\mathfrak{k}}_{j-1}, \Gamma\tilde{\mathfrak{k}}_{j-1})^{\mu}\left[\frac{1}{2}(\xi(\tilde{\mathfrak{m}}_j, \Gamma\tilde{\mathfrak{k}}_{j-1}) + \xi(\tilde{\mathfrak{k}}_{j-1}, \Gamma\tilde{\mathfrak{m}}_j))\right]^{1-S-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_{j-1})]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}})]^{S}\xi(\tilde{\mathfrak{k}}_{j-1}, \tilde{\mathfrak{m}}_j)^{\mu}\left[\frac{1}{2}\left(\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{m}}_j) + \xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)\right)\right]^{1-S-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_{j-1})]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{S}\xi(\tilde{\mathfrak{k}}_{j-1}, \tilde{\mathfrak{m}}_j)^{\mu}\left[\frac{1}{2}\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)\right]^{1-S-\eta-\mu} \quad \text{....(10)}$$

Suppose that $\frac{1}{2}\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j) \leq \xi(\tilde{\mathfrak{k}}_{j-1}, \tilde{\mathfrak{m}}_j)$....(11)

Consequently using (7) in (6)

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_{j-1})]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{S}\xi(\tilde{\mathfrak{k}}, \tilde{\mathfrak{m}}_j)^{\mu}[\xi(\tilde{\mathfrak{k}}_{j-1}, \tilde{\mathfrak{m}}_j)]^{1-S-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_{j-1})]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{S}[\xi(\tilde{\mathfrak{k}}_{j-1}, \tilde{\mathfrak{m}}_j)]^{1-S-\eta} \ldots(12)$$

Equation (8) is equivalent to

$$\xi(\tilde{\mathfrak{m}}, \tilde{\mathfrak{k}}_j) \leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_{j-1})] \ldots(13)$$

By induction in (9), we get

$$\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j) \leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_{j-1})]$$

$$\leq \delta^2[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_{j-1})]$$

$$\leq \ldots.$$

$$\leq \delta^{2n}[\xi(\tilde{\mathfrak{m}}_1, \tilde{\mathfrak{k}}_0)] \ldots(14)$$

We find that for $\tilde{\mathfrak{m}} = \tilde{\mathcal{m}}_j$and $= k_j$,

$$\xi(\tilde{\mathfrak{m}}_{j+1}, \tilde{\mathfrak{k}}_j) = \xi(\Gamma\tilde{\mathfrak{k}}_j, \Gamma\tilde{\mathfrak{m}}_j)$$

$$\leq \Omega\left(\xi(\Gamma\tilde{\mathfrak{k}}_j, \Gamma\tilde{\mathfrak{m}}_j)\right)$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \Gamma\tilde{\mathfrak{m}}_j)]^{S}\xi(\tilde{\mathfrak{k}}_j, \Gamma\tilde{\mathfrak{k}}_j)^{\mu}\left[\frac{1}{2}(\xi(\tilde{\mathfrak{m}}_j, \Gamma\tilde{\mathfrak{k}}_j) + \xi(\tilde{\mathfrak{k}}_j, \Gamma\tilde{\mathfrak{m}}_j))\right]^{1-S-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \Gamma\tilde{\mathfrak{k}}_j)]^{S}\xi(\tilde{\mathfrak{k}}_j, \Gamma\tilde{\mathfrak{m}}_{j+1})^{\mu}\left[\frac{1}{2}(\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{m}}_{j+1}) + \xi(\tilde{\mathfrak{k}}_j, \tilde{\mathfrak{k}}_j))\right]^{1-S-\eta-\mu}$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{S}\xi(\tilde{\mathfrak{k}}_j, \tilde{\mathfrak{m}}_{j+1})^{1-S-\eta}$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{\eta}[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)]^{1-\eta}$$

$$\leq \delta[\xi(\tilde{\mathfrak{m}}_j, \tilde{\mathfrak{k}}_j)] \quad \text{--- (15)}$$

By Induction in (11) we get

$$\xi(\tilde{\mathfrak{m}}_{j+1}, \tilde{\mathfrak{k}}_j) \leq \delta^{2j+1}[\xi(\tilde{\mathfrak{m}}_0, \tilde{\mathfrak{k}}_0)] \ldots (16)$$

$$\xi(\tilde{\mathfrak{m}}_{j+p}, \tilde{\mathfrak{k}}_j) \leq \xi(\tilde{\mathfrak{m}}_{j+p}, \tilde{\mathfrak{k}}_{j+1}) + \xi(\tilde{\mathfrak{m}}_{j+1}, \tilde{\mathfrak{k}}_{j+1}) + \xi(\tilde{\mathfrak{m}}_{j+1}, \tilde{\mathfrak{k}}_j)$$

$$\leq \xi(\tilde{\mathfrak{m}}_{j+p}, \tilde{\mathfrak{k}}_{j+1}) + (\delta^{2j+2} + \delta^{2j+1})\,\xi(\tilde{\mathfrak{m}}_0, \tilde{\mathfrak{k}}_0)$$

$$\leq \xi(\tilde{\mathfrak{m}}_{j+p}, \tilde{\mathfrak{k}}_{j+2}) + \xi(\tilde{\mathfrak{m}}_{j+2}, \tilde{\mathfrak{k}}_{j+2}) + \xi(\tilde{\mathfrak{m}}_{j+2}, \tilde{\mathfrak{k}}_{j+1}) + (\delta^{2j+2} + \delta^{2j+1})\xi(\tilde{\mathfrak{m}}_0, \tilde{\mathfrak{k}}_0)$$

$$\leq \xi(\tilde{\mathfrak{m}}_{j+p}, \tilde{\mathfrak{k}}_{j+2}) + (\delta^{2j+4} + \delta^{2j+3} + \delta^{2j+2} + \delta^{2j+1})\xi(\tilde{\mathfrak{m}}_0, \tilde{\mathfrak{k}}_0)$$

$$\leq (\delta^{2j+2p-1} + \delta^{2j+2p-2} + \delta^{2j+2p-3} + \cdots + \delta^{2j+1})\xi(\tilde{\mathfrak{m}}_0, \tilde{\mathfrak{k}}_0)$$

$$\leq \delta^{2j+1} \sum_{j=0}^{\infty} \delta^j \rho(\tilde{m}_0, \tilde{k}_0) = \delta.\Phi_n < \Phi_n$$

$$\xi(\tilde{m}_j, \tilde{k}_{j+p}) \leq \xi(\tilde{m}_j, \tilde{k}_j) + \xi(\tilde{m}_{j+1}, \tilde{k}_j) + \xi(\tilde{m}_{j+1}, \tilde{k}_{j+p})$$

$$\leq (\delta^{2j} + \delta^{2j+1})\, \xi(\tilde{m}_0, \tilde{k}_0) + \xi(\tilde{m}_{j+1}, \tilde{k}_{j+p})$$

$$\leq (\delta^{2j} + \delta^{2j+1})\xi(\tilde{m}_0, \tilde{k}_0) + \xi(\tilde{m}_{j+1}, \tilde{k}_{j+1}) + \xi(\tilde{m}_{j+2}, \tilde{k}_{j+1}) + \xi(\tilde{m}_{j+2}, \tilde{k}_{j+p})$$

$$\leq (\delta^{2j} + \delta^{2j+1} + \delta^{2j+2} + \delta^{2j+3})\, \xi(\tilde{m}_0, \tilde{k}_0) + \xi(\tilde{m}_{j+2}, \tilde{k}_{j+p})$$

…**……**

$$\leq \delta^{2j} \sum_{j=0}^{\infty} \delta^j \xi(\tilde{m}_0, \tilde{k}_0) = \Phi_n$$

Now since $0 < \delta < 1$ for any $\epsilon > 0$, we can find an integer j_0 such that

$\Phi_{j_0} = \frac{\delta^{2j_0+1}}{1-\delta}.\xi(\tilde{m}_0, \tilde{k}_0) < \frac{\epsilon}{3}$.

Hence $\xi(\tilde{m}_j, \tilde{k}_i) \leq \xi(\tilde{m}_j, \tilde{k}_{j_0}) + \xi(\tilde{m}_{j_0}, \tilde{k}_{j_0}) + \xi(\tilde{m}_{j_0}, \tilde{k}_i) \leq 3\Phi_{n_0} < \epsilon$ and $(\tilde{m}_j, \tilde{k})$ is a Cauchy bisequence. Thus $\xi(\tilde{m}_j, \tilde{k}_i) \to 0$ as $j, i \to \infty$. Since $(\widetilde{\mathcal{M}}, \xi)$ is complete, $\{\tilde{m}_j, \tilde{k}_i\}$ converges to some point $w \in \widetilde{\mathcal{M}}$ with $\rho(w, w) = 0$.

By definition (2.2) we have

$$\xi(w, w) = \left(\lim_{j\to\infty} \tilde{m}_j, w\right) = \lim_{i,j\to\infty} \xi(\tilde{m}_j, \tilde{k}_j)$$

Suppose that $\tilde{m}_j \neq \Gamma\tilde{m}_j \forall\, j \geq 1$and by the increasing property of Ω, we have

$$\xi(\tilde{m}_{j+1}, \Gamma w) = \Omega\left(\xi(\Gamma\tilde{m}_j, \Gamma w)\right)$$

$$< \xi(\Gamma\tilde{m}_j, \Gamma w)$$

$$\xi(\Gamma\tilde{m}_j, \Gamma w) \leq \delta\left[\xi(\tilde{m}_j, w)\right]^{\eta}\left[\xi(\tilde{m}_j, \Gamma\tilde{m}_j)\right]^{S} \xi(w, \Gamma w)^{\mu} \left[\frac{1}{2}(\xi(\tilde{m}_j, \Gamma w) + \xi(w, \Gamma\tilde{m}_j))\right]^{1-S-\eta-\mu}$$

$$\xi(w, \Gamma w) \leq \delta[\xi(w, w)]^{\eta}[\xi(w, w)]^{S} \xi(w, \Gamma w)^{\mu} \left[\frac{1}{2}(\xi(w, \Gamma w) + \xi(w, w))\right]^{1-S-\eta-\mu}$$

$$\leq \delta\left[\xi(\tilde{m}_j, w)\right]^{\eta+S} \xi(w, \Gamma w)^{1-S-\eta}$$

$$\leq \delta\left(\xi(w, \Gamma w)\right)$$

We find that $\xi(w, \Gamma w) = 0$, which is a contradiction.

Hence $w = \Gamma w$.

Corollary 3.5. Let $(\widetilde{\mathcal{M}}, \widetilde{\mathcal{K}}, \xi)$ be a complete bipolar metric space. Then the functionΓ satisfy the conditions of Theorem 3.2 and Theorem 3.4, if any of the subsequent contractions are used:

(i) Riech-Rus-Ciric type contraction mapping is the contraction that follows.

$$\Omega\left(\xi(\Gamma\tilde{m}, \Gamma\tilde{k})\right) \leq \delta\left[\xi(\tilde{m}, \tilde{k})\right]^{\eta}[\xi(\tilde{m}, \Gamma\tilde{m})]^{\zeta}\Gamma(\tilde{k}, \Gamma\tilde{k})^{1-\zeta-\eta} \quad \forall\, \tilde{m}, \tilde{k} \notin \text{Fix}(\Gamma)$$

where Fix $(\Gamma) = \{\omega \in \widetilde{\mathcal{M}} \cup \widetilde{\mathcal{K}}: \Gamma(\omega) = \omega\}$,where$\delta \in [0,1)$ and $\zeta + \eta < 1$.

(ii) The subsequent outcomes for Chatterjea type contraction mappings

$$\Omega\left(\xi(\Gamma\tilde{m}, \Gamma\tilde{k})\right) \leq \delta\left[\xi(\tilde{m}, \Gamma\tilde{k})\right]^{\zeta}\Gamma\left(\frac{1}{s^2}\tilde{k}, \Gamma\tilde{m}\right)^{1-\zeta} \forall \tilde{m}, \tilde{k} \notin \text{Fix}(\Gamma)$$

where Fix $(\Gamma) = \{\omega \in \widetilde{\mathcal{M}} \cup \widetilde{\mathcal{K}}: \Gamma(\omega) = \omega\}$, where $\delta \in \left[\frac{0,1}{s}\right)$ and $\zeta \in (0,1)$.

CONCLUSION

This study concludes in detail the theoretical foundations of fixed point theorems in bipolar metric spaces, and investigate, in particular the behavior of fixed points in the setting of interpolative Hardy-Rogers type contraction mappings.

ABSTRACT

Investigation of *Catharanthus roseus* mediated silver nanoparticles with leaf extract is done for the evaluation of cancer activity. The green synthesis approach for nanoparticle preparation is environmentally friendly. *Catharanthus roseus* is a plant that is used in traditional medicine. Silver nanoparticles (AgNPs) are significant chemotherapeutic agents that have been engaged in recent years towards the treatment of a variety of malignancies, including breast, blood, prostate, lung and ovarian cancers. The AgNPs are synthesized using $AgNO_3$ and the leaves of *Catharanthus roseus* (*C.roseus*). Different characterization methods, including XRD, SEM, TEM, CV and EDS were used to analyze the AgNPs in detail. The XRD pattern confirms that the synthesized nano material was a face centered cubic. Cyclic voltammetry (CV) has been used to assess AgNPs' catalytic activity. The green synthesized AgNPs cathodic and anodic peak potentials showed hysteresis in the range of -1.0V to 1.7V, as demonstrated by cyclic voltammetric investigations. Anticancer activity was studied by *in vitro* method using human lung cancer cell lines (A549).

Keywords: Green synthesis, *Catharanthus roseus* (*C.roseus*), Silver nanoparticles (AgNPs), Cyclic voltammetriy(CV) , Anti cancer activity (Lung cancer)

INTRODUCTION

In recent years nanotechnology has been considered an advanced field. Every day, there are significant advancements in this field throughout the globe [1].The development of green method processes of nano particles is evolving into an important role of nanotechnology. The green method of Ag NPs synthesis using biological entities like bacteria, fungi and plants were reported to be nontoxic and eco-friendly acceptable when compared to physical and chemical methods [4]. ZnO_2 and $AgNO_3$ were observed for their unique anticancer, high anti-microbial activity and UV properties. Ag has long been recognized as having antimicrobial properties in industrial and medicinal processes [12]. The most essential characteristics of Ag NPs in the medical industry are usage such as topical ointments to prevent infection against burns and open wounds. Further biologically synthesized NPs were found to be highly preferred as it is expeditious, eco-friendly, low cost and a relevant method for green route [4]. There are several publications on the production of Ag NPs utilizing various plant extracts, particularly *C.roseus. C.roseus* is a traditionally used medicinal plant. Based on the flowers, two varieties of this plant are available viz. white flowered alba and pink flowered rosea [4]. *C.roseus* is found widely at tropical area and they grow up to a height of 1m. *C.roseus* is an important medicinal plant due to the presence of essential anti-cancer medicines i.e *vinciristine, vinblastine, vindesine, tabersonine,* and *vinpocetine*. *Vincristine: Vincristine* is also known as leurocristine and is marketed under the trade name Oncovin, among others, in chemotherapy [13]. It should be considered in the treatment of several forms of cancer. Acute lymphocytic leukaemia, acute myeloid leukaemia, Hodgkin's disease, neuroblastoma, and small cell lung carcinoma are only a few examples. *Vinblastine: Vinblastine* is a chemotherapeutic drug that is sold under the brand names Velban and others. It is used topically in together with other drugs. Non-small cell lung cancer, Hodgkin's lymphoma, bladder cancer, brain cancer, testicular cancer, and melanoma are among the cancers treated. It is given as an injection into a vein. *Vindesine: Vindesine,* an anti-mitotic vinca alkaloid, is used in chemotherapy. It ought to be used to the management of a number of cancer types, such as or under leukaemia, multiple melanoma lymphoma, breast cancer, and lung cancer. It is handled via the intravenous method. *Tabersonine*: The indole alkaloid terpene *tabersonine* is present in the *vinca rosea* plant, a source of traditional medicine. *vinpocetine*: These are the vinca alkaloid vincamine's chemically synthesised derivatives. These are derived from the seeds of Voacangan africana or the leaves of Vinca minor (lesser periwinkle). Because of its potentially dangerous nootropil qualities, the selling of vinpocetin supplements was banned in New Zealand, Australia, and Canada. Similarly, different plant ingredients, such as geraniol, have reducing properties and reduce silver nanoparticles with homogeneous sizes and shapes ranging from 1 to 8 nm, with an average size of 4 nm. It possesses known antimicrobial activity, antioxidant, antibiotic, wound healing and anti cancer activities [4]. As a result, the goal of this work is to establish a green synthesis of AgNPs utilizing the medicinal plant *C.roseus*, which has been shown to have anti-cancer properties. Cyclic voltammetry (CV) was used to analyze the performance of silver spherical particles as effective as supercapacitors in order to demonstrate the as-synthesized silver spheres for electrochemical applications [33,34]. The findings showed that silver spherical particles had higher capacities than silver raw nanoparticles. This is appears to be the result of the single crystalline nature of silver spherical particles, which enhances electronic conductivity.

MATERIALS AND METHODS

Materials

C.roseus fresh leaves were identified and collected from the college campus. Silver nitrate (Analytical grade) was purchased from scientific company.

Preparation of Plant Extract

Fresh and green *C.roseus* leaves were properly cleaned four to five times with deionised water before being chopped into fine pieces. The beaker was filled with 15 g of fresh leaves and 150 ml of deionized water and heated for 1 hour.

Allowed for cooling to reach room temperature and filtered by using Whatmann filter paper. The collected extract was used for further processes.

Synthesis of AgNPs

Ag NPs were prepared by adding definite volumes of the plant extract in. The plant extract was treated with aqueous 0.1M silver nitrate solution in a beaker. A Brown-Yellow solution was formed as a result. It is an indication of the formation of AgNPs. It shown that aqueous plant extracts may reduce aqueous silver ions to produce highly stable AgNPs in water, which were then heated to between 60 and 80 °C in hotplate stirrers. This temperature is suitable for silver metals. The nanoparticles were collected after being centrifuged at 4000 rpm for 10 minutes after the supernatant was removed. The above liquid was placed in the beaker; these beakers were incubated at 80°C overnight in hot air oven. A black powder was obtained after a 24 hours of incubation, indicating the formation of nanoparticles.

Characterization Techniques for Nanoparticles

X-ray diffraction analysis (XRD)

XRD is a technique for studying the structure of crystalline metallic nanoparticles that uses X-rays to penetrate deeply into the material. The resultant diffraction pattern verifies that crystalline nanoparticles were formed.

Scanning electron microscopy (SEM)

SEM can be used to determine the topography and morphology of various nanoparticles and to measure their sizes at the micro- (10^{-6}) and nano (10^{-9}) scales. The surface of the sample nanoparticles are hit by a high-energy electron beam created by a scanning electron microscope (SEM), and the backscattered electrons that result reveal the sample's distinctive properties.

Energy-dispersive X-ray spectroscopy (EDX)

The utilization of the EDX technique in nanotechnology has been well-documented and is a crucial tool for determining a sample's elemental composition. The elemental composition of each nanoparticle can be investigated using the different types of X-ray peaks that each element's atomic structure produces.

Transmission electron microscopy (TEM)

TEM is an especially useful method for characterizing nanoparticles since it may reveal details about their size and morphology. Compared to SEM, the resolution of the TEM is 1,000 times better, and the images produced by it provide more precise information about the size, shape, and crystallography of the nanoparticles.

Cyclic Voltammetry

Cyclic Voltammetry (CV) was used to investigate the electrochemical property of biosynthesized silver nanostructures among various silver. Through direct nanoparticle detection, cyclic voltammetry (CV) was used to characterize the nanoparticles [33,34]. Furthermore, the silver nanoparticle was examined using CV to check for the possibility of the presence of electroactive substances that might obstruct the nanoparticle analysis process. The synthesis of AgNPs mediated by leaf extract demonstrated comparable redox features to solutions-synthesised silver nanoparticles, based on the results (Fig.5).

Cell culture

A549 (Human small Lung cancer) was obtained from the National Centre for Cell Sciences(NCCS), Pune, India, and the cells were grown in DMEM media supplemented with 10% FBS, 1% of Antibiotic solution 100x (10000 U penicillin,10mg streptomycin). The cells were kept in 25cm^2 plastic tissue culture flasks as monolayers at 37°C in a humidified atmosphere with 5 % CO2 in the air. In every experiment, exponentially growing cells were used. [8, 9]

Cell cytotoxicity studies (*in-vitro* method)

A549 (Human small Lung cancer) cells were plated at a density of 1×10^6 cells per well in a 96-well plate at 37°C in a 5 percent CO_2 incubator for this experiment to measure cell viability. After a 24-hour culture, the medium in each well was changed and treated with silver nanoparticles at concentrations ranging from 5g to 100g. 100 µl of DMEM medium with MTT dye solution (5 mg/ml in phosphate buffer pH 7.4) were added to each well after 24 hours and 48 hours of incubation. Formazan crystals were solubilized with 100 µl of DMSO after 4 hours of incubation at 37°C and 5 percent CO_2, and the solution was vigorously agitated to dissolve the reactive dye. The absorbance of each well was measured using a 570 nm microplate reader. Using culture medium devoid of cells, the spectrophotometer was calibrated to zero absorbance. The following formula was used to determine the relative cell viability (percentage) compared to control wells containing cell culture media:

$$\textbf{Percentage (\%) of cell viability} = 100 \times \frac{\textbf{Sample absorbance}}{\textbf{Control absorbance}}$$

Using graph pad prism 7.0, the value of IC 50 was calculated.

DAPI Staining

Fluorescence microscopy was used to evaluate cell nuclear morphology following 4,6-diamidino-2-phenylindole (DAPI) staining. The A549 cells were plated at a density of 3×10^6 cells/well in a 6-well plate at 37°C in 5% CO_2 incubator. Cells were treated with Ag NPs after 24 hours of culture. The cells were fixed with ice-cold paraformaldehyde, rinsed with PBS (pH 7.4), added DAPI in a volume of 5µl (1 mg/ml), and incubated for 15 minutes at 37°C while being covered in aluminum foil. After that, the cells were washed with PBS and observed at with an Olympus CKX53 fluorescence microscope.

ROS (Reactive Oxygen Species) Generation

The A549 cells were plated at a density of 3×10^6 cells/well in a 6-well plate with High –Glucose medium, at 37°C in 5% CO_2 incubator and then A549 cells were treated with Ag NPs for 24 hrs. The cells were rinsed with PBS (pH 7.4) before staining with DCF-DA. 10µl (1mg/ml) was added and incubated for 15 minutes at 37 C 37°C while being covered in aluminum foil. After that, the cells were washed with PBS and observed at with an Olympus CKX53 fluorescence microscope.

Detection of apoptosis by AO and EB staining

The Acridine Orange and Ethidium Bromide staining methods were used to detect apoptosis. A549 cells were grown in a 6-well plate at a density of $2 – 3 \times 10^6$ cells/well at 37°C in a 5 percentage CO_2 incubator. Cells were treated with Ag NPs after 24 hours of culture. Following acridine orange and ethidium bromide 20µl (1 mg/ml) addition, the cells were rinsed with PBS (pH 7.4), fixed with ice-cold paraformaldehyde, and then incubated for 15 min at 37 °C wrapped in aluminum foil. The cells were then cleaned with PBS before being examined with an Olympus CKX53 fluorescence microscope. The image obtained using the two separate channels were later combined into a single image that revealed the green and orange cells.

RESULTS AND DISCUSSION

Characterization of the Green Synthesized Silver Nanoparticles

X-ray diffraction Analysis:

The analysis of XRD pattern (Fig.1) of AgNPs, shows the predominant peaks at 2θ= 38.17°, 44.33°, 64.51°, 77.36° [5]. According to XRD peaks corresponding to the (111), (200), (220), and (311) planes, which show similar the cubic silver's JCPDS card no. 04-0783, it confirms the formation of cubic (fcc) silver. Using the Debye–Scherrer formula given as $D=0.9\lambda/\beta\cos\theta$, where D is the average crystalline size, λ is the X-ray wavelength, β is the angular line width at half maximum intensity and the θ Braggs angle, crystalline size of the Ag NPs was also calculated using X-ray line broadening.[5] The average size of the Ag NPs is estimated to be around 31 nm.

Scanning Electron Microscope and Energy-dispersive X-ray spectroscopy:

The size and shape of AgNPs synthesized using the green synthesis method is shown in a scanning electron microscope (SEM) image (Fig.2). The composition and purity of the synthesized Ag NPs can be found by EDX. Ag NPs are presented in the shows of EDX analysis (Fig.3).

Transmission Electron Microscope

The crystalline nature of the AgNPs is suggested by the selected area electron diffraction (SAED) pattern of the AgNPs synthesized from *Catharanthus roseus* leaf extract (Fig. 4), which is in excellent accordance with the X-ray diffraction (XRD) results. To determine the morphology, shape, and size of NPs, TEM is used. The particles are spherical in shape and evenly distributed without any appreciable aggregation, according to TEM micrographs (Fig. 4b and Fig.4c). Crystalline nature of the nanoparticles is evidenced by the SAED.

Electrochemical analysis

Cyclic voltammetry

Cyclic voltammetry is used to assess the electrochemical reversibility of the produced silver nanoparticles. The silver||electrolyte||silver setup was used to measure CV analysis. This plot was recorded on a potential window of -1.0 V to 1.7 V at room temperature with varied scan rates of 10, 30, 80, and 100 mVs^{-1}as shown in Fig. 6. The prepared sample exhibits well-defined anodic and cathodic current peaks, indicating pseudo capacitor behavior. This pseudo capacitor behavior is produced by the rapid ionic reactions at the electrode (Glassy Carbon) adjacent surface area because an oxidation and reduction process occurs at the faradic energy storage system. The redox peaks are increasing as the scan rate an increase, which is caused by an increase in ion migration as resistance decreases. As a result, enhance the charge accumulation at the electrode-electrolyte boundary[32,34]. The simultaneously broadening of the CV curve area and scan rate shows the interfacial compatibility, polaron, and ionic conduction in the prepared biosynthesized silver nanoparticle sample.

Cytotoxicity Assessments of *C.roseus*-AgNPs by MTT Assays

Figure.6 shows the cytotoxic impact of AgNPs on A549 cell lines *in vitro* method. In the A549 cell line, the Biogenic Ag NPs demonstrated concentration-dependent cytotoxicity [6]. Figure 6 illustrates the MTT assay results in A549 cells exposed to 5 to 100 $\mu g/ml$ for 24 and 48 hours. The A549 cells' viability was found to be decreasing in a concentration-dependent manner. 100 $\mu g/ml$ of *C.roseus* -AgNPs caused the highest reduction in cell viability, which was assessed as 5 and 19 % for 24 and 48 hours, respectively [7]. The *C.roseus* -AgNPs' cytotoxic effects provide suggestions that biosynthesized *C.roseus* -Ag NPs may be useful in the search for chemotherapeutic agents [7]. At 25 $\mu g/ml$ of *C.roseus* -Ag NPs, the obtained data indicated that cell death ranged from 40 to 60%. Higher concentrations of *C.roseus* -AgNPs may cause cytotoxic effects because of the plant components attached to the Ag NPs [7]. Several evidences for the cytotoxic effect of biosynthesized Ag NPs with *C.roseus* leaf extract against the A549 cell line provided strong support for the findings of the study.

Effects of green synthesized AgNPs on Cellular Morphological Changes of A549 Cells (DAPI Staining)

The mode of death of A549 cells after treatment with a methanolic fraction of (green synthesized AgNPs) was investigated. Apoptosis and necrosis can be distinguished by their distinct nuclear changes. When excited under a fluorescence microscope, the nuclear stain DAPI(4,6-diamidino-2-phenylindole) exhibits blue fluorescence. In the present work, DAPI staining showed that A549 cells treated with methanolic fraction displayed changes indicating of apoptosis (Figures 7(a) and 7(b)) [8]. The A549 cell exhibits the morphological changes related to apoptosis, such as chromatin condensation and nuclear fragmentation. [10]. Figure 7(b) shows the results of the methanolic fraction treatment, which indicated apoptotic changes

Evaluation of Intracellular ROS (Reactive Oxygen Species)

ROS (Reactive Oxygen Species**)** generation was usually associated with cell apoptosis [8]. We used the oxidation-sensitive fluorescent dye 2,7-dichlorofluoresce in diacetate to examine the level of ROS production in A549 cells with or without the methanolic fraction of green synthesized AgNPs. Reactive oxygen species (ROS) [8] formation was

shown to be increased in the treatment group (Figure 8(b)) compared to the control group (Figure 8(a)) in fluorescent microscope images.

Detection of apoptosis by Acridine orange and Ethidium bromide (AO/EB) fluorescent assay

Apoptosis determination is more important than the MTT cell viability assay because it is unable to discriminate between dead and apoptotic cell [8]. The Dual AO/EB assay is a successful technique for detecting apoptosis. To check the effect, 200 µg/mL of AgNPs were added to the cell. Acridine orange is a dye that, after binding to DNA, emits green fluorescence when it penetrates a normal cell with an intact membrane, but ethidium bromide can only enter damaged membrane cells and emits orange or red fluorescence, denoting apoptotic and necrotic cells, respectively [8]. . After 24 hours of incubation, a control cell that had not been treated showed green fluorescence, whereas cells that had been treated with green synthesized AgNPs had both green and orange fluorescence, indicating the start of apoptosis or early apoptosis [8]. The integrity of the cellular membrane was changed as a result of the cells being exposed to the biogenic green synthesized AgNPs. Therefore, cells can be classified as living shows green and apoptotic shows orange based on intracellular fluorescence. [8].

CONCLUSION

$AgNO_3$ contains nano particles which were prepared using the extract of C.*roseus (Catharanthus roseus)* through bio (green route) synthesis. Green route is a best synthesis method as compared to other chemical used methods. The XRD results clearly show that Ag NPs formed by the reduction of Ag+ ions by the *C.roseus* leaf extract are crystalline in nature. The NPs are 31nm confirmed by XRD. The presence of Ag was also confirmed by EDX testing. The TEM investigation of the biosynthesized Ag NPs revealed that the Ag NPs are spherical in shape. Cyclic voltammetry investigation demonstrated well-defined oxidation and reduction peaks at potential window ranges of -1.0 V to 1.7 V.The prepared sample shown good efficacy and these nanoparticles can be used to treat cancer and other diseases because they were effective against all the targeted organisms. Ag NPs can benefit and be used in the medical field all over the world. This work may be continued in order to study the antimicrobial activity of this material and also this work may be extended for different concentrations of *C.roseus* and to be characterization.

ABSTRACT

The shift to green energy globally marks a crucial point at the intersection of energy, geopolitics, and environmental sustainability. This narrative review paper provides a comprehensive examination of the intricate dynamics surrounding the geopolitics of green energy, revealing its intricate connections with established power structures, international relations, and resource rivalries. Various geopolitical aspects, including energy security, resource competition, and global collaboration, are scrutinized. The study investigates how nations strategically position themselves in the pursuit of green energy dominance and securing access to vital resources like rare earth minerals. It emphasizes the transformation of global power dynamics resulting from the shift from fossil fuels to green energy, impacting traditional energy-exporting nations and giving rise to renewable energy superpowers. The review assesses international agreements like the Paris Agreement, analysing their influence on geopolitics and global cooperation. It delves into challenges and conflicts arising from green energy adoption, such as disputes over renewable resources, and trade tensions within the clean energy supply chain. Case studies spotlight specific regions and nations, like China's global renewable energy investments and the European Union's energy transition, showcasing the geopolitical implications of green energy adoption. The role of environmental diplomacy in shaping nations' strategies for green energy on the global stage is discussed, illustrating how countries navigate climate and energy issues internationally. The paper concludes by summarizing key findings and their implications for policymakers, energy professionals, and researchers. It identifies future trends and challenges in the geopolitics of green energy, stressing the ongoing importance of research in this dynamic and crucial field. This thorough review paper enhances our comprehension of the evolving landscape of energy geopolitics, focusing on green energy as its central theme. It elucidates the profound impact of the global transition to sustainable energy sources on international relations, resource competition, and environmental sustainability.

Keywords: Green energy, Geopolitics, Sustainability, International relation, Climate change

INTRODUCTION

In a world evermore interconnected and environmentally conscious, the geopolitics of energy have taken centre stage. As nations grapple with the dual challenges of climate change and energy security, the global landscape is undergoing a profound transformation. The transition from fossil fuels to green energy sources, driven by the imperative to combat climate change, has given rise to a new era of international relations: one defined by the quest for sustainable, clean, and renewable energy resources. The urgency of addressing climate change, coupled with the finite nature of fossil fuels and their geopolitical implications, has compelled nations to reassess their energy strategies [1]. This transition is not merely an environmental imperative; it is also a geopolitical imperative. In this research paper, we delve into the intricate web of issues surrounding green energy geopolitics, examining how the shift towards sustainable energy sources is shaping international relations, politics, and security. The field of Geopolitics has always been intrigued by energy matters because regular energy sources like oil, natural gas, and coal are vital geographic factors with strategic importance. Geopolitics acknowledges that how the world manages its energy and how countries trade it can have a big impact on how countries get along [2]. There is a back-and-forth relationship between geopolitical risks and renewable energy [3]. Geopolitical risks drive renewable energy adoption due to concerns like energy security and resource competition [4]. Simultaneously, renewable energy influences geopolitical risks through factors like economic growth and fossil fuel prices. This reciprocal relationship is crucial for comprehending both renewable energy and geopolitical stability.

Renewable energy systems are fairer and more equitable than fossil fuel systems. Fossil fuels often result in power imbalances based on supply and demand among nations. In contrast, renewable energy spreads these relationships more evenly worldwide, involving and benefiting a broader range of countries, potentially reducing the influence of a few major players [5]. Throughout history, nations have vied for control over fossil fuel resources, often resulting in conflicts and power struggles. Today, the geopolitics of energy have evolved to encompass renewable resources such as solar, wind, hydro, and geothermal power. The quest for dominance in the emerging green energy sector is rapidly redefining alliances and rivalries on the world stage. The global leaders in green energy technology and production are now positioning themselves for greater influence, while nations with abundant renewable resources are becoming strategic players. As the world stand on the cusp of a green energy revolution, the choices we make today will have profound implications for the future of our planet and the stability of our world. Understanding the dynamics of green energy geopolitics is essential for policymakers, scholars, and global citizens alike.

This research paper aims to contribute to that understanding and provide insights into the complex interplay of energy, environment, and international relations. Green energy, characterized by its eco-friendly and sustainable nature, holds the promise of addressing environmental concerns associated with conventional energy sources [6]. It is sourced from renewable resources such as solar, hydro, biomass, wind, and geothermal energy, making it an essential part of the global shift towards sustainability. Green energy's capacity to significantly reduce emissions during electricity generation underscores its role in environmental betterment and greenhouse gas reduction. This cleaner and more sustainable alternative is vital for serving the energy needs of various sectors. Looking ahead to year 2050, our future energy landscape reveals significant growth in both fossil fuel and green energy consumption. While fossil fuels are projected to remain a dominant force at 13,807.2 million tonnes of oil equivalent (Mtoe), the expected increase in green energy utilization to 2,694.9 Mtoe signifies a positive shift towards cleaner energy sources. This projection emphasizes the ongoing need to reduce our dependency on fossil fuels as we strive for a more sustainable energy future[7]. In the context of green energy geopolitics, experts are questioning the notion of "green growth," which aims to balance economic expansion with environmental sustainability. The concern arises from the lack of strong evidence that economic growth can coexist with reduced carbon emissions [8]. This uncertainty raises the need to explore different development strategies and carefully scrutinize green energy initiatives to ensure they genuinely align with sustainability and environmentally friendly objectives. This narrative review paper unfolds with the overarching theme of transitioning to green energy, foreseeing it as a pathway to a sustainable and peaceful future. Moreover, challenges and opportunities are highlighted as the study dissects the intricate layers of

geopolitical shifts within the renewable energy landscape. The exploration extends to the convergence of energy security and geopolitical dynamics in the global energy market, providing a holistic understanding of critical junctures. Furthermore, the pivotal role of international alliances in shaping the trajectory of green energy and influencing global climate action is examined. Recognizing the urgency of embracing sustainable energy sources on a global scale, we position this transition as an imperative for a resilient future. The paper also incorporates in-depth case studies, including the European Union's leadership in climate diplomacy and the evolving role of China in the global energy market. Through these analyses, the study aims to offer a comprehensive and insightful perspective on the dimensions that define the complex landscape of the green energy geopolitics.

Green Energy Transition: A Path to a Sustainable and Peaceful Future:

Over the last century, our heavy reliance on fossil fuels has endangered the liveability of the Earth's environment, necessitating a challenging but feasible transition to alternative energy sources [9]. The transition in energy sources represents a significant transformation with profound economic, societal, and political implications. This transition involves moving from one energy source to another, such as the shift from steam to coal, coal to oil, and the current transition toward renewable energy. Interestingly, the historical context shows that many nation-states, particularly in Europe, were established during these energy transitions, requiring significant capital investments and centralized decision-making to manage these changes, which transformed both energy systems and governance structures [2]. As we shift towards renewable energy sources, there are varying opinions on the practicality and timing of this transition. It emphasizes the need to assess a country's readiness to adopt clean energy and to remain flexible in adapting to unforeseen events that may require changes to decarbonization plans. These diverse opinions underscore the complex nature of the transition to green energy and highlight the need for a comprehensive and adaptable approach for its success [8]. Investing in green energy is widely recognized as crucial for the future, ensuring a stable energy supply, benefiting the environment, and driving economic growth and innovation. Developed countries have demonstrated that green energy projects lead to new scientific discoveries and practical innovations, serving as models for other regions. Investing in green energy doesn't just benefit energy and the environment; it also makes economies stronger and encourages new ideas and innovations in various regions [10]. Government and other authorities should encourage investment in green energy to facilitate a transition away from fossil fuels for more environmentally benign and sustainable future [7]. This transition is about looking at the practical changes and strategies that individuals and organizations are adopting to make their energy-related activities appear more environmentally friendly, even if they were primarily based on traditional, polluting energy sources in the past.

The term "climate crisis" is commonly used to describe urgent environmental issues tied to climate change, but different people and industries interpret it differently. The oil industry and its supporters see it primarily as an economic challenge and are seeking opportunities to diversify their financial interests by investing in clean energy projects to enhance their public image. This allows them to establish a reputation as "green" or environmentally conscious, aligning with changing public and regulatory expectations [11]. In the contemporary global landscape, industries reliant on high energy consumption are transitioning toward decarbonization to ensure their viability and environmental sustainability. Transnational corporations are aligning their supply chains with decarbonization efforts. As more nations commit to achieving net-zero emissions by 2050, they will deploy economic and trade mechanisms to reduce emissions, affecting resource and goods flow. This shift redirects financial sector investments toward zero-carbon initiatives. Ambitious climate policies will have tangible geographic and physical effects, with subnational governments potentially taking a central leadership role in these transformations [12]. The transition toward a more environmentally sustainable future involves navigating uncertainties and risks. In the later stages of the energy transition, substantial 60% reduction in greenhouse gas emissions can be achieved through strategies like the increased utilization of renewable energy sources(wind, solar, and hydropower), "green hydrogen" production, and electrification of various sectors. These approaches represent powerful means to address climate change and curbing emissions as compared to traditional fossil fuels [13]. Simultaneously, this green transformation offers promising opportunities and a host of co-benefits, from job creation and competitive advantages in green sectors to improved public health, enhanced energy access, and heightened security. Recognizing the mutually reinforcing dynamics of change, it’s imperative to support positive feedback loops, where new technologies and information-

sharing boost environmental awareness, driving more ambitious regulations, and allowing scientific insights to inform sustainable development narratives, creating a cycle of positive progress [14]. In summary, while there are concerns about security, the overall expectation is that renewables can contribute to a more peaceful global energy scenario in the long term [15]. Transitioning to renewable energy while managing high energy consumption can present energy security challenges such as supply interruptions and geopolitical instability in energy-producing nations. Conversely, it is expected that greater use of renewable energy may lead to smaller conflicts while reducing the likelihood of major conflicts between countries. It's essential to address not only the adoption of renewable energy but also the underlying issue of high energy demand to achieve energy security and sustainability [16]. The move to clean energy may bring financial windfalls for some nations, but it could also pose challenges. However, it's crucial to understand that a large-scale resource curse, where resource wealth leads to negative consequences, is not inevitable [17]. The "Big Green Deal" scenario is considered the best approach to transition the global economy to low carbon with substantial benefits aligned with Sustainable Development Goals. It significantly reduces the risk of energy-related conflicts through a multilateral approach, making disputes less likely on both global and regional scales [18]. Green energy sources are expected to emerge as the most appealing energy choices in the near future, holding great promise from both technological and environmental standpoints throughout the 21st century, notably in the context of sustainable development [6]. So, to mitigate the detrimental effects of fossil fuels, it is imperative to expand the use of green energy sources and technologies, primarily due to their environmental compatibility.

Navigating Geopolitical Shifts in Renewable Energy: Challenges and Opportunities

In the realm of renewable energy geopolitics, the relationship between geopolitical risks and the adoption of renewable energy sources is a central theme. The transition to renewable energy is seen as an opportunity to integrate emerging global powers into the international political framework, fostering international peace and reducing geopolitical risks. This shift is strategic, not only enhancing energy supply and security but also creating space for new international players while diminishing conflicts associated with traditional energy sources [19]. Conversely, the adoption of renewable energy sources has the potential to trigger international disputes, akin to historical tensions related to fossil fuel control and distribution. This is due to the transformative impact of transitioning to renewable energy, which can reshape global power dynamics and international influence [20]. As per some renowned authors, the advancement of renewable energy sources can lead to more equitable distribution of energy resources and economic power. This equitable distribution has the potential to mitigate geopolitical tensions by offering a more evenly spread distribution of geopolitical influence, reducing the likelihood of international conflicts tied to energy resources[21], [22], [23], [24]. While the study of renewable energy geopolitics is relatively new, some widely accepted arguments involve applying principles from oil and gas geopolitics to renewables, despite their substantial differences in technology and infrastructure.

Geopolitical analysis still focuses on resource-rich regions, critical infrastructure, transport routes, energy supply control, and potential supply disruptions, as these continue to be sources of power in the international arena [17]. Nations currently investing in renewable energy sources and technology may become dominant geopolitical forces in the future [25]. However, the transition to renewable energy may bring geopolitical challenges similar to those in the conventional energy landscape. This includes the possibility of "green protectionism" in Western nations and difficulties for oil-producing nations as the demand for fossil fuels declines, these oil-producing nations may grapple with economic and geopolitical uncertainties stemming from the reduced significance of oil in the global energy sphere [26]. Renewable energy is associated with the concept of "energy democracy," allowing for more diverse participation and benefits for individuals and communities. A more inclusive energy approach can contribute to a fairer and more stable global energy environment, enhancing geopolitical stability [27]. In a world where energy is democratized, with broader access and control, it's anticipated that geopolitical stability will also rise. Considering the historical geopolitical conflicts surrounding oil, it is logical to replace oil with new energy sources in geopolitical discussions, particularly critical materials for emerging technologies. This shift from oil-centric geopolitics reflects the evolving global energy and resource landscape to address new challenges and opportunities [15].Investments in renewable energy and emerging technologies can establish novel hubs of geopolitical influence, potentially reshaping global power dynamics and governance. This transformative process may lead to a world with a handful of

dominant powers or one where geopolitical power is more equitably distributed among numerous countries [25]. The decisions made in the realms of renewable energy and technological progress hold the potential to reshape the global power dynamics, with significant implications for the future landscape of international affairs and governance. The transition to green energy technologies is essential to bolster global sustainability and mitigate worldwide instability. Reducing fossil fuel consumption is imperative for a more sustainable and stable global environment [6]. Understanding a region's energy geopolitics involves analysing factors like natural resource size and location, accessibility, costs, transportation routes, market dynamics, regulations, political decisions, and pricing. These elements collectively shape a region's energy policies, security, and its role in the global energy landscape [28]. The significance of geopolitical considerations, like the Russian-Ukrainian conflict, on energy security will diminish as renewable energy sources are integrated into the global energy mix. The growing adoption of renewables will reduce the world's dependence on conventional energy sources and the associated geopolitical complexities, rendering energy security less susceptible to such geopolitical conflicts [29]. Novel international coalitions have emerged around specific renewable energy technologies, challenging established institutions like OPEC (Organization of Petroleum Exporting Countries). These changes may require substantial alterations to the existing energy landscape's structure and mission, potentially diminishing the significance of traditional institutions [18].

Intersecting Energy Security and Geopolitical Dynamics in the Global Energy Market

Within the domain of energy security and its intricate relationship with geopolitics, the objectives pursued by nations are intricately linked to their roles in the global energy market [29]. Import-dependent countries prioritize the stability of their energy supply, while energy exporters focus on gaining access to international markets, energy producers emphasize resource development, and forward-thinking nations prioritize the adoption of clean energy solutions. A central aspect of this interplay lies in the concept of "import dependency," signifying a nation's inability to meet its energy demands solely through domestic production, thus necessitating energy imports. This dependency has profound implications for a country's energy security and its international energy relationships [28]. To navigate these complex dynamics, it is imperative to consider the impact of climate change and implement effective policies. These measures can significantly influence energy security, potentially leading to a paradigm shift focused on reducing carbon emissions and accentuating the pivotal role of renewable energy sources. A particularly exciting prospect on the horizon involves the development of a global high-capacity electricity grid capable of transmitting power generated from renewable sources like wind and solar. This grid would interconnect regions abundant in renewable resources, such as the North Pole and African deserts, with high-demand areas like the United States, Asia, and Europe. Such a transformation, transitioning from fossil fuels to clean electricity, holds the potential to reshape energy security and revolutionize the broader energy landscape [30]. It is evident that an increase in energy efficiency has a dual advantage, as it simultaneously enhances both energy security and environmental sustainability. Conversely, a lack of energy efficiency presents challenges to both energy security and environmental well-being, exerting a negative impact on economic development [31]. The concerns are shared by both energy importers, who seek a reliable and cost-effective energy supply, and exporters, who strive for stable demand and fair pricing. Both worry about unpredictable energy prices, which make planning and policy challenging, further compounded by concerns regarding the security of critical energy infrastructure within the global energy system [32]. An interesting observation arises when examining nations specializing in fossil fuel production. Contrary to conventional assumptions associated with the "resource curse" concept, these countries do not consistently outperform their counterparts in guaranteeing energy security for their populations. In essence, while being a significant fossil fuel producer doesn't guarantee improved energy security, it also doesn't inherently result in decreased security [33].

International Alliances Shaping the Future of Green Energy and Climate Action

International alliances for green energy are gaining prominence due to several converging factors. Global economic growth fuels the demand for energy, making renewable sources more appealing. Environmental commitments, propelled by international agreements, are further accelerating the transition to renewable energy. This convergence sets the stage for renewable energy development to accommodates new power players and heighten global competition while addressing environmental concerns [19]. The International Solar Alliance (ISA) emerged as a novel

endeavour initiated during the 2015 Paris climate conference, with India and France working together to establish it [34]. Over the years, the ISA has evolved into a prominent participant in global effort to combat climate change. It leverages the expertise of its global network to support solar energy solutions, economic development, and social equity within its member nations [35]. In regions characterized by abundant sunlight, particularly those within the Tropic of Cancer to the Tropic of Capricorn, the focus is on harnessing solar energy for a sustainable and environmentally conscious future. The importance of international collaboration in securing a reliable energy supply was prominently recognized at the Paris Climate Summit in December 2015, particularly championed by the Indian Government. This vision aimed to unite nations within the solar-rich band, facilitating the exchange of experiences and collective technology-based solutions. In response, the International Solar Alliance (ISA) was conceived as a consortium of countries committed to leveraging their solar assets for environmental improvement and an enhanced quality of life. The International Solar Alliance (ISA) functions as a cooperative platform, primarily among developing nations, with the dual goal of promoting solar energy adoption and collaborative research and development for indigenous solar power equipment manufacturing.

This collective effort unites countries to pool resources and knowledge to enhance their solar technology capabilities, encompassing principles of knowledge sharing, experience exchange, and global resource pooling. The alliance aspires to translate the concept of "power for all" into a pragmatic reality by enabling research and technology cooperation within developing nations, thereby not only enhancing access to clean and sustainable energy sources but also bringing universal energy access closer to reality [36]. International partnerships focused on solar energy have significant geopolitical advantages. These collaborations can bridge the economic gap between more developed northern countries and less affluent southern nations, fostering global markets for cutting-edge energy technologies without sparking conflicts over scarce energy resources. These solar energy partnerships level the global energy playing field and promote cooperation in pursuit of sustainable energy solutions [37]. The European Union-Brazil Strategic Partnership, which prioritizes cooperation in addressing climate change challenges, has faced some complexities in its execution. Despite the European Union's recognition of Brazil as a significant partner in international forums since 2007, Brazil's alignment with the BASIC coalition of emerging economies post-COP 15 and the EU's historical neglect of Brazil have contributed to the EU's limited influence in the country [38]. To address climate change, a global transition is essential. This transition involves reducing carbon emissions within international supply chains, fostering cross-border collaboration for clean technology, and implementing advanced technologies worldwide. Recent initiatives, like the Indonesian Just Energy Transition Partnership, the Australia-Singapore Green Economy Agreement, the proposed U.S.-EU Carbon-Based Sectoral Arrangement on Steel and Aluminium Trade, and the Africa-EU Energy Partnership, represent coordinated worldwide efforts to promote cleaner and more sustainable energy practices [39]. Establishing partnerships with Russia under the Kyoto Protocol has been challenging due to the absence of well-defined institutional arrangements and distinct roles. Russia actively seeks alliances to protect its economic advantages from protocol ratification. Capacity development is a valuable tool for creating these alliances and advancing Russia's domestic developments [40]. The ongoing discourse surrounding the green economy highlights the North-South divide in international relations. Developing nations express concerns that the concept of a 'green economy' may be manipulated by developed countries for their own interests [41].

Transitioning to Sustainable Energy Sources: A Global Imperative

Over the past century, global energy consumption has undergone a significant transformation. In 1925, coal was the dominant energy source, supplying 80% of the world's energy needs. However, recent decades have witnessed a shift, with petroleum, natural gas, and coal contributing 45%, 25%, and 30%, respectively, driven by factors such as population growth and rising energy demand. Notably, concerns about the finite nature of fossil fuel reserves have become increasingly urgent, with estimates suggesting less than 40 years of petroleum, around 60 years of natural gas, and roughly 250 years of coal reserves [42]. This underscores the critical need to transition to sustainable energy sources to meet the energy demands of a growing global population and address pressing environmental issues[43]. The systemic nature of the transition toward sustainability necessitates the integration of green energy policies with other policy domains, including trade and public investment. This integrated set of tools available to governments, collectively known as "green energy policy," encompasses all governmental measures aimed at reshaping a country's

energy sector to align with the imperatives of sustainable development while considering ecological limits and natural resource availability. This policy framework is fundamental in achieving the goals of a green economy, characterized by a low carbon footprint, efficient resource utilization, and societal inclusivity as defined by the United Nations Environment Programme. In essence, it revolves around transforming the energy sector into a more environmentally sustainable system, contributing to broader sustainability objectives within the economy [14].Governments are proactively pursuing investments in two essential domains: sustainability initiatives and economic diversification projects. Sustainability efforts involve the development of policies and projects aimed at safeguarding the environment, reducing carbon emissions, and promoting responsible resource utilization in response to concerns about climate change and broader environmental issues. In parallel, governments are striving for economic diversification to reduce dependence on specific sectors, particularly industries like oil, by venturing into diverse economic areas. These investments reflect the state's ambition to modernize its economic landscape, recognizing the importance of adapting to contemporary challenges and seizing emerging opportunities [11].

Furthermore, the effectiveness of sustainability strategies, with a focus on green energy, is directly related to increasing technological, sectoral, and application impact ratios. This indicates that as these ratios rise, the adverse effects on industrial, technological, sectoral, and societal progress are progressively reduced or even entirely mitigated during the transition to and utilization of green energy technologies. Such amelioration is most pronounced when sustainable energy approaches are prioritized and put into practice. Therefore, the strategic implementation of sustainable energy policies becomes crucial. These sustainable energy strategies hold significant potential, especially in nations endowed with abundant sources of green energy, spanning wind, solar, tidal, and biomass. It is imperative for governments and relevant authorities to actively endorse and invest in the advancement of green energy, steering nations toward a more ecologically responsible and sustainable future while gradually phasing out fossil fuels in favour of cleaner and renewable alternatives [7].

There is a growing commitment of multinational enterprises (MNEs) and public organizations to sustainability and decarbonization through investments in renewable energy, so the concept of energy democracy takes on a broader dimension. It extends beyond the mere expansion of the energy sector to accommodate large-scale renewable projects. Specifically, wind-energy investments, guided by the principles of the United Nations' Partnerships for the Goals, offer sustainable pathways to universal energy access and climate change mitigation, in alignment with the objectives of the 2030 Agenda for Sustainable Development, particularly targeting Energy for All and environmental sustainability [44]. Low-carbon technologies, which are essential for sustainability, have multifaceted effects on security, serving as diplomatic tools, enhancing military capacity, or becoming targets of conflicts. Competition for these innovations can lead to disputes, potentially disrupting energy supply chains. The risk of uncoordinated geoengineering actions poses escalation risks. Understanding this intricate interplay between technology and security is increasingly important as these technologies advance [45]. While the era of fossil fuels may not be ending soon, the transition to sustainable energy is crucial due to the finite nature of fossil fuel reserves. The shift to green energy represents a cost-efficient and environmentally favourable transformation that offers a path to a more sustainable and responsible future [46]. However, green energy policies face a complex landscape marked by uncertainty and a need for long-term planning. The real-world dynamics of economics and society involve competing interests, leading to conflicts and disagreements among different societal groups with varying objectives. Given these challenges, actions taken to promote the green transition must be widely accepted and considered legitimate. To bear the additional costs associated with this transformation, it's crucial to prioritize social inclusion and fairness. Sustaining long-term support for these initiatives depends on ensuring that various segments of society perceive the sharing of responsibilities as fair and that the benefits derived from these policies are distributed equitably. Achieving this balance is vital for gaining and retaining public support for green initiatives [14]. In summary, the green economy combines economic, environmental, and social considerations, offering a path to both growth and sustainability while safeguarding natural resources for the benefit of individuals, society, and global stakeholders [47].

Case studies:

EU Leadership in Climate Diplomacy and Energy Transition Challenges

In recent times, global attention has sharpened on decarbonization and effective climate policies, spurred by the increasing frequency of extreme weather events(like droughts, heatwaves, heavy rainfall, floods) worldwide, including Europe. These events serve as a stark reminder of the urgent need for collective climate action [29]. The European Union (EU) is a key player in global climate diplomacy and energy geopolitics. It successfully influenced major countries like China, India, and the United States to commit to legally binding emissions targets in Paris agreement. The EU not only shapes diplomacy but also sets energy market rules, recognizing climate change as a security issue. However, there are concerns that its focus on costly oil and gas infrastructure may contradict its climate goals [48].Many European countries heavily rely on fossil fuels, with over 60% of their energy consumption coming from them. Even leading nations like Germany and the United Kingdom have more than 80% reliance on fossil fuels. Achieving low-carbon energy systems remains challenging, despite policy efforts. The EU's approach to cooperating with Russia, particularly regarding climate change, has fluctuated and now faces uncertainties due to the Ukraine crisis [49]. The EU's cautious approach to cooperating with Russia, influenced by Russia's aggressive foreign policy since 2014, was warranted. Nevertheless, from 2019 until Russia's assault on Ukraine in 2022, both sides showed interest in collaborating on climate change. At present, Russia's conduct doesn't support selective engagement, including climate and energy transition [50]. The EU is also emphasizing a reduced reliance on Russian energy supplies since then [48]. The EU has made notable progress in reducing greenhouse gas emissions, aligning with its carbon-neutral objectives. However, the EU's growing dependence on energy imports, now at 60.6%, raises concerns about energy security [29].

Renewable energy sources are steering the transition to low-carbon energy, a global priority. In the EU, renewables supplied 38% of electricity in 2020, a significant part of the energy mix. Achieving carbon neutrality through green energy sources, energy conservation, and sustainable bio economies is strategically and economically feasible in EU countries. However, challenges like energy import dependency, cost concerns, political issues around renewables, and limited emission reduction policies require further research [29]. In late 2019, the European Union introduced an ambitious initiative known as the "Green Deal," designed to propel EU member states to the forefront of the fight against climate change. This comprehensive plan is focused on achieving zero net greenhouse gas emissions by 2050 and commits to reducing emissions by a minimum of 55% by 2030 compared to 1990 levels[51].Also, out of the 1.8 trillion Euros allocated for COVID-19 recovery, the EU plans to spend at least 30% on climate protection to meet its decarbonization commitments. This demonstrates a proactive approach to addressing the pandemic's economic impact while advancing climate goals [52]. Achieving deep decarbonization within the EU can be financially viable, with costs similar to maintaining the current energy system, assuming the implementation of appropriate policies and regulations [29]. This transition also has the potential to be socially acceptable if measures are taken to address and mitigate any distributional impacts stemming from more extensive decarbonization, irrespective of global actions in this regard [53]. The Kyoto Protocol, a significant climate agreement signed in 1997, set emission reduction targets for developed nations but notably excluded major polluters such as China and India, a significant limitation in the battle against climate change. As the EU progresses toward an energy transition, it's crucial for consumers and businesses to engage actively in energy conservation and efficient usage. Energy companies are pivotal in this process, adapting their strategies accordingly, and the EU's economic competitiveness and energy security face new challenges in the post-pandemic energy landscape [54].

China's Evolving Role in the Global Energy Market: Investments, Opportunities, and Challenges

China's engagement in the global energy market demands a focus on energy security and a balanced approach to investment sources, ensuring global energy stability. The inception of China's "Going Out" policy in the 1990s, which aimed to promote foreign investments by leading national companies, saw minimal Chinese involvement in the global power sector until 2012 [55]. The Chinese government exerts significant influence on foreign energy investments by impacting the choices made by energy firms and offering diplomatic assistance in cross-border energy investment partnerships [56]. The transition from facing severe power shortages in the 1980s to witnessing Chinese corporations now holding a substantial $115 billion USD in global electric power assets (covering the period

from 2000 to 2017) represents a remarkable journey. These investments typically involve an average ownership stake of 73%, translating to a total capacity of 81 GW and a net capacity of 59 GW. These ventures primarily focus on developing countries, particularly in Asia and Latin America [55]. Research by Ren & Sovacool (2015) identifies hydroelectricity and wind power as promising sources for China's energy security, while solar power lags due to intermittency and regional variability. China's investment through BRI in 28 renewable power projects in Pakistan created 8,905 jobs and generated $39.8 million in production, wind power projects contributed $30.7 million, and solar power projects contribute $9.1 million to this total. These projects with Chinese involvement also lead in creating jobs and production value [57]. Chinese investments in Africa follow a distinct model encompassing loans, foreign direct investment (FDI), trade, and renewable energy projects. Concerns about exploitative development persist but hinge on local firms' capabilities compared to foreign counterparts. Bridging this capability gap is vital, emphasizing the creation of green and cost-effective infrastructure, regardless of the builder [58]. China's rapid growth as an investor in Europe's energy sector, exceeding 20 billion euros in 2015, raises concerns due to the significant role of state-owned enterprises and potential national interest-driven motives, with accompanying apprehensions regarding national security risks [59]. China is prioritizing overseas investments in renewable energy, particularly in solar and wind, which could result in substantial economic gains. Their global hydropower investments are also noteworthy, and if they were to double these investments in the next 15 years, China alone could meet the emissions reduction goals of all Paris Agreement countries. However, it's crucial to acknowledge that not all of these investments may reduce carbon emissions. China has significant opportunities for growth in solar and wind technologies [60]. Chinese policy banks allocate a substantial part of their energy portfolio to renewables, demonstrating a strong commitment to green energy [61]. The Chinese energy cooperation model drives rapid growth, primarily benefiting specific sectors, while Central Asian countries require institutional reforms to transition to market-based economies. Some experts see China's experience as a valuable model for other developing nations participating in the Belt and Road Initiative (BRI).

Conclusion and future directions

This research paper has illuminated the multifaceted landscape of green energy geopolitics, underlining the profound implications of transitioning to sustainable energy sources. It is evident that the global shift towards renewable energy holds significant promise and also presents various challenges that encompass economic, societal, and political dimensions. While navigating uncertainties and risks is an inherent part of this transition, there is a prevailing expectation that renewables have the potential to contribute to a more peaceful global energy scenario in the long term. The "Big Green Deal" scenario emerges as a beacon, offering a path to transition the global economy towards low carbon, with substantial benefits in alignment with the Sustainable Development Goals. The geopolitics of energy unfolds as both an opportunity and a concern. The transition to renewable energy provides an avenue for integrating emerging global powers into the international political framework, fostering international peace, and reducing geopolitical risks. Simultaneously, it carries the potential to trigger international disputes, reminiscent of historical tensions surrounding fossil fuel control and distribution. Investments in renewable energy and emerging technologies have the power to establish novel hubs of geopolitical influence, potentially reshaping global power dynamics and governance. As renewable energy sources are integrated into the global energy mix, the significance of geopolitical considerations, such as those arising from conflicts like the Russian-Ukrainian conflict, on energy security is expected to diminish. The emergence of novel international coalitions centred around specific renewable energy technologies challenges established institutions like OPEC. The research also highlights the intricacies of energy security, emphasizing that an increase in energy efficiency offers dual advantages by enhancing both energy security and environmental sustainability. Conversely, a lack of energy efficiency presents challenges in both realms and exerts a negative impact on economic development. It is noteworthy that being a significant fossil fuel producer does not guarantee improved energy security, nor does it inherently result in decreased security. The concept of "import dependency" plays a pivotal role, indicating a nation's reliance on energy imports to meet its demands. Furthermore, international alliances focusing on green energy, such as the International Solar Alliance (ISA) and the European Union-Brazil Strategic Partnership, carry significant geopolitical advantages. These alliances have the potential to reshape global cooperation in addressing climate change and advancing sustainable energy solutions. However, the discourse surrounding the green economy underscores the North-South divide in international

relations, emphasizing the need for equitable global participation in the transition to renewable energy. Lastly, the paper delves into sustainability and the integration of green energy policies with other policy domains. The systemic nature of transitioning toward sustainability necessitates a comprehensive approach involving trade, public investment, and strategic policy tools. Governments are proactively investing in sustainability initiatives and economic diversification projects, recognizing the importance of increasing technological, sectoral, and application impact ratios. The commitment of multinational enterprises and public organizations to sustainability and decarbonization through investments in renewable energy signifies the broadening dimensions of energy democracy.

As we move forward, future trends in this field of research are likely to focus on several key areas. First, scholars may delve into the evolving role of renewable energy in international politics and its impact on global governance structures. Second, the dynamics of international cooperation and competition in the green energy sector will continue to be a subject of study, especially concerning emerging global powers. Third, research on the socioeconomic implications of the transition to sustainable energy and its influence on income distribution and job markets will gain prominence. Fourth, in the context of the North-South divide, there will be an emphasis on strategies for equitable international participation in renewable energy development. Lastly, scholars may explore innovative policies and initiatives aimed at enhancing the integration of green energy into various policy domains, such as trade, investment, and technological innovation. In a world where the finite nature of fossil fuel reserves necessitates a shift to sustainable energy, the research presented here underscores the importance of understanding the multifaceted landscape of green energy geopolitics, its intricate interplay with energy security, and the need for effective, sustainable policies to shape the future of our global energy landscape.

ABSTRACT

The Primary goal of this study is to present the concept of a Supernumerary number of directed and Total directed graphs. We have investigated some of the properties of Engender edge set and extended to it to introduce the super numerary number . A directed graph is said to be minimally connected sub digraph if removal of any one edge from it will disconnects the directed graph. The minimum cardinality of a set $E \subseteq A$ is said to be Engender edge set of Dif (i) $\gamma^+(D) = \gamma^+(D-E)$(ii) $D-E$ is a minimally connected sub digraph. The minimum cardinality of a Engender edge set is called a Supernumerary number of a directed graph D and it is denoted by $S_n(D)$ and we prove that the supernumerary number of Total graph of some standard graphs.

Keywords: Total graph, Minimally connected sub digraph, Total directed graph, Engender edge set, Super numerary number.

INTRODUCTION

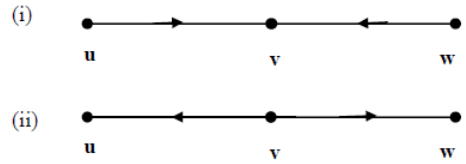
The total graph of a given graph defined in the open literature. Total graph of a graph G, denoted by $T(G)$ is a graph whose vertices are represented by each vertex and each edge of G. There is an edge between two vertices in $T(G)$ if and only if there is edge-edge adjacency or edge-vertex incidence or vertex-vertex adjacency in G .The structural properties of total graphs were investigated in some open literature. The research gap is no researchers to find the total graph of a directed graph. This research gap is induced us to define a Total directed graph of a directed graph. Both total and directed graphs was using in Network Theory. The total directed graph will enrich the Network Theory, this is the reason for choosing the method. A directed graph is said to be minimally connected sub digraph if

removal of any one edge from it, then the directed graph will be disconnected. A directed graph with minimum cardinality of a set $E \subseteq A$ is said to be Engender edge set of D if (i) $\gamma^+(D) = \gamma^+(D-E)$(ii) $D-E$ is a minimally connected sub digraph.The minimum cardinality of a engender edge set is called a supernumerary number $S_n(D)$ of a directed graph *D*. We investigate some bounds of a super numerary number$S_n(D)$of a directed graph $D$and to establish the various parameters of a super numerary number $S_n(T(D))$of a Total directed graphs $T(D)$.

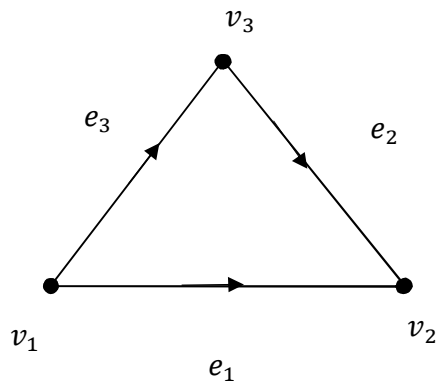
METHODOLOGY

Definition 2.1:
Two adjacent edges are said to be Anti directed if either $(u,v)(w,v) \in A(D)$or $(v,u)(v,w) \in A(D)$.

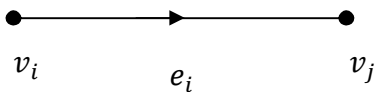
Example 2.1 (a):

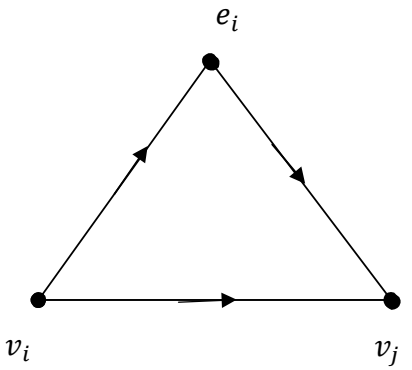


Definition 2.2:
A closed anti directed walk from u to v is a Anti directed cycle if all its vertices are distinct except that $u = v$. The Anti directed cycle with n vertices is denoted by $\overleftrightarrow{C_n}$.
Example 2.2(a): Consider the Anti directed cycle $\overleftrightarrow{C_3}$ with 3 vertices.

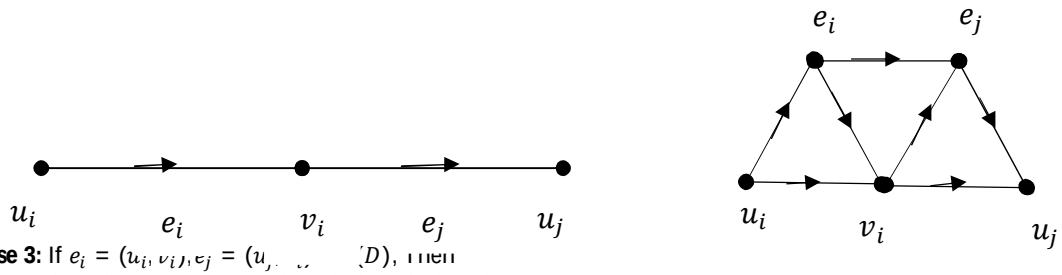


Definition 2.3:
The **Total directed graph $T(D)$** of a digraph D is defined as follows :
(i) Consider $T(G(D))$ total graph of underlying graph.
(ii)We give directions to each edge in $E(T(G(D)))$ as follows.
Case 1: If $e_i = (v_i, v_j) \in A(D), Then\ (v_i, e_i), (e_i, v_j), (v_i, v_j) \in A(T(D))$.

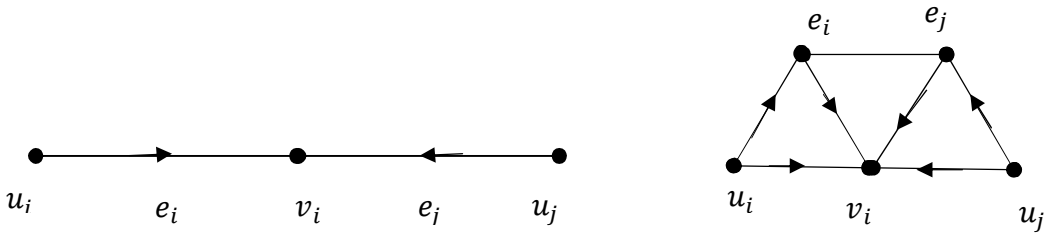




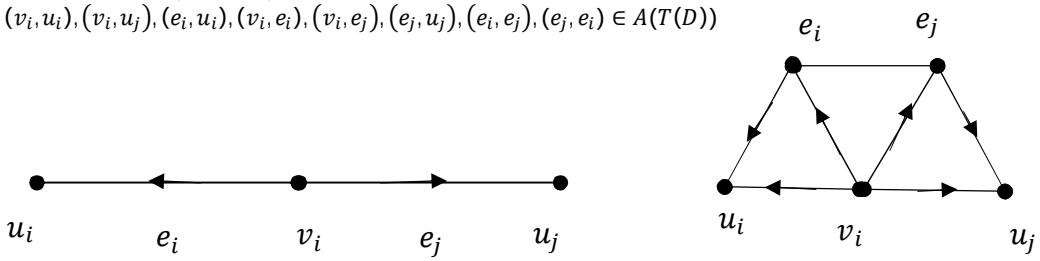
Case 2: If $e_i = (u_i, v_i), e_j = (v_i, u_j) \in A(D)$, Then$(u_i, v_i), (v_i, u_j), (u_i, e_i), (e_i, v_i), (v_i, e_j), (e_j, u_j), (e_i, e_j) \in A(T(D))$



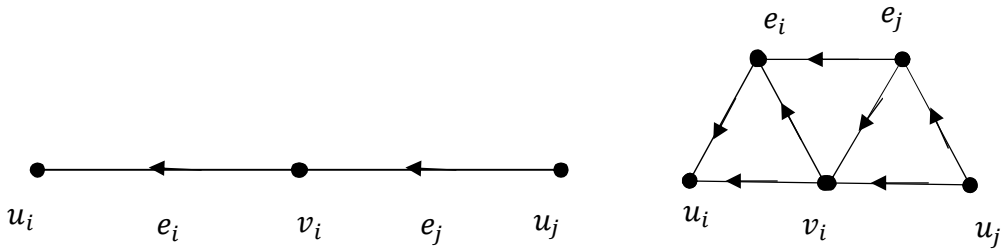
Case 3: If $e_i = (u_i, v_i), e_j = (u_j, v_j) \in A(D)$, Then
$(u_i, v_i), (u_j, v_i), (u_i, e_i), (e_i, v_i), (e_j, v_i), (u_j, e_j), (e_i, e_j), (e_j, e_i) \in A(T(D))$



Case 4: If $e_i = (v_i, u_i)$, $e_j = (v_i, u_j) \in A(D)$,
Then $(v_i, u_i), (v_i, u_j), (e_i, u_i), (v_i, e_i), (v_i, e_j), (e_j, u_j), (e_i, e_j), (e_j, e_i) \in A(T(D))$

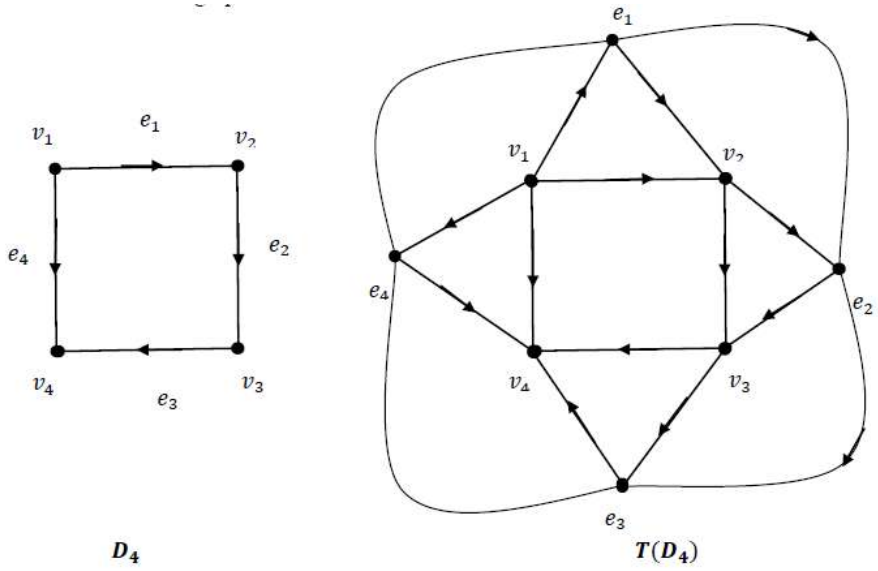


Case 5: If $e_i = (v_i, u_i), e_j = (u_j, v_i) \in A(D)$, Then
$(v_i, u_i), (u_j, v_i), (v_i, e_i), (e_i, u_i), (u_j, e_j), (e_j, v_i), (e_j, e_i) \in A(T(D))$



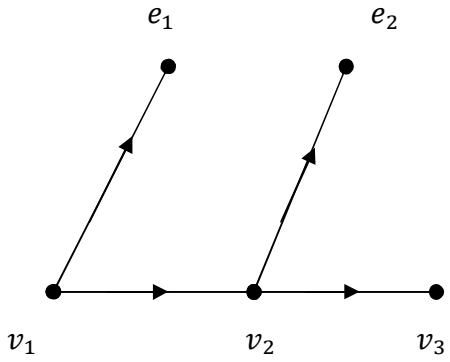
If (u_i, v_j) and $(v_j, u_i) \in A(D)$, then we write as instead of

Example 2.3(a):
(i)Consider the directed graph with 4 vertices .



Definition 2.4:
A directed graphis said to be minimally connected sub digraph if removal of any one edge from it, then the directed graphwill be disconnected. A minimally connected sub digraph need not be either weakly connected or strongly connected .A minimally connected sub digraph has no cycles.

Example 2.4(a):

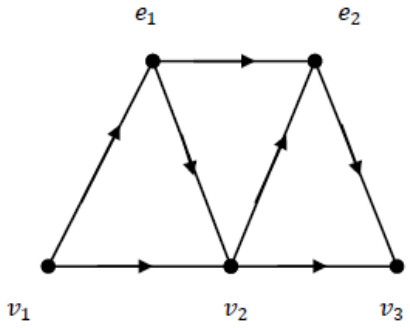


From the above figure, if we remove any one arc from it, then the sub digraph will be disconnected.

Definition 2.5: Let$D = (V, A)$ be a directed graph. The minimum cardinality of a set $E_e \subseteq A$ is said to be Engender edge set of Dif (i) $\gamma^+(D) = \gamma^+(D - E)$(ii) $D - E_e$ is a minimally connected sub digraph.

Definition 2.6:
Let $E_e$be a Engender edge set and the minimum cardinality of a Engender edge set is called a Super numerary number of a directed graph D and it is denoted by $S_n(D)$.

Example 2.6(a) :



From the above figure, the set of all edges $\{(e_1, v_2)(e_2, v_3)(e_1, e_2)\}$ be the Engender edge set $E_e(D)$ of $D$and $|E_e(D)|$ = 3. Therefore, the Supernumerary number of a above graph is 3.

RESULT AND DISCUSSION

Theorem 3.1:

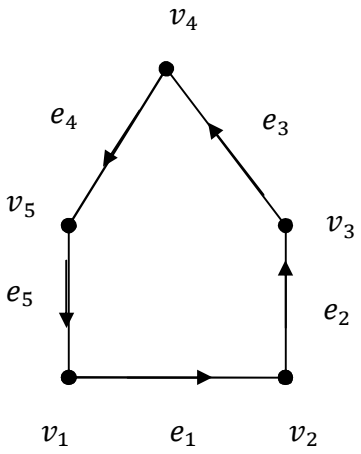
The Supernumerary number of directed cycle $S_n(\overrightarrow{C_n})$ is one.

Proof

Let $v_1, v_2, \ldots, v_n$be the vertices and $e_1, e_2, \ldots, e_n$be the arcs of directed cycle $\overrightarrow{C_n}$. By definition 2.5, we can find the engender edge set$E_e(\overrightarrow{C_n})$ and it contains only one edge.After removing the Engender edges, $\gamma^+(D) = \gamma^+(D - E_e)$ and $D - E_e$ is minimally connected sub digraph. By definition 2.6, $S_n(\overrightarrow{C_n}) = |E_e(\overrightarrow{C_n})|$ be the supernumerary number of a directed cycle and it has one edge.Hence , the supernumerary number of directed cycle $S_n(\overrightarrow{C_n})$ is one.

Example 3.1(a):

Consider the directed cycle with 5 vertices $\overrightarrow{C_5}$.

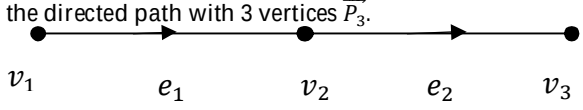


From the above figure, the set of all edges $\{(v_2, v_3)\}$ be the Engender edge set $E_e(\overrightarrow{C_5})$ of $\overrightarrow{C_5}$and $|E_e(\overrightarrow{C_5}.)|$ = 1. Therefore, the supernumerary number of a directed cycle with 5 vertices $S_n(\overrightarrow{C_5})$ is one .

Theorem 3.2:
The Supernumerary number of directed path $S_n(\overrightarrow{P_n})$ is zero.

Proof :
Let $v_1, v_2, \dots, v_n$be the vertices and $e_1, e_2, \dots, e_{n-1}$be the arcs of directed path$\overrightarrow{P_n}$. By definition 2.5, we can find the engender edge set $E_e(\overrightarrow{P_n})$ and it contains no edges. After removing the Engender edges, $\gamma^+(D) = \gamma^+(D - E_e)$ and $D - E_e$ is minimally connected sub digraph.By definition 2.6, $S_n(\overrightarrow{P_n}) = |E_e(\overrightarrow{P_n})|$ be the supernumerary number of a directed path and it has no edges. Hence , the supernumerary number of directed path$S_n(\overrightarrow{P_n})$ is zero .

Example 3.2(a):
Consider the directed path with 3 vertices $\overrightarrow{P_3}$.

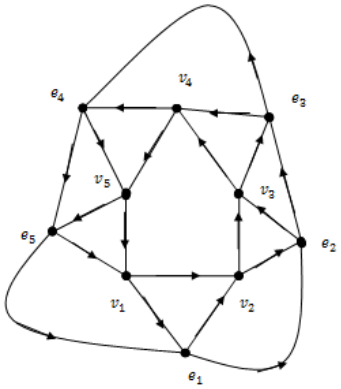


From the above figure, the Engender edge set $E_e(\overrightarrow{P_3})$ of $\overrightarrow{P_3}$ contains no edges and $|E_e(\overrightarrow{P_3})|$ = 0. Therefore, the supernumerary number of a directed path with 3 vertices $S_n(\overrightarrow{P_3})$ is zero .

Theorem 3.3:
The Supernumerary number of Total directed cycle $S_n(T(\overrightarrow{C_n}))$ is $2n + 1$.

Proof :
Let $v_1, v_2, \dots, v_n$be the vertices and $e_1, e_2, \dots, e_n$be the arcs of directed cycle $\overrightarrow{C_n}$. By Definition 2.3, $T(\vec{C}_n)$has the vertices $v_1, v_2, \dots, v_n$and $e_1, e_2, \dots, e_n$. Hence $|V(T(\vec{C}_n))| = n + n = 2n$ and $|E(T(\vec{C}_n))| = 4n$. By definition 2.5, we can find the Engender edge set $E_e(T(\overrightarrow{C_n}))$and it contains $2n + 1$ edges.After removing the Engender edges, $\gamma^+(D) = \gamma^+(D - E_e)$ and $D - E_e$ is minimally connected sub digraph. By definition 2.6, $S_n(T(\overrightarrow{C_n})) = |E_e(T(\overrightarrow{C_n}))|$ be the supernumerary number of a Total directed cycle and it contains $2n + 1$ edges. Hence, the supernumerary number of Total directed cycle $S_n(T(\overrightarrow{C_n}))$ is $2n + 1$.

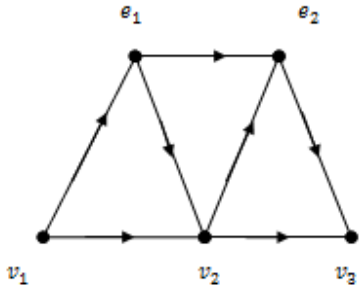
Example 3.3(a):
Consider the Total directed cycle $T(\vec{C}_5)$ with 5 vertices. In this graph, the set of all edges $\{(e_1, e_2)(e_1, v_2)(v_2, e_2)(v_3, e_3)(v_3, v_4)(e_3, e_4)(e_4, v_5)(e_4, e_5)(v_5, v_1)(e_5, v_1)(e_5, e_1)\}$ be the Engender edge set $E_e(T(\vec{C}_5))$ of $T(\vec{C}_5)$and $|E_e(T(\vec{C}_5))|$ = 11.Therefore, the supernumerary number of a Total directed cycle with 5 vertices $S_n(T(\overrightarrow{C_5}))$ is $2 \times 5 + 1 = 11$.



Theorem 3.4:
The Supernumerary number of Total directed path $S_n(T(\overrightarrow{P_n}))$ is $2n-3$.

Proof :
Let $v_1, v_2, \dots, v_n$be the vertices and $e_1, e_2, \dots, e_{n-1}$be the arcs of directed path$\overrightarrow{P_n}$. By Definition 2.3, $T(\vec{P}_n)$ has the vertices $v_1, v_2, \dots, v_n$and $e_1, e_2, \dots, e_{n-1}$. Hence $|V(T(\vec{P}_n))| = n + n - 1 = 2n - 1$and $|E(T(\vec{P}_n))| = 4n - 5$. By definition 2.5, we can find the Engender edge set $E_e$and it contains $2n-3$ edges.After removing the Engender edges, $\gamma^+(D) = \gamma^+(D - E_e)$ and $D - E_e$ is minimally connected sub digraph.By definition 2.6, $S_n(T(\overrightarrow{P_n})) = |E_e(\mathrm{T}(\overrightarrow{P_n}))|$ be the supernumerary number of a total directed path and it contains $2n-3$ edges. Hence, the supernumerary number of Total directed path $S_n(T(\overrightarrow{P_n}))$is $2n-3$.

Example 3.4(a):
Consider the Total directed path $T(\vec{P}_3)$ with 3 vertices



From the above figure, the set of all edges $\{(e_1, v_2)(e_1, e_2)(e_2, v_3)\}$ be the Engender edge set $E_e(\overrightarrow{P_3})$ of $\overrightarrow{P_3}$and $|E_e(\overrightarrow{P_3})| = 2 \times 3 - 3 = 3$.

CONCLUSION

This study has discussed some bounds and parameters of Supernumerary number of directed graphs and Total directed graphs .In future, comparative study of Supernumerary number and Static index number of Total directed graphs can be done.

ACKNOWLEDGEMENT

The authors are highly grateful to the refree for his/her careful reading, valuable suggestions and comments, which helped us to improve the presentation of this paper.

Declaration

The work has been presented in " International Conference on Emerging Trends in Mathematical Sciences (ICETMS-2024) Organized by the Department of Mathematics of S.B.K College, Aruppukottai on 24.04.2024. The Organizer Claims the peer review responsibility.

ABSTRACT

The researcher meticulously examines in this article, the action research with topology, and gives a articulate description about the contradiction of continuity to introduce some important insights into the use of contra $p(gg)^*$-continuous functions and therefore gives a pathway for almost contra$p(gg)^*$-continuous functions in topological spaces. Some characterization concerning these continuous functions are uttered clearly and the contradiction to investigation with some of their basic properties using $p(gg)^*$-closed and$p(gg)^*$-continuous are made and discovered significant results. In this article, the properties of$p(gg)^*$-closed sets are focused for comparing the desired continuous function.

Keywords: $p(gg)^*$-closed,$p(gg)^*$-open,$p(gg)^*$-continuous, contra $p(gg)^*$-continuous functions and almost contra$p(gg)^*$-continuous.

Mathematics Subject Classification : 54A05,54C05,54D70.

INTRODUCTION

Generalized closed sets play savital role in General topology and they are now there search topics of many topologist worldwide. Indeed a significant theme in general to pology and real analysis concerns the variously modified forms of continuity, seperation axiom setc., The concept of generalized closed sets [1] in topological space was introduced by N.Levine in 1970. D.E.Cameronand M.Stone introduced regular open [2] and regular semi open

sets[3] respectively. In 2017,Basavaraj M.Ittanagi and Govardhana Reddy introduced and studied generalization of generalized closed sets [4] in topological spaces. In 2018, I.Christal Bai and T.Shyla Isac Mary introduced and studied generalization of generalized star closed sets [5] in topological spaces and further they have introduced alpha generalization of generalized star closed sets[6]in2022.Where$\boldsymbol{\alpha(gg)^*}$-closed sets are compared with alpha closed, regular closed, $\boldsymbol{g^*}$-closed and many more.In 2023, J.Rajakumariand S.Pavithra [7] has introduced Pre generalization of generalized star closed sets in topologicalspaces as proceeding .where $\boldsymbol{p(gg)^*}$-closed set is defined and compared with $\boldsymbol{\alpha}$-closed, $\boldsymbol{\alpha(gg)^*}$-closed and many more. Dontchev [8] introduced the notions of contra continuity and strong S-closedness into pologicals paces. In this he defined a function $\boldsymbol{f: X \to Y}$is said to be contra continuous only if the pre image of every open set of $\boldsymbol{Y}$is closed in $\boldsymbol{X}$. In 2007,M.Caldas,S.Jafari,T.Noiri,M.Simeos [9]introduceda new generalization of contra continuity viale vines$\boldsymbol{g}$-closedsetsS. Jafari and T.Noiri [10] introduced about contra $\boldsymbol{\alpha}$-continuous functions between topological spaces. From the direction of this we have introduced contra$\boldsymbol{p(gg)^*}$-closedsets.

2. Preliminaries

Throughout this paper(X,τ), $(Y,\sigma)$and (Z,η)orX,Y,Zrepresents non empty topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset A of a space(X,τ), cl(A) and in t(A) denote the closure and interior of A respectively. The power set of X is denoted by P(X).

Definition2.1A sub set A of a topological space $(X,\tau)$is called $p(gg)^*$-closed sets [7] if $pcl(A)\subseteq U$ whenever $A\subseteq U$ and U is$(gg)^*$-open in(X,τ).

Definition2.2A function $f:(X,\tau)\to(Y,\sigma)$is called $p(gg)^*$-continuous if$f^{-1}(O)$ is a$p(gg)^*$-open set of(X,τ)fo revery open set $O$of (Y,σ).

Definition2.3A function $f:(X,\tau)\to(Y,\sigma)$ is called contra continuous(8)if $f^{-1}(O)$ is a closed set of$(X,\tau)$for every open set $O$of(Y,σ).

Definition 2.4A function$f:(X,\tau)\to(Y,\sigma)$is called contra$g$-continuous(resp.contraα– continuous[10],contra rw-continuous[13],contra R* continuous[14]) if $f^{-1}(O)$ is a g-closed set(resp. α-closed set,rw-closedset,R^*-closed set)of$(X,\tau)$for every open set$O$ o f(Y,σ).

Definition 2.5 A function f :$(X,\tau)\to(Y,\sigma)$ is called perfectly$p(gg)^*$- continuous if $f^{-1}(O)$ is both open and closed set in$(X,\tau)$for every $p(gg)^*$-open set$O$of(Y,σ).

Definition2.6A function $f:(X,\tau)\to(Y,\sigma)$is called $p(gg)^*$-Irresolute continuous if $f^{-1}(O)$is $p(gg)^*$-open in$(X,\tau)$for every $p(gg)^*$-open set$O$of(Y,σ).

Definition 2.7A function $f:(X,\tau)\to(Y,\sigma)$ is called strongly $p(gg)^*$-continuous if the inverse image of every $p(gg)^*$-closed in$(Y,\sigma)$is closed in(X,τ).

Definition2.8A Topological space X is said to be $p(gg)^*$-$T_{1/2}$if every $p(gg)^*$-open set of X is open in X.

Definition 2.9 A Topological space $X$is said to be locally indiscrete [15] if each open subset of X is closed in X.

Definition 2.10 Let A be a subset of a topological space (X,τ). The set $\cap\{U \in \tau | A \subseteq U\}$ is called the kernel of A [7] and is denoted by $ker(A)$.

lemma 2.11 The following properties hold for subsets A, B of a space X:
1. $x \in ker(A)$if and only if $A \cap F \neq \emptyset$, for any $F \in C(X,x)$.
2. $A \subseteq ker(A)$ and $A = ker(A)$ if A is open in X.
3. If $A \subseteq B$ then $ker(A) \subseteq ker(B)$.

Theorem 2.12 Let $f: (X,\tau) \to (Y,\sigma)$ be a function. Then the following are equivalent:
1. f is $p(gg)^*$-continuous.
2. The inverse image of a closed set in Y is p(gg)* closed in X.
3. $f(\ p(gg)^* cl(A)) \subseteq cl(f(A))$ for every subset A in X.
4. $p(gg)^*(f^{-1}(G)) \subseteq f^{-1}(cl(G))$ for every subset G of Y.
5. $f^{-1}(int(G)) \subseteq p(gg)^* int(f^{-1}(G))$ for every subset G of Y.

Theorem 2.13 Every open set is $p(gg)^*$-open and every closed is $p(gg)^*$-closed.
2. Every α-open sets is $p(gg)^*$-open and every α- closed set is $p(gg)^*$-closed.
3. Every g-open set is $p(gg)^*$-open and every g-closed set is $p(gg)^*$-closed.

3. Contra $p(gg)^*$- Continuous Functions

Definition 3.1A function $f: (X,\tau) \to (Y,\sigma)$ is called contra $p(gg)^*$-continuous functions if $f^{-1}(O)$ is a $p(gg)^*$-closed in (X,τ) for every open set O in (Y,σ).

Example 3.2 Let $X = Y = \{a,b,c,d\}$, $\tau = \{\emptyset,\{c\},\{d\},\{c,d\},\{a,c,d\},X\}$,$\tau^c = \{\emptyset,\{b\},\{a,b\},$ {a, b, c}, $\{a,b,d\}, X\}$ and $\sigma = \{\emptyset,\{a\},\{c,d\},\{a,c,d\},Y\}$, $\sigma^C = \{\emptyset,\{b\},\{a,b\},\{b,c,d\},Y\}$
$p(gg)^*C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$
Let $f: (X,\tau) \to (Y,\sigma)$ be defined by $f(a) = a, f(b) = b, f(c) = c = f(d)$
Clearly f is contra $p(gg)^*$ continuous in (X,τ).

Theorem 3.3 Every contra continuous function is a contra $p(gg)^*$-continuous.

Proof: Let $f: (X,\tau) \to (Y,\sigma)$ be a contra continuous function.Let O be any open set in (Y,σ).
Since f is contra continuous, then $f^{-1}(O)$ is closed in (X,τ).Hence by theorem [2.13] $f^{-1}(O)$ is $p(gg)^*$-closed in (X,τ).Therefore f is contra $p(gg)^*$-continuous.

Remark 3.4 The converse of the above theorem is need not be true.

Example 3.5 Let $X = Y = \{a,b,c,d\}$, $\tau = \{\emptyset,\{c\},\{d\},\{c,d\},\{a,c,d\},X\}$, $\tau^c = \{\emptyset,\{b\},\{a,b\},$ {a, b, c}, $\{a,b,d\}, X\}$ and $\sigma = \{\emptyset,\{a\},\{c,d\},\{a,c,d\},Y\}$, $\sigma^C = \{\emptyset,\{b\},\{a,b\},\{b,c,d\},Y\}$
$p(gg)^*C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$.
Let $f: (X,\tau) \to (Y,\sigma)$ be defined by $f(a) = a, f(b) = d, f(c) = c, f(d) = b$
Clearly f is contra $p(gg)^*$-continuous but $f^{-1}(\{a\}) = \{a\}$is not closed in X.

Theorem 3.6 Every contra g-continuous function is a contra $p(gg)^*$-continuous.
The proof is forthright.

Theorem 3.7 Every contra αcontinuous map is a contra $p(gg)^*$ continuous.
The proof is forthright.

Remark 3.8 The converse of the above theorems need not be true.

Example 3.9 From Example [3.5]$g\ C(X,\tau) = \{\emptyset,\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},$
$\{a,b,d\},X\}.p(gg)^*\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},$
$\{a,b,d\},X\}$.Let $f:(X,\tau)\to(Y,\sigma)$ be defined by $f(a)=a, f(b)=d, f(c)=c, f(d)=b$
Clearly f is contra $p(gg)^*$ continuous but $f^{-1}(\{a\})=\{a\}$is not g closed in X.

Example 3.10 From Example [3.5] $\alpha\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{a,b,c\},\{a,b,d\},X\}$
$p(gg)^*\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$.
Let $f:(X,\tau)\to(Y,\sigma)$ be defined by $f(a)=a, f(b)=d, f(c)=c, f(d)=b$
Clearly f is contra $p(gg)^*$-continuous but $f^{-1}(\{c,d\})=\{b,c\}$is not α -closed in X.

Remark 3.11 The concept of contra rw-continuous and contra $p(gg)^*$-continuous are independent.

Example 3.12 From Example [3.5] $rw\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{c,d\},\{a,b,c\},\{b,c,d\},$
$\{a,c,d\},\{a,b,d\},X\}\ p(gg)^*\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},$
$\{a,c,d\},\{a,b,d\},X\}$. Let $f:(X,\tau)\to(Y,\sigma)$ be defined by $f(a)=a, f(b)=d, f(c)=c,$
$f(d)=b$. Clearly f is contra $p(gg)^*$-continuous but $f^{-1}(\{c,d\})=\{b,c\}$is not
rw -closed in X.Therefore f is not contra rw-continuous.

Example 3.13 From Example [3.5] $rw\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{c,d\},\{a,b,c\},\{b,c,d\},$
$\{a,c,d\},\{a,b,d\},X\}\ p(gg)^*\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},$
$\{a,c,d\},\{a,b,d\},X\}$. Let $f:(X,\tau)\to(Y,\sigma)$ be defined by $f(a)=b, f(b)=a, f(c)=d,$
$f(d)=c$. Clearly f is contra rw -continuous but $f^{-1}(\{c,d\})=\{c,d\}$is not
$p(gg)^*$-closed in X. Therefore f is not contra $p(gg)^*$-continuous.

Remark 3.14 The concept of contra R^*-continuous and contra $p(gg)^*$-continuous are independent.

Example 3.15 From Example [3.5] $R^*C(X,\tau) = \{\emptyset,\{c,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$
$p(gg)^*\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$.
Let $f:(X,\tau)\to(Y,\sigma)$ be defined by $f(a)=a, f(b)=d, f(c)=c, f(d)=b$.
Clearly f is contra $p(gg)^*$ -continuous but $f^{-1}(\{a\})=\{a\}$is notR^*-closed in X.
Therefore f is not contra R^*-continuous.

Example 3.16 From Example [3.5] $R^*C(X,\tau) = \{\emptyset,\{c,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$
$p(gg)^*\ C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$.
Let $f:(X,\tau)\to(Y,\sigma)$ be defined by $f(a)=b, f(b)=b, f(c)=c, f(d)=d$.

Clearly f is contra R^* -continuous but $f^{-1}(\{c,d\}) = \{c,d\}$is not $p(gg)^*$-closed in X.
Therefore f is not contra $p(gg)^*$-continuous.

Remark 3.17 The composition of two contra $p(gg)^*$-continuous need not to be a contra $p(gg)^*$ Continuous.

Example 3.18 Consider $X = Y = Z = \{a,b,c,d\}$, $\tau = \{\emptyset,\{c\},\{d\},\{c,d\},\{a,c,d\},X\}$, $\sigma = \{\emptyset,\{a\},\{c,d\},\{a,c,d\},Y\}$ and $\eta = \{\emptyset,\{b\},\{b,d\},\{a,b,c\},Z\}$, $p(gg)^* C(X,\tau) = \{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$, $p(gg)^* C(Y,\sigma) = \{\emptyset,\{b\},\{c\},\{d\},\{a,b\},\{a,c\},\{a,d\},\{b,d\},\{c,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},Y\}$.
Let $f:(X,\tau) \to (Y,\sigma)$ be defined by $f(a) = a, f(b) = b, f(c) = c, f(d) = d$
Clearly f is contra $p(gg)^*$ -continuous . consider the map $g : (Y,\sigma) \to (Z,\eta)$ be defined by $g(a) = a,\ g(b) = c, g(c) = b, g(d) = d$. Clearly g is contra $p(gg)^*$-continuous.
But $(gof) : X \to Z$is not contra $p(gg)^*$-continuous, $(gof)(\{b\}) = f^{-1}(g^{-1}\{b\}) = f^{-1}(\{c\}) = \{c\}$. Which is not $p(gg)^*$-closed in X.

Theorem 3.19 Let Let $f:(X,\tau) \to (Y,\sigma)$ be a map. The following are equivalent.
1. f is contra $p(gg)^*$-continuous.
2.The inverse image of a closed set F of Y is $p(gg)^*$- open in X.

Proof :(1) ⇒ (2) Let F be a closed set in Y. Then $Y - F$ is an open set in Y. By the assumption of (1), $f^{-1}(Y - F) = X - f^{-1}(F)$ is a $p(gg)^*$-closed in X. It implies that $f^{-1}(F)$ is $p(gg)^*$-open in X.(2) ⇒ (1) Suppose the inverse image of a closed set F of Y is $p(gg)^*$-open in X. We show that $f:(X,\tau) \to (Y,\sigma)$ is contra $p(gg)^*$-continuous. Let F be a open set in Y, then $(Y - F)$ is closed in Y. Therefore $f^{-1}(Y - F) = X - f^{-1}(F)$ is $p(gg)^*$-open in X. Therefore $f^{-1}(F)$ is $p(gg)^*$-closed in X. Then F is contra $p(gg)^*$-continuous.

Theorem 3.20 The following are equivalent for a function $f:(X,\tau) \to (Y,\sigma)$.Assume that $p(gg)^* O(X,\tau)$ resp. $p(gg)^* C(X,\tau)$ is closed under any union(resp; intersection).
1.f is contra $p(gg)^*$ -continuous.
2.The inverse image of a closed set $F$of $Y$is $p(gg)^*$-open in X.
3.For each $x \in X$ and each closed set B in$Y$ with $f(x) \in B$,there exists an $p(gg)^*$-open set A in$X$ such that$x \in A$ and $f(A) \subseteq B$.
4.$f(p(gg)^* cl(A) \subseteq ker\ (f(A))$for every subset $A\ of\ X$
5. $p(gg)^* cl(f^{-1}(B)) \subseteq f^{-1}(kerB)$for every Subset $B\ of\ Y$

Proof:(1)⇒(3) Let $x \in X$ and B be a closed set in$Y$with$f(x) \in B$. By (1),it follows that $f^{-1}(Y - B) = X - f^{-1}(B)$ is $p(gg)^*$-closed and so $f^{-1}(B)$ is $p(gg)^*$-open. Take $A = f^{-1}(B)$.We obtain that$x \in A$and$f(A) \subseteq B$.
(3) ⇒ (2) Let$B$ be a closed set in Y with $x \in f^{-1}(B)$. since $f(x) \in B$, by (3) there exists an $p(gg)^*$ -open Set A in X containing x such that $f(A) \subseteq B$. It follows that $x \in A \subseteq f^{-1}(B)$.
(2)⇒(1)Follows from the previous theorem
(2)⇒ (4) Let A be a subset of X. let $y \notin$ ker $(f(A))$. Then there exists a closed set F containing y such that $f(A) \cap F = \emptyset$. Hence we have $A \cap f^{-1}(F) = \emptyset$ and $p(gg)^* cl(A) \cap F = \emptyset$. Hence $f\left(p(gg)^* cl(A)\right) \cap F = \emptyset$ and $y \notin f(p(gg)^* cl(A))$.Thus, $f(p(gg)^* cl(A) \subseteq$ ker $f(A)$.

(4) ⇒ (5) Let B be any subset of Y. By (4), and lemma (2.11) $f(p(gg)^*cl(f^{-1}(B))) \subseteq kerB \Rightarrow p(gg)^*$cl $(f^{-1}(B)) \subseteq f^{-1}(kerB)$.Hence $p(gg)^*cl(f^{-1}(B)) \subseteq f^{-1}(kerB)$ for every subset$B$ of Y.
(5) ⇒ (1) Let B be any open set of Y. By (5) and lemma (2.11) $p(gg)^*cl(f^{-1}(B)) \subseteq f^{-1}(kerB) = f^{-1}(B)$. We get $p(gg)^*cl(f^{-1}(B)) = f^{-1}(B)$. Hence we get $f^{-1}(B)$ is $p(gg)^*$-closed in X.

Theorem 3.21 If $f:(X,\tau) \to (Y,\sigma)$ is $p(gg)^*$-irresolute and $g:(Y,\sigma) \to (Z,\eta)$ is contra $p(gg)^*$ Continuous then their composition $(gof):(X,\sigma) \to (Z,\eta)$ is contra $p(gg)^*$-continuous.

Proof: Let O be any closed set in (Z,η). Since g is contra $p(gg)^*$ -continuous, then $g^{-1}(O)$ is $p(gg)^*$ -open in (Y,σ). Since f is $p(gg)^*$ -irresolute, then $f^{-1}(g^{-1}(O))$ is $p(gg)^*$ -open in (X,τ). Therefore $g\ o\ f$ is contra $p(gg)^*$ -continuous.

Theorem 3.22 If $f:(X,\tau) \to (Y,\sigma)$ is contra $p(gg)^*$-continuous and $g:(Y,\sigma) \to (Z,\eta)$ is Continuous then their composition $(gof):(X,\tau) \to (Z,\eta)$ is contra $p(gg)^*$-continuous.

Proof: Let O be any closed set in (Z,η). Since g is continuous, then $g^{-1}(O)$ is open in (Y,σ) and since f is contra $p(gg)^*$ -continuous, then $f^{-1}(g^{-1}(O))$ is $p(gg)^*$ -closed in (X,τ). Therefore $g\ o\ f$ is contra $p(gg)^*$ -continuous.

Theorem 3.23 If $f:(X,\tau) \to (Y,\sigma)$ is contra α -continuous and $g:(Y,\sigma) \to (Z,\eta)$ is Continuous then their composition $g\ o\ f:(X,\sigma) \to (Z,\eta)$ is contra $p(gg)^*$-continuous.

Proof: Let O be any open set in (Z,η). Since g is continuous, then $g^{-1}(O)$ is open in (Y,σ) and since f is contra α -continuous, then $f^{-1}(g^{-1}(O))$ is α -closed in (X,τ). By theorem [2.13], we have $f^{-1}(g^{-1}(O))$ is $p(gg)^*$ -closed in (X,τ). Therefore $g\ o\ f$ is contra $p(gg)^*$ -continuous.

Theorem 3.24 If $f:(X,\tau) \to (Y,\sigma)$ is strongly $p(gg)^*$-continuous and $g:(Y,\sigma) \to (Z,\eta)$ is contra $p(gg)^*$-Continuous then their composition $g\ o\ f:(X,\tau) \to (Z,\eta)$ is contra continuous.

Proof : Let O be any open set in (Z,η). Since g is contra $p(gg)^*$-continuous, then $g^{-1}(O)$ is $p(gg)^*$ -closed in (Y,σ) and since f is strongly $p(gg)^*$-continuous, then $f^{-1}(g^{-1}(O))$ is closed in (X,τ). Therefore $g\ o\ f$ is contra continuous.

Theorem 3.25 If $f:(X,\tau) \to (Y,\sigma)$ is contra $p(gg)^*$-continuous and $g:(Y,\sigma) \to (Z,\eta)$ is perfectly continuous then their composition $g \circ f:(X,\tau) \to (Z,\eta)$ is contra $p(gg)^*$-continuous.
Proof: Let O be any open set in (Z,η). since g is perfectly continuous, then $g^{-1}(O)$is both open and closed in (Y,σ) and since f is contra $p(gg)^*$- continuous, then $f^{-1}(g^{-1}(O))$ is $p(gg)^*$-closed in(X,τ). Therefore $g\ o\ f$is contra $p(gg)^*$-continuous.

Theorem 3.26 Let $f:(X,\tau) \to (Y,\sigma)$ be a function and X be a $p(gg)^*T_{1/2}$-space. Then the following are equivalent.
1. f is contra continuous.
2. f is contra $p(gg)^*$-continuous.

Proof : (1) ⇒ (2) Let O be any open set in (Y,σ).since f is contra continuous$f^{-1}(O)$ is closed in (X,τ) and since every closed set is $p(gg)^*$-closed,$f^{-1}(o)$ is $p(gg)^*$-closed in (X,τ). Therefore f is contra $p(gg)^*$-continuous.

(2) ⇒ (1) Let O be any open set in (Y,σ).since f is contra $p(gg)^*$-continuous, $f^{-1}(O)$is $p(gg)^*$-closed in (X,τ) and since X is $p(gg)^*T_{1/2}$ space,$f^{-1}(O)$is closed in (X,τ). Therefore f is contra continuous.

Theorem 3.27 If f is $p(gg)^*$-continuous and if Y is locally indiscrete, then f is contra $p(gg)^*$-continuous.

Proof: Let O be any open set of Y. since Y is locally indiscrete , O is closed, and since f is $p(gg)^*$-continuous, $f^{-1}(O)$is $p(gg)^*$-closed in (X,τ) .Therefore f is contra $p(gg)^*$-continuous.

Theorem 3.28 If a function $f:(X,\tau)\to(Y,\sigma)$ is continuous and X is a locally indiscrete space, then f is contra $p(gg)^*$-continuous.

Proof: Let O be any open set in (Y,σ).since f is continuous, $f^{-1}(O)$is open in (X,τ).since X is locally indiscrete, $f^{-1}(O)$is closed in X. Since every closed set is $p(gg)^*$-closed then $f^{-1}(O)$is $p(gg)^*$-closed in X. Therefore, f is contra $p(gg)^*$-continuous.

Theorem 3.29 Let $f:(X,\tau)\to(Y,\sigma)$ be a function and $g:X\to X\times Y$ the graph function, given by $g(x)=(x,f(x))$ for every $x\in X$. Then f is contra $p(gg)^*$-continuous if g is contra $p(gg)^*$-continuous.

Proof: let F be a open subset of Y. Then $X\times F$ is a open subset of $X\times Y$. Since g is contra $p(gg)^*$-continuous. Then $g^{-1}(X\times F)$ is a $p(gg)^*$-closed subset of X. Also $g^{-1}(X\times F)=f^{-1}(F)$. Hence f is contra $p(gg)^*$-continuous.

4. Almost contra $p(gg)^*$- continuous

Definition 4.1 A function $f:(X,\tau)\to(Y,\sigma)$is called almost contra $p(gg)^*$-Continuous functions if $f^{-1}(O)$is $p(gg)^*$-closed in $(X,\tau)$for every regular open set O in (Y,σ).

Example 4.2 From Example [3.5] $p(gg)^*C(X,\tau)=\{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}R\ O(Y,\sigma)=\{\emptyset,\{a\},\{c,d\},Y\}$ Let $f:(X,\tau)\to(Y,\sigma)$ be defined by $f(a)=a,f(b)=d,f(c)=c,f(d)=b$.Clearly f is almost contra $p(gg)^*$-continuous in (X,τ).

Theorem 4.3 Every contra $p(gg)^*$-continuous function is almost contra $p(gg)^*$-continuous.

Proof: Let O be a regular open set in (Y,σ). Since, every regular open set is open which implies O is open in (Y,σ). since $f:(X,\tau)\to(Y,\sigma)$ is contra $p(gg)^*$-continuous, then $f^{-1}(O)$ is $p(gg)^*$-closed in(X,τ). Therefore f is almost contra $p(gg)^*$-continuous.

Remark 4.4 The converse of the above theorem need not be true.

Example 4.5 From Example [3.5] $p(gg)^*C(X,\tau)=\{\emptyset,\{a\},\{b\},\{a,b\},\{b,c\},\{b,d\},\{a,b,c\},\{b,c,d\},\{a,c,d\},\{a,b,d\},X\}$ and $\sigma=\{\emptyset,\{b\},\{c\},\{b,c\},\{a,b\},\{a,b,c\},Y\},\sigma^c=\{\emptyset,\{d\},\{a,d\},\{c,d\},\{a,c,d\},\{a,b,d\},Y\}$. $R\ O(Y,\sigma)=\{\emptyset,\{c\},\{a,b\},Y\}$Let $f:(X,\tau)\to(Y,\sigma)$ be defined by $f(a)=a,f(b)=d,f(c)=b=f(d)$.Clearly f is almost contra $p(gg)^*$-continuous but $f^{-1}(\{b\})=(\{c,d\})$ is not $p(gg)^*$-closed in X. Therefore, f is not contra $p(gg)^*$-continuous.

Theorem 4.6 The following are equivalent for a function $f: X \to Y$.
1. f is almost contra $p(gg)^*$-continuous.
2. $f^{-1}(int(cl(G)))$ is $p(gg)^*$-closed set in X for every open subset G of Y.
3. $f^{-1}(cl(int(F)))$ is $p(gg)^*$-open set in X for every closed subset F of Y.

Proof: (1) ⇒ (2) Let G be an open set in Y. Then $int(cl(G))$ is a regular open set in Y. By (1), $f^{-1}(int(cl(G))) \in p(gg)^*$closed in X.
(2) ⇒ (1) The proof is obvious.
(1) ⇒ (3) Let F be a closed set in Y. Then $cl(int(F))$ is a regular closed set in Y. By (1), $f^{-1}(cl(int(F))) \in p(gg)^*$ open in X.
(3) ⇒ (1) The proof is obvious.

Theorem 4.7 The following are equivalent for a function $f: X \to Y$.
1. f is almost contra $p(gg)^*$-continuous.
2. The inverse image of a regular closed set F of Y is $p(gg)^*$-open in X.
3. For each $x \in X$ and each regular closed set F of Y containing $f(x)$, there exists $U \in p(gg)^*O(X,\tau)$, such that $f(U) \subseteq F$.
4. For each $x \in X$ and each regular open set V of Y non-containing $f(x)$, there exists an $p(gg)^*$-closed set K of X non-containing x such that $f^{-1}(V) \subseteq K$.

Proof: (1) ⇒ (2) Let F be a regular closed set of Y.Then $(Y - F)$ is regular open in Y. By (1) $f^{-1}(Y - F) = X - f^{-1}(F) \in p(gg)^*C(X)$.Hence $f^{-1}(F)$ is $p(gg)^*O$ in X.
(2) ⇒ (1) Let G be a regular open set in Y. Then $Y - G$ is a regular closed set in Y. By (2) $f^{-1}(Y - G) = X - f^{-1}(G)$ is $p(gg)^*$-open in X. Therefore $f^{-1}(G)$ is $p(gg)^*$-closed in X. Then f is almost contra $p(gg)^*$-continuous.
(2) ⇒ (3) Let F be a regular closed set in Y containing $f(x)$ which implies $x \in f^{-1}(F)$. By (2) $f^{-1}(F)$is $p(gg)^*$-open set in X containing x. Assume $U = f^{-1}(F)$, which implies U is a $p(gg)^*$-open set in X containing x and $f(U) = f(f^{-1}(U)) \subseteq F$ Therefore $f(U) \subseteq F$.
(3) ⇒ (2) Let F be a regular closed set in Y containing $f(x)$, which implies $x \in f^{-1}(F)$. From (3), there exists an open set U_x in X containing x such that $f(U_x) \subseteq F$. That is, $U_x \subseteq f^{-1}(F)$. Thus,$f^{-1}(F) = \{\cup U_x : x \in f^{-1}(F)\}$, Which is the union of $p(gg)^*$-open sets. Therefore $f^{-1}(F)$ is $p(gg)^*$-open set of X.
(3) ⇒ (4) Let V be a regular open set in Y not containing $f(x)$. Then $Y - V$ is regular closed set in Y containing $f(x)$. From (3) there exists a $p(gg)^*$-open set U in X containing x such that $f(U) \subseteq Y - V$. This implies $U \subseteq f^{-1}(Y - V) = X - f^{-1}(V)$. Hence $f^{-1}(V) \subseteq X - U$, Set $K = X - U$ then K is $p(gg)^*$-closed set not containing x in X such that $f^{-1}(V) \subseteq K$.
(4) ⇒ (3) Let F be a regular closed set in Y containing $f(x)$. Then $Y - F$ is a regular open in Y not containing$f(x)$. from (4), there exixts $p(gg)^*$-closed set K in X not containing x such that $f^{-1}(Y - F) \subseteq K$. This implies $X - f^{-1}(F) \subseteq K$. Hence $X - K \subseteq f^{-1}(F)$, that is $f(X - K) \subseteq F$. Set $U = X - K$, where U is $p(gg)^*$-open set containing x in X such that $f(U) \subseteq F$.

Definition 4.8 A space X is said to be locally $p(gg)^*$-indiscrete if every $p(gg)^*$-open subset of X is closed in X.

Theorem 4.9 A Contra $p(gg)^*$-continuous function $f: (X,\tau) \to (Y,\sigma)$ is continuous when X is locally $p(gg)^*$-indiscrete.

Proof: Let O be an open set in Y. Since f is contra $p(gg)^*$-continuous, then $f^{-1}(O)$ is $p(gg)^*$-closed in X. Since X is locally $p(gg)^*$-indicrete, which implies $f^{-1}(O)$ is open in X. Therefore f is continuous.

Theorem 4.10 Let $f: (X, \tau) \to (Y, \sigma)$ is $p(gg)^*$-irresolute map with Y as locally $p(gg)^*$-indiscrete space and $g: (Y, \sigma) \to (Z, \eta)$ is contra $p(gg)^*$-continuos, then $g\ o\ f$is $p(gg)^*$-continuous.

Proof: Let B be a closed set in Z. Since g is contra $p(gg)^*$-continuous, $g^{-1}(B)$ is $p(gg)^*$-open in Y. But Y is locally $p(gg)^*$-irresolute, $g^{-1}(B)$ is closed in Y. Hence, $g^{-1}(B)$ is $p(gg)^*$-closed in Y. Since f is $p(gg)^*$-irresolute, $f^{-1}(g^{-1}(B)) = (g\ o\ f)^{-1}(B)$ is $p(gg)^*$-closed in X. Therefore $(g\ o\ f)$is $p(gg)^*$-continuous.

Definition 4.11A map $f: (X, \tau) \to (Y, \sigma)$ is said to be $pre\ p(gg)^*$-closed if the image of every $p(gg)^*$-closed set of X is $p(gg)^*$-open in Y.

Theorem 4.12A map $f: (X, \tau) \to (Y, \sigma)$ be surjective, $p(gg)^*$-irresolute and $pre\, p(gg)^*$-closed and $g: (Y, \sigma) \to (Z, \eta)$ be any map. Then $g\ o\ f: (X, \tau) \to (Z, \eta)$ is contra $p(gg)^*$-continuous if f g is contra $p(gg)^*$-continuous.

Proof: Let B be a open set in (Z, η). Then $(g\ o\ f)^{-1}$(B) is $p(gg)^*$-closed in X. since f is $pre\, p(gg)^*$open, $f(f^{-1}(g^{-1}(B)))$ is $p(gg)^*$-closed in Y. Therefore g is contra $p(gg)^*$-continuous. The converse is, let B be a closed set in Z. Since g is contra $p(gg)^*$-continuous, $g^{-1}(B)$ is $p(gg)^*$closed in Y. since f is $p(gg)^*$-irresolute, then $f^{-1}(g^{-1}(B))$ is $p(gg)^*$-closed in X. Therefore $(g\ o\ f)^{-1}(B)$ is $p(gg)^*$-closed in X. Hence $g\ o\ f: (X, \tau) \to (Z, \eta)$ is contra $p(gg)^*$-continuous.

CONCLUSION

Findings about the contra continuous and almost contra continuous for the desired class set $p(gg)^*$ is gathered and the recommendations for future research are made. It is also hoped that it can be extended to bitopological and tritopological spaces.

ABSTRACT

The harmonic index $H(G)$ of a graph G is defined as $\frac{2}{d(u)+d(v)}$ for all edges uv, where $d(u)$ and $d(v)$ be the degree of the vertices u and v, respectively. Likewise, the eccentric harmonic index $H_e(G)$ of a graph G is defined as $\frac{2}{e(u)+e(v)}$ for edges uv, where $e(u)$ and $e(v)$ be the eccentricity of the vertices u and v,respectively, of a graph G. Here, we deduce $H(G)$ and $H_e(G)$ for double star fanbell graph and petersenfanbell graph.

Keywords: harmonic index, eccentric harmonic index, fan graph, double star fanbell graph, petersenfanbell graph.

INTRODUCTION

In this paper, $G = (V, E)$ be simple, finite, undirected, connected graph with vertex set V and edge set E. Let $|V(G)| = v$ and $|E(G)| = \epsilon$, be the order and size of the graph G. For every vertex $v \in V$, the open neighbourhood $N(v)$, is the set of all vertices that are adjacent to v. The degree of vertex v in a graph G is $d(v) = |N(v)|$. A vertex of degree 1 is called pendant vertex. The eccentricity of a vertex u in a graph G is $e(u) = max\{d(u, v): v \in V(G)\}$. In [1] double star and bistar is defined. A double star is a graph obtained by joining an edge to center of $K_{1,n}$ and $K_{1,m}$, for $n > m \geq 2$ and it is denoted by $B_{n,m}$, see Figure 1.1 (a) for $B_{3,5}$. If $n = m$ in the double star it is called as bistar and is denoted by $B_{n,n}$, see Figure 1.1 (b) for $B_{5,5}$. In [2] fan graph and double fan graph are defined. A fan graph $F_{m,n}$ is defined as the

graph join $\overline{K}_m + P_n$, where $\overline{K}_m$ is the empty graph on m vertices and P_n is the path on n vertices. In $F_{m,n}$ when $m = 1$ it is nothing but a usual fan graph, when $m = 2$ it is known as double fan graph, see Figure 1.2 (a) for $F_{1,5}$ and Figure 1.2 (b) for $F_{2,5}$. A topological index is a numerical quantity related to a graph. In a theoretical chemistry, topological indices is called as molecular descriptor. It is used to analyse and investigate some physicochemical properties of a molecule. Molecular descriptors play a significant role in Quantitative Structure-Property Relationship (QSPR). Also in Quantitative Structure-Activity Relationship (QSAR) investigations. At present, there are numerous topological indices which are classified by the structural properties of the graphs. Furthermore, the most widely used topological indice is the Wiener index [3] which was used by Harold Wiener in 1947, to compare the boiling points of some of the alkane isomers. For a graph G the Wiener index is defined by

$$W(G) = \sum_{u,v \in V(G)} d(u,v),$$

where $d(u,v)$ is the distance between u and v in G and the sum goes over all the unordered pairs of vertices. In literature Randić connectivity index and the Zagreb group indices are calculated using the degree of vertices. In [4] Randić connectivity index, $R(G)$ introduced by Milan Randić given by

$$R(G) = \sum_{uv \in E(G)} \left(d(u)d(v)\right)^{-\frac{1}{2}}.$$

Based on this, a numerous topological indices have been proposed. In [5, 6] the first Zagreb index M_1 and the second Zagreb index M_2 are introduced as an successor of R, given by

$$M_1(G) = \sum_{i=1}^{n} d(v_i)^2 \text{ and } M_2(G) = \sum_{uv \in E(G)} d(u)d(v).$$

In [7], Fajtlowicz introduced an another topological index named harmonic index, given by

$$H(G) = \sum_{uv \in E(G)} \frac{2}{d(u) + d(v)}.$$

In [8]Sowaity et.al., had introduced the eccentric harmonic index as similar to harmonic index, by considering the eccentricity of the vertices instead of degree of the vertices, which is given by,

$$H_e(G) = \sum_{uv \in E(G)} \frac{2}{e(u) + e(v)}.$$

In [9] Zhong determined the minimum and maximum values of harmonic index on unicyclic graphs and characterized the corresponding extremal graphs. Jianxi Li et.al., [10]provide a simpler method for determining the unicyclic graphs with maximum and minimum harmonic index among all unicyclic graphs. Onagh [11] determine harmonic index of cartesian, lexicographic, tensor, strong, corona and edge corona product of two connected graphs. Mahdieh Azari [12] determine the eccentric harmonic index of various families of graph products. Kamel Jebreen et.al., [13]determine eccentric harmonic index for the cartesian product of some particular graphs.

DOUBLE STAR FANBELL GRAPH

In this section we deduce the harmonic index and the eccentric harmonic index of double star fanbell graph. In[14] the double star fanbell graph $BSF_{r_1,r_2,\dots,r_{m+n}}$ is introduced and it is obtained from double star $B_{m,n}$ and $(m + n)$number of fan graph F_{1,r_i} by merging root vertex of each F_{1,r_i} and the i^{th} leaf of $B_{m,n}$, where $r_i \geq 2, 1 \leq i \leq m + n$ and $m, n \geq 2$ (see Figure 2.1). Here we discuss about the double star fanbell graph $BSF_{r_1,r_2,\dots,r_{m+n}}$ with uniform size of fan graph, that is, $r_1 = r_2 = \cdots = r_{m+n} = r, BSF_{\underbrace{r,r,\dots,r}_{(m+n)times}}$.

Theorem 2.1. Let $G = BSF_{\underbrace{r,r,\dots,r}_{(m+n)times}}$ be a double star fanbell graph with $m, n \geq 2$ and $r \geq 2$. Then,

i. $$H(G) = \begin{cases} \frac{13(m+n)}{10} + \frac{2m}{m+4} + \frac{2n}{n+4} + \frac{2}{m+n+2} & : r = 2 \\ (m+n)\left[\frac{5r-3}{15} + \frac{4}{r+3} + \frac{2(r-2)}{r+4}\right] + \frac{2m}{m+r+2} + \frac{2n}{n+r+2} + \frac{2}{m+n+2} & : r \geq 3 \end{cases}$$

ii. $$H_e(G) = (m+n)\left[\frac{133r+27}{315}\right] + \frac{1}{3}.$$

Proof: The double star fanbell graph $G = BSF_{\underbrace{r,r,\dots,r}_{(m+n)times}}$ has $|V(G)| = (m+n)(r+1) + 2$ and $|E(G)| = (m+n)2r + 1$.

(i). The harmonic index of double star fanbell graph is

Case 1: When $m, n \geq 2$ and $r = 2$

$$H(G) = \sum_{i=1}^{m+n} \frac{2}{d(v_{i,1}) + d(v_{i,2})} + \sum_{i=1}^{m+n} \sum_{j\in\{1,2\}} \frac{2}{d(v_{i,0}) + d(v_{i,j})} + \sum_{i=1}^{m} \frac{2}{d(u_0) + d(v_{i,0})}$$
$$+ \sum_{i=m+1}^{m+n} \frac{2}{d(u_0') + d(v_{i,0})} + \frac{2}{d(u_0) + d(u_0')}$$
$$= (m+n)\left(\frac{2}{2+2}\right) + 2(m+n)\left(\frac{2}{3+2}\right) + m\left(\frac{2}{m+1+3}\right) + n\left(\frac{2}{n+1+3}\right) + \frac{2}{m+1+n+1}$$
$$= \frac{13(m+n)}{10} + \frac{2m}{m+4} + \frac{2n}{n+4} + \frac{2}{m+n+2}.$$

Case 2: When $m, n \geq 2$ and $r \geq 3$

$$H(G) = \sum_{i=1}^{m+n} \sum_{j\in\{1,r-1\}} \frac{2}{d(v_{i,j}) + d(v_{i,j+1})} + \sum_{i=1}^{m+n} \sum_{j=2}^{r-2} \frac{2}{d(v_{i,j}) + d(v_{i,j+1})} + \sum_{i=1}^{m+n} \sum_{j\in\{1,r\}} \frac{2}{d(v_{i,0}) + d(v_{i,j})} + \sum_{i=1}^{m+n} \sum_{j=2}^{r-1} \frac{2}{d(v_{i,0}) + d(v_{i,j})}$$
$$+ \sum_{i=1}^{m} \frac{2}{d(u_0) + d(v_{i,0})} + \sum_{i=m+1}^{m+n} \frac{2}{d(u_0') + d(v_{i,0})} + \frac{2}{d(u_0) + d(u_0')}.$$
$$= 2(m+n)\left(\frac{2}{2+3}\right) + (m+n)(r-3)\left(\frac{2}{3+3}\right) + 2(m+n)\left(\frac{2}{r+1+2}\right) + (m+n)(r-2)\left(\frac{2}{r+1+3}\right)$$
$$+ m\left(\frac{2}{m+1+r+1}\right) + n\left(\frac{2}{n+1+r+1}\right) + \left(\frac{2}{m+1+n+1}\right).$$
$$= (m+n)\left[\frac{5r-3}{15} + \frac{4}{r+3} + \frac{2(r-2)}{r+4}\right] + \frac{2m}{m+r+2} + \frac{2n}{n+r+2} + \frac{2}{m+n+2}.$$

Therefore,

$$H(G) = \begin{cases} \frac{13(m+n)}{10} + \frac{2m}{m+4} + \frac{2n}{n+4} + \frac{2}{m+n+2} & : r = 2 \\ (m+n)\left[\frac{5r-3}{15} + \frac{4}{r+3} + \frac{2(r-2)}{r+4}\right] + \frac{2m}{m+r+2} + \frac{2n}{n+r+2} + \frac{2}{m+n+2} & : r \geq 3 \end{cases}$$

(ii). Eccentricity of the vertices in a graph $G$are given by

$$e(u_0) = e(u_0') = 3,$$

$e(v_{i,0}) = 4$ for $i = 1,2,\dots,m+n$ and

$e(v_{i,j}) = 5$ for $i = 1,2,\dots,m+n$ and $j = 1,2,\dots,r$.

The eccentric harmonic index of double star fanbell graph for $m, n \geq 2$ and $r \geq 2$ is given by

$$H_e(G) = \sum_{i=1}^{m+n} \sum_{j=1}^{r-1} \frac{2}{e(v_{i,j}) + e(v_{i,j+1})} + \sum_{i=1}^{m+n} \sum_{j=1}^{r} \frac{2}{e(v_{i,0}) + e(v_{i,j})} + \sum_{i=1}^{m} \frac{2}{e(u_0) + e(v_{i,0})}$$
$$+ \sum_{i=m+1}^{m+n} \frac{2}{e(u_0') + e(v_{i,0})} + \frac{2}{e(u_0) + e(u_0')}.$$
$$= (m+n)(r-1)\left(\frac{2}{5+5}\right) + (m+n)r\left(\frac{2}{4+5}\right) + m\left(\frac{2}{3+4}\right) + n\left(\frac{2}{3+4}\right) + \frac{2}{3+3}.$$

Therefore,
$H_e(G) = (m+n)\left[\frac{133r+27}{315}\right] + \frac{1}{3}$.

PETERSENFANBELL GRAPH

In this section we deduce the harmonic index and eccentric harmonic index of petersenfanbell graph.

In [14] the petersenfanbell graph $PF_{m_1,m_2,\dots,m_5}$ is introduced and it is obtained from Petersen graph and fan graph F_{1,m_i} by merging root vertex from each F_{1,m_i} and the outer 5 vertices of Petersen graph where $m_i \geq 2$ (see Figure 3.1). Here we discuss about the petersenfanbell graph $PF_{m_1,m_2,\dots,m_5}$ with uniform size, that is, $m_1 = m_2 = \cdots = m_5 = m$, $PF_{\underbrace{m,m,\dots,m}_{5\ times}}$.

Theorem 3.1. Let $G = PF_{\underbrace{m,m,\dots,m}_{5\ times}}$ be a petersenfanbell graph with $m \geq 2$.Then,

(i). $H(G) = \begin{cases} \frac{779}{84} & : m = 2 \\ \frac{5m+2}{3} + \frac{20}{m+5} + \frac{10(m-1)}{m+6} + \frac{5}{m+3} & : m \geq 3 \end{cases}$

(ii). $H_e(G) = \frac{75m+105}{28}$.

Proof: The petersenfanbell graph $G = PF_{\underbrace{m,m,\dots,m}_{5\ times}}$ has $5(m+2)$ vertices and $10(m+1)$ edges.

(i). The harmonic index of apetersenfanbell graph is

Case 1: When $m = 2$

$$H(G) = \sum_{i=1}^{5} \frac{2}{d(v_{i,1}) + d(v_{i,2})} + \sum_{i=1}^{5} \sum_{j\in\{1,2\}} \frac{2}{d(v_{i,0}) + d(v_{i,j})} + \sum_{i=1}^{5} \frac{2}{d(v_{i,0}) + d(v_{i+1,0})} + \sum_{i=1}^{5} \frac{2}{d(v_{i,0}) + d(u_i)} + \sum_{i=1}^{5} \frac{2}{d(u_i) + d(u_{i+2})},$$

where the addition$i + 1$ and $i + 2$in suffix of $v_{i+1}$are taken modulo 5.

$$= 5\left(\frac{2}{2+2}\right) + 10\left(\frac{2}{5+2}\right) + 5\left(\frac{2}{5+5}\right) + 5\left(\frac{2}{5+3}\right) + 5\left(\frac{2}{3+3}\right).$$

$$= \frac{779}{84}.$$

Case 2: When $m \geq 3$

$$H(G) = \sum_{i=1}^{5} \sum_{j\in\{1,m-1\}} \frac{2}{d(v_{i,j}) + d(v_{i,j+1})} + \sum_{i=1}^{5} \sum_{j=2}^{m-2} \frac{2}{d(v_{i,j}) + d(v_{i,j+1})} + \sum_{i=1}^{5} \sum_{j\in\{1,m\}} \frac{2}{d(v_{i,0}) + d(v_{i,j})} + \sum_{i=1}^{5} \sum_{j=2}^{m-1} \frac{2}{d(v_{i,0}) + d(v_{i,j})} + \sum_{i=1}^{5} \frac{2}{d(v_{i,0}) + d(v_{i+1,0})} + \sum_{i=1}^{5} \frac{2}{d(v_{i,0}) + d(u_i)} + \sum_{i=1}^{5} \frac{2}{d(u_i) + d(u_{i+2})},$$

where the addition $i + 1$ and $i + 2$ in suffix of $v_{i+1}$are taken modulo 5.

$$= 10\left(\frac{2}{2+3}\right) + 5(m-3)\left(\frac{2}{3+3}\right) + 10\left(\frac{2}{m+3+2}\right) + 5(m-2)\left(\frac{2}{m+3+3}\right) + 5\left(\frac{2}{m+3+m+3}\right) + 5\left(\frac{2}{m+3+3}\right) + 5\left(\frac{2}{3+3}\right).$$

$$= \frac{5m+2}{3} + \frac{20}{m+5} + \frac{10(m-1)}{m+6} + \frac{5}{m+3}.$$

Therefore,

$$H(G) = \begin{cases} \frac{779}{84} & : m = 2 \\ \frac{5m+2}{3} + \frac{20}{m+5} + \frac{10(m-1)}{m+6} + \frac{5}{m+3} & : m \geq 3 \end{cases}$$

(ii). Eccentricity of the vertices in a graph G is given by

$e(u_i) = e(v_{i,0}) = 3$ for $1 \leq i \leq 5$ and
$e(v_{i,j}) = 4$ for $1 \leq i \leq 5$ and $1 \leq j \leq m$.

The eccentric harmonic index of petersenfanbell graph is given by

$$H_e(G) = \sum_{i=1}^{5}\sum_{j=1}^{m-1}\frac{2}{e(v_{i,j}) + e(v_{i,j+1})} + \sum_{i=1}^{5}\sum_{j=1}^{m}\frac{2}{e(v_{i,0}) + e(v_{i,j})} + \sum_{i=1}^{5}\frac{2}{e(v_{i,0}) + e(v_{i+1,0})} + \sum_{i=1}^{5}\frac{2}{e(v_{i,0}) + e(u_i)} + \sum_{i=1}^{5}\frac{2}{e(u_i) + e(u_{i+2})},$$

where the addition$i + 1$ and $i + 2$in suffix of $v_{i+1}$are taken modulo 5.

$= 5(m-1)\left(\frac{2}{4+4}\right)$

$+5m\left(\frac{2}{3+4}\right)$

$+5\left(\frac{2}{3+3}\right) + 5\left(\frac{2}{3+3}\right)$

$+5\left(\frac{2}{3+3}\right).$

Therefore,

$H_e(G) = \frac{75m+105}{28}.$

ABSTRACT

A prevalent gynecological condition in *Ayurveda*, *Asrigdara* mimics the dysfunctional kind of abnormal uterine bleeding (DUB). It has a detrimental impact on life quality and is linked to women's bad health. Women with abnormal uterine bleeding for which no obvious cause can be found are diagnosed with dysfunctional uterine bleeding (DUB). In both ovulatory and anovulatory cycles, DUB has been documented. Nonsteroidal anti-inflammatory medications (NSAIDs), oral contraceptives, progestins, danazol (a synthetic androgen), GnRH agonists, and antifibrinolytic medications are examples of medical therapy. In addition to adverse effects, a disadvantage of medical therapy is that its benefits are temporary—they only persist as long as the patient takes the medicine. The preparation and analysis of *MustadiGhanavati*, a *PradaraRoga* formulation referenced in *Sahasrayogam*, is the goal of this work. HPTLC and other phytochemical marking instruments are used in the analysis. MustadiGhanavati is prepared and subjected to an analytical assessment as part of a laboratory-based study design. According to the pharmaceutical analysis, the *MustadiGhanavati* was dark in color. The disintegration time is 64.41 minutes, the pH is 6, and the taste is bitter and astringent. The findings of the HPTLC study of the *MustadiGhanavati* were obtained in the form of chromatograms (scanned at the wavelengths of 254 nm, 366 nm, and 540 nm) representing various peaks. The HPTLC analysis was performed using the CAMAG Linomat 5 HPTLC machine. The phytochemical profile of the medication was ascertained and is displayed in tables with Rf values, peak area, peak heights, total number of peaks, and percent area.
Ingredients are widely effective on base of chemical compositionwith a variety of bioactive ingredients, *MustadiGhanavati* is aefficient herbal tablet for treating dysfunctional uterine hemorrhage.

INTRODUCTION

One of the seven dhatus is *Rakta*. It is very essential for life sustenance, according to *Acharya Sushruta: "Raktam Jeeva Iti Sthithi."* The idea of "*Tristhuna*" (three pillars) of *Deha* (body), which supports the house or body when it becomes aberrant and destroys the body, is found in ancient *Ayurvedic* literature. *Dosha, Dhatu,* and *Mala* are the three fundamental components of the human body among them. *Rakta* is the second of those *Saptadhatus*. In addition, the *Acharya* stated that *Shonita*, the fourth dosha, is present throughout the body's creation, existence, and demise. This literary analysis leads to the conclusion that *Rakta* is essentially a *Dhatu* and that, due to its significance, it has been given the noun (*sangya*) "*Dosha*," much as *Doshas*in the body. The Sanskrit word *Asrigdara* means "menorrhagia" or profuse menstrual bleeding in English. *Asrigdara* is classified as a gynecological condition in *Ayurveda*, the traditional Indian medical system, and is characterized by prolonged, excessive monthly bleeding that exceeds normal physiological limits. This illness has a substantial negative impact on a person's mental health and quality of life in addition to their physical health.[1] In clinical practice, one of the most frequent concerns that doctors hear is about excessive uterine bleeding. Menorrhagia has significant social and financial repercussions. Menorrhagia has become more common over time, maybe because of greater access to healthcare[1]. Abnormal uterine bleeding (DUB) is described as bleeding that is not connected to a tumor, inflammation, or pregnancy. Any abnormal bleeding, including irregularities in the menstrual cycle, regular or irregular uterine bleeding, and changes in the volume or duration of monthly blood loss, is referred to as DUB. However, the word is most frequently used to refer to excessive regular menstrual bleeding or essential menorrhagia. Without tissue diagnosis, DUB management is incomplete, particularly in the perimenopausal and postmenopausal stages.[2] Genital and extra-genital lesions are among the wide range of causes of irregular uterine bleeding. Patients in this category who do not have a clear underlying lesion are diagnosed with DUB. It can happen in both anovulatory and ovulatory cycles, at any point between menarche and menopause. It has been linked to nearly every kind of endometrium, including hyperplasia, irregular shedding throughout the menstrual cycle, and atrophy.[2]

Pharmaceutical study

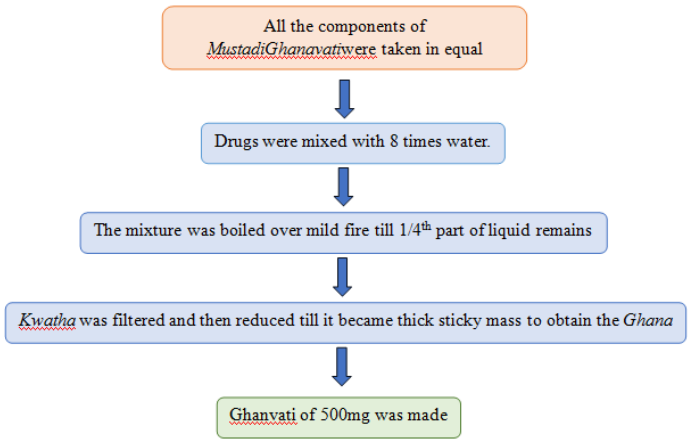
Collection of raw materials

Raw materials were collected from authorised dealer and were authenticated from department of *Dravyaguna*, Parul Institute of Ayurved, Parul University, Vadodara.

Musta (Cyperus rotundus)
Haritaki (Terminalia chebula)
Durva (Cynodondactylon)
Guduchi (Tinospora cordifolia)
Sariva (Hemidesmus indicus)
Tila (Sesamum indicum)

Preparation of *MustadiGhanavati:*

क्वाथादीनांपुनःपाकाद्घनत्वंसारसक्रिया। (Sa. Ma Kha. 8/1)[1]



Precautions taken during preparation of the drug

The study was carried out in a lab environment, with a preparation-focused design. Care was given to avoid burning of the reducing content, therefore constant stirring was crucial toward the end of the preparation. Before being stored, the produced pills are dried in the shade. To keep them in form and totally dry, they can also be smeared with the same drug's fine powder.

RESULT

Analytical study

HPTLC ANALYSIS

HPTLC of *MustadiGhanavati* was carried out at Vasu Research Centre Vadodara, Gujarat.

Methodology

Preparation of Test solution

Add 20 milliliters of methanol to it, then reflux it on a water bath for 20 minutes. When the allotted time has elapsed, take the flask out of the water bath, and filter it using Whatmann No. 1. Utilize the resulting Test Solution for HPTLC fingerprinting.

Preparation of Spray reagent [Anisaldehyde – sulphuric acid reagent]:

10 mL of glacial acetic acid is combined with 0.5 mL of anisaldehyde, 85 mL of methanol, and 5 mL of sulphuric acid (98%) in order of concentration.

DISCUSSION

HPTLC of *MustadiGhanavati* was seen at three different wavelengths. At 254 nm, 7 spots were found. At 366nm, 7 spots were found. At 540nm, 9 spots were found. On observing the Rf values, it is seen that three values are common in all the three wavelengths**.** According to the pharmaceutical analysis, the *MustadiGhanavati* was dark in color. The disintegration time is 64.41 minutes, the pH is 6, and the taste is bitter and astringent. The findings of the HPTLC study of the *MustadiGhanavati* were obtained in the form of chromatograms (scanned at the wavelengths of 254 nm, 366 nm, and 540 nm) representing various peaks. The HPTLC analysis was performed using the CAMAG Linomat 5 HPTLC machine. The phytochemical profile of the medication was ascertained and is displayed in tables with Rf values, peak area, peak heights, total number of peaks, and percent area. In this study the chemical constitute found according to rf value are Berberine[1],Rutin[1],Quercetin[1],Gallic acid[1].

As seen in the figures and tables, the HPTLC analysis of the *MustadiGhanavati* revealed the presence of a number of phytoconstituents at varying amounts. In the *MustadiGhanavati* High-Performance Thin-Layer Chromatography (HPTLC) examination, the determined retention factor (RF) values show the presence of many substances. *T. chebula* is found to be an excellent anti-oxidant. Terminalia plant was studied and found to contain several constituents like tannins, flavonoids, sterols, amino acids, fructose, resin, and fixed oils. It is also found to contain compounds like anthraquinones, gallic acid, chebulinic and chebulagic acid, ellagic and ethaedioic acid, 4,2,4 chebulyl-d-glucopyranose, terpinenes and terpinenols. Which exhibit anti-inflammatory and wound healing properties.[1] A wide range of phytochemical compounds, such as lignans, polyphenols, phytosterols, phenols, anthraquinones, naphthoquinones, triterpenes, cerebroside, fatty acids, vitamins, proteins, essential amino acids, sugars, and other organic compounds, have been identified and isolated from seeds, seed oil, and different plant organs.

Numerous pharmacological studies have demonstrated the diverse range of activities exhibited by various plant organs, seed extracts, and sesame seed oil, including but not limited to antidiabetic, anticancer, antioxidant, cardioprotective, neuroprotective, anti-inflammatory, hepatoprotective, nephroprotective, wound healing, antimicrobial, antifungal, antibacterial, profertility potential, and antinociceptive activity.[1] Numerous phytoconstituents, including lignans, pregnane glycosides, steroids, terpenoids, aromatic aldehydes, saponins, flavonoids, and aliphatic acids, are abundant in *Hemidesmus indicus* and may potentially enhance its pharmacological qualities.[2] *Cyperus rotundus*contains four biflavone components. The study findings indicate that amentoflavone has the potential to significantly decrease the uterine coefficient in model rats, lower serum estrogen levels in rats with uterine fibroids, improve the pathological conditions of uterine tissues, significantly reduce the number of Bcl-2- and Bax-positive dots in smooth muscles, and significantly inhibit tumor-like proliferation in model rats ($P<0.01$), with the greatest effects observed in the amentoflavone high-dose group.[1] Numerous pharmacological activities are exhibited by cynodondactylon, including antidiabetic, hyperlipidemic, anti-cancer, antimicrobial, antifungal, antiviral, antihypertensive, antibacterial, antitumor, anti-epilepsy, anti-infertility, antiulcer, antioxidant, antipyretic, and anti-inflammatory properties.[1] Alkaloids, steroids, diterpenoid lactones, aliphatics, and glycosides are just a few of the active ingredients that have been extracted from Tinospora cordifolia and have been found in the plant's root, stem, and entire body. The plant's purported therapeutic benefits, which include anti-diabetic, anti-periodic, anti-spasmodic, anti-inflammatory, anti-arthritic, anti-oxidant, anti-allergic, anti-stress, anti-leprotic, anti-malarial, hepatoprotective, immunomodulatory, and anti-neoplastic effects, have recently piqued the interest of researchers all over the world.[1]

CONCLUSION

Many different bioactive components of *MustadiGhanavati* have been identified by thorough investigation, some of which may be involved in the plant's therapeutic benefits. These herbs are regarded as safe to eat and have a long history of traditional use. Women who experience heavy menstrual bleeding can effectively manage menorrhagia without jeopardizing their personal health by choosing to use this medication.

Conflicts of Interest: None declared.

ABSTRACT

Linear Fractional Programming (LFP) poses a significant challenge in optimization due to its complex nature and non-linear characteristics. In this paper, an algorithm has been proposed which approaches the Fourier-Motzkin Elimination Method to efficiently solve LFP instances, where LFP problem is converted into crisp one. Then it is transformed into a multi objective linear programming problem and the objective functions are then changed into linear inequalities. Fourier Motzkin elimination is employed to solve the system of linear inequalities. Some numerical illustrations are given to show the efficacy of the proposed algorithm.

Keywords: Linear Programming Problem, Linear Fractional Programming, Fourier-Motzkin Elimination method, Operations Research and Optimization.

INTRODUCTION

Linear Fractional Programming (LFP) problem is a state where the variables are related linearly, the objective function is optimized with ratio of two linear functions, and given constraints are linearly expressed. LFP problems occur when it is necessary to maximize the efficiency of a specific activity, such as the company's profit per unit of labor expense, production cost per unit of production, the nutritional ratio per unit of charge. Significant research effort has been dedicated to LFP because of its practical advantages over standard linear programming. Various methods have been offered to solve the LFP problem. For instance, Geir Dahl [11] explored combinatorial properties of Fourier-Motzkin Elimination, while JurajStacho [12] advocated for the Fourier Elimination method in linear programming. Kanniappan and Thangavel [13] adapted the modified Fourier elimination method for linear programming problem solutions. Also, Macro Chirandini [14] utilized Fourier-Motzkin elimination for linear programming. This paper converts the LFP problem into a multi-objective linear programming problem, converting

objective functions as linear inequalities. Consequently, Fourier-Motzkin elimination is applied to solve the resultant system of linear inequalities. The efficacy of the proposed algorithm is demonstrated through numerical examples provided in the paper.

METHODOLOGY

The proposed methodology harnesses the Fourier-Motzkin Elimination Method, a powerful technique in polyhedral computation, to address LFP instances effectively. By systematically eliminating variables and inequalities, the Fourier-Motzkin method converts the original fractional constraints into a series of equivalent linear inequalities. This process simplifies the conversion of the LFP problem into a sequence of standard linear programming subproblems, which can be efficiently solved using established optimization algorithms.

Algorithm

Step 1: Consider a linear fractional programming problem for maximization or minimization.

$\max z = \frac{(l_i x_i + \propto)}{(m_i x_i + \beta)} \quad (m_i x_i + \beta) \neq 0$

With subject to the constraints:

$Ax_i \geq c \quad (i = 1,2,3 \dots n)$

$x_i \geq 0 \quad (i = 1,2,3 \dots n)$

Step 2: Convert the objective function of the above fractional programming into the standard form such as:

$(b_i x_i + \beta)z \geq (a_i x_i + \propto)$ for the maximum case

$(b_i x_i + \beta)z \leq (a_i x_i + \propto)$ for the minimum case

Step 3: Now make all the inequalities in the same form that is in ($\geq$) for the maximization problem, similarly for the minimisation problem.

$i.e(m_i z - l_i)x_i \geq 0 \quad (i = 1,2,3 \dots n) \quad (1)$

$-(m_i z - l_i)x_i \geq 0 \quad (i = 1,2,3 \dots n) \quad (2)$

$Ax_i \geq c \quad (i = 1,2,3 \dots n) \quad (3)$

$x_i \geq 0 \quad (i = 1,2,3 \dots n) \quad (4)$

Step 4: For the further solution of the problem start eliminating the unknown variables from the above equations one by one with elimination method.

Step 5: After eliminating the unknown variables find the optimal value of Z and extreme points (x, y)which satisfies all inequalities and hence we get the feasible solution otherwise the solution is infeasible.

Numerical Illustrations

Example 1: Maximize $Z = \frac{5x_1 + 3x_2}{5x_1 + 2x_2 + 1}$

Subject to: $3x_1 + 5x_2 \leq 15$

$5x_1 + 2x_2 \leq 10$

$x_1 \geq 0, \quad x_2 \geq 0$

Solution:

Now convert the objective function into the standard form for both the maximum and minimum case i.e

$(5x_1 + 2x_2 + 1)Z \geq 5x_1 + 3x_2$ for the maximum case

$(5x_1 + 2x_2 + 1)Z \leq 5x_1 + 3x_2$ for the minimum case

On solving we get

$5(Z - 1)x_1 + (2Z - 3)x_2 + Z \geq 0 \quad (1)$

$-5(Z - 1)x_1 - (2Z - 3)x_2 - Z \geq 0 \quad (2)$

$-3x_1 - 5x_2 \geq -15 \quad (3)$

$-5x_1 - 2x_2 \geq -10 \quad (4)$

$x_1 \geq 0 \quad (5)$

$x_2 \geq 0 \quad (6)$

Using equation 1 and 2 we realise maximum value of Z we assume $1 < Z < \frac{3}{2}$

Eliminate the unknown variable x_1 from the above inequalities

$$x_1 + \frac{2Z-3}{5Z-5}x_2 + \frac{Z}{5Z-5} \geq 0$$

$$-x_1 - \frac{2Z-3}{5Z-5}x_2 - \frac{Z}{5Z-5} \geq 0$$

$$-x_1 - \frac{5}{3}x_2 \geq -5$$

$$-x_1 - \frac{2}{5}x_2 \geq -2$$

$$x_1 \geq 0$$

$$x_2 \geq 0$$

After eliminatingx_1 from the above inequalities, we get

$$x_2 \geq \frac{78Z-75}{19Z-16}$$

$$x_2 + 9Z + 10 \geq 0$$

$$-x_2 - \frac{Z}{2Z-3} \geq 0$$

$$-x_2 \geq -3$$

$$-x_2 \geq -5$$

$$x_2 \geq 0$$

After eliminatingx_2 from the above inequalities, we get

$$Z \geq \frac{75}{78}$$

$$Z \geq \frac{10}{11}$$

$$Z \geq \frac{9}{7}$$

$$Z \geq \frac{15}{11}$$

Out of all the values of Z, Z=9/7 is the maximum value which satisfies all the inequalities and hence through the back substitution method we get the extreme points i.e$x_1 = 0$ and $x_2 = 3$

Result: $Z_{max} = \frac{9}{7}$ and extreme points are $(x_1, x_2) = (0,3)$

Example 2: Maximize $Z = \frac{2x_1+6x_2+12}{3x_1+2x_2+12}$

Subject to: $5x_1 + 2x_2 \leq 10$

$3x_1 + 2x_2 \leq 18$

$x_1 \geq 0,\ x_2 \geq 0$

Solution: Similarly on solving the above linear fractional programming problem with the help of Fourier- Motzkin Elimination Technique, we get

Result: $Z_{max} = \frac{42}{22}$ and extreme points are $(x_1, x_2) = (0,5)$

CONCLUSION

Linear fractional programming has attracted many minds which resulted its continuous growth. As a center of interest and attraction many methods have been developed for solving the linear fractional programming.

The proposed Fourier-Motzkin elimination method is quite easy and also understandable for solving linear fractional programming problem. Calculation through this algorithm is quite simple besides other algorithms which have been developed earlier.

ABSTRACT

Muthuchippi parpam a Siddha marine drug used traditionally over a long period. Muthuchippi parpam is derived from pearl oyster shell, the oyster shell contains calcium carbonate at 95% along with shell proteins 0.1 – 5%. This calcium-based preparation has been used historically in Siddha practice to mitigate various ailments, owing to its potent bioactive properties. The aim of this study is to evaluate the changes in molecular composition of Muthuchippi parpam at various stages of processing. The Muthuchippi parpam samples were collected at different stages of preparation (Raw, purified, intermediate and parpam) and subjected to FT-IR characterization. These observations Indicates the presence of compounds like phenols, aromatic ketones, aldehydes or esters in these samples.

Keywords: Muthuchippi parpam, FT-IR Analysis, Siddha Medicine, Purification, Pearl oyster shell.

INTRODUCTION

The marine environment is a natural habitat for a wide diversity of species with varying physiologies and adaptability to the environment. Out of the more than 33 animal phyla known today, 32 phyla are represented in the marine environment, 15 of which are peculiar to the marine environment [1]. More than 80% of the world's plant and animal species live in the oceans. By 2016, 28500 Marine Natural

Products had been identified, and most were proven scientifically to have anti-inflammatory, analgesic, antimicrobial and Neuroprotective properties [2]. Although research in marine products has started only 50 years ago, Siddha system of medicine had made use of these marine organisms since antiquity [3]. Oysters are abundant source in the ocean. Mollusk shells are built by shell matrix proteins, which assemble aragonite and calcite into a three-layer structure: Outer Periostracum layer, a calcite-based middle prismatic layer and an aragonite-based inner nacreous [5]. Oyster shells, valued for their flavorful meat and calcium-rich shells, play a significant economic and ecological role. Comprising 60% of the oyster's total weight, the shell is primarily composed of calcium carbonate (approx. 95%) and a smaller organic matrix of skeletal proteins (0.1-5%). This unique blend of minerals and proteins protects the soft tissue within [6]. Pearl oyster shell, also known as *Muthuchippi*, is a key sea-derived medicine in Siddha practice. These shells include iron oxide, alumina, silica, calcium carbonate, phosphate, and sulphate of calcium and magnesium. Since it has been specially recommended to improve the strength, nutrition, and vitality of weak patients as well as for palpitations, digestion, heart tonic, and appetizer, pearl oysters are important in Siddha medicine. Traditionally, Calcined pearl oysters shell has been used to treat musculoskeletal diseases, ano-rectal diseases, respiratory diseases, and gastro-intestinal diseases due to their high calcium carbonate content [5] This research investigates the transformations occurring during the processing of Muthuchippi Parpam (Oxidized Pearl Oyster Shell) using FT-IR spectroscopy to analyze and compare the characteristics at different stages [4].

MATERIALS AND METHODS

The FT-IR spectra of Muthuchippi parpam at various stages of formulation in Potassiun Bromide (KBr) matrix recorded with scan rate of 20 scan per minute at the resolution 0.25cm-1 in the wave number region 400- 4000cm-1. The samples were ground into fine powder using agate mortar and pestle and then with KBr. They were then pelletized by applying pressure to prepare the specimen (the size of specimen about 13mm diameter and 0.3mm in thickness) to record the FT-IR spectra under standard conditions. FT-IR spectra were used to determine the changes in the functional group during the preparatory procedure of Muthuchippi parpam [6]. The recorded spectrum is represented in figure 1 - 4.

RESULTS AND DISCUSSION

Siddha medicine formulations can be accurately analyzed using FTIR spectroscopy, which identifies and quantifies constituent molecules, ensuring quality, authenticity, and therapeutic consistency [7]. FTIR spectroscopy is a powerful analytical tool that rapidly captures detailed infrared spectra of solids, liquids, and gases, providing valuable insights into molecular structure and composition [8]. The FTIR spectrum of Muthuchippi parpam at various stages of processing showed in Figure1, 2, 3, 4. The presence of mineral in the formulation can be inferred from inter-atomic vibrations (in fingerprint region). Raw sample showed Strong absorption around 3400 cm^{-1}: O-H stretching (indicative of alcohols or phenols), Strong absorption near 1700 cm^{-1}: C=O stretching (carbonyl group), Absorption near 1600 cm^{-1}: C=C stretching (aromatic rings). Purified sample showed Strong absorption around 3400 cm^{-1} indicating O-H stretching, Strong absorption near 1700 cm^{-1} indicating C=O stretching, Absorption near 1600 cm^{-1} indicating C=C stretching. Intermediate sample showed Strong absorption around 3400 cm^{-1} indicating O-H stretching, Absorption between 3000-2850 cm^{-1} indicating C-H stretching (alkanes), Strong absorption near 1700 cm^{-1} indicating C=O stretching, Absorption near 1600 cm^{-1} indicating C=C stretching. Muthuchippi parpam showed Strong absorption around 3400 cm^{-1} indicating O-H stretching, Strong absorption near 1700 cm^{-1} indicating C=O stretching, Absorption near 1600 cm^{-1} indicating C=C stretching. All samples showed significant O-H, C=O, and C=C stretching absorptions, indicating the presence of hydroxyl groups, carbonyl groups, and aromatic rings, respectively which suggest they could have similar chemical compositions. Intermediate sample also shows C-H stretching absorptions, suggesting the presence of alkanes. These observations indicate the presence of compounds like phenols, aromatic ketones, aldehydes or esters in these samples. [10]

CONCLUSION

Instrumental analysis via FT-IR confirms functional groups crucial for therapeutic activity, necessitating additional studies to validate efficacy and safety through rigorous standardization, facilitating the identification of active constituents.

ACKNOWLEDGEMENT

I express my thanks to Mr. T. Mathan Kumar, Technical Assistant Technology Transfer and Business Development (TTBD) Section, CSIR- Central Electrochemical Research Institute (CCECRI), Karaikudi – 630 003, for carried out FTIR analysis. I extend my gratitude to Faculties of Nanju Maruthuvam department and Director of National Institute of Siddha.

ABSTRACT

Probation of Offenders as a conditional suspension of sentence is a progressive alternative to incarceration, embodying a penal policy focused on individualisation and prioritising rehabilitation and reintegration. Because of the increasing rate of crime in India and overcrowding in prisons, the importance of probation for offenders has multiplied in terms of benefit to the national economy by reducing the financial burden on the exchequer, as well as the minimal possibility of recidivism due to non-association with hard-hearted criminals in prison, and utility of the probationer to his family as well as society. Moreover, from a human rights perspective, the possibility of a COVID-19-like pandemic has made an advanced system of offender probation an urgent necessity at any time. This manuscript explores probation's medico-legal significance, analysing its multi-faceted effects on offenders across various domains. The analysis examines how probation supervision influences mental health, cognitive function, socioeconomic opportunities, and environmental support systems. The findings point out that Probation supervision, integrating medical, psychological, and social interventions, offers a transformative approach to offender rehabilitation, even utilising digital means. In this perspective the researchers form a workable solution that that by prioritising medico-legal feasibility, evidence-based practices, interdisciplinary collaboration, individualised care, ethically feasible technology-informed supervision and legislative reforms, probation can effectively reduce recidivism, enhance public safety, and safeguard the human rights of offenders.

Keywords: Probation, Offender Rehabilitation, Medico-legal, Criminal Justice, Mental Health, Treatment

INTRODUCTION

Criminology and criminal law work synergistically to achieve a shared goal: reducing crime, ensuring public safety, and upholding justice. Criminology's emphasis on treatment over punishment[1] has influenced criminal law toward more rehabilitative approaches[2]. This shift fosters fairer legal systems[3], enhances the effectiveness of criminal justice practices[4], and guides essential policy reforms[5]. Recent advancements in brain science and treatment development have encouraged closer collaboration between psychiatry and criminology, focusing on biological explanations for criminal behaviour. This trend promises more targeted and less invasive interventions in the future[6]. Providing treatment instead of punishment can be transformative for individuals struggling with addiction[7]. Probation, which originated as a period to test a defendant's commitment to reform[8], currently provides a unique opportunity to address the underlying causes of criminal behavior. This study explores the medico-legal significance of probation in offender rehabilitation. We analyse the theoretical foundations of using probation as a therapeutic tool and examine its practical implications for improving offenders' physical and mental health, ultimately aiming to reduce recidivism and achieve fairness in offenders' rehabilitation.

A MEDICO-LEGAL APPROACH TO PROBATION: THEORETICAL FOUNDATIONS

Criminology as a foundation for effective probation:

Criminology employs a scientific lens to understand criminal behaviour and inform effective crime control strategies[9]. Diverse criminological perspectives highlight valuable insights for community corrections. Each theory emphasises specific factors contributing to crime and underscores the need for individualised interventions that address general crime trends and offender-specific characteristics. Classical criminology, focusing on rational choice and swift, certain punishment, underpins sentencing and surveillance practices. Despite limitations, deterrence theory remains influential, driving incarceration and electronic monitoring in community corrections[10]. Probation supervision increasingly utilises deterrence-based interventions such as intensive monitoring and swift sanctions for violations. Programs like HOPE (Hawaii) exemplify this approach[11]. While EM can be a valuable tool, its implementation varies significantly across jurisdictions, evolving from a rehabilitative focus to a more surveillance-oriented approach. As a supplementary tool for controlling behaviour and enforcing conditions, EM's effectiveness depends on its careful integration with other rehabilitative interventions and the specific needs of monitored individuals[12]. The Probation Board for Northern Ireland's development of an offender management app designed for individuals under probation supervision and the implementation of 'alcohol interlocks' for drink-driving offenders are promising examples of contemporary probation practices that leverage technology to deter recidivism[13].

Psychological theories inform community corrections by guiding risk assessment, case management, and offender interventions. Psychoanalytic theory emphasises the importance of addressing childhood experiences through individual and family counselling[14]. Social learning theory emphasises using behavioural programs, like token economies, to modify learned behaviours. However, these programs require ongoing evaluation to ensure sustained compliance. Cognitive development theory suggests increased probation officer contact to improve moral reasoning, with evidence supporting treatment programs for drug offenders[15]. Following participation in the Forensic Cognitive-behavioural Techniques (CBT) training program, probation officers exhibited increased utilisation of CBT strategies, enhanced focus on criminogenic factors, and improved communication skills. Notably, overall recidivism rates within their caseloads declined post-training[16]. Sociological criminology emphasises social and environmental influences on criminality, prompting community corrections to address these root causes[17]. Strain theories highlight the need for educational and employment opportunities in disadvantaged communities[18]. Sub cultural and social-ecological theories emphasise the impact of social environments on crime risk. Exposure to deviant values (subcultural) and community disorganisation (social-ecological) can increase risk. These theories advocate for changing community values and fostering positive peer influences. Control theories posit that solid social bonds (attachment, commitment) deter crime, suggesting interventions that strengthen these bonds (improved parent-child relationships, increased pro-social activities)[19]. Life-course theories focus on crucial turning points (marriage, employment) that can influence desistance from crime[20]. Conflict and societal reaction theories advocate for social

justice and restorative justice reforms. Probation officers play a crucial role in implementing these various sociological approaches. Biological criminology posits a potential genetic or biological predisposition towards criminal behaviour. Although controversial, this theory influences probation/parole services, potentially leading to treatment options and selective incapacitation policies (requiring increased resource allocation)[21]. The bio psychosocial model considers biological, psychological, and social factors to explain criminal behaviour. It acknowledges the potential for biological interventions (medications) but stresses the importance of social and environmental factors, particularly early childhood development, in crime prevention. Challenges in resource allocation and the potential stigmatisation of individuals deemed biologically vulnerable raise concerns regarding this approach's ethical implementation[22].Probation officers' use of treatment referrals within the drug court model for offenders with substance use problems as a tool for detoxification, treatment for housing, individual, family, or group counselling and medication[23] is an example of the biopsychosocial model. Digital Therapeutics (DTx), a growing field within digital health, leverages digital interventions, including computer-based cognitive behavioural therapy, to effectively manage, treat, and prevent various health issues. In the realm of substance use disorders (SUDs), DTx has demonstrated potential in treating addictions such as nicotine and opioid dependence, particularly among justice-involved populations, including those on parole or probation. This approach may help reduce the stigma of seeking treatment in traditional clinical settings[24].The figure.1 demonstrates the Cumulative Effect of Criminological Factors on Probation outcomes.

The penological basis of probation: Amulti-faceted tool for penal reform:

The philosophy of punishment encompasses a spectrum of perspectives. Some view it as a means of retribution, inflicting pain and expressing societal disapproval. Others emphasise its potential for reducing crime through deterrence or rehabilitation. Probation, by incorporating elements of enforcement, rehabilitation, and public protection, reflects a multi-faceted approach that balances both retributive and reductive goals[25]. Probation embodies principles associated with rehabilitative, reformative, or corrective theories of punishment. It can be viewed as a reward for offenders who demonstrate good behaviour, offering an alternative to incarceration[26]. This realises the emphasis on behaviour modification and treatment inherent in rehabilitation theories. However, probation also incorporates elements of retribution, acknowledging the need to address censure, victim needs, and societal values[27]. This broadens the definition of punishment beyond mere retribution, recognising probation's role in facilitating social and legal reintegration, a cornerstone of restorative justice principles[28].Figure 2. Illuminates Penological focus of probation of offenders

Enhancing Offender Rehabilitation And Reintegration:

The Therapeutic Potential Of Probation

Probation is crucial for promoting offender rehabilitation by addressing the root causes of criminal behaviour. This approach, often called risk reduction, focuses on identifying and targeting criminogenic needs – factors contributing to an individual's likelihood of reoffending[29]. Probation officers utilise various evidence-based interventions to address these needs, aiming to cultivate pro-social attitudes and behaviours that support successful reintegration into society, leading to positive behavioural change[30].

Importance of mental health in backing the psychological characteristics:

A significant portion of offenders experience mental health issues, including depression, anxiety, and trauma[31]. Probation programs can connect offenders with mental health professionals for treatment, potentially reducing recidivism rates[32]. Additionally, trauma-informed approaches are increasingly employed to address the underlying psychological effects of traumatic experiences, fostering healing and reducing the risk of future offences[33]. Many offenders struggle with substance abuse, which can be a significant criminogenic need. Probation programs often incorporate mandatory participation in treatment programs, aiming to achieve sobriety and equip individuals with relapse prevention strategies[34]. Methadone treatment (MT) may also be considered for individuals with opioid use disorder (OUD) to some individuals in community supervision[35].Probation officers

find drug courts to be an effective intervention for achieving positive outcomes for offenders under their supervision. Most drug courts incorporate three phases: stabilisation, intensive treatment, and transition.[36]

Cognitive-behavioural interventions and motivational interviewing

Probation programs often integrate interventions to address underlying emotional and cognitive factors contributing to criminal behaviour. Many offenders struggle with managing anger and emotions effectively, leading to impulsive and aggressive behaviour. Probation may incorporate anger management classes, stress reduction techniques, and emotional regulation skills training. By improving emotional self-control, offenders can navigate challenging situations constructively, reducing the risk of reoffending[37]. Probation programs can utilise CBT to challenge and modify distorted thinking patterns and beliefs contributing to criminal activity. Through CBT, offenders learn to identify and replace negative and irrational thoughts with more adaptive and pro-social ones. This process enhances self-control, problem-solving skills, and decision-making abilities, ultimately promoting positive behaviour change[38]. Motivation is a critical factor in successful probation outcomes. Probation officers utilise Motivational Interviewing (MI) to help offenders explore their reasons for change and build intrinsic motivation by focusing on their strengths and resources. Through open-ended questions and reflective listening, probation officers can help offenders identify their ambivalence towards change and ultimately move towards positive behaviour modification. Recognising and celebrating successes through positive reinforcement motivates them to stay committed to rehabilitation[39].

Positive social support - a need to build networks:

Positive social support networks are crucial for successful offender rehabilitation[40]. Probation programs actively promote the development of pro-social relationships and support systems[41]. Probation officers can encourage offenders to Strengthen relationships with family and friends who can offer emotional support and a sense of belonging, connect with positive community members who can serve as mentors or role models and access community resources that provide practical assistance and opportunities for pro-social involvement[42]. Building a strong social support network can significantly benefit offenders in several ways. Social connections can combat feelings of isolation and loneliness, fostering a sense of belonging and reducing stress[43]. Positive social support can provide structure, accountability, and positive reinforcement, ultimately discouraging criminal behaviour. Promoting empathy and perspective-taking can help offenders understand the impact of their actions on victims and the community. Restorative justice practices, such as victim-offender mediation, can facilitate the development of empathy and accountability in offenders[44]. Probation programs can teach offenders pro-social skills, such as effective communication, problem-solving, and conflict resolution. These skills enhance their ability to maintain healthy relationships and reintegrate into society successfully[45]. For offenders with a history of criminal behaviour or substance abuse, probation may include relapse prevention planning[46]. Psychological assessments are vital to probation, allowing officers to identify individual risks and needs. This information helps tailor supervision plans and interventions that address specific criminogenic needs for effective risk management[47].Figure 3 exhibitsmental health interventions and psychological support for offenders under probation.

Societal Impacts Of Probation: A Catalyst For Positive Change

Studies suggest that probation can be as effective, or even more effective, than incarceration in lowering recidivism rates. Probation of offenders translates to safer communities and reduced strain on the justice system. Probation alleviates prison overcrowding, realising better resource allocation towards higher-risk offenders requiring more intensive supervision[48]. Probation programs address the root causes of criminal behaviour by providing support, interventions, and opportunities for offenders to maintain connections with their families and communities. It fosters pro-social attitudes and skills that empower successful reintegration[49]. Recognition of unique needs across offender populations leads to implementing culturally tailored programs within probation, enhancing program effectiveness and promoting positive outcomes for diverse offenders[50]. By collaborating with local organisations to build supportive offender relationships with family, friends, and mentors, probation strengthens social support networks, promotes well-being, and reduces recidivism risk[51]. Access to legal aid through probation services empowers

offenders to understand their rights and responsibilities[52]. It generates a sense of fairness in the justice system and bolsters public confidence in rehabilitating offenders[53]. Figure 4 demonstrates the cumulative societal benefits of probation of offenders.

The Economic Benefits Of Probation: A Cost-Effective Approach To Criminal Justice

Community corrections are significantly cheaper than incarceration due to lower housing, food, healthcare, security, and administration costs[54]. Lower recidivism rates translate to reduced expenditures on investigating, prosecuting, and incarcerating repeat offenders[55]. Administrative costs associated with probation are typically lower compared to prison operations[56]. Community-based programs offer short-term and long-term cost savings through reduced recidivism, facilitate economic opportunities for offenders[57], and minimise the collateral costs of incarceration on families and communities, lessening the burden on social services[58]. Offenders participating in probation can contribute to the economy through financial amends, vocational training, and employment, reducing reliance on public assistance and promoting economic growth[59]. Figure 5 demonstrates the cumulative economic benefits of probation of offenders.

Globally effective probation programs and successful practices.

Several effective probation programs promote rehabilitation and desistance from crime across the globe. The Risk-Need-Responsivity (RNR) model guides interventions by matching supervision intensity to individual risk assessments and specific criminogenic needs[60]. It is found that drug courts that restrict violent offenders are associated with lower recidivism rates[61].Most drug courts involve three phases of treatment, which follow the risk, needs, and responsivity model[62]. This personalised approach fosters better results. Successful probation officers utilise frequent interactions, risk assessments, and tailored interventions to reduce recidivism rates, even for violent offenders[63]. Cognitive-behavioural therapy (CBT) interventions demonstrate effectiveness across diverse offender populations, including drug offenders, domestic violence perpetrators, and sex offenders[64]. CBT equips individuals with tools to manage emotions and make positive choices by addressing underlying thought patterns. Probation officer training strengthens their ability to interact effectively with offenders and deliver targeted interventions[65]. Ongoing training and supervision remain crucial[66]. Effective communications with probationers involve avoiding labels, explaining decisions clearly, and actively listening to client concerns[67]. Procedural justice principles build trust[68] even with video conferencing for probation check-ins[69]. Individualised assessments that go beyond generic risk scores lead to more effective interventions[70]. Tailoring programs to specific needs improves outcomes. Solution-focused supervision helps offenders establish routines, dismantle barriers to opportunity, and develop positive coping mechanisms, all contributing to desistance[71]. Client motivation, family support, and religious involvement further enhance program success[72]. Building a support network is crucial for positive reintegration.

Probation practices emphasising compassion and understanding over punishment increase trust and build a foundation for successful rehabilitation[73]—techniques like "reintegrative shaming" focus on motivating change rather than solely on punishment. Ethical humility within probation services encourages staff to be open to new ideas and respectful of clients, leading to stronger outcomes[74]. Collaboration across legal, social, and mental health services fosters a holistic approach to addressing client needs and promoting desistance[75]. Building "thick" relationships based on trust and empathy between probation officers and clients is critical for successful rehabilitation[76]. Probation practices prioritising social justice and care for individuals under supervision reflect a commitment to societal responsibility[77]. Electronic monitoring devices and risk assessment tools enhance offender management and the efficiency of probation services in this information age[78]. Research suggests promising results from programs like gardening initiatives for women in corrections, highlighting the importance of innovative and engaging intervention. Figure 6 illustrates Globally effective probation programs and successful practices.

Optimising Probation: From Challenges To Opportunities For Positive Outcomes

Effectively rehabilitating offenders requires dedicated time and qualified personnel[79]. A purely compliance-oriented approach may not be sufficient to address the root causes of criminal behaviour. Effective probation

programs incorporate strategies like holding officials accountable, utilising evidence-based practices, and leveraging technology for treatment delivery. Creating robust information systems facilitates collaboration and better decision-making. Selective interventions, reduced restrictions, and opportunities for redemption can minimise recidivism[80]. Programs that emphasise repairing the harm caused by crime can promote offender rehabilitation and victim satisfaction[81].Research indicates public backing for programs that focus on education, substance abuse treatment, and counselling for offenders[82]. Studies suggest that individuals receiving medication-assisted treatment (MAT) have positive perceptions of individual probation officers but negative experiences with the broader correctional system. Interventions are needed to address potential knowledge gaps among probation officers regarding substance use disorders and MAT to better support individuals on probation or parole[83]. Well-designed pre-arrest diversion programs for people with substance use disorders (SUD) can significantly reduce crime and overdose rates while improving individual lives. These programs require thorough evaluation and ongoing feedback from community partners to ensure effectiveness[84]. Figure 7 exhibits Challenges, strategies and promising practices in probation supervision.

Probation In India: A Modern Approach To Criminal Justice

Modern civilised societies increasingly emphasise rehabilitation within their justice systems. Punishment focused solely on retribution or inflicting suffering is no longer seen as effective. On the other hand, rehabilitation focuses on improving the offender, and as the saying goes, "You can't improve someone by hurting them." This approach recognises that criminals often go astray, and the goal is to reshape and reintegrate them into society. By prioritising rehabilitation, communities protect themselves and have a better chance of reducing future crime; hence, a therapeutic rather than an in terrorem outlook should prevail in our criminal courts[85]. In India, Probation of offenders, an embodiment of the progressive penal policy of individualisation of punishment, may be defined as a conditional suspension of the imposition of sentence on selected offenders on their undertaking to maintain good behaviour for a specified period with or without the supervision of a probation officer. The concept of criminal justice has evolved significantly since the enactment of the Probation of Offenders Act, 1958. This Act embodies the progressive idea that criminal punishment should aim to rehabilitate offenders, not just inflict retribution[86]. In India, the word "probation" means the conditional suspension or, imposition or execution of sentences by the court in selected cases, especially of young offenders who are not sent to prison but are released on probation either after simple admonition as contemplated under Section 3 of the Act or on a bond, with or without sureties, to keep the peace and be of good behaviour[87].

If a person is found guilty of an offence under sections 379, 380, 381, 404, or 420 of the Indian Penal Code or any offence punishable by up to two years' imprisonment or a fine and has no prior convictions, the court may, considering the case's circumstances and the offender's character, release them with a warning instead of sentencing or probation according to sec.3 of the Act. If a person is found guilty of an offence not punishable by death or life imprisonment, the court may, considering the case's circumstances and the offender's character, release them on probation of good conduct. Instead of immediate sentencing, the court can require a bond for up to three years, during which the offender must maintain peace and good behaviour according to sec.4 of the Act. The court has the discretion to consider the probation officer's report, but it is not mandatory in all cases. According to sec.6 of the Act, if a person under 21 is found guilty of an offence punishable by imprisonment (but not life imprisonment), the court should not sentence them to imprisonment unless it deems it necessary, given the case's circumstances and the offender's character. If imprisonment is ordered, the court must record its reasons. The Probation of Offenders Act (1958) can override earlier laws, including mandatory minimum sentences in the Indian Penal Code when sentencing options for an offender[88].

Probation Of Offenders: Medico-Legal Necessity For India In The Wake Of Covid-19

The human rights violations caused by prison overcrowding during COVID-19 are severe and require urgent action. Ongoing interventions and a cautious approach are essential to effectively manage public health emergencies by reforming the criminal corrections system.

Decarceration as a public health strategy: post COVID-19 measures:

The COVID-19 pandemic warned the dangers of prison overcrowding in the US, disproportionately impacting the incarcerated population[89]. Inmates faced a five times higher infection risk due to cramped conditions and limited hygiene[90]. Federal responses varied, leaving some inmates unequal access to healthcare and vaccines[91]. This crisis exposed the need for reform, as overcrowded facilities become hotspots for infectious diseases, endangering inmates, staff, and surrounding communities[92]. Decarceration, or reducing prison populations, is a key strategy. It allows for better social distancing and reduces transmission risks[93]. Portugal successfully implemented early releases and activity restrictions, preventing inmate deaths from COVID-19, but faced challenges like overwhelmed probation services[94]. Many countries adopted similar measures, including Spain and Turkey, demonstrating the effectiveness of reducing prison populations[95]. The pandemic underscored the moral and public health imperative of protecting incarcerated people. It is not just about reducing racial disparities in COVID-19 outcomes but also about safeguarding overall public health[96]. Policymakers should focus on permanent prison population reduction, ensuring access to protective measures for inmates, and adhering to recommended medical practices[97]. This pandemic serves as a stark reminder of the urgency for prison reform to create a safer and healthier environment for all.

Indian prisons struggle with overcrowding and pandemics like COVID-19:

Even before the pandemic, Indian prisons faced severe overcrowding, exceeding 118% capacity on average. In 2016, the court directed a committee to review the use of probation for first-time offenders to reduce prison populations. In 2020, due to COVID-19 concerns, the court ordered the release of 34,000 prisoners based on state committee recommendations. Overcrowding remained a significant issue; social distancing was nearly impossible in some facilities. Certain facilities experienced even more severe conditions, surpassing 500% capacity, as seen in Kerala's Irinjalakkuda Special Jail, reaching a staggering 636%, thus rendering social distancing nearly impossible[98]. Releases likely spread the virus to communities. Harsh isolation and quarantine measures negatively impacted inmates' mental health. Overcrowding, poor sanitation, and inadequate medical care threaten public health. Overcrowding and inadequate COVID-19 measures led to protests that were forcefully suppressed by authorities[99].

Probation in India: A Human Right Response to prison Overcrowding and Public Health Emergencies:

Section 2 of the Protection of Human Rights Act, 1993, defines human rights as those related to life, liberty, equality, and dignity, guaranteed by the Constitution or recognised in international covenants and enforceable by Indian courts. Probation upholds the right to life and personal liberty under Article 21 by prioritising rehabilitation over harsh punishment. It meets the fairness and reasonableness requirements mandated by Article 21[100], safeguarding offenders' liberty while considering societal needs. The right to health, also a fundamental right under Article 21, ensures that patients are treated with dignity. Hospitals, nursing homes, and clinics must provide treatment to the best of their capacity to all patients[101]. Probation adheres to the proportionality principle by ensuring that punishments are commensurate with the severity of the offence[102].

Article 14 of the Constitution ensures equal protection of the laws but does not mandate universal applicability. It allows the state to classify individuals or entities for legislative purposes, provided the classification is reasonable and related to the legislative objective[103]. It mandates that equals must be treated equally while recognising that unequal should not be treated alike, and it allows for classification when implementing the right to equality[104]. The legality of such classifications depends on their reasonableness and relevance to the law's purpose rather than their universality[105]. An enactment may be constitutional even if it applies to a single individual, given there are special circumstances or reasons specific to that individual justifying their distinct classification[106]. Equal protection of the laws denotes equality of treatment in similar circumstances. It implies that the law should be equally administered among equals, treating cases alike without distinction of race, religion, wealth, social status, or political influence[107]. Thus, the rule is that like should be treated alike and not that unlike should be treated alike[108]. Article 15 empowers the state to extend special provisions for advancing socially and economically backward classes. Offenders must be classified equally under the law based on relevant differences, not arbitrarily. Any differentiation

must be based on relevant, genuine distinctions rather than irrelevant or artificial ones[109]. The principle of equity is central to the concept of equality before the law, as outlined in Articles 14 and 15 of the Constitution. When crime results from any form of disability—social, psychological, psychiatric, hereditary, physiological, or therapeutic—equitable treatment is necessary. These disabilities create vulnerabilities to committing offences, meaning offenders are not in similar circumstances and lack equal opportunities, perpetuating disadvantage. Effective probation can help address this inequality, ensuring offenders receive equal legal protection. The Probation of Offenders Act is essential in upholding Article 39-A of the Indian Constitution, which ensures equal justice and free legal assistance. It mandates free legal services for those who cannot afford representation due to poverty or other reasons. The state must provide legal representation, if necessary unless the accused objects. The POA Act offers rehabilitation instead of imprisonment for certain offenders, ensuring equal opportunities regardless of economic or social status. This aligns with the constitutional goal of justice based on equal access. Thus, the Act is vital for implementing the principles of equal justice and free legal assistance in Article 39-A. Examining the legality of probation as a conditional suspension of imprisonment, considering offenders' circumstances and rehabilitative potential, reveals its foundation in the Indian Constitution and human rights principles. It is crucial during public health emergencies like COVID-19. Based on the deliberation of the above legal aspects, the probation of offenders in India can be understood as an essential human right, particularly during public health crises, and a medico-legal necessity. Figure. 8 demonstrates the medico-legal necessity of probation from a public health perspective.

Reviving probation in india: addressing sentencing disparities and reintegration challenges.

Probation in India remains underutilised despite its potential to reduce recidivism and prison overcrowding[110]. Scholars advocate for a multi-pronged approach to revitalise probation. Firstly, legislative reforms are crucial to address sentencing disparities. Judges currently have significant discretion, leading to inconsistencies[111]. Learning from models with clear sentencing guidelines, like the US and UK, could promote proportionality and rehabilitation[112]. Additionally, strengthening the Probation of Offenders Act 1958 is necessary. Research suggests the Act fails to address social reintegration adequately and assigns limited responsibility to society for offender support[113]. Secondly, promoting individualised sentencing that considers psychological factors and background information is essential. Judges should consider psychological aspects and background information for sentencing, promoting rehabilitative options like open prisons, after-care programs, stakeholder coordination, parole, probation, education, employment, prison separation, living standards, family visits, therapy, and counselling[114]. This aligns with the concept of individualised punishment gaining traction elsewhere, potentially leading to the broader use of probation[115]. Finally, maximising the potential of probation requires a shift in focus. Remand can hinder reintegration, whereas probation facilitates supervision and societal reconnection. Further research is needed to assess the Act's effectiveness in reducing recidivism and develop best practices for implementation[116]. By addressing these issues, India can harness the potential of probation as a vital tool for rehabilitation and a more balanced criminal justice system. Figure 9 exhibits the Medico-Legal Framework as A Holistic Approach from Crime to Redemption: A Pathway to Rehabilitation.

CONCLUSION

A medico-legal approach to probation combines medicine and law to address the root causes of crime, improving public health. As a rehabilitative alternative to incarceration, probation focuses on offender reintegration. Probation programs prioritise rehabilitation by integrating medical, psychological, and social interventions through advanced technology and digitisation. This approach fairly addresses the root causes of crime, fostering a more just criminal justice system. Probation offers a holistic response to offenders' complex needs, including mental health, substance abuse, and social support deficiencies. Evidence-based practices, like cognitive-behavioural therapy and motivational interviewing, are crucial for fostering positive behaviour change and reducing recidivism. Probation also offers significant economic benefits. By diverting offenders from prison, governments save money. Successful reintegration contributes to economic growth and reduces the burden on social services. Web science technologies can enhance

probation practices. Digital interventions can address offenders' needs while reducing stigma. Digital tools can revolutionise offender monitoring, communication, and data analysis, enabling more effective supervision.

In India, the Probation of Offenders Act, 1958, provides a legal foundation for rehabilitating and reintegrating offenders. However, to fully realise its potential, there is a pressing need for the development and implementation of evidence-based practices within the framework of this Act. Enhancing the effectiveness of probation will require increased investment in training probation officers, expanding access to mental health and substance abuse treatment, developing technology-informed probation practices, and fostering collaboration among various agencies. While probation serves as a promising avenue for offender rehabilitation, persistent challenges such as resource constraints, a shortage of specialised personnel, and societal stigma continue to hinder its success. Overcoming these obstacles necessitates a concerted effort from policymakers, practitioners, and the broader community.

In conclusion, a well-designed and comprehensive probation system is a powerful tool for reducing crime, promoting public health, and building safer communities. By prioritising rehabilitation, collaboration, and evidence-based practices, policymakers and practitioners can unlock the full potential of probation. A comprehensive approach to probation should encompass individualised interventions tailored to offender needs and risk factors, utilising evidence-based practices, fostering collaboration between various agencies, integrating technology to enhance supervision and communication, ensuring adequate resources, and promoting public awareness to reduce stigma. Accordingly, there is a need for reforming and updating legislation, including The Probation of Offenders Act, 1958. By addressing these critical areas, probation can become a more effective tool to combat rising crime rates, alleviate prison overcrowding, and even contribute to public safety. This study acknowledges limitations regarding web-based interventions' long-term impact and ethical implications. Future research should evaluate these interventions, address societal stigma, improve resource allocation, conduct comparative analyses, and examine long-term outcomes. Collaboration with stakeholders and ethical considerations are crucial for developing effective and equitable probation programs.

ACKNOWLEDGEMENTS

The authors express their sincere gratitude to the School of Law and Research Centre at Christ University, Bangalore, particularly the Advanced Research and Development Department of the Christ University Library, for providing essential opportunities, internet resources, and databases that were instrumental in completing this research. The authors confirm that they prepared this manuscript exclusively by utilising these resources.

ABSTRACT

Salinity is a critical environmental stressor, affecting nearly one-third of irrigated regions globally and significantly preventing plant growth by altering soil composition, nutrient availability, and water absorption. This study investigates the effects of chitosan nanoparticles (ChNPS) on mitigating salinity stress in tomato plants (Lycopersicumesculentum L.), a key global vegetable crop. The experiment was conducted in a completely randomized block design (CRBD) with treatments including control, NaCl (100mM), NaCl + ChNPS, and ChNPS (120 mg/L) alone. Salinity stress was found to markedly reduce plant height, stem diameter, leaf area, chlorophyll, and carotenoid content, as well as the number of fruits per plant. Conversely, foliar application of ChNPS significantly improved these parameters, enhancing plant growth, fruit yield, and stress tolerance by promoting nutrient uptake and chlorophyll biosynthesis. The optimal chitosan concentration of 120 mg/L was particularly effective in mitigating the adverse effects of salinity, demonstrating its potential as a natural, eco-friendly solution for improving tomato productivity in saline soils. This study highlights the importance of chitosan as a growth enhancer and stress mitigator in agricultural practices.

Keywords: Salinity, Chitosan Nanoparticles, Tomato, Plant Growth, Stress Tolerance, Nutrient Uptake, Chlorophyll, Carotenoids, Fruit Yield, Sustainable Agriculture

INTRODUCTION

Among the numerous non-biological pressures, salinity has emerged as a significant problem that affects around one-third of the irrigated regions worldwide and has a detrimental effect on plant performance (Akladious and Mohamed 2018). By changing the soil's composition and nutrient availability, this extreme stress limits plant growth. It also influences the way in which plants absorb nutrients and water (Sofy *et al.* 2020b). Salinity is acknowledged as the main soil problem in Pakistan that negatively affects plant growth and productivity (Shahid *et al.* 2011). It diminishes plant growth and yield by reducing water use efficiency and modifying plant metabolism (Munns 2002). Salinity impacts numerous physiological processes, including seed germination, plant development, photosynthesis, lipid metabolism, DNA, RNA, protein production, and cell division (Niu *et al.* 2013). Drought stress is a major factor contributing to significant reductions in plant growth, productivity, and yield. The use of chitosan has been shown to enhance drought resistance and improve water use efficiency (Khan *et al.* 2020). Chitosan is a natural, low-toxicity, and cost-effective compound that is biodegradable and eco-friendly, making it suitable for various agricultural applications (Basit *et al.* 2020). It is beneficial and safe for both plants and animals. Chitosan is derived from D-glucosamine and N-acetyl-D-glucosamine, formed by replacing the acetyl group in chitin with an amino group (Sofy *et al*. 2020a; Sugiyama *et al.* 2001). It is a widely available fundamental biopolymer with structural similarities to cellulose (de Alvarenga 2011). Chitosan is commonly used for post-harvest coating to extend shelf life and also aids in enhancing growth and yield (Haytova 2013). Additionally, it boosts plant defense mechanisms against both biotic and abiotic stresses (Sofy *et al.* 2020a). By promoting nutrient uptake, chitosan improves both the qualitative and quantitative aspects of crops (Malerba and Cerana 2016). It can be applied as a soil treatment or foliar spray to induce stress tolerance and enhance plant performance (Ortiz *et al.* 2007). Chitosan is crucial within the plant system, as it activates various enzymes to combat multiple stresses. Today, chitosan is predominantly used as a growth enhancer due to its organic, environmentally friendly, and biodegradable nature, improving plant stress resistance.

Tomato (*Lycopersicumesculentum*L.) is a member of the Solanaceae family, commonly known as the nightshade family, and is cultivated worldwide. It ranks as the second most important vegetable crop globally, with cultivation extending to nearly every country (Megahed *et al.* 2013). Tomatoes thrive in tropical and subtropical regions (Nicola *et al*. 2009). In Pakistan, tomatoes are grown extensively across 60.7 thousand hectares, yielding approximately 570.6 thousand tons and a relatively cool climate with sufficient sunlight for optimal growth and development. They are a vital part of the human diet due to their flavor and nutritional benefits. Tomatoes are hermaphroditic but are sensitive to high temperatures, which can affect fruit set and size. The ideal temperature range for fruit development is between 25 and 30°C (Anonymous 1999). They grow best in sandy and heavy clay soils with a pH level between 5.5 and 7.5. Tomatoes are primarily consumed fresh but are also processed into various products (Beutner *et al.* 2001). However, tomato yields can be compromised by several issues, including biotic and abiotic stresses, use of low-yielding varieties, improper fertilization, and pest management problems. To achieve optimal yields, tomato plants require adequate nutrition

MATERIALS AND METHODS

The seeds of *Lycopersicumesculentum*L.(PKM1) variety were collected from Tamil Nadu agricultural university, Tamil Nadu, India.

Experimental procedures

The experimental work were carried out in Botanical Garden and Stress Physiology Lab, Department of Botany, Annamalai University, Tamil nadu, India. The pots were filled with homogenous mixture of garden soil containing red soil, sand along with farmyard manure in the ratio of 1:1:1.with factorial arrangement and size of plastic bags was (16×24 inches) The pots were arranged in Completely Randomized Block Design (CRBD).plants were allowed to grow up to 25 days with regular water irrigation. The salt (100mM) was given on 28th DAS, onwards in regular intervals till final concentration achieved. salinity of the pot soil was maintained same by checking it's EC regularly.

Plant samples were collected on 35th, 45th and 55thDAS.i. Plants without any chemicals kept as "CONTROL."ii. Plants with NaCl treatment (100mM) kept as "NaCl"iii. Plants with NaCl and Chitosan Nanoparticles treatment together kept as "NaCl + ChNPS"iv. Plants with Chitosan Nanoparticles treatment only kept as "ChNPS (120 mg/L)" Foliar application of chitosan was sprayed after 30 days of transplantation and it was sprayed 3 times during research. Samples were taken at the end of experiment to determine the morphological attributes and biochemical analysis. The morphological measurements are root length,shoot length ,fresh weight dry weight, average number of compound leaves plant−1 , leaf area (cm2), stem diameter (mm), No of fruits plant−1. In addition, some biochemical parameters such as chlorophyll and carotenoid contents.

Soil Analysis

10 grams of soil were taken from the Botanical Gardenand sent to Annamalai University Department of Soil Science. The soil sample was added to 40 millilitres of distilled water, shaken for 40 minutes, and then filtered through Watt man filter paper. Following the filtration process, the salinity was assessed using an electrical conductivity meter. The sample was placed inside the probe, and the resultant value was recorded at 0.64 dsm−1. With the aid of a pH meter, the pH of the soil was likewise found to be 5.7.

Data Analysis

Data obtained were expressed as the mean of three replicates and data were subjected to one-way analysis of variance (ANOVA) test. Differences between means were determined by least significance difference at $P< 0.05$, using SPSS Statistical Package version 20.

Morphological Attributes

Determination of Root length and Shoot length; Thetomato plants were uprooted, washed with tap water and taken to the lab. Immediately to determine the morphological traits, the root length was measuring below the point of root-shoot transition to the farthest point of root tip. The length between shoot tip and point of the root shoot transition region was taken as shoot length. The values were expressed in cm plant-1.

Determination of Fresh weight and Dry weight

After carefully blotting the plant roots and shoots using tissue paper to remove moisture, the roots and shoots were cleaned with tap water. An electronic balance (Model: DS-852J Series) was used to weigh the fresh roots and shoots. The plants were then dried for 48 hours at 70 degrees in a hot air oven. The material was held in the same oven until a consistent dry weight was achieved after their weight was measured after drying. Fresh and dried weight values were noted and represented as grams per plant-1.

Determination of Chlorophyll and Carotenoid contents

500 mg of fresh leaf tissues were pulverized in a mortar that had been cooled beforehand with 10 ml of 80% acetone (v:v). Following full extraction, the mixture was centrifuged for 15 minutes at 4 x 800 x g. Furthermore, by discarding the supernatant, the extraction process was repeated. Ultimately, 80% acetone was added to the collected supernatant to reach a final amount of 10 ml. Using a spectrophotometer (Model-118, Systronic India Limited, Gujarat, India, UV–VIS), the absorbance was measured at 645, 663, and 480 nm. The obtained amounts of carotenoid and chlorophyll were calculated and expressed in mg g-1 FW using the Arnon (1949) and Kirk and Allen (1965) equations.

RESULTS

Plant height of tomato was significantly decreased with increasing salinity level as compared with unstressed plants. The maximum value of plant height (82.11 cm) was found in control plants, while the minimum value of plant height (62.14 cm) was noted in plants treated with the high concentrations of salinity (100 mM). Regarding chitosan foliar application, maximum value of plant height (93.75 cm) was noted in plants treated with 120 mg L−1 of chitosan concentration. All concentrations of chitosan can alleviate the adverse efect of salinity levels. The most pronounced

increases were detected in plants treated with 120 mg L−1 of chitosan nanoparticles at all salinity level as compared with salt stressed plants.

Stem diameter

(mm) the maximum value of stem diameter (10.48 mm) were recorded in chitosan NPS treatment plants, while the minimum value of stem diameter (9.36 mm) was noted in plants treated with the high salinity level of 100 mM. Moreover, chitosan foliar application showed significantly increased in stem diameter as compared to salt stressed plants. Te most pronounced increases have been observed in plants treated with chitosan 120 mg L−1 (table 2)

Number of fruits plant−1

The highest number of fruits plant−1 (15.6) were found in chitosan NPS while the least fruits plant−1 (6.5) were noted in plants grown under high salinity stress level (100 mM). Also, chitosan foliar application showed the highest fruits plant−1 (15.6.) concentrations of chitosan caused signifcantly increased in number of fruits plant−1 as compared to salt stressed plants .

Chlorophyll pigment contents

The chlorophyll-a, chlorophyll-b and values are high in the plants of Chitosan Nanoparticles treatment(ChNPS)(Fig. 9, Fig. 10 and Fig. 11).The plants of control have higher pigments compared to NaCl+ ChNPS. Salinity decreased all photosynthetic pigments in sorghum Sorghumbicolor L. (Damodaran, T *et al*). The content of chlorophylls showed a significant response to ChNPStreatment under salinity in tomato*Lycopersicumesculentum*L. (El-Flaah, R.F *et al*).It also showed that plants treated with ChNPS synthesized more cytokinin, which in turn enhanced chloroplast differentiation and chlorophyll biosynthesis, and prevented chlorophyll degradation (Karimian Z *et al*). Chlorophyll concentration per unit leaf area was enhanced by ChNPS due to a great concentration of chlorophyll in a much smaller leaf area and synthesized more cytokinin which in turn enhanced chloroplast differentiation and chlorophyll biosynthesis and prevented chlorophyll degradation in common garden peony Paeonialactiflora Pall. (Franklin *et al*). ChNPS significantly increased chlorophyll content and photosynthetic rates of rape Brassica napus L. (Kamiab, F *et al)*

Carotenoid pigment content

The carotenoid pigments are abundant in the plants of the Chitosan nanoparticles (ChNPS) (Fig.2). Plants treated with NaCl+ChNPS have larger levels of carotenoid pigment than plants treated with NaCl. The carotenoid pigment content in control plants is greater than in NaCl treated plants. Carotenoids are important antioxidants that protect the photosynthetic machinery from damaging environmental influences and are also precursors to important vitamins (Fraser, P *et al).* Carotenoids protect plasma-membrane lipids from further oxidation and improve stress tolerance in tomato plant by scavenging directly active oxygen species generated during stress (Doganlar, Z.B *et al).* Carotenoids, the naturally occurring isoprenoids form essential components of photosynthetic antenna and reaction centre complexes. Thus they play a significant role in absorption, dissipation and transfer of light energy for the process of photosynthesis,(Kao, W.Y *et al)* Improvement of total carotenoids in green microalgae Chlorella vulgaris Beijerinck by exogenous application of ChNPS. Chitosan nanoparticles improved chlorophyll and carotenoid contents in response to salinity in sweet sorghum Sorghumbicolor L. Moench *et al.*

DISCUSSION

Salinity significantly reduced the height of tomato plants, likely due to its impact on root growth, morphology, and physiology, which in turn affected water and ion uptake, leading to decreased plant growth and productivity (Tejera *et al*. 2006). Additionally, salinity stress can hinder water absorption and disrupt metabolic processes, as noted by Mohamed *et al*. (2018a). Similar findings were reported by Mohamed *et al. (*2018b), who observed that salinity stress adversely affected wheat growth, and by Akladious and Mohamed (2018), who found that salt stress significantly suppressed the morphological characteristics of pepper plants.

On the other hand, chitosan application positively influenced the height of tomato plants, potentially because its amino groups enhance the photosynthetic capacity of the plants, leading to increased growth (Sofy *et al.* 2020a). The observed growth improvement after chitosan treatment might be due to its role in enhancing the uptake and transport of essential minerals like nitrogen, phosphorus, and potassium. Previous studies have also shown that chitosan positively impacts plant height in sweet pepper, cucumber, and radish plants (Farouk *et al.* 2008), and Guan *et al.* (2009) reported similar effects on maize. The reduction in the number of compound leaves might be attributed to high salinity concentrations causing osmotic stress, which limits water and nutrient availability to the roots, disrupting plant tissue and reducing meristematic activity and cell expansion. Uddin *et al*. (2005) observed a decline in leaf number with increased NaCl levels in Brassica species. These findings align with Akladious and Mohamed (2018), who also reported reduced growth in pepper plants under salt stress. Conversely, chitosan significantly increased the number of compound leaves per plant, likely due to its role in enhancing phosphorus and potassium levels, which promote cell division, cell size, chloroplast development, and chlorophyll synthesis (Latif and Mohamed 2016). The findings align with those of Jian *et al*. (2002), who observed that chitosan application enhanced the number of branches, plant height, and leaf count in rice plants. Similarly, Khan *et al*. (2002) reported that using chitosan as a foliar spray on soybean and maize positively influenced the number of leaves in these crops. Moreover, Islam *et al.* (2018) found that chitosan treatment in tomato plants led to an increase in internodes per plant, which consequently boosted leaf production.Salinity stress has a pronounced impact on the leaf area of tomato plants, particularly at higher concentrations. This is likely due to salinity's effect on nitrogen levels, which reduces the photosynthesis rate and, as a result, diminishes leaf area (Kashem *et al.* 2000). Conversely, different concentrations of chitosan have been shown to significantly enhance tomato leaf area. This improvement may be attributed to increased water and nutrient availability, which boosts the activity of key nitrogen metabolism enzymes and enhances nitrogen transport, thereby elevating photosynthesis rates, growth, and overall plant development (Guan *et al.* 2009). Sofy *et al.* (2020a) also observed that varying chitosan concentrations positively impacted plant height and other growth parameters in cucumber plants.

Increased uptake of nitrogen and potassium, facilitated by chitosan, promotes plant growth and development, leading to thicker stems (Ibraheim and Mohsen 2015). However, various levels of salinity have been found to significantly reduce the number of fruits per plant, as salinity decreases the availability of essential nutrients needed for plant growth and development. Salinity causes hyperosmotic stress and ion imbalances, which disrupt the plant's metabolic pathways (Foolad 2004). Chitosan treatment, on the other hand, significantly increased the number of fruits per tomato plant. This effect may be due to chitosan's ability to enhance photosynthetic pigments and biochemical activities in plants, resulting in more photosynthates being allocated to fruit production, thereby increasing the fruit count (El-Tantawy 2009). These findings are consistent with those of Mondal *et al.* (2013), who found that foliar application of chitosan at concentrations up to 95 mg L^{-1} significantly improved the number of tomato fruits. Additionally, Chibu *et al.* (2002) reported that chitosan treatment in rice and soybeans led to a notable increase in the number of soybean pods during early growth stages. However, fruit weight was significantly reduced as salt concentration increased, likely due to salinity's adverse effects on chlorophyll pigments, which decreased the rate of photosynthesis and, consequently, reduced the production of photosynthates, ultimately leading to lower fruit weight. Similar observations were made by El-Beltagi *et al.* (2013, 2020) and El-Mashad and Mohamed (2012).Chitosan significantly increased the number of fruits per tomato plant, likely because it enhances water supply and nutrient absorption by regulating osmotic pressure at the cellular level. Additionally, it boosts enzymatic and antioxidant activities in the plant. These results are consistent with those of Rahman *et al.* (2018), who found that foliar application of chitosan led to an increase in the fruit weight of strawberry plants The foliar application of chitosan resulted in reduced transpiration and water use, while still maintaining biomass production and yield. Salinity has been shown to enhance total soluble solids (TSS) in fruits, likely due to increased accumulation of sodium (Na^+), potassium (K^+), and chlorine (Cl^-) ions (Mizrahi *et al*. 1988). These results are consistent with Islam *et al.* (2018), who observed that TSS in tomatoes rose as salinity levels increased. Additionally, the application of chitosan as a foliar spray boosts TSS in tomatoes, possibly due to greater metabolite accumulation and the rapid conversion of starch into soluble sugars during fruit growth and development, influenced by growth regulators. In our study, we observed a significant rise in total soluble solids (TSS).

ACKNOWLEDGEMENT

We sincerely grateful towards Department of Botany, Annamalai University, TN.

CONCLUSION

This work emphasizes the value of applying a foliar spray containing a natural chitosan component, particularly to salt-affected soils. Appropriate application of chitosan concentrations can mitigate the harmful effects of elevated saline levels and enhance tomato plant development and productivity by enhancing several morphological features and chlorophyll quality. This study suggests using 120 mg L−1 of chitosan nanoparticles to improve tomato plant growth and yield.

ABSTRACT

Fruit diseases affect the crop's quality and output. Thus, it is crucial to have an automated system for identifying diseases in fruit leaves. Deep learning exhibits encouraging disease detection and classification outcomes in artificial intelligence (AI) applications, particularly in agriculture. A few obstacles stand in the way of fruit disease detection using the latest AI-based methods, including low-resolution photos, limited datasets for model training, and the removal of unnecessary features. This study suggested a new methodology for identifying fruit leaf diseases that use enhanced pathfinder optimization and deep learning features. This work uses two fruit types—apple and grape—for the validation process. This research aims to identify and categorize plant illnesses caused by bacteria and fungi using artificial intelligence techniques like the dynamic SURF method and neural network model. The classifier is trained and tested using a deep learning model. According to the quantitative experimental results of this research work, the authors have implemented ANN and DCNN to achieve improved accuracy, which is significantly higher than other previously proposed methods in this field.

Keywords: Deep Learning, Convolutional Neural Networks, Artificial Intelligence, Disease Recognition, Artificial Neural Networks, Image processing.

INTRODUCTION

Feeding the world's rapidly expanding population is becoming a significant problem, particularly in light of the way that climate change is altering agriculture and presenting new threats in the form of crop and fruit diseases. To put it

briefly, eating is a basic human need that is required for everyone to have the proper nutrition to be healthy and energetic. Plants provide a variety of food categories and traits that are useful to living things, such as fruits, vegetables, meat, legumes, dairy products, and so forth. In today's cutthroat food economy, food quality is the most crucial component [1]. The quality of food is directly correlated with its demand. The higher the food's quality, the higher the likelihood of its demand in today's market. According to assessments by the FAO (Food and Agriculture Report of the United Nations), fungus and other plant diseases cause 20 to 40 percent of agricultural production losses annually worldwide. The global economy suffers annual losses from plant illnesses and other diseases totaling around $220 billion (about Rs. 22 crore) and fungi-bacterial insects that cost about US$70 billion (roughly Rs. 7 crore). It was discovered that the annual cost of treating plant illnesses worldwide is close to these crores of rupees [2]. Research indicates that ten out of every hundred people who become ill from eating plant-based foods die as a result of bacterial and fungal illnesses. The World Health Organization (WHO) estimates that bacterial fungus meals derived from sick plants cause about 4,20,000 deaths annually. This study provides us with the justification to enhance treatment strategies in response to the global expansion of germs, plants, and illnesses to lower the global death rate [2]. Artificial intelligence is a technique that mimics how the human brain functions [3]. Since all contaminated food originates from fungi and diseased plants, we can use artificial intelligence techniques like machine learning and deep learning in the food industry for a variety of tasks like food preparation and sorting, food supply chain management, and food quality and safety improvement [2,3]. Many government organizations currently use deep learning and machine learning models to forecast and achieve high efficiency in complicated operations such as food safety and quality [3]. In the food processing industry, a variety of algorithms, such as convolution neural networks (CNN) and artificial neural networks (ANN), are widely used to solve various problems caused by fungi and damaged plants. It has been discovered that ANN is a very useful technique for evaluating food that is generated from sick plants. This study aims to identify fungi and bacteria in plants to make them healthier and fresher by analyzing the optimistic solutions using CNN, deep learning, ANN, and deterministic probability-based data fusion [4,5].

Literature review

To improve the process of fruit disease identification and classification, a large number of researchers are working in the fields of computer vision and machine learning. The necessity of automated disease detection and categorization in fruit plants was highlighted by Bansal *et al*. [7], as the manual procedure is laborious and time-consuming. Early disease identification is crucial for the economy of a nation, particularly in agriculture, which depends on the supply and quality of food. Apple leaf diseases are categorized using a concatenation of features calculated from Dense Net and EfficientNet-B7 in the proposed model [7]. Since there are more than two classes in the dataset, multiclass classification is done. The accuracy rate provided by the suggested model is 96.25%. According to Li *et al*. [8], improving the quality and quantity of fruit harvests requires sophisticated, early disease identification and classification. Five types of apple leaf datasets are handled by the CNN-based model Reg Net, which is shown in the corresponding paper. The suggested model is validated against various cutting-edge models, specifically Shuffle Net, MobileNet-V3, and EfficientNet-B0; several data augmentation methods, such as picture rotation, translation, scaling, and brightness calibration, are employed for data balancing. According to Kamilaris *et al.* [5], DL methods were used for many agricultural issues. The study discovered that deep learning techniques performed better than traditional image processing techniques. Fernandez-Quintanilla *et al.* evaluated how well weed-monitoring techniques worked in crops [10]. They focused on ground-based and remotely sensed weed monitoring devices in agricultural settings [24]. They argue that managing weeds requires weed monitoring. They predicted that data collected by various sensors would be stored in a public cloud and utilized as needed. Lu *et al.* published a review for CNN-based plant disease classification [11]. Using the DL criteria in addition to CNN—a classification system for plant diseases—they evaluated the main problems and solutions. Prospects and current obstacles were described by Golhani *et al.* [15]. They also introduced NN approaches for SDI development in short order. They discovered that as long as SDIs are required for efficient crop protection, they must be assessed at the plant leaf scale utilizing a range of hyper spectral sensors. Bangari *et al.* [16] reviewed CNN-based disease detection with a focus on potato leaf disease. They concluded that convolutional neural networks are more successful in diagnosing the ailment after looking through several studies. They also discovered that CNN significantly contributed to the greatest degree of sickness detection

accuracy. A model based on enhanced deep learning techniques and K-Nearest Neighbor (KNN) was presented by Gu *et al*. [17]. The fruit trees under consideration are pears and apples. Testing has been allowed for six different data classes: black necrotic, fire blight, anthracnose, scab, marssonina blotch, and Alternaria leaf spot. Deep features are extracted by seven pre-trained models: NasNet, VGG-16, Inception ResNet, DenseNet-121, ResNet-50, and VGG-19. By manually removing the ROI from the images, recognition accuracy is increased. Subsequently, the obtained images are fed into the pre-trained CNN models for ultimate optimization. Then, utilizing the features that were retrieved, the KNN algorithm is utilized to identify connected symptoms. After training with pre-trained models, the authors of the aforementioned approaches carried out the categorization [23]. A few authors developed personalized models and extracted features, which were then classified using machine learning classifiers. The previously described research did not train on noisy data [26]. Training a model on noisy data can help it become more scalable. Furthermore, they did not focus on optimizing features to reduce the computing time.

Proposed Work

The Proposed work is depicted in Figure 1. To begin with, the dataset of two fruit leaf diseases—apple and grape leaf is gathered for analysis. Original data refers to the samples that were first collected, while noisy data refers to data that has additional artifacts added to it. Next, transfer learning is used to apply a fine-tuned Deep Convolutional Neural Network model on both the original and noisy data. Consequently, two recently trained models—Model 1 and Model 2—are produced. Then, original and noisy data features are obtained by fusing the valuable and non-redundant features obtained from the state-of-the-art feature extraction technique.

Database Preparation

The original dataset and the noisy dataset are the two sections of the database that were made for the evaluation. Two fruit leaves, such as those from apples and grapes, make up the original dataset. There are four data classes in the Apple dataset: one class of healthy leaves and three classes of diseased leaves. Cedar rust, scab, and black rot are the other three classes. There is the same amount of images in each of the four classes, or 6000 total. Four groups of data are included in the grape dataset: healthy (1446 images), black rot (2960 images), esca (black measles) (3400 images), and leaf blight (2800 images). Figure. 2 displays the original dataset's photos. Fifty percent of the accessible datasets have been chosen to validate our findings for training and testing of the proposed architecture. The fruit leaf diseases included in the original data are still there in the noisy database, but extra noise has been added. The same amount of photos used for the original are used for evaluation purposes, namely for the leaves of apple and grapefruit fruits. The following kinds of sounds have been introduced to the data: Rayleigh, exponential, Gaussian, uniform, and salt and pepper noises.

Deep Convolutional Neural Network

The method of recognition or classification before to the development of DCNN models used the extraction of features that were either insufficient or did not reach a greater degree of accuracy [17]. DCNN models are effectively reaching higher accuracy levels across all domains where they are used. A collection of back propagation algorithms, such as feature extraction and convolutional and pooling layers, are also followed by CNN models. Neural networks imitate as much of the human brain as they can to function. Multiple convolutional layers are used in DCNN, which aids in the recognition of digital data or images. In a DCNN design, the convolutional layer is the most crucial and fundamental [18]. This layer generates the activation function or map for the corresponding image by convolving the image pixel matrix. The activation map helps to reduce the quantity of data that needs to be processed by storing the values of discriminant features. Any DCNN model's most crucial phase is convolution, and the convolutional layer (CL) is the most crucial overall. The 2D convolution of the input and kernel in the forward pass is its responsibility [23]. The weights of the kernels are initially chosen at random and are changed throughout the iteration. When network training begins, the loss function modifies the weights. In the end, the learned kernel can identify certain patterns inside the input image.

Pooling Layer

This layer's primary job is to shrink a feature map's spatial dimensions without sacrificing any of its essential content. As a result, pooling helps to tackle the over fitting issue and decreases the amount of information that the training model needs to learn [26]. By assisting the CNN model in learning every aspect of an input image, the pooling layer improves the efficiency of the recognition process. Pooling layers come in several varieties, such as average and maximum pooling layers. A localized process known as pooling or down-sampling is carried out. It provides dominating information as an output response from that particular region by storing information that is either redundant or unique in the neighboring receptive fields.

Fully Connected Layer

A fully connected layer utilized for classification is the final layer fed into the neural network. The action of a fully linked layer is globally conducted, which sets it apart from convoluting and pooling layers [19]. Additionally, this layer might take the place of the global average pooling layer [27]. It receives features as input and analyzes the global output of the layers that came before it.

Features Extraction

Features are retrieved from the average pooling layer during TL training, yielding two feature vectors with dimensions of N × 1280 and N × 1280, respectively. Subsequently, the serial concatenation probability technique is used for feature fusion. The technique of fusing multiple feature vectors to create a single feature vector that is more enticing and discriminative than the input feature vectors is known as fusion. Given two feature vectors with dimensions of N × 1280 and N × 1280, respectively, we have them as h1(i) and h2(i). Assume that h3(i) represents a fused vector of dimensions (N × 1280 + N × 1280). Path Finder Algorithm (PFA) is a metaheuristics optimization algorithm [44]. There are similarities between this algorithm and other swarm-based intelligence methods. The guidelines that living things follow to survive are the source of this algorithm. PFA has the advantage of being species-specific, in addition to using swarm-based intelligence algorithms. If we use the grey wolf algorithm as an example, then this method is solely dependent on the gray wolf population. The animal group, which is split into two groups based on fitness value, is the foundation of the PFA algorithm. The leader and followers are two different class types, where the leader has a lower fitness rating.

RESULTS AND DISCUSSION

The experimental setup and conclusions made for the two distinct fruit plants—apples and grapes—are discussed in this section. For clarification, use the various deep learning frameworks to characterize the accuracy of DCNN classification in the section below. For multi-class illnesses, an experimental analysis was conducted using 4500 training images and 1500 testing images.

Apple Dataset Results

Four types of apple data—black rot, cedar rust, scab, and healthy—are employed in the experiment, and 10-fold cross-validations are used to assess the data. In the case of the apple plant, the highest classification accuracy rate of 97.78% is achieved on the Deep Convolutional Neural Network classifier. Figure 3 shows the confusion matrix for the predicted class in the Apple dataset. Table 1 shows the results of the Apple dataset using deep learning methods.

Grapes Dataset Results

The evaluation findings of the suggested work for the grape plant were covered in this section. Classification accuracy is the primary statistical criterion utilized in the evaluation process. The four classes that make up the grape dataset are leaf blight, black rot, black measles, and healthy. Deep Convolutional Neural Networks method achieved good accuracy rates, i.e., 97.40%. Figure 4 shows the confusion matrix for the predicted class in the grape dataset. Table 2 shows the results of the grape dataset using deep learning methods. For the Apple and Grapes leaves datasets, the suggested framework yielded accuracy values of 97.75% and 97.45% respectively. Additionally, Grad-

CAM visualization is used for the visual analysis, as seen in Fig. 5. This figure makes it evident that the suggested framework for diagnosing the disease region is accurate and highlights the need of having deeper models that have received superior training.

CONCLUSION

Several deep learning methods are used in the proposed system to describe and classify fruit diseases. A variety of feature extraction methods are used with training and test datasets. This paper presents an automated approach for disease classification of two different fruit varieties using the idea of feature fusion with key point optimization. The Deep Convolutional Neural Network model is then applied via transfer learning to the original and noisy data, calculating representative and non-redundant features that are subsequently fused to obtain features from both the original and noisy data. Thus, the proposed fusion technique is found to improve prediction performance and increase processing effectiveness. The optimization stage also contributes to testing time reduction without sacrificing categorization accuracy. In the future, researchers will suggest a CNN-based model and suggest using Bayesian optimization to maximize the hyper parameters of the model. In addition, certain novel point nomination techniques and efficient learning methodologies will be applied.

ABSTRACT

The present study was to developa ready-to-cook convenience food using Jackfruit seed flour incorporated with millet and pulse as a premix and further evaluate it. Jackfruit seeds are rich in proteins, thiamine, riboflavin, resistant starch, and antioxidants. Jackfruit seed flour was chosen together with roasted Bengal gram and foxtail millet, which were standardized under three variations: V1 (50:30:20), V2 (50:25:25), V3 (50:15:35), and control (50:20:30). Sensory analysis showed that V3 had higher scores than others. Nutrient analysis carried out showed that there was energy content (391.76 kcal), protein (19.91 g), fat content (7.92 g), carbohydrates (59.18 g), iron (36.9 mg), crude fiber (11.6 g), calcium (236.1 mg), moisture (7.13 g), ash (5.86 g), antioxidant activity (49.1 g), etc. Physical-chemical parameters were bulk density (0.56 cc/g), water absorption capacity (4.3 ml/g), oil absorption capacity (3.2 ml/g), swelling capacity (25.8%), and foaming capacity (17.6%). Microbial analysis indicated that the developed premix has a shelf life of about sixty days. Comparing other popular brands of Premix, the developed Premix is a budget-friendly product with high nutritional value.

Keywords: premix, convenience food, ready-to-cook food, jackfruit seed, foxtail millet, roasted Bengal gram, aluminum Foil.

INTRODUCTION

The current trend in the food industry is convenience food. The consumption pattern of convenience foods should be understood since such products are on the rise. Jackfruit is a compound fruit that comes from the dicot jack tree (*Artocarpus heterophyllus L*). It belongs to the Moraceae family. Found in tropical Southeast Asian countries, common in India and Bangladesh. Jackfruit is termed as National Fruit and cultivated all round Bangladesh. The areas that harvest the most are Dhaka, Dinajpur, Gazipur, Khagrachari, Tangail, Moulvibazar, Mymensingh, Narsingdi, Rangamati and Rangpur. This tropical tree produces a fruit packed with nutrients, including carbohydrates, proteins, vitamins, minerals, dietary fibers, and plant chemicals. Studies have shown that jackfruit has an impact on health in many ways. It has anti-carcinogen, antidiabetic & antifungal properties, and helps in wound healing [1]. The components of jackfruit are seeds, tasty yellow-flesh bulbs, and rind. Ripe fruits are consumed raw or processed to make candies and snacks. According to Ocloo[2], seeds include a significant concentration of carbohydrates and protein, accounting for 10 to 15% of the fruit's total weight (30-365/fruit). Despite a few exceptions, the seeds are typically thrown away as waste after being boiled or roasted. Large volumes of jackfruit seed are lost since there do not exist processing and preserving methods. According to Díaz [3], products that use jackfruit seed flour have a higher nutraceutical appeal, which increases customer acceptability. The nutritional breakdown of jackfruit seeds (per 100g) includes: 38.4 g carbohydrates, 7.04 g protein, 0.43 g fat, 1.5 g fiber, 50 mg calcium, 1.5 mg iron, 97 mg phosphorus, 11 mg vitamin C, 17 IU vitamin A, 0.3 mg riboflavin, 0.25 mg thiamine, 63.2 mg of sodium, and 246 mg potassium. [4].

These seeds provide a good source of proteins, starch, and fiber. Jackfruit also contains high levels of minerals like Cu Zn, S, Mg, Ca, K, P, and N. The seeds have healthy plant compounds such as isoflavones, saponins, and lignans. Adding jackfruit seed flour to deep-fried foods can help reduce fat absorption. These seeds also offer dietary fiber and vitamin B complex. The high fiber content might help control blood sugar and boost gut health. Jackfruit seeds show antimicrobial effects against food-microbes; jacalin, a main protein in these seeds, helps in boosting the immune system in people with HIV [5]. Also, mixing jackfruit seed flour into various baked goods and cereals boosts their nutritional value. Arpit and John [6] examined three different amounts of jackfruit seed flour affecting chocolate cake quality as an option to replace regular flours. Their research found that adding 10 g of jackfruit seed flour per 100g of cake lowered fat content and increased ash and protein levels. Bread made with jackfruit seed flour had more crude fiber, which helps address the low dietary fiber in baked products. Jackfruit seeds have high levels of nonreducing sugars, which is a good source of prebiotics. Several studies have used jackfruit seeds as a carbon source for the extracellular production of pullulan by *Aureobasidium pullulans* MTCC2195 and polyhydroxybutyrate using *Bacillus sphaericus* NCIM 5149 [7]. [8],have extracted oils from the seeds of five jackfruit types. These oils have good amounts of essential fatty acids and antioxidants.

MATERIAL AND METHODS

Raw Materials

Jackfruit seed, roasted Bengal gram, Foxtail Millet, Wheat flour were the selected ingredients to develop the premix. The ingredients were collected from the wholesale market at Coimbatore and stored at room temperatures (20±5 °C) for further analysis.

Formulation of Premix

All the selected ingredients were cleaned to remove dirt, dust and stones so as to ensure food safety. Then the selected ingredients were roasted (60±5°C). Followed by drying, the ingredients were grinded to fine powder in a commercial roller and blended thoroughly. The premix was developed using Jackfruit seed flour, Foxtail millet and roasted Bengal gram under three variations as V1 (50:30:20), V2 (50:25:25), V3 (50:15:35) whereas control (50:20:30) respectively Table 1. Wheat flour was added 50% to all the three variations and control samples. Premix laddus were

prepared by adding 10g of jaggery and 5g of ghee for sensory evaluation [9]. The developed premix does not contain jaggery and ghee, as it was subjected to further investigation such as microbial growth for shelf life.

Sensory Evaluation

The chosen sample underwent nutrient analysis. A five-point hedonic scale was utilized to assess the sensory attributes, which involves appearance, flavor, texture, taste and overall acceptability [10]. The prepared premix laddus were evaluated for sensory properties including appearance, taste, texture, flavor, and overall acceptability evaluated by a panel of 25 semi-trained judges. Variation 3 was anticipated to receive higher scores, and future research was focused on the variation 3 premix powder.

Physicochemical Characteristics and Nutrient Analysis

Physicochemical characteristics analysis refers to the procedure of identifying the physicochemical properties such as oil absorption, water absorption, bulk density, foaming capacity and swelling capacity. The above tests were performed for the developed premix using AOAC method. Nutrient analysis involves assessing the nutrition composition of food and food items Table 2**.** Energy value (Kcal) is calculated using the formula: Energy value (Kcal)= 4(protein g + Carbohydrates g) + 9(g fat) + 2(g fiber) [11]. [12] examined the nutritional and functional properties of composite flour made from wheat, ragi, and jackfruit seeds. They created 11 mixtures, with pure wheat flour as a control. For comparison purposes, they also included 100% ragi and jackfruit flour in their experiments. The proximate composition analysis revealed that Jackfruit seed flour had higher protein content (13.9 g), less fat(1.44 g), lower moisture(6.5%) and ash content(0.97%), and superior water and oil absorption capacity. Blends of wheat, ragi, and jackfruit seed flour in different ratios showed significant differences ($p < 0.05$) compared to wheat flour alone.

Storage stability and Microbial Analysis

Premix is a dehydrated product preserved through drying. Storage stability of the selected sample was evaluated by storing it in an airtight container and evaluating it initially and after 30 days. Samples were drawn at 0, 15, and 30-day intervals and subjected to microbial analysis using total plate count. Standard plating on nutrient agar was performed. Nutrient agar media was used to determine newly developed microbial loads [19].

Labeling and packing

Instant premix powder was packed in aluminum foil during the storage period. Packing in aluminum foil thickness of 0.006-0.2 mm which acts as a barrier for moisture, helps in maintaining the flavor and texture of the food product.

RESULT AND DISCUSSION

Organoleptic Evaluation for developed Premix

Twenty-five semi-trained judges evaluated the sensory characteristics of the premix powder, including color, texture, taste, flavor and overall acceptability. From Table 3 it is observed that Variation 3 was likely to have higher score and future studies were continued with variation 3 premix powder.

Physicochemical characteristics and Nutrient Analysis for Developed Premix

Bulk density 0.56 cc/g, water absorption 4.3 ml/g, oil absorption 3.2 ml/g, swelling capacity 25.8% and foaming capacity 17.6% were revealed through physicochemical analysis of Table 5. Also, nutrient analysis showed energy 391.76 kcal, protein 19.91 g, fat 7.92 g, carbohydrates 59.18 g, iron 36.9 mg and crude fiber 11.6 g, Calcium 236.1 mg, and moisture 7.13 g, ash 5.86 g, antioxidant 49.1 g.

Microbial Analysis of Development Premix

The total plate count method was employed for microbial analysis. As the name implies, total plate count measures the overall viable bacteria present in the food. The number of viable colonies in the developed premix was recorded

for 0th 30th 60th days respectively Table 6. The microbial load of the developed premix remained within acceptable limits for up to 60 days post-preparation.

Cost calculation of the developed Premix

Cost Analysis has been determined for the developed premix. Comparing the cost of Ayush Rasya Premix and other popular brand Premix our Instant Premix cost 20% less and is a budget friendly product with more nutritional value than another Popular Brand Premix.

CONCLUSION

Convenience food significantly reduces cooking and labor time in the kitchen. To enhance their convenience, they should be lightweight, have a long shelf life, be easily accessible, offer a variety of options, and be of good quality. The current study "Development and Evaluation of a Nutrient-Rich Premix using *Artocarpus heterophyllus* Seeds with Millet and Pulse" has proposed to carry out to provide convenience food, thereby promoting a healthy nation, taking into account the current lifestyle of the population and the importance of convenience food. The developed premix contains appreciable amounts of protein, antioxidant and iron content and it is considered to be budget friendly premix compared to another popular brand premix. Using this premix various food products can be developed and therefore this Jackfruit seed flour with millet and pulses premix is termed as Ready-to-cook food. The developed premix can be stored for about 60 days either at room temperature or under refrigeration.

ABSTRACT

Watermelon, scientifically known as *Citrullus lanatus L.* (Thunb.), has its origins in Africa and is known by different vernacular names such as tarbuj, kalinga, tarmuj, and kalindi in various regions of India. The study was conducted in early season (January–March) and late season (April–June) 2024 in Ananthamangalam, Nagapattinam district, Tamil Nadu, to investigate the effect of integrated nutrient management on the growth and flowering characteristics of watermelon (Citrullus lanatus Thunb.). The research included 7 treatments and 3 replications using Randomized Block Design (RBD). The observation was taken from the growth and quality parameters of watermelon. Based on the results, the late-season crop with application of RDF 75% + VC + Azotobacter + Boron showed maximum vegetative growth in vine length (109.03 cm), (129.66 cm), and (186.16 cm) at 30 DAS, 45 DAS, and 60 DAS, respectively. Maximum number of branches: 3.66, 6.33, and 8.33 at 30 DAS, 45 DAS, and 60 DAS, respectively. The highest number of leaves was 11.33, 25.33, and 35.33 at 30 DAS, 45 DAS, and 60 DAS, respectively. Based on the flower parameter, the days required for 1st flower treatment T4 displayed the shortest duration (40.66 days); the shortest duration for 50% of the flowers to appear was in treatment T1, with an average of 50.33 days. The highest number of flowers per vine is at (T4) 11.33. The present study concluded that using 75% recommended dose of fertilizer (RDF) + Vermicompost + Azotobacter + Boron resulted in the maximum vine length, number of branches, number of leaves, and number of flowers per vine, and the minimum days required for the first flower and the days required for 50% of flowers. When compared between two season late season summer crops recorded maximum vegetative characters and flowering characters than early season summer crops.

Keywords: Watermelon, INM, RDF, Vermicompost, Azotobacter, and Boron

INTRODUCTION

India is blessed with diverse agro-climatic zones, which allow for the cultivation of a wide variety of horticultural crops. Among these crops, watermelon stands out as the most prominent, with a production volume of 427,105 tons. Watermelon, scientifically known as Citrullus lanatus L. (Thunb.), has its origins in Africa and is known by different vernacular names such as tarbuj, kalinga, tarmuj, and kalindi in various regions of India (Panigrahi and Sharma, 2017). One of the challenges faced by Indian farmers is the common practice of using only the recommended dose of fertilizer, which can lead to reduced yield and fruit quality, as well as an increase in pests and diseases. To address these issues, integrated nutrient management techniques have been introduced with the primary objective of enhancing the growth, flowering characteristics, yield, and fruit quality of watermelon. This study aims to explore and implement strategies to overcome these difficulties and optimize the production of watermelon in India.

MATERIALS AND METHODS

The study was conducted in early season (January-March) and late season (April-June) 2024 in Ananthamangalam, Nagapattinam district, Tamil Nadu to investigate the effect of integrated nutrient management on the growth and flowering characteristics of watermelon (Citrullus lanatus Thunb.). The research included 7 treatments and 3 replications using Randomized Block Design (RBD): T1- RDF (100:50:50) NPK Kg/ha (Control); T2- RDF 75% + VC + Azotobacter; T3- RDF 75% + VC + Boron; T4- RDF 75% + VC + Azotobacter + Boron; T5- RDF 50% + VC + Azotobacter; T6- RDF 50% + VC + Boron; and T7- RDF 50% + VC + Azotobacter + Boron. Watermelon seeds were sown at a spacing of 2 m x 2.5 m using the pit method. The study observed vine length (cm), number of branches per vine, number of leaves per vine, days required for 1st flower, days required for 50% flowering, and number of flowers per vine.

RESULTS AND DISCUSSION

RESULTS

Vine length (cm)

At 30 days after sowing, early season plants showed the maximum vine length observation was recorded in T4 (RDF 75% + VC + Azotobacter + Boron) (98.26 cm), followed by T2 (RDF 75% + VC + Azotobacter) (96.60 cm), and minimum data was recorded in T1-control (RDF (100:50:50) NPK Kg/ha) (84.90 cm) (Table 1). In late season, the maximum vine length observation was recorded in T4 (RDF 75% + VC + Azotobacter + Boron) (109.03 cm), followed by T2 (RDF 75% + VC + Azotobacter) (108.23 cm), and minimum data was recorded in T1-control (RDF (100:50:50) NPK Kg/ha) (91.66 cm) (Table 2). After 45 days of sowing, early season crops showed the maximum vine length of 121.40 cm was observed in T4 (RDF 75% + VC + Azotobacter + Boron). The minimum vine length of 112.20 cm was recorded in T1 (Control) (Table 1). In late season, the maximum vine length of 129.66 cm was observed in T4 (RDF 75% + VC + Azotobacter + Boron), which was similar to treatments T2 (RDF 75% + VC + Azotobacter) at 127.50 cm and T7 (RDF 50% + VC + Azotobacter + Boron) at 125.56 cm. The minimum vine length of 112.20 cm was recorded in T1 (Control) (Table 2). At 60 DAS (Table 1), the data showed in early season the maximum vine length observed in T4 (181.06 cm) when compared to control T1 (163.36 cm). In late season, treatment T4 achieved the maximum vine length of 186.16 cm, which was similar to treatment T7 (184.50 cm), while treatment T1 achieved the minimum vine length of 170.53 cm (Table 2).

Number of branches

In early season, the highest number of branches (2.66) was recorded in treatment T4, and the minimum number of branches (2.0) was recorded in treatment T1 at 30 DAS. In late season, the highest number of branches (3.66) was recorded in treatment T4, which was on par with treatment T2 (3.33) and treatment T7 (3.0). The minimum number of branches (2.0) was recorded in treatment T1 at 30 DAS. At 45 days after sowing, the plant labeled T4 exhibited the highest number of branches, measuring 6.00, while the plant labeled T1 displayed the lowest number of branches,

measuring 3.66 in the early season of summer. At 45 days after sowing, the plant labeled T4 exhibited the highest number of branches, measuring 6.33, while the plant labeled T1 displayed the lowest number of branches, measuring 3.66 in the late season of summer. At 60 DAS in the early season, the integrated use of the recommended dose of fertilizer (RDF) at 75%, along with VC (Vermicompost) + Azotobacter + Boron (T4), resulted in a significant improvement in the production of branches, with an average length of 7.66 as compared to the control (5.66). At 60 DAS, the integrated use of the recommended dose of fertilizer (RDF) at 75%, along with VC (Vermicompost) + Azotobacter + Boron (T4), resulted in a significant improvement in the production of branches, with an average length of 8.33 cm as compared to the control (6.33 cm) in late season.

Number of leaves

In early season data, it was found that the maximum number of leaves was observed in treatment T4 (RDF 75% + VC + Azotobacter + Boron). The increased number of leaves recorded at 30, 45, and 60 DAS was 9.33, 22.66, and 32.66, respectively. In the data study, it was noted that treatment T1, which involved the application of RDF (100:50:50) NPK Kg/ha as the control, led to the development of the minimum number of leaves. Specifically, at 30, 45, and 60 DAS, the number of leaves increased to 5.00, 14.66, and 23.66, respectively. In late-season data, it was found that the maximum number of leaves was observed in treatment T4 (RDF 75% + VC + Azotobacter + Boron). The increased number of leaves recorded at 30, 45, and 60 DAS was 11.33, 25.33, and 35.33, respectively. In the data study, it was noted that treatment T1, which involved the application of RDF (100:50:50) NPK Kg/ha as the control, led to the development of the minimum number of leaves. Specifically, at 30, 45, and 60 DAS, the number of leaves increased to 8.00, 21.33, and 28.67, respectively.

Days Required for 1st Flower

The number of days required for the first flower to appear was significantly influenced by the different nutrition strategies. The data revealed that treatment T1 had the longest duration, with the first flower appearing after 55.33 days in early season and 47.0 days in late season. In contrast, treatment T4 displayed the shortest duration, with the first flower appearing after an average of 44.66 days in early season and 40.66 days in late season.

Days Required for 50% Flowers

According to the data presented in the table, it took an average of 67.33 days in the early season and 56.33 days in the late season for 50% of the flowers to appear on the plants treated with treatment T1. Additionally, the shortest duration for 50% of the flowers to appear was in treatment T1, with an average of 53.0 days in early season and 50.33 days in late season.

Number of flowers/vines

In the early season of summer, the treatment T4 (RDF 75% + VC + Azotobacter + Boron) demonstrated the highest number of flowers per vine at 9.33, which was on par with the treatment T7 (RDF 50% + VC + Azotobacter + Boron) at 8.33. Conversely, the treatment T1 (RDF 100:50:50 NPK Kg/ha) exhibited the lowest number of flowers per vine at 4.33. In late summer, the treatment T4 (RDF 75% + VC + Azotobacter + Boron) demonstrated the highest number of flowers per vine at 11.33, which was on par with the treatment T7 (RDF 50% + VC + Azotobacter + Boron) at 10.66. Following closely was the treatment T2 (RDF 75% + VC + Azotobacter) at 10.33. Conversely, the treatment T1 (RDF 100:50:50 NPK Kg/ha) exhibited the lowest number of flowers per vine at 7.00.

DISCUSSION

In terms of vine length, number of branches, and number of leaves, it was evident that plants treated with 75% of the recommended dose of fertilizer (RDF) along with Vermicompost (VC), Azotobacter, and Boron exhibited faster nutrient uptake compared to the other treatments. The integrated application significantly increased vine length, number of branches, and number of leaves in bell pepper. These results were observed by Gopinath et al. (2008). Singh et al. (2018) found that using 75% RDF + 12.5% FYM + 12.5% vermicompost significantly increased cucumber

vine length, number of leaves per vine, and number of branches per vine compared to other treatments. Kaur and Kaur (2018) reported that application of 75% NPK + 25% FYM recorded maximum vine length (2.34 m). Singh et al. (2020) found that using 75% RDF + 12.5% FYM + 12.5% vermicompost resulted in superior growth, with a vine length of 137.70 cm and 8.50 primary branches per vine. The increase in vegetative parameters, such as vine length and the number of primary branches per vine, may be attributed to the positive impact of nitrogen. Nitrogen plays a vital role in supporting the growth and development of plant cells by promoting cell multiplication and elongation. Additionally, nitrogen facilitates the essential process of chlorophyll synthesis, which is crucial for plants to carry out photosynthesis, the process by which they convert light energy into chemical energy (Prabhu et al., 2006). The application of organic sources of nutrients, such as compost or manure, can have a positive impact on soil physical properties. These organic materials can improve soil structure, porosity, and water retention, creating a more favorable environment for plant growth. Additionally, organic nutrients can stimulate the development of a root system, which enhances the plant's ability to absorb essential nutrients and water from the soil. This improved nutrient and water uptake can contribute to overall plant health and vigor, leading to increased growth and productivity (Bindiya et al., 2014). Application of biofertilizer consortia fix nitrogen, solubilize phosphorus, and release growth-promoting substances to increase vegetative growth (Kanaujia and Daniel 2016). In terms of days required for 1st flower, days required for 50% flowers, and number of flowers/vines, it may be achievable due to the availability of nitrogen, phosphorus, and potassium in a more accessible form through vermicompost and the use of biofertilizer (Azotobacter) in the early stages of the vine's life. This aids in foliage growth and early flowering in watermelon." Anjanappa et al. (2012) found that cucumber plants treated with 75% RDF + 75% FYM + Azotobacter took the fewest days to flower during summer 2005 and rabi 2006. Mohan et al. (2016) found that using 60% RDF + 60% vermicompost + Azotobacter + Trichoderma and PSB resulted in 36.67 days to 1st flowering and 44.33 days to 50% flowering. Singh et al. (2017) reported that integrating nutrient sources resulted in a significant reduction in the minimum days to 1st flowering, days to 50% flowering, and days to 1st harvest while working on cucumber. On comparison of two season, late season crop performed well which might be due to high intent amount of sunlight favouring fruit development and high yield (Singh et al. 2020).

CONCLUSION

The present study concluded that using 75% recommended doses of fertilizer (RDF) + vermicompost + azotobacter + boron resulted in the maximum vine length, number of branches, number of leaves, and number of flowers per vine. Additionally, it promoted flowering, with the minimum days required for the first flower and the days required for 50% of flowers. In the late season of summer, record maximum vegetative characteristics when compared to the early season of summer.

ABSTRACT

The aim of this research was to design and assess conducting investigation into the antimicrobial activity of herbal gel based on okra mucilage. This okra mucilage is previously documented for its anti-bacterial property. The present research has been undertaken to formulate the herbal gel based orka mucilage from *Abelmoschus esculentus* and to evaluate its physical factors such pH, homogeneity, viscosity, extrudability, spreadability, and stability was conducted for the more effective antibacterial polyherbal gel. The antibacterial activity of the okra mucilage gel formulations F1, F2, F3, and F4 was demonstrated against *Staphylococcus aureus* and *Escherichia coli.* Formulations F1 and F4 showed significant anti-microbial activity against *S. aureus* and *E.coli* was found to be 25.33±0.25, 29.01±0.88 and, 22.40± 0.15, 25.43±0.91 respectively compared to standard drug Clindamycin gel which was found to 30.33±0.51, 28.05±0.55, whereas F2 and F3 formulations exhibited the moderate activity.

Keywords: *Abelmoschus esculentus*, Okra Mucilage, Herbal gel, anti-microbial activity

INTRODUCTION

The use of traditional medicines is rapidly growing on a global scale. For medical care, almost 75% of the world's population depends on plants and plant extracts. The main obstacles to the acceptability of herbal medications are their quality, safety, and the availability of scientific data supporting their purported health benefits. Topical gel formulations are more popular because of their many benefits, including ease of use, quick action, reduced greasiness, and affordability. As nature has long been a source of therapeutic substances, many of modern medications have been separated from it, many of which have been chosen for their application in conventional medicine able to produces broad range of bioactive molecules[1]. For centuries, diverse cultures around the world applied herbal medicines for their treatment of the sick. They have been exploited to make treatment. By ancient books like the Bible and the Vedas natural materials having therapeutic effect are extensively utilized in manufacturing herbal medicine and traditional medicine preparations. In fact, plants synthesize numerous bioactive compounds that shows a wide prospect of cures. From the plant kingdom for thousands of years, plants have been reliable prescriptions to promote human health. As the World Health Organization mentions, one can expect to find widest variety of herbal medications from medicinal plants which have been grown recently. For instance, around 80% of people in developed countries use traditional medicine that consists of drugs and remedies made from therapeutic flora. To know more about these plants attributes, safety, and usefulness, comprehensive researches should be carried out[2]. Bacterial infections significantly affect public health, manifesting in diseases across various anatomical sites, stemming from either the pathogenic organism itself or the host's response to its presence. Transmission of bacteria to humans occurs through diverse avenues such as air, water, food, or living vectors. The primary modes of bacterial infection transmission encompass contact, airborne, droplet, vectors, and vehicular routes. Implementing preventive measures plays a crucial role in mitigating morbidity and mortality associated with bacterial infections. These measures involve interventions like water treatment, immunization of both animals and humans, adherence to personal hygiene practices, and the adoption of safer sexual behaviours[3].Bacterial infections play a substantial role in morbidity and mortality observed in individuals infected with the human immunodeficiency virus (HIV). The recognition of their significance has grown, particularly with advancements in prophylactic measures against opportunistic pathogens[4].

Gums and Mucilage are polysaccharide e hydrocolloids which are rich source naturally. Mucilage is the metabolised product produced inside of the plant cell and without damaging the plant [5-6]. The mucilage in found in different parts of plants like roots, rhizomes, seeds etc. It is simple secondary metabolites and serve as major role in frost tolerance, and ionic balance of plant cells. It has ability to resists the drought due to this characteristic [7]. Plant components such as leaf cells, seed coats, roots, barks and middle lamella are rich in plant mucilage. It is a translucent and amorphous powder and polymer of monosaccharides. Natural mucilage thus has a wide range of acceptance due to low cost, easy availability, biocompatibility, non-toxicity and least irritancy [8]and thus, preferred mostly than synthetic excipients, which can be used as disintegrant, emulsifier, suspending agent, gelling agent, stabilizing agent, thickening agent [9]. Okra, scientifically identified as *Abelmoschus esculentus* (L.) Moench, formerly classified as Hibiscus esculentus (L.), belongs to the Malvaceae family(Figure1), Genus is Abelmoschus. In the year 2010, global production of okra was approximated to be nearly 7 million metric tons.Okra, being a perishable fruit, is susceptible to browning of its skin due to water loss, consequently diminishing its economic value for fresh consumption. Despite the rejection of such fruit, there is potential for its utilization, given the presence of mucilaginous substances typically concentrated in the pod walls. Generally, Okra is nothing but dietary fibre, well know constituents like phytosterols, flavonoids, carotenoids, tocopherols, and minerals that are present. Beta-carotene, lycopene, lutein, others like vitamin B6, Vitamin B1, potassium, Magnesium and Manganese. Whereas Okra mucilage is a natural polysaccharide composed of galactose, rhamnose, and galacturonic acid. Notably, it serves as a renewable and cost-effective source of biodegradable material, characterized by high water solubility, plasticity, elasticity, and viscosity. The applications of okra mucilage extend to various domains, including its use as a mucilaginous food additive to counter gastric irritative and inflammatory diseases. Furthermore, it exhibits potential

in tissue engineering applications as hydrogels. Okra mucilage serves as a binding or granulating agent and retardant material in the development of pharmaceutical solid dosage forms. Notably, recent utilization involves its role as a natural coagulant, attributed to its water-soluble natural polysaccharides, which possess the capability to flocculate small particles.[10] Hence, we mainly focused on isolation of mucilage from okra, formulation and evaluation of herbal antimicrobial gel containing okra mucilage.

MATERIALS AND METHODS

Plant material

Fruits of*Mangifera indica* were collected from local area Bangaluru, Kernal seeds was authenticated by Dr. PE Rajashekharan, Principal Scientist, Division of Flower and Medicinal crops,Indian Institute of Horticulture research (IIHR), Bengaluru, KarnatakaVoucher specimens (MI/2021-22/0083) are kept at the Acharya & BM Reddy College of Pharmacy, Soladevanahalli, Bengaluru. India.

Extraction of Okra

Young and tender okra pods (*Abelmoschus esculentus*) were acquired from the local market in Bangalore. Before being delivered to the lab, the purchased pods were stored in polyethylene bags. The pods of okra were cut into pieces using a stainless-steel knife after being cleaned in distilled water in the laboratory. Since they lack mucilage, the seeds were removed. After first drying at room temperature, the sliced pods were placed in an oven set at 50 °C to continue drying. After being dried and ground into a fine powder using an electric grinder, the okra pods were sealed in airtight plastic containers and kept dry until they were needed for testing. The powder was then filtered through an 18-mesh screen[11].

Isolation of mucilage from Okra

A systematic procedure was employed for the extraction of mucilage from okra powder. The aqueous okra mucilage was obtained from powdered pods through the use of distilled water in a beaker, maintaining a water-to-seed ratio of 30:1. Subsequently, the swollen powder underwent slow stirring on a magnetic stirrer at 700 rpm and 55 ºC for a duration of 3 hours to facilitate mucilage extraction. A white muslin cloth served as a filter for separating the viscous okra extract (mucilage). Simultaneously, acetone was introduced while stirring to precipitate the mucilage, employing a ratio of 3 parts acetone to 1 part of the mucilage extract [12]. Following this, one volume of ethanol (96% v/v) was incorporated to eliminate pigments and other impurities. Ultimately, the collected mucilage was subjected to drying at 100 ºC for 4 hours in an oven. The powdered mucilage was packed in airtight polyethylene plastic bags and was stored in a desiccator until required for analysis. Finally, the percentage yield of mucilage was calculated

Phytochemical Evaluation for okramucilage

Organoleptic Evaluation

The Organoleptic evaluation refers to the evaluation of colour, odour, shape, taste and special features like texture and touch. The majority of evidence on the identity, purity and quality of the material can be drawn from these observations. reveals that, okra mucilage was isolated by using acetone solvents, the colour was found to be dull green viscous extract.

Identification test for Mucilage

Powdered okra mucilage was treated with ruthenium red solution and observed under microscope, the results reveal that, okra mucilage particles acquire pink colour which gave positive test for Mucilage[13].

Swelling index

Swelling index of mucilage polysaccharide was determined by using modified method reported. One gram of powder (#100 mesh passed) was accurately weighed and transferred to a 100 ml stopper measuring cylinder. The initial volume of the powder in the measuring cylinder was noted. The volume was made upto 100 ml mark with

distilled water. The cylinder was stopper, shaken gently and set aside for 24 hours. The volume occupied by the gum sediment was noted after 24 hours[14].
Swelling index (SI) is expressed as percentage and calculated according to the following equation

$$SI = \frac{Final\ volumen - Intial\ volume}{Intial\ voleme}$$

The results shown that, swelling index of okra Mucilage was found to 67 ±0.157

pH of Mucilage
The mucilage was accurately weighed and dispersed in water % w/v solution and then pH of solution was measured by using pH digital meter as described by authors in the publication [15]. The pH of okra mucilage was found to be 6.5 ± 0.35.

Prepration of Carbopol 940 Gel
Methyl paraben and propyl paraben was dissolved in 80°C water. A specific weight of Carbopol 940 was evenly distributed in water at 40°C while being constantly stirred with a mechanical stirrer running at 1200 rpm. for 30 minutes. After dissolving the extracts in PEG 400, they were mixed thoroughly with the base. After that, Triethanolamine was added to bring the pH down to pH, 6 and the mixture was carefully stirred until a clear gel was formed.[16].

Preparation of herbal gel
Okra mucilage extract was taken and then it was mixed with Carbopol 940 Gel after mixing the herbal gel is formed. Similarly, the four different concentration of herbal gel was prepared. Measure accurately 35 ml of water in a 500ml capacity beaker, kept on water bath until it reaches the temperature at 80°C. add required quantity of methyl paraben and propyl paraben and mixed well by keeping the beaker on magnetic stirrer and maintain the temperature at 80°C and around 500 rpm and add the Carbopol prepared gel drop by drop, this time increase the rpm upto 2000 in order to mix well by adding the Methyl Paraben and Propyl Paraben solution into the Carbapol solution and mix in this stirrer for 30 minutes. After formation of gel, add 13ml of PEG along with the okra mucilage and mixture was homogenized for 10 minutes to get better consistently to avoid the grittiness [17]. Once the gel is formed, at this stage add PEG 400 to the gel. Finally, the formulated gel was homogenized once again for 10 minutes to get the better consistency of gel of all four different formulations Table 1.

Evaluation Parameters for formulated gel
Physical evaluation parameters
Observations were made through visual inspections of physical attributes, including colour, clarity, consistency, homogeneity and grittiness.[18].the results are manually recorded.

Determination of Extrudability
The gel formulations were filled into collapsible metal tubes or aluminium collapsible tubes. The tubes were pressed to extrude the material and the extrudability of the formulation was checked and recorded.

Determination of Spreadbility
Spreadbility is quantified by the duration, measured in seconds, it takes for two slides to separate when subjected to a specific load and placed within the gel [19]. A shorter time for the dividing the two slides indicates improved Spreadbility.
The calculation is determined by the formula: $S = \frac{M*L}{T}$
Where "*M*" denotes the denotes, the weight affixed to the upper slide, *L* denotes the weight affixed to the upper slide, *T* signifies the time required for the slides to separate [20].

pH determination of Gel

The pH level of the gel was studied using a pH meter, which was calibrated with standard buffer solutions (pH 4 and 7). Each gel composite, accurately measured to be one gram, was dissolved in 10 ml of distilled water. The electrode was placed inside the sample compartment ten minutes before the data at room temperature was recordedand then we obtained the pH of the gel formulation [21].

Viscosity

The viscosity of gel formulation determination was carried out using Brookfield viscometer. The determination was carried out in triplicate and the average of the three were recorded.

Stability studies

The stability studies for the four formulations were accessed using ICH Guidelines. To evaluate the formulations' stability under extremely low temperatures, 15 grams of gel from each of the formulation was prepared 48 hours in advance, subjected to -8°C for 48 hours, and subsequently stored at 25°C for six intervals. The assessment of the gel formulation's stability was then conducted [22, 23] till 60 days.

Anti-bacterial activity

For this, the Agar well diffusion method was employed. Strains of *Staphylococcus aureus* and *Escherichia coli* were employed in the investigation. To ensure that the bacterial cultures were evenly distributed throughout the medium, they were added to the recently created nutritional media and thoroughly mixed. Sterilized petri dishes were filled with the medium, which was then left to stand still and harden. Next, wells measuring 6 mm in diameter were created in the petri dishes using sterilized cork borer, to which the produced gel formulations were poured, enabling the medication to diffuse throughout the medium [24]. After that, it was incubated at 370 °C for a full day. After that, it was incubated at 370° C for a full day. With the aid of a ruler, the diameter of the zone of inhibitions was measured (in mm). The antibacterial activity of each formulation was evaluated in triplicate, and the average result was noted. Here, the study's reference medication for comparison was standard Clindamycin gel.

RESULT AND DISCUSSION

Physical evaluation for four different gel formulations

The results of Physical Evaluation of Gel formulation. The gel formulation's clarity, consistency, homogeneity and grittiness in formulations F1, F2, F3, and F4 Display the transparent gel. Green is the colour that the gel formulation displays. Additionally, the gel's consistency appears to be three categories ie., far, good and excellent which was recorded manually in table 2.

Extrudability

The percent of the extruded gel was calculated (>90 % extrudability: Excellent, >80 % extrudability: Good, and >70 % extrudability: Fair) table 3.

Determination of Spreadbility

Table 5 shows the Spreadbility of the Gel formulation. Formulation F4 exhibits superiority in comparison to formulations F1, F2 and F3table 4.

pH determinisation of gel

The pH levels were measured by using pH meter, given in the table 5**,** which shows each Gel formulation's pH. Formulations F2 and F4 demonstrate superiority when compared to F1 and F3.

Viscosity

The viscosity of different gel formulations was determination was carried out using Brookfield viscometer. The determination was carried out in triplite and the average of the three were recorded in table 6.

Stability studies

All four formulations demonstrate stability in both thermal and freeze tests which were recorded in table 7.

Anti-bacterial activity of Herbal gel

Formulated okra mucilage gel was evaluated for its antibacterial activity and results are given in table 8 and figure 2. In this, study of Anti-bacterial activity of Okra mucilage gel is done by agar plate method by employing *Staphylococcus aureus* and *Escherichia coli*as test organism. Microbial evaluation was measured in terms of formation of zone of inhibitions and Clindamycin was taken as the standard drug. Orka mucilage gel formulations F1 and F4 showed 25.33±0.25, 29.31±0.88 zone of inhibition for *S. aureus* and for *E. coli* was found to be 22.40 ± 0.15, 25.43±0.91, while standard drug Clindamycin gel showed 30.33±0.51, 28.05±0.55 zone of inhibition against *S. aureus and E. colli*, whereas F2 and F3 formulations exhibited moderated activity compare to standard shown in table 8.

CONCLUSION

This study was main focused towards the formulation of okra mucilage gel with four different formulations for its anti-bacterial properties. The four formulations were prepared by varying the different proportions of polymers and evaluated for physicochemical parameters like Extrudability, Spreadbility, pH, viscosity and stability studies along with anti-bacterial activity against both gram-positive and gram-negative bacteria (*S. aureus and E. colli)*. Based on these studies, all these four formulations were observed and it is found to be satisfactory. The antibacterial properties of all formulation maybe due to the rich in polysaccharides[25], minerals, proteins, palmitic acid, stearic acid. It is necessary to carry out further studies to confirm the role of each constituent for antibacterial activity. Okra mucilage extract having antimicrobial, antibacterial, antioxidant, used in the treatment for diabetes. So, okra mucilage extract containing constituents which is responsible for antibacterial activity is incorporated into a proper gel base and a herbal gel is prepared for administrating on bacterial infection. Thus, our study reveals that orka mucilage gel formulation can show better antibacterial property, with no side effects and can also use to treat various skin infections topically.

ABSTRACT

In the modern day, Machine Learning (ML) techniques play an important role in the timely prediction of academic performance. There is a growing interest in applying these approaches to predict pupils academic performance so that teachers can step in and provide appropriate support as needed. The article explores the application of machine learning techniques in evaluating student learning outcomes. The aim of this study is to identify innovative approaches that can enhance the process and provide valuable insights into student performance and progress. The research endeavors to construct a predictive model by synthesizing academic, behavioral, and co-curricular data to forecast student performance. The objective of this study is early identification of academic challenges and enabling tailored interventions. By leveraging a holistic dataset, including behavior and co-curricular activities, the model aims to enhance accuracy in predicting student outcomes. The study seeks to empower educators with insights into individual student needs, fostering a proactive approach to support. There are three algorithms named Decision Tree, Adaboost and Catboost that are used to evaluate the model. The train accuracy, test accuracy, precision, Recall and F1 score are computed and compared. The Cat Boost algorithm is outperformed while comparing with other models in all parameters.

Keywords: Machine learning, Decision tree, Adaboost, Catboost, Predictive analysis.

INTRODUCTION

With the advancements in machine learning, there is an opportunity to leverage data-driven techniques to enhance evaluation methods and improve student learning outcomes. Assessment plays a pivotal role within the educational framework, serving as a crucial element for gaining valuable insights into both student learning achievements and the efficacy of instructional methodologies. This study intends to delve into diverse evaluation methodologies employing machine learning algorithms to gauge student performance, pinpoint areas for enhancement, and deliver tailored feedback. By comprehending the capabilities of these methods, educators and policymakers can make well-informed decisions to enrich the educational journey and foster student achievement. The paper seeks to address the challenge of predicting student performance by integrating academic, behavioral, and co-curricular data. By leveraging machine learning algorithms such as decision tree, Ada boost, and Cat boost, the model is designed to achieve early identification of students facing challenges and enable customized interventions to support them. Through the synthesis of diverse data sources and the use of interpretable models, educators can gain valuable insights into individual student needs, enabling proactive support strategies. The ultimate goal is to improve educational outcomes by enhancing the accuracy of performance prediction and fostering a proactive approach to student support. Within an extended program, students benefit from an extended timeline for completing a qualification, supported by a curriculum that encompasses developmental courses. This adaptable format caters to the diverse learning needs of students, fostering a supportive and enriching educational experience [1]. At the core of bridging, foundation, and extended curriculum programs lies the proactive extension of tutoring hours for students. This proactive measure underscores the commitment to addressing the needs of underprepared students by providing them with the necessary time and resources to succeed in university education [2]. In 2006, witnessed the integration of foundation programs with mainstream first-year courses, culminating in the introduction of the extended curriculum model. This structural modification extended the duration of the first year, dividing it into two years of study [3]. Forecasting student performance presents an essential quandary within the education sector.

Various factors can impact student performance, thus indirectly affecting university accreditation. Sustaining a high learning rate within universities poses challenges, particularly with low-performing students present. Extensive research endeavours aim to enhance tailored learning systems to meet student needs. Confronting the assessment of student performance, deploying advanced teaching and learning techniques for prediction, and outlining research objectives are formidable challenges faced by numerous universities presently. Institutes of higher education implement strategies to ameliorate student performance issues encountered during their academic journey. Creating and assessing intervention methods is made easier with the use of student performance predictions at admission and during the academic year. Such prognostic analytics benefit both management, including teachers, and students, furnishing insights into performance trends and facilitating targeted support mechanisms [4].Utilizing machine learning techniques stands out as a primary approach in examining student performance or achievement, alongside statistical analysis and data mining. Tackling academic performance presents a formidable hurdle for tertiary education establishments worldwide [5]. The performance of Support Vector Machine (SVM), Naive Bayes, Logistic Regression, and Multilayer Perceptron (MLP) algorithms are used topredict the student achievement. The methodology outperforms existing approaches. The paper introduces a predictive framework for student achievement, consisting of a data processing module and an achievement prediction module. Results demonstrate that the LSMLP method achieves superior performance, particularly with three hidden layers and a specific number of neurons [6]. K-means cannot automatically determine the optimal number of clusters within a dataset. This popular unsupervised machine learning algorithm partitions a dataset into K clusters. Nonetheless, a notable drawback of K-means is its requirement for the user to predefine the number of clusters (K) beforehand. While there are techniques such as the Elbow Method or Silhouette Score that help in selecting an optimal K value, these methods are not fool proof and may require subjective interpretation. The K-means algorithm does not inherently include automated techniques for determining the optimal number of clusters, such as the silhouette method. This limitation of K-means necessitates manual intervention and lacks built-in mechanisms for automatically identifying the optimal number of clusters. Careful consideration, experimentation, and domain knowledge are necessary to select an

appropriate K value for effective clustering using the K-means algorithm [7]. A comprehensive literature review examines the hurdles encountered by educational institutions when analyzing student performance and improving educational management. The study investigates diverse machine-learning techniques aimed at enhancing predictive accuracy through the utilization of student-generated data. The review identifies prevalent automatic learning techniques employed for developing predictive models based on academic performance, with classification being the most commonly utilized approach. The study suggests that leveraging automatic learning techniques enables educational institutions to enhance the quality of education by effectively assessing the academic performance of their students. It provides a comprehensive understanding of the existing scholarly work related to the topic, offering a broad view of methodologies, findings, and trends. Conducting a comprehensive literature survey demands significant time and effort to search, review, and analyze a substantial volume of scholarly literature [8].

MATERIALS AND METHODS

Despite advancements in educational technology and data analytics, traditional methods of assessing and supporting student learning often fall short in providing personalized and proactive interventions. The challenge lies in effectively leveraging the vast amount of academic, behavioral, and co-curricular data available to predict student performance accurately and guide interventions that cater to individual needs. As a result, it is essential to scrutinize the potential of machine learning methods in amalgamating diverse data sources to maximize student learning outcomes. This paper addresses this gap by evaluating the effectiveness of machine-learning approaches in predicting student performance and facilitating personalized interventions, while also identifying existing limitations and proposing avenues for future enhancements in this domain. The proposed system integrates academic, behavioral, and co-curricular data to predict student performance using Decision tree Classification, Ada boost, and Cat boost algorithm. It leverages features such as grades, attendance, behavior records, and extracurricular participation to provide a holistic view of each student. Employing interpretable models, real-time monitoring, and a feedback loop, the system enables educators to access a user-friendly dashboard with actionable insights. An early warning system identifies at-risk students, facilitating timely interventions tailored to their need Ethical considerations, continuous improvement, and collaboration with stakeholders are integral components, of ensuring a scalable, transparent, and effective tool for enhancing student success. The 'Performance' column is the target variable that we aim to predict.

It is a categorical variable with four unique categories: 'Poor', 'Average', 'Good', and 'Excellent'. Here is a breakdown of the 'Performance' column:

- 'Poor': This category includes 257 students, making it the most common performance level in the dataset. Students in this category may be struggling academically and could potentially benefit the most from targeted interventions.
- 'Average': This category includes 106 students. These students are performing at an average level compared to their peers. With additional support, they may have the potential to move into the 'Good' or 'Excellent' categories.
- 'Good': This category includes 125 students. These students are performing well academically, but there may still be room for improvement.
- 'Excellent': This category includes 223 students, making it the second most common performance level in the dataset. These students are performing at a high academic level.

These categories can be used as the target variable for predicting student performance. The other columns in the dataset can be used as features for the prediction model. The prediction of the 'Performance' column will be based on the other parameters in the dataset, such as 'Age', 'Gender', 'Class', 'Size of Family', 'Father education', 'Mother education', 'Father Occupation', 'Mother Occupation', 'Health Issues', 'Parent Marital Status', 'Practice Sport', 'Attendance', 'Homework completion', 'Academic Score', 'Attentivity in Class', 'Behavioral Patterns', 'Self-Esteem', 'Socially Skills', 'Teacher Interaction', 'Cognitive Development', 'Technology Influence', 'Social Media Influence', and 'Involved in Extra-Curricular'. These parameters provide a comprehensive view of the students' personal and

academic life, making them suitable for predicting student performance. The goal of our prediction model will be to accurately classify students into these four categories based on a variety of factors, including personal characteristics, family background, academic behaviors, and social factors. By doing so, we can identify students who may be at risk of poor academic performance and implement interventions to support them. The features that can be used for predicting performance include demographic information (like age, gender, and family size), parental information (like education and occupation), health issues, attendance, homework completion, academic score, attentivity in class, behavioral patterns, self-esteem, social skills, teacher interaction, cognitive development, technology influence, social media influence, and involvement in extra-curricular activities. These features can provide a comprehensive view of a student's background and habits, which can be crucial in predicting their academic performance. There are three algorithms namely Decision Tree, Adaboost and Catboost that are used to evaluate the model. The decision tree stands out as a widely employed machine learning algorithm for classification tasks. It operates by constructing a tree-like structure of decisions and their potential outcomes. This tree is built through iterative division of the dataset into subsets, based on the attribute value that offers the most effective separation. This division process persists until either all data in a subset belongs to the same class or a predetermined stopping criterion is reached. Decision tree classification is known for its interpretability, and its efficacy can be enhanced through methods like pruning, bagging, and boosting. AdaBoost (Adaptive Boosting) algorithm adjusts the weights of incorrectly classified instances and trains subsequent models to focus more on these instances. Adaboost is a method for strengthening weak learners to create a strong learner, usually for classification or regression problems. The Cat Boost Algorithm is an innovative machine-learning algorithm that combines boosting and gradient methods. This algorithm can be used for classification or regression tasks and is known for its efficiency and scalability. This algorithm is known for its ability to handle large datasets and complex data with missing values. The machine learning model is going to find the best algorithm for performing the best student learning outcome. Then it is going to utilize real-time monitoring and give feedback about that student's performance. In this process, it will apply the best algorithm for the student learning outcome for the future purpose. This can improve the student's ability to learn more efficiently and the process of the outcome will be in the improved form. The system can create customized learning paths for each student based on their strengths, weaknesses, and learning styles, ensuring that they receive targeted instruction. By analyzing student data in real time, the system can identify the students who are at risk of falling behind or struggling with certain concepts.

Data Set Analysis

The system has generated an amazing pre-processing process, which is excellent for analysis and performance. This provides the best approach to applying machine learning models. Each step of the pre-processing is depicted in graphs. Figure 1-7 illustrates the analysis of the dataset which is used to evaluate and predict the student learning outcomes.Figure 1. shows the distribution of ages in the dataset. The x-axis is the age, and the y-axis is the count. The bars are colored from left to right in the order of age, from 4 to 15. The most common age is 9, followed by 8 and 10.
Figure 2.shows the distribution of social skills among three groups: Active, Moderately active, and Inactive. The majority of people (76%) are active, followed by moderately active (15%) and inactive (9%). Figure 3 illustrates the value counts of performance. The x-axis is the performance level and the y-axis is the student count. The chart shows that there are four categories of performance: Average, Good, Excellent, and Poor. However, in this studywe also incorporated additional features such as behavioral patterns, health issues, academic scores, and social media influence to enhance student learning outcomes are shown Figure 4, 5, 6 and 7 respectively

RESULTS AND DISCUSSION

The primary objective of this study is to develop a predictive model to forecast student performance. This multifaceted model is designed with several metrics

Early Identification: The model aimed to enable the early identification of academic challenges and at-risk students by leveraging diverse data inputs.

Tailored Interventions: Through the utilization of predictive analytics, the model sought to facilitate tailored interventions tailored to the specific needs of identified students.

Prediction Accuracy: An essential focus of the model development was to enhance prediction accuracy by amalgamating various data sources and employing advanced analytical techniques.

Transparent and Scalable System: The model aimed to provide educators with a transparent and scalable system, ensuring ease of implementation and accessibility for educational institutions.

Continuous Improvement: Emphasis was placed on fostering a culture of continuous improvement, wherein insights from model outcomes would inform ongoing enhancements to student support strategies.

Ethical Considerations: The study addressed ethical considerations related to data utilization, privacy, and the ethical implications of student interventions.

The ultimate goal of this research is to enhancing student success by delivering timely interventions and personalized support grounded in a comprehensive understanding of students' profiles. The results and discussions presented herein demonstrate the efficacy and potential of the developed predictive model in achieving these objectives.

Train Accuracy

The train accuracy is calculated using the Eq-1. It computes the ratio of the number of accurate predictions (true positives) made by the model on the training set to the total number of instances within the training set. This ratio reflects the proportion of correctly classified instances in the training data, serving as a measure of the model's accuracy on its training data.

Train Accuracy = (Number of correct predictions on training set) / (Total number of instances in training set)……Eq1.

Test Accuracy

The Eq-2 computes the ratio of the number of accurate predictions (true positives) made by the model on the test set to the total number of instances within the test set. Analogous to Train Accuracy, this ratio indicates the proportion of correctly classified instances in the test set, thus reflecting the model's accuracy on unseen data.

Test Accuracy = (Number of correct predictions on test set) / (Total number of instances in test set)……Eq-2.

Precision

The formula mentioned in Eq-3 expresses the ratio of true positive predictions to the total number of positive predictions generated by the model. Essentially, it quantifies the proportion of instances correctly classified as positive out of all instances classified as positive by the model. A higher precision value signifies that the model has fewer false positives about true positives, a desirable trait in numerous applications.

Precision = (TP) / (TP + FP)…….Eq-3.

Recall

The Formula given in Eq-4 signifies the ratio of true positive predictions to the total number of actual positive instances within the dataset. In essence, it assesses the proportion of instances correctly classified as positive out of all instances that are genuinely positive according to the ground truth. A higher recall value suggests that the model excels at capturing all positive instances, thereby reducing the number of false negatives.

Recall = (TP) / (TP + FN).....Eq-4.

F1 score

The equation (Eq-5) represents the ratio of correct positive predictions to all positive predictions, while recall denotes the proportion of true positive instances correctly predicted out of all actual positive instances. The harmonic mean, used in the F1 Score, prioritizes lower values, meaning the F1 Score is elevated only if both Precision and Recall are high. This metric offers a balanced assessment between Precision and Recall, proving particularly valuable in binary classification scenarios with imbalanced classes or when both false positives and false negatives hold equal significance.

F1 score = 2 * (precision * recall) / (precision + recall).....Eq-5.

The F1 score can be interpreted as1 if it indicates perfect accuracy otherwise 0.

AUC Accuracy

The AUC (Area Under the Curve) accuracy assesses the model's ability to differentiate between classes, with values ranging from 0 to 1. AUC is frequently computed using diverse techniques such as the trapezoidal rule, which may entail numerical integration methods. It quantifies the area under the Receiver Operating Characteristic (ROC) curve, a graphical representation of the true positive rate plotted against the false positive rate across different threshold values. The ROC curve visualizes the trade-off between sensitivity (true positive rate) and specificity (true negative rate) of a classification model across various threshold settings. A higher AUC value indicates superior discrimination ability of the model, with an AUC of 1 representing perfect classification performance. Table 1.shows the performance of three different machine learning models on a classification task. The models are evaluated on their training and test accuracy, as well as their precision, recall, F1 score, and AUC accuracy. The decision tree model has the highest training accuracy, but the lowest test accuracy of 2.7%. This suggests that the decision tree model is over fitting to the training data and is not generalizing well to new data. The Cat Boost model has the highest test accuracy and the highest AUC accuracy. This suggests that the Cat Boost model can learn from the training data and generalize well to new data. The Cat Boost model has the highest precision of 74.8% and the highest recall of 74.8%. This suggests that the Cat Boost model can correctly identify both positive and negative examples. Overall, the Cat Boost model appears to be the best model for this classification task. It has the highest test accuracy and AUC accuracy, and it can learn from the training data and generalize well to new data.Figure 8. shows the the performance comparisons of three different machine learning models across various evaluation metrics. The evaluation metrics are Train Accuracy, Test Accuracy, Precision, Recall, F1 Score, AUC (Area Under the Curve), and Accuracy score. From Table 1 and Figure 8, we conclude the over all performance of the models. The Decision Tree and Cat Boost models show similar performance across most metrics, with Decision Tree having a slight edge in Train Accuracy and Precision. AdaBoost generally shows slightly lower performance compared to the other two models. It's important to note that while the Decision Tree seems to perform well on the training data, the similar Test Accuracy and other metrics between Decision Tree and Cat Boost suggest that Cat Boost may generalize better to new data. The Cat Boost algorithm demonstrated a higher accuracy rate compared to other algorithms used in this paper.

CONCLUSION

The system combines academic, behavioral, and co-curricular data to predict and support student success. It offers early identification of at-risk students, personalized interventions, and a user-friendly dashboard for educators. Emphasizing transparency, continuous improvement, and ethical considerations, the system aims to enhance overall educational outcomes through proactive measures and collaboration. Future enhancements may involve AI and NLP integration for accurate predictions while considering biometric data and gamification.

ABSTRACT

Food consumption choices are developing from childhood. At the age of toddlers, they are exposed to different types of food. This is the period where they develop preferences of food choices and eating practices and also learn the motor skills of feeding themselves, contributing to lifelong healthy nutritional food habits. In today's era, the parents find it a very difficult task of developing healthy dietary habits. Here, the Ayurvedic concept of Satmya is one of the important concepts in developing healthy food habits. Satmya's knowledge actively guides parents in developing their child's food habits. The food parenting guiding review work is available, but no correlative work is done based on the Ayurvedic concept of Satmya. So, This review aims to explore the Ayurvedic concept of *Satmya* and its role in guiding food parenting practices to promote the development of healthy dietary habits in children. The objective of this study is to correlate modern food parenting practices with the Ayurvedic concept of *Satmya*, and to provide insights into how this traditional knowledge can support parents in establishing healthy food habits in their children. A systematic review of literature on food parenting practices was

conducted, analysing 29 references published between 2000 and April 2023. These articles were assessed to draw a correlation between *Satmya* and contemporary strategies in food parenting. The review focuses on how early exposure to various foods and the development of motor skills during toddlerhood shape lifelong dietary preferences and habits. The study concludes that the Ayurvedic concept of *Satmya* offers valuable guidance for parents in cultivating healthy eating habits in children. By integrating *Satmya* into food parenting practices, parents can more effectively support the development of their child's preferences and habits, leading to long-term health benefits. Despite existing research on food parenting, there is a lack of work connecting these practices with Ayurvedic principles, which this review aims to address.

Keywords: Satmya, Food parenting in children, Ayurveda, Children's dietary habits, Childhood nutrition, Healthy eating

INTRODUCTION

Ayurveda is the science to prevent and manage lifestyle disorders, so the world is being attracted towards Ayurveda as a potential foremost life science. The holistic approach of Ayurveda has a constructive focus on complete physical, psychological, and spiritual well-being, which makes this science a wonderful option for maintaining a healthy lifestyle. Diet plays an important role in developing physical and mental health. Healthy eating habits begin in toddlerhood, resulting in long-lasting nutritional habits and overall health development. (1,2) During this age, children develop their motor skills5. These motor skill helps to feed themselves and develop preferences for selecting food. Satmya is one of the important concepts of Ayurveda that must be understood by the parents while dealing with their child's food habits. One of the significant causes behind understanding the concept of Satmya is prime consideration while implementing diet or medicine. (2) Satmya is where the substance used constantly has wholesome effects. Satmya is well understood by its different types, such as Okasatmya, Desha-Satmya, ritu-satmya, Vyadhi-Satmya, Dosha-Satmya, Prakriti-Satmya, Vaya-Satmya, etc. Most parents wish to offer the best food for their children—whether they have the privilege of raising them or are simply blessed enough to know and love them. This review article aimed to apply the concept of Satmya, the ancient wisdom of Ayurveda, to the food parenting practice in support of their vibrancy. This paper reviews and highlights the relevance between Satmya and food parenting practices. Hence, we searched PubMed, Central, and Google Scholar databases to review relevant articles on Satmya and food parenting practices. The search capitulated 29references published from 2000 to April 2023. The correlation between these two concepts is put forward in this article. Moreover, the application of Satmya extends beyond mere dietary choices; it encompasses a broader understanding of lifestyle practices that can profoundly influence children's overall health. For instance, incorporating Ayurvedic principles such as daily routines (Dinacharya) and seasonal adjustments (Ritucharya) into family life can further enhance well-being by aligning with natural rhythms and promoting balance in both physical and mental states. This holistic approach not only nurtures children's growth but also instills lifelong habits that foster resilience against lifestyle diseases prevalent in modern society, which are often linked to poor eating habits and sedentary lifestyles. By actively engaging families in these practices, we can cultivate a generation that values healthful living, rooted in ancient wisdom yet relevant to contemporary challenges.

Concept of Satmya

"A satmya substance or regimen is one that is suitable for the body when used consistently." The experts on appropriateness identify behaviour and eating as Satmya, which is the antithesis of place, disorder, Prakriti, Dosha, and season (1). According to Ayurveda, when creating a meal plan, the notion of Satya should be taken into account. Satya depends on a person's Prakruti, Agni, Kostha, as well as the Rasa, Guna, Virya, and Vipaka of their food as well as the Rutu (season).

Prakriti-Satmya (2)

he concept of *PrakritiSatmya* begins with the development of the fetus's*Prakriti*, which is influenced by the qualities of the three *doshas* present in the sperm and ovum at the time of fertilization. Additionally, the diet and lifestyle of the pregnant woman, along with the *doshic* state of the uterus during pregnancy, play crucial roles in shaping the fetus's*Prakriti*.(3) When making food choices based on *Prakriti* (individual constitution), it is essential to understand both one's *Agni* (digestive fire) and *DehaPrakriti* (body constitution). These factors help ensure that the food consumed aligns with the individual's digestive capacity and natural balance of *doshas*, promoting overall health and well-being.

VISHAMAGNI (2)

Hunger is erratic. As a result, the Vishama Agni will affect how long digestion takes as well as how it behaves.

TEEKSHNAGNI (2)

Due to Teekshna Agni, the digestion is swift and the appetite will be robust and good.

MANDAGNI (2)

The appetite is relatively lesser, digestion will be slow, and the person can even skip a meal without undue discomfort. In Ayurveda, the proper quantity of diet is defined as the amount of food that can be fully digested in a timely manner without disrupting the body's natural balance. (4)It emphasizes that the right portion should nourish without causing discomfort or imbalance. Parents must observe their child's individual needs and recognize that each child has a unique digestive capacity. Understanding this variation in *Agni* (digestive fire) is key to determining the appropriate amount of food for optimal health and digestion.

RELATION BETWEEN RASA (Taste) & PRAKRUTI (5)

The relationship between *Rasa* (taste) and *Prakriti* is closely linked to the concept of *Rasa Satmya*, which refers to the compatibility of tastes with an individual's constitution. Typically, a person gravitates towards tastes that counterbalance their inherent *DoshajPrakriti*. For example, those with a predominance of a particular *dosha* may naturally prefer tastes that help maintain equilibrium by either pacifying or balancing the *doshas* (whether in a state of balance, increase, or decrease). It is important for parents to introduce all six *rasas* (sweet, sour, salty, pungent, bitter, and astringent) to their child, allowing the child to intuitively select the tastes that best suit their body's needs.
Food taste preferences are often guided by an individual's *Prakriti*.(5)

- **VataPrakriti**: A child with *Vata* constitution should favor*Madhura* (sweet), *Amla* (sour), and *Lavana* (salty) tastes, as these help balance *Vata*. They should avoid excessive *Tikta* (bitter), *Katu* (pungent), and *Kashaya* (astringent) tastes, which can aggravate *Vata*.
- **Pitta Prakriti**: A child with *Pitta* constitution should focus on *Madhura* (sweet), *Tikta* (bitter), and *Kashaya* (astringent) tastes to calm *Pitta*. They should minimize *Katu* (pungent), *Amla* (sour), and *Lavana* (salty) tastes, which may increase heat and intensity in their system.
- **KaphaPrakriti**: A child with *Kapha* constitution benefits from *Katu* (pungent), *Tikta* (bitter), and *Kashaya* (astringent) tastes, which help balance the heavy and moist qualities of *Kapha*. They should avoid *Madhura* (sweet), *Amla* (sour), and *Lavana* (salty) tastes, as these can further elevate *Kapha* qualities.

Each *Prakriti* has specific taste preferences that help maintain balance, and understanding these can guide healthy dietary choices.

VAYA-SATMYA(4)

Vaya-Satmya is a Sanskrit term that refers to what is healthy or suitable for different stages of life. In Ayurveda, it is understood that the three *doshas*—*Vata*, *Pitta*, and *Kapha*—influence each phase of life in unique ways.

- **Childhood** is the first stage of life, governed by the *Kapha*dosha. This stage is characterized by growth, development, and nourishment, with *Kapha* providing the stability, lubrication, and nurturing needed for a child's physical and mental growth.

- **Puberty** and young adulthood represent the second stage, ruled by the *Pitta*dosha. This period is marked by transformation, energy, metabolism, and intensity, reflecting the fiery nature of *Pitta*.
- **Old age**, from around fifty until death, is governed by the *Vata*dosha. This stage is associated with the qualities of movement, dryness, and lightness, as *Vata* influences physical decline, the drying of tissues, and the increasing fragility of the body and mind.

Each stage of life requires different forms of nourishment and care to maintain balance, and understanding the influence of the *doshas* helps promote health according to one's age. As per Ayurveda, food preferences naturally shift with age, aligning with the dominant *dosha* during each life stage. During childhood, when *Kapha* is the dominant *dosha*, children often prefer foods that are sweet, juicy, and nourishing. These foods help support the growth and development associated with the *Kapha* phase, as they provide the moisture, stability, and energy needed for physical and mental growth. The sweet and juicy tastes not only satisfy their natural cravings but also help balance *Kapha*, nurturing their bodies and aiding in building tissues. As children grow, their dietary needs and preferences evolve, reflecting changes in their *dosha* balance over time.

Ritusatmya(5)

Ayurveda identifies six *Rutus* (seasons) and their effects on the human body, emphasizing the importance of adapting to these changes through the concept of *Ritusatmya*—seasonal lifestyle adjustments. Each season influences the body's *doshas* and *Agni* (digestive power), and maintaining balance according to these shifts is key to staying healthy.

- **Agni (Digestive Power)**: *Agni* is most active during *Hemanta* (early winter) and *Shishir* (late winter) *Rutus*, allowing the body to digest heavier, nourishing foods. However, during *Grishma* (summer) and *Varsha* (monsoon), *Agni* weakens, so lighter, cooling foods are recommended.
- **Dosha Imbalances**: In *Vasant* (spring), *Kapha*dosha tends to become aggravated, leading to issues like allergies, congestion, and lethargy. In *Sharad* (autumn), *Pitta*dosha is more likely to become vitiated, which can manifest as inflammation, skin issues, or digestive disturbances.
- **Rutusandhi**: This is the transitional period between two seasons, when lifestyle and dietary habits should be gradually adjusted to accommodate the upcoming season. If abrupt changes are made without considering the body's adaptation process, it can lead to *Asatmyaj* diseases—illnesses caused by failure to adapt to the new season. The key is a gradual shift in habits, allowing the body to acclimate smoothly.

Understanding and respecting these seasonal rhythms is essential for maintaining balance and preventing seasonal imbalances in *doshas* and *Agni*.

Desha-Satmya (6)

The Desha means geographical land. These are classified into three categories - JangalaDesha (dry land), which is predominantly Vata; Anupa (marshy land), which is predominantly of Kapha; and Sadharana (normal Land), which has all the Doshas in normal condition. In India, we can see the different types of food culture based on geographical conditions.

Okasatmya (8)

This concept is referred to as *AbhyasSatmya*, where something becomes suitable or acceptable to the body through regular use, even if it is inherently unhealthy. Over time, the body adapts to these habits or foods, and they become less harmful due to a phenomenon known as *Okasatmya*—the body's ability to tolerate certain foods or habits through consistent exposure. However, it is important to note that when withdrawing from such *Okasatmya* habits or foods, the process should be gradual. Abrupt cessation can disturb the body's adaptation and lead to negative health effects. By slowly reducing the use of these substances, the body can adjust more easily, avoiding potential imbalances or issues. Here are some modern concepts for food parenting practices that align with contemporary understanding of nutrition and child development: Food parenting practices play a crucial role in shaping children's eating behaviors and emotional regulation. Research shows that coercive control practices—such as using food as a reward or to manage emotions—can negatively impact children's relationship with food. Specifically, these practices may lead to

emotional overeating in preschoolers, as they can obstruct the development of healthy emotional regulation strategies. When children learn to rely on food for comfort or to cope with emotions, they may struggle to recognize their true hunger and fullness cues, which can result in unhealthy eating patterns and difficulties in managing emotions effectively . (9). Additionally, the quality of coparenting affects how these practices manifest, with supportive parenting linked to healthier eating behaviors in children(10). Furthermore, parents engaging in disordered eating behaviors are more likely to adopt coercive food practices, perpetuating maladaptive eating patterns in their children(11). Cultural factors, such as acculturation and food insecurity, also shape food parenting practices, particularly in diverse populations(12). Lastly, community organizations play a role in promoting structured feeding practices, although some restrictive advice can be challenging for parents to implement(13).

Food parenting practices undeniably serve a pivotal role in the intricate process of shaping not only children's eating behaviors but also their capacity for emotional regulation, which is fundamental for their overall development and well-being. An extensive body of research convincingly demonstrates that coercive control practices—such as the detrimental use of food as a reward or as a tool to manage emotional states—can profoundly and negatively impact the way children relate to food throughout their lives. (9)Specifically, these harmful practices may contribute to a pattern of emotional overeating in preschool-aged children, as they can significantly obstruct the essential development of healthy emotional regulation strategies that are crucial for navigating life's challenges. When children are conditioned to rely on food for comfort during distressing moments or as a primary means of coping with various emotions, they may face considerable difficulties in recognizing their authentic hunger and fullness cues, which can ultimately lead to the establishment of unhealthy eating patterns and significant challenges in effectively managing their emotions in a constructive manner. (10) Additionally, the quality of coparenting dynamics plays a vital role in determining how these food parenting practices manifest in children, with research indicating that supportive and nurturing parenting is intricately linked to the cultivation of healthier eating behaviors in children, fostering a positive relationship with food. Furthermore, it is noteworthy that parents who engage in disordered eating behaviors themselves are statistically more likely to adopt coercive food practices, thereby perpetuating a cycle of maladaptive eating patterns that can be detrimental to their children's health and well-being. Cultural factors, including acculturation processes and experiences of food insecurity, also significantly influence food parenting practices, particularly within diverse populations where varying cultural backgrounds can shape attitudes toward food and eating habits. Lastly, community organizations play an instrumental role in advocating for and promoting structured feeding practices that can support healthy eating, although it is important to acknowledge that some of the restrictive advice offered can present significant challenges for parents striving to implement these practices effectively in their daily routines. While coercive practices are prevalent, some parents may adopt more supportive strategies that foster autonomy and healthy eating, highlighting the need for balanced approaches in food parenting.

Modeling

Parents are crucial socialisation agents who serve as educators, role models, and advocates for health in the lives of their kids. Either modelling or restrictive advice was retrieved from the parental factors. The use of food as a reward, availability, accessibility, active advice and education, and encouragement to consume it are all examples of modelling. Rules-making and eating pressure are examples of restrictive advice, as is Active advice. (14) In a number of ways, parents are crucial in helping their kids form healthy eating habits. Most obviously, people control what meals are available and how much of them there are; their eating habits can be an example. (15) Parental consumption of a target food item served as a proxy for modelling. In this instance, a significant modelling impact was demonstrated by a positive association between parent and child intake. Due to their insufficient capacity for self-regulation, younger children in the POS are less likely to adhere to parentally imposed rules or restrictions. (16). Children who receive food as rewards tend to eat more unhealthy foods. By rewarding children's bad behaviour with these unhealthy foods, kids may come to view them as desirable and pleasant, leading them to eat more of them when given the option (17).

It is important to highlight that rewarding with praise seemed to be more effective with younger children. Verbal praise might lead to higher consumption of nutritious foods, suggesting that rewarding with praise and rewarding with material prizes are different practises with different consequences.

Restrictive guidance

"Restrictive guidance" refers to the regularity with which parents place boundaries, guidelines, or limitations on food consumption. This encompasses a variety of overt parental restriction categories like rule-making and parental overt control and is closely tied to the parental mediation facet of restrictive mediation. (18) Regulating food-related parenting techniques, particularly parent-centered feeding techniques where the parent determines what, when, and how much the child should eat. One theoretical tenet that has shaped a lot of the research in this field is that when parents intervene in their children's eating, it interferes with their capacity to naturally react to their internal hunger and satiety cues, leading to the development of unhealthy eating habits. (19) To be more specific, in addition to pressure and restriction, a variety of other controlling food parenting behaviours have also been taken into account, such as pushiness, encouraging the child to clean their plate, parent control of intake, threatening to withhold food/play, aversive instruction, aversive contact, coerciveness, and rewarding eating with desired activities or nonfood objects. These tactics could perhaps be linked to certain child traits and varied results. Food parenting techniques are more sensitive to situational details such location, child's age, gender, and weight status. (20) Parenting techniques involving food, such as rigorous parental control, can have negative consequences and may make kids prefer restricted meals or reduce their intake of wholesome foods. (21) Children's food intake habits are closely correlated with parents' eating habits and the availability of particular food types. Conversely, some behaviours, such as active and restrictive guidance, are only effective in specific situations; active guidance is more effective at promoting the consumption of fruits and vegetables, whereas restrictive guidance is more effective at discouraging the consumption of unhealthy foods, such as sugar-sweetened beverages (SSBs). (22) Understanding how children's eating preferences are formed can help people's health for the rest of their lives. Particularly, restricting the intake of sugar-sweetened drinks (SSBs) while increasing the intake of nutritious foods like fruits and vegetables can benefit people's health. (23)

Picky eating behavior (24)

Picky/fussy eaters are children who "consume an inadequate variety of foods through rejection of a substantial amount of food that is familiar (as well as unfamiliar) to them," according to Dovey et al.'s most widely recognised definition of picky eating. Dovey and co. The body of research shows that food fear is widespread in kids and does not raise their risk of being underweight.

DISCUSSION

Consider the child's Prakriti, or unique constitution, when using Satmya in parenting techniques. Every child has a different ratio of the three doshas (Vata, Pitta, and Kapha), which impacts their ability to digest food and general health. Parents can encourage healthy digestion and nutrition absorption by adjusting the diet to the child's Prakriti, enhancing overall well-being. Rasa-Satmya emphasizes the value of providing children with a diverse diet with various flavors. Early exposure to various flavors helps broaden a child's taste and increase their openness to eating new meals. Children can enjoy a balanced and enjoyable dinner when all six tastes—sweet, sour, salty, bitter, pungent, and astringent—are present. Ritusatmya emphasizes the value of eating in season. Eating meals keeping up with the current season gives the body vital nutrients and supports its natural processes. Eating following the seasons can also help the environment and foster a sense of connectedness with the natural world. (5) Vaya-Satmya knows that as kids age and grow, their nutritional demands alter. By tailoring the diet to the child's developmental stage, you can ensure they get the nutrients they need for strong, healthy growth and development. (4) Finding a balance in one's approaches to food parenting is crucial, even though the Satmya idea offers insightful information. A predisposition for unhealthy meals and finicky eating habits may result from overly restricted or restricting food practices. Children can be motivated to make healthy food choices through positive food modelling, providing

healthy options, and verbal praise for good eating habits. Additionally, by comprehending Satmya, parents can be better equipped to decide on their child's food while considering their particular needs and preferences. This strategy supports a lifetime of healthy eating behaviors and a happy relationship with food. Despite the possible advantages of implementing Satmya in parenting techniques related to food, it is important to be aware of any difficulties or restrictions. Individual tastes, outside influences, and cultural and socioeconomic issues affect how parents handle their kids' meals. Additionally, not all components of Ayurveda may be compatible with contemporary nutrition science, and evidence-based study is required to confirm the efficacy of some practices.

CONCLUSION

In conclusion, the Ayurvedic notion of Satmya provides important insights into contemporary approaches to food parenting. Parents can provide a nurturing and encouraging atmosphere for their children to develop good eating habits by comprehending and putting the ideas of Satmya into practice. Each child's unique constitution, or Prakriti, is extremely important in defining nutritional requirements. Dietary modifications considering each child's Prakriti can promote healthy digestion and general well-being. Additionally, as Rasa-Satmya emphasizes, providing a range of flavors can broaden the child's palette and inspire them to adopt a balanced and varied diet. Ritusatmya, or seasonal eating, is crucial for supplying the body with the right nutrients and sustaining its physiological functions all year long. By altering the food per the child's age (Vaya-Satmya), it is ensured that they obtain the right nourishment for their stage of development. The Satmya philosophy offers helpful suggestions, but it's important to strike a balance when it comes to food parenting methods. A predisposition for unhealthy meals and finicky eating habits may result from overly restrictive or controlling methods. Children can be motivated to choose healthy foods through positive food modelling, providing healthy options, and verbal praise for good eating habits. Ayurvedic knowledge can be incorporated with contemporary nutrition theories to provide a comprehensive approach to food parenting and the groundwork for a lifetime of healthy eating behaviors. To validate the efficacy of specific practices, it is necessary to be open to evidence-based research and aware of potential obstacles and limitations. In conclusion, incorporating Satmya into parenting strategies related to food can potentially improve kids' health and well-being. Parents can play a critical role in influencing their children's eating habits and fostering a healthy future for the next generation by adopting this traditional wisdom and modern nutritional science.

ABSTRACT

Amavata is one of the challenging disorder for the clinician due to its Chronicity, Incurability, Problems and Morbidity. In Allopathy remedy are suggested NSAID , Steroids which offers the symptomatic relief, However those has more side effects, The Ayurvedic treatment not only devoid such type of sick effect but also present a higher way by using treating Agni and Aam at its roots. In Amavata, the undigested food juice that is Ama is circulated in all over the body and accumulates in the joints also referred to an accumulation over the tongue. That is known as Sama Avastha. That is why by examining the tongue, we can probably diagnose the Amavata. Tongue is a reflection of what is happening inside a body and it reflects the overall digestive, nutritive, and metabolic conditions of body. Tongue examination is an easy and indispensable part to know Sama, Nirama and Vriddhi, KshayaAwastha of Dosha, finally in the diagnosis of disease. It is one of the important examination tool mentioned in Ayurveda but not backed by documented scientific research. So for the diagnosis of disease AamaVata, tongue examination can be very usefool diagnostic tool. In this study, an effort will be made to analyze the changes in Jihwa due to AamaVata and this work will be unique contribution in Ayurveda.

Keywords: Amavata, Rheumatoidarthritis, Jihwapariksha, Tongue examination, RA factor

INTRODUCTION

*Acharyas*emphasize the importance of thoroughly examining both the patient (*Rogi)* and the disease (*Roga)* before beginning treatment. In Ayurveda, proper diagnosis (*RogaVinishchaya*) is crucial and highly valued. Ayurvedic *Pariksha* (examination) is used to assess potential health risks and adjust diet and lifestyle to prevent diseases. Various methods of examination are detailed in classical Ayurvedic texts. Among these, *Acharya Yog-Ratnakara's Ashtavidha Pariksha* (eightfold examination) is a key method for identifying the causes of diseases. One of the simplest yet significant diagnostic tools is *Jihwa Pariksha* (tongue examination), which is particularly important for assessing the digestive system, as the tongue is considered an indicator of stomach health. *Amavata,* originating from the ideas of *Madhukoshkara in Madhavnidan*, is described in Ayurveda as a *RasavahasrotodushtiVyadhi* caused by *Ama* and *vata.* It primarily affects joints like hands, feet, back, and knees, leading to pain, heaviness, fatigue, and digestive issues. *Amavata's* symptoms closely resemble rheumatoid arthritis (RA), an autoimmune disorder that causes joint inflammation, pain, and stiffness. Globally, RA affects about 0.8% of people, with higher rates among women, especially those over 70. In India, prevalence ranges from 0.5 to 3.8% in women and 0.15 to 1.35% in men.

NEED FOR THE STUDY

- *Amavata* is a chronic and challenging disorder, often managed with NSAIDs and steroids in Allopathy, which have side effects.
- Ayurvedic treatment, however, addresses the root causes by targeting Agni and Ama without adverse effects. In *Amavata*, undigested food (*Ama)* accumulates in the joints and can be detected on the tongue, known as Sama Avastha.
- Tongue examination is a valuable diagnostic tool in Ayurveda, reflecting internal health, and this study aims to explore its role in diagnosing *Amavata.*

AIMS AND OBJECTIVES

- AIM: To conduct *JihwaPariksha* in patients of *Amavata with special reference to Rheumatoid arthritis.*
- OBJECTIVES: To study changes in *Jihwa* manifested in patients of *Amavata with special reference to Rheumatoid arthritis***.**

MATERIALS AND METHODS

SOURCES OF DATA

LITERARY SOURCE

All available literature on *AamaVata and* Rheumatoid Arthritis *and Jihwa Pariksha.* All *Bhrihatrayi, Laghutrayi* and other available *Ayurveda* texts. Modern books (Pathology, Medicine, Surgery) etc Reviewed research articles, papers and journals. Authenticated internet sources.

CLINICAL SOURCE:

Patients attending OPD & IPD from Parul Ayurved Hospital, Parul Sewashram Hospital and Khemdas Ayurved Hospital and from camp if required.

COLLECTION METHOD OF DATA

Detailed history taking with specially designed case proforma was filled out accordingly. Patient having *Lakshanas*of *Amavata*[Rheumatoid arthritis]selected and tongue photograph were taken as per protocol. were taken between the age of 30-70 years

Inclusion criteria

Patients having the *lakshana* of *Amavata*[Rheumatoid arthritis]were included. Patients of *Amavata*[Rheumatoid arthritis] between the age of 30-70 years were included.

Exclusion criteria

Patients with local tongue infection and congenital anomalies were excluded. Patients having major ailments of other systems. E.g., AIDS, carcinoma of any organs, pregnancy, Hepatitis B, Hepatitis C, Tuberculosis, etc at the time of enrolling the patient were excluded.

Objective criteria

Signs for *Jihwa as mentioned in Yogaratnakar*

जिह्वाशीताखरस्पर्शास्फुटितामारुतेऽधिके |

रक्ताश्यामाभवेत्पित्तेकफेशुभ्राऽतिपिच्छिला || (Yogratnakar)

Classical signs for *Jihwa*as mentioned in *Yogaratnakar*[8] which can be assessed by*Darshan pariksha:*

*In VatajaJihwa – Sphutita (*fissured*)*

*In PittajaJihwa – Rakta (*red*) , Shyama (*darkblue/blackish*)*

*In KaphajaJihwa – Sama (*coated*) , Shubhra (*white*) ,Atipichhila (*excessivelygreasy*)*

In DvandvajaJihwa – Mixed features observed.

*In SannipatajaJihwa – Krushna (*blackish*), Sakanataka (*thronylike*) , Shushka (*dry*)*

Diagnostic Criteria

Patients having the *lakshana* of *Amavata*as mentioned in madhavnidan 25thchepter as follow

Sandhi shoola (joint pain)

Sandhi shotha (joint swelling)

Sparshasahyata (Tenderness in joints)

Sandhigraha (Stiffness in joints)

For Rheumatoid arthritis ACR criteria as follow

JOINT INVOLVEMENT
Large [knee,hip,elbow,shoulder,ankle] Small [wrist,MCP,PIP,thumb IP, 2nd -5th MIP
SEROLOGY [RA FACTOR]
ACUTE PHASE REACTANT [ERYTHROCYTE SEDIMANTATION RATE-ESR]
DURATION OF SYMPTOMS> 6 MONTHS

DISCUSSION

ON NIDANA

VIRUDDHA CHESTA

In this study 47.3% of patients indulged in virudhachesta.it include Day time sleeping Exertion immediately after taking unctuous meal. Cold Water bath Performing heavy acts which are beyond the one's capacity. Sleeping on uneven bed Taking Ushna and Sheet soon after one another Excessive Sexual intercourse Awakening at night ,Physical exertion just after taking meal

MANDAGNI (Decreased digestive power)

In this study majority of the patient having*mandagni*.it increases the risk of illness. *Ama* (toxic substance) is more likely to develop. *Jatharagni*, the primary form of Agni, is crucial as it not only digests food but also enhances the functions of *Bhutagni and Dhatwagni*.

Viruddha Ahara

Majority of the patient indulg into this nidana.Viruddha Ahar is refers to the Ahar dravyas that cause Dosha vitiation but unable to expel it from the body. These are Dhatushaithilyakara and Doshaprakopaka. One of the most significant causes of Amavata is Viruddha Ahara.

Nishchalatva(lack of physical exercise)

46.0% of patient indulg into this in this study .Physical inactivity leads to Kapha Vriddhi which results in Agnimandya and formation of Ama.

SnighdhamBhuktavatovyayamam

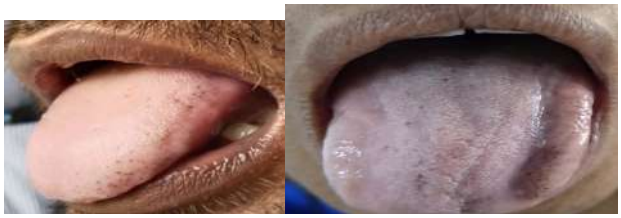
in this study 58.0% of patient indulge into it. Exertion immediately after taking Snigdha Ahara is the causative factors for disease Amavata .Agni in the body becomes vitiated due to Snigdha Ahara, which is Guru, and Ama is produced as a result. Whereas in Sandhis, Vyayama immediately following Snigdha Bhojana promotes the vitiation of both Vayu and Khavaigunya. There is an over mobilisation of Sandhis during Vyayama. They could develop khavaigunyaas a result of using Sandhi excessively. Therefore, Vyayama after eating acts as khavaigunya creating Nidana, and when combined with Snigdha Bhojana, it creates a particular Nidana for Amavata.

DISCUSSION ON *JIHWA* FOUND IN AMVATA: *JIHWA* IMAGES THAT DENOTES COATING ON *JIHWA*

NOTE: *JIHWA IMAGES TAKEN AS PER PATIENTS CASE RECORD FORM AND CONSENT*

- Out of all patients, only 20% patients found with no coating, other than that all 80%patients were found with some kind coating.Among them, 28.% of patients were found with patchy coating, 36% of patients were found with thin coating,and14.%of patients were found with thick coating.
- *Kapha and medavardhaknidanasevana* results in *mandagni* which ultimately leads to the formation of *Ama* which having similar properties of *DushtKapha.*
- It will circulate all over the body and also cause the *Dushti* of *SthanikKapha* of *Jihwa* and will cause *LiptaJihwa*(coating of *Jihwa*)

SOME *JIHWA* IMAGES THAT DENOTES COLOUR OF JIHWA



COLOUR OF *JIHWA*

Among all patients of *Amavata*, majority of patients (66%) had normal pink coloured *Jihwa* and remaining(34%) patients had other than pink colour on *Jihwa* like blackish colour or spot on lateral side of the tounge

***JIHWA* IMAGES THAT DENOTES FISSURE ON JIHWA**

There were only 5% patients having no fissure on *Jihwa* rest of the 94.51% of patients were having fissures in various numbers on the *Jihwa*.Amongst them 43 % patients were having fissures ranging from 1 to 3 in numbers, 46 % patients were having fissures ranging from 4 to 10 in numbers on the *Jihwa*. And about 6% of patient having more than 10 fissures on jihwa There were 55.3% patients were having normal texture of *Jihwa* and rest 44.7% of patients were having mild rough texture on *Jihwa*. People with RA may experience xerostomia, or dry mouth. Having RA increases the risk of developing Sjögren's disease, which causes dryness in the eyes and mouth, among other symptoms. Like RA, Sjögren's disease is an inflammatory autoimmune disorder. RA can also cause saliva ducts to narrow or close, leading to an uncomfortable feeling of dryness and difficulty eating and swallowing.

CONCLUSION

In accordance with clinical and statistical observations in the study, It can be said that the disease *Amavata* and changes in *Jihwa* has significant relation both clinically and statistically. *Amavata* and coating of *Jihwa* has significant relation specially in avaranjanyasamprapti,which is due to *kapha* and *medavardhaknidanasevana* results in *mandagni* which leads to the formation of *Ama* which is having similar properties of *DushtKapha* and that circulates all over the body and disturbs the *sthanikkapha* of *Jihwa* and being seen in the form of coating. *Vatavruddhikaranidanasevana* leads to *vata* aggravation and in aggravated state of *vata* the *gunas* like *ruksha* and *parushya* were observed over the tongue in the form of fissures and due to *kharaguna* of *vata*, thus patients developed rough texture over *Jihwa*. There were fissures ranging from 1 to 3 and mild rough texture over *Jihwa* observed predominantly in *Amavata* Only 4 criteria(colour, coating, fissures & texture of *Jihwa*) found significant in other than these 2 criteria (size/shape & movement of *Jihwa*) were found Non-significant in the study.

ABSTRACT

Walking is a simple yet powerful tool for promoting healthy aging. The better life outcomes result from the early diagnosis of developmental delays and impairments. The first step in starting early treatments is screening and facilitated by the Internet of Health Things (IoHT), which has revolutionized healthcare applications. Everywhere in the world, parents and caregivers can discover developmental delays and disabilities in the community by using a variety of methods. Despite the fact that several techniques were created for effective impairment identification, they did not reduce time consumption or computing complexity. The review explores the utilization of machine learning and deep learning techniques for efficient disability detection to tackle the aforementioned issues.

Keywords: Walking, disability detection, machine learning, deep learning, healthcare application, caregivers.

INTRODUCTION

Now a day, the tele- healthcare systems are growing into a huge daily assistance package for the aged and disabled. The potential for the IoHT to revolutionize disability detection and management is enormous. The IoHT devices collect a wide range of health data such as activity data (that involves movement patterns and gait analysis), physiological data, environmental data, and behavioral data. The IoHT data enables early intervention by detecting

minute changes that might occur before a disability diagnosis. Any study on gait analysis has to accurately characterize each unique gait event. The gait disorder is a significant human societal issue, affects the ability to walk rhythmically, requiring muscular coordination and balance, leading to potential life-threatening injuries. The researchers studied walking distance for people with seven disabilities: visual, hearing, physical/mobility, intellectual, learning, autism, and emotional/behavioral, focusing on physical abilities and subjective health. Many researchers conducted research to identify disorders, enabling physicians to develop suitable treatment plans for patients. The organization of this paper is structured as follows: Section 2 discusses the objectives, merits, and demerits of the existing machine learning and deep learning methods. Besides, the dataset and metrics utilized while performing the disability detection methods are provided in the Section 2. Section 3 explains the methodology utilized for the disability identification. The conclusion is given in the Section 4.

LITERATURE SURVEY

Ghoussayni algorithm

Ghoussayni algorithm identify crucial moments during walking, such as heel strike and toe-off. It detects foot strike in individuals with cerebral palsy. Employs an event detection method. Utilizes a walking speed-dependent threshold. Data was collected from the Motion Analysis Laboratory at the Institute Guttmann in Badalona, Spain. The metric of this algorithm is accuracy and mean. This study collected synchronized kinematic and kinetic data from 16 children with bilateral spastic cerebral palsy, who walked barefoot at their own pace. Gait events were detected using ground reaction forces. The disadvantage of this algorithm detection accuracy was not significantly improved to an effective level.

Foot VErtical & Sagittal Position Algorithm (F-VESPA)

This algorithm determine the exact moment of foot-ground contact (foot strike) during walking. Real-time algorithm for recording and analyzing leg motion kinematics, accurate detection of foot-strike events using kinematic data, without relying on future data points. Utilized a publicly available dataset for analysis. In this algorithm accuracy, latency, mean absolute error, mean time delay occurred. This study achieved reduced latency in real-time implementation, eliminated the need for parameter tuning for different subjects and treadmill speeds. The study failed to effectively minimize computational complexity, limiting its efficiency.

Eldo-Care System

In this algorithm to develop a tele-healthcare system catering to the needs of the disabled and elderly population. It introduced the Eldo-care system for assessing and managing various neurological conditions. Facilitates access to services for people with disabilities and frequent users focuses on rehabilitative technologies incorporating human-computer interfaces with social-emotional intelligence. It utilized a raw EEG dataset for analysis. In method have moreover recall precision and accuracy. This study supports cognitive rehabilitation in elderly and disabled individuals through machine learning techniques. In this technique monitors psycho-neurological conditions such as tracks human brain activity using Kinect sensors. But this algorithm failed to efficiently reduce detection time, limiting its effectiveness.

Hand-held dynamometry

It analyzes walking performance in multiple sclerosis patients across different disability groups. Investigated the relationship between lower body and trunk muscle strength and walking performance utilized dynamometry to compare walking performance between mild and moderate disability groups in multiple sclerosis patients. It uses collected clinical endurance test data for ankle plantar flexion, trunk flexion, trunk extension assessments. It has effective accuracy. Employed hand-held dynamometry to measure muscle strength in ankle, knee, hip, and trunk muscle groups assessed walking speed and endurance using Timed 25-Foot Walk and 6-Minute Walk Reported Pearson correlations and beta coefficients for bivariate relationships between muscle strength and walking

performance in mild and moderate disability groups. In this algorithm failed to fail to achieve a significant improvement in precision.

Bland-Altman plot

It Investigate the effectiveness of wearable sensors in detecting variations in walking patterns. Examined the validity of wearable sensors in assessing peak force, impulse, and loading in older adults to determined the ability of wearable sensors to detect age and sex variations in walking parameters Collected data simultaneously under various conditions. It uses 20 healthy young adults and 23 healthy older adults. The metric of this algorithm is peak force, loading rate, and impulse.

The main advantage of this algorithm is co-variation walking speed analysis to identify age and gender differences. The main disadvantages of this algorithm are optimizing space complexity, limiting its efficiency.

Quasi-automated screening procedure

This algorithm develops a procedure to improve the detection of toe walking gait in preschool children. It's identify potential toe walking cases in a large population of preschool children. Combine parent observations with objective foot contact parameters during gait utilize automated screening of 3D video recordings. It takes motor skills in preschools cohort (Project-ID: 5-20150178), approved by Region Southern Denmark's scientific ethical committees. Evaluation metric of this algorithm is accuracy.

Early detection of toe walking in children through video screening and quasi-automated algorithms detection of idiopathic toe walking (ITW) and potential musculoskeletal or neurologic disorders in early childhood. The procedure did not improve detection accuracy as expected.

Intelligent walking assist robot and gait rehabilitation robot

In this algorithm develop an effective abnormal gait recognition system. Introduced a gait recognition method to accurately identify fall and drag-to-drop gaits in a stable and comfortable manner. Designed an abnormal gait recognition system using a built-in robot Kinect to distinguish between normal and emergency walking states. Utilized leg movement data from the built-in robot camera to establish gait patterns through contrast tests and error analysis. Utilized X, Y, and Z axes datasets acquired by the sensor for Signal Vector Magnitude (SVM) calculations. Metric of this algorithm is recognition rate. The new ESMF algorithm accurately determines knee angles and efficiently addresses marker point loss, providing higher stability and comfort for elderly and disabled walkers. The disadvantage of this algorithm is the wearable sensor caused user discomfort and added complexity to the system.

Functional Near-Infrared Spectroscopy (F-NIRS)

It investigate the neural correlates of walking in older adults by analyzing fNIRS data to distinguish between different walking patterns and associated brain activity. Conducted single-task walking (STW) experiments with varying attention levels to automatically detect low and high attention walking states. Employed feature engineering techniques to extract relevant fNIRS features from 3-channel images, enhancing data quality through augmentation.

F-NIRS uses comprehensive fNIRS dataset including gender and cognitive status information. Evaluation metrics of this algorithm classification accuracy, confusion matrix, precision, F1 Score, accuracy. Fine-tuned deep learning models with gender and cognitive status information, leading to improved classification accuracy in fNIRS-based single and dual task walking classification for older adults. It's failed to reduce computational costs, potentially impacting scalability and efficiency.

Human–computer interaction system

In this study develop an alternative communication system to assist paralyzed people in interacting with electronic devices. Utilizes impulse radio ultra-wideband (IR-UWB) sensors to recognize breathing patterns. Generates commands through distinct signal patterns created by user inhalation and exhalation. Employs radio sensors to emit signals to the user's abdomen or chest, analyzing the reflected signals to identify breathing patterns.

Collected data from healthy male volunteers aged 25-40 using IR-UWB sensors. Detection accuracy is the metric. Designed a system for severely disabled individuals that leverages conventional gesture-based interfaces to create

convenient and comfortable breathing patterns through feature extraction. This algorithm has a limitation significantly reduce detection time, potentially impacting system responsiveness.

Early Detection and Intervention (EDI) system.
In this algorithm to implement Early Detection and Intervention (EDI) programs for children with disabilities, enabling timely support and resources. Explore the perspectives of teachers and administrators in Philippine public schools on the effectiveness of EDI programs for children with disabilities. Gather in-depth insights through Focus Group Discussions and Key Informant Interviews Employed inductive analysis using NVivo 11 software to analyze data from 25 participants across three Focus Group Discussions and three Key Informant Interviews. Accuracy is the metric. It provides a nuanced understanding of lived experiences and challenges faced by children with disabilities. Reveals unexpected insights and areas for improvement in EDI programs. It's failed to optimize time complexity, potentially impacting the efficiency of the analysis process.

METHODOLOGY DISCUSSION

In [1], the Ghoussayni algorithm was implemented in order to perform gait event detention for children with bilateral spastic cerebral palsy (CP) by examining the kinematic data, particularly focusing on the movement of markers placed on the child's body (e.g., heel and toe). The retrospective study of 16 children with bilateral spastic cerebral palsy, (7 boys and 9 girls; ages 8.9 ± 2.7 years) walking barefoot at self-selected speed on a 7-m walkway was conducted to collect the synchronized kinematic and kinetic data. During this, two reflective markers were positioned on each child's foot, one on the posterior aspect of the calcaneus and the other on the second metatarsal head according to the Plug-in-Gait model. This study carries out the gait event detection by utilizing methods such as ground reaction forces, Ghoussayni's algorithm with a threshold of 0.5 m/s, and Ghoussayni's algorithm with a walking speed dependent threshold. By comparing the timing of when the foot markers' velocities dropped below the threshold, the new adaptation allowed for the distinction of heel and/or toe foot strikes. The analysis was done on the variations in the three approaches as well as the spatiotemporal characteristics such as stride length, stride time, stride speed, first double support, singles support, time of toe off derived from the two Ghoussayni thresholds. These characteristics were computed to give a complete picture of the child's walking pattern once gait events have been reliably detected. The performance of Ghoussayni's algorithm was superior for food strike compared to toe off. In [2], the Foot VErtical & Sagittal Position Algorithm (F-VESPA) was implemented for carrying out the gait analysis by detecting the heel-strike event utilising body movement data (kinematic data) without any delay.

This study uses data from a publicly accessible dataset for the 42 healthy participants, 24 of whom were young people and 48 of whom were elderly adults. During simulation, the kinematic data was collected at 150 Hz using a camera-based motioncapture system (12 cameras, Raptor-4; Motion Analysis Corporation, Santa Rosa, CA, USA), while ground-reaction force data was measured on a dual-belt instrumented treadmill (FIT; Bertec, Columbus, OH, USA)at 300 Hz. Initially, it takes kinematic data to precisely approximate foot-strike occurrences while eliminating the need for subsequent data points. This leads to minimize latency during real-time implementation. It is appropriate for a range of subjects and treadmill speeds because its parameters don't need to be changed. In [3], the Eldocare system was designed to provide a more comprehensive assessment and management of various neurological conditions in a remote healthcare setting for elderly and disabled individuals. This study utilizes two sensors such as EEG (Electroencephalogram) and kinect sensor for obtaining insights into cognitive function and monitoring physical activity by determining the electrical activity in the brain and tracking user's body movements and gestures respectively. In order to provide a more complete picture of a patient's state, the study integrates data from both sensors. In [4], the Hand-held dynamometry was developed with the goal of determining the walking performance between groups of MS patients with mild and moderate disabilities by comparing the correlations between the lower body and trunk muscular strength. The study included 36 participants with mild and 36 participants with moderate MS, based on their EDSS scores (0 to 3.5) and 4.0 to 5.5 respectively. In [5], the Bland-Altman plot was developed for investigating the feasibility and effectiveness of using wearable sensors for age and

gender-based gait analysis in non-lab settings. A group of 20 healthy young adults (11 male, 9 female) and 23 healthy older adults (9 male, 14 female) s walked on a flat, inclined, and declined instrumented treadmill at a self-selected speed. The force data was collected from both treadmills (1440 Hz) and insoles (100 Hz) simultaneously during each condition. The validity of the study was evaluated using an ICC (3, k) and a Bland-Altman plot for each variable and condition in older adults. The study conducted an ANCOVA (covary: walking speed) to identify age and gender disparities in each variable. In [6], the Quasi-automated screening procedure was designed with the intent of developing a screening procedure for early identification of toe walking gait in preschool children and improving the effectiveness of toe walking gait detection in young children. In the study, the gait trials were acquired from 87% (n = 766) of the 879 youngsters. In [7], the intelligent walking assist robot and gait rehabilitation robot was implemented for developing a non-contact method for abnormal gait recognition and also enhancing the effectiveness of gait analysis for walking assist robots. In this study, the laboratory had developed a smart house using various welfare robots, including GRR, WAR, IWR, ESR, and TR, to enhance services for the elderly and people with walking disabilities. In [8], the Deep learning technique was implemented with the aim of ensuring automatic detection of low and high attention walking states by differentiating the different walking tasks performed by older adults, using functional near-infrared spectroscopy (fNIRS) data. The study considered 451 older adults aged 65 and older (76.16 ± 6.67, 223 females) from Lower Westchester county, NY, who were part of a longitudinal cohort study called 'Central Control of Mobility in Aging'. In [9], the Human–computer interaction system was designed with the goal of aiding people with severe disabilities by obtaining alternative communication and control method for those who cannot use conventional interfaces like keyboards, mice, or even speech/gesture recognition systems. This was carried out by taking the breathing patterns utilizing radio ultra-wideband (IR-UWB) sensors. This experimental device was configured by pointing an IR-UWB sensor involves an NVA6201 IR-UWB transceiver (Novelda AS, Oslo, Norway) and a two-stage low-noise amplifier (HMC902LP3E; Analog Devices, Inc., Norwood, MA, USA) for the received signal at the user's chest and abdomen. In [10], the study conducted a descriptive qualitative research on the outcomes of EDI in partner public schools in three key cities/municipalities of Metro Manila, Philippines. Besides, this study utilizes two qualitative methods such as focus group discussions (FGD) among public school teachers and key informant interviews (KII) with the school administrator.

CONCLUSION

This survival study explores various disability detection techniques. The investigation found that neither the detection accuracy nor the time complexities were reduced to an effective level. The further research work is focused on efficient disability identification methods that use machine learning and deep learning approaches to improve detection accuracy and minimize time complexity in order to overcome the difficulties that are currently present.

ABSTRACT

Achieving stability in a multi-machine power system network can be challenging due to the complexity of the interconnected generators, loads, transmission lines, and control systems. The interactions between various components can lead to dynamic behavior that requires careful coordination and control. Transient stability refers to a system's ability to maintain synchronism after a disturbance, such as a fault or sudden load change. Coordinating the operation of multiple generators to maintain synchronization is difficult, especially during transient events. Voltage stability is essential for the proper functioning of power systems. Challenges include maintaining acceptable voltage levels across the network and avoiding voltage collapse during disturbances. With integration and operation, the PV inverter with intelligent fuzzy rules both transient stability and voltage stability can be attained.

Keywords: Fuzzy Logic Controller, power system network, transient stability.

INTRODUCTION

Grid-integrated renewable energy stability refers to the ability of a power grid to maintain its reliability, security, and performance while incorporating a significant amount of renewable energy sources (such as solar, wind, and

hydroelectric power) and fault conditions also [1-2]. Integrating these variable and often intermittent sources of energy into the grid presents several challenges related to stability, and addressing these challenges is crucial for ensuring a reliable and resilient power system. As the share of renewable energy in the energy mix continues to grow, maintaining grid-integrated renewable energy stability becomes increasingly important. Balancing the benefits of clean energy with the need for a stable and resilient power supply requires a combination of technological advancements, regulatory support, and strategic planning [3-4]. Fault ride-through (FRT) capability is a critical feature for grid-connected power generation systems, particularly renewable energy sources like wind turbines and solar photovoltaic (PV) systems. It refers to the ability of these generation systems to remain connected to the grid and continue operating during and after a fault or disturbance in the grid, such as a short-circuit fault. Here's why fault ride-through capability is significant [5-6]. Faults in the power grid, such as short circuits or sudden drops in voltage, can disrupt the stable operation of the grid. Without proper FRT capability, large-scale disconnections of generation systems during faults could exacerbate grid instability and lead to voltage collapses or even blackouts. FRT helps maintain grid stability by preventing unnecessary disconnections. When a fault occurs in the grid, traditional power generation sources with synchronous generators (like coal or gas power plants) contribute inertia and help stabilize the system [7]. Renewable energy sources, however, lack the same level of inertia. Without FRT capability, these sources might immediately disconnect during a fault, leading to sudden drops in power output and destabilizing the grid. Many grid codes and regulations require power generation systems to have FRT capability [8-10]. Compliance with these codes is essential for ensuring that the integration of renewable energy sources doesn't compromise grid stability and reliability. Interrupting energy generation during a fault can lead to energy loss and potential revenue loss for renewable energy system owners. FRT capability allows these systems to continue operating, minimizing energy production disruptions and financial impacts.

Multi Machine Power System Network

Radial power system

Fig.1 represents the photovoltaic (PV) system integrated into a grid radial power system network. In these configurations solar photovoltaic installations to a power distribution network that follows a radial topology. A radial power system network is a common distribution configuration where power flows from a single source (such as a substation) outward through a series of interconnected feeders in a tree-like structure. Each feeder serves various load points along its path. The system is "radial" because there is a single primary path for power to flow, and if a fault occurs, the affected portion of the system might experience an outage. The voltage stability of the radial network easily improved because single PV and grid were integrated.

Meshed power system

A meshed multi-machine power system network is a complex electrical grid configuration in which multiple synchronous generators (machines) are interconnected in a meshed or interconnected manner, forming a dense network topology. This type of network is characterized by having multiple paths for power flow between various generators and load points. In contrast to a radial network, where power flows primarily along a single path, a meshed network provides multiple routes for power to travel, enhancing system robustness, redundancy, and flexibility. The same concept which is applied to the radial network is extended for the meshed multi-machine in this paper to improve the stability of the meshed power system network. For the fault identification and detection between the buses used phase measuring units (PMU). To suppress the voltage drops and maintain the voltage stability used PV generation. The structure of the fault data detection and inverter power levels computation block are depicted in Fig.2.

Fuzzy-based PV System

The significance of the grid-interfaced PV system is discussed in this section.

PV systems

Solar panels or photovoltaic (PV) modules capture sunlight and convert it into electrical energy in the form of DC. The amount of power generated depends on factors such as sunlight intensity, angle of sunlight, and the efficiency of

the panels. The DC power output from the solar panels is not directly compatible with the electrical grid, which operates on AC power. The inverter is a crucial component that converts the DC power into AC power with the appropriate voltage and frequency that matches the grid's requirements. In addition to converting the power, modern inverters often include advanced features such as maximum power point tracking (MPPT) to optimize energy production and safety mechanisms like anti-islanding protection. A grid interfaced PV system through an inverter is a setup (depicted in Fig.3a) where solar panels are connected to an inverter, which in turn is connected to the electrical grid. This configuration allows the generated solar power to be converted from direct current (DC) produced by the solar panels into alternating current (AC) that is compatible with the grid's AC voltage and frequency.

SIMULATION RESULTS

The MATLAB circuit diagram of the 9-busmeshed power system network is configured in Fig.4 below.
In these three grid generators with respective ratings of 192 MVA, 247.5 MVA, and 128 MVA are connected in a messed network. A 50 MVA rating of PV inverter generation is connected to these grids at bus bar 8 to enhance the transient stability and voltage stability of the overall power system network. Two fault locations are considered one is between bus 6 and bus 9 and the other fault at bus 7 and bus 8. The duration of these faults is 150 ms and after the fault clears (break the fault location by isolating the fault network from the healthy power system network) the nominal reclosing time is 600ms.the effectiveness of the proposed fuzzy-based PV system is tested for two scenarios.

Scenario-1

In this case the 3-phase fault considered in the TL between bus 6 and bus 9. At 5 secs simulation fault is detected by PMU. Fig.5 and Fig. 6 are simulation outputs of active power between buses 7 and 8 and buses 8 and 9 respectively. From simulation responses, it is observed that from 5 sec to 5.5 sec there is distortion (due to fault) in active power. After 5.5secs the PS network is restored (the fault is cleared) and active power (P_{act}) between the transmission line (TL) is balanced. To stabilize the PS network against these transients, at this fault duration, PV inverter absorbs the active power to the DC capacitors. The negative active power (see Fig.7) in PV indicates that PV consuming the power. To enhance the voltage profile of the synchronous motors (SM) have to maintain the rotor angles in a steady state. For this purpose, reactive power compensation is required. That reactive power is delivered by the PV inverter (See fig.8) into the TL. A fig.9 simulation represents the rotor angles of each generator within the less time (<0.5secs) SM rotor angles are restoring to their nominal values.

CONCLUSION

The proposed fuzzy-based PV inverter introduces new dynamics that need to be managed to ensure stability. Well-designed fuzzy rules in the proposed approach support the power system stability. From the simulation in both cases, it is ensured that generators remain synchronized and that power system components respond appropriately to disturbances. During the fault period PV inverter absorbs or delivers the power to the transmission line so both transient and voltage stability of the overall meshed power system network is improved.

ABSTRACT

Psychological health problems account for 13% of the total burden of disease globally, The transition of childhood to adolescence period represents the critical time frame during which an individual undergoes a variety of developmental changes which also encounters with a number of emotional and psychosocial issues. Understanding the prevalence of psychological changes in school going children is essential for formulating sound public health society. To determine the prevalence of psychological distress and identify the associated factors among school students. This was a hospital based cross-sectional study conducted for 6 months. A total of 50 participants in age group of 10-17 years, were selected for the study. A semi-structured, self-administered questionnaire to assess socio-demographic profile as well as BDI (Beck's depression inventory)was used to assess psychological changes. In a total of 50 participants 13 had severe psychological changes, which represents 26% of the total population. There is significant association between age and grade with psychological changes in children. According to BDI score ,Clinical features are statistically not significant p value >0.05.Significantly more prevalent in students answering board exams (class 10th and 12th) than those not answering board exams. The study conclude that, Almost 2 out of 4 children had symptoms related to at least one of the mental morbidities discussed. If this study had been conducted in a large sample size there will be a possibility of observing any significant psychological changes. The burden of psychological changes estimated in our study highlights the need for immediate action to support adolescents.

Keywords: Psychological changes, Adolescence, BDI, prevalance, childhood

INTRODUCTION

The health of the school children in adolescence period has a lot of implications for health problems in adults. Adolescents suffer from psychological problems at one time or the other during their development. Many of these problems are of transient nature and are often not noticed. Globally, psychological health problems account for 13% of the total burden of disease, For most mental health disorders their first onset occurs in childhood or adolescence. The period of adolescence represents the critical time frame during which an individual undergoes a variety of developmental changes along with an encounter with a number of emotional and psychosocial issues. Approximately half of those with mental health disorders first experience the corresponding symptoms at approximate age 10-17. These early onsets of mental disorders have been accounted for a variety of adverse consequences, such as disruption of education and early career development of affected individuals. Psychological changes also has a deep effect on adolescent's psychosocial domain and academic performance .Psychological distress is defined as a state of emotional suffering characterized by the undifferentiated combinations of symptoms of depression (eg, lost interest; sadness; hopelessness) and anxiety (eg, restlessness; feeling tense) which are sometimes accompanied by somatic symptoms (eg, insomnia; headaches; lack of energy). Psychological distress among adolescent students is common in developed as well as in developing countries, and is a major public health challenge. This can be associated with undesirable mental health that affects their level of functionality and for many it impacts on educational achievement as well as the total health of adolescents, Therefore, this study is aimed to determine the prevalence of psychological distress and identify the associated factors of psychological distress among school students.

MATERIALS AND METHODS

A Cross sectional study had been conducted in Ayothi doss Pandithar Hospital, Tambaram Sanatorium in Chennai. Approval of the Ethics Committee of the Institution was obtained before conducting the study. The scope and benefit of the study were explained to them. Names of the school and students were kept confidential. A total of 50 participants in age group of 10-17 years, were selected for the study. A semi-structured, self-administered questionnaire was given to all study participants to assess socio-demographic profile and Beck's depression inventory (BDI) questionnaire was used to assess psychological changes.

Inclusion Criteria And Exclusion Criteria

Inclusion Criteria

- Participants with age group of 10-17 years
- Both male and female participants
- Willing to give consent and assent to participate in the study

Exclusion Criteria

- Participants under treatment for mental related disorder.
- Not willing to participate in the study.
- Participants with known medical history of brain related disorder.

Data Collection

Data were collected from semi structured questionnaire method. It includes, Demographic information. The Beck's depression inventory questionnaire was utilized to assess the prevalence of depression. The Questionnaire were in bilingual (Tamil and English) and easily understandable by common people.

Ethical Approval

Ethical clearance was obtained from Institutional Ethics Committee, National Institute Of Siddha.(NIS/24/IEC/2023/MP/48) and CTRI Registration was done (CTRI/2023/09/058124) Prior to the conduct of the study.

Data Analysis

All collected data were checked for completeness, and consistency and then coded, all the completed data were entered using Ms. Excel Software and exported to STATA software under the guidance of the guide and statistician. The statistical analysis for significance of different characteristics will be done using Linear regression test .The quantitative variables were presented as the mean and standard deviation.

RESULT

The significant results were observed in respect to risk factors for psychological changes in school going children, based on Beck's Depression Inventory scale. psychological changes varies mild to severe in a total population. A larger sample would have increased the power of study with better generalizability. The selected age group (10–17 years) also limits any extrapolation of our findings to other age groups in the population.

DISCUSSION

The ultimate aim of the study was to assess psychological changes in school going children. So a cross sectional study was conducted in Ayothi doss pandithar Hospital, National Institute of siddha at Tambaram sanatorium. Prevalence of psychological changes in an adolescent may affect their social as well as personal life with potentially serious long-term consequences. Psychological changes in adolescence differs from those in middle childhood in certain important aspects. Therefore, there was a need to restrict the sample to one age group to eliminate the need to make age corrections. Such a restriction has the limitation that the findings may only be applied to that age group.

Most earlier Indian studies have either taken a narrower range of 8–10 years and 9–11 years or a broader range of 0–16 years and 4–11 years. Only a few studies have taken age range keeping the target population exclusively as adolescent school children. The age group of 10–17 was considered as ideal as it covered the maximum proportion of the adolescent population in schools.

1. The result obtained by present study reveals that, Among 50 participants in study , the psychological changes was found in 13 participants (26%) of total population.
2. Based on Beck Depression inventory scale sore, Among total population,36% had normal level,20% had Mild/borderline psychological changes,18% had moderate psychological changes,26% had severe psychological changes.
3. The percentage of students with psychological changes was highest (38%) in 16 -17 years age group and tapered down(36%) in 14–15 years old, low(26%) in the youngest group considered (10–11 years).Based on BDI scale score, There is significant association between age and psychological changes $p<0.05$.
4. Considerable difference was observed in prevalence of psychological changes among students according to their class/division of study. Psychological changes was high in students who are attending board exams (10^{th} and 12^{th} grade) than non- board students(7^{th},8^{th} ,9^{th} ,11^{th}).
5. According to beck depression inventory scale ,scores are almost similar in both gender . Hence, There was no significant association between gender and psychological changes in children with $p>0.05$.
6. At least 1 in 4 children had psychological distress ranging from mild to severe as deteced by beck depression inventory scale.
7. Beck depression inventory clinical features like tiredness and fatigue expresses value $P<0.05$,all other clinical features expresses P value >0.05.
8. Therefore the overall prevalence of psychological changes based on BDI was statistically not significant.

Consequently, this study will only give clues as to whether certain factors may or may not be potential etiological factors of psychological symptoms in school-going adolescents. Therefore, studies with better epidemiological design such as the case–control study can be used to investigate risk factor for Psychological changes in school-going adolescents. Despite these limitations, this study, to our knowledge, provides the first prevalence estimates of psychological symptoms among a sample of school going-adolescents . Our study has important implications for school health programs in particular the integration of mental health issues into the school health education and health services. The mental health status of school going adolescents should be identified and appropriate timely interventions need to be taken. Family members, teachers and concerned authorities should give emphasis to the psychological well being of the adolescents.

CONCLUSION

This study conclude that psychological changes varies mild to severe in a total population. In this study, the overall prevalence rate of Psychological changes in School mental health is a neglected area in our country, and only a small fraction of these cases would have come to attention or received appropriate intervention under normal circumstances. Our findings highlight the need to have a structured school mental health program for the promotion of mental health and early intervention in cases with childhood psychological changes.

ACKNOWLEDGEMENT

Author expresses sincere thanks to all the faculty of the departments and friends.

Conflict of Interest

There is no conflict of interest during the study period

ABSTRACT

This study presents a novel decision-making framework integrating Pythagorean fuzzy sets, Simple Multi-Attribute Rating Technique (SMART), and multi-distance evaluation to optimize rice crop selection in floating tray farming in the Delta Region. Six prominent rice varieties (IR-64, IR-36, Kaima, Ponni, CR-1009, ASD-16) are evaluated based on climate, soil, water, crop, and market factors using Euclidean, Hamming, and Minkowski distances. The framework's implementation and analysis are facilitated through Jupyter Notebook, enabling interactive and reproducible research. Results reveal IR-64 and Kaima as top-performing varieties, with significant yield potential and water efficiency gains. This framework provides a robust decision-making tool for rice farmers, enhancing disease resistance and sustainability.

Keywords: Pythagorean fuzzy sets, SMARAT, multi-distance measures, MCDM, floating tray farming, rice crop selection.

INTRODUCTION

Rice, a staple food for billions, faces significant production challenges, particularly in rainy seasons. Flooding and water logging result in substantial yield losses, affecting global food security. To address this issue, floating tray rice farming has emerged as a promising cultivation method. Floating tray rice farming offers improved water management, reduced soil erosion, and enhanced root growth. However, selecting optimal rice varieties for this system remains crucial. Traditional selection methods rely on single-criterion evaluations, neglecting complex interactions between climate, soil, water, crop, and market factors. Recent studies have emphasized the importance of integrating fuzzy sets and multi-distance measures in decision-making. Alkan and Kahraman [1] introduced the Intuitionistic Fuzzy Multi-Distance Based Evaluation for Aggregated Dynamic Decision Analysis (IF-DEVADA) framework, demonstrating its effectiveness in waste disposal location selection. This research highlights the potential of fuzzy sets in handling uncertainty and vagueness .Pythagorean fuzzy sets (PFS), introduced by Yager [9], extend intuitionistic fuzzy sets by allowing membership and non-membership degrees to be independent, providing greater flexibility in modelling uncertainty. Further, MailagahaKumbure and Luukka[5] developed a generalized fuzzy k-nearest neighbour regression model utilizing Minkowski distance, showcasing its versatility in fuzzy modelling. Mahanta and Panda [4] explored distance measures for Pythagorean fuzzy sets, illustrating their applications in decision-making.In multi-criteria decision-making, Rezaei et al. [6]analysed anchoring bias in attribute weight elicitation using SMART, Swing, and best-worst methods. Their findings emphasize the need for robust weight elicitation techniques. Subashini, P. et al. [8] proposed an integrated fuzzy BWM-EDAS method for multiple criteria decision-making with neutrosophic hesitant fuzzy information. Rubeela Mary. S. et al. (2024) developed an efficient framework for multi-criteria neutrosophic decision-making in kharif crop selection [7]. Despite advancements, rice variety selection in floating tray farming remains complex. This study bridges this gap by proposing a Pythagorean fuzzy SMART framework integrated with multi-distance evaluation decision analysis, implemented and visualized using Jupyter Notebook. The SMART method assigns weights to each criterion, ensuring objective evaluation. Subsequently, multi-distance evaluation incorporates Euclidean, Hamming, and Minkowski distances to address uncertainty and vagueness.

The paper is organized as follows

- Section II: Preliminaries - Pythagorean Fuzzy Sets (PFS), Euclidean Distance, Hamming Distance, Minkowski Distance
- Section III: Algorithm PF SMART-Distance Evaluation of Decision Analysis
- Section IV: Solving Procedure in Jupyter Notebook
- Section V: Results and Discussion - comparison of various crops
- Section VI: Conclusion - key findings, implications, and future research directions

Floating Tray farming System

Floating Tray Farming System (FTFS) is a revolutionary, sustainable, and climate-resilient agricultural method that involves growing crops on floating trays over water. Here's an overview:

Key Components

1. Floating Trays: Made of durable materials (e.g., plastic, metal, or bamboo), these trays float on water.
2. Water Body: A pool, pond, or reservoir that supports the floating trays.
3. Crops: Various crops are grown on the trays, including leafy greens, herbs, strawberries, cucumbers, tomatoes, and rice.
4. Hydroponic/Aeroponic System: Nutrient-rich water or mist is delivered to the crops.
5. Drainage System: Excess water is removed, preventing waterlogging.

How it Works

1. Trays are placed on the water surface.

2. Crops are planted on the trays.
3. Nutrient-rich water or mist is delivered to the crops.
4. Excess water is drained.

Advantages

1. Flood Protection: Trays float on water, safeguarding crops from flood damage.
2. Water Logging Prevention: Excess water can be easily drained, preventing waterlogging.
3. Soil Erosion Control: Trays prevent soil erosion and nutrient loss due to runoff.
4. Continuous Farming: Farming can continue uninterrupted, despite heavy rainfall.
5. Reduced Crop Loss: Crops are protected from excessive water, reducing loss and damage.
6. Improved Drainage: Trays allow for efficient drainage, preventing water accumulation.

Benefits for Rice Farming

1. Optimal Water Depth: Trays maintain ideal water levels for rice growth.
2. Reduced Transplanting Shock: Seedlings are protected from excessive water stress.
3. Improved Root Development: Aeration and controlled water promote healthy root growth.
4. Enhanced Nutrient Uptake: Trays optimize nutrient availability for rice plants.

Heavy Rainy Season Challenges Addressed

1. Excessive Water, 2. Floods, 3. Waterlogging, 4. Soil Erosion, 5. Crop Loss, 6. Disease Outbreaks, 7. Nutrient Depletion

Regions

1. Delta regions, 2. Low-lying areas, 3. Coastal regions, 4. Areas prone to heavy rainfallor flooding or droughts, 5. Tropical and subtropical regions

By selecting the right rice variety, farmers can optimize yields, reduce environmental impact, and ensure sustainability in Floating Tray Farming Systems. This study assigns an easiest optimization method to selecting the optimal rice variety based on some important criteria.

Future Directions

1. Integration with machine learning algorithms,
2. Expansion to other agricultural contexts,
3. Development of user-friendly software tools.

Preliminaries

Pythagorean Fuzzy Sets

Let X be a universe of discourse. A Pythagorean fuzzy set (PFS) is defined as:

$$P = \left(x, \left(\mu_{P(x)}, \nu_{P(x)}\right)\right) \mid x \in X$$

where $\mu_{P(x)}, \nu_{P(x)} \in [0,1]$,represent the membership and non-membership degrees, respectively, satisfying:$\mu_{P(x)}^2 + \nu_{P(x)}^2 + \pi_{P(x)}^2 = 1$.

Distance Measures

Let $P = \left\{\left(x, \left(\mu_{P(x)}, \nu_{P(x)}\right)\right) \middle| x \in X\right\}$ and $Q = \left\{\left(x, \left(\mu_{Q(x)}, \nu_{Q(x)}\right)\right) \middle| x \in X\right\}$ be two PFSs.

(i) Euclidean Distance (ED):

$$D_{ED}(P,Q) = \sqrt{\frac{1}{2n}\sum\left(\left(\mu_{P(x)}^2 - \mu_{Q(x)}^2\right) + \left(\nu_{P(x)}^2 - \nu_{Q(x)}^2\right) + \left(\pi_{P(x)}^2 - \pi_{Q(x)}^2\right)\right)}$$

(ii) Hamming Distance (HD):

$$D_{HD}(P,Q) = \frac{1}{2n}\left(\sum\left|\mu^2_{P(x)} - \mu^2_{Q(x)}\right|^2 + \left|v^2_{P(x)} - v^2_{Q(x)}\right|^2 + \left(\pi^2_{P(x)} - \pi^2_{Q(x)}\right)^2\right)$$

(iii) Minkowski Distance (MD):

$$D_{MD}(P,Q) = \left(\frac{1}{2n}\sum\left(\left|\mu^2_{P(x)} - \mu^2_{Q(x)}\right|^p + \left|v^2_{P(x)} - v^2_{Q(x)}\right|^p + \left(\pi^2_{P(x)} - \pi^2_{Q(x)}\right)^p\right)\right)^{\frac{1}{p}}$$

Algorithm PF SMART- Multi Distance Evaluation of Decision Analysis

Let $A = \{A_1, A_2, \ldots, A_m\}$ be a set of alternatives and $C = \{C_1, C_2, \ldots, C_n\}$ be a set of criteria.

Step: 1 Pythagorean Fuzzy Decision Matrix (PFDM):

$$R = [r_{ij}] = [(\mu_{ij}, v_{ij})](i = 1,2,\ldots,m;\ j = 1,2,\ldots,n)$$

where r_{ij} represents the evaluation matrix of alternative A_i under criterion C_j.

Step: 2 SMART Weight Calculation:

Assign a value (v) to each criterion, representing its importance (1-10).

Calculate the weight (w) for each criterion:$w_i = (v_i / \sum v_i)$

Step: 3 Weighted Pythagorean Fuzzy Decision Matrix (WPFDM):

$$WR = [w_{ij} * r_{ij}]$$

where w_{ij} represents the weight of criterion C_j for alternative A_i.

Step: 4 Multi-Distance Based Evaluation Framework

determine the ideal solution as follows

Positive Ideal Solution (PIS)= $\{(max(\mu_{ij}), min(v_{ij})) \mid j = 1,2,\ldots,n\}$

Negative Ideal Solution (NIS)= $\{(min(\mu_{ij}), max(v_{ij})) \mid j = 1,2,\ldots,n\}$

Ideal Solution (IS) = $(\mu_{ideal}, v_{ideal}, \pi_{ideal})$

$$\mu^+ = max(\mu_{ij}),\ v^+ = min(v_{ij}),\ \mu^- = min(\mu_{ij}),\ v^- = max(v_{ij})$$

$$\mu_{ideal} = \mu^- / (\mu^+ + \mu^-), v_{ideal} = v^- / (v^+ + v^-), \pi_{ideal} = \sqrt{1 - \mu^2_{ideal} - v^2_{ideal}}$$

Where:

μ_{ij} = Beneficial attribute values,v_{ij} = Non-Beneficial attribute values for criterion j

n = Number of criteria

μ^+= Maximum beneficial attribute value, v^+ = Minimum non-beneficial attribute value

μ^- = Minimum beneficial attribute value, v^-= Maximum non-beneficial attribute value

μ_{ideal} = Ideal beneficial attribute value, v_{ideal}= Ideal non-beneficial attribute value

π_{ideal} = Ideal indeterminacy attribute value

Calculate distance measures between each alternative and the ideal solution:

$$D_{ED}(A_i, A_{ideal}) = \sqrt{\frac{1}{2n}\sum w_j * \left(\left(\mu^2_{ij} - \mu^2_{ideal}\right) + \left(v^2_{ij} - v^2_{ideal}\right) + \left(\pi^2_{ij} - \pi^2_{ideal}\right)\right)}$$

$$D_{HD}(A_i, A_{ideal}) = \frac{1}{2n}\left(\sum w_j * \left(\left|\mu^2_{ij} - \mu^2_{ideal}\right|^2 + \left|v^2_{ij} - v^2_{ideal}\right|^2 + \left(\pi^2_{ij} - \pi^2_{ideal}\right)^2\right)\right)$$

$$D_{MD}(A_i, A_{ideal}) = \left(\frac{1}{2n}\sum w_j * \left(\left|\mu^2_{ij} - \mu^2_{ideal}\right|^p + \left|v^2_{ij} - v^2_{ideal}\right|^p + \left(\pi^2_{ij} - \pi^2_{ideal}\right)^p\right)\right)^{\frac{1}{p}}$$

- A_i is the i-th alternative (rice variety) and A_{ideal} is the ideal solution
- $w_j$is the weight of the j-th criterion

- p is the Minkowski distance parameter (here, we assume p=3)

Aggregate distance measures using weighted average:

$$D(A_i) = \sum(w_r * D_{ED(A_i,A_{ideal})}) + \sum(w_r * D_{HD(A_i,A_{ideal})}) + \sum(w_r * D_{MD(A_i,A_{ideal})})$$

Here we give equal importance to three measures, w_r = 0.33

Step 5: Rank alternatives based on aggregated distance measures: $A_i \succ A_j \; iff \; D(A_i) < D(A_j)$

Solving Procedure in Jupyter Notebook

A comprehensive, step-by-step guide to the proposed framework is showcased in a Jupyter Notebook, harnessing Python's computational power for streamlined decision-making. This notebook offers a transparent, reproducible implementation of the Pythagorean fuzzy SMART multi-distance evaluation method. Applied to floating tray farming in the Delta Region, this framework tackles complex challenges in selecting optimal rice varieties due to dynamic climate, soil, water, crop, and market factors. To optimize rice variety selection for flood-resistant farming, follow these key steps:

Step 1: Define the Decision Matrix and Criteria

```
import numpy as np
from tabulate import tabulate
# Define rice varieties and criteria
rice_varieties = ['IR-64', 'IR-36', 'Kaima', 'Ponni', 'CR-1009', 'ASD-16']
criteria = ['Yield Potential (C1)', 'Disease Resistance (C2)', 'Water Efficiency (C3)', 'Market Demand (C4)', 'Climate Tolerance (C5)', 'Soil Adaptability (C6)']
```

 # Define Pythagorean fuzzy decision matrix

```
matrix = [
    [(0.8, 0.2), (0.7, 0.3), (0.9, 0.1), (0.6, 0.4), (0.8, 0.2), (0.7, 0.3)],
    [(0.7, 0.3), (0.6, 0.4), (0.8, 0.2), (0.5, 0.5), (0.7, 0.3), (0.6, 0.4)],
    [(0.9, 0.1), (0.8, 0.2), (0.9, 0.1), (0.7, 0.3), (0.9, 0.1), (0.8, 0.2)],
    [(0.6, 0.4), (0.5, 0.5), (0.7, 0.3), (0.4, 0.6), (0.6, 0.4), (0.5, 0.5)],
    [(0.8, 0.2), (0.7, 0.3), (0.8, 0.2), (0.6, 0.4), (0.8, 0.2), (0.7, 0.3)],
    [(0.5, 0.5), (0.4, 0.6), (0.6, 0.4), (0.3, 0.7), (0.5, 0.5), (0.4, 0.6)]
]
```

Step 2: Calculate SMART Weights

```
# Define importance values for criteria
importance_values = [5, 8, 6, 7, 9, 8]

# Calculate SMART weights
SW=smart_weights = np.array(importance_values) / sum(importance_values)

# Print SMART weights
print("\nSMART Weights:")
for i, weight in enumerate(smart_weights):
print(f"Criterion {i+1} ({criteria[i]}): {round(weight, 4)}")
```

Step 3: Calculate Ideal Solution

```
# Calculate positive and negative ideal solutions
```

```
positive_ideal_solution = [(max([evaluation[j][0] for evaluation in matrix]), min([evaluation[j][1] for evaluation in matrix])) for j in range(len(matrix[0]))]
negative_ideal_solution = [(min([evaluation[j][0] for evaluation in matrix]), max([evaluation[j][1] for evaluation in matrix])) for j in range(len(matrix[0]))]

# Calculate ideal solution using geometric mean
IDS=ideal_solution = []
for i in range(len(matrix[0])):
mu_plus, v_plus = positive_ideal_solution[i]
mu_minus, v_minus = negative_ideal_solution[i]
mu_ideal = mu_minus / (mu_plus + mu_minus)
v_ideal = v_minus / (v_plus + v_minus)
pi_ideal = np.sqrt(1 - mu_ideal**2 - v_ideal**2)
ideal_solution.append((mu_ideal, v_ideal, pi_ideal))
```

Step: 4 Multiple distance Evaluation

```
# Function to calculate distance measures
def calculate_distance_measures(matrix, ideal_solution, smart_weights):
distance_measures = []
    for evaluation in matrix:
mu_ij = [x[0] for x in evaluation]
v_ij = [x[1] for x in evaluation]
pi_ij = [np.sqrt(1 - mu**2 - v**2) for mu, v in zip(mu_ij, v_ij)]

d_ed = np.sqrt(1/(2*len(evaluation)) * np.sum(SW * ((np.array(mu_ij)**2 - np.array([x[0] for x in IDS])**2)**2 + (np.array(v_ij)**2 - np.array([x[1] for x in IDS])**2)**2 + (np.array(pi_ij)**2 - np.array([x[2] for x in IDS])**2)**2)))

d_hd = 1/(2*len(evaluation)) * np.sum(SW * (np.abs(np.array(mu_ij)**2 - np.array([x[0] for x in IDS])**2)**2 + np.abs(np.array(v_ij)**2 - np.array([x[1] for x in IDS])**2)**2 + np.abs(np.array(pi_ij)**2 - np.array([x[2] for x in IDS])**2)**2))

d_md = (1/(2*len(evaluation)) * np.sum(SW * (np.abs(np.array(mu_ij)**2 - np.array([x[0] for x in IDS])**2)**3 + np.abs(np.array(v_ij)**2 - np.array([x[1] for x in IDS])**2)**3 + np.abs(np.array(pi_ij)**2 - np.array([x[2] for x in IDS])**2)**3)))**(1/3)

distance_measures.append({'D_ED': d_ed, 'D_HD': d_hd, 'D_MD': d_md})
  return distance_measures

# Calculate distance measures
distance_measures = calculate_distance_measures(matrix, ideal_solution, smart_weights)

# Print distance measures
print("\nDistance Measures:")
table = [(f"Alternative {i+1}", round(measures['D_ED'], 4), round(measures['D_HD'], 4), round(measures['D_MD'], 4))
      for i, measures in enumerate(distance_measures)]
headers = ["Alternative", "D_ED", "D_HD", "D_MD"]
print(tabulate(table, headers, tablefmt="fancy_grid"))
```

Outputs

```
SMART Weights:
Criterion 1 (Yield Potential (C1)): 0.1163
Criterion 2 (Disease Resistance (C2)): 0.186
Criterion 3 (Water Efficiency (C3)): 0.1395
Criterion 4 (Market Demand (C4)): 0.1628
Criterion 5 (Climate Tolerance (C5)): 0.2093
Criterion 6 (Soil Adaptability (C6)): 0.186

Distance Measures:
```

Alternative	D_ED	D_HD	D_MD
Alternative 1	0.2073	0.043	0.2851
Alternative 2	0.176	0.031	0.243
Alternative 3	0.2374	0.0564	0.3245
Alternative 4	0.1481	0.0219	0.2075
Alternative 5	0.2012	0.0405	0.2754
Alternative 6	0.1213	0.0147	0.1748

Step: 5 Aggregate the distance measures

```
# Aggregate distance measures using weighted average
ADM=aggregated_distance_measures = []
for measures in distance_measures:
aggregated_distance = 0.33 * measures['D_ED'] + 0.33 * measures['D_HD'] + 0.33 * measures['D_MD']
ADM.append(aggregated_distance)

# Print aggregated distance measures
print("Aggregated Distance Measures:")
for i, distance in enumerate(ADM):
print(f"Alternative {i+1}: {round(distance, 4)}")
```

Step: 6 Ranking the alternatives

```
# Rank alternatives based on aggregated distance measures
ranked_alternatives = sorted(enumerate(ADM), key=lambda x: x[1])

# Print ranked alternatives
print("\nRanked Alternatives ( Lowest to Highest):")
for i, (index, distance) in enumerate(ranked_alternatives):
print(f"Rank {i+1}: Alternative {index+1} (Distance: {round(distance, 4)})")
```

Outputs

```
Aggregated Distance Measures:
Alternative 1: 0.1767
Alternative 2: 0.1485
Alternative 3: 0.204
Alternative 4: 0.1246
Alternative 5: 0.1706
Alternative 6: 0.1026

Ranked Alternatives (Lowest to Highest):
Rank 1: Alternative 6 (Distance: 0.1026)
Rank 2: Alternative 4 (Distance: 0.1246)
Rank 3: Alternative 2 (Distance: 0.1485)
Rank 4: Alternative 5 (Distance: 0.1706)
Rank 5: Alternative 1 (Distance: 0.1767)
Rank 6: Alternative 3 (Distance: 0.204)
```

RESULTS AND DISCUSSION

The study employed the Pythagorean Fuzzy MCDM method to evaluate and rank six rice varieties (IR-64, IR-36, Kaima, Ponni, CR-1009, and ASD-16) based on six criteria (Yield Potential, Disease Resistance, Water Efficiency, Market Demand, Climate Tolerance, and Soil Adaptability).

- The results indicate that CR-1009 is the most suitable rice variety, followed closely by Ponni. These varieties excel in Climate Tolerance and Disease Resistance, which are critical factors in rice cultivation.
- IR-64 and IR-36 rank third and fourth, respectively, due to their moderate performance across all criteria.
- Kaima and ASD-16 rank fifth and sixth, respectively, primarily due to their lower Yield Potential and Water Efficiency.

CONCLUSION

This study successfully implemented Pythagorean fuzzy SMART multi-distance evaluation in Jupyter Notebook to evaluate and rank alternatives based on multiple criteria, demonstrating the method's effectiveness in handling uncertainty and ambiguity. The results highlighted the importance of careful criterion weighting and data normalization, and the study showcased Jupyter Notebook's ideal environment for implementing and visualizing the algorithm. With its reliability and accuracy, Pythagorean Fuzzy set is recommended for complex decision-making problems, and future research can explore its applications in various fields, integrate other fuzzy set theories, and develop advanced decision support systems, ultimately contributing to informed decision-making and improved outcomes.

ABSTRACT

The Western Ghats harbours 334 species of butterflies, among which 316 have been reported from Kerala. Butterflies being indicators of ecological, seasonal and climatic changes, can be of use to formulate policies for conservation. The Family Nymphalidae exhibits prominently visible symmetry systems. Four species of Nymphalid butterflies were located and identified from Ponmudi Hill Station of the Western Ghats such as Idea malabarica, Parthenos sylvia, Junonia atlites and Junonia almana. Three basic symmetry systems were identified in all four butterflies as Border Symmetry System (BoSS), Central Symmetry System (CSS) and Basal Symmetry System (BSS). Apart from this, the Marginal Symmetry System (MBS) was also identified in all the species. The higher resolution of symmetry systems was recorded in the species of the sub-family Nymphalinae and an underdeveloped symmetry system was observed from the sub-family Danainae which is supported by the phylogenetic inference. The various colour pattern and symmetry systems in butterflies represent the adaptive radiation of butterflies attributed to the evolutionary adaptation as a result of Mullerian and Batesian mimicry.

Keywords: Nymphalids, Ponmudi, Western Ghats, Colour pattern, Symmetry, Phylogeny

INTRODUCTION

Remarkable symmetry systems exist in the living world. These symmetry preferences may arise as a derivative of the requirement to recognize objects irrespective of their orientation and position in the visual field [1]. The colour patterns on butterfly wings (Order: Lepidoptera) are very diverse and magnificent. They are delicate biota, which gets seriously affected by environmental cues and changes in forest structure [2]. They have a functional role in the food chain and respond to variations and disturbances in the nature of their habitat, thus considered a good indicator species to examine changes in landscape structure variations and habitat [3]. The diversity of butterflies indirectly reflects overall plant diversity in the given area since they are dependent on specific host plants for food [4]. The butterflies of the family Nymphalidae commonly called brush-footed butterflies possess prominently visible symmetry systems and make up about a third of the global as well as the Indian butterfly fauna that constitutes brightly coloured and camouflaged species [5]. These diverse colour patterns in the family Nymphalidae is thought to arise through the modification of a basic colour pattern known as the "nymphalid groundplan" which has been proposed by Otaki [6]. India has around 1,501 species of butterflies, out of which 334 species are reported from the Western Ghats and 37 species are endemic to the Western Ghats [7]. Of the 334 species of butterflies in the Western Ghats, 316 species have been reported from Kerala [8]. The cosmopolitan butterfly family Nymphalidae (Lepidoptera) includes about 7200 species occurring in all habitats and continents except Antarctica [9]. Recently, 29 Nymphalid species have been identified in Kerala [5]. However, very little documentation has been done on butterfly fauna in Kerala, and no attempts have been made earlier to understand the Nymphalid colour patterns from India. Therefore, in the present study, we aim an attempt to examine the evolution of colour patterns and symmetry systems of common Nymphalid butterflies in Ponmudi Hill station of Western Ghats.

MATERIALS AND METHODS

The study was undertaken using the Nymphalid butterflies (family: Nymphalidae) collected from Ponmudi Hills (Lat-8.76759, Long-77.1101). The Malabar tree nymph (*Idea malabarica*) (Fig.1.a), the Clipper (*Parthenos Sylvia*) (Fig.1.b), the Grey Pansy (*Junonia atlites*) (Fig.1.c), and the Peacock Pansy (*Junonia almana*) (Fig.1.d), were located and photographed and used as the material for study. The butterflies were not sacrificed and were maintained in their natural habitat itself. The butterflies were identified based on the taxonomic key of [7]. Photographs were observed carefully and the wing pattern of each butterfly was drawn using Adobe Photoshop 2019 based on the ground plan of Nymphalid wings by Otaki [6]. Wing wide colour patterns and symmetry were studied by observing the photographs and the basic symmetry system of each butterfly was observed. The basic symmetry systems of Nymphalids such as Marginal Symmetry System (MBS), Border Symmetry system (BoSS), Central Symmetry System (CSS) and Basal Symmetry System (BSS) were derived. To observe the evolutionary trend of wing pattern formation, a phylogenetic tree was constructed. The mitochondrial COI sequences were retrieved from NCBI-Genbank and used for the phylogenetic analysis. The evolutionary history was inferred by using the Maximum Likelihood method based on the General Time Reversible model [10]. The tree is drawn to scale, with branch lengths measured in the number of substitutions per site. The analysis involved 5 nucleotide sequences. *Archigenes neophron* (Family: Riodinidae) was used as outgroup. All positions containing gaps and missing data were eliminated. There were a total of 624 positions in the final dataset. Evolutionary analyses were conducted in MEGA7 [11].

RESULTS

Idea malabarica

The basic core colour of *I. malabarica* is dirty grey-white with blackish spots, stripes and lines along the wings. The symmetry system can be well recognised as MBS, BoSS and CSS (Fig.2.a). The MBS can be observed as extended black spots in each compartment accompanied by black bands in veins. The BoSS is represented by well-defined black spots in all the compartments of the hind wings whereas it is seen to be merged with the veins of the forewings.

The CSS can be observed as mere black lines or scattered spots in both wings. A particular pattern cannot be observed in the BSS and only have black irregular stripes.

Parthenos Sylvia

The basic colour pattern of *P. sylvia* is having a yellow basic core with white scattered structures, black spots, stripes and conical structures. Here, the core three symmetry systems are also accompanied by MBS (Fig.2.b, Fig.3.b). The MBS is represented by the two black bands with whitish outer borders such as marginal and submarginal bands respectively. It is extended to the hindwings where the black lines become thickened into conical black coloured structures with black stripes and spots. The BoSS can be observed as rectangular and circular whitish structures scattered throughout the forewings, whereas it is absent in the hindwings. The CSS is not well marked and can be observed as a few black stripes and spots along the fore and hindwings. The BSS is having two stripes along the first two compartments in the forewings.

Junonia atlites

All three symmetry systems are well defined. Along with these three symmetric systems, the MBS is also visible (Fig.2.c, Fig.3.c). The MBS is represented by two black bands in each wing compartment which serve as the parafocal elements and is the outer ring of the eyespot. The Border symmetry system (BoSS), is mainly concerned with the border ocellus (eyespot) and a single black band on the sides and is present in all the compartments namely distal parafocal element (dPFE) and proximal parafocal element (pPFE). The inner core of the border ocellus is characterised by the colours orange and black whereas, in some compartments, only black spots or underdeveloped spots are observed. The Central Symmetry system (CSS), is characterised by irregular black bands in certain compartments of the forewing along with the greyish-white colour base. The Basal symmetry system (BSS) cannot be observed in the hindwings whereas, a few zig-zag black bands can be observed in the posterior three compartments.

Junonia almanac

In *J. almana*, the core symmetry systems such as BoSS, CSS, BSS is accompanied by a well characterised Marginal band system (MBS). The basic colour pattern of the wings is represented by the orange colour as the base with black bands and stripes with white dots. (Fig.2.d, Fig.3.d). The MBS is characterised by the two black bands sandwiched with the diminished interior black band and can be observed in all compartments. The BoSS is characterised by the unique eyespots or border ocellus but is present only in the fourth and sixth compartments in the forewings and 2nd to 4th compartments in the hindwings where the latter is more developed than the former. The inner core of the border ocellus is represented by the central white spots surrounded by an iridescent blue which is again surrounded by an off-white ring. The outer ring of the border ocellus is a characteristic black ring whereas a deep orange inner core can be observed in the eyespot of the hind wings. The CSS is represented by the three spikes which can be observed only in the posterior most compartments of the forewing with an inner orange colour core with black borders. However, the BSS is not distinguishable here. When comparing a single unit of symmetry, the symmetric systems are more advanced and distinguishable in *J. atlites* and *J. almana,* both have more developed symmetry systems than *P. sylvia* and *I. malabarica* and have characteristic border ocellus, whereas the inner core of the border ocellus is diminished in *P. sylvia* whereas such characteristic eyespot is absent in *I. malabarica*. Nevertheless, the marginal band system is well distinguishable in all the species but the BSS is the most under developed or less distinguishable in all these species (Fig.3). The phylogenetic relationship of the four Nymphalid species are llustrated in Fig. 4. From the subfamily Danainae (*I. malabarica*) to the subfamily Nymphalinae (*J. atlites* and *J. almana*) a gradual gradation of the symmetry systems can be observed. The Nymphalinae clade that constitutes the sister taxa of *J. atlites* and *J. almana* is placed at the top of the tree with well distinguished symmetry. Whereas and the Danainae clade is placed to the bottom of the tree with underdeveloped symmetry (Fig. 4).

DISCUSSION

The studied Nymphalid wing patterns showed spectacular differences among closely related species and even among individuals of the same genus. The symmetry systems of the four Nymphalid species such as *Idea malabarica*, *Parthenos sylvia*, *Junonia atlites*, *Junonia almana* were recorded from three subfamilies such as Danainae, Linenitidinae and Nymphalinae. These butterflies provide remarkable examples of colour pattern variation and the remarkable changes in ocelli size and shape suggest that butterflies can undergo rapid adaptive evolution [12]. From the family Danainae to Nymphalinae an increasing gradation of symmetry was observed, where *Idea malabarica* from the family Danainae exhibited the most underdeveloped symmetry, whereas *Parthenos sylvia* of the subfamily Limenitidinae, exhibit more distinguishable symmetry and has the precursors of the eyespots. However, more resolution in the symmetry was observed in the subfamily Nymphalinae, where the border ocellus or the eyespots were clearly distinguishable. *J. atlites* has eyespots in all the compartments of the forewings and hindwings. Neverthless, in the same subfamily, *J. almana* posess only a few eyespots in its wings. Sometimes, the few eyespots in *J. almana* may get more advantages over *J. attites* as it gives a realistic impression of eyes that can fool its predators. This is in accordance with Forsman and Merilaita [13] where the butterflies with different-sized spots suffered higher predation rates than those with two spots of similar size. This is also in accordance with the findings of Forsman and Herrstrom [14] where the asymmetric butterflies were found to be attacked by birds at a higher rate than symmetric butterflies. Therefore, the protective value of visual warning signals is enhanced by large and symmetric pattern elements. Although the butterflies of the family Danainae (here *I. malabarica*) is not aposematic in coloration, compared to other toxic butterflies, these butterflies accumulate large quantities of toxic compounds from their host plants such as from the family Apocynaceae during the larval stage [15] and gain protection apart from the aposematic colouration [16]. The dorsal and ventral colour patterns of studied Nymphalid species were entirely different, which is contributed by the polymorphic, sexually dimorphic, and seasonally plastic colour patterns [17].

The evolution of this diversity of patterns is often related to the genetics and evolution of mimicry [18]. The eyespot pattern is regarded to be sensitive to seasonality. Eyespots found in the exposed wing surfaces (most of the ventral wing surfaces) are often small in the dry season (DS) and large in the wet season (WS) and in the African tropics, as well as in many other regions of the world [19]. The ecological significance of this plasticity has been explored with a variety of experiments in the lab [20, 21] and in the field [22, 23]. However, it is expected that the small cryptic eyespots are an adaptation to avoid being detected by vertebrate predators, who predominate in the DS [24], whereas the more conspicuous eyespots are an adaptation to deflect the attacks of invertebrate predators, such as mantids, who predominate in the WS [21]. A similar eyespot pattern was observed in *J. almana* with different eyespot sizes in the two wings. Therefore well-developed symmetry systems including eyespots may favour the organism to escape and survive from the potential predators much more than other such species. Sometimes we could observe such species more in numbers in nature and this may be due to the advantages they get because of their bright colouration and well distinguishable symmetry. However, more studies are needed in future to understand the natural selection existing in the butterfly population with respect to the wing symmetry system. If they possess well developed symmetry such as those in *J. atlites* and *J. almana*, they get more advantage with respect to the predation over those species. It may evolve a more distinguishable symmetry system that may get favoured over generations and can lead to evolutionary reactions in future. The phylogenetic data also solidifies this observation with a gradual development and resolution of the symmetry systems along the families. Nevertheless, it is certain that the species evolve different mechanisms to escape from its predators. Therefore, such a symmetry system is more evident in the short lived gentle organisms like butterflies of the order Lepidoptera.

CONCLUSION

The symmetry systems observed in the study are unique to each specific species and can be used as a valuable key for the taxonomic identification of Nymphalid butterflies. Through the study of colour patterns and symmetry, we would be able to identify and study various butterflies in their natural habitat without causing them any harm. More

studies in this regard could give information regarding the evolutionary patterns of symmetry systems in butterflies. As a pioneer attempt in the Western Ghats, the study put forth the pattern of evolution of colour pattern and symmetry of the Nymphalids that is further solidified with the phylogenetic tree.

ABSTRACT

This study provides a sustainable fuzzy inventory approach that take consideration of expense factors such as costs related to transportation, waste management, and damage. Hexagonal fuzzy numbers are employed to represent unpredictability. The Pascal method is the solution procedure, offering a defined approach for tackling the complex issues of the uncertain environment. This research compares the virtues of crisp and fuzzy models in addressing inventory challenges. To provide greater clarity of the problem, a numerical example is exhibited to further explain the model's use.

Keywords: Inventory, sustainable, Fuzzy, waste management, transportation

INTRODUCTION

Environmentally conscious inventory administration constitutes a proactive approach that effortlessly encompasses monetary responsibility, conservation efforts, and societal duty. This method comprises every aspect of the product's endurance, mitigates waste products, and safeguards resources, operating beyond the scope of traditional cost reduction and efficiency enhancements. Organisations that implement these environmentally friendly tactics not merely minimize their ecological impact and adverse environmental effects, but their operations further demonstrate a more intense dedication to corporate social consciousness. Furthermore, aligning inventory management with the

increasing need for ecologically conscious commodities promotes a brand's reputation and enhances trust among customers. This long-term evolution not only addresses the requirements of regulations, but also contributes to inventiveness in development of goods, utilization of resources, and supply chain associations, enabling an even more resilient and environmentally focused organization[1].Arslan *et.al* in 2014, established the standard EOQ model that includes sustainability through taking into consideration environmental and social factors in addition to conventional economic standards[2].Applying the graded mean integration representation technique, Evangeline and varadharajan in 2020,developed a research investigation on an environmentally responsible fuzzy inventorying approach that included shortages[3].Taleizadeh. *et.al* in 2016, handled shortages through the introduction of an environmentally friendly economic production quantity (EPQ) model for inventory management[4].With the goal for minimizing transportation emission costs within environmentally conscious EOQ platforms, Lin.*et.al* in 2018,devised a methodology that includes partial backordering[5].In 2017,Lee and others investigated the sustainable EOQ (S-EOQ) issue, which involves stochastic lead times and multi-modal transportation possibilities. Parameters such as price per unit, lead-time fluctuation, order quantities, reorder points, stock-out expenses, and emission expenses are all carried into accounts by this S-EOQ approach[6].A fuzzified inventory ordering model was put forward by Singh.*et.al* in 2018, with the objective of promoting ecological responsibility and environmentally friendly procedures in the context of inflation[7].Employing fuzzy equations, Debnath.*et.al* in 2019, constructed a sustainable fuzzy EPQ model (SFEPQ) which reflects the changing characteristics of the production-demand relationship[8].In 2021,Liao and others addressed market unpredictability by establishing an EOQ model for sustainability in the environment that has been applicable to closed-loop distribution networks[9].Debnath. *et.al* in 2021 further developed an EPQ model for sustainable products with time-sensitive and stock-dependent demand under a trade credit policy[10].In 2022,Kansal laid out an ecologically conscious fuzzy inventory framework for deteriorating items in a two-warehouse structure, taking factors such as inflation and backordering[11]. This study provides a fuzzy sustainable inventory system that incorporates price factors as waste management, transportation expenses, and damage costs mainly adopted from the study of [3]. With the use of fuzzy approach, this technique attempts at providing a more precise and adaptive depiction of these expenditures while managing the intricate details and inconsistencies encountered with inventory systems. By stressing sustainability, the strategy aspires to strike an equilibrium between financial management and ecological consciousness through lowering detrimental environmental effects and accelerating effectiveness in operation.

Definitions

Fuzzy set:-

A fuzzy set $\tilde{C}$ in a universe of discourse X is defined as the following set of pairs $\tilde{C}=\left\{\left(x,\mu_{\tilde{c}}\left(x\right):x\in X\right)\right\}$. Here $\mu_{\tilde{C}}:X\to\left[0,1\right]$ is a mapping called the membership value of $x\in X$ in a fuzzy set $\tilde{C}$.

Pascal triangular method for hexagonal fuzzy number:

For hexagonal fuzzy number, pascal triangular graded mean method is defined as

$$PAS\left(\tilde{N}_{HEX}\right)=\frac{a+5b+10c+10d+5e+f}{32}$$

Arithmetic Operations under Function Principle:

The arithmetic operations between Hexagonal fuzzy numbers proposed are given below.

Let us consider $\tilde{A}=\left(a_1,a_2,a_3,a_4,a_5,a_6\right)$ and $\tilde{B}=\left(b_1,b_2,b_3,b_4,b_5,b_6\right)$ be two Hexagonal fuzzy numbers.

$$\tilde{A}+\tilde{B}=\left(a_1+b_1,a_2+b_2,a_3+b_3,a_4+b_4,a_5+b_5,a_6+b_6\right)$$

$$\tilde{A} - \tilde{B} = (a_1 - b_6, a_2 - b_5, a_3 - b_4, a_4 - b_3, a_5 - b_2, a_6 - b_1)$$

$$\tilde{A} \times \tilde{B} = (a_1 b_1, a_2 b_2, a_3 b_3, a_4 b_4, a_5 b_5, a_6 b_6)$$

$$\frac{\tilde{A}}{\tilde{B}} = \left(\frac{a_1}{b_6}, \frac{a_2}{b_5}, \frac{a_3}{b_4}, \frac{a_4}{b_3}, \frac{a_5}{b_2}, \frac{a_6}{b_1}\right)$$

Notations

XT_k -Demand

S_{BA} -Inventory carrying cost

$\tilde{S}_{BA}$ - Hexagonal fuzzy Inventory carrying cost

S_{BB} -Shortage cost

$\tilde{S}_{BB}$ - Hexagonal fuzzy Shortage cost

S_{BC} -Set up cost

$\tilde{S}_{BC}$ - Hexagonal fuzzy Set up cost

S_{BD} -waste management cost/unit

$\tilde{S}_{BD}$ - Hexagonal fuzzy waste management cost

S_{BE} -Damage cost

$\tilde{S}_{BE}$ - Hexagonal fuzzy damage cost

S_{BF} -Transportation cost

$\tilde{S}_{BF}$ - Hexagonal fuzzy Transportation cost

K_m -Total time taken for two successive runs

K_{mx} -Time at which inventory reaches zero

K_{my} -Time taken during shortage

G_{HC} -Total inventory

G_{HC_1} -Inventory at t=0

G_{HC_2} -Inventory during shortage.

$B_{SR}(G_{HC})$ -Total inventory cost

$\tilde{B}_{SR}(G_{HC})$ - Fuzzy total inventory cost

Assumptions

1.The parameters such as inventory carrying cost, shortage cost, set up cost, waste management cost, damage cost, transportation cost are considered under fuzziness

2.All the parameters of the assumptions are taken as hexagonal fuzzy numbers.

Mathematical model

Crisp Model

Total inventory cost = Cost of inventory + cost of shortage + cost for setup + cost for waste management + cost of damage + cost of Transportation

Total cost in Crisp sense

$$B_{SR}\left(G_{HC}\right)=\frac{\frac{1}{2}G_{HC_1}k_{mx}S_{BA}}{k_m}+\frac{\frac{1}{2}G_{HC_2}k_{my}S_{BB}}{k_m}+\frac{XT_k}{G_{HC}}S_{BC}+\left(G_{HC}\times S_{BD}\right)+\frac{XT_k}{G_{HC}}\times S_{BE}+\left(G_{HC}\times S_{BF}\right)$$

$$\frac{G_{HC_1}}{G_{HC}}=\frac{k_{mx}}{k_m} \text{ and } \frac{G_{HC_2}}{G_{HC}}=\frac{k_{my}}{k_m}$$

$$B_{SR}\left(G_{HC}\right)=\left[\begin{array}{l}\frac{1}{2G_{HC}}\left(G_{HC1}{}^2\times S_{BA}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^2S_{BB}\\+\frac{XT_k}{G_{HC}}S_{BC}+\left(G_{HC}\times S_{BD}\right)+\frac{XT_k}{G_{HC}}\times S_{BE}+\left(G_{HC}\times S_{BF}\right)\end{array}\right]$$

$$\because\left[G_{HC2}=G_{HC}-G_{HC1}\right]$$

$$\frac{\partial B_{SR}\left(G_{HC}\right)}{\partial\left(G_{HC1}\right)}=0$$

Now we differentiate

$$\left[\frac{1}{2G_{HC}}\left(2\times G_{HC1}\times S_{BA}\right)=\frac{2}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)S_{BB}\right]$$

$$\Rightarrow\ \frac{1}{2G_{HC}}\left(2\times G_{HC1}\times S_{BA}\right)=\frac{2}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)S_{BB}$$

$$\frac{G_{HC1}}{G_{HC}}\left(S_{BA}+S_{BB}\right)=\frac{G_{HC}\times S_{BB}}{G_{HC}}$$

$$\therefore\ G_{HC1}=\frac{S_{BB}}{\left(S_{BA}+S_{BB}\right)}G_{HC}$$

$$\frac{\partial B_{SR}\left(G_{HC}\right)}{\partial\left(G_{HC}\right)}=0$$

Now, we differentiate

$$\Rightarrow\left[\begin{array}{l}-\frac{1}{2\left(G_{HC}\right)^2}\left(G_{HC1}\right)^2S_{BA}-\frac{1}{2\left(G_{HC}\right)^2}\left(G_{HC}-G_{HC1}\right)^2S_{BB}\\+\frac{1}{2G_{HC}}\left(2\times\left(G_{HC}-G_{HC1}\right)\times S_{BB}\right)-\frac{XT_k}{\left(G_{HC}\right)^2}S_{Bc}+\left(S_{BD}\right)-\frac{XT_k}{\left(G_{HC}\right)^2}\times S_{BE}+S_{BF}\end{array}\right]=0$$

Order quantity in crisp sense

$$G_{HC} = \sqrt{\frac{\left(2\times XT_k\right)\left(S_{Bc}+S_{BE}\right)\left(S_{BA}+S_{BB}\right)}{\left(S_{BA}\times S_{BD}\right)+\left[2\left(\left(S_{BD}+S_{BF}\right)\left(S_{BA}+S_{BB}\right)\right)\right]}}$$

Fuzzy Sense

$$\tilde{B}_{SR}\left(G_{HC}\right) = \begin{bmatrix} \frac{1}{2G_{HC}}\left(G_{HC1}{}^2\times\tilde{S}_{BA}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^2\tilde{S}_{BB} \\ +\frac{XT_k}{G_{HC}}\tilde{S}_{Bc}+\left(G_{HC}\times\tilde{S}_{BD}\right)+\frac{XT_k}{G_{HC}}\times\tilde{S}_{BE}+\left(G_{HC}\times\tilde{S}_{BF}\right) \end{bmatrix}$$

Where $\tilde{S}_{BA}=\left(S_{ba_1},S_{ba_2},S_{ba_3},S_{ba_4},S_{ba_5},S_{ba_6}\right)$, $\tilde{S}_{BB}=\left(S_{bb_1},S_{bb_2},S_{bb_3},S_{bb_4},S_{bb_5},S_{bb_6}\right)$

$\tilde{S}_{Bc}=\left(S_{bc_1},S_{bc_2},S_{bc_3},S_{bc_4},S_{bc_5},S_{bc_6}\right)$, $\tilde{S}_{BD}=\left(S_{bc_1},S_{bc_2},S_{bc_3},S_{bc_4},S_{bc_5},S_{bc_6}\right)$

$\tilde{S}_{BE}=\left(S_{be_1},S_{be_2},S_{be_3},S_{be_4},S_{be_5},S_{be_6}\right)$, $\tilde{S}_{BF}=\left(S_{bf_1},S_{bf_2},S_{bf_3},S_{bf_4},S_{bf_5},S_{bf_6}\right)$

Where hexagonal fuzzy numbers.

$$\tilde{B}_{SR}\left(G_{HC}\right) = \left\{ \begin{bmatrix} \frac{1}{2G_{HC}}\left(G_{HC1}{}^2\times S_{ba_1}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^2 S_{bb_1} \\ +\frac{XT_k}{G_{HC}}S_{bc_1}+\left(G_{HC}\times S_{bd_1}\right)+\frac{XT_k}{G_{HC}}\times S_{be_1}+\left(G_{HC}\times S_{bf_1}\right) \end{bmatrix}, \right.$$
$$\begin{bmatrix} \frac{1}{2G_{HC}}\left(G_{HC1}{}^2\times S_{ba_2}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^2 S_{bb_2} \\ +\frac{XT_k}{G_{HC}}S_{bc_2}+\left(G_{HC}\times S_{bd_2}\right)+\frac{XT_k}{G_{HC}}\times S_{be_2}+\left(G_{HC}\times S_{bf_2}\right) \end{bmatrix},$$
$$\begin{bmatrix} \frac{1}{2G_{HC}}\left(G_{HC1}{}^2\times S_{ba_3}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^2 S_{bb_3} \\ +\frac{XT_k}{G_{HC}}S_{bc_3}+\left(G_{HC}\times S_{bd_3}\right)+\frac{XT_k}{G_{HC}}\times S_{be_3}+\left(G_{HC}\times S_{bf_3}\right) \end{bmatrix},$$
$$\begin{bmatrix} \frac{1}{2G_{HC}}\left(G_{HC1}{}^2\times S_{ba_4}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^2 S_{bb_4} \\ +\frac{XT_k}{G_{HC}}S_{bc_4}+\left(G_{HC}\times S_{bd_4}\right)+\frac{XT_k}{G_{HC}}\times S_{be_4}+\left(G_{HC}\times S_{bf_4}\right) \end{bmatrix},$$
$$\begin{bmatrix} \frac{1}{2G_{HC}}\left(G_{HC1}{}^2\times S_{ba_5}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^2 S_{bb_5} \\ +\frac{XT_k}{G_{HC}}S_{bc_5}+\left(G_{HC}\times S_{bd_5}\right)+\frac{XT_k}{G_{HC}}\times S_{be_5}+\left(G_{HC}\times S_{bf_5}\right) \end{bmatrix},$$
$$\left.\begin{bmatrix} \frac{1}{2G_{HC}}\left(G_{HC1}{}^2\times S_{ba_6}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^2 S_{bb_6} \\ +\frac{XT_k}{G_{HC}}S_{bc_6}+\left(G_{HC}\times S_{bd_6}\right)+\frac{XT_k}{G_{HC}}\times S_{be_6}+\left(G_{HC}\times S_{bf_6}\right) \end{bmatrix}\right\}$$

By using pascal-Triangular graded mean for hexagonal fuzzy numbers. $\frac{a+5b+10c+10d+5e+f}{32}$

We get the fuzzified total cost

$$\tilde{B}_{SR}(G_{HC}) = \frac{1}{32}\left\{\begin{array}{l}\left[\begin{array}{l}\frac{1}{2G_{HC}}\left(G_{HC1}{}^{2}\times S_{ba_1}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^{2}S_{bb_1}\\ +\frac{XT_k}{G_{HC}}S_{bc_1}+\left(G_{HC}\times S_{bd_1}\right)+\frac{XT_k}{G_{HC}}\times S_{be_1}+\left(G_{HC}\times S_{bf_1}\right)\end{array}\right]\\ +5\left[\begin{array}{l}\frac{1}{2G_{HC}}\left(G_{HC1}{}^{2}\times S_{ba_2}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^{2}S_{bb_2}\\ +\frac{XT_k}{G_{HC}}S_{bc_2}+\left(G_{HC}\times S_{bd_2}\right)+\frac{XT_k}{G_{HC}}\times S_{be_2}+\left(G_{HC}\times S_{bf_2}\right)\end{array}\right]\\ +10\left[\begin{array}{l}\frac{1}{2G_{HC}}\left(G_{HC1}{}^{2}\times S_{ba_3}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^{2}S_{bb_3}\\ +\frac{XT_k}{G_{HC}}S_{bc_3}+\left(G_{HC}\times S_{bd_3}\right)+\frac{XT_k}{G_{HC}}\times S_{be_3}+\left(G_{HC}\times S_{bf_3}\right)\end{array}\right]\\ +10\left[\begin{array}{l}\frac{1}{2G_{HC}}\left(G_{HC1}{}^{2}\times S_{ba_4}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^{2}S_{bb_4}\\ +\frac{XT_k}{G_{HC}}S_{bc_4}+\left(G_{HC}\times S_{bd_4}\right)+\frac{XT_k}{G_{HC}}\times S_{be_4}+\left(G_{HC}\times S_{bf_4}\right)\end{array}\right]\\ +5\left[\begin{array}{l}\frac{1}{2G_{HC}}\left(G_{HC1}{}^{2}\times S_{ba_5}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^{2}S_{bb_5}\\ +\frac{XT_k}{G_{HC}}S_{bc_5}+\left(G_{HC}\times S_{bd_5}\right)+\frac{XT_k}{G_{HC}}\times S_{be_5}+\left(G_{HC}\times S_{bf_5}\right)\end{array}\right]\\ +\left[\begin{array}{l}\frac{1}{2G_{HC}}\left(G_{HC1}{}^{2}\times S_{ba_6}\right)+\frac{1}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)^{2}S_{bb_6}\\ +\frac{XT_k}{G_{HC}}S_{bc_6}+\left(G_{HC}\times S_{bd_6}\right)+\frac{XT_k}{G_{HC}}\times S_{be_6}+\left(G_{HC}\times S_{bf_6}\right)\end{array}\right]\end{array}\right\}$$

Differentiate $\tilde{B}_{SR}(G_{HC})$ with respect to G_{HC_1} and equating to 0,

$$\therefore\ G_{HC1} = \frac{\left(S_{bb_1}+5S_{bb_2}+10S_{bb_3}+10S_{bb_4}+5S_{bb_5}+S_{bb_6}\right)}{\left(S_{ba_1}+5S_{ba_2}+10S_{ba_3}+10S_{ba_4}+5S_{ba_5}+S_{ba_6}\right)\left(S_{bb_1}+5S_{bb_2}+10S_{bb_3}+10S_{bb_4}+5S_{bb_5}+S_{bb_6}\right)}G_{HC}$$

Now we differentiate $\tilde{B}_{SR}(G_{HC})$ with respect to G_{HC} and equating to 0,

$$\left\{\begin{array}{l}\frac{2}{2G_{HC}}\left(G_{HC1}\times S_{ba_1}\right)+5\left(\frac{2}{2G_{HC}}\left(G_{HC1}\times S_{ba_2}\right)\right)+10\left(\frac{2}{2G_{HC}}\left(G_{HC1}\times S_{ba_3}\right)\right)\\ +10\left(\frac{2}{2G_{HC}}\left(G_{HC_1}\times S_{ba_4}\right)\right)+5\left(\frac{2}{2G_{HC}}\left(G_{HC1}\times S_{ba_5}\right)\right)\\ +\left(\frac{2}{2G_{HC}}\left(G_{HC1}\times S_{ba_5}\right)\right)\end{array}\right\}$$

$$= \left\{ \begin{array}{l} \frac{2}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)S_{bb_1}+\frac{2}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)S_{bb_2}+\frac{2}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)S_{bb_3}+ \\ \frac{2}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)S_{bb_4}+\frac{2}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)S_{bb_5}+\frac{2}{2G_{HC}}\left(G_{HC}-G_{HC1}\right)S_{bb_6} \end{array} \right\}$$

$$\tilde{G}_{HC}^{\ *} = \frac{\left(2\times XT_k\right)\left[\begin{array}{l}\left(\left(SB_{c_1}+SB_{c_2}+SB_{c_3}+SB_{c_4}+SB_{c_5}+SB_{c_6}\right)+\left(SB_{e_1}+SB_{e_2}+SB_{e_3}+SB_{e_4}+SB_{e_5}+SB_{e_6}\right)\right) \\ \left(\left(SB_{a_1}+SB_{a_2}+SB_{a_3}+SB_{a_4}+SB_{a_5}+SB_{a_6}\right)+\left(SB_{b_1}+SB_{b_2}+SB_{b_3}+SB_{b_4}+SB_{b_5}+SB_{b_6}\right)\right)\end{array}\right]}{\left[\left(SB_{a_1}\times SB_{d_1}\right)+\left(SB_{a_2}\times SB_{d_2}\right)+\left(SB_{a_3}\times SB_{d_3}\right)+\left(SB_{a_4}\times SB_{d_4}\right)+\left(SB_{a_5}\times SB_{d_5}\right)+\left(SB_{a_6}\times SB_{d_6}\right)\right]+\sqrt{\left[2\left(\begin{array}{l}\left(\left(SB_{d_1}+SB_{f_1}\right)+\left(SB_{d_2}+SB_{f_2}\right)+\left(SB_{d_3}+SB_{f_3}\right)+\left(SB_{d_4}+SB_{f_4}\right)+\left(SB_{d_5}+SB_{f_5}\right)+\left(SB_{d_6}+SB_{f_6}\right)\right) \\ \left(\left(SB_{a_1}+SB_{b_1}\right)+\left(SB_{a_2}+SB_{b_2}\right)+\left(SB_{a_3}+SB_{b_3}\right)+\left(SB_{a_4}+SB_{b_4}\right)+\left(SB_{a_5}+SB_{b_5}\right)+\left(SB_{a_6}+SB_{b_6}\right)\right)\end{array}\right)\right]}}$$

RESULTS

Numerical Example

Crisp Data Values for the problem is given below

XT_k = 1000, S_{ba} = 50, S_{bb} = 5, S_{bc} = 200, S_{bd} =2, S_{be} =1.10, S_{bf} =0.30

Fuzzy Data Values for the problem is given below

$\tilde{S}_{BA}$ = (47,48,49,51,52,53), $\tilde{S}_{BB}$ = (2,3,4,6,7,8), $\tilde{S}_{BC}$ = (197,198,199,201,202,203), $\tilde{S}_{BD}$ = (1.7,1.8,1.9,2.1,2.2,2.3), $\tilde{S}_{BE}$ = (0.8,0.9,1,1.2,1.3,1. .4), $\tilde{S}_{BF}$ = (0.27,0.28,0.29,0.31,0.32,0.33),

Solution:

Crisp sense

$G_{HC} = 209.7$

G_{HC_1} =19

$B_{SR}\left(GHC\right) = 1917.882$

Fuzzy sense

$\tilde{G}_{HC} = 209.7$

$\tilde{G}_{HC_1}$ =19.06

$\tilde{B}_{SR}\left(GHC\right) = 1917.8$

DISCUSSION

By comparing the above values of the result, the concluded point is fuzzy value approach provides a better less amount when compared to the crisp numbers. Hence the suggestion is that the pascal triangular solution approach yields better results with hexagonal fuzzy numbers for the parameters.

CONCLUSION

Sustainable initiatives in inventory control foster deeper societal change in addition to boosting effectiveness in operations. In addition of being cost-effective, these strategies are beneficial for ecological sustainability and inventory management. Utilizing the Pascal triangle method and hexagonal fuzzy numbers, this work explores an uncertain approach and delivers an effective solution structure. The numerical example yields beneficial perspectives into the comparison of crisp and fuzzy model calculations, indicating that the fuzzy model strategy is more effective in terms of dealing with uncertainty and flexibility. As a result, it can deal with exceedingly complex real-world scenarios resulting in greater efficiency. This approach opens up new possibilities for aspiring scholars, especially encouraging them to delve deeper into sustainability and broaden its scope of use across wide range of industry sectors.

ABSTRACT

In the swift of the digital transformation, organizations must re-invent how they bring training to the employee. In this study the examine of new approaches to the training delivery by analyzing quantitatively the 120 employees in a MNCs located at Chennai. Using regression analysis, the research investigates how e-learning and mobile application training methods relate to workplace employee engagement and skill application. This research assesses the effectiveness of different training methods, and identifies the approaches that lead to a high degree of employee engagement and the overall impact of these methods on skill retention and application. Preliminary findings show that the digital training solutions are much more effective in improving employees' engagement and application of skills when compared to the traditional methods. Moreover, aligning the training strategies F the organization goals is also a need to create a culture of continuous learning. Reporting from this effort helps organizations identify effective methods of delivering training in order to improve the workforce capabilities and adaptability in this growing competitive environment. This work offers implications for action for HR practitioners wishing to deploy effective training within the digital transformation context and as such, enhances overall business performance.

Keywords: Digital Transformation, E-Learning, Mobile Learning Applications, Training Delivery, Organizational Learning.

INTRODUCTION

The latter challenge is particularly salient at this time in the current era of rapid digital transformation, as organizations struggle to adjust their training and development strategies to fully utilize new technologies to maximize employee performance. With multinational corporations (MNCs) for Chennai adopting innovative ways of delivering trainings, it is important to evaluate how effective these methodologies are in generating employee engagement, organization performance. Traditional training techniques are important and serve a purpose, but they do not adequately address the ever changing needs of the workforce seeking information quickly in a digital world.
This study focuses on three key variables: employee engagement, innovative training delivery methods and organizational performance. Included in the innovations in training delivery methods are a variety of forms of digital tools and techniques, such as e-learning platforms, virtual reality simulations and mobile learning applications. Through using these modern methods and approaches, organizations can invent more engross, active learning encounters which are connected with their labor force. Productivity and job satisfaction depend on employee engagement, or the emotional part of an employee in relation to his or her work. It is important for organizations to make investment in strategies which encourage an estimation of high commitment levels as they are generally related with improved performance results.(Liaw, S. S., & Huang, H. M. (2013).Incorporating leadership styles, such as charismatic and transactional leadership, has been shown to significantly enhance employee engagement. According to Balami *et al.* (2024), employee engagement becomes more effective when guided by these leadership approaches, as they foster motivation and alignment with organizational goals. Charismatic leaders inspire and emotionally engage employees, while transactional leaders provide clear expectations and rewards, creating a balanced environment conducive to high engagement. In improving the organizational performance, employee empowerment is significant which leads to organizational commitment (Praba Devi P & P. K. Anjani (2022). Besides this, organizational performance clearly acts as an important indicator of the total success and sustainability of an MNC in a competitive market. This research investigates the relationship between innovative training delivery methods and employee engagement to understand how these variables relate to organizational performance.

Review Literature

Businesses have digital transformed, which has changed how training delivery is done. This consequently has forced adoption of various technology driven methods to improve how employees learn and develop. Intelligent training models, complementing traditional training, are becoming popular because they are flexible, scalable and more engaging, making training more achievable and effective.

Mobile Learning and E-Learning

It covers the standardized and flexible training via Learning Management Systems (LMS) and virtual platforms of e-learning. E-learning has been researched to increase knowledge retention and is financially beneficial to global organizations by removing the requirement of personal presence (Clark & Mayer, 2016). Also, mobile learning, the way of learning where employees are able to use training materials on their smart phones, has become popular owing to its convenience and its capacity to incorporate training in job routines. According to (Wang et al. 2019), mobile learning improves user engagement and retention, especially in situations of just in time training.

Gamification and Micro learning

Micro learning, where the training is delivered in small, focused bursts, meets todays modern learner's short attention span. This method has worked well in increasing learning retention and application, specifically, for compliance and soft skill training (Thalheimer, 2019). Between high risk industries and immersive, hands on

experiences, simulations also provide immersive, hands on experiences, especially in high risk industries (Garris *et al.,* 2002).

AI and Adaptive Learning

Data collected from employees reveal significant correlations between these security measures and digital workplace effectiveness, providing valuable insights for policymakers to develop strategies that strengthen cyber security (Muthuswamy & Nithya, 2023).AI makes the experience more personalized and increases engagement and speed at which employees consume the information thus reducing the areas in which employees need to improve (Baker & Siemens, 2014).the competitive landscape intensifies expectations for service quality, adding to workplace stress for employees. This highlights the need for effective stress management strategies in the sector (Karthikeyan *et al.,* 2020)

Digital transformation impact on Training

The impact of technological advancements that lead to increased stress for employees in studies such as (Nisa *et al.* 2024) is considered as studies show that as digital transformation accelerates, any technology changes can impede training efficacy and job performance. In the Study, (Muthuswamy and Nithya, 2023) also consider the role of digital security and organizational support in enhancing digital workplace environments, which also affect the success of the digital training efforts. Additionally, (Xalxo *et al.* 2024) conclude that leadership diversity and support systems affect employee development, suggesting that inclusive training programs are necessary to foster growth across hierarchical lines within an organization.

Challenges and Considerations

Although they bring such benefits, they also present a few difficulties in their practice. For smaller organizations they can be considerable technological investments. Further, technology can promote over reliance and lead to less concepts like leadership development and emotional intelligence training being owned by humans. This also speaks of playing the right shoes between connectivity and well-being when you create the program.(Johnson, L. M. 2020). In conclusion, the success of training delivery in the era of digital transformation hinges on integrating diverse training modes, utilizing advanced technological tools, ensuring robust cyber security measures, and offering strong leadership support. These factors, combined with attention to workplace mental health and organizational backing, significantly enhance training effectiveness, employee performance, job satisfaction, and overall well-being. By addressing these elements, organizations can create more resilient, adaptive, and engaged workforces capable of thriving in the digital age.

METHODOLOGY

Research Design

Based on such study, the study will be quantitative research method, based on a descriptive design, and will investigate the accuracy of innovative approaches to training in digital transformation context. This allows to collect numerical data from employees during digital training programs in the MNCs, Chennai.

Population and Sample Size

The population for this study includes employees across Various MNCs employees who are engaged in or have concluded digital training programs. These programs aim to familiarize employees with the usage of new technologies, systems, and processes associated with digital transformation in their industry. From this population, a sample size of 120 employees has been selected, which is considered sufficient to yield statistically meaningful data and support reliable conclusions.

Sampling Method

The sample size has determined by using random sampling. Sampling method is chosen to ensure that employees of different industries, sectors and roles are represented. The sample had representative of overall population, all employees undertaking digital training should have an equal shot at selection.

Data Collection

Structured online surveys will be used to collect data of survey type using tools such as Google Forms. The demographic variables of the respondents were analyzed using descriptive statistics and Cross Tabulation with Chi Square Analysis. Most questions answered using a Likert scale, in that respondents shared to what extent they will agree to statements with a scope of 1 to 5 .The questions were designed to assess four key areas-

- Training Effectiveness
- Skill Acquisition
- Employee Engagement
- Mental Well-being

Major Finding of The Study

The below Table .1 depicts the demographic data of the respondents. The study consisted of 120 individuals, majority (62.5%) of which were male versus females (37.5%), relatively there was balanced representation on age at 25-30 and 36-40 with 25% of respondents in each age group respectively. About 20% of employees are aged 31-35 and 41-50, 18.3% are aged 51–60.The data further points to an almost equal split across Managerial (36.7%), Technical (35.8%) and Operational (35.8%) roles where functions are spread across the organization. The majority of respondents have between 1-15 years' experience 1-5 years at 42.5% and 10-15 year sat 44.2%, while those with 20-25 years represent a smaller portion at 21.7%. Finally, Cyber Security and AI & Machine Learning each draw an equal 37.5% of the respondents to their training program preferences. Cloud Computing and Data Analysis also attracted 21.7% and 20% of the interest, which reveals that workforce is interested in emerging technologies. This demographic profile is overall of the organization and compiled that the talent pool have diversity and this will be the area targeting training and development. The below Table .2 shows the years of Experience have an extremely high influence on Job Role. In fact, employees with 1-5 years of experience mostly work as Managerial, and 10-15 years as technics. On the other hand, Operational positions are more likely to be occupied by employees who have from 20 to 25 years of experience. This association is confirmed by the Chi Square test, as significantly associated ($P<0.001$), which shows that Years of Experience is highly associated to the Job Role type. It may be a progression of the company, where the newer employee is more likely to be given managerial responsibility, whereas the more experienced employee is more likely to be relegated to an operational or hyper specialized technical role over time. Chi-Square test for the association between Gender and Training Program resulted in a Chi-Square Statistic of 77.33, 3 degrees of freedom and a p-value less than 0.0001. This analysis reveals distinct patterns in training program preferences based on gender there tends to be a difference in the roles that male and female employees play in these fields, as well as in their representation. This discrepancy highlight underlying issues with gender diversity, especially if there are trends in job responsibilities, levels of seniority, or access to certain types of projects. A highly significant p value leads us to conclude that there is a notable difference in the training program preferences among the genders, which can be explained with the variability in interests, skills specialization, or the organizational assignment practice that forces given genders to prefer given training areas.

RECOMMENDATIONS

1. Training opportunities, expand them to Cyber Security and AI and Machine Learning to improve this employee's competence.
2. To make the workplace more inclusive, there should be strategies to make gender diversity a matter of promoting gender diversity through targeting recruitment and mentorship programs among others.
3. Build mentorship program pairing newbies amongst employees with old hands to share information and also career progression.

4.Regularly assess job satisfaction and career aspirations to see exactly how aligned with the dynamic of transitioning into and out of changed roles.
5.Take out time to ask your employees about their training necessities and career interests, and match programs with what would work best for them.
6.Put more emerging technologies into the training programs to set employees in a position to handle things to come challenges and opportunities.

CONCLUSION

The take way here is about creating personalized and enhancing training programs, creating gender diversity, and installing the mentorship programs to develop professional growth and knowledge transfer. The organization can improve employee engagement and retention by aligning their training offerings in terms of employee preferences and an inclusive workplace. Taking these recommendations together will put the organization in the best position to succeed in a competitive environment and remain nimble and responsive to the changing needs of their organization, their workforce, and, in fact, the entire industry.

ABSTRACT

Conventional and Transportation vehicles are a major medium of commutation for the entire population. It has become a major concern due to the movement of products from a source such as a plant, factory or workshop to a new destination like warehouse, customer or retail one. Also there is a high demand of public commutation vehicles. This has become a great challenge in terms of maintaining the road traffic and the environmental impacts. Besides all these there is a substantial Carbon Dioxide (CO2) emissions, in a significant quantities of Carbon Monoxide (CO), Hydrocarbon (HC), Nitrogen Oxide (NOx), Suspended Particulate Matter (SPM) and other air toxins are emitted from these motor vehicles in the atmosphere, causing serious environmental and health impacts.. Typically, vehicular emission contributes 20-30% of Particulate Matter (PM) 2.5 at the breathing level of air quality that can be considered as one of the criticality that impacts the environment. In this research paper, the study is made to understand the comparison of conventional and electric vehicles in terms of gas emission contributing towards sustainability and also the intervene of green technology towards the greenhouse effect. The Secondary data is collected from different sources and further study is done. Furthermore research can be done based on the data analysis and its projection.

Keywords: Conventional and Electric Vehicles, Vehicle gas emission, Particular matter, Green technology, Greenhouse effect.

INTRODUCTION

In today's growing population there has been a tremendous increase in road transportation of 2 and 4 wheeler vehicle traffic due to the fast growth of economic development and consumption habits throughout the world. This effect of vehicle pollutant emission is significantly more in the urban areas This has led to uncontrolled growth of both commercial and residential activities giving rise to too much of traffic junction and emissions. The metropolitan cities are impacted with air pollution due to the vehicle discharge emissions directly into the breathing zone. It has been proved that about 60% of the air pollution in cities is due to the automobile exhaust emission. According to the Deccan Herald article cited on July 2020, the almost half of Bengaluru carbon dioxide emission comes from vehicles. Also as per the Centre for Ecological Science the 43% of carbon dioxide is emitted by vehicles.

OBJECTIVE OF THE STUDY

- To study the conventional vehicle emission in Bengaluru
- To understand the contribution of emission to air pollution
- To know the EV vehicle battery recycle process
- To project the impact of fossil fuel vehicle or EV's on sustainability.

RESEARCH METHODOLOGY

In this paper the research is completely based on Secondary data. The data is sourced from Newspaper article, Magazines and Karnataka state pollution control board. These sourced data can be completely reliable as the article is from Deccan Herald, Times of India , Karnataka State Pollution Control Board etc.,

LIMITATION OF THE STUDY

- The study is limited to only Bengaluru limit.
- It is referred to only secondary data sources

STUDY ON CONVENTIONAL VEHICLES

There has been a tremendous growth of the vehicles of 2W and 4W which is close to 11 million registered vehicles across the Bangalore city from the fiscal year 2006-2022. The below table discloses the fleet of vehicles being registered. Fig 1 There has been a strong population growth over a period of time with the usage of both the 2W and 4Wheeler. This has led to easy commutation by causing traffic congestion and pollution to the city at large.

Sources of Emissions of Air Pollutants and its Impact

The major pollutants emissions are, carbon monoxide (CO), nitrogen oxides (NOx), photochemical oxidants, air toxics, namely benzene (C_6H_6), aldehydes, 1,3 butadiene (C_4H_6), lead (Pb), particulate matter (PM), hydrocarbon (HC), oxides of sulphur (SO_2) and polycyclic aromatic hydrocarbons (PAHs).

STUDY ON NEW INVENTION OF TECHNOLOGY – ELECTRIC VEHICLE

An Electric Vehicle is distinct which does not have the ability to be propelled by gasoline. It takes electricity from a battery with a capacity of at least four kilowatt-hours and is capable of being charged from an external source.

How does EV work?

Electric Vehicle's receive energy from a charging station and store the energy in its battery. This battery leads to the power tomotor that creates a motion to the wheels. There are many electrical parts that work composed in the background to make the motion to happen.

EFFICIENCY

The EVs can be efficient by converting more than 85 percent of electrical energy into motion, as a comparison with the other combustible engines with less than 40% convert scale. The EVs have low maintenance cost unlike the engine of internal combustion.

EV REGISTRATION AND ITS SALES

Approximately 4,000 000 new vehicles are registered in Bengaluru each year. When it came to new registrations in Bengaluru before 2021, EVs made up roughly 0.8% of the total. With a goal of reaching 50% by 2030, this share climbed considerably in March 2021 to 2.3% and to 6.5% in March 2022. Source: International Journal of Engineering and Research Greenhouse gas (GHG) emissions are a direct cause of human-induced climate change. India accounted for 2.9 billion tonnes of CO2 emissions in 2019. The transportation sector accounts for roughly 10% or 290 million tonnes of CO2 emissions per year. Road transport, mainly comprising heavy vehicles (buses and trucks) and to some extent personal vehicles (two wheelers [2Ws] and four wheelers [4Ws]), is the leading contributor to these emissions. Based on the latest trends, a recent study by the Center for Study of Science, Technology and Policy (CSTEP) reported that vehicle electrification is the most practical approach to curb vehicular GHG emissions, with the added benefit of significantly inhibiting sources of urban pollution including particulate matter (PM), nitrogen oxides (NOx), and black carbon (BC). Therefore, a significant uptake of electric vehicles (EVs) was estimated, with sales penetration reaching 100% for most of the vehicle classes, except passenger vehicles. To realise this scenario, the EV segment in Bengaluru needs to grow at a weighted CAGR of 56%. The Indian Energy Storage Alliance projected the EV growth for India to be around 44%; therefore, the current projections seem plausible for a Tier 1 city like Bengaluru. This study estimates an EV fleet size of 2.34M vehicles in 2030, with EVs constituting a sizable proportion of the total onroad vehicles for most classes (35% of 2Ws, 60% of three wheelers, 30% of light goods vehicles, and 28% of buses).

POLLUTANTS OF EV'S

Cumulative vehicular pollution loads in 2030 2W: Two wheelers; 3W: Three wheelers; 4W (P): Four wheelers (personal); 4W (C): Four wheelers (commercial); NOx: Nitrogen oxides; PM10: Particulate matter with a diameter of 10 μm or less; PM2.5: Particulate matter with a diameter of 2.5 μm or less Thus, as a result of switching to EVs, emissions of roughly 3.3M tonnes of CO2/year could be avoided. This is akin to taking 4.85M ICE 2Ws off the roads in Bengaluru by 2030. To realise this scenario, a high growth in each of the EV classes is required

RECYCLING OF EV BATTERY

It can be recycled by little expensive.

1. Lithium is a highly reactive element.
2. It can get hot or **spark a fire if damaged or improperly handled**.
3. It helps in **reduction of the need for new mineral extraction,** which is always a win for the environment.
4. While not everything in a lithium battery is recoverable, the majority of the materials can be recycled. The technology is improving, and recycling methods are becoming more efficient, aiming to increase this percentage.
5. Depending on the brand, they typically contain **5-20% cobalt, 5-10% nickel, and 5-7% lithium.** Along with these metals, there are also about **15% organic chemicals and 7% plastics** that make up the rest of the battery.
6. In landfills, these batteries c**an leak dangerous contaminants, including cobalt, manganese, and nickel**—not to mention hazardous **lithium salts and plastics**.
7. Moreover, lithium-ion batteries pose a risk of igniting underground fires that smolder for extended periods. These fires can release toxic chemicals into the surrounding waste and create substantial voids in the landfill, potentially leading to surface collapse and further burying of flammable materials.
8. Before lithium-ion batteries even reach landfills, they pose a toxic threat.
9. If they're damaged, they can release fine particles with aerodynamic diameters of less than 10 or 2.5 μm—known as **PM10 and PM2.5**—into the air.

10. These particles are especially harmful because they carry metals like **arsenic, cadmium, and cobalt** that can be breathed in, leading to serious health issues.
11. Used lithium-ion batteries can also **emit hydrofluoric acid (HF)**, a gas that's dangerous if it comes into contact with skin or is inhaled, as it penetrates deep into the body, causing severe toxic effects. A single electric vehicle's battery pack can release an alarming amount of HF.
12. It is estimated that between **20 and 200 mg of HF** can be released per Wattage Capacity of the electric vehicle battery pack.

SCOPE FOR FURTHER RESEARCH

There were 75,000 EVs in Bengaluru in 2021. The study projects that the EV fleet will grow at a weighted average CAGR of 56 per cent during 2021-2030. The two-wheelers will see the biggest growth with 20 lakh e-bikes, followed by 1.4 lakh four-wheeler and 1.3lakh three-wheelers. The number of vehicles on the road will increase from 57 lakh to 89 lakh, the carbon emissions will increase from 1.11 crore to 1.38 crore tonnes. The moderate increase is "directly attributed to the 23.4 lakh EVs which will not have any emissions". The most practical ways can be considered for procuring renewable energy to offset to all the electricity is needed by EV in 2030.

Major Differences between Electric Cars and Petrol Cars

Electric and petrol car options differ from each other in the following ways:

PROS AND CONS OF ELECTRIC CARS

Pros of Electric Car

- Electric cars are highly energy efficient.
- They have almost zero emission levels.
- These cars are high performing.
- Their maintenance costs are low due to fewer moving parts.

Cons of Electric Car

- Batteries take several hours to charge.
- Their purchase cost is higher if we compare electric vehicles vs petrol vehicles.
- Replacing the battery of an EV is a costly affair.
- Electric cars cover smaller distances compared to petrol cars.
- Installing the charging point is expensive.

Pros and Cons of Petrol Car

Pros of Petrol Car

- The repair costs are more affordable if we compare electric vs petrol cars due to cheaper and easily accessible spare parts.
- A well-maintained petrol vehicle emits minimum noise, giving quiet rides.
- These have longer service life than EVs.

Cons of Petrol Car

- Petrol vehicles emit high volumes of CO_2 that pollute the environment.
- Their engines are less fuel efficient.
- They demand regular maintenance to prevent clogging.
- Petrol cost is higher if we compare the fuel costs of an electric and petrol car.

CONCLUSION

From this research it's been clear that both the Combustible and Electric vehicles has contribution towards Environmental hazards and the people. It becomes utmost important that new inventions must be done in support to the greenhouse gas effect and on a larger end for sustainability. Some of the recommendation could be

- Considering to grow more of trees
- Invention of technology to recycle certain metals
- Utilisation of Solar energy to run the transportation sector.

ANNEXURE

Fact 1 –

Greenhouse gas (GHG) emissions are a direct cause of human-induced climate change. India accounted for 2.9 billion tonnes of CO2 emissions in 2019. The transportation sector accounts for roughly 10% or 290 million tonnes of CO2 emissions per year. Road transport, mainly comprising heavy vehicles (buses and trucks) and to some extent personal vehicles (two wheelers [2Ws] and four wheelers [4Ws]), is the leading contributor to these emissions. Based on the latest trends, a recent study by the Center for Study of Science, Technology and Policy (CSTEP) reported that vehicle electrification is the most practical approach to curb vehicular GHG emissions, with the added benefit of significantly inhibiting sources of urban pollution including particulate matter (PM), nitrogen oxides (NOx), and black carbon (BC). In the current study, the on-road vehicle stock in Bengaluru was obtained by accounting for all vehicles registered in the last 20 years (2001–2021) and those that were retired (due to wear and tear, accident, or total loss) during this period. Further, the vehicle population was projected into the horizon year (2030) by extending the past growth trends in each vehicle class. These projections showed that the on-road vehicle stock grows 1.5 times (from 5.7M vehicles to 8.9M vehicles), at an overall growth rate of 5%

Table:1 Sources of Emissions of Air Pollutants and its Impact

Pollutants	Impact
Carbon monoxide (CO)	It causes harmful effect on health by reducing oxygen delivery to body organs. It is also more serious to those who suffer from heart disease which also causes chest pain.
Nitrogen oxides (NOx)	The Nitrous acid from nitrite salts. This,NOx and its derivatives gets reacted with either as gases in the air, as acids in droplets of water, or as a salt. These act as an adverse for acid rain.
Photochemical oxidants	They are the secondary air pollutants formed by the action of sunlight on nitrogen oxides and reactive hydrocarbons.
Particulate matter	They are the small particles that affect the lungs and heart that can cause premature death in people with heart or lung disease and Non-fatal heart attacks.
Hydrocarbon (HC)	These carbon left into the atmosphere contributes to photochemical ozone (O_3) production, with related adverse health effects, reduction in plant growth, and climate change.
Oxides of sulphur (SO2)	It pollutes the air and are harmful to your lungs and that makes it difficult to breathe, If inhaled regularly it can cause asthma and bronchitis. Sulfur trioxide vapors are toxic if inhaled and cause burns to the skin and organs.

Table 2: Cumulative vehicular pollution loads in 2030

Pollutant	2W	3W	4W(P)	4W(C)	Bus	Total
NO_x(tonnes/year)	14358.5	675.3	12403.2	7160.6	10648.5	45246
$PM_{2.5}$ (tonnes/year)	957.3	48	167.1	1516.8	1829.9	4519
PM_{10}(tonnes/year)	1063.6	53.3	185.6	1685.4	2,033.2	5021

Table:3 Electric and petrol car options differ from each other in the following ways

Parameters	Petrol Cars	Electric Cars
Fuel Requirement	A petrol car has a combustion engine that uses fossil fuels like petrol for operation.	An electric car has an electric motor and battery that stores power for operation.
Cost	While the purchase price of a petrol car is relatively lower, the fuel and maintenance costs increase over time.	Electric cars are expensive, but they help save money in the long run due to cheaper charging costs than petrol.
Recharge	You must take your petrol car to a petrol pump for refuelling.	You can install an EV recharge station at home to recharge it conveniently. You may also drive the car to a public charging station to recharge it.
Carbon Emissions	Petrol vehicles emit huge volumes of carbon dioxide that pollute the environment.	Electric vehicles are smoke-free and do not emit any polluting substances. Thus, they are eco-friendlier options for daily commuting.
Registration	You must pay registration charges when you buy a petrol car, which is a percentage of the vehicle's price.	Currently, electric cars have no registration charges, making them an economical vehicle option.
Insurance	Insurance premiums for petrol cars are cheaper.	Insurance premiums for electric vehicles are comparatively expensive.

ABSTRACT

Periodontal tissue consist of bone, cells, fibers and cementum. Destruction of anyone component leads to periodontal loss. The ultimate goal of periodontal therapy is to attain complete regeneration of the lost periodontium and maintain its functional homeostasis. With advances in the regenerative medicine, new regenerative strategies have been studies upon to counter the challenges in the regeneration of periodontium. Stem cells therapy has gained much attention in this aspect. Mesenchymal Stem Cells have been studied extensively in animals and humans. However newly identified Periodontal Ligament Stem Cells (PDLSCs) have recently been applied in the field of periodontics. This narrative review aims at reviewing the current applications, characteristics and limitations of PDLSCs through literature search from databases. The resultant data overview suggest many applications of the cells with a regenerative potential. Therefore, PDLSCs can be considered as an alternative to traditional regenerative techniques.

Keywords: Periodontal Ligament Stem Cells, Periodontal Regeneration, Infrabony Defects, Furcation Defects, Tissue Engineering.

INTRODUCTION

Periodontal disease is a multifactorial inflammatory condition caused by dental biofilm, primarily resulting into periodontal destruction. The loss of soft and hard tissue due to lack of treatment, ultimately leads to tooth loss and

loss of function.[1-2] There is a high prevalence of chronic periodontitis, showing its significant effect on public health. [3]The main aim of periodontal therapy is to stop the disease from progressing and help in regeneration of the lost periodontium that is bone, cementum, periodontal ligament and gingiva and to restore their original form and function.[4] The traditional treatment modalities includes both surgical and nonsurgical methods to prevent periodontal disease progression. With the basic completion of non-surgical therapy which includes oral health care guidelines, scaling and root planing and other non-surgical method like low level laser or photodynamic therapy, there is a need for surgical approach in the reconstruction of the lost periodontium.[5] Reconstructive or regenerative surgeries are to be considered when there are residual pockets or residual bone defects after initial phase of periodontal therapy. The idea behind theses treatment modalities is to eliminate the inflammation and prevent further disease progression, following the regeneration of functionally lost periodontium by means of grafts and growth mediators.[6-7] In order to achieve the functional periodontal regeneration, several methods have been used in periodontal surgical therapy which includes tissue bone grafts, artificial grafts, tooth derived graft materials, growth factors under the guidelines of guided bone regeneration or guided tissue regeneration.[6,8-10] The outcome of these stand alone or combined treatment modalities results in the clinical improvement of probing pocket depth (PPD) and clinical attachment level (CAL). However, these clinical outcomes with the standard approaches are proven to be unpredictable.[11]Hence there was an urge to develop an alternative strategy in the field of regenerative periodontics. The recent advances in field of regenerative medicine have showed the development of new treatment modality by using the principles of tissue engineering.[3]At the time of tooth development, the pluripotent stem cells of dental-follical undergoes differentiation into various periodontal progenitor cells like fibroblast, cement oblast and osteoblast to form periodontal ligament (PDL), cementum and alveolar bone respectively.[12]The cells of the dental follicle forms a niche microenvironment of active cells, scaffold and growth factors to induce the formation of tooth supporting structures. With the progress of development of the niche, activity gets reduced. This leads into the difficulty of restoring the lost periodontium after complete maturation. Bioengineering helps the tissues to recapitulate in the niche which further helps in the regeneration of functional tissue.[13] The niche that incorporates undifferentiated stem cells, has the ability to differentiate into a specialized cells under conditioned stimulus.[5]Studies have shown the regeneration of periodontium using Mesenchymal Stem Cells(MSCs) – the most common source of stem cells used in regenerative medicine. With the advances in technology, it has been found that a variety of tissues can differentiate into the cells of periodontium. Among these, Periodontal Ligament Stem Cells (PDLSCs) have now been studies extensively because of its unique properties. Studies have shown that PDLSCs can differentiate into osteoblast, chondrocyte and adipose cells under given conditions.[14-15] Animal studies have demonstrated their differentiation into cementum and PDL like sturctures.[19-17]Despite with these evidences, the role of PDLSCs have less been understood. Therefore, this review article highlights the evidences on the application of PDLSCs in the periodontics.

General Features of Periodontal Ligament

The mammalian periodontium comprises of four components: Gingiva, Cementum, Periodontal Ligament and Alveolar Bone. The periodontal attachment of a mammalian is most complex in terms of its function and structure due to the fact that they developed from early vertebrates but during the late stage of evolution. The periodontal ligament attachment is the codont fibrous attachment within the tooth socket.[18]Therefore periodontal ligament are exposed to physical forces during tooth movements under normal occlusion and parafunctional occlusion. Cells of the periodontal ligament participates in the formation as well as resorption of cementum and bone, during the accommodation of the periodontium to occlusal forces and at the time of repair and regeneration. However the rate of formation and the differentiation of periodontal ligament cells into osteoblasts, cementoblasts, and fibroblasts affect the rate of formation of collagen, cementum, and bone due to many factors involved in its regenerative potential. [19] Periodontitis is a chronic form of multifactorial disease caused by microorganisms resulting into the dysregulation between microbial biofilm leading to destruction of supporting structures of periodontium and ultimately tooth loss. [20]The aim of periodontal treatment is to control this inflammation and helps in regeneration of the lost structures. Numerous non-surgical and surgical approaches have been applied in this aspect. With the advances in regenerative technology, principles of tissue engineering have been employed. Cell sheet technology, biomaterial scaffolding and growth factor applications are few examples used in periodontal regeneration. For

periodontal regeneration, mesenchymal stems cells (MSCs) have been studied extensively both *in-vitro* and *in-vivo*. These cells can be of dental origin or non-dental origin. The dental origin MSCs includes dental pulp stem cells (DPSCs), cells of exfoliated deciduous teeth (SHEDs), cells of periodontal ligament origin (PDLSCs), cells from apical papilla and cells from dental follicle (DFPCs).[21] PDLSCs originate from neural crest cells during embryogenesis. They are located in the close approximation with the perivascular walls of PDL. The cells have capability to differentiate and proliferate into periodontal structures. PDLSCs have also shown immunomodulatory capabilities similar to MSCs.[22] PDLSCs shares similarities with the markers of MSCs, e.g. CD166/VCAM1, CD105, CD73, CD29,26,44,13,10, STRO3 and 4. The proliferative and differentiation of the PDLSCs was first demonstrated by Seo *etal*.[15]The cells of PDL origin can differentiate in to adipocytes, chondrocytes and osteoblast.[23]Characteristics of the PDLSCs activity has shown its effect on fibroblast differentiation, neural cell origin, embryonic cell activity, osteogenic potential in a microbial affected derived tissue or inflammatory conditions, as depicted in the Table 1.[20]

Factors Influencing the Properties of PDLSCs

Multiple factors are responsible for the characteristic activity of the cells to differentiate into osteoblast, chondrocytes and adipocytes. The growth of the stem cells can be varied due to changes in its characteristic like origin of cells, age of donor, growth factors and growth media. Some of the important characteristics of PDLSCs have been depicted in Table 2.[24]

Periodontal Application of PDLSCs

Periodontal ligament stem cells can be considered as a good candidate for periodontal regeneration since their availability is relatively simple by means of mere extraction of tooth. They have the ability to differentiate into pre-periodontal cells to form cementum-fibers-bone complexes. The feasibility and safety of the stem cells have been predetermined through animal studies. The evidences for periodontal regeneration have shown that PDLSCs is effective in regeneration of fenestration and infra-bony defects. In the infra-bony defects studies using PDLSCs with hydroxyapatite substituent have shown regeneration of lost bone, cementum and fibers, in both autogenously derived and allogeneic derived stem cells.[25]Fu, in 2014 [26] conducted an animal experiment on miniature pigs to treat infra-bony defects using PDLSCs and stem cells form exfoliated deciduous teeth in combination with alloplastic material and found that both types of stem cells were able to produce bone cells over period of 3 months. Three separate studies done on beagle dogs to treat infra bony defects and fenestration by using PDLSCs and resorbable collagen membrane showed new cementum formation[27] along with some areas of new bone[28]and orientation of new collagen fibers formation.[29] With the gained results from the animal studies, the PDLSCs have been used in the regenerative periodontics in humans. Studies have shown their potential use in treatment of infra-bony defects and furcation involvements. Feng in 2010,[30]transplanted PDL progenitor (PDLPs) cells sheet in three different periodontitis patients with infra-bony defects. The transplanted PDLPs provided a therapeutic effect with no adverse reaction observed. In-vitro study showed high proliferation and multipotent differentiation of the cells into periodontal tissues. An interesting application of PDLSCs in a supracrestal regeneration for mandibular Grade-II furcation defects was performed by Akbay in 2005[31] with the direct application of the autogenous periodontal ligament tissue. Upon surgical re-entry after 6 months, the sites demonstrated a significant improvement in both horizontal and vertical defect fill. Therefore it can be concluded that the direct application of periodontal ligament stem cells can be a viable alternative in the treatment of furcation defects. Similarly Vandana KL[32] and co-workers treated mandibular grade-II furcation defects using a technique - autologous stem cell assisted periodontal regeneration technique where direct application of periodontal ligament cell niche placement into defects resulted in clinical and radiographic improvement, suggesting the ease in clinical feasibility success and cost effectiveness of the periodontal regenerative technique. Another application in regenerative periodontics for treatment of infra-bony defects were studied by few authors using PDLSCs. In a prospective study, the use of direct application of stem cellniche into the defects with a gelatine sponge in test group, compared to open flap debridement alone in control group was investigated. The year-long follow-up shows a significant improvement in probing depth reduction, clinical attachment gain with radiographic evidence of bone gain at the defect sites.[33] In a 1 year follow-up case report for the treatment of infra-bony defect using direct application of stem cell niche, suggested a viable option in the treatment of periodontal osseous defects by bypassing the ex-vivo culture of PDLSCs.[34]A separate single

centred randomized control trial conducted in the year 2016, twenty infra-bony defects were treated with PDLSCs - extracted, isolated and cultured from third molars by the principles of tissue engineering. The cell sheet was placed with demineralized bovine matrix and guided tissue membrane, was followed-up till 1 year. The outcome showed a gain in alveolar bone height and better clinical results.[35] The future perspective in the field of periodontal regeneration using PDLSCs is with the introduction of 3D printing technology. The technology can produce a much complex spatial and precise 3-dimensional hybrid scaffold which can guide the orientation and organisation of the periodontal structures. It can be assumed with new biomaterials that the regeneration of the periodontal structures can be enhanced, mimicking the nature.[36] However the basic law for the tissue growth remains same – cells of origin, the bioenvironmental, the growth factors and the duration. Different methodologies have been studied in the treatment of periodontal defects, like cell sheet, ex-vivo culturing, pre-treated bioactive molecules, cell scaffolding and direct application of stem cells. Evidence based studies have been done on PDLSCs as a periodontal regenerative material which includes *in-vivo, in-vitro* and *ex-vivo*, largely on animals, however the human trials or conducted studies are less. Multiple reasons exist which makes stem cell therapy, still a therapy of reluctance. With PDLSCs, there are still no specific markers to identify these cells. Mostly the mesenchyme stem cell (MSCs) markers are used to identify its MSCs like function related to periodontal ligament. In recent times, periost in marker has been identified as a valid marker for PDLSCs function.[37] The biological safety of the cells transplanted as in case of allogenic cells have to be thoroughly tested before its use in the patients. Lately few incidences of tumorigenicity have been reported with the use of stem cell therapy.[38]However such incidences have not yet been noticed with PDLSCs application, but the risk must be considered. The immunogenic rejection of inflamed PDLSCs transplanted into an animal have been identified. Lastly, none of the stem cell therapy recipients have been followed-up for a long term, hence the fate of the PDLSCs is yet to be understood. The current research should therefore focus on the applicability of PDLSCs in other defect regions as well, identifying and using its vast potential in regenerative medicine.

CONCLUSION

The ultimate goal of periodontal therapy is to regenerate and attain the function of the lost periodontium. Stem cell therapy, in its recent times due to advances have been gaining much importance. Exploring the potential and using the huge potential of periodontal ligament stem cells will provide better outcomes not only for periodontal regeneration, but also in neural or retinal regeneration. However the current potential is been tested for periodontal treatment, the newer methods like cell sheet technology and advances in scaffolding with tissue engineering has a wide scope of research for the same. Until the ease of application of PDLSCs is developed, direct application of autogenous periodontal ligament niche is a viable option in periodontal regeneration.

Table.1: Basic Characteristics of PDLSCs Activity

Activity of PDLSCs	Characteristics	Markers Associated
Action on fibroblast expression	Connective tissue increase collagen synthesis	COL1,3, PDL associated protein1[39]
Expression of neural crest markers	Differentiation of neural cells lineage	Micro RNA, miR-132 [40-42]
Action of Embroyonic Cells	Differentiate into Cardiomyocytes [43]	SOX2, OCT4
In presence of perio-pathogens	↓growth of PDLSCs, and therefore low calcified deposits	COL1↓, Osteocalcin ↓, TLR4+, ↓NF-kappa-beta. [44-45]
Inflammatory conditions	↑differentiation activity osteoblast and cementoblast	Periostin, teno-modulin, Alfa SMA[46]

Table.2: Characteristic Factors of PDLSCs

Characteristics	Features	
Origin of PDLSCs	➢ Mainly found on middle third of root surface.	
	➢ PDLSCs derived from Alveolar bone vs root derived [47]	Better proliferation, differentiation
	➢ Deciduous tooth origin vs Permanent tooth origin	↑ adipogenesis and osteogenic potential [48]
	➢ Cells from granulation tissue/ periodontitis subjects	New bone formation seen, although risk of infection exist[49]
	➢ Inflamed periodontal tissue origin	↑ Proliferation and better migration rate but ↓ ostrogenesis and cementogenesis.[50]
Age of Donor	➢ As age progresses the potential of regeneration decreases[51]	
	➢ Age >41yrs expresses less STRO1 and CD146	Lack to form cementum and PDL structures [52]
Growth Factors	➢ Have effect of differentiation of osteoblast and cementoblast cells	
	➢ Bone Morphogenic Protein (BMP)[53]	Enhance proliferation, ↓ Sox2 and Oct4 expression: promotes cell growth
	➢ BMP 2/7, Vascular endothelial growth factors, Fibroblast growth factors	Increases proliferative rate of cells and osteogenesis
	➢ Transforming Growth Factor - beta	Fibroblast differentiation of PDLSCs
Growth Medium	Aim to grow PDLSCs faster without compromising its stem cell property.	
	Enzyme digestion method	Faster proliferation, better colonies, good differentiation.
	Dulbecco's minimum essential medium / alpha-minimum essential medium	Added requirement of 20% oxygen

ABSTRACT

Traditional system and its practices followed by the ancestors which had been destroying. Some traditional and ritual practices which would be helpful in health practices. Tribal people are living in the mountain or forests, a well demarcated geographical territory. They were still following the unusual traditional practices and rituals. Tamil Kurawar and Kaatunaickar were included in this study. Collecting honey, making baskets, and preparing bow and arrow is the occupation of Kurawar and most of the snake charmers are comes under the group of Kaatunaickar. These snake charmers are well trained in handling the snakes. This study is intended to collect the data from the tribal people, which was their rituals, and simple health care practices. This information might be helpful in several ways in treating snake bites, and also for the prevention of destruction of ancestor belief and rituals. This work was carried out to document the traditional health care practices and rituals among tribes in sivagangai district**.** To Study the various lifestyle and traditional practices and rituals among the tribal people. A descriptive – Cross sectional study conducted in tribal people in sivagangai. Face to face interview was done in tribal people as convenient sampling. All men and women are included in this study. A pre – designed questionnaire was used to collect the information. Verbal consent was taken from informers.

House to house survey was done to collect the information. The traditional knowledge of ancestors transferred orally for centuries and could be get lost, when it is not documented. This study facilitates to protect the intellectual properties of the traditional knowledge.

Keywords: Cross sectional study, Kurawar, Kaatunaickar, Snake charmers, Traditional Knowledge.

INTRODUCTION

The health care practices are followed in various ways such as allopathy and herbal medicine. Some of the people following their own rituals and health care practices which would not be revealed to the society, and even though they knew it, that it was not followed among the tribes. Tribal people were well known about their occupation such as hunting, collecting honey, making bamboo baskets [2] in traditional way and using the simple herbs for several disease that it might be an effective method, handling snakes and effective treatment for snake bites without using any antidotes or any anti- Snake venom. To revealing the hidden and unrevealed methods in tribal people among the two groups of sivagangai district. One is *Kurawar*[1] comes under *Koraga* tribes. In Sivagangai district they called as *Narikuravargal*. The word is derived from their profession. Originally found in South Karnataka and Bellary district migrated to Tamil Nadu. They live in the outskirts of villages. The *Koraga*[3] speak Tulu or Kannada. Among tribes the main occupation of the people is hunting. But their entry to the forests are prohibited so, they were forced to take up other alternatives such as selling beaded ornaments to survive. Hence they migrate from place to place to find a market of their beads[4]. The other group is *Kattunaickar* also called as *Paambatigal.* Snake charming as if exists today probably originated in India, the earliest snake charmers were likely traditional healers by trade. As part of their training, they learned to treat snake bites. Many also learned how to handle snakes and people called on them to remove snakes from their homes. The information collected from the tribal people of sivagangai district was documented for to revealing the traditional methods and health practices.

MATERIALS AND METHODS

Study type
Descriptive study

Study design
Cross sectional study

Study area
This research work was conducted from key informers of Tribes (Kurawar and Kattunaickar) in Sivagangai district.

Sampling procedure
Convenient sampling Ethical clearance certificate - 5676/P&D/2014 (Government Siddha Medical College, Palayamkottai, Tirunelveli)

Methods of approach
Face to Face interview

Study duration
4 months. (From August 2021 to November 2021).

Methods

A descriptive study conducted in the Tribal people (Kurawar and Kattunaickar) who lives in Sivagangai District.

- All men and women were included in this study.
- A pre –designed questionnaire used to collect the information.
- Verbal consent taken from informers.
- House to house survey was done to collect the information.

Data Collected from Kurawar

For respiratory disease: (mentioned in table.1) Table .1 – Medicine for respiratory disease

Animal origin: (mentioned in table.2) Table.2 – Medicines for Cough (Animal Origin)

Mouth ulcer: milk of *Jatropha gossyfolia*-direct application in the mouth

Jaundice

1.*Phyllanthus amarus* (Keezhanelli),onion (*Allium cepa)* -grind with water- Oral administration
2.Unripened pomegranate (*Punicagranatum)* grinded with cowmilk – Oral administration
3.*Centropussinensis* (cukoo bird variety)- Steam inhalation of the crushed bird.

External treatment for piles

1.Boiled *Jatropha gossyfolia*(athalai) leaf in the rice water and used as a bandage for piles.
2.Smoke of Tortoise (*Geochelone elegans)* shellfumigated over the anorectal region area.

Burning micturition and Kidney stone-

1. Soaked Fenugreek (*Triconellafoenum graecum)* and Cumin (*Cuminumcymimum)* in the tender coconut water and it has to be consumed in the empty stomach.
2. Squeezed *Tribulusterrestris* (Nerinjil leaf) extract mixed with water and should be taken orally.

Hot fomentation for swelling and Knee joint pain

1.Boiled *Delonixelata* (vathanarayan) leaf kept in the cloth and hot fomentation given.
2.Boiled *Morindacitrifolia* leaf (Nuna leaf) with salt and hot fomentation given.

Infertility treatment for Female

1.Malaivembu (*Melia dubia)* juice –Orally taken
2.*Strychnospotatorum* (Thetran)- Soaked *Strychnos potatorum* and grinded then given as oral administration.

Pregnancy care

1. Dry ginger (*Zingiberofficianale*)(chukku)
2. *Acoruscalamus*(vasambu)—Decoction
3. Aloe vera (Katrazhai) root juice

Detoxification for Postpartum women

1. *Piperlongum*(Tippili) powder with hot water and has to be taken orally.It expull the lochia completely.
2. 65 mg of *Moschus moschiferus*(Kasthuri) mixed with hot water and taken orally with empty stomach.

For Normal Delivery

Alpiniaofficinarum (sitrarathai) powder mixed in the water and boiled. It has to be given orally at the time last month of pregnancy.

For Primi Mother

1.*Piper longum*(Thippili),*Strychnospotatorum*(thetran),Turmeric*(Curcuma longa)*,Dry ginger and palm jaggery mixed with hot rice then they give to eat.

2. *Anethumgraveoluns*(sathakuppai),*Nigella sativa*(karunjeeragam),Palm jaggery- grinded as powder taken orally.

To Differentiate the Labor Pain from other abdominal pain

1. They dry coriander (*Coriandrum sativaum*) seeds, drumstick (*Moringa oleifera*) leaves, cumin (Cuminumcyminum) in the sunlight then boiled in the water and drink. If the pain stops it is common abdominal pain. If the pain persists for long time it is the labor pain.

For Amenorrhoea

1.They mix *Anethumgraveoluns*(Sathakuppai), *Nigella sativa*(Karunjeeragam), *Piper cubeba*(Vaal milagu), *Piper longum* (Thippili), Palm jaggery and made it as a powder and given.

Dosage: 1 spoon twice a day.

Treatment for Animals, Insects and Snake bite:

1. Scorpion bite and Sting bite-They apply limestone

2. Musk Rat bite - If wheezing like symptoms comes they mix *Erythrinavariegata* (Mulmurungai*)* juice with all purpose flour(Maida) and make 7 dosa with ghee. The half portion of the dosa kept over the palmar region of the hand and it has to be ingested. The another portion should be kept over the back or the hand and ingested. It has to be followed for three new moon day.

3. Snake bite - They believe no snakes will attack if a person keep the root of *Opuntiastricta(*nagathaali) or tie the root of *Opuntia stricta* (nagathaali) in their waist.

4. The juice of *Polygallaelongata* (siriyanangai) given to the person, who were bited by a snake. The venomwill get down.

3. Data Collected from Kaarunaickar (*Paambaatigal)*

3.1.Precautions before catching Snakes

They keep the leaf of *Aristalochiaindica* (Suruli),*Polygallaelongate*, root of *Opuniastricta* (nagathaali*)*, *Crinum viviparum* (vishamoongil). Plants shown infront of the snakes to calm down. Symptoms of snake bite (Table.3),
(Table .4 Treatment for Snake bites). Other bites and its treatment (Table.5)

For Stroke

Neem oil, Pungan oil, Gingelly oil, Garlic oil, white turmeric, Horse nail mixed well and heated. It applied over the affected parts of the body. It strengthens nerves.

For Amnesia and Giddiness:

Meliadubia (Mountain Neem) oil and Neem (*Azadirachtaindica)* oil mixed and heated. Then it has to be applied over the head.

For Alopecia

1. grinded*Aristalochiabracheolata* leaf (Aadutheendapaalai), and *Citrullus colocynthis* (Aatruthumatti) leaf paste mixed and applied over the scalp.
2.Soaked*Vettiveriazizanoides*(Vettiver) in coconut oil and applied over the hair.

Puberty rituals

Boiled rice has to made into three colour as a ball. One is plain ball, another one is red (mixed with fresh chick blood) and the last one is black (mixed with Charcoal). Each colour has made into 3 balls. The 9 colored rice balls kept over the head of the woman who attained puberty and pooja has to be done. Once the pooja gets over the rice balls thrown out. The woman return back home after this rituals. This ritual is specifically for the defilement removal. They make tent with the sticks of Calotropis and they keep her uncle as a security for that tent for 9 days. They do pooja with

fresh blood of chick. They add Turmeric, *Ocimum sanctum*(Thulasi), *Cassia auriculata* (aavarai) plant in the water for the woman to take bath.

DISCUSSION

Two group of people were selected through convenient sampling in sivagangai district. Information collected from the group were traditionally following methods and their rituals. Two to groups are, one is Kurawar and the another group is Kattunaickar. The Kurawar group gave an information regarding Cough, Cold (Coryza), Fever, amerrhoea, Diarrhoea, Abdominal pain, for mouth ulcer, jaundice, piles (heamorrhoids), for urinary tract infection, giddiness and for joint pain. The another group is Kattunaickar were specialized in the snake charming. They treat different types of snake bites and other bites such as scorpion, centipede, musk rat, dog bite, lizards bite. They gave special care to the women for the menarche, Dysmenorrhoea, Prepartum and postpartum. They follow the puberty rituals. Even though the information were not in the literature they were following the ancestor belief. Its been documented for further transfer of ancestor knowledge for upcoming generation.

CONCLUSION

The value of medicine of tribal people is not known because of absence of recorded data. Numerous ancient knowledge has been lost by the absence of supportive literatures. It has to preserved that these valuable natural resources with the help of new technologies. The existing traditional knowledge could be systematic and scientifically proved.

Table.1: Medicine for respiratory disease. For respiratory disease

DISEASES	MEDICINE	PREPARATION	ADMINISTRATION
1.Cold	❖ Musk (secretion from Moschusmoschiferus) – Kasthuri. ❖ Cow stone (collection from Gall bladder) – Korosanai	mix with hot water	Intake
2. Fever	❖ Lactus of calotrotips(Erukku) ❖ Acoruscalamus(Vasambu). ❖ Neem leaves with brick	rubdown in mother's milk.	Hot fomentation. Over the tongue
3. Cough	Ginger, Garlic, Pepper	decoction	Oral

Table.2: Medicines for Cough (Animal Origin).

Cough	Snail flesh,pepper, garlic and salt added. & bat flesh	fry	Oral
Cough	Boiled gum of Mango tree	Sedimentation of Filtered water	Oral

Table.3: Symptoms of Snake bite.

	SNAKE BITE	SYMPTOMS
1.	Cobra	vomiting, giddiness
2.	Viper	swelling on the site of snake bite
3.	Black snake (karumpanisai)	loss of sensation, death within 3 hours
4.	Python	loss of eye sight
5.	Hydrophidae	death within 45 minutes

Table.4: (Treatment for Snake bites)

	SNAKE BITE	TREATMENTS
1.	Poisonous snake	1. They tie knots in between forearm and arm to reduce blood flow to the heart. 2. They give juice of polygala elongata(Siriyanangai)to drink. 3. They cut the wound and remove the blood by Sucking and split out from mouth.
2.	Thalaisuruli	They mix Polygala elongata with children's urine and Grind then give it to drink.
3.	Karumpanisai(Black snake)	They grind Polygala elongata with goat urine and give it to drink.After 2 hours they will give 5-6 pepper to chew then drink water.
4.	Python	They grind bark of Strychnoxnuxvomica (Etti)with lemon and give it to drink. If not the patient will lose eye sight.
5.	Hydrophidae	They grind sea sand ,lemon,Cissusquadrangularis(Pirandai) Bark of Strychnosnux vomica and give to eat Immediately.
6.	Suruttai	They grind Pollygalaelongata,Strychnosnux vomica root barkand give to eat.They grind the root of Achyranthusaspera and apply the site of snake bite.
7.	Tail snake	Grind Pollygalaelongata,Aristalochiaindica (Aditheendapalai) and give to eat.
8.	King cobra	There is no medicine.
9.	Malaivalalai snake	They grind Mimosa pudicaleaf,Pedaliummurax (Thotarsurungi)Enicostemmaaxillare (Vellarugu), Solanumsurattense (kandankathiri)Mukiamadaraspatana(musumusukai) leaf. They give intake as well as external application.

Table.5: (Treatment for Other bites)

1.	Scorpion bite	1. They chew 2 betal leaves with 2 pepper and chick's residue then swallow it. 2. They apply the leaf of Abrusprecatorius (kundrimani) on the site of Scorpion bite.
2.	Sting bite	They make juice from stem of Ragi and they give to drink.
3.	Beetle bite	They grind leaf of Pollygalaelongata, Datura metal with Lemon juice and apply on the site of beetle bite.
4.	Rabid dog bite	They extract juice from the leave of Justicia adathoda, Papaya, Crinum asiaticum, Ocimumtenuiflorum (karunthulasi) and give to drink.4 days Diet without salt, oil, spice. 4 days Monodiet kanji of moong dhal.
5.	Dog bite	They believe the poison will get down when the person drink water
6.	Lizard's poison	Fruit of Palm tree they give to eat. To drink toddy from palm tree.

ABSTRACT

Acne vulgaris is a widespread dermatological issue impacting individuals across the globe. This study focuses on the formulation and evaluation of anti-acne gel containing *Calendula officinalis* extract, Tretinoin, and their combination. *Calendula officinalis* is recognized for its anti-inflammatory, antimicrobial, and soothing effects on the skin, while Tretinoin, a retinoid, is widely utilized for its ability to reduce comedones and promote exfoliation. The gel formulations were developed using an appropriate gelling agent and optimized for physicochemical parameters such as pH, viscosity, and spreadability. The evaluation process included in-vitro antibacterial activity tests, stability studies, and skin irritation assessments. The anti-acne potential was examined through clinical trials involving volunteers with mild to moderate acne. Parameters such as acne lesion count, sebum levels, and overall skin health were monitored over a specific time frame. The findings revealed that the combination of *Calendula officinalis* and Tretinoin in a gel formulation effectively decreased acne lesions without significant irritation or side effects, highlighting its potential as a synergistic treatment for acne management.

Keywords: Acne vulgaris, *Calendula officinalis*, Tretinoin, topical gel, anti-acne formulation.

INTRODUCTION

Acne, scientifically referred to as Acne vulgaris, is a common skin condition involving the oil glands associated with hair follicles. It primarily develops during puberty when sebaceous glands become active due to stimulation by androgens produced by the adrenal glands in both males and females. While acne is not life-threatening, it can result in scarring, which may impact an individual's confidence and quality of life. The skin contains pores that are connected to sebaceous glands located beneath the surface. These glands produce sebum, an oily substance responsible for carrying dead skin cells through small canals called follicles to the skin's surface. Acne arises when these follicles become clogged, leading to the accumulation of oil and debris beneath the skin, forming pimples. Topical delivery systems are specialized formulations designed to deliver drugs locally to the site of application rather than systemically, making them suitable for treating localized conditions such as skin disorders. These systems are utilized for various therapeutic applications, including dermatological, ophthalmic, otic, vaginal, and rectal treatments. A topical product is typically applied as a thin layer to the skin, where it exerts its action without leaving a significant residue. Common therapeutic categories for topical agents include corticosteroids, antifungal agents, antibiotics, acne treatments, emollients, antiseptics, local anesthetics, and anticancer drugs. Depending on their mode of action, these agents may function as protective barriers, cleansers, emollients, or physical barriers. Other topical agents, such as astringents, keratolytic agents, and irritants, act through chemical mechanisms to achieve their effects. Research on medicinal plants has gained significant attention as an alternative approach for managing various health conditions, including acne. This focus addresses challenges such as the rise of antibiotic resistance. The aerial parts of *Calendula officinalis* have been used traditionally for their therapeutic properties and have demonstrated antimicrobial, anti-inflammatory, and wound-healing activities. These properties are attributed to bioactive compounds such as *triterpenic saponins*, *flavonoids, faradiol, carotenoids, sesquiterpenoids,* and *polyphenols.* The current study aims to formulate and evaluate the efficacy of anti-acne gel preparations containing *Calendula officinalis* extract, Tretinoin, and their combination as a novel approach to acne management.

MATERIALS AND METHODS

Materials

Tretinoin was procured from Dhamtec Pharma and Consultants, Navi Mumbai. Other components, such as carbopol-934, carboxymethyl cellulose, methyl paraben, triethanolamine, and propylene glycol, were of pharmaceutical-grade quality, while all other chemicals used were of analytical-grade standards.

Collection and Authentication of Plant Material

The stem, leaves, and aerial parts of *Calendula officinalis* were collected from Bhopal, Madhya Pradesh. The plant material was cleaned and dried under shade at room temperature until completely dehydrated. The dried plant material was stored in airtight glass containers in a cool, dry place to prevent contamination and degradation. Authentication of the *Calendula officinalis* plant material was carried out by a qualified plant taxonomist to confirm its identity and purity.

Extraction of Plant Material Using the Soxhlet Method

The dried and coarsely powdered plant material (300 g) of *Calendula officinalis* was subjected to successive extraction using different organic solvents. Initially, the material was defatted using petroleum ether, followed by extraction with methanol for 36 hours in a Soxhlet apparatus. The extracts were concentrated under reduced pressure using a rotary evaporator to ensure complete solvent removal. The resulting dried residue was stored in an airtight container for subsequent formulation and testing.

Formulation of Anti-Acne Herbal Gel

Carbopol-934 was soaked in 50 mL of warm water (Solution A) for 2 hours and homogeneously dispersed using a magnetic stirrer at 600 rpm. In a separate container, carboxymethyl cellulose and methyl paraben were dissolved in 50 mL of warm water (Solution B) and stirred until a stiff gel was formed. Solutions A and B were mixed with continuous stirring. Triethanolamine was then added dropwise to adjust the pH. *Calendula officinalis* extract and Tretinoin were incorporated into the gel, followed by the addition of the permeation enhancer, propylene glycol. The final dispersion was stirred until a smooth gel was formed, free of lumps.

Characterization of Gel Formulation

1.**Physical Appearance**

The gel formulations were examined visually for their appearance, color, odor, and homogeneity.

2.**pH Measurement**

The pH of the gel was determined using a calibrated digital pH meter. The probe was rinsed with distilled water, dried, and immersed in the gel sample to record the pH. Readings were taken in triplicate, and the pH was adjusted to match skin pH using triethanolamine, if necessary.

3.**Viscosity**

The viscosity of the gel was measured using a Brookfield viscometer with spindle no. 62 at 100 rpm at 25°C.

4.**Spreadability**

Spreadability was determined by placing 1 g of gel between two glass slides. A 50 g weight was placed on the top slide, and the distance the gel spread was measured over a specific time.

Spreadability was calculated using the formula:

S=M×LTS

Where,

- S = Spreadability (g·cm/s),
- M = Weight placed on the upper slide (g),
- L = Length of gel spread (cm),
- T = Time taken for gel spread (s).

5. **Skin Irritation Test**

The test was conducted on Wistar rats (150–200 g). Hair was removed from a small section of the rats' skin two days prior to the experiment. The gel was applied to the shaven area daily for three days. The treated skin was observed for 24 hours for erythema, edema, or other signs of irritation.

Antimicrobial Activity of Gel Formulation Using Well Diffusion Assay

1.**Preparation of Nutrient Agar Media**

Nutrient media (28 g) was dissolved in 1 liter of distilled water, and the pH was adjusted before sterilization. The media was autoclaved at 121°C and 15 psi for 15 minutes, poured into Petri dishes, and allowed to solidify in a laminar air flow.

2.**Well Diffusion Assay**

A standardized bacterial suspension of *E. coli* (108 CFU/mL) was spread onto the agar plates. Wells of 6 mm diameter were created using a sterile cork borer. Each well was filled with 100 µL of the gel formulation (1 mg/mL). The plates were incubated at 37°C for 18–24 hours. The zone of inhibition (ZOI) was measured in millimeters using a ruler, including the well diameter.

Stability Studies

The gel formulations were packed in suitable containers and stored under accelerated stability conditions at 25°C ± 2°C/60% ± 5% RH and 40°C ± 2°C/70% ± 5% RH for three months as per ICH guidelines. Samples were analyzed for

changes in pH, viscosity, and spreadability at intervals of 30, 45, 60, and 90 days. Results were compared to the initial day (Day 0) as a reference.

RESULT AND DISCUSSION

Percentage Yield

The percentage yield of phytochemical extraction is an essential parameter to assess the extraction efficiency for a specific plant, its various parts, or different solvents utilized. The yield of the extracts obtained from *Calendula officinalis* is presented in Table 1.

Preliminary Phytochemical study

Organoleptic properties

The organoleptic properties of Tretinoin, including color, odor, and appearance, were evaluated. Tretinoin was found to possess a yellow color, was odorless, and appeared as a solid powder. These characteristics were consistent with the specifications outlined in the Indian Pharmacopoeia (I.P.) standards. The results are summarized in Table 3.

Solubility study

The solubility of Tretinoin was analyzed in different volatile and non-volatile solvents, including dimethyl sulfoxide, methanol, ethanol, chloroform, and water, as shown in Table 4. The results indicated that Tretinoin is highly soluble in dimethyl sulfoxide and methanol, while exhibiting limited solubility in water. Melting point

DISCUSSION

The melting point of Tretinoin was determined using the capillary method. The observed melting point was 178°C, which falls within the acceptable range specified for the drug, as shown in Table 5. The absorption maximum (λ-max) of Tretinoin was determined using a double-beam UV-visible spectrophotometer (Shimadzu-1700). The λ-max was found to be 358.0 nm, which is consistent with the specified range for the drug.

Calibration curve of Tretinoin

The linearity of the proposed method was determined through least squares linear regression analysis of the calibration curve. A plot of absorbance versus the concentration of Tretinoin was constructed for concentrations ranging from 2 to 12 μg/mL. Seven data points were used to generate the calibration curve within this concentration range. The drug's response was found to be linear across the investigated concentration range, with the linear regression equation given as $y = 0.073x + 0.030$, and a correlation coefficient (R^2) of 0.991.

Functional group identified by FTIR

Evaluation parameter of anti acne herbal gel formulation

An evaluation of the gel's characteristics, including color, appearance, and homogeneity, was performed. The gel was found to have a yellowish color upon testing. Its appearance and color were consistent with the specifications outlined in the Indian Pharmacopoeia (I.P.) standards. The results are summarized in Table 8. The pH values of all the prepared formulations ranged from 5.7 to 6.5. These pH values were deemed suitable, as they minimize the potential for skin irritation upon application. The results are presented in Table 9.

Determination of Viscosity

Viscosity is a crucial characteristic of semisolid formulations, reflecting a liquid's resistance to flow and the internal friction within the fluid. This rheological property is essential for assessing the consistency of the gel and its drug diffusion rate. The viscosity of the prepared gel was measured using a Brookfield viscometer with spindle no. 62. The results are presented in Table 10. Spreadability refers to the ability of the gel to cover a larger area upon application

to the skin or affected area. The spreadability of various gel formulations was evaluated, and the formulations demonstrated good spreadability. The results are shown in Table 11.

Acute skin irritation study

Results of skin irritation test indicate that prepared gels were not produce irritation, redness, or edema on application and free from dermatological reaction.

Antimicrobial activity of Gel formulation

Stability studies

The formulations were found to be stable both physically and chemically over a 3-month period under accelerated stability conditions (30°C ± 2°C, 60% ± 5% RH) and (40°C ± 2°C, 70% ± 5% RH). No significant changes were observed in the physicochemical parameters, including viscosity, pH, and spreadability during the stability tests. The results of the assay and other evaluation parameters at different time intervals during the stability studies are summarized in Table 13.

Assessment of Efficacy of Anti-Acne Gel Formulations Containing Calendula Officinalis Extract, Tretinoin, and Their Combination

The study successfully developed and evaluated anti-acne gel formulations containing Calendula officinalis extract, tretinoin, and a combination of both. These formulations were analyzed for their physicochemical properties, stability, and effectiveness in treating acne. The combination formulation showed improved therapeutic effects compared to the individual components. The Calendula officinalis extract exhibited anti-inflammatory and antimicrobial properties, while tretinoin facilitated exfoliation and skin renewal. The combined action of these ingredients significantly reduced acne severity, enhanced skin texture, and reduced inflammation without causing significant irritation [32-35].

CONCLUSION

The combined use of tretinoin and Calendula officinalis extract offers a promising solution for acne treatment with fewer adverse effects. Future studies should focus on patient compliance, safety, and the long-term effectiveness of these formulations for broader clinical applications.

ABSTRACT

This study contemplates on evidential analysis of the effects of Artificial Intelligence (AI) on logistics and supply chain primarily in the focal areas which include demand forecasting, inventory management and route optimization. Thus, as the complexity of supply chains raises, organizations seek various ways to apply AI to minimize the repercussions from volatility. The use of artificial intelligence in predicting the demand patterns provides more accuracy as compared to traditional statistical models so as to avoid situations in which there is no stock or more stock than required. Likewise, automated inventory control systems utilize AI techniques to determine the appropriate inventory holding costs that improve service levels simultaneously. Use of AI within routing also leads to minimization of transportation duration and fuel usage enhancing both cost effectiveness and ecological friendliness. In this paper, recent academic investigations and business cases are used to evaluate the numerous quantifiable advantages of AI in the field of logistics, and the main issues arise from its usage such as, data aggregation problems, AI's ability to scale supply chain solutions, and AI's potential moral defects. The study throws light on how AI is

revolutionizing the supply chain management to be nimble and more resistance to disruptions; thus, the results serve as useful guidelines for companies interested to apply AI to improve Supply chain delivery.

Keywords: Artificial Intelligence, Global Environment, Logistics, Supply Chain, Inventory Management.

INTRODUCTION

AI plays a significant and increasingly more important role in influencing and improving the criteria of operations in logistics and supply chain management. However, conventional distribution centers themselves have been experiencing issues including for example; fluctuating demand, inefficient inventories, and poor route planning which serve to escalate the operational costs, time and harm the environment in a worldwide competitive and global environment. These issues on the other hand have a been solved by Technology and in particular by AI as the main determinant through the effective use of data as well as automation to make the processes of the logistics systems quicker and efficient. By application of AI, organizations are in a better position to forecast their demand more accurately therefore reducing the incidence of stock outs and excessive stock holdings and matching supply to demand cycles. Further, most AI-driven stock control applications change stocks levels continually, thereby cutting holding costs while enhancing product accessibility. In transportation and distribution, the self-improving route optimization algorithms incorporating traffic, weather and an array of other factors cut down the delivery time as well as fuel consumption thus saving cost and reducing the carbon imprint. Apart from these operational advantages, AI positively encourages supply chain robustness too. Marketing planning can also be practical since machine learning models can point out disruptions in advance helping a company to provide timely responses to the shifts in the supply chain or the demand. As a result, the involvement of AI in logistics and supply chain processes also has its own difficulties which are such as data incorporation, ethical issues, and avoidable issues in making across all the chains of the supply chain. Logistics Performance and AI of this paper will focus on the effectiveness of AI in logistics and supply chain performance, outlined advantages and issues associated with the implementation of AI in the modern supply chain management systems.

Review Literature

AI is discussed in the contemporary literature as a powerful tool in the process of logistics and supply chain management to increase efficiency and supply chain responsiveness. They find that AI tools in demand forecasting make businesses more accurate through the use of historical and current data to predict demand patterns thus reducing the risks associated with stock outs and excess stock (Zhong *et al.,* 2022). To support organization's growth and produce an inclusive work culture, the authors recommend employability programs for diverse applicants and leadership training (Xalxo, 2024). In case of inventory management also AI delivers the best outcomes when it comes to monitoring and analyzing the data in real time and uses the predictions in increasing or decreasing the stock levels. Research by (Lee and Wang, 2023) has shown that by implementing an AI-driven system, consumption rates can be automatically adjusted with demand forecasting and lead times cutting holding costs and enhancing product availability. In the Study, (Muthuswamy &Nithya, 2023) also consider the role of digital security and organizational support in enhancing digital workplace environments, which also affect the success of the digital training efforts, It contributes to route optimization in logistics at least in the same manner as in the case of time and fuel saving during the deliveries. Using traffic flow, climate condition, and road data, the AI-driven navigation system weigh the best route for delivering the merchandise which in turn reduces operational expenses and pollutions (Singh & Gupta, 2023). This is the reason more and more firms today input AI in the administration of routes with consideration of both environmental and economic concerns. Occupational exposure is of more concern as compared to the community exposure hence the call for protection measures and anti-fear policies to be conducted at the work places. (Muthuswamy & Nithya, 2023) There has also been an addition to supply chain resilience by use of AI as it does not only focus on the risks, but is also capable of producing work around. Even in recent research by (Romero and Castillo ,2023), it showed that AI systems can provide information on potential indicators that prompt disruption,

thus helping organizations to prevent vulnerability to issues like slow supply chain or calamities. In addition, competition intensifies demands on productivity for services thus increasing workplace stress on employees. This realize highlights the need for stress prevention interventions across the sector (Karthikeyan *et al.).* However, there are several limitations encountered during the integration of AI in the context of logistics: the data quality problem, the integration problem and the problem of scalability. However, to achieve effective usage of AI, strong data management systems are needed, and the topic of AI explain ability as well as data protection is becoming more significant (Kumar & Bose, 2022). To promote health, interpersonal relationship, and work performance, all workers in the healthcare system require stress management interventions that are focused at individual and organizational level (Nisa *et al.,* 2024). Accordingly, the literature reveals the place of AI as it contributes positively to the improvement of the logistics and supply chain management although future work is required to address the practical and ethical barriers that can help to unlock AI's potential in this field.

Need For The Study

The integration of Artificial Intelligence (AI) in logistics and supply chain management is essential due to the persistent challenges in demand forecasting, inventory management, and route optimization that traditionally result in increased costs and inefficiencies. AI enhances decision-making by utilizing advanced data analytics and machine learning, enabling more accurate demand predictions, real-time inventory optimization, and efficient route planning. These improvements lead to cost savings, reduced delays, and enhanced customer satisfaction. As organizations strive for operational excellence and sustainability, understanding AI's impact and practical applications in logistics and supply chains is critical for maintaining competitiveness in a rapidly evolving marketplace.

Objectives

- Examine how AI enhances the accuracy of demand forecasting in logistics to improve inventory management.
- Assess the effectiveness of AI-driven systems in optimizing inventory levels and reducing holding costs.
- Investigate the role of AI algorithms in optimizing transportation routes for cost reduction and improved delivery efficiency.

RESEARCH METHODOLOGY

Research Design

This research adopted a descriptive research approach to capture the enhancement of AI within logistics and supply chain management. The focal point of the present study lays in awareness of the current uses, advantages/uses and disadvantages of AI technologies. The current research study employed quantitative research method.

Population And Sampling Technique

The target population will comprise logistic and supply chain, information technology and operations managers as well as different staff from organizations that have adopted AI solutions. A stratified random sampling method used to ensure representation from different sectors (e.g., retail, manufacturing, and transportation). The sample size of 200 respondents, determined based on the desired confidence level and margin of error, ensuring that the findings are statistically significant and applicable across diverse Sector.

Data Collection Methods And Data Analysis Techniques

Quantitative data on the impact of AI on demand forecasting, inventory management and route optimization was collected from structured questionnaires. Statistical methods such as descriptive statistics and regression analysis used to analyze the collected data, and used to determine the relationship between AI integration and operational outcomes.

Major Finding

The above Table .1 depicts the demographic data on the sphere of logistics and supply chain management, important trends, and observations. This sample covers various industrial sectors, however, the results show that Manufacturing sector users the logistic system most frequently (30%) while the second place took the Transportation users (25%), E-commerce users' (25%), and IT user (20%), which indicates that logistic is appropriate for all these fields. When examining the distribution of responses according to the position held at their employing organization, it is conclude that Operations Managers (25%) are the most dominant, which is only reasonable, since the duties of such employees encompass many aspects of logistics management processes. The second most frequently reported job title was Supply Chain Managers (20%), which speaks of the authoritative importance of data analysis in making effective decisions. There is a split in terms of experience within the work force the largest group of employees has professional experience between 2-5 years (30%). Another 25% of the employees also displayed skills and at least ten years of working experience which implies that the workforce is composed of experienced workers. Job roles do add more variety to the workforce and a breakdown of jobs included Project Manager who accounted for 25% of the workforce, which is an implication of the fact that many activities in logistics are project related. All the data confirms a great desire for artificial intelligence (AI) 40% of the respondents are implementing AI, while 35% apply AI systems. However, 25% resent that their organization does not currently have plans in implementing AI, which may hinder digital transformation strategy projection. Concerning the AI usage frequency, 35% of the respondents revealed that they have never used AI, indicating the areas of concern in an organization, while the remaining 25% respond that they use AI on a daily basis, implying that they have some interaction with new technologies.

Finally, this demographic breakdown suggests that the workforce hiring managers engage with is experienced, diverse in general responsibilities, and increasingly invested in AI solutions for logistics and Supply Chain Management. Thus, there is a high level of interaction with AI technologies but having people who did not make any decisions to integrate AI means that there are potential prospects for further improvements in digital transformation in the sphere for all organizations in the industry The results of the regression analysis shows in the Table.2 portrays that Years of Experience statistically significant ($p = 0.008$), suggesting in the level of experience of individuals who involved in logistics and supply chain management plays a crucial role in contributing to operational efficiency. This implies that more experienced individuals may have a better understanding and capability to leverage AI tools effectively, even if AI implementation itself is not yet fully optimized in the organization. On the other hand, both AI Implementation Status ($p = 0.838$) and Frequency of AI Usage ($p = 0.232$) are not statistically significant, meaning that, within the context of the current dataset, the stage of AI implementation and how often AI is used do not appear to have a direct, measurable impact on operational outcomes. This could indicate that while AI tools may be present, their full integration or frequent usage might not be sufficient on their own to significantly improve operational efficiency. It may also suggest that other factors, such as organizational readiness or the quality of AI models, could be influencing the results. Overall, these findings highlight the importance of experience and expertise in managing AI systems and suggest that greater emphasis might be needed on training and familiarizing employees with AI technology to maximize its impact on logistics and supply chain management. Additionally, the lack of significance in AI implementation and usage frequency implies that AI's potential benefits may take time to materialize, or that further advancements in AI systems and their application could be needed for more noticeable improvements in operational performance.

Recommendatations

- Management should invest in programs such as human capital development programs for employees to understand about AI and its benefits in logistics.
- Recommended that AI should be implemented in mini pilot projects so that the effectiveness of the new technology can be assessed before full scale implementation can be made.
- It also necessary that there are strong IT structures and efficient cloud infrastructure for ease of integration of Artificial Intelligence at the organization
- Smaller teams that are drawn from different departments should be encouraged to work on AI projects, in brackets this will increase the chances of including different perspectives.

- Develop an obvious standard to measure AI solutions effectiveness and performance and compare periodically for enhancement.
- Overcome organizational resistance of the employees and ensure proper promotion of the benefits of utilizing AI.
- Looking for grants or partnerships in order to capitated the costs associated with the AI project.
- Create a data analytics capacity in order to improve decision-making with the help of AI, and optimize the supply chain.

CONCLUSION

In conclusion, the utilization of AI in logistics has the capacity to bring about impressive actualization of productivity, cost optimization and competitiveness. To get the most out of these benefits, the staff of organizations needs to take successful human capital development programs that would provide them with the necessary knowledge and skills necessary for working with AI. Applying Artificial Intelligence in an organization using pilot scale solutions prevents the growth of technological business risks and fosters employee trust. In addition, successful AI logistcs depends on strong IT and cloud platforms to integrate AI, as well as cross-functional input to feed AI projects with data from varying perspectives. The problem of resistance may be eased by increasing the awareness of the value of AI solutions, as well as creating clear goals of performance against which the AI solutions can be compared when striving for continuous enhancement of the overall performance.

ABSTRACT

This paper introduces the Prefix-Cartesian Distributed Hash Table (PC-DHT), a novel algorithm designed to overcome scalability challenges in Wireless Sensor Networks (WSNs). PC-DHT integrates the prefix-based routing mechanism of Pastry with the multi-dimensional Cartesian coordinate system of Campus Area Network (CAN) to facilitate efficient lookup and storage operations in large-scale WSNs for load balancing and replication. The algorithm dynamically organizes the network into cells using a combination of routing tables and leaf sets to maintain scalability and ensure fault tolerance. By distributing data management tasks evenly across nodes, PC-DHT enhances resource utilization, reducing network congestion and improving overall performance. Simulation results demonstrate the effectiveness of PC-DHT in achieving better scalability, robustness, and resource efficiency compared to existing Distributed Hash Table (DHT) approaches in WSNs. These results highlight PC-DHT as a promising solution for large-scale and distributed data management in wireless sensor networks.

Keywords: Campus Area Network, Distributed Hash Table, Data Management, Fault Tolerance, Wireless Sensor Networks

INTRODUCTION

A WSN comprises resource-constrained sensor nodes in terms of storage, energy, and computing power [1]. Among the many uses for WSNs are industrial process management, vehicle monitoring, environmental and habitat monitoring, and military applications [2]. Nodes in WSNs collect sensor data, analyze it, and then send it to a central station via wireless connections [3]. Since the WSN is vulnerable to hostile attackers, security becomes paramount in these applications. Three things must be in place for two sensor nodes to communicate securely: authentication, privacy, and integrity [4]. Consequently, a standard secret key should be shared between nodes [5]. In order to establish secret keys between communication nodes, one canutilize one of several key distribution and agreement procedures, collectively referred to as the key agreement approaches issue [6]. In recent years, WSNs have gained significant traction as an essential tool for data collection and monitoring in various fields, including smart cities, healthcare, industrial automation, and environmental monitoring [7-8]. Many tiny sensor nodes work together in these networks to collect, analyze, and send data [9]. Problems with scalability, data dissemination, and fault tolerance are especially noticeable when dealing with massive sensor nodes, which are becoming more common as WSNs expand [10, 11]. Data administration in WSNs has traditionally relied on hierarchical or centralized systems, which can become a stumbling block as the network grows [12]. One decentralized approach to effectively managing data over large-scale networks is Distributed Hash Tables (DHTs) [13]. Regarding WSNs, however, current DHT-based systems have their limits, especially when it comes to scaling, dealing with node mobility, failures, and unequal data distribution [14]. A new technique called the Prefix-Cartesian Distributed Hash Table (PC-DHT) is presented here as a solution to these problems. Data search, storage, and administration in WSNs can be efficiently and scalable using PC-DHT, which combines Pastry's prefix-based routing with a multi-dimensional Cartesian coordinate system [15]. To provide fault tolerance and efficient resource utilization, the suggested method uses routing tables and leaf sets to partition the network into cells, which distribute data uniformly among sensor nodes [16].

The main contribution of the paper is:

- Prefix-Cartesian Distributed Hash Table

This paper is organized as follows for the rest of it. In Section 2, several writers discuss various scalable techniques for WSNs. Section 3 displays the PC-DHT model. The findings of the study are reviewed in Section 4. A discussion of the outcome and potential future research makes up Section 5.

Motivation of the paper

The motivation behind this paper stems from the growing need for scalable and efficient data management solutions in Wireless Sensor Networks (WSNs), which face significant challenges as network size and data traffic increase. Existing Distributed Hash Table (DHT) approaches often struggle with scalability, resource utilization, and fault tolerance, leading to performance bottlenecks in large-scale WSNs. To address these issues, the paper proposes the Prefix-Cartesian Distributed Hash Table (PC-DHT), designed to overcome these limitations by combining Pastry's prefix-based routing with the Cartesian coordinate system of CAN, offering a robust, scalable, and resource-efficient solution for managing data in WSNs.

Background study

Abolghasemi, O.*et al.* [1]the author looked at the restrictions and difficulties of building a scalable Iridium Short Burst Data(SBD)-based sensor network. Power consumption, scalability, bandwidth, and adaptability were highlighted as significant obstacles. Dogra R.*et al.* [3],the author has laid out the problems that smart cities encounter in this article. The author has devised a plan to make the combined IoT-WSN a reality. The author demonstrated that some routing techniques designed for smaller regions were inapplicable to larger ones. Nodes must be able to communicate for extended periods and interact on a large-scale network for smart city applications to operate. By expanding its region, the Zone-Stable Election Protocol(Z-SEP) fails to meet energy efficiency standards, as the author has shown in these author's case. In contrast to LEACH and SEP, Z-SEP has a much higher network throughput. An improvement for its use in the IoT can be achieved by altering the connection topology. To help

smart cities save energy, the author proposes a communication protocol based on a chain. Kumar, A. [5] Network modelling, a standard step in localization, was inherently non-deterministic. Because fuzzy logic systems are so good at dealing with uncertainties, this paper's research tried to describe the network so that it might solve the localization problem. The acquired results were further fine-tuned to ensure higher precision. On top of that, a cooperative approach that can scale to accommodate networks with a high number of nodes was suggested as a cost-effective option. To ensure that entrusted sensor nodes can distinguish between legitimate and malicious anchors, an authenticated system was included for security purposes. Modiri, V.*et al.* [7]. The goal of these authors in this study was to develop a combinatorial design for a critical pre-distribution mechanism in WSNs that might scale. These authors first applied residual design theory as a foundational framework for combinatorial algebra. The author translated the residual design to key pre-distribution as a service for WSNs. These authors' network scalability and connection were superior to other important pre-distribution systems. Padmanabhan, J., &Manickavasagam, V. [9]For systems that rely on mobile sensor networks, the author provides a decentralized wormhole detection approach using SPRT to determine wormholes based on neighbourhood changes. The system's security was assessed, the attacker's advantage was limited, and the system's mistake rates were examined. The study examines the impact of system characteristics on the proposed method and calculates the system overheads related to communication, computing, and storage. Zhong, X., & Liang, Y. [14] Incorporating opportunistic routing into the conventional souring routing method, the author introduced OSR, a protocol and strategy to route data using such opportunities. This allows for scalable, dependable downward actuation in massive WSN/IoT networks. Regarding resource-constrained and noisy WSNs, the unique opportunistic character of OSR fixes the basic problems with the drastic wireless connection dynamics.

Problem definition

The problem addressed in this paper is the scalability and efficiency limitations of existing Distributed Hash Table (DHT) algorithms in Wireless Sensor Networks (WSNs). As WSNs grow, these algorithms often face challenges related to data management, network congestion, uneven resource utilization, and fault tolerance, leading to reduced overall network performance. There is a need for a more scalable and efficient solution that can handle the increasing demands of large-scale WSNs while maintaining robustness and minimizing network delays.

MATERIALS AND METHODS

This section presents the proposed method, Prefix-Cartesian Distributed Hash Table (PC-DHT), as a scalable and efficient solution for data management in Wireless Sensor Networks (WSNs).

Network model

This section describes the network model for the Prefix-Cartesian Distributed Hash Table (PC-DHT). The network consists of a large-scale Wireless Sensor Network (WSN) where nodes are distributed across a Cartesian coordinate space. The WSN is divided into cells using the Cartesian coordinate system, with each node responsible for managing data within its assigned cell. The routing mechanism is based on a prefix-based routing scheme, similar to Pastry, which facilitates efficient data lookup and storage across the network. Let the WSN be modelled as a graph$G = (N, L)$, where N is the set of sensor nodes, and L represents the communication links between them. Each node$N_i \in N$ is assigned a unique identifier based on its Cartesian coordinates(x_i, y_i). The Cartesian plane is divided into cells, where each cell covers a region of space, and nodes are responsible for managing data in that space. The position of a node iii in the network is represented by its coordinates.(x_i, y_i). Nodes are organized based on the prefix-based routing mechanism. The region R managed by node i can be described as:

$R_i = \{(x, y) | x_{min} \leq x \leq x_{max}, y_{min} \leq y \leq y_{max}$ ---------- (1)

Where$x_{min}, x_{max}, y_{min}, y_{max}$, define the boundaries of the cell for node i.

Each node maintains a routing table.R_i and a leaf set L_i, which store information about neighbouring nodes and their respective regions. The routing table uses a prefix-based approach to forward data to the appropriate node based on its identifier.

For a given query with target coordinates(x_q, y_q), the routing decision is made by calculating the Euclidean distance between the current node i and the target position:

$$d(i,q) = \sqrt{(x_i - x_q)^2 + (y_i - y_q)^2} \text{ ---------- (2)}$$

The node with the smallest distance $d(i,q)$Is selected to forward the data.

System model

If we want our system to be practical, we must first pretend that the physical lines supporting it are flawless and that there is no packet loss while in transit. Secondly, we use the aforementioned model to simulate system churn; thus, the following is the definition of node failure probability under churn in our work:

$$p = 1 - \frac{E[R]}{E[R]+E[S]} \text{ ---------- (3)}$$

$E[R]$ is the estimated residual lifetime of the nodes; $E[S]$ is the expected routing information maintenance specialist'stime or stabilization interval in Chord.

Prefix-Cartesian Distributed Hash Table

The Prefix-Cartesian Distributed Hash Table (PC-DHT) is a novel algorithm designed to enhance scalability and efficiency in WSNs. It combines the prefix-based routing mechanism of Pastry with the multi-dimensional Cartesian coordinate system of CAN. PC-DHT dynamically organizes the network into cells, enabling efficient data lookup and storage operations. By distributing data management tasks evenly across nodes, PC-DHT improves resource utilization, reduces network congestion, and ensures fault tolerance, making it a robust solution for large-scale WSNs. Starting a broadcast operation is the first step for a node in a DHT network to create a d-ary PC-DHT, also known as a broadcast partition tree. Over time, this will partition the space of unique identifiers for which the node stands. Here, we have the d-ary BPT building process: All identity space is traversed by the root node. This collection of RPNs constitutes the child nodes of the root node. From the DHT protocol Chord and Tapestry, among others, we know that the node that met while going clockwise among each zone is the successor of the initial id of each area. Our method can potentially acquire the region's RPN using the DHT technique's basic function lookup. The node keeps specific timings for each region. If a child node c fails to acknowledge a node b before the timeout expires, the parent node will reflect a new RPN from the RPN list of the area the child node represents. Resetting the timer requires the node to broadcast a new message to the newly assigned RPN. Assuming the n_{succ}Timeout has passed, and no node is detected in the given area. The broadcast operation will be complete if no ACK is received for any RPNs in the RPN list.

$$T_i = n_{succ}^{h-i-1} \times T_B \ (i \geq 2) \text{ ---------- (4)}$$

Since σ is defined as 0.1 Δ and Δ is the mean of one-hop in the DHT network, we can express TB as 2(4 Δ + σ). There is sufficient time for the RPN in the lower area to finish the broadcast and retransmission processes, just as with TCP-style timeout settings. Therefore, the timer in the lower area suffers a timeout only because of an RPN node failure event. The top part has a timeout setting that is n_{succ}Times longer than the bottom section. In this section, we will present our PC-DHT implementation and quickly go over the design and analysis of the PC-DHT system. An easy and apparent way to minimize bandwidth would be to aggregate events into a single message, significantly if a peer can locally buffer them over time and send them all at once. However, this approach prolongs the time it takes for events to spread, which means there are more old entries in the routing tables. This problem is challenging because

many factors—like the system size and turnover rate—depend on the answer, and those variables might change abruptly. Two theorems, including conservative equations for calculating the average number of maintenance messages and bytes exchanged per peer, and eight well-defined rules describe PC-DHT in the original PC-DHT article.

$\Theta = \left(2 \cdot f \cdot S_{avg} - 2 \cdot \rho \cdot \delta_{avg}\right)/(8 + \rho)secs$ ---------- (5)

$N_{msgs} = 1 + \sum_{l-1}^{\rho-1} 1 - (1 - 2\Theta/S_{avg})^{i}$, ---------- (6)

$B_{D1TH} = N_{msgs} \cdot (v_m + v_a) + 2 \cdot n \cdot m \cdot \Theta/S_{avg}$---------- (7)

PC-DHT stands for the average maintenance bandwidth demand by the peer, δ_{avg} for the average message delay and S_{avg}For the average session duration. In a maintenance message, v_aIt is the number of bits used to indicate the message's status, and in an acknowledgement message, m is the number of bits used to describe the event. The longest period a peer can buffer events for, and Θ represents the maximum interval between two maintenance messages it sends in these equations.

Algorithm 1: Prefix-Cartesian Distributed Hash Table

Input:

- **ID Space (DHT Network)**: Total identifier space in the network, partitioned progressively.
- **Node List (n nodes)**: Nodes distributed across the ID space.

Steps:

- Identify the root node representing the entire ID space.
- Partition the ID space into smaller regions by identifying the child node-set using RPNlookup (via DHT protocol).
- The root node initiates the broadcast operation by sending the message to all child nodes in the first layer of the Broadcast Partition Tree (BPT).
- Each node keeps a timer T_i It is responsible for every region. If no ACK is received before the timeout, the node selects a fresh RPN for that region from the RPN list and retransmits the broadcast message.
- The timeout for a region in the i-th layer is computed as:

$T_i = n_{succ}^{h-i-1} \times T_B$ $(i \geq 2)$.

Output:

- **Successful Broadcast Operation**: Message propagated to all regions of the DHT network.

RESULTS AND DISCUSSION

The results and discussion section provides an analysis and interpretation of the outcomes of implementing the PC-DHT algorithm in Wireless Sensor Networks (WSNs). This section highlights the performance metrics, comparisons with existing methods (Z-SEP and SBD), and insights into the algorithm's effectiveness in improving routing efficiency, reducing energy consumption, and enhancing overall network performance. We will explore key metrics such as throughput levels, routing efficiency, energy levels, and packet delivery ratio to evaluate the performance of PC-DHT Routing and its advantages over Z-SEP and SBD in WSNs.

Throughput= $\frac{Numberof PacketSize}{Timeduration*SuccessfulaveragePacketsize}$ ---------- (8)

Figure 2: Throughput comparison chart

Table 1 and Figure 2 show throughput levels of the Z-SEP, SBD, and PC-DHT algorithms at different packet sizes, demonstrating a clear performance improvement trend as packet size increases. At a packet size of 50 bytes, PC-DHT achieves the highest throughput with a value of 0.685, outperforming Z-SEP (0.496) and SBD (0.598). This trend continues as packet sizes increase, with PC-DHT consistently leading in throughput. At 100 bytes, PC-DHT reaches

1.35, while SBD and Z-SEP show lower values of 1.196 and 0.942, respectively. At 150 bytes, PC-DHT extends its lead to 1.975, compared to 1.794 for SBD and 1.468 for Z-SEP. As packet size reaches 200 and 250 bytes, PC-DHT maintains its superior performance, achieving throughput values of 2.6 and 3.325, respectively, whereas SBD follows at 2.382 and 2.961, and Z-SEP trails at 1.984 and 2.391. These results indicate that PC-DHT consistently delivers higher throughput across all packet sizes, demonstrating its scalability and efficiency in handling larger data packets compared to Z-SEP and SBD.

$$\text{Energy}= \frac{Number of Sensor nodes}{Energy consumption for sending packets at a times} x\ 100 \quad \text{---------- (9)}$$

Table 2 and Figure 3 show energy consumption levels of Z-SEP, SBD, and PC-DHT across different numbers of nodes, revealing that PC-DHT consistently uses less energy than both Z-SEP and SBD, making it more energy-efficient. For a network with ten nodes, PC-DHT consumes 41 joules, lower than Z-SEP (48 joules) and SBD (44.6 joules). As the number of nodes increases, this trend continues, with PC-DHT consuming 81.9 joules at 20 nodes, while Z-SEP and SBD use 107 and 90 joules, respectively. At 40 nodes, PC-DHT's energy usage rises to 113.9 joules, still significantly lower than Z-SEP's 215 joules and SBD's 160 joules. As the node count reaches 60, 80, and 100, PC-DHT maintains its efficiency, consuming 220.8, 317, and 414.7 joules, respectively. In contrast, Z-SEP and SBD exhibit higher energy consumption, with Z-SEP reaching 548 joules and SBD at 466 joules for 100 nodes. These results highlight that PC-DHT is more energy-efficient, especially in more extensive networks, optimizing resource usage compared to Z-SEP and SBD.

$$\text{Time Delay}= \frac{Number\ of\ Sensor\ nodes}{energy\ consumption\ for\ sending\ packets\ at\ a\ times\ x\ forwarding\ time\ in\ ms} \quad \text{---------- (10)}$$

Table 3 and Figure 4 show end-to-end time delay in milliseconds (ms) across different numbers of nodes for Z-SEP, SBD, and PC-DHT, showing that PC-DHT consistently has the lowest delay, indicating superior efficiency in data transmission. PC-DHT has a delay of 0.035 ms for ten nodes, outperforming Z-SEP (0.050 ms) and SBD (0.044 ms). As the number of nodes increases to 20, PC-DHT maintains its lower delay at 0.081 ms, compared to 0.100 ms for Z-SEP and 0.090 ms for SBD. Notably, for 40 nodes, PC-DHT continues to exhibit a delay of 0.081 ms, while SBD's delay increases significantly to 0.185 ms, and Z-SEP experiences a slight increase to 0.107 ms. This trend holds as the node count grows, with PC-DHT recording delays of 0.171 ms, 0.262 ms, and 0.352 ms for 60, 80, and 100 nodes, respectively. In contrast, Z-SEP's delay reaches 0.418 ms, and SBD's delay hits 0.368 ms by 100 nodes. These results demonstrate that PC-DHT consistently achieves lower end-to-end delays, making it more suitable for time-sensitive applications in large-scale networks.

$$\text{PDR}= \frac{Number of Packets Receive}{Total Packets} * 100 \quad \text{---------- (11)}$$

Table 4 and Figure 5 showthe Packet Delivery Ratio (PDR) across different numbers of packets for Z-SEP, SBD, and PC-DHT, showing that PC-DHT consistently achieves the highest delivery rate, reflecting its superior reliability in data transmission. At 50 packets, PC-DHT delivers 99.3% of the packets, outperforming both Z-SEP (97.3%) and SBD (98.9%). As the packet count increases to 100, PC-DHT maintains a higher PDR of 99.7%, compared to 98.7% for Z-SEP and 99.3% for SBD. With 150 packets, PC-DHT reaches 99.8%, slightly ahead of SBD (99.57%) and Z-SEP (99.1%). For 200 packets, PC-DHT improves further to 99.9%, while SBD and Z-SEP record 99.7% and 99.4%, respectively. At 250 packets, PC-DHT slightly dips to 99.89%, still outperforming SBD at 99.69% and Z-SEP at 99.5%. These results demonstrate that PC-DHT offers the most reliable packet delivery across varying packet sizes, ensuring higher data transmission success in wireless sensor networks.

CONCLUSION

The Prefix-Cartesian Distributed Hash Table (PC-DHT) presented in this research addresses critical scalability challenges in Wireless Sensor Networks (WSNs) through an innovative integration of Pastry's prefix-based routing and CAN's multi-dimensional Cartesian coordinate system for load balancing and replication. PC-DHT significantly improves scalability, fault tolerance, and resource utilization by efficiently organizing the network into cells and distributing data management tasks evenly among nodes. The simulation results demonstrate that PC-DHT outperforms traditional Distributed Hash Table (DHT) approaches, particularly in handling large-scale networks with complex data management requirements. PC-DHT's ability to maintain robust network performance even under high node mobility and fault scenarios showcases its potential as a viable solution for dynamic WSN environments. Future work could further explore optimizing PC-DHT for specific WSN applications and extending its capabilities to incorporate energy-efficient routing mechanisms. Ultimately, PC-DHT offers a scalable, fault-tolerant, and resource-efficient framework for effective data management in WSNs, paving the way for more reliable and efficient sensor network deployments.

ABSTRACT

Nowadays, green synthesis plays a crucial role in modern science. It reduces the usage of toxic chemicals in the synthesis process and enhances their applications. This current work describes the synthesis of silver nanoparticles (AgNPs) using *Trigonellafoenum* seed aqueous extract as a stabilizing agent. The green synthesized nanoparticles are characterized by Fourier transform infrared spectroscopy (FTIR), X-ray diffraction (XRD), Scanning electron microscopy (SEM), and Energy dispersive X-ray spectroscopy (EDAX). XRD shows the crystallite size is about 84.64 nm. SEM images confirmed the Topographical morphology of Ag nanoparticles.

Keywords: silver, green synthesis, *Trigonellafoenum*, characterization.

INTRODUCTION

The study and manipulation of incredibly small-scale matter is known as nanoscience and nanotechnology, and it has several applications in physics, biology, and material science, among other scientific domains [1]. Noble metal-based nanoparticles, like those made of silver, gold, and other elements, are highly recognized for their distinct physicochemical properties and have a wide range of uses in a number of scientific domains, including biosensors, [5] food packaging, [6] environmental sciences, [4] tissue imaging, [7] biomedicine, [8] and catalysis [2, 3]. Due to

their exceptional properties, silver nanoparticles, or AgNPs, are becoming more and more useful in a variety of scientific and technological domains, including chemical, optical, electronic, photo electrochemical, catalytic, magnetic, and wound recuperation [9]. In the past few years, different methods have been employed to synthesize NPs, of which the biogenic method using plant extracts as reducing agents has drawn a lot of attention. Although many chemical and physical methods are employed to synthesize AgNPs, these methods either require high energy or may produce toxic by- products [10,11] which are not encouraging for biomedical uses. This has prompted new investigations in the field of green synthesis [12]. Plants are a good source of active. compounds, which can stimulate the reduction of Ag ions to AgNPs [13]. Although the exact mechanism for bio reduction still needs further elucidation, various studies have shown the safe, effective, and ecofriendly application of green synthesized AgNPs in the field of biomedicine [14,15,16], Fenugreek, or *Trigonella foenum graecum* , is a fragrant leguminous plant that is widely cultivated around the world. The primary source of several necessary elements, including iron, phosphorus, and sulphur, is fenugreek seeds. Fenugreek seeds have long been utilized for their many medicinal qualities, which include anti-parasitic, anti-cancer activity. Fenugreek (L. foenum-graecum), is a herb that is generally found in the Mediterranean parts of the world. The seeds and leaves are mainly used as a culinary spice and in Egypt, Italy and South Asia it is also used to treat a variety of health problems.[17,18,19,20] Fenugreek seeds contain protein, vitamin C, niacin, potassium, and diosgenin (which is a compound that has properties similar to estrogen). Other active constituents in fenugreek are alkaloids, lysine and L- tryptophan, as well as steroidal saponins (diosgenin, yamogenin, tigogenin, and neotigogenin) [21,22] Additionally, the development of a "green" form of AgNP synthesis is mostly dependent on the constituent bioactive components that are used as capping and stabilizing agents. Over the past few years, nanoscience research has concentrated on the biosynthesis and characterisation of metal nanoparticles with efficient photocatalytic activity utilizing clean technology, Because of their distinctive optical and catalytic qualities, AgNPs stand out in this regard and are frequently employed as photochemical degradation nanomaterials [23].

MATERIALS AND METHODS

Fresh seeds of fenugreek were collected from the local sellers. Every reagent was bought from Molychem in Mumbai, India. Analytical grade compounds were all that were used. We bought N/50 silver nitrate solution from Molychem Pvt. Ltd.

Seed extract Preparation

To get rid of any debris or dust particles, the seed was repeatedly rinsed with water. After that, the dried seed was grind into fine powder.. The powdered Fenugreek seed (10 gm) were dissolved in 100 mL of distilled water and boiled for approximately 40 minutes at a steady 80° C. After 30 minutes of incubation, the solution was centrifuged for 30 minutes at room temperature and 5000 rpm. Whatman filter paper was used to separate and filter the supernatant. Subsequently, silver ions (Ag+) were reduced to silver nanoparticles (Ag°) using the solution.

Preparation of Silver Nitrate Solutions

Silver nitrate solution was prepared by diluting the silver nitrate salt in various ratios with distilled water, different molar concentrations of the solutions were created.

Synthesis of Silver nanoparticle

To begin the process of creating silver nanoparticles, 2 mL of fenugreek seed extract was added to a solution of silver nitrate (1 mM). The sample's colour began to change after 15 minutes of incubation, from colourless to brownish to dark brown, which indicates the creation of silver nanoparticles in the sample. Ag ion is reduced to Ag° by the

bioactive compounds present in the seed extract. These atoms cause light to diffract at various wavelengths, which changes the sample's colour.

UV SPECTROSCOPY

In order to monitor the stability of AgNPs, UV-vis spectroscopy is a highly helpful and trust worthy approach for the primary characterisation of synthesised nanoparticles. The stability of AgNPs prepared from green methods was observed an SPR peak at the same wavelength using UV-vis spectroscopy.

FTIR

Using the KBr pellet technique, FT-IR spectra of synthesised Ag nanoparticles was obtained using a Shimadzu FT IR 8400S spectrometer. The FT IR spectrometer has a 4000-400 cm-1 spectral range. Bond vibrations produce the absorption spectrum, which provides important details on the existence of functional groups in the sample.

XRD

XRD pattern of the sample was performed with the help of an instrument named as Philips X'pert PRO 3040/60 diffracto meter at 298K in range 2020-80° using Cuka radiation A 1.5405 A. The average crystalline size of Ag NPs can be calculated using Debye-scherrer Formula.

$D = k\lambda/\beta \cos\theta$ Where D is particle size, K is constant, λ is the wavelength of X-rays used (1.54056 A), β is full width at half maximum and θ, Bragg's angle. Lattice parameters can be calculated using UnitCellWin software and crystallinity using Origin 2019b software.

EDAX

To ascertain the elemental composition and purity of the synthesised Ag nanoparticles, EDAX analysis was performed.

RESULTS AND DISCUSSION

Green synthesis of AgNPs

The fenugreek seed extract was used as a source of bio reducing agents to reduce silver ions during the green synthesis process that produced the silver nanoparticles. The determination and characterization of the synthesized silver nanoparticles form the basis of the previous investigation. Following a 24-hour incubation period, the sample was exposed to several characterization procedures, yielding the following outcomes:

Characterization Studies

Evaluation using a UV spectrophotometer

The UV-visible spectra verified the reduction of AgNPs in the silver complex's aqueous solution during the reaction with fenugreek seed extract. There was no peak between 300 and 600 nm in the AgNO3 solution or the fenugreek aqueous seed extract by themselves .This figure shows the UV spectrum of synthesized silver nanoparticles absorbed by the wavelength 449nm. Fig-1

INFRA RED SPECTROSCOPY

FTIR analysis of silver nano particle synthesized by seed extract. The FTIR spectrum of silver nanoparticles, the band between 3444.63 cm−1 and 2083.94 cm−1 corresponds to O–H stretching H-bonded alcohols and phenols or N–H amide groups. The peak found around 1634.56 cm−1 showed a stretch for C–H bond. The peak at 895.87 cm−1

characteristics to C-H bending ring deformation. The functional groups such as –N–H, –O–H, and C=O, groups present in sample might be responsible for bio reduction of Ag + to Ag nano particle.
1634.56 C=C Stretching

1634.56 indicates the presence of Benzene and Acrylate. 1000 -800cm−1 indicates C-H bending ring deformation. 3444.63cm−1 shown OH- Stretching from water or hydroxyl groups on the nanoparticle surface. 3200-3500cm−1 indicates Amine N-H Stretching. 2083.94 cm−1 Suggest the presence of alkyl Chains of capping agents or organic solvents. Fig-2

XRD

The XRD spectra of synthesised AgNPs shows crystalline structure. The presence of peaks at 20 values is 31.9", 38.2", 44.9°, 64.6", 77.5" The average crystalline size was calculated using Debye Scherrer Formula. The particle size of Silver Nanoparticles is 84.64nm. Fig-3

Scanning Electron Microscopy

The morphology of the green synthesized silver nanoparticles were characterized by SEM analysis. The Ag NPs are primarily flakes in form and aggregate into bigger particles, as shown by the SEM image. Fig-4

EDAX

Peaks were clearly seen in the EDAX spectrum, further confirming the synthesised AgNPs purity. For silver, the synthesised nanoparticles' elemental makeup is 100% by weight. Fig-5

In summary

The fenugreek seed extract used in this study was simple, fast, and effective green method of AgNP production. The chosen approach is consistent with the green chemistry concept since it makes use of naturally occurring bioactive compounds that act as capping and reducing agents while also being environmentally friendly. SEM revealed the morphology of synthesised nanoparticles are flakes-shaped. Using XRD analysis the size of the synthesised AgNPs is 84 nm.

ABSTRACT

The menopausal transition, including before perimenopause and perimenopause, involves significant physical, hormonal, and psychological changes. While much research focuses on physical and hormonal aspects, psychological well-being during this period is increasingly recognized as crucial. This study evaluates and compares psychological well-being between before perimenopausal and perimenopausal women to assess the impact of perimenopause on mental health. Conducted at Ayurved Hospital, Parul University, Vadodara, from April to July 2024, this observational study involved two groups: Group A (before perimenopausal women aged 20-39) and Group B (perimenopausal women aged 40-55). Psychological well-being was measured using the Psychological Well-being Scale. Group A showed higher scores across all dimensions compared to Group B, with particularly low Mental Health scores in perimenopausal women. The findings indicate a decline in psychological well-being during perimenopause. The study highlights the need for targeted psychological support during the menopausal transition.

Keywords: Menopause, Psychological Well-being, Perimenopause, Hormonal Changes, Mental Health

INTRODUCTION

The menopausal transition, which includes the before perimenopause, perimenopause, and post-menopause stages, is a normal and predictable occurrence in a healthy woman's life.[1] It usually happens in the fifth decade of life and signifies the termination of ovarian function and the ability for conception. The menopausal transition is acknowledged as a pivotal time marked by a variety of physical, hormonal, and psychological changes in addition to its physiological outcomes.[2,3] These changes, make it a unique and transformative experience for women. and helped to understanding of the unique challenges so it helped to improve the quality of care provided to them. There are many researches were done on different stages of women's life and they mostly centred on the physical changes and hormonal shifts.[4,5] Psychological aspects of the women have gained attention in recent years, acknowledging that psychological wellbeing is the part of health. This change in trends, led to an understanding of the different challenges of women and helped to improve the quality of care given to them. Here made an attempt to focus on other side of the coin that is psychological aspects of perimenopause.

METHODOLOGY

This is a non-randomized, observational study conducted between April 2024 to July 2024 in the Ayurved Hospital, Parul University, Vadodara, Gujarat, India. There was total two Group, and Health assessment taken in women with the help of "Health Assessment by Self Reporting questionaries"[6] and psychological health through "Psychological well-being scale" in the either group.[7]

Selection Criteria

In this study, the inclusion criteria encompassed apparently healthy females divided into two groups: Group A, before perimenopausal women aged between 20 to 39 years, and in Group B, Perimenopausal women aged 20 to 39 years. Exclusion criteria included females who have been menopausal for more than two years, those who have undergone hysterectomy, and any individuals diagnosed with major psychiatric illnesses or psychosomatic disorders affecting the mental health. After eligibility assessments, we included 40 patients from both the group.

Psychological well-being scale

In the present investigation measure the psychological wellbeing scale by Dr. Devendra Singh Sisodia and Pooja Choudhry was used the psychological well-being scale consists 50 items and subdived into five difrrent area of Satisfaction, Efficiency, sociability, Mental Health and Interpersonal Relations with answers like strongly agree, agree, disagree, response pattern.

RESULT

The study found that Group A exhibited higher scores across all areas of psychological well-being compared to Group B, as mentioned in the table1. This indicates a notable decline in psychological well-being during perimenopause.

Before Perimenopause (Group A)

The results for women in the Before Perimenopause stage demonstrate a generally high level of psychological well-being. Specifically, the mean scores for Satisfaction, Sociability, Mental Health, and Interpersonal Relations are all classified as "Above Average," while Efficiency is classified as "High." The overall psychological well-being score for this group is high. This suggests that women in this stage typically experience stability and positivity in various aspects of their psychological health.[8]

Perimenopause (Group B)

In contrast, the psychological well-being of women in the Perimenopause stage appears to decline. The mean scores for Satisfaction, Sociability, and Interpersonal Relations are classified as "Average," while Efficiency remains relatively high, classified as "Above Average." Mental Health, however, is classified as "Below Average," resulting in an overall "Average" level of psychological well-being for this group.[8]

DISCUSSION

Perimenopause, often referred to as the menopausal transition, is the period leading up to menopause characterized by hormonal fluctuations and symptoms such as irregular menstrual cycles, hot flashes, sleep disturbances, and mood changes.[9,10] These beginning in a woman's 40s but sometimes it may varies, this stage contrasts with the reproductive years. And before perimenopausal women generally experience stable hormone levels, regular menstrual cycles, and fewer symptoms.[11] Understanding the differences in psychological well-being between these stages is crucial for developing targeted interventions and support systems for women transitioning through these phases. Result shows (Table 1) the decline in psychological well-being during perimenopause can be attributed to several factors. Hormonal fluctuations, particularly changes in estrogen and progesterone levels, are known to affect mood and mental health.[12] These hormonal changes can lead to symptoms such as anxiety, depression, and irritability, which negatively impact psychological well-being.[13] Additionally, perimenopausal women often face increased life stressors, such as career pressures, family responsibilities, and concerns about aging, which can further contribute to reduced psychological well-being.[14] The observed decline in psychological well-being from Before Perimenopause to Perimenopause aligns with existing literature suggesting that perimenopausal women often experience increased psychological distress.[12,15,16] Hormonal fluctuations during perimenopause have been linked to mood disorders and decreased mental health, which is reflected in the lower mental health scores for Group B. The findings of this study have important implications for understanding the psychological transitions that women undergo during the menopausal transition. The high levels of psychological well-being observed in pre-perimenopausal women suggest that this stage is generally a period of psychological stability. However, the transition to perimenopause is associated with a noticeable decline in psychological well-being, particularly in mental health, which underscores the need for targeted psychological support during this stage.

FUTURE SCOPE

Future research should focus on longitudinal studies to track changes in psychological well-being across the menopausal transition in a larger and more diverse sample. Investigating the underlying mechanisms driving the decline in mental health during perimenopause could also provide valuable insights for developing interventions. Furthermore, exploring the role of lifestyle factors, such as diet, exercise, and social support, in mitigating psychological distress during this period would be beneficial.

CONCLUSION

In conclusion, this study highlights significant differences in psychological well-being between women in the Before Perimenopause and Perimenopause stages. The decline in psychological well-being during perimenopause, particularly in mental health, suggests a critical need for increased awareness and support for women undergoing this transition. These findings contribute to the growing body of literature on women's health and underscore the importance of addressing psychological well-being in midlife women.

ABSTRACT

In this paper, the proposed ANFIS-based PV-Wind hybrid system. In conventional systems, they proposed PI and FLC Currently, in power system networks, the distribution of energy plays a significant role in preserving power dependability in distribution systems designed to manage constant changes in the operating needs of the hybrid system. This design included a hybrid PV and wind energy system in addition to the planned hybrid system. To get the most out of the specified system approaches for maximum power point tracking (MPPT) have been presented. This study also concentrated on enhancing the hybrid system's stability. We provide a novel control strategy called the distributed power flow controller (DPFC) implementation with an optimization approach called the lion optimization algorithm (LOA)technique to enhance the power quality and transient stability of the proposed system. The use of a DPFC controller in a grid-connected system led to the initial development of this LOA control approach. Signals from the system's voltage and current characteristics were used to build the control approach. This work employed lion optimization and ANFIS methodologies to fine-tune these parameters. The proposed controller-equipped system was evaluated in MATLAB/Simulink, and the outcomes were contrasted.

Keywords: ANFIS Controller, PV Cell, Wind Energy.

INTRODUCTION

In the present scenario, the demand for electrical energy has increased rapidly. The utilization of conventional power generation systems, such as gas, coal, and nuclear power plants, causes pollution and greenhouse effects [1]. To overcome these environmental problems and meet the electrical demands, non-conventional sources play a key role in the present energy generation systems [2]. The main advantages of these renewable sources are pollution-free, low maintenance costs, and economical. There are more renewable systems available in the market; however, compared to all wind and solar energy systems, they play a key role because of their simple structure, available sources in the environment, and highly efficient conditions [3]. PV and wind energy systems play key roles as major energy sources in hybrid systems [4]. Photovoltaic systems are one of the most convenient renewable energy systems compared to other renewable energy sources [5]. Photovoltaic systems are not naturally stable in time, location, season, and weather, and the cost of installing solar systems is very high. Changes in weather conditions affect the output generated by the solar system [6]. Therefore, to achieve the maximum output and increase the efficiency of the solar panel, MPPT techniques were implemented [7]. Based on the available natural conditions, wind energy systems are also a major renewable source for PV systems. The ratio of electrical energy generation is based on the availability of wind in nature [8]. Changes in weather conditions affect the outputs generated by the wind systems [9]. Therefore, to achieve maximum output and increase the efficiency of the wind system, MPPT techniques are implemented. The system must maintain synchronization with the grid.

Methodology And Conceptual Framework

This interdisciplinary study focuses on creating sustainable development for solar PV systems. To create a conceptual framework and to overcome the practical limitations, a robust approach is followed in the current research. The research agenda and framework, illustrated in Fig. 2, provide a novel sustainable research model for solar PV energy conversion with specific reference to India. This model links transformation and its associated organizational activities. Through innovating new research models, one can re-conceptualize the purpose of the energy sector, value-creating logic, and reanalyse the value perceptions. In the current research paper, the people's insights and sociocultural divergence upon solar PV energy systems are discussed.

Proposed System Configuration

The system layout investigated in this paper is shown in Fig. 1. It consists of a solar PV connected through a DC/DC boost converter where the MPPT algorithm receives the current and voltage values of the solar PV and outputs the duty cycle that switches the boost converter to extract maximum power from the solar PV. On the other hand, the charging and discharging of the battery is performed by the battery charge controller through the bidirectional buck-boost converter, whereby the parameters considered are battery current and voltage at the DC bus to ensure that the voltage at the DC bus is kept constant. Solar PV as the main source of power operates at Maximum Power Point (MPP) while the battery ESS complements the entire system by charging or discharging in order to balance power supplied to the DC and AC loads.

ANFIS Structure

For simplicity, it is assumed that the fuzzy inference system under consideration has two inputs and one output. The rule base contains the fuzzy if-then rules of Takagi and Sugeno's type as follows:

If x is A and y is B then z is f(x, y)

where A and B are the fuzzy sets in the antecedents and z = f (x, y) is a crisp function in the consequent. Usually f(x, y) is a polynomial for the input variables x and y. But it can also be any other function that can approximately describe the output of the system within the fuzzy region as specified by the antecedent. When f(x,y) is a constant, a zero-order Sugeno fuzzy model is formed which may be considered to be a special case of the Mamdani fuzzy inference system where each rule consequent is specified by a fuzzy singleton. If f (x, y) is taken to be a first-order

polynomial a first-order Sugeno fuzzy model is formed. For a first order two rule Sugeno fuzzy inference system, the two rules may be stated as:
Rule 1: If x is A1 and y is B1 then f1 = p1x + q1y + r1
Rule 2: If x is A2 and y is B2 then f2 = p2x + q2y + r2
The corresponding equivalent ANFIS structure is shown in Fig. 4.

SIMULATION RESULTS

In this paper, modeling, and coordination control of hybrid solar PV-wind systems for rural electrification applications have been presented. The proposed control scheme maintains the system frequency and voltage at the PCC notwithstanding the load variations. It has been confirmed that proper optimization of the ESS highly reduced the investment cost of renewable systems that can expedite rural electrification. Performance of the system has been validated through simulations carried out in MATLAB/Simulink platform where different scenarios were successfully tested and results are shown in Fig 5, Fig 6, and Fig 7 with ANFIS Controller. Case 1: Improvement of Power Quality In A Hybrid System Using Pi And Fuzzy Based DPFC Controllers

CONCLUSION

For a distributed power flow controller, we suggested a novel optimization-based (ANFIS) control technique in this thesis to increase a hybrid system's dependability, power quality, and transient stability. Additionally, an MPPT controller was put in place for the hybrid system's PV and wind energy systems to enhance performance. To adjust the settings of DPFC series and shunt controllers, many control strategies have been used in the literature. In the MATLAB/Simulink environment, these examples passed testing and verification with flying colours. Based on these findings, the LOA-based ANFIS controller outperformed the traditional fuzzy controller in terms of stability and power quality.

ABSTRACT

The Bharatiya Sakshya Adhiniyam (BSA) 2023 represents a significant reform in India's legal framework, particularly concerning the handling and admissibility of digital evidence. This legislation modernizes the Indian Evidence Act of 1872, acknowledging the critical role of electronic records in contemporary legal proceedings. The BSA establishes electronic and digital records as primary evidence, thereby simplifying the process of evidence submission in courts. This shift not only reflects the growing reliance on digital communication but also addresses the challenges posed by technological advancements, such as the potential for evidence manipulation and authenticity disputes. The act delineates clear guidelines for the admissibility of electronic evidence, including emails, text messages, and digital documents, ensuring they carry the same legal weight as traditional paper documents. Furthermore, it introduces provisions for the authentication of such evidence, requiring certificates to validate the origin of contested digital records. This framework aims to enhance the credibility of judicial proceedings while safeguarding against potential abuses of digital evidence. The BSA's implications extend to both civil and criminal cases, facilitating a more efficient legal process in an increasingly digital world. As legal practitioners navigate this new landscape, the need for robust safeguards and clear judicial interpretations will be paramount. This examination of the BSA 2023 seeks to explore its provisions, challenges, and the broader impact on the Indian legal system as it adapts to the digital age.

Keywords: Bharatiya Sakshya Adhiniyam, Digital Evidence, Legal Framework, Admissibility, Electronic Records, Judicial Proceedings

INTRODUCTION

The advent of the digital age has profoundly impacted every aspect of human society, including the legal system. As digital communication and record-keeping have become ubiquitous, the need for a robust legal framework to handle electronic evidence has become increasingly apparent. In response to this need, India has introduced the Bharatiya Sakshya Adhiniyam (BSA) 2023, a landmark legislation that significantly reforms the country's approach to digital evidence. The BSA 2023 represents a crucial update to the Indian Evidence Act of 1872, which, despite numerous amendments, had struggled to keep pace with rapid technological advancements. This new legislation acknowledges the central role that electronic records now play in legal proceedings and aims to provide a comprehensive framework for their admissibility and handling in courts. The importance of digital evidence in modern law cannot be overstated. From emails and text messages to social media posts and digital financial records, electronic data has become integral to both civil and criminal cases. However, the unique nature of digital evidence – its ease of manipulation, issues of authenticity, and the technical expertise often required for its interpretation – presents significant challenges to the legal system. The BSA 2023 seeks to address these challenges by establishing clear guidelines for the treatment of digital evidence. By recognizing electronic and digital records as primary evidence, the Act aims to streamline the process of evidence submission in courts. This shift not only reflects the reality of modern communication but also has far-reaching implications for the conduct of legal proceedings in India. This paper will examine the key provisions of the BSA 2023, explore its impact on judicial proceedings, and discuss the challenges and safeguards associated with the new framework. Through this analysis, we aim to provide a comprehensive understanding of how the BSA 2023 is reshaping India's legal landscape in the digital age.

Key Provisions of the BSA 2023

Definition and Classification of Digital Evidence

The BSA's definition of "document" in Section 2(d) states that it "means any matter expressed or described or otherwise recorded upon any substance by means of letters, figures or marks or any other means or by more than one of those means, intended to be used, or which may be used, for the purpose of recording that matter and includes electronic and digital records." This expanded definition of "document" to explicitly cover electronic and digital records is a key change from the previous Indian Evidence Act, 1872. The BSA aims to treat electronic evidence on par with traditional documentary evidence, subject to certain safeguards. The Bharatiya Sakshya Adhiniyam, 2023 provides a comprehensive definition of digital evidence, expanding upon previous legislative efforts to encompass the wide array of electronic records that are now commonplace in legal proceedings. Under the BSA, digital evidence is broadly defined as any information of probative value that is stored or transmitted in digital form. This includes, but is not limited to:

1. Emails and instant messaging communications
2. Social media posts and interactions
3. Digital documents and spreadsheets
4. Database records
5. Digital images and videos
6. Website content and metadata
7. Log files from computers and networks
8. Data from mobile devices and apps

The Act further classifies digital evidence into two main categories:

a) Native Digital Evidence

Information that is "born digital," i.e., created, stored, and transmitted in digital form from its inception. Examples include emails, digital photographs, and computer-generated reports.

b) Digitized Evidence

Physical evidence that has been converted into digital form, such as scanned documents or digitized audio recordings. This classification is significant as it recognizes the diverse origins of digital evidence and potentially impacts the methods used to authenticate and present such evidence in court.

Relevance of Section 57 Primary Evidence with new explanations under the Bharatiya Sakshya Adhiniyam (BSA) 2023

Section 57 of the Bharatiya Sakshya Adhiniyam (BSA) 2023 has added four new explanations to define what constitutes primary evidence:

1. **Electronic or digital records**, when recorded or stored, are each considered primary evidence.
2. **An electronic or digital record** produced from proper custody is primary evidence unless contested.
3. **Each stored video recording** in electronic form or during transmission is primary evidence.
4. **When an electronic record** is stored in multiple spaces within a computer resource, each automated storage, including temporary files, is considered primary evidence.

Explanation 4 of Section 57

"Where an electronic or digital record is created or stored, and such storage occurs simultaneously or sequentially in multiple files, each such file is primary evidence." This explanation addresses situations where digital content is stored in multiple files, either simultaneously or sequentially. Each of these files is considered primary evidence.

Example

Imagine a company's financial software that automatically saves transaction data in multiple formats (e.g., .csv, .xlsx, and .pdf) for backup and reporting purposes. Each of these files, despite containing the same information, would be considered primary evidence under this explanation.

Case Study

In a corporate fraud investigation, the accused argues that only the .xlsx file should be admissible as primary evidence. However, the prosecution successfully argues that all three file formats (.csv, .xlsx, and .pdf) are primary evidence under Explanation 4, allowing for a more comprehensive examination of the financial records.

Explanation 5of Section 57

"Where an electronic or digital record is produced from proper custody, such electronic and digital record is primary evidence unless it is disputed." This explanation establishes that electronic or digital records from proper custody are considered primary evidence by default, unless challenged.

Example

Emails retrieved from a company's official email server by the IT department would be considered primary evidence in a workplace harassment case.

Case Study

In a defamation lawsuit, the plaintiff presents social media posts retrieved from the defendant's account by a court-appointed digital forensic expert. The posts are considered primary evidence under Explanation 5. However, the defendant disputes the authenticity of the posts, claiming their account was hacked. This dispute triggers a more in-depth investigation into the posts' authenticity.

Explanation 6of Section 57

"Where a video recording is simultaneously stored in electronic form and transmitted or broadcast or transferred to another, each of the stored recordings is primary evidence." This explanation deals with video recordings that are both stored and transmitted, establishing that each instance of the recording is primary evidence.

Example
A live-streamed video of a public event that is simultaneously recorded on the streamer's device and on the streaming platform's servers would result in two instances of primary evidence.

Case Study
During a high-profile political rally, a controversial statement is made. The speech is live-streamed and simultaneously recorded on multiple devices. In subsequent legal proceedings, both the original recording on the videographer's camera and the version stored on the streaming platform's servers are admitted as primary evidence, allowing for comparison and verification of the statement's context and content.

Explanation 7 of section 57
"Where an electronic or digital record is stored in multiple storage spaces in a computer resource, each such automated storage, including temporary files, is primary evidence." This explanation broadens the scope of primary evidence to include all instances of a digital record within a computer system, including temporary files.

Example
When a user edits a document in a word processor, the software may create temporary files and autosave versions. Under this explanation, all these files would be considered primary evidence.

Case Study
In a copyright infringement case, the defendant claims they never possessed a certain digital artwork. However, a forensic analysis of their computer reveals traces of the artwork in temporary files and the system's cache. Despite the defendant's attempts to delete the main file, these temporary and cached versions are admissible as primary evidence under Explanation 7, providing crucial proof in the case. These explanations collectively broaden the definition of primary evidence in the digital realm, acknowledging the complex nature of electronic data storage and transmission. They aim to ensure that all relevant digital records can be considered in legal proceedings, promoting a more comprehensive approach to electronic evidence.

Admissibility Criteria for Electronic Records
One of the most significant aspects of the BSA 2023 is its establishment of clear criteria for the admissibility of electronic records in legal proceedings. The Act stipulates that electronic records are admissible as evidence if they meet the following conditions:

1. **Authenticity**: The electronic record must be demonstrably authentic, meaning it can be shown to be what it purports to be. The Act provides guidelines for establishing authenticity, including the use of digital signatures, hash values, and metadata analysis.
2. **Integrity:** The record must be shown to have maintained its integrity from the time of its creation to its presentation in court. This means demonstrating that the record has not been altered or tampered with in any unauthorized manner.
3. **Reliability**: The system or process used to produce the electronic record must be shown to be reliable. This includes considerations of the security measures in place, the expertise of the personnel involved, and the consistency of the output.
4. **Best Evidence Rule**: The BSA 2023 modifies the traditional "best evidence" rule to accommodate electronic records. It stipulates that an electronic record can be considered the best evidence if it is the original or a duplicate that accurately reproduces the original.
5. **Hearsay Rule:** The Act addresses the application of the hearsay rule to electronic records, providing exceptions for business records and public records that are kept in electronic form.
6. **Chain of Custody**: For electronic records to be admissible, a clear chain of custody must be established, detailing how the evidence was collected, stored, and handled from its creation or discovery to its presentation in court.

7. **Expert Testimony**: In cases where the interpretation of electronic evidence requires specialized knowledge, the Act provides for the admissibility of expert testimony to explain technical aspects of the evidence. These admissibility criteria are designed to ensure that electronic records are treated with the same rigor as traditional forms of evidence while acknowledging their unique characteristics. The Act also empowers judges to consider the reliability and accuracy of the methods used to generate, store, and retrieve electronic records when determining their admissibility. Furthermore, the BSA 2023 introduces a presumption of validity for certain types of electronic records, such as those produced by government agencies or regulated financial institutions, provided they meet specific criteria outlined in the Act. This presumption shifts the burden of proof to the party challenging the authenticity or reliability of such records. By establishing these clear and comprehensive admissibility criteria, the BSA 2023 aims to provide a robust framework for the handling of digital evidence in Indian courts, balancing the need for technological adaptation with the fundamental principles of evidence law.

Difference between Section 65 B of Indian Evidence Act 1872 (Old Law) and Section 63 of Bharatiya Sakshya Adhiniyam 2023 (New Law)

The key differences between Section 65B of the Indian Evidence Act, 1872 (IEA) and Section 63 of the Bharatiya Sakshya Adhiniyam, 2023 (BSA) regarding the admissibility of electronic evidence are:

a. Expanded Scope of Electronic Records

- **IEA Section 65B**: Covers electronic records stored in optical or magnetic media.
- **BSA Section 63**: Expands the scope to electronic records stored in semiconductor memory and any communication device like smartphones and laptops.

b. Mandatory Certificate Requirement

- **IEA Section 65B (4)**: Requires a certificate identifying the electronic record, describing its generation, and certifying its integrity and reliability.
- **BSA Section 63(4)**: Retains the mandatory certificate requirement but specifies it must be provided by the person in charge of the computer/device and an expert.

c. Format of Certificate

- **IEA**: Does not specify the format of the certificate, often presented as an affidavit in practice.
- **BSA Section 63(4)(c)**: Introduces Schedule A and B for the certificate format. Part A to be filled by the party producing the record, Part B by an expert certifying the hash values.

d. Admissibility of Secondary Evidence

- **IEA Section 65B**: Allows secondary evidence of electronic records in certain circumstances like loss of original.
- **BSA**: Reclassifies electronic records as primary evidence, making them admissible without requiring secondary evidence status.

e. Contradictory Provisions

- **BSA**: While retaining certificate requirements, also classifies electronic records as documents, potentially creating contradictions in their treatment. In summary, the BSA expands the scope of electronic records, retains mandatory certificates but with expert involvement, introduces a standardized format, and reclassifies electronic records as primary evidence. However, it also introduces potential contradictions in the treatment of electronic evidence compared to the IEA.

Impact of Digital Evidence under BSA 2023 on judicial proceedings

The introduction of the Bharatiya Sakshya Adhiniyam (BSA) 2023 has significantly transformed the landscape of judicial proceedings in India, particularly regarding the handling of digital evidence.

Comprehensive Framework for Admissibility

1. **Clear Guidelines**
    - The BSA 2023 establishes clear guidelines for the admissibility of electronic records, addressing ambiguities that existed under previous laws. This clarity helps legal practitioners understand the requirements for presenting digital evidence, reducing disputes over admissibility.

2. **Presumption of Genuineness**
    - Section 63(3) introduces a presumption of genuineness for electronic records that meet the conditions outlined in Section 63(2). This presumption shifts the burden of proof to the opposing party, making it easier for litigants to present their digital evidence without extensive preliminary challenges.

Impact on Evidence Collection and Authentication

1. **Standardized Procedures**:
    - The BSA 2023 mandates specific procedures for collecting and authenticating digital evidence, including the requirement for a certificate of authentication under Section 63(4). This standardization ensures that evidence is collected in a manner that preserves its integrity and reliability.
2. **Expert Involvement**:
    - The provision for expert testimony regarding the authenticity and reliability of digital evidence enhances the credibility of the evidence presented in court. Experts can provide insights into the functioning of digital systems, helping judges understand complex technological issues.

Presentation of Evidence in Court

1. **Holistic Approach**:
    - By treating multiple devices as a single "computer or communication device," Section 63(3) allows for a more holistic presentation of evidence. This is particularly relevant in cases involving interconnected systems, such as IoT devices or cloud storage, where evidence may originate from various sources.
2. **Efficiency in Proceedings**:
    - The streamlined processes for admitting digital evidence contribute to greater efficiency in judicial proceedings. Courts can focus on the substantive issues of a case rather than getting bogged down in procedural disputes over the admissibility of evidence.

Utilization of Technological Advancements

1. **Embracing Digital Tools**:
    - The BSA 2023 encourages the use of technological advancements in legal arguments. Lawyers can leverage digital evidence from emails, social media, and other electronic communications to support their cases, reflecting the realities of modern communication.
2. **Facilitating Remote Evidence**:
    - The framework supports the admissibility of evidence collected remotely, such as video conferencing records or data from online transactions. This flexibility is particularly important in a post-pandemic world where remote interactions have become commonplace.

Safeguards Against Manipulation

1. **Preventing Tampering**:
    - The requirements for authentication and expert validation serve as safeguards against the manipulation or tampering of digital evidence. Courts can rely on the integrity of the evidence presented, which is crucial for maintaining public trust in the judicial system.
2. **Accountability**:
    - The accountability placed on individuals responsible for the collection and authentication of digital evidence helps ensure that the evidence presented in court is reliable and trustworthy.

Modernization of Legal Processes

1. **Alignment with the Digital Age**:
    - The BSA 2023 modernizes legal processes to align with the realities of the digital age. As society increasingly relies on digital communication and transactions, the legal framework must adapt to ensure that justice is served effectively.
2. **Faster Resolutions**:
    - With a more efficient framework for handling digital evidence, cases involving electronic communications or transactions can be resolved more quickly. This is particularly beneficial in commercial disputes, cybercrime cases, and other matters where time-sensitive evidence is crucial. Overall, the introduction of digital evidence provisions under the BSA 2023 significantly enhances the judicial process by providing a comprehensive framework for the admissibility and handling of electronic records. It modernizes legal practices, ensures the integrity of evidence, and allows for the effective utilization of technology in legal arguments. As a result, the BSA 2023 not only improves the efficiency of judicial proceedings but also strengthens the overall framework for justice in an increasingly digital world.

Key differences between the Indian Evidence Act, 1872 (Old Law) and the Bharatiya Sakshya Adhiniyam (BSA)2023 (New Law) regarding electronic records:

The key differences between the Indian Evidence Act, 1872 and the Bharatiya Sakshya Adhiniyam 2023 regarding electronic records are:

Definition of "Document"

- The Indian Evidence Act, 1872 defined "document" in a limited way, without explicitly including electronic records.
- In contrast, the Bharatiya Sakshya Adhiniyam 2023 has expanded the definition of "document" to explicitly include "electronic and digital records."

Admissibility of Electronic Evidence

- The Bharatiya Sakshya Adhiniyam 2023 provides that electronic or digital records shall have the same legal effect, validity and enforceability as any other document.
- It seeks to expand the scope of secondary evidence to include copies made from original by mechanical processes, copies made from or compared with the original, and oral accounts of the contents of a document accompanied by a matching hash value.

Certificate for Electronic Evidence

- The old 65B Certificate under the Indian Evidence Act is replaced by a new two-part certificate under Section 63(4)(c) of the Bharatiya Sakshya Adhiniyam 2023.
- Part A is to be filled by the party submitting the evidence, and Part B is to be filled by an expert.

Hash Value Requirement

- The Bharatiya Sakshya Adhiniyam 2023 mandates submitting a report of the hash value of the electronic record along with the certificate under Section 63(4)(c). In summary, the Bharatiya Sakshya Adhiniyam 2023 has significantly expanded the definition and admissibility of electronic records as evidence, with new certification and hash value requirements, compared to the previous Indian Evidence Act, 1872

Process for submitting electronic evidence into court under the BSA

The process for submitting electronic evidence into court under the Bharatiya Sakshya Adhiniyam (BSA) 2023 in India involves the following key steps:

Classifying Electronic Records as Primary Evidence:

- The BSA explicitly classifies electronic and digital records as a form of "primary evidence" under Section 57.
- This is a significant shift from the Indian Evidence Act, 1872 which had categorized electronic records as "secondary evidence."

Mandatory Hash Value Report:

- The BSA mandates submitting a report of the hash value of the electronic record along with the certificate under Section 63(4)(c).
- The hash values serve as digital fingerprints to verify the integrity and authenticity of the electronic evidence.

Two-Part Certificate:

- The electronic evidence is submitted along with a two-part certificate as required under Section 63(4)(c) of the BSA.
- Part A is filled out by the party submitting the evidence, providing details about the electronic records.
- Part B is filled out by a digital forensics' expert, who validates the authenticity and integrity of the electronic evidence.

Chain of Custody Documentation:

- The digital forensics expert also provides detailed documentation on the chain of custody for the seized electronic devices and the extracted digital evidence.
- This includes logging the handling and storage of the devices and data during the investigation process.

Expert Testimony:

- During the trial, the digital forensics expert who filled out Part B of the certificate may be called upon to testify about the certification process and the authenticity of the electronic evidence.
- The expert can explain the technical details, such as the hash value generation, the chain of custody procedures, and any other relevant information to assist the court in evaluating the reliability and admissibility of the electronic evidence. By following this process, which includes the mandatory hash value report, two-part certificate with expert validation, and chain of custody documentation, the party submitting electronic evidence can establish its integrity and authenticity as per the requirements of the BSA 2023.The court can then evaluate the admissibility and weight of the electronic evidence based on the information provided through this certification process.

Elaboration of Certificate under Section 63 of BSA 2023 appended as a schedule to the Adhiniyam 2023:

The Certificate under Section 63(4) of the BSA 2023 is divided into two parts:

Part A: To be filled by the person in charge of the computer or communication device or the management of the relevant activities

Identification of Electronic Record(s)

- This section requires the identification of the specific electronic record(s) containing the relevant information.
- The person filling out the certificate must provide a detailed description of the electronic record(s), including the file name(s), file type(s), and any other relevant details.

Description of Production Manner

- This section requires a description of the manner in which the electronic record(s) were produced.
- The person filling out the certificate must provide information about the devices, communication channels, and processes involved in the creation, storage, or processing of the electronic record(s).

Particulars of Devices Involved:

- This section requires the provision of details about the devices involved in the production of the electronic record(s).

- The person filling out the certificate must provide information such as the type of device(s), the period over which the device(s) were used, and the activities for which the device(s) were regularly used.

Compliance with Section 63(2) Conditions

- This section requires the person filling out the certificate to address the conditions outlined in Section 63(2) of the BSA 2023.
- The person must confirm that the electronic record(s) were produced during the regular use of the devices, that the relevant information was regularly fed into the devices, and that the devices were operating properly during the material part of the period.

Hash Value(s) of the Electronic Record(s)

- This section requires the person filling out the certificate to provide the hash value(s) of the electronic record(s).
- The hash value(s) must be generated using legally acceptable standard hash algorithms, such as SHA1, SHA256, or MD5.

Signature and Identification of the Signatory:

- The certificate must be signed by the person in charge of the computer or communication device or the management of the relevant activities.
- The signatory must provide their name, designation, and contact details.

Part B: To be filled by the expert

Verification of Hash Value(s):

- This section requires an expert to verify the hash value(s) provided in Part A of the certificate.
- The expert must confirm that the hash value(s) were generated using the appropriate hash algorithm(s) and that the electronic record(s) have not been tampered with or altered.

Signature and Identification of the Expert:

- The certificate must be signed by an expert, who can be a digital forensics expert or a person with specialized knowledge in the relevant field.
- The expert must provide their name, qualifications, and contact details. The key differences between the Certificate under Section 63 of the BSA 2023 (New Law) and the previous Section 65B Certificate under the Indian Evidence Act 1872 (Old Law). The main changes include:

1. The requirement for the certificate to be signed by two persons instead of one: the person in charge of the devices/activities and an expert.
2. The inclusion of specific details about the devices involved and their compliance with the conditions outlined in Section 63(2).
3. The requirement to provide the hash value(s) of the electronic record(s) and have them verified by an expert. These changes aim to enhance the reliability and authenticity of the electronic evidence presented in court, ensuring that the legal framework keeps pace with the evolving technological landscape

Implications for Civil and Criminal Cases

The BSA 2023 has far-reaching implications for both civil and criminal cases in India. Its provisions affect various aspects of legal proceedings, from investigation and discovery to trial and appeal.

In Civil Cases

1. *E-Discovery*: The Act provides a framework for electronic discovery, making it easier for parties to request and obtain relevant digital evidence from opposing parties or third parties.
2. *Contractual Disputes*: Digital contracts and electronic signatures are given explicit legal recognition, potentially simplifying the resolution of contractual disputes.

3. *Intellectual Property*: The BSA 2023 enhances the ability to present and analyze digital evidence in intellectual property cases, particularly those involving software patents or online copyright infringement.
4. *Employment Law*: The Act facilitates the use of electronic communications and digital records as evidence in employment-related disputes, such as wrongful termination or workplace harassment cases.

In Criminal Cases

1. *Cybercrime Prosecution*: The BSA 2023 strengthens the legal framework for prosecuting cybercrimes by providing clear guidelines for the admissibility of digital forensic evidence.
2. *Digital Alibi*: The Act recognizes digital evidence that may provide an alibi, such as geolocation data from mobile devices or electronic transaction records.
3. *Surveillance Evidence*: The BSA 2023 addresses the admissibility of evidence obtained through digital surveillance, balancing law enforcement needs with privacy concerns.
4. *Chain of Custody*: The Act's provisions on maintaining the chain of custody for digital evidence are particularly crucial in criminal cases, where the integrity of evidence is often scrutinized.

Across both civil and criminal domains, the BSA 2023 is expected to:

1. **Accelerate Legal Proceedings**: By streamlining the handling of digital evidence, the Act may lead to faster resolution of cases.
2. **Increase Reliance on Expert Witnesses**: The technical nature of digital evidence may necessitate greater involvement of expert witnesses to interpret and authenticate electronic records.
3. **Enhance Cross-Border Litigation**: The Act's provisions for handling international digital evidence may facilitate more effective cross-border litigation and cooperation.
4. **Shift in Legal Strategy**: Lawyers may need to adapt their strategies to effectively leverage or challenge digital evidence under the new framework.
5. **Judicial Training**: The complexity of digital evidence may require enhanced training for judges to effectively evaluate and weigh such evidence.

The BSA 2023 thus represents a significant shift in the Indian legal landscape, requiring adaptation from all stakeholders in the judicial system. While it presents challenges, it also offers opportunities for more efficient and technologically relevant legal proceedings in both civil and criminal contexts.

Challenges and Safeguards

Issues of Authenticity and Manipulation

The increased reliance on digital evidence brings with it significant challenges, particularly concerning the authenticity and potential manipulation of electronic records. The BSA 2023 acknowledges these challenges and attempts to address them, but several issues remain at the forefront:

1. *Digital Forgery*: Advanced technologies have made it increasingly difficult to distinguish between genuine and forged digital documents. The Act must contend with sophisticated methods of creating false emails, doctored images, or manipulated video content.
2. *Metadata Manipulation*: Metadata, which provides crucial information about the creation and modification of digital files, can be altered. This poses challenges in establishing the true origin and history of electronic evidence.
3. *Cloud Storage Complexities*: With data often stored across multiple servers in different jurisdictions, establishing the authenticity and chain of custody for cloud-based evidence becomes complex.
4. *Deep Fakes*: The rise of AI-generated deep fake technology presents a significant challenge in authenticating audio and video evidence.
5. *Encryption and Data Recovery*: Strong encryption can make it difficult to access and verify the contents of digital evidence, while data recovery techniques may raise questions about the integrity of recovered information.
6. *Time Stamping and Chronology*: Establishing the exact timing and sequence of digital events can be challenging, especially when dealing with evidence from different time zones or systems with unsynchronized clocks.

7. Volume and Complexity: The sheer volume and technical complexity of digital evidence can make thorough authentication a time-consuming and resource-intensive process.

Proposed Safeguards for Digital Evidence

To address these challenges, the BSA 2023 proposes several safeguards and best practices:

1. *Digital Forensics Standards*: The Act calls for the development and regular updating of standardized digital forensics procedures to ensure consistent and reliable examination of electronic evidence.
2. *Blockchain for Authentication*: The use of blockchain technology is proposed as a means to create tamper-evident logs of digital evidence, providing a verifiable chain of custody.
3. *AI-Assisted Verification*: The Act encourages the development of AI tools to assist in detecting manipulated or forged digital content, while acknowledging the need for human oversight in the verification process.
4. *Enhanced Metadata Protection*: Stricter protocols for preserving and authenticating metadata are outlined, including the use of cryptographic hashing to detect any alterations.
5. *Expert Witness Certification*: The BSA 2023 proposes a certification program for digital forensics experts to ensure that courts have access to qualified professionals who can accurately analyze and testify about complex digital evidence.
6. *Judicial Training Programs*: Comprehensive training programs for judges and legal professionals are mandated to enhance their understanding of digital evidence and associated technologies.
7. *Cross-Examination Guidelines*: The Act provides guidelines for the effective cross-examination of witnesses presenting digital evidence, including questions to probe the authenticity and reliability of electronic records.
8. *International Cooperation*: Provisions for international cooperation in digital evidence collection and verification are included, recognizing the global nature of many digital crimes and disputes.
9. *Continuous Review Mechanism*: The BSA 2023 establishes a committee to continuously review and update the Act's provisions in light of technological advancements and emerging challenges.
10. *Privacy Safeguards*: While facilitating the use of digital evidence, the Act also includes provisions to protect individual privacy, setting limits on the collection and use of personal digital information. These safeguards aim to strike a balance between leveraging the benefits of digital evidence and maintaining the integrity and fairness of legal proceedings. However, their effectiveness will depend on consistent implementation and ongoing adaptation to technological changes. As the legal system continues to grapple with the complexities of digital evidence, the BSA 2023 represents a significant step towards creating a more robust and technologically aware legal framework. The success of this framework will rely on the continued collaboration between legal professionals, technologists, and policymakers to address emerging challenges and refine the safeguards in place.

CONCLUSION

Summary of Findings

The Bharatiya Sakshya Adhiniyam, 2023 marks a pivotal moment in the evolution of India's legal system, particularly in its approach to digital evidence. This comprehensive legislation addresses the growing importance of electronic records in legal proceedings and provides a structured framework for their admissibility and handling. The key findings of this examination can be summarized as follows: *Modernization of Evidence Law*: The BSA 2023 successfully updates the century-old Indian Evidence Act to accommodate the realities of the digital age, recognizing electronic records as primary evidence. *Clear Admissibility Criteria*: The Act establishes detailed criteria for the admissibility of digital evidence, addressing issues of authenticity, integrity, and reliability. This provides much-needed clarity for courts and legal practitioners. *Streamlined Judicial Processes*: By allowing for electronic submission and standardizing digital evidence formats, the BSA 2023 has the potential to significantly enhance the efficiency of judicial proceedings. *Broad Impact*: The implications of the Act extend to both civil and criminal cases, potentially transforming various aspects of legal practice, from e-discovery to cybercrime prosecution. *Technological Challenges*: While the BSA 2023 addresses many issues related to digital evidence, it also highlights the ongoing challenges posed

by rapidly evolving technologies, such as deep fakes and advanced data manipulation techniques. Safeguards and Best Practices: The Act proposes a range of safeguards and best practices, including the use of blockchain for authentication, AI-assisted verification, and enhanced training for legal professionals. Balancing Act: The BSA 2023 attempts to strike a balance between leveraging the benefits of digital evidence and maintaining the integrity and fairness of legal proceedings, while also considering privacy concerns.

Future Directions for Legal Practice in the Digital Age

As the Indian legal system adapts to the framework provided by the BSA 2023, several key areas will require ongoing attention and development:

1. **Continuous Legislative Review**: Given the rapid pace of technological change, there will be a need for regular review and updating of the BSA 2023 to ensure it remains relevant and effective.
2. **Interdisciplinary Collaboration**: The complex nature of digital evidence necessitates closer collaboration between legal professionals, digital forensics experts, and technologists to ensure the effective implementation of the Act's provisions.
3. **International Harmonization**: As digital evidence often crosses national boundaries, there will be a growing need for international cooperation and harmonization of digital evidence laws.
4. **Ethical Considerations**: The legal community will need to grapple with ethical issues raised by new technologies, such as the use of AI in evidence analysis or the privacy implications of extensive digital evidence collection.
5. **Skill Development**: Law schools and continuing legal education programs will need to adapt their curricula to ensure that future and current legal professionals are well-versed in the technical aspects of digital evidence.
6. **Technological Infrastructure**: Courts and legal institutions will need to invest in robust technological infrastructure to effectively manage and secure digital evidence as per the Act's requirements.
7. **Public Awareness**: There is a need for increased public awareness about the implications of digital evidence in legal proceedings, particularly regarding personal data and online activities.
8. **Precedent Development**: As cases are adjudicated under the new framework, the development of case law will be crucial in interpreting and applying the provisions of the BSA 2023.
9. **Alternative Dispute Resolution**: The impact of the BSA 2023 on alternative dispute resolution mechanisms, such as online arbitration, will need to be explored and potentially regulated.
10. **Cyber Insurance**: The legal industry may see the emergence of specialized cyber insurance products to address risks associated with digital evidence handling and potential liabilities.

In conclusion, the Bharatiya Sakshya Adhiniyam, 2023 represents a significant step forward in adapting India's legal system to the digital age. It provides a comprehensive framework for handling digital evidence, addressing many of the challenges that have arisen with the proliferation of electronic communications and records. However, the effectiveness of this legislation will ultimately depend on its implementation, the adaptability of legal professionals, and the continued evolution of the law in response to technological advancements. As the Indian legal system navigates this new landscape, it will be crucial for all stakeholders – including lawmakers, judges, lawyers, technologists, and academics – to work collaboratively to refine and improve the framework established by the BSA 2023. The coming years will likely see a period of adjustment and interpretation as courts begin to apply the new provisions and establish precedents. Moreover, the global nature of digital information means that India's approach to digital evidence, as codified in the BSA 2023, may have implications beyond its borders. It could potentially influence international standards and practices, particularly in countries grappling with similar challenges in modernizing their evidence laws. The BSA 2023 is not just a legal document; it represents a bridge between traditional legal principles and the realities of a digital world. Its success will be measured not only by its ability to facilitate justice in an increasingly digital society but also by its capacity to adapt to future technological developments that we can scarcely imagine today. As we move forward, it is clear that the intersection of law and technology will continue to be a dynamic and challenging field. The BSA 2023 provides a foundation, but it is up to the legal community to build upon this foundation, ensuring that the principles of justice, fairness, and truth-seeking

remain at the forefront of legal practice in the digital age. The journey of adapting legal systems to technological change is ongoing, and the BSA 2023 marks an important milestone in this journey for India. It sets the stage for a more technologically aware and responsive legal system, one that is better equipped to serve justice in the 21st century and beyond.

ABSTRACT

With Information Technology (IT) experiencing a fast 4th Industrial Revolution, work has become much more complex and there are higher expectations for employees. In this study, we examine the effect of digital transformation on the range of workload for IT employees and how workload is related to stress levels among the employees. The research seeks to understand how changes in technological demand impact sense of work pressure, productivity and overall well-being. The second aspect of the study involves the analysis of demographic characteristics of the respondents so as to enhance understanding on how different groups are influenced by these changes. Structured surveys and interviews were conducted to gather data on a diverse sample of IT professionals, to capture their experiences and developments within their practice with respect to workload, stress, and coping mechanisms in a digitally transforming environment. Significant correlations between this digital transformation surge and increased workload, and then rising employee stress levels are also found in the findings. Furthermore, stress responses varied across demographic categories, with implications for the variation in impact on junior compared to senior staff as well as other factors, including gender and years of experience. Such needs for the adoption of effective workload management strategies and provision of support systems to avoid stress are analyzed by the study. These findings are important because they can help guide the design of interventions aimed at improving employee well-being as well as organizational productivity in the future digital era.

Keywords: Digital Transformation, Mental Health, Stress, Workload, Emotional Support

INTRODUCTION

The rapid pace of digital transformation has reshaped industries worldwide, with the Information Technology (IT) sector at the forefront of this revolution. Advancements in automation, artificial intelligence, cloud computing, and other emerging technologies have redefined how work is done, enhancing efficiency and innovation. However, alongside the opportunities presented by digital transformation, there are significant challenges, particularly concerning the well-being of IT employees. As companies adopt and integrate these technologies, IT professionals face increasing workloads, heightened expectations, and the pressure to continuously adapt and acquire new skills. This intensified work environment can lead to increased stress levels, fatigue, and a sense of being overwhelmed. Moreover, the boundary between work and personal life has become blurred, particularly with the rise of remote work, which has added another layer of complexity to managing employee well-being. While organizations are implementing various support systems to help employees cope with the stress and workload associated with digital transformation, the effectiveness of these measures remains uncertain. It is crucial to understand how these support systems ranging from mental health programs to flexible work arrangements affect employee well-being and whether they can adequately mitigate the pressures IT employees face. Through a detailed analysis of these factors, the research seeks to provide actionable insights for organizations striving to maintain a healthy, productive workforce in an era of continuous digital change.

Literature Review

The increasing impact of digital transformation on organizational workflows, particularly in the IT sector, has sparked widespread interest in the effects of these changes on employee well-being. This review examines key variables such as workload, employee stress, organizational support systems, work-life balance, job performance, and turnover intention

Workload And Digital Transformation

Digital transformation has significantly altered the traditional work environment, leading to an increase in the intensity and complexity of workloads for IT employees. Research shows that the introduction of new technologies, automation, and the need for constant up skilling often contributes to higher job demands and work pressure. Studies have highlighted how technological advancements have reshaped task structures and time management, leading to increased workloads that challenge employees' ability to meet deadlines and maintain productivity (Smith, 2019). Increased workloads due to digital innovation can negatively affect job satisfaction and well-being (Nguyen, 2021).The rapid growth of India's telecommunications industry, especially in cellular and smart phone markets, has introduced advancements alongside increased stress for consumers and providers. While technologies like broadband and 4G enhance connectivity, they also create pressure to remain constantly connected, leading to digital fatigue. Additionally, the competitive landscape intensifies expectations for service quality, adding to workplace stress for employees. This highlights the need for effective stress management strategies in the sector (Karthikeyan *et al*.).

Employees Stress Levels And Workload

A substantial body of literature links workload to elevated levels of workplace stress. Heavy workloads, particularly in IT, have been found to directly contribute to employee stress, as workers are required to manage continuous changes in technology while maintaining high levels of performance (Wang & Green, 2020). Studies show that excessive workload leads to burnout, fatigue, and emotional exhaustion, impacting employee well-being (Gonzalez & Johnson, 2022). Stress is also heightened when employees face the pressure to up skill or keep pace with the evolving digital landscape (Patel, 2020). Review of "A Study of Prevalence of Occupational Stress among Doctors and its Impact on Job Performance "This study highlights the significant occupational stress faced by doctors, particularly house officers, and its impact on job performance among government doctors in Salem District, Tamil Nadu. Various stressors, such as organizational inefficiencies, high staff turnover, absenteeism, and reduced healthcare quality, contribute to decreased job satisfaction and performance. Using data from 520 doctors, the study found an inverse

relationship between job stress and job performance, confirming that higher stress leads to lower performance. The research emphasizes the need for stress management interventions at both individual and organizational levels to improve health, interpersonal relationships, and overall job performance in the healthcare sector(Nisa *et al.,* 2024).

Job Performance And Turnover Intention

Research consistently shows that stress and workload negatively affect job performance. High stress levels can lead to reduced concentration, lower productivity, and ultimately, a decline in performance quality (Taylor & King, 2020). Moreover, long-term exposure to stress and high workloads increases the likelihood of turnover intention, with employees more likely to leave their jobs if they feel overwhelmed by the demands of digital transformation (Harrison & Brooks, 2018). The study examine how vaccination and COVID-19 exposure impact healthcare professionals' psychological health. Their study reveals that while vaccination reduces fear of COVID-19, it does not significantly affect overall psychological well-being. Occupational exposure causes greater anxiety than community exposure, highlighting the need for workplace safety measures to mitigate fear and protect mental health. (Muthuswamy & Nithya, 2023)

Organizational Support Systems

Organizations increasingly recognize the importance of support systems in mitigating the negative effects of digital transformation on employees. Research has demonstrated that robust organizational support such as mental health programs, employee assistance programs (EAPs), and flexible work arrangements can significantly reduce stress levels and enhance employee well-being (Brown & Zhao, 2018. The recent study emphasizes the crucial role of cyber security in enhancing the effectiveness of the digital workplace in Saudi Arabian private sector organizations. It examines how critical infrastructure security and cloud security positively influence the digital workplace, highlighting the importance of digital awareness and organizational support as moderating factors. Data collected from employees reveal significant correlations between these security measures and digital workplace effectiveness, providing valuable insights for policymakers to develop strategies that strengthen cyber security (Muthuswamy & Nithya, 2023).

Work-Life Balance And Employee Well-Being

Work-life balance is another critical factor in maintaining employee well-being in the age of digital transformation. The flexibility offered by remote and hybrid work models has both positive and negative consequences for IT employees. While flexibility can reduce stress by allowing better time management, it can also lead to the blurring of boundaries between personal and professional life, thereby increasing stress levels (Davis & Mitchell, 2019). Study highlights the vital role of women leaders in decision-making and employee engagement. Despite their contributions, women face barriers like gender bias, insufficient mentorship, and work-life balance challenges that hinder their advancement in management. The authors suggest targeted interventions, including inclusive recruitment and leadership development programs, to foster equitable workplaces and improve organizational performance (Xalxo, Seema, 2024).

Need For The Study

In the digital transformation era, more IT employees are dealing with increasing workload, stress, and burnout compounded by an ongoing need to stay on top of new technologies. This study focuses on the impact of digital transformation on employee well-being in remote and hybrid work environment. Stress and resilience can be reduced through the organization's support systems such as mental health resources and assistant from manager. The link between workload, support systems, and stress should be understood to develop such strategies that boost employee's well-being, performance and retention at the digital workplace.

Objectives

1.To study the demographic profile of the IT employees.
2.To examine the impact of digital transformation on the workload of IT employees.
3.To analyze the relationship between increased workload and employee stress levels in IT organizations.

RESEARCH METHODOLOGY

Research Design

The present study makes use of a quantitative research methodology with a descriptive design to examine the effect of digital transformation on employees' workload, stress levels and general wellbeing in the Information Technology (IT) sector. It was done within a leading multinational corporation in IT and Information Technology Enabled Service (ITES) space, situated in a prominent urban centre of Chennai, Tamil Nadu, India.

Sample Size

This study is of its sample size, which is 100 IT employees across all departments in the organization. Representative cross section of employees impacted by the organization's digital transformation efforts were these employees.

Sampling Technique

In the process of selecting participants for in depth interviews, for which purposive sampling was employed, employees directly involved in digital transformation projects or whose work were significantly changed by workload changes and organizational support systems, were called. Thus, this method of sampling makes sure that the study is made on people concerned in this research objectives most.

Tools of Data Collection

A structured questionnaire was devised to return data related to certain variables including work workload, work stress levels, work life balance and employee well-being. Descriptive statistics, correlations analyses was perform on the data using SPSS.

Major Finding

In the case of the above table 1., the details of the age distribution that is nearly balanced with respondents majority (30%) consisting in the 36- 45 age group. In fact, 25 percent of these people are between 26 and 35, 23 percent are in the 18 and 25 bracket, and 22 percent are 46 or older. Such an illustration is of a workforce that is quite mature, having a lot of younger and more experienced employees. A slight gender disparity was observed on gender of the respondents with 56% of female respondents and 44% males. An IT related study, the sector is usually dominated by men. Most respondents have advanced degrees 40 percent have a Masters degree and 32 percent possess a Bachelors degree. The larger portion, 62%, have completed a Post Graduate Certificate in Education (PGCE), 18% have a Diploma, 10% fall into the "Other" category. What this indicates is a well-educated workforce with heavy to intermediate IT skills. When it comes to experience in the Industry the experience range is large with the largest group (25%) having 7 -10 years of experience. In fact, a large portion (24%) in the industry has 4- 6 years experience and 22% have more than 10 years. Its a mix of seasoned pros and newer employees. Most of the respondents reported on the job role: The IT Support Specialist (35%) and Data Analysts (25%).And 10% of Software Developers and System Administrators, 5% of Project Managers, and 15% of Cyber security Specialists. It's easy to see the different roles within IT organization and how this diverse range spans everything from network to system administration, infrastructure, quality, security, etc. A large percentage of respondents (64%) work on site, 36% have some form of hybrid work, while 10% work entirely at home. That means that this is an organization that prefers traditional, in office work, and in small amounts. It was found that most of the respondents are married (61%), single (31%) and divorced or widowed (8). This has implications for how employees manage work life balance and how employees manage family commitments in particular. In most cases, respondents (74%) have three or more dependents, and 12% have none. What this means is that most employees have a lot of family responsibility that might impact their stress levels and level of need for support.

Correlation Matrix

Table 1.2 Correlation Matrix of Workload and Employee Well-being Variables

H_1: There is a significant relationship among workload, task complexity, and stress levels, and these factors negatively impact job satisfaction and managerial support in IT employees.

H_0: There is no significant relationship among workload, task complexity, and stress levels, and these factors negatively impact job satisfaction and managerial support in IT employees

Above Table.2 shows working hours and Its Impact on Stress Levels Correlation with stress level (0.98) a strong positive correlation lets us deduce that the more working hours, the more stress levels increase significantly. Examining how digital transformation impacts the workload/stress (in other words, the longer hours) is in line with this objective of helping to determine the number of longer hours your employee contributes to a heavy workload and stress. High stress correlated to Burnout Frequency (0.90) Burnout is also linked to high working hours. That makes it clear that workforce management is pivotal in mitigating employee burnout, as it is proven that overloading is a distinguishing factor in employee exhaustion. Stress and Task Complexity (1.00) stress correlates perfectly positively with task complexity, which means such complexity directly leads to increasing stress levels. Yet increased task complexity is a leading factor when it comes to stress, and in the context of digital transformation, it is frequently accompanied by employees need to handle new technologies and more sophisticated systems. As the complexity of tasks increase, employees experience a higher frequency of burnout which is strongly correlated with Burnout Frequency (0.94). Thus confirming that digital transformation can bring more difficult tasks that employees will find difficult to tackle and which will bring along stress and burnout. The patterns in overtime frequencies and employee stress correlation with stress level (0.95) indicates frequent overtime will result in elevated stress level. Digital transformation can bring overtime through factors related to digital transformation such as the need for continuous up skilling, managing new technologies or being forced to adapt to automation, all which place the load and the heat on. A high frequency of overtime strongly correlates with burnout (Correlation with Burnout Frequency (0.94)). Physical and emotional exhaustion occurs as a result of employees working beyond their regular hours on the regular. Both Satisfaction with Personal Time and Managerial Support Protective factors – Negative correlation with the level of stress (-1), the level of satisfaction employees have with the amount of personal time they have and/or Managerial Support negatively correlates simply with the level of stress. In other words, though workload and task complexity increase stress, strong support systems (e.g., managerial support, flexible work arrangements) and healthy work-life balance appear to act as buffers, reducing the extent to which stress translates into health problems.

Job Satisfaction and Well-being **-** Positive Correlation with Satisfaction with Personal Time (0.95) and Managerial Support**,** Employees who feel they have adequate personal time and who receive managerial support are more satisfied with their jobs. This finding aligns with your focus on examining the role of organizational support systems, such as mental health resources and managerial assistance, in mitigating stress and enhancing employee well-being. The findings from workload-related variables such as working hours, task complexity, and overtime frequency reveal that digital transformation increases these factors, leading to higher employee stress. Task complexity is especially crucial, as digital tools can introduce more demanding tasks. The strong positive correlations between workload (working hours, task complexity) and stress levels emphasize that increased workload significantly elevates stress. However, organizational factors like managerial support and personal time satisfaction can moderate this relationship, reducing stress and improving overall well-being. Hence Based on the correlation matrix, the hypothesis is accepted**.** The data shows strong positive correlations between workload, task complexity, and stress levels, indicating that as workload and task complexity increase, stress and burnout levels rise significantly. For instance, the correlation between workload and stress is 0.98, and task complexity and stress is 1.00, both indicating nearly perfect relationships. Additionally, there are strong negative correlations between these variables and job satisfaction, as well as managerial support. For example, task complexity and job satisfaction have a correlation of -0.95, while workload and managerial support have a correlation of -0.98. These findings confirm that increased workload and task complexity not only lead to higher stress and burnout but also negatively impact job satisfaction and perceived managerial support, validating the original hypothesis.

Recommendations

- Implement Workload Management to regularly assess and redistribute workloads to prevent employee burnout. Use tracking tools to identify those who may need support.
- Enhance Training & Up skilling to provide continuous training to help employees adapt to new technologies, reducing task complexity and stress, and boosting confidence.
- Create an open Communication in order to encourage open discussions about workload and stress with management. Regular feedback sessions can help address issues early.
- Promote Flexible Work to provide an options of remote or flexible work arrangements to help employees better manage work-life balance and reduce stress.
- Strengthen Support Systems to invest in mental health resources, employee assistance programs, and managerial training to provide better support during stressful times.
- Monitor Well-being by conducting a regular assessments to track employee stress, workload, and satisfaction, enabling timely interventions.
- Encourage Work-Life Balance to promote breaks, vacations, and post-work disconnection through policies that help prevent burnout.
- Recognize Employee Efforts to acknowledge their hard work and achievements, especially during high-demand periods, to boost morale and job satisfaction.
- Facilitate Peer Support to create peer support groups to encourage employees to share coping strategies and offer emotional support, fostering a sense of community.

CONCLUSIONS

This report on "Well-being within the Age of Digital Transformation" describes how present day digital transformations are happening across IT ecosystem and the challenges that IT employees are dealing with as a result of increased workload together with more sophisticated work. The workloads results are found to have a strong positive correlation with stress, showing that additional hours of work and more complex task generate more stress and burning out. Workload management, training programs and flexible work arrangements can suggest recommendations to increase employee well-being. However, there is one thing that carries greater importance, and that is the well-being of your employees, as prioritizing their well-being will help improve your productivity as well as improving the well-being of your workplace with continued digital changes. Finally, employee well-being in a digital transformation is important to increase productivity and reduce turnover. If organizations can provide an atmosphere of a supportive work environment, they are able to make their workplace healthier and more sustainable for the IT employees.

ABSTRACT

GULLIAN – BARRE SYNDROME is a disease with severe acute paralytic neuropathy. GBS is a rare neuroimmune disorder that causes episodes of inflammation in the central nervous system with a rapid onset of muscle weakness caused by the immune system. The peripheral nervous system[5]gets damaged on both sides of the body with weakness starting from feet and hands often spreading to arms and upper body; symptoms are gradually increasing over hours to a few weeks during the acute phase. The disorders can be life-threatening with about 20-30 % of people developing weakness in respiratory muscles.[1] The clinical manifestations of GBS typically start one to two weeks after the immune stimulation, with rapidly evolving areflexic motor paralysis, often accompanied by sensory disturbances. The weakness usually manifests as ascending paralysis, more commonly affecting the lower limbs than the upper limbs. The main phenotypes[2] of Guillain-Barré Syndrome (GBS) are acute inflammatory demyelinating polyneuropathy (AIDP) [2] and acute motor axonal neuropathy (AMAN)[2]. These phenotypes are distinguished by the specific pathology involved. AIDP involves inflammation and damage to the myelin sheath surrounding nerves, while AMAN primarily affects the nerve axon. This differentiation is crucial for understanding the clinical manifestations and management strategies for GBS. *Ayurveda* has mentioned a clinical condition termed *pittavrutavyana* and *kaphavruta vyana vayu*; of which, symptoms are related to GBS. In *pittavruta vyana* and *kaphavruta vyana vayu* presents itself the movement of body organsbecomes restricted, burning sensation and pain, heaviness all over the body,severe pricking and aching pains, and may affect from a single limb to the whole body. Treatment of *pittavruta vyana and kapha Avruta vyana* belongs to the pathological state of *vatadosha*. *Vatadusti* [1]can be

due to a primary increase in *Vata*with an affliction of other *dosha* and *dhatus*, state of *Vata* can be *saama or* niraama. Pathological staging could be due to the *Avarana of Vayu.*The treatment is planned, considering these factors; *santarpana* and aptarpana chikitsa.[7]

Keywords: Guillain-Barre syndrome[1], Pittaavruta vyana vayu[7] Kaphavruta vyana vayu, Santarpana-Apatarpana.[7]

INTRODUCTION

GBS is a very rare condition in which a person's immune system attacks the peripheral nerves.[5] People of all ages can be affected but it is more common in adults and males. Guillain-Barré syndrome is potentially life-threatening. People with Guillain-Barré syndrome should be treated and monitored as quickly as possible; some may need intensive care. Treatment includes supportive care and some immunological therapies.[4] In Ayurveda, some GB syndrome type of symptoms can be correlated with pittaavruta vyana vayu and kaphavruta vyana vayu.

Patient information

A 30-year-old female patient came with complaints of numbness and tingling sensation in both upper limbs and pain in the left legin th2-3 days. The patient was diagnosed with hypertension and has been taking medicine since last month. She was admitted to a private hospital at Vadodara to have treatment for the same. The patient shifted for further management at Parul Ayurveda Hospital.

Clinical finding

Patients have developed symptoms of weakness which started from the upper limb to the lower limb, difficulty in breathing, verbally inappropriate, generalized weakness, and tingling sensation in both the upper and lower limbs. Duringthe assessment of the patient, limb power 0-1, and lower limb power 0-1^{3},both palmar and plantar reflex were absent.

Chronology

The patienthada fever 15 days back which lasted for 5 days, treated by a general physician on the 5th day. The patient has noticed gradually progressive weakness, numbness, tingling sensation in both upper and lower limbs, and pain in the left leg for which she has been shifted to Parul Ayurveda Hospital. The patient taking hypertensive medicine-tab. Telmisartan- 40 mg once a day for a month.

Blood investigation

Hb: 10.7, TC:12690, PLT:3.37, K:3.8, Create:0.8, Total protein :7.7, albumin :3.5, CRP:55, Lipidprofile:cholesterol:190, triglyceride :106, HDL:43,LDL:125.8, total lipid :686.
D dimer:1800, SGPT: 41,
MRI CERVICAL SPINE WITH WSS: No significant abnormality detected.
MRI BRAIN WITH MR VENOGRAM: Empty cells with prominent peri neural csf space around b/l optic nervehypoplastic right transverse and sigmoid sinuses nerves caliber superior sagittal straight left sigmoid and left transverse sinuses with normal flow related signals.

Medical intervention

Patient treatment in a private hospital with antibiotics, antacids, fluid management, and specific GB syndrome treatment; intravenous immunoglobulins (IVIG)infusion[6] for 12 days. The symptoms decreased after IVIG infusion, but due to poor economic conditions, the patient approached Parul Ayurveda Hospital for further management. A patient diagnosed with pittavruta vyana vayu and kaphavruta vyana vayu*;* pathological staging of kapha pitta dosha abnormality along with Vata Dosha. The treatment was planned with Shodhan (Virechana)*[13],*

Sarvanga Abhaynga[14](oil massage) with *ksheerbala taila[14] and Aswagandha taila, Shastika shali pinda sweda[15](*rubbing of medicated rice poultice over body*), Shirodhaara* with *Ashwagandhataila,Basti[16]- (Niruha and Anuvasanabasti),ShamanaAushadhi* (oral medicine for pacification)given.

Assessment

Pharmaceutical Preparations

1.Yograj guggul – [10]

2.Brihat vata Chintamani rasa- [10]

3.Rasna saptak qwath- [11]

4.Dashmoolarishta [12]

5.*Ksheerbalathailam* [12]

6.Balaswagandhadi Tailam [12]

7.*Sahacharadi Kashayam*[9]

8.Mahavishagarbhataila[10]

Follow-up and outcome

The patient was treated over one month, for weakness in both upper and lower limbs, numbness and tingling sensation in both limbs, and pain in the left leg gradually decreasing, advised on nursing care, physiotherapy, and mobilized Follow-up every 3rd day at the hospital. All neurologic deficits progressively restoreddecreased.[5]

DISCUSSION

Ayurvedic treatment is effective in the management of GB syndrome. If a patient came here early stage of diagnosis extended follow-up observation that improvement was well sustained. Patients continue to follow up advice even after symptoms subside other health complaints management according to medicine advised as follows. Patients have developed symptoms of weakness is start from upper limb to lower limb, difficulty in breathing, verbally inappropriate words, generalized weakness, and tingling sensation in both upper and lower limb gradually decreasedafter Management was with *Shodhana (Virechana), Sarvangabhaynga* with *Ksheerbala tail[14], Aswagandha tail, shastika shali pinda sweda[15] (*rubbing of medicated rice poultice over body*), Shiro Dhara* with *Aswagandha tail, Basti [16] (Niruha, Anuvasana basti), Shaman Aushadhi*(Oral medicine for pacification) given.

CONCLUSION

Ayurveda management of GBS showed neurological deficits decreased. Treatment with 15 days of various Panchakarma procedures and oral administration of *Ayurveda* medicine for the next 4-5 months shows complete recovery of neurological deficits. These treatments are effective outcomes showing a significant role of *Ayurveda* in GB syndrome disorder. *Ayurveda* management can improve disability of All neurologic deficits progressively restoring decreased[5]and improvement in quality of life.

ABSTRACT

Imbalance is a common problem in medical datasets, where the minority class instances are likely to be poorly predicted by a biased model. To address this challenge, this research proposes a new method that involves GAN-based oversampling with feature selection and attention techniques. The typical methodological framework applied in this work consists of adaptive feature selection to preserve the most critical characteristics and the utilization of GANs trained with attention mechanisms to produce realistic and diverse synthetic samples. These synthetic samples are then used to make a balanced dataset since using the other option affects the training process of the classifiers. The use of AdaBoost and stacking expands the approach of ensemble learning which boosts the predictive accuracy of the model. Experiment analysis proves that the proposed method has greater accuracy, F1-score, and AUC-ROC in comparing with the oversampling methods and baseline models on the imbalanced medical datasets. The main contribution of this work is that the proposed GAN-based data generation, adaptive selection of features, and attention mechanisms are used together, which allows developing a highly effective approach to the classification of medical data, taking into account the fact of class imbalance.

Keywords: Imbalanced datasets, Medical data classification, Generative Adversarial Networks, Feature selection, Attention mechanism, Ensemble learning

INTRODUCTION

However, many medical datasets are characterized by a class imbalance issue, which means that the number of samples belonging to a specific class is significantly larger than the number of samples in another class [1]. This may put the machine learning models in a position of bias where the model largely favors the majority class especially when it has a large number of instances while the actual predictive capability from samples of the minority class is very low [2, 3]. The solution of the problem is essential for creating the efficient and highly accurate medical diagnostic systems. This paper presents an improved model that involves the use of GAN-based oversampling, feature selection, and attention mechanism to improve the classification of the imbalanced medical datasets.

Background

Class imbalance is a significant issue in medical datasets, where the number of instances in one class (e.g., patients with a disease) is much lower than in the other class (e.g., healthy patients) [4, 5]. This can cause problems when building a model since minority class examples will be under-represented, or if a model is built using only the majority class and tested using only examples from the minority class it will perform poorly [6]. There are several traditional approaches for dealing with this issue, for example Synthetic Minority Over-sampling Technique (SMOTE) that creates synthetic samples for the minority class [6, 7]. However, they are ineffective to learn the nature and variability of medical information, which results in the lower performance of the model established. Modern approaches related to GANs have now successfully produced synthetic data of high quality [8]. They are an architecture with two neural networks, the generator and the discriminator; two networks that are in an adversarial relationship where the generator generate data samples with the purpose of fooling the discriminator [9]. Thus, the generated data by GANs on imbalanced datasets are richer in the variety and more realistic of the minority class than methods of oversampling [10]. Besides, the incorporation of the feature selection process of classifiers and the attention mechanism can also be used to enrich the content of the data with higher feature relevance and boost the performance of the classification models [11].

Motivation and Problem Statement

The primary motivation for this research is the need for more effective methods to address class imbalance in medical datasets. Traditional oversampling techniques often produce synthetic data that lack the complexity and variability of real medical data [12]. This limitation results in suboptimal model performance, particularly in accurately predicting the minority class. Improving the quality of synthetic data is crucial for developing reliable diagnostic models that can accurately identify rare conditions. The problem statement is to improve synthetic data generation to capture the imbalance patterns in the medical data and more. Previous solutions based on GAN have been implemented, but feature selection and attention mechanisms are not well utilized in improving the quality of the data. The problem is in how these techniques should be combined to form a strong method that gives out realistic and numerous synthetic samples. The rationale of integration with AI is intended to enhance the model performance and in particular the performance on minority class instances to benefit the domain of medical data analysis and diagnosis.

Objectives

The primary objective of this research is to develop a novel method that effectively addresses class imbalance in medical datasets. This method will integrate GAN-based oversampling with adaptive feature selection and attention mechanisms. Specific objectives include:

- Enhance Synthetic Data Quality: Utilize GANs to generate realistic and diverse synthetic samples that capture the complexity of medical data.
- Optimize Feature Selection: Implement adaptive feature selection techniques to identify and retain the most relevant features.
- Incorporate Attention Mechanisms: Use attention mechanisms to improve the focus on critical features during data generation.

Scope of the Work

This study focuses on several imbalanced medical datasets. It evaluates the proposed method against traditional oversampling techniques and baseline models. This study aims to develop and validate a novel method for handling class imbalance in medical datasets by integrating GAN-based oversampling, adaptive feature selection, and attention mechanisms. The study ensures the applicability of the method across various medical datasets with different degrees of imbalance, aiming to improve classification accuracy and model robustness in predicting minority class instances.

Organization of the Paper

The paper is organized as follows:

- Section 2 reviews related work on oversampling techniques, feature selection methods, and attention mechanisms.
- Section 3 describes the proposed methodology, including adaptive feature selection, GAN-based oversampling, and hybrid ensemble learning.
- Section 4 details the experimental setup and presents the results.
- Section 5 concludes with the findings and includes an ablation study.

RELATED WORK

Oversampling Techniques

Ensemble mechanisms are well known to deal with the minority class samples in a dataset through a process which refers to as known as oversampling. Among them the most famous is the SMOTE is the most employed [6]. SMOTE synthesizes a new sample using those vectors that are closest to the vectors belonging to the minority class. It constructs new samples on the line segments passing through pairs of samples belonging to the minority classes so that the classifier's training is enhanced on the characteristics of the minority class [7]. Some of the extensions of the basic SMOTE are available to overcome its demerit [13 – 17]. Borderline-SMOTE mainly concentrates on creating synthetic instances around the boundary area; this leads to effective separation between the classes [14]. Another variant is Adaptive Synthetic Sampling (ADASYN) which produces more synthetic samples for hard minority samples and hence achieves a balance between them [15]. Nevertheless, these improvements still do not guarantee better sampling for the traditional oversampling methods, as those are unable to capture the intricate distribution of high-dimensional data, which results in low effectiveness of oversampling in real-world cases [18].

GANs for Data Generation

Currently, GANs have become one of the viable solutions for oversampling. There are two main parts of the GANs, a generator, and a discriminator, the generator creates a new data set, and the discriminator determines if it is authentic or not [9]. This kind of adversarial training leads to the generation of very accurate synthetic samples which when used to augment the training set the performance of classifiers on imbalanced cases is massively boosted. Another research done reveals that compared to GAN-based oversampling methods surpass the traditional techniques by creating far superior and diverse synthetic samples [19]. Evaluating the classification performance of a classifier in the context of imbalanced classes is a crucial issue known as the Class Imbalance Problem (CIP) [20], which is quite essential in the diagnosis of medical conditions where the incidence of some diseases is lower than others. This brings about the creation of unbalanced models that incline more to the majority class; a situation that poses low prediction accuracy for the minority class [21]. Different solutions have been made for handling of CIPs some of which are; Data level approach and Algorithm level approach [20]. Another technique similar to data-level method is over-sampling and under-sampling whereby the objective is to equalize the classes prior to the formation of the model [20]. Among them, oversampling techniques have attracted much attention because they can extend the minority class without losing the samples by synthesizing the new samples [20]. From the sampling strategies, simple oversampling such as the random oversampling (ROS) as well as the synthetic minority oversampling technique (SMOTE) has been employed [20, 22]. As for the medical imaging application, GAN based data augmentation methods have been investigated to handle the problem of a lack of labeled data and the class imbalance problem [23].

It can be noted that these techniques can be useful to enhance the classification of skin lesions as well as other medical image analysis using deep learning models [23]. While GAN-based oversampling techniques offer advantages over traditional methods, challenges remain, such as the need for careful hyperparameter tuning and the potential for mode collapse in minority classes [24]. Additionally, the evaluation of GAN-based oversampling methods often involves multiple comparisons across different datasets and classification algorithms, requiring robust statistical tests like the Friedman test with Iman-Davenport correction [25].

Feature Selection Methods

Likewise, feature selection is an important process of selecting the most relevant features from the dataset to improve performance of model. There are many techniques with their specific strengths [11]. Filter methods rank or select features based on their relevance to the target variable with no regard to a learning algorithm, and common statistical measures are used [18]. Mutual Information estimates the coupling between each feature and the target variable, Chi-Square Test investigates the relation of a feature with the target variable and more and tests if the features are independent of the target [26, 27]. The Correlation Coefficient assesses the level of a direct relationship that the features have with the target variable [28]. These methods are fast and easy to apply to the data but the decision function does not take into account interactions between the features. Wrapper methods assess subsets of features based on the entire process of training and testing of the model with different features [29]. Recursive Feature Elimination (RFE) is a process where the least important features are removed using the least important feature approach upto reaching the defined number of features [30]. Forward Selection initiates with no feature and enters the most relevant feature at each step, on the other hand Backward Elimination begins from all features and use least features at each step [31]. These methods are however computationally intensive even though they can capture the interactions of the features. As for embedded methods, feature selection is achieved as part of the training procedure [32]. Lasso Regression (L1 Regularization) imposes a penalty equal to the absolute sum of magnitude of the coefficients of feature thereby setting some coefficients of feature to zero resulting in feature selection [33]. This is true for Decision Trees and Random Forests where the feature importance scores from the training process were used to choose the features [34]. Finally, it is proved that Elastic Net combines the features of L1 and L2 regularization to enhance feature selection performance [35]. These methods provide a good compromise between the extent of computation and topological interactions' descriableness. The main methods of selecting advanced features take into account recent developments in machine learning [36]. The Boruta Algorithm applies the random forest classifier to remove features that have lower importance than random probes [37]. Stability selection works with bootstrapping and feature selection to increase resistance to the change. SHAP (SHapley Additive exPlanations) offers the integral rating of the feature importance by estimating the response of each feature to the model [38].

Attention Mechanisms

In the recent years, attention mechanisms have emerged as essential functionalities in multiple machine learning operations specifically in natural language processing and computer vision [39]. These mechanisms allow models to pay attention to what matters in the input data; in turn this leads to better performance and model interpretability [40]. Intra-attention is known as self-attention which enables a model to have a measure for relevance of the specific elements in the input data set during the production of an output [41]. It produces the weighted sum of the input features, in which the weights depend on the input features to be processed. Self-attention's critical elements include query vectors Q, key vectors K, and vectors of values V extracted from the provided data. The attention scores are computed as follows [42]:

$$\text{Attention}(Q, K, V) = \text{softmax}\left(\frac{QK^T}{\sqrt{d_k}}\right)V \quad \text{..... (1)}$$

where d_k is the dimension of the key vectors. This mechanism allows the model to attend to different parts of the input data with varying degrees of importance. Multi-head attention is a generalization of the self-attention mechanism as the name suggests the model learns to attend to information from different subspaces of representations at different positions [43]. Unlike the single attention function, the multi-head attention performs multiple attention in parallel, and for each attention function, it generates more than one attention outputs which are then concatenated and passed through linear transformation. This can be mathematically represented as [44]:

$\text{MultiHead}(Q, K, V) = \text{Concat}(\text{head}_1, \ldots, \text{head}_h)W^O$ ..... (2)

where each head head_i is an instance of the self-attention mechanism. In GANs, attention mechanisms can be integrated to improve the quality of generated data [45]. By focusing on the most relevant features during the generation process, attention mechanisms help the generator create more realistic and coherent samples. This is particularly useful in complex data domains like images and medical records, where certain features may carry more significance [46]. For imbalanced datasets, attention mechanisms can be used to enhance the learning process by prioritizing features that are more informative for the minority class [47]. This can lead to better discrimination between classes and improved overall performance of the classifier. By integrating attention mechanisms with GANs and feature selection methods, the proposed approach aims to generate highquality artificial data that accurately represents the minority class.

PROPOSED METHODOLOGY

The suggested method can be effective in improving the classification metrics of imbalanced medical datasets since it combines the advantages of the GANs, adaptive, feature selection, and attention mechanisms. Figure 1 represents the workflow of the proposed methodology. The approach is divided into several key phases:

i. Data Preprocessing: Initial preprocessing steps include normalizing the dataset and handling any missing values. This ensures that the data is clean and ready for further processing.
ii. Adaptive Feature Selection: This phase involves a two-step process to dynamically select the most relevant features from the dataset, improving the quality and relevance of the input data for the GAN.
iii. GAN with Attention Mechanism: A generator model with an integrated attention layer is designed to focus on the most critical features during data generation. This enhances the quality of synthetic data, making it more representative of the minority class.
iv. Training the GAN: The GAN is trained using the refined feature set. The training process involves generating synthetic samples and iteratively improving both the generator and discriminator models.
v. Hybrid Ensemble Learning: After generating a balanced dataset, multiple base classifiers are trained. An ensemble method, such as AdaBoost, is then applied to combine these classifiers, enhancing the overall predictive performance.
vi. Evaluation: The final model is evaluated using multiple metrics, including accuracy, precision, recall, F1-score, and AUC-ROC, to ensure comprehensive performance assessment. Comparative analysis with baseline models is also conducted to highlight the improvements achieved by the proposed method. The following sections detail each phase, starting with adaptive feature selection.

Adaptive Feature Selection

The adaptive feature selection process is therefore intended to identify pertinent features as well as select and maintain features for generating synthetic data and enhancing the models' efficacy. This process consists of two main steps: In the first step, all the features are ranked by using Mutual Information followed by a re-ranking using L1-regularization.

Initial Feature Selection with Mutual Information

Mutual Information (MI) measures the dependency between each feature and the target variable. It is defined as:

$I(X;Y) = \sum_{x \in X} \sum_{y \in Y} p(x,y) \log \left(\frac{p(x,y)}{p(x)p(y)} \right)$ ..... (3)

where:

- X and Y are random variables.
- p(x, y) is the joint probability distribution of X and Y.
- p(x) and p(y) are the marginal probability distributions of X and Y, respectively. The MI scores for all features are computed, and the top-k features with the highest scores are selected. Let F_{MI} denote the selected feature set:

$$F_{MI} = \{f_1, f_2, \ldots, f_k\}$$

Refinement with L1 Regularization

L1 regularization (Lasso) is used to further refine the feature selection by assigning weights to features based on their contribution to the model. The Lasso regression objective function is:

$\min_\beta \left\{ \frac{1}{2n} \sum_{i=1}^{n} \left(y_i - \sum_{j=1}^{p} x_{ij} \beta_j \right)^2 + \alpha \sum_{j=1}^{p} \left| \beta_j \right| \right\}$ ..... (4)

where:

- β_j are the coefficients of the features.
- α is the regularization parameter controlling the strength of the penalty.
- n is the number of samples.
- p is the number of features.
- x_{ij} and y_i are the feature values and target variable for the i-th sample, respectively.

After fitting the Lasso model, the features with non-zero coefficients are retained. Let F_{L1} denote the final refined feature set:

$F_{L1} = \{ f_j \mid \beta_j \neq 0 \}$ ..... (5)

The adaptive feature selection process ensures that only the most relevant features are used, enhancing the quality of the synthetic data generated by the GAN and improving the overall model performance. This refined feature set F_{L1} is then used in the subsequent GAN training phase.

Procedure

Step 1: Compute mutual information between each feature and the target variable.
Step 2: Select top-k features based on MI scores.
Step 3: Apply L1 regularization to the selected features.
Step 4: Retain features with non-zero coefficients.

GAN with Attention Mechanism

The GAN with an attention mechanism enhances the generation of synthetic samples by focusing on the most critical features. This section describes the architecture and training of the GAN, incorporating the attention mechanism to improve data generation quality. The generator G aims to create realistic synthetic samples from a latent space z. The attention mechanism helps the generator focus on important features during data generation.

Generator Function

$G(z; \theta_G)$ ..... (6)

where:

- $z \sim p_z(z)$ is the input noise vector from a prior distribution.
- θ_G are the parameters of the generator network.

Attention Layer

The attention mechanism computes a weighted sum of the input features, emphasizing more relevant ones.

$a_i = \frac{\exp(e_i)}{\sum_{j=1}^{k} \exp(e_j)}$ ..... (7)

where:

- $e_i = f(h_i)$ is the alignment score for feature i computed by a function f of hidden state h_i.
- a_i is the attention weight for feature i.

The weighted sum of features is given by:

$c = \sum_{i=1}^{k} a_i h_i$ ..... (8)

where c is the context vector used in subsequent layers of the generator.

Generator with Attention

$G(z) = \text{Decoder}(c, z)$ ..... (9)

where the Decoder function generates synthetic data using the context vector c and latent vector z.

Discriminator

The discriminator D distinguishes between real and synthetic samples. It is a binary classifier trained to maximize the probability of correctly classifying real and generated data.

Discriminator Function:

$D(x; \theta_D)$ ..... (10)

where:

- x is the input data (real or synthetic).
- θ_D are the parameters of the discriminator network.

Training the GAN

Concerning the GAN training, this is a process that is characterized by the relative optimization of the discriminator and generator. The aim of this setup is for the generator to output data the discriminator will not be able to differentiate from actual data.

Discriminator Loss

$$L_D = -E_{x \sim p_{data}(x)}[\log D(x)] - E_{z \sim p_z(z)}\left[\log\left(1 - D(G(z))\right)\right] \quad \text{..... (11)}$$

Generator Loss

$$L_G = -E_{z \sim p_z(z)}\left[\log D\left(G(z)\right)\right] \quad \text{..... (12)}$$

The overall training procedure involves the following steps:

1. Update Discriminator:

- Sample minibatch of real data $\{x^{(i)}\}_{i=1}^{m} \sim p_{data}(x)$.
- Sample minibatch of noise $\{z^{(i)}\}_{i=1}^{m} \sim p_z(z)$.
- Compute discriminator loss L_D.
- Update discriminator parameters θ_D using gradient descent.

2. Update Generator:

- Sample minibatch of noise $\{z^{(i)}\}_{i=1}^{m} \sim p_z(z)$.
- Compute generator loss L_G.
- Update generator parameters θ_G using gradient descent.

Hybrid Ensemble Learning

Hybrid ensemble learning combines the strengths of multiple base classifiers to improve the predictive performance on imbalanced medical datasets. This section outlines the process of creating and training a hybrid ensemble model, leveraging the balanced dataset generated by the GAN with attention mechanism.

Base Classifiers

Let $\mathcal{C}_1, \mathcal{C}_2, \ldots, \mathcal{C}_{\mathcal{N}}$ represent the N base classifiers used in the ensemble. These classifiers can be any machine learning models such as Decision Trees, Support Vector Machines (SVMs), k-Nearest Neighbors (k-NN), etc.

AdaBoost Algorithm

Adaptive Boosting (AdaBoost) is used to improve the performance of the base classifiers by assigning higher weights to misclassified instances. The process iteratively updates the weights and combines the weak learners into a strong classifier.

AdaBoost Procedure

Initialize weights $w_i = \frac{1}{n}\ for\ i = 1, \ldots, n$, where n is the number of training samples.

For t = 1 to T (number of iterations):

Train a base classifier $\mathcal{C}_t$ on the weighted training data.

Calculate the error rate ϵ_t:

$\epsilon_t = \sum_{i=1}^{n} w_i \cdot I(y_i \neq \mathcal{C}_t(x_i))$ ..... (13)

Compute the classifier weight α_t:

$\alpha_t = \frac{1}{2}\ln\left(\frac{1-\epsilon_t}{\epsilon_t}\right)$ ..... (14)

Update the weights:

$w_i \leftarrow w_i \cdot \exp\left(\alpha_t \cdot I(y_i \neq \mathcal{C}_t(x_i))\right)$ ..... (15)

Normalize w_i to sum to 1.

The final strong classifier $\mathcal{H}(x)$ is given by:

$\mathcal{H}(x) = \text{sign}(\sum_{t=1}^{T} \alpha_t \mathcal{C}_t(x))$ ..... (16)

Stacking Ensemble

Stacking is a technique of training a meta-classifier about the classifiers where in aggregation of the base classifiers are made. The output of the base classifiers becomes features for the meta-classifier where the number of features equals the number of base classifiers used.

Step 1: Train base classifiers $\mathcal{C}_1, \mathcal{C}_2, \dots, \mathcal{C}_{\mathcal{N}}$ on the training set.

Step 2: Generate predictions $\boldsymbol{P_{base}}$ on the validation set:

$\mathbf{P_{base}} = [\mathcal{C}_1(x), \mathcal{C}_2(x), \dots, \mathcal{C}_{\mathcal{N}}(x)]$ ..... (17)

Step 3: Train the meta-classifier $\mathcal{M}$ on $\boldsymbol{P_{base}}$ to produce the final prediction.

a. Base classifiers' predictions: $P_i = \mathcal{C}_i(x)\ for\ i = 1, \dots, N$

b. Meta-classifier training set: $\mathbf{P_{meta}} = \{(P_1, y), (P_2, y), \dots, (P_N, y)\}$

c. Meta-classifier: $\mathcal{M}(\mathbf{P_{base}}) = y$

Step 4: The overall prediction of the stacking ensemble is given by:

$\mathcal{E}(x) = \mathcal{M}(\mathcal{C}_1(x), \mathcal{C}_2(x), \dots, \mathcal{C}_{\mathcal{N}}(x))$ ..... (18)

Experimental Setup and Results

Datasets

To assess the effectiveness of the proposed method, experiments were carried out on several benchmark medical datasets that are imbalanced and are obtained from UCI Machine Learning Repository and other sources. Table 1 shows the descripton of the datasets.

Experimental Procedure

i. **Data Preprocessing:** Each dataset was normalized, and missing values were handled appropriately.

ii. **Feature Selection:** The adaptive feature selection method was applied to identify the most relevant features for each dataset.

iii. **GAN Training:** GAN with attention mechanism was trained using the above-mentioned refined feature set to create artificial instances of the minority class.

iv. **Hybrid Ensemble Training:** Multiple base classifiers were trained on the balanced dataset generated by the GAN. AdaBoost and Stacking Ensemble methods were applied to combine the base classifiers.

v. **Model Evaluation:** The performance of the ensemble models was evaluated on a held-out test set using the defined metrics. Comparisons were made with traditional oversampling methods such as SMOTE and baseline classifiers trained on the original imbalanced data.

RESULTS

The results of the experiments conducted in this paper are provided in the Table 1 and Table 2 where the traditional oversampling techniques and the baseline models' performance as well as the proposed method's performance is
