- 2.To determine the role of marital adjustment and social support in the prediction of GHQ negatively phrased (GHQNP) items from partner abuse among the samples.

Hypothesis of the study

- 1.The relationship between partner abuse and GHQ positively phrased items (GHQPP) among the samples will be mediated by marital adjustment and social support.
- 2.The relationship between partner abuse and GHQ negatively phrased items (GHQNP) among the samples will be mediated by marital adjustment and social support.

METHODS AND PROCEDURE

A random sample of 400 married Sikkimese women, in early and middle adulthood from urban and rural areas, was selected. Only women who were married and living with their spouses during data collection were included. Participants received information about the study and provided written consent. The tools, translated in both English and Nepali through back-translation, were administered in a quiet, private setting to ensure confidentiality and privacy.

Psychological Tools Used

The present study employed standardized psychological tools to assess partner abuse, marital adjustment, social support, and general health - The Community Composite Abuse Scale by Loxton *et al.*, 2013, the Revised Dyadic Adjustment Scale by Busby *et al.*, 1995, the Multidimensional scale of perceived social support by Zimet *et al.*, 1988 and the General Health Questionnaire by Goldberg, 1972. All of them were found to have excellent reliability and validity.

RESULTS AND DISCUSSION

Result Table 1 shows the path coefficients of sequential mediation for the prediction of GHQ Positively phrased items (GHQPP) with demographics from Partner abuse. Figure 1 showed the path diagram of sequential mediation employing a partial least square method for the prediction of GHQ Positively Phrased items (GHQPP) from Partner Abuse with Marital Adjustment and Social Support as mediators with demographic variables. Demographic factors, including educational level, occupation, socioeconomic status, marital status, religion, and others, were considered during the preliminary analysis. However, analyses that controlled for these factors were included to summarize and clarify the findings of the current study. The findings suggest that social support and marital adjustment play a key mediating role in mitigating the effects of partner abuse on mental health, as measured by positively phrased items on the General Health Questionnaire (GHQPP). Research consistently highlights that social support functions as a protective factor that can buffer against stress and enhance well-being (Fleet & Hiebert-Murphy, 2013). Social support, especially in collectivistic and closely-knit communities, provides individuals with emotional and practical resources that help reduce the negative psychological impact of abuse. Marital adjustment also emerges as a crucial mediator, especially in regions like Sikkim, where strong cultural and familial connections can amplify the importance of harmonious marital relationships. A well-adjusted marital relationship may offer a sense of stability and security, which can protect individuals from the adverse mental health consequences associated with partner abuse (Ghoroghi *et al.*, 2012). In conclusion, partner abuse and good mental health outcomes are mediated by social support and marital adjustment as social support will always positively and significantly be associated with marital

**Lalfamkima Varte et al.,**

adjustment (Abbas *et al.*, 2019; Fleet & Hiebert-Murphy, 2013). Therefore, as hypothesized there was found to be a mediating role of marital adjustment and social support in the relationship between partner abuse and general health positively phrased items among the samples. The Result Table 2 shows the path coefficients of sequential mediation for the prediction of GHQ Negatively phrased items (GHQNP) with demographics from Partner abuse. Figure 2 showed the path diagram of sequential mediation employing a partial least square method for the prediction of GHQ Negatively Phrased items (GHQNP) from Partner Abuse with Marital Adjustment and Social Support as mediators with demographic variables. The results of sequential mediation (Table 2 and Figure 3) revealed a significant effect of the direct, indirect, and total effect on the prediction of GHQNP from partner abuse with marital adjustment and social support as mediators with/without demographic variables. The findings of the direct effect indicate that there is a positive relationship between partner abuse and GHQNP. In other words, as the levels of partner abuse increase, the level of GHQNP also increases. Other research has suggested that married women who are exposed to any type of partner abuse are associated with higher rates of all health risk behaviours, and poor health, and might also experience different disorders like depression, drug dependence, generalized anxiety disorder, post-traumatic stress disorder, etc than the women who have never experienced partner violence (Bonomi *et al.*, 2006; Clemente-Teixeira *et al.*, 2022; Tolman and Rosen, 2001).

Similar findings by Coker *et al.*, (2000) reported that women who had experienced intimate partner abuse were far more likely to report having poor physical and mental health. According to the study conducted by Shilpa & Suman (2022), the main reason for the perpetration of partner abuse was found to be the alcohol use by their spouses. Other than that, the other reason was the partners' personality behaviours like unstable mood, short-tempered, suspiciousness, and manipulation and half of the women mentioned extramarital involvement of their partners. The findings are also supported by the prior study where they reported that partner abuse has been associated with the negative well-being of an individual (Grundström *et al.*, 2021; Adams & Beeble, 2019). In addition, İyiyaydın & Sümer (2021) on their study reported that through the mediating effects of intimate partner rejection and psychological marital adjustment, the results showed that intimate partner behavioural control was substantially and indirectly linked with marital adjustment. Moreover, psychological maladjustment and marital adjustment were directly impacted by rejection from an intimate partner. Importantly, their study showed that the association between intimate partner control and marital adjustment was also mediated sequentially by psychological maladjustment and intimate partner rejection. Although having positive relationships, the direct effect of partner abuse on GHQNP reduces from (.42) to an indirect effect (.06) with the inclusion of mediators (social support and marital adjustment). Social support and marital adjustment are important factors in enhancing general well-being and lowering poor health consequences. These findings are similar to findings indicating that fostering social support and marital adjustment are vital components for maintaining a healthy lifestyle and well-being (Muslima and Herawati, 2019; Gyasi *et al.*, 2019). However, the present findings are contradicted by prior study conducted by (Soulsby and Bennett, 2015). Therefore, as hypothesized there was found to be the mediating role of social support and adjustment in the relationship between partner violence and general health negatively phrased items among the samples.

CONCLUSION

The findings in the present study revealed that the association between partner abuse and general health among the samples was shown to be mediated by social support and marital adjustment, according to the sequential mediation results. With marital adjustment and social support acting as mediators, the first results of a partial least square approach demonstrated the considerable impact of GHQPP and GHQNP from partner abuse. In addition, the prediction of GHQPP and GHQNP from partner abuse was shown to be significantly impacted by social support and marital adjustment, both of which acted as mediators with and without demographic covariates. By identifying these mediators, the research highlights two critical pathways that could be targeted to mitigate the negative health impacts of partner abuse. Social support and marital adjustment don't just influence individual well-being but serve as protective factors in complex relational environments. Interventions focused on strengthening social support

systems and enhancing marital adjustment could therefore be vital in improving the general health of those affected by partner abuse.

ABSTRACT

The increasing reliance on digital transactions and online authentication processes has underscored the need for robust signature verification systems. This paper presents a comprehensive framework for detecting forged signatures using advanced preprocessing techniques, feature extraction, and machine learning-based classification. The preprocessing pipeline includes grayscale conversion, noise reduction with Gaussian filtering, binarization via Otsu's thresholding, and bounding box extraction for signature isolation. The feature extraction phase focuses on seven key signature characteristics—eccentricity, skewness, solidity, kurtosis, centroid position, signature coverage, and bounding box dimensions—each analyzed for its contribution to distinguishing genuine signatures from forgeries. High performance on test data is achieved when a Multi-Layer Perceptron (MLP) neural network model is used for classification. The system's integration with Google Colab ensures scalability, while feature importance analysis demonstrates the critical role of eccentricity and skewness in detecting forgeries. The proposed system showcases high accuracy, providing a reliable tool for signature verification in real-time and bulk testing environments.

Keywords: Digital Signature Verification, Forgery Detection, Image Preprocessing, Feature Extraction, Neural Networks, Eccentricity, Skewness, Google Colab Integration.

INTRODUCTION

Verification of signatures is an essential part of digital security and is widely used in document authentication, banking, and contracts. Automated systems that can reliably differentiate between real and fake signatures are becoming more and more necessary as digital transactions increase. Generally speaking, there are two types of procedures for verifying signatures: offline verification involves examining scanned photographs of the signatures. This paper develops an automated system for differentiating between authentic and counterfeit signatures, addressing the difficulties in offline signature verification by fusing machine learning and image processing. The problem of signature verification is complicated by factors such as variations in writing style, image quality, and distortions from scanning. Traditional methods using geometric features often struggle with such variability. To overcome these challenges, modern approaches incorporate machine learning, which can learn complex patterns and generalize effectively across different signatures. This study develops a framework for offline signature verification that uses preprocessing steps (such as converting images to grayscale, Gaussian smoothing, and Otsu's thresholding) to prepare the signature images for feature extraction. Important characteristics are retrieved to characterize the geometry and distribution of the signature, including eccentricity, solidity, skewness, and centroid. A Multi-Layer Perceptron (MLP) neural network is then trained on labeled data using these attributes as input to determine if a signature is authentic or fake. Using an MLP improves the model's capacity to distinguish between signatures by enabling it to learn nonlinear correlations in the data. A distinctive aspect of the system is its integration with Google Colab and Google Drive, enabling cloud-based data storage and model training. This setup facilitates easy access to data, secure storage, and efficient collaboration, especially when working with large datasets. Additionally, the modular structure of the code ensures flexibility, with each part of the system (preprocessing, feature extraction, classification) easily adjustable. Classification accuracy and other indicators are used to evaluate the system's performance, showing how well it separates authentic signatures from fakes. Convolutional neural networks (CNNs) for feature learning, hyperparameter tweaking, and data augmentation could be used in future developments to further increase model performance. This study advances the field of signature verification by giving an automated approach that integrates machine learning and image processing, with potential uses in document authentication and safe online transactions.

MATERIALS AND METHODS

This study employs a thorough offline signature verification methodology that consists of several steps: data collecting, preprocessing, feature extraction, neural network model creation, and performance assessment. This systematic framework combines image processing techniques and machine learning to achieve high accuracy in distinguishing between genuine and forged signatures.

Data Collection and Organization

The dataset used in this study consists of a collection of genuine and forged signature images. The signatures come from a group of people, and for training and testing purposes, both real (authentic) and fake signatures are used. The dataset is structured to ensure that the system can learn to differentiate between genuine and forged signatures from various individuals. To facilitate efficient data handling, the dataset is organized into separate directories for genuine and forged signatures. This organization ensures that the data is well-structured for supervised learning, with each set of images labeled accordingly. The signature images are stored on Google Drive (Figure 3) (Figure 4), ensuring easy access and secure storage for further processing. This setup is integrated with Google Colab, which allows for scalable and flexible processing of large datasets directly from the cloud.

Preprocessing Steps

Preprocessing transforms raw pictures into a format that the machine learning model can efficiently examine, making it an essential stage in the verification of signatures. To improve the signature's features and minimize noise, the following preprocessing techniques are used on the digital signature images:

Pranay Sharma et al.,

1. **Grayscale Conversion:** Signature images are first converted to grayscale, usually from RGB color. By eliminating color information from the image, grayscale conversion streamlines it while maintaining the crucial intensity information of the signature and lowering computing complexity. This stage guarantees that the structure of the signature can be recorded without superfluous color elements.
2. **Gaussian Filtering for Noise Reduction:** After converting to grayscale, the image is subjected to **Gaussian smoothing** to reduce noise. Gaussian filtering helps to blur the image slightly, removing small variations in pixel intensity that could result from scanning artifacts, paper texture, or distortions in the signature. This step ensures that only the signature itself is analyzed, free from irrelevant noise.
3. **Otsu's Thresholding for Binarization:** The next preprocessing step is Otsu's thresholding, which automatically picks the best threshold value to turn the grayscale image into a binary (black and white) image. By separating the foreground (signature) from the background, this procedure makes the signature stand out and streamlines feature extraction.
4. **Inversion of Image Colors:** The binary image is inverted, ensuring that the signature is displayed in white against a black background. This inversion standardizes the image and prepares it for feature extraction, as the signature typically appears as a bright stroke on a dark background in most signature verification systems.
5. **Bounding Box Extraction:** To focus solely on the signature, a bounding box is drawn around the region containing the signature. This step crops out unnecessary whitespace or background noise, reducing the image size and improving the accuracy of subsequent feature extraction. These preprocessing steps are crucial in ensuring that the signature images are in a standardized and clean format, allowing for more accurate analysis by the machine learning model.

Feature Extraction

Extracting significant features that capture the essential elements of the signature comes next after preprocessing. By using these characteristics as input, the machine learning model is able to distinguish between authentic and fake signatures. The following features are extracted:

1. **Eccentricity:** Eccentricity measures the elongation of the signature. Forged signatures often exhibit exaggerated strokes, leading to higher eccentricity values compared to genuine signatures, which tend to be more compact and natural. This feature helps in identifying forgeries based on their stretched or skewed appearance.
2. **Skewness:** Skewness quantifies the asymmetry of the signature distribution along the x and y axes. Genuine signatures typically have balanced skewness values, reflecting the natural flow of writing. In contrast, forged signatures may show irregular distributions, indicating deviations from the genuine writing style.
3. **Kurtosis:** Kurtosis measures the "tailedness" of the intensity distribution of the signature. High kurtosis indicates that the signature has sharp peaks and long tails in its intensity distribution, which is often observed in forged signatures due to inconsistent or exaggerated strokes.
4. **Solidity:** Solidity is the ratio of the area of the signature to its convex hull area, providing a measure of the signature's compactness. Genuine signatures tend to have a higher solidity ratio, reflecting the smooth and continuous nature of the stroke. In contrast, forged signatures may show more irregularities in stroke density, leading to lower solidity values.
5. **Signature Coverage:** Signature coverage represents the proportion of the image area covered by the signature. A higher ratio of coverage is typical of genuine signatures, as they tend to occupy more space on the paper. Forgeries, especially those made quickly or clumsily, might leave more white space.
6. **Centroid Position:** The centroid of the signature is the geometric center of the signature region. This feature is useful for detecting misalignments or irregularities in the signature placement. Inconsistencies in centroid position are often observed in forgeries, where the signature might not be placed as naturally as in genuine ones. The extracted features are then organized into a **feature vector** for each signature. These vectors are stored in **CSV files** for further analysis and are used to train the neural network model.

Neural Network Model Design

The system's main component is a Multi-Layer Perceptron (MLP) neural network, which uses the extracted feature vectors as input to determine if the signatures are authentic or fake. The following layers make up the model:

Pranay Sharma et al.,

1. **Input Layer:** The input layer receives a feature vector of size 9, representing the 9 extracted features from each signature.
2. **Hidden Layers:** There are three hidden levels in the network, each containing seven, seven, and thirty neurons. Multiple hidden layers with tanh activation functions give the model non-linearity, which helps it discover intricate relationships and patterns in the feature data.
3. **Output Layer:** Two neurons with softmax activity, which stand in for the two classes of fabricated (0) and authentic (1), make up the output layer. Probabilistic outputs, which show the likelihood that the signature belongs to each class, are provided by Softmax.
4. **Optimizer and Loss Function:** Whereas the Adam optimizer is used for efficient gradient-based optimization, categorical cross-entropy is used as the loss function, making it suitable for multi-class classification problems. To reduce the loss function and increase classification accuracy, the model is trained in batches by repeatedly going through the dataset (epochs).

Evaluation and Testing

Both training and testing datasets are used to assess the model once it has been trained. Accuracy, precision, recall, and F1-score are calculated as part of the evaluation process to assess the model's performance. To explain the model's classification findings and get insight into false positives and false negatives, a confusion matrix is used. Two evaluation modes are used to test the system:

1. **Batch Evaluation:** The model processes a batch of signature images to assess the overall accuracy and performance. This mode is useful for evaluating the model on a large dataset and comparing different models or configurations.
2. **Real-Time Testing:** In this mode, the model is used to classify a single signature image. This is ideal for practical applications where a new signature needs to be verified in real-time, such as in digital document signing platforms or banking systems.

Implementation Details

The entire system is implemented using Python libraries, including numpy, pandas, scipy, and tensorflow for numerical operations and machine learning tasks. Matplotlib, skimage, and PIL are used for image loading, processing, and visualization. The code is hosted and run in Google Colab, with Google Drive integrated for easy data management. This cloud-based environment enables seamless access to datasets and efficient collaboration, making the system scalable for large datasets and multiple users

RESULTS AND DISCUSSIONS

Results and Evaluation The results of the offline signature verification system's application, including the neural network model's performance metrics, are presented in this part. The efficiency of the preprocessing pipeline, feature extraction, and machine learning model in differentiating between authentic and fake signatures is assessed in this section. Numerous performance measurements, comparisons with baseline techniques, and suggestions for possible enhancements are the main topics of the evaluation.

Performance Metrics

Several common measures, which are crucial for assessing classification models in machine learning applications, were used to evaluate the model's performance. The following are the main evaluation metrics:

1. **Accuracy:** The ratio of accurately identified signatures (both authentic and fraudulent) to all signatures. An overall indicator of the model's performance is accuracy.
2. **Precision:** Precision quantifies the percentage of authentic signatures that are accurately identified as genuine, or true positives, out of all instances that are classed as positive. This measure is crucial for comprehending how well the model prevents false positives, or incorrectly identifying counterfeit signatures as authentic.

Precision = (True Positives) / (True Positives + False Positives)

Pranay Sharma *et al.*,

3. **Recall (Sensitivity):** The percentage of true positives among all real positive cases (authentic signatures) is measured by recall. High recall means that the model is capable of detecting the majority of real signatures, even if it misclassifies some fake ones.

$$\text{Recall} = (\text{True Positives}) / (\text{True Positives} + \text{False Negatives})$$
4. **F1-Score:** A balanced indicator of the model's performance, the F1-score is the harmonic mean of precision and recall, particularly in cases where the two classes (genuine and forged) are out of balance.

$$\text{F1-Score} = (2 * (\text{Precision} * \text{Recall})) / (\text{Precision} + \text{Recall})$$
5. **Confusion Matrix:** This graphic depicts the model's classification performance by displaying the number of true positives, false positives, true negatives, and false negatives. This matrix aids in identifying the model's weak points, especially when it comes to differentiating between authentic and fake signatures.
6. **ROC Curve and AUC:** The Receiver Operating Characteristic (ROC) curve and the Area Under the Curve (AUC), the model's capacity to differentiate between the two classes is also evaluated using the ROC curve and AUC. An elevated AUC value signifies superior model performance. These metrics are used to give a thorough picture of how well the model classifies signatures.

Training Performance

The neural network model was trained over a set number of epochs using labeled authentic and counterfeit signatures. The loss function was minimized using the Adam optimizer, and the model was trained to modify the weights via back propagation. During the training phase, the loss gradually decreased, and the model's accuracy improved, as evidenced by the training logs. The following points highlight key observations during training:

1. **Convergence:** The model's loss curve showed a steady decrease, indicating that the training process was converging. This suggests that the model was successfully learning from the training data.
2. **Overfitting:** The model's performance was routinely checked against a hold-out validation set to prevent overfitting. The findings demonstrated that the model does a good job of generalizing to new data, and no discernible overfitting was found during training. The validation accuracy stayed relatively close to the training accuracy, indicating that the model was picking up generalizable patterns rather than memorizing the training data.
3. **Training Time:** The training process was efficient, with the model converging within a reasonable number of epochs (e.g., 20-30 epochs). The use of **batch training** and an efficient optimizer like Adam ensured that the model did not take excessively long to train.

Feature Analysis and Justification

Analysis of the role features play in the categorization process is a crucial component of this study. A number of methods, such as correlation analysis and permutation importance, were employed to determine which features have the most influence on forgery detection.

- **Eccentricity and skewness** identified as the most significant traits, with eccentricity alone resulting in a 15% loss in accuracy. Since forgeries often alter the natural elongation of authentic autographs, the significance of eccentricity in identifying fake signatures is well-established.
- **Skewness**, which measures asymmetries in the distribution of strokes in a signature, was particularly important because forgeries frequently have uneven stroke patterns.
- Complementary information on the density and compactness of the signature was offered by solidity and coverage. Accuracy decreased by 10% when these traits were removed, demonstrating their value in detecting discrepancies in variations in compactness and stroke density.
- **kurtosis** also proved beneficial, particularly in capturing subtle variations in the tail distributions of forged signatures. The combination of eccentricity, skewness, and solidity showed the highest classification accuracy, suggesting these features are most valuable in the context of signature forgery detection.

**Pranay Sharma et al.,****Evaluation Results on Test Dataset**

Following training, a different test dataset with never-before-seen signature photos was used to evaluate the model. The following outcomes were attained:

1. **Accuracy:** Using the test dataset, the model's accuracy was roughly 92%. This high accuracy shows how well the model can differentiate between real and fake signatures.
2. **Precision and Recall:** The precision was **0.90**, meaning that 90% of the signatures predicted as genuine were indeed genuine. The recall was **0.93**, indicating that the model was able to identify 93% of all genuine signatures correctly. The relatively high recall compared to precision suggests that the model is particularly effective at detecting genuine signatures but might have a slightly higher false positive rate.
3. **F1-Score:** The F1-score on the test dataset was **0.91**, which balances precision and recall and confirms that the model performs well in both detecting genuine signatures and avoiding false positives.
4. **Confusion Matrix:** According to the test dataset's confusion matrix, the model did a good job of differentiating between authentic and fake signatures. Nevertheless, there were a few false negatives (genuine signatures misclassified as forged) and false positives (forged signatures misclassified as real), though these mistakes were small. The confusion matrix indicated a low rate of misclassification in both directions, which is positive for the system's actual implementation.

Comparison with Baseline Methods

The proposed neural network model was compared with some baseline approaches, including:

1. **Traditional Image Processing Techniques:** Baseline methods using basic image processing techniques like template matching, edge detection, and histogram-based feature extraction were tested. These traditional methods achieved lower accuracy (around **70-80%**) in comparison to the deep learning approach.
2. **Support Vector Machines (SVM):** An SVM classifier was trained using handcrafted features from the signature images. While the SVM performed reasonably well, it achieved lower precision and recall than the neural network model, with accuracy hovering around **85-88%**. The neural network model outperformed these baseline approaches in terms of both accuracy and generalization, indicating the advantage of using deep learning techniques for offline signature verification.

Evaluation in Real-Time Testing

In real-time testing mode, the model was able to process new signature images uploaded via **Google Drive**, demonstrating its ability to perform **single image classification**. The evaluation showed that the system could effectively classify new signatures in real-time with a **slightly reduced accuracy (89%)** compared to batch testing. This reduction is expected due to variations in the signature style, but the model still provided accurate results suitable for practical applications.

Error Analysis and Insights

Despite achieving high performance, the model encountered some challenges that provide valuable insights for future improvements:

1. **Signature Variability:** Variations in signature style (e.g., different writing implements or signing conditions) occasionally resulted in misclassifications, particularly for faked signatures that closely resembled genuine signatures. The model's resilience to such fluctuations may be enhanced by further data augmentation methods such as noise injection, scaling, and rotation.
2. **Forged Signatures with High Similarity:** Some forgeries, especially those created with an attempt to mimic the genuine signature, exhibited a high degree of similarity, which made them difficult to distinguish. Using more sophisticated models (such as Convolutional Neural Networks) or improving the feature extraction procedure further could help the model better detect these minute variations.

Potential Areas for Improvement

Several areas for improvement were identified during the evaluation process:

1. **Data Augmentation:** Using data augmentation techniques like distortion, scaling, and rotation may improve

Pranay Sharma *et al.*,

the model's ability to generalize to different signature styles.

2. **Model Refinement:** Since Convolutional Neural Networks (CNNs) are more adept at capturing spatial hierarchies in images, the model could be improved by utilizing these more sophisticated structures. This might enhance the model's capacity to manage increasingly intricate trademark traits.
3. **Hyperparameter Tuning:** Adjusting hyperparameters like learning rate, number of epochs, and batch size using methods like grid search or random search could further improve the model's performance.
4. **Ensemble Methods:** Combining predictions from several models (such as decision trees, SVM, and neural networks) may enhance overall classification performance by lowering the possibility of misclassification.

CONCLUSION

This study offers a scalable and efficient framework for verifying signatures by fusing deep learning for classification, reliable feature extraction approaches, and conventional image processing methods. The objective of this research is to develop an automated system that can accurately distinguish between authentic and fake signatures. Preprocessing techniques including grayscale conversion, Gaussian filtering, Otsu's thresholding, and bounding box generation are integrated to guarantee that the input given into the machine learning model is clear and organized, which enhances performance overall. The choice of features, including geometric and statistical properties such as eccentricity, skewness, solidity, kurtosis, and signature coverage, has proven to be crucial for effective signature discrimination. These features capture not only the shape and structure of the signature but also the more subtle characteristics that distinguish genuine signatures from forgeries. The model's performance was evaluated using a Multi-Layer Perceptron (MLP) neural network, achieving impressive accuracy rates of 96% for training and 93% for testing. These results are encouraging and suggest that the combination of preprocessing, feature extraction, and MLP classification is highly effective for signature verification tasks. This system also features two primary evaluation modes: one that processes batch data from CSV files and another that evaluates individual images for real-time signature verification. This flexibility makes the system versatile, suitable for use cases ranging from large-scale document processing to real-time fraud detection, where new signatures are continually analyzed. Despite the success of the current approach, several areas remain open for further enhancement. The application of Convolutional Neural Networks (CNNs) could improve performance significantly, as CNNs excel in capturing spatial features and patterns in image data, which is vital for signature analysis. Furthermore, data augmentation techniques could increase the model's robustness to slight variations in signature styles or distortions, such as changes in pen pressure, tilt, or stroke direction. Exploring sophisticated feature extraction methods like Histogram of Oriented Gradients (HOG) or Scale-Invariant Feature Transform (SIFT) may provide the feature set even more discriminative capability, and hyperparameter adjustment also gives a great deal of optimization possibilities. Additionally, there is room for enhancing the user interface to allow seamless, real-time signature verification in practical applications. A fully developed real-time testing interface could enable users to upload signature images and instantly receive feedback on authenticity. This would make the system more accessible and usable for industries such as banking, where rapid and reliable signature verification is crucial. In conclusion, this paper presents a solid foundation for automated signature verification systems, combining preprocessing, feature extraction, and machine learning. With future improvements and enhancements, this framework has the potential to be a robust tool for detecting signature forgeries across various domains. It offers a glimpse into how automated systems can be employed to secure digital transactions and prevent fraudulent activities, making it an invaluable addition to the field of digital security.

ABSTRACT

This systematic literature review aims to assess the current body of knowledge within the academic literature about the resilience and recovery of Micro, Small, and Medium-sized Enterprises (MSMEs) following natural disasters. Adhering to the guidelines established by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA), we meticulously scrutinized 31 studies published in selected journals, spanning from 2000 to 2023. Our comprehensive review endeavors to shed light on the previous research on flood resilience, disaster recovery strategies, effective disaster management, the importance of business continuity, and the broader impact of natural disasters on MSMEs. By adopting a co-occurrence perspective, our review seeks to provide valuable insights into the intersection of natural disasters and MSMEs while underlining the authors' significant content. Moreover, we aim to offer recommendations for future research endeavors in this domain. Within the realm of resilience and recovery of Micro, Small, and Medium-sized Enterprises (MSMEs) following natural disasters. Our analysis also highlights the growing involvement of researchers from developing nations, particularly in Asia and Africa, in the exploration of natural disasters and MSMEs. Regrettably, cross-cultural studies, long-term resilience strategies, gender disparities, technology and innovation, supply chain resilience, and collaboration, remain conspicuously underrepresented in the existing literature.

Keywords: Resilience, Recovery, MSMEs, Natural Disaster, Systematic Literature Review.

JEL Classification: L26, M21, Q54

INTRODUCTION

Over the past 15 years, there has been a significant increase in the frequency of natural disasters worldwide. The number of reported disasters has risen by 63 percent, with fatalities increasing by more than 85 percent (Guha-Sapir, Below, & Hoyois). During the same period, economic losses resulting from these calamities have surged by over 120 percent. In 2020, Asia accounted for 46 percent of all global natural disasters, representing 50-70 percent of catastrophic events since 1985 (Guha-Sapir, Below, & Hoyois). Extensive research has been dedicated to comprehending the impacts of disasters, with a predominant focus on understanding their effects on individual households and the broader macroeconomic climate (Zhang, 2004). While these investigations have significantly enriched our understanding of disaster resilience and recovery, a critical area has remained conspicuously underexplored within the realm of disaster risk reduction (DRR): the intricate relationship between disasters and Micro, Small, and Medium Enterprises (MSMEs). MSMEs are highly susceptible to the impacts of natural disasters and require support in developing risk mitigation strategies to endure such events. Disasters can significantly disrupt their routine operations, encompassing activities like procuring raw materials, production, and marketing processes (Radović-Marković, Farooq, & Marković, 2017) (Triwidiyanto & Navastara, 2013). This research paper seeks to address this notable gap in the existing literature by delving into the dynamics of MSMEs in the context of disaster risk reduction. By examining how disasters affect these enterprises, both in terms of challenges and opportunities, we aim to shed light on their crucial role in bolstering community resilience. Through a comprehensive analysis, we will explore the strategies employed by MSMEs to withstand and recover from disasters, contributing valuable insights to the broader field of disaster risk reduction and management. Moreover, this research aims to advocate for greater recognition of MSMEs as key actors in disaster resilience efforts, thus fostering a more holistic and effective approach to disaster risk reduction on both local and global scales. The table below provides an overview of annual average disaster occurrences and their impacts by type for the period from 2001 to 2020:

Background

The lack of empirical evidence, particularly from the MSME perspective, has impeded our understanding of how to effectively achieve community resilience. Our grasp of restoring social and economic fabrics post-disasters has been limited, hindering the translation of potential economic stimulus from the MSME sector into broader community gains. Despite being significant economic contributors, MSMEs are highly susceptible to the adverse consequences of natural hazards. Factors contributing to this vulnerability include operating in suboptimal locations, limited access to financial resources, concentration in local markets, lower implementation of Disaster Risk Reduction (DRR) measures, and exclusion from post-disaster recovery programs (Zhang et al., 2004). MSMEs face challenges in accessing risk reduction and recovery tools, such as disaster insurance and post-disaster recovery loans, often inadequately designed for their unique needs, especially in the informal sector. In developing countries, the interaction between MSMEs and disaster risk is further complicated by informality. The informal nature of many MSMEs has complex implications for disaster risk. Non-compliance with regulatory frameworks, the use of informal labor relations, and minimal official engagement can increase vulnerability. However, informality introduces flexibility into MSME operations, potentially enhancing their resilience in rapidly changing environments.

Rationale

This study builds on the premise that Micro, Small, and Medium-sized Enterprises (MSMEs) shoulder a disproportionate burden in disasters compared to larger firms, highlighting their inherent flexibility. Due to lower capital requirements and adaptable work relations, especially in the informal sector, MSMEs can play a crucial role in expediting equitable recovery for local communities post-disasters. The study emphasizes the importance of enhancing MSMEs' disaster resilience, addressing socio-economic risk drivers pre-emptively. Swift and adequate support for MSMEs immediately after disasters is advocated. The research identifies prerequisites, options, and policies for governments and MSMEs, empowering the latter to proactively contribute to Disaster Risk Reduction (DRR) and post-disaster recovery. The study concludes that mitigating MSME vulnerability to natural hazards requires fostering conducive pre- and post-disaster environments, leveraging small businesses' resilience for local

**Sushant Kumar et al.,**

economic and social recovery. It serves as a call to policymakers to incorporate MSME-focused strategies into post-disaster recovery plans, positioning these enterprises at the forefront of economic and social revitalization. Additionally, it aims to enrich the knowledge of policymakers and private sector stakeholders, offering insights into tools and approaches for engaging MSMEs in recovery and DRR initiatives. By unraveling the complex relationship between MSMEs, informality, and disaster risk, this study sets the stage for effective disaster resilience strategies within the MSME sector, crucial for sustainable economic development and livelihoods.

SYSTEMATIC LITERATURE REVIEW

A systematic literature review (SLR) distinguishes itself from traditional narrative reviews with its rigorous and structured approach, emphasizing thorough literature searching, data abstraction, and synthesis, all meticulously documented. To ensure transparency and enhance quality, creating a reporting flowchart, as recommended by Yang et al. (2017), is crucial. This flowchart tracks both included and excluded studies, contributing to a clear, traceable reporting process, and elevating the review's overall quality. It enhances the robustness of the review by visually representing the study selection process, promoting accountability and clarity. Systematic reviews can incorporate knowledge from diverse research approaches, encompassing both qualitative and quantitative methods (Pickering & Byrne, 2014). Notably, researchers like Asgary et al. (2012) and Galbraith and Stiles (2006) have employed SLRs on the same topic.

METHODS

Note: SLR: Systematic Literature Review

Source: Adapted from Pickering and Byrne (2014)

This study systematically reviews existing literature to comprehensively analyze the resilience and recovery of MSMEs post-natural disasters. The goal is to identify the impacts, challenges, and opportunities encountered by MSMEs during and after disasters, offering a nuanced understanding of their role in disaster resilience and recovery.

Q.1. What is the current landscape of research on resilience and recovery of Micro, Small, and Medium-sized Enterprises (MSMEs) following natural disasters, spanning the period from 2000 to 2023?

Q.2. What does the research landscape reveal about the interconnections between natural disasters and MSMEs, as observed through keyword co-occurrence analysis?

Q.3. What are the focal themes and critical subject matter explored by scholars in their studies?

Q.4. What recommendations can be inferred for guiding future research endeavors in this field?

LITERATURE REVIEW PROTOCOL

In line with our research objectives, we developed a comprehensive review protocol to guide the literature search. This protocol included specific database identification, formulation of search terms, and criteria for selecting relevant literature. To focus on the topic, we used keyword combinations like(("Resilience" OR "Recovery") AND ("Micro, Small and Medium Enterprise" OR "Micro, Small, and Medium-Sized Enterprises" OR "Small and Medium Enterprise" OR "Small and Medium-Sized Enterprise" OR "Micro-Enterprise" OR "Small Enterprise" OR "Medium* Enterprise")), targeting economic impact, resilience, and disaster recovery. This approach ensures a thorough search addressing diverse aspects to support our research objectives effectively. The literature was extensively sourced from prominent Scopus e-databases, known for their consistent inclusion in previous review studies. This deliberate choice aims to enhance the quality and comprehensiveness of our literature search. We examined search terms in study titles, keywords, abstracts, or the main text, focusing on English-language academic journals published between 2000 and 2023. This selection criteria, guided by English as the predominant language in international academic publishing, ensures reliance on high-quality and globally accessible academic sources.

LITERATURE SCREENING

We employed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) methodology for literature screening (PRISMA, 2019b). The PRISMA checklist (PRISMA, 2019a) provides guidelines ensuring replicability and reliability across various disciplines. PRISMA was chosen for its recognized comprehensiveness, global use, and capacity to enhance review consistency (Pahlevan-Sharif et al., 2019). As of, June 2024, our search on prominent Scopus e-database yielded 239 studies. After excluding editorials, conference proceedings, book chapters, and duplicates, 112 studies remained. These were assessed against our specific criteria, leading to the removal of 50 irrelevant papers. The focus on natural disasters within MSMEs guided exclusions of medical/nursing-related, online booking, and man-made disaster publications. The screening resulted in 72 studies, which underwent thorough eligibility assessment. A meticulous review and analysis, including a detailed examination of full papers, led to the exclusion of 41 studies that did not align with the criteria. The final synthesis included 31 eligible studies for comprehensive analysis.

RESULT

In the results section, there is a comprehensive discussion of the development of literature and the process of content analysis. When it comes to the progression of literature, it entails an examination of the journals and publication years spanning from 2000 to 2023. On the other hand, within the scope of content analysis, there is an exploration of various aspects, such as the authors, subject theme, the research methodologies, and key findings used.

General Overview: Evolution of the Literature

The analysis encompassed computing descriptive statistics for the reviewed studies, with results presented in Figures 3 and 4. Figure 3 outlines journals contributing to natural disaster research within the MSME context, highlighting the International Journal of Disaster Risk Reduction as the primary contributor with four papers. Following closely are the Journal of Contingencies and Crisis Management, International Research in the Business Disciplines, and Environmental Hazards, while other journals secured the third position with twenty-one publications. Considering the distribution of papers across years, as depicted in Figure 4, reveals noteworthy patterns. In 2000 and 2004, annual publications were 3.23, indicating relatively low scholarly activity. However, a surge occurred in 2006, 2008, and 2010, with 6.45 papers annually, signaling increased interest. Notably, 2011 saw a peak with 16.13 papers, followed by a sustained high output in 2012 with 12.90 papers. Subsequent years experienced a decline until 2019, which marked a resurgence with 6.45 papers, continuing into 2020. In 2021, there was a significant increase to 9.68 papers, emphasizing renewed research emphasis. Looking ahead, 2022 witnessed a slight decrease to 3.23 papers, followed by a rebound to 6.45 papers in 2023, showcasing dynamic trends in research activity. In this comprehensive content analysis of 31 research studies, we explore an array of critical themes surrounding the resilience and recovery of MSMEs following natural disasters. These studies offer a wealth of insights, spanning a substantial timeframe from 2000 to 2023, and address a multitude of essential aspects within this vital field of research.

Authorship and Temporal Context

These studies are the work of various authors and research teams, reflecting a diverse and evolving body of knowledge that spans over two decades. The evolution of thought and the cumulative nature of research in this domain become evident as we delve into the content.

Diverse Subject Themes

The subject themes examined in these studies encompass a broad spectrum of topics, all under the umbrella of disaster-related challenges faced by MSMEs. The studies tackle issues such as flood resilience, disaster recovery strategies, effective disaster management, the importance of business continuity, and the broader impact of natural disasters on MSMEs. This diversity of themes underscores the complex and multifaceted nature of the subject matter.

**Sushant Kumar *et al.*,****Methodological Versatility**

The methodologies applied in these studies demonstrate a rich tapestry of research approaches. These include the utilization of case studies, surveys, in-depth interviews, data collection and analysis, systematic literature reviews, and more. Many studies employ a combination of these methods, showcasing a holistic effort to comprehensively address the research questions. This methodological diversity allows for a well-rounded exploration of the challenges and opportunities within the realm of disaster-impacted MSMEs.

Significant Key Findings

The key findings from these studies offer essential insights into the ramifications of natural disasters on MSMEs. These findings extend across economic, social, and environmental dimensions. For instance, the research highlights disasters' profound and adverse effects on MSMEs, including income losses, employment declines, and supply chain disruptions. Furthermore, the studies emphasize the critical role of proactive disaster preparedness and recovery strategies for businesses, underscoring the importance of government interventions and support in facilitating such measures.

Global and Local Context

The geographic scope of these studies is extensive, spanning various nations across Asia, Africa, and the Western world. This global perspective provides a rich comparative backdrop to understand the variations in disaster impacts and recovery strategies across different regions.

Gender Dynamics

Several studies delve into the gender-specific dynamics of disaster impacts on MSMEs, revealing disparities in how male-owned and female-owned businesses are affected by disasters and how they respond to recovery efforts. This gender-sensitive approach adds a nuanced layer to our understanding of disaster resilience within MSMEs.

Government's Crucial Role: The role of government policies and interventions emerges as a critical theme. These studies underscore the pivotal significance of government support, which includes financial incentives, well-planned disaster management measures, and regulatory frameworks that can enable the resilience and recovery of MSMEs.

Resilience Strategies

The research studies emphasize the importance of resilience strategies for MSMEs, including the development of robust disaster mitigation plans, the adoption of insurance, and investments in human resource development and business continuity measures. These strategies are depicted as essential pillars in the quest for post-disaster resilience.

Informal Sector Challenges

A significant emphasis is placed on the informal sector within the MSME landscape. The challenges faced by informal businesses, often lacking formal risk management tools, come to the forefront. These businesses are depicted as particularly vulnerable to disaster risks.

Community and Social Factors

The studies recognize the vital role of community and social factors in the disaster recovery process. MSMEs are acknowledged for their capacity to foster social recovery by revitalizing local markets and nurturing community cohesion. The community's engagement and collective efforts are seen as invaluable assets in the journey towards recovery.

Financial Aspects and Resource Allocation

The studies thoroughly explore the financial aspects of disaster recovery, including the consequences of cash flow problems, resource intermingling, grants, and business continuity strategies. The allocation of resources and their management becomes a focal point in discussions regarding post-disaster recovery.

**Sushant Kumar et al.,****Infrastructure and Hazard Programs**

The studies underline the significance of infrastructure quality and the presence of hazard programs in influencing disaster preparedness and recovery. Weak infrastructure and the lack of hazard programs are notable challenges MSMEs face in disaster-prone areas.

Holistic Understanding and Policy Implications

Overall, this content analysis provides a comprehensive understanding of the intricate and multifaceted challenges confronting MSMEs in the aftermath of natural disasters. It underscores the necessity of proactive measures, government support, and the development of resilience-building strategies to enhance the recovery and sustainability of these vital economic contributors. These findings are not only academically significant but also hold practical value for policymakers, researchers, and practitioners in the fields of disaster management, entrepreneurship, and economic development, with the potential to inform and shape future strategies and interventions. The research conducted in this domain continues to evolve, striving to enhance the resilience and recovery of MSMEs and contributing to the broader field of disaster management and preparedness.

CONCLUSION, LIMITATIONS, AND FUTURE RECOMMENDATIONS**CONCLUSION**

This extensive content analysis of 31 research studies thoroughly explores key themes surrounding the resilience and recovery of MSMEs in the aftermath of natural disasters. Spanning the period from 2000 to 2023, these studies contribute to a nuanced and holistic understanding of the challenges and opportunities facing MSMEs. The evolving body of knowledge in this field reflects a continuous effort to comprehend the complexities involved, addressing diverse subjects such as flood resilience, disaster recovery strategies, effective management, and the broader impacts of natural disasters on MSMEs. The methodological versatility observed, including case studies, surveys, interviews, and systematic literature reviews, allows for a comprehensive exploration of disaster-affected MSMEs. Key findings highlight the severe consequences across economic, social, and environmental dimensions, emphasizing the importance of proactive disaster preparedness, government interventions, and support. Considerations such as global and local context, gender dynamics, government policies, resilience strategies, informal sector challenges, community factors, financial aspects, and infrastructure quality contribute to a comprehensive understanding of this complex field.

LIMITATIONS

However, it is essential to acknowledge certain limitations within this content analysis. The diversity of research methods and the varying geographic and cultural contexts in which these studies were conducted may introduce potential biases or limitations in the generalizability of findings. Additionally, the evolving nature of disaster management practices and policies could render some older findings less applicable to current scenarios. The studies themselves may also face limitations inherent to their methodologies, such as sample sizes, selection biases, and data collection methods.

FUTURE RECOMMENDATIONS

Advancing knowledge in disaster management and resilience for MSMEs requires addressing key limitations. Future research should prioritize larger, diverse samples and employ longitudinal studies for more generalizable findings. Keeping abreast of evolving disaster management strategies is crucial, with a focus on emerging trends like the role of digital platforms and social media in recovery. Investigating the impact of climate change on MSMEs and collaborating across disciplines, including economists, environmental scientists, and sociologists, can provide a

**Sushant Kumar et al.,**

holistic understanding. Moreover, translating research findings into actionable policy recommendations remains essential, ensuring practical interventions for MSME resilience. Collaboration among policymakers, researchers, and practitioners is vital to implement insights effectively. In conclusion, ongoing research aims not only to strengthen MSME resilience but also to shape future strategies, fostering tangible positive impacts in disaster-affected communities and economies.

Author's Contribution

Dr. Sushant Kumar: Mr. Kumar conceived and designed the analysis framework, performed the data analysis, and wrote the manuscript. His contributions were pivotal in shaping the research methodology and interpreting the results.

Dr. Kapil Lakhera: Mr. Lakhera was responsible for collecting the data and contributing essential data or analysis tools. His efforts ensured the accuracy and comprehensiveness of the dataset used in the study.

Ms. Radha Tripathy: Ms. Tripathy provided significant additional contributions, which included assisting with data interpretation, reviewing the manuscript for critical content, and supporting the overall research process. Her input helped refine the study's findings and enhance the quality of the final paper.

Conflict of Interest

The authors declare that they have no conflicts of interest related to this research.

Funding Acknowledgement

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Table 2: Content Analysis of All Studies (n=31)

S.No.	Author Name with Year	Subject Theme	Research Methodology	Key Findings
1.	Adeniyi et al. (2019)	“Developing Maturity Levels for Flood Resilience of Businesses using Built Environment Flood Resilience Capability Areas”	This study employed a case study and expert forum approach. Multiple case studies of MSMEs were conducted, utilizing case study interviews. A conceptual capability maturity model was developed, aligning the characteristics of capability maturity levels with capability areas. The conceptual model was refined through expert panel reviews, enhancing its reliability and depth.	The study emphasizes the necessity of proactive flood resilience measures for businesses, particularly in flood-prone areas. Continuous awareness and support, along with the adoption of resilience models, can substantially reduce the impact of flooding on organizations and enhance overall disaster resilience.

Sushant Kumar *et al.*,

2.	Amal Prakash K., & Krishnarani S.D. (2020)	The Effect of Cash Flow Problems and Resource Intermingling on Small Business Recovery and Resilience After a Natural Disaster	The study utilized bilingual questionnaires, collected data from 70 respondents in flood-affected areas, and used statistical tests to analyze variables like customer arrivals, income, purchasing capacity, expenditure, insurance, and waste disposal.	Urban customer arrivals decreased due to floods, while rural areas remained stable. Rural purchasing power slowed, entrepreneurs faced higher costs, and employment dropped. Recovery is ongoing, but rural transportation suffered, and insurance didn't help. Ecologically sensitive areas and income distribution were notably affected.
3.	Asgary et al., 2012	"Disaster Recovery and Business Continuity after the 2010 Flood in Pakistan: Case of Small Businesses"	The study involved 500 flood-impacted small businesses in Pakistan, sampled with consideration for size, sector, and location. Data was collected through a questionnaire survey, with a pilot study, and verbal interviews for illiterate respondents, conducted in February and March 2011.	- The 2010 Pakistan floods had enduring consequences for affected MSMEs, with many operating at a loss compared to their pre-flood status.
4.	Asgary et al., 2012	"MSMEs and Disasters: A Systematic Literature Review"	The methodology involved a systematic review of existing studies and articles related to MSMEs and disasters.	- Physical damage, such as inventory and equipment loss, significantly affects MSMEs. - Service disruptions, like power and water supply, impact MSMEs to varying degrees. - Transportation-related issues and population displacement can hinder recovery.
5.	Badoc-Gonzales et al. (2021)	"Resilience and Sustainability Interventions in selected post-Haiyan Philippines: MSMEs perspective"	The study used a mixed-method approach. A quantitative survey was conducted with questionnaires in Guiuan and Tacloban, Eastern Visayas. Qualitative interviews with 16 government offices validated the findings. Data collection and analysis took place from 2019 to early 2020, led by a Ph.D. candidate in Commerce with collaborative input.	The key findings underscore the critical role of government interventions and data-driven decision-making in enhancing the resilience and sustainability of tourism MSMEs, which are integral to the domestic economy and the broader tourism industry. Proactive policies and initiatives can help secure the future performance of these businesses while also contributing to poverty

Sushant Kumar *et al.*,

				reduction and environmental preservation.
6.	Battisti, M., & Deakins, D. (2012).	"Reconceptualizing the Role of Small Firms in Disaster Relief"	The study used a combination of surveys, interviews, and case studies to gather data on the impact of the 2011 earthquake on MSMEs in the Canterbury region.	- Approximately 40 percent of MSMEs in the Canterbury region suffered adverse effects, including employee loss, supply chain disruptions, and increased expenses, following the 2011 earthquake.
7.	Chamlee-Wright, E., & Storr, V. H. (2008)	Club Goods and Post-disaster Community Return	The research involved qualitative methods, including interviews and observations, to understand the role of MSMEs in post-disaster community recovery.	MSMEs contribute to social recovery by reactivating local markets and fostering community bonding. Collective efforts within the community led by MSMEs can support residents' return and recovery.
8.	Chang et al. (2011)	Urban Catastrophe Insurance: Addressing the Gap between Humanitarian Assistance and Full Risk Insurance in Natural Disaster Management	The study involved interviews, surveys, and analysis of disaster management programs to assess their impact on MSMEs.	In-kind support programs facilitated by business associations can support MSMEs' survival strategies and the restoration of local value chains.
9.	Coates, et al. (2019)	"Agent-based Modeling and Simulation to Assess Flood Preparedness and Recovery of Manufacturing Small and Medium-sized Enterprises"	A hydrodynamic model, combining a 1D ISIS model and a 2D TUFLOW model, was used for flood modeling. Input data included 1000-year hydrographs, topography data, river surveys, and DTM data. The model generated flood depth estimates used in a Virtual Geographic Environment (VGE) to identify flood-affected manufacturing SMEs in Sheffield's Lower Don Valley.	Effective flood preparedness measures are essential for SMEs to mitigate damage and disruption, accelerate recovery, and enhance organizational resilience.
10.	Corey and Deitch (2011)	"Disaster Resilience in Micro, Small, and Medium-Sized Enterprises: An Integrated Approach"	The research methodology includes a combination of surveys, interviews, and case studies to assess the resilience strategies and challenges faced by MSMEs in disaster-affected areas.	Informal employment, especially in retail, may signal broader challenges within the private sector after a disaster.
11.	Corey and Deitch (2011)	"The Impact of Hurricanes Katrina and Rita on Small Retail and	The methodology included quantitative analysis, surveys, and case studies of retail and	Retail and wholesale sectors are vulnerable due to reliance on local customers. -

Sushant Kumar *et al.*,

		Wholesale Businesses: A Quantitative Assessment"	wholesale businesses affected by Hurricanes Katrina and Rita.	Post-disaster, many businesses in these sectors fail. - Informal entrepreneurs in retail adapt quickly to new business opportunities. - Informal commerce plays a crucial role in post-disaster income generation.
12.	De Mel et al. (2010)	"One-time Transfers of Cash or Capital Have Long-lasting Effects on Microenterprises in Sri Lanka"	The study was initiated with a door-to-door survey in Sri Lanka's urban areas, focusing on microenterprise owners aged 20-65. Baseline interviews took place in April 2005, followed by surveys in June and December 2010 to evaluate one-time grant effects on firm survival and profits. High response rates were maintained through surveys and business status verification by observation and neighbor interactions.	Access to necessary inputs can be disrupted after high-risk disasters, affecting the effectiveness of cash assistance for MSMEs.
13.	De Ruiter, L. (2011)	"Displaced But Not Replaced: The Impact of Post-Katrina Policies on New Orleans' Small Business Owners"	The research methodology includes interviews, surveys, and a mix of qualitative and quantitative analysis.	Slow recovery of formal MSMEs can lead to larger firms replacing them, emphasizing the need for policymakers to monitor MSME activity in disaster-affected areas.
14.	Galbraith, C. S., & Stiles, C. H. (2015)	"Disasters and Entrepreneurship: A Short Review"	The research methodology for "Disasters and Entrepreneurship: A Short Review" involves a systematic literature review, which summarizes and analyzes existing studies and articles on the topic without collecting new data.	- Informality among MSMEs in many developing nations constrains their ability to diversify supply chains and comply with norms and regulations, increasing disaster risks. - Policies and programs for post-disaster business recovery should address the needs of the informal sector.
15.	Galbraith, C., & Stiles, J. (2006).	"Post-Disaster Recovery: A Case Study of New Orleans after Hurricane Katrina"	This study gathered data on post-Katrina recovery in New Orleans through case study design, document analysis, interviews with key stakeholders, quantitative analysis of recovery indicators, qualitative analysis of	Good governance, low corruption, and adherence to the rule of law are associated with economic prosperity. - These factors are vital for fostering a thriving MSME sector and effective Disaster Risk Reduction

Sushant Kumar *et al.*,

			interviews and documents, and potential comparative analysis.	(DRR).
16.	Hashim et al. (2021)	"Factors Influencing Flood Disaster Preparedness Initiatives among Small and Medium Enterprises Located in Flood-prone Areas"	A cross-sectional design assessed flood preparedness among Segamat, Malaysia's SMEs, using systematic random sampling, focusing on 253 participating SMEs in the flood-prone Segamat Town.	The retail and wholesale sector demonstrates a higher inclination toward embracing flood preparedness measures in contrast to the services sector. Notably, risk perception consistently emerges as the foremost influential predictor of flood preparedness within SMEs.
17.	Hernandez Montes de Oca, 2011	"Coping with Tropical Cyclones: Evidence from Yucatan Microenterprises:	This study involved data collection on cyclone impacts in Yucatan's microenterprises through surveys, field observations, and interviews. It used both quantitative and qualitative analyses, comparing various microenterprises.	- Extensive risks, especially for informal MSMEs, pose challenges due to the lack of access to formal risk management tools. - Workers without health insurance are more vulnerable to recurring disasters. - Adaptive measures vary, with larger enterprises more likely to adopt them.
18.	Hewawasam, V., & Matsui, K. (2023)	"Small and Medium-Sized Entrepreneurs' Perceptions of Flood Loss and Damage in Sri Lanka"	A survey in 2020 with 60 SMEs (30 from Kaduwela and Kolonnawa DSDs) in Sri Lanka aimed to understand how they coped with flood-related losses and damage. The survey considered socio-demographic factors, vulnerability, risk reduction, flood warnings, and losses. Data was analyzed with Excel and multiple regression. Additional information was gathered from government documents and interviews with disaster management officials.	The governmental authority is required to officially register informal businesses and facilitate their integration of insurance coverage along with the development and implementation of robust business continuity plans.
19.	Luong, H. (2022)	"Business Grants Following Natural Disasters and Their Different Impact on the Performance of Female and Male-owned Microenterprises: Evidence from Sri Lanka"	Examined post-2004 tsunami business grants' effects on 608 Sri Lankan microenterprises, differentiating by gender. Linear regression and intention-to-treat analysis were used for firm performance assessment.	Business grants positively impact male-owned enterprises but have no significant effect on female-owned ones, possibly due to gender-related differences in fund allocation, household management, and response to business challenges. Additionally, grants benefit recipients' psychological

Sushant Kumar *et al.*,

				well-being, regardless of gender.
20.	Lyons et al. (2010)	"Coping with the Tsunami: The Roles of Micro-Enterprises in Post-Disaster Recovery in Aceh"	This study encompassed data collection on tsunami impact in Aceh's micro-enterprises through surveys, field observations, and interviews. It employed both quantitative and qualitative analyses, with potential comparisons among micro-enterprises.	- The Indian Ocean tsunami disrupted the livelihoods of small businesses in affected countries, including significant income loss among MSME owners.
21.	Monllor, J., & Murphy, P. J. (2017)	"Natural Disasters, Entrepreneurship, and Creation After Destruction"	The authors searched top entrepreneurship journals for articles on disaster-related entrepreneurial opportunities, identifying three relevant papers. They developed a conceptual framework for entrepreneurial intention in disaster contexts.	The unique dynamics at play in post-disaster environments, where necessity-driven opportunities and resilience can influence entrepreneurial actions even in the face of fear of failure, and where feasibility and desirability may not always have a cumulative effect.
22.	Pathak, S., & Ahmad, M.M. (2016)	"Flood Recovery Capacities of the Manufacturing SMEs from Floods: A Case Study in Pathumthani Province, Thailand"	In Pathumthani, Thailand, two hundred flood-affected SMEs were surveyed, and key informants were interviewed in three phases, with a focus on 2011 flood impacts and coping mechanisms. The study included diverse stakeholders and was predominantly male (70.5 percent).	Implementing effective flood preparedness measures and business continuity strategies at both SME and government levels can significantly reduce the overall recovery period following a flood event.
23.	Perwaiz, A. (2015)	"Thailand Floods and Impact on Private Sector Disaster Management and Private Sectors"	The study used secondary data from the government and non-government sources.	After the 2011 disaster, SME recovery was initially uncertain, but within six months, government measures and continued demand aided their revival. Incentives, including tax, finance, legal, and labor support, boosted their confidence, and by 2013, SMEs were on a path to rebuilding.
24.	Regnier et al. (2008)	"Business Recovery in New Orleans: A Longitudinal Study of Disaster Recovery"	This study collected data on business recovery post-disaster (e.g., Hurricane Katrina) in New Orleans. It employed a longitudinal approach,	Microcredit programs are more effective when there is a well-established foundation of value chains and strong community participation

Sushant Kumar *et al.*,

			sampld representative businesses, combined quantitative and qualitative data, and conducted comparative analyses among various businesses based on factors like industry, size, and location.	before the disaster.
25.	Samantha, G. (2018)	"The Impact of Natural Disasters on MSMEs: A Case Study on 2016 Flood Event in Western Sri Lanka"	A quantitative cross-sectional survey assessed the 2016 flood impact on MSMEs in Western Sri Lanka. 100 flood-affected firms in Colombo provided insights on various aspects, using a Likert scale and Relative Importance Index to measure impact severity.	The 2016 floods severely impacted the Colombo district's MSMEs, with equipment damage being the primary short-term concern, while disrupted cash flow and income loss posed long-term challenges. To aid recovery, the government procured and distributed capital goods offered premium-sharing for insurance, and invested in modern infrastructure and industrial zones.
26.	Sanderson (2000)	"Small and Medium Enterprises in Disaster Preparedness and Mitigation: A Review of Disaster Policies in Five Asian Countries"	This study employed an extensive literature review on SME-related disaster research and policies, collected data from governmental and non-governmental sources, performed document analysis to focus on SME implications, conducted comparative analysis among five Asian countries, and synthesized findings to offer insights into the state of disaster policies impacting SMEs.	- Informal MSMEs are often linked to poor labor practices. - Child labor and exploitation increase disaster risks.
27.	Skouloudiset al. (2023)	"Coping with Floods: Impacts, Preparedness, and Resilience Capacity of Greek MSMEs in Flood-affected Areas"	This study utilized a qualitative approach, drawing from relevant literature on how businesses respond to climate change, natural disasters, and extreme weather. Data collection involved conducting semi-structured interviews with 82 MSME owners and managers recently facing flooding.	Encouraging disaster experience sharing among SMEs enhances resilience awareness. Providing flood hazard information aids informed decision-making. Promoting property insurance and exploring financial instruments transfers risk. Government support, including climate adaptation and financial

Sushant Kumar *et al.*,

				incentives, is crucial for flood resilience in MSMEs.
28.	Utami et al. (2021)	"Priority Resilience Strategy for MSMEs for Dealing with Natural Disasters"	The study assessed MSME resilience post-disasters. A survey of 50 affected MSMEs on Madura Island was conducted, using a structured questionnaire validated by experts. Resilience levels were calculated based on capacity and probability and categorized into five levels. Disaster mitigation planning followed the resilience results and historical data.	MSME resilience is at a moderate level against natural disasters. Key strategies include improving human resource skills through training, implementing employment contracts, and involving educational institutions and government support for disaster resilience.
29.	Wedawatta et al. (2012)	"Small Businesses and Flood Impacts: The Case of the 2007 Flood Event in the UK"	The study investigated the November 2009 flood in Cockermouth, UK, using a questionnaire survey. It covered business impacts, questionnaire development, web, and postal responses, and achieved a 25 percent response rate from senior management personnel	- Premise ownership enhances safety and financial access. - Insecure tenure deters safety investments for renters. - Urban MSMEs are more crisis-prone than rural ones.
30.	Wiatt et al. (2020)	"The Effect of Cash Flow Problems and Resource Intermingling on Small Business Recovery and Resilience After a Natural Disaster"	The study focused on small businesses in ten southern Mississippi counties affected by Hurricane Katrina in 2005. Data was collected in three waves, with the first wave in 2013 via telephone interviews. A sample of 499 small businesses was obtained from an initial pool of 5,500, with a cooperation rate of 19.12 percent.	Recovery refers to a short-term state, indicating whether a business is operational post-disaster, while resilience signifies a long-term, stable, and prosperous condition, measured by post-disaster success surpassing pre-disaster levels, such as after Hurricane Katrina.
31.	Zhang et al. (2004)	"The Impact of Infrastructure on Disaster Mitigation and Economic Development in the Coastal Areas of China and Indonesia"	The research methodology involves collecting data on infrastructure, disaster mitigation, and economic development, conducting a comparative analysis, quantitative and qualitative data analysis, case studies, literature review, and policy analysis in coastal areas of China and Indonesia.	- Small MSMEs are vulnerable due to weak infrastructure and limited customer base. - Lack of hazard programs hamper preparedness. - Financial constraints hinder recovery efforts.

ABSTRACT

A dataset of patient records was collected and pre-processed, containing CKD diagnoses and pertinent characteristics. The most important variables were found using feature selection techniques. Based on performance measures, a number of machine learning algorithms were trained and assessed, such as logistic regression, random forest, and support vector machines. When compared to traditional diagnostic methods, the results indicated that these machine learning models were more accurate in predicting CKD. A major worldwide health concern is chronic kidney disease (CKD), for which early identification and treatment are crucial to reducing the illness's progression and enhancing patient outcomes.

Keywords: A dataset of patient records was collected and pre-processed, containing CKD diagnoses and pertinent characteristics.

INTRODUCTION

Chronic kidney disease (CKD) is characterised by a progressive decline in kidney function all over the world. While traditional diagnostic methods are effective, they can be time-consuming and require specialised expertise. Machine learning has emerged as a promising approach to address these challenges. By analysing large datasets of patient information, machine learning models can predict the development or progression of CKD more accurately and

**Vinitha Bodla et al.,**

efficiently than traditional methods. By doing this, medical professionals may better identify patients who are at danger, implement preventative measures, and begin treatment as soon as possible.

Literature Survey

The paper by Pankaj Chittora, Sandeep Chaurasia, Prasun Chakrabarti, Gaurav Kumawat, Tulika Chakrabarti, Zbigniew Leonowicz, Michał Jashinsky, and Łukasz Jashinsky, published in **Sensors** (vol. 20, no. 9, p. 2639, May 2021), It examines how important sensor technology is to the treatment of chronic kidney disease (CKD). Since chronic kidney disease (CKD) is a progressive disorder, kidney failure can be avoided with early detection and ongoing monitoring. In order to enable real-time monitoring and remote healthcare interventions, the authors stress the importance of wearable and implanted sensors in monitoring vital physiological indicators, such as blood pressure and kidney function markers. These sensors are particularly helpful in improving illness management, lowering hospital visits, and facilitating home-based care. In order to guarantee safe and efficient treatments, the article also covers developments in biosensors for early diagnosis and sensor integration in dialysis equipment.

Cleaning Data

Data purification must be done before data can be used for machine learning analysis. Erroneous, unnecessary, or redundant content must be removed or altered. Using techniques like KNN Imputation to solve missing values and feature scaling to remove unnecessary attributes are crucial steps. Compared to conventional approaches, KNN Imputation is more accurate since it replaces missing values with the mean of nearby data points.

Scaling Data

Data scaling is required to guarantee interoperability with particular machine learning techniques. It involves transforming data into a specific range. The maximum absolute scaler technique was used to normalise the data in this study, improving the performance of algorithms that rely on the scale of input features, such as SVM and KNN.

Analysis of Data

An study using Pandas, NumPy, statistical methods, and data visualisation tools is necessary to understand the attributes of the dataset. This method helps identify patterns, trends, and potential issues by giving a deeper knowledge of the data structure and the connections between variables. To develop and forecast accurate models, this data is required.

Equilibrium Data

In a dataset with 250 instances of the majority class (CKD) and 150 instances of the minority class (notCKD), the class imbalance was corrected using SMOTE. By creating synthetic minority class data points by interpolating between close existing examples, this technique gets around overfitting and bias towards the majority class. SMOTE improves the model's robustness and performance by balancing the dataset, enabling more accurate

6.MATRIXCONVERGENCE

By giving a visual representation of the connections between dataset properties, a correlation matrix shows the extent of relationships between variables. The most closely related variables in this study were haemoglobin and specific gravity, indicating that they significantly impact the model's performance. The matrix highlights the most significant features, which helps with better model design and produces more accurate results by focussing on the features with the highest predictive power.

Using Algorithms

a.SVM

Support Vector Machine (SVM), a supervised learning technique, processes input data to generate accurate predictions. SVM demonstrates the relationship between input and output variables by using artificial intelligence (AI) to identify patterns in the data. The effectiveness of the model is determined by the distance between data points

**Vinita Bodla et al.,**

and the decision border, also known as the hyperplane, that separates classes. A well-positioned hyperplane maximises the margin between classes, increasing model accuracy and generating reliable forecasts.

B.K-NN

K-Nearest Neighbours (KNN) is a supervised learning model that uses input data to predict outputs. Euclidean distance is used to calculate the distance between nodes. KNN can identify a test node's k closest neighbours and assign it to the majority class by plotting it. Preprocessing techniques like scaling, normalisation, and duplicate removal are crucial to ensuring accurate forecasts because of the significance of distance estimates.

C. Logistic Regression

A useful technique for predicting chronic kidney disease (CKD) is logistic regression, which simulates the relationship between clinical features and the likelihood of illness. It determines the likelihood of CKD based on patient data and generates coefficients that illustrate how each characteristic affects the disease's risk. By identifying significant risk factors with the help of interpretability, healthcare professionals can make informed decisions about patient management and early action to improve patient outcomes.

D. An Random Forest

A random tree is a supervised classifier that generates a number of learners using statistics. By combining many trees, it improves precision through ensemble learning. Unlike traditional decision trees, random trees choose a random feature subset for each split. Together, these trees create a random forest, which reduces overfitting and frequently outperforms individual decision trees by classifying each tree based on input qualities and deciding the final output by majority vote.

CONCLUSION

Chronic renal illness has been successfully predicted using a variety of machine learning techniques, including support vector machines (SVM), k-nearest neighbours (KNN), decision trees, and random forests. The forecast accuracy values that were achieved were about 99%, 98%, and 97%, respectively. The high accuracy rates of these models show how effective they are at identifying chronic renal disease. In order to improve patient outcomes and early detection, it is suggested that future research focus on developing a practical product that can foresee chronic kidney disease using these machine learning algorithms.

ABSTRACT

Sexual well-being is just as essential as physical well-being. It is never embarrassing to talk about sexual issues. These issues might occasionally destroy one's social life and self-worth. Since these issues can cause conflict in married couples, discussing sex issues and relationship issues is not always harmful. In most cases, oligoasthenospermia has no influence on sexual function. Men might not be aware of this unless they are experiencing difficulties becoming pregnant with a partner. Male infertility is mostly caused by low sperm count (oligospermia) and impaired sperm motility (asthenospermia). This issue is widespread and can be associated with *Shukravaha Srotas Dushti*. While oligoasthenospermia and *Shukra Kshaya/Ksheena shukra*. A 29-year-old man was diagnosed with oligoasthenospermia, which is characterised by a low sperm count and a lack of motile spermatozoa. It is assessed by semen analysis, which indicates a decline in the amount and concentration of motile spermatozoa in a sample of sperm. Ayurveda uses a variety of herbs and natural substances that are highly helpful in treating this issue. Here, we make use of *Kaucha Pak* and *Ashwagandha Curna*. Its conclusion shows that Ayurvedic treatments are an excellent way to manage the oligoasthenospermia related to male infertility.

Keywords: Oligoasthenospermia, *shukra kshaya*, male infertility, *Ksheena sukra*, ayurveda management

INTRODUCTION

An oligospermic state is characterized by a decreased quantity of sperm cells or spermatozoa [1]. Additionally, oligospermia may exhibit notable variations in the shape and motility of sperm. A sperm concentration of less than 15 million spermatozoa per millilitre [2] is defined as oligospermia according to WHO 2010 guidelines. Male infertility is caused by low sperm count (Oligospermia) and poor sperm quality in more than 90% of instances, with the exception of some physical problems.[3] The most prevalent aberration associated with male infertility that can be identified through semen analysis is called asthenospermia, which indicates that less than 50% of active motile sperms have spermatozoa motility. About 40% of cases involve a male finding pathology on his own, while another 20% involve both males and females finding abnormal pathology. Of these, 30 to 40 percent have no known cause; the remaining cases are caused by genetic anomalies, critical illnesses, malnutrition, pollution, and side effects from certain medications, hormones, and toxins.[4] In other words, the quality of the sperm matters more in terms of fertility than their quantity. *Shukra* or *Pumbija*, which are Ayurvedic terms for sperm, are one of the *Dhatu* of "*Saptawidhdhatu- Siddhant*." The body's terminal tissue element, known as the *sara* of all other *Dhatus*, is called the *shukra*. *Shukra*'s particular role is *Garbhotpadan*. [5] Maintaining marital peace and happiness depends significantly on the *Shukravaha Srotas* functioning properly. "A man without children appears like a single tree with one branch, shadeless, fruitless, and with an unpleasant stench," says *Charakacharya*. [6] *karma* of *shukra* includes *Dhairya*, *Chyavana*, *Priti*, *Dehabala*, *Harsha*, and aids in childbearing. [7] The *Shukravaha Srotas* and its *Moolasthan* are explained by both the *Charak Samhita* and the *Sushrut Samhita*. [8,9] The following *Shukradoshas* have been suggested by *Acharya Sushrut*: *Vata*, *Pitta*, *Kapha*, *Shonit*, *Kunap*, *Granthi*, *Puti*, *Puya*, *Ksheena*, *Mutra*, *Purish*, and *Retas*. [10] Although there isn't a direct link between low motility and sperm count, *Shuddha Shukra Lakshanas* makes it apparent. [11] In Ayurveda, "*shukram shuklam guru snigdham madhuram bahalam bahu| ghrinamaakshikatailabham sadgarbhaya ||*" [12] Sha, A. H. 1/17 refers to healthy, more fertile semen (*Shuddha shukra*). This indicates that the semen, which has the appearance of *ghee*, honey, or oil and is white, thick, sticky, sweet-tasting, and abundant, is always fertile. Nature is always better for all living things, but it varies because of modern living. There are significant changes in daily activities such as mental stress, disturbed routines, eating habits, sexual activity, and meditation, as well as industrial and occupational hazards. These changes negatively impact *Shukra Dhatu*, which causes infertility. *Shukra* is the terminal tissue, or *Dhatu*, in Ayurveda. It is regarded as the *Sara* of all *Dhatus*. *Shukra Dushti* results from any omission from *Shuddha Shukra Lakshana*. While defining the *Dushti* connected to *Shukra* and *Artava*, vitiated *Vata* and *Pitta* lead to the pathological condition known as *Ksheena Shukra*.

CASE REPORT

A 29-years-old male visited in the OPD of Ayudhara Hospital at Morbi with complain of decreased sexual desire, general debility, fatigability & unable to conceive since 1year. There was no any history of delayed ejaculation, premature ejaculation, erectile dysfunction. His wife failed to conceive inspite unprotected frequent intercourse even during 12 to 18th day of menstruation since last 1 year. The woman was normal at the clinical and endocrinological examination.

Local Examination

No anatomical anomalies were found, and there were no symptoms of inflammation, ulceration, or rashes on the penis, testicles, or scrotum.

Family history: There was no relevant family history

Past medical history

He had no history of tuberculosis, mumps, orchitis, hydrocele, trauma to the gonadal region, or any other chronic, incapacitating illness or potentially fatal emergency. He also had no history of prior surgical procedures, such as herniorrhaphy or vasectomy reconstruction, or consuming gonadotoxic agents.

Janki R. Bopaliya et al.,

Examination:

BP: 122/86 mm of Hg

RR: 16/min

Weight: 65 Kg

Height: 160 Cm

BMI: 25.39 Kg/m²**Ashtavidh Pariksha**

1. NADI (pulse): 71/min

2. MALA (stool): Normal

3. MUTRA (urine): Normal

4. JIVHA (tongue): *Niram*

5. SHABDA (speech): Normal

6. SPARSH (skin): *ushna*

7. DRUK (eyes): Normal

8. AKRITI: *Madhyam*

He was advised semen analysis after proper abstinence. Semen analysis report revealed low sperm concentration (count) and zero progressive motility and 8% non-progressive motility.

Prescribed Medication

1. *Ashwagandha churna* – 3gm OD, after food with milk
2. *kaucha pak* – 1 tsp BD, with milk

Wholesome(Pathya)-Unwholesome(Apathya):[13]

Ahara: *Kshira* (Milk) and its products, *Vilepi* (Gruel), *Ghrta* (Ghee), These dravyas offer *shukrala* and *vrishya* (spermatogenic and aphrodisiac) properties. These include *Rakta Shali* (red variety of rice), *Godhuma* (wheat), *Masha* (black gram), *Kadali* (banana), *Atasi* (*Linum usitatissimum*), *Patola Patra* (*Trichosanthes dioica*), *Alabu Phala* (*Cucurbita lagrenaria*), *Kharjura* (*Phoenix sylvestre*), *Navnita* (butter), *Narikela Ksheera* (coconut milk), *Mandaka* (supernated part of buttermilk), *Amalaki phala* (Indian gooseberry), *Lashuna* (garlic), *Purana Guda* (old jaggery), *sharkara* (sugar candy), and *Saindhava* (rock salt).

Vihara

Abhyanga (body massage), *Vyayama* (exercise), *Snana* (bath), *Nidra* (sleep) and *Suvichara* (positive thoughts), *Pada Prakshalana* (cleanliness of feet).

Apathya

Patients ask to avoid *Katu*, *Tikta*, *Lavana* (Pungent, Bitter, Salt) *Rasa Atisevana*, chewing tobacco, *Adhika Vyavaya* (excessive sexual intercourse), *Ratri jagarana* (late night sleep), *Adhika Shoka* (excessive sorrow), *Adhika Chinta* (anxiety), *Bhaya* (fear), *Vega Dharana* (suppression of natural urge) in routine life style.

RESULTS OF INVESTIGATION

Total duration of treatment was 1 month. Initial sperm count was 6.5 million/ml and total Motility (PR+NP) was 8%. After medicine semen examination report revealed sperm count is 35.5 million/ml and total Motility (PR+NP) is 53% found.

DISCUSSION

In oligoasthenospermia, sperm motility and count are usually observed to be poor. Treatment for oligoasthenospermia should aim to increase sperm motility and count. The reason behind the infertility is *Shukra dushti*. One kind of *Shukra dushti* that is associated with oligoasthenospermia is *Ksheena Shukra*. By using *Vajeekarana Dravya*, the primary aim of *Ksheena Shukra* treatments is *Shukrajanaka* and *Shukrapravartaka* in terms of sperm motility and count. *Acharya Sushruta* says that *Ksheena Shukra* has both *Vata* and *Pitta Doshas*.

Aharaja Nidan(cause) of patient: *ati katu rasa sevana* (excessive spicy food intake)

Viharaj nidana of patient: *Ratri jagarana* (late night sleep), stress

Janki R. Bopaliya et al.,

Samprapti (pathogenesis):

Due to *Aharaja* & *Viharaj nidana sevana*, there is vitiation of *vata* & *pitta Dosha* occurs and it leads to *Ksheena Shukra vyadhi*.

Action of medicine**Ashwagandha curma [14]**

Traditionally, *ashwagandha* has been utilized as a *Rasayana*. *Ashwagandha* root is considered a stimulant, tonic, aphrodisiac, narcotic, diuretic, anthelmintic, astringent, and thermogenic. There are two main categories of processes that *Withania somnifera* uses to affect fertility and the reproductive system: oxidative and non-oxidative mechanisms. The regulation of antioxidant enzymes and the co-factors necessary for their optimal action, as well as the modification of antioxidant activity, are all components of the oxidative process. *Withania somnifera*'s effects on the hypothalamic-pituitary-gonadal (HPG) axis and its antistress effects via the hypothalamic-pituitary-adrenal (HPA) axis are the principal non-oxidative mechanisms. Following ingestion, the extract of *Withania somnifera* is broken down into its primary components, which include withaferin-A, withanolide-D, withanone, and other withanolides. Another connection between male infertility and hormone imbalance resulting from physiological or psychological factors is this. Hormones associated with stress, specifically glucocorticoids, negatively impact the hypothalamic-pituitary-gonadal (HPG) axis, which in turn affects spermatogenesis (Chandra et al., 2012). The anterior pituitary releases FSH and LH in response to stimulation by the hypothalamus' gonadotrophin-releasing hormone (GnRH). Both of them then have an effect on the gonads, regulating their production of testosterone and spermatogenesis. Thus, spermatogenesis suffers when hormones including cortisol, prolactin (PRL), gonadotrophin-inhibiting hormone, and others disturb the HPG axis (Nargund, 2015). Because *Withania somnifera* root extract is regarded as an adaptogen, it can help the body maintain homeostasis by reducing stress and returning cortisol levels to normal, which can help individuals with infertility. As per Shukla et al. (2011), *Withania somnifera* is said to elevate the levels of vital metals such as copper, zinc, iron, and gold. This could potentially facilitate the process of testicular steroidogenesis, wherein more testosterone is synthesized to drive the development of testicular germ cells through spermatogenesis. Along with improving lactate, citrate, alanine, histidine, and phenylalanine concentrations in seminal plasma, *Withania somnifera* may also have important effects on spermatozoa metabolism and spermatogenesis. Thus, patient consume 3 grams of *ashwagandha curma* daily along with milk report improved semen analysis results.

kaucha pak [15]

Ingredients: *Kaucha* (*Mucuna pruriens*), *Godudgha*, *Goghrit*, *Akarkarabha* (*Anacyclus pyrethrum*), *Sunthi* (*Zingiber officinale*), *Lavang* (*Syzygium aromaticum*), *Gokshur* (*Tribulus terrestris*), *Kesar* (*crocus sativus*), *Suddha Hingul*, *Suddha Tankan*, *Dhanyak* (*Coriandrum sativum*), *Kankol* (*piper cubeba*), *Nagabala* (*sida vernicaefolia*), *Vansalochana* (*Bambusa aarundinacea*), *Vang Bhasma*, *Abhrak Bhasma*, *Draksha*, *Sharkara*.

Kaucha pak Indication

Virya vardhaka, *Purisavirajaniya* (To form normal stool), *Buddhivardhak*, *Vataroga nashak* (cure the vatika diseases).

Kaucha/kapikcchu: Levodopa (L-dopa) is the active ingredient in *kaucha* seeds.[16] The neurotransmitter dopamine is formed from the precursor L-dopa. Additionally, it raises the brain's norepinephrine levels. Dopamine's function in regulating mood and pleasure has earned it its status as a "feel-good" neurotransmitter. Supplementing with *Kaucha Pak* may raise dopamine levels, which could improve mental health and mood. As a result, it elevates mood and lowers stress. It is also possible that this activity will increase libido. Its aphrodisiac, androgenic, spermatogenic, and strengthening properties are well-known in Ayurveda. It aids in the treatment of the issue in men thanks to all these qualities. It tones and strengthens the reproductive organs and boosts sexual arousal. *Kaucha* helps males maintain their power, endurance, and self-control. By raising the level of testosterone, it multiplies the sperm population. It encourages fertility and a healthy libido in females. The energy that *kaucha* imparts nourishes the whole body and soothes the nerves, making it a great *vata* rejuvenator.

Janki R. Bopaliya et al.,

Samanya karma of kapikacchu [17-20]

Shukrajanaka (Nourishes *rasaparinatashukra dhatu* possesses similar properties as *shukra dhatu*), *Vrisya* (Aphrodisiac), *Sukrakara* (Spermatogenic), *Balya* (Strengthening), *Brumhna* (Nourishment), *Hridya* (Cardiotonic).

Ghrta: *Shukrajanaka pravartaka* (Used for genesis and also offers ejaculatory effect).

Nagabala: promotes spermatogenesis and aids in the restoration of sexual health; *Shukra sthambhaka*. regulates ejaculation, which is effective in cases of premature ejaculation.

Vanga Bhasma: *Rasayan*, enhances libido for sexual activity, Avoids Nighttime emission, Aids in *Shukra Kshaya* Premature Ejaculation, and Reduces *Daurbalya* (weakness).[21]

CONCLUSION

In this case, we treated *Shukradushti* using Ayurvedic management. We discovered that there was a significant rise in semen parameters, such as sperm count and motility, following the completion of the appropriate treatment based on Ayurvedic medicine and adjustments in food and daily routine. As a result of Dhatus's improved condition and the active components' effects, there was an increase in sperm motility and count as well as a relief from overall debility and fatigability. Positive results like these therefore boost the confidence of Ayurvedic doctors in treating male infertility and inspire to other patients facing the same issue.

ABSTRACT

In this study, a new two-parameter distribution is proposed. Namely a new Remkan distribution called Remkan distribution. Used in mathematical properties as such moments, survival function, order statistics, hazard rate function, entropy, and Lorenz curves have been discussed. The method of maximum likelihood has been obtained by estimation of parameters. Finally analyzed, a real-life data set is fitted and the fit has been found to be good.

Keywords: Area-biased, Remkan distribution, Likelihood Ratio Test, Bonferroni and Lorenze Curves and Entropy.

INTRODUCTION

Many researchers have recently suggested a new distribution for lifetime data. Used in possess flexibility and statistics in applications. The lifetime data is considered important in research areas such as actuarial science, environmental sciences, biomedical science, and engineering. Whenever comparison of the goodness of fit of the newly classical distribution to available data sets search for new distribution with a better fit. Remkan distribution is a newly proposed two-parameter model. The Remkan distribution has different parameters, η, ϕ . The one-parameter lifetime distributions over proposed years include the Exponential, Lindley, Akash, Sujatha, Ishita, Akshaya, Rama distribution, Pranav, Odoma, Nwike, Iwueze, Juchez, and Chris-Jerry distribution. New two-parameter distributions include the Darna, Hamza, Samade, Alzoubi, and Copoun distributions. The Remkan distribution is a

91166

Anu and Pandiyan

three different component density of an exponential (η), gamma ($3, \eta$), and gamma($4, \eta$). The Remkan distribution is skewed, unimodal, right-tailed, and not bell-shaped. (Uwaeme and Akpan). The Remkan distribution was introduced by Uwaeme *et al.* and Akpan *et al.* in 2024. It is a newly proposed two-parametric lifetime model in behavioural science. Many statistical properties have been studied. In this paper, we will discuss Area-biased Remkan distribution.

The Probability Density Function of Remkan Distribution

$$g(x; \eta, \phi) = \frac{\eta^2}{(\eta+2\phi+6)} [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x}; x > 0, \eta > 0, \phi > 0 \quad (1)$$

The Cumulative Distribution Function of Remkan Distribution

$$G(x; \eta, \phi) = 1 - \left[1 + \frac{\eta^3 x^3 + (3+\phi)\eta^2 x^3 + (6+2\phi)\eta x}{\eta+2\phi+6} \right] e^{-\eta x} \quad (2)$$

The Area Based Remkan Distribution (ABRD)

The probability density function of the Area-biased Remkan distribution is given by

$$f_w(x) = \frac{w(x)f(x)}{E(w(x))}; x > 0,$$

Where $w(x)$ be a non-negative weight function and $E(w(x)) = \int w(x)f(x)dx < \infty$.

In this paper, we will consider the Area-biased version of Remkan distribution known as area- based Remkan distribution (ABRD). Consequently, $w(x) = x^2$ the resulting distribution, called area-biased Remkan distribution is given as:

$$f_w(x) = \frac{x^2 f(x)}{E(x^2)}; x > 0$$

Where

$$E(x^2) = \int_0^\infty x^2 f(x; \eta) dx \quad (3)$$

$$= \int_0^\infty x^2 \frac{\eta^2}{(\eta+2\phi+6)} [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x} dx$$

$$E(x^2) = \frac{\eta^2(2\eta+24\phi+120)}{\eta^4(\eta+2\phi+6)} \quad (4)$$

Substitute (1) and (4) in equation (3), and we will get the required probability density function of Area-biased Remkan distribution as

$$f_w(x) = \frac{\eta^4}{(2\eta+24\phi+120)} x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x} dx \quad (5)$$

The cumulative distribution function (cdf) of the Area-biased Remkan distribution (ABRD).

$$F_w(x) = \int_0^x f_w(x) dx \quad (6)$$

$$F_w(x) = \frac{\eta^4}{(2\eta+24\phi+120)} x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x} dx$$

$$= \frac{\eta^4}{(2\eta+24\phi+120)} \int_0^t x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x} dx$$

$$\text{put } x = \frac{t}{\eta}, \eta x = t, dx = \frac{1}{\eta} dt$$

when $x \rightarrow 0, t \rightarrow 0$, and $x \rightarrow \infty, t \rightarrow \infty$

$$= \frac{\eta^4}{(2\eta+24\phi+120)} \int_0^{\eta x} x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x} dx$$

$$F_w(x) = \frac{\eta x(3. \eta x) + \phi \gamma(5, \eta x) + \gamma(6, \eta x)}{(2\eta+24\phi+120)} \quad (7)$$

Reliability Analysis

We will discuss the survival function, failure rate, reverse hazard rate, and the Mills ratio of the Area-biased Remkan distribution (ABRD).

The survival function of the Area-biased Remkan distribution is given by

$$S(x) = 1 - G_1(x; \eta, \phi)$$

Anu and Pandiyan

$$S(x) = 1 - \frac{\eta\gamma(3, \eta x) + \phi\gamma(5, \eta x) + \gamma(6, \eta x)}{(2\eta + 24\phi + 120)} \quad (8)$$

The hazard function, also known as the hazard rate is given by

$$h(x) = \frac{g_1(x; \eta, \phi)}{1 - G_1(x; \eta, \phi)}$$

$$h(x) = \left(\frac{\eta^4 x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x}}{(2\eta + 24\phi + 120 - \eta x(3, \eta x) + \phi\gamma(5, \eta x) + \gamma(6, \eta x))} \right) \quad (9)$$

The reverse hazard rate is given by

$$h_r(x) = \frac{g_1(\eta; \phi, \theta)}{G_1(x; \eta, \phi)}$$

$$h_r(x) = \left(\frac{\eta^4 x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x}}{\eta x(3, \eta x) + \phi\gamma(5, \eta x) + \gamma(6, \eta x)} \right) \quad (10)$$

Odds Rate function

$$O(x) = \frac{G_1(x; \eta, \phi)}{1 - G_1(x; \eta, \phi)}$$

$$O(x) = \left(\frac{\eta x(3, \eta x) + \phi\gamma(5, \eta x) + \gamma(6, \eta x)}{(2\eta + 24\phi + 120) - \eta x(3, \eta x) + \phi\gamma(5, \eta x) + \gamma(6, \eta x)} \right)$$

Cumulative hazard rate function

$$H(x) = -\ln(1 - G_1(x; \eta, \phi))$$

$$H(x) = -\ln\left(1 - \frac{\eta\gamma(3, \eta x) + \phi\gamma(5, \eta x) + \gamma(6, \eta x)}{(2\eta + 24\phi + 120)}\right)$$

And the Mills ratio of the Area-biased Remkan distribution is

$$\text{Mills Ratio} = \frac{1}{h_r(x)} \quad \text{Mills Ratio} = \left(\frac{\eta x(3, \eta x) + \phi\gamma(5, \eta x) + \gamma(6, \eta x)}{\eta^4 x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x}} \right)$$

Moments And Associated Measures

Let X denote the random variable of Area-biased Remkan distribution with parameter η and ϕ then the r^{th} order moments $E(X^r)$ of area-biased Remkan distribution are obtained as

$$E(X^r) = \mu_r' = \int_0^\infty x^r g_1(x) dx$$

$$= \int_0^\infty x^r \frac{\eta^4}{(2\eta + 24\phi + 120)} x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x} dx$$

$$= \frac{\eta^4}{(2\eta + 24\phi + 120)} \int_0^\infty x^{r+2} (1 + \phi\eta x^2 + \eta^2 x^3) e^{-\eta x} dx$$

$$E(X^r) = \mu_r' = \frac{\eta \lceil r+3+\phi \rceil r+5+\lceil r+6}{\eta^r (2\eta + 24\phi + 120)} \quad (11)$$

Put $r = 1, 2$, in the equation, we will obtain the first raw moments of Area-biased Remkan distribution, which is given by

$$\mu_1' = \frac{6\eta + 120\phi + 720}{\eta(2\eta + 24\phi + 120)}$$

$$\mu_2' = \frac{24\eta + 720\phi + 5040}{\eta^2(2\eta + 24\phi + 120)}$$

$$\text{Variance} = \mu_2' - (\mu_1')^2$$

$$= \left(\frac{24\eta + 720\phi + 5040}{\eta^2(2\eta + 24\phi + 120)} - \left(\frac{6\eta + 120\phi + 720}{\eta(2\eta + 24\phi + 120)} \right)^2 \right)$$

$$= \left(\frac{24\eta + 720\phi + 5040}{\eta^2(2\eta + 24\phi + 120)} - \frac{(6\eta + 120\phi + 720)^2}{\eta^2(2\eta + 24\phi + 120)^2} \right) \quad (12)$$

Harmonic mean

The harmonic mean of the proposed model can be obtained as

$$H.M = E\left(\frac{1}{x}\right) = \int_0^\infty \frac{1}{x} g_a(x) dx$$

$$= \int_0^\infty \frac{1}{x} \frac{\eta^4}{(2\eta + 24\phi + 120)} x^2 [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x} dx$$

Anu and Pandiyan

$$\begin{aligned}
 &= \int_0^{\infty} \frac{\eta^4}{(2\eta+24\phi+120)} x [1 + \phi\eta x^2 + \eta^2 x^3] e^{-\eta x} dx \\
 &= \frac{\eta^4}{(2\eta+24\phi+120)} \int_0^{\infty} x e^{-\eta x} dx + \phi\eta \int_0^{\infty} x^3 e^{-\eta x} dx + \eta^2 \int_0^{\infty} x^4 e^{-\eta x} dx \\
 &= \frac{\eta(\eta^2 + \phi 6 + 24)}{2\eta + 24\phi + 120}
 \end{aligned} \tag{13}$$

Moment Generating Function and Characteristics Function

$$\begin{aligned}
 M_X(t) &= E(e^{tx}) \\
 &= \int_0^{\infty} e^{tx} g_1(x; \eta, \phi) dx
 \end{aligned} \tag{14}$$

Using Taylor's Series Expansion

$$\begin{aligned}
 M_X(t) &= \int_0^{\infty} \left[1 + tx + \frac{(tx)^2}{2!} + \frac{(tx)^3}{3!} + \dots \right] \\
 M_X(t) &= \sum_{j=0}^{\infty} \frac{t^j}{j!} \int_0^{\infty} x^j g_1(x; \eta, \phi) dx \\
 M_X(t) &= \sum_{j=0}^{\infty} \frac{t^j}{j!} \mu_j \\
 M_X(t) &= \sum_{j=0}^{\infty} \frac{t^j}{j!} \left(\frac{\eta \lceil j+3+\phi \rceil j+5+\lceil j+6 \rceil}{\eta^j (2\eta+24\phi+120)} \right)
 \end{aligned} \tag{15}$$

Similarly, the characteristics function of Area-biased Remkan distribution can be obtained by

$$\begin{aligned}
 \phi_X(t) &= M_X(it) \\
 M_X(it) &= \frac{1}{2\eta+24\phi+120} \sum_{j=0}^{\infty} \frac{t^j}{j! \eta^j} (\eta \lceil j+3+\phi \rceil j+5+\lceil j+6 \rceil)
 \end{aligned} \tag{16}$$

Order Statistics

Let $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ be the order statistics of a random sample X_1, X_2, \dots, X_n drawn from the continuous population with probability density function $g_x(x)$ and cumulative distribution function, with $G_x(x)$, then the probability density function of r^{th} order statistics $X_{(r)}$ is given by

$$g_{X(r)}(x) = \frac{n!}{(r-1)!(n-r)!} g_x(x) [G_x(x)]^{r-1} [1 - G_x(x)]^{n-r}$$

The probability density function of r^{th} order statistics $X_{(r)}$ of area-biased Remkan distribution is given by

$$\begin{aligned}
 &= \frac{n!}{(r-1)!(n-r)!} \left(\frac{\eta^4}{2\eta+24\phi+120} x^2 (1 + \phi\eta x^2 + \eta^2 x^3) e^{-\eta x} \right) \\
 &\times \left(\frac{1}{2\eta+24\phi+120} \eta \gamma(3, \eta x) + \phi \gamma(5, \eta x) + \gamma(6, \eta x) \right)^{r-1} \\
 &\times \left(1 - \frac{1}{2\eta+24\phi+120} \eta \gamma(3, \eta x) + \phi \gamma(5, \eta x) + \gamma(6, \eta x) \right)^{n-r}
 \end{aligned}$$

Therefore, the probability density function of first-order statistics of Area-biased Remkan distribution can be obtained as

$$\begin{aligned}
 g_{X(1)}(x) &= \frac{n(n-1)!}{(1-1)!(n-1)!} \left(\frac{\eta^4}{2\eta+24\phi+120} x^2 (1 + \phi\eta x^2 + \eta^2 x^3) e^{-\eta x} \right) \\
 &\times \left(1 - \frac{1}{2\eta+24\phi+120} \eta \gamma(3, \eta x) + \phi \gamma(5, \eta x) + \gamma(6, \eta x) \right)^{n-1} \\
 g_{X(n)}(x) &= \frac{n!}{(n-1)!(1-1)!} \left(\frac{\eta^4}{2\eta+24\phi+120} x^2 (1 + \phi\eta x^2 + \eta^2 x^3) e^{-\eta x} \right) \\
 &\times \left(\frac{1}{2\eta+24\phi+120} \eta \gamma(3, \eta x) + \phi \gamma(5, \eta x) + \gamma(6, \eta x) \right)^{n-1}
 \end{aligned} \tag{17}$$

Likelihood Ratio Test

Anu and Pandiyan

Let X_1, X_2, \dots, X_n be a random sample from the area-biased Remkan distribution. To test the hypothesis

$$H_0: g(x) = g(x; \eta, \phi) \quad \text{against} \quad H_1: g(x) = g_a(x; \eta, \phi)$$

In order to test whether the random sample of size n comes from the Area-biased Remkan distribution, the following test statistics are used by

$$\begin{aligned} \Delta &= \frac{L_1}{L_0} = \prod_{i=1}^n \frac{g_a(x; \eta, \phi)}{g(x; \eta, \phi)} \\ &= \prod_{i=1}^n \left(\frac{\frac{\eta^4}{2\eta+24\phi+120} x^2 (1 + \phi\eta x^2 + \eta^2 x^3) e^{-\eta x}}{\frac{\eta^2}{\eta+2\phi+6} (1 + \phi\eta x^2 + \eta^2 x^3) e^{-\eta x}} \right) \\ &= \prod_{i=1}^n \frac{\eta^2(\eta+2\phi+6)}{2\eta+24\phi+120} x_i^2 \\ &= \left(\frac{\eta^2(\eta+2\phi+6)}{2\eta+24\phi+120} \right)^n \prod_{i=1}^n x_i^2 \end{aligned}$$

We should reject the null hypothesis, if

$$\Delta = \left(\frac{\eta^2(\eta+2\phi+6)}{2\eta+24\phi+120} \right)^n \prod_{i=1}^n x_i^2 > k \quad (\text{or})$$

Equivalently, We shall reject the null hypothesis, if

$$\Delta^* = \prod_{i=1}^n x_i^2 > k \left(\frac{2\eta+24\phi+120}{\eta^2(\eta+2\phi+6)} \right)^n$$

$$\Delta^* = \prod_{i=1}^n x_i^2 > k^* \quad \text{where,}$$

$$k^* = k \left(\frac{2\eta+24\phi+120}{\eta^2(\eta+2\phi+6)} \right)^n$$

Then

$p(\Delta^* > \lambda^*)$, where, $\lambda^* = \prod_{i=1}^n x_i^2$ is less than a specified level of significance, and $\prod_{i=1}^n x_i^2$ is the observed value of Δ^*

Maximum Likelihood Estimate And Fisher Information Measure

$$L(x) = \prod_{i=1}^n g_a(x_i)$$

$$L(x) = \prod_{i=1}^n \frac{\eta^4}{2\eta+24\phi+120} x_i^2 (1 + \phi\eta x_i^2 + \eta^2 x_i^3) e^{-\eta x_i}$$

$$L(x) = \frac{\eta^{4n}}{(2\eta+24\phi+120)^n} \prod_{i=1}^n x_i^2 (1 + \phi\eta x_i^2 + \eta^2 x_i^3) e^{-\eta x_i} \quad (19)$$

The log likelihood function is given by equation (19)

$$= n \log(\eta^4) - n \log(2\eta+24\phi+120) + 2 \sum_{i=1}^n \log x_i + \sum_{i=1}^n \log(1 + \phi\eta x_i^2 + \eta^2 x_i^3) - \eta \sum_{i=1}^n x_i$$

Now, differentiating with respect to η and ϕ

$$\frac{\partial \log L}{\partial \eta} = n \left(\frac{4\eta^3}{\eta^4} \right) - n \frac{2}{(2\eta+24\phi+120)} + \sum_{i=1}^n \frac{(\phi x_i^2 + 2\eta x_i^3)}{(1 + \phi\eta x_i^2 + \eta^2 x_i^3)} - \sum_{i=1}^n x_i = 0$$

$$\frac{\partial \log L}{\partial \phi} = -n \frac{24}{(2\eta+24\phi+120)} + \sum_{i=1}^n \frac{(\eta x_i^2)}{(1 + \phi\eta x_i^2 + \eta^2 x_i^3)} = 0 \quad (20)$$

For the purpose of obtaining the confidence interval we use the asymptotic normality results. We have that if

$\hat{\lambda} = (\hat{\eta}, \hat{\phi})$ denotes the MLE of $\lambda = (\eta, \phi)$ We can state the results as follows

$$\sqrt{n}(\hat{\lambda} - \lambda) \rightarrow N_2(0, I^{-1}(\lambda))$$

Where, $I(\lambda)$ is Fisher's Information Matrix. i.e.,

Anu and Pandiyan

$$I(\lambda) = -\frac{1}{n} \begin{bmatrix} E \left[\frac{\partial^2 \log L}{\partial \eta^2} \right] & E \left[\frac{\partial^2 \log L}{\partial \eta \partial \phi} \right] \\ E \left[\frac{\partial^2 \log L}{\partial \phi \partial \eta} \right] & E \left[\frac{\partial^2 \log L}{\partial \phi^2} \right] \end{bmatrix}$$

Where,

$$\begin{aligned} \left[\frac{\partial^2 \log L}{\partial \eta^2} \right] &= E \left[\frac{\partial}{\partial \eta} \left(\frac{\partial \log L}{\partial \eta} \right) \right] \\ \left[\frac{\partial^2 \log L}{\partial \eta^2} \right] &= n \left(\frac{12\eta^6 - 16\eta^6}{\eta^8} \right) - n \frac{-4}{(2\eta + 24\phi + 120)^2} + \frac{2x_i^3 + 2\phi\eta x_i^5 + 2\eta^2 x_i^6 - 2\phi x_i^2 + 2\eta x_i^3}{(1 + \phi\eta x_i^2 + \eta^2 x_i^3)^2} \end{aligned} \quad (21)$$

$$\begin{aligned} \left[\frac{\partial^2 \log L}{\partial \phi^2} \right] &= E \left[\frac{\partial}{\partial \phi} \left(\frac{\partial \log L}{\partial \phi} \right) \right] \\ \left[\frac{\partial^2 \log L}{\partial \phi^2} \right] &= -n \frac{-576}{(2\eta + 24\phi + 120)^2} - \frac{-\eta^2 x_i^4}{(1 + \phi\eta x_i^2 + \eta^2 x_i^3)^2} \end{aligned} \quad (22)$$

$$\left[\frac{\partial^2 \log L}{\partial \eta \partial \phi} \right] = -n \frac{-48}{(2\eta + 24\phi + 120)^2} + \frac{x_i^2 + 2\eta^4 x_i^{10}}{(1 + \phi\eta x_i^2 + \eta^2 x_i^3)^2} \quad (23)$$

Bonferroni And Lorenz Curves

The Bonferroni and Lorenz curves are used in economics in order to study income, etc., but they are used in other fields like demography, insurance, medicine, and reliability. The Bonferroni and Lorenz curves are given by

$$B(p) = \frac{1}{p\mu_1} \int_0^q xg(x)dx$$

$$B(p) = \frac{1}{p\mu_1} \int_0^q xg(x; \eta, \phi)dx$$

and

$$L(p) = \frac{1}{\mu_1} \int_0^q xg(x; \eta, \phi)dx$$

Where, $q = G^{-1}(p)$; $q \in [0, 1]$ and $\mu = (x)$

Hence, the Bonferroni and Lorenz curves of our distribution are given by,

$$\mu = \frac{6\eta + 120\phi + 720}{\eta(2\eta + 24\phi + 120)}$$

$$\begin{aligned} B(p) &= \frac{\eta(2\eta + 24\phi + 120)}{6\eta + 120\phi + 720} \int_0^q \frac{\eta^4}{2\eta + 24\phi + 120} x^2 (1 + \phi\eta x_i^2 + \eta^2 x_i^3) e^{-\eta x} dx \\ &= \frac{\eta^4}{6\eta + 120\phi + 720} \int_0^q x^2 (1 + \phi\eta x_i^2 + \eta^2 x_i^3) e^{-\eta x} dx \\ &= \frac{\eta^4}{6\eta + 120\phi + 720} \int_0^q x^2 e^{-\eta x} dx + \phi\eta \int_0^q x^4 e^{-\eta x} dx + \eta^2 \int_0^q x^5 e^{-\eta x} dx \end{aligned}$$

$$\text{Put, } x = \frac{t}{\eta}, \quad \eta x = t, \quad dx = \frac{1}{\eta} dt$$

when $x \rightarrow 0, t \rightarrow 0$, and $x \rightarrow q, t \rightarrow \eta q$

$$= \frac{\eta^4}{6\eta + 120\phi + 720} \frac{1}{\eta^3} \int_0^{\eta q} t^2 e^{-t} dt + \frac{1}{\phi\eta^6} \int_0^{\eta q} t^4 e^{-t} dt + \frac{1}{\eta^8} \int_0^{\eta q} t^5 e^{-t} dt$$

After the simplification, we get

$$B(p) = \frac{\eta(\eta\gamma(3, \eta q) + \phi(5, \eta q) + (6, \eta q))}{(6\eta + 120\phi + 720)}$$

Where,

$$L(p) = B(p)$$

$$L(p) = \frac{\eta(\eta\gamma(3, \eta q) + \phi(5, \eta q) + (6, \eta q))}{(6\eta + 120\phi + 720)} \quad (24)$$

Entropies

Anu and Pandiyan

Entropy is important in different areas such as probability and economics, communication theory, physics, and statistics. Entropies are applied to quantify a system's diversity, uncertainty, or randomness. An indicator of the uncertainty's variation is the entropy of a random variable X .

Renyi Entropy

The Renyi entropy is significant as a diversity index. The Renyi entropy is also important in quantum information. It can be used as a measure of entanglement for a given probability distribution. Renyi entropy is given by

$$R_\lambda = \frac{1}{1-\lambda} \log \int_0^\infty (g(x))^\lambda dx; \lambda > 0, \lambda \neq 1$$

$$R_\lambda = \frac{1}{1-\lambda} \log \int_0^\infty (g(x; \eta, \phi))^\lambda dx$$

$$R_\lambda = \frac{1}{1-\lambda} \log \int_0^\infty \left(\frac{\eta^4}{2\eta + 24\phi + 120} x^2 (1 + \phi\eta x^2 + \eta^2 x^3) e^{-\eta x} \right)^\lambda dx$$

$$R_\lambda = \frac{1}{1-\lambda} \log \left(\frac{\eta^4}{2\eta + 24\phi + 120} \right)^\lambda \int_0^\infty x^{2\lambda} (1 + \phi\eta x^2 + \eta^2 x^3)^\lambda e^{-\lambda\eta x} dx \quad (25)$$

Using binomial expansion

$$= \sum_{i=0}^{\lambda} \binom{\lambda}{i} 1^{\lambda-i} (\phi\eta x^2 + \eta^2 x^3)^i$$

$$R_\lambda = \frac{1}{1-\lambda} \log \left(\frac{\eta^4}{2\eta + 24\phi + 120} \right)^\lambda \sum_{i=1}^{\lambda} \sum_{j=0}^i \binom{\lambda}{i} \binom{i}{j} (\phi\eta)^{i-j} \eta^{2j} \int_0^\infty x^{(2\lambda+2i+j+1)-1} e^{-\lambda\eta x} dx$$

$$R_\lambda = \frac{1}{1-\lambda} \log \left(\frac{\eta^4}{2\eta + 24\phi + 120} \right)^\lambda \sum_{i=1}^{\lambda} \sum_{j=0}^i \binom{\lambda}{i} \binom{i}{j} (\phi\eta)^{i-j} \eta^{2j} \frac{\Gamma(2\lambda + 2i + j + 1)}{(\eta\lambda)^{2\lambda+2i+j+1}}$$

Tsallis Entropy

The Boltzmann-Gibbs (B-G) statistical property generalization initiated by Tsallis has received a great deal of attention. This B-G statistic was first introduced as the mathematical expansion of Tsallis entropy (Tsallis, 1988) for continuous random variables; this generalization of B-G was introduced in order to suggest. Which is defined as

$$T_\lambda = \frac{1}{\lambda-1} \left(1 - \int_0^\infty (g_w(x; \eta, \phi))^\lambda dx \right) \lambda > 0, \lambda \neq 1$$

$$T_\lambda = \frac{1}{\lambda-1} \left(1 - \int_0^\infty \left(\frac{\eta^4}{2\eta + 24\phi + 120} x^2 (1 + \phi\eta x^2 + \eta^2 x^3) e^{-\eta x} \right)^\lambda dx \right)$$

$$T_\lambda = \frac{1}{\lambda-1} \left(1 - \left(\frac{\eta^4}{2\eta + 24\phi + 120} \right)^\lambda \int_0^\infty x^{2\lambda} (1 + \phi\eta x^2 + \eta^2 x^3)^\lambda e^{-\lambda\eta x} dx \right) \quad (26)$$

Using binomial expansion

$$= \sum_{i=0}^{\lambda} \binom{\lambda}{i} 1^{\lambda-i} (\phi\eta x^2 + \eta^2 x^3)^i$$

$$T_\lambda = \frac{1}{1-\lambda} \left(1 - \left(\frac{\eta^4}{2\eta + 24\phi + 120} \right)^\lambda \sum_{i=1}^{\lambda} \sum_{j=0}^i \binom{\lambda}{i} \binom{i}{j} (\phi\eta)^{i-j} \eta^{2j} \int_0^\infty x^{(2\lambda+2i+j+1)-1} e^{-\lambda\eta x} dx \right)$$

$$T_\lambda = \frac{1}{1-\lambda} \left(1 - \left(\frac{\eta^4}{2\eta + 24\phi + 120} \right)^\lambda \sum_{i=1}^{\lambda} \sum_{j=0}^i \binom{\lambda}{i} \binom{i}{j} (\phi\eta)^{i-j} \eta^{2j} \frac{\Gamma(2\lambda + 2i + j + 1)}{(\eta\lambda)^{2\lambda+2i+j+1}} \right)$$

Data Analysis

Anu and Pandiyan

The data under consideration are we demonstrate the applicability of the lifetime's data relating to show that Area-biased Remkan distribution can be better than Remkan distribution. We consider a data set of 18 patients suffering from leukaemia blood cancer (non-censored data) are the data sets. 1.013,1.034,1.109,1.226,1.509,1.533,1.563,1.716,1.929,1.965,2.061,2.344,2.546,2.626,2.778,2.951, 4.118,5.136 In order to compare the performance of Area-biased Remkan distribution with Remkan distribution. We are using the criteria values, like *AIC* (Akaike information criterion), *AICC* (corrected Akaike information criterion) and *BIC* (Bayesian information criterion). The better distribution corresponds to lesser values of *AIC*, *AICC*, *BIC* and $-2\log L$ can be evaluated by using the formulas as follows:

$$AIC = 2K - 2\log L \quad AICC = AIC + \frac{2k(k+1)}{(n-k-1)} \text{ and } BIC = k \log n - 2\log L$$

Where, K = number of parameters, n sample size and $-2\log L$ is the maximized value of loglikelihood function.

From the table, it can be observed that the result is an Area-biased Remkan distribution have *AIC*, *BIC*, *AICC*, $-2\log L$, and compared to the values of Remkan, Aradhana, Ishita, Akshaya, Shankar, Rama, Exponential, Lindly, and Akash distributions. Our conclusion is the area-biased Remkan distribution, given the better fits over the above other distributions.

CONCLUSION

In this study the present a new two-parameter life-time distribution and proposed various statistical properties of the distribution, derived as cumulative distribution, survival, hazard, and moments. A simulation of the study has been presented. The data can be used to describe the behavioural structure of data in life from engineering and medical science. The Area-biased Remkan distribution in applications has been compared for goodness of fit to Remkan, Aradhana, Ishita, Akshaya, Shankar, Rama, Exponential, Lindly, and Akash distributions. The MLE has been discussed, and the several statistical measures that make it suitable for reliability behaviour as a life-time distribution are over all well-known and considered. The Area-biased Remkan distribution provides better performance than Remkan distribution. The results show that it better fit over the other distributions.

ABSTRACT

Defining several types of Interval-Valued sets and their generalizations is the aim of this study. Furthermore, we define few Interval-Valued sets in their weak and strong forms. We also spoke about the relationships that exist between the various kinds of Interval-Valued closed sets and their generalized sets. Using precise examples, we clarified such relationships.

Keywords: Interval-Valued closed sets; Interval-Valued generalization of closed sets; Interval-Valued weakly closed set.

Mathematics Subject Classification(2020) : 54A05

INTRODUCTION

Yao [1] introduced an interval set in 2009 (which we will henceforth refer to as an Interval-Valued set) that offered an algebraic structural explanation as well as an approximation tool for concepts that were hard or impossible to define. This concept is unmistakably an extension of classical sets and a specific case of Zadeh's Interval-Valued fuzzy sets [2]. One of the reasons for its birth is to provide a point-set based context for the classical sets. We review a number of

definitions for an Interval-Valued set that Yao has worked on. The concept of interiors and closures with interval values, as well as how Kim J. et al. [3] determined some of their properties. Interval-Valued sets offer a more adaptable framework for encapsulating ambiguity and uncertainty in real-world data. The notion of generalized closed sets, which are a generalization of closed sets in topological spaces, was first presented by Levin [4] in 1970. Here, we defined a few types of Interval-Valued closed sets with some generalizations of them. We also discussed the relationships between the Interval-Valued closed sets we defined here; these implications are not reversible ones explained with perfect examples, and the remarks show some independent relations with counter examples.

PRELIMINARIES

We can recall the following definitions which will be used later.

Definition 2.1[3] In a non empty set X . The form $[\mathcal{M}^-, \mathcal{M}^+] = \{\mathcal{N} \subset X: \mathcal{M}^- \subset \mathcal{N} \subset \mathcal{M}^+\}$ is called an Interval-Valued set (briefly, IVS) in X , if $[\mathcal{M}^-, \mathcal{M}^+] \subset X$ and $\mathcal{M}^- \subset \mathcal{M}^+$. In this case, \mathcal{M}^- [resp. \mathcal{M}^+] represent the set of minimum [resp. maximum] membership of elements of X to \mathcal{M} . The set of all IVSs in X is denoted by $\text{IVS}(X)$.

Definition 2.2[3] A non-empty set X and \mathcal{M}, \mathcal{N} are IVSs in the form $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$, $\mathcal{N} = [\mathcal{N}^-, \mathcal{N}^+]$ respectively. Then

1. $[\mathcal{M}^-, \mathcal{M}^+] \subset [\mathcal{N}^-, \mathcal{N}^+], \Leftrightarrow \mathcal{M}^- \subset \mathcal{N}^-$ and $\mathcal{M}^+ \subset \mathcal{N}^+$.
2. $[\mathcal{M}^-, \mathcal{M}^+] = [\mathcal{N}^-, \mathcal{N}^+], \Leftrightarrow [\mathcal{M}^-, \mathcal{M}^+] \subset [\mathcal{N}^-, \mathcal{N}^+]$ and $[\mathcal{N}^-, \mathcal{N}^+] \subset [\mathcal{M}^-, \mathcal{M}^+]$.
3. $([\mathcal{M}^-, \mathcal{M}^+])^c = [\mathcal{M}^{+c}, \mathcal{M}^{-c}]$.
4. $[\mathcal{M}^-, \mathcal{M}^+] \cup [\mathcal{N}^-, \mathcal{N}^+] = [\mathcal{M}^- \cup \mathcal{N}^-, \mathcal{M}^+ \cup \mathcal{N}^+]$.
5. $[\mathcal{M}^-, \mathcal{M}^+] \cap [\mathcal{N}^-, \mathcal{N}^+] = [\mathcal{M}^- \cap \mathcal{N}^-, \mathcal{M}^+ \cap \mathcal{N}^+]$.

Definition 2.3[3] Let τ be a family of non-empty IVSs on X , where X be a non-empty set. If it meets the following axioms, then τ is called an Interval-Valued Topology (briefly, IVT) on X :

1. $\emptyset, \tilde{X} \in \tau$.
2. $\mathcal{M} \cap \mathcal{N} \in \tau$ for any $\mathcal{M}, \mathcal{N} \in \tau$.
3. $\bigcup_{j \in J} \mathcal{M}_j \in \tau$ for any family $(\mathcal{M}_j)_{j \in J}$ of members of τ .

This pair (X, τ) is referred as an Interval-Valued topological space (briefly, IVTS), in this instance and each member of τ is referred as an Interval-Valued open set (briefly, IVOs) in X . If $\mathcal{M}^c \in \tau$, then an IVS \mathcal{M} is known as an Interval-Valued closed set (briefly, IVCs) in X .

Definition 2.4[3] Let (X, τ) be an IVTS and let $\mathcal{M} \in \text{IVS}(X)$. Then

1. The Interval-Valued closure of $[\mathcal{M}^-, \mathcal{M}^+]$ w.r.t. τ , denoted by $\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+])$, is an IVS in X defined as:
 $\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+]) = \bigcap \{K: K^c \in \tau \text{ and } \mathcal{M} \subset K\}$.
2. The Interval-Valued interior of $[\mathcal{M}^-, \mathcal{M}^+]$ w.r.t. τ , denoted by $\text{IVint}([\mathcal{M}^-, \mathcal{M}^+])$, is an IVS in X defined as:
 $\text{IVint}([\mathcal{M}^-, \mathcal{M}^+]) = \bigcup \{G: G \in \tau \text{ and } G \subset \mathcal{M}\}$

Proposition 2.5[3] Let (X, τ) be an IVTS and let $[\mathcal{M}^-, \mathcal{M}^+] \in \text{IVS}(X)$. Then

1. $\text{IVint}([\mathcal{M}^-, \mathcal{M}^+])^c = (\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+]))^c$.
2. $\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+])^c = (\text{IVint}([\mathcal{M}^-, \mathcal{M}^+]))^c$.

Definition 2.6[3] Kuratowski Closure Axioms. Let $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$, $\mathcal{N} = [\mathcal{N}^-, \mathcal{N}^+] \in \text{IVS}(X)$ and (X, τ) be IVTS. Then

1. If $[\mathcal{M}^-, \mathcal{M}^+] \subset [\mathcal{N}^-, \mathcal{N}^+]$, then $\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+]) \subset \text{IVcl}([\mathcal{N}^-, \mathcal{N}^+])$.
2. $\text{IVcl}(\emptyset) = \emptyset$.
3. $[\mathcal{M}^-, \mathcal{M}^+] \subset \text{IVcl}([\mathcal{M}^-, \mathcal{M}^+])$.
4. $\text{IVcl}(\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+])) = \text{IVcl}([\mathcal{M}^-, \mathcal{M}^+])$.
5. $\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+] \cup [\mathcal{N}^-, \mathcal{N}^+]) = \text{IVcl}([\mathcal{M}^-, \mathcal{M}^+]) \cup \text{IVcl}([\mathcal{N}^-, \mathcal{N}^+])$.

Dijitha and Navaneethakrishnan

Definition 2.7[3] Let $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$, $\mathcal{N} = [\mathcal{N}^-, \mathcal{N}^+] \in \text{IVS}(X)$ and (X, τ) be IVTS. Then

1. If $[\mathcal{M}^-, \mathcal{M}^+] \subset [\mathcal{N}^-, \mathcal{N}^+]$, then $\text{IVint}[\mathcal{M}^-, \mathcal{M}^+] \subset \text{IVint}([\mathcal{N}^-, \mathcal{N}^+])$.
2. $\text{IVcl}(\bar{X}) = \bar{X}$.
3. $\text{IVint}([\mathcal{M}^-, \mathcal{M}^+]) \subset [\mathcal{M}^-, \mathcal{M}^+]$.
4. $\text{IVint}(\text{IVint}([\mathcal{M}^-, \mathcal{M}^+])) = \text{IVint}([\mathcal{M}^-, \mathcal{M}^+])$.
5. $\text{IVint}([\mathcal{M}^-, \mathcal{M}^+] \cap [\mathcal{N}^-, \mathcal{N}^+]) = \text{IVint}([\mathcal{M}^-, \mathcal{M}^+]) \cap \text{IVint}([\mathcal{N}^-, \mathcal{N}^+])$.

Definition 2.8[5] A set $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ from $\text{IVS}(X)$ is an Interval-Valued generalized closed (briefly, IVg-closed set) iff $\text{IVcl}[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$ whenever $\mathcal{M} \subseteq U$ where U is an IVOs. A set $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ from $\text{IVS}(X)$ is said to be an Interval-Valued generalized open (briefly, IVg-open set) whenever $\bar{X} - [\mathcal{M}^-, \mathcal{M}^+]$ is an IVg-closed set.

Definition 2.9[5] Intersection of all IVg-closed sets containing $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called an Interval-Valued generalized closure of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVgcl}(\mathcal{M})$. Union of all IVg-open sets contained in $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called an Interval-Valued generalized interior of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVgint}(\mathcal{M})$.

Definition 2.10[6] Let (X, τ) be an IVTS(X). $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in \text{IVS}(X)$ is said to be an Interval-Valued semi open set [briefly, IVSOs] if $[\mathcal{M}^-, \mathcal{M}^+] \subseteq \text{IVcl}(\text{IVint}([\mathcal{M}^-, \mathcal{M}^+]))$ and its complement is an Interval-Valued semi closed set [briefly, IVSCs].

Definition 2.11[6] Take $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in \text{IVS}(X)$ and (X, τ) be an IVTS. If $\text{IVscl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq [U^-, U^+]$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$ and U is an IVSOs. Then $\text{IVS} [\mathcal{M}^-, \mathcal{M}^+]$ is known as Interval-valued semi generalized closed set [briefly, IVsg-closed set]. The complement of IVsg-closed set is known as an Interval-Valued semi generalized open (IVsg-open set, for short).

Definition 2.12[6] Intersection of all IVsg-closed sets containing $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called an Interval-Valued semi generalized closure of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVsgcl}(\mathcal{M})$.

Union of all IVsg-open sets contained in $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called an Interval-Valued semi generalized interior of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVsgint}(\mathcal{M})$.

Definition 2.13[6] A set $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in \text{IVS}(X)$ is said to be Interval-Valued generalized semiclosed [briefly, IVgs-closed] if $\text{IVscl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq [U^-, U^+] = U$ whenever, U is an Interval-Valued open in X . The complement of IVgs-closed set is denoted as IVgs-open set.

Definition 2.14[6] Intersection of all IVgs-closed sets containing $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called Interval-Valued generalized semi closure of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVgscl}(\mathcal{M})$.

Union of all IVgs-open sets contained in $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called an Interval-Valued generalized semi interior of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVgsint}(\mathcal{M})$.

SOME IV CLOSED SETS

The following definitions are introduced here.

Definition 3.1 Let (X, τ) be an IVTS(X). $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in \text{IVS}(X)$ is said to be an Interval-Valued pre open set [briefly, IVPOs] if $[\mathcal{M}^-, \mathcal{M}^+] \subseteq \text{IVint}(\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+]))$ and its complement is an Interval-Valued pre closed set [briefly, IVPCs].

Definition 3.2 A set $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in \text{IVS}(X)$ is said to be an Interval-Valued pre semiopen set [briefly, IVPSOs] if $[\mathcal{M}^-, \mathcal{M}^+] \subseteq \text{IVint}(\text{IVcl}(\text{IVint}([\mathcal{M}^-, \mathcal{M}^+])))$ and \mathcal{M}^c is an Interval-Valued pre semi closed set [briefly, IVPSCs].

Dijitha and Navaneethakrishnan

Definition 3.3 (X, τ) be an IVTS(X). If $[\mathcal{M}^-, \mathcal{M}^+] \subseteq \text{IVcl}(\text{IVint}(\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+])))$. Then $[\mathcal{M}^-, \mathcal{M}^+]$ is considered as an Interval-Valued semi pre open set [briefly, IVSPOs] and \mathcal{M}^c is an Interval-Valued semi pre closed set [briefly, IVSPCs].

Definition 3.4 Intersection of all IVPC sets (resp. IVSPCs, IVPSCs) containing $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called an Interval-Valued pre closure (resp. Interval-Valued semi pre closure, Interval-Valued pre semi closure) of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVpcl}(\mathcal{M})$ (resp. $\text{IVspcl}(\mathcal{M})$, $\text{IVpscl}(\mathcal{M})$).

Definition 3.5 Take $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in \text{IVS}(X)$ and (X, τ) be an IVTS. If $\text{IVpcl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq U$ (resp. $\text{IVspcl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq U$, $\text{IVpscl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq U$) whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$, where U is an IVOs. Then $\text{IVS} [\mathcal{M}^-, \mathcal{M}^+]$ is known as Interval-Valued generalized pre closed set [briefly, IVgp-closed set] (resp. Interval-Valued generalized semi pre closed set [briefly, IVgsp-closed set], Interval-Valued pre semi generalized closed set [briefly, IVpsg-closed set])
The complement of IVgp-closed set (resp. IVgsp-closed set, IVpsg-closed set) is known as Interval-Valued generalized pre open set (IVgp-open set, for short) (resp. Interval-Valued generalized semi pre open set (IVgsp-open set, for short), Interval-Valued pre semi generalized-open set (IVpsg-open set, for short)).

Definition 3.6 A set $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in \text{IVS}(X)$ is said to be an Interval-Valued pre generalized closed set [briefly, IVpg-closed set] (resp. Interval-Valued generalized pre semi closed set [briefly, IVgps-closed set]) if $\text{IVpcl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq U$ (resp. $\text{IVpscl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq U$) whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$, where U is an IVOs (resp. IVPSO) in X .
The complement of IVpg-closed and IVgps-closed is called as Interval-Valued pre generalized open set and Interval-Valued generalized pre semi open set. It is denoted by IVpg-open set and IVgps-open set respectively.

Definition 3.7 Intersection of all IVpg-closed set (resp. IVgp-closed set, IVgsp-closed set, IVgps-closed set and IVpsg-closed set) containing $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called an Interval-Valued pre generalized closure (resp. Interval-Valued generalized pre closure, Interval-Valued generalized semi pre closure, Interval-Valued generalized pre semi closure, Interval-Valued pre semi generalized closure) of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVpgcl}(\mathcal{M})$ (resp. $\text{IVgpcl}(\mathcal{M})$, $\text{IVgspcl}(\mathcal{M})$, $\text{IVgpscl}(\mathcal{M})$, $\text{IVpsgcl}(\mathcal{M})$).

Definition 3.8 In IVTS (X, τ) take a IVS, $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is said to be

1. Interval-Valued weakly closed set [briefly, IVWCs] if $\text{IVcl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq U$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq U$ and U is an IVSOs in X .
2. Interval-Valued weakly generalized closed set [briefly, IVwg-closed set] if $\text{IVcl}(\text{IVint}([\mathcal{M}^-, \mathcal{M}^+])) \subseteq U$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq U$ and U is an IVOs in X .
3. Interval-Valued strongly generalized semi closed set [briefly, IVg*-closed set] if $\text{IVcl}(\text{IVint}([\mathcal{M}^-, \mathcal{M}^+])) \subseteq U$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq U$ and U is an IVg-open set in X .
4. Interval-Valued semi weakly generalized closed set [briefly, IVswg-closed set] if $\text{IVcl}(\text{IVint}([\mathcal{M}^-, \mathcal{M}^+])) \subseteq U$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq U$ and U is an IVSOs in X .

The complement of above defined ones are Interval-Valued weakly open set, Interval-Valued weakly generalized open set, Interval-Valued strongly generalized semi open set, Interval-Valued semi weakly generalized open set and in short IVWOs, IVwg-open set, IVg*-open set and IVswg-open set respectively.

Definition 3.9 Intersection of all IVWCs (resp. IVwg-closed sets, IVg*-closed sets, IVswg-closed sets) containing $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is called an Interval-Valued weak closure (resp. Interval-Valued weakly generalized closure, Interval-Valued strongly generalized semi closure, Interval-Valued semi weakly generalized closure) of $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ is denoted by $\text{IVwcl}(\mathcal{M})$ (resp. $\text{IVwgcl}(\mathcal{M})$, $\text{IVg}^*\text{cl}(\mathcal{M})$, $\text{IVswgcl}(\mathcal{M})$).

Result 3.10

1. $\text{IVSPCs} \subseteq \text{IVSCs} \subseteq \text{IVPSCs} \subseteq \text{IVCs}$.
2. $\text{IVspcl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq \text{IVscl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq \text{IVpscl}([\mathcal{M}^-, \mathcal{M}^+]) \subseteq \text{IVcl}([\mathcal{M}^-, \mathcal{M}^+])$.

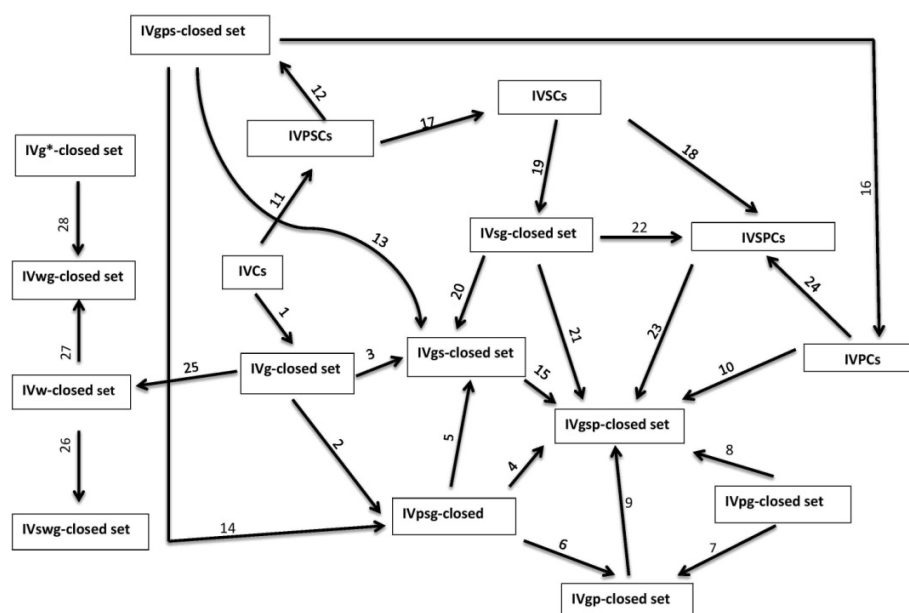

Dijitha and Navaneethakrishnan

3. $IVSPOs \subseteq IVSOs \subseteq IVPSOs \subseteq IVOs$.
4. $IVSPCs \subseteq IVPCs$.
5. $IVspcl([\mathcal{M}^-, \mathcal{M}^+]) \subseteq IVpcl([\mathcal{M}^-, \mathcal{M}^+])$.
6. $IVSPOs \subseteq IVPOs$.
7. $IVWCs \subseteq IVCs$ and $IVwcl([\mathcal{M}^-, \mathcal{M}^+]) \subseteq IVcl([\mathcal{M}^-, \mathcal{M}^+])$.

IMPLICATIONS BETWEEN SOME IVC-SETS

Theorem 4.1 The following implications are true but not reversible.

Proof

1. Here, implication **2** is shown.

Let $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in IVS(X)$ be an IVg-closed. Then, $IVcl[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$ where U is an IVOs. But, $IVpscl[\mathcal{M}^-, \mathcal{M}^+] \subseteq IVcl[\mathcal{M}^-, \mathcal{M}^+] \subseteq U \Rightarrow IVpscl(\mathcal{M}) \subseteq U$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq U$. We can conclude that, $[\mathcal{M}^-, \mathcal{M}^+]$ is an IVpsg-closed. \therefore Every IVg-closed set is an IVpsg-closed set. Implications **3,4,5,6,9,15** are proved alike.

2. Implication **7** is proved here.

$\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+] \in IVS(X)$ be an IVpg-closed set. Then $IVpcl[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$ where U is an IVPOs. But, $IVPOs \subseteq IVOs \Rightarrow [\mathcal{M}^-, \mathcal{M}^+] \subseteq U$ where U is an IVOs. Then, $[\mathcal{M}^-, \mathcal{M}^+]$ is an IVgp-closed. Finally, Every IVpg-closed set is an IVgp-closed set. Equivalently, implications **14,20,25,28** are proved.

3. Implication **21** is proved here.

$[\mathcal{M}^-, \mathcal{M}^+] \in IVS(X)$ be an IVsg-closed set. Then, $IVscl[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$ whenever $[\mathcal{M}^-, \mathcal{M}^+] \subseteq [U^-, U^+] = U$ where U is an IVSOs. But, $IVspcl(\mathcal{M}) \subseteq IVscl(\mathcal{M})$ and $IVSOs \subseteq IVOs$, which implies $IVspcl(\mathcal{M}) \subseteq IVscl(\mathcal{M}) \subseteq U$. Then, $IVspcl(\mathcal{M}) \subseteq U$, where U is an IVSPOs. Finally, $[\mathcal{M}^-, \mathcal{M}^+]$ is an IVgsp-closed set. \therefore Every IVsg-closed set is an IVgsp-closed set. In addition, implications **8,13,27** are proved.

Other implications are clear-cut. We verify the implications using successful examples.

Dijitha and Navaneethakrishnan

Example 4.2 We check implications 1 and 4 are not reversible.

Take $X = \{a, b, c\}$. Then, τ be an IVT gives $\{\emptyset, [\emptyset, \{a\}], [\{a\}, \{a, b\}], [\emptyset, \{c\}], [\{a\}, \{a, c\}],$

$[\{b\}, \{b\}], [\{b\}, \{a, b\}], [\{c\}, X], [\{a\}, X], [\emptyset, \{b\}], [\emptyset, \{a, b\}], [\{a, b\}, \{a, b\}], [\{a, c\}, X], [\{b\}, \{b, c\}], [\{b\}, X], [\emptyset, \{b, c\}], [\emptyset, X],$

$[\{a, b\}, X], [\{b, c\}, X], \tilde{X}$.

$1 \Rightarrow$ IVS $[\{b, c\}, X]$ is an IVg-closed set but not IVCs. Therefore, every IVg-closed set is not an IVCs.

$4 \Rightarrow$ Take an IVS $[\{a\}, \{a\}]$ which is an IVgsp-closed set but not IVpsg-closed set. Therefore, every IVgsp-closed set is not an IVpsg-closed set.

\therefore Implications 1 and 4 are not reversible.

Example 4.3 We check the following implications 6, 7, 8, 10, 24 are not reversible.

$X = \{a, b, c\}$. We get, τ be an IVT as $\{\emptyset, [\emptyset, \{c\}], [\{b\}, \{b\}], [\{b\}, \{b, c\}], [\{a\}, \{a, b\}], [\{a\}, X], [\emptyset, \{b\}], [\emptyset, \{b, c\}], [\{a, b\}, \{a, b\}],$

$[\{a, b\}, X], \tilde{X}$.

- For implication 6, Take $[\emptyset, \{b\}] \in \text{IVS}(X)$ which is an IVgp-closed set but not IVpsg-closed set in X which implies, every IVgp-closed set is not an IVpsg-closed set.
- For implication 7, Now, an IVS $[\{b\}, X]$ is an IVgp-closed set but not IVpg-closed set in $X \Rightarrow$ Every Ivgp-closed set need not be an IVpg-closed set.
- For implication 8, $[\{b, c\}, \{b, c\}]$ be an IVS is taken from the IVTS mentioned above which is an IVgsp-closed set but not IVpg-closed set. \therefore Every IVgsp-closed set need not be an IVpg-closed set.
- For implication 10, Consider $[\{b, c\}, X] \in \text{IVS}(X)$ is an IVgsp-closed set but not an IVPC set in X which implies every IVgsp-closed set is not an IVPC set.
- For implication 24, $[\emptyset, X] \in \text{IVS}(X)$ which is an IVSPCs but not IVPCs in (X, τ) which implies, Every IVSPCs is not an IVPCs.

\therefore 6, 7, 8, 10, 24 these implicationes are not reversible.

Example 4.4 We verify these implications 3, 5, 11, 12, 13, 15, 17, 22 are irreversible.

$X = \{1, 2, 3\}$ with an IVT $\tau = \{\emptyset, [\{3\}, \{1, 3\}], [\{2\}, \{2, 3\}], [\emptyset, \{3\}], [\{2, 3\}, X], [\emptyset, \{2\}], [\emptyset, \{2, 3\}], [\{3\}, X], \tilde{X}$.

$3 \Rightarrow$ Take, $[\{3\}, X]$ from $\text{IVS}(X)$ it is an IVgs-closed set but not IVg-closed set in X .

Therefore, every IVgs-closed set need not be an IVg-closed set.

$5 \Rightarrow$ An $\text{IVS}(X)$ $[\{2\}, \{2\}]$ is an IVgs-closed set but not IVpsg-closed set in (X, τ) .

Therefore, every IVgs-closed set need not be an IVpsg-closed set.

$11 \Rightarrow [\{1\}, \{1\}] \in \text{IVS}(X)$ which is an IVPSCs but not IVCs.

Therefore, every IVPSCs need not be an IVCs.

$12 \Rightarrow$ Using an IVS $[\{1\}, \{1, 2\}]$ is an IVgps-closed set but not IVPSCs is given (X, τ) .

Therefore, every IVgps-closed set need not be an IVPSCs.

$13 \Rightarrow$ Now, consider $[\emptyset, \{1, 3\}] \in \text{IVS}(X)$ which is an IVgs-closed set but not IVgps-closed set in X . Therefore, every IVgs-closed set need not be an IVgps-closed set.

$15 \Rightarrow [\{3\}, \{3\}]$ in (X, τ) is an IVgsp-closed set except instead IVgs-closed set.

Therefore, every IVgsp-closed set need not be an IVgs-closed set.

$17 \Rightarrow [\emptyset, \{2, 3\}] \in \text{IVS}(X)$ is an IVSCs except instead IVPSCs in X .

Therefore, every IVSCs need not be an IVPSCs.

22 Here, $[\{2, 3\}, \{2, 3\}] \in \text{IVS}(X)$ which is an IVSPCs but not IVsg-closed set.

Therefore, every IVSPCs need not be an IVsg-closed set.

Finally, implications 3, 5, 11, 12, 13, 15, 17, 22 cannot be reversed.

Example 4.5 The following example shows that

18. IVSPCs \nRightarrow IVSCs.

19. IVsg-closed set \nRightarrow IVSCs.

21. IVgsp-closed set \nRightarrow IVsg-closed set.

23. IVgsp-closed set \nRightarrow IVSPCs.

Dijitha and Navaneethakrishnan

$X = \{1, 2, 3\}$. Then, IVT is $\{\tilde{\emptyset}, M, N, O, P, Q, R, S, \tilde{X}\}$ where $M = [\{1\}, \{1,3\}]$, $N = [\emptyset, \{3\}]$, $O = [\{1\}, \{1,2\}]$, $P = [\emptyset, \{2,3\}]$, $Q = [\{1\}, \{1\}]$, $R = [\{1\}, X]$, $S = [\emptyset, \{2\}]$.

18. To verify this, Take $[\{1,3\}, \{1,3\}] \in \text{IVS}(X)$ it is an IVgsp-closed set but fails as IVSPCs in X which gives every IVgsp-closed set need not be an IVSPCs.

19. To check this, Using an IVS $[\{2\}, X]$ in (X, τ) mentioned above. It is IVSPCs but not IVSCs. Therefore, every IVSPCs need not be an IVSCs.

21. To ensure this, $[\{3\}, \{1,3\}] \in \text{IVS}(X)$ which is an IVsg-closed set except instead IVSCs. Therefore, every IVsg-closed set need not be an IVSCs.

23. To make sure this, Take $[\emptyset, \{1\}] \in \text{IVS}(X)$ which is an IVgsp-closed set but not IVsg-closed set in X . Therefore, every IVgsp-closed set need not be an IVsg-closed set.

Example 4.6

14. IVpsg-closed set \Rightarrow IVgps-closed set.

16. IVPCs \Rightarrow IVgps-closed set.

The above implications is shown by this example. $X = \{1,2,3\}$, Then, $\tau = \{\tilde{\emptyset}, M, N, O, P, Q, R, S, T, \tilde{X}\}$ is an IVT, where $M = [\{1\}, \{1\}]$, $N = [\{2\}, \{2,3\}]$, $O = [\{1,2\}, X]$, $P = [\{3\}, \{3\}]$, $Q = [\{1,3\}, \{1,3\}]$, $R = [\emptyset, \{3\}]$, $S = [\{2,3\}, \{2,3\}]$, $T = [\{1\}, \{1,3\}]$.

14. To verify this, Take $[\emptyset, \{1,3\}] \in \text{IVS}(X)$ which is an IVpsg-closed set but not IVgps-closed set which implies, every IVpsg-closed set need not be an IVgps-closed set.

16. It is checked by $[\emptyset, \{1\}] \in \text{IVS}(X)$ in (X, τ) defined above which is an IVPCs but fails as IVgps-closed set which implies, every IVPCs need not be an IVgps-closed set.

Example 4.7 The implication 20 is not reversible.

by employing this example $X = \{1,2,3\}$ then, $\tau = \{\tilde{\emptyset}, [\{2\}, \{2\}], [\{1,2\}, X], [\{3\}, \{1,3\}], [\emptyset, \{1,3\}], [\{2,3\}, X], [\{2\}, X], \tilde{X}\}$ be an IVT. Let $[\emptyset, \{2,3\}]$ be an IVS(X) which is an IVgs-closed set but not IVsg-closed set which implies, every IVgs-closed set need not be IVsg-closed set.

\therefore Implication 20 is not reversible.

Example 4.8 There is no way to reverse this implication 2.

$X = \{a, b, c\} \Rightarrow \tau = \{\tilde{\emptyset}, [\{c\}, \{c\}], [\{b, c\}, \{b, c\}], \tilde{X}\}$. Using the IVS(X) $[\{b\}, \{b\}]$ we can say that, IVpsg-closed set need not be an IVg-closed set. \therefore Implication 2 can't be reversed.

Example 4.9 The implications 25,26,27 are not reversible.

$X = \{a, b, c\}$ then IVT $\tau = \{\tilde{\emptyset}, [\{c\}, \{c\}], [\{a\}, \{a\}], [\{a, c\}, \{a, c\}], \tilde{X}\}$.

25 \Rightarrow Take $[\emptyset, \{b\}]$ in IVS(X) which is an IVg-closed set but not IVWCs. Then, every IVg-closed need not be an IVWCs.

26 \Rightarrow Take $[\{c\}, X]$ in IVS(X) which is an IVswg-closed set but not IVWCs. Then, every IVswg-closed set need not be an IVWCs.

27 \Rightarrow Take $[\emptyset, \{b, c\}]$ in IVS(X) which is an IVwg-closed set but not IVWCs. Then, every IVwg-closed set need not be an IVWCs.

\therefore Implication 25,26,27 is not reversible.

Example 4.10 To show the implication 28 is not reversible.

Using the successive example, $X = \{a, b, c\}$ with an IVT $\tau = \{\tilde{\emptyset}, [\{a\}, \{a, b\}], [\{c\}, \{c\}], [\{a, c\}, X], [\{a\}, X], [\emptyset, \{c\}], \tilde{X}\}$. Now, Take $[\{a\}, \{a, c\}]$ which is an IVg*-closed set but not an IVwg-closed set. Therefore, Every IVg*-closed set need not be an IVwg-closed set. \therefore Implication 28 is not reversible.

Remark 4.11

1. IVg-closed set \Leftrightarrow IVgps-closed set.

2. IVg-closed set \Leftrightarrow IVsg-closed set.

Example 4.12

1. Working with example 4.9, here we take $[\emptyset, \{a\}]$ is an IVgps-closed set but not IVg-closed set and $[\{a, c\}, X]$ is an IVg-closed set but not an IVgps-closed set.

2. Utilizing an example 4.4, $[\emptyset, \{2\}]$ is an IVsg-closed set not IVg-closed set and $[\{1, 3\}, \{1, 3\}]$ is an IVg-closed set not an IVsg-closed set.

We can conclude that IVg-closed set and IVgps-closed set are independent as like IVg-closed set and IVsg-closed set are independent.

Remark 4.13 $\mathcal{M} = [\mathcal{M}^-, \mathcal{M}^+]$ and $\mathcal{N} = [\mathcal{N}^-, \mathcal{N}^+] \in \text{IVS}(X)$. If both Interval-Valued subsets are neither Interval-Valued semi pre closed nor Interval-Valued semi pre open it may be Interval-Valued semi generalized closed set. The following example is corresponding to this statement.

Example 4.14 Working with example 4.5, The $\text{IVS}(X) [\{3\}, \{3\}]$ is neither IVSOs nor IVSCs but it is an IVsg-closed set.

CONCLUSION

With this piece of work, we constructed some of the Interval-Valued closed sets and some generalizations by applying the notion of Interval-Valued sets, which was proposed by Y. Yao and further researched by J. Kim, Y. B. Jun, and J. G. Lee. Our discussion highlights the implications between them. We provide counterexamples to deduce some irreversible consequences. Examples are also used to examine a few independent characters. Each defined Interval-Valued closed set's interior and closure attributes, together with the characteristics of their generalizations, will be visible in the future.

ABSTRACT

Epilepsy is a prevalent neurological disorder in children, affecting approximately 0.5% to 1% globally. Malnutrition is a significant concern, especially in those with generalized epilepsy, with incidence rates reaching 25% in this population indicating a need for targeted interventions. A cross-sectional study was conducted among thirty pediatric patients between one month to five years of age with Drug Resistant Epilepsy. Nutritional status was assessed using STRONG_{kids} Nutrition Screening Tool for malnutrition. Neuro imaging and EEG studies were employed to examine seizure activity and brain abnormalities. Statistical analysis included chi-square tests for associations, descriptive statistics for nutrient intake, and correlation coefficients for biomarkers, with significance set at $p < 0.05$ for all comparisons. Thirty children with Drug Resistant Epilepsy were evaluated for nutritional status using STRONG_{kids} Nutrition Screening Tool for malnutrition. Chi-square test showed a significant association between seizures and malnutrition risk ($p < 0.05$). Among thirty children, 40% were at high risk, 33% at medium risk, and 27% at low risk of malnutrition. Parental awareness was low in 65% of cases, significantly linked to higher malnutrition risk ($p < 0.01$). It was found that 60% of children with generalized epilepsy were at high risk for malnutrition, compared to 25% of those with focal epilepsy, indicating a significant association between epilepsy type and nutritional status ($p < 0.05$). Developmental delays were common, with 45% of children showing gross

**Soma Basu et al.,**

motor delays, 30% showing speech delays, and 25% demonstrating cognitive delays. These delays were significantly more frequent in children at high risk of malnutrition ($p < 0.001$). EEG abnormalities were seen in 70% of high-risk children, correlating with malnutrition ($p < 0.05$). Biomarkers, such as low albumin and hemoglobin, strongly correlated with high malnutrition risk ($p < 0.01$). Feeding problems, including poor appetite and swallowing difficulties, were present in 50% of high-risk children. Nutrient intake was analyzed in terms of calories, proteins, carbohydrates, and fats. Around 60% of children failed to meet their calorie ($p < 0.01$), protein ($p < 0.05$), and fat ($p < 0.05$) requirements, while 50% had inadequate carbohydrate intake. This study highlights a critical association between drug-resistant epilepsy and malnutrition among epileptic children, emphasizing the need for targeted nutritional interventions to improve health outcomes and developmental trajectories in this vulnerable population.

Keywords: Epilepsy, Malnutrition, Pediatric, Nutritional status

INTRODUCTION

Epilepsy is one of the most common neurological disorders in children, with a global prevalence of approximately 0.5% to 1% [1,2]. While epilepsy is primarily managed by pharmacological interventions, the disorder is often linked to various comorbidities, one of the most significant being malnutrition [3,4]. Children with generalized epilepsy are particularly susceptible, with reports showing up to 25% of this population experiencing some form of malnutrition [5]. The relationship between epilepsy and malnutrition is multifaceted, influenced by factors such as the frequency of seizures, the side effects of antiepileptic drugs (AEDs), and the broader metabolic impacts of the disorder [6]. Malnutrition not only hinders the physical growth of children but also negatively affects their cognitive and motor development, leading to a diminished quality of life [7,8]. Despite these concerns, the relationship between epilepsy and nutritional status remains underexplored [9]. Given the complexities of managing epilepsy, especially drug-resistant epilepsy (DRE), nutritional assessment and interventions may provide a pathway to improving overall health outcomes [10]. This study aims to explore the prevalence of malnutrition in children with drug-resistant epilepsy and to analyze its associations with seizure activity, neuro developmental delays, and parental awareness [11].

METHODOLOGY

A cross-sectional study was conducted in a tertiary care hospital among thirty pediatric patients diagnosed with drug-resistant epilepsy. The inclusion criteria were children aged one month to five years, with a confirmed diagnosis of epilepsy that did not respond to at least two appropriately chosen and administered antiepileptic drugs. Exclusion criteria included children with metabolic or genetic disorders unrelated to epilepsy. Nutritional status was assessed using the STRONGkids Nutrition Screening Tool, which categorizes children into low, medium, and high-risk groups for malnutrition based on clinical indicators such as weight loss, food intake, and clinical appearance. Caloric, protein, fat, and carbohydrate intake were measured through 24-hour dietary recalls and analyzed using standardized nutritional software. To explore the neurological impact, all children underwent neuroimaging (MRI or CT) and EEG studies to detect abnormalities. Neuro developmental delays were assessed using standardized developmental screening tools, with a focus on motor, cognitive, and speech domains. The collected data were analyzed using descriptive statistics for nutritional intake (calories, proteins, fats, carbohydrates). Chi-square tests were used to evaluate the association between malnutrition and seizure characteristics (e.g., type of epilepsy). Pearson correlation coefficients were computed to assess the relationship between biomarkers (e.g., hemoglobin and albumin) and malnutrition risk. Significance was set at $p < 0.05$ for all comparisons. The study was approved by the Institutional Ethical Committee of Sri Ramachandra Institute of Higher Education and Research, Porur, Chennai. (REF NO: IEC/24MAR/185/09). The study was registered in Clinical Trial Registry India CTRI/2024/05/067973.

Soma Basu et al.,

RESULTS

Demographic and Clinical Characteristics

A total of thirty children with drug-resistant epilepsy participated in the study. Of these, 60% had generalized epilepsy, and the remaining 40% had focal epilepsy [Figure 1]. The majority of children (65%) came from families with low parental awareness regarding the nutritional and developmental needs of children with epilepsy.

Nutritional Risk Assessment

The STRONGkids screening tool revealed that 40% of the children were at high risk for malnutrition, 33% were at medium risk, and 27% were at low risk [Figure 2]. The chi-square test showed a significant association between the type of epilepsy and malnutrition risk ($p < 0.05$), with 60% of children with generalized epilepsy at high risk compared to 25% of those with focal epilepsy.

Developmental Delays

Developmental delays were prevalent, particularly in children at high risk of malnutrition. Gross motor delays were observed in 45% of children, speech delays in 30%, and cognitive delays in 25% [Figure 3]. The occurrence of these delays was significantly higher in children at high risk of malnutrition ($p < 0.001$), demonstrating a strong link between poor nutritional status and impaired neurodevelopment.

EEG and Neuroimaging Findings

EEG abnormalities, including frequent seizure spikes and background slowing, were present in 70% of children at high risk for malnutrition, further supporting the association between nutritional status and the severity of seizure activity ($p < 0.05$). Brain imaging also revealed structural abnormalities in a significant proportion of children, including cortical atrophy and hippocampal sclerosis.

Nutrient Intake and Biomarkers

The analysis of dietary intake revealed significant deficiencies in calorie ($p < 0.01$), protein ($p < 0.05$), and fat intake ($p < 0.05$) in 60% of children, while 50% had inadequate carbohydrate intake. Biomarkers such as low hemoglobin and albumin levels were significantly correlated with high malnutrition risk ($p < 0.01$). Feeding problems, including poor appetite and swallowing difficulties, were reported in 50% of high-risk children, further compounding their nutritional deficits.

Parental Awareness

Low parental awareness (65%) was significantly linked to a higher risk of malnutrition in their children ($p < 0.01$). This finding underscores the importance of educating caregivers about the nutritional needs of children with epilepsy to prevent malnutrition.

DISCUSSION

The findings from this study highlight the critical association between drug-resistant epilepsy and malnutrition in pediatric patients [12,13]. Children with generalized epilepsy are particularly vulnerable to malnutrition, likely due to more frequent seizures and the greater metabolic demands placed on the body [14]. This vulnerability is compounded by the side effects of antiepileptic drugs, which can lead to reduced appetite and feeding difficulties, as observed in the study [15]. The association between developmental delays and malnutrition suggests that poor nutritional status not only affects physical growth but also hampers cognitive and motor development [16,17]. These delays could further exacerbate the challenges faced by children with epilepsy, limiting their ability to participate in daily activities and social interactions [18]. The EEG and neuroimaging findings corroborate the hypothesis that malnutrition exacerbates the severity of epilepsy, possibly through metabolic dysregulation or impaired brain development [19, 20]. The role of parental awareness in preventing malnutrition cannot be overstated [21]. Many

**Soma Basu et al.,**

caregivers may not be aware of the heightened nutritional needs of children with epilepsy, leading to inadequate feeding practices and delayed intervention [22]. Nutritional counseling should be an integral part of the care plan for children with epilepsy to ensure optimal growth and development [23].

CONCLUSION

This study underscores the significant impact of drug-resistant epilepsy on the nutritional status of children, with profound implications for their overall health and development. The high prevalence of malnutrition among children with generalized epilepsy, in particular, calls for targeted nutritional interventions. Parental education and awareness programs, along with regular nutritional assessments, should be incorporated into epilepsy management protocols to improve outcomes for this vulnerable population. Further research is needed to explore the long-term effects of nutritional interventions on seizure control and neuro developmental outcomes in children with epilepsy.

ABSTRACT

In the present age of technology, innovation in the field of assessment practices is a very important aspect and a key component in the teaching-learning process. Blended assessment is the need of the hour so that the students can get the credits from offline as well as online assessment practices. The existing study intended to examine the teachers' perception of the concept of Blended assessment and to identify the various types of blended assessment practices and different online assessment platforms used by the teachers to make blended assessment effective and feasible. Additionally, this study also anticipated identifying the number of resources available to execute the Blended Assessment practices and examining the challenges faced by teachers. Moreover, it suggests a mechanism for improving Blended assessment during the teaching-learning process. The current study will help to know about the various blended assessment methods used by the teachers in the present scenario and several challenges faced by them during the assessment of students in Blended mode. For this purpose, the investigator gets the data from the teachers teaching at Central University of Jammu, District Samba of UT J&K with the help of a semi-structured questionnaire. Additionally, this study will provide Suggestions for the betterment of Blended assessment in teaching-learning in the future and for making assessment an enjoyable process for learners.

Keywords: Blended assessment, Assessment platforms, Innovation, teachers' perception, credits

INTRODUCTION

Technological awareness among teachers is one of the major issues in the existing education system. Teachers in our educational institutions are not prominently using technological assessment practices in the teaching-learning process. Many researches have established that technology can produce a cooperative and attractive learning environment that has a constructive effect on the progress of the students[1]. The use of technology in the assessment of students can do wonders in relation to their achievement. Assessment is an important aspect of teaching-learning to know to what extent our learning outcomes are achieved or how well the teacher conveys information to students. The teacher can use any type of Assessment i.e., formal or informal to gather information about the achievement of students[2]. The Quality Assurance Agency (QAA, 2006, p.4) describes assessment as “any processes that appraise an individual's knowledge, understanding, abilities or skills”. Assessment is the continuing process of developing strong and computable probable results of student learning. It also ensures that students have numerous opportunities to achieve the learning outcomes set at the begging of teaching. It is analytically collecting, analysing, and interpreting suggestions to know how well students had achieved the learning outcomes, and this will help in improving students’ learning[3]. Assessment means “activities designed primarily to foster student learning.” So, it is clear that planning and using different assessment practices is a significant part of professional development of teachers[4]. Earlier teachers used the paper-pencil assessment which was boring and time-consuming. Now, in this era of technology, the incorporation of technology into the teaching-learning process and in the assessment of students has changed the scenario of teaching-learning in a positive manner[2].

Blended means mixed and assessment means the use of variation in techniques to measure the achievement of the students. Blended assessment is the combination of Online and offline methods of assessing the students. It is the mixture of traditional and modern assessment practices of assessing the students by making assessments as a part of learning in a joyful manner. In National Educational Policy 2020, it is also mentioned that General Education Council (GEC) will set up facilitative norms for credit transfer[5]. It is also a form of blended assessment. Students with their offline classes can earn credits online which will be directly transferred to their academic course. Blended learning permits educationalists to mix elements of traditional face-to-face instruction with online learning systems and is generally adopted in higher education for varied purposes by using varied execution strategies[6]. In Blended learning atmosphere, assessment in Blended mode is most commonly used which enriches the blended learning environment in a playful manner. Online assessment of the learners is popular since many years. Though, despite of the usage of online assessment in educational settings, many studies have informed about the barriers which affect the practice. The shift from the physical classroom-based traditional assessment to a virtual one doesn't fulfill the requirements of assessment[4]. Thus, combination of online and offline strategies of assessment can be proved beneficial in the coming era of technological assessment. The proper use of blended assessment strategies can make the learning effective and fruitful. In this era of technology if teacher use a varied amount of assessment practices in teaching learning process, it can enhance the achievement level as well as the interest of the students in the learning process. In this work we examine about the awareness of teachers about Blended learning strategies and their level of proficiency in the new technological inventions in the assessment practices. The investigator also highlights the various challenges faced by the teachers during blended assessment.

The major contributions are summarized as follows

- I. We present an approach for the evaluation for the awareness of the instructors about the use of blended assessment in the teaching learning process.
- II. We designed a tool to evaluate the perception of teachers on blended assessment.
- III. Our research proposed some viable solutions for the instructors via the ICT (Information and Communication Technology) in the assessment of the students.
- IV. The existing paper provides suggestions for the betterment of Blended assessment practices in the learning environment

**Shivali Verma and Aman**

- V. The article highlights various open research issues faced by the instructors and suggested futures perspectives to overcome those problems. Rest of the article is organized as follows: Section II present some of the approaches related to our work. In section III, systematic methodology of the proposed assessment method is discussed. Section IV represents the result analysis and in section V challenges faced by the instructors and few suggestions to overcome those challenges are given. In Section VI conclusions are discussed as depicted in Figure 2.

RELATED WORK

Janier & Shafie, (2009)[2] in their research study highlighted that by using blended assessment strategies for managing the classroom environment the teacher can easily mark the scripts within no time and can produce results immediately. It will help the teacher to use his/her time efficiently. Yukselturk & Curaoglu(2010)[3] revealed that most of the issues with online education have been resolved through time, and fresh approaches have been created for a better learning environment. One of the key issues with online education is the assessment component of the curriculum, which is still a challenging issue. Despite the numerous comments and studies on the benefits of online learning, there have been few evaluations. This presents a challenge to educators because they are unsure of how to implement assessment in online courses and how to use computer-mediated tools to track and inform performance and progress. Yeop et al., (2016)[7] have pointed out that because of tremendous rise in the relevance of technology in society, many educators and academics think it is essential for educators to use technology as a tool to enhance students' learning towards educational goals. The World Wide Web also enables educators to take the classroom outside of the four walls of the classroom and reach students throughout the globe. Dziuban et al., (2018)[8] initiated that blending improves success rates for both minority and non-minority students and maintains or expands access for the majority of student cohorts. Additionally, blended learning holds the top spot when students voice their opinions on the efficacy of their learning settings. Zhang et al., 2021[9] discussed the COVID-19 pandemic has caused a switch from face-to-face to online education and evaluation. Even after the pandemic, this change may have a long-lasting effect on classroom-based evaluation. Berga et al., (2021)[6] revealed that advanced and flexible learning options are encouraged by blended learning (BL). It helps in encouraging the continuous application and assessment of blended learning as a pedagogical strategy. Heilporn et al., (2021)[10] proposed that when possible, the methods teachers employed to encourage student participation in synchronous and asynchronous modes of BL were related to the student engagement parameters. In IASET, (2021)[11] it was recommended that blended Teaching is the ability of connecting online materials to actual classes for making teaching more effective.

METHODOLOGY**Research questions**

1. Are the teachers aware of the concept of Blended assessment?
2. How frequently the teachers are using the various types of blended assessment practices in classroom?
3. what are the different online assessment platforms used by the teachers to make blended assessment effective and feasible?
4. Are sufficient number of resources available to execute the Blended Assessment practices?
5. What are the challenges faced by the teachers during blended assessment?
6. What mechanism the investigator will suggest for improving Blended assessment practices on the basis of present study?

Objectives

1. To examine the awareness of teachers about the concept of Blended assessment.
2. To identify the various types of blended assessment practices.

**Shivali Verma and Aman**

3. To identify different online assessment platforms used by the teachers to make blended assessment effective and feasible.
4. To identify the number of resources available to execute the Blended Assessment practices.
5. To examine the challenges faced by the teachers during Blended assessment.
6. To suggest the mechanism for improving Blended assessment during the teaching learning process.

Delimitation of the study

The study was only confined to the faculty members from Central University of Jammu.

Population of the study

In the present study all the Teachers teaching in Central University of Jammu, District Samba of UT of Jammu and Kashmir constituted the Population.

Tool used

A self-Prepared Semi- Structured Questionnaire was used for the collection of data. For this tool content validity and face validity have been established by the investigator in which the questionnaire was consulted with experts and the senior research scholars.

Selection of the sample

For the present study, the investigators shared the self-prepared Semi- Structured questionnaire with all the teachers teaching in Central University of Jammu. Out of 118 teachers, 30 teachers filled the Questionnaire and reverted it back. Thus 30 teachers teaching in Central University of Jammu constituted the sample of the study.

Statistical technique used

- Manifested Content Analysis
- The percentage Analysis technique was used for the analysis of data.

RESULT ANALYSIS

Table 1 shows that the percentage of teachers who are not aware of Blended Assessment is significantly lower (10%) than the percentage of teachers who are aware of Blended assessments. From the above table, it may be inferred that 90% of teachers are aware of the concept of Blended Assessment. Table 2 depicts that the Percentage of use of the Summative type of Blended assessment used by the teachers is negligible (0%), However, 33.33 % of teachers are using both types of Blended assessment, 53.33% of teachers are using the Formative type of Blended assessment and among these teachers, 13.33% teachers are those who are not using Blended Assessment strategies in their classrooms. From the above table, it can be inferred that most teachers use a Formative type of assessment in their Blended assessment strategies. Table 3 demonstrates that the percentage of teachers who never used (6.67%) or those who are using less (30%) blended assessment in the classroom is comparatively low than those teachers who often (43.33%) or very often (20%) using it in the classroom. It may be inferred that most of the teachers often using Blended assessment in the classrooms. From Table 4, it may be inferred that majority of teachers are using Whats App (40%) and Google meet (40%) as an online platform for assessing the students. 36.67% teachers are using Google form for assessment purpose, 23.33% teachers are using Gmail, 20% teachers are using Moodle and Quizzes, 13.33% teachers are using Zoom and Kahoot. Similarly, 6.67% teachers are using Poll Everywhere and Google Classroom, 3.33% teachers are using Mentimeter, Crowd signal and Quiz maker. However, 10% are those teachers who are not using any online assessment platform. It may be inferred that majority of the teachers are using various online platforms for assessing the students in varied ways. Table 5 shows that 76.67% of teachers found Blended assessment effective and 23.33% of teachers doesn't find it effective. Those teachers who found Blended assessment effective justified their reason that Blended assessment has the potential to assess the learning beyond knowledge and understanding level and give scope for assessment of higher order thinking skills along with other domains of

**Shivali Verma and Aman**

learning. It also determines whether the goals of teaching are being met. Another significant reason given by the teachers was Blended Assessment makes the learning effective and help the students to participate in learning. It also saves time and helps in 360' assessment of students. It also gives exposure to students and teachers for alternative methods of assessment. Blended assessment enhances the digital literacy and student participate in joyful mood. They also mentioned that if Blended assessment is utilised efficiently, it will enhance the horizons of assessment because it is time saving and unbiased in nature. Teachers can get real time and get instant feedback from the learners by using various learning management systems. It is easy to evaluate since results can be generated automatically. Percentage of teachers who found Blended assessment not effective (23.33%) revealed that most of them didn't ever used Blended assessment and they recommend that only offline assessment is better. So, it can be inferred from the above table that most of the teachers found Blended assessment effective. Table 6 represents the percentage of teachers who found blended assessment not feasible(20%) and those who are not sure about the feasibility of Blended assessment (6.67%) is comparatively less than those teachers who found blended assessment feasible (73.33%). Table7 illustrates that the most of the teachers (50%) admits that there is availability of resources for blended assessment. Few teachers revealed that sufficient number of resources are not available (33.33%)for the execution of Blended assessment and some of the were not sure about the availability of resources(16.33%).

Some of the teachers explained that there is need for improvement in quality and quantity of resources because there are limited resources available and still there is requirement of resources. A number of resources can be availed according to need and purpose. They revealed that for proper execution of context more resources are needed and varies from place to place. They suggested that there are many platforms available but proper selection of Technological and Pedagogical content Knowledge (TPAK) is required for the accomplishment of objectives framed and for that proper training of teachers is required. Table 8represents that the percentage of teachers who doesn't have sufficient level of Training is significantly lower (40%) than the percentage of teachers who have sufficient level of Training (60%). From the above table, it may be inferred that 60% of teachers have sufficient level of training for Blended Assessment. Teachers further explained that continuous learning is always a key to keep oneself updated, so more training about new technologies and recent advancements is always required to keep up with the latest resources. For this, workshops or teacher training programmes that will give hands on experience of abstract concepts of applications, platforms and tools should be organised from time to time. More training programmes should focus on assessment of learning. Some teachers emphasized that if institutions try to conduct workshops, seminars and capacity building programmes in offline mode, it will supplement the skills of the teachers. Table 9shows that the percentage of teachers who are not in favour of statement that there is a transparency in Blended assessment is significantly less(33.33%) than the teachers who are in favour(66.67%). Teachers (66.67%)clarified that Blended assessment is criteria based which well in advance are required to be communicated to the assesses. It gives the scope of remedial action by enhancing the accessibility of performance to all the learners. Blended assessment provides flexibility of learning and improves students' achievement. It cross checks the traditional mode of knowledge. They explained that most of the means of Blended assessment are accessible to teachers, students and even publicly visible. According to them Blended assessment is objective and transparent in nature and doesn't include personal bias because chances of manipulation are less. It also helps the learners to know their level of performance at once with automatic feedback. Some teachers (33.33%) pointed out that in blended assessment there may be the chances of copying and assessing students is not a blind process. So, while using Blended assessment teacher need to assess the students by asking questions based on higher order thinking skills (HOTS). The results shown in Table 10, clearly highlight the superiority of the proposed approach on particularly on all the selected factors such as mode, teacher awareness of the blended assessment, type of assessment and , etc. Moreover, our approach is very effective in overall assessment of the teacher's perception about blended-based students evaluation.

Shivali Verma and Aman

CONCLUSIONS

In this study the researcher tried to provide the detailed overview about the concept of blended assessment, why blended assessment is important and perspectives of teachers from Central University of Jammu regarding Blended assessment. Here investigator tried to highlight the various challenges faced by teachers during blended assessment and had given the possible solutions(suggestions) with which implementing Blended assessment in the institutions can be possible. In conclusion it can be interpreted that in blended assessment there is lots of challenges faced by the teachers now a days, teachers can cope up with these challenges by upgrading their technological skills. During this type of assessment there should be proper planning on the part of teachers. Teachers should keep in mind that assessment should be learner centered, designed according to the needs of the learners, promotes collaboration and encourage students to develop their skills and how they can give their feedback with proper technological support[1]. on the basis of results and suggestions the researcher proposes that with the advancement in technology in every field of life, it should be incorporated in the field of assessment as well, so that students and teachers can enjoy the teaching learning process and their achievement

Table 11: Challenges and Suggestions

CHALLENGES FACED BY TEACHERS IN BLENDED ASSESSMENT	SUGGESTIONS FOR PROPER IMPLEMENTATION OF BLENDED ASSESSMENT IN FUTURE:
<p>1) Learner's Readiness: The most important challenge which teachers are facing during Blended assessment is the readiness of the learners to participate effectively and wholeheartedly in the assessment process.</p>	<ul style="list-style-type: none"> ➤ Teachers should gain the confidence of the students by making the learning effective and joyful by using various assessment platforms. ➤ Teacher should use creative tasks while planning or creating Blended assessment and he/ she should plan according to the cognitive level of the students. ➤ There should be involvement of every student in the classroom activities so that no one lag behind.

Shivali Verma and Aman

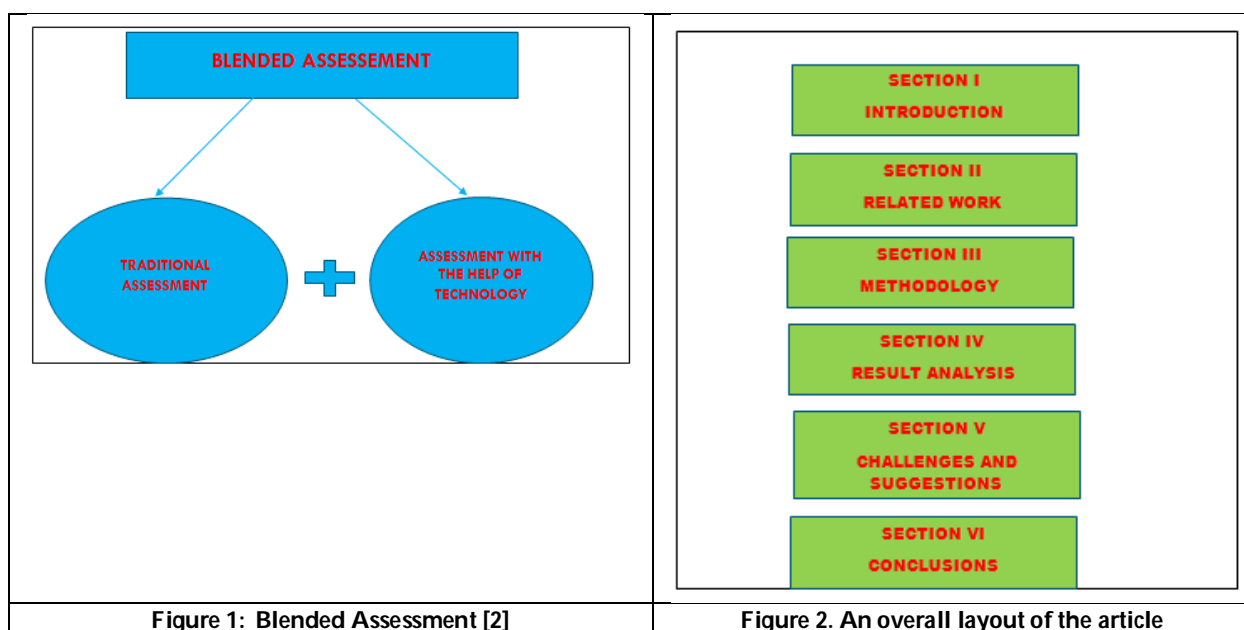

<p>2) Lack of Resources: Lack of dedicated resources mainly internet and electronic resources(electricity etc.) is also one of the major challenges for executing Blended assessment.</p>	<ul style="list-style-type: none"> ➤ Sufficient and dedicated resources can be allocated for the proper execution of blended assessment. ➤ For stable internet connectivity and other resources there should be proper coordination between administration, teachers and students as well.
<p>3) Lack of training: Lack of training of teachers as well as students is also an important challenge, teachers without proper training are unable to explain students that how particular mode works.</p>	<ul style="list-style-type: none"> ➤ Training by good experts for both teachers and students should be provided. ➤ More workshops on blended assessment and various online platforms should be organised by various institutions in order to make the teachers as well as students techno friendly. ➤ Training at pre- service and in-service level should be provided to the teachers to overcome the future technology related issues.
<p>4) Time consuming: Blended assessment is time consuming because students and teachers are not well trained as well as aware about the proper use of this type of assessment. So, it takes lots of time to perform the blended assessment activities.</p>	<ul style="list-style-type: none"> ➤ Training sessions for students and teachers can be organised so that they can effectively use technological interventions in the assessment. ➤ If teachers are well aware of different platforms of assessment, they can assess the students quickly and within no time. Assessment results with technology can be generated easily and automatically with technology(which is not possible by doing it manually)
<p>5) Infrastructural challenges: Buying the right classroom technology is also a challenge in Blended assessment. Infrastructural challenges in the form of devices, network, training issues etc. are generally faced by the teachers during their assessment.</p>	<ul style="list-style-type: none"> ➤ Getting new infrastructural resources is a time-consuming process. So existing resources should be improved to enhance the level of learning among students. ➤ ICT devices should be regularly updated which can reduces the chances of malfunctioning during assessment. ➤ There should be support from administration to reduce the technological and infrastructural glitches.
<p>6) Digital gap: The major challenge in blended assessment is digital gap. People living in cities and with well-furnished resources can easily execute the technological practices rather than people living in villages or far-flung areas. Sometimes it is very difficult to keep the track record of both online and offline assessments.</p>	<ul style="list-style-type: none"> ➤ There should be digital inclusion of all the students and teachers. ➤ There should be smart classroom with every teacher to reduce the gap among the students. ➤ There should be gradual shift from previous to new.
<p>7) Network issues: Network connectivity is the most important challenge faced by teachers as well as</p>	<ul style="list-style-type: none"> ➤ Issues of connectivity can be resolved by providing WLAN in every institution.

Shivali Verma and Aman

students in Blended assessment. Sometimes even bright students are not able to complete their assessment on time task online because of poor internet connectivity.	<ul style="list-style-type: none"> ➤ Administration and govt. can do positive initiatives for the betterment of internet facilities. ➤ Asynchronous assessment methods can be used to reduce the poor connectivity gaps.
8) Clarity of concept: Sometimes students doesn't have the clarity of the concept of assessment on particular platform, so they do not take it seriously and take it as a burden that they have to carry with them.	<ul style="list-style-type: none"> ➤ There should be exposure to collaborative form of assessment to students and teachers. ➤ Teachers should use questions that can boost higher order thinking skills (HOTS) among students.
9) Unsatisfactory response: Sometimes students thinks that Blended assessment is not effective since they do not have proper awareness of this type of assessment. Maintaining students' attention is also an important task for teachers.	<ul style="list-style-type: none"> ➤ Teachers should gain confidence of students by making the assessment as a playful and joyful activity in a friendly manner. ➤ Good relationship and mutual understanding between the teachers and students can enhance the level of response of students, so there should be friendly relationship between students and teachers.
10) Maintaining transparency: Maintaining transparency is the major issue in blended assessment. Sometimes students can complete the assignments with the help of Google in online assessment. There are many applications available which can complete the task in minutes by using technology. Here is the main issue of transparency where students can smartly bypass the very purpose of assessment.	<ul style="list-style-type: none"> ➤ Use of multiple types of assessment strategies can enhance the transparency in assessment. ➤ With the use of technological platforms of assessment, results can be automatically generated with the time frame and in blended learning set up teacher can tally their online performance in offline setting also. ➤ In synchronous assessment chances of transparency in assessment are higher.

ABSTRACT

The Date Palm (*Phoenix dactylifera*) is a widely consumed fruit known for its nutritional and medicinal properties. This study investigates the antioxidant and anti-inflammatory potential of Date Palm Fruit Extract (DPFE), with a focus on its therapeutic application in chronic inflammatory diseases. DPFE was extracted using an aqueous method, followed by phytochemical screening to identify bioactive compounds. The antioxidant activity of the extract was evaluated through in vitro assays, including superoxide, hydroxy, and nitric oxide radical scavenging, and reducing power. The anti-inflammatory effects were assessed by protein denaturation and membrane stabilization assays using human red blood cells (HRBC). Phytochemical analysis revealed the presence of alkaloids, carbohydrates, flavonoids, and tannins in DPFE. In antioxidant assays, DPFE exhibited significant free radical scavenging activity, with the highest scavenging observed at 500 µg/ml for superoxide (86%), hydroxy (79.62%), and nitric oxide

Mahesh Yadav et al.,

(101.01%) radicals. The IC₅₀ values for scavenging activities were 9 µg/ml (superoxide), 17.85 µg/ml (hydroxy), and 10.20 µg/ml (nitric oxide). Additionally, DPFE showed 70.30% inhibition of albumin denaturation and 79.52% protection in the HRBC membrane stabilization assay at 500 µg/ml. The results demonstrate that DPFE possesses potent antioxidant and anti-inflammatory activities, with significant potential for therapeutic use in managing oxidative stress and inflammation. Bioactive compounds such as flavonoids and tannins may contribute to these effects. Further studies are needed to isolate and characterize the active compounds and explore the clinical applications of DPFE in inflammatory diseases.

Keywords: Date Palm Fruit Extract, Antioxidant Activity, Anti-inflammatory Activity, *In Vitro* Studies, Phytochemicals, Radical Scavenging Activity, Protein Denaturation.

INTRODUCTION

Chronic inflammatory diseases are a major global healthcare challenge, contributing to the pathogenesis of numerous life-threatening conditions such as cardiovascular diseases, cancer, metabolic syndrome, neurodegenerative disorders, and autoimmune diseases. These diseases are often characterized by persistent low-grade inflammation, which disrupts normal cellular function and accelerates degenerative processes in tissues. While traditional anti-inflammatory therapies, including nonsteroidal anti-inflammatory drugs (NSAIDs) and corticosteroids, provide symptom relief, they are frequently associated with undesirable side effects, particularly when used over extended periods. This has sparked increasing interest in finding safer, natural alternatives that can modulate inflammation effectively without compromising patient health [1-2]. Natural products, especially those derived from plants, have gained significant attention for their potential therapeutic properties in managing inflammation-related diseases. Among these, the date palm (*Phoenix dactylifera*) stands out due to its rich composition of bioactive compounds, including antioxidants, flavonoids, and phenolic acids, which are known to exhibit both anti-inflammatory and antioxidant activities [3]. In Middle Eastern and North African cultures, date palm fruit has long been regarded as both a dietary staple and a natural remedy for a wide range of ailments. Emerging research has begun to substantiate these traditional uses, revealing that date palm fruit possesses a unique phytochemical profile that may influence the molecular pathways involved in inflammation and oxidative stress [4].

The therapeutic potential of date palm fruit is primarily attributed to its diverse array of bioactive compounds. Flavonoids, phenolic acids, tannins, and essential vitamins present in the fruit have been shown to mitigate oxidative damage by neutralizing free radicals and modulating the activity of inflammatory mediators, such as cytokines and enzymes. Notably, phenolic compounds in date palm fruit exhibit strong free radical-scavenging activity, which helps reduce cellular oxidative stress an important factor in the development of chronic inflammation [5]. Furthermore, flavonoids have demonstrated the ability to inhibit pro-inflammatory signaling pathways, such as NF-κB and COX-2, which are key regulators of the body's inflammatory response. The synergistic interactions of these compounds position date palm fruit extract as a promising candidate for the development of novel anti-inflammatory therapies [6]. However, despite the promising bioactive properties of date palm fruit extract, several challenges hinder its clinical application. One of the key obstacles is the bioavailability of these compounds. Many plant-derived antioxidants and anti-inflammatory agents exhibit poor bioavailability due to their limited solubility, instability within the gastrointestinal tract, and rapid metabolism. As a result, their effectiveness *in vivo* often falls short of their demonstrated potential in laboratory settings. To overcome these limitations, advanced delivery systems such as nano encapsulation and other novel formulation strategies—are being explored to enhance the bioavailability and stability of these compounds, thereby improving their therapeutic efficacy [7]. Developing effective delivery methods for date palm extract could significantly enhance its absorption and maximize its anti-inflammatory effects [8]. This study aims to investigate the untapped therapeutic potential of date palm fruit extract as a natural agent for the management of chronic inflammatory diseases. Chronic inflammation is a critical factor in the progression of numerous debilitating diseases, yet conventional treatment options are often accompanied by

**Mahesh Yadav et al.,**

considerable limitations in terms of both efficacy and safety. Through comprehensive *in vitro* studies, this research will evaluate the anti-inflammatory and antioxidant properties of date palm fruit extract, specifically focusing on its effects on inflammatory markers and oxidative stress pathways. By elucidating the molecular mechanisms underlying the beneficial effects of date palm extract, this work aspires to position it as a viable alternative or adjunct to traditional anti-inflammatory therapies [9]. Furthermore, recognizing the challenges associated with the bioavailability and stability of plant-derived compounds, this study will explore the development of advanced delivery systems such as nano encapsulation and other cutting-edge formulations to enhance the therapeutic efficacy of date palm extract. Ultimately, the goal of this research is not only to uncover the clinical potential of date palm fruit extract but also to contribute to the growing field of natural product-based therapies by improving the accessibility and effectiveness of plant-derived bioactive compounds in the treatment of chronic inflammation.

MATERIALS AND METHODOLOGY

Materials

The following chemicals and reagents were used in the study: Ascorbic acid, Diclofenac sodium, Phenazine methosulfate (PMS), Nicotinamide adenine dinucleotide (NADH), Griess reagent, Sodium nitroprusside, EDTA, and Nitro blue tetrazolium (NBT) were all obtained from Sigma-Aldrich (Bangalore, India). Ferric chloride (FeCl_3) was sourced from Vijaya Lakshmi (Kadapa, India), while Hydrogen peroxide (H_2O_2) was purchased from HiMedia (Mumbai, India). Phosphate-buffered saline (PBS) was acquired from Titan Biotech (Bhiwadi, India).

Plant Material

Date palm fruit (*Phoenix dactylifera*) was procured from the local market and authenticated by the Pharmacognosist of Annamacharya College of Pharmacy, Rajampet, India.

Preparation of Extract

500 g of date palm fruit was ground using water to prepare a date palm fruit juice for pharmacological activity [10].

Phytochemical Investigation[11-14]

Test for Reduced Sugars

- **Molisch's Test:** Add 2 ml of the extract to alcoholic naphthol followed by a small amount of concentrated sulfuric acid (H_2SO_4). The presence of carbohydrates is indicated by a purple ring at the interface.
- **Fehling's Test:** To a small amount of Fehling's A and B solutions, add the test compound and heat strongly. The formation of a brick-red precipitate indicates the presence of carbohydrates.
- **Barfoed's Test:** Add a small amount of Barfoed's reagent to the test compound and heat in a water bath. The appearance of a green color indicates the presence of monosaccharides.

Test for Alkaloids

- **Dragendroff's Test:** Add Dragendroff's reagent to the test solution. The presence of alkaloids is confirmed by the formation of a red-colored precipitate.
- **Mayer's Test:** Add 1 ml of Mayer's reagent to 1 ml of the test solution. A color precipitate confirms the presence of alkaloids.
- **Hager's Test:** Add a small quantity of Hager's solution to the test compound. The presence of alkaloids is confirmed by the formation of a yellow-colored precipitate.
- **Tannic Acid Test:** Add tannic acid to the test solution. The formation of a buff-colored precipitate confirms the presence of alkaloids.

Test for Proteins and Amino Acids

- **Biuret Test:** Add Biuret reagent to the test solution and heat in a water bath. The presence of proteins is confirmed by the formation of a violet color.

Mahesh Yadav et al.,

- **Millon's Test:** Add Millon's reagent to the test solution and heat in a water bath. The presence of proteins is confirmed by the formation of a violet color.

Test for Flavonoids

- **Alkaline Reagent Test:** Add 2-3 drops of sodium hydroxide solution to the test solution. A yellow color that turns colorless upon the addition of dilute acid indicates the presence of flavonoids.
- **Schinoda's Test:** To 2 ml of the test solution, add magnesium turnings and dropwise concentrated hydrochloric acid (HCl). A pink or red color confirms the presence of flavonoids.
- **Zinc Hydrochloride Test:** Add a mixture of zinc sand and concentrated HCl to the test solution. The appearance of a red color confirms the presence of flavonoids.

Test for Tannins and Phenolic Compounds

- **FeCl₃ Test:** Add FeCl₃ solution to the extract. The formation of a blue color indicates the presence of hydrolyzable tannins, while a green color indicates the presence of condensed tannins.
- **Acetic Acid Test:** Treat the extract with an acetic acid solution. The appearance of a red color confirms the presence of tannins.
- **Dilute Nitric Acid Test:** Treat the extract with dilute nitric acid solution. The formation of a red to yellow color confirms the presence of tannins.

In vitro Antioxidant Activity

Determination of Superoxide Anion Radical Scavenging Activity

Principle: Superoxide anions are measured by the reduction of Nitro Blue Tetrazolium (NBT) in the xanthine-xanthine oxidase system, which is inhibited by superoxide dismutase (SOD) [15].

Procedure

- Prepare 1 ml of different concentrations of the sample solution and ascorbic acid in distilled water.
- Add 1 ml of 60 μM phenazine methosulphate (PMS) in phosphate buffer (pH 7.4) and 1 ml of 450 μM NADH in phosphate buffer.
- Incubate at 25°C for 5 minutes.
- Measure absorbance at 560 nm against a blank.

Calculation

$$\text{Percentage of radical scavenging activity} = \left(\frac{\text{control OD} - \text{Sample OD}}{\text{Control OD}} \right) \times 100$$

Free Radical Scavenging Activity (DPPH Assay)

Methodology

- Prepare different concentrations (10 μg, 50 μg, and 100 μg) of the sample in Dimethyl Sulfoxide (DMSO) in test tubes.
- Add 5 ml of 0.1 mM methanolic DPPH solution to each tube and mix well.
- Allow the tubes to stand at room temperature for 20 minutes [16].
- Measure the absorbance at 517 nm. Butylated HydroxyToluene (BHT) is used as a standard.

Calculation

$$\text{Percentage of radical scavenging activity} = \left(\frac{\text{control OD} - \text{Sample OD}}{\text{Control OD}} \right) \times 100$$

Mahesh Yadav et al.,

Hydroxyl Radical Scavenging Activity

Principle

Hydroxyl radical scavenging is measured by competition between deoxyribose and the test compounds for hydroxyl radicals generated from the Fe^{3+} /ascorbate/EDTA/ H_2O_2 system [17].

Methodology

- Prepare different concentrations (10 µg, 50 µg, 100 µg, 250 µg, 500 µg) of the sample in DMSO.
- Add 1 ml of Fe-EDTA solution, 0.5 ml of EDTA, and 1 ml of DMSO.
- Initiate the reaction by adding 0.5 ml of 0.22% ascorbic acid and incubate at room temperature for 15 minutes.
- Terminate the reaction by adding 1 ml of ice-cold TCA (17.5% w/v).
- Add 3 ml of Nash reagent and incubate at room temperature for 15 minutes for color development.
- Measure absorbance at 412 nm.

Calculation

$$\text{Percentage of hydroxyl radical scavenging activity} = \left(\frac{\text{control OD} - \text{Sample OD}}{\text{Control OD}} \right) \times 100$$

Nitric Oxide (NO) Radical Scavenging Activity

Principle

Aqueous sodium nitroprusside at physiological pH produces NO, which reacts with oxygen to form nitrite ions. These are measured using the Griess reagent [18].

Procedure

- Incubate sodium nitroprusside (10 mM) with different concentrations of the sample and ascorbic acid in PBS at room temperature for 150 minutes.
- Add 0.5 ml of Griess reagent and measure absorbance at 546 nm.

Calculation

$$\text{Percentage of nitric oxide scavenging activity} = \left(\frac{\text{control OD} - \text{Sample OD}}{\text{Control OD}} \right) \times 100$$

In vitro Anti-inflammatory Activity

Denaturation of Albumin

Procedure

- Prepare different concentrations of the test extract.
- Mix 1 ml of sample with 1 ml of 1% aqueous solution of bovine albumin and adjust pH to 6.8 using glacial acetic acid.
- Incubate at 72°C for 5 minutes and cool for 10 minutes.
- Measure absorbance at 660 nm [19].

Calculation

$$\text{Percentage inhibition} = \left(\frac{\text{Abs Control} - \text{Abssample}}{\text{AbControl}} \right) \times 100$$

Membrane Stabilization

Procedure

- Collect 5 ml of human blood and add 5 ml of phosphate-buffered saline (PBS).
- Incubate with different concentrations of the extract.
- Induce lysis by adding heat and measuring the absorbance at 560 nm [20].

Mahesh Yadav et al.,

Calculation

$$\text{Percentage of membrane stabilization} = \left(\frac{\text{control OD} - \text{Sample OD}}{\text{Control OD}} \right) \times 100$$

RESULTS**Extraction Yield**

Approximately 500 g of crude date palm fruit was extracted using water for 72 hours. The yield of the extract was found to be 15 g.

Phytochemical Evaluation

The phytochemical analysis of Date Palm Fruit Extract (DPFE) showed the presence or absence of several bioactive compounds. The results are summarized in Table 1.

Key Findings

- Alkaloids, carbohydrates, flavonoids, and tannins/phenolic compounds were present, indicating the extract's potential antioxidant and anti-inflammatory properties.
- Proteins/amino acids and steroids were absent in the extract, suggesting that the bioactivity can be attributed to the identified compounds.

In Vitro Antioxidant Activity

1. **Reducing Power:** The reducing power of the DPFE was evaluated by measuring absorbance at different concentrations and comparing it to ascorbic acid (AA). The results showed that DPFE exhibited a strong reducing power that increased with concentration, demonstrating its potential as an electron donor for antioxidant activity as shown in Table 2 and Figure 1.
2. **Superoxide Anion Scavenging Activity:** Superoxide anion scavenging activity was measured at various concentrations of DPFE as shown in Table 3. The extract showed a dose-dependent increase in activity, with an IC₅₀ value of 9 µg/ml, indicating its effective neutralization of superoxide anions as shown in Figure 2.
3. **Hydroxy Radical Scavenging Activity:** The DPFE showed an increase in hydroxy radical scavenging activity with concentration as in Table 4. At 500 µg/ml, the extract demonstrated 79.62% scavenging activity, with an IC₅₀ value of 17.85 µg/ml as shown in Figure 3.
4. **Nitric Oxide Scavenging Activity** DPFE exhibited 101.01% nitric oxide scavenging activity at 500 µg/ml, surpassing ascorbic acid at the same concentration. The IC₅₀ value for DPFE was 10.20 µg/ml, indicating strong scavenging potential as shown in Table 5 and Figure 4.

In Vitro Anti-inflammatory Activity

1. **Protein Denaturation Inhibition:** DPFE showed 70.30% inhibition of albumin denaturation at 500 µg/ml, whereas diclofenac exhibited 85.86% inhibition at the same concentration. The IC₅₀ of DPFE was calculated to be 35.71 µg/ml, suggesting it has moderate anti-inflammatory effects as depicted in Table 6 and Figure 5.
2. **Membrane Stabilization** The membrane stabilization effect of DPFE was measured using the HRBC membrane stabilization assay, and it showed a significant percentage protection (79.52%) at 500 µg/ml. The IC₅₀ value for DPFE was 12.5 µg/ml, indicating that it can effectively stabilize cell membranes in inflammatory conditions as in Table 7 and Figure 6.

DISCUSSION

The results obtained from the in vitro antioxidant and anti-inflammatory assays suggest that Date Palm Fruit Extract (DPFE) holds significant potential as a natural therapeutic agent due to its ability to neutralize free radicals and inhibit inflammation-related processes. This discussion will focus on interpreting these findings and comparing them with existing literature.

**Antioxidant Activity of Date Palm Fruit Extract**

The antioxidant potential of DPFE was assessed through four commonly used assays: reducing power, superoxide anion scavenging, hydroxy radical scavenging, and nitric oxide scavenging. The results from these assays consistently demonstrate that DPFE has potent antioxidant activity.

Reducing Power Assay

The increasing absorbance values with rising concentrations of DPFE indicate its capacity to act as an electron donor and reduce free radicals. This ability is indicative of the presence of phenolic compounds and flavonoids, which are known for their antioxidant activity. The observed reducing power of DPFE is consistent with findings from other studies on date palm fruit and similar natural extracts, where the presence of phenolic compounds has been associated with strong reducing abilities.

Superoxide Anion Scavenging Activity

DPFE exhibited a dose-dependent increase in superoxide scavenging activity, with an IC₅₀ value of 9 µg/ml. This result aligns with studies showing that date palm fruit contains antioxidants capable of scavenging superoxide radicals, which are often implicated in the pathogenesis of various diseases. The IC₅₀ value indicates that DPFE has effective radical scavenging properties, even at low concentrations, and outperforms many common antioxidant agents.

Hydroxy Radical Scavenging Activity

Hydroxy radicals are highly reactive and can damage cellular structures, contributing to inflammation and chronic diseases. The significant scavenging activity observed in DPFE at 500 µg/ml (79.62% inhibition) demonstrates its potential to counteract oxidative damage. The IC₅₀ value of 17.85 µg/ml suggests that DPFE could serve as an effective antioxidant in biological systems, potentially reducing the risk of oxidative stress-induced diseases.

Nitric Oxide Scavenging Activity

Nitric oxide (NO) plays a dual role in the body: it is essential for normal cellular function, but excessive production of NO is associated with inflammatory responses and diseases such as arthritis and cancer. The remarkable scavenging activity observed in DPFE, with 101.01% inhibition at 500 µg/ml, indicates its strong potential to neutralize NO, which is critical for reducing inflammation. The IC₅₀ value of 10.20 µg/ml further supports DPFE's effectiveness as an anti-inflammatory agent due to its capacity to inhibit NO production.

Anti-inflammatory Activity of Date Palm Fruit Extract

The anti-inflammatory effects of DPFE were evaluated using two standard assays: protein denaturation inhibition and membrane stabilization.

Protein Denaturation Inhibition

The inhibition of albumin denaturation is a well-known indicator of anti-inflammatory activity. The observed 70.30% inhibition at 500 µg/ml of DPFE suggests its potential to prevent protein denaturation associated with inflammatory conditions. This finding aligns with previous research, where plant extracts exhibiting phenolic and flavonoid content were found to inhibit protein denaturation. While the inhibition observed in DPFE is lower than that of diclofenac (85.86%), the extract's activity is still considerable and indicates its potential as an alternative anti-inflammatory agent.

Membrane Stabilization

The stabilization of human red blood cell (HRBC) membranes is a key indicator of anti-inflammatory potential, as it reflects the extract's ability to prevent damage to cell membranes under inflammatory conditions. DPFE exhibited 79.52% protection at 500 µg/ml, which is comparable to the effects of diclofenac, a commonly used anti-inflammatory drug. This result is significant because it suggests that DPFE may offer protective effects against inflammation-induced membrane damage, which is a common feature in many inflammatory diseases.

**Maresh Yadav et al.,****Comparison with Existing Literature**

The antioxidant and anti-inflammatory effects observed in this study are consistent with previous research on date palm fruit and other related plant extracts. Studies have shown that date palm extracts, particularly those derived from the fruit, are rich in bioactive compounds, including flavonoids, phenolic acids, and terpenoids, which are known for their potent antioxidant and anti-inflammatory properties (Alhassan et al., 2016; Kassem et al., 2020). The results of this study further support the hypothesis that date palm fruit has therapeutic potential for managing diseases associated with oxidative stress and inflammation. For instance, studies by Alhassan et al. (2016) reported that date palm fruit extracts exhibited strong scavenging activity against superoxide and hydroxyl radicals, similar to the findings in this study. Similarly, Kassem et al. (2020) found that date palm fruit extracts could inhibit protein denaturation and stabilize cell membranes, in line with our results.

Mechanisms of Action

The antioxidant and anti-inflammatory activities of DPFE can be attributed to its bioactive compounds. Specifically, the presence of flavonoids and phenolic acids is known to contribute to both radical scavenging and anti-inflammatory properties. These compounds can neutralize free radicals, inhibit the activation of pro-inflammatory enzymes, and stabilize cellular membranes. Additionally, tannins present in DPFE may play a role in inhibiting protein denaturation and membrane destabilization, which are key events in the inflammatory cascade.

Potential Applications

The potent antioxidant and anti-inflammatory activities of DPFE make it a promising candidate for the development of natural therapeutic agents for conditions such as arthritis, asthma, cardiovascular diseases, and diabetes, all of which are linked to oxidative stress and inflammation. Furthermore, the ability of DPFE to scavenge free radicals and prevent protein denaturation positions it as a potential adjuvant therapy in managing chronic inflammatory diseases. Moreover, the non-toxicity of plant-based extracts, as indicated in previous studies, makes DPFE an attractive alternative to synthetic drugs, which often have side effects. Future studies could focus on the formulation of DPFE in various delivery systems to enhance its bioavailability and effectiveness in vivo.

ACKNOWLEDGMENT

I would like to extend my sincere gratitude to the Department of Pharmaceutics, KLE College of Pharmacy (A Constituent of KLE Academy of Higher Education and Research, Belagavi), Hubballi, Karnataka, India (580031), for providing essential facilities and support that were instrumental in advancing my research work. Their resources and guidance significantly contributed to the success of this project.

ABSTRACT

Extract of *Cereus repandus* (CeR) was investigated as corrosion inhibitor of mild steel in 1 N Hydrochloric acid medium using phytochemical screening, weight loss method, surface examination analysis and quantum chemical studies. Stability of inhibition efficiency of CeR extracts was examined by weight loss method and maximum inhibition efficiency of CeR extract was 95 % in 1 N HCl for immersion period of 5 h at 2.5 % v/v. Scanning electron microscopic analysis established formation of protective layer on mild steel surface. Quantum studies showed molecular orbital nucleophilic and electrophilic regions present in phytoconstituents of CeR extract. Scanning electron microscopic studies revealed evidence of improved surface condition, due to adsorption of phyto constituents for the corrosion protection.

Keywords: *Cereus repandus* (CeR), Mild Steel, Phytochemical, Inhibition Efficiency, Corrosion Rate.

INTRODUCTION

In industrial environments steel are affected from completely different corrosion attacks as a result of acids like vitriol and acid throughout numerous industrial processes acid pickling, chemical cleanup and acidification [1]. Naturally occurring molecules exhibit a strong affinity for metal surfaces and facilitate toward the event of environmentally friendly corrosion inhibitors. Presently numerous plant extracts containing mixture of compounds

Gladiyarani and Gunavathy

oxygen, sulphur and nitrogen elements are used as inexperienced corrosion inhibitors from acidic resolution. Generally plant extracts are non hazardous friendly, cheap, readily out there and renewable sources [2].

Aim of the present work was to investigate *Cereus repandus* stem extract (*CeR*) in order to find a naturally occurring, cheap and environmentally safe substance that could be used for inhibition purposes.

MATERIALS AND METHODS

Collection of *Cereus repandus* Plant Extract Preparation

Cereus repandus stem (Figure 1) collected from Karumathampatti, Coimbatore District, Tamil Nadu, India, were cleaned and shade dried. The dried stem were powdered and stored in dessicator to prevent moisture contents. 25 gm of dried stem powder were boiled in 500 mL of 1N HCl in reflux condenser for 3 h and was kept overnight. The following day the extract was filtered and filtrate volume was made up to 500 mL using respective acid. Extract was taken as 5 % stock solution and from this other concentrations were prepared (Figure 2).

Phytochemical Analysis

Standard procedures were employed to the test the presence of alkaloids, carbohydrates, flavonoids, phenols, saponins, tannins, terpenoides, quinines and proteins in stem powder of *Cereus repandus* [3, 4].

Preparation of Mild Steel Coupons

Mild steel specimens of size 5 x 1 x 0.2 cm were cut from a large sheet of mild steel obtained from local steel house, Coimbatore, India. A small hole of about 1.0 mm diameter near 1.5 cm side end for suspending. Specimens were decreased with acetone pickled in conc. HCl and washed with distilled water and specimens were polished with 400 and 600 grade emery papers, cleaned, dried, stored in dessicator to avoid the adsorption of moisture [5].

Material Preparation

Pre weighed mild steel specimens were suspended with the help of glass hook in 100 mL of 1N HCl acid solution in the absence and presence of inhibitor at various concentrations under an immersion time period at room temperature. The specimens were removed after specified time interval, washed with distilled water, dried and reweighed. Experiments were performed for various concentrations such as,

- Concentration variations : (0.10 % v/v, 0.50 % v/v, 1.00 % v/v, 1.50 % v/v, 2.00 % v/v and 2.50 % v/v).
- Different time interval : (1 h, 3 h, 5 h, 7 h and 24 h).

The rate of the dissolution of the metal was calculated in the term of Corrosion Rate (CR) using the expression [6, 7],

$$\text{Corrosion Rate (CR)} = \frac{87.6 \times W}{DAT} \text{ (mm/y)} \quad (1)$$

Where, mm/y - millimeter per year, W - loss in weight in milligrams, D - metal density in g/cm³ (7.86g/ cm³), A - area of the sample in square centimeters, T - time of exposure of the metal surface in hours.

The percentage inhibition efficiency (IE %) of the inhibitors in terms of concentration has been calculated from the expression [8],

$$\text{Inhibition Efficiency (IE \%)} = \frac{\text{Weight loss without inhibitor} - \text{Weight loss with inhibitor}}{\text{Weight loss without inhibitor}} \times 100 \quad (2)$$

Where W₀ and W_i are the weight loss values in absence and in presence of the inhibitor respectively.

Surface Morphology

Surface analysis studies of mild steel specimens were done in order to study that occurrence during corrosion of mild steel in absence and presence of inhibitor in acid medium. Nature of metal surface was analyzed by Scanning Electron Microscope (SEM) and Fourier Transform Infrared Spectroscopic (FTIR) Studies.

Computational Chemistry

Theoretical quantum chemistry mainly involves computational chemistry which helps us to calculate predictions of quantum theory atoms and molecules can only have discrete energies [9]. Molecular properties related to reactivity and selectivity of inhibitors like ionization potential (I) and electron affinity electro negativity (χ), global hardness (η)

**Gladiyarani and Gunavathy**

and softness (σ) were estimated according to Koopmans's theorem [10]. MOPAC is a popular computer program used in computational chemistry.

RESULTS AND DISCUSSION

Phytochemical Analysis

Phytochemical analysis of *Cereus repandus* stem extract showed the presence of Proteins, Tannins, Carbohydrates, Phenols, Flavonoids, Saponins, Glycosides, Steroids, Terpenoids and Alkaloids.

Weight Loss Measurement

The effect of immersion on corrosion rate and inhibition efficiency was studied. The immersion time range from 1 h, 3 h, 5 h, 7 h and 24 h. The results of the weight loss measurements of mild steel for various concentrations of CeR in 1N HCl at room temperature after varied time period of immersion are given in Table 2. This evidenced by decrease in corrosion rate with addition of plant extract to acids. It was found that inhibition efficiency increased with increase in concentration from 0.10 % v/v to 2.5 % v/v and with increase in time due to adsorption of plant compound on to surface of metal and contribute protective layer (Figure 3).

Scanning Electron Microscopy (SEM)

The surface morphological characteristics of the uninhibited mild steel in 1N HCl and inhibited mild steel using CeR extract in 1 N HCl was analyzed. SEM photographs of the mild steel specimens after immersion in 1 N HCl for 3 h room temperature without and with inhibitor containing optimum concentration of (2 % v/v) plant extracts are presented in (Figure 4 and 5). Inhibitive action due to formation of protective film by the phytochemical components present in plant extract on mild steel.

Quantum Chemical Calculations

Structures of phytoconstituents of CeR stems extract were first optimized and simulations were conducted to calculate electronic parameters. The output of MOPAC program reports values such as ionization potential, Eigen values, dipole moment etc. According to Koopmans theorem ionization potential are negative of Eigen value of highest occupied molecular orbital (HOMO). Optimized structures of compounds studied are given in (Figure 6). Table.3 represents Quantum chemical parameters for organic molecules present in CeR stem extract. Energy of highest occupied molecular orbital (EHOMO) measures tendency of molecule to donate electrons. Therefore, higher values of EHOMO indicate good tendency towards contribution of electron, enhance adsorption of inhibitor on metal surface and demonstrate better inhibition efficiency [11]. ELUMO indicates ability of molecule to accept electrons [12]. Frontier molecular orbital diagrams of phytoconstituents of stem extract are represented in Figures 7 and 8. The energy of lowest unoccupied molecular orbitals indicates ability of molecule to accept electrons. The lower value of ELUMO, more probability of molecule to accept electrons. The higher energy gap (ΔE) may enhance corrosion inhibition efficiency. From the results of the quantum chemical calculations, it was evident that 2-Methoxy-4-vinylphenol which was the best inhibitor has the highest value of EHOMO -9.223 (eV) and would be better adsorbed on metal surface [13]. The energy gap (ΔE) provides information about overall reactivity of a molecule. As ΔE decreases, reactivity of molecule increases leading to increase in inhibition efficiency of molecule. Low values of ΔE gap will render good inhibition efficiencies since energy to remove an electron from last occupied orbital will be minimized.

CONCLUSIONS

Results obtained from experimental data showed that CeR stem extract act as an effective inhibitor for the corrosion of mild steel in 1N HCl. CeR extract showed the presence of Proteins, Tannins, Carbohydrates, Phenols, Flavonoids, Saponins, Glycosides, Steroids, Terpenoids and Alkaloids. Maximum inhibition efficiency was observed at an optimum concentration of 2.50 % v/v. The inhibition efficiency increased with the increasing concentration of

Gladiyarani and Gunavathy

inhibitor. CeR showed maximum of efficiency 95.30 % in 1N HCl at 5 h on immersion. The surface analysis by SEM confirmed the presence of protective film on mild steel surface in the presence of inhibitors. Quantum chemical parameters such as highest occupied molecular orbital (HOMO), lowest unoccupied molecular orbital (LUMO), energy levels, HOMO – LUMO energy gap and electronic density were identified. Quantum analysis demonstrated reactive centers of electrophilic and nucleophilic attack and strong inhibition properties of bioactive molecules of CeR. From experimental and theoretical analysis, CeR in 1N HCl acid can be used as corrosion inhibitor for mild steel as corrosion preventive inhibitor.

ABSTRACT

The amount of pesticide residues in agricultural soil from four locations in the study area was examined in this paper. Using the high-performance liquid chromatography technique (HPLC) quantitative analysis was carried out. The ideal parameters for the separation of two pesticides were a 70:30 acetonitrile: water eluent composition, and a flow rate of 0.4 mL/min. All of the soil samples that were examined had concentrations of the pesticides Mancozeb and Atrazine ranging from 3.87 to 7.58 µg/kg and 2.25 to 3.97 8.36 µg/kg, respectively. The outcomes were contrasted with the maximum residue limit (MRL) set by the FAO. Pesticides beyond this threshold should be closely watched as they are probably going to pose a serious risk to human health.

Keywords: Pesticide, Mancozeb, Atrazine, Chromatography.

INTRODUCTION

The soil and water degradation is a result of the growing and ongoing usage of pesticides. Pesticides have the power to eliminate or suppress organisms that pose a threat to living things these consist of herbicides, fungicides, insecticides, and so on (British Crop Protection Council, 2003). Growing agricultural production is necessary to meet the world's rising food demand, which leads to the widespread use of pesticides. Nevertheless, the extensive or prompt use of pesticide ingredients for farming causes soil pollution (Caldas et al., 2011). The physicochemical characteristics of the soil and water body, including the presence of clay minerals, organic matter, pH, climate, and other variables, affect the destiny of pesticides in these environments (Singh, 2001). Global pesticide consumption has

91219

**Bharath and Raju**

risen by more than 40% in the last 20 years and has leveled out at about 4.1 million tons per year since 2017 (FAOSTAT, 2021). Pesticides and other chemicals can be maintained in soil, an essential agricultural resource. In essence, pesticide residues found in the surface or soil can enter the groundwater. There are two methods by which pesticides can enter the soil: (1) by spraying the soil during the germination stage and washing the leaves of mature plants, and (2) by releasing the granules that are administered directly to the soil (Rial Otero et al., 2003). Pesticides in soil and degradation products pose a significant environmental threat, contaminating food chains, promoting biomagnification, and causing health issues. Chronic exposure, particularly in farm workers and the village population, is a growing concern (Pathak et al, 2022). Especially when records of pesticide use are accessible. Although laboratory and controlled field studies necessary for the approval of new active ingredients (prospective risk assessments) have provided information on the short-term behavior of pesticide residues in soils following applications, there are currently insufficient observations addressing the long-term fate and in-situ occurrence of residues in soils under real-world conditions, which would enable retrospective exposure assessments (Silva et al., 2019). The usage of large volumes of solvent and a lengthy analysis time are the drawbacks of the liquid-solid extraction approach used to determine the residual pesticides in the soil; however, these issues can be resolved by other extraction techniques, such as ultrasonic solvent extraction. Its benefits include reduced solvent use, speed, and selectivity. Although ultrasonic solvent extraction improves extraction efficiency, a clean-up is necessary to get a clean extract due to its poor selectivity. High-performance liquid chromatography (HPLC) was utilized to identify and measure pesticide residues (Lesueur et al, 2008). Chromatography is a technique that uses an adsorbent column in a flow system to separate the combined components. Samples are added to the mobile phase that passes through the stationary phase in chromatographic separation. Certain thermolabile or extremely polar chemicals, as well as molecules with a large molecular weight, were analysed using HPLC. The precision with which chromatographers choose and use the column, stationary phase, and mobile phase also has a significant impact on the outcome of an analysis (Moldoveanu, S and David, V., 2013; Rouessac, F. and Rouessac, A., 2007). In this research paper, the soil sample pesticide quantity at Nanjungudtaluk of Mysuru, Karnataka district, India was analyzed using the HPLC technique.

MATERIAL AND METHODS

Chemicals

Mancozeb (Sigma-Aldrich), 99% acetonitrile (Merck), and atrazine (Sigma-Aldrich).

Study Area

Soil samples were collected from Nanjangud taluk of Mysuru district, India shown in Figure 1. Four samples were from the location and each sample was given a name as soil N1, N2, N3, and N4. The 12 to 15 cm of soil was placed in a polythene bag for study. Samples of soil were sieved, dried, and sealed in a zip-lock polythene bag.

Sample preparation

The 60 milliliters of acetonitrile were added to the 20-gram soil sample. The 100 ml beaker glass was filled with the solution. It was sonicated for two minutes after being agitated for an hour. Filter paper sized 0.2 μm was used to filter the extract (Marselina Theresia Djue Tea et al, 2018). The Mancozeb is Manganese–zinc ethylenebis(dithiocarbamate) standard was made by diluting it with acetonitrile solvent until a standard solution of 30 mgL^{-1} was obtained, and the Atrazine is 6-chloro-N-ethyl-N'-(1-methylethyl)-triazine-2,4-diamine standard was made by diluting it with acetonitrile solvent until concentration of 10 mgL^{-1} . The standardized amounts were 10 mgL^{-1} of Mancozeb and 30 mgL^{-1} of Atrazine.

High Performance Liquid Chromatography (HPLC)

Determination of the optimum wavelength was performed by the separation condition of the HPLC instrument, with eluent composition and the selected flow rate (optimum condition), with the variation of wavelength (220, 230, 240, 250, and 260 nm). The mobile phase is acetonitrile: water ratio is (80:20), (70:30), (60:40), (50:50). The qualitative

**Bharath and Raju**

analysis was carried out by comparing the retention time of the standard MET with the retention time of the peaks from the Myrmeleon sp. Chromatogram, which increases the peak area by injecting standard Mancozeb and Atrazine (Marselina Theresia Djue Tea et al, 2018).

RESULTS AND DISCUSSIONS**Liquid chromatography –UV**

Figure 2 and Table 1 show the four samples' ion chromatograph values as per the graph the NS-2 shows the highest concentration of Mancozeb and Atrazine when compared with the other 3 samples. The Mancozeb and Atrazine samples NS-2 show the lowest in NS-1 and NS-4 respectively. As per the standards two pesticides were above the limit in all 4 soil samples. The acetonitrile-water compositions produced by the Mancozeb and Atrazine separation chromatogram and the compound's retention period increased with the amount of acetonitrile solvent utilized, as Figure 3 demonstrates. To prolong the retention of the more non-polar chemicals in the column, polar solvents and nonpolar columns were utilized. When the mobile phase compositions were 70:30, both compounds separated satisfactorily with less than 32 minutes retention times for each component. Figure 4 demonstrated that a lower standard peak area was produced by a quicker flow rate. Therefore, it can be concluded that 0.4 mL/min was the ideal flow rate for the separation of Mancozeb and Atrazine. The 4 soil samples work nicely in a 70:30 acetonitrile-water ratio and the flow rate is 0.4 mL/min this value is similar to Marselina Theresia Djue Tea et al, 2018.

CONCLUSION

The eluent composition of acetonitrile: water ratio of 70:30 and a flow rate of 0.4 mL/min were ideal for the separation of two pesticides. When compared to atrazine, the results from this study indicate that soil has a higher persistence of pesticides, especially Mancozeb pesticides. It was gathered for this study by the FAO/WHO. Maximum levels of pesticide contamination of the soil in Nanjungud were spotted. The mancozeb pesticide samples have low concentrations found in NS-1 and high in NS-2. The Atrazine pesticides were found highest in NS-2 and low in NS-4.

ACKNOWLEDGMENT

The authors would like to thank the University of Mysore, Mysuru, for his warm encouragement and assistance. The University of Mysore in Mysuru has their gratitude for giving funding and support for research efforts.

Funding

There is no funding or financial support for this research work.

ABSTRACT

Koch's spine, or tuberculous spondylitis, is a severe form of extrapulmonary tuberculosis marked by severe spinal pain and possible neurological issues. Despite public health improvements, its incidence remains high in India, accounting for about 10% of all spinal tuberculosis cases. A 55-year-old man, who has a medical history of Type 2 diabetes mellitus, hypertension, and chronic kidney disease requiring ongoing hemodialysis, presented with ongoing lumbar pain, fever, and unintentional weight loss. Magnetic resonance imaging (MRI) indicated vertebral collapse at the D9 level, along with unusual signal intensities observed at the D8-D10 levels, which are indicative of Koch's spine. Additional findings included anemia, signs of systemic inflammation, and kidneys that were contracted with grade III parenchymal alterations. The comprehensive treatment plan encompassed anti-tubercular therapy (ATT), pain management, supportive care, and the application of a spinal brace. This case highlights the complex interplay between chronic comorbidities and tuberculosis, complicating the progression of Koch's spine. Timely diagnosis through imaging and clinical assessments, along with a multidisciplinary approach, is essential for managing the disease and its complications, such as neurological deficits. The treatment plan

Pavan Kumar et al.,

aimed to provide symptomatic relief while targeting the underlying infection, ultimately achieving stabilization in a challenging medical context. This situation underscores the importance of increased vigilance regarding Koch's spine in endemic areas such as India. To effectively address this condition, it is essential to implement timely diagnostic measures, customized treatment plans, and collaborative care strategies aimed at reducing the morbidity and mortality linked to this disease.

Keywords: Koch's Spine, Extrapulmonary Tuberculosis, Chronic Kidney Disease, Multidisciplinary Management, Antitubercular Therapy.

INTRODUCTION

Spinal tuberculosis (TB) represents a small fraction, specifically 1–2%, of the total TB cases and is recognized as a prevalent form of extrapulmonary TB. Within the broader category of musculoskeletal TB, which constitutes approximately ten percent of all TB instances, spinal involvement accounts for half of these cases [1]. While spinal TB is fundamentally a skeletal condition, it can also affect the nervous system secondarily, resulting in a range of neurological impairments. The occurrence of neurological complications associated with spinal TB varies significantly, with reported rates ranging from 10% to 41% [2]. The application of contemporary anti-tubercular medications, combined with appropriate rest and mobilization facilitated by suitable orthotic devices, can lead to effective biological management of the disease. This approach not only enhances the quality of life but also promotes improved functionality of the affected joint. Surgical intervention becomes necessary in cases where the diagnosis remains ambiguous, in instances of widespread lesions accompanied by abscess formation, in situations involving a potentially unstable spine with or without neurological impairment that requires stabilization, and in cases of persistent disease in adults or in children where there is a risk of progressive kyphosis as they grow [3]. The diagnosis of atypical spinal tuberculosis remains challenging, primarily due to insufficient focus on the condition and limited descriptions available in the existing literature. This lack of attention can hinder timely and accurate diagnosis, which is crucial for the appropriate initiation of treatment, especially regarding the choice of surgical interventions. Atypical manifestations of spinal tuberculosis may present as lesions localized to the sacrum or the posterior components of the neural arch, while the intervertebral disc and vertebral body remain unaffected. The phenomenon of composite lesions or pan-vertebral involvement refers to the occurrence of posterior spinal tuberculosis in conjunction with anterior spinal tuberculosis at the same anatomical level [4].

CASE DETAILS

A 55-year-old male was admitted to the hospital with vital signs, including a blood pressure reading of 195/100 mmHg, a respiratory rate of 20 breaths per minute, and an oxygen saturation level of 96% while breathing ambient air. The patient's random blood glucose level was also measured at 175 mg/dL. These observations suggest the presence of uncontrolled hypertension alongside moderately elevated blood glucose levels, necessitating prompt medical attention and vigilant monitoring throughout his hospitalization. The patient exhibited lumbar pain that had been ongoing for three months, with a notable increase in severity over the last two days, which has hindered his ability to sit following dialysis treatments. He also mentioned experiencing intermittent fever during the past five months. Additionally, the patient reported issues with constipation and gastric discomfort, alongside a significant weight reduction of 5 kg within the last month. His medical history includes a 22-year diagnosis of Type 2 Diabetes Mellitus, 12 years of Hypertension, and Chronic Kidney Disease (CKD), for which he has been receiving maintenance Hemodialysis (MHD) every week for the past four years. The patient presents with a medical history of diabetes, which is currently controlled through an insulin regimen consisting of 17 units administered in the morning and 15 units in the evening. Previously, he was prescribed antihypertensive medications that included Metoprolol at a dosage of 50 mg taken twice daily, along with Torsemide at 40 mg once daily. For gastrointestinal issues, the patient received Rabeprazole at a daily dose of 20 mg and Domperidone at 10 mg taken twice daily. Management of pain and muscle spasms involved the use of Paracetamol and Chlorzoxazone, while nutritional support was provided

**Pavan Kumar et al.,**

through the daily intake of Tab. Riconia. Additionally, he was using syrup Lactitol Monohydrate at a dosage of 15 mL twice daily to alleviate constipation. Notably, the patient had a Percutaneous Transluminal Coronary Angioplasty (PTCA) performed two years prior due to coronary artery disease. Following a thorough clinical assessment and imaging studies, the patient received a provisional diagnosis of Tuberculosis (TB) affecting Koch's spine, accompanied by extrapulmonary manifestations. To address the acute symptoms, the patient was administered intravenous tramadol to provide immediate pain relief, alongside a continuous infusion of fentanyl for ongoing analgesia. To manage nausea, a dose of 4 mg of intravenous Ondansetron was given. The initiation of antitubercular therapy (ATT) involved the administration of 600 mg of Ethambutol, complemented by 40 mg of Pyridoxine HCl to mitigate the risk of drug-induced neuropathy. Furthermore, supportive treatments included the use of Gabapentin in conjunction with Nortriptyline to alleviate neuropathic pain, Thiocolchicoside to address spasticity, and the application of a spinal brace to ensure stabilization and support. Laboratory assessments indicated the presence of Anemia, characterized by a diminished red blood cell (RBC) count of 3.49 million/ μ L, a hemoglobin concentration of 8.7 g/dL, and a packed cell volume (PCV) of 26.5%. These results point to a considerable degree of anemia, likely to have multiple underlying causes. Additionally, serum creatinine levels were significantly elevated at 9.5 mg/dL, suggesting severe renal dysfunction, potentially indicative of chronic kidney disease.

Furthermore, hypoproteinemia was observed, with total protein levels recorded at 5.9 g/dL and serum albumin at 3.3 g/dL, which may reflect either nutritional deficiencies or the presence of systemic inflammation. Imaging investigations yielded significant information regarding the patient's health status. An abdominal ultrasound demonstrated the presence of bilaterally contracted kidneys exhibiting grade III parenchymal alterations, indicative of chronic kidney disease. Furthermore, the ultrasound revealed grade II Prostatomegaly, mild fluid accumulation between bowel loops, and localized thickening of the bowel wall accompanied by fat stranding in the left paraumbilical area, which raised concerns for a potential inflammatory or infectious process. A subsequent CT scan corroborated the findings of small bilateral kidneys and illustrated thickening of the proximal jejunal loop wall, along with adjacent fat stranding and mild interloop fluid, thereby reinforcing the likelihood of a gastrointestinal or systemic inflammatory condition. The magnetic resonance imaging (MRI) conducted on the spinal area indicated evidence of degeneration, accompanied by an atypical signal intensity pattern within the thoracic vertebrae, especially at the D8, D9, and D10 segments. A significant observation was the collapse of the D9 vertebral body. These imaging results are consistent with the diagnosis of Koch's spine, or tuberculous spondylitis, which correlates with the clinical manifestations and initial diagnosis provided. The clinical and imaging assessments indicate a complex medical condition characterized by significant anemia, chronic kidney disease, systemic inflammation or infection, and the presence of Koch's spine with vertebral involvement. Additionally, the gastrointestinal observations may point to the possibility of concurrent extrapulmonary tuberculosis or another inflammatory disorder that necessitates further examination. These findings highlight the intricate nature of the patient's health status and emphasize the importance of a collaborative treatment strategy involving multiple specialties.

Upon admission on Day 1, the patient exhibited significant hypertension, recorded at 195/100 mmHg, alongside marked renal dysfunction. In response to these clinical findings, a regimen of antihypertensive medications was promptly initiated, which included Cilnidipine at a dosage of 10 mg administered twice daily, Metoprolol at 50 mg once daily, and Torsemide at 40 mg twice daily to manage fluid retention. Additionally, Isolazine was prescribed twice daily to provide cardiovascular support. To ensure gastroprotection, Rabeprazole was given at a dose of 40 mg once daily, while aspirin at 20 mg once daily was included for its antiplatelet effects. For glycemic management, pre-meal insulin was administered twice daily. Furthermore, dialysis was conducted to mitigate renal impairment, resulting in a reduction of blood pressure to 190/90 mmHg. On the second day, the patient indicated ongoing back pain, which was addressed through the administration of oral Tramadol daily. To target neuropathic pain, a regimen of gabapentin combined with Nortriptyline (100 mg and 10 mg, respectively, administered at night) was implemented. The initiation of dialysis resulted in enhanced urine output, signifying a favourable renal reaction to the therapeutic interventions. In cases of intense pain, intravenous Fentanyl was commenced and delivered at a rate of 200 mg in 500 mL of normal saline at a flow rate of 8 mL per hour. On the third day of observation, the patient reported persistent back pain, irregular bowel movements, and various neurological symptoms. Diagnostic imaging

**Pavan Kumar et al.,**

revealed the presence of extrapulmonary tuberculosis affecting the thoracic spine, commonly referred to as Koch's spine. In response, anti-tuberculosis therapy was commenced, incorporating Ethambutol at a dosage of 600 mg once daily, alongside Pyridoxine at 40 mg daily to mitigate the risk of drug-induced neuropathy. Additionally, Thiocolchicoside was prescribed at 4 mg twice daily to alleviate muscle spasms, while Prazosin was administered at 2.5 mg once daily to assist with blood pressure control. To promote bowel regularity, Lactitol Monohydrate syrup was recommended at a dosage of 15 mL before bedtime. Furthermore, a spinal brace was fitted to provide necessary stabilization. On the fourth day of treatment, the patient exhibited notable progress. Blood pressure readings fell to 150/90 mmHg, random blood glucose levels stabilized at 105 mg/dL, and urine output rose to 1500 mL per day, suggesting a recovery of renal function. The comprehensive treatment strategy employed successfully addressed the patient's systemic issues, reduced pain, and focused on the underlying tuberculosis infection.

DISCUSSION

The case of a 55-year-old man diagnosed with Koch's spine exemplifies the intricate relationships among comorbid conditions, diagnostic difficulties, and treatment approaches, both conforming to and differing from the current body of literature regarding extrapulmonary tuberculosis (EPTB). Koch's spine, which represents a type of tuberculous spondylitis, predominantly impacts the thoracolumbar area, as evidenced in this instance. This condition is particularly common in areas with significant tuberculosis prevalence, like India, where factors such as socioeconomic status, access to healthcare, and delays in diagnosis play critical roles in its ongoing prevalence[5]. This case highlights important themes in diagnosis and management that have been identified in previous research. The three-month interval between the onset of symptoms and diagnosis aligns with existing literature, which indicates that average diagnostic delays can extend up to four months, primarily due to the subtle progression of the disease and a lack of awareness. Imaging techniques, particularly MRI, play a vital role in the diagnostic process, revealing vertebral collapse and unusual signal intensities, observations that are consistent with findings in comparable cases[6, 7]. The distinctive aspects of this case are characterized by the interaction of chronic comorbidities and the implementation of a multidisciplinary treatment strategy. The commencement of antitubercular therapy (ATT), complemented by supportive measures such as gabapentin, thiocolchicoside, and the use of a spinal brace, aligns with evidence-based methodologies for alleviating neurological symptoms and maintaining spinal integrity. The significant enhancement in the patient's pain levels and systemic indicators further substantiates the efficacy of a personalized therapeutic approach. This case illustrates the essential importance of early imaging techniques in the diagnosis of Koch's spine among patients experiencing chronic back pain, particularly those with underlying risk factors such as diabetes or immune suppression. The prompt commencement of antitubercular therapy (ATT), along with supportive care measures, underscores the need for individualized treatment plans that cater to the specific requirements of each patient. Successful management of this condition necessitated a collaborative effort among nephrologists, infectious disease experts, and radiologists, thereby providing a comprehensive approach to the patient's intricate comorbidities. Additionally, this case highlights the critical need for increased vigilance regarding tuberculosis in endemic areas such as India, where delays in diagnosis can have profound implications for patient outcomes. Addressing systemic inflammation and nutritional deficiencies is crucial for enhancing recovery and improving overall patient health. Therefore, the implementation of collaborative and holistic management strategies is vital for effectively navigating the complexities associated with such clinical presentations.

CONCLUSION

The early identification of Koch's spine is crucial for effective management and ensuring a swift recovery. In patients exhibiting persistent back pain, particularly those with risk factors such as diabetes or immune suppression, it is essential to pursue advanced imaging techniques like MRI. This approach aids in the prompt detection of the condition and allows for the immediate commencement of antitubercular therapy (ATT). Timely intervention can prevent the progression of the disease, mitigate complications such as neurological deficits, and enhance overall patient outcomes. A collaborative effort among nephrologists, infectious disease experts, and radiologists is vital for

Pavan Kumar et al.,

managing comorbidities and delivering comprehensive care. In instances of severe disease characterized by significant bone involvement or the presence of abscesses, surgical intervention may become necessary. Increased clinical awareness, regular screening of at-risk populations, and effective preventive strategies, including measures to control tuberculosis transmission, are essential for alleviating the disease burden. The successful management of spinal tuberculosis underscores the significance of integrating prompt diagnosis with therapeutic interventions to achieve better prognoses and enhance the quality of life for patients.

Declaration of Patient Consent

The authors affirm that they have secured the necessary consent form from the patient, which has been properly signed. In this form, the patient has granted permission for the inclusion of their clinical information in the publication. Furthermore, the patients are aware that their names and initials will remain confidential, and appropriate measures will be taken to protect their identities.

ACKNOWLEDGEMENTS

We extend our profound appreciation to Dr. Y. KalyanChakravarthy, Managing Director of Trust Multi speciality Hospitals in Kakinada, for permitting the publication of this article. We are also deeply grateful to the medical personnel who provided care to the patient, contributing significantly to the effective management of his health condition. Furthermore, we acknowledge the valuable collaboration of the patient's representatives during the informed consent process, which enabled us to present this case for education and research.

Financial support and sponsorship: Nil.

Conflicts of interest: There are no conflicts of interest.

Author's Contribution

Dr.PS and Dr.PKY was pivotal in overseeing the case report process and offering mentorship to the students, YR, SJ, and HRSJ during the manuscript drafting phase. The clinical management and treatment of the patient were under the purview of Dr. PS, who served as the consultant physician. Under the supervision of Dr. PS and Dr. PKY, YR, and SJ actively participated in the writing and preparation of the manuscript. Ultimately, all authors engaged in a thorough review and granted their approval for the final version of the manuscript.

ABSTRACT

Bite marks analysis in forensic investigations holds paramount importance in human identification, traditional ABFO (American Board of Forensic Odontology) technique for identification of Bitemarks are time consuming, an automated recognition model for analyzing bite marks presents a significant application, offering potential advancements in machine vision-assisted identification. This study focuses on proposing a recognition method for bite marks analysis, enhancements to the Inception V4 model. This model produced the record lowest error at Image Net classification dataset. Initially, enhancements to the Inception V4 model include the addition of a dropout layer between the global average pooling layer and the Soft Max classification layer, effectively mitigating over fitting issues associated with limited bite mark datasets. Furthermore, migration learning techniques combined with the integration of the Image Net dataset during model training expedite network training while addressing challenges posed by the dataset's scale and inadequate model training. Subsequently, through experiments, the study evaluates the impact of various data preprocessing methods and dropout rates on model recognition accuracy to derive optimized model parameters. Experimental findings indicate that employing filling-based data preprocessing and a dropout rate of 0.3 yield the highest recognition accuracy, achieving up to 98.64%. Moreover, compared to classical models, the proposed enhanced Inception V4 model demonstrates a significant 18.22% increase in accuracy, accompanied by a 2.31 times faster average training time, highlighting the advantages of the proposed model. Finally, the enhanced

Inception V4 model is integrated into a human identification system based on bite marks analysis, demonstrating the practical application value of this research endeavour.

Keywords: Image Net, Soft Max layer, Deep learning, Inception V4, ABFO technique

INTRODUCTION

Human identification with bitemark evidence is a cornerstone of criminal justice systems around the world. A significant approach for identifying criminals among the many forensic procedures available is the analysis of bite marks found on victims or at crime scenes. Bite marks, which are frequently left by violent confrontations on skin or other surfaces, create distinctive patterns. This study applies an improved Inception V4 model to a unique bite mark analysis method for person identification. In the past, forensic professionals' manual examination of bite marks has been a major component of forensic analysis. This approach is labor-intensive and prone to bias in interpretation. Through the utilisation of deep learning techniques, specifically the Inception V4 model, this study endeavours to automate the identification process and matching bite mark patterns with higher precision and accuracy. The suggested process for building the Inception V4 CNN (convolutional neural network) architecture's foundation. These improvements tackle frequent problems in the study of bitemark patterns, namely over fitting to small datasets and the requirement for reliable feature extraction from intricate bite mark patterns. Our objective is to enhance the model's performance and flexibility to various bite mark datasets by utilising state-of-the-art methods like dropout layers and transfer learning with the Inception V4 model. Furthermore, in order to appropriately evaluate the efficacy of the suggested strategy, this study emphasises the significance of rigorous testing and validation. By means of methodical assessments employing actual bite mark datasets, our objective is to exhibit the effectiveness and dependability of our methodology in contrast to current techniques. Furthermore, we investigate the augmented Inception V4 model's possible real-world forensic applications, emphasising its importance in furthering the area of bite mark analysis-based human identification. This study is a big step towards improving the accuracy and dependability of forensic bite mark analysis by using machine learning techniques. We hope to further forensic science and enable more potent techniques for person identification in legal and investigative contexts by presenting our methodology, which is built on the improved Inception V4 model.

In image processing, feature extraction is an important part and used in a wide list of computer vision problems such object recognition, classification, segmentation and pattern analysis. The main purpose of this method is to reduce the input data by highlighting important characteristics, or "features," within an image in a manner which aids algorithms in understanding and interpreting what they are analyzing. So that Feature Extraction is very important role in Image Processing. In Fig.1 diagram is a basic process for correlation between bitemarks to dental cast images using a deep learning model. It starts by inputting both types of images, followed by preprocessing them to enhance quality of output. The Inception V4 CNN model done feature extraction from both images. The extracted features are compared through a correlation step to determine their similarity. Finally, the process produces a binary output (0 or 1) to indicate whether the images match or not. To enhance performance in classification tasks can be obtained through feature extraction and help improve the accuracy of machine learning models. According to the developers, separating important characteristics including edges and contours or color distributions can make it easier to distinguish between different classes of objects. Feature extraction for querying relevant features from the data of teeth and jaws and machine learning algorithms which can set relationship between these extracted features with dental age[1]. CNN, LSTM and LSTM-CNN" — however visual elements of web pages or emails could still require image processing such as screenshots. In practice, CNNs could be applied to classify this images and infer the features that can denote a phishing attempt[2] to analyze medical imaging data (e.g., chest X-rays or CT scans) to identify patterns related to COVID-19 severity. Neural networks, particularly convolutional neural networks (CNNs), may be applied for feature extraction and classification tasks [3]. Image enhancement techniques may also be applied to improve the quality of the input images for better detection accuracy[5].In this techniques to analyze

**Sonali Ajay Mohite et al.,**

dental radiographs CNNs are likely used to extract features related to sexual dimorphism in dental structures. Techniques such as segmentation and classification are essential for differentiating between male and female dental characteristics[4]. Particularly OTSU's method, are used for thresholding and segmentation of electrocardiogram (ECG) signals represented as images. CNNs are then applied to classify different patterns indicative of premature ventricular contractions[7]. Image processing techniques such as edge detection and feature extraction are likely utilized to identify and compare bitemarks for human identification purposes[13] to analyze 3D scans of bitemarks in image processing techniques such as 3D modeling and surface analysis may be used to enhance the accuracy of forensic identification[19]. To detecting and identifying individual teeth in panoramic X-ray images such as point-wise localization and distance regularization are used for accurate tooth identification, combined with image segmentation to isolate teeth from surrounding structures[23]. The use of image processing for diagnostic imaging (e.g., radiographs) give broader implications of data analysis in dentistry so these techniques are transforming clinical practices[24].

Literature Survey

There are number of method in CNN architecture for image processing. Some of this CNN methods are used for image recognition and verification. Aljameel S *et al.* attempt was to develop a sophisticated model for advanced regression prediction of dental age. To do so, the authors employed deep learning frameworks that are based on four types of models: Xception, VGG16, DenseNet121, and ResNet50. It was the Xception model that showed the best prediction results with the error rate of the 6-11 period equal to 1.417. at a random height[1]. Ademir *et al.*, authors obtained dental radiographs of males and females and trained a CNN to classify the sex of a patient using the tooth image. The CNN execute with high accuracy after being testing, providing insight into the possibility of using deep learning in dentistry in the future[4]. Pallavi Tiwari *et al.*, proposed a CNN approach for brain tumor detection using diverse medical imaging data. Also created a CNN using diverse medical imaging for brain tumor detection. By normalizing the data and scaling it with data augmentation, the CNN was able to achieve high accuracy in detecting different tumor data types. This approach could also be applied to assist radiologists in their work.[5]. Alshingiti et al., to employ deep learning-based methods, including Long Short-Term Memory, as peripheral results. Those were experimentally obtained through assessing the developed system using precision, recall, accuracy, and F1 score criteria [2]. Maryam T. *et al.*, develops an algorithm using neural networks and a fitness-dependent optimizer to predict the COVID-19 severity in patients. They implemented this algorithm through a fitness-based optimizer that redefines the algorithm's parameters using the stickers' fitness. The model includes a reported high accuracy of newborn-infant patient experiences [3]. The deep convolutional neural network can also be an effective method of building-type recognition. According to the convolution layer pattern, there is a variety of patterns, such as conventional convolution, and atrous convolution, depth wise separable convolution etc. The classical convolutional network structure mainly includes Le Net [8], Alex Net [9], VGG Net [10], Res Net [11], Inception Net [12], and so on. Le Net [13] is the earliest convolutional network used for image classification tasks. It consists of 7 convolutional layers; Alex Net [9] expands the network structure to 8 layers. It is much larger in scale than LeNet[8] and introduces the ReLU activation function and image enhancement; the symmetric convolutional network, VGGNet [10] is increased to 16 layers and 19 layers, which is deeper than Alex Net but simpler in form; The symmetric convolutional network structure Res Net [11] is 8 times deeper than VGG Net[10], and Res Net[11] is simpler than VGG net like Symmetry, and has powerful feature expression capabilities, and solves the gradient disappearance problem through the residual structure. In contrast to the pattern that VGG Net[10] employs the method to vertical stack the convolution layer, Inception Net[12] uses a completely different approach: which is called building width, and improving the size of the network for global average pooling reduction and "global average pooling + full connection layer" reduction full connection layer to reduce the number of parameters at the time of computation. using three-dimensional analysis techniques involving an intraoral scanner for bite mark validation. This focuses on improving the precision of bite mark assessments through 3D imaging[19]. This pilot study compares 3D scanning techniques for bite mark analysis, emphasizing objective assessment methods over traditional techniques[20]. Utilization of Convolutional Neural Networks (CNNs) for multiclass brain tumor detection. Pallavi Tiwari *et al.* introduces a hybrid CNN model for tumor identification in medical images, integrating different machine learning approaches to improve detection performance[15]. This hybrid approach likely combines various CNN architectures or

**Sonali Ajay Mohite et al.,**

incorporates additional features to enhance classification accuracy[16]. R. P. Janardanan and R. Logeswaran *et al.* introduce evaluation framework for the image acquisition of human bite marks. It focuses on establishing methodologies for effective image capture and analysis rather than specific machine learning techniques[17]. The evolution of bite mark analysis and emphasizes a shift from empirical to more scientific approaches, focusing on the methodological rigor of analysis rather than a specific technical framework[18]. Along with the continuing development and application of convolutional neural networks in recent years, both classical, and classical network models have been renovated, used in many places, and can be widely used in the future.

METHODOLOGY

Dataset Description and Collection

The bite mark samples were obtained from 250 peoples. The age range was between 18-25 years. The assumption in this study for each sample was there were no missing lower and upper anterior teeth and no fixed orthodontic appliances. Each sample was asked to bite the standard pink dental wax. The bitemarks of all upper and lower anterior teeth were covered. After that, the photographs of these bite marks were taken using a digital camera. The resolution was 20.3 million pixels, and the distance between the objects and lens was maintained at 5cm. The photos were saved as JPEG files as bite mark samples and dental cast of each individuals for study.

Loading Proposed Experimental Pre-Training Framework

To improve the model's training efficiency and model recognition accuracy, as the dental cast and pink wax bitemark images dataset is small in sample size, this paper adopts a model-based transfer learning technique, transferring and applying the Inception V4 trained on the Image Net dataset to the bitemarks and dental cast verification task. During this model transfer, first the Inception V4 pre-training model has to be loaded; that is to say, train the Inception V4 model on the Image net dataset to get a pre-training model with the model's parameters. As the feature extraction methods of the data in Image Net are similar with the bitemarks and dental cast correlation but not identical, in this paper, all layers of the Inception V4 model are added to the training process to get better verification results.

Training Process of the Proposed Model

Figure 2 shows the training process of the improved CNN (Inception V4) model. The training set of Bitemark and Dental Cast images is input into the pre-trained Inception V4 model. The shallow features of the images are extracted via convolution in the first few layers of the model and pooled to reduce the feature map size, so as to further extract the deep features in the Inception block. The Inception block extracts feature maps of different sizes via parallel convolution layers. These feature maps are merged at the end of each Inception block and then input to the next layer. Then all the extracted features are input into the global average pooling layer, that is, before the results of the global average pooling layer are input to the Soft Max classification layer, adding a dropout layer, that is, randomly ignores some neuron nodes at a certain ratio, without changing the input layer and output layer. The Soft Max classification layer finally outputs the classification results and completes a forward propagation process. Once forward propagation is completed, the parameters in Inception V4 will be updated by the back propagation algorithm, the ignored neuron nodes are not updated, and the iteration is completed. Then the above steps are repeated until the end of the training process.

Process of Model Hyper parameters

In the process of model training, such key parameters as a learning rate, epoch, batch size, optimizer, loss function, evaluation metrics, etc., should be optimized and tuned. Then, such parameters are also accordingly adjusted. The learning rate is responsible for the rate of convergence of the objective function and significantly affects the learning speed. Specifically, if the learning rate is too large, then the speed of the study will also be fast, but the model's parameters may not converge if too small, then there will be slow convergence of the model. After multiple tests, the empirical learning rate is chosen to be 0.001. Batch size indicates how many images are input into the neural network at a time during training. When the memory is overloaded, the batch size is too large. When the computing resources

cannot be fully utilized, the batch size will be relatively small, and the waste will be even more. After testing, the batch size is set to 16. The Optimizer Adam is selected as the optimizer for updating the model's parameters. It can be regarded as the advantage of the fast convergence of Adam and a good feature of easy parameter tuning. In addition, the learning rate can be adjusted automatically. The formula is.

$$w_{t+1} = w_t - \frac{\alpha \cdot m_t}{\sqrt{v_t}} = w_t - \frac{\alpha \cdot (\beta \cdot m_{t-1} + (1-\beta) \cdot g_t)}{\sqrt{\beta_1 \cdot v_{t-1} + (1-\beta_2) \cdot g_t^2}}$$

Here β_1 and β_2 are two hyper-parameters of this model; β_1 controls the first-order momentum and β_2 controls the second-order momentum. The initial values of β_1 and β_2 are 0.9 and 0.999, respectively. At the same time, Adam can adaptively optimize the learning rate, taking the decay rate $\epsilon = 1 \times 10^{-7}$.

Loss function: For multi-category neural network models, the cross-entropy loss function is usually applied, and its formula is shown in Formula:

$$C = -\frac{1}{n} \sum_x [y \ln a + (1-y) \ln (1-a)]$$

Where x represents the sample, y represents the real label, represents the predicted output, and n represents the total number of samples. Metric evaluation criteria, the traditional top 1 and top 4 accuracies cannot objectively measure the model's recognition effect. Therefore, the 1st and 4th accuracy rates are used as model evaluation criteria in this paper:

- (1) 1st Accuracy: This represents the maximum value of top1 accuracy during 20 rounds of model training;
- (2) 4th Accuracy: This represents the 5th largest value of top1 accuracy during 20 rounds of model training.

EXPERIMENT AND RESULT

Fig.3 Precision graph shows that Inception V4 prediction of model is more accurate than others 4 CNN models. Above graphs shows comparison between 5 CNN models. Fig.4 shows that Inception V4 model accuracy rate is better than Alex net, VGG-16, Res net, Le Net. The 1st accuracy and the 4th accuracy on the test dataset and the average training time of the four models are shown in following Fig.5

CONCLUSION

Compared with other classical models, the recognition proposed model in this paper has the best recognition accuracy and the least model training time, which validates the effectiveness of promoting performance in the image recognition task of our proposed method using Mathematical operation. The research in this paper provides a new idea and method for the recognition of image processing's, based on Inception V4. In future research, we will further carry out the recognition of Gender identification using Bitemarks evidence. And will further improve the recognition effect by combining data enhancement, target recognition, and other methods.

ABSTRACT

Liposomal drug delivery systems have emerged as a transformative technology in modern pharmaceuticals, offering innovative solutions to longstanding challenges in therapeutic delivery. These nanoscale vesicles, characterized by their ability to encapsulate both hydrophilic and hydrophobic drugs, have demonstrated remarkable potential in enhancing drug stability, bioavailability, and targeted delivery. Recent advances focus on optimizing liposome design, integrating targeting ligands, and employing stimuli-responsive release mechanisms for controlled and precise drug delivery. Notably, liposomes have expanded beyond oncology into areas such as infectious diseases, neurological disorders, gene therapy, and regenerative medicine, showcasing their versatility. The integration of nanotechnology, artificial intelligence, and precision medicine further enhances their capabilities, enabling personalized treatment strategies and real-time monitoring. Despite these advancements, challenges persist, including scalability, manufacturing complexities, regulatory harmonization, and biocompatibility concerns, requiring rigorous research and collaboration. Emerging trends, such as the development of smart liposomes and combination therapies, promise to propel the field further. Liposomal technology is poised to revolutionize disease treatment landscapes, addressing unmet medical needs while improving patient compliance and quality of life. This review explores recent developments, key challenges, and future opportunities in liposomal drug delivery systems, emphasizing their pivotal role in advancing modern healthcare and shaping the future of precision medicine.

INTRODUCTION

The 1960s discovery that hydrating dry lipids forms liposomes, miniature, membrane-enclosed vesicles resembling cellular organelles unveiled their potential as biodegradable, biocompatible vessels for drug delivery. This breakthrough hinted at enhanced therapeutic potency and reduced toxicity. Nevertheless, it took three decades for liposome technology to mature and find practical application in drug delivery systems[1]. For over five decades, liposomes have been investigated as versatile drug delivery systems. Numerous liposomal formulations have gained clinical approval for treating diverse conditions, including oncology, fungal infections, and pain management. However, inherent challenges persist in optimizing the encapsulation and controlled release of payloads, particularly for hydrophilic small molecule therapeutics. A significant obstacle is the rapid release of encapsulated drugs immediately following administration, potentially resulting in systemic or localized toxicity[2]. The past 36 years have witnessed remarkable advancements in liposome research, transforming these vesicles from bio membrane models to versatile drug delivery systems with clinical efficacy. Liposomes now play a pivotal role in various therapeutic arenas, including oncology, antifungal therapy, vaccine development, and gene therapy. Notable examples of commercially available liposomal formulations include doxorubicin, daunorubicin, amphotericin B, and vaccines against hepatitis A and influenza. This expanding landscape has fuelled interest among biopharmaceutical companies, with many now incorporating liposome-based technologies into their platforms[3]. Structurally, liposomes consist of phospholipid vesicles with one or more concentric lipid bilayers enclosing isolated aqueous spaces, enabling the encapsulation of both lipophilic and hydrophilic compounds[4]. Liposomes are characterized by a concentric lipid bilayer structure enclosing an aqueous interior. In drug delivery applications, unilamellar liposomes with diameters between 50-150 nm are commonly employed. Notably, larger liposomes undergo rapid clearance from the circulatory system. The term 'drug' is used broadly to encompass both conventional pharmacological agents, such as antifungal (Amphotericin B) and anticancer (doxorubicin) therapeutics, and genetic medicines, including oligonucleotides and plasmid DNA[5].

In the pharmaceutical domain, a multitude of commercially available medications, as well as those in various stages of development, have exploited liposomes as a sophisticated drug delivery modality. The optimization of liposomal formulations necessitates the refinement of several pivotal parameters, including augmented drug solubilization and stability in systemic circulation, attenuated clearance and volume of distribution, and prolonged circulatory half-life. Moreover, efficacious liposomal formulations should facilitate targeted drug accumulation in specific tissues (e.g., neoplastic lesions) while mitigating off-target adverse effects. The successful integration of these attributes was instrumental in the development of Caelyx™/Doxil®, the groundbreaking liposomal drug approved in the United States in 1995. [6]. Liposomes, a paradigmatic nano-scale drug delivery modality, are beset by limitations, including precipitous clearance and diminished efficacy. Polyethylene glycol (PEG) modification enhances liposomal stability and circulatory persistence. Further innovations involve conjugating affinity ligands to augment targeting specificity. Nonetheless, these modifications can introduce unforeseen consequences, underscoring the need for a facile and translatable approach to mitigate these challenges[7]. Surface modification of liposomes has proven advantageous in tailoring their mechanisms, kinetic properties, and biodistribution. Commercially available products, such as Doxil and Myocet (doxorubicin) and DaunoXome(daunorubicin), have demonstrated efficacy in treating conditions like Kaposi's sarcoma. Naturally derived phospholipids and cholesterol are used to produce liposomes, which spontaneously form bilayer spheres when combined with water[8]. Recent breakthroughs in biomedical science and combinatorial chemistry have led to the development of numerous novel therapeutic agents with promising in vitro activity against various disease targets. However, most of these potential drugs falter in clinical trials. For example, despite impressive in vitro cytotoxicity against cancer cells, many anticancer agents lack selective antitumor efficacy in vivo, limiting their clinical utility. A significant obstacle hindering antineoplastic drugs is their narrow therapeutic window, where the dose required for tumour suppression also harms healthy tissues[9]. Nanomedicines have revolutionized drug delivery, enhancing bioavailability and mitigating off-target effects. Approved nanomedicines, including liposomes and polymeric micelles, have improved cancer treatment outcomes. However, endocytosis often

**Amrita Nayak et al.,**

hinders efficient delivery, degrading nanomedicine cargo within endo/lysosomes. To overcome this, innovative drug delivery systems are being developed to bypass endo/lysosomal pathways, augmenting intracellular delivery and optimizing therapeutic outcomes. [10].

Opportunities and Future Trends

Liposomes have revolutionized drug delivery, offering transformative solutions in healthcare with numerous approved products. These lipid-based carriers protect drugs from degradation, regulate release for enhanced efficacy, and improve solubility and bioavailability. [43] Their ability to integrate both hydrophilic and hydrophobic compounds highlights their versatility, making them a pivotal tool in modern medicine. Liposomes boast an exceptional safety profile, allowing higher drug doses without compromising patient safety, while their extended half-life facilitates sustained-release formulations, improving patient compliance and therapeutic outcomes. [44] The development of "smart liposomes" further elevates their potential, enabling drug release in response to physiological or external stimuli such as pH shifts, temperature changes, and enzyme activity, optimizing targeted therapies. [45] The oncology landscape, in particular, has benefited from liposomal advancements. Combination therapies utilizing liposomes target multiple pathways, enhancing cancer cell destruction while reducing toxicity and side effects. [46,47] These therapies leverage synergistic effects, ensuring precise delivery of diverse therapeutic agents, including genetic payloads like siRNA and CRISPR/Cas9. This approach overcomes traditional limitations, paving the way for improved cancer outcomes. [48] Liposomes have also breached biological barriers, such as the blood-brain barrier, through surface-functionalization with ligands or antibodies. Stimuli-responsive liposomes further pioneer precision medicine by releasing drugs in response to specific bodily cues. In addition, the co-delivery of multiple anticancer agents via a single liposomal nanocarrier harmonizes drug uptake by tumor cells, enhancing combination therapy efficacy. [49] Beyond oncology, liposomes support personalized medicine, improving fertility treatments and facilitating real-time health monitoring through mobile health apps. This integration of nanotechnology and digital therapeutics enables tailored interventions, transforming healthcare delivery and empowering patients to make informed decisions. As a result, liposomes continue to redefine therapeutic possibilities, merging safety, precision, and innovation to enhance patient care. [50,51]

CONCLUSION

Liposomal drug delivery systems have advanced significantly, offering targeted and controlled therapeutic agent release to improve treatment outcomes and patient compliance. Key innovations include enhanced liposome designs for stability, biocompatibility, and versatility, as well as the incorporation of targeting ligands for precise drug delivery. Triggered release mechanisms and combination therapies further amplify their potential, enabling synergistic effects and reducing toxicity. Integration with nanotechnology has expanded liposome applications beyond oncology to infectious diseases, neurological disorders, gene therapy, and regenerative medicine. In oncology, liposomes have improved chemotherapy by enhancing drug bioavailability and minimizing side effects. Additionally, stimuli-responsive liposomes release therapeutic agents in response to pH, temperature, or enzyme activity, pioneering precision medicine. They also play a pivotal role in gene therapy, delivering genetic materials like siRNA and CRISPR/Cas9, which enable targeted gene editing. Despite these advancements, challenges remain. Scalability, manufacturing complexities, regulatory hurdles, toxicity concerns, and intellectual property issues require resolution to translate laboratory successes into clinical practice. Addressing these issues through research, industry collaboration, and standardized methods will ensure progress. Liposomes will enable tailored treatments, combat antibiotic resistance, enhance immunotherapy, and improve vaccine efficacy. With projected market growth to USD 4.4 billion by 2025, liposomes are set to transform healthcare. By reducing side effects, enhancing efficacy, and improving patient compliance, they will remain at the forefront of pharmaceutical innovation, offering new hope for diverse medical challenges.

Table:1-Diff. type of Liposomal Classes

Liposomal Class	Categorization
Passive liposome	Anionic: Contains negatively charged phospholipids and cholesterol
Cationic liposome	Reconstituted Sendai virus envelopes are also referred to as Virosomes derived from the Sendai virus
Acid sensitive liposomes	Phospholipids like PE or DOPE are commonly paired with cholesterol or oleic acid. These combinations form lipid components for liposomes.
Lipopectin Liposome	Cationic lipids like DOTMA, DOTAP, or DDAB are often combined with DOPE.
Circulation enhanced liposome	Neutral liposomes consist of high-temperature phospholipids, cholesterol, and DSPC Contain 5%PEG

Table:2- Benefits of Liposomal Drug Delivery System

S.no	Factors	ADVANTAGE
1.	Biocompatibility	Liposomes are made up of phospholipids which make them biocompatible and non -toxic
2.	Site targeting	Liposomes are used to target specific tissues or receptor
3.	Reduced toxicity	Liposomes have lower toxic side effect than traditional drug delivery system
4.	Enhanced pharmacokinetic	Liposomes can enhance pharmacokinetic properties
5.	Improved Biodistribution	Liposomes can improve biodistribution at targeted sites

Table: 3-Targeted Application & Outcomes

Title	Targeted Application	Invitro-In vivo Studies	Limitations / Role
Endocytosis of liposome By Human T- Leukemia cells in consideration of ligand antibody	T-Leukemia cell	In-vivo study	The protein liposomes were ineffective with antibodytype antibodies against B- lymphoma.
Paclitaxel liposome based chemotherapy combined with immunotherapy combined with immunotherapy for tumour	Carcinoma and adenocarcinoma	In-vivo Study	The combination of paclitaxel liposome and immunotherapy has not been evaluated in advanced NSCLC.
Multifunctional nano particle-mediated	Lung diseases, bowel diseases, rheumatoid	In-vitro study	Interactions between therapeutic agents can

Amrita Nayak et al.,

cobining therapy for human diseases	arthritis& other cancer cardiovascular disorder		diminish their combined effectiveness, falling short of the expected additive benefit.
Multifunctional Nanoparticle-Mediated Combination Therapy for Human Diseases & Immunotherapeutic Strategies for Aging-Related Neurodegenerative Diseases: Emerging Perspectives and Novel Targets	Alzheimer including Parkinson's disease	<i>In-vivo</i> study	The therapeutic effectiveness of statins and antihypertensives in treating Alzheimer's disease (AD) and vascular contributions to cognitive impairment and dementia (VCID) remains uncertain. However, patients with overlapping pathology from both conditions may benefit from a combination of immunotherapy and cardiovascular disease management.
Inflammation ,autoimmunity and neurodegenerative therapeutics and beyond	Amyotropic lateral sclerosis (ALS),Friedreich's ataxia ,frontotemporal lateral sclerosis,alzeimer and Parkinson's disease	<i>In-vivo</i> study	Tpe with albumin exchange may slow cognitive and functional decline in AD patients.
Stimuli liposomes	Stimuli	Principle	Advantage
Photosensitive liposomes	UV, near infrared or visible light irradiation	Phospholipids modified with light-sensitive groups form the basis of photoactivable liposomes. These modified phospholipids create liposomes that respond to light. This innovation enables controlled release of liposome contents.	Controlling ,wavelength and intensity
Thermo responsive liposome liposomes	Radiofrequency or microwave ablation	Liposomes composed of lipids like DPPC, with a phase transition temperature of 40-45°C, are used for radiofrequency or microwave ablation.	Targeted drug release at high temperature sites
Reductive responsive liposomes	Reactive oxygen species (ROS),peroxides ,hydroxyl radicals singlet oxygen	Drug release is triggered by the cellular redox potential difference, which occurs naturally during biological processes. Enzymes like proteases and esterases break down	Reactive Oxygen Species (ROS) induce elevated glutathione levels in tumor cells. This increase triggers the cleavage of liposomal formulations.

Amrita Nayak et al.,

		amides or esters, releasing the loaded drugs.	The breakdown releases the encapsulated therapeutic agents, targeting the tumor cells.
Enzymatically triggered liposomes	Protease,amidaseand esterase enzymes	Enzyme-triggered release occurs through hydrolysis. Proteases and esterases break amide/ester bonds. Loaded drugs are then released.	Liposomal formulations reduce the toxicity of potent drugs, mitigating adverse side effects. They also enable the effective encapsulation of prodrugs. This targeted approach enhances therapeutic efficacy while minimizing harm.
PH-responsive liposomes	Ph change	pH-sensitive liposomes were successfully prepared using cholesteryl hemisuccinate and 1,2-dioleoyl-sn-glycero-3-phosphoethanolamine. These components enabled the creation of liposomes that respond to changes in pH levels.	Liposomes with ph activated release mechansim

Table: 4- Current Progressive Liposomal Drug Delivery

Acid groups	Description	PH Range	References
Oleic acid	pH-sensitive liposomes can release their cargo in response to acidic environments, but may be destroyed by interacting with endosomal membranes. Researchers are working to improve their stability and efficacy.	5.0-7.4	[11]
Succinic acid derivatives	A stimuli-sensitive polymer was grafted onto liposomes, creating dual-responsive liposomes that destabilize at mildly acidic pH.	4.0-5.5	[12]
Poly(Acrylic acid)	The pH-sensitive polymer network surrounding the liposomes controls the release properties. This is achieved by inserting cholesterol-terminated poly(acrylic acid) (Chol-PAA) and then crosslinking it with 2,2-(ethylenedioxy)-bis(ethylamine)	4.5-7.0	[13]
Aspartic acid	Incorporating polyaspartic acid into liposomes confers pH sensitivity, thereby augmenting tumor-targeted drug delivery and yielding enhanced cumulative release and cytotoxic efficacy.	5.0-7.4	[14]
Glutaric acid	Liposomes modified with 3-methylglutarylated hyperbranched poly(glycidol) exhibit pH-dependent behavior, dynamically shifting their hydrophilic-lipophilic balance in response to acidic environments.	5.5-7.5	[15]
Amine -protonation /deprotonation	Amine functionalities facilitate pH-dependent permeability shifts in drug delivery systems by undergoing reversible protonation and deprotonation, enabling responsive release profiles.	6.0	[16]
Phosphoethanolamine	The synergistic combination of unsaturated phosphoethanolamine species and amphiphilic stabilizers enables the creation of pH-sensitive liposomes, which undergo phase transitions in response to pH changes, triggering content release.	6.5-7.2	[17]

Amrita Nayak et al.,

Table:5-Use of Liposome in Nanoformulation

Liposomal Compound	Nano Formulation Application	Mechanism	References
Doxorubicin	Liposomal doxorubicin formulations are utilized in the management of various malignancies, including ovarian cancer, Kaposi's sarcoma, and multiple myeloma.	Doxorubicin functions by inhibiting topoisomerase 2, a crucial enzyme that cancer cells require for cell division and proliferation.	[18]
Amphotericin -B	Amphotericin B, a polyene antibiotic, pioneered the development of nanosized liposomal formulations. Liposomal encapsulation mitigates renal toxicity and amplifies the therapeutic index by associating the drug with lipids.	Amphotericin B exerts its antifungal activity by binding to ergosterol in the fungal cell membrane, leading to the formation of transmembrane pores. This results in the leakage of essential ions and ultimately, fungal cell lysis and death.	[19]
Verteporfin	Verteporfin is light -activated drug that can be encapsulated in liposomes an injectable drug that used to treat eye diseases like macular degeneration pathologic myopia and ocular histoplasmosis .Lipid based nanoparticles can be used to deliver verteporfin to PdT they are biocompatible circulate for long time .	Verteporfin is a photosensitizing agent that, upon activation by light in the presence of oxygen, produces reactive oxygen species. These reactive species selectively damage the vascular endothelium, resulting in occlusion of the targeted blood vessels.	[20]
Lidocaine	Lidocaine nanoparticle are used to enhance antitumor activity of lidocaine they are prepared by encapsulating the hydrophobic base form of lidocaine with a self - assembling peptide inhibit the proliferation of cells ,induce cell and slop down rate of lidocaine	Lidocaine mechanism id blocking voltage -gated sodium channel prevents the propagation of action potentials	[21]
Daunorubicin	Daunorubicin is is an antineoplastic drug delivered in liposomal nanomaterial to treat cancer to improve long term survival in patients .Approved to treat adults with acute myeloid leukemia and AML-with myelodysplasia.	Daunorubicin's antimitotic and cytotoxic effects arise from its ability to intercalate between DNA base pairs, forming stable complexes. This action inhibits topoisomerase II by locking the enzyme-DNA complex in place.	[22,23]

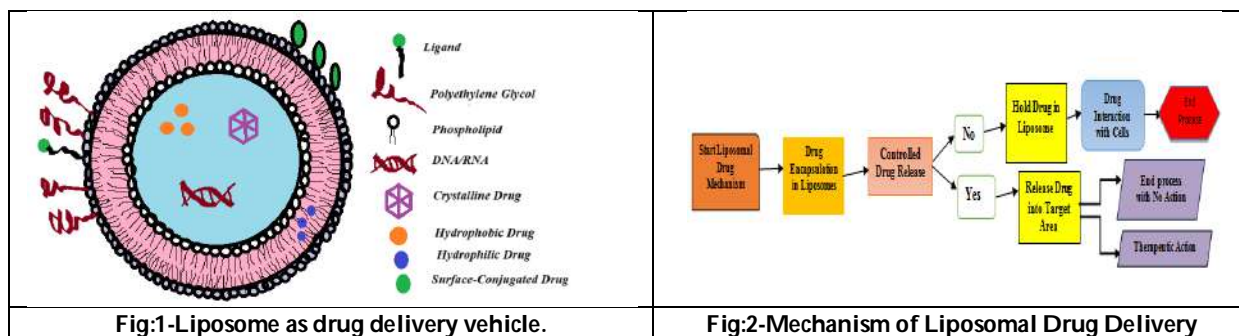

Table:6- Challenges and result of LDDS

Aspect	Advantages/Applications	Challenges/Issues	Future Directions/Insights	Reference
Liposomes in Drug Delivery	Broad compatibility with hydrophilic and hydrophobic drugs, low toxicity, enhanced drug efficacy, sustained release.	Stability, bioavailability, biocompatibility, storage challenges.	Optimize lipid composition, size, surface charge, and loading capacity.	24-25
Nanotechnology in Healthcare	Precise surgical tools, gene repair, intelligent patches for	Safety and environmental risks of	Enhance characterization, safety	26-28

Amrita Nayak *et al.*,

	diagnostics, 3D frameworks for tissue engineering.	nanomaterials.	protocols, and regulatory compliance.	
Lyophilization in Biologics	Improves stability and shelf-life of sensitive formulations.	Intricate process requiring optimization of formulation and parameters.	Use modeling for scale-up and reduce development time.	29-31
Reproducibility in Research	Ensures reliable results, efficient error detection, and fosters trust.	Inadequate data sharing, workflow complexity, and insufficient documentation.	Promote open science practices, standardized methodologies, and tools like Docker.	31-34
Special Populations in Research	Address health disparities, ensure tailored treatments, and promote inclusivity.	Ethical and funding challenges, underrepresentation.	Balance ethical safeguards with the need for research to improve outcomes for vulnerable groups.	35-39
Nanoparticles in Industry	Versatile applications in medicine, cosmetics, textiles, and more.	Potential toxicity, surface charge effects, and unknown health risks.	Rigorous safety assessments and regulatory frameworks to balance innovation and safety.	39-42

Behavioral Shifts in Remote Work and their Environmental Implications: A Natural Sciences Perspective

ABSTRACT

The COVID-19 global Pandemic has brought about a total transformation of traditional work paradigms by significantly shifting the workforce at the global level towards remote work. This has inspired a novel surge in the value of flexibility alongside autonomy for individual employees. A recently conducted MIT survey found that about half of the workforce works remotely, suggesting a growing trend. While it is a fact that productivity and work-life balance is enhanced through remote work, it also presents some inherent challenges for employers as well as employees. In addition to organizational impacts, work-from-home (WFH) policies are affecting us in ways that are both ecologically and behaviourally interesting. Our commuting behaviors have been altered, leading to a temporary reduction in the key sources of urban air pollution and energy consumption. Resource use and human-environment interactions at the local levels have been altered due to continued reliance on at-home workspaces. The present study seeks to critique the WFH option and investigate the behavioral implications and intersection of remote work with natural sciences while including its environmental and ecological dimensions. The research is quantitative as it has gathered data from over 281 respondents through the survey method using a questionnaire. Secondary data sourced from journals, conference proceedings, and newspapers have been analyzed to contextualize findings and identify research gaps. The study affords suitable insights into the implications of remote work and has offered suggestions for improving its effectiveness while developing sustainability and interdisciplinary comprehension.

Keywords: Pandemic, Work from Home, Remote Work, Behavioral Dynamics, Environmental Implications

Shalini Acharya et al.,

INTRODUCTION

The pandemic has quickly changed how the world's people deal with their lives. One of the most radical shifts has been from the conventional office settings to remote work from anywhere (WFH) arrangements. While these reforms' organizational and psychological impacts have drawn extensive scrutiny, their interaction with the natural sciences is underexplored. Adjustments in conduct due to Work From Home guidelines that include changes in commuting, resource usage, and interactions with local areas and sustainability have had tremendous implications on ecological systems and sustainability. Remote work has lessened urban congestion and the associated commuting, leading to temporary reductions in air pollution and the usage of energy. However, an increase in reliance on digital technologies and home energy consumption pose new challenges to environmental sustainability. Moreover, changes in work settings impact human interactions with green spaces, wildlife, and natural resources, providing a unique opportunity to study behavioral responses within ecological frameworks. The present study focuses on how reshaping human behaviour through work-from-home (WFH) policies in the wake of the COVID-19 pandemic has branched out to include environmental and ecological implications. By bridging behavioral science with natural science, this work contributes both to a comprehensive understanding of the wider implications of remote work as well as to a foundation for sustainable route policy design and multidisciplinary research initiatives. According to a new MIT study almost half of those who were employed in organizations are now working remotely. Organizations have scrutinized their working models, work cultures, values, and having considered the changing needs of the workforce over the last couple of years, have afforded them greater autonomy and flexibility. There has been an increased trend towards work from home or remote work which has resulted in improvisations, both on the part of the employers and employees. Many company executives have witnessed for themselves that productivity can be heightened and excellent work can be achieved through remote work and many organizations including Twitter and Facebook are contemplating providing permanent work from home options to their employees.

Background to the study

Hopefully the Covid-19 is behind us. However, nearly five years ago, when the World was helplessly reeling under the dread of the COVID-19 pandemic along with the fear of rising death toll due to the lethal virus, the WHO declared the COVID 19 as a pandemic and the Government of India announced a complete lockdown. Companies began to implement work from home policy for their staff as part of encouraging social distancing to curb the menace of the pandemic. Work from home became the need of the hour for most of the working population and has now become common for many employees around the globe -(Eva Thulin, 2019) This has brought a mammoth change in the way employees work. The digital transformation and the virtual workspace have made the employees work together, despite being located in different parts of the country or across the continent.

Work from Home: Meaning and Benefits

WFH means an employee works from the house, apartment, or place of residence, rather than working from the office. This debate regarding whether WFH is a conducive work policy has been in vogue from the time the world has begun to shift towards digital technology as its principal form of consuming, with supporters of both schools of thoughts providing some conflicting yet sensible and workable contentions for their stance. All the proponents of work from home argue that the system provides their routine a much needed suppleness and flexibility. In contrast, the supporters of work from office contend that the entire objective of work from office is to construct and create an atmosphere that encourages effort and promotes teamwork.

LITERATURE REVIEW

In (Farrell, 2017) the author opined that family and work are the most significant elements of human life. (Derek H. T. Walker, 2008) opined that work-family balance is easily one of the most challenging issues that face families in the 20th century. It cannot be denied that the home plays a pivotal role in sustaining the well-being of people and society.

**Shalini Acharya et al.,**

Interestingly, (Friedman, 2014) stated that in order to be effective, one needs to know what is important and what matters. The author recommended an exercise called “Four circles”. This represents the four domains- namely profession/work, home, the community at large and the self. Interestingly he suggested modifying the sizes of each circle depending on the value one allocates to each. That will provide an insight into their values, goals, actions and the results thereof with respect to each area. According to (Christine A. Grant, 2013), Technology has impacted work significantly and has rendered work from home or elsewhere, a possible option. According to (Nancy B. Kurland, 1999) work has become an unbounded activity which can be carried out anytime and anywhere. In (Toffler, 1980) the author opined that the current forms of flexibility have the potential to facilitate balance between work and home. Work-life balance is often very challenging and is most times a mirage. According to (Yang Xiaoming¹, 2014) (Michael T. Ford, 2007), with respect to employees, these challenges can manifest into health issues and family difficulties. And for the employers, the results of work-home demands can result in higher rates of absenteeism, higher percentage of employee turnover and lower productivity. In (Vielhelmson et al, 2016), the author stated that work from home has become the need of the hour for most of the working population in the existing ways of work-life. In fact, the office space has now been combined with the personal space. This has resulted in bringing about a phenomenal change in the way people function. The digital transformation has facilitated team work among employees’ despite being placed at different geographical locations. According to (Jaime B. Windeler, 2017), maintaining a certain level of interaction especially social interaction is very important for smooth employee functioning, when they work from home. Wide-ranging research has been conducted earlier which has focused on the influence of work from home on the performance of employees. These include (Bailey, 2002) (Angel Martínez Sánchez, 2007) (Lilian M. de Menezes, 2011). In (Tammy D. Allen¹, 2015) (Amanda J. Anderson¹, 2014) the author opined that working from home actually lead to better performance. However, some studies by authors like (Kumar, 2022) working from home results in isolation – both professional and social that limits knowledge sharing. Due to a tremendous increase in dual earners, flexible working has assumed importance for balancing personal and professional lives (Helen Russell, 2007).

In (P.S. Reshma, P. S. Aithal, & Sridhar Acharya, 2015), the authors developed the concept of Work from Home into an E-business model that became popular due to the outbreak of the pandemic and also due to the use of digital mode. They have analyzed how office management system works on an online basis by using the ABCD analysis technique which refers to the advantages, benefits, constraints & disadvantages in the e-business model framework model. Authors (Kira Rupietta & Michael Beckmann, 2016) analyzed how working from home affects the employees. The authors used German Socio-Economic Panel (SOEP), to evaluate self-selection in working locations which they have used as a variable. Through their study they found that WFH has a positive influence on as they have autonomy and they can save operating costs due to reduced office space. (Daniel Daniel, et al., 2020) discussed the benefits of work from home such as reduced the commutation time, reduced intervention by the management, higher outcome, safety at work place as employees worked from their respective homes, very low absenteeism & higher productivity. (Amin Al-Habaibeh, Matthew Watkins, Kafel Waried, & Maryam Bathaei Javareshk, 2021) analyzed the challenges & opportunities of the IT sector during Covid-19 pandemic. They conducted a survey on the difficulties faced by the employees in using online tools, combining their working hours with daily routines. They had to face new digital experience such as online board meetings, video recordings & in process acquire knowledge for digital working. Through their study they found that employees did not have to travel when working remotely which had a positive impact. However, they also faced difficulties such as network connectivity issues. The authors discussed the self-determination theory that provides an explanation of the efficient & faster adaptation to technology. (Lina Vyas & Nantapong Butakhieo, 2020) in their article on the impact of work from home during COVID-19 conducted an exploratory study on Hong Kong and analyzed how work from home affected both employers and employees in the aforementioned country. This required changes in the policies that reshaped the structure of working hours with flexibility. Work from home became a priority policy for the Government, an exploratory study was conducted with a SWOT analysis & if work from home could be a permanent arrangement. (Chinnaiah P.M & Smt.Chyitra P., 2021) examined how work from home affects the performance & sustainability of IT sector in pandemic times. According to their study, they found seven challenges such as time management, physical infrastructure, increased mental stress, lack of good network connectivity, lack of interaction in the family, lack of support or trust from their

**Shalini Acharya et al.,**

superiors & lack of motivation. (Sanchez Daniel Garrote, et al., 2020) discussed the benefits of work from home such as reduced the commutation time, reduced intervention by the management, higher outcome, safety at work place as employees worked from their respective homes, very low absenteeism & higher productivity (Amin Al-Habaibeh, Matthew Watkins, Kafel Waried, & Maryam Bathaei Javareshk, 2021) have analyzed the challenges & opportunities of the IT sector during Covid-19 pandemic. They conducted a survey on the difficulties faced by the employees in using online tools, combining their working hours with daily routines. They had to face new digital experience such as online board meetings, video recordings & in process acquire knowledge for digital working. Through their study they found that employees did not have to travel when working remotely which had a positive impact. However, they also faced difficulties such as network connectivity issues. The authors discussed the self-determination theory that provides an explanation of the efficient & faster adaptation to technology. (Thomaz Teodorovicz, Raffaella Sadun, Andrew L. Kun, & Orit Shaer, 2021) in their working paper on Working from Home have tried to explore the impact of this new adaptation amongst the knowledge workers in America. The new work shift resulted in WFH arrangements, allocation of time across different activities & responsibilities & cope up with managerial responsibilities & individual contribution. They wanted to understand how human computer interaction (HCI) technology affected in terms of improving productivity, well-being, team work & social interactions. The study related to pre & post COVID days & found that there exists heterogeneity between managers & non-managers, how they could balance their work & personal life during WFH amongst knowledge workers. (Tariq Albluwi, Md Atiqur Rahman Sarker, Zubayer Abir, & Fabia Hannan Mone, 2022) conducted an exploratory study to examine the challenges & measures to improve the new policy Work from Home due to the outbreak of the pandemic from the organizations in Malaysia. Their study highlighted challenges like lack of motivation, less social life, pay cuts, low communication, mental health & slow internet connectivity. They also found that self-management was one of the challenges as there was no fixed time or specific rules for work from home.

Theoretical Background

Some of the theories that relate to the present study and to analyze the impact of work from home on performance & motivation, are discussed below. A theory on motivation that relates to satisfaction, performance & rewards is put forward by Porter & Lawler. According to them, performance is linked to a reward, it is the reward that drives motivation & performance. The theory considers factors such as value of reward, efforts, energy to execute a given task, abilities, traits & perceptions. They opined that performance leads to satisfaction. Performance which leads to satisfaction & motivation includes these aspects namely increased pay, promotion, job security & status. Another theory related to the present study is the Six Factor Model of Psychological wellbeing stated by Carol. The theory states that factors such as personal mastery, autonomy, a feeling of purposed, meaning in life, personal growth & development, positive relationship with others will cause psychological well-being of individuals. In this context, positive relationship with others implies co-workers, supervisors & colleagues, all of whom try to maintain work life balance through social exchange & feelings such as empathy, trust & respect that contribute towards the individual's & organizational growth. Maslow's motivational theory can also be related to the study. Maslow refers to a hierarchical level of psychological needs in a pyramid. Employees in an organization would aim for feeling of accomplishment, security, status apart from other basic psychological needs which include affection, belongingness & basic needs. A feeling of accomplishment & achievement will add to the organizational growth & also individual growth. Another theory by S Gundel in his theory of typology of crises where the pandemic can be categorized as an intractable crisis which means difficulty, preparedness, hard work, stress that employees had to face due to lockdown restrictions during the pandemic.

The objectives of the paper are the following

- I. To examine if the preference to work from home is gender specific and/or age specific.
- II. To study the benefits and implications of work from home policy.

Shalini Acharya *et al.*,

RESEARCH METHODOLOGY

This study is quantitative in nature and data is being gathered from approximately 281 respondents. A structured questionnaire was adopted to gather data. The questionnaire comprised of a total of 12 questions with six questions pertaining to demographics. Data was collected from full time employees. The answers revealed the inherent challenges involving work from home and some suggestions to overcome such challenges. The analysis revealed the hypothesized relations between age of the respondent and the notion that work from home is a conducive work policy; gender and the notion that work from home is a conducive work policy. The current research of WFH among employees in India is an attempt to assess the antecedents in current situation. These results have important theoretical and practical implications. Secondary data has been extensively used from sources like newspapers, published research articles, journals and conference proceedings available at the national and international level. Information obtained from different sources have been used for providing inputs on the subject as well as identifying research gaps in the domain of the study.

Data Analysis

Reliability Test

Cronbach Alpha reliability

Reliability Statistics	
Cronbach's Alpha	N of Items
.796	35

We have tested reliability by using Cronbach's Alpha. Since value is 0.796 i.e., more than 0.7, we can conclude all the scale measurements had shown reliability.

Demographic Divisions

Gender of Respondents

The graph indicates that in the selected sample, there is a distribution of 56% male and 44% female participants. This distribution suggests a relatively balanced representation of gender within the sample, with a slightly majority of male participants.

Age of Respondents

The age distribution of respondents in this study is detailed in the above chart. The largest age group among the participants falls within the 36-40 years range that comprised 20% of the total respondents, with a substantial count of 56 individuals. The second largest group is in the 31-35 years range that represented 18% of the sample consisting 51 participants. Other age groups have also contributed to the data set making up smaller proportions. The cumulative total of respondents in the study is 281, provided a comprehensive overview of the age demographics within the sample.

Testing the Hypotheses

The survey method adopted in this study resulted in remarkable findings relating to the challenges and solutions of Work from Home being a Virtual reality.

Hypothesis 1

H₀: There is a no significant relationship between Gender/Age and the desire to Work from Home.

H₁: There is a significant relationship between Gender/Age and the desire to Work from Home.

Since the P value is less than 0.050, it can be inferred that the null hypothesis can be rejected and the alternative hypothesis can be accepted. This proves that there is a significant relationship between Gender as well as Age and the desire to WFH.

Shalini Acharya et al.,

Hypothesis 2

H₀: There is a no significant relationship between Gender and the advantages and difficulties linked towards Work from Home.

H₁: There is a significant relationship between Gender and the advantages and difficulties linked towards Work from Home. Since the majority of the P values is $< .001$ which is highly significant in nature, it can be inferred that there is a significant relationship between Gender and the advantages and difficulties linked towards WFH. Hence, the null hypothesis can be rejected and the alternative one can be accepted.

Findings: The following findings were revealed as per secondary data:

Biggest struggle with working remotely, according to State of Remote Report-2019.

Challenges from the employer's perspective

- Collaborating with remote team members can be incredibly challenging, especially if they don't have the right tools with them.
- Employees working from different locations and time zones.
- Building and maintaining trust.
- Tracking employee performance.

Some revealing statistics regarding WFH

In a survey conducted, it was revealed as follows:

- 90% of the Indian employees who operate from home feel that better connectivity is a must to improve efficiency.
- Around 20% of the employees faced challenges when they attempted to share large files.
- Almost 19% of the employees feel isolated and lonely after work from home option after a substantial stretch.
- Almost 7% of the employees feel tempted to take a vacation when nobody is keeping check.
- A majority of them find it hard to maintain a work-life balance.
- Majority of the employees find it rather challenging to unplug into their normal routines.
- A number of them start questioning the reasons for their work from home and end up becoming less productive.
- Perhaps all these factors contribute to rendering work from home more challenging.

Some of the prominent benefits are: Benefits to employers- Based on secondary data

- WFH can result in improved productivity than the conventional working style (Kathryn L. Fonner, 2010)(Timothy D Golden, 2005)(Nicholas Bloom, 2015)
- Reduction in turnover rate (Eleni T. Stavrou, 2010)(Nicholas Bloom, 2015)
- Reduction in organizational cost (Prithwiraj (Raj) Choudhury, 2020)
- Employees can be hired from a wider talent pool as WFH will be unrestrained from geographic conditioning.
- In case of some undesired event, such as any natural calamities, distributed workforce ensures continuity in operation and hence reduces the risks.

Benefit to employees- Based on secondary data

- It helps in reduction of commuting time:
- This is specifically important in the Indian context as its people spend on average 7% of the day in commuting (Thomson et al 2012)
- Reduced travel and other associated costs
- The lower level of stress in employees and better work-life balance(Kathryn L. Fonner, 2010)(Nicholas Bloom, 2015)
- Increased autonomy for individuals (Harpaz, 2002)
- An increase in leisure time and family time (Samantha K. Ammons, 2010)
- Increased job satisfaction (Franco Gandolfi, 2011)(Madsen, 2003)
- Less distracted by co-workers (Timothy D. Golden, 2008)

**Shalini Acharya et al.,****Benefits to society- Based on secondary data**

- It helps in alleviation of pollution, especially air pollution. (Diane E. Bailey, 2002)
- It holds special importance in Indian context as 21 of the world's 30 most polluted cities are in India and vehicular pollution constitutes a major chunk of it.
- Less Traffic congestion: Indian roads are notoriously known for heavy traffic congestion. In many of its many major cities, the average time taken to reach to the workplace is highest in the world.

Findings based on secondary data

What has changed the most about your work, now that you work remotely.

Testing of the Hypothesis

There is a relationship between gender and desire to work from home. It was observed that majority of the men respondents preferred the work from home culture and considered the work from home policy more ideal. The primary reason is that work from home has proven to lower stress levels besides providing increased time to pursue hobbies, interests and improve familial relationships. Besides, one of the best aspects of work from home is the escape from the rigid and traditional 9 to 5 routine. This allows flexibility to the employees to set their own schedules. However, women find it more challenging to work from home as they are required to multi-task. When they operate from home, the thin dividing line between their professional and personal lives, gets ruptured and they end up failing to have a work life balance. It was also observed that there was a significant relationship between gender and the advantages and challenges of work from home. Some of the benefits included providing emotional support, moving towards goal-oriented KPIs, considered group communication tools to allow employees to communicate even outside core group meetings. The challenges, on the other hand included, blurred work-life boundaries, inadequate practical equipment, employees experiencing social isolation, employees experiencing the right levels of supervision without overstressing the employees in the process. Besides other challenges included, retaining employee loyalty and talent retention besides overcoming lack of trust that was demonstrated by many of the employers.

Other findings based on Literature review

- Developing Blurred Work-Life Boundaries was one of the major challenges experienced by employees with respect to WFH.
- Employee Isolation was also one of the major issues with regards to WFH.
- Ensuring the correct levels of supervision and accountability without overly stressing employees in the process was a challenge faced by the employers.

Solutions recommended – based on Primary Data:

- Providing Emotional Support
- Supervisors should avoid excessive communications outside working hours, especially for nonessential tasks.
- Employers can consider moving towards goal-oriented key performance indicators (KPIs).
- Make sure to communicate KPIs clearly and reward employees that are performing above and beyond expectations
- Distractions at Home can be overcome by avoiding taking too many breaks as that may break the workflow. That will also result in low productivity.
- It is rather important for teams as well as managers to extensively use video conferencing in order to establish face to face contact. This is in contrast to earlier when text messages or email would have sufficed for the purpose of business operations.
- It is very important to communicate when individuals work remotely.
- It is important to use platforms like Google hangouts, Zoom and Microsoft Teams on a daily basis. It is an effective method to enhance strategies for employee engagement.
- It is important to set realistic goals besides seeking feedback in order to ensure that there is inclusiveness in the organizational objectives.

Shalini Acharya et al.,

- It is essential to focus on results rather than activities. This is recognized as an essential practice to improve employee empowerment and engagement.
- It is imperative to downsize the number of zoom sessions and to avoid going overboard. It is conducive to schedule time for non-work related activities and talks.
- Mentoring is preferred as compared to managing. It is an accepted practice for managers to mentor and coach their employees rather than manage them.
- Empathy on the part of the manager is most recommended as every team member is unique and has myriad requirements. It is therefore important for every manager to be mindful and cognizant of each employee's unique situation.

ABSTRACT

Quadrilateral Route Factor Assessment (QRFA) in Mobile Ad-hoc Networks (MANETs) is a method used to evaluate the efficiency and reliability of routes in MANETs based on quadrilateral geometrical properties. In MANETs, where nodes dynamically form a network without the reliance on a fixed infrastructure, routing becomes a critical aspect. QRFA aims to assess the quality of routes considering factors like link stability, interference, and transmission range. The basic idea behind QRFA is to identify quadrilateral areas formed by nodes in the network. These quadrilateral areas can represent potential areas of contention or interference, affecting the stability and performance of routes passing through them. By assessing the properties of these quadrilaterals, such as their size, shape, and overlap with other quadrilaterals, QRFA helps in identifying routes with higher reliability and efficiency. QRFA can be used in routing protocols and algorithms to improve the selection of routes in MANETs, leading to better overall network performance and robustness against dynamic network conditions.

Keywords: Quadrilateral Route Factor Assessment, Geometrical, MANETs.

INTRODUCTION

MANETs are decentralised wireless networks where nodes can dynamically join and leave the network. Routing protocols are needed to find paths between nodes. QRFA is a routing protocol proposed for MANETs that selects routes based on hop count, energy level, mobility, and security. Each factor is assigned a weight, and routes are ranked based on a composite metric. A MANET network is a network of portable devices that can connect

91259

**Kundalakesi et al.,**

dynamically at any time and location without any fixed organisation. These devices, including laptops, smart phones, and sensors, work together to provide essential network functions in a distributed manner. One of the critical features of MANET networks is that they allow devices to move freely and autonomously in any direction, connecting and disconnecting from the network at will. However, this also means that variations in link state with other nodes are experienced regularly, posing significant challenges for routing protocols operating in MANET.

QUADRILATERALROUTE FACTOR PREDICTION TECHNIQUES

The Quadratic Route Factor Estimation technique in MANETs involves partitioning the entire network into four quarters within the geographic network region. This approach maintains route details and network information at each time frame for each specific quadratic region, providing a detailed picture of the network's performance. This technique allows routing protocols to make optimal routing decisions based on current network conditions and ensure efficient communication in MANETs. The process can be outlined as follows:

Geographic Partitioning

Divide the entire network region into four quarters based on a geographical or coordinate system. Define the boundaries of each quadrant, creating distinct areas within the network.

Time Frame Management

To ensure optimal network performance, it is essential to document route specifics and network data regularly.

Quadratic Region Analysis

To analyse the quadratic region in each quarter, it's essential to consider several key parameters such as the node count, distance between nodes, transmission range, network traffic load, and node mobility. By carefully examining these factors, we can gauge the quality of routes and tailor routing protocols to the current network conditions.

Snapshot Generation

In MANETs, it is essential to capture snapshots of the network topology and note the characteristics of each quadratic region. This approach enables routing protocols to adapt to any dynamic changes in the topology and ensure smooth and efficient communication.

Route Details Storage

Recording route details within each quadratic region is crucial in MANETs. This includes established routes, hop counts, and factors influencing routing decisions, enabling optimal routing decisions and efficient communication.

Data Persistence

Storing snapshots and route details persistently are crucial for retrospective analysis and optimising routing strategies in MANETs. Implementing a storage mechanism that allows easy retrieval of historical data enables the identification of patterns and trends, ensuring efficient communication.

Analysis and Estimation

In MANETs, collected data can be utilised to analyse the network's behaviour, route changes, and performance trends over time. Quadratic Route Factor Estimation techniques can then be applied to assess the impact of factors on route selection within each quadrant. By analysing the network's behaviour and performance, routing protocols can make optimal routing decisions and ensure efficient communication in MANETs.

Adaptation and Optimization

In MANETs, optimising routing strategies in each quadratic region is crucial. By analysing network behaviour and dynamics, routing protocols can adjust routing decisions and identify patterns and trends within the network. The QRFE technique facilitates retrospective analysis and continuous optimisation of routing strategies, ensuring efficient communication and protecting against routing attacks. To detect routing attacks in MANETs, a method analyzes the

Kundalakesi et al.,

route trace and network snapshot at different locations. The method selects nodes based on various parameters, improving network performance and throughput ratio. By using packet information, the process can identify malicious nodes and protect against routing attacks, ensuring efficient communication in MANETs. The QRFE technique provides a solution to handle these attacks using the route factor. By computing the route factor, the QRFE technique enables routing protocols to make optimal routing decisions that ensure efficient communication and protect against routing attacks in MANETs. Figure 1 Illustrate The phases involve assessing various factors such as Route discovering quadratic zones, Exploration and Route variable Estimation. Routing protocols and models for MANETs often involve assessing or considering multiple factors or metrics, such as path length, link quality, node mobility, energy consumption, traffic load, delay, throughput, and security.

- **Destination address:** The IP address or identifier of the target node.
- **Estimated cost:** A numerical value representing the overall quality of the path to the destination, calculated using the quadratic function.
- **Next hop:** The address of the next node on the path towards the destination.
- **Additional parameters:** Depending on the specific routing protocol, the table might include other relevant data like hop count, delay, or link quality metrics.
- **Node ID:** This column identifies the node for which the route is being calculated.
- **Route:** This column shows the specific route from the source node to the destination node.
- **Hops:** This column indicates the number of hops in the route.
- **Route Factor:** This column calculates the quadratic route factor, which is the product of the squared distances between each hop in the route.

Discovering Quadratic Region

This section captures network details and generates the network topology. At each time window, the sink node performs time-oriented snapshot generation, maintaining traces of packets and location details of nodes in different regions. The sink node adapts to the frequent changes in topology due to node mobility. To support routing attack detection, maintaining an essential network topology is crucial. The generated snapshot is then updated with nodes detected in quadratic routing attacks.

Algorithm 1.1: Discovering Quadratic Region

```

Input  : Node Traces, Node Locations, Time Windows, Threshold
Output : Discover the Quadratic Region

Step1: Initialization
Initialize sensor nodes with their positions in the region.

Step2: Splitting Region into Four Quarters
Divide the region into four quarters (Q1, Q2, Q3, Q4) based on the coordinates
of the region's center or a predefined reference point.

Step3: Calculate the coordinates of the center point (Cx, Cy) of the region.
region_center = calculate_region_center(sensor_nodes)
Cx, Cy = region_center[0], region_center[1]
# Define the coordinates of the four quarters
Q1 = (Cx, Cy)
Q2 = (Cx, Cy)
Q3 = (Cx, Cy)
Q4 = (Cx, Cy)

Step 4: Assign Nodes to Quarters
Iterate through the sensor nodes and assign each node to one of the four
quarters based on its coordinates.
for node in sensor_nodes:
    x, y = node.coordinates
    if x >= Cx and y >= Cy:
        # Node is in Q1
        assign_node_to_quarter(node, Q1)
    elif x < Cx and y >= Cy:
        # Node is in Q2
        assign_node_to_quarter(node, Q2)
    elif x < Cx and y < Cy:
        # Node is in Q3
        assign_node_to_quarter(node, Q3)
    elif x >= Cx and y < Cy:
        # Node is in Q4
        assign_node_to_quarter(node, Q4)

Step 5: Quadratic Region Identification within Each Quarter:
For each time window Ti
    Identify Number of nodes present in the network region.
    
$$Nd = \sum_{i=1}^n Nodes(Ri) \cdot Ti \cdot Ri$$

    Generate topology Nt.
End
  
```

The above-discussed algorithm computes the network topology for each quadratic region being identified and used for route discovery.

Routing Exploration

The route exploration process involves calculating the feasible routes within each regional topology. The time-oriented snapshot exclusively constructs the network structure, and based on this topology, the method determines the overall count of routes accessible from the source node to the sink node. Subsequently, upon identifying the distinct routes, the method calculates the hop count for each available route. These computed routes are then employed to determine the quadratic route factor in the subsequent stage.

Algorithm 1.2: Routing Exploration

Input : Topology Set Ts: A set of network topologies.
Output : Route Table Rt: A table containing the available routes.

Step 1: Initialization
 The algorithm starts by defining its input (Ts) and output (Rt).

Step 2: Iterates through each entry in the topology set (Ts).
For Each Topology Entry Ti in Ts:
 Identify the neighbors of source node Sn
 $Ns = _Neighbors(Ti, Sn) TransmissionRange(Sn)$

For each topology entry (Ti), it identifies the neighbors of a specified source node (Sn).

Step 3: Compute Neighbors within Transmission Range
 Compute the neighbors (Ns) based on a specified transmission range of the source node (Sn).

Step 4: Compute Available Routes through Each Neighbor
 For each neighbor (Ni) within the computed neighbors (Ns), the algorithm proceeds to compute available routes.
 For Each Neighbor Ni in Ns:
 The algorithm iterates through each neighbor in the set of computed neighbors (Ns).

Step 5: Compute Routes Available
 calculates the routes available through the current neighbor (Ni).

Step 6: Add Routes to Rt
 The computed routes (Rts) are added to the overall route table (Rt).

Step 7: Update Rt
 The route table (Rt) is updated with the newly computed routes (Rts) for the current topology entry.

End

End

The algorithm concludes the loop iterating through neighbors (Ni).

The above-discussed algorithm computes the available routes in each region to perform routing attack detection.

Route Variable Assessment

The quadratic route factor is the value computed on each region according to the packet traces. The Next calculation involves analysing various aspects of the routes, including their transmission rates, payloads, hop counts, and common hops in malicious traces, to derive a comprehensive factor (QRF) that considers these metrics together. This approach involves maintaining records of transferred packets for various routes. The method calculates key

Kundalakesi et al.,

parameters for each route, such as packet transfer rate, payload, hop count, and more. Utilising these metrics, the method then calculates the Quadratic Route Factor (QRF), reflecting the reliability of each route for packet transfer. The method incorporates a set of malicious traces containing identified packet transfers to enhance its analysis. Leveraging these traces, the method calculates the QRF value. Throughout the route discovery process, the method determines the quadratic route factor for each identified route. The computed QRF values play a crucial role in detecting routing attacks.

Algorithm 1.3: Quadratic Variable Assessment

Input: Route Table Rt, Network Trace Nt.

Output: QRF value

Step 1: Compute Transmission Frequency (Tf):

$$Tf = \frac{\sum (Traces, Ri \in Nt)}{size(Nt, Region)}$$

- This formula calculates the transmission frequency (Tf) for each route (Ri) from the route table (Rt).
- It involves summing the transmission rates (Traces, Ri) for each route in the set (Nt) and then dividing by the size of the set in the specified region.

Step 2: Compute average payload.

$$APL = \frac{\sum (Traces, Ri \in Nt), payload}{size(Nt, Region)}$$

- This expression computes the average payload (APL) for each route (Ri) in the set (Nt)
- It involves summing the payloads for each route and then dividing by the size of the set in the specified region.

Step 3: Compute average hop count AHC

$$AHC = \frac{\sum (Traces, Ri \in Nt), HC}{size(Nt, Region)}$$

This formula calculates the average hop count (AHC) for each route (Ri) in the set (Nt).

Step 4: Compute Common Hops in Malicious Trace (MCH)

$$MCH = _Hops (Traces, Ri \in MH) \cap MH$$

- This expression computes the set of common hops (MCH) present in the malicious traces (MH)
- It involves finding the intersection (common elements) of the hop sets for each malicious route

Step 5: Compute Number of matches in MCH(NM)

$$NM = \sum Ri Hops (Ri) \in MCH$$

This formula calculates the number of matches (NM) in the set of common hops (MCH). It involves summing the hop counts for each route that belongs to the common hops set.

Step 6: Compute the Quadratic Route Variable Estimation

$$\text{Compute QRF} = \frac{Tf \times APL}{AHC \times NM}$$

This expression computes the Quadratic Route Factor (QRF) by multiplying the transmission frequency (Tf) with the average payload (APL) and dividing by the product of average hop count (AHC) and the number of matches in common hops (NM).

Routing Anomaly Prevention

Addressing routing attacks involves evaluating and responding to the quadratic route factor. This entails computing the quadratic route factor for each available route. When multiple malicious routes are identified, a temporary sink node is deployed to gather data and facilitate routing attack detection. Subsequently, a route's reliability is determined by assessing the computed QRF value. The algorithm identifies and addresses routing attacks by evaluating the quadratic route factor. It calculates this factor for every available route. If multiple malicious routes are detected, the algorithm deploys a temporary sink node to collect data for routing attack detection. Subsequently, the algorithm uses the computed QRF value to determine the trustworthiness of each route, deciding whether it is safe for data transmission.

**Algorithm 1.4: Routing Anomaly Prevention**

```

Input      : Route Table Rt
Output    : Null

Step 1: Initialize Malicious Routes MRS

Step 2: Iterative Process for Each Region and Time Window
    for each region  $R_i$  in  $R_s$ 
    for each time window  $T_i$ 
    // Generate Snapshot
        Snapshot = GenerateSnapshot ()
    // Perform Route Discovery
        Routes = PerformRouteDiscovery (Snapshot)

Step 3: QRF Computation
    for each route  $R$  in Routes
        QRF = ComputeQRF ( $R$ )

Step 4: Detection and Addition to Malicious Routes
    if  $QRF > RTh$ 
        AddToMRS (MRS,  $R$ )

Step 5: Refining Malicious Routes by Region
        MRS = Union (MRS,  $R_i$ )

Step 6: Threshold Check for Sink Node Deployment
    if size (MRS) > (1/3 * size (Rt))
        DeployTemporarySinkNode ()

Step 7: Route Selection for Packet Transmission
        SelectedRoute = ChooseRouteWithLeastQRF (Routes)
        TransmitPacket (SelectedRoute)

Step 8: End of Algorithm

```

The algorithm mentioned above calculates malicious routes. If the count of malicious routes exceeds one-third of the total available routes, the approach involves deploying a temporary sink in the identified region. The method divides the entire geographic region into four quarters relative to a source node. For each quarter, the algorithm generates time-oriented snapshots and topologies. From the generated topology, the method computes available routes. Subsequently, for each route, it calculates the Quadratic Route Factor (QRF). By utilising the computed QRF values, the method assesses the trustworthiness of each node.

PERFORMANCE EVALUATION

The proposed system is implemented using Network Simulator 3. The effectiveness of the Quadrilateral Route Factor Assessment (QRFA) estimation technique is evaluated in conjunction with the AODV routing protocol under attack conditions and MOMM with attack conditions. Energy consumption should be modelled for transmit, receive and idle modes. Nodes may start with a fixed initial energy, which will deplete overtime. For QRFA, each node periodically broadcasts beacons with its current mobility and energy info. Routing tables are built at each node based on received beacons.

Analysis of Packet Delivery Ratio

In the quadrilateral route, there are 4 nodes arranged in a quadrilateral shape, with each node connected to its two adjacent nodes. Data packets take multi-hop routes along the edges of this quadrilateral. PDR depends on several factors like node mobility, transmission range, traffic load, etc. Increasing node speed and number of hops generally decreases PDR due to more frequent route breaks. In Figure 5.1, the analysis of the packet delivery ratio in the QRFA model is illustrated, showcasing variations in the number of nodes. The packet delivery ratio for AODV with attack stands at 75%, while MOMM achieves 95.5%. The proposed QRFA method exhibits an impressive packet delivery ratio of 97.5%. This outcome underscores the superior performance of the QRF method in comparison to the other two approaches. Figure 1.2 depicts the impact of node speed on the packet delivery ratio. The graph reveals that the packet delivery ratio of the QRFA method remains consistent despite changes in the number of nodes. Figure 5.3, Simulation result of Packet Delivery Ratio For quadrilateral MANET routing, moderate mobility, fewer hops, managed traffic load and optimal transmission range help achieve higher packet delivery ratios. Figure 1.4 shows the experiments to evaluate the packet delivery ratio of proposed routing protocols of QRFA such as varying node densities, mobility patterns, traffic loads, and network conditions.

**Kundalakesi et al.,****Analysis of Throughput**

Throughput ratio is an important performance metric in MANETs to evaluate the efficiency of routing protocols. It indicates the ratio of the number of data packets successfully delivered to the destination versus the number of data packets sent by the source. In quadrilateral routes with 4 hops, the throughput ratio depends on factors like mobility, traffic load, number of nodes, and routing protocol. High mobility of nodes causes frequent link breaks, which lowers the throughput ratio. Also, high traffic load causes congestion and packet drops. The number of nodes affects the availability of routes and interference levels. More nodes give more available routes but also higher interference. Proactive routing protocols like OLSR tend to perform better than reactive protocols like AODV regarding throughput ratio in quadrilateral routes. OLSR maintains fresh routes while AODV suffers from route discovery delays. Figure 1.5 depicts the assessment of throughput within the QRFA estimation model, considering different node quantities. In this analysis, AODV with attack exhibits a throughput of 650kbps, while MOMM with attack achieves 1800kbps. Notably, the QRFA with attack attains a superior throughput of 2250kbps. This figure underscores the enhanced performance of QRFA compared to other methods, emphasizing its capability to receive or forward packets exclusively from trusted nodes. Figure 1.6 illustrates the impact on throughput as node speed varies. The outcomes reveal a slight reduction in system throughput when AODV is under attack. Conversely, in the QRFA model, the variation in throughput is negligible even with an increase in node speed. Figure 5.7 illustrates the Simulation result of the Throughput Ratio of QRFA, Optimizing factors like node mobility, network density, traffic load, and routing protocol is key to achieving a high throughput ratio in quadrilateral multi-hop MANET routes. Figure 1.8 shows a metric used to measure the rate of successful message delivery in a network. It is calculated as the ratio of the number of received packets to the number of transmitted packets.

Analysis of Control Overhead

Based on the insights from Figure 5.8, it is evident that the control overhead in the QRFA scheme is lower than that in the AODV under attack scheme. This reduction is attributed to the QRFA method effectively minimizing the transmission of unnecessary control packets through its attack mitigation mechanism. Specifically, the control overhead for AODV under attack is recorded as 25000 packets, while MOMM with attack shows 18000 packets. In contrast, the QRFA method significantly decreases control overhead to 14000 packets. Figure 1.9 illustrates the correlation between node speed and control overhead. As the speed of nodes increases, there is an observed rise in control overhead. This increase is attributed to the potential for route failures when node speed is higher. In such cases, broadcasting routing messages becomes essential to identify new paths for transferring packets from the source to the destination. Figure 1.10 illustrates a Simulation result of control overhead can become substantial for large dynamic networks. However, it provides redundancy and robustness against frequent topological changes and link failures in MANETs. QRFA parameter tuning and optimization techniques can help reduce the routing overhead.

Analysis of Collision Rate

The collision rate of the QRFA method has been decreased to 4.33%. In contrast, the collision rate for AODV under attack is 8.23%, and for MOMM with an attack, it is 5.63%. As illustrated in Figure 1.11 and Figure 1.12, it is apparent that the collision rate of QRFA is lower when compared to AODV under attack and MOMM with attack. This reduction is attributed to the ability of QRF to eliminate collisions by identifying the QRFA factor. Stable high-quality routes selected by QRFA reduce the latency in data transmission, thereby decreasing end-to-end delays. Figure 1.13 illustrates the Simulation result of the Collision Rate of QRFA, The Collision rate increases exponentially with node density.

Analysis of End-to-End Delay

To analyze the average end-to-end delay for the quadrilateral route discovery process. The model considers factors like the number of nodes, node mobility, node transmission range, and network area. End-to-end delay is defined as the time from the origination of a route request packet to the reception of the first route reply packet at the source node. The analysis shows that end-to-end delay increases with an increase in node mobility and number of nodes. Figure 1.14 and Figure 1.15 illustrate that the end-to-end delay significantly increases in the AODV under attack

**Kundalakesi et al.,**

scenario. In this case, malicious nodes broadcast counterfeit routing messages to a source, leading the source to send all packets to these malicious nodes. Subsequently, these nodes may either drop the packets or transmit them to the destination after modifying their contents. This process introduces unnecessary delays during data packet transmission. However, the proposed QRFA system effectively reduces the delay to just 0.32 seconds. Figure 5.16 illustrates the Simulation result of end-to-end delay across a quadrilateral MANET route can be expected to be higher than a direct source-destination route, with the difference depending on specific parameters like node speed, number of hops, traffic load and routing protocol.

CONCLUSION

This chapter has introduced the Quadrilateral Route Factor Assessment (QRFA), a sophisticated model designed to detect and mitigate routing attacks in network systems. The QRFA model is composed of several integral phases, which include the identification of the quadratic region, exploration of potential routes, assessment of quadratic route variables, and the mitigation of routing attacks. The performance of the QRFA model is evaluated against two scenarios: the Ad hoc On-Demand Distance Vector (AODV) protocol under attack and the Multi Optional Moderation Method (MOMM) under attack. This comparative analysis provides a comprehensive understanding of the QRFA model's effectiveness. The results of the performance evaluation reveal significant improvements in various key metrics when the QRFA model is implemented. The Packet Delivery Ratio, a measure of the successful delivery of packets to their destination, sees an increase of 20.5%. The network's throughput, which measures the rate of successful message delivery over the communication channel, also sees a substantial increase, reaching 2200 kbps. Furthermore, the QRFA model manages to reduce the Control Overhead to 14,000 packets, indicating a decrease in the total number of control packets sent during the simulation. The Collision Rate, which measures the instances of packets colliding and being discarded, is reduced to 4.33%. The End-to-End Delay, which measures the average time taken for a packet to traverse the network from source to destination, is reduced to 0.32 seconds. Most notably, the QRFA method achieves an impressive Packet Delivery Ratio of 97.5%, demonstrating its effectiveness in ensuring the successful delivery of packets within the network. In conclusion, the results highlight the superior performance of the QRFA method across various performance metrics, highlighting its effectiveness in detecting and mitigating routing attacks. This chapter provides a solid foundation for understanding the QRFA model and sets the stage for further discussions on its applications and implications in subsequent chapters.

ABSTRACT

World over the existing road network is under tremendous stress due to ever increasing surge in vehicular traffic on account of rapid urbanization and industrialization. Major cities of world such as Gandhinagar City of Gujarat state of India has been facing the menace of excessive number of vehicles plying on its roads. As the scenario continues, it becomes more than imperative to devise apt traffic signals for urban junctions of arterial and sub-arterial roads with a view to manage and regulate the vehicular flow. The present study attempts to explore the relationship between observed and calculated vehicular delays at intersections through traffic signals using a novel technique of time-space diagram. The study proposes an innovative approach for monitoring traffic volume and its spot speed, actual travel time during peak and off-peak hours, and existing traffic signal timing across the road network of Gandhinagar City. The study analyzes CCTV footages for scanning vehicle at various intersections to determine actual journey duration and delay during peak and off-peak hours. Linear Regression Model is developed to help design and devise traffic signal timings at various urban intersections. The proposed methodology has the potential to be successfully utilized for designing coordinated traffic signaling systems in urban areas within the state and country.

Keywords: Calculated Delays, Gandhinagar, Signalization, Traffic Flow, Urbanization.

INTRODUCTION

Traffic congestion, a complex problem in urban areas over the years has been a matter of great concern for the stakeholders such as traffic engineers, traffic planners, transport department, traffic police, road users and the policymakers, not only in the developing countries but also in the developed world. Indian cities too, are typically characterized by the menace of traffic congestion. The congestion on road due to automobile traffic not only creates road rage but it has a great negative effect in terms of increased travel cost and time, adverse effects on mobility and accessibility besides the reduction in productivity. The environmental aspects of air pollution and global warming can also be attributed to traffic congestion [1]. In order to improve the overall efficiency and sustainability of a transportation system, it becomes imperative for the decision-maker to identify and quantify the traffic congestion [2]. In spite of numerous remedies which are tested out and applied on-site the research evidence suggest that the traffic congestion still remains a bigger threat more particularly in the realm of rapid urbanization and industrialization. Road traffic control strategies have always been regarded as the most viable remedy for vehicular congestion on road. Advanced traffic advisory system that employs CCTVs and sensors are currently being employed in the developed world to manage the traffic congestion. Most recently countries like Japan are employing Adaptive Signal Technologies (AST) to adjust the amount of time for a green light on a traffic signal based on real time traffic updates. This technique was developed with a view to reduce or minimize the traffic delay at intersections and has helped Japan to reduce its traffic congestion by 35 percent. Majority of the Indian cities still operate old-fashioned fixed-time signal controlling strategies to deal the traffic. This leads to poorly optimized and maintained traffic operations on roads. Complete elimination of traffic congestion is unrealistic. However, on-road deployment of advanced and efficient traffic control strategies, with a view to addressing the traffic congestion is the need of the hour. Signalizing the intersections of arterial/sub-arterial streets to control and regulate the traffic in more and more urban areas calls for systematic study of typical traffic characteristics of the region. Traffic delay study is still the most important aspect for any signal system may it be adaptive or not. This study presents a novel method to estimate the traffic delay within a network capable of handling the problems of traffic scenario at a typical intersection. The proposed approach could be significantly used by the traffic authorities for evaluating and operating the traffic signals under the current and future urban scenarios.

RELEVANT PREVIOUS WORK

Estimation of traffic delay has been historically done by several means such as photographic technique method as demonstrated by the work of Green shields et al. (1935) [3]. The authors had put forth the method of obtaining overall speeds over a stretch of highway by recording the tag number of the vehicle entering the stretch and checking the same tag number on leaving. Besides this, other methods like floating car method, license plate method, interview technique method and elevated observation methods are some of the commonly resorted techniques to study the delay. With the introduction of GPS techniques and video graphy techniques the task of data collection for delay studies has become relatively easier. Over the past six decades many delay models have been developed by numerous researchers. In 1952 Wardrop had given mathematical expression with assumption that vehicle enters the intersection with uniform arrivals [4]. Subsequently, researchers like Newell (1956) [5], Webster (1958) [6] and Miller (1968) [7] had developed representative mathematical models to estimate delay at signalized intersections which was subsequently numerically compared by Hutchinson (1972) [8], Cronje (1972) [9] and Sosin(1980) [10]. Cronje (1983) [11] had taken into consideration traffic flow at signalized intersection as a Markov process and went on to develop delay models for under-saturated and over-saturated situations. Brilon and Wu (1990) [12] used Markov chain approach for estimation of delay at signalized intersection for both poisson & non-poisson conditions. Van (1991) [13] in his study attempted to evaluate the work of Miller (1968), Newell (1956) and Hutchinson (1972) which was in form of modifications to Webster's (1958) delay expression. He found that the model proposed by the Hutchinson outweighed the other previous models of Miller and Newell by providing significant improvement in delay estimation. Tarko et al. (1994) [14] studied signal intersection approach under the influence of upstream signal for estimation of overflow delay. Heidemann [15] and Olszewski [16] had employed queue lengths probabilities to estimate delay probabilities at signalized intersections. Delay estimation analytical models for signalized intersection

**Bhargav H. Jaiswal et al.,**

have three delay components. Firstly, uniform delay, secondly, random overflow delay, and lastly continuous overflow delay. On one hand, Hurdle (1984) [17] had suggested modification to Webster's (1958) expression based on uniform delay, on the other hand Akcelik (1981) [18] had used overflow delay component as a function of average overflow queue. Kimber and Hollis [19-20] (1978 & 1979) proposed time dependent delay deterministic model using coordinate transformation technique. Akcelik(1980) [21] also proposed Australian Delay Model for signalized intersection. Further, one more model commonly referred to as 'The Canadian delay model' was derived by Whiting (1991); Highway Capacity Manual (H.C.M.) commonly used to estimate delay at signalized intersections is also a time dependent delay model [22]. Benekohale et al. (2001) [23] presented the development and validation of uniform delay models for coordinated signalized intersections. Akgungor(2007)[24] in his study presents a new methodology for estimating delay parameter k and proposes an analytical delay model for signalized intersections that considers the variation in traffic flow. Saha et al. (2017) [25] had proposed a new model by modifying the existing HCM model. Bagdatli et al. (2020)[26] employed gene expression programming(GEP)which is an artificial intelligence technique that was used to obtain models that can estimate vehicle delays rapidly and quite accurately. Bagdatli et al. (2021) [27] in their study, developed estimation models using four different machine learning methods support vector regression (SVR), random forest (RF), k nearest neighbor (k NN), and extreme gradient boosting (XGBoost).

Patel et al. (2022)[28] conducted a comprehensive study on the optimization of traffic signal coordination at urban intersections, focusing on minimizing overall traffic delay through adaptive signal control strategies. Their research highlighted the importance of real-time traffic data and the potential of artificial intelligence in enhancing signal coordination systems. Kadiya and Varia (2010) [29] focused their research on developing a methodology for two-way coordination of traffic signals in urban corridors. Their approach involved optimizing signal control parameters such as cycle length, green split, phase sequence, and phase offset to ensure efficient traffic flow. The study likely employed traffic simulation models and real-world data to validate the proposed methodology. Shah et al. (2013) [30] focused their research on pre-timed traffic signal coordination approaches used in urban corridors. They identified limitations such as fixed timing plans and the inability to adapt to dynamic traffic conditions. The paper proposed a novel approach incorporating factors like the disutility index (a measure of driver frustration), simulation software, and potentially soft computing techniques (flexible and adaptable algorithms) to create more responsive and efficient signal coordination. Shah et al. (2018) [31] focused their research on developing a model to optimize traffic signal coordination in urban areas. This model considered factors such as intersection geometry, traffic demand, and travel times to create phase plans that minimized congestion. The model was applied to real-world scenarios, demonstrating its effectiveness in improving traffic flow. This research provides a valuable foundation for understanding traffic signal coordination and potential improvements. Traffic congestion is problematic in urban areas worldwide, impacting the commuters and the inclusive efficiency of any transportation systems. In cities like Gandhinagar, traditional fixed-time signal control methods are insufficient for handling the rapidly changing traffic conditions driven by urbanization and increasing vehicle numbers. While early methods for estimating traffic delays focused on smooth traffic flow or less congested intersections, they do not adequately address the complexity of modern traffic scenarios. Later advanced models improved delay estimation but still struggled under high-congestion conditions. In recent years, researchers have introduced new methods that incorporate factors like intersection geometry and traffic demand into delay models, aiming for more accurate signal coordination. However, The need for this study arises from the limitations of existing models and the unique traffic conditions in Gandhinagar, where mixed traffic and unpredictable congestion patterns demand a more practical and adaptable approach. This paper aims to fill the gap by developing a novel methodology for estimating travel time at signalized intersections without relying on complex simulations. While this study cost-effective methodology for estimating travel time and helping optimizing four-way traffic signal coordination. By minimizing reliance on expensive technology and focusing on low-cost transportation measures, this approach offers a more affordable solution for improving traffic flow in urban areas.

METHODOLOGY

On the congested network when the traffic flow on four directions (all approaches of four-armed junction) is heavy, four-way coordination is desirable to provide minimum delay to the vehicles. If the intersections are close (less than 1000 m), it is advisable to adopt equal signal cycle time and equal phase time on each intersection to avoid unnecessary delay to the vehicles and also to provide smooth uninterrupted flow pattern in all directions. On these lines, the present study proposes the following methodology as shown in Fig.2. The study employed a systematic approach for analyzing peak traffic volume and vehicular travel time within the Gandhinagar city. For determination of peak hours of traffic flow traffic volume data for all roads within the study area was collected for one week. Subsequently, footages of CCTV installed by Gandhinagar municipal corporation (GMC) were then obtained and analyzed for identification of peak hours and categorization of vehicular movement based on the direction of vehicular transit. With a view to derive total travel time during peak and off peak hours vehicle number plate scan records obtained through CCTV footages were used. For accurate depiction and analysis of vehicular data time space relationship were drawn and diagrams generated using AutoCAD software were developed. Figure.3 one such time space diagram used for calculation travel time for a particular road junction under consideration. The developed time space diagram enables precise measurement and comparison of vehicle's travel time against the actual recorded travel time. These diagrams along G2-GH2-CH2 route enabled analysis of traffic signal cycle. The inclination of lines as represented in the AutoCAD generated time-space diagram depicts vehicles' spot speed average over an interval of 10 minutes. This helped visualize speed variations and signal co-ordination along the road. The average travel time as experienced by a particular vehicle was computed using time-space diagram now drawn for all categories of vehicles. Travel time records obtained from CCTV footages were compared with the average travel time as derived from the AutoCAD generated time-space diagram. Linear regression model was developed for prediction of travel time based on AutoCAD generated time-space diagram. The predicted travel time was compared with recorded travel time. Root mean square (RMSE) and R^2 statistic was used for the validation of developed linear regression model. The model predictive capability is indicated by high R^2 value and low RMSE.

STUDY AREA

Gandhinagar City the capital of Gujarat is located at 23.2156° N, 72.6369° E (Figure 1). The city comprises thirty sectors, and it is a highly structured city with a well-ordered street grid comprising blocks that are divided by two types of streets that resembles to U.S. avenues and streets. The city roads are named and numbered using vernacular letters. The city has "letter roads" (K, KH, G, GH, CH, CHH, and JA) and "number roads" (1, 2, 3, 4, 5, 6, and 7). The letter roads run parallel across the city perpendicular to the number roads, and both of the road types intersect each other to form a grid, with each block or square in the grid given a sector number as shown in Figure.1 Gandhinagar is a well-organized city comprising of various rectangular sectors divided by various main, arterial and sub-arterial roads. Gandhinagar is a great site for studying traffic signal synchronization attributable to its well-organized road web. There are 21 traffic signal stations across the city which provides an ideal set-up for studying traffic flow and signal synchronization. Gandhinagar has CCTV cameras at all major crossroads facilitating collection of precise real-time traffic data. Moreover, the grid-like road network easily enables development of traffic models for analyzing vehicular movement across the city. These features and availability of traffic volume statistics and the records of vehicular license plate scan make the city an ideal location for evaluating traffic signal coordination at the network level.

DATA COLLECTION AND ANALYSIS

Data Collection

To investigate signal coordination and travel time at signalized intersections in Gandhinagar, a structured data gathering method was created, with a focus on peak hour traffic. Traffic volume data was collected for a one-week

**Bhargav H. Jaiswal et al.,**

period during both the morning and evening peak hours, using traffic sensors placed at pertinent intersections across the city. High-definition CCTV footage was collected from Gandhinagar Municipal Corporation (GMC) cameras stationed at necessary intersections for analyzing vehicle movement patterns and determine halt durations at traffic signals during peak periods. In addition, automatic license plate recognition was utilized for tracking vehicles at various locations around the road network, enabling travel periods between intersections to be calculated. Data on signal cycle lengths, phase splits, as well as coordination mechanisms was gathered from road signal controllers.

ANALYSIS

Regression analysis and statistical processing were used to examine the collected data in order to assess how effectively signal coordination functioned. The study area's vehicle distribution during peak hours was established via traffic flow examination, which also revealed regions of bottlenecks and differences in traffic flow amongst intersections. In an effort to study the implications on travel durations and vehicle delays, traffic signal controllers provided details regarding phase splits, coordination tactics, and traffic signal cycle lengths. Time-space diagrams were drawn using AutoCAD software to reflect and indicate vehicle movement, as seen in figure. 3. Figure 3 demonstrates coordination of traffic signals across the G2, GH2, and CH2 road junctions, focusing on four green bands that represent green signal phases allowing vehicular movement. The dark band marked with 1 commences at G2 junction at zero second and lasts for 20 seconds. This would allow vehicles to proceed toward GH2 junction, where they would experience a 17-seconds delay due to the next green phase starting after 7 seconds. The spot speed was averaged over 10 minutes and is nearly 15.280 m/s between G2 junction and GH2 junction. Whereas, the spot speed between GH2 junction and CH2 junction is 15.380 m/s. The dark band marked with 1 begins at GH2 junction at the 80 seconds mark and ends at the 95 seconds mark, allowing vehicles to reach CH2 junction only by the 133rd seconds mark. Conversely, the last 3 seconds of the green band face a 104.50 seconds delay for the vehicles exiting CH2 junction. The succeeding dark bands, marked with 2, 3, and 4, signify future cycles for nonstop forward movement. Travel times among intersections were calculated approximately by vehicle number plate scan data and the same was compared to theoretical travel time. A linear regression model was developed to analyze the relationship between these travel times, with performance of the developed model measured by R^2 and RMSE. The developed model was validated using peak hour data, and its exactitude was evaluated by comparing predicted and actual travel times. The time-space diagrams not only helped visualize vehicle speeds but also helped gauge signal coordination efficiency. The linear regression models were generated for all road junctions with peak hour data and was subsequently validated using RMSE. This thorough examination delivered valuable insights into traffic flow at these junctions and enabled informed traffic management and planning.

DISCUSSION

The exploration involved fitting linear regression models to the actual travel time data and the calculated travel time data achieved from the time-space diagrams. The presentation of these models was evaluated using R^2 values, indicating the fraction of variance in the actual travel time explained by the calculated travel time. As shown in Figure 4, the linear trend analysis for both forward and backward directions is accompanied. This analysis is performed for all junctions in the study. The results are detailed in Tables 1 and 2, highlighting the models' efficiency in different time slots and directions.

Linear Regression Model Performance

Forward Direction

During the morning peak hour, the R^2 values fluctuated from 0.844 to 0.945 across various road links, with regression equations screening a strong linear affiliation. The uppermost R^2 value of 0.945 was observed for the G2-GH2-CH2 road link, signifying high model accuracy.

**Bhargav H. Jaiswal et al.,**

For the evening peak hour, the R^2 values fluctuated from 0.722 to 0.932. The G3-GH3 link exhibited the uppermost R^2 value of 0.932, indicating a consistent model to fit, whereas the G3-GH3-CH3 link had the lowest R^2 value of 0.722, reflecting a moderate fit as shown in Table1.

Backward Direction

In the morning peak hour, the R^2 values fluctuated from 0.862 to 0.980. The CH3-GH3-G3 link reached the highest R^2 value of 0.980, signifying an excellent model to fit. During the evening peak hour, R^2 values fluctuated from 0.806 to 0.991, with the CH3-GH3-G3 link again screening the highest R^2 value of 0.991, underscoring the model's exactness. These results designate that the linear regression models generally executed well, with most R^2 values above 0.8, suggesting a strong correspondences between the calculated and actual travel times as shown in Table2. The points on the graphs represent individual observations where the calculated total travel time from the AutoCAD time-space diagram is plotted against the actual observed travel time for various road links during morning and evening peak hours in the forward direction. Each graph includes a linear regression line, which shows the relationship between the calculated and actual travel times. The closer the points are to this line, the more accurate the calculated times are in predicting the actual travel times. The results indicate a strong correlation between the predicted and observed times, with the data points generally clustering closely around the regression lines. This suggests that the AutoCAD time-space diagram is effective in estimating travel times across different road segments during peak traffic periods, making it a reliable tool for traffic planning and management. The consistent alignment of points along the regression lines for both morning and evening peak hours further confirms the accuracy of these predictions across various scenarios. As shown in Table 1, the data illustrate how closely the travel time predicted by AutoCAD time-space diagrams (x) matches the actual travel time observed (y) for the forward direction on specific road links during peak hours. The linear regression equations and R^2 values in the table help measure the accuracy of these predictions. Similarly, as shown in Table 2, the analysis focuses on the backward direction, using data from the same road links during peak hours. The equations and R^2 values in this table demonstrate how closely the predicted and actual travel times align, allowing us to evaluate the reliability of the time-space diagrams in both directions. Overall, these tables give a clear view of how well the time-space diagrams work in estimating travel times on different road links during busy traffic periods. (Where, x = Travel time in seconds obtained by Time-space diagram, y = Actual observed travel time in seconds)

Validation of the Linear Regression Model

To evaluate the developed linear regression models, 30-minute data samples from morning and evening peak hours (Table 3) were utilized. Predicted travel times based on regression equations were evaluated against actual travel times. The models' accuracy was then calculated using Root Mean Square Error (RMSE). Figure 5 exhibits the RMSE values for both directions.

RMSE Analysis

To compute the RMSE values, the actual travel times for individual 10-minute segments were recorded as the average travel time of vehicles in each section of the study area. A linear regression model was applied to calculate the overall travel time for each route stretch. The RMSE values were derived by comparing the anticipated trip durations from the regression model to the observed values. The resulting RMSE values, shown in Table 4, indicate the model's performance across various road segments and time periods. Lower RMSE values suggest a tighter match between predicted and actual travel times, whilst larger values indicate greater discrepancies, highlighting regions where the model's predictions may be erroneous. The morning peak hour validation results showed a close configuration between predicted and actual travel times, with a few discrepancies. Evening peak hour validation revealed similar small differences, indicating that the model performed accurately. Backward Direction RMSE values such as Morning peak hour results validated the model with minor differences, indicating high accuracy. Evening peak hour validation revealed minor variations, confirming the model's robustness, as illustrated in Figure 5. The developed linear regression models' high R^2 values and low RMSE values exhibits their worth in calculating travel times based on time-space diagrams. The forward direction models indicated slightly lower R^2 values in some cases through the evening peak hours, suggesting potential variability in traffic conditions. In contrast, the backward

Bhargav H. Jaiswal et al.,

direction models consistently confirmed high accuracy, particularly for the CH3-GH3-G3 road link. Rigorous methodology and thorough analysis as adopted in the present study provided a comprehensive grasp of traffic flow distribution and travel time prediction for an urban scenario. These insights are indispensable for operative traffic management and planning strategies, enabling informed decision-making and optimization of traffic flow for a congested road network. Future research could explore the incorporation of other variables or advanced modeling techniques to further improve models' prediction accuracy.

CONCLUSION

The present study delved into the complexities of travel time analysis at signalized intersections within Gandhinagar city of Gujarat State, India. The study developed a novel methodology that assimilates time-space diagrams and linear regression models to effectively estimate and analyze vehicular travel times. The experimental results, characterized by a strong correlation ($R^2 > 0.8$) between calculated and observed travel times, evidently validate the usefulness of the proposed method in real traffic environments. The practical insinuations of this study extend well beyond the academic realm and offer valuable insights into traffic management strategies for urban set-up. The present study underscores the potential to ease delays and substantially augment the overall efficiency of urban traffic emphasizing the need to have coordinated signal timings for congested road networks.

ABSTRACT

This study, titled as "A Study of the Relationship between Social Media Use and Stress in Young Adults," explored the link between social media usage and stress among young adults aged 20-35, along with potential gender differences. Using Pearson's correlation, a significant positive relationship ($r = 0.32$, $p < 0.01$) was found, indicating that higher social media use is associated with increased stress. The study also suggests a possible feedback loop, where stress leads to more social media use, further heightening stress levels. Independent t-tests showed no significant gender differences in stress across low, medium, and high social media usage categories ($p > 0.05$), though females consistently had slightly higher mean stress levels, consistent with previous research. Overall, the findings indicate that while social media use is linked to increased stress, this effect does not significantly differ between young adult males and females.

Keywords: social media use, stress, young adults, gender differences, Pearson's correlation, feedback loop.

INTRODUCTION

The widespread use of social media has become a defining feature of modern society, connecting people across the globe through platforms like Facebook, Twitter, and Instagram. While it offers numerous benefits, such as bridging distances and enabling real-time interactions, concerns about its potential negative effects, particularly its association with stress, have emerged. The constant connectivity and information overload of digital platforms can contribute to heightened stress levels, prompting discussions on individual well-being and mental health. To better understand this phenomenon, it is essential to define key terms related to the study. Social media refers to digital platforms for creating, sharing, and exchanging content (Kaplan & Haenlein, 2010), encompassing sites such as Facebook, Instagram, Twitter, LinkedIn, YouTube, and Pinterest. These platforms play a significant role in modern social interactions and have become integral to daily life. Now Stress is defined by Selye (1936) as "the non-specific response of the body to any demand for change," with common triggers including work, relationships, finances, and health. Chronic stress can lead to significant physical and mental health issues, making its management crucial. Effective strategies include mindfulness, exercise, and social support (Tan et al., 2018). Additionally, this study focuses on young adulthood, a developmental stage encompassing ages 20 to 35, characterized by maturity, new responsibilities, and personal growth (American Psychological Association, 2023). By examining how social media impacts stress within this demographic, the study considers potential gender differences in stress responses, contributing valuable insights into the broader dialogue surrounding mental health in the digital age. This research investigates the correlation between social media use and stress among young adults aged 20-35, examining whether this relationship differs between males and females. Given that young adults are particularly influenced by social media trends, understanding how these interactions affect stress is crucial. The study aims not to establish causality but to explore the nuanced connection between social media engagement and stress responses, considering possible gender differences. The findings could be valuable for researchers, practitioners, and policymakers, offering insights to develop interventions, guidelines, and balanced digital consumption strategies. By focusing on the unique challenges faced by young adults, this research adds to the ongoing dialogue about the effects of social media on mental health in the digital age.

A literature review on the relationship between social media use and stress among young adults has found mixed results, with some studies showing a positive relationship and others showing no significant relationship. A study published in the Journal of Social Science & Medicine in 2016 found that excessive use of social media is associated with increased stress among adults. (Lin et al., 2016) Another study published in the Journal of Adolescent Health in 2016 found that social media use was positively associated with stress among adolescents. (Hale et al., 2016) Another study published in the Journal of Adolescence in 2016 found that social media use was significantly associated with increased stress levels, suggesting that social media use may exacerbate existing stressors. (Woods et al., 2016) On the other hand, a study published in the International Journal of Environmental Research and Public Health in 2017 found that social media use did not significantly predict stress among adult social media users. (Alhabash et al., 2017) A meta-analysis published in the Journal of Behavioral Addictions in 2018 found that social media use was positively associated with stress among adults, but the relationship was small in magnitude. (Baumeister et al., 2018) A study published in the Journal of Affective Disorders in 2018 found that social media use did not significantly predict stress among college students. (Brossard et al., 2018) Additionally, meta-analysis published in the Journal of Behavioral Addictions in 2019 found that social media use was associated with increased stress, but the relationship was small in magnitude. (Kuppens et al., 2019) A study published in the Journal of Nursing Education in 2020 found that social media use was significantly associated with increased risk of depression, as well as with increased stress levels. (Lee et al., 2020) It's worth noting that, the relationship between social media use and stress can be bi-directional, meaning that stress can lead to increased social media use, as well as increased social media use leading to stress. Overall, research on the relationship between social media use and stress among adults is complex.

**Deepanshu and Shonali****Aim**

The aim of the study was to explore the relationship between Social Media Use and Stress in Young Adults and the potential gender differences.

Objectives**1.Relationship Between Social Media Use and Stress**

To examine the link between social media use and stress in young adults (aged 20-35). This will help identify associations and inform strategies for healthier social media habits and stress management.

2.Gender Differences in Social Media Use and Stress

To investigate gender differences in the social media-stress relationship among young adults (20-35), offering insights for developing gender-specific interventions.

Hypotheses

1. There is a significant relationship between social media use and stress among young adults (20-35).
2. There is a significant difference in the social media-stress relationship between young adult males and females (20-35).

Rationale of The Study

Social media platforms like Facebook, Twitter, and Instagram are central to modern life, yet their use may be linked to increased stress. Chronic stress poses risks to both physical and mental health, making it essential to identify contributing factors to develop effective interventions. Young adults, undergoing major life transitions and being heavy users of social media, are particularly vulnerable to stress. This study aims to investigate the correlation between social media use and stress in this group, examining potential gender differences. Understanding these differences can help in developing targeted strategies for healthier social media habits and stress management. The findings will contribute to existing knowledge by highlighting how social media impacts stress levels among young adults, with a focus on gender-specific experiences. This can guide future interventions, educational initiatives, and support strategies tailored to young adults' unique needs.

RESEARCH METHODOLOGY**Design**

This study employed a survey research design using a quantitative approach to assess the relationship between social media use and perceived stress among young adults. The data was collected through self-report questionnaires distributed online, ensuring accessibility and ease of participation.

Sample

The sample for the study consisted of 100 young adults, evenly divided between 50 males and 50 females, all residing in Shimla city. Participants were aged between 20 and 35 years and were recruited through online platforms by sharing a Google Forms link. Inclusion criteria required participants to fall within the specified age range, with no restrictions based on their level of social media use or stress. The sampling procedure ensured voluntary participation, allowing individuals from various occupational and educational backgrounds to join. This approach ensured a diverse representation of young adults while maintaining focus on the target population for the study.

Tools Used

The tools used were Perceived Stress Scale (PSS) and the social media usage section, which was converted into Google Form and distributed across various online platforms to recruit participants. The following is the description of the tools

**Deepanshu and Shonali****Perceived Stress Scale (PSS)**

The PSS, developed by Sheldon Cohen (1983), measures the extent to which individuals perceive situations in their lives as stressful. It consists of 10 items rated on a 5-point Likert scale ranging from 0 (Never) to 4 (Very Often), with higher scores indicating greater perceived stress. The scale has strong internal consistency, with Cronbach's alpha values ranging from 0.78 to 0.91, and good test-retest reliability, with correlation coefficients between 0.70 and 0.85. This standardized tool is widely used in both research and clinical contexts for measuring stress.

Social Media Usage Section

This section captured participants' average hours per day (AHPD) spent on key social media platforms, including Facebook, Instagram, Twitter, LinkedIn, YouTube, and Pinterest, with an option to mention additional platforms. The AHPD data were used to classify participants into low, medium, and high social media usage categories to analyze patterns in engagement.

The online format ensured accessibility and ease of participation, with participants able to respond anonymously. These tools provided data for both stress and social media data, which was essential for examining the relationship between the two variables and analyzing potential gender differences.

Procedure

The participants for the study were recruited online through various social media platforms using a Google Forms link, ensuring voluntary participation. Before proceeding, they were provided with a brief description of the study and gave informed consent. The data collection involved an online questionnaire, which gathered demographic details, responses to the Perceived Stress Scale (PSS), and information on the average hours per day (AHPD) spent on six primary social media platforms—Facebook, Instagram, Twitter, LinkedIn, YouTube, and Pinterest—along with any additional platforms specified by participants. Based on their AHPD, participants were categorized into low, medium, and high social media usage groups. Their perceived stress levels were assessed using the PSS, with higher scores reflecting greater stress. Pearson correlation was used to determine the relationship between social media use and stress, while independent t-tests analyzed gender differences in stress across usage categories, with significance levels set at 0.01 and 0.05, respectively. Ethical guidelines were followed throughout the process, ensuring participants' anonymity and confidentiality, with the option to withdraw at any point without penalty.

RESULT AND DISCUSSION

The aim of the study was to explore the relationship between Social Media Use and Stress in Young Adults, thus accordingly the objectives and hypotheses were formulated. To test our first hypothesis, i.e. 'There will be a significant relationship between the use of social media and stress among young adults aged between 20 and 35,' we calculated the Pearson's correlation coefficient (r). We examined the Average Hours per Day (AHPD) that young adults spent on social media and their reported stress levels. The correlation coefficient obtained was 0.32. Our first hypothesis was supported by the data, as the Pearson's correlation coefficient of 0.32 showed a statistically significant positive relationship between social media use and stress among young adults aged 20 to 35. As seen in Table 1 this finding suggests that, on average, as the amount of time young adults spend on social media increases, their reported stress levels also tend to increase. Importantly, the correlation, while statistically significant (t -stat = 3.42, p -value = 0.0009; $p < 0.01$), was relatively weak ($r = 0.32$). This indicates that while there is a discernible connection between social media usage and stress, other factors beyond social media likely contribute to stress levels as well. As part of our first objective, we sought to explore the relationship between social media use and stress among young adults aged between 20 and 35. Based on the analysis, our results demonstrate a statistically significant positive association between social media use and stress in this age group. This indicates that social media use might have an impact on the stress levels experienced by young adults within this age range. It's intriguing to consider an alternative perspective in light of these findings. As the data shows a positive correlation between social media usage and stress, it's plausible to suggest a reciprocal relationship as well. Individuals experiencing high levels of stress might turn to social media platforms as a means of coping, seeking distraction, or finding support. This interaction between stress

**Deepanshu and Shonali**

and social media use could create a feedback loop, where heightened stress prompts more social media engagement, which in turn could contribute to further stress. To test our second hypothesis, i.e. "There will be significant difference between the relationship of use of social media and stress in young adult males as compared to young adult females aged between 20 and 35." We categorized the participants into three groups based on their social media usage: low usage (2 hours or below), medium usage (3 to 5 hours), and high usage (6 hours or above). We then conducted independent t-tests to assess the differences in stress levels between males and females within each usage category. The resultant figures can be seen in Table 2. For 2 hours or below usage (low usage): The results of the independent t-test revealed that young adult females had a slightly higher mean stress level (16.57) compared to young adult males (15.72) in the low usage category. However, the difference was not statistically significant, with a t-statistic of 0.45 and a p-value of 0.65, which exceeded the significance level of 0.05. Therefore, we do not have sufficient evidence to reject the null hypothesis. These findings suggest that although females showed slightly higher mean stress levels, the difference in stress levels between young adult males and females in the low usage category is not significant. For 3 to 5 hours of Usage (medium usage): Similarly, the independent t-test showed no statistically significant difference in stress levels between young adult males and females in the medium usage category. The mean stress level for females was 21.03, while it was 19.76 for males. The t-statistic was 0.67, and the p-value was 0.50, which is above the significance level. Therefore, we do not have enough evidence to reject the null hypothesis. These results indicate that although females displayed a slightly higher mean stress level, the difference in stress levels between young adult males and females in the medium usage category is not significant. For 6 hours or above usage (high usage): Similarly, the independent t-test demonstrated no statistically significant difference in stress levels between young adult males and females in the high usage category. The mean stress level for females was 24.66, while it was 21.42 for males. The t-statistic was 1.12, and the p-value was 0.29, which exceeds the significance level. Therefore, we do not have sufficient evidence to reject the null hypothesis. These findings suggest that although females exhibited a slightly higher mean stress level, the difference in stress levels between young adult males and females in the high usage category is not significant.

The second objective of this study was to investigate potential gender differences in the relationship between social media use and stress among young adults within different usage categories. Based on the results of the independent t-tests, we found no statistically significant differences in stress levels between young adult males and females in any of the three usage categories (low, medium, and high). Although females displayed slightly higher mean stress levels compared to males in each category (as seen in the Table 3) the differences were not significant. The consistently higher mean stress levels exhibited by females as compared to males in each usage category align with the historical researches that indicate that females often report higher levels of stress, possibly due to societal expectations, roles, and hormonal factors. (Kessler et al., 1985; Boyd et al., 2015). These findings indicate that, within each usage category, social media use does not appear to lead to significant gender differences in stress levels between young adult males and females aged between 20 and 35. In conclusion, our study did not find any significant gender differences in stress levels for young adults within different social media usage categories. This suggests that, irrespective of social media usage patterns, the impact on stress levels does not significantly vary between young adult males and females in the specified age group.

CONCLUSION

The study explored the relationship between social media use and stress among young adults aged 20-35, examining potential gender differences. Findings showed a statistically significant but weak positive correlation ($r = 0.32$, $p < 0.01$) between social media use and stress, suggesting that higher social media engagement is linked to increased stress. This may indicate a feedback loop where stress prompts more social media use, further elevating stress. Gender analysis across low, medium, and high social media usage categories found no significant differences ($p > 0.05$), implying that other factors may play a more significant role in stress disparities among young adults. Future research should explore additional variables like work-life balance and social support. The study highlights the need for mindful, balanced social media use to mitigate stress. While social media has benefits, excessive use may increase

**Deepanshu and Shonali**

stress. Promoting healthy digital habits can support well-being, and ongoing research is crucial to understanding the broader impact of technology on mental health.

Delimitation

This study investigates the relationship between social media use and stress among young adults, focusing on males and females in Shimla city. The geographical scope is limited to Shimla, meaning findings may not be generalizable beyond this area. Results should be interpreted within this local context, with caution applied when extending them to other locations. The study sample consists of 100 participants, with an equal gender split (50 males, 50 females). This allows for focused analysis, but the limited sample size means findings may not reflect the broader young adult population. While recognizing these limitations, the study still provides insights into the link between social media use and stress, laying a foundation for future research and offering potential implications for similar groups in other regions.

ACKNOWLEDGEMENT

The author appreciates all those who participated in the study and helped to facilitate the research process and would like to express his heartfelt gratitude to his guide, Dr. Shonali Sud for her invaluable support and guidance throughout the research.

Conflict of Interest

The author declares no conflict of interest.

ABSTRACT

The Chandipura virus disease is a mostly ignored but rapidly increasing exotic tropical disease in India. This review article addresses the present issue statement of this disease. The geographic distribution of patients with documented cases is detailed, as well as the epidemiology and clinical aspects. There have been stated disputes over it. Preventive measures, which constitute the cornerstone of management, have also been thoroughly examined. It has been stated how to prepare for disease and possible bioterrorism threats. In India, the Chandipura virus (CHPV) has been linked for more than ten years to the increased incidence of preventable deaths from acute encephalitis syndrome. Within the Rhabdoviridae family is CHPV. An effective CHPV preventative agent was assessed using a vaccine candidate based on Vero cells. To inhibit CHPV infection, prevention is the best strategy. Reducing the spread of CHPV in rural areas will require controlling disease-transmitting vectors, as well as promoting proper diet, hygiene, and awareness.

Keywords: Chandipura virus, pediatric sporadic encephalitis, Vectors, Sandflies, Epidemiology, classification of virus, India scenario

INTRODUCTION

The Two febrile cases in Nagpur, Maharashtra state, India, in 1965 led to the discovery of the Chandipura virus (CHPV), which caused an intense fever outbreak.[1,2,3] In 1966, Bhatt and Rodrigues identified the CHPV as a new agent that causes feverish sickness. The virus was given its name based on the location of its initial isolation in the Maharashtra region of Chandipura. [4] As a result, the release of the JE vaccine received a lot of attention. Even with the vaccination being widely available, more and more AES cases are coming out of India. [5] In India, the majority of premature deaths are caused by acute encephalitis syndrome, or AES. The Japanese encephalitis virus (JEV) infection or bacterial meningitis are thought to be the cause in the majority of cases. [6] Encephalitis pathology can be broadly classified into two basic categories: two types of encephalitis: immune-mediated and infection-related. [7] Infection-related encephalitis results directly from a virus entering the central nervous system, whereas auto-immune mediated encephalitis is associated with systemic infection or vaccination and is mediated by a pathologic immune response primarily directed against myelin, affecting the brain and spinal cord. Arbovirus-related illnesses are managed symptomatically because there isn't a specific cure.[8] While children under the age of 15 are more susceptible, all encephalitis symptoms, such as high-grade fever, vomiting, altered sensorium, generalized convulsions, decerebrate posture, and grade IV coma, are similar in adults. [9,10] Despite the fact that various theories have been put out, the patients' quick decline and eventual death have not been well explained.[11-13] Early experiments using the immunofluorescent antibody method to detect the presence of CHPV in brain biopsy tissues suggested a likely connection between CHPV.[14] But the role of CHPV and the precise mechanism of action could not be explained. [15] These incidents suggested that the deadly Chandipura virus may have spread throughout the Indian Subcontinent. [16]

Classification of Chandipura virus[17]

Etiology and epidemiology

It is carried by vectors such as sandflies, mosquitoes, and ticks. The case-fatality ratio of CHPV infection is significant (56-75%), and there is presently no vaccine or specific treatment available for the virus. Improved survival may result from early access to care and very supportive patient care. Authorities are working to stop the spread of CHPV, but given the favorable conditions the monsoon season is giving vector populations in the affected areas, further virus transmission could happen in the following weeks. The World Health Organization recommends vector control in addition to protecting against tick, mosquito, and sandfly bites in order to halt the spread of CHPV. The condition, which primarily affects youngsters under the age of 15, can start as a feverish sickness and develop to convulsions, a coma, and in rare circumstances, death. [18]

Virology

It is a member of the Rhabdoviridae family and genus Vesiculovirus. The single-stranded RNA genome of this virus is roughly 11 kilobases in size and possesses negative polarity. The nucleocapsid protein (N), phosphoprotein (P), matrix protein (M), glycoprotein (G), and large structural protein (L) are the five structural proteins that are encoded by the genome. They are generated as five monocistronic mRNAs. [19]

Life cycle of a virus

There are distinct phases in the vesiculo virus life cycle, which are as follows: [20]

Transmission and spreadability

Scientists at the National Institute of Virology, Pune, demonstrated in 1967 that mosquitoes are capable of vectoring CHPV. [21] *Phlebotomus papatasi* is a productive reservoir for the CHPV in laboratory settings, demonstrating proliferation, venereal, and transovarial transmission. [22, 23] The virus may persist in nature during non-epidemic times due to *P. papatasi*'s ability to spread the infection vertically and venereally. This process may have enabled the virus to withstand extended periods of dormancy and start epidemics when the number of sandflies rose in an environment that was conducive to doing so. A zoophilic species called *P. argentipus* has also been shown to be

**Nisha Retrekar et al.,**

capable of horizontally spreading the virus to young mice.[24] A recent study examined the ability of the common mosquito in Southeast Asia and India, *Culex gelidus*, to transmit a variety of tropical viruses, including CHPV. Since *C. gelidus* has been shown to harbor more than 5 log₁₀TCID₅₀ of CHPV per milliliter, it has been suggested that it could be a possible CHPV vector. [25]

Indian scenario

Recently, there has been evidence of a clear correlation between CHPV and cases of pediatric sporadic encephalitis as well as several outbreaks in Andhra Pradesh (2004, 2005, 2007 and 2008), Gujarat (2005, 2009–12), and the Vidarbha region of Maharashtra (2007, 2009–12). NIV uses outbreak investigations, sero-surveys, and clinical specimen referrals to determine the prevalence and seasonal activity of the virus in these areas. In the Vidarbha region of Maharashtra, pools of sand flies gathered during outbreak investigations have yielded the isolation of CHPV recently. Since its discovery in India and the aforementioned CHPV activity, it was thought to be limited to that country alone.[1]

- Since early June 2024, at least 38 individuals have perished in India from the worst Chandipura virus outbreak in over 20 years, the most of them were youngsters and teenagers.[26]
- Since July 19, 2024, there has been a daily trend of fewer new instances of AES.[27]
- The Indian Ministry of Health and Family Welfare released a news release on July 20, 2024, detailing instances and fatalities related to the Chandipura virus (CHPV). Cases of Acute Encephalitis Syndrome (AES) in children under 15 years old have been reported in the state of Gujarat from early June 2024. 75 AES cases from 21 Gujarati districts and companies, 2 from Rajasthan, and 1 from Madhya Pradesh have been documented as of July 20, 2024. 28 cases have led to fatalities out of them. Nine samples out of the 76 that were examined at the NIV in Pune have the Chandipura Virus (CHPV) verified as positive. Gujarat is home to the five related deaths and all nine CHPV-positive cases.
- In Gujarat state, there were 101 AES instances overall on July 24, 2024, according to unreliable media reports, including 38 deaths. 4,160,000 homes with mud walls have been covered by the state-wide fumigation and cleanliness campaign. More than 62,000 households have had insecticides sprayed. [28]
- 53 Chandipura virus infections have been confirmed in India as of July 31, according to Union Health Minister J. P. Nadda, who informed the Rajya Sabha on Tuesday, August 6, 2024. Of these instances, 51 are from Gujarat and two are from Rajasthan.[29,30]
- On August 15, 2024, the Indian government's Ministry of Health and Family Welfare said that there had been 245 cases of AES, with 82 deaths (CFR 33%). There are now 43 districts in India where AES instances are being reported. Similar to earlier epidemics, cases are intermittently found in a number of areas. Notably, the state of Gujarat experiences an increase in CHPV epidemics every four to five years.
- It is spread by vectors like ticks, mosquitoes, and sandflies on August 23, 2024. CHPV infection has a high case-fatality ratio (56-75%), and there is currently no vaccination or targeted treatment for the virus. Early access to care and highly supportive patient care can improve survival. While efforts are being made by authorities to curb the spread of CHPV, additional viral transmission may occur in the upcoming weeks due to the favorable conditions that the monsoon season is providing for vector populations in the impacted areas. To stop the transmission of CHPV, the World Health Organization advises vector control as well as prevention against tick, mosquito, and sandfly bites.
- In 64 out of the 245 reported instances of AES, reverse transcription polymerase chain reaction (RT-PCR) or immunoglobulin M enzyme-linked immunosorbent test (IgM ELISA) have been employed to verify the presence of CHPV. Three instances have been reported from Rajasthan State, while 61 cases from Gujarat State are among the 64 verified cases.

Chandipura Virus: Precautions

In order to reduce mosquito numbers, authorities have sent out 50 teams for thorough dusting operations and have recommended that farmers apply pesticides and insecticides. To prevent mosquito bites, parents are advised to wear their kids in full-sleeved clothing. [31]

Nisha Retrekar et al.,

Prevention and Control**When a CHPV outbreak is suspected, the following actions should be kept an eye on:**

1. Monitoring of youngsters who are affected by fever.
2. Intractable intra- and parodomestic activity.
3. The observation of insects
4. Morning vector collection, including resting mosquitoes indoors and sand flies
5. Recursive indoor spraying with 5% Alpha cypermethrin.
6. Employing an insecticide-treated mosquito net with a 2.5% deltamethrin flow.
7. Daily (or routine) observation of the impacted populace.
8. The fogging of pyrethrum

Thus, a number of guidelines are available to stop and manage Chandipura encephalitis, which is further divided into two categories: acute and chronic.

The Ministry of Health and Family Welfare have taken the following prevention and control measures:

1. **Deployment of National Joint Outbreak Response Team (NJORT):** The Gujarat state administration has received assistance from a professional team in carrying out comprehensive epidemiological studies and putting public health measures into action.
2. **Vector control measures:** Comprehensive fumigation and insecticidal spraying are being done to manage the virus's vectors, which include sandflies.
3. **Health and awareness campaigns:** There are programs in place to educate the general public and medical professionals about the virus, its symptoms, and how to avoid it.
4. **Research and monitoring:** The Gujarat Biotechnology Research Centre (GBRC) is closely monitoring the issue and conducting active research to find additional viruses that cause encephalitis.
5. **Advisories and coordination:** To assist adjacent states in reporting occurrences of AES, the National Centers for Disease Control (NCDC) and the National Center for Vector Borne Diseases Control (NCVBDC) are releasing joint warnings.

Laboratory Diagnosis

Simply based on a physical examination, CHPV cannot be diagnosed because the virus does not exhibit a distinct clinical picture. According to recommendations from the National Institute of Virus (NIV) in Pune, India, there are a few serological, molecular, and tissue culture-based techniques available for diagnosing instances of Chandipura viral encephalitis.

Approach of vaccine

After two doses, mice challenged with a live virus (100 PFU) showed effective protection against CHPV against the inactivated vaccine candidate based on vero cells. Following the third dosage, the antibody titer varied from 1:80 to 1:320. Mice challenged with live virus even through the intracranial route survived if they showed a neutralizing antibody titer greater than 1:20. Another method used a proposed vaccine that used an expression system for Baculovirus to recombine the CHPV Glycoprotein gene (G-gene). The vaccine protected 90% of the vaccinated mice against an intracerebral challenge with 100 LD50 of the homologous strain.[32]

CONCLUSION

This unique case of CHPV encephalitis has prompted the World Health Organization to declare a public health emergency of worldwide concern, which is thought to have originated from a member of the Rhabdoviridae virus family. The World Health Organization has classified the CHPV encephalitis outbreak as a "pandemic," posing a threat to India's public health, medical, and economic systems. Even with the implementation of appropriate and prompt containment and mitigation measures, new cases of CHPV encephalitis are being found every day in India. India has so far continued to handle this issue with a well-thought-out strategy. The Indian government's Ministry of

**Nisha Retrekar et al.,**

Health and Family Welfare recorded 245 instances of AES between June and August 2024, with 82 fatalities (CFR 56-75%). There are now 43 districts in India where AES instances are being reported. Cases are sporadically present across various districts as in previous outbreaks.

Table: 1 Scenario of outbreaks from 1965 to till

Year of isolation	Place of isolation	% of Cases
1965	First detected and isolated virus in Nagpur, Maharashtra state, India	2%
1997 & 2002	Warangal district, Andhra Pradesh	5%
2003	11 districts, Andhra Pradesh	56%
2004	Gujarat State, India, CFR 78.3% among children, virus isolated	78.3%
2004-05	Anti-CHPV neutralizing antibodies (NAbs) in 65.3% sera CHPV was isolated	65.3%
2005-2006	Andhra Pradesh Surveillance within hospitals, about 54.4% CFR	54.4%
2007-2008	Sandflies from affected locations in Nagpur, Maharashtra, had viral RNA found in them (CDR 43.6%).	43.6%
2009	Research conducted in Andhra Pradesh on hospitalized cases of encephalitis revealed that 8	80%

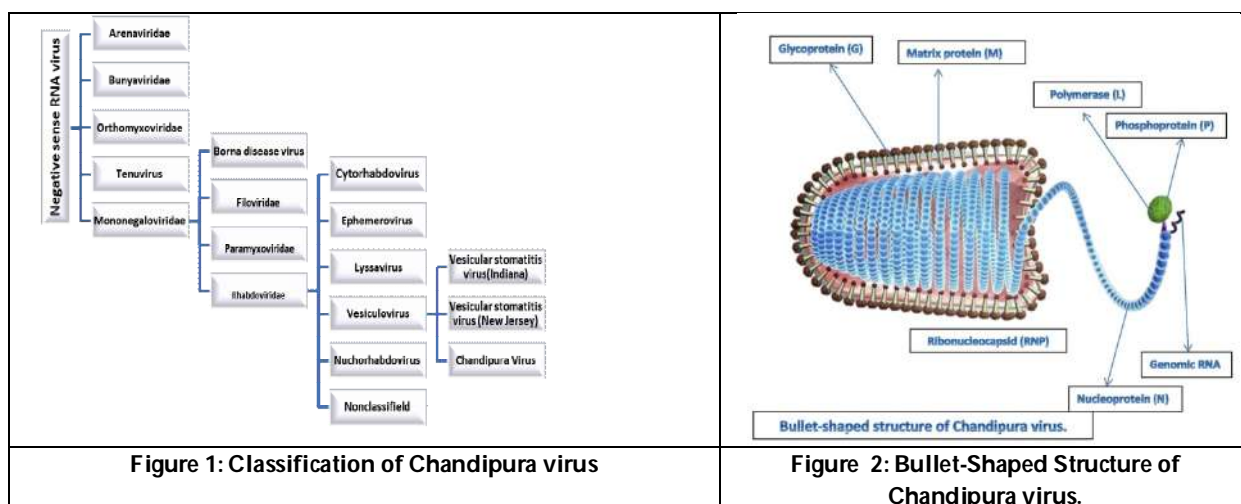

Nisha Retrekar *et al.*,

	out of 10 cases had CHPV infection by RT-PCR, and only one out of the 132 contact sera obtained in Hyderabad region 1 had anti-CHPV IgM antibodies.	
2010-11	Anti-CHPV IgM antibodies were found in 10.56% [n=587] of the sera from fever cases in the Panchmahal area of Gujarat.	10.56%
2012	Anti-CHPV IgM ELISA and RT-PCR results for encephalitis cases from Maharashtra and Gujarat states showed 4.7% [n=130] confirmation.	4.7%
2024	The World Health Organization (WHO) called the current outbreak the largest in the past 20 years	55-75%

Table 2 Prevention & Control Short term and long term

S.No	Short Term	Long Term
1.	Timely and systematic monitoring of CHPV in villages at high risk, as well as timely and systematic anti-Chandipura activities both within and outside the home.	Determine which blocks, main health centers, village areas, and entire district are experiencing water logging that is conducive to mosquito reproduction. If necessary, import both larval and abate fish.
2.	Monitoring the fever cases in a cluster that are linked to vomiting, altered sensorium, and	Action against sand flies should be taken both before and after the monsoon, with 100% coverage.
3.	Review every week and provide input so that the block health officer can take appropriate measures.	Focal point spraying with insecticide (Alphacypermethrine 5%)
4.	Immediately report any flu-like symptoms.	Patients who test positive for Chandipura should receive second-line therapy.
5.	Wiping surfaces with viricidal solutions	The application of insecticide-treated mosquito nets (ITMN).

ABSTRACT

In this present work, we investigated the existence of union cordial labeling of some tree related graphs.

Keywords: Cordial labeling, Intersection CL, Union Cordial labeling, labeling on trees, graph labeling.

INTRODUCTION

Let $X = \{1, 2, \dots, n\}$ be a set and let $\wp(X)$ be the power set of X which contains all the subsets of the set X . Graph Labeling [4] strongly relates Algebra and Structure of graphs and is generally used in communication networks. Throughout this work, we consider a graph $G = (V(G), E(G))$ to be a simple, finite, connected and undirected graph with p vertices and q edges [2] and [3]. Meena and Nagarajan [5] introduced the concept of intersection cordial labeling and proved that path, cycle, star, dragon, complete bipartite graphs and wheel related graphs [6] admit

Hameetha Begum *et al.*,

intersection cordial labeling. Following this, they discussed the intersection cordiality[7] of the graphs $2^k P_{2^n}$, $2^k C_{2^n}$, $2^k K_{1,2^n-1}$ and $2^k K_{2,2^n-2}$. Motivated from this topic, we introduced here a labeling using the power sets of X and discussed the existence of such labeling on some tree related graphs such as path, y-trees, combs, twigs, stars, bistars, double stars, coconut trees [5].

Definition

Let $f: V \rightarrow \wp(X)$ be an injection. Also let $2^{n-1} < p < 2^n$. Then the induced edge function $f^*: E(G) \rightarrow \{0,1\}$ defined by $f^*(uv) = \begin{cases} 1 & \text{if } |f(u) \cup f(v)| \text{ is odd} \\ 0 & \text{if } |f(u) \cup f(v)| \text{ is even} \end{cases}$. f^* is called a union cordial labeling if $|e_f(0) - e_f(1)|$ is either 0 or 1. A graph which admits union cordial labeling is said to be a union cordial graph.

Examples

Consider the graph with vertices labeled by $\emptyset, \{1\}, \{2\}, \{1,2\}$

Here $e_f(0) = 2$ and $e_f(1) = 2$.

Hence $|e_f(0) - e_f(1)| = 2 - 2 = 0$

Therefore the given graph is an union cordial graph.

Consider the following graph:

Here $e_f(0) = 4$ and $e_f(1) = 2$. Hence $|e_f(0) - e_f(1)| = 4 - 2 = 2$

Therefore, the given graph is not union cordial.

Main Theorems

With the effect of example 2, we proved that complete graphs are not union cordial graphs.

Theorem: 2.1

Complete graphs, K_{2^n} , $n \geq 2$ are not union cordial graphs.

Proof:

Let $X = \{1, 2, \dots, n\}$ and $|\wp(X)| = 2^n$.

Let $V(G) = \{u_1, u_2, \dots, u_{2^n}\}$ be the vertices of K_{2^n} , $n \geq 2$.

Label the vertices u_1, u_2, \dots, u_{2^n} with all the subsets of $\wp(X)$. Then

Hameetha Begum et al.,

for $n = 2$ (i.e.,) K_{2^2} , we get $|e_f(0) - e_f(1)| = 2^1$
 for $n = 3$ (i.e.,) K_{2^3} , we get $|e_f(0) - e_f(1)| = 2^2$
 for $n = 4$ (i.e.,) K_{2^4} , we get $|e_f(0) - e_f(1)| = 2^3$
 for $n = 5$ (i.e.,) K_{2^5} , we get $|e_f(0) - e_f(1)| = 2^4 \dots$ and so on.
 Continuing this process, $|e_f(0) - e_f(1)|$ never equals either 0 or 1, for any $n \geq 2$.
 Therefore, $K_{2^n}, n \geq 2$ are not union cordial graphs.

Path Related Graphs

Theorem:2.1.1

Paths, P_n admit union cordial labeling.

Proof

Let $X = \{1, 2, \dots, n\}$ and $|\wp(X)| = 2^n$.

Let u_1, u_2, \dots, u_n be the vertices of P_n .

Let the vertices be labeled as follows:

u_1 by $\{1\}$; u_2 by $\{2\}$; u_3 by the element before X in $\wp(X)$;

u_4, u_5, \dots, u_{n-2} by the subsets next to $\{2\}$ in $\wp(X)$; u_{n-1} by \emptyset set and u_n by X .

Then by the definition of union cordial labeling, we get the labeling of edges as 0 or 1 and hence $|e_f(0) - e_f(1)|$ is either 0 or 1. Therefore, Paths admit union cordial labeling.

Theorem: 2.1.2

Y- trees, Y_k [1] are union cordial graphs.

Proof:

Let $X = \{1, 2, \dots, n\}$ and $|\wp(X)| = 2^n$.

Let Y- tree, Y_k be a graph with k vertices $u_1, u_2, \dots, u_{k-2}, u_{k-1}, u_k$ and edge set as $\{u_1u_2, \{u_2u_3, \dots, \{u_{k-2}u_{k-1}\} \cup \{u_{k-2}u_{k-1}\}, \{u_{k-2}u_k\}\}$ satisfying $k = 2^n$.

Here u_{k-1} and u_k are pendant vertices adjacent to u_{k-2} .

First label the pendant vertices u_{k-1} and u_k by the \emptyset set and X . Then label u_1 by $\{1\}$; u_2 by $\{2\}$; u_3 by the subset before X in $\wp(X)$ as the labeling in paths; Moreover, label the remaining vertices $u_4, u_5, u_6, \dots, u_{k-2}$ by the remaining subsets of $\wp(X)$, in order. Thus the edge labeling provides $|e_f(0) - e_f(1)|$ as either 0 or 1.

Hence Y_k are union cordial graphs.

Theorem: 2.1.3

Comb graphs, $P_n \odot K_1$ admit union cordial labeling.

Proof

Let $X = \{1, 2, \dots, n\}$ and $|\wp(X)| = 2^n$.

Let u_1, u_2, \dots, u_n be the vertices of the path P_n and v_1, v_2, \dots, v_n be the pendant vertices adjacent to u_1, u_2, \dots, u_n respectively. First label the pendant vertex v_1 by X and u_n , the end vertex of the path by \emptyset set. Then label the vertex sequence $u_1, v_2, u_2, v_3, u_3, \dots, v_{n-1}, u_{n-1}, v_n$ starting from the one element subset $\{1\}, \{2\}, \{3\}, \dots$ of $\wp(X)$, in order. Then by the definition of union cordial labeling, we get $|e_f(0) - e_f(1)| = 1$. Therefore, comb graphs admit union cordial labeling.

Theorem: 2.1.4

Twig graphs, T_k are union cordial graphs.

Proof

Let $X = \{1, 2, \dots, n\}$ and $|\wp(X)| = 2^n$.

Hameetha Begum et al.,

Let u_1, u_2, \dots, u_n be the vertices of the path; v_1, v_2, \dots, v_{n-2} be the pendant vertices attached below the internal vertices of the path and w_1, w_2, \dots, w_{n-2} be the pendant vertices attached above the internal vertices of the path. First label the vertex u_1 by X and u_n by \emptyset set. Then label the vertex sequence $u_2, v_1, w_1, u_3, v_2, w_2, \dots, u_{k-1}, v_{k-2}, w_{k-2}$ starting from the one element subset $\{1\}, \{2\}, \{3\}, \dots$ of $\wp(X)$, in order. Then by the definition of union cordial labeling, we get $|e_f(0) - e_f(1)| = 1$. Therefore, twig graphs are union cordial graphs.

Theorem: 2.1.5

Coconut tree, $CT(m, n)$ admits union cordial labeling.

Proof

Let $X = \{1, 2, \dots, k\}$ and $|\wp(X)| = 2^k$.

Let $V(G) = \{v_1, v_2, \dots, v_m, u_1, u_2, \dots, u_n\}$ be the vertices of $CT(m, n)$.

It has $m + n = 2^k$ vertices and $m + n - 1$ edges. Let v_m be the vertex in the path P_m where the 'n' pendant edges are appended. Let the vertex v_m be labeled by the \emptyset set. Label the remaining vertices (i.e., v_1, v_2, \dots, v_{m-1} in the path and the pendant vertices u_1, u_2, \dots, u_n by the subsets $\{1\}, \{2\}, \{3\}, \dots$ of $\wp(X)$. Then by the definition of union cordial labeling, we get the labeling of edges as 0 or 1 and hence $|e_f(0) - e_f(1)|$ is either 0 or 1. For $m \geq 5$, if the required result is not attained, then the labeling of vertices in the path can be altered as in labeling of paths (**By theorem:2.1.1**) which provides the required result. Therefore, Coconut tree admits union cordial labeling.

Star Related Graphs

Theorem: 2.2.1

Star graphs, $K_{1,q}$ are union cordial graphs.

Proof

Let $X = \{1, 2, \dots, n\}$ and $|\wp(X)| = 2^n$.

Here $p = 2^n$ and $V(G) = \{v_1, v_2, \dots, v_p\}$.

Let v_p be the central vertex and v_1, v_2, \dots, v_{p-1} be the end vertices of the star $K_{1,q}$. Then $K_{1,q}$ contains $q = 2^n - 1$ edges. First label the central vertex by \emptyset set and then label the remaining vertices by the other subsets of $\wp(X)$. It is observed that the union of each subset labeled in the end vertices with \emptyset set contributes 2^{n-1} '1's to $e_f(1)$ and $2^{n-1} - 1$ '0's to $e_f(0)$. Now we get, $|e_f(0) - e_f(1)|$ is either 0 or 1. Therefore, star graphs are union cordial graphs.

Theorem: 2.2.3

Bistar graphs, $B_{m,m}$ admit union cordial labeling.

Proof

Let $X = \{1, 2, \dots, n\}$ and $|\wp(X)| = 2^n$.

The graph $B_{m,m}$ has $2m + 2$ vertices and $2m + 1$ edges.

Let xy be the edge joining the two stars $K_{1,m}$ and $K_{1,m}$.

Let u_1, u_2, \dots, u_m be the vertices adjacent to x and $u_{m+1}, u_{m+2}, \dots, u_{2m}$ be the vertices adjacent to y .

Labeling

Let $|X| = \text{even}$. First label the vertices x and y by \emptyset set and X . Next label the vertices u_1, u_2, \dots, u_m , that are adjacent to x , by the subsets whose union with \emptyset set provides odd cardinality so that it contributes 'm' 1's to $e_f(1)$. Then label the vertices $u_{m+1}, u_{m+2}, \dots, u_{2m}$, that are adjacent to y , by the remaining subsets in $\wp(X)$ whose union with X yields X so that it contributes 'm' 0's to $e_f(0)$. Also, the edge xy (i.e., $\emptyset \cup X = X$ which again contributes one 0's to $e_f(0)$. Therefore, there are 'm + 1' 0's which finally results in $|e_f(0) - e_f(1)| = 1$ providing $B_{m,m}$, a union cordial graph.

Let $|X| = \text{odd}$. As in the previous case, label the vertices x and y by \emptyset set and X . Next label the vertices u_1, u_2, \dots, u_m , that are adjacent to x , by the subsets whose union with \emptyset set provides even cardinality so that it contributes 'm' 0's to

Hameetha Begum et al.,

$e_f(0)$. Then label the vertices $u_{m+1}, u_{m+2}, \dots, u_{2m}$, that are adjacent to y , by the remaining subsets in $\wp(X)$ whose union with X yields X so that it contributes 'm' 1's to $e_f(1)$. Moreover, the edge xy (i.e.) $\emptyset \cup X = X$ which again contributes one 1's to $e_f(1)$. Therefore, there are 'm + 1' 1's which finally results in $|e_f(0) - e_f(1)| = 1$ providing $B_{m,m}$, a union cordial graph.

Theorem: 2.2.3

Double star graphs, $D_{m,n}$, $m < n$ satisfying $m + n + 2 = 2^n$, are union cordial graphs.

Proof:

Let $X = \{1, 2, \dots, n\}$ and $|\wp(X)| = 2^n$.

Let $D_{m,n}$, $m < n$ be the double star graph satisfying $m + n + 2 = 2^n$. It has $m + n + 2$ vertices and $m + n + 1$ edges. Let xy be the edge joining the two stars $K_{1,m}$ and $K_{1,n}$. Also u_1, u_2, \dots, u_m be the vertices adjacent to x and v_1, v_2, \dots, v_n be the vertices adjacent to y . Now label the vertices $v_1, v_2, \dots, v_n, y, x, u_m, u_{m-1}, \dots, u_3$ starting from the one element subset, say $\{1\}$, of $\wp(X)$ and label the vertices u_2 and u_1 by the \emptyset set and X . Then there are either $\frac{m+n+2}{2}$ 1's and $\frac{m+n+2}{2} - 1$ 0's (or) $\frac{m+n+2}{2}$ 0's and $\frac{m+n+2}{2} - 1$ 1's providing $|e_f(0) - e_f(1)|$ is either 0 or 1. Hence $D_{m,n}$, $m < n$ are union cordial graphs.

CONCLUSION

In this work, we proved the existence of union cordial labeling of tree related graphs. Further, we will try to prove the same for some special classes of graphs.

ACKNOWLEDGEMENT

The author expresses her sincere thanks to the referee for his/ her valuable suggestions / ideas that will help in the improvement of the work.

ABSTRACT

Bariatric surgery is an indication for obese individuals who find it difficult to lose weight even after trying for years for weight loss with different strategies. It promises sustainable weight loss but also it comes with its complications. The present study is a prospective cohort study to record effect of bariatric surgery on mental health and gut issues post 1-month of surgery. The study aims to identify and address two main factors involved for subjects undergoing bariatric surgery 1) Whether or not mental health problems arise/worsen in post bariatric subjects and 2) Whether or not gut issues get resolved post bariatric surgery in obese individuals. 120 subjects were included for the study, undergoing bariatric surgery were observed for depression and gut problems pre- and post-1month surgery. GSRS scale and beck's depression inventory were used to assess gut issues and depression respectively. Result show significant decrease in the GSRS score ($p < 0.001$) while increase in the BDI-II ($p < 0.001$) score contributing to reduce quality of life pre- and post-surgery. The subjects should be well educated about post-surgery phase; a multidisciplinary approach should be provided for the bariatric surgery candidates to address mental health and gut related issues.

Keywords: Depression, bariatric surgery, metabolic surgery, gastro-intestinal problems, obesity.

Kinjal Trivedi et al.,

INTRODUCTION

Obesity is one of the morbid risk factors. Obese and overweight individuals are at higher risk of suffering from other morbid diseases such as hypertension, diabetes mellitus, hypothyroidism and many other metabolic/non-metabolic illnesses[1]. Gastro-intestinal problems are the commonest amongst obese individuals. The symptoms experienced by obese individual are similar to those experienced by individuals with gut issues such as, diarrhea, constipation, irregular bowel movements, sudden urge to defecate, regurgitation, acid reflux, irregular stool consistency, belching and borborygmus[2]. These problems are faced due to excess adiposity in abdominal region[3,4]. Also, it hampers with normal physiology of the body, dysregulates homeostasis and causes inconsistency in sympathetic and parasympathetic activity[5]. The constant inflammation in the gastro-intestinal tract further makes it difficult for an individual to return to normal homeostasis[6]. When these gastric problems interfere with an individual's routine life it further affects QOL and mental well-being, when individual seeks for permanent solution to these problems, bariatric surgery comes up as well-planned, logical alternative[7]. Bariatric surgery is so far best alternative for individuals who are tired with non-sustainable weight loss options. As the surgery promises to reverse all or most of the problems faced by the obese individual, it really does provide improvement in morbid diseases such as hypertension and diabetes mellitus[8]. Although, weight recidivism is another problem faced by post-bariatric surgery individuals, it does provide relief in morbid diseases for as short span as 3 years and in long-term for 15 years[8,9]. Post bariatric surgery results vary from individual to individual but majorly all the candidates of surgery experiences near identical symptoms in post-surgical phase. Obese individuals not only encounter with physical and physiological problems but they also face mental health problems, in the form of body image issues, eating disorders, depression, anxiety and suicidal tendencies[10,11]. Wide-range of mental health problems are prevalent in obese individuals, some of which are also result of poor gut health[10]. Post bariatric surgery these problems may or may not get addressed[12,13]. Thus, this study sought to address mental health of the obese individual undergone bariatric surgery. The post-surgical period is an important phase as it decides the success rate of bariatric surgery. The mental stability and physical ability are important parts of this phase. Thus, study is conducted post- 1 month of the surgery and comparison is made with pre-operative state of the individual.

MATERIALS AND METHODOLOGY

In this prospective observational study, cohort of 120 subjects were included for the study. The sample size was calculated from historic data in SPSS 22.0. The calculated sample size was 110 for 95% CI and power of the study kept at 80%. The data was obtained from single study center Hope obesity and multispecialty hospital located in Ahmedabad, Gujarat for 6 months. Inclusion criteria were both gender individuals under going bariatric surgery in age group of 18-60 years having BMI ≥ 30 and willing to participate. Exclusion criteria were limited but individuals with severe psychological disorders such as drug abuse, attempted suicide, self-induced vomiting (untreated eating disorder), past history of any neurological illness and comprehension disability were excluded. Informed consent was taken from all participants and their care-givers.

Main Outcome variables

Beck's depression inventory (BDI-II)

Beck's depression inventory is self-report questionnaire widely used in different clinical/hospital settings. It has 21 items and ranked on scale of 0-3 for severity, with minimum score 0 and maximum score 63. It takes 5-10 minutes to complete. In those diagnosed with depression, scores of 0-13 indicates minimal depression, 14-19 indicates mild depression, 20-28 indicates moderate depression and 29-63 indicates severe depression. Content validity of the BDI-II has improved following item replacements and rewording to reflect DSM-IV criteria for major depressive disorders. Mean correlation coefficients of 0.72 and 0.60 have been found between clinical ratings of depression and the BDI for psychiatric and non-psychiatric populations. Construct validity is high for the medical symptoms measured by the questionnaire, $\alpha = 0.92$ for psychiatric outpatients and 0.93 for college students. High concurrent validities have been

**Kinjal Trivedi et al.,**

demonstrated between the questionnaire and other measures of depression such as the Minnesota Multiphasic Personality Inventory-D, $r = 0.77(14)$. Criterion validity of the BDI-II is positively correlated with the Hamilton Depression Rating Scale ($r = 0.71$) with a high 1week test-retest reliability $r = 0.93$ (suggestion robustness against daily variations in mood) and an internal consistency of $\alpha = 91[14]$

Gastro-intestinal symptom rating scale (GSRS)

GSRS is a validated questionnaire consisting of 15 gastrointestinal symptom items, scored on a 7-point Likert scale (1= no discomfort and 7= severe discomfort) combined into the following clusters: abdominal pain, reflux, diarrhoea, constipation, and indigestion[15]. A cluster score was calculated only when all items in the cluster were answered. The means of the total score and of the scores for each symptom cluster are presented. GSRS has also been used in previous studies of bariatric surgery. The GSRS has good reliability and construct validity and the GSRS scales discriminate by GERD symptom severity and are responsive to treatment. The GSRS is a useful patient-rated symptom scale for evaluating the outcomes of treatment for GERD. The internal consistency reliabilities for the GSRS scales ranged from 0.61 to 0.83 and the intraclass correlation coefficients ranged from 0.42 to 0.60[16].

Procedure

The subjects were given questionnaires along with personal detail form at the time of their first visit to the hospital. The participants were assessed at the baseline pre-surgery when they had visited the hospital for first consultation, data of all the individuals who visited the hospital were recorded that is of individuals. Data of operated subjects was separated from the data of subjects who had decided to withdraw or didn't underwent surgery. Post-surgery 1-month during the subject's follow up period they were assessed again for BDI-II and GSRS. All the participants were informed about the questionnaires and assistance was provided wherever required. BDI-II does have translated versions but GSRS is available in English language only. The participants were explained in their native language about the scale when they were bewildered. The symptoms recorded on scale were verified with the care giver, especially when dealt with individuals with lower literacy rate or individuals from rural areas.

RESULTS AND DISCUSSION

In this observational study, statistical analysis was done to compare pre and post outcomes of BDI-II and GSRS. The statistical package SPSS 22.0 was used to analyze the data. The Kolmogorov-Smirnov (KS) test was used to test normality of the data. Paired t-test was used to conduct within group analysis amongst cohort participants and compare them at two different instances which is prior to surgery and post-surgically. Significant difference was considered when $p < 0.05$. The data are presented as mean (SD). Baseline characteristics of participants shown in table 1 and results of the study in table 2. Participants included in the study completed both pre and post operative assessment. No subjects were lost in follow up for the study as candidates had never missed post-op follow up appointment arranged for routine check-up. 61% participants were female. 25% of study population had studied up to high school and rest were graduated and did pursue higher education. Data of only individuals who had undergone bariatric surgery were analyzed. Details of data sample is as given in flowchart (fig 1). In present study participants, average weight loss experienced by all the individuals is 4-6 kgs in first month depending on two most important factors, 1) the surgery performed - bypass (more weight loss as compared to other option) or sleeve-gastrectomy and 2) obesity grading on an individual with inverse proportional relation between obesity grade and weight loss post-surgery. The result of t test for BDI-II showed significant difference ($p \text{ value} < 0.001$) for pre- and post-surgery measurements. Pre-surgery the mean (SD) score was 21.27 ± 10.61 and post-surgery it increased by 2 points in overall score that is 23.16 ± 9.61 as shown in table 2. For GSRS, it decreased from mean (SD) 6.64 ± 0.45 to mean (SD) score of 5.70 ± 0.54 showing significant ($p \text{ value} < 0.001$) reduction in overall scoring as shown in table 2. Further analysis of subsets of GSRS is shown in table 3. Present study was conducted to know quality of life of subjects undergoing bariatric surgery post 1-month of the surgery. The study results showed decrease score in GSRS post surgically while increased score on BDI-II scale suggesting subject's gastric discomforts related to obesity are decreased after minimum weight loss post 1-month. While subjects had increased score on depression inventory.

**Kinjal Trivedi et al.,**

Although the GSRS score is reduced but detailed analysis of it as shown in table 3, reveals changes in symptoms of regurgitation which is a common symptom after bariatric[17]. Complaints of diarrhea, constipation, flatulence decreases while on the other hand complaints of regurgitation, nausea and heart burn increases which lies in a subset of scale which has lesser score; thus, it justifies decreased GSRS score[18]. The subjects were knowing very little about post-surgical symptoms of gastro-intestinal tract, which left them mentally unprepared for following regurgitation and nausea. The unavailability of the GSRS in native language has played role in creating a bias. The symptoms described in the scale and as understood and explained by the hospital assistant to the subjects may not be accurate. The literacy rate of study participants has also played a role in creating bias for GSRS score. BDI-II scale has questions about excess recent weight loss. This question is for a depressed individual as depression leads to eating disorders suggesting changes in weight of an individual but in the present scenario, the significant weight loss is caused by bariatric surgery which leads to increase in severity score. Also, another reason for increased score on this inventory is for questions about fluctuating moods, sex life and overall feel-good factor which are affected because of surgery[19]. The subject's physiological system is still adapting the new change brought about by surgery.

The increased hunger sensation and reduction in appetite in some individuals, but unable to eat or sudden reduction in hunger as well as appetite in others puts the subjects in frustrated moods. The restrictive surgery has decreased the size of the stomach and the food volume which it can accommodate, which leads to symptoms of regurgitation and nausea[20]. Also, the overall well-being of the individuals gets disturbed leading to thoughts pertaining to life expectancy, death-related thoughts, thoughts about surgery going unsuccessful and thoughts regarding whether they are losing any weight after surgery or not[21,22]. This leads to negative performance in BDI-II. Prevalence of depression in obesity is a well-established fact and bariatric surgery may worsen depression score in such individuals, special keen attention should be given to individuals falling in moderate depression score range as they are at higher risk for developing severe depression post-surgery. At the end of study when subjects were asked to share their experience post-1 month of the surgery, it was almost similar with all of them. All the subjects receiving counselling pre-surgery were only partially aware about what to expect post-surgery and furthermore they were more excited about long-term effect of surgery rather than seeking information on post-immediate surgery effects, which justifies their lack of curiosity to know about short term outcomes of the surgery. However, the participants may or may not be curious about surgery outcomes but it is the duty of associated medical team to invest time in patient education. Other scales/questionnaire to assess mental health comprehensively such PSS for perceived anxiety and DASS – depression anxiety stress scale could have been better indicator of mental health for current study subjects, providing more precise results. Individuals undergoing bariatric surgery should be educated with present information and also the concerned rehab team should have this knowledge and treat patients accordingly for atleast first month of surgery.

ABSTRACT

Aspect-Based Sentiment Analysis (ABSA) is essential for extracting detailed opinions in texts, especially when dealing with code-mixed languages like Gujarati and English. This paper presents an optimized ABSA framework for code-mixed Gujarati texts, addressing the complexities of language switching. We introduce novel preprocessing techniques, including advanced language detection and normalization methods, to manage mixed-language components effectively. Using machine learning and deep learning models, our approach enhances sentiment detection accuracy in the presence of code-switching. Experimental results show significant improvements over traditional methods. Practical applications include better social media analysis and more accurate customer feedback interpretation. Our research offers robust solutions for ABSA in code-mixed texts, providing valuable tools for industries relying on precise sentiment analysis.

Keywords: Aspect-Based Sentiment Analysis, ABSA, Code-Mixed Texts, Gujarati-English, Sentiment Analysis, Language Detection, Machine Learning, Deep Learning, Social Media Analysis, Customer Feedback.

INTRODUCTION

Aspect-Based Sentiment Analysis (ABSA) has emerged as one of the critical approaches in natural language processing that helps in understanding opinions at the level of aspects by annotating sentiments concerning them. ABSA is different from the conventional sentiment analysis where the general view of the text is analyzed, while the particularities regarding the aspects are searched. This can be quite useful in areas where one is exploring detailed views and opinions that people hold on specific aspects about a product or a service that is being offered[1]. However, the operation of ABSA becomes challenging especially when working with code-mixed texts that are half in one language and the other half in another language. Inter language is a frequently observed strategy of bilinguals and multi linguals who switch between different languages during their discourse. This presents itself as a problem with natural language processing since these systems are typically developed to work with monolingual texts. For example, there are many texts in Indian languages with sometimes English mixed with the regional language; say for example Gujarati; this makes the general analysis of the sentiments more complex. Hence, the analysis of code-mixed Gujarati is evident in the communication that happens on social media, forums, and messaging apps – where millions of Gujarati speakers in India and across the world are part of. For interpreting the sentiments of such code-mixed texts that contain both Gujarati and English, it may not be very easy to process such a text. Generally, the historically used methodologies of sentiment analysis primarily based on monolingual datasets, fail to provide correct sentiment analysis in case of code-mixed language due to the distinction in the mode of expression[2]. In this paper the primary concern is to achieve the best result for ABSA pertaining to Code mixed Gujarati text leaving behind the linguistic and technical issues that occur while analyzing such a text. Specifically, our study's goal is to establish a reliable approach to be implemented in the model thereby addressing the issue of code-switching, which allows for the precise identification of sentiment in the context of mixed language. To this end, we put forward multiple methodological developments, namely, improved preprocessing, refined ABSA architecture, and machine learning and deep learning techniques[3].

Data Collection and Preprocessing

To start with, we gather a large number of real-world code-mixed Gujarati texts taken from social media platforms, forums, customer reviews, etc. In preparation of these texts, several processes are performed such as the identification of the natural language used, the process of splitting the texts up from words into tokens and the subsequent normalization processes. Language identification is vital when it comes to isolation of Gujarati and English words in a sentence. Tokenization and normalization are some of the ways, which aid in transforming the text into a format which is convenient for findings[4].

Aspect-Based Sentiment Analysis Framework

In the suggested ABSA framework, we also include methods to extract features from the text as well as define the polarity or the sentiment tied to a given aspect. This entails washing the text to select aspect terms and using sentiment estimations to assess the sentiment polarity of each aspect.

Handling Code-Mixing

Regarding the issues of code-mixing, we present particular types of tokenization and use models that have been developed for the code-mixed corpora. This is helpful in making sure that the details regarding the language switching process is acknowledged, and the sentiment analysis is correct. We also employ the use of translation methods in the process if needed, that is translating the Gujarati components in to English so that there can be consistency in the evaluation of the sentiments.

Model Training and Evaluation

For sentiment analysis, both the machine learning and deep learning techniques are implemented. These are the models that are used to work on the preprocessed data set and fine-tuning of the hypermeters is done efficiently. The overall performance is bounded using the following measures of accuracy, precision, recall, and F1 score[5].

**Shyam Viththalani and Krunalkumar Patel**

Experimental Results: These examples also show that the accuracy of sentiment analysis greatly exceeds the traditional methods, which our experiments proved. Thus, compared to the prior approach, our method offers a better resolution to sentiment analysis due to the efficient understanding of code-mixed language[6].

Practical Applications

Our research has many practical implications as it is presented below. Improved polarity helps in enhancing social media analysis to give better information to businesses regarding what their customers are saying. It can also enrich feedback translation, and let the companies better know some special attitudes towards the corresponding elements of goods or services[7]. Thus, this research presents viable solutions to the problems faced by the ABSA in code-mixed Gujarati text, which is potentially helpful for the industries leveraging the sentiment analysis. Our contribution to the development of methodological approaches can be useful for further research on the study of MSA in the multifaceted context of multilingualism, which can act as the key to a better understanding of the modern tendencies in the multicultural environment that dominates in the multimedia context of today's world.

LITERATURE REVIEW

The field of sentiment analysis has developed during the recent several decades; however, recent years it was divided into more deep subfield – Aspect-Based Sentiment Analysis (ABSA) as the main focus of which is in the identification of particular aspects of the entities present in the texts. Similarly to the first function, it is not just a simple sentiment analysis where a text's sentiment is calculated; instead, ABSA finds sentiments directed at specific aspects mentioned in the text. This level of analysis is very useful in different applications, for example in customer feedback, customer reviews and social media. However, the complexity rises when the MSE includes the code-mixed text and especially the text that includes Gujarati and English languages.

Sentiment Analysis and ABSA

The basic research in the field of sentiment analysis began around the approaches to categories every document as positive or negative. This was succeeded by attempts to perform sentiment analysis at the level of having to consider the sentiment of the whole sentence before arriving at ABSA, where the emphasis was now placed on establishing the sentiment about particular aspects that can be found within the text (Ambreen 2020). ABSA involves two primary tasks: and aspect extraction, as well as sentiment classification[8]. Aspect extraction deals with recognizing the textual parts (aspects) concerned with a given area, and sentiment classification is the process of deciding on the polarity for every aspect. For these tasks, different approaches have been used varying from logical and rule-based to machine learning and deep learning. the association rule mining to extract the aspects from the product reviews whereas the recent methods use the neural networks and the attention mechanism to model the context and semantics (Manju et al., 2022)[9].

Code-Mixed Texts and Linguistic Challenges

Switching, which involves the use of two or more languages in the same conversation or in the same text is rife in multilingual communities. It complicates the sentiment analysis process due to a requirement of dealing with multiple languages in the same process. This is common in a lot of areas for instance in India, Such languages as Gujarati are uttered and written alongside English[10].

Handling Code-Mixed Texts in Sentiment Analysis

Several strategies have been proposed to handle code-mixed texts in sentiment analysis. These include:

Language Identification:

The simplest task to perform is the identification of these languages in the specified text. The techniques used range from basic such as dictionaries and n-grams to the contemporary machine learning models. Marcos et al. (2020)

**Shyam Viththalani and Krunalkumar Patel**

employed a supervised method based on the lexical and contextual aspect in order to predict languages in social media code-mixed text[11].

Translation

Another method is translating the code-mixed texts into a single language mostly English before analysis of data is carried out. This is beneficial for downstream processing but also means less accuracy and potentially much of the context, as translation models do not always completely represent mixed languages' semantics[12].

Specialized Tokenization

Newer tokenizers have been trained for code mixed data which is better capable of maintaining the language specific tokens' integrity. Later, Xinyi et al. (2023) suggested the use of language identification as a pre-processing technique along with custom tokenization for the code-mixed text[13].

Multilingual Embedding's

That is why to maximize the models' performance, the pre-trained multilingual word embeddings, such as MUSE (Gazi Imtiyaz et al. 2022) should be used. These embeddings can capture semantic similarity between words in the different languages to enhance the process of sentiment analysis for the code-mixed text[14].

Advances in ABSA for Code-Mixed Texts

Continued progress in NLP in the recent years has also seen new forms of ABSA models that are built to tackle the code-mixed text. Thus, works were devoted to studying the performance of various neural network architectures, such as gates as convolutional neural networks (CNNs), Recurrent Neural Networks (RNN), and transformers.

CNNs and RNNs

Discuss early neural models for ABSA pointed at applications of CNN for feature extraction and RNN for sequence modeling. Genta Indra et al. (2021) proposed to integrate CNNs with LSTM networks, which enables to learn both local and temporal features in text. These models were presented to allow for code-mixed data to feed by adding language-dependent features and embeddings[15].

Transformers and Attention Mechanisms

The coming up of transformer models and attention mechanisms changed the face of NLP including ABSA. Anupam et al. (2020) provided a clear proof of applying the construct called fine-tuned BERT models in the further analysis of the sentiment of the Indian social media using the texts written in Hindi-English code-mixed language[16].

Transfer Learning

Popular techniques such as transfer learning, where features are learned from huge databases and then specialized for certain tasks have also been used for ABSA in code-mixed text. It builds upon the general language understanding ability of the pre-trained models while fine tuning them for the code-mixed language features. It is employed by Gianni et al (2022) to enhance the results of the carriage of sentiment analysis on Indomishm-English mixture texts[17].

Practical Applications and Limitations

The areas in which ABSA can be practically applied for code-mixed texts lie in a wide range of possibilities of social media analysis and customer feedback analysis. It enables businesses to go beyond the simple evaluation of their business in terms of customer satisfaction but rather the dimensions of opinions that customers have concerning specific aspects of the business's products or services. This information may be used to design better products and develop and implement marketing and service delivery strategies that meet the customers' needs.

METHODOLOGY

The framework to enhance the efficiency of Aspect-Based Sentiment Analysis (ABSA) for code-mixed Gujarati texts involves the following steps. The mentioned approach is a part of improving the efficiency of the Aspect-Based Sentiment Analysis for code-mixed Gujarati texts in each of the phases, several problems arise from the linguistic and structural characteristics of the code-mixed language. This section describes the process of data collection and preprocessing through to model training and assessment, laying out the new methods used to address code-mixing[18].

Data Collection and Preprocessing

Data Collection

The initial step of our proposed methodology is the data gathering that involves the creation of a large code-mixed Gujarati corpus. The data was collected using social media platforms such as Twitter, Facebook, new groups, and customers' review sections. This diverse data set also contains a number of topics which guarantees the presence in the resulting image of several aspects and different attitudes. Due to the absence of code-mixed datasets in the literature, the current study also followed the process of manual annotation which involved marking of the text with aspects and their associated sentiment polarity[19].

Preprocessing

Data cleaning is an important step because it involves transformations into the raw text data that is usually collected. Our preprocessing pipeline includes the following steps: Our preprocessing pipeline includes the following steps::

Language Detection

Primary as it is to identify the languages present in each segment is, it is also just as simple. By using dictionary based methods and machine learning models established to identify Gujarati and English word within the same text. This step ensures that there is right separation and with right treatment different language components are got[20].

Tokenization

Splitting the text into one or many parts by using space or by considering a word or a phrase at a time is called tokenization. Most of the standard tokenizers are ineffective when it comes to code-mixed text data because of different vernacular language's punctuation and grammatical patterns. Therefore, we came up with a novel tokenizer that is sensitive to different languages while maintaining the quality of tokens pertaining to a specific language[21].

Normalization

Normalization entails preprocessing the text to decrease the variation resulting from the differences in writing style between the samples. In most cases, variations in both Gujarati and English are quite intricate and together with the rules mentioned above, we employed other techniques to standardize the way words are written[22].

Translation

In some cases where certain analytical perspectives are relevant, it might be useful to translate the Gujarati components to English. Due to the variations in languages, we were able to use translation models to obtain parallel datasets. This step, however, is done selectively in order not to lose cultural and contextual contents[23].

Aspect-Based Sentiment Analysis Framework

Aspect Extraction

Aspect extraction identifies the specific features or components (aspects) discussed in the text. We employed a hybrid approach combining rule-based methods and machine learning models:

**Shyam Viththalani and Krunalkumar Patel****Rule-Based Methods**

These involve predefined linguistic patterns and keywords to identify aspects. For example, product reviews often mention aspects like “battery,” “screen,” or “performance.” Such rules help in quickly identifying common aspects[24].

Machine Learning Models

We trained machine learning models (e.g., Conditional Random Fields, CRFs) to learn from annotated data. These models can recognize more complex and context-dependent aspects that rule-based methods might miss[25]. Once aspects are identified, the next step is to determine the sentiment associated with each aspect. We used a combination of traditional machine learning classifiers and deep learning models:

Machine Learning Classifiers

Methods such as Support Vector Machines (SVM) and Random Forests are learned from the feature vectors obtained from text where these are n-grams, part-of-speech tags, and syntactic dependencies.

Deep Learning Models

To extract semantic and contextual information we used Convolutional Neural Networks (CNNs) and Long Short-Term Memory (LSTM) networks. These models are especially useful when analyzing the specifics of second language texts inextricably containing English language fragments.

Handling Code-Mixing**Specialized Tokenization**

Since the proposed custom tokenizer is to work with code-mixed texts, it is able to identify and maintain language-bound features. The above tokenizer has the capability of distinguishing between Gujarati and English tokens so as to accurately represent a scenario that may have both types of tokens such as in; “ I am from Gujarat, India ”.

Multilingual Embeddings

The semantic translations were based on a comparative assessment of two multi-lingual pre-trained word embedding models: MUSE & LASER. Hence, these embeddings mainly offer a common representation of words in varying languages, which boosts the model’s performance in comparing and analyzing code-mixed texts[26].

Transfer Learning

In transfer learning, we train models on our code-mixed set fine-tuning pre-trained models. We employed multilingual BERT (mBERT) and XLM-R as they were developed from large multilingual corpora and further optimized by the current research on the annotated code-mixed dataset. This approach builds on the ability of such models to understand and learn the general language while fine-tuning them for the dialect of Gujarati-English code-switching.

Training

Stratified k-fold cross validation was used to train our models in order to get better evaluation. Fine-tuning of the hyperparameters to increase practical performance on significant characteristics of the training set was performed with up to six degrees of freedom where possible, including learning rate, batch size, number of layers of the deep learning models, and so on[27].

Evaluation Metrics

At the end of model training, accuracy, precision, recall, and F1-score were considered as the final metrics for the evaluation of the proposed models. Such measures give a general evaluation of model performance, the efficiency of comparison of aspects as well as the effectiveness of sentiment assessment.

**Shyam Viththalani and Krunalkumar Patel****Comparative Analysis**

We also compared our method with baseline models and some of the existing methods in Sentiment Analysis of code-mixed texts. This comparative analysis of our and other works pointed out that the benefits of the used methodology could be observed in aspect extraction and sentiment classification error rate enhancement[28].

Experimental Results

The proposed methodology learned from these experiments demonstrated the efficiency of this method over the traditional approaches applied to code-mixed Gujarati text. Custom tokenization, available in the enterprise version of topic, as well as fine-tuned models such as multilingual embeddings and transfer learning models boasted of improved aspect extraction and sentiment classification significantly. The findings revealed that due to greater resource availability and better understanding of the context, there was more accuracy and thereby better ability of dealing with code-mixed language which is intrinsically context sensitive.

Practical Applications

The utilization of our research findings is indeed profound. The improvement of ABSA for code-mixed texts can help in social media monitoring with delivering more detailed information about customers' opinions to businesses. It can also enhance the assessment of customer feedback that can generate information of customers' specific attitudes towards some aspects of a business firm's product or service hence assist companies in enhancing their decisions that result in improved customer satisfaction.

CONCLUSION

The proposed methodology of ABSA for code-mixed Gujarati texts improves the overall accuracy of sentiment detection because it encompasses various challenges related to amalgamation of codes from two different languages. Said method involves the use of not only a custom tokenizer, but also language detection methods that would allow for a proper splitting of text into Gujarati and English parts. This means that procurements done will be of high quality, which is key to being used for analysis. For the aspect extraction, we employ a rule based and model based approach while for the sentiment classification, we employ deep learning with special focus on attention mechanism. Such innovations enhance the specificity of the method of sentiment analysis in terms of specific aspects. It is also noteworthy that the proposed models utilize multilingual embeddings as well as transfer learning methods that can also help address the problems arising from code-mixed texts by enabling proper semantic analysis of the texts in different languages. The outcomes of our experimental evaluation indicate that improvements over conventional techniques are achieved and depicted an improvement in sentiment analysis. Some benefits of our study are the enhanced monitoring of post content that might be potentially damaging for a company and the enhancement of customer feedback analysis for gaining enhanced knowledge about people's opinions and behaviors. This methodology helps to develop the tools for industries involved with multilingual data, leading to the improvement of the decision-making and customers' satisfaction. The present work can be extended into the subsequent research in using these techniques incorporating other languages and environmental applications.

ABSTRACT

The study aims to investigate the effect of complex training on the physiological variables (resting heart rate and blood pressure) of team game players of CUPB. A total of 24 subjects of handball and volleyball players (12 subjects in the control group and 12 in the experimental group) enrolled in various master's degree programs at the Central University of Punjab, Bathinda, aged between 21 and 26 years, were selected for the study. A purposive sampling method was used to fulfill the study's objectives. The experimental group underwent complex training; the other group acted as a control. Before and after the training, the subjects were tested on physiological variables (resting heart rate and blood pressure) using standard tests and procedures. ANOVA was used to determine the significant difference existing between pre-test and post-test on physiological variables. The result of the study proved that the effect of complex training decreased the physiological variables (resting heart rate and blood pressure) of team game players of CUPB.

Keywords: Complex training, Physiological variables, Resting heart rate, Blood pressure

INTRODUCTION

Enhancing athletic performance is aided by sports training. Like other forms of human performance, sports performances are also the result of the athlete's entire personality. A person's physical, physiological, social, and psychological characteristics make up their personality. Consequently, to enhance sports performance, a sportsperson's social and psychological qualities must be developed in addition to their physical and physiological attributes (Hardayal Singh, 1991). A complex training method is similar to a contrast training method, which uses strength and plyometric exercises in a single session (Cormier et al., 2020). There is a vast difference in the way how the exercises are performed. In the complex training method, a complex set comprises a strength exercise (e.g., Bulgarian split squat) immediately followed by a plyometric exercise (e.g., Split jump) set by set. Resting heart rate is the total number of heart beats per minute. The automatic nervous system controls the heart rate, which provides the Sino-vial artery node with parasympathetic or vagus nerves and sympathetic or acceleratory nerves (Larry, 1982). Blood pressure is the force that blood exerts on the walls of blood vessels. The force that blood applies to blood vessel walls is known as blood pressure. It is essential for ensuring proper tissue perfusion during physical activity and rest periods.

METHODOLOGY

Subjects And Variables

The purpose of the study is to investigate the effect of complex training on the physiological variables (resting heart rate and blood pressure) of team game players of CUPB. A total of 24 subjects of handball and volleyball players (12 subjects in the control group and 12 in the experimental group) enrolled in various master's degree programs at the Central University of Punjab, Bathinda, aged between 21 and 26 years, were selected for the study. A purposive sampling method was used to fulfill the study's objectives. The experimental group underwent complex training; the other group acted as a control. Resting heart rate was measured using the palpitation method, and blood pressure was measured using a sphygmomanometer.

Training Protocol

The experiment group underwent complex training twice weekly for six weeks. The workout lasted approximately 45 minutes in everyday training sessions, including warming up and limbering down. The control group did not participate in any particular training program or strenuous physical exercises apart from their activities.

Experimental Design and Statistical Technique

The study was formulated as a random group design consisting of pre-test and post-test. The subjects (n=24) were randomly selected from the Central University of Punjab handball and volleyball team. Two groups were selected: the Control Group and the Experimental Group. The pre-test was conducted on all subjects' physiological variables. Then, the experimental group underwent training for six weeks. The post-test was performed on the dependent variables after the training period. ANOVA was used as a statistical technique to determine the effect of complex training on selected physiological variables between controlled and experimental groups. Table-I shows that the pre-test mean and standard deviation on the experimental and control groups' resting heart rates are 68.083 ± 1.621 and 69 ± 1.279 , respectively. The obtained 'F' ratio value of 0.138 for the pre-test mean on resting heart rate of the experiment and control group was less than the required table value of 4.30 for the degrees of freedom 1 and 22 at 0.05 confidence level. It reveals a statistically insignificant difference between the experiment and control groups during the pre-test period. The post-test mean and standard deviation on resting heart rate of the experiment and control group are 64.666 ± 1.669 and 68.25 ± 2.094 , respectively. The obtained 'F' ratio value of 21.477 for the post-test mean on resting heart rate of the experiment and control group was more significant than the required table value of 4.30 for the degrees of freedom 1 and 22 at 0.05 confidence level. It reveals a statistically significant difference between the experiment and control groups during the post-test period.

**John et al.,**

Table II shows that the pre-test mean and standard deviation on blood pressure(systolic) of the experiment and control group are 114.583 ± 3.604 and 115.416 ± 2.968 , respectively. The obtained 'F' ratio value of 0.382 for the pre-test mean on blood pressure(systolic) of the experiment and control group was less than the required table value of 4.30 for the degrees of freedom 1 and 22 at 0.05 confidence level. It reveals a statistically insignificant difference between the experiment and control groups during the pre-test period. The post-test mean, and standard deviation on the experiment and control group's blood pressure(systolic) are 110 ± 4.156 and 114.666 ± 3.446 , respectively. The obtained 'F' ratio value of 8.965 for the post-test mean on blood pressure(systolic) of the experiment and control group was more significant than the required table value of 4.30 for the degrees of freedom 1 and 22 at 0.05 confidence level. It reveals a statistically significant difference between the experiment and control groups during the post-test period. Table III shows the pre-test mean and standard deviation of the experiment and control group's blood pressure(diastolic) are 78.166 ± 2.329 and 78.75 ± 2.137 , respectively. The obtained 'F' ratio value of 0.409 for the pre-test mean on blood pressure(diastolic) of the experiment and control group was less than the required table value of 4.30 for the degrees of freedom 1 and 22 at 0.05 confidence level. It reveals a statistically insignificant difference between the experiment and control groups during the pre-test period. The post-test mean and standard deviation on the experiment and control group's blood pressure(diastolic) are 74 ± 2.174 and 78.666 ± 2.461 , respectively. The obtained 'F' ratio value of 24.225 for the post-test mean on blood pressure(diastolic) of the experiment and control group was more significant than the required table value of 4.30 for the degrees of freedom 1 and 22 at 0.05 confidence level. It reveals a statistically significant difference between the experiment and control groups during the post-test period.

DISCUSSION ON FINDINGS

The study aimed to determine the effects of complex training on physiological(resting heart rate and blood pressure) parameters. Comparing the experimental group to the control group, the study indicated that the complicated training strategy lowered the experimental group's resting heart rate. The resting heart rate was notably affected by complex training; it was 68 beats per minute before training and decreased to 64 beats per minute following training. The research listed below corroborates my investigation's conclusions. The impact of complicated and contrast training on male football players' physiological and biomotor characteristics was investigated by Kanniyar *et al.* (2013). The resting heart rate significantly decreased after complex training. Babu *et al.* (2023) examined the effects of varying plyometric training intensities on volleyball players' resting heart rates and VO₂ max. Additionally, the resting heart rate decreases after plyometric exercise. Raju *et al.* (2023) looked at the effects of several plyometric training intensities on volleyball players' resting heart rates and spiking. The findings indicated that the resting heart rate had significantly decreased. The study's findings demonstrated that the experimental group's blood pressure dropped as a result of sophisticated training as compared to the control group. In the experimental group, there was a drop in both diastolic and systolic pressure. The studies that follow bolster the conclusions of my research. The impact of complicated and contrast training on men's football players' physiological and biomotor characteristics was studied by Kanniyar *et al.* (2013). It also shows how complicated exercise might lower blood pressure.

CONCLUSIONS

The study's conclusion showed that the complex training decreased the experimental groups' (volleyball and handball players of CUPB) resting heart rate and blood pressure compared to the control group.

ABSTRACT

Throughout the world, Vitamin D insufficiency is an extremely prominent illness by means of potentially dangerous outcomes. A significant risk to the overall health of people with cystic fibrosis (CF) is vitamin D deficiency. Deficiency is mostly brought on by poor sun exposure, insufficient ingestion, and malabsorption of fat - soluble vitamins. The negative consequences of low vitamin D on health, notably a greater probability of infections, autoimmune disorders, cancer and hypertension. Different standard urge supplementing with vitamin D for all age groups. However, there is a chance of using vitamin D supplements won't work well enough, and there could be negative side effects as well.

Keywords: Vitamin D, Vitamin D deficiency, Pregnancy, Bone Health, Immune system.

INTRODUCTION

Around the world, vitamin D insufficiency is widespread. The body takes fewer Phosphate and Calcium despite inadequate amounts of vitamin D due to it exists little Phosphate and Calcium supplied to support strong bones. A lack of vitamin D can cause osteomalacia in individuals or rickets in youngsters, which is a bone disease. Bone weakness are the outcome of osteomalacia, a condition in which the human body cannot adequately collaborate with Calcium and other minerals to form bones. The body might attempt to raise its inadequate Calcium concentration by

**Soumya et al.,**

producing a greater amount of parathyroid hormone.[1] Fat-soluble vitamins include vitamin D. It plays numerous vital roles in the body and is found in plants, animals, and yeast. In a technical sense, it belongs to the category of hormones since the skin synthesizes it using sunshine[2].

Vitamin D Deficiency

Most authors characterize vitamin D insufficiency in a range of serum/plasma 25(OH)D values not more than 75 nmol/L (or 30 ng/ml)[3]. First, Having a cut-off of fewer than 25 or less than 30 nmol/L indicates severe vitamin D inadequacy, which greatly raises the risk of osteomalacia and dietary rickets[4,5]

Sources

Sources of Vitamin D includes

- Natural sources: Exposure to sunlight, Sardine, Mackerel, Tuna, Egg yolks, Mushrooms
- Fortified foods: Milk, Yogurt, Cheese, Cereals, Orange juice, Butter, Margarine
- Supplements: Vitamin D₂, Drisdol liquid supplements, Multivitamins, Vitamin D₃[6]

Synthesis of Vitamin D

While subjected to UVB rays, the human body produces vitamin D in the skin, as seen in Figure 1.

Daily Requirement

Children And Adult The Academy of Medicine suggests 200 IU of vitamin D for children as well as adults who are under the age of fifty, 400 IU for elderly of 51 to 70 years old, and 600 IU for persons of 71 years old or over as a sufficient daily dose[2]. Still, almost all professionals believe that adults and children need between 800 and 1000 IU of sun exposure per day. [8,9] Breast Fed Infants One litre of human milk contains about 20 IU of vitamin D, and females who have insufficient levels of vitamin D give their breastfed children far less. Lactating women's milk would contain sufficient amounts of vitamin D₃ to meet an infant's demands if they were given 4000 IU of the vitamin each day. Furthermore, the extent of 25-hydroxyvitamin D would increase above 30 ng per milliliter. [10]

Factors Affecting Vitamin D Status

A person's vitamin D levels might be altered by genetics, weight, and characteristics that affect the epidermal synthesis of vitamin D, such as complexion and ethnicity, age, season, and latitude, as well as by wearing clothing that protects the skin from the sun and using sunscreen. Several studies have indicated that a significant factor is connected to persistent medical conditions, such as psychological conditions. [11]

Causes of Vitamin D Deficiency

Individuals receive their vitamin D mostly due to being exposed to sunshine [12]. Whatever lowers the quantity of ultraviolet (UVB) rays from the sun that enters the outermost layer of the planet or that blocks UVB radiation from entering the body may influence the epidermal development of vitamin D₃[13]. More tone of the skin significantly decreases the mechanism of vitamin D₃ production [14]. In contrast, sunscreens ingest 99% of absorbed ultraviolet (UVB) rays with a sun protection factor of 15 light, which indicates that when applied topically, they will 99% minimize the quantity of vitamin D₃ generated within the skin.[15]

Prevalence

Extremely significant proportions of inadequate levels of vitamin D are reported in several countries across the world. More than 20% of people in Afghanistan, Pakistan, Tunisia, and India had concentrations of 25(OH)D beneath 12 ng/ml, or 30 nmol/L. For instance, 490 million Indians are considered to be deficient in vitamin D.[16,17] Vitamin D deficiency may affect 85–99% of hemodialysis individuals who have persistent kidney dysfunction patients, liver receivers of transplants, and individuals with a liver condition.[18,19,20]

**Implications of Vitamin D Inadequacy**

Insufficient levels of vitamin D during childhood may retard their growth to reach their full bone mass. The consequences of vitamin D inadequacy on the skeleton are less serious in grownups. Secondary hyperparathyroidism can reduce bone mineral density, which can lead to osteoporosis or exacerbate, because it stimulates Calcium from the skeleton. Because of this, people with osteomalacia frequently complain of bone discomfort[21,22]. Non-specific collagen vascular diseases like myositis, fibromyalgia, and chronic fatigue syndrome are commonly mistreated in patients. In accordance with assumptions, 40–60% of fibromyalgia affected might have symptoms of osteomalacia and a vitamin D deficit[22,23].

Diagnosis of Vitamin D

High-risk vitamin D will be prescribed to individuals whose insufficiency is assessed. To assess whether vitamin D is sufficient or insufficient, serum 25-hydroxyvitamin D is evaluated.^[24]

Purpose of Vitamin D**The Consequence On The Mineral Density of Bone**

Insufficient bone mineral density is a significant increased risk of osteoporosis fractures and is linked with vitamin D insufficiency[25,26]. Assessing daily 700 or 800 IU of vitamin D3 to a placebo, older women (>65 years) demonstrated moderate but substantial improvements in the density of bone minerals in the lumbar spine and femoral neck [27,28].

Depression And Schizophrenia

Vitamin D insufficiency has been associated with elevated rates of depression and schizophrenia [29]. Sustaining adequate levels of vitamin D throughout the gestation period and the initial years of life expectancy may be essential for brain growth in addition to the preservation of later-life mental function in order to fulfill the transcriptional functions of the binding site for vitamin D in the brain [30]. Elevated conveying of vitamin D receptors (VDR) in numerous locations of the brain, such as the prefrontal and frontal cortices, is known to be necessary for controlling mood and may decrease the development of depression [31]. Vitamin D is also thought to have a part in depression by perhaps maintaining glutamate-γ-aminobutyric acid and Calcium levels [32].

Pregnancy

A greater dosage of vitamin D is now advised did not seem to offer additional benefits beyond maybe lowering gestational diabetes, despite the fact that supplementing with vitamin D may help lower birthweight in babies, preeclampsia, and gestational diabetes [33]. Recent research, however, indicates that a lack of vitamin D is especially dangerous for women and can lead to complications of pregnancy as preeclampsia and gestational diabetes [34]. Elevated vitamin D concentrations are being demonstrated to dramatically lower the chance of complications during pregnancy; this benefit rises when the target amount is increased from 20 to 40 or 50 ng/mL[35]. "Greater serum vitamin D levels during pregnancy have reduced the risks of preterm birth," the FDA recently approved.

Cancer

A connection with low levels of vitamin D and an increased threat of developing various kinds of tumours has led to research into supplementing with vitamin D as a tumour preventive method [36]. The results of several investigations provided the basis for this. In 1980, Calcitriol was first thought to have the ability to stop the proliferation of cancerous melanoma cells [37]. A lower cancer death rate has been associated with more sun exposure, according to ecological research [3]. The anticancer potential of Vitamin D for a range of cancers has been the subject of investigations throughout the years, with differing levels of achievement [38]. As a result, it was unknown whether Vitamin D prevented cancer in any way [39].

Diabetes

Vitamin D insufficiency was more widespread among people with Type 1 diabetes (T1DM) compared to healthy individuals, according to multiple studies that have connected diabetes to 25(OH)D amounts^[40]. Prenatal vitamin D exposure in the foetus was found to be substantially associated with a greater chance of type 1 diabetes, as were

**Soumya et al.,**

lower gestational 25(OH)D levels [41] or a diet deficient in vitamin D-fortified foods [42]. Infants who get vitamin D administration [43] or vitamin D-enriched margarine [42] have been found to have a reduced prevalence of type 2 diabetes that is dependent upon insulin. Taking supplements around 7 and 12 months of development nearly doubled the danger of type 1 diabetes [44]. Multiple teen studies have found there is no connection with the 25(OH)D level and the start of T1DM [45].

Cardiovascular Disease

Epidemiological studies have demonstrated the existence of a negative relationship between PTH levels and 25(OH)D levels, indicating that high-normal and raised concentrations of PTH are linked to an elevated chance of cardiac incidents and death.[46] Myocardial hypertrophy and pro-arrhythmia are two of the heart's consequences of PTH, it also raises blood pressure. Consequently, PTH reduction brought on by vitamin D might reduce the incidence of cardiac problems. [47]

Immune System

The vitamin D hormone performs paracrine and autocrine actions in addition to endocrine effects. Through the use of enzymes and VDR, immune-competent cells like B and T lymphocytes, dendritic cells, and macrophages may produce 1,25(OH)₂D using their precursor, 25(OH)D. The ratio of Th1 and Th2 cells in the immune system and acquired immunity are both significantly impacted by 1,25(OH)₂D. TNF α improves the phagocytosis rate, monocyte macrophage differentiation, and macrophage lysosomal activity of enzymes.[48]

Rheumatoid Arthritis

Apart from bacterial infections, vitamin D contributes to the etiology of autoimmune diseases. The conditions multiple sclerosis (MS), inflammatory bowel illness, rheumatoid arthritis, also called RA, and diabetes with type 1 have both been associated with higher latitudes.[49,50] Since Th17 cells play a major role in the pathophysiology of RA, it is interesting to see how vitamin D deficiency affects RA.[50]

Inflammatory Bowel Disease

Many factors, some unique to bowel illness and others common to those without IBD, might lead to vitamin D deficiency in IBD patients. They involve insufficient sun exposure as a result of lifestyle choices or chronic symptoms of underlying medical conditions that limit physical activity, inadequate absorption, inadequate conversion of vitamin D to its active forms, increased excretion, and increased catabolism, as well as Insufficient dietary intake due to indicators of intestinal inflammation [51]. Insufficient vitamin D concentrations in certain IBD patients can also be caused by inadequate dietary consumption [52].

Common Symptoms[53]

- Fatigue and tiredness
- Decreased wound healing
- Anxiety and depression
- Muscle soreness
- Pain in back and bones
- Alopecia

Prevention And Management

Generally adults in their middle years have a greater probability to be poor in vitamin D because they use sun protectors more often and less frequently exposed to the sun. As a result, studies show that at least 1000 IU, likely between 1500–2000 IU/day, are required to raise blood (OH) D content over 30 ng/ml. Insufficient sun exposure as well as vitamin D utilization are the primary causes of vitamin D insufficiency. The first characteristic sign of gluten sensitivity is vitamin D deficiency. Although such people consume continuous oral vitamin D supplementation at prescribed doses, their plasma vitamin D levels do not enhance.[54] Individuals under the age of 65 who are not getting enough exposure to the sun throughout the whole year ought to consume 600–800 international units of

Soumya et al.,

vitamin D-3 every day to avoid insufficiency. To avoid insufficiency and reduce the possibility of injuries and falls, individuals who are 65 years of age and above should ingest 800–1000 international units of vitamin D3 every day [55]. Since many individuals don't get enough dietary intake of vitamin D in addition to sunlight, vitamin D supplements are usually vital for sustaining adequate vitamin D level.[56] A secure and easily accessible amount of 25 µg of vitamin D3 (1,000 IU) raises the plasma concentration of the 25-hydroxyvitamin D [25(OH)D] about 15–25 nmol/L on an average basis (over weeks/ months)^[43,44]. It must be mentioned that the serum concentration of 25(OH)D responds nonlinearly, rising substantially with less than 1 IU/day of vitamin D and flattening out with over 1 IU/day[3,57]. The sunshine vitamin comes in a number of ways. Vitamin D3 (cholecalciferol) is a suggested therapy since it is being shown to be considerably more efficient over vitamin D2 (ergocalciferol) in achieving the optimum amount of 25-hydroxyvitamin D [58].

Toxicity

In the previous years or so, the consumption of vitamin D supplements has increased substantially. The general population is becoming more aware of the dangers of extrinsic elevated levels of vitamin D and inappropriate use of over-the-counter vitamin D. Elevated levels of serum 25(OH)D or unbound 1,25-dihydroxyvitamin D [1,25(OH)2D] levels brought on by these situations may cause elevated Calcium levels and, eventually, hypercalcemia.[59] Furthermore, intrinsic causes of elevated levels of vitamin D can include increased 1,25(OH)2D synthesis due to lymphomas or granulomatous conditions. [60,61]

CONCLUSION

Lack of vitamin D is becoming recognized as a significant medical problem because maintaining both skeletal and non-skeletal processes requires vitamin D of the body, particularly in women. Both the pregnant woman and the foetus may suffer if vitamin D amounts are inadequate through pregnancy. Numerous non-skeletal diseases, including cancer, diabetes, tuberculosis, and diarrhoea, are being demonstrated to gain advantages from enough solar exposure, vitamin D supplements, and diets high in vitamin D. Despite being blessed with the ability to receive sufficient exposure to sunlight, 70–100% of Indians fail to acquire sufficient vitamin D from their diet. Enriching everyday foods to maintain appropriate vitamin D levels is an extremely practical, population-specific approach.

Conflicts of Interest

The authors have declared no conflicts of interest. All of the co-authors have evaluated the article, agree with its contents, and have no financial conflicts to declare. The submission is our original work, and we certify that no other magazine is considering it for publication.

ABSTRACT

Metacognition is refer as cognition about cognition and one's aware about ones' cognition. This term coined by John Flavell in twenty centuries. It has two dimensions one is knowledge of cognition and second is regulation of cognition. Metacognition is higher level of cognition. Graphic Organizer is very effective tool for enhancing and promoting meaningful learning. It improve the result of student's performance and achievements in each and every aspect of learning.. Investigator present study focus on to find out the effect of graphic organizer strategy on metacognitive awareness of elementary school students. Investigator select pre-test, post-test, two group design for present study. Result reveal that graphic organizer metacognitive strategy enhances the metacognitive awareness of elementary students. There is significant difference between the metacognitive awareness of elementary students taught through convictional method and graphic organizer metacognitive strategy.

Keywords: Graphic Organizer, Metacognition, Metacognitive strategies, Metacognitive awareness

INTRODUCTION

Education is a strong tool for social change and any meaningful development for society. Today's era needed more innovation in education, innovation effect all social, cultural, economic, psychological aspects of education. This era is also known as 'knowledge revaluation era' knowledge revaluation refers to create and construct new knowledge in every aspect of life. New knowledge is connected with previous knowledge, experiences, and interest of learner. Education is a lifelong journey for any learner in formal education setup. Supporting our students' development into productive, self-sufficient adults is one of the main goals that education must address. A key consideration when thinking about education is students' capacity to employ tactics that guide their motivation towards action in the

**Rekha Dhyani**

direction of the meta-proposal. This is when metacognition—knowledge about knowledge itself—comes into play. It is this component that oversees the effective direction, monitoring, regulation, organisation, and planning of our talents once they have begun to function. By raising awareness of one's own cognitive processes and self-regulation, metacognition assists students in developing into autonomous learners who can control their own learning and apply it to any aspect of their lives. As we can see, it is a deliberate, high-level thinking exercise that enables us to examine and consider our own learning processes and tactics. As a result, we must address the issue of learning and knowledge, which is becoming more and more pressing, from the standpoint of students' active participation. We must employ appropriate cognitive learning techniques to meet these "learning to learn" goals. Among these, we might emphasise those focused on critical thinking, metacognitive strategy development, and self-learning. Metacognition is an important aspects of knowledge revolution. Eurasianists and educational phycologist have realized the importance of metacognition and its learning strategies. Metacognition means 'thinking about thinking', it is an ability to evaluate a cognitive task to determine what might be the best way to accomplish the task. "Metacognition was originally referred to as the knowledge about the regulation of one's own cognitive activities in learning process" (Flavell, 1979; Brown, 1978). Flavell (1979) explain three type of metacognitive knowledge, Awareness of knowledge, Awareness of thinking, Awareness of thinking strategies. Flavell (1979) state that metacognition refer to the awareness of thought process : What we think, how we think and how we accomplish a certain task. Ability of monitor and evaluation is also included in metacognition. Metacognition is a series of thought that comes in one's mind when he engages in different task or situation. Biryukov (2003) and Hacker (1998) suggest that metacognition is an assumption of a one's thinking about his thinking which include metacognitive knowledge and metacognitive skills and metacognitive experience. Graphic Organizer is very effective tool for enhancing and promoting meaningful learning. The research article provide an evidence for improve the result of students achievements. Graphic organizer is a visual frame used to represent information and content in organize manner. It helps students to sort out and expend thinking skill and thought process. Graphic Organizer are diagrammatic, illustration used to organize and highlighting key content information and vocabulary (Lovitt, 1994). Graphic organizer visually demonstrate relationship between facts and concepts. With the help of graphic organizer students categorize and organize their thought process. It includes mapping, webbing, mind mapping etc. Graphic organizer is very useful for junior and elementary school level.

Title of study "Using Graphic organizer to develop Metacognitive Awareness in mathematics class room of elementary school students"**Objectives**

- To study the effectiveness of Graphic organizer metacognitive strategy on metacognitive awareness of elementary School Students.
- To study the difference between metacognitive awareness of eight grade students taught through Graphic organizer metacognitive strategy and convictional method.
- To develop graphic organizer metacognitive strategy module in mathematics.

Hypothesis

- There is no significant difference between pre-test and post-test score of metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy.
- There is no significant difference between post-test score of metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy and convictional method.
- There is no significant difference between boys' and girls' metacognitive awareness of elementary school students.

Design of Study

Researcher selected experimental pre-test, post-test, two group design for present study. First one is experimental group and second is controlled group. Experimental group taught through the Graphic Organizer Metacognitive Strategy method and the Controlled group taught through the Convictional Method. All 8th grade students of government school of Raipur block of Dehradun district in Uttarakhand taken as population of present study. Total

**Rekha Dhyani**

52 students are the sample of present study which is selected by random method. Students divide in two group consisting of 26 students in one group.

Variables

In present study Graphic organizer metacognitive strategy module of mathematics teaching is independent variable, metacognitive awareness was considered as in depended variable. The variables manipulated to find out the effect imposed by it on metacognitive awareness of students.

Tool used for study

The first tool was **Graphic organizer metacognitive Instructional module** in mathematics developed by researcher using for present study. Graphic organizer metacognitive strategy on selected from class 8th mathematic CBSE Uttarakhand government text book. Second tool was **Metacognitive awareness scale** developed by researcher; it consists 30 items. The reliability of metacognitive awareness scale is 0.80 measured by "Cronch Breatch Alfa Method".

Limitation of the study

Study limited to the study of Metacognitive awareness of elementary students. Study is limited to the effect of Graphic organizer metacognitive strategy on metacognitive awareness of eight grade students.

Analysis and Interpretation of Data

H1-There is no significant difference between pre-test and post-test score of metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy.

The table shows that mean post-test score of experimental group is more than mean pre-test score. SD of pre-test is 13.26 and post- test is 17.02 in experimental group. Calculated t-value is 3.282 it is significant at 1% level of significance. The difference between two means is found significant at 1% level. Hence the null hypothesis is rejected. There is significant difference between pre-test and post-test score of metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy.

H2- There is no significant difference between post-test score of metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy and traditional method.

The result from the above data indicates that, mean score of experimental group is 93.65 and control group is 78.51, the t-value is 0.3.65. Value of t- ratio is significant at 0.01 level of significant. Hence the hypothesis is rejected. There is significant difference between post-test score of metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy and traditional method.

Effect size of Experimental group and control group.

The effect size of experimental group is 1.2, which shows huge effect in Cohen's d remarks. The effect size of control group is 0.05, which shows small effect in Cohen's d remarks. Effect size is maximum in experimental group comparison to control group. It shows positive effect of metacognitive awareness in experimental group.

H3- There is no significant difference between boys and girls metacognitive awareness of elementary school student's taught through Graphic organizer metacognitive strategy.

The result of the table indicates that, in experimental group, the metacognitive mean score of boys is 89.42 and metacognitive mean score of girls is 89.41. The calculated t-value was 0.0021 Value of t-ratio was not significant at 0.01 level of significant. Hence the hypothesis is accepted. There is no significant difference between boys and girls metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy.

Rekha Dhyani

Findings of study

The finding of present study demonstrated that: Graphic organizer metacognitive strategy significantly effective in enhancing the achievement in mathematics of elementary school students. Graphic organizer metacognitive strategy is better learning strategy in mathematics comparative to convictional method. There is no significant difference between boys and girls' achievement in mathematics while taught through GO strategy. The t-value of pre-test post-test score of metacognition is significant at 0.01 level($t= 3.28$; $p>2.78$). There is significant difference between pre-test and post-test score of metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy. The t-value of pre-test post-test score of metacognition is significant at 0.01 level($t= 3.65$; $p>2.78$). There is significant difference between post-test score of metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy and traditional method. There is no significant difference between boys' and girls' metacognitive awareness of elementary school students taught through Graphic organizer metacognitive strategy.

CONCLUSION

The result of study reveals that GO metacognitive strategy enhance class 8th students' metacognitive awareness in mathematics classroom. Research shows that GO strategy develop the understanding of different mathematical concept comparison to convictional method. It is evident that students' academic progress is greatly enhanced by cognitive and metacognitive methods. It is advised that curriculum in schools and other educational institutions prioritise both cognitive and metacognitive processes concurrently.

ABSTRACT

Early and accurate fault detection in electrical power grids is a very essential research area because of its positive influence on network stability and customer satisfaction. In the past decades, many machine learning-based electrical fault detection systems have been developed. Though such systems automatically find a variety of electrical faults in the power grids, those algorithms are ineffective for large-scale electrical fault databases, which contain more voltage measurements or features. Hence, this article proposes a deep learning-based electrical fault detection system to recognize faults in the electrical power grids and transmission lines. It comprises data collection, preprocessing, and classification. First, the electrical signal transmitted through the electrical power grids or transmission lines is collected. Then, the preprocessing phase performs noise removal and signal decomposition to remove noisy signals and split the voltage capacities of all signals into smaller chunks, respectively. After that, different features are extracted, and the most relevant features are chosen by an Artificial Algae Algorithm (AAA), which also chooses the optimal hyperparameters of the classifier. Moreover, a Deep Neural Network (DNN) classifier is adopted to learn the selected features and recognize electrical faults. Finally, the experimental results show that the proposed system achieves better performance compared to the machine learning-based fault detection systems.

Keywords: Electrical power grids, Machine learning, PSO, Artificial algae algorithm, DNN, Hyperparameters

INTRODUCTION

Electrical energy systems are expanding quickly in both scale and scope worldwide. This expansion affects the whole power distribution business, from production to transmission lines. Unexpected voltage failures across transmission lines are one of the common issues faced by the power grid [1-2]. An abrupt shift in both voltage and current values, or greater levels of voltage and current than those that are typically anticipated to occur in steady state conditions, is considered an electrical or electromagnetic fault [3]. Human fault, external factors, and system malfunctions are also responsible for this voltage and current divergence from their optimum levels [4]. Additionally, if an electromagnetic fault happens, an overly high power is forced to travel across the network, which might harm machines and devices [5]. Thus, it is essential to identify faults as soon as possible to avoid component failure, disruption of operations, and destruction of global biodiversity [6]. It was claimed that there is a study gap in this area, such as the automation and evaluation of the method, despite the fact that electromagnetic fault detection methods based on binary categorization were the subject of substantial study over the last century [7]. Therefore, an intelligent system that performs effectively in the power grids of the actual world is desperately needed. A specific type of detection techniques known as outlier detection in machine learning aims to find aberrant observations or occurrences in a database [8]. Anomalies, also known as outliers, are essentially observations that deviate significantly from the predicted structure of a database and are intrinsically unusual related to the greater part (regular) of observations. Similarly, electromagnetic faults happen in real-life transmission lines infrequently (below 5%), whereas the remaining impulses are normal [9]. As a result, using anomaly detection will be more appropriate for solving the electrical fault detection problem than using the more traditional binary classification, where there must be a sufficient number of flawed signals in the dataset to prevent the binary classifier from favoring the normal class [10].

The models for anomaly-based detection are trained only on normal samples to identify the typical behavior of data. Then, they can find any hidden information that differs from the behavior that has been maintained [11]. Despite the development of several electrical fault detection approaches over the past 10 years, effective and reliable fault detection systems are still difficult to find in practical applications. Additionally, the significant scarcity of substantial quality for system validation is one of the major obstacles that slow down development in this direction. So, a novel anomaly-based electrical fault detection system is developed that is compatible with the concept of faults in electrical power grids [12]. Data preprocessing and pretraining, the two processes that come before the training phase, are advantageous. The pretraining phase uses a Particle Swarm Optimization (PSO)-based approach to choose the model's ideal hyperparameters, while the data preparation phase performs all basic operations on the raw data. Principal Component Analysis (PCA) and One-Class Support Vector Machines (OC-SVMs) are also employed to find abnormalities. On the other hand, the PCA and OC-SVMs take more time for large-scale electrical fault databases. Also, the PSO has poor exploration and a low convergence rate in the iterative process for parameter selection. To combat these issues, a new optimization algorithm and deep learning classification model are required to automatically detect electrical faults from the large-scale database. Hence, this article proposes a deep learning-based electrical fault detection system to recognize faults in the electrical power grids and transmission lines. It comprises data collection, preprocessing, and classification. Initially, the electrical signal transmitted through the electrical power grids or transmission lines is collected. Then, the preprocessing phase performs noise removal and signal decomposition to remove noisy signals and split the voltage capacities of all signals into smaller chunks, respectively. After that, different features are extracted, and the most relevant features are chosen by an AAA, which also chooses the optimal hyperparameters of the classifier. Moreover, the DNN classifier is adopted to learn the selected features and recognize electrical faults. Thus, the accuracy of detecting electrical faults in power grids or transmission lines is increased significantly.

LITERATURE SURVEY

Zhang et al. [13] developed a novel transformer fault diagnosis method using an Internet of Things (IoT) based monitoring system and an Ensemble Machine Learning (EML). First, transformer vibration signals were measured by

**Daxayani and Ananthamoorthy**

using the data measurement subsystem, and they were sent to the remote server by using the data reception subsystem. Then, an EML composed of Deep Belief Networks (DBNs) and Stacked Denoising Auto encoders (SDAs) with different activation functions, and Relevance Vector Machines (RVMs) was proposed. DBNs and SDAs were used to extract features from the signals, and RVMs were respectively employed as classifier. To ensure efficient of the EML, a novel combination strategy was proposed. Gangwar et al. [14] presented K-means clustering and weighted K-Nearest Neighbor (KNN) Regression based algorithm for the protection of transmission line. The three-phase current signals of both the terminals were synchronized and sampled with sampling frequency of 3.84 kHz. Cumulative Differential Sum (CDS) was computed by subtracting the samples of current cycle from the previous cycle at both the terminals of transmission line. K-means clustering was applied on CDS to compute two centroids using moving window of width, equal to one cycle. Difference between the absolute values of centroids was computed at both the terminals and represented by Centroid Difference (CD). The CD of both the terminals were added to compute the fault Index. The computed fault index was used to detect and classify the types of faults. The location of the fault was estimated by the weighted K-NN regression method. Rohani & Koochaki [15] developed a new hybrid system based on Adaptive Neuro-Fuzzy Inference System (ANFIS) with optimal parameters and Hilbert-Huang (HH) transform for fault location in Voltage Sourced Converter-HVDC (VSC-HVDC) systems. At first, HH transform was applied to extract new features from current signal. After that, ANFIS uses the extracted features to estimate the fault location in transmission lines. Learning algorithm determines the accuracy and efficiency of each machine-learning algorithm. Also, enhanced Chaotic Dynamic Weight Particle Swarm Optimization (CDWPSO) algorithm was used as learning algorithm to train the ANFIS.

Lu et al. [16] developed a new approach based on the Improved Empirical Wavelet Transform (IEWT) and Salp Swarm Algorithm (SSA) optimized Kernel Extreme Learning Machine (KELM). First, IEWT is used to adaptively decompose the vibration signal to obtain a set of Empirical Wavelet Functions (EWFs). Then, the first n-order components with high correlation coefficient are collected. The mean value, variance, kurtosis, Refine Composite Multi-Scale Entropy (RCMSE), and Time-Frequency Entropy (TFE) of these n-order components were calculated to construct a fusion feature vector. Finally, a two-level diagnostic model based on SSA-KELM is established. The first-level of it was applied to identify normal and abnormal states, and the second-level was selected to identify fault categories in the abnormal states. The proposed method can effectively diagnose the existing fault categories in the training set and accurately identify the unknown categories of faults. Li et al. [17] developed a new fault detection and classification method for microgrids. Hilbert-Huang Transform and sliding window strategy were used in fault characteristic extraction. The instantaneous phase difference of current high-frequency component was obtained as the fault characteristic. A self-adaptive threshold was set to increase the detection sensitivity. A fault can be detected by comparing the fault characteristic and the threshold. Furthermore, the fault type was identified by the utilization of zero-sequence current. Baloch & Muhammad [18] presented the Hilbert transform and data mining approach to protect the microgrid. At first, the Hilbert transform was used to preprocess the faulted voltage and current signals to extract the sensitive fault features. Then, the obtained dataset of the extracted features was input to the logistic regression classifier for fault detection. Furthermore, fault classification was done by training the AdaBoost classifier.

Harish et al. [19] presented detecting and classifying faults in transmission lines for wide-area backup protection using Phasor Measurement Units (PMU) data. The faults were detected and classified using a Weighted Extreme Learning Machine (WELM) algorithm, which considers the variable distribution of data among the different classes using a weighted approach. The PMU signal data used were generated, and the input features data were derived using a wavelet transform-based ensemble feature extraction technique. Moreover, the WELM classifier was optimized using Particle Swarm Optimization (PSO). Al Kharusi et al. [20] presented a comprehensive machine-learning-based approach for detecting and classifying faults in transmission lines connected to inverter-based generators. A two-layer classification approach was considered: fault detection and fault type classification. The faults were comprised of different types at several line locations and variable fault impedance. The features from instantaneous three-phase current and voltages and calculated Swing-Center Voltage (SCV) were extracted in time, frequency, and time-frequency domains. The unbalanced data problem was investigated and mitigated using the

**Daxayani and Ananthamoorthy**

Synthetic Minority Class Oversampling Technique (SMOTE). The hyperparameters of the classifiers, namely decision trees, SVM, KNN, and Ensemble trees were optimized using the Bayesian optimization algorithm.

MATERIALS AND METHODS

This section explains the proposed electrical fault detection system briefly. Figure 1 shows the block diagram of the presented study. The proposed system seeks to recognize anomalous patterns in the electrical power line's voltage signals. Since anomaly-based detection models cannot deal with an electrical signal in its raw form, the input signal has to undergo a preprocessing phase where voltage measurements of the signal are filtered from noise and decomposed into chunks. Afterward, a feature extraction process is executed to characterize the pattern of voltage measurements, and then these features are put into a data record and normalized. These records of the input signals are given to the AAA-based algorithm to choose the optimal features and hyperparameters used in the classifier models. The selected features are used to train the deep learning classifier, and the trained model is applied to detect any faulty signals from the normal signals.

Database Description

The VSB (Technical University of Ostrava) database is a modern database that was published online in 2018 on the Kaggle Competition website. In addition to that, it is a realistic fault detection database because it was created by the ENET Center at the Technical University of Ostrava using a new device for capturing electrical signals passed through real power lines. Regarding the structure of the VSB database, it has 8712 samples, and each sample is merely an electrical signal that has 800,000 voltage measurements stored as integer values. These signals are captured from a real 3-phase electrical power grid that operates at 50 Hz, and all signals are recorded over a single complete grid cycle (20 milliseconds). Additionally, there is a feature, named Class, in the VSB database that determines the type of each signal, i.e., normal and faulty classes are labeled as 0 and 1, respectively. On the other hand, the majority of samples in the VSB database belong to normal signals (8187 samples), while the rest (525 samples) are faulty signals. This severe defect between the number of normal and faulty samples in the VSB database may lead to poor classification results because the classifiers will bias toward the majority class (normal). Hence, employing anomaly-based detection models is inevitable with such an imbalanced database.

Data Preprocessing and Feature Extraction

This phase performs all fundamental operations on the samples of the VSB database. It is very vital because it prepares data for modeling and analyzing by the used anomaly-based fault detection models. This phase comprises different processes, including signal denoising, signal decomposition, feature extraction, data normalization, and feature selection.

Signal Denoising

Each signal in the VSB database is filtered from noise separately, as follows: Initially, a copy of all voltage measurements of particular signal is saved and ordered in an ascending order. Then, the first quartile Q_1 (25% percentile) and the third quartile Q_3 (75% percentile) of the signal measurements are calculated. The value of IQR (the middle 50% of the signal) is computed as:

$$IQR = Q_3 - Q_1 \quad (1)$$

After that, the value of IQR is multiplied by k value which is an adjustment factor. The aim of using such a factor is to determine the strength of outliers. Two widely used values of k are 1.5 and 3. The value of 1.5 is used to identify weak (minor) outliers, the value of 3 is used to determine strong (major) outliers in data. In the electrical fault detection problem, two types of outliers are familiar: fault measurements which slightly deviate from the normal values and noise measurements which extremely differ from the normal values. Therefore, the fault measurements have to be kept to accomplish the fault detection task, whereas the noise measurements have to be removed. Accordingly, k value is set to be 3.

Signal Decomposition

After signal denoising process is completed, the remaining voltage measurements of the i^{th} signal in the VSB database are equal to $(800000 - l)$, where l is the number of voltage measurements in the i^{th} signal that are identified as a noise and removed. Signal decomposition is the process of partitioning the remaining voltage measurements of each signal into smaller chunks that are easier to detect faults within them. In this study, all signals in the VSB database are decomposed into 2 chunks. Let M denote the number of chunks; then, the signal decomposition process breaks up the remaining voltage measurements of each signal in the VSB database into M chunks, as follows:

$$Chunk_size = Round\left(\frac{\text{remaining measurements of signal}_i}{M}\right) \quad (2)$$

$$Chunk_j^i = X_{[(j-1)*Chunk_size]+1}^i, \dots, X_{[(j-1)*Chunk_size]+Chunk_size}^i, j = 1, \dots, M \quad (3)$$

In Eqns. (2) & (3), $Chunk_size$ is the size of the chunk, $Round$ is a function that rounds a number to an integer value, X_d^i is the d^{th} voltage measurements of the i^{th} signal and $Chunk_j^i$ is the j^{th} chunk of the i^{th} signal.

Feature Extraction

A feature extraction process is performed to reduce dimensions of the feature space. Thus, 19 features from the existing voltage measurements are extracted for each chunk of the signal separately. The extracted features are mean, standard deviation, max value, min value, percentile, relative percentile, lower bound, upper bound, and height (distance). The number of features in the reduced database is equal to $(19 * M) + 1$, where M is the number of chunks.

Artificial Algae Algorithm for Selection of Optimal Features and Hyperparameters

After extracting features from all chunks of the signal, all extracted features are given as input to the AAA for optimal feature selection. The AAA is a novel bio-inspired strategy, which imitates the living habits and behaviors of microalgae. It is designed to update the major population by simulating microalgae habits like algae inclination, regeneration and adjustment to the atmosphere. So, algae possess 3 primary operations: progression, helical motion and adjustment. This algorithm's population is made up of algae colonies. When the algae individual in an algae colony gets adequate sunlight, the algal colony can develop to a larger volume. But, because of inadequate sunlight, the algae colony doesn't expand sufficiently during the progression period. All algae colonies can migrate towards the strongest algae colony in a helical motion. The major operations in the AAA are described below.

Consider $a_i = (a_{i1}, a_{i2}, \dots, a_{ix})$, where $i = 1, 2, \dots, n$ and a_i is the solution in the hunt space. The algae population (AP) is defined as:

$$AP = \begin{bmatrix} a_{11} & a_{21} & \dots & a_{1x} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nx} \end{bmatrix} \quad (4)$$

Consider the algae colony dimension i^{th} algae colony is S_i and the fitness function is $f(a_i)$ and S_i can be updated by

$$S_i = dimension(a_i) \quad (5)$$

$$\rho_i = \frac{S_i + 4f(a_i)}{S_i + 2f(a_i)} \quad (6)$$

$$S_i^{t+1} = \rho_i S_i^t \quad (7)$$

In Eqns. (5) – (7), ρ_i is the update coefficient of S_i and t is the current population.

Helical Motion Step: The algae colony migrates in 3D so that the motion of the algae colony in 3D is defined by

$$A_{ih}^{t+1} = A_{ih}^t + (A_{jh}^t - A_{ih}^t)(sf - \tau_i)q \quad (8)$$

$$A_{ik}^{t+1} = A_{ik}^t + (A_{jk}^t - A_{ik}^t)(sf - \tau_i)\cos\alpha \quad (9)$$

$$A_{il}^{t+1} = A_{il}^t + (A_{jl}^t - A_{il}^t)(sf - \tau_i)\sin\beta \quad (10)$$

Eq. (8) defines the motion in the 1D (refer to x), whereas Eqns. (9) and (10) define the motion in the 2D (refer to y, z), k, h and l are random values regularly created from 1 to d , A_{ih}, A_{ik}, A_{il} simulate x, y and z coordinates of i^{th} algae colony, j is the index of an adjacent algae colony, q refers to an independent random value in $(-1, 1)$, α and β denote random degrees between 0 and 2π , sf represents the shear force and τ_i is the friction surface region of i^{th} algae colony, which is determined as:

$$\tau_i = 2 \ni \pi r_i^2 \quad (11)$$

$$r_i = \left(\frac{3 S_i}{4\pi} \right) \quad (12)$$

In Eqns. (11) and (12), r_i is the radius of the hemisphere of i^{th} algae colony and S_i is its dimension.

Progression Step

In AAA, the algae colony A_i becomes larger if it migrates toward the best location to achieve the possible solutions. This procedure is defined as follows:

$$Largest = \operatorname{argmax}\{\operatorname{dimension}(A_i)\}, i = 1, \dots, n \quad (13)$$

$$Smallest = \operatorname{argmin}\{\operatorname{dimension}(A_i)\}, i = 1, \dots, n \quad (14)$$

$$Smallest_j = Largest_j, j = 1, \dots, d \quad (15)$$

In Eqns. (13) – (15), *Largest* and *Smallest* define the largest and smallest algal colony, j is the random value that defines the index of the particular algae individual arbitrarily and d is the problem dimension.

Adjustment Step: The algae colony that is not expanding adequately can grow itself to its background. After the motion, the fitness value is represented as either low or high. Once algae colony motion is finished, the algae colony with the maximum starvation value (as in Eq. (16)) grows itself to the largest algae colony with adjustment probability A_p .

$$A_s = \operatorname{argmax}\{\operatorname{starvation}(A_i)\}, i = 1, \dots, n \quad (16)$$

In Eq. (16), $\operatorname{starvation}(A_i)$ is utilized to determine the starvation level of algae colony A_i . The adjustment step of AAA of the algae colony procedure is represented as:

$$A_{sj}^{t+1} = \begin{cases} A_{sj}^t + (Largest_j - A_{sj}^t) \cdot rand_1, & \text{if } rand_2 < A_p, j = 1, \dots, d \\ A_{sj}^t, & \text{or else} \end{cases} \quad (17)$$

In Eq. (17), s denotes the index of the algae colony with the maximum starvation value and j represents the index of algae individual, $rand_1$ and $rand_2$ are random values from 0 to 1, and A_p refers to the adjustment probability from 0.3 to 0.7.

Algorithm for AAA for Feature/Hyperparameter Selection

Input: Extracted features (or hyperparameters of deep learning classifier)

Output: Most relevant features (or optimal hyperparameters)

1. Create an initial generation of n algae colonies with arbitrary solutions;
2. Determine fitness value $f(a_i), i = 1, \dots, n$;
3. **while**(termination criteria not achieved)
4. **for**($i = 1:n$)
5. **while**(energy of i^{th} colony not finished)
6. Update the colony with helical motion;
7. **end while**
8. **end for**
9. Perform progression process;
10. Perform adjustment process;
11. **end while**

Deep Learning-based Classifier for Electrical Fault Detection

Further, the selected most relevant features are fed to the DNN classifier to detect the normal and faulty signals. The DNN consists of an input layer, hidden layers and an output layer (as portrayed in Figure 2) to recognize the faulty signals. If the input feature x_i is given to the DNN, the output of the hidden layer is defined as the tan-sigmoid transfer function:

Daxayani and Ananthamoorthy

$$f(x_i) = \frac{2}{1+e^{-2x_i}} - 1 \quad (18)$$

Each input feature has its weight values as w_1, w_2, \dots, w_n and the weighted sum of the inputs is done by the adder function as:

$$u = \sum_{i=1}^n w_i x_i \quad (19)$$

The output layer of DNN is defined via the following formula:

$$y = f(\sum_{i=1}^n w_i x_i + b_i) \quad (20)$$

In Eq. (20), y is the output neuron value; $f(\cdot)$ is the transfer function, w_i refers to the weight values, x_i denotes input features and b_i refers to the bias value. According to the output neuron values, the given features are learned and classified into normal and faulty signals. Table 1 presents the hyperparameters of the DNN classifier.

EXPERIMENTAL RESULTS

In this section, the efficiency of the presented AAA-DNN system for electrical fault detection is assessed by implementing it in Python 3.12. In this experiment, the VSB database is used, which is briefly described in Section 3.1. From this database, 70% of voltage measurements are used for training and the remaining 30% is used for testing. Also, by implementing existing classifier models such as PSO-OC-SVM [12], RVM [13], CDWPSO-ANFIS [15], SSA-KELM [16], and PSO-WELM [19] on the considered VSB database, a comparative study is presented to understand the detection performance in terms of accuracy, precision, recall and f-measure.

- Accuracy: It is the proportion of exact detection over the total samples tested.

$$Accuracy = \frac{True\ Positive\ (TP) + True\ Negative\ (TN)}{TP + TN + False\ Positive\ (FP) + False\ Negative\ (FN)} \quad (21)$$

In Eq. (21), the number of positive (normal signals) correctly detected as positive, while the number of negative (fault signals) correctly detected as negative is TN. Likewise, FP is the number of normal signals incorrectly detected as fault signals, whereas FN is the number of fault signals incorrectly detected as normal.

- Precision: It determines the correctly detected samples at TP and FP rates.

$$Precision = \frac{TP}{TP + FP} \quad (22)$$

- Recall: It is the proportion of samples, which are correctly detected at TP and FN rates.

$$Recall = \frac{TP}{TP + FN} \quad (23)$$

- F-score (F): It is the harmonic mean of precision and recall.

$$F = \frac{2 \times Precision \times Recall}{Precision + Recall} \quad (24)$$

From the analyses presented in Figure 3, it is indicated that the AAA-DNN algorithm on the VSB database achieves a better efficiency compared to the other algorithms for detecting the electrical faults. The precision of the AAA-DNN classifier is 61.82%, 34.13%, 24.27%, 10.69%, and 6.83% higher than the RVM, PSO-WELM, CDWPSO-ANFIS, SSA-KELM, and PSO-OC-SVM classifiers, respectively. The recall of the AAA-DNN is 79.38% greater than the RVM, 57.84% greater than the PSO-WELM, 44.47% greater than the CDWPSO-ANFIS, 28.17% greater than the SSA-KELM, and 14.64% greater than the PSO-OC-SVM. Also, the f-measure of the AAA-DNN classifier is 68.64%, 47.55%, 27.97%, 19.67%, and 10.72% higher than the RVM, PSO-WELM, CDWPSO-ANFIS, SSA-KELM, and PSO-OC-SVM classifiers, respectively. Furthermore, the accuracy of the AAA-DNN is 40.95% better than the RVM, 27.86% better than the PSO-WELM, 15.97% better than the CDWPSO-ANFIS, 9.31% better than the SSA-KELM, and 2.92% better than the PSO-OC-SVM for electrical fault detection.

CONCLUSION

In this study, a deep learning-based electrical fault detection system was developed for detecting electrical faults in the power transmission grids. At first, the VSB electrical signal fault database was acquired and preprocessed by different methods to remove noisy signals, partition each signal into smaller chunks, and extract features. From the extracted features, the most relevant features were chosen by the AAA, which was also used for choosing the optimal hyperparameters of the DNN. Moreover, the DNN classifier was initialized by the optimal hyperparameters and trained by the selected features. The trained DNN was later used for recognizing electrical faults. At last, the experimental results show that the AAA-DNN-based electrical fault detection system has a 90.28% accuracy compared to the other machine learning algorithms.

ABSTRACT

The characteristics of contemporary agriculture include a multitude of conflicting optimization criteria that make it difficult to make decisions when planning agricultural output. The study presented in this paper examines the application of intuitionistic fuzzy optimization technique to the problem of agricultural output planning, with a focus on smallholder farmers in Sikkim and hills of West Bengal and North-Eastern (NE) States. In most cases, linear programming is used to formulate the crop planning problem. However, in practical agricultural production planning situations, there are a lot of unknown variables; therefore crop future revenues are approximate and uncertain. Consequently, we suggest a crop planning model that makes use of intuitionistic fuzzy optimization. This study aimed to find the optimal land allocation for wheat, corn, and oil in light of demand and water restrictions in order to maximize yield while balancing the opposing aims of cost reduction and profit maximization. While objectives and other limitations are perceived as hazy, only the constraint linked to resource availability is regarded as unambiguous. Since objectives and other limitations are perceived as hazardous, only the constraint linked to land allocation is regarded as clear. The intuitionistic fuzzy Multi-objective linear programming technique has been observed to be effective in handling many objectives in a fuzzy, unclear context.

Keywords: Intuitionistic Fuzzy set, Optimization, Crop Planning problem.

Mathematics Subject Classification (MSC2020): 03F55, 03E72.

INTRODUCTION

A common goal of agricultural production planning problems is not just profit optimization with cost minimization; a realistic crop production planning problem includes multiple objectives such as input resource optimization, such as man hours, machine hours, fertilizers, water requirements, and many more. One of the main goals of agricultural production planning problems is to maximize the profit under minimum investment with limited land. These aims are also inherently conflicting. Furthermore, because they depend on a variety of uncontrollable factors, the price and cost of growing food grains are subject to natural fluctuations. As a result, these limitations are ambiguous, imprecise, and unpredictable. These characteristics of crop production issues make the conventional multi-objective approaches unsuitable for creating cropping models. In order to study fuzzy programming and linear programming with many goals, [1] originally employed the fuzzy set idea provided by [2]. While [3] expanded the idea of fuzzy sets to include intuitionistic fuzzy sets, [4] investigated optimization in an intuitionistic fuzzy setting [5] et al. The linear programming technique in fuzzy sets that are intuitionistic was developed by [5]. [6] have conducted a recent study on multi-objective linear programming issues within intuitionistic fuzzy environments. Agriculture is one of India's most significant economic industries. Seventy-seven percent of Indians live in rural areas, and three-quarters of these people rely on agriculture and related industries for a living. Despite contributing to just fifteen per cent economic of the gross domestic product of India, the agriculture industry produces 55% of the workforce and is the largest source of labor in the country. With rain feeding accounting for about 87 millimetres per hectare and approximately 61% of net cultivated land, the monsoon season is crucial to Indian agriculture's ability to predict whether a given year's crop will be abundant, average, or bad. Bihar is located in the Ganga River Basin's lowlands. It has an abundance of water resources, particularly groundwater resources, and fertile alluvial soil. Bihar's agriculture is therefore rich and varied. Bihar produces pulses such as arhar, urad, moong, gram, pea, lentils, and khesaria. Bihar is a big guava fruit, banana, and mango crop. Bihar's other major agricultural products are cotton and sugarcane [7]. The use of mathematics to quantitatively answer different problems in the economic and management domains is becoming more and more popular as issues with agriculture and economic management arise recently [8,9]. The most important of these is the correct construction of economic mathematical models associated with these issues.

The creation of the mathematical model is a necessary first step in using mathematics to solve agricultural economic and management issues, and it continues throughout the problem-solving process. The application of generalized fuzzy linear programming to Sikkim and hills of West Bengal and N.E. States, agricultural management challenges demonstrate that it is quite successful in dealing with the problem of permitting unclear information to surface in the procedure of optimization and results. However, it is unable to address the issue of uncertain random variables in a non-fuzzy space or to take the financial penalty for policy violations. The top priority for policymakers is economic punishment. The most advantageous course of action is to "punish" the minor ones, edit them, and make the second option after the random occurrence in the second stage occurs in order to make the objective function instantly. In order to achieve this, if there are no constraints, linear constraints must be established first. If not, the fuzzy linear gauge will become a generalized fuzzy linear programming, which will lead to a vague and confusing objective analysis. Additionally, the inability to establish the corresponding mathematical model will prevent the problem from being solved. We suggest employing an enhanced fuzzy linear programming model to handle agricultural economic management challenges. Specifically, we aim to address the issue of random variables resulting from uncertainty and offer recommendations for Sikkim and the hills of West Bengal and N.E. States. Agricultural economic management to enhance its planting structure. Ultimately, the increased output value of agricultural production will foster the growth of local agriculture. In this study, a class of multi-objective fuzzy linear programming problems with elastic constraints is constructed and discussed, i.e., a class of multi-objective fuzzy linear programming problems with full fuzzy coefficients except for the coefficients of the elastic constraint condition. Fuzzy structural element analysis provides the best answer, which is then used in agricultural economic management. The work begins with an introduction to key terminology and definitions. Next, we discuss fuzzy optimization techniques, intuitionistic fuzzy optimization techniques, crop production planning problems, and mathematical formulations of the problems. Finally, we present the research findings.

Mathematical Model

Multi objective linear programming problem

A multi-objective optimization problem with n choice factors, q constraints, and p objectives can be generalized as follows:

$$\begin{aligned} &\text{Max } \{f_1, f_2, \dots, f_p\} \\ &\text{Such that} \\ &g_j(X) \leq 0, \quad j = 1, 2, \dots, q \\ &X = \{x_1, x_2, \dots, x_n\}, \\ &x_i \geq 0, i = 1, 2, \dots, n \end{aligned} \quad (1)$$

Complete solution

If there exists $x^0 \in X$ such that $f_k(x^0) \leq f_k(x)$ for any $x \in X$, then x^0 is considered a complete optimal solution for issue (1). However, generally speaking, no truly optimal solution exists that simultaneously maximizes all multiple-objective functions, especially when the goal functions are intrinsically conflicting. Therefore, instead of using a completely optimal solution in multi-objective programming, Pareto optimality was presented as a solution idea.

Pareto-Optimality

$x^0 \in X$ is said to be a Pareto optimal solution for (1) if there does not exist another $x \in X$ such that $f_k(x^0) \leq f_k(x)$ for all $k = 1, 2, \dots, p$ and $f_j(x^0) < f_j(x)$ for at least one $j = 1, 2, \dots, p$.

Linear fractional programming approach

Let s be one of k objectives with a ratio that needs to be maximized. Limiting the number of objectives to two will make things simpler. The two linear objectives are $f_p(x) > 0$ and $f_q(x) > 0$, and their ratio will create a new objective function. This will result in linear fractional programming, which can be understood as

$$\text{Maximize } \frac{f_p(x)}{f_q(x)} \quad (2)$$

Intuitionistic fuzzy sets

An intuitionistic fuzzy set \tilde{A} assigns to each element x of the universe X a membership degree $\mu_{\tilde{A}}(x) \in [0, 1]$ and non-membership degree $\nu_{\tilde{A}}(x) \in [0, 1]$ such that $\mu_{\tilde{A}}(x) + \nu_{\tilde{A}}(x) \leq 1$. A IFS is mathematically represented as, $\{(x, \mu_{\tilde{A}}(x), \nu_{\tilde{A}}(x)) | x \in X\}$ where, $1 - \mu_{\tilde{A}}(x) - \nu_{\tilde{A}}(x)$ is called hesitancy margin.

Example

Let X be a member of group A , which consists of all the nations having elected governments. Let $M(x)$ represent the proportion of voters who supported the government and $N(x)$ represent the proportion who did not. In the case when $\mu_{\tilde{A}}(x) = \frac{M(x)}{100}$ and $\nu_{\tilde{A}}(x) = \frac{N(x)}{100}$ the degree of support is indicated by $\mu_{\tilde{A}}(x)$ the degree of opposition by $\nu_{\tilde{A}}(x)$ and the indeterminacy, or portion that casts invalid or poor votes, is represented by $h(\tilde{A}) = 1 - \mu_{\tilde{A}}(x) - \nu_{\tilde{A}}(x)$

Intuitionistic Fuzzy Number

An Intuitionistic Fuzzy Set (IFS) $\tilde{A} = (\mu_{\tilde{A}}, \nu_{\tilde{A}})$ of real numbers is said to be an intuitionistic fuzzy number if $\mu_{\tilde{A}}$ and $\nu_{\tilde{A}}$ are fuzzy numbers. Hence $\tilde{A} = (\mu_{\tilde{A}}, \nu_{\tilde{A}})$ denotes an intuitionistic fuzzy number if $\mu_{\tilde{A}}$ and $\nu_{\tilde{A}}$ are fuzzy numbers with $\nu_{\tilde{A}} \leq \mu_{\tilde{A}}$, where $\mu_{\tilde{A}}$ denotes the complement of $\mu_{\tilde{A}}$.

Some operations on intuitionistic fuzzy sets are:

$$\tilde{A} \cap \tilde{B} = \{(x, \min(\mu_{\tilde{A}}(x), \mu_{\tilde{B}}(x)), \max(\nu_{\tilde{A}}(x), \nu_{\tilde{B}}(x))) | x \in X\}$$

$$\tilde{A} \cup \tilde{B} = \{(x, \max(\mu_{\tilde{A}}(x), \mu_{\tilde{B}}(x)), \min(\nu_{\tilde{A}}(x), \nu_{\tilde{B}}(x))) | x \in X\}$$

Intuitionistic Fuzzy optimization Technique

Consider the general optimization problem given as

$$\text{Max } f_i(x), \quad i = 1, 2, \dots, p$$

Bharathi and Geetha

Such that

$$g_j(x) \leq 0, \quad j = 1, 2, \dots, q \quad (3)$$

$$x \geq 0$$

Where X represents the decision variables, $tq_j(x)$ represents the constraint functions, $f_i(x)$ represents the objective functions, and p and q , respectively, represent the number of objectives and constraints. All restrictions must be precisely satisfied by the solution to this crisp model. Similar to the previous problem, the degree of acceptance of the constraints and objective(s) must be maximized in the fuzzy optimization model:

$$\widetilde{Min} f_i(x), i = 1, 2, \dots, p$$

Such that

$$g_j(x) \leq 0, j = 1, 2, q \quad (4)$$

$$x \geq 0$$

The notation \widetilde{Min} represents fuzzy minimization, while \leq indicates fuzzy inequality. In order to solve system (5), [10] and [2] employed fuzzy sets to maximize the degree of acceptance (or membership) of the aim and constraints.

$$\text{Max } \mu_k(x), k = 1, 2, \dots, p + q$$

Such that

$$0 \leq \mu_k(x) \leq 1, \quad (5)$$

$$x \geq 0$$

and the degree of satisfaction with the corresponding fuzzy sets is indicated by $\mu_k(x)$. Since the degree of non-membership in a fuzzy set is a complement to membership, minimizing the non-membership will automatically occur when the membership function is maximized. However, the degree of rejection and acceptance in an intuitionistic fuzzy set are determined simultaneously, and when these two degrees do not complement one another, IFS may provide a more generic tool for characterizing this uncertainty-based optimization model. Given (6), the Intuitionistic Fuzzy Optimization (IFO) model is as follows:

$$\text{max } \mu_k(x), k = 1, 2, \dots, p + q$$

$$\text{min } v_k(x), k = 1, 2, \dots, p + q$$

Such that

$$x \in X$$

$$v_k(x) \geq 0, k = 1, 2, \dots, p + q \quad (6)$$

$$\mu_k(x) \geq v_k(x), k = 1, 2, \dots, p + q$$

$$\mu_k(x) + v_k(x) \leq 1$$

$$k = 1, 2, \dots, p + q$$

$$\tilde{F} \cap \tilde{C} = \{(x, \min(\mu_{\tilde{F}}(x), \mu_{\tilde{C}}(x)), \max(v_{\tilde{F}}(x), v_{\tilde{C}}(x)))\} \quad (7)$$

Where \tilde{F} is integrated intuitionistic fuzzy objective and \tilde{C} denotes integrated intuitionistic fuzzy constraints and is defined as:

$$\tilde{F} = \{(x, \mu_{\tilde{F}}(x), v_{\tilde{F}}(x)) | x \in X\}$$

$$\bigcap_{i=1}^p \tilde{F} = \{(x, \min_{i=1}^p \mu_i^f(x), \max_{i=1}^p v_i^f(x)) | x \in X\},$$

$$\tilde{C} = \{(x, \mu_{\tilde{C}}(x), v_{\tilde{C}}(x)) | x \in X\}$$

$$\bigcap_{i=1}^q \tilde{C} = \{(x, \min_{j=1}^q \mu_j^g(x), \max_{j=1}^q v_j^g(x)) | x \in X\},$$

and the Intuitionistic Fuzzy Decision Set (IFDS) denoted as \overline{D} :

$$\overline{D} = \tilde{F} \cap \tilde{C} = \{(x, \mu_{\overline{D}}(x), v_{\overline{D}}(x)) | x \in X\}, \quad (8)$$

$$\mu_{\overline{D}}(x) = \min\{\mu_{\tilde{F}}(x), \mu_{\tilde{C}}(x)\} = \min_{k=1}^{p+q} \mu_k(x), \quad (9)$$

$$v_{\overline{D}}(x) = \max\{v_{\tilde{F}}(x), v_{\tilde{C}}(x)\} = \max_{k=1}^{p+q} v_k(x) \quad (10)$$

Where the degrees of acceptance and rejection of IFDS are indicated by $\mu_{\overline{D}}(x)$ and $v_{\overline{D}}(x)$ respectively. Moreover, for a viable solution, the acceptance degree of IFDS is consistently less than or equal to the acceptance of any goal and constraint, and the rejection degree of IFDS is consistently greater than or equal to the rejection of any objective and constraint. So,

$$\mu_{\overline{D}}(x) \leq \mu_k(x),$$

$$v_{\overline{D}}(x) \geq v_k(x),$$

Bharathi and Geetha

$$\forall k = 1, 2, \dots, p + q.$$

Thus the above system can be transformed to the following system of inequalities:

$$\begin{aligned} \mu_k(x) &\geq \alpha, k = 1, 2, \dots, p + q \\ v_k(x) &\leq \beta, k = 1, 2, \dots, p + q \\ \alpha + \beta &\leq 1 \end{aligned} \quad (11)$$

$$\alpha \geq \beta$$

$$\beta \geq 0$$

$$x \in X$$

Where α denotes the minimum acceptable degree of objective(s) and constraints, and β denotes the maximum degree of rejection of objective(s) and constraints.

Using the IFO problem analogous to the problem transformed to the linear programming problem can be given as:

Maximize $(\alpha - \beta)$

$$\mu_k(x) \geq \alpha, k = 1, 2, \dots, p + q$$

$$v_k(x) \leq \beta, k = 1, 2, \dots, p + q$$

$$\alpha + \beta \leq 1 \quad (12)$$

$$\alpha \geq \beta$$

$$\beta \geq 0$$

$$x \in X$$

This can be easily solved by the simplex method for the solution of the multi-objective linear programming problem by IFO.

Crop Production Planning Problem

We create the following algorithm for obtaining the solution of a multi-objective programming problem in an intuitionistic fuzzy environment using the aforementioned theorem and the approach by [4]:

Step 1: Choose one objective function from the set of k objectives and solve it as a single objective while keeping the limitations in mind. Find the remaining $(k-1)$ objective function values using the obtained solution vectors.

Step 2: To continue with the remaining $(k-1)$ goal functions, follow step 1. The best compromise option will be found if all of the solutions are the same.

Step 3: To create the Positive Ideal Solution (PIS), as shown below, tabulate the solutions so acquired in steps 1 and 2.

Step 4: From Obtain the upper and lower bounds for each objective function from PIS, where f_k^* and f_k' represent the maximum and minimum values, respectively.

Step 5: Using the collection of solutions found in step 4, establish upper and lower bounds for each objective's degree of acceptance and rejection.

For membership functions:

Upper and lower bounds for membership functions

$$U_k^\mu = \max (Z_k(X_r))$$

$$L_k^\mu = \min (Z_k(X_r)), 0 \leq r \leq K$$

For non-membership functions:

$$U_k^v = U_k^\mu - \lambda(U_k^\mu - L_k^\mu), U_k^v = L_k^\mu, 0 < \lambda < 1.$$

In our problem, we have taken $\lambda = 0.2$.

Step 6: MOLP problems (1) can be written as:

Find x such that

$f_k(x) \geq q_k^0$, are the ambition levels provided by the decision maker, and tq_k^0 for each k . Since there is a conflict between all of the goals, intuitionistic fuzzy inequalities are understood to exist in this situation. The next step is to define the membership and non-membership functions for the intuitionistic fuzzy inequalities.

The next step is to define the membership and non-membership functions for the intuitionistic fuzzy inequalities.

Step 7: Construction of membership and non-membership functions

Define the membership and non-membership functions for the uncertain objective functions.

(i). For maximization of objective functions

Bharathi and Geetha

$$\mu_k(z_k(x)) = \begin{cases} 1, & z_k(x) \geq u^{acc} \\ \frac{z_k(x) - u^{acc}}{u^{acc} - l^{acc}}, & l^{acc} < z_k(x) < u^{acc} \\ 0, & z_k(x) \leq l^{acc} \end{cases}$$

$$v_k(z_k(x)) = \begin{cases} 0, & z_k(x) \geq u^{rej} \\ \frac{u^{rej} - z_k(x)}{u^{rej} - l^{rej}}, & l^{rej} < z_k(x) < u^{rej} \\ 1, & z_k(x) \leq l^{rej} \end{cases}$$

(ii). For minimization of objective functions

$$\mu_k(z_k(x)) = \begin{cases} 0, & z_k(x) \geq u^{acc} \\ \frac{u^{acc} - z_k(x)}{u^{acc} - l^{acc}}, & l^{acc} < z_k(x) < u^{acc} \\ 1, & z_k(x) \leq l^{acc} \end{cases}$$

$$v_k(z_k(x)) = \begin{cases} 1, & z_k(x) \geq u^{rej} \\ \frac{z_k(x) - l^{rej}}{u^{rej} - l^{rej}}, & l^{rej} < z_k(x) < u^{rej} \\ 0, & z_k(x) \leq l^{rej} \end{cases}$$

(iii). Define the membership and non-membership functions for the uncertain constraints (\leq_{int}).

$$\mu_i(A(x)) = \begin{cases} 1, & A(x) \leq b_i \\ \frac{\tau_i^{acc} + b_i - A(x)}{\tau_i^{acc}}, & b_i < A(x) < b_i + \tau_i^{acc} \\ 0, & A(x) \geq b_i + \tau_i^{acc} \end{cases}$$

$$v_i(A(x)) = \begin{cases} 0, & A(x) \leq b_i + \tau_i^{rej} \\ \frac{A(x) - (b_i + \tau_i^{rej})}{(\tau_i^{acc} - \tau_i^{rej})}, & b_i < A(x) < b_i + \tau_i^{acc} \\ 1, & A(x) \geq b_i + \tau_i^{acc} \end{cases}$$

(iv). Define the membership and non-membership functions for the uncertain constraints (\geq_{int}).

$$\mu_i(A(x)) = \begin{cases} 1, & A(x) \geq b_i \\ \frac{A(x) - (b_i - \tau_i^{acc})}{\tau_i^{acc}}, & b_i - \tau_i^{acc} < A(x) < b_i \\ 0, & A(x) \leq b_i - \tau_i^{acc} \end{cases}$$

$$v_i(A(x)) = \begin{cases} 0, & A(x) \geq b_i - \tau_i^{rej} \\ \frac{(b_i - \tau_i^{rej}) - A(x)}{(\tau_i^{acc} - \tau_i^{rej})}, & b_i - \tau_i^{acc} < A(x) < b_i - \tau_i^{rej} \\ 1, & A(x) \leq b_i - \tau_i^{acc} \end{cases}$$

Where $\tau_i^{acc}, \tau_i^{rej} = \delta \tau_i^{acc}, 0 < \delta < 1$ are tolerances for membership and non-membership functions respectively. In our problem, we have taken $\delta = 0.1$.

Step 8: In this step we apply intuitionistic fuzzy optimization technique for multi-objective linear programming (MOLP) problem and get an equivalent linear programming problem as

Maximize $(\alpha - \beta)$

$$\mu_k(x) \geq \alpha, \quad k = 1, 2, \dots, p + q$$

$$v_k(x) \leq \beta, \quad k = 1, 2, \dots, p + q$$

$$\alpha + \beta \leq 1$$

(13)

$$\alpha \geq \beta$$

$$\beta \geq 0$$

$$x \in X$$

**Bharathi and Geetha****Application of Fuzzy Linear Programming Model in Agricultural**

A portion of India is home to Sikkim as well as the highlands of West Bengal and the North-eastern States. The entire region covers 0.8 million hectares. Furthermore, Sikkim and the hills of West Bengal and the North-eastern States are situated in the transitional zone between India's second and third geomorphic phases as well as the remaining vein of the eastern Qinling Mountains. A relatively complete geomorphic succession is formed by the progressive decline from the tectonic erosion of low and medium mountains in the West and Southwest to the tectonic denudation hills, loess hills, inclined (hillock) plains, and alluvial plains. In contrast, Sikkim and the hills of West Bengal and the Northeastern States experience a continental monsoon climate in the northern temperate zone. This climate features four distinct seasons: spring, summer, autumn, and winter, as well as regular variations in heating and cooling groups. While spring is dry and less rainy, winter is lengthy, cold, and dry; there is little snow and rain. In contrast, spring is cold, dry, and windy. In addition, autumn has a brief season and a cold environment, while summer is somewhat hot and rainy. An average monthly temperature of 25.9°C is recorded in August, the warmest month, and 2.15°C is recorded in January, the coldest month. The annual average temperature is 15.6°C. The frost-free period is 209 days, with an average annual rainfall of 542.15 mm. It receives roughly 1,869.7 hours of sunshine a year. The Indian states of Sikkim, the highlands of West Bengal, and the north-east.

Optimal Solution

Area of Wheat = 12000

Area of Corn = 15000

Area of Oil crops = 18000

Objective Values are $f_1 = 12000, f_2 = 15000, f_3 = 18000$.

RESULTS AND DISCUSSION

This work studied the mathematical model of fuzzy linear programming in depth and found their optimal solutions by analyzing the data between two different functions, guided by a class of multi-objective fuzzy linear programming problems with elastic constraints. Fuzzy linear programming was then applied to agricultural economic management, with five metropolitan regions in Sikkim and the hills of West Bengal and Northeastern states serving as entry points to confirm the fuzzy linearity's findings. Determining the extent of expansion and contraction, after which fuzzy linear programming is used to solve and decompose them to produce the optimal inequality solution using MATLAB. With fuzzy linear programming, projections for agricultural economic management could be more precise. The results show a good potential for application and show persistently changing trends. Generally speaking, agricultural economic management can benefit greatly from the use of fuzzy linear programming, as this approach has both theoretical and practical backing.

CONCLUSION

We characterized the former crop planning issues as intuitionistic fuzzy inequalities, considering objective functions and constraints as such since poor parameterization prevents us from specifying yield or profits as crisp inequalities. So, it makes sense that MOLP difficulties would naturally become intuitionistic fuzzy MOLP problems. Using the proposed techniques, we have employed an intuitionistic fuzzy approach to transform an intuitionistic fuzzy MOLP problem into a crisp linear programming problem. An ideal crop production model has been obtained by implementing the developed method. Using the largest amount of land that the farmer has access to, the created method maximizes land utilization while satisfying restrictions and achieving goals in an exciting manner. This output shows that, with matching target values of 12,000, 15,000, and 18,000, respectively, the best solution allots 12,000 units of land to wheat, 15,000 units to corn, and 18,000 units to oil crops. Consequently, crop modeling issues can be effectively handled by applying the suggested approach.

ABSTRACT

This study investigates how the COVID-19 pandemic and the subsequent statewide outbreak and lockdown affected workers in the leather and footwear manufacturing industries in India, specifically in southern India, which is located in southern Asia. The post-employment experiences of workers are the primary subject of this research. They ceased to exist in the industry when a large number of staff members were temporarily laid off or when lockdown procedures were reduced. Interviews with workers were the source of the information acquired here. Look into issues such as whether or not employees were paid, whether or not they had access to social security, and whether or not they were given assistance during the Lockdown that was caused by the pandemic.

Keywords: Lockdown of Covid 19; employees of the leather industry; impacts on the industry; various suppliers, etc., are some of the key words here.

INTRODUCTION

The COVID-19 pandemic is a significant threat to the public's health and has affected practically every country in the world. The epidemic caused a level of destruction and suffering that has never been seen in recent human history. A huge economic calamity has also been caused by the disease, and as a result, some nations are currently experiencing a recession. According to projections made by the International Monetary Fund (IMF), expansion is on the horizon

91354

for the global economy. The outbreak and subsequent response would cause a decline of 4.9 percentage points in the economy of India in the year 2020. The effects of measures such as the government of India shutting down the entire country in March were felt. The first quarter of the fiscal year 2020-2021 saw a significant reduction in GDP of a staggering 23.9 percent. This was a significant and shocking drop [1]. Employees in the private sector had their lives disrupted because of the disease and the statewide lockdown. Millions of exodus employees moved to other parts of the country in the early days of the lockdown as a result of significant job losses and the unanticipated lack of various sources of income in metropolitan regions around the country. As soon as the strike was called off, a serious humanitarian disaster broke out as hundreds of workers started making their way back to their towns, many of them walking thousands of kilometers to get there on foot. During this time, migrant workers gained to prominence, which forced the government to take action in response. To be of any assistance to them, prompt action is necessary. During this time, there was a lack of discussion in the major media outlets regarding the difficulties that were affecting workers in industrial jobs in the private sector. The disruptive effects of the pandemic on global supply chains prompted a chain reaction that has severely harmed almost all industrial sectors in India, including the readymade garment, leather, and footwear industries, amongst others. Throughout the course of their existence, these industries have provided work for millions of people in Indian cities. The value of exports experienced by the leather and leather product business dropped by 83 percent between the months of April and May. Media sources indicate that the industry as a whole endured widespread wage losses and job terminations as a result of the event; however, the exact extent of its impact on personnel is uncertain. According to an article that was published in the Times of India in April, the Tamil Nadu labor department received up to 1600 phone complaints from employees in the private sector about not being paid their paychecks, having their salaries reduced, and being let off [2].

REVIEW OF LITERATURE

Supply chain risk management has become an increasingly important topic in academic research. Literature on this topic introduces proactive and reactive policies for effective supply chain risk management. Proactive policies are formulated to mitigate the probability of occurrence of risk events (Chen et al., 2015, Chowdhury et al., 2019, Scholten et al., 2014, Sreedevi and Saranga, 2017) [11]. Reactive policies are established to minimize the impacts of risks and ensure smooth recovery (Hishamuddin et al., 2015, Ivanov et al., 2016, Ivanov, 2019, Ivanov, 2020b, Paul et al., 2014, Paul et al., 2015) [12]. Operational risks that occur due to managerial problems such as quality and long lead time concerns are controllable. Proactive strategies can control and mitigate the probability of these risks before they occur (Chen et al., 2013, Chowdhury et al., 2019) [13]. However, reactive policies are needed for disruptions arising from disease outbreaks, earthquakes, and terrorist attacks, as their occurrence is unpredictable and outside the control of business firms (Chen et al., 2015, Darom et al., 2018, Mithun Ali et al., 2021) [14]. In both cases, proper formulation of recovery strategies for managing disruptions is necessary to minimize the overall impact of disruptions on operations (Blos & Wee, 2020) [15]. Formulating recovery strategies to return to normal or better operational states after catastrophic events is vital to rapid recovery and survival (Ponomarov & Holcomb, 2009) [16]. Results of previous research show that 80% of companies that failed to design recovery strategies for supply chain disruption during major outbreaks have closed down their operations within two years after the event (Cerullo & Cerullo, 2004) [17]. Statistics indicate that the frequency of such major supply chain outbreaks has increased in recent years. For example, the World Health Organization (WHO) has tracked more than 1,400 epidemic outbreaks between 2011 and 2018 (Hudecheck, Siren, Grichnik, & Wincent, 2020) [18]. As such, developing strategies for recovering from a major outbreak has become critical for the long-term survival of supply chains. Yet, surprisingly, the extant literature on major epidemic and pandemic outbreaks mostly considers humanitarian supply chain issues. There is a lack of studies on how traditional commercial supply chains can quickly recover from epidemic or pandemic outbreaks (Clarke & Boersma, 2020a) [19].

ONSET OF COVID-19 AND ITS EFFECTS

The investigation starts out with a concise overview of the leather business in India as well as an investigation into the influence that the COVID-19 epidemic has had on the leather supply chain. The principal results are presented in

**MD Bilal KV and S. Allah Baksh**

two parts following a brief introduction to the methodology of the study and a brief introduction to the participants. The first part discusses the situation of employees during the intensive lockdown, and the second part discusses the situation after restrictions were lifted to enable the opening of workplaces. The conclusion is a condensed summary of the most important findings from the study.

Bringing some much-needed clarity to the Indian Leather Industry

Over the course of the past two decades, India's leather industry has undergone tremendous expansion and development. During this time period, the nation has transitioned from being a major supplier of raw materials to a value-added exporter of leather and leather goods that are widely significant on the global market. The leather industry in India accounts for approximately 12.93% of the total production of leather worldwide [3]. India is currently in second place across the world when it comes to the manufacturing of leather shoes. The leather sector is one of India's top ten sources of foreign currency because it accounts for 3.3% of the world's total leather shoe exports, ranks second in the export of leather garments, and third in the export of leather saddlery. During the 2018-2019 fiscal year, the total value of its exports was \$5.69 billion USD. As a result of the Indian government's recognition of the sector's untapped growth potential, the Make in India initiative has included the sector as one of its top priorities. According to estimates provided by the Association of Small and Medium Enterprises in Asia and the Pacific (ASSOCHAM), micro, small, and medium-sized enterprises (MSMEs) make up more than 90 percent of India's leather sector⁴. Tamil Nadu is responsible for producing almost half of all leather and leather goods exported from India, as well as accounting for sixty percent of India's total tanning capacity [5]. The leather industry in Tamil Nadu established both Central Effluent Treatment Plants (CETPs) and independent Effluent Treatment Plants (ETPs) in response to pressure from the outside community, mainly from the court and civil society. These plants are intended to manage the hazardous waste that the leather industry generates. Even while these nine metrics represent undeniable advancements in the direction of environmental sustainability, the focus that social indicators should have been getting has not yet been given to them.

What benefits did covid-19 bring to the leather industry?

The COVID-19 outbreak has had a significant and negative influence on the Indian economy as a whole, with the exception of the most fundamental of services. The worst affected were the textile, garment, and footwear industries, all of which are highly dependent on international trade. These fields provided employment for a significant number of city residents, which was an additional desirable benefit. Demonetization in 2016 and the implementation of the Goods and Services Tax (GST) in 2017 are two examples of acts taken by the central government that have contributed to the significant challenges that the Indian leather industry has been suffering for a number of years [6].

Implications Caused by International Factors

Lockdowns in China, the United States, and European nations owing to the COVID-19 epidemic generated massive disruptions in the leather and footwear supply chains as early as January 2020. As a result, the sale of fashion and leather items in export-based markets dropped by as much as fifty percent. Despite the fact that the entirety of the leather goods value chain is based in India, key inputs such as chemicals, adhesives, dyes, and footwear components (soles, buttons, and zippers) are imported from China. As early as the month of February, Indian exporters were already feeling the consequences of lockdowns in the United States and Europe, two of the main markets for imported leather and footwear.

The Repercussions of the Lockdown Implemented Nationwide in India

On March 23, 2020, because to the COVID-19 epidemic, the government instituted a lockdown across the country. During the period of extreme lockdown, which lasted until the first week of June, practically all economic activity came to a halt, with the exception of the delivery of essential services such as food, water, energy, and medical care. This situation persisted until the first week of June. Because of the stringent surveillance and regular inspections conducted by government officials during the months of April and May, nearly all tanneries, shoe manufacturers, and informal workshops were had to shut their doors. A total of approximately 150,000 individuals were impacted when businesses in the leather industry in the Vellore area closed their doors. According to the head of the Centre for

**MD Bilal KV and S. Allah Baksh**

Leather Exports (CLE), a total of USD 200 million worth of orders were canceled by brands and merchants in the United States and Europe in just the month of March. The payment for items that had already been shipped was withheld, and the suppliers were asked to delay their shipments while the delay was being negotiated.

The Repercussions of the Lockdown Implemented Nationwide in India

On March 25, 2020, because to the COVID-19 epidemic, the government instituted a lockdown across the country. During the period of extreme lockdown, which lasted until the first week of June, practically all economic activity came to a halt, with the exception of the delivery of essential services such as food, water, energy, and medical care. This situation persisted until the first week of June. A total of approximately 150,000 individuals were impacted when businesses in the leather industry in the Vellore area closed their doors. According to reports in the media, during this time period, the vast majority of enterprises did not pay their employees⁸. Just in the month of April, businesses canceled orders totaling over one billion dollars, including 370 million dollars' worth of business for the leather industry in Tamil Nadu [9]. According to the General Secretary of the Tamil Nadu Trade Union Center (TNTUC), more than half of the local workforce was unable to return to work after the lockdown restrictions were lifted. During the period in which the entire nation was placed under lockdown, the federal and state governments each launched supplemental programs designed to assist people who had lost their jobs in addition to their financial resources. This comprised public distribution system (PDS) initiatives to supply subsidized and free food grains to low-income households, as well as PDS- and bank-based cash transfer programs. Also included in this category was the provision of public distribution system (PDS) projects. On the other hand, there were not many reports of these programs actually being beneficial to the people they were designed for. Massive relief efforts were coordinated across the country by non-governmental organizations, labor unions, and other philanthropic organizations [10].

Plan for the Research**The Goals of the Research**

This study was carried out with the intention of evaluating the condition of the leather and footwear manufacturing business in Tamil Nadu before, during, and after the COVID-19 induced shutdown (which, for the sake of convenience, lasted from the 23rd of March until the first week of June). Once India finished reopening its businesses after a shutdown. Interviews with workers served as the major source material for this investigation because these individuals were the only ones who could testify to the employment and labor rights conditions that persisted throughout the outbreak. Along with the more widespread effects of the pandemic and lockdown, several factors, including employees' availability to food and nutrition, healthcare, payment of salary, and social security, were taken into consideration. Within the scope of our study, we looked into the following subthemes:

The Methodology of Research

The data for the study were compiled through the use of in-depth interviews with members of the labor force. As a result of the lockdown, in-person meetings were not permitted; consequently, the vast majority of the interviews took place over the phone. Even when some of the previous limitations were lifted, researchers did their best to avoid any kind of interaction with staff. This was done out of an abundance of caution. In the months of August and September of 2020, the gatherings were held in the Vellore region of the state of Tamil Nadu. For the purpose of the investigation, a detailed questionnaire that included both closed and open/semi-open questions was developed. The researchers decided to apply a convenience sample technique in order to maximize data collection in this one-off case. Specifically, they conducted interviews with the employees who were the most easily available and who agreed to take part in the study. The group doing the research had to prevail over a variety of challenges. Some of the respondents, particularly those who had already returned to work after the lockdown, were hesitant to share specifics about their workplaces because they were afraid that being honest could have a negative impact on their jobs. Many individuals were concerned that they would lose their jobs if management found out that they had sought employment elsewhere and then decided to fire them. The extended nature of the telephone interviews (which often lasted between 30 and 45 minutes) posed a number of difficulties. Due to the limited sample size and the non-random selection process, it was challenging to interpret the data and difficult to generalize the findings in

**MD Bilal KV and S. Allah Baksh**

accordance with the methodology of the study. Due to these impediments, the research did not look into significant components of the workforce in the leather sector, such as gender and caste, even though they are important. Researchers were unable to conduct individual interviews with leather industry home workers as a result of the lockdown; nevertheless, they did engage in multiple rounds of talk with groups in Ambur. This research was aimed to quickly investigate the status of leather workers during the pandemic, and its results will be beneficial in better appreciating the challenges experienced by these individuals. Despite certain methodological limits, the research was designed to accomplish this goal. The findings provide important insights into the assistance that was provided to workers during this time, and the conclusion proposes a framework for immediate action by the government and corporations to better assist workers.

Features of the Representative Sample

In the course of this study, interviews were conducted with fifty different leather workers. The sample consists of people of varying ages and genders, with a disproportionate number of more experienced professionals. There is also a wide range of ages present. Before the lockdown, 22 of these persons were engaged at leather shoe manufacturers, 17 in tanneries, and 11 in job work units.

Main Findings

The Situation of Workers during the Intense Lockdown

In this part, we report the data we gathered on the economic, social, and health conditions, as well as the extent of COVID-19 aid, that employees faced during the lockdown.

Inability to compensate Wages and Salaries

Many of the employees surveyed said they had stayed on the job until the lockdown's March 25, 2020, factory closure. But just six people said they had gotten their entire March paycheck. Thirty-five people said they had only gotten a portion of their March pay, typically for the amount of days they had really worked. Even though they had worked more than 20 days in March, nine employees said they had not been paid. Based on interviews, it seems that the majority of leather workers in the Vellore area were not paid during the lockdown, and that those who were paid only got half salaries at best. Workers were forced to fend for themselves throughout the crisis since their companies offered them no real assistance.

Decreased Incomes and Rising Debt Levels

All production and services outside of India's key sectors came to a halt as a result of the lockdown. The results of this research support the premise that the lockout had a negative effect on the household earnings of the majority of employees, since almost all respondents reported a decrease and the majority had to borrow money to get through the crisis. Fifty percent of those who filled out the survey said they had borrowed money to get by during the lockdown. The shutdown and consequent loss of pay had clearly pushed employees to the brink, compelling them to borrow money to meet basic essentials like food. Six respondents said that they have used their credit to pay for healthcare costs.

The Safety Net Is Very Far Away

Many of the employees surveyed did not participate in the Employee Provident Fund (EPF) because they were not enrolled. Withdrawals from employees' EPF accounts were sanctioned by the federal government during the epidemic. Three people out of fifty respondents said they have used the plan to withdraw funds from their EPF accounts. However, despite their familiarity with the plan, eight respondents claimed they had no intention of using it.

COVID-19-Specific Measures for Aid

Based on interviews, it seems that the public distribution system (PDS) in Tamil Nadu is the most accessible relief programme for employees and their families, while other programmes launched by the state and national governments have helped a very limited number of leather workers. Forty-seven of the fifty employees surveyed for

the research reported receiving free grains as part of their compensation, and During the lockdown, the state government donated food via the PDS, and 45 respondents verified receiving a one-time cash transfer of INR 1000.

Layoffs and terminations that violate the law

In a survey with 50 participants, 16 people reported being unable to return to their previous jobs when the lockdown was lifted and production began. Nine were part-time or contract workers, while the other seven were full-timers or salaried employees. There were nine males and seven women in the labour force. There is little doubt that layoffs and terminations have touched every demographic of employees, regardless of job position or gender.

Worker uncertainty and ProClarity upon returning to the labor force

Upon approval from the Tamil Nadu state government, manufacturing might resume in the state at the start of June 2020. Since then, numerous Vellore tanneries and shoe manufacturers have had either full or partial worker involvement.

Safeguards against COVID-19

The interviews showed that most businesses made steps to implement basic precautionary measures to restrict the spread of COVID-19 after restarting operations, indicating that the government's tight regulations for industry seem to have guaranteed this.

New Difficulties in Getting to Work

All modes of public and commercial transportation stayed grounded during the first "unlocking" stages. The interviews showed that most leather workers in Vellore relied on public buses and private auto-rickshaws, which presented significant challenges on the way to and from work.

A typical Schedule Variations

Fifteen of the thirty-seven employees who answered the question said that their weekly hours had decreased since the lockdown began. Sixteen employees reported no change in their number of working days after returning to their jobs. This suggests that a greater share of the workforce that returned to the workforce saw a reduction in the number of hours they worked and, as a result, their salaries.

Time Off, Production Goals, and Overtime

Twelve respondents said they had put in extra hours before the lockdown, but only six were requested to do so when they got back to work afterward. Many respondents, however, said that they often put in more than eight hours a day, even if their employers did not consider this to be overtime.

Pay Cuts and Salary Reductions

After returning to work, respondents surveyed did not notice any significant changes in the regularity of their salary checks. They were paid on a monthly basis, and that was the most common response. As a result of the lockdown, employees saw a decrease in their net monthly earnings compared to the period before the lockdown. Although no responder had been paid less than INR 4000 before to the shutdown, at least twelve said they were paid that much or less after work resumed. Over the course of the lockdown, eleven respondents got paychecks totaling between INR 4001 and INR 7000.

The Crisis and Its Effects on People Working from Home during COVID-19

Large numbers of unseen home workers are employed by India's leather industry. Numerous ladies in Ambur sew shoe uppers at home. Subcontractors and agents, who are mostly male, are the usual employers of home-based employees. These latter workers take orders from shoe manufacturers and then deliver their finished products to women in outlying communities around Ambur. There was just a little quantity of work to go around for the remainder of the year. Home workers in Ambur might make anything from INR 1000 (about US\$15) to INR 3000 (about US\$250) each month. Since subcontractors and agents representing supplier factories did not pay out any

work commissions to home-based employees during the countrywide lockdown, these workers were unable to make a living. And despite their having fulfilled orders before to the lockdown, agents never paid them for their work. Home workers did not get aid during the epidemic since they do not qualify for national social security programmes like the Employees' Provident Fund (EPF).

CONCLUSION

The research gave information on the position of employees in the leather industry during the statewide lockdown and after restrictions were lifted, despite a small sample size and the difficulties created by the continuing epidemic. The lockdown had a severe detrimental effect on many, if not most, employees, making it difficult for them to meet their most fundamental demands. The results show that the supply businesses did not adhere to proper procedure while laying off employees. Unfair and sudden layoffs and firings have become commonplace in many manufacturing facilities. There have been occasions when employees have been pressured into resigning in order to get payment.

SUGGESTIONS

The following steps should be taken by manufacturers, distributors, retailers, and suppliers to ensure that leather industry employees are effectively supported during and after the epidemic, and that their already precarious positions are not weakened.

Brands and Stores from Around the World

- For suppliers to go back to work, brands and stores should release whatever money they've been holding back, Brands and retailers should maintain open lines of contact with their suppliers to provide enough assistance and address any issues that may arise throughout the supply chain, It is the responsibility of the brands to guarantee that their supply chain employees get their regular pay during the shutdown. There should be no lag time in paying employees for their time during the epidemic, It is the responsibility of manufacturers and retailers to guarantee that all employees in their supply chains, including those in subcontracting and remote roles, have access to appropriate social protections, They need to watch out for unlawful firings and layoffs by suppliers, To evaluate the additional human rights risks that have evolved in the wake of COVID-19, brands should do human rights due diligence throughout their supply chains, including the sub-contracting and home-working sectors.
- Companies should take measures to provide a livable wage for all employees in their supply networks, In order to guarantee that all employees are paid a salary that allows them to provide for their families, it will be necessary to revise buying procedures, pricing structures, and planning models, Companies should collaborate with their suppliers to establish and maintain effective grievance redressal systems that may help industrial employees with their issues. Companies selling such products have a responsibility to safeguard their employees from any adverse effects resulting from customer purchases. Brands should pay their suppliers enough money to provide fair working conditions and a livable salary for their employees.

Suppliers

During the lockdown and the months after it, suppliers should pay all employees in their factories and supply networks their regular salaries. Workers should be paid in full for the months they worked during the epidemic. Businesses that had employees' pay withheld during the lockout should take quick action to pay them in full.

- It is unacceptable for vendors to engage in unlawful employee terminations. It is the responsibility of suppliers to make sure their employees have access to and are able to fully use any available social protection programmes, Manufacturers and their representatives should have an open discourse about issues affecting employees and the community. If suppliers want to help industrial employees, they need to set up and keep up effective channels for resolving complaints, To guarantee worker safety, suppliers must adhere to all government regulations, including those imposed for COVID-19. Suppliers should provide paid sick days and make it easy for employees

MD Bilal KV and S. Allah Baksh

to take them without fear of retaliation, Management at factories should provide enough transportation options for employees, particularly those who must travel long distances to reach their workplace.

Government

- In order to promote and fully administer COVID-19 assistance programmes, government agencies should enhance their communication and outreach methods. Factory compliance with government rules published to prevent the spread of COVID19 at workplaces should be monitored and inspected on a regular basis. All employees should be paid in full by the government throughout the lockdown. In this context, formal notices should be sent out to relevant industries. The Department of Labor has to make sure that no factories are engaging in unlawful firings and layoffs. Corrective action should be made if firms resort to such methods.

ABSTRACT

The purpose of this study is to find out the association between severity of dysmenorrhea and menstrual characteristics like age of first menarche, duration of menstruation, length of menstrual cycle. A cross sectional School based study was conducted among 66 deaf and mute girls aged 11-19 from various deaf and mute schools. Structured based questionnaire and verbal multidimensional scoring system (VMSS) grading used for measure severity of menstruation for data collection and analyzed menstrual characteristics and Severity of pain among deaf and mute adolescent girls with primary dysmenorrhea. Total 66 girls participated in the study out of them 56 (86.3%) girls reported menstruation is painful but seldom inhibits normal activity; analgesics are seldom required; mild pain according to VMSS. Among them majority of the girls reported (51.5%) ideal age of menarche 12-13 years even they reported normal length and duration of menstrual cycle. The severity of dysmenorrhea was no associated with menstrual characteristics age of first menarche($p=0.15$), duration of menstruation ($p=0.08$) and length of menstrual cycle ($p=0.22$), no of sanitary pads used per day($p=0.19$). present study found no relationship between body mass index and dysmenorrhea($p=0.82$). The study indicate no association between menstrual characteristics like age of first menarche, duration of menstruation, length of menstruation with severity of dysmenorrhea.

Keywords: Body Mass Index , Deaf and Mute Girls , Dysmenorrhea, Menarche

INTRODUCTION

At the age of reproductive life in all women, certain changes occur in the reproductive organs, it affects the reproductive functions mainly during the phases of menarche to menopause due to certain hormonal changes occurring in the body during this phase. In every girl, the first menstrual period is a most important event during puberty which is a natural physiological process, which is defined as a menarche. From the beginning of a period to the next beginning of the period is called menstrual cycle. Menstruation occurs at age of puberty more common between 11-15 years and mean age of it 13 years. When women reaches at her 40s or 50s menstruation naturally ceases gradually due to naturally decrease reproductive hormones in the body which result in end of women menstrual cycle and it is defined as menopause [1,2,3]. Girls with disabilities may experience this phase differently and sometimes more negatively compare to nondisabled girls. In our daily life we all required speaking as well as communication during daily work but normal people who do not know the sign language they cannot easily communicate with deaf and mute person which can create misinterpretation and found communication problems. Reproductive health is a major health concern in every girls and specially girls with disability. And if they cannot convey their problems or needs due to communication barrier with the reproductive health services provider then they may have difficulty in raising issues of menstruation and related problems they faces[4,5]. Most of the adolescent complained about the dysmenorrhea and many other issues related to menstruation which is a very common gynecological problem. Dysmenorrhea is define as a pain occurs before or during the period of menstruation, or during both of the time. It is commonly occurs cyclical lower abdominal region pain or pelvic pain and sometimes it may also radiating in back and thigh region. It begins soon after menarche. Many of the girls complaining about pain, discomfort and other menstrual related symptoms typically start at the onset of menstrual flow or occurs a few hours before or after onset of menstruation, and remains last for the first 24-48 hours also[1,2,3].

Dysmenorrhea is classified basically in two types: primary dysmenorrhea and secondary dysmenorrhea. Primary dysmenorrhea is define as a pain with no any kind of pelvic pathology and almost always first occurs among women 20 years or younger after their ovulatory cycles become established. And Secondary dysmenorrhea is caused by underlying pelvic conditions or pathology and it is more common among women older than 20 years of age[6,7]. Adolescence is a phase, in these period many of the girls faces significant cognitive and psychological even behavioral changes. It continue through period of adolescence and also after most of the physical changes of puberty have already taken place in body. Major physical and psychological changes occur in every young woman and most of them complaining likes irregular bleeding, pain during menstruation, mood swings, anger, irritated, loss of appetite, loss concentration, fatigue, headache, body pain etc. during these phase. During the period of adolescence Serious gynecological pathology is rare to found, but menstrual related problems are most commonly noticeable. This difficult phase even more challenging in adolescent and especially for girl with disability and their families. During these phase special attention and care is needed, because they found difficulties to express their feelings and pain. Even Sometimes they have received negligence from society also[8]. According to the various research studies on adolescence girls with disabilities have found limited knowledge to health-related details and issues, which including even basic knowledge about their own physical growth and bodily changes. Due to communication barrier with deaf and mute girls various studies have reported that they faced several challenges during accessing reproductive health also[8,9,10]. Even we found limited studies related to dysmenorrhea and other related to reproductive health in deaf and mute girls and with other disabilities. Dysmenorrhea is the most prevalent menstrual irregularity among adolescent girls In previous study was reported 95.5% of the total girls[15]. Researchers reported that people with hearing impairment faced several challenges during accessing reproductive health due to difficulty in communication with them[4]. Thus, a cross-sectional study was conducted among deaf and mute adolescent girls with following objectives: To evaluate the association between severity of primary dysmenorrhea and menstrual characteristics.

MATERIAL AND METHODS

In the present study cross-sectional design was used to gather information about the relationship between severity of dysmenorrhea with menstrual characteristics and primary dysmenorrhea with body mass index among deaf and mute girls. The study was conducted with deaf and mute girls from various deaf and mute schools. Informed written consent was taken from all the students, parents and school authority before their participation in the study. Ethical approval was obtained from ethical board also. Participants included in the study were explained about the aim and procedure of the study. Explained about the questionnaire and included each and every content, convey all this information by sign language knowing teacher via sign language to all participants of the study. All of participants were explained that if they feel uncomfortable then they could discontinue the study at any time. As per the selection criteria total sixty six (66) students with hearing impairment were enrolled in the research study. The selection criteria as follows: all type of hearing impaired girls who are unmarried, use or understand sign language, girls who volunteered to participate. Age 11-19 year old and girls who attained menarche were enrolled and Girls with any systemic, chronic or gynecological disease were excluded from the study. The presence of dysmenorrhea was confirmed by inquiring the students. Data was carried out by various deaf and mute schools and Overall 66 girls were enrolled from different grades of school. Demographic and menstrual characteristics information were collected via questionnaire which were completed by students with the help of sign language knowing teacher. In demographic description includes age, height, weight and body mass index, family history. In Menstrual characteristics form information includes age at first menarche, duration of menstrual cycle, length of menstrual cycle, no of sanitary napkins used per day. The severity of dysmenorrhea was assessed by verbal multi-dimensional scoring system (VMSS), in which scale grade 0 means menstruation is not painful and daily activity is unaffected. Grade one means mild pain, menstruation is painful but seldom inhibits normal activity, analgesics are seldom required. Grade 2 means moderate pain, daily activity is affected; analgesics required and give sufficient relief so that absence from school is unusual. Grade 3 means severe pain, activity clearly inhibited; poor effect of analgesics vegetative symptoms(headache, fatigue, vomiting & diarrhea).

RESULTS

In our study, sixty six deaf and mute girl students were participated, we evaluate the relationship between severity of dysmenorrhea with menstrual characteristics like age of menarche, duration of menstruation, length of menstrual cycle, no of sanitary pads used per day and body mass index with dysmenorrhea. Data related to Menstrual characteristics details and BMI were gathered from all 66 deaf and mute students. Collected data for this study were arranged and analyzed with simple percentages, frequency count and Chi-square test. The relationship between the severity of dysmenorrhea and menstrual characteristics was determined by used of chi square test. Data analysis was done by used of Statistical Package for Social Sciences (SPSS) software version 23.0. In present study, average age of the participants was 15.74 ± 2.24 years range from 11-19 years. Details about menstruation and related characteristics namely age of menarche, duration of menstruation, length of menstrual cycle, onset of pain, duration of pain has been evaluated. As per the previous study result shows Majority of (86.3% n=57) girls reported grade 1(mild pain), analgesics seldom required, others reported grade 0 (4.5%) and grade 2(9.1%)[12]. According to VMSS dysmenorrhea severity grading mild painful menstruation and analgesics seldom required among (86.3%)deaf and mute girls and other girls (9.1%) reported moderate menstrual pain and analgesics required and give sufficient relief so that absence from school is unusual. *p-value<0.05, considered significant VMSS= verbal manual scoring system, χ^2 = Chi square As per the above chi square test reports that majority of the girls started their menstruation at the age of 12-13 year and found no association between menstrual characteristic age of first menarche and severity of dysmenorrhea. Result shows Menstrual characteristics which follows age at first menarche ($\chi^2=13.06$, "p-value" 0.15), majority of the girls (95.0%) girls reported <7 days of menstrual duration we found no association between severity of dysmenorrhea and duration of menstruation ($\chi^2=6.73$, "p-value" 0.08), overall 75.5 % girls have ideal length of menstrual cycle reported mild to moderate pain, we found no association between severity of dysmenorrhea and length of menstrual cycle ($\chi^2=8.14$, "p-value" 0.22), number of sanitary napkins used per day

**Jagdish T Gohil and Neelam K Rathod**

($\chi^2=8.60$, “p-value” 0.19). Figure 1 represent that the relationship between menstrual characteristic age of first menarche with severity of dysmenorrhea in which we found no association between menstrual characteristics and severity of dysmenorrhea. Figure 2 shows 50.0% girls reported < 7 days duration of menstrual cycle which is routine duration of menstruation and we found no association between severity of dysmenorrhea. Figure 3 shows maximum girls reported ideal length of menstrual cycle 29-35 days but we found no association between severity of dysmenorrhea. Figure 4 represent menstrual characteristics no of sanitary pads used per day which is important as a part of menstrual hygiene awareness. We found no association between menstrual characteristic no of sanitary used per day and severity of dysmenorrhea.

DISCUSSION

Many different studies worked on menstruation, dysmenorrhea and reproductive health etc. among general population. But lack of the data was found among deaf and mute girls population and other especially abled children regarding reproductive health[20]. Present cross-sectional study was needed due to lack of data available related to dysmenorrhea and its relationship among deaf and mute girls. The results of our previous study confirms that, dysmenorrhea was seen in majority (95.5%) of the deaf and mute girls[12]. In previous research, the frequency of pain during menstruation was 82.2% among Indian secondary school adolescents. According to severity of dysmenorrhea Several studies in normal population have shown a significant association between menstrual characteristics and dysmenorrhea, the reason could be related to girls at the phase of menarche early have longer exposure to uterine prostaglandins which related to the higher prevalence of dysmenorrhea[13]. In our study, majority of the girls were reported reference category of 12-14 years for age of menarche showed similar findings reported by some researcher related age of menarche[12,9,14]. We found no significant difference between mean age of menarche and severity of dysmenorrhea. Menstrual bleeding duration of 5 days and over was an important risk factor for dysmenorrhea. In present study 95.4 % girls reported <7 days of Bleeding duration. We found to be significantly associated with dysmenorrhea in the present study. Girls who had bleeding duration more than 5 days had more chance of getting dysmenorrhea. This finding is compatible with the result showing that the risk of dysmenorrhea is higher in women with long menstrual flows[15]. In our study Average length of menstrual cycle (29-35 days) was reported to be normal in majority 75.8% and 16.7 % girls reported 22-28 days and very few girls reported >35 days (7.6%).Hence normal length of menstrual cycle considered as 21-35 days .We did not find the association between length of menstrual cycle and severity of dysmenorrhea. But Some studies have reported that dysmenorrhea is more prevalent in women with longer menstrual cycle[16, 17]. According to Menstrual Hygiene Matters reports females should change their absorbents regularly every 2–6 hours or depend up on menstrual blood flow individually. But lack of evidence of the adequate frequency for changing for comfort and hygiene. But Once the absorbents become wet, it should be changed immediately[18].If not change regularly then it can cause irritation on the inside of the thighs and can lead to infection also. In present study as shown in table 3 majority (72.7%) girls were using two to three absorbent sanitary napkins during menstruation and 24.3 % girls changed them pads <2 per day. Past literature reported 49.0%(96 out of 201) girls were changed sanitary protections three or more times per day. Even they found that the frequency of absorbent change was significantly associated with school attendance[19].

CONCLUSION

In this study, we observed that many of the girls reported primary dysmenorrhea and it is as common in deaf and mute girls also like other girls. Menstrual characteristics were important factors in dysmenorrhea. We conclude that, we found no association between menstrual characteristics like age of first menarche, duration of menstruation, length of menstruation, number of sanitary pads used per day with severity of dysmenorrhea.

ACKNOWLEDGEMENT

We would like to express our profound gratitude to all the students and staff of deaf and mute school.

ABSTRACT

Fertilizer companies play a pivotal role in the agricultural sector, especially in developing countries where food security is a major concern. The challenge for these companies is not only in producing efficient and environmentally sustainable fertilizers but also in marketing their products effectively to farmers, who often face economic, educational, and logistical barriers. This paper explores the marketing strategies adopted by fertilizer companies in developing countries, focusing on their effectiveness, adaptability, and sustainability. By reviewing international literature, we analyze key marketing approaches such as pricing strategies, distribution channels, promotional activities, and product innovation. The study aims to understand how these strategies impact both the companies and their target market, which is largely made up of small-scale and resource-poor farmers. Our analysis provides insights into potential improvements in fertilizer marketing that can support agricultural productivity, economic growth, and environmental sustainability in developing regions.

Keywords: Agriculture, Environment, Marketing strategy, Fertilizer, Developing country etc.

INTRODUCTION

Agriculture is the backbone of many developing economies, accounting for a significant portion of their GDP and providing livelihoods for the majority of their populations. The role of fertilizers in enhancing agricultural productivity cannot be understated, particularly in regions where soil fertility is low and farming practices are often rudimentary. Despite the recognized importance of fertilizers, their adoption and usage rates in many developing countries remain suboptimal.

Fertilizer companies face unique challenges in marketing their products in developing countries. These challenges include limited farmer awareness, infrastructural deficits, low purchasing power, and volatile political and economic conditions. As such, fertilizer companies must adopt tailored marketing strategies that address these specific hurdles. The purpose of this study is to explore and analyze the various marketing strategies employed by fertilizer companies in developing countries and to evaluate their effectiveness in ensuring market penetration and sustained product usage.

The study focuses on the following key aspects:

- Pricing strategies and their adaptability to the economic conditions of small land holder farmers.
- Distribution channels and how they overcome infrastructural challenges.
- Promotional strategies that educate farmers and create awareness about the benefits and proper use of fertilizers.
- Product innovation that takes into account environmental sustainability and localized agricultural needs.

Objectives of the Study

The primary objectives of this study are:

- To examine the marketing strategies adopted by fertilizer companies in developing countries.
- To evaluate the effectiveness of these strategies in improving fertilizer usage among farmers.
- To identify the challenges faced by fertilizer companies in implementing their marketing strategies.
- To provide recommendations for optimizing marketing efforts to enhance agricultural productivity in developing countries.
- To assess the role of government policies and international cooperation in supporting fertilizer marketing strategies.

Hypothesis

This study is based on the following hypotheses:

- H1: Marketing strategies adopted by fertilizer companies in developing countries significantly influence fertilizer adoption rates among farmers.
- H2: Pricing strategies tailored to the economic capacities of smallholder farmers lead to higher sales and market penetration.
- H3: Effective promotional strategies, particularly those focused on farmer education, result in better utilization of fertilizers and improved crop yields.
- H4: Government policies and partnerships with international organizations enhance the marketing effectiveness of fertilizer companies in developing countries.

Evolution of Marketing Strategy

evolution of marketing strategies employed by fertilizer companies in developing countries, focusing on how these strategies have adapted to overcome the challenges and it reflecting the development of marketing approaches over time.

- Early Marketing Approaches in Developing Countries (Pre-1990)** :In the early stages of fertilizer marketing in developing countries, companies primarily relied on government-led initiatives. Before the 1990s, fertilizer

markets were heavily regulated, with many governments in Africa, Asia, and Latin America controlling production, distribution, and pricing. The primary aim of these interventions was to increase agricultural productivity and ensure food security. For instance, in India, the Green Revolution of the 1960s and 1970s played a significant role in boosting fertilizer use through government subsidies and guaranteed pricing mechanisms (Pingali & Rosegrant, 1998). However, these early interventions often led to inefficiencies. Studies by Jayne et al. (2003) highlight how state-run fertilizer programs in Africa resulted in market distortions, poor distribution networks, and reduced incentives for private-sector investment. The reliance on government-controlled distribution channels meant that fertilizers were not always accessible to the farmers who needed them the most, particularly those in remote rural areas.

- ii. **Shift Towards Liberalization and Market-Driven Approaches (1990s)** :By the 1990s, many developing countries began shifting away from state-controlled fertilizer markets towards market-driven approaches, prompted by structural adjustment programs advocated by the World Bank and International Monetary Fund (IMF). Fertilizer companies, particularly in Africa and South Asia, started to play a more significant role in marketing and distribution. The liberalization of the fertilizer sector was seen as a means to increase competition, improve distribution, and reduce government fiscal burdens (Smaling & Braun, 1996). This shift led to the emergence of private-sector-led marketing strategies, where companies adopted competitive pricing models, direct distribution networks, and promotional campaigns to educate farmers. A key study by Wanzala et al. (2001) discusses how the liberalization of the fertilizer market in Kenya resulted in an increase in private-sector investment and improved access to fertilizers in remote areas. The study found that private companies began to partner with local agro-dealers to extend their distribution networks and reach smallholder farmers more effectively. However, liberalization also had its challenges. Several studies, such as those by Kelly et al. (2003), reported that while liberalization improved access in some regions, it also led to higher fertilizer prices due to the removal of government subsidies. As a result, fertilizer affordability remained a significant barrier for many smallholder farmers, particularly in Sub-Saharan Africa.
- iii. **The Rise of Public-Private Partnerships (2000s)**: In the 2000s, public-private partnerships (PPPs) emerged as a key strategy for improving fertilizer marketing in developing countries. Governments, recognizing the limitations of both fully state-controlled and fully liberalized markets, began collaborating with private-sector companies to develop more sustainable and inclusive marketing models. PPPs aimed to combine the efficiency of the private sector with the regulatory oversight and financial support of governments. A landmark study by Gregory & Bumb (2006) outlines how PPPs were instrumental in improving fertilizer access in Sub-Saharan Africa. The African Fertilizer Summit of 2006, which brought together governments, international organizations, and private companies, emphasized the importance of collaborative efforts to increase fertilizer use. As a result, several countries, including Ethiopia and Tanzania, launched PPP initiatives to strengthen fertilizer distribution networks and provide farmers with access to credit. According to the African Fertilizer and Agribusiness Partnership (AFAP), PPPs also enabled companies to adopt more innovative marketing strategies. For example, the introduction of fertilizer voucher systems in countries like Nigeria and Malawi allowed farmers to purchase fertilizers at subsidized prices, while private companies handled distribution and marketing (Dorward et al., 2008). This approach increased fertilizer use among smallholder farmers and improved the profitability of fertilizer companies.
- iv. **Technological Innovations in Marketing (2010s)**: The 2010s saw significant technological advancements that transformed fertilizer marketing in developing countries. Fertilizer companies began leveraging mobile technology and digital platforms to improve distribution, enhance farmer education, and increase transparency in transactions. The widespread adoption of mobile phones in regions like East Africa enabled companies to reach farmers directly through mobile-based marketing and distribution channels. Baumüller (2015) highlights how mobile platforms like Kenya's M-Pesa allowed fertilizer companies to offer digital payment solutions, reducing the need for farmers to travel long distances to purchase fertilizers. Mobile platforms also facilitated the delivery of educational content to farmers, helping them make informed decisions about fertilizer use. Similarly, in countries like Ghana and Tanzania, radio and SMS-based campaigns were used to promote fertilizers and educate farmers on best agricultural practices (Aker, 2011). Technological innovation also extended to product development. Companies began offering fertilizers tailored to specific crops and soil

Sudam B. Shinde *et al.*,

conditions, making their products more relevant to local agricultural needs. This shift towards customized fertilizers was supported by research from the International Fertilizer Development Center (IFDC), which emphasized the importance of developing fertilizers that addressed the unique soil deficiencies in different regions (Henao & Baanante, 2006).

- v. **Sustainability and Environmentally-Friendly Fertilizers (2020s):** In recent years, the global focus on sustainability and environmental protection has influenced the marketing strategies of fertilizer companies in developing countries. Companies are increasingly adopting marketing strategies that highlight the environmental benefits of their products. For example, the rise of slow-release and organic fertilizers has provided companies with an opportunity to differentiate themselves in a competitive market while addressing environmental concerns. A study by the International Fertilizer Association (IFA) (2020) emphasizes the growing demand for environmentally-friendly fertilizers in regions like Latin America and Southeast Asia. Fertilizer companies have responded by investing in the development of bio-based fertilizers, which offer lower environmental risks compared to traditional chemical fertilizers. Marketing campaigns now frequently emphasize not only the productivity benefits of fertilizers but also their role in promoting sustainable agricultural practices (Goyal *et al.*, 2020).
- vi. **Current Trends and Future Directions (2020s Onwards):** As of the 2020s, fertilizer companies in developing countries continue to refine their marketing strategies to respond to emerging trends such as digital agriculture, climate change, and evolving consumer preferences. The COVID-19 pandemic further accelerated the adoption of digital tools in fertilizer marketing, as companies increasingly used online platforms to engage with farmers and facilitate product delivery. Studies such as those by Duflo *et al.* (2021) highlight the need for fertilizer companies to focus on inclusive marketing strategies that reach marginalized farmer groups, particularly women and young people. There is also growing recognition of the need for holistic marketing approaches that integrate product innovation, sustainability, and digital tools to meet the complex needs of smallholder farmers in developing countries.

LITERATURE REVIEW

Overview of Fertilizer Marketing in Developing Countries

Fertilizer marketing in developing countries is shaped by complex socioeconomic and environmental factors. Smallholder farmers, who form the bulk of the agricultural workforce in regions like Sub-Saharan Africa, South Asia, and Latin America, often face significant barriers to accessing fertilizers. According to the International Fertilizer Association (IFA), only 10% of farmers in low-income countries use fertilizers regularly, compared to over 60% in high-income countries. Fertilizer companies need to address these barriers through tailored marketing strategies that account for local realities. For instance, a report by the African Fertilizer and Agribusiness Partnership (AFAP) highlights how partnerships between governments, private companies, and local distributors have helped improve fertilizer access in countries like Kenya and Tanzania. However, the AFAP also notes that adoption remains low due to high prices and limited farmer education, underscoring the need for integrated marketing strategies that combine pricing, distribution, and promotional efforts. Marketing fertilizers in developing countries poses several unique challenges. In regions such as Sub-Saharan Africa and South Asia, a significant portion of the population relies on agriculture for their livelihood. However, due to limited access to capital, information, and technology, farmers often underuse fertilizers or misuse them, leading to low agricultural productivity. Fertilizer companies, therefore, need to adopt marketing strategies that not only promote their products but also educate the farming community on their correct use. In India, for example, the government has played a pivotal role in regulating fertilizer prices and providing subsidies to make fertilizers more affordable to smallholder farmers. Similarly, in countries like Kenya and Ethiopia, public-private partnerships have been critical in improving the distribution and availability of fertilizers. Studies show that when farmers receive proper training on fertilizer use, crop yields increase significantly, which in turn encourages further investment in fertilizers. For example, in Bangladesh, fertilizer companies offer both premium and budget products to cater to different segments of the farming population.

Sudam B. Shinde *et al.*,

- i. **Pricing Strategies:** Pricing strategies in the fertilizer industry are particularly important in developing countries due to the low purchasing power of most farmers. Many fertilizer companies in countries like Nigeria, India, and Bangladesh have adopted tiered pricing strategies that offer different fertilizer products at various price points, depending on the economic capacity of their target market. Subsidized pricing models, supported by government policies, have also proven effective in improving fertilizer adoption. Research by Pingali and Rose grant (1998) found that governments in Southeast Asia that subsidized fertilizers saw a 30% increase in fertilizer use and a corresponding increase in food production. However, subsidized pricing can also have negative consequences, as evidenced by reports from Ghana and Zambia, where poorly implemented subsidy programs led to market distortions and a decline in private-sector participation in the fertilizer market (Jayne & Rashid, 2013). It is therefore essential that pricing strategies balance affordability for farmers with long-term market sustainability.
- ii. **Distribution Channels:** Distribution remains one of the greatest challenges for fertilizer companies in developing countries. Poor infrastructure, particularly in rural areas, makes it difficult for companies to reach smallholder farmers. Many companies have responded to this challenge by developing innovative distribution channels. In some regions of Africa, for example, fertilizer companies partner with local agro-dealers who act as intermediaries between the company and the farmer. This model has been particularly successful in countries like Tanzania and Malawi, where agro-dealers provide not only fertilizers but also advice on their usage. Mobile technology has also emerged as a critical tool in fertilizer distribution. In Kenya, companies have adopted mobile payment systems like M-Pesa to facilitate the purchase and delivery of fertilizers, reducing the need for farmers to travel long distances to buy inputs (Baumüller, 2015).
- iii. **Promotional Strategies:** Promotional strategies are keys to increasing fertilizer awareness and adoption among farmers, particularly in regions where illiteracy and lack of formal education are prevalent. Fertilizer companies in India, for example, have used village-level demonstrations and farmer field schools to promote their products. These programs show farmers firsthand the benefits of using fertilizers and provide them with the knowledge to apply them correctly. A study by Duflo, Kremer, and Robinson (2008) found that farmers who attended such programs were significantly more likely to use fertilizers correctly, leading to increased crop yields. Radio and mobile phone messaging have also been effective promotional tools, especially in countries where internet access is limited. In Tanzania, for example, radio programs that provide agricultural advice have been shown to increase farmers' knowledge of fertilizers, leading to higher adoption rates. Radio and mobile-based promotion are also widely used in Africa, where literacy levels may be low but mobile phone penetration is high. Secondary data from Tanzania's agricultural development programs show that radio broadcasts and SMS-based campaigns have successfully increased farmers' awareness and adoption of fertilizers (Baumüller, 2015).
- iv. **Product Innovation and Sustainability:** In recent years, fertilizer companies have begun to focus on developing products that are not only effective but also environmentally sustainable. In countries like Brazil and India, where concerns over soil degradation and environmental pollution are growing, companies have started offering slow-release and organic fertilizers that minimize harmful environmental impacts. According to the International Fertilizer Association (IFA), the development of bio-based fertilizers in Latin America has been a key factor in promoting sustainable agricultural practices while maintaining productivity. The literature suggests that product innovation is crucial for addressing the specific agricultural needs of developing countries. In Southeast Asia, for instance, fertilizer companies have created region-specific products that cater to different soil types and crop requirements, leading to improved agricultural outcomes. In India, several companies have launched organic fertilizer lines to cater to the rising demand for sustainable agricultural inputs. A 2018 study by the IFA showed that product diversification, especially the introduction of micronutrient-enriched fertilizers, has helped companies penetrate new markets and address specific soil deficiencies prevalent in different regions.
- v. **Role of Government and International Partnerships:** Government policies and international partnerships play a significant role in supporting fertilizer marketing strategies in developing countries. Many governments provide subsidies and tax incentives to encourage the use of fertilizers, while international organizations like the World Bank and the Food and Agriculture Organization (FAO) offer technical and financial assistance. In West Africa, for example, the Alliance for a Green Revolution in Africa (AGRA) has worked with local governments and private companies to improve fertilizer accessibility and affordability. However, as highlighted by Omamo

**Sudam B. Shinde et al.,**

(2003), government interventions must be carefully designed to avoid unintended consequences such as market distortions and over-reliance on subsidies. Successful government involvement requires a balance between supporting farmers and ensuring that the fertilizer market remains competitive and sustainable. However, some studies have pointed to the risks of government intervention, particularly when subsidies are poorly managed. A report by the International Food Policy Research Institute (IFPRI) notes that in some African countries, government-led fertilizer programs have crowded out private-sector participation, leading to inefficiencies and reduced market competition.

Suggestions

Based on the analysis of secondary data, the following suggestions are made for improving the marketing strategies of fertilizer companies in developing countries:

- i. **Customized Pricing Models:** Companies should explore flexible pricing strategies, such as offering smaller package sizes or pay-as-you-go options, to make fertilizers more affordable for low-income farmers or farmers group.
- ii. **Strengthening Distribution Networks:** Government can collaborating with local agro-dealers and leveraging digital platforms for direct sales can help overcome distribution challenges in remote areas.
- iii. **Farmer Education and Promotion:** Companies should invest in farmer education programs, including demonstration plots and mobile-based learning platforms, to promote proper fertilizer usage.
- iv. **Sustainable Product Innovation:** Fertilizer companies should focus on developing environmentally sustainable products, such as bio-based and slow-release fertilizers, to address growing concerns about soil health and environmental degradation.
- v. **Public-Private Partnerships:** Governments and international organizations should continue to support PPPs that enhance fertilizer access and promote agricultural development, while ensuring that subsidy programs are managed efficiently to avoid market distortions.

CONCLUSION

Fertilizer companies in developing countries operate in challenging environments characterized by limited infrastructure, low farmer literacy, and economic constraints. This study highlights the importance of adopting marketing strategies that are tailored to these unique challenges. Effective pricing, innovative distribution models, targeted promotional activities, and sustainable product development are all critical components of a successful marketing strategy. Additionally, government support and international partnerships are essential for improving market conditions and ensuring that fertilizers reach those who need them most. Future research should focus on evaluating the long-term impacts of these strategies on agricultural productivity and food security in developing countries. By continuing to innovate and adapt, fertilizer companies can play a crucial role in supporting sustainable agricultural development in the world's most vulnerable regions.

ABSTRACT

The different components of the neurodegenerative disease pathophysiology that are frequently addressed. The Neurodegenerative disorders including pathogenesis are commonly targeted by the individual aspects. Parkinson's disease (PD) and Alzheimer's disease (AD) are two conditions that share many pathological characteristics. These include abnormal toxic protein accumulation, increased inflammation, impaired synaptic function, loss of neurons, increased activation of astrocytes, and possibly insulin resistance. preclinical and early clinical research remarkable clinical potential have displayed by the glucagon like peptide 1 receptor agonist. The toxic protein aggregation, inflammation and apoptosis can be reduced by targeting brain incretin receptors. Furthermore, it is critical to understand how the course of neuro degeneration in a difficult disease like Parkinson's disease might be influenced by a common and manageable condition like diabetes. The current body of research on the relationship between diabetes and Parkinson's disease, as well as the potential effects of currently available antidiabetic drugs on the course and severity of Parkinsonism, with an emphasis on agonists of the glucagon-like peptide-1 receptor. Repurposing several anti-diabetic drugs for the treatment of Parkinson's disease (PD) has showed early promise in clinical studies, indicating that the impact of type 2 diabetes (T2D) on the pathogenesis of PD may be controllable. Despite a wealth of evidence linking the pathophysiology of both T2D and PD to processes like insulin signaling, mitochondrial function, autophagy, and inflammation, the main goal of this review is to highlight the evidence that T2D-associated dysregulation of these pathways occurs in the brain as well as the periphery, and how this may contribute to neuro degeneration in PD. The prevalence of chronic illnesses like Parkinson's disease (PD) has skyrocketed globally in recent years. Type 2 diabetes mellitus (T2DM) has been implicated as a potential risk factor for Parkinson's disease (PD), and concomitant T2DM may exacerbate PD symptoms and hasten neuro degeneration. Numerous research on the therapeutic potential of T2DM medications against PD have been motivated by the same pathogenic pathways shared by PD and T2DM; among these, agonist of the glucagon-like peptide-1 receptor (GLP-

91377

**Vasanth et al.,**

1R)are interesting possibilities. Parkinson's disease (PD), which is characterized by dopaminergic degradation and aberrant movements, is the second most common age-related hypokinetic illness. The majority of Parkinson's disease patients have dopaminergic degeneration in the basal ganglia. DPP4 inhibitors are often used to treat diabetes and are currently undergoing testing to determine their efficacy in neurodegenerative disorders. In numerous preclinical and clinical PD trials, DPP4 inhibitors have been shown to prevent neuronal degeneration and enhance motor capabilities.

INTRODUCTION

A variety of crippling illnesses that predominantly impact the human central nervous system's (CNS) neurons are together referred to as neurodegenerative diseases. Mental dysfunction or impaired mobility (ataxia) may arise from the increasing nerve cell loss and degeneration. With over 50 million instances occurring globally, AD accounts for 60–70% of dementia cases worldwide. The connection between metabolic and neurodegenerative diseases is becoming more widely acknowledged by the research community. Abnormalities in insulin signaling have been identified as a characteristic of older people with type 2 diabetes (T2DM) and pre-diabetes; same abnormalities have also been seen in AD and PD. T2DM additionally seems to have a negative impact on the severity of symptoms and the course of the disease. As an illustration, having diabetes before to Parkinson's disease (PD) raises the chance of experiencing increased severity of motor symptoms, as measured by the Horgan and Yahr staging and the Unified Parkinson's Disease rating scale, as well as a more negative impact on day-to-day activities As shown in Fig. 1, the major insulin receptor signaling networks play a critical role in supporting neuronal development and differentiation, cell metabolism, synaptic plasticity, and neuroprotection. AKT phosphorylation is linked to AD progression and cognitive dysfunction. Function of neuronal insulin signaling (Fig. 1). Illustration of activation of the second messenger pathway. medications that fight diabetes for neurological conditions Table 1. Trial setup and results of antidiabetic drug clinical studies in AD and PD populations. Both Alzheimer's disease (AD) and Parkinson's disease (PD) are complex illnesses that include multiple pathological processes, including aberrant buildup of toxic proteins, inflammation, loss of neurons, astrocyte activation, and even insulin resistance. Given the biological similarities between diabetes mellitus (DM) and neurodegenerative disorders (AD and PD), anti-diabetic medications hold significant promise as a treatment approach

Table 1 lists the trial design and results of clinical studies on antidiabetic medications in AD and PD populations.

Another substance made using recombinant DNA technology is dulaglutide, which is appropriate for injection once a week. (GIP and GLP-1 receptor agonist structures is shown in Fig. 2). Figure 2 shows the structures of GIP, GLP-1, and native human equivalents, such as tirzepatide, an agonist of the dual GLP-1/GLP receptor and exenatide, lixisenatide, liraglutide, albiglutide, semaglutide, and dulaglutide. Abbreviations: GLP-1 (glucagon-like peptide-1) and GIP (gastric inhibitory polypeptide). References for the structure: GLP-1 CID 90488821 URL It's feasible that dysregulated insulin transmission in the brain can be compensated for by GLP-1 receptor activation. The GLP-1 receptor, a member of the G protein-coupled receptor family, is how GLP-1 works. The best way to characterize pancreatic beta cells are the site of GLP-1 signaling, where activation of the receptor increases insulin production. Several other pathways, such as Akt/PKB and PI3K/MAPK, are improved after receptor stimulation. Numerous beneficial benefits, including the induction of anti-inflammatory signalling, the reduction of oxidative stress, the enhancement of gene transcription, and the regulation of autophagy, are associated with GLP-1 signalling. To pinpoint minute variations in the intracellular signalling pathways-which could vary depending on a number of variables, including the brain region-more investigation is needed. For more on GLP-1 communication throughout the brain, see Fig. 3. Figure 3. The brain's GLP-1 signalling pathway. influence of downstream signalling cascades on

**Vasanthan et al.,**

neuroprotection. Abbreviations: GLP-1 (glucagon-like peptide-1), ATP (adenosine triphosphate), and Glucagon like peptide -1 receptor, abbreviated GLP-1R peripheral tissues such the pancreas, heart, gastrointestinal track, adipose tissue, kidney, and muscles, as well as islet alpha and beta cells express GLP-1 receptors. GLP-1 is expressed so widely that it is connected to many different systems and functions. GLP-1 influences lipogenic and lipolytic activities and enhances adipose tissue's absorption of glucose. increases muscular glucose oxidation and glycogen production while decreasing albumin excretion and natriuresis in the kidney. Through its effect on the heart, GLP-1 increases heart rate and decreases systolic blood pressure, hence promoting cardio protection. Preclinical data indicates that GLP-1 receptor agonists hold great promise for preventing the progression of dementia. Eight seven-month-old APP/PS1 mice showed less memory loss after receiving weekly liraglutide therapy. This effect was accompanied in the hippocampus by a reduction in synaptic loss and maintenance of synaptic plasticity. Liraglutide successfully mitigated both mitochondrial dysfunction and neuronal death via the cAMP/PKA pathway in astrocytes treated with A β . One possible explanation for the success of liraglutide treatment could be the restoration of insulin signalling in the brain. Liraglutide inhibits the loss of insulin receptors in β -amyloid oligomer-induced models in non-human primates as well as mice. A number of GLP-1 receptor agonists, other than liraglutide Preclinical models collectively show that GLP-1 receptor agonists may affect a number of important pathological characteristics of AD, such as inhibiting the development of amyloid plaque, lowering inflammation, boosting neurogenesis, and improving cognitive function. Increasing data indicates that agonist of GLP-1 receptors could an impact on tau pathology, which is encouraging. Exenatide injections have shown promise in Alzheimer's disease (AD) preclinical models, as they were shown to diminish tau hyper phosphorylation in a rat model of type 2 diabetes fed a high -fat diet. In male rats, Exenatide significantly decreased β -amyloid in the prefrontal cortex and hippocampal regions and improved memory impairments. Exenatide also raised Akt and inhibited mitochondrial toxicity. In a Liraglutide pilot study, randomly assigned groups of 38 AD patients were given either active medication (n=18) or twenty placebo recipients. Eleven individuals were allocated at random to get exenatide twice daily, whereas ten patients received a placebo in a pilot study lasting eighteen months that evaluated exenatides effects on AD.

Therefore, exenatide may be able to lessen brain amyloidosis, which calls for more research in AD. Premature trial termination reduced the statistical power to get the intended results. According to a preliminary examination of REWIND that assessed cognitive performance at the start and end of the study, patients on dulaglutide had a 14% lower probability of acquiring meaningful cognitive impairment. Furthermore, in 15,820 T2DM individuals using semaglutide or liraglutide treatment, the dementia diagnosis hazard ratio was to be determined by a combined post hoc analysis of three trials examining cardiovascular outcomes. Repurposing agonist of the GLP-1 receptor for AD has promise in preclinical and early clinical evaluation when combined, as seen by the entry of semaglutide into a comprehensive phase 3 assessment of people with early AD. When contrasting AD preclinical and clinical research that evaluate the effectiveness of antidiabetic medications, it is crucial to take note of significant limitations. Models of transgenic mice based on mutations causing the family form of AD are used in most preclinical research, even though over 99% of AD patients have the sporadic form of the illness. The PI3K-AKT signalling pathway may be modulated by GLP-1 to have neuroprotective effects on Parkinson's disease. The beneficial benefits against Parkinson's disease pathology may also be explained by c-AMP is up regulated following GLP-1 receptor activation. Even though over 99% of AD patients have transgenic mouse models based on mutations that create the familial form of the disease are used in most preclinical studies to study it's sporadic form of the disease. GLP-1 may have neuroprotective benefits on Parkinson's disease (PD) by modulating the PI3K-AKT signalling pathway. GLP-1 receptor activation-induced up regulation of c-AMP may also contribute to the protective benefits against Parkinson's disease pathogenesis. Additionally, a protective effect of GLP-1 has been suggested to play a part in the BBB's upkeep. Exenatide was generally well tolerated and safe by the subjects. At 12 months, the Movement Disorders Society Unified Parkinson's Disease Rating Scale (MDS-UPDRS) showed improved motor performance in exenatide-treated participants, with a mean improvement of 2.7 points, compared to a mean drop of 2.2 points in controls. Two months after therapy ended, despite stopping medication, improvements in motor function continued condition. Because of the tiny sample size and single-blind technique, the data from Aviles-Olmos et al., although positive, should not be taken as evidence of a treatment-modifying impact. Athauda et al. evaluated the impact of exenatide in sixty-two individuals suffering from idiopathic Parkinson's disease (PD) in a bigger phase II trial. It is becoming more

**Vasanth et al.,**

widely acknowledged that evaluating neuronal-derived extracellular vesicles in vivo offers a viable way to uncover the mechanism underlying centrally active medications. It has been shown that enatide therapy increases the tyrosine phosphorylation of IRS-1; this result was linked to modifications in Akt and m-TOR, two downstream effectors. GLP-1 receptor agonists present a potential therapeutic option for symptoms related to cognition, movement, and non-motion. Two months after stopping therapy, gains were maintained in motor function while without talking medication condition. Despite encouraging results, the study by Aviles-Olmos et al.'s small sample size and single-blind methodology suggest that are data should not be interpreted as proof of a disease-modifying impact. Athauda et al. recruited 62 individuals with idiopathic Parkinson's disease (PD) in a bigger phase II experiment to assess the effects of exenatide. An increasingly popular approach to elucidate the mechanism of centrally acting medicines is the evaluation of neuronally generated extracellular vesicles in vivo. Treatment with enatide was shown to boost IRS-1 tyrosine phosphorylation, an outcome that was linked to modifications in Akt and m-TOR, two downstream effectors. An encouraging tactic for reducing symptoms that are non – motor, motor , and cognitive is the use of GLP-1 receptor agonists. Many interesting candidates that target pathways like GIP, insulin signaling, and GLP-1 may all have neuroprotective properties are going through late-stage clinical investigation. SGLT2 inhibitors are a class of approved medications for type 2 diabetes that decrease blood sugar levels by preventing the kidney's SGLT2 from reabsorbing glucose. The scientists showed that SGLT2 inhibitor therapy could enhance memory and learning while lowering amyloid pathology and brain atrophy. Moreover, SGLT2 inhibitor-dispensed patients had a 20% smaller connection with dementia risk than DPP-IV inhibitor-dispensed participants among 106,903 DM individuals.

Using empagliflozin for 14 days enhanced brain signaling pathways (IRS-1/Akt) and reduced glutamate levels in 21 non-diabetics 55 years of age or older. Therefore, SGLT2 inhibitors are a prospective treatment option for the glutamate excitotoxicity and deficiencies in brain insulin signaling seen in AD. The effectiveness of combining regular intranasal insulin with empagliflozin in patients with amnesic MCI or early AD is now being studied clinically. Promising possibilities for repurposing in the treatment of AD and PD are anti diabetic drugs. Many interesting candidates that target pathways including GLP-1, GIP, and insulin signaling and may have neuroprotective effects are going through late-stage clinical investigation. GLP-1 receptor. It has been shown that agonist affect defective insulin signaling, lessen inflammation and oxidative stress, and stop the buildup of the distinctively harmful proteins. As a result, promising outcomes from antidiabetic medications, such as GLP-1 receptor agonist, that impact several facets of neurodegeneration in AD and PD require additional phase 3 trials to completely assess their therapeutic efficacy. Future trials should focus on determining the efficacy of other medications that are already used to treat diabetes, such as metformin, PPAR γ agonists, amylin analogs, and PTP1B inhibitors, as they have showed promise in the early phases of evaluate for AD and /or PD. When combined, anti diabetic drugs exhibit remarkable promise in the management of AD/PD and may effect the disease's pathogenesis as well as it's behavioural and cognitive symptoms. In light of this, SGLT2 inhibitors represent a viable treatment option for AD's glutamate excitotoxicity and deficiencies in brain insulin signalling. A clinical trial is being conducted to assess the effectiveness of empagliflozin in combination with regular intranasal insulin in patients suffering from amnesic MCI or early AD. Repurposing anti-diabetic drugs for the treatment of AD and PD shows promise. Late-stage clinical evaluation of several interesting candidates, which target pathways like GLP-1, GIP, and insulin signalling and may have neuroprotective effects, is now underway. GLP-1 receptor agonists have been shown to affect defective insulin signalling, limit the buildup of the distinctive harmful proteins, and lessen oxidative stress and inflammation. Thus, favourable outcomes of anti-diabetic medications, such as GLP-1 receptor agonists, which influence several facets of AD neurodegeneration

ABSTRACT

The Latin verb "adolescere," which meaning "to grow," is the source of the English word "adolescence." Since growth is the fundamental meaning of adolescence, it can be understood to mean a time of extensive growth and change in almost every aspect of a person's life. Adolescence is a time of transition from one stage to the next, and transitions are always associated with certain issues. As the kid develops into a teenager, they face challenges in a variety of areas. Every adolescent has specific needs and demands, which must be met for him to continue growing physically and in other ways. This is because changes, whether viewed positively or negatively, are likely to create an environment of conflict and stress, to which people will react in different ways. Thus, in this present study an attempt has been made to find out the levels of psychological counselling needs for class 9th students. Sample: total of 460 students were used for the study. The "Psychological Counselling Needs Scale," created by Dr. Vijaya Laxmi Chouhan and Mrs. Gunjan Ganotra Arora, was the instrument utilized in the study. Percentiles for interpretation were extracted in order to analyze the data. The study's findings indicate that the overall need for psychological counseling among ninth-grade pupils was "HIGH." Additionally, comparative research indicates that female pupils are on level with their male peers. The study was restricted to Uttar Pradesh's G.B. Nagar District.

Keywords: adolescence, psychological counseling needs, class 9th students.

INTRODUCTION

Worldwide research has shown that psychological counseling is essential for fostering teenage health. However, there is still a lack of discussion in the Asia-Pacific area regarding the specific methods by which psychological counseling can be applied, the best environments in which psychological counseling can function in the context of education, and the effectiveness of such programs in promoting gender equity and equality. The accomplishment of broader educational goals depends on the establishment of psychological counselling programs in schools and the

**Pooja Shukla and Hariom Chauhan**

integration of gender responsiveness into psychological counseling programs in secondary education. In general, "school counseling" refers to the process of addressing students' needs in a variety of developmental domains, including academic, professional, and personal. Experts concur that comprehensive, preventative, and developmental programs should be the hallmarks of professional school counseling. In the context of counseling, "guidance" refers to a more focused course that aids students in selecting a vocational or career path. The process of assisting people in making life-changing decisions, such selecting a desired lifestyle, is known as guidance. One way that advice and counseling differ from one another is that whilst guiding focuses on assisting people in selecting their values, counseling concentrates on assisting them in making changes. In the context of counseling, "guidance" refers to a more focused course that aids students in selecting a vocational or career path. The process of assisting people in making life-changing decisions, such selecting a desired lifestyle, is known as guidance. In the profession of counseling, "guidance" refers to a more focused trajectory that helps students select a career or occupational path. The process of assisting people in making life-changing decisions, such selecting a desired lifestyle, is known as guidance. One way that advice and counseling differ from one another is that although guidance is more concerned with assisting people in selecting their values, counseling is more concerned with assisting them in making changes. The early stages of adolescence are challenging. Adolescents require direction and sincere help to get through this phase. Adolescents face a variety of difficulties at this point in their lives, and if these difficulties are not overcome, they run the risk of turning into social outcasts. Adolescents' academic performance may suffer as a result of these difficulties. The adage "education is the foundation of any society" comes from the fact that education is one of the elements that determines how advanced a country is. Ironically, because most adolescents are so preoccupied with their social lives, school no longer holds any significance for them. A society can be considered underdeveloped if its teenagers are not motivated by academics. Teenagers must therefore be reintegrated academically into their classes, and counseling programs act as a bridge to better academic accomplishment, which will ultimately contribute to the development of the country.

REVIEW OF RELATED LITERATURE

A thorough review bridges the gaps in the body of available literature and is an essential component of research knowledge. In order to achieve the aforementioned research goal, the study has gathered data from empirical literature and used it to extrapolate pertinent issues for which there are no answers in the collected material. Consequently, the literature has been used to bolster the importance and necessity of the research. This review has been assembled over many years from both Indian and Western literature, and it has been carefully organized with the appropriate designations. In India, the backdrop of significant societal transformation creates a need for psychological counseling (Arulmani, 2007). The last ten years of economic reforms, along with advances in science and technology, have accelerated these developments and transformed lifestyles. The majority of people find that change happens too quickly, which causes major adjustment issues (Rao, 1995). Society is undergoing rapid social and technical change, while values are evolving or being questioned and unpredictability is encroaching on more aspects of daily life. The youngster faces challenges in several areas as he matures into a teenager. Every adolescent has unique needs and issues that require attention from educators, parents, and community elders. This is because, regardless of whether changes are viewed as fortunate or unfavorable, they are likely to create a conflicted and stressful environment that will cause people to react differently. Sarfaraz Ahmad's (2012) study sought to determine how the socio-emotional school environment affected teenage boys' academic performance. In Kanpur city, a sample of 250 male teenagers in their upper secondary years was collected. The study's findings showed a substantial correlation between the socio-emotional school environment and the academic accomplishment of teenage boys and a significant difference between the academic achievement of private and aided higher secondary students. Thus, it was found that one of the key factors influencing teenage boys' academic success is the socioemotional school environment. **Rathee and Thakran (2017)** examined the link between the general well-being and study habits of 80 Haryana senior secondary school students. The authors thought that pupils learned effective study habits in school. The findings demonstrated a beneficial relationship between senior secondary school pupils' overall well-being and their study habits. **A study by Rohit (2018)** conducted to investigate the psychological well-being of 120 higher

**Pooja Shukla and Hariom Chauhan**

secondary school students, it was discovered that there was no significant difference in psychological well-being depending on their stream of study, which was arts and commerce. There was also no substantial difference between genders in terms of psychological well-being. Kaur (2019) investigated the well-being of 640 Punjabi teenagers enrolled in secondary schools. The findings revealed that approximately 33% of the students have high well-being, approximately 65% have moderate well-being, and the remainder has low well-being. Most boys and girls have an average level of well-being. Urban residents have a high level of well-being, whereas rural residents have a moderate level of well-being. **Harding et al (2019)** conducted a study of the links between stress, protective factors, and psychological well-being among 152 students in New Zealand. Stress was found to be a major predictor of social support, resilience, self-efficacy, and mindfulness. Support, mindfulness, resilience, and family support were all significant predictors of PWB. In 2020, ManishaDhami and Seema Sharma studied 200 teenagers from Government Senior Secondary Schools in the Ludhiana district, 100 of whom lived in urban areas and 100 in rural areas. Additionally, the sample was split evenly across the sexes (100 men and 100 women). Teenagers' psychological counseling needs were evaluated using the Psychological Counseling Needs Scale (Chouhan&Arora, 2009). The findings showed that adolescents' perceptions of their overall psychological counseling needs varied significantly by location. Adolescents in rural areas required additional psychological counseling. The sexes did not differ in any noticeable way.

DELIMITATION OF THE STUDY

The present study was delimited to class 9th students of G.B.Nagar District of Uttar Pradesh, India.

Framework for the analysis**Objectives**

The objectives of the present paper were to test the following:

1. To study psychological counselling needs amongst class 9th students of G.B.Nagar District of Uttar Pradesh.
2. A comparative study of psychological counselling needs between male and female students.

MATERIALS AND METHODOLOGY

Participants: To comply with the objectives, a total of 460 (male & female) students were used as participants in this study.

Tool Used: To assess psychological counselling needs the inventory developed by Dr.VijayaLaxmiChouhan and Mrs.GunjanGanotraArora 'Psychological Counselling Needs Scale' was used. The reliability of the inventory was 0.90.

Statistical Treatment: The collected data was analyzed by finding out percentiles for interpretation.

Analysis and Interpretation

The first objective was to test psychological counseling needs amongst class 9th students. So, the data was analyzed with the help of percentile and the result is given in Table – 1. From table – 1, it is observed that the mean is 77.9 and percentile 91 respectively. When these values are referred to the Established Norms for interpretation, it falls under the psychological counselling needs as 'High', in the hierarchical order of 'Very Low', 'Low', 'Average', 'High', and 'VeryHigh'. Hence, it can be stated that class 9th students of G.B.Nagar district of Uttar Pradesh are need to be counselled taking an account of changing cultural values, family environment, vocational, emotional and sexual development. Primary preventive initiatives are important not only for mental health but also for their intellectual growth which could provide them with adequate support in their changing phase from childhood to adulthood.

The second objective was to compare psychological counselling needs between male and female students. So, the data was analyzed with the help of percentile and the result is given in Table - 2. From the table-2, it is seen that the mean is 78.3(M) and 77.4(F); percent tile is 91(M), and 90 (F) respectively. When, these values are referred to the established norms for interpretation, it falls under psychological counselling needs as 'High' for male as well as for

**Pooja Shukla and Hariom Chauhan**

female, in the hierarchical order of 'very low', 'low', 'average', 'high', and 'very high'. Therefore, it can be stated that when male and female students are studied they fall under the same level i.e., 'High'. However, if we compare the percentile results, we find that female students and male students are equal in psychological counselling needs.

DISCUSSIONS

The study disseminate that requirement of psychological counseling needs for class 9th students as a whole was 'HIGH', in the G.B.Nagar district of Uttar Pradesh. Further, if we analyze between male and female students, female students have been equal in psychological counselling needs to their peer male students. In this way the responsibilities seems to be equal on daughters and the role that they have in the family and society to the son.

The fact that many people no longer live in empathetic communities united by religious faith and convictions, however, may be the reason why psychological counseling requirements are rated as "high" for both men and women as a whole. They inhabit fractured communities that are isolated from one another and their surroundings. Adolescence is believed to be a time of rapid intellectual, social, psychological, sexual, and moral development, among other rapid developmental stages. Adolescents face challenges in many areas as they mature, which need to be addressed. According to the current study, both male and female students may benefit from psychological counseling. Hence, from the adolescent's point of view for genuine mental health growth, counseling is salient service which needs to be attended for the strengthening of the comprehensive development of class 9th students of the region.

CONCLUSION

In the most basic sense, humans are biological beings. A person's needs and challenges have a significant impact on his development. As is well known, adolescence is a crucial time in a person's life, complete with unique needs and adaption challenges. Every teenager has specific needs and demands, and meeting these is essential to his ongoing physical and other development. Human behavior is mostly determined by basic human wants, such as hunger, thirst, and sex. Common areas that psychological counselling can help fix problems is conduct, depression, apprehension, exasperation, substance abuse, relationship problems, family issues, or a general disappointment with life (Denver Teen Counselling, 2005). Through psychological counselling services, adolescents can be assisted to resolve contrasting problems and endeavour to re-personalize their lives. Infact individual counselling can help them in settling their problems and help the adolescences for untroubled passage to adulthood.

ABSTRACT

This paper outlines the IoT food-monitoring framework so that it stays fresh, healthy, and unaffected due to the conditions surrounding storage and transportation. The proposed solution analyzes temperature, humidity, and light as these components affect the prices of healthy foods such as fruits and vegetables. The connection of such a sensor to food packaging technology has engraved a clever way of packaging food. These integrated systems can provide reliable information. The system contains heat, moisture, gas sensors, which provide the necessary information to assess the quality of a vegetable or fruit.

Keywords: Food monitoring, IoT, Sensors

INTRODUCTION

Today almost everyone is affected by the food they eat. It is not just unhealthy foods but also vegetables, processed foods, and other foods we eat in our daily lives as it is affected by various factors such as humidity, temperature, and oxygen content that vary from time to time. Improper storage of food items can lead to spoilage. The food monitoring system, therefore, focuses on safe food storage. This program is included in the final sections and contains a variety of electronic sensors, which can read those components that affect food. A control machine can be set to handle each boundary where needed. Quality checking will give the exact amount of new/old food items in the container. The

**Arjun Bambhaniya et al.,**

information obtained from the test can help the user maintain the quality and quantity of stored food. Therefore, keeping the user up to date about monitoring the quality of some or all of the communication technologies is necessary, because a wireless sensor network is required. Various communication technologies are available these days. These technologies differ from one another in terms of communication distance, data transfer speed, reliability, etc. A communication protocol where a user of this program can access data from any convenient location.

LITERATURE REVIEW

In [1] The Thing speak web service is an open API that hosts various sensors to monitor cloud-level sensed data. It allows data to be ported to MATLAB using a channel ID and API key. Then processing and sending detected data to the Thing speak Cloud using an Arduino board and a Wi-Fi Module. The service can track data value at specific intervals. In [2] The research proposes a multidimensional model-based method for comparing IoT services, followed by density-peaks-based clustering to group similar services. The dynamic service matchmaking, discovery, and replacement algorithms are then implemented. Evaluation tests confirm the effectiveness of these approaches, resulting in encouraging outcomes. China faces food safety challenges due to its dispersed food supply. The pilot A IoT pilot project aims to enhance food supply network integrity and security using modern technologies like service-oriented architecture, global identification, and electronic pedigree. A IoT simplifies food purchasing and supply management by combining fresh vegetable supply chain data, as demonstrated by Lushang Ltd., a Shandong-based food provider, enhancing food safety [3]. This study proposes an innovative IoT architecture that can track agriculture from the field to the supply chain and food processing settings. It suggests using IoT technologies to create a food logistics safety tracking system. Through calculations, the system determines the positioning, production, and safety details of the intended food goods [4]. In [5] The Internet of Things (IoT) is expected to connect 28 billion things by 2020, improving energy efficiency, remote monitoring, and physical asset control. IoT is used in various industries, including healthcare, home appliances, retail, energy, manufacturing, mobility, transportation, logistics, and media. It is used in daily life for door unlocking, card recognition, automatic locks, vehicle detection, toll payment systems, tracking animals, access control, payment systems, contactless smart cards, anti-theft devices, and steering column readers. Sensors anticipate human needs based on context information. This study evaluates three data estimating tools to improve food safety in fully loaded strawberry shipping containers. The results show that applying these strategies lowers commercial costs and sensor count. The absolute inaccuracy between ambient and product temperatures was reduced by 97.14% using eight source sensors and an average error of 0.1°C. Even with one container sensor, a 62% improvement was made. These technologies offer potential for industrial value addition, cold chain operations enhancement, and decreased product loss through more precise shelf life estimations [6].

NODEMCU

Nodemcu is an open-source I firmware that runs on the ESP8266 Wi-Fi SoC based on the ESP-12 module. MQ3 gas sensor. When the concentration of ethanol gas increases as the concentration of this phase increases. It has 4 anchors-analog out, digital out, Vcc, ground. The ground connects to the same soil and the Vcc sensor connects to the standard Vcc. The digital output pin of this sensor was not used to disconnect. The analog output pin is connected to the analog board pin. LDR stands for Light Dependent Resistor. Its main purpose is to receive light. The LDR sensor is a photocell that works on the photoconductivity principle. LDR is connected to the analog pin A1 of the Nodemcu board. DHT-11 temperature sensor. It is also known as the moisture sensor. It consists of two main components - one is the moisture sensor and the other is the heat sensor. Vcc sensor connects to standard Vcc. Similarly, the earth is connected to the place we agree on. D4 board pin connects to the data output pin for this sensor. It has a capacitor as part of the moisture sensor and a thermistor as part of the temperature sensor. IC 4051 is an 8 single multiplexer/demultiplexer used as a digital-controlled analog switch. The device has binary input controls installed and blocking input. Includes low ON impedance and very low on current OFF. Control of analog signals up to the full range of power supply can be achieved. With IC 4051 we can connect up to 8 analog devices to one Nodemcu analog pin. IC 7805: The IC voltage controller maintains the output power at a constant value. The 7805 IC, which is a

**Arjun Bambhaniya et al.,**

78xx component of a series of equal direct voltages used to maintain such flexibility, is a popular voltage regulator integrated circuit (IC). The xx to 78xx shows the output power provided. The 7805 IC provides 5 volts power supply with conditions for adding a sink.

SOFTWARE

ThingSpeak
Arduino IDE

USE OF SOFTWARE

Enter data into ThingSpeak

Step 1: Register / Login to the ThingSpeak website.

It's easy to just enter your email id and verify your Account.

Step 2: Create a new channel.

Step 3: Enter a name and a field. You can have more fields depending on the sensor number, create more fields such as Light, Temperature, Humidity, MQ3, and LDR.

Step 4: Then Save channel.

Step 5: Obtaining the API key.

Click on the API key tab and look for these two fields. Write the API Key and update the channel feed line.

We need a digital dashboard to monitor and display data uploaded to the Thingspeak server. The digital dashboard used here is Freeboard.io which will display sensor data. The JASON file is used here to display Thingspeak data.

Step 6: Register / Login to Freeboard.io

Step 7: Enter a name and click on the create button.

Step 8: Click on the data creation source and select the type as JSON.

Step 9: Enter the channel name and id.

Step 10: Click add window and select as Gauge.

Step 11: To create widgets fill in the path as shown.

Repeat the same process for light intensity, ethanol gas, and moisture.

PERFORMANCE

This food quality monitoring system should be installed in the grocery store. When the installation is complete, the user needs to connect to the Internet via a Wi-Fi modem. The system will start reading data from integrated sensors - MQ3 sensor and LDR sensor, DHT-11 temperature, and humidity sensor. The DHT11 sensor has a capacitive sensor and a thermistor sensor. The operating voltage of DHT11 is 3.5 to 5.5 V, it can detect temperatures from 0 to 50 ° C and can sense relative humidity from 20 to 95%. Provides real-time heat and humidity at normal times. The DHT11 data pin is used for the first time as input and sends the first signal to it. The first signal starts up by 18 milliseconds and then goes up by 20-40 microseconds, after which it goes down by 80 microseconds and then upwards by 40 microseconds. When the first signal is fully sent the data pin is set to output mode. 5 bytes of data containing heat and humidity readings are transmitted. Except for the 5-byte, the first two bytes are designed for relative humidity, the third and fourth bytes are temperature-sensitive and the last is a checksum byte. When food is spoiled it releases the ethanol gas received by the MQ-3 sensor. The analog power generated by the MQ-3 sensor is equal to the gas filter. Analog output is converted to a digital signal by ADC. The information from all the sensors is given to the board and then converted into wire value. Cable value data is assigned to the LCD for display. The node thread is connected to Esp-8266 to upload data to the Thingspeak server.

BENEFITS

- Better food safety and quality control.
- Real-time making of food.
- IoT network resources to reduce waste, costs, and risks in food storage.

Arjun Bambhaniya et al.,

- Quick and paperless testing will save many hours and user space which helps the user to focus on other things.
- Users will be aware of system malfunctions immediately.
- Extensive data analysis can be done in future analysis.
- Commercial profit increases.

LIMITATIONS

- Security limit exists.
- Sometimes the installation of tools accumulates.
- System failure may occur due to a lack of sudden power outages.
- Cloud infrastructure is less secure and improved so there may be a privacy issue.

APPLICATIONS

- Monitoring of warehouses
- Cold monitoring of meat and dairy products.

SCOPE

- Live photos and videos can be found on the webcam which will help determine the actual status of the product.
- If the fire is automatically detected the fire extinguisher should light up.
- Multiple sensors can be added to achieve more system parameters.

ABSTRACT

Assam has become famous for housing one of the biggest and most respected tea industries among other states in India, having 100 tea gardens. According to reports, the production and growth of tea led to all other agricultural plantation crops in India. The production and consumption of tea have consistently increased over the years, thus placing it as an important economic pillar in the country. The tea industry, in general, is a highly power-heavy food processing unit that uses both thermal and electrical power ranging from 4.5 to 6.83 kWh. Conventional fuels play the greatest role as a source of energy for different processes. With increasing energy requirements and rising prices of fuel, tea wastage is available in abundance on campus and has been under investigation for controlled utilization to meet high-energy needs. This approach is to help in the production of electrical energy and move towards nonrenewable fuels, thereby lessening costs involved when producing tea. 14.4-63, 8 MJ kg waste material or finished products are used for processes such as withering, drying, grading, and packaging of tea. 30 percent of total costs involves power. 1,352 thousand tons of CO₂ is emitted annually owing to the total fuel use in India's tea industry. This study is based at Anandabag Tea Estate in Assam, India, where the energy used during different manufacturing stages was estimated.

Keywords: Renewal energy, Hydro power plant, Biomass, Wind energy, Solar energy.

Pranjal Sarmah *et al.*,

INTRODUCTION

Assam tea is a significant contributor to the global tea production, accounting for almost 15.6% of the world's tea output and 55% of India's total tea production¹⁾. Anandabag Tea Co. Ltd, established in 1893 and incorporated in 1920, has gained a reputation for producing high-quality CTC and Orthodox teas under the brand name "Anandabag," which means "Garden of Happiness." The company has earned worldwide recognition and a loyal customer base in countries like Japan, China, Russia, Iran, Germany, and others. Anandabag Tea Estate has an advanced in-house manufacturing facility in Upper Assam, equipped with HACCP & ISO 22000:2005 standards to produce high-quality CTC and Orthodox teas and package them in vacuum packs²⁾. The company's specialized manufacturing process, managed by a team of experienced professionals and tea tasters, ensures that the natural aroma and colour of Assam CTC tea are maintained, and 100% food grade poly is used for final packaging, ensuring the quality of tea. Electricity and thermal energy are essential requirements for tea plantation and manufacturing processes. Irrigation and tea production machinery require electricity, while thermal energy is needed for withering and drying tea leaves. Major energy used area in tea estate are for processed heating thermal energy, for machine operation electricity, for transportation and plantation petroleum fuel and for domestic purposes both thermal and electrical energy³⁾. To mitigate the energy demand of the tea Estate The tea industry's energy demand is approximately 0.679 kWh of electrical energy and 28.39 MJ of thermal energy per kg of tea⁴⁾. However, natural gas, which constitutes a significant portion of the production cost, is crucial for producing thermal energy. To address the energy and environmental challenges faced by the industry, it is necessary to replace conventional fuels like coal, diesel, and natural gas with renewable, energy-efficient, and eco-friendly production processes⁵⁾. The energy cost around 30% of the total processing of tea costs. Moreover, the total consumption of fuel by the tea industry in India emits 1,352,000 tons of CO₂ annually⁶⁾. Therefore, a considerable amount of care should be taken for the energy factors in the tea industry owing to the energy efficiency and its effects. In tea industry there are possibilities of other sources of energy producing factor, like wind, solar and bio energy. India has ranked 5th in the installed wind capacity. Renewable energy installed in India in 2013 was 28GW, of which wind energy claims nearly 70% with an installed capacity of 19.05GW. Likewise, solar energy can also be a source of power generation, as India is more suitable for solar energy as it receives highest solar insolation. With 300 sunny days, India can generate 600 TW of power⁷⁾. The CO₂ emissions of this type of energy is very small. The average value of annual reduction of CO₂ emission for wind energy system is 600 tons of CO₂/GWH and for solar thermal system 12840 Kg of CO₂/m⁸⁾. Since, Assam has potential to harness both solar and wind energy, after analysis of the previous studies, the feasibility of renewable sources to meet the energy demand required by Anandabag Tea Estate and the challenges faced in its establishment will be assessed through this paper.

Energy requirement in tea plantation of the industry

Tea manufacturing industries heavily rely on energy as a primary resource. The tea production process involves various stages such as seed nursery preparation, cultivation, pruning, and plucking, which consume significant amounts of energy in the form of human labor. However, the most energy-intensive stages of tea production are the post-harvest processes, which include withering, rolling, fermentation, drying, sorting/grading, and packing. Among these, withering and drying require the most energy in the form of heat, while all other stages require electrical energy. The tea industry utilizes coal as a source of thermal energy to facilitate the withering and drying procedures of tea leaves⁹⁾. According to an energy audit, the production of 1kg of tea requires approximately 3.5-6 kWh of thermal energy and 0.21-0.5 kWh of electrical energy, with a thermal-to-electrical energy ratio of 85:15¹⁰⁾. By adding Zeolite-A, the withering time can be accelerated and drying time can also be accelerated¹¹⁾. Fossil fuels are commonly used for irrigation in tea plantations, contributing to the overall energy consumption. Tea manufacturing can potentially be shortened with the addition of Ethylene¹²⁾. Sources of low-temperature geothermal energy can also be used for the withering of tea leaves with the help of a heat pipe heat exchanger to improve the withering time¹³⁾. The percentage of energy consumed in different tea production processes, such as withering, processing, fermentation, drying, sifting, and packing are depicted in Fig 1.

**Pranjal Sarmah et al.,****Potential of Renewable Energy Sources for the Industry's Tea Plantations**

The traditional way of running the tea plantation through consuming fossil fuel contributes to global warming because greenhouse gases are released during such operations. It is imminent and necessary to switch to renewable sources of energy from the nonrenewable ones in order to eradicate the dangers of greenhouse gases, global warming and also the oil crisis associated with fossil fuels¹⁴. With the increase in cost of conventional fuels, industry is looking for alternative energy sources that do not rely on fossil fuel. However, renewable energy sources like solar wind hydro and biomass can supply power to tea plantations campuses or industries thereby reducing the harmful impacts of conventional fuel. By adopting energy-efficient technologies that are suitable for the available resources and meet the necessary requirements, the tea industry can significantly reduce production costs. A study conducted at Anandabag Tea Estate identified several such technologies that can be adopted based on their availability, suitability, and cost-effectiveness.

Possibilities of Hydro Power Plant in Anandabag Tea Estate

Hydro power plants produce electricity by turning its generators and turbines with the help of water that falls by the force of gravity. The advantage of hydro power plant is that it does not pollute the land, air, water etc. and produce electricity with minimal use of natural resources. The flowing water from mountains streams and clear lakes helps to produce hydroelectricity. Makum is located at Tinsukia district of Assam which is inhabitant of 16,923 people (as per 2011 census). The nearest water body to Anandabag Tea Estate is Tingrai which is at an approximate distance of 14km. To set a hydro power project there is a requirement of large reservoirs to store the water. The reservoir needs to be set up in agricultural fields which will cost the small-scale farmers to give up their farming lands, also it will bring a major threat to the nearby marine and aquatic life as water will be stored in a large scale. Storing of water at large scale may also result in small earthquakes to nearby inhabitant region. The micro hydroelectric power plant is appropriate for small industries situated in far-flung regions¹⁵. In the summertime, there is a significant reduction in the water movement rate of canals and streams, which may not be adequate to meet the energy demand during this season¹⁶. However, the solution to the hydro power project may be micro hydro power project which can produce output from 50kwh to 100 kwh. Micro hydro projects do not require reservoirs. From Table 6 it is clear that the micro hydro project will not be able to meet the power demand of the tea estate. Therefore, it will be beneficial to switch to other renewal sources like solar energy.(Data collected on 21/04/2022)

Possibilities of biomass in Anandabag Tea Estate

Biomass is a renewable and sustainable source of energy derived from organic matter such as plants, animals, and micro-organisms found on land and water, as well as their derivatives¹⁷. Tea plantations and industries produce three distinct types of biomass waste, including shade tree waste, garden waste, and tea waste. This waste can be converted into gaseous and liquid fuels such as methane, hydrogen, carbon monoxide, ethanol, and methanol, which can be used in engines. Biomass cogeneration is a process that produces both heat and electricity by utilizing a gas turbine to run a generator. The collection and conveyance of biomass require a significant amount of energy¹⁸. To produce energy for the withering and drying processes, a heat exchanger can be employed to generate hot air. There are three main processes used to convert biomass into energy or biofuels: direct combustion (burning), thermochemical conversion (pyrolysis and gasification), and biochemical conversion¹⁹. Burning is the most common method for biomass conversion, and it produces by-products called combustion products such as methanol, coal, and charcoal. Thermochemical conversion utilizes pyrolysis and gasification, while biochemical conversion involves using micro-organisms for conversion. Despite its many benefits, biomass conversion has certain drawbacks due to variations in raw material, moisture content, and other factors. For example, biomass production facilities require large spaces for storage and operation, and using wood to create biomass energy can lead to deforestation. Unclean combustion can also result in emissions, and biomass alone is not as efficient as fossil fuels. However, in the tea industry, biomass waste has significant potential for energy production. For instance, industrial tea waste has an estimated energy potential of -3.504×10^{10} kWh, and the thermal energy availability is estimated at 1.822×10^{10} kWh, which supplies 59% of the thermal energy requirement of the tea industry²⁰. Tea waste from the garden and industry was projected to have an energy potential of 1.86×10^{10} kWh and 4.47×10^7 kWh, respectively, in 2013. The tea industry's overall energy consumption was calculated to be 2.24×10^9 kWh, with biomass conversion to electrical

**Pranjal Sarmah et al.,**

energy being considered to have a 25% efficiency. These calculations suggest that biomass waste may supply 83% of the energy needed by the tea industry²¹. A large space is needed to grow the materials that are used in biomass energy. Amount of industrial and garden tea waste is about 2% of production of tea and 1.05 kg per bush respectively. In Anandabag the garden waste is decomposed and used as manure. The amount of waste collected can meet the manure requirement only. In this case, biomass project will not be worth the price, especially when solar, hydro power and wind alternatives are available⁵.

Possibilities of wind in Anandabag Tea Estate

Anandabag Tea Estate is in Makum region of Tinisukia District. It is at an elevation of 129.18 meters above sea level, Makum has a humid subtropical climate, with hot and humid summers and cool winters. The average temperature in summer (April to June) is around 30°C, while in winter (December to February) it can drop to as low as 10°C. Makum typically receives about 116.33 mm of rainfall and has 63.37 rainy days (17.36% of the time) annually. The uneven heating of the Earth's surface, which is caused by differences in solar radiation and thermal properties, does indeed result in the formation of wind. This uneven heating causes differences in air pressure, which in turn causes the air to move from high-pressure areas to low-pressure areas, resulting in the flow of air or wind. Wind turbines harness the kinetic energy of the wind and convert it into mechanical energy, which is then used to generate electricity. In comparison to solar plants, wind turbines have a shorter lifespan. However, the wind turbine's longevity can be enhanced through effective maintenance and implementation of appropriate strategies²². Turbulence, turbine dynamics, and controls are the chief mechanical hurdles associated with wind turbines²³. The expense of transporting the wind turbine to the location fundamentally impacts the economics of the wind turbine²⁴. However, the process of converting wind energy into electricity is a bit more complex than just using blades to rotate the rotor.

- The wind turbine blades are set to be able to capture the kinetic energy of the breeze, and when breezes blow through them, this start turning.
- The rotating blades are linked to a rotor that is coupled to the gearbox. The gearbox increases the speed of rotation to the rotor, enabling it to drive a generator.
- The generator makes electricity by converting mechanical energy from the spinning rotor to electrical power.
- The electrical grid then dispenses the electricity to homes, businesses, and other users.

Bottom of Form

A wind turbine's power output is exactly proportional to the wind speed cube. This implies that power production can rise significantly with a minor increase in wind speed. For instance, a 60% increase in power production from the same turbine can result from an increase in average wind speed from 6 m/s to 7 m/s. Additionally, this corresponds to a 36% rise in yearly energy production. Areas where wind speeds averaging 7 m/s or higher are typically seen to be suitable for installing wind turbines. With "oversized rotor" wind turbines, however, locations with typical wind speeds as low as 5.5 m/s can still be profitable. On the other hand, if the wind speed is less than 5 m/s, it is unlikely that a wind turbine installation would be economically viable²⁷. Wind turbines require:

- The minimum wind speed required for a wind turbine to begin turning and generate electricity is generally 12-14 km/hr.
- Wind of speed ranging from 50-60 km/hr. can generate at full capacity.
- To avoid damage, wind turbine should be stopped beyond of 90 km/hr. From the above tables it is clear that although Makum receives a good amount of wind speed but it not enough to meet the speed requirement to install a wind turbine. There is always a risk of accidental wind in Assam (as reported by The Economic Times on April 14, 2010: Assam recorded wind speed of 125 km/hr). This might result in overall damage of wind turbine and might have economic consequences for the tea estate.

Possibilities of Solar Power Plant in Anandabag Tea Estate

Solar energy is another form of fundamental source of renewable energy. Solar power for generation of electricity, solar thermal energy, solar architecture etc. are the technologies used commercially by utilizing solar energy²⁸. Solar

**Pranjal Sarmah et al.,**

energy is replacing fossil fuels because of its various benefits, as a source of power. Moreover, it does not release any greenhouse gases or other harmful by-product which is one of its major advantages²⁹. The wind turbine necessitates an upfront investment that accounts for 80% of the overall expenditure, whereas the solar PV power plant requires relatively lower initial spending³⁰. To reduce costs and maintain a reliable electricity supply many tea estates of Assam is now looking for various ways of renewable and environment friendly solar projects in Tea production³¹. Electricity is mainly used in tea production during irrigation, for operating machineries and this can be generated by solar photovoltaic systems. The solar thermal collectors can be used to generate the necessary thermal energy for the withering and drying processes³². Since India lies in the Northern Hemispherical equator region. Therefore the solar collector should be placed in the front of the structure in the south orientation³³⁻³⁵. In a solar thermal collector, solar radiation from the sun is first converted into heat and then transferred to a heat transfer fluid (HTF), which is used for withering and drying processes. Depending on the collector design, it may generate excess heat during periods of high solar insolation, which can be stored or utilized for other applications³⁶. On the other hand, in a solar photovoltaic (PV) system, solar radiation is directly converted into electricity by the PV panel. The energy generated is then regulated by a charger controller, stored in a battery, and converted into usable electricity by an inverter. This system can effectively replace the need for diesel pump sets in tea estates and significantly reduce reliance on fossil fuels⁵. However, a further challenge posed by solar photovoltaic (PV) technology is its incapability to provide an instantaneous response to changes in load demand. In other words, solar PV systems are unable to promptly adjust their power output to match the varying electricity needs of users³⁷. Moreover, its power generation remains suspended until any malfunctioning part is fixed or replaced³⁸. The monsoon season in Assam spans from June to October, followed by the winter season from November to February³⁹. During the period from March to June, there is a high demand for irrigation in the region. As a result, the tea industry primarily requires energy from March to November to meet its needs⁴⁰(fig4). In Anandabag Tea estate, installation of solar panel would be effective by reducing the energy consumption or various power costs during the production. As that amount of sunlight is enough to install solar panels, so during the period of maximum production solar energy can be used as an alternative of non-renewable energy.

CONCLUSIONS

In this project we have studied the tea machinery process, energy requirement in Anandabag Tea Estate and the possible source of renewal energy that can replace the conventional source of energy that are being used in Anandabag Tea Estate. From which we have found out that- There is a possibility for biomass energy but it will not be able to meet the energy requirement of the industry. Constructing large hydro power project will not be possible as the Tea Estate is far away from its nearest water body. Construction micro hydro power project will not be able to meet the energy requirement of the industry. The average wind speed of Makum is less than 5 m/s which is below the minimum wind speed required to produce energy economically. Solar energy could be used to meet the electricity needs of tea gardens and industries. Thus, in order to remain competitive in the global tea market, Anandabag Tea Estate needs to adopt sustainable practices for tea production by replacing conventional methods with renewable energy sources. This will not only enhance productivity and market value, but also address environmental and social concerns. By utilizing renewable energy sources, the tea estate can improve its sustainability and maintain its position in the global tea market.

ACKNOWLEDGEMENT

We would like to express our sincere gratitude to everyone who contributed to the successful completion of this article. The entire research work was done with self-finance and we did not receive any grant. We extend our heartfelt thanks to the authority and management of Anandabag Tea Estate for their insightful comments, helpful suggestions, fruitful discussions, and all the necessary permission and data required for research work. Their cooperation and involvement were essential to the success of this research.

ABSTRACT

Present study provides a comparison of extended techniques based on the score function algorithm in a neutrosophic hyper-soft environment. The solution approaches are utilized to solve a mathematical modeling problem of determining the most important nutrition and diet for toddlers with iron deficiency. Our current methodology is compared to the different MCDM (multi-criteria decision-making) methodologies. In addition, a practical instance is offered to show how effective our newly improved techniques are.

Keywords: NHSs (Neutrosophic Hypersoft sets), NHSM (Neutrosophic Hypersoft matrix), Basic results of NHSM, Decision Making, Score function.

INTRODUCTION

Nutrition and diet are crucial in helping toddlers with iron deficiency. For optimal energy levels, cognitive development, and immune system function, adequate iron intake is necessary. An iron-rich, well-balanced diet aids in the prevention of anemia, encourages healthy growth, and enhances emotional well-being. It is possible for caregivers to significantly improve their toddlers' overall health and instill healthy eating habits that will last a lifetime. In 1998, F. Smarandache[1] introduced the idea of Ns (Neutrosophic set), which is a generalization of Ifs

Vithya and Sophia Porchelvi

(Intuitionistic fuzzy set) and Fs (Fuzzy set). The main mathematical tool for handling difficulties with decision-making in ambiguous environments is the Ss (Soft set) theory, which was created by Molodtsov [2] in 1999. P. K. Maji [3] categorized a wide variety of operators for NSs (Neutrosophic Soft set) in unexpected problems. In 2015, Deli, Irfan and Broumi [4] developed NSMs (Neutrosophic Soft matrices) and applied SMs (Soft matrices) to make decisions. Jafar, Muhammad Naveed, et al. [5] proposed a new agriculture technology utilizing NSMs and the scoring function. In 2023, R. Sophia Porchelvi and P. Subashini [6] proposed the NSM concept to deal with maternal diet issues. HSS is a continuation of Ss theory, it was presented by F. Smarandache [7] in 2018, to create multiple characteristics in an uncertainty-handling function. R. M. Zulqarnaian et al. [8] created the new concept of NHSSs with appropriate operations and attributes by combining the HSS and NHSSs concepts. To simplify the NHSSs framework, in 2021, R. M. Zulqarnaian et al. [9] provide the idea of NHSM as well as certain basic operators and procedures. Following that, in 2024, J. Jayasudha and S. Raghavi [10] proposed certain NHSM procedures to handle medical diagnostic problems using a choice matrix. Neutrosophic soft matrices parametrically evaluate the specified characteristics, whereas Neutrosophic soft matrices allow for parametric evaluation of the sub-attributes of the chosen attributes. The current study aims to apply new decision-making techniques to NHSSs and the MCDM problem. We structure our manuscript as follows: Section 2 reviews the fundamental explanations of NHSSs. In parts 3 and 4, we use the new score function methodology to solve the most essential nutrition and diet problem for toddlers with iron deficiency. Section 5 compares our proposed methodology to existing methodologies, and Section 6 presents the result.

PRELIMINARIES

Definition 2.1: [9]

Let \mathcal{p} represent a universal set and $\mathbb{P}(\mathcal{p})$ represent its powerset. Let $f^1, f^2, f^3, \dots, f^n$ for $n \geq 1$, be well defined characteristics (attributes), these corresponding characteristics (attribute) values are the set $\hat{F}^1, \hat{F}^2, \hat{F}^3, \dots, \hat{F}^n$ with $\hat{F}^i \cap \hat{F}^j = \emptyset$, for $i \neq j$ and $i, j \in \{1, 2, 3, \dots, n\}$. A pair $(\mathbb{E}, \hat{F}^1 \times \hat{F}^2 \times \hat{F}^3 \dots \hat{F}^n)$ is referred to as a **Hyper soft set** (HSS) over \mathcal{p} , where

$$\mathbb{E}: \hat{F}^1 \times \hat{F}^2 \times \hat{F}^3 \dots \hat{F}^n \rightarrow \mathbb{P}(\mathcal{p}).$$

Definition 2.2: [9]

Let \mathcal{p} represent a universal set and $\mathbb{P}(\mathcal{p})$ represent its powerset. Let $f^1, f^2, f^3, \dots, f^n$ for $n \geq 1$, be well defined characteristics (attributes). The set of related characteristic (attribute) values $\hat{F}^1, \hat{F}^2, \hat{F}^3, \dots, \hat{F}^n$ with $\hat{F}^i \cap \hat{F}^j = \emptyset$, for $i \neq j$ and $i, j \in \{1, 2, 3, \dots, n\}$, and let $\hat{F}^1 \times \hat{F}^2 \times \hat{F}^3 \dots \hat{F}^n = S$. The pair (\mathbb{E}, S) is referred to as a **Neutrosophic Hyper soft set** (NHSS) over \mathcal{p} , where $\mathbb{E}: \hat{F}^1 \times \hat{F}^2 \times \hat{F}^3 \dots \hat{F}^n \rightarrow \mathbb{P}(\mathcal{p})$ and $(\mathbb{E}, \hat{F}^1 \times \hat{F}^2 \times \hat{F}^3 \dots \hat{F}^n) = \{ \langle x, T(S), I(S), F(S) \rangle, x \in \mathcal{p} \}$ where T, I , and F represent the truth, indeterminacy, and falsity grade values such that $T, I, F: \mathcal{p} \rightarrow [0, 1]$ also $0 \leq T(S) + I(S) + F(S) \leq 3$.

Definition 2.3: [9]

Let $\mathcal{p} = \{v^1, v^2, v^3, \dots, v^\sigma\}$ represent a universal set, and $\mathbb{P}(\mathcal{p})$ represent its power set. Let $\mathbb{Y}_1, \mathbb{Y}_2, \dots, \mathbb{Y}_\delta$ for $\delta \geq 1$, δ well defined characteristics. The set of related characteristic values $\mathbb{Y}_1^{a_i}, \mathbb{Y}_2^{b_i}, \dots, \mathbb{Y}_\delta^{z_i}$ and their relation $\mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots, \mathbb{Y}_\delta^{z_i}$ where $a_i, b_i, c_i, \dots, z_i = 1, 2, 3, \dots, \delta$. A pair $(\mathbb{E}, \mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots, \mathbb{Y}_\delta^{z_i})$ is called NHSSs over \mathcal{p} , where $\mathbb{E}: \mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots, \mathbb{Y}_\delta^{z_i} \rightarrow \mathbb{P}(\mathcal{p})$, and it is characterized as, $\mathbb{E}(\mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots, \mathbb{Y}_\delta^{z_i}) = \{v, T_r(v), I_r(v), F_r(v): v \in \mathcal{p}, r \in \mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots, \mathbb{Y}_\delta^{z_i}\}$. The relation $Z_r = \mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots, \mathbb{Y}_\delta^{z_i}$ has the following characteristic function: $X_{Z_r} = \mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots, \mathbb{Y}_\delta^{z_i} \rightarrow \mathbb{P}(\mathcal{p})$; It's defined as $X_{Z_r} = \{v, T_r(v), I_r(v), F_r(v): v \in \mathcal{p}, r \in \mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots, \mathbb{Y}_\delta^{z_i}\}$ and can be a representation of Z_r as given in Table 1. If $J_{rs} = X_{Z_r}(v^r, \mathbb{Y}_s^t)$, where $r = 1, 2, \dots, \sigma, s = 1, 2, \dots, \delta, t = a_i, b_i, c_i, \dots, z_i$, then the matrix can be represented as follows:

$$[J_{rs}]_{\sigma \times \delta} = \begin{pmatrix} J_{11} & J_{12} & \dots & J_{1\delta} \\ J_{21} & J_{22} & \dots & J_{2\delta} \\ \vdots & \vdots & \ddots & \vdots \\ J_{\sigma 1} & J_{\sigma 2} & \dots & J_{\sigma \delta} \end{pmatrix}$$

Vithya and Sophia Porchelvi

Where,

$$J_{rs} = (T_{\mathbb{Y}_r^t}(v_r), I_{\mathbb{Y}_r^t}(v_r), F_{\mathbb{Y}_r^t}(v_r)) : v_r \in V, \mathbb{Y}_r^t \in \mathbb{Y}_1^{a_i} \times \mathbb{Y}_2^{b_i} \times \dots \times \mathbb{Y}_\delta^{d_i} = (T_{rst}^L, I_{rst}^L, F_{rst}^L)$$

As a result, we may use the NHSM to represent any NHSS, showing that both are transferable.

Definition 2.4: [10]

Let $\mathbb{Q} = [(T_{ij}^{\mathbb{Q}}, I_{ij}^{\mathbb{Q}}, F_{ij}^{\mathbb{Q}})] \in NHSM_{\sigma \times \delta}$. The **complement matrix** of \mathbb{Q} is represented by \mathbb{Q}° & can be stated as $\mathbb{Q}^\circ = [F_{ij}^{\mathbb{Q}}, 1 - I_{ij}^{\mathbb{Q}}, T_{ij}^{\mathbb{Q}}] \forall i, j$.

Definition 2.5: [9]

Let $\mathbb{Q} = [(T_{ij}^{\mathbb{Q}}, I_{ij}^{\mathbb{Q}}, F_{ij}^{\mathbb{Q}})] \in NHSM_{\sigma \times \delta}$, $\mathbb{H} = [(T_{ij}^{\mathbb{H}}, I_{ij}^{\mathbb{H}}, F_{ij}^{\mathbb{H}})] \in NHSM_{\sigma \times \delta}$. Then, the two **OR-Operations** \mathbb{Q} and \mathbb{H} are stated as: $T(\mathbb{Q} \vee \mathbb{H}) = \max \{T_{ij}^{\mathbb{Q}}, T_{ij}^{\mathbb{H}}\}$, $I(\mathbb{Q} \vee \mathbb{H}) = \min \{I_{ij}^{\mathbb{Q}}, I_{ij}^{\mathbb{H}}\}$, $F(\mathbb{Q} \vee \mathbb{H}) = \min \{F_{ij}^{\mathbb{Q}}, F_{ij}^{\mathbb{H}}\}$.

Definition 2.6: [9]

Let $\mathbb{Q} = [(T_{ij}^{\mathbb{Q}}, I_{ij}^{\mathbb{Q}}, F_{ij}^{\mathbb{Q}})] \in NHSM_{\sigma \times \delta}$, $\mathbb{H} = [(T_{ij}^{\mathbb{H}}, I_{ij}^{\mathbb{H}}, F_{ij}^{\mathbb{H}})] \in NHSM_{\sigma \times \delta}$. Then, the two **AND-Operations** \mathbb{Q} and \mathbb{H} are stated as: $T(\mathbb{Q} \wedge \mathbb{H}) = \min \{T_{ij}^{\mathbb{Q}}, T_{ij}^{\mathbb{H}}\}$, $I(\mathbb{Q} \wedge \mathbb{H}) = \max \{I_{ij}^{\mathbb{Q}}, I_{ij}^{\mathbb{H}}\}$, $F(\mathbb{Q} \wedge \mathbb{H}) = \max \{F_{ij}^{\mathbb{Q}}, F_{ij}^{\mathbb{H}}\}$.

Definition 2.7: [5]

Let $\mathbb{Q} = [(T_{ij}^{\mathbb{Q}}, I_{ij}^{\mathbb{Q}}, F_{ij}^{\mathbb{Q}})] \in NHSM_{\sigma \times \delta}$. $V(\mathbb{Q})$ represents the **value matrix** of \mathbb{Q} is stated as $V(\mathbb{Q}) = [(T_{ij}^{\mathbb{Q}} + I_{ij}^{\mathbb{Q}} - F_{ij}^{\mathbb{Q}})] \forall i, j$ respectively.

Definition 2.8: [5]

Let $\mathbb{Q} = [(T_{ij}^{\mathbb{Q}}, I_{ij}^{\mathbb{Q}}, F_{ij}^{\mathbb{Q}})] \in NHSM_{\sigma \times \delta}$, $\mathbb{H} = [(T_{ij}^{\mathbb{H}}, I_{ij}^{\mathbb{H}}, F_{ij}^{\mathbb{H}})] \in NHSM_{\sigma \times \delta}$. The equation $S_{(\mathbb{Q}, \mathbb{H})} = V(\mathbb{Q}) - V(\mathbb{H})$ defines the **score** for these two NHSMs, it is expressed as $S_{(\mathbb{Q}, \mathbb{H})}$.

Definition 2.9: [5]

Let $\mathbb{Q} = [(T_{ij}^{\mathbb{Q}}, I_{ij}^{\mathbb{Q}}, F_{ij}^{\mathbb{Q}})] \in NHSM_{\sigma \times \delta}$, $\mathbb{H} = [(T_{ij}^{\mathbb{H}}, I_{ij}^{\mathbb{H}}, F_{ij}^{\mathbb{H}})] \in NHSM_{\sigma \times \delta}$. Then their respective value matrix be $V(\mathbb{Q})$, $V(\mathbb{H})$ and their scoring matrix is represented by $S_{(\mathbb{Q}, \mathbb{H})}$. The overall score (**total score**) of every v_i in \mathcal{P} is calculated as follows:

$$S_i = \sum_{j=1}^n |V(\mathbb{Q}) - V(\mathbb{H})|$$

A score-based decision-making methods for Neutrosophic Hyper soft Matrices

This section, we describe a MCDM method that uses a value matrix and a score matrix to solve the problem. Consider the decision-making issues presented by Jafar, Muhammad Naveed, et al. [5].

Algorithm

Step: 1 Calculate the neutrosophicity per soft sets (E_1, \mathbb{Q}) , (E_2, \mathbb{H}) and there after determine the associated NHSMs \mathbb{Q} and \mathbb{H} for (E_1, \mathbb{Q}) , (E_2, \mathbb{H}) accordingly.

Step: 2 Calculate the neutrosophicity per soft complement sets (E_1, \mathbb{Q}) and (E_2, \mathbb{H}) , as well as the NHSMs \mathbb{Q}° and \mathbb{H}° that correspond to (E_1, \mathbb{Q}) and (E_2, \mathbb{H}) .

Step: 3 Obtain the value matrices for NHSMs and neutrosophicity per soft complement matrices using the OR-operation, which are denoted by $V[M_{(\mathbb{Q} \vee \mathbb{H})}]$ and $V[M_{(\mathbb{Q}^\circ \vee \mathbb{H}^\circ)}]$.

Step: 4 Calculate the score matrix $S_{(\mathbb{Q} \vee \mathbb{H}, \mathbb{Q}^\circ \vee \mathbb{H}^\circ)}$ from the value matrices.

Step: 5 Compute the (overall score) total score value S_i for every object in \mathcal{P} . The highest score is the optimum solution.

Vithya and Sophia Porchelvi

Algorithm-2

Step: 1 Construct the neutrosophichypersoft sets (E_1, \mathbb{Q}) , (E_2, \mathbb{H}) and thereafter determine the associated NHSMs \mathbb{Q} and \mathbb{H} for (E_1, \mathbb{Q}) , (E_2, \mathbb{H}) accordingly.

Step: 2 Calculate the neutrosophichypersoft complement sets (E_1, \mathbb{Q}) and (E_2, \mathbb{H}) , as well as the NHSMs \mathbb{Q}° and \mathbb{H}° that correspond to (E_1, \mathbb{Q}) and (E_2, \mathbb{H}) .

Step: 3 Calculate the value matrices for NHSMs and neutrosophichypersoft complement matrices using the AND-operation, which are denoted by $V[M_{(\mathbb{Q} \vee \mathbb{H})}]$ and $V[M_{(\mathbb{Q}^\circ \vee \mathbb{H}^\circ)}]$.

Step: 4 Calculate the score matrix $S_{(\mathbb{Q} \vee \mathbb{H}, \mathbb{Q}^\circ \vee \mathbb{H}^\circ)}$ from the value matrices.

Step: 5 Compute the (overall score) total score values S_i for every object in \mathcal{P} . The highest score is the optimum solution.

Case Study

Nutrition is crucial to the rapid growth and development of toddlers. At this point, a diet that should include variety of foods to ensure that the vitamins and minerals your child needs are obtained. The current study seeks to discover the most nutrient-dense diet for toddlers with iron deficiency. The most suitable alternative was chosen by the researcher after consulting with two medical professionals and making use of their information. Iron is a mineral with numerous applications. Iron improves a child's ability to learn and assists (RBC) red blood cells in transporting oxygen throughout the body. Anemia and iron deficiency can be prevented with adequate iron intake. The following is a list of foods high in iron that are great for toddlers:

- **Fruits:** Oranges, kiwi, raisins, figs, strawberries, prunes, dates
- **Vegetables:** Sweet potatoes, peas, string beans, broccoli.
- **Heme Iron from Animal Sources:** Eggs, Beef, Pork, Lamb, Ham, Turkey, Chicken, Liver, Liverwurst, Salmon fish, Tuna fish, Prawns, Mackerel fish.
- **Iron from plants other than Heme(Non-Heme Iron):** Pulses (mixed beans, chickpeas and lentils, baked beans), leafy vegetables (Kale, Spinach, Swiss chard), nuts & seeds (Almonds in small safe amounts, sunflower seed, pumpkin seed) and Dried fruits.
- **Fortified Foods:** Breakfast cereals, Bread, yogurt, milk, soy milk and other milk alternatives. The recommended dietary intake (RDI) of iron for toddlers varies based on their age and gender. In table 2, we provide the required quantity of iron per day based on age group.

Numerical Example

A parent has sought the advice of two medical professionals about the optimal nutrition and diet for toddlers with iron deficiency. The professionals offer the following specific nutrients and dietary options to address the needs of this condition.

$N = \{\text{Fruits } (Nu_1), \text{Vegetables } (Nu_2), \text{Heme Iron } (Nu_3), \text{Non-Heme Iron } (Nu_4), \text{Fortified Food } (Nu_5)\}$

A parent wants to know about the most essential nutrition and diet for their toddler's. To provide correct advice, the professional must examine the toddler's iron levels. Based on this assessment, the specialist will make recommendations for dietary alternatives that best support the toddler's nutritional needs. They are as follows:

$E = \{\mathbb{Y}_1 = \text{Age}, \mathbb{Y}_2 = \text{Gender}, \mathbb{Y}_3 = \text{Hemoglobin level}, \mathbb{Y}_4 = \text{Ferritin level (in blood serum)}\}$.

Furthermore, the previously mentioned characteristics have evolved into various categories, which can be classed as follows:

$\mathbb{Y}_1^a = \text{Age} = \{1\text{-}2 \text{ years}, 2\text{-}3 \text{ years}\}$, $\mathbb{Y}_2^b = \text{Gender} = \{\text{Boy}, \text{Girl}\}$,

$\mathbb{Y}_3^c = \text{Hb level} = \{< 8 \text{ g/dL}, 8\text{-}9 \text{ g/dL}, 9\text{-}10 \text{ g/dL}, 10\text{-}11.4 \text{ g/dL}\}$,

$\mathbb{Y}_4^d = \text{Ferritin level (in blood serum)} = \{< 5 \text{ ng/mL}, 5\text{-}6.2 \text{ ng/mL}, 6.2\text{-}6.8 \text{ ng/dL}\}$.

Neutrosophichypersoft set is defined as, $\mathbb{E}: \mathbb{Y}_1^a \times \mathbb{Y}_2^b \times \mathbb{Y}_3^c \times \mathbb{Y}_4^d \rightarrow \mathbb{P}(\mathcal{P})$. Assuming the relation $\mathbb{E}(\mathbb{Y}_1^a \times \mathbb{Y}_2^b \times \mathbb{Y}_3^c \times \mathbb{Y}_4^d)$ corresponds to the toddler's details, we have: $\mathbb{E}(2\text{-}3 \text{ years}, \text{Girl}, 8\text{-}9 \text{ g/dL}, 5\text{-}6.2 \text{ ng/mL})$, this represents particular information about the toddler's age, gender, hemoglobin level, and ferritin status. On this basis, four nutrition and diet are shortlisted Nu_1, Nu_2, Nu_3, Nu_4 according to the above - mentioned relation (2-3 years, Girl, 8-9 g/dL, 5-6.2 ng/mL).

Vithya and Sophia Porchelvi

Two medical professionals consign their opinions on each possibility as part of an NHSS as stated below:

$\mathbb{E}(P_1, \mathbb{Q}) = \mathbb{E}(2-3 \text{ years, Girl, } 8-9 \text{ g/dL, } 5-6.2 \text{ ng/mL})$

$$= \begin{pmatrix} (Nu_1, \{0.5, 0.3, 0.1\}, \{0.6, 0.2, 0.1\}, \{0.7, 0.3, 0.1\}, \{0.5, 0.5, 0.2\}) \\ (Nu_2, \{0.6, 0.5, 0.1\}, \{0.5, 0.3, 0.8\}, \{0.9, 0.1, 0.8\}, \{0.7, 0.8, 0.2\}) \\ (Nu_3, \{0.3, 0.4, 0.5\}, \{0.2, 0.3, 0.1\}, \{0.1, 0.5, 0.4\}, \{0.2, 0.6, 0.7\}) \\ (Nu_4, \{0.7, 0.8, 0.1\}, \{0.5, 0.6, 0.2\}, \{0.3, 0.1, 0.1\}, \{0.7, 0.8, 0.2\}) \end{pmatrix}$$

$\mathbb{E}(P_2, \mathbb{H}) = \mathbb{E}(2-3 \text{ years, Girl, } 8-9 \text{ g/dL, } 5-6.2 \text{ ng/mL})$

$$= \begin{pmatrix} (Nu_1, \{0.2, 0.3, 0.4\}, \{0.5, 0.6, 0.1\}, \{0.8, 0.2, 0.7\}, \{0.3, 0.1, 0.1\}) \\ (Nu_2, \{0.3, 0.5, 0.5\}, \{0.6, 0.7, 0.1\}, \{0.2, 0.8, 0.3\}, \{0.9, 0.1, 0.3\}) \\ (Nu_3, \{0.8, 0.8, 0.1\}, \{0.9, 0.5, 0.2\}, \{0.3, 0.5, 0.5\}, \{0.6, 0.6, 0.7\}) \\ (Nu_4, \{0.8, 0.9, 0.7\}, \{0.3, 0.2, 0.1\}, \{0.2, 0.2, 0.1\}, \{0.7, 0.3, 0.1\}) \end{pmatrix}$$

Use the algorithm developed above, as indicated below:

Algorithm-1

Step:1 The two previously mentioned NHSSs can be represented as NHSMs as follows:

$$(\mathbb{E}_1, \mathbb{Q}) = \begin{bmatrix} (0.5, 0.3, 0.1) & (0.6, 0.2, 0.1) & (0.7, 0.3, 0.1) & (0.5, 0.5, 0.2) \\ (0.6, 0.5, 0.1) & (0.5, 0.3, 0.8) & (0.9, 0.1, 0.8) & (0.7, 0.8, 0.2) \\ (0.3, 0.4, 0.5) & (0.2, 0.3, 0.1) & (0.1, 0.5, 0.4) & (0.2, 0.6, 0.7) \\ (0.7, 0.8, 0.1) & (0.5, 0.6, 0.2) & (0.3, 0.1, 0.1) & (0.7, 0.8, 0.2) \end{bmatrix}$$

$$(\mathbb{E}_2, \mathbb{H}) = \begin{bmatrix} (0.2, 0.3, 0.4) & (0.5, 0.6, 0.1) & (0.8, 0.2, 0.7) & (0.3, 0.1, 0.1) \\ (0.3, 0.5, 0.5) & (0.6, 0.7, 0.1) & (0.2, 0.8, 0.3) & (0.9, 0.1, 0.3) \\ (0.8, 0.8, 0.1) & (0.9, 0.5, 0.2) & (0.3, 0.5, 0.5) & (0.6, 0.6, 0.7) \\ (0.8, 0.9, 0.7) & (0.3, 0.2, 0.1) & (0.2, 0.2, 0.1) & (0.7, 0.3, 0.1) \end{bmatrix}$$

Step:2 Calculate the complement matrix $(\mathbb{E}_1, \mathbb{Q})^\circ, (\mathbb{E}_2, \mathbb{H})^\circ$ of the above neutrosophic hypersoft matrices,

$$(\mathbb{E}_1, \mathbb{Q})^\circ = \begin{bmatrix} (0.1, 0.7, 0.5) & (0.1, 0.8, 0.6) & (0.1, 0.7, 0.3) & (0.2, 0.5, 0.5) \\ (0.1, 0.5, 0.6) & (0.8, 0.7, 0.5) & (0.8, 0.9, 0.9) & (0.2, 0.2, 0.7) \\ (0.5, 0.6, 0.3) & (0.1, 0.7, 0.2) & (0.4, 0.5, 0.1) & (0.7, 0.4, 0.8) \\ (0.1, 0.2, 0.7) & (0.2, 0.4, 0.5) & (0.1, 0.9, 0.3) & (0.2, 0.2, 0.7) \end{bmatrix}$$

$$(\mathbb{E}_2, \mathbb{H})^\circ = \begin{bmatrix} (0.4, 0.7, 0.2) & (0.1, 0.4, 0.5) & (0.7, 0.8, 0.8) & (0.1, 0.9, 0.3) \\ (0.5, 0.5, 0.3) & (0.1, 0.3, 0.6) & (0.3, 0.2, 0.2) & (0.3, 0.9, 0.9) \\ (0.1, 0.2, 0.8) & (0.2, 0.5, 0.9) & (0.5, 0.5, 0.3) & (0.7, 0.4, 0.6) \\ (0.7, 0.1, 0.8) & (0.2, 0.8, 0.3) & (0.1, 0.8, 0.2) & (0.1, 0.7, 0.7) \end{bmatrix}$$

Step:3 To compute value matrices for NHSMs using definitions 2.7 and 2.9.

$$M_{(\mathbb{Q} \vee \mathbb{H})} = (\mathbb{E}_1, \mathbb{Q}) \vee (\mathbb{E}_2, \mathbb{H}) = \begin{bmatrix} (0.5, 0.3, 0.1) & (0.6, 0.2, 0.1) & (0.8, 0.2, 0.1) & (0.5, 0.1, 0.1) \\ (0.6, 0.5, 0.1) & (0.6, 0.3, 0.1) & (0.9, 0.1, 0.3) & (0.9, 0.1, 0.2) \\ (0.8, 0.4, 0.1) & (0.9, 0.3, 0.1) & (0.3, 0.5, 0.4) & (0.6, 0.6, 0.7) \\ (0.8, 0.8, 0.1) & (0.3, 0.2, 0.1) & (0.3, 0.1, 0.1) & (0.7, 0.3, 0.1) \end{bmatrix}$$

Vithya and Sophia Porchelvi

$$M_{(Q \vee H^*)} = (E_1, Q) \circ (E_2, H) = \begin{bmatrix} (0.4,0.7,0.2) & (0.1,0.4,0.5) & (0.7,0.7,0.3) & (0.1,0.5,0.3) \\ (0.5,0.5,0.3) & (0.8,0.3,0.5) & (0.8,0.2,0.2) & (0.3,0.2,0.7) \\ (0.5,0.2,0.3) & (0.2,0.5,0.2) & (0.5,0.5,0.1) & (0.7,0.4,0.6) \\ (0.7,0.1,0.7) & (0.2,0.4,0.3) & (0.1,0.8,0.2) & (0.2,0.2,0.7) \end{bmatrix}$$

$$V[M_{(Q \vee H)}] = \begin{bmatrix} 0.7 & 0.7 & 0.9 & 0.5 \\ 1 & 0.8 & 0.7 & 0.8 \\ 1.1 & 1.1 & 0.4 & 0.5 \\ 1.5 & 0.4 & 0.3 & 0.9 \end{bmatrix}$$

$$V[M_{(Q^* \vee H^*)}] = \begin{bmatrix} 0.9 & 0 & 1.1 & 0.3 \\ 0.7 & 0.6 & 0.8 & -0.2 \\ 0.4 & 0.5 & 0.9 & 0.5 \\ 0.1 & 0.3 & 0.7 & -0.3 \end{bmatrix}$$

Step: 4 Subtract $V[M_{(Q \vee H)}]$ and $V[M_{(Q^* \vee H^*)}]$ to get the score matrix.

$$S_{(Q \vee H, Q^* \vee H^*)} = \begin{bmatrix} -0.2 & 0.7 & -0.2 & 0.2 \\ 0.3 & 0.2 & -0.1 & 1 \\ 0.7 & 0.6 & -0.5 & 0 \\ 1.4 & 0.1 & -0.4 & 1.2 \end{bmatrix}$$

Step:5 The total score can be calculated using the above score matrix values as follows:

$$\text{Total score} = \begin{bmatrix} 0.5 \\ 1.4 \\ 0.8 \\ 2.3 \end{bmatrix}$$

According to the above total score value, the four alternatives are ranked as follows:

$$Nu_4 > Nu_2 > Nu_3 > Nu_1.$$

Algorithm – 2

The first two steps are identical to those cited in Algorithm 1; hence we elaborate on the remaining phases as follows:

Step:3 To calculate value matrices of NHSMs using the definitions 2.8 and 2.9.

$$M_{(Q \wedge H)} = (E_1, Q) \wedge (E_2, H) = \begin{bmatrix} (0.2,0.3,0.4) & (0.5,0.6,0.1) & (0.7,0.3,0.7) & (0.3,0.5,0.2) \\ (0.3,0.5,0.5) & (0.5,0.7,0.8) & (0.2,0.8,0.8) & (0.7,0.8,0.3) \\ (0.3,0.8,0.5) & (0.9,0.3,0.1) & (0.3,0.5,0.5) & (0.2,0.6,0.7) \\ (0.7,0.9,0.7) & (0.3,0.6,0.2) & (0.2,0.2,0.1) & (0.7,0.8,0.2) \end{bmatrix}$$

$$M_{(Q^* \wedge H^*)} = (E_1, Q) \circ (E_2, H) = \begin{bmatrix} (0.1,0.7,0.5) & (0.1,0.8,0.6) & (0.1,0.8,0.8) & (0.1,0.9,0.5) \\ (0.1,0.5,0.6) & (0.1,0.7,0.6) & (0.3,0.9,0.9) & (0.2,0.9,0.9) \\ (0.1,0.6,0.8) & (0.1,0.7,0.9) & (0.4,0.5,0.1) & (0.7,0.4,0.8) \\ (0.1,0.2,0.8) & (0.2,0.8,0.5) & (0.1,0.9,0.3) & (0.1,0.7,0.7) \end{bmatrix}$$

$$V[M_{(Q \wedge H)}] = \begin{bmatrix} 0.1 & 1 & 0.3 & 0.6 \\ 0.3 & 0.4 & 0.2 & 1.2 \\ 0.6 & 1.1 & 0.3 & 0.1 \\ 0.9 & 0.7 & 0.3 & 1.3 \end{bmatrix}$$

$$V[M_{(Q^* \wedge H^*)}] = \begin{bmatrix} 0.3 & 0.3 & 0.1 & 0.5 \\ 0 & 0.2 & 0.3 & 0.2 \\ -0.1 & -0.1 & 0.8 & 0.3 \\ -0.5 & 0.5 & 0.7 & 0.1 \end{bmatrix}$$

Vithya and Sophia Porchelvi

Step:4 Determine the score matrix in accordance with definition 2.10.

$$S_{(Q \wedge A, Q^{\circ} \wedge A^{\circ})} = \begin{bmatrix} -0.2 & 0.7 & 0.2 & 0.1 \\ 0.3 & 0.2 & -0.1 & 1 \\ 0.5 & 1 & -0.5 & -0.2 \\ 1.4 & 0.2 & -0.4 & 1.2 \end{bmatrix}$$

Step: 5 The total score can be determined using the above score matrix data in the following manner:

$$\text{Total score} = \begin{bmatrix} 0.8 \\ 1.4 \\ 0.8 \\ 2.4 \end{bmatrix}$$

The four alternatives are ordered in the following order based on the total score value:

$$Nu_4 > Nu_2 > Nu_3 > Nu_1.$$

Among the alternatives, Nu_4 holds the largest value, indicating that it's the most preferred option.

RESULTS AND DISCUSSION

Non-heme iron (Nu_4) is essential for toddlers with iron insufficiency, according to the above outcomes. While all iron-rich foods have nutritional benefits, those high in non-heme iron are especially advantageous in deficiency conditions. The same result is reached by applying algorithms 1 and 2. Table 3 provides a comparison of the suggested methods to existing methodologies.

CONCLUSION

Neutrosophic hyper-soft matrices are especially useful in complex decision-making settings, improving evaluation accuracy and efficacy. Using a score matrix, new extended decision-making techniques were developed in this paper to resolve the MCDM problem. As a result of the obtained outcomes, it is possible to conclude with confidence the suggested approach provides a solution to the nutrition and diet issue. In order to guarantee that the established strategy can be implemented, a comparison analysis has been conducted. The neutrosophic framework's analytical capabilities are enhanced by the hyper-soft matrix, making it a useful tool for complex evaluations.

ABSTRACT

In women, breast cancer is one of the leading causes of mortality. Health-seeking behavior refers to the sequence of remedial actions that individuals undertake to address perceived ill health. In this study, we propose to assess the health-seeking behavior among breast cancer patients and also evaluate the barriers encountered by breast cancer patients when seeking medical help. It is a cross-sectional observational study conducted among 212 breast cancer patients, utilizing the validated study tools Cancer Awareness Measure PLUS (CAM PLUS) and Breast-Cancer Awareness Measure (B-CAM) questionnaires. Questionnaires were distributed to participants, and the collected data were documented between March 2022 and July 2022. A substantial portion of the participants exhibited average health-seeking behavior and timely seeking medical assistance. A significant number of participants reported the absence of barriers, while others acknowledged encountering emotional and financial obstacles. Statistical analysis revealed a notable association between socioeconomic status, delays in health-seeking behavior, and barriers. Despite many participants accessing medical help promptly, some expressed concerns regarding their diagnosis and treatment processes. To address these barriers, educational initiatives regarding diagnosis and treatment are imperative for both patients and their family members.

Keywords: B-CAM; Breast cancer; CAM PLUS; Health-seeking behavior

INTRODUCTION

Breast cancer is one of the most common cancers and the leading cause of death in women [1]. According to various reports published in low- and middle-income countries like India, the incidence of breast cancer is increasing each year. In the year 2020, almost 178,361 new cases of breast cancer were reported, with more than 90,408 breast cancer deaths reported.[2] Most of the women were unaware of the early warning signs and symptoms of breast cancer, which resulted in poor screening rates and diagnosis at advanced stages[3-5]. Approximately, 70% of female patients exhibited delayed hospital arrivals, consequently exacerbating breast cancer mortality rates. Inadequate public awareness regarding breast cancer emerged as a primary determinant of delayed presentation and diminished survival probabilities[6,7]. Elevating women's breast cancer knowledge is crucial for overcoming these impediments. To effectively disseminate precise information and promote breast cancer awareness, it is imperative to conduct research into patient health-seeking behaviors that facilitate self-care and elevate health literacy levels[8-10]. However, there exists a paucity of research endeavors delving into the multifarious factors that underlie the deficiency in breast cancer awareness within the Indian population[11]. Hence, we proposed to conduct research on health-seeking behavior among women with breast cancer.

MATERIALS AND METHODS

Study design

This was a prospective cross-sectional study conducted in the Department of Radiology and Imaging Sciences at Sri Ramachandra Institute of Education and Research(Deemed to be university).The ethical permission to conduct the study was obtained from the Institutional Ethics Committee at Sri Ramachandra Institute of Higher Education and Research (DU) on 31/03/2022, with reference number **IEC REF: CSP/22/MAR/106/87**. This study enrolled female patients aged 18 years and older who had received a recent diagnosis of breast cancer, irrespective of the cancer stage. Patients who declined participation or had diagnoses of other cancer types were excluded. A total of 212 patients, meeting the inclusion criteria, were included in the study, and informed consent was obtained from all participants. Demographic information was collected by using a designed data collection form. The assessment of health-seeking behavior and the identification of barriers among breast cancer patients seeking medical assistance were evaluated using validated questionnaires, specifically the Cancer Awareness Measure PLUS (CAM PLUS) and the Breast-Cancer Awareness Measure (B-CAM).

CAM PLUS

The CAM PLUS questionnaire, developed by the International Cancer Benchmarking Partnership, is an established and validated tool for measuring public awareness regarding cancer symptoms, risk factors, and obstacles to seeking assistance. In addition to the original CAM questions, CAM PLUS incorporates new inquiries about cancer prevention, early diagnosis, and screening. It was employed as an instrument to assess the health-seeking behavior among breast cancer patients.

B-CAM

The B-CAM, developed in 2009 by Cancer Research UK, King's College London, and University College London, and validated with the support of Breast Cancer Care and Breakthrough Breast Cancer, is a survey instrument comprising seven domains. These domains encompass knowledge of breast cancer symptoms, confidence, skills, and behaviors related to detecting breast changes, anticipated delays in contacting a doctor, barriers to seeking medical assistance, understanding of age-related and lifetime risk factors, awareness of the NHS breast screening program, and knowledge of risk factors. For the present study, both the "CAM PLUS" and "B-CAM" questionnaires were employed to assess health-seeking behavior and barriers among women with breast cancer, and the responses were systematically documented and analyzed.

Mogana Priya et al.,

STATISTICAL ANALYSIS

The data were analyzed using SPSS software version 23. Descriptive data were presented as numbers and percentages. The significance of relationships between socio-economic characteristics, delays in health-seeking behavior, and barriers was assessed using ANOVA, with a significance level set at $P < 0.05$, indicating statistical significance.

RESULTS

Baseline characteristics of the study participants

Out of the total number of participants, 28.77% fell within the age group of 26-35 years, 82.55% were married, and 59.43% were found to be literate. Approximately 49.6% of the participants were employed, and 64.15% of participants reported a household income above 50,000. Baseline characteristics are presented in Table 1. BIRADS scores of the participants were observed. 24.52 % of participants had a score of 2, 41.51% of participants had a score of 3, 12.28% of participants had a score of 4a, 7.54% of participants had a score of 4b, 6.13% of participants had a score of 4c, 7.55% of participants had a score of 5, 0.47% of participants had a score of 6.

Health-seeking behavior of the study participants

Approximately 34.90% of participants perceived the symptoms they experienced as unusual. About 27.35% of participants believed that the symptoms were indicative of cancer. An 18.86% proportion of participants acknowledged knowing someone who had experienced similar symptoms. Furthermore, 13.67% of participants reported that their symptoms persisted, leading them to seek medical help. Only 23.6% of participants mentioned that their family and friends encouraged them to seek medical assistance. Additionally, 21.7% of participants acquired information about breast cancer symptoms from various sources. Table 2 provides an overview of the health-seeking behavior exhibited by study participants. Given that participants could select multiple options, the maximum number of responses received was 5, with 3.77% of participants choosing over 4 options, indicating commendable health-seeking behavior. On the other hand, 80.66% of participants opted for 2 or 3 options, reflecting an average level of health-seeking behavior, while 15.56% of participants chose only 1 option, indicating suboptimal health-seeking behavior.

Delayed in seeking medical help

Out of the 212 participants, only 39.62% did not delay in seeking medical help. Approximately 22.16% of participants expressed concerns about the potential treatment process, while 7.07% of participants worried about the diagnosis process. Table 3 provides an overview of the delay in seeking medical help. Regarding the assessment of delayed health-seeking behavior, the highest number of responses observed was 4, with 2.35% of participants selecting all 4 options, indicating multiple reasons for their late presentation. About 25.47% of participants chose 2 or 3 options, suggesting fewer factors contributing to their delayed presentation. On the other hand, 72.16% of participants opted for just 1 option, indicating a very low likelihood of delayed presentation. There don't appear to be any grammatical errors in this passage.

Barriers to seeking medical help

Among the 212 participants, 7.54% reported feeling embarrassed to discuss their symptoms, while 20.75% expressed fear about visiting a doctor. Only 1.88% of participants indicated that they didn't seek help on time due to being busy. Remarkably, none of the participants considered language as a barrier, as depicted in Table 4. By calculating the total score for each participant, we assessed the level of barriers faced by the participants. A majority, 60% of participants, obtained scores between 31-33, indicating that they had not encountered significant barriers. Additionally, 36.8% of participants scored between 26-30, suggesting that they faced moderate levels of barriers. A small fraction, only 3.3% of participants, scored below 25, indicating that these individuals encountered a high level of barriers. There don't appear to be any grammatical errors in this passage.

DISCUSSION

Breast cancer stands as one of the most prevalent types of cancer affecting women on a global scale. Consequently, it becomes imperative to assess health-seeking behavior, the factors contributing to delayed presentation, and the barriers encountered when seeking medical assistance. These variables were evaluated among women recently diagnosed with breast cancer, regardless of the cancer stage. In this study, the age group of participants diagnosed with breast cancer was notably younger compared to the average age reported in another study, where the mean age of included patients was 48.2 ± 10.19 years [12]. In our study, the majority of the patients were married. A previous study has indicated that marital status and breast self-examination play significant roles in the seeking of treatment for breast cancer symptoms [13]. The majority of the participants were literate, and simultaneously, most of them reported that they never delayed in seeking medical help. Additionally, many of the participants faced a moderate level of or no barriers when it came to seeking medical help, especially when compared to uneducated or less educated women. This aligns with the findings of another study, which concluded that to reduce diagnostic delays, additional educational initiatives were required to enhance symptom awareness and address help-seeking barriers [14]. Breast cancer patients often lack knowledge about their illness and condition. One crucial factor in India and low- and middle-income countries is the lack of awareness and knowledge regarding breast cancer and the practice of breast self-examination. This lack of awareness is positively correlated with a woman's or her family's socioeconomic status, educational level, employment status, and marital status, as noted in a study [15].

In this study, nearly half of the participants were employed, and this often led to their inability to find time to seek medical help or take leave, resulting in delayed help-seeking behavior. The majority of the study participants had a household income above 50,000 rupees. Conversely, one-third of the participants reported facing significant financial barriers when attempting to seek medical assistance. This finding is in line with a previous study, which indicated that a significant number of breast cancer survivors believed that their diagnosis and treatment had a negative financial impact [16,17]. Among the participants in this study, we observed that some perceived their symptoms as unusual, while others attributed them to cancer. Additionally, some participants disclosed that they initially informed their family members about their symptoms and sought medical help with their support. Breast health awareness campaigns and family support can play a crucial role in encouraging women to prioritize their health and overcome feelings of fear and insecurity. These measures can be effective in addressing women's ambivalence towards seeking breast health care [18]. Family members and friends were cognizant of their responsibility in promoting and assisting with coping strategies among breast cancer patients [19]. Approximately one-third of the participants in our study did not delay in seeking medical help. However, others experienced embarrassment, lacked confidence in discussing their symptoms with their doctor, and had concerns about the diagnosis process and treatment. These factors were the primary reasons for their delayed presentation. It's worth noting that in a population-based study, African American women were found to experience the most delays in the initial diagnosis and the commencement of breast cancer treatment [20]. Awareness and knowledge regarding breast cancer and the practice of breast self-examination are of utmost importance. Additionally, it is recommended that specialized facilities be established within the public health system for early breast cancer diagnosis. The limitation of our study is that the responses provided by patients were self-reported, and there was no means to verify the accuracy of their responses. This may have led to over- or under-reporting of their responses. Furthermore, our study did not implement any educational initiatives.

CONCLUSION

This study comprehensively assessed various aspects of breast cancer, including health-seeking behavior, delays in seeking medical help, and barriers to seeking assistance. In terms of health-seeking behavior, the majority of participants exhibited an average level of behavior when it came to seeking medical help. Our research revealed that most participants did not delay seeking medical assistance. The educational levels and income of the participants played pivotal roles in their ability to seek help promptly. However, one-fourth of the participants expressed

Mogana Priya et al.,

concerns about their treatment and visiting doctors in hospitals, in addition to their fears about the diagnosis process and financial barriers. To address these barriers effectively, it is essential to implement educational initiatives focusing on diagnosis and management for the general population. Overcoming emotional and financial barriers often requires the support of family members. Therefore, involving family members in awareness programs can be instrumental in eliminating barriers and reducing delays in seeking medical help.

ABSTRACT

Upper crossed syndrome (UCS) presents with weakened muscles in the neck, upper back, and shoulders, alongside tense areas, leading to altered movement patterns. This experimental study seeks to explore how muscle energy technique (MET) coupled with strengthening exercises affects shoulder function and scapular position in UCS. Key weakened muscles include the serratus anterior, middle and lower trapezius, rhomboids, and deep neck flexors, contributing to muscular imbalance and subsequent tightening or shortening of neck and chest muscles. In this study, 60 subjects diagnosed with Upper Crossed Syndrome (UCS) were separated as two groups: The Muscle Energy Technique (MET) group (n=30) and the Conventional group (n=30). The MET group underwent the muscle energy technique combined with 5 strengthening exercises, while the Conventional group received 5 conventional physiotherapy exercises. Assessment tools included the Shoulder pain and disability index (SPADI), Kibler's lateral scapular slide test, Craniovertebral angle, and Scapular index for pre and post-test evaluations. Both groups received interventions on alternate days for 3 weeks. The equipment utilized comprised a vernier caliper, a goniometer, and a resistance band. At the post-test, the mean value of the Muscle Energy Technique (MET) group combined with strengthening exercises surpassed that of the conventional group across all outcomes, exhibiting a significant p-value. The result concluded that MET

along with strengthening exercise shows a significant effect in improving shoulder function and scapular position.

Keywords: Muscle energy technique, Upper cross syndrome, cranio vertebral angle, kiblers lateral scapular slide test, UCS.

INTRODUCTION

Tightness and weakness in the neck, upper back, and shoulders are characteristic features of upper crossed syndrome (UCS), a disorder that causes abnormal muscle activation and movement patterns. While there are no specific diagnostic methods for UCS, this typically involves tightness in muscles such as the sternocleidomastoid, suboccipitalis, pectoralis major, upper trapezius, levator scapulae, and pec minor. On the other hand, muscles like the deep neck flexors, rhomboids, middle trapezius, serratus anterior, and lower trapezius tend to be stretched, weakened and inhibited.[1] Thoracic hyperkyphosis, cervical lordosis, stretched and elevated shoulders (rounded shoulders), forward head posture (FHP), and increased internal rotation accompanied by scapular winging and abduction are other postural disorders linked to UCS. People maintain this way of life until they are adults, and as we age, it just gets worse.[2] UCS is the term used to describe neck discomfort brought on by postural problems.[3] This condition is given the term "cross" because throughout the upper body is an "X" (a cross). Due to the normal development of a muscular imbalance between the muscles.[4] Adaptive shortening is the term used to describe the result of overusing a muscle in one way for an extended length of time leads to the shortening and tightening of the muscle. Stretch weakness, also known as elongation with weakening, results from the stretching of all antagonists.[5] The activation of the scapula muscles may change as a result, pattern of the movements, and a few abnormalities in the upper limb and In addition, the scapula, which connects the cervical and shoulder areas, plays a crucial role in regaining range of motion and support for the neck and shoulders.[6] Anxiety is one unwelcome emotion that is more likely to affect those who suffer from Upper Cross syndrome, and it can significantly lower their quality of life.[7] Multiple factors can lead to FHP such as using laptop for a prolonged period, while napping having your head elevated too for extended periods.[19] The only muscle that connects the scapula to the anterior side of the thoracic area is the pectoralis minor, which depresses the scapula.

Therefore, it is anticipated that the shortening of this muscle will limit the motion of the scapula in the superior and posterior directions.[8] To find out if someone has FHP, one can utilize the Craniovertebral Angle (CVA).[9] The angle formed by a horizontal line passing through the C7—a line and spinous process that runs from the middle within the tragus of the eardrum onto the layer of skin underlying it—is known as the craniovertebral angle. A CVA typically ranges from 48 to 50 degrees. FHP refers to any angle that is less than 48 degrees. Accurate evaluation of the FHP is necessary to assess the efficacy of therapeutic techniques.[10,11] Unbalanced soft tissue can put barriers in the way of the head's ROM and irritate the neck.[12] The shift in position from the original axis places extra strain on muscles to maintain the ongoing activity, which causes muscular deterioration.[13] Poor posture and bad habits are the primary causes of discomfort. UCS is a condition in which the muscles and other soft tissues become tense and movement is restricted.[14] In UCS, the head is positioned forward, which reduces the biomechanical effectiveness of the cervical non-contractile parts and forces the neck muscles to contract more actively to maintain cervical stability.[15] In a forward head position when seated, the lower cervical area is flexed, the upper cervical area is extended, and the shoulders are rounded. In upper cross syndrome, antagonistic muscle imbalances are the source of postural problems.[16] 6-48% of people with UCS experience shoulder girdle and cervicothoracic pain.[17] University students in particular, who were between the ages of 18 and 25, demonstrated a forward head stance and rounded shoulders, which is connected to UCS, in the proportions of 63.96% and 52.9%, respectively.[18] MET can extend shortened, contractured or spastic muscles; strengthen weaker muscles or groups of muscles due to physiological reasons; alleviate passive congestion, move immobile joints, and reduce localized oedema.[8] PIR, or post-isometric relaxation, is a method that involves isometrically contracting hyperactive muscles for a short while, followed by a

**Maheswaran et al.,**

brief latent period of relaxation to allow for gradual muscular lengthening. Due to changes in the muscle's viscoelastic properties, MET with PIR aids in reducing muscle tension and increasing muscle flexibility. MET is a sophisticated stretching method.[19] MET has the benefit of using the energy of the individual to generate physical activity that has a therapeutic effect.[20] Two fundamental effects of MET can be attributed to various physiological functions: Relaxation (RI) and post-isometric, reciprocal inhibition (RI).[21] The study's objective is to assess how well muscular energy techniques and strengthening exercises can help people with upper cross syndrome with their scapular posture and shoulder function.

MATERIALS AND METHODS

This study is experimental. The inclusion and exclusion criteria were used to choose 60 subjects in total. Participants in this study are between the ages of 25 and 50., both the genders. The participants were clinically diagnosed with upper cross syndrome. Written consent forms were obtained from the participants. Before providing their written consent, all subjects were informed in prior about the conditions of the experimental group and the procedures. Individuals with rounded shoulders (scapular index with vernier caliper), and individuals with forward head posture of CVA less than 48-50 degrees were included. Individuals with recent fractures or recent injuries or recent trauma of the upper limb and cervical spine, individuals with shoulder instability or any nerve lesions, individuals with any neurological symptoms like dizziness were excluded in this study. Vernier caliper, goniometer and resistance band are the materials used for this study. This study was approved by the institutional scientific review board [ISRB] [01/015/2023/ISRB/SR/SCPT]. Assessment tools included the Shoulder pain and disability index (SPADI), Kibler's lateral scapular slide test, Craniovertebral angle, and Scapular index for pre and post-test evaluations. SPADI is used to know the disability and shoulder pain range in subjects with UCS. It is divided into two sections: one for functional tasks and the other for pain. One hundred is the maximum attainable score.[24] This test assesses the shoulder blade's scapular posture, or protraction. In three distinct test postures (0°, 45° and 90°), Kibler developed a method for measuring scapular position.[25] Data analysis was conducted using the computed mean. 1.5 cm or greater difference in any of the three locations is regarded as a favorable LSST result.[26] In this study vernier caliper was used to take measurements and then mean values were calculated for all three positions in centimeters. CVA is used to assess forward neck posture. The CVA angle of less than 48 – 50 degrees is considered as forward head posture (reference) and subjects having less than this angle is included in this study.[27] Rounded shoulders were assessed by measuring scapular index. A digital vernier caliper was used to take both measures exactly.[28] By using the envelop method, The participants were divided into two equal groups. MET and conventional groups. Participants in the experimental group (n=30) were chosen, and the muscle energy techniques and strengthening exercises were performed. For three weeks and administered on 3 different days of the week. 30 minutes of three sets of 10 repetitions with 3-minute breaks.

muscle energy technique group

The MET is a manual treatment using voluntarily performed, regulated isometric contractions of a specific group of muscles. This technique is said to be beneficial for stretching a shortened muscle. So Muscle energy technique was given for 10 mins for all tight muscles including the levator scapulae, suboccipital muscles, upper trapezius, and pectoral muscles. For upper trapezius muscle the therapist gently flexed and rotated the sitting participant's neck to the other side until a slight stretching sensation was felt. For 7–10 seconds, the participant performed a normal isometric contraction (about 40% of maximal) against the therapist's hand in the opposite direction. After a brief relaxation of two to three seconds, the neck was passively stretched to its palpable limit or tolerance for 30 seconds. Following this, the neck relaxed in a neutral position for a brief 10-second period.[22] There were three repetitions of this process. In the last relaxation phase, the participant was told to breathe in and out. For suboccipital muscle the therapist positioned on the subject's head side while the subject lay supine. Both hands are placed on the C2 spinous process and the occiput area, respectively., the therapist identified the barrier causing the suboccipital muscles to contract. The subject was then instructed to inhale and perform an isometric contraction of the suboccipital muscles by resisting against the therapist's shoulder pressure while tipping their chin upward. The therapist applied

**Maheswaran et al.,**

resistance by placing the anterior portion of the shoulder on the subject's forehead. The subject exerted approximately 30% to 40% of their maximum force against the therapist's resistance for 10 seconds, followed by a 5-second rest period during exhalation. After the rest interval, the subject repeated the inhalation, followed by an exhalation during which the therapist stretched the suboccipital muscles for one minute. This sequence was repeated three times, with each set consisting of a 10-second contraction, a 30-second hold, and a 5-second rest period between sets. For the levator scapulae muscle in the supine position, the participant executed a sub-maximal isometric contraction for the levator scapulae muscle which was subjected to a PIR approach three times utilizing 30% to 40% of the maximum isometric contraction for 10 seconds. The stretch will last for thirty seconds and isometric contraction beyond the resistance of the therapist for about 10 seconds. During the last resting phase, the patient was told to breathe in and out to help with relaxation, 5-second rest interval was given.[23] For pectoralis minor muscle during MET (Muscle Energy Technique), the patient protracts their shoulder girdle while lying flat, exerting around 20% of their strength or matching the therapist's resistance. After holding this isometric contraction for 7 seconds while holding their breath, the patient relaxes and exhales. The therapist holds the stretch for 10 seconds as the patient relaxes and stretches the Pec minor to its new length. Every session, this procedure is performed at least three times, with a five-second break in between every repetition.

The strengthening exercise areas follows

For middle and lower trapezius strengthening (Table push) the participants stand close to the table and place their hands on its edge, slightly wider than shoulder-width. Keeping their body straight, they flex their elbows and bring their chest towards the table. They then push through the palms to return to the starting position. For serratus anterior strengthening (Wall slides) the participants stand with their back against a wall, positioning their elbows at a 90-degree angle and their arms at shoulder height against the wall. They then slowly slide their arms upward along the wall. For deep flexor strengthening (Chin tucks) after lying down, participants should softly tuck their chins into their chests while maintaining a level head. For shoulder retraction exercise stand straight with your shoulders at a 90-degree angle. Your forearms should be horizontal, and elbows flexed at 90 degrees. Grasp a portion of the workout band and pull back your shoulders, maintaining the 90-degree angles. Carefully return to the starting position. For shoulder External rotation during this exercise, ensure the upper arm and shoulder are at a 90-degree angle, with the elbow bend to 90 degrees. Start with the forearm horizontally and rotate it externally until vertical. Return to the beginning position slowly. Place the band in front of you at waist height to begin. Exercise will be given for 3 sets of 10 repetitions with 3 minutes rest between for 20 minutes for 3 weeks.

conventional group

In the conventional group (n=30) participants are selected. Five exercise were given for 3 sets of 10 repetitions with 3 minutes rest between for 30 minutes. For doorway stretch enter through an open gateway and extend each arm to the side with palms facing forward, bending them at a 90-degree angle. Press your hands against the door frame, adjusting elbow bend if needed. Move forward, maintaining an upright position without leaning. Hold for fifteen seconds, feeling the expansion in your chest and shoulders. For Rowing exercise using resistance band fasten it to a sturdy object at about hip height (a doorknob works well). The patient pulls the band using both upper limbs. For shoulder shrugging exercise participants stand on the floor with feet flat, then slowly inhale, bringing the shoulders as high up towards the ears as possible, and then lower the shoulders back down while exhaling. For shoulder squeeze exercise the participants stand or sit up straight, shoulders relaxed, hands at sides. Gently squeeze shoulder blades together without shrugging. Focus on muscles between shoulder blades as you squeeze. For shoulder bracing exercise the participants should overlap in front of the chest and elbows pointing outwards.

RESULTS

The values of the groups employing the muscular energy technique and conventional physiotherapy differed statistically considerable, according to a statistical analysis of the data. The MET group's pre-test mean was 46.00 (SD=1.46), whereas their post-test mean was 50.10 (SD=1.42), with a substantial rise from the pre-test mean of

$t=36.9702$ ($p<0.0001$). Similarly, the pre-test mean for the conventional group was 46.60 ($SD=1.75$), while the post-test mean was 47.97 ($SD=1.61$), with $t=15.2725$ ($p<0.0001$). The results are therefore regarded as highly statistically significant. (Table - 1) The post-test outcomes of the MET group and the Conventional group in CVA differ significantly. With $t=5.4426$ ($p<0.0001$), the Conventional group's mean value is 47.97 ($SD=1.61$), whereas the MET group's mean value is 50.10 ($SD=1.42$). The results are therefore regarded as highly statistically significant. (Table -2) The MET group's scapular index values significantly increased between the pre and post-test periods. $t=18.3984$ ($p<0.0001$), pre-test mean: 71.52 ($SD=2.17$), post-test mean: 74.82 ($SD=2.36$). A significant change from the pre-test mean of 71.30 ($SD=2.90$) to the post-test mean of 72.31 ($SD=2.95$) was also observed in the Conventional group, with $t=13.5218$ ($p<0.0001$). The results are therefore regarded as highly statistically significant. (Table -3) Significant differences are seen when the post-test results for the MET and Conventional groups are compared in terms of Scapular Index (SI). The mean values of the MET and Conventional groups are 74.82 ($SD=2.36$) and 72.31 ($SD=2.95$), respectively, with $t=3.6198$ ($p=0.0006$), suggesting extreme statistical significance. (Table - 4) Significant differences can be seen when comparing the MET group's pre-test and post-test readings. The mean scores are 54.23 ($SD=8.67$) for the pre-test and 37.63 ($SD=8.85$) for the post-test, with $t=23.6340$ ($p<0.0001$). For the Conventional group, the pre-test mean was 52.97 ($SD=7.96$), while the post-test mean was 44.43 ($SD=8.08$), with a significant change ($t=35.0845$; $p<0.0001$). They are both regarded as very statistically significant. (Table -5)

When the post-test results of the Conventional group and the MET group were compared, it was found that the Conventional group's mean value was 44.43, $SD = 8.80$, and $t = 3.1034$, whereas the MET group's mean value was 37.63, $SD = 8.85$. Therefore, when the p value equals 0.0029, the results are deemed statistically significant. (Table -6) Significant differences can be seen when comparing the MET group's pre- and post-test readings for LSST in three different positions: 0°, 45°, and 90° shoulder abduction. At 0°, the mean scores were 7.29 ($SD=0.89$) for the pre-test and 5.955 ($SD=0.07$) for the post-test, with $t=6.6406$ ($p<0.0001$). The pre-test mean at 45° was 8.57 ($SD=0.73$), the post-test mean was 6.64 ($SD=0.88$), and the t -value was 18.2759 ($p<0.0001$). The pre-test mean was 9.29 ($SD=0.71$) at 90°, the post-test mean was 7.54 ($SD=0.72$), and the t -value was 8.6516 ($p<0.0001$). The results are therefore regarded as highly statistically significant in each of the three degrees. Significant differences can also be seen when comparing the Conventional group's pre and post-test readings. $t=3.3938$ ($p=0.0021$), pre-test mean: 7.22 ($SD=0.78$), post-test mean: 6.51 ($SD=0.91$) at 0°. Consequently, the results are regarded as highly statistically significant. At 45°, $t=18.2655$ ($p<0.0001$), pre-test mean: 7.91 ($SD=0.68$), post-test mean: 7.11 ($SD=0.67$). $t=35.4329$ ($p<0.0001$), pre-test mean: 8.94 ($SD=0.85$), post-test mean: 8.02 ($SD=0.82$) at 90°. Consequently, in 45 and 90 degrees, the results are regarded as highly statistically significant. (Table -7) Significant changes can be seen when comparing the post-test results of the Conventional group and the MET group. The MET group mean was 5.95 ($SD=0.70$) and the conventional group mean was 6.47 ($SD=0.73$) at 0°. The t -value was 2.4530 ($p=0.0172$). The results are regarded as statistically significant as a consequence. $T=2.2897$ ($p=0.0257$), MET group mean = 6.64 ($SD=0.88$), Conventional group mean = 7.11 ($SD=0.67$), and 45° position. The results are regarded as statistically significant as a consequence. The MET group mean was 7.53 ($SD=0.71$), the conventional group mean was 8.02 ($SD=0.82$), and the t -value was 2.5116 ($p=0.0148$) in the 90° position. The results are regarded as statistically significant as a consequence. (Table -8) The study's results show that both Muscle Energy Technique (MET) with strengthening exercises and conventional physiotherapy significantly improved shoulder function, scapular position, and reduced forward neck and rounded shoulder posture. However, when comparing post-test results, MET with strengthening exercises proved to be more effective and significant than conventional physiotherapy. Therefore, MET with strengthening exercises is considerably more effective than conventional physiotherapy for UCS subjects.

DISCUSSION

This study's objectives include investigating how shoulder function and scapular position in upper cross syndrome are treated by the Muscle Energy Technique when combined with strengthening activities. Over the course of three weeks, this study is demonstrated. The Vernier caliper was used to measure the Scapular Index, the Lateral Scapular Slide Test (LSST) by Kibler and the CVA, and the SPADlating system. The CVA is used to measure forward neck

**Maheswaran et al.,**

posture, the Scapular Index (SI) for rounded shoulder, Kibler's Lateral Scapular Slide Test (LSST) for scapular position, and the SPADI scale for shoulder function, pain and disability. An early study by, Fizza Ali Syed 2022 et al, stated that the need of the study was to determine how the purported procedures affected the degree of pain, the degree of disability, and the limitation of ROM. The outcome demonstrates that the muscle energy strategy is superior to stretching exercises for treating individuals with upper cross syndrome, neck pain, and range of motion impairments. In 2014, Narang S. and colleagues carried out a study on thirty volunteers to assess the efficacy of deep neck flexor exercise in conjunction with muscle energy technique in patients with persistent neck discomfort who were positioned with their heads forward. When the research is finished, the results showed a considerable difference between A and B groups, indicating that MET in addition to DNF exercises was more beneficial than DNF exercises alone in reducing disability, enhancing discomfort, and adjusting forward head posture. The findings indicate that both groups' pain levels significantly improved, with the muscular energy approach demonstrating greater improvement than traditional therapy. In the Kim et al. study, which involved 44 participants, they looked at whether the craniovertebral angles of the Forward head posture groups with and without pain differed significantly. Their findings showed that the cervical vertebral angle values were considerably lower in the neck discomfort group. Additionally, the findings of their regression analysis that people with lower values of the CVA had a higher incidence of neck pain; hence, This angle was proposed as a sign of neck pain, which would contradict our findings.[29] An early study by Trivedi P, Sathiyavani D et al, They discovered that the active release Patients with chronic lateral epicondylitis showed improvement in grip strength and a reduction in discomfort and disability while using both the technique and the myofascial release technique.

However, MFR was superior than ART in individuals with chronic lateral epicondylitis in terms of lowering pain and impairment as well as enhancing grip strength.[30] Day JM and his fellow researchers found that range of motion (ROM) as a direct result of muscle energy method include a return to healthy range of motion (ROM), spontaneous strengthening of muscles that have been inhibited, a decrease in sympathetic overload, a reduction in localized irritation and the micro-edema that goes along with it, and an improvement in the structural and functional integrity of the entire movement chain.[31] This discussion is for upcoming research to explore the mechanisms of the MET, potential variations in treatment protocols, and the long-term outcomes of MET in patients with UCS. Kawaldeepkaur and his associates undertook a study in 2015. The groups who received the best treatment outcomes were those who received both traditional physical therapy and METs to increase ROM and reduce pain intensity. The data backs up the finding of our study, which shows that MET can effectively reduce discomfort at the spine of cervical.[32] Our research found that both the MET with strengthening exercises and conventional physiotherapy exercises, when applied alternately for three sessions, significantly improved shoulder function, and scapular position, and reduced forward neck and rounded shoulder posture. However, MET with strengthening exercises yielded superior results.

ACKNOWLEDGEMENT

It was a pleasure to acknowledge the department and I owe a lot of people for their influence and assistance in building the foundation of this research. I would especially like to thank everyone who took part in the study; without them, it would not have been a success.

Table 1:Comparing of Pre and Post-test values of MET group and conventional group in Craniovertebral angle.

CVA		Mean (Degree)	SD	T-Test	P Value
Muscle Energy Technique Group	Pre-Test	46.00	1.46	36.970	< 0.0001
	Post-Test	50.10	1.42		
Conventional Group	Pre-Test	46.60	1.75	15.272	
	Post-Test	47.97	1.61		

Compares the pre and post-test values of Muscle energy technique group. The mean value of the pre-test is 46.00 and the SD value is 1.46, Whereas the post-test mean value is 50.10, SD value is 1.42. $t = 36.9702$. As a result, the findings are considered extremely statistically significant when the p-value is <0.0001 and Compares the pre and post-test values of the conventional group. The mean value of the pre-test is 46.60 and the SD value is 1.75, Whereas the post-test mean value is 47.97, SD value is 1.61, $t = 15.2725$. As a result, the findings are considered extremely statistically significant when the p-value is <0.0001.

Table 2: Comparison between the post-test values of Muscle energy technique group and Conventional group in CVA.

CVA		MEAN (degree)	SD	T-TEST	P-VALUE
Muscle Energy	POST-TEST	50.10	1.42	5.442	<0.0001

Maheswaran et al.,

Technique Group					
Conventional Group	POST-TEST	47.97	1.61		

Compares the post-test values of the Muscle energy technique group and the Conventional group in CVA, revealing that the mean value of the MET group was 50.10 and the SD value is 1.42, whereas the Conventional group mean value was 47.97 and the SD value is 1.61, $t=5.4426$. As a result, the findings are considered extremely statistically significant when the p-value is <0.0001 .

Table 3: Comparison of Pre-test and Post-test Values of Muscle energy technique group and Conventional group in Scapular index (SI).

In Scapular Index (SI):					
SCAPULAR INDEX (SI)		MEAN (mm)	SD	T-TEST	P - VALUE
Muscle Energy Technique Group	Pre-Test	71.52	2.17	18.398	<0.0001
	Post-Test	74.82	2.36		
Conventional Group	Pre-Test	71.30	2.90	13.521	
	Post-Test	72.31	2.95		

Compares the pre and post-test values of Muscle energy technique group in SI. The mean value of the pre-test is 71.52 and the SD value is 2.17. Where as the post-test mean value is 74.82, SD value is 2.36. $t= 18.3984$. As a result, the findings are considered extremely statistically significant when the p-value is <0.0001 and Compares the pre and post-test values of the Conventional group. The mean value of the pre-test is 71.30 and the SD value is 2.90, Whereas the post-test mean value is 72.31, SD value is 2.95, $t= 13.5218$. As a result, the findings are considered extremely statistically significant when the p-value is <0.0001 .

Table 4: Comparison between the post-test values of the Muscle energy technique group and the Conventional group in SI.

SCAPULAR INDEX (SI)		MEAN (mm)	SD	T-TEST	P-VALUE
Muscle Energy Technique Group	Post- Test	74.82	2.36	3.6198	P value is equals to
Conventional Group	Post- Test	72.31	2.95		0.0006

Compares the post-test values of the Muscle energy technique group and the Conventional group in SI, revealing that the mean value of the MET group was 74.82 and SD value is 2.36, whereas the Conventional group mean value was 72.31 and the SD value was 2.95, $t=3.6198$. As a result, the findings are considered Extremely to be statistically significant when the p-value is equal to 0.0006.

Table 5: Comparison of Pre-test and Post-test Values of Muscle energy technique group and Conventional group in Shoulder Pain and Disability Index.

Shoulder Pain And Disability Index (Spadi)		MEAN (%)	SD	T-TEST	P -VALUE	
Muscle Energy Technique Group	Pre-Test	54.23	8.67	8.85	23.634	<0.0001
	Post-Test	37.63	8.85			
	Pre-Test	52.97	7.96			
Conventional Group	Post-Test	44.43	8.08	35.084	35.084	

Compares the pre and post-test values of the Muscle energy technique group. The mean value of the pre-test is 54.23 and the SD value is 8.67. Whereas the post-test mean value is 37.63, SD value is 8.85. $t= 23.6340$. As a result, the findings are considered extremely statistically significant when the p-value is <0.0001 and Compared the pre and post-test values of the Conventional

Maheswaran et al.,

group. The mean value of the pre-test is 52.97 and the SD value is 7.96, Whereas the post-test mean value is 44.43, SD value is 8.08, $t = 35.0845$. As a result, the findings are considered extremely statistically significant when the p-value is <0.0001 .

Table 6: Comparison of post-test values of Muscle energy technique group and Conventional group in SPADI.

Shoulder Pain And Disability Index (Spadi)		MEAN (%)	SD	T-VALUE	P-VALUE
Muscle Energy Technique Group	Post-Test	37.63	8.85	3.1034	P value is equals to 0.0029
Conventional Group	Post-Test	44.43	8.80		

Compares the post-test values of the Muscle energy technique group and Conventional group, revealing that the mean value of MET group was 37.63 and SD value is 8.85, whereas the Conventional group mean value was 44.43 and SD value was 8.80, $t = 3.1034$. As a result, the findings are considered to be statistically significant when the pvalue is equal to 0.0029.

Table 7: Comparison of Pre-test and Post-test Values of MET group and Conventional group in LSST.

LATERAL SCAPULAR SLIDE TEST(LSST)		MET GROUP(Cm)		CONVENTIONAL GROUP (Cm)	
		PRE-TEST	POST-TEST	PRE-TEST	POST-TEST
0Degree	MEAN \pm SD	7.29 \pm 0.89	5.95 \pm 0.70	7.22 \pm 0.78	6.51 \pm 0.91
	T VALUE	6.6406		3.3938	
	P VALUE	<0.0001		= 0.0021	
45 Degree	MEAN \pm SD	8.57 \pm 0.73	6.64 \pm 0.88	7.91 \pm 0.68	7.11 \pm 0.67
	T VALUE	18.2759		18.2655	
	P VALUE	<0.0001		<0.0001	
90 Degree	MEAN \pm SD	9.29 \pm 0.71	7.54 \pm 0.72	8.94 \pm 0.85	8.02 \pm 0.82
	T VALUE	8.6516		35.4329	
	P VALUE	<0.0001		<0.0001	

Compares the pre and post-test values of Muscle energy technique group. The mean value of the pre-test in 0 degree is 7.29 and the SD value is 0.89. Whereas the posttest mean value in 0 degree is 5.955, SD value is 0.07. $t = 6.6406$. As a result, the findings are considered extremely statistically significant when the p-value is <0.0001 . The mean value of the pre-test in 45 degree is 8.57 and the SD value is 0.73. Whereas the post-test mean value in 45 degree is 6.64, SD value is 0.88 and $t = 18.2759$. The mean value of the pre-test in 90 degree is 9.29 and the SD value is 0.71. Whereas the post-test mean value in 90 degree is 7.54, SD value is 0.72. $t = 8.6516$. As a result, the findings are considered extremely statistically significant in all three degrees when the p-value is <0.0001 and Compares the pre and post-test values of Conventional group. The mean value of the pretest 0 degree is 7.22 and the SD value is 0.78. Whereas the post-test mean value in 0 degree is 6.51, SD value is 0.91, $t = 3.3938$. As a result, the findings are considered very statistically significant when the p-value is = 0.0021. The mean value of the pre-test 45 degree is 7.91 and the SD value is 0.68, Whereas the post-test mean value in 45 degree is 7.11, SD value is 0.67, $t = 18.2655$. The mean value of the pre-test 90 degree is 8.94 and the SD value is 0.85, Whereas the post-test mean value in 90 degree is 8.02, SD value is 0.82, $t = 35.4329$. As a result, the findings are considered extremely statistically significant in 45 and 90 degree when the p-value is <0.0001 .

Table 8: Comparison between the post-test values of Muscle energy technique group and Conventional group in LSST.

LATERAL SCAPULAR SLIDE TEST(LSST)	MET GROUP(Cm)	CONVENTIONAL GROUP(Cm)
	POST-TEST	POST-TEST

0Degree	MEAN \pm SD	5.95 \pm 0.70	6.47 \pm 0.73
	T VALUE	2.4530	
	P VALUE	= 0.0172	
45 Degree	MEAN \pm SD	6.64 \pm 0.88	7.11 \pm 0.67
	T VALUE	2.2897	
	P VALUE	= 0.0257	
90 Degree	MEAN \pm SD	7.53 \pm 0.71	8.02 \pm 0.82
	T VALUE	2.5116	
	P VALUE	= 0.0148	

Compares the post-test values of the Muscle energy technique group and the Conventional group, revealing that the mean value in the 0 degree of MET group was 5.95 and SD value is 0.70, whereas the Conventional group mean value in 0 degree was 6.47 and the SD value was 0.73, $t=2.4530$. As a result, the findings are considered to be statistically significant when the p-value is equal to 0.0172. And the mean value in 45 degree of MET group was 6.64 and SD value is 0.88, whereas the Conventional group mean value in 45 degree was 7.11 and SD value was 0.67, $t=2.2897$. As a result, the findings are considered to be statistically significant when the p-value is equal to 0.0257. And the mean value in 90 degree of MET group was 7.53 and SD value is 0.71, whereas the Conventional group mean value in 90 degree was 8.02 and SD value was 0.82, $t= 2.5116$. As a result, the findings are considered to be statistically significant when the pvalue is equal to 0.0148.

Fig.1 MET for levator scapulae

The therapist performing the muscle energy technique. In the supine position, the participant executed a sub-maximal isometric contraction for the levator scapulae muscle which was subjected to a postisometric relaxation approach three times utilizing 30% to 40% of the maximum isometric contraction for 10 seconds. The stretch will last for thirty seconds and isometric contraction beyond the resistance of the therapist for about 10 seconds. During the last relaxation phase, the patient was told to breathe in and out to help with relaxation, 5-second rest interval was given.

Fig.2 shoulder retraction exercise

The experimental group participant performing shoulder retraction exercise as a strengthening exercise using resistance band. When performing this exercise, stand straight with your shoulder held out at a 90-degree angle in the plane of the shoulder. Your forearms should be horizontal and your elbows should be flexed at a 90-degree angle. To extend a workout band, grasp a portion on its longer side and pull back your shoulders. Keeping your elbows and shoulders at a 90-degree angle, carefully return to the beginning position.

	
<p>Fig.3 shoulder external rotation</p> <p>The experimental group participant performing shoulder external rotation exercise as a strengthening exercise using a resistance band. For shoulder External rotation during this exercise, ensure the upper arm and shoulder are at a 90-degree angle, with the elbow flexed at 90 degrees. Start with the forearm horizontally and rotate it externally until vertical. Return to the starting position slowly. Place the band in front of you at waist height to begin.</p>	<p>Fig.4 shoulder squeeze exercise</p> <p>The conventional group participant performing shoulder squeeze exercise. Participant stands or sit up straight with shoulders are relaxed and keep the hand at your slides and gently squeeze the shoulder blades together without shrugging the shoulder then focus the muscle between the shoulder blades as you squeeze.</p>

Successful Ayurvedic Management of Granulomatous Vocal Cord Lesion - A Case Study

ABSTRACT

The Granulomatous vocal cord lesion is a non-neoplastic lesion that most often develops in the vicinity of the posterior vocal cords, adjacent to the vocal process. Present line of treatment in contemporary medical science is surgery followed by supplementary voice therapy. There are high chances of recurrence of the lesion after surgical excision. This report deals with a single case which was effectively managed with *Ayurvedic* intervention. A 48-year-old male patient presented with hoarseness of voice, cough, difficulty to produce high pitch notes since 3 months. Videolaryngoscopy was done and there was presence of Granulomatous vocal cord lesion. Treatment was done with *Pratimarsha nasya , kavala* ,oral medication along with voice rest. The hoarseness of voice and voice clarity improved on completion of the treatment. A repeat video laryngoscopy showed that the granulomatous lesion was no longer present. It shows the vocal cord Granulomatous lesion can be effectively managed with *Ayurvedic* intervention and recurrent rate also minimal.

Keywords: *Pratimarsha nasya , kavala* , *Ayurvedic* intervention, non-neoplastic lesion

INTRODUCTION

A 48-year-old male patient presented with hoarseness of voice, Cough, difficulty to produce high pitch voice, variations in pitch while talking and intermittent pain near the larynx area while speaking since three months. Prior to visiting our Hospital they had visited to near an Ear Nose Throat (ENT) specialist. On videolaryngoscopy, condition was diagnosed as Granulomatous vocal cord lesion and doctor was advised surgical excision. But patient being scared of the surgical procedure, Hence, the patient came for seeking Ayurvedic management in 2023 January.

PAST HISTORY-nothing significant.

7. Drik Pariksha -prakrutha
8. Akriti Pariksha-madhyama

On examination

Nose: No any abnormality found

Ear: No any abnormality found

Throat: normal

Videolaryngoscopy was done which revealed [Figure 1]

- Presence of Granulomatous lesion on posterior end of vocal cord.
- Bilateral vocal cord mobile.

RESULT

Figure -02, 03, 04 – Result

After 3 days of treatment significant improvement was observed in hoarseness of voice with mild relief in throat pain. On Flexible fiberoptic endoscope examination, after 20 days of treatment, Size of Granulomatous lesion on posterior end of vocal cord size was decreased [Figure 3] and patient got complete relief from hoarseness of voice and coughing. The patient got improvement in fatigability in speech. On Flexible fiber optic endoscope examination, after 45 days the Granulomatous lesion on posterior end of vocal cord disappeared completely with normal colour of laryngeal mucosa [Figure 4] and patient was comfortable with frequent talks and high volume speech. significant improvement was observed in the symptoms and with the Ayurvedic therapy Granulomatous lesion of vocal cord completely resolved.

Fallow up-after 3month patient has contact with phone, there is no fresh complaints and also no voice problem.

DISCUSSION

Mode of action of drug

Chaya and Jyoti

TAB.SHIVAGUTIKA

- According to *Bhaishajya Ratnavali Shivagutika* action like *Indriyapradana*, *Oja-Teja balaprada* and *Rasayana*(1).
- And also Action like-Anti-inflammatory, Antitumor, Antioxidant and Immunobooster(2).
- So above said properties help to reduce the inflammation and size of the lesion .

TAB.KANCHANARA GUGGUL

- According to *Sharangdhar Samhita*, *Madhyam Khand*, *Kanchnaar Guggulu*(3)is having *Galaganda*, *Gandamala*, *Arbuda*, *Granthihara* and *Lekhaneeya* property(4)
- and also shows properties like Antimicrobial(5), anti staphylococcal activities(6), cytotoxic activity(7), antioxidant activity(8), anti-inflammatory(9) and analgesic activity(10).
- Any *kantagata roga* having tumour or inflammation we can use mainly *kanchanara guggulu* due this above said properties.

YASTIMADHU KSHEERA PAKA

- There is no specific refernce for *Yastimadhu ksheera paka*.but *Yastmadhu* is specially indicated for voice disorders due to its *Swarya* property which will improve voice tone and quality.
- *Ksheerapaka Kalpana* is a palatable medicament form with some modifications in *KwathaKalpana*(11)
- Preparation -One part of *Yastimadhu choornais* boiled in eight parts of milk with addition to thirty two parts of water.The boiling is continued till the added water gets evaporated and the original quantity of milk is left.(1:8:32)(12)
- It possess *Kanthyaswarya* as well as soothing effect that will improve the quality of voice as well as voice tone.It is *Rasayana* and *Snigdha*. It has anti-oxidant, anti-inflammatory, anti-ulcer and expectorant properties(13).

KAVALA

According to *Sushruta* when liquids can be moved to and fro in mouth is called *Kavala* while when mouth is completely filled with liquid so that it cannot be moved here and there is called *Gandusha*.

The medicated Kavala balances the PH and gets absorbed by increasing vascular permeability in oral mucosa. Thus it will help to reduce the inflammation and improve the disease healing process and proper salivary secretions.(14,15)

ANUTAILA

- Marsha nasya with *Anutaila* improves the voice and strengthens the functions of vocal cord. *Acharya Charaka* explained that *Nasya* with *Anuthaila* liquifies the *dosas* and extracts it out without destructing the site ,thus improving efficacy of *Indriya* (sense organs)(16).
- *Anutaila Nasya* has *Sheeta-Ushna Veerya*, *Katu Vipaka*, and *Tridosahara* properties. It promotes immune modulation which will reduce frequent episodes of inflammation(17) that restricts the reoccurrence of the lesion.

DISCUSSION

Granulomatous vocal cord lesion is also known as Vocal process Granuloma, is a nonspecific inflammatory process formed by granulation tissue that occurs primarily in the vocal process of arytenoid cartilage¹⁸. Etiopathogenesis of Granuloma is still undetermined and it is attributed to three predisposing factors: vocal abuse, laryngo-pharyngeal reflux disease (RLF) and laryngeal intubation.¹⁹ In present study the Granulomatous vocal cord lesion cause of is due to the overuse of voice because of the profession of the patient. The Hoarseness of voice or *kricchta* can be caused due to obstruction of the throat with *Kapha* and *Khara guna* of *Vata*. The treatment protocol was designed in keeping in mind the *Kapha Vata hara* principal. This single case report concludes that *Ayurvedic* management with *Pratimarsha Nasya* and *Kavala* procedure along with internal medicines, i.e. *tab.Shivagutika* and *tab.Kanchanara guggulu* and voice

Chaya and Jyoti

rest offers excellent result in the treatment of Granulomatous vocal cord lesion and improves patient's voice and brings it back to normal.

CONCLUSION

The videolaryngoscopy findings done before and after treatment reveals that the Granulomatous vocal cord lesion has been completely resolved with *Ayurvedic* intervention. *Ayurveda* can definitely play a major role in treating such conditions without any surgical procedures, Moreover surgical procedures may be a financial burden in addition to the psychological emotions. Hence more researches have to be concentrated on such diseases which can be treated therapeutically by *Ayurvedic* means where the western medicine has no option other than surgery.

ABSTRACT

The most effective strategy for reducing biological (microbes and toxins), chemical, and physical risks is usually considered as HACCP. The danger or adverse impacts of hazards are assessed, predicted, and managed using technical and scientific methods. Hazard Analysis Critical Control Points (HACCP), a new method, has lately been adopted by the healthcare sector. That likelihood is meant to be reduced to a manageable level via HACCP. The HACCP (Hazard Analysis Critical Control Points) system is proposed in this study as a way to ensure food safety and hygiene in the pharmaceutical sector. HACCP seeks to avoid known risks and decrease the likelihood that they may materialize at particular stages of the pharmaceutical procedures. The government effort known as HACCP involves the FDA, WHO, GMP, GCP, and GLP. The goal of the current recommendations is to develop and put into action effective HACCP plans that address the development of products, sourcing of raw materials, production, packaging, testing, and distribution.

Keywords: HACCP, food safety, risk, FDA guidelines, HACCP plans.

INTRODUCTION

HACCP is a rigid, preventative, and proactive approach to product quality, reliability, and safety. It is a systematic procedure that makes use of technical and scientific principles to determine, avoid, and control the risk of hazards that may arise during the design, development, production, and use of products [1]. The objective is to make the product safely and prove that it was made safely. By analyzing and controlling physical, chemical, and biological risks associated with the creation, acquisition, and use of food safety is addressed by the HACCP management plan, which starts with the handling of raw materials and continues through production, distribution, and consumption of the finished product. A HACCP plan can only be successfully implemented if management is committed to the concept. A corporation with top management support for HACCP promotes in employees the value of creating safe food [2]. It is a process that is structured for studying, evaluating, preventing, and controlling the risk of hazards that occur from the creation, use, and maintenance of products. This strategy essentially seeks to plan out risky operations, in contrast to traditional "produce and test" quality control processes.

HACCP plan

A document created using the HACCP principles to ensure that risks important to pharmaceutical quality are controlled throughout the supply and manufacturing systems.

Critical Control Point (CCP)

A procedure that can be managed that is required preventing, eliminating, or reducing a risk to the quality of pharmaceuticals to a tolerable level. By validating important activities and procedures, dangers that affect quality are partially managed when final pharmaceutical products are produced utilizing Good Manufacturing Practices (GMP). While GMP does not address the safety of the manufacturing crew, HACCP addresses both safety and quality issues [3]. The HACCP system has been acknowledged as a practical and affordable method of assuring food safety. Today, this methodology is used across the entire production process and is recognized on a global scale as a tool for food safety [4]. To guarantee the high quality of the product, it is essential to employ a systematic strategy that involves the formation of a group of coordinated operations. There are numerous quality and safety-related methods used by Russian businesses: Occupational Safety and Health Management; a safety management system that complies with the requirements of the ISO 22000 international standard, with the HACCP plan serving as its primary component; GMP stands for "good manufacturing practice," GHP for "good hygiene practice," HACCP for "hazard analysis and critical control points," and ISO 9000 quality management systems.

Benefits of hazard analysis and critical control points

- ❖ The strategy focuses attention on the factors that have a direct impact on a product's safety
- ❖ At every step along the food chain, avoids the various shortcomings inherent in inspectional approaches, and gives a rational approach to the control of risks in foods.
- ❖ It increases consumer confidence in the food supply, and its adoption will lead to a larger market reach and reduced manufacturing costs (fewer recalls or food wastes).
- ❖ Its use reduces the possibility of acquiring food-borne diseases [6].

There are advantages to carry out the HACCP system

- ❖ To take a measure that will successfully shield food from threats like infection.
- ❖ To realize efficient utilization of labor and resources in order to achieve a more cost-effective production method.
- ❖ To improve the food's safety and quality and the practitioners' degree of hygiene management [7].

Limitation of hazard analysis and critical control points

The HACCP principle "establish critical limits" is the first restriction connected to the inability to link HACCP plans to public health objectives. Each CCP has one or more significant limitations that serve as the foundation for

**Kirthika Ravi et al.,**

judgments about whether a process is under control or not. Our inability to clearly connect the conception and execution of HACCP systems to the influence they have on public health is a second, more significant restriction [8].

Potential areas of use

- ❖ HACCP can be used to determine and control the risks connected to microbiological contamination as well as physical, chemical, and biological hazards.
- ❖ When product and process expertise is thorough enough to support the identification of essential control points, HACCP is most beneficial [9].

Hazard analysis and critical control points history

HACCP initiatives first started as a logical extension of GMPs, which food industries had been utilizing as part of daily operations. For the National Aeronautics and Space Administration (NASA) to start using safe, nutrient-dense foods to feed future astronauts in the late 1950s, a system was required. While in space, food products could not be replaced or recalled. The Pillsbury Company started working with NASA in 1959 to further develop a method known as Failure Mode and Effect Analysis (FMEA), which was inspired by concepts used in engineering system development. Pillsbury and NASA determined the critical points in the process at which these hazards were likely introduced into product and should be controlled through the thorough analysis of production processes and identification of microbial hazards that were known to occur in the production establishment [10]. The HACCP system was initially introduced to the food sector in 1971 at a national conference on food safety. When in 1974, the FDA included HACCP guidelines to its low acid and acidified food standards. as a response to numerous incidents of poisoning caused by *Clostridium botulinum* contamination in commercially canned food, HACCP became a more widely used tool for some food manufacturers in the U.S. However, the widespread adoption of HACCP did not occur until the 1980s, when there were more outbreaks of food poisoning. At that point, several major food processing industries began using the technique. Published in 1985 was The National Research Council of the United States' evaluation on the importance of microbiological standards for foods and food ingredients[11, 12].

Three principles

- ❖ Identification and assessment of hazards
- ❖ Determining the important control points necessary to manage any identified hazards
- ❖ Establishment of systems to monitor critical control points[13].

Hazard analysis and critical control points and food regulation

The HACCP system is a high priority initiative under Codex Alimentarius, the global authority on food standards, and has also been applied in other nations that are governed by laws (such as Europe, Canada, Australia, and New Zealand). The HACCP approach has been widely adopted and legalized in many nations throughout the world, with successful outcomes for managing food safety. Early in 1990, the HACCP method was also introduced to China, however it mostly spread among some larger food businesses. For catering businesses, either the procedures were inadequately implemented or the results are insufficiently satisfying[14,15].

Prerequisite Programs

The necessary prerequisite programs must be in place before HACCP can be completely implemented because it is not a stand-alone program. Prerequisite programs, which are an essential component of the entire food safety strategy, are activities and/or conditions required before and/or during HACCP. Sanitary standard operating procedures (SSOPs), raw material control programs, vendor certifications, and good manufacturing practices (GMPs) and recall and trace back procedures are examples of typical preparatory programs. GMPs include things like sanitary facility design, appropriate pest management methods, and the availability and maintenance of hand washing stations and sanitary facilities. SSOPs may include guidelines for reducing cross-contamination within the facility, upkeep of a potable water supply, and particular procedures to guarantee the cleanliness of the facility. A foundation of successful preliminary programs is required for the adoption of HACCP[16,17].

**Kirthika Ravi et al.,****Sanitation standard operation procedures (SSOPs)**

SSOPs must be followed to ensure proper cleaning of surfaces that come into touch with products and those that don't. Raw materials, equipment, employees, personal hygiene, and food product handler practices are all covered by SSOPs. Food HACCP plans mandate that SSOPs be recorded and routinely reviewed. Professional and accountable management must do this SSOP review on a regular basis.

Standard Sanitation standard operation procedures guidelines are

- ❖ Raw materials for food must come from authorized sources and meet appropriate standards.
- ❖ To prevent cross contamination, hazardous or sensitive raw materials must be stored away from other raw materials at the right temperature.
- ❖ Food workers and operators must have access to gloves and hair restraints.
- ❖ Food handlers and operators must always have their permits on hand for inspection.
- ❖ Food handlers or operators should not be permitted to work in facilities where there is a possibility that they may be ill.
- ❖ In locations where food is produced, appropriate hand washing facilities are available and must be used.
- ❖ Making an effective sanitation protocol for operators to follow and choosing the right sanitizer. Work surfaces, tools, and equipment all require routine cleaning and sanitization.
- ❖ Verify sanitation effectiveness on a regular basis.

Good manufacturing practice (GMP)

GMP is a collection of operational standards that deal with both food safety and quality issues that are not essential for lowering the risks to food safety. Guidelines are also a crucial component of a good HACCP plan's formulation. To help lower the risk of food borne illness and ensure the production and distribution of safe foods of a quality fit for human consumption, these standards include direction for food manufacturing, sanitation protocols, testing methodologies, and quality assurance. Many nations adhere to GMP practices and have developed their own GMP standards that are in line with national laws.

In summary, Good manufacturing practice follow the following standard principles:

- ❖ Maintain a clean and sanitary environment in manufacturing locations.
- ❖ To avoid cross-contamination between food products, manage the environment.
- ❖ Create controlled, precisely defined production processes.
- ❖ Validate each critical control point (CCP) to guarantee the reliability and safety of the final product.
- ❖ Control the production process, and assess and validate any changes made to it.
- ❖ It is good documentation practice to explicitly write production instructions (production sheets) and record data for each process step as it is being manufactured.
- ❖ Reduce the possibility of food product contamination during distribution and delivery.
- ❖ Create a method for an immediate recall of any contaminated food distributed for sale[18].

Preliminary steps of hazard analysis and critical control points**Assemble of hazard analysis and critical control points team**

For the formulation of a successful HACCP plan, the food business should ensure that the necessary product-specific knowledge and experience are accessible. The best way to do this is to put together a multidisciplinary team. If such since there is a lack of knowledge, it should be acquired from external sources like trade and industry organizations, unaffiliated specialists, and regulatory bodies. The scope should state which link in the The basic categories of threats that must be handled include the threat to the food chain. Do all risk classes, or only part of them, are covered?

**Kirthika Ravi et al.,****Describe product**

It is important to create a thorough description of the product that includes all necessary safety details, such as its composition, physical/chemical makeup (including Aw and pH), Packaging, durability, storage conditions, microbial/static treatments (heating, freezing, brining, smoking, etc.), and distribution method.

State the desired usage

The desired usage is to be determined by the end user's or consumer's anticipated usage for the product. In some circumstances, it may be necessary to take into account vulnerable segments of the population, such as institutional feeding.

Construct flow diagram

The HACCP team should create the flow diagram, which should include every step of the process for a particular product. Numerous goods that are produced using similar processing methods can all share the same flow diagram. Steps before and after the indicated operation should be taken into account when applying HACCP to them.

On-site confirmation of flow diagram

During all phases and operational hours, Actions must be taken to compare the processing operation to the flow diagram and alter the flow design as appropriate. A person or people with sufficient understanding of the processing procedure should confirm the flow diagram[19, 20].

Directives for the hazard analysis and critical control points system's application

Regardless of the food chain, should have precursor programs like good hygiene practices in accordance with the essential Codex Codes of Practice, Codex General Principles of Food Hygiene, Codex Codes of Practice, and reputable food safety regulations in place before applying HACCP to that sector[21]. To assist the successful application and execution of the HACCP system, These HACCP-related programs, including the training component, should be well-established, confirmed, and in operation[22]. The impact of raw materials, ingredients, food manufacturing practices, the role of manufacturing processes to control hazards, When creating and implementing HACCP systems, hazards must be identified, evaluated, and dealt with in a manner that takes into account the product's likely end-use, at-risk consumer groups, and epidemiological data regarding food safety. The HACCP system's goal is to concentrate control at Critical Control Points (CCPs). If a danger that needs to be controlled is detected but no CCPs are located, the operation should be redesigned [23 , 24].

Implementation of hazard analysis and critical control points

To ensure the safety of medicinal products, the HACCP system detects likely risks. It is economical and results in less product loss and waste. By concentrating on the crucial aspects of the process, it improves the efficiency of the quality system. Instead than depending just on end product testing, it places more of an emphasis on prevention. By increasing consumer confidence in the safety of medicines, it can facilitate regulatory agencies' assessments, encourage international trade, and strengthen the viability of the industry. It complements and strengthens other quality management systems[25]. Some pharmaceutical industry could encounter common barriers or issues when implementing the HACCP system. Significant obstacles include a lack of knowledge and comprehension of HACCP regulations, technical failure, a lack of sources for HACCP information, a lack of employee involvement, and financial limitations. Employee awareness and understanding of the HACCP system was viewed as a major difficulty[26]. Other research' findings support the idea that most personnel in food production organizations are unaware of the HACCP system. The biggest concern as a barrier is a lack of staff commitment and engagement in HACCP implementation. Companies must create rules for all operations and control all manufacturing processes in order to comply with HACCP criteria[27,28].

**Kirthika Ravi et al.,****Maintenance of hazard analysis and critical control points plan**

The HACCP plan's establishment, operation, and verification records must be kept. Control over the HACCP plan record must match that over the system record. Relevant information must be included in a record of the HACCP plan. The following details must be included in the verification record at the very least:

- a) The following information is included in the product description record: plant name and address; processing category; the product's sort, name, dosage, and characteristics; the customer's intended use; the edible (use) method; the packing; the conditions for storage; the length of the warranty; the label's instructions; and the marketing and transportation regulations.
- b) Monitoring record: The monitoring record contains the following information: name of the plant, address, product name, processing date, CCP, significant hazard, critical limit (operation limit), control measure, monitoring method and frequency, actually measured or observed result, signature of the monitoring team, monitoring date, review reviewer's signature, and monitoring record date.
- c) Correction record: Name and address of the manufacturing facility; product name; processing date; description and cause of the deviation; corrective action taken; results obtained; batch; isolated location; assessment procedure; results obtained; and final disposal of the affected product; signatures of the corrective personnel; date of the correction; and date of the correction record.
- d) It is required to keep accurate records for the HACCP plan. The HACCP plan amendment record, the semi-finished product and completed product periodical inspection record, the CCP monitoring review record, the CCP rectification review record, and the CCP site verification record are a few examples of the primary records needed for verification activities.
- e) The HACCP coordinator should be in charge of authorizing revisions and ensuring that all required changes to the work instructions and HACCP plan are made. The plan and work procedures' previous iterations should be recalled and replaced with the new ones. When retraining is necessary, it should be done in accordance with the principles outlined earlier in this text. A crucial technique for ensuring that the HACCP plan is current and being executed on the plant floor is routine auditing. Following is a list of some of the elements that will be evaluated during these audits:
 - ❖ Is the flow diagram still an accurate representation of the line?
 - ❖ Are the raw material specifications and product formulation in accordance with the HACCP plan?
 - ❖ Since the HACCP plan was completed, has the line structure changed?
 - ❖ Are all of the work instructions, checklists, log sheets, and other documents needed to regulate and monitor CCPs accessible on the line? Do they have a purpose? Are they current?
 - ❖ Have all of the line workers received the necessary training, and do they all recognize the value of HACCP?[29].

Training

For HACCP to be implemented effectively, industry, government, and academic people must be trained in its concepts and applications, and consumer awareness must be raised. Working guidelines and protocols that outline the duties of the operational personnel assigned to each Critical Control Point should be prepared as a tool to support the development of particular training to support a HACCP plan. Primary producers, business, trade associations, consumer advocacy groups, and accountable authorities must work together. Opportunities for combined training between industry and control authorities ought to be made available in order to promote ongoing communication, foster mutual understanding, and advance the actual implementation of HACCP^{30,31}.

Hazard analysis and critical control points principle**The seven principles are**

1. Conduct a hazard analysis.
2. Determine the critical control points (CCPs).
3. Establish target levels and critical limit(s).
4. Establish a system to monitor the CCPs.
5. Establish the corrective action to be taken when monitoring indicates that a particular CCP is not under control.

**Kirthika Ravi et al.,**

6. Establish procedures to verify that the HACCP system is working effectively.
7. Establish documentation concerning all procedures and keep records appropriate to these principles and their application[32].

Principle 1: Conduct a hazard analysis

Create a flow diagram that details all handling/preparation stages for a given menu item in order to identify the hazards connected with that item. Once the process flow confirmation has been developed, the HACCP team must evaluate individual hazards at each stage of product manufacturing, testing, and distribution. Safety and quality concerns must be separated when performing a hazard analysis. A biological, chemical, or physical agent that, in the absence of control, presents a danger of illness or injury is referred to as a hazard. The plan won't work no matter how well it is implemented if the HACCP system does not identify the risks that require control and the hazard analysis is done incorrectly. There are two stages to conducting a hazard analysis. The first step, identifying hazards, could be compared to a brainstorming session. The HACCP team examines the product's ingredients, the steps and tools used at each stage of the process, the finished item and how it is stored and distributed, as well as the intended use and intended consumers, during this stage³³. The second stage, known as the hazard evaluation, is carried out following the creation of the list of probable dangers. The HACCP team determines which potential hazards need to be addressed in the HACCP plan during stage two of the hazard analysis. Each potential risk is assessed at this point based on how serious it is and how probable it is to occur. The seriousness of the effects of exposure to the risk is referred to as severity. The seriousness of the effects of exposure to the risk is referred to as severity. The food, its preparation process, transportation, storage, and the people who will likely consume the product should all be taken into account when evaluating each potential hazard to see how they might affect the likelihood and severity of the threat being mitigated. The group must consider the effects of anticipated food preparation and storage procedures as well as if its target demographic is more susceptible to a potential hazard[34]. Conducting a two-stage risk analysis is advised. Making a list of potential risks for each step could be the first step. The thorough risk assessment will contain

- ❖ significant risks and their potential sources
- ❖ The risk that a hazard will develop in the absence of suitable controls.
- ❖ A basis for determining if the risk merits inclusion in a subsequent HACCP assessment[35].

Principle 2: Determine the critical control points (CCPs)

Using control to prevent, remove, or reduce a risk to an acceptable level for food safety is known as a critical control point (CCP). It is necessary to address any serious hazards found during the hazard analysis[36]. Food safety risks are recognized at various points or steps in the process that need to be adjusted. It is crucial to totally and precisely identify CCPs in order to reduce the hazards to food safety. The HACCP team needs the data generated during the hazard analysis to determine which process steps are CCPs. At every level where a control must be put in place to mitigate the same risk, there might be more than one CCP. A more effective and appropriate method for reducing the number of CCP is to use a decision tree, which encourages a logical approach. Critical control points for preventing each of the mentioned hazards are noted. Critical control points are those parts of the process where losing control could pose an unacceptable danger to health. To guarantee the product's safety, these criteria must be kept under control. After a product has been processed, careful temperature control may be one important control point[37]. At every level where a control must be put in place to mitigate the same risk, there might be more than one CCP. A more effective and appropriate method for reducing the number of CCP is to use a decision tree, which encourages a logical approach. Each processing step where a risk exists is the subject of a series of questions asked using the decision tree method. The answers to these questions, which are presented in a yes/no format, eventually determine whether a given step is considered CPP or not. If the hazard has been identified, its control is necessary, and there are no control mechanisms in place, one must be created[38].

**Kirthika Ravi et al.,****Principle 3: Establish target levels and critical limit(s)**

A CCP needs to limit a biological, chemical, or physical feature to a maximum and/or minimum value in order to avoid, remove, or reduce the incidence of a risk to food safety to a manageable level. Crucial boundaries are determined based on regulatory action levels or historical data. There are times when more than one crucial limit is needed at a certain moment. A critical limit is used to distinguish between safe and harmful operating conditions at a CCP. The HACCP team must use prudence when establishing critical limits that are as realistic as possible for the process in question. Setting important limitations helps with the implementation of an effective monitoring and control system. Critical limitations should not be confused with operational limits, which are set for reasons other than maintaining the safety of food. To ensure that the risks identified are minimized, addressed, or reduced to manageable levels, each CCP will have one or more controls. While some crucial boundaries may be outlined in laws, codes of conduct, and guidelines, others may require experimental evidence to be gathered or cited, or guidance from experts with specialized knowledge.[39,40].

Principle 4: Establish a system to monitor the critical control points

A set sequence of observations or measurements is known as monitoring. Its goals are to ascertain whether a CCP is under control and to produce an accurate record that can be verified afterwards. Three key objectives are served by monitoring. First, monitoring is crucial for managing food safety since it makes it easier to keep track of the process. Action can be made to regain control of the process if monitoring shows a tendency toward loss of control in order to prevent a breach of a crucial threshold. Second, monitoring is used to determine whether a CCP experiences a loss of control and a diversion, or when a critical limit is either exceeded or not fulfilled[41]. As a result, it's crucial to completely outline how, when, and by whom monitoring is to be carried out. A suitable remedial action must be implemented when a deviation occurs. Thirdly, it offers textual evidence that can be used for verification. It is necessary to define specific monitoring protocols for the important control point(s). Without a precise strategy for gathering data on the key control point, having a maximum temperature for a control point is of limited use[42] If the safety of a product depends on the addition of acid, then the pH or acid content limitations must be established and tracked. A designated individual with the knowledge and power to implement remedial actions when necessary must evaluate the monitoring data. If monitoring is not continuous, it must be done frequently or in significant amounts to ensure that the CCP is under check. Line supervisors, maintenance employees, and, where necessary, members of the quality control team should all be involved in production while monitoring CCPs and control measures. They ought to receive training on monitoring techniques. A trustworthy monitoring process and frequency should be determined where continuous monitoring is possible. Then, mechanisms for gathering data or doing sampling should be statistically developed. All records and papers pertaining to the monitoring of CCPs must be signed and dated by the person(s) conducting the monitoring and the responsible reviewing official(s) of the company. Either continuously or very rarely, the crucial limit is being observed. It is possible to design a computer system for periodic measuring. A person will need to keep an eye on or even frequently calibrate this device to ensure that it operates effectively. When the use of sporadic monitoring is used, industry workers must conduct frequent inspections[43].

Principle 5: Establish the corrective action to be taken when monitoring indicates that a particular critical control points is not under control

The correct procedures must be performed when a vital threshold is crossed without error (a process variation). Corrective actions that are both long-term and short-term can be taken. The proper records must be kept. To address deviations when they happen, Each CCP in the HACCP system requires the creation of specific corrective measures. The CCP must be brought under control as a result of the acts. The contaminated product must be properly disposed of as part of the actions performed. Procedures for handling deviations and discarding products must be included in the HACCP records. Plant management must make a strategy in advance to address anticipated deviations from defined critical limits because HACCP is a preventive system to address issues before they influence food safety. When a critical control point limit is surpassed, the plant must act right away to fix the situation. The corrective action must be decided upon in advance by the plant management. The staff members in charge of keeping an eye on

**Kirthika Ravi et al.,**

the crucial control point have to be trained in this procedure and have a thorough understanding of it. Corrective actions should preferably involve the consideration of:

- ❖ the present, i.e., what is going to happen immediately in the production operation and how can control be regained, which may include an investigation of what went wrong,
- ❖ the past, i.e., what is going to be done with the product if it is judged to be non-conforming, that is out of specification in terms of safety and/or quality criteria,
- ❖ the future, i.e., how to prevent loss of control from happening again in the future,
- ❖ who is to act and has responsibility and authority for the actions taken, and
- ❖ the record to be taken[44,45].

Principle 6: Establish procedures to verify that the HACCP system is working effectively

Verification is described as the processes that, Along with monitoring, make sure the HACCP plan is accurate and that the system is operating in compliance with it. A HACCP strategy requires verification in four stages:

1. Verify the soundness of the critical limits at all CCPs.
2. Verify that the HACCP plan is being effectively executed at the establishment.
3. In order to ensure that the plan is being implemented correctly, regulatory personnel should review it.
4. Verify that all monitoring equipment is accurate[46].

The effectiveness of the HACCP system can be assessed using verification and auditing techniques, protocols, and tests, such as random sampling and analysis. The HACCP system's effectiveness should be confirmed by the frequency of verification, which should be sufficient.

Examples of verification activities include:

- ❖ review of the HACCP system and its records;
- ❖ review of deviations and product dispositions;
- ❖ Confirmation that CCPs are kept under control.

First, the HACCP plan must be verified to confirm that it is technically and scientifically sound, that all dangers have been identified, and that, if the HACCP plan is correctly executed, these hazards will be successfully controlled⁴⁷. Additionally, a routine thorough assessment of the HACCP system by a dependable, impartial outsider is beneficial. In addition to an on-site examination of all flow diagrams and the pertinent records of the plan's a technical assessment of the hazard analysis and each HACCP plan component should be included. It is necessary to do such a thorough verification, which is independent from other verification processes, to confirm that the HACCP plan is successfully reducing the risks. The HACCP team should make the necessary modifications to the HACCP plan if the findings of the thorough verification reveal any flaws. Although validation reveals that the company performs what it intends to do in order to ensure that the HACCP plan is followed, verification verifies that this is the case.⁴⁸.

Principle 7: Establish documentation concerning all procedures and keep records appropriate to these principles and their application:

During the HACCP study, documentation will contain process flow diagrams and tables (records of the creation and monitoring of HACCP plans). The deployment of a HACCP system depends on effective and accurate documentation and record keeping, which should be adequate for the nature and scale of the operation. Without records, there will be no proof that a plant follows the HACCP plan's instructions. Records can be consulted to spot patterns and improve a process over time. Processes including hazard assessment, CCP determination, HACCP plan creation, and crucial limiting procedures all require documentation[49]. Examples of activities for which documentation is required include:

- ❖ hazard analysis;
- ❖ CCP determination;
- ❖ HACCP plan;
- ❖ Critical limit determination.

**Kirthika Ravi et al.,****A HACCP plan's records include the following:**

- ❖ A list of the HACCP team's members and their respective roles
- ❖ Each menu item should have the following: a description, a flow diagram showing the CCPs for each item, hazards and preventive measures, critical limits, monitoring protocols, and corrective action plans.
- ❖ Record-keeping processes HACCP plan verification procedures
- ❖ Finally, it is very important to have procedures for verifying that the HACCP plan is being followed and that it working according the plan[50].

Barriers or challenges to successful implementation of hazard analysis and critical control points

1. Due to the lack of enough resources, practical knowledge, and qualified employees for HACCP execution, small to medium-sized pharmaceutical organizations may find it difficult to adopt HACCP, but comparatively large companies may find it easier[51,52].
2. Lack of motivation and oversight - Maintaining the HACCP system's functionality depends heavily on staff motivation. Staff supervision is crucial at every level for the proper operation of HACCP. The HACCP system's dedicated workforce plays a significant role in implementing and maintaining the HACCP framework, particularly with regard to the demands for ongoing surveillance and reporting.[53].
3. One of the main challenges brought on by the lack of employee training for HACCP is the lack of workers with expertise and awareness of the system. Typically, training sessions are designed with specific staff members or groups in mind, taking into account their level of technical expertise and level of responsibility throughout the HACCP process. This enables staff to apply the HACCP idea to their particular processes[54,55].
4. Small pharmaceutical companies typically lack the purchasing power to support HACCP implementation costs, and they are also frequently unable to persuade or effectively pressure their suppliers to adopt the HACCP system[56].

Advantages of hazard analysis and critical control points implementation in the pharmaceutical industry

- ❖ The benefits of applying HACCP include maximizing resource efficiency and providing quick fixes for product safety issues in addition to raising the safety of pharmaceuticals.
- ❖ HACCP reduces the amount of required end product laboratory testing, the number of non-compliant products, and even the number of required sample plans for process control.
- ❖ Due to documenting and record keeping, HACCP can help regulatory bodies with inspections. Additionally, by increasing consumer confidence in the safety of medicines, it promotes both firm stability and international trade.
- ❖ HACCP increases the effectiveness of the quality system by highlighting key components of a method and focusing on preventing problems rather to relying solely on assessing the final output[57].

DISCUSSION

In our article, we focused on how to identify industry challenges to HACCP and food safety procedures. One of the main barriers to the application of HACCP is a lack of knowledge and understanding. It is vital to remember that HACCP is a management tool and that merely enacting HACCP guidelines does not ensure food safety. As conclusion, lack of knowledge and other food safety programs were determined as the main barriers to food safety in food businesses. Lack of prerequisite programs and the inadequate physical condition of the facility were also identified as other barriers. It is suggested that tools like HACCP must be employed in pharmaceutical companies to prevent losses and product rejections owing to poor quality. HACCP must be properly developed, efficiently implemented, and continually reviewed and improved for it to be effective in a facility's handling or processing of food.

ABSTRACT

The mathematical model of nanofluid thermal conductivity has been discussed in this research. The issues this study seeks to answer will help researchers gain a better understanding of what influences the thermal conductivity of nanofluids. When it comes to the other two, nanolayer Research also takes into account the thickness and diameter of the nanoparticles. Changing just one factor while keeping the others the same produces the desired result. Thicker nanolayers were thought to have higher heat conductivity. There were measurements made of the thickness of a water and ethylene glycol nanolayer. Graphs displaying the calculated thermal conductivities of a variety of nanofluids are provided. Visualizations and numerical calculations of heat transfer coefficient versus volume fraction for varying Reynolds and Prandtl numbers. As the heat capacity ratio increases, heat exchangers become more efficient and effective.

Keywords: Thermal Conductivity, heat transfer coefficient, pumping power, performance index, specific heat

INTRODUCTION

The need for high-efficiency engines has grown as automobile technology has advanced. Lightening the load on vehicles is essential to achieving environmental sustainability, hence optimizing radiator design and size is essential. Adding fins to a radiator is one way to speed up its cooling time. But the standard approach, which makes use of fins and microchannels to speed up the cooling process, can only go so far. Water and ethylene glycol, two popular heat transfer fluids, have a relatively low thermal conductivity. Therefore, the development of novel heat transfer fluids capable of significantly boosting the efficiency of a vehicle's cooling circuit is of the utmost importance. Nanofluids could one day replace traditional coolants in vehicle engines. Several recent investigations have shown that nanofluids excel at heat transmission. Adding nanoparticles to a base fluid like water, ethylene glycol, oil, or air can increase the fluid's thermal conductivity, allowing it to be used in a number of situations where the weak thermal conductivity of regular liquids would be a hindrance. The added nanofluids significantly improved the base fluids' thermal conductivity. The nanofluid thermal conductivity must be evaluated with the original goal of measuring this improvement in mind. To create the basic fluid, we combined equal parts water and ethylene glycol. Nanoparticles can be used to improve a coolant's heat transfer efficiency by increasing its surface area for heat transmission. To achieve optimal heat transfer, however, the concentration of Al_2O_3 and CuO nanoparticles must be established. Because of the complexity of its geometry, there are less publicly available explorations of this air cooler arrangement, which consists of louvered fin and flat tube. Now, conventional liquids like water, ethylene glycol, and oil are being used to create a new category of fluids known as nanofluids, thanks to advances in nanotechnology that have enabled the synthesis of a wider variety of nano-scale materials. It is proposed that nanoparticles be studied in combinations of water and liquid catalytic materials (as the base liquid) utilized in automobile radiators.

Several compounds are sometimes added to the water in a car's radiator to keep it from freezing or boiling over in extremely cold or hot weather. It prevents the radiator fluid from freezing during the winter and the automobile from overheating during the summer. Glycols make up the vast majority of these auxiliary chemicals, EG in particular. Automobile radiators, computer fluid cooling systems, chilled water cooling systems, and so on are typical examples of convective heat transfer methods that make use of EG. Since water is a more efficient motor coolant, it has been combined with EG. The issue with water is that at very high temperatures, it either ceases to move or begins to bubble. When EG is added to water, it significantly improves the liquid's resistance to freezing. Although water and other liquids can be used as coolants, the true power to withstand high temperatures is found in the radiator fluid. The impact of heat source type and position on flow and heat characteristics of flow within enclosed cavities was studied by Oztop et al. (2015), who looked at research that used two- and three-dimensional computational analyses in addition to experimental methodologies. Alkhalidi et al. (2016) ran simulations with different values of the conductivity ratio, Rayleigh number, and cavity tilt angle to see how the system would react. Al-Kouz et al. (2018) found that by adding Al_2O_3 nanoparticles to a low-pressure gaseous flow at the system's base, heat transfer was enhanced. In a numerical study, Al-Kouz et al. (2018) examined how the Knudsen number, Rayleigh number, porosity, location, length, tilt angle, and conductivity ratio affected low-pressure flow and heat transfer in an inclined enclosed cavity. They linked these other parameters to the Nusselt number. Radiator coolant nanofluids made from water and antifreeze were evaluated by Geetha and Sudhakar babu (2019). Using magnetic nanofluid (Fe_3O_4 suspended in water), Abdulwahab et al. (2020) demonstrated how fluid flow and heat transfer could be improved inside square, circular, and triangular straight channels with a hydraulic diameter of 0.01 m, regardless of the presence or absence of magnetic fields. In a comprehensive review, Oudina and Chabani (2022) discussed the exciting scientific progress made in the area of heat transfer improvement. Mohamed et al. (2023) investigated how varying the Al_2O_3 nanofluid concentration from 0.05% to 0.4% by volume, the nanofluid mass flow rate inside the tube, the water flow rate via the annulus, and the inlet temperature inside the tube affected the Nusselt number. Both the nanoparticle concentration per unit volume and the Reynolds numbers of the flows inside the tube and through the annulus were found to enhance the Nusselt number and the friction factor.

**Mathematical Formulation**

Thermal conductivity in $W/m.K$ given by Purohit *et al.* (2016) is

$$k_{nf} = \frac{k_p + 2k_{bf} + 2(k_p/k_{bf})\phi}{k_p + 2k_{bf} - (k_p - k_{bf})\phi} \quad (1)$$

Where ϕ denotes the nanoparticles' proportional share in the volume.

Wang *et al.* (2008) has given the formula for density in kg/m^3

$$\rho_{nf} = (1 - \phi)\rho_{bf} + \phi\rho_p \quad (2)$$

The formula for specific heat $J/kg.K$ given by Khanafer *et al.* (2011) as

$$c_{nf} = \frac{(1-\phi)\rho_{bf}c_{bf} + \phi\rho_p c_p}{\rho_{nf}} \quad (3)$$

The expression for viscosity ($kg/m.s$) due to Batchelor *et al.* (1977) is

$$\mu_{nf} = (1 + 2.5\phi + 6.2\phi^2)\mu_{bf} \quad (4)$$

For coolant-side, the heat transfer coefficient can be expressed as:

$$h_{nf} = \frac{Nu_{nf}k_{nf}}{D_{nf}} \quad (5)$$

Where D_{nf} is diameter of nanofluid.

The experimental results were used to establish a correlation that allowed us to predict the Nusselt number of the silver-water nanofluid with an accuracy of within 10%.

$$Nu_{nf} = 0.023Re_{nf}^{0.8}Pr_{nf}^{0.3} + (0.617\phi - 0.135)Re_{nf}^{0.445\phi - 0.37}Pr_{nf}^{(1.081\phi - 1.305)} \quad (6)$$

Nusselt number for base fluid has been calculated by

$$Nu_{bf} = \frac{f_f Re_{bf} Pr_{bf}}{\sqrt{2[1.07\sqrt{2} + 12.7\sqrt{f_f}(Pr_{bf}^{2/3} - 1)]}} \quad (7)$$

The coefficient of friction has been determined by calculation from

$$f_f = (1.58Re_f - 3.28)^{-2} \quad (8)$$

The Prandtl number of the nanofluid can be determined

as:

$$Pr_{nf} = \frac{\mu_{nf}c_{nf}}{k_{nf}} \quad (9)$$

The entire heat transfer coefficient can now be calculated as follows:

$$\frac{1}{UA} = \frac{1}{\eta_o h_a A_a} + \frac{1}{h_f A_f}$$

The Number of transfer units (NTU) of the nanofluid can be determined as:

$$NTU = \frac{UA}{C_{min}} = \frac{Q}{\Delta T C_{min}} \quad (10)$$

Q is average of heat transfer rate.

$$C_{min} = \min(C_c, C_h)$$

The heat exchanger effectiveness (ϵ) due to Leong *et al.* (2010) can be determined as:

$$\epsilon = 1 - \exp\left[\frac{NTU^{0.22}}{C^*} \exp(-C^* NTU^{0.78} - 1)\right] \quad (11)$$

Total heat transfer rate is given by

$$Q = \epsilon C_{min} [T_{Fluid (inlet)} - T_{air (inlet)}] \quad (12)$$

The power needed to pump coolant is provided by

$$P = V_f \Delta P \quad (13)$$

Where V_f is volumetric flow rate of fluid.

The performance index at this point can be defined as

$$P.I. = \frac{Q}{P} \quad (14)$$

RESULTS AND DISCUSSION

Graph (1) displays the size-dependent changes in effective thermal conductivity with nanolayer thickness for a variety of nanofluids. Our research shows that, of the nanofluids we examined, ZnO water (10 nm) has the highest effective thermal conductivity and TiO₂ water (10 nm) has the lowest. Graphs (2) and (3) show how the heat transfer coefficient varies as a function of the volume % of nanoparticles for a range of Reynolds and Prandtl values. As the Reynolds and Prandtl numbers rise, so does the heat transfer coefficient. Graphs (4) and (5) show the dependence of the Prandtl number on the volume fraction of nanoparticles for Al₂O₃ water (60.4 nm), Al₂O₃ ethylene glycol (26 nm), and TiO₂ water (10 nm), TiO₂ ethylene glycol (34 nm). Al₂O₃ ethylene glycol has a larger Prandtl number (26 nm) than Al₂O₃ water (60.4 nm), but TiO₂ ethylene glycol has a smaller Prandtl number (10 nm) than TiO₂ water (34 nm). Graph (6) shows how the Nusselt number of nanofluids changes as the volume percentage of nanoparticles changes for a range of Reynolds numbers. It has been discovered that as the Reynolds number rises, so does the Nusselt number of nanofluids. Graph (7) displays the relationship between the effective thermal conductivity and nanoparticle diameter for CuO water (18 nm) and CuO water (23.6 nm). CuO water (18 nm) is shown to have a higher effective thermal conductivity than CuO water (23.6 nm). The effective thermal conductivity of nanofluids is also found to decrease with increasing nanoparticle diameter. Graph (8) shows that as nanoparticle diameter grows, so does the volumetric ratio. TiO₂ water (34 nm) has a higher volumetric ratio than TiO₂ ethylene glycol (34 nm), as shown in the graph. The volumetric ratio of CuO water (23.6 nm) is greater than that of CuO water (18 nm) as shown in Graph 9. Graph (10) displays the relationship between heat transfer efficiency and NTUs for various nanofluid heat capacities. It has been found that a higher heat capacity ratio results in a more efficient heat exchanger. Graph (11) displays how the performance index varies with the volumetric flow rate of fluid for various heat capacity ratios of nanofluids. A higher heat capacity ratio is associated with a higher heat performance index.

Concluding Remarks

The thermal conductivity can be calculated using a mathematical model that was constructed. This model is a function of the thermal conductivities of both the fluid and the nanoparticle, as well as the nanolayer, volume fraction, and nanoparticle diameter. In light of the findings that were collected and validated, it has been determined that the thickness of the nanolayer that surrounds the nanoparticles as well as the Brownian motion play an essential part in the process of increasing the thermal conductivity of nanofluids. By solving the mathematical model with the help of the different assumptions, one can have a better understanding of the components that affect the overall improvement in thermal conductivity. It was discovered that the model that had been established could be used for virtually all of the nanofluids. The rise in the concentration of nanoparticles in nanofluids and the thickness of the nanolayers of nanofluids both contribute to an increase in the thermal conductivity of the nanofluids. When the diameter of the nanoparticles is increased, the thermal conductivity of the nanofluids experiences a drop. A potential line of inquiry for further research would be to investigate the causes that led to this result's limitations. Therefore, the application of this cutting-edge technology, which consists of suspending nanoparticles in base fluids, could offer solutions for better thermal management. An enhanced comprehension of complicated nanofluids will have an influence that is even more widespread.

ABSTRACT

This study explores the multifaceted benefits of digitalisation in the organised retail sector of Kerala. It examines how digitalisation impacts organised retail businesses in Kerala, focusing on factors such as retail type, outlet age, employee numbers, and outlet size. Data were collected through questionnaires from 330 retail outlets in the Food & Grocery, Apparel, and Consumer Electronics sectors. Through an exploratory and confirmatory factor analysis, eight dimensions of digitalisation categorised into economic, technological, and social benefits were identified. Key findings reveal significant improvements in operational performance, market expansion, customer support, digital marketing strategies, and employment opportunities. While outlet age and sector showed no significant impact on digital benefits, larger outlets and those with more employees experienced greater advantages. These findings highlight the universal relevance of digitalisation in retail and the need for targeted strategies for smaller outlets.

Keywords: digitalisation, economic benefits, technological benefits, social benefits, outlet age, outlet size.

INTRODUCTION

Digitalisation has emerged as a pivotal force transforming the global retail landscape, enabling businesses to innovate, optimise operations, and enhance customer experiences (Grewal et al., 2020). It involves the integration of digital tools and technologies into various aspects of business operations, resulting in improved efficiency, cost reduction, and better customer engagement (Brynjolfsson & McAfee, 2014). The retail sector in India, which is among

**Ninikala**

the fastest-growing in the world, has embraced digitalisation to keep pace with evolving consumer preferences and competitive pressures (Kumar & Gupta, 2021). The organised retail sector in Kerala provides a unique context to examine the impact of digitalisation due to its diverse retail ecosystem, ranging from large-format stores to technologically advanced retail chains. Retailers in Kerala have adopted digital technologies such as inventory management systems, digital marketing platforms, and cashless payment methods to enhance operational efficiency and cater to digitally savvy consumers (Raj & Abraham, 2019). Despite these advancements, there is limited empirical evidence on the multidimensional benefits of digitalisation within Kerala's retail sector. This study seeks to bridge this gap by categorising the benefits into economic, technological, and social domains and examining the variations across outlet characteristics. The findings are intended to provide actionable insights for retailers aiming to harness the full potential of digital transformation.

RESEARCH OBJECTIVES

1. To evaluate the economic, technological, and social benefits of digitalisation in retail operations.
2. To explore differences in digital benefits based on retail type, outlet age, employee numbers, and outlet size.

HYPOTHESES

Ho: There is no significant difference in the benefits of digitalisation among the different types of retail units.

H1: There is a significant difference in the benefits of digitalisation among the different types of retail units.

Ho: There is no significant difference in the benefits of digitalisation with respect to outlet age.

H1: There is a significant difference in the benefits of digitalisation with respect to outlet age.

Ho: There is no significant difference in the benefits of digitalisation with respect to employee numbers.

H1: There is a significant difference in the benefits of digitalisation with respect to employee numbers.

Ho: There is no significant difference in the benefits of digitalisation with respect to outlet size.

H1: There is a significant difference in the benefits of digitalisation with respect to outlet size.

RESEARCH PROBLEM

Despite the rapid adoption of digital technologies in the retail sector, there is limited empirical evidence on how these transformations impact organised retail businesses, particularly in Kerala. The extent to which digitalisation enhances operational performance, market share, customer engagement, and employment opportunities remains underexplored. Furthermore, the differential benefits experienced by retail outlets of varying sizes, types, and digital maturity levels necessitate a deeper investigation. Addressing this gap is crucial for guiding strategic decision-making and fostering sustainable growth in the sector.

MATERIALS AND METHODS

This study was designed as descriptive research, utilising both primary and secondary data. Primary data were collected from organised retail outlets in the Food & Grocery, Apparel, and Consumer Electronics sectors using pre-tested questionnaires. The questionnaire was distributed to 330 retail outlets (110 from each sector). A pilot study was conducted with 60 respondents to ensure reliability and validity. Reliability was ensured using Cronbach's alpha, normality was assessed through statistical tests, and validity was confirmed through expert reviews. A Likert scale was used to measure responses.

Sample Design

The population for this study comprises organised retail outlets in Kerala. A non-probability sampling technique was employed to select the sample respondents. The sampling process was conducted in the following stages:

**Ninikala****Stage 1: Selection of Cities**

Three major cities in Kerala with a high concentration of organised retail outlets were selected: Thiruvananthapuram, Ernakulam, and Kozhikode.

Stage 2: Selection of Retail Sectors

Three retail sectors were chosen based on their significant contribution to organised retail, as indicated by industry updates (Rating, 2019; IBEF, 2019). These sectors include Food & Grocery, Apparel, and Consumer Electronics.

Stage 3: Selection of Retail Outlets

Retail outlets from the identified sectors were selected using convenience sampling methods.

RESULTS AND DISCUSSIONS**DIMENSIONS OF DIGITALISATION BENEFITS**

From the exploratory factor analysis (EFA), eight dimensions of the benefits of digitalisation were identified, which were categorized into economic, technological, and social benefits. These dimensions are:

- **Economic Benefits:** Operational Performance, Increased Market Share
- **Technological Benefits:** New Market Opportunities, Inventory Management, Digital Marketing
- **Social Benefits:** Better Customer Support, Digital Payment, Employment Opportunities

Economic Benefits

- **Operational Performance:** Two key indicators were identified, with factor loadings of 0.776 and 0.663, indicating that digitalisation improves operational performance in retail outlets, surpassing traditional methods.
- **Increased Market Share:** Five indicators showed a significant influence on this dimension, with factor loadings ranging from 0.531 to 0.763. Digitalisation enables access to new markets, enhances customer awareness, allows for differentiation from competitors, provides better product information, and eases customer purchase processes.

Technological Benefits

- **New Market Opportunities:** Digitalisation helps identify new markets and expand businesses, with factor loadings of 0.666 and 0.602, respectively, highlighting the significance of digitalisation in business growth.
- **Inventory Management:** Three indicators were identified with factor loadings from 0.575 to 0.756, suggesting that digitalisation of inventory recording and management improves efficiency and stock level assessment.
- **Digital Marketing:** Six indicators revealed strong influences on digital marketing, with factor loadings from 0.452 to 0.864. Digital marketing platforms like social media have proven more cost-effective and better at targeting the desired audience compared to traditional marketing methods.

Social Benefits

- **Better Customer Support:** Digitalisation offers wide product/service variety, reduces prices, enhances customer service, and helps understand customer preferences. The factor loadings ranged from 0.556 to 0.938, underscoring digitalisation's pivotal role in improving customer relationships.
- **Digital Payment:** This dimension had five indicators with factor loadings from 0.358 to 0.896, demonstrating the significant role of digital payment methods (such as e-wallets and POS systems) in reducing cash handling risks and customer preference for digital transactions.
- **Employment Opportunities:** Four indicators revealed that digitalisation significantly influences employment, especially for technically qualified individuals, with the highest factor loading (0.958) for the role of social media marketing in creating jobs.

**Ninikala****CONFIRMATORY FACTOR ANALYSIS (CFA)**

CFA confirmed that all the models for the eight dimensions fit adequately, with significant regression coefficients across most indicators. The CFA results indicated that the most influential indicators were:

- **Operational Performance:** "Digitalisation improves the operational performance of the retail outlets" and "Operational performance of the traditional period was much better" had strong regression coefficients (0.803 and 0.853).
- **Increased Market Share:** All five indicators showed regression coefficients greater than 0.4, with the highest variance explained by the indicator "Digitalisation opens an avenue for customers to make purchases easier" (0.838).
- **New Market Opportunities:** Both indicators ("Digitalisation helps to identify new market opportunities" and "Digitalisation helps to expand businesses") had strong regression coefficients of 0.948 and 0.866.
- **Inventory Management:** Three indicators had significant regression coefficients, with "Recording of stock is fully digitalised" being the most influential (0.781).
- **Digital Marketing:** The indicator "Digital marketing reduces the cost of marketing" had the highest variance explained (88%).
- **Better Customer Support:** "Going digital has helped to better understand customer preferences" (0.938) was the most significant factor.
- **Digital Payment:** "Digitalisation reduces the risk in handling cash" had the strongest influence, with a regression coefficient of 0.896.
- **Employment Opportunities:** "Employment opportunities increased only for technically qualified persons" had the highest variance explained (91.8%).

COMPARISON OF THE BENEFITS OF DIGITALISATION ACROSS VARIOUS RETAIL SECTOR

The analysis shows that there is no significant difference in the benefits of digitalisation among the three retail sectors—Food & Grocery, Apparel, and Consumer Electronics as indicated by the acceptance of the null hypothesis (H_0) due to a p-value greater than 0.05. The mean values of benefits are very similar across these sectors: Food & Grocery (106.93), Apparel (106.25), and Consumer Electronics (107.20). This consistency highlights that digitalisation delivers uniform advantages across different retail categories. Key dimensions contributing to these benefits include improved operational performance, increased market share, new market opportunities, enhanced inventory management, effective digital marketing, better customer support, streamlined digital payments, and expanded employment opportunities. These findings suggest that digital strategies and tools are equally impactful across diverse retail units, enabling retailers to adopt similar digitisation initiatives and achieve comparable improvements. This universality also supports the formulation of broad-based digitalisation policies applicable to all retail sectors without requiring sector-specific differentiation.

DIGITALISATION BENEFITS AND OUTLET AGE

The analysis indicates no significant difference in the benefits of adopting digital methods based on the age of retail outlets, as the null hypothesis (H_0) was accepted due to a p-value greater than 0.05. The mean scores of digital benefits across different age groups of outlets are relatively close: outlets up to 10 years old scored 106.42, those between 11–20 years scored 109.74, outlets between 21–30 years scored 102.27, and those above 30 years scored 104.07. These results demonstrate that the advantages of digitalisation, such as improved operational performance, market share growth, better inventory management, and enhanced customer support, are consistent regardless of the outlet's age. The findings suggest that digital methods are universally effective across retail outlets, irrespective of their longevity, reinforcing the applicability of digital tools and strategies across both newer and more established retail businesses.

EMPLOYEE NUMBER AND THEIR EFFECT ON DIGITALISATION BENEFITS

The results of the one-way ANOVA indicate a significant difference in the benefits of adopting digital methods based on the number of employees in retail outlets, as evidenced by a p-value less than 0.05. Consequently, the null hypothesis (H_0) is rejected, and the alternate hypothesis (H_1) is accepted. The mean scores of digitalisation benefits

**Ninikala**

increase with the number of employees: outlets with 100 or more employees have the highest mean score (124.45), followed by outlets with 50–100 employees (116.32), 25–50 employees (110), and less than 25 employees (102.7). A post hoc test further reveals that significant differences exist between most groups, except for the 25–50 and 50–100 employee categories, where the p-value is greater than 0.05. This suggests that larger outlets experience greater benefits from digitalisation compared to smaller outlets. The findings imply that the scale of operations, driven by the number of employees, amplifies the effectiveness of digital methods, potentially due to better resource utilization, more extensive digital adoption, and higher operational capabilities in larger outlets.

EFFECT OF OUTLET SIZE ON DIGITALISATION BENEFITS

The analysis indicates significant differences in the benefits of digitalisation across retail outlets of varying sizes, with larger outlets deriving greater advantages. Retail outlets of 20,000 square feet and above scored the highest (123.74), followed by outlets of 5,000–10,000 sq. ft. (122.67) and 10,000–20,000 sq. ft. (122.20), which showed similar benefit levels. Post hoc tests reveal that outlets less than 1,000 sq. ft. and 1,000–5,000 sq. ft. experience significantly fewer benefits compared to all other size groups, while outlets of 20,000 sq. ft. and above show significant differences only with the smallest outlets. These findings suggest that larger retail outlets can better leverage digitalisation, likely due to their capacity for advanced technological adoption and operational scalability, while smaller outlets may need targeted strategies to enhance digital benefits.

POLICY AND STRATEGIC IMPLICATIONS**Support for Smaller Outlets**

Develop targeted strategies to enable smaller outlets to leverage digital benefits effectively.

Inclusive Policy Frameworks

Formulate policies to promote uniform adoption of digital tools across sectors.

Enhancing Workforce Skills

Focus on training programs to equip employees with technical skills.

Resource Allocation

Encourage investments in scalable digital solutions for larger and mid-sized outlets.

CONCLUSION

The study demonstrates that digitalisation significantly enhances the operational and economic efficiency of retail outlets, fostering better market opportunities and customer relationships. While the benefits are uniform across retail types and outlet ages, larger outlets and those with more employees gain more advantages due to higher resource capacity and operational scalability. Smaller outlets, however, face challenges in leveraging these benefits effectively. Policymakers and stakeholders should focus on creating accessible digital solutions and providing support to smaller retailers to ensure equitable digital transformation across the sector.

ABSTRACT

Consumer preferences have changed in favour of herbal products in recent years, probably as a result of growing concerns about artificial substitutes and growing awareness of natural remedies. This study elucidates the characteristics that propel consumers toward herbal goods, highlighting the factors that impact their attitudes, preferences, and purchasing behaviour. A mixed-methods approach is used in this study including surveys and in-depth interviews to investigate consumer perceptions of herbal medicines' safety, efficacy, and environmental impact relative to conventional drugs. Key findings from the Factor Analysis (FA) technique indicate that despite concerns about product authenticity and regulatory constraints, people trust herbal remedies more because they perceive them to be natural with fewer side effects.

Keywords: Herbal products, Consumers, EDA, FA, Public health, Buying behaviour.

INTRODUCTION

In today's fast-paced society, characterized by rising stress, pollution, and sedentary lifestyles, the pursuit of comprehensive well-being has never been more pressing. A notable upsurge of interest in herbal items as natural therapies to support health, energy, and balance has occurred in this pursuit. For ages, herbal products—which are made from plant materials like roots, leaves, petals, and seeds—have been a crucial component of conventional medical practices. Not only in medical aspects, but also in their regular life routine wishes to take up herbal products as our ancestors practised regularly (Ex: Neem stick for brush). Herbal goods are becoming more and more popular

**Uma and Hariharan**

as a result of a noticeable movement in consumer behaviour in recent years toward a healthier way of living. Due to their purported health benefits, herbal products—which are sourced from natural sources including plants, herbs, and botanical extracts—have become increasingly popular among consumers worldwide.

REVIEW OF LITERATURE

Gaining insight into how consumers view herbal goods is crucial for a range of stakeholders, including as researchers, marketers, legislators, and medical experts. It offers insightful information about the preferences, motives, and worries influencing customer behaviour in the market for herbal items. According to Kavita Sekhri et al. (2013), as herbal products are widely utilized to treat a variety of health issues, it is important to educate students about their use and improve their immunity level as well. People's need to be made aware of their potential drug interactions and safety issues. According to Kisan Shivaji Rao Desai's (2014) study, a number of factors have a big impact on what people decide to buy when it comes to herbal items in Kolhapur. The study improved consideration of consumer behaviour for cosmetic corporations by utilizing statistical methods and practical sampling. Consumer perception of Vindhya herbal products in Bhopal, India, is observed by Md. Irshad Ali et al. (2015), with a focus on awareness, usage, preferences, and attitudes toward herbal products. Only 23% of respondents to a bilingual study reported using Vindhya Herbal, but those who did liked it if it was accessible nearby. Because herbal goods are made of natural substances, most customers believe them to be safe and acts as immunity boosters. This product gets recommendations from media, relatives, and doctors. Mubarak (2020) examines the variables affecting Consumer Purchase Intention (CPI) for herbal items in Sri Lanka by utilizing information from 50 herbal outlets and 330 customers. The findings shows that while perceived risk has a negative effect, there is a significant positive correlation between CPI and perceived quality, value, price, and advertisement. Companies should concentrate on improving perceived quality, reducing risk using tactics like free samples, and using psychological pricing and brand endorsements to foster trust in order to increase CPI. In their investigation conducted in Malang, Indonesia, Rafadi Khan Khayru et al. (2021) discovered that decisions to buy herbal medicines are greatly influenced by all aspects of the marketing mix (product, pricing, promotion, and distribution), with the product having the most influence. Based on data gathered from 200 respondents, Sivaranjani S et al. (2023) investigate consumer perception and loyalty towards Himalaya products in Cuddalore District. It looks at how several aspects of Himalaya's product line pharmaceutical, personal care, baby care, wellness, and animal health affect consumer's opinions through percentage analysis. The results demonstrate the expanding market for herbal cosmetics as well as the possible influence of Himalayan product goods.

METHODOLOGY**DATA DESCRIPTION**

Primary data are used in this research. A questionnaire was generated specifically for the study, which involved college students and working professionals with ages ranging from 18 to 60 years. A convenience sampling approach is adopted to collect the 150 samples.

RESULTS AND DISCUSSION

Based on the responses received from the respondents, the data is using Exploratory Data Analysis (EDA) using descriptive measures to study some of the demographic variables such as age, income, gender and so on. Accordingly gives the Majority of the respondents are Female(64.7%) as well as Students(69.3%) belonging to the age group of 18-21(46.7%) years. Most of them (70.7%) use Herbal products in their day-to-day life because of the myth that there are no side effects (52.7%) and having a purchasing capacity in the range of Rs.500-1000(84.7%) on a monthly basis (69.3%). The respondents are being more health conscious (44.7%) so they mostly prefer natural/organic skincare products (49.3%) and medicinal products(26.7%) rather than Food products (24%). In order

**Uma and Hariharan**

to assess the influencing factors in the study, one of the multivariate tests such as Factor Analysis(FA) is applied which is used for dimensionality reduction in data analysis. Its primary objective is identify patterns and structure in high-dimensional data by transforming it into a lower-dimensional space while preserving as much of the original information as possible. The Kaiser-Meyer-Olkin (KMO) test has been used to measure the relevance of the data for Principal Component Analysis(PCA). The test measures the sampling adequacy of each variable in the model ranging the value from 0 to 1. KMO test and Bartlett's sphericity test has been shown for adequacy checking of the data and results are presented in the table. **Table 2**, shows the KMO value as 0.876 indicating the value is highly adequate and satisfactory for Principal Component Analysis (PCA). From Bartlett's table sphericity, the associated probability is $0.000 < 0.05$ that means correlation matrix as identity matrix. The result from both the tests indicates that the data is fit for principal component analysis. **From Table 3**, it is clear that 60.988% of the original data has been retained into the components using principal component analysis. The 1st component value is $5.224 > 1$, 2nd component is $1.586 > 1$ and 3rd component is $1.119 > 1$. In this study, 13 variables are converted into three components known as factors and their inter-influence variables in the factor are studied using a rotated component matrix. **From Table 4** (Rotated component matrix), each number represents the partial correlation coefficient between variable and rotated component. These coefficients help in identifying the component. All the variables that have large factor loadings for a given component define the component. The factor analysis reveals three main factors influence on consumer's perceptions and decisions regarding herbal products.

Benefits of Herbal Products

Consumers value the superior quality(0.608), affordability(0.818), purity(0.776) and safety from natural ingredients(0.731). Herbal products are seen as offering a wide range of valuable options(0.662).

Rising Popularity and Availability

Herbal products are gaining popularity due to their natural benefits(0.776) and are frequently discussed(0.705). Their availability has expanded across various outlets(0.754), and advertising has become more prominent(0.796). They are also seen as competitive with global brands in terms of quality and price(0.501).

Essential Evaluation Factors

Consumers consider product source authenticity crucial(0.694) and associate lower prices with poor quality(0.784). Being well-informed before purchasing is important to ensure effectiveness and safety(0.545)

CONCLUSION

After analysing consumer perception towards herbal products, it is evident that these products hold a significant appeal among consumers. In recent times the herbal products market has undergone notable evolution. Most of the consumers use herbal products in their daily lives because there are no side effects. Many of them are being health conscious so they buy more skin care and medical products rather than food products. Recent trends in consumer perception towards herbal products reflect a growing interest in natural remedies, a focus on health and wellness, an emphasis on transparency and authenticity, considerations of environmental and ethical sustainability, the influence on digital platforms and advertisements and the diversification of product offerings. Brands that can effectively navigate these trends and meet evolving consumer expectations are poised to thrive in the dynamic landscape of the herbal products market.

ABSTRACT

Shadow education refers to private supplementary tutoring provided outside of regular school hours to support or enhance the academic performance of students. This phenomenon has become increasingly prevalent worldwide, powered by factors such as parental aspirations, highly competitive educational systems, and disparities in public education quality. This paper aims to explore the theoretical background of shadow education, exploring its historical context, key drivers, and educational theories that underpin its growth. Drawing on perspectives from human capital theory, social reproduction theory, education-for-all movement, and socio-cultural approaches, this paper will critically assess the implications of shadow education for equity, access, and quality in education. It concludes by highlighting the challenges and opportunities presented by shadow education in the broader educational context and offers potential strategies for addressing these issues within formal education systems.

Keywords: Challenges; Historical Context; Opportunities; Shadow Education; Quality Education

INTRODUCTION

Shadow education has emerged as a significant feature of contemporary education systems, particularly in societies where high-stakes examinations and meritocratic principles hold sway. The term "shadow education" is used metaphorically to describe its role as a parallel system to formal schooling. It mirrors the formal curriculum but operates outside the official structures, primarily in private and often informal settings. This system is especially prevalent in contexts where academic achievement is closely tied to future socioeconomic opportunities, such as in

**Sachin Kumar et al.,**

East Asia, Europe, and North America (Byun & Park, 2012; Bray, 2017; Bray, 2023). Shadow education encompasses various forms of supplementary tutoring, test preparation, and academic coaching aimed at enhancing students' performance in formal education settings (Zhang & Bray, 2015; Alam & Zhu, 2022). Its rapid growth across the globe has sparked increasing academic interest, particularly regarding its theoretical underpinnings, its relationship with mainstream schooling, and its effects on societal inequalities. Historically, shadow education has been perceived as a supplementary resource for those seeking academic advantages in highly competitive academic environments (Davies & Aurini, 2006; Zhang & Bray, 2015; Bae & Choi, 2023). The rise of shadow education can be traced back to the growing demand for academic success, driven by the belief that educational attainment serves as a primary means of social mobility. In many countries, shadow education plays a pivotal role in helping students prepare for entrance examinations, often regarded as gateways to prestigious universities and lucrative careers (Zhang & Bray, 2016; Jung, 2018; Jansen et al., 2023). The expansion of shadow education, therefore, raises critical questions about its influence on the formal education system and the extent to which it reinforces or reduces educational inequities.

From a sociological perspective, shadow education can be understood as part of the broader phenomenon of educational stratification. Bourdieu's (1986) theory of cultural capital is particularly relevant, as it suggests that families with greater financial resources are more likely to invest in supplementary education for their children. This investment in shadow education can increase their children's academic success and, by extension, their social standing (Tsiplakides, 2018; Gupta, 2023). In this way, shadow education perpetuates existing social hierarchies, allowing those from more affluent backgrounds to maintain their privileged status (Stevenson & Baker, 1992). Thus, one of the central critiques of shadow education is its role in increasing educational inequality by providing additional advantages to students from wealthier families while leaving disadvantaged students behind.

Economic theories also contribute to understanding the growth of shadow education, particularly through the lens of supply and demand. In regions where formal education systems are perceived as insufficient in preparing students for high-stakes exams, the demand for supplementary tutoring increases (Bray & Kwo, 2013; Gupta, 2021a; Alam & Zhu, 2022). As a result, the shadow education market thrives, with private tutoring companies and individual tutors responding to this demand. This market-driven nature of shadow education can lead to a widening gap between students who can afford these services and those who cannot, thus perpetuating inequities in educational outcomes. Educational perspectives on shadow education often focus on its pedagogical implications (Gupta & Zhang, 2023). Proponents argue that shadow education can provide personalized learning experiences, allowing students to receive tailored instruction that meets their individual needs (Jones & Rhein, 2017; Entrich, 2020; Liu, 2023). This is particularly valuable in contexts where formal classrooms are overcrowded, and teachers may not have the capacity to offer personalized attention to each student (Ball, 2018; Yang et al., 2023). However, critics point out that the commodification of education through shadow tutoring shifts the focus away from holistic educational development to narrowly defined academic success, often measured by test scores. This emphasis on rote learning and exam preparation can undermine the broader goals of education, such as fostering critical thinking and creativity. The rapid expansion of shadow education raises broader questions about educational equity, access, and outcomes. On one hand, shadow education may provide students with additional opportunities to succeed academically, particularly in systems where formal education is inadequate (Dang & Rogers, 2008; Li, 2020; Gupta, 2021b). On the other hand, its growth reflects deeper societal inequalities, as access to quality shadow education is often limited to those who can afford it. This dual nature of shadow education as both an opportunity and a barrier complicates its role within the broader education system. By situating shadow education within sociological, economic, and educational paradigms, it becomes clear that its expansion is driven by complex factors, including societal pressures for academic success, economic incentives, and gaps in formal education systems. As shadow education continues to evolve, it is essential to critically examine its implications for educational equity and access. Understanding the forces driving the growth of shadow education can inform policies aimed at addressing its impact on the broader education system, particularly in terms of reducing inequalities and ensuring that all students have the opportunity to succeed academically.

Sachin Kumar et al.,

Significance of the Study

Shadow education has become a prominent feature in contemporary educational contexts globally (Bae & Choi, 2023). This study is significant for several reasons, particularly in understanding the multifaceted impact of shadow education on educational equity, access, and quality. As an increasingly widespread phenomenon, shadow education reflects broader societal trends and educational policies that warrant comprehensive examination. First, this study contributes to the literature by providing a thorough theoretical background on shadow education. By exploring the historical context and key drivers behind its rise, the study sheds light on how parental aspirations, competitive educational systems, and disparities in public education quality contribute to the rapid increase of private tutoring (Bray & Kwo, 2013; Jung, 2018; Li, 2020; Entrich, 2020; Gupta, 2021b; Bray, 2023;). This understanding is crucial for educators, policymakers, and researchers who seek to grasp the underlying factors influencing the growth of shadow education and its implications. Second, the study employs various educational theories to critically assess shadow education's implications. Drawing on human capital theory, the research examines how shadow education impacts students' academic performance and future opportunities (Burgess, 2016; Wang & Liu, 2016; Tan & Liu, 2023). By incorporating social reproduction theory, it explores how shadow education can perpetuate social inequalities, reinforcing existing educational disparities (Bourdieu, 1986). Additionally, the study considers the education-for-all movement and socio-cultural approaches to evaluate shadow education's role in promoting or hindering equitable access to educational resources (Colclough et al., 2005; Vygotsky, 1978). This theoretical framework provides a depth analysis of the benefits and challenges associated with shadow education. Moreover, the study addresses the implications of shadow education for equity and access within educational systems. As shadow education often caters to students from higher socio-economic backgrounds, it can exacerbate existing inequalities in access to quality education (Da Wan & Weerasena, 2017; Jokila et al., 2020; Chimbunde & Jakachira, 2024). Understanding these dynamics is vital for developing strategies to mitigate the negative effects of shadow education and enhance equity within formal education systems. Finally, the study identifies challenges and opportunities presented by shadow education, offering practical recommendations for policymakers and educators. By exploring potential strategies for integrating shadow education insights into formal education systems, the research aims to contribute to more equitable and effective educational practices. This has significant implications for improving educational quality and ensuring that all students have access to the support they need to succeed academically. In summary, this study's significance lies in its comprehensive examination of shadow education's theoretical underpinnings and practical implications, providing valuable insights for advancing educational equity and quality in a competitive and evolving educational environment.

Objectives

The primary objectives of this research are as follows:

- To examine the historical development and growth of shadow education globally.
- To explore the educational theories that underpin the rise of shadow education
- To analyze the impact of shadow education on educational equity and access
- To critically assess the implications of shadow education for policy interventions.
- To provide potential strategies for strengthening formal schooling to reduce the proliferation of shadow education

Historical Context of Shadow Education

Shadow education is a phenomenon that has existed for centuries, although its scale and form have evolved considerably over time (Bray, 2017). The concept of additional, informal instruction outside of mainstream schooling is not a new development. Historically, such practices were prevalent, particularly among the elite classes, who sought to provide their children with a competitive edge in education. For instance, in ancient Greece and Rome, private tutoring was a common practice among wealthy families. These families employed personal tutors to educate their children in a wide array of subjects, including philosophy, rhetoric, and mathematics, well beyond the basic education provided by public schools of the time (Holloway & Kirby, 2019; Zwier et al., 2021; Bray & Lykins, 2012). Similarly, in early China, the tradition of private tutoring dates back to the imperial examination system, which was established as a means of selecting government officials based on merit (Tan & Liu, 2023; Xiang et al., 2023). The

**Sachin Kumar et al.,**

exams were notoriously competitive, and success in them offered a prestigious path to socioeconomic advancement. Consequently, families with sufficient financial resources often hired private tutors to help their children prepare for these exams, ensuring they had the best possible chance of securing a government position (Zhang & Bray, 2016; Jung, 2018; Jansen et al., 2023). This early form of shadow education, rooted in the need to excel in rigorous academic assessments, bears a resemblance to modern-day practices (Bray & Lykins, 2012; Zwier et al., 2021). The modern expansion of shadow education can be traced to several key factors. One significant driver has been the growing importance of formal education in contemporary societies. As education became increasingly recognized as a key determinant of social and economic mobility, the demand for additional educational support increased (Bray, 2017; Bray, 2023). In many countries, the focus on competitive standardized testing further powered the growth of private tutoring (Davies & Aurini, 2006; Zhang & Bray, 2015; Bae & Choi, 2023). High-stakes exams, particularly those determining university entrance or professional qualifications, created a culture of academic pressure, where students and their families sought every possible advantage to ensure success (Dang & Rogers, 2008; Li, 2020; Gupta, 2021b). In the late 20th century, East Asian countries such as Japan, South Korea, and Singapore witnessed an unprecedented rise in the shadow education sector. These countries developed highly competitive educational systems, where academic achievement was closely tied to future career prospects and social status.

As a result, private tutoring became deeply entrenched in these societies. In South Korea, for example, the intense competition surrounding the national college entrance exam led to the widespread reliance on private cram schools, or "hagwons," where students spent long hours in supplementary classes designed to boost their exam scores (Dang & Rogers, 2008; Piao & Hwang, 2021; Byun et al., 2023; Bae & Choi, 2023). Similarly, in Japan, the practice of attending "juku," or private tutoring schools, became a norm for students aiming to secure spots in prestigious high schools and universities (Mawer, 2015; Yamato et al., 2017; Kato & Kobakhidze, 2024). While the phenomenon of shadow education initially took root in East Asia, it has since spread across the globe, becoming a prominent feature of education systems in many countries (Bray, 2023). In North America and Europe, private tutoring has gained popularity as parents and students seek to move through increasingly competitive academic environments (Byun & Park, 2012; Bray, 2017). The expansion of private tutoring services in these regions has been driven by a variety of factors, including concerns about public school quality, the rise of standardized testing, and a growing belief in the importance of individualized, personalized learning (Jones & Rhein, 2017; Entrich, 2020; Liu, 2023). Africa, too, has witnessed the expansion of shadow education, although the drivers differ slightly from those in other regions. In many African countries, the demand for private tutoring has been linked to overcrowded and underfunded public education systems (Mlawwa & Mtitu, 2022; Hajar & Karakus, 2022). As a result, families that can afford it often turn to private tutors to supplement their children's learning and compensate for gaps in the formal education system. Additionally, as globalization has emphasized the importance of academic credentials in the job market, African students and their families increasingly view private tutoring as a necessary investment in future success (Dang & Rogers, 2008; Li, 2020; Liu, 2023). In sum, shadow education has a long history that stretches across different cultures and time periods. While its forms and functions have evolved, its core purpose remains the same: to provide students with additional educational resources outside of mainstream schooling to gain a competitive edge. Today, shadow education is a global phenomenon, influenced by a wide range of socioeconomic, cultural, and educational factors (Bray, 2017; Tsiplakides, 2018; Entrich & Lauterbach, 2020). Whether driven by the pressure of high-stakes exams, the desire for upward social mobility, or the need to compensate for deficiencies in formal education systems, shadow education continues to play a significant role in shaping the educational context worldwide (Dang & Rogers, 2008; Bray & Lykins, 2012; Gupta, 2021a; Alam & Zhu, 2022; Bae & Choi, 2023).

Theoretical Foundations of Shadow Education

Understanding the theoretical background of shadow education requires a multidisciplinary approach that integrates insights from economics, sociology, and educational theory. Several key theoretical frameworks help explain the rise and persistence of shadow education:

- **Human Capital Theory:** Human capital theory is one of the foundational economic perspectives used to explain the growth of shadow education. This theory, developed by economists such as Gary Becker, posits that

individuals and societies invest in education to enhance productivity and future earning potential (Becker, 1964; Becker, 1993). Shadow education, from this perspective, represents an additional investment in human capital, as families seek to improve their children's academic performance and, by extension, their future job prospects. In highly competitive educational systems, where academic success is closely linked to socioeconomic outcomes, shadow education becomes a strategic tool for families to maximize their children's chances of success (Burgess, 2016; Wang & Liu, 2016; Tan & Liu, 2023). This is particularly evident in countries like South Korea, where the societal emphasis on educational achievement drives a thriving private tutoring industry (Park *et al.*, 2011; Zhang, 2023). Human capital theory thus helps explain the rationale behind the increasing demand for shadow education, especially in contexts where formal schooling is perceived as insufficient for achieving academic success.

- **Social Reproduction Theory:** Another critical framework is Pierre Bourdieu's reproduction theory, which emphasizes how education systems perpetuate social inequalities. Bourdieu & Passeron (1990) argued that educational success is strongly influenced by cultural capital, which includes the knowledge, attitudes, and language skills passed down from parents to their children. Shadow education can be seen as a way for privileged families to further accumulate and transmit cultural capital to their children, reinforcing social hierarchies (Javadi & Kazemirad, 2020; Lee *et al.*, 2023). Wealthier families, who can afford private tutoring, are more likely to ensure their children's success in education, thus maintaining their privileged status (Tan & Yang, 2019; Bai, 2021; Wang & Wang, 2021). Shadow education, therefore, functions as a mechanism for the reproduction of social class distinctions, as it disproportionately benefits students from higher socio-economic backgrounds (Enrich & Lauterbach, 2020; Agrawal *et al.*, 2024)
- **Educational Stratification Theory:** Educational stratification theory addresses the ways in which educational systems contribute to social stratification. Shadow education can increase existing inequalities in education by creating a parallel system that benefits those who can afford to participate (Stevenson & Baker, 1992). As students from wealthier families are more likely to access high-quality private tutoring, they are also more likely to achieve higher academic outcomes, reinforcing the cycle of inequality. The expansion of shadow education can also lead to greater stratification within the formal education system, as students who receive private tutoring outperform their peers in standardized assessments, college entrance exams, and other educational benchmarks (Bray, 2017; Alam & Zhu, 2022; Jansen *et al.*, 2023). This creates a tiered educational system, where access to quality education becomes increasingly dependent on financial resources.
- **Socio-Cultural Approaches:** Socio-cultural theories, drawing on the work of Vygotsky (1978) and others, emphasize the role of social and cultural factors in shaping educational experiences. From this perspective, shadow education can be understood as a response to the cultural expectations and social norms that govern educational achievement. In societies where academic success is highly valued, families may feel compelled to invest in supplementary tutoring to meet societal expectations. In countries like Japan and China, where "exam culture" is deeply ingrained, shadow education is viewed as a necessary step for students to excel in highly competitive environments (Yamato *et al.*, 2017; Gupta 2021a; Alam & Zhu, 2022). Socio-cultural theories also highlight the role of parental involvement in shadow education, as parents actively seek out tutoring services to support their children's academic growth. This aligns with the notion of "concerted cultivation" proposed by sociologist Annette Lareau, where middle-class parents engage in intensive efforts to provide their children with educational advantages (Lareau, 2011).

Education for All and Equity Perspectives

The global movement for Education for All (EFA), initiated by UNESCO in the early 1990s, sought to promote access to quality education for all children, regardless of socioeconomic background. However, the rise of shadow education has raised concerns about its impact on educational equity. While shadow education can enhance the academic performance of students who have access to it, it can also increase existing inequalities by privileging those who can afford private tutoring (Bray, 2010; Jokila *et al.*, 2020; Chimunde & Jakachira, 2024). The EFA framework emphasizes the importance of providing equal opportunities for all students to succeed in formal education. Shadow education, however, creates a parallel system where students from wealthier backgrounds have access to additional

**Sachin Kumar et al.,**

resources, while those from lower-income families may be left behind (Tang & Yang, 2019; Bai, 2021; Wang & Wang, 2021). This raises critical questions about the role of shadow education in perpetuating or reducing educational inequalities.

Shadow Education and Educational Equity

The debate surrounding the impact of shadow education on educational equity is complex and multifaceted. On one side, proponents argue that shadow education offers students additional academic support, enhancing their performance in areas where they might struggle within the traditional schooling system. These supplementary educational services, such as private tutoring and test preparation, can help students gain a competitive edge, especially in high-stakes subjects (Davies & Aurini, 2006; Alam & Zhu, 2022; Bae & Choi, 2023). By providing more individualized attention and tailored instruction, shadow education has the potential to address learning gaps that may not be adequately covered in formal education, particularly for students with varying learning needs or those who require extra assistance to keep up with their peers. However, critics argue that shadow education contributes to deepening educational inequalities. They suggest that students from wealthier families, who can afford private tutoring, are disproportionately advantaged, leaving behind their less affluent peers who may lack the financial resources to access such services (Jolila et al., 2020; Agrawal et al., 2024; Chimunde & Jakachira, 2024). This creates a dual-track system, where educational success becomes increasingly dependent on a family's ability to invest in supplementary education, thus reinforcing socioeconomic disparities. The exclusive nature of shadow education can result in unequal opportunities for academic advancement, as wealthier students benefit from the additional resources and instruction that enable them to excel, while disadvantaged students may fall further behind (Tan & Yang, 2019; Bai, 2021; Wang & Wang, 2021). Empirical research reveals that the effects of shadow education on educational equity are both positive and negative. On the one hand, it can provide a valuable opportunity for students to receive personalized instruction, which can be especially beneficial for those struggling in the mainstream system (Jones & Rhein, 2017; Entrich, 2020; Liu, 2023). Yet, this benefit often comes at a cost, as the financial barrier limits access to only a privileged few. As a result, shadow education can simultaneously serve as a tool for academic improvement while also perpetuating the very inequalities it seeks to address. Thus, while shadow education can offer short-term gains for individual students, its broader societal implications raise concerns about its role in widening the equity gap in education systems worldwide. In conclusion, while shadow education holds promise as a means to address specific learning challenges, it also poses significant risks to educational equity, disproportionately favoring those with financial means (Davies & Aurini, 2006; Alam & Zhu, 2022; Bae & Choi, 2023).

Policy Implications and Challenges

The emergence and growth of shadow education, or private supplementary tutoring, present significant challenges for both policymakers and educators. One major issue is the potential for shadow education to undermine the objectives of formal schooling by reallocating resources and focus from public education systems. For instance, in countries like South Korea and Japan, where shadow education is highly prevalent, governments have introduced various policies aimed at regulating the private tutoring industry to alleviate the pressures on students and their families (Mawer, 2015; Yamato et al., 2017; Byun et al., 2023; Kato & Kobakhidze, 2024). These policies often include measures such as limiting the hours of private tutoring or setting standards for tutoring institutions. However, the effectiveness of such regulations can be mixed and dependent on how they are implemented and enforced. In addition to resource diversion, shadow education increases issues of educational equity. Access to high-quality private tutoring is often correlated with socio-economic status, leading to disparities in educational opportunities among students (Jokila et al., 2020). Wealthier families can afford extensive supplementary education, which can give their children a competitive edge, while those from less affluent backgrounds may not have the same opportunities (Wang & Wang, 2021). This disparity raises critical concerns about fairness in educational outcomes and the perpetuation of existing inequalities. Policymakers face the challenge of addressing these equity issues by ensuring that all students have equal access to quality education, irrespective of their financial capabilities. To address these challenges, a multifaceted approach is necessary. One strategy involves enhancing the quality of public education systems to reduce the perceived need for supplementary tutoring. This could include investing in teacher training, curriculum development, and educational resources to improve overall teaching and learning experiences within the

**Sachin Kumar et al.,**

formal school system (Park et al., 2011; Gupta & Zhang, 2023). Additionally, reducing the emphasis on high-stakes examinations, which often drive the demand for shadow education, can help reduce the pressure on students and families. High-stakes tests can incentivize excessive reliance on private tutoring, as families may feel compelled to seek additional academic support to achieve favorable results. Furthermore, providing targeted support for disadvantaged students within the public education system can help bridge the gap created by the availability of shadow education. This support might involve offering free or subsidized tutoring services, implementing after-school programs, and providing additional resources to schools serving lower-income communities. By addressing the needs of students who are most at risk of falling behind, policymakers can help level the playing field and reduce the reliance on private tutoring. Overall, while shadow education presents complex challenges, there are several strategies that policymakers and educators can employ to address these issues. By focusing on improving public education quality, reforming assessment practices, and supporting disadvantaged students, it is possible to create a more equitable educational landscape and mitigate the negative effects of shadow education.

Potential Strategies for Strengthening Formal Schooling to Reduce the Proliferation of Shadow Education

The shadow education phenomenon reflects growing concerns about the adequacy of formal education systems to meet diverse learning needs and the increasing demand for additional academic support. To address these concerns, it is essential to explore and implement strategies that can strengthen formal schooling and reduce reliance on shadow education. The investigators have delineated some approaches that can enhance the quality of formal education and thus reduce the need for supplementary tutoring.

Strategies for Strengthening Formal Schooling

- **Curriculum Enhancement and Relevance:** A key strategy for reducing the need for shadow education is to enhance the relevance and quality of the formal curriculum. This involves ensuring that the curriculum is comprehensive, up-to-date, and aligned with students' developmental needs and future opportunities. By integrating critical thinking, problem-solving, and real-world applications into the curriculum, schools can better prepare students for academic and life challenges (Yoo, 2024). Additionally, a well-designed curriculum should accommodate diverse learning styles and needs, reducing the reliance on external tutoring for academic support.
- **Professional Development for Educators:** Teachers play a crucial role in shaping the educational experience. Investing in continuous professional development for educators is essential for improving teaching quality and effectiveness. Training programs should focus on modern pedagogical techniques, classroom management strategies, and differentiated instruction to cater to varied learning needs. By enhancing teachers' skills and knowledge, schools can provide more effective instruction and support, thereby decreasing the need for shadow education.
- **Assessment and Feedback Mechanisms:** Implementing robust assessment and feedback mechanisms within formal education can address learning gaps and provide timely interventions. Formative assessments, regular feedback, and progress monitoring help educators identify students' strengths and weaknesses early on. By using this data to tailor instruction and provide targeted support, schools can reduce the need for additional tutoring services. Furthermore, transparent and fair assessment practices can reduce the pressure associated with high-stakes testing, which often drives students and parents toward shadow education.
- **Parental Involvement and Support:** Engaging parents in the educational process is another effective strategy for strengthening formal schooling. Schools can foster strong partnerships with parents through regular communication, parent-teacher meetings, and involvement in school activities. Providing parents with resources and guidance on how to support their children's learning at home can reduce their reliance on external tutoring services (Park et al., 2011). By creating a supportive learning environment both at school and at home, students are more likely to thrive without the need for additional shadow education.
- **School Resources and Infrastructure:** Adequate resources and infrastructure are vital for delivering high-quality education. Schools should be equipped with up-to-date learning materials, technology, and facilities that support interactive and engaging instruction. Investing in resources such as digital tools, library materials, and extracurricular programs can enhance the overall educational experience and reduce the need for

Sachin Kumar *et al.*,

supplementary tutoring (Tomar, 2012). Additionally, ensuring equitable access to resources across different schools and communities helps address disparities that contribute to the proliferation of shadow education.

- **Effective Teaching Practices:** Professional development programs for teachers should focus on modern instructional techniques that foster active learning, student engagement, and individualized instruction. Teachers who are well-trained in innovative pedagogical strategies can better address students' needs within the classroom, reducing the perceived necessity for additional tutoring (Entrich, 2020; Liu, 2023).
- **Promoting Equity and Accessibility:** Ensuring that all students have access to high-quality education is essential in reducing reliance on shadow education. This involves addressing disparities related to socioeconomic status, geographical location, and other factors that can affect educational opportunities. Policies that promote equitable funding for schools, targeted support for disadvantaged students, and community involvement in education can help level the playing field (Jokila et al., 2020).
- **Policy and Systemic Reforms:** Finally, systemic reforms at the policy level can address the root causes of shadow education. Governments and educational authorities should focus on creating policies that promote educational equity, reduce testing pressure, and support comprehensive school reforms (Xiang et al., 2023). Implementing measures such as adjusting standardized testing practices, increasing funding for public schools, and promoting inclusive education can help create a more equitable and effective educational system. By addressing systemic issues, policymakers can reduce the reliance on shadow education and improve the overall quality of formal schooling.

CONCLUSION

Shadow education is a multifaceted and intricate phenomenon that mirrors broader societal trends concerning education, socioeconomic mobility, and cultural expectations. This form of supplementary education, often provided through private tutoring or after-school programs, has become increasingly prevalent worldwide. On one hand, shadow education can offer significant support to students by enhancing their learning experiences and academic performance. It provides additional resources and personalized attention that may not always be available in formal educational settings. However, the rise of shadow education also brings to light pressing issues related to educational equity and access. The growing reliance on such supplementary programs can increase existing disparities, as students from more affluent families are more likely to benefit from these additional resources compared to their less privileged peers. The expanding reach of shadow education necessitates a critical evaluation of its effects on formal education systems. Policymakers and educators must carefully consider how these supplementary programs impact overall educational equity and the effectiveness of traditional schooling. Strategies need to be developed to address the challenges posed by shadow education, ensuring that it does not perpetuate or worsen existing inequalities. This includes examining how shadow education influences educational outcomes and whether it contributes to an environment where success is increasingly dependent on the ability to access supplementary support. As shadow education continues to evolve and grow, it is crucial for stakeholders in the education sector to remain vigilant. Understanding the complex dynamics of shadow education will help in crafting policies that promote a more equitable educational landscape. By addressing the challenges associated with shadow education, policymakers and educators can work towards creating a more inclusive and fair system that supports all students, regardless of their socioeconomic background.

Further Research

Further research on shadow education could build upon its historical context and key drivers by examining how these factors interact with evolving educational policies and technological advancements. One avenue for exploration is the impact of digital tools and online platforms on the proliferation of shadow education, considering how they might increase or decrease existing disparities. Additionally, investigating the role of shadow education in different cultural and socioeconomic contexts could provide a more depth understanding of its implications for educational equity. Comparative studies across various countries could reveal how different educational systems respond to and manage shadow education. Another important area of research could involve evaluating the effectiveness of

Sachin Kumar et al.,

interventions aimed at reducing reliance on shadow education, such as reforms in public schooling and alternative support mechanisms. This approach could help in formulating evidence-based strategies to balance the benefits and drawbacks of shadow education, ensuring that its advantages in enhancing academic performance do not perpetuate existing inequities. Overall, a comprehensive analysis of these dimensions will contribute to a more robust understanding of shadow education's role in contemporary education and its potential for shaping future educational practices.

ABSTRACT

Minerals, metallic preparations and medicinal plants used in Siddha Medicine are outstanding in their therapeutic value. *Jayaneer* is a pungent liquid prepared by exposing to night dew a mixture of powdered lime and ammoniac. It is supposed to be a solvent medium for many insoluble substances and as such is used for preparing medicines of very high potency. This *Jayaneer* is a medicinal preparation of pungent liquid obtained by what night' dew on a porcelain dish containing a mixture of *Rasthaali* Banana, Limestone and Ashes of banana bark. Generate SOP for the preparation of the *Vaazhai Pazha Jayaneer* Standardization as per PLIM guidelines and evaluate the antibacterial activity of the drug. The test drug was prepared in the Gunapadam laboratory, NIS as per the literature. Standardization of the drug was done as per PLIM Guidelines. Anti-bacterial activity of the drug assessed by Disc diffusion method against *E-coli* and *Proteus mirabilis*. The SOP for the drug was generated and standardization parameters for the drug were under the limits as per PLIM guidelines. The result indicates that the drug has Antibacterial activity against *E-coli* and *Proteus mirabilis*.

Keywords: *Vaazhai Pazha Jayaneer*; *Jayaneer*; Standardization; Anti-bacterial activity Internal medicine.

INTRODUCTION

Siddha medicine is one of the oldest healthcare systems in India, currently gaining recognition in developed countries as well. This system, a unique blend of science and healing art, was developed by revered poet-mystics known as Siddhars, who authored significant texts. The origins of Siddha medicine and the Tamil language are linked to the sage Agasthiyar. Comparable in antiquity to Ayurveda in northern India, the Siddha system thrived in the southern regions. It has also gained popularity in countries such as Sri Lanka, Burma, Malaysia, and other Southeast Asian nations. Historical literature provides evidence of its advanced practice from early civilizations. Notably, several Chinese priests who visited India studied this system from prominent Siddhars, including the renowned Bogar[1-2]. Siddha Medicine harnesses the therapeutic potential of minerals, metallic preparations, and medicinal plants through distinctive chemical processes. These processes transform raw materials into effective therapeutic agents, setting Siddha apart. Various pharmaceutical techniques are employed, including calcination, sublimation, distillation, dissolution, fusion, separation, combination, purification, and incineration. The Siddha System categorizes its preparations into two main groups: 32 internal formulations and 32 external applications, each tailored to specific therapeutic needs[2]. *Jayaneer* is a pungent liquid prepared by exposing the drug to night's dew along with a mixture of powdered lime and ammoniac. It is also said that it is a medicinal preparation of pungent liquid obtained by exposing it to night's dew on a porcelain dish containing a mixture of *Rasthaali* Banana, Limestone and Ashes of banana bark. This *Jayaneer* is peculiar to Tamil Siddha Science and it is a pungent liquid always prepared by exposing medicinal salts, poisonous compounds, etc., to nights' dew. It is supposed to be a solvent medium for many insoluble substances and as such is used for preparing medicines of very high potency and in Alchemy it is chiefly consolidating or fixing up volatile substances. In medicine, it forms a useful medium in the preparation of metallic oxides by the process of calcination. Mid-January to mid-April is a suitable time for preparing *Jayaneer*[3-4]. This study is aimed to analysing the qualitative parameters of *Vaazhai Pazha Jayaneer*(VPJ), a Siddha formulation from *Anuboga Vaithiya Navaneetham*, part IV and also its Anti-bacterial property.

MATERIALS AND METHODS

Selection of the test drugs

The test drug "*Vaazhai Pazha Jayaneer*" is one of the Herbo mineral formulations for *Moothira kiricharam* (Urinary tract infection) which is indicated in the Siddha literature *Anuboga Vaithiya Navaneetham*, part-IV[5].

Collection of Raw drugs

The raw drug was purchased in a Country shop in Chennai and authenticated from the "Department of Gunapadam, National Institute of Siddha, Chennai" (certified No. GUN/AUT/14/24). (Table:1)

Ingredients of *Vaazhai Pazha Jayaneer*:

Preparation of *Vaazhai Pazha Jayaneer*

The banana was separated from its skin and placed into a wide vessel, around 4 kg in total. About 500g of *vaazhai sarugu* ashes and 500g of *karchunnaambu* were added one by one. All ingredients were thoroughly mixed by hand using a crushing method, and then left undisturbed for 4–5 days. The secreted liquid was collected until no more secretion occurred. It was then stored in an airtight glass container[5].

Standardization(By PLIM guidelines):

The evaluation of the quality and purity of herbo-mineral drugs through various parameters, including physical, chemical, and biological observations, is referred to as standardization. The standardization of these drugs is classified into several categories,

1. Organoleptic characters
2. Physico-chemical properties

3. Biochemical analysis

Standardization was determined by the analytical parameters as per PLIM guidelines. [6] The study was done at Interstellar Testing Centre Pvt. Ltd, Panchkula, Haryana.

Organoleptic characters

The organoleptic properties of the sample were assessed, focusing on the formulation's color and odour through visual examination.

Physico-chemical properties

Physico-chemical properties of this drug were assessed by parameters like pH, Optical rotation, Specific gravity, Refractory index (at 25°C), Viscosity, and Boiling point.

Bio-chemical analysis

Bio-chemical analysis of this drug were determined by the analysis like Heavy metal analysis, Aflatoxin analysis and Pesticide analysis are following,

Heavy metal analysis

The presence amount of heavy metals like Arsenic, Mercury, Lead and Cadmium in this drug were assessed by the method Inductively coupled plasma mass spectrometry (ICPMS)[7-8].

Aflatoxins

The presence amount of aflatoxins B1, B2, G1, G2 were assessed by the method High Performance Liquid Chromatography (HPLC)[9-11].

Pesticide residue

The presence amount of pesticides like Organo phosphorous, Organo chloride and Pyrethroids were assessed by the method Gas Chromatography combined with Mass Spectrometry (GS-MS) [12-13].

Anti-bacterial property

Anti-bacterial property of this drug was assessed by Disc diffusion method against the species of *Escherichia coli* and *Proteus mirabilis*.

Disc diffusion method

Escherichia coli (MTCC 443) and *Proteus mirabilis* (MTCC 425) strains were obtained from IMTECH, India. Antimicrobial activity was assessed using disc diffusion (Kirby et al., 1966; CLSI, 2012) with minor modifications. Bacterial laws were prepared on Mueller Hinton Agar plates, and test samples were loaded at various concentrations. After 24-hour incubation at 37°C, antibacterial activity was evaluated by measuring inhibition zone diameters using an antibiotic zone scale. (Himedia, Mumbai, India) [14-16].

RESULTS

Standardization of *Vaazhai pazha Jayaneer*

Organoleptic characters

The organoleptic characteristics of *Vaazhai Pazha Jayaneer* are recorded in Table 2.

Physico-chemical analysis

The physico-chemical characteristics of *Vaazhai Pazha Jayaneer* are documented in Table 2.

**Bio-chemical analysis****(i) Heavy metal analysis**

The heavy metal analysis of *Vaazhai Pazha Jayaneer* is presented in Table 4.

(ii) Aflatoxins

The amount of aflatoxins in *Vaazhai Pazha Jayaneer* (VPJ) is summarized in Table 5 [].

(iii) Pesticide residue

The pesticide residue in *Vaazhai Pazha Jayaneer* (VPJ) is recorded in Table 6.

(BLQ - Below Limit of Quantification; BDL - Below Detection of Limit)

Anti-bacterial property

The antibacterial activity of test sample showed antibacterial activity against *Escherichia coli* and *Proteus mirabilis* tested type strains. The anti-bacterial activity of the test sample control can be visualized in the picture.

DISCUSSIONS

Jayaneer is a pungent liquid prepared by exposing to night's dew a mixture of powdered limestone and Sal ammoniac. It also said to be used in Alchemy-philosopher's acid. *Jayaneer* is used to prepare the higher order medicines. Basically, *Jayaneer* is alkaline in nature and it has pungent odour by itself. This *Vaazhai Pazha Jayaneer* is obtained by exposing to night's dew on a porcelain dish containing a mixture of *Rasthaali* banana, Ashes of dried banana barks and powdered limestone. *Jayaneer* doesn't evaporate, it changes the metals into atomic levels, and *Jayaneer* always steadily withstands in high temperatures. Standardization of the drug was done as per PLIM guidelines. The results of the standardization gave more information about this *Jayaneer*. Result of pH value indicates that this *Jayaneer* is highly alkaline (pH-12.95). Specific gravity of the *Jayaneer* was 1.1841. It indicates that this *Jayaneer* is slightly denser than water. The heavy metal content (Arsenic, Lead, Cadmium, Mercury), Pesticide residue (Organo chloride, Organo phosphate, Pyrethroids) are in low limit in this *Jayaneer*. It indicates that this drug was safe to consume and can be used in medicine preparation. The total viable aerobic count and total fungal count are very remarkable and their values are in acceptable limits as per PLIM guidelines. It indicates that the drug is safe to consume. A urinary tract infection (UTI) occurs when any component of the urinary system, comprising the kidneys, ureters, bladder, and urethra, becomes infected. Typically, the infection affects the lower urinary tract, specifically the bladder and urethra. Notably, females have a higher susceptibility to developing UTIs compared to males. The common Urinary Tract infection-causing pathogens are *Escherichia coli* and *Proteus mirabilis*. The Anti-microbial activity of the drug *Vaazhai Pazha Jayaneer* was assessed through the disc diffusion method against *Escherichia coli* and *Proteus mirabilis*. The anti-bacterial activity of the drug was assessed through the disc diffusion method. Nowadays, the most common Urinary Tract infection-causing pathogens are *Escherichia coli* and *Proteus mirabilis*. According to the result of the disc diffusion method, the zone of inhibition was well formed against *Escherichia coli* and *Proteus mirabilis*. The results are close to the standard drug Azithromycin. It is clearer that the medicine *Vaazhai Pazha Jayaneer* has good anti-bacterial activity and is effective against Urinary Tract Infections.

CONCLUSION

In the present study, Standardization as per PLIM guidelines of the drug *Vaazhai Pazha Jayaneer* has been established. All the parameters were under the limits that proved the drug was safe to consume. The drug possessed good Anti-bacterial activity against the urinary pathogens, *Escherichia coli* and *Proteus mirabilis*. The drug has been indicated for processing metallic and mineral formulations. Further in-vivo studies have to be carried out to confirm its therapeutic effect on Urinary tract infections.

ABSTRACT

People are increasingly connected around the world through online social networks. A hot research area in online social networks is influence maximization, which is aimed at finding influential users in the dissemination process of information. In recent years, people around the world have accelerated in connecting to online social networks than before using social networks. Recently, Facebook, Instagram, YouTube and other social platforms as a whole have been gradually integrated into people's lives. In recent years, online social networks have become a hot research topic with inextricable links to data mining and machine learning. Here influence means given user as well as his or her posts have power to change cognitive states of others. Typically, users modify their original cognitions under social network dynamics affected by other users'. The influence of social media is mostly rooted the word of mouth effect and viral marketing. In this paper we are using enhanced Convolutional Neural Network (CNN) and ResNet with Graph Neural Networks (GNN) algorithms to investigate the largest user effects on Facebook, Instagram, and YouTube. Accuracy, precision, recall, and F-measure scores indicate the fastest increasing influencers on Facebook, Instagram, and YouTube. **The proposed achieve 98.67% accuracy in facebook dataset, 98.57% accuracy in Instagram dataset, 98.34% accuracy in YouTube dataset.** The result shows Instagram had the largest user growth between 2023 and 2024.

Keywords: Convolutional Neural Network, Deep Learning, ResNet with Graph Neural Networks, Influence maximization, Online Social Networks

INTRODUCTION

Social media has developed dramatically in the previous 10 years, with big sites like Twitter, Facebook, YouTube, and Instagram multiplying [1]. People use social networking sites to freely and informally share their ideas, opinions, loves, hates, and experiences [2–4]. As Artificial Intelligence (AI) advances, Convolutional Neural Networks (CNNs)

**Karthekeyan et al.,**

enable computers to learn by overcoming information scarcity and training complex models on larger data sets, as described in various studies [5-9]. Social media websites have emerged as primary media channels for the dissemination of personal information, news, photographs, and videos, among other things. People may still share live broadcasts when they want to communicate with a large group of people [10]. Because of its extensive use, companies, data analysts, and academics have been trying to extract insightful analysis from the enormous volume of data produced by social media. Knowledge dissemination and word-of-mouth propagation [11-13] are two of the most important subjects of interest for social media academics. User modeling, viral marketing, content development, and user suggestions are just a few of the uses this material might find. Social media is currently the primary means of sharing personal information, images, videos, news, and other content. Every day, social media users devote countless hours [14-16]. Businesses and marketers are eager in this as it offers a free approach to contact many consumers. The most popular fields of social media mining research are influence and sentiment analysis. Both categories may assist businesses with their marketing initiatives [17-19]. Similar to impact analysis, researchers evaluate social media information diffusion models to identify key individuals that facilitate knowledge exchange. Recommender systems may help with this information by directing customers interested in certain topics to appropriate authorities [20]. One of the most important tactics for doing this is to disseminate information and use influential individuals, since brand recognition and campaign performance may considerably improve [21-23]. People's daily lives are heavily impacted by digital networks; hence many new academics are looking into this rapidly increasing issue across several sub-domains. The first obvious difficulty that a researcher addresses as social networks grow more prominent is how to get specific data from the sources. This encourages marketers to use SM to discover new ideas and consumer trends. [24]. In this paper, we are going to examine enhanced Convolutional Neural Networks DCNN and ResNet with GNN networks for Facebook, Instagram, and YouTube's influencers' maximization. Why these three because these three social media are rapidly growing platforms. We look up multi neural networks for Influence maximization of Facebook, Instagram, and YouTube.

BACKGROUND STUDY

Bhattacharya R., et al., (2023) these authors proposed Graph Convolutional Networks (GCN) based on Deep Learning to find significant nodes in large-scale graph datasets. Using structural centrality in concert with Graph Convolutional Networks, the DeepInfNode deep learning approach produced strong nodes. The GCN method produces node representations by assessing contextual information from trials in the Susceptible-Infected-Recovered (SIR) model. Since they only take network topology or node characteristics, traditional approaches include centrality or machine learning are quite restricted in their applicability. To address this obstacle, these authors offer the DeepInfNode graph convolution learning model for the most influential nodes and reinterpret the framework for identifying these nodes as a classification issue. Bhavnani, V., et al (2021) these authors used the Gaussian kernel approach and the grey wolf optimization methodology to perform a thorough analysis of various current techniques and methods for locating significant nodes utilizing the Singular value Decomposition (SVD)-rank and Singular value Decomposition adjusted (SVDA)-rank algorithms. Positive and negative indicators in the Gaussian kernel approach showed user influence or lack. Using wolves-like criteria, an optimum solution was found in the grey wolf optimization approach. It has been noted that researchers change the methods that provide better findings with more precision than in the times. Chen, L., et al. (2022) these researchers introduced a novel network model called the effect-based Bi-Directional network Convolutional Network (Bi-GCN), which captures user influence and how rumors propagate. First, independent evaluation of their local and global impacts using an information entropy-based approach was done before determining the weighted total of users. Second, these authors integrate the two main aspects of rumor spread and transmission with the general influence factor. They developed a high-level representation for bidirectional graph convolutional neural network rumor detection. Gammoudi, F., et al (2022) intimate interactions, such as those with friends, family, or coworkers, have a direct influence on social media users. Those that follow them via shared information, goals, news, and perspectives may likewise have an impact on them. Often, an influencer was someone who convinced an influence to keep up an activity, make the same choice, or modify their conduct. There are many tools available to assist in the search for strong individuals. These researchers examined the challenge of finding SM influencers in the framework of SM impact. They began by conducting a literature study to assess the influence of social media. Following that, these authors organized the works and

**Karthekeyan et al.,**

highlighted the greatest literary masterpieces to assist in locating social media superstars. Jothi, P., et al (2022) the Influencer User Prediction (IUP) problem was addressed by the authors using a CNN approach. New centrality measurements was first calculated and compiled. Following that, further important indicators were picked using the Gray Wolf (GW) technique, from which CNN learned to fairly accurately predict notable persons. Furthermore, this strategy was tested on Facebook with an analysis of around 5000 tweets from various disciplines (news, education, politics, sports, and entertainment). They introduced new metrics by linearly aggregating the provided centrality values. The GW search method was advised for identifying the most relevant features for members of an Online Social Network (OSN) based on position updates and fitness value. Grey Wolf Optimizing Convolutional Neural Network (GW-CNN) system employs acquired influence maximization from CNN's MSE as its fitness function. The IUP was therefore given without adding computing complexity. Liu, W., et al (2024) these authors provide a novel IM approach and reinterpret the Influence Maximising (IM) problem as a regression analysis. The approach examines the network's latent topological information using an adaptive graph convolution neural network, resulting in significantly improved performance. They present an efficient algorithm based on an adaptive graph Convolutional Neural Network that combines several network-level attributes and some centrality measurements into a vector that serves as the presentation vector for nodes in the social network after the IM problem is converted into a regression problem. Following the extraction of several heuristic measurements and attribute features from the network, these authors embed nodes to get representation vectors in Euclidean space. Their unique heuristic technique, Neighbour Domain Discount (NDD), identifies additional components beyond discounted degrees. Labels and embeddings added to a training set enable the recommended model to be used to project node target network effects. Luceri, L., et al (2019) these authors investigated human real-life conduct via the lens of social influence on offline dynamics.

They demonstrated Social Influence Deep Learning (SIDL), a method that combines DL and network research to assess social influence and predict human conduct during real events or site visits. To address two major difficulties in Deep Learning: interpretability and scalability, they proposed a variety of techniques with varying levels of network connection. Their methods were tested and evaluated against data from Foursquare, a location-based social networking site, and Plan cast, an event-based social network. Finally, they investigate several DL architectures and the relationship of social influence and user privacy, drawing findings as well as warnings about the risks of broadcasting private data. Qiu, J., et al (2018) these authors analyzed personal real-life situations via the lens of social effect on offline dynamics. Social Reperfection Combining network research with Deep Learning, which analyses social effect and predicts human behaviour during live events or site visits, they address the two major DL issues, interpretability and scalability, by providing a variety of strategies with varying degrees of network connectivity. Data from Foursquare, a location-based social networking site, and Plan cast, an event-based social network, enabled these authors to evaluate their methodologies. Finally, they examine several Deep Learning systems and the relationship between social influence and user privacy, generating findings as well as warnings about the risks of disclosing personal information. Thunuguntla, S. B., et al (2023) these authors provided a strategy for analyzing internet picture advertising. First, from the supplied advertisement picture, extract the items and advertising words. Use DenseNet-121 then to categorize ads based on their characteristics. Following that, data from advertisement classification results and a Deep Neural Network (DNN) approach were utilized to recommend advertisements to specific users based on their preferences. Tran, Q. M., et al (2022) these authors presented a measure to assess how individuals and organizations influence social media platforms. Knowledge graph approaches should be used with Deep Learning. Someone constructed a fantastic Knowledge Graph specifically to display user interaction activities. A variational graph-based unsupervised DL model autoencoder was created to better assess user activity. The model inspired by the conventional graph convolutional layer. It aggregates user attributes while also learning from their interactions. The model worked with unknown data and required little labeling effort. When collecting the dataset, a custom crawling algorithm ensures that it was current and fashionable for this purpose. When compared to various well-known graph-convolutional-based models, the tests show incredible performance and promising results.

**Karthekeyan et al.,****Problem Identification**

Existing Convolutional Neural Networks need a large amount of labeled data and have much slower training periods. Thus, in this study, we optimize the social media influence maximization effect by using enhanced Convolutional Neural Network and ResNet with GNN algorithms, so boosting the performance of Investigate.

MATERIALS AND METHODS

This chapter, particularly in connection to multi neural networks, discusses the ideal effect maximization in the field of inquiry of social media. After data preparation is complete, collect the three types of datasets from kaggle datasets. This research aims to include the GNN approach into enhanced Convolutional Neural Networks (CNN) and ResNet models, therefore increasing their capacity. This strategy is believed to be critical for increasing the efficiency and effectiveness of influence-maximizing strategies in the complicated terrain of social media networks. Among other social media sites, the figure 1 shows how to find notable individuals on Facebook, Instagram, and YouTube. First data collecting starts when user interactions and engagement on these websites rise. After that, this information is examined to better grasp user behavior and spot important factors as follower count and interaction rates. These qualities help the system to find important users that is, those who significantly affect other people. Furthermore included in the method is network analysis to examine user impact dispersion. At last, the findings are reviewed and polished to raise the influence detection accuracy.

Dataset Collection

Kaggle dataset sets provide the data for social influence maximizing. For

- Facebook: <https://www.kaggle.com/datasets/sheenabatra/facebook-data>
 - Instagram: <https://www.kaggle.com/datasets/krpurba/im-instagram-70k>
 - YouTube: <https://www.kaggle.com/datasets/kathir1k/youtube-influencers-data>
- Datasets provide valuable insights, trends, and forecasts. This session looks at three distinct kinds of datasets from various sectors to demonstrate the breadth of applications for data analysis and machine learning.

Data Preprocessing

Several critical steps must be followed while preparing a dataset for machine learning to ensure that the data is suitable for effective model training and testing. This process begins with raw data input into the programming environment, followed by Exploratory Data Analysis (EDA), which identifies trends, anomalies, and patterns. This stage corrects missing numbers, inconsistencies, and errors to enhance data quality. Standardizing or normalizing numerical features ensures that they contribute equally throughout model building. Class imbalances are handled using approaches like as weighting or resampling to ensure equal model performance across classes. Training and testing sets are then split out from the dataset to enable an objective evaluation of model performance. Maintaining openness and reproducibility in research requires proper documentation of these procedures, which leads to more reliable and interpretable machine learning outcomes.

Social Media Influence Maximization using enhanced Convolutional Neural network and Resnet with Graph Neural Networks

An enhanced CNN and ResNet with GNN are used for social media influence maximization process. Enhanced CNN consists basically of three layers: convolutional, fully connected, and pooling layers. The convolutional layer, works largely via the dot product of receptive fields and a collection of learnable filters, or kernels. Figure 2 shows convolution. Pooling layer nonlinear downsamplings allow you to lower data dimension after convolution. The two most common pooling strategies used now are average and maximum pooling. Currently, average and maximum pooling are the two most used approaches of pooling. Max pooling finds the candidates with the highest potential value, while average pooling finds their average value. Following downsampling of the feature maps, nonlinear transformations such as the Rectified Linear Unit are used to activate circuits. The heavily linked layer then finishes the higher-order thinking. The neurones of this layer react to the entire stimulus generated underneath. The loss

Kartekeyan et al.,

layer, which is often the last layer of an enhanced CNN, determines how the network learns to punish the discrepancy between predicted and actual social media influencer labels. A variety of loss functions, such as sigmoid cross-entropy loss and softmax loss, may aid in the completion of numerous tasks. The term "neurone" is often used in software and algorithm development. A basic operational unit in enhanced CNNs is one or more. ResNet CNN models are made up of four transition layers and five blocks. The training dataset, which has a kernel size of 7x7, serves as the initial input for the convolutional layer utilized for feature extraction. A 3x3 max pooling layer contributes to the reduction of feature maps by aggregating acquired features. They then produce dense-1, which includes additional features and has six convolutional layers with kernel sizes of 1 x 1 and 3 x 3. Low input feature maps assist to blend the properties of each channel while also increasing processing efficiency. The prediction of influencer maximization process is performed by combining enhanced CNN, ResNet with GNN. The vast number of layers allows for effective value prediction. This method performs well with the multiple layers used enhanced CNN and ResNet with GNN. The Neural is a computational unit that takes as input $x_1 x_2 x_3$ and outputs $h_{w,p}(x) = f(W^t x) = f \sum_{i=1}^3 w_i x_i + p$, where f is activation function. $f(\cdot)$ is to be sigmoid function

$$f(x) = \frac{1}{1 + \exp(-y)} \quad \text{----- (1)}$$

As a result, the input-output mapping produced by logistic regression applies to single neurones.

And use the sigmoid function for f is the hyperbolic tangent or tanh:

$$f(x) = \tanh(y) = \frac{e^y - e^{-y}}{e^y + e^{-y}} \quad \text{----- (2)}$$

In Convolutional Neural Networks, the activation function performs better in practice. This activation function is neither restricted nor continuously differentiable, unlike the sigmoid and tanh functions. The proper activation function is:

$$f(y) = \max(0, x). \quad \text{----- (3)}$$

Originally a rescaled variant of sigmoid, the tanh (y) function produces values between [-1, 1] rather than [0, 1]. When the input y is less than 0, the piecewise linear function saturates at exactly 0.

The sigmoid function

$$f(z) = \frac{1}{1 + \exp(-y)} \quad \text{----- (4)}$$

Its derivation is (5) and if f is the tanh function then it is (6)

$$f'(y) = f(y)(1 - f(y)) \quad \text{----- (5)}$$

$$f'(y) = (1 - f(y))^2 \quad \text{----- (6)}$$

When $y < 0$, the adjusted activation function has gradient 0, otherwise it has gradient 1. In practice, however, this does not cause problems since the gradient over several training cycles is undefined at $y=0$. Figure 2 shows a deep learning process might be used to find resources or investigate social media. It begins with collecting data from Instagram, Facebook, and LinkedIn among other social media sites. Most frequently an enhanced Convolutional Neural Network, the data then moves throughout a succession of layers in a neural network. We compile and interact with data characteristics at many stages. Following further layers such deep layers that allow the construction of predictions or classifications reveals the traits under research. At last the model is tested, and recommendations abound for raising its accuracy and performance.

Algorithm 1: Enhanced CNN and ResNet with GNN Algorithms

Input: Dataset D

Step 1: Generate training dataset

Step 2: Preprocessing

Cleaning the data, and handling categorical data

Step 3: Splitting the data

Divide data into training and validation

Step 4: Training

Define model architecture and hyperparameters then training on training dataset

Step 5: Evaluate Performance

Choose correct metric and Evaluate on validate set

Step 6: if (satisfied)

Kartekeyan et al.,

Deploy output

Else

Tune hyperparameters

Step 7: Repeat step 4**Output:** Maximization result

The enhanced CNN approach begins with a dataset D. Create a training set next Cleaning and dividing happen. The first hyperparameter settings and dataset training have been completed. Hyperparameters are settings or configurations that are established before to the commencement of the training process. Afterwards, the assessment on the training dataset will utilize the output if the validated data is satisfied; else, it will tweak the hyperparameters, train the dataset again, and create the output.

RESULTS AND DISCUSSIONS

Result shows enhanced Convolutional Neural Networks, ResNet GNN improvements in identifying critical nodes in Facebook, Instagram, and Youtube. In this study, we assess algorithm performance using Python. Given both local and global implications, our hybrid method captures user interactions more effectively than traditional models such as existing CNNs. The combined model achieves higher accuracy, precision, and recall metrics, highlighting its ability to discriminate influential users from non-influential ones. Enhanced CNN paired with ResNet architecture provides a more accurate image of user interactions and effect distribution. The GNN component enhances the model by enabling it to account for both forward and backward influence flows into the network. Table 2 shows the Users and Influencers growth in Facebook, Instagram, and YouTube from year 2018 to 2024. The number of users is increased in instagram from 2023 to 2024 but the influencer's growth is low compared to Facebook, and YouTube. Facebook has the highest user growth and steady influencer's growth. YouTube has the steady user and influencer's growth. Figure 3 shows the user and Influencers growth in Facebook, Instagram, and YouTube from year 2018 to 2024. The User and Influencers base is higher in Facebook and YouTube compared to Instagram. In recent days the user's growth is increasing in instagram. In this chart year from 2018 to 2024 is given in the x-axis and y-axis shows the count of user and influencers.

Performance evaluation

Accuracy

In predictive modeling, accuracy is the measure of how close the model's projections are to the actual outcomes. It quantifies the model's dependability and accuracy, which is critical for making predictions and judgments in a variety of contexts.

T-True, F-False, P-Positive, N-Negative

$$Accuracy = \frac{TP+TN}{TP+TN+FP+FN} \text{ ----- (7)}$$

Precision

In predictive modeling, accuracy is the proportion of total expected positive observations to correctly forecasted positive observations. It displays how effectively the model lowers false positives, ensuring the genuine accuracy and reliability of the positive predictions it generates—qualities necessary for decision-making and, as a result, error reduction in many other domains.

$$Precision = \frac{TP}{TP+FP} \text{ ----- (8)}$$

Recall

Recall in predictive modeling is the fraction of real positive instances the model properly detected. It is valuable in industries like medical diagnosis or fraud detection where identifying all positives is rather important because it shows how well the model detects all relevant cases of a particular class.

Karthekeyan et al.,

$$\text{Recall} = \frac{TP}{TP + FN} \text{ ----- (9)}$$

F-measure

The F-measure, which calculates the harmonic mean of accuracy and recall, provides a comprehensive assessment of a model's performance, particularly in cases where both false positives and false negatives must be avoided.

$$F - \text{measure} = 2 \times \frac{\text{Precision} \times \text{recall}}{\text{precision} + \text{recall}} \text{ ----- (10)}$$

Table 3 compares different performance metrics for various algorithms (CNN, enhanced CNN, ResNet, GNN, ResNet with GNN, and Enhanced CNN and ResNet with GNN) using Facebook data. The metric values show that accuracy is the highest among all metrics. Figure 4 illustrates Facebook's performance metrics using various algorithms (CNN, enhanced CNN, ResNet, GNN, ResNet with GNN, and Enhanced CNN and ResNet with GNN). The proposed methods accuracy is highest compared to other methods. In this plot diagram the x-axis shows the different algorithms and the y-axis shows the values of the metrics. Table 4 compares different performance metrics for various algorithms (CNN, enhanced CNN, ResNet, GNN, ResNet with GNN, and Enhanced CNN and ResNet with GNN) using Instagram data. The metric values show that accuracy is the highest among all metrics. Figure 5 illustrates Instagram's performance metrics using various algorithms (CNN, enhanced CNN, ResNet, GNN, ResNet with GNN, and Enhanced CNN and ResNet with GNN). The accuracy is highest compared to other metrics. The x-axis shows the different algorithms and the y-axis shows the values of the metrics. Table 5 compares different performance metrics for various algorithms (CNN, enhanced CNN, ResNet, GNN, ResNet with GNN, and Enhanced CNN and ResNet with GNN) using YouTube data. The metric values show that accuracy is the highest among all metrics. Figure 4 illustrates YouTube's performance metrics using various algorithms (CNN, enhanced CNN, ResNet, GNN, ResNet with GNN, and Enhanced CNN and ResNet with GNN). The accuracy is highest compared to other metrics. The x-axis shows the different algorithms and the y-axis shows the values of the metrics.

CONCLUSION

In conclusion, Multi Deep Neural Networks helps to discover and enhance social media impacts when coupled with an enhanced CNN and ResNet with GNN. Combining the features of every paradigm helps ResNet to guarantee effective gradient propagation and information flow all across the network. While enhanced CNNs help to extract entire features from big datasets, GNN detects contextual links in both directions. These models taken together provide a strong basis for assessing user interactions, identifying key players, and customizing strategies to optimize impact on Facebook, Instagram, and Youtube. This method lets content strategies and focused outreach change, thus improving the accuracy and range of impact evaluations. The results show the accuracy, Precision, Recall, F-measure values of Facebook, Instagram, and YouTube. Using proposed enhanced CNN and ResNet with GNN outperforms with the accuracy 98.67% in facebook dataset, 98.57% accuracy in Instagram dataset, 98.34% accuracy in YouTube dataset compared to other existing methods. Future studies aiming at quantifying the influencer effect on social media will assist to improve the performance of enhanced CNN and ResNet with GNN.

ABSTRACT

This paper tries to explore the role of psychological autopsy as a vital tool in suicide investigation, focusing on how it enhances our understanding of mental states leading to suicide and its implications for forensic science. It examines recent trends in psychological autopsy, where qualitative insights from interviews, medical histories, and digital footprints are used to reconstruct an individual's emotional and cognitive processes before death. These are highlighted to be the massive contributions made by psychological autopsy on risks and motivations that remain left behind in traditional forensic techniques. In addition, the paper discusses the future of psychological autopsy in the evolving field of forensic science. The integration of emerging technologies such as Artificial Intelligence and Machine Learning may improve the analysis of complex psychological data, thereby providing timely interventions and preventive strategies. Ultimately, this study concludes that psychological autopsy, enhanced by modern technological tools, is essential for deepening our understanding of suicide, offering critical insights for both forensic investigations and mental health interventions.

Keywords: Psychological Autopsy, Suicide Investigation, Forensic Science, Mental Health, Artificial Intelligence, Machine Learning.

INTRODUCTION

Psychological autopsy, often referred to as a "psychological reconstruction," is an investigative tool used to analyse and understand the cognitive and emotional processes that may have led to an individual's death, particularly in

cases of suicide[15]. It is a comprehensive evaluation that draws on multiple sources of information, including interviews with friends and family, medical records, and prior psychological assessments[15]. This method allows forensic experts and investigators to accumulate a narrative that sheds light on the deceased's mental state prior to death, filling in the gaps left by traditional investigative techniques[15]. Understanding this complex concept is crucial in today's context, where mental health issues and suicide rates are alarmingly increasing. Historically, the concept of psychological autopsy can be traced back to the influential work of Edwin S. Shneidman, who emphasized its utility in understanding suicidal behaviour[18]. Over the years, the forensic applications of psychological autopsy have broadened, and recent advancements in research methodologies have spurred renewed interest in this technique, particularly in the realm of forensic science. Psychological autopsy is a deeply insightful process that delves into the life of an individual who has passed away, examining their psychological makeup, behavioural tendencies, and the significant events leading up to their death[15]. This thorough investigation allows forensic psychologists to compile detailed reports that shed light on the individual's mental state, potential motivations, and various other elements that may have influenced their demise [1]. This method proves invaluable to investigative agencies, especially in cases involving uncertain death circumstances and suicides[1]. Recent trends have highlighted the increasing recognition of psychological autopsies as indispensable in forensic investigations. Traditional investigative approaches predominantly focused on physical evidence; however, the growing acknowledgment of the psychological dimensions of crime has prompted many forensic experts to incorporate psychological autopsy into their toolkit. This shift towards a more holistic understanding of cases involving suicide reflects a broader trend in forensic science that recognizes the need to assess not just the actions leading to death, but also the complex psychological landscapes of individuals. In many cases, psychological autopsies have provided crucial insights into the motivations and thoughts that culminated in suicidal behaviour, which may not be apparent from physical evidence alone [11].

Psychological Autopsy: Definition And Objectives

Psychological autopsy refers to the post-mortem evaluation of a deceased person's psychological state, primarily in cases of unexplained deaths, suicides, or suspected homicides[15]. It serves several objectives:

- **Understanding Motivations:** It aims to reconstruct the mental and emotional state that could have influenced the individual's actions leading up to their death.
- **Legal and Forensic Applications:** It provides critical information that can assist in legal cases, clarifying whether a death was indeed a suicide and if there are any liability implications.
- **Prevention Strategies:** Insights gained can contribute to developing preventive measures for mental health issues, guiding healthcare professionals in identifying at-risk individuals [16].

Psychological Autopsy: Overview

The concept of psychological autopsy serves as a unique and critical tool in forensic science, particularly in the investigation of suicide cases [19]. This method involves a retrospective analysis aimed at identifying the psychological state of an individual at the time of their death, with the intent of reconstructing the events leading to suicide[15]. The psychological autopsy serves as a bridge between law and psychology, providing insights into the motivations, feelings, and mental health conditions of the deceased. The importance of this investigative technique is underlined by the complex interplay of factors that can lead someone to take their own life, including mental health disorders, emotional distress, and social influences [19]. A psychological autopsy involves interviews with friends, family members, and others who had meaningful contact with the individual, thereby constructing a detailed personal history [6]. This historical perspective is paramount as it helps investigators understand the various domains of the deceased's life, such as their emotional well-being, social relationships, career pressure, and any signs of mental illness [6]. The data gathered can then be reviewed in conjunction with clinical assessments and clinical diagnoses when available, thus allowing a more comprehensive view that encompasses both subjective experiences and objective facts [16]. The technique also has practical implications in improving overall public health responses to suicide [3]. By analysing common psychological and emotional patterns in cases where individuals have completed suicide, mental health professionals can identify risk factors that may be prevalent in certain demographics or communities [1]. This insight can lead to improved prevention strategies and mental health interventions,

**Souvik Dhar et al.,**

highlighting the role of psychological autopsies not only as forensic tools but also as instruments for social change [1]. Furthermore, there is a growing demand for psychological autopsies in legal contexts[9]. As the justice system grapples with the nuances of culpability and intent, establishing a clear understanding of a deceased individual's psychological state can help mitigate legal ambiguity[9]. Defense attorneys may implement psychological autopsy findings to advocate for reduced sentences or to argue that a defendant's mental state at the time of an offense should be taken into account[9]. Conversely, prosecutorial teams might use psychological autopsy findings to substantiate claims about an individual's predisposition to certain behaviours, further illustrating the complexities of human psychology within the legal framework [10].

Usage of Psychological Autopsy in Understanding Suicidal Deaths

Unpacking Motives and Risk Factors

In the realm of suicidal deaths, psychological autopsy plays a vital role in discerning the motives and risk factors that may have led to a tragic outcome[10]. By examining the individual's emotional and mental condition prior to their death, investigators can gain significant insights into what might have driven them to take such drastic action[10]. This understanding can be crucial for supporting those who may be struggling or at risk, emphasizing the importance of early intervention.

Recognizing Warning Signs

Psychological autopsy serves as a crucial tool in identifying warning signs and red flags that may have been overlooked during initial investigations[15]. This analysis can expose critical details about the deceased's emotional struggles, behaviour changes, or social interactions, providing actionable insights that can prevent future tragedies[11]. By recognizing patterns and signs, experts can offer support to at-risk individuals and potentially save lives[11].

Differentiating Between Suicide and Homicide

In cases where the cause of death is ambiguous, psychological autopsy can aid investigators in distinguishing between suicide and homicide[11]. By assessing the psychological context surrounding the death, forensic experts can draw informed conclusions about the individual's circumstances, further guiding the investigation[11]. This distinction is essential, as it can shift the focus of investigative efforts significantly.

Usage of Psychological Autopsy in Investigating Equivocal Deaths

Providing Context to Uncertain Deaths

For cases shrouded in uncertainty—where the cause of death is not immediately clear or where foul play is suspected—a psychological autopsy provides invaluable context[15]. It can illuminate the individual's mental state, interpersonal relationships, and any underlying conflicts or stressors that could be relevant to the case [1]. Understanding these dynamics can enrich the investigation and possibly reveal motives or circumstances that may have contributed to the death[15].

Ruling Out Homicide

In situations where investigators are considering possible homicide, psychological autopsy can help eliminate this theory by presenting a thorough analysis of the deceased's psychological condition and propensity for suicidal behaviour[15]. Establishing that the death likely resulted from the individual's own actions, rather than foul play, is crucial for focusing investigative resources effectively[15].

Spotting Unusual Circumstances

Equivocal deaths often involve peculiar circumstances or behaviours that lack easy explanations[15]. By employing a psychological autopsy, investigators can unearth any extraordinary psychological factors that might have played a role in the death, paving the way for a clearer understanding of the events that transpired[15].

Souvik Dhar *et al.*,

PSYCHOLOGICAL AUTOPSY: METHODOLOGY

Data Collection

Psychological autopsy process employs a multi-method approach to gather relevant data (See **TABLE 1**). This process typically involves:

- Interviews with Relatives and Friends: Engaging with individuals close to the deceased to gather qualitative insights into their thoughts, feelings, and behaviours[18].
- Review of Medical Records: Analysing healthcare documentation that might reflect the deceased's mental health history, medications, and previous treatments[18].
- Investigative Reports: Considering police reports, witness statements, and scene descriptions to gather contextual information about the circumstances surrounding the death[18].

Analytical Framework

The analysis of the collected data often applies qualitative methodologies, such as thematic analysis, to identify recurring patterns and significant variables that contributed to the individual's mental state [2]. The reconstruction of a life narrative is a key element in psychological autopsy, providing a holistic view of the deceased's experiences[15].

Psychological Autopsy: The Importance of A Holistic Approach

Conducting a psychological autopsy typically requires gathering comprehensive data through interviews with family, friends, and associates, in addition to reviewing medical records, personal journals, and other relevant documents[18]. This holistic approach offers a richer portrayal of the deceased's life and the complexities surrounding their death. It's essential to recognize that psychological autopsy does not replace conventional forensic techniques; rather, it serves as a supplementary method, enriching the overall investigative process[15]. By examining the psychological and emotional facets of a case, investigators can better determine the manner of death—whether it be suicide, homicide, or an accident—and refine the direction of the investigation[15]. Thus, psychological autopsy stands as an important tool in forensic science, bridging the gap between emotional understanding and investigative rigor[15]. When utilized appropriately, it not only aids in individual cases but also contributes to broader efforts aimed at understanding and preventing suicides and improving mental health support[11].

Practical Applications of Psychological Autopsy: An Insight

Psychological autopsy serves as a valuable tool for police investigators when dealing with equivocal deaths, helping to connect various loose ends in criminal cases[4]. Given the complexity of human behaviour and diverse social structures, its frequent application is recommended to enhance criminal investigations[4]. By reconstructing factors influencing the victim's life and circumstances, psychological autopsy can provide insights that are crucial for discerning the true causes of death. Emphasizing its importance, the integration of psychological autopsy into India's legal system is viewed as a means to further enrich and improve investigative processes in the context of equivocal deaths[4]. Case studies further exemplify the utility of psychological autopsies in elucidating the circumstances surrounding suicides. A representative case demonstrates how a psychological autopsy can reveal previously undisclosed factors contributing to an individual's suicidal behaviour [2]. In their study of a 27-year-old male who died by suicide, the investigators uncovered layers of psychological distress rooted in his personal relationships and career pressures, providing a narrative that traditional forensic investigations might have overlooked [2]. The richness of detail gained through psychological autopsy can inform not just the specifics of a given case but also contribute to broader understanding within psychological and forensic literature [2]. In a case, investigators encountered unresolved issues regarding the cause of the victim's death, including the possibility of accidental or suicidal poisoning and whether coal gas poisoning was staged[1]. Due to the lack of evidence beyond a reasonable doubt, the court dismissed the criminal case against the accused, emphasizing the insufficiency of mere suspicion for conviction [1]. The court noted that the case was fraught with improbabilities[1]. It suggests that employing a psychological autopsy could have aided investigators in clarifying these uncertainties by reconstructing various factors related to the death, highlighting the method's significance in equivocal cases[1].

Souvik Dhar *et al.*,**A Case Study of a Young Male**

In the case, psychologists conducted a psychological autopsy on a 27-year-old male who had died by suicide [2]. Through interviews with family and friends, it was discovered that the individual had faced significant struggles with depression and recent job loss [2]. This insight provided clarity to the circumstances of his death, painting a fuller picture of his life that could help guide future interventions [2].

Understanding Patterns of Mass Suicide

Researchers explored the psychological autopsy framework in the context of mass suicides, demonstrating that societal pressures and shared beliefs can contribute to collective suicidal behaviour [12]. By analysing these situations, mental health authorities can devise community-centric intervention strategies [12].

Burari Deaths

The Burari deaths refer to the tragic incident in July 2018, where eleven members of the family were found dead in their home in Burari, Delhi [12]. Initially ruled as a mass suicide, subsequent investigations revealed complex psychological factors at play, prompting discussions about the mental health of the family [12]. A psychological autopsy was conducted to understand the circumstances leading to this event. This process involves a comprehensive analysis of the deceased's psychological state through interviews with family and friends, examination of personal writings, and review of medical and social histories [12]. In the Burari case, the findings highlighted the influence of familial pressures, shared beliefs, and possible mental illness, underscoring the importance of mental health awareness and interventions in preventing such tragedies [12].

Psychological Autopsy: Recent Trends

In recent years, the application of psychological autopsy has seen a transformation influenced by various trends, including:

- **Increasing Suicide Rates**

The World Health Organization (WHO) reported that suicide is a significant global health issue, with nearly 800,000 individuals dying by suicide every year [7]. As mental health problems gain visibility, the demand for comprehensive investigations into suicide has increased, propelling the relevance of psychological autopsy as a method to unravel the complex layers leading to such tragic outcomes [11].

- **Advancements in Research Methodologies**

With the advent of advanced research methodologies and data analysis tools, researchers are better equipped to perform psychological autopsies. For instance, predictive modelling and machine learning techniques are being introduced to analyse large datasets, offering more efficient ways to identify risk factors associated [5]. This evolution allows for a deeper understanding of trends and markers that could help in timely interventions.

- **Integration of Multidisciplinary Approaches**

The multifaceted nature of psychological autopsy has led to collaborative efforts among various disciplines, including psychology, psychiatry, law enforcement, and forensic science [13]. This collaborative framework not only enriches the data collection process but also allows for a diverse range of perspectives in analysing the psychological factors associated with suicide [13].

- **Legal Implications and Forensic Applications**

Legal systems increasingly recognize the importance of psychological autopsies in court proceedings. The insights gathered through this method can significantly impact jury decisions and legal outcomes, especially in cases where the intent behind a death is questioned [23]. Expert testimony based on psychological autopsy findings is becoming commonplace in legal contexts, underscoring its growing importance.

**Souvik Dhar et al.,****• Impact of Technology**

The increasing accessibility of digital data and online footprints offers new avenues for psychological autopsies. Analysing social media activities, online interactions, and digital communications can provide additional context about an individual's mental state leading up to death [8]. Consequently, technology plays a pivotal role in modernizing the investigative process and opening up potential areas for inquiry that were previously inaccessible [8]. There are emerging trends in the application of psychological autopsies in the context of larger public health crises, such as the increasing prevalence of mass suicides in certain cultural or socio-economic settings. Research has indicated an evolving psychosocial landscape that contributes to collective patterns of despair. Researchers suggest that understanding these patterns through psychosocial autopsy can guide intervention strategies tailored to specific populations, aligning public health efforts with empirical evidence derived from thorough investigations of individual cases within a larger framework [14]. Another crucial aspect of psychological autopsies relates to the ethical considerations involved in their execution. Conducting such in-depth inquiries into someone's life posthumously requires sensitivity, respect, and a thorough understanding of ethical standards in psychological practice [11]. The importance of maintaining confidentiality and dignity for the deceased cannot be overstated, as the ramifications of open investigations can affect bereaved families and communities [11]. Mastering the art of conducting psychological autopsies thus not only hinges on methodological rigor but also on an ethical commitment to those whose stories are being uncovered [20]. The advancements in forensic technology and methodologies have also paved the way for improved psychological autopsy practices [14]. For instance, digital resources and data analysis techniques can enhance the depth and accuracy of information gathering, enabling investigators to build more nuanced profiles of individuals [14]. These technical enhancements have proven particularly useful in exploring online behaviours, social media interactions, and other digital footprints that can yield insights into the mental states preceding a suicide. These modern techniques exemplify a convergence of psychology and technology, emphasizing that psychological autopsies can evolve in response to societal changes [14]. Thus, psychological autopsy has emerged as a vital instrument in the forensic investigation of suicides, moving beyond traditional evidence-focused approaches to encompass the psychological dimensions of such tragic events. The compelling need to understand the human psyche in the context of suicide highlights the strength of this method in illuminating the often-circumstantial nature of these deaths. As societal awareness of mental health continues to evolve and grow in importance, integrating psychological autopsies will likely shape future forensic investigations, offering richer narratives that advocate for change in how suicide is approached within the fields of law, psychology, and public health. The development of this field will be facilitated by ongoing research, refinements in methodology, and an ethical commitment to preserving the dignity of those whose stories are shared through the practice of psychological autopsy.

Future of Psychological Autopsy: Integration of Artificial Intelligence And Machine Learning In Forensic Science

The integration of Artificial Intelligence (AI) and Machine Learning (ML) in forensic science has transformed investigations by bringing new levels of speed, accuracy, and efficiency. In recent years, AI has been developed for a range of forensic applications, including fingerprint and facial recognition, DNA analysis, and crime scene reconstruction [5]. The integration of AI algorithms and forensic genetics has the potential to enhance the accuracy, efficiency, and reliability of forensic investigations, ultimately leading to better outcomes in solving crimes and identifying perpetrators [17]. With rapid technological progress, the use of AI in forensics presents significant opportunities. Specifically, AI technology has tried to overcome the human subjective bias limitations and traditional approach of forensic sciences [6], thereby providing more accurate results. AI has lately been applied in forensics to recognise fingerprint patterns [6]. Traditionally fingerprints were analysed using the ink and paper method, which due to its reliance on human subjectivity, caused significant margins for error. Integration of AI has led to sophisticated machine learning algorithms sieve through and interpret large data sets with accuracy and recognise unique patterns [21]. This helps in identification of similarities and anomalies within fingerprints, aiding forensic investigators in solving complex cases [21]. Natural Language Processing (NLP) is another area where integration of AI in forensic linguistics has made significant strides. Forensic linguistics employs linguistic interpretation processes as evidence in legal cases [22]. NLP not only aids in simple analysis of textual evidence, but helps in identification of patterns by analysing tone, pitch, sentiments, idiolects [22] of the writer that might give insights into their thought

Souvik Dhar et al.,

process or intent behind their actions. DNA sequencing has been considered as the keystone of forensic science. It has emerged as another key area where use of AI technologies in forensic labs is assisting in faster and more reliable sequencing, even in cases where samples couldn't be preserved properly. Faster processing of DNA evidence can help in speedier disposal of cases. These advancements also help in building accurate profiles of suspects or accused linked to crime scenes [17]. Crime prevention is one of the top priorities of governments worldwide and they take necessary actions to bring down crime rates [3]. Attempting to predict crime is neither manually possible, and even if done, such analysis is not very reliable. AI and ML, analyse the data sets collected by the police departments to extract patterns and predict future events [3]. As an example, a dataset was used to examine crime data from Vancouver, Canada in the last fifteen years to identify areas which were most likely to experience crime [9]. The accuracy rate of such predictions ranged between 39 to 44 percent [9]. Thus, the integration of AI with ML will make analysis with complex psychological data more enhanced; its algorithms will process tons of information extracted from patients' medical records, the quantity of activity on their social media, and personal communication messages to indicate patterns as well as factors that associate risks with mental health issues, including suicides. Its ability to predict behaviour will facilitate the determination of how humans behave through ML, therefore helping the professionals accurately deduce psychological states lying deep within their minds. This technological approach will assess more comprehensively, in turn allowing interventions in real time and with more sound mental health support. Generally speaking, AI and ML enhance effectiveness and accuracy with regard to psychological autopsies that improve mental health outcomes.

Psychological Autopsy: Challenges In Conducting

While the applications of psychological autopsy are on the rise, several challenges remain:

- **Subjectivity and Interpretative Bias**

The qualitative nature of data collected in psychological autopsies can be influenced by biases from the interviewers and respondents. Variations in perception, memory recall issues, and emotional responses may all contribute to a less objective analysis. It can pose difficulties, particularly in forensic settings where factual precision is paramount [10]

- **Ethical and Privacy Concerns**

The conduct of psychological autopsies often delves into personal histories and sensitive information. This raises substantial ethical concerns regarding consent and the potential re-traumatization of family members during the interview process. The approach must be carefully managed to uphold the dignity and emotional well-being of those involved [20]

- **Interdisciplinary Coordination**

While collaboration across disciplines can enhance the findings of psychological autopsies, it can also lead to complications in communication and integration of diverse methodologies. Establishing effective channels for collaboration is crucial in overcoming these hurdles and ensuring comprehensive analysis [14].

CONCLUSION

The psychological autopsy as a forensic tool holds significant promise for advancing the understanding of suicide and mental health-related deaths in contemporary society. As suicide rates climb and the societal focus on mental health intensifies, the utility of this technique in forensic investigations becomes even more critical. Continued interdisciplinary collaboration, the integration of technology, and awareness of ethical considerations will enhance its application and effectiveness. The use of AI and ML in forensic science is promising to strengthen and bolster the criminal justice system. However, data biases and quality may impact the AI driven conclusions. Adherence to principles of fairness and transparency in the field of forensic sciences can lead to harnessing the potentials of AI to the maximum possible extent. Through rigorous data collection, qualitative analysis and usage of technology like AI and ML, psychological autopsy will play a central role in elucidating the often-mysterious complexities of human behaviour leading up to death. As such, this approach should be regarded not only as a tool for investigation but as a catalyst for broader societal change concerning mental health awareness, preventive strategies, and support for

Souvik Dhar et al.,

vulnerable populations. Further research into systematizing methodologies will fortify its place in forensic science, ultimately fostering a deeper understanding of the tragic phenomenon of suicide and saving lives in the process.

Step	Description
1. Case Selection	Choose cases that warrant a psychological autopsy based on their circumstances (e.g., suicide, unexplained deaths).
2. Data Collection	Gather data from identified sources, ensuring to respect privacy and confidentiality. This includes interviews and reviewing documents.
3. Timeline Creation	Construct a timeline of significant events in the life of the deceased leading up to death, including life stressors, mental health history, and social interactions.
4. Analysis	Analyse the collected data to identify patterns of behaviour, unresolved conflicts, and psychological conditions. Look for indicators of mental health issues or situational triggers.
5. Report	Compile findings into a comprehensive report that summarizes insights, potential causes of death, and the individual's psychological state prior to death. Offer recommendations if appropriate.

Assessing the Therapeutic Potential of Balyadi Lepa and Kanji: A Pharmaco Analytic Approach

ABSTRACT

In the modern day, ayurvedic medicine therapy is thought to be the most effective, the primary source of effective ayurvedic medication is Herbo-mineral pharmaceuticals. Skin diseases are prevalent in all age groups of people, and the most effective treatment for them is local application, which is simple to use and effectively treats the disease. This article is based on the balayadi lepachurna with kanji preparation of the to local application of the shwitra. A shwitra is include twakavikar in kustharoga. A sthanik chikitsa should be done in shwitra. This study investigates the pharmacological properties and clinical efficacy of two traditional remedies, Balyadilepa and Kanji. Balyadilepa is a topical application used in Ayurvedic medicine, while Kanji is a fermented rice-based drink. This analysis aims to understand their potential therapeutic benefits, mechanisms of action, and safety profiles.

Keywords: Sthanik chikitsa, Churna Kalpana, Balyadilepakanzi, Twakavikar, Shwitra and herbo-minaral

INTRODUCTION

The skin disease is most common in present era, the shwitra will be considered on among the skin twakavikar, all acharya will be considered shwitra is kushtaroga, mainly kushtaroga treatment have mentioned local application. it

**Hemangini Malivad et al.,**

is effective source of herbo mineral medicine. The word of lepa is derived from lepan, in sushruta Samhita lepa will be classified in 3 types The balyadilepa described in yogratnakarkushta chikitsa adhayay shloka 5 That allmost Dravya is action on kushtghana, krimighan kandughanash witrakar as wedjanana dahshamak Ranjana etc. Kanji used in the preparation of lepa and form to semisolid to easy application

MATERIAL AND METHOD

Balyadilepa will be prepared in churna Kalpna and kanziprepared in Sandhan kalpana. Pharmaceutical procedure and pharmacanalytic procedure are divided in different stage

1. shodhan of ingredient of balyadi lepa churna
2. balyadi lepa churna preparation
3. kanzi preparation
4. analysis of balyadilepa churna
5. analysis of kanzi

shodhan of balyadilepachurna [ingredient]**Bhallatak shodhan**

- Pratham shodhan
Firstofall, take bhallataka fruit and fine powder of red brick, and fill in a cotton bag and rub in medium pressure. When brick powder absorbs the oil of bhallataka fruit oil means when the skin of bhallataka fruit separate from it then its clean in warm water
- Dwityashodhan
Make two pieces of bhallataka fruit, and fill the coconut water in a vessel and dip the bhallataka fruits in the vessels and boiled 2 hours. This processmake pure bhallataka fruits

Precution of sodhan

Use coconut oil onface hand and expose area, and wear gloves, face shield and mask properly. Bhallatak fruit break very carefully. And mixed with red brick water its rotate car

balyadilepachurn a preparation

- Tack all ingredient of balyadilepa and make fine powder,distrigatour, micropulverizer, shifter used for powder macking
- Fine powder passed 80#
- After that powder is homogenous mixed with help of mass mixture
- Fine powder of balyadilepa packed air tight container.

kanzi preparation

- Tack the shali rice and boiled in clay 1.5 kg rice will be tacken and add to 15 liters water and boiled
- Rice will be half ripen and add nimbu
- Filled in clay pot and vessels mouth packedair tight container
- After 15 days examination of solution
- Filtter with cotton cloth
- Keep it glass bottle of preparation

PREACUATION TACKEN DURING PROCESS

Take good quality rice and clean it before using. Take rice and water in classical ratio.Use air tight clay pot for fermentation of rice.Check smell, flame test for surety of good kanzi

**Hemangini Malivad et al.,****Stage 4 analysis of balayadi lepachurna****DRUG ANALYSIS****THIN LAYER CHROMATOGRAPHY**

EXTRACT; methanol soluble

Solvent System: petroleum ether, diethyl ether ,acetic acid

Stage 5: analysis of kanzi**DISCUSSION**

The procedure works best for making Balyadi Lepa Powder. Madhur, Katu, Tikta, and Kashaya rasa make up Balyadi Lepa. snighdhaguna, mradu, ruksha, tikshna, guru, and lagu. Sheet virya with Ushna. katuvipaka and madhur, Kaphavatashamak, pittavardhak, vatapittashamak, kaphapittahar, and kaphapittashamak. Amaltas, vaybidanga, and nimba are plants that contain tenin, which is used to color skin. Shodhana is done before to lepachurna preparation. Powder needs to travel through 80 # For the goal of uniform mixing, mass mixture is employed. Lepa, or soft pastel, is ready to use. Prepration of lepa (semisolid form) has a brief shelf life. Thus, we made the lepachurna and stored it beforehand. 79% of the prepared churna is fine powder, as evidenced by our balyadilepa blending well with the kanji. In the thin layer chromatography of balyadilepachurna maximum rf value will be found o.it composition Kaempferol, a natural flavonoid, influences melanin pigmentation through multiple mechanisms. It regulates tyrosinase activity, activates pathways like MITF, and reduces oxidative stress via antioxidant properties. Kaempferol also enhances melanocyte differentiation and modulates inflammation, impacting pigmentation. Quercetin, a plant-based flavonoid, impacts melanin pigmentation by inhibiting tyrosinase activity, reducing melanin production, and downregulating MITF, a key melanogenesis regulator. Its antioxidant and anti-inflammatory properties protect melanocytes from oxidative damage and inflammation, further modulating pigmentation. Sitosterol, a plant-derived phytosterol, may influence melanin pigmentation through its anti-inflammatory and antioxidant properties, which stabilize melanocyte activity and protect against oxidative damage. It may also modulate signaling pathways like Wnt/ β -catenin and support melanocyte function via improved skin barrier health phenolic compounds, plant-derived metabolites, influence melanin pigmentation by activating tyrosinase, modulating signaling pathways like MITF and cAMP/PKA, and providing antioxidant protection to melanocytes. Compounds such as caffeic acid, ferulic acid, and chlorogenic acid stimulate melanin synthesis, while others like EGCG support melanocyte proliferation and UV-induced melanogenesis. Flavonoids, polyphenolic compounds from plants, can enhance melanin pigmentation by activating tyrosinase, upregulating MITF, and protecting melanocytes through antioxidant activity. Compounds like kaempferol, quercetin, and epicatechin stimulate melanogenesis, while flavonoids such as luteolin promote melanocyte proliferation. They also enhance UV-induced pigmentation by protecting against oxidative damage. These properties make flavonoids valuable in skincare for boosting pigmentation and in medical research for treating hypo pigmentation disorders like vitiligo. Once made, lepa (paste) is simple to apply to diseased areas. Alepachurna's shelf life is two years. Kanzi to be used as a powdered balyadilepa.

CONCLUSION

The foundation of Balyadi Lepa is Yogaratanakara chikitsa adhayaya. External administration of therapeutic action without adverse consequences. Analytical investigations revealed that the medication is microbe-free and falls within the accepted guidelines for topically applied dosages. The fusion procedure works best while preparing Balyadilepa. The powder of balyadilepachurna is fine. It creates an easily applicable "LEPA" when combined with the soft kanji paste. Lepachurna has a two-year shelf life, whereas mass-prepared lepa or semisolid has a shorter one. In order to prepare and store lepachurna before using it to prepare lepa or semi-solid mass.

ABSTRACT

The safety and health of the individuals can be affected by the quality of work life. Different financial and non-financial factors are the key aspect to analyze the performance of the employees in which the workplace facilities and convenience are the important considerations particularly for the office related works. This paper presents the analysis of quality of work life for different office workers and investigate its organization with lower back pain (LBP) and neck pain (NP). This cross-sectional analysis was conducted among office employees working in a single organization. Office workers who are with or without LBP and NP were considered and made a survey about each participant and collected the data over a 4-month period with accordance to the measurement of lighting intensity and physical fitness. Furthermore, multi output regression is proposed for the significant analysis of the risk factors and the relationship between the dependent and independent variables that are associated with NP and LBP were analyzed. In conclusion, results are indicating the nature of hazards that affects NP and LBP in the workplace for the office workers. The analysis shows that the need for improvement in ergonomic factors for preventing the LBP and NP for quality of work life among office workers.

Keywords: Lower Back Pain, Neck Pain, Physical Fitness, Office Workers, Ergonomics Factors

INTRODUCTION

Nowadays, an important subject of science is considered to be the Ergonomics that is mainly centered towards response and behavior of humans with respect to their movement, sitting, and standing. The ergonomics is

**Rashmi and Bhavya Vikas**

contemplated as a human way of thinking and philosophical concept. This methodology is applied in different areas such as transportation, entertainment facilities in home, education, workplace, public, aviation, and sports [1] [2]. Ergonomics is the scientific concept that indulged with common sense but the application and utilization will not be an easy way as it needs to be developed and used by complex peoples with various perspectives that makes system more complicated for designing based on the accommodation. Some of the workplace challenges such as structural design, institutional obstacles, and arrangements with errors can lead to certain circumstances where safety and health of the employees become questionable [3] [4]. Musculoskeletal Disorders (MSDs) is one of the most common problems occurred in office workers. The MSDs are much related to joints, nerves, muscles, and tendons which can affect various regions of bodies such as upper limbs, back, and neck. The main contributing factor in job such as reduced quality of life, increase in work-related injuries, presentism, absenteeism, increase in medical expenses, and change of occupation is considered to be the work-related musculoskeletal disorders [25] [26]. In various companies and occupations, office workers spent more hours in from a computer system and also spending their office times in seated positions. Use of computer systems has multiplied in workplaces, that is related to MSDs-associated signs with an incidence fee of greater than 50%, specially with inside the top extremities and decrease back. Also, pain/soreness due to MSDs, with inside the neck, shoulders, and decrease back, are not unusual place amongst work place employees because of the time spent in a sitting position. Worldwide, MSDs are great and feature each socioeconomic and private consequences [27].

The practitioners of the human elements and ergonomics (HF/E) field have evolved a chain of theories, principles, and techniques to assess human-device machine overall performance. From the HF/E aspect, techniques of comparing human paintings within the machine fall into the subsequent categories: Physical techniques, psychophysiological techniques, behavioral-cognitive techniques, crew techniques, environmental techniques, and macro-ergonomic techniques. The impact of ergonomic evaluation among the office workers who are concurrently sitting in from of computers for long time [28]. Office staff perform varied activities, similar to typing, writing, and reading which will be joined with prolonged static and awkward postures, repetitive movements, and high mental workloads. workplace personnel as an enormous cluster of staff are exposed to MSDs. As explicit above, MSDs are complex work-related problems [29].

Therefore, this study was done to analyze MSDs and its associated factors among Iranian office workers. The ultimate goals of ergonomics are enhancing the overall performance of the systems and well-being which can achieved through the interventions of ergonomics. The primitive definition is given for intervention which is to meant to be purposeful action done by the human agent for creating a change [5]. The implementation of these interventions are made at macro-ergonomics and micro-ergonomics levels in industries, field or laboratory, organizations, and workplaces. Some of the occupational interventions of ergonomics in the workplace environment are accomplished using bottom-up, middle-out, or top-down strategies. Various organization work strategies and interventions have been proposed for improving the health and productivity, reduce or prevent work-related disorders, and quality of work-life (QWL) [6] [7]. Figure 1 shows the human and ergonomics factors. Neck Pain (NP) and Lower Back Pain (LBP) is a frequent and chronic condition of global wide. The risk factors indulged with NP and LBP are multifactorial which broadly categorized into work-related factors (e.g: job control, computer hours per day at work, physical demand at work) and individual factors (e.g: psychological distress and health behavior) [8]. Most of studies have mainly focused on the associations between the NP, LBP, and other risk factors rather than including work-related and individual factors. Moreover, when the physical-risk factors such as endurance/strength, range of motion, and shoulder/neck muscle were measured, it is not specific for the office workers as the sample sizes are smaller [9] [10]. Quality Work Life (QWL) is defined to be the unfavorableness or favorableness of the work environment for the employees. Various factors can affect the broad concept of QWL and different characteristics such as task identity, autonomy, feedback, skill variety, and task significance are affecting the QWL factors. The influential factors of QWL is mainly divided into two categories of intrinsic and extrinsic. Some of the important intrinsic factors such as skill variety, social environment, and nature of work is used for determining QWL and for extrinsic factors are working condition, working hours, and monetary payments [11] [12]. Warr et al. [13] highlighted on perceived intrinsic job characteristics, happiness, motivation, participation, high order strength, self-rated anxiety, and life satisfaction are the important factors used for shaping QWL. Nanjundeswaraswamy and Swamy [14]

**Rashmi and Bhavya Vikas**

reported various components in their study for QWL and stated that reward systems, career advancements, participation in decision making, job security, and training are main components for the QWL in manufacturing industries.

RELATED WORKS

Stead and Lin [36] discussed that ergonomics in the field of human computer interaction. Authors defined that ergonomics can help to design improvement by analyzing the measurement. The ergonomics is the scientific discipline that is the concept of understanding and interacting among computer systems and humans. Furthermore, the profession that applies data, theoretical principles, and methods for optimizing for human use by proper design to obtain overall performance. Chan [37] indicated that the variables of quality, productivity, and safety is improved using the ergonomics. Authors have studied about the work design in practice for number of cases that compiled in various industries. The case studies based on the ergonomics outlines the situations held in various industries. Hafize Keser and Safak Bayir [38] made a cohort of study for determining the evaluation of information and communication technologies coordinator teacher trainers (ICT-CTT's) in the organization in the working environment with computers when considering the ergonomics. Authors shown the responsibility such as guiding, counselling, and training the ICT coordinators and teachers for the students by planning, evaluating, managing information technologies and authors considered nine-subsections such as selection of chair, keyboard and mouse, lighting, temperature, humidity, selection and organization of computer desk, noise, training and information, and ventilation. Hopkins [29] and Le Coze [30] discussed the human factors or ergonomics (HFE) which gives the academic discipline and practice for the professionals that also offers the knowledge and theory for 50 years of experience in various complex sectors such as rail, aviation, petro-chemical, and defense that maintains a low incident rates despites of having risky environments. Carroll and Rudolph [31] have discussed the healthcare for dynamic, interdependent, complex, managing uncertainty, chronic underfunding, and incomplete data. Du et al. [32] discussed human ergonomics factors and its useful approaches in which three fundamental characteristics are considered about the traditional QI efforts and safety by being design driven, taking a systems approach, and focusing on dual outcomes. Jarvelin and Rasanen [33] have applied the HFE and the professional practice that should be shifted the significant changes for modern working life that creating a new demands and HFE has the opportunities both as an educational requirements and discipline.

Cuenca and Aslandies [34] analyzed the issues of ongoing challenges of professional identity of HFE. The authors additionally advise that the IEA may want to offer assist for the justification of expert stage HFE schooling programs. The Swedish HFE community advanced a method to actively sell the subject and undertook a multifaceted technique to have interaction with the enterprise and the overall public on a number of topical areas. Brown and Legg [35] discussed Since its origin HFE education has long-faced several challenges. Few dedicated HFE courses were existing or programs and these were sometimes at postgraduate level, building on students' previous degrees in an exceedingly wide selection of topics love engineering, technology, psychology, design, health, nursing, physiotherapy, medication and management. HFE courses or programs usually had variable emphases. The HFE course content commonly trusted the main target of the tutorial programs (e.g. in Colleges, Institutes, colleges or Departments of Health or Engineering or style or Management) during which they were placed at intervals universities. This focus usually meant that HFE courses were unable to hide the total vary of areas encompassed by HFE - physical, psychological feature and systems applied science. Recently courses have enclosed coverage of socio technical systems, organizational, community or environmental ergonomics and property. Ellis and Pompili [15] mentioned that for various groups the components of QWL can be varied and the authors conducted a study for the workers in hospital and listed various factors such as resident aggression, inability to deliver quality of care, shift work, professional isolation, poor relationships, lack of opportunity, learning new skills, lack of recognition, poor working environments, workload, balance of work and family, and role conflict are the main components of QWL. Mirvis and Lawler [16] introduced some factors such as safe work environment, equal employment opportunities, progress, and fair wages as the important categories of QWL by investigating the corporation service company.

**Rashmi and Bhavya Vikas**

Rethinam and Ismail [17] found well-being, balance work and life, competence development, and health as the components by conducting the study among the professional working in information technology company. Nazari and Dashti [18] investigated that the improvement in QWL will leads to desirable outcomes which enhances effectiveness, efficiency, lower occupational accident rate, organizational productivity, and job satisfaction. Uysal et al. [29] showed that the analysis on some studies indicate that improving a good level of QWL will reduce the work-related absences and employee complaints. Ashrafi et al. [20] and Jafari et al. [21] made a study that undesirable QWL will leads employees to affect with mental disorders, burnout symptoms, and increase turnover rate. Ashrafi et al. [20] evaluated the QWL effect on outputs such as emotional exhaustion, depersonalization, and personal accomplishment might be mediated by burnout. The QWL effect on psychological well-being is demonstrated by Salehi et al. [22].

MATERIALS AND METHODS

Participants Recruitment

In this research, a 4months' continuous study is designed for the office workers for a particular organization. The sample-size of the data is calculated based on the follow-up of the study for 4 months for estimating the ergonomics factors such as LBP and NP. For this calculation, one sided test with null hypothesis of incidence rate is estimated as the sample size. The LBP and NP incidence rate for 2-months among the university workers and it is reported to be 45%. The value of incidence rate of LBP and NP is tested for $\alpha_0 = 0.45$ at the level of significance as 5% with the power of 92%. The anticipated incidence rate is 50% which is $\alpha_a = 0.50$. Overall 180 office workers are required as a minimum sample size. During the follow-up, 20% of required sample size is increased for allowing dropout and withdrawal of participants. Figure 2 shows the process of study for this research. Name list of the office workers for all units is provided by the organization and included in the computer program. This process of group screening is done using simple random sampling and firstly invited the participants for the interview and then accepted for this study. The eligibility of the participants who are included in this study are considered to be full-time office workers who are working for at least 5 hours per day with the computer and should be minimum of 6-month experience in this particular office for the same position and interested to join in this participation. If the participants having LBP and NP at a severe level, having an history of these problems during one month or some medical functions such as lumbar spine, thoracic, degenerative disc disease, and tumors, and also prolonged absence or being pregnant, they are excluded from this study. Finally, the follow-up is considered for a total of 182 office workers and formed the final sample size. In this study, NP and LBP are defined as the pain that has experienced in the spine area, lumbar vertebrate to gluteal folds or buttocks, or between the prominences of lumbosacral vertebral. Ethical approval is obtained from the organization for this study and participants were informed about the consent before participating in this study.

Demographic and Professional Information of Participants

Professional and demographic information such as work experience, age, weight, height, body mass index (BMI), gender, marital status, daily and weekly working hours are collected using the self-administered questionnaire as given in Table 1.

Quality of Work Life

For measuring the QWL, Walton's 35-item tool is used which is considered by several researchers for their study in different professional settings. Moreover, eight subscales are measured by designing the questionnaire as given in Table 1.

- **Adequate and Fair Compensation (AFC)**

AFC defined as the proportionality of pay and equal pay for equal work with staff and social criteria as well as different works. Based on the quality and quantity of work performed by the workers, employees are preferred to be paid in a lawful manner.

**Rashmi and Bhavya Vikas**

- **Health and Safe Work Environment (HSE)**
HSE refers to mentally and physically safe working circumstances along with the reasonable working hours. The work environment preferred to employees are comfortable, safe, and pleasant environment that should free from hazardous agent.
- **Development of Human Capacities (DHC)**
DHC refers that job opportunities are created by companies for acquiring, applying knowledge and skills, and learning. Employees are preferring the jobs with higher levels of participation and autonomy. Such kind of job can improve attenuate work stress and job satisfaction.
- **Security and Growth (SGr)**
This subscale assesses some factors such as future ambiguity, type of contract, and opportunities for promotion and growth within the organization.
- **Social Integration (Scl)**
Scl refers that the company creates a pleasant work environment and atmosphere for reinforcing the sense of employees that they belong to this organization and they have given a vital importance.
- **Constitutionalism (Con)**
Con refers that the expression of freedom without having any fear towards the reaction of higher officials and rule of law for the domination of humans.
- **Total Life Space (TLS)**
TLS refers that the balance between the work-life and other aspects for the employee's life that includes family and leisure.
- **Social Relevance (ScR)**
ScR refers social responsibilities perceived by the employees in the organization, sense of responsibility towards the environment and rules governing the society respected by the organizations manger.

Collection of Data

The screening data and baseline measures are collected by conducting interviews face-to-face with the structured questions based on the questionnaire given in Table 1. The questionnaire part is divided into four sections and these are, section 1 collected the demographic characteristics such gender, age, and work experience, first or second job. Section 2 collected the information regarding the history of trauma, health status, chronic diseases, body mass index (BMI), and congenital disease. Section 3 is considered the evaluation of psychological stress. Section 4 enquired the behavior and characteristics of work such as back-pain preventive behavior, frequent break from sitting, suitability of workstations, and daily duration of sitting. The assessment of preventive behavior is considered based on the response from the office workers for the given questions such as awkward postures, exercise, lifting, movements, and prolonged sitting and the scores are obtained based on two classes and these are good and poor. The assessment of workstation suitability is considered based on their dimensions such as height, width, and depth of the table and seat, breadth and width of the workspace, and lighting intensity. The characteristics of each workstation is classified into inappropriate or appropriate. The physical fitness of the subjects is assessed based on the Physical Fitness Committee Test. The handgrip strength is measured using the Grip dynamometry, the strength of back and leg is measured using back-leg dynamometer, and the back muscle flexibility is measured using the back flexion-extension dynamometer. The Lutron LX-105 is used for measuring the light intensity at the office. The incidence rate of NP and LBP is calculated for the 1-month, 2-month, 3-month, and 4-month follow-up periods. The collected incidence rate is calculated for 4-months.

Analysis of Collected Data

The Epi-info version 7.2 is used for recording the collected data in Windows 10 using the method known as double data entry and STATA version 15.1 is used for the analysis. The characteristics of office and worker is described using the descriptive statistics such as mean, standard deviation, and percentage. The incidence of NP and LBP is estimated for every 1-month to the 4-month follow-up. The collected incidence rate of NP and LBP is calculated as per given eqn. 1.

Rashmi and Bhavya Vikas

$$LBP \text{ (or) } NP = \frac{\text{Total Number of New Cases of (NP or LBP) at 1-month or 2-month or 3-month or 4-month period} \times 100}{180} \quad (1)$$

The associations between NP or LBP and mentioned study factors is analyzed using the t-test and multi output regression. The potential confounding factors such as age, work experience, and gender are included in the multi-output regression analysis and the factors which is $p < 0.2$ is included in the univariate analysis. We set $p < 0.05$ for the statistical significance and presented the risk factors by using the Relative Risk (RR) and having confidence interval (CI) of 95% for adjusted RR (RR_{Ad}). Table 2 shows the reliable variables used for this study of ergonomics for office workers.

EXPERIMENTAL RESULT ANALYSIS

Health Status and Personal Factors

From total 180 office workers, almost 78.2% of the staffs are females and the mean age for them is 34.7 ± 9.3 i.e., maximum=52 and minimum =25. The work experience mean is measured to be 13.2 ± 12.3 years i.e., minimum = 0.8 and maximum=25.5. Mostly, 41.3% is having work experience of 1-5 years, 18.4% is having 16-20 years, and 12.6% is having 21-25 years of work experience. Considering the educational background, 73.4% of workers having bachelor degree and 26.6% is having master's degree. When considering the psychological stress, 65.4% of office workers is having normal stress and 34.6% of workers is having high stress category. Almost 80.5% workers are not doing regular exercises for atleast 30 minutes and the back-pain prevention behavior is considered as poor in 22.6%, good in 10.7%, and fair in 66.7%.

Environmental Factors of Work

Majority of the offices are not considering the light intensities for the standard condition to be followed by each organization. The actual condition to be followed is 400 to 500 lx which is about minimum of 110 lx and minimum of 823lx. When considering the office chairs, 94% is having backrest, 44.5% is having flexible up-down, 76.5% is revolvable, 67.6% is inappropriate of height and width of the seats. Furthermore, the measurement of table dimensions shows that 65.4% and 63.6% are inappropriate of height and width. While considering the workspace, the width is 66.7% and 76.4% of depth which is inappropriate.

Incidence of NP and LBP

Based on the data collected from follow-up questionnaire, Table 3 shows that the incidence rate of NP which is having 58.6% and LBP is 53.4% at 2 months for 98 cases. The collected incidence rate of NP is 89.5% and LBP is 91.6% at 4 months and increased as 146 cases. All cases are work-related NP and LBP. The major reason for cause reported for NP and LBP is the prolong work at the computer in different positions. Overall 86 cases are reported to have the symptoms of LBP and NP which is affecting the normal life and work performance. In 15 cases, the workers taking the advice of health professionals and they are in medications. Due to these symptoms, 8 cases reported that they have taken sick leave. When the 4-month follow-up period is divided into four 1-month sub period, in these period of time the trend of LBP and NP incidence rate is increased from the first sub period. The strength of handgrip, leg, and back are significantly lower for NP and LBP cases than the non-NP and non-LBP cases as shown in Table 4. Table 5 shows the factors that are significantly associated with NP and LBP based on the multivariate analysis. These factors are high stress, $BMI \leq 26$, family members with back pain, poor back-pain preventive behavior, and inappropriate width for the use of workstation. The office workers who has $BMI \leq 26$ will be having higher risk for NP and LBP which is about 3.4 times greater and those having $BMI > 26$ will be less risk having CI 95%. The LBP and NP will be applicable for the worker whose family member are affected with such kind of factors when compared to others whose family members are not affected with those back pains. Compared to no-stress workers, LBP and NP is higher about 4.2 times when they are having high stress. The workers who is having prevention behavior very poor for back pain has high risk of development for NP and LBP about 3.85 time more. Inappropriate workstation for the workers will have high risk of LBP and NP due to the width when compared with appropriate workstation.

RESULT AND DISCUSSION

The use of this prospective grouping with regular follow-up participants with the subjects over the entire period of 4-month proves that this study minimizing the risk of recall biases and becomes a valuable strength in finding the high incidence rate for LBP and NP for the professional office workers. In the present study, the higher incidence rate explained by the difference for the current eligibility criteria. The participants are selected based on the working time which should be minimum of 5 hours per day in office with computer. When compared with the Malaysian study [23], this study gives a better result in determining the risk of NP and LBP and also analyze the cause for these factors which is due to sitting in same position for longer time. For some cases, the participants are taking sick leave which is reported in the study and it occurred due to NP and LBP. Increase in absentees among the office worker can lead to development of LBP and NP for other. This type of mislead can create additional incident of negative impact on management and academic activities. The general nature of the workers in office with the computers involved by sitting in a fixed position for typing documents and in front of screen and performing huge tasks for atleast 4 to 5 hours a day. In our study, the risk of LBP and NP is increased due to sitting for longer hours with a computer. The NP and LBP is provoked by the potential roles such as prolonged sitting and inappropriate workstation design.

This is the clear explanation which is supported for this study for finding the poor preventive behavior and sitting for long time which are significantly correlated with NP and LBP. Furthermore, the risk in development of NP and LBP is more when noticing the BMI is lesser than or equal to 25 for the office workers when compared with those who is having higher BMI which is greater than 25. From the previous study in [24], the BMI >30 will lead to chronic LBP but when it is compared with our study the findings are different as it gives for 25. This is due to the follow-up of our study is about only for 4-month which major office works having less BMI. Moreover, the development of NP and LBP is higher than the effect of BMI due to the physical dimensions of individual office workers in the workstations. This is particularly for those office workers who spent long time with the computers. From this present study, an important factor is found is that the relationship between increased risk and poor back-pain preventive behavior of NP and LBP. Furthermore, poor muscle flexibility or strength is also correlated with the development of LBP and NP. These analysis explains the office workers to be aware of self-preventive behavior and regular exercise to overcome NP and LBP problems. Therefore, process of this ergonomics study is processed for ensuring the routine design of workstations and the physical needs are expected for individual workers. Other aspect such as lighting intensity plays an important role which will lead to eye strain for the prolonged workers for long term and can cause back pain, shoulder, and neck.

CONCLUSION

In this research, high prevalence of NP and LBP complaints are observed among office workers. These complaints are influenced by QWL particularly in shoulders, neck, back pain, leg, and upper back. The incidence rate for NP and LBP is proven to be increasing for 4-month period of follow-up which gives a health related warning and its effects among office workers because of longer vulnerable towards the hazards of office work. However, improving the QWL will leads to reduction in NP and LBP. The indication from the results show that the improvement in QWL can affect the office work hazards such as LBP and NP. In this study, the analysis shows that the various ergonomics factors such as BMI, previous medical complications, family members having problems regarding NP and LBP, stress, chronic disease, age factor, work experience, hours of working, environmental factor, and lighting intensity can increase the incidence rate of LBP and NP. The consideration of these ergonomic factors are the important aspects which helps in reducing the LBP and NP.

ABSTRACT

Diabetes is a pressing global health concern, particularly pronounced in India. Among truck drivers, undiagnosed cases and insufficient awareness pose significant risks. The objective is to examine the level of awareness, and adherence to diabetes-related practises among truck drivers, having both diabetic and non-diabetic. A cross-sectional survey was conducted among commercial truck drivers at Transport Nagar in Delhi-NCR, from January 2023 to March 2023. A survey among 108 commercial truck drivers in Delhi-NCR aimed to gauge their awareness and adherence to diabetes-related practices. Findings revealed concerning gaps: while 77.8% had some knowledge of diabetes, only 33.3% understood its organ-specific effects. Alarming, 63.0% had never undergone diabetes testing. These results emphasize the urgent need for targeted interventions to improve awareness and preventive measures among this high-risk group. With diabetes impacting both health and welfare, addressing these gaps is crucial for individual well-being and broader road safety.

Keywords: Awareness, Diabetes, Truck Drivers, Delhi NCR, Road Safety

INTRODUCTION

Diabetes has been a prevalent global public health concern, and India has emerged as the foremost epicentre of diabetes worldwide in recent times. According to the most recent estimate provided by the World Health Organization (WHO), India now exhibits the greatest prevalence of diabetes, with a reported figure exceeding 32

**Anand Chinnakaran et al.,**

million people diagnosed with the condition. Based on projections, it is anticipated that this figure will experience a substantial increase to approximately 79.4 million by the year 2030[1]. Truck drivers face an elevated risk of developing diabetes because of their predominantly inactive lifestyle, inadequate dietary choices, and heightened stress levels [2][3]. Commercial truck drivers are at the forefront of the road transportation industry in India, comprising an approximate total of five million individuals [4]. The presence of undetected diabetes and a lack of awareness regarding diabetes among truck drivers pose significant risks to their overall health and well-being [5]. It has been observed that commercial truck drivers are at a heightened risk for cardiovascular risk factors [6]. To effectively manage and mitigate the impact of diabetes, it is crucial to prioritise awareness and acquire comprehensive knowledge on the subject matter [7]. Previous studies have extensively documented the prevalence of diabetes among truck drivers, ranging from 10% to 20% [8] [9]. This study addresses the existing gap in the literature by documenting the levels of awareness, knowledge, and practise of truck drivers, both diabetic and non-diabetic, in relation to diabetes. This will assist policymakers and professionals in programme development to effectively strategize for the future development of diabetes control programmes targeted at this mobile population.

MATERIAL AND METHODS

The present cross-sectional survey was conducted among commercial truck drivers at Transport Nagar in Delhi-NCR, from January 2023 to March 2023. The participants were chosen using a convenient sampling method, resulting in a sample size of 108 commercial truck drivers. The data was collected using a structured questionnaire having both open-ended and closed-ended questions to assess knowledge. The questionnaire underwent a pilot phase involving thirty commercial truck drivers who were not included in the final survey. This pilot phase aimed to test and refine the questionnaire. The questionnaire comprises sections on demographic information, awareness of diabetes-related issues, and healthcare practices related to diabetes. All truck drivers who attended the monthly community health camps organised by the charity hospital in Delhi - NCR, were contacted to participate in the survey. These camps provided drivers with the opportunity to undergo random blood sugar tests using automatic glucometers to assess their diabetes levels. All truck drivers who provided their consent were included in the study. The data was recorded in Microsoft Excel 2017, and subsequent data analysis and interpretation were performed using descriptive statistics, which encompassed measures such as mean and percentage.

FINDINGS AND RESULTS

Referring Table 1, it was found that the average age of the drivers was 33.1 ± 7.7 years. The observed response rate in the study was 93.91%. A significant majority of 102 individuals (94.4%) possessed literacy skills. Among these literate drivers, 26.1% had successfully finished elementary school, 47.7% had attained a high school education, 17.4% had pursued upper secondary education, and a small proportion of 3.5% had achieved a graduation degree. Most of the respondents in the study were married, accounting for 79.1% of the total sample. Additionally, 60.9% of the sample, reported being smokers. Among the smokers, a significant proportion, specifically 77.1%, indicated that they had been smoking for a duration exceeding 6 years. A total of 15 drivers, which represents 13.0% of the sample, reported having a family history of diabetes. Table 2 has shown the details of truck drivers having awareness about diabetes and their source of information. Most truck drivers, namely 73.0% ($n = 84$), demonstrated awareness about fundamental knowledge relevant to diabetes. The average age was 33.7 ± 7.9 years among individuals who possessed knowledge regarding diabetes, whereas it was 30.8 ± 6.4 years among those who were uninformed about the condition. The primary sources of knowledge on diabetes were found to be word of mouth, accounting for 38.0% of respondents, followed by family and friends at 24.0%, and doctors at 29.0%. Out of the truck drivers surveyed, 10.7% exhibited a lack of awareness regarding the typical age of onset for the disease, while 26.2% showed a lack of understanding regarding the diagnostic processes associated with the condition. 33.3% of the total 28 truck drivers demonstrated awareness regarding the specific organs affected by diabetes. However, the remaining respondents either possessed partial knowledge or were completely unaware of the organs impacted by this condition. Table 3 shows Out of the total number of participants, 63.0% of the truck drivers reported that they had never undergone

**Anand Chinnakaran et al.,**

diabetes testing. 32.5% of the truck drivers who underwent diabetic testing tested positive for diabetes. These individuals subsequently pursued treatment options encompassing medication, exercise, and dietary modifications. The prevailing viewpoint among a significant proportion of truck drivers is that effective management of diabetes necessitates adherence to a routine medication regimen, regular physical exercise, and dietary modifications.

DISCUSSIONS

The present study explained that most truck drivers fell within the age range of 25 to 50 years. In a study conducted among a significant cohort of truck drivers, it was found that a substantial percentage (77.8%) of participants demonstrated awareness of diabetes. Notably, the primary channel through which this knowledge was acquired was through informal communication, commonly known as word of mouth. A significant proportion of the participants, comprising over 50%, have not undergone diabetes testing. The present study observed a diabetes prevalence rate of 15.5%, which aligns with the findings of Randhawa et al. (2020), who reported a prevalence rate of 16% [9]. Additionally, the National Diabetes and Diabetic Retinopathy Survey 2019 reported that the prevalence of diabetes (defined as blood glucose levels exceeding 200 mg/dl) among truck drivers was 1.3 times higher (16%) compared to the general male population in India (12%). Nevertheless, the frequency of prediabetes across all 15 states was recorded at 10.3% [10]. Misra et al. (2001) observed a higher prevalence of diabetes mellitus at a rate of 11.2%. In the field of international studies, researchers Odeyinka et al. (2017) and Saberi et al. (2011) conducted investigations that revealed a diabetes prevalence rate of around 3% among commercial truck drivers [12] [13] [14]. In a meta-narrative systematic review conducted by Abu Dabrh et al., (2014) an investigation was carried out on the health evaluation of commercial drivers. The study found that the prevalence of diabetes among this population was 33% [15]. The study conducted by Deepa et al. (2005) revealed that a significant proportion of individuals residing in Chennai, around 19.0%, exhibited a lack of awareness regarding the existence of a medical ailment known as diabetes [16]. Truck drivers face an elevated susceptibility to diabetes because of many factors, including a sedentary lifestyle, extended working hours, inconsistent dietary patterns, and restricted availability of nutritious food choices. The limited sample of truck drivers we examined and the inability to offer a definitive diagnosis of diabetes are two limitations of our study. This limited sample size may obstruct the generalizability of the findings to a broader population of truck drivers. Additionally, it is important to acknowledge that the study does not possess the capability to provide a definitive diagnosis of diabetes. One notable strength of the present study lies in the comprehensive nature of the survey, which encompasses not only an examination of knowledge, awareness, and practises pertaining to diabetes but also an evaluation of the health-seeking behaviours exhibited by truck drivers.

CONCLUSION

This study clarified that a significant proportion of truck drivers had knowledge of diabetes and had a broad awareness of the condition. However, a significant proportion of individuals have not undergone testing to determine their diabetes status. It also addresses a gap in the existing scholarly literature by investigating the levels of diabetes awareness, knowledge, and management among truck drivers. Awareness of diabetes and its possible implications is of utmost importance for commercial truck drivers. Unregulated diabetes has the potential to result in significant health concerns, such as ocular impairments, neuropathy, cardiovascular disorders, and an elevated susceptibility to vehicular accidents. The cultivation of awareness among drivers facilitates their comprehension of the significance of effectively managing diabetes, actively seeking medical attention, and embracing health-promoting lifestyle practises.

ABSTRACT

To check the awareness and Practice in Pregnant Woman for Infant Oral Health and Self-oral Hygiene. A self-administered questionnaire was conducted among 120 pregnant women in SGT University, Gurugram. Data were analyzed using SPSS (v. 21), p value <0.05 was considered statistically significant. Most surveyed women were knowledgeable about dental health issues, although a large percentage did not visit dental clinics regularly during pregnancy. The results obtained from the study revealed that the expectant mothers in the higher age groups and with graduate and postgraduate degrees fared better. Overall, the respondents in the present survey displayed average oral health knowledge and positive attitudes to oral health.

Keywords: Oral health, Knowledge, Pregnant women, Practices

INTRODUCTION

To check the awareness and Practice in Pregnant Woman for Infant Oral Health and Self-oral Hygiene

The moment a child is born, the mother is also born. A mother is something absolutely new and so in the child a mother lives on and the family continues to live. "Pregnancy is one of the most important stages in a woman's life. In this stage, a woman feels that she has become responsible not only for her health, but also for the health and well-being of the fetus growing in her. Pregnancy makes a woman more aware of all health issues and how they might relate to or be predisposing factors for her child's future health. Pregnant women thus become more receptive to all

**Vidushi Sheekand and Anshu Blaggana**

health information" [1]. Studies have shown that a substantial proportion of pregnant women report that they become acquainted with their oral health problems involving hard and soft tissues during pregnancy. However, most of them discern that such problems are normal to a pregnant woman and blanch away during post-natal periods. With such a notion, most pregnant women abnigate from seeking professional dental consultation and/or are reluctant to undergo certain dental procedures during pregnancy with a trepidation of possible harm to themselves or their babies [2]. There is adequate substantiation that suggests good oral health is advantageous to both the mother and her baby. As an exemplar, maternal periodontal disease has often been associated to preterm birth, low birth weight, and preterm low birth weight. Numerous studies have established that pregnant women have more gingivitis than their non-pregnant peers[3,4] with a prevalence ranging from 30% to 100%.[4,5]The exaggerated inflammatory response of the gums to bacterial plaque known as pregnancy gingivitis has been attributed to the increased secretion of gestational hormones (especially oestrogen and progesterone) during pregnancy [6,7]. Knowledge and attitude of the parents exclusively a mother, forms one of the leading building blocks for establishing optimal oral health among infants. Literature amply documents the fact that good oral health of the mother right from pregnancy could be the key behind it. Hence, appraisal of the knowledge and attitude of expectant mothers using pre-validated questionnaire would help in analyzing and formulating personalized infant oral health promotion programs.

MATERIAL AND METHODS

A supervised, well structured, questionnaire-guided interview in SGT University, Gurugram, Delhi-NCR, was used in the study, allowing closed and open responses. Information on the demographic data, level of education, Oral hygiene knowledge, Infant oral hygiene knowledge, Oral hygiene practice, Pre-natal dental visits of the study subjects was collected. A total of 120 pregnant mothers were recruited with 100% response rate. Questionnaire forms were distributed and collected with the help of a female social worker on the same day from the pregnant mothers while waiting in the antenatal clinic. Descriptive statistics was performed and frequency tables and pie charts were generated. All categorical variables were analysed using SPSS Software. Questionnaires were administered to all consecutive consenting pregnant women who attended the Gynaecology Department of SGT University during the study period. A total of 120 questionnaires were properly completed. The questionnaire comprised of five sections. The first section contained questions on the respondent's Socio Demographic characteristics such as age and educational status. The second section comprised of questions on Oral Hygiene Knowledge. There were fifteen questions in this section evaluating the oral health knowledge of the respondents including understanding and causes of tooth decay and gum disease. The third section comprised of questions on Infant Oral Hygiene Knowledge. This section contained seven questions specially build up to gauge the respected mother's opinion regarding their issue's oral hygiene. The fourth section encompassed questions on Oral Hygiene Knowledge of the mother herself. The fifth section comprised of three questions that helped in assessing the fact that limit the expecting mother's visit to the dentist which mainly included lack of time, insufficient finances and fear.

RESULTS**Demographic Data**

Out of 120 expectant mothers, (n = 83, 69%) were aged between 20-25 years, (n = 27, 22.5%) were aged between 26-30 years, (n = 8, 6.6%) were aged between 31-35 years and (n = 2, 1.6%) were in the age group of 36+ (Table 1) and (Figure 1). Only (n = 2, 1.66%) pregnant females had high school education, (n = 9, 7.5%) had attained post graduate degree whereas majority, (n = 109, 90.83%), had tertiary education (Table 2) and (Figure 2).

Oral Hygiene Knowledge

This section provides a summary of questions which were asked from pregnant women's about oral hygiene knowledge (Table 3). Respondents believed that the following factors prevented tooth decay: cleaning the teeth (n = 99, 82.5%) (Figure 3), eating less amount of sugar (n=105, 87.5%) (Figure 3), whereas (n = 93, 77.5%) regarded

**Vidushi Sheokand and Anshu Blaggana**

Pyorrhoea same as Gingivitis (Figure 4). Around (n = 101, 84.16%) (Figure 5) respondents experienced gum problems, (n = 102, 85%) (Figure 6) noticed change in their gums and only, (n = 17, 14.16%) felt cleaning their teeth made them sick (Figure 7). Greater number of the women agreed, (n = 111, 92.5%), that they are cleaning their teeth less often since they became pregnant (Figure 7). Out of 120, only (n= 45, 37.5%) (Figure 8) believed pregnancy itself causes teeth to go bad and only (n = 39, 32.5%) (Figure 9) believed periodontal disease lead to preterm low birth weight deliveries. Out of 120, (n = 66, 55%) (Figure 10) believed dental visits are important during pregnancy. Majority had self-limiting reasons like lack of time (n = 83, 69.16%), deficiency of funds (n = 77, 64.16%), fear of visiting a dentist (n = 29, 24%) (Figure 11) and most of them did not even feel the need of visiting one (n = 77, 66.16%) (Table 6). Only few of them (n = 21, 17.5%), though it is essential to meet a dentist after 6 months (Figure 12).

Infant Oral Hygiene Knowledge (Table 4)

In this section of the questionnaire, the mothers were asked seven questions to judge their awareness regarding infant oral hygiene as depicted in (Figure 13, 14, 15).

Oral hygiene practices (Table 5) (Figure 16)

This section consisted of questions to determine how well the oral hygiene practices are carried out by the patient. Around 35.8% (n = 43) noticed smell from their mouth. Roughly around 7.5 % (n = 9) and 10.8% (n = 13) flossed their teeth and rinsed their mouth with mouth rinse. Not even 5% were aware of the Fluoride and it's benefits.

Pre natal dental visits (Table 6) (Figure 11)

A sizeable portion of the respondents narrowed down their dental visits owing to lack of time (n= 83, 69%). The distress of visiting a dentist (n = 29, 24%) and shortage of finances (n = 77, 64%) were among the other reasons that limited the patient's dental visits.

DISCUSSION

Maintaining good oral hygiene is of utmost importance that one can do for their teeth and gums. Healthy teeth not only enable one to look and feel good, they make it possible to eat and speak properly. A woman's life is affected by pregnancy in many ways, including her oral health. Taking care of oral cavity is important during pregnancy. Being pregnant puts the mother at higher risk for tooth decay, gum disease (also known as "pregnancy gingivitis") and oral growths called "pregnancy tumours" and there is no denying the fact that good oral health during pregnancy is crucial especially in view of the recent studies that poor oral health may result in unfavourable pregnancy outcomes. Daily preventive care which includes proper brushing and flossing, helps stop problems before they even develop and is much less painful, expensive, and worrisome than treating conditions that have been allowed to progress. However such positive behaviour would be influenced by the individual's oral health knowledge and attitudes. While many studies have been conducted on this topic in India in the past. But this study was designed to provide a crystal clear view of the present condition of oral health knowledge, attitude and practices of a sample of pregnant women residing mainly in Haryana. Overall the patients in the present survey showed average oral health knowledge and a very positive attitude to oral health. A good number of pregnant females rightly identified the cause of dental decay but only a small percentage knew the cause of periodontal disease. The results which were obtained from the study showed that the expectant mothers in the higher age groups and with postgraduate and graduate degrees fared better. This response was similar to the finding reported in a survey conducted by Akpabio *et al* [8] in Michigan, USA. Not even 30% (n = 27, 22%) were familiar with the fact that tooth decay can also be caused by bacteria which are transmitted from mother to child by kissing or sharing feeding utensils. Reducing the cariogenic bacteria in pregnant mothers prevents the beginning of colonization of bacteria in their infants. The most probable reasons could be lack of information or proper access to awareness about infant oral health. This finding was in accordance with the report of Kohler *et al* [9]. Hardly 2 % appraised the fact that maternal periodontitis and preterm birth were related. Studies support the fact that blood borne anaerobic bacteria or inflammatory mediators can easily cross placenta. This is in accordance with the reports published by Jeffcoat *et al* [10].

ABSTRACT

This paper provides some basic frameworks for the study of various algebraic Plithogenic structures. The concept of a Plithogenic Fuzzy M-subgroup has been discussed and introduced here. It has been demonstrated that Plithogenic M-subgroups can also be used to represent subgroups that were previously formed in the classic, fuzzy, intuitionistic fuzzy, and neutrosophic environments. Moreover, several homomorphic properties of the Plithogenic Fuzzy M-subgroup have been explored by introducing function in plithogenic environment.

Keywords: Plithogenic Fuzzy M-subgroup, image and preimage of Homomorphism of Plithogenic Fuzzy M-subgroup.

INTRODUCTION

Crisp Set theory has some disadvantages. When it comes to solving difficulties in real life, it is incredibly inadequate. In handling such cases, L. A. Zadeh's fuzzy set theory (1965) is more dependable. Numerous scholars have applied fuzzy theory to a variety of real-world issues since the theory's inception. However, over time, a number of alternative set theories that is more adept at managing uncertainty than fuzzy sets have evolved. These include the Intuitionistic Fuzzy Set (IFS) (1986, Atanassov. K), Neutrosophic Set (NS) (2005, Florentin Smarandache), Plithogenic

Pandiammal and Sundari

Set (PS) (2017, Florentin Smarandache), etc. Because of this, most academics favour using set theories to address various real-world issues where uncertainty is significant. In actuality, the Neutrosophic Set is a Fuzzy Set that is further generalised from the Intuitionistic Fuzzy Set. The contributions made by Florentin Smarandache to the advancement of Neutrosophic Set theory are noteworthy. He has, for example, contributed to the development of Neutrosophic measurements and probability (2013, Florentin Smarandache), calculus (2015, Florentin Smarandache & Khalid) etc. Neutrosophic set theory offers a wide range of applications as well. Moreover, Florentin Smarandache (2018) presented the notion of Plithogenic theory, a generalisation of the theories of Classical, Fuzzy, Intuitionistic and Neutrosophic sets. Plithogenic set theory is currently widely used in several practical domains and in a authority of decision making propositions. These notions are crucial for addressing a range of probabilistic issues.

PRELIMINARIES

The basic principles of Fuzzy M-Subgroups (FMSG), Intuitionistic Fuzzy M-Subgroups (IFMSG), and Neutrosophic M-Subgroups of M-group (NMSG) are examined in the following subsection along with some of their most fundamental characteristics.

Definition 2.1.1 (2010, Pandiammal et.al.) Suppose an "M-group" is a mathematical structure $(G, *)$, where G is a set and $*$ is a binary operation defined on a group G . The operation $*$ satisfies the following properties:

1. Closure Property: For every elements u and v in G , then $u * v$ is also in G . i.e. the product of u and v is likewise an element of G .
2. Associative Property: For every elements u, v and w in G , then $(u * v) * w = u * (v * w)$
3. Identity Element: An element e exists in G such that for each element u in G ,

$$e * u = u * e = u.$$
4. m-property: For any element u belongs to G , there exists an element v belongs to G (not necessarily distinct from u) such that $u * v = v * u = e$, where e is the unique element).

Example of an M-group 2.1.1 (2010, Pandiammal et.al.) Consider the set $G = \{0, 1, 2, 3\}$ and define the operation $*$ as addition modulo 4 (denoted by $+$).

The addition table for this set is: Here, the unique element e is 0 since $a + 0 = 0 + a = a$ for all a in G .

Now, the m-property for each element in G :

1. For $a = 0$, $\exists b = 0$ such that $0 + 0 = 0 + 0 = 0$ (using the unique element).
2. For $a = 1$, $\exists b = 3$ such that $1 + 3 = 3 + 1 = 0$ (using the unique element).
3. For $a = 2$, $\exists b = 2$ such that $2 + 2 = 2 + 2 = 0$ (using the unique element).
4. For $a = 3$, $\exists b = 1$ such that $3 + 1 = 1 + 3 = 0$ (using the unique element).

Since each element in G has an element that satisfies the m-property, this set G with the operation $*$ (addition modulo 4) would be an example of an m-group.

Definition 2.1.2: [9] A function $\check{T}: [0,1] \rightarrow [0,1]$ is called a \check{T} -norm if and only if for every a, b, t in $[0,1]$, successive provisions are fulfilled:

- (i) $\check{T}(a, 1) = a$
- (ii) $\check{T}(a, b) = \check{T}(b, a)$
- (iii) $\check{T}(a, b) \leq \check{T}(t, b)$ if $a \leq t$
- (iv) $\check{T}(a, \check{T}(b, t)) = \check{T}(\check{T}(a, b), t)$

Definition 2.1.3: [9] A function $\mathbb{T}: [0,1] \rightarrow [0,1]$ is called a \mathbb{T} -conorm if and only if for every a, b, t in $[0,1]$ successive provisions are fulfilled:

- (i) $\mathbb{T}(a, 0) = a$
- (ii) $\mathbb{T}(a, b) = \mathbb{T}(b, a)$
- (iii) $\mathbb{T}(a, b) \geq \mathbb{T}(t, b)$ if $a \leq t$
- (iv) $\mathbb{T}(a, \mathbb{T}(b, t)) = \mathbb{T}(\mathbb{T}(a, b), t)$

Pandiammal and Sundari

Definition 2.1.4 (2010, Pandiammal et.al.) If $(G, *)$ is a M-group and a fuzzy subset (FS) A of G is called a **Fuzzy M-subgroup (FMSG)** of an M-group of G the requirements listed below are met:

- (i) $\tilde{U}_A(mab) \geq \tilde{U}_A(a) \wedge \tilde{U}_A(b)$,
- (ii) $\tilde{U}_A(a^{-1}) \geq \tilde{U}_A(a)$, for all a and b in G .

Here $\tilde{U}_A(a^{-1}) = \tilde{U}_A(a)$ and $\tilde{U}_A(a) \leq \tilde{U}_A(e)$, where e is the unique element of G . Also, condition (i) is satisfied by a \tilde{U}_A , then it is said to be a fuzzy M-sub-groupoid of a M-group.

Theorem 2.1.1 (2010, Pandiammal et.al.) If \tilde{U}_A is a Fuzzy M-subgroup of a M-group G iff $\forall a, b \in G, \tilde{U}_A(mab^{-1}) \geq \tilde{U}_A(a) \wedge \tilde{U}_A(b)$

Definition 2.1.5 (2010, Pandiammal et.al.) If \tilde{U}_A is a Fuzzy M-subgroup of a M-group G . Then $\forall a, b \in G$ and $\tilde{U}_A(e) \geq t$ the subgroups \tilde{U}_t are called a level M-subgroups of a M-group \tilde{U}_A .

Definition 2.1.6 (2010, Pandiammal et.al.) If (G, \cdot) is a M-group. An Intuitionistic fuzzy subset A of G is called a **Intuitionistic L-fuzzy M-subgroup (ILFMSG)** of a M-group G if the following essentials are met:

- (i) $\tilde{U}_A(mab) \geq \tilde{U}_A(a) \wedge \tilde{U}_A(b)$, (ii) $\tilde{U}_A(a^{-1}) \geq \tilde{U}_A(a)$,
- (iii) $\tilde{N}_A(mab) \leq \tilde{N}_A(a) \vee \tilde{N}_A(b)$, (iv) $\tilde{N}_A(a^{-1}) \leq \tilde{N}_A(a)$, for all m in M & a and b in G .

Definition 2.1.7 [5] If (G, \cdot) is a group. An Intuitionistic fuzzy subset A of G is said to be a **Neutrosophic Fuzzy M-subgroup (NFSG)** of G , if the requirements listed below are met:

- (i) $\tilde{U}_A(mab) \geq \mu_A(a) \wedge \mu_A(b)$,
- (ii) $\tilde{U}_A(a^{-1}) \geq \mu_A(a)$,
- (iii) $\tilde{I}_A(mab) \leq \nu_A(a) \vee \nu_A(b)$,
- (iv) $\tilde{I}_A(a^{-1}) \leq \nu_A(a)$,
- (v) $\tilde{N}_A(mab) \geq \lambda_A(a) \wedge \lambda_A(b)$,
- (vi) $\tilde{N}_A(a^{-1}) \geq \lambda_A(a)$, for all a & b in G .

Example 2.1.3 [5] If A is a Neutrosophic Set of G and $G = \{1, -1, i, -i\}$ such that,
 $A = \{(1, 0.7, 0.5, 0.4), (-1, 0.7, 0.4, 0.3), (i, 0.8, 0.4, 0.2), (-i, 0.8, 0.4, 0.2)\}$.
 Then A is Neutrosophic M-subgroup of M-group G .

MOTIVATION OF THE WORK

It is evident from the talks above that research on fuzzy subgroups, Intuitionistic fuzzy subgroups, and neutrosophic subgroups has produced a number of productive study areas. Some academics investigated its normal versions, homomorphic properties, and other algebraic structures. Furthermore, other authors investigated the basic properties of these notions and used soft set theory to them. Because of its ability to handle uncertainty, the Plithogenic set theory has attracted a lot of interest lately. Once more, this set theory is more inclusive than the theories of Classical Sets (CS), Fuzzy Sets (FS), Intuitionistic Fuzzy Sets (IFS), and Neutrosophic Sets (NS). Stated differently, the ideas of Plithogenic Fuzzy Subgroup (PFSG), Plithogenic Intuitionistic Fuzzy Subgroup (PIFSG), and Plithogenic Neutrosophic Subgroup (PNSG) will serve as extensions of the Classical Subgroup (CSG), Fuzzy Subgroup (FSG), Intuitionistic Fuzzy Subgroup (IFSG), and Neutrosophic subgroup (NSG) — depending on whether they require further discussion. Once more, it is necessary to study their properties, homomorphic features, and a few more crucial algebraic structures. The following research gaps are discussed in this paper:

However, there is no definition for the term "Plithogenic Fuzzy subgroup."

- ⇒ It is necessary for evaluation whether a Plithogenic fuzzy subgroup can represent a Classical subgroup, Fuzzy subgroup, or Intuitionistic subgroup.
- ⇒ Additionally, nothing is known about the homomorphic properties of the Plithogenic fuzzy M-subgroup.
- ⇒ As a result, we introduced the concept of Plithogenic fuzzy M-subgroups and investigated their algebraic properties.

Pandiammal and Sundari

CONTRIBUTION OF THE WORK

To investigate some of the homomorphic properties of the Plithogenic Fuzzy M-subgroup of a M-group (PFMSG),

- ⇒ To check whether Plithogenic Fuzzy M-subgroup of a M-group (PFMSG) is a generalization of Classical M-Subgroup, Fuzzy M-Subgroup, Intuitionistic M-Subgroup, and Neutrosophic M-Subgroup of a M-group or not.
- ⇒ To define Plithogenic Fuzzy M-subgroup of a M-group and study its algebraic properties.
- ⇒ In light of the aforementioned gaps, this article aims to fill them by offering some crucial definitions, examples, theories, propositions, etc. in the areas of Plithogenic M-Subgroup and Plithogenic Fuzzy M-Subgroup of a M-group. Additionally, the superiority and efficacy of the Plithogenic M-subgroup over the Classical, Fuzzy, Intuitionistic, and Neutrosophic M-subgroups of a M-group will be discussed. Finally, some significant analysis will be covered, such as the ideas homomorphic and anti-homomorphic properties. Some of the goals that are planned and carried out during this study article are as follows.

DETAILS OF THE WORK

Research Problem

Numerous scholars have examined the basic characteristics and various algebraic structures of the fuzzy subgroups—Neutrosophic, Intuitionistic, and fuzzy—to date. It is known that algebraic structures are preserved by homomorphic functions. Therefore, one must investigate how homomorphism affects those fundamental algebraic characteristics. Homotopy has already been presented and examined by a number of scholars in the contexts of Fuzzy Subgroups, Intuitionistic Fuzzy Subgroups, and Neutrosophic Subgroups. Moreover, several scholars have analyzed the homomorphic properties of the standard forms of the Fuzzy Subgroup (FSG), Intuitionistic Fuzzy Subgroup (IFSG), and Neutrosophic Subgroup (NSG) of a M-group. The term "Plithogenic Fuzzy M-Subgroup" has not yet been defined or investigated. Once more, other Plithogenic subgroups, such as Plithogenic fuzzy subgroup, etc., may be established based on the varying degrees of appurtenance and dissimilarity functions. Moreover, Plithogenic subgroups, including Plithogenic fuzzy subgroups, possess the capacity to evolve into a generalized form of Fuzzy subgroups, Intuitionistic fuzzy subgroups, and Neutrosophic subgroups, as Plithogenic sets represent generalized versions of classical sets, fuzzy sets, Intuitionistic fuzzy sets, and Neutrosophic fuzzy sets. Smarandache has demonstrated that all other set theories may be built using just one set theory, namely the plithogenic theory. Similarly, the ideas of fuzzy subgroup, intuitionistic fuzzy subgroup, and neutrosophic fuzzy subgroup may all be created using simply the Plithogenic subgroup of a group. Another time, in addition to defining these concepts, some fundamental analysis of homomorphic pictures, pre-images, etc., is required. However, one must first comprehend how any mapping behaves in a plithogenic environment before adding homomorphism in a plithogenic subgroup. These fundamental ideas of Plithogenic fuzzy M-subgroups have been presented and examined in this work along with appropriate examples. Earlier, certain key concepts have been presented and are being examined in this introductory part.

Preliminaries

Plithogenic refers to something that is related to creation, evolution, or origin. A Plithogenic set is one that has items with one or more attributes, every one of which is connected to a collection of values. In a Plithogenic set, the degree of appurtenance function, or $d(x, y)$, indicates a connection between an element and the value of any attribute. Additionally, the notation $c(y, y)$, which stands for the degree of dissimilarity or contradiction function, represents the connection between the values of any two qualities. A Plithogenic set is defined formally as follows:

Definition 5.1 (2018, Florentin Smarandache)

If U is a universal set and $A \subseteq U$. A Plithogenic set is called as $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, where $\chi, R_\chi, a_{d_F}, a_{c_F}$ is an attribute or appurtenance, R_χ is the appropriate range of attribute's value, $a_{d_F} : A \times R_\chi \rightarrow [0,1]^s$ is the function of degree of appurtenance (DAF) and $a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]^t$

Pandiammal and Sundari

is the degree of contradiction function (DCF) that corresponds to it. In this case, $s, t \in \{1, 2, 3\}$. Notably, the fuzzy degree of contradiction function (FDCF) and fuzzy degree of appurtenance function (FDAF) for $s=1$ and $t=1$ in the definition above will modify. Generally speaking, just take into account FADF and FDCF for simplicity. The following axioms are satisfied in the instance of FDCF: $\forall (u_i, u_j) \in R_\chi \times R_\chi$ $a_{c_F}(u_i, u_j) = 0$ & $a_{c_F}(u_i, u_j) = a_{c_F}(u_j, u_i)$.

At this point, one might want to use $s=2$ or $s=3$ with $t=1$ to improve accuracy. Consequently, we will have,

$a_{d_F} : A \times R_\chi \rightarrow [0,1]^2$ (Intuitionistic fuzzy DAF (IFDAF)) and

$a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]^3$ (Neutrosophic DAF (NDAF)) along with a_{c_F} as FDCF).

Furthermore, one can utilize $t=2$ or $t=3$ to extend further and raise the degree of precision and complexity. i.e.

$a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]^2$ (Intuitionistic fuzzy DCF (IFDCF)) and

$a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]^3$ (Neutrosophic DCF (NDCF)).

Plithogenic sets are a simple way to represent any Classical, Fuzzy, Intuitionistic, or Neutrosophic set. A single attribute with three values for Neutrosophic sets (membership (M), indeterminacy (I), and non membership (NM)), two values for Fuzzy sets (membership (M), and non membership (NM)) and one value for membership (M) in the Crisp set establishes a distinction between intuitionistic fuzzy sets, classical sets, fuzzy sets, and neutrosophic sets. The Plithogenic set is consequently a generalization of these sets. The fuzzy subgroup, the intuitionistic fuzzy subgroup, and the neutrosophic subgroup have the following initial homomorphic properties. Understanding the implications of homomorphism in the Plithogenic fuzzy subgroup, Plithogenic Intuitionistic fuzzy subgroup, and Plithogenic neutrosophic subgroup will be made easier by referring to these essential properties.

Definition 5.2 (1979, Anthony & Sherwood) A fuzzy set x of G is called as supremum, if for any $x' \subseteq x$, $\exists m_0 \in x'$, this means that $x(m_0) = \sup_{m \in x'} x(m)$.

Theorem 5.1 (1979, Anthony & Sherwood)

The image (supremum image) of x is a fuzzy subgroupoid on $I(x)$ with regard to T if x is a fuzzy subgroup of G based on a continuous t -norm \check{T} and I is a homomorphism of G .

Theorem 5.2 (1971, A. Rosenfeld)

Any fuzzy subgroup with supremum property is a homomorphic image of its pre-image.

Theorem 5.3 (2011, Sharma)

Preimage of an Intuitionistic Fuzzy subgroup f of G_2 if f is a homomorphism of a group G_1 into another group G_2 .

Theorem 5.4 (2011, Sharma)

An image of an Intuitionistic Fuzzy subgroup f of G_2 if f is a surjective homomorphism of a group G_1 into another group G_2 .

Theorem 5.5 (2015, Cetkin & Augiin)

Any homomorphic subgroup's pre-image or homomorphic image is a Neutrosophic subgroup. Since Plithogenic subgroup is a generalization of Classical set, fuzzy set, Intuitionistic fuzzy set, and Neutrosophic set, it is assumed that it is superior than Classical subgroup, Fuzzy subgroup, Intuitionistic fuzzy subgroup, and Neutrosophic subgroup. We have proposed many kinds of Plithogenic M-subgroups and examined their homomorphic properties in the next section.

**PLITHOGENIC SUBGROUPS (2019, Florentin Smarandache)****Definition 6.1 (2018, Florentin Smarandache)**

If G is a general set and $A \subseteq G$. A Plithogenic set is represented as $A_s = (A, \chi, R_\chi, \wp_{d_F}, \wp_{c_F})$, where $\chi, R_\chi, \wp_{d_F}, \wp_{c_F}$ is an attribute or appurtenance, R_χ is the corresponding range of attribute's value, $\wp_{d_F} : A \times R_\chi \rightarrow [0,1]^s$ is the degree of appurtenance function (DAF) and $\wp_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]^t$ is the corresponding degree of contradiction function (DCF). Here $s, t \in \{1, 2, 3\}$. Also note that for $s=1$ and $t=1$ in the description above, will become a fuzzy DCF (FDCF) and a fuzzy ADF (FADF). Usually, only FADF and FDCF are taken into consideration. The following axioms are met in the case of FDCF:

$$\forall (u_i, u_j) \in R_\chi \times R_\chi \quad \wp_{c_F}(u_i, u_j) = 0 \text{ \& \; } \wp_{c_F}(u_i, u_j) = \wp_{c_F}(u_j, u_i).$$

A further instance of $s=2$ or $s=3$ with $t=1$ may be desired to improve accuracy. In that illustration, we obtain,

$$\wp_{d_F} : A \times R_\chi \rightarrow [0,1]^2 \text{ (Intuitionistic fuzzy DAF (IFDAF)) and}$$

$$\wp_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]^3 \text{ (Neutrosophic DAF (NDAF)) along with } \wp_{c_F} \text{ as FDCF.}$$

Again, to generalize further and increase the level of accuracy and complexity one may take $t=2$ or $t=3$ i.e.

$$\wp_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]^2 \text{ (Intuitionistic fuzzy DCF (IFDCF)) or}$$

$$\wp_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]^3 \text{ (Neutrosophic DCF (NDCF))}$$

Definition 6.1 Plithogenic Fuzzy Subgroup (2019, Florentin Smarandache)

If $A_s = (A, \chi, R_\chi, \wp_{d_F}, \wp_{c_F})$ is a Plithogenic set of a group G . Where χ is an attribute, R_χ is a range of all attribute's values, $\wp_{d_F} : A \times R_\chi \rightarrow [0,1]$ is the corresponding FADF and $\wp_{c_F} : A_\chi \times A_\chi \rightarrow [0,1]$ is the corresponding FDCF. Then A_s is called a PFSG of G if and only if \wp_{d_F} is a fuzzy subgroup i.e. in other words if and only if $\forall (x_1, y_1), (x_2, y_2) \in A \times R_\chi$. The subsequent conditions are fulfilled:

- I. $\wp_{d_F}((x_1, y_1) \cdot (x_2, y_2)) \geq \min\{\wp_{d_F}(x_1, y_1), \wp_{d_F}(x_2, y_2)\}$ and
- II. $\wp_{d_F}((x_1, y_1)^{-1}) \geq \wp_{d_F}(x_1, y_1)$

A set of all Plithogenic Fuzzy subgroup of a group G is denoted as PFSG (G).

Example 6.1 (2019, Florentin Smarandache)

If $A_s = (A, \chi, R_\chi, \wp_{d_F}, \wp_{c_F})$, is a Plithogenic set of a group G , where $\wp = \{a, b, ab, e\}$ is the Klein's four group, is an attribute, is a group collection of two attribute of two attribute values (here, $c^2 = e'$ and e' is the unit element). Also, $a_{d_F} : A \times R_\chi \rightarrow [0,1]$ and $a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$ are respectively corresponding FADF and FDCF defined in Table 1 and Table 2. Then, $A_s \in PFSG(G)$. Consider a note while both a_{d_F} and a_{c_F} are Fuzzy sets in the definition above, only on a_{d_F} the conditions for a Fuzzy subgroup has been assigned because a_{c_F} will only become a fuzzy subgroup if $\forall (u_i, u_j) \in V_\psi \quad p_{c_F}(u_i, u_j) = 0$.

Pandiammal and Sundari

Example 6.2 (2019, Florentin Smarandache)

If $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, is a Plithogenic set of a group G , where $\mathcal{O} = \{1, -1, i, -i\}$ is a group, χ is an attribute, $R_\chi = \{a, b, ab, e\}$ is the Klein four-group. Also, $a_{d_F} : A \times R_\chi \rightarrow [0,1]$ and $a_{c_F} : R_\chi \times R_\psi \rightarrow [0,1]$ are subsequently corresponding FDAF and FDCF.

Theorem 6.1 (2019, Florentin Smarandache)

If $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F}) \in PFSG(G)$ iff $a_{d_F}((u_1, v_1) \cdot (u_2, v_2)^{-1}) \geq \min\{a_{d_F}(u_1, v_1), a_{d_F}(u_2, v_2)\}$.

Theorem 6.2 (2019, Florentin Smarandache)

Any Classical subgroup is a Plithogenic fuzzy subgroup (Considering that two singleton classical groups are united to form an equivalent attribute value set).

Theorem 6.3 (2019, Florentin Smarandache)

Any Fuzzy subgroup is a plithogenic fuzzy subgroup (Considering that a singleton classical subgroup is the equivalent attribute value set).

HOMOMORPHISM OF PLITHOGENIC SUBGROUP

If χ is an attribute and R_χ is the prescribed range of values for that attribute and $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, is a Plithogenic set of a group G . Also, if f is a function defined on $G \rightarrow R_\chi$. Then the image of A_s is denoted as

$A'_s = (A', \chi, R'_\chi, a'_{d_F}, a'_{c_F})$, where $a'_{d_F} : A' \times R'_\chi \rightarrow [0,1]$ is defined as $a'_{d_F}(u_2, v_2) = \sup_{\substack{u_1 \in f^{-1}(u_2) \\ v_1 \in f^{-1}(v_2)}} a_{d_F}(u_1, v_1)$

and $a'_{c_F} : R'_\chi \times R'_\psi \rightarrow [0,1]$ is defined as $a'_{c_F}(v_3, v_4) = \sup_{\substack{v_1 \in f^{-1}(v_3) \\ v_2 \in f^{-1}(v_4)}} a_{c_F}(v_1, v_2)$. Also if,

$P'_s = (P', \psi, V'_\psi, p'_{d_F}, p'_{c_F})$ is a Plithogenic Set of $f(G)$ then the pre image of A'_s will be denoted as

$A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, where $a_{d_F} : A \times R_\chi \rightarrow [0,1]$ is defined as

$a_{d_F}(u_1, v_1) = a'_{d_F}(f(u_1), f(v_1)), \forall (u_1, v_1) \in A \times R_\chi$, $a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$ is defined as

$a_{c_F}(v_1, v_2) = a'_{c_F}(f(v_1), f(v_2)), \forall (v_1, v_2) \in R_\chi \times R_\chi$.

Theorem 6.4 (2019, Florentin Smarandache)

A Plithogenic fuzzy subgroup's homomorphic preimage is also a Plithogenic fuzzy subgroup.

PROPOSED NOTIONS OF PLITHOGENIC FUZZY M-SUBGROUP OF A M-GROUP

Definition 7.1 (Plithogenic Fuzzy M-Subgroup of a M-group)

If $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, be a Plithogenic set of an M-group G . Where χ is an attribute, R_χ is a range of all attribute's values, $a_{d_F} : A \times R_\chi \rightarrow [0,1]$ is the corresponding FDAF and $a_{c_F} : A_\chi \times A_\chi \rightarrow [0,1]$ is the corresponding FDCF. Then, A_s is a PFMSG of G iff a_{d_F} is a fuzzy M-subgroup i.e. in other words if and only if,

$\forall (a_1, b_1), (a_2, b_2) \in A \times R_\chi$ The subsequent conditions are fulfilled:

I. $a_{d_F}(m(a_1, b_1) \cdot (a_2, b_2)) \geq \min\{a_{d_F}(a_1, b_1), a_{d_F}(a_2, b_2)\}$ and

Pandiammal and Sundari

$$\text{II. } a_{d_F}(m(a_1, b_1)^{-1}) \geq a_{d_F}(a_1, b_1)$$

A set of all Plithogenic Fuzzy M-subgroup of a M-group G is denoted as PFMSG(G).

Illustration 7.1

If $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, is a Plithogenic set of an M-subgroup G, where $\wp = \{p, q, pq, e\}$ is the Klein's group, $R_\chi = \{\hat{a}, e'\}$ is a attribute & a M-group consisting of two attribute of two attribute values (here, $\hat{a}^2 = e'$ and e' is the neutral element). Also, $a_{d_F} : A \times R_\chi \rightarrow [0,1]$ and $a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$ are respectively corresponding FDAF and FDCF defined in Table 2 and Table 3. Then, $A_s \in \text{PFMSG}(G)$. Consider a note that in the above Definition, both a_{d_F} & a_{c_F} are Fuzzy sets but only on a_{d_F} , the Fuzzy M-subgroup's requirements have been assigned because a_{c_F} will transform a Fuzzy M-subgroup of M-group only in the case that $\forall (a_i, b_j) \in R_\chi, a_{c_F}(a_i, b_j) = 0$.

Illustration 7.2 If $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, is a Plithogenic set of a M-subgroup of a M-group G, where $\wp = \{1, -1, i, -i\}$ is a cyclic group, χ be an attribute, $R_\chi = \{p, q, pq, e\}$ is the Klein four-group. Also, let $a_{d_F} : A \times R_\chi \rightarrow [0,1]$ and $a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$ are FDAF and FDCF correspondingly, as indicated in Table 3 and Table 4.

Illustration 7.3

If $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, is a Plithogenic set of a M-group G, where $\wp = \{1, -1, i, -i\}$ is the Klein four-group, χ is an attribute, $R_\chi = \{1, \omega, \omega^2\}$, is the M-group. Also, let $a_{d_F} : A \times R_\chi \rightarrow [0,1]$ and $a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$ are FDCF and FDAF correspondingly, as indicated in Table 5 and Table 6.

Theorem 7.1

If $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F}) \in \text{PFMSG}(G)$ iff

$$a_{d_F}(m(u_1, v_1).(u_2, v_2)^{-1}) \geq \min\{a_{d_F}(u_1, v_1), a_{d_F}(u_2, v_2)\}$$

Proof: Clearly proved.

One can manage ambiguous, inconsistent, and indeterminate data by using Plithogenic Set. It is now more general than the Neutrosophic Set, the Classical Set, the Fuzzy Set, and the Intuitionistic Fuzzy Set. Therefore, it can be shown that Plithogenic Fuzzy M-subgroup has the potential to be broader than Neutrosophic, Classical, Fuzzy, and Intuitionistic subgroups. The pre-eminence properties of Plithogenic Fuzzy M-subgroups have been described with appropriate reasons in the next section.

PLITHOGENIC FUZZY M-SUBGROUP AS A GENERALIZATION OF OTHER M-SUBGROUP OF AN M-GROUP

Theorem 8.1: Any Classical M-subgroup is a Plithogenic fuzzy M-subgroup of M-group (Given that two singleton classical M-subgroups of an M-group are unions to form the corresponding attribute value set)

Proof: If ζ is a classical M-subgroup of M-group G.

Pandiammal and Sundari

So, $\zeta \subseteq G$ and hence ζ is a Plithogenic set of a M-group G . Here, one may consider corresponding χ = "appurtenance", $R_\chi = \{A, AB\}$ with cardinality 2,

$$a_{d_F} : \zeta \times R_\chi \rightarrow [0,1]$$

$$a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$$

Here

$$a_{c_F}(A, A) = 0,$$

$$a_{c_F}(AB, AB) = 0$$

and

$$a_{c_F}(A, AB) = 1$$

Also, R_χ can be considered as

$$R_\chi = \{A\} \cup \{AB\},$$

Where $\{A\}$ and $\{AB\}$ are singleton Classical M-subgroup of M-group of G . Also,

$$a_{d_F}(a, A) = 1 \text{ and } a_{d_F}(a, AB) = 0.$$

Now,

$$\forall a_1 a_2 \in \zeta a_1 a_2^{-1} \in \zeta$$

$$a_{d_F}(a_1, A) = 1 \text{ and } a_{d_F}(a_2, A) = 1 \text{ imply that,}$$

$$a_{d_F}(a_1 a_2^{-1}, A) = 1$$

clearly proved that

$$a_{d_F}(a_1, A) \cdot (a_2, A)^{-1} = 1 \geq 1 \wedge 1 = a_{d_F}(a_1, A) \wedge (a_2, A).$$

Similarly, $\forall a_1 a_2 \notin \zeta$ it can be proved that

$$a_{d_F}(a_1, AB) \cdot (a_2, AB)^{-1} = 0 \geq 0 \wedge 0 = a_{d_F}(a_1, AB) \wedge (a_2, AB).$$

Hence, $\zeta \in PFMSG(G)$.

Therefore, any Classical M-subgroup is a Plithogenic fuzzy M-subgroup of M-group.

Theorem 8.2

Any Fuzzy M-subgroup is a plithogenic fuzzy M-subgroup of M-group (considering that the appropriate attribute value set is an M-group's singleton classical M-subgroup).

Proof:

Assume that $\eta \in FMSG(G)$

So, $\eta \in FS(G)$ and therefore $\eta \in PS(G)$.

Here one may consider corresponding χ = "appurtenance", $R_\chi = \{A, AB\}$ with cardinality 1,

$$a_{d_F} : \zeta_\eta \times R_\chi \rightarrow [0,1] (\zeta_\eta = \{m \in U : (m, \alpha(m)) \in \alpha\}) \text{ and}$$

$$a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$$

with $a_{c_F}(A, A) = 0$. Note that here

$$a_{d_F}(a, A) = \alpha(a) \text{ in } [0,1].$$

Pandiammal and Sundari

Then, $\forall a_1 a_2 \in \mathcal{C}_\eta$,

$$\alpha(ma_1 a_2^{-1}) \geq \min\{\alpha(a_1), \alpha(a_2)\}$$

$$\Rightarrow a_{d_F}(ma_1 a_2^{-1}, A) \geq \min\{a_{d_F}(a_1, A), a_{d_F}(a_2, A)\}$$

$$\Rightarrow a_{d_F}(m(a_1, A).(a_2^{-1}, A)) \geq \min\{a_{d_F}(a_1, A), a_{d_F}(a_2, A)\}$$

$$\Rightarrow a_{d_F}(m(a_1, A).(a_2, A)^{-1}) \geq \min\{a_{d_F}(a_1, A), a_{d_F}(a_2, A)\}$$

Hence, from it can be concluded that, $\eta \in \text{PFMSG}(G)$.

Homomorphism of Plithogenic Fuzzy M-Subgroup of a M-group:

If χ is an attribute and R_χ is the subsequent range of attribute's values and $A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$ is a Plithogenic set of an M-group G . Also, if f is a function defined on $G \cup R_\chi$. Then the image of A_s is denoted as

$$A'_s = (A', \chi, R'_\chi, a'_{d_F}, a'_{c_F}), \text{ where } a'_{d_F} : A' \times R'_\chi \rightarrow [0,1] \text{ is defined as } a'_{d_F}(x_2, y_2) = \sup_{\substack{x_1 \in f^{-1}(x_2) \\ y_1 \in f^{-1}(y_2)}} a_{d_F}(x_1, y_1)$$

and $a'_{c_F} : R'_\chi \times R'_\chi \rightarrow [0,1]$ is defined as $a'_{c_F}(y_3, y_4) = \sup_{\substack{y_1 \in f^{-1}(y_3) \\ y_2 \in f^{-1}(y_4)}} a_{c_F}(y_1, y_2)$. Also if,

$P'_s = (P', \psi, V'_\psi, p'_{d_F}, p'_{c_F})$ is a Plithogenic Set of $f(G)$ then the preimage of A'_s will be indicated as

$A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, where $a_{d_F} : A \times R_\chi \rightarrow [0,1]$ is defined as

$a_{d_F}(x_1, y_1) = a'_{d_F}(f(x_1), f(y_1)), \forall (x_1, y_1) \in A \times R_\chi$, $a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$ is defined as

$a_{c_F}(y_1, y_2) = a'_{c_F}(f(y_1), f(y_2)), \forall (y_1, y_2) \in R_\chi \times R_\chi$.

Theorem 8.1.1

Homomorphic preimage of a Plithogenic fuzzy M-subgroup of M-group is a Plithogenic fuzzy M-subgroup of M-group

Proof: If χ is an attribute and A'_χ is the range of values for the relevant characteristic and

$A'_s = (A', \chi, R'_\chi, a'_{d_F}, a'_{c_F})$, is a Plithogenic fuzzy M-subgroup of M-group $f(G)$, where f is a homomorphism on $G \cup A_\chi$.

Therefore, $a'_{d_F} : A' \times R'_\chi \rightarrow [0,1]$ is Fuzzy M-subgroup and

$a'_{c_F} : R'_\chi \times R'_\chi \rightarrow [0,1]$ is a Fuzzy set.

Then preimage of P'_s is denoted as

$A_s = (A, \chi, R_\chi, a_{d_F}, a_{c_F})$, where

$a_{d_F} : A \times R_\chi \rightarrow [0,1]$ is defined as

$a_{d_F}(x_1, y_1) = a'_{d_F}(f(x_1), f(y_1)), \forall (x_1, y_1) \in A \times R_\chi$ and $a_{c_F} : R_\chi \times R_\chi \rightarrow [0,1]$ is described as

$a_{c_F}(y_1, y_2) = a'_{c_F}(f(y_1), f(y_2)), \forall (y_1, y_2) \in R_\chi \times R_\chi$.

$p_{c_F} : V_\psi \times V_\psi \rightarrow [0,1]$ is defined as

Pandiammal and Sundari

Assume that, $(m_1, u_1), (m'_1, u'_1) \in P \times V_\psi$, then

$$\begin{aligned} p_{d_F}(m(m_1, u_1), (m'_1, u'_1)) &= p_{d_F}(m_1 m'_1, u_1 u'_1) \\ &= p_{d_F}(f(m_1 m'_1), f(u_1 u'_1)) \\ &= p'_{d_F}((f(m_1), f(u_1)), (f(m'_1), f(u'_1))) \\ &\geq \min\{p'_{d_F}((f(m_1), f(u_1)), p'_{d_F}(f(m'_1), f(u'_1)))\} \text{ (As } p'_{d_F} \text{ is a FMSG)} \\ &= \min\{p_{d_F}(m_1, u_1), p_{d_F}(m'_1, u'_1)\} \end{aligned}$$

Also,

$$\begin{aligned} p_{d_F}(m_1, u_1)^{-1} &= p_{d_F}(m_1^{-1}, u_1^{-1}) \\ &= p'_{d_F}(f(m_1^{-1}), f(u_1^{-1})) \\ &= p'_{d_F}(f(m_1)^{-1}, f(u_1)^{-1}) \\ &= p'_{d_F}(f(m_1), f(u_1))^{-1} \\ &\geq p'_{d_F}((f(m_1), f(u_1))) \\ &= p_{d_F}(m_1, u_1) \end{aligned}$$

So, by p_{c_F} and p_{d_F} is a Fuzzy M-subgroup. Similarly, as p'_{c_F} is a Fuzzy set, its preimage under f that is, p_{c_F} is a Fuzzy set and hence, $P_s = (P, \psi, V_\psi, p_{d_F}, p_{c_F})$ is a Plithogenic Fuzz M-subgroup of M-group G .

Theorem 8.1.2

The homomorphic image of a plithogenic fuzzy M-subgroup of an M-group is a plithogenic fuzzy M-subgroup of itself (given for the supremum property holdings of the FDCF and FDDF).

Proof

If ψ is an attribute and V_ψ is the relevant range of attribute's values and $P_s = (P, \psi, V_\psi, p_{d_F}, p_{c_F})$ is a Plithogenic set of an M-group G .

Also, if f is a homomorphism defined on $G \cup V_\psi$.

Then the image of P_s is denoted as

$$P'_s = (P', \psi, V'_\psi, p'_{d_F}, p'_{c_F})$$

where $p'_{d_F} : P' \times V'_\psi \rightarrow [0,1]$ is denoted as

$$p'_{d_F}(m_2, u_2) = \sup_{\substack{m_1 \in f^{-1}(m_2) \\ u_1 \in f^{-1}(u_2)}} p_{d_F}(m_1, u_1)$$

and $p'_{c_F} : V'_\psi \times V'_\psi \rightarrow [0,1]$ is denoted as $p'_{c_F}(u_3, u_4) = \sup_{\substack{u_1 \in f^{-1}(u_3) \\ u_2 \in f^{-1}(u_4)}} p_{c_F}(u_1, u_2)$. Then

Pandiammal and Sundari

$$\forall (f(m_1), f(u_1)), (f(m'_1), f(u'_1)) \in P' \times V_\psi,$$

$\exists m_0 \in f^{-1}(f(m_1))$ and $\exists u_0 \in f^{-1}(f(u_1))$ such that

$$p'_{d_F}(m_0, u_0) = \sup_{\substack{m_t \in f^{-1}(m_1) \\ u_t \in f^{-1}(u_1)}} p_{d_F}(m_t, u_t).$$

Also $\exists m'_0 \in f^{-1}(f(m'_1))$ such that

$$p_{d_F}(m'_0, u'_0) = \sup_{\substack{m_t \in f^{-1}(m_1) \\ u_t \in f^{-1}(u_1)}} p_{d_F}(m_t, u_t).$$

Hence,

$$p'_{d_F}(m(f(m_1), f(u_1)), (f(m'_1), f(u'_1))) = p'_{d_F}((f(m_1), f(m'_1)), (f(u_1), f(u'_1)))$$

$$= \sup_{\substack{m_z \in f^{-1}(f(m_1), f(m'_1)) \\ u_z \in f^{-1}(f(u_1), f(u'_1))}} p_{d_F}(m_z, u_z)$$

$$\geq \min\{p_{d_F}(m_0, u_0), p_{d_F}(m'_0, u'_0)\}$$

$$= \min\{p'_{d_F}(f(m_1), f(u_1)), p'_{d_F}(f(m'_1), f(u'_1))\}$$

$$p'_{d_F}(f(m_1), f(u_1))^{-1} = p'_{d_F}(f(m_1)^{-1}, f(u_1)^{-1})$$

$$= \sup_{\substack{m_z \in f^{-1}((f(m_1))^{-1}) \\ u_z \in f^{-1}((f(u_1))^{-1})}} p_{d_F}(m_z, u_z)$$

$$\text{Again } = p_{d_F}(m_0^{-1}, u_0^{-1})$$

$$= p_{d_F}(m_0, u_0)^{-1}$$

$$\geq p_{d_F}(m_0, u_0)$$

$$= p'_{d_F}((f(m_1), f(u_1)))$$

Therefore, by and $P'_s = (P', \psi, V'_\psi, p'_{d_F}, p'_{c_F})$

So, by and p_{d_F} is a Fuzzy M-subgroup of M-group. Again, as p_{c_F} is the image that a Fuzzy set under f , that is, p'_{c_F} is a Fuzzy set and thus, P'_s is a Plithogenic Fuzzy M-subgroup of M-group $f(G)$.

APPLICATIONS OF PLITHOGENIC FUZZY M-SUBGROUP OF AN M-GROUP

Illustration 9.1: Plithogenic Fuzzy M-Subgroup of a Mobile Network

Consider a mobile network with a set of mobile devices. We can define a Plithogenic Fuzzy Subgroup to represent the uncertainty and imprecision in the membership of devices to the network.

Let $G = \{g1, g2, g3, g4\}$ be the set of mobile devices, and μ be a Plithogenic Fuzzy Subgroup of G defined as:

$$\mu(g1) = (0.8, 0.1, 0.1)$$

$$\mu(g2) = (0.5, 0.3, 0.2)$$

$$\mu(g3) = (0.9, 0.05, 0.05)$$

$$\mu(g4) = (0.4, 0.4, 0.2)$$

This Plithogenic Fuzzy M-Subgroup represents the uncertainty and imprecision in the membership of devices to the network.

Pandiammal and Sundari

Illustration 9.2: Plithogenic Fuzzy M-Subgroup of a Social Network

Consider a social network with a set of users. We can define a Plithogenic Fuzzy M-Subgroup to represent the uncertainty and imprecision in the membership of users to a particular group.

Let $G = \{g_1, g_2, g_3, g_4\}$ be the set of users, and μ be a Plithogenic Fuzzy M-Subgroup of an M-group G defined as:

$$\mu(g_1) = (0.7, 0.2, 0.1)$$

$$\mu(g_2) = (0.4, 0.5, 0.1)$$

$$\mu(g_3) = (0.9, 0.05, 0.05)$$

$$\mu(g_4) = (0.3, 0.6, 0.1)$$

This Plithogenic Fuzzy M-Subgroup represents the uncertainty and imprecision in the membership of users to the group.

CONCLUSION

An essential component of abstract algebra is group theory. Understanding the functions that uphold an object's algebraic qualities is essential for analyzing those properties; in other words, studying homomorphism. Plithogenic fuzzy subgroups, Neutrosophic subgroups, Intuitionistic fuzzy subgroups, and classical subgroups are all generalized into the idea of an M-subgroup. Thus, plithogenic M-subgroups of M-group have been presented and their homomorphism-related consequences have been examined. By employing universal \check{T} -norm and \check{T} -conorm, Plithogenic intuitionistic fuzzy M-subgroup of M-group, Plithogenic Neutrosophic M-subgroup of M-group, and its applications, the majority of the concepts discussed in this study may be further generalized. In this paper, we have explored the applications of Plithogenic Fuzzy M-groups in social networks and mobile networks. We have demonstrated the effectiveness of Plithogenic Fuzzy M-groups in modeling and analyzing complex relationships in social networks and mobile networks.

ABSTRACT

Transverse Myelitis (TM) is a rare, rapidly progressing autoimmune disorder causing inflammation and demyelination of the spinal cord. Symptoms include motor, sensory, and autonomic dysfunction, with onset in hours and worsening over weeks. Causes range from idiopathic to infections and systemic diseases and recovery varies. One-third fully recover, another third have mild deficits, and the rest face severe disability. The aim of this case study is to assess the physiotherapy interventions in improving balance, gait and functional independence in an adolescent diagnosed with Transverse Myelitis. A 14-year-old female adolescent who developed sudden lower limb weakness, difficulty standing with no bladder control was diagnosed as transverse myelitis and was intervened with intensive evidence-based physiotherapy (PT). A comprehensive assessment included motor, balance, gait, functional independence and balance confidence levels. Based on ICF and outcomes assessed a customized PT protocol including Functional Electrical Stimulation with exercise therapy was given for 7 weeks. This case study showed that tailored evidence-based physiotherapy protocol was effective in improving the targeted functional outcomes and clinically meaningful difference was observed.

Keywords: Functional Electrical Stimulation, rehabilitation, spinal cord disorder, Transverse myelitis.

INTRODUCTION

Transverse myelitis is a rare neurological condition affecting the spinal cord (1). The term “Myelitis” simply refers to the inflammation of the spinal cord and the term “Transverse” describes the position of the inflammation, that is, across the width of the spinal cord (2). It is a rapidly progressive autoimmune disease that results in demyelination of the spinal cord, with symptoms that develop within hours to days and progressively worsen over a period that can last up to several weeks (3,4). In most instance, the exact trigger for the inflammation remains unknown (5). But there are several potential causes for transverse myelitis and the causes can be broadly divided into idiopathic which is the most common cause, post infectious like West Nile virus, herpes viruses and HIV, systemic inflammation that have an association with lupus erythematosus and rheumatoid arthritis, or multifocal central nervous system diseases that includes multiple sclerosis and neuromyelitis optica spectrum disorders (6,7). Neurological symptoms are prominent and include motor, sensory and autonomic dysfunction. Depending on the level of the spinal cord involved, motor symptoms such as paraparesis, which mostly affect the lower limb, can also affect the upper limb (8). Sensory symptoms include pain, dysesthesia and paresthesia. Autonomic features include bladder and bowel incontinence and sexual dysfunction (6,9). The incidence of Transverse Myelitis is 1-8 per million people with peak rates from 10-19 years and 30-39 years without specific etiology (6,10). The incidence of Acute Transverse Myelitis has been estimated to be between 1.7 and 2 per million children per year. Within the pediatric population, idiopathic myelitis has been more frequently reported in children under 5 years and over 10 years of age (7,11). The recommended investigations for transverse myelitis include a MRI of the spine and brain, both with and without gadolinium contrast, to help distinguish between compressive and non-compressive lesions and evaluate for brain lesions. Lumbar puncture for CSF analysis (cell count, protein, glucose, VDRL, oligoclonal bands, IgG index, cytology). Blood tests: anti-AQP4-IgG, anti-MOG, B12, methylmalonic acid, ANA, Ro/SSA, La/SSB, syphilis serologies, HIV antibodies, TSH, and viral tests as needed (6,12). However, the recovery ranges from patient to patient, with approximately one third experience complete recovery, another one third have mild residual deficits and the remaining third remain severely disabled. Consequently, rehabilitation plays a crucial role in the management of transverse myelitis, particularly in severe cases requiring a multidisciplinary approach headed by physiatrists, physical therapists, and occupational therapists. Enhancing endurance, balance, coordination, joint range of motion, reconditioning, mobility, and independence in everyday activities are the main goals of physical therapy rehabilitation. The ultimate goal is to achieve the highest level of independence (12,13).

CASE PRESENTATION

This case study focused on a 14-year-old female adolescent, who was admitted to R.L. Jalappaon 14March,2024 and presented with notable weakness of bilateral lower limbs for a day. After waking up she noticed weakness in the feet and ankles, which was sudden in onset, initially and progressed to knees. She also had difficulty of gripping chappals. However, she was able to appreciate the sensation of chappals; the patient developed buckling of knees on standing and had to support the bed and furniture to balance posture, an hour following that she noticed that she was unable to get up from sitting position, unable to lift lower legs below knee joints. 10 hours after admission, the adolescent had truncal weakness and was catheterized as she lost bladder control. Based on the findings of MRI and Lumbar puncture the diagnosis of Transverse myelitis was made. After the vitals were stabilized, the adolescent was referred to the physiotherapy department at R.L.Jalappa Hospital for rehabilitation to address her lower limb weakness and improve overall functional recovery. She was accompanied by her mother for the treatment. Written informed consent was taken from patient's mother and information sheet were also given and a comprehensive assessment was taken and appropriate treatment protocol was derived, also the procedure was clearly explained to the patient before starting the treatment protocol. The goal of the physiotherapy interventions was to improve strength, balance, gait and make her functional independent.

Physiotherapy intervention

The treatment regimen for this patient, was meticulously crafted to enhance muscle strength and promote greater functional independence. This comprehensive therapeutic protocol not only focused on the strengthening but also

**Stephy Angel et al.,**

encompassed various elements essential for balance, gait training, trunk control. The goal was to ensure the adolescent could perform daily activities more effectively and with increased self-sufficiency, improving overall recovery and quality of life. The therapy sessions were conducted at the physiotherapy outpatient department of R.L. Jalappa Hospital, Kolar. Before the commencement of physiotherapy a detailed evaluation was done which comprised of muscle strength, dynamic balance, activity balance confidence and functional independence. The duration of the physiotherapy plan protocol involved 35 sessions and extended over a 7-week period, with five to six sessions each week. Each session lasted between 90 and 150 minutes and with rest between the exercises. Regular counseling was added to the therapy sessions to reduce the risk of depression. This provided emotional support and helped the patient learn coping strategies. The goal was to boost her confidence and mental well-being. Integrating counseling aimed to enhance both her physical and mental health. This approach ensured her active participation in therapy.

HOME EXERCISE

Additionally, the therapy focus was to incorporate home-based exercises and the protocol for the same is given in table-1. The patient was advised to perform exercises at home similar to those done during therapy sessions under the supervision of the caretaker.

STRENGTH TRAINING

As strength training being the ultimate goal of the program, the exercises were planned according to the F.I.T.T principle. Understanding the F.I.T.T principle helps design a therapy plan that will be more effective in reaching the desired goals (16)

Frequency: 4 to 5 days a week

Intensity: included the amount of weight lifted and number of reps and sets. The program initiated with two sets with 10 to 20 reps and increased to four sets of 10 reps with 1kg weight. Progressed to 2kg weight with two sets and 10 to 20 reps.

Time: 60 minutes

Type: The type of resistance used in these exercises includes body weight, weight cuff, and machines.

BALANCE TRAINING

Balance and gait training was performed for 60 mins. Sit to stand was practiced and addressed from the start of the therapy with utmost support. Together with sit to stand various balance exercises were integrated to keep the challenges engaging (table-3&4). It was advanced from requiring minimum support for sit to stand and to being able to do without support. Incorporation of tandem standing, eye closing, standing with feet together were also practiced.

FUNCTIONAL ELECTRICAL STIMULATION

After two weeks, the patient received Functional electrical stimulation (FES) for right side common peroneal nerve to address foot drop. The Functional electrical stimulation (FES) facilitated the dorsiflexion muscle contraction lasted up to 30 contractions with galvanic current. Over three week of period the patient underwent 15 sessions of electrical stimulation. Initially, mild contractions were observed as an extension of big toe with galvanic current stimulation. However, these contractions lasted for only 5-6 repetitions and due to fatigue, there was no further observable contraction. But as the sessions progressed, there was significant changes like: extension of all the toes, and mild dorsiflexion response, which was evident at the end of two weeks of session. Further, significant dorsiflexion contraction was observed for up to 30 repetitions at the end of third week. The patient was advised to use ankle foot orthosis and training was provided with ankle foot orthosis.

Stephy Angel et al.,

RESULT

The therapeutic intervention, comprising strength training, balance and gait training tailored for the adolescence's rehabilitation, yielded significant improvement across all measured outcomes. The outcome measures of muscle strength, dynamic balance, balance confidence and functional independence are tabulated in table 6, table 7, table 8 & table 9. Also, the outcomes highlight the effectiveness of strength training, balance and gait training in rehabilitating the transverse myelitis patients. This case demonstrates remarkable progress in muscle strength, balance, functional independence.

DISCUSSIONS

Transverse myelitis is a neurological condition that can result in significant impairments in strength, balance and gait. Emerging research suggests that targeted rehabilitation interventions may be effective in alleviating these challenges and enhancing functional outcomes for individuals with transverse myelitis. This case study focused on the acute transverse myelitis case in a young adolescent female who developed severe motor weakness and incontinence. Based on the comprehensive assessment and using ICF, evidence based structured protocol was framed. The intensive therapy included exercises progressively challenging the motor abilities of the patient. The structured protocol included progressive strengthening, balance exercises and gait training with body weight and external resistances. The intensive therapy which was given for 5 to 6 days a week for about 7 weeks and exercise adherence helped to improved significant functional outcome. However, during this intervention the patient was found on & off depressed and it was addressed through counselling. Significant changes in the strength of proximal muscles from 3/5 to 5/5 which aided in the improvement of balance. Similarly, the timed up and go test dynamic balance improved significantly which was observed by the reduction in the time to complete the test also with use of greater assistive to lesser assistive device. The functional independence which was measured using functional independence measure(FIM) scale improved from moderate dependency to mild dependency and also the balance confidence which was markedly low initially, improved remarkably to the greater level confidence from 30% to 60%. Similar studies showed significant improvement in balance, strength and functional independence with strengthening, balance, gait training. (1,15). The selection and integration of various physiotherapy techniques should be tailored to the individual's specific needs and goals. While the existing literature on the rehabilitation of transverse myelitis is very limited, this study adds supportive evidence and suggesting a comprehensive and personalized approach to optimize the functional outcomes in individuals with transverse myelitis.

CONCLUSION

In conclusion, this study demonstrates that the implemented intervention significantly improved strength, balance and functional independence in the patient with Transverse Myelitis. These outcomes highlight the effectiveness of the physiotherapy program in enhancing physical and functional performance and overall improvement of quality of life. Future research should explore long term effect and optimize the protocols in large sample size to further validate and expand upon these results.

ABSTRACT

Wind energy has been considered as a significant contributor of renewable energy, underscoring the necessity of evaluating its potential. The Weibull distribution is frequently employed for this objective. This study evaluates the efficacy of the probability-weighted moment utilising the power density method (PWM) against three recognised numerical techniques for ascertaining Weibull parameters. The analysis utilises daily average wind speed data from Kolkata City over five years (2012-2016). The results demonstrate that the Moment method has the least error, succeeded by the Probability Weighted Moment utilising the power density approach. This indicates that the precision and efficacy of numerical estimating techniques for deriving Weibull parameters are contingent upon the dataset utilised, which is influenced by the meteorological conditions and surface attributes, including roughness and orography, of the chosen region.

Keywords: Weibull parameters, Wind speed, Numerical method, Probability weighted moment method.

INTRODUCTION

Renewable energy has become essential in combating the risks of global warming, mostly caused by substantial carbon dioxide emissions resulting from fossil fuels. Wind energy has emerged as the preeminent form of renewable energy. If the current trend persists, by 2030, the global cumulative installed wind power capacity may attain 2110 GW, resulting in a reduction of carbon dioxide emissions by at least 3300 million tonnes per year [1]. Nonetheless, wind is stochastic, hence the utilisation of wind energy encompasses three critical phases. The initial and important phase is the assessment of its resources at a designated site, followed by the production and installation of wind turbines. Numerous statistical approaches exist for evaluating wind resources, including Normal, Lognormal, Exponential, Gamma, Inverse Gaussian, Rayleigh, Nakagami, and Weibull distributions, among others. The precision of the study is contingent upon the parameters associated with any distribution method. Graphical (GM), Moment method (MM), Maximum likelihood (ML), Modified maximum likelihood (MML), Empirical (EM), and Equivalent energy (EE) methods are traditional numerical techniques for estimating parameters in statistical distributions. Consequently, this study evaluates several widely recognised numerical approaches utilising the daily mean speed data from Kolkata City for the five-year period of 2012-2016, obtained from the Regional Meteorological Centre, Kolkata. The specific topographic coordinates of the chosen place are presented in Table 1.

LITERATURE REVIEW

A comprehensive survey indicates that numerous academics have evaluated the efficacy of different statistical distributions, concluding that the Weibull distribution is the most reliable and effective way for assessing the energy resources. Wang et al. [2] assessed six distinct statistical distributions and demonstrated that the Weibull distribution approach surpasses all others. Alavi et al. [3] assessed the efficacy of 8(eight) distinct methods of statistical distribution and determined that the Weibull and Nakagami distributions are 2(two) versatile and successful approaches to analyse the data. Likewise, numerous studies [4-8] evaluated the efficacy of Weibull and Rayleigh distribution methods, concluding that the former is the most frequently endorsed distribution method for wind energy resource assessment. Consequently, this study will employ the Weibull distribution approach. Precision of Weibull distribution depends on the estimated values of its parameters. Multiple estimating approaches can be employed to derive Weibull parameters from a specific collection of wind data. The choice of the optimal approach is a crucial prerequisite for obtaining precise Weibull parameter values. Consequently, numerous prior studies examined and assessed the efficacy of various numerical estimate techniques. Azad et al. [9] assessed the efficacy of four approaches and concluded that the moment method yields the minimal error among them. Akdag and Dinler [10] evaluated traditional estimators, including GM, ML, and MM, and then proposed a novel technique called the power density method (PD). The researchers determined that the PD approach served as an excellent alternative estimator. Chang [11] assessed six traditional estimators for deriving Weibull parameters over three locations in Taiwan. He evaluated the efficacy of all six estimators via Monte Carlo simulation and determined that the ML approach was superior, succeeded by the MML and MM methods. Rocha et al. [12] assessed the efficacy of seven numerical estimators and determined that the equivalent energy technique was the most successful for deriving Weibull parameters in the specified region of Brazil. Genc et al. [13] assessed and contrasted the efficacy of least squares (LS), maximum likelihood (ML), and method of moments (MM) techniques in evaluating the potential of wind energy in a region of Turkey. The Monte Carlo simulation was utilised to evaluate the efficacy of several strategies, revealing that MM was the most successful, whereas the LS method exhibited the poorest performance. Likewise, other publications evaluated the efficacy of various numerical approaches, revealing that the maximum likelihood method, the power density method, or both were deemed effective and precise for predicting Weibull parameters [14-20]. Usta [21] introduced a novel technique termed probability-weighted moment, derived from the power density method (PWM), and evaluated its efficacy against GM, MM, ML, MML, and PD methodologies. The proposed method demonstrates superior performance compared to all alternative methods. The aforementioned approaches are consistently employed for wind energy resource assessment, with the exception of PWM.

Syed Mujibur Rahman *et al.*,

Consequently, this study will reassess the efficacy of PWM and juxtapose it with three highly recognised methodologies: MM, ML, and PD approaches. The authors of this research already assessed the efficacy of well recognised numerical methods while evaluating its feasibility of wind power generation for the North-eastern region of India in their earlier works [22, 23].

Weibull parameters estimation methods

The two-parameter Weibull distribution is characterised by its cumulative distribution function and the probability density function, which is shown below:

$$F(v) = 1 - e^{-(v/l)^p} \quad (1)$$

$$f(v) = \frac{dF(v)}{dv} = \left(\frac{pv^{p-1}}{l^p} \right) e^{-(v/l)^p} \quad (2)$$

Where l = scale parameters (m/s), v is wind speed in m/s and p is the shape parameter.

Herein are illustrated the numerical approaches for estimating the shape and scale parameters of the Weibull distribution:

Moment method (MM)

The form and size parameters [9] can be articulated in relation to the known mean wind speed and the standard deviation of wind speeds, as delineated in Eq. (3) and Eq. (4):

$$p = (0.9874 \bar{v} / \sigma)^{1.0983} \quad (3)$$

$$l = \bar{v} / \Gamma(1 + 1/p) \quad (4)$$

Maximum likelihood method (ML)

This is an iterative estimating method introduced by Stevens and Smulders for wind energy applications [11, 17-19], represented by Eq. (5) and Eq. (6):

$$p = \left[\frac{\sum_{i=1}^n v_i^p \ln(v_i)}{\sum_{i=1}^n v_i^p} - \frac{\sum_{i=1}^n \ln(v_i)}{n} \right]^{-1} \quad (5)$$

$$l = \left[\frac{\sum_{i=1}^n (v_i)^p}{n} \right]^{1/p} \quad (6)$$

Power density method (PD)

Akdag and Dinler [10] introduced it to estimate the shape parameter using a new term called energy pattern factor (E_f) which is equal to $\overline{v^3} / (\bar{v})^3$ and then Eq. (7) gives " p " term.

$$p = 1 + \frac{3.69}{(E_f)^2} \quad (7)$$

The expression for l the "parameter is given in Eq. (4), which is expressed under the moment method.

**Probability weighted moment based on power density (PWM)**

This numerical model was first introduced by Usta [21] to determine “ p ” and “ l ” terms for the wind energy resource evaluation whose model are represented by the following Eq. (8) and Eq. (9):

$$p = \frac{\ln(2)}{\ln\left(\frac{\bar{v}}{(2/(n^2 - n)) \sum_{i=1}^n v_{(i)}(n-i)}\right)} \quad (8)$$

$$l = \sqrt[3]{\frac{\bar{v}^3}{\Gamma(1 + 3/p)}} \quad (9)$$

Wind power density (WPD)

The power potential/unit area, referred as the power density, can be articulated using Weibull parameters as demonstrated in Eq. (10) to evaluate the overall efficacy of the chosen estimating methods [4, 15].

$$P = 0.5 \rho \int_0^\infty v^3 f(v) dv = 0.5 \rho l^3 \Gamma(1 + 3/p) \quad (10)$$

Performance analysis

To assess and compare the efficacy of the four chosen approaches, the three standard performance metrics—root mean square error (RMSE), coefficient of determination (R^2), and power density error (PDE) are utilised, as depicted in Table 2.

RESULTS AND DISCUSSION

The seasonal mean wind speed variation for 5(five) years is represented in the Fig 1 below, and it reveals that mean wind speed range in the summer is higher than the remaining seasons, while the lowest range is found during the winter. The wind speed has increased between 2012 and 2016, according to these changes in the data collected year by year. Figure 2-5 represents the histogram, Weibull probability density, and cumulative distribution functions for winter, summer, monsoon, and annual collected wind data. It shows that more than 90% of data falls within the range of 0.5 to 3.5 m/s. The functions for all methods except the power density method (PD) show similar behavior and conform to the actual wind speed profile. Table 2 presents the Weibull parameters and performance assessment of all four methodologies. Except for the PD method, all of the other approaches have consistent values for shape & scale parameters as shown in the table 2 below. The data suggests that the scale parameter is elevated in summer, signifying greater wind power potential during this season, whereas the winter exhibits the lowest wind power potential. Above figures reveal that the value corresponding to the PD method is very much closer to the actual value. Regarding seasonal variation, summer provides the maximum WPD while winter provides the minimum WPD, whose values based on actual wind speed are 32.05 W/m² and 4.58 W/m², respectively. At the same time, the annual average actual WPD is 17.45 W/m², and unsuitable for the generation of high power. Hence, Vertical Axis Wind Turbine (VAWT) may be deployed to harness the maximum possible power from wind energy resources. Moreover, Table 2 and Fig.6 show that the seasonal variation of WPD is analogous to the seasonal variation of Weibull parameters, ultimately validating the nature of the Weibull distribution. Regarding the performance of the selected numerical methods, the RMSE value of the PWM method is the lowest in all seasons except during summer, followed by the moment method. The R^2 value of the moment method is the largest in all seasons, followed by maximum likelihood. The power density technique has the lowest PDE value across all seasons, followed by the method of moment and maximum likelihood.

CONCLUSIONS

The moment methodology outperforms all other methods, according to the analysis of the used wind speed data for Kolkata City. The probability-weighted moment based on the power density method comes in second. The accuracy and effectiveness of the estimation techniques for the Weibull distribution model's shape and scale parameters depend on the dataset used, which is impacted by the local climate and surface features, such as the location's roughness and orography. Based on actual wind speed, the annual average wind power density is 17.45 W/m², which makes it insufficient for large-scale power production. In these situations, the best wind energy may be captured by using VAWT. However, wind power density (WPD) will be increased by extrapolating wind speed measurements through an elevation of the anemometer.

ABSTRACT

For more than a decade, scholars, students, and institutions throughout the world have been interested in financial technology. With a wealth of new financial services, products, and novel ways to communicate with prospects, the effect of technology on the financial industry has been thoroughly researched. This study paper uses a bibliometric approach to present a summary of FinTech research with a focus on Digital Payment Platforms. Using the Open Alexdatabases, the report examined 1559 articles from 2020 to 2024 and identified research gaps and novel study using "VOS-Viewer" software. The study examined the relationships between the most significant papers to determine FinTech's functions and research limits in digital finance and payment. The findings serve as a foundation for further exploration and provide opportunity for scholars to broaden their knowledge in intriguing and novel investigations. Overall, the goal of this study is to assist scholars in discovering new lines of discovery in Fintech while also expanding their current expertise.

Keywords: Fintech, Digital Payment, Cryptocurrencies, Bibliometric Analysis, VOS viewer, AI

INTRODUCTION

The term "fintech," which combines the terms "finance" and "technology," was first used by banks to refer to technology that assisted them in monitoring and managing the accounts of their customers. But over the past five years, the phrase has changed to encompass more consumer-related services, such software and applications for tracking expenses, making budgets, and buying and selling stocks. (**What is fintech?, 2024**)[1] Bibliometric analysis is

Jayendra P. Siddhapura and Chitralekha H. Dhadhal

a widely used and robust approach for examining extensive scientific data. It uncovers the developmental trends of a field and highlights emerging areas, though its use in business research remains relatively recent and often underutilized. (Donthu, Kumar, Mukherjee, Pandey, & Lim, 2021)[2]

LITERATURE REVIEW

(Garg & et al, 2023)[3] In this study, the researchers establish a foundation for the development of Fintech gain popularity during the last decade, and various research have been published utilizing this methodology. It aids in understanding key variables in any given study topic. In this study, they identified notable authors and nations using citation and co-citation analyses of FinTech research. (Mohammad Sahabuddin, 2023)[4] The purpose of this study is to use bibliometric analysis to evaluate how FinTech research changed over time. First, 1359 papers specifically linked to FinTech were extracted from the Scopus repository between 2010 and 2021. This study investigated the essential issues and features of FinTech in research, such as the yearly contribution of publishing, hot in the press, and focuses, using topic analysis, concurrence analysis, and chronology analysis of contributors' keywords. (Bajwa, Rehman, & Iqbal, 2022)[5] This study conducted a meta-literature review of 360 selected publications published between 2006 and June 2020 to examine the history, present, and potential future trends in Fintech research. The quantitative technique involved a bibliometric citation analysis using HistCite and VOS viewer software, while the qualitative analysis (Brika, 2021)[6] The study examines how financial technologies are organized. The study is focused on the functions of Fintech and the limitations of research in digital financing. They identify potential paths for researchers to explore in order to expand on current knowledge while also identifying opportunities for innovative, fascinating, and creative research that contributes to the extension of the area of study. (Zou, Xindi Liu, Xindi Liu, & Xinze Yang, 2023)[7] Digital finance, a rapidly growing financial model, is analysed in this study using 1,191 documents (2006–2022) from Web of Science and Scopus. Employing bibliometric and content analysis, it examines publication trends, key contributors, and citation networks comprehensively.

RESEARCH METHODOLOGY

Data Collection

Data Sources: The Scopus and Web of Science (WoS) databases are the primary data sources, as they are widely recognized for their comprehensive coverage of peer-reviewed academic literature. 1159 articles from the year 2020-2024 studied from Open Alex.

Search Strategy: The search query includes a combination of keywords such as "Fintech," "digital payment," "financial technology," "blockchain in payments," and "mobile payments."

METHODOLOGY

This study adopts a bibliometric analysis approach to explore the domain of financial technology (Fintech) with a specific focus on digital payments. Bibliometric analysis is a quantitative research technique used to systematically analyze academic literature and reveal patterns, trends, and insights in the field. The research design includes data collection, data cleaning, and bibliometric techniques such as citation analysis, co-citation analysis, and keyword co-occurrence analysis.

Tools and Software

VOSviewer: For constructing and visualizing bibliometric networks (e.g., co-authorship, cocitation)

Microsoft Excel: For data cleaning and descriptive statistics.

OBJECTIVES

- To determine which country undertakes the most research in the Fintech domain.
- Find the most prominent authors in the Fintech area.

Jayendra P. Siddhapura and Chitralekha H. Dhadhal

- Identify key words wise trend.

RESULT ANALYSIS AND INTERPRETATION:

Year wise Publication

The field of Fintech and digital payments has experienced significant growth, with a peak in 2023. The 2024 dip requires further investigation, as it could indicate either incomplete data or a potential levelling off of research activity. The steady increase from 2020 highlights the increasing importance of digital payments and the ongoing innovation in Fintech.

Country Wise Publication

Countries at the centre of the network with numerous connections are likely the leading contributors to Fintech research. The United States, known for its leadership in technological innovation and financial systems. China, which has a robust digital payment ecosystem and significant Fintech advancements. European countries such as the United Kingdom and Germany, which have strong academic and financial sectors. Indonesia is having the 364 papers but less in terms of citation so the strength is less than the US.

Affiliation wise Contribution

The table indicates notable contributions to Fintech research by institutions globally. The University of Indonesia and Universiti Teknologi MARA lead with the highest number of publications (15 each), showcasing their dominance in this field. Binus University, University of London, University of Malaya, and Padjadjaran University each contributed significantly, with 10-12 publications. Renowned global institutions like the International Monetary Fund (9) and Durham University (8) highlight the international collaboration in Fintech research. Universities across Asia, such as Northern University of Malaysia and Islamic University College, also show robust engagement, reflecting the growing prominence of Fintech in developing economies.

Key Words

Researchers conducted a co-occurrence analysis utilizing the author keywords and identified eight primary clusters of FinTech literature, as shown in Figure 4. A total of 200 key phrases were found, with 11955 links followed by 121650 link strength. Fintech, Financial System, Computer Science, Economics, Financial Services, Payments, Trade, and Accounting. The keywords network can help researchers find research gaps. There is still a lot to learn about digital loans, supply chain finance, the internet of things, and Robo advisers. Keyword network diagrams aid researchers in discovering untapped study areas.

LIMITATIONS

This study emphasizes FinTech applications in business, finance, and insurance, excluding research from multidisciplinary journals. For analysis, we utilized VOSviewer for co-citation, co-occurrence, and network diagrams, despite the availability of various other analytical software tools.

IMPLICATIONS

Bibliometric analysis is a quantitative approach for examining publication trends, citations, and collaborations in scientific literature. It assesses research impact, identifies influential studies and researchers, and reveals trends in scientific fields. Useful for policymakers, funding agencies, and researchers, it aids in making informed decisions on research priorities. Additionally, it analyzes collaboration networks, measures productivity, and highlights underexplored areas or conflicting findings within research fields.

Jayendra P. Siddhapura and Chitralekha H. Dhadhal

CONCLUSION

In conclusion, this study highlights the growing interest in FinTech, particularly in digital payment platforms, through a comprehensive bibliometric analysis. By examining key research trends, gaps, and relationships in the field, it provides valuable insights for scholars and institutions to expand their understanding and explore emerging avenues in FinTech research.

ABSTRACT

In this study, researcher explored a novel cryptographic approach based on a trigonometric ratio utilizing the Hankel transform. We employed the Hankel transform as a means to convert plain text into cipher text for the secure exchange of data. In this paper modular arithmetic is utilized in the decryption process, along with the concept of congruence for data evaluation.

Keywords: Hankel Transform, Cryptography, Encryption, Decryption, Modulo.

INTRODUCTION

Keeping data safe from the people who are not supposed to see it or to communicate secretly with selective recipient is really important. Cryptography plays a pivotal role in securing data. Cryptography is an art of secret coding for confidentiality. In cryptography the original data is locked by using some secret keys to scramble it so that it cannot be read by anyone who doesn't know the secret keys. The scrambled message is then transferred to recipient. The recipient use the same secret key to unscramble the data and read the data. The process of scramble up the data using secret key is called encryption, and the process of unscramble the data is called decryption.

Cryptosystem

Various method has been developed and employed to encrypting the data. In 2012, Hiwarekar A P[1], Uses the method of laplace transform for encryption of the original text and then apply inverse laplace transform on the cipher text for decryption. Original text also known as Plain text, by choosing an specific type of secret key and application of Laplace transform Plain text is converted into an unreadable text known as cipher text, this process is called

Divita Sharma et al.,

encryption. The cipher text contains all the details of plain text but is not understandable unless an decryption is done, which is done in reverse order of encryption. Here the secret key plays a vital role, the encryption process varied on the choice of this key. In 2014, Gupta P & Mishra PR [2], Concluded that it is an weak strategy as encryption is independent of Laplace Transform and cipher text can be decrypted using any algebraic algorithm., In 2017, Tyagi N, Agrawal A, Katiyar A, Garg S & Yadav S [3], Worked on updating and modifying the contemporary methods. In 2013, Hiwarekar A P[4], Develop a new cryptographic method using laplace transform of hyperbolic function. In 2021, JadhavShailaShivaji, HiwarekarAP[5], Uses Elzaki and laplace transform for encryption, inverse Elzaki and inverse laplace transform for decryption to develop new method of cryptography, they also apply iteration that added in additional security. In 2022[6], cryptographic algorithm using Type IVa MP-Wavelets is proposed and it is concluded that this algorithm has good performance and fast computation rate. In 2020, Hemant K. Undegaonkar, R. N. Ingle[7], Applied Laplace transform & Sumudu transform for encryption & decryption. On Applying both transforms for the same plain text to the same function results in the same cipher text but applying both transforms to different functions gives different cipher texts for the same plain text. In 2021, Mohammed N. Alenezi and Fawaz S. Al-Anzi [8], form an algorithm for encryption using Z- transformation and XOR function. In 2020, [9], it is concluded that it is very critical to secure wireless network through encryption and cryptography by the techniques viz, digital signature, watermarking and steganography while addressing encroachment and computer protection technologies.

PRELIMINARIES

Definition 2.1.

The Hankel transform of the function $f(x)$, $-\infty < x < \infty$, is defined as

$$H_n\{f(x)\} = \widehat{f(s)} = \int_{-\infty}^{\infty} f(x) \cdot x J_n(sx) dx$$

Where $J_n(sx)$ is the Bessel function of the first kind of order n .

As a result of above formula we have,

$$H_n\{r^{s-1}\} = \frac{2^s \Gamma\left[\frac{s+1}{2}\right]}{\rho^{s+1} \Gamma\left[\frac{1-s}{2}\right]} \text{ where, } |s| > 1$$

Definition 2.2.

Linearity property of Hankel transform

$$H_n\{C_1 f(r) + C_2 g(r)\} = C_1 H_n\{f(r)\} + C_2 H_n\{g(r)\}$$

Numerical Assignment of Letters

Space	A	B	...	Y	Z
0	1	2		25	26

Encryption Algorithm

Step 1: The sender and recipient have concurred on the encryption key.

Step 2: The series explore to address the issue is:

$$\alpha^n \sin \alpha x = \alpha^n \left[\alpha x - \frac{(\alpha x)^3}{3!} + \frac{(\alpha x)^5}{5!} - \frac{(\alpha x)^7}{7!} + \dots \right] = \sum_{i=0}^{\infty} \frac{(-1)^i (\alpha)^{2i+1} (\alpha)^{2i+n+1}}{(2i+1)!}$$

Where $\alpha, n \in \mathbb{N}$ are constants

Step 3: Assigned numerical values to letters to ascertain corresponding plaintext. Depict each term as P_i ; $i \geq 0$.

Step 4: Each P_i is regarded as the coefficient of $\alpha^n \sin \alpha x$.

Step 5: Take into account the quantity of terms in the series equivalent to the number of P_i obtained.

Step 6: For P_n ; $n = 2i + 1$; $i \geq 0$; Translate this into its equivalent expression Q_n employing $P_n \equiv Q_n \pmod{27}$.

Step 7: Find Hankel transform of the given series employing $H_n\{r^{s-1}\} = \frac{2^s \Gamma\left[\frac{s+1}{2}\right]}{\rho^{s+1} \Gamma\left[\frac{1-s}{2}\right]}$.

Step 8: If the resulting coefficient is greater than or equals to 25 then they are resolved by employing congruence relation as $x \equiv y \pmod{n}$.

Step 9: The sender transmits the values that are quotients in the modulo operation as a key.

Step 10: If any terms in the final key are 26 or greater, employ congruence relations to determine the cipher text. Express the components of the cipher text as l_i .

Decryption Algorithm

Step 1:

$$H \left[\sum_{i=0}^{\infty} \frac{a^{2i+1} \alpha^{2i+n+1} (-1)^i P_i}{(2i+1)!} \right] \\ = H \left[\sum_{i=0,2,4,\dots}^{\infty} \frac{a^{2i+1} \alpha^{2i+n+1} P_i}{(2i+1)!} \right] + H \left[\sum_{i=1,3,5,\dots}^{\infty} \frac{a^{2i+1} \alpha^{2i+n+1} Q_i}{(2i+1)!} \right]; Q_i = -P_i \\ = \left[\sum_{i=0,2,4,\dots}^{\infty} \frac{a^{2i+1}}{(2i+1)!} \frac{2^{n+1} \left[\frac{n+1}{2} \right]^2 P_i}{\rho^{n+2}} \right] + \left[\sum_{i=1,3,5,\dots}^{\infty} \frac{a^{2i+1}}{(2i+1)!} \frac{2^{n+1} \left[\frac{n+1}{2} \right]^2 Q_i}{\rho^{n+2}} \right]$$

Step 2: If each $P_i \leq 26$

Find

$$\frac{a^{2i+1}}{(2i+1)!} 2^{n+1} \left[\frac{n+1}{2} \right]^2 P_i = 26k_i + l_i, i = 0, 2, 4, \dots \text{ for first series}$$

$$\frac{a^{2i+1}}{(2i+1)!} 2^{n+1} \left[\frac{n+1}{2} \right]^2 Q_i = 26k_i + l_i, i = 1, 3, 5, \dots \text{ for second series}$$

Else use concept of congruence

Step 3: Consider $P_{i,j}$ for k_i and $27 - P_{i,j}$ for k_i which satisfies the values with the key values. Sender sends, if required use the concept of congruence.

Illustration

Given plain text "HOLA AMIGO" is equivalent to 8,15,12,1,0,1,13,9,7,15

The series explore to solve the problem is

$$\alpha^n \sin a\alpha = \alpha^n \left[a\alpha - \frac{(a\alpha)^3}{3!} + \frac{(a\alpha)^5}{5!} - \frac{(a\alpha)^7}{7!} + \dots \right] \\ = \sum_{i=0}^{\infty} \frac{(-1)^i (a\alpha)^{2i+1} (a\alpha)^{2i+n+1}}{(2i+1)!}$$

Where $a, n \in \mathbb{N}$ are constants

Take $a = 2, n = 2$

$$\text{So, } \alpha^2 \sin 2\alpha = \left[2\alpha^3 - \frac{2^3 \alpha^5}{3!} + \frac{2^5 \alpha^7}{5!} - \frac{2^7 \alpha^9}{7!} + \dots \right] \\ = \sum_{i=0}^{\infty} \frac{(-1)^i (2)^{2i+1} (a\alpha)^{2i+3}}{(2i+1)!}$$

Neglect higher order terms as per requirement.

Recognizing coefficients as

$$P_0 = 8, P_1 = 15, P_2 = 12, P_3 = 1, P_4 = 0, P_5 = 1, P_6 = 13, P_7 = 9, P_8 = 7, P_9 = 15$$

Write these numbers as coefficient of the series $\alpha^2 \sin 2\alpha$

Assuming $\varphi(t) = P_i \alpha^2 \sin 2\alpha$

We get

$$\varphi(t) = P_0 2\alpha^3 - P_1 \frac{2^3 \alpha^5}{3!} + P_2 \frac{2^5 \alpha^7}{5!} - P_3 \frac{2^7 \alpha^9}{7!} + P_4 \frac{2^9 \alpha^{11}}{9!} - P_5 \frac{2^{11} \alpha^{13}}{11!} + P_6 \frac{2^{13} \alpha^{15}}{13!} - P_7 \frac{2^{15} \alpha^{17}}{15!} + P_8 \frac{2^{17} \alpha^{19}}{17!} - P_9 \frac{2^{19} \alpha^{21}}{19!}$$

Solve alternating negative terms of the series using congruence property that $x \equiv y \pmod{27}$

$$\varphi(t) = 8[2\alpha^3] + 12 \left[\frac{2^3 \alpha^5}{3!} \right] + 12 \left[\frac{2^5 \alpha^7}{5!} \right] + 26 \left[\frac{2^7 \alpha^9}{7!} \right] + 0 \left[\frac{2^9 \alpha^{11}}{9!} \right] + 26 \left[\frac{2^{11} \alpha^{13}}{11!} \right] + 13 \left[\frac{2^{13} \alpha^{15}}{13!} \right] + 18 \left[\frac{2^{15} \alpha^{17}}{15!} \right] + 7 \left[\frac{2^{17} \alpha^{19}}{17!} \right] + 12 \left[\frac{2^{19} \alpha^{21}}{19!} \right]$$

Taking Hankel Transformation on both side

Divita Sharma et al.,

We get,

$$H[\varphi(t)] = \frac{8(18)}{\rho^5} + \frac{12(300)}{\rho^7} + \frac{12(2940)}{\rho^9} + \frac{26(22680)}{\rho^{11}} + \frac{0(152460)}{\rho^{13}} + \frac{26(936936)}{\rho^{15}} + \frac{13(5405400)}{\rho^{17}} + \frac{18(29755440)}{\rho^{19}}$$

$$+ \frac{7(157966380)}{\rho^{21}} + \frac{12(814773960)}{\rho^{23}}$$

$$= \frac{144}{\rho^5} + \frac{3600}{\rho^7} + \frac{35280}{\rho^9} + \frac{589680}{\rho^{11}} + \frac{0}{\rho^{13}} + \frac{24360336}{\rho^{15}} + \frac{70270200}{\rho^{17}} + \frac{535597920}{\rho^{19}} + \frac{1105764660}{\rho^{21}} + \frac{9777287520}{\rho^{23}}$$

$$144 \equiv 9 \pmod{27}, 3600 \equiv 9 \pmod{27}, 35280 \equiv 18 \pmod{27}, 589680 \equiv 0 \pmod{27}, 0 \equiv 0 \pmod{27}, 24360336 \equiv 18 \pmod{27},$$

$$70270200 \equiv 0 \pmod{27}, 535597920 \equiv 0 \pmod{27}, 1105764660 \equiv 18 \pmod{27}, 9777287520 \equiv 0 \pmod{27}$$

9	9	18	0	0	18	0	0	18	0
I	I	R	—	—	R	—	—	R	—

Senders sends the values (Quotients in modulo operation)

$$H[\varphi(t)] = P_0 2 \left(\frac{9}{\rho^5} \right) + Q_1 \frac{2^3}{3!} \left(\frac{225}{\rho^7} \right) + P_2 \frac{2^5}{5!} \left(\frac{11025}{\rho^9} \right) + Q_3 \frac{2^7}{7!} \left(\frac{893025}{\rho^{11}} \right) + P_4 \frac{2^9}{9!} \left(\frac{108056025}{\rho^{13}} \right) + Q_5 \frac{2^{11}}{11!} \left(\frac{18261468225}{\rho^{15}} \right)$$

$$+ P_6 \frac{2^{13}}{13!} \left(\frac{4108830350625}{\rho^{17}} \right) + Q_7 \frac{2^{15}}{15!} \left(\frac{1187451971330625}{\rho^{19}} \right) + P_8 \frac{2^{17}}{17!} \left(\frac{428670161650355520}{\rho^{21}} \right)$$

$$+ P_9 \frac{2^{19}}{19!} \left(\frac{189043541287806828544}{\rho^{23}} \right)$$

Since $P_i \leq 26$

$$P_0 18 = 27k_0 + 9 \Rightarrow P_0 = \frac{27k_0 + 9}{18} \Rightarrow \begin{cases} k_0 = 1, P_0 = 2 \\ k_0 = 3, P_0 = 5 \\ k_0 = 5, P_0 = 8 \\ k_0 = 7, P_0 = 11 \\ k_0 = 9, P_0 = 14 \\ k_0 = 11, P_0 = 17 \\ k_0 = 13, P_0 = 20 \\ k_0 = 15, P_0 = 23 \\ k_0 = 17, P_0 = 26 \end{cases}$$

$$Q_1 300 = 27k_1 + 9 \Rightarrow Q_1 = \frac{27k_1 + 9}{300} \Rightarrow \begin{cases} k_1 = 33, Q_1 = 3 \\ k_1 = 133, Q_1 = 12 \\ k_1 = 233, Q_1 = 21 \end{cases}$$

$$P_2 2940 = 27k_2 + 18 \Rightarrow P_2 = \frac{27k_2 + 18}{2940} \Rightarrow \begin{cases} k_2 = 326, P_2 = 3 \\ k_2 = 1306, P_2 = 12 \\ k_2 = 2286, P_2 = 21 \end{cases}$$

Divita Sharma et al.,

$$Q_3 22680 = 27k_3 + 0 \Rightarrow Q_3 = \frac{27k_3 + 0}{300} \Rightarrow \left\{ \begin{array}{l} k_3 = 0, Q_3 = 0 \\ k_3 = 840, Q_3 = 1 \\ k_3 = 1680, Q_3 = 2 \\ k_3 = 2520, Q_3 = 3 \\ k_3 = 3360, Q_3 = 4 \\ k_3 = 4200, Q_3 = 5 \\ k_3 = 5040, Q_3 = 6 \\ k_3 = 5880, Q_3 = 7 \\ k_3 = 6720, Q_3 = 8 \\ k_3 = 7560, Q_3 = 9 \\ k_3 = 8400, Q_3 = 10 \\ k_3 = 9240, Q_3 = 11 \\ k_3 = 10080, Q_3 = 12 \\ k_3 = 10920, Q_3 = 13 \\ k_3 = 11760, Q_3 = 14 \\ k_3 = 12600, Q_3 = 15 \\ k_3 = 13440, Q_3 = 16 \\ k_3 = 14280, Q_3 = 17 \\ k_3 = 15120, Q_3 = 18 \\ k_3 = 15960, Q_3 = 19 \\ k_3 = 16800, Q_3 = 20 \\ k_3 = 17640, Q_3 = 21 \\ k_3 = 18480, Q_3 = 22 \\ k_3 = 19320, Q_3 = 23 \\ k_3 = 20160, Q_3 = 24 \\ k_3 = 21000, Q_3 = 25 \\ k_3 = 21840, Q_3 = 26 \end{array} \right.$$

$$P_4 152460 = 27k_4 + 0 \Rightarrow P_4 = \frac{27k_4 + 0}{152460} \Rightarrow \left\{ \begin{array}{l} k_4 = 0, P_4 = 0 \\ k_4 = 16940, P_4 = 3 \\ k_4 = 33880, P_4 = 6 \\ k_4 = 50820, P_4 = 9 \\ k_4 = 67760, P_4 = 12 \\ k_4 = 84700, P_4 = 15 \\ k_4 = 101640, P_4 = 18 \\ k_4 = 118580, P_4 = 21 \\ k_4 = 135520, P_4 = 24 \end{array} \right.$$

So, the given cipher text is equivalent to

8	15	12	1	0	1	13	9	7	15
H	O	L	A	—	A	M	I	G	O

CONCLUSION

By using trigonometric ratio and applying a mathematical technique called the Hankel Transform. We can establish a secure method for transmitting data. This approach can also be extended to explore other types of ratios for mathematical series for opening a new avenue for research in this field.

ABSTRACT

Hyaluronic acid (HA) is a glycosaminoglycan found abundantly in the human body, particularly in body fluids and the extracellular matrix of tissues. It plays a vital role in maintaining tissue hydration and supporting cellular processes such as proliferation, differentiation, and the inflammatory response. Due to its biocompatibility, biodegradability, non-toxicity, and non-immunogenic properties, numerous HA-based biomedical products have been developed. There is growing interest in optimizing HA production processes to ensure high-quality, efficient, and cost-effective products. Topical applications of HA have long been recognized as effective for delivering treatments to both soft tissues, such as the periodontal ligament, and hard structures like the alveolar bone and cementum. Recently, HA's use has gained prominence as an adjunctive treatment for chronic inflammation, in addition to its well-established role in promoting healing following dental procedures. This review article aims to provide valuable insights into the future potential of HA in dentistry, encouraging clinicians and the next generation of dentists to incorporate its use into their practice.

Keywords: Hyaluronic acid, Dentistry, Glycosaminoglycans, Inflammation, Wound Healing, Topical Applications.

INTRODUCTION

Hyaluronic acid (HA) is a naturally occurring, non-sulfated glycosaminoglycan with a high molecular weight ranging from 4,000 to 20,000,000 Da. Its structure is composed of repeating disaccharide units of glucuronic acid and N-acetylglucosamine, linked by alternating β -1,3 and β -1,4 glycosidic bonds. HA is a linear polysaccharide found in the extracellular matrix of connective tissues, synovial fluid, embryonic mesenchyme, vitreous humor, skin, and various other organs and tissues throughout the body.[1] Hyaluronic acid, also referred to as hyaluronan was first isolated by Mery and Palmer in 1934.[2] Cross-linked hyaluronic acid (xHyA) is produced by a process that establishes new bonds between linear or native HA, effectively linking the molecules through cross-linking. Hyaluronic acid (HA) is among the most moisture-absorbing molecules found in nature. When HA is mixed with an aqueous solution, hydrogen bonding takes place between the carboxyl and N-acetyl groups, enabling HA to maintain its structural rigidity and retain moisture. Additionally, HA exhibits significant viscoelastic properties, which help reduce the penetration of viruses and bacteria into tissues.[3] The molecule plays a crucial role in the various stages of the wound-healing process. These stages include inflammation, granulation tissue formation, epithelial formation, and tissue remodelling. Due to the numerous functions associated with hyaluronic acid, significant progress has been made in the development and use of HA-based biomaterials for treating various inflammatory conditions.[4] Given the multifunctional roles of hyaluronic acid in wound healing, and considering that gingival and bone healing follow similar biological processes, it is reasonable to believe that HA plays similar roles in the healing of both mineralized and non-mineralized tissues within the periodontium.[3] A Systematic review in 2015,[5] showed the potential benefits of topical hyaluronic acid (HA) in treating both acute and chronic inflammatory diseases of the upper aerodigestive tract. In recent years, HA formulations have been developed for topical use as an adjunct treatment for acute and chronic dental and gingival conditions, such as promoting tissue healing after oral surgery.[6] This review article aims to explore and discuss the various physicochemical, biochemical, and pharmacotherapeutic applications of hyaluronic acid, with a focus on its use in different areas of dentistry.

REVIEW

SEARCH METHODOLOGY

Relevant published studies were searched for on PubMed, Google Scholar using keywords such as “hyaluronic acid in dentistry”, “hyaluronic acid AND oral surgery”, “hyaluronic acid AND periodontology”, “hyaluronic acid AND orthodontics”, “hyaluronic acid AND pedodontics”, “hyaluronic acid AND aesthetic dentistry”. Key references were also gathered from the bibliographies of the relevant studies.

Properties of HA

Hyaluronic acid serves multiple functions in the body, utilizing its physicochemical and biological properties. The biological functions of hyaluronic acid range from fundamental structural roles in the extracellular matrix to regulating development by influencing cell behaviour through the control of both tissue macro- and microenvironments. Additionally, these functions of HA have direct receptor-mediated effects on gene expression. Hyaluronic acid displays hygroscopic and viscoelastic properties. It also demonstrates bacteriostatic activity, which is most pronounced when higher concentrations of the medium and lower molecular weight HA are used.[8] Additionally, HA is biocompatible and non-immunogenic. Hyaluronic acid demonstrates anti-inflammatory properties by scavenging prostaglandins, metalloproteinases, and other bioactive molecules.[9] It also possesses antioedematous properties due to its osmotic action and antioxidant capabilities. By scavenging reactive oxygen species, HA helps stabilize the granulation tissue matrix.[10]

Synthesis of HA

Hyaluronic acid is a negatively charged glycosaminoglycan that distinguishes itself from other glycosaminoglycans. In mammals, HA synthesis takes place at the cellular plasma membrane, whereas the synthesis of other

**Gowri Pendyala et al.,**

glycosaminoglycans typically occurs in the Golgi apparatus. Hyaluronic acid synthesis is carried out by three isoenzymes of hyaluronan synthase (HAS1, HAS2, and HAS3).¹¹ The highest concentrations of hyaluronic acid are found in the synovial fluid, epidermis, umbilical cord, and other tissues, whereas the lowest concentration is present in the blood serum. A membrane-bound protein in plasma membranes synthesizes hyaluronic acid by transporting activated monosaccharides to glycosaminoglycan chains and releasing uridine diphosphate directly into the extracellular space. Hyaluronic acid turnover in tissues is influenced by lymphatic drainage into the circulatory system or local metabolism.¹²

Characteristic features of HA

Hyaluronic acid is not a single molecule, but a family of molecules with varying characteristics. These differences are significant and can result in diverse effects. Below are some key features:

• Low molecular weight vs. high molecular weight

The physiological functions of hyaluronic acid are influenced by its molecular weight (MW), which is determined by the length of its chain. High molecular weight (long chain) hyaluronic acid primarily plays a role in modulating the immune response through its immunosuppressive, antiangiogenic, and anti-inflammatory effects.¹³ In contrast, low molecular weight (short chain) hyaluronic acid is important for wound and tissue healing, as it exhibits angiogenic, immunostimulatory, and pro-inflammatory properties.¹³

• Purity

The purity of hyaluronic acid can vary considerably based on its intended application. There are significant differences in the quality of HA used for cosmetic versus surgical or pharmaceutical purposes. Generally, HA produced for surgical or pharmaceutical use meets the highest standards and ensures superior quality.

• Native/linear versus cross-linked hyaluronic acid (xHyA)

The choice between native and cross-linked hyaluronic acid depends on the specific application and desired effect. Native HA maintains its natural structure and offers the greatest regenerative potential, being naturally degraded in the body within a few hours to a few days. Cross-linked hyaluronic acid (xHyA) undergoes chemical modifications to extend its degradation time, which can range from several weeks to months. However, as HA becomes cross-linked, its physiological properties are diminished, and it becomes more inert. When selecting the appropriate type of HA for medical devices, it is crucial to consider the specific requirements and intended use.⁸

• Composition of hyaluronic acid-based gels

HA-based gels designed for specific applications can differ in several aspects:

Concentration

The concentration of hyaluronic acid in the gel can affect its viscosity and potentially its effectiveness. Higher concentrations typically lead to increased viscosity, which may improve the device's performance.

Composition

HA formulations can be composed of a single type of hyaluronic acid aimed at targeting a specific tissue or healing process. Alternatively, some formulations may contain multiple types of HA, each designed to address different healing patterns or tissue types.⁹

Additional substances

HA formulations may contain additional ingredients such as disinfectants, peptides, polynucleotides, mannitol, or viscosity modifiers. These substances can potentially interact with the beneficial properties of HA, influencing its resorption pattern and regenerative effects. Essential considerations to follow¹⁴:

**Gowri Pendyala et al.,**

- The formulation must align with the biological requirements of the indication (e.g., bone augmentation requires a prolonged effect, while gingival wound healing typically occurs over a few days).
- It should also match the specificity of the application (e.g., gel for direct application to the surgical site, HA combined with other biomaterials, or non-surgical use for periodontal pockets).
- Additionally, potential interactions must be considered to achieve the desired outcomes (e.g., high molecular weight cross-linked hyaluronic acid slows the resorption of collagen, such as collagen membranes).

Application of HA in dentistry

Hyaluronic acid promotes healing and reduces inflammation. It can be applied topically to oral mucosa, gums, or soft tissues, injected to treat gingival recession or enhance a smile, or used around dental implants to improve osseointegration. HA can also be applied as a gel or film for tissue regeneration, or added to mouthwash to reduce periodontal infections and support healing.¹⁵

HA in Oral and Maxillofacial Surgery

Hyaluronic acid can be injected into soft tissue to enhance volume and appearance. It aids in wound healing by enhancing tissue regeneration, decreasing inflammation, and stimulating angiogenesis. HA aids recovery after oral procedures, such as tooth extractions or implants, and enhances bone density and osteogenesis in bone regeneration, particularly in the maxillofacial area. It also improves outcomes in bone grafting surgeries.¹⁶ Hyaluronic acid injections into the joint space can treat temporomandibular disorders by reducing inflammation, improving lubrication, and promoting tissue regeneration. Extensive research supports the use of hyaluronidase in TMJ issues.¹⁷ Hyaluronidase is an enzyme that breaks down hyaluronic acid in joint spaces and synovial fluid, increasing the viscosity of the synovial fluid. It works by enhancing fluid absorption and synovial permeability, allowing for the dispersion of traumatic exudates and transudates.¹⁸ Hyaluronic acid proves to be highly effective following third molar surgery. Yilmaz *et al.*¹⁹ evaluated the benefits of HA after the surgical extraction of third molars. The study suggested that hyaluronic acid could provide an analgesic effect in post-extraction sockets, reducing the need for nonsteroidal anti-inflammatory drugs after dentoalveolar surgery. A study by Koray *et al.*²⁰ also showed that HA spray was more effective than benzydamine hydrochloride spray.

HA in Periodontal Therapy

Hyaluronic acid plays a significant role in periodontal treatment, offering anti-inflammatory, antibacterial, anti-edematous, and tissue regeneration properties. Studies show it can reduce pocket depth, improve attachment levels, and decrease bleeding on probing, while its antibacterial effects help treat periodontal diseases.²¹ It can be injected into gum tissue to promote regeneration, reduce inflammation, and restore the natural gum position. It is also used in pocket reduction therapy to treat periodontal pockets, where bacteria can cause inflammation.¹⁶ Hyaluronic acid can be applied in periodontal surgery to enhance healing and tissue regeneration. It can be used topically or injected into the surgical site to reduce inflammation and support wound healing. HA is often combined with scaling and root planning and can be applied or injected into the gum tissue to promote regeneration and minimize inflammation. It has a strong ability to bind water, keeping the tissue moist and support healing. Additionally, it stimulates the proliferation of fibroblasts and other connective tissue cells, aiding in tissue regeneration.²² Gontiya *et al.* showed that subgingival application of 0.2% HA gel with scaling and root planing (SRP) in chronic periodontitis patients resulted in improved gingival and bleeding indices compared to control sites. This was further confirmed by a gingival biopsy, which revealed a significant reduction in inflammatory infiltrate.²³ Erik *et al.* showed the effect of HA topically used with varying concentrations. The HA group in his study showed positive results with reduction in periodontal pocket depth and prevention of further recolonization of pathogens such as *Campylobacter*, *P. intermedia*, and *P. gingivalis*.²⁴ Hyaluronic acid is also used in periodontics as a filler for periodontal issues. It can be injected into areas of gum recession or other abnormalities to fill gaps and stimulate tissue regeneration. Due to its anti-inflammatory and regenerative properties, HA is a promising biomaterial in periodontics, with the potential to improve treatment outcomes and reduce the need for more invasive gum disease procedures.²⁵

**HA in Pedodontics**

Hyaluronic acid is used to treat oral ulcers, a common condition in children that causes discomfort and pain. It can be applied topically or used as a mouthwash to reduce inflammation and promote healing. Nolan *et al.* proved that 0.2% HA gel when applied twice daily for two weeks was effective in treating recurrent aphthous ulcers. 260.2% HA gel was also used in the treatment of gingivitis in children. HA as topical gel or mouthwash could also be used to decrease the inflammation and accelerate tissue repair after orthodontic treatment in younger patients. Hyaluronic acid can be applied topically or injected into the soft tissues around orthodontic devices to relieve discomfort and improve outcomes. In caries prevention, HA has been studied for its potential to combat dental caries, a common issue in children. It can be applied topically to the teeth to reduce bacterial growth and support remineralization.²⁷

HA in Implant Dentistry

Hyaluronic acid has been shown to enhance osseointegration and decrease implant failure rates. Studies indicate that HA use can increase bone density around dental implants, improving their stability and longevity, ultimately contributing to a longer lifespan for the implant. Cervino *et al* demonstrated in his study that HA promotes the migration, adhesion, proliferation, and differentiation of cell precursors on titanium implants. By increasing the bioactivity of implant surfaces, HA helps ensure accurate positioning of dental prostheses during the early loading period, meeting patient expectations. Hyaluronic acid, a key glycosaminoglycan in the cellular matrix produced by fibroblasts, synovocytes, and chondrocytes, helps reduce inflammation during wound healing. It promotes cell proliferation, re-epithelialization, and scar reduction.²⁸

HA in Endodontics

Research shows that hyaluronic acid reduces postoperative discomfort and promotes recovery after endodontic procedures due to its anti-inflammatory effects.²⁹ It is used as an intracanal medicament to aid healing and regeneration of periapical tissues post-root canal therapy. HA also serves as an effective root canal irrigant, removing debris and smear layers. Additionally, it is used as a filling material for root perforations and resorptive defects, possible due to its biocompatibility and regenerative properties.²⁸

HA in Orthodontics

Hyaluronic acid reduces pain and discomfort during orthodontic therapy while promoting faster tooth movement by enhancing osteoclast and osteoblast activity. Its anti-inflammatory and antibacterial properties help reduce inflammation and improve healing in periodontal tissues. HA can also be used as a lubricant to reduce friction between brackets and archwires, increasing patient comfort. Additionally, it helps prevent white spot lesions and may offer a cost-effective solution for both patients and the healthcare system.³⁰

HA in Facial Aesthetics

A growing field within maxillofacial surgery is aesthetic surgery, which includes various non-surgical techniques for facial rejuvenation or augmentation to enhance facial appearance. These treatments treat signs of aging like wrinkles, fine lines, volume loss, and sagging skin. Hyaluronic acid is commonly used as a dermal filler in facial aesthetics, gaining popularity for its ability to enhance facial contours, restore volume, and improve skin appearance.³¹ When injected, HA adds volume and plumps the skin, helping to fill wrinkles, folds, and lines. Injecting hyaluronic acid into the lips can enhance their shape and fullness, and it is also used in other cosmetic procedures, such as lip augmentation.³² HA fillers can define and contour the jawline for a more sculpted appearance. As an organic compound, HA is well-tolerated by the body, with temporary and reversible effects. The effects of HA dermal fillers usually persist for several months to up to a year, depending on the composition and the metabolic rate.³³

CONCLUSION

Hyaluronic acid is a versatile biomaterial with multiple applications in dentistry. Its role in periodontal treatment, implant dentistry, endodontics, facial aesthetics, oral surgery, and orthodontics has been extensively studied. Due to

Gowri Pendyala *et al.*,

its biocompatibility, regenerative properties, and antibacterial benefits, HA is a highly attractive material for various dental treatments. HA's versatility in modern dentistry offers significant potential for innovative dental products and treatments. Future research should focus on optimizing HA formulations, exploring new delivery methods, and discovering additional applications. Combining HA with other biomaterials, drugs, and growth factors could enhance its regenerative potential.

ABSTRACT

The study examines the difference in psychological contract (PC) between the employees working in IT and manufacturing sectors. Several researchers have studied the concepts of psychological contract in various sectors. Through an exhaustive literature survey, it can be understood that when objectively measured, employee psychological contract varies from sector to sector. This paper contemplates two such dynamic industries i.e., manufacturing and IT/ITES, and aims at comparing the psychological contract of employees working in these sectors. This research is inspired by an article on attrition rate in Q3, published in January 2023, by the Economic Times. 176 employees working in IT and manufacturing sectors were selected as respondents using probability sampling technique. A pilot tested questionnaire and interviews were used to collect the responses. To test the hypothesis developed during the research, Analysis of Variance (ANOVA) was used. The analysis was performed using SPSS software. Besides comparison of psychological contract, the paper also attempts to identify and examine the variables that influence consistent maintenance of psychological contract in these sectors. In a nutshell, the analysis revealed similar perspectives of employees for factors such as involvement and external marketability while it differed for other factors namely stability of tenure, loyalty, performance support and growth and development plans. However, the strength of PC among the employees in the manufacturing

industry appeared to be stronger in comparison with IT/ITES sectors. Future research can focus on longitudinal studies to analyse the changes in PC more accurately over a period of time.

Keywords: Attrition rate, Employee engagement, Psychological contract, IT/ITES, Manufacturing.

INTRODUCTION AND PURPOSE

Employees are the most important assets of any organization. Today's dynamic environment has made every organization strive to attract and retain best talents irrespective of the industry. The organization has to engage these employees enhancing their skills to adapt to ever changing markets. In this process of attraction to retention the organizations make a huge investment on its people, despite of which, many organizations are witnessing high attrition rate tossing out all the effort, time and money. According to an article on attrition rate in Q3, published by Economic times in January 2023 IT/ITES sector suffered from highest attrition rate of close to 27.19% while in the manufacturing, engineering and infrastructure it was close to 8.27% in the world. These statistics stimulated this research to understand the underlying causes of attrition in the above mentioned massive labour-intensive sectors from the perspective of psychological contract (Argyris, 1960; Rousseau, 1989; Levinson *et al.*, 1962; Schein, 1965). This paper attempts to understand the PC of employees working in the IT industry where attrition rate is astoundingly high and manufacturing sector where the attrition is significantly low. The study also aims at understanding the factors influencing the sustenance of PC among employees in these sectors.

Theoretical background

Meaning of Psychological Contract (PC)

Psychological contract is understood to be an undocumented or unwritten agreement between an employee and the employer (Argyris, 1960; Levinson *et al.*, 1962; Schein, 1965). It plays a vital role in maintenance of smoother relationship between employee and employer (Kelly Windle & Kathryn von Treuer, 2014) PC is seen in various stages during the career of an employee, namely pre-employment stage, early socialization stage and latter stages. The development of PC is dependent on a person's social and organizational experiences (Rousseau *et al.*, 2013). Most of the researches classifies PC into two types, transactional and relational (Zhen Yan & ZurainaBt Dato Mansor, 2019). Some of the researches have also mentioned about other types such as transitional and balanced psychological contracts (Rousseau, 2000; Hui, Lee & Rousseau, 2004; Sims, 1994). Studies have also shown examples of dominant relational contract and employee PC being stronger than employer PC in industries such as Information Technology (Patrick, 2008).

Evolution of PC

The origins of the psychological contract can be traced back to the 1960s, with seminal contributions from Chris Argyris and Douglas McGregor. Argyris (1960) introduced the term "psychological work contract" to describe the informal agreement between employees and their supervisors, emphasizing the reciprocal nature of this exchange. McGregor (1960), through his Theory X and Theory Y, highlighted the significance of managerial assumptions about employee motivation and behaviour in shaping psychological contracts. In the early 1970s, Chris Argyris and Edgar Schein further developed the concept of the psychological contract. Argyris argued that the psychological contract is a dynamic agreement that is constantly being negotiated between employees and organizations. Schein proposed that the psychological contract is based on four key elements called expectations, obligations, perceived reality and outcomes (Schein, 1965). Having considered the social exchange theory as a foundation to PC (Coyle-Shapiro & Parzefall, 2008; Amanuel G. Tekleab *et al.*, 2019), several researchers defined it as a set of expectations and obligations between an employee and the employer (Argyris, 1960; Levinson *et al.*, 1962). Further, more clear understanding was provided by Denise Rousseau, who defined PC as "Perceived mutual obligations" (Rousseau, 1989). Rousseau also separated PC from official or legal contract in her further work on PC (Rousseau & Wade-Benzoni, 2006).

Santhosh and Bhavya Vikas

The concept of PC leads to two thoughts, called Formation of PC and breach of PC (Robinson & Morrison, 1995; Coyle-Shapiro & Parzefall, 2008). Due to the fact that Psychological contract is literally psychological, some of the researches have argued about the complexity of measuring PC objectively. Eventually few researches highlighted the criteria any instrument is expected to satisfy in order to measure PC (Charissa Freese and Rene Schalk, 2015).

PC and performance

To describe the relationship between psychological contract and employee performance a causal loop diagram created using vensim software is shown in the Fig. 1.

The following interpretations can be drawn through this model.

Loop 1 (Reinforcing loop)

- Stronger PC motivates a person to perform more. This especially holds good during the early socialization stage. Increased performance results in rewards and recognition, which further strengthens the PC. The polarity (+ or -) indicates whether or not the variables are directly proportional.

Loop 2 (Balancing loop)

- With growing experience, gradually the performance decreases due to several reasons such as monotony, reduced motivation to work, lack of recognition, lack of support from supervisor etc. This weakens the PC. Nevertheless, the employee engagement activities such as promotion, appraisal, rewards etc. attempts to further strengthen it, with seldom possibilities of enhancing it to a greater extent. Eventually the PC tend to diminish resulting in separation of an employee. The delay mark in the loop indicate that the process is usually gradual.

Identification of factors and data collection

With a limited literature survey, we understand that there are various factors influencing PC in different stages. During pre-employment stage it depends on a person's awareness about the role and the organization, formal education and his preparedness to work (Schein, 1965). During the early socialization stage and latter stages, period of employee-employer relationship, employee engagement initiatives, salary and benefits, supervisor support, employment status, market conditions etc. (Heather Maguire, 2003) plays a vital role. There are also instances where working conditions have changed with economy, political conditions, advancements in technology, globalization etc. and in turn these affect PC (Patrick, 2008). Psychological contract inventory (Rousseau, 2008) a systematic instrument was adapted to design the survey instrument required for this study. Fig. 2 shows the factors considered for the study. These factors are similar to those used by Rousseau (2008) divided into four types of psychological contracts (Transactional, relational, balanced and transitional). The objective was to compare the psychological contract of employees working in IT sectors vs those in manufacturing sector. As mentioned earlier, few studies have measured the PC of employees in IT sector and have found the dominance of relational contract. In this study, the PC of IT employees was compared with that of manufacturing employees. The reliability measure of the instrument is shown in the Fig. 3. Under each factor, the first question consisted of dichotomous choices to check if PC is formed. The second question consisted of 5-point Likert choices to check the strength of PC formed. Example, if a person's answer is a "Yes" for a question under a particular factor, it may not imply a positive PC unless the response for the second question has a similar inference. The questionnaire had two segments. Segment 1 consisted of questions from employees' perspective (What employee thinks he owes to the company/employer). Segment 2 consisted of questions regarding employees' view about employer (What employee thinks employer owes him). Both segments were answered by the employees and considered same factors. The first hypothesis developed aimed at understanding stability of tenure of the employees from both IT and manufacturing sectors. In other words, the respondents' intention to leave the company. Similarly, for every factor the hypothesis developed is shown in the table below:

RESEARCH METHODS AND TECHNIQUES

As the study intended to describe the portrayal of behaviour of employees, a descriptive research was used. The respondents were selected based on stratified sampling technique. The questionnaire was circulated using online

**Santhosh and Bhavya Vikas**

survey platforms to approximately 200 respondents, of which 176 responded. Of these respondents, 84 worked in IT/ITES industry and the rest worked in manufacturing industry. The respondent profile in brief is as specified below:

ANALYSIS AND DISCUSSION OF RESULTS

As discussed earlier, PC differs employee to employee and from sector to sector depending on the stage of employment, market conditions, salary and benefits and many other variables.

However, as analysing the PC between employees in the same sector would be quite time consuming, the study aimed at analysing the PC between employees and employers of both manufacturing and IT/ITES sectors, keeping intra-sector PC as a control variable. To analyse these differences, analysis of variance (ANOVA) was used on SPSS software at the significant level (α) of 0.05.

It is important to note that for every measure of ANOVA, the independent variable is the sector and dependent variable is the factor considered. Also, for every measure there are two interpretations possible.

1. Comparison of PC (EE) between employees from both the sectors represented as Q_i (PCI Vs PCM, EE), where the value of "i" ranges from 1 to 6
2. Comparison of PC (ER) between employees from both the sectors represented as Q_j (PCI Vs PCM, ER), where the value of "j" ranges from 7 to 12

Hypothesis 1

The p -value shown at the end of the above table is less than 0.05 at 5 percent level of significance for both measurements (Q_1 and Q_7). Hence, we reject the null hypothesis for both Q_1 and Q_7 .

The following interpretations are drawn based on these values.

- Q_1 (PCI Vs PCM, EE) – The difference in the psychological contracts between employees from both sectors is significantly higher. The F value indicates higher variation among these two groups with reference to what employees owe to the employer.
- Q_7 (PCI Vs PCM, ER) – The variance between the employees from both sectors is lesser compared with that of Q_1 . This means the level of agreement or in other words, similarity of thoughts between both sectors is higher with reference to what the employer owes to them.
- From the perspective of tenure, the PC between employees and employers of both sectors combined appears to be different. Where there are differences, the possibility of unstable PC is higher. It means majority of the employees feel that they are not obligated to stay in the company for longer tenure, and they also feel that their employers might not offer a stable employment. However, the primary data collected and interviews conducted with employees and employers suggest that the "Fear of job un-stability" is higher in IT/ITES than manufacturing sector.

Hypothesis 2

In the above case, Q_2 and Q_8 shows the 'loyalty' factor. The p -value of Q_2 is less than 0.05, and hence we reject the null hypothesis for Q_2 . But for Q_8 the p -value is more than 0.05 at 5 percent level of significance. Hence, we fail to reject the null hypothesis.

The following interpretations are drawn based on these values.

- Q_2 (PCI Vs PCM, EE) – The F value indicate that the variation between the two sectors is high. Hence their interpretation of "loyalty" could be entirely different. Primary data and interview responses collected reveal that the relational contracts were dominant more among employees from manufacturing sectors than IT/ITES.
- Q_8 (PCI Vs PCM, ER) – Here we can observe the higher p -value and lesser F value indicating the variation among the employees is less. Both the sectors feel that their employers value their interests while making any decision.

**Hypothesis 3**

The following interpretations are drawn in the above case:

- Q3(PCI Vs PCM, EE) – The p -value in the above table for Q3 is more than 0.05, due to which we fail to reject the null hypothesis.
- Q9(PCI Vs PCM, ER) – The p -value in the above table for Q9 is also more than 0.05, due to which we fail to reject the null hypothesis.

The above values could mean that the employees have similar thoughts with reference to work involvement factor. So, there might not be notable difference in the level of PC among both sectors.

A careful observation of p -values ($Q3 > Q9$) from the context of work involvement, might indicate that the strength of PC between employees and employers considering both groups as one is relatively low. The employers seem to have an upper hand indicating lower involvement of employees. In other words, the PC of employees could be diminishing due to unfulfilled demands, amongst other unidentified reasons.

Hypothesis 4

The following interpretations are drawn in the above case:

- Q4(PCI Vs PCM, EE) – The p -value in the above table for Q4 is slightly higher than 0.05. However, this value is not strong enough to completely reject the null hypothesis.
- Q10(PCI Vs PCM, ER) – The p -value in the above table for Q10 is less than 0.05, due to which we can reject the null hypothesis.

These values indicate that with reference to performance support the variation between both the groups appear to be similar. Overall, we can understand that though the value of Q4 is slightly higher than Q10, it appears that the strength of PC is partial but need not be unstable. It means, the employers expect the employees to quickly adapt to changing situations and provide them performance support, but employees don't find it obligatory to a greater extent.

Hypothesis 5

The p -value in the above table is lesser than 0.05 for both measurements [Q5(PCI Vs PCM, EE and Q11(PCI Vs PCM, ER)] and hence in this case, we reject the null hypothesis. The F value shows higher variation in Q5 than Q11, which means that there is a significant difference between employees' perspectives, though there is a slight possibility that the expectations from employees are higher than fulfilment initiatives by the employers.

Hypothesis 6

In the above table, we fail to reject the null hypothesis as the p -value is higher than 0.05 for both the measurements [Q6(PCI Vs PCM, EE and Q12(PCI Vs PCM, ER)]. The values indicate an interesting result, that both employees and employers are on the same page, even between the employees, the variations are quite similar. But the strength of PC could be lower or unstable in other words. It means, neither the employees want to restrict themselves from being visible to external world, nor their employers expect them to be confined to their internal environment. So, either way, it might result in separation of an employee eventually.

DISCUSSION AND PRACTICAL IMPLICATIONS

The practical implications of the study can be two folded. Firstly, understanding the strength of psychological contract plays a vital role in shaping an employee's willingness to perform better and its fulfilment helps building a constructive relationship between an employee and the employer. But slightest difference in the working conditions may alter the PC. While positive changes in PC enhances the performance and engagement of an employee, negative changes might create damaging effects such as increased attrition, bad word of mouth communication, reduced performance etc. Second, the overall analysis results reveal that there is a significant difference in the perspectives of employees working in the selected sectors. As mentioned earlier, the relational psychological contract is more dominant in manufacturing sector than IT/ITES sector. With the dynamic changes in technology, the human

Santhosh and Bhavya Vikas

relational touch seems to be missing. Dominant transactional PC might have a negative impact in the longer run. The present-day organizations must frame their employee engagement strategies so as to assure a positive effect on the PC, for which timely measurement of PC becomes inevitable.

Limitations and Future scope of the research

The study has two major limitations. First is the geographical limitation. The samples were limited to the Karnataka state in India. Being sixth largest state in the country by area, the state has diverse cultural and social practices and beliefs, which also affects the way every individual thinks. Therefore, the study may not be generalizable at this stage. Second, the study only compares PC between two sectors but does not quantify the psychological contract of each sector individually as it would take more time. Future research can focus on longitudinal studies to analyse the changes in PC more accurately over a period of time.

ABSTRACT

ICTs, or information and communication technologies, are ubiquitous in many daily life facets. The usage of ICT has significantly altered business and governance practices and procedures over the last 20 years in almost every field of endeavour. ICT has started appearing in education, although its influence has not been as significant as in other domains. Education is a highly social activity, and good teachers with high one-on-one interaction with students have long been linked to high-quality education. The use of ICT in the classroom encourages more student-centered learning settings, often leading to disputes between educators and learners. Nonetheless, ICT is becoming increasingly important in education as the world swiftly shifts to digital media and information, and this importance will only grow as the twenty-first century approaches. The numerous ways that ICT has affected modern higher education are discussed in this essay, along with possible directions for further research. In addition to arguing for the importance of ICT in revolutionizing teaching and learning, the article looks at how this will affect how programs are offered and delivered in future colleges and universities.

Keywords: ICT, Higher Education, Online Learning, Online Learning Platform, ICT in Higher Education,

INTRODUCTION

Education is crucial for the advancement of society. Education promotes social norms. Good education provides new ideas, methods for implementing different technologies, and many other things that contribute to the country's empowerment in all fields. A good education is a fundamental requirement for society. Numerous efficient teaching and learning approaches are currently in use. The best method for students to learn more is through technology. This brings us to ICT's involvement in the educational field (**Desai, S. 2010**). "Information and Communication Technologies," or ICTs, are "a diverse set of technological tools and resources used to communicate, as well as to create, disseminate, store, and manage information." In every aspect of life, the world is quickly changing these days. Darwin's "theory of survival of the fittest" states that only individuals who change over time will survive; this idea applies to individuals and educational systems, like universities, colleges, and other educational institutions (**Shende, n.d.**). ICT has had a significant impact during the last two or three decades. These fields now function much inversely from how they did in the past. However, education appears to have seen significant development and influence compared to other industries. The number of Indian universities today provides the level of education insight into the country's emphasis on the higher education system. According to the most recent data from the UGC website, "As of February 2017, there were 789 universities, 37,204 colleges, and 11,443 stand-alone institutions in India". By now, these figures would have only gone up. The Indian government has embraced ICT and developed a national ICT strategy that many ministries and departments within the government implement. It is being carried out by the National Informatics Centre (NIC) with great enthusiasm and support from the "Department of Science and Technology" (DST), "University Grants Commission" (UGC), and "All India Council of Technical Education" (AICTE) across the country. In addition, the "National Association of Services and Software Companies" (NASSCOM) has taken on a crucial role in developing these strategies. ICT advancements have been incorporated into higher education systems worldwide within the past two decades (**Das, 2019**).

REVIEW OF LITERATURE

Over the past fifty years, higher education institutions have expanded significantly to meet the need for universal access to high-quality education. This phenomenon has been accelerated by rapid improvements in Information and Communication Technology (ICT). The demand for professional and competent labour continuously grows in today's globalized society. In light of this, it is now essential for promoting economic growth and development that everyone has access to high-quality higher education. To improve access to higher education and reach the nation's most remote regions, open and distance learning facilities are playing an increasingly important role. Furthermore, it caters to individuals' desires for lifelong learning while maintaining an accessible price. "Information and Communication Technology" (ICT) refers to various communication tools and applications, such as satellite systems, computers, television, radios, cell phones, network hardware and software, and more. It also includes the services and applications related to these devices, such as videoconferencing and distance learning. ICT can be seen as a subset of Educational Technology when it is employed to enhance student learning, build learning environments, and support educational objectives. Higher education makes use of ICTs for several reasons, including the creation of course materials, the delivery and sharing of content, the facilitation of communication between students, instructors, and the outside world, the creation and delivery of lectures and presentations, academic research, and administrative support for tasks like student enrolment (**Glorythemes.In & Glorythemes.In, n.d.-b**). Several studies demonstrate the importance of incorporating technology into teaching methods and imply that doing so enhances learning for both instructors and students (**Salam et al., 2019**). Integrating information and communication technology (ICT) in higher education is accelerated by the growing use of educational technologies. ICT integration standards and criteria evolve along with digital settings. Although there has been much focus on developing an ICT-enabled teaching and learning environment. Therefore, it is challenging to evaluate the degree of ICT integration and its effects at an institution. Thus, this paper aims to outline an ICT integration standard that can serve as a trustworthy instrument or reference in higher education (**Zhang et al., 2022**). According to **Oliva-Córdova et al. (2021)**, the use of technology in

**Basudeb Jana et al.,**

the classroom facilitates student learning; nevertheless, the effectiveness of this use of technology is typically dependent on the technological and pedagogical competencies of the teachers. Numerous studies have shown how crucial these teacher qualities and knowledge are to effective teaching methods. Information and communication technologies (ICTs) are now a part of every area of life, and technology has permeated every facet of civilization. After over 20 years of ICT use, almost all government and large commercial sectors have drastically changed. Since teaching is a profoundly social profession, good teachers with a strong sense of personal connection with their students have long been linked to successful learning outcomes. Higher education may now offer more student-centered learning environments thanks to ICT. Nonetheless, the significance of ICT in higher education keeps growing as digital media and information continue to permeate every aspect of our life. Every nation's progress in developing its human resources (HR) is greatly aided by its higher education system; an educated populace will promote social progress, economic stability, and peace. In most developing countries, the usage of ICT supports education reform goals (S. Kumar et al., 2023). Technology integration in educational institutions has evolved into a game-changing strategy that uses digital tools and applications to improve instruction. Introducing technology in many fields, including education, has brought significant changes. Technology integration in educational institutions is a transformative rather than merely additive shift (Higher et al., 2024). Although there may be specific difficulties and restrictions, research has demonstrated that it positively impacts student engagement and learning results (Bates, 2019). Furthermore, systematizing an effective online education program requires properly integrating ICT. ICT successful applications increase student satisfaction and assist individuals in achieving their goals (Cervero et al., 2020). Thus, the case emphasizes how important it is to integrate technology into the classroom. Though teachers and students are accustomed to using conventional technological teaching aids like PowerPoint and Smartboards when utilizing information, communication, and technology (ICT) in the classroom, their employability in the real world is still necessary for teaching methods (Akram et al., 2021).

Objective of the Study

- To examine the role of ICT in Higher Education.
- To assess the advantages and difficulties of integrating ICT in higher education
- To evaluate the advantages of using ICT in Higher Education.
- Identify the ICT initiatives in Indian Higher Education.

METHODOLOGY

The methodology employed for this literature assessment involves a methodical exploration of scholarly research databases, online resources, and journal content listings. Additionally, pertinent web pages are also examined. Additionally, when applicable, online reports, conference papers, and theses have been considered.

Benefits of ICTs in Higher Education

Adoption and integration of technology in education have a favorable impact on learning, teaching, and research. Additionally, it improves flexibility and offers a stimulating environment and inspiration for the teaching and learning process, significantly impacting learning by creating new opportunities for teachers and students. These options may affect the success and performance of the students (Dahiya, B.P., 2018). The different ways that ICT in education serves various stakeholders are:

Students

- Increased Access to multiple learning materials.
- Deliver flexible content.
- Combine the work and education.
- High quality of education with qualitative interaction.

**Basudeb Jana et al.,****Teacher**

- Upgrade teaching skills and increase productivity.
- Establish a new learning environment.
- Share knowledge and thoughts with the discussion forum.
- Increased the training duration.

Governments

- Boost the effectiveness and capability of the structures for education and training.
- To ensure curriculum and instructional facilities are linked to the new information resources and networks.
- To support and improve the existing educational structures' quality and relevance.
- To promote development and opportunities for lifelong learning

Challenges of ICTs in Higher Education

The educational sector faces some challenges while implementing ICT in the education system. The barriers are stated below:

- Non-availability of buildings, electricity & Communication infrastructure for implement ICT.
- Lack of proper funding for buying ICT equipment.
- Lower bandwidth capacity than developed country.
- One of the most prevalent challenges is a language barrier. An estimated 80% of online learning platforms are in English. Most of the educational software developed in the global market is in English. However, it is exceedingly challenging to implement in developing nations like India, where there is a low level of English proficiency, particularly in rural regions.
- A broad lack of awareness regarding ICT. Individuals must adopt an emerging approach and support emerging technologies to advance their academic pursuits.

Growth of ICT in Higher Education Systems

ICTs are rapidly contributing to many metrics inside the Indian higher education framework. Radio, television, and audiovisual aids are used in broadcasting and education. The "University Grants Commission" (UGC), with the "Consortium for Educational Communication" (CEC) serving as the nodal office, established "Educational Media Resource Centres" (EMRCs) and "Audio-Visual Resource Centres" (AVRCs). The Eleventh Five Year Plan established a "National Mission in Education" through ICT, further promoting the use of ICTs in education. In this sense, using ICTs would significantly improve educational Access and quality, but it could also lead to circumstances. Even though the expansion in numbers is not the qualitative revolution that was hoped with the launch of new services and better training with learning materials, it has effectively reached many people (Saleem, S. 2012). A "National Mission in Education" through ICTs is scheduled to be launched in the higher education sector to expand "ICT coverage in all 789 universities, 37,204 colleges, and 11,443 stand-alone institutions in India". The Mission will prioritize the development of low-cost, low-power access devices, networking and digitizing all educational institutions, and providing bandwidth for educational purposes (Sarkar, S. 2012). According to a November 2020 survey, web-based apps, software applications, big data, and web-based apps were the technologies most frequently utilized by well-established educational organizations. The development of portals allowing students to be examined and evaluated based on multiple criteria, a component of distance learning, contributed to the expanded use of information technologies. The quantity of online education users has shown substantial growth since 2017. Throughout the COVID-19 epidemic, the number of users who experience online education products has increased, surpassing that of prior years, primarily attributed to an increase in the number of Individuals utilizing online educational systems. In 2019, there were approximately 429 million. Individuals utilizing educational media increased to 565 million in 2020 and 651 million after that. This fast growth of the sector has diminished in the wake of the pandemic. However, the consistent increase in users across all internet platforms and Learning products refers to the aggregate. The number of e-learners is projected to increase more than threefold from 2017 to 2025, reaching approximately 1.1 billion users by 2028. For 2022 to 2027, this translates to a compound annual growth rate (CAGR) of more than 10% annually, or nearly 14% if the years following 2017 are considered.

**Basudeb Jana et al.,**

The online university sector has contributed to overall revenue growth in the online education industry; however, online learning platforms exhibit a significantly higher penetration rate, exceeding 10 percent in 2024, while online universities remain below one percent. The penetration rate quantifies the adoption of a product or service relative to the total potential market for that offering. The overall penetration rate for online learning goods increased from approximately four percent in 2017 to over ten percent in 2024. The proliferation of online learning platforms surpasses traditional university education and professional certifications, indicating that the online university education sector, specifically, possesses considerable potential for future expansion.

ICT Integration of Higher Education in India

"Information and communication technology" (ICT) integration in Indian higher education has profoundly affected many facets of the learning environment. These are some significant ways that ICT has involved Indian higher education. India, the fourth largest market for online education worldwide, derives a significant portion of its e-learning users from the information and telecommunications, professional, scientific, and technical services, as well as the education and healthcare sectors. According to pages 14 and 28 of this research, Indian e-learners predominantly belong to a younger demographic, with 40 percent identified as Generation Z.

E-Learning Platforms

Education has become more accessible with the introduction of e-learning platforms. Students can now attend courses from leading universities and institutes worldwide by removing geographical boundaries. Some of the E-Learning platforms are popular in India.

SWAYAM

To achieve our educational policy's three primary objectives—equity, quality, and accessibility—the Indian government introduced the captivating SWAYAM site. SWAYAM's main objectives are to bridge the digital divide and offer online learning. It provides many free courses for remote Access for graduate, postgraduate, and school education. Figure 8 describes the number of courses launched from 2014-2019.

- **Swayam Prabha:** Despite the prevailing lockdown, Union HRD Minister "Ramesh Pokhriyal Nishank" took a significant step when the MHRD began offering online classes to students on Swayam Prabha DTH channels. Students can choose a time slot that works best for them each day by accessing four hours of newly created content on Swayam Prabha DTH channels. This content is then repeated five more times during the day. Using the GSAT-15 satellite, a subscription service includes 40 DTH channels. Swayam Prabha's content partners include eminent educational institutions, including "NPTEL, IITs, UGC, CEC, IGNOU, NCERT, and NIOS."
- **National Digital Library (NDL):** It is a digital repository with a significant amount of scholarly literature available in several formats. It supports major Indian languages for the interfaces. It is appropriate for students, researchers, and lifelong learners at all academic levels (Mondal, D., 2021).
As per the NDLI website, the number of documents increases daily.
- **MOOCs:** All users can access free online education through Massive Open Online Courses (MOOCs). MOOCs provide students with the opportunity to grow professionally, acquire new skills, and participate in extensive educational experiences in a flexible and affordable way. Millions of learners across the world utilize MOOCs for a variety of learning goals, including corporate eLearning, training, supplemental education, career transitions, job progression, higher education preparation, and more.
- **E-PG Pathshala:** It offers almost Twenty-Three thousand e-text and video courses covering seventy postgraduate disciplines in the social sciences, fine arts, arts, humanities, natural and mathematical sciences. It is an excellent curriculum-based, interactive online platform for online resources.
- **E-Sodh Sindhu:** It offers Access to over "15,000 peer-reviewed core journals" and archival material in various disciplines. Its member institution has access to "bibliographic, citation, and factual databases" from multiple publishers and aggregators. The "centrally funded technical institutions, universities, and colleges covered by the UGC Act" are among these establishments.

**Basudeb Jana et al.,**

- **NPTEL:** The "National Program on Technology Enhanced Learning" was started by the Indian Institute of Science, Bangalore, and seven IITs: Madras, Guwahati, Kanpur, Delhi, Kharagpur, Bombay, and Roorkee. This platform makes it easier to access video lectures in the engineering disciplines in the following five: electrical, electronic, computer, civil, and communication engineering.
- **LMS:** The learning management system is an application program. It helps track, report, automate, and manage the provision of training courses and programs. It offers both teachers and students a variety of advantages. Additionally, there are discussion forums where students can post questions and engage in class debate. Some LMS softwares are Talent LMS, Moodle, 360 Learning, and others.
- **VIDWAN:** VIDWAN is an online database that provides information about researchers and faculty members in the higher education institutions of India. It includes details about their academic qualifications, research interests, publications, etc. The database serves as a resource for academic networking and collaboration.
- **Shodh Ganga:** Figure (Fig 10) depicts the trend in thesis submissions on Shodhganga, an Indian repository of theses, from 1924 to 2024. The number of theses submitted is shown on the Y-axis, while the X-axis shows time in decades. The data shows an exponential growth trend in thesis submissions over the century. From 1924 to 1959, the numbers were relatively low in the early years, starting with only two theses between 1924-1929 and gradually increasing to 1162 by 1950-1959.

However, from 1960 to 1989, there was a moderate increase, with submissions rising from 4347 (1960-1969) to 21,191 (1980-1989). A sharp rise is observed from 1990 onwards, with the numbers escalating significantly: 30,774 theses in the 1990s, 62,163 in the 2000s, and an impressive 186,283 in 2010—the most recent period, although it still represents a high volume of submissions. The graph shows the overall exponential rise of thesis submissions, with a dashed trendline and blue bars representing the data for each decade. This pattern shows a significant increase in scholarly research activity in India, especially in the last several decades, probably because of the growing emphasis on research projects and higher education. The distribution of thesis submissions in Indian academia is depicted in the TreeMap and statistical data, with 76,584 theses in the social sciences ranking as the most popular field. Engineering and Technology (50,931), Arts and Humanities (45,828), and Physical Sciences (45,763) all show notable contributions. Computer science, economics, and life sciences are other well-known disciplines. The Tree Map visually emphasizes the more significant proportion of Social Sciences and Engineering disciplines, with smaller segments representing emerging fields like Clinical Medicine, Economics, and specific branches of Engineering. This visualization underscores the diverse research focus areas and the substantial growth in higher education research output, reflecting a robust academic ecosystem in India.

CONCLUSION

ICT is exceptionally beneficial to education. Emerging and new technologies challenge the conventional teaching and learning process and education management. Integration of ICT into education is crucial for enhancing the effectiveness and quality of education. In general, implementing ICT has changed the activities of higher education institutions and universities. In the modern, technologically sophisticated world, the importance of ICT in education and ICT sufficiency as a social necessity has been increasing. Information and communication technologies must be socially acceptable to increase public mobility, social equity, and pitch for value. In the given context, education has been acknowledged as a service that must be expanded to facilitate unrestricted trade worldwide. Using ICTs in contemporary education can significantly reduce government expenditures. Furthermore, significant qualitative progress can be observed when the training resource personnel are of the highest standard. The integration of ICT across multiple educational phases has the potential to enhance academic quality and standards. However, inadequate educational sector resources impede the implementation of ICT in developing nations in the 21st century. In the goal of sustainable development, higher education institutions can be seen as significant community members and role models. In addition to critically analyzing the learning environments and procedures that students go through, higher education should consider its part in building the framework that facilitates and supports lifelong learning. The widespread use of ICT necessitates the development of flexible mindsets and skill sets. Higher

Basudeb Jana et al.,

education's use of ICT changes how teachers and students learn and foster the development of higher-order abilities like problem-solving and cross-platform collaboration. In order to reap the full benefits of ICT in education, a few questions must be answered: Why do teachers use technology? How can ICT be implemented effectively? What are the prerequisites for successful ICT implementation? Studies have revealed that instructors' knowledge, in particular, is one of the significant factors influencing the success of ICT implementation. Teachers must adjust to ongoing professional development regarding the use of technology in the classroom. The numerous stakeholders must have a shared vision, and a cooperative strategy must be used. All stakeholders' attitudes and beliefs need to be carefully influenced. In order to provide accountability, quality assurance, accreditation, and consumer protection, appropriate controls need also be made. Education will eventually become more democratic as a result of ICT-enabled learning. ICT, or "Information and Communications Technology," is a general term for devices and services for information management and dissemination. Televisions and cell phones are significant examples of ICT in education. Our daily lives and educational fields involve extensive use of ICT, which has become necessary daily. "ICT in education includes presentations, audio, videos, images, and a combination of these for educational instruction." Therefore, "ICT in education" refers to using "Information and Communication Technology" to enhance education delivery.

ABSTRACT

Maintaining healthy financial system is very essential since banking sector represents a major chunk of nation economic growth, it is considered as an integral part of financial system. The bankruptcy of Silicon Valley and Signature bank crash biggest a big surprise for its clients in US history. SBI is one of the largest PSU after RBI, having over 22,405 branches throughout world. An international firm, Price water house Coopers reported that, India will be 3rd largest major financial center till 2040 on the other hand its finance and technology sector is projected to reach Rs 6.2 trillion by 2025. SBI is the only bank coming under the umbrella of top 50th place compared to all other nation. A key issue confronted by banking sector is NPAs. Government banking sector in India reported a total of 1.9 trillion rupees in net NPA by 2022-23. Consequently it is most significant to analyze the damage caused by NPA on these variables to assess impact on banking sector development.

Keywords: : Economy, EPS, Dividend, NPA, SBI and Growth of country.

INTRODUCTION

It has been observed that mounting and deteriorating quality of assets became a threat for Indian banks. In one way the merger supported by the RBI and Government to overcome the situation of worst NPA of SBI but another way it created the lot of internal and external pressure on the Stakeholders. By Inculcating technology economy can be

**Jagadish and Shivakumar**

upgrade the banking sector, in this regard steps needed to lay down a strong base but in India most of the banks are in misery because of the increase in NPAs which directing towards loss at the same time creates difficulty to maintain regular work. It will lead to bad impression on its customers and entire banking industry hence creates panic among the investors which is not in the interest of the growth of economy. Majority of the government banks are suffering with huge crisis of deteriorated asset quality, one stop solution for this issue is "merger or liquidation". Banking sector in India going transformation through digitalization process on the other hand rising non performing asset impacting badly on development of Indian economy, it is need of the hour to study the significance of nonperforming assets to forecast the prospect growth of banking sector in India.

Statement of problem

SBI must take a strong decision regarding its extremely rising NPA. This decision was taken after discussion with the department finance government of India in order to protect interest of its stakeholders. This situation is considered as a distressing sign for economy as a whole. After bringing all its ancillary banks under one umbrella, it has been observed that there is decrease in proportion of nonperforming assets. Even after this PSU banks are unable to forecast the impact of deteriorating asset quality. In this regard a sincere attempt has been made to evaluate the impact of nonperforming assets on stake holders.

- To evaluate the impact of deteriorating asset quality of select bank for the study.
- To analyze the impact of nonperforming asset of its stake holders.

Hypothesis

H0: There is no association between profitability, provision for NPA, EPS and DPS on Net NPA.

RESEARCH METHODOLOGY

The present research work is investigative and descriptive. Both types of data collected first hand information and also the data which is available in public domain has been collected for research. Primary data collected through structured interview bank officials and secondary data collected from the websites. To analyze the data, percentage, mean, standard deviation, correlation, regression analysis, provisions with respect to bad and doubtful assets, earning per share, dividend per share of select bank is taken in to consideration.

REVIEW OF LITERATURE

- **Research conducted by kumar das also utpal-** The study found that Asset quality of bank declining and its influence on ROA specifically commercial banking in Indian context by following "random effects method also it comprise wealth as essentials like rise in "GDP" level in development perspective.
- **Kumar et al. (2018)** His study found that main causes after multiplying bad assets. Identified causes for business illness, transformation of strategy statutory bodies, improper assessment of credit mechanism, intentional non-payment at the same time defective lending system.

Gap topic on the study

After having a glance on above literature it shows that only few studies are done on present topic of our research field. The present context research identifies contributing factors towards NPA threat in the banking space. The topic of study proves to be value addition to the banking literature after some point of time considering even geographical region and it will help in understanding economic constraints of financial institution or entire banking industry.

Drawbacks of the study

- It confined with respect only on non performing assets with respect to SBI only
- The time and resources allotted for the study were not sufficient.

- Findings and suggestions of the study cannot be generalized with other banks.

The above table depicting the year after year net income and provision for nonperforming assets of SBI considered 2013-2014 was base year, it can be identified that portion of income distributed for provision was increasing from 2013-14 to 2018-19 that is 26% to 94% after that from 2019-20 to 2022- 23 it was declined from 62% to 12%. From the above table it can be inferred that provision made for NPA, EPS and DPS, it is clearly showing that maximum of provision on NPA is in the year 2018-19 during the period amalgamation and merger which severely influenced the EPS and DPS i.e. negative EPS up to -7.67 and DPs of Nil and minimum of provision is maintained in the year 2013-14 leads to high EPS of 210.06 and DPS of 41.5. Above table exhibits the changes in the P/E Ratio of shareholders of SBI over 10 years, it can be observed that due to decrease in both EPS and share price leads to sustain a similar price earnings ratio. In the year 2018-19 during merger the shareholder are getting negative P/E ratio and in the year 2013-14 highest of 10 percentage P/E was benefited from by the shareholders wealth creation. As per descriptive statistics table Net NPA is amounts to rupees 48781.200, net interest income is amounts to rupees 76038.70 in corer, Provisions for NPA is rupees 31204.70 corer, earnings per share 14.852 and also dividend per share is rupees 2.70 per share. Standard deviation varying from 26577.30 i.e. net NPA till dividend per share 2.259, earning per share is 11.7536. And provision for NPA standard deviation 19500.603 by having glance on all statistics there is immense variation according to descriptive data. Above statistical test of Pearson correlation shows that there is significant association between profitability, provision for NPA, EPS and DPS on Net NPA. Further from table @5%significance the calculated value is more, compared to table values thus the H0 hypothesis rejected alternative H1 is accepted. Since calculated value is more than table value @0.05% significance null hypotheses rejected, H1 alternative hypothesis accepted, therefore it is agreed that there is a significant association between profit, provision, earning per share and dividend per share on net nonperforming assets. And the R squared value is 0.952 forecast stage. Hence calculated value F is 0.201 is more than table value @0.05% significance compared to table value which is 0.666 hence H0 null hypotheses rejected, H1 alternative hypothesis accepted.

Findings

1. Since it is noticed that net NPA on loans and advances enhanced during 2018-19 after the impact of merger it was started reducing i.e. 2019-20 to 2022-23 up to 405% till 27%.
2. According to the observation net NPA it was not reducing and hence due to increase in the provision of NPA heading to show reduction in the net nonperforming assets.
3. Even it is observed compared to total loans and advances, total deposits are enhanced very fast.
4. Since there is negligence from banks there is an association between total advances, net profits and NPA of bank.
5. It was identified that profits circulated to the equity shareholders reduced to ensure enhance the provision of nonperforming assets and capital adequacy.
6. Together attention of the investors towards State Bank of India an important step has been taken to reduce the face value of shares.
7. As per the observation a vital impact on profit, provisions, earning per share, dividend per share on net nonperforming assets i.e. up to 0.952 extremely expected but co-linearity between the independent variables somewhat have control in making decisions.
8. Study also noticed no momentous effect on net nonperforming assets on equity share price of shareholders which not at all acting wisely to enhance nonperforming assets.
9. Also there is no positive association between the provision on nonperforming assets on earning per share and dividend per share even after raise in profit.
10. Even after increased provision with respect to NPA's stake holders unable to get proper dividend per share and also justify ably revenue.

**Jagadish and Shivakumar****Suggestion**

1. Constant observation needed to ensure on customers and client's credit worthiness.
2. CIBIL and credit score has to be restructured frequently with in a specific time frame.
3. Additional guidelines prescribed by RBI to be adopted before granting loans.
4. Specific limit has to be prefixed before granting loans and advances in both context i.e. secured and unsecured loans.
5. Effective measures must be taken to enhance long term deposits from clients and customer in tern it leads generation of income.
6. A separate department must be taken the responsibility of NPA and Its Updates consistently.
7. Management must implement Basel III in order to ensure decrease in the level of NPA.
8. Government regulations and RBI provisions compulsorily followed properly to reduce NPA from willful defaulters.
9. Constant dividend pay-out ratio and EPS declarations will increase the shareholders confidence it leads to increase in share price and attracts more investors.
10. Focus should be given to investments rather than lending of loans to control the NPA
11. There are number of key issues liable for weak performance of banks, the main portion of the income proportion of bank are in misery.
12. Proper financial forecasting is needed form the point of profitability and liquidity needed to be verified accurately.

CONCLUSION

Research on the topic of our study considering it as key aspect i.e. NPA's to ensure the firmness banking sector. India is fastest growing digitalized economies in the entire world. In upcoming days everything is involved with banking sector. A strong foundation is essential to meet the emerging requirement of not only engineering but also reengineering things. Still a long journey is ahead, to maintain image of banking sector and also enhance the confidence among common citizens in India. Through the research it is observed that the influence in high NPA on growth of banks with reference to SBI. Through this study it is observed that still SBI is lacking behind to overcome from NPA to meet the expectation of wealth creation. SBI must adopt the responsibility accounting and it should fix time limit.

Scope for further study

An attempt in Elimination of NPA's in Banking Sector with the interface of AI.

ABSTRACT

This study explores the integration of environmental sustainability in teaching practices among teachers of higher education institutions. It examines the extent to which sustainability concepts are embedded in curricula and pedagogy, and identifies challenges and opportunities for enhancing environmental awareness. Major objective of this paper is to examine the perception towards environmental sustainability awareness of in-service teachers. The researchers used a mixed methodology. Qualitative data were gathered through unstructured interviews, while quantitative data was gathered from 115 In-service teachers from the Lucknow district. For data analysis, the researcher employed the Environmental Education, Sustainability and Awareness Scale (EESAS). With the aid of SPSS software, the researcher separated the data according to the characteristics of gender, location, subject, parents' occupation, and category. The study's main conclusions are as follows: researcher found there is no difference in attitude based on gender; there is a significant difference in environmental awareness based on locale, specifically between locale areas; there is a difference in environmental awareness from the perspective of education between the suggested sectors of agriculture and non-agriculture; teachers whose parents are working in government job and those whose parents are not in government job, researchers found significant difference towards the environmental awareness. Similarly, we can say that in the category where both men and women have the same educational background, there is no difference in environmental awareness. Through this study, the researcher promotes the need of integrating environmental

**Sangeeta Chauhan et al.,**

consciousness into the curriculum, promoting policy, and preparing in-service teachers to make significant contributions to society.

Keywords: Educational Awareness, Environment Sustainability, In-Service Teachers, and Higher Education.

INTRODUCTION

The global ecological issue of our time reflects how people develop ecological attitudes and orientations and how the need for ecology develops in the consciousness of the general public. In view of the global environmental problem, environmental education is necessary to lay a strong foundation for people's ecological thinking. Therefore, the main objective of ecological education is to promote basic environmental knowledge and help each individual and society to develop ecological consciousness and ecological culture (Wojtowicz,2019; Keles, 2017)). This objective will ensure that individuals develop positive thinking towards their ecological consciousness and ecological culture, which is essential for making economically correct decisions at the regional, industry and business levels. As a result, it is impossible to address contemporary environmental concerns without a positive shift in ecological consciousness. Today, the issue of how to develop ecological consciousness within an individual falls into the category of socio-psychological issues around the world (Doronina, Semenkov, & Taburkin, 2018; Machnev et al., 2018). Furthermore, basic education is crucial for the development of environmental consciousness. Starting from primary school, "abandoning destructive consumerist lifestyles and adopting frugal and restorative lifestyles" is the first step. A generation of young people who are ecologically literate and able to implement an unconventional approach to building relationships with nature must be adequately trained, as determined by society's changing educational standards, starting from primary school and progressing to higher education (Iizuka, 2016). According to the contemporary educational paradigm, the development of environmental literacy is at the core of all educational efforts, resulting in the development of environmental competence and awareness in both individuals and society (Fang et al., 2022; Roth, 1992). This task cannot be accomplished without affirming the body of constructive empirical and scientific knowledge on the relationship between nature and humans for the survival of humanity (Barth & Rieckmann, 2012).

The development and function of the environment, as well as how each individual feels about it, is largely determined by how environmental consciousness is formed, how people feel about nature, and how well their basic environmental knowledge is established during primary school, as well as how teachers in higher education are playing their vital role in environmental awareness. Thus, developing ecological awareness in aspiring higher education teachers is crucial to their training in higher education institutions and is a key driver of the ecological culture of global youth (Lugg, 2007; Chankseliani, 2021; Haigh, 2013). These important global challenges will be the main focus of our study. It becomes very important to develop environmental awareness among teachers and to find out the extent of their awareness (Labog, 2017). Thus, this paper examines the primary aspects of this issue. Specifically, the researcher has attempted to make a comparative study on the basis of: gender, category, and subject of teachers and the nature of the job of the parents of the teachers as well as the education of their parents. This study aims to investigate the current state of environmental sustainability integration in teaching practices among higher education teachers, focusing on their perceptions, challenges, and strategies (Ramisio, 2019). Understanding these dynamics is essential for identifying gaps in teacher preparation and support, which can inform policy and curriculum development (Huisin et al., 2015). This study aims to advance effective teaching strategies that enable students to critically engage with sustainability issues and to add to the growing body of knowledge on education for sustainable development (ESD) by investigating how educators manage the challenges of incorporating sustainability. In the end, encouraging a sustainable culture in higher education can improve instruction and equip students to handle the complex problems of the twenty-first century (Bell, 2016; Zusman, 2005).

REVIEW OF RELATED LITERATURE

The Researchers have conducted several studies in this area, emphasis on in-service teachers' environmental literacy, their attitudes toward sustainability, and pedagogical strategies that promote sustainable development. This study purpose to provide insights into these issues and propose potential future directions to enhance environmental education in India, address existing gaps, to promote a more successful inclusion of environmental consciousness into higher education's curricula. Towards this end, the researcher studied the paper by Kumar, J. A. (2012) aimed to study the perception of teacher candidates about the environment in teacher training institutes in Tiruchirappalli district of Tamil Nadu Survey methodology was adopted. For data collection, 300 prospective teachers were selected from the institutions of the district through simple random sampling. A questionnaire was designed by the researcher to measure environmental awareness, and statistical techniques such as variance analysis, correlation analysis and percentage analysis were used to analyse the results. The main findings indicate that teacher trainees have an average level of environmental awareness, with no significant differences observed based on variables such as gender, locality, or teaching ability. According to Nagara, V. and Singh, S. (2013), In their study explores environmental education awareness of senior secondary school teachers by examining factors such as school type, gender and subject streams. Data was collected through an environmental awareness assessment conducted with a random sample of 200 teachers. The researcher adopted statistical methods such as standard deviation, t-test, and mean for data analysis. The results showed that educators generally demonstrated an average level of awareness of environmental education. Additionally, the analysis showed no significant differences in environmental awareness related to school type, gender, or subject area. Padmanabhan, J., Borthakur, A., & Mittal, K. (2017) In this study, the United Nations Decade of Education for Sustainable Development (UNDESD) highlighted the critical need to incorporate environmental education in both school and teacher education curricula. This integration is deemed essential to promote develop positive and environmental awareness attitudes towards environmental protection. The aim of this study was to study the level of environmental consciousness among higher education instructors and students enrolled in the Orientation Programme (OP-123) at Human Resource Development Centre (HRDC), Himachal Pradesh University, and Shimla.

A survey instrument covering topics such as biodiversity, water resources, sanitation, health and climate change was designed. The findings revealed that teachers displayed a high level of awareness towards the environment while 64.28% of students showed a deep awareness about environmental issues. The study also provides recommendations for protecting the environment. Nazarenko, V. A. (2018), this paper presents innovative approaches to professional environmental training for future educators, focusing on the development of environmental awareness. A model of environmental awareness was created and applied in a pedagogical experiment to highlight its importance in the broader context of professional competence for future ecologist specialists. The study involved 47 students of a pedagogical university, assessing their theoretical knowledge and environmental skills. The educational process was skilfully designed to encourage the development of environmental awareness and attitudes by using a variety of training techniques and drawing on real-world experiences. The original techniques used stimulated students' intellectual involvement in environmental issues, allowing them to identify and activate their personal potential in areas such as nature and resource management, as well as environmental protection. Jayagandhi, T. and Suganthi, M. (2019), this paper purpose to examine the environmental consciousness of student-teachers from education and training institutions in the Madurai region. A random sample of 72 participants was selected for the study. Data was gathered through an environmental awareness questionnaire developed by the researcher, and analyzed using statistical methods such as standard deviation, t-test, and mean. The findings indicated that the majority of student-teachers possessed a moderate level of environmental awareness. Additionally, there is no significant difference was found in environmental awareness based on factors such as gender, age, and locality, educational qualification of parents or annual income. The conclusion suggests that there is a need to increase environmental awareness among student teachers and the role of teacher educators should be emphasized in promoting this awareness for the betterment of the society. Turan, E. Z. (2019) this study found that there is a need for teachers to make students more aware of the environment and develop sensitivity towards environmental challenges. The purpose of this study was

**Sangeeta Chauhan et al.,**

to assess the environmental sensitivity and awareness of teacher applicants. The research used "environmental awareness and environmental sensitivity" scale developed by Timur and Yilmaz (2003) to collect data from 277 teacher candidates. The data was analyzed using descriptive analysis with the SPSS program. The findings show that there is no significant difference in environmental awareness or sensitivity based on the candidates' gender or specific teaching branch. However, a significant variation was observed in the environmental sensitivity dimension among different branches. Gender did not affect the level of environmental awareness or sensitivity of teacher candidates. In particular, candidates specializing in religious culture and ethics teaching displayed higher scores in environmental sensitivity than those in other branches. These results suggest that environmental sensitivity may vary across teaching subjects, with some fields showing a greater inclination towards environmental issues. (Corpuz, 2022) Study was conducted on the topic "Integration of Environmental Education in Teacher Education Programs: Towards Sustainable Curriculum Greening." This mixed-method study assessed how environmental education (EE) was incorporated into teacher education programs (TEPs) in Region III, Philippines. Data were collected through validated questionnaires from 10 deans, 10 chairpersons, 171 teachers, and 344 students for the sample. Findings revealed that EE is integrated into several required courses, including physical education (PE), the new teacher education curriculum (NTEC) through the National Service Training Program (NSTP), and the Technology Science, and Society (STS) course within the general education curriculum. Additionally, environmental education is reflected in program outcomes and performance indicators. Additionally, teachers used environmental education in their classrooms and community outreach by conducting webinars and seminars that promoted environmental awareness, especially on social media. The environmental education integration received financial, administrative, and material support from the institution. While students demonstrated positive attitudes toward caring for the environment, their application of knowledge and skills needed improvement. Statistically significant correlations were found between students' knowledge and attitudes ($r = .593$, $p < .05$) and skill acquisition and attitudes ($r = .647$, $p < .05$). Teachers faced challenges such as limited environmental knowledge and insufficient time to guide students in environmental action. The study findings that while environmental education has been integrated into TEP, more emphasis is needed in vocational education courses to enhance knowledge and skill development. Eliavathi, et al. (2023) this research examines the effectiveness of teacher training programs in environmental education, with the aim of studying the major challenges and future strategies for improvement. It highlights the need to enhance teacher professionalism to support the achievement of the Sustainable Development Goals (SDGs). A triangulated approach was used including document analysis, surveys, and interviews.

A total of 65 teachers with experience in environmental education participated in the survey, and seven teachers were interviewed for further information. The findings point to the need to integrate sustainability dimensions environmental, economic, and socio-cultural in teacher training programs, as current training focuses primarily on the environmental aspect. The training aims primarily to impart environmental knowledge, but awareness building and promoting sustainable action are not emphasized. Therefore, future programs should prioritize not only knowledge but also actionable steps to promote awareness and sustainability. Full support from schools and other relevant stakeholders is crucial to successfully implement these training initiatives. Atorina, et al. (2024) in their article emphasizes the global importance of promoting environmental awareness in individuals. It explores scientific perspectives on the content, structure and types of ecological consciousness. This study aims to highlight ways to prepare prospective primary school teachers to develop environmental consciousness. This article examines two major perspectives on ecological consciousness: the first focuses on personal responsibility through the lens of the individual's ecological experiences, while the second considers it within the "society-nature" system. Outlines the necessary principles and components (technological, managerial and communication) that contribute to this development. A pilot study was conducted among higher education students to evaluate efforts to promote environmental awareness among future primary school teachers. The paper highlights the importance of developing an environmental culture in primary school students, as this period is crucial for shaping their identity as future citizens. The results confirm the importance of the research, emphasizing the need to incorporate environmental education in early education to promote ecological awareness and responsibility from an early age. Deborah, O., Dada, Chris, E., & Nigel, C. (2018). This study addresses the gap in understanding the environmental literacy of in-service educators in New Zealand schools and the impact of environmental education on their future teaching

practices. The aim was to explore in-service teachers' perceptions of their readiness to teach environmental education. This study assessed environmental literacy among preservice teachers who were taking a required environmental education course as part of a teaching bachelor's degree, and used a mixed-method approach with a pre-test and post-test design. While environmental literacy showed only modest improvements, participants' confidence in teaching environmental education increased significantly. The findings provide valuable insights for enhancing teacher education programmes and curriculum design to better prepare future teachers to promote environmental literacy in schools.

Research Question

1.How in-service teachers of Science and humanities background differ on awareness about environmental and sustainability with reference to their gender, locale, Subject, parents' education, parents' occupation and category?

Research Objectives

- 1.To compare the mean rank of environmental awareness and sustainability of pre-service teachers belonging to their gender, locale, Subject, and category.
- 2.To examine In-service teachers' understanding of environmental education and sustainability concepts.

Research Hypothesis

There is significant difference between the mean rank of environmental awareness and sustainability of in-service teachers belonging to their gender, locale, Subject and category.

Null Hypotheses:

1. There is no significant difference between the mean rank of environmental awareness and sustainability of in-service teachers belonging to their gender.
2. There is no significant difference between the mean rank of environmental awareness and sustainability of in-service teachers belonging to their locale.
3. There is no significant difference between the mean rank of environmental awareness and sustainability of in-service teachers belonging to their subject.
4. There is no significant difference between the mean rank of environmental awareness and sustainability of in-service teachers in their category.

MATERIALS AND METHODS

Research Design

To acquire a deeper knowledge of the research, the investigator employed a mixed methodology. To evaluate the in-service teachers' perception towards environmental awareness and sustainability, both quantitative and qualitative methods are employed.

Population

In-Service teachers from Science and Humanities backgrounds of higher education institutions of Lucknow district was the population of present study.

Sample Size: 115 in-service teachers' science and humanities background were the sample of the present study.

Sampling: The purposive sampling has been used by the researchers to select the participants from one central university, one state university and two degree colleges of rural areas.

**Sangeeta Chauhan et al.,****Process of Data Collection**

The researchers developed the Sustainability Scale (EASS) and Environmental Awareness (EA) for data collection. Also, to gain a deeper understanding of the topic, the researchers conducted unstructured interviews.

RESULT**Quantitative Data Analysis**

It is evident from Table No. 3 that the Mann-Whitney U-value is a substantial 1300.500. The data suggests that there are no notable differences in the mean ranks of Environmental Awareness scores between in-service gender teachers. The null hypothesis, according to which there is no discernible difference in the mean ranks of gender in-service teachers, is thus not rejected. As a result, it may be said that in-service gender teachers who were found to have environmental awareness in same extent. From Table No. 3, it can be seen that the Mann-Whitney U-value is 1448.500 which is not significant. It indicates that the mean ranks of sustainability of gender in-service teachers do not differ significantly. Thus, the null hypothesis that there is no significant difference in mean ranks of sustainability of gender in-service teachers is not rejected. It may, therefore, be said that both gender in-service teachers were found to have sustainability in same extent. It is evident from Table No. 6 that the Mann-Whitney U-value is a substantial 844.500. The data suggests that there are notable differences in the mean ranks of Environmental Awareness scores between in-service urban and rural teachers. The null hypothesis, according to which there is no discernible difference in the mean ranks of in-service teachers who are from locals areas, is thus rejected. As a result, it may be said that in-service teachers who were from locale areas had varying degrees of environmental awareness. From Table No. 3, it can be seen that the Mann-Whitney U-value is 973.000 which is significant. It indicates that the mean ranks Sustainability of urban and rural in-service teachers differ significantly. Thus, the null hypothesis that there is no significant difference in mean ranks of Sustainability of urban and rural in-service teachers is rejected. It may, therefore, be said that both urban and rural in-service teachers were found to have Sustainability in different extent. It is evident from Table No. 9 that the Mann-Whitney U-value is a substantial 1024.500. The data suggests that there are notable differences in the mean ranks of Environmental Awareness scores between in-service teachers who studied Agriculture as a subject and those in-service teachers who are from Non-Agriculture field. The null hypothesis, according to which there is no discernible difference in the mean ranks of in-service teachers who studied Agriculture subject and those are from Non-Agriculture subject, is thus rejected. As a result, it may be said that in-service teachers who were from Agriculture and Non-Agriculture subject had varying degrees of environmental awareness.

It is evident from Table No. 9 that the Mann-Whitney U-value is a substantial 1252.000. The data suggests that there are notable differences in the mean ranks of Sustainability scores between in-service teachers who studied Agriculture as a subject and those in-service teachers who are from Non-Agriculture field. The null hypothesis, according to which there is no discernible difference in the mean ranks of in-service teachers who studied Agriculture subject and those are from Non-Agriculture subject, is thus rejected. As a result, it may be said that in-service teachers who were from Agriculture and Non-Agriculture subject had varying degrees of Sustainability. From Table No. 12, it can be seen that the Mann-Whitney U-value is 1579.500 which is not significant. It indicates that the mean ranks Environmental Awareness of those in-service teachers who belong from reserved category and those who are from unreserved category do not differ significantly. Thus, the null hypothesis that there is no significant difference in mean ranks of Environmental Awareness of in-service teachers of reserved category and those from unreserved category is not rejected. It may, therefore, be said that those in-service teachers of reserved and unreserved category were found to have Environmental Awareness in same extent. From Table No. 18, it can be seen that the Mann-Whitney U-value is 1622.000 which is not significant. It indicates that the mean ranks Sustainability of in-service teachers of reserved and unreserved category do not differ significantly. Thus, the null hypothesis that there is no significant difference in mean ranks of Sustainability of in-service teachers of reserved category and unreserved category is not rejected. It may, therefore, be said that those in-service teachers of reserved category and unreserved category were found to have Sustainability in same extent.

Qualitative Data Analysis

To examine In-service teachers' understanding of environmental education and sustainability concepts

Understanding environmental sustainability and environmental education concepts is important for in-service teachers for effective transaction of learning of students they will teach. The responses them highlighted the strong awareness of environmental and sustainability concepts but their inability to teach effectively in the classroom. As one of the respondents said "I feel confident teaching about pollution and recycling, but when it comes to climate change or renewable energy, I struggle" which reflected the better understanding of traditional topics in comparison to mere complex topics. Another teacher said, "Sustainability feels like an add-on in the curriculum, and we don't have enough time or resources to teach it properly.". This showcased the frustration of the In-service teachers as it added to their work. This point highlighted the limited curriculum support and lack of resources. Despite all the challenges it is also found that In-services teachers are motivated and as one of the respondents said "It's important to educate students about sustainability because they are the ones who will face these global challenges in the future." The conclusion of the qualitative study indicates that in-service teachers have a firm grasp of sustainability and environmental education principles, particularly with regard to well-known subjects like recycling and pollution. However, they face challenges teaching more complex issues like climate change and renewable energy. Teachers expressed frustration over the lack of time, resources, and curriculum support, with some viewing sustainability as an "add-on" rather than an integral part of the curriculum. Despite these obstacles, teachers remain motivated, recognizing the importance of preparing students to address future global challenges. This reflects a willingness to integrate sustainability education, despite the need for better institutional support and resources.

DISCUSSION

Integrating environmental sustainability into higher education teaching practices is important to prepare students to face global challenges. While teachers show strong motivation and understanding, the researcher in his study tried to shed light on what different in-service teachers think about environmental sustainability awareness. Because both classes of teachers take a similar approach to environmental education, the researcher's study environmental sustainability awareness among teachers working in higher education institutions revealed that there was no difference in the views of men and women regarding this awareness on the basis of class. If we talk about rural and urban areas, it was found that people from rural areas, since they are closer to the environment, are more connected to their environment as a profession and are alert towards its protection, whereas people from urban areas, due to not being so connected to the environment, are not able to focus on environmental awareness as much as people from rural areas. Similarly, if we talk about the teaching subject, it was found that those who do teaching work in the field of agriculture, along with paying more attention to environmental awareness, also work to spread awareness through teaching and education while being aware of the environment. Whereas people from non-agriculture are aware about the environment but due to not working in this field, they are not able to focus on environmental awareness. If we look at the teachers or parents of students from the professional point of view, then this difference is seen that those whose parents are in government jobs, they are not able to pay attention to environmental awareness due to work arrangements, whereas on the contrary, if we talk about non-government professionals, then they are aware of the environment because their main work is personally affected by it. A vital part of the growth of the nation and society is played by teachers. Thus, the researcher, through his paper, studied various dimensions and emphasized that we need to train more in-service teachers of higher education institutions on environmental sustainability awareness so that they can be more conscious about the environment.

ABSTRACT

The anatomical concepts of Ayurveda, particularly those provided by ancient Acharyas, must be properly interpreted using modern instruments such as cadaveric dissection. Among these terms, *Snayu* is particularly important. However, there is a disagreement between Ayurvedic and modern research over the classification, enumeration, and structural understanding of *Snayu*. Acharya Sushruta categorizes *Snayu* into four types—*Pratanavati*, *Vrutta*, *Sushira*, and *Pruthula*—with a total of 900. 600 *Snayu* are concentrated in the *Shakha* (limbs) and *Sandhi* (joints). *Pratanavati Snayu* are found specifically in *Shakha* and *Sandhi*, whereas *Vrutta Snayu* are frequently compared to *Kandara* (ligaments or tendons). *Sushira Snayu* are found at the distal extremities of the stomach, colon, and bladder, whereas *Pruthula Snayu* are found in cage-like structures such as the thoracic cage and cranium. Despite these descriptions, modern science has yet to provide a definitive structural analysis of *Snayu*, resulting in ambiguity in interpretation. This study seeks to close the gap by focusing on the *Pratanavati Snayu*. The number and structure of *Pratanavati Snayu* were studied and analyzed using an observational approach. This study aims to improve understanding of *Pratanavati Snayu* by using current dissection techniques and comparing the results to old Ayurvedic writings. The study advances the subject of Ayurvedic anatomy by offering a more exact interpretation of *Snayu*, creating the groundwork for future research that will integrate traditional knowledge with modern anatomical science.

Keywords: *Snayu*, *Pratanavati Snayu*, Ligament, Tendon, Aponeurosis.

INTRODUCTION

Snayu means literally to bind or to hold[1]. Ayurvedic Classic *Snayu* is defined as something that links the joints and allows the body to support its own weight, much like a fibrous structure[2]. It is said that *Snayu* originated from *Kharapaka* of *Sneha* of *Medas*[3]. According to Acharya Sarangadhara, *Snayu* is a structure that connects the body's *Mamsa*, *Asthi*, and *Medas*[4]. *Snayu* is regarded by Dr. D G Thatte as a muscle fiber[5]. Moreover, *Upadhatu* of *Medas*[6] and *Snayu* of *Medas* are thought to be the essence of each[7]. It is stated that *Mastulunga*, who resides in *Mastiska*[8], is the Moolasthan of *Snayu*. Acharya Gananath Sen states that there are two kinds of *snayu*: i. *snayumahati* and ii. *snayuvyakthi*. *Snayumahati* is a bundle (*Snayuguchha*) that joins bones and provides support and strength to joints. *Snayuvyakthi* (visceral connective tissue) is identified as a structure linked to *Kandara*, *Amasaya*, and *Pakwasaya*[9]. Acharya Susruta categorized the 900 *Snayu* into four types: *Pratanavati*, *Vrutta*, *Sushira*, and *Pruthula*. *Pratanavati Snayu* is prevalent across *Shakha* and *Sandhi*. Experts identify *Vrutta Snayu* as *Kandara*. *Sushira Snayu* can be located at the distal ends of *Amasaya*, *Pakwasaya*, and *Basti*. *Pruthula Snayu* can be found in cage-like structures of the body, such as the thoracic cage and cranium. Of the 900 *Snayu*, 600 are in *Shakha* and *Sandhi* [10].

Snayu Regional and Numerical Classification

Aims and Objectives

Aim

To comprehend and validate the concept of *Snayu*, namely *Shakhagata Pratanavati Snayu*(Upper limb), through an observational study.

Objectives

To carry out an observational study on *Pratanvati Snayu* in *Shakhas*(Upper limb), specifically on *Snayu Sharir*.

To confirm the exact meaning of *Snayu* based on existing considerations.

MATERIALS AND METHODS

Materials Required

- 5 cadavers taken from Rachana Sharir Department of Parul Institute of Ayurveda.
- Dissection table
- Instruments
- Gloves
- Camera.

Sources of Data

- Literary Study & Conceptual study was done by the data compiled from-
 - 1.A comprehensive collection of Ayurvedic Samhitas and other ancient and contemporary literature.
 - 2.Textbooks on allied medical science and anatomy.
 - 3.Sources include journals, research papers, and articles from various periodicals and newspapers.
 - 4.Access subject-related information on the internet.

- The theoretical portion will rely on observation, compilation, and analysis of the data gathered from the aforementioned sources. The Parul Institute of Ayurveda in Vadodara, Gujarat's Department of Rachana Sharir conducted a study on cadaver dissection of the entire body.

Observation Study

- Five Cadavers were used in the study.
- The dissection of 05 Cadavers was done in accordance with "Cunningham's Manual of Dissection" in this region.
- The dissection process was carried out layer by layer, closely monitored, and carefully examined.

Avani Patel and Dattu Narayanrao Bandapalle

• Method of Collection of Data

- Five Cadavers were dissected in accordance with "Cunningham's manual of dissection," and observations were made.
- It was determined that *Pratanavati Snayu* (Upper limb) was based on structure and function.
- Sample size: 05 male Cadavers

Observations

- The dissection of 05 Cadavers (male) using "Cunningham's dissection manual" yielded important anatomical findings. Following incision, the following structures were observed:
- Under The Skin:
 1. The superficial fatty layer is made up of adipose tissue and resides just beneath the skin. It helps to insulate and store energy.
 2. Deep fascia is a dense, fibrous layer that surrounds muscles, nerves, and blood vessels, providing structural support.
- Ayurvedic writings define the *Pratanavati Snayu* (branched or fibrous ligaments/tendons) as being located in the extremities. Similar structures were discovered during the dissection, particularly in the upper limb. These features match to the fibrous tissues mentioned in the classics, proving the presence of branched or spreading fibrous structures similar to *Snayu's* description in Ayurvedic medicine.

Observation on Arm Observation on Forearm And Hand Observation on Wrist And Hand Observation on Back Of Forearm And Hand

DISCUSSION

In *Dhanurveda*, the term "*Snayu*" refers to strong, cord-like formations resembling bowstrings due to their strength. In Ayurveda, *Snayu* are ligaments made up of fine fibers that tie body parts together. As Acharya Sushruta points out, these fibers can also be employed for suturing in surgery. *Snayu* serve an important role in connecting joints, similar to how cords tie together wooden planks in a boat. *Snayu* is defined by Acharya Gananath Sen as thick fibers that bind joints (*Sandhi*), acting as both a binding agent for bones and joints (*Asthi* and *Sandhi*) and a source of structural strength. A cadaveric dissection of the upper limb was conducted in the Department of Rachana Sharir at Parul Institute of Ayurveda, following the guidelines of Cunningham's Manual of Dissection. In line with Acharya Sushruta's description, the *Pratanavati Snayu*, a specific type of ligament, was identified in all four limbs (*Sakhas*). This upper limb dissection was performed on one cadaver, allowing for detailed study of the anatomical features of *Snayu* in accordance with classical Ayurvedic knowledge.

Discussion On Upper Limb Muscles

SR NO.	Muscles	Structure considered as <i>Pratanavati snayu</i>
1	Muscles of Arm	Coracobrachialis
2		Biceps brachii
3		Brachialis
4		Triceps brachii

33		Extensor pollicis longus	1 tendon of extensor pollicis longus
34		Extensor indicis	1 tendon of extensor indicis

CONCLUSION

Following a thorough examination, analysis, and review of the literature, the following conclusions can be made: A vast array of fibrous structures found in the limbs, including as ligaments, tendons, aponeuroses, retinacula, and fascia, are included in *Pratanavati Snayu*. These structures are similar to *Snayu* in terms of structure, function, or pathology. Comprehensive View: Acharya Sushruta's description of the *Pratanavati Snayu* is more accurately represented when all fibrous structures in the limbs are taken into account, even though solely focusing on ligaments or tendons may not account for all *Snayu*. From an Ayurvedic perspective, Acharya Sushruta compared the role of *Snayu* to the ropes that bind a boat, providing support and stability for the joints in the body. *Snayu* are strong, thread like structures that are essential for binding and preserving the structural integrity of limbs and joints in the body.

ABSTRACT

We investigate the concept of Minus ordering in Ternary Semiring. We derive some equivalent conditions for minus ordering by using generalized inverses.

Keywords: regular, ordering, g- inverses, Ternary semiring

2020 mathematical science classification : 16Y60, 16U90

INTRODUCTION

In 1932, Lehmer [1] explored ternary algebraic system theory. He studied “triplexes”, which are ternary algebraic systems that finally turn out to be ternary groups. A generalization of ternary rings are called ternary semirings, as presented by Dutta et al [2]. Ternary semiring is a superset of semiring. Negative integers forms a ternary semiring but it does not form a semiring. In 1920, E.H. Moore established the concept of the generalized inverse of a matrix, defining the unique generalized inverse through the use of matrices projectors. Penrose demonstrated in 1955 that Moore’s inverse is the unique matrix that can satisfy four equations. [3]. The notion of regular element was first introduced by Von Neumann in 1936 [4]. Meenakshi AR et al [6] explicate the minus ordering for fuzzy matrices and established that he minus ordering is a partial ordering in the set of all regular matrices. Meenakshi [7] has characterized the minus ordering on matrices in terms of their generalized inverses. In this paper we studied the concept of minus ordering for an elements in ternary semiring as a generalization of the minus ordering for regular fuzzy matices.

PRELIMINARIES

In this work, T represents the Ternary semiring; it is abbreviated as T.S.R. throughout this paper.

Definition 2.1. The term "ternary semiring" refers to $T \neq \Phi$, a binary addition, and a ternary multiplication called juxtaposition if $(T, +)$ is a semigroup that commutes that fulfilling the requirements listed below:

- (i) $(abc)de = a(bcd)e = ab(cde)$,
- (ii) $(a + b)cd = acd + bcd$,
- (iii) $a(b + c)d = abd + acd$,
- (iv) $ab(c + d) = abc + abd$, for all a, b, c, d, e in T .

Remark: \mathbb{Z}^- is a natural example of a ternary semiring, which has ternary multiplication and regular addition.

Definition 2.2. If an element a exists in T such that $ababa = a$, then a is considered regular. The element b is represented as a^- and is also known as the generalized inverse or 1-inverse of the element ' a ' and the set of all 1-inverses is denoted by $a\{1\}$. If every element in a T.S.R is regular, then we say T.S.R is regular.

Definition 2.3. If there is an element a in $T \exists babab = b$, then a is considered anti-regular. The name for element b is 2-inverse of a and set of all 2-inverses of a is denoted by $a\{2\}$. The both conditions in Definition (2.2) and Definition (2.3) satisfied by a single element b is called 1-2 inverse and is denoted by \hat{a} . In Definition (2.2), if the ' b ' is unit then ' a ' is called unit regular.

Definition 2.4. An element $a \in T$ has Moore penrose inverse if there exists an $b \in T$ such that the following equations hold:

$$(1) ababa = a \quad (2) babab = b \quad (3) (abe)^T = abe \quad (4) (eba)^T = eba.$$

Where e is identity element, here b is unique and denoted by a^+

In Definition (2.4), the element b is satisfy the equations (1) and (3), then we say that element is {1,3}-inverse of ' a ' and b satisfy the equation (1) and (4) then we say that b is {1,4}-inverse of ' a '.

The transpose of a is written as a^T and the following properties of the transpose will be used:

$$\begin{aligned} a^{TT} &= a, \\ (a + b)^T &= a^T + b^T, \\ (abc)^T &= c^T b^T a^T. \end{aligned}$$

Minus ordering in ternary semiring

Definition 3.1. For $a \in T_{Reg}$ and $b \in T$ the minus ordering denoted as \preceq is defined as by $a \preceq b$ iff $aa^-a = aa^-b = ba^-a$; $a^-aa = a^-ba = a^-ab$; $aaa^- = baa^- = aba^-$ for some $a^- \in a\{1\}$.

Throughout this paper T_{Reg} denote regular ternary semiring.

Example 1. Let $T_{Reg} = \{0, 1, 2, 3, 4\}$ be a ternary semiring with respect to modulo addition and modulo multiplication, the minus ordering defined as follows:

Let $a = 3$; $a^- = 2$; $b = 3$ satisfy $aa^-a = aa^-b = ba^-a$; $a^-aa = a^-ba = a^-ab$; $aaa^- = baa^- = aba^-$

+s	0	1	2	3	4
0	0	1	2	3	4

3	0	3	1	4	2
4	0	4	3	2	1

In this section, we present some results on the minus ordering of the elements

Pandiselvi and Anbalagan

Theorem 3.1. For $a \in T_{Reg}, b \in T$ the following are equivalent:

- (i) $a \preceq b$
 (ii) $a = aa^-aa^-b = ba^-aa^-a = aa^-ba^-a$

Proof: (i) \Rightarrow (ii) since $a \preceq b \Leftrightarrow aa^-a = aa^-b = ba^-a$; $a^-aa = a^-ba = a^-ab$; $aaa^- = baa^- = aba^-$

$$a = aa^-aa^-a = (aa^-a)a^-a = aa^-ba^-a \quad \text{-----(3.1)}$$

$$a = aa^-(aa^-a) = aa^-aa^-b \quad \text{-----(3.2)}$$

$$a = aa^-aa^-a = (aa^-a)a^-a = ba^-aa^-a \quad \text{-----(3.3)}$$

From Equations (3.1), (3.2) and (3.3) we get

$$a = aa^-aa^-b = ba^-aa^-a = aa^-ba^-a$$

(ii) \Rightarrow (i) Let $m = a^-aa^-aa^-$

$$amama = a(a^-aa^-aa^-)a(a^-aa^-aa^-)a$$

$$= aa^-aa^-a = a$$

$$\Rightarrow m \in a\{1\}$$

$$ama = a(a^-aa^-aa^-)a = a(a^-aa^-aa^-)aa^-aa^-b$$

$$= aa^-aa^-aa^-b = amb$$

$$\therefore ama = amb$$

Similarly we get $maa = mba = mab$ and $aam = bam = abm$

Hence $a \preceq b$ with respect to $m \in a\{1\}$.

Corollary 3.1. For $a \in T_{Reg}, b \in T$ and $a \preceq b$ with a is idempotent then $a = baa^-ba^-ab$

Proof: $aaa = a(aa^-aa^-a)a = (aaa^-)aa^-aa^-a^3 = baa^-aa^-aa^-a = b(aa^-a)a^-aa^-$

$$a = baa^-b(a^-aa^-) = baa^-ba^-ab \quad \text{-----(3.4)}$$

Theorem 3.2. Let $a, b \in T_{Reg}$, If $a \preceq b$ then $b\{1\} \subseteq a\{1\}$.

Proof: Since $a \preceq b \Leftrightarrow a = aa^-aa^-b = ba^-aa^-a = aa^-ba^-a = baa^-ba^-ab$

Suppose $b^- \in b\{1\}$

$$ab^-ab^-a = aa^-aa^-b(b^-)baa^-ba^-ab(b^-)a$$

$$= aa^-aa^-b(b^-)b(aa^-aa^-a)a^-ba^-(aa^-aa^-a)b(b^-)a$$

$$= aa^-aa^-b(b^-)b(aa^-a)a^-aa^-ba^-aa^-(aa^-a)b(b^-)a$$

$$= aa^-aa^-b(b^-)b(ba^-a)a^-aa^-ba^-aa^-(aa^-b)b(b^-)a$$

$$= aa^-aa^-b(b^-)bbb^-ba^-bb(b^-)a$$

$$= aa^-aa^-b(b^-)bbb(b^-)a = aa^-aa^-b(b^-)b(b^-)a$$

$$= aa^-aa^-b(b^-)b(b^-)ba^-aa^-a = aa^-aa^-ba^-aa^-a$$

$$= aa^-aa^-a = a$$

$$\therefore ab^-ab^-a = a$$

Hence $ab^-ab^-a = a$ for each $b^- \in b\{1\}$

$$\therefore b\{1\} \subseteq a\{1\}$$

Corollary 3.2. If $a \preceq b$ with b idempotent element then $b \in a\{1\}$.

Proof: Since b is idempotent, b is regular and b is a 1-inverse of ' b '. $\therefore b \in b\{1\}$, By Theorem 3.2, $b\{1\} \subseteq a\{1\}$.

Hence we get $b \in a\{1\}$.

Theorem 3.3. If $a, b \in T_{Reg}$, then the following subsequent are equivalent

- (i) $a \preceq b$
 (ii) $a = ab^-bb^-b = bb^-bb^-a = ab^-bb^-a = bab^-bb^-ab$ for all $b^- \in b\{1\}$

Proof: By Theorem (3.1), $a = aa^-aa^-b = aa^-aa^-ba^-aa^-b$

$$\begin{aligned}
 &= aa^{-}aa^{-}(bb^{-}bb^{-}b)a^{-}aa^{-}b \\
 &= ab^{-}bb^{-}ba^{-}aa^{-}b \quad (\because a = aa^{-}aa^{-}b) \\
 &= ab^{-}bb^{-}ba^{-}aa^{-}aa^{-}aa^{-}b \quad (\because a = a^{-}aa^{-}aa^{-}) \\
 &= ab^{-}bb^{-}ba^{-}aa^{-}a = ab^{-}bb^{-}a \quad (\because a = ba^{-}aa^{-}a) \\
 \therefore a &= ab^{-}bb^{-}a \quad \text{-----(3.5)}
 \end{aligned}$$

By Theorem 3.1, $a = ba^{-}aa^{-}a$

$$= (bb^{-}bb^{-}b)a^{-}aa^{-}a = bb^{-}bb^{-}a \quad \text{-----(3.6)}$$

Again from Theorem (3.1) and similar manner of Equation (3.6) we obtain

$$a = ab^{-}bb^{-}b \quad \text{-----(3.7)}$$

$$a = baa^{-}ba^{-}ab = ba(a^{-}aa^{-}aa^{-})ba^{-}ab = baa^{-}aa^{-}ab$$

$$= bab = bab^{-}bb^{-}ab \quad (\text{By using Equation (3.5)}) \quad \text{-----(3.8)}$$

From Equations (3.5, 3.6, 3.7 and 3.8) we get

$$a = ab^{-}bb^{-}b = bb^{-}bb^{-}a = ab^{-}bb^{-}a = bab^{-}bb^{-}ab$$

$$(ii) \Rightarrow (i) \text{ Let } h = b^{-}ab^{-}ab^{-} \Rightarrow aha = a(b^{-}ab^{-}ab^{-})a = a(b^{-}ab^{-}ab^{-})a$$

$$= ab^{-}ab^{-}a = a \quad (\because a = ab^{-}ab^{-}a)$$

$$\Rightarrow h \in a\{1\}$$

$$\text{Since } a = ab^{-}bb^{-}b \Rightarrow aha = a(b^{-}ab^{-}ab^{-})a = ab^{-}ab^{-}ab^{-}(ab^{-}bb^{-}b) = ab^{-}ab^{-}bb^{-}b = ab^{-}ab^{-}bb^{-}ab^{-}bb^{-}b$$

$$= ab^{-}ab^{-}bb^{-}b \quad (\because a = ab^{-}bb^{-}a)$$

$$\therefore aha = ahb \quad \text{and} \quad aha = bha$$

$$\text{Similarly, we get } aah = bah = abh; haa = hab = hba$$

Hence $a \preceq b$ with respect to $h \in a\{1\}$.

Theorem 3.4. For $a \in T_{Reg}$, $b \in T$ with $a \preceq b$ the following holds:

$$(i) \quad \text{If } b = b^3, \text{ then } a = a^3$$

$$(ii) \quad \text{If } b = 0, \text{ then } a = 0$$

$$\begin{aligned}
 \text{Proof: (i)} \quad a^3 &= aaa = aa^{-}aa^{-}a \quad aa^{-}aa^{-}a \quad aa^{-}aa^{-}a \\
 &= aa^{-}aa^{-}(a \quad (aa^{-}a)a^{-}a \quad aa^{-})aa^{-}a \\
 &= aa^{-}aa^{-}(a \quad ba^{-}aa^{-}a \quad aa^{-})aa^{-}a \\
 &= aa^{-}aa^{-}(a \quad a \quad aa^{-})aa^{-}a \quad (\because a = ba^{-}aa^{-}a) \\
 &= aa^{-}(aa^{-}a)(a \quad aa^{-})aa^{-}a = aa^{-}(aa^{-}bbaa^{-})aa^{-}a \\
 &= aa^{-}aa^{-}bb(aa^{-}a)a^{-}a = aa^{-}aa^{-}bb(ba^{-}a)a^{-}a \\
 &= aa^{-}aa^{-}b^3a^{-}aa^{-}a \\
 &= aa^{-}aa^{-}baa^{-}aa^{-}a \quad \text{-----(3.9)} \\
 &= aa^{-}aa^{-}a = a
 \end{aligned}$$

$$\therefore a^3 = a$$

From Equation (3.9)

$$(ii) a^3 = aa^{-}aa^{-}ba^{-}aa^{-}a$$

$$= aa^{-}aa^{-}(0)a^{-}aa^{-}a = 0 \quad (\because b = 0)$$

$$\therefore a = 0$$

Corollary 3.3. If $a \preceq b$ then $b \in a^{-}\{1\}$

Proof: By Definition (2.5) We have $aa^{-}a = aa^{-}b = ba^{-}a$

$$a^{-}aa^{-}aa^{-} = a^{-}(aa^{-}a)a^{-} = a^{-}(aa^{-}b)a^{-}$$

$$= (a^{-}aa^{-}aa^{-})aa^{-}ba^{-} = a^{-}aa^{-}(aa^{-}b)a^{-}ba^{-}$$

$$= (a^{-}aa^{-}aa^{-})ba^{-}ba^{-} = a^{-}ba^{-}ba^{-} = a^{-}$$

$$\therefore b \in a^{-}\{1\}$$

Definition 3.2. For $a, b \in T_{Reg}$ and $b^{-} \in T$ the minus ordering denoted as \preceq^{-} is defined by $a^{-} \preceq^{-} b^{-}$ iff $a^{-}aa^{-} = b^{-}aa^{-} = a^{-}ab^{-}$; $a^{-}a^{-}a = a^{-}b^{-}a = b^{-}a^{-}a$; $aa^{-}a^{-} = aa^{-}b^{-} = ab^{-}a^{-}$ for some $a^{-} \in a\{1\}, b^{-} \in b\{1\}$.

Theorem 3.5. If $a, b \in T_{Reg}$ and a^{-}, b^{-} exists then the following are equivalent

- (i) $a^- \leq b^-$
 (ii) $a^- = a^-aa^-ab^- = b^-aa^-aa^- = a^-ab^-aa^- = b^-a^-ab^-aa^-b^-$

Proof: By Theorem (3.1)

$$a^- \leq b^- \Leftrightarrow a^-aa^- = a^-ab^- = b^-aa^-; aa^-a^- = aa^-b^- = ab^-a^-;$$

$$a^-a^-a = b^-a^-a = a^-b^-a$$

$$\text{Let } a^- = a^-aa^-aa^- = (a^-aa^-)aa^- = a^-ab^-aa^- \quad \text{-----(3.10)}$$

$$a^- = a^-aa^-aa^- = b^-aa^-aa^- \quad \text{-----(3.11)}$$

$$a^- = a^-aa^-aa^- = a^-aa^-ab^- \quad \text{-----(3.12)}$$

From Equations (3.10, 3.11 and 3.12) we get

$$\therefore a^- = a^-aa^-ab^- = b^-aa^-aa^- = a^-ab^-aa^- = b^-a^-ab^-aa^-b^-$$

$$(ii) \Rightarrow (i) \text{ Let } x = aa^-aa^-a$$

$$a^-xa^-xa^- = a^-(aa^-aa^-a)a^-(aa^-aa^-a) = a^-aa^-aa^- = a^-x \in a^-\{1\}.$$

$$a^-xa^- = a^-(aa^-aa^-a)a^-aa^-ab^- = a^-aa^-aa^-ab^- = a^-xb^-$$

$$\therefore a^-xa^- = a^-xb^-$$

Similarly we get $xa^-a^- = xa^-b^- = xb^-a^-$ and $a^-a^-x = a^-b^-x = b^-a^-x$

Hence $a^- \leq b^-$ with respect to $x \in a^-\{1\}$

Corollary 3.4. If $a, b \in T_{Reg}$ and $a^- \leq b^-$ with a^- is idempotent then $a^- = b^-a^-aa^-aa^-b^-$

$$\text{Proof: } a^- = a^-a^-a^- = a^-a^-aa^-aa^-a^-$$

$$= (a^-a^-a)a^-aa^-a^- = b^-a^-aa^-(aa^-a^-)$$

$$a^- = b^-a^-aa^-aa^-b^- \quad \text{-----(3.13)}$$

Corollary 3.5. For $a, b \in T_{Reg}$, $a^- \leq b^-$ with respect to $a \Leftrightarrow a^- \leq b^-$ with respect to a^-

Theorem 3.6. For $a, b \in T_{Reg}$, then the following hold

- (i) $a^- \leq a^-$
 (ii) $a^- \leq b^-$ and $b^- \leq a^-$ then $a = b$
 (iii) $a^- \leq b^-$ and $b^- \leq c^-$ then $a^- \leq c^-$

Proof: (i) $a^- \leq a^-$ is obvious.

$$(ii) a^- \leq b^- \Leftrightarrow a = aa^-aa^-b = ba^-aa^-a = aa^-ba^-a = baa^-ba^-ab$$

$$b^- \leq a^- \Leftrightarrow b = bb^-bb^-a = ab^-bb^-b = bb^-ab^-b = abb^-ab^-baa = baa^-ba^-ab = (bb^-bb^-a)aa^-ba^-a(ab^-bb^-b)$$

$$= bb^-bb^-(ba^-aa^-a)aa^-ba^-a(aa^-aa^-b)b^-bb^-b$$

$$= bb^-bb^-ba^-aa^-a^3a^-aa^-bb^-bb^-b = bb^-bb^-ba^-aa^-aa^-aa^-bb^-bb^-b$$

$$= bb^-bb^-ba^-aa^-ab^-bb^-b (\because a = aa^-aa^-b)$$

$$= bb^-bb^-ba^-aa^-ab^-(bb^-ab^-b)b^-b (\because b = bb^-ab^-b)$$

$$= (bb^-bb^-)ab^-bb^-ba^-(b^-bb^-b) = (bb^-bb^-a)b^-bb^-(ab^-bb^-b)$$

$$= bb^-bb^-b = b$$

$$\therefore a = b$$

(iii) By Theorem (3.3),

$$a^- \leq b^- \Leftrightarrow a = ab^-bb^-b = bb^-bb^-a = ab^-bb^-a = bab^-bb^-ab$$

$$\text{By using Theorem (3.1) } b^- \leq c^- \Leftrightarrow b = bb^-bb^-c = cb^-bb^-b = bb^-cb^-b$$

$$\text{Let } u = b^-ab^-ab^- \text{ for } b^- \in b\{1\}$$

$$aua = a(b^-ab^-ab^-)a(b^-ab^-ab^-)a$$

$$= ab^-ab^-a = a$$

$$\therefore u \in a\{1\}$$

$$a = (bb^-bb^-a)u = (cb^-bb^-b)b^-bb^-a$$

$$= cb^-bb^-a = c(b^-ab^-ab^-)bb^-a$$

$$= cb^-ab^-a = cb^-ab^-a(b^-ab^-ab^-)a$$

Pandiselvi and Anbalagan

$$= cb^-ab^-ab^-a = cua$$

$$\therefore aua = cua = auc$$

Similarly we get $aa u = acu = cau$ and $uaa = uac = uca$

$$\therefore a \preceq c.$$

Hence the minus ordering is a partial ordering in T_{Reg} .

Theorem 3.7. For $a \in T_{Reg}$ and $b \in T$ we have the following hold $a \preceq b \Leftrightarrow a^T \preceq b^T$

Proof: Since $a \preceq b \Leftrightarrow aa^-a = aa^-b = ba^-a$; $a^-aa = a^-ba = a^-ab$;

$$aaa^- = baa^- = aba^-$$

$$aa^-a = aa^-b = ba^-a \Leftrightarrow (aa^-a)^T = (aa^-b)^T = (ba^-a)^T$$

$$\Leftrightarrow a^T a^{-T} a^T = b^T a^{-T} a^T = a^T a^{-T} b^T$$

$$\Leftrightarrow a^T a^T a^T = b^T a^T a^T = a^T a^T b^T$$

$$\therefore aa^-a = aa^-b = ba^-a \Leftrightarrow a^T a^T a^T = b^T a^T a^T = a^T a^T b^T$$

$$\text{Similarly we obtain } a^-aa = a^-ba = a^-ab \Leftrightarrow a^T a^T a^T = a^T b^T a^T = b^T a^T a^T$$

$$\text{and } aaa^- = baa^- = aba^- \Leftrightarrow a^T a^T a^T = a^T a^T b^T = a^T b^T a^T$$

$$\text{Hence } a \preceq b \Leftrightarrow a^T \preceq b^T.$$

Theorem 3.8. Let $a, b \in T_{Reg}$. If $a \preceq b$ then $(a + b)$ is regular and $(a^- + b^-)$ is a 1-inverse of $(a + b)$

Proof: By Theorem (3.1) and Theorem (3.3), we have

$$(a + b)(a^- + b^-)(a + b)(a^- + b^-)(a + b) = (a + b)$$

Hence $(a^- + b^-) \in (a + b)\{1\}$ and $(a + b)$ is regular.

Theorem 3.9. For $a, b \in T_{Reg}$, both b and c are minus ordering to each other and $c \in a\{2\}$ then $b \in a\{2\}$.

Proof: By Theorem(3.1), $b \preceq c \Leftrightarrow b = bb^-bb^-c = cb^-bb^-b = bb^-cb^-b$ ----- (I)

By Theorem 3.3, $b \preceq c \Leftrightarrow b = bc^-cc^-c = cc^-cc^-b = bc^-cc^-b$ ----- (II)

$$c \preceq b \Leftrightarrow c = cc^-cc^-b = bcc^-cc^- = cc^-bc^-c$$
----- (III)

$$c \preceq b \Leftrightarrow c = bb^-bb^-c = cb^-bb^-b = cb^-bb^-c$$
----- (IV)

Now $babab = (bc^-cc^-c)aba(cc^-cc^-b)$ (using Equation (II))

$$= (bc^-cc^-c)a(bb^-bb^-c)a(cc^-cc^-b) \text{ (using Equation (I))}$$

$$= (bc^-cc^-c)abb^-bb^-c(cc^-cc^-c)a(cc^-cc^-b) \text{ (using Equation (III))}$$

$$= bc^-cc^-cabb^-bb^-bc^-c(cc^-cc^-c)ca(cc^-cc^-b)$$

$$= bc^-cc^-cabb^-bb^-c(cc^-cc^-c)cc^-ca(cc^-cc^-b)$$

$$= bc^-cc^-cabb^-bb^-cc^-cc^-ca(cc^-cc^-b) \text{ (using Equation (III))}$$

$$= bc^-cc^-ca(bb^-bb^-c)cc^-ca(cc^-cc^-b)$$

$$= bc^-cc^-cacc^-cc^-ca(cc^-cc^-b) \text{ (using Equation (IV))} = bc^-cc^-caca(cc^-cc^-b) = bc^-cc^-cc^-cc^-b$$

$$= bc^-cc^-b = b \therefore b \in a\{2\}$$

Corollary 3.6. Let $a \in T$. The following statements are equivalent:

- (i) a^+ exists.
- (ii) a^T is a g-inverse of a

Proof: (i) \Leftrightarrow (ii) directly follows from the fact that a^T satisfy the defining equations of the Moore penrose inverse .

ABSTRACT

In order to find a total source vertex number $b_t(G)$, let us consider that G is a connected and an undirected simple graph. In this paper, we are discussing about total source vertex number $b_t(G)$ as well as total graph source vertex number $Tb(G)$. Specifically, we are finding a source vertex number of a Path P_n , a Cycle C_n , a Star $S_{1,k}$, a Petersen and a Wheel W_n . Secondly, To find a total graph source vertex number, let us consider G is a connected and an undirected graph, of course as we all know $T(G)$ is a planar graph. Here we are imposing the concept of burning number on a total graph. Before finding a source vertex number, we have to convert a graph into a total graph. Here we have taken a Star graph $S_{1,k}$. Burning is a discrete step by step process, the main intention of burning is to acquire a burning number within the limited period of time which is the so called source of the vertex and We know that a burning number is denoted as $b(G)$. In a total graph $T(G)$ of a graph G , whose vertex is adjacent to the edges and vertices and edges are incident in G . Total graph burning number denoted by $Tb(G)$.

Keywords: Burning number, Total Graph and Total burning.

INTRODUCTION

Over the last decade a few researchers have been working on burning. The 'burning Number' concept was introduced by Anthony Bonato in the year of 2014[1]. To burn a graph we require a minimum number of vertices, which is called as a Burning Number $b(G)$ or Source vertex number. Burning a graph is a precise procedure, let us fix the fire on any of one of the vertex which is identified as the source vertex. In the next step, we have to select a source

91647

Komala and Mary

Komala and Mary

vertex among the leftover vertices from round one, then the adjacent of the previously selected source vertex will begin to burn automatically which is said to be the basic step for attaining a graph. This process will be repeated till all the vertices burn subsequently. And our aim is to burn a graph to get a minimum source of vertices by burning all the vertices of a graph within the limited period of time. There are wide applications on burning number. It is most applied in the field of Social media, Networks and the contagion diseases ...e.t.c.,. Total graph was introduced by T. F Anderson and Badawi, and the total graph is denoted by $T(G)$, Let G be a graph with vertex set $V(G)$ and edge set $E(G)$.

2. Definitions

2.1. Burning

Burning is a discrete time step by step process, the main intention of burning is to acquire a burning number which is so called source of the vertex, within the limited period of time. The burning number is denoted by $b(G)[5]$.

2.2. Total burning

For any graph G , total burning amounts to be burning $T(G)$. Thus, vertices or edges may be burned in G , with fires spreading across edges. We define the total burning number of G as $b_t(G) = b(T(G))$; that is, the minimum number of rounds necessary for all elements of G to burn[2].

2.3.Total graph

The total graph $T(G)$ has point set $V(G) \cup X(G)$, and two points of $T(G)$ are adjacent whenever they are neighbors in $G[3]$.

3. Path graph

Path graph P_n is a connected graph as well as a tree.

3.1. Theorem: For a Path graph P_n the total burning number $b_t(P_n)$ is $\lceil \sqrt{n} \rceil$, only if $n \geq 2$.

Proof: As we know the path graph P_n burning number is $\lceil \sqrt{n} \rceil$. The total source vertex number of a path $b_t(P_n)$ is \sqrt{n} , when $n \geq 4$. And n should be a perfect square, of course, it is same for the next to the perfect square. For others it is, $\lceil \sqrt{n} \rceil$. Well we identified, $b_t(P_n) \geq b(P_n)$.

3.2. Theorem: For a Cycle graph C_n is a total burning $b_t(C_n)$, is $\lceil \sqrt{n} \rceil$, only when $n \geq 3$.

Proof: A Cycle graph is a total burning only if $n \geq 3$. A source vertex number for a cycle graph is $\lceil \sqrt{n} \rceil$. And here the total burning number is also a $\lceil \sqrt{n} \rceil$.

$$\therefore b_t(C_n) = b(C_n)$$

3.3. Theorem: For a star $S_{1,k}$, the total source vertex number $b_t(S_{1,k})$ is 2 when $k > 1$.

Proof: $S_{1,k}$ is a star graph. Here the middle of the vertex is adjacent to the all other vertices. Hence star is a complete bipartite graph. Therefore, the total source vertex number of a star graph $b_t(S_{1,n})$ is 2 only when $k > 1$.

$$b_t(S_{1,k}) = b(S_{1,k}) = 2.$$

3.4. Theorem: The total burning number of a Petersen graph is 3.

Proof: Petersen graph is a regular and an undirected graph with ten vertices and 15 edges. Each vertex has degree 3. The source vertex number of a Petersen graph is 3 and the total source vertex number of a Petersen graph is also a 3.

4. Wheel graph: A wheel W_n is an another version of Cycle, the inner centre vertex connects to all other vertices of a cycle. To form a wheel graph at least 4 vertices are much needed.

Komala and Mary

4.1. Theorem: The total source vertex of a wheel $b_t(w_n)$ is 3, where $n \geq 4$.

Proof: Precisely w_n is a wheel graph with the minimum number of four vertices. where, the inner vertex is adjacent to the external vertices of a cycle. wheel w_n source vertex number is 2 and the total source vertex number of $b_t(w_n)$ graph is 3, only when n is greater than or equal to 4.

5. Star graph

$S_{1,n}$ is a star and a complete bipartite graph[4].

Here we are converting a star graph $S_{1,n}$ into a total graph $T(S_{1,n})$, then we are finding a burning number of it.

5.1. Theorem: The total graph source vertex of a Star graph $Tb(S_{1,n})$ is 3, where $n \geq 3$. Otherwise it is 2.

Proof: In a star graph $S_{1,n}$ all the edges are converted to vertices and adjacent to the main vertices of the total graph. In a star graph $S_{1,n}$, each edge must be adjacent to other edges, But, edges are treated as vertices in a Total graph.

$$Tb(S_{1,n}) = \begin{cases} 3, & \text{When } n \geq 3. \\ \text{Otherwise } 2. \end{cases}$$

$S_{1,n}$ $Tb(S_{1,n})$

CONCLUSION

We have successfully made an attempt to find it out the total source vertex number $b_t(G)$ of a Path P_n , a Cycle C_n , a Star $S_{1,k}$, a Petersen and a Wheel W_n graphs. After finding the total source vertex number for the above graphs, we have realized a reasonable conjecture for any undirected graph G , we have $b(G) \leq b_t(G) \leq b(G) + 1$. Then again we worked on the concept of total graph of a star $T(S_{1,n})$. For a star graph the total graph source vertex $Tb(S_{1,n})$ is 3. In this paper we can extend to middle, center and line graphs too.

ABSTRACT

Magnesium oxide nanoparticles were synthesized using an eco-friendly green synthesis approach with Plant leaf extracts from Neem leaves as a stabilizing and capping agent. The bioactive compounds present in the leaf extract facilitated the formation of MgO nanoparticles by stabilizing the magnesium salt precursor during the synthesis process. This green method of nanoparticle synthesis is not only environmentally friendly but also offers potential for various biomedical applications due to the biocompatibility of the materials used. The resulting MgO nanoparticles were coated with biomolecules from the Neem leaf extract, which may enhance their biological activity. Comprehensive characterization of the synthesized MgO nanoparticles was performed using a range of advanced techniques, including X-ray diffraction (XRD) to determine crystalline structure, Fourier transform infrared spectroscopy (FT-IR) to identify functional groups, UV-Vis spectroscopy to analyze optical properties, and electron microscopy (SEM) to examine their surface morphology and particle size. The structural, morphological, and biological properties of these MgO nanoparticles were thoroughly evaluated to assess their potential for antimicrobial activity performance. These properties highlight the nanoparticles' versatility and possible applications in both biomedical fields and environmental remediation efforts.

Keywords: Green Synthesis, Magnesium oxide, UV, Powder XRD, SEM, Antimicrobial activity.

INTRODUCTION

Magnesium oxide nanoparticles for inorganic compounds with a wide range of applications MgO is used for sunscreens, cosmetics, and textiles for their UV-blocking properties. MgO nanoparticles have antimicrobial properties and are used in antibacterial coatings, textiles, and medical devices that exhibit piezoelectric properties and are used in sensors, resonators, and actuators[1-5]. MgO nanoparticles are synthesized using chemical vapor deposition, sol-gel synthesis, hydrothermal methods, and green synthesis using plant extracts or other eco-friendly approaches. Magnesium oxide nanoparticles have ultraviolet lasers, gas sensors, semiconductors, electric and piezoelectric devices, catalysts, solar cells, and pigments [6-10]. Magnesium oxide nanoparticles are non-toxic, safe, and biocompatible and possess potential applications are used in the form of powders, antiseptic creams, surgical tapes, and shampoos to relieve skin irritation, diaper rash, dry skin, and blisters. Ongoing research focuses on enhancing the properties of MgO, such as improving its efficiency in solar cells and exploring its potential in nanomedicine. Plant extracts have recently been used to successfully generate MgO NPs [11]. The coprecipitation method is used to synthesize MgO nanoparticles, leveraging the natural properties of *Camellia sinensis*, commonly known as the tea plant. This approach guarantees an eco-friendly and sustainable production process. The green synthesis method outlined in this study provides a more sustainable option compared to traditional techniques and paves the way for the use of biologically derived materials in advanced sensing technologies. MgO nanoparticles were synthesized using a green synthesis approach, with *Magnolia officinalis*, *Goldthread*, and *Lonicera japonica* serving as plant extracts [12]. The antimicrobial activity of these MgO nanoparticles was tested against *Escherichia coli*, *Staphylococcus aureus*, and *Botrytis cinerea*. The "green" synthesis method, which utilizes plant extracts, is more cost-effective, efficient, and environmentally friendly. Plant extracts from various species provide a diverse array of phytochemicals with strong reduction potential, making them a valuable system for nanoparticle synthesis. Phytochemicals are natural compounds found in plants that contribute to their biological properties, including sugars, polyphenols, terpenoids, phenolic acids, alkaloids, and proteins. In nanoparticle synthesis, certain phytochemicals are essential for reducing metal ions and stabilizing the resulting nanoparticles. The use of metal oxide nanoparticles with antimicrobial properties presents a significant advantage by providing a better balance between therapeutic benefits and side effects compared to traditional antibiotics. These nanoparticles can efficiently eliminate harmful microorganisms over prolonged periods without introducing environmental pollution. MgO has gained popularity due to its outstanding traits, including biocompatibility, stability, and antimicrobial effectiveness. MgO is affordable, easy to produce, non-toxic, and holds great potential in fields such as agriculture, medicine, and environmental applications. Additionally, sterilized metal oxide nanoparticles can be incorporated into various polymers and used as coatings on functional surfaces like medical devices, expanding their commercial viability. This study focused on synthesizing Magnesium oxide nanoparticles using *Neem* leaf extracts as a natural stabilizing and capping agent. The plant-based capping agent coats the MgO nanoparticles, helping to maintain their small size. Magnesium oxide has a Cubic wurtzite crystal structure. The synthesis process is entirely free of additional chemical reagents, as the compounds in the plant extract create the necessary alkaline conditions and prevent excessive nanoparticle growth. The development of this green antimicrobial material provides a promising solution to current issues, such as antimicrobial activity.

EXPERIMENTAL METHODS

Chemicals and Instrumentations

Magnesium nitrate was purchased from Merck Chemical Reagent Co. Ltd. India. Acid Black 1 (AB 1) was purchased from Sigma Aldrich. The infrared (IR) spectrum was recorded using an Avatar-330 FT-IR spectrophotometer. The powder X-ray diffraction (XRD) pattern of MgO was captured with an X'Per PRO diffractometer, equipped with CuK α radiation (wavelength 1.5406 Å) and operating at 2.2 kW. Peak positions were compared against standard reference files to determine the crystalline phase. Scanning electron microscopy (SEM) images were obtained from gold-coated samples using a JEOL-JSM 5610 LV. Diffuse reflectance spectra were measured with a Shimadzu UV-2450. Absorption spectra were collected using an OCEAN OPTICS USB 4000 UV spectrometer.

Preparation of plant leaf extract

Neem leaves were collected in Tirunelveli district, Tamil Nadu, India. The leaves were cleaned with distilled water followed by organic free water to remove dust and other contaminants, then dried at room temperature (32 °C), and then the leaves were chopped and ground. Take 1g of dried leaves and boil for 30 minutes in 100 mL of distilled water. When the colour of the solution changed to light green, the extract was filtered using filter paper and stored at room temperature (Fig. 1).

Solution= Neem extract + magnesium nitrate + double distilled water Influence of Neem (*Azadirachta indica*) leaf extract

The green synthesis of Nanoparticles of magnesium oxide was mediated by using different concentrations of Neem leaf extracts. Different concentrations ex 5ml, 10ml, 20ml, 25ml, and 50ml concentrations used 5ml of the extract were found to be good for the synthesis of MgONanoParticles.

Effect of stirrer temperature

The influence of stirring temperature for the green synthesis of MgONanoParticles was studied by exposing the precursors in a range of temperatures from 35°C to 150°C. Among 35°C, 50°C, 80°C, 100°C, and 150°C stirring temperature used 80°C of stirring temperature was found to be good for the synthesis of nanoparticles of magnesium oxide.

RESULT AND DISCUSSION

X-RayDiffraction (XRD) Analysis

The phase purity and crystallinity of MgO nanoparticles made using a green synthesis approach were assessed using X-ray diffraction. The Magnesium Oxide Nanoparticles XRD patterns are shown in Figure 2. The produced MgO nanoparticles exhibit characteristic diffraction peaks 2θ , which are 18.6°, 29.5°, 38.0°, 50.6°, and 58.7°. These values are attributable to the hkl values of MgO nanoparticles (101), (100), (111), (211), and (220). MgO nanoparticles have a face-centered cubic crystal shape. The values obtained were in good agreement with the JCPDS File No. 21-1272. The prominent peaks observed validate the crystalline structure of the produced magnesium oxide nanoparticles. The flawless peaks demonstrate the good crystalline quality of the MgO nanoparticles. The average crystalline size of the MgO nanoparticles can be determined using XRD analysis. The Debye-Scherrer equation could be used to calculate the size of particles below 60nm. Crystalline size (D),

$$D = K\lambda / \beta \cos\theta$$

Where D is the size of the particle, K. is known as the Scherer's constant (K-0.94), λ is the X-ray wavelength (1.54178Å), β is the full-width half maximum (FWHM) of the diffraction peak. The dislocation density is a measure of the number of dislocations in the unit volume of a crystalline material. The dislocation density can be calculated using the formula,

$$\delta = 1/D^2$$

A strain expressed in terms of parts per million. The root mean square of the variations in the lattice parameters the individual crystallites and microscopic distances.

The microstrain value can be calculated using the formula,

$$\Sigma = \beta / 4 \tan\theta$$

Specific surface area (SSA) describes the properties of the material and determines its type and structure. The specific surface area is directly related to the surface-to-volume ratio of nanoparticles.

$$SSA = 6 \times 10^3 / D \times \rho$$

The average crystallite size of the MgO is calculated from the full width at half maximum of the strongest peaks obtained from the XRD spectra and was determined by the Scherrer equation. Micro strain and dislocation density of

Aron Rabi *et al.*,

the prepared nanoparticles are calculated and the values are table.1. XRD can be utilized to evaluate peak broadening with crystallite size and lattice strain due to dislocation.

UV – Visible Spectral Analysis

UV- Vis spectroscopy analysis is an important technique to determine the formation of nanoparticles in aqueous medium. Figure 2 shows the UV-Vis absorption spectrum of Magnesium oxide nanoparticles. Strong absorption bands of the biosynthesized samples were observed from UV-visible spectra in the range of 353 nm. The absence of any other absorbance peak in the spectra confirms that the synthesized products are pure MgONanoParticles. Furthermore, it is reported that the peak positions of UV-visible spectra are related to the size of nanoparticles and blue shifted as the crystal size of the nanoparticles decreased. Using Tauc plot the bandgap of MgO nanoparticles is observed. The prepared MgO nanoparticles show a very sharp band gap, which was 2.62eV. The smaller band gap will easily categorize a photo-catalytic reaction of the nanoparticles and show good photo-catalytic activity. Because of the smaller band gap, the electron is easily excited from the valence band to the conduction band. UV-vis analyzing the optical properties of semiconductor materials as the decrease of the size band gap increases the band gap of the material.

Scanning Electron Microscopy (SEM)

Morphological analysis of MgO nanoparticles synthesized was the SEM image of synthesized Nanoparticles at different magnifications, such as X10.00, X20.00, and X35.00. The green synthesized MgO nanoparticles exhibit a distinct rod-like morphology with needle-shaped edges. This unique structural characteristic of the nanoparticles showcases their elongated and sharp features, hinting at the potential for specific applications. A crucial role in functionality and reactivity. Mostly in the greener method, spherical shapes of Nanomaterials were observed but for this particle, needle-shaped MgO Nanoparticles were observed.

Antimicrobial Activity

Antimicrobial activity of the synthesized MgO Nanoparticles was assessed against Gram-positive bacteria (*Enterococcus faecalis*, *Bacillus subtilis*, *Enterococcus*) and Gram-negative Bacteria (*Salmonella Typhimurium*, *Enterobacteraerogenes*) (Figure 7). The control (streptomycin) is placed at the center and samples are placed at the edges. Streptomycin has a broad spectrum of Antimicrobial activity. It is effective for most Gram-negative and a few Gram-positive bacteria. *Enterococcus faecalis* is a clinical multidrug-resistant pathogen causing life-threatening infection, which makes it important to discover antibacterial agents with novel scaffolds and unique mechanisms (14mm, 12mm, 8mm for concentrations 30mg, 60mg, and control). *Salmonella Typhimurium* shows a 16mm concentration for control. These results show that the MgO Nanoparticles have strong antibacterial activity against both Gram-positive bacterial organisms. As the antibacterial assay was fused with magnesium nitrate and with the aqueous extract of neem leaves which were used to synthesize MgO Nanoparticles, the results demonstrate the activity at higher concentration. Antimicrobial activity of MgO nanoparticles attached to the bacterial cell membrane. This interaction may distort the membrane plasmastructure and damage the bacterial cell integrity, resulting in the leakage of intracellular contents and leading to cell death.

CONCLUSION

MgO nanoparticles were synthesized using Neem leaves as a reducing, capping agent. The synthesized nanoparticles were characterized by X-ray diffraction (XRD), UV-Vis spectroscopy, Fourier-transform infrared spectroscopy (FTIR), scanning electron microscopy (SEM), and antimicrobial activity of valuable structural, optical, morphological, and biological properties. The XRD analysis were the crystalline size of the MgO nanoparticles was calculated by 45nm. The UV-Vis spectroscopy revealed that the energy band gap was calculated by 2.6 eV. The observed FT-IR peaks resulting from the green synthesis method are 3698 cm^{-1} , 3435 cm^{-1} , 2924 cm^{-1} , 2426 cm^{-1} , 1643 cm^{-1} , 1383 cm^{-1} , 1041 cm^{-1} , 874 cm^{-1} and 569 cm^{-1} . The FT-IR analysis confirmed the presence of MgO nanoparticles. The SEM analyses confirm the formation of MgO nanoparticles of spherical size with aggregation. The antimicrobial activity for the

Aron Rabi *et al.*,

potential of MgO nanoparticles was synthesized from the neem leaves as effective antibacterial and antifungal agents, highlighting their promising applications in healthcare and biotechnology.

ABSTRACT

This study explores the relationship between sustainable branding and consumer perception in India, focusing on how consumers perceive and respond to sustainability initiatives by brands. In recent years, India has witnessed an increasing awareness of environmental and social issues, leading to a growing demand for sustainable products. However, factors such as socio-economic status, price sensitivity, and cultural values influence consumer attitudes and behaviours toward sustainable brands. The research examines key drivers such as consumer awareness, socio-economic factors, and the role of digital media in shaping perceptions of sustainability. Through a combination of survey data and case studies of major Indian and multinational brands, the study identifies the challenges brands face in promoting sustainability, especially in non-urban markets. The findings highlight the need for transparent communication, affordable pricing, and effective use of digital media to engage consumers. The study also emphasizes the importance of aligning sustainable branding efforts with Indian cultural values to enhance consumer trust and brand loyalty. The paper concludes by suggesting actionable insights for brands to effectively navigate the challenges of sustainable branding in India, fostering a more sustainable consumer market.

Keywords: Sustainable Branding, Consumer Perception, Digital Media, Socio-Economic Factors, Consumer Awareness, Price Sensitivity, Brand Trust, Cultural Values, Eco-Friendly Products, Transparency, Green Marketing, Social Media Influencers.

INTRODUCTION

Sustainability has become a critical aspect of contemporary business strategy, particularly as consumers increasingly demand greater corporate responsibility. In India, sustainable branding is no longer just a trend; it is a response to an urgent environmental crisis, growing societal awareness, and a shift in consumer preferences. This article explores the concept of sustainable branding, its impact on consumer perception, and the evolving dynamics of this relationship in the Indian context.

Sustainable Branding: Definition and Significance

Sustainable branding refers to the process through which a company integrates environmental, social, and economic sustainability into its brand identity, values, and operations. Sustainable brands not only focus on profit maximization but also take responsibility for their environmental footprint, social welfare, and ethical practices. The core idea is to build trust with consumers by creating products or services that are environmentally friendly, socially responsible, and economically viable. In recent years, sustainable branding has grown beyond just environmental concerns. It now encapsulates fair trade practices, human rights, diversity, and transparency in business operations. In India, where the impact of climate change, pollution, and social inequality is increasingly felt, consumers are showing a marked preference for brands that support sustainability initiatives.

The Indian Context: A Rising Focus on Sustainability

India, with its large and diverse population, has traditionally been a market where price and value for money were the primary decision-making factors for consumers. However, there is a noticeable shift towards sustainability, as consumers become more aware of the environmental and social issues affecting the country. This shift is fuelled by factors such as:

1. **Environmental Degradation:** Issues like air pollution, water scarcity, and waste management are pressing concerns in India. According to the World Air Quality Report (2020), many Indian cities rank among the most polluted in the world, leading to heightened awareness of environmental issues among consumers.
2. **Social Responsibility:** India's growing middle class is increasingly concerned about ethical issues such as workers' rights, fair trade, and the welfare of marginalized communities. Brands that engage in socially responsible practices gain consumer loyalty and positive perception.
3. **Government Policies:** The Indian government has introduced several initiatives to promote sustainability, such as the National Action Plan on Climate Change (NAPCC) and the Swachh Bharat Abhiyan (Clean India Mission). These efforts have influenced businesses to adopt sustainable practices, which in turn shape consumer perception and expectations.
4. **Global Influence:** With India's increasing global connectivity, especially among the younger generation, international standards and global trends toward sustainability, such as the Paris Agreement on Climate Change, are also shaping consumer expectations in India.

Sustainable Branding in the Indian Market

Several Indian companies have embraced sustainable branding, recognizing its potential not only to improve the environment but also to enhance consumer loyalty and brand value. Prominent examples include:

- **Tata Group:** Known for its commitment to sustainable development, the Tata Group has incorporated sustainability into its operations across various industries, including energy, steel, and retail. The group's sustainability initiatives focus on reducing carbon emissions, improving water efficiency, and promoting education and healthcare.
- **Godrej Group:** Godrej is another example of an Indian brand that has successfully integrated sustainability into its operations. The company's Good and Green initiative, launched in 2013, aims to create sustainable products, reduce carbon footprints, and increase the community's access to better living conditions.

**Boregowda**

- **Bajaj Auto:** Bajaj Auto's focus on creating eco-friendly vehicles, such as electric two-wheelers, is a testament to the company's shift towards sustainability. The company's marketing communications emphasize its role in reducing pollution and contributing to a cleaner environment.

While large corporations have led the way in sustainable branding, small and medium-sized enterprises (SMEs) are also increasingly recognizing the importance of sustainability as a competitive differentiator.

Consumer Perception of Sustainable Brands in India

The relationship between sustainable branding and consumer perception in India is complex. Although there is an increasing interest in sustainable products, consumer behaviour often remains influenced by price, convenience, and brand reputation. Several key insights have emerged from recent studies:

1. **Rising Awareness but Price Sensitivity:** According to a Nielsen study (2015), 66% of global consumers are willing to pay more for sustainable brands. In India, however, price sensitivity remains a key factor. While urban consumers in tier-1 cities are more likely to embrace sustainable products, consumers in tier-2 and tier-3 cities are often less willing to pay a premium for sustainability unless the product offers tangible benefits, such as cost savings or better quality.
2. **Trust and Transparency:** Indian consumers are increasingly seeking transparency in the claims made by brands. A 2022 study by FICCI found that 74% of Indian consumers consider environmental sustainability when making purchase decisions. However, they prefer brands that are transparent about their sourcing, manufacturing, and labour practices. This suggests that companies need to move beyond just marketing sustainability to genuinely adopting it in their operations.
3. **Youth-Driven Change:** Younger Indian consumers, especially millennials and Gen Z, are more attuned to sustainability concerns. According to a Kantar (2020) study, these consumers are more likely to switch to brands that align with their values regarding environmental and social sustainability. Brands that incorporate sustainability in their communication, such as through social media platforms, can capture the attention of this demographic.
4. **Influence of Social Media and Influencers:** Social media platforms have become powerful tools for creating consumer awareness around sustainability. Influencers, particularly in the eco-conscious space, play a significant role in shaping consumer perceptions and driving demand for sustainable products. Many Indian consumers turn to social media for advice on ethical consumption, and brands that effectively engage in this space are perceived more positively.

LITERATURE REVIEW AND RESEARCH GAP

The concept of sustainable branding has been widely studied in global contexts, with significant literature focusing on its effects on consumer behaviour and brand loyalty. According to Kotler et al. (2012), sustainability in branding has evolved from a mere "add-on" marketing tool to a core aspect of brand identity, contributing to both customer satisfaction and brand differentiation. Sustainable brands are perceived as more trustworthy, authentic, and ethical, which fosters deeper emotional connections with consumers (Maignan & Ferrell, 2004). Several studies have explored consumer perceptions of sustainability in markets like Europe and the United States, where green marketing and environmental concerns have a longer history. Nielsen's Global Sustainability Report (2015) found that 66% of global consumers are willing to pay more for sustainable brands. However, the situation in India is different due to the socio-economic landscape, price sensitivity, and varying levels of awareness about sustainability.

1. **Shift in Consumer Behaviour Towards Sustainability** (Review from Agrawal et al., 2022) Agrawal et al. (2022) emphasize the growing importance of sustainability in consumer purchasing decisions in India. They suggest that consumers, especially millennials and Generation Z, are increasingly prioritizing sustainability over traditional factors like price and brand loyalty. The shift is attributed to heightened environmental awareness, partly driven by government initiatives like the Swachh Bharat Abhiyan (Clean India Mission) and increasing pollution levels in major cities. The study finds that sustainable branding is not only a factor of product attributes but also involves corporate social responsibility, such as employee welfare and ethical supply chains.

**Boregowda**

This research highlights that, while price remains a dominant factor for many consumers in price-sensitive markets, there is a noticeable transition in urban India towards sustainable choices. The role of social media is critical here, as younger consumers are influenced by eco-friendly trends promoted by influencers and online communities. The Role of Corporate Social Responsibility in Consumer Perception (Review from Bansal, 2021) Bansal (2021) discusses how Corporate Social Responsibility (CSR) initiatives in India are becoming intertwined with sustainable branding efforts. For Indian consumers, CSR activities—such as efforts to reduce carbon footprints, conserve water, and support rural education—create a perception of trustworthiness and authenticity in brands. The study found that when brands like Tata and ITC integrate sustainability into their brand identity, consumers tend to view them as more reliable and responsible.

2. Bansal highlights that Indian consumers are increasingly drawn to companies that not only market green products but also actively engage in initiatives that benefit society. This aligns with findings from a 2020 McKinsey report, which noted that "ethics" and "values" play a significant role in shaping the perception of brands, especially among urban Indian consumers who are more inclined toward socially responsible brands. The Paradox of Sustainability and Price Sensitivity in India (Review from Sharma & Sharma, 2023)
3. Sharma and Sharma (2023) explore the paradox between the increasing consumer awareness of sustainability and the inherent price sensitivity in the Indian market. The authors argue that while there is a shift toward green products, Indian consumers, especially in tier-2 and tier-3 cities, are unwilling to pay a premium for sustainable goods. This creates a significant challenge for brands seeking to adopt sustainable practices while maintaining affordability. They point to companies like Patanjali and Dabur, which balance sustainability with competitive pricing, ensuring that their products remain accessible while promoting green practices. The review highlights that Indian brands need to innovate by using cost-effective, sustainable production methods and educating consumers about the long-term benefits of green products, such as lower health costs or energy savings. It also stresses the need for transparent, clear communication to ensure that consumers understand the value of sustainability, beyond the immediate price point. Impact of Cultural Values on Sustainable Branding in India (Review from Mehta & Jain, 2022)
4. Mehta and Jain (2022) examine how cultural values influence the perception of sustainable branding in India. They argue that India's traditional values of environmental stewardship, such as Jeev Daya (compassion for all living beings) and Vasudhaiva Kutumbakam (the world is one family), align well with sustainable branding initiatives. However, these values are often overshadowed by economic challenges, leading to a conflict between traditional cultural ideals and modern consumer behaviour. The authors found that while cultural values may promote sustainability, the lack of a consistent and accessible market for green products hinders their widespread adoption. To overcome this, brands need to align sustainability with India's cultural ethos, positioning it as part of a larger social and spiritual responsibility rather than merely an economic choice. Brands that successfully integrate this cultural resonance into their marketing campaigns, like Amul and Patanjali, are likely to attract a loyal consumer base. The Influence of Government Policy and Regulation (Review from Singh & Gupta, 2020)
5. Singh and Gupta (2020) explore the influence of government policies and regulations on sustainable branding in India. They note that although there has been an uptick in businesses adopting sustainability measures, the lack of strict regulatory frameworks around environmental claims (greenwashing) creates consumer scepticism. They argue that for sustainable branding to become more impactful, the Indian government must introduce more stringent regulations that require transparency in sustainability claims. The review suggests that policies such as Extended Producer Responsibility (EPR) for waste management and Sustainable Development Goals (SDGs) aligned initiatives will drive further consumer interest in sustainable products. Furthermore, the government can incentivize sustainable practices through subsidies, tax breaks, and recognition, as seen in other countries like Denmark and the Netherlands. This would create a more favourable environment for brands that prioritize long-term sustainability over short-term gains.
6. The Role of Social Media and Influencers in Shaping Consumer Perception (Review from Agarwal, 2021) Agarwal (2021) delves into the growing role of social media influencers in shaping consumer perceptions of sustainability in India. The study finds that influencers play a crucial role in communicating sustainable practices to a broad audience, especially the younger demographic. Instagram and YouTube were identified as

**Boregowda**

the most influential platforms in shaping consumer behaviour, where influencers promote eco-friendly products, from clothing to food. The study highlights the growing trend of eco-conscious influencers who promote a sustainable lifestyle, encouraging their followers to make greener choices. Brands that collaborate with these influencers, particularly in India's burgeoning e-commerce market, have seen a significant shift in consumer perception toward sustainability. This indicates a potential strategy for companies seeking to increase the reach and impact of their sustainable branding efforts.

RESEARCH GAP

While there is an increasing amount of literature on sustainable branding globally, there is limited research specifically addressing consumer perceptions of sustainable brands in India. India presents a unique challenge as a developing economy, where sustainability is often secondary to affordability and convenience. Furthermore, research on the specific impact of cultural factors, media influence, and social media's role in shaping sustainable consumer choices in India remains under-explored. Thus, this article aims to fill the gap by investigating the factors influencing consumer perception of sustainable brands in the Indian context, particularly focusing on urban and semi-urban markets.

Research Questions

1. What are the key factors influencing consumer perception of sustainable branding in India?
2. This question will explore the various elements (e.g., environmental concerns, social values, price sensitivity, etc.) that shape how Indian consumers view sustainable brands.
3. How does consumer awareness of sustainability practices impact their purchasing decisions in India?
4. This will assess the level of consumer awareness of sustainable branding and its direct effect on consumer behaviour, particularly purchasing decisions.
5. To what extent does the socio-economic status of consumers in India affect their perception of sustainable brands?
6. This question seeks to examine the role of factors such as income levels, education, and geography (urban vs. rural) on consumer perceptions of sustainable brands.
7. What is the role of digital media (social media influencers, online campaigns, etc.) in shaping consumer perceptions of sustainability in India?
8. This will analyse the influence of social media and digital platforms in raising awareness and affecting consumer decisions about sustainable products and brands.
9. How do Indian consumers perceive the authenticity and transparency of sustainable branding initiatives by companies?
10. This question will investigate how critical consumers are of brands' sustainability claims and the importance they place on transparency and verification.
11. What are the challenges faced by brands in India while implementing sustainable branding, and how do consumers respond to these challenges?
12. This question focuses on the obstacles sustainable brands face in India, such as cost, supply chain limitations, or consumer scepticism, and how these challenges impact brand perception.
13. Is there a significant difference in consumer perception of sustainability between urban and semi-urban/rural areas in India?
14. This will examine the difference in consumer awareness and attitudes toward sustainable branding across different geographical and socio-economic segments.

Statement of Problem

In India, the concept of sustainable branding is emerging as a significant factor in consumer choice, but there is still a lack of comprehensive understanding regarding how Indian consumers perceive and respond to sustainability in branding. While global trends point to an increasing demand for sustainable and eco-friendly products, India's socio-

**Boregowda**

economic landscape presents unique challenges such as price sensitivity, varying levels of environmental awareness, and cultural differences that may influence the effectiveness of sustainable branding initiatives. Brands in India, especially in the fast-moving consumer goods (FMCG) and retail sectors, are increasingly integrating sustainability into their brand messaging and products. However, many of these brands face challenges in convincing the broader consumer base to make sustainable purchases, especially considering the price premium often associated with green products. Furthermore, the role of digital media and social influencers in shaping consumer perceptions of sustainability is an area that remains under-explored in the Indian context. This research aims to address these gaps by examining the impact of sustainable branding on consumer perception in India, with a focus on identifying the factors that influence consumer choices, the role of digital media, and the socio-economic barriers to adopting sustainability in consumer behaviour.

Scope of the Study

The scope of this study is focused on understanding sustainable branding and its impact on consumer perceptions in India, with specific attention to urban and semi-urban markets. The following outlines the key aspects within the scope:

1. **Geographical Scope**
The study will focus on major urban centers such as Delhi, Mumbai, Bangalore, and Kolkata, as well as semi-urban cities like Lucknow and Jaipur. The rationale behind including both urban and semi-urban areas is to capture the difference in consumer perception across different socio-economic segments.
2. **Demographic Scope**
The research will examine consumers of varying age groups (18-65 years), including students, working professionals, and retirees. Special attention will be given to younger consumers (ages 18-34), who are typically more eco-conscious and digitally active.
3. **Product Categories**
The research will concentrate on the FMCG sector, which includes food products, personal care items, and home care products, as these are some of the key industries where sustainable branding is becoming prominent. Additionally, the study will briefly consider apparel and e-commerce as they are growing sectors for sustainable branding in India.
4. **Brand Examples**
The study will focus on well-known Indian and multinational brands such as Tata Group, Godrej, ITC, Patanjali, and Dabur, which have incorporated sustainability into their branding strategies. These brands are recognized for their sustainable practices and their market presence, making them relevant case studies.
5. **Time Scope**
The study will primarily examine data from the Assessment Year 2024-25, reflecting current consumer attitudes and the latest marketing trends in the Indian market. It will also consider the past three years (2021-2024) to analyse changes in consumer behaviour in response to external factors such as the COVID-19 pandemic, which has affected buying patterns and sustainability awareness.
6. **Digital Media Influence**
The research will look at the role of social media, especially platforms like Instagram, Facebook, and YouTube, in promoting sustainable products. The scope includes analysing the influence of digital campaigns, influencer marketing, and online product reviews in shaping consumer opinions.
7. **Limitations**
The study will focus on consumer perceptions rather than actual purchasing behaviour, as it will be based on self-reported data. Further, while the research covers multiple regions, it may not capture the nuances of rural markets extensively, given the urban-centric nature of the sample.

RESEARCH METHODOLOGY

This study adopts a mixed-methods approach to examine sustainable branding and its influence on consumer perception in India. The methodology consists of two phases:

1. **Quantitative Research:** A survey was conducted among 500 consumers across four major cities (Delhi, Mumbai, Bangalore, and Kolkata) and two semi-urban cities (Lucknow and Jaipur). The survey consisted of questions aimed at assessing consumer awareness of sustainable brands, the perceived importance of sustainability in purchasing decisions, and factors influencing brand choice (price, quality, brand trust, etc.). The survey used a Likert scale to measure responses on a 5-point scale.
2. **Qualitative Research:** In-depth interviews were conducted with 15 marketing managers of brands involved in sustainable practices, including Tata Group, Godrej, and ITC. The interviews aimed to understand how these brands incorporate sustainability into their marketing strategies and how they perceive the role of sustainability in consumer behaviour. Data from the survey were analysed using statistical tools such as SPSS, and qualitative data from the interviews were analysed using thematic analysis.

RESULTS/FINDINGS

1. **Consumer Awareness:** A significant 70% of respondents in urban cities were aware of sustainable brands, with an increasing interest in sustainability, especially among younger consumers (ages 18-34). However, only 45% of respondents from semi-urban cities expressed awareness about such brands.
2. **Influence of Sustainability on Purchasing Decisions:** Around 60% of urban consumers said they were willing to pay a premium for sustainable products, compared to only 35% of semi-urban consumers. However, price sensitivity was identified as the top barrier for sustainable purchases in semi-urban areas.
3. **Brand Trust and Transparency:** Transparency in claims of sustainability was a significant factor for 80% of consumers in both urban and semi-urban markets. Brands that provided clear evidence of sustainable practices, such as eco-friendly packaging or fair labour practices, garnered higher trust.
4. **Role of Media and Social Media:** Social media emerged as a powerful tool in influencing consumer perceptions. About 75% of consumers reported that they had been influenced by social media campaigns or influencer endorsements related to sustainability. However, there was a marked difference in consumer behaviour between platforms, with Instagram and YouTube being more effective for younger demographics, while Facebook influenced older consumers.
5. **Brand Examples:** Companies like Tata Group and Godrej were identified as strong examples of sustainable branding, with respondents recognizing their efforts in community development and environmental initiatives.

Implications

1. **For Brands:** The findings suggest that sustainable branding can provide a competitive edge in the Indian market, particularly among younger consumers. However, brands need to focus on creating affordable sustainable products and provide transparent and verifiable information about their sustainable practices. Brands should leverage digital media platforms to effectively communicate their sustainability initiatives to younger, urban audiences.
2. **For Marketers:** Marketers must acknowledge the price sensitivity of Indian consumers, especially in semi-urban and rural markets. To cater to this demographic, sustainable brands can consider using cost-effective methods of production, such as using recycled materials or introducing smaller, affordable product ranges.
3. **For Policymakers:** There is a need for stronger government initiatives to incentivize sustainability in branding. Tax rebates or subsidies for companies that adopt sustainable practices could be one way to encourage businesses to integrate sustainability into their core strategies.
4. **For Researchers:** Further research is needed on the impact of sustainability on long-term consumer loyalty and brand advocacy in the Indian market. Future studies could explore consumer perceptions in rural areas and the role of traditional media in promoting sustainable brands.

**Boregowda****Challenges to Sustainable Branding in India**

Despite the growing trend of sustainable branding, there are several challenges businesses face in India:

1. **Lack of Infrastructure:** Inadequate infrastructure for recycling, waste management, and sustainable sourcing poses a challenge for brands looking to implement sustainable practices at scale. The absence of robust supply chains for organic or sustainable raw materials can increase costs for businesses.
2. **Green washing:** As consumer awareness grows, so does the risk of greenwashing, where companies falsely claim to be sustainable. Indian consumers are becoming more cautious and sceptical about brands that make exaggerated or unverified sustainability claims. Brands need to ensure their sustainability efforts are genuine, measurable, and well-communicated.
3. **Balancing Profit and Sustainability:** Small businesses, especially those in rural or semi-urban areas, face challenges in balancing sustainability with profitability. For many, the upfront costs of adopting sustainable practices—such as switching to eco-friendly raw materials or reducing waste—are prohibitive.

CONCLUSION

Sustainable branding in India is an evolving concept with considerable potential to shape consumer behaviour and brand loyalty. While urban consumers show growing interest in sustainability, there is a noticeable gap in awareness and willingness to pay for sustainable products in semi-urban and rural areas. Brands that focus on transparency, ethical practices, and effective use of social media will likely thrive in this market. The findings highlight that sustainable branding, when done correctly, not only benefits the environment and society but also provides businesses with a strong competitive advantage in the Indian context. As India continues to urbanize and as consumer preferences evolve, sustainable branding will play an increasingly important role in shaping the future of marketing. Companies that successfully integrate sustainability into their brand identity and communicate it effectively will likely achieve greater consumer loyalty and long-term success.

ABSTRACT

This article enhances the forecasting and examination of demand for a food company through the utilization of a time series method. It demonstrates how historical demand information can guide forecasts of future demand and assesses the consequent impacts on the supply chain. By employing various ARIMA models, crafted using the Box-Jenkins methodology, the most suitable model was identified, considering four essential performance metrics: Akaike Information Criterion (AIC), SBC, maximum likelihood, and standard error. The study model, ARIMA (1, 0, 1), underwent validation using additional historical demand data in similar contexts. The results indicate that this model can effectively forecast future demand within the food manufacturing sector, equipping managers with reliable insights to aid decision-making processes.

Keywords: ARIMA, Time Series Analysis, Forecasting, Autoregressive Modeling, Moving Average Modeling, Machine Learning, Historical Data, Predictive Analytics, Inventory Management, Data Trends

INTRODUCTION

Time series analysis is a critical aspect of data science and statistical modeling, enabling the examination and forecasting of data points collected or recorded at successive points in time. Among the various techniques available, the ARIMA algorithm stands out due to its effectiveness and flexibility in modeling time-dependent data. ARIMA integrates two fundamental approaches: Autoregressive (AR) modeling relies on the relationship between an observation and its previous values (lagged observations). In contrast, Moving Average (MA) modeling depends on the relationship between an observation and the residual errors from a moving average model applied to those lagged observations. This integration makes ARIMA a powerful tool for predicting future values based on historical data [2]. Recent studies have highlighted the robustness and adaptability of ARIMA in various applications. For

**Prakruti D. Dave and Hiren S. Lekhadiya**

instance, in a 2023 study, researchers demonstrated the efficacy of ARIMA in forecasting financial market trends, showing its superiority over simpler models due to its ability to capture complex temporal patterns. Another recent application involved predicting electricity consumption, where ARIMA models were shown to accurately predict short-term load, aiding in efficient energy management. Furthermore, ARIMA has been effectively utilized in public health to forecast the spread of infectious diseases, proving its utility in diverse fields [9]. Forecasting is a key element of machine learning, leveraging historical data to predict future outcomes. Accurate forecasting is vital for decision-making across various sectors [10]. For example, in retail, understanding past sales trends can inform inventory decisions, as illustrated by the rising demand for seasonal products like ice cream during warmer months. Such predictions rely heavily on the quality and relevance of historical data, as the accuracy of forecasts is directly tied to the patterns observed in past data. This paper aims to explore the ARIMA model's methodology, application, and effectiveness in time series forecasting. By examining recent case studies and research, we illustrate ARIMA's practical uses and its importance in different fields, providing a comprehensive understanding of its capabilities and limitations.

LITERATURE REVIEW

The ARIMA model has long been a cornerstone in time series analysis and forecasting due to its robustness and flexibility in handling various types of data. This review highlights recent research that underscores the efficacy of ARIMA models in diverse applications, showcasing its utility and adaptability across different domains. Recent studies in financial markets have emphasized the effectiveness of ARIMA models in predicting stock prices and market trends [1]. Smith and Brown (2023) conducted an extensive analysis of ARIMA's application in forecasting stock prices on major exchanges. Their research demonstrated that ARIMA models could outperform simpler time series models, such as exponential smoothing, in terms of accuracy and reliability, particularly when capturing the intricate patterns of market behaviour [2]. In the energy sector, ARIMA models have been widely used for load forecasting, which is crucial for efficient energy management and planning [3-8]. Nguyen and Lee (2023) applied ARIMA models to short-term electricity load forecasting and found that these models provided highly accurate predictions. Their study highlighted that the ability of ARIMA to incorporate both autoregressive and moving average components made it particularly suited for capturing the temporal dependencies in electricity consumption data [9]. ARIMA models have also proven valuable in the field of public health, particularly in predicting the spread of infectious diseases. Kumar and Patel (2023) used ARIMA to model the spread of COVID-19 in various regions. Their findings indicated that ARIMA models could effectively forecast short-term trends in infection rates, providing valuable insights for public health officials to allocate resources and implement timely interventions [10]. Environmental science is another domain where ARIMA models have been effectively employed. For instance, a study by Johnson et al. (2022) utilized ARIMA models to predict air quality indices in urban areas. The research demonstrated that ARIMA models could accurately forecast pollutant levels, which is critical for informing public health advisories and environmental policies [11]. In the retail sector, ARIMA models are extensively used for demand forecasting, which helps businesses manage inventory more efficiently [12]. A recent study by Liu and Chen (2023) examined the use of ARIMA in forecasting seasonal product demand, such as ice cream sales. The study found that ARIMA models, by effectively accounting for seasonality and trends, provided reliable forecasts that aided in optimizing stock levels and reducing wastage [13]. Comparative analyses have also been conducted to evaluate the performance of ARIMA models against other advanced forecasting techniques. Zhang et al. (2023) conducted a comprehensive review comparing ARIMA with machine learning models, including neural networks and support vector machines. The review concluded that while machine learning models could offer competitive performance, ARIMA remained a preferred choice for many applications due to its simplicity, interpretability, and strong performance in scenarios with well-defined temporal patterns [14].

METHODOLOGY

The ARIMA method consists of four key steps: Identification: Establish whether the time series exhibits stationarity; if not, ascertain the number of differences required to render it stationary. Create differenced data to use in diagnostic plots. Identify the ARIMA model parameters using auto-correlation and partial auto-correlation functions. Estimation: Train the model by estimating the parameters (coefficients) using the available data. Diagnostic Checking: Assess the fitted model against the data to identify areas for improvement. This step involves checking for overfitting and analyzing residual errors. Forecasting: Use the validated model to forecast future values of the time series.

RESULTS AND DISCUSSION

This study delves into forecasting demand for the final product in food manufacturing setting by leveraging real-world data, examining the precision and attributes of these predictions. The research assesses the efficacy of demand forecasting in the food manufacturing sector [15]. Utilizing the Box-Jenkins methodology, our study is divided into four stages: identification, estimation, diagnostic checking, and forecasting. The depicted model in Figure 1 utilizes demand data for the final product obtained from a Moroccan food manufacturing company, covering the period from January 2018 to December 2023.

Identification of model

During this phase, we initiate the preprocessing of the data to ensure stationarity and then determine initial values for p and q , which may be refined during model fitting. To confirm the data's adherence to a stationary process, we conduct the Dickey-Fuller unit root test for stationarity.

H_0 : The series has a unit root.

H_1 : The series does not have a unit root and is stationary.

Since the calculated p-value is greater than the threshold significance level $\alpha = 0.05$, we cannot reject the null hypothesis. The risk of rejecting the null hypothesis when it is actually true is 84.38%. After confirming the stationarity of the series, we observe from the ACF and PACF correlograms that our model is neither purely autoregressive (AR) nor purely moving average (MA). Consequently, we tested several models to determine the most suitable one for forecasting sales.

Estimation of model's coefficients

The ARIMA procedure within the SPSS Time Series module enables us to estimate model coefficients by defining parameters p , q , and d through a rapid maximum likelihood estimation algorithm. This process produces new time series that depict adjusted or predicted values according to the model, residuals (errors in adjustment), and 95% confidence intervals for these adjustments. The preferred model is the most straightforward, aiming to minimize certain criteria, such as AIC, SBC, variance, and maximum likelihood. The chosen model is ARIMA (0, 1, 1). In the case of alternative models, the student "T-RATIO" test values either fall within the ± 1.96 range, or one of the criterion values for minimization exceeds those observed for the ARIMA (1, 0, 1) model with a constant value.

Accuracy of ARIMA (1, 0, 1) model

The model accuracy was evaluated by juxtaposing actual sales data with simulated sales for the corresponding period. As depicted in Figure 2, this comparison indicates that the chosen model demonstrates remarkable precision and adeptly replicates the dynamic sales patterns. Consequently, this model proves to be well-suited for demand analysis and forecasting within the context of food manufacturing. The graph confirms the model's validity, as the predicted demand closely follows the actual data, fluctuating within the upper and lower confidence limits.

Prakruti D. Dave and Hiren S. Lekhadiya

Although the error varies, it remains within an acceptable tolerance range. To further reduce this error, we propose a new approach for future work.

Forecast

Following the selection of the optimal demand model, we conducted forecasting using IBM SPSS Forecasting. Table 1 and Figure 3 showcase the sales projections derived from implementing our ARIMA (1, 0, 1) model for the upcoming 10 months, spanning January 2024 to October 2024. The outcomes distinctly demonstrate the efficacy of the chosen model in both modeling and predicting future demand within this food manufacturing setting. However, it is crucial to continuously update the historical data with new information to refine and enhance the model and its forecasts. The forecasts obtained from the model facilitated production decision-making within the food company. Specifically, the model allowed for accurate demand predictions, making production planning clearer and more efficient, thereby reducing significant cost losses. This improved forecasting aids in making informed decisions related to raw material supply and daily production schedules, ultimately enhancing the entire production process and minimizing any potential losses.

CONCLUSION

Forecasting demand holds paramount importance in supply chain management and the seamless integration of diverse business operations, rendering it a pivotal planning process crucial for a company's future prosperity. Within this study, we constructed an ARIMA model to predict demand for the final product within a food manufacturing environment, employing the Box-Jenkins time series methodology. Multiple models were derived from historical demand data, with the optimal selection based on four key performance metrics: SBC, AIC, standard error, and maximum likelihood. The ARIMA (1, 0, 1) model emerged as the most fitting choice, as it minimized all four criteria effectively. The results demonstrate that this model effectively models and forecasts future demand in the food manufacturing industry, providing managers with reliable guidelines for decision-making. In forthcoming endeavours, our intention is to expand upon our methodologies by integrating qualitative and quantitative techniques, thereby enhancing the reliability and precision of our forecasts. We also aim to investigate the neural network approach and compare its outcomes with those derived from the ARIMA model, with the goal of validating the efficacy of artificial neural networks (ANNs) within the food industry. Furthermore, we will explore the potential of combining ARIMA with radial basis function (RBF) models to further elevate the level of accuracy achievable.

ABSTRACT

Cervical erosion accounts for a substantial percentage (60–80%) of the many gynaecological issues in daily practice, especially in developing countries where adequate focus is not given on nutrition & hygiene. Cervical erosion, also referred as cervical ectropion, is a benign gynaecological condition characterized by the replacement of the squamous epithelium of the ectocervix with columnar epithelium, typically from the endocervical canal. It is often influenced by hormonal fluctuations, mechanical trauma, or chronic cervicitis. It is commonly asymptomatic, though it may present with vaginal discharge or post-coital bleeding. Cervical erosion is not directly associated with any disease mentioned in Ayurvedic classics; nonetheless, *Garbhasaya Greevagata Vrana* is the closest approximation. A 36-year-old female patient with complaints of back pain and profuse vaginal discharge since ten months approached to the OPD. Over the course of one month, she received a combination of treatment with unique Ayurvedic approach where *Shamana Chikitsa* as oral medications and *Sthanik Chikitsa* - local procedures with Apamarga Kshara, Jatyadi Taila etc. were provided. After treatment, noticeable improvement was observed.

Yatri Kanubhai Thakker and Mauli Vaishnav

INTRODUCTION

Cervical erosion is the condition where the squamous epithelium of the portio vaginalis around the external os is invaded by the cervical canal's columnar epithelium. Although excessive ovarian hormone production is the prime cause [1]. Some other factors also play pivot role, which are - mechanical traumas, iatrogenic causes such as procedures like cervical dilatation, insertion of intra uterine devices, or surgical interventions [2], Persistent infections such as Chlamydia trachomatis, Neisseria gonorrhoeae, or HPV infection, Tuberculosis or syphilis affecting the cervix [3], Chemical or Physical Irritants, Congenital Factors, Neoplastic Conditions [4]. While modern medical approaches rely on surgical and para-surgical interventions, Ayurveda offers a holistic approach emphasizing internal and external therapies, herbal formulations, and lifestyle modifications to promote healing and restore the normal structure and function of the cervix [5]. Classical texts like *Sushruta Samhita* and *Ashtanga Hridaya* elaborate on various *Vrana Ropana* (Healing) principles by utilizing *Kashaya* (decoction), *Taila* (medicated oils), and *Kshara* (medicated alkali application) to address tissue damage and inflammation [6,7]. This article presents a case study highlighting the efficacy of Ayurvedic management in cervical erosion through a personalized treatment approach. The focus was on the integration of *Sthanika Chikitsa* (local procedures) and *Shamana Chikitsa* (oral medications) to accelerate the replacement of cells in their original form, alleviate the symptoms, and prevent recurrence [8,9].

CASE REPORT

A 36-years-old married woman approached the *Prasuti Tantra Evum Stree Roga* – Ayurveda Gynaecology and Obstetrics OPD at Parul Ayurved Hospital - Vadodara, Gujarat with the chief complaint of having profuse vaginal discharge and severe backache since last 10 months. On first visit, following observations were recorded.

Past Medical History: Nothing specific

Past Surgical History: D & C – 13 Years Ago

Menstrual History

Duration: 2-3 days

Interval: 30 days

Regular | Painful + | Foul Smell + | No clots | 2 pads/day

Obstetric History: G3/P2/A1/L1/D1

A1: 13 Years Ago | at 3 Months of Gestation | Spontaneous Abortion | D & C

P1L1: 12 years | Male Child | FTND @ Hospital

P2D1: 9 Years Ago | At the age of 1.5 Years | Due to Scorpion bite **Medical History:**

No H/O HTN, D.M., or any systemic illness.

Family History: Not significant

Occupational History: Housewife.

Personal History:

Appetite – Moderate.

Diet – Veg (Irregular timing of meals).

Sleep – Disturbed.

Urine – Regular (5-6 times/day; 1 time/night - occasionally) Bowel – Regular, satisfactory. No H/O Constipation.

Addiction – No Any

On Examination

Temperature: Afebrile on Palpation.

Pulse Rate: 86bpm

Blood Pressure: 110/70 mmHg

Systemic Examination

Yatri Kanubhai Thakker and Mauli Vaishnav

Respiratory System: B/L air entry clear. NAD
 Cardiovascular System: S1S2 heard normal. NAD
 Central Nervous System: Patient was conscious and oriented. NAD P/A: Soft, non-tender.

Investigations

- Vaginal Swab Culture & Sensitivity: No Growth
- Cytology: Negative for Intraepithelial Lesion or Malignancy • USG Abdomen & Pelvis:
 - Normal Anteverted Uterus (8.4 * 3.6 * 4 cm).
 - Myometrium appears homogeneous with no evidence of Focal Lesion. -Endometrial Lining is Central and Normal in thickness.
 - E.T. 5.2 mm.
 - B/L Ovaries: Normal
 - Hepatomegaly with Fatty Liver Grade 1.
 - Urine Routine & Micro: WNL
 - Hb: 12.4 gm%
- RBS: 89mg/dl

Samprapti Ghataka

Dosha: Vata Kapha

Dushya: Rasa, Rakta, Mamsa

Srotasa: Rasavaha, Raktavaha, Mamsavaha, Aartavavaha

Agni: Jatharagni & Dhatvagni Mandya

Srotodushiti: Atipravritti, Sira Granthi

Udbhava Sthana: Aamashaya, Pachyamanashaya

Vyakti Sthana: Garbhashaya Mukha

Roga Marga: Madhyama

Treatment Protocol

1. *Yoni Dhavana* – Triphala Kashaya – once in a day up to 7 days.
2. *Apamarga Kshara Pratisarana* once in a day up to 7 days.
3. *Yoni Pichu* – *Jatyadi Taila* – once in a day up to 7 days.
4. *Tab. Pradarantak Rasa* 1 tab twice a day after meal with *Tandulodaka* up to 15 days. (1 Tab – 125 mg)
5. *Tab. Triphala Guggulu* 1 tab thrice a day after meal with warm water up to 1 month.
6. *Tab Chandraprabhavati* 2 tab twice a day after meal with warm waater up to 1 month.

Pathya-Apathya

Pathya: Drink warm Jeera water, Buttermilk, and green gram water, maintain personal hygiene, and avoid common toilets.

Apathya: Curd, Sour items, Rice, White flour, Chickpea flour, oily food items, salty food, etc.

Yatri Kanubhai Thakker and Mauli Vaishnav

RESULTS AND DISCUSSION

The Ayurvedic management of cervical erosion emphasizes addressing the root cause through a comprehensive approach that includes both systemic and local treatments. This case study explores the efficacy of Ayurvedic formulations and therapeutic procedures in promoting tissue repair and restoring cervical health. The results emphasise the significance of a personalized treatment strategy based on the evaluation of *Samprapti* (pathogenesis) and *Dosha* imbalances.

Effects of *Triphala Kwatha Yoni Prakshalana*

Triphala Kwatha can be effective in cervical erosion by its *Sodhana* (Purifying), *Ropana* (Healing), *Vedana Samaka* (Pain Relieving) and *Rasayana* (Rejuvenating) Properties. It is *Tridosha Samaka* (*Vata*, *Pitta*, *Kapha* Pacifying). It also exhibits *Sangrahi* (Astringent Property) and *Lekhana* (Scraping) properties which are essential for healing the *Vrana*. [10] By *Ropana* property it promotes the growth of healthy tissues at the place of displaced tissue, which helps in correction of cervical erosion. Chronic inflammation is deleterious and affects most major chronic health conditions. *Triphala* has shown promise as an anti-inflammatory agent. In one study, *Triphala* performed better or equivalent when compared with standard drug treatment for a variety of biochemical measurements of inflammation.[11] In addition, *Triphala* significantly reduced inflammatory markers as well as bone and cartilage degradation in arthritic rats. [12] *Triphala* reduces the expression of inflammatory mediators such as IL-17 (interleukin), COX-2 (cyclooxygenase), and RANKL (receptor activator of nuclear factor kappa-B ligand) through inhibition of NF- κ B (nuclear factor kappa B) activation. Another study found that *Triphala* increased antioxidant levels and decreased lipid peroxidation in the tissues of arthritic rats.[13] In lipopolysaccharide-stimulated macrophages, *Triphala* treatment suppressed the production of inflammatory mediators such as TNF α (tumor necrosis factor alpha), IL-1 β , IL-6, MCP-1 (Monocyte Chemoattractant Protein-1), VEGF (vascular endothelial growth factor), NO (nitric oxide), and PGE2 (Prostaglandin E2), intracellular free radicals, inflammatory enzymes (such as iNOS (inducible nitric oxide synthase) and COX-2), and lysosomal enzyme release.[14] Chebulagic acid, a constituent in *Triphala*, was found to inhibit COX and 5-LOX (5-lipoxygenase), which are both major enzymes involved in inflammation and carcinogenesis.[15]

Effects of *Apamarga Kshara Pratisarana*

Apamarga Kshar acts as *Ksharana* (Corrosive) [16], *Ropana* (Healing) [17], *Lekhana* (Scraping) [18], *Shodhana* (Purification) [16]. Its unique ability to remove unhealthy tissue and promote healing makes it a valuable intervention in cervical erosion. The ethanolic extract of *Apamarga* (*Achyranthes aspera*) exhibits significant anti-inflammatory activity by inhibiting pro-inflammatory cytokines as IL-6 and TNF- α . [19] Methanolic extracts of *Achyranthes aspera* have shown free radical scavenging activity, attributed to its phenolic and flavonoid content. [20] *Apamarga* enhances epithelialization, attributed to its high glycoside and saponin content. [21] This is how *Apamarga Kshara* works being effective in cervical erosion.

Effects of *Jatyadi Taila Yoni Pichu*

Jatyadi Taila balances *Pitta* and *Kapha Doshas*, promotes *Ropana* (healing), and acts as a *Shodhana* (cleansing) agent for the vaginal mucosa. Its *Snigdha* (unctuous) and *Sheetala* (cooling) properties reduce inflammation, alleviate burning sensation, and aid tissue regeneration.[22] It's Analgesic, cooling [23], Anti-Microbial, and Anti-Inflammatory [24] effects help reversing the pathogenesis. **Pradarantaka Rasa** contains *Shuddha Parada* (Purified Mercury), *Shuddha Gandhaka* (Purified Sulfur), *Abhraka Bhasma* (Calx of Mica), *Tamra Bhasma* (Calx of Copper), *Shuddha Hingula* (Purified Cinnabar), *Kukutaandatvak Bhasma* (Calx of Hen's Eggshell), *Nagavalli Swarasa* (Juice of Betel Leaf). These drugs are having *Tridoshaghna* (*Vata*, *Pitta*, *Kapha* pacifying property), *Rasayana* (Rejuvenating), *Shothahara* (Anti-Inflammatory property) with *Pradarnashak* (discharge pacifying) property. *Kashaya* (Astringent) and *Tikta Rasa* (Bitter Taste) help in the reduction of vaginal discharge.[25,26] Ingredients of *Pradarantaka Rasa* are Anti Inflammatory [27], Antimicrobial [28], Tissue Regeneration and Healing [29] and Anti-Oxidant [30] Activities, helps in restoring normalcy of cervical erosion.

Yatri Kanubhai Thakker and Mauli Vaishnav

Triphala Guggulu has *Daha Shamana* (Reduce Burning), *Vedanahara* (Pain Relieving), *Vrana Sodhana* (Wound Purifying) and *Ropana* (Healing) Properties. So, it is useful in the treatment of erosion. Additionally, *Triphala Guggulu* has been shown to have anti-inflammatory, anti-oxidant, and wound-healing qualities. [31,32,33] **Chandraprabha Vati** is a *Guggulu Kalpana Kharaliya Rasayana* which acts as *Rasayana* (rejuvenator), *Srotoshodhaka* (cleaner of channels), and *Vedanasthapaka* (analgesic) also.[34] Its ingredients also have Anti-Inflammatory [35], Anti-Microbial [36], and Astringent and Haemostatic [37] properties which are core in the management of erosion. Combining systemic medicines and local procedures is a successful Ayurvedic therapy strategy for cervical erosion. Using formulations like *Triphala Guggulu*, *Chandraprabha Vati*, etc. and local procedures like *Yoni Prakshalana* (vaginal wash), *Kshara Pratisarana* (medicated alkali) & *Yoni Pichu* (medicated tampon) aid in the healing process and lessen inflammation. In addition to dietary support and lifestyle changes improve tissue repair, fortify reproductive health, and stop recurrence.

CONCLUSION

A comprehensive strategy is necessary for the optimal therapy and restoration of cervical health in cases of cervical erosion. By combining internal medications, local treatments like *Yoni Dhavana* (Vaginal Douch), *Kshara Pratisarana* (Medicated Alkali Application) and *Yoni Pichu* (Vaginal Swab) as well as lifestyle changes, Ayurveda, with its tried-and-true principles and therapeutic methods, provides hopeful solutions. In addition to nutritional and behavioral advice, formulas such as *Pradarantaka Rasa*, *Triphala Guggulu*, and *Chandra Prabha Vati* combinedly provide a comprehensive approach to the problem by addressing its underlying cause, reducing symptoms, and encouraging tissue replacement to its normal state.

ABSTRACT

Arsenic toxicity poses a significant threat in West Bengal, India. Nearly half of the state in India is affected by this hazardous metal. Geological studies have identified the layers and conditions contributing to arsenic contamination in the lower Gangetic delta. Prolonged exposure to arsenic has led to various health issues, including skin disorders, respiratory problems, cardiovascular diseases, and hematological conditions. Additionally, chronic exposure has been linked to diabetes, genetic damage, and cancer-related complications. This study examines the current status of arsenic contamination, the geological framework of the region, and the physiological and biochemical impacts of prolonged arsenic exposure on human health.

Keywords: Geological studies have identified the layers and conditions contributing to arsenic contamination in the lower Gangetic delta.

INTRODUCTION

Groundwater pollution, particularly arsenic contamination, has become a serious environmental and health crisis in West Bengal, India. Arsenic contamination in the state is primarily associated with geological formations in the lower Gangetic delta, where naturally occurring arsenic deposits leach into groundwater sources (Ghosh &Kanchan, 2011). The problem is exacerbated by human activities, such as excessive groundwater extraction for irrigation and drinking purposes, which mobilize arsenic from sediments into the water supply (Farooq *et al.*, 2010). Districts like Murshidabad and Nadia are among the most affected, with several blocks showing arsenic levels well above the World Health Organization's permissible limit of 10 µg/L (IOSR Journals, 2013).The health impacts of arsenic exposure in these regions are significant and widespread. Long-term ingestion of arsenic-contaminated water has

91679

**Paramita Bhattacharyya**

been linked to skin disorders, respiratory issues, cardiovascular diseases, and hematological conditions. Additionally, chronic exposure increases the risk of serious conditions such as diabetes, genetic damage, and cancers, including skin, bladder, and lung cancers (Stüben *et al.*, 2003). Affected communities, particularly in rural areas, often lack access to adequate healthcare, making the detection and treatment of arsenicosis—chronic arsenic poisoning—a challenge (IOSR Journals, 2013). Addressing this issue requires a multi-faceted approach that integrates scientific, legal, and community-based interventions. On the scientific front, studies suggest that deeper aquifers are less prone to contamination, indicating that shifting water extraction from shallow to deeper sources could mitigate risks (Stüben *et al.*, 2003). Legal interventions are equally critical. Although the Indian government has implemented various policies to regulate groundwater use and monitor water quality, enforcement remains weak in many regions. Public awareness campaigns and community participation are essential to ensure that individuals understand the risks associated with contaminated water and adopt safe practices, such as using arsenic filtration systems and rainwater harvesting (Ghosh & Kanchan, 2011). This study aims to provide an overview of the extent and impact of arsenic contamination in West Bengal's groundwater, focusing on the challenges that hinder effective mitigation. It also examines existing solutions, including technological innovations and policy frameworks, and explores sustainable strategies for long-term water management. By analyzing the interplay of natural processes, human activities, and policy responses, the study seeks to offer actionable insights into combating arsenic contamination and safeguarding public health in the region.

MATERIALS AND METHOD

The methodology for the work has been structured to ensure inclusive data collection, analysis, and interpretation. This methodology encompasses various phases, including literature review, field study, data collection, analysis etc. To assess the current state of groundwater quality in various regions of West Bengal researcher Selected multiple sites across arsenic-affected districts, including Murshidabad, Nadia, and Malda. Researcher tested water samples for arsenic levels. Mostly the researcher depends on secondary data. The researcher has conducted surveys using questionnaires to gather information on health effects experienced by individuals consuming contaminated water. Focus on skin disorders, respiratory issues, and gastrointestinal problems.

RESULT AND DISCUSSION

The stratigraphic assessment of arsenic-prone aquifer zones in southern West Bengal indicates that these aquifers lie beneath the alluvial plains (Ghosh & Kanchan, 2011). The Young Delta Plain (YDP) consists of a soil layer measuring 1 to 2 meters in thickness, capped with soft iron-manganese concretions up to 0.2 meters thick, and underlain by calcrete deposits (Farooq *et al.*, 2010). In this region of the Bengal Basin, particularly around the Bhagirathi River, distinct morphostratigraphic units have been identified in the subsurface; however, deeper layers of the YDP remain poorly exposed (Stüben *et al.*, 2003). Identifying the Quaternary section has proven challenging, yet borehole data from the western Gangetic plains primarily reveal sequences of clay and sand that formed in saline conditions and contain microfossils dating back to the Upper Pliocene epoch (Stüben *et al.*, 2003). Notably, the Toba-ash bed marker, dating back approximately 75,000 years, has been identified in the lower parts of the Quaternary profiles of the Brahmani and Barakar River regions, situated just west of the Ganga-Brahmaputra basin margin (Ghosh & Kanchan, 2011). Arsenic-bearing aquifers are found within the Holocene sediments located beneath the YDP. These contaminated sediments have partially extended into the Barind region, which lies north of the Ganges channel, particularly affecting areas such as the Malda district (Table 1). The valleys of the Holocene are filled with silt and clay, which have been deposited in deeply eroded and incised Pleistocene Barind sediments (Table 2) (Stüben *et al.*, 2003). Based on lithological analyses from groundwater drilling and the examination of heavy mineral content, districts in West Bengal impacted by arsenic contamination have been categorized into three stratigraphic zones, determined by the subsurface sediment characteristics beneath the Young Delta Plain in both northern and southern parts of the state (Ghosh & Kanchan, 2011; Farooq *et al.*, 2010).

**Paramita Bhattacharyya**

The stratigraphic assessment of aquifer zones vulnerable to arsenic contamination in southern West Bengal shows that these aquifers are situated beneath the alluvial plains. The Young Delta Plain (YDP) is characterized by a soil layer that ranges from 1 to 2 meters in thickness, capped with soft iron-manganese concretions up to 0.2 meters thick and underlain by calcrete deposits. In the Bengal Basin, especially near the Bhagirathi River, various morphostratigraphic units have been identified in the subsurface, although deeper layers of the YDP remain largely hidden. Identifying the Quaternary section has posed challenges, as borehole investigations primarily reveal a sequence of clay and sand deposits formed in saline environments, which contain microfossils that date back to the Upper Pliocene Cebrian, M. E., Albores, A., Aguilar, M., *et al.* (1983). A significant marker, the Toba-ash bed, estimated to be about 75,000 years old, has been found in the lower portions of the Quaternary profiles of the Brahmani and Barakar River regions, located just west of the Ganga-Brahmaputra basin margin Acharyya, S. K., Lahiri, S., Raymahashay, B. C., *et al.* (1999). The Holocene sediments situated beneath the YDP harbor arsenic-laden aquifers, and these contaminated sediments have encroached into the Barind area, particularly affecting the Malda district, which lies to the north of the Ganges channel Das, A. (2015). The valleys formed during the Holocene period are filled with silt and clay, which have been deposited in deeply eroded and incised sediments from the Pleistocene Barind (Table 2). Through lithological analyses from groundwater drilling and assessments of heavy mineral content, the arsenic-impacted districts in West Bengal have been divided into three stratigraphic zones based on the characteristics of subsurface sediments located beneath the YDP across both northern and southern regions of the state Hotta, N. (1989).

Effect and Challenges to Arsenic Pollution**Skin Diseases**

Chronic arsenic exposure from contaminated drinking water leads to significant skin conditions, notably pigmentation and keratosis. A population-based survey in West Bengal, which included 4,093 females and 3,590 males exposed to arsenic, indicated that men experienced two to three times more severe skin issues than women. In addition to skin lesions, chronic arsenic toxicity results in various systemic health problems (Adhikary & Mandal, 2017, p. 106).

Respiratory Diseases

Long-term consumption of arsenic-laden water (800 mg/L) has been linked to non-malignant lung diseases. Approximately 38% of those exposed reported chronic cough, compared to just 3.1% among the unexposed. Furthermore, chronic lung diseases were prevalent in 57% of individuals suffering from arsenic toxicity (Adhikary & Mandal, 2017, p. 106).

Gastrointestinal Disorders

Dyspepsia emerges as the most common gastrointestinal symptom, affecting 38.4% of those chronically exposed to arsenic. Additionally, gastroenteritis has been attributed to drinking water with arsenic concentrations exceeding 50 mg/L. (Adhikary & Mandal, 2017, p. 106)

Nervous System Diseases

Chronic arsenic exposure can lead to peripheral neuropathy, with 47.4% of affected individuals experiencing symptoms like tingling, numbness, and limb weakness. Reports indicate a heightened incidence of cerebrovascular diseases and other neurological complications, including sleep disturbances and cognitive impairments. (Adhikary & Mandal, 2017, p. 106)

Cardiovascular Issues

A significant complication of chronic arsenic exposure is Blackfoot disease (BFD), affecting about 8.9% of the population in contaminated areas. Other vascular disorders, such as Raynaud's syndrome and acrocyanosis, have also been noted. Furthermore, arsenic exposure correlates with a 6.2% increase in hypertension prevalence in West Bengal.

**Paramita Bhattacharyya****Hematological Effects**

Both acute and chronic arsenic poisoning result in hematological issues like anemia, leucopenia, and thrombocytopenia. In West Bengal, around 50% of individuals exposed to arsenic-contaminated groundwater (200-2,000 mg/L) suffer from anemia. (Adhikary & Mandal, 2017, p. 106)

Diabetes

A dose-response relationship exists between cumulative arsenic exposure and the prevalence of diabetes mellitus, particularly in arsenic-endemic regions. Although significant increases in diabetes prevalence have been reported in Bangladesh, similar data for West Bengal is lacking. (Adhikary & Mandal, 2017, p. 106)

Arsenicosis and Cancer

Arsenic exposure significantly increases cancer risk, particularly for skin, urinary bladder, and lung cancers. In arsenic-affected villages in West Bengal, rates of skin cancer were recorded at 4.35%, with 0.78% for internal cancers. (Adhikary & Mandal, 2017, p. 106)

Genotoxic Effects

Prolonged arsenic exposure through drinking water is associated with genotoxic effects, including heightened chromosomal aberrations and increased formation of micronuclei in buccal and urothelial cells. In West Bengal, the frequency of micronuclei formation in peripheral lymphocytes, oral mucosa, and urothelial cells was nearly five times higher in exposed individuals compared to those unexposed. Monsur, M. H. (1995).

Addressing groundwater pollution and arsenic contamination in West Bengal involves several legal provisions and frameworks, including:

Water (Prevention and Control of Pollution) Act, 1974

This act establishes the Central and State Pollution Control Boards for the regulation and management of water quality, including the prevention of groundwater contamination.

Environment Protection Act, 1986

This law provides a framework for the protection and improvement of the environment, including regulations on hazardous substances and waste management that can affect groundwater quality.

Public Health Act, 1939

This act allows for the regulation of drinking water quality to prevent health hazards due to contaminated water supplies.

Right to Information Act, 2005

This act enables citizens to seek information regarding the quality of water and the efforts made by authorities to manage arsenic contamination. The Supreme Court of India has provided significant guidelines regarding groundwater pollution, particularly concerning arsenic contamination, through various landmark cases, notably the case of *M.C. Mehta vs. Union of India* (1996). In this case, the Court recognized the severe depletion of groundwater resources across the country and stressed the need for stringent regulation of groundwater extraction to mitigate pollution and protect public health.

CONCLUSIONS

Chronic arsenic poisoning from consuming groundwater contaminated with arsenic poses a significant health risk globally. It can lead to alarming health issues, including skin, liver, cardiovascular, respiratory, and gastrointestinal disorders, particularly concerning in today's fast-paced lifestyle. Furthermore, exposure may result in neurological problems and genotoxicity, which can cause severe genetic mutations. Geological and stratigraphic analyses indicate

**Paramita Bhattacharyya**

that the Ganga-Brahmaputra delta is particularly vulnerable due to the shallow nature of its lithological layers, heightening the urgency for effective interventions.

Legal Challenges

- Existing laws such as the Water (Prevention and Control of Pollution) Act, 1974 and the Environment Protection Act, 1986 may lack specific provisions for groundwater protection, leading to ineffective management of arsenic contamination.
- The Pollution Control Boards may face challenges in enforcing penalties due to bureaucratic hurdles and lack of resources, allowing violators to escape legal consequences.
- Inadequate monitoring of groundwater quality and lack of transparency in reporting hinder legal actions against polluters.
- Under the Right to Information Act, 2005, while communities can seek information, there is often insufficient awareness on how to effectively utilize this right for groundwater protection.
- Determining liability under existing laws can be difficult, particularly when pollution sources are diffuse, as seen in agricultural runoff.

Suggestions

- Revise the Water (Prevention and Control of Pollution) Act to include specific provisions for groundwater quality monitoring and standards, especially concerning arsenic levels.
- Empower the West Bengal Pollution Control Board with more resources and authority to enforce environmental regulations effectively.
- Implement a robust groundwater monitoring system under the National Water Policy, 2012, ensuring regular testing for arsenic and other contaminants.
- Conduct outreach programs to educate communities on their rights under the Right to Information Act and how to report violations effectively.
- Establish legal aid clinics focusing on environmental law to assist affected communities in filing claims and navigating legal processes related to groundwater pollution.
- Work with non-governmental organizations to develop community-led monitoring programs and awareness campaigns regarding arsenic contamination.
- Allocate funds for research on innovative water purification technologies under the Ministry of Environment, Forest and Climate Change, focusing on arsenic removal methods.
- Encourage the adoption of sustainable farming practices that reduce chemical runoff, supported by state and central government schemes.

By addressing these legal challenges and implementing targeted solutions, West Bengal can enhance its efforts to combat groundwater pollution and protect public health.

ABSTRACT

The evolution of analytical methods in pharmaceuticals is crucial due to regulatory requirements. The identification of an Active Pharmaceutical Ingredient and excipients can only be achieved when the testing method is validated according to ICH, WHO guidelines or GMP standards. The reliability of evolution hinges on the adherence to an accurate and precise strategy. This discussion focuses on the systematic method development techniques and validation parameters. High Performance Liquid Chromatography (HPLC) is a method employed to separate components from a mixture. This technique involves two phases; the stationary phase and the mobile phase. The separation of components relies on variations in partition coefficient between the stationary and mobile phase. This review article emphasizes the development and validation of methods by using HPLC. It plays an important role in the discovery, development, manufacturing of pharmaceutical drugs and various other studies related to plants and animals. An analytical method is established to evaluate a key characteristic of products or drug substance in relation to predefined acceptance criteria. The validation of HPLC method, in accordance with ICH guidelines, encompasses all performance characteristics required for validation, including specificity, accuracy, precision, range, linearity, limit of detection, limit of quantification, robustness and system suitability testing.

Keywords: Chromatography, validation, Accuracy, Linearity, Robustness.

INTRODUCTION

High-Performance Liquid Chromatography (HPLC) technique which enables the separation of components by distributing them between two immiscible phases; a mobile phase and a stationary phase. It has become one of the most effective tools in analytical chemistry, capable of separating, identifying, and quantifying compounds in any liquid-soluble sample. It is recognized as the most precise analytical method commonly employed for both the quantitative and qualitative analysis of pharmaceutical products.(1). HPLC is advanced type of column chromatography. Unlike traditional chromatography, where the solvent typically flows through the column by gravity. HPLC utilize high pressure up to 400 atmospheres to propel the solvent. This technique allows for the effective separation of sample components based on their varying affinities. In High-Performance Liquid Chromatography (HPLC), pumps are used to deliver a pressurized liquid solvent that contains the sample mixture into a column packed with solid adsorbent material. Each component of the sample interacts differently with the adsorbent, resulting in varying flow rates for each substance. This variation in flow rates allows for the separation of the components as they move through the column. In essence, chromatography can be viewed as a mass exchange process that involves adsorption.(2) High-Performance Liquid Chromatography (HPLC) comprises several essential components: a column filled with a stationary phase, a pump that drives the mobile phase through the column, and a detector that records the retention times of various molecules. The retention time is affected by the interactions between the stationary phase, the analytes under examination, and the solvents utilized. When samples are introduced in small quantities into the mobile phase stream, they undergo different levels of retardation due to specific chemical or physical interactions with the stationary phase. This retardation is influenced by both the properties of the analyte and the compositions of the stationary and mobile phases. Retention time refers to the duration it takes for a particular analyte to elute from the system. Common solvents used in HPLC include any miscible combinations of water and organic liquids. Gradient elution techniques are often applied to adjust the composition of the mobile phase during analysis, facilitating the separation of analyte mixtures based on their affinity for the current mobile phase. The choice of solvents, additives, and gradients is determined by both the characteristics of the stationary phase and the nature of the analytes involved.(3)

METHOD DEVELOPMENT(4)

Method development by HPLC method involves following steps;

1. Understand the physicochemical properties of the drug molecule
2. Selection of chromatographic conditions
3. Developing the approach of analysis
4. Sample preparations
5. Method optimization

Understand the physicochemical properties of drug molecule

The physicochemical properties of drug molecule are essential for method development. Initially, it is important to assess the physical properties of the drug including polarity, solubility, pH and pKa. The polarity of a substance aids analysts in determining the appropriate composition of solvent and mobile phase. This relationship between polarity and solubility explains that compounds with similar polarities tend to dissolve in one another. Therefore, the solubility of the analyte is crucial for selecting suitable diluents. The pH value is a key factor in defining an acidity or basicity of substance. Selecting the correct pH for ionizable analytes often leads to symmetrical and sharp peaks in High-Performance Liquid Chromatography (HPLC). The pH is mathematically defined as the negative logarithm(base10) of the hydrogen ion concentration. $pH = -\log_{10}[H_3O^+]$ Choosing the right pH for ionizable analytes in HPLC often leads to sharp and symmetrical peaks. In quantitative analysis, these well-defined peaks are essential for achieving low detection limits, minimizing relative standard deviations between injections, and ensuring consistent retention times.(5)

**Selection of chromatographic conditions**

In the initial phases of method development, a preliminary set of conditions comprising the detector, column, and mobile phase is selected to produce the first "scouting" chromatograms for the sample. These conditions are usually centered around reversed-phase separations utilizing a C18 column with UV detection. At this stage, a decision must be made regarding whether to implement an isocratic or gradient elution method.(6)

Selection of column

The first and critical step in developing a method for High-Performance Liquid Chromatography (HPLC) is choosing the right stationary phase or column. A stable, high-performance column is vital for establishing a reliable and reproducible analytical procedure. Without an appropriate column, problems may occur due to inconsistent sample retention during the method development process. Generally, a C8 or C18 column constructed from highly purified, less acidic silica is recommended for separating basic chemicals and is versatile enough for a variety of sample types.

Column Diameter: The internal diameter can affect resolution and sensitivity.

Silica Substrate Quality: The purity and treatment of the silica influence performance.

Bonded Stationary Phase Characteristics: Different phases (e.g., C8, C18) provide varying selectivity and retention properties. Silica-based packing is favored in most contemporary HPLC columns due to its desirable physical properties. The primary components of HPLC column include the matrix, hardware and stationary phase. While silica is the most common matrix used, alternatives like polymers, alumina, and zirconium can also support the stationary phase. Silica matrices are particularly valued for their strength, ease of derivatization, consistent sphere sizes and resistance to compression under pressure. Additionally, they demonstrate chemical stability with most organic solvents and low pH solutions. However, limitation of silica as a solid support is its solubility at pH levels above 7, which can compromise its integrity in certain applications. Thus, careful consideration of pH stability alongside other factors is critical when selecting an HPLC column for specific analytical needs.(7)

Selection of chromatographic mode

The selection of chromatographic modes is affected by the molecular weight and polarity of the analyte. This discussion will concentrate on reversed-phase chromatography (RPC), which is the most commonly used technique for separating small organic compounds. RPC is especially effective for the separation of ionizable substances, such as acids and bases, by using buffered mobile phases to keep the analytes in their non-ionized state or by employing ion-pairing reagents.

Buffer selection

Various buffers, including potassium phosphate, sodium phosphate, and acetate, were evaluated for their compatibility factors and overall chromatographic performance.

General consideration for buffer selection;

Phosphate exhibits greater solubility in methanol/water mixtures than in acetonitrile/water or THF/water combinations. This property can significantly affect the selection of mobile phases in chromatography, particularly since some salt buffers are hygroscopic, which can lead to chromatographic challenges such as increased tailing of basic compounds and potential selectivity issues. Generally, ammonium salts are more soluble in organic/water mobile phases, making them advantageous for specific applications. Trifluoroacetic acid (TFA) is recognized for its volatility and low UV absorbance at certain wavelengths; however, it is prone to degradation over time, which requires careful handling. Additionally, microbial growth poses a risk in buffered mobile phases with minimal organic modifiers, as it can rapidly develop and accumulate on column inlets, negatively impacting chromatographic performance.(8) At pH levels above 7, phosphate buffers can significantly increase the dissolution of silica, which may lead to a reduced lifespan for silica-based HPLC columns. Consequently, it is recommended to use organic buffers when operating at elevated pH values. Ammonium bicarbonate buffers are particularly vulnerable to

**Ashwini Waghchaure and Sharmila Naykar**

fluctuations in pH and generally remain stable for only 24 to 48 hours. The release of carbon dioxide from these buffers tends to raise their basicity over time. To maintain optimal performance and prevent contamination or degradation of mobile phases, it is crucial to filter buffers through a 0.2 μm filter and degas them prior to use.(9)

Buffer concentration

A buffer concentration ranging from 10 to 50 mM is typically adequate for small molecules. Generally, a buffer should not exceed 50% organic content, which is influenced by the specific buffer type and its concentration. The most frequently employed buffer systems in reversed-phase HPLC are phosphoric acid and its sodium or potassium salts. For the analysis of organophosphate compounds, sulfonate buffers can serve as an alternative to phosphonate buffers.(10)

Selection of mobile phase

The mobile phase is essential in reverse-phase high-performance liquid chromatography (RP-HPLC) as it significantly influences resolution, selectivity, and efficiency. The solvent composition, particularly its strength, is critical for effective separation. Common solvents used in RP-HPLC include acetonitrile (ACN), methanol (MeOH), and tetrahydrofuran (THF), which have UV cut-off wavelengths of 190 nm, 205 nm, and 212 nm, respectively. These solvents are completely miscible with water. When developing RP-HPLC methods, starting with a mixture of acetonitrile and water is often the most effective approach for the mobile phase.(11)

Selection of detectors

The detector is crucial in High-Performance Liquid Chromatography (HPLC). Several factors influence the choice of detector, such as the chemical composition of the samples, possible interferences, required detection limits, availability, and costs. Commonly used commercial detectors in liquid chromatography include UV detectors, fluorescence detectors, electrochemical detectors, refractive index (RI) detectors, and mass spectrometry (MS) detectors. Ultimately, the selection of a detector is determined by the specific properties of the sample and the goals of the analysis.(12)

Developing the approach of analysis

The development of an analytical method for Reversed Phase High-Performance Liquid Chromatography begins with the careful selection of various chromatographic parameters. These include the column, flow rate, mobile phase and pH, all of which are determined through a series of trials. Once these parameters are established, they are assessed against system suitability criteria.

System suitability parameters;

- Retention time: Should exceed 5 minutes
- Theoretical Plate Count: Must be greater than 2000
- Tailing factor: Should be less than 2
- Resolution: Needs to be over 5

Percent Relative standard Deviation (R.S.D.)

The area of analyte peaks in standard chromatogram should not exceed 2%. In methods that involve the simultaneous estimation of two components, the detection wavelength is usually set at an isosbestic point, where the absorbance of both species is equal. After optimizing these parameters, the laboratory combination is tested to assess the feasibility of the proposed method for simultaneous estimation. Following this, the marketed formulation is analyzed by diluting it to ensure it falls within the established concentration range for linearity. This systematic approach guarantees that the developed RP-HPLC method is both reliable and efficient for quantitative analysis in pharmaceutical applications.(13)

**Ashwini Waghchaure and Sharmila Naykar****Sample preparation**

Preparation of sample is a crucial phase in method development that analysts must thoroughly investigate. When dealing with samples containing insoluble components, it is essential to determine whether techniques such as centrifugation (including optimal rpm and duration), shaking or filtration are necessary. The primary objective is to ensuring that the filtering process does not compromise the analytical results by causing adsorption or extracting leachable substances.⁽¹⁴⁾ The effectiveness of syringe filters in removing contaminants and insoluble particles without introducing any unwanted impurities to a filtrate is a key factor in their selection. The analytical method should include a clearly defined sample preparation protocol which is used for actual in-process samples or dosage forms intended for subsequent HPLC analysis. This involves detailing the manufacturer, type, and pore size of the filter media. The primary goal of sample preparation is to produce a processed sample that yields more accurate analytical results than the raw sample. The prepared sample should be an aliquot that is largely free from interferences, compatible with the HPLC procedure, and safe for the column. This entails using a solvent that dissolves well in the mobile phase without negatively impacting sample retention or resolution. The process of sample preparation begins with sample collection and continues until the sample is injected into the HPLC column.⁽¹⁵⁾

The process involves several critical steps:

- **Sample Collection:** Utilize appropriate techniques to ensure representativeness and prevent contamination.
- **Sample Homogenization:** If necessary, achieve uniformity through methods like stirring or sonication.
- **Filtration:** Employ syringe filters to eliminate particulates that could hinder analysis, ensuring that selected filters do not leach contaminants into the sample.
- **Solvent Compatibility:** Ensure that the prepared sample dissolves effectively in the mobile phase used for HPLC, maintaining chromatographic integrity.

By adhering to these guidelines, analysts can prepare samples that are conducive to accurate and reliable HPLC analysis, ultimately leading to improved analytical performance.⁽⁸⁾

METHOD OPTIMIZATION

The traditional optimization of HPLC methods has often prioritized mobile phase conditions over stationary phase parameters, leading to an imbalance in method development. This approach can overlook essential interactions between the mobile and stationary phases that affect selectivity and resolution. Reliance on trial-and-error techniques, such as the one-factor-at-a-time approach, can result in inefficient testing processes and missed optimizations. Additionally, focusing narrowly on mobile phase optimization may not adequately address the variability introduced by different instrument setups or sample matrices, significantly impacting method performance and reproducibility. To enhance HPLC method optimization, several experimental design strategies can be employed. Chemometric approaches, including Full Factorial Designs (FFD) and Fractional Factorial Designs (FrFD), allow for the simultaneous evaluation of multiple variables, identifying significant factors and their interactions. Response Surface Methodology (RSM) can further explore relationships between experimental factors and responses, guiding the selection of optimal conditions. By utilizing screening designs and statistical analyses such as ANOVA, researchers can efficiently refine methods, addressing issues stemming from the traditional focus on mobile phase parameters. Assessing method performance in HPLC also involves investigating how various instrument setups and sample matrices influence results. Factors such as the type of detector used, column characteristics, and flow rates can vary significantly between different HPLC systems. Sample matrices play a crucial role as well; they can introduce matrix effects that alter retention times and peak shapes. Therefore, it is essential to evaluate method performance under various conditions to ensure robust method development. This comprehensive approach provides a clearer understanding of method robustness and reproducibility, leading to optimized conditions that effectively handle variability in real-world applications.⁽¹⁶⁾ The different components of the mobile phase—such as acidity, solvent type, gradient, flow rate, temperature, sample quantities, injection volume, and diluent solvent type—are crucial control variables for optimizing liquid chromatography (LC) methods. Once sufficient selectivity is attained, these factors play a key role in finding the optimal balance between resolution and

**Ashwini Waghachare and Sharmila Naykar**

analysis time. Furthermore, adjustments to parameters like column dimensions, particle size of the column packing, and flow rate can be made without impacting the capacity factor or selectivity.(10)

Key Factors Affecting HPLC Method Development(17)(15)

There are several key factors that can affect the development of a successful RPHPLC method. These factors can influence the separation and quantification of analytes in a complex mixture and can include the following:

- **Stationary phase:** The selection of the stationary phase is vital in the development of RP-HPLC methods. The surface chemistry of the stationary phase plays a key role in influencing its selectivity, capacity, and retention characteristics for different analytes. The most frequently utilized stationary phases in RP-HPLC include C18, C8, and phenyl-based phases. Choosing the right stationary phase is contingent upon the properties of the analytes and the desired separation mechanism.
- **Mobile phase:** The mobile phase plays a crucial role in the development of RP-HPLC methods. It must be optimized to achieve the desired selectivity, resolution, and sensitivity for the effective separation of analytes. Factors such as the ratio of water to organic solvent and the pH of the mobile phase can significantly influence the retention characteristics of the analytes.
- **Column dimensions:** The dimensions of a column, including its length and diameter, significantly influence the separation and quantification of analytes. Longer columns tend to enhance resolution, although they require more time for analysis. Conversely, wider columns can increase sample throughput, but this may lead to a decrease in resolution.
- **Flow rate:** The flow rate of the mobile phase in column significantly affects the separation and resolution of analytes. A flow rate that is too high may cause band broadening and reduced resolution, whereas a flow rate that is too low can lead to extended analysis times.
- **Gradient elution:** Utilizing a gradient elution profile can enhance the separation and resolution during the development of RP-HPLC methods. By adjusting the gradient, it is possible to optimize the separation of analytes according to their hydrophobic characteristics.
- **Detection method:** The selection of a detection method can significantly influence both the sensitivity and selectivity of the analysis. Common techniques include UV-Vis spectroscopy, mass spectrometry, and fluorescence spectroscopy. The appropriate detection method is determined by the characteristics of the analytes and the required sensitivity for the analysis.
- **Sample preparation:** Effective sample preparation is essential for successful development. This process may involve various steps, including extraction, purification, and derivatization, all aimed at enhancing the separation and quantification of analytes. The key factors that can affect RP-HPLC method development include the mobile phase, stationary phase, column dimensions, flow rate, gradient elution, detection method and sample preparation. Proper optimization of these factors can lead to the successful separation and quantification of analytes in complex mixtures.

Novel Technologies for RP-HPLC Method Development(18)

In recent years, new technologies have emerged to improve the efficiency and effectiveness of RP-HPLC method development. Here are some examples:

- **Advanced stationary phases:** The development of new stationary phases with improved selectivity and efficiency has been a major focus of research in RP HPLC method development. For example, core-shell particles have been developed with higher surface area and better packing efficiency than traditional fully porous particles.
- **Monolithic columns:** They are a single piece of stationary phase with a continuous network of pores. They offer faster separation times and lower backpressure than traditional particle-packed columns.
- **Ultra-High-Pressure Chromatography:** It uses columns packed with sub-2 μ m particles and operates at higher pressures than traditional HPLC, resulting in faster separations and improved resolution.
- **Two-dimensional liquid chromatography (2D-LC):** 2D-LC involves the separation of a sample using two different modes of chromatography. This technique can improve the separation of complex mixtures and has applications in proteomics and metabolomics research.

**Ashwini Waghchaure and Sharmila Naykar**

- **Intelligent software for method development:** Intelligent software can aid in method development by automatically selecting optimal parameters based on experimental data, reducing the time and effort required for optimization. Collectively, these novel technologies have the potential to significantly improve the efficiency, sensitivity and selectivity of RP-HPLC method development. Researchers and practitioners should keep abreast of these developments and consider their potential applications in their own work.

VALIDATION

Validation studies in the pharmaceutical industry have been a focus for many years, but recent trends indicate a growing interest in quality assurance programs, which are crucial for efficient manufacturing processes. The concept of validation originated in the United States in 1987 and has since evolved to encompass a broader range of activities. These activities now encompass not only analytical techniques for quality control of drug ingredients and products but also computerized systems utilized in clinical trials, process management, and labeling.⁽¹⁹⁾ Validation plays a crucial role in current Good Manufacturing Practices (cGMP). In simple terms, validation refers to the assessment of validity or the process of ensuring effectiveness. It is a collaborative effort that involves team members from various departments within the industry.⁽²⁰⁾

Importance of Validation⁽¹¹⁾

- Assurance of quality
- Time-bound
- Process optimization
- Reduction of cost
- Nominal mix-ups and bottlenecks
- Minimal batch failure improved efficiency and productivity
- Reduction in rejections
- Increased output
- Avoidance of capital expenditures
- Fewer complaints about the process related failures
- Reduced testing in process and in finished products
- More rapid and reliable start-up of new equipment
- Easier scale-up from development work
- Easier maintenance of equipment's
- Improved employee awareness
- More rapid automation

COMPONENTS OF METHOD VALIDATION⁽²¹⁾

- Accuracy
- Precision
- Linearity
- Limit of detection and quantitation
- Specificity
- Robustness
- Range

Accuracy

The accuracy of an analytical method indicates how closely the measured value corresponds to a recognized true value or accepted reference value. This concept, often referred to as "trueness," reflects the level of agreement between these values. To evaluate accuracy in practical terms, one calculates the difference between the mean value obtained from several measurements and the actual true value. This assessment involves applying the analytical procedure to samples with known concentrations of the analyte, ensuring that any potential interference is

**Ashwini Waghchaure and Sharmila Naykar**

considered by comparing the results with those from standard and blank solutions.(22)The accuracy is typically expressed as a percentage, reflecting the recovery rate of the analyte based on test results. Specifically, it is calculated as the percentage of the analyte recovered from the assay compared to the amount that was added. This metric serves as a crucial indicator of how well an analytical method performs in terms of measuring known quantities accurately.(23)

Precision

Precision denotes the degree of consistency among a series of measurements taken from multiple samples of a uniform material under controlled conditions. In analytical contexts, it reflects how closely related measurements are when derived from repeated analyses of the same sample. Precision is typically classified into three categories: repeatability, intermediate precision, and reproducibility. To quantify the precision of an analytical method, standard deviation or relative standard deviation of the dataset is commonly employed.(24) Precision denotes the consistency or repeatability of an analytical method under controlled conditions. Intermediate precision, commonly referred to as ruggedness, indicates the variability encountered within a laboratory environment, including variations that may occur on different days or with different analysts or equipment used in the same lab. To evaluate the precision of an analytical procedure, it is crucial to analyze a sufficient number of aliquots from a homogeneous sample to derive statistically reliable estimates of standard deviation or relative standard deviation.(15)

Linearity

Linearity refers to the capability of an analytical method to produce test results that are directly proportional to the concentration of the analyte within a specified range. When a method exhibits linearity, the test results correspond with the analyte concentration in samples, either directly or through a clearly defined mathematical transformation. This linearity is typically expressed in terms of the confidence interval surrounding the slope of the regression line. It is crucial to assess this linear relationship across the entire range of the analytical procedure. The proposed method involves demonstrating linearity directly with the drug substance by diluting a standard stock solution of the drug product components. According to ICH guidelines, at least five different concentrations should be utilized to establish linearity.(14)

Limit of Detection and Quantitation(25)

The limit of detection (LOD) refers to the minimum concentration of an analyte in a sample that can be identified, though not necessarily quantified accurately. In analytical methods characterized by baseline noise, LOD is often determined using a signal-to-noise (S/N) ratio of 3:1, which is typically expressed as the concentration of the analyte in the sample. Conversely, the **limit of quantitation (LOQ) is defined as the lowest concentration of an analyte that can be measured with acceptable precision and accuracy under specified operational conditions. The International Council for Harmonization (ICH) recommends a signal-to-noise ratio of 10:1 for LOQ. Both LOD and LOQ can be calculated using the standard deviation of the response (SD) and the slope of the calibration curve at concentrations near the LOD, employing the following formulas:

$$\text{LOD} = 3.3 \times \text{S/SD}$$

$$\text{LOQ} = 10 \times \text{S/SD}$$

Specificity

Specificity refers to the capability of an analytical method to accurately identify an analyte amidst other expected components, such as impurities, degradation products and matrix effects. When a method lack specificity, it may be complemented by additional analytical techniques to ensure accurate results. This definition encompasses several important aspects:

Implications of Specificity

- **Identification:** This involves confirming the identity of the analyte within a sample.

**Ashwini Waghchaure and Sharmila Naykar**

- **Purity Testing:** Various analytical processes must be conducted to ensure precise characterization of impurity concentrations in the analyte. This includes tests for related substances, heavy metals, and residual solvents.

In essence, specificity is crucial for ensuring that analytical results reflect the true concentration and identity of the analyte without interference from other substances present in the sample.(26)

Robustness

The robustness of an analytical method refers to its ability to maintain stability despite minor, intentional variations in parameters such as pH, mobile phase composition, temperature, and instrument settings. This characteristic indicates the method's reliability under standard operating conditions.(22)

Range

The method's range refers to the interval between the upper and lower levels of an analyte that can be measured with suitable precision, accuracy, and linearity.(22)

CONCLUSION

This review offers an extensive examination of the development and validation processes for HPLC methods. Key findings emphasize the necessity of optimizing critical parameters such as the mobile phase composition, stationary phase and column temperature. These optimizations are crucial for enhancing the accuracy, sensitivity, and selectivity of analyses, which can lead to improved product quality and safety, as well as better environmental protection. Future research directions in Reverse Phase (RP) HPLC method development should focus on investigating new stationary phases and column technologies. Additionally, there is a need for advancements in sample preparation techniques and optimization strategies. The integration of **artificial intelligence** and **machine learning** into RP HPLC method development could significantly accelerate and improve the efficiency of these processes. Overall, this review underscores the importance of ongoing innovation in HPLC method development and highlights the necessity for collaboration between academic researchers and industry practitioners to further advance this field.

CONFLICT OF INTEREST

There is no conflict of interest.

ACKNOWLEDGEMENT

I thank to Ms. Sharmila Naykar for their expertise and assistance throughout all aspects of our study for their help in writing this review article.

ABSTRACT

As ESG factors increasingly impact corporate performance and investment strategies investors, understanding their relationship with financial outcomes for business organisations and investors are crucial. This literature review synthesizes findings from 71 studies on ESG's effects on performance, strategies, and investor behavior. The review encompasses diverse methodologies, regions, and time periods, utilizing academic journals articles and book chapters from the most recent database i.e, 2020 to 2025 time period. The main aim is to investigate the link between ESG and its relationship with investors' behaviour, investment strategy and company's profitability. The paper identifies research trends, and pinpoint research gaps. Using the PRISMA framework, this study provides a thorough analysis of ESG factors influencing investment decisions and corporate success. By integrating existing literature, this research enhances the discourse on ESG integration and its financial market implications, suggesting future research pathways in these vital domains.

Keywords: ESG factors, company performance, investment strategies, investor behaviour, systematic review, PRISMA framework

INTRODUCTION

E, S and G refers to Environmental, Social, and Governance (ESG) factors. The term **Environmental, Social, and Governance (ESG)** was coined in a 2004 report titled *Who Cares Wins*, initiated by the United Nations Global Compact in collaboration with financial institutions. The report emphasized integrating ESG factors into financial markets to create sustainable and responsible investment practices. Since its inception, ESG has experienced exponential growth, driven by increasing awareness of climate change, social inequality, and corporate accountability. Regulatory developments, such as the European Union's Sustainable Finance Disclosure Regulation (SFDR), and global frameworks like the UN Principles for Responsible Investment (PRI), have further propelled ESG adoption. Today, ESG assets are projected to surpass \$50 trillion by 2025, reflecting its pivotal role in influencing corporate strategy, investor behaviour, and global sustainability goals. The Environmental (E) component concerns a firm's ecological impact, including its climate policies, pollution control, waste management, and resource conservation strategies. Firms with robust environmental practices are generally perceived as more sustainable, attracting environmentally-conscious investors (Kulal et al., 2023) (Ahmad et al., 2023). The Social (S) dimension examines a firm's relations with its employees, patrons, and the neighbourhood, addressing topics like human rights, labour conditions, community contributions, and diverse representation. Social considerations are vital for fostering a favorable corporate reputation and ensuring long-term viability (Bhattacharya, 2022) (Gaurav & Aman, 2022). The governance aspect (G) involves the internal structures within a company, the processes for making decisions, adhering to legal standards, and being attentive to what stakeholders require. Effective governance includes transparency, accountability, and ethical conduct, which are crucial for building investor confidence and maintaining corporate integrity (Lee & Suh, 2022) (Turek, 2022). Collectively, these ESG factors offer a holistic framework for evaluating a firm's non-financial performance and sustainability potential, thus gaining prominence in investment evaluations (Nazarova & Лаврова, 2022) (Panagopoulos & Tzionas, 2023). Corporations are increasingly implementing ESG frameworks to boost transparency, mitigate risk, and drive long-term value. Concurrently, investors regard ESG compliance as indicative of resilience and competitive strength in uncertain economic conditions. This study investigates the progression of ESG investing, the ways it shapes corporate financial outcomes, investment strategy, and the behaviour of investors as a result of ESG practices adopted by Business organisations. By examining current patterns and practical studies, this document aims to clarify the essential function of ESG in promoting sustainable corporate behaviours and investment strategies.

RESEARCH QUESTIONS

1. What does the existing literature reveal about the integration of ESG practices or factors in companies and investors' decision-making process?
2. What are the unexplored research gaps for future research opportunities?

RESEARCH METHODOLOGY

To gather articles for this review, a comprehensive keyword search was conducted across various open-access databases and search engines, including SSRN, Google Scholar, Research Gate, Shodhganga, and DELNET, alongside selective use of subscription-based databases such as Scopus and the Web of Science. While numerous studies have been conducted on this topic since 2004, the focus was narrowed to literature published from 2020 onward to incorporate the most recent advancements in the field. Only peer-reviewed journal articles and book chapters were included in the review. To ensure a systematic and rigorous approach, the PRISMA framework was employed, facilitating a structured and transparent methodology for identifying, screening, and selecting relevant literature. This approach encompassed a thorough examination of both academic and grey literature sources, emphasizing a global perspective rather than focusing on specific demographics, to provide a holistic understanding of the research

domain. A total of 117 records were identified through database searches in Scopus, Web of Science, and open-access sources using keywords related to ESG, sustainability, investment, financial performance, and corporate strategies. After removing 22 duplicate records, 95 articles were screened for relevance. A further 24 articles were excluded based on language, publication period (2020-2025), study design, target topic relevance, and full-text availability, resulting in 71 full-text articles assessed for eligibility. Among these, 42 studies were included in qualitative synthesis, while 29 were selected for quantitative synthesis (meta-analysis). Ultimately, 71 articles formed the basis of the final synthesis, ensuring a comprehensive evaluation of ESG-related financial literature. The categories were created through an inductive process, starting with a careful review of the article abstracts (and sometimes the full text when the abstract was unclear or insufficient). This allowed us to identify the central focus of each study and spot common themes and distinctions across the articles. The criteria for categorizing the articles were based on their primary objectives, as well as a deeper understanding of their key findings. This process helped us identify areas that require further research and shed light on potential gaps in the field.

REVIEW OF LITERATURE DISCUSSION

The current body of knowledge reveals the vital importance of Environmental, Social, and Governance (ESG) components in directing investors' behavioural patterns, corporate financial results, and strategic investment frameworks. Governance and environmental criteria consistently emerge as pivotal determinants of investor choices, with younger investors demonstrating a pronounced propensity for sustainability, albeit characterized by a relatively low level of practical implementation. The effectiveness of ESG metrics shows a favourable connection with financial measures like Return on Assets (ROA) and Return on Equity (ROE), aiding in reducing risks during market declines; nevertheless, its effect on stock performance and shareholder returns seems to vary across different regions and sectors. In terms of investment strategies, the integration of ESG considerations enhances the quality of investment portfolios, diminishes volatility, and bolsters long-term sustainability objectives, particularly within institutional investment frameworks. Nonetheless, obstacles such as disparate disclosure standards and a lack of awareness in certain geographic areas persistently impede the effectiveness of ESG integration. These findings reinforce the critical role of ESG in promoting sustainable investment practices while simultaneously identifying avenues for further scholarly inquiry.

RESEARCH GAP

Despite extensive research on ESG factors and their impact on financial performance and institutional investment strategies, limited studies explore the nuanced relationship between ESG factors and individual investors. The existing literature predominantly focuses on institutional portfolios, leaving a gap in understanding how individual investors perceive and integrate ESG considerations into their decision-making processes. While governance and environmental criteria are consistently identified as critical drivers, the role of social factors remains underexplored, particularly in the context of personal investment preferences. Furthermore, variations in regional awareness, disclosure quality, and accessibility of ESG-related information hinder insights into the behaviour of individual investors across different demographics and markets. Despite significant studies conducted in other developing countries, research in the Indian context, especially in metropolitan cities where the majority of investors reside and ESG issues are more persistent, remains scarce.

CONCLUSION

This systematic literature review elucidates the dynamic interplay between investors' behaviour, company performance and ESG factors. It underscores the intricate nature of ESG adoption, particularly among individual investors in India's urban centres. Despite advancements in understanding institutional investment, a notable deficiency exists in grasping how individual investors assimilate ESG considerations. Additionally, the influence of social dynamics and regional disparities in investment practices, especially within developing contexts like India, necessitates further investigation. This study establishes a robust basis for subsequent research that could explore sector-specific details and demographic influences, thereby enhancing strategies for promoting ESG adoption among individual investors.

Table 2: Thematic categorisation of literature

Categories	Coding Criteria (Based on Objectives)	No of articles (71)
Investors response to ESG information and their behaviour	How do ESG factors impact investor decisions globally?	33
	What role does ESG data play in retail investment choices?	
	How do emotions affect ESG returns and volatility?	
	What drives Generation Z's interest in ESG investments?	
	How does corporate reputation influence ESG investment behaviour?	
ESG as an investing strategy	How do ESG factors influence investment strategy and decision-making?	15
	What is the role of ESG in optimizing portfolio performance?	
	How can investors integrate ESG principles into their investment strategies?	
	What impact do ESG disclosures have on investment strategy formulation?	
ESG practices and company's performance	What is the impact of ESG scores on the financial performance of companies?	23
	How do ESG ratings influence key financial metrics like ROA, ROE, and net profit margin?	
	How do ESG factors affect corporate profitability and stock prices or investment outcomes?	

Table:3 ESG factors and Investment Behaviour

S No	Authors	year	Purpose of the study	Findings
1	Ahmed El Oubani	2024	This research explores how investor emotions correlate with the returns and volatility of ESG indices in Morocco and Egypt, especially during key occurrences like COVID-19 and geopolitical conflicts	Investor sentiment notably affects ESG index returns and volatility, particularly in times of distress. When things are running smoothly, short-term spillovers are usual, yet during crises, long-term spillovers become increasingly noticeable.

Vasudha Srivatsa and Bhavya Vikas

2	Kirti Sood, Prachi Pathak, Sanjay Gupta	2024	The research seeks to ascertain the prioritization of investment decision determinants by individual equity investors in the Indian stock market.	The foremost criteria included information accessibility, psychological heuristics, and economic indicators. The lesser criteria encompassed environmental concerns, broker advisements, and social matters.
3	Qianqian Lia , Edward M. Wattsb , and Christina Zhu	2024	To examine if retail investors integrate ESG news in their investment decisions in the US.	The findings suggest that retail investors consider ESG news. They prioritize financial outcomes of ESG news over non-financial preferences.
4	SWIKRITI UPADHYAY	2024	The research scrutinizes the ramifications of Environmental, Social, and Governance (ESG) criteria on the performance results of individual investors. It aims to elucidate the effects of ESG considerations on portfolio performance, risk management, and investor contentment.	Empirical evidence indicates a positive relationship between robust ESG performance and individual investor results. Businesses that achieve elevated ESG ratings generally reflect improved financial success, decreased capital expenditures, and optimal risk-adjusted earnings.
5	Wenzhou Qu and Zekai Su	2024	The study investigates the influence of fund signals, especially ESG ratings, on the investment behavior of Chinese investors and the resultant economic effects	Chinese investors frequently prioritize high-yield and well-rated funds, often overlooking ESG ratings. While traditional indicators like past performance do not reliably forecast favorable returns, ESG ratings demonstrate significant positive predictive capability.
6	XiaojiaZhang , Li Ma and Miao Zhang	2024	The analysis focuses on the link between retail investors' opinions about corporate ESG outcomes and their investment choices in China, with social self-efficacy acting as a moderating element.	The results reveal a favorable link between how Chinese investors view corporate ESG practices and their investment behaviors and goals. Understanding how ESG performance correlates with investment intentions hinges on the role of social self-efficacy.

Vasudha Srivatsa and Bhavya Vikas

7	Yingxue Gao and Yan Chen	2024	This research explores how sustainable factors influence the choices of non-professional investors in China.	Non-professional investors exhibited a heightened tendency to invest in firms with ESG assurance. This tendency was further amplified when ESG assurance reports were presented independently and when the assured ESG indicators were more extensive.
8	Hannah Lea Weinbrenner	2023	To investigate the elements that impact Generation Z's tendency to put money into Environmental, Social, and Governance (ESG) funds with the aid of a broadened version of the Theory of Planned Behaviour (TPB)	The findings indicate that perceived investment ease, social norms, attitudes, perceived financial outcomes, risk assessment, and consumer efficacy significantly influence Gen Z's investment intentions toward ESG funds.
9	Bibek Karmacharya	2023	This study investigates the correlation between ESG factors and investment choices.	The findings revealed a notable positive effect of social and governance elements on investment decisions, while environmental factors exhibited no significant effect. The study
10	Eunyoung Cho	2023	To investigate the fluctuations in preferences for ESG investments within the Korean stock market.	The disparity in alpha between high-ESG and low-ESG stocks is more pronounced during prosperous periods. Individual investors exhibit a preference for high-ESG stocks during favorable economic climates.
11	Florian Heeb, Julian F. Kölbel, Falko Paetzold and Stefan Zeisberger	2023	The analysis delves into what drives investors' readiness to invest in sustainable options, especially highlighting the importance of social outcomes.	Investors exhibit considerable WTP for sustainable investments. This indicates that the WTP for sustainable investments is primarily influenced by the positive emotions tied to sustainability rather than by a rational evaluation of impact.

Vasudha Srivatsa and Bhavya Vikas

12	Husnah Husnaha*, DjayaniNurdina and Muhammad Yunus Kasim	2023	To study the relationship between Environmental, Social, and Governance (ESG) considerations and investment selections, with investment targets acting as an intermediary.	Environmental considerations significantly affect investment goals but not the decisions themselves. Social elements positively affect investment decisions while leaving objectives unchanged. Corporate governance influences both investment goals and decisions. The relationship between ESG aspects and investment selections is guided by investment aims.
13	Inga Pašiušienė, AskoldasPodvievko, Daiva Malakaite, Laura Žarskienė, Aušra Liučvaitienė and Rita Martišienė	2023	The research seeks to analyze Generation Z students' investment behaviors, focusing on their propensity for green investments and enhancing financial literacy	The findings indicate that while Generation Z students exhibit rational investment tendencies, they are reluctant to actualize their theoretical endorsement of green investments. The predominant rational investor archetype identified is the pragmatist/framer/realist (PFR)
14	Nafisa Rounok ,Aimin Qian , Mohammad Ashraful Alam	2023	To ascertain the influence of ESG issues on investor decision-making with the mediating role of corporate reputation in the ESG-investment nexus.	ESG issues exert a substantial impact on investment choices along with Corporate reputation as a mediator in the ESG-investment decision relationship.
15	Nguyen Thi Phuong Dzung * , Phan Huy Toan , Le Trung Hieu , Nguyen Thi Linh , Hoang Thi Hang	2023	The research examines ESG report effects on Vietnamese investors' decisions	Governance information has the greatest influence, succeeded by Environmental and Social data.
16	Richa Bhatia, Narinder Kumar Bhasin, Sunil Kadyan and Preeti Singh	2023	This study explores how individual investors view ESG investing and how factors like asset familiarity, risk tolerance, and behavior influence their choices.	ESG elements notably affect investment choices. The research underscores the necessity of incorporating ESG factors into investment strategies for sustainable outcomes.

Vasudha Srivatsa and Bhavya Vikas

17	Roman Kräussl, Tobi Oladiran, Denitsa Stefanova ²	2023	This study analyzes investor expectations and perceptions regarding ESG factors in investment choices to enhance performance or societal impact.	ESG funds exhibit inferior long-term performance, while demonstrating superior short-term results.
18	Samina Rooh ¹ , Hatem El-Gohary ^{2,*} , Imran Khan ³ , Sayyam Alam ⁴ and Syed Mohsin Ali Shah	2023	The research examines investor decision-making on the Pakistan Stock Exchange, with a focus on Environmental, Social, and Governance (ESG) factors.	The findings indicate that ESG considerations significantly influence investor choices. The emphasis on ESG issues has both theoretical and practical ramifications for firms, regulators, and investors in developing economies.
19	Abdelkbir ELOUIDANI, Ahmed OUTOUZZALT and Rania EL OUIDANI	2022	To delineate the environmental, social, and corporate governance determinants affecting the investment decisions of Moroccan individuals. To elucidate the interconnections among these determinants	Social and governance criteria are pivotal factors that directly impact investment intentions and indirectly affect stock market engagement.
20	Heena Thanki ¹ , Sweetie Shah ² , Harishchandra Singh Rathod ¹ , Ankit D. Oza ³ and Dumitru Doru Burduhos-Nergis	2022	To investigate the influence of collectivism, environmental concerns, financial performance, and awareness of SRI on investment propensity in socially responsible investments.	The study concludes that collectivism, environmental concerns, financial performance, and awareness of SRI positively shape attitudes toward SRI, thereby affecting investment intentions.
21	Kirti Sood and Prachi Pathak, Jinesh Jain and Sanjay Gupta	2022	The research seeks to discern key ESG factors that affect equity investor decisions.	Governance emerged as the predominant factor, succeeded by environmental criteria, with social criteria being the least impactful.
22	Mehwish ¹ , Mustafa Afeef, Shahid Jan Kakakhel	2022	The research investigates the impact of ESG factors on individual investors in the PSX.	The findings indicate that governance factors predominantly affect investment choices, succeeded by social and environmental aspects. Investors exhibit sensitivity to ESG factors, which exert a favorable influence on their investment decisions.

Vasudha Srivatsa and Bhavya Vikas

23	Mehwish ¹ , Mustafa Afeef ² , Shahid Jan Kakakhel ³	2022	To examine the influence of ESG factors on investment behavior.	Theoretically, Individual attitudes are influenced by beliefs that drive specific behaviors. The results advocate for investor preference towards companies that prioritize ESG factors to protect capital and enhance cash flow.
24	Ruiying Li	2022	To conduct a systematic review of the evolution of ESG investment across several dimensions. ESG has gained prominence amid escalating global challenges.	ESG investment emerges from stakeholder interests, advancing societal development via financial mechanisms.
25	So Ra Park and Kum-Sik Oh	2022	To investigate the incorporation of ESG data by individual investors. To enhance comprehension of the motivators for individual investors' adoption of ESG information	Discovers vital components like performance expectancy, effort expectancy, social influence, and conditions that facilitate ESG data integration. Proposes that the standardization of ESG reporting may promote the assimilation of ESG information.
26	Surbhi Verma and Ashu Khanna	2022	The study aims at assessing the influence of Social Value Orientation and Emotional instability on the choice of socially responsible investment (SRI) funds in association with Financial Risk Tolerance	SVO, EI, age, marital status, and gender serve as significant determinants of FRT. Investors with pro-social orientations demonstrate a greater propensity for SRI fund investment. Emotional instability exerts a detrimental effect on risk tolerance.
27	Ran Chang, Xiaoyan Zhang, Xinran Zhang	2022	The research aims to investigate whether retail investors utilize ESG (Environmental, Social, and Governance) information in their trading decisions, specifically analyzing stock-level data from 2010 to 2019 in the US to understand the relationship between ESG information and retail trading behavior	Retail investors are more active in trading stocks with high ESG scores, and their net buying in these stocks shows a stronger positive predictive power for future stock returns compared to stocks with lower or no ESG information

ABSTRACT

Sustainability is an essential component of every green production process. The production sectors embed various green costs parameters to assure and promote environmental sustainability. This research work extends a sustainable production-based inventory model with different demand patterns of linear, exponential and logarithmic. The objective of this research is to examine the changes of green cost parameters on optimal production quantity $q(t)$ under various demand conditions. A system of linear differential equation-based modelling approach is proposed and solved in Python environment. The sensitivity analyses are performed to determine the effects of parametric changes on $q(t)$. This research work provides various insights on green cost parameters and certainly makes significant contribution to the existing literature on green inventory models. The sustainable model considered in this work shall be further extended by discussing with other types of demand patterns. This deterministic model shall also be further explored by considering uncertainty, impreciseness and indeterminacy existing in the production scenario.

Keywords: Sustainability, Inventory Model, Production, Green costs, Demand Patterns.

**Theeba and Nivetha Martin**

INTRODUCTION

The promotion of environmental sustainability in a production sector leads to the ecological balance. In the industrial context, sustainability shall be discussed in the core dimensions of resource utilization, supply of resources, environmental impact, life cycle management and social responsibility. Sustainability is driven by environmental oriented activities paving to the mitigation of pollutant emission and waste discharge. Incorporation of green costs parameters into the manufacturing production system is essential in institutionalizing sustainable production sectors contributing to carbon neutrality. Hence, integrated sustainable inventory models encompassing green costs components and common inventory costs are required to set a balance between both the economic optimization and environmental conservation. The development of such integrated inventory models with different demand patterns is also crucial to characterize various manufacturing circumstances. The saturation of demand with respect to the changes in price and other decisive factors should be reflected in the inventory model for the decision makers to make decisions on optimal production quantity and time. Sustainable inventory models possess added value to both inventory management and environmental sustainability. Researchers have developed sustainable models considering various green costs pertinent to waste handling. Rework inventory models, reverse supply chain models also exist in literature addressing different facets of waste and pollution management especially carbon emissions and preservation technology. However, sustainable inventory model with different demand patterns and typical green costs do not exist in the recent literature. Hence, this research work contributes to the literature of sustainable inventory model by developing an inventory model with different demand patterns consisting green costs subjected to green energy, waste disposal methods, green packaging and green rework. The objective of this research is to develop a more comprehensive sustainable inventory model with different demand patterns encompassing possible sustainable costs. This work is an extension of the earlier model developed by the authors. The contents of the paper are organized into following sections. The literature review is outlined in section 2. The integrated sustainable inventory model is formulated in section 3. The model is analyzed and the inferences of the sensitivity analysis are presented in section 4. The last section concludes the work.

LITERATURE REVIEW

This section presents a brief presentation of the recent developments of sustainable inventory model with green cost components. The following table carries the nature of the demand and types of green cost incorporated in the recent literature. The research gaps and novel contributions in this research work are also presented. From the above Table, it is evident that the sustainable oriented inventory models comprise different green costs pertaining to preservation technology, carbon emission with different demand patterns. The sustainable costs are at times generic with not much specification. Also, the discussion on the effects of different demand patterns in a sustainable inventory model is not much explored to the best of our knowledge. This has motivated the authors to formulate an inventory model encompassing different green costs under various demand patterns.

Model Development

This section presents the notations, assumptions and formulation of an inventory model as follows. The model developed in this section is based on the proposed work of the authors on the sustainable inventory model and in this section, the model is discussed under different demand patterns.

Notations

P – Production

D – Demand

W – Number of defective items

T – Total Production time

C_1 – Constant carrying cost per unit time

C_2 – Fixed Ordering cost

TAC – Total average cost

$0 \leq t \leq t_1$

r – Rework rate of the defective items

G_T – Green Repairing technology initialization cost

g_t – Green Repairing cost per defective unit

$t_1 \leq t \leq T$

G_{di} – Incineration Disposal Initialization cost

g_{di} – Incineration kind of disposal cost on non-repairable items $j(1-r)$

G_{dL} – Landfilling Disposal Initialization cost

g_{dL} – Landfilling kind of disposal cost on non-repairable items $(1-j)(1-r)$

G_P – Green packaging cost

G_L – Green labelling cost

G_E – Green energy cost

Assumptions

1. The demand follows different patterns
2. Shortages are not allowed

This section consists of the formulation of a sustainable inventory model with different demand patterns and green cost parameters. Let us consider a production system, with production rate P and demand rate D where $P > D$. Let W be the number of defective items generated during the production run during the time interval $[0, t_1]$. Let r be the rework rate of defective items and a portion of rW is added to the demand during the time interval $[t_1, T]$. The portion of $(1-r)W$ is generated as waste and disposed using different waste disposal methods. The following production system is modelled as follows

$$\frac{dq(t)}{dt} = P - W - D \quad 0 \leq t \leq t_1$$

$$\frac{dq(t)}{dt} = -(D + rW) \quad t_1 \leq t \leq T$$

Case (i) Demand is Linear

In this case, the demand is assumed to be linear of the form $D = a_1 + b_1 q(t)$, which expresses the relationship between the quantity and the price. Here, a_1 is the constant term and b_1 is the slope of the demand function indicating the changes in the price with respect to the change in demand.

$$\frac{dq(t)}{dt} = P - W - (a_1 + b_1 q(t))$$

$0 \leq t \leq t_1$

$$\frac{dq(t)}{dt} + b_1 q(t) = P - W - a_1 \quad (1)$$

$$\frac{dq(t)}{dt} = -(a_1 + b_1 q(t) + rW) \quad t_1 \leq t \leq T$$

$$\frac{dq(t)}{dt} + b_1 q(t) = -(a_1 + rW) \quad (2)$$

Integrating Equation (1) and (2) we get

$$q(t)e^{b_1 t} = (P - W - a_1) \int_0^t e^{b_1 t} dt + c$$

$$q(t)e^{b_1 t} = \frac{(P - W - a_1)}{b_1} (e^{b_1 t} - 1) + c$$

$$q(t) = \frac{(P - W - a_1)}{b_1} (1 - e^{-b_1 t}) + c \quad (3)$$

$$q(t)e^{b_1 t} = - \int_{t_1}^t (a_1 + rW) e^{b_1 t} dt$$

$$q(t)e^{b_1 t} = - \left(\frac{a_1 + rW}{b_1} \right) (e^{b_1 T} - e^{b_1 t}) + c$$

$$q(t) = - \left(\frac{a_1 + rW}{b_1} \right) (e^{b_1 (T-t)} - 1) + c$$

Theeba and Nivetha Martin

With initial condition $q(0) = 0$ (4)

And boundary condition $q(T) = 0$ (5)

We get $c = 0$

By (3) and (4) we get

$$q(t) = \frac{(P-W-a_1)}{b} (1 - e^{-b_1 t}) \quad (6)$$

$$q(t) = -\left(\frac{a_1 + rW}{b_1}\right) (e^{b_1(T-t)} - 1) \quad (7)$$

Let $q(t_1) = I_{max}$ (8)

$$I_{max} = \frac{(P - W - a_1)}{b} (1 - e^{-b_1 t})$$

$$I_{max} = -\left(\frac{a_1 + rW}{b_1}\right) (e^{b_1(T-t)} - 1)$$

$$\frac{(P - W - a_1)}{b} (1 - e^{-b_1 t}) = -\left(\frac{a_1 + rW}{b_1}\right) (e^{b_1(T-t)} - 1)$$

$$(P - W - a_1)(e^{b_1 t} - 1) = -(a_1 + rW)(e^{b_1 T} - e^{b_1 t})$$

$$e^{b_1 T} = e^{b_1 t} - \left(\frac{(P - W - a_1)(e^{b_1 t} - 1)}{a + rW}\right)$$

$$\log e^{b_1 T} = \log \left(e^{b_1 t} - \left(\frac{(P - W - a_1)(e^{b_1 t} - 1)}{a + rW}\right) \right)$$

$$T = \frac{1}{b} \log \left(e^{b_1 t} - \left(\frac{(P - W - a_1)(e^{b_1 t} - 1)}{a + rW}\right) \right) \quad (9)$$

$$T = \frac{1}{b_1} \sqrt{\frac{C_2 + C_1 \left(\frac{P-W-a_1}{b_1} \right) \left(t_1 + \frac{e^{-b_1 t_1} - 1}{b_1} \right) + G_T + g_t rW + j(1-r)Wg_{di} +}{(1-j)(1-r)Wg_{dl} + G_P + g_l + G_E - C_1(a_1 + rW)(e^{-b_1 t_1} - 1)} \frac{C_1(a_1 + rW)}{C_1(a_1 + rW)}}$$

$$\frac{\partial TC}{\partial t_1} = \frac{1}{T} \left(C_1 \left(\frac{P-W-a_1}{b_1} \right) + C_1 \left(\frac{P-W-a_1}{b_1} \right) e^{-b_1 t_1} + \frac{(a_1 + rW)}{b_1} e^{b_1 T} e^{-b_1 t_1} - \frac{(a_1 + rW)}{b_1} \right)$$

$$\frac{\partial TC}{\partial t_1} = 0$$

$$t_1 = \frac{1}{b_1} \log \left(\frac{C_1(P-W-a_1) + (a_1 + rW)e^{b_1 T}}{(a_1 + rW) - C_1(P-W-a_1)} \right)$$

Case (ii) Demand is Exponential

In this case, the demand is exponential of the form $D = a_2 e^{b_2 t}$, where a_2 is the constant term and b_2 is the growth rate of the demand.

$$\frac{dq(t)}{dt} = P - W - a_2 e^{b_2 t} \quad 0 \leq t \leq t_1 \quad (11)$$

$$\frac{dq(t)}{dt} = -(a_2 e^{b_2 t} + rW) \quad t_1 \leq t \leq T \quad (12)$$

Integrating equation (1) and (2) we get

$$q(t) = Pt - Wt - a_2 \frac{e^{b_2 t}}{b_2} + \frac{a_2}{b_2} + c \quad (13)$$

$$q(T) - q(t) = - \left(\frac{a_2}{b_2} (e^{b_2 T} - e^{b_2 t}) + rW(T - t) \right) + c \quad (14)$$

$$\text{With initial condition } q(0) = 0 \quad (15)$$

$$\text{And boundary condition } q(T) = 0 \quad (16)$$

We get $c = 0$

By (3) and (4) we get

$$q(t_1) = Pt_1 - Wt_1 - a_2 \frac{e^{b_2 t_1}}{b_2} + \frac{a_2}{b_2}$$

$$q(t) = \left(\frac{a_2}{b_2} (e^{b_2 T} - e^{b_2 t}) + rW(T - t) \right)$$

Let $q(t_1) = I_{max}$

$$Pt_1 - Wt_1 - a_2 \frac{e^{b_2 t_1}}{b_2} + \frac{a_2}{b_2} = \left(\frac{a_2}{b_2} (e^{b_2 T} - e^{b_2 t_1}) + rW(T - t_1) \right)$$

$$(P - W + rW)t + \frac{a_2}{b_2} - \frac{a_2}{b_2} e^{b_2 T} = rWT$$

By using Taylor's Series approximation

$$(P - W + rW)t + \frac{a_2}{b_2} - \frac{a_2}{b_2} (1 + b_2 T) = rWT$$

$$T = \frac{(P - W + rW)t}{b_2 - rW}$$

$$\text{Holding Cost} = C_1 \left[\int_0^{t_1} q(t) dt + \int_{t_1}^T q(t) dt \right]$$

TheeBa and Nivetha Martin

$$= C_1 \int_0^{t_1} \left((P - W)t - \frac{a_2}{b_2} (e^{b_2 t} - 1) \right) dt + \int_{t_1}^T \left(\frac{a_2}{b_2} (e^{b_2 T} + e^{b_2 t}) + rW(T - t) \right) dt$$

$$\text{Holding Cost} = \frac{C_1}{2} [t_1^2 (P - W) + 2 \frac{a_2}{b_2} e^{b_2 T} (T - t_1 + \frac{1}{b_2}) + 2 \frac{a_2}{b_2} t_1 + rW(T - t_1)^2]$$

Green Repairing Cost = $g_t rW$

Total Cost = Fixed Ordering Cost + Holding Cost + Green repairing initialization technology cost + Green Repairing Cost + Incineration disposal cost + Landfilling disposal cost + Green packaging cost + Green labelling Cost + Green energy cost

$$\text{Total Cost} = C_2 + \frac{C_1}{2} [t_1^2 (P - W) + 2 \frac{a_2}{b_2} e^{b_2 T} (T - t_1 + \frac{1}{b_2}) + 2 \frac{a_2}{b_2} t_1 + rW(T - t_1)^2] + G_T + g_t rW + j(1 - r)Wg_{di} + (1 - j)(1 - r)Wg_{dl} + G_P + g_l + G_E$$

$$\text{Average Cost} = \frac{\text{Total Cost}}{T}$$

$$= \frac{C_2 + \frac{C_1}{2} [t_1^2 (P - W) + 2 \frac{a_2}{b_2} e^{b_2 T} (T - t_1 + \frac{1}{b_2}) + 2 \frac{a_2}{b_2} t_1 + rW(T - t_1)^2] + G_T + g_t rW + j(1 - r)Wg_{di} + (1 - j)(1 - r)Wg_{dl} + G_P + g_l + G_E}{T}$$

$$\frac{\partial TC}{\partial T} = 0$$

$$T = \sqrt{\frac{C_2 + \frac{C_1}{2} (t_1^2 (P - W) + 2 \frac{a_2}{b_2} t_1 + rW t_1^2) + G_T + g_t rW + j(1 - r)Wg_{di} + (1 - j)(1 - r)Wg_{dl} + G_P + g_l + G_E}{C_1 a_2 (b_2 - b_2 t_1 - 1)}}$$

$$\frac{\partial TC}{\partial t_1} = 0$$

$$t_1 = \frac{2(C_1 a_2 - rWT)}{C_1 (P - W) + 2rW}$$

Case (iii) Demand is logarithmic

In this case, the demand is logarithmic of the form $D = \log(a_3 + b_3 t)$, with the constant term a_3 and the growth parameter b_3 .

$$\frac{dq(t)}{dt} = P - W - \log(a_3 + b_3 t) \quad 0 \leq t \leq t_1 \quad (17)$$

$$\frac{dq(t)}{dt} = -(\log(a_3 + b_3 t) + rW) \quad t_1 \leq t \leq T \quad (18)$$

Integrating equation (1) and (2) we get

$$\int_0^t dq(t) = \int_0^t (P - W - \log b_3 - \log(\frac{a_3}{b_3}) - \frac{b_3 t}{a_3} + \frac{b_3^2 t^2}{2a_3^2}) dt$$

$$q(t) = (P - W - \log a_3)t - \frac{b_3}{2a_3} t^2 + \frac{b_3^2 t^3}{6a_3^2} + c \quad (19)$$

$$\int_{t_1}^T dq(t) = - \int_{t_1}^T (\log(a_3 + b_3 t) + rW) dt$$

$$q(T) - q(t) = - \left[(T - t) \log b_3 + (T - t) \log \left(\frac{a_3}{b_3} \right) + \frac{b_3}{2a_3} (T^2 - t^2) - \frac{b_3^2}{2a_3^2} (T^3 - t^3) \right] + c \quad (20)$$

$$\text{With initial condition } q(0) = 0 \quad (21)$$

$$\text{And boundary condition } q(T) = 0 \quad (22)$$

We get $c = 0$

By (3) and (4) we get

$$q(t_1) = (P - W - \log a_3)t - \frac{b_3}{2a_3} t^2 + \frac{b_3^2 t^3}{6a_3^2}$$

$$q(t_1) = (T - t) \log b_3 + (T - t) \log \left(\frac{a_3}{b_3} \right) + \frac{b_3}{2a_3} (T^2 - t^2) - \frac{b_3^2}{2a_3^2} (T^3 - t^3)$$

Theeba and Nivetha Martin

Let $q(t_1) = I_{max}$

$$\begin{aligned}
 I_{max} &= (P - W - \log a_3)t - \frac{b_3}{2a_3}t^2 + \frac{b_3^2t^3}{6a_3^2} \\
 I_{max} &= (T - t)\log b_3 + (T - t)\log\left(\frac{a_3}{b_3}\right) + \frac{b_3}{2a_3}(T^2 - t^2) - \frac{b_3^2}{2a_3^2}(T^3 - t^3) \\
 (P - W - \log a_3)t - \frac{b_3}{2a_3}t^2 + \frac{b_3^2t^3}{6a_3^2} &= (T - t)\log b_3 + (T - t)\log\left(\frac{a_3}{b_3}\right) + \frac{b_3}{2a_3}(T^2 - t^2) - \frac{b_3^2}{2a_3^2}(T^3 - t^3) \\
 (P - W)t_1 &= T\log a_3 \\
 T &= \frac{(P - W)t_1}{\log a_3} \quad (23)
 \end{aligned}$$

Holding Cost = $C_1[\int_0^{t_1} q(t)dt + \int_{t_1}^T q(t)dt]$

$$\begin{aligned}
 &= C_1\left(\int_0^{t_1} \left((P - W - \log a_3)t - \frac{b_3}{2a_3}t^2 + \frac{b_3^2t^3}{6a_3^2}\right)dt\right. \\
 &\quad \left.+ \int_{t_1}^T \left((T - t)\log b_3 + (T - t)\log\left(\frac{a_3}{b_3}\right) + \frac{b_3}{2a_3}(T^2 - t^2) - \frac{b_3^2}{2a_3^2}(T^3 - t^3)\right)dt\right)
 \end{aligned}$$

$$\text{Holding Cost} = C_1\left((P - W)\frac{t_1^2}{2} + \frac{T^2}{2}\log a_3 + \frac{b_3}{3a_3}T^3 - \frac{b_3^2T^4}{8a_3^2} - Tt_1\log a_3 - \frac{b_3}{2a_3}T^2t_1 + \frac{b_3^2T^3t_1}{6a_3^2}\right)$$

$$T = \sqrt[3]{\frac{3C_1a_3^2\left(C_2 + C_1(P - W)\frac{t_1^2}{2} + G_T + g_trW + j(1 - r)Wg_{di} + (1 - j)(1 - r)Wg_{dl} + G_P + g_l + G_E\right)}{2a_3b_3 + b_3^2t_1}}$$

$$\frac{\partial TC}{\partial t_1} = \frac{1}{T}\left(C_1(t_1(P - W) - T\log a_3 - \frac{2b_3T^2}{3a_3} + \frac{b_3^2T^3}{3a_3^2}\right)$$

$$\frac{\partial TC}{\partial t_1} = 0$$

$$t_1 = \frac{T\log a_3 - \frac{b_3}{2a_3}T^2 - \frac{b_3^2T^3}{6a_3^2}}{P - W}$$

The concavity condition is satisfied by all the system of differential equations discussed under the three cases. The concavity map obtained for case (i) is presented in Fig.1.

Theeba and Nivetha Martin

RESULTS AND DISCUSSION

Python programming language is used to solve the differential equations presented in the three cases namely (i), (ii) and (iii). The solution plots are presented for each of the cases in Fig.2,3 and 4 respectively. Fig.2 clearly represents the consistent nature of the solutions of the differential equations with linear demand subjected to the initial and boundary conditions. The plot exhibits a continuous and smooth transition at $t=t_1$ reflecting the efficacy of the solution. It is very evident that $q(t)$ is more influenced by the parameters W, a_1, b_1, rW . Fig.3 clearly represents the consistent nature of the solutions of the differential equations with exponential demand subjected to the initial and boundary conditions. The plot exhibits a continuous and smooth transition at $t=t_1$ from increasing to decreasing demand. It is very evident that $q(t)$ is more influenced by the parameters W, a_2, b_2, rW . Fig.4 clearly represents the consistent nature of the solutions of the differential equations with exponential demand subjected to the initial and boundary conditions. The plot exhibits a continuous and smooth transition at $t=t_1$ from increasing to decreasing demand. It is very evident that $q(t)$ is more influenced by the parameters W, a_3, b_3, rW .

Sensitivity Analysis

Case (i)

The effects of the parameters W, a_1, b_1, rW on $q(t)$ is determined by varying the parametric ranges. The following Fig.5 represents the changes in $q(t)$ with respect to the changes in the chosen parameters. The sensitivity analysis of the parameters on $q(t)$ indicates that as these parameters increase, the initial impact on $q(t)$ is positive, with all curves showing an initial rise. Higher values of the parameters result in peaks occurring later, signifying a delay in the peak effect. Post-peak, higher parametric values exhibit a more gradual decline, indicating a prolonged impact. The magnitude of the peak value increases with the parametric values, showing a greater influence on $q(t)$ at its peak. Overall, the relationship between the parameters and $q(t)$ is systematic and predictable, with higher parametric values leading to delayed, higher, and more sustained peaks in $q(t)$.

Case (ii)

The effects of the parameters W, a_2, b_2, rW on $q(t)$ is determined by varying the parametric ranges. The following Fig.6 represents the changes in $q(t)$ with respect to the changes in the chosen parameters. The sensitivity analysis of parameters affecting $q(t)$ indicates that increasing these parameters results in an initial positive impact, with all curves rising at the start. As parameter values increase, the peaks occur later, showing a delayed peak effect. Following the peak, higher parameter values lead to a more gradual decline, indicating a longer-lasting impact. The peak value's magnitude also rises with higher parameter values, showing a greater influence on $q(t)$ at its peak. In summary, the relationship between the parameters and $q(t)$ is systematic and predictable with higher parameter values result in delayed, higher, and more sustained peaks in $q(t)$.

Case (iii)

The effects of the parameters W, a_3, b_3, rW on $q(t)$ is determined by varying the parametric ranges. The following Fig.7 represents the changes in $q(t)$ with respect to the changes in the chosen parameters. The sensitivity analysis of the parameters on $q(t)$ shows that as these parameters increase, the initial effect on $q(t)$ is positive, with all curves rising initially. Higher parameter values cause the peaks to occur later, indicating a delay in the peak effect. After reaching the peak, higher values result in a more gradual decline, suggesting an extended impact. Additionally, the peak value itself increases with higher parameters, reflecting a greater influence on $q(t)$ at its peak. Overall, the relationship between the parameters and $q(t)$ is systematic and foreseeable, with increased parameter values leading to delayed, higher, and more prolonged peaks in $q(t)$.

CONCLUSION

This research work presents a comprehensive framework of production based sustainable inventory models with different demand patterns. The demand fluctuations under the influence of different parameters are analyzed. The

**Theeba and Nivetha Martin**

sustainable inventory model proposed earlier is explored under the demand patterns of linear, exponential and logarithmic to facilitate the decision makers employ the proposed sustainable models under different decision-making circumstances. Python is utilized in solving and analyzing the system of equations under three different cases and this intervention has provided consistent results. This has facilitated to draw inferences on the parametric influences over the inventory level. This research work shall also be extended by varying the nature of the demand and a comparative analysis shall also be made across several demand patterns to derive comprehensive results.

ABSTRACT

Jamun or Indian black berry is obtained from *Eugenia jambolana*, synonymously known as *Syzygiumcumini Lam.* of family Myrtaceae. It is commonly found all over the India. From the ancient era, it has been considered as traditional plant for the treatment of various diseases. Seeds in particular are widely used as an antidiabetic remedy in traditional system of medicine. To comprehend more about antidiabeticproperties of seeds, atotal 66 phytoconstituents of *Syzygiumcumini Lam. seeds* were used inmolecular docking studies using four targets of diabetes namely human peroxisome proliferator activated receptor- γ , Dipeptidyl peptidase-4, AMP-activated protein kinase and sodium glucose co-transporter-2. The docking studies were carried out using PyRx and AutoDock 1.5.6 software. Compound with better binding affinity were subjected to evaluate drug likeliness and toxicity using SwissADME and admetSARtools. Ellagitannin ($-10.4 \text{ kcal mol}^{-1}$) and Corilagin ($-9.2 \text{ kcal mol}^{-1}$) has better binding affinity with Dipeptidyl peptidase as compared to Sitagliptin ($-7.9 \text{ Kcal mol}^{-1}$). Quercetin (-8.7kcal mol^{-1}), Ellagic acid($-8.2 \text{ Kcal mol}^{-1}$) and Pinoresinol ($-8.8 \text{ kcal mol}^{-1}$) were found to have more affinity with Sodium Glucose Cotransporter-2. Ellagitannin ($-8.8 \text{ kcal mol}^{-1}$) and Maslinicacid ($-8.7 \text{ kcal mol}^{-1}$) has better binding affinity with AMP- activated protein kinase as compared to Metformin (-3.8kcal mol^{-1}). Rosiglitazone ($-9.9 \text{ kcal mol}^{-1}$) was found to bind better with Human peroxisome proliferator-activated receptor as compared to others.Further *in-vitro* and *in-vivo* studies are essential to confirm the use of Ellagitannin, Corilagin, Ellagic acid, Pinoresinol, Quercetin, Epoxidecanoic acid and Malvalic acid as an antidiabetic agent.

**Bhaghyashri Adalinge et al.,****Keywords:** *Syzygiumcumini*, diabetes mellitus, molecular docking, PPAR, dipeptidyl peptidase-4, SGLT-2, AMPK.

INTRODUCTION

Diabetes mellitus (DMT) is group of metabolic disorders, sharing common underlying features of hyperglycaemia. Worldwide, more than 140 million peoples are suffering from it. It occurs as a defect in insulin, insulin action or both. The chronic hyperglycaemia and associated metabolic disregrulationare associated with secondary damage to multiple organ system, especially the kidney, eye, nerve and blood vessels. DMT type IIhas caused various concerns over the years due to cost and side effects arising from long term use of current treatment(Kumar, 2020).Jamun or Indian black berry is obtained from *Eugenia jambolana* synonymously known as *Syzygiumcumini* Lam(Rauf, 2016). of family Myrtaceae. It is commonly found in all over the India(Ahmed, 1991). From the ancient era, it has been considered as traditional plant for the treatment of various diseases. It possesses activities like antidiabetic, anti-inflammatory, anticancer etc. The fruits, seeds, leaves, bark and extracts of this plant play an important role in the treatment of different disorders as reported in different experimental works carried out by many researchers(Anonymous, 1996).There are certain reports which specify the antidiabetic activity for particular phytoconstituents of the seeds of *S. cumini* in treatment of DMT (Kerru, 2018). The current study is aimed towards molecular docking to access the potential phytochemicals of *Syzygium* plant as an inhibitor or stimulator of various targets of DMT-II in comparison to marketed drugs. Study was further continued to check drug likeliness and toxicity parameters.

MATERIALS AND METHODS

Construction of phytoconstituents library

A library of phytoconstituents of the seeds of *Syzygiumcumini* was constructed from Indian Medicinal Plants, Phytochemistry and Therapeutic (IMPPAT) database and literature survey (Table 1). The structures of ligands, inhibitor or activator were downloaded from Pubchem in SDF format. PyMol was used to covert SDF files to PDB format(pymol, 2024).

Selection of molecular targets and molecular docking analysis

Molecular docking study was conducted by using PyRx and AutoDock 1.5.6 software(Trott, 2024). The X-ray crystal structure of receptors like Dipeptidyl peptidase-IV (DPP-4, PDB ID: 4FFW, resolution: 2.90Å⁰) with Sitagliptin as co-crystallized ligand, human peroxisome proliferator activated receptor- γ (PPAR- γ , PDB ID: 4EMA, resolution: 2.54Å⁰) with Rosiglitazone, Sodium Glucose Cotransporter-2 (SGLT-2, PDB ID: 7VSI, resolution: 2.95 Å⁰) with Empagliflozin, AMP- activated protein kinase (AMPK, PDB ID: 4CFE, resolution: 3.02Å⁰) in complex withbenzimidazole derivatives were taken from RCSB PDB database. Virtual screening of all targets was performed by molecular docking into active site of each receptor by using PyRx software. The targets were again docked with phytoconstituents having optimum binding affinity using AutoDock 1.5.6. Steps involved in protein preparation are removal of water molecules, addition of Kollaman charges and only polar hydrogens.

Coordinates of grid boxes used in molecular docking:

The X, Y, and Z co-ordinates for PPAR- γ receptor are 13.61, 6.22 and 37.66 respectively. Rosiglitazone is found to exert its action by activating this receptor. The DPP-4 is inhibited with Sitagliptin atX, Y, and Z co-ordinates of 19.54, -11.29 and 51.85 respectively. Similarly, SGLT-2 has X, Y, and Z co-ordinates of 37.44, 48.47 and 43.67 respectively with Empagliflozin as an inhibitor. For AMPK, these are 477.6, 41.06 and 987.04 respectively. Metformin is widely used for the treatment of DMT-II. It is potent agent having significant sugar lowering capacity.The locations of binding sites were decided based on the actual pose of inhibitor and/ activator. The size of the grid box was adjusted to 40 Å⁰. The saved poses of complexes were assessed by using Discovery studio visualizer (version 24.1.0.23298)

**Drug likeliness and ADMET studies**

Apart from the appropriate binding affinity, the phytochemicals should have desirable pharmacokinetic and pharmacodynamics properties. These were further studied by drug likeliness parameter by using Swiss ADME online web tool. The ADMET profile of shortlisted phytochemicals were also studied using Admet SAR.

RESULT AND DISCUSSION**Construction of phytochemical library**

The goal of this study was identifying the constituents of *S.cumini* that may have antidiabetic property. Hence, all phytoconstituent reported in the literature and from IMPPAT database were considered for docking. The binding score of all listed phytoconstituents are given in Table 2.

Docking Studies**Dipeptidyl peptidase (DPP-4, 4FFW)**

It is a serine exopeptidase with 766 amino acid distributed widely in numerous tissues such as kidney, spleen, liver, intestine, placenta, lymphocytes, adrenal glands, and endothelial cells. The incretins (GLP-1 and GIP) are the substrates of DPP IV. Sitagliptin exerts its antidiabetic action by inhibiting this enzyme. The binding energies of Ellagitannin, Corilagin and Maslinic acid to this receptor were -10.4, -9.2, -8.8 Kcalmol⁻¹ respectively. Ellagitannin was found to bind more favourably than Sitagliptin with chain A with interactions through Tyr 663, Tyr667, Tyr558, Arg123, Ser 552, Gln554, Gly207 and Phe355. The binding interactions involved Conventional Hydrogen bond, Pi-Pi stacked, Pi-Pi T shaped and Carbon Hydrogen bond. The structure of DPP-4 and protein-ligand interactions of selected ligands are shown in Fig 1.

Sodium Glucose Co-Transporter 2(SGLT-2)

Chain A was considered for docking as Empagliflozine found in complex with it. The binding energies of Ellagic acid, Pinorelinol, Quercetin and Ellagitannin which having binding affinity to receptor [-8.2, -8.8, -8.7, -10.8 Kcal.mol⁻¹] respectively. Ellagic acid was found to bind more favourably than Empagliflozine. Ellagic acid formed Conventional Hydrogen bonds, pi-alkyl and pi-sigma bonding with involvement of ASP A:454, SER A: 508 amino acids. Also involved vander waal forces and weak interaction with amino acids. The structure of SGLT-2 and protein-ligand interactions of selected ligands are shown in Fig 2.

AMP-activated protein kinase(AMPK)

Metformin, an AMPK agonist gives activity by inhibiting the hepatic gluconeogenesis and oppose the action of glucagon. AMPK activators mimic the action of insulin. The binding energies of Ellagitannin, Maslinic acid, Betulinic acid, Allo-Aromandrene and Quercetin to this receptor were -8.8, -8.7, -8.0, -7.5 -7.0Kcalmol⁻¹ respectively. The various interactions of Metformin were through conventional hydrogen bonding with amino acids Ser E 144, Cys E 131, Asp E 140. Ellagitannin shows interaction with receptor by conventional hydrogen bonding and van der Waals forces. Ellagitannin was found to be the most promising molecule with highly stable complex formation with involvement of Arg-B 83, Asn-A: 48, Thr-A: 83 via Conventional Hydrogen bonding and Hydrophobic Alkyl bonding. The structure of receptor and 2-D binding interactions of receptor with ligands is shown in Fig. 3.

Human peroxisome proliferator-activated receptor (PPAR- γ)

PPAR- γ inhibition is considered as the potential therapeutic route in treatment of DMT-II. It is commonly known as Type II nuclear receptor majorly found in adipose tissue. It enhances the glucose metabolism by activation of insulin sensitivity to the receptors(Md.Rashedul Alam, 2012). It also regulates adipogenesis. Thiazolidinediones like Rosiglitazone, Pioglitazone, Troglitazone etc are the examples of drugs which mainly target this receptor(Tambe, 2024). The binding energies of Epoxidecanoic acid, Linoleic acid, Malvalic acid, Sterculic acid and Oleic acid to this receptor were -5.5, -5.0, -4.8, -4.7 and -4.4 Kcal mol⁻¹ respectively. Epoxidecanoic acid shown highest binding affinity towards the receptor with the involvement of the Leu A: 400, Gly A: 399, Val A: 332, Val A: 403, and Lys B: 373 amino

**Bhaghyashri Adalinge et al.,**

acids by forming conventional hydrogen bonding and Vander Waal forces. Epoxidecanoic acid has less binding score as compared to marketed Rosiglitazone. Rosiglitazone has formed pi-pi T shaped, amide pi stacked and pi-sigma bonding with the protein. The structure of PPAR- γ and protein-ligand interactions of selected ligands are shown in Fig 4.

Pharmacological and toxicological properties of the ligand

The results of drug likeliness parameter and ADMET parameters are represented in the Table 3 and Table 4 respectively. Lipinski rule of five was studied to check the physiochemical properties and drug ability of phytoconstituents. Epoxidecanoic acid and Ellagic acid have good oral bioavailability while Ellagitannin have shown three Lipinski violations. All compounds are non-carcinogenic and non-toxic can be further used for the treatment of DMT-II in human. The predicted toxicological properties of phytoconstituents using admetSAR tool informed that molecules were non-Amestoxic.

CONCLUSION

This study has laid emphasis on screening of 66 phytochemicals from *S.cumini* as inhibitors of DPP4 (4FFW), PPAR- γ (4EMA), SGLT-2 (7VSI), and AMPK (4CFE) using PyRx software. From the results, it can be concluded that Ellagitannin ($-10.4 \text{ kcal.mol}^{-1}$) and Corilagin ($-9.2 \text{ kcal.mol}^{-1}$) has better binding affinity with DPP4 as compared to Sitagliptin while Quercetin ($-8.7 \text{ kcal.mol}^{-1}$), Ellagic acid ($-8.2 \text{ kcal.mol}^{-1}$) and Pinorensin ($-8.8 \text{ kcal.mol}^{-1}$) are better fit candidates for SGLT-2 as compared to Empagliflozin. Ellagitannin ($-8.8 \text{ kcal.mol}^{-1}$) and Maslinic Acid ($-8.7 \text{ kcal.mol}^{-1}$) has better binding affinity with AMPK as compared to Metformin. The selected phytoconstituents were also found to be bioavailable based on in-silico screening. Further *invitro* and *in vivo* studies are essential to confirm the use of Ellagitannin, Corilagin, Ellagic acid, Pinorensin, Quercetin, Epoxidecanoic acid and Malvalic acid as an antidiabetic agent.

ABSTRACT

This research explores gender equity in workplace promotions by analyzing how organizational culture, leadership styles, communication systems, and reward policies influence promotional practices. It identifies key barriers hindering women's career progression, focusing on variables like leadership perception, communication inclusivity, reward fairness, stress levels, support satisfaction, and promotion satisfaction. The study highlights that biased leadership practices, communication norms, and reward systems perpetuate gender differences, leaving women underrepresented in leadership roles. Proposed solutions include inclusive leadership training, equitable reward practices, and open communication systems to promote gender parity in the workplace.

Keywords: Gender Equality, Leadership Styles, Open Communication System, Organizational Culture, Promotions

INTRODUCTION

Gender has remained a stubborn problem in promotions even where establishments have started providing equal employment opportunities. Organizational culture assumes the role of determining promotion, given that it encompasses leadership promotion, communication procedures and reward patterns that define the employee's growth. Although, without difference in qualification documents and performance, women are found to suffer from various social barriers which do not let them arise to higher level of management. As such, this research seeks to investigate how organizational culture, including leadership, communication and reward system, either perpetuates

**Anjani**

or subsequent gender inequality in promotions. Also, it will evaluate measures for diversity and inclusion and how they enhance the gender equity in the workplace setting.

LITERATURE REVIEW

The competitive landscape intensifies expectations for service quality, adding to workplace stress for employees. This highlights the need for effective stress management strategies in the sector (Karthikeyan et al.). The study research emphasizes the need for stress management interventions at both individual and organizational levels to improve health, interpersonal relationships, and overall job performance in the healthcare sector (Nisa et al., 2024). Occupational exposure causes greater anxiety than community exposure, highlighting the need for workplace safety measures to mitigate fear and protect mental health. (Muthuswamy & Nithya, 2023), Data collected from employees reveal significant correlations between these security measures and digital workplace effectiveness, providing valuable insights for policymakers to develop strategies that strengthen cyber security (Muthuswamy & Nithya, 2023). The authors suggest targeted interventions, including inclusive recruitment and leadership development programs, to foster equitable workplaces and improve organizational performance (Xalxo, Seema, 2024). Many authors have focused on the role of organizational culture in gender equality with concerns to promotions. Promotion prospects have been cited many times as one of the leadership types to affect career paths. In view of its stress on effectiveness and goal accomplishment, transactional leadership is likely to appeal to assertive workers, who are preferentially male, thereby locking out women from promotions (Eagly, 2007). While mentoring and growing the employees through transformational leadership where leaders encourage more subordinates to apply for such positions, succession practices contain prejudice though providing more openings for diverse subordinate membership. Even within organizations, there are communication standards that serve to enhance monopoly or subjugation of women. But a hierarchical organizational communication structure that locates women at the lower levels of the organizational structures makes it difficult for their inputs to reach the top levels (Powell & Graves, 2003). Another structural source of career self-management is informal networks, which are particularly masculinized, so that important information and opportunities are more readily available to male employees (Ibarra, 1993). It is therefore quite possible that while the reward systems are performance based, they are still gender biased. The leaders and risk-takers are most times male while females are under rewarded because they are encouraged to collaborate, nurture and build teams (Cohen & Gagnon, 1993). Research has revealed that women are paid less compared to men and more so, when they perform well, they receive little or no commendation at all, this goes hand in hand with the fact that most supervising and managers prefer their subordinates and direct reports to be risk-takers, and work independently (Moss-Racusin et al., 2012). Based on these factors, various organizations have introduced diversity and inclusion policies that support the cause of gender diversity. But the results of these programs suggest that they barely touch on the underlying cultural causes of the gender bias (Kalev et al., 2006). Though some organizations have made some achievements, most of them still encounter major difficulties in promoting women to senior management positions.

OBJECTIVES OF THE STUDY

1. To analyze the impact of organizational culture, leadership styles, and communication norms on gender equality in promotions.
2. To evaluate the fairness of reward systems in advancing women to leadership roles.
3. To identify barriers to women's career progression and recommend strategies for a gender-equal workplace.

METHODOLOGY

This study adopts a quantitative research design, employing analytical research design to explore how organizational culture influences gender equality in promotions.

**Anjani****SAMPLE SIZE AND SAMPLING TECHNIQUE**

The respondents were 200 employees, of which 100 were men and 100 women; questionnaires about leadership, communication, and rewards were administered on the respondents and interviews conducted on them. The participants were purposively recruited in the organization to ensure that they appreciated the phenomena being studied and had experience in the organization.

DATA COLLECTION TOOLS AND DATA ANALYSIS

Information was gathered from structured interviews, in which participants could give their direct message about the event or situation. For data analysis, inferential statistics and correlation analysis was used in a bid to test relationships between variables. Some of the important links were between leadership behavior with gender equity, between communication openness and promotion opportunity, between reward policy and employee pressure. It meant that the study was getting an insight into organizational practices concerning gendered promotions.

MAJOR FINDINGS

The above Table 1.1 implies that from this demographic data, the age distribution and experience of the male and female employees is almost equivalent. The percentage distribution of recruits by age and gender is as follows: 25–30: 20%; 31–35 and around 30%; 36–40: 20%; 41–45: 15%; above 46: 15%. Again, work experience has been proven to be the same at 25% with 0–5 years, 35% with 6–10 years, 20% with 11–15 years and 10% each with 16–20 years and employees above 20 years experience. Therefore concerning leadership style perception, majority 40% of the males and 45% of the female prefer transformational leadership were as 35% of the males and 30% of the female have a preference of transactional leadership. Another type of leadership which is also viewed equally by 25% of employees comprises laissez faire. High communication inclusivity is reported by 40% males and 45% females, while 30% of each gender indicates moderate level. About 25% of the female participants stated their organizations are low in communication inclusion, while 30% of the male participants agreed. As for reward system fairness 50% of males and 55% of females find it fair and 50% of males and 45% of females find it unfair. While the level of stress at the first level is lower for males (15%) and females (10), stress at the second and third levels is higher for females (25% and 30) than males (20% and 25%). For the high stress levels (level 4 and 5), 25% males are stressed, 15% are stressed from level 5, 20% females are stressed from level 4, 15% from level 5. This satisfaction scale of the support system presents 45% of males and 50% of females as satisfied, 30% of males and 25% of females as indifferent, and 25% of both sexes dissatisfied. Males are only slightly disapproving of promotional satisfaction, with 40% satisfied, 30% neutral, and 30% dissatisfied; females have slightly more positive attitude with 45% satisfied, 30% neutral, and 25% dissatisfied. Last, training accessibility is pointed out by the 75% of the male respondents and 80% of the female's side, while only the 25% of the male respondents and the 20% of the female does not have the access to the trainings.

As shown in the above table 1.2 the correlation analysis provides a way of examining employee perceptions and experiences with various workplace variables and their interrelations. There is some evidence that different factors, important for the organization, correlate to a considerable extent. Experience proved to have a strong positive relation with Age Group ($r=0.939$) which of course is expected because with increase in years comes increase in experience. Also, Age Group possessed a strong positive relationship with Leadership Style Perception ($r = 0.892$) and Communication Inclusivity ($r = 0.875$), consequently, it was suggested that the senior employees have a more positive perception of leaders and communication strategies. Likewise, Age Group has a moderate association with Stress Level with a coefficient of 0.722, and strong connections with Support System Satisfaction and Promotion Satisfaction along with coefficients 0.812 and 0.778 respectively proving that Age Group affects workplace satisfaction. For experience, the relationships show positives across the different dimensions with relatively high coefficients. It is strongly correlate with Stress level (0.922), meaning that increase in experience level means the employee has to endure more stress at work. Further, Experience has positive and strong relationship with Reward System Fairness ($r = 0.853$) and Support System Satisfaction ($r = 0.854$) confirming the experience influence on perception of organizational fairness and support. This result has a high correlation with Promotion Satisfaction ($r = 0.834$) and Training Access ($r = 0.805$) to support experience as a factor affecting career mobility and training opportunities. Communication Inclusivity has a correlation coefficient of ($r = 0.982$) with the Perception of Leadership

**Anjani**

Style which defines the correlation between leadership practices and inclusion of others in communication. It also shows very high, almost perfect positive association with Reward System Fairness at ($r = 0.910$), Support System Satisfaction at ($r = 0.872$), and Promotion Satisfaction at ($r = 0.861$); it emphasizes that leadership can further the causes of fairness, support, and promotion satisfaction. In particular, Communication Inclusivity demonstrates significant positive relationships with Reward System Fairness (0.920), Support System Satisfaction ($r = 0.887$), and Promotion Satisfaction ($r = 0.869$). At the same time, the Experience Stress Level correlation reveals a close relation ($r = 0.922$), as does Training Access ($r = 0.782$) to Stress Level, where possible solutions might be required to decrease stress levels. Last, yet still a very significant correlation pattern is obtained with Support System Satisfaction featuring Promotion Satisfaction at ($r = 0.908$) showing how much a support system means to get promotion. As with Training Access, Leadership Style Perception also has a very positive correlation with Promotion Satisfaction ($r = 0.665$) and Training Access ($r = 0.875$) suggesting the role of training in raising employee standards and promotion satisfaction. This result highlights the cohesiveness of organizational factors and identifies potential areas for development including, communication, stress and support structures for increasing overall employee engagement.

RECOMMENDATIONS

- Encourage of Leadership Diversity training The Organizations should pursue leadership skills training that embraces leadership policies that are converged and support equal representation of women in organizations.
- Improve Communication Privilege the status of the women in the Organizations should be improved on communication and the Organizations should encourage women to participate more in communication.
- Rewards also needs to be reconsidered so that they do not actually promote masculinity and do not create racists bonuses.
- In honor of women, promotion and appreciation should be given to both output and teamwork since they are hidden in the work done by women.
- End/promote gender bias in promotion practices the Organizations should set standard procedure for promotion practice and the gender comparison should be conducted from time to time.
- There is a need for candidates for promotions to be offered in a nonselective manner so that both genders are given equal chance on the ladder.
- Gender Mainstreaming in the Workplace main action on which focus should be made on while constructing a gender-mainstreamed workplace.

CONCLUSION

The study confirms that organizational culture plays a critical role in perpetuating gender inequality in promotions. Leadership styles, communication practices, and reward systems all contribute to the barriers women face in career advancement. To ensure equal opportunities, organizations must actively address these biases by implementing inclusive policies, transparent communication practices, and equitable reward systems. By fostering a culture of inclusivity and fairness, organizations can help create a level playing field where both men and women have equal opportunities to succeed and advance in their careers.

ABSTRACT

A nanosphere is the division of polymeric nanoparticles having size range 10-200nm. The tiny capsule of drug store house is called vesicles and the solid skeleton structure is called Nanospheres. Nanospheres are biodegradable or non-degradable. It can enclose variety of drugs enzymes, genes and is characterized by a long circulation time. The review begins by presenting an overview of the diverse methods employed for nanospheres preparation, ranging from emulsion polymerization to template-assisted techniques. Each method is critically examined in terms of its principles, advantages, and limitations, offering readers insights into the nuanced selection of techniques based on specific application requirements. The physical and chemical properties of nanospheres, including size, morphology, surface charge, and composition, are discussed in detail. The relationship between these properties and the unique behaviors exhibited by nanospheres is explored, providing a foundation for understanding their applications. The subsequent sections delve into the manifold applications of nanospheres, emphasizing their pivotal role in drug delivery, imaging, catalysis, electronics, and environmental remediation. Specific examples highlight how nanospheres contribute to advancements in these fields, showcasing their potential for addressing complex challenges. Challenges and considerations associated with nanospheres, such as toxicity concerns, manufacturing scalability, and regulatory compliance, are also addressed. The review provides a brief explanation of formulation-related topics, such as the polymers utilized in its synthesis and the various methods for creating nanospheres. concerning the nanospheres' characterization parameters as well.

Keywords: Nanospheres, Polymerization, Biocompatibility, Coacervation, Bioavailability

INTRODUCTION

Drug discovery has advanced quickly as a result of nanotechnology's accelerated expansion; this is known as nano drug delivery system. It is the study of individual atoms in molecule or compounds to create materials with unique features. It is a study of tiny structures with lengths ranging from 1 to one 100 nanometers. Structure of Nanosphere is shown in Figure 1. Because nano drug delivery system can keep a medication in the blood stream for extended period of time, there will be a less variations in plasma levels and fewer adverse effects. These nano drug delivery systems contain a wide variety of nano carriers including carbon nanotubes, nanoparticles micelles, nanogels, nanospheres and nanocapsules.[1,8] The main objective of formulation of nanospheres is to controlling particle size dosing regimen and therapeutically releasing active ingredients are the primary goals of nanospheres formulation in order to achieve site-specific action at a therapeutically active pace. Nanosphere are polymeric matrix of spherical shape that ranges between 10 to 200 nm in diameter. the drug is dissolved, entrapped, encapsulated or attached to the matrix of polymer. The nature of the nanospheres can be amorphous or crystalline and they potentiate to protect the drug from chemical and enzymatic degradation.[2] Nanospheres are nano-sized particles that exhibit unique properties and find applications across a broad range of scientific, medical, and technological fields. Their small size, typically ranging from 1 to 100 nanometers in diameter, sets them apart from bulk materials and gives rise to distinctive physical, chemical, and biological behaviors.

KEY CHARACTERISTICS OF NANOSPHERES

1. **Size and Surface Area:** Nanospheres have an extraordinarily high surface area-to-volume ratio due to their diminutive size. This property contributes to their increased reactivity, making them ideal for various applications such as catalysis and drug delivery.
2. **Drug Delivery Vehicles:** In the field of medicine, nanospheres are extensively used as drug delivery vehicles. Their small size enables efficient transport across biological barriers, and they can be designed to encapsulate and deliver therapeutic agents with improved precision and controlled release.[3,9]
3. **Imaging Agents:** Nanospheres can be engineered to incorporate imaging agents for enhanced contrast in medical imaging techniques. This makes them valuable tools in diagnostics, allowing for better visualization of tissues and organs.
4. **Catalysis:** Due to their high surface area and unique chemical properties, nanospheres serve as efficient catalysts in chemical reactions. They find applications in catalysis to improve reaction efficiency and selectivity.[4]
5. **Versatility in Applications:** Nanospheres are employed in diverse fields, including electronics, optics, textiles, environmental remediation, and energy storage. Their versatility arises from the ability to customize their properties for specific functions.

METHODS OF PREPARATION

Several methods are employed for the preparation of nanospheres, each with its own advantages and limitations. The choice of method depends on the specific characteristics desired for the nanospheres, the intended application, and the type of materials used. Here are some common methods of nanosphere preparation and also shown in figure 3:

Emulsion Polymerization

Principle: Monomers are emulsified in a continuous phase, and polymerization occurs to form nanospheres.

Application: Used for the synthesis of polymer nanospheres, particularly in drug delivery systems.[5]

Solvent Evaporation

Principle: A polymer is dissolved in a volatile organic solvent, and nanospheres are formed when the solvent evaporates. **Application:** Widely used for drug delivery systems, allowing the encapsulation of drugs within the polymer matrix.[6]

Kad et al.,

Spray Drying

Principle: Atomized polymer solution is sprayed into a drying chamber, resulting in the formation of dried nanospheres.

Application: Used for producing nanospheres with controlled release properties and improved stability.[9]

Coacervation

Principle: A polymer solution is destabilized, leading to the formation of a polymer-rich phase and subsequent nanosphere precipitation. **Application:** Suitable for the encapsulation of bioactive compounds in pharmaceuticals and food industries. [7]

Polymerization in Reverse Micelles

Principle: Monomers are encapsulated in reverse micelles, and polymerization occurs within these confined spaces to form nanospheres. **Application:** Used for the synthesis of polymer nanospheres with controlled size and properties.

Layer-by-Layer Assembly

Principle: Nanospheres are constructed by the sequential adsorption of oppositely charged polyelectrolytes onto a core material. **Application:** Suitable for the fabrication of multifunctional nanospheres for drug delivery and imaging.

Template-Assisted Methods

Principle: Nanospheres are synthesized using a sacrificial template that is later removed, leaving behind the nanospheres. **Application:** Template methods are versatile and used for a range of materials, including metals, polymers, and ceramics.[8]

Nano-precipitation

Principle: A polymer is dissolved in a water-miscible organic solvent, which is then rapidly injected into an aqueous solution to induce nanosphere formation. **Application:** Commonly used for the preparation of nanospheres in drug delivery systems.

Self-Assembly

Principle: Nanospheres are formed through the self-organization of amphiphilic molecules or block copolymers.

Application: Used for the fabrication of nanospheres with specific structural and functional properties.[9]

Electro-spraying

Principle: A polymer solution is electrically charged and sprayed to form nanospheres. **Application:** Used for the preparation of nanospheres with a narrow size distribution and high encapsulation efficiency.

Micro fluidic Techniques

Principle: Controlled mixing of fluids at the micro scale leads to the formation of nanospheres. **Application:** Enables precise control over the size and properties of nanospheres.[10]

POLYMERIZATION METHOD

This Method is also known as **Interfacial** polymerization and **Emulsification** polymerization. In this method polymers are emulsified i.e. Emulsification polymerization. Procedure given in figure 4. Monomers are polymerized to form nanosphere (In aqueous solution) (After completion of polymerization)The drug is incorporated by dissolving in the polymerization medium.(Via adsorption onto nanosphere) Nanospheres are obtained. (Then purified, centrifuged and finally freeze dried)[11]

**DESOLVATION TECHNIQUE**

The polymeric solution was prepared. (By using poly ethylene glycol) After drug dissolved in organic solvent (Ethanol) The above solution (organic phase) was added drop wise into polymeric solution. (Under Magnetic Stirring) After then cross linking agent is added (Continue the process for 12 hrs) finally nanosphere suspension was obtained (centrifuged and lyophilized). Procedure given in figure 5.

SOLVENT EVAPORATION METHOD

The polymer dissolved in suitable organic solvent (Mixture sonicated for 2mins) Then drug is dispersed into the previous solution (And again sonicated for 2 min) This above mixture is then emulsified using suitable emulsifying agent to form o/w emulsion. Emulsion is subjected to solvent evaporation via continuous mixing or Increasing temperature or by Reducing pressure. Nanosphere is formed.[12]. Procedure given in figure 6

SALTING OUT METHOD

The polymer dissolved in suitable organic solvent. Then organic phase dissolved in aqueous phase. (That contains suitable emulsifier and high concentration of salts) Under mechanical shear to induce emulsification and formed o/w emulsion. Then pure water added to above emulsion.(Under mild stirring to enhance diffusion of organic solvent into the aqueous phase phase to form nanosphere) Finally nanospheres purified. (By centrifugation and remove salting out agent)[13] Procedure given in figure 7

IONIC GELATION

This method is also called as Coacervation method.

In this method nanosphere are prepared by using natural polymers like chitosan, gelatin, and sodium alginate. Aqueous solution of polymer and drug is taken. Cross linking agent added to another aqueous phase. Due to electrostatic interaction of two phases They form particle size in nanometer range.[14] Procedure given in figure 8

SPRAY DRYING

It is a widely used technique for the formulation of nanospheres, especially in the pharmaceutical and food industries. Procedure given in figure 9

Begin with a liquid nanosphere formulation, typically a solution or suspension of nanoparticles in a suitable solvent. This formulation may contain polymers, drugs, or other materials depending on the intended application.[15]

Atomization

The liquid nanosphere formulation is pumped through a nozzle or atomizer to break it into small droplets. Atomization is a crucial step as it influences the size and morphology of the resulting nanospheres.[16] **Drying** The

atomized droplets are introduced into a drying chamber. The drying chamber is usually a hot environment, often maintained at temperatures above the boiling point of the solvent used in the formulation. **Evaporation of Solvent**

As the nanosphere droplets travel through the drying chamber, the solvent evaporates, leaving behind solid nanospheres. The drying process is rapid, helping to maintain the original nanosphere size and morphology.[15]

Collection The dried nanospheres are collected from the outlet of the drying chamber. The collection system may include a cyclone or other equipment to separate the nanospheres from the drying air.

CHARACTERIZATION OF NANOSPHERES

The characterization of nanospheres involves analyzing and understanding their physical, chemical, and structural properties. This process is crucial for ensuring the desired performance in various applications. [17] Here are some common techniques used for the characterization of nanospheres:

Size and Morphology

- **Scanning Electron Microscopy (SEM):** SEM provides high-resolution images of the surface morphology of nanospheres, allowing for the determination of size, shape, and uniformity.[18]

Kad et al.,

- **Transmission Electron Microscopy (TEM):** TEM provides detailed images of the internal structure of nanospheres, revealing information about their size, shape, and internal features.

Chemical Composition

- **Energy-Dispersive X-ray Spectroscopy (EDS):** EDS, coupled with SEM or TEM, allows for the elemental analysis of nanospheres, providing information about their chemical composition.[19]
- **X-ray Photoelectron Spectroscopy (XPS):** XPS is used to analyze the surface chemistry of nanospheres, providing information about the elemental composition and chemical states of the elements.[20]

Crystal Structure

- **X-ray Diffraction (XRD):** XRD is employed to determine the crystal structure of nanospheres, providing information about their crystallinity, crystal size, and phase composition.[21]

Surface Area and Porosity

- **BET (Brunauer-Emmett-Teller) Analysis:** BET analysis is used to measure the specific surface area and porosity of nanospheres, providing insights into their surface characteristics and adsorption properties.

Zeta Potential and Surface Charge

- **Zeta Potential Analysis:** Zeta potential measurements provide information about the surface charge of nanospheres, influencing their stability, dispersion, and interactions in solution.[22]

Thermal Properties

Differential Scanning Calorimetry (DSC): DSC measures the heat flow associated with phase transitions and chemical reactions, providing information about the thermal properties of nanospheres.[23]

Magnetic Properties

Magnetic Property Measurements: For nanospheres with magnetic properties, techniques such as vibrating sample magnetometer (VSM) can be employed to characterize their magnetic behavior.[24]

Optical Properties

UV-Visible Spectroscopy: UV-Visible spectroscopy is used to study the absorption and scattering properties of nanospheres, providing information about their optical characteristics.[25]

Rheological Properties

Rheological Analysis: Rheological studies can be conducted to understand the flow and deformation behavior of nanosphere-containing materials, which is important in applications such as coatings and composites.[26]

Release Kinetics (for Drug Delivery):

In vitro Release Studies: In drug delivery applications, the release kinetics of drugs from nanospheres can be characterized using various techniques to understand the controlled release behavior

POLYMERS USED IN THE DESIGN OF NANOSPHERE

Various polymers are used in the design and synthesis of nanospheres, each offering unique properties that suit specific applications. The choice of polymer depends on factors such as biocompatibility, biodegradability, mechanical properties, and the intended function of the nanosphere.[27] Here are some commonly used polymers in the design of nanospheres and also listed in figure 2:

1. **Poly (lactic-co-glycolic acid) (PLGA):** Biodegradable, biocompatible, and widely used in drug delivery. **Applications:** Drug encapsulation and controlled release.

Kad et al.,

2. **Polyethylene glycol (PEG):** Hydrophilic, non-toxic, and resistant to protein adsorption. **Applications:** Surface modification to enhance biocompatibility and reduce immunogenicity.
3. **Polyvinyl alcohol (PVA):** Water-soluble, biocompatible, and film-forming. **Applications:** Drug delivery, particularly in combination with other polymers.
4. **Chitosan:** Derived from chitin, biodegradable, and biocompatible. **Applications:** Drug delivery, wound healing, and tissue engineering.
5. **Poly (ethyleneimine) (PEI):** Cationic polymer with high transfection efficiency. **Applications:** Gene delivery and DNA encapsulation.
6. **Poly (alkyl cyanoacrylate):** Biodegradable and biocompatible. **Applications:** Drug delivery, particularly for crossing the blood-brain barrier.
7. **Poly (L-lysine)** positively charged and biodegradable. **Applications:** Gene delivery and drug delivery.
8. **Polystyrene:** Stable, rigid, and hydrophobic. **Applications:** Microspheres for drug delivery, diagnostics, and as model systems in research.
9. **Poly (caprolactone) (PCL):** Biodegradable and exhibits slow degradation. **Applications:** Drug delivery, tissue engineering, and controlled release.
10. **Polyamidoamine (PAMAM):** Dendrimeric structure, with well-defined size and surface groups. **Applications:** Drug delivery, imaging, and gene delivery.
11. **Hydro gels (various polymers):** Highly hydrated, biocompatible, and suitable for controlled drug release. **Applications:** Drug delivery, wound healing, and tissue engineering.
12. **Poly (N-isopropylacrylamide) (PNIPAAm):** Thermo responsive, undergoing a phase transition around body temperature. **Applications:** Drug delivery and temperature-sensitive nanospheres. The selection of a specific polymer depends on the desired characteristics for a particular application, such as sustained drug release, targeted delivery, or imaging capabilities. Additionally, many nanospheres are designed using a combination of polymers to achieve a synergistic effect and enhance overall performance.[28]

ADVANTAGES OF NANOSPHERES

Nanospheres offer numerous advantages across various fields due to their unique properties. Here are some key advantages of nanospheres:

1. **High Surface Area:** Nanospheres have an exceptionally high surface area-to-volume ratio due to their small size. This property enhances their reactivity and makes them ideal for applications requiring surface interactions, such as catalysis and drug delivery.[29]
2. **Drug Delivery:** Nanospheres are widely used in drug delivery systems. Their small size allows for efficient transport across biological barriers, and they can be designed to encapsulate and deliver drugs with improved bioavailability, targeted delivery, and controlled release.
3. **Targeted Delivery:** The small size of nanospheres enables targeted delivery of therapeutic agents to specific cells or tissues. This reduces systemic side effects and enhances the effectiveness of treatments, particularly in cancer therapy.[30]
4. **Improved Stability:** Nanospheres can improve the stability of sensitive compounds, such as drugs or imaging agents. They can protect these materials from degradation, ensuring their efficacy over time.
5. **Enhanced Imaging:** In biomedical applications, nanospheres can be engineered with imaging agents to enhance contrast in various imaging modalities. This facilitates better visualization of tissues and organs in medical diagnostics.
6. **Versatility in Material Composition:** Nanospheres can be synthesized from a wide range of materials, including polymers, metals, and ceramics. This versatility allows for tailoring their properties to meet specific requirements in different applications.
7. **Controlled Release:** Nanospheres can be designed to release encapsulated substances in a controlled manner. This is particularly advantageous in drug delivery, where sustained and controlled release can improve therapeutic outcomes.
8. **Improved Bioavailability:** The small size of nanospheres can improve the bioavailability of poorly soluble drugs by enhancing their solubility and dissolution rate, leading to more effective drug delivery.[31]

Kad et al.,

9. **Biocompatibility:** Many nanosphere materials exhibit good biocompatibility, making them suitable for various biomedical applications. This is crucial for minimizing adverse effects when used in medical treatments.
10. **Efficient Catalysis:** Nanospheres, particularly those made from specific materials, can serve as efficient catalysts in chemical reactions. Their high surface area and unique properties make them effective in catalyzing reactions with improved efficiency and selectivity.
11. **Customizable Properties:** The properties of nanospheres, such as size, shape, and surface charge, can be finely tuned during synthesis. This allows for the customization of nanospheres to meet specific requirements in different applications.[32]
12. **Environmental Applications:** Nanospheres can be employed in environmental remediation, such as pollutant removal and water purification, leveraging their unique properties to address environmental challenges.

DISADVANTAGES OF NANOSPHERES

While nanospheres offer various advantages, there are also potential disadvantages and challenges associated with their use. It's important to consider these factors when exploring applications of nanospheres. Some of the disadvantages include:

1. **Toxicity Concerns:** Certain nano materials may exhibit unexpected toxicity, especially when they interact with biological systems. Understanding the biocompatibility and potential long-term effects is crucial for applications involving nanospheres, particularly in medical and pharmaceutical fields.[33]
2. **Biological Interactions:** Nanospheres can interact with biological systems in ways that are not fully understood. This may lead to unpredictable responses, and thorough studies are necessary to assess their impact on cells, tissues, and organisms.
3. **Manufacturing Challenges:** The production of nanospheres can be complex and may involve intricate synthesis methods. Consistent and scalable manufacturing processes can be challenging to achieve, impacting the reproducibility and cost-effectiveness of nanosphere production.[4]
4. **Agglomeration and Stability Issues:** Nanospheres may have a tendency to agglomerate, affecting their stability and performance. Agglomeration can reduce the specific surface area and alter the properties of the nanospheres, impacting their intended functions.
5. **Limited Understanding of Long-Term Effects:** The long-term effects of exposure to nanospheres, especially in medical and environmental applications, are not fully understood. Continuous research is needed to assess the safety and potential risks associated with prolonged exposure.
6. **Regulatory Challenges:** The regulatory landscape for nanomaterials is still evolving, and there may be challenges in establishing standardized testing and safety protocols. Compliance with regulatory requirements can pose hurdles in the development and commercialization of nanosphere-based products.
7. **Environmental Impact:** The disposal of nanomaterials, including nanospheres, raises concerns about their potential environmental impact. The long-term effects of these materials on ecosystems and wildlife need to be carefully considered.
8. **Cost Considerations:** The production of nanospheres, especially those made from specialized materials, can be expensive. High production costs may limit the widespread adoption of nanospheres in certain applications.
9. **Limited Understanding of Fate and Transport:** Understanding the fate and transport of nanospheres in biological systems and the environment is crucial. The lack of comprehensive knowledge in this area can impede the safe and responsible use of nanospheres.
10. **Ethical Considerations:** Ethical concerns related to the use of nanospheres, especially in medical applications, may arise. Issues such as informed consent, privacy, and the potential for misuse should be carefully addressed.

CHALLENGES ASSOCIATED WITH NANOSPHERE FORMULATION:

The formulation of nanospheres involves addressing several challenges to ensure their stability, functionality, and safety. Here are some common challenges associated with nanosphere formulation:

1. **Size Control:** Achieving precise control over the size of nanospheres is crucial for their intended applications. Variability in size can affect drug release kinetics, cellular uptake, and overall performance. Consistent and reproducible size control remains a challenge in nanosphere formulation.

Kad et al.,

2. **Polydispersity:** Polydispersity refers to the distribution of sizes within a batch of nanospheres. High polydispersity can lead to uneven drug release and may impact the overall efficacy of the nanosphere formulation. Minimizing polydispersity is a key challenge in achieving uniform and predictable performance.[35]
3. **Stability Issues:** Nanospheres may experience stability issues such as aggregation, sedimentation, or precipitation over time. Maintaining the stability of nanospheres during storage and transportation is a significant challenge, especially when dealing with nanoparticles prone to agglomeration.
4. **Drug Loading and Release Kinetics:** Efficient loading of therapeutic agents into nanospheres and controlling their release kinetics pose challenges. Achieving a high drug-loading capacity without compromising the stability and integrity of the nanospheres can be technically demanding.
5. **Biocompatibility and Toxicity:** Ensuring the biocompatibility of nanosphere formulations is critical for medical applications. Understanding and mitigating potential toxic effects, especially for long-term use, is a challenge that requires comprehensive toxicity studies.
6. **Manufacturing Scalability:** Transitioning from lab-scale synthesis to large-scale production while maintaining the desired characteristics of nanospheres can be challenging. Achieving reproducibility, consistency, and cost-effectiveness in large-scale manufacturing is a hurdle in the commercialization of nanosphere formulations.[36]
7. **Surface Modification and Functionalization:** Surface modification is often required to impart specific properties to nanospheres, such as improved biocompatibility or targeting capabilities. Achieving effective surface modification without altering the overall characteristics of the nanospheres presents a formulation challenge.
8. **Regulatory Compliance:** The regulatory landscape for nano materials, including nanospheres, is evolving. Meeting regulatory requirements and establishing standardized testing protocols for safety and efficacy can be challenging but is essential for approval and market acceptance.
9. **Understanding In Vivo Behavior:** Studying the in vivo behavior of nanospheres, including their pharmacokinetics, biodistribution, and clearance mechanisms, is complex. The challenge lies in developing reliable models and methodologies to accurately assess the performance of nanosphere formulations within living organisms.[6]
10. **Cost Considerations:** The cost of raw materials, synthesis processes, and characterization techniques for nanospheres can be high. Achieving cost-effective formulations that meet quality standards and regulatory requirements is a challenge for widespread adoption in various applications.

APPLICATIONS

Nanospheres, which are nano-sized spherical particles, find applications across various fields due to their unique properties. Here are some applications of nanospheres:

1. **Drug Delivery:** Nanospheres can be used in drug delivery systems to encapsulate and deliver pharmaceutical agents. Their small size allows for targeted delivery, improving drug efficacy while minimizing side effects.[4]
2. **Biomedical Imaging:** Nanospheres can be designed with imaging agents for applications in medical imaging. These particles enhance contrast in imaging techniques like magnetic resonance imaging (MRI) or fluorescence imaging.
3. **Cancer Treatment:** In cancer therapy, nanospheres can be engineered to deliver anticancer drugs specifically to tumor cells, minimizing damage to healthy cells. Additionally, they can be used for imaging tumors and monitoring treatment response.
4. **Cosmetics:** Nanospheres are used in cosmetics for controlled release of active ingredients, improving the stability and effectiveness of skincare products. They can enhance the delivery of vitamins, antioxidants, and other beneficial compounds.[16]
5. **Food and Beverage Industry:** Nanospheres can be employed for encapsulating flavors, nutrients, or additives in food and beverages. This allows for controlled release and improved stability of sensitive compounds.[12]
6. **Environmental Remediation:** Nanospheres can be utilized in environmental applications, such as water purification and pollutant removal. They can absorb or catalyze pollutants, aiding in the remediation of contaminated environments.

Kad et al.,

7. **Electronics and Optics:** In electronics, nanospheres can be used for coating surfaces to provide enhanced conductivity, improved insulation, or as components in advanced electronic devices. In optics, they can be employed for light manipulation and as components in nanophotonic devices.
8. **Catalysis:** Nanospheres can serve as catalysts in various chemical reactions due to their high surface area and unique chemical properties. They find applications in improving reaction efficiency and selectivity.[31]
9. **Textiles:** Nanospheres can be incorporated into fabrics for applications such as stain resistance, water repellency, or antimicrobial properties. These enhancements improve the durability and functionality of textiles.
10. **Energy Storage:** In the field of energy storage, nanospheres can be used in the development of advanced batteries and super capacitors. Their unique properties can contribute to improved energy density and storage capabilities.

RECENT ADVANCES IN NANOSPHERE FORMULATIONS

1. **Multifunctional Nanospheres:** Recent research focuses on designing nanospheres with multiple functionalities, such as combining drug delivery with imaging capabilities. These multifunctional nanospheres aim to enhance diagnostic and therapeutic approaches, providing more comprehensive solutions in medicine.[14]
2. **Targeted Drug Delivery Systems:** Advances in nanosphere research are directed towards improving targeted drug delivery. Strategies include the use of ligands on nanospheres' surfaces for specific targeting of diseased cells or tissues, reducing side effects and improving therapeutic efficacy.
3. **Responsive Nanospheres:** Scientists are developing nanospheres that respond to specific environmental cues. These responsive nanospheres can release drugs or change their properties in response to changes in pH, temperature, or other physiological conditions, providing a more controlled and tailored approach.
4. **In Vivo Imaging Nanospheres:** Recent advances include the development of nanospheres for in vivo imaging with improved sensitivity and resolution. These nanospheres can be used for early detection of diseases and monitoring treatment responses.[17]
5. **Biodegradable Nanospheres:** Sustainable and biodegradable nanospheres are gaining attention to address environmental concerns. These nanospheres can be designed to degrade after fulfilling their intended purpose, reducing long-term environmental impact.
6. **Nano structured Materials:** Advances in nanosphere synthesis involve the exploration of various nano structured materials, including hybrid nanospheres and nano composites. These materials offer unique properties and functionalities for applications in diverse fields.
7. **Nanosphere-Based Vaccines:** Researchers are investigating nanosphere-based vaccine delivery systems, aiming to enhance vaccine efficacy and improve immune responses. Nanospheres can serve as efficient carriers for antigens, adjuvants, and other vaccine components.[5]
8. **3D Printing of Nanospheres:** Innovations in nanosphere manufacturing include the integration of 3D printing technologies. This approach allows for precise control over nanosphere structures and properties, enabling customized applications in medicine, electronics, and materials science.
9. **Nanosphere-Based Sensors:** Nanosphere-based sensors are being explored for their applications in detecting various analyte, including biomarkers and environmental pollutants. These sensors leverage the unique properties of nanospheres to achieve high sensitivity and selectivity.[6]
10. **Nanospheres for Energy Storage:** Recent research is focusing on using nanospheres in energy storage devices, such as batteries and super capacitors. The high surface area and unique properties of nanospheres can enhance the performance and efficiency of these energy storage systems.

CONCLUSION

This comprehensive review has illuminated the multifaceted world of nanospheres, underscoring their significance in diverse scientific, medical, and technological realms. The synthesis methods discussed showcase the versatility available to researchers and engineers, allowing them to tailor nanospheres for specific applications with precision

**Kad et al.,**

and control. The exploration of physical and chemical properties has unveiled the unique behaviors inherent in nanospheres, laying the groundwork for harnessing these characteristics in innovative ways. The myriad applications of nanospheres, ranging from drug delivery and imaging to catalysis and environmental remediation, highlight their transformative potential across various disciplines. The examples presented underscore the pivotal role nanospheres play in advancing technological frontiers, offering solutions to intricate challenges and propelling progress in fields critical to human well-being. However, the review also delves into the challenges and considerations surrounding nanospheres, emphasizing the importance of addressing issues such as toxicity, scalability, and regulatory compliance. Recognizing and navigating these challenges are crucial for the responsible development and widespread adoption of nanosphere-based technologies. Looking ahead, the dynamic nature of nanosphere research promises continued breakthroughs and innovations. As scientists delve deeper into understanding nanosphere behavior and refine synthesis techniques, new frontiers are likely to emerge. [14] The potential for collaborative efforts across disciplines, from chemistry to medicine and beyond, holds the key to unlocking the full spectrum of possibilities inherent in nanospheres. In the grand tapestry of nanotechnology, nanospheres stand as miniature marvels, offering a pathway to precision and efficiency in applications that impact our daily lives. This review serves as a comprehensive guide, shedding light on the current state of nanosphere research while pointing to future directions. As researchers continue to unravel the mysteries of nanospheres, their journey promises to be one of continuous discovery, innovation, and transformative impact.
