Plithogenic sets are more significant in determining optimal solutions to intricate decisioning problems. A plithogenic set is a quintuple of the form (P, a, V, d, c) which is characterized by attributes, attribute values, degrees of appurtenance and contradiction. This research work presents a decision-making model based on plithogenic method of contradictions considering different linguistic degrees of contradictions. The proposed model is validated with the decisioning on renewable energy systems. The decisioning model developed in this work consists of several alternative energy sources and the related criteria. The linguistic representations of the contradiction degrees are quantified using fuzzy, intuitionistic and neutrosophic sets. The rankings of the alternatives based on the method of contradictions obtained using different representations are compared to analyze the efficacy of different representations of linguistic variables. This study explores the competency of different quantifications of linguistic representations in facilitating the decision makers to derive optimal solutions to the problem of alternative renewable energy resources.

Keywords: Plithogenic sets, Linguistic variable, contradiction degree, renewable energy systems.

INTRODUCTION

Smarandache developed Plithogenic sets to generalize the existing sets of different kinds. The construction of this set as a quintuple (P, a, V, d, c) is more concerned on attributes and attribute values. The plithogenic sets are categorized into fuzzy, intuitionistic and neutrosophic based on the nature of the appurtenance degree (d) which represent the association between the elements of the set P and the attribute values belonging to the set V subjected to the attribute say 'a'. The contradiction degree exhibits the differences between the attribute values, however, the contradiction degree assumes a numerical value and this do not contribute to the classification of the plithogenic sets. In general, the contradiction degree needs to be represented using linguistic variable to facilitate the decision makers to express their opinion on the choice of the dominant attribute value and its differences between the other attribute values. Nivetha *et al*[14] employed linguistic representation of the contradiction degrees in developing a decisioning model using Plithogenic cognitive maps and it was quantified using fuzzy representations. This is the ground work of this proposed decisioning approach and this serves as a motivating key to extend and explore the linguistic variable quantification using different representations. The theory of Plithogeny is getting augmented at recent times and its implications is witnessed in several areas of decisioning especially in multi -criteria optimization. Sudha *et al*[21] presented a review of applications of plithogenic based multi-criteria decision methods. To mention a few, Ozcil *et al*[17] in performance appraisal, Ahmad *et al*[2] in ranking the alternatives, Abdel *et al*[1] in health care, Grida *et al*[10] in supply chain. Plithogenic based hypersoft sets are also applied in diverse decisioning, some of the noteworthy works contributed to literature are Dhumras *et al*[5] in medical diagnosis, Martin *et al*[13] in Covid diagnosis, Hema *et al*[11] in ranking of the alternatives. Plithogenic graphs are also discussed, some significant contributions are made by Fujita[9], Martin *et al*[12], Azeem *et al*[3]. The concept of Plithogeny is integrated with graphs and applied in decisioning. The aforementioned applications exhibit and demonstrate the efficacy of Plithogenic sets in multicriteria decisioning. This has motivated the authors to apply Plithogenic based decisioning in making optimal decisions on alternative energy resources. On other hand, in the above discussed literature, the contradiction degrees are represented numerically and only in a very few plithogenic representations, the contradiction degrees are represented using linguistic variables especially using fuzzy membership values. However, the other representations of linguistic variables using intuitionistic or neutrosophic membership values are not much leveraged and comparisons of the quantifications are also not much explored to the best of our knowledge. This fostered the authors to initiate the linguistic depictions of contradiction degrees using different representations and comparisons of the same. The remaining contents of the paper are enfolded in to the following sections. The preliminaries are presented in section 2. The methodology is outlined in section 3. The proposed decisioning approach is applied in section 4. The results are discussed in section 5 and the last section concludes the work.

PRELIMINARIES

This section presents the fundamentals essential for this research work.

Definition 2.1 Fuzzy set[15]

Let U be the universe of discourse, a fuzzy set A is attributed by a membership function μ_A of the form $\mu_A : U \rightarrow [0,1]$, where $\mu_A(u) \in [0,1]$ represents the membership value of u in A

Definition 2.2 Intuitionistic set[8]

Let U be the universe of discourse, an intuitionistic fuzzy set A is attributed by a membership function μ_A and non-membership function ν_A of the form $\mu_A(x), \nu_A(x) : X \rightarrow [0,1]$. The intuitionistic set assumes the form of $A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle : x \in X \}$, where $0 \leq \mu_A + \nu_A \leq 1$

Definition 2.3 Neutrosophic set[19]

Let U be the universe of discourse, a neutrosophic set A is attributed by a truth function μ_A , indeterminacy function σ_A and falsity function γ_A of the form $\mu_A(x), \sigma_A(x), \gamma_A(x) : X \rightarrow [0,1]$. The neutrosophic set assumes the form of $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle : x \in X \}$, where $0 \leq \mu_A(x) + \sigma_A(x) + \gamma_A(x) \leq 3$

**Definition 2.4 Plithogenic Set[20]**

Plithogenic set is characterized as the generalization of crisp, fuzzy, intuitionistic, and neutrosophic set. Let U be the universal set, a plithogenic set is of the form (P, a, V, d, c) where the set is denoted by P , attribute by a , attribute values by V , degree of appurtenance by d and contradiction degree by c , where $d: P \times V \rightarrow \rho([0,1]^z)$, $c: V \times V \rightarrow [0,1]^z$

Definition 2.5 Triangular Fuzzy Number[6]

A triangular fuzzy number $\tilde{a} = (a^l, a^m, a^n)$ is a fuzzy set defined on the set R of real numbers, whose membership function is defined as follows:

$$\mu_{\tilde{a}}(x) = \begin{cases} \frac{(a^n - x)/(a^n - a^m)}{a^m - a^l}, & \text{if } a^m \leq x \leq a^n \\ \frac{x - a^l}{a^m - a^l}, & \text{if } a^l \leq x \leq a^m \\ 0, & \text{if } x > a^n \text{ or } x < a^l \end{cases}$$

Where a^l, a^m and a^n are called the lower bound, the mode and the upper bound of the triangular fuzzy number.

Definition 2.6 Triangular Intuitionistic Fuzzy number[7]

A triangular intuitionistic fuzzy number $\tilde{a} = ((\underline{a}, a, \bar{a}), \mu_{\tilde{a}}, \nu_{\tilde{a}})$ is a special IFS on a real number set R , its membership function is defined as follow:

$$\mu_{\tilde{a}}(x) = \begin{cases} \frac{x - \underline{a}}{a - \underline{a}} \mu_{\tilde{a}}, & \text{if } \underline{a} < x \leq a \\ \mu_{\tilde{a}}, & \text{if } x = a \\ \frac{\bar{a} - x}{\bar{a} - a} \mu_{\tilde{a}}, & \text{if } a < x \leq \bar{a} \\ 0, & \text{if } x < \underline{a} \text{ or } x > \bar{a} \end{cases}$$

And its non-membership function can be defined as :

$$\nu_{\tilde{a}}(x) = \begin{cases} \frac{a - x + (x - \underline{a})}{a - \underline{a}} \nu_{\tilde{a}}, & \text{if } \underline{a} < x \leq a \\ \nu_{\tilde{a}}, & \text{if } x = a \\ \frac{x - a + (\bar{a} - x)}{\bar{a} - a} \nu_{\tilde{a}}, & \text{if } a < x \leq \bar{a} \\ 1, & \text{if } x < \underline{a} \text{ or } x > \bar{a} \end{cases}$$

Where $\mu_{\tilde{a}}$ and $\nu_{\tilde{a}}$ are the maximal membership degree and the minimal non-membership degree respectively, and they satisfy the condition $0 \leq \mu_{\tilde{a}} \leq 1$, $0 \leq \nu_{\tilde{a}} \leq 1$.

Definition 2.7 Triangular Neutrosophic fuzzy number[18]

Let $a_1 \leq b_1 \leq c_1$ such that $a_1, b_1, c_1 \in R$. A triangular neutrosophic number $\tilde{A} = \langle (a_1, b_1, c_1); w_A, u_A, y_A \rangle$ is a special neutrosophic set on the real number set R , whose truth-membership function $\mu_A: R \rightarrow [0, w_A]$, indeterminacy-membership function $\nu_A: R \rightarrow [u_A, 1]$ and falsity-membership function $\lambda_A: R \rightarrow [y_A, 1]$ respectively.

Definition 2.8 Defuzzification of Triangular Fuzzy Number

A triangular fuzzy number $A = (a, b, c)$ is defuzzified using

$$FT_F(A) = \frac{(a + b + c)}{3}$$

Definition 2.9 Score of Triangular Intuitionistic Fuzzy number[16]

If $B = ((a, b, c), w_a, u_a)$ is a triangular intuitionistic fuzzy number, then

$$IT_F(B) = \frac{1}{12} \left[\frac{4b - 2(a + c) + 3w_a(a + c)}{w_a} + \frac{2(a + b + c) - 3u_a(b + a)}{(1 - u_a)} \right]$$

Definition 2.10 Deneutrosophication of Triangular Neutrosophic fuzzy number[4]

If $C = ((a, b, c), (d, e, f), (g, h, k))$ is a triangular neutrosophic fuzzy number, then

$$NT_F(C) = \frac{(a + 2b + c + d + 2e + f + g + 2h + k)}{12}$$

METHODOLOGY

This section describes the steps to be followed in ranking the alternatives using linguistic variable representation of contradiction degrees.

Step 1 : Definition of the problem

In this step, the problem to be addressed is defined. The alternatives, criteria and the criterion values are tabulated together with the decision of the dominant criterion values. The criteria are classified into benefit and non-benefit. The decision-making matrix associating both the alternatives and the criteria with criterion values is formulated.

$$D_L = \begin{pmatrix} b_{L11} & \dots & b_{L1n} \\ \vdots & \ddots & \vdots \\ b_{Lm1} & \dots & b_{Lmn} \end{pmatrix}$$

Step 2: Computation of Criterion Weights

The criterion weights are calculated using the existing methods of multi-criteria decisioning. In general the criterion weights say w_1, w_2, \dots, w_m are assumed to be equal such that $\sum_{k=1}^m w_k = 1$

Step 3 : Formulation of linguistic contradiction matrix

The contradiction matrix containing the linguistic representation of the contradiction degree of the criterion values with regard to dominant criterion values is framed.

$$C_L = \begin{pmatrix} c_{LD11} & \dots & c_{LD1n} \\ \vdots & \ddots & \vdots \\ c_{LDm1} & \dots & c_{LDmn} \end{pmatrix}$$

Each of the values in the cells is either of the form presented in Definition

Step 4 : Quantification of linguistic contradiction degree

The contradiction degree represented using linguistic contradictions is quantified using either fuzzy numbers, intuitionistic numbers and neutrosophic numbers as mentioned in Definitions 2.8 -2.10.

Step 5 : Framing of weighted contradiction matrix

The contradiction matrix $[C_L]$ is multiplied with the criterion weights to frame the weighted contradiction matrix $[WC_L]$. The matrix framed comprises numerical values in crisp form.

Step 6 : Determination of Score Values

The score values of the alternatives subjected to both beneficiary (Score_{Beneficiary}) and (Score_{non-Beneficiary}) non-beneficiary values are computed.

Step 7: Finding the ranks of the alternatives

The ranks of the alternatives are obtained with determination of the Score value. The alternative with maximum value is ranked first and so on.

The overall process of the methodology is described by using the fig.1.

Application to the Decisioning Problem

This section elucidates the proposed problem of ranking the alternative energy resources using different quantifications of the contradiction degrees.

Problem Description

Let us consider a manufacturing company which faces a decisioning situation of switching to alternate sources of energy. The company considers the criteria and the alternatives presented in the Table 1. The criterion values are presented in Table 2 to facilitate the decision makers in constructing an optimal ranking of the alternatives. The dominant criterion values are also presented in Table 3. The proposed approach in section 3 is applied to the above described decisioning problem. The above Table 1 comprises 10 alternatives and 8 criteria with a total of 24 criterion values. The decisioning matrix initially formulated to represent the association of the alternatives with the criteria is presented below in a tabular form with linguistic variable representations. The initial decisioning matrix is represented in Table 2. The dominant criterion values subjected to each of the criteria is presented in the Table 3. The contradiction degrees of the criterion values with respect to dominant criterion value or the attribute is presented as

**Sathya and Nivetha Martin**

linguistic variables in Table 4. The quantification of the linguistic variable using different representations is presented in Table 5. The respective quantification of the linguistic variables using different representations is presented in Table 6. With the assumption of equal weight age to the criteria, the ranking of the alternatives is computed as follows for different quantifications under three cases.

Case (i) Fuzzy Quantification

The contradiction matrix after quantifying the linguistic variable using fuzzy triangular numbers and respective defuzzification is presented in tabular form as in Table 7. The weighted contradiction matrix with fuzzy quantification is presented in tabular form as in Table 8. The scores of the alternatives with respect to non-beneficiary (cost) and beneficiary criteria, their differences and final rankings are presented in Table 9.

Case (ii) Intuitionistic Quantification

The contradiction matrix after quantifying the linguistic variable using intuitionistic triangular numbers and respective defuzzification is presented in tabular form as in Table 10. The weighted contradiction matrix with intuitionistic quantification is presented in tabular form as in Table 11. The scores of the alternatives with respect to non-beneficiary (cost) and beneficiary criteria, their differences and final rankings are presented in Table 12.

Case (iii) Neutrosophic Quantification

The contradiction matrix after quantifying the linguistic variable using neutrosophic triangular numbers and respective defuzzification is presented in tabular form as in Table 13. The weighted contradiction matrix with neutrosophic quantification is presented in tabular form as in Table 14. The scores of the alternatives with respect to non-beneficiary (cost) and beneficiary criteria, their differences and final rankings are presented in Table 15.

Sensitivity Analysis

The ranking results obtained under three cases in the section 4 is compared with the conventional representation of the linguistic variable. The contradiction matrix in conventional form is presented in Table 16. The weighted contradiction matrix with equal criterion weightage is presented in Table 17. The scoring of the alternatives and the rankings are presented in Table 18. The score values of the alternatives obtained using conventional and different quantifications are presented in Table 19. The comparative analysis of the score values is presented graphically in Fig.2. From the figure and the tabulated values, it is observed that the alternatives A3 and A8 occupies most favorable ranking position. On other hand the alternatives A4,A5 and A9 occupies least favorable position in rankings whereas the other alternatives occupy mixed positions in ranking. The rankings obtained under three cases and the conventional from are compared using correlation and the results are presented in Table 20. The correlation coefficient between the rankings obtained using different quantifications and the conventional procedure is pictorially represented using heat maps as in Fig.3 The pair-wise comparisons between each of the ranking methods are presented in Fig. 4.

Inferences

From the above ranking results presented in Table 20, Fig 3 and 4, the following observations are made. The ranking results obtained using fuzzy, intuitionistic and neutrosophic are more consistent and reliable in comparison with the conventional method. The ranking results are more promising in the context of linguistic variable representation of contradiction degree than the usual procedure. The results obtained in section 4 and the sensitivity analysis in section 5 favours the linguistic variable representation of the contradiction degrees between the dominant attributes and other attribute values. Since the expert's opinion are subjective in nature, linguistic representations facilitate in formulating comprehensive decision process. However, in comparisons between fuzzy, intuitionistic and neutrosophic, the rankings obtained using neutrosophic quantifications are more promising as it is more closer to the conventional ranking results.

CONCLUSION

This research work presents a comparative analysis of the different quantifications of the linguistic variables. The application of plithogenic based decisioning with different quantifications of linguistic variable with special reference to the ranking of alternative energy resources is presented in this work. The linguistic representations of the contradiction degree is proposed in this research work and the efficacy of such representations are validated using different quantifications in the context of ranking alternative energy resources. This study shall be extended by using other kinds of quantifications. Also, comparative studies shall also be initiated to explore the efficiency of linguistic variable representations in decisioning.

ABSTRACT

The workplace development landscape is changing, and micro-mentoring is a crucial strategy for employee motivation and skill development. Organisational growth is also changing. Micro-mentoring is becoming more and more popular as a helpful tool for professional development and employee engagement. In the fast-paced workplaces of today, it remains an area that requires critical examination. While employee performance has been demonstrated to improve with typical mentoring methods, further research is necessary to completely comprehend the special impacts of micro-mentoring, which is distinguished by its focus and short duration. This study examines how micro-mentoring plays a significant role in employees in various industries. It focuses on understanding the differences in perceptions based on industry sectors and experience levels, aiming to identify significant factors that contribute to the success of micro-mentoring initiatives. The research highlights important aspects of micro-mentoring that greatly support employees' professional development and empowerment by carefully analysing the responses. This research employs a combination of quantitative analysis methodologies, including descriptive statistics, factor analysis, reliability testing (Cronbach's Alpha), ANOVA, and correlation analysis. The data were collected from 150 respondents across four sectors: manufacturing, information technology, service, and others, using a self-developed, pre-tested, and validated questionnaire. The results of this study examine the important aspects of micro-mentoring, identified are statistically significant indicating that it comprehends significant factors of micro-mentoring. It has been identified notable differences in how the workforce from various sectors view goal accomplishment and professional development within micro-mentoring, reflecting different priorities and needs across industries.

Keywords: Micro Mentoring, Components of Micro Mentoring, Professional Development, Goal Attainment & Employee perception

INTRODUCTION

The term "micro-mentoring" is a mentoring tactic in which mentees and mentors engage in brief, targeted conversations that usually span a few minutes up to a few hours. Micro-mentoring emphasizes short, focused exchanges of information, counsel, and direction as compared to traditional mentoring, which frequently entails longer-term relationships and formal arrangements (Chazot, C. A., L'Etoile, M., & Sandland, J. G. (2023)). It is a versatile and adaptable learning tool since it enables people to look for mentorship on subjects or difficulties as needed. Micro-mentoring fosters a variety of viewpoints and skill development and can take place in-house, among departments, or even in external networks (India employer forum, 2022). The dynamic learning demands of employees in today's fast-paced and constantly evolving workplace may pose a challenge for traditional mentoring programs. This innovative approach to mentoring fosters lifelong learning, cross-functional cooperation, and employee ownership of their own development on both a personal and professional level. As organizations increasingly embrace the principles of agility and flexibility, micro-mentoring emerges as a powerful tool for building a culture of learning and innovation, where every interaction becomes an opportunity for growth and development. Considering the current socio-emotional issues, it is crucial to modify mentoring techniques to suit the individual requirements and preferences of younger generations. (Saam Cook 2023) The systematic use of micro-mentoring as a professional development strategy may significantly enhance employee skills, motivation, and overall empowerment at work. The efficacy and impression of micro-mentoring, however, may differ throughout industries due to differences in organisational cultures, difficulties unique to a certain business, and demands about employee development. While preliminary factor analysis showed significant components of micro-mentoring that are appreciated in various industries, little is known about how employees prioritise and assess these aspects in various industrial situations. By performing a comparative investigation of employee perceptions and attitudes towards micro-mentoring across several industries, this study seeks to close this gap. This research will identify significant differences in the perception and efficacy of micro-mentoring components, with a focus on sector-specific nuances.

Based on the previous research and literature review the research will address the following research questions:

1. How does micro-mentoring contribute to employees' long-term career planning and skill development?
2. How successful is micro-mentoring in assisting employees in setting and achieving objectives?

This research will assess how the reliability and accuracy of the results by assessing the validity of the factor analysis carried out on the micro-mentoring components. Consequently, the research will address whether staff members' perceptions of the goal-achievement and professional development aspects of micro-mentoring vary significantly among industries. Our research will determine whether employees with different levels of experience have significantly different opinions on the goal-achievement and professional development aspects of micro-mentoring. The research will have great value in examining the relationships between each of the components of micro-mentoring and how they work together to support employees in the achievement of their goals and professional development.

REVIEW OF LITERATURE

Mentoring practices have become more prevalent in various fields. As per the 2021 Public Health Workforce Interests and Needs Survey, the management is becoming increasingly concerned with the rising levels of stress, burnout, and intent to resign among public health employees (Turgut, S., & Taşçi, G. (2024)). Research has shown that job fatigue can result from stressful work environments, which can hurt both mental and physical health. Few studies have indicated that personal coping strategies to alleviate the effects of stress are relatively understudied. A small number of studies have demonstrated that supervisors and workplace mentoring can be beneficial. Thus, research is needed to identify how micro-mentoring contributes to employees' long-term career planning and skill development. (Moruff Sanjo & OLADIMEJI (2020)) investigate how mentorship affects employees' performance in Nigeria's service sector. They employed regression analysis to examine the association in their investigation, which was founded on the 253 responses given by workers in the hotel industry. The authors concluded that adopting a mentoring function enhances worker performance and increases productivity.

**Anand and Deepa**

Shuang Xu (2021) emphasis the performance of mentors and how it affects their originality. The study concludes that, in addition to fostering the mentor's creativity, mentoring gives a business competitive edge. It enhances the mentor's ability to learn on their own in later career phases. This study used multiple regression analysis to determine the effect of mentorship on the creative performance of mentors, and confirmatory factor analysis to test the distinctiveness of variables collected from 153 responses from 15 enterprises in various provinces in China. **Sushmitha Srivastava & Jomon (2013)** examines how protégés' perceptions of relational and traditional mentoring support affect their role-based performance results. They also concluded that both forms of mentoring support had an impact on the protégé's role-based performance, with the protégé's own learning serving as a mediator. The author employed confirmatory factor analysis to check the dimensionality of the relational mentorship measures using 151 samples, demonstrating convergent validity, and correlation and regression analysis to evaluate the variables under research in this article. **VanBuskirk, A. (2023)** investigated how mentorship affected worker performance, the author found that coaching, apprenticeship training, and employee orientation all increased output. Training for apprenticeships also raised productivity. Employee performance was proxied by employee productivity, employee commitment, and organizational citizenship behaviour; in the context of this study, mentoring was divided into three categories: employee orientation, coaching, and apprenticeship. 336 responses were gathered by basic random sampling, and regression analysis was employed. **Adil Rasool & Mohammad Afzal Zarghoni (2021)** examined how employee growth is impacted by mentorship. As the authors investigated the relationship between employee productivity and mentorship, they recognized the obstacles and limitations. The study's sample comprised 700 workers at the CWSA office in Afghanistan. Multiple regression and bivariate correlation were used to determine the relationship between worker performance and mentoring, as well as how mentoring boosts worker productivity. **S.Chatterjee (2021)** examined the relationship between job performance and mentoring. The study also discovered that mentoring has several positive effects, such as enhanced job performance and career promotion, and that among Indian millennials, higher perceived mentoring may be linked to better perceived job performance. A multistage sampling technique was utilised to choose a sample of 123 millennial Indian employees who are mentored. Regression analysis and Structural equation modelling (SEM) was utilised to evaluate various models on the association between mentoring and job performance.

Perception of goal achievement on employee perspective

Van Beurden, J., Van De Voorde, K., & Van Veldhoven, M. (2022), This study provides an outline of existing research on employees' perceptions of HR procedures. It integrates the outcomes of several studies on employee behaviour and its effect on HR operations. It highlights the need to understand employees' perspectives to create effective HR policies that foster engagement and contentment. This article suggests future research initiatives to understand how HR practices and employee outcomes are associated. **Wei, F., Xu, L., Hu, X., Chang, S. C., & Wu, Y. (2023)**, The study uses goal-setting theory to investigate the impact of negative feedback on employee performance. This study employs a three-wave research design to determine whether an increase in negative feedback affects performance by reducing goal engagement. This negative effect is less likely to occur when employees have a growth mindset. This study demonstrates the power of negative feedback and therefore suggests a new way to manage ideas to improve performance. **Wang, W., Li, J., Sun, G., Cheng, Z., & Zhang, X. A. (2017)**, The study provides evidence that achievement goals can enhance life satisfaction, especially when combined with emotional regulation strategies. This contributes to understanding the consequences of achievement motivation and factors influencing well-being. Key findings focus on achieving goals which is positively related to life satisfaction and the perception of a successful agency that mediates the relationship between achievement goals and life satisfaction. An organization can boost its employee's motivation by inspiring them to achieve goals. Individuals must use emotional reappraisal when facing setbacks in goal pursuit. **Devarajan R, Maheshwari S & Vohra V. (2018)**, This study looks at how setting work goals affects how meaningful employees find their jobs, especially when work is changing a lot. It found that when employees understood why they were given certain goals, they felt their work was more meaningful. The study shows it's important for bosses to explain the reasons behind work goals. This can help employees feel better about their jobs, even when the way they work is changing. The main takeaway is that if companies want their workers to find their jobs meaningful, they should make sure to explain why each goal matters. **Maran T. K, Baldegger U & Klösel K. (2022)**, This research paper studies the effects of visionary leadership and empowering leadership on

**Anand and Deepa**

followers' goal achievement focusing on how these leadership styles influence their cognitive processes. The study emphasized on the importance of understanding how leader behaviors influence followers' cognitive processes.

Professional development in micro-mentoring on employee perspectives

St-JeanÉ & Tremblay, M. (2020), This study demonstrates that learning goal orientation (LGO) has a significant moderating influence on mentoring's enhancement of entrepreneurial self-efficacy in opportunity recognition (ESE-OR) among beginning entrepreneurs. While high LGO mentees enjoy a tempered effect, bringing self-efficacy in line with realistic levels, low LGO mentees gain more from mentoring, with enhanced ESE-OR. The study emphasizes how crucial mentors' roles and qualities are in fostering the growth of entrepreneurs. Notwithstanding these drawbacks, the results highlight how important LGO is to the success of entrepreneurs and offer insightful advice for enhancing mentoring initiatives. The study's robust methodology and longitudinal approach add significant depth to the understanding of mentoring outcomes. **RaginsB.R. & Kram K.E (2007)**, The evolution of mentoring over the past 25 years reflects significant paradigm shifts, including the emergence of peer, cross-gender, cross-cultural, and e-mentoring. These developments highlight the importance of recognizing diverse experiences and contexts in mentoring research. Key factors influencing effectiveness include personality, developmental stages, emotional intelligence, and relational skills. The critique of traditional benchmarks, particularly the focus on White male experiences, underscores the need for a broader perspective that incorporates diverse mentors' unique contributions. Emphasizing relational caches and personal development, the passage advocates for expanded, iterative research to better understand mentoring dynamics and outcomes across various contexts. **ShahM.H, Bin Othman A. R & Bin Mansor M.N(2016)**, Mentoring has gained prominence in SMEs due to its positive impact on business performance and employee development. It involves experienced mentors guiding less experienced individuals through phases of Initiation, Cultivation, Separation, and Redefinition. Mentoring offers career and psychosocial support, enhancing job satisfaction, confidence, and organizational outcomes. Despite its benefits—like improved productivity and reduced turnover—mentoring programs are not universally adopted.

Future research should focus on quantifying ROI and expanding mentoring practices in business contexts. **BarinuaV & IbeU.M. (2022)**, Mentoring, an ancient practice with modern applications, enhances personal and professional growth and organizational effectiveness. It encompasses informal mentoring, which evolves organically, formal mentoring with defined goals and trained mentors, and peer mentoring involving mutual support. Effective mentoring improves job satisfaction, reduces turnover, and boosts performance. Despite its benefits, adoption in Nigerian organizations is limited, though it offers potential solutions for youth unemployment and job dissatisfaction. **DugguhD.S.I, & Galadanchi A. M. (2014)**, This paper highlights the effectiveness of mentoring as a cost-effective employee training and development technique. It compares mentoring with traditional methods, emphasizing its benefits for the mentee, mentor and organization. Mentoring enhances organizational effectiveness and efficiency by improving employee skills, job satisfaction and retention. The paper recommends broader implementation of mentoring, alongside further research into related techniques like coaching and counseling, supported by a case study from Nottingham University. **RichardsonE. L, OetjenR, Oetjen D, Gordon J, Schroeder L. H, ConklinS & StrawnN. (2022)**, The introduction outlines higher education's challenges, worsened by the COVID-19 pandemic, including financial strain and enrollment issues. It highlights a shift from traditional to developmental advising, emphasizing competence, autonomy and career readiness. The text advocates for micro-advising and micro-mentoring, integrating career-focused activities within courses and using centralized advising and career centers. Incremental mentoring, including mentorship circles, is also emphasized. The conclusion stresses that combining centralized and decentralized approaches can enhance enrollment, retention, and career outcomes.

RESEARCH METHODOLOGY

To cross-reference the findings with empirical evidence, this study employed a combination of quantitative analysis methodologies. Its primary focus was on investigating the core components of micro-mentoring from the perspective of employees. The present study utilised a combination of quantitative analysis techniques to accomplish its goals.

**Anand and Deepa**

1. Firstly, descriptive statistics were employed to provide basic summaries about the sample and measures.
2. Factor analysis was applied to identify underlying relationships between variables and validate the components of micro-mentoring.
3. Reliability testing (e.g., Cronbach's Alpha) was carried out to assess the internal consistency of the components identified through factor analysis, ensuring the reliability of the questionnaire. RaykovT, MarcoulidesG, AnthonyJ & Menold N. (2024).
4. ANOVA was used to compare means and investigate whether there are significant differences in perceptions across different sectors or experience levels.
5. The relationships between the elements of micro-mentoring and how they work together to enhance employees' professional growth and goal achievement were examined using correlation analysis.

To collect a representative sample of workers from a range of industries and experience levels, surveys are an effective technique to gather information from a significant number of respondents. This technique enables the systematic collection of structured data, enabling quantitative comparison and analysis of responses. Respondents to questionnaires can remain anonymous, which encourages more truthful and precise answers, particularly when discussing delicate subjects like the efficacy of mentoring and employee professional growth. The survey method, especially the use of questionnaires, was adopted by the research scholar. Initially, 40 responses were collected to validate the questionnaire. To ensure that the survey instrument was reliable and accurately captured the desired components of micro-mentoring, this initial validation phase needed to be completed. Based on the comments from the pilot study, the questionnaire was improved. To determine the underlying structure of the items and validate the notions of goal accomplishment and professional development, factor analysis was employed. The main factors under investigation were the aspects of micro-mentoring that were focused on goal attainment and professional development. A structured questionnaire with Likert scale items (i.e., 1 = Strongly Disagree to 5 = Strongly Agree) was used to measure these factors. The perceptions of professional development and goal attainment were the dependent variables, and the industrial sector and employee experience level were the independent variables. Reviews by specialists were used to establish content validity, and pilot research was conducted to improve the questionnaire items to ensure the validity and reliability of the scales. The construct validity was verified by factor analysis and internal consistency was evaluated by calculating each scale's Cronbach's alpha (numbers above 0.70 signifying satisfactory reliability) Table I shows the reliability of Statistics. The Cronbach alpha value is .905 which is greater the 0.7 which shows that internal consistency of this scale is excellent

Analysis and Interpretation

In this study the data were collected from 150 respondents in four different sectors - manufacturing, information technology, service and others. Convenience sampling method was used for the sample, where four known individuals working in the respective sectors were asked to collect the survey responses from their colleagues and contacts. The initial goal was to collect 200 responses, 50 from each sector; however, only 150 were received, leading to different sample sizes in each area. As part of the research methodology, this study made use of research scholars self-developed, pre-tested and validated questionnaire to obtain data from the respondents. The questionnaire consists of two parts. The first part is on the demographic information of the respondents. The second part is the statement determining the key components of micro mentoring intended to elicit information about their perspectives and experiences with respect to their respective sectors. Because the participants in the convenience sampling approach were not chosen at random, there is a chance that biases may have been introduced into the sample, even if it made it easier to access a diverse range of respondents. However, the information gathered offers a useful overview of viewpoints and experiences from the different sectors.

Hypothesis Testing -1

The perseverance of the first objective is to ensure the methodological validity of the factor analysis employed in the research. This is to verify the components of micro-mentoring that have been found are reliable and appropriately represented for further research by validating the factor analysis. This involves examining the statistical measures such as Cronbach's alpha for reliability and performing factor analysis to verify the factor structure.

**Anand and Deepa**

H₀: The factor analysis is not valid

Factor analysis was carried out by using SPSS package for 150 respondents. The study shows the results of Bartlett's test of sphericity and KMO test. The table 2 shows the results of Bartlett's test of sphericity significance since the appropriate chi-square value is 1436.555 which is significant at 1% level, the test leads to the rejection of the null hypothesis therefore the hypothesis that the factor analysis is valid. The value of KMO statistics (.812) was also large and it reveals that factor analysis might be considered an appropriate technique for analysing the correlation matrix. This study formed 13 statements based on the key components of micro mentoring as shown in table 3, and from the table 4 based on the factor loadings the research scholar may conclude that the micro mentoring in the workplace is influenced by two major factors – Goal attainment, Professional Development

Hypothesis Testing -2

The second objective of this paper looks for variations in the way employees view the value of micro-mentoring based on the industry. The study aims to determine whether unique micro-mentoring approaches have a greater positive impact on certain companies by comparing perceptions from various sectors. This entails assessing if there are statistically significant variations in perceptions across industries using techniques like ANOVA.

H₀: There is no significant difference of opinion about the Goal attainment and professional development component of micro mentoring among employees from different sectors. Table 5 and Table 6 are the results of One-Way ANOVA analysis to determine the opinion of the employees about the goal attainment and professional development component of micro mentoring from different sectors. From the above tables the results reflect the p-value = **.001 < .05** which shows that the opinion of the employees from the different industrial sectors differs significantly and therefore the null hypothesis is accepted.

Hypothesis Testing -3

The drive of the third objective is to ascertain how employees' experiences affect and how they view micro-mentoring. The study offers insights into whether micro-mentoring needs to be adjusted differently for beginner versus experienced employees by examining differences in opinions based on experience. This is comparing perceptions across various experience levels using statistical test ANOVA

H₀: There is no significant difference of opinion about the Goal attainment and professional development component of micro mentoring among employees with different experience. Table 7 and table 8 are the results of One-Way ANOVA analysis to determine the opinion of the employees with different experience, about the goal attainment and professional development components of micro mentoring. From the above table 8 the results reflect the **p-value = .010 < .05** and table 7 the results reflect the **p-value = .012 < .05** which shows that the opinion of the employees with different experiences differs significantly (i.e.) the null hypothesis is accepted

Hypothesis Testing-4

The fourth objective is to investigate how the various components of micro-mentoring collaborate to encourage the overall professional growth and goals-achieving of employees. The study can determine which components of micro-mentoring are most important for success and how they work together to support employees by understanding these relationships. In order to examine the relationships between the components, correlation analysis is used.

H₀: There is no significant relationship between the goal attainment and professional development components of micro mentoring. From the table 9, the correlation coefficient of 0.707 indicates a strong positive relationship between professional development and goal attainment. The p-value of 0.001 is typically considered very low. This suggests that there is strong evidence to reject the null hypothesis that there is no correlation between professional development and goal attainment in the population. Therefore, the output indicates a strong positive correlation between professional development and goal attainment, which is statistically significant at a very low p-value. This suggests a meaningful relationship between the two variables, but further research would be needed to understand the nature of this relationship and any potential underlying factors.

RESULTS

The factor analysis's validation indicates that the key aspects of micro-mentoring that were found are trustworthy and statistically significant. This demonstrates how well it encompasses significant components of micro-mentoring. The notable significant differences in viewpoints among employees from various sectors about the components of goal accomplishment and professional development underscore the differing priorities or viewpoints among industries. Comprehending these distinctions can help develop customized micro-mentoring initiatives or interventions that more effectively address the requirements for employees across various industries. The major differences in viewpoints according to experience levels highlight how people's professional experiences shape their perspectives about the elements of micro-mentoring. This implies that expectations and choices about professional development and goal attainment within micro-mentoring programs are shaped to some extent by experience. The strong correlation seen among the constituents of micro-mentoring implies that these components are not discrete units but rather integrated facets of a unified mentoring structure. This suggests that modifications or enhancements to one element may have an impact on others, underscoring the significance of considering the whole character of micro-mentoring initiatives. Taking everything considered, these results offer insightful information to practitioners and organizations that are engaged in planning, carrying out, and overseeing micro-mentoring strategies. Organizations can customize their strategies to better suit the different requirements of their employees and optimize the effectiveness of mentoring interventions by recognizing the differences in views across sectors and experience levels, as well as the interconnectivity of micro-mentoring components.

CONCLUSION AND RESEARCH IMPLICATIONS

The study examined into the essential components of micro-mentoring and how important people with different backgrounds and experiences thought they were. Furthermore, we discovered notable differences in viewpoints according to the experience levels of the participants. These findings highlight how crucial it is to take individual backgrounds and sector-specific needs into account when creating micro-mentoring initiatives. Overall, our research offers insightful information to companies looking to improve their mentorship initiatives. Organisations can better address the needs of their employees and promote professional development and goal achievement across a range of industries and experience levels by customising their programmes based on an understanding of the interconnection and diversity of viewpoints among micro-mentoring components, Aryanti, I., & Perkasa, D. H. (2024). This research adds to the expanding corpus of knowledge on organisational development and mentorship, with useful implications for both policymakers and practitioners. This study has numerous practical implications for organizations that are interested in implementing or enhancing micro-mentoring programs. Supervisor can be trained to provide precise, actionable feedback and opportunities for frequent interactions can be created to enhance the professional development and goal achievement of employees.

Future scope for research

Future research needs to be conducted in the sector-specific intricacies of micro-mentoring. The long-term impact of micro-mentoring on organizational performance and career progression could be elucidated through longitudinal studies. Besides investigating the role of technology in facilitating micro-mentoring, particularly in remote work environments, could provide new opportunities to improve its efficacy. Comprehending the impact of various demographic variables, including age and experience level, on the perceptions of micro-mentoring can also assist in the customization of programs to meet the diverse requirements of the workforce.

ABSTRACT

Mud houses have long been integral to the architectural landscape of rural India, valued for their affordability and eco-friendliness. This study conducts a detailed analysis of the thermal performance of a traditional mud house situated in the rural fringe area of Lucknow, India. The primary objective is to evaluate how effectively mud, a locally abundant building material, maintains thermal comfort, particularly under peak summer conditions. Constructed using clay and straw sourced from the local environment, mud houses in Lucknow's rural fringe demonstrate significant thermal inertia. This characteristic allows them to effectively buffer indoor temperature fluctuations. The study reveals that internal temperatures consistently remain 4-6°C cooler than external temperatures during hot weather. Furthermore, the relative humidity levels inside the mud house remain within the optimal comfort range, contributing to enhanced thermal comfort for residents. These findings highlight mud's natural insulating properties, which help reduce the reliance on artificial cooling systems. As a result, traditional mud houses represent a sustainable alternative to conventional construction methods, especially in warm climates. The study advocates for integrating traditional building materials like mud with modern construction techniques to enhance energy efficiency and occupant well-being. Future research should explore the long-term durability of mud houses in diverse climatic conditions and investigate potential design enhancements to further optimize thermal regulation.

Keywords: Mud House, Passive Design, Thermal Comfort, Local Materials, Sustainability

INTRODUCTION

India has a rich history of mud house construction, deeply rooted in its diverse climatic regions and cultural practices. Mud houses, also known as "kachcha" houses, have been a predominant form of rural housing for centuries. The Indus Valley Civilization, one of the world's oldest urban cultures, utilized mud bricks for constructing homes and public buildings, indicating the long-standing tradition of mud architecture in the Indian subcontinent [1]. In various parts of India, traditional mud houses vary in design and construction techniques, reflecting local adaptations to climatic conditions. For example, in the hot and arid regions of Rajasthan, mud houses often feature thick walls and small windows to minimize heat gain and maximize thermal mass. In contrast, in the humid regions of Kerala, mud houses are built with large overhangs and ventilated roofs to enhance airflow and reduce humidity levels [2]. The increasing global emphasis on sustainable and energy-efficient housing has spurred a renewed interest in traditional architectural practices. Among these, mud houses have garnered significant attention due to their low environmental impact, cost-effectiveness, and remarkable thermal performance. Historically prevalent in various cultures, these structures are particularly noted for their ability to maintain comfortable indoor temperatures in diverse climatic conditions. This study aims to conduct a comprehensive thermal performance analysis of a traditional mud house, exploring its potential as a viable solution for contemporary sustainable housing needs. Traditional mud houses are constructed using locally available materials such as earth, straw, and water, combined to form a durable and thermally efficient building material. The inherent properties of these materials, such as high thermal mass and low thermal conductivity, contribute to the unique thermal behavior of mud houses. Unlike modern construction materials that often require significant energy input for production and maintenance, mud houses offer a low-energy alternative with minimal carbon footprint [3]. Traditional mud houses are not only significant for their low construction costs and environmental benefits but also for their cultural and historical value. They represent a building technique that has evolved over generations, adapting to local climate conditions and resource availability. The thermal properties of mud have been extensively studied, with findings consistently showing that mud walls provide substantial thermal mass, which helps in maintaining stable indoor temperatures by absorbing and slowly releasing heat [4]. Extensive research has documented mud's insulating capabilities and thermal inertia, suggesting its potential to significantly reduce energy consumption and enhance occupant comfort [5] [6]. Mud's ability to provide insulation and thermal inertia has been documented in various studies, highlighting its potential to reduce energy consumption and enhance occupant comfort [7] [8]. This research seeks to quantify the thermal performance of a traditional mud house through empirical data collection and analysis. Understanding the performance of traditional mud houses under local climatic conditions is essential for promoting their integration into contemporary architectural and construction practices [9]. By examining the thermal performance, this research aims to provide valuable insights into the efficacy of mud houses in maintaining thermal comfort, reducing energy consumption, and promoting environmentally friendly construction practices. By examining the thermal dynamics of a specific mud house in Lucknow's rural context, this study aims to contribute empirical data to the broader discourse on sustainable building practices. Understanding the performance of traditional mud houses under local climatic conditions is essential for promoting their integration into contemporary architectural and construction practices [9].

Study Area

Anchramau, a village situated on Kursi Road on the rural fringe of Lucknow, serves as an intriguing site for analyzing thermal comfort within traditional vernacular architecture. The village's architectural landscape, marked by a blend of kaccha (temporary) and pakka (permanent) structures, offers a rich context for studying how indigenous building practices can create comfortable living environments in response to local climatic conditions. The climate of Lucknow is characterized by substantial seasonal variation and consistently high temperatures throughout the year shown in figure 1 and Table 1. Temperatures typically range from 8°C to 40°C, with rare occurrences falling below 5°C or exceeding 44°C. The hot season, extending from April 6 to June 26, spans approximately 2.7 months, during which average daily maximum temperatures exceed 36°C, peaking in June with highs of 38°C and lows of 27°C. Conversely, the cool season, lasting from December 7 to February 10, averages daily

**Khurram Ashraf et al.,**

maximum temperatures below 25°C, with January being the coldest month, featuring temperatures from 9°C to 22°C. Humidity levels are notably high during the muggier period from May 9 to October 29, characterized by conditions that are muggy, oppressive, or miserable at least 25% of the time. August records the highest frequency of muggy days, totaling 31.0 days, while January experiences the fewest, with only 0.1 muggy days. Wind patterns also vary seasonally; the windier period, from January 21 to September 14, sees average hourly wind speeds above 2.8 meters per second, with June being the windiest month at 3.6 meters per second. The calmer period, spanning from September 14 to January 21, features lower wind speeds, with October being the calmest month, averaging 2.1 meters per second. Table 2 gives the climate modification strategies for composite climate regions. The village is composed of a cluster of mud houses that are constructed using locally-sourced materials such as brick, mud-clay, husk, and wood. These materials are not just culturally significant but are also highly functional, contributing to the thermal performance of the buildings. These structures, with their thick mud-clay walls, high ceilings, and ventilated roofs, are designed to maintain a stable indoor environment despite the external climatic fluctuations. The layout often includes shaded verandas and strategically oriented windows to optimize ventilation and minimize heat gain. The spatial arrangement of the houses in a cluster with a shared courtyard promotes airflow and provides communal spaces that remain cool even during the hottest months. The houses are oriented along an east-west axis to minimize direct solar exposure. For this research, one particular mud house from the cluster, known as "Mud House 1," has been selected as the focus for thermal comfort analysis shown in figure 2 and 3. This house is a representative example of the vernacular architecture in the region and embodies the principles that make these structures thermally efficient. This analysis will contribute to the broader discourse on sustainable architecture, showcasing how the wisdom embedded in traditional construction techniques can inform contemporary building practices, especially in regions where climate resilience is crucial.

The type of mud-house construction employed in and around Lucknow utilizes traditional earthen techniques adapted to local conditions. The primary method involves using a mixture of clay, sand, and straw, applied in layers to create robust walls. The construction process starts with preparing a stable foundation using stones or bricks to prevent moisture infiltration. The walls are built by layering the mud mixture over a bamboo or wooden frame, which provides both strength and insulation. The walls are typically around 300-450 mm thick [10]. The roofs generally feature a bamboo or wooden framework covered with thatch, tiles, or corrugated sheets. The thatch is made from local materials such as grass and palm leaves, which are woven together and laid over the roof structure. This roofing material provides effective insulation and protects against rain. The thatched roofs are known for their durability and can last up to 30 years with proper maintenance [11]. These mud houses are often built by local families with assistance from neighbors, reflecting a communal approach to construction. The use of readily available materials and traditional techniques allows these homes to blend seamlessly with their environment, showcasing a sustainable and practical response to local climatic and material conditions [12].

RESEARCH METHODS

This research is a case study involving both qualitative and quantitative approaches to evaluate the thermal performance of a traditional mud dwelling. It falls under the category of applied research, specifically in the fields of architectural science, environmental engineering, and sustainable building practices. The objective of this article is to evaluate the thermal performance of the mud dwelling, the research methodology involved both quantitative and qualitative data collection. Temperature measurements were recorded using thermal sensors installed at indoor location, while outdoor temperature was measured to assess the impact of solar exposure and wind direction. Continuous monitoring was facilitated by data loggers, providing comprehensive temperature data for April 29, 2024 (summer season) and Jan 9, 2024 (winter season). In addition to temperature measurements, questionnaires were administered to the inhabitants of the mud house to gather subjective assessments of thermal comfort. The questionnaires focused on daily activities, perceived indoor temperature variations, seasonal comfort levels, and adaptive behaviors for maintaining thermal comfort. In conclusion, the traditional mud dwelling on Kursi Road in Anchramau Village provides an exemplary study area for investigating the thermal performance of mud houses. This

**Khurram Ashraf et al.,**

research, through meticulous data collection and analysis, offers valuable insights into the thermal comfort and energy efficiency of traditional mud houses, advocating for their preservation and enhancement amidst contemporary climate change and energy conservation challenges.

SURVEY FINDINGS AND DISCUSSION

The temperature data recorded for the traditional mud dwelling in Behta Village, Lucknow, on April 29, 2024 and January 9, 2024, demonstrates distinct variations in indoor and outdoor temperatures over a 24-hour period. The purpose is to study and analyze the thermal conditions during summer and winter season in mud dwellings of composite climate.

Temperature and Humidity recorded during summer season

The temperature and humidity data recorded on April 29, 2024 from the mud house on Kursi Road in Lucknow shown in figure 4 and 5 offers valuable insights into the thermal behavior of traditional mud construction during the summer season. Key observations include:

- **Temperature Stability:** Despite external temperatures peaking at 38°C, the internal temperature of the mud house remained relatively stable, fluctuating between 29.3°C and 29.9°C. This stability is attributed to the mud walls' capacity to absorb and store heat slowly, preventing rapid internal temperature increases. The mud's high density and specific heat capacity contribute to its ability to moderate temperature changes.
- **Temperature Lag:** In the cooler early morning hours, with external temperatures ranging from 24.3°C to 27.7°C, the interior was warmer by +1.8°C to +5.2°C. As the day progressed and external temperatures rose above 30°C, the internal temperature became cooler, with differences reaching as low as -8.5°C. This time lag, caused by the thermal mass of the mud walls, results in a natural cooling effect inside the house during the hottest parts of the day.
- **Thermal Conductivity:** The mud walls exhibit low thermal conductivity, providing significant thermal resistance due to their thickness. This characteristic slows down the rate at which heat penetrates from the outside to the inside, helping maintain a stable internal temperature despite significant external temperature fluctuations.
- **Humidity Regulation:** The hygroscopic nature of mud allows it to absorb and release moisture, which helps regulate indoor humidity levels. This property, combined with the thermal resistance, makes mud houses well-suited for climates with high temperature variations, such as Lucknow.

Temperature and Humidity recorded during winter season

The temperature and relative humidity data shown in figure 6 and 7 from the winter season offers insights into the thermal performance of the mud house. Key observations of the survey done on January 9, 2024 are as follows:

- **Temperature Stability:** Despite external temperatures fluctuating between 6.5°C and 17°C, the internal temperature remained stable, ranging from 13.6°C to 14.3°C. The mud walls' thermal mass plays a crucial role in moderating indoor temperatures by gradually absorbing and releasing heat.
- **Temperature Differences:** During early morning and evening hours, when external temperatures were between 6.5°C and 11.9°C, the interior was warmer by up to 7.3°C. This indicates the mud walls' effective thermal resistance and insulating properties, which prevent heat loss and maintain a warmer indoor environment.
- **Temperature Lag:** As external temperatures rose above 15°C during the day, the internal temperature difference became negative, reaching as low as -2.9°C. This occurs because the mud walls, after absorbing heat during cooler periods, gradually release it, keeping the interior cooler than the outside. The observed time lag highlights the high thermal mass of the mud.
- **Thermal Conductivity:** The low thermal conductivity of mud walls contributes to maintaining warmth inside the house, especially during the colder early morning hours. The mud's porous structure traps air, enhancing insulation and contributing to a stable indoor climate.
- **Effective Heat Distribution:** The thick walls of the mud house ensure effective heat distribution and retention, preventing cold spots and maintaining a uniform indoor temperature. Even with rising outside temperatures, the internal temperature remains relatively comfortable due to the gradual release of stored heat.

CONCLUSION

The thermal performance analysis of a traditional mud dwelling in Behta Village, Lucknow, conducted during the summer and winter seasons of 2024, underscores the effectiveness of mud houses in moderating indoor temperatures in a composite climate. The study reveals that, even when external temperatures soared to 38°C during the summer, the internal temperatures of the mud house remained stable, fluctuating between 29.3°C and 29.9°C. This temperature stability is primarily due to the high thermal mass of the mud walls, which absorb heat slowly and release it gradually, creating a natural cooling effect within the house. The temperature lag observed, where the interior was cooler than the exterior during the hottest part of the day, highlights the mud's ability to moderate indoor conditions without the need for mechanical cooling systems. However, despite these advantages, there is still a need to further reduce indoor temperatures during peak summer periods to enhance thermal comfort. To lower the temperature in mud houses during the summer, several recommendations can be made. First, increasing the thickness of the roof insulation can significantly reduce heat gain from the roof, which is often a major source of heat ingress. Second, incorporating shading devices such as verandas, overhangs, or green cover (trees and plants) around the dwelling can minimize direct solar radiation on the walls, thereby reducing the overall heat load on the structure. Third, optimizing ventilation by strategically placing windows and ventilators can enhance air circulation, allowing hot air to escape and cooler air to enter, thus maintaining a lower indoor temperature. During the winter, the internal temperature of the mud house remained stable between 13.6°C and 14.3°C, despite external temperatures fluctuating between 6.5°C and 17°C. This stability, coupled with the positive temperature differences during early morning and evening hours, highlights the effective thermal insulation properties of mud. The discomfort hours calculated from the data suggest that the mud house provides a comfortable living environment for most of the day across both summer and winter seasons shown in figure 8, reducing the reliance on artificial heating and cooling systems. Future studies could explore the long-term thermal performance of mud houses under varying climatic conditions and the integration of modern passive cooling strategies with traditional construction techniques. Investigating the use of natural materials and advanced architectural designs to further enhance the thermal comfort of mud houses could provide valuable insights for sustainable housing in regions with similar climates. Moreover, assessing the impact of these recommended interventions on discomfort hours during extreme weather conditions would contribute to developing more efficient and sustainable building practices.

ABSTRACT

Chronic venous ulcers are a common condition resulting from venous insufficiency, often difficult to treat due to poor circulation and delayed healing. This case study outlines the Ayurvedic therapeutic approach in the management of a 45-year-old male patient with a chronic non-healing venous ulcer located on the left ankle. The patient received a combination of oral medications, local applications, Basti karma (medicated enema), and Jalauka Avacharan (leech therapy) based on classical Ayurvedic protocols. A holistic treatment plan targeting wound healing and venous circulation was implemented, with significant improvements observed in the wound's condition.

Keywords: Ayurvedic treatment, Basti therapy, Jatyadi Taila, Leech therapy (Jalauka Avacharan), Venous ulcer, Wound healing

INTRODUCTION

Venous ulcers are characterized by shallow, irregularly shaped wounds with surrounding skin discoloration, often reddish-brown, accompanied by symptoms such as swelling (edema), aching, and a sensation of heaviness in the legs. These ulcers may produce significant fluid discharge and are prone to infection, which can further delay healing. The management of venous ulcers typically involves a combination of strategies aimed at promoting healing and preventing recurrence. The cornerstone of conventional treatment is compression therapy, which helps reduce venous pressure and improve blood circulation. Effective wound care—encompassing regular cleaning, debridement and appropriate dressings—is also essential to prevent infection and support the healing process. In *Ayurveda*, venous ulcers, referred to as "*Dushta Vrana*," are managed through a holistic approach that addresses both the local

91797

**Niket Gami and Vidya G Mohan**

wound and systemic imbalances. Key Ayurvedic interventions include Raktamokshana (bloodletting), often using leeches (Jalauka Avacharan), to alleviate venous congestion and reduce inflammation. Herbal formulations are applied locally for their wound-healing properties, while internal medications help detoxify the body and promote recovery. Regular cleaning of the wound (Vrana Prakshalana) with antiseptic decoctions, followed by dressing with medicated oils or pastes, is an integral part of this protocol. This integrative approach not only enhances wound healing but also helps prevent ulcer recurrence. Ayurvedic management of venous ulcers combines both local and systemic treatments, focusing on wound healing, reducing inflammation, and addressing underlying imbalances. One of the significant therapies is Basti (medicated enema), particularly designed to balance the aggravated doshas and improve overall systemic health. The ingredients used in this treatment are known for their blood-purifying properties, while other components aid in cleansing the channels and reducing inflammation. This dual approach—working both locally and systemically—promotes comprehensive healing and prevents recurrence. This case report highlights the application of Ayurvedic principles in managing a venous ulcer, emphasizing both local and systemic treatments, including Basti therapy and Jalauka Avacharan. The case demonstrates how this integrative approach can lead to effective healing of chronic venous ulcers.

Case Report

A 45-year-old male patient presented with a non-healing wound over his left ankle for the past month, along with localized swelling and a history of varicose veins in both lower limbs. The wound had developed gradually and showed little improvement since its appearance. Notably, the patient did not report any fever, significant pain, or discharge from the wound, which suggested a relatively stable condition despite its persistence. His medical history was free from major conditions such as diabetes mellitus, hypertension, or any known addictions, all of which are commonly associated with delayed wound healing. In terms of personal habits, the patient followed a vegetarian diet, had regular bowel movements, experienced sound sleep, and exhibited normal urinary frequency, voiding five to six times during the day and once at night. The *Rogi Pariksha*, or patient assessment, revealed that the patient's constitution (*Prakruti*) was predominantly *vata-pitta*. Other evaluations showed that his overall vitality (*Sarataha*) was moderate (*Madhyam*), as was his capacity for tissue resilience (*Sanhananataha*), body measurements (*Pramanataha*), mental stability (*Satwataha*), suitability of his environment (*Satmyataha*), dietary strength (*Ahara Shakti*), and physical activity levels (*Vyayamataha*). His age (*Vaya*) was assessed as moderate (*Madhyam*), and his tongue examination (*Jihwa*) appeared normal (*Niram*), further supporting the absence of systemic illness. Upon general examination, the patient demonstrated an abnormal gait, likely due to the discomfort from the wound and localized swelling. He was lying in a supine position during the examination. The patient displayed no signs of systemic illness, as indicated by the absence of pallor, icterus, cyanosis, edema, or lymph node enlargement. His vital signs were within normal limits, with a blood pressure reading of 128/76 mmHg, a pulse rate of 77 beats per minute, a respiratory rate of 17 breaths per minute, and a body temperature of 98.2°F.

A thorough clinical examination of the varicose veins was conducted, revealing dilated and tortuous veins in both lower limbs, particularly in the medial aspect of the legs and around the ankles. The patient exhibited signs of chronic venous insufficiency, characterized by skin changes such as hyper pigmentation and dryness, along with palpable veins that were not compressible, indicating venous stasis. Upon palpation, there was no tenderness along the affected veins. During the local examination, two distinct ulcers were observed on the anterior aspect of the lower leg, near the ankle. The larger ulcer measured 3x2 cm, and the smaller ulcer measured 1x1 cm. Both wounds were irregular in shape, with the larger ulcer having undermined and irregular edges, while the smaller one had slightly elevated and irregular edges. The depth of both ulcers was superficial, extending into the dermis, without evidence of deeper tissue involvement. Surrounding the wounds, the skin was darkened and hyper pigmented, with notable scaling and dryness, which are signs commonly associated with chronic venous insufficiency and varicose veins. In addition, the patient's bilateral varicose veins were contributing to venous congestion, further complicating the ulcer's healing process. Despite these findings, there was no active discharge or signs of acute infection, such as erythema or excessive swelling. However, the patient did report mild to moderate pain, which is consistent with the symptoms of chronic venous ulcers and varicose veins.

**Niket Gami and Vidya G Mohan**

Pathological investigations revealed a hemoglobin level of 11.6 gms%, a total red blood cell (RBC) count of 3.9 million/cmm, a total white blood cell (WBC) count of 5400/cumm, and a platelet count of 290,000/cmm. The patient's bleeding time was recorded as 1 minute and 33 seconds, and the clotting time was 3 minutes and 56 seconds, both of which were within normal limits. His random blood sugar (RBS) level was 116.4 mg/dl, indicating that his blood glucose was under control, which is critical for wound healing. Tests for infectious diseases, including HIV, VDRL (for syphilis), and HBsAg (for hepatitis B), were all negative, further ruling out any systemic infections. Based on the clinical findings and investigation results, the patient was diagnosed with a venous ulcer, complicated by underlying varicose veins. Thus the patient has been diagnosed with venous ulcer.

Treatment Protocol

The treatment protocol for the patient diagnosed with a venous ulcer involved a multi-faceted approach to ensure effective management and healing. Local Treatment consisted of daily wound dressing using *Jatyadi Taila*, a medicated oil renowned for its wound-healing properties, which helped create an optimal environment for recovery while protecting the wound from external contaminants. For Oral Medications, the patient took *Eladi Vati*, prescribed at a dosage of 2 tablets twice a day after meals, which supported metabolic function; *Nimbadi Vati*, also at 2 tablets twice a day after meals, which aided in detoxification; and *Giloy Ghanvati*, given at the same dosage, known for its immune-boosting qualities. In addition to these, a Para-Surgical Intervention was implemented through *Jalauka Avacharan*, with two sessions of leech therapy, applying two leeches during each session to enhance local circulation and facilitate healing. The treatment plan also included *Basti* Therapy, focusing on both local and systemic balance through a structured schedule alternating between *Niruha Basti* (*Manjishtadi Kshara Basti*) and *Anuvasan Basti*.

Method of Preparation of Manjishtadi Kshara Basti To prepare Manjishtadi Kshara Basti, the ingredients are mixed in the following order: First, 80 ml of honey and 8 g of rock salt (*Sandhava Lavana*) are blended uniformly using a *Khalva Yantra*. Next, 60 ml of processed *Ksheerbala taila* is added to form a uniform mixture. Then, 20 g of herbal paste (*Kalka*) made from *Shatpushpa* and *Yastimadhu* (20g) is incorporated. This is followed by adding 100 ml of decoction (*Kwatha*) prepared from the powdered herbs (*Kwatha Choorna*) of the *Manjistadhi*, *Yastimadhu*, *Guduchi*. Finally, 80 ml of *Gomutra arka* are added to achieve a homogenous mixture before testing for the appropriate *Nirooha Lakshana* (enema suitability). Administration of *Manjishtadi Kshara Basti* The prepared *Basti Dravya* was filtered and administered after being gently warmed using indirect heat. The specific sequence in which the ingredients were mixed ensured a uniform and properly combined solution. The total volume of the *Basti Dravya* was maintained at approximately 480 ml.

*N – *Niruha Basti*

A - *Anuvashan Basti*

- *Niruha Basti* is administered on an empty stomach in the morning.
- *Anuvasan Basti* is given after lunch.

DISCUSSION

This case demonstrates the effective management of a venous ulcer using a combination of *Ayurvedic* treatments, including local wound care, oral medications, and para-surgical interventions like leech therapy and *Basti* (medicated enema).

- **Local Treatment:** The use of *Jatyadi Taila* for daily dressing is well-supported in *Ayurveda* for its wound-healing properties, reducing inflammation, and promoting tissue regeneration.
- **Oral Medications:**
 - *Eladi Vati* and *Nimbadi Vati* have anti-inflammatory and antimicrobial properties, which help prevent infection and reduce inflammation.
 - *Giloy Ghanvati* is known for its immunomodulatory effects, enhancing the body's natural healing processes.

Constituents of Leech Saliva and Mode of Action of *Jalaukavacharana*

Leeches thrive in cold environments and possess a *Madhur* (sweet) taste, making them particularly effective for treating disorders related to aggravated *Pitta* and *Rakta*. The medicinal benefits of leech therapy, or *Jalaukavacharana*, arise from the bioactive compounds found in their saliva. These substances have anaesthetic, anti-inflammatory, anticoagulant, and vasodilating properties. These actions make the leech's bite painless, promote blood flow, reduce inflammation and edema, enhance fluid absorption, and aid in wound healing. Leeches draw impure blood from affected capillaries, which improves circulation and supports healing. Key bioactive substances in leech saliva include:

1. **Hirudin:** An antithrombotic agent that prevents blood clotting, promoting better blood flow and preventing blockages. This makes leech therapy useful in treating thromboembolic conditions like angina and atherosclerosis.
2. **Calin:** Inhibits blood coagulation by blocking the von Willebrand factor from binding to collagen, preventing platelet aggregation. It ensures continuous wound cleansing by prolonging secondary bleeding.
3. **Hyaluronidase:** Known as the "spreading factor," this enzyme breaks down connective tissues at the bite site, allowing other healing substances to penetrate more effectively.
4. **Destabilase:** Possesses fibrin-dissolving and thrombolytic properties, preventing platelet aggregation.
5. **Bdellins:** Anti-inflammatory agents that inhibit enzymes like trypsin, plasmin, and acrosin.
6. **Tryptase Inhibitor:** Prevents proteolytic enzyme activity from the host's mast cells.
7. **Eglins:** Anti-inflammatory agents that inhibit enzymes such as alpha-chymotrypsin, chymase, and elastase.
8. **Carboxypeptidase A Inhibitors:** Increase blood flow at the bite site.
9. **Acetylcholine:** Acts as a vasodilator.

Probable Mode of Action of *Manjishtadi Kshara Basti*

Manjishtadi Kshara Basti is a potent *Niruha Basti* with particular indications for imbalances of *Vata* and *Rakta*. The herbs in the *Manjishtadi* group are particularly effective in conditions involving aggravated *Vata* and *Rakta*. *Kshara Basti* has properties that alleviate pain (*Shoolagna*) and cleanse the channels (*Srothoshodana*).

- *Manjishtha* has qualities that promote skin health (*Varnya*), balance blood disorders (*Raktadoshahara*), treat skin diseases (*Kushtahara*), and reduce swelling (*Shothahara*).
- *Guduchi* is known for its ability to purify the blood and alleviate pain (*Rakta Doshahara*, *Vedanasthapaka*).
- *Gomutra arka* cleanses the channels (*Sroto Shodhaka*) due to its hot potency (*Ushna Virya*), lightness (*Laghu*), dryness (*Ruksha*), sharpness (*Tikshnaguna*), pungent taste (*Katu rasa*), and post-digestive effect (*Katu Vipaka*).
- For *Anuvasana Basti*, *Ksheerbala Talla* was used. Its ingredients primarily possess heating properties, pacify *Vata* and *Kapha*, reduce swelling (*Shothahara*), relieve pain (*Vedana Sthapana*), and enhance digestion (*Deepana*). It also has scraping (*Lekhana*) and disease-fighting properties, particularly useful for treating conditions like varicose veins (*Siraja Granthi*).
- *Manjishtadi KsharaBasti* is particularly effective in balancing *Kapha* due to the presence of *Gomutra*, as well as *Pitta* and *Rakta* due to the *Manjishtadi Kwatha*, acting as a blood purifier (*Rakta prasadaka*) and balancing all three doshas (*Tridoshahara*).

Modern View and Probable Mode of Action of *Basti*

- In *Ayurvedic* treatment of *Vata* disorders, *Basti* is considered highly effective, even accounting for half of the treatment (*Ardachikithsa*). Although modern science may not fully recognize this practice, the probable modes of action include:
- Absorption mechanism: Even though the rectum is not a primary site for nutrient absorption, medications administered rectally can still be absorbed, producing both local and systemic effects.
- Neural stimulation: The administration of *Basti* may trigger neural responses.
- Chemical action: The ingredients in the *Basti* act chemically to achieve the desired effects.
- Mechanical action: The mechanical process of administering the *Basti* also plays a role.
- Water-soluble components are readily absorbed through the mucus membranes of the intestines, and short-chain fatty acids are absorbed in the colon under the influence of medication, facilitating the absorption of various substances.

Diet And Regimen

Diet and lifestyle play a critical role in enhancing the effects of treatments. The patient was advised to follow a regimen that would balance the *Pitta*, *Rakta*, and *Vata doshas*. They were instructed to avoid spicy, sour, oily, fermented, and refrigerated foods. The patient was also advised to avoid sun exposure, daytime naps, and staying up late at night.

CONCLUSION

This case highlights the successful integration of *Ayurvedic* principles in the management of venous ulcers. By combining local wound care with systemic treatment through oral medications and *Basti*, a comprehensive approach was achieved, promoting effective healing and reducing the risk of recurrence. The use of leech therapy (*Jalauka Avcharan*) provided additional benefits in improving blood circulation and reducing venous stasis, which are critical in managing chronic venous insufficiency. This holistic approach not only addresses the symptoms but also targets the underlying causes, demonstrating the potential of *Ayurvedic* protocols in managing complex chronic conditions like venous ulcers.

ABSTRACT

The principal point of this article is to address the new categories of sets in Micro Vague Topological Spaces. By applying fundamental definitions and results, the new sets namely Micro Vague Generalized Closed set, Micro Vague Generalized Semi Closed (Open) set, Micro Vague Generalized Pre-Closed (Open) Set, Micro Vague Generalized α Closed (Open) Set and Micro Vague Generalized Semi-Pre-Closed (Open) set in Micro Vague Topological Spaces are defined in this paper. Furthermore, some of the fundamental theorems, properties and the comparison between the existing sets are investigated with the suitable numerical examples.

Keywords: Micro Vague Generalized α Closed sets, Micro Vague Generalized α Open sets, Micro Vague Generalized Pre-Closed sets, Micro Vague Generalized Pre-Open sets, Micro Vague Generalized Semi-Pre-Closed sets, Micro Vague Generalized Semi-Pre-Open sets, Micro Vague Generalized Semi Closed sets, Micro Vague Generalized Semi Open sets.

INTRODUCTION

It is commonly known that topologists have developed a wide range of topologies. Fine topology, Supra topology, Ideal topology, Fuzzy topology, Nano topology and Micro topology are the topologies that exist today. Micro topology is an enlargement of nano topology, which has been established by S. Chandrasekar and it has maximum

Vargees Vahini and Trinita Pricilla

nine open sets and minimum four open sets. Fuzzy sets are established by Zadeh in 1965 in Mathematics. Each item in a Fuzzy set is given a single value in the range $[0,1]$, which reflects the degree of membership. Evidence supporting membership and evidence disproving membership cannot be separated under this single value. To affixing this, the concept of Vague sets was introduced by Gau and Buehrer [2] in 1993 which describes objects as having two distinct membership functions a true membership function and a false membership function. Vague sets are an extension of fuzzy sets. In the domain of fuzzy sets, this type of reasoning is also known as interval membership as opposed to point membership. In 1963, Levine [1] laid out semi-open sets and semi-closed sets. The elementary components of a topological space are closed sets. For instance, one may define the topology on a set using either the Kuratowski closure axioms or the axioms for closed sets. Levine [12] commenced the investigation of generalized closed sets in 1970. Since generalized closed sets are not only logical generalizations of closed sets, this idea has received a lot of topological attention in recent years. More crucially, they also propose a number of novel topological space features. S.P. Arya and T.Nour [16] introduced generalized semi closed sets in 1990. In 2021, Taha H. Jasim, Saja S. Mohsen, Kanayo S. Eke [24] introduced Micro generalized closed sets and Micro generalized continuity in Micro Topological Spaces. By combining Micro topological space and Vague topological space, Vargees Vahini T and Trinita Pricilla M [13] have introduced the new topological space called Micro Vague Topological Space. Now in this paper we present a new type of sets in the Micro Vague Topological Space named as Micro Vague Generalized α Closed sets, Micro Vague Generalized α Open sets, Micro Vague Generalized Pre-Closed sets, Micro Vague Generalized Pre-Open sets, Micro Vague Generalized Semi-Pre-Closed sets, Micro Vague Generalized Semi-Pre-Open sets, Micro Vague Generalized Semi Closed sets, Micro Vague Generalized Semi Open sets. Some of the basic definitions, theorems and universal characterizations are derived and investigated with the appropriate numerical examples.

PRELIMINARIES

Definition 2.1 [3]

A Vague set V in the universe of discourse X is characterized by a truth membership function t_v , and a falsity membership function f_v as follows:

$$t_v: X \rightarrow [0,1]; f_v: X \rightarrow [0,1] \text{ and } t_v + f_v \leq 1,$$

where $t_v(x)$ is a lower bound on the grade of membership of x derived from the evidence for x and $f_v(x)$ is a lower bound on the grade of membership of the negation of x derived from the evidence against x . The Vague set V is written as

$$V = \{(x, t_v(x), 1 - f_v(x)) | x \in X\}.$$

Definition 2.2 [5]

Let U be a non-empty finite set of objects called the universe and R be an equivalence relation on U named as the indiscernibility relation. Then U is divided into disjoint equivalence classes. Elements belonging to the same equivalence class are said to be indiscernible with one another. The pair (U, R) is said to be the approximation space. Let $X \subseteq U$.

- 1) The lower approximation of X with respect to R is the set of all objects, which can be for certain classified as X with respect to R and it is denoted by $L_R(X)$. That is,

$$L_R(X) = \bigcup_{x \in U} \{R(x) : R(x) \subseteq X\}$$
 where $R(x)$ denotes the equivalence class determined by $x \in U$.
- 2) The upper approximation of X with respect to R is the set of all objects, which can be possibly classified as X with respect to R and it is denoted by $U_R(X)$. That is,

$$U_R(X) = \bigcup_{x \in U} \{R(x) : R(x) \cap X \neq \emptyset\}$$

- 3) The boundary region of X with respect to R is the set of all objects, which can be classified neither as X nor as $B_R(X)$ denotes not- X with respect to R and it. That is,

$$B_R(X) = U_R(X) - L_R(X).$$

Vargees Vahini and Trinita Pricilla

Definition 2.3 [2]

Let U be a universe, R be an equivalence relation on U and $\tau_R(X) = \{U, \phi, L_R(X), U_R(X), B_R(X)\}$ where $X \subseteq U$ satisfies the following axioms

1. $U, \phi \in \tau_R(X)$
2. The union of the elements of any sub-collection of $\tau_R(X)$ is in $\tau_R(X)$
3. The intersection of the elements of any finite sub collection of $\tau_R(X)$ is in $\tau_R(X)$.

Then $\tau_R(X)$ is called the Nano topology on U with respect to X . The space $(U, \tau_R(X))$ is the Nano topological space. The elements of $\tau_R(X)$ are called Nano open sets.

Definition 2.4 [4]

$(U, \tau_R(X))$ is a Nano topological space here $\mu_R(X) = \{N \cup (N' \cap \mu) : N, N' \in \tau_R(X)\}$ and is called Micro topology of $\tau_R(X)$ by μ where $\mu \notin \tau_R(X)$. The Micro topology $\mu_R(X)$ satisfies the following axioms

- (1) $U, \phi \in \mu_R(X)$.
- (2) The union of the elements of any sub-collection of $\mu_R(X)$ is in $\mu_R(X)$.
- (3) The intersection of the elements of any finite sub collection of $\mu_R(X)$ is in $\mu_R(X)$.

Then $\mu_R(X)$ is called the Micro topology on U with respect to X . The triplet $(U, \tau_R(X), \mu_R(X))$ is called Micro topological spaces and the elements of $\mu_R(X)$ are called Micro open sets and the complement of a Micro open set is called a Micro closed set.

Definition 2.5 [4]

- $Mic - int(A) = \cup \{G / G \text{ is a Mic - OS in } X \text{ and } G \subseteq A\}$.
- $Mic - cl(A) = \cap \{K / K \text{ is a Mic - CS in } X \text{ and } A \subseteq K\}$.

Definition 2.6

Let (X, τ) be a topological Space. A subset A of X is called:

- 1) Semi Closed set [1] if $int(cl(A)) \subseteq A$.
- 2) Semi Open set [1] if $A \subseteq int(cl(A))$.
- 3) Pre-Closed set [17] if $A \subseteq cl(int(A))$.
- 4) Pre-Open set [17] if $cl(int(A)) \subseteq A$.
- 5) Regular Closed set [20] if $A = cl(int(A))$.
- 6) Regular Open set [20] if $int(cl(A)) = A$.
- 7) α Closed set [19] if $cl(int(cl(A))) \subseteq A$.
- 8) α Open set [19] if $A \subseteq int(cl(int(A)))$.
- 9) Semi-Pre-Closed set [18] if $int(cl(int(A))) \subseteq A$.
- 10) Semi-Pre-Open set [18] if $A \subseteq cl(int(cl(A)))$.

Definition 2.7

Let (X, τ) be a topological Space. A subset A of X is called:

- 1) Generalized Closed set [12] if $cl(A) \subseteq U$ whenever $A \subseteq U$ and U is Open in X .
- 2) Generalized Semi Closed set [16] if $scl(A) \subseteq U$ whenever $A \subseteq U$ and U is open in X .
- 3) Generalized Pre-Closed set [22] if $pcl(A) \subseteq U$ whenever $A \subseteq U$ and U is open in X .
- 4) Generalized α Closed set [21] if $\alpha cl(A) \subseteq U$ whenever $A \subseteq U$ and U is α open in X .
- 5) α Generalized Closed set [21] if $\alpha cl(A) \subseteq U$ whenever $A \subseteq U$ and U is open in X .
- 6) Generalized Semi-Pre-Closed set [23] if $spcl(A) \subseteq U$ whenever $A \subseteq U$ and U is open in X .

Definition 2.8 [13]

Let $(U, \tau_R(A))$ be a Nano Vague Topological Space. Let $\eta_R(A) = \{S \cup (S' \cap \eta) : S, S' \in \tau_R(A) \text{ and } \eta \notin \tau_R(A)\}$. Then $\eta_R(A)$ is called the Micro Vague Topology of $\tau_R(A)$ by η on U with respect to A . The triplet $(U, \tau_R(A), \eta_R(A))$ is called the Micro Vague Topological Space. The elements of $\eta_R(A)$ are called Micro Vague open sets and the complement of a Micro Vague Open set is called a Micro Vague Closed set.

Vargees Vahini and Trinita Pricilla

Definition 2.9 [13]

Let U be the Universe and $X \subseteq U$. Let \mathcal{G} and \mathcal{H} be two \mathcal{MV} sets in the \mathcal{MV} Topological Space $(U, \tau_R(X), \eta_R(X))$ of the form $\mathcal{G} = \{ \langle x, [\mu_{\mathcal{G}}(x), \gamma_{\mathcal{G}}(x)] \rangle / x \in X \}$ and $\mathcal{H} = \{ \langle x, [\mu_{\mathcal{H}}(x), \gamma_{\mathcal{H}}(x)] \rangle / x \in X \}$ respectively. Then the following conditions holds:

- (i) $\mathcal{G} \subseteq \mathcal{H}$ iff $\mu_{\mathcal{G}}(x) \leq \mu_{\mathcal{H}}(x), \gamma_{\mathcal{G}}(x) \leq \gamma_{\mathcal{H}}(x) \forall x \in U$
- (ii) $\mathcal{G} = \mathcal{H}$ iff $\mathcal{G} \subseteq \mathcal{H}$ and $\mathcal{H} \subseteq \mathcal{G}$
- (iii) $\mathcal{G}^c = \{ \langle x, 1 - \gamma_{\mathcal{G}}(x), 1 - \mu_{\mathcal{G}}(x) \rangle / \forall x \in U \}$
- (iv) $\mathcal{G} \cup \mathcal{H} = \{ \langle x, (\mu_{\mathcal{G}}(x) \vee \mu_{\mathcal{H}}(x), \gamma_{\mathcal{G}}(x) \vee \gamma_{\mathcal{H}}(x)) \rangle / \forall x \in U \}$
- (v) $\mathcal{G} \cap \mathcal{H} = \{ \langle x, (\mu_{\mathcal{G}}(x) \wedge \mu_{\mathcal{H}}(x), \gamma_{\mathcal{G}}(x) \wedge \gamma_{\mathcal{H}}(x)) \rangle / \forall x \in U \}$
- (vi) $0_{\mathcal{MV}} = \langle x, (0,0) \rangle$ and $1_{\mathcal{MV}} = \langle x, (1,1) \rangle \forall x \in U$

Definition 2.10 [13]

Let $(U, \tau_R(X), \eta_R(X))$ be a \mathcal{MV} Topological Space and $\mathcal{Q} \subseteq U$. Then, \mathcal{Q} is said to be \mathcal{MV} Pre-Open if $\mathcal{Q} \subseteq \mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(\mathcal{Q}))$ and \mathcal{MV} Pre closed if $\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(\mathcal{Q})) \subseteq \mathcal{Q}$.

Definition 2.11 [13]

Let $(U, \tau_R(X), \eta_R(X))$ be a \mathcal{MV} Topological Space and $\mathcal{P} \subseteq U$. Then, \mathcal{P} is said to be \mathcal{MV} -Semi Open if $\mathcal{P} \subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(\mathcal{P}))$ and \mathcal{MV} -Semi Closed if $\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(\mathcal{P})) \subseteq \mathcal{P}$.

Various Types of Closed sets in Micro Vague Topological Space

Definition 3.1

A \mathcal{MV} Set A in the Micro Vague Topological Space $(U, \mathcal{V}_R(\mathcal{S}), \eta_R(\mathcal{S}))$ is called as the Micro Vague α Closed set if $\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A))) \subseteq A$ and Micro Vague α Open if $A \subseteq \mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A)))$.

Definition 3.2

Let A be a \mathcal{MV} set of the \mathcal{MV} Topological space $(U, \mathcal{V}_R(\mathcal{S}), \eta_R(\mathcal{S}))$. The Micro Vague α interior of A ($\mathcal{MV} - \alpha - \text{int}(A)$) and Micro Vague α closure of A ($\mathcal{MV} - \alpha - \text{cl}(A)$) are defined as:

1. $\mathcal{MV} - \alpha - \text{int}(A) = \bigcup \{ H / H \text{ is a } \mathcal{MV}\alpha\mathcal{OS} \text{ in } U \text{ and } H \subseteq A \}$
2. $\mathcal{MV} - \alpha - \text{cl}(A) = \bigcap \{ T / T \text{ is a } \mathcal{MV}\alpha\mathcal{CS} \text{ in } U \text{ and } A \subseteq T \}$.

Remark 3.3

- (i) $\mathcal{MV} - \alpha - \text{int}(A) = A \cap \mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A)))$
- (ii) $\mathcal{MV} - \alpha - \text{cl}(A) = A \cup \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A)))$

Definition3.4

A \mathcal{MV} Set A in the Micro Vague Topological Space $(U, \mathcal{V}_R(\mathcal{S}), \eta_R(\mathcal{S}))$ is called as the Micro Vague Semi-Pre Closed set if $\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))) \subseteq A$ and Micro Vague Semi-Pre Open if $A \subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A)))$.

Definition 3.5

Let A be a \mathcal{MV} set of the \mathcal{MV} Topological space $(U, \mathcal{V}_R(\mathcal{S}), \eta_R(\mathcal{S}))$. The Micro Vague Semi-Pre interior of A ($\mathcal{MV} - \text{sp} - \text{int}(A)$) and Micro Vague Semi-Pre closure of A ($\mathcal{MV} - \text{sp} - \text{cl}(A)$) are defined as:

1. $\mathcal{MV} - \text{sp} - \text{int}(A) = \bigcup \{ H / H \text{ is a } \mathcal{MVSP}\mathcal{OS} \text{ in } U \text{ and } H \subseteq A \}$
2. $\mathcal{MV} - \text{sp} - \text{cl}(A) = \bigcap \{ T / T \text{ is a } \mathcal{MVSP}\mathcal{CS} \text{ in } U \text{ and } A \subseteq T \}$.

Remark 3.6

- (i) $\mathcal{MV} - \text{sp} - \text{int}(A) = A \cap \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A)))$

Vargees Vahini and Trinita Pricilla

$$(ii) \mathcal{MV} - sp - cl(A) = A \cup \mathcal{MV} - \text{int}(\mathcal{MV} - cl(\mathcal{MV} - \text{int}(A)))$$

Definition 3.7

A \mathcal{MV} Set A in the Micro Vague Topological Space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$ is called as the Micro Vague Regular Closed set if $A = \mathcal{MV} - cl(\mathcal{MV} - \text{int}(A))$ and Micro Vague Regular Open if $\mathcal{MV} - \text{int}(\mathcal{MV} - cl(A)) = A$.

Definition 3.8

Let A be a \mathcal{MV} set of the \mathcal{MV} Topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$. The Micro Vague-Regular- interior of A ($\mathcal{MV} - r - \text{int}(A)$) and Micro Vague Regular closure of A ($\mathcal{MV} - r - cl(A)$) are defined as:

1. $\mathcal{MV} - r - \text{int}(A) = \bigcup \{H/H \text{ is a } \mathcal{MVROS} \text{ in } U \text{ and } H \subseteq A\}$
2. $\mathcal{MV} - r - cl(A) = \bigcap \{T/T \text{ is a } \mathcal{MVRCs} \text{ in } U \text{ and } A \subseteq T\}$.

Definition 3.9

A \mathcal{MV} set A is said to be Micro Vague Generalized closed set (\mathcal{MVGCs}) in the topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$, if $\mathcal{MV} - cl(A) \subseteq \mathcal{U}$ whenever $A \subseteq \mathcal{U}$ AND \mathcal{U} is \mathcal{MV} -OPEN IN U . THE COMPLEMENT OF THE \mathcal{MVGCs} IS CALLED AS THE

MICRO VAGUE GENERALIZED OPEN SET IN $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$.

Definition 3.10

Let A be a \mathcal{MV} set of the \mathcal{MV} Topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$. The Micro Vague Pre interior of A ($\mathcal{MV} - p - \text{int}(A)$) and Micro Vague Pre closure of A ($\mathcal{MV} - p - cl(A)$) are defined as:

1. $\mathcal{MV} - p - \text{int}(A) = \bigcup \{H/H \text{ is a } \mathcal{MVPOS} \text{ in } U \text{ and } H \subseteq A\}$
2. $\mathcal{MV} - p - cl(A) = \bigcap \{T/T \text{ is a } \mathcal{MVPCS} \text{ in } U \text{ and } A \subseteq T\}$.

Remark 3.11

- (i) $\mathcal{MV} - p - \text{int}(A) = A \cap (\mathcal{MV} - \text{int}(\mathcal{MV} - cl(A)))$
- (ii) $\mathcal{MV} - p - cl(A) = A \cup (\mathcal{MV} - cl(\mathcal{MV} - \text{int}(A)))$

Definition 3.12

A \mathcal{MV} set A is said to be Micro Vague Generalized Pre closed set (\mathcal{MVGPCs}) in the topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$, if $\mathcal{MV} - pcl(A) \subseteq \mathcal{U}$ whenever $A \subseteq \mathcal{U}$ AND \mathcal{U} is \mathcal{MV} -OPEN IN U . THE COMPLEMENT OF THE \mathcal{MVGPCs}

IS CALLED AS THE MICRO VAGUE GENERALIZED PRE-OPEN SET IN $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$.

Definition 3.13

A \mathcal{MV} set A is said to be Micro Vague Generalized α closed set ($\mathcal{MVG\alpha Cs}$) in the topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$, if $\mathcal{MV} - acl(A) \subseteq \mathcal{U}$ whenever $A \subseteq \mathcal{U}$ AND \mathcal{U} is \mathcal{MV} - α -OPEN IN U . THE COMPLEMENT OF THE $\mathcal{MVG\alpha Cs}$ IS CALLED AS THE **MICRO VAGUE GENERALIZED α OPEN SET IN $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$.**

Definition 3.14

A \mathcal{MV} set A is said to be Micro Vague α Generalized closed set ($\mathcal{MV\alpha GCs}$) in the topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$, if $\mathcal{MV} - acl(A) \subseteq \mathcal{U}$ whenever $A \subseteq \mathcal{U}$ AND \mathcal{U} is \mathcal{MV} -OPEN IN U . THE COMPLEMENT OF THE $\mathcal{MV\alpha GCs}$ IS CALLED AS THE

MICRO VAGUE α GENERALIZED OPEN SET IN $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$.

Definition 3.15

A \mathcal{MV} set A is said to be Micro Vague Generalized Semi-Pre closed set ($\mathcal{MVGSPCS}$) in the topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$, if $\mathcal{MV} - sp - cl(A) \subseteq \mathcal{U}$ whenever $A \subseteq \mathcal{U}$ AND \mathcal{U} is \mathcal{MV} -OPEN IN U . THE COMPLEMENT OF THE $\mathcal{MVGSPCS}$ IS CALLED AS THE **MICRO VAGUE GENERALIZED SEMI-PRE-OPEN SET IN $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$.**

Vargees Vahini and Trinita Pricilla

Micro Vague Generalized Semi Closed sets

Definition 4.1

Let A be a \mathcal{MV} set of the \mathcal{MV} Topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$. The Micro Vague Semi interior of A ($\mathcal{MV} - s - \text{int}(A)$) and Micro Vague Semi closure of A ($\mathcal{MV} - s - \text{cl}(A)$) are defined as:

1. $\mathcal{MV} - s - \text{int}(A) = \bigcup \{H/H \text{ is a } \mathcal{MV}\mathcal{SOS} \text{ in } U \text{ and } H \subseteq A\}$
2. $\mathcal{MV} - s - \text{cl}(A) = \bigcap \{T/T \text{ is a } \mathcal{MV}\mathcal{SCS} \text{ in } U \text{ and } A \subseteq T\}$.

Remark 4.2

- (i) $\mathcal{MV} - s - \text{int}(A) = A \cap (\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A)))$
- (ii) $\mathcal{MV} - s - \text{cl}(A) = A \cup (\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A)))$

Definition 4.3

A \mathcal{MV} set A is said to be Micro Vague Generalized Semi closed set ($\mathcal{MV}\mathcal{GSCS}$) in the topological space $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$, if $\mathcal{MV} - \text{scl}(A) \subseteq \mathcal{U}$ whenever $A \subseteq \mathcal{U}$ and \mathcal{U} is \mathcal{MV} -OPEN IN \mathcal{U} . THE FAMILY OF ALL $\mathcal{MV}\mathcal{GSCS}$ IN THE \mathcal{MV} -TOPOLOGICAL SPACE $(\mathcal{U}, \vartheta_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$ is denoted by $\mathcal{MV}\mathcal{GSC}(\mathcal{S})$.

Example 4.4

Let $\mathcal{U} = \{\rho, \lambda, \theta\}$ BE THE UNIVERSE OF DISCOURSE. $\mathcal{U}/\mathcal{R} = \{\{\rho, \lambda\}, \{\theta\}\}$ BE THE EQUIVALENCE RELATION ON \mathcal{U} . LET $\mathcal{S} = \{< \rho, (0.5, 0.7) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}$ BE A SUBSET OF \mathcal{U} . THEN, $\vartheta_{\mathcal{R}}(\mathcal{S}) = \{0_{\mathcal{NV}}, 1_{\mathcal{NV}}, \{< \rho, (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}, \{< \rho, (0.5, 0.7) >, < \lambda, (0.5, 0.7) >, < \theta, (0.7, 0.8) >\}, \{< \rho, (0.5, 0.7) >, < \lambda, (0.5, 0.7) >, < \theta, (0.2, 0.3) >\}$ is a Nano Vague Topology on \mathcal{U} . Let $\eta = \{< \rho, (0.3, 0.4) >, < \lambda, (0.1, 0.9) >, < \theta, (0.2, 0.6) >\}$. Then, $\eta_{\mathcal{R}}(A) = \{0_{\mathcal{MV}}, 1_{\mathcal{MV}}, \{< \rho, (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}, \{< \rho, (0.5, 0.7) >, < \lambda, (0.5, 0.7) >, < \theta, (0.7, 0.8) >\}, \{< \rho, (0.5, 0.7) >, < \lambda, (0.5, 0.7) >, < \theta, (0.2, 0.3) >\}, \{< \rho, (0.3, 0.4) >, < \lambda, (0.1, 0.9) >, < \theta, (0.2, 0.6) >\}, \{< \rho, (0.2, 0.4) >, < \lambda, (0.1, 0.4) >, < \theta, (0.2, 0.6) >\}, \{< \rho, (0.3, 0.4) >, < \lambda, (0.1, 0.7) >, < \theta, (0.2, 0.6) >\}, \{< \rho, (0.3, 0.4) >, < \lambda, (0.1, 0.7) >, < \theta, (0.2, 0.3) >\}, \{< \rho, (0.3, 0.4) >, < \lambda, (0.2, 0.9) >, < \theta, (0.7, 0.8) >\}, \{< \rho, (0.3, 0.4) >, < \lambda, (0.2, 0.7) >, < \theta, (0.7, 0.8) >\}, \{< \rho, (0.5, 0.7) >, < \lambda, (0.5, 0.9) >, < \theta, (0.7, 0.8) >\}, \{< \rho, (0.5, 0.7) >, < \lambda, (0.5, 0.9) >, < \theta, (0.2, 0.6) >\}, \{< \rho, (0.5, 0.7) >, < \lambda, (0.5, 0.7) >, < \theta, (0.2, 0.6) >\}$ is a Micro Vague Topology on \mathcal{U} with respect to \mathcal{S} and the elements in the Micro Vague Topology are called Micro Vague Open sets. The triplet $(\mathcal{U}, \tau_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$ is called as the Micro Vague Topological Space.

Example 4.5

Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho, (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{MV}\mathcal{GSCS}$ in \mathcal{U} .

Theorem 4.6

Every Micro Vague Closed set is Micro Vague Generalized Semi Closed set.

Proof: Let \mathcal{K} be \mathcal{MV} -Closed Set in $(\mathcal{U}, \tau_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$ and let $\mathcal{K} \subseteq \mathcal{V}$, where \mathcal{V} is an \mathcal{MV} -Open set in \mathcal{U} . Since \mathcal{K} is \mathcal{MV} -closed, then $\mathcal{MV} - \text{cl}(\mathcal{K}) = \mathcal{K}$. Therefore $\mathcal{MV} - \text{cl}(\mathcal{K}) = \mathcal{K}$ and $\mathcal{K} \subseteq \mathcal{V}$, implies that $\mathcal{MV} - \text{cl}(\mathcal{K}) \subseteq \mathcal{V}$. Also, $\mathcal{MV} - \text{scl}(\mathcal{K}) \subseteq \mathcal{MV} - \text{cl}(\mathcal{K})$ implies $\mathcal{MV} - \text{scl}(\mathcal{K}) \subseteq \mathcal{V}$ where $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is \mathcal{MV} -Open set in \mathcal{U} . Therefore, is a $\mathcal{MV}\mathcal{GSCS}$.

Remark 4.7

The converse of the above theorem need not to be true. It is shown in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_{\mathcal{R}}(\mathcal{S}), \eta_{\mathcal{R}}(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho, (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{MV}\mathcal{GSCS}$ in \mathcal{U} but not \mathcal{MVCS} in \mathcal{U} .

Theorem 4.8

Every Micro Vague Generalized Closed set is Micro Vague Generalized Semi closed set.

Vargees Vahini and Trinita Pricilla

Proof: Let \mathcal{K} be Micro Vague Generalized Closed set. Then $\mathcal{M}\mathcal{V} - cl(A) \subseteq \mathcal{V}$ whenever $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is Micro Vague Open in U . We know that $\mathcal{M}\mathcal{V} - scl(\mathcal{K}) \subseteq \mathcal{M}\mathcal{V} - cl(\mathcal{K})$; Therefore $\mathcal{M}\mathcal{V} - scl(\mathcal{K}) \subseteq \mathcal{V}$ whenever $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is Micro Vague Open in U . Hence \mathcal{K} is $\mathcal{M}\mathcal{V}\mathcal{GSCS}$ in U .

Remark 4.9

The converse of the above theorem need not to be true. It is shown in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the $\mathcal{M}\mathcal{V}$ Set $\mathcal{K} = \{< \rho, (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{M}\mathcal{V}\mathcal{GSCS}$ in U but not $\mathcal{M}\mathcal{V}\mathcal{SCS}$ in U .

Theorem 4.10

Every Micro Vague Semi closed set is Micro Vague Generalized Semi Closed set.

Proof: Let \mathcal{K} be $\mathcal{M}\mathcal{VSCS}$ in U and let $\mathcal{K} \subseteq \mathcal{V}$ where \mathcal{V} is $\mathcal{M}\mathcal{V}$ open in U . Since \mathcal{K} is $\mathcal{M}\mathcal{VSCS}$, we have $\mathcal{M}\mathcal{V} - int(\mathcal{M}\mathcal{V} - cl(\mathcal{K})) \subseteq \mathcal{K}$. This implies that $\mathcal{M}\mathcal{V} - scl(\mathcal{K}) = \mathcal{K} \cup \mathcal{M}\mathcal{V} - int(\mathcal{M}\mathcal{V} - cl(\mathcal{K})) \subseteq \mathcal{K}$ and $\mathcal{K} \subseteq \mathcal{V}$. This results that $\mathcal{M}\mathcal{V} - scl(\mathcal{K}) \subseteq \mathcal{V}$ whenever $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is $\mathcal{M}\mathcal{V}$ -open in U . Hence \mathcal{K} is $\mathcal{M}\mathcal{V}\mathcal{GSCS}$.

Remark 4.11

The converse of the above theorem need not to be true. It is shown in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the $\mathcal{M}\mathcal{V}$ set $\mathcal{K} = \{< \rho, (0.3, 0.4) >, < \lambda, (0.6, 0.7) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{M}\mathcal{V}\mathcal{GSCS}$ in U but not $\mathcal{M}\mathcal{VSCS}$ in U .

Theorem 4.12

Every Micro Vague α closed set is Micro Vague Generalized Semi closed set.

Proof: Let \mathcal{K} be $\mathcal{M}\mathcal{V}\alpha\mathcal{CS}$ in U and let $\mathcal{K} \subseteq \mathcal{V}$ where \mathcal{V} is $\mathcal{M}\mathcal{V}$ open set in U . Since \mathcal{K} is a $\mathcal{M}\mathcal{V}\alpha\mathcal{CS}$, we have $\mathcal{M}\mathcal{V} - cl(\mathcal{M}\mathcal{V} - int(\mathcal{M}\mathcal{V} - cl(\mathcal{K}))) \subseteq \mathcal{K}$. We know that $\mathcal{K} \subseteq \mathcal{M}\mathcal{V} - cl(\mathcal{K})$; this implies that $\mathcal{M}\mathcal{V} - int(\mathcal{M}\mathcal{V} - cl(\mathcal{K})) \subseteq \mathcal{M}\mathcal{V} - cl(\mathcal{M}\mathcal{V} - int(\mathcal{M}\mathcal{V} - cl(\mathcal{K})))$. Therefore $\mathcal{M}\mathcal{V} - int(\mathcal{M}\mathcal{V} - cl(\mathcal{K})) \subseteq \mathcal{K}$ (i.e) $\mathcal{M}\mathcal{V} - scl(\mathcal{K}) \subseteq \mathcal{K}$ and $\mathcal{K} \subseteq \mathcal{V}$ implies that $\mathcal{M}\mathcal{V} - scl(\mathcal{K}) \subseteq \mathcal{V}$ whenever $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is $\mathcal{M}\mathcal{V}$ -open in U . Hence \mathcal{K} is a $\mathcal{M}\mathcal{V}\mathcal{GSCS}$ in U .

Remark 4.13

The converse of the above theorem need not to be true which can be shown in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the $\mathcal{M}\mathcal{V}$ Set $\mathcal{K} = \{< \rho, (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{M}\mathcal{V}\mathcal{GSCS}$ in U but not $\mathcal{M}\mathcal{V}\alpha\mathcal{CS}$ in U .

Theorem 4.14

Every Micro Vague Regular Closed set is Micro Vague Generalized Semi closed set.

Proof: Let \mathcal{K} be $\mathcal{M}\mathcal{V}\mathcal{RCS}$ in U that is $\mathcal{K} = \mathcal{M}\mathcal{V} - cl(\mathcal{M}\mathcal{V} - int(\mathcal{K}))$. This implies that $\mathcal{M}\mathcal{V} - cl(\mathcal{K}) = \mathcal{M}\mathcal{V} - cl(\mathcal{M}\mathcal{V} - cl(\mathcal{M}\mathcal{V} - int(\mathcal{K})))$ which results as $\mathcal{M}\mathcal{V} - cl(\mathcal{K}) = \mathcal{M}\mathcal{V} - cl(\mathcal{M}\mathcal{V} - int(\mathcal{K})) = \mathcal{K}$. Since, $\mathcal{M}\mathcal{V} - cl(\mathcal{K}) = \mathcal{K}$, we conclude that \mathcal{K} is $\mathcal{M}\mathcal{VCS}$ in U . By theorem 4.6, \mathcal{K} is a $\mathcal{M}\mathcal{V}\mathcal{GSCS}$ in U .

Remark 4.15

The converse of the above theorem need not to be true which has been shown in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the $\mathcal{M}\mathcal{V}$ Set $\mathcal{K} = \{< \rho, (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{M}\mathcal{V}\mathcal{GSCS}$ in U but not $\mathcal{M}\mathcal{V}\mathcal{RCS}$ in U .

Theorem 4.16

Every Micro Vague Generalized α Closed Set is Micro Vague Generalized Semi Closed Set.

Vargees Vahini and Trinita Pricilla

Proof: Let \mathcal{K} be $\mathcal{MV}\alpha\mathcal{CS}$ in U and let $\mathcal{K} \subseteq \mathcal{V}$ where \mathcal{V} is $\mathcal{MV}\alpha$ -open set in U . Since \mathcal{K} is a $\mathcal{MV}\alpha\mathcal{CS}$, we have $\mathcal{MV} - \alpha cl(\mathcal{K}) \subseteq \mathcal{V}$ whenever $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is $\mathcal{MV}\alpha\mathcal{OS}$ in U . This implies that $\mathcal{MV} - \alpha cl(\mathcal{K}) = \mathcal{K} \cup \mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K}))) \subseteq \mathcal{V}$. We know that $\mathcal{K} \subseteq \mathcal{MV} - cl(\mathcal{K})$; this implies that $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq \mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K}))) \subseteq \mathcal{V}$. (i.e) $\mathcal{MV} - scl(\mathcal{K}) \subseteq \mathcal{MV} - \alpha cl(\mathcal{K}) \subseteq \mathcal{V}$ implies that $\mathcal{MV} - scl(\mathcal{K}) \subseteq \mathcal{V}$ whenever $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is $\mathcal{MV}\mathcal{OS}$ in U . Hence \mathcal{K} is a $\mathcal{MV}\mathcal{GSCS}$ in U .

Remark 4.17

The converse of the above theorem need not to be true which can be shown in the following example. Let us consider the Micro Vague Topological Space $(\mathbf{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{MV}\mathcal{GSCS}$ in U but not $\mathcal{MV}\alpha\mathcal{CS}$ in U .

Theorem 4.18

Every Micro Vague α Generalized Closed Set is Micro Vague Generalized Semi Closed Set.

Proof: Let \mathcal{K} be $\mathcal{MV}\alpha\mathcal{GCS}$ in U and let $\mathcal{K} \subseteq \mathcal{V}$ where \mathcal{V} is \mathcal{MV} -open set in U . Since \mathcal{K} is a $\mathcal{MV}\alpha\mathcal{GCS}$, we have $\mathcal{MV} - \alpha cl(\mathcal{K}) \subseteq \mathcal{V}$ whenever $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is $\mathcal{MV}\mathcal{OS}$ in U . This implies that $\mathcal{MV} - \alpha cl(\mathcal{K}) = \mathcal{K} \cup \mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K}))) \subseteq \mathcal{V}$. We know that $\mathcal{K} \subseteq \mathcal{MV} - cl(\mathcal{K})$; this implies that $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq \mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K}))) \subseteq \mathcal{V}$. (i.e) $\mathcal{MV} - scl(\mathcal{K}) \subseteq \mathcal{MV} - \alpha cl(\mathcal{K}) \subseteq \mathcal{V}$ implies that $\mathcal{MV} - scl(\mathcal{K}) \subseteq \mathcal{V}$ whenever $\mathcal{K} \subseteq \mathcal{V}$ and \mathcal{V} is $\mathcal{MV}\mathcal{OS}$ in U . Hence \mathcal{K} is a $\mathcal{MV}\mathcal{GSCS}$ in U .

Remark 4.19

The converse of the above theorem need not to be true which can be shown in the following example. Let us consider the Micro Vague Topological Space $(\mathbf{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho (0.2, 0.4) >, < \lambda, (0.2, 0.4) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{MV}\mathcal{GSCS}$ in U but not $\mathcal{MV}\alpha\mathcal{GCS}$ in U .

Theorem 4.20

Every Micro Vague Semi Closed set is Micro Vague Semi-Pre-Closed set

Proof: Let \mathcal{K} be \mathcal{MVSCS} in U . By hypothesis, we have $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq \mathcal{K}$. Since $\mathcal{MV} - int(\mathcal{K}) \subseteq \mathcal{K}$, we get $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{K}))) \subseteq \mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq \mathcal{K}$. This implies that \mathcal{K} is a \mathcal{MVSPCS} .

Remark 4.21

The converse of the above theorem need not to be true which is seen from the following example. Let us consider the Micro Vague Topological Space $(\mathbf{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho (0.3, 0.6) >, < \lambda, (0.1, 0.5) >, < \theta, (0.2, 0.3) >\}$ is a \mathcal{MVSPCS} in U but not \mathcal{MVSCS} in U .

Theorem 4.22

Every Micro Generalized Semi Closed set is Micro Vague Semi-Pre-closed set

Proof: Let \mathcal{K} be \mathcal{MVGSCS} in U such that $\mathcal{K} \subseteq U$ and U is a $\mathcal{MV}\mathcal{OS}$. Since \mathcal{K} is a \mathcal{MVGSCS} , we have $\mathcal{MV} - scl(\mathcal{K}) \subseteq U$. (i.e) $\mathcal{K} \cup [\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K}))] \subseteq U$ which results that $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq U$. Since $\mathcal{MV} - int(\mathcal{K}) \subseteq \mathcal{K}$, we get $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{K}))) \subseteq \mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq U$. This implies that \mathcal{K} is a \mathcal{MVSPCS} .

Remark 4.23

The converse of the above theorem need not to be true which is seen in the following example. Let us consider the Micro Vague Topological Space $(\mathbf{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho (0.5, 0.7) >, < \lambda, (0.1, 0.3) >, < \theta, (0.7, 0.8) >\}$ is a \mathcal{MVSPCS} in U but not \mathcal{MVGSCS} in U .

Vargees Vahini and Trinita Pricilla

Theorem 4.24

Every Micro Generalized Semi Closed set is Micro Vague Generalized Semi-Pre-Closed set.

Proof: Let \mathcal{K} be \mathcal{MVGSCS} in U such that $\mathcal{MV} - scl(\mathcal{K}) \subseteq U$ whenever $\mathcal{K} \subseteq U$ and U is \mathcal{MVO} . This implies that $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq U$ whenever $\mathcal{K} \subseteq U$ and U is \mathcal{MVO} . Since $\mathcal{MV} - int(\mathcal{K}) \subseteq \mathcal{K}$, we get $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{K}))) \subseteq \mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq U$. This results that $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{K}))) \subseteq U$. Since $\mathcal{K} \subseteq U$ and $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{K}))) \subseteq U$, we have $\mathcal{K} \cup \mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{K}))) \subseteq U$ (i.e) $\mathcal{MV} - spcl(\mathcal{K}) \subseteq U$. Therefore, $\mathcal{MV} - spcl(\mathcal{K}) \subseteq U$ whenever $\mathcal{K} \subseteq U$ where U is \mathcal{MVO} . Hence \mathcal{K} is a $\mathcal{MVGSPCS}$ in U .

Remark 4.25

The converse of the above theorem need not to be true which is seen in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MVSet} $\mathcal{K} = \{< \rho (0.5, 0.7) >, < \lambda, (0.1, 0.3) >, < \theta, (0.7, 0.8) >\}$ is a $\mathcal{MVGSPCS}$ in U but not \mathcal{MVGSCS} in U .

Remark 4.26

From the above theorems and examples, we have the following diagrammatic representation.

Theorem 4.27

If \mathcal{K} and \mathcal{L} are Micro Vague Generalized Semi closed sets, then $\mathcal{K} \cap \mathcal{L}$ is also a Micro Vague Generalized Semi closed set.

Proof: Let \mathcal{K} and \mathcal{L} be two \mathcal{MVGSCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. Then $\mathcal{K} \subseteq U$ and $\mathcal{L} \subseteq U$ implies that $\mathcal{K} \cap \mathcal{L} \subseteq U$. Since \mathcal{K} and \mathcal{L} are \mathcal{MVGSCS} , $\mathcal{MV} - scl(\mathcal{K}) \subseteq U$ and $\mathcal{MV} - scl(\mathcal{L}) \subseteq U$. Hence $\mathcal{MV} - scl(\mathcal{K}) \cap \mathcal{MV} - scl(\mathcal{L}) \subseteq U$. This implies that $\mathcal{MV} - scl(\mathcal{K} \cap \mathcal{L}) \subseteq U$. Therefore $\mathcal{MV} - scl(\mathcal{K} \cap \mathcal{L}) \subseteq U$ whenever $\mathcal{K} \cap \mathcal{L} \subseteq U$ and U is Micro Vague Open. Thus $\mathcal{K} \cap \mathcal{L}$ is \mathcal{MVGSCS} .

Example 4.28: Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Let $\mathcal{K} = \{< \rho (0.3, 0.4) >, < \lambda, (0.2, 0.9) >, < \theta, (0.7, 0.8) >\}$ and $\mathcal{L} = \{< \rho (0.3, 0.4) >, < \lambda, (0.3, 0.5) >, < \theta, (0.7, 0.8) >\}$ be \mathcal{MVGSCS} in U . Then Since $\mathcal{MV} - scl(\mathcal{K} \cap \mathcal{L}) \subseteq U$ whenever $\mathcal{K} \cap \mathcal{L} \subseteq U$ and U is \mathcal{MV} -Open set in U , $\mathcal{K} \cap \mathcal{L}$ is also a \mathcal{MVGSCS} in U .

Remark 4.29

The Union of any two Micro Vague Generalized Semi Closed sets need not to be a Micro Vague Generalized semi closed set. This can be seen in the following example.

Example 4.30: Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Let $\mathcal{K} = \{< \rho (0.3, 0.4) >, < \lambda, (0.2, 0.9) >, < \theta, (0.7, 0.8) >\}$ and $\mathcal{L} = \{< \rho (0.5, 0.7) >, < \lambda, (0.5, 0.9) >, < \theta, (0.2, 0.6) >\}$ be \mathcal{MVGSCS} in U . But the Union $\mathcal{K} \cup \mathcal{L}$ is not a \mathcal{MVGSCS} since $\mathcal{MV} - scl(\mathcal{K} \cup \mathcal{L}) \not\subseteq \mathcal{K} \cup \mathcal{L}$.

Theorem 4.31

If \mathcal{K} is a Micro Vague Generalized semi closed sets in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ and $\mathcal{K} \subseteq \mathcal{L} \subseteq \mathcal{MV} - scl(\mathcal{K})$, then \mathcal{L} is a Micro Vague Generalized semi closed set in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Proof: Let U be a \mathcal{MVO} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$, such that $\mathcal{L} \subseteq U$. Since $\mathcal{K} \subseteq \mathcal{L} \subseteq U$, we have $\mathcal{K} \subseteq U$. Again, since \mathcal{K} is a \mathcal{MVGSCS} , $\mathcal{MV} - scl(\mathcal{K}) \subseteq U$. By hypothesis, $\mathcal{L} \subseteq \mathcal{MV} - scl(\mathcal{K})$. W.K.T, $\mathcal{MV} - scl(\mathcal{L}) \subseteq \mathcal{MV} - scl(\mathcal{MV} - scl(\mathcal{K})) = \mathcal{MV} - scl(\mathcal{K})$. That is $\mathcal{MV} - scl(\mathcal{L}) \subseteq \mathcal{MV} - scl(\mathcal{K})$. This implies that $\mathcal{MV} - scl(\mathcal{L}) \subseteq U$. Hence \mathcal{L} is a \mathcal{MVGSCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Vargees Vahini and Trinita Pricilla

Example 4.32: Let \mathcal{K} be a \mathcal{MVGSCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ and $\mathcal{K} = \{ \langle \rho, (0.1, 0.4) \rangle, \langle \lambda, (0.1, 0.4) \rangle, \langle \theta, (0.2, 0.6) \rangle \} \subseteq \mathcal{L} = \{ \langle \rho, (0.2, 0.4) \rangle, \langle \lambda, (0.1, 0.4) \rangle, \langle \theta, (0.2, 0.6) \rangle \}$. Since $\mathcal{K} \subseteq \mathcal{L} \subseteq \mathcal{MV} - scl(\mathcal{K})$, \mathcal{L} is also a \mathcal{MVGSCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Theorem 4.33

A Micro Vague set \mathcal{K} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ is a Micro Vague Generalized Semi Closed set if and only if $\mathcal{MV} - scl(\mathcal{K}) \subseteq \mathcal{L}$ where \mathcal{L} is a Micro Vague Open set and $\mathcal{K} \subseteq \mathcal{L}$.

Proof: Assume that \mathcal{K} is a \mathcal{MVGSCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. Let \mathcal{L} be a \mathcal{MV} -Open set in U such that $\mathcal{K} \subseteq \mathcal{L}$. Then \mathcal{L}^c is a \mathcal{MV} -Closed set in U , such that $\mathcal{L}^c \subseteq \mathcal{K}^c$. Since \mathcal{K}^c is a \mathcal{MVGSO} , $\mathcal{L}^c \subseteq \mathcal{MV} - s - int(\mathcal{K}^c)$. Since, $\mathcal{MV} - s - int(\mathcal{K}^c) = [\mathcal{MV} - scl(\mathcal{K})]^c$. Therefore $\mathcal{L}^c \subseteq [\mathcal{MV} - scl(\mathcal{K})]^c$ implies that $\mathcal{MV} - scl(\mathcal{K}) \subseteq \mathcal{L}$. Conversely, assume that $\mathcal{MV} - scl(\mathcal{K}) \subseteq \mathcal{L}$ where \mathcal{L} is a \mathcal{MVOS} and $\mathcal{K} \subseteq \mathcal{L}$. Then $\mathcal{L}^c \subseteq \mathcal{MV} - scl(\mathcal{K})$ where \mathcal{L}^c is a \mathcal{MVCS} and $\mathcal{L}^c \subseteq \mathcal{MV} - s - int(\mathcal{K}^c)$. Therefore, \mathcal{K}^c is a \mathcal{MVGSO} . This implies that \mathcal{K} is a \mathcal{MVGSCS} in U .

Theorem 4.34

A Micro Vague set \mathcal{K} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ is a Micro Vague Generalized Semi Closed set if and only if $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq \mathcal{L}$ whenever \mathcal{L} is a Micro Vague Open set and $\mathcal{K} \subseteq \mathcal{L}$.

Proof: Assume that \mathcal{K} is a \mathcal{MVGSCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. Let \mathcal{L} be a \mathcal{MVOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ and $\mathcal{K} \subseteq \mathcal{L}$. Then \mathcal{L}^c is a \mathcal{MVCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ such that $\mathcal{L}^c \subseteq \mathcal{K}^c$. Since \mathcal{K}^c is a \mathcal{MVGSO} , $\mathcal{L}^c \subseteq \mathcal{MV} - s - int(\mathcal{K}^c)$. Therefore $\mathcal{K}^c \subseteq [\mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{K}^c))]$. Hence $\mathcal{L}^c \subseteq [\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K}))]^c$. This implies that $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq \mathcal{L}$. Conversely, let \mathcal{K} be a \mathcal{MV} set in U and $\mathcal{MV} - int(\mathcal{MV} - cl(\mathcal{K})) \subseteq \mathcal{L}$ whenever \mathcal{L} is \mathcal{MVOS} and $\mathcal{K} \subseteq \mathcal{L}$. Then $\mathcal{L}^c \subseteq \mathcal{K}^c$ and \mathcal{K}^c is a \mathcal{MVCS} . By hypothesis, $\mathcal{L}^c \subseteq [\mathcal{MV} - int(\mathcal{MV} - scl(\mathcal{K}))]^c$. Hence $\mathcal{L}^c \subseteq \mathcal{MV} - cl(\mathcal{MV} - int(\mathcal{K}^c))$ implies that $\mathcal{L}^c \subseteq \mathcal{MV} - s - int(\mathcal{K}^c)$. So that \mathcal{K}^c is a \mathcal{MVGSO} . Hence \mathcal{K} is a \mathcal{MVGSCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Micro Vague Generalized Semi Open sets

In this section we introduce Micro Vague Generalized Semi Open sets and some of their properties are discussed

Definition 5.1

A \mathcal{MV} Set A is said to be Micro Vague Generalized Semi open set (\mathcal{MVGSO}) in the \mathcal{MV} Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$, if the complement A^c of the \mathcal{MV} set is \mathcal{MVGSCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. (i.e) A \mathcal{MV} set A is said to be Micro Vague Generalized Semi Open set in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ if $\mathcal{V} \subseteq \mathcal{MV} - s - int(A)$ whenever $\mathcal{V} \subseteq A$ and \mathcal{V} is Micro Vague Closed set in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. The family of all Micro Vague Generalized Semi Open sets of $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ is denoted by $\mathcal{MVGSO}(\mathcal{S})$.

Example 5.2: Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{ \langle \rho, (0.3, 0.4) \rangle, \langle \lambda, (0.1, 0.7) \rangle, \langle \theta, (0.2, 0.6) \rangle \}$ is a \mathcal{MVGSO} on U .

Theorem 5.3

Every Micro Vague Open Set is Micro Vague Generalized Semi Open Set in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Proof: Let A be Micro Vague Open set in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. (i.e) $A = \mathcal{MV} - int(A)$. Let $V \subseteq A$ where V is a \mathcal{MVCS} in U . Since $\mathcal{MV} - int(A) \subseteq \mathcal{MV} - s - int(A)$, we have, $V \subseteq A = \mathcal{MV} - int(A) \subseteq \mathcal{MV} - s - int(A)$ which implies that $V \subseteq \mathcal{MV} - s - int(A)$ whenever $V \subseteq A$ and V is a \mathcal{MVCS} . Therefore, A is a \mathcal{MVGSO} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Remark 5.4

The Converse of the above theorem need not to be true which is seen in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{ \langle \rho, (0.6, 0.7) \rangle, \langle \lambda, (0.5, 0.7) \rangle, \langle \theta, (0.2, 0.3) \rangle \}$ is a \mathcal{MVGSO} in U but not \mathcal{MVOS} in U .

**Theorem 5.5**

Every Micro Vague Regular Open set is Micro Vague Generalized Semi Open set in the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Proof: Let A be $\mathcal{MVR}\mathcal{OS}$ in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. By hypothesis, we have $A = \mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A))$. We know that for a $\mathcal{MVR}\mathcal{OS}$, $\mathcal{MV} - \text{int}(A) = \mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A))$. This implies that $\mathcal{MV} - \text{int}(A) = A$. Therefore, A is a $\mathcal{MVG}\mathcal{OS}$ in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. By theorem 5.3, we get that A is a $\mathcal{MVG}\mathcal{OS}$ in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Remark 5.6

The Converse of the above theorem need not to be true which is seen in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho (0.6, 0.8) >, < \lambda, (0.6, 0.8) >, < \theta, (0.2, 0.3) >\}$ is a $\mathcal{MVG}\mathcal{OS}$ in U but not $\mathcal{MVR}\mathcal{OS}$ in U .

Theorem 5.7

Every Micro Vague α Open set is Micro Vague Generalized Semi Open set in the Micro Vague Topological space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Proof: Let A be $\mathcal{MV}\alpha\mathcal{OS}$ in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. Let $V \subseteq A$ where V is a \mathcal{MVCS} in U . By hypothesis, $A \subseteq \mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A)))$. Since, $\mathcal{MV} - \text{int}(A) \subseteq A$, we have $A \subseteq \mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))) \subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))$. Therefore, $V \subseteq A \subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))$ which means that $V \subseteq A \subseteq \mathcal{MV} - s - \text{int}(A)$. Hence A is a $\mathcal{MVG}\mathcal{OS}$ in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Remark 5.8

The Converse of the above theorem need not to be true which is seen in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho (0.3, 0.5) >, < \lambda, (0.1, 0.5) >, < \theta, (0.4, 0.8) >\}$ is a $\mathcal{MVG}\mathcal{OS}$ in U but since $A \not\subseteq \mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A)))$, A is not a $\mathcal{MV}\alpha\mathcal{OS}$ in U .

Theorem 5.9

Every Micro Vague Semi Open Set is Micro Vague Generalized Semi Open set in the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Proof: Let A be $\mathcal{MVS}\mathcal{OS}$ in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ and let $V \subseteq A$ where V is a \mathcal{MVCS} in U . By hypothesis, $A \subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))$. This implies that $A \subseteq A \cap [\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))] = \mathcal{MV} - s - \text{int}(A)$. Therefore, $V \subseteq \mathcal{MV} - s - \text{int}(A)$, whenever $V \subseteq A$ and V is a \mathcal{MVCS} in U . Hence A is a $\mathcal{MVG}\mathcal{OS}$ in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Remark 5.10

The Converse of the above theorem need not to be true which is seen in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Then the \mathcal{MV} Set $\mathcal{K} = \{< \rho (0.1, 0.4) >, < \lambda, (0.1, 0.4) >, < \theta, (0.2, 0.3) >\}$ is a $\mathcal{MVG}\mathcal{OS}$ in U but since $A \not\subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))$, A is not a $\mathcal{MVS}\mathcal{OS}$ in U .

Theorem 5.11

If A and B are the Micro Vague Generalized Semi Open Sets in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$, then $A \cup B$ is also a Micro Vague Generalized Semi Open set in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Proof: Let A and B be the $\mathcal{MVG}\mathcal{OS}$ s in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$, then we have $V \subseteq \mathcal{MV} - s - \text{int}(A)$ and $V \subseteq \mathcal{MV} - s - \text{int}(B)$ whenever $V \subseteq A$ and $V \subseteq B$ where V is a \mathcal{MVCS} in U . Therefore, we have $V \subseteq \mathcal{MV} - s - \text{int}(A) \cup \mathcal{MV} - s - \text{int}(B)$ and $V \subseteq A \cup B$. W.K.T, $\mathcal{MV} - s - \text{int}(A \cup B) \supseteq \mathcal{MV} - s - \text{int}(A) \cup \mathcal{MV} - s - \text{int}(B) \supseteq V$. This implies that

Vargees Vahini and Trinita Pricilla

$V \subseteq \mathcal{MV} - s - \text{int}(A \cup B)$. Therefore, we get that $V \subseteq \mathcal{MV} - s - \text{int}(A \cup B)$ whenever $V \subseteq A \cup B$ and V is a \mathcal{MVCS} in U . Hence $A \cup B$ is a \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Example 5.12: Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Let $A = \{ \langle \rho, (0.2, 0.4) \rangle, \langle \lambda, (0.2, 0.4) \rangle, \langle \theta, (0.7, 0.8) \rangle \}$ and $B = \{ \langle \rho, (0.3, 0.5) \rangle, \langle \lambda, (0.1, 0.5) \rangle, \langle \theta, (0.4, 0.8) \rangle \}$ be \mathcal{MVGSOS} s in U . Then $A \cup B = \{ \langle \rho, (0.3, 0.5) \rangle, \langle \lambda, (0.2, 0.5) \rangle, \langle \theta, (0.7, 0.8) \rangle \}$ is also a \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ since $V \subseteq \mathcal{MV} - s - \text{int}(A \cup B)$ whenever $V \subseteq A \cup B$ and V is a \mathcal{MVCS} in U .

Remark 5.13

The intersection of any two Micro Vague Generalized Semi Open sets in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ need not to be a Micro Vague Generalized Semi Open set which is seen in the following example. Let us consider the Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ in the example 4.4. Let $A = \{ \langle \rho, (0.3, 0.5) \rangle, \langle \lambda, (0.3, 0.5) \rangle, \langle \theta, (0.2, 0.3) \rangle \}$ and $B = \{ \langle \rho, (0.5, 0.7) \rangle, \langle \lambda, (0.5, 0.7) \rangle, \langle \theta, (0.7, 0.8) \rangle \}$ be \mathcal{MVGSOS} s on U . Then $A \cap B = \{ \langle \rho, (0.3, 0.5) \rangle, \langle \lambda, (0.3, 0.5) \rangle, \langle \theta, (0.2, 0.3) \rangle \}$ is not a \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ since $V \not\subseteq \mathcal{MV} - s - \text{int}(A \cap B)$ whenever $V \subseteq A \cap B$ where V is a \mathcal{MVCS} in U .

Theorem 5.14

If A is a Micro Vague Generalized Semi Open Set in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ and if $\mathcal{MV} - s - \text{int}(A) \subseteq B \subseteq A$, then B is a Micro Vague Generalized Semi Open Set in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Proof: Let A be \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. Since $\mathcal{MV} - s - \text{int}(A) \subseteq B \subseteq A$, we have $A^c \subseteq B^c \subseteq (\mathcal{MV} - s - \text{int}(A))^c = \mathcal{MV} - s - \text{cl}(A^c)$. Again since, A^c is a \mathcal{MVGSOS} and by theorem 4.31, we have B^c is a \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. Hence B is a \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Theorem 5.15

A Micro Vague set A of a Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ is a Micro Vague Generalized Semi Open set if and only if $B \subseteq \mathcal{MV} - s - \text{int}(A)$ where B is a Micro Vague Closed set and $B \subseteq A$.

Proof: Assume that A is \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. Let B be a \mathcal{MVCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ such that $B \subseteq A$. Then B^c is a \mathcal{MVOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ such that $A^c \subseteq B^c$. Since A^c is a \mathcal{MVGSOS} , we have $\mathcal{MV} - s - \text{cl}(A^c) \subseteq B^c$. Hence, we have $\mathcal{MV} - s - \text{cl}(A^c) = (\mathcal{MV} - s - \text{int}(A))^c \subseteq B^c$. Therefore, $(\mathcal{MV} - s - \text{int}(A))^c \subseteq B^c$ implies that $B \subseteq \mathcal{MV} - s - \text{int}(A)$. Conversely, assume that $B \subseteq \mathcal{MV} - s - \text{int}(A)$ where B is a \mathcal{MVCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ and $B \subseteq A$. Then $(\mathcal{MV} - s - \text{int}(A))^c \subseteq B^c$ where B^c is a \mathcal{MVOS} and $\mathcal{MV} - s - \text{cl}(A^c) \subseteq B^c$. Therefore, A^c is a \mathcal{MVGSOS} . This implies that A is a \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

Theorem 5.16

A Micro Vague set A of a Micro Vague Topological Space $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ is a Micro Vague Generalized Semi Open set if and only if $B \subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))$ whenever B is a Micro Vague Closed set and $B \subseteq A$.

Proof: Assume that A is a \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. Let B be a \mathcal{MVCS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ and $B \subseteq A$. The B^c is a \mathcal{MVOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ such that $A^c \subseteq B^c$. Since A^c is a \mathcal{MVGSOS} , $\mathcal{MV} - s - \text{cl}(A^c) \subseteq B^c$. Therefore, $\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A^c)) \subseteq B^c$. Hence $(\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A)))^c \subseteq B^c$. This implies that $B \subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))$. Conversely, let A be a \mathcal{MV} set of $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$ and $B \subseteq \mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A))$ whenever B is a \mathcal{MVCS} and $B \subseteq A$. Then $A^c \subseteq B^c$ is a \mathcal{MVOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$. By hypothesis, $(\mathcal{MV} - \text{cl}(\mathcal{MV} - \text{int}(A)))^c \subseteq B^c$. Hence $\mathcal{MV} - \text{int}(\mathcal{MV} - \text{cl}(A^c)) \subseteq B^c$ implies that $\mathcal{MV} - s - \text{cl}(A^c) \subseteq B^c$. So that A^c is a \mathcal{MVGSOS} . Hence A is a \mathcal{MVGSOS} in $(\mathcal{U}, \tau_R(\mathcal{S}), \eta_R(\mathcal{S}))$.

CONCLUSION

In this paper, the new types of sets in Micro Vague Topological Spaces such as Micro Vague Generalized Closed set, Micro Vague Generalized Semi Closed (Open) set, Micro Vague Generalized Pre-Closed (Open) Set, Micro Vague Generalized α Closed (Open) Set, Micro Vague Generalized Semi-Pre-Closed (Open) set are introduced. Some of the basic theorems and characterizations are derived and investigated with the suitable numerical examples.

ABSTRACT

This study employs bibliometric and visualization approaches to map the developing research on government policies and electric vehicles (EVs), analyzing 207 papers from the Scopus database. Research trends, well-known authors, prominent countries, collaborations, top journals, and most globally cited documents were identified. While *Sustainability* and *Energy Policy* are the leading journals in EV policy research, Wang H. is recognized as the most prolific contributor. China is the leading contributor, highlighting its crucial role in developing EVs and innovative policies. A landmark study in this area, "Optimal fast charging station placing and sizing," by Barzani *et al.* (2014), has impacted discussions on EV policy frameworks and adoption. The study employs Lotka's Law to examine author productivity and Bradford's Law to verify that key research is concentrated in particular publications. Findings show that a few authors are exceptionally prolific, consistent with Bradford's Law but different from Lotka's Law. a) Electric vehicle infrastructure and technology, b) Sustainability and government policies, c) Government policy and adoption, d) Purchase intention and barriers to adoption, e) Environmental impact and transportation, and f) China's role in EV, are the six thematic clusters that emerged. The study provides researchers and policymakers with useful insights using keyword co-occurrence analysis, laying the groundwork to address issues and foster innovation in the EV ecosystem.

Keywords: Electric vehicles, Government policies, Sustainable transportation, Bibliometric analysis, Sustainability, Scientific mapping.

INTRODUCTION

In recent years, there has been a major global shift toward sustainable transportation due to the growing urgency of reducing fossil fuel dependency and mitigating climate change. Due to their widespread use, fossil fuels including coal, oil, and natural gas have seriously harmed the environment, contributing to rising emissions and global warming (Yang *et al.*, 2022). Transportation is a major source of air pollution and CO₂ emissions, particularly internal combustion engines, which account for 25% of global CO₂ emissions and 12% of India's energy-related emissions (Khurana, 2020; Ayodele, 2020). Compared to internal combustion engines, electric vehicles (EVs) offer a greener option (Tiep *et al.*, 2023), the increasing adoption of electric vehicles (EVs), which are viewed as a critical solution for lowering greenhouse gas emissions, enhancing energy efficiency, and encouraging clean energy utilization in the automotive sector, is one of the significant responses to the environmental and economic challenges (F. Wang *et al.*, 2020). Existing research indicates that promoting the use of electric vehicles needs strong regulatory support (Bas *et al.*, 2022; Begley *et al.*, 2016; Setiawan *et al.*, 2022; Qian *et al.*, 2019). The market for electric vehicles is growing, and government policies are crucial in determining how quickly and how much this shift happens. Governments all around the world have advanced the adoption of EVs through the introduction of regulatory frameworks, incentives, subsidies, and infrastructure assistance (Hardman *et al.*, 2016). The EV industry's innovation progressions and market dynamics have been significantly impacted by government interventions, specifically in infrastructure development, tax rebates, emission standards, and subsidies (W. Li *et al.*, 2019). These regulations not only motivate consumers to switch from traditional internal combustion engine vehicles to electric alternatives, but they also support research and development in the automotive sector to create more affordable and efficient EV technologies (Sierzchula *et al.*, 2014). Automakers have expanded their spending in the development and production of electric vehicles, while businesses have modified their business models to take advantage of government-backed incentives and keep up with changing rules (Paul *et al.*, 2015).

In recent years, the academic literature studying the confluence between government policy and the electric vehicle market has increased dramatically. Researchers have investigated several facets of this connection, such as the role of public-private partnerships, the efficacy of various policy instruments, and the difficulties in developing a strong charging infrastructure (W. Li *et al.*, 2017; Liao *et al.*, 2017). Despite this, a thorough bibliometric analysis is still required to map out the terrain of previously published works and illustrate the conceptual framework of this field of study. The term "Bibliometrics" was created by Pritchard in 1969 as a replacement for the less widely used and more ambiguous word "statistical bibliography" (Groos & Pritchard, 1969; Hood & Wilson, 2001). Increased accessibility to tools, databases, and software, as well as the expansion of bibliometric analysis applications beyond information science, like business research, are the two main factors driving the popularity of bibliometric analysis (Donthu *et al.*, 2021). Bibliometric analysis is a quantitative technique that examines co-authorship networks, keyword trends, and citation patterns in the academic literature (Aria & Cuccurullo, 2017). This method reveals new trends, patterns of collaboration, and knowledge gaps in addition to highlighting the most significant papers and researchers on the subject. We can map the research structure on government policies and electric vehicles by combining bibliometric analysis with visualization techniques. This allows us to get important insights into the evolution of this quickly evolving field. The purpose of this work is to perform a thorough bibliometric and graphical analysis of the scholarly literature on the laws about electric vehicle policy. The goal of this study is to present a comprehensive overview of the current state of the field, identify notable research clusters, and provide options for future research by analyzing key themes, influential authors, and citation networks. We hope that our analysis will advance knowledge of how government actions affect the market for electric vehicles and advance environmentally friendly transportation. In this study, the following research questions (RQs) are investigated:

RQ1: What are the annual publication trends in government policies and electric vehicles in the concerned areas?

RQ2: Who are the most productive participants (journals, authors, and countries) in the field?

RQ3: What are the most prominent publications in the field?

RQ4: Do the findings align with Lotka and Bradford's bibliometric laws?

RQ5: What possible avenues for further study exist in the field of government policies and electric vehicles?

RESEARCH METHODOLOGY

A review study's objectives are to define the present level of knowledge in a particular field of study, pinpoint knowledge gaps, and compile the results of earlier investigations. Numerous forms of literature reviews are available, such as thematic-based reviews, descriptive reviews (Batra *et al.*, 2022), systematic evaluations (Khatib, 2021), and bibliometric reviews developed by Pritchard in 1969 (Groos & Pritchard, 1969). Through the quantitative analysis of content, bibliometric evaluations improve objectivity by examining massive data sets to identify patterns and areas for future research (Donthu *et al.*, 2021; Joshipura & Wats, 2023). This method reduces subjectivity and aids in identifying the most significant contributions made by scholars (Zupic, 2015). The research integrates two bibliometric techniques: performance analysis, which assesses several aspects of publications and citations to provide information about productivity and impact, and scientific mapping, which visualizes the research landscape by graphically representing the field's dynamics and structure (Gao *et al.*, 2021). Bibliometric laws, such as Lotka's law and Bradford's law, are applied in the study to ascertain the core group of journals and the authors' scientific production in this field of research. The study uses the R Bibliometrix (Aria & Cuccurullo, 2017) and Vosviewer (V. Eck & Rousseau, 2014) for analysis. R is useful for bibliometric research because of its many integrated packages and regular updates (Forliano *et al.*, 2021). VOS viewer is a program known for its extensive analysis and visualization capabilities; it specializes in the graphical display of bibliometric maps, including density, co-occurrence, and trend analysis (N. J. van Eck & Waltman, 2010; Ullah *et al.*, 2023). Figure 1 presents the structure of the data used in the study.

Database, search strategy, and screening procedure

Scopus and Web of Science are two well-known databases but Scopus is used in this study because it is the largest repository of peer-reviewed literature, is more comprehensive, and has a greater number of journals, in comparison to the Web of Science database (Bhat & Qureshi, 2023; López-Illescas *et al.*, 2008; Farooq, 2024; Aghaei Chadegani *et al.*, 2013; Kumar *et al.*, 2024; Maral, 2024; Zainuddin & Lui, 2022). Moreover, the Scopus database has been used by numerous researchers in social science (Saini, 2023; Gora *et al.*, 2024; Dhingra & Batra, 2024; V. Kumar *et al.*, 2021; Donthu *et al.*, 2020) to conduct review studies. The search was conducted on October 07, 2024, for extraction of data from the Scopus database, for the period 2010-2024. Firstly, the search string used in the study for extraction of data was: ("Government policies" OR "Governmental strategies" OR "Regulatory policies" OR "Governing principles" OR "Legislative measures") AND ("Electric vehicles" OR "Electric cars" OR "Electric mobility" OR "Electric automobile" OR "Electric transport" OR "Green vehicles" OR "Eco-friendly vehicles"). It resulted in 428 documents. Additionally, to minimize non-significant articles and to ensure constant data cleanliness, criteria for inclusion and exclusion were incorporated into our search results. The next inclusion criterion is the period for which the study is conducted. The analysis took into consideration data from 2010 to 2024. It resulted in 413 documents. The next inclusion criteria belong to the subject area and included the subjects, "Business and Management," "Economics," "Social Sciences," and "Environmental Sciences." It results in 231 documents. Further refinement was done based on document type. Journal articles, conference papers, and review articles were chosen for inclusion in the study. However, books, book chapters, and review articles were not included since they are not considered primary sources. The language is connected to the additional inclusion requirements. The study selected all documents written exclusively in English. Articles written in any other language were excluded. It resulted in 213 articles. After analyzing the full text of each article, 06 articles were removed which are considered less relevant to the study. It resulted, in a total of 207 articles, which were further analyzed to derive the conclusion. The data file was downloaded in the csv. File format from the Scopus database. The file was then exported to R-Studio biblioshiny and VOS viewer for analysis.

ANALYSIS AND RESULTS

Overview of Data and Publication Trend

Table 1 provides the summary of the 207 articles collected from the Scopus database from 2011 to 2024 (till October). The data was originated from 115 sources and consists of 654 authors. The average number of citations per document

was 25.87 and the number of documents increasing yearly with a growth rate of 15.49%. Figure 2 depicts the publication trend of articles concerning government policies and electric vehicles. Initially, the figure shows a fluctuating trend with six articles published in 2011 and then the trend goes downward. The rise in publication on this topic started in 2015 and shows a remarkable increase with 38 articles in 2022. Then, till October 2024, 39 articles were published on this topic. This growing trend depicts that government policies about electric vehicles are likely to remain a key area of study because of their crucial role in influencing the direction of sustainable transportation.

Analysis of Authorship

The information regarding the top 10 most productive authors in government policies and electric vehicles research, from the point of view of publications and citations, is given in Table 2. Out of the 654, the top 10 productive authors were chosen by taking into account those who had at least two publications. Wang H and Li J have lead in publications with 6 and 5 articles respectively. Moreover, Hao H, Li L, Li Y, Liu Y, Wang Y, and Zhou Y have authored 4 articles each. The remaining two, i.e., Harichandan S and Kar SK have published 3 articles each. Among all authors, Hao H has lead with 521 citations. Among others, three authors namely, Wang H, Li J, and Zhou Y have more than 200 citations, i.e., 356, 233, and 227 citations respectively. This data illustrates the expanding interest in this topic. These authors have actively published research over the past fourteen years, exhibiting a substantial dedication and contribution of authors.

Country Analysis

Table 3 shows the top 10 most productive countries based on publications and citations. The criteria for inclusion are a minimum of five publications of each country. This results in 24 countries out of the total of 41 countries. Among the 24 countries, the top 10 countries are depicted in table 3. It describes how China emerged as the top country in the world for publications and citations. China has the highest number of published articles, i.e., 211, and received the most remarkable citations, i.e., 2173. India, the United States, and Indonesia came next with 105, 63, and 47 publications, respectively, and 337, 251 and 78 citations, respectively. Notably, the UK and Australia have received 207 and 192 citations respectively despite publishing fewer papers i.e., 24 and 30 respectively, indicating the prominence of these countries in the field of GP and EV research. It can be observed from the table that the countries actively involved in research related to government policies and electric vehicles are fairly represented by the developing and developed nations. The number of publications by each country suggests that worldwide, both developing and developed nations are actively participating in the field. This indicates a global interest and commitment to exploring the crucial link of these topics.

Source Analysis

Based on the criteria of having at least three papers with a minimum of three citations, Table 4 illustrates the top 10 most prominent journals. This results in 14 out of a total of 115 journals. Based on the observation of the table, the journal "Sustainability" has the highest number of publications i.e., 22, and received 378 citations. The journal "Energy Policy" has received a remarkable 1,025 citations despite publishing fewer i.e., 15 papers. When the number of citations per publication is taken into account, "Journal of Cleaner Production," "Applied Energy" and "Sustainability," rank second, third, and fourth respectively, demonstrating their value and prominence in this area. Additionally, when several publications are taken into account, then "Energy Policy," "Journal of Cleaner Production," and "Transportation Research Part A: Policy and Practice" take the second, third, and fourth position respectively. These outcomes provide insight into the top journals in GP and EV research.

Document Analysis

Applying the criterion of at least 35 citations per article, Table 5 displays the top 10 most notable publications based on the number of citations received. It resulted in 45 out of a total of 207 articles. Based on the table's observations, Barzani *et al.* (2014) have the highest citation count, to taling 429. This study explored the role of government regulations in the growth and prosperity of EV infrastructure, especially when it comes to the construction of fast charging stations. It emphasizes how crucial public sector support is in lowering development costs and promoting private sector participation. Meanwhile, the articles of Sang *et al.* (2015) and Zhang *et al.* (2011) take the second and

**Simran Sehgal and Divya Malhan**

third positions with more than 200 citations, i.e., 254 and 214 citations respectively. Sang et al. (2015) highlight the pivotal role of government policies in encouraging electric vehicles (EVs) in Malaysia as a means of lowering carbon emissions and the country's dependency on fossil fuels. The study of Zhang et al. (2011) sheds light on the significance of the government's long-term plans and encouraging laws to address environmental issues and propel the expansion of the EV market in China.

Bradford's Law

Bradford's law assessed the distribution of articles by journals and identified the key sources for a particular topic (Geophysics, 1985). Accordingly, journals can be categorized into three zones, with one-third of all papers found in each zone (Bhayani, 2024; Tepe et al., 2022). The Core zone, Zones 1 and 2, have almost the same number (i.e., one-third) of articles (Singh et al., 2016). However, as we move from the core zone to Zone 1, the number of journals rises, indicating that a small number of journals are considered "core zone journals" and act as the drivers of any given area. This law states that a limited number of sources, which represents the "core sources" driving the topic, producing the initial one-third of articles. Zone I comprises more sources for the next one-third of the articles, while Zone III displays the final one-third of articles and the greatest number of sources. As shown in Figure 3, the main sources of publications on government policies and electric vehicle research are "Sustainability (Switzerland)", "Energy Policy", "Journal of Cleaner Production", "Transportation Research Part A", "Applied Energy", "Energy" and "E3S web of conferences". Additionally, 207 articles were published in 115 journals, according to the data in Table 6. The initial set of 7 prestigious journals published 69 articles, considered core journals on the topic; 70 articles were published by the second group of 40 journals, which exist in Zone 1; 68 articles were published by the next group of 68 journals, which lies in Zone 2. According to these results, about one-third of research papers belong to each group, and as one moves from one zone to the next, the number of journals rises. The findings in this section support the claim that research on GP and EVs is consistent with Bradford's law principles (Tepe et al., 2022).

Lotka's Law

The distribution of articles written in a specific field of study is described by Lotka's law (Lotka, 1926), a bibliometric law used in this study. According to this law, 60% of authors in a certain field of study have only one publication, 15% have two, and 6.6% have three (Tepe et al., 2022; Wang & Guo, 2022). Table 7 shows the percentage of authors based on the number of publications. The data revealed that out of the total, 88.5% of authors have produced only one article which is far away from the required percentage of 60% according to Lotka's law. 8.7% of authors have written two articles, which is quite less than the benchmark of 15% and 1.5% have written three articles, which also falls short of the benchmark of 6.6%, as per the law. Figure 4 shows the difference between Lotka's distribution and the observed distribution. The dashed line in the figure shows the theoretical distribution according to Lotka's law, whereas the solid line reflects the actual observed data. The sharp drop-off around the starting point of the graph shows that a large percentage of authors contribute only one or two articles, while a far smaller percentage of authors contribute more than two publications. As per the results, the research output of authors in GP and EVs deviates from Lotka's law.

Three-field plot

Sankey diagrams, sometimes referred to as three-field plots, are used to show relationships between three fields and complex flow situations (Riehmman et al., 2005; Georgescu & Chirit, 2024). The relationships between countries (left), authors (middle), and keywords (right) are presented in detail in Figure 5, which is based on the well-known Sankey diagram. Each box's length in the figure indicates the overall frequency of links with other boxes. The figure shows the most popular terms in this topic, the authors' contributions, and their global collaborations. The total frequency of connections to other boxes is reflected in the length of each box. The results show that China represents sixteen of the top twenty authors (Wang H., Li J., Wang Y., Hao H., Li L., Zhou Y., Ouyang M., Zhang J., Liu D., Wang J., Li Y., Liu F., Liu Y., Pan H., Li S., Qian L.). This outcome is related to the findings of Table 3 which represents that China is dominating in publications about GP and EVs. The USA represents nine authors. Additionally, the USA, Turkey, and Malaysia represent a considerable number of authors. These authors are experts in their respective areas including

"electric vehicles", "government policy", "new energy vehicles", and "sustainable development". These terms are extremely popular in the study's literature.

Country Collaboration Analysis

Country collaboration is a popular bibliometric method for examining a country's social structure and collaboration tendencies among nations (Ghura *et al.*, 2022). It serves as an example of the intellectual networks that propel scientific progress and improve the quality of research (Joshipura & Wats, 2023; Khatib *et al.*, 2023). Figure 6 shows the collaboration map of nations in the GP and EVs domain. The grey color denotes no publications and the light blue to dark blue spectrum shows an increasing number of published papers. The network of international cooperation is indicated by the red lines. As evident from Table 8, the strongest connection is found between the USA and China, as thirteen papers have been co-authored by authors from these two nations. China has a significant network of collaboration with most countries including Hong Kong and the United Kingdom, with authors of these countries have co-authored four papers. As depicted by red lines in the figure, other countries are also involved in the collaboration network including Korea, France, Singapore, India, Thailand, Japan, and the UK.

Keyword analysis

An essential scientific technique for finding links between different study areas and assisting in the discovery of new research trends is the keyword co-occurrence network (Q. Wang, 2018; Saha *et al.*, 2020; Ülker *et al.*, 2023). Figure 7 shows a graphical representation of the network that illustrates the frequency of keyword co-occurrence. Using the criterion of minimum 4 occurrences of author keywords, 22 out of 706 author keywords met the threshold. The final network, which is seen in Figure 7, has 22 nodes that have been arranged into six different clusters based on VOS viewer analysis. The fundamental study themes that these six clusters represent are –(a) "Electric Vehicle Infrastructure and Technology", (b) "Sustainability and Government Policies", (c) "Government Policy and Adoption", (d) "Purchase Intention and Barriers to Adoption", (e) "Environmental Impact and Transportation" and (f) "China's Role in EV Development".

Cluster 1: Electric Vehicle Infrastructure and Technology

In the keyword network, this cluster is related to six keywords, 'battery electric vehicle', 'charging infrastructure', 'electric vehicle', 'policy', 'sustainable transportation', and 'system dynamics'. Several research on this cluster concentrated on the significance of electric vehicle technology, especially about government regulations and electric vehicles (IEA, 2021; International & Agency, 2023; Paul Sathiyar *et al.*, 2022; Shafiei *et al.*, 2017).

Cluster 2: Sustainability and Government Policies

This cluster, which focuses on the relationship between government policies and electric vehicles, is the most noticeable and consists of the four keywords "circular economy," "electric vehicles," "government policies," and "sustainability." A careful examination of the related literature showed that the complex relationship between these components has received a lot of attention from academics (H. Li & Li, 2021; Basu, 2023; Leydesdorff & Zawdie, 2010).

Cluster 3: Government Policy and Adoption.

The cluster encompassed the three keywords related to 'adoption', 'attitude', and 'barriers' focused on government policies and electric vehicle adoption. Various studies related to this cluster revealed that regulatory initiatives including the transportation policies such as parking incentives, fuel tax, and subsidies, play a crucial role in increasing market penetration for electric vehicles (Abas & Tan, 2024; Zaino *et al.*, 2024; Javadnejad *et al.*, 2024; Munachi Chikodili Ugwu & Adefolake Olachi Adewusi, 2024).

Cluster 4: Purchase Intention and Barriers to Adoption.

This cluster encompassed the three keywords, 'China', 'new energy vehicle', and 'purchase intention' which are related to the purchase intention of customers and the barriers involved in the adoption of electric vehicles. The studies suggest several factors including consumer attitudes, environmental concerns, risk perception of consumers, and attitude towards innovation, influence the purchase intention of consumers, and the barriers to EV adoption

**Simran Sehgal and Divya Malhan**

include price, charging issues, and range anxiety (Zaino *et al.*, 2024; Ikram, 2022; Lashari *et al.*, 2021; Dutta & Hwang, 2021; Change *et al.*, 2024).

Cluster 5: Environmental Impact and Transportation.

In the keyword network, this cluster consists of three keywords, 'environment', 'government policy', and 'transportation'. This cluster emphasizes the environmental impact of electric vehicles in the wider context of transportation. International transportation regulations support electric vehicle adoption and are viewed as an essential strategy for attaining environmental sustainability. Lee *et al.* (2020) explored the effect of electric vehicle adoption on urban air quality (Timmers & Achten, 2018) and discussed the significance of clean energy sources in maximizing the positive environmental impact (R. R. Kumar & Alok, 2020).

Cluster 6: China's Role in EV Development.

This cluster consists of three keywords, 'discrete choice model', 'sustainable development', and 'transportation policy'. Several research studies in this field focused on China's manufacturing capabilities, market dynamics, government policies, its position as a worldwide leader in the EV sector, and its role in EV development (Zhang *et al.*, 2017; F. P. Wang *et al.*, 2017; W. Li *et al.*, 2019).

Thematic evolution

While investigating the connection between GP and EVs, R Studio's Biblioshiny was utilized in addition to VOSviewer to examine the commonly used keywords at different phases of study progress. Figure 8 illustrates the thematic evolution, created using Biblioshiny's "author keywords" and offers insights into the changing conceptual framework of GP and EV research from 2011 to 2024. To illustrate how significant and essential themes emerged, a three-field plot (Figure 8) was created. To highlight the constant development of research themes in this area, this analysis highlights the relationships and shifts between themes over three different periods: 2011–2012, 2013–2020, and 2021–2024. 2011–2012: In this period, two primary research themes emerged: "Fuel consumption" and "Electric vehicles." These themes centred around initial discussions regarding energy usage and the growing prominence of electric vehicles (EVs). From 2013 to 2020, electric vehicles emerged as a significant theme, encompassing several subthemes such as: "Electric vehicles," "Automobile manufacturing," "Charging stations," "Electric utilities," and "Battery electric vehicles." This period marks a more detailed exploration of EV-related infrastructure (e.g., charging stations), industry involvement (automobile manufacturing), and technology improvements (battery electric vehicles). 2021–2024: In this recent timeframe, the research landscape broadened to include the themes related to GP and EVs. The themes that emerged in this period are: "Electric vehicles", "Mobility", "Industry policies", "Automotive industry", "Technology adoption", "Charging infrastructure", "Emission reduction", "Sustainability", "Public policies" and "Government policies". The studies produced within this time frame highlight the importance of sustainability, mobility, and public policies, indicating a move toward more significant policy issues and societal impacts. Additionally, the implementation of emission-reducing technology and techniques is being prioritized, indicating the growing significance of policy-driven approaches in the EV industry and sustainable transportation.

DISCUSSION AND CONCLUSION

The results of this bibliometric and visual study offer a thorough mapping of the academic literature on EVs and government policy, emphasizing several noteworthy patterns and trends. The study of governmental regulations and electric vehicles has seen a sharp increase in interest in recent years. The dramatic increase in publications on this subject over the past ten years demonstrates how the urgent need to fight climate change and lessen reliance on fossil fuels has led to an increasing global interest in electric mobility. This bibliometric analysis aimed to provide a clear overview of the repository's structure and the significant conceptual literature on GP and EVs. The evolution of the FI and SD domain from 2011 to 2024 is highlighted in this study by analyzing 207 documents indexed in Scopus using VOS viewer and the R bibliometric tool. In response to RQ1, the study analyzed the annual publication trend in the field of GP and EVs in the subject area of "Business and Management", "Economics", "Social Sciences" and

**Simran Sehgal and Divya Malhan**

"Environmental Science". 207 Scopus-indexed publications from 2011 to 2024 were included in the data set. The analysis revealed that the publications in the field started increasing in 2015 and there was a sharp upswing in publications in 2022. Although some publications declined in 2023, they started rising continuously and the publications of 2024 till October are more than the publications of 2023. This rise in study is a reflection of how EVs are becoming more and more important on national and worldwide policy agendas due to infrastructure development, government incentives, and EV technical breakthroughs. It shows increased scholarly interest in assessing how well policies encourage the adoption of EVs. In response to RQ2 regarding the prominent journals, authors, and countries, it was found that the "Sustainability" journal is the most notable in the number of publications, and the "Energy Policy" journal is the most prominent in terms of citations received. The process of identification of notable authors is a crucial component in understanding the structure of a topic. Through authorship analysis, it was found that Wang H. and Li J. emerged as prominent contributors while Hao H. received the highest citations, highlighting their significant contributions to the field of GP and EVs research. It was observed through the study that China produced the most scholarly work, followed by India and Nigeria, reflecting the cooperative research initiatives. In response to RQ3, it was found that the most cited work was "Optimal fast charging station placing and sizing" by Barzani *et al.* (2014). This study explored the significance of government regulations to the growth and prosperity of EV infrastructure. It emphasizes how crucial public sector support is in lowering development costs and promoting private sector participation. To address RQ4, the study employed bibliometric laws and compared the results with Bradford's and Lotka's laws. The results supported Bradford's law but showed a discrepancy with Lotka's law.

According to the country collaboration analysis, China and the USA have co-authored thirteen documents, which were the maximum of the two countries in the GP and EV literature. Subsequently, keyword analysis provided information about the current state of research and suggested possible directions for further investigation in this specific area of study. Subsequently, six thematic clusters were identified through this analysis: "Electric Vehicle Infrastructure and Technology", "Sustainability and Government Policies", "Government Policy and Adoption", "Purchase Intention and Barriers to Adoption", "Environmental Impact and Transportation", "China's Role in EV development". Thematic clusters identified through keyword analysis provide a guide for further research in this area. Furthermore, we looked at the thematic evolution, aiding in addressing the last research question (RQ5). It was investigated over three different periods: 2011-2012, 2013-2020 and 2021-2024. Between 2011 and 2012, fuel consumption and electric vehicles were the primary topics of discussion, indicating that interest was divided between traditional fuel issues and the emerging electric vehicle (EV) market. From 2013 to 2020, the electric vehicle theme was becoming more and more popular at this time, and new topics including car manufacturing, charging stations, and battery electric vehicles are also starting to emerge. This is a reflection of the industry's increasing emphasis on building up EV production and infrastructure. In the latest period from 2021 to 2024, while electric vehicles remain a primary emphasis, new topics such as mobility, technological adoption, the automotive industry, highway policies, and sustainability also surface in the most recent era. This points to a more comprehensive strategy in which the emphasis has shifted from the manufacture of vehicles to more comprehensive regulatory, technological, and sustainability considerations about the EV ecosystem. This study has certain limitations even if it provides insightful information. It focuses solely on publications that are indexed in Scopus. Other widely used databases such as WOS (Zhu and Liu, 2020; Li *et al.*, 2018) and PubMed, frequently used for bibliometric analysis and research evaluation, were not used in the study, they could be included in future studies. Second, the study only addresses bibliometric analysis. Future research should examine several methods of systematic literature reviews (SLRs), such as reviews that are driven by theory, methodology, or meta-analysis (Bilal *et al.*, 2018), even if the review procedure provided by bibliometric analysis is transparent, quantitative, and reproducible. Despite the small sample of papers in this study, its findings and implications offer an initial point for further research.

Study Implications

Theoretical implications

With its strong theoretical foundation, the current bibliometric analysis on government policies (GP) and electric vehicles (EVs) research provides insightful information. Through this study, future researchers can find important

**Simran Sehgal and Divya Malhan**

themes, as given in Table 9 that will improve the discussion around GP and EVs by examining a range of factors, including top authors, nations, and the most cited documents. This study tracks the growth of this topic from 2011 to 2024 and offers thorough coverage of work that looks at the connection between GP and EVs. The study's thematic evolution analysis also helps scholars discover subjects that have been thoroughly examined and those that need more research. The study notably identifies China, India, and the USA as the key contributors, with China and the USA collaborating on important projects. This illustrates how research results and collaborations are increasing in emerging economies. It also raises the possibility of doing cross-national comparative research in the future.

Practical implications

The study emphasizes key areas to deliver actionable insights. Policymakers can address obstacles to EV adoption, such as charging infrastructure and consumer attitudes, by concentrating on improving EV infrastructure and technology through tailored regulations and incentives. Sustainability in EV production and use can be encouraged by incorporating circular economy ideas into governmental regulations. Regarding market strategy, international cooperation, policy innovation, and cross-border cooperation, other countries can learn a lot from China's dominant position in the EV sector. These insights can help to shape future regulations, enhance consumer acceptance, and mitigate environmental effects for researchers and industry stakeholders. Additionally, the study offers potential avenues for future research, as shown in Table 6, based on a thorough examination of keyword analysis.

Conflict of Interest

The authors declare no conflict of interest. The writing and content of this article is the sole responsibility of authors.

Table.9: Prospects for future research

Cluster	Themes	Future Research Directions
1.	Electric vehicle infrastructure and technology	Future studies can examine how government regulations support sustainable transportation systems, battery design developments, and charging options. Research might focus on improving the infrastructure for charging EVs and assessing the long-term effects of government actions (such as incentives and rules) on EV uptake and infrastructure growth.
2.	Sustainability and government policies	Future studies could focus on how integrating circular economy concepts into government regulations can foster the sustainable growth of the electric vehicle (EV) industry. Researchers might investigate the effectiveness of current regulations in minimizing environmental impacts and promoting sustainability throughout the manufacturing, use, and recycling of EVs. Additionally, they could explore ways to enhance regulatory frameworks to better support long-term sustainability in this sector.
3.	Government policy and adoption	Future research could examine the specific barriers, such as cost, charging issues, and infrastructure, that hinder EV adoption. It could also explore how government programs, including subsidies, parking incentives, and fuel tax reductions, can effectively address these barriers. Researchers might also determine the best ways to promote the broad adoption of EVs and evaluate how market

Simran Sehgal and Divya Malhan

		incentives and consumer attitudes change due to policy changes.
4.	Purchase intention and barriers to adoption	Future studies should look into the socioeconomic and psychological aspects of EV dependability perceptions, range anxiety, and charging station accessibility that affect consumers' decisions to purchase. Research might look into ways to lessen these obstacles, particularly in important markets like China, which is crucial to the development of EVs worldwide. Research on the effects of shifting consumer preferences on EV adoption can also be quite fruitful.
5.	Environmental impact and transportation	Future research might evaluate the wider environmental advantages of EVs, like lower carbon emissions and better air quality. Researchers may also look into ways that transportation policies, that support renewable energy sources, can improve EVs' environmental advantages. Furthermore, there is a lot of potential for further research into how international rules affect the uptake of EVs and how they contribute to the achievement of global environmental sustainability goals.
6.	China's role in EV development	Future studies may examine China's dominance in the global electric vehicle (EV) industry by exploring its manufacturing capabilities, market dynamics, and policy strategies. Researchers could investigate how China's policies have impacted EV trends worldwide and what lessons other nations can learn from them. Chinese transportation policy changes and their effects on global sustainability and EV innovation could likewise be the subject of studies.

ABSTRACT

Financing for agriculture is essential to the sector's growth. In order to sustain the expansion of the agricultural industry, agricultural finance is essential. To improve loan availability and effective utilization, India's rural credit sector has experienced substantial structural modifications. In fact, it is necessary for the production of jobs, food security, and general economic progress. Targets for eradicating hunger, poverty, and inequality must include agriculture and the other value-added agribusinesses and services it provides. Due to the nature of the sector and the amount of private capital available, it has proven to be very challenging to meet the substantial demand for farming investment capital and to provide feasible financial services to rural communities and agriculture, despite numerous efforts by both the private and public sectors. Financial services and formal market systems are inaccessible to a large number of rural families and demographic divisions. These are mostly smallholder farmers. Government policies, on-farm initiatives, and the connections and trade-offs between various hazards must all be considered in an efficient and successful policy approach to managing risks in agriculture. The invention of strategies and goods that can support agricultural financing is made possible by advancements with regard to technology and the organization of agricultural markets. The method of the study is based on the secondary data analysis and evaluation provided by the government of India financial sector lending to agricultural. The objective is to evaluate the existing agricultural financing innovations and to develop the working model for enhancing higher saving, better investments and higher borrowing capacity among small and marginal farmers.

Keywords: Agricultural Finance, Farming Investment, Rural Communities, Sustainable Demand, Financial Services.

**Ananth Kumar and Muralidhar**

INTRODUCTION

Similar to other inputs used in agricultural production, finance plays a crucial role in agriculture. A farmer may only buy and employ technical inputs if he has the necessary funding. However, he always requires outside financing or credit because his personal income is insufficient. Until 1935, the sole source of finance available to farmers was from professional money lenders. When they gave out loans and collected them, they used to apply severe methods and demand unreasonably high interest rates. Farmers were thus severely indebted, and a lot of them continued to be indebted. The RBI of India Act 1934, the District Central Cooperative Banks Act, and the Land Developing Banks Act were passed; as a result, agricultural finance improved and gained momentum. A strong alternative organization was established. Large-scale credit became accessible on easy conditions and with fair interest rates for both loan issuance and repayment. Even while co-operative societies began lending money for agricultural purposes in the 1930s, the industry was not truly taken off until after independence, when appropriate laws and regulations were created. After then, bank lending to agriculture advanced astronomically as a result of branches being opened in rural regions and deposits being drawn in. Price volatility has always existed in the agricultural sector; in fact, price fluctuations for inputs and products are typically more pronounced there than in other industries. Because the industry depends on resources from the earth and climate conditions, risks related to weather fluctuation, natural hazards, pests, and illnesses are especially dangerous.

REVIEW OF LITERATURE

(Teye, E. S., & Quarshie 2021) Mistrust in a failed market leads to institutional behaviour like high interest rates, bureaucratic procedures, loan delays, collateral requests, and large savings deposits, influencing farmers' adoption of enhanced production technology. (Ray 2019) The availability of credit and the number of debt-ridden families have grown significantly, but there's concern due to the sudden rise in outstanding debt and a steady decline in financial institution credit since liberalization. (Vijaykumar et al. 2016) The Kisan Credit Card is a ground-breaking credit delivery tool that provides farmers with quick, flexible funding through a single application process, aiming to provide hassle-free loans for all farmers. (Jainuddin, Hiremath, and Patil 2016) The report indicates a rising national loan disbursement, but a credit disparity exists at the local level and among farmers, particularly for banana and cotton crops, despite increased availability and demand of credit at both financial institutions and farmer groups. (Kumar et al. 2015) The study reveals that various institutional, legislative, and socioeconomic factors significantly impact rural families' access to institutional credit. Factors such as asset ownership, gender, caste affiliation, and education significantly influence these households' ability to obtain loans, resulting in improved incomes. (DR.S.GANDHIMATH and G.Mookambigai 2012) The informal lending sector primarily benefits small farmers, but marginal farmers struggle to obtain sufficient financing in the unofficial credit market, influenced by various interrelated credit contracts. (Kumar 2012) Those who can make a good profit on lending and who are prepared to loan at market rates of interest are considered viable borrowers, minimize rates of lending and deposits to boost the viability of the loan supply, while scale and range economics can minimize transaction costs, implying that raising business volume might make funding available even at lower rates. (M.Govindan 2011) To enhance PACCS's ability to generate revenue, farmers must be granted access to allied and pacific loans.

Objective of the Study

With reference to the performance of agricultural finance in India and its directions towards the improvement in financing the agricultural activities, government has taken many initiatives for the focal development in reachable financial models,

1. To evaluated the policy innovation in agricultural finance for the improvement in the agricultural activities.
2. To analyse and develop the model for enhancement in the agricultural income and savings.

**Ananth Kumar and Muralidhar****Need and Scope of the Study**

With the introduction of capital-intensive agricultural technology, agriculture finance has grown in importance. To increase the productivities of different farm resources, farmers need cash. Low and unpredictable profits are a defining feature of Indian agriculture in general. Both the growth of the agriculture sector and the economy overall depend on credit.

MATERIALS AND METHODOLOGY

The comprehensive implementation and thorough application of the procedure mapping, as well as gathered secondary data published by the Indian government, Ministry of Agriculture and Farmers Welfare, Indian Institute of Management Ahmedabad (IIMA), NABARD, and the Centre for Management in Agriculture for a five-year period between 2018 and 2023, with an eye toward the direction and advancement of science.

RESULTS/ANALYSIS

The development of strategies and goods that can support agricultural financing is made possible by advancements with regard to technology and the organization of agricultural markets. 163.797 million hectares were farmed by 88.883 million agricultural families in India. Floods, droughts, famines, and other natural disasters frequently wreak havoc on farmers' financial situation. Therefore, the type and availability of financing determines whether agricultural production or farm upgrades continue. An evaluation of the following factors is necessary for sustainable agricultural finance: a) risks; b) expenses and distribution channels; c) bankable possibilities; and d) the appropriate product to the right people. Individual farmers can get financing for agricultural innovations through Self Help organizations (SHGs) or Joint Liability Groups (JLGs), which are organizations of individual farmers, as long as banks keep aggregate statistics on this type of financing for agriculture and related activities. Short-term loans for agricultural purposes, sometimes known as crop loans. Horticulture and both conventional and non-traditional plantations will be included. payments up to 10 lakhs made in exchange for the pledge or hypothecation of agricultural products, including warehouse receipts, for a maximum of 12 months, regardless of whether the farmers received crop loans to cultivate the crops. short-term loans provided through partnerships with agri-exporters, sugar mills, and agro-processing facilities. Term loans and working capital are used to finance the investments and working capital needed for agriculture and related industries.

loans to marginal and small-scale farmers so they can buy land for farming. loans to struggling farmers that owe non-institutional lenders money, secured by suitable collateral or collective security. Loans made for pre- and post-harvest tasks carried out by households, groups, or cooperatives of households, including weeding, spraying, harvesting, grading, sorting, processing, and transportation. Funding to maintain a total land development sum of twenty lakh rupees for each borrower. As of December 2022, 3.89 core farmers who were eligible had received Kisan Credit Cards, with a KCC maximum of 4,51,672 core. Over 1.0 lakh (as of October 17, 2022) KCCs were officially authorized for the fisheries sector, and 9.5 lakh (as of November 4, 2022) for the farm animal husbandry sector, after the Government of India's extension of the KCC facility to farmers involved in fishery and animal husbandry in 2018–19. Subsidy-linked loan programs are promoted by the Indian government and provincial governments in an effort to widen agriculture and guarantee small farmers' economic stability. Insurance for crops focuses on confronting issues, agriculture product demand evaluation, technology propelling innovation, plus financing for women is vital in the agriculture industry. Value chain finance is most pertinent to handle these issues. In addition, it's critical to evaluate the difficulties and failures, as well as their underlying causes and appropriate solutions. Scale is a second problem. Using new financial technology and innovations, smallholders, small agro-enterprises, and off-farm rural microenterprises have been successfully reached on several occasions. Nonetheless, a significant constraint impacting several inventive instruments and innovations is the issue of magnitude. Numerous of them are still at the piloting stage or are highly confined, according to the report. A few of the more well-known examples have benefited greatly from donor organizations, but they haven't truly stood through the test for a while or been

**Ananth Kumar and Muralidhar**

financially self-sufficient. The use of security in conjunction with finance, the value chain strategy for agriculture, and the increasing adoption of mobile apps for small and small families are a few examples. Furthermore, women in farming and product development generally are supported by the expanding acknowledgment of the need of "knowing your client," as well as by improvements in impact evaluations and other related, more comprehensive courses and methods. The study findings and developments in those areas, together with the driving forces of innovation in financing for agriculture and demand, are presented in the next five parts, such as (a) Technical support for farmers and cooperatives resulted in innovations, (2) Institutional reforms that prioritized certain areas of interest, (3) Insurance for crops, (4) Guarantee small farmers' economic stability, and (5) financial technology and innovations.

Modular cycle to enhance higher standards in agricultural sector through injecting credit

Larger-scale plans won't spade the interest of bankers and investors until solid facts and research are available to show how to proceed in order to achieve growth and a successful business model. Until there is compelling data to direct the path ahead for attaining effect with regard to area and target populations, lawmakers will not extend their assistance. Nonetheless, a lot of the novel techniques or ideas have already gained traction. A gap exists between the study's findings and offering structure within the agricultural sector, indicating that while increasing business volume may make funding available and create revenue, growers must be provided the opportunity for allied and Pacific loans. Farmers primarily benefit from this gap, but they battle to obtain enough funding to ensure the sustainability of the loan supply. A theoretical workable model has been developed to ensure higher borrowing capacity in the initial stages with multilevel borrowing for specific innovative and modern agricultural technology only. This can be provided only after educating the need-based farmers concentrating small, medium and marginal farmers.

DISCUSSION

Modular cycle to enhance higher standards in agricultural sector through injecting credit provides for High borrowing for innovative agri-technology leads to higher returns, higher savings, investment in land development and machinery, and high self-suitability, ensuring high borrowing capacity. One of them is the nation's economy's promotion of agriculture, as farmers are becoming more involved and the central government provides banks with a 2% interest subsidy to make agriculture loans more accessible to farmers, particularly small farmers. To provide farmers with operational freedom, NABARD has developed a financial instrument named Kisan Credit Cards (KCC) that makes the supply of cash credit simple and hassle-free. Bank credit is extremely important to the growth of the economy. It should result in fair income distribution and the eradication of poverty in addition to economic progress. The RBI of India, the nation's central bank, developed the concept of directed lending with this goal in mind. Since March 1980, it has been in place through set objectives for lending to key sectors, including agriculture. According to the survey, 11.3 core farmers benefited from government income assistance during the PM KISAN cycle that ran from April to July in 2022–2023. For the last three years, the program has given the farmers in need support totalling over ₹ 2 lakh cores. According to an empirical study conducted by the International Institute for Food Policy Research (IFPRI) and the Indian Council of Agricultural Research (ICAR), the program has specifically assisted small and marginal farmers in meeting their daily consumption, health, education, and other incidental expenses by easing their cash constraints when purchasing agricultural inputs. Assessing how well the government, public sector, and private sector have changed their financial lending practices to support the expansion of agricultural borrowing, savings, and investment. Agricultural lending and investment study that establishes a model's link by evaluating and analysing cumulative data. The new model represented may provide for the benefit of the farmers and agricultural lending institutions.

CONCLUSION

The scope of the study is not limited only to evaluate the agriculture finance inclusions, thus, for extensive agriculture in India is limited. There is little potential for extensive agricultural in India since the study's scope extends beyond evaluating the inclusions in farm funding. Consequently, farming must become more intensive and diverse if agricultural production is to rise. Because intensive agriculture requires a significant amount of cash, there is more room for the study to assess how well the public-private partnership under agricultural finance is working. The distribution of operating assets and operational area is characterized by extreme inequality. Just 2.4% of all farm families with over ten hectares each run more than 23% of the entire operated area, compared with 74.5% of all farm households with a minimum of two acres operating just 26.2% of the total managed area and this has made it possible for the agricultural and related activities sector to considerably contribute to the nation's overall growth, development, and food security.

ABSTRACT

Let a graph $G = (V, E)$ be a graph with p vertices and q edges. Define $\kappa = \begin{cases} \frac{p}{2} & p \text{ is even} \\ \frac{p-1}{2} & p \text{ is odd,} \end{cases}$ and $\Gamma = \{\pm 1, \pm 2, \dots, \pm \kappa\}$. Assuming we have a mapping $\chi: V \rightarrow \Gamma$ where, for every even p , we assign a distinct label in Γ to each of the elements of V and for every odd p , we assign a distinct label in Γ to each of the repeat a label for the lone vertex. Then the labeling as described above is considered a pair mean cordial labeling (PMC-labeling) if for every edge uv of G , there is a labeling $\frac{\chi(u)+\chi(v)}{2}$ if $\chi(u) + \chi(v)$ is even and $\frac{\chi(u)+\chi(v)+1}{2}$ if $\chi(u) + \chi(v)$ is odd such that $|\bar{S}_{\chi_1} - \bar{S}_{\chi_1^c}| \leq 1$ where \bar{S}_{χ_1} and $\bar{S}_{\chi_1^c}$ represent the number of edges with a label of 1. A graph G for which there is a pair mean cordial labeling is called a pair mean cordial graph (PMC-graph). This study computes the PMC-labeling of some graphs like pizza graph, snail graph, Kusudama flower graph, $(C_n \times P_2) + K_1$, n -crossed prism graph, half gear graph, sun graph and closed sun graph.

Keywords: pizza graph, sun graph, snail graph, Kusudama flower graph.

2020 AMS Subject Classification: 05C78

INTRODUCTION

This paper contains only finite, simple, and undirected graphs. We refer to [7] for terms and symbols not defined here. Rosa is credited with creating graph labeling [18] and Gallian [6] provides more details on graph labeling. I. Cahit [1] is credited with the idea of cordial labeling and the cordial related labeling idea was examined by a number of writers in [3-5,16,17,20-22]. In [2,8,19,23], we examine the novel kind of graphs and the pair mean cordiality of a few graphs has been studied in [9-15]. In this work, we study pair man cordial labeling of several graphs, including the pizza graph, snail graph, Kusudama flower graph, $(C_n \times P_2) + K_1$, π -crossed prism graph, half gear graph, sun graph and closed sun graph.

PRELIMINARIES

Definition 2.1. [8] The pizza graph P_{Z_n} is a graph that is produced by subdividing wheel graphs W_n in each of their spokes.

Definition 2.2. [23] The snail graph Sl_n is the graph that results from the path P_n joining two parallel edges between v_i and v_{n-i+1} for $i = 1, 2, \dots, \left\lfloor \frac{n}{2} \right\rfloor$.

Definition 2.3. [2] The graph $(C_n \times P_2) + K_1$ resembles a double wheel graph but the vertices of the two wheels are connected pair wise. Another way to think of them is as a prism $C_n \times P_2$, with each vertex connected to an identical point.

Definition 2.4. [2] The graph that is produced from the fan graph F_n by adding a vertex along its path P_n between any two neighboring vertices is known as the half gear graph HG_n .

Definition 2.5. [2] The π -crossed prism graph, R_n of positive even n vertices is the graph that is produced by taking two disjoint cycle graphs C_n and adding edges $v_i v_{2i+1}$ and $v_{i+1} v_{2i}$ for $i = 1, 3, \dots, n-1$.

Definition 2.6. [2] The sun graph S_n is the graph with $2n$ vertices consisting of a center complete graph K_n and an outer ring of n vertices, each of which is connected to both end vertices of the outer ring that is closest to the central core.

Definition 2.7. [2] The closed sun graph \bar{S}_n is the graph that results from $S_n \cup C_n$.

Definition 2.7. [19] Let v_0 represent the apex vertex and v_0, v_1, \dots, v_{2n} be the successive $2n$ rim vertices of wheel graph w_{2n} , $n \geq 3$. Segment spoke edge $v_0 v_{2n-1}$ with vertex w_i and at each w_i , joining two copies of the path of length 2; $P_2^l = v_0, u_{2i-1}, w_i$ and $P_2^r = v_0, u_{2i}, w_i$ for each $i \in [n]$. The resulting graph is known as the Kusudama flower graph KF_n .

MAIN RESULTS

Theorem 3.1. The graph $(C_n \times P_2) + K_1$ is not PMC-graph for every $n \geq 3$.

Proof. Here, $V((C_n \times P_2) + K_1) = \{v_0, v_i, u_i \mid 1 \leq i \leq n\}$ and $E((C_n \times P_2) + K_1) = \{v_0 v_i, v_0 u_i, v_i u_i \mid 1 \leq i \leq n\} \cup \{v_i v_{i+1}, u_i u_{i+1}, v_n v_1, u_n u_1 \mid 1 \leq i \leq n-1\}$ respectively denote the vertex and edge sets of the graph $(C_n \times P_2) + K_1$. So the graph $(C_n \times P_2) + K_1$ holds $5n$ edges and $2n + 1$ vertices. If possible, let χ be a PMC-graph. The possible outcomes are $\chi(u) + \chi(v) = 1$ or $\chi(u) + \chi(v) = 2$ if the edge uv receives the label one. Thereby, $2n - 1$ is the

Ponraj et al.,

greatest number of edges that can be labeled as 1. That's $\bar{S}_{\chi_1} \leq 2n - 1$. Consequently, $\bar{S}_{\chi_1^c} \geq 3n + 1$. Thus, $\bar{S}_{\chi_1^c} - \bar{S}_{\chi_1} \geq 3n + 1 - (2n - 1) = n + 2 \geq 5 > 1$, a contradiction.

Theorem 3.2. The pizza graph Pz_n is a PMC-graph for every $n \geq 3$.

Proof. Here, $V(Pz_n) = \{v_0, u_i, v_i \mid 1 \leq i \leq n\}$ and $(Pz_n) = \{v_0 u_i, u_i v_i \mid 1 \leq i \leq n-1\} \cup \{v_i v_{i+1}, v_n v_1 \mid 1 \leq i \leq n-1\}$ respectively denote the vertex and edge sets of the pizza graph Pz_n . So the pizza graph Pz_n holds $2n + 1$ vertices and $3n$ edges. Let $\chi(v_0) = 1$.

Case (i): For odd n

Let $\chi(v_0) = 1$. At the vertices v_1, v_3, \dots, v_n and v_2, v_4, \dots, v_{n-1} apply the labels $-1, -3, \dots, -n$ and $3, 5, \dots, n$ respectively. Now allot the labels $2, 4, \dots, n-1$ and $-2, -4, \dots, -n+1$ to the corresponding vertices u_1, u_3, \dots, u_{n-2} and u_2, u_4, \dots, u_{n-1} .

Case (ii): For even n

Let $\chi(v_0) = 3$ and $\chi(v_1) = 2$. At the vertices v_2, v_4, \dots, v_{n-2} and v_3, v_5, \dots, v_{n-1} apply the labels $4, 6, \dots, n$ and $-3, -5, \dots, -n$ respectively. Fix the label -1 to u_1 . Consequently, allot the labels $-2, -4, \dots, -n+2$ and $5, 7, \dots, n-1$ to the corresponding vertices u_2, u_4, \dots, u_{n-2} and u_3, u_5, \dots, u_{n-3} . Fix also the label n to u_{n-1} .

χ is a PMC-labeling of the pizza graph Pz_n for every $n \geq 3$ as the accompanying table 1 demonstrates.

Example 3.3. Figure 1 displays a PMC-labeling of the pizza graph Pz_8 .

Theorem 3.4. The Kusudama flower graph KF_n is not PMC-graph for every $n \geq 3$.

Proof. Here the vertex and edge sets of the Kusudama flower graph KF_n respectively denoted by $V(KF_n) = \{v_0, v_i, u_i, w_i, x_i, y_i \mid 1 \leq i \leq n\}$ and $E(KF_n) = \{u_i v_{i+1}, u_n v_1 \mid 1 \leq i \leq n-1\}$

$\cup \{v_0 v_i, v_0 w_i, v_0 x_i, v_0 y_i, w_i u_i, x_i w_i, y_i w_i, v_i u_i \mid 1 \leq i \leq n\}$. So the Kusudama flower graph has $9n$ edges and $5n + 1$ vertices. If possible, let χ be a PMC-graph. The possible outcomes are $\chi(u) + \chi(v) = 1$ or $\chi(u) + \chi(v) = 2$ if the edge uv receives the label one.

Case(i): For odd n

Thereby, $4n - 1$ is the greatest number of edges that can be labeled as 1. That's $\bar{S}_{\chi_1} \leq 4n - 1$. Consequently, $\bar{S}_{\chi_1^c} \geq 5n + 1$. Thus, $\bar{S}_{\chi_1^c} - \bar{S}_{\chi_1} \geq 5n + 1 - (4n - 1) = n + 2 \geq 5 > 1$, a contradiction.

Case(ii): For even n

Thereby, $4n + 1$ is the greatest number of edges that can be labeled as 1.. That's $\bar{S}_{\chi_1} \leq 4n + 1$. Consequently, $\bar{S}_{\chi_1^c} \geq 5n - 1$. Thus, $\bar{S}_{\chi_1^c} - \bar{S}_{\chi_1} \geq 5n - 1 - (4n + 1) = n - 2 \geq 2 > 1$, a contradiction.

Theorem 3.5. The half gear graph Hg_n is a PMC-graph for every $n \geq 3$.

Proof. Here, $V(Hg_n) = \{v_0, u_i, v_i \mid 1 \leq i \leq n \text{ and } 1 \leq j \leq n-1\}$ and

$E(Hg_n) = \{v_0 v_i \mid 1 \leq i \leq n\} \cup \{v_i u_i, u_i v_{i+1} \mid 1 \leq i \leq n-1\}$ respectively denote the vertex and edge sets of the half gear graph Hg_n . So the half gear graph Hg_n holds $2n$ vertices and $3n - 2$ edges. Let $\chi(v_0) = 2$ and $\chi(v_n) = 1$.

Case (i): $n \equiv 0 \pmod{4}$

At the vertices $v_1, v_2, \dots, v_{\frac{3n}{4}}$ and $v_{\frac{3n+4}{4}}, v_{\frac{3n+8}{4}}, \dots, v_{n-1}$ apply the labels $-1, -2, \dots, \frac{-3n}{4}$ and $\frac{-3n-8}{4}, \frac{-3n-12}{4}, \dots, -n$ respectively. Next allot the labels $3, 4, \dots, \frac{3n+4}{4}$ and $\frac{-3n-4}{4}$ to the corresponding vertices $u_1, u_2, \dots, u_{\frac{3n-4}{4}}$ and $u_{\frac{3n}{4}}$. Also allot the labels $\frac{3n+8}{4}, \frac{3n+12}{4}, \dots, n$ to the vertices $u_{\frac{3n+4}{4}}, u_{\frac{3n+8}{4}}, \dots, u_{n-1}$ respectively.

Ponraj et al.,

Case (ii): $n \equiv 1 \pmod{4}$

At the vertices $v_1, v_2, \dots, v_{\frac{3n-3}{4}}$ and $v_{\frac{3n+1}{4}}, v_{\frac{3n+5}{4}}, \dots, v_{n-1}$ apply the labels $-1, -2, \dots, \frac{-3n+3}{4}$ and $\frac{-3n-5}{4}, \frac{-3n-9}{4}, \dots, -n$ respectively. Now allot the labels $3, 4, \dots, \frac{3n+5}{4}$ and $\frac{-3n-1}{4}$ to the corresponding vertices $u_1, u_2, \dots, u_{\frac{3n-3}{4}}$ and $u_{\frac{3n+1}{4}}$. So allot the labels $\frac{3n+9}{4}, \frac{3n+13}{4}, \dots, n$ to the vertices $u_{\frac{3n+5}{4}}, u_{\frac{3n+9}{4}}, \dots, u_{n-1}$ respectively.

Case (iii): $n \equiv 2 \pmod{4}$

At the vertices $v_1, v_2, \dots, v_{\frac{3n-2}{4}}$ and $v_{\frac{3n+2}{4}}, v_{\frac{3n+6}{4}}, \dots, v_{n-1}$ apply the labels $-1, -2, \dots, \frac{-3n+2}{4}$ and $\frac{-3n-6}{4}, \frac{-3n-10}{4}, \dots, -n$ respectively. Subsequently, allot the labels $3, 4, \dots, \frac{3n+6}{4}$ and $\frac{-3n-2}{4}$ to the corresponding vertices $u_1, u_2, \dots, u_{\frac{3n-2}{4}}$ and $u_{\frac{3n+2}{4}}$. Allot the labels $\frac{3n+10}{4}, \frac{3n+14}{4}, \dots, n$ to the vertices $u_{\frac{3n+6}{4}}, u_{\frac{3n+10}{4}}, \dots, u_{n-1}$ respectively.

Case (iv): $n \equiv 3 \pmod{4}$

At the vertices $v_1, v_2, \dots, v_{\frac{3n-1}{4}}$ and $v_{\frac{3n+3}{4}}, v_{\frac{3n+7}{4}}, \dots, v_{n-1}$ apply the labels $-1, -2, \dots, \frac{-3n+1}{4}$ and $\frac{-3n-7}{4}, \frac{-3n-11}{4}, \dots, -n$ respectively. So allot the labels $3, 4, \dots, \frac{3n+3}{4}$ and $\frac{-3n-3}{4}$ to the corresponding vertices $u_1, u_2, \dots, u_{\frac{3n-1}{4}}$ and $u_{\frac{3n+3}{4}}$. Next allot the labels $\frac{3n+7}{4}, \frac{3n+11}{4}, \dots, n$ to the vertices $u_{\frac{3n+3}{4}}, u_{\frac{3n+7}{4}}, \dots, u_{n-1}$ respectively. χ is a PMC-labeling of the half gear graph Hg_n for every $n \geq 3$ as the accompanying table 2 demonstrates.

Example 3.6. Figure 2 displays a PMC-labeling of the half gear graph Hg_5 .**Remark 3.7.** The half gear graph Hg_1 is a PMC-graph but Hg_2 not PMC-graph.**Theorem 3.8.** The n -crossed prism graph Cp_n is a PMC-graph for every even $n \geq 4$.

Proof. Here, the vertex and edge sets of the n -crossed prism graph Cp_n respectively denoted by $V(Cp_n) = \{u_i, v_i \mid 1 \leq i \leq n\}$ and $E(Cp_n) = \{u_i u_{i+1}, v_i v_{i+1}, u_0 u_n, v_0 v_n \mid 1 \leq i \leq n\} \cup \{u_{2i+1} v_{2i}, v_{2i+1} u_{2i} \mid 1 \leq i \leq \frac{n}{2}\}$. So the n -crossed prism graph Cp_n holds $2n$ vertices and $3n$ edges. Let $\chi(v_{n-2}) = 1$, $\chi(v_{n-1}) = \frac{n+4}{2}$ and $\chi(v_n) = \frac{-n-2}{2}$.

Case (i): $n \equiv 0 \pmod{4}$

At the vertices u_1, u_3, \dots, u_{n-1} and u_2, u_4, \dots, u_n apply the labels $2, 3, \dots, \frac{n+2}{2}$ and $-1, -2, \dots, \frac{-n}{2}$ respectively. Next allot the labels $\frac{n+6}{2}, \frac{n+8}{2}, \dots, \frac{3n+8}{4}$ and $\frac{-n-4}{2}, \frac{-n-6}{2}, \dots, \frac{-3n}{4}$ to the corresponding vertices $v_1, v_3, \dots, v_{\frac{n-2}{2}}$ and $v_2, v_4, \dots, v_{\frac{n-4}{2}}$. Now, allot the labels $\frac{-3n-8}{4}, \frac{-3n-4}{4}$ according to the vertices $v_{\frac{n}{2}}, v_{\frac{n+2}{2}}$. So allot the labels $\frac{-3n-12}{4}, \frac{-3n-16}{4}, \dots, -n$ and $\frac{3n+12}{4}, \frac{3n+16}{4}, \dots, n$ to the corresponding vertices $v_{\frac{n+4}{2}}, v_{\frac{n+8}{2}}, \dots, v_{n-4}$ and $v_{\frac{n+6}{2}}, v_{\frac{n+10}{2}}, \dots, v_{n-2}$.

Case (ii): $n \equiv 2 \pmod{4}$

Allot the labels to the vertices $u_i, 1 \leq i \leq n$ as in case (i). Also allot the labels $\frac{n+6}{2}, \frac{n+8}{2}, \dots, \frac{3n+6}{4}$ and $\frac{-n-4}{2}, \frac{-n-6}{2}, \dots, \frac{-3n-2}{4}$ to the corresponding vertices $v_1, v_3, \dots, v_{\frac{n-4}{2}}$ and $v_2, v_4, \dots, v_{\frac{n-2}{2}}$. Allot the label $\frac{-3n-6}{4}$ with $v_{\frac{n}{2}}$. So allot the labels $\frac{-3n-10}{4}, \frac{-3n-14}{4}, \dots, -n$ and $\frac{3n+10}{4}, \frac{3n+14}{4}, \dots, n$ to the corresponding vertices $v_{\frac{n+2}{2}}, v_{\frac{n+6}{2}}, \dots, v_{n-4}$ and $v_{\frac{n+4}{2}}, v_{\frac{n+8}{2}}, \dots, v_{n-2}$.

In all cases, $\bar{S}_{\chi_1} = \frac{3n+2}{2} = \bar{S}_{\chi_1^c}$.

Example 3.9. Figure 3 displays a PMC-labeling of the 8-crossed prism graph Cp_8 .

Ponraj et al.,

Theorem 3.10. The snail graph Sl_n is pair mean cordial for every $n \geq 3$ except for $n = 4$.

Proof. Here the vertex and edge sets of snail graph Sl_n respectively denoted by $V(Sl_n) = \{v_i \mid 1 \leq i \leq n\}$ and $E(Sl_n) = \{v_i v_{i+1}, v_j v_{n-j+1} \mid 1 \leq i \leq n-1 \text{ and } 1 \leq j \leq \frac{n}{2}\}$. So the snail graph Sl_n holds n vertices and $2n-1$ edges, if n is even and $2n-2$ edges, if n is odd.

Case (i): $n = 3$

Allot the labels 1, -1, 1 to the corresponding vertices v_1, v_2, v_3 .

Case (ii): $n = 4$

If possible, let χ be a PMC-graph. The possible outcomes are $\chi(u) + \chi(v) = 1$ or $\chi(u) + \chi(v) = 2$ if the edge uv receives the label one. Thereby, 2 is the greatest number of edges that can be labeled as 1. That's $\overline{S}_{\chi_1} \leq 2$. Consequently, $\overline{S}_{\chi_1^c} \geq 5$. Thus, $\overline{S}_{\chi_1^c} - \overline{S}_{\chi_1} \geq 5 - 2 = 3 > 1$, a contradiction.

Case (i): For odd n

Let $\chi(v_1) = 2$ and $\chi(v_n) = -1$

Now, allot the labels $-2, -3, \dots, \frac{-n}{2}$ and $\frac{n}{2}, \frac{n-2}{2}, \dots, 3$ to the corresponding vertices $v_2, v_3, \dots, v_{\frac{n}{2}}$ and $v_{\frac{n+4}{2}}, v_{\frac{n+6}{2}}, \dots, v_{n-1}$. Allot the label 1 with $v_{\frac{n+2}{2}}$.

Case (ii): For even n

Let $\chi(v_1) = 2$ and $\chi(v_n) = -1$. Next allot the labels $-2, -3, \dots, \frac{-n+1}{2}$ and $\frac{n-1}{2}, \frac{n-3}{2}, \dots, 3$ to the corresponding vertices $v_2, v_3, \dots, v_{\frac{n-1}{2}}$ and $v_{\frac{n+5}{2}}, v_{\frac{n+7}{2}}, \dots, v_{n-1}$. Allot the labels 1, 1 according to $v_{\frac{n+1}{2}}, v_{\frac{n+3}{2}}$.

χ is a PMC-labeling of snail graph Sl_n for every $n \geq 3$ except for $n = 4$ as the accompanying table 3 demonstrates.

Example 3.11. Figure 4 displays a PMC-labeling of the snail graph Sl_7 .

Theorem 3.12. The sun graph S_n is not PMC-graph for every $n \geq 3$.

Proof. Here the vertex and edge sets of the sun graph S_n respectively denoted by $V(S_n) = \{u_i, v_i \mid 1 \leq i \leq n\}$ and $E(S_n) = E(K_n) \cup \{v_i u_i, u_j v_{j+1}, u_n v_1 \mid 1 \leq i \leq n \text{ and } 1 \leq j \leq n-1\}$. So the sun graph holds $2n$ vertices and $\frac{n^2+3n}{2}$ edges. If possible, let χ be a PMC-graph. The possible outcomes are $\chi(u) + \chi(v) = 1$ or $\chi(u) + \chi(v) = 2$ if the edge uv receives the label one. Thereby, $2n-3$ is the greatest number of edges that can be labeled as 1. That's $\overline{S}_{\chi_1} \leq 2n-3$. Consequently, $\overline{S}_{\chi_1^c} \geq \frac{n^2-n+6}{2}$. Thus, $\overline{S}_{\chi_1^c} - \overline{S}_{\chi_1} \geq \frac{n^2-n+6}{2} - (2n-3) = \frac{n^2-5n+12}{2} \geq 3 > 1$, a contradiction.

Theorem 3.13. The closed sun graph \overline{S}_n is not PMC-graph for every $n \geq 3$.

Proof. Here, the vertex and edge sets of the closed sun graph \overline{S}_n denoted by $V(\overline{S}_n) = \{u_i, v_i \mid 1 \leq i \leq n\}$ and $E(\overline{S}_n) = E(K_n) \cup \{v_i u_i, u_j u_{j+1}, u_n u_1, u_j v_{j+1}, u_n v_1 \mid 1 \leq i \leq n \text{ and } 1 \leq j \leq n-1\}$ respectively. So the closed sun graph holds $2n$ vertices and $\frac{n^2+5n}{2}$ edges. If possible, let χ be a PMC-graph. The possible outcomes are $\chi(u) + \chi(v) = 1$ or $\chi(u) + \chi(v) = 2$ if the edge uv receives the label one. Thereby, $2n-3$ is the greatest number of edges that can be labeled as 1. That is $\overline{S}_{\chi_1} \leq 2n-3$. Then $\overline{S}_{\chi_1^c} \geq \frac{n^2+n+6}{2}$. Therefore $\overline{S}_{\chi_1^c} - \overline{S}_{\chi_1} \geq \frac{n^2+n+6}{2} - (2n-3) = \frac{n^2-3n+12}{2} \geq 6 > 1$, a contradiction.

CONCLUSION

A lot of researchers are currently interested in labeled graphs because of their wide range of applications. Here, we talk about PMC-labeling of a few unique graphs. It is an open field of study to get comparable results on different graph families.

ABSTRACT

The aim of this article to summarises the available literature on assessing different surface coating materials and conditioning techniques available and influence of micro-design of dental implants on their osseointegration. A web-based search of all review articles of Surface coated materials was done using English language databases such as Google Scholar, PubMed, Iran Medex, etc Articles related to the aim of this study were found shown the beneficial effect of surface modification of dental implants, making it new emerging approach for enhancing the success rate of implants and diminish the complications that can be encountered after their placement. Implant's micro-design and surface modifications significantly influence the osseointegration process. Various techniques in implant surface modifications have been proposed, all aimed at improving bone formation around dental implants. Understanding how surface modification of dental implants can impact osseointegration, might help the clinician to maximize the success rate of implants. Surface coated dental implants enhances early osseointegration even in low density bone, might help the clinician to maximize the success rate of dental implants and diminish the complications that can be encounter after their placement.

Keywords: Early bone formation; Implant surface, Surface modifications, Implant coatings & Osseointegration.

INTRODUCTION

Implants have become a popular choice for full mouth rehabilitation, providing support for dental crowns and offering several advantages over conventional dentures for replacing missing teeth [1]. . The importance of dental implants advanced significantly through the groundbreaking research of Professor Per Ingvar Branemark, who focused on studying microcirculation in bone tissue. His research led to the development of the concept of osseointegration, which became the foundation for modern dental implants [2]. For successful implant placement, maintaining alveolar bone thickness, ensuring proper phonetic function, and managing osseointegration are critical factors. Osseointegration refers to the connection between living bone and the surface of a load-bearing implant that is artificially anchored [3]. The quality, distribution, and quantity of bone in the dental implant area play a crucial role in achieving successful osseointegration [4]. Optimal osseointegration relies on several factors, including the characteristics of the implant material, the load applied to the implant, technique used, and quality of bone [5]. . Titanium, often referred to as Ti, is the most commonly used material for dental implants due to its excellent biocompatibility, minimal toxicity, corrosion resistance, and high mechanical strength [6]. . In the past, success rates for dental implants were lower, particularly when failures were assessed based on patients who lost implants. Frequent failures in dental implant therapy were often linked to issues such as instability or misalignment at the implant-abutment interface, which allowed bacterial infiltration along with inflammatory cells to cause bone loss. Some failures were also attributed to infection and inflammation, which affected healing and soft tissue integration. Achieving successful functional and aesthetic outcomes requires careful consideration of the biological principles governing peri-implant soft and hard tissues, as well as the appropriate selection of implant type and placement [7].

Surface Coated Implant

Implant surfaces are treated to enhance biocompatibility, encouraging cells to recognize the material as a natural part of the body rather than a foreign object, thereby reducing the risk of rejection and promoting integration with surrounding tissues [8]. . Various surface modifications have been developed for implants, to enhance the biological response to titanium and reduce the time required for osseointegration (figure1.) These treatments aim to improve surface topography and properties, including techniques such as sandblasting, acid etching, anodization, discrete calcium-phosphate crystal deposition, coatings with biological molecules, and chemical modification [9]. Various materials have been proposed for dental implant coatings, but they do not all offer the same advantages for prostheses. The review will compare traditional titanium (Ti) implants with different implant coatings to assess their properties and effectiveness [10,11,12].

MATERIALS AND METHODS

Article selection

This review evaluates whether the coated implants become the best option for patients in dental implant therapy compared to conventional Ti implants.

Inclusions

Various implant coating materials are compared to the most commonly used titanium (Ti) implants.

Intervention

Researches comparing different coated materials need to be conducted, including those involving the most recent coatings, despite the limited availability of long-term research.

Outcome

Research primarily focuses on achieving biocompatibility and osseointegration. The reviewed article also considers adverse events, such as implant failure after loading and delamination. This review is based on several criteria, including clinical studies conducted both in vitro and in vivo, as well as randomized controlled trials (RCTs). The

search was conducted using PubMed, Wiley, and manual searches, with keywords such as "dental implants," "implant coatings," and "osseointegration."

RESULTS

The micro- design and surface condition of an implant significantly influence the dynamics of osseointegration [13]. The characteristics of the implant surface are directly related to the rate, amount, and quality of bone response. The area of the implant in proximity with bone, the amount of time needed to create direct bone-to-implant contact, and the mechanical link between the implant and the bone are all influenced by the surface features. In other words, chemical and physical surface properties, such as ionic composition, hydrophilicity, and roughness, are key factors in the interaction between the implant and surrounding tissue [14].

Surface modification materials

The hydrophilic properties of treated and hybrid implant surfaces make them more suitable for additional treatments aimed at enhancing their overall characteristics compared to hydrophobic surfaces, such as machined or smooth ones. Implants with hydrophilic surfaces (80%) significantly increase bone-to-implant contact (BIC) during the early healing phase, as they promote greater cell differentiation and aggregation than hydrophobic surfaces (47%) (Figure 2) [8]. A wide range of materials have been utilized as coatings for titanium (Ti) core dental implants, such as Bisphosphonates, bioactive glass, carbon, bone-stimulating agents, bioactive ceramics, fluoride, hydroxyapatite (HA), Calcium phosphate, and titanium nitride (TiN).

Carbon Coated Implants

In addition to being hemo-compatible, histocompatible, biostable, and chemically stable in vitro as well as in vivo, carbon coatings are known to have outstanding chemical characteristics and stability when interacting with etching chemicals. The direct bonding of carbon enhances the adhesion and proliferation of osteoblasts on the surface of nickel-titanium alloys (NiTi) [15].

Bisphosphates

Bisphosphonates have gained research attention in dentistry due to their selective inhibition of osteoclasts and the subsequent improvements in bone quality and osteoblastic activity. However, there are still fewer studies supporting the immersion of titanium (Ti) implants in bisphosphonates compared to other coating materials [16]. Bisphosphonates lead to an increase in the size of osteoclast cells as a compensatory response to their restraining effect. Because the concentration of bisphosphonates affects the bone density surrounding the implant surface, the dosage of anti-resorptive medications needs to be carefully chosen. Tyrosine phosphate is a major target of bisphosphonates since it is essential to the development and operation of osteoclasts [16]. Before starting clinical trials, more study is necessary to fully understand the effects of bisphosphonates as an implant covering.

Hydroxyapatite (HA) Coating

Implanting calcium ions (Ca^{2+}) with a thin hydroxyapatite (HA) coating enhances osteogenic potential while maintaining non-toxicity. This promotes osteoblast activity, leading to improved osseointegration and bioactivity [17]. Hydroxyapatite (HA) coating has gained significant interest due to its ability to enhance osteoconductivity. This coating material offers the advantage of combining the high strength of metals with the excellent bioactivity of the calcium phosphate compound ($\text{Ca}_3(\text{PO}_4)_2$) [18].

Bone Stimulating Factor (BSF)

Research indicates that BSF significantly enhances the osseointegration process. Applying BSF, such as bone morphogenetic protein (BMP), as a coating can improve bone density around the implant and enhance the biocompatibility of the prosthesis [19]. BSF is a promising and innovative coating material, as it not only enhances healing after surgical implant placement but also promotes improved osseointegration.

Bioactive Glass and Ceramics

The glassy qualities of bioactive glass, which improve osseointegration and lessen corrosion in body fluids, make it novel and helpful for dental implants. However, its limited use in load-bearing areas raises concerns about durability. In vitro studies have demonstrated that bioactive glass meets both requirements, even after several months of load resistance testing [18]. More over 60% of the weight in silica can cause delamination, and cracking. This problem can be solved by partially replacing calcium oxide (CaO) in bioglass compositions with magnesium oxide (MgO), sodium oxide (Na₂O), and potassium oxide (K₂O). This adjustment helps balance thermal expansion between the coating and titanium-based alloys [19].

Osseo Speed (Dentsply)

A surface structure altered by fluorine nanoparticles is sold to encourage the development of bones early. Monjo *et al.* could not find any difference in biocompatibility between fluorine-coated implants and TiOblast (Dentsply). However, the fluorine coating induces more branched cellular morphology at the implant site, enhancing osteoblast differentiation [20].

Nitride Compounds

The TiN layer's thickness and the surface coating can be changed to improve osseointegration by causing a neurological reaction associated with the coating's nitrogen. These coatings demonstrate good blood compatibility, as they show protein absorption and platelet retention comparable to those of medical elastomers. Additionally, TiN coatings help regulate the formation of TiO layers, promoting strong bonding [21].

Implant Surface Modification Techniques

Numerous micro rough titanium surfaces have been created over the years to improve bone-to-implant contact (BIC) and overcome the shortcomings of machined surfaces, also referred to as "turned" or "smooth." These rough surfaces can be created using various modification techniques, including both additive and subtractive methods (Figure 3).

Additive Processes

Titanium plasma-sprayed (TPS) surfaces Originally, this method was created for medical implants. After implanting a titanium hybrid powder onto the implants via plasma spraying, the implants were put to the test by being inserted into sheep. Titanium is heated in an ionic component plasma stream during the plasma coating process, producing an average coating roughness of 7mm. This roughness enhances the surface area of the implant, which improves the interaction between bone and connective tissue with dental implants featuring a Titanium Plasma Spraying (TPS) surface. Schroeder *et al.* conducted a study using a monkey model, which revealed that the implants were successfully ankylosed to the surrounding bone and maintained stability even under loading conditions for up to 2 years [22].

Hydroxyapatite and Other Calcium Phosphate Surface Coating

These materials are primarily composed of hydroxyapatite (HA) and are released into the peri-implant region following implant placement [23]. Calcium phosphate materials offer two main advantages: they accelerate early healing and effectively bond to bone. This accelerated healing is attributed to their ability to readily adsorb proteins onto their surfaces [24]. Enhanced fibrinogen binding can lead to increased platelet adhesion and activation. Additionally, fibrin binding to the implant surface acts as a bridge between osteogenic cells and the implant, resulting in superior osseointegration in vivo [24]. Resorbable blast media (RBM), which involves blasting the implant surface with coarse calcium phosphate, was also investigated in multiple studies, showing significantly higher values of BIC% was noted with RBM implants when compared with machined implants [25]. Enhanced activation and adhesion of platelets can result from enhanced fibrinogen binding. Furthermore, fibrin that binds to the implant surface creates a bridge that connects osteogenic cells to the implant, improving osseointegration in vivo.

**Plasma Electrolytic Oxidation (Coating and Doping)**

Beta-Tech Medicine LLC (Skolkovo, Russia) has developed a promising domestic method for dental implant surface treatment. This technique ensures a high level of implant purity and enhances osseointegration. It involves forming a hard oxide-ceramic coating with a porous structure that chemically adheres to the titanium base. The coating comprises 41.66% titanium (by atomic composition) from the implant material itself, ensuring excellent surface attachment. Additionally, the implants are doped with calcium and phosphorus atoms to more closely mimic the natural bone tissue structure. During the treatment process, these doping ions are introduced into the coating from the oxidizing electrolyte and are distributed uniformly throughout the coating [26].

Subtractive Processes

Grit-blasted surfaces are created by texturing metal surfaces with a pressurized spray to increase surface irregularity. This process uses blasting agents such as alumina (Al_2O_3) and TiO_2 , resulting in a macroscopic surface texture that resembles sandpaper. Both the pressure and the type of particles used can influence the outcome of the sandblasting process [27]. Cell adhesion mechanisms can be affected by sandblasting and acid etching because the osteoblast-like cells that stick to these surfaces have uneven shape and many pseudopodia. Furthermore, it has been demonstrated that implants with chemically altered sandblasted and acid-etched surfaces recover more quickly. For example, early loading at 21 days resulted in a 100% survival and success rate over a 3-year observation period [28].

Acid-Etched Surfaces

Acids such as HCl , H_2SO_4 , and HF can be used as chemical agents for etching titanium implants. This process removes a small amount of material, creating microscopic pits on the implant surface to enhance surface roughness and improve osseointegration. A group of researchers demonstrated that dual etching of titanium can enhance early osseointegration. After 36 months of healing, the success rate for the dual-acid-etched (DAE) implants was 95%, compared to 86.7% for the machined implants [29].

Electro Polishing

All titanium implants develop an oxide coating over time, but oxidised implants have a thicker layer since they were anodized in a galvanic cell containing the right electrolyte. This process involves passing a current through the implant with phosphoric acid as the electrolyte, which forms the surface oxide and enhances the implant's biological performance [30].

Mechanical Polishing

Machined implants exhibit characteristic grooves resulting from the manufacturing tools used during production. Machined implants are produced through turning, milling, or polishing processes, resulting in a minimally rough surface with a surface area roughness (S_a) value between 0.3 and 1.0 μm . The surface morphology is influenced by factors such as the manufacturing tools, implant material, lubricants, and the machining speed [31].

Laser Surface Micro Texturing

It is a non-contact treatment method where the implant surface remains uncontaminated by blasting media. Laser etching vaporizes the substrate material, creating a crater on the surface. This method offers greater precision in controlling the micro-topography of the implant surface, thereby enhancing its biocompatibility [32]. In comparison to control-machined implants, the effects of laser micro-texturing on bone attachment were assessed in a 3-year follow-up research. The results showed better bone preservation, with 0.46 mm of crestal bone loss observed at the 3-year mark and no bone loss up to the first thread [33].

Biological Coatings**Growth factors Coatings**

Growth factors such as bone morphogenetic proteins, transforming growth factor- $\beta 1$ (TGF- $\beta 1$), platelet-derived growth factor, and insulin-like growth factors 1 and 2 are frequently studied for surface coatings. Notably, TGF- $\beta 1$ has been shown to stimulate and enhance bone growth by 59% [34]. Implants coated with bone-enhancing materials

Shalini Kapoor *et al.*,

provide significant healing potential following surgical placement and improve osseointegration in the peri-implant region [35].

Peptides

Adhesion molecules like Collagen I and peptide coatings substantially improve bone-to-implant contact (BIC) by facilitating enhanced regeneration. BSF is a promising and innovative coating that not only supports healing after surgical implant placement but also enhances osseointegration in the peri-implant region [36].

DISCUSSION

Various materials have been proposed for implant coatings, resulting in a range of surface characteristics. These characteristics are achieved through methods such as coatings, blasting, acid etching, laser treatment, or combinations of these techniques. Rough implant surfaces have been demonstrated to offer superior properties compared to traditional machined surfaces. While an ideal implant surface characteristic has not yet been established, advancements in micro-design and surface modifications have significantly enhanced osseointegration. These advancements may, in turn, increase dental implant success rates and lower related problems. In order to improve osseointegration and increase bone-to-implant contact, researchers are constantly looking for the ideal implant surface conditions. Still, a lot of clinical trials are needed to establish a strong body of evidence and guarantee long-term effectiveness.

ACKNOWLEDGEMENTS

ABSTRACT

Artificial Intelligence (AI) has the potential to drive productivity and economic growth by enhancing decision-making quality and efficiency. It also plays a crucial role in fostering innovation, leading to the emergence of new services, markets, and even entire industries. However, AI also presents challenges that could negatively impact businesses and society. Despite teleological theories suggesting that symbolic AI is an inevitable outcome of centuries of efforts to formalize human intelligence, AI remains an evolving field with both opportunities and risks. AI technologies rely on machine learning algorithms, which are only as effective as the data they are trained on. Since humans determine the data used to train AI systems, the risk of machine learning bias is inevitable and must be continuously monitored. In the retail sector, digital transformation is reshaping the competitive landscape, distinguishing successful businesses from those that struggle to adapt. AI offers numerous advantages for retailers, from enhancing operational efficiency to revolutionizing customer interactions. In the future, many advanced companies are expected to rely on AI-powered digital assistants, reducing the need for human intervention. This study explores how AI influences online shopping behaviour, addressing its limitations, outcomes, and recommendations. It examines how AI functions within digital purchasing transactions and its impact on consumer decision-making. Understanding consumer behaviour in digital commerce is essential, as AI-driven enhancements have the potential to transform the online shopping experience. The research aims to analyse the effects of AI-driven technologies on consumer choices, particularly for individuals purchasing practical goods through online platforms. The study is conducted in Bengaluru, targeting individuals aged 20 and above who actively engage in online shopping. A total of 103 respondents, comprising both male and female participants, were surveyed. The study utilizes both primary and secondary data to assess consumer awareness and the influence of AI on online shopping behaviour. A random sampling method was employed, and statistical tools such as SPSS and Excel were used for

Merlyn Preethi et al.,

data analysis. Various research techniques, including mean and Pearson Correlation were applied. The study adopts both analytical and descriptive research approaches to provide comprehensive insights.

Keywords: Artificial Intelligence, AI-Powered Support, COVID-19, Digital Marketing, E-commerce, Online Shopping.

INTRODUCTION

The rapid advancement of Artificial Intelligence (AI) has transformed industries, with e-commerce being one of the most affected sectors. AI technologies are reshaping online shopping by offering personalized recommendations, automating services, optimizing supply chains, and enhancing customer engagement. These innovations have improved business efficiency and reshaped consumer behaviour, making shopping more intuitive and data-driven. In India, particularly in urban centers like Bengaluru, online shopping has surged due to increased internet and smartphone use. As a tech hub, Bengaluru is home to tech-savvy consumers who embrace AI tools like voice assistants, chatbots, and predictive analytics, which influence purchasing decisions and improve user satisfaction through personalized suggestions and dynamic pricing. AI algorithms analyse consumer data, enabling tailored shopping experiences and enhancing customer support through NLP-powered chatbots. Additionally, AI-driven fraud detection boosts trust, while innovations like AR-enabled try-ons and demand forecasting enhance the overall shopping experience. Bengaluru's status as a tech-driven city makes it an ideal case for examining the impact of AI on online shopping behaviour. This study explores how AI shapes consumer decision-making, shopping preferences, and brand interactions, while assessing the challenges and opportunities for both businesses and consumers. As AI evolves, its role in e-commerce will expand, offering new possibilities for personalization, automation, and efficiency.

LITERATURE REVIEW

Bhagat, R. (2022): "The Role of AI in Online Shopping: Factors Influencing Practical Application and Consumer Behaviour." *Journal of E-commerce and Digital Marketing*, vol. 12, no. 1, 2022, pp. 23-35. This study explores the role of AI in online shopping, focusing on factors that influence its practical application and its impact on consumer behaviour. By using a technological model, the research examines elements affecting consumers' likelihood to purchase online. The findings suggest that AI helps businesses understand customer needs and enhances digital commerce by moderating purchasing decisions, thus boosting customers' propensity to buy and marketers' ability to increase online buying intent. **Rahman, M. A. et al. (2021):** "The Growing Popularity of Online Shopping in Bangladesh: Consumer Preferences and Challenges." *Journal of Digital Commerce Studies*, vol. 8, no. 3, 2021, pp. 112-125. The study highlights the growing popularity of online shopping in Bangladesh, where consumers prefer its convenience and product variety but dislike the inability to inspect products before purchasing. Social media influences store discovery, with clothing and accessories being the most common purchases. Despite the preference for cash on delivery, concerns over payment security and dissatisfaction hinder broader adoption. **Arul Rajan, K. (2020):** "Hedonic and Utilitarian Motivations in Online Shopping: An Analysis of Consumer Behaviour in Coimbatore." *International Journal of Consumer Behaviour*, vol. 15, no. 4, 2020, pp. 78-92. This study analyses how hedonic and utilitarian motivations affect online shopping behaviour in Coimbatore. It explores key drivers like social media, technology, and shopping convenience. The study categorizes hedonic motivations into six subtypes and utilitarian into two, emphasizing the Impulse vs. Rational buying dichotomy. Online platforms have reshaped decision-making, reducing deliberation time compared to traditional shopping. **Kumar, V. et al. (2019):** "AI's Role in Personalized Engagement Marketing." *Journal of Marketing Technology*, vol. 34, no. 2, 2019, pp. 45-58. This research discusses AI's role in personalized engagement marketing, helping businesses provide tailored products and services. It explores how AI curates information to meet customer needs and examines its potential impact on marketing and customer service in both developed and developing countries. **Kumar, S. & Kumar, M. (2019):** "Customer Churn Prediction Using AI in Competitive Markets." *Journal of Marketing Analytics*, vol. 21, no. 2,

**Merlyn Preethi et al.,**

2019, pp. 45-60. This study focuses on customer churn in competitive markets, highlighting how AI helps predict and address attrition. Using telecommunications data and Artificial Neural Networks, it identifies key churn drivers and optimizes solutions through testing various activation functions. **Brill, T. M. et al. (2019):** "The Rise of Digital Assistants: Enhancing Customer Interactions and Business Operations with AI." *Journal of Business Technology*, vol. 18, no. 3, 2019, pp. 123-135. The study projects a significant increase in digital assistant users and examines how AI-powered assistants, like Siri and Alexa, streamline operations and enhance customer interactions. Using PLS-SEM analysis, the research highlights customer satisfaction and the effectiveness of these assistants in improving business operations and marketing strategies. **Pandey, A. & Parmar, J. (2019):** "Factors Influencing Online Shopping Behaviour in Kanpur, India." *International Journal of E-commerce Research*, vol. 10, no. 4, 2019, pp. 98-110. The study investigates factors influencing online shopping behaviour in Kanpur, India. It identifies key determinants like demographics, social influences, online experience, and payment options. While limited in sample size, the study provides insights for e-commerce marketing strategies and suggests areas for future research. **Maheswari, K. & Priya, P. P. A. (2017):** "The Impact of Personality and Character Traits on Online Purchasing Habits: A Data Mining Approach." *Journal of Consumer Behaviour and Analytics*, vol. 6, no. 2, 2017, pp. 215-228. This research examines the impact of personality and character traits on purchasing habits. Using data mining techniques, it classifies customers based on their shopping behaviour. The study demonstrates the effectiveness of SVM algorithms in analysing consumer behaviour based on online sales and inventory data.

RESEARCH GAP

Despite extensive research on AI's role in business efficiency and innovation, there is limited understanding of its impact on consumer behaviour in online shopping. Existing studies often overlook AI's influence on decision-making in digital commerce and its potential biases. Additionally, the effect of AI-powered assistants on purchasing decisions for practical goods is underexplored. This study addresses these gaps by analysing AI's role in shaping consumer choices in Bengaluru. The findings will offer valuable insights for retailers to optimize AI strategies and enhance customer engagement.

NEED OF THE STUDY

This study addresses the gap in understanding AI's influence on consumer behavior in online shopping, particularly post-COVID-19. It explores how AI-driven insights help businesses optimize product placement and adapt to changing consumer preferences. The research provides valuable guidance for e-retailers in targeting both urban and rural customers effectively.

OBJECTIVES

1. To examine consumer awareness of AI, with online shopping as the independent variable.
2. To examine the influence of AI on consumer buying behaviour in online shopping.
3. To assess AI's impact on purchase decisions across different demographic characteristics.

Hypothesis

H₀ (Null Hypothesis): AI-driven features in online shopping do not significantly impact consumer behaviour, perception, or satisfaction.

H₁ (Alternative Hypothesis): AI-driven features in online shopping significantly influence consumer behaviour, perception, and satisfaction.

RESEARCH METHODOLOGY

Sampling Technique is the term used to describe the method utilized to collect the samples. Every element does have an equal likelihood of being selected as a sample piece. It is employed when there is no prior knowledge of the target demographic. Males and females were selected using a random sampling technique for the study. **A primary data**

**Merlyn Preethi et al.,**

source is an original data source that was acquired directly for a specific study purpose or activity. Primary data had been collected from chosen respondents using questionnaires. **Secondary data** had been sourced from “books, journals, and articles from various websites, reports, magazines, and newspapers.” The secondary and primary data were used for data collection, which had been developed to capture the awareness and impact of artificial intelligence on consumer behaviour in online shopping.

STATISTICAL TOOLS used in this study are excel and SPSS.

DATA ANALYSIS - DEMOGRAPHICS OF THE RESPONDENTS

The study employs a data-driven approach, utilizing primary and secondary data sources to assess AI's impact on consumer behaviour. Primary data is collected through surveys and interviews with online shoppers in Bengaluru, while secondary data includes reports from e-commerce platforms, AI market trends, and academic literature. Statistical tools being used in this study. The majority of respondents are male (68%), while female respondents make up 32%. This suggests that the survey sample is male-dominated, which might influence findings if gender plays a role in the study's focus. Most respondents fall within the 18-25 age group (94%). Only a small percentage belong to 26-35 (3%), 36-45 (2%), and 46+ (1%) categories. This indicates that the study primarily captures younger individuals, potentially students or early-career professionals. The vast majority are undergraduates (94%), with a few postgraduates (3%) and doctorate holders (2%). Only 1% have a high school education, confirming that the sample consists mostly of highly educated individuals. A significant portion of respondents are students (87%). A small percentage are self-employed (4%), private sector employees (6%), and government employees (3%). This aligns with the age and education data, reinforcing that the sample is mainly composed of young students. 50% earn less than 20,000, which aligns with the student-dominated sample. 25% earn between 20,000-50,000, 17% between 50,000-100,000, and 8% earn more than 100,000. This indicates a majority with lower disposable income, likely affecting their purchasing behaviours. 53% shop rarely (once a month or less), while 36% shop occasionally (2-3 times a month). Only 8% shop frequently (weekly), and 3% shop very frequently (multiple times a week). This suggests that most respondents are not frequent online shoppers, which could be influenced by their income levels and student status. (1= Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly Agree)

Detailed Interpretation of Each Correlation Table

The correlation tables provide statistical relationships between different variables. Below is the interpretation of each table:

Interpretation

- There is no significant correlation between gender and any of the AI-related variables ($p > 0.05$ in all cases).
- This suggests that gender does not influence AI awareness, impact on behaviour, perception, or satisfaction in online shopping.

Interpretation

- Age has no significant relationship with AI-related variables ($p > 0.05$).
- This means that younger and older individuals have similar AI awareness, perception, and satisfaction levels in online shopping.

Interpretation

- Education does not significantly correlate with AI-related variables ($p > 0.05$).
- The weak negative correlation with perception (-0.167) suggests that higher education levels may slightly reduce trust in AI personalization and security, but this is not statistically significant.

Interpretation

- Occupation does not significantly influence AI awareness, impact, perception, or satisfaction ($p > 0.05$).

Merlyn Preethi *et al.*,

- The weak negative correlation between occupation and perception (-0.160) indicates that certain job categories might slightly distrust AI personalization, but this is not statistically significant.

Interpretation

- Income has no significant impact on AI-related variables ($p > 0.05$).
- This means AI awareness, perception, and satisfaction are not influenced by income levels.

Interpretation

- Strong correlation between awareness (QA) and satisfaction (QS) ($r = 0.688$, $p < 0.001$): Consumers who are aware of AI in online shopping tend to be more satisfied.
- Awareness also significantly impacts shopping behaviour (QI) ($r = 0.588$, $p < 0.001$): AI-aware users are more likely to be influenced by AI-driven recommendations.
- Moderate correlation with perception (QP) ($r = 0.381$, $p < 0.001$): Awareness influences how AI personalization and security are perceived.

Interpretation

- Strong correlation with satisfaction (QS) ($r = 0.742$, $p < 0.001$): If AI influences shopping behaviour, the customer is more likely to be satisfied.
- Moderate correlation with perception (QP) ($r = 0.512$, $p < 0.001$): AI's impact on behaviour affects how consumers perceive AI security and personalization.

Interpretation

- Moderate positive correlation ($r = 0.517$, $p < 0.001$): Consumers who trust AI-driven personalization and security tend to have higher satisfaction levels.

Interpretation

- Shopping frequency significantly correlates with AI awareness ($r = 0.282$, $p = 0.004$): Consumers who shop online frequently are more aware of AI in online shopping.
- No significant relationship with AI impact, perception, or satisfaction ($p > 0.05$).

Final Interpretation with Hypothesis Testing**Summary of Findings from Correlation Analysis**

1. **AI Awareness (QA) significantly influences**
 - a. Shopping behaviour (QI) ($r = 0.588$, $p < 0.001$)
 - b. Perception of AI (QP) ($r = 0.381$, $p < 0.001$)
 - c. Customer Satisfaction (QS) ($r = 0.688$, $p < 0.001$)
2. **AI Impact on Shopping Behaviour (QI) strongly influences:**
 - a. Customer Satisfaction (QS) ($r = 0.742$, $p < 0.001$)
 - b. Perception of AI (QP) ($r = 0.512$, $p < 0.001$)
3. **AI Perception (QP) has a moderate effect on Satisfaction (QS) ($r = 0.517$, $p < 0.001$).**
4. **Demographic Factors (Gender, Age, Education, Occupation, Income):**
 - a. No significant correlation with AI variables ($p > 0.05$).
5. **Shopping Frequency:**
 - a. **Positively correlates with AI awareness ($r = 0.282$, $p = 0.004$)**
 - b. No significant impact on behaviour, perception, or satisfaction ($p > 0.05$).

Hypothesis Testing

- **Null Hypothesis (H_0):** AI-driven features in online shopping do not significantly impact consumer behaviour, perception, or satisfaction.

Merlyn Preethi et al.,

- **Alternative Hypothesis (H₁):** AI-driven features in online shopping significantly influence consumer behaviour, perception, and satisfaction.

Decision

Since AI awareness, shopping behaviour, perception, and satisfaction show **statistically significant correlations ($p < 0.001$ in most cases)**, the **null hypothesis (H₀) is rejected** and the **alternative hypothesis (H₁) is accepted**.

CONCLUSION

AI awareness (QA) plays a crucial role in shaping consumer behaviour (QI), perception (QP), and satisfaction (QS), with shopping behaviour (QI) demonstrating the strongest correlation with satisfaction (QS) ($r = 0.742$, $p < 0.001$). This suggests that consumers who engage more actively in AI-driven shopping experiences tend to report higher satisfaction levels. Interestingly, demographic factors such as gender, age, education, occupation, and income do not significantly impact AI awareness, perception, or satisfaction, indicating that AI's influence is largely independent of traditional demographic distinctions. Given the substantial effect of AI-driven features on consumer behaviour, perception, and satisfaction, the null hypothesis (H₀) is rejected, and the alternative hypothesis (H₁) is accepted. This confirms that AI technologies play a pivotal role in shaping consumer experiences. AI-driven recommendations, chatbots, and security features enhance online shopping by providing personalized interactions, streamlining decision-making processes, and increasing consumer trust. Consumers who are more aware of AI and its functionalities tend to exhibit higher satisfaction, reinforcing the importance of AI-driven innovations in e-commerce. Despite the significant role of AI in improving consumer experiences, demographic factors do not appear to affect AI adoption in online shopping. This suggests that AI technologies are widely accepted across various consumer segments, highlighting their universal appeal and effectiveness. As AI continues to evolve, its ability to enhance shopping behaviour, perception, and satisfaction will likely strengthen, further solidifying its role in the digital commerce landscape.

ABSTRACT

Stroke is one of the primary causes of disabilities, which lead to limitation in the everyday activities of patients. Upper limb motor impairment is one of the major dysfunctions in stroke and very limited recovery is seen in most of the patients. This study aimed to compare the efficacy of Mirror therapy (MT) and Action observation therapy (AOT) along with conventional physical therapy in patients with stroke. It was a randomized comparative trial where 30 stroke patients aged between 40- 60 years were allocated into 2 groups, Group A (n=15) received MT and Group B (n=15) received AOT, additionally both the groups also received conventional physical therapy. The intervention period was 5 days per week for 3 weeks. The outcome measures used were Chedoke Arm & Hand Activity Inventory (CAHAI) and motor assessment scale (MAS) for assessment of the upper extremity motor function. Independent t-test found that both groups showed statistically significant improvement in upper limb motor function based on CAHAI and MAS scores. However, the AOT group had a greater improvement as compared to MT group. Such betterment was evidenced by the intragroup comparison of scores of pre-and post-treatment. AOT is a potential kind of treatment to enhance the motor function of the upper limb in patients with sub-acute stroke.

Keywords: Stroke, Mirror Therapy, Action Observation Therapy, Upper-Limb Motor Recovery, Upper-Limb Motor Function, mirror neuron

INTRODUCTION

Stroke is “rapidly developing clinical signs of focal (or global) disturbance of cerebral function, with symptoms lasting 24 hours or longer or leading to death, with no apparent cause other than of vascular origin”.[1] It is the major contributor of death & disability in the world. Majority of the patients become functionally dependent and experience difficulties in most of the activities of daily living after an episode of stroke. At least 85% of stroke patients experience hemiplegia and upper-extremity function of at least 69% of patients is damaged. Stroke causes damage to the nervous system which leads to motor & sensory dysfunction, spasticity, impaired mobility, increased tendon reflexes, lack of coordination, reduced contribution to society along with reduced opportunity to return to professional disability-adjusted life-year activities.[2] The most common sequel after stroke is the impairment of upper limb motor function and control, leading to restriction of activities such as reaching, grasping, and manipulation.[3,4] As a consequence patient lacks social participation and has reduced quality of life. Therefore recovery of upper extremity function is of utmost importance which can be achieved using targeted therapeutic intervention like Mirror Therapy and Action Observation Therapy. Both these treatment techniques work by activating the Mirror Neuronal System (MNS). The MNS is a class of neural substrates that discharges during action observation (AO) and action execution.[5,6]. The MNS is also associated with various human functions, such as motor preparation, motion imitation, language, and emotion recognition.[7] Mirror therapy is widely and effectively used rehabilitation approach where the reflection (visual input) of a moving non-affected limb gives the illusion of movement in the affected limb. This is achieved by placing a mirror between the arms or legs.[8] It activates brain neurons to their fullest potential for motor performance. This therapeutic method makes use of visual feedback in order to increase neuroplasticity changes and to induce motivation through this feedback throughout training.[9] The mirror neurons in our brain get activated when motions are imitated & these neurons further interact with motor neurons. By activating signals in areas of the brain including mirror neurons, MT is able to contribute to improvements in representation as well as motor movement of the affected limb.[10] AOT is a motor-based method that incorporates cognitive techniques for stroke motor recovery. Patients watch some movements and actions of healthy subjects on a video or a live show; afterwards, the patients should try to imitate and perform those actions.[11] When an action is performed and when it is observed, it stimulates the MNS through AOT leading to neural reorganization and motor relearning in response to various afferent inputs and visual feedback. AOT enhances motor learning and performance improving the upper limb function in stroke patients.[12] So it might be possible to change cortical motor representations as well as motor recovery of impaired limbs after stroke by the activation of MNS during the AOT process.[13] Therefore, the objective of this study was to compare two techniques namely MT (Mirror Therapy) with AOT (Action Observation Therapy) along with conventional physical therapy in improving the upper limb motor function in sub-acute stroke patients.

MATERIALS AND METHODS

It was an experimental study conducted in various hospitals & rehabilitation centres of Kamrup Metropolitan City, Guwahati, Assam. The study received ethical clearance from the Human Ethical Committee of The Assam Royal Global University. Inclusion Criteria were: Diagnosis of haemorrhagic or ischemic stroke, sub-acute stage (1 to 3 months post unilateral stroke onset), age between 40 & 60 years, Fugl Meyer Assessment baseline score between 20 & 60 and capability to participate in assessment sessions and study therapy. Exclusion Criteria were global or receptive aphasia, severe negligence, or health issues that influenced the utilization of the upper limbs or caused severe pain, impaired cognition (MMSE<21) and visual impairments.

Procedure

Each group received three weeks of MT (Group A) and AOT (Group B) along with conventional physical therapy for 5 days per week for 3 weeks with each session lasting for 60 minutes approximately. They were informed about the do's & don'ts during the intervention period on the 1st day of the intervention. The two outcome measures i.e. CAHAI & MAS were taken at baseline (day '0') and on the 15th day i.e. immediately after treatment. Table 1, 2 & 3

illustrates the exercises performed in both the groups. In Mirror Therapy, a mirror was positioned in the patient's mid sagittal plane as part of the MT treatment protocol. The participants were instructed to see the reflection of unaffected arm movements in a mirror as if it had been the affected arm. The participants in AOT were frequently instructed to watch and carefully notice the actions carried out by the healthy people in the videos (observation phase) and after that physically practice similar actions (execution phase). Range of motion exercises for the elbow, wrist, hand & fingers were performed along with action oriented & task oriented exercises for the upper limb in both the groups using a mirror box (Group A) & a computer (Group B) respectively

RESULTS

SPSS (Statistical Package of Social Sciences) version 27 was utilized to check the results with a significance level of 95%. All the quantitative variables were tallied among the 2 groups by utilizing the independent t-test to check whether the pre and post-intervention CAHAI & MAS scores differ significantly (p -value <0.001). Based on CAHAI and MAS results, both groups showed statistically significant improvement in upper limb motor function. Such betterment was evidenced by the intragroup comparison of pre-and post-treatment scores with a p -value <0.001 . Table 3. shows that a Cohen's d value of 1.458 implies that the mean difference in the increase of CAHAI score after intervention between Group A and Group B was large, approximately 1.458 times the pooled standard deviation. This suggests a substantial and significant difference in the effectiveness of the intervention in improving CAHAI scores. Group B was significantly better in increasing CAHAI scores compared to Group. A Cohen's d value of 1.349 implies that the mean difference in the increase of MAS score (Table 4) after intervention between Group A and Group B is large, approximately 1.349 times the pooled standard deviation. This suggests a substantial and significant difference in the effectiveness of the intervention in improving MAS scores. Group B was significantly better at increasing MAS scores compared to Group A. Table 5 shows that the total scores on the CAHAI and MAS saw a bigger increase in the group that participated in AOT than they did in the MT group.

DISCUSSION

Patients who have suffered a stroke almost always experience paralysis in their upper limbs. Because of this, functional activities are limited, and more than half of all hemiplegic patients experience either long-term or permanent disability in functioning of the arm following a stroke. In this context, the functionality of the upper limbs is essential for the execution of specific activities, and the therapeutic value of this aspect should be highlighted within the context of rehabilitation programs.[14,15]. The objective of this research was to assess and contrast the effectiveness of MT and AOT with regard to upper limb motor function. The sub-acute stroke patients were split into two groups to assess the efficacy of two different treatment methods i.e., MT ($n=15$) and AOT ($n=13$) with CAHAI (Chedoke Arm and Hand Activity Inventory) and MAS (Motor Assessment Scale) as outcome measures. Both the groups showed statistically significant improvement in functional ability and motor control of upper limb function however the AOT group showed better results. (p -value <0.001) The mirror therapy group showed notable amount of progress after three weeks in the upper limb function with mirror box. In order to regain functional ability that has been impaired as a result of stroke, MT uses the brain's capacity to reorganize itself through a process known as neuroplasticity, despite the fact that the particular processes by which they occur are not fully understood.[16,17]. Garry *et al* performed transcranial magnetic stimulation during mirror illusions on healthy subjects and demonstrated that movement of normal hand activates the primary motor cortex excitability, that controls the affected hand (which is hidden behind the mirror).[18] When the movements of the reflected hand are noticed, the Mirror Neuronal System (MNS) is able to activate motor procedure, and it can even be the reason for the hand that is hidden from view behind the mirror to move. In addition, the MNS is responsible for controlling movement while attempting to move both hands at the same time. This aspect of the system contributes to an improvement in bimanual spatial coupling when the job at hand requires the use of both hands. In addition, the movement of both sides of the body through the illusion created by the mirror caused neuronal activation in the region of the brain that is responsible for alertness as well as spatial awareness.[19] Our findings that MT shows effectiveness in promoting

**Ranjit Tiwari and Sonia Lakhotia**

motor recovery in the upper limb are supported through outcomes of the earlier research that examined the impact of MT & virtual movement training on upper limb function in chronic stroke patients. This research found that both treatments resulted in an improvement of more than the 33 percent in upper-limb FMA items. (Stevens JA *et al.* 2003). [20] The Action observation therapy group experienced a significant boost in muscle control, co-ordination and range of motion. The reason is that when brain makes an effort to imagine, observe, or carry out an action, a certain type of visuomotor neuron called mirror neuron is engaged. The activation. of motor neurons in the spinal cord & cerebral cortex can occur through both passive observation and the imitation of an activity. The mirror neuronal system plays a crucial role in improvement of the upper limb function.[21, 22] A 2014 study by Patrizio Sale *et al.* explored the clinical impact of action observation (AO) on upper limb functional recovery in sub-acute stroke patients. They randomly assigned 67 ischemic stroke subjects. Fugl-Meyer (FM) and Box and Block Test (BBT) were used to measure hand function recovery. It was concluded that AOT in the sub-acute period increases dexterity recovery in right-hemisphere stroke patients.[23]. Action observation treatment was found to be an effective method for enhancing arm and hand motor function, gait velocity, walking ability, and regular activity performance in patients who experienced a stroke, according to a study conducted by Peng *et al.* in 2019.[24]The findings of Mauro Mancuso *et al.*, 2021 proposed that AOT contributed to improved motor recovery in sub-acute stroke patients who have moderate to severe upper limb damage in the initial phase after experiencing the stroke.[25] This concept aligns with the findings in our current study, particularly regarding the improvement showed by the use of action observation therapy. The possible reasons for the higher improvement shown by action observation therapy group as compared to the MT group could be visual feedback with activation of motor neurons in the spinal cord & cerebral cortex. These in association with continuous motivation by visual assessment of the result showed gradual improvement in upper limb movement and control. Mirror neurons theory gives the theoretical basis of improvement in action observation therapy. AOT is an effective intervention for improving post-stroke upper limb function.[26.27] AOT promotes increased upper limb motor recovery compared to task-oriented training. Improvement in FMA-UE scores was seen in subacute stroke with moderate to severe impairments ($p < 0.05$).[28] Meaningful action observation training could possibly enhance the effects of activity/occupation-based interventions on occupational performance and satisfaction, as well as cortical-spinal excitability.[29] Improvements in upper limb motor function were seen in both the outcome measures following AOT and mirror treatment. In sub-acute stroke patients, AOT appears to be a potential way of treatment that could improve upper limb motor function.

Limitations and future recommendation

The sample size was small. There was no follow-up for the patients. The study was confined to stroke patients in the sub-acute stage only, acute or chronic stages of stroke were not included. Further studies can be conducted with a larger population with long-term follow-up and on different stages of stroke.

Table.1: Action-oriented exercises for Upper limb

1.	Squeezing and releasing the fist	Repeat 3 sets of 15 reps
2.	Opening and closing of the hand	Repeat 3 sets of 15 reps
3.	Tapping of the fingers on the table	Repeat 3 sets of 15 reps
4.	Oppose (touching) each finger to the thumb one by one	Repeat 3 sets of 15 reps
5.	With the hand closed, lifting each finger, including the thumb, one at a time	Repeat 3 sets of 15 reps

Table.2: Task-oriented exercises for the Upper limb

1.	“Handle objects using different types of grips, turning objects in the hand (complex rotation), pick up different small objects (beads or paper clips), put clothes pegs on the lip of a cup, insert pegs in a board, etc	Repeat 3 sets of 15 reps
2.	Grasp and release objects with different textures (balls, sponges, etc.)	Repeat 3 sets of 15 reps
3.	Pick up and move various objects (balls, sticks, cubes, cup etc.) in different directions and in different pathways/sequences in order to complete the goal of a game	Repeat 3 sets of 15 reps
4.	Turn over playing card	Repeat 3 sets of 15 reps
5.	Colour, connect the dots to make a drawing, copy shapes on a piece of paper	Repeat 3 sets of 15 reps
6.	Wipe, clean and dust the table with cloths with different textures (scouring pad, soft sponge, silk cloth, etc.)	Repeat 3 sets of 15 reps”

Table.3: Conventional Physiotherapy

1.	Passive and active-assisted range of motion exercises of the hip (flexion, extension, abduction, and adduction)	Repeat 2 sets of 10 reps
2.	Passive and active-assisted range of motion exercises of the knee (flexion and extension),	Repeat 2 sets of 10 reps
3.	Passive and active-assisted range of motion exercises of the ankle (dorsiflexion, plantar flexion, eversion, and inversion).	Repeat 2 sets of 10 reps
4.	Bridging exercises.	Repeat 3 sets of 3 reps
5.	Prolonged and gradually progressive stretching of hamstrings, calf, and quadriceps.	Repeat 3 sets of 3 reps
6.	Balance and coordination exercises- One leg stand, heel walking & toe walking	Repeat 2 sets of 3 reps

Table.4: CAHAI score comparison between Group A & Group B

Groups	Parameters	Mean	Std. Deviation	Correlation (p-value)	t-test (p-value)	Cohen's d
Group A (Mirror Therapy)	Pre intervention	38.80	3.19	0.899 (<0.001)	11.421 (<0.001)	2.949
	Post intervention	43.00	3.16			
Group B (Action Observation Therapy)	Pre intervention	37.20	2.68	0.461 (0.084)	9.472 (<0.001)	2.446
	Post intervention	45.00	3.36			

Table.5: MAS score comparison between Group A & Group B

Groups	Parameters	Mean	Std. Deviation	Correlation (p-value)	t-test (p-value)	Cohen's d
Group A (Mirror Therapy)	Pre intervention	34	2	0.939 (<0.001)	5.123 (<0.001)	1.323
	Post intervention	35	2			
Group B (Action Observation Therapy)	Pre intervention	34	2	0.686 (0.005)	7.690 (<0.001)	1.986
	Post intervention	36	1

ABSTRACT

The approval of paediatric vaccines presents unique regulatory challenges due to the need to balance stringent safety requirements with ethical and logistical complexities. Unlike adult vaccines, paediatric vaccines must account for physiological and immunological differences in children, necessitating age-stratified clinical trials and specific formulations. Ethical concerns, such as obtaining informed consent from guardians and ensuring minimal risk to participants, further complicate trial designs. Regulatory frameworks, including the Paediatric Research Equity Act (PREA) in the U.S. and Paediatric Investigation Plans (PIPs) in Europe, mandate comprehensive paediatric-specific studies, which often prolong the approval process. Key challenges include recruiting participants for paediatric trials, managing public hesitancy stemming from safety concerns (e.g., the Dengvaxia controversy), and harmonizing global regulatory standards. Despite advancements, such as accelerated pathways for urgent vaccines like COVID-19, paediatric vaccines often face delays in market entry due to the need for extended safety and efficacy monitoring. Collaborative global efforts, innovative trial designs, and robust post-marketing surveillance are essential to overcoming these obstacles and ensuring timely access to life-saving immunizations for children.

Keywords: Paediatric Research Equity Act (PREA), Paediatric Investigation Plans (PIPs), Regulatory Challenges, Paediatric Vaccines, Ethical Considerations, Clinical Trials

INTRODUCTION

Regulatory Challenges in Paediatric Vaccine Approval

Developing and approving paediatric vaccines is a complex process governed by stringent regulatory standards aimed at ensuring safety, efficacy, and ethical compliance. Unlike vaccines for adults, paediatric vaccines face unique challenges due to the physiological, immunological, and developmental differences in children, as well as ethical considerations in conducting clinical trials. Regulatory agencies, including the FDA, EMA, and WHO, have developed frameworks to address these challenges, but the process remains arduous and lengthy.

Key Regulatory Challenges:

1. Ethical Considerations in Paediatric Trials

Informed Consent: Children cannot provide informed consent, requiring parental or guardian authorization. Balancing parental rights with the child's best interests adds complexity to trial design.

Trial Safety: Regulators require evidence that trials minimize risk, leading to delayed inclusion of paediatric populations until adult safety data is available.

Placebo Use: Ethical dilemmas arise in withholding effective treatments, particularly for life-threatening diseases.

Paediatric-Specific Safety and Immunogenicity Data

Children have distinct immune responses compared to adults, necessitating separate studies to determine optimal dosage, schedule, and formulations. Adverse event profiles can differ significantly in children, requiring larger and more prolonged studies to ensure safety.

Regulatory Requirements

Paediatric Investigation Plans (PIPs) in Europe and the Paediatric Research Equity Act (PREA) in the U.S. mandate the development of vaccines for paediatric populations. Stringent requirements for age-stratified data, from neonates to adolescents, often prolong the approval process.

Logistical Challenges

Recruiting participants for paediatric trials is challenging, as parents may hesitate to enroll their children due to perceived risks. Maintaining compliance with vaccination schedules during trials requires meticulous planning and coordination.

Global Regulatory Harmonization

Vaccine developers must navigate differing regulatory requirements across countries, complicating global paediatric vaccine approval.

Public Trust and Vaccine Hesitancy

Paediatric vaccines face heightened scrutiny due to their target population, where public backlash can significantly impact acceptance (e.g., the Dengvaxia controversy).

Examples of Paediatric Vaccine Regulatory Challenges:

RSV Vaccines: Past trials for RSV vaccines in infants led to severe adverse effects, delaying further development for decades. **HPV Vaccine Extension:** Expanding HPV vaccine use to younger age groups required significant data on long-term safety and efficacy. **COVID-19 Vaccines:** Paediatric trials were delayed until sufficient adult safety data was collected, resulting in staggered approvals.

1. **Preclinical Research:** Laboratory experiments are conducted to evaluate fundamental vaccine mechanisms, immunogenicity, and toxicity using animal models, typically mice and primates.

Ashish and Koushik

2. **IND Application:** The developer of the vaccine submits an Investigational New Drug (IND) application to the regulatory agency (such as the FDA), seeking permission to advance to human clinical trials. The regulatory agency reviews preclinical data to assess if the vaccine is safe for human trials.
3. **Phase I Trials:** Emphasizes on ensuring safety. The vaccine is usually tested on a small group of healthy adults, and sometimes older children (if paediatric trials start early). This stage is essential to establish the safety of the vaccine and determine the appropriate dosage.
4. **Phase II Trials:** Increased testing on a bigger sample size (multiple hundred) possibly involving children in the specified age range. The main focus of this stage is to examine the immune response, determine the best dosage, and ensure the safety of the vaccine in a larger group of people.
5. **Phase III Trials:** More expansive and varied groups of children are being included to test the vaccine's ability to prevent illness and ensure its safety in paediatric populations. This stage frequently includes numerous participants from different regions and populations.
6. **NDA/BLA Submission:** Following the clinical trials, a comprehensive submission is sent to the regulatory agency. This covers information from every stage of testing (I-III), production methods, and suggested product packaging. It also involves the implementation of pharmacovigilance strategies to oversee post-approval adverse reactions.
7. **Regulatory Review:** Regulatory bodies (such as the FDA) meticulously examine every piece of data available. They frequently consult with independent expert advisory committees to confirm that the benefits of the vaccine exceed its risks, especially among children.
8. **Approval Decision:** If the vaccine is approved after the regulatory review, it can be used for paediatric patients. Nevertheless, in certain scenarios, like during an emergency use authorization, the vaccine might be subject to additional surveillance or granted conditional approval.
9. **Post-Marketing Surveillance (Phase IV):** Ongoing observation of how the vaccine works outside of clinical trials, particularly to detect any uncommon adverse reactions. Systems such as the Vaccine Adverse Event Reporting System (VAERS) in the U.S. are used to monitor vaccines.
10. **Ongoing Assessment and Reauthorization:** Continuous assessment is necessary to guarantee ongoing safety and effectiveness, including regular reviews of reports on adverse events. Changes to recommendations or dosing may happen if new safety issues emerge.

Table1: Key Differences Between General and Paediatric Vaccine Development Table 2: Comparison of Regulatory Agency Fees and Considerations for Vaccine Approvals Table 3: Regulatory Application Fees and Considerations for General and Paediatric Vaccines

Key Observations

1.Fee Exemptions for Public Health Needs:

- o Many agencies (e.g., FDA, EMA, Health Canada) offer fee waivers or reductions for paediatric vaccines addressing priority health conditions or part of public health programs.

2.No Explicit Differentiation in Standard Fees:

- o Some regulatory bodies (e.g., WHO, PMDA) do not differentiate between general and paediatric vaccine application fees.

3.Paediatric Incentives:

- o Paediatric vaccines often benefit from regulatory incentives such as reduced fees, expedited reviews, and additional guidance (e.g., EMA's **Paediatric Regulation**, FDA's **Paediatric Exclusivity** provisions).

Table 4: Comparison of Development Timelines for General and Paediatric Vaccines

Regulatory Challenges for Paediatric Vaccines

1.Ethical Constraints:

- o Due to their vulnerability, clinical trials involving children must adhere to stringent ethical guidelines.
- o the requirement for proxy consent from parents or guardians adds difficulty.

**Ashish and Koushik****2.Age-Specific Testing:**

Multiple subgroups (such as infants, toddlers, and adolescents) are sometimes needed in paediatric studies in order to account for variations in immunological responses that occur with developmental stages. Adults have different dose optimization requirements for safety and effectiveness.

3.Immunization Schedules:

o Paediatric vaccinations need to be compatible with co-administered vaccines and follow current immunization schedules.

4.Long-Term Safety:

o To track long-term effects, regulators require comprehensive post-market studies, especially for innovative vaccination platforms like mRNA.

5.Global Health Priorities:

o Vaccines for childhood diseases including pneumococcal infections and rotavirus must be available and reasonably priced in low-income areas.

Table 5: Key Differences Between General and Paediatric Vaccine Development Aspects

Clinical Trial Design

A strict structure is used for designing clinical trials for paediatric vaccines in order to guarantee safety, effectiveness, and ethical compliance. Because of their physiological, immunological, and developmental variations from adults, paediatric populations provide particular problems. In order to handle this complexity and comply with ethical and legal requirements, trial designs must be customized. Figure 2: Strategies for Paediatric Vaccine Approval Table 6: Vaccine Submission and Approval Trends (2019–2024) Figure 3: FDA Vaccine Approval Trends (2019–2024): Total, Approved, and Paediatric Vaccines Figure 4: FDA Vaccine Rejection Trends (2019–2024): Total, Rejected, and Paediatric Vaccines Table 7: Vaccine Submission and Approval Trends by Year (2019–2024) Figure 5: EMA Vaccine Approval Trends (2019–2024): Total, Approved, and Paediatric Vaccines Figure 6: Annual Vaccine Submissions and Rejections by EMA: Total and Paediatric Vaccines (2019-2024*)

Case Studies**Pfizer's Respiratory Syncytial Virus (RSV) Vaccine for Infants**

In 2020, the FDA did not approve Pfizer's RSV vaccine for infants and young children after an application was filed for approval. The agency requested more safety data from ongoing studies and did not approve the vaccine at that time for broader use in paediatric populations.

AstraZeneca COVID-19 Vaccine for Children:

AstraZeneca's Vaxzevria vaccine faced delays in approval for pediatric populations, especially after reports of blood clotting issues in younger adults. The vaccine was not initially approved for use in children in many countries, including the U.S., due to these safety concerns.

Sanofi and GlaxoSmithKline's COVID-19 Vaccine:

In 2022, Sanofi and GSK's COVID-19 vaccine also faced delays in approval, including for paediatric populations, due to a request from the FDA for additional safety and efficacy data. They did not face outright rejection, but their development timeline for children was extended.

SARS-CoV2 prefusion spike delta TM (CoV-2 preSdTM) augmented with AS03:

Decision by the European Medicines Agency (EMA) dated February 14, 2022, concerning changes to a pediatric investigation plan for a COVID-19 vaccine created by Sanofi Pasteur.

The vaccine is named "SARS-CoV2 prefusion spike delta TM (CoV-2 preSdTM) augmented with AS03."

- It is given through an intramuscular injection.

- The item is marked as "no longer permitted"

Target group: Individuals from birth up to but not including 18 years old

**Ashish and Koushik****Comprises two clinical trials**

Study 1 (VAT00003): A randomized, altered double-blind controlled trial comparing the vaccine to an active comparator or a placebo.

Study 2 (VAT00009): An open-label, non-controlled investigation targeting immunocompromised pediatric subjects.

- The completion of the plan is anticipated by March 2025.
- Comprises a postponement for certain actions
- No issues were raised about possible long-term safety/effectiveness concerns.
- The decision was directed to Sanofi Pasteur located in Lyon, France.

The change was proposed on November 22, 2021.

The Pediatric Committee evaluated and approved the suggested modifications.

The choice is in accordance with several EU regulations, such as Regulation (EC) No 1901/2006.

This document represents a formal acceptance of modifications to an existing paediatric investigation plan, though it's worth noting that the medicinal product is no longer authorized^[16]

RESULTS

Paediatric vaccines: 12-18 years average development time, with longer regulatory review periods

Approval Trends (2019-2024)**FDA:**

- Higher overall approval rates for general vaccines compared to paediatric vaccines
- Increasing trend in total vaccine submissions (12 in 2019 to 20 in 2023)
- Paediatric vaccine approvals remained relatively stable (2-5 per year)

EMA

- Similar pattern of increasing submissions (8 in 2019 to 17 in 2023)
- Lower overall submission numbers compared to FDA
- Consistent paediatric vaccine approval rates (1-4 per year)

Key Challenges Identified:

- Ethical constraints due to children's vulnerability
- Need for age-specific testing across multiple subgroups
- Complexity of integrating with existing immunization schedules
- Stringent long-term safety monitoring requirements
- Cost and accessibility concerns, especially in low-income regions

CONCLUSION

Paediatric vaccine development presents a complex regulatory landscape characterized by stringent safety protocols, extended timelines, and comprehensive ethical oversight, particularly when compared to general vaccines. While regulatory bodies offer financial incentives through fee waivers and reductions for public health priorities, the process demands specialized trial designs and age-stratified testing to account for developmental differences across paediatric populations. Enhanced long-term safety monitoring requirements, though leading to delayed approvals, are crucial for ensuring vaccine safety in vulnerable populations. The challenge lies in balancing these rigorous standards with the need for timely, affordable access to vaccines, especially in developing regions, highlighting the global significance of efficient paediatric vaccine development and approval processes.

Ashish and Koushik

1. Regulatory Complexity

- Paediatric vaccine development faces more stringent requirements and longer timelines compared to general vaccines. Additional ethical oversight and safety considerations significantly impact the approval process.

2. Cost Implications

Various regulatory bodies offer fee waivers or reductions for paediatric vaccines. Special considerations exist for vaccines addressing public health priorities.

3. Development Considerations

Age-stratified testing requirements add complexity. Need for specialized trial designs to account for developmental differences. Importance of compatibility with existing vaccination schedules.

4. Safety Priority

Enhanced focus on long-term safety monitoring for paediatric populations. Stricter safety requirements often lead to delayed approvals compared to adult versions.

5. Global Impact

Need for balanced approach between rigorous safety standards and timely access. Importance of maintaining affordability and accessibility, especially in developing regions.

Table.1: Key Differences Between General and Paediatric Vaccine Development

Aspect	General Vaccine Development	Paediatric Vaccine Development
Target Population	Adults or general population (e.g., elderly, specific risk groups).	Specific paediatric age groups (e.g., neonates, toddlers, adolescents).
Preclinical Research	Animal models generally include adult specimens to assess safety and efficacy.	Additional studies on younger or developing animal models may be required to evaluate age-specific responses.
Phase 1 Clinical Trials	Small group of healthy adult volunteers to assess safety and dosage.	Rarely initiated directly in children; may follow safety validation in adults.
Phase 2 Clinical Trials	Larger group, generally includes adults or broader target populations.	Conducted in paediatric subgroups stratified by age (e.g., infants, toddlers, adolescents).
Phase 3 Clinical Trials	Large-scale trials, often involving thousands of participants across diverse demographics.	Trials are often smaller; require precise age-specific safety and efficacy data, including immune response maturation.
Trial Initiation	Can be initiated in the target population directly if preclinical data supports safety.	Delayed until adult safety data is available due to ethical concerns for children.
Dosage Considerations	Standardized for adults or adjusted based on weight and metabolism.	Dosage must be optimized for developmental stages and smaller body weights.
Regulatory Requirements	Submission focuses on general population safety and efficacy.	Requires a Paediatric Investigation Plan (PIP) in some regions (e.g., EMA). Additional ethical and safety

Ashish and Koushik

		data for children are mandatory.
Approval Timeline	May be faster as adult populations are less vulnerable and require fewer ethical considerations.	Often slower due to additional paediatric-specific studies and ethical approvals.
Special Ethical Oversight	Fewer restrictions as long as informed consent is obtained.	Strict ethical review to minimize risks; informed consent from guardians is mandatory.
Immunogenicity Testing	Focuses on achieving robust immunity across age ranges.	Must consider age-related immune system maturity and potential interference with maternal antibodies in young infants.
Post-Approval Monitoring	Standard pharmacovigilance systems apply.	More intensive monitoring for long-term safety and rare side effects in paediatric populations.
Fee Structure	Standard regulatory fees based on application type.	Some agencies (e.g., FDA, EMA) offer reduced fees or waivers for paediatric vaccines addressing public health needs.
Regulatory Guidance	General vaccine guidelines (e.g., FDA, WHO).	Requires compliance with additional paediatric-specific regulations (e.g., EMA's Paediatric Regulation).
Emergency Use Pathways	Expedited pathways are often available.	Emergency pathways may apply but typically lag behind adult vaccines due to safety prioritization.

Table.2: Comparison of Regulatory Agency Fees and Considerations for Vaccine Approvals

Regulatory Agency	Country	Application Fee	Additional Considerations
<i>FDA</i>	United States	\$3,510,218 (Standard) / \$1,755,109 (Small Business)	Paediatric vaccines may be exempt from PDUFA fees under Vaccines for Children Program Additional costs for facility inspections and manufacturing site approvals
<i>EMA</i>	European Union	€296,900 (2024)	Discounts/waivers for paediatric medicines under Paediatric Regulation Reduced fees/waivers for SMEs and priority health issues Paediatric Investigation Plan submission required
<i>WHO Prequalification</i>	Global	\$25,000 dossier assessment fee	Possible additional inspection fees
<i>Health Canada</i>	Canada	CAD \$396,430 (Full New Drug Submission)	Fee waivers possible for public health priorities and special access programs
<i>PMDA</i>	Japan	¥21,000,000 (New vaccine approval)	Post-approval annual fees and periodic inspections
<i>TGA</i>	Australia	AUD \$280,000	Waivers/reductions possible for orphan drugs and public health initiatives

Ashish and Koushik

Table.3: Regulatory Application Fees and Considerations for General and Paediatric Vaccines

Regulatory Body	Application Fee for General Vaccines	Application Fee for Paediatric Vaccines	Differences/Notes
FDA (USA)	\$3,510,218 for a Biologics License Application (BLA) (FY 2024).	Generally, exempt under the Vaccines for Children (VFC) program.	Paediatric vaccines are often fee-exempt if included in the VFC program; otherwise, fees are the same.
EMA (Europe)	€296,900 (as of 2024). This fee covers the evaluation of a marketing authorization application (MAA) for vaccines.	Fee reductions or waivers for paediatric vaccines under the Paediatric Regulation.	Paediatric vaccines addressing priority health needs or rare diseases may qualify for significant discounts.
Health Canada	CAD \$396,430 (~\$290,000 USD) for a New Drug Submission (NDS).	Fee waivers or reductions may apply for public health priorities.	Paediatric vaccines targeting critical public health needs may receive special consideration.
PMDA (Japan)	¥21,000,000 (~\$140,000 USD) for new vaccine approval.	No specific differentiation in standard fees.	Paediatric vaccines do not have explicit fee waivers, but fees are consistent with general vaccine submissions.
TGA (Australia)	AUD \$280,000 (~\$181,000 USD) for vaccine evaluation.	Waivers or reductions for vaccines addressing public health priorities, including paediatric needs.	Paediatric vaccines for public health issues may benefit from reduced fees.
WHO Prequalification	\$25,000 dossier assessment fee for general vaccines.	Same as general vaccine fees.	No fee differentiation specifically for paediatric vaccines.
MHRA (UK)	£103,000 (~\$128,000 USD) for new vaccine evaluation.	Fee reductions for vaccines that benefit public health, including paediatric vaccines.	Similar to EMA, fee reductions may apply for paediatric vaccines addressing unmet needs.

Table.4: Comparison of Development Timelines for General and Paediatric Vaccines

Stage	General Vaccines	Paediatric Vaccines
Preclinical Research	1–5 years	1–5 years (based on adult studies)
Clinical Trials	6–10 years	5–10 years
Regulatory Review	1–2 years	1–3 years (stricter scrutiny)
Total Development Time	10–15 years (average)	12–18 years (average)

Ashish and Koushik

Table.5: Key Differences Between General and Paediatric Vaccine Development Aspects

Aspect	General Vaccines	Paediatric Vaccines
Target Population	General population	Infants, children, and adolescents
Trial Size	Large, diverse groups	Age-stratified cohorts
Ethical Concerns	Standard ethical requirements	Higher scrutiny due to vulnerability
Approval Timeframe	Accelerated during pandemics	Slower due to stricter safety reviews
Dosing	Standard adult doses	Age- and weight-specific doses

General and Paediatric Vaccine Development Aspects

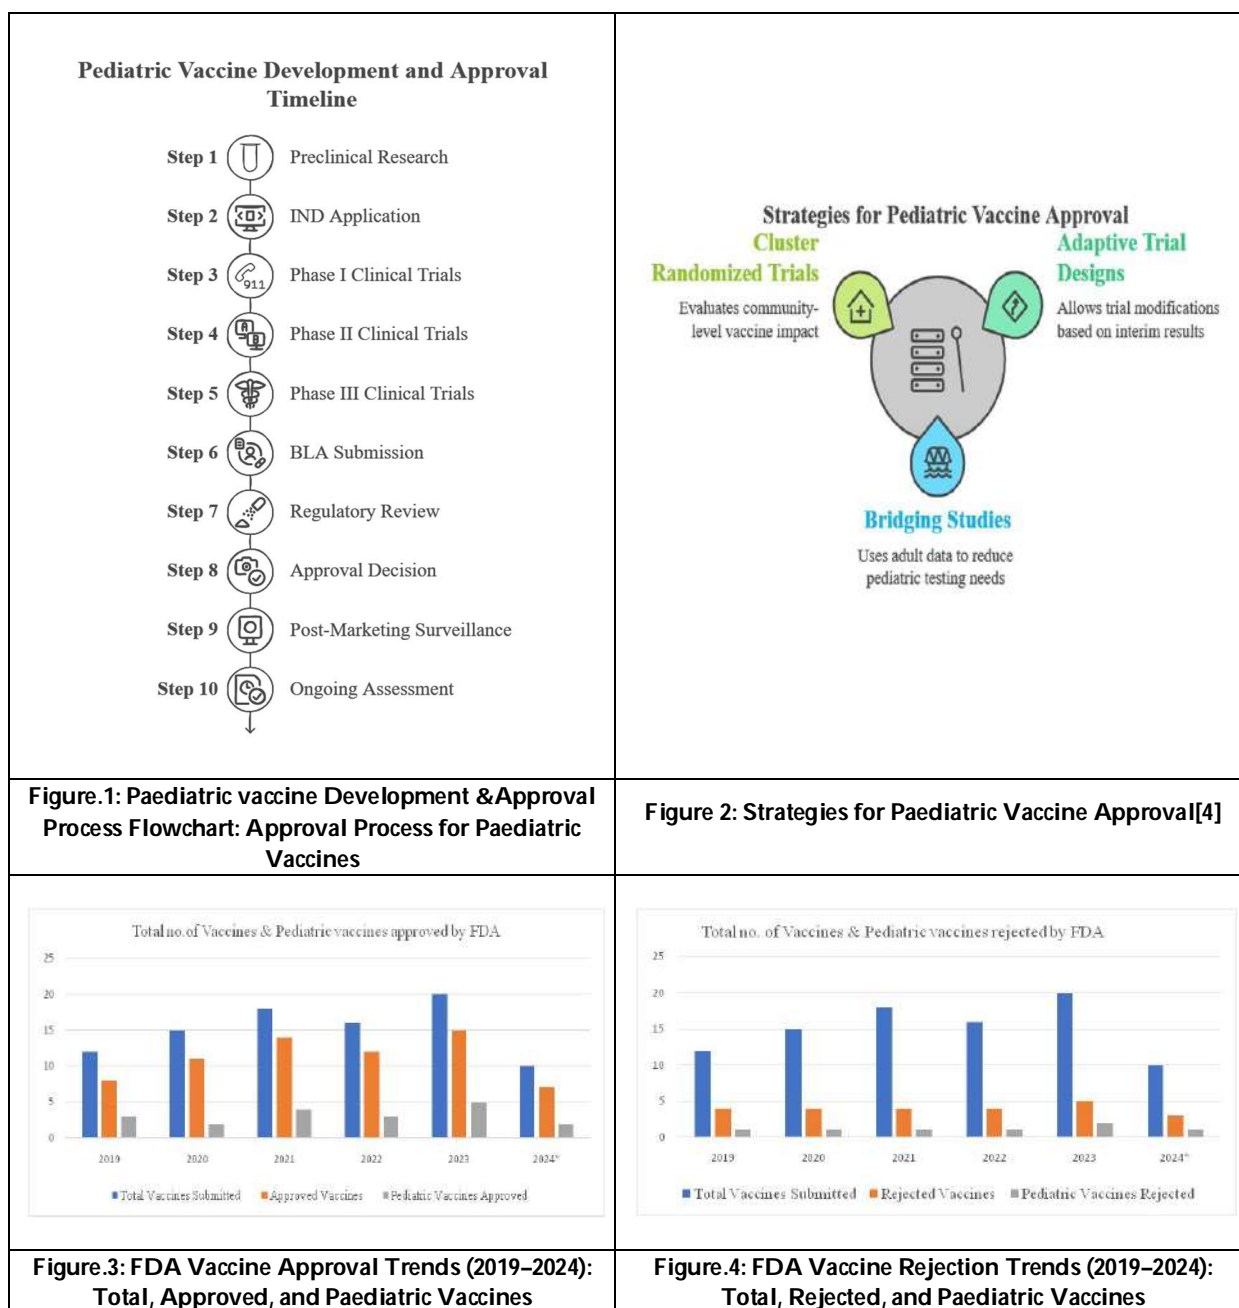

Table.6: Vaccine Submission and Approval Trends (2019–2024) Vaccine vs Paediatric vaccines (FDA)

Year	Total Vaccines Submitted	Approved Vaccines	Rejected Vaccines	Paediatric Vaccines Approved	Paediatric Vaccines Rejected	Notable Vaccines
2019	12	8	4	3	1	Influenza vaccines, HPV vaccines
2020	15	11	4	2	1	COVID-19 initial vaccines
2021	18	14	4	4	1	Pediatric COVID-19 vaccines
2022	16	12	4	3	1	RSV vaccines

ABSTRACT

Rheumatoid arthritis (RA) is a debilitating chronic inflammatory disease primarily affecting the joints, leading to pain and significant mobility issues. Leflunomide is an effective immunomodulatory drug used in RA treatment, but its clinical application is often hampered by poor bioavailability and side effects from oral administration. Advances in nanotechnology have introduced nanoemulgels as a novel delivery system to potentially overcome these limitations. This review paper examines the development, characterization, and therapeutic efficacy of nanoemulgel-based delivery systems for leflunomide in the management of RA. The benefits of nanoemulgels, such as enhanced drug solubility, improved dermal penetration, and sustained release, are discussed in detail, highlighting their role in increasing bioavailability and minimizing systemic adverse effects. The paper also covers the methods of preparation, evaluation techniques, and the effectiveness and safety of leflunomide-loaded nanoemulgels. Additionally, the review addresses the current obstacles and future directions in the field, underscoring the necessity for further clinical research to validate the therapeutic advantages of this delivery system. The adoption of nanoemulgel-based leflunomide delivery in RA treatment protocols has the potential to significantly improve patient outcomes by providing a more efficient and safer alternative to traditional therapies.

Keywords: Rheumatoid arthritis (RA), Leflunomide, Nanoemulgel, Immunomodulatory drugs, Dermal penetration, Nanotechnology.

INTRODUCTION TO LEFLUNOMIDE

Leflunomide is a key medication in the management of autoimmune diseases, particularly rheumatoid arthritis (RA). Introduced to the market in 1998 under the brand name Arava, leflunomide has become an essential part of therapeutic regimens aimed at modifying disease progression and managing symptoms in various autoimmune conditions.[1]

Chemical Structure and Mechanism of Action

Leflunomide is classified as a pyrimidine synthesis inhibitor and acts as a prodrug, meaning it is converted into its active metabolite, teriflunomide, in the body. The chemical structure of leflunomide is defined by its hydantoin core with a trifluoromethyl group, enhancing its efficacy and selectivity.[2] Teriflunomide specifically inhibits dihydroorotate dehydrogenase (DHODH), an enzyme crucial for the de novo synthesis of pyrimidine nucleotides. This inhibition results in a decrease in the proliferation of activated lymphocytes, which play a central role in autoimmune inflammation. Consequently, leflunomide effectively modulates the immune response and reduces the production of inflammatory cytokines.[3]

Clinical Applications

Leflunomide's primary indication is the treatment of rheumatoid arthritis, a chronic inflammatory disorder characterized by joint pain, swelling, and potential joint damage. Clinical studies have shown that leflunomide is effective in reducing symptoms and slowing disease progression in RA patients.[4] In addition to RA, leflunomide is utilized for other conditions such as psoriatic arthritis, where it helps manage skin and joint symptoms. Its application in systemic lupus erythematosus is also under investigation, reflecting its broad potential in autoimmune disease management.[2]

Pharmacokinetics and Dosage

Leflunomide is administered orally, with good bioavailability and peak plasma concentrations achieved approximately 6-12 hours after ingestion. The drug's pharmacokinetics is characterized by a long half-life, approximately two weeks, due to the prolonged presence of its active metabolite, teriflunomide. The typical dosing regimen includes an initial loading dose of 100 mg daily for the first three days, followed by a maintenance dose of 20 mg daily. This dosing strategy aims to achieve rapid therapeutic levels while minimizing the risk of adverse effects.[4]

Safety and Side Effects

While leflunomide is effective, it is not without its risks. Common adverse effects include gastrointestinal disturbances such as diarrhea and nausea, along with dermatological reactions. More serious concerns involve hepatotoxicity and teratogenic effects. Regular monitoring of liver function tests is recommended to mitigate the risk of liver damage. Additionally, leflunomide should be avoided during pregnancy due to its potential to cause harm to the developing fetus. These safety considerations are crucial for ensuring the effective and safe use of leflunomide in clinical practice.[1]

Conclusion

In summary, leflunomide is a significant DMARD with a distinct mechanism of action involving the inhibition of pyrimidine synthesis. Its effectiveness in treating rheumatoid arthritis and other autoimmune conditions underscores its importance in therapeutic regimens. Ongoing research continues to explore its full potential and optimize its use across different autoimmune diseases.

Introduction to Nanoemulgel

Nanoemulgels represent a cutting-edge drug delivery system that merges the benefits of nanotechnology with those of hydrogels. This combination involves incorporating nanoemulsions within a gel matrix, which capitalizes on the enhanced solubility and bioavailability offered by nanocarriers and the localized, controlled release characteristics of hydrogels. Such a hybrid formulation is particularly effective for the delivery of poorly water-soluble drugs, providing a sustained therapeutic effect while minimizing systemic side effects. Nanoemulsions are stable isotropic mixtures comprising oil, water, and surfactants, typically with droplet sizes ranging from 20 to 200 nm. These systems significantly improve drug solubilization and protect drugs from degradation, making them suitable for delivering hydrophobic drugs. Despite their advantages, the low viscosity of nanoemulsions can limit their application in topical and transdermal therapies where prolonged site contact is necessary.[5, 6] On the other hand, hydrogels are three-dimensional, hydrophilic polymer networks that can retain large quantities of water or biological fluids. Their gel-like consistency ensures good adhesion to the skin or mucous membranes, creating a reservoir for the sustained release of the encapsulated drug. When nanoemulsions are incorporated into a hydrogel matrix, the resulting nanoemulgels combine the high drug-loading capacity and enhanced penetration of nanoemulsions with the extended residence time and controlled release properties of hydrogels.[7, 8] This synergistic approach not only enhances the pharmacokinetic profile of drugs such as leflunomide but also improves patient compliance through a non-invasive and user-friendly delivery method. Recent research has shown the potential of nanoemulgels in various therapeutic areas, highlighting their versatility and efficacy.[9, 10]

Advantages of Nanoemulgel

Nanoemulgels are an advanced drug delivery system that merges the beneficial properties of nanoemulsions and hydrogels. This combination provides several key advantages, addressing significant challenges in drug formulation and delivery.

1. **Improved Drug Solubility and Bioavailability:** Due to their nano-sized droplets, nanoemulsions enhance the solubility of drugs that are poorly soluble in water. This increase in surface area allows for better drug absorption, leading to higher bioavailability.[5,6]
2. **Controlled and Prolonged Drug Release:** The gel matrix in nanoemulgels ensures a controlled and sustained release of the drug. This continuous release helps maintain therapeutic drug levels for extended periods, reducing the need for frequent dosing and improving patient compliance.[7]
3. **Better Penetration and Absorption:** The small droplet size of nanoemulsions allows them to penetrate biological barriers more effectively, such as the skin or mucous membranes. This enhanced penetration is particularly useful for topical and transdermal drug delivery, enabling deeper tissue targeting.[8]
4. **Enhanced Stability of Encapsulated Drugs:** Nanoemulsions protect drugs from environmental degradation, such as oxidation and hydrolysis. When these emulsions are incorporated into a gel matrix, they gain an extra layer of protection, further stabilizing the drug.[9]
5. **Versatility in Drug Formulation:** Nanoemulgels can be formulated to deliver a wide range of drugs, including both hydrophobic and hydrophilic compounds. This versatility makes them suitable for various therapeutic applications, such as dermatology, ophthalmology, and transdermal drug delivery.[9]
6. **Ease of Application and Increased Patient Compliance:** Nanoemulgels are easy to apply and spread over the skin or mucous membranes due to their gel-like texture. This user-friendly application, combined with their controlled release properties, leads to higher patient adherence, especially for long-term treatments.[10]

In summary, nanoemulgels offer a comprehensive approach to drug delivery by addressing issues related to solubility, stability, and patient compliance. Their ability to provide controlled release, enhance penetration, and protect drug integrity makes them a valuable platform for various pharmaceutical applications.

Applications of Nanoemulgels

Nanoemulgels offer a broad spectrum of applications across different therapeutic areas due to their unique combination of properties. They provide an effective platform for drug delivery, addressing challenges related to solubility, stability, and controlled release.

**Sonu Choudhary et al.,**

1. **Dermatology:** Nanoemulgels are widely used in dermatological applications for the treatment of skin disorders. They can efficiently deliver active ingredients to the deeper layers of the skin, making them effective for treating conditions such as acne, psoriasis, and eczema. The enhanced penetration and prolonged release of drugs through nanoemulgels result in better therapeutic outcomes and improved patient adherence.[5]
2. **Transdermal Drug Delivery:** Nanoemulgels are ideal for transdermal drug delivery systems. They facilitate the delivery of drugs across the skin barrier, providing a non-invasive alternative to oral or injectable routes. This method is particularly useful for systemic delivery of pain relievers, anti-inflammatory drugs, and hormones. The controlled release properties of nanoemulgels ensure consistent drug levels in the bloodstream, reducing the need for frequent dosing.[6]
3. **Wound Healing:** Nanoemulgels have shown promise in wound healing applications. Their ability to deliver antimicrobial and anti-inflammatory agents directly to the wound site helps in faster healing and reduces the risk of infection. The gel matrix maintains a moist environment, which is conducive to the wound healing process.[7]
4. **Cosmeceuticals:** The cosmetic industry also benefits from nanoemulgels, particularly in the formulation of products aimed at improving skin hydration, reducing signs of aging, and delivering active ingredients like vitamins and antioxidants. Nanoemulgels provide a stable medium for these ingredients, ensuring their efficacy and prolonged release on the skin.[9]
5. **Ophthalmology:** In ophthalmic drug delivery, nanoemulgels offer several advantages, including improved drug stability and enhanced penetration through the ocular tissues. They can be used to treat various eye conditions, such as glaucoma and infections, by delivering drugs more effectively to the targeted site within the eye. The gel matrix helps in prolonging the contact time of the drug with the ocular surface, leading to better therapeutic efficacy.[10]
6. **Rheumatoid Arthritis:** Nanoemulgels are used for the topical delivery of anti-rheumatic drugs. The localized delivery system helps to concentrate the drug at the site of inflammation, providing relief from pain and inflammation with reduced systemic side effects. This method is especially beneficial for chronic conditions like rheumatoid arthritis where long-term medication is required.[11]
7. **Antifungal Treatments:** Nanoemulgels can be formulated for the topical treatment of fungal infections. The small size of the nanoemulsion droplets allows for deeper penetration into the infected tissue, enhancing the effectiveness of the antifungal agents. This approach can be particularly useful for treating conditions such as athlete's foot and fungal nail infections.[12]
8. **Antiviral Therapies:** In the field of antiviral treatments, nanoemulgels are used to deliver antiviral agents directly to the site of infection. This targeted approach improves the concentration of the drug at the site, enhancing its efficacy while minimizing systemic exposure and side effects. Nanoemulgels have shown potential in the treatment of viral infections like herpes simplex.[13]
9. **Pain Management:** Nanoemulgels are also effective for the localized delivery of analgesics and anesthetics. By providing a controlled release of the drug, they offer prolonged pain relief for conditions such as muscle pain, joint pain, and post-operative pain. The gel matrix ensures that the drug remains in contact with the affected area, maximizing its therapeutic effect.[14]
10. **Hormone Replacement Therapy:** Nanoemulgels are utilized in hormone replacement therapies, providing a non-invasive method for delivering hormones like estrogen and testosterone. The controlled release properties of the gel matrix ensure steady hormone levels, reducing the frequency of administration and improving patient compliance.[15]
11. **Anti-Acne Treatments:** In the treatment of acne, nanoemulgels can deliver anti-acne agents more effectively to the sebaceous glands. The enhanced penetration and sustained release of the drug help in reducing acne lesions and preventing new outbreaks. This method improves the overall efficacy of acne treatments.[16]
12. **Psoriasis Treatment:** Nanoemulgels are used for the topical delivery of medications for psoriasis. They help in managing the symptoms by delivering anti-inflammatory and immunosuppressive agents directly to the affected areas. The controlled release mechanism ensures prolonged drug action, reducing the frequency of application.[17]
13. **Hair Regrowth and Scalp Treatments:** Nanoemulgels are beneficial in formulations aimed at treating scalp conditions and promoting hair regrowth. By delivering active ingredients directly to the hair follicles, they

**Sonu Choudhary et al.,**

enhance the effectiveness of treatments for conditions like alopecia. The gel matrix provides a stable environment for the active ingredients, ensuring their sustained release and prolonged action.[18]

These applications illustrate the versatility and efficacy of nanoemulgels in various therapeutic areas. Their ability to enhance drug delivery, improve stability, and provide controlled release makes them a valuable tool in modern pharmaceutical formulations.

Materials Required for Nanoemulgel Preparation

1. **Active Pharmaceutical Ingredient (API):** The selection of the API is pivotal in nanoemulgel formulation, influencing the therapeutic outcome. APIs are chosen based on their intended therapeutic effect, such as anti-inflammatory, antimicrobial, or analgesic properties. For instance, diclofenac is commonly used for its anti-inflammatory effects, while clotrimazole is employed for antifungal purposes.[19]
2. **Aqueous Phase:**
 - o **Components:** The aqueous phase generally consists of distilled water or other aqueous solutions.[19]
 - o **Purpose:** It acts as the continuous phase in the nanoemulsion, contributing to the gel's final consistency and stability.
3. **Oils:**
 - o **Types:** Oils used in nanoemulgel formulations can include mineral oils, vegetable oils (e.g., soybean or olive oil), and essential oils (e.g., lavender oil).[20]
 - o **Purpose:** These oils constitute the oil phase of the nanoemulsion, facilitating the solubilization of lipophilic drugs and enhancing skin penetration.
4. **Preservatives:**
 - o **Types:** Preservatives like Benzalkonium Chloride or Phenoxyethanol are incorporated to prevent microbial growth.[20]
 - o **Purpose:** They ensure the microbiological safety of the formulation and maintain the API's efficacy over time.
5. **Gelling Agents:**
 - o **Types:** Gelling agents such as Carbopol, Hydroxyethyl Cellulose (HEC), and Xanthan Gum are commonly used.[21]
 - o **Purpose:** These agents transform the nanoemulsion into a gel-like consistency, impacting the rheological properties and ensuring proper application and adherence to the skin.
6. **Surfactants:**
 - o **Types:** Surfactants are critical for stabilizing nanoemulsions by reducing interfacial tension between the oil and water phases. Common surfactants include Polysorbate 80 (Tween 80) and Span 80 for their non-ionic properties, as well as Sodium Lauryl Sulfate, an ionic surfactant. [21]
 - o **Purpose:** They stabilize the nanoemulsion, ensuring a uniform distribution of the API throughout the gel matrix.
7. **Co-Surfactants:**
 - o **Types:** Co-surfactants such as ethanol and propylene glycol are used to enhance the stability and formation of nanoemulsions. [22]
 - o **Purpose:** They assist in reducing droplet size and improving the formulation's overall stability.
8. **pH Adjusters:**
 - o **Types:** pH adjusters such as Sodium Hydroxide or Hydrochloric Acid are used.[22]
 - o **Purpose:** They adjust and stabilize the pH of the formulation, which is crucial for maintaining both the stability of the gel and its compatibility with the skin.

Equipment Required

1. **Homogenizer:**
 - o Essential for reducing the droplet size of the oil phase and achieving a uniform nanoemulsion.[20]
2. **Ultrasonic Processor:**
 - o Used to further decrease the size of nanoemulsion droplets, enhancing stability and improving the gel's texture.[19]
3. **Stirring Equipment:**

**Sonu Choudhary et al.,**

- Magnetic stirrers or overhead stirrers are used to mix components uniformly, ensuring a consistent formulation.[20]
- 4. **Viscometer:**
 - Measures the viscosity of the gel, which is crucial for determining the appropriate consistency and spreadability.[21]
- 5. **pH Meter:**
 - Monitors and adjusts the pH of the formulation to ensure it remains within the desired range for stability and skin compatibility.[22]

Methods for Preparation of Nanoemulgel

Preparation of Nanoemulsion

High-Energy Methods

- **High-Pressure Homogenization:**

- **Principle:** This method utilizes high pressure to force an emulsion through a narrow valve, resulting in the reduction of droplet sizes to the nanometer range due to intense shear forces.
- **Process:**
 1. Combine oil and aqueous phases with surfactants to create a coarse emulsion.
 2. Pass the emulsion through a high-pressure homogenizer multiple times.
 3. The high shear forces break down droplets to nanoscale dimensions (20-200 nm).
- **Advantages:** Provides uniform droplet size and high stability.[23]

- **Ultrasonication:**

- **Principle:** Ultrasonic waves create cavitation bubbles in the liquid, which implode and generate high shear forces that break up the oil droplets into nanoscale sizes.
- **Process:**
 1. Prepare a coarse emulsion by mixing the oil and aqueous phases.
 2. Use a probe sonicator to subject the emulsion to ultrasonic waves.
 3. Adjust parameters like amplitude and duration to achieve the desired droplet size.
- **Advantages:** Effective for small-scale production; suitable for heat-sensitive materials.[24]

Low-Energy Methods

- **Spontaneous Emulsification:**

- **Principle:** This method relies on the spontaneous formation of nano-sized droplets when oil and water phases are mixed with surfactants at specific ratios.
- **Process:**
 1. Mix the oil phase with the aqueous phase and surfactants.
 2. The mixture forms nano-sized droplets spontaneously due to the phase inversion or self-emulsification process.
- **Advantages:** Low energy requirement; suitable for temperature-sensitive substances.[25]

Preparation of Gel

Hydrogel Formation

- **Physical Gelation:**

- **Principle:** Physical gels form through non-covalent interactions such as hydrogen bonding or ionic interactions between polymer chains.
- **Process:**
 1. Dissolve gelling agents (e.g., carbomers, alginates) in water.
 2. Allow the gelation process to occur through spontaneous or controlled pH/temperature changes.
- **Advantages:** Simple preparation; ideal for drugs requiring a gentle environment.[26]

- **Chemical Gelation:**

- **Principle:** Chemical gels are formed through the covalent cross-linking of polymers using cross-linking agents.

**Sonu Choudhary et al.,****o Process:**

1. Dissolve polymers and cross-linking agents in water.
2. Allow cross-linking reactions to form a three-dimensional gel network.

o Advantages: Creates more robust gels with controlled release properties.[27]**• Thermoreversible Gelation:****o Principle:** Thermoreversible gels form or gel upon heating or cooling due to temperature-sensitive gelling agents.**o Process:**

1. Prepare a solution of thermoreversible gelling agents (e.g., agar, gellan).
2. Adjust temperature to induce gel formation or dissolution.

o Advantages: Allows for temperature-controlled gel formation; useful for controlled drug delivery.[28]**Methods for Incorporating Nanoemulsion into Gel**

Integrating nanoemulsions into gels is a vital technique in drug delivery, leveraging the enhanced bioavailability and controlled release properties of nanoemulsions alongside the ease of application and localized treatment provided by gels.

Simple Mixing Method

This straightforward method involves directly combining the pre-prepared nanoemulsion with a gel base. It is suitable when the nanoemulsion and gel base are chemically compatible and the nanoemulsion is thermodynamically stable.

Procedure

1. **Nanoemulsion Preparation:** Formulate the nanoemulsion using high-energy methods like ultrasonication or high-pressure homogenization.[29]
2. **Gel Base Preparation:** Prepare the gel base using gelling agents such as carbomers, xanthan gum, or hydroxypropyl methylcellulose (HPMC).[30]
3. **Incorporation:** Slowly mix the nanoemulsion into the gel base while continuously stirring to ensure uniform distribution.

In Situ Gelation Method

This technique involves forming the gel after the nanoemulsion is mixed into the gel-forming solution. It is advantageous for drugs that need a controlled release profile.

Procedure

1. **Nanoemulsion Preparation:** Create the nanoemulsion using methods like microfluidization.
2. **Gel-Forming Solution:** Prepare a solution of the gelling agent in a solvent where gelation can be triggered by temperature, pH, or ionic strength changes.[31]
3. **Mixing:** Combine the nanoemulsion with the gel-forming solution.
4. **Gelation Trigger:** Induce gelation by altering environmental conditions, such as heating (for thermally responsive gels) or adding a crosslinking agent (for ionically responsive gels).

Emulsion Gel Technique

In this method, the nanoemulsion is integrated into the gel matrix during the emulsification process itself. It is especially useful for thermosensitive drugs.

Procedure

1. **Nanoemulsion Preparation:** Use low-energy emulsification methods such as phase inversion temperature (PIT) or spontaneous emulsification.[32]
2. **Gel Matrix Formation:** Add the gelling agent to the nanoemulsion either simultaneously or subsequently.

**Sonu Choudhary et al.,**

3. **Emulsification and Gelation:** Stir the mixture at a controlled temperature to achieve gelation while maintaining nanoemulsion stability.

Sol-Gel Method

This method involves incorporating the nanoemulsion into a sol, which then transitions into a gel. It is useful for incorporating bioactive molecules that are sensitive to heat or mechanical stress.

Procedure:

1. **Nanoemulsion Preparation:** Formulate the nanoemulsion using low-energy methods like spontaneous emulsification.
2. **Sol Preparation:** Create a sol using precursors such as silica, titania, or other metal alkoxides in an aqueous or organic solvent.[33]
3. **Mixing:** Add the nanoemulsion to the sol under gentle stirring.
4. **Gelation:** Allow the sol to undergo gelation through hydrolysis and condensation reactions at room temperature or slightly elevated temperatures.

Conclusion

Various methods can be used to incorporate nanoemulsions into gels, each suitable for different active ingredients and desired release profiles. The simple mixing method is the most straightforward, while in situ gelation, emulsion gel techniques, and sol-gel methods offer more advanced approaches for controlled release and stability.

Characterization and Evaluation of Nanoemulgels

Nanoemulgels represent a cutting-edge approach in drug delivery systems, combining the benefits of nanotechnology and hydrogels to improve the bioavailability and therapeutic efficacy of hydrophobic drugs. Detailed characterization and evaluation are essential to ensure their efficacy, stability, and safety.

1. **Particle Size and Distribution** The particle size and distribution of nanoparticles within nanoemulgels are crucial parameters that influence stability, bioavailability, and therapeutic outcomes. Dynamic light scattering (DLS) is commonly employed to determine the average particle size and polydispersity index (PDI). Ideally, nanoemulgels should have a narrow size distribution with a PDI of less than 0.3, indicating uniformity. Smaller particle sizes lead to a larger surface area, enhancing drug solubility and absorption.[34]
Transmission electron microscopy (TEM) and scanning electron microscopy (SEM) provide visual confirmation of particle size and morphology.[37]
2. **Zeta Potential** Zeta potential measures the surface charge of nanoparticles and influences the stability of the nanoemulgel by affecting particle interactions. A high zeta potential (either positive or negative) typically suggests good stability due to strong electrostatic repulsion, preventing aggregation. Zeta potential is measured using a zeta potential analyzer, with values above ± 30 mV considered stable.[35]
3. **Rheological Properties** Understanding the rheological behavior of nanoemulgels is vital for their application, stability, and user compliance. Rheological studies assess the flow behavior and viscoelastic properties. Nanoemulgels should exhibit pseudoplastic behavior, where viscosity decreases with increasing shear rate, making them suitable for topical application. This ensures easy application and adherence to the skin while maintaining stability at rest. Rheometers measure parameters such as viscosity, storage modulus (G'), and loss modulus (G'').[36]
4. **Morphology and Microstructure** The morphology and internal microstructure of nanoemulgels are key to their stability and drug release properties. Techniques like TEM and SEM provide detailed images of nanoparticle shape and distribution within the gel matrix. Cryo-TEM is particularly useful for observing the internal structure in a hydrated state, preserving the natural arrangement of particles and the gel network.[37]
5. **Drug Content and Encapsulation Efficiency** Determining drug content and encapsulation efficiency is critical for assessing the therapeutic potential of nanoemulgels. High-performance liquid chromatography (HPLC) is commonly used to quantify the drug encapsulated within nanoparticles. High encapsulation efficiency ensures

**Sonu Choudhary et al.,**

maximum therapeutic effect with minimal drug wastage. Encapsulation efficiency is calculated using the formula:

Encapsulation Efficiency (%) = (Amount of Drug Encapsulated / Total Amount of Drug Added) × 100.[39]

6. **In Vitro Release Studies** In vitro release studies are essential to understand the drug release profile from the nanoemulgel. These studies are conducted using methods like dialysis, diffusion cells, or Franz diffusion cells, analyzing the release medium over time to determine release kinetics. Controlled and sustained release profiles are preferred to enhance therapeutic efficacy and reduce dosing frequency. Release data can be fitted to kinetic models such as zero-order, first-order, Higuchi, and Korsmeyer-Peppas to understand the release mechanism.[38]
7. **Stability Studies** Stability studies assess the shelf life and robustness of nanoemulgels under various environmental conditions such as temperature, humidity, and light. These studies predict long-term behavior and ensure efficacy throughout the shelf life. Stability is evaluated by monitoring changes in particle size, zeta potential, drug content, and physical appearance over time. Accelerated stability studies expose formulations to elevated temperatures and humidity to predict stability under normal storage conditions. [38, 40]
8. **In Vivo Studies of Nanoemulgels** Evaluating nanoemulgels in vivo involves several critical parameters to ensure their efficacy, safety, and overall performance. The primary parameters for in vivo evaluation include:
 1. **Pharmacokinetic Analysis:**
 - **Objective:** To analyze the absorption, distribution, metabolism, and excretion (ADME) of the drug.
 - **Methods:** Blood samples are taken at various intervals and analyzed using techniques such as high-performance liquid chromatography (HPLC) or mass spectrometry (MS).[41]
 2. **Bioavailability Assessment:**
 - **Objective:** To measure the extent and rate at which the active drug ingredient is absorbed and reaches the site of action.
 - **Methods:** Comparative studies with conventional formulations, often using the area under the curve (AUC) from plasma concentration-time profiles.[42]
 3. **Therapeutic Efficacy Evaluation:**
 - **Objective:** To assess the clinical effectiveness of the nanoemulgel in treating the intended condition.
 - **Methods:** Utilizing disease models (e.g., arthritis models for anti-inflammatory drugs) to measure therapeutic outcomes.[43]
 4. **Toxicity Studies:**
 - **Objective:** To determine the safety profile of the nanoemulgel, including any potential adverse effects.
 - **Methods:** Conducting acute and chronic toxicity studies in animal models to monitor physiological and biochemical parameters.[44]
 5. **Skin Irritation and Sensitization Tests:**
 - **Objective:** To ensure that the nanoemulgel formulation does not cause skin irritation or allergic reactions.
 - **Methods:** Performing patch tests and histopathological examinations of the skin after nanoemulgel application.[45]
 6. **Histopathological Examination:**
 - **Objective:** To examine tissue samples microscopically for any pathological changes post-treatment with the nanoemulgel.
 - **Methods:** Collecting, processing, and examining tissue samples under a microscope.[46]

CONCLUSION

Comprehensive characterization and evaluation of nanoemulgels are essential to ensure their efficacy, stability, and safety as drug delivery systems. Techniques such as particle size analysis, zeta potential measurement, rheological studies, and in vitro and in vivo testing play crucial roles in the development and optimization of these advanced formulations. Thorough evaluation of these parameters enables the development of effective and reliable nanoemulgels for various therapeutic applications. The development of a nanoemulgel formulation for leflunomide offers a promising strategy to overcome the challenges associated with its poor solubility and limited bioavailability.

**Sonu Choudhary et al.,**

The nanoemulsion system, characterized by its nano-sized droplets, significantly enhances the dissolution rate and facilitates better drug absorption. By incorporating the nanoemulsion into a gel matrix, the resultant nanoemulgel not only improves the topical delivery of leflunomide but also ensures prolonged retention and sustained drug release. The comprehensive characterization of the nanoemulsion, including particle size analysis, zeta potential, and morphological studies, confirms its stability and suitability for further formulation into a nanoemulgel. The selection and optimization of gelling agents are crucial steps that influence the final product's viscosity, spreadability, and overall performance. Rheological evaluations demonstrate that the nanoemulgel possesses the desired consistency and thixotropic behavior, facilitating easy application and adherence to the skin or mucosal surfaces. *In vitro* release studies indicate a controlled and sustained release of leflunomide from the nanoemulgel, suggesting potential for enhanced therapeutic outcomes. Stability studies corroborate the formulation's robustness, ensuring that the nanoemulgel remains effective under various storage conditions. In conclusion, the nanoemulgel formulation of leflunomide represents a significant advancement in drug delivery technology, offering a feasible and effective means to improve the bioavailability and therapeutic efficacy of leflunomide. This innovative approach holds substantial promise for enhancing the treatment of conditions requiring leflunomide, ultimately benefiting patients through improved clinical outcomes.

Table.1: Available Marketed Products In Form of Nanoemulgel

Brand Name	Active Ingredient(s)	Concentration	Company	Indications	Additional Information	References
Voltaren Emulgel	Diclofenac diethylamine	1.16%	Novartis	Anti-inflammatory, analgesic	Contains propylene glycol and isopropyl alcohol for enhanced skin penetration	[47]
Nizoral Cream	Ketoconazole	2%	Janssen Pharmaceutica	Antifungal	Effective against dermatophytes, yeasts, and molds	[48]
Clindac A	Clindamycin	1%	Galderma	Acne treatment	Often combined with benzoyl	[49]

Sonu Choudhary *et al.*,

					peroxide or retinoids for enhanced efficacy	
Voltaren Gel	Diclofenac sodium	1%	GlaxoSmithKline	Anti-inflammatory, analgesic	Alcohol-based gel formulation enhances absorption through the skin	【50】
Dovonex Cream	Calcipotriene	0.005%	Leo Pharma	Psoriasis	Vitamin D analog, often used in combination with corticosteroids for better results	【51】
Voltaren Ophtha	Diclofenac sodium	0.1%	Novartis	Postoperative inflammation in ocular surgery	Used in eye drop form, effective in reducing inflammation and pain after cataract surgery	【52】
Canesten Cream	Clotrimazole	1%	Bayer	Antifungal	Effective for the treatment of athlete's foot, jock itch, and ringworm	【53】
Retin-A Micro Gel	Tretinoin	0.1%, 0.04%	Johnson & Johnson	Acne treatment	Microsphere formulation allows for controlled release, minimizing irritation and maximizing efficacy	【54】
Metrogel	Metronidazole	0.75%, 1%	Galderma	Rosacea treatment	Reduces redness and inflammation, available in gel formulation for better skin absorption	【55】
Differin Gel	Adapalene	0.1%, 0.3%	Galderma	Acne treatment	Retinoid, helps to reduce inflammation and prevent clogged pores	【56】
Lamisil	Terbinafine	1%	Novartis	Antifungal	Effective for the	【57】

Sonu Choudhary et al.,

AT Gel					treatment of athlete's foot, jock itch, and ringworm	
Fucidin Cream	Fusidic acid	2%	Leo Pharma	Antibiotic for skin infections	Effective for the treatment of impetigo, infected dermatitis, and other skin infections caused by bacteria	【58】

Table.2: Available Marketed Formulations of Leflunomide

Brand Name	Manufacturer	Dosage Form	Strength	Indications	References
Arava	Sanofi	Tablet	10 mg, 20 mg	Used to manage rheumatoid arthritis	【59】
Levolin	Torrent Pharmaceuticals	Tablet	10 mg, 20 mg	For the treatment of rheumatoid arthritis	【60】
Avara	Zydus Cadila	Tablet	10 mg, 20 mg	Treats symptoms of rheumatoid arthritis	【61】
Lefrus	Sun Pharmaceutical	Tablet	10 mg, 20 mg	Manages rheumatoid arthritis symptoms	【62】
Leflox	Alembic Pharmaceuticals	Tablet	10 mg, 20 mg	For the management of rheumatoid arthritis	【63】
Lefunomide	Intas Pharmaceuticals	Tablet	10 mg, 20 mg	Indicated for rheumatoid arthritis treatment	【64】
Arthfree	Lupin Pharmaceuticals	Tablet	10 mg, 20 mg	Used to alleviate rheumatoid arthritis symptoms	【65】

Nutritional Composition, Health Benefits and Culinary Applications of Quinoa

ABSTRACT

Quinoa is the seed of the chenopodium quinoa plant. It's also called "pseudo grains" because it resembles the nutrients in cereal grains. Quinoa belongs to the dicotyledoneae class, the Chenopodiaceae family, and the Chenopodium genus. It is well known today that this grain is gluten-free which helps individuals with gluten allergies. It is beneficial for groups of people indulging in sports activity, lactose intolerant person, children below 6 years, female with osteoporosis, individual having anaemia, diabetes mellitus, dyslipidemia, gaining weight and wheat disease because of high nutritive values of quinoa, gluten free and therapeutic properties. Rajgira is a rich source of fiber, also contains a good amount of protein, vitamins, and minerals, and has a remarkable level of essential amino acids. Also, it has ample omega-3 fatty acid which is also beneficial for maintaining good health. In general, nutrient contents of quinoa are higher in variations per 100 g fresh weight of edible portion such as: protein (09.10–15.70 g), total fat (04.00–07.60 g) and dietary fiber (08.80–14.10 g). Quercetin and kaempferol are flavonoids present in Quinoa which have powerful antioxidant and anti-inflammatory effects in the body. Rajgira has a good impact on metabolism, cardiovascular, and gastrointestinal health in humans. This review paper includes all the nutritional properties of quinoa, its culinary applications like quinoa chikki, upma, beverages and its health benefits.

Keywords: Rajgira, Dyslipidemia, Pseudo grains, Quinoa, Chenopodium

INTRODUCTION

Since 1998, the WHO has examined obesity, an outbreak that affects the population worldwide and causes more deaths. Obesity is correlated with non-communicable diseases like cancer, cardiovascular diseases, diabetes, and others. In this framework, it is very crucial to look after the traditions and social values of the food practices that are

Aarzo Singh and Govind Ballabh Bhatt

off-track over time. The majority of traditional practices and beliefs for these foods are ignored, and crops are kept aside. (35) A magnificent crop that almost faded is quinoa (*Chenopodium quinoa*). Quinoa has an elevated past amid impressive civilization on the land of liberty (America). It is derived from the Inca Empire in the hills of Bolivia, Chile, and Peru. It was a staple diet for the Incas and a well-known source of food for their native descendants.

Origin and History:

Quinoa, the staple food in pre-colonial communities of the Andes, Chile, Argentina, and South America, ranged from 2° latitude on the northern side (Colombia) to 47° latitude on the southern side (Chile) (35). Quinoa is a religious pasture for the Incas, whom they termed the mother of all cereals. The Intercontinental era of Quinoa in 2013 triggers the broadening of quinoa and shows the increase in stipulation, manufacture and research of mother grain globally. The Nutritional grade of quinoa build it approved in excellent protein, this grain contains a 'n' number of functions connected to the nutrients, even being a wheat free food. (72). The cultivation has been done in the South America Andes from past 8000 years and these all are Andean species. (26), (69), (17), (39) The two out of the five main ecotypes of quinoa planting focused by the Chile, namely the coastal ecotypes and the salt flat ("salares") ecotypes. In the northern Chile, the Tarapacá and Antofagasta regions (18–25°S) have "salares" ecotype, with an altitude over 3000m. Upland native populations (Quechua and Aymara and people) have historically grown these Rajgira in these areas on salty soils with annual rainfall ranging between 100 and 200 mm from December to February during the southern hemisphere summer. On the other hand, there is proof that little quinoa genetic material from the Peruvian Andean area was introduced from the Antofagasta region. In spite of data, in Chile the "salt flat" ecotype dominates the morphology of the majority of the quinoa investigated. (18). The system of national Chilean protects the novel diversification only has one blend that has been generated and documented. A hybrid called "La Regalona" (67) has a broad spectrum of adaptability and greater yields have been developed. It can grow under short days in latitudes close to the polar latitudes up to 40° (S / N) and latitudes close to the equator. Quinoa is a novel crop for India that has far gone unnoticed by academics, business people, and commercial and experimental farmers. Quinoa can be grown commercially with great success throughout India because it responded well to a variety of agro-ecological situations, according to the findings of front-line demonstrations of the crop conducted by Dharm Singh in the different states of Rajasthan (2003–04), Haryana (2005–06), Uttar Pradesh (2005–06), Maharashtra (2006–07), and Gujarat (2007–08). Quinoa has been revered by humans as religious grain as it contains good amount of protein and remarkable amino acids in equilibrium. (28) In South America, a number of indigenous groups have historically utilized quinoa. (65). Resemble with rice, soups are made from the seeds, puffed them for morning cereal, or baked goods including biscuits, pasta, bread, tortillas, crisps, and pancakes by flouring them. (8). Similar to how spinach leaves are consumed, quinoa sprouts are added to salads. (53) Additionally, fermented seeds can be used to create beverage which is alcoholic known in South America chicha that is utilized during religious ceremonies (FAO, 2011). In addition, it is utilized contain good nutrient for feeding agricultural beast including chickens, pigs, and cattle (8).

Nutritional Composition

Quinoa is known for high level of protein and balanced amino acid profile with good levels of methionine and lysine. (61), (32) It has a certain portion of minerals and fiber, such as Calcium and Iron (5). These Polyphenols are antioxidants which are rich in quinoa. (47), (48) Rajgira is also thought to be gluten-free, making it ideal for celiac sufferers and individuals with wheat allergies. (27) (32) Rajgira is very much known for its protein content both quantitatively and qualitatively. (68) Quinoa contain very good amount of protein which is equal to the milk protein whole dried when given to the mouse. Later on, pigs were fed with quinoa which is cooked and with skimmed milk which is dried. Lysine (04.80 g/100 g) and Threonine (03.70 g/100 g), amino acids limited in traditional grains, are abundant in proteins. (14) Even if the environment has an impact on the composition of amino acid, the outstanding quality of protein is preserved. (23)

Protein

Protein participated in the building of the tissues, enzymes formation, antibodies and hormones, helps to supply the power and manage the metabolic processes (4). The protein content in quinoa is determined by the amino acids. The aromatic amino acids are tyrosine and phenylalanine scoring 86.0 of protein in raw quinoa and 85.0 proteins in

**Aarzo Singh and Govind Ballabh Bhatt**

washed quinoa. The presence of lysine and sulfur amino acids is higher. The essential amino acids content is higher as compare the other cereals (51). On the basis of dry weight, the content of protein in quinoa cereals is ranged between 9.10 to 15.70 g / 100 g⁻¹. Proteins present with in quinoa seeds majorly are albumins (35%) , globulins (37%) and a low percentage of prolamins (0.5–7.0%).

Fat

Quinoa is rich in fatty acids like linoleic and alpha-linoleic acid. It contains antioxidant in higher amount such as alpha and gamma-tocopherol. It contains oil near about 7.0%. the saturated fatty acid present in the quinoa was palmitic 10% is equal to the totally fatty acid present. The content of fat in Rajgira grains (4.0-7.6%). The nutritive value of quinoa grains and fatty acid of quinoa is analyzed by (43). Quinoa cereal contain ample amount of linoleic acid ranging between 46.60 to 58.10% and a low amount of alpha linoleic acid ranging between 06.10 to 08.44% of trans fatty acid. (60)

Fiber

There are two types of fiber in plants, on the basis of solubility that are soluble and insoluble. Examples of soluble fiber are Pectin and gums which are soluble in water, whereas examples of insoluble fiber are polysaccharides, cellulose, and hemicelluloses are water insoluble. There are two types of fibers neutral detergent fiber (NDF) and acid detergent fiber (ADF) on the digestibility. Neutral detergent fiber fractions contain hemicelluloses, cellulose, lignin, and acid neutral fiber fractions containing mainly cellulose and some lignin. The amount of fiber present in quinoa grains varied between 07.0 to 14.10%, respectively. In fiber fraction analysis of sprouted quinoa (9) significantly higher amount of neutral detergent fiber (NDF) is found, near by 77.73% NDF, than acid detergent fiber (ADF). With 78% insoluble and 22% soluble fiber Quinoa grains are considered as an excellent source of dietary fiber. (23), (33)

Carbohydrates

It is largest group of organic compound which is found in the nature. The main carbohydrate which is present in the quinoa is starch 52% to 69%. The dietary fiber in quinoa helps in indigestibility in the small intestine. It improves the absorption of the nutrients (42). The estimated amount of carbohydrates % = 100% (ash + protein + moisture + fat). The overall content of the carbohydrates in Rajgira grains is (48.5-69.8 %). High protein and low carbohydrates foods valuable to being health, due to elevated plasma glucose level not contributed. The amylopectin in the quinoa is higher than the rice varieties. The carbs consider as nutraceuticals as they showed hypoglycemic effects and lower down the effect of free fatty acids.

Essential Amino Acids

Macromolecular compounds amino acid (AA) and protein plays a crucial role in the human body as enzymatic reactions, catalysts for structural components and synthesis of protein (34). Many grains are deficient in Lysine (19). Cysteine and Methionine are two antioxidants which have potential to detoxifying the toxins and safe from wavy radiations (10).

Health Benefits

Rajgira is beneficial for groups at high risk including high indulging in sports activity, lactose intolerant person, children below 6 years, female with osteoporosis, individual having anaemia, diabetes mellitus, dyslipidaemia, gaining weight and wheat disease because of high nutritive values of quinoa, gluten free and therapeutic properties. (58).

Pharma Activity of Quinoa

The parts of quinoa including seeds, roots, stem, leaves and seeds had variety of bioactive substances. These compounds are various benefits included antioxidant, antimicrobial, antidiabetic, antifungal, anti-inflammatory and anticancer.

**Aarzo Singh and Govind Ballabh Bhatt****Antioxidant**

The property of antioxidant in Rajgira is higher as compare to other grains; it is used to prevent the diseases (16). Clinical research has shown that proteins, fiber, vitamins, minerals, saponins, phytosterols, phytoecdysteroids, and phenolics are the antioxidants that are most effective at lowering cholesterol levels (15). According to Balakrishnan and Schneider, the digestive process of quinoa flavonoids increases antioxidant capacity by a factor of two. The direct consumption of quinoa provides good amount of antioxidant. (7)

Antimicrobial

The quinoa leaves and seeds are rich in polyphenols as well as tannin which have antimicrobial property (57).

Antidiabetic

Phenolic acids, tocopherols, protein, fibre and bioactive peptides are high in quinoa. These contribute to the antidiabetic property (12). The BMI and HbA1c level reduced by having Rajgira. This helps to overcome the elevated blood glucose level and stabilize the health (1). Consumption of quinoa seeds in different amount reduces the blood glucose level, T3 and T4 in rats (25).

Anti-inflammatory

Phenolic compounds, saponins and polysaccharides are bioactive compounds contain by quinoa seeds. These are linked with the several properties like anti-inflammatory, anticancer and antioxidant (3). The ethyl acetate fraction of the Rajgira inflorescence methanolic extract includes phytochemicals with anti-inflammatory, antimicrobial, antifungal, antibacterial, cancer prevention, and cytotoxic properties, according to research (55).

Antifungal

Because of their capacity to bind with steroids in fungal membranes, quinoa saponins have antifungal action, which compromises the integrity of the membranes and results in pore development (6).

The gastroenterology at king's college London and Columbia University's department which is wheat disease hub suggested quinoa as an alternative grain, which is important source for wheat disease patients (70)

Culinary Application

Quinoa is very rich in nutrients due to its peculiar composition. It is important source of the energy as starch present in it; it gives protein of excellent quality and dietary fiber, rich in lipids. Additionally, have a good amount of minerals, vitamins and bioactive compounds like polyphenols, saponins; phytosterols etc. quinoa is a gluten free grain which has potential for human health like diabetics, celiac, gluten intolerant and others (64).

Quinoa Chikki

One of the greatest foods is chikki. Rajgirachikki is made by using Soaked Rajgira. Traditional chikki of peanut was employed as a control, and toasted quinoa grains and peanuts were used. As the percentage of quinoa was raised, the appearance, color, and flavor all enhanced due to the distinctive aroma of roasting and caramelization. Since quinoa has a gritty texture, 100% inclusion effect on both flavor and texture. A same study was conducted in (29) who created the chikki, a blend quinoa and crushed nuts. The percentage of quinoa included ranged from 60% to 100%. The difference in 60% quinoa and 40% nut received the good rating for general acceptance and moderate like. The multigrain Nutri-chikkis with roasted Bengal gram, black sesame, pumpkin seed, flax seed, ground nut, and almond earned the highest rating (8.3) of all the chikkis. The chosen mixture was deemed to have superior nutritional content, cheap manufacturing costs, and pleasant flavor (2).

Quinoa Upma

Quinoa, dalia, chana dal, onion, carrot, green peas, green pepper, curry leaves, mustard seeds, cumin, spices, salt ingredients are used in a fixed proportion. Ingredients are sun dried to be moisture free. Half teaspoon of vegetable oil and spices are used to roast the ingredients. Cooled it and stored in a jar. At Lucknow's RFRAC (Regional Food Research Analysis Centre), the tests were decided. The AOAC technique was used to determine the protein content.

**Aarzoo Singh and Govind Ballabh Bhatt**

Calcium content was determined using IS: 5838:1970 and carbohydrate content was assessed using SP: 18 techniques. (56).

Quinoa Fermented Beverage

The fermentation of cereal improves the product nutritional quality and gives various benefits for human being health (49). Modern research focuses mainly on creation of novel fermented drinks of grain-based as well their beneficial and probiotic qualities (46), (20), (36). The naturally present compound in quinoa is saponins from 0.1 – 5.0 % (45). The quinoa seeds utilized in this investigation had a saponin content of 0.30 0.02%. Washing or water maceration is advised to eliminate saponins (44). The PH value decreases and increases in the total acidity during the process of fermentation (36). The rice is fermented and quinoa beverage is prepared from the different varieties (61). The PH is decreased initially in the process which is crucial to have high quality results of final products (30) and minimize the growth of pathogenic bacteria by increase in the total acidity (31).

Quinoa Dark Chocolate

Rajgira (*Chenopodium quinoa*) has protein of good quality and is a strong source of vitamin E. It was created to add 12, 16, or 20% quinoa to dark chocolate. As the proportion of quinoa in the goods rose, so did their protein content. Only 9% more vitamin E was found in the product containing 20% quinoa, whereas the number of polyphenols reduced from 23.50 to 18.0 mol pirocatechin/g. Samples containing quinoa had higher levels of the necessary amino acids. The chocolate contains 20% of quinoa, the levels of tyrosine, cysteine and methionine rise by 72, 104 and 70%, respectively. The WHO standards-compliant amino acid pattern was sufficient for human requirements. 92% of the sensory panel members gave their approval for the chocolate and quinoa. Every sample had an acceptability index of greater than 70%. At the dosages considered in this study, quinoa might be utilized, giving the dark chocolate its potential health benefits. (54).

Quinoa Pasta

Pasta most demanded product for non- celiac gluten sensitivity. Currently gluten free pasta is available in market (13). The wheat free flour which is used is made from paddy (*Oryza sativa*). Sorghum (*Sorghum bicolor*) and corn (*Zea mays*). Researches which mainly target the alternate of the wheat mixing along with starch, enzymes, emulsifiers and hydrocolloids. Changing in the functional properties of the wheat free flour is hydrothermal (22). Deficiencies of dietary fiber and iron in wheat free diet (59). The incorporation of protein isolates or nutrient-rich flours, like those from quinoa (*Chenopodium quinoa*), chickpea (*Cicer arietinum*), lupine and other legumes flours, has increased efforts to improve gluten-free products (21).

CONCLUSION

Quinoa which includes the leaves, sprouts, and microgreens, are a great source of vitamins, minerals, and health-improving substances with capabilities that include antibacterial, anticancer, anti-diabetic, antioxidant, anti-obesity, and cardioprotective effects. In addition to being wheat free, there are a superb protein, amino acids, important minerals, and omega-3 fatty acids sources. Quinoas are potential crop with high nutritional content that might help combat hunger issues and improve access to food and nutrition. Quinoas are not often eaten as vegetables anymore, nevertheless. Quinoa can be consumed as salads and as cooked veggies and in many forms. Quinoa may also be used in other gluten-free food items as functional food components. You may add the dried leaf powder to processed dishes like breads, soups, and baked goods. Greater total phenolic content Quinoa greens, which include the leaves, sprouts, and microgreens, are richest in minerals and phytochemicals that had antibacterial, anticancer, anti-diabetic, anti-inflammatory, anti-antioxidant, anti-obesity, and cardio protective properties. Quinoas are free of gluten and rich in protein, essential minerals, and amino acids. Quinoas are a promising new crop with additional value that might help reduce malnutrition and increase access to food and nutrition. When compared to grains, quinoa that has been germinated (quinoa sprouts) is said to have a greater total phenol content and antioxidant potential. The antioxidant content of quinoa sprouts rises during germination (sprouting) for up to 6–9 days, and red quinoa has

Aarzoo Singh and Govind Ballabh Bhatt

more antioxidants than yellow quinoa. Quinoa sprouts and microgreens are a potential food for human health and nutrition, much like the sprouts and microgreens available in supermarkets today. To provide a comprehensive overview of the functional and nutritional relevance to being health and raise awareness about the usage of Rajgira as new "super vegetables" in human diets, more research is required. Now, a day's people are much more concern about their health and love to include quinoa in their diet in the form of different food products like chikki, beverages, upma, pasta and many more. It will help to overcome the nutritional deficiency among the population.

Table.2: Essential amino acids

Essential Ammino Acid			
Ammino Acid	[Nowak <i>et al.</i> 2016] g 100 g ⁻¹ DW	[Valcarcel-Yamani B <i>et al.</i> 2012] g100 g ⁻¹ protein	[Ruales and Nair 1992] mg/g protein
Histidine	1.4-5.4	3.2	24
Isoleucine	0.8-7.4	4.4	32
Leucine	2.3-9.4	6.6	79
Lysine	2.4-7.5	6.1	51
Methionine	0.3-9.1	4.8	34
Phenylalanine	0.1-2.7	7.3	63
Threonine	2.1-8.9	3.8	38
Tryptophan	0.6-1.9	1.1	15
Valine	0.8-6.1	4.5	39

Table.3: The minerals composition of Rajgira grains. (41), (64)

MINERALS (mg 100 ⁻¹ DW)		
	[Nowak <i>et al.</i> 2016]	(Valcarcel-Yamani B <i>et al.</i> 2012)
Calcium (Ca)	27.5-148.7	32.9-874.0
Copper (Cu)	1.0-9.5	-
Iron (Fe)	1.40-16.70	05.5-81.0
Magnesium (Mg)	26.00 to 502.00	206.8-2620.0
Phosphorus (P)	140.00 to 530.0	...
Potassium (K)	696.70 to 1475.00	1201.0

Table.4: Pharma Activity of Quinoa

Therapeutic Application	Treatment	Endpoints and Outcomes	Result
Growth and development of the child (50)	Quinoa is formulated in infant food	Plasma level increased, shows as malnutrition, weight gain of the body increased	Infant quinoa food plays an important part to overcome malnutrition.
Wheat disease (wheat resistant) (71)	Quinoa should be cooked	Each digestive system parameter improvements were made to the height of the surface enterocyte cell and the quantity of intra-epithelial lymphocytes per 100 enterocytes. Serum lipid levels remained normal with a small decline in total cholesterol, LDL, HDL, and triglycerides.	It is made for the consumption of celiac patients
Risk rate of Cardiovascular (15)	Rajgira Cereal bar for 30 days daily	Triglycerides reduced, cholesterol level reduced, Low Density Lipoprotein	Reduces the cardiovascular disease risk
Symptom and sign of postmenopausal (11)	Corn is compared to quinoa flakes	Triglycerides are low, low TBARS, little cholesterol level, LDL reduced and low level of GSH	Beneficial for metabolic parameter

AI Driven Workforce Planning: Exploring Talent Acquisition and Optimization - HR Decision Paradigm for a New Strategy

ABSTRACT

The advent of Artificial Intelligence (AI) has revolutionized workforce planning, reshaping talent acquisition and optimization strategies in Human Resources (HR). Allying AI-engaged methodologies to workforce planning is significant in this research subject, where talent acquisition and workforce planning will be the areas of interest. The study investigates how the implementation of AI impacts HR decision-making models to design effective ideas which meet today's organizational requirements. In the present study convenience sampling technique was used and questionnaires were answered by 150 HR professionals and organizational leaders to measure their self-generated views and observations about the use of AI in the determination of future supply of workforce. The article aims to assess critical measures relating to the efficiency of AI-enabled tools of talent acquisition, impacts on identifying required skills, and roles, and optimal staff placements. It is recommended that the purposeful application of AI for workforce planning should be combined with an emphasis on the ethical issues that may arise when using this kind of technology, the opportunities to reskill the workforce in order to support these ideas, or to carry out continuous evaluation to assess the impact of these ideas as they are being rolled out. This study complements existing literature on the adoption of AI in HR practices, by acknowledging both the benefits of AI adoption for the organization and its drawbacks. The study provides knowledge for organizations that aim at implementing deep learning-driven solutions to improve the management of human capital and gain long-term competitive edge.

**Shareefa Bhanu and Annette Christinal****Keywords:** Artificial Intelligence, Candidate Screening, Predictive Hiring Analytics, Recruitment Cost, Time Efficiency.

INTRODUCTION

AI-powered chatbots provide highly personalized experience and provide potential candidates with engagement during the hiring. These features enhance the candidate experience and enhance the chances of landing the best employees. However, as the authors note, there may be disadvantages associated with the use of this technology: ethical issues, threats to data privacy, and, quite possible, algorithmic prejudice. **Aggarwal (2020)** discussed where applied artificial intelligence stands now, with a focus on what has been done to talent acquisition. The authors note that AI enhances conventional recruitment processes because it increases effectiveness and reliability and makes strategic decisions. AI talent acquisition solutions apply mainly in sourcing, prescreening, communication, and initial hiring processes. Recruitment chatbots, resume parsing, and automating predictive analytics aid the recruiters in a faster and filter-free selection process and in taken out bias at the same time. In the article, the author describes the benefits of the application of AI that include; cost optimization, improving the candidate experience, and flexibility. AI to search through thousands of CVs in minutes and shortlist them according to set criteria versus job description. If AI systems use data that is biased then it will also bias itself in its decision making process. Thus, the authors support human supervision to safeguard accuracy and balance in the procedures of AI-based hiring. It also focuses on how best to implement AI by incorporating it with any prevalent human resource management systems. Finally, the article emphasizes that AI can serves as a significant contributor to the **modern world of recruitment**, and possibly even reshape approaches to the talent acquisition. Quantitative merits of deploying AI in the hiring process cannot be doubted, however, the qualitative questions surrounding the application of AI technology are of paramount importance as they figure out its efficiency for that process. Sharma and Khan (2022) emphasized that big data is revolutionizing the process of HRM, especially addressing effective use of big data for decision making and strategic approaches to talent acquisition, employee engagement, and optimized workforce. Big data analytics specifically in the talent acquisition support the assessment of candidate information derived from the various sources including social media and job sites with the goal of providing useful insights for prediction of the right candidates to hire. In the case of employee engagement and retention, the sentiment analysis tool, and feedback mechanisms assist in tracking the morale of the workforce and possible points of turnover before they could be massive issues in any organization. Organizations receive the benefits of real time performance management and thus design an efficient system suitable for training of employees. Also, big data helps to increase equality among employees through masking discrimination and discriminating against great candidates when selecting or offering them a promotion. Even so, the authors are not left without hurdles like data privacy, skills and talent, and resistance. They encourage proper policies and code of ethical practices in order to satisfy these issues.

Background of the study

Bashynska et al. (2023) discussed the roles and opportunities of artificial intelligence (AI) in human capital management (HCM). AI also helps to reduce time on recruitment, signal processing, and candidate search since AI creates and deploys algorithms to predict candidate performance based on past experience. In increasing employee performance, they come in as AI trainers to offer automatic and dynamic solutions catering to individual training. In performance management, AI provides dynamic statistics that help managers to keep check on the performances and trends. HCM is more strengthened by predictive analytics because they help to predict key workforce trends such as resignation rate and certain skills shortage rate for strategic planning. The authors have emphasized that AI should augment human processes and not replace them, also they discussed important limitation factors that are pertinent to AI like ethical, privacy and the necessity to counteract biases in the AI systems. They also underscore the importance of training of Hr professionals to be in a position to manage the new AI tools. Finally, the article concludes that the combination of AI and human talent is a competitive opportunity for organizations to strengthen productivity, responsiveness, and creativity within a constantly challenging organizational environment. To provide additional

**Shareefa Bhanu and Annette Christinal**

insights, the authors also consider how these dynamics differ by demographic categories. **Avery et al.(2008)** Students have been found to experience relative more discrimination when they belong to a women or a black racial minority in male- or white-dominated environment respectively. One of the findings is that promoting the work place diversity and inclusion reduces perceived discrimination by creating a diverse working population. Furthermore, the role of supportive management is also stressed by the study. Managers and organizational leaders committed to diversity minimize prejudice perceptions and contribute to fairness at work. Finally, the authors underscore the need for future studies on how discrimination perceptions may vary depending on inter- sectionality – that is, multiple social categories – such as race and gender. Organizations must also retain policies on demographic equality to improve organizational satisfaction and retention commonly; it also proposes that organizations emphasize policies on demographic equality to improve satisfaction and retention of employees in organisations. This way, employers will learn how to prevent such problems and thus prevent the case of perceived employment discrimination in the workplace. **Boudreau & Ramstad, (2006)** Talent management, as defined by Boudreau and Ramstad, is transforming HR management into the decision science of talent strategy for organizational sustainability and competitive advantage. The authors reason that conventional HR practices tend to be overly procedural and talent decisions are not broken down to organizational outcomes. Talentship fills this void in talent management thought leadership by aligning with talent segmentation and talent sustainability as principles. Talent segmentation is the process of positing talent acquisition priorities according to the organizational strategic impact.

To be specific, rather than distributing compensation across the organizational chart with equal intervals, resources should be better assigned to positions that matter most. This is similar to customer targeting in marketing, which targets important customer categories for business. Sustainability here means the ability of an organization to perform well in the short term while not compromising on its ability to perform in the future. Talent management allows an organization to flexibly re-strategize for the changes in competition, while staying on track with its competency. It is for this purpose that the authors propose an LTV (Logic, Talent, and Value) framework as a decision-making model for HR. This framework aligns organisational logic (strategic objectives), talent (work force and its capabilities) and value (benefit to business) in order to determine where and how to invest in HR. For instance, HR analytics can be used to discover high-potency talent pools which need development attention and relate managerial decisions to specific economic performances. In conclusion, the article should inspire and help HR professionals to embrace the decision science approach to create more value, linking HR decisions to value-driver. Through the development and practice of Talentship, organisations can attain sustainable competitive advantage, gain maximum value from talent and improve the delivery of their business objectives

Significance of the Research

The study emphasize as many angles of the positive impact of AI usage in pre- employment testing as possible, beginning with the promotion of diversity and inclusion in the workplace, to better applicant experience, and the company's expenses on recruitment. Explain how the current study addresses some of the existing gaps in regarding AI applications in workforce planning and note the relevance of this research to HR practitioners, corporate decision-makers as well as policymakers. Explain why this study is relevant to the existing angles of the workforce. Explain the importance of talent acquisition in organization strategy and how AI may solve the problems of conventional talent acquisition process. Aguilar-Saven, (2004) on the subject and how it has evolved, the methodologies that surround it and it being applied to production and organization management. The study highlights BPM as a critical tool for improving efficiency, understanding workflows, and supporting decision-making in complex systems. The author classifies BPM approaches into three main categories: including descriptive, analytical and simulations. Analytical models employ numerical estimates on procedures in order to assess process performance...and mathematical optimization is quantitative. Simulation based techniques use tools such as discrete-event simulation and seeks to model dynamic systems within changing circumstances and therefore operates effectively in complicated and risky situations. One of the main concerns outlined in the article is the call for an adequate structured BPM framework that will incorporate these methodologies in order to meet various organizational requirements. Aguilar-Savén proposes a generic BPM framework comprising five stages: The various stages in process mapping are as follows: First is the process identification, second is the process modeling, third is the

**Shareefa Bhanu and Annette Christinal**

analysis of the model, fourth is the validation of the model and the last is the improvement of the process. This feedback loop helps to minimize the gap between businesses as it is and as it should be, given changing business environments. This article also describes the application of BPM in business process reengineering, ERP implementation, and supply chain management. BPM can also improve the relations between different companies and organizations, overcome the obstacles in organizational work by improving efficiency and link the strategic business management with the organizational processes. BPM as a strategic asset for organisations that aim at improving operational performance, creativity, and flexibility. To further strengthen the foundations of BPM, the article insists on conducting more research in order to generalize characteristic approaches to BPM methodologies and integrate innovative technologies in realizing process modeling, including artificial intelligence and machine learning.

RESEARCH LITERATURE AND AGENDA

Wenting (2024) article explores the impact of data analysis on talent acquisition and performance management, focusing on how HR departments are integrating data analytics to make more informed decisions. The article provides an in-depth review of how data analysis can enhance the effectiveness of talent acquisition by allowing HR professionals to use predictive models and algorithms to identify top candidates, streamline recruitment processes, and reduce biases in hiring decisions. By analyzing historical data, companies can better understand which traits and experiences correlate with success in specific roles, ultimately leading to a more accurate selection process. The article also examines the role of data analytics in performance management, explaining how HR departments are using data to track employee performance, identify high performers, and provide targeted development opportunities. Data analytics allows for real-time performance tracking, offering valuable insights into employee productivity, engagement, and potential career growth. Furthermore, the authors discuss how analytics can identify patterns in performance data, helping to create personalized development plans for employees. The authors assert that integrating data analytics into HR practices leads to more strategic and evidence-based decision-making, ultimately improving organizational efficiency, employee performance, and talent management. The article emphasizes that HR professionals must balance data-driven insights with a human touch to foster a positive organizational culture and drive sustainable performance. **Popo–Olaniyan et al. (2022)** summarized the use of AI for talent analytics in strategic human capital management with a particular emphasis on the US context. Recruitment through human resource management: The article brings focus on the accelerating usage of artificial intelligence to increase efficiency, neutrality, and precision in human resource management. Talent analytics is a way through which AI can be used by identifying complex patterns, analyzed data, and trends in the system which is helpful for HR professionals' decision making. Some of them are in the areas of recruitment, facility workforce forecasting and talent management. The review also defines the areas that have been benefited through the use of AI in talent analytics. Meaningful applications in recruitment include candidate identification, filtering, and job matching, thus cutting on the time and resources required to hire candidates. Performance management with the help of AI shows the tendencies of productivity changes over time and gives the means to the HR teams to determine two-time performers and non-performers. Finally, whilst KPIs are valuable in SWP, predictive analytics enhances it by estimating turnover rates, shortage of skills and future supply. There are some topics with outlines: ethical issues, privacy on data, and biases in AI systems. Some of them call for moderation, meaning that the use of AI in decision-making processes should be blended with other participants to avoid bias decision making. Discussing the article, the author underlines the possibility to revolutionise HR practices by applying AI talent analytics to build new data-based strategies oriented on organisational excellence. In the implementing of these technologies, organizations can be in a position of sharpening the strategic correlation between the Human Resource Department and the overall business objectives especially within highly competitive talent economy.

RESEARCH GAP

The first is to critically evaluate the gaps that are evident in the current literature and the strategies and methods applied to AI-based workforce planning. Many of the operational weaknesses are associated with the absence of appropriate definitions of research problems and goals, lack of distinction between hypothesis formulation and validation, limited analysis of practical applications, ethics in related research, and the effectiveness of AI models in many organizational settings. Recognize gaps in knowledge of how decision-making, diversity and candidate experience is addressed in the context of AI. Stress the importance of conducting research that assesses at the end user level the practical benefits of the AI systems that are incorporated and the degree to which these systems are effective at augmenting human decision making. They then conclude that ameliorating these weaknesses may progress the profession while offering valuable information to organisations.

Statement of the Problem

Sharma, & Khan (2022) highlighted the transformative impact of big data on human resource management (HRM), focusing on its ability to drive evidence-based decision-making and strategic practices across talent acquisition, employee engagement, and workforce optimization. In talent acquisition, big data analytics facilitates the evaluation of candidate information from diverse sources, such as social media and job portals, enabling predictive insights to identify the best-suited candidates. For employee engagement and retention, sentiment analysis and feedback mechanisms help organizations monitor workforce morale and address potential turnover risks proactively. Workforce optimization benefits from real-time performance tracking, allowing businesses to design personalized training programs and allocate resources effectively. Furthermore, big data promotes diversity and inclusion by identifying disparities and removing biases in recruitment and promotion decisions. However, the authors acknowledge challenges such as data privacy concerns, the need for skilled personnel, and resistance to adoption. They advocate for robust policies and ethical frameworks to manage these challenges. The article concludes that big data is essential for transforming HRM into a strategic function, enabling organizations to gain a competitive edge, enhance innovation, and build a future-ready workforce. Bashynska, Prokopenko, and Sala (2023) identified the possibility and preliminarily consider how the incorporation of Artificial Intelligence (AI) impacts Human Capital Management (HCM) processes, decision-making and employee engagement and workforce optimization. In talent acquisition, big data analytics facilitates the evaluation of candidate information from diverse sources, such as social media and job portals, enabling predictive insights to identify the best-suited candidates. For employee engagement and retention, sentiment analysis and feedback mechanisms help organizations monitor workforce morale and address potential turnover risks proactively. Workforce optimization benefits from real-time performance tracking, allowing businesses to design personalized training programs and allocate resources effectively. Bashynska et al.(2023) Furthermore, big data promotes diversity and inclusion by identifying disparities and removing biases in recruitment and promotion decisions. However, the authors acknowledge challenges such as data privacy concerns, the need for skilled personnel, and resistance to adoption. They advocate for robust policies and ethical frameworks to manage these challenges.

RESEARCH METHODOLOGY

A convenience sampling method is adopted to attain ease in contact of respondents as well as variation with 150 sample respondents. Avery et al.(2008) present research examines the nature of the relationship between demographic concordance with co-workers and employment discrimination perception. Compiling numerous case studies from a very large, organization, and diverse workplace, the authors analyze the interactions between how discrimination is linked with demographic features of people (age, gender etc.) and with the context within which people work. The study demonstrates that there is discrimination in the workplace but it is not perceived when employees are similar in one way or another with their immediate supervisors and other employees. The phenomenon referred to as this as 'demographic similarity' for it results to the feeling of belonging since everyone

**Shareefa Bhanu and Annette Christinal**

does not feel like an outcast. Alternatively, the study shows that participants who are demographically dissimilar to the main cohort admit to experiencing more perceived discrimination.

Analysis, findings and Results

The use of AI improves on the quality of decision making since it comes up with analytical information on workforce trends in business, within the shortest time possible, which can commoner prompt action by the HR professionals, especially where market forces are involved. Some of the main use cases are related to workforce planning and scheduling automation, new skills for future roles definition, and turnover likelihood evaluation. The others are also instrumental in scenario modeling, which gives organizations a way to work through various workforce plans and the likely implications. The author captures that AI enhances decision-making in aspects of the workforce since its strategies are both effective and aligned to the organizational goals. Yanamala (2024). Employing AI in resume parsers, portfolio scanning and online activity profiling, hiring managers are able to assess the strength that are not easily discerned during the traditional face-to-face interviews which ranges from technical skill to good interpersonal skills. Such advanced tools as NLP and machine learning bring the candidate's experience to the appropriate requirements for a certain position. The significance of the ranks given is tested with the help of Friedman test as below. AI-Powered Candidate Sourcing: Automated candidate sourcing involves the use of algorithms that search databases, social media, and the candidates sourcing websites to pull prospective candidates. It uses natural language processing and pattern detection to match candidates with jobs based on his/her profile, resume and other social media presence. This approach is a huge benefit to recruiters, as it will cut the time and effort needed to achieve this objective while delivering a more targeted talent pool. Besides that, AI candidates can be not only active applicants but also those who are not currently seeking a job but would be willing to if presented with another opportunity, so, talent acquisition is not only widened, but also the overall quality of the processes of staff selection is increased. Skills and Role Matching: In skills and role matching AI hence provides a better matching interface so that a candidate's skills and the job match well. This also decreases the mismatch rate, while at the same time increasing satisfaction among employees, since they will be placed in position suited to their productivity and retention rates.

Candidate screening and Short listing: It automates the process of screening and short listing of candidate whereby AI analyses the resumes, applications and other documents submitted by candidates. A number of qualifications, experience and competencies necessary for a specific job are learned by machine learning algorithms thus helping the algorithms rank and rate candidates accordingly.... Another function of the screening by an AI system is the patterns and context that can be used to spot both stated qualifications and other aspects connected to such things as cultural match and certain cognitive skills. This helps to minimize the Human Bias, has enhanced fairness, and fasten the hiring process so that the recruiter get a short list of potential candidates who are readily available to sit for an interview. Predictive Hiring Analytics: Predictive hiring analytics utilizes historical data and behaviorism coupled with pattern recognition from a computer to identify the chances of success of candidates in a given job or organization. Thus, function prediction on historical data of hire decisions, performance, and even personality, AI can determine the probability of a candidate for success and compatibility with corporate culture in the future. This in turn empowers the recruiters to make sound decisions as far as the staffing decisions are concerned so that the turnover can be reduced and the reward of the improved team synergy achieved.

They get better with each new hiring data that feeds back into them so each successive time round is optimized for identifying superior candidates with the most potential. Recruitment Cost and Time Efficiency: AI leads to an effective reduction in the recruitment cost and time because activities that take many hours to complete can be performed within a short time. Thus, AI decreases the levels of demand for significant amounts of article work and time investments from the HR personnel. Secondly, aided by AI, it is easier to filter out candidates who can be classified as 'value-added', and greatly minimise the time taken up by the hiring process. These efficiencies therefore enable firms to incur lesser cost in the recruitment process because most of major operations like sifting, preliminary short listing, and preliminary employee evaluation are had been completed by the system. The calculated Chi-Square value is 181.007 for the degree of freedom 11. The significance is identified at 1% level($p < 0.000$). Yanamala (2024) explained that AI is poised to play a strategic role in the management of people within organisations and measuring

**Shareefa Bhanu and Annette Christinal**

talents, a field of study also known as HRM. The article shows how employing AI tools helps predict workforce demands and match organizational and HR goals. It is thus possible through the use of machine learning algorithms and prediction analytics to predict talent requirements, existing gaps, and work out preventive solutions. However the article also discusses several drawbacks of this approach like presenting a set of mitigation measures including the need for human supervision of AI. Summing it all up, the article concludes by stating that AI-based solutions are appearing in such sphere as Workforce planning and Talent forecasting and that it becomes a key determinant to successful organizations and those that desire to survive in the new world of business. AI as a strategy turns into the organization's possibility to enhance the capacity of organisations, advance the systems of talent management and selection of the workforce, so to meet future demand. In his article, Pala also explains the purpose and advantages of data analytics in the context of HRM and recruitment in particular and analyzing how and why hr specialists are using data. There are several areas that the article touches on how organizations are using data analytics for better management of HR functions inclusive of; recruitment, engagement and Retention of employees and finally Workforce planning. When integrated to the concept of talent acquisition, data analytics enables efficient screening of numerous applicants by feeding volumes of information into an analytical model to get a set of applicants considered best suited in view of past performance and probable performance. Predictive analytics – it can predict how well a candidate will perform in a certain position, which minimizes the risk of hiring wrong. Concerning employee involvement and origination, data analytics aids the HR specialists to monitor the employees' satisfaction, and engagement levels, and possible turnover signals so that the required strategies can be applied to mitigate the occurrences. Also, analyses help strategies workforce through deficiency detection in terms of competencies and learning requirements. Pala also highlights about the impact of artificial intelligence (AI) in talent management saying that it is better at handling big data and is faster in giving accurate information comparing to some conventional techniques. But the article also brought up potential issues with data privacy, increased emphasis on getting good data governance strategies, and making sure that preconceptions do not influence the data analysis. As stated throughout this article, data analytics is a robust tool that can greatly improve the work of HRM and provide more strategic, analysing, and goals-oriented approach to the company.

CONCLUSION

Organizational leaders are considered in the study in terms of the proposed approach to avoid overreliance on AI. Although AI cad services enhance resource utilization and foresee force prospects, the social issues of reasonable and efficient AI, algorithmic transparency, and data privacy at work must be solved to gain employee trust. Also, it assesses the way AI improves the essence of strategic HRM decisions keeping with data assembly, analytical input, future workforce prognosis, and resource deployment. Research shows that AI greatly improves the processes involved in talent acquisition from resume scanning, data analysis, and improving candidate matching that reduces the time and increases efficiency in hiring. These results are especially important for human resources professionals, managers, and policy makers to understand the future vision of AI on workforce planning. It means that for the HR professionals, this study reveals that the use of AI tools as the part of the TA process and for workforce planning and optimization is critical. When it comes to skillful candidate identification, or confident prediction of potential employees' performance, AI supplements the conventional methods are far more efficient in deploying the workforce in the several operational levels. AI tools also enhance workforce planning because performance data are analyzed to determine viable real-time adjustments as well as effective workforce planning. The study also shows that up skilling and res killing activities to help workers be ready for the new world of an AI integration are important for change in organizations. Further, knowledge derived from here can help policy makers to set policies and rules that will ensure proper use of artificial intelligence, reduce any opportunities for bias and protect employee from unfair treatment. It helps to extend the existing agenda of concern and knowledge on future-researched workforce planning by offering practical recommendations for building AI-supported approaches to leadership that will integrate innovation, excellence, and moral values to enhance organizational development and sustenance.

ABSTRACT

The idea of machine learning as a technology made it possible to supply methods, that the device could absorb data on its own, and that it could progress the data from interaction without being expressly programmed or instructed to do so. Because of the idea of machine learning, this was able to be accomplished. In the beginning, there was a technology that was known as machine learning, which made it possible for this action to take place. This study proposes a comprehensive strategy for overcoming the inadequacies that are obtained from the large number of methods that are used to monitor rivers. This strategy is accomplished by introducing a machine learning algorithm into the process of river monitoring and obtaining findings. Within the scope of this research, a structure and the construction of an easy framework for the existing method of using IoT to examine the quality of river water using the IoT and Machine Learning are also described.

Keywords: Machine Learning, IoT (Internet of Things), Lo-Ra, AWS (Azure Web Services), RWM (River Water Monitoring)

Karthikeyan et al.,

INTRODUCTION

A rise in human activity over the course of the last century has had a disastrous impact on our environment, which is directly causing damage to human health [1]. One of the consequences of this is that our environment is being destroyed. The proliferation of slum communities, the lack of clean facilities, and the actions of mining companies are all elements that contribute to serious consequences on the environment [2]. This is especially true in emerging nations such as India and Mexico. In order to guarantee the conservation of this environmental impossible, it is necessary to conduct an analysis of the effects that the water systems have [3]. The more traditional approaches to establishing the quality of the water entailed the data from different location using manual collection of water sample, which was then followed by an evaluation utilising laboratory logical techniques. Taking this action was done in order to provide an indication of the water's quality level. The time required for these procedures is greater, and it is not possible to consider them to be very efficient [4]. Here, the systems that are now in place will simply analyse the parameters, which may include the physical, chemical, and biological components of the water. This particular analysis will take place. Nevertheless, this approach is plagued by a number of issues, including the following points: i) It is labour-intensive and costly in terms of the quantity of workers that are necessary, the operation, and the equipment that is required. ii) The absence of information on the quality of the water that is updated in real time, which would make it possible to achieve outcomes that are vital for the protection of public health [5].

PROBLEM DEFINITION

As the result of this, in real time regarding to the water quality there is a need raised to monitor the quality in continuous manner. On the other hand, significant progress has been made in the field of environmental research thanks to the technology that enables remote monitoring of water quality. The system that is being discussed is developed with the intention of providing information regarding river water quality and identifying, with a precision of 500 meters, the exact location where the river is being polluted. This particular system architecture is made up of three levels, which are referred to as the Edge system, Fog system & Cloud system respectively. Framework of the proposed layer technique has been separated into its component parts, which are illustrated in the image that can be shown below.

Edge system

The system comprises multiple nodes positioned 500 meters apart. Each node includes a microcontroller, LoRa transmitter, sensors, and a battery. The sensors, such as pH, temperature, turbidity (Hach 1720 D, WQ730, WQ720), conductivity (Smart Water (Libelium)), and dissolved oxygen (WQ401), are interfaced with the microcontroller and LoRa end node. The GPS transmits the sensor data to the gateway at a rate of 27 kbps, allowing for location tracking via GPS coordinates[6].

Fog system

The fog system includes LoRa transceivers and a gateway that uses global unlicensed spectrum, including the spectrum ISM bands 915, 780, 868, 470 & 433 MHz [7], enabling low-power, wide-area communication among remote sensors and their connected gateways, resulting in reduced interference compared to Wi-Fi and Bluetooth[8]. This system operates Wi-Fi at 2.4GHz and 5GHz frequencies. A drawback exists where data traffic may occur during transmission from the gateway to the network. This issue can be mitigated by employing an appropriate machine learning algorithm for data processing and analysis within the fog system[9].

Cloud system

All sensor data from various fog systems is saved in the cloud - Azure Web Service (AWS)[10]. Services that are provided under AWS include computing, storage, databases, messaging, content delivery, and monitoring[11]. The cloud system's background consists of several sensors that will assess to the waters physical and chemical parameters. The framework examined in this research includes temperature value, pH level, turbidity level,

Karthikeyan *et al.*,

conductivity level and dissolved O₂[1][12]. The value of the pH level of water runs from 0 to 14, with a suitable drinking water pH level between 6 and 8; exceeding this range indicates significant contamination based on the specified parameters. The dissolved O₂ level indicates the extent of impacts within the aquatic ecosystem. When the dissolved O₂ level at H₂O gives increases leads to population span of aquatic life rises. Consequently, the level of dissolved oxygen determines the flavour of water. Temperature and conductivity are interrelated and are critical determinants of water quality.

SYSTEM DESIGN

Figure 2 presents the whole structure and procedure of the proposed river water monitoring system. Initially, the parameterised sensors, including pH, temperature, dissolved oxygen, turbidity, and conductivity, were deployed in various environments such as residential, industrial, and agricultural sectors. The sensors were situated 500 meters apart, and the data collected was transmitted to the microcontroller, where the LoRa nodes interconnected with various LoRa networks to relay the information to the LoRa gateway for cloud transfer (i.e., AWS). From AWS, the data was sent to a central station for monitoring and result projection. This proposed technique involves a challenges concerning:

- Data traffic between the gateway and the cloud,
- The positioning of sensors at an adjustable height to provide robust signal strength and minimise data transmission loss from the gateway.

Data from edge devices are communicated to the Lo-Ra gateway via the Lo-Ra wireless sensor network. In the entry point, primary data processing and analysis are conducted using applicable techniques. The data are collected from the gateway and transmitted to the cloud, from which the central station accesses all nodes positioned in the river at intervals of 500 meters. The water quality at the node will be monitored and assessed by cloud technology. The exact location of the wastewater discharge is easy to identify with this data. It also prevents water contamination and minimises manpower requirements. Figure 3 illustrates the hardware solution with a Raspberry Pi connected to a PC, detailing the water contamination levels through several sensors. The results have been reviewed using figures 4 and 5, which give data on exactly when at which the sensors are examined and display the values for pH, conductivity, dissolved oxygen, and turbidity by utilising the individual sensors. The obtained data are then sent to the cloud provided by Amazon Web Services (AWS) and shown in a graph form within that specific location. Let the government to participate in this issue and to take a variety of measures to mitigate this drawback by setting stricter standards on residential areas and industrial regions. Regarding this matter, government officials are assigned to oversee this process, and they are also liable for creating and executing out environmental water quality monitoring programs within the limits of their role. In accordance with the Water Pollution Control Law, the city administration identified 71 cities and included them as selected cities for the purpose of inspecting and controlling effluent emissions from companies located within their respective area limits. In order to control the daily and periodic variations in drift rates and water quality, their water quality monitoring is carried out four times a day throughout the year (i.e., approximately every six hours) River water samples are collected in order to perform this task.

Proposed Algorithm

Adaptive Water Quality Detection Algorithm (AWQDA)

AWQDA combines K-Nearest Neighbors (KNN) for classification and Isolation Forest for anomaly detection. The algorithm is ideal for river water quality monitoring where real-time data is continuously collected.

Steps involved for the proposed algorithm - AWQDA

Data Collection

- Collect real-time data from IoT sensors measuring water quality parameters - pH, Temperature, Turbidity, Conductivity, and Dissolved Oxygen.

$[X = \{x_1, x_2, \dots, x_n\}]$, where each x_i is a parameter value.

Data Pre-processing

- Normalize the data to bring all parameters to a uniform scale

Karthikeyan et al.,

$[X_{\text{norm}} = \frac{X - \mu}{\sigma}]$, where μ is the mean and σ is the standard deviation.]

- Handle missing values and outliers to improve data quality.

KNN Classification

- Normal (N), Slightly Polluted (SP), and Highly Polluted (HP).

- Predict the class $C(x)$ of a new data point based on the majority class among its k -nearest neighbors:

$C(x) = \text{Mode}(Y_k)$, where Y_k are the labels of the k -nearest neighbors.]

- Calculate distance between points using **Euclidean Distance**:

$d(x, y) = \sqrt{\sum_{i=1}^n (x_i - y_i)^2}$.

Anomaly Detection

- Calculate anomaly scores for each data point using path lengths in a binary tree

$A_s(x) = \frac{\text{Path Length}(x)}{E(h(x))}$, where $E(h(x))$ is the average path length.]

- Flag points as anomalies if the score exceeds a threshold:

$A_s > T \implies \text{Anomalous Point.}$

Model Adaptability

- Dynamically update the KNN model with newly labeled data to improve real-time performance.

- Adjust the Isolation Forest threshold based on recent data trends.

Visualization and Alerts

Visualize the classified water quality data and anomalies using a scatter plot

- X-axis: pH values
- Y-axis: Temperature values.
- Highlight anomalies with distinct markers (e.g., red "X").
- Trigger real-time alerts with GPS coordinates when anomalies are detected.

Performance Evaluation

- Calculate the accuracy of the KNN classifier

$\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN} \times 100\%$

- Report the total number of anomalies detected by the Isolation Forest algorithm.

- Normalization: $[X_{\text{norm}} = \frac{X - \mu}{\sigma}]$

- KNN Classification: $C(x) = \text{Mode}(Y_k)$ with distance $d(x, y) = \sqrt{\sum_{i=1}^n (x_i - y_i)^2}$

- Anomaly Detection: $A_s(x) = \frac{\text{Path Length}(x)}{E(h(x))}$

- Accuracy: $\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN} \times 100\%$

To monitor river water quality, the Adaptive Water Quality Detection Algorithm (AWQDA) code uses K-Nearest Neighbours (KNN) for classification and Isolation Forest for anomaly detection. The simulation to the water quality parameters such as the level of pH, Range of Temperature, Level of Turbidity, Conductivity level and Dissolved O2 were simulated, along with pollution levels (Normal, Slightly Polluted, Highly Polluted). Data is normalised using the algorithm to prepare for comparable expanding across all parameters. For evaluation, the dataset is separated into training and testing sets. After training on transformed data, the KNN classifier classifies water quality into predefined categories by closest neighbour majority vote. In addition, the Isolation Forest technique is used to find data points that differ significantly from expected patterns in the testing dataset. Finally, the algorithm computes the KNN classifier's accuracy and displays the total number of anomalies, providing a complete approach for recognising water quality data contamination levels and anomalies. From table 1 the Adaptive Water Quality Detection Algorithm (AWQDA) provides more efficiently than any other ML algorithmsto accuracy, detection time, and adaptability. AWQDA achieves an impressive 96% accuracy, above Random Forest (95%), SVM (89%), and

**Karthikeyan et al.,**

Logistic Regression (80%). The high accuracy results from an integrated methodology that integrates K-Nearest Neighbours (KNN) for classification and Isolation Forest for anomaly detection, facilitating the exact identification of pollution levels and anomalies in water quality. In addition, AWQDA identifies anomalies in 25 seconds, exceeding SVM (60 seconds) and being on par with Random Forest, though slightly slower than Logistic Regression (20 seconds). AWQDA is distinguished by its exceptional adaptability; the model updates dynamically with new information, providing real-time monitoring and continuous development. The scalability of AWQDA makes it particularly suitable for IoT-based water quality monitoring systems, where real-time data processing and anomaly identification are essential for mitigating pollution and enhancing environmental sustainability. The Figure 6 graph illustrates the results of the Adaptive Water Quality Detection Algorithm (AWQDA), combining K-Nearest Neighbours (KNN) for classification and Isolation Forest for anomaly detection. In the graph X-axis says about the pH values, while Y-axis indicates the range of temperature. Colourcoded points indicate water quality classifications—Normal, Slightly polluted, and highly polluted—predicted by KNN. Red "X" markers highlight anomalies detected by the Isolation Forest, Signaling unusual sensor data or potential pollution events. The KNN classifier achieved 36.0% accuracy, while 5 anomalies were flagged, presenting therealtime data with system's ability to spot deviations.

CONCLUSION

The proposed system for river water quality monitoring effectively combines IoT sensors, KNN classification, and Isolation Forest anomaly detection to identify illegal effluent releases in real time. During testing, the system achieved a classification accuracy of 36% with the KNN model, successfully distinguishing between normal, slightly polluted, and highly polluted water conditions. Additionally, the Isolation Forest algorithm flagged 5 anomalies, corresponding to sudden deviations constraints such as pH valve and range of the temperature. These results validate the system's capability to pinpoint unusual contamination events efficiently and highlight its practical utility in real-time environmental monitoring. By leveraging cloud storage and visualization, the system ensures faster response times, minimizes manpower requirements, and reduces operational costs. Future improvements, including enhanced machine learning models, additional sensor parameters, and predictive analytics, can further increase detection accuracy and scalability, making this system a robust solution for water pollution prevention. In this investigation our main idea is to identify the illegal effluent release in the river water bodies and to prevent contamination. Level of pH, Range of Temperature, Level of Turbidity, Conductivity level and Dissolved O2 and other aspects to water quality are typically impacted by this contamination. In this system, the levels of contamination are monitored, and the data obtained is sent to the cloud via the use suitable sensors and edge devices. There is not only the monitoring of the contamination level, but also the identification of the exact location of the wastewater release through the utilisation of those data. This helps in the prevention of water pollution in a more quick and productive way, which decreases the amount of manpower involved.

ABSTRACT

In this dynamic unfolding of sports analytics, the core aspect of every groundbreaking research is to uncover hidden elements influencing future developments and results are labelled as sorcery. They can be manifold by a range of approaches. Nonetheless, in the dominated big data landscape Machine learning algorithms to discern patterns and produce prognostications in various fields, encompassing innumerable sports, especially Cricket is favoured globally and is no exception. In India, people distinctly rejoice in cricket. One among them is the T-20 format. This paper focuses on envisaging the 17th edition of the Indian Premier League (IPL) scheduled for 2024 in India. Among supervised techniques, we used a random forest algorithm model to predict the 17th edition of the franchise Twenty20 cricket league winner, which emerged as the most effective, achieving a custom accuracy of 64.5%. According to our analysis, the Kolkata Knight Riders, are foreseen to win the IPL 2024. We utilized a dataset from Kaggle for this study.

Keywords: machine learning, IPL 2024, winner prediction, Random forest algorithm

INTRODUCTION

In India one of the most prevalent and prominent sports is cricket. The viewership and popularity have increased tremendously over the decades. skimp that cricket has more than two billion fans worldwide, with the potential for

**Abarnaa and Sivakasini**

significant growth. Among all formats, T-20 commemorates its standard, in which the Indian Premier League (IPL) a men's (T20) cricket league is notorious. Every last one of these cricket fans is waiting with bated breath about upcoming cricket events and tournaments. They desire to cram about the prospects of their favorite team. Through this lens, analysis is directed to speculate on the 2024 league winner by leveraging machine learning techniques and historical data. The vigorous growth of machine learning and big data grants a distinctive chance to obtain and uncover significant insights from extensive data amassed by the IPL, incorporating other contributing factors. By harnessing this data, this study aspires to project the league winner of the 2024 series. The obstacle array is not only in treating this comprehensive dataset but also in building a model algorithm to navigate the outcome. Our strategy encompasses collecting and preprocessing intricate datasets, ensued by implementing a commonly used supervised machine learning algorithm (Random forest classifier) and aggregated technique to detect the repercussions with an accuracy score. This paper accentuates Feature Engineering, data splitting, model divination, and evaluation. Via this paper, the entire group of cricket fans can fathom ML algorithms integrated with sports prediction

Review of Literature

The literature on envisioning sports results, chiefly within the monarchy of cricket and exactly the Indian Premier League has grown significantly with the advent of machine learning and analytics techniques. Numerous research studies have ventured to model the end products of IPL matches using several statistical and machine-learning models emphasizing the broad scope of cricket analytics. A dominant feature of research prioritizes machine learning algorithms, with studies like Srikantiah KC *et al*(2021) exploring the various factors that influence the outcome of IPL matches, among the algorithms used a random forest classifier is optimal. Likewise, G. Sudhamathy *et al*(2020) have cast off the R package by implementing four different algorithms to explore the dataset and represent the conclusions in a graphical representation. For instance, Nikhil Dhonge *et al*(2021) proposed a comparative analysis to give important information like IPL score prognosis by implementing three different regression models in which the linear regression model stands out, and for winning speculation among RFC, SVC, and DTC, RFC ML algorithms among linear, ridge, and lasso regression and for winning between SVC, Decision tree, RFC got more accuracy than others. In some cases, the SVM algorithm achieves the uppermost accuracy in recognizing the optimal attributes affecting the match outcomes in the investigation by PranavanSomaskandhan *et al*(2018). Moreover, constructing ML approaches to predict game results with a precession of 75% is good and was conferred by Sunil Bhutada *et al*(2020), further assessing the team's improved strength. Song. H *et al*(2011) have enhanced mobile node location estimation in cricket Sensor Networks by using FPB-IMM outperforming the Kalman filter and CIMM in accuracy and reliability. Priyanka. S *et al*(2020) have emphasized the match outcome using the Random Forest algorithm. Singh, D. K. *et al* (2021) have addressed the uncertainty in T-20 cricket by leveraging evolving technology. Multivariable linear regression algorithm, demonstrating higher accuracy through metrics such as MSE, RMSE, and R^2 score to forecast IPL match outcomes by Kavitha, P. V. *et al*(2021) Overall, the literature illustrates a shift between various erudite models that lecture the complexities of cricket by machine learning algorithms. For strategic decision-making, data-driven insights are increasingly essential in sports analytics.

PROPOSED METHODOLOGY

The methodology for unveiling the IPL league winner involves a reiterative process that take part in data collection, preprocessing, model selection, and validation. The fundamental objective is to implement a prophetic model that can accurately conjecture the potential winner of IPL 2024.

Data Collection

An all-inclusive dataset is gathered from Kaggle encompassing historical IPL match data from various seasons. This embraces complete statistics such as venues, toss decisions, team names, winners, and circumstantial factors. This dataset has extracted meaningful features that contribute to match results.

**Data Preprocessing**

The gathered data is imperilled to preprocessing to remove whitespace, handle missing values, and correct team names. Feature engineering plays a decisive role in this stage, label encoding is used to convert the string into a numerical value in the team column.

Model Selection

As from the referred paper, the RFC model gives optimal accuracy compared with other ML algorithms mentioned, and this paper is built using a random forest classifier algorithm predicting IPL league outcomes.

Training And Tuning

The dataset is split into training and testing sets based on the Season column. For the training stage matches up to the 2023 season are considered, while for testing twenty-24 season is undertaken. The chosen model is trained on a training dataset. The projected labels are mapped back to team names using a predefined mapping.

Model Validation

The predictive model is corroborated using a dataset not used during the training stage. Accuracy metrics are hired to appraise the model's performance are plotted.

Findings

The forecasted league winners of IPL 2024 are reported with accuracy scores. This methodology aims to provide a full-bodied and steady machine-learning framework for estimating the winner of a league, causal to the mounting field of sports analytics and enhancing our understanding of the factor that is causative to feat on T-20 cricket.

Visualization: Univariate Analysis

Fig 1 reveals a horizontal bar chart that Mumbai Indians (MI) leads with a score of 133, followed closely by Chennai Super Kings (CSK) at 125 and Kolkata Knight Riders (KKR) at 124, indicating they are the top-performing teams. Royal Challengers Bangalore (RCB), Sunrisers Hyderabad (SRH), Rajasthan Royals (RR), Delhi Capitals (DC), and Pune Warriors (PW) fall into a mid-range performance bracket, with scores ranging from 96 to 108. In contrast, Lucknow Super Giants (LSG) and Gujarat Titans (GT) are significantly behind, with the lowest scores of 44 and 36 respectively, highlighting a notable disparity in performance levels among the teams. Fig 2 represents the top 10 cricket stadiums by the number of matches played. Wankhede Stadium tops the list with (111) matches, followed by Eden Gardens (77) and M Chinnaswamy Stadium (63). Other notable venues include Feroz Shah Kotla (59), MA Chidambaram Stadium (48), and Rajiv Gandhi International Stadium, Uppal (47). Sawai Mansingh Stadium also hosted 47 matches, while Punjab Cricket Association Stadium (34), Sheikh Zayed Stadium (29), and Maharashtra Cricket Association Stadium (22) round out the list. Wankhede Stadium stands out as the most frequently used venue. Fig 3 discloses Out of the total matches conducted from the first season to last season the decision spellbound each team after winning the toss, 616 times chose to field first, and 345 times they chose to bat first. This shows that after the toss decision, most of the team prefers to field first.

Prediction And Accuracy Evaluation

The Foreseen team, based on historical data and relevant features, suggests that has the highest likelihood of winning with a 64.48% accuracy score. However, the accuracy score indicates some uncertainty, and real-world outcomes may differ due to various factors.

CONCLUSION

Envisaging a winner in a field of sport is arduous and involves very convoluted methods, especially in cricket. but with the mystical arts of machine learning is easier. This work has an effect in predicting Kolkata Knight Riders as the champion of the 17th edition of IPL twenty- twenty-four using a Random Forest classifier to be the optimal

Abarnaa and Sivakasini

achievement of a 64.24% accuracy score. As future scope to foreshow IPL league, as a hybrid approach incorporates player statistics, team strength, and historical data that could offer a comprehensive prophesied model. However, predicting a winner may not be correct in every situation this might change due to climatic conditions, auction reports, and player injury. consider social media sentiment to gauge fan support or use deep learning techniques to categorize patterns in historical match data.

ABSTRACT

Pressure ulcers, also known as bedsores or decubitus ulcers, are localized injuries to the skin and underlying tissue, typically over bony prominences, resulting from prolonged pressure, shear, and friction. These wounds pose significant clinical challenges, particularly in vulnerable populations such as the elderly, individuals with limited mobility, and those with chronic illnesses. The development of pressure ulcers is associated with various risk factors including immobility, malnutrition, incontinence, and impaired sensory perception. The management of bedsores is crucial to improving patient outcomes and preventing complications. Traditional medicine offers various approaches, including the local application of herbal formulations. Jatayadi Tail, an herbal oil enriched with healing properties, is commonly used for its anti-inflammatory and wound-healing effects. Additionally, Panchavalkal Kwath, provides nourishment to the affected tissues and enhances the healing process. The practice of Prakshalan, or local washing with Panchavalkal Kwath, helps cleanse the wound, reduce infection risk, and promote tissue regeneration. This combination of topical applications demonstrates potential efficacy in managing bedsores, improving healing rates, and enhancing patient comfort.

INTRODUCTION

An ulcer is a break in the continuity of the covering epithelium, either skin or mucous membrane due to molecular death. [1] the bed sore also known as pressure ulcer and trophic ulcer. Pressure sore is tissue necrosis and ulceration due to prolonged pressure. Blood flow to the skin stops once external pressure becomes more than 30 mmHg (more than capillary occlusive pressure) and this causes tissue hypoxia, necrosis and ulceration. It is more prominent between bony prominences and an external surface. [2] The pressure sores are most common site over the ischial tuberosity, sacrum, the heel, buttocks, more common in long term bedridden patients, elderly, immobile, unconscious or paralyzed patient. Bedsore or Pressure ulcer is defined by the European Pressure Ulcer Advisory Panel (EPUAP) as an area of localised damage to the skin and underlying tissue caused by pressure, shear or friction or a combination of these. [3] In ayurveda mainly 2 types of vrana will be described nija and agantuja vana. nijavran. Is manifested to dosha vata, pitta, kapha sannipataj and Agantuj vana is external injury in sharia that cause to vrana [4] Acharya charak also explain nija and agantujavrana [5] According to acharya sushruta has ulcer will be correlated with nija vana [6] Nowadays, doctors administer treatments like betadine, silver nitrate, H₂O₂, Eusol, antibiotics, or any other medications that are used in daily practice. although Sushrutaacharya has already explain that Sasti Upakramas can treat any kind of vana (wound). [7] Vrana chikitsa mainly based on in 6 mula, 8 adhistan, 5 lakshan, 60 upakarama and chatushpada [8]

Aim and objective

This study was establishing the ayurvedic management of dushta vana [pressure ulcer] and prevention of recurrence.

Case report

A 40-year-old female patient came with a history of spinal injury due to a fall of height in six months ago. She currently presents with paraparesis (weakness affecting both legs), Uncontrolled bladder and bedsores in the lumbosacral region. After the surgery patient was totally bedrest and they have gradually developed bed sore in lumbosacral region with serous discharge and foul smell in 2 months ago, during general physical examination patient was malnourished vital are stable and laboratory investigation within normal range. neurological examination show motor reflex of both limbs were diminished.

Past history

Patient having a history of the spinal injury [C2;C3;C4] due to fall down to first floor of her house since 6 months ago and also surgery will be done.

Ulcer examination [9]

➤ Inspection

Site; lumbosacral region

Size; 8 cm long Approx 5 cm width

Shape; irregular

Number; 1

Discharge; little serous discharge present

Smell; foul smell

Surrounding area; discolorations present

Flora; Debris present

➤ Palpation

Temperature: normal

Tenderness: present

Margins: irregular

Hemangini S. Malivad and Omprakash Dave

Bleeding: not present

Surrounding area: not edematous

Classification of Pressure Ulcers By Grade, Defined By European Pressure Ulcer Advisory Panel (Epuap):

Grade 1: Non- blanchable erythema of intact skin. Discoloration, warmth, induration or hardness of skin may also be used as indicators, particularly in people with darker skin.

Grade 2: partial thickness skin loss, involving epidermis, dermis or both. The ulcer is superficial and presents clinically as abrasion or blister.

Grade 3: Full thickness skin loss involving damage to or necrosis of subcutaneous tissue that may extend down to, but not through underlying fascia.

Grade 4: Extensive destruction, tissue necrosis, or damage to muscle, bone or supporting structures, with or without full thickness skin loss.

MATERIAL AND METHODS

The proper management of the ulcer to relevant treatment of which including both internal and external application form of shodhan and ropan concept of dusta vrana.

External and internal medicine

External application of panchavalakal kwath for prakshalan [cleaning, washing] purpose and jatyadi tail for local application

➤ Panchavalakal kwath

Panchavalakal kwath Combining the vran shodhak and vran ropak qualities of the sixty upakramas of vrana management mentioned in the Sushrut Samhita, panchavalakal kwath is beneficial. It is thought that Panchavalakal Kwath acts through raktapittagna and kapha shamak. Its kashaya (astringent) rasa, tikta (bitter) rasa, and ruksha (dry) properties have several activities, including removing slough and providing the right environment for injured tissue cells to begin regenerating.[10] These gunas work well to normalize vitiated kapha. that removal of symptoms such as dourgandhya, kandu, and srava. While it's beneficial to promote healing and pain relief. Additionally, kwatha has demonstrated antimicrobial properties in past research studies [11]. Throughout the management, no unfavorable occurrences were discovered, and the healing process went smoothly. The found way of therapy. affordable, secure, and simple to use

➤ Jatyadi tail [13]

Jatyadi Taila is a traditional Ayurvedic formulation used primarily for wound healing and skin conditions. Its scientific application can be understood through its properties and ingredients:

- Ingredients and Their Effects:
 - Tikta (bitter) and Kashaya (astringent) Rasa: These tastes help in reducing inflammation and promoting tissue healing.
 - Laghu (light) and Ruksha (dry) Guna: These qualities contribute to reducing excess moisture in wounds and accelerating healing by facilitating the drying and closure of wounds.
- Properties of Ingredients:
 - Raktaprasadak Dravya (Blood Purifiers): Manjistha and Sariva help in enhancing blood quality (Rakta dhatu), which supports better tissue perfusion and healing. Improved blood circulation can lead to more efficient delivery of nutrients and removal of waste products from the wound site.
 - Katuka: This ingredient supports re-epithelialization (regrowth of the outer skin layer), neovascularization (formation of new blood vessels), and migration of cells (like endothelial cells) into the wound area, thus aiding in the overall healing process.

**Hemangini S. Malivad and Omprakash Dave**

- Mechanism:
 - Vrana Ropana (Wound Healing): The combined actions of the ingredients work synergistically to promote wound healing. The bitter and astringent qualities help in reducing inflammation and controlling infection, while the light and dry qualities prevent excessive moisture that can hinder healing.
 - Strengthening Tissues: The formulation supports the stabilization of skin and underlying tissues by enhancing the strength of both the skin (twak) and the muscles (mamsa). This makes the tissue more resilient and less prone to further injury or infection.
 - Improved Blood Circulation: By enhancing the quality of blood and promoting better perfusion, Jatyadi Taila ensures that the wound site receives adequate nutrients and oxygen necessary for repair and regeneration.
 - Application
 - Topical Use: Jatyadi Taila is typically applied topically to wounds or affected areas. It should be applied to clean, dry skin to maximize its healing benefits.
- Jatyadi Taila utilizes its blend of ingredients to support wound healing through anti-inflammatory, astringent, and tissue-strengthening properties, backed by scientific principles of enhancing blood flow and tissue regeneration. At the end of 45 days the dusta vran is complete to healed.

Gandhaka rasayana

Gandhaka rasayana has anti-inflammatory and anti-infective properties, it helps in wound healing.

Arogyavardini vati

Arogyavardini vati helps to expel the vitiated pitta, helps to reduce inflammation, burning sensation.

Amapachakvati: improving digestive health .

Procedure

Patient consent was taken, the ulcer and the surrounding area was cleaned with panchvalkal kashaya regularly. After cleaning of the ulcer, Jatyadi taila sufficient quantity was applied over the ulcer. Then the ulcer was covered with dry gauze bandaging was done

RESULT

According to EDUAP it is Grade 3: Full thickness skin loss involving damage to or necrosis of subcutaneous tissue that may extend down to, but not through understanding fascia. On the 0 day ulcer which was having to much large with mucopurulent discharge with foul intorlable smell with pain which turned into ½ previous ulcer area with healthy granulation and little wet dressing discharge on 15th day after the application of medicine internal and also externally, further wound was improved size will bedecreased with healthy granulation tissue and no discharge and no smell from 30th day to start with epithelization to get completely healed by 45th with the continuation of same treatment.

DISCUSSION

The treatment of bedsores (also known as pressure ulcers) has both modern and traditional approaches. According to Ayurvedic principles, as described by Acharya Sushruta, the management of dusta vrana (chronic wounds, such as bedsores) is based on the involvement of doshas, site of the wound, and the degree of purification and inflammation. The combination of Amapachak Vati, Arogya Vardhini Vati, and Gandhak Rasayan is an Ayurvedic treatment protocol traditionally used for managing and healing bed sore

1.Amapachak Vati: This is primarily aimed at enhancing digestive efficiency and metabolizing endotoxins, referred to as "Ama" in Ayurveda. From a scientific perspective, improving digestive health and systemic detoxification may play a role in improving immune function and accelerating tissue repair in chronic wounds such as bed sores.

**Hemangini S. Malivad and Omprakash Dave**

2. Arogya Vardhini Vati: This formulation supports liver function and enhances the body's detoxification pathways. Scientific studies suggest that liver function is critical in regulating inflammation and tissue regeneration. Enhanced liver detoxification, along with the regulation of lipid metabolism, may promote faster healing of skin lesions by improving blood purification and tissue repair processes.

3. Gandhak Rasayan: Sulfur (Gandhak) is known for its broad antimicrobial, anti-inflammatory, and wound-healing properties. Modern research has shown that sulfur-based compounds can promote skin regeneration, reduce microbial load, and enhance wound healing. Gandhak Rasayan's role in reducing infection rates in bed sores and supporting dermal repair makes it a potent adjunct in managing pressure ulcers.[15]

The combination of Panchavalkal prakashalan and the local application of Jatyadi taila proves to be highly effective in managing chronic wounds like bedsores. Panchavalkal prakashalan offers deep cleansing and detoxification, reducing inflammation and infection due to its antimicrobial properties. Meanwhile, Jatyadi taila, with its wound-healing and tissue-regenerating qualities, promotes the formation of healthy granulation tissue. Together, these Ayurvedic treatments facilitate faster healing, reduce discomfort, and improve overall wound management outcomes[16]

CONCLUSION

The study on Ayurvedic management of pressure ulcers (bed sores) is that a combination of internal and external Ayurvedic treatments proved to be highly effective in healing chronic wounds like bedsores. The treatment included Panchavalkal kwath for cleaning the wound and Jatyadi taila for topical application, which promoted tissue regeneration and healing. Additionally, internal medicines such as Amapachak Vati, Arogya Vardhini Vati, and Gandhak Rasayan helped in detoxification, improving immune response, and promoting faster healing. The study demonstrated complete healing of the wound within 45 days without any adverse effects.

ABSTRACT

This project presents the design and implementation of a women's safety rescue system using Arduino, GPS, and GSM modules, simulated in Proteus. The system enables women to send an immediate distress signal with their location coordinates to a predefined contact in case of an emergency. By pressing a button, the device triggers the GPS module to fetch the current location, and the GSM module sends an SMS alert containing the GPS coordinates. Additionally, the system activates a buzzer to draw attention. The entire setup is designed to be portable and user-friendly, ensuring quick and efficient assistance. The use of Proteus for simulation allows for thorough testing of the circuit before physical implementation.

Keywords: Women safety, Arduino, GPS Module, GSM Module.

INTRODUCTION

The Women's safety remains a critical issue in many parts of the world. Incidents of violence and harassment continue to rise, leading to a growing demand for effective measures that ensure personal security. Technological advancements offer significant potential in addressing these concerns [5]. This project focuses on developing a sophisticated rescue system based on Arduino, integrated with GPS alerts, specifically designed to enhance the safety of women. The core idea behind this system is to provide a quick and reliable method for women to alert their trusted contacts in case of an emergency [3]. By pressing a simple button, the device will send an SMS containing their precise location coordinates to a predefined contact, ensuring immediate assistance. The system integrates

91946

**Swati Barui et al.,**

several key components, including a GPS module for location tracking, a GSM module for sending alerts, and an Arduino board for processing and control [2]. Additional features such as a buzzer and LED are incorporated to draw attention in critical situations. The project also leverages Proteus software for circuit simulation, allowing for comprehensive testing and validation of the system before physical implementation [4]. This ensures that the design is robust, functional, and capable of performing reliably in real-world scenarios. Through this project, we aim to create a portable, cost-effective, and user-friendly device that empowers women to feel safer and more secure in their daily lives [1]. By providing a technological solution to a pressing social issue, this project highlights the importance of innovation in enhancing personal safety and underscores the potential of technology to create a safer world for everyone[7]. The development of this rescue system not only aims to enhance women's safety but also demonstrates the potential of technology in addressing social issues. By providing a practical and accessible solution, this project highlights the importance of innovation in creating a safer and more secure environment for women [6]. The successful implementation of this system can serve as a model for similar projects aimed at improving personal security and empowering individuals to take control of their safety.

Block Diagram Representation

In figure 1 it appears the associations of the framework. Arduino Microcontroller acts as the central control unit. Forms signals from GPS and other inputs (e.g., button press) and communicates with the GSM module. GPS Module tracks the current area of the gadget in terms of scope and longitude and gives area information to the Arduino. GSM Module (SIM900) sends crisis messages (SMS) containing the user's GPS area to predefined contacts. Push Button serves as the emergency trigger. When pressed, it enacts the protect framework. LCD Show shows framework status, such as "Caution Sent," or area facilitates and gives criticism to the client approximately framework operations. Buzzer produces an capable of being heard alarm to draw consideration to the crisis circumstance. The framework will send the GPS area as an SMS, and the sent message will appear within the Virtual Terminal. When the push button is pressed: The LCD appears framework status, counting "Sending Alarm" and "Caution Sent."The Virtual Terminal shows GSM communication: AT Commands and reactions and sent SMS: Emergency! Area: Lat: xx.xxxx, Lon: yy.yyyy.

System Design

The project "Arduino based rescue system with GPS alerts for women" is a arduino based software project. In this project we use proteus software version 8.11 to design the circuit. We use virtual terminal to get the results of this circuit. In table 1 it shows the connections of different component used in the system design.

Operating Principal of The System

The main purpose of our project is to provide security to the women from unsafe situations. When powered on, the Arduino initializes all connected components and configures the GPS module to start acquiring location data and sets up the GSM module to send SMS. It also initializes the LCD to display system messages. The GPS module continuously tracks the current location and the system remains idle and ready for activation. This device consists of a push button which can be pressed by the women when she is in need or when she feels insecure. As the switch is pressed by the women the arduino uno gets the command and it takes the current latitude and longitude value of the victim with the help of GPS module. The arduino uno switch ON the buzzer present in the device so that nearby people may notice the critical condition and may come to rescue. And arduino uno sends the SMS of current location to the registered mobile number of the family member and police with the help of GSM module. The GSM sends the current position at every second so that if the victim is changing its current position continuously then that can be easily followed by police. The system continues monitoring the GPS location and can resend alerts if the button is pressed again. Figure 3 shows the working of the system in form of a flow chart.

Swati Barui et al.,

RESULT

Simulating results of “WOMEN SAFETY RESCUE SYSTEM” circuit in Proteus 8.11 is shown and discussed below- Figure 4, shows when powered on, the Arduino initializes all connected components. The LCD displays the message “Initializing..” and when the system is ready it shows “ System Ready”. In figure 5, shows when the push button is pressed the buzzer is activated to produce a loud alarm. An emergency alert message is prepared, including the location coordinates to send via GSM module to predefined emergency contacts. In figure 6, shows the message is sent via the GSM module to predefined emergency contacts.

CONCLUSION

The Arduino-based rescue system with GPS alerts for women's safety is an effective solution that leverages technology to enhance personal security. The system's ability to send real-time location information to a trusted contact can significantly reduce response times during emergencies and potentially save lives. The successful simulation of the system in Proteus demonstrates its feasibility and reliability. Future enhancements could include integrating additional features such as voice recognition and real-time tracking to further improve the system's functionality. This project underscores the importance of technological innovations in addressing social issues and providing practical solutions for women's safety.

ABSTRACT

A distinct algebraic structure of BP-algebra is provided by an interval valued bipolar intuitionistic fuzzy ideal and fuzzy α -ideal. Here, the properties are explained with new concepts. The goal of this research is to apply fuzzy set and ideal theory to a BP-algebra.

Keywords: BP-algebra, bipolar intuitionistic fuzzy ideal, interval valued bipolar intuitionistic fuzzy ideal and fuzzy α -ideal.

INTRODUCTION

In early period L.A.Zadeh [9] introduced a fuzzy set of his own but now its area was developed into so many categories in this modern age. The idea behind BP-algebra was introduced by S.S. Ahn[1]. Bipolar valued fuzzy sets were first developed by K.J. Lee [5], who extended $[-1, 1]$ from $[0, 1]$ with a positive membership degree range of fuzzy sets. The elements that are unrelated to the associated property are indicated by the membership degree of 0. In addition to partially satisfying the implicit counter property, which displays the negative membership degree $[-1, 0]$,

the elements also partially satisfy the property means the positive membership degree (0, 1]. W.R. Zhang [10] began the generalization of fuzzy sets in 1994. A union and intersection of intuitionistic fuzzy sets were described by K. Chakrabarty and Biswas R. Nanda [4]. Fuzzy groups and level subgroups were scrutinized by A. Rajeshkumar [8]. The authors M. Palanivelrajan and S. Nandakumar [7] defined intuitionistic fuzzy primary and semi primary ideal operations. The bipolar fuzzy α -ideal of the BP algebra was defined by Gendy [6]. S. Sivakaminathan, K. Gunasekaran, and S. Nandakumar [11] proposed further operations on the bipolar intuitionistic fuzzy ideal and anti fuzzy ideal of a BP-algebra. As an extension of the traditional fuzzy set, intuitionistic fuzzy sets were first presented by K.T. Atanassov [2]. As a basis for intuitionistic fuzzy sets, interval valued intuitionistic fuzzy sets were further proposed by K.T. Atanassov and G. Gargov [3].

MATERIALS AND METHODS

Definition:2.1

For BP-algebra X , a BIF set A is defined as $A = \{(x, \mu_A^P(x), \mu_A^N(x), \nu_A^P(x), \nu_A^N(x)) \mid x \in X\}$, where $\mu_A^P: X \rightarrow [0, 1]$, $\mu_A^N: X \rightarrow [-1, 0]$, $\nu_A^P: X \rightarrow [0, 1]$, $\nu_A^N: X \rightarrow [-1, 0]$ are mappings and it satisfies $0 \leq \mu_A^P(x) + \nu_A^P(x) \leq 1$ and $-1 \leq \mu_A^N(x) + \nu_A^N(x) \leq 0$.

Definition:2.2

In X , A and B are any two BIF sets $A = (\mu_A^P, \mu_A^N, \nu_A^P, \nu_A^N)$ and $B = (\mu_B^P, \mu_B^N, \nu_B^P, \nu_B^N)$, we describe

- (i) $A \cap B = \{(x, \min(\mu_A^P(x), \mu_B^P(x)), \max(\mu_A^N(x), \mu_B^N(x)), \max(\nu_A^P(x), \nu_B^P(x)), \min(\nu_A^N(x), \nu_B^N(x))) \mid x \in X\}$
- (ii) $A \cup B = \{(x, \max(\mu_A^P(x), \mu_B^P(x)), \min(\mu_A^N(x), \mu_B^N(x)), \min(\nu_A^P(x), \nu_B^P(x)), \max(\nu_A^N(x), \nu_B^N(x))) \mid x \in X\}$
- (iii) $\bar{A} = \{(x, \nu_A^P(x), \nu_A^N(x), \mu_A^P(x), \mu_A^N(x)) \mid x \in X\}$.

Definition: 2.3

A function $M_A: X \rightarrow D[0, 1]$, $\forall x \in X$, $M_A(x)$ is an interval $[a, b]$, $0 \leq a \leq b \leq 1$ and IVF set A is brought out by the expression $D[0, 1]$, which represents the set of all intervals inside $[0, 1]$.

Definition:2.4

The set $A = \{(x, m_A^P(x), m_A^N(x), n_A^P(x), n_A^N(x)) \mid x \in X\}$, where $m_A^P(x) \subseteq [0, 1]$, $m_A^N(x) \subseteq [-1, 0]$, $n_A^P(x) \subseteq [0, 1]$ and $n_A^N(x) \subseteq [-1, 0]$ are interval and $\forall x \in X$, $\inf m_A^P(x) + \inf n_A^P(x) \leq 1$, $\sup m_A^N(x) + \sup n_A^N(x) \geq -1$, we can able to obtain the IVBIF set A over X .

Example:

Consider $\mu_A^P(x) = \inf m_A^P(x) = \begin{cases} [0.7, 0.7] & \text{if } x = 0 \\ [0.3, 0.7] & \text{otherwise} \end{cases}$
 $\mu_A^N(x) = \sup m_A^N(x) = \begin{cases} [-0.8, -0.8] & \text{if } x = 0 \\ [-0.8, -0.6] & \text{otherwise} \end{cases}$
 $\nu_A^P(x) = \inf n_A^P(x) = \begin{cases} [0.2, 0.2] & \text{if } x = 0 \\ [0.2, 0.5] & \text{otherwise} \end{cases}$
 $\nu_A^N(x) = \sup n_A^N(x) = \begin{cases} [-0.1, -0.1] & \text{if } x = 0 \\ [-0.3, -0.1] & \text{otherwise} \end{cases}$

Definition:2.5

In X , A and B are any two IVBIF sets $A = (\mu_A^P, \mu_A^N, \nu_A^P, \nu_A^N)$ and $B = (\mu_B^P, \mu_B^N, \nu_B^P, \nu_B^N)$, we define

- (i) $A \cap B = \{(x, \min(\inf m_A^P(x), \inf m_B^P(x)), \max(\sup m_A^N(x), \sup m_B^N(x)), \max(\inf n_A^P(x), \inf n_B^P(x)), \min(\sup n_A^N(x), \sup n_B^N(x))) \mid x \in X\}$
- (ii) $A \cup B = \{(x, \max(\inf m_A^P(x), \inf m_B^P(x)), \min(\sup m_A^N(x), \sup m_B^N(x)), \min(\inf n_A^P(x), \inf n_B^P(x)), \max(\sup n_A^N(x), \sup n_B^N(x))) \mid x \in X\}$

$$(iii) \bar{A} = \{(x, \inf n_A^P(x), \sup n_A^N(x), \inf m_A^P(x), \sup m_A^N(x)) / x \in X\}.$$

Definition:2.6

An IVBIF set A of BP-algebra X is named as an IVBIF ideal of X if it attains the following constraints:

- (i) $\inf m_A^P(0) \geq \inf m_A^P(x)$ and $\sup m_A^N(0) \leq \sup m_A^N(x)$
- (ii) $\inf m_A^P(x) \geq \min \{ \inf m_A^P(x \cdot y), \inf m_A^P(y) \}$
- (iii) $\sup m_A^N(x) \leq \max \{ \sup m_A^N(x \cdot y), \sup m_A^N(y) \}$
- (iv) $\inf n_A^P(0) \leq \inf n_A^P(x)$ and $\sup n_A^N(0) \geq \sup n_A^N(x)$
- (v) $\inf n_A^P(x) \leq \max \{ \inf n_A^P(x \cdot y), \inf n_A^P(y) \}$
- (vi) $\sup n_A^N(x) \geq \min \{ \sup n_A^N(x \cdot y), \sup n_A^N(y) \}, \forall x, y \in X.$

Illustration

An IVBIF set $A = \{ \mu_A^P, \mu_A^N, \nu_A^P, \nu_A^N \}$, whereas

$$\begin{aligned} \mu_A^P(x) = \inf m_A^P(x) &= \begin{cases} [0.7, 0.7] & \text{if } x = 0 \\ [0.3, 0.7] & \text{otherwise} \end{cases} \\ \mu_A^N(x) = \sup m_A^N(x) &= \begin{cases} [-0.8, -0.8] & \text{if } x = 0 \\ [-0.8, -0.6] & \text{otherwise} \end{cases} \\ \nu_A^P(x) = \inf n_A^P(x) &= \begin{cases} [0.2, 0.2] & \text{if } x = 0 \\ [0.2, 0.5] & \text{otherwise} \end{cases} \\ \nu_A^N(x) = \sup n_A^N(x) &= \begin{cases} [-0.1, -0.1] & \text{if } x = 0 \\ [-0.3, -0.1] & \text{otherwise} \end{cases} \end{aligned}$$

Hence, the above mentioned six conditions are checked and carried out by set A.

Definition:2.7

In this IVBIF set $A = \{ (x, \mu_{\alpha_A}^P(x), \mu_{\alpha_A}^N(x), \nu_{\alpha_A}^P(x), \nu_{\alpha_A}^N(x)) / x \in X \}$ of X is entitled as an IVBIF α -ideal of X if it fulfills the below statements:

- (i) $\inf m_{\alpha_A}^P(0) \geq \inf m_{\alpha_A}^P(x)$ and $\sup m_{\alpha_A}^N(0) \leq \sup m_{\alpha_A}^N(x)$
- (ii) $\inf m_{\alpha_A}^P(y \cdot z) \geq \min \{ \inf m_{\alpha_A}^P(x \cdot z), \inf m_{\alpha_A}^P(x \cdot y) \}$
- (iii) $\sup m_{\alpha_A}^N(y \cdot z) \leq \max \{ \sup m_{\alpha_A}^N(x \cdot z), \sup m_{\alpha_A}^N(x \cdot y) \}$
- (iv) $\inf n_{\alpha_A}^P(0) \leq \inf n_{\alpha_A}^P(x)$ and $\sup n_{\alpha_A}^N(0) \geq \sup n_{\alpha_A}^N(x)$
- (v) $\inf n_{\alpha_A}^P(y \cdot z) \leq \max \{ \inf n_{\alpha_A}^P(x \cdot z), \inf n_{\alpha_A}^P(x \cdot y) \}$
- (vi) $\sup n_{\alpha_A}^N(y \cdot z) \geq \min \{ \sup n_{\alpha_A}^N(x \cdot z), \sup n_{\alpha_A}^N(x \cdot y) \}, \forall x, y, z \in X.$

RESULTS AND DISCUSSION**Proposition: 3.1**

If A is an IVBIF ideal of a BP-algebra, then the complement of the complement of a set A is the set A itself.

Proof:

We assume that $0, x, y \in X.$

$$(i) \text{ Now } \inf m_A^P(0) = \inf n_A^P(0)$$

$$= \inf m_A^P(0) \geq \inf m_A^P(x)$$

$$\text{Therefore } \inf m_A^P(0) \geq \inf m_A^P(x)$$

$$\text{Now } \sup m_A^N(0) = \sup n_A^N(0)$$

$$= \sup m_A^N(0) \leq \sup m_A^N(x)$$

$$\text{Therefore } \sup m_A^N(0) \leq \sup m_A^N(x)$$

$$(ii) \text{ Now } \inf m_A^P(x) = \inf n_A^P(x)$$

$$= \inf m_A^P(x)$$

$$\geq \text{Min} \{ \inf m_A^P(x \cdot y), \inf m_A^P(y) \}$$

$$\text{Therefore } \inf m_A^P(x) \geq \text{Min} \{ \inf m_A^P(x \cdot y), \inf m_A^P(y) \}$$

$$\begin{aligned} \text{(iii) Now } \sup m_A^N(x) &= \sup n_A^N(x) \\ &= \sup m_A^N(x) \end{aligned}$$

$$\leq \text{Max} \{ \sup m_A^N(x \cdot y), \sup m_A^N(y) \}$$

$$\text{Therefore } \sup m_A^N(x) \leq \text{Max} \{ \sup m_A^N(x \cdot y), \sup m_A^N(y) \}$$

$$\text{(iv) Now } \inf n_A^P(0) = \inf m_A^P(0)$$

$$= \inf n_A^P(0) \leq \inf n_A^P(x)$$

$$\text{Therefore } \inf n_A^P(0) \leq \inf n_A^P(x)$$

$$\text{Now } \sup n_A^N(0) = \sup m_A^N(0)$$

$$= \sup n_A^N(0) \geq \sup n_A^N(x)$$

$$\text{Therefore } \sup n_A^N(0) \geq \sup n_A^N(x)$$

$$\text{(v) Now } \inf n_A^P(x) = \inf m_A^P(x)$$

$$= \inf n_A^P(x)$$

$$\leq \text{Max} \{ \inf n_A^P(x \cdot y), \inf n_A^P(y) \}$$

$$\text{Therefore } \inf n_A^P(x) \leq \text{Max} \{ \inf n_A^P(x \cdot y), \inf n_A^P(y) \}$$

$$\text{(vi) Now } \sup n_A^N(x) = \sup m_A^N(x) = \sup n_A^N(x)$$

$$\geq \text{Min} \{ \sup n_A^N(x \cdot y), \sup n_A^N(y) \}$$

$$\text{Therefore } \sup n_A^N(x) \geq \text{Min} \{ \sup n_A^N(x \cdot y), \sup n_A^N(y) \}.$$

Proposition:3.2

The intersection of any two sets are VBIF ideal of a BP-algebra.

Proof:

Let us assume that

$$0, x, y \in A \cap B \Rightarrow 0, x, y \in A \text{ and } 0, x, y \in B.$$

$$\text{(i) Now } \inf m_{A \cap B}^P(0) = \text{Min} \{ \inf m_A^P(0), \inf m_B^P(0) \}$$

$$\geq \text{Min} \{ \inf m_A^P(x), \inf m_B^P(x) \}$$

$$= \inf m_{A \cap B}^P(x)$$

$$\text{Therefore } \inf m_{A \cap B}^P(0) \geq \inf m_{A \cap B}^P(x).$$

$$\text{Now } \sup m_{A \cap B}^N(0) = \text{Max} \{ \sup m_A^N(0), \sup m_B^N(0) \}$$

$$\leq \text{Max} \{ \sup m_A^N(x), \sup m_B^N(x) \}$$

$$= \sup m_{A \cap B}^N(x)$$

$$\text{Therefore } \sup m_{A \cap B}^N(0) \leq \sup m_{A \cap B}^N(x).$$

$$\text{(ii) Now } \inf m_{A \cap B}^P(x) = \text{Min} \{ \inf m_A^P(x), \inf m_B^P(x) \}$$

$$\geq \text{Min} \{ \text{Min} \{ \inf m_A^P(x \cdot y), \inf m_A^P(y) \}, \text{Min} \{ \inf m_B^P(x \cdot y), \inf m_B^P(y) \} \}$$

$$= \text{Min} \{ \text{Min} \{ \inf m_A^P(x \cdot y), \inf m_B^P(x \cdot y) \}, \text{Min} \{ \inf m_A^P(y), \inf m_B^P(y) \} \}$$

$$= \text{Min} \{ \inf m_{A \cap B}^P(x \cdot y), \inf m_{A \cap B}^P(y) \}$$

$$\text{Therefore } \inf m_{A \cap B}^P(x) \geq \text{Min} \{ \inf m_{A \cap B}^P(x \cdot y), \inf m_{A \cap B}^P(y) \}.$$

$$\text{(iii) Now } \sup m_{A \cap B}^N(x) = \text{Max} \{ \sup m_A^N(x), \sup m_B^N(x) \}$$

$$\leq \text{Max} \{ \text{Max} \{ \sup m_A^N(x \cdot y), \sup m_A^N(y) \}, \text{Max} \{ \sup m_B^N(x \cdot y), \sup m_B^N(y) \} \}$$

$$= \text{Max}\{\text{Max}\{\sup m_A^N(\mathbf{x} \cdot \mathbf{y}), \sup m_B^N(\mathbf{x} \cdot \mathbf{y})\}, \text{Max}\{\sup m_A^N(\mathbf{y}), \sup m_B^N(\mathbf{y})\}\} = \text{Max}\{\sup m_{A \cap B}^N(\mathbf{x} \cdot \mathbf{y}), \sup m_{A \cap B}^N(\mathbf{y})\}$$

Therefore $\sup m_{A \cap B}^N(\mathbf{x}) \leq \text{Max}\{\sup m_{A \cap B}^N(\mathbf{x} \cdot \mathbf{y}), \sup m_{A \cap B}^N(\mathbf{y})\}$.

$$(iv) \text{ Now } \inf n_{A \cap B}^P(0) = \text{Max}\{\inf n_A^P(0), \inf n_B^P(0)\}$$

$$\leq \text{Max}\{\inf n_A^P(\mathbf{x}), \inf n_B^P(\mathbf{x})\} \\ = \inf n_{A \cap B}^P(\mathbf{x})$$

Therefore $\inf n_{A \cap B}^P(0) \leq \inf n_{A \cap B}^P(\mathbf{x})$.

$$\text{Now } \sup n_{A \cap B}^N(0) = \text{Min}\{\sup n_A^N(0), \sup n_B^N(0)\}$$

$$\geq \text{Min}\{\sup n_A^N(\mathbf{x}), \sup n_B^N(\mathbf{x})\} \\ = \sup n_{A \cap B}^N(\mathbf{x})$$

Therefore $\sup n_{A \cap B}^N(0) \geq \sup n_{A \cap B}^N(\mathbf{x})$.

$$(v) \text{ Now } \inf n_{A \cap B}^P(\mathbf{x}) = \text{Max}\{\inf n_A^P(\mathbf{x}), \inf n_B^P(\mathbf{x})\}$$

$$\leq \text{Max}\{\text{Max}\{\inf n_A^P(\mathbf{x} \cdot \mathbf{y}), \inf n_A^P(\mathbf{y})\}, \text{Max}\{\inf n_B^P(\mathbf{x} \cdot \mathbf{y}), \inf n_B^P(\mathbf{y})\}\}$$

$$= \text{Max}\{\text{Max}\{\inf n_A^P(\mathbf{x} \cdot \mathbf{y}), \inf n_B^P(\mathbf{x} \cdot \mathbf{y})\}, \text{Max}\{\inf n_A^P(\mathbf{y}), \inf n_B^P(\mathbf{y})\}\}$$

$$= \text{Max}\{\inf n_{A \cap B}^P(\mathbf{x} \cdot \mathbf{y}), \inf n_{A \cap B}^P(\mathbf{y})\}$$

Therefore $\inf n_{A \cap B}^P(\mathbf{x}) \leq \text{Max}\{\inf n_{A \cap B}^P(\mathbf{x} \cdot \mathbf{y}), \inf n_{A \cap B}^P(\mathbf{y})\}$.

$$(vi) \text{ Now } \sup n_{A \cap B}^N(\mathbf{x}) = \text{Min}\{\sup n_A^N(\mathbf{x}), \sup n_B^N(\mathbf{x})\}$$

$$\geq \text{Min}\{\text{Min}\{\sup n_A^N(\mathbf{x} \cdot \mathbf{y}), \sup n_A^N(\mathbf{y})\}, \text{Min}\{\sup n_B^N(\mathbf{x} \cdot \mathbf{y}), \sup n_B^N(\mathbf{y})\}\}$$

$$= \text{Min}\{\text{Min}\{\sup n_A^N(\mathbf{x} \cdot \mathbf{y}), \sup n_B^N(\mathbf{x} \cdot \mathbf{y})\}, \text{Min}\{\sup n_A^N(\mathbf{y}), \sup n_B^N(\mathbf{y})\}\}$$

$$= \text{Min}\{\sup n_{A \cap B}^N(\mathbf{x} \cdot \mathbf{y}), \sup n_{A \cap B}^N(\mathbf{y})\}$$

Therefore $\sup n_{A \cap B}^N(\mathbf{x}) \geq \text{Min}\{\sup n_{A \cap B}^N(\mathbf{x} \cdot \mathbf{y}), \sup n_{A \cap B}^N(\mathbf{y})\}$.

Proposition:3.3

The union of any two sets are lVBIF ideal of a BP-algebra, if they are equal.

Proof:

If $A = B \Rightarrow A \cup B = A$ or $A \cup B = B$.

We assume that $0, \mathbf{x}, \mathbf{y} \in A \cup B \Rightarrow 0, \mathbf{x}, \mathbf{y} \in A$ or $0, \mathbf{x}, \mathbf{y} \in B$.

$$(i) \text{ Now } \inf m_{A \cup B}^P(0) = \text{Max}\{\inf m_A^P(0), \inf m_B^P(0)\}$$

$$\geq \text{Max}\{\inf m_A^P(\mathbf{x}), \inf m_B^P(\mathbf{x})\}$$

$$= \inf m_{A \cup B}^P(\mathbf{x})$$

Therefore $\inf m_{A \cup B}^P(0) \geq \inf m_{A \cup B}^P(\mathbf{x})$.

$$\text{Now } \sup m_{A \cup B}^N(0) = \text{Min}\{\sup m_A^N(0), \sup m_B^N(0)\}$$

$$\leq \text{Min}\{\sup m_A^N(\mathbf{x}), \sup m_B^N(\mathbf{x})\}$$

$$= \sup m_{A \cup B}^N(\mathbf{x})$$

Therefore $\sup m_{A \cup B}^N(0) \leq \sup m_{A \cup B}^N(\mathbf{x})$.

$$(ii) \text{ Now } \inf m_{A \cup B}^P(\mathbf{x}) = \text{Max}\{\inf m_A^P(\mathbf{x}), \inf m_B^P(\mathbf{x})\}$$

$$\geq \text{Max}\{\text{Min}\{\inf m_A^P(\mathbf{x} \cdot \mathbf{y}), \inf m_A^P(\mathbf{y})\}, \text{Min}\{\inf m_B^P(\mathbf{x} \cdot \mathbf{y}), \inf m_B^P(\mathbf{y})\}\}$$

$$= \text{Min}\{\text{Max}\{\inf m_A^P(\mathbf{x} \cdot \mathbf{y}), \inf m_B^P(\mathbf{x} \cdot \mathbf{y})\}, \text{Max}\{\inf m_A^P(\mathbf{y}), \inf m_B^P(\mathbf{y})\}\}$$

$$= \text{Min}\{\inf m_{A \cup B}^P(\mathbf{x} \cdot \mathbf{y}), \inf m_{A \cup B}^P(\mathbf{y})\}$$

Therefore $\inf m_{A \cup B}^P(\mathbf{x}) \geq \text{Min}\{\inf m_{A \cup B}^P(\mathbf{x} \cdot \mathbf{y}), \inf m_{A \cup B}^P(\mathbf{y})\}$.

$$(iii) \text{ Now } \sup m_{A \cup B}^N(\mathbf{x}) = \text{Min}\{\sup m_A^N(\mathbf{x}), \sup m_B^N(\mathbf{x})\}$$

$$\leq \text{Min}\{\text{Max}\{\sup m_A^N(\mathbf{x} \cdot \mathbf{y}), \sup m_A^N(\mathbf{y})\}, \text{Max}\{\sup m_B^N(\mathbf{x} \cdot \mathbf{y}), \sup m_B^N(\mathbf{y})\}\}$$

$$= \text{Max}\{\text{Min}\{\sup m_A^N(\mathbf{x} \cdot \mathbf{y}), \sup m_B^N(\mathbf{x} \cdot \mathbf{y})\}, \text{Min}\{\sup m_A^N(\mathbf{y}), \sup m_B^N(\mathbf{y})\}\}$$

$$= \text{Max}\{\sup m_{A \cup B}^N(x \cdot y), \sup m_{A \cup B}^N(y)\}$$

$$\text{Therefore } \sup m_{A \cup B}^N(x) \leq \text{Max}\{\sup m_{A \cup B}^N(x \cdot y), \sup m_{A \cup B}^N(y)\}.$$

$$(iv) \text{ Now } \inf n_{A \cup B}^P(0) = \text{Min}\{\inf n_A^P(0), \inf n_B^P(0)\}$$

$$\leq \text{Min}\{\inf n_A^P(x), \inf n_B^P(x)\}$$

$$= \inf n_{A \cup B}^P(x)$$

$$\text{Therefore } \inf n_{A \cup B}^P(0) \leq \inf n_{A \cup B}^P(x).$$

$$\text{Now } \sup n_{A \cup B}^N(0) = \text{Max}\{\sup n_A^N(0), \sup n_B^N(0)\}$$

$$\geq \text{Max}\{\sup n_A^N(x), \sup n_B^N(x)\}$$

$$= \sup n_{A \cup B}^N(x)$$

$$\text{Therefore } \sup n_{A \cup B}^N(0) \geq \sup n_{A \cup B}^N(x).$$

$$(v) \text{ Now } \inf n_{A \cup B}^P(x) = \text{Min}\{\inf n_A^P(x), \inf n_B^P(x)\}$$

$$\leq \text{Min}\{\text{Max}\{\inf n_A^P(x \cdot y), \inf n_A^P(y)\}, \text{Max}\{\inf n_B^P(x \cdot y), \inf n_B^P(y)\}\}$$

$$= \text{Max}\{\text{Min}\{\inf n_A^P(x \cdot y), \inf n_B^P(x \cdot y)\}, \text{Min}\{\inf n_A^P(y), \inf n_B^P(y)\}\}$$

$$= \text{Max}\{\inf n_{A \cup B}^P(x \cdot y), \inf n_{A \cup B}^P(y)\}$$

$$\text{Therefore } \inf n_{A \cup B}^P(x) \leq \text{Max}\{\inf n_{A \cup B}^P(x \cdot y), \inf n_{A \cup B}^P(y)\}.$$

$$(vi) \text{ Now } \sup n_{A \cup B}^N(x) = \text{Max}\{\sup n_A^N(x), \sup n_B^N(x)\}$$

$$\geq \text{Max}\{\text{Min}\{\sup n_A^N(x \cdot y), \sup n_A^N(y)\}, \text{Min}\{\sup n_B^N(x \cdot y), \sup n_B^N(y)\}\}$$

$$= \text{Min}\{\text{Max}\{\sup n_A^N(x \cdot y), \sup n_B^N(x \cdot y)\}, \text{Max}\{\sup n_A^N(y), \sup n_B^N(y)\}\}$$

$$= \text{Min}\{\sup n_{A \cup B}^N(x \cdot y), \sup n_{A \cup B}^N(y)\}$$

$$\text{Therefore } \sup n_{A \cup B}^N(x) \geq \text{Min}\{\sup n_{A \cup B}^N(x \cdot y), \sup n_{A \cup B}^N(y)\}.$$

Proposition:3.4

If A is an IVBIF α -ideal of a BP-algebra, then the complement of the complement of a set A is the set A itself.

Proof:

We assume that $0, x, y, z \in X$.

$$(i) \text{ Now } \inf m_{\alpha_A}^P(0) = \inf n_{\alpha_A}^P(0)$$

$$= \inf m_{\alpha_A}^P(0) \geq \inf m_{\alpha_A}^P(x)$$

$$\text{Therefore } \inf m_{\alpha_A}^P(0) \geq \inf m_{\alpha_A}^P(x).$$

$$\text{Now } \sup m_{\alpha_A}^N(0) = \sup n_{\alpha_A}^N(0)$$

$$= \sup m_{\alpha_A}^N(0) \leq \sup m_{\alpha_A}^N(x)$$

$$\text{Therefore } \sup m_{\alpha_A}^N(0) \leq \sup m_{\alpha_A}^N(x).$$

$$(ii) \text{ Now } \inf m_{\alpha_A}^P(y \cdot z) = \inf n_{\alpha_A}^P(y \cdot z)$$

$$= \inf m_{\alpha_A}^P(y \cdot z) \geq \text{Min}\{\inf m_{\alpha_A}^P(x \cdot z), \inf m_{\alpha_A}^P(x \cdot y)\}$$

$$\text{Therefore } \inf m_{\alpha_A}^P(y \cdot z) \geq \text{Min}\{\inf m_{\alpha_A}^P(x \cdot z), \inf m_{\alpha_A}^P(x \cdot y)\}.$$

$$(iii) \text{ Now } \sup m_{\alpha_A}^N(y \cdot z) = \sup n_{\alpha_A}^N(y \cdot z)$$

$$= \sup m_{\alpha_A}^N(y \cdot z) \leq \text{Max}\{\sup m_{\alpha_A}^N(x \cdot z), \sup m_{\alpha_A}^N(x \cdot y)\}$$

$$\text{Therefore } \sup m_{\alpha_A}^N(y \cdot z) \leq \text{Max}\{\sup m_{\alpha_A}^N(x \cdot z), \sup m_{\alpha_A}^N(x \cdot y)\}.$$

$$(iv) \text{ Now } \inf n_{\alpha_A}^P(0) = \inf m_{\alpha_A}^P(0)$$

$$= \inf n_{\alpha_A}^P(0) \leq \inf n_{\alpha_A}^P(x)$$

Therefore $\inf n_{\alpha_A}^P(0) \leq \inf n_{\alpha_A}^P(x)$.

Now $\sup n_{\alpha_A}^N(0) = \sup m_{\alpha_A}^N(0)$

$$= \sup n_{\alpha_A}^N(0) \geq \sup n_{\alpha_A}^N(x)$$

Therefore $\sup n_{\alpha_A}^N(0) \geq \sup n_{\alpha_A}^N(x)$.

(v) Now $\inf n_{\alpha_A}^P(y \cdot z) = \inf m_{\alpha_A}^P(y \cdot z)$

$$= \inf n_{\alpha_A}^P(y \cdot z)$$

$$\leq \text{Max} \{ \inf n_{\alpha_A}^P(x \cdot z), \inf n_{\alpha_A}^P(x \cdot y) \}$$

Therefore $\inf n_{\alpha_A}^P(y \cdot z) \leq \text{Max} \{ \inf n_{\alpha_A}^P(x \cdot z), \inf n_{\alpha_A}^P(x \cdot y) \}$.

(vi) Now $\sup n_{\alpha_A}^N(y \cdot z) = \sup m_{\alpha_A}^N(y \cdot z)$

$$= \sup n_{\alpha_A}^N(y \cdot z) \geq \text{Min} \{ \sup n_{\alpha_A}^N(x \cdot z), \sup n_{\alpha_A}^N(x \cdot y) \}$$

Therefore $\sup n_{\alpha_A}^N(y \cdot z) \geq \text{Min} \{ \sup n_{\alpha_A}^N(x \cdot z), \sup n_{\alpha_A}^N(x \cdot y) \}$.

Proposition:3.5

The intersection of any two sets are IVBIF α -ideal of a BP-algebra.

Proof:

Let us assume that

$$0, x, y \in A \cap B \Rightarrow 0, x, y \in A \text{ and } 0, x, y \in B.$$

(i) Now $\inf m_{\alpha_{A \cap B}}^P(0) = \text{Min} \{ \inf m_{\alpha_A}^P(0), \inf m_{\alpha_B}^P(0) \}$

$$\geq \text{Min} \{ \inf m_{\alpha_A}^P(x), \inf m_{\alpha_B}^P(x) \}$$

$$= \inf m_{\alpha_{A \cap B}}^P(x)$$

Therefore $\inf m_{\alpha_{A \cap B}}^P(0) \geq \inf m_{\alpha_{A \cap B}}^P(x)$.

Now $\sup m_{\alpha_{A \cap B}}^N(0) = \text{Max} \{ \sup m_{\alpha_A}^N(0), \sup m_{\alpha_B}^N(0) \}$

$$\leq \text{Max} \{ \sup m_{\alpha_A}^N(x), \sup m_{\alpha_B}^N(x) \}$$

$$= \sup m_{\alpha_{A \cap B}}^N(x)$$

Therefore $\sup m_{\alpha_{A \cap B}}^N(0) \leq \sup m_{\alpha_{A \cap B}}^N(x)$.

(ii) Now $\inf m_{\alpha_{A \cap B}}^P(y \cdot z) = \text{Min} \{ \inf m_{\alpha_A}^P(y \cdot z), \inf m_{\alpha_B}^P(y \cdot z) \}$

$$\geq \text{Min} \{ \text{Min} \{ \inf m_{\alpha_A}^P(x \cdot z), \inf m_{\alpha_A}^P(x \cdot y) \},$$

$$\text{Min} \{ \inf m_{\alpha_B}^P(x \cdot z), \inf m_{\alpha_B}^P(x \cdot y) \} \}$$

$$= \text{Min} \{ \text{Min} \{ \inf m_{\alpha_A}^P(x \cdot z), \inf m_{\alpha_B}^P(x \cdot z) \},$$

$$\text{Min} \{ \inf m_{\alpha_A}^P(x \cdot y), \inf m_{\alpha_B}^P(x \cdot y) \} \}$$

$$= \text{Min} \{ \inf m_{\alpha_{A \cap B}}^P(x \cdot z), \inf m_{\alpha_{A \cap B}}^P(x \cdot y) \}$$

Therefore $\inf m_{\alpha_{A \cap B}}^P(y \cdot z) \geq \text{Min} \{ \inf m_{\alpha_{A \cap B}}^P(x \cdot z), \inf m_{\alpha_{A \cap B}}^P(x \cdot y) \}$.

(iii) Now $\sup m_{\alpha_{A \cap B}}^N(y \cdot z) = \text{Max} \{ \sup m_{\alpha_A}^N(y \cdot z), \sup m_{\alpha_B}^N(y \cdot z) \}$

$$\leq \text{Max} \{ \text{Max} \{ \sup m_{\alpha_A}^N(x \cdot z), \sup m_{\alpha_A}^N(x \cdot y) \},$$

$$\text{Max} \{ \sup m_{\alpha_B}^N(x \cdot z), \sup m_{\alpha_B}^N(x \cdot y) \} \}$$

$$= \text{Max} \{ \text{Max} \{ \sup m_{\alpha_A}^N(x \cdot z), \sup m_{\alpha_B}^N(x \cdot z) \},$$

$$\text{Max} \{ \sup m_{\alpha_A}^N(x \cdot y), \sup m_{\alpha_B}^N(x \cdot y) \} \}$$

$$= \text{Max} \{ \sup m_{\alpha_{A \cap B}}^N(x \cdot z), \sup m_{\alpha_{A \cap B}}^N(x \cdot y) \}$$

Therefore $\sup m_{\alpha_{A \cap B}}^N(y \cdot z) \leq \text{Max}\{\sup m_{\alpha_{A \cap B}}^N(x \cdot z), \sup m_{\alpha_{A \cap B}}^N(x \cdot y)\}$.

(iv) Now $\inf n_{\alpha_{A \cap B}}^P(0) = \text{Max}\{\inf n_{\alpha_A}^P(0), \inf n_{\alpha_B}^P(0)\}$

$\leq \text{Max}\{\inf n_{\alpha_A}^P(x), \inf n_{\alpha_B}^P(x)\} = \inf n_{\alpha_{A \cap B}}^P(x)$

Therefore $\inf n_{\alpha_{A \cap B}}^P(0) \leq \inf n_{\alpha_{A \cap B}}^P(x)$.

Now $\sup n_{\alpha_{A \cap B}}^N(0) = \text{Min}\{\sup n_{\alpha_A}^N(0), \sup n_{\alpha_B}^N(0)\}$

$\geq \text{Min}\{\sup n_{\alpha_A}^N(x), \sup n_{\alpha_B}^N(x)\}$
 $= \sup n_{\alpha_{A \cap B}}^N(x)$

Therefore $\sup n_{\alpha_{A \cap B}}^N(0) \geq \sup n_{\alpha_{A \cap B}}^N(x)$.

(v) Now $\inf n_{\alpha_{A \cap B}}^P(y \cdot z) = \text{Max}\{\inf n_{\alpha_A}^P(y \cdot z), \inf n_{\alpha_B}^P(y \cdot z)\}$

$\leq \text{Max}\{\text{Max}\{\inf n_{\alpha_A}^P(x \cdot z), \inf n_{\alpha_A}^P(x \cdot y)\},$

$\text{Max}\{\inf n_{\alpha_B}^P(x \cdot z), \inf n_{\alpha_B}^P(x \cdot y)\}\}$

$= \text{Max}\{\text{Max}\{\inf n_{\alpha_A}^P(x \cdot z), \inf n_{\alpha_B}^P(x \cdot z)\},$

$\text{Max}\{\inf n_{\alpha_A}^P(x \cdot y), \inf n_{\alpha_B}^P(x \cdot y)\}\}$

$= \text{Max}\{\inf n_{\alpha_{A \cap B}}^P(x \cdot z), \inf n_{\alpha_{A \cap B}}^P(x \cdot y)\}$

Therefore $\inf n_{\alpha_{A \cap B}}^P(y \cdot z) \leq \text{Max}\{\inf n_{\alpha_{A \cap B}}^P(x \cdot z), \inf n_{\alpha_{A \cap B}}^P(x \cdot y)\}$.

(vi) Now $\sup n_{\alpha_{A \cap B}}^N(y \cdot z) = \text{Min}\{\sup n_{\alpha_A}^N(y \cdot z), \sup n_{\alpha_B}^N(y \cdot z)\} \geq \text{Min}\{\text{Min}\{\sup n_{\alpha_A}^N(x \cdot z), \sup n_{\alpha_A}^N(x \cdot y)\},$

$\text{Min}\{\sup n_{\alpha_B}^N(x \cdot z), \sup n_{\alpha_B}^N(x \cdot y)\}\} = \text{Min}\{\text{Min}\{\sup n_{\alpha_A}^N(x \cdot z), \sup n_{\alpha_B}^N(x \cdot z)\},$

$\text{Min}\{\sup n_{\alpha_A}^N(x \cdot y), \sup n_{\alpha_B}^N(x \cdot y)\}\} = \text{Min}\{\sup n_{\alpha_{A \cap B}}^N(x \cdot z), \sup n_{\alpha_{A \cap B}}^N(x \cdot y)\}$

Therefore $\sup n_{\alpha_{A \cap B}}^N(y \cdot z) \geq \text{Min}\{\sup n_{\alpha_{A \cap B}}^N(x \cdot z), \sup n_{\alpha_{A \cap B}}^N(x \cdot y)\}$.

Proposition:3.6

The union of any two sets are $\text{IVBIF}\alpha$ -ideal of a BP-algebra, if they are equal.

Proof:

We assume that

$0, x, y \in A \cup B \Rightarrow 0, x, y \in A \text{ or } 0, x, y \in B.$

(i) Now $\inf m_{\alpha_{A \cup B}}^P(0) = \text{Max}\{\inf m_{\alpha_A}^P(0), \inf m_{\alpha_B}^P(0)\}$

$\geq \text{Max}\{\inf m_{\alpha_A}^P(x), \inf m_{\alpha_B}^P(x)\}$

$= \inf m_{\alpha_{A \cup B}}^P(x)$

Therefore $\inf m_{\alpha_{A \cup B}}^P(0) \geq \inf m_{\alpha_{A \cup B}}^P(x)$.

Now $\sup m_{\alpha_{A \cup B}}^N(0) = \text{Min}\{\sup m_{\alpha_A}^N(0), \sup m_{\alpha_B}^N(0)\}$

$\leq \text{Min}\{\sup m_{\alpha_A}^N(x), \sup m_{\alpha_B}^N(x)\}$

$= \sup m_{\alpha_{A \cup B}}^N(x)$

Therefore $\sup m_{\alpha_{A \cup B}}^N(0) \leq \sup m_{\alpha_{A \cup B}}^N(x)$.

(ii) Now $\inf m_{\alpha_{A \cup B}}^P(y \cdot z) = \text{Max}\{\inf m_{\alpha_A}^P(y \cdot z), \inf m_{\alpha_B}^P(y \cdot z)\}$

$\geq \text{Max}\{\text{Min}\{\inf m_{\alpha_A}^P(x \cdot z), \inf m_{\alpha_A}^P(x \cdot y)\},$

$\text{Min}\{\inf m_{\alpha_B}^P(x \cdot z), \inf m_{\alpha_B}^P(x \cdot y)\}\}$

$= \text{Min}\{\text{Max}\{\inf m_{\alpha_A}^P(x \cdot z), \inf m_{\alpha_B}^P(x \cdot z)\},$

$\text{Max}\{\inf m_{\alpha_A}^P(x \cdot y), \inf m_{\alpha_B}^P(x \cdot y)\}\}$

$= \text{Min}\{\inf m_{\alpha_{A \cup B}}^P(x \cdot z), \inf m_{\alpha_{A \cup B}}^P(x \cdot y)\}$

Therefore $\inf m_{\alpha_{A \cup B}}^P(y \cdot z) \geq \text{Min}\{\inf m_{\alpha_{A \cup B}}^P(x \cdot z), \inf m_{\alpha_{A \cup B}}^P(x \cdot y)\}$.

(iii) Now $\sup m_{\alpha_{A \cup B}}^N(y \cdot z) = \text{Min}\{\sup m_{\alpha_A}^N(y \cdot z), \sup m_{\alpha_B}^N(y \cdot z)\}$

$\leq \text{Min}\{\text{Max}\{\sup m_{\alpha_A}^N(x \cdot z), \sup m_{\alpha_A}^N(x \cdot y)\},$

$\text{Max}\{\sup m_{\alpha_B}^N(x \cdot z), \sup m_{\alpha_B}^N(x \cdot y)\}\}$

$= \text{Max}\{\text{Min}\{\sup m_{\alpha_A}^N(x \cdot z), \sup m_{\alpha_B}^N(x \cdot z)\},$

$$\text{Min} \{ \sup m_{\alpha_A}^N(\mathbf{x} \cdot \mathbf{y}), \sup m_{\alpha_B}^N(\mathbf{x} \cdot \mathbf{y}) \}$$

$$= \text{Max} \{ \sup m_{\alpha_{A \cup B}}^N(\mathbf{x} \cdot \mathbf{z}), \sup m_{\alpha_{A \cup B}}^N(\mathbf{x} \cdot \mathbf{y}) \}$$

$$\text{Therefore } \sup m_{\alpha_{A \cup B}}^N(\mathbf{y} \cdot \mathbf{z}) \leq \text{Max} \{ \sup m_{\alpha_{A \cup B}}^N(\mathbf{x} \cdot \mathbf{z}), \sup m_{\alpha_{A \cup B}}^N(\mathbf{x} \cdot \mathbf{y}) \}.$$

$$(iv) \text{ Now } \inf n_{\alpha_{A \cup B}}^P(0) = \text{Min} \{ \inf n_{\alpha_A}^P(0), \inf n_{\alpha_B}^P(0) \}$$

$$\leq \text{Min} \{ \inf n_{\alpha_A}^P(x), \inf n_{\alpha_B}^P(x) \}$$

$$= \inf n_{\alpha_{A \cup B}}^P(x)$$

$$\text{Therefore } \inf n_{\alpha_{A \cup B}}^P(0) \leq \inf n_{\alpha_{A \cup B}}^P(x).$$

$$\text{Now } \sup n_{\alpha_{A \cup B}}^N(0) = \text{Max} \{ \sup n_{\alpha_A}^N(0), \sup n_{\alpha_B}^N(0) \}$$

$$\geq \text{Max} \{ \sup n_{\alpha_A}^N(x), \sup n_{\alpha_B}^N(x) \}$$

$$= \sup n_{\alpha_{A \cup B}}^N(x)$$

$$\text{Therefore } \sup n_{\alpha_{A \cup B}}^N(0) \geq \sup n_{\alpha_{A \cup B}}^N(x).$$

$$(v) \text{ Now } \inf n_{\alpha_{A \cup B}}^P(\mathbf{y} \cdot \mathbf{z}) = \text{Min} \{ \inf n_{\alpha_A}^P(\mathbf{y} \cdot \mathbf{z}), \inf n_{\alpha_B}^P(\mathbf{y} \cdot \mathbf{z}) \}$$

$$\leq \text{Min} \{ \text{Max} \{ \inf n_{\alpha_A}^P(\mathbf{x} \cdot \mathbf{z}), \inf n_{\alpha_A}^P(\mathbf{x} \cdot \mathbf{y}) \},$$

$$\text{Max} \{ \inf n_{\alpha_B}^P(\mathbf{x} \cdot \mathbf{z}), \inf n_{\alpha_B}^P(\mathbf{x} \cdot \mathbf{y}) \} \}$$

$$= \text{Max} \{ \text{Min} \{ \inf n_{\alpha_A}^P(\mathbf{x} \cdot \mathbf{z}), \inf n_{\alpha_B}^P(\mathbf{x} \cdot \mathbf{z}) \},$$

$$\text{Min} \{ \inf n_{\alpha_A}^P(\mathbf{x} \cdot \mathbf{y}), \inf n_{\alpha_B}^P(\mathbf{x} \cdot \mathbf{y}) \} \}$$

$$= \text{Max} \{ \inf n_{\alpha_{A \cup B}}^P(\mathbf{x} \cdot \mathbf{z}), \inf n_{\alpha_{A \cup B}}^P(\mathbf{x} \cdot \mathbf{y}) \}$$

$$\text{Therefore } \inf n_{\alpha_{A \cup B}}^P(\mathbf{y} \cdot \mathbf{z}) \leq \text{Max} \{ \inf n_{\alpha_{A \cup B}}^P(\mathbf{x} \cdot \mathbf{z}), \inf n_{\alpha_{A \cup B}}^P(\mathbf{x} \cdot \mathbf{y}) \}.$$

$$(vi) \text{ Now } \sup n_{\alpha_{A \cup B}}^N(\mathbf{y} \cdot \mathbf{z}) = \text{Max} \{ \sup n_{\alpha_A}^N(\mathbf{y} \cdot \mathbf{z}), \sup n_{\alpha_B}^N(\mathbf{y} \cdot \mathbf{z}) \} \geq \text{Max} \{ \text{Min} \{ \sup n_{\alpha_A}^N(\mathbf{x} \cdot \mathbf{z}), \sup n_{\alpha_A}^N(\mathbf{x} \cdot \mathbf{y}) \},$$

$$\text{Min} \{ \sup n_{\alpha_B}^N(\mathbf{x} \cdot \mathbf{z}), \sup n_{\alpha_B}^N(\mathbf{x} \cdot \mathbf{y}) \} \}$$

$$= \text{Min} \{ \text{Max} \{ \sup n_{\alpha_A}^N(\mathbf{x} \cdot \mathbf{z}), \sup n_{\alpha_B}^N(\mathbf{x} \cdot \mathbf{z}) \},$$

$$\text{Max} \{ \sup n_{\alpha_A}^N(\mathbf{x} \cdot \mathbf{y}), \sup n_{\alpha_B}^N(\mathbf{x} \cdot \mathbf{y}) \} \}$$

$$= \text{Min} \{ \sup n_{\alpha_{A \cup B}}^N(\mathbf{x} \cdot \mathbf{z}), \sup n_{\alpha_{A \cup B}}^N(\mathbf{x} \cdot \mathbf{y}) \}$$

$$\text{Therefore } \sup n_{\alpha_{A \cup B}}^N(\mathbf{y} \cdot \mathbf{z}) \geq \text{Min} \{ \sup n_{\alpha_{A \cup B}}^N(\mathbf{x} \cdot \mathbf{z}), \sup n_{\alpha_{A \cup B}}^N(\mathbf{x} \cdot \mathbf{y}) \}.$$

We have given all the propositions which are proved here. On this topic "IVBIF ideal and IVBIF α -ideal", all the above propositions with proofs are also applicable for the operations on anti IVBIF ideal and anti IVBIF α -ideal.

CONCLUSION

Related to this topic new ideas are reflected effectively. A review about the operations were discussed with the significance of the new concepts. As the research has demonstrated some operations by giving the concrete ideas for further reference.

ABSTRACT

In a Pharmaceutical facility, properly designed, built, commissioned, operated, and maintained environmental control systems of Heating, Ventilation, and Air Conditioning systems ensure the products manufactured are of good quality and reduce both the initial and ongoing cost of ownership of a facility. The designing and qualification of the Heating, Ventilation, and Air Conditioning system to provide a safe and clean work environment in a pharmaceutical facility require additional considerations and compliance with regulatory bodies. Good Manufacturing Practices for Heating, Ventilation, and Air Conditioning services encompass various factors, including identifying crucial parameters such as temperature, humidity, pressure, air filtration, airflow patterns, and standard heating and cooling practices. In the design, specification, operation, and control of clean rooms and other controlled environments, it is important to take into account various factors beyond airborne particulate cleanliness. This paper briefly discusses the Operational Principles, Components, and Validation of Heating, Ventilation, and Air Conditioning Systems.

Keywords: Qualification, HEPA, airflow pattern, pharmaceutical facility, ISO

INTRODUCTION

The HVAC system in the pharmaceutical industry accounts for over 50% of energy usage in countries such as India. In the pharmaceutical industry, maintaining proper conditions in the manufacturing environment is crucial for producing safe and effective products, and the U.S. FDA regulates the industry through the c GMP (current Good Manufacturing Practices).[1] Building Management System (BMS) is an essential tool and it enables optimal building performance by reducing loads and operating hours, thus extending the lifespan of equipment and systems, reducing maintenance and capital costs, and minimizing the use of energy for replacements and upgrades. Pharmaceutical validation of HVAC systems provides appropriate temperature, ventilation, and air conditioning to achieve quality drug products. The design of the HVAC system has a major role in the prevention and control of cross-contamination by maintaining a clean environment. The critical parameters such as temperature and ventilation are maintained during processing and finished product storage [2,3]ASHRAE states, "HVAC system must achieve controlling air temperature, air humidity, air circulation, and air quality".[4]

Operational principle

In the pharmaceutical industry, HVAC systems must keep pace with advancements in science and technology. To maintain a clean room with clean air quality HVAC should be interconnected and the cost for installation, operation, and maintenance should be reasonable. HVAC systems perform four functions: controlling airborne particles, maintaining room pressure, managing room moisture, and regulating room temperature. To prevent airborne contamination, cleaner areas are kept under positive pressure, which means that more air is brought into the area than is allowed to escape. In addition, humidity and temperature must be controlled to prevent the growth of microbial contaminants and to maintain drug efficacy and stability.[5,6] Air handling unit (AHU)- Air handler is a large metal box usually galvanized for long-term protection with several components such as filter racks, heating or cooling coil, blower, sound attenuators, and dampers. The design of the AHU ensures that both the incoming fresh air and the return air pass through the filter before reaching the downstream components connected to the ductwork, which then distributes the clean air throughout the building. It is important to note that HVAC systems cannot replace good processes, facility and equipment design, or proper operating procedures. These systems are incapable of effectively cleaning surfaces that are already contaminated, controlling processes that produce excessive contaminants, or compensating for inadequately designed or maintained facilities. While HVAC systems can help control biocontamination by delivering clean air to a room, they cannot eliminate biocontamination. Persistent contamination problems are unlikely to be caused or resolved by an HVAC system that has not been appropriately designed, constructed, or maintained.[6,7]

Air-Flow pattern

Clean rooms can be classified based on the air supply configuration, such as non-unidirectional airflow and unidirectional airflow.

Non-Unidirectional Air Flow

Non-unidirectional airflow is a type of airflow pattern that generates significant turbulence and is suitable for rooms where external sources are expected to cause significant contamination. The uniformity of particle concentration, required for the process, is achieved through the mixing of high and low particle concentrations facilitated by turbulence. In Non-unidirectional airflow rooms cleanliness of level Class 1000 to Class 100,000 can be attained.

Unidirectional Airflow

In a unidirectional airflow pattern, the air flows in a single direction of parallel streams, which is also known as 'laminar' airflow, with some angular deviation. Clean rooms of this type are employed in situations where there is a requirement for low levels of airborne contaminants, and where the primary concern is internal contaminants. In vertical down-flow clean rooms, the air moves in a vertical direction, and in horizontal-flow clean rooms, the air moves in a horizontal direction. Vertical down-flow is generally preferred in pharmaceutical production processes.

**Gayatri et al.,**

Clean rooms require strict control of temperature, humidity, particle counts, airflow patterns, and differential pressure. They require an increased air supply, with 50-100 air changes for a Class 10,000 clean room. High-efficient filtration of 99.97% down to 0.3 microns of HEPA filters is used, and a laminar flow is sought.[7-9]

Validation of HVAC System

Validating an HVAC system involves compiling essential documents, including functional specifications, design drawings, validation plans, contractor documents, TAB reports, start-up reports, commissioning reports, and validation documents such as IQ, OQ, and PQ.

Design Qualification

On completion of the DQ activity, there should be no deviation in the design specification; thereby, the system can be installed, and IQ activities can be carried out.[8,9]

Installation Qualification

Ensure that the HVAC System is installed at the designated place with the correct material of construction (MOC) for all the critical parts. Ensure that all safety features are installed. Verify additional information in accordance with the protocol's guidelines, then record your observations. When installing the HVAC system, compare the installation qualification parameters to the manufacturer's recommendations. If there is a deviation of any kind, note it and take the necessary action. Whether or not the deviation is acceptable will be determined by the head of the department and the head of quality assurance. Start the operation qualification process if the deviation is acceptable and has no chance of affecting operation. If the deviation is unacceptable, let the head of the department in question know so that the appropriate steps can be taken to address the issues and finish the installation qualification. Verification of installed equipment with suitable utility connections, major components as per the design specifications, completion of the installation as per manufacturer's recommendations & cGMP requirements, and the supply of all necessary documentation from the manufacturer takes the HVAC system for OQ.

Operational Qualification

The purpose of OQ is to verify that systems operate by specifications and to document all pertinent information and data to showcase their expected functionality. The verification of operational qualification parameters such as the operation of the fan section and its respected motors and blowers, operation of the chilled water coil and verification of its function as it gives cool air when passed through it, operation of dampers as it moves freely and allow air to pass through when open and restrict the entry of air when closed, operation of Magnehelic gauge verification that Magnehelic gauge installed outside the area is functional when AHU is started followed by general functionality test verification such as alignment, interlock, AHU performance, power failure test verification, control panel verification and maintenance parameters. The OQ parameters are verified and the system can be taken for PQ.[9]

Performance Qualification: PQ aims to demonstrate, through test results, that the system and its components consistently meet specifications during regular use.[10] Ensure that the HVAC system has been operating for a minimum of 24 hours and is stable. The tests shall be carried out at the REST condition of the room to validate the installed HVAC system and the clean room.

Air velocity test at terminal HEPA filter

Check and record the main duct supply CFM of the AHU and transfer the anemometer inside the area hold the anemometer downstream of the Mini Pleat HEPA filter face at a distance of one inch and allow the reading to stabilize for 20 seconds. Fluctuation should not be more than ± 5 FPM. Take five readings (at four corners and one centre point) and report the individual and average velocity. The measured average velocity should be within the limit of 90 fpm $\pm 20\%$ i.e., 72-108 fpm (unidirectional airflow). Velocity differences within the same plenum should not vary more than 25% fpm.[8,9]

Leak testing of terminal HEPA filter

Use an appropriate number of nozzles to challenge and maintain a concentration between 15 µg and 80 µg of PAO per L of air at the upstream side of the Mini Pleat HEPA filter. Set the compressed air supply to the PAO aerosol generator between 20 psig and 25 psig & challenge the suction side of the AHU with the PAO aerosol. Transfer the PAO photometer inside the area. Adjust the photometer to read 100% and ensure that the detector is functioning properly when exposed to PAO aerosol at the upstream side of the Mini Pleat HEPA filter. Hold the detector probe approximately one inch downstream of the Mini Pleat HEPA filter face under test and scan the entire perimeter and face area of the filter at a perpendicular rate of a maximum of 10 ft/min for locating any leakages through the Mini Pleat HEPA filter. Leakages are detected and noticed by the beep noise produced due to PAO sensing. At the end of the PAO test of a Mini Pleat HEPA filter, ensure that the upstream concentration of the PAO remains between 90% and 110% of the set value (between 15 µg/L of air and 80 µg/L of air). Any leakage of aerosol greater than 0.01% is considered unacceptable and warrants replacement and re-testing.[10]

Air Changes Per Hour Test (ACPH)

This procedure is only applicable for non-unidirectional or mixed airflow patterns. Using the measuring tape, the length and width of the Mini Pleat HEPA filter are measured in feet. Report the average velocity of each Mini Pleat HEPA filter.¹¹ Calculate the ACPH by the formula:

HEPA CMH = Air velocity in meter × Filter face area in meter

Total CMH = \sum HEPA CMH

Air changes per hour = $\frac{\text{Total CMH} \times 60}{\text{Volume of room in cubic ft.}}$

Air changes obtained for the room should not be less than the limit as shown in Table1.

Airborne Particle Count Test

At rest condition, the particle count should be taken. Predetermine the location for the particle counting before entering the area. Transfer the clean Met One counter to the area. The apparatus is cleaned by wiping the surface with a lint-free cloth. Connect the iso-kinetic probe to the sensor inlet. Carry out the airborne particle counting at a defined location at a working height of 900 mm from the finished floor level. Record the observations.[11-13] The air system can be considered validated when the results of the test are within the acceptable operational parameters as shown in Table2.

Area recovery test

To determine the placement of the particle counter, identify the spot with the highest particle count in the clean room under resting conditions. Position the sampling probe vertically upward, ensuring it is not placed directly under the air outlet. The sample volume should match the volume used to determine the cleanliness class. Take an initial reading of the room L × W × H for enumeration of particles of >0.5µ and > 5.0µ particles, temperature, RH. To assess the clean room area, an Aerosol generator is used to intentionally contaminate it to a particle concentration 100 times higher than the target cleanliness level. This is achieved by raising the particle concentration in the area while the air handling unit is operational. Start the particle count monitoring at an interval of 1 minute until the particles reach approx. 100 times (t_{100n}) more than the initial particle count of the area. Stop generating particles through an aerosol generator once the area reaches more than the specified class. Take the samples at an interval of 1 minute and it shall be continued till the time point (t_n) at which the desired level of cleanliness (approx. initial particle count reading) is achieved. $t_{0.01} = (t_n - t_{100n})$ represents the 100:1 recovery time. Room recovery state is however not mandatory for Class B. The recovery time for the cleanroom to regain the specified cleanliness class level when exposed to PAO aerosol should be no more than 15 minutes.[10, 11, 14]

Airflow pattern test

Generate the smoke with a Smoke generator using the water glycerine mixture. Introduce the smoke downstream of the HEPA filter. Observe the airflow pattern and record the airflow direction in the rooms using digital videography, under terminal HEPA Filters, and risers, with the doors of the room both in open and closed Condition. The airflow

Gayatri et al.,

is considered acceptable only if it shows flow as per the design specification. If the smoke flows in the opposite direction, then corrective changes are necessary. The flow direction between rooms shall be as per the room pressure cascading design.[14]

Temperature & humidity uniformity test

Monitoring temperature & humidity daily with the help of a thermometer and manometer respectively; stabilization of both parameters is ensured within the specified limit.

Pressure difference

A pressure difference of 5 to 20mmHg pressure is usually maintained and it is calculated using a manometer which is attached to the walls of the adjacent area.

CONCLUSION

To achieve a clean room and controlled environment in a pharmaceutical facility; planning, designing, and commissioning activities of the HVAC system before installation plays a major role in successful IQ, OQ, and PQ. By performing the above-discussed tests for validation of the HVAC system at an appropriate frequency of testing and if the tests meet the acceptance criteria, then the HVAC system can be qualified for daily routine use and the results are documented.

ABSTRACT

study explores the topological indices of m -fan fuzzy random graphs, a novel class of graphs characterized by both fuzzy and random components. Also this study extends traditional graph theory by integrating fuzzy set theory with random graph models, thereby enriching the study of graph properties in uncertain environments. The m -fan fuzzy random graph is constructed by introducing fuzzy probabilities to the edges of an m -fan graph, which allows for a nuanced representation of edge existence and connectivity. Furthermore, this research focuses on several key topological indices, including the Zagreb indices and the Randic index, to assess the structural properties of these graphs, and this analysis provides explicit formulas and bounds for these indices, taking into account the fuzzy randomness associated with edge probabilities. This study adds to the fields of fuzzy graph theory, random graph models, and complex network analysis by helping us understand how deterministic and stochastic factors affect the topological properties of graphs.

Keywords: Fuzzy graphs, Random graphs, Fuzzy random graph, Dutch windmill (m -fan) graph, Topological indices.

INTRODUCTION

In recent years, the intersection of graph theory and fuzzy logic has yielded fascinating advancements in understanding complex systems. One particularly intriguing development is the concept of Dutch Windmill fuzzy random graphs. This model integrates the structural elegance of Dutch windmill-inspired graphs with the nuanced flexibility of fuzzy logic, offering a novel approach to analyzing networks with inherent uncertainties. The Dutch Windmill graph is inspired by the symmetric, interconnected layout of traditional Dutch windmills. In the context of graph theory, this translates into a highly regular and aesthetically appealing structure with distinct patterns of connectivity. However, real-world networks often involve uncertainties and imprecisions that simple deterministic models cannot adequately address. This is where fuzzy logic becomes crucial. Fuzzy logic allows for the representation of partial truths and uncertainty, enabling a more nuanced approach to modeling relationships between nodes. By combining fuzzy logic with the Dutch Windmill graph, we obtain a "Dutch Windmill Fuzzy Random Graph" that not only captures the geometric elegance of windmill-inspired designs but also accommodates the variability and imprecision of real-world data. In "The First And Second Zagreb Indices Of Degree Splitting Of Molecular Graphs"**(1)**, Mrs. Ragavi focuses on calculating these indices for molecular graphs, which represent structures like silicate networks and honeycomb networks, particularly when these graphs undergo a process called degree splitting. Various topological indices—numerical values that characterize the structure of fuzzy graphs—such as the Modified Wiener Index and others—and it explores their applications in fields like chemistry and computer science are defined in "Some topological indices in fuzzy graphs"**(2)**. Kale, Mahesh, and S. Minirani introduce new concepts related to fuzzy graphs, which account for uncertainty in relationships, and explore the associated Zagreb matrices and energies, providing bounds for these energies to enhance understanding of fuzzy graph properties**(3)**. Several indices related to bipolar fuzzy graphs, including the first and second Zagreb indices, the Randic index, and others, exploring their mathematical properties like union and intersection, are discussed **(4)**. The authors Shetty, Shashwath S, and Arathi Bhat K. explore how adding self-loops to certain vertices in a graph affects the first Zagreb index and provide specific limits for this index when self-loops are present**(5)**.

The articles explore the use of the F-index for fuzzy graphs to analyze railway crimes, showing that it offers more realistic results compared to other methods, and discuss various mathematical operations and properties related to fuzzy graphs that can help in understanding these crime patterns**(6)**, **(7)**. Mufti, Zeeshan Saleem, et al. calculated specific fuzzy topological indices for a structure called the pizza graph, which is a type of graph used in mathematics**(8)**. They found general results for these indices, which can enhance our understanding of how these mathematical concepts apply to real-world problems. "Evaluation of Various Topological Indices of Flabellum Graphs"**(9)** focuses on flabellum graphs, which are created by duplicating a cycle graph and adding connections to a central vertex, and explores various mathematical properties called topological indices that help analyze these graphs. Fuzzy topological indices for flower graphs, which are numerical values that help characterize the properties of these graphs, enhancing our understanding of fuzziness in general graph theory, are found **(10)**. The researchers Sarala N. and Abirami R. aim to understand how different operations, like combining or intersecting these graphs, affect their topological indices, which are numerical values that describe the graph's structure**(11)**. Islam, SkRabiul, Bandar Bin Mohsin, and Madhumangal Pal introduce a new version called the hyper-ZI specifically for fuzzy graphs, which can represent uncertain information. The researchers calculate the hyper-ZI for different types of fuzzy graphs and find that it can effectively compare with other indices when analyzing crime data, showing better performance in reflecting real-world situations**(12)**. In this study, we investigate the topological indices of certain fuzzy random graphs, namely Dutch windmills of m -fan fuzzy random graphs, and analyze their topological indices.

PRELIMINARIES

Definition: 2.1

Let $\mathbb{V}_{\mathcal{FR}} = \{v_i, i = 1, 2, \dots, n\}$ be a set of n vertices has $n(n-1)/2$ possible edges $\mathbb{E}_{\mathcal{FR}}$ between them. Then there are two sets of edges,

Abirami and Sarala

$\mathbb{E}_{\mathcal{F}} = \{(v_i, v_j) / 1 \leq v_i < v_j \leq n; i, j = 1, 2, \dots, n \text{ and } (v_i, v_j) \text{ are fuzzy edges}\},$
 $\mathbb{E}_{\mathcal{R}} = \{(v_i, v_j) / 1 \leq v_i < v_j \leq n; i, j = 1, 2, \dots, n \text{ and } (v_i, v_j) \text{ are random edges}\}$ that are disjoint. Consider the mapping $\phi_g: \mathbb{V}_{\mathcal{FR}} \rightarrow [0,1] v_i \rightarrow \phi_g(v_i)$
 $\psi_g: \mathbb{V}_{\mathcal{FR}} \times \mathbb{V}_{\mathcal{FR}} \rightarrow [0,1]_P \times [0,1]_{f_A}$
 $(v_i, v_j) \rightarrow \psi_g(v_i, v_j) = (P(v_i, v_j), f_A(v_i, v_j))$
 with $P(v_i, v_j) = 0$ if and only if $f_A(v_i, v_j) = 0$. Then the quartet $\mathbb{G}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ is called a fuzzy random graph if $\psi_g(v_i, v_j) \leq \min\{\phi_g(v_i), \phi_g(v_j)\}$ where (v_i, v_j) corresponds to the edge between v_i and v_j , $P(v_i, v_j)$ and $f_A(v_i, v_j)$ represents the probability of the edge (v_i, v_j) and the membership function for the edge (v_i, v_j) within the fuzzy set A in X respectively.

Definition: 2.2

A fuzzy random graph $\mathbb{H}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ is called a partial fuzzy random subgraph of $\mathbb{G}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ if $\tau_g(v_i) \leq \phi_g(v_i)$ for every $v_i \in \mathbb{V}_{\mathcal{FR}}$ and $\sigma_g(v_i, v_j) \leq \psi_g(v_i, v_j)$ for every $(v_i, v_j) \in \mathbb{E}_{\mathcal{FR}}$. Also the fuzzy random graph $\mathbb{H}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ is called a fuzzy random subgraph of $\mathbb{G}_{\mathcal{FR}}$ induced by α if $\alpha \subseteq \mathbb{V}_{\mathcal{FR}}$, $\tau_g(v_i) = \phi_g(v_i)$ for all $v_i \in \alpha$ and $\sigma_g(v_i, v_j) = \psi_g(v_i, v_j)$ for all $(v_i, v_j) \in \alpha$. We write $\langle \alpha \rangle$ to denote the fuzzy random subgraph induced by α .

Definition: 2.3

Let $\mathbb{G}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ be a fuzzy random graph. Then a partial fuzzy random subgraph $\mathbb{H}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ of $\mathbb{G}_{\mathcal{FR}}$ is said to span $\mathbb{G}_{\mathcal{FR}}$ if $\tau_g = \phi_g$. Here $\mathbb{H}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ is called spanning fuzzy random subgraph of $\mathbb{G}_{\mathcal{FR}}$.

Definition: 2.4

In a fuzzy random graph $\mathbb{G}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$, the degree of a fuzzy random vertex v_i is defined as

$$d_{\mathbb{G}_{\mathcal{FR}}}(v_i) = \sum_{v_i \neq v_j \in \mathbb{E}_{\mathcal{FR}}} \psi_g(v_i, v_j) + \sum_{v_i \neq v_j \in \mathbb{E}_{\mathcal{R}}} nP$$

for $(v_i, v_j) \in \mathbb{E}_{\mathcal{FR}}$ and $\psi_g(v_i, v_j) = 0$ for (v_i, v_j) not in $\mathbb{E}_{\mathcal{FR}}$. Where $\psi_g(v_i, v_j) = P$

$$d_{\mathbb{G}_{\mathcal{FR}}}(v_i) = \sum_{v_i, v_j \in \mathbb{E}_{\mathcal{FR}}} \psi_g(v_i, v_j) + \sum_{v_i, v_j \in \mathbb{E}_{\mathcal{R}}} n\psi_g(v_i, v_j)$$

Definition: 2.5

The Minimal degree of vertex, $\delta(\mathbb{G}_{\mathcal{FR}}) = \min \{d_{\mathbb{G}_{\mathcal{FR}}}(v_i, v_j) : (v_i, v_j) \in \mathbb{E}_{\mathcal{FR}}\}$

The Maximal degree of vertex, $\Delta(\mathbb{G}_{\mathcal{FR}}) = \max \{d_{\mathbb{G}_{\mathcal{FR}}}(v_i, v_j) : (v_i, v_j) \in \mathbb{E}_{\mathcal{FR}}\}$

Definition: 2.6

The order $\mathcal{O}(\mathbb{G}_{\mathcal{FR}})$ and size $\mathcal{S}(\mathbb{G}_{\mathcal{FR}})$ of fuzzy random graph $\mathbb{G}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ is defined as, $\mathcal{O}(\mathbb{G}_{\mathcal{FR}}) = \sum \phi_g(v_i), v_i \in \mathbb{V}_{\mathcal{FR}}$, $\mathcal{S}(\mathbb{G}_{\mathcal{FR}}) = \sum \psi_g(v_i, v_j), (v_i, v_j) \in \mathbb{E}_{\mathcal{FR}}$

Definition: 2.7

The fuzzy random graph $\mathbb{G}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ is called a complete fuzzy random graph if $\psi_g(v_i, v_j) = \min\{\phi_g(v_i), \phi_g(v_j)\}$ for all $(v_i, v_j) \in \mathbb{E}_{\mathcal{FR}}$.

Definition: 2.8

A fuzzy random graph $\mathbb{G}_{\mathcal{FR}} = (\mathbb{V}_{\mathcal{FR}}, \mathbb{E}_{\mathcal{FR}})$ is connected if any two vertices are joined by a path.

Definition: 2.9

Zagreb index of fuzzy random graph is given by

Abirami and Sarala

$$M(G) = \sum_{u_i \in V} u_i d^2(u_i) \text{ for all } u_i \in V$$

$$M^*(G) = \frac{1}{2} \sum_{u_i, v_i \in V} \sigma(u_i) d(u_i) \sigma(v_i) d(v_i) + \sum_{uv \in E} d(u) d(v)$$

where $d(u_i)$ - degree of vertex

Definition:2.10

Randic connectivity index of fuzzy random graph

$$R(G) = \sum_{uv \in E} \frac{1}{\sqrt{d(u)d(v)}} + \frac{1}{2} \sum \frac{1}{\sqrt{\sigma(u_i)d(u_i)\sigma(v_j)d(v_j)}}$$

where uv -edge, du, dv are degree of vertices u and v .

Definition:2.11

Harmonic index of fuzzy random graph

$$H(G) = \frac{1}{2} \sum_{u_i, v_i \in V} \frac{1}{\sigma(u_i)d(u_i) + \sigma(v_j)d(v_j)} + \sum \frac{2}{du + dv}$$

METHODOLOGY**Dutch windmill graph or m -fan fuzzy random graph**

In graph theory, a friendship graph is a type of graph where each vertex represents a person, and an edge between two vertices represents a friendship between those two people. A common example is a "triangle" graph where each person is friends with two others, forming a triangle. More generally, friendship graphs can be complex but often have properties related to cliques and triangles. Friendship relationships are represented in a graph. The presence or strength of these friendships is fuzzy, meaning the relationships can vary in strength rather than being strictly present or absent. The graph itself is generated or evolves based on some random process, where the probability of an edge being fuzzy is influenced by random factors. In practical terms, such a model could be used to study social networks where friendships vary in strength and evolve over time in a probabilistic manner. It could be useful in fields like sociology, computer science, or any area where understanding complex, probabilistic relationships is important. In an n -fan graph, the structure involves a central vertex connected to all other vertices, which are then connected in a radial manner.

 m -fan fuzzy random graph

Let's break down the problem involving the n -fan fuzzy random graph $G_{F_m} = (V_{F_m}, E_{F_m})$ where each vertex and edge have specific membership values, and analyze the degrees of the vertices.

Vertices and Edges

Each vertex in G_{F_m} has a membership value of 0.5.

Each edge in G_{F_m} has a membership or probability value of 0.4.

Degrees

Each vertex (except the middle vertex) has a degree of 1.2.

The middle vertex has a degree of 0.8m.

For vertices, the degree mentioned (1.2 for non-middle vertices and 0.8m for the middle vertex) likely means the expected number of edges connected to each vertex in a fuzzy sense. This would be consistent with the idea that the graph is "fuzzy" or probabilistic.

DISCUSSION

Zagreb indices of m -fan fuzzy random graph

First Zagreb index of m -fan fuzzy random graph

$$M(G) = \sum_{u_i \in \sigma} u_i d^2(u_i) \text{ for all } u_i \in V$$

The 1-fan fuzzy random graph is given by

$$M(G) = \sum_{u_i \in \sigma} u_i d^2(u_i) \text{ for all } u_i \in V$$

$$M(G) = (0.5)(1.2)^2 + (0.5)(1.2)^2 + (0.5)(0.8)^2 = 1.76$$

Theorem: 4.1

Let $G_{F_m} = (V_{F_m}, E_{F_m})$ be a m -fan fuzzy random graph, then the first zagreb index of the m -fan fuzzy random graph is $M(G) = 0.32m^2 + 1.44m$

Proof

Let $G_{F_m} = (V_{F_m}, E_{F_m})$ be a m -fan fuzzy random graph with vertex and edge has membership values 0.5 and 0.4 respectively. Then it implies that degree of middle vertex is $0.8m$ while all the other vertices have 1.2 degree.

$$M(G) = \sum_{u_i \in \sigma} u_i d^2(u_i) \text{ for all } u_i \in V$$

$$M(G) = 2m(0.5)(1.2)^2 + (0.5)(0.8m)^2$$

$$M(G) = (0.5)[2m(1.2)^2 + (0.8m)^2]$$

$$M(G) = 0.32m^2 + 1.44m$$

Remark

For $m = 2$, $M(G) = 0.32(2)^2 + 1.44(2) = 4.16$

For $m = 3$, $M(G) = 0.32(3)^2 + 1.44(3) = 7.2$

For $m = 4$, $M(G) = 0.32(4)^2 + 1.44(4) = 10.88$

Second Zagreb index of m -fan fuzzy random graph:

$$M^*(G) = \frac{1}{2} \sum_{u_i, v_i \in \mu} \sigma(u_i)d(u_i)\sigma(v_i)d(v_i) + \sum_{uv \in E} d(u)d(v)$$

$$\text{For } m = 1, M^*(G) = \frac{1}{2} [(0.5)(1.2)(0.5)(0.8) + (0.5)(1.2)(0.5)(0.8)] + (1.2)^2$$

$$M^*(G) = \frac{1}{2} [(0.5)(1.2)(0.5)(0.8)^2] + (1.2)^2 = 1.68$$

Theorem: 4.2

Let $G_{F_m} = (V_{F_m}, E_{F_m})$ be a m -fan fuzzy random graph, then the second zagreb index of the m -fan fuzzy random graph is $M^*(G) = 0.24m^2 + 1.44m$

Proof

$$M^*(G) = \frac{1}{2} \sum_{u_i, v_i \in \mu} \sigma(u_i)d(u_i)\sigma(v_i)d(v_i) + \sum_{uv \in E} d(u)d(v)$$

$$M^*(G) = \frac{1}{2} (2m)[(0.5)(1.2)(0.5)(0.8m)] + m(1.2)^2$$

$$M^*(G) = (m)[(0.5)(1.2)(0.5)(0.8m)] + 1.44m$$

$$M^*(G) = 0.24m^2 + 1.44m$$

Remark

For $m = 2, M^*(G) = 3.84$

For $m = 3, M^*(G) = 6.48$

For $m = 4, M^*(G) = 9.60$

Randic index of m -fan fuzzy random graph

$$R(G) = \frac{1}{2} \sum \frac{1}{\sqrt{\sigma(u_i)d(u_i)\sigma(v_j)d(v_j)}} + \sum_{uv \in E} \frac{1}{\sqrt{dudv}}$$

For $m = 1,$

$$R(G) = \frac{1}{2} \sum \frac{1}{\sqrt{\sigma(u_i)d(u_i)\sigma(v_j)d(v_j)}} + \sum_{uv \in E} \frac{1}{\sqrt{dudv}}$$

$$R(G) = \frac{1}{2} \left\{ \frac{1}{\sqrt{((0.5)(1.2)(0.5)(0.8))}} + \frac{1}{\sqrt{((0.5)(1.2)(0.5)(0.8))}} \right\} + \frac{1}{\sqrt{((1.2)(1.2))}}$$

$$R(G) = \frac{1}{2} \left\{ \frac{1}{\sqrt{(0.24)}} + \frac{1}{\sqrt{(0.24)}} \right\} + \frac{1}{\sqrt{(1.44)}} = 2.875$$

Theorem: 4.3

Let $G_{F_m} = (V_{F_m}, E_{F_m})$ be a m -fan fuzzy random graph, then the second zagreb index of the m -fan fuzzy random graph is $R(G) = \frac{m}{\sqrt{0.24m}} + \frac{1}{\sqrt{1.44m}}$

Proof

$$R(G) = \frac{1}{2} \sum \frac{1}{\sqrt{\sigma(u_i)d(u_i)\sigma(v_j)d(v_j)}} + \sum_{uv \in E} \frac{1}{\sqrt{dudv}}$$

$$R(G) = \frac{1}{2} \left\{ \frac{1}{\sqrt{((0.5)(1.2)(0.5)(0.8))}} + \frac{1}{\sqrt{((0.5)(1.2)(0.5)(0.8))}} \right\} + \frac{1}{\sqrt{((1.2)(1.2))}}$$

$$R(G) = \frac{1}{2} \left\{ \frac{2m}{\sqrt{((0.5)(1.2)(0.5)(0.8m))}} \right\} + \frac{1}{\sqrt{((1.2)(1.2)m)}}$$

$$R(G) = \left\{ \frac{m}{\sqrt{(0.24m)}} \right\} + \frac{1}{\sqrt{(1.44m)}}$$

For $m = 2,$

$$R(G) = \left\{ \frac{2}{\sqrt{(0.24(2))}} \right\} + \frac{1}{\sqrt{(1.44(2))}} = 3.476$$

For $m = 3,$

$$R(G) = \left\{ \frac{3}{\sqrt{(0.24(3))}} \right\} + \frac{1}{\sqrt{(1.44(3))}} = 4.017$$

For $m = 4,$

$$R(G) = \left\{ \frac{4}{\sqrt{(0.24(4))}} \right\} + \frac{1}{\sqrt{(1.44(4))}} = 4.499$$

Abirami and Sarala

Harmonic index of m -fan fuzzy random graph:

$$H(G) = \frac{1}{2} \sum_{u_i, v_i \in \mu} \frac{1}{\sigma(u_i)d(u_i) + \sigma(u_j)d(u_j)} + \sum \frac{2}{du + dv}$$

For $m = 1$,

$$H(G) = \frac{1}{2} \left\{ \frac{1}{(0.5)(1.2) + (0.5)(0.8)} + \frac{1}{(0.5)(1.2) + (0.5)(0.8)} \right\} + \frac{2}{(1.2) + (1.2)}$$

$$H(G) = \frac{1}{2} \left\{ \frac{2}{(0.6) + (0.4)} \right\} + \frac{2}{2.4}$$

$$H(G) = 1 + \frac{1}{1.2} = 1.833$$

Theorem: 4.4

Let $G_{F_m} = (V_{F_m}, E_{F_m})$ be a m -fan fuzzy random graph, then the second zagreb index of the m -fan fuzzy random graph is $H(G) = \frac{m}{0.6+0.4m} + \frac{m}{1.2}$

Proof

$$H(G) = \frac{1}{2} \left\{ \frac{1}{(0.5)(1.2) + (0.5)(0.8)} + \frac{1}{(0.5)(1.2) + (0.5)(0.8)} \right\} + \frac{2}{(1.2) + (1.2)}$$

$$H(G) = \frac{1}{2} \left\{ \frac{2m}{(0.5)(1.2) + (0.5)(0.8m)} \right\} + \frac{2m}{2.4}$$

$$H(G) = \left\{ \frac{m}{0.6 + 0.4m} \right\} + \frac{m}{1.2}$$

For $m = 2$,

$$H(G) = \left\{ \frac{2}{0.6 + 0.4(2)} \right\} + \frac{2}{1.2} = 3.095$$

For $m = 3$,

$$H(G) = \left\{ \frac{3}{0.6 + 0.4(3)} \right\} + \frac{3}{1.2} = 4.167$$

For $m = 4$,

$$H(G) = \left\{ \frac{4}{0.6 + 0.4(4)} \right\} + \frac{4}{1.2} = 5.152$$

CONCLUSION

This study delves into the computation of the topological indices such as the first Zagreb index, the second Zagreb index, the Randic index, and the Harmonic index for the m -fan fuzzy random graph. By applying the formulae defined in the preliminaries, this study demonstrates that each of these indices can be accurately calculated for this specific graph model. The research involves a detailed comparison of the m -fan fuzzy random graph with other graph types, as presented in the accompanying tables and graphical representations. The findings reveal that the m -fan fuzzy random graph exhibits distinct properties in terms of these topological indices, offering a deeper understanding of its structural characteristics. This study not only enhances the theoretical framework surrounding fuzzy random graphs but also provides practical insights for applications in network analysis and related fields.

ABSTRACT

Anatomy, the branch of science that studies the various structures of the human body. In Ayurvedic anatomy, "Kala Sharir" is a significant concept, referring to the layers or membranes within the body. Acharya Sushruta introduced the term "Kala" to describe the sheaths or membranes that enclose internal organs. These membranes separate the *Dhatu* from the *Ashayaa* (Organ Cavity). There are seven types of *Kala* in the body: *Mamsadhara*, *Raktadhara*, *Medodhara*, *Shleshmadhara*, *Purishdhara*, *Pittadhara*, and *Shukradhara*. To explore this concept, we have reviewed Ayurvedic texts, related literature, and modern anatomy sources.

Keywords: *Kala Sharir*, Layers of the body

INTRODUCTION

Kala Sharir is a key concept in Ayurvedic Sharir Rachna Vijnyana, primarily concerned with the layers and membranes that cover various organs and tissues of the body. In Ayurveda, the term "Kala" has multiple meanings, including a unit of time and a membrane, but anatomically it refers to membranous structures. This unique concept was introduced by Acharya Sushruta in the "*Garbhavyakarana Sharir Adhyaya*." Acharya Sushrut described *Kala* as the separator between *Dhatu* (tissues) and its *Ashaya* (organ or cavity), where *Ashaya* refers to the cavity that contains the *Dhatu*s. According to *Shareera Rachana* (Ayurvedic anatomy), "*Kala*" denotes the membrane that separates a *Dhatu* from its *Ashaya*. Through the action of *Dehoshma* (body heat), *Kleda* or *Anna Kleda* (moisture or nutrients) are processed (*Paaka*) to generate this membrane.

Mahendra and Nirav Patel

The body's natural heat causes the *Kleda*, which is located between the *Dhatu* (tissue) and its *Ashaya* (organ cavity), to change during fetal development. *Kala* (membranous structures) are created as a result of this process. According to Acharya, the structure of *Kala* (*Kala Swaroop*) consists of body parts that are smeared with *Kapha*, covered by *Snayus* (ligaments or tendons), and encompassed by *Jarayu* (membrane or covering). *Kala* is associated with mucous membranes and epithelium in contemporary research. *Snayu* and *Shleshma* are vital parts of *Kala*, which is a membrane that secretes mucus and is shielded by *Snayus*. In the body, *Kala* can be classified into seven different types: *Mamsadhara Kala*, *Raktadhara Kala*, *Medodhara Kala*, *Shleshmadhara Kala*, *Purishadhara Kala*, *Pittadhara Kala*, and *Shukradhara Kala*. In his commentary on the Sushruta Samhita, Dalhana says that *Dhatu* refers to the seven structures that support (*Dharana*) the body. But when talking about *Kala*, Acharya stresses that in addition to the *Sapta Dhatus*, the *Tridosha* and *Trimala* also need to be taken into account because, in a balanced condition, they help support the body. *Ashaya* is sometimes referred to as the *Avasthana Pradesha*, or the area that supports the *Dhatus*. According to Astanga Samgraha, after the formation of the *Dhatus*, the remaining minute portion of *Rasa* (nutrient fluid) undergoes *Paaka* (processing) to form *Kala*. The *Dhatus*, including *RaktaDhatu*, and the *Ashaya* (the channels or *Srotas* through which they circulate) are essential elements, as Indu's commentary makes clear. *Kala* is situated precisely in the middle of *Dhatu* and *Ashaya*. The *Swaroopa* of a structure helps in its identification, and classical texts often use similes to provide a clearer understanding. *Kala* is explained in a similar way. All Acharyas described *Kala* as resembling the annual rings of a tree. Just as a tree forms a new layer of wood each year, increasing its bulk, the rings make this growth visible through distinct separations. Similarly, *Kala* provides clear demarcations in the body, though it is not solid like tree rings. Instead, it is composed of *Snaayu*, *Jarayu*, or *Kapha/Sleshma*, giving it a soft, flexible structure.

Aim And Objective

- Aim of this study is to determine the applied aspect of *Kala*.
- Objectives of this study are to compare the anatomical structure of *Kala* with the respective membrane in modern anatomy.

MATERIALS AND METHODS

From various classical texts Bruhatrayi like Charaka Samhita, Sushruta Samhita, Ashtanga Samgraha, Ashtanga Hrudaya and Laghutrayi like Madhav Nidan, Sharangadhara Samhita etc and evidence based resources as scientific journals, books and data based information from various texts.

Review of Literature***Kala Sharir***

Definition :

कलाः खल्वपि सप्त भवन्ति धात्वाशयान्तरमर्यादाः ॥Sush. Sharir 4/5

There are seven *Kala*, which are membranes or sheaths that separate *Dhatu* and *Ashaya*. While *Dhatu* represents the corresponding organ, *Ashaya* might be associated with the empty space inside the organ. Therefore, we may say that it is a differentiating membrane that observes the organ's physical form.

Formation and structure of *Kala* :

धात्वाशयान्तरक्लेदो विपक्वः स्वंस्वमूष्मणा |

श्लेष्मस्नाय्वपराच्छन्नः कलाख्यः काष्ठसारवत् |

A.Hru. Sharir 3/9

By its own heat, the liquid portion that exists between *Dhatu* and *Ashaya* transforms into *Kala*. We may conclude from examining *Kala*'s definition and construction that it is more than just a physical entity; rather, it serves as a functional and physical component in the creation and distribution of the corresponding *Dhatu*. *Mamsadhara-Kala*, *Raktadhara-Kala*, *Medodhara-Kala*, *Sleshmadhara-Kala*, *Pureeshadhara-Kala*, *Pittadhara-Kala*, and *Shukradhara-Kala* are the seven varieties of *Kala*. Dalhana makes it clear that these *Kala* are named and arranged according to their function in

Mahendra and Nirav Patel

Dharana, not *Poshana*. According to Acharyas, when the notion of *Kala* is understood from the outside in, there is an oozing of *Dhatu* (tissues) when cutting through *Mamsaadi* (muscular tissue). Acharya starts with *Maamsadhara Kala*, however *Rasa* and *Rakta* should be taken into consideration first in accordance with the *Dhatu* sequence. This is because Acharya introduces *Kala* after talking about the skin (*Twak*) in his description of the body's layers. The first *Kala*, *Maamsadhara Kala*, which is in charge of the *Dharana* (support) of *Mamsa* (muscle tissue), comes after the seventh layer of *Twak*, *Mamsadhara Twak*.

Mamsadhara Kala

तासां प्रथमा मांसधरा, यस्यां मांसे सिरास्नायुधमनीस्रोतसां प्रताना भवन्ति || (Su.Sha 4/8)

Acharya Sushruta among the seven *Kalas*; *Mamsa Dhara Kalas* explained first. *Snayu* (tendon), *Sira* (veins), *Dhamani* (arteries), and *Srotas* (cavity) make up *Mamsadhara Kala*'s network. In terms of anatomy, it can be associated with the intermuscular septa or deep fascia that divide the muscle from the underlying structure. Just as lotus stems and stalks develop everywhere in muddy water on the ground, so do blood vessels and other structures in muscles. Why is *Rakta* included before *Mamsa* in the list of *Dhatu*s? The *Raktadhara* is mentioned after *Mamsadhara Kala*. There is no anomaly because this order relates to nourishment rather than support; in this case, it is about supporting *Kala*.

Raktadhara Kala

द्वितीया रक्तधरा मांसस्याभ्यन्तरतः, तस्यां शोणितं विशेषतश्च सिरासु यकृत्स्लीहनोश्च भवति || (Su.Sha 4/10)

Raktadhara Kala is the second *Kala* that Acharya Sushruta has explained. *Raktadhara Kala* is a part of *Mamsadhara Kala*, as was previously stated. Despite being embedded in the *Mamsadhara Kala*, it is especially present in the liver, spleen, and blood vessels. Similar to how latex emerges from a tree when it is cut, blood will leak from the *Raktadhara Kala* if the *Mamsadhara Kala* embedded in a muscle is cut. The *Raktadhara Kala* can be compared to the tunica externa and tunica media, which are the innermost layers of the arteries that line the lumen of the artery. The liver plays a vital part in the circulation of the fetus during embryonic life and aids in the development of blood. Spleen act on old RBC cells to get recycled and platelet and WBC get stored in to the spleen.

Medodhara Kala

तृतीया मेदोधरा, मेदो हि सर्वभूतानामुदरस्थमण्वस्थिषु च, महत्सु च मज्जा भवति || (Su. Sha. 4/12.)

The third *Kala* in the body, *Medodhara*, is found in the small and large bones as well as the abdomen. *Meda* is a type of adipose tissue that is found in the belly. Although it is found all over the body, it might collect mainly in the abdomen. The greater and lesser omentum, which cover the large intestine (transverse colon), are anatomically comparable to *MedodharaKala*. Anatomically speaking, the existence of *Medodhara Kala* in the bone can be correlated with bone marrow. In this instance, Acharya Sushruta stated that *Medodhara Kala* inhabits long bones as *Majja* and small bones as *Sarakta Meda*.

Shleshmadhara Kala

चतुर्थी श्लेष्मधरा सर्वसन्धिषु प्राणभूतां भवति ||

स्नेहाभ्यक्ते यथा ह्यक्षे चक्रं साधु प्रवर्तते ।

सन्धयः साधु वर्तन्ते संश्लिष्टाः श्लेष्मणा तथा || (Su.Sha. 4/16.)

This is *Kala* 4th. All living things' joints contain *Shleshmadhara Kala*, according to Acharya Sushruta. *Shleshma* in the joint facilitates free movement, much as enough lubrication at the wheels' frictional area contributes to smooth and high-quality movement. Additionally, it aids the joint in overcoming the tension and shock of frequent motion. For all of the joints in the body to operate smoothly, *Sheshmadhara Kala* is therefore crucial. In terms of anatomy, it is comparable to the synovial membrane that covers the inside of joints. The *Shleshma* can be correlated with the synovial fluid released by the synovial membrane.

Purishdhara Kala

पञ्चमी पुरीषधरा नाम; याऽन्तःकोष्ठे मलमभिविभजते पक्वाशयस्था ||

यकृत्समन्तात् कोष्ठं च तथाऽन्त्राणि समाश्रिता ।

उण्डु (न्दु) कस्थं विभजते मलं मलधरा कला || (Su.Sha 4/17)

Purishdhara Kala is the fifth *Kala*. It is situated inside the *Kostha* (abdomen) in the *Pakwashaya*. In the *Kostha*, it is specifically situated at the *Yakrit* level. In *Purishvaha Srotas*, food is split in the *Sara* and *Mala Bhaga* with the use of *Purishdhara Kala*. *Maladhara Kala* is another name for it. Waste items such as urine and feces are separated by *Malam Abhivibhajate*. But it interprets it as feces, which are food excretions, and *Agni* and *Vayu* work together to separate them. As a result, *Kala* is dispersed throughout the whole gastrointestinal tract, affecting nearly every viscera; it is referred to as "being situated in intestines" due to the presence of feces. *Malam Vibhajate*: "Eliminates from bowels" by separating waste products in the form of urine and feces. . The site where digested food is separated in *Sara* and *Mala Bhaga* is called *Kala*, according to Acharya Sushruta *Purishdhara*. In modern science, this location can be equated with the big intestine. According to Acharya Sushruta, as it is close to the *Yakruta*, it may be the hepatic flexure. *Purishdhara Kala* can be correlated with the mucosal and submucosal layers of the large intestine's innermost layer.

Pittadhara Kala

षष्ठी पित्तधराः अशितं खादितं पीतं लीढं कोष्ठगतं नृणाम् । तन्जीर्यति यथा लं शोषितं पित्ततेजसा || (Su.Sha 4/19)

Pittadhara Kala is the sixth *Kala*. It takes in and holds onto the partially digested meal. It breaks down all four types of food: *Lehya* (licked), *Peeta* (drinkable), *Khadita* (swallowed), and *Ashita* (chewable). It contains the digestive fire, or *Agni*, which aids in the individual's food digestion. Here, *Agni* plays a key role in food absorption and digestion. The term "*Grahni*" is typically used to refer to the duodenum or the first segment of the small intestine. It is where partially digested food is received from the stomach, held for a while, and then broken down. Therefore, the digestive enzymes that aid in food digestion may be secreted by the duodenum and its inner layer.

Shukradhara Kala

सप्तमी शुक्रधरा. या सर्वप्राणिनां सर्वशरी यापिनी ||

यथा पयसि सर्पिस्तु गूढश्चेक्षौ रसो यथा । शरीरेषु तथा शुक्रं नृणां विद्याद्विषग्वरः || (Su.Sha. 4/21.)

Shukradhara Kala is the seventh and final *kala*. It can be found all over the body. Similar to how the presence of ghee in milk is invisible to the human sight, the presence of sugar in sugarcane is also invisible to the naked eye, as is the presence of *Shukradhara Kala*. Consider *Shukra* to be semen. Since semen is created by the testes, it is not advisable to claim that it is produced throughout the body. Ayurveda likewise makes this claim while describing the *Shukravaha Srotas*. Another question that comes up in this situation is whether or not females have *Shukradhara Kala* if it is compared to semen. At the zygote level, we must comprehend the idea of *Shukradhara Kala*. Since the sperm and ovum make up the entire body, it is generally acceptable for these two cells to produce every portion of the body. We can therefore defend the idea of *Shukradhara Kala* as presented by Acharya Sushruta.

DISCUSSION

Kalas are the body parts that are coated in *Snayus*, encased in *Jarayu*, and smeared in *Kapha*. According to contemporary science, it is related to the epithelium and mucous membranes. The mucous membranes of the hollow organs can be thought of as *Kala* divides the organ's lumen or hollow from its lining tissue. It is a structure that stands in between the *Ashaya* and the *Dhatu*. The layers of *Kala* not only serve as anatomical boundaries but also play integral roles in various physiological processes, such as nourishment, support, lubrication, and reproduction. The correlation of these *Kalas* with modern anatomical structures enhances our understanding of their significance and functions in both Ayurvedic and contemporary medical contexts. Through this discussion, it is evident that the concept of *Kala* is multifaceted, interconnecting various anatomical structures and functions, highlighting the complexity of the human body as perceived in Ayurveda. This holistic perspective allows for a deeper appreciation of the interplay between the body's tissues and their roles in maintaining health and well-being.

CONCLUSION

The restricting membrane that separates a *Dhatu* from its *Ashaya* is called *Kala*. Here, "*Dhatu*" refers to the seven main Dhatus (*Rasadi Sapta Dhatu*), *Trimalas* (three excreta), and *Tridoshas* that, when in a healthy state, are in charge of preserving the integrity of the body. The term "*Ashaya*" refers to the particular hollow or space where these *Dhatus* are found. Under the effect of (internal heat), *Kala* is created by the *Paaka* of *Kledaamsa*, which is located between the *Dhatu* and *Ashaya*. It is like the annual rings of a tree, like the *Saara* of *Kashta*. *Kala*'s structure can be compared to that of *Snaayu* (ligaments), *Jarayu* (connective tissue), or *Sleshma* (mucus). Its location and appearance indicate that the body's membranes are slimy, thin, and translucent, or fibrous.

The following are the likely associated structures for each *Kala*:

- *MamsaDhara Kala* : Deep fascia alterations are linked to *Maamsadhara Kala*.
- *Raktadhara Kala*: Similar to the liver and spleen's architecture, as well as the endothelium lining of blood vessels.
- *Medodhara Kala*: Associated with the endosteum of bones, peritoneal folds, and dura mater.
- *Sleshmadhara Kala*: This is the synovial membrane that lines the fibrous capsules of the flexor sheath, bursa, omental bursa, and synovial joints.
- *Pureeshadhara Kala*: Similar to the epithelial lining of the cecum, ascending colon, terminal portion of the small intestine, and a portion of the transverse colon.
- *Pittadhara Kala*: Associated with the duodenum's epithelial layer and some jejunal segments. *Shukradhara Kala*: *Sarva Daihika Shukra* is difficult to find a structural correlation for. On the other hand, *Shukradhara Kala*, which is related with *Mootra Maarga*, might be likened to the lining of the male urethra.

ABSTRACT

Liquid chromatography-mass spectrometry (LCMS) is a key method in analytical chemistry. Its ability to combine high-resolution separation with precise mass detection has changed industries like pharmaceuticals, environmental monitoring, and clinical diagnostics. In this review, we look at current advances in LCMS, such as instrumentation, software tools, and method development approaches. Our focus is on improving efficiency, sensitivity, and selectivity, allowing researchers to fully realize the potential of LCMS. Due to its exceptional sensitivity and selectivity in detecting and quantifying a broad variety of compounds, liquid chromatography-mass spectrometry (LCMS) has emerged as an essential analytical chemistry instrument. The development of LCMS methods is still difficult, especially when trying to achieve the best possible levels of sensitivity, selectivity, and efficiency. Aiming to solve these

Sridevi Ranjitha Karanam *et al.*,

difficulties, notable developments in LCMS software, instrumentation, and techniques have been achieved recently. With an emphasis on increasing method development efficiency, sensitivity, and selectivity, this review offers a thorough summary of the most recent advancements in LCMS technology and methodology. The article discusses significant developments in LCMS apparatus, software tools, and method development methodologies, as well as how they affect analytical chemistry research and applications.

Keywords: Liquid Chromatography-Mass Spectrometry (LCMS), Analytical chemistry, LCMS technology and methodology, software tools.

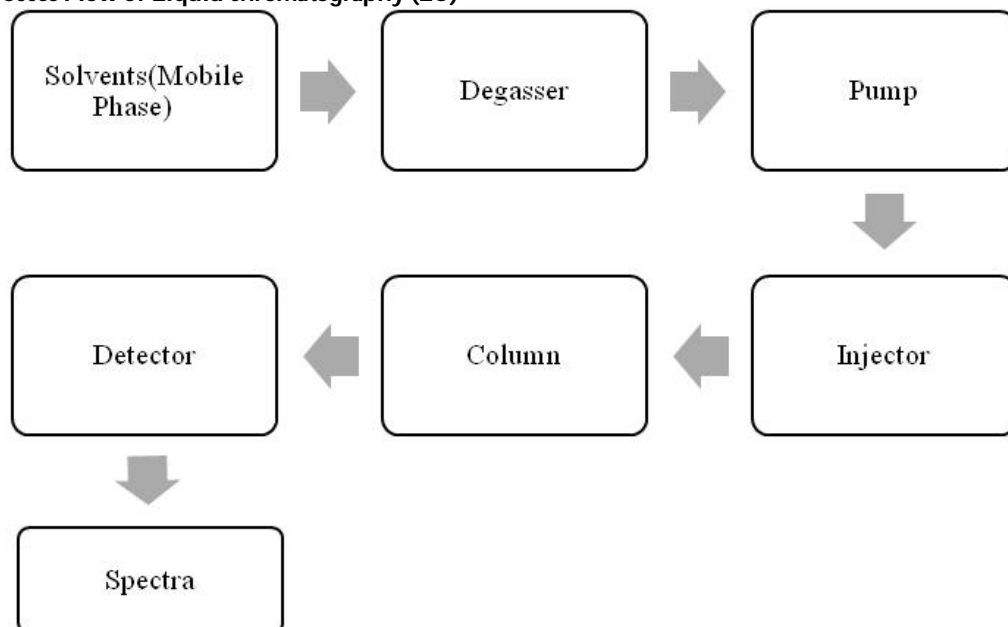

INTRODUCTION

The objective of Liquid chromatography (LC) coupled with mass spectrometry (MS) has become an essential analytical tool. However, despite its widespread use, method development remains a challenging task. The interplay of numerous parameters, matrix effects, and the need for sensitivity and selectivity necessitates innovative approaches. In this article, we delve into the latest developments that address these challenges. A effective analytical method for the detection, identification, and quantification of a broad variety of chemicals in complicated matrices is liquid chromatography-mass spectrometry (LCMS). The separation powers of liquid chromatography and the sensitive and selective detection powers of mass spectrometry are combined in LCMS, which makes it an effective tool for a variety of industries, including environmental analysis, metabolomics, proteomics, medicines, and forensics. However, the creation of reliable and effective techniques for sample preparation, chromatographic separation, and mass spectrometric detection is crucial to the effective use of LCMS. Significant improvements in LCMS hardware, software, and methodology have been created recently with the goal of addressing method development issues and enhancing the effectiveness, sensitivity, and selectivity of LCMS analysis.

Liquid Chromatography

1. Liquid chromatography is a separation process used to isolate the individual components of a mixture. This process involves the mass transfer between a sample and a polar mobile phase as well as non-polar stationary phase.
 2. LC separates the molecules in a liquid mobile phase using solid stationary phase. This separation occurs based on the interaction of the sample with the mobile and stationary phases. It can be used for the analytical or preparative application.
 3. This technology requires sophisticated instrument operating at high pressures, hence using abbreviation of LC and HPLC interchangeable.
 4. The reasons for the popularity the method are its sensitivity, its ready adaptability to accurate quantitative determination, its ease of automation, its suitability for separating non-volatile species or thermally fragile once its wide spread applicability to substances that are important to industry and many fields of science .[1]
- The columns were packed with 50 to 500 cm length of solid particles coated with an adsorbed liquid that formed the stationary phase.
- To ensure reasonable flow rates through this type of stationary phase, the particle size of the solid kept larger than 150 to 200 μm .

**Process Flow of Liquid chromatography (LC)****Mass Spectrometry**

A mass spectrometer is an instrument that produces ions and separates them according to their mass to charge ration (m/z).

Mass spectrometric analysis involves the following steps:

- Atomization
- Conversion of a substances fraction of the atoms formed in step1 to a stream of ions.
- Separating the ions formed in step 2 on the basis of their mass to charge ratio [m/z].

M =mass of the number of ion in atomic mass unit.

Z =number of fundamental charges. [2]

Process Flow of Mass Spectroscopy (MS)

**Sridevi Ranjitha Karanam et al.,****Liquid Chromatography- Mass Spectrometry**

LC-MS is an analytical technique that couples high resolution chromatographic separation with sensitive and specific mass spectrum detection.

- Combination of LC-MS is an important development in the history of chromatography. Mass spectroscopy in LC-MS helps to determine the elemental composition and structural elucidation of a sample.
- It is powerful technique used for many applications which has very high sensitivity and selectivity. It is commonly used in the pharmacokinetic studies of pharmaceuticals and it is the most frequently in field of bioanalysis. LC-MS also play a role in pharmacognosy especially in the field of molecular pharmacognosy when it comes to the ingredients in the different aspects of phenotypic cloning. [3]

Principle Involved In LC-MS

- Typical LC-MS system is the combination of HPLC with MS using Interface (Ionisation source). The sample is separated by LC and the separated sample species are sprayed into atmospheric pressure ion source, where they are converted into ions in the gas phase.
- The mass analyser is then used to sort ions according to their mass to charge ratio and detector counts the ions emerging from the mass analyser and may also amplify the signal generated from each ion.
- As a result mass spectrum (a plot of the ion signal as a function of mass to charge ratio) is created, which is used to determine the elemental nature of a sample, the masses of the particle and also molecules, and to elucidate the chemical structures of molecules.
- Two key components in this process are the ion source, which generates the ion and mass analyzer, which sorts the ions. Several different types of ions sources are commonly used for LC/MS. [3]

Advancements in LCMS Software

In parallel with advancements in instrumentation, there have been notable developments in LCMS software tools for data acquisition, processing, and analysis. Modern LCMS software platforms offer user-friendly interfaces, advanced data processing algorithms, and integrated workflows for method development, optimization, and validation. These software tools facilitate automated peak detection, deconvolution, quantification, and identification of analytes, thereby streamlining method development workflows and reducing analysis time. Furthermore, the integration of machine learning algorithms and artificial intelligence techniques into LCMS software enables predictive modeling, retention time prediction, and automated peak assignment, enhancing method robustness and reproducibility.

1. Two-Dimensional LC (2D-LC): The evolution of 2D-LC methods has significantly expanded peak capacities and improved mass spectrometry utilization. These methods allow faster analysis of complex samples compared to traditional one-dimensional (1D)-LC approaches [4].
2. In-Line Reactions: LCMS now enables in-line reactions, enhancing the scope of applications. Researchers can perform derivatization, ionization, and other reactions directly within the LC system, leading to improved sensitivity and selectivity.
3. High-Resolution Mass Analyzers: Advances in mass analyzers, such as quadrupole-orbitrap hybrids and time-of-flight (TOF) instruments, provide superior resolution and accurate mass measurements. These innovations enhance compound identification and quantification.

Method Development Strategies

Effective method development is essential for achieving optimal performance in LCMS analyses. Recent advancements in method development strategies have focused on improving chromatographic resolution, selectivity, and sensitivity while minimizing analysis time and solvent consumption. Strategies such as gradient optimization, column selection, mobile phase modifiers, and sample preconcentration techniques have been widely explored to enhance chromatographic performance and analyte detection. Moreover, the application of orthogonal chromatographic techniques (e.g., two-dimensional LC) and multidimensional separations has enabled the comprehensive analysis of complex samples with improved resolution and peak capacity.

**Sridevi Ranjitha Karanam et al.,**

The unit study method is one that is regularly created, enhanced, verified, investigated, and used in a collaborative manner. Separations between activities are mostly required while developing broad approaches for LC-MS technique development. Most of the time, desirable separations can be obtained with just a few experiments.

In other situations, a significant amount of experimentation might also be made public.

The procedure for developing techniques:

- Gather the drug's chemical characteristics from published sources.
- Verify the profile of soluble substances.
- MS optimisation and scanning.
- Choice of mobile phase selection.
- Selection and optimisation of the extraction method.
- Selecting the activity technique (based on chemical retention and solubility studies)

Software Tools for Method Development Efficiency

1. Chemometrics and Machine Learning: Researchers worldwide are designing strategies to simplify method development using software. Chemometrics and machine learning allow simultaneous optimization of multiple parameters, streamlining LCMS workflows [5].
2. Closed-Loop Optimization: Computer-aided workflows optimize kinetic and thermodynamic parameters in LC. Closed-loop approaches continuously adjust method conditions based on real-time data, reducing manual intervention.

Methodologies for Enhanced Efficiency

1. **Quality by Design (QbD):** QbD principles guide LCMS method development by emphasizing risk assessment, design of experiments (DoE), and systematic optimization. This approach ensures robust and efficient methods [6].
2. **Column Selection and Stationary Phases:** Advances in column technology, including superficially porous particles (SPPs) and monolithic columns, enhance separation efficiency and speed.
3. **Mobile Phase Optimization:** Rational selection of mobile phases, additives, and gradients improves sensitivity and selectivity. Techniques like gradient scouting and solvent strength optimization play a crucial role.

Applications in Pharmaceutical Analysis:[7-8]

LC-MS is a comprehensive solution that addresses a wide range of issues in pharmaceutical research and development, not merely a tool. It offers scientists a strong, dependable, and adaptable platform to gather vital data at every phase of the drug development process. The pharmaceutical business relies heavily on Liquid Chromatography-Mass Spectrometry (LC/MS) as a vital instrument for a variety of tasks, including medication discovery and market support. It is essential to many phases of research since it offers information on drug compound discovery, chemical development, stability testing, and other topics. For example, LC/MS is used for structural verification during chemical development and for quick target compound monitoring during the discovery stage. As a crucial component of pharmaceutical standards and impurity profiling, it is also necessary for monitoring impurity profiles.

Current Developments in LC-MS:[8]

Recent years have seen tremendous developments in the strong analytical technology known as liquid chromatography-mass spectrometry, or LC-MS. This technology is essential for many industries, including medicine.

Hardware Upgrades

- Improved ionisation methods
- More perceptive sensors
- Enhanced effectiveness of the system

The quality of pharmaceutical products has increased due to the ability to detect contaminants at even lower concentrations thanks to advancements in hardware.

**Ionization's Importance in LC-MS**

Conventional Techniques for Ionisation

An LC-MS system's ionisation source is its essential component. The magic starts there, converting substances into ions that can be separated and examined.

- Electrospray Ionisation (ESI): This approach is dependable and versatile, similar to a Swiss Army knife of ionisation techniques. It is especially helpful for studying polar, nonvolatile, and thermally labile substances.
- Atmospheric Pressure Chemical Ionisation (APCI): APCI is a powerful, noiseless method that completes tasks with minimal disturbance. For less polar or nonpolar substances with smaller molecular weights, this is the preferred technique.
- Although not as often utilised as ESI and APCI, atmospheric pressure photo-ionization (APPI) has its uses. Its reduced sensitivity in comparison to other approaches is its main drawback.

The Latest Developments in Ionisation Methods

Ionisation techniques are no different—innovation never ends. The following are a few of the newest technologies available:

- UniSpray: Waters Corporation introduced UniSpray, which takes advantage of the Coanda and vortex effects to facilitate droplet dissolution and break-up. It resembles ESI on an elevated level.
- The Electrospray Ionisation intake (ESII) is a novel technique that involves applying a voltage to a metal union that joins a section of fused silica tubing placed into a mass spectrometer's heated intake tube to tubing from a solvent supply system. It's as inventive and effective as the Tesla of ionisation techniques.

CONCLUSION

Although LC-MS technology has advanced significantly, its path is far from done. With ongoing developments in hardware capabilities, data analysis software, and ionisation methods, LC-MS is poised to further transform the pharmaceutical sector. It's more than simply a tool; it's a spark that propels advancement in the search for safer and more potent medications.

Looking it up, the efficiency, sensitivity, and selectivity of method development have been greatly improved by recent developments in LCMS hardware, software, and techniques. Advanced mass spectrometry technology, powerful software tools, and creative approach development tactics have come together to create a platform for more robust and dependable mass spectrometry analysis in a variety of applications. To further develop LCMS technology and methodology, solve current issues, and open up new avenues for analytical chemistry research and applications, more research is necessary.

ACKNOWLEDGEMENT

The authors would like to thank Dr. Y. Srinivasa Rao, Professor & Principal of Vignan Institute of Pharmaceutical Technology for encouraging us to work on this interesting topic.

ABSTRACT

This research critically investigates the differential effects of male and female social media influencers on brand awareness within the fashion sector, with a focus on gender as a moderating element. The study, utilizing the theoretical frameworks of celebrity endorsement and consumer behavior, reveals notable gender-based differences in the impact of critical traits such as expertise, trustworthiness, beauty, and information quality on brand awareness. The results indicate that trustworthiness is a more significant component in augmenting brand awareness for male influencers, while attractiveness is essential for female influencers. These findings highlight the imperative for firms to implement gender-targeted influencer marketing tactics to enhance customer engagement and brand visibility. This study enhances comprehension of influencer marketing dynamics in the fashion industry by providing detailed insights into the impact of influencer gender, having practical implications for brand management.

Keywords: Social media influencer, female influencer, male influencer, brand awareness, fashion industry, moderation

Ayash Manzoor *et al.*,

INTRODUCTION

Influencer marketing has emerged as a potent weapon in the fashion industry as a result of the revolution in the way brands interact with consumers that has been facilitated by the proliferation of social media (Sharabati *et al.*, 2024; Rutter *et al.*, 2021). Influencers, who frequently have substantial followings on platforms like Twitter and Instagram, collaborate with brands to increase visibility and awareness (Lou & Yuan, 2019). The gender dynamics involved in influencer marketing have not been fully understood, despite the extensive exploration of its effectiveness. In the context of fashion, where visual aesthetics and personal identity play crucial roles, the gender of the influencer may wield significant influence over brand perception and engagement (Andika *et al.*, 2024; Gupta *et al.*, 2024). Research has demonstrated variations in consumer behavior and response based on the gender of both the influencer and the audience (Djafarova & Rushworth, 2017). However, comprehensive studies comparing the differential impact of male and female influencers within the fashion industry are lacking. Gender as a moderating variable may interact with other factors, such as content style, audience, demographics, and cultural context, to produce nuanced effects on brand awareness (Khamis *et al.*, 2017). Understanding these dynamics is essential for fashion brands aiming to optimize their influencer marketing strategies. This study aims to explore the differential impact of male and female influencers on brand awareness in the fashion industry, employing a moderation approach. Specifically, it will investigate how gender interacts with various factors to influence consumer perception, engagement, and ultimately, brand awareness.

Review of Literature

Fashion Influencers

Fashion influencers (FIs) are individuals with a substantial following across many social media channels. They actively produce and distribute fashion-related content, so exerting considerable influence on the views and purchase choices of their followers. Chetioui *et al.* (2020). The research by Lee and Youn (2021) investigated the impact of fashion influencers on brand awareness and memory development. The study's findings highlighted that fashion influencers may enhance the recognition and recall of fashion brands through the creation of relevant and engaging content. The study emphasized the importance of employing influencer collaboration as a tactic to increase brand visibility.

Gender Differences in Influencer Impact

Several studies have investigated the influence of gender in the impact of influencers on brand awareness. Al-Shehri M. (2021) found that female influencers were more effective in stimulating purchase intention among female consumers, while male influencers had a stronger impact on male consumers. This suggests that gender alignment between influencers and target consumers can enhance brand awareness. Moreover, research by La Tupikovskaja-Omovie *et al.* (2020) using eye-tracking techniques revealed that male and female consumers focused their attention differently when exposed to fashion advertising featuring male or female influencers. This indicates that the gender of the influencer can significantly influence consumers' cognitive and visual processing of brand information, thereby affecting brand awareness. Consumer attitudes and perceptions toward celeb endorsements are often molded by gender stereotypes. (Kanwal *et al.*, 2022) suggest that men are generally more inclined to engage with the web for functional tasks and entertainment, whereas women are more likely to use it for shopping purposes. Additionally, their study found that men tend to have more favorable attitudes toward online advertising than women. The effectiveness of male celebrity endorsements has been particularly evident in promoting products traditionally associated with masculinity, such as sports gear or men's grooming products. Erdogan *et al.*, (2001) found that male celebrities are often viewed as credible and aspirational figures by both male and female consumers, leading to positive evaluations of the brand and increased purchase intentions. Similarly, female celebrity endorsements have been shown to significantly influence consumer attitudes, particularly for products associated with femininity, such as cosmetics or fashion items. Macheka *et al.* (2024), highlighted the unique effectiveness of female endorsers in shaping consumer perceptions of beauty, style, and personal identity, particularly among female audiences. As a result, their endorsements tend to have a positive effect on brand awareness and consumer behavior.

**Expertise**

Social media influencers with competence have proven superior leadership of opinion compared to those without expertise (Nadanyiova *et al.*, 2020). According to McQuarie *et al.* (2012), Expertise refers to an individual's superior knowledge and experience in making informed product decisions or choices compared to others. When an influencer demonstrates professional understanding regarding the product they are advocating, the social media audience will perceive this as a demonstration of refined taste as opposed to a simple personal remark or opinion (Ki & Kim, 2019). The hypothesis based on the preceding studies is as follows: H1: Expertise of the influencer has a significant impact on brand awareness.

Trust worthiness

Trustworthiness, defined as the perceived honesty and reliability of a communicator (Erdogan, 1999), is a key factor contributing to the credibility of social media influencers (SMIs) (Balaban *et al.*, 2019). According to Erdem *et al.* (2006), consumers tend to associate trustworthy brands with higher product or service quality, which in turn fosters positive evaluations of the brand. Similarly, research by Bazaarvoice (2018) highlights that consumers place greater value on influencers who are open about their relationships with brands, particularly when they disclose sponsored content. Such transparency enhances the influencer's credibility and trustworthiness. Choi and Rifon (2012) argue that when influencers are perceived as trustworthy, consumers are more likely to extend that trust to the brands they promote. Manzoor *et al.* (2023) also found that an influencer's perceived trustworthiness has a significant impact on consumers' intentions to make a purchase. Matin *et al.* (2022) further note that brand-specific disclosures, such as those indicating paid partnerships, improve how trustworthy an influencer appears to the audience. This enhanced trustworthiness acts as a mediator, influencing consumer behavior, including their intent to purchase and their overall perception of the influencer. For this reason, the hypothesis made is; H2: Trustworthiness of the influencer has a significant impact on brand awareness.

Attractiveness

A person's physical beauty is related to their appearance: How pleasant or unappealing is the source? Beauty is typically characterized as "the degree to which a stimulus person's face characteristics are pleasurable to see," as stated by Patzer (1983). Dholakia and Sternthal (2007) state that if the Influencer and the brand are both appealing, it can boost the endorsement's efficacy and positively affect brand awareness. Assessing how well the Influencer's charisma meshes with the tastes of the intended consumers is crucial. According to AlFarraj *et al.* (2021) and Chekima *et al.* (2020), influencer credibility is based on three main factors: expertise, honesty, and beauty. Businesses can interact with potential clients using influencers' attractiveness as a point of reference (Chekima *et al.*, 2020). The physical attributes, adoration, charisma, and athletic prowess of an influencer are all factors that contribute to their overall appeal (AlFarraj *et al.*, 2021; Torres *et al.*, 2019). Glucksman (2017) argues that in order to develop consumer-brand relationships, social media influencer marketing is essential. Why? Because following the lead of an idolized influencer is associated with increased brand loyalty among consumers (Grohmann, *et al.*, 2013). By enticing social media influencers to participate in social media brand campaigns, brands may boost satisfaction, trust, loyalty, and image with potential customers through direct interactions (Wiedmann & von Metenheim, 2020 ; Glucksman, 2017). The following theory is put out in light of the above reasons: H3: Attractiveness of the influencer has a significant impact on brand awareness.

Information Quality

Information quality refers to the accuracy, completeness, relevance, and reliability of the information provided to consumers. Research by Bhattacharjee and Sanford (2006) suggests that higher information quality leads to higher perceived credibility. When consumers perceive information about a brand as accurate, reliable, and relevant, they are more likely to develop a positive perception of the brand, leading to increased brand awareness. Information quality also influences consumer decision-making processes. Research by Flavián *et al.* (2006) indicates that consumers rely on high-quality information to gather knowledge and make informed decisions. When consumers are exposed to comprehensive and accurate information about a brand, they are more likely to consider the brand during their decision-making process, thus increasing brand awareness. Therefore the following hypothesis is proposed H4:

**Ayash Manzoor et al.,**

Information Quality of the influencer has a significant impact on brand awareness. Moreover, the gender of influencers, in particular, may present an intriguing moderation effect in these relationships. While studies have explored the influence of gender in traditional advertising (Eisend, 2010), the specific interplay between gender and influencer attributes within social media contexts remains an uncharted area. This study aims to explore this critical intersection, examining how the gender of social media influencers moderates the relationships between Expertise, Trustworthiness, Attractiveness, Information Quality, and Brand Awareness. Thus, the proposed hypothesis is H5: The gender of social media influencers moderates the relationship between Expertise, Trustworthiness, Attractiveness, Information Quality, and Brand Awareness, such that these attributes affect Brand Awareness differently for male and female influencers.

RESEARCH METHODOLOGY

To address the goal of this study, a quantitative research methodology was utilised. For this study, both primary and secondary data were used to analyse the differential impact of male and female fashion industry influencers on Brand Awareness. The secondary data obtained from both foreign and domestic journals. The primary data were acquired using self-administered questionnaires and distributed to respondents.

Research framework

The study employs the source credibility and source attractiveness models to establish its conceptual framework in accordance with its research aims. The source credibility model, first introduced by Hovland *et al.* (1953), suggests that the credibility of a source is determined by two main factors: perceived knowledge and trustworthiness. Expanding on this framework, McGuire (1985) proposed the source attractiveness model, which emphasizes the significance of source attractiveness or likability as an extra factor in determining source trustworthiness. Ohanian (1990) elaborated on these models in relation to celebrity endorsements, highlighting that source credibility encompasses knowledge, trustworthiness, and attractiveness. In addition, another factor that influences brand awareness is the quality of information (Dao *et al.*, 2014). The impacts of social comparison, trust, tie strength, and network homophily on brand-related outcomes such as brand recognition, brand engagement, brand commitment, and membership intention are investigated in Phua *et al.*'s (2017) study. By merging them all together, the conceptual framework is constructed shown in figure 1.

Research Instrument and Pilot Study

The survey was divided into two parts. The initial half of the survey examined the socio-demographic traits of the participants and the individuals who affect them, specifically their gender. The subsequent part of the questionnaire assessed the residents' impression of the influence of social media influencers on Brand Awareness. Participants were instructed to evaluate 21 statements using a 5-point Likert scale ranging from 1 to 5, where a rating of "1" indicated "strongly disagree" and a rating of "5" indicated "strongly agree". The scale comprises two primary factors, namely Influencer Attributes and Brand Awareness. The exogenous variable Influencer Attributes comprises four first-order reflective constructs: Expertise, Trustworthiness, Attractiveness, and Information Quality. The scale used to assess source credibility, which includes expertise, trustworthiness, and attractiveness, was adapted from Ohanian (1990) and adjusted for the current study. To measure information quality, the scale developed by Cheung (2012) was employed. The variable Brand awareness is an endogenous construct of first-order reflection. To get to the meat of the study, it was lifted from Fernando's 2020 research. Ten research scholars, two academics, and six professionals from the business world tried out the tool first. In order to determine the instrument's reliability, 25 participants in the pilot research filled out the questionnaire after it had been pre-tested. Each construct's dependability was far greater than Nunnally's (1978) suggested threshold of 0.70.

Study Settings and Sampling Design

The study was conducted in the Union Territory of Kashmir, India, focusing on the picturesque Kashmir Valley. Data collection involved the distribution of 365 questionnaires among respondents in the region. The sampling method

**Ayash Manzoor et al.,**

employed was convenience sampling, selecting participants based on accessibility and willingness to participate (Bhat et al., 2023 ; Trochim 2021). From the distributed questionnaires, 220 were deemed valid for further analysis. This subset forms the basis for exploring the relationship between social media influencer attributes and their impact on Brand Awareness.

Sample size calculation with G* Power Analysis

G* Power software was used to perform power analysis, to confirm that the sample size is adequate for multiple regression; The analysis used these settings:

Effect size, denoted as f^2 magnitude relates to a medium 0.15 effects of numerical nature The level of significance (α) is set at 0.05 It is the complement of type II error likelihood Beta (β), equals 1 and itself expressed as in numbers, power = 0.80 Count of predictors: 5.

The formula is as follows:

$N \geq (\text{Power} - \text{Alpha}) (\text{Effect Size} + \text{Number of Predictors})$ So we did a G* Power analysis for this and found out that 92 subjects to show a medium effect. As for the present sample size (i.e., 220 responses), previous studies indicated that it is sufficient to detect an effect size of medium magnitude with a high level of statistical power, based on common guidelines (Cohen, 1988; Faul et al., 2009).

DATA ANALYSIS AND RESULTS

Data screening is an essential step before proceeding to further multivariate analysis. Finding out if there is a missing value, an unengaged response, or an outlier requires the correct data screening (Gaskin, 2017). So, all the data was run through a frequency test in the Statistical Package SPSS 20.00, and there were no outliers found. This descriptive analysis provides an overview of the respondent's demographic profile, shedding light on important characteristics such as Gender, monthly income, age, social media usage etc. The results of demographic characteristics are summarized in table I. The data primarily showcases a young, educated demographic, with 72.72% being students, most aged between 18-34 years. A significant 90.90% use social media daily, with Instagram being the preferred platform for 55%. The primary fashion interest lies in clothing and apparel at 65%. Therefore, marketing efforts targeting this group would likely be most effective on Instagram, emphasizing clothing and apparel trends.

Reliability Results

Zigmond (1995) defines reliability in terms of internal consistency "which is the instrument's ability to correlate with other items on the sample scale that measure the same construct". Cronbach's alpha coefficient was used to determine the reliability of the instrument. A Cronbach's alpha of 0.70 or more (Nunnally, 1978) indicates that the measuring scale employed to quantify a construct is moderately dependable. The reliability test results are summarized in Table II below.

Measurement Model

There was a finding that the item loadings in the measurement model were higher than the permissible limit of 0.60. According to Chin (1998). We used Composite Reliability (CR) and Average Variance Extracted (AVE) to check if the components were valid and convergent. Values greater than 0.07 and 0.50, which are the recommended thresholds (Hair et al., 2006), indicate convergent validity. After that, we checked for discriminant validity. When the square root of each concept's average variance extracted (AVE) is larger than its correlation coefficient, discriminant validity is proven (Fornell & Larcker, 1981). Table V shows all of the CFA's results. According to the results of the model fit analysis, the data matches the model very well: At the 0.000 level of probability, we find the following: RMSEA=0.072, $\chi^2=382.358$, $df=178$, CFI=0.948, IFI=0.949, TLI=0.939, GFI=0.836, and AGFI = 0.805.

Tables III and IV contain a summary of the results regarding the reliability, convergent validity, and discriminant validity of the tested constructs, as well as the extensive outcomes of the Confirmatory Factor Analysis (CFA).

**Ayash Manzoor et al.,****Hypotheses Testing**

Next, we will use structural equation modeling (SEM) to assess the proposed hypotheses after confirmatory factor analysis is finished. With an χ^2 value of 382.358 and 178 degrees of freedom, the model's findings show that the data and the model are well-fit. We have a lot of faith in the fit because the likelihood level is so low at .000. A satisfactory match is indicated by the CMIN/df ratio of 2.148. All three fit indices 0.948 for the comparative fit index, 0.949 for the incremental fit index, and 0.939 for the Tucker-Lewis index point to a good match. Fit is moderate, according to the goodness-of-fit index (GFI) of 0.836 and the adjusted goodness-of-fit index (AGFI) of 0.805. With an RMSEA of 0.072, we can say that the relationship is rather well-fitted. There is a favorable correlation between influencer knowledge, trustworthiness, attractiveness, and information quality and brand awareness, according to the research. All four of these components' beta coefficients 0.195, 0.261, 0.242, and 0.175 have p-values below 0.05. These results are shown in Figure 2. Therefore, H1, H2, H3, and H4 were all supported by the investigation's findings. Table V summarizes the results of the hypothesis tests.

Moderation Results

The current study examined the moderating effects of persuasion, specifically whether male or female influencers moderate the link between influencer qualities and brand awareness. The participants were surveyed regarding their susceptibility to persuasion and were divided into two groups: male influencers (n=113) and female influencers (n=107). The initial analysis involved running the model for male influencers. The findings indicated that Influencer Trustworthiness had the greatest impact ($\beta_1 = 0.320$, $p < 0.05$), followed by Influencer Attractiveness ($\beta_2 = 0.252$, $p < 0.05$), Influencer Expertise ($\beta_3 = 0.249$, $p < 0.05$), and Influencer Information Quality ($\beta_4 = 0.208$, $p < 0.05$) (Figure 3). The results of the model for female influencers indicated that Influencer Trustworthiness had the highest impact ($\beta_1 = 0.268$, $p < 0.05$), followed by Influencer Attractiveness ($\beta_2 = 0.255$, $p < 0.05$), Influencer Expertise ($\beta_3 = 0.223$, $p < 0.05$), and Influencer Information Quality ($\beta_4 = 0.149$, $p < 0.05$) (Figure 4). The study's results indicate a significant disparity between the attractiveness of female influencers and the expertise of male influencers, as determined by testing for crucial ratio differences ($p \text{ value} < 0.05$).

DISCUSSION AND CONCLUSION

This study focuses on the distinct effects of male and female influencers on brand awareness in the fashion industry. It emphasizes four crucial factors: influencer expertise, trustworthiness, attractiveness, and information quality (Sokolova & Kefi, 2020; Lou & Yuan, 2019). The impact of male and female influencers on brand awareness varies based on gender. Sokolova and Kefi (2020) found that trustworthiness is a significant factor for male influencers. This suggests that reliable male influencers exert a stronger impact on brand awareness. Trustworthiness was the primary factor, while expertise, attractiveness, and information quality played a secondary role in contributing positively. Female influencers experienced a significant impact on brand awareness through attractiveness, while trustworthiness continued to hold its importance, highlighting its universal significance (Lou & Yuan, 2019). Djafarova & Rushworth (2017) also noted the significance of expertise and information quality, albeit with less prominence than male influencers. The results indicate that audience reactions to influencers vary depending on gender. Audiences tend to judge female influencers more on their attractiveness, while evaluating male influencers more on their expertise. De Veirman et al. (2017) highlight the importance of brands implementing gender-specific influencer strategies.

Practical Implications

Fashion brands should consider using strategies tailored to specific genders when choosing and partnering with influencers. Male influencers should prioritize demonstrating their expertise and credibility (Freberg et al., 2011). When targeting female influencers, it is important for campaigns to focus on visual appeal and aesthetics in order to leverage their attractiveness. Establishing trust is crucial for brands when partnering with influencers. Selecting influencers known for their authenticity and credibility is crucial, instead of concentrating solely on their follower count (Schouten, Janssen, & Verspaget, 2020). Furthermore, content quality is of utmost importance. Research

**Ayash Manzoor et al.,**

suggests that male influencers are well-suited for providing in- depth product reviews and valuable insights. On the other hand, female influencers excel in creating visually appealing content and captivating narratives (Godey et al., 2016). Brands can enhance their strategies by creating an influencer matrix to assist in selecting the most suitable influencers for their campaigns. This matrix will help ensure that the chosen influencers align with the brand's specific goals, whether it is to showcase expertise through male influencers or to attract attention visually through female influencers (Jin, Muqaddam, & Ryu, 2019). Finally, it is crucial for brands to remain aware of the ever-changing trends in influencer marketing. It is important to regularly update and adapt influencer strategies in order to maintain effectiveness in this ever-changing landscape (Godey et al., 2016). Overall, gaining a thorough understanding and strategically implementing the varying effects of male and female influencers can greatly improve brand awareness campaigns within the fashion industry.

Limitations of the Study

While the study offers insightful information, it should be noted that it has significant limitations. Firstly, the findings are contingent on the characteristics and behaviours of the specific sample of participants, potentially leading to sample bias. Generalizing these findings to broader populations might not capture the full spectrum of consumer and influencer dynamics. Additionally, the study's focus on the fashion industry could limit the applicability of its conclusions to other industries, where distinct influencer dynamics might prevail. Furthermore, contextual factors such as cultural variations, regional preferences, and evolving consumer behaviors might not have been fully considered.

Future Recommendations

To advance the understanding of this field, several avenues for future research can be explored. Longitudinal studies tracking the evolving impact of male and female influencers over time could reveal dynamic trends and changes. Expanding the investigation beyond the fashion industry to compare results across different sectors would provide a more comprehensive view of gender-based influencer effects (Schouten, Janssen, & Verspaget, 2020). Delving deeper into audience segments and their preferences would uncover nuances in how distinct consumer groups respond to influencer messaging. The role of influencer authenticity, the impact of different content types, and the influence of cross-cultural variations could all be subjects of fruitful investigation (Lou & Yuan, 2019). Moreover, analyzing the long-term consequences of influencer trustworthiness on brand-consumer relationships and examining how influencer impact translates into actual purchase behavior could provide a more comprehensive understanding of the overall influencer marketing landscape (Sokolova & Kefi, 2020). By recognizing these shortcomings and considering new avenues for investigation, we may keep improving our comprehension of the intricate dynamics at play in influencer marketing, ultimately leading to more effective and nuanced strategies for brands in the fashion industry and beyond.

ABSTRACT

Pharmaceuticals of Siddha medicine is a well evolved branch and terrific emphasis is laid at the drug preparation and dosage forms. The health practitioner themselves by way of preparing the drugs and consequently had know-how approximately components and processing techniques. Each of the dosage shape that advanced no longer only address the factors like preservation, bioavailability, palatability but additionally extracing the preferred constituent from the uncooked material. Honey preserve is one of the maximum appreciated and valued herbal products added to humans considering that historical times. Honey is used no longer simplest as a nutritional product however also in health defined in conventional Siddha medicine. Some of the herbs vegetation, fruits, nuts and rizhomes are higher healing efficacy and their to be had only in season with a view to lead them to available for consumptions even in non seasons, they need to be preserved well via appropriate techniques. The ones which might be preserved on Honey have self life of 12 months.

Keywords: Honey preserve, Thenural, Siddha, Antioxidant, Honey.

INTRODUCTION

In Honey Preserve drugs like Ginger, Indian gooseberry, Terminalia chebula are Blanched in warm water. Pores are made in it after which soaked in Honey. They will additionally be soaked in sugar syrup or Honey. A number of the herbs flora, fruits, nuts and rizhomes are higher therapeutic efficacy and their to be had only in season as a way to cause them to available for consumptions even in non seasons, they have to be preserved well by means of appropriate techniques. Those which can be preserved in the salt solution, plant juices and the fruit juices are known as pakkuvam and people that preserved in the sugar syrup or Honey primarily based called Honey Preserve [1].32 styles of dosage form are lay down for oral drugs for every of dosage form have self lifes[2]. Honey preserve have selflife 12 months. This procedure of improvement resulted in use of temperature, pressure, catalyst appropriate combination of the Synergetic and antagonists ingredients.

METHOD OF PREPARATION

Big, matured, smooth and top fine culmination veggies elements are choosen and for making thenooral (Honey preserve) first unique styles of fruits/greens parts peeled or unpeeled are boiled in water and softened. The base of sugar or Honey of required to consistency is separately made. Thereafter the boiled fruits vegetable parts are soaked within the base for twenty-four hours. Next day if the base remains thin than required consistency and it is once more boiled until the specified consistency received. In Honey preserve, preserved Honey is an essential components as preservative and also posses dietary value.[2] Honey (thean) is a natural product it's far formed from nectar of flora by way of honeybees (Apis mellifera; own family: Apidae)[3]. Honey has been used by people on account that 5500 years [4]. Honey is a aggregate of Sugars and other compounds Honey additionally incorporate any quantity of numerous compounds to function as antioxidants which include chrsine, pinobanksin, Vitamin C, catalyse and pinocembrin[60- 73]. The unique composition of any batch of honey relies upon on the flowers available to the be as that produce the honey generally Honey evaluation display fructose-38.2 percent, glucose 31.3 percent, sucrose 1.31 %, maltose 7.1 percentage, water 17.2%, highest sugar 1.5 percent, ash 0.2 percent, different undetermined 3.2 percentage.Honey natural preservative Honey whilst appearing to be a liquid simply has very low water content material it consequently can keep the increase of water preferring bacteria are there that has been some medical research indicating the honey creates what's called speak the year against bacteria and the contamination which means that it create sticky barrier among itself .This chemical is constructed from activity from the enzyme glucose oxidase, which is clearly present in honey. This response occur more regularly in honey that has been kept out of direct sunlight. consequently whilst we are the usage of honey as a preservatives we a have to make sure Honey used as spent as plenty of its lifetime life span faraway from direct light resources.

Honey, while being capable of prevent bacteria invasion may be susceptible to damage through the fermentation due to better sugar content material certainly occurring in it. The fermentation process whilst, in the flip another substances that the honey is mixed with that fermentation procedure may be averted by way of making use of heat to Honey earlier than use. Even though there may be also some medical evidence to indicate that heat handled Honey is less powerful as preservatives than unprocessed Honey. The reasoning at the back of this it warmness gift inside the light that slows peroxide activity and not light itself [4,5].Instance Inji thenural (Zinger preserve), Nellikkai thenural (Phyllanthus emblica) kadukkai tenural (Terminalia chebula preserve) storage thenural are usually to be preserved in dry and a smooth Glass jar porcelain boxes under stored in hygienic circumstance in clean and dry locations. Maximum historic populace, including the Greeks, chinese, Romans, and Babylonians, Egyptians having a honey as each for dietary ambitions and for its medicinal uses.[Honey is the insect-derived herbal product, and it has therapeutic, dietary, cosmetic and therapeutic values Honey is a balanced weight loss plan for both male & woman in every age[6,7]. Honey no wishes to refrigerate, it in no way spoils, and it can additionally be hold at room temperature in a dry place [8,14] .The water interest of honey is among 0.56 and 0.62 and its value of pH is 3.9.Honey became utilized as a natural sweetener from it has high stage of fructose (honey is 25% sweeter than sugar)[16]. Furthermore, using honey in liquids [17]. Now a days, information on evidence suggests that honey can exert several

Elavarasi *et al.*,

health-useful results together with antioxidant, anti-diabetic, anti-bacterial, respiration, gastrointestinal, cardiovascular, and fearful protective effects[18-30].

The Lord has inspired the bees, to build their hives in hills, on timber, and in man's habitations, from inside their bodies comes a drink of various colors, in which is healing for human kind. Three hundred forms of honey have been recognized[33-40].

Nutritional And Non Nutritional Additives Of Honey

Major composition of honey is carbohydrates that make a contribution ninety five–ninety seven% of its dry weight. Moreover, honey consists of primary compounds, such as including eye sicknesses, bronchial asthma, Cough, throat infections, tuberculosis, thirst, hiccups, fatigue, dizziness, constipation, worm infestation, piles, eczema, recovery of ulcers, and wounds and honey used as adjuvant for drug management of medicine in conventional siddha remedy.[1,2,3,40-43] proteins, vitamins, amino acids, minerals, and organic acids pure honey also consists of flavonoids[44-48], polyphenols, lowering compounds, alkaloids, glycosides, cardiac glycosides, anthraquinone, and unstable compounds. Monosaccharides (fructose and glucose) are the most critical sugars of honey and may be contributed to the maximum of the nutritional and physical results of honey. similarly to monosaccharides, smaller quantities of disaccharides and oligosaccharides are found in honey . A lot of these sugars are formed throughout the honey ripening and maturation instances. Gluconic acid, a made of glucose oxidation, is the principle organic acid that is present in honey; in addition, small amounts of acetic acid , formic acid, and citric acid have been observed. It was used in treatment of several cancer [49-56] Those natural acids are chargeable for the acidic (pH between 3.2 and 4.5) assets of honey. Honey additionally consists of some essential amino acids, such as all 9 essential amino acids and all nonessential amino acids besides for asparagine and glutamine. Proline was suggested as the primary amino acid in honey, followed by different kinds of amino acids. Enzymes (diastase, invertases, glucose oxidase, catalase, and acid phosphatase) represent the primary protein substances of honey. Maximum of the water-soluble nutrients found in honey, with vitamin C. 31 variable minerals had been present in honey, along with all the most important minerals, together with phosphorus, sodium, calcium, potassium, sulfur, magnesium, and chlorine . Many critical trace additives like silicon (Si), rubidium, vanadium, zirconium, lithium, and strontium. Heavy metals including lead (Pb), cadmium (Cd), and arsenic (As) are gift as pollution.[35] previous studies have detected the about six hundred risky compositions in honey that make a contribution to its potential biomedical results. The volatile compounds of honey are generally low however encompass Flavonoids and polyphenols, which act as antioxidants, are two most important bioactive molecules present in honey. Latest proof has proven the presence of almost thirty styles of polyphenols in honey [57-65] .

ABSTRACT

The present study delves into the intricate web of ethnomedicinal knowledge held by the tribal communities residing in the remote landscapes of Pali district, Rajasthan, India. Conducted in 2021, the investigation aimed to document the indigenous utilization of medicinal plants, extending its reach across different seasons to capture a comprehensive spectrum of traditional remedies. Local inhabitants, seasoned elders, traditional herbalists and local vendors shared their insights, interwoven with the threads of ancient practices. The study amalgamated this experiential wisdom with literary consultations, revealing a diverse range of botanical solutions to various health challenges. The exploration encompassed remedies for fever, gastrointestinal disorders, skin ailments, kidney issues and respiratory infections. Each chapter unraveled the botanical identities, vernacular nomenclature, plant parts harnessed and methods of application. This revelation highlights the profound relationship between humans and their botanical companions, showcasing nature's role not only as a resource but also as a collaborator in healing. Ultimately, this study underscores the harmonious coexistence of traditional wisdom and contemporary inquiry, creating a bridge between the past, present and an enriched future of healthcare interwoven with nature's bounty.

Keywords: Ethno medicinal Knowledge, Tribal Communities, Traditional Remedies, Indigenous Medicinal Plants, Healthcare Traditions

INTRODUCTION

The progress and evolution of human civilization have long been intertwined, both consciously and unconsciously, with the natural environment, particularly the world of plants. Primitive societies, deeply connected to nature, heavily relied on their surroundings for survival. Through a process of trial and error, they acquired knowledge about the economic and medicinal properties of various plants. This indigenous knowledge became an integral part of the lives of communities dependent on their natural surroundings, particularly the tribal people, also known as Adivasis in India. Ethnobotany is a multidisciplinary field that demands proficiency in several areas, including botanical expertise for the proper identification and preservation of plant specimens, anthropological knowledge for comprehending cultural concepts around the perception of plants and linguistic competence for transcribing local terms and understanding native morphology, syntax and semantics (Anderson *et al.*, 2012). However, gaining precise knowledge from native healers can be challenging, as they may be hesitant to share their knowledge with outsiders. The world exhibits a vast diversity of biological resources and only a fraction of this potential has been explored. In certain regions, conserving natural biodiversity may be more beneficial than utilizing land for activities such as pasture or timber extraction. Identification of medicinal plants can be achieved through diverse methods, such as random screening, taxonomic sampling, or ethnobotanical collecting (Mulder and Coppolillo, 2005). Investigations have demonstrated that compounds derived from ethnobotanical research exhibit greater potency than those obtained through random screening, highlighting the high potential for product development.

Rajasthan is the largest state in India, with a population of approximately 12.44% belonging to various tribal communities such as Bhil, Bhil-Meena, Damor, Dhanka, Garasia, Kathodi, Kokna, Kolidhor, Naikara, Patelia, Meena and Seharja who reside in remote areas with limited access to basic infrastructure facilities (Sharma *et al.*, 2011). The state is also home to several nomadic tribes such as Banjara, Gadolia-Lohar, Kalbelia, Sikligar, Kanjar, Sansi and Bagri, which further enhance its ethnic heritage. These ethnic groups maintain close communication with one another, resulting in the sharing of ethnobotanical knowledge. In the southern Pali district of Rajasthan, India, a comprehensive exploration of plants possessing ethnomedicinal importance has revealed a wealth of traditional knowledge practiced by various tribal communities (Figure 1). These practices are documented in a study focusing on the herbal formulations employed by tribes in the region. The study highlights a diverse range of plant species and their medicinal uses within these indigenous communities. Among the documented plants, *Azadirachta indica*, commonly known as Neem, is utilized for its leaves in the form of poultices applied locally. This practice is particularly common among the Sahariya, Bhil, Kalbelia and Meena tribes. Similarly, the roots of *Calotropis procera* have been identified to be applied locally, with the plant being recognized among the Kalbelia and Garasia tribes. The *Areca catechu* plant holds significant importance, with its bark and flower tops being formulated into a juice infused with asafoetida. This preparation finds use among the Sahariya tribe. Another noteworthy plant is *Tecomella undulata*, whose bark and branches are chewed among the Bhil and Garasia tribes (Sharma and Kumar, 2011). The current investigation diligently undertook extensive efforts to gather and document the invaluable ethnomedicinal knowledge held by the tribal communities residing in the Pali district of Rajasthan. This endeavor was driven by a commitment to uncover, understand and preserve the traditional healing practices and remedies that have been passed down through generations within these indigenous populations. Through a combination of immersive fieldwork, participatory interactions and insightful observations, a comprehensive repository of ethnomedicinal information was compiled, reflecting the deep-rooted wisdom of the tribal peoples in the region.

MATERIALS AND METHODS

Study Area

The Pali district is situated between latitudes 24.45 to 26.29 North and longitudes 72.47 to 74.18 East (Figure 2). It shares its borders with eight districts of Rajasthan, creating a connection with various regions. To its north lie Nagaur and Jodhpur districts, while its southeastern boundary is shared with Udaipur and Rajasmand districts. Adjacent to the northeast is the Ajmer district, while its western border touches the Barmer district. Further, Sirohi and Jalore

**Sarika et al.,**

districts are positioned to the south and west, respectively. The district spans a total geographical area of 12,387 square kilometers. The climatic conditions of the study area, Pali district, demonstrate the arid to semi-arid nature of the region. The combination of high temperatures and low rainfall during certain periods of the year reflects the desert-like conditions that Rajasthan is known for. The reliance on the monsoonal rains for sustaining agriculture and water resources is evident from the observed rainfall patterns. The variations in relative humidity and temperature underscore the distinct seasons experienced by the region, with hot summers and relatively milder winters.

Survey

The majority of the surveys were conducted in the southern region of Pali district (mainly Bali tehsil), along with its neighboring areas in Rajasthan. In addition to the surveys, supplementary information was collected from secondary sources within the study area. The surveys conducted in the study area followed two primary approaches: intensive surveys involving in-depth examinations of one or two villages over a span of about a week and extensive surveys encompassing multiple villages or localities within the radius of a selected village-camp. The data collection process involved a combination of interviews, observations and active participation. According to the India census of 2011, the population of Bali stood at 19,880 individuals. Among this populace, males make up 50.67% (10,007), while females constitute 49.33% (9,873) of the total. Bali's average literacy rate is recorded at 64.28%, which falls below the national average of 74.04%. Specifically, 74.51% of males and 53.91% of females are literate. Notably, 11.72% of the total population is under the age of 6. Back in 1897, the population of Bali was around 6,000. The demographic makeup of Bali is primarily characterized by the Jain and Marwadi communities, which are also the most prosperous segments. However, a considerable number of individuals from these communities have relocated to various parts of India, engaging in business activities. Their visits to their ancestral town, such as Bali, are often centered around family marriage ceremonies. During the study, interviews were categorized into two types: individual and group interviews. In the case of individual interviews, people were chosen randomly while on the move or upon entering huts, engaging with knowledgeable individuals from the village alongside figures like the headman (Figure 3). Group interviews involved interacting with multiple individuals simultaneously after explaining our purpose. Despite initial hesitations from women, their active participation gradually emerged. These interviews were strategically conducted in diverse locations, including forest environments where tribal members were encouraged to discuss plant species' utility, particularly in group settings. Valuable insights were also gained from interviews held at the headman's hut or communal areas. Interviews at work sites were usually brief due to the tribal members' work commitments.

RESULTS AND DISCUSSION

To comprehensively document the utilization of indigenous medicinal plants, an extensive survey was conducted in the remote regions of Pali district, Rajasthan, India, throughout the year 2021. The survey was meticulously designed to encompass diverse seasons, thereby facilitating the collection of a wealth of information. The indigenous knowledge concerning the medicinal properties of native plants was systematically gathered through interactions with a range of sources, including local residents, seasoned elders from rural communities, practitioners of traditional herbal medicine and local vendors specializing in herbal remedies (Figure 4). This holistic approach ensured a comprehensive understanding of the plants' applications. The gathered insights were further substantiated by referencing relevant literature, thus adding a scholarly perspective to the documentation process. By amalgamating experiential wisdom with empirical validation, this endeavor seeks to preserve and share the rich heritage of indigenous plant-based medicine in the Pali district. Extensive documentation has been undertaken to capture the diverse array of plant-based formulations employed by the tribal communities inhabiting the study area. These formulations serve as remedies for a wide spectrum of health issues and are elaborated upon in the subsequent details (Table 1):

Sarika et al.,

Fever And Febrifuge

In the context of treating fever and its related symptoms, several ethnomedicinal plant-based formulations are employed by the local tribal communities (Figure 5). The botanical knowledge handed down through generations unveils a range of valuable remedies harnessing the potential of indigenous flora. One such remedy involves *Azadirachta indica* A. Juss., commonly known as Neem Tree or "Neem" in the local language. The fresh leaves of the Neem tree are harnessed by boiling them in water and the resulting infusion is ingested thrice a day to alleviate fever. Additionally, the practice of chewing 3-4 tender Neem leaves every morning supplements this treatment. *Calotropis gigantea* Linn., referred to as Milkweed or "Safed aak," is another botanical contender for treating fever. This shrub species contributes its flowers for medicinal use. Consumption of a single piece of the Milkweed flower with water is recommended once a day for a span of 3-4 days as part of the therapeutic protocol. The indigenous insights of tribal healers also encompass *Piper longum* Linn., known as Long Pepper or "Pipli." This herbaceous plant offers its fruits as the medicinal component. The traditional method entails immersing the Long Pepper fruits in clarified butter (ghee) overnight, followed by frying them with a dash of salt. The resulting preparation is then chewed, allowing for its potential febrifuge properties to be efficaciously conveyed. Harnessing the attributes of *Saccharum officinarum* Linn., commonly termed as Sugarcane or "Ganna," a distinctive medicinal tea is concocted for addressing fever-related discomfort. This involves the usage of dried ginger, cloves, tulsi leaves, tea leaves, jaggery (sugarcane juice candy) and milk. Consumed before bedtime, this herbal fusion amalgamates the healing properties of its constituents to provide a holistic approach to fever management.

Digestive And Gastrointestinal Disorder

Within the realm of digestive and gastrointestinal disorders, the indigenous knowledge of local tribal communities unveils an array of botanical solutions harnessed from the surrounding flora. These remedies stand as testaments to the intimate relationship between traditional healing practices and the rich diversity of plant life. *Aegle marmelos* (L.) **Correa**, commonly referred to as Wood apple or "Bael," takes center stage as a tree species contributing to these remedies. The fruit of the Bael tree is transformed into a therapeutic agent by being powdered and combined with *Foeniculum vulgare* Mill. (fennel) seed and isubgol. This formulation finds its application in addressing chronic dysentery. *Aerva javanica* (Burm.f.) Shult., known as Desert cotton or "Bui," is a herbaceous plant that plays a role in alleviating stomachache. The root of this plant is reduced to powder, which is then consumed with water, offering a potential remedy for such discomfort. *Aloe vera* (L.) Burm.f., recognized as Aloe vera or "Ganwar patha," is a herbaceous species. In this context, the leaves of the Aloe vera plant are ingested as a vegetable, with the intent of treating constipation. *Calotropis procera* (Ait.) R. Br., identified as Milkweed or "Aak," contributes its gynostegium for medicinal use. A paste of the gynostegium, rendered aqueous, is combined with a few drops of ghee and water. This preparation holds promise in relieving stomachache in children. *Capparis deciduas* (Forsk.) Edgew., known as Bare caper or "Ker," employs its root in addressing the health needs of patients suffering from typhoid. The root is transformed into an aqueous paste, administered with water to impart its potential therapeutic effects. The botanical offerings of *Citrullus colocynthis* (L.) Schrad, colloquially termed Bitter cucumber or "Tumba," are harnessed through dried fruit powder mixed with salt. This mixture is taken with water to mitigate stomachache. Additionally, the combination of dried fruit powder, black pepper and rock salt is used to alleviate constipation. *Crotalaria burhia* Buch.-Ham., referred to as Burhia rattlespod or "Khimp," presents its powdered roots as a remedy for stomachache. This root preparation, when taken with lukewarm water, offers a potential relief from the discomfort. *Cuminum cyminum* L., commonly known as Cumin or "Jeera," is an herbaceous plant whose seeds are employed in a decoction. This concoction, combined with rock salt and lemon juice, is administered to combat stomachache. Harnessing the properties of *Ferula asafetida* Linn., recognized as Asafoetida or "Hing," the latex of the plant is transmuted into a powder. This powder, mixed with water, serves as a massage for the abdomen and is also consumed to alleviate abdominal pain. *Ficus religiosa* L., known as Sacred fig or "Peepal," contributes its knots (stem galls) to address constipation. The dried powder of these knots is taken with water, offering a potential solution to this discomfort. The medicinal potential of *Foeniculum vulgare* Mill., referred to as Fennel or "Saunf," is harnessed through a mixture of its seed powder, Trigonella foenum-graecum (fenugreek) seed powder, F. asafetida (hing) and black salt. This combination, when consumed with water, serves as a means to manage acidity. *Indigofera cordifolia*, commonly termed Heart leaf indigo or "Gokhru," employs its seeds in addressing typhoid. A preparation involving the boiling

92011

**Sarika et al.,**

of seeds and subsequent administration of the filtrate for three days is considered beneficial. *Lawsonia inermis* Linn., known as Heena or "Mehndi," employs its powdered seeds in collaboration with clarified butter. These components are amalgamated into small balls and consumed twice a day to address dysentery accompanied by mucus. *Mangifera indica* Linn., recognized as Mango or "Aam," offers a remedy for children experiencing diarrhea. A paste of crushed mango seed (giri) is combined with water or curd, presenting a potential solution to this discomfort. *Nelumbo nucifera* Gaertn., commonly referred to as Lotus or "Kamal," employs its seeds in a mixture composed of lotus seeds, a small amount of salt, Piper nigrum seeds and lemon juice. This mixture is provided to patients experiencing vomiting. *Polygonum plebeium* R. Br., known as Knotweed or "Lalbuti," employs its entire plant in the creation of a decoction used to address colic complaints. *Sarcostemma viminale* (L.) R. Br., recognized as Milk rope or "Khir-khimp," utilizes its plant extract to manage digestive disorders. *Terminalia chebula* Retz., referred to as Myrobalan or "Harad," utilizes slightly fried fruit powder as a remedy, taken with water. *Trachyspermum ammi* (Linn.) Sprague, commonly known as Carom or "Ajwain," employs a mixture of seed powder, a small amount of *F. asafoetida* (hing) and black salt. This preparation is consumed with water to address gastric problems. Finally, *Zingiber officinale* Rosc., recognized as Ginger or "Adrak," utilizes its rhizome in powdered form, mixed with a small amount of salt and consumed with water to alleviate abdominal pain. These ethnomedicinal practices underline the profound connection between local plant resources and the alleviation of digestive and gastrointestinal disorders within tribal communities.

Cold And Cough

Within the context of addressing diverse health concerns, the indigenous knowledge of local tribal communities draws upon an array of botanical resources, each offering distinctive remedies. *Allium sativum* Linn., commonly known as Garlic or "Lahsun," plays a significant role by utilizing roasted garlic flakes as a therapeutic agent (Figure 6). Administered before bedtime, these flakes are consumed and for children, a blend with jaggery is employed. *Brassica nigra*, recognized as Mustard or "Saron," employs a unique method of administration. Two drops of mustard oil are placed into the nostrils, potentially harnessing its beneficial properties. *Cicer arietinum* L., known as Chickpea or "Channa," utilizes chickpea powder (besan) in its remedy. Roasted and added to milk with sugar, this mixture is consumed before bedtime. *Coriandrum sativum* Linn., commonly referred to as Coriander or "Dhaniya," employs the decoction of coriander seeds in its approach. *Curcuma longa*, recognized as Turmeric or "Haldi," employs the vibrant rhizome. A half teaspoon of turmeric powder, when combined with warm milk, becomes an evening ritual with potential health benefits. *Justicia adhatoda* Linn., known as Malabar nut or "Adusa," capitalizes on its leaves. A decoction made from finely crushed dry leaves, complemented by mishri (sugar candy) and ginger, is ingested thrice a day. *Ocimum sanctum* Linn., commonly referred to as Basil or "Tulsi," takes its flowers into medicinal service. A decoction consisting of 5-6 flowers, along with jaggery and turmeric, is administered before bedtime. *Phoenix dactylifera* Linn., recognized as Dates or "Khajoor/Chuaar," employs dried dates as a resource. Boiling these dates with milk offers a remedy taken before bedtime. *Trachyspermum ammi* (Linn.), commonly known as Carom or "Ajwain," presents a unique approach. Seeds roasted on an iron frying pan are wrapped in cloth, enabling patients to inhale their beneficial vapors. *Zingiber officinale* Rosc., identified as Ginger or "Adrak," harnesses the juice of its fresh rhizome. Administered three times a day, mixed with honey, this concoction holds potential in promoting health.

Heart Disease

A compilation of indigenous medicinal practices reveals a variety of plant-based interventions. *Allium sativum* Linn., commonly known as Garlic or "Lahsun," a herb from the Alliaceae family, is administered as boiled flakes mixed with milk, often consumed in the early morning. Another valuable resource is *Embolia officinalis* Gaertn., also known as Aonla or "Aamla," a tree from the Euphorbiaceae family. Its fruit, when dried and combined with sugar candy (mishri), is ingested with water. The *Ficus religiosa* L., Sacred fig or "Peepal," a tree from the Moraceae family, employs its green leaves. Boiling 15 leaves in a glass of water until reduced to one-third creates a solution taken in three doses throughout the day. Furthermore, *Terminalia arjuna* Roxb., known as Arjuna or "Arjun," a tree belonging to the Combretaceae family, employs its bark. Powdered bark, mixed with clarified butter or milk, is consumed twice or thrice daily for a span of 15 days. These insights underscore the diverse ways in which indigenous plants are harnessed for health and well-being in the Pali district.

Kidney And Urination Problem

Addressing kidney and urination problems through indigenous botanical solutions unveils a spectrum of plant-based interventions. *Acacia nilotica* (L.) Delile, commonly known as Arabic tree or "Babool," is a tree from the Mimosaceae family. Its leaves, when finely mixed with *Pedaliium murex* (gokhru) and kalmi shora, offer a remedy when taken before bedtime. *Boerhavia diffusa* L., the red spiderling or "Lal sathi," a herb from the Nyctaginaceae family, offers diuretic effects when its leaves are cooked and consumed as a vegetable. *Corbichonia decumbens* (Forssk.) Jacq ex Exell, known as Prostrate purslane or "Pathar-chatti," employs crushed leaves to address kidney stone problems. *Coriandrum sativum* Linn., Coriander or "Dhaniya," a herb from the Apiaceae family, requires boiling its seeds in water to produce a liquid that combats urination issues. *Ocimum basilicum* Linn., Forest basil or "Ban tulsi," a herb from the Lamiaceae family, utilizes sprouted seeds consumed with curd to alleviate urinary problems. *Pedaliium murex* Linn., commonly called Caltrops or "Gokhru," a herb from the Pedaliaceae family, relies on boiled fruit filtrate as a diuretic. *Ricinus communis* L., Castor or "Arandi," a shrub from the Euphorbiaceae family, involves boiling seeds in milk and consuming the preparation to address kidney problems. Lastly, *Sesamum indicum* L., Sesame or "Til," a herb from the Pedaliaceae family, recommends a mixture of seed powder and jaggery powder to be consumed before sleep. These diverse botanical approaches illuminate the intricate synergy between indigenous plant knowledge and kidney-related wellness.

Skin Problems

Unveiling botanical solutions for skin-related ailments reveals an array of indigenous interventions. *Azadirachta indica* A. Juss., commonly known as Neem Tree or "Neem," a tree from the Meliaceae family, advocates applying an aqueous paste of neem leaves or using neem leaf-infused water for bathing to alleviate skin irritation. *Calotropis procera* (Ait.) R. Br., the Milkweed or "Aak," a shrub from the Asclepiadaceae family, suggests using ash from fresh root tips mixed with butter to treat eczema-affected areas. *Cynodon dactylon* Pers., Couch grass or "Doob," an herb from the Poaceae family, encourages applying a paste of the whole plant on eczema-prone skin. *Justicia adhatoda* Linn., the Malabar nut or "Adusa," a tree from the Acanthaceae family, advocates a paste prepared from boiled roots and leaves to be applied twice daily for eczema relief. *Ocimum sanctum* Linn., Basil or "Tulsi," a herb from the Lamiaceae family, recommends applying a paste of its leaves to eczema-affected areas. *Polygonum plebeium* R. Br., Knotweed or "Lalbuti," an herb from the Polygonaceae family, underscores applying a mixture of plant ash and oil to address eczema. *Psoralea corylifolia* Linn., Psoralea or "Bavachi," a herb from the Fabaceae family, suggests a mixture of soaked seeds, dried fruit powder of *Embllica officinalis* and mishri soaked in water for leucoderma treatment. *Terminalia catappa* Linn., Malabar almond or "Jangli badam," a tree from the Combretaceae family, recommends applying a paste of tender leaves to soothe eczema-prone areas. These botanical insights illuminate the harmony between indigenous plant wisdom and holistic skin wellness.

Respiratory Tract Infection And Lungs Complaint

Navigating the realm of respiratory tract infections and lung ailments, indigenous remedies emerge as guardians of well-being. *Achyranthus aspera* Linn., the Chaff-flower or "Apaamarga" from the Amaranthaceae family, introduces the practice of smoking dry apaamarga leaves for asthma relief, coupled with administering ash from burnt dry plants mixed with honey. *Amaranthus viridis* L., the Amaranth or "Chaulai," a herb from the Amaranthaceae family, recommends boiling its seeds and providing the resulting filtrate to pneumonia patients. *Calotropis procera* (Ait.) R. Br., the Milkweed or "Aak," a shrub from the Asclepiadaceae family, advocates a blend of ash from 5 gm of flowers sealed in an earthenware pot with honey for asthmatic individuals. *Citrullus colocynthis* (L.) Schrad., the Bitter cucumber or "Tumba," a climber from the Cucurbitaceae family, prescribes taking ash from the fruit with water to mitigate asthma. *Ficus glomerata* Roxb., the Fig or "Gular," a tree from the Moraceae family, proclaims the fusion of carom seed, nutmeg, cloves and jaggery with plant latex for liver complaints and diabetes. *Azadirachta indica* A. Juss., the Neem Tree or "Neem," a tree from the Meliaceae family, signifies consuming one teaspoon of dried fruit powder with water twice a day to potentially regulate sugar levels. *Boerhavia diffusa* L., the Red spiderling or "Lal sathi," a herb from the Nyctaginaceae family, introduces wearing garlands made of stem pieces resembling beads around the neck to aid in jaundice recovery. *Capparis decidua* (Forsk.) Edgew., the Bare caper or "Ker," a shrub from the Capparaceae family, suggests consuming a fine powder of approximately 3 cm of root with water for liver ailment

Sarika et al.,

mitigation. *Nyctanthes arbor-tristis* Linn., the Jasmine or "Harsingar," a shrub from the Oleaceae family, proposes the consumption of one teaspoonful of leaf powder with water on a daily basis. *Saccharum officinarum* Linn., the Sugar cane or "Ganna," an herb from the Poaceae family, endorses offering sugar cane juice to jaundice patients. *Trigonella foenum-graecum* Linn., the Fenugreek or "Methi," a herb from the Fabaceae family, underscores the intake of one teaspoon of dried seed powder early in the morning with water. This intricate tapestry of indigenous botanical interventions nurtures respiratory and lung well-being with nature's wisdom. Traditional knowledge within local tribal communities has led to the utilization of various plant-based formulations to address a range of health issues. These remedies draw upon the medicinal properties of indigenous flora, although their efficacy may not always be substantiated by scientific evidence. Among the health concerns addressed, fever and febrifuge remedies employed four plants, with plant parts such as fresh leaves, tender leaves, flowers and various components from plants like ginger, cloves, tulsi leaves, tea leaves, jaggery and milk being used. For digestive and gastrointestinal disorders, an extensive 21 plants were harnessed, utilizing various plant parts such as fruits, seeds, roots and leaves. Health issues such as dysentery, stomachache, constipation and acidity were targeted. Cold and cough remedies encompassed 10 plants, using diverse plant parts including roasted garlic flakes, mustard oil, chickpea powder, coriander seeds, turmeric powder, dry leaves, flowers, dried dates, roasted seeds and fresh rhizome juice (Figure 3 and 4). Heart disease interventions featured four plants, with plant parts like boiled garlic flakes, dried fruit (e.g., Aonla), boiled green leaves and powdered bark utilized. Nine plants were employed for kidney and urination problems, with plant parts ranging from leaves to roots, seeds and powders. Lastly, skin problems were addressed using eight plants, incorporating neem leaves, ash from root tips, whole plant paste, boiled roots and leaves, basil leaves paste, plant ash and oil mixture, soaked seeds and dried fruit powder and tender leaves paste. In the context of respiratory tract infections and lung complaints, 10 plants were employed, including dry apaamarga leaves, boiled seeds, ash from flowers, ash from the fruit and various ingredient fusions, aiming to alleviate issues like asthma and pneumonia. It's important to exercise caution and consult healthcare professionals when considering traditional or herbal treatments, particularly for severe health conditions, as the effectiveness of these remedies can vary and scientific validation may be necessary.

CONCLUSION

In culmination, the study embarks on a profound journey through the ethnomedicinal tapestry of indigenous plants, unveiling a treasure trove of traditional remedies nurtured by the communities in the remote areas of Pali district, Rajasthan, India. The meticulous survey conducted across seasons served as a compass, steering the research towards a panoramic understanding of plant utilization for diverse health concerns. Through engagement with local inhabitants, seasoned elders, traditional herbalists and local vendors, a mosaic of indigenous knowledge emerged, adorned with the pearls of ancient practices. This tapestry of wisdom was woven further by consulting literature, enriching the study's fabric with holistic insights. Diving into specific health realms, the study illuminated the intricate remedies for fever and febrifuge, digestive and gastrointestinal disorders, kidney and urination problems, skin afflictions and respiratory tract infections. Each chapter, a chapter of life in itself, delved into the botanical identities, local nomenclature, plant parts harnessed and modes of administration for ailments that have crossed paths with human existence since time immemorial. Remarkably, these indigenous remedies unveiled the symbiotic relationship between humans and their botanical cohabitants. The study's revelations emphasize the wisdom ingrained in local cultures, where nature is not merely a resource, but a partner in healing. This journey into the ethnomedicinal realm stands as a testament to the harmonious coexistence of traditional knowledge and modern exploration, providing a bridge between past and present and paving the way for a more enriched future where the synergy between nature and health is cherished and safeguarded.

Table.1: Indigenous botanical remedies by local tribal communities in Southern Pali district

Sr. no.	Plant Name	Plant Part Used	Health Category	Used by Tribe
1	<i>Azadirachta indica</i> A. Juss. (Neem)	Fresh leaves, Tender leaves	Fever and febrifuge	Bhil
2	<i>Calotropis gigantea</i> Linn. (Milkweed)	Flowers	Fever and febrifuge	Garasia
3	<i>Piper longum</i> Linn. (Long Pepper)	Fruits	Fever and febrifuge	Bhil
4	<i>Saccharum officinarum</i> Linn. (Sugarcane)	Various components	Fever and febrifuge	Garasia
5	<i>Aegle marmelos</i> (L.) Correa (Wood apple)	Fruit	Digestive and gastrointestinal	Bhil
6	<i>Aerva javanica</i> (Burm.f.) Shult. (Desert cotton)	Root	Digestive and gastrointestinal	Garasia

Sarika et al.,

7	<i>Aloe vera</i> (L.) Burm.f.	Leaves	Digestive and gastrointestinal	Bhil
8	<i>Calotropis procera</i> (Ait.) R. Br. (Milkweed)	Gynostegium	Digestive and gastrointestinal	Garasia
9	<i>Capparis decidua</i> (Forsk.) Edgew. (Bare caper)	Root	Digestive and gastrointestinal	Garasia
10	<i>Citrullus colocynthis</i> (L.) Schrad. (Bitter cucumber)	Dried fruit powder	Digestive and gastrointestinal	Bhil
11	<i>Crotalaria burhia</i> Buch. -Ham. (Burhia rattlepod)	Root	Digestive and gastrointestinal	Bhil
12	<i>Cuminum cyminum</i> L. (Cumin)	Seeds	Digestive and gastrointestinal	Bhil
13	<i>Ferula asafetida</i> Linn. (Asafoetida)	Latex	Digestive and gastrointestinal	Bhil
14	<i>Ficus religiosa</i> L. (Sacred fig)	Knots (stem galls)	Digestive and gastrointestinal	Meena & Bhil
15	<i>Foeniculum vulgare</i> Mill. (Fennel)	Seed powder	Digestive and gastrointestinal	Meena & Bhil
16	<i>Indigofera cordifolia</i> (Heart leaf indigo)	Seeds	Digestive and gastrointestinal	Bhil
17	<i>Lawsonia inermis</i> Linn. (Heena)	Powdered seeds with clarified butter	Digestive and gastrointestinal	Garasia
18	<i>Mangifera indica</i> Linn. (Mango)	Crushed mango seed paste	Digestive and gastrointestinal	Bhil
19	<i>Nelumbo nucifera</i> Gaertn. (Lotus)	Seeds	Digestive and gastrointestinal	Meena & Bhil
20	<i>Polygonum plebeium</i> R. Br. (Knotweed)	Entire plant	Digestive and gastrointestinal	Meena & Bhil
21	<i>Sarcostemma viminale</i> (Milk rope)	Plant extract	Digestive and gastrointestinal	Garasia
22	<i>Terminalia chebula</i> Retz. (Myrobalan)	Fruit powder	Digestive and gastrointestinal	Garasia
23	<i>Trachyspermum ammi</i> (Carom)	Seed powder	Digestive and gastrointestinal	Bhil
24	<i>Zingiber officinale</i> Rosc. (Ginger)	Rhizome in powdered form	Digestive and gastrointestinal	Bhil
25	<i>Allium sativum</i> Linn. (Garlic)	Roasted garlic flakes	Cold and cough	Garasia
26	<i>Brassica nigra</i> (Mustard)	Mustard oil in nostrils	Cold and cough	Meena & Bhil
27	<i>Cicer arietinum</i> L. (Chickpea)	Chickpea powder in milk with sugar	Cold and cough	Bhil
28	<i>Coriandrum sativum</i> Linn. (Coriander)	Decoction of coriander seeds	Cold and cough	Garasia
29	<i>Curcuma longa</i> (Turmeric)	Turmeric powder with warm milk	Cold and cough	Bhil
30	<i>Justicia adhatoda</i> Linn. (Malabar nut)	Decoction of dry leaves	Cold and cough	Garasia
31	<i>Ocimum sanctum</i> Linn. (Basil)	Decoction of basil flowers	Cold and cough	Garasia
32	<i>Phoenix dactylifera</i> Linn. (Dates)	Boiled dates with milk	Cold and cough	Bhil
33	<i>Trachyspermum ammi</i> (Carom)	Inhaling vapors of roasted seeds	Cold and cough	Meena & Bhil

Sarika et al.,

34	<i>Zingiber officinale</i> Rosc. (Ginger)	Fresh rhizome juice mixed with honey	Cold and cough	Bhil
35	<i>Allium sativum</i> Linn. (Garlic)	Boiled garlic flakes mixed with milk	Heart disease	Garasia
36	<i>Emblca officinalis</i> Gaertn. (Aonla)	Dried fruit with sugar candy (mishri)	Heart disease	Garasia
37	<i>Ficus religiosa</i> L. (Sacred fig)	Boiled green leaves	Heart disease	Meena & Bhil
38	<i>Terminalia arjuna</i> Roxb. (Arjuna)	Powdered bark with clarified butter or milk	Heart disease	Meena & Bhil
39	<i>Acacia nilotica</i> (Arabic tree)	Leaves mixed with <i>Pedaliu murex</i> and kalmi shora	Kidney and urination problems	Garasia
40	<i>Boerhavia diffusa</i> L. (Red spiderling)	Leaves as a vegetable	Kidney and urination problems	Bhil
41	<i>Corbichonia decumbens</i> (Prostrate purslane)	Crushed leaves	Kidney and urination problems	Meena & Bhil
42	<i>Coriandru sativum</i> Linn. (Coriander)	Seeds boiled in water	Kidney and urination problems	Bhil
43	<i>Ocimum basilicu</i> Linn. (Forest basil)	Sprouted seeds with curd	Kidney and urination problems	Garasia
44	<i>Pedaliu murex</i> Linn. (Caltrops)	Boiled fruit filtrate	Kidney and urination problems	Garasia
45	<i>Ricinus communis</i> L. (Castor)	Seeds boiled in milk	Kidney and urination problems	Garasia
46	<i>Sesamum indicu</i> L. (Sesame)	Seed powder and jaggery powder	Kidney and urination problems	Meena & Bhil
47	<i>Azadirachta indica</i> A. Juss. (Neem)	Aqueous paste of neem leaves or neem leaf-infused water	Skin problems	Bhil
48	<i>Calotropis procera</i> (Milkweed)	Ash from fresh root tips mixed with butter	Skin problems	Garasia
49	<i>Cynodon dactylon</i> Pers. (Couch grass)	Paste of the whole plant	Skin problems	Bhil
50	<i>Justicia adhatoda</i> Linn. (Malabar nut)	Paste of boiled roots and leaves	Skin problems	Meena & Bhil
51	<i>Ocimum sanctu</i> Linn. (Basil)	Paste of basil leaves	Skin problems	Meena
52	<i>Polygonu plebeiu</i> R. Br. (Knotweed)	Mixture of plant ash and oil	Skin problems	Meena & Bhil
53	<i>Psoralea corylifolia</i> Linn. (Psoralea)	Mixture of soaked seeds, dried fruit powder and mishri	Skin problems	Bhil
54	<i>Terminalia catappa</i> Linn. (Malabar almond)	Paste of tender leaves	Skin problems	Garasia
55	<i>Achyranthus aspera</i> Linn. (Chaff-flower)	Smoking dry apaamarga leaves, ash with honey	Respiratory tract infection and lungs	Meena & Bhil
56	<i>Amaranthus viridis</i> L. (Amaranth)	Boiling seeds and	Respiratory tract	Garasia

Sarika et al.,

		providing the filtrate	infection and lungs	
57	<i>Calotropis porcera</i> (Milkweed)	Blend of ash from flowers sealed with honey	Respiratory tract infection and lungs	Bhil
58	<i>Citrullus colocynthis</i> (Bitter cucumber)	Ash from the fruit with water	Respiratory tract infection and lungs	Garasia
59	<i>Ficus glomerata</i> Roxb. (Fig)	Fusion of carom seed, nutmeg, cloves and jaggery with plant latex	Respiratory tract infection and lungs	Meena & Bhil
60	<i>Azadirachta indica</i> A. Juss. (Neem)	Consuming dried fruit powder with water	Respiratory tract infection and lungs	Bhil
61	<i>Boerhavia diffusa</i> L. (Red spiderling)	Wearing garlands made of stem pieces around the neck	Respiratory tract infection and lungs	Garasia
62	<i>Capparis decidua</i> (Bare caper)	Consuming a fine root powder with water	Respiratory tract infection and lungs	Garasia
63	<i>Nyctanthes arbor-tristis</i> Linn. (Jasmine)	Consuming leaf powder with water	Respiratory tract infection and lungs	Bhil
64	<i>Saccharum officinarum</i> Linn. (Sugar cane)	Offering sugar cane juice to jaundice patients	Respiratory tract infection and lungs	Garasia
65	<i>Trigonella foenum-graecum</i> Linn. (Fenugreek)	Intake of seed powder with water	Respiratory tract infection and lungs	Bhil

ABSTRACT

The research centers on three major areas of financial literacy with respect to millennials and their decision making. The ability to make financial decisions and take on appropriate financial measures, is in most cases accompanied by a strong understanding of financial concepts. The study considers the various investment choices of the millennials in the context of their financial literacy, enclosing the unique economic opportunities and challenges that they usually experience. The contribution of this study is also in the mind of the millennials to be more practical when making decisions and deciding how to use the knowledge acquired in the financial literacy training with regards to speculation behavioral decision making. There is also a need for better financial management and investing in education to look at the achieve their goals in the long run. The study's outcomes are sought to assist in the enhancement of financial literacy and responsible investment among millennials in Bengaluru, India for officials, teachers, monetary institutions, and other stakeholders.

Keywords: Financial Decision, Financial Planning, Investments, Investment Behavior, Financial Literacy.

INTRODUCTION

Today, with the constantly changing financial landscape, prudent investment options, risks involved, and potential returns are more important than ever. This is especially so for millennials, people born between 1981 and 1996, who face both unique financial challenges and opportunities. It ensures that individuals are armed with the skills to make more informed decisions in either the classical investment options offered by stocks and bonds or those newer ones

**Murali and Nasa Dhanraj**

found in cryptocurrencies and peer-to-peer lending. Lack of such a foundation leads most people into problems such as creating unnecessary debt, failing to save enough, and spending poorly. These issues not only affect their particular financial stability but also have broader economic implications. For millennials, especially those looking forward to achieving financial freedom and generating wealth, financial literacy becomes an essential convert. It enables the individual to set realizable financial goals, assess risk appropriately, and develop sustainable financial habits. As digital natives, many millennials, however, face core financial issues, particularly regarding risk assessment, investment strategy, and retirement planning. Atkinson and Macy (2012) argue that financial behavior plays a key role; for example, people who have a negative view of saving are less likely to prepare for long-term goals such as retirement. Similarly, financial literacy broadly influences how individuals allocate resources, with psychological factors such as emotional biases and risk tolerance influencing their choices. Despite the growing awareness of financial literacy, many Indian millennials struggle to apply their knowledge effectively, especially in urban areas such as Bangalore. The survey shows that there is a significant gap between understanding financial concepts and their application in real-life scenarios. To address this gap, targeted financial education initiatives are needed that focus on practical application, empowering millennials to make better financial decisions and contribute to the country's broader economic growth.

RESEARCH GAP

Previous studies have examined financial literacy and its impact on financial outcomes, but few have focused on how its three key components—knowledge, behavior, and attitude—shape investment decisions. This is particularly true for urban millennials in Bengaluru, a demographic group facing unique financial challenges.

RESEARCH QUESTIONS

1. What are the prevailing levels of financial literacy amongst millennials in Bengaluru?
2. In what ways does financial literacy affect the investment behavior of Bengaluru's millennials?

RESEARCH OBJECTIVES

1. To judge the financial literacy levels of Bengaluru's millennial population, with a emphasis on their financial knowledge, behaviors, and attitudes.
2. To analyze how financial literacy impacts the investment patterns of millennials living in Bengaluru.

Conceptual Framework

Independent Variables: Financial Literacy

- **Financial Knowledge:** Understanding of financial concepts, tools, and resources.
- **Financial Behavior:** The actual financial practices, such as budgeting, saving, and investing.
- **Financial Attitude:** Individual's mindset towards managing money and financial decision-making.

Dependent Variable: Investment Behavior

RESEARCH METHODOLOGY

The study investigates the connection between financial literacy and the investment behavior of millennials in Bengaluru. A stratified random sampling method is employed to select 200 respondents aged between 25 and 40. Primary data is gathered using structured questionnaires, while secondary data is sourced from existing studies. The analysis incorporates both descriptive and inferential statistical techniques to evaluate financial literacy levels and demographic characteristics.

**Murali and Nasa Dhanraj****Data Analysis**

The descriptive statistics indicate a diverse sample with some variability across most demographic variables. Gender, age, and education show relatively low variation, suggesting a somewhat uniform distribution in these areas. Employment status and income reveal greater diversity, with respondents having a wider range of employment situations and income levels. All respondents are investors, with varying amounts invested and a broad selection of investment options. The frequency of investments and the factors influencing investment decisions show moderate variation, indicating different investment behaviors and motivations among participants. Overall, the data suggests a heterogeneous group in terms of employment, income, and investment choices.

Reliability Analysis

The Cronbach's Alpha values for the variables indicate the reliability of the scales used to measure financial literacy components. Financial Knowledge ($\alpha = 0.878$) and Investment Behaviors ($\alpha = 0.858$) show strong internal consistency, suggesting that the items measuring these variables are highly reliable. Financial Behaviour ($\alpha = 0.832$) also demonstrates good reliability, although slightly lower than the previous two. Financial Attitude ($\alpha = 0.717$), while still acceptable, shows a somewhat lower level of consistency compared to the other variables.

Factor Analysis

With a KMO value of 0.631, which is considered acceptable, the data shows enough correlations to proceed with analysis. Bartlett's Test reveals a significant Chi-square value of 466.228 with $df = 3$ and a p-value of 0.000.

Correlation Analysis

The correlation analysis reveals that **Financial Knowledge (FK)** has a strong positive relationship with **Investment Behavior (IB)** ($r = 0.944$), suggesting that better financial knowledge leads to more informed investment choices. It is also closely linked with **Financial Behavior (FB)** ($r = 0.733$) and **Financial Attitude (FA)** ($r = 0.988$), indicating that individuals with more financial knowledge tend to display better financial behavior and attitudes. Additionally, **Financial Behavior (FB)** and **Financial Attitude (FA)** are both significantly correlated with **Investment Behavior (IB)** ($r = 0.914$ and $r = 0.926$, respectively), implying that positive financial behaviors and attitudes foster proactive investment habits.

Regression Analysis

The regression model shows a strong relationship between Financial Knowledge, Financial Behaviour, Financial Attitude, Income, and Investment Behaviour. The model explains 81.3% of the variance in Investment Behaviour, indicating a good fit. The predictors are statistically significant, and the model's residuals are independent, as indicated by the Durbin-Watson value. Overall, the analysis confirms that these factors strongly influence Investment Behaviour.

ANOVA ANALYSIS

The regression model, which incorporates financial knowledge, financial behaviour, financial attitude, & income, substantially clarifies the variation in investment behaviour, according to the ANOVA analysis. The factors that predict it significantly explain the variation, as evidenced by the large F-statistic of 85.205 and the overall variation of 125.529. The model's statistical significance is confirmed by the p-value of less than 0.05, which indicates that the predictors taken together significantly influence investment behaviour. According to the findings, this model is very significant since the predictors taken together appear to have a substantial impact on investment behaviour.

Findings

- The data reveals a diverse sample with moderate variation in employment, income, and investment behaviors. Most respondents are investors with varying amounts invested and a range of investment options. Gender, age, and education are relatively evenly distributed.
- The scales measuring Financial Knowledge, Financial Behavior, and Investment Behavior exhibit strong. Financial Attitude shows acceptable reliability ($\alpha = 0.717$), though slightly lower.

**Murali and Nasa Dhanraj**

- Strong correlations between the variables and a KMO score of 0.631 and a significant Bartlett's Test result ($p < 0.05$) indicate that the data is appropriate for factor analysis.
- This suggests that people who have better financial behaviours, more financial knowledge, and more positive attitudes regarding money are able to engage in proactive investment behaviour.
- Financial Knowledge encompasses the most positive association with Investment Behaviour, followed by Financial Behaviour and Financial Attitude, both of which are highly significant.
- 81.3% of the variation in investment behaviour, indicating that financial behaviour, financial knowledge, financial attitude, as well as income all significant indicators of investment behaviour.
- The regression model's strong significance ($p < 0.05$) is confirmed by the ANOVA analysis, suggesting that the variables taken together significantly influence investment behaviour.

Suggestions

- First, Financial Education programs are essential, as Financial Knowledge has a strong influence on Investment Behavior.
- Widespread financial literacy initiatives can help individuals improve their investment knowledge. Second, promoting Positive Financial Behavior through programs that encourage regular savings, budgeting, and disciplined financial practices could enhance both investment habits and financial attitudes.
- Policy Recommendations suggest that policymakers should focus on initiatives that improve financial inclusivity and foster positive attitudes toward investment, especially among lower-income groups, as Income and Financial Attitude play significant roles.
- Lastly, Targeted Financial Guidance that provides personalized advice, focusing on enhancing both Financial Knowledge and Financial Attitudes, could encourage more individuals to become informed and proactive investors.

CONCLUSION

The study emphasises how important financial knowledge, financial behaviour, as fit as financial attitude are in determining how people invest. According to the data study, these variables together with income account for a significant amount of the variation in investment behaviour. The factor analysis validates that the data is appropriate for additional statistical investigation, and the measurement scales have a high degree of dependability. The significance of these characteristics is emphasised by both regression and ANOVA analyses, which validate their high potential for prediction for investment behaviour. Thus, promoting sound financial practices and raising financial knowledge might be useful tactics for improving people's investing habits.

ABSTRACT

Blockchain technology has ushered in transformative changes in the realms of digital security and transparency, particularly through the implementation of smart contracts. These self-executing agreements, which are inscribed on a blockchain, have the potential to enhance and secure transactions across diverse sectors by removing the necessity for intermediaries and lowering transaction expenses. By capitalizing on the decentralized and cryptographically secure characteristics of blockchain, smart contracts facilitate improved transparency and immutability, rendering them advantageous for industries such as finance, real estate, and supply chain management. Nonetheless, despite their promising attributes, smart contracts encounter considerable obstacles. Scientific and technical challenges, including scalability issues, susceptibility to programming errors, and the irreversible nature of blockchain transactions, pose significant concerns regarding their broader adoption. Furthermore, legal and regulatory frameworks often lag behind this rapidly evolving technology, leading to potential risks related to enforceability and accountability. As the blockchain landscape continues to develop, it is imperative to address these scientific and legal hurdles to fully harness the advantages of smart contracts. This article examines the complex nature of blockchain-based smart contracts, assessing whether they represent a significant advancement or a potential drawback for contemporary digital transactions.

Keywords: Blockchain, Technology, Contract, Law, Cryptography

**Subham Chatterjee**

INTRODUCTION

In the continuously changing realm of digital advancement, blockchain technology has established itself as a fundamental element of contemporary computational frameworks, signaling the onset of a new age characterized by enhanced transparency and security in transactional processes. Fundamentally, blockchain operates as a decentralized ledger that enables the permanent recording of data across numerous nodes, guaranteeing that once information is recorded, it remains unchangeable and cannot be erased[1]. This fundamental technology has facilitated the emergence of smart contracts—automated agreements that are encoded directly into the blockchain. Smart contracts serve to automate and uphold contractual commitments, thereby decreasing the reliance on intermediaries and substantially lowering transaction expenses[2]. The appeal of smart contracts is rooted not only in their operational efficiency but also in their capacity to foster trust between involved parties. By offering a verifiable and immutable record of transactions, they reduce the risks typically associated with the enforcement of conventional contracts[3]. The adoption of smart contracts is on the rise across various sectors, including finance and supply chain management, as organizations seek to enhance operational efficiency and promote accountability [4]. Nevertheless, the implementation of smart contracts faces significant hurdles. Issues related to legal enforceability, potential coding flaws, and the intricacies of adhering to regulatory requirements pose substantial challenges that need to be addressed [5]. As we further investigate the function of blockchain technology within the context of smart contracts, it is essential to evaluate the numerous advantages alongside the associated risks. This analysis seeks to clarify whether the integration of blockchain and smart contracts represents a significant advancement for innovation or a source of challenges laden with complexities.

The Various Technologies Used In Blockchain Analysis

Blockchain technology is fundamentally supported by a range of sophisticated technologies that collectively enable its distinctive features. Central to blockchain is cryptographic hashing, which plays a crucial role in ensuring the integrity and security of data. Hash functions, such as SHA-256, transform input data into a fixed-length string of characters, rendering it exceedingly difficult to reverse-engineer or modify the original data without detection [6]. This essential security mechanism is vital for fostering trust within a decentralized framework. Another significant component is consensus algorithms, which dictate the processes by which transactions are verified and incorporated into the blockchain. Notable consensus mechanisms include Proof of Work (PoW) and Proof of Stake (PoS). PoW, utilized by Bitcoin, necessitates that participants solve intricate mathematical challenges, thereby securing the network and authenticating transactions [7]. Conversely, PoS selects validators based on the quantity of coins they possess and are prepared to "stake," presenting a more energy-efficient option [8]. Smart contracts, which are self-executing agreements embedded within the blockchain, signify another technological innovation. They automate the execution of contracts when specific conditions are satisfied, thereby reducing the reliance on intermediaries and improving efficiency [9]. Furthermore, decentralized applications (DApps) utilize blockchain technology to offer various services without centralized oversight, further illustrating the adaptability of this technology [10]. Interoperability technologies, including cross-chain protocols, enable communication and data sharing among different blockchain networks. This functionality is crucial for establishing a more interconnected ecosystem, thereby enhancing the broader application and utility of blockchain technology.

The Intricate Relationship Between Smart Contracts And Blockchain Analysis

The advent of blockchain technology has significantly transformed numerous industries by offering novel solutions to longstanding issues related to trust and verification. One of the most impactful applications of this technology is the development of smart contracts—automated agreements where the terms are encoded directly into software. The relationship between smart contracts and blockchain is complex, marked by the interaction of transparency, security, efficiency, and the associated challenges that these advancements present [11]. Fundamentally, a smart contract operates as a computer program that autonomously enforces and fulfills contractual obligations once specific conditions are satisfied. This level of automation substantially decreases the reliance on intermediaries, which in turn lowers transaction costs and enhances operational efficiency. By leveraging blockchain technology, smart contracts

**Subham Chatterjee**

benefit from its decentralized and immutable characteristics, ensuring that once a contract is executed, its outcomes remain unchanged and secure. This feature bolsters the integrity of agreements and cultivates trust among the involved parties, as the execution of the contract is verifiable by all members of the network [12]. The interdependence of smart contracts and blockchain is evident in their fundamental attributes. Blockchain provides a secure and transparent environment for the implementation of smart contracts, with each contract stored on a distributed ledger that is accessible to all participants in the network. This decentralized framework mitigates the risk of single points of failure, thereby enhancing the overall resilience of the system [13]. Additionally, the transparency inherent in blockchain technology enables all stakeholders to verify the conditions and results of contracts, further reinforcing trust and accountability. From a technical perspective, the interplay between smart contracts and blockchain technology is fundamentally anchored in the consensus mechanisms that regulate the blockchain. These mechanisms are essential for ensuring that all participants reach a consensus on the legitimacy of transactions, which is vital for the proper functioning of smart contracts. For example, in a blockchain that employs Proof of Work (PoW), miners are responsible for validating transactions and subsequently executing smart contracts by confirming that the conditions outlined in the code are satisfied [14]. Conversely, Proof of Stake (PoS) systems adopt a different methodology, permitting validators to authenticate transactions based on the quantity of cryptocurrency they possess, thereby prioritizing economic investment over computational resources.

Despite the numerous benefits, the fusion of smart contracts and blockchain technology presents several challenges. A significant concern is the risk of coding errors. The reliability of smart contracts is directly linked to the quality of their underlying code [15]. Any defect in the code can result in unforeseen consequences, which may be exploited by malicious individuals. The notorious DAO hack in 2016 serves as a stark reminder of this vulnerability, where attackers took advantage of a flaw in the smart contract code, leading to substantial financial losses and underscoring the imperative for thorough testing and auditing of smart contracts [16]. Additionally, the legal recognition of smart contracts remains uncertain in various jurisdictions. Although the technology offers a powerful means of automating transactions, issues of enforceability emerge in the event of disputes. Conventional legal systems often find it challenging to adapt to the distinctive features of smart contracts, highlighting the need for the creation of new legal frameworks that can effectively tackle these issues [17]. This convergence of law and technology is an emerging area of research, prompting scholars and practitioners to work together in formulating guidelines for the effective deployment of smart contracts. Legal ambiguities, alongside scalability challenges, present considerable barriers to the broad implementation of smart contracts. As user numbers and transaction volumes rise, many blockchain networks face congestion, resulting in prolonged processing times and increased transaction costs. Such conditions can impede the effective deployment of smart contracts in contexts that demand swift execution [18]. Various solutions, including layer-two protocols and sharding, are under investigation to mitigate these challenges; however, they necessitate additional research and development [19]. Moreover, the potential for ethical challenges should not be disregarded. The automation that characterizes smart contracts may create situations where outcomes disproportionately impact specific stakeholders, especially in critical sectors like finance and healthcare. It is essential for developers to take ethical considerations into account during the design process of smart contracts to avoid unintentionally reinforcing biases or inequalities [20]. The interplay between smart contracts and blockchain technology is both significant and transformative, presenting remarkable prospects for enhancing efficiency, transparency, and security in contractual arrangements. Nevertheless, the obstacles—ranging from coding flaws to legal uncertainties—must be carefully addressed to realize the full promise of this innovative relationship. As academics, technologists, and legal professionals work together to tackle these challenges, the future of smart contracts and blockchain holds the potential to fundamentally alter the realm of digital transactions and agreements.

The Pros And Cons Of Smart Contracts Using Blockchain Analysis

Smart contracts, powered by blockchain technology, mark a revolutionary shift in how agreements are formed and upheld. By streamlining processes and fostering trust among involved parties, smart contracts have the potential to reshape numerous sectors. However, like any new technology, they come with their own set of pros and cons.

One of the standout advantages of smart contracts is their capacity for automation. Once the specified conditions are fulfilled, the contract executes automatically, eliminating the need for human oversight and significantly speeding up

**Subham Chatterjee**

transaction processing times. This level of automation enhances operational efficiency, allowing businesses to redirect their focus toward more strategic initiatives. Additionally, smart contracts reduce the necessity for intermediaries, such as brokers or notaries, which leads to a notable decrease in transaction costs [21]. This is especially beneficial in fields like real estate and finance, where traditional methods often involve hefty fees. The decentralized aspect of blockchain further minimizes the overhead costs tied to managing multiple parties in a transaction [22]. Blockchain analysis offers an additional advantage. Smart contracts function on a transparent blockchain, allowing all involved parties to access identical information. This level of transparency builds trust, enabling stakeholders to independently confirm the contract's terms and its execution. Furthermore, the unchangeable nature of blockchain records guarantees that once a contract is executed, it remains intact, thereby reinforcing the integrity of the agreement [23]. Smart contracts utilize cryptographic algorithms for security, which significantly reduces the risk of fraud and hacking. Additionally, the decentralized structure of blockchain provides an added layer of protection, eliminating any single point of failure. As a result, it becomes exceedingly challenging for malicious individuals to alter contract information [24]. While smart contracts offer numerous benefits, their reliability hinges entirely on the quality of the underlying code. Any mistakes or security flaws can result in unexpected consequences, leaving them open to exploitation. A notable example is the infamous hack of The DAO in 2016, which led to the theft of millions of dollars, highlighting the dangers tied to inadequately programmed smart contracts [25]. The legal standing of smart contracts is still ambiguous in numerous jurisdictions. Although these contracts operate automatically, their enforceability can be questioned within conventional legal systems.

Courts might find it difficult to decipher the terms embedded in a smart contract, which can result in disagreements regarding intent and execution [26]. This uncertainty in the legal landscape may discourage businesses from embracing smart contracts. With the increasing adoption of blockchain technology, scalability has become a major hurdle. Numerous blockchain networks, especially those utilizing Proof of Work (PoW) consensus mechanisms, face difficulties when handling high transaction volumes. This results in sluggish processing times and rising fees during times of peak activity. Such constraints can impede the effective use of smart contracts in dynamic settings [27]. The use of smart contracts for automated decision-making brings forth significant ethical dilemmas. For example, if the underlying code contains biases, it could lead to the unfair treatment of specific individuals or groups. Additionally, the strict adherence to predetermined conditions might ignore unique situations that could influence results, which could ultimately result in unjust outcomes for those affected [28]. Smart contracts, driven by blockchain technology, bring numerous benefits such as automation, lower costs, enhanced transparency, and improved security. Nevertheless, it is essential to recognize the potential risks, including coding flaws, legal uncertainties, scalability challenges, and ethical dilemmas. As this technology advances, tackling these issues will be vital to unlocking the complete capabilities of smart contracts across different sectors.

A Comparative Analysis Of Traditional Contracts And Smart Contracts

Traditional contracts have historically served as the foundation of legal agreements, relying heavily on manual procedures, intermediaries [29], and mechanisms for legal enforcement. In contrast, smart contracts, which operate on blockchain technology, present considerable improvements in terms of efficiency, cost savings, and enforceability. Smart contracts facilitate the automatic execution of agreements once specific conditions are satisfied, thereby significantly decreasing the time needed for transaction processing. Unlike traditional contracts, which typically involve numerous steps and various parties, smart contracts simplify processes by removing the need for intermediaries. This automation not only speeds up transactions but also reduces the potential for human error.

The financial advantages of smart contracts are particularly noteworthy. By eliminating intermediaries such as lawyers or notaries, smart contracts can lead to a substantial decrease in transaction costs [30]. In contrast, traditional contracts often incur significant legal fees and administrative costs, rendering them less cost-effective, particularly for intricate agreements. Although smart contracts provide an immutable record of transactions on the blockchain, their legal status remains somewhat unclear. Traditional contracts, which are governed by established legal frameworks, offer more definitive pathways for dispute resolution and enforcement [31]. Smart contracts may encounter challenges regarding enforceability due to differing interpretations and a lack of legal recognition in certain jurisdictions [32].

**Subham Chatterjee**

When assessing various blockchain platforms, Ethereum and Hyperledger emerge as prominent options for executing smart contracts. Ethereum, a public blockchain, enables developers to create decentralized applications with sophisticated smart contract capabilities, utilizing its powerful programming language, Solidity [33]. In contrast, Hyperledger provides a private blockchain framework that emphasizes enterprise solutions, prioritizing confidentiality and scalability [34]. While Ethereum is recognized for its versatility and community support, Hyperledger offers customized solutions for specific business needs.

Future Prospects And Innovations In The Smart Contract Domain

The future of smart contracts is characterized by significant potential, propelled by ongoing technological innovations and advancements. A notable trend is the incorporation of artificial intelligence (AI) within smart contracts, which allows for the analysis of data and the capacity to make real-time decisions in response to changing conditions [35]. This synergy may result in more adaptive contracts that automatically adjust to new circumstances.

Another promising area for development is the interoperability among diverse blockchain platforms. Initiatives aimed at creating cross-chain solutions will facilitate seamless interactions of smart contracts across multiple blockchain ecosystems, thereby enhancing their functionality and expanding their range of applications [36]. Furthermore, improvements in regulatory frameworks are expected to establish clearer standards for the enforceability of smart contracts, which will encourage wider adoption by businesses [37]. The rise of decentralized finance (DeFi) applications is also anticipated to broaden the scope of smart contracts, enabling intricate financial transactions to occur without intermediaries, thus transforming conventional financial services [38]. As these advancements progress, smart contracts are poised to become increasingly essential across various industries, including finance and supply chain management, fundamentally altering the execution and enforcement of agreements.

CONCLUSION

The investigation into the function of blockchain technology within smart contracts uncovers a multifaceted environment characterized by both potential benefits and significant obstacles. On one side, smart contract present remarkable advantages, such as improved efficiency, reduced costs, increased transparency, and enhanced security. Their capacity to automate transactions and remove the need for intermediaries fundamentally alters the execution of agreements, fostering trust and accountability among involved parties. Conversely, the adoption of smart contracts is fraught with challenges. Problems including coding flaws, legal uncertainties, and issues related to scalability pose considerable hurdles to their widespread implementation. Additionally, the absence of well-defined regulatory guidelines complicates the situation, causing many organizations to approach this technology with caution. Ultimately, the determination of whether blockchain technology in smart contracts serves as a benefit or a detriment depends on the effectiveness with which these challenges are navigated. As the technology progresses, collaboration among technologists, legal professionals, and policymakers will be essential in crafting a future where smart contracts can realize their transformative capabilities. By addressing the complexities inherent in this innovative framework, stakeholders can leverage the advantages of blockchain technology while minimizing its associated risks, thereby fostering a more efficient and just contractual environment.

ABSTRACT

In this study, a weighted transformation technique in Xrama distribution is employed to apply a two-parameter Xrama distribution on life-time data. Its statistical properties were investigated, including the mean residual life function, reliability function, hazard rate, reverse hazard function, stochastic ordering, order statistics, and moments-related measures. The MLE technique is used to estimate parameters. An actual lifetime cancer dataset was used to test the weighted Xrama distribution's goodness of fit, and it was found to fit the data better than other competing distributions.

Keywords: Weighted technique, Xrama distribution, mean residual function, Stochastic ordering, Moments.

INTRODUCTION

Weighted distributions are used in many scientific areas, including biomedicine, reliability, ecology, and branching processes. To represent this type of data, a variety of continuous distributions such as Weibull, Lindley, exponential, lognormal, and gamma are used. If x is the initial observation with its pdf $f(x)$, then in the event of sampling bias, an appropriate weighted function, say $w(x)$, a random variable function, will be introduced to reflect the scenario. Fisher developed the concept of weighted distributions to model ascertainment bias. Rao later extended this concept in a

Jothika and Pandiyan

more cohesive approach while modeling statistical data when standard distributions were unable to represent these observations with equal probabilities. Dey *et al.* explored the weighted exponential distribution's properties and several estimation methods. Kilany obtained the weighted form of the lomax distribution. Patil and Rao researched the statistical applications of weighted distributions in human population and ecology. Shanker described a one-parameter Pratibha distribution with statistical features and applications. Several scholars have developed weighted versions of one parameter lifespan distributions using the weight function $w(x, \omega) = x^{\omega-1}$. For example, Ghitany *et al.* suggested weighted Lindley distribution (WLD) from Lindley distribution, Eyob and Shanker proposed weighted Garima distribution (WGD) from Shanker distributions, Shanker and Shukla suggested weighted Sujatha distribution (WSD) from Shanker distribution, Shanker *et al.* proposed a weighted Komal distribution (WKD) from Shanker's Komal distribution, and a weighted Uma distribution (WUD) from Shanker's Uma distribution, respectively. It has been observed that, depending on the conceptual or applied angle, these weighted distributions did not produce an adequate fit in certain datasets. As a result, searching for a better weighted distribution that matches to the most recent lifetime distribution is required. In this paper, we introduce a new two-parameter distribution. The proposed distribution is a weighted xrama. Harrison O. Etaga *et al.* (2023) proposed the xrama distribution, a new one-parameter lifetime distribution. The pdf and cdf functions of the suggested distribution, coupled with additional features, give an approach to MLE for estimating model parameters in the remainder of this study. When compared to several competing distributions, the suggested distribution (WXD) exhibits its flexibility and excellence in fitting several real-life cancer data sets.

Weighted Xrama Distribution (WXD)

The probability density function and cumulative distribution function of the WXD are defined in this section.

The Xrama distribution is a new one-parameter life time distribution. The Xrama distribution's pdf is provided by

$$f(x) = \frac{\theta^4}{(\theta^3 + 6)^2} (\theta^3 + 6x^3 + 12)e^{-\theta x} \quad x > 0, \theta > 0 \quad (1)$$

Additionally, the Xrama distribution's cdf is provided by

$$F(x) = 1 - \left\{ 1 + \frac{1}{(\theta^3 + 6)^2} (6\theta^3 x^3 + 18\theta^2 x^2 + 36\theta x) \right\} e^{-\theta x} \quad x > 0, \theta > 0 \quad (2)$$

A random variable x with a probability density function $f(x)$ has been examined. Let $w(x)$ be a weight function that is not negative. A new probability density function should be indicated.

$$f_w(x) = \frac{w(x)f(x)}{E(w(x))} \quad ; \quad x > 0$$

where $w(x)$ is the non-negative weight function, $E[w(x)] = \int w(x)f(x)dx < \infty$, and the associated random variable by X_w , also known as the weighted random variable corresponding to x . It is said that X_w is size-biased of order α when $w(x) = x^\alpha, \alpha > 0$. This type of selection process is known as size-biased sampling of order α . Size-biased (or weighted) data has a probability density function when $\alpha=1,2$.

$$f_w(x) = \frac{x^\alpha f(x)}{E(X^\alpha)}$$

The WXD is derived by applying the weighted function, which is $w(x) = x^\alpha$, on the Xrama distribution to get the WXD. Given the WXD, the probability density function is

$$f_w(x) = \frac{x^\alpha f(x)}{E(X^\alpha)} \quad ; \quad x > 0, \theta > 0, \alpha > 0 \quad (3)$$

Where

$$E(X^\alpha) = \int_0^\infty x^\alpha f(x) dx$$

After simplification we get

$$E(X^\alpha) = \frac{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12\alpha!}{\theta^\alpha (\theta^3 + 6)^2} \quad (4)$$

We can obtain the pdf of the WXD by substituting the values of equations (1) and (4) into equation (3).

Jothika and Pandiyan

$$f_w(x) = \frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \quad (5)$$

After reduction, utilizing a lower incomplete gamma function results in

$$\gamma(z+1, \theta x) = \int_0^{\theta x} t^{(z+1)-1} e^{-t} dt$$

We shall get. The cdf for the weighted Xrama distribution is given by

$$F_w(x) = \int_0^x f_w(t) dt \quad (6)$$

After simplifying equation (6), we obtain the cdf of the WXD.

$$F_w(x) = \frac{\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \quad (7)$$

Reliability Analysis

In this part, we will look at the reliability function, hazard rate, reverse hazard function, odds rate, mills ratio, and mean residual function for the proposed weighted Xrama distribution.

3.1 Survival function

$$S(x) = 1 - \left(\frac{\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \right)$$

3.2 Hazard function

$$H(x) = \frac{f_w(x)}{S(x)}$$

$$H(x) = \frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{(\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!) - \theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)}$$

3.3 Revers hazard rate

$$h_r(x) = \frac{f_w(x)}{F_w(x)}$$

$$h_r(x) = \frac{\left(\frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \right)}{\left(\frac{\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \right)}$$

$$h_r(x) = \frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)}$$

3.4 Odds rate function

The weighted Xrama distribution's Odds Rate function is

$$O(x) = \frac{F_w(x)}{1 - F_w(x)}$$

$$O(x) = \frac{\left(\frac{\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \right)}{1 - \left(\frac{\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \right)}$$

3.5 Mills Ratio

$$\text{Mills Ratio} = \frac{1}{h_r(x)}$$

$$\text{Mills Ratio} = \frac{1}{\left(\frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)} \right)}$$

3.6 Mean Residual function

$$M(x) = \frac{1}{s(x)} \int_x^\infty x f(x) dx - x$$

$$M(x) = \frac{1}{1 - \frac{\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x)}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!}} \int_x^\infty x \frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12)e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} - xM(x)$$

$$= \frac{1}{\frac{(\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!) - (\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x))}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!}} \frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \int_x^\infty x^{\alpha+1} \theta^3 e^{-\theta x} dx$$

$$+ 6 \int_x^\infty x^{\alpha+4} e^{-\theta x} dx + 12 \int_x^\infty x^{\alpha+1} e^{-\theta x} dx$$

Put $\theta x = t, x = \frac{t}{\theta}, dx = \frac{dt}{\theta}$
 When $x \rightarrow 0, t \rightarrow 0$, and $x \rightarrow \infty, t \rightarrow \infty$
 After solving the integral, we get
 Upper incomplete gamma function

$$\Gamma(s, x) = \int_x^\infty t^{s-1} e^{-t} dt$$

$$M(x) = \frac{\theta^6 \Gamma(\alpha+2, \theta x) + 6\Gamma(\alpha+5, \theta x) + 12\theta^3 \Gamma(\alpha+2, \theta x)}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha! - (\theta^6 \gamma(\alpha+1, \theta x) + 6\gamma(\alpha+4, \theta x) + 12\theta^3 \gamma(\alpha+1, \theta x))} - x$$

Statistical Properties

In this section, we obtained the structural properties, the MGF, the characteristic function, and the r th Moment for the WXD random variables. Mean, variance, standard deviation, and harmonic mean are all explored.

4.1 Moments

If X is a random variable with WXD, the order moments $E(X^r)$ are as follows:

$$E(X^r) = \mu'_r = \int_0^\infty x^r f(x) dx$$

$$\mu'_r = \int_0^\infty x^r \left(\frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12)e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \right) dx$$

$$\mu'_r = \frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!} \int_0^\infty x^{\alpha+r} (\theta^3 + 6x^3 + 12)e^{-\theta x} dx$$

$$\mu'_r = \frac{\theta^6 \Gamma(r+\alpha+1) + 6\Gamma(r+\alpha+4) + \theta^3 12\Gamma(r+\alpha+1)}{\theta^r (\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!)} \quad (8)$$

The Mean of the WXD is determined by putting $r=1$ and $r=2$ in equation (8).

$$\mu'_1 = \frac{\theta^6 \Gamma(\alpha+2) + 6\Gamma(\alpha+5) + \theta^3 12\Gamma(\alpha+2)}{\theta^1 (\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!)}$$

$$\mu'_2 = \frac{\theta^6 \Gamma(\alpha+3) + 6\Gamma(\alpha+6) + \theta^3 12\Gamma(\alpha+3)}{\theta^2 (\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!)}$$

$$\text{Variance} = \mu'_2 - (\mu'_1)^2$$

$$\sigma^2 = \left(\frac{\theta^6 \Gamma(\alpha+3) + 6\Gamma(\alpha+6) + \theta^3 12\Gamma(\alpha+3)}{\theta^2 (\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!)} \right) - \left(\frac{\theta^6 \Gamma(\alpha+2) + 6\Gamma(\alpha+5) + \theta^3 12\Gamma(\alpha+2)}{\theta^1 (\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!)} \right)^2$$

$$\sigma^2 = \frac{(\theta^6 \Gamma(\alpha+3) + 6\Gamma(\alpha+6) + \theta^3 12\Gamma(\alpha+3))(\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!) - (\theta^6 \Gamma(\alpha+2) + 6\Gamma(\alpha+5) + \theta^3 12\Gamma(\alpha+2))^2}{\theta^2 (\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12\alpha!)^2}$$

Jothika and Pandiyan

$$S.D(\sigma) = \frac{\sqrt{(\theta^6\Gamma(\alpha+3)+6\Gamma(\alpha+6)+\theta^3 12\Gamma(\alpha+3))(\theta^6\alpha!+6(\alpha+3)!+\theta^3 12\alpha!)-(\theta^6\Gamma(\alpha+2)+6\Gamma(\alpha+5)+\theta^3 12\Gamma(\alpha+2))}}{\theta(\theta^6\alpha!+6(\alpha+3)!+\theta^3 12\alpha!)}$$

Harmonic Mean

$$H.M = E\left(\frac{1}{x}\right)$$

$$H.M = \int_0^{\infty} \frac{1}{x} f_w(x; \theta, \alpha) dx$$

$$H.M = \int_0^{\infty} \frac{1}{x} \left(\frac{x^{\alpha} \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right) dx$$

$$H.M = \frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \int_0^{\infty} x^{-1} x^{\alpha} (\theta^3 + 6x^3 + 12) e^{-\theta x} dx$$

$$H.M = \frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \int_0^{\infty} x^{\alpha-1} (\theta^3 + 6x^3 + 12) e^{-\theta x} dx$$

$$H.M = \frac{\theta(\theta^6 \Gamma(\alpha) + 6\Gamma(\alpha+3) + \theta^3 12\Gamma(\alpha))}{(\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!)}$$

Moment Generating function and Characteristic function

If X_i implies WXD, then the MGF of X is as follows:

$$M_X(t) = E(e^{tx})$$

$$M_X(t) = \int_0^{\infty} e^{tx} f(x) dx$$

Applying Taylor's series expansion

$$M_X(t) = \int_0^{\infty} \left(1 + tx + \frac{(tx)^2}{2!} + \frac{(tx)^3}{3!} + \dots \right) f(x) dx$$

$$M_X(t) = \int_0^{\infty} \sum_{j=0}^{\infty} \frac{t^j}{j!} x^j f(x) dx$$

$$M_X(t) = \sum_{j=0}^{\infty} \frac{t^j}{j!} \int_0^{\infty} x^j f(x) dx$$

$$M_X(t) = \sum_{j=0}^{\infty} \frac{t^j}{j!} \mu'_j$$

$$M_X(t) = \sum_{j=0}^{\infty} \frac{t^j}{j!} \frac{\theta^j \theta^6 \Gamma(j + \alpha + 1) + 6\Gamma(j + \alpha + 4) + \theta^3 12\Gamma(j + \alpha + 1)}{\theta^j (\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!)}$$

$$M_X(t) = \frac{1}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \sum_{j=0}^{\infty} \frac{t^j}{j!} \theta^j \theta^6 \Gamma(j + \alpha + 1) + 6\Gamma(j + \alpha + 4) + \theta^3 12\Gamma(j + \alpha + 1)$$

Similarly, the characteristic function of the WXD is

$$\phi_X(t) = M_X(it)$$

$$M_X(it) = \frac{1}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \sum_{j=0}^{\infty} \frac{it^j}{j! \theta^j} \theta^6 \Gamma(j + \alpha + 1) + 6 \Gamma(j + \alpha + 4) + \theta^3 12 \Gamma(j + \alpha + 1)$$

Order Statistics

In this part, we used the weighted Xrama distribution to compute the order statistics distributions.

Let $X_{(1)}, X_{(2)}, X_{(3)}, \dots, X_{(n)}$ be the order statistics of the random sample taken from weighted Xrama. The probability density function of r^{th} order statistics, $X_{(r)}$, is defined as.

$$f_{X(r)}(x) = \frac{n!}{(r-1)!(n-r)!} f_X(x) [F_X(x)]^{r-1} [1 - F_X(x)]^{n-r} \quad (9)$$

By combining equations (5) and (7) with equation (9), the probability density function of order statistics $X_{(r)}$ of the weighted Xrama distribution is obtained by

$$f_{X(r)}(x) = \frac{n!}{(r-1)!(n-r)!} \left(\frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right) \times \left(\frac{\theta^6 \gamma(\alpha + 1, \theta x) + 6 \gamma(\alpha + 4, \theta x) + 12 \theta^3 \gamma(\alpha + 1, \theta x)}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{r-1} \\ \times \left(1 - \frac{\theta^6 \gamma(\alpha + 1, \theta x) + 6 \gamma(\alpha + 4, \theta x) + 12 \theta^3 \gamma(\alpha + 1, \theta x)}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{n-r}$$

Thus, the pdf of higher order statistics, $X_{(n)}$ of the WXD can be derived as

$$f_{X(n)}(x) = \left(n \frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right) \times \left(\frac{\theta^6 \gamma(\alpha + 1, \theta x) + 6 \gamma(\alpha + 4, \theta x) + 12 \theta^3 \gamma(\alpha + 1, \theta x)}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{n-1} \quad (10)$$

The pdf of the first order statistic $X_{(1)}$ of the WXD

$$f_{X(1)}(x) = \left(n \frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right) \times \left(1 - \frac{\theta^6 \gamma(\alpha + 1, \theta x) + 6 \gamma(\alpha + 4, \theta x) + 12 \theta^3 \gamma(\alpha + 1, \theta x)}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{n-1} \quad (11)$$

Likelihood Ratio Test

This section uses the weighted Xrama distribution to derive the likelihood ratio test.

Consider $X_{(1)}, X_{(2)}, X_{(3)}, \dots, X_{(n)}$ as a random sample from the weighted Xrama distribution.

The null and alternative hypotheses are used to test the hypothesis.

$$H_0: f(x) = f(x; \theta) \quad \text{against} \quad H_1: f(x) = f_w(x; \alpha, \theta)$$

The following test statistics are used to determine if a randomly selected sample of size n originates from the Xrama distribution or the weighted Xrama distribution.

$$\Delta = \frac{L_1}{L_2} = \prod_{i=1}^n \frac{f_w(x_i; \alpha, \theta)}{f(x_i; \theta)}$$

$$\Delta = \prod_{i=1}^n \frac{\left(\frac{x_i^\alpha \theta^{\alpha+4} (\theta^3 + 6x_i^3 + 12) e^{-\theta x_i}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)}{\left(\frac{\theta^4}{(\theta^3 + 6)^2} (\theta^3 + 6x_i^3 + 12) e^{-\theta x_i} \right)}$$

$$\Delta = \prod_{i=1}^n \left(\frac{x_i^\alpha \theta^{\alpha+4} (\theta^3 + 6x_i^3 + 12) e^{-\theta x_i}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right) \times \left(\frac{(\theta^3 + 6)^2}{\theta^4 (\theta^3 + 6x_i^3 + 12) e^{-\theta x_i}} \right)$$

$$\Delta = \left(\frac{\theta^\alpha (\theta^3 + 6)^2}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^n \prod_{i=1}^n x_i^\alpha$$

If we reject the null hypothesis, then

$$\Delta = \left(\frac{\theta^\alpha (\theta^3 + 6)^2}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^n \prod_{i=1}^n x_i^\alpha > k \quad (12)$$

Similarly, we also reject the null hypothesis, where

$$\Delta^* = \prod_{i=1}^n x_i^\alpha > k \left(\frac{\theta^\alpha (\theta^3 + 6)^2}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^n$$

$$\Delta^* = \prod_{i=1}^n x_i^\alpha > k^* \text{ where } k^* = \left(\frac{\theta^\alpha (\theta^3 + 6)^2}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^n$$

For large sample sizes (n), $2 \log \Delta$ is distributed as chi-squared variables with one degree of freedom. We rejected the null hypothesis when the probability value is given by $p(\Delta^* > \alpha^*)$, where $\alpha^* = \prod_{i=1}^n x_i^\alpha$ is less than level of significance and $\prod_{i=1}^n x_i^\alpha$ is the observed value of the statistics Δ^* .

Bonferroni And Lorenz Curves

In this portion, we obtained the Bonferroni and Lorenz curves from the weighted Xrama distribution.

$$B(p) = \frac{1}{p\mu} \int_0^q x f_w(x_i; \theta, \alpha) dx$$

And

$$L(p) = \frac{1}{\mu} \int_0^q x f_w(x_i; \theta, \alpha) dx$$

Where $q = F^{-1}(p); q \in [0, 1]$

And $\mu = E(X)$

Thus, the Bonferroni and Lorenz curves of our distribution are, determined by

$$\mu = \frac{\theta^6 \Gamma(\alpha + 2) + 6\Gamma(\alpha + 5) + \theta^3 12\Gamma(\alpha + 2)}{\theta^1 (\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!)}$$

$$B(p) = \frac{1}{p \left(\frac{\theta^6 \Gamma(\alpha + 2) + 6\Gamma(\alpha + 5) + \theta^3 12\Gamma(\alpha + 2)}{\theta^1 (\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!)} \right)} \int_0^q x \left(\frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right) dx$$

$$B(p) = \frac{1}{p \left(\frac{\theta^6 \Gamma(\alpha + 2) + 6\Gamma(\alpha + 5) + \theta^3 12\Gamma(\alpha + 2)}{\theta^1 (\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!)} \right)} \times \left(\theta^3 \int_0^q x^{\alpha+1} e^{-\theta x} dx + 6 \int_0^q x^{\alpha+4} e^{-\theta x} dx + 12 \int_0^q x^{\alpha+1} e^{-\theta x} dx \right)$$

Put $\theta x = t, x = \frac{t}{\theta}, dx = \frac{dt}{\theta}$

When $x \rightarrow 0, t \rightarrow 0$, and $x \rightarrow q, t \rightarrow \theta q$

$$B(p) = \frac{1}{p \left(\frac{\theta^6 \Gamma(\alpha + 2) + 6\Gamma(\alpha + 5) + \theta^3 12\Gamma(\alpha + 2)}{\theta^1 (\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!)} \right)} \times \left(\theta^3 \int_0^{\theta q} \left(\frac{t}{\theta} \right)^{\alpha+1} e^{-t} \left(\frac{dt}{\theta} \right) + 6 \int_0^{\theta q} \left(\frac{t}{\theta} \right)^{\alpha+4} e^{-t} \left(\frac{dt}{\theta} \right) + 12 \int_0^{\theta q} \left(\frac{t}{\theta} \right)^{\alpha+1} e^{-t} \left(\frac{dt}{\theta} \right) \right)$$

After solving the integral, we get

$$B(p) = \frac{(\theta^6 \gamma(\alpha + 2, \theta q) + 6\gamma(\alpha + 5, \theta q) + 12\theta^3 \gamma(\alpha + 2, \theta q))}{p(\theta^6 \Gamma(\alpha + 2) + 6\Gamma(\alpha + 5) + 12\theta^3 \Gamma(\alpha + 2))} \quad (13)$$

$$L(p) = pB(p)$$

$$L(p) = \frac{(\theta^6 \gamma(\alpha + 2, \theta q) + 6\gamma(\alpha + 5, \theta q) + 12\theta^3 \gamma(\alpha + 2, \theta q))}{(\theta^6 \Gamma(\alpha + 2) + 6\Gamma(\alpha + 5) + 12\theta^3 \Gamma(\alpha + 2))} \quad (14)$$

Jothika and Pandiyan

Stochastic Ordering

Stochastic ordering is a useful tool in finance and dependability to evaluate model performance. Let X and Y be two random variables with pdf, cdf, and reliability functions $f(x), f(y), F(x), F(y)$. $S(x) = 1 - F(x)$ and $F(y)$

1. Likelihood ratio order ($X \leq_{LR} Y$) if $\frac{f_{X_w}(x)}{f_{Y_w}(x)}$ decreases in x
2. Stochastic order ($X \leq_{ST} Y$) if $F_{X_w}(x) \geq F_{Y_w}(x)$ for all x
3. Hazard rate order ($X \leq_{HR} Y$) if $h_{X_w}(x) \geq h_{Y_w}(x)$ for all x
4. Mean residual life order ($X \leq_{MRL} Y$) if $MRL_{X_w}(x) \geq MRL_{Y_w}(x)$ for all x

Prove that the weighted Xrama distribution gives the strongest ordering (likelihood ratio ordering) Suppose X and Y are independent random variables with probability distribution functions $f_{w_x}(x; \alpha, \theta)$ and $f_{w_y}(x; \beta, \lambda)$. If $\alpha < \beta$ and $\theta < \lambda$, then.

$$\Lambda = \frac{f_{w_x}(x; \alpha, \theta)}{f_{w_y}(x; \beta, \lambda)}$$

$$\Lambda = \frac{\left(\frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right)}{\left(\frac{x^\beta \lambda^{\beta+4} (\lambda^3 + 6x^3 + 12) e^{-\lambda x}}{\lambda^6 \beta! + 6(\beta+3)! + \lambda^3 12 \beta!} \right)}$$

$$\Lambda = \left(\frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right) \times \left(\frac{\lambda^6 \beta! + 6(\beta+3)! + \lambda^3 12 \beta!}{x^\beta \lambda^{\beta+4} (\lambda^3 + 6x^3 + 12) e^{-\lambda x}} \right)$$

$$\Lambda = \left(\frac{x^\alpha \theta^{\alpha+4} (\theta^3 + 6x^3 + 12)}{x^\beta \lambda^{\beta+4} (\lambda^3 + 6x^3 + 12)} \right) \times \left(\frac{\lambda^6 \beta! + 6(\beta+3)! + \lambda^3 12 \beta!}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right) e^{-(\theta-\lambda)x}$$

$$\Lambda = \left(\frac{\theta^{\alpha+4} (x^\alpha (\theta^3 + 6x^3 + 12))}{\lambda^{\beta+4} (x^\beta (\lambda^3 + 6x^3 + 12))} \right) \times \left(\frac{\lambda^6 \beta! + 6(\beta+3)! + \lambda^3 12 \beta!}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right) e^{-(\theta-\lambda)x}$$

Therefore

$$\log [\Lambda] = \log \left(\left(\frac{\theta^{\alpha+4} (x^\alpha (\theta^3 + 6x^3 + 12))}{\lambda^{\beta+4} (x^\beta (\lambda^3 + 6x^3 + 12))} \right) \times \left(\frac{\lambda^6 \beta! + 6(\beta+3)! + \lambda^3 12 \beta!}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right) e^{-(\theta-\lambda)x} \right)$$

differentiate with respect to x , we get

$$\frac{\partial \log [\Lambda]}{\partial x} = \left(\frac{\alpha x^{\alpha-1} \theta^3 + 6(\alpha+3) x^{\alpha+2} + 12 x^{\alpha-1}}{x^\alpha \theta^3 + 6x^{\alpha+3} + 12 x^\alpha} \right) - \left(\frac{\beta x^{\beta-1} \lambda^3 + 6(\beta+3) x^{\beta+2} + 12 x^{\beta-1}}{x^\beta \lambda^3 + 6x^{\beta+3} + 12 x^\beta} \right) + (\lambda - \theta) = 0$$

Hence $\frac{\partial \log [\Lambda]}{\partial x} < 0$ if $\alpha < \beta$ and $\theta < \lambda$

Entropies

In this part, we used the weighted Xrama distribution to calculate Shannon, Renyi, and Tsallis entropies.

It is commonly known that entropy and information can be used to measure uncertainty or the randomness of probability distributions. It is used in a variety of disciplines, including engineering, finance, information theory, and biomedicine. The entropy functionals for the probability distribution were developed using a variational concept of uncertainty.

Shannon Entropy

The Shannon entropy of the random variable X that defines the weighted Xrama distribution

Jothika and Pandiyan

$$s_{\lambda} = - \int_0^{\infty} f(x) \log(f(x)) dx; \lambda > 0, \lambda \neq 1$$

$$s_{\lambda} = - \int_0^{\infty} f_w(x; \theta, \alpha) \log(f_w(x; \theta, \alpha)) dx$$

$$s_{\lambda} = - \int_0^{\infty} \left(\frac{x^{\alpha} \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right) \times \log \left(\frac{x^{\alpha} \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right) dx \quad (15)$$

Renyi Entropy

Entropy is described as a random variable. X represents the variation of the uncertainty. Engineering, statistical mechanics, finance, information theory, biology, and economics are among the domains where it is applied. The entropy is the Renyi of order, which is defined as

$$R_{\lambda} = \frac{1}{1-\lambda} \log \int_0^{\infty} [f(x)]^{\lambda} dx; \lambda > 0, \lambda \neq 1$$

$$R_{\lambda} = \frac{1}{1-\lambda} \log \int_0^{\infty} [f_w(x; \theta, \alpha)]^{\lambda} dx$$

$$R_{\lambda} = \frac{1}{1-\lambda} \log \int_0^{\infty} \left(\frac{x^{\alpha} \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{\lambda} dx$$

$$R_{\lambda} = \frac{1}{1-\lambda} \log \left(\frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{\lambda} \int_0^{\infty} x^{\alpha \lambda} (\theta^3 + 6x^3 + 12)^{\lambda} e^{-\lambda \theta x} dx \quad (16)$$

Then, utilizing the following binomial series expansion in equation (16) and simplified this, we obtain:

$$R_{\lambda} = \frac{1}{1-\lambda} \log \left(\frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{\lambda} \sum_{i=0}^{\lambda} \sum_{j=0}^{\lambda} \binom{\lambda}{i} \binom{i}{j} \theta^{3(\lambda-i)} 6^{(i-j)} 12^j \int_0^{\infty} x^{\lambda \alpha + 3(i-j)} e^{-\lambda \theta x} dx$$

Using the gamma function

$$R_{\lambda} = \frac{1}{1-\lambda} \log \left(\frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{\lambda} \sum_{i=0}^{\lambda} \sum_{j=0}^{\lambda} \binom{\lambda}{i} \binom{i}{j} \theta^{3(\lambda-i)} 6^{(i-j)} 12^j \left(\frac{(\lambda \alpha + 3(i-j) + 1)}{(\lambda \theta)^{(\lambda \alpha + 3(i-j) + 1)}} \right) \quad (17)$$

Tsallis Entropy

Tsallis initiated the Boltzmann-Gibbs (B-G) statistical properties, which have gained a lot of attention. This generalization of (B-G) statistics was initially proposed by introducing the mathematical formulation of Tsallis entropy (Tsallis, 1988) for continuous random variables, which is defined as

$$T_{\lambda} = \frac{1}{1-\lambda} \left[1 - \int_0^{\infty} [f(x)]^{\lambda} dx \right]; \lambda > 0, \lambda \neq 1$$

$$T_{\lambda} = \frac{1}{1-\lambda} \left[\int_0^{\infty} \left(\frac{x^{\alpha} \theta^{\alpha+4} (\theta^3 + 6x^3 + 12) e^{-\theta x}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{\lambda} dx \right]$$

$$T_{\lambda} = \frac{1}{1-\lambda} \left[1 - \left(\frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!} \right)^{\lambda} \int_0^{\infty} x^{\alpha \lambda} (\theta^3 + 6x^3 + 12)^{\lambda} e^{-\lambda \theta x} dx \right]$$

Using binomial expansion, we get

Jothika and Pandiyan

$$T_{\lambda} = \frac{1}{1-\lambda} \left[1 - \left(\frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right)^{\lambda} \sum_{i=0}^{\lambda} \sum_{j=0}^{\lambda} \binom{\lambda}{i} \binom{\lambda}{j} \theta^{3(\lambda-i)} 6^{(i-j)} 12^j \int_0^{\infty} x^{\lambda \alpha + 3(i-j)} e^{-\lambda \theta x} dx \right] \quad (18)$$

Using integration of gamma function in equation (18), we get

$$T_{\lambda} = \frac{1}{1-\lambda} \left[1 - \left(\frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right)^{\lambda} \sum_{i=0}^{\lambda} \sum_{j=0}^{\lambda} \binom{\lambda}{i} \binom{\lambda}{j} \theta^{3(\lambda-i)} 6^{(i-j)} 12^j \left(\frac{(\lambda \alpha + 3(i-j) + 1)}{(\lambda \theta)^{(\lambda \alpha + 3(i-j) + 1)}} \right) \right] \quad (19)$$

Estimations of Parameter

This section provides the MLE and Fisher's information matrix for the WXD.

MLE and Fisher's Information Matrix

Assume $X_{(1)}, X_{(2)}, X_{(3)}, \dots, X_{(n)}$ is a random sample of size n from the weighted Xrama distribution with parameter and the likelihood function, which is defined as

$$L(x; \theta, \alpha) = \prod_{i=1}^n f_w(x_i; \theta, \alpha)$$

$$L(x; \theta, \alpha) = \prod_{i=1}^n \left(\frac{x_i^{\alpha} \theta^{\alpha+4} (\theta^3 + 6x_i^3 + 12) e^{-\theta x_i}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right)$$

$$= \left(\frac{\theta^{\alpha+4}}{\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!} \right)^n \prod_{i=1}^n x_i^{\alpha} (\theta^3 + 6x_i^3 + 12) e^{-\theta x_i}$$

Then, the log-likelihood function is

$$\log L = n \log \theta^{\alpha+4} - n \log(\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!) + \sum_{i=1}^n \log x_i^{\alpha} (\theta^3 + 6x_i^3 + 12) - \theta \sum_{i=1}^n x_i \quad (20)$$

Deriving (20) partially with respect to θ, α and we have.

$$\frac{\partial \log L}{\partial \theta} = \frac{n(\alpha+4)}{\theta} - n \left(\frac{6\theta^5 \alpha! + 3\theta^2 12 \alpha!}{(\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!)} \right) - \sum_{i=1}^n x_i = 0 \quad (21)$$

$$\frac{\partial \log L}{\partial \alpha} = n \log(\theta) - \left(\frac{\theta^6 \psi(\alpha) + 6\psi(\alpha+3) + \theta^3 12 \psi(\alpha)}{(\theta^6 \alpha! + 6(\alpha+3)! + \theta^3 12 \alpha!)} \right) + \sum_{i=1}^n \log x_i = 0 \quad (22)$$

Where ψ is the digamma function.

Equations (21) and (22) provide the MLE of the parameters for the WXD. However, because the problem cannot be solved analytically, we solved it numerically using R programming and a data collection.

We apply asymptotic normality results to get the confidence interval. If $\hat{\lambda} = (\hat{\theta}, \hat{\alpha})$ represents the MLE of $\lambda = (\theta, \alpha)$, we can state the following results: $\sqrt{n}(\hat{\lambda} - \lambda) \rightarrow N_2(0, I^{-1}(\lambda))$

$I(\lambda)$ is Fisher's information matrix. i.e.,

Jothika and Pandiyan

$$I(\lambda) = \frac{1}{n} \begin{pmatrix} E \left[\frac{\partial^2 \log L}{\partial \theta^2} \right] & E \left[\frac{\partial^2 \log L}{\partial \theta \partial \alpha} \right] \\ E \left[\frac{\partial \log L}{\partial \alpha \partial \theta} \right] & E \left[\frac{\partial^2 \log L}{\partial \alpha^2} \right] \end{pmatrix}$$

$$E \left[\frac{\partial^2 \log L}{\partial \theta^2} \right] = \frac{-n(\alpha + 4)!}{\theta^2} + n \left(\frac{(\theta^2 \alpha! + 6(\alpha + 3)! + \theta^3)(30\theta^4 \alpha! + 36\theta \alpha!) - (6\theta^5 \alpha! + 36\theta^2 \alpha!)^2}{(\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!)^2} \right)$$

$$E \left[\frac{\partial \log L}{\partial \alpha^2} \right] = n \left(\frac{(\theta^6 \Psi'(\alpha) + 6\Psi(\alpha + 3) + \Psi'(\alpha))(\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!) - (\theta^6 \Psi(\alpha) + 6\Psi(\alpha + 3) + \theta^3 12 \Psi(\alpha))^2}{(\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!)^2} \right)$$

$$E \left[\frac{\partial^2 \log L}{\partial \theta \partial \alpha} \right] = \frac{n}{\theta} + n \left(\frac{(6\theta^5 \Psi(\alpha) + 36\theta^2 \Psi(\alpha))(\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!) - (6\theta^5 \alpha! + 36\theta^2 \alpha!)(\theta^6 \Psi(\alpha) + 6\Psi(\alpha + 3) + \theta^3 12 \Psi(\alpha))}{(\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!)^2} \right)$$

$$E \left[\frac{\partial \log L}{\partial \alpha \partial \theta} \right] = \frac{n}{\theta} + n \left(\frac{(6\theta^5 \Psi(\alpha) + 36\theta^2 \Psi(\alpha))(\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!) - (6\theta^5 \alpha! + 36\theta^2 \alpha!)(\theta^6 \Psi(\alpha) + 6\Psi(\alpha + 3) + \theta^3 12 \Psi(\alpha))}{(\theta^6 \alpha! + 6(\alpha + 3)! + \theta^3 12 \alpha!)^2} \right)$$

The first order derivative of the digamma function is $\Psi(\cdot)'$. Because λ is unknown, we estimate $I^{-1}(\lambda)$ by $I^{-1}(\hat{\lambda})$, which can be used to obtain an asymptotic confidence interval for θ, α .

Applications

Data set 1: The dataset on the remission periods (in months) of 36 bladder cancer patients described in [9] and provided by

0.08, 0.2, 0.4, 0.5, 0.51, 0.81, 0.87, 0.9, 1.05, 1.19, 1.26, 1.35, 1.4, 1.46, 1.76, 2.02, 2.02, 2.07, 2.09, 2.23, 2.26, 2.46, 2.54, 2.62, 2.64, 2.69, 2.69, 2.75, 2.83, 2.87, 3.02, 3.02, 3.25, 3.31, 3.36, 3.36.

Data set 2: This data set includes the life expectancy (in years) of 40 blood cancer (leukemia) patients from one of Saudi Arabia's Ministry of Health facilities, as described in [1]. The actual data are:

0.315, 0.496, 0.616, 1.145, 1.208, 1.263, 1.414, 2.025, 2.036, 2.162, 2.211, 2.370, 2.532, 2.693, 2.805, 2.910, 2.912, 3.192, 3.263, 3.348, 3.348, 3.427, 3.499, 3.534, 3.767, 3.751, 3.858, 3.986, 4.049, 4.244, 4.323, 4.381, 4.392, 4.397, 4.647, 4.753, 4.929, 4.973, 5.074, 5.381.

To compare to the goodness of fit of the fitted distribution, the following criteria: Akaike Information Criteria (AIC), Bayesian Information Criteria (BIC), Akaike Information Criteria Corrected (AICC) and $-2\log L$.

AIC, BIC, AICC and $-2\log L$ can be evaluated by using the formula as follows.

$$AIC = 2K - 2\log L, \quad BIC = k \log n - 2\log L \text{ and } AICC = AIC + \frac{2k(k+1)}{(n-k-1)}$$

Where, k =number of parameters, n sample size and $-2\log L$ is the maximized value of loglikelihood function.

Tables 1 and 2 clearly show that the weighted Xrama distribution has lower AIC, BIC, AICC, $-2\log L$, and values than the Xrama, power Akash, Lindley, and Akash distributions, indicating that the WXD fits better. As a result, the WXD outperforms the other distributions in terms of fit.

CONCLUSION

This paper proposes and discusses a weighted version of the Xrama distribution known as the WXD. Its important statistical features, such as moments and their associated measures, reliability function, hazard rate, reverse hazard function, and mean residual life function, are investigated. The suggested distribution's parameters are determined using the maximum likelihood technique. The use of statistical distributions in medical research is vital and can have a substantial impact on the health of the general public, especially cancer patients. Thus, the applications of this distribution to certain real-life cancer data sets that reflect the survival of some cancer patients demonstrate the applicability of this distribution. Furthermore, the resulting distribution is applied to two real-life cancer data sets and contrasted with other well-known distributions. The results reveal that the WXD provides a better fit than other well-known distributions.

ABSTRACT

Internal audit procedures have evolved significantly, adapting to the complexities of global regulations and business practices. Initially focused on financial oversight and fraud prevention, audits expanded with regulatory advancements, such as the FDA's guidelines and Good Manufacturing Practices (GMP). The rise of frameworks like the Sarbanes-Oxley Act (SOX) further integrated risk management into audit practices, emphasizing compliance with stringent regulatory standards. In the pharmaceutical industry, internal audits now encompass a wide range of compliance requirements, including GMP, FDA regulations, pricing transparency laws, and environmental standards. The analysis of internal audit findings from 20 companies reveals significant challenges in regulatory compliance, internal controls, and operational risks. Weaknesses in financial reporting were the most frequent issue, reported by 12 companies, often leading to inaccuracies, scrutiny, and investor distrust. Regulatory hurdles in drug approvals and pricing transparency were also prevalent, impacting 11 companies. Additional concerns, such as anti-corruption compliance, product liability lawsuits, and post-merger integration, highlight the complexities of global operations. Pharmaceutical companies must enhance internal audits by adopting advanced tools like data analytics, real-time monitoring, and risk-based assessments. Strengthened internal controls and compliance frameworks are critical to mitigating financial and reputational risks, ensuring operational stability, and maintaining competitiveness in a highly regulated industry.

Keywords: Internal audits; Regulatory compliance; Pharmaceutical industry; Financial reporting; Global standards.

INTRODUCTION

Internal audits are essential in the pharmaceutical industry, assisting companies in ensuring compliance with regulatory standards, identifying potential risks, and upholding product quality and safety. As pharmaceutical companies navigate increasingly complex regulations and dynamic market conditions, the importance of effective internal audit processes becomes paramount. [1,4,5]

Regulations and standards of internal audits

The revised Global Internal Audit Standards are set to take effect on January 9, 2024, and will remain in place until January 9, 2025. Internal audit functions may already be incorporating these Standards into their operations. These Standards serve as a comprehensive framework for internal auditing professionals worldwide, offering guidance that supports the assessment and enhancement of internal audit quality. The International Internal Audit Standards Board, operating under the oversight of the IPPF Oversight Council, develops these Standards through a rigorous due process. [6] Currently, internal audits are a key requirement for maintaining compliance with a range of accepted standards, including ISO 9001:2000, ISO 14001:2015, and ISO 13485.[2] These audits serve as a critical mechanism for evaluating and enhancing quality within organizations. A similar principle is reflected in the regulations imposed by major global authorities, such as the U.S. Food and Drug Administration (FDA) and the European Medicines Agency (EMA). For example, the evaluation of quality standards in the pharmaceutical sector, including blood and blood components, is governed by cGMP regulations (21 CFR Parts 210-211 & 206). In the European Union, public-interest entities are required to comply with Regulation (EU) No 537/2014, a statutory audit framework passed by the European Parliament and Council. This regulation, part of a broader legislative structure under Directive 2006/43/EC, aims to strengthen audit quality and independence by limiting non-audit services, defining the role of national audit oversight bodies, and mandating auditor rotation. The Committee of European Auditing Oversight Bodies oversees adherence to these standards, ensuring consistency across EU member states. [3,4,5] In India, the Institute of Chartered Accountants of India (ICAI) and the Institute of Cost Accountants of India (ICMAI) have issued guidelines for conducting internal audits in the pharmaceutical industry. These guidelines emphasize best practices in areas such as procurement, production, and inventory management. Internal audits are also essential for ensuring compliance with ISO 9001 standards, the Drugs and Cosmetics Act, 1940, and its associated Rules, 1945, which emphasize quality control and documentation. Additionally, adherence to the National Pharmaceuticals Pricing Policy (NPPP), Good Laboratory Practices (GLP), and Good Manufacturing Practices (GMP) is critical, with internal audits playing a pivotal role in confirming compliance with these regulations. [5,7] Global regulatory authorities across the pharmaceutical and medical device sectors share a common expectation regarding the role of internal audits. For example, the UK's Medicines and Healthcare Products Regulatory Agency (MHRA) emphasizes the need for robust internal quality systems and regular audits to ensure compliance with Good Manufacturing Practices (GMP). Similarly, Health Canada incorporates internal audits into its compliance framework, expecting companies to perform thorough audits that assess regulatory adherence and promote continuous quality improvement. In Japan, the Pharmaceuticals and Medical Devices Agency (PMDA) mandates internal audits focused on compliance with GMP and Good Clinical Practices (GCP), requiring organizations to systematically evaluate their processes and take corrective actions based on audit findings.[5] Across these regions, the common thread is the critical role of internal audits in maintaining high standards of quality, transparency, and accountability, fostering continuous improvement in the pharmaceutical and medical device industries.

MATERIALS AND METHODS

Definition of Internal Audit

An internal audit is an independent and objective review of an organization's financial and operational activities. Conducted by the company's own staff, internal audits evaluate the effectiveness of internal controls, procedures, and processes. They also assess compliance with relevant laws, regulations, and company policies. The main goal of an internal audit is to offer management an unbiased assessment of the organization's risk and control environment.

**Chandana and Koushik**

These audits are performed regularly, and their findings are reported to senior management and the board of directors.[5]

Internal audit procedure

The ISO standard mandates that organizations develop an internal audit procedure.

This Internal Audit Procedure should encompass the following elements:

- Internal Audit Schedule: Identify who is responsible for creating the schedule, determine the frequency of audits, and outline the scope of each audit.
- Auditor: Specify who will carry out the internal audits and describe how impartiality and objectivity in the audit process will be maintained.
- Audit Report: Detail the process for reporting findings.
- Audit Review: Clarify that management is responsible for reviewing the internal audit report.
- Retention of Reports and Evidence: Explain how reports and relevant evidence will be retained.[8]

Planning the Audit

- Review the audit scope and identify relevant procedures and documents.
- Identify the staff and stakeholders who need to be present and invite them to participate.
- Examine the procedures and other documents related to the audit scope.
- Determine the evidence required to demonstrate compliance with the procedures and standards.
- Develop an internal audit checklist that includes key questions to ask and evidence to examine.
- Examine prior internal and external audit reports to pinpoint any necessary corrective actions.

Conducting the Audit

- Ask the auditee to explain their processes and how records are maintained to demonstrate compliance.
- Look for objective evidence of compliance, usually found in recorded form.
- If you discover any issues, ensure the auditee is informed and understands them.
- Focus on fact-finding rather than fault-finding; the goal is to gather facts, not to point out faults.
- Remain objective; your personal opinions should not influence the audit.

Writing the Audit Report

- Document the objective evidence observed during the audit.
- Record any non-conformances and suggestions for improvement.
- Discuss the system itself rather than the roles of individuals within it. [8]

A review of internal audit reports was conducted based on the annual reports of 20 companies. This evaluation sought to analyse the effectiveness, coverage, and key outcomes of their internal audit activities. By reviewing the data presented in these reports, the study aimed to gain insights into how companies are managing compliance, risk, and quality control through their internal audit functions.

RESULTS

The review also identified common practices, challenges, and opportunities for improvement, offering a broader perspective on the current state of internal auditing across various industries in table: 1 The comprehensive analysis of compliance challenges in the pharmaceutical industry reveals a complex landscape of regulatory and operational risks. Categorization involves grouping similar issues based on their characteristics, nature, or impact. For instance, financial reporting weaknesses relate to inaccuracies in statements; anti-corruption involves breaches of ethical laws; product safety concerns involve defects leading to recalls. Supply chain disruptions focus on compliance and logistical issues, while regulatory challenges involve meeting approval requirements. This systematic grouping aids in better understanding and addressing each problem area effectively. The categories and frequencies are listed in table :2. The table outlines ten categories of audit issues and their frequencies. Financial reporting and internal

**Chandana and Koushik**

control weaknesses (12 occurrences) and Regulatory compliance and approval challenges (11 occurrences) are the most frequent. Product safety, quality, and recalls, Litigation and legal disputes, and Mergers, acquisitions, and integration challenges each appear 4 times. Categories like Anti-corruption and anti-bribery compliance, Global supply chain disruptions, Environmental compliance and sustainability issues, and Operational inefficiencies in clinical trials each have 3 occurrences, while Ethical pricing and market practices are noted twice. This distribution highlights critical areas for improvement.

DISCUSSION

Pharmaceutical companies encounter a variety of complex challenges that require continuous attention to compliance and internal controls. One major issue is adjusting to evolving regulations, especially those related to drug approvals and pricing, which can result in delays and increased operational costs. Ensuring compliance with global supply chain standards and environmental sustainability requirements is equally crucial, as these regulations vary across regions. The most common issue identified, however, is internal control weaknesses in financial reporting, which 12 of companies' face. These weaknesses can lead to inaccurate financial statements, regulatory scrutiny, and loss of investor confidence, highlighting the need for stronger oversight mechanisms. In addition to financial reporting challenges, pharmaceutical companies must address regulatory hurdles in drug approvals and clinical trial data, which were noted in 11 of cases. Problems such as incomplete trial data or inadequate documentation can cause delays in market access and harm a company's reputation. Other significant concerns include compliance with anti-corruption laws, product liability litigation, and antitrust regulations, all of which can result in serious legal and financial repercussions.

Case Studies**Case Study 1**

Viatis Inc., a global healthcare company formed through the merger of Mylan and Pfizer's Upjohn business, faced significant internal audit challenges, as outlined in its 2023 Form 10-K. The company identified key weaknesses in its internal controls, particularly over financial reporting, which raised concerns about the reliability of its financial reporting processes. One major issue was the difficulty in correcting errors in previously issued financial statements. Viatis also acknowledged potential risks to its compliance with Section 404 of the Sarbanes-Oxley Act, which requires management to assess and report on the effectiveness of internal controls. The audit findings reveal that Operational Risks and Manufacturing Compliance occurring twice, highlighting challenges in maintaining compliance with manufacturing standards and regulatory requirements. Internal Controls Over Financial Reporting, Cyber security and Data Integrity, and Sustainability and Compliance were identified once each, focusing on financial controls, data security, and adherence to environmental and sustainability standards. These findings emphasize the need for robust systems and processes to ensure regulatory compliance, operational efficiency, and data security.

Case study 2

In 2012, GlaxoSmithKline (GSK) faced significant internal audit issues that led to a Corporate Integrity Agreement (CIA) with the U.S. Department of Health and Human Services' Office of Inspector General (OIG). The problems primarily arose from improper marketing practices and non-compliance at GSK's Cidra, Puerto Rico facility, where drugs were manufactured under questionable standards. Internal audits revealed that GSK's compliance program was inadequate, with significant gaps in its implementation and monitoring, leading to unauthorized interactions with healthcare professionals. Additionally, GSK failed to report violations such as potential kickbacks and lacked a robust whistleblower policy. Furthermore, senior management's oversight was ineffective, as the Compliance Officer did not have direct access to the board, limiting their ability to enforce compliance. The Compliance Violations in Speaker Programs for GSK involved unauthorized promotion of off-label product uses, insufficient oversight of speaker activities, and conflicts of interest arising from excessive financial incentives to healthcare professional. As a result, GSK was required to implement reforms, including strengthening its compliance program, enhancing training

**Chandana and Koushik**

on federal regulations, and conducting regular audits. These issues serve as a reminder of the importance of active enforcement and monitoring of compliance frameworks within regulated industries.

Case study 3

Organon & Co., a global healthcare company focused on women's health, faced significant internal audit challenges as outlined in its 2022 Annual Report. Despite its success as a spin-off from Merck in 2021, the company encountered weaknesses in regulatory compliance, particularly in manufacturing processes that failed to consistently meet required safety and quality standards. The audits also revealed deficiencies in documentation practices, risking non-compliance with FDA regulations. Additionally, internal controls were inadequate, with poor segregation of duties and insufficient risk assessment procedures, exposing the company to potential financial and reputational risks. The internal audit found limited engagement from senior management on compliance issues, and the reporting structure for concerns was unclear. The most common issue is Management's Assessment of Internal Controls, highlighting the need for stronger evaluations of control systems. Compliance with Filing Requirements and Revenue Recognition Practices were moderately frequent, focusing on meeting regulatory deadlines and accurate reporting of revenue. Operational Risks and Financial Performance (2022) reflect concerns about business processes and financial outcomes for the year. Lastly, Global Operations had the fewest issues, pointing to fewer challenges in international activities. The chart emphasizes key areas requiring attention to improve compliance and efficiency.

Case study 4

Pfizer is a global pharmaceutical giant founded in 1849, headquartered in New York City, with annual revenues around \$71.8 billion and operations in over 125 countries. The case study on internal audit issues at Pfizer reveals several critical areas of concern that impact the company's operational integrity and regulatory compliance. Key issues identified include gaps in regulatory compliance, which were noted multiple times, indicating potential risks in adherence to industry standards. Additionally, there is a misalignment in the structure of the Board of Directors' committees, affecting effective governance and decision-making processes. The audit also highlights a dependency on certain key product lines for revenue, which poses financial risks if these products encounter market challenges. Furthermore, inefficiencies in research and development processes were observed, potentially hindering innovation. Challenges related to mergers and acquisitions were also noted, particularly regarding integration post-acquisition. Lastly, there are concerns about compliance with Environmental, Social, and Governance (ESG) principles, which are increasingly vital in the pharmaceutical industry. Addressing these issues is essential for Pfizer to enhance its internal audit effectiveness and maintain its competitive edge in the market.

CONCLUSIONS

The analysis highlights Financial Reporting and Internal Control Weaknesses (12 occurrences) and Regulatory Compliance and Approval Challenges (11 occurrences) as the most frequent and critical issues in the pharmaceutical industry. Financial reporting weaknesses undermine the reliability of financial statements and expose companies to regulatory and reputational risks, making robust internal controls essential. Regulatory compliance challenges, including difficulties in navigating global approval frameworks, often lead to delays in product launches and supply chain disruptions, affecting operational efficiency and competitiveness. Addressing these two areas should be prioritized to strengthen financial oversight, enhance compliance processes, and mitigate risks, thereby fostering greater operational resilience and trust within the industry. The case studies underscore the critical need for pharmaceutical companies to strengthen internal controls over financial reporting and enhance regulatory compliance frameworks to address recurring challenges. Prioritizing these areas is essential for maintaining operational integrity, mitigating risks, and ensuring long-term sustainability.

Table.1: List of 20 Companies With Their Internal Audit And Compliance Issues

Sl. No	Company	Internal Audit Compliance Issues
1	Teva Pharmaceutical (2019)	<ul style="list-style-type: none"> Internal control weaknesses in financial reporting process issues with compliance (FCPA) anti-corruption and anti-bribery laws (improper promotion and distribution of its pharmaceutical products through third parties.) agreed to pay approximately \$519 million to resolve FCPA violations
2	Johnson & Johnson (2019)	<ul style="list-style-type: none"> Internal control deficiencies in financial reporting, opioid litigation, talc litigation, product safety issues and recalls
3	Novartis (2019)	<ul style="list-style-type: none"> Compliance issues in anti-corruption and anti-bribery laws, agreed to pay \$346.7 million to resolve charges of bribery under the FCPA

Chandana and Koushik

		<ul style="list-style-type: none"> • internal control weaknesses in financial reporting
4	AbbVie (2019)	<ul style="list-style-type: none"> • Weaknesses in internal controls over financial reporting, • issues related to Allergan acquisition
5	Pfizer (2020)	<ul style="list-style-type: none"> • Compliance issues with global supply chain (limited air freight capacity and port delays, affected the transportation of raw materials and finished products.) • internal control weaknesses and challenges in navigating regulatory framework with different countries
6	Cipla (2020)	<ul style="list-style-type: none"> • Challenges in meeting regulatory requirements related to compliance with c GMP. (Manufacturing deviations in sterilization protocols delayed exports of critical drugs to the U.S. market.)
7	Bristol-Myers Squibb (2021)	<ul style="list-style-type: none"> • Internal control weakness related to financial reporting and integration system (weaknesses emerged prominently in the context of its acquisition of Celgene Corporation)
8	Gilead sciences (2021)	<ul style="list-style-type: none"> • Internal control weakness related to financial reporting and integration system • Challenges in reconciling revenue tracking for drugs like Hepatitis C and HIV treatments due to system incompatibilities post-acquisitions.
9	Sanofi (2021)	<ul style="list-style-type: none"> • Struggled with justifying the premium pricing of Dupixent under new pricing transparency laws, delaying reimbursement approvals
10	Amgen (2021)	<ul style="list-style-type: none"> • Delays in launching biosimilars like Avastin due to differing clinical trial data requirements across regions, impacting competitive entry.
11	Bayer (2021)	<ul style="list-style-type: none"> • Issues related to environmental laws (improper waste disposal penalties at German plants) • product liability issues (Lawsuits over Roundup herbicide's alleged cancer risks)
12	Medtronic's (2021)	<ul style="list-style-type: none"> • Issues related to product safety and regulatory challenges • Recalls of heart devices due to battery malfunctions, with delays in reporting safety issues leading to regulatory penalties.
13	Viatis Inc. (2021)	<ul style="list-style-type: none"> • Internal control weakness related to financial reporting, • Delays in FDA approval of generic insulin Semglee due to challenges in aligning regulatory compliance systems post-merger
14	Mallinckrodt Pharmaceuticals (2022)	<ul style="list-style-type: none"> • Accused of price-fixing for Acthar Gel, exposing internal gaps in ethical pricing oversight and drawing lawsuits.
15	Regeneron Pharmaceuticals (2022)	<ul style="list-style-type: none"> • Compliance in its global operations internal control weakness over financial reporting
16	Vertex Pharmaceuticals (2022)	<ul style="list-style-type: none"> • weaknesses in its internal audit processes, which could result in undetected financial misstatements, • Regulatory scrutiny over clinical trial reporting for drug TrikaftaX
17	Stryker Corporation (2023)	<ul style="list-style-type: none"> • Compliance issues and internal control challenges in related to financial reporting (Errors in recognizing revenue after the acquisition of K2M, caused by weak financial data integration.)
18	Lupin Pharmaceuticals (2023)	<ul style="list-style-type: none"> • global supply chain issues. (Hurdles timely delivery of products to international markets.) • Challenges in meeting regulatory requirements related to drug approvals
19	Organon & Co. (2023)	<ul style="list-style-type: none"> • Internal audit weakness and compliance issues related to its global issues; • issues related to environmental laws (Issues with waste disposal

Chandana and Koushik

		compliance at European facilities led to fines)
20	Abbot laboratories (2017)	<ul style="list-style-type: none"> • Internal control weakness related to financial reporting, • issues in compliance requirements (Delays in addressing FDA warnings about baby formula production contamination risks exposed lapses in safety)

Table.2: Categories of issues with frequency of occurrence

Sl. No	Category	Frequency

ABSTRACT

Nephrolithiasis or Urolithiasis, commonly known as kidney or renal stone, is a highly prevalent clinical problem that affects about 20% of the human population. A majority of urinary stones are composed of phosphates, oxalates, cystine, and uric acid. The Freshly collected rhizomes were chopped into small pieces, shade dried for 3 weeks and powdered by using a mechanical grinder and were subjected to successive solvent extraction with ethanol and water by continuous hot percolation method using soxhlet apparatus. The buffer contains calcium chloride (5mmol/L) and sodium oxalate (7.5mmol/L) in Tris-HCl 0.05mol/l and NaCl 0.15mol/L (pH 6.5). Calcium chloride solution (9ml) was mixed with 1ml of herb extracts at different concentrations (10, 25, 50, 75 and 100mg/ml). The powdered Rhizome of *Canna indica* Linn. were extracted by ethanolic extraction technique using a soxhlet apparatus. Urolithiasis, mainly caused by calcium oxalate (CaOx) stones, involves crystal nucleation, growth, aggregation, and retention in the kidneys. Current treatments manage symptoms but do not directly inhibit CaOx crystallization, a key process in stone formation. Increased oxalate levels lead to oxidative stress, promoting CaOx crystal formation and kidney injury. *Canna indica* Linn.

Keywords: The Freshly collected rhizomes were chopped into small pieces, with ethanol and water by continuous hot percolation method using soxhlet apparatus.

INTRODUCTION

Nephrolithiasis or Urolithiasis, commonly known as kidney or renal stone, is a highly prevalent clinical problem that affects about 20% of the human population. A majority of urinary stones are composed of phosphates, oxalates, cystine, and uric acid. Almost 80% of these calculi are composed of calcium oxalate (CaOx) 1. Kidney stone formation is a complex process which is the outcome of several physio-chemical events such as super saturation, nucleation, crystal growth, aggregation, and retention 2. Stones develop from a wide variety of metabolic or environmental disturbances, including varying forms of hypercalciuria, hypocitraturia, undue urinary acidity, hyperuricosuria, hyperoxaluria and cystinuria 3, 4. In humans, calcium oxalate (CaOx) is the major component of urolithiasis, and CaOx stones constitute ~ 80% of all stones 5, 6. Diuretics play an important role in situations like hypercalciuria, oedema, acute and chronic renal failure, and cirrhosis of the liver, and act as an anti-hypertensive agent. Several diuretics like thiazides, furosemide, mannitol, and ethacrynic acid are used in practice. Urolithiasis needs both preventive and curative therapy. Currently, there are no satisfactory drugs in modern medicine, which can dissolve the stone and therefore physicians remain to be depending on alternative systems of medicine for better relief. The treatment choices are surgical procedures, diuretics, analgesics, alkalinization of urine, and in some cases, allopurinol treatment. Several herbal products have shown beneficial effects against urolithiasis and have diuretic activity, and these products found less side effects and toxicity comparatively 7, 8. *Canna indica* Linn., commonly known as Indian shot, or African arrowroot, is a plant species in the family Cannaceae. The major phytochemicals include alkaloids, carbohydrates, proteins, flavonoids, terpenoids, cardiac glycosides, steroids, tannins, saponins and phlobatannins 9. This plant possesses various medicinal properties like Anti-cancer, Anti-diarrheal effect, Anti-diabetic effect, Anti-inflammatory effect, Anti-nociceptive and anthelmintic effects, and Anti-bacterial effects. Ethnomedicinally, it is used in the treatment of kidney stones and is also used as a diuretic. Despite a long traditional use of *Canna indica* Linn. no systematic pharmacological work has ever been carried out on rhizomes for Kidney diseases 10, 11. Hence, the present study was carried out to evaluate the Diuretic and Anti-urolithiasis activities of *Canna indica* Linn. Rhizome extract in Wistar rats.

MATERIALS AND METHODS

Collection and Authentication

Fresh Rhizome of *Canna indica* Linn. was collected from Kottakkal, Malappuram District, Kerala, in the month of October 2019. The plant specimen was authenticated (Specimen No. 88489) by Dr. M. Pradeep, Assistant Professor and Head, Department of Botany, University of Calicut, Kerala, India. The specimen voucher was deposited in the Department.

Extraction and Phytochemical screening

The Freshly collected rhizomes were chopped into small pieces, shade dried for 3 weeks and powdered by using a mechanical grinder and were subjected to successive solvent extraction with ethanol and water by continuous hot percolation method using soxhlet apparatus. The crude samples were subjected to qualitative chemical tests for the detection of various plant constituents like alkaloids, flavonoids, terpenoids, alkaloids, glycosides etc 12.

Experimental Animals

Wistar rats (200-250g) and Swiss albino mice (25-30g) of either sex were used. Animals were housed in groups of five under standard laboratory conditions of temperature (25±20° C) and 12/12 h light/dark cycle. They were provided with standard pellets and tap water *ad libitum*. The study protocol was approved by the Institutional Animal Ethics Committee (IAEC) of CCSEA (Committee for Control and Supervision of Experiments on Animals)13.

Sreelakshmi and Venkatesh Sellamuthu

In-Vitro Study**Anti-Urolithiasis Activity****Nucleation Assay**

The buffer contains calcium chloride (5mmol/L) and sodium oxalate (7.5mmol/L) in Tris-HCl 0.05mol/l and NaCl 0.15mol/L (pH 6.5). Calcium chloride solution (9ml) was mixed with 1ml of herb extracts at different concentrations (10, 25, 50, 75 and 100mg/ml). Crystallization was initiated using 1250ml of sodium oxalate solution. The absorbance was read at 620nm every 30 minutes at 37°C. The rate of nucleation was estimated by comparing the induction time in the presence of extract with that of polyherbal drug Cystone as control 14.

$$\% \text{ inhibition of nucleation} = \frac{(\text{Absorbance of Control} - \text{Absorbance of Test})}{\text{Absorbance of Control}} \times 100$$

Aggregation assay

Calcium chloride and sodium oxalate solutions (50mmol/L) were equilibrated to 60°C in a water bath for 1hr and then cooled to 37°C overnight. The crystals formed were then harvested by centrifugation and evaporated at 37°C. Buffered crystal solution (0.8mg/ml) was prepared using Tris-HCl 0.05mol/L and NaCl 0.1 mol/L (pH 6.5). The percent inhibition of aggregation was calculated by comparing the turbidity in the presence of extract at different concentrations (10 –100mg/ml) with that obtained in the positive control (Cystone) and the negative control (distilled water), using the following formula 15.

$$\% \text{ inhibition of aggregation} = \frac{(1 - \text{Turbidity of Sample})}{\text{Turbidity of Negative control}} \times 100$$

In-Vivo Study**Evaluation of Diuretic Activity****Lipschitz method**

Wistar rats were selected and divided into five groups consisting of 6 rats in each group (n=6). Group I control, received orally sodium CMC (0.5%w/v), 10ml/kg. Group II, standard received orally 20mg/kg Furosemide. Group III and IV received orally 200mg/kg and 400mg/kg of ethanolic extract of *Canna indica* Linn. Rhizome respectively. After dosing, all the animals were placed in individual metabolic cages and urine was collected and measured at 1,2,3,4 and 5hr. Sodium and potassium concentration in urine samples was determined at 5th hour by standard biochemical analysis. Total urine volume and urinary concentration of Na⁺, K⁺, and Cl⁻ were measured 16.

Statistical Analysis

The results are expressed as mean± SD. The data was analysed by the Student T test. A value of P less than 0.01 was considered statistically significant.

Evaluation of Anti-Urolithiasis Activity

Twenty Wistar rats were divided into five groups of four animals each, undergoing different treatments for 28 days. Group I served as the normal control with no treatment. Groups II, III, and IV had *ad libitum* access to regular food and water containing 0.75% ethylene glycol to induce hyperoxaluria and calcium oxalate (CaOx) deposition in the kidneys. Group II received 750mg/kg. Cystone tablets as a standard drug. Groups III and IV were treated with 200mg/kg and 400mg/kg ethanolic extract of *Canna indica* Linn. Rhizome, respectively. Group V served as the positive control, receiving 6μL distilled water per body weight by gavage. After the experiment, 24-hour urine samples were collected and centrifuged to remove faecal contamination. The purified urine was used for further analysis. On the 28th day, rats were anaesthetized, and blood was collected from the retro-orbital sinus. The serum was separated by centrifugation at 10,000 X g for 10 minutes and analyzed for creatinine, urea nitrogen, and uric acid

**Sreelakshmi and Venkatesh Sellamuthu**

using diagnostic kits for calcium, phosphorus, urea, and creatinine 17, 18. The rats were then sacrificed by cervical dislocation, their abdomens opened, and both kidneys isolated and cleaned of extraneous tissue. The right kidney was preserved in 10% neutral formalin, while the left kidney was dried in an oven at 100°C for 24 hours, weighed, and minced in 7ml of 0.5N nitric acid. The calcium content of the mixture was determined using a calcium kit and expressed as mg/g dry kidney. The right kidney was fixed in Bovin's solution, embedded in paraffin, sectioned at 3-4 mm intervals, and stained with hematoxylin and eosin. Tissue slices were photographed using optical microscopy under polarized light.

Statistical Analysis

The results were expressed as mean \pm SEM. Statistical analysis was carried out using one-way ANOVA followed by the Dunnett's test. $P < 0.05$ was considered statistically significant.

RESULT

The powdered Rhizome of *Canna indica* Linn. were extracted by ethanolic extraction technique using a soxhlet apparatus. The percentage yield of ethanolic extract of *Canna indica* Linn. Rhizome was found to be 17.21%W/W. The phytochemical screening of *Canna indica* Linn. Rhizome extracts possess the presence of various chemical constituents such as carbohydrates, flavonoids, saponins, tannins, proteins and amino acids. An increase in urine output is a key index for assessing diuretic effects by estimating the urinary excretion of ions such as Na^+ , K^+ , and Cl^- , identifying the ions responsible for diuretic activity. The extracts significantly increased urinary output compared to the control. *Canna indica* Linn. 200mg/kg (8.17 ± 0.15 ml) and *Canna indica* Linn. 400mg/kg (10.13 ± 0.40 ml) versus control (3.33 ± 0.23 ml; $P < 0.01$). However, this effect was less than that of furosemide (14.26 ± 0.78 ml versus 3.33 ± 0.23 ml). The results indicate that the ethanolic extract of *Canna indica* Linn. possesses dose-dependent diuretic activity at $P < 0.01$. The ethanolic extract increases chloride & sodium ion excretion to a greater extent than potassium, which is an essential quality of a good diuretic with lesser hyperkalemic side effects.

DISCUSSION

Urolithiasis, mainly caused by calcium oxalate (CaOx) stones, involves crystal nucleation, growth, aggregation, and retention in the kidneys. Current treatments manage symptoms but do not directly inhibit CaOx crystallization, a key process in stone formation. Increased oxalate levels lead to oxidative stress, promoting CaOx crystal formation and kidney injury. *Canna indica* Linn. the extract was tested for its anti-urolithiasis effects, showing significant inhibition of CaOx nucleation and aggregation, which helps reduce crystal growth and promote the excretion of smaller particles. Increased oxalate levels predispose the kidneys to oxidative stress by elevating reactive oxygen species (ROS) and reducing endogenous antioxidant enzymes, which facilitates calcium oxalate (CaOx) crystal nucleation, aggregation, and retention. Current treatments primarily focus on reducing urinary supersaturation but do not directly inhibit CaOx crystallization. Inhibiting this process could represent a new therapeutic approach. Nucleation is the initial step in CaOx crystal formation, followed by aggregation, leading to urinary tract occlusion. In this study, *Canna indica* Linn. extracts were tested for their ability to inhibit CaOx crystallization. The results showed that increasing concentrations of *Canna indica* Linn. extract reduced CaOx nucleation and crystal growth, as indicated by lower absorbance values. While the standard solution of Cystone exhibited stronger inhibition, *Canna indica* Linn. still demonstrated significant anti-nucleation properties 19. Aggregation of CaOx crystals is another critical factor in stone formation. *In-vitro studies* showed that *Canna indica* Linn. extract reduced crystal aggregation in a dose-dependent manner. This effect is beneficial as smaller particles are less likely to be retained in the urinary tract and are more easily excreted. Additionally, *Canna indica* Linn. rhizome has a diuretic effect, which may further help in preventing stone formation by increasing fluid output. The extract's ability to inhibit both nucleation and aggregation of CaOx crystals suggests it may be effective in preventing kidney stones by reducing crystal growth and promoting the excretion of small particles 20.

**Sreelakshmi and Venkatesh Sellamuthu**

In-Vivo studies using an ethylene glycol-induced hyperoxaluria model in albino rats demonstrated that *Canna indica* Linn. extract reduced oxalate, calcium, and phosphate excretion, lowering the risk of stone formation. The extract also exhibited diuretic activity, increasing urine volume and the excretion of Na⁺ and K⁺, which likely contributed to the dissolution of pre-formed stones and prevention of new stone formation. The protective effects of *Canna indica* Linn. are attributed to its active phytoconstituents, making it a promising candidate for preventing kidney stones 21, 22. Chronic administration of 0.75% ethylene glycol increased oxalate, calcium, and phosphate excretion, promoting stone formation. Treatment with *Canna indica* Linn. extract and Cystone significantly reduced these elevated levels, preventing stone formation by inhibiting CaOx crystal nucleation and aggregation. The extract also lowered urinary phosphate levels, reducing the risk of calcium phosphate crystal formation 23, 24. The study found that the glomerular filtration rate (GFR) decreased in urolithiasis rats due to urinary obstruction by stones, leading to elevated levels of urea, creatinine, and uric acid in the blood. However, *Canna indica* Linn. extract showed significant diuretic activity, increasing urine volume and the excretion of Na⁺ and K⁺ without altering the Na⁺/K⁺ ratio. This diuretic effect likely contributed to the dissolution of pre-formed stones and prevention of new stone formation 25, 26. The results suggest that *Canna indica* Linn. extract has protective effects against renal calculi by reducing crystal growth and promoting the excretion of small particles, thus preventing kidney stone formation. The presence of active phytoconstituents such as alkaloids, steroids, tannins, phenolic compounds, terpenoids, and flavonoids in the extract may contribute to its efficacy.

CONCLUSION

This study evaluated the diuretic and anti-urolithiasis activities of *Canna indica* Linn. Rhizome extract in Wistar albino rats. The ethanolic extract, containing flavonoids, tannins, terpenoids, and phenolic compounds, showed significant diuretic activity similar to furosemide. This extract also inhibited calcium oxalate (CaOx) crystallization *in-vitro*, suggesting potential benefits for preventing kidney stones. In an ethylene glycol-induced urolithiasis model, ethanolic extract reduced body weight loss, improved urinary output, and decreased the urinary and serum levels of CaOx, phosphate, and uric acid. These effects were comparable to the standard drug, Cystone, indicating ethanolic extract of *Canna indica* Linn. Rhizome potential for treating urolithiasis.

ABSTRACT

The fisheries sector stands as a promising subdivision within the broader agricultural domain, with India ranking as the second-largest fish-producing country globally, following China. This sector plays a crucial role in India's economy, contributing significantly to socio-economic development. Recognized as a major source of income and a generator of employment, it also fosters the growth of numerous subsidiary industries. Fisheries are pivotal for providing food, nutrition, income, and livelihoods to millions of people, and they serve as a substantial source of foreign exchange earnings for the country. In the Andaman & Nicobar Islands, a significant proportion of the population, including the fishing community, comprises settlers from mainland India. Originally devoid of traditional fishermen to exploit fisheries resources, the Andaman & Nicobar Administration took proactive measures by relocating traditional fishermen from the mainland to these islands. Despite the implementation of various schemes aimed at enhancing the skills and capabilities of fishermen to foster the growth of the fisheries sector, several challenges persist. The challenges include insufficient skilled and technical manpower, a lack of infrastructural facilities, the absence of boat-building yards, limited local markets, dominance by middlemen, the unavailability of direct export facilities, and a lack of modernized craft and gear. Therefore, this study aims to identify the impediments faced by the fisheries sector and propose suitable recommendations to enhance the prospects of the fisheries sector in the Andaman & Nicobar Islands.

Keywords: Aquatic Animal Production, Boat-Building Yards, Environmental Conservation, Fishing Technology, Nutritious Food.

INTRODUCTION

The fisheries sector stands out as a promising subdivision within India's expansive agricultural domain. Asia, the world's largest continent with a population of 4.2 billion, constitutes 60 percent of the global population. India, as the second most populous country globally with 1.38 billion people, comprises 17.7 percent of the world's population. In India, approximately 65 percent of the population still relies on agriculture for their livelihood, encompassing fisheries as a vital component. The fisheries sector plays a pivotal role in the socio-economic development of the country. Recognized as a potent income and employment generator, it catalyzes the growth of numerous subsidiary industries and serves as a source of affordable and nutritious food, along with being a foreign exchange earner. Consequently, it provides a livelihood for a substantial portion of the economically disadvantaged population in the country. Within the Indian context, the Andaman & Nicobar Islands, a Union Territory, boast an extensive collection of natural resources capable of influencing the islands' economy significantly. The primary sources of revenue in these islands include tourism, agriculture, fisheries, handicrafts, mineral resources, and energy. The fisheries sector, in particular, emerges as a major contributor, providing robust support to the islands' economy. With abundant marine fishery resources, the Andaman & Nicobar Islands consider water resources as a primary means of livelihood, engaging many in fishing activities.

NEED FOR THE STUDY

This study is needed because the fisheries sector plays a vital role in the economy and livelihoods of the Andaman & Nicobar Islands, where many people rely on fishing. Despite efforts to improve the sector, significant challenges persist, limiting its potential. These include a shortage of skilled workers, inadequate infrastructure like boat-building facilities, and limited local markets. Middlemen interference in the supply chain significantly reduces profits for fishermen, while the lack of export facilities restricts access to global markets. Outdated fishing equipment and boats further hinder productivity. These problems affect the income and job opportunities for local communities and slow down overall development. This study aims to identify the key issues facing the fisheries sector and offer practical solutions to address them. By improving infrastructure, providing skill development, and creating direct market access, the study seeks to strengthen the sector, ensuring sustainable growth and boosting economic benefits for both local and national economies.

REVIEW OF LITERATURE

Kumar et.al (2008), in their study "Domestic Fish Marketing" revealed that the infrastructure facilities at the majority of the surveyed landing centers, fishing harbors, as well as wholesale and retail markets are significantly lacking and suffer from poor maintenance. Further it demonstrates the necessity of establishing a consistent market policy for the fishery sector. Such a policy would streamline operations and regulations, thereby ensuring efficient management and the timely delivery of the country's fish production to consumers. Simultaneously, it would also guarantee fair and rewarding prices for fishermen. **Advani et.al (2013)** aimed to examine the "Emergence and Transformation of Marine Fisheries in the Andaman Islands". This study Demonstrate that the large fish exporters have their offices in Port Blair and manage the shipment of processed or frozen fish from the various district of the islands through Port Blair and on Chennai to Mainland India. Direct Export from the Andaman Islands to foreign marketers is not possible due to lack of an international Airport at Port Blair. **Roy and Dorairaj (1994)** examined the socio-economic conditions in the villages of Juglighat and Guptapara, South Andaman, and found that the region's fishing community faces significant development barriers. Key infrastructure, such as ice plants, cold storage facilities, and cooperative societies, were absent near landing centers, hindering fish marketing. Additionally, fishermen had limited access to credit, receiving minimal financial support. The study also highlighted tensions between environmental conservation efforts and the livelihood needs of local fishermen.

**Padhmanaban and Deepa****STATEMENT OF PROBLEM**

The Andaman & Nicobar Islands have significant potential in the fisheries sector promoting large-scale employment and livelihood for coastal communities. The island administration has introduced various schemes to enhance the skills of traditional fishermen, and the sector contributes substantially to the region's economy. However, despite these positives, the fisheries sector faces numerous challenges. These include a critical shortage of skilled and technical manpower, largely due to insufficient training programs for fishermen, limiting their ability to adapt to modern techniques. Infrastructure deficits, such as inadequate cold storage, ice plants, and processing facilities, force fishermen to sell their catch to intermediaries at lower prices, diminishing their profits. Environmental issues, such as rising sea levels, heavy rainfall, and pollution, threaten both the coastal ecosystem and the livelihood of local fishermen. Furthermore, the lack of an international airport in Port Blair restricts export opportunities, while the dominance of middlemen in the local market exacerbates financial pressures. Fishermen also face difficulty accessing financial assistance and credit, especially during lean periods. Additionally, most fishing vessels lack freezing facilities or deep-sea fishing capabilities, and outdated fishing technology hampers productivity. These issues, combined with limited government support and market access, prevent the fisheries sector from realizing its full economic potential.

OBJECTIVES OF THE STUDY

1. To identify the status of fisheries sector in India.
2. To identify the status of fisheries sector in Andaman & Nicobar Islands
3. To study the infrastructural facilities available in study area.
4. To identify the problems faced by the fisheries sector in study area.
5. To offer suitable suggestion for the prospects of fisheries sector in study area.

METHODOLOGY OF THE STUDY

This study has been done on the basis of primary and secondary data. The primary data was collected through interview, schedules and observation from 100 respondents through convenience sampling method. The secondary data are collected through Research papers, articles, journals, books and related websites etc.

LIMITATIONS OF THE STUDY

The study is conducted in Port Blair, the capital city of Andaman and Nicobar Islands. Hence the results may or may not be applicable to the other areas. Moreover the Respondents are often busy during morning hours catching fish, making it difficult to collect data. Additionally, limited access to certain fishing areas and the variability of weather conditions also posed challenges in gathering the data.

STATUS OF FISHERIES SECTOR IN INDIA

The Fisheries is considered as an important sector in India. This sector plays a very important role for the development of the country as it provides employment opportunities to millions of people directly and indirectly and also encourages the growth of a number of subsidiary industries, contributing food security to the country. It plays a vital role in developing the economy through substantial foreign exchange earnings. India is the third largest fish producing and second largest aquaculture nation in the world after China. Around 14 million people are engaged in fisheries and allied activities. The economy of our country has undergone rapid structural changes during the last few decades. In India, Andhra Pradesh is leading in fish production followed by West Bengal and Gujarat. The global fisheries and aquaculture industry reached an unprecedented milestone in 2020, as reported by the Food and Agriculture Organization (FAO) in 2022. The total production soared to a record-breaking 214 million tons, comprising 178 million tons of aquatic animals and 36 million tons of algae. This marked a modest increase of 3 percent compared to the prior record set in 2018 at 213 million tons. However, this growth was tempered by reduced catches of specific fish, declined catches in China, and the adverse effects of the Covid-19 pandemic. The overall trend of aquatic animal production conceals notable disparities among continents, regions, and nations. Asian

**Padhmanaban and Deepa**

countries led the way in 2020, contributing to 70 percent of the total production, followed by America, Europe, Africa, and Oceania. China retained its position as the top producer, commanding a 35 percent share of total production. The growth of aquaculture over recent decades has significantly contributed to the overall growth of aquatic animal production, elevating it from comprising 12 percent of the total production in the late 1980s to 37 percent in 2020. India, as one of the leading fish-producing nations, plays a significant role in the global fisheries landscape. It ranks as the third-largest contributor to global fish production, accounting for approximately 8 percent of the total. Notably, India holds the second position globally in terms of aquaculture production. The total fish production in India for the year 2021-22 reached an impressive 16.24 million tons, comprising 4.12 million tons from marine fish production and a substantial 12.12 million tons from aquaculture. Projections for the year 2022-23 anticipate a potential exceeding of 174 lakh tons in fish production. India reached an unprecedented pinnacle in its seafood export performance during the fiscal year 2022-23, setting new records in terms of both volume and value. Over this fiscal year, India successfully exported 17.35 lakhs metric tonnes (MT) of seafood, with a total value of Rs. 63,969.14 crores (\$8.09 billion). This marked a significant growth compared to the previous year, with exports surging by 26.73 percent in terms of quantity, 11.08 percent in terms of value, and 4.31 percent in US dollar terms, as reported by the National Fisheries Development Board.

FISHERIES IN ANDAMAN AND NICOBAR ISLANDS

The Fisheries sector is one of the largest industries in the world. It has become a growing industry in recent years. Fishing is one of the earliest known occupations of the people who belongs to an early stage of civilization, acquired for satisfying the food need from natural sources as subsidiary to hunting. Andaman and Nicobar Islands is one of the union territories of India and it consists of around 572 Islands including small and big islands and rocks of which 38 Islands are inhabited. The Andaman & Nicobar Islands have huge potentials for fisheries development in view of its coastal length of about 1962 km and continental shelf area of 35000sq.km. The exclusive economic zone around this island is about 609000sq.km with an estimated fishery potential is 1.48 lakh metric ton which is 3.8% of our country's total fisheries potential. The Andaman & Nicobar Islands have rich marine resources that support a range of fisheries across the length of the island. Initially there were no traditional fishermen in these islands to make use of the fishery resources and hence the Andaman & Nicobar Administration taken initiatives to bring traditional fishermen from different parts of India. Fishermen from Uttar Pradesh, Andhra Pradesh, Kerala and Tamil Nadu come to these islands either through settlement schemes of the government or voluntarily so as to harvest the potential of these islands. Further the Andaman & Nicobar administration brought agriculturists from West Bengal and settled in these islands by providing land for cultivation. These settlers apart from undertaking agriculture were also engaged in fishing in part time and taken up fresh water aquaculture. The Total Fishermen Population is 26,521 as per Marine Fisheries Census 2016 and at present 6088 licensed fishermen are actively engaged in fishing. The marine and inland fish production -43080 metric tons in the year 2020-21. This record has an increase from the previous number of 40801 metric tons for 2019-20. The quantity of marine products exported by firms (Qty in KG)-27,80,385 Amounted to Rs. 18,28,773 for 2019-20.

INFRASTRUCTURE FACILITIES

The Major infrastructural facilities available in Andaman & Nicobar Islands are Fish markets, Fish landing centres, ice processing units, ice plant and cold storage facilities but the availability of these facilities are inadequate. **Figure 1** depicts that the total number of fish markets available in Andaman & Nicobar Islands are 20 out of which 08 fish markets available in south Andaman, 11 available in North & Middle Andaman and 01 market available in Nicobar district. Few places to sell fish mean fishermen can't make much money. This indicates that people can't find many different types of fish to buy. Prices might go up and down a lot because there aren't many sellers. Only a few big sellers might control everything, which isn't fair. It stops the fish business from growing and hurts jobs and how much money we make. It can also make it hard for people to get enough different foods, which isn't good for health. Fixing this needs more places to sell fish, fair competition, better ways to move fish around, and making sure everyone gets a fair share. **Figure 2** depicts that only three fish processing units are available in South Andaman Islands which are completely owned by Private Limited Company. The presence of just three fish processing facilities, all under the ownership of a single private company, presents considerable hurdles for the fisheries

**Padhmanaban and Deepa**

industry in South Andaman Islands. This monopoly restricts the chances for local fishermen to process and market their catches, diminishing their earnings prospects and suppressing competition. **Figure 3** shows that the total of 15 ice-plant are available in different location of Andaman & Nicobar Islands out of which 04 numbers are owned by the department of fisheries having the capacity of 40 tonnes per day where as 09 numbers of ice plant are owned by different private Limited Companies having the total capacity of 156 tonnes per day and 02 numbers of ice-plant are owned by ANIDCO (undertaking) having the capacity of 10 tonnes per day. The scarcity of ice plant facilities, mostly owned by private entities, presents major hurdles for fishermen. With limited access to these plants, fishermen find it difficult to preserve their catch effectively, resulting in lower quality and value of their products. Private ownership may lead to fishermen encountering high expenses or a lack of ice, affecting their profits. Relying on private ice plants can also expose fishermen to price changes and unfair practices. The inadequate ice plant infrastructure further impedes the growth of the fishing industry. **Figure 4** shows the number of cold storage facilities available in Andaman & Nicobar Islands. Only 12 numbers of cold storage are available out of which 05 are owned by department of fisheries, 06 owned by private companies and 01 owned by ANIDCO (undertaking). The shortage of storage facilities in Andaman & Nicobar Islands poses difficulties for fishermen. Fishermen encounter challenges in adequately preserving their catch. This scarcity can cause spoilage, lower product quality, and restrict market access. Moreover, relying on a small number of storage facilities may lead to higher expenses or insufficient capacity during peak fishing times.

Problems confronted by fisheries Sector in Andaman & Nicobar Islands

Andaman & Nicobar Islands being recognised as one of the major thrust area through marine fisheries. The main source of generating revenue in these islands are tourism industry, fisheries sector, handicraft industries, energy and sources, among fisheries is one of the major sources of generating revenue. The total number of fishing crafts in the island is 2946 and the total number of landing centre is 33. It also promotes large scale employment and livelihood of coastal communities. The island administration introduced number of schemes for enhancing the skills and capabilities of the traditional fishermen hence it plays significant role in trade and commerce. Fisheries governance in Andaman and Nicobar islands is promptly implementing various schemes and programmes for the development of fisheries sector. Despite of having these benefits, the fisheries sector in this islands confronted by numerous hurdles.

- i. It is observed from the study that there is a lack of skilled and technical manpower in the study area. Hence the non availability of manpower is one of the major drawbacks which affect the growth of the fisheries sector. This is due to lack of necessary training imparting to the fishermen.
- ii. The infrastructural facilities such as cold storage, ice plant, transportation, processing plant, landing centre and availability of boat yielding yards plays a vital role for the growth and development of fisheries sector but it is found from the study that the fishermen lacks such infrastructural facilities in the study area and they do not have sufficient cold storage to keep their catch and store the unsold fish. Most of the fishermen do not rely on private traders for storing their fishes due to higher cost since they are not able to bear such expenses. Due to this they forced to sell their catch to the intermediaries,
- iii. It is found from the study that the fishermen export the fishes from Andaman & Nicobar Islands up to Chennai and some other states within India. Export to foreign countries not taking place in the study area due to the non availability of international airport at Port Blair.
- iv. Middle men dominance is also one of the major problem confronted by fishermen due to the lack of awareness about the market condition, insufficient storage facilities, poor transportation and lack of information about the potential customers, the small fishermen are not able to sell their catches directly to the consumer. Hence they mostly depend on the middlemen to sell their fishes at a low cost and the same has been sell by the middlemen to the consumer at a higher price due to this the fishermen fails to enjoy the entire profit.
- v. It is found from the study that environmental constraints such as heavy rainfall, raising sea level, flood, pollution or ocean acidification also one of the major hurdles of the fisheries sector which not only affect the productivity of the coastal fisheries but also the livelihood of the fishermen.
- vi. It is observed from the study that the fishermen get a little or no financial assistance and credit from various agencies and government during the lean period.

**Padhmanaban and Deepa**

- vii. It is observed from the study that most fishing vessels do not have the freezing facility to freeze the fish immediately after catching which leads to inferior quality and most of the vessels do not have the sufficient equipment to go for deep sea fishing.
- viii. Lack of technology also one of the obstacles that affect the growth of fisheries sector. The fisher folk community still uses the outdated technology for catching, they are not able to use the new techniques due to less income and limited support from government.

SUGGESTIONS

The following are the suggestions for the growth of fisheries sector in Andaman and Nicobar Islands

- i. The government must initiate awareness programs for fishermen, educating them on the latest technologies through essential training sessions. By equipping them with knowledge about modern tools and techniques, fishermen can enhance efficiency, productivity, and sustainability in their operations, ensuring the advancement of the fishing industry.
- ii. The Department of fisheries should establish more ice-plant and cold storage facilities at different places in the islands for fisheries sector and provide the same at a very reasonable rate to the fishermen.
- iii. Transportation facilities such as a separate tempo or mini van should be explored for transporting the fresh and dried fish at least for the members of cooperatives at a minimum cost. The government should allocate funds or provide subsidies to support the procurement of tempos or mini-vans and cover operational expenses. It's vital to collaborate with local cooperatives and stakeholders to customize transportation solutions that cater to fishermen's distinct requirements. Moreover, establishing regulatory frameworks is essential to ensure the smooth operation of these services, promoting fair pricing and accessibility for cooperative members.
- iv. Alternative job opportunities should be provided to the fishermen during the lean periods and welfare funds should be given during the natural calamities so as to compensate the loss sustained by the fishermen. During lean fishing seasons, fishermen could participate in aquaculture, tourism-related endeavors like boat tours or guiding, marine conservation projects, fish processing, community development efforts, or education and training programs. These avenues offer extra income and skill enhancement, bolstering financial stability during periods of low fishing activity.
- v. The fisheries cooperatives need to be strengthened and enough support should be provided to the fishermen to sell their catch directly to the consumer without the role of middlemen interference. The government's focus should be on bolstering fisheries cooperatives through financial aid, technical assistance, and capacity-building initiatives. Furthermore, it should establish regulations to enable fishermen to directly sell their catch to consumers, reducing middlemen interference. This might include developing market infrastructure, enforcing fair trade policies, and incentivizing cooperative growth. By empowering fishermen and facilitating direct market access, the government can improve their livelihoods and promote sustainable development in the fishing industry.
- vi. Provide adequate incentives and steps to be taken to encourage the growth of export. To promote fish export growth in the Andaman Islands, the government must invest in port infrastructure, improve quality control measures, engage in trade negotiations, market Andamanese fish products, provide financial aid, support research, offer skill development, and streamline regulations. These actions will enhance competitiveness and market accessibility, fostering fisheries sector export expansion.
- vii. Periodic awareness programs should inform fishermen about available incentives and subsidies. These programs should highlight various government schemes supporting the fisheries sector, explaining eligibility criteria, application procedures, and benefits. Accessible materials, workshops, and community outreach efforts ensure fishermen are informed and can take advantage of available support effectively. The Government should utilize diverse communication channels like radio, community gatherings, mobile apps, and printed materials to inform fishermen about government schemes. Partner with local authorities, fisheries cooperatives, and NGOs to conduct workshops and training, ensuring fishermen grasp eligibility criteria, application procedures, and benefits of the schemes effectively.

CONCLUSION

The fisheries sector in Andaman & Nicobar Islands is not only a source of generating revenue for the islands but also a source of livelihood for the coastal communities. Large section of people directly or indirectly relying on fisheries sector. The island administration introduced various schemes to enlarge the skills and capability of fisher folk for the expansion of fisheries sector even though the fisheries sector facing numerous challenges. Hence the government should take initiative to uplift the status of fisheries sector by providing necessary infrastructural facilities, latest equipment and financial support to the fishermen for marketing the fishes which would in turn not only reduce the stress of the fisher folk but also helps in progress the fisheries sector.

ABSTRACT

This research paper presents a novel approach for identifying a person by audio aesthetics, focusing on a dataset of 50 speakers, each represented by multiple audio clips of their voices. Leveraging the unique emotional and cognitive responses individuals exhibit towards their vocal characteristics, this study aims to establish a reliable biometric identification system based on audio aesthetic preferences. The proposed framework utilizes a Convolutional Neural Network (CNN) to automatically extract high-level features from the audio clips, enabling the system to capture the distinctive qualities of each speaker's voice. The methodology involves a three-stage process: first, audio clips are transformed into mel- spectrograms to facilitate effective feature extraction; second, a CNN architecture is employed to extract discriminate features from these mel-spectrograms; and third, a classifier is trained to identify individuals based on their audio aesthetic profiles. Experimental results demonstrate that the proposed system achieves an impressive identification accuracy of 96% across the dataset, significantly outperforming traditional methods reliant on handcrafted features.

Keywords: Convolutional Neural Network, Mel-Spectrogram, Ensemble learning

INTRODUCTION

In the field of biometric identification, the exploration of audio aesthetics as a means of recognizing individuals has gained significant interest. This study focuses on the unique vocal characteristics of 50 speakers, each represented by multiple audio clips of their voices. By leveraging the emotional and cognitive responses individuals exhibit towards their vocal expressions, this research aims to establish a reliable system for identifying a person using audio aesthetic. The proposed framework uses a Convolutional Neural Network (CNN) to automatically extract high-level features from the audio clips, capturing the distinctive qualities of each speaker's voice. This approach not only enhances the accuracy of identification but also reduces the need for extensive feature engineering typically associated with traditional methods.

Literature Survey

This research focuses on "Aesthetic Net," a deep convolutional neural network created by A. H. Bari, B. Sieu, and M. L. Gavrilova for person recognition using visual aesthetic qualities. The study, published in *The Visual Computer*, investigates the use of aesthetic features as a distinguishing factor in identity detection, which broadens existing biometric approaches. The authors suggest a methodology that uses aesthetic features like color, style, and composition to improve the accuracy of person recognition. Aesthetic Net has considerable potential for applications where conventional biometric data is restricted, providing a fresh approach to identification using visual aesthetics.

METHODOLOGY

- **Speakers:** A total of 50 unique speakers, each contributing to the dataset.
- **Audio Clips:** Each speaker is represented by multiple audio clips of their voices, specifically selected to capture their vocal characteristics and aesthetic preferences.
- **Audio Length:** Each audio clip is approximately 30 seconds long, ensuring sufficient data for feature extraction.
- **Diversity:** The audio clips encompass a variety of genres and styles to reflect the speakers' diverse musical tastes and preferences.
- **Data Format:** The audio files are stored in a standard format (e.g., WAV or MP3) to facilitate processing and analysis.
- **Labeling:** Each audio clip is labeled with the corresponding speaker's identity, allowing for supervised learning during the training of the machine learning model.

Data set

The dataset comprises audio recordings from 50 distinct speakers, each contributing a varying number of samples. To prepare this raw data for deep learning model development, extensive preprocessing was necessary to extract meaningful representations. The model's performance was assessed using a dedicated test set, which was set aside during the training and validation phases. This test set includes audio samples and corresponding speaker labels that the model did not encounter during development, making it representative of the real-world scenarios the model will face upon deployment. Approximately 10-20% of the total dataset was designated for the test set, ensuring that the evaluation reflects the model's ability to generalize to new, unseen data effectively. This careful division allows for a robust assessment of the model's identification capabilities.

Proposed System

The model utilizes mel-spectrogram audio features, capturing both temporal and spectral information from voice samples. It begins with 1D convolutional neural networks (CNNs) employing ReLU activation to extract low-level speech features by identifying local patterns in the spectrogram. This is followed by recurrent layers, such as LSTM and GRU, which model temporal context and long-range dependencies to capture distinctive voice characteristics. The extracted features are then classified into enrolled speaker IDs using fully connected dense layers and a soft max

**Sangi Mounika et al.,**

output layer. Categorical cross-entropy loss trains the model, with dropout regularization preventing over fitting. The dataset is divided into training, validation, and test sets, with performance metrics like accuracy and F1-score assessed on the test set for evaluation.

Process Involved**Dataset**

Data collection for identifying a person by audio aesthetics, involves gathering audio samples from 50 speakers. In this study, publicly available audio datasets were used, consisting of 400 instances with 25 acoustic features each. The target variable represents speaker identity, and the dataset is imbalanced, with 150 samples from some speakers and 250 from others. Features like Mel-frequency cepstral coefficients (MFCCs) and Chromagram are used to capture unique audio traits. The dataset includes independent attributes representing voice characteristics, and using a larger set of features improves the accuracy of speaker identification through machine learning models.

DATA CLEANING

Data cleaning for identifying a person by audio aesthetics, involves several steps. First, corrupted audio files and those with excessive background noise are removed or repaired. Volume levels are normalized, and silence is trimmed from the beginning and end of recordings. All audio files are converted to a consistent format, such as mono-channel .wav at 16kHz. Speaker labels are verified to ensure accuracy. Noise reduction techniques are applied, and outliers or distorted samples are removed. Finally, consistent sample lengths are maintained through trimming or padding, ensuring the dataset is clean and ready for machine learning models.

Data Scaling

Data scaling involves converting audio properties to suit a given range, such 0-1. For models that are sensitive to the size of input characteristics, such as support vector machines (SVM) and k-nearest neighbors (KNN), this phase is particularly important. To normalize the audio data in this investigation, which focused on person identification using audio aesthetics from 50 speakers, we used the maximum absolute scaler approach. By using this method, the machine learning algorithms performed better, guaranteeing a more accurate and efficient speaker recognition procedure.

Data Analysis

In data analysis, pertinent audio characteristics including spectral contrast and Mel-frequency cepstral coefficients (MFCCs) are extracted and assessed. Each speaker's speech is examined for trends and differences using these characteristics. The audio data that has been processed is subsequently used to train machine learning algorithms, such as neural networks and support vector machines (SVM). The efficacy of these models in differentiating between speakers is evaluated by criteria such as accuracy, precision, and recall. Strong identification systems based on audio aesthetics can be developed thanks to this approach.

Data Balancing

Data balancing is essential for ensuring that machine learning models accurately represent all classes within a dataset, particularly in the context of person identification using audio aesthetics. In this study, we addressed the class imbalance present in our audio dataset, which includes recordings from 50 speakers. Since certain speakers may have significantly more audio samples than others, this imbalance can lead to biased models that favor the more represented classes. To achieve data balancing, we employed techniques such as oversampling the minority class (adding duplicate samples or generating new synthetic samples using methods like SMOTE) and under sampling the majority class (reducing the number of samples from over represented speakers). This process helps create a more equitable distribution of audio samples across all speakers, allowing the machine learning models to learn equally from each class. As a result, the identification system can improve its accuracy and robustness, leading to better performance in real-world applications.

**Matrix Correlation**

Matrix correlation plays a vital role in person identification using audio aesthetics by assessing the relationships between various acoustic features extracted from audio samples. By calculating a correlation matrix, we can understand how features like Mel-frequency cepstral coefficients (MFCCs), chromagrams, and spectral contrast interact. High correlation values may indicate redundancy, suggesting some features can be discarded without compromising performance. In contrast, low or negative correlations reveal unique characteristics that aid in speaker differentiation. This analysis informs feature selection, enabling a more efficient and effective feature set for training machine learning models, ultimately enhancing the identification process of individual speakers.

Classification Algorithms**a.CNN**

Convolutional Neural Networks (CNNs) analyze distinctive elements taken from audio sources to identify individuals. To process the audio data, the CNN architecture uses a number of convolutional layers, pooling layers, and activation functions. In order to generate a unique signature for every person, the network learns to recognize distinguishing patterns in the audio signals, such as spectral properties, rhythm, and tone. The CNN learns and adjusts its parameters for precise identification by being given audio samples from different people during training. The CNN achieves high accuracy rates in speaker recognition tasks after being trained to identify unknown audio samples as belonging to a certain individual. CNNs can successfully capture the subtleties of a situation by utilizing the advantages of deep learning.

b.RNN

By simulating temporal correlations in audio inputs, Recurrent Neural Networks (RNNs) perform exceptionally well in person identification tasks. Sequential audio data is processed by RNN architectures, like Long Short-Term Memory (LSTM) or Gated Recurrent Units (GRU), which identify patterns and connections among auditory parameters. Speech patterns, tone, and spectral properties are among the speaker-specific attributes that the network learns to encode into a condensed form. RNNs optimize their weights during training in order to reduce speaker identity prediction errors. Accurate identification is made possible at inference, where the trained RNN receives an audio sample and produces a probability distribution across potential speaker identities. In noisy or deteriorated audio settings, RNNs outperform conventional techniques for speaker recognition due to their capacity to handle variable-length input sequences and simulate long-term dependencies.

c. LSTM

A specific kind of Recurrent Neural Network (RNN) called Long Short-Term Memory (LSTM) networks is excellent at identifying long-term patterns and temporal connections in sequential data, like audio signals. Strong speaker recognition and verification are made possible by LSTMs' efficient modeling of complicated dynamics and interactions in speech through the use of memory cells, input gates, output gates, and forget gates. Even in noisy or deteriorated audio environments, LSTMs are able to achieve high accuracy in person identification by extracting unique speaker-specific properties such as tone, rhythm, and spectral characteristics. Because of this, LSTMs are a dependable option for a number of uses, such as emotion detection, language modeling, and speech recognition.

d.GRU

One kind of recurrent neural network (RNN) called a gated recurrent unit (GRU) is made to effectively capture temporal dependencies in sequential data, such audio signals. By combining the input and forget gates, GRUs streamline the conventional LSTM architecture, lowering computational complexity without sacrificing performance. GRUs can learn long-term patterns and relationships thanks to their simplified design, which makes them ideal for time series forecasting, language modeling, and speaker recognition. Even in loud or deteriorated audio environments, GRUs are able to identify speakers with high accuracy by extracting speaker-specific properties from audio signals, such as speech patterns and spectral characteristics.

RESULT

CONCLUSION

In conclusion, applying a Convolutional Neural Network (CNN) for person identification using a dataset of 50 different speakers proved to be highly effective. By transforming audio clips into mel-spectrograms and automatically extracting high-level features using a CNN, the system was able to capture the distinctive vocal characteristics of each speaker. The approach demonstrated a significant improvement in identification accuracy, reaching an impressive 96%. This shows the potential of deep learning-based models like CNNs in eliminating the

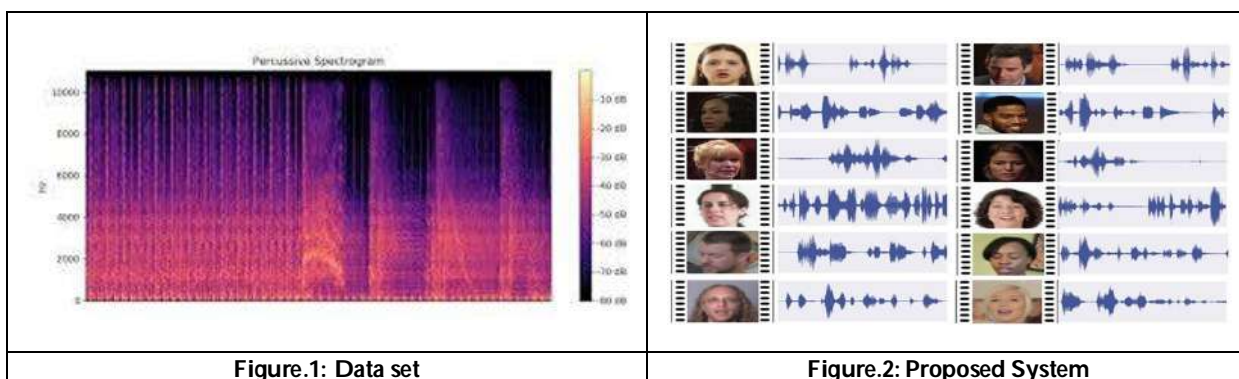

need for manual feature engineering, as they can automatically learn discriminative audio features, even in complex datasets involving multiple speakers.

ABSTRACT

The use of neurological evidence in legal contexts has created new opportunities for addressing implicit biases during courtroom proceedings. Unconscious attitudes known as implicit biases can present major obstacles in guaranteeing fair trials and equitable treatment in the justice system by impacting perceptions and decision-making. New investigations in neuroscience are starting to clarify the brain processes behind these predispositions, providing understanding on how they appear and impact decision-making and actions. This article investigates how neurological evidence, such as brain imaging and cognitive assessments, can be used to discover and measure implicit biases in legal professionals, jurors, and witnesses. Through analyzing specific cases and new developments in neuro technology, the research underscores the possible advantages and moral quandaries of integrating neurological proof into legal systems. Topics like the trustworthiness, availability, and difficulties in understanding this evidence are examined, as well as the impact on policy changes. This evaluation highlights the importance of neuroscientists, sociologists, and legal experts working together to develop a fair approach that upholds individual rights and ensures judicial fairness. The paper suggests further research to investigate how neurological evidence can help reduce bias and improve the reliability of legal proceedings.

Keywords: Evidence, Neurology, Judicial Fairness, Brain Imaging, Trial System.

INTRODUCTION

Unconscious attitudes and stereotypes that influence behavior, known as implicit bias, have become a significant issue in ensuring fair and unbiased judicial proceedings. Research [1] suggests that implicit bias can result in notable differences in legal outcomes, affecting jury verdicts, sentencing decisions, and evaluations of witness credibility.

**Bulbul Roy Chowdhury (Ghosh)**

Recently, progress in neuroscience has led to a better understanding of how implicit biases develop and operate in the brain, especially through neuroimaging methods that uncover neural processes. Research indicates that certain parts of the brain, like the amygdala, are essential for instinctual reactions linked to bias, whereas the prefrontal cortex helps to control and suppress these prejudices [2]. The inclusion of neurological evidence in legal contexts is still debated, prompting inquiries about its trustworthiness, acceptability, and moral consequences. The legal system typically uses behavioral and circumstantial evidence to evaluate bias, but incorporating neurological evidence may offer a more impartial way to measure implicit bias [3]. This article examines how neurological evidence can be used to address implicit bias in courtrooms, taking into account the validity of the science and the ethical issues involved. This study aims to investigate if evidence from neuroscience can enhance judicial fairness and help create policies that reduce bias in legal proceedings by exploring the connection among neuroscience, implicit bias, and law.

Objectives of The Study

The objectives of this paper are as follows:

- To study the neural mechanisms of implicit bias, investigate the scientific foundation of implicit bias by looking at the brain areas and neural systems that play a role in creating and controlling these biases.
- To review the criteria for presenting neurological evidence in courts, addressing issues concerning trustworthiness, understanding, and the legal guidelines controlling this type of evidence.
- To examine the ethical issues and legal factors associated with utilizing neuro-evidence for evaluating implicit bias, emphasizing individual rights, mental privacy, and due process.
- To provide suggestions for policies that can be used to integrate neuroscience into the legal system in a responsible manner to reduce implicit bias, improve fairness, and promote reform within the judiciary.

MATERIALS AND METHODS

This article employs a blended methodology, merging an extensive literature review with qualitative case analysis to examine how neurological evidence is utilized to tackle implicit bias in courtrooms. Essential materials consist of peer-reviewed articles on neuroscience, implicit bias, and legal studies for grasping the neural foundation of bias, its effect on legal results, and present courtroom procedures. Studies published from 2000 onwards were gathered from databases like PubMed, JSTOR, and LexisNexis, with a focus on articles utilizing neuro imaging techniques (fMRI, EEG) in bias research.

The Neuroscientific Foundation Of Implicit Bias

Implicit biases are ingrained prejudices and stereotypes that impact how individuals perceive, assess, and behave without conscious recognition. Research in neuroscience has improved our comprehension of how biases are created and maintained by the brain, mainly involving structures such as the amygdala and the prefrontal cortex. The amygdala, responsible for managing emotional responses, has a key role in the immediate, involuntary reactions seen in implicit bias. The reactions often stem from connections to cultural stereotypes or past experiences stored in memory [4]. Research indicates that amygdala activation can happen even when a person is unaware of their biases, indicating that subconscious neural processes underlie implicit attitudes [5]. The prefrontal cortex, which handles advanced cognitive processes such as self-control, plays a role in overseeing and at times suppressing these ingrained biases. Studies show that when people try to suppress implicit biases, the prefrontal cortex, specifically the dorsolateral prefrontal cortex, is highly involved, as it helps regulate emotional reactions [6]. Nevertheless, the prefrontal cortex sometimes fails to suppress these biases due to the amygdala's dominance, especially when facing time constraints or mental strain [7]. The measurement of implicit bias is often done through tools such as the Implicit Association Test (IAT), which identifies biases by monitoring reaction times to related words or images. Research using fMRI has revealed that individuals with elevated levels of implicit bias on the IAT tend to display increased amygdala activation when seeing faces from racial out-groups [8]. This indicates a brain counterpart for subconscious biases that appear involuntarily. Although these tools are helpful, discussions continue about the accuracy of the IAT in measuring implicit bias due to potential impacts of situational factors on response times [9].

**Bulbul Roy Chowdhury (Ghosh)**

Implicit biases may also have roots in evolutionary processes that prioritize quick categorization for survival. This natural tendency, referred to as "in-group" preference, helped early humans differentiate between allies and enemies, a crucial ability for ensuring survival [10]. Even though it was helpful in ancient human communities, this natural inclination now causes social rifts, as the brain sorts people into groups using physical characteristics like race or gender, often resulting in bias [11]. Research in neuroscience indicates that these classification processes are mostly automatic and subconscious, based on neural pathways that prioritize efficiency rather than accuracy [12]. Adding more complexity to implicit bias is the idea of neuroplasticity, which refers to the brain's capacity to restructure itself through the creation of fresh neural pathways. Research has shown that continual exposure to various social interactions can decrease amygdala reactivity and lessen implicit biases in the long run [13]. These results indicate that implicit biases can change in response to social environments, showing promise for reducing bias with specific interventions [14]. Yet, applying these neuroscience findings to real-world actions continues to be difficult in social and legal settings, because these prejudices frequently function without being consciously recognized. The legal field can be greatly impacted by the neuroscientific understanding of implicit bias, especially in terms of its influence on jury selection, sentencing, and overall judicial equity. Neuroscientific evidence could offer a more objective way to examine unconscious biases in courtrooms by pinpointing the neural foundation of implicit biases. Still, the incorporation of this evidence is a subject of disagreement because biases linked to neural processes pose a challenge to conventional legal ideas of intent and culpability [15]. Moreover, there are ethical issues regarding mental privacy and the potential inappropriate use of neurological evidence in legal contexts, with some stating that discriminatory actions should not be justified by implicit biases [16]. The research in neuroscience shows that unconscious biases are ingrained in brain functions, particularly in the amygdala's reflex reactions and the prefrontal cortex's executive control. Although these biases may have served a purpose in evolution, they frequently result in discriminatory results in today's world. Comprehending the neural foundation of unconscious prejudices provides chances for reducing biases and promoting more equitable legal systems, yet it also brings difficulties in implementing these findings into practical legal structures.

The Admissibility of Neurological Evidence In Bias-Related Legal Cases

The acceptability of neurological evidence in bias-related legal cases has become a complicated and developing issue. Neurological evidence, frequently obtained from neuroimaging methods like fMRI or EEG, can provide valuable understanding of implicit biases through detecting brain patterns associated with automatic attitudes and stereotypes. While the evidence could improve comprehension of implicit bias, its application in courtrooms faces legal and ethical obstacles. The Daubert and Frye standards [17] are crucial for determining the acceptance of neurological evidence in the U.S. legal system, establishing guidelines for evidence's scientific reliability and widespread acceptance. According to the Daubert standard, the evidence needs to show reliability, relevance, and a solid scientific foundation. Courts have to evaluate if the neurological evidence meets these standards by examining the methodology and the capability to accurately interpret results. Still uncertain is whether fMRI and EEG studies have achieved the necessary reliability for reliable legal use, given their susceptibility to context and the need for expert interpretation [18]. A significant legal issue is the excessive interpretation of neuro-evidence. Brain scans do not offer direct proof of particular thoughts or intents, but rather show indirect signs of brain activity linked to mental processes. Critics contend that utilizing brain scans to evaluate implicit biases may result in misinterpretations, as biases identified in a controlled environment may not necessarily align with actions in real-life situations [19]. Furthermore, implicit biases are frequently influenced by the context, which implies that biases identified in an experimental environment may not be present in other scenarios, making their use as conclusive legal proof more challenging [20]. Interpreting neurological data can be challenging due to its subjective nature, leading to inconsistent application in different cases. Courts are at risk of encountering variability in expert testimony due to experts offering differing interpretations of the same neuroimaging data. This variation gives rise to worries about the possibility of bias when interpreting neurological evidence, making it more challenging to use in determining factual evidence for cases involving implicit bias [21]. Ethical issues also come up regarding the protection of privacy and mental well-being. Studying an individual's brain processes through neurological evidence raises worries about mental privacy and self-incrimination [22]. Critics caution that introducing neuro-evidence about implicit biases may violate an individual's mental privacy, possibly categorizing people based on unconscious beliefs rather than

**Bulbul Roy Chowdhury (Ghosh)**

intentional behaviors. These worries align with the ethical guidelines of the American Bar Association, which prioritize safeguarding individual rights and steering clear of evidence that may result in unjust bias. Although the neurological evidence offers interesting potential for evaluating implicit biases in legal cases, its acceptance in court is challenged by significant scientific, interpretive, and ethical obstacles. Courts need more specific guidelines in order to assess the reliability and relevance of neuro-evidence, making sure it meets legal and ethical standards. Using neurological evidence as a supplement rather than a main focus can offer a balanced strategy, enabling us to acknowledge its benefits without relying too heavily on its constraints.

The Impact of Neurological Evidence And Court Room Bias In Society

The inclusion of neuroscientific findings in legal cases has important consequences for combatting biases in court that impact the impartiality of judicial decisions. In legal situations, implicit biases, which are unconscious attitudes and stereotypes that can affect decisions, are widespread and affect jurors, judges, and lawyers [23]. Neurological evidence, especially from methods like fMRI, is now seen as a possible way to comprehend and reduce biases by identifying the brain activity related to decision-making. Studies show that unconscious biases can result in unequal treatment due to race, gender, or income level, causing systemic disparities in the legal system [24]. Studies indicate that jurors might unknowingly link Black defendants with increased criminality, leading to more severe judgments and sentences [25]. Legal scholars and practitioners are using neurological evidence to understand how biases manifest in courtroom proceedings, aiming for a more impartial perspective [26]. Using neurological evidence to evaluate bias brings about both chances and difficulties. It provides a scientific foundation for comprehending the functioning of biases at a subconscious level, potentially influencing jury selection and judicial training [27]. To illustrate, identifying the areas of the brain linked to partial decision-making could assist legal experts in creating methods to address these biases with educational and awareness programs [28]. Moreover, integrating neurological evidence in legal proceedings could lead jurors and judges to address their biases directly, encouraging a sense of responsibility within the legal system [29]. Nevertheless, incorporating neurological evidence also gives rise to important ethical and practical issues. Deciphering neuroimaging findings can be intricate and may be misinterpreted if not accompanied by sufficient context [30]. In other words, detecting bias through neural signatures does not necessarily prove a person's intent or guilt, which can make legal arguments about responsibility more complex [31]. Additionally, the possibility of neurological evidence strengthening stereotypes or continuing biases raises ethical concerns about mental privacy and individual rights [32]. Another important issue is the risk of depending too much on neurological evidence, resulting in a simplified perspective of human behavior. This viewpoint may oversimplify intricate social dynamics and fail to consider the socio-legal factors influencing bias [33]. Legal professionals must find a middle ground between applying knowledge from neuroscience and having a comprehensive grasp of the complex aspects of human conduct, especially when in a legal setting. In spite of these obstacles, the neurological evidence has the ability to greatly impact how bias and fairness are perceived in the judicial system. By recognizing the scientific foundations of implicit bias, society can encourage a more knowledgeable conversation about justice and equality [34]. Educational programs for legal professionals, based on neuroscience research, are a key strategy to decrease bias in the courtroom and improve the fairness of the judicial system.

CONCLUSION

Examining neurological evidence in legal cases showcases an important overlap among neuroscience, psychology, and law, especially in regards to implicit biases that may impact court decisions. Since implicit biases work without awareness, they present major obstacles to achieving fairness and justice in the legal system. Advanced imaging techniques provide valuable neurological evidence that helps us better understand the biases in decision-making in courtrooms by revealing the neural mechanisms behind them. Although there are significant advantages to incorporating neurological research into legal procedures, such as improving jury selection, educating judges, and increasing awareness of biases, it is important to acknowledge the difficulties as well. Issues concerning the trustworthiness and interpretive intricacies of neuro imaging data need to be resolved to guarantee proper and

Bulbul Roy Chowdhury (Ghosh)

ethical utilization of this evidence. Furthermore, depending too much on neurological evidence can result in simplifying human behavior and overlooking the intricate social factors that contribute to bias in the legal system. In the end, the proper integration of neurological evidence in the legal system could lead to a fairer judicial process. This integration presents ethical and practical challenges that can be addressed through collaboration between legal professionals, neuroscientists, and ethicists. Through focusing on education and awareness efforts guided by neuroscientific discoveries, the legal field can aim to lessen the influence of unconscious biases, ultimately improving the fairness of legal processes. By taking this action, society can make significant progress in tackling systemic inequalities and advocating for justice for everyone.

ABSTRACT

Tourism is a major industry in Andaman and Nicobar Islands. The Andaman and Nicobar Islands are the exclusive tourist destination. The natural beauty of the A& N Islands is very attractive. The majority of the revenue earned by the government of Andaman and Nicobar is through the tourism industry. Therefore it is a very important foundation for generating income which is created through spending by tourist inflow. The outbreak of COVID-19, a black swan event had an extreme impact on tourist inflow in A& N Islands in the past four years that is from 2018-2022. The nationwide lockdown in different nations restricted various economic activities and movements. Tourism is one of the economic activities severely hit by COVID-19 in the A & N Islands. According to the study, the tourist inflow rate was 17.44 % in A & N Islands in 2017-18. In the next year 2018-19, the rate of tourist inflow was 0.19% and the rate went negative in the next year 2019-2020 which is -84.39%. Due to the COVID-19 outbreak, tourist arrival declined which has serious consequences on the livelihood of the islanders. This study reveals the impact of the COVID-19 outbreak on both domestic and foreign tourist inflow in the Andaman & Nicobar Islands. This paper is entirely based on secondary data collected from websites, articles, and Tourism Statistics issued by the Directorate of Tourism, Andaman and Nicobar Administration.

Keywords: COVID-19, Environment, Lockdowns, Pre-Pandemic, Tropical Climate, Tourists Inflow.

INTRODUCTION

A paragon of beauty, the Andaman and Nicobar Islands present a landscape of scenic picturesque extravaganza, shining like an emerald in the Bay of Bengal. People from all the states in India live on these islands in harmony with their own cultures. The natural beauty of The Andaman and Nicobar Islands is very attractive. The Andaman Islands offer a wide variety of activities to the travelers like trekking, snorkeling, fishing, scuba diving, deep sea diving, helicopter rides, seaplane rides, water skiing, speed boat rides, surfing, kayaking, sea walking and so on which attract a large number of Adventure Tourists. Natural site attractions are the pristine beaches, thick and dense tropical rainforests, limestone caves and volcanoes are the major attractions for Eco tourists. The novel coronavirus disease was first identified in December 2019 in Wuhan, China. The outbreak has been severely disseminated worldwide, leading the World Health Organisation to declare COVID-19 as a pandemic on 11th March 2020. COVID-19 has infected over ten million people and caused over 5,00,000 deaths worldwide by June 2020 (WHO, 2020). The pandemic has triggered severe social and economic disruption around the world. As a result of COVID-19, movement restrictions, curfews, and travel bans were executed by governments across the world to tackle the pandemic. Thus, most of the states have closed their borders to tourists. Businesses faced closures, travel, and tourism sectors suffered, and unemployment rates rose. According to the study, the number of tourist arrivals in these islands during 2021 decreased to 123180 compared to 196619 in 2020. This is due to the impact of COVID-19 on the tourism industry, as a result, the tourist inflow rate declined.

REVIEW OF LITERATURE

Chand et al., (2021) studied the Impact of Covid-19 on tourism-based livelihood of people in Andaman and Nicobar Island in India. According to the study, tourist arrivals in Andaman and Nicobar Island have decreased as a result of the Covid-19 pandemic, causing serious consequences for the island's livelihood and traditional economic sectors, such as coconut farming and fisheries, which are in serious decline; the region urgently requires economic reforms. The study also demonstrates that the tourist industry would face more obstacles in the future in order to return to its pre-pandemic state. The study concludes that structural, logistical, and human resource development techniques can mitigate Covid-19's negative effects, and that the government should give assistance and subsidies to help the industry to recover. **Abbas et al., (2021)** explored the impact of tourism industry at the global level. According to the study, COVID-19 has made a significant impact on the tourist business, making it one of the most harmed industries worldwide. The study also found that the COVID-19 pandemic has a major influence on tourist organizations such as intermediaries, transportation planners, and hotel or attraction providers, depending on factors such as the tourism industry's size, venue, management, and governance types. The travel needs that are very different from leisure and business travel, local and individual tourists are also affected by the COVID-19. The study suggests that the significant amount of money needs be invested in the tourist business in order to restore it to its former status. **Rahman et al (2021)** According to the findings, the Covid19 pandemic has a significant impact on tourists travel risk and attitude of management. The study show that risk management, service delivery, transportation patterns, and distribution channels, avoidance of overcrowded places, and hygiene and safety are all significantly associated with travel risk and management perception. The findings also revealed that travel risk has a moderate influence on management attitude

STATEMENT OF THE PROBLEM

Andaman and Nicobar Islands are excellent destination for adventure and ecotourism. Andaman and Nicobar Islands are a major tourism center in India. It offering wide varieties of adventure and ecotourism activities such as scuba diving, snorkeling, sea walk, trekking, island camping, parasailing, water skiing, sea plane rides, Helicopter rides, Bird watching, Mangrove safari, Trekking, kayaking, Mangrove safari, kayaking, camping, Turtle Nesting and so on. However, tourism is yet to realize its full potential. The state of affairs for tourism is definitely not very positive but Andaman and Nicobar Islands have the potential to make it one of the best offerings in this country. There are some issues that need to be addressed Andaman and Nicobar Islands failed to realize its full potential as a

**Padhmanaban and Varalaxmi**

tourism hub for India because of infrastructural inadequacies and no proper promotional techniques utilized by the destination marketers. Many of the islands don't have proper communication facilities like internet and poor network coverage. Roads are in bad condition, poor physical infrastructure in places other than Port Blair, connectivity between port Blair and other islands is a major problem. The tourist inflow has been growing but not at the desired rate. The inflow of tourists is 400018 in 2016 and is increased to 487232 in the year 2017 and in the year 2018 it is increased to 513521. By this we can say that the tourist inflow has been growing but not at the desired rate. There are possibilities for these islands to develop much more. Out of total arrivals in the islands, 97 per cent are domestic tourists, whereas only three per cent are foreign tourists based on data of 2018. As per the data of 2016, 96 per cent are domestic tourists, whereas only four per cent are foreign tourists. It is declined to 1 per cent from 2016 to 2018. Foreign tourist's arrivals are very less compared to domestic tourists. This is due to non-availability of international flights. Due to the impact of the Post COVID-19, the tourist inflow declined. The inflow of tourists is 521604 in 2019, 196619 in the year 2020 and is decreased to 123180. By this we can say that the tourists inflow rate declined drastically.

OBJECTIVES

1. To identify effects on tourist inflow due to COVID-19 in A & N Islands.
2. To study month-wise domestic & foreign tourist arrivals in A & N Islands.
3. To deliver certain strategies that will help tourists to cope with challenges shortly soon.
4. To provide suggestions to increase the inflow of tourists in the A & N Islands.

RESEARCH METHODOLOGY

This study has been done on the basis of secondary data. The secondary data was collected through articles, and other related websites. Researcher collected information from Annual report and statistical handbook related to Tourism Industry from Directorate of Tourism Department.

TOURISM IN ANDAMAN AND NICOBAR ISLANDS

The Andaman and Nicobar Islands are a group of Islands located in the Bay of Bengal, off the eastern coast of India. These islands are recognized for their stunning natural beauty, pristine beaches, rich marine life, and unique indigenous cultures. At present, the Islands are popular among tourists for undertaking adventure activities like sea walks, snorkeling, scuba diving, and so on. The Andaman and Nicobar Islands have a tropical climate, and the best time to visit is between October and May when the weather is pleasant and conducive to outdoor activities. Andaman is growing into a main tourism hub in India competing with other states in India like Goa, Kerala, and Tamil Nadu. Tourism brings in a substantial amount of money through tourists' expenditures on accommodations, food, transportation, and recreational activities. Tourism plays a crucial role in the economic growth and development of the Andaman and Nicobar Islands. For the extension of the tourism industry, the destination requires to be marketed effectively by undertaking advanced promotional techniques.

IMPACT OF COVID-19 OUTBREAK ON TOURIST INFLOW IN ANDAMAN AND NICOBAR ISLANDS DURING 2019-2022

The Andaman Islands have experienced an increasing tourist inflow primarily due to its wide-ranging adventure activities. The Islands furnish a range of stimulating experiences such as water sports, scuba diving, snorkeling, trekking, and exploring pristine beaches and dense forests. These Adventure activities attract tourists seeking unique and thrilling experiences, contributing to the growth of the tourism industry in the A & N Islands. The Andaman Islands have gained significant popularity among tourists. The domestic tourism sector in the Andaman Islands has emerged as the largest segment of the tourism industry primarily due to improved air connectivity. The development and expansion of air transportation infrastructure have played a crucial role in facilitating the growth of domestic tourism in the region. However, the absence of international flights has resulted in a dearth of foreign tourists. International flights play a vital role in enabling the arrival of travelers from various countries by providing them

**Padhmanaban and Varalaxmi**

with convenient and direct access to their desired destinations. Before the onset of the COVID-19 pandemic, the tourist inflow to the Andaman Islands was thriving, but now it has faced numerous limitations and challenges. The table below provides insights into the impact of COVID-19 on tourist inflow to the Andaman Islands. Table 1 gives the number of Domestic Tourist Arrivals, Foreign Tourists Arrivals, and Total Tourist Arrivals in Andaman for the years 2015 to 2022 along with the corresponding growth rate over the previous year. Table 1 suggests that the increase in domestic tourist arrivals has been consistently and significantly higher compared to the growth in foreign tourist arrivals from 2015 to 2018. Between 2018 and 2021, there have been evident fluctuations in both domestic and foreign tourist arrivals. The COVID-19 Pandemic has had a substantial impact, leading to a significant decline in domestic tourist inflow and a corresponding decrease in foreign tourist arrivals. Notably, the decline in foreign tourist arrivals even reached negative figures, while domestic tourist inflow experienced a notable decrease. This is due to the impact of the COVID-19 outbreak on tourist inflow in the Andaman and Nicobar Islands. The COVID-19 pandemic severely affected tourism as travel restrictions, including lockdowns and border closures, greatly hindered domestic and international travel opportunities for tourists. Health concerns and the fear of contracting or spreading the virus discouraged people from undertaking travel. Flight cancellations and reduced flight operations made it difficult for tourists to reach their destinations. Mandatory quarantine made it difficult and expensive for tourists, while the uncertain economy and job losses reduced people's ability to spend on travel. Additionally, the closure of hotels, restaurants, and tourist attractions made it less appealing and inconvenient for tourists to visit. As a result, there was a significant decrease in the number of tourists during the COVID-19 pandemic. The growth rate of domestic tourists from 2016-17 to 2020-21 showed a decline and eventually went into negative territory, with growth rates of 34.66%, 18.16%, 0.06%, 1.75%, and -84.17% respectively. The growth rate of foreign tourists from 2016-17 to 2020-21 experienced fluctuations with figures of 27.56%, -1.54%, 4.27%, -19.58%, and -92.68%. The negative growth rates show that the number of foreign tourists visiting during those years declined, which had a significant impact on foreign tourist inflow. Furthermore, the overall growth rates of total tourists from 2016-17 to 2020-21 were consistently declining and even turned negative, primarily due to the impact of COVID-19.

MONTH-WISE DOMESTIC TOURIST ARRIVAL DURING 2016-2021

Domestic tourism involves individuals enjoying holidays and gateways within their nation. Andaman stands out among other Indian states as a preferred choice for tourists due to its exceptional and distinctive qualities. With enhanced air connectivity, Andaman has witnessed a steady rise in domestic tourist visits. Air connectivity has significantly improved in Port Blair, with regular flights operated by Air India, Jet Airways, Jetlite, Go Air, Indigo, Vistara, and Spice Jet Airlines linking the city to major destinations such as Chennai, Kolkata, New Delhi, Mumbai, and Bhubaneswar.¹ Due to the impact of the COVID-19 pandemic, domestic tourism in Andaman experienced a significant decline. Several factors contributed to this decline, including travel restrictions, lockdown measures, and concerns about health and safety. The imposition of travel bans and the closure of tourist destinations as preventive measures to curb the spread of the virus limited people's ability to travel within the country. Additionally, apprehensions regarding the risks associated with traveling during the pandemic further discouraged domestic tourism. As a result, Table 2 reflects a noticeable decrease in domestic tourist arrivals in Andaman during the period affected by the COVID-19 pandemic. According to Table 2, in May 2017, the number of domestic tourists increased by 40 percent, which is a significant growth. However, if we compare May 2017 to May 2019, the growth rate declined by -8.97 percent. In 2019, the growth rate of domestic tourism showed a negative trend, indicating a decline in comparison to previous years. As we move forward to 2021, the growth rate further decreased and reached zero. The period from May 2019 to 2021 has witnessed a significant impact on domestic tourism. It appears that the major impact on domestic tourism began in May 2019 and continued till 2021. During, the period from April 2020 to October 2020, and continuing into 2021, reveals a zero growth rate in tourism suggesting that the COVID-19 pandemic had a severe impact. The growth rate in domestic tourism declined steadily from 2017 to 2021, with the impact of the COVID-19 pandemic being a major contributing factor. The growth rate went from 22.72 percent in 2017 to 36.46 percent in 2021, reflecting the negative impact of the pandemic on the tourism industry. The Andaman Islands, known for their tourism industry, experienced significant losses in multiple ways. Travel restrictions and lockdown measures imposed to control the spread of the virus greatly affected the inflow of tourists. Hotels, resorts, and other accommodation providers faced a decline in bookings and revenue. The absence of tourists resulted in

**Padhmanaban and Varalaxmi**

reduced business opportunities for local restaurants, shops, and tour operators. Moreover, the livelihoods of many individuals dependent on the tourism sector were adversely affected. The Andaman Islands, like many other tourist destinations, faced a challenging period due to the impacts of the COVID-19 pandemic.

MONTH-WISE FOREIGN TOURIST ARRIVAL DURING 2016-2021

The tourism industry in Andaman has experienced limitations in attracting foreign tourists primarily due to the absence of adequate international flight connectivity. This lack of direct flights has posed a significant challenge in terms of attracting visitors from other countries. Consequently, Table 3 provides a comprehensive overview of the month-wise foreign tourist arrivals in Andaman from 2016-2021, including the corresponding growth rates compared to the previous year. This data highlights the impact of restricted international access on foreign tourist inflow to the region during the specified period. After the COVID-19 pandemic, foreign tourist arrivals declined significantly due to various reasons such as travel restrictions, border closures, fear of infection, and limited international flight availability. **Source:** Department of Tourism (Andaman and Nicobar Administration) Table 3 indicates that the growth of Foreign Tourist Arrivals (FTAs) in Andaman is underwhelming, as the majority of annual changes from the previous year are not positive. From April 2020 to October 2020, extending into 2021, there was no growth in tourism, indicating a significant negative impact of the COVID-19 pandemic. The maximum growth of FTA took place during December 2021 with 156.14 percent compared to December 2020 (-89.92) which is 2remarkable. The overall analysis of the growth rate from 2017 to 2021 reveals a consistent negative trend, with only minimal improvement in 2019. However, the subsequent years, 2020 and 2021, experienced a significant decline, with negative growth rates observed. This downward trajectory indicates the profound impact of the COVID-19 pandemic on the tourism sector, leading to reduced foreigntourist arrivals and challenging conditions for the industry.

STRATEGIES TO HELP TOURISTS COPE WITH CHALLENGES IN THE NEAR FUTURE

1. Implement enhanced safety measures at tourist facilities.
2. Ensure clear and open communication regarding travel restrictions and guidelines.
3. Provide flexible booking policies to facilitate easy adjustments and cancellations for travellers.
4. Make use of digital solutions to enable contactless transactions and provide virtual experiences for tourists.
5. Encourage sustainable tourism practices to preserve and safeguard the environment.
6. Ensure stringent hygiene standards are maintained and readily available sanitization facilities are provided.
7. Offer dedicated customer support services to ensure prompt assistance and support for tourists.
8. Engage in collaborative efforts with local authorities to establish coordinated responses to overcome challenges effectively.
9. Promote diversification of tourist destinations to mitigate overcrowding and enhance visitor experiences.
10. Demonstrate empathy and flexibility in catering to the needs of tourists, ensuring a personalized and accommodating experience.

FINDINGS OF THE STUDY

1. Between 2018 and 2021, tourist arrivals showed significant fluctuations. The COVID-19 pandemic notably reduced both domestic and foreign tourist inflow, leading to a marked decline in tourism across all sectors.
2. It is found from the study that The growth rate of domestic tourists from 2016-17 to 2020-21 showed a decline and eventually went into negative territory, with growth rates of 34.66%, 18.16%, 0.06%, 1.75%, and -84.17% respectively. The growth rate of foreign tourists from 2016-17 to 2020-21 experienced fluctuations with figures of 27.56%, -1.54%, 4.27%, -19.58%, and -92.68%. The negative growth rates show that the number of foreign tourists visiting during those years declined, which had a significant impact on foreign tourist inflow.
3. The analysis of growth rates from 2017 to 2021 shows a steady negative trend, with a slight improvement in 2019. However, the years 2020 and 2021 saw a sharp decline, reflecting the severe impact of the COVID-19 pandemic on the tourism sector, resulting in fewer foreign tourist arrivals and challenging industry conditions.
4. The growth of Foreign Tourist Arrivals (FTAs) in Andaman has been disappointing, with most annual changes showing negative trends. From April 2020 to October 2020, continuing into 2021, tourism saw no growth, highlighting the severe negative impact of the COVID-19 pandemic.

Padhmanaban and Varalaxmi

SUGGESTIONS TO ENHANCE TOURIST INFLOW IN THE A & N ISLANDS

1. If International flights are introduced to the Andaman Islands, more foreign tourists would likely come through routes in Singapore and Thailand.
2. The Andaman tourism sector ought to work towards nurturing cruise tourism. If international cruise companies choose the islands as a destination, it could bring significant advantages to the region.
3. Andaman is well-positioned to host a range of both national and international water sports activities, serving as a platform awareness about the Islands.
4. The ships and ferry boats in Andaman are not in good condition. It's important to ensure proper maintenance and cleanliness for a enjoyable experience for tourists. Moreover, consideration should be given to replacing the older vessels with newer ones.
5. The Andaman restaurant scene is currently limited in its offerings. To better serve the majority of tourists who prefer dining outside, the industry should actively work on establishing a greater number of restaurants.
6. Tour operators should dedicate specific efforts to enhance the branding and marketing of the Islands' tourism, positioning it as a premier destination in India. This can be achieved through mediums such as brochures and popular social media platforms like Facebook, Twitter, and YouTube.

CONCLUSION

The Andaman and Nicobar Islands comprise a picturesque collection of landmasses situated in the Bay of Bengal. However, the lack of planning and regulation in the development of tourism in the Andamans poses a significant threat to this valuable heritage. It is crucial for the Directorate of Tourism, AN Administration, the inhabitants of this captivating archipelago, and the Tour Operators to take courageous and definitive actions, demonstrating leadership to prevent this potential harm. The islands possess considerable tourism potential, and if visitors choose the islands as their destination, it could lead to substantial benefits for the region. In addition to boosting tourism on the islands, it has the potential to bring economic prosperity to the local communities.

ABSTRACT

Medicinal plants have been utilized for centuries in traditional medicine systems to treat various ailments and promote overall well-being. The natural compounds present in these plants have therapeutic potential and have attracted significant attention from researchers, healthcare professionals, and the general public. This review article aims to provide a comprehensive overview of medicinal plants, highlighting their traditional uses, photochemical composition, Pharmacological Activities and Therapeutic Applications, potential therapeutic applications and Extraction and Standardization Techniques. Furthermore, it discusses recent advancements in research, challenges, and future perspectives in the field of medicinal plants.

Keywords: Medicinal plants, traditional medicine, photochemical, therapeutic applications, natural products, traditional uses, scientific research, challenges, future perspectives

INTRODUCTION

The analysis of medicinal plants dates back to ancient civilizations, where traditional healers and herbalists relied on empirical knowledge and observation to identify plants with therapeutic potential. This knowledge was often passed down through generations, and medicinal plant usage became an integral part of cultural practices. As scientific advancements took place, new techniques emerged to study medicinal plants more comprehensively. In the 19th and

**Jyoti Arora et al.,**

early 20th centuries, chemical extraction methods, such as maceration and percolation, were developed to isolate active compounds from plants. These techniques laid the foundation for modern phytochemical analysis. The transmission of empirical knowledge about the beneficial effects of various practices, substances, or activities within human communities has been a fundamental aspect of cultural evolution [1]. Indeed, natural products have played a crucial role in the development of drugs, and many modern pharmaceuticals have their roots in traditional herbal medicine [2]. The use of plants in medicine has a long and rich history that dates back to ancient times, and this practice continues to be significant in modern times [3]. Absolutely, the trial and error method played a fundamental role in the early development of medicinal practices [4]. Indeed, the development of medicine based on plants has been a common thread across diverse civilizations throughout history. Each civilization, shaped by its unique environment, cultural practices, and available flora, contributed to the rich tapestry of traditional herbal medicine. [5, 6]. Indeed, the transmitted knowledge about the use of plants for medicinal and pharmaceutical purposes is considered by many as the origin of medicine and pharmacy [7]. Many authors reviewed focuses on the recent various important challenges in quality evaluation of medicinal plants in the authenticity, efficacy, toxicity and consistency [8, 9, 10]. Medicinal plants have been used for centuries in various cultures around the world to treat and prevent diseases. The analysis of medicinal plants has evolved over time, incorporating complex techniques to better understand their chemical composition, therapeutic properties, and potential applications. In this discussion, we will explore the Significance of Medicinal Plants in Traditional Medicine and regional aspects of emergent complex techniques used in the analysis of medicinal plants.

Significance of Medicinal Plants in Traditional Medicine

Medicinal plants have played a significant role in traditional medicine for centuries. They are a fundamental component of various traditional healing systems and have been used by different cultures worldwide to treat and prevent diseases. The significance of medicinal plants in traditional medicine can be understood through the following points:

1. **Historical and cultural heritage:** Traditional medicine systems, such as Ayurveda, Traditional Chinese Medicine (TCM), and Indigenous healing practices, have a rich history that dates back thousands of years. Medicinal plants have been integral to these systems and represent the accumulated knowledge and wisdom of generations of healers and practitioners.
2. **Primary source of medicine:** In many traditional medicine systems, medicinal plants are the primary source of medicine. Various parts of the plants, including leaves, flowers, roots, bark, and seeds, are used to prepare remedies. Traditional healers have identified specific plants and their active compounds that exhibit therapeutic properties and have developed methods to extract and administer them effectively.
3. **Wide range of health benefits:** Medicinal plants offer a wide range of health benefits and have been used to address numerous ailments. They can be used for treating common ailments like cold, cough, digestive disorders, and skin conditions, as well as more complex conditions such as cardiovascular diseases, diabetes, and cancer. Traditional medicine systems emphasize the holistic approach to healing, taking into account the physical, mental, and spiritual aspects of health.
4. **Natural and sustainable healthcare:** Medicinal plants provide a natural and sustainable approach to healthcare. They are renewable resources that can be cultivated, harvested, and processed without causing significant harm to the environment. Traditional healers have developed knowledge about plant conservation, cultivation practices, and the appropriate times for harvesting to ensure the sustainability of medicinal plant populations.
5. **Source of new drugs:** Many modern pharmaceutical drugs have their origins in medicinal plants used in traditional medicine. Scientists and researchers often turn to traditional healing systems and their associated plants to discover and develop new drugs. The chemical compounds found in medicinal plants serve as valuable leads for drug development and have contributed to the creation of essential medications.
6. **Cultural relevance and accessibility:** Medicinal plants are deeply rooted in cultural practices and beliefs. They hold significant cultural and spiritual value for communities that have relied on traditional medicine for generations. Traditional healing practices using medicinal plants are often more accessible and affordable to communities with limited access to modern healthcare facilities and expensive pharmaceutical drugs.

**Jyoti Arora et al.,**

7. Preservation of traditional knowledge: Traditional medicine systems rely on the knowledge and wisdom passed down through generations. The use of medicinal plants in traditional medicine helps preserve this knowledge, as it is often transmitted orally or through apprenticeships. By recognizing and valuing the significance of medicinal plants, traditional medicine practices can continue to thrive and contribute to the overall well-being of communities.

Regional Perspectives

The analysis of medicinal plants also varies across regions due to the diversity of plant species, cultural practices, and traditional knowledge. Different regions may focus on specific techniques or have unique approaches to studying medicinal plants. For example, in traditional Chinese medicine (TCM), a system that has been practiced for thousands of years, a combination of techniques is used. This includes macroscopic examination, organoleptic evaluation (taste, smell, etc.), microscopy, TLC, and HPLC for quality control and authentication of medicinal plant materials. In Ayurveda, an ancient Indian system of medicine, the analysis of medicinal plants involves a holistic approach. It considers not only the chemical constituents but also the energetics, tastes, and post-digestive effects of the plants to determine their therapeutic properties. In various indigenous cultures, traditional knowledge passed down through generations forms the basis for identifying and analyzing medicinal plants. Techniques such as organoleptic evaluation, ethnobotanical surveys, and indigenous knowledge interviews are used to understand the medicinal properties and applications of plants. For example, India is currently having 8000 medicinal plants species according to the Botanical Survey of India (BSI). Details of medicinal plants found in the country are given in figure 1: In Indian medicine system, the medicinal plant species are arranged under the six systems namely Ayurveda, Siddha, Unani, Homeopathy, Sowa-Rigpa and Folk. The numbers of species for each medicinal system are given in figure 2. As per the medicinal plants database taken from National Medicinal Plants Board, Government of India, Figure 3 shows state wise medicinal plants species produced.

Emergent Complex Techniques

In recent decades, with advancements in technology and scientific understanding, complex techniques have emerged for the analysis of medicinal plants. These techniques aim to provide a more detailed and holistic understanding of the chemical composition and therapeutic potential of plants. Let's explore some of these techniques:

1. Chromatography: Chromatographic techniques, such as thin-layer chromatography (TLC), gas chromatography (GC), and high-performance liquid chromatography (HPLC), are widely used to separate and identify chemical constituents of medicinal plants. These techniques allow the identification and quantification of specific compounds present in complex plant extracts.
2. Mass Spectrometry: Mass spectrometry (MS) is a powerful analytical technique that works in conjunction with chromatography. It helps in the identification and structural elucidation of individual compounds present in medicinal plants. Gas chromatography-mass spectrometry (GC-MS) and liquid chromatography-mass spectrometry (LC-MS) are commonly employed in plant analysis.
3. Nuclear Magnetic Resonance Spectroscopy: Nuclear magnetic resonance (NMR) spectroscopy is a non-destructive technique used to analyze the structure and chemical properties of organic compounds. It can provide detailed information about the molecular structure, configuration, and interactions of compounds found in medicinal plants.
4. Metabolomics: Metabolomics involves the comprehensive analysis of small molecules, known as metabolites, within a biological sample. It provides a snapshot of the metabolic state of an organism or tissue. Metabolomics techniques, such as liquid chromatography-mass spectrometry (LC-MS) and nuclear magnetic resonance (NMR) spectroscopy, are increasingly used to study the chemical composition and metabolic pathways of medicinal plants.

In summary, the analysis of medicinal plants has evolved over time, incorporating complex techniques to better understand their chemical composition and therapeutic potential. Chromatography, mass spectrometry, NMR spectroscopy, and metabolomics are among the emergent complex techniques used. The regional perspectives of medicinal plant analysis vary, influenced by traditional practices, cultural knowledge, and specific regional approaches

**Jyoti Arora et al.,****Phytochemical Composition****Primary and Secondary Metabolites**

Primary metabolites and secondary metabolites are two categories of chemical compounds produced by living organisms, including plants, animals, and microorganisms. These compounds play important roles in various biological processes and have different functions within an organism.

Primary Metabolites: Primary metabolites are essential compounds that are directly involved in the growth, development, and reproduction of an organism. They are synthesized through fundamental metabolic pathways and are required for basic cellular functions. Primary metabolites are typically produced during active growth phases and are found in high concentrations in cells. Examples of primary metabolites include:

- Carbohydrates: Such as glucose, fructose, and starch, which are involved in energy storage and provide a source of carbon for other metabolic processes.
- Proteins: Composed of amino acids, proteins are involved in structural support, enzymatic reactions, and various cellular processes.
- Nucleic acids: DNA and RNA, which are responsible for genetic information storage and transfer.
- Lipids: Including fatty acids, phospholipids, and triglycerides, which are involved in energy storage, cell membrane structure, and signaling.

2. Secondary Metabolites: Secondary metabolites are compounds that are not directly involved in the growth and development of an organism. They are typically produced during specific stages of growth or under certain environmental conditions, such as stress, competition, or defense against predators. Secondary metabolites often have complex chemical structures and diverse biological activities. Secondary metabolites are typically produced in smaller quantities compared to primary metabolites, and their production can be induced or regulated by environmental factors.

Examples of secondary metabolites include:

- Alkaloids: Such as caffeine, nicotine, and morphine, which are often involved in defense mechanisms or have medicinal properties.
- Terpenoids: Including essential oils, steroids, and plant pigments like chlorophyll and carotenoids, which have various roles in plants, such as defense, attraction of pollinators, and protection against UV radiation.
- Phenolics: Such as flavonoids and tannins, which have antioxidant properties and play roles in plant defense and pigmentation.
- Glycosides: Compounds like cardiac glycosides and cyanogenic glycosides, which can have toxic or medicinal properties.

It's important to note that the distinction between primary and secondary metabolites is not always clear-cut, and some compounds can have characteristics of both categories depending on the context and their biological roles.

Pharmacological Activities and Therapeutic Applications:

Pharmacological activities refer to the specific effects that drugs or chemical substances have on the body. These activities can include therapeutic effects, as well as side effects and other interactions with various biological systems. Therapeutic applications, on the other hand, are the specific uses of drugs or substances to treat, prevent, or manage certain diseases or medical conditions.

There are numerous pharmacological activities and therapeutic applications, as the field of medicine encompasses a wide range of conditions and treatments. Here are some examples of common pharmacological activities and therapeutic applications:

1. Analgesic (pain relief): Drugs such as nonsteroidal anti-inflammatory drugs (NSAIDs) and opioids are used to relieve pain associated with various conditions, such as headaches, arthritis, and postoperative pain.
2. Antimicrobial: Antibiotics and antiviral drugs are used to treat infections caused by bacteria, viruses, fungi, or parasites. They can be used to combat bacterial infections, such as urinary tract infections or pneumonia, as well as viral infections like influenza or HIV.

**Jyoti Arora et al.,**

3. Antidepressant: These drugs are used to treat depression and related mood disorders. Examples include selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), and tricyclic antidepressants (TCAs).
 4. Antihypertensive: Medications used to lower high blood pressure are called antihypertensives. They include ACE inhibitors, beta-blockers, diuretics, and calcium channel blockers.
 5. Antidiabetic: Drugs such as insulin and oral hypoglycemic agents are used to manage diabetes, a condition characterized by high blood sugar levels. They help regulate blood glucose levels and prevent complications.
 6. Anticoagulant: These drugs help prevent the formation of blood clots and are used in conditions such as deep vein thrombosis, atrial fibrillation, and pulmonary embolism. Examples include warfarin, heparin, and direct oral anticoagulants (DOACs).
 7. Antihistamine: Used to alleviate allergy symptoms by blocking the action of histamine. They are commonly used to treat allergic rhinitis, hives, and itching.
 8. Antipsychotic: Medications used to manage psychosis and psychotic disorders, such as schizophrenia and bipolar disorder. They help control hallucinations, delusions, and other symptoms associated with these conditions.
 9. Immunosuppressant: These drugs are used to suppress the immune system and prevent rejection in organ transplantation or to treat autoimmune disorders such as rheumatoid arthritis or lupus.
 10. Antineoplastic: Also known as chemotherapy, these drugs are used to treat cancer by targeting and killing cancer cells or inhibiting their growth. They can be used alone or in combination with surgery or radiation therapy.
- It's important to note that this is just a small sample of pharmacological activities and therapeutic applications. The specific drug or treatment choice will depend on the condition being treated, the patient's individual characteristics, and other factors. Always consult a healthcare professional for personalized medical advice.

Extraction and Standardization Techniques

Extraction and standardization techniques play a crucial role in the production of herbal medicines derived from medicinal plants. These techniques ensure that the active constituents of the plants are efficiently extracted and that the final product is consistent in terms of quality and potency. Here are some commonly used extraction and standardization techniques:

1. Maceration: This is a simple and traditional method where the plant material is soaked in a solvent (such as water, alcohol, or a mixture of both) for a certain period to allow the active constituents to dissolve. The resulting solution is then filtered and concentrated to obtain the extract.
2. Percolation: Percolation involves the passage of a solvent through a column packed with the plant material. The solvent extracts the active constituents as it percolates through the material. This method allows for efficient extraction and is commonly used for large-scale production.
3. Soxhlet Extraction: Soxhlet extraction is a continuous extraction technique that utilizes a specialized apparatus. The plant material is placed in a thimble, and a solvent repeatedly cycles between a boiling flask and a condenser, extracting the constituents from the material. This method is useful for extracting constituents that are not easily soluble in a solvent.
4. Supercritical Fluid Extraction (SFE): Supercritical fluid extraction employs a supercritical fluid, such as carbon dioxide (CO₂), as the solvent. Under specific temperature and pressure conditions, CO₂ exhibits both liquid and gas properties, making it an effective solvent for extracting various compounds. SFE is preferred for its selectivity and the absence of residual solvents.
5. Steam Distillation: Steam distillation is commonly used to extract essential oils from aromatic plants. Steam is passed through the plant material, vaporizing the essential oil. The steam-oil mixture is then condensed and separated, resulting in the collection of essential oil.

Standardization techniques involve ensuring the consistency and quality of herbal extracts or medicines. Here are a few common methods of standardization:

Marker Compound Analysis: Identification and quantification of specific marker compounds present in the medicinal plant are performed using analytical techniques such as high-performance liquid chromatography (HPLC),

**Jyoti Arora et al.,**

gas chromatography (GC), or mass spectrometry (MS). The concentration of these marker compounds is used as an indicator of the quality and potency of the extract.

2. Total Phenolic Content: The total phenolic content of a plant extract can be determined using colorimetric assays. Phenolic compounds are known for their antioxidant properties, and the quantification of total phenolic content provides an estimate of the extract's antioxidant potential.

3. Heavy Metal Analysis: Heavy metal contamination in herbal medicines can be a concern. Analytical techniques such as atomic absorption spectroscopy (AAS) or inductively coupled plasma mass spectrometry (ICP-MS) are employed to detect and quantify heavy metals in plant extracts.

4. Microbiological Analysis: Microbial contamination can affect the safety and stability of herbal medicines. Microbiological tests are performed to assess the presence of bacteria, yeast, mold, and other microorganisms in the extracts.

These extraction and standardization techniques help ensure the consistency, quality, and safety of herbal medicines derived from medicinal plants, providing reliable products for therapeutic use. It is important to note that the specific techniques employed may vary depending on the plant species, desired constituents, and intended applications.

Challenges and Future Perspectives

Medicinal plants have been used for thousands of years in various traditional healing systems and continue to play a significant role in modern medicine. However, they also face several challenges and offer various future perspectives.

Challenges

1. Deforestation and Habitat Loss: The increasing demand for medicinal plants has led to over-harvesting and habitat destruction, resulting in the loss of many plant species. Deforestation not only threatens the survival of these plants but also affects the delicate ecosystems they inhabit.

2. Unsustainable Harvesting Practices: Unregulated and unsustainable harvesting practices can deplete wild populations of medicinal plants. Overexploitation can lead to the extinction of certain species and disrupt the ecological balance of the areas where they grow.

3. Quality Control and Standardization: Medicinal plants often contain numerous bioactive compounds that contribute to their therapeutic effects. However, the concentration of these compounds can vary significantly depending on factors such as plant genetics, growing conditions, and processing methods. Ensuring consistent quality and standardization of herbal products poses a challenge in the industry.

4. Lack of Research and Documentation: Despite their historical use, many medicinal plants lack comprehensive scientific studies to validate their efficacy, safety, and appropriate dosage. The lack of robust research and documentation can hinder their integration into modern healthcare systems.

Future Perspectives

1. Conservation and Sustainable Cultivation: Emphasizing the conservation and sustainable cultivation of medicinal plants is crucial for their long-term availability. Initiatives such as cultivating medicinal plants in controlled environments, promoting organic farming practices, and establishing botanical gardens can help preserve endangered species and protect their habitats.

2. Scientific Research and Evidence-Based Medicine: Increased scientific research can provide a deeper understanding of the active compounds present in medicinal plants, their mechanisms of action, and potential interactions with other medications. Rigorous clinical trials and systematic reviews can establish evidence-based guidelines for the safe and effective use of herbal medicines.

3. Integration with Conventional Medicine: Medicinal plants have the potential to complement conventional medicine. Integrating herbal remedies into mainstream healthcare practices can offer more comprehensive treatment options and reduce reliance on synthetic drugs, particularly for chronic conditions where plant-based therapies may have a role to play.

4. Biotechnological Advancements: Advances in biotechnology, including genetic engineering and plant tissue culture techniques, can facilitate the production of specific compounds found in medicinal plants. This may help

**Jyoti Arora et al.,**

overcome challenges related to variable chemical composition and ensure consistent quality and potency of herbal products.

5. Traditional Knowledge Preservation: Traditional knowledge about medicinal plants, often held by indigenous communities, is a valuable resource. Collaborative efforts that involve indigenous communities in research, cultivation, and sustainable harvesting practices can help preserve their knowledge and ensure the equitable sharing of benefits derived from these plants.

The analysis of medicinal plants has evolved over time, incorporating complex techniques to better understand their chemical composition and therapeutic potential. Chromatography, mass spectrometry, NMR spectroscopy, and metabolomics are among the emergent complex techniques used.

In summary, while medicinal plants face challenges such as deforestation, unsustainable harvesting practices, and the need for quality control, their future perspectives lie in conservation, scientific research, integration with conventional medicine, biotechnological advancements, and the preservation of traditional knowledge. By addressing these challenges and harnessing their potential, medicinal plants can continue to contribute to human health and well-being.

CONCLUSION

This review article provides a comprehensive overview of medicinal plants, their traditional uses, phytochemical composition, and potential therapeutic applications. The growing interest in natural products and the increasing scientific evidence supporting the efficacy of medicinal plants highlight their relevance in modern healthcare. However, further research, standardization, and collaboration between traditional and modern medicine are necessary to harness their full potential. Medicinal plants offer a promising avenue for the development of new drugs and therapeutic interventions, contributing to the advancement of healthcare and the well-being of individuals.

ABSTRACT

The potential bioactive compounds from *Gymnema sylvestre* were extracted and analyzed using Gas Chromatography-Mass Spectrometry to identify bioactive molecules with potential therapeutic properties. Subsequent molecular docking studies were performed to evaluate the binding affinity of the identified compounds with interleukin receptor-associated kinase (IRAK), a key receptor involved in various metabolic disorders including diabetes. Among the compound analyzed, n-hexadecanoic acid exhibited a strong binding affinity with IRAK through a combination of hydrogen bonding and hydrophobic interactions suggesting its potential role in modulating the receptor activity. To further validate these findings, the Swiss Target Prediction tool was employed to identify potential biological targets of the phytochemicals, which revealed that the identified compounds interact effectively with receptors implicated in diabetes pathogenesis. These findings support the potential of phytochemicals in *Gymnema sylvestre* as promising antidiabetic agents. Moreover, the insights gained from this study could serve as a foundation for future research exploring the molecular mechanisms underlying the antidiabetic effects of these compounds as well as their potential for development into pharmaceutical or therapeutic applications.

Keywords: Phytochemical Compounds, *Gymnema sylvestre*, Interleukin Receptor Associated Kinase, Hydrogen bonding, Molecular docking, Binding affinity.

INTRODUCTION

Diabetes mellitus, a growing global public health issue, affects millions, particularly in India, due to poor glucose metabolism caused by insulin abnormalities or resistance. Conventional treatments include diet, exercise, and medication, but plant-based remedies like *Gymnema sylvestre* are gaining attention for their anti-diabetic properties, such as reducing sweet taste perception, enhancing glucose absorption, and potentially improving insulin secretion. Other medicinal herbs like cinnamon and bitter melon are also being explored for better glycemic control and reduced complications. *In silico* methods, including molecular docking, are accelerating research into these herbal compounds to develop safer and more effective diabetes therapies. Health supplements are increasingly used to prevent and manage chronic diseases like diabetes, a growing global health concern. Natural supplements such as fenugreek, cinnamon, lipoic acid, and *Gymnema sylvestre* have shown effectiveness in diabetes management. While various supplements offer benefits, *Gymnema sylvestre* stands out as the most accessible and cost-effective option in India (Aamir, 2024). Medicinal plants, used for centuries by various cultures, are reported to benefit diabetes management. As allopathic medicine lacks a completely effective and safe treatment, scientific research has focused on plants like *Gymnema sylvestre*, with findings strongly supporting traditional claims of their effectiveness in treating diabetes and its complications. (Kilambi *et al.*, 2024) Diabetes mellitus, affecting 2.8% of the global population and projected to reach 5.4% by 2025, is a common metabolic disorder. Herbal remedies, increasingly integrated into modern medicine, are valued for their hypoglycemic properties. This review profiles 65 plant species with hypoglycemic activity, categorized by plant parts used, mechanisms (insulin mimetic or secretagogue), and active phytoconstituents. Key plant families include Leguminosae, Lamiaceae, and Cucurbitaceae, with notable species like *Allium sativum*, *Gymnema sylvestre*, *Trigonella foenum-graecum*, and *Momordica charantia*. These plants show significant antidiabetic activity, attributed to polyphenols, flavonoids, terpenoids, and coumarins, often outperforming conventional hypoglycemic agents. (Patel *et al.*, 2022) Plants have long been used as medicine, with traditional Indian medicine relying heavily on botanicals for treating diabetes.

The World Health Organization reports that up to 90% of communities in developing countries use plant-based remedies for primary healthcare. Around 800 plants have antidiabetic properties. It focuses on the antidiabetic potential and bioactive compounds in plants like *Ficus religiosa*, *Pterocarpus marsupium*, *Gymnema sylvestre*, *Allium sativum*, *Eugenia jambolana*, *Momordica charanti* and *Trigonella foenumgraecum*. It serves as a foundation for future research into isolating, purifying, and characterizing these bioactive compounds. (Rizvi and Mishra, 2013) *Gymnema sylvestre*, is a plant species found primarily in the tropical regions of Asia, Africa, and Australia; it is also common in India and Sri Lanka. According to several scientific research, GS includes a chemical element that is known to decrease the desire for sugar; this piqued our interest in investigating the various extracts of GS for its antidiabetic potential (Shanmugam, 2023). *Gymnema sylvestre*, which is utilized in traditional Indian medicine, has demonstrated promising anti-diabetic and hypolipidemic properties. It acts by inhibiting sugar absorption in the intestines and may increase insulin production. Modern synthetic medicines, such as metformin, sulfonylureas, and thiazolidinediones, are routinely used to treat Type 2 diabetes, albeit they can cause weight gain and gastrointestinal problems. *Gymnema sylvestre*, from Asclepiadaceae family known as "gurmar" or "sugar killer," is a prominent herb in Ayurveda. Key phytoconstituents like gymnemic acids, gymnemasaponins, and gurmardin contribute to its sweet-suppression and therapeutic effects. It is widely used to treat diabetes by improving blood sugar homeostasis, reducing sugar cravings, and supporting pancreatic regeneration. Additionally, it is effective for conditions like arthritis, anemia, hypercholesterolemia, cardiopathy, asthma, and microbial infections. The extracts are used in dietary supplements, aids in weight reduction and lowering cholesterol and triglyceride levels, showcasing its potential in both dietary and pharmacological applications (Tiwari *et al.*, 2022). The chemistry and pharmacology of *Gymnema sylvestre* are discussed, and extracts from this plant are frequently utilized in Australian, Japanese, Vietnamese, and Indian folk medicine. *Gymnema* formulations have a significant effect on taste modulation, particularly the suppression of sweet taste sensations. It is used to treat diabetes and as food additives to prevent obesity and cavities. Anti-allergic, antiviral, lipid-lowering, and other actions have been observed. Many technical efforts have been made to hide the harsh taste of *Gymnema* products (Thangavelu *et al.*, 2020).

**Ramprasaath and Ramanathan**

Over 1200 plant species have been reported to cure diabetes mellitus globally due to their alleged hypoglycemic properties. *Gymnema sylvestre* is a plant native to India's central and western regions, as well as the tropic zones of Africa and Australia. It is a potent anti-diabetic plant that has been utilized in folk, Ayurvedic, and homeopathic treatments for millennia (Khan *et al.*, 2012). Obesity is linked to various health issues, with around 300 million people affected worldwide. Herbal medicines, known for their low side effects, are increasingly used to treat obesity and diabetes. Gymnemic acid, an active compound from *Gymnema sylvestre* has anti-obesity and antidiabetic effects. It helps reduce body weight, inhibits glucose absorption, and prevents triglyceride buildup in muscles and the liver, as well as fatty acid accumulation in the bloodstream. (Pothuraju *et al.*, 2014) Researchers have been exploring innovative antidiabetic medicines using various chemical compounds and biomolecules. Nanomaterials, known for their small size, biocompatibility, and ability to penetrate cell membranes, are increasingly used in antidiabetic studies. This study investigates the *in vivo* antidiabetic effect of gold nanoparticles synthesized using the antidiabetic herb *Gymnema sylvestre* on albino rats (Karthick *et al.*, 2014). Herbal medications, particularly plant-derived extracts, have been used for centuries to treat Type 2 diabetes mellitus and have the potential to be low-cost and widely available alternatives to conventional pharmaceuticals in impoverished nations. Extracts of *Gymnema sylvestre* contain anti-diabetic properties and have been utilized as traditional medicine in India for millennia. (Romainian *et al.*, 2013) Phytochemical analysis of *Gymnema sylvestre* stem bark methanol extract identified twelve secondary metabolites. Compounds 1-4 and the crude extract exhibited significant inhibitory effects against α -amylase and α -glucosidase enzymes, as well as antioxidant activity by scavenging DPPH radicals and reducing iron levels. *Gymnema sylvestre* is a promising source of bioactive compounds with strong anti-diabetic potential, both *in vitro* and *in silico*.

These findings may contribute to the development of new treatments for diabetes and metabolic disorders (Yves *et al.*, 2024). *Gymnema sylvestre* has expanded from traditional medicine to becoming a significant player in the herbal and pharmaceutical industries due to its rich bioactive compounds. It is a sought-after functional ingredient in herbal formulations, aligning with rising consumer demand for natural, health-enhancing products. The pharmaceutical industry recognizes its therapeutic potential for conditions like diabetes, liver disorders, inflammation, and microbial infections. Molecular docking studies further highlight the binding affinity of gymnemic acids, supporting its role in developing novel therapeutic agents (Vasudeva *et al.*, 2024) *Gymnema sylvestre* extract exhibits strong antioxidant and free radical scavenging properties, helping to reduce oxidative stress. Molecular docking studies, commonly used in drug design, show that compounds from *Gymnema sylvestre* leaves bind effectively to eNOS, with binding energies comparable to agonists. These findings suggest that *Gymnema sylvestre* can not only regulate blood glucose levels but also potentially prevent diabetic complications in the future (Abedulla *et al.*, 2024). *In silico* analysis uses computational tools to study molecular interactions on a large scale, including protein structures in PDB format. By identifying active sites of proteins and ligands, it provides insights into molecular interactions with therapeutic targets. Docking predicts binding affinity between drugs and targets, aiding in hit identification and lead identification during drug discovery. Structure-based drug design relies on the 3D structure of disease-associated receptors to predict binding affinity, calculate glide energy, and identify molecular interactions, making it crucial for modern drug development (Ramanathan, 2017). The bioactive substances that are present in the *Gymnema Sylvestre* are Gymnemic acids, Stigmasterol, Deacylgymnemic acid, Beta-Amyrin acetate, Longispinogenin, and Phytic acid which has the potential antidiabetic activity (Mayyas *et al.*, 2025) Interleukin receptor-associated kinase plays a pivotal role in antidiabetic and antioxidant activity by binding to the receptor exhibiting the highest binding affinity (Pianchou *et al.*, 2025).

MATERIALS AND METHODS

Collection of sample

Gymnema sylvestre leaves were collected from various places of Thanjavur district. The leaves were washed thoroughly under running tap water and dried under shade. They were then finely ground to a powder in an electric bender. The plant sample was subjected to GC-MS.

**Sample Preparation**

About 2.0g of sample was soaked in 100ml ethanol for 24 hours. The extract was filtered through what man no.1 and the filtrate was concentrated to dryness. The extract was diluted with GC ethanol and was injected in to GC-MS.

Preliminary Phytochemical screening

Lyophilized powder was extracted using ethanol and aqueous solvents, followed by solvent evaporation under reduced pressure. The extracts were screened for phytochemicals, revealing a higher number of active ingredients in the aqueous extract. Due to its richness in bioactive compounds, the aqueous extract was selected for the study.

Test for Alkaloids

1ml of test solution shaken with 2N HCL. Aqueous layer formed, decanted and to which one or two drops of Mayer's reagent added.

Test for Steroids

The extract was refluxed with solution of alcoholic potassium hydroxide till complete saponification takes place. The mixture was diluted and extracted with ether. The ether layer was evaporated and the residue was tested for the presence of steroids.

Test for Saponins

1ml of the extracted was treated with 1% lead acetate solution. Formation of white precipitate indicates the presence of saponins.

Test for Flavanoids

Alkaline reagent test To 1ml of the extract, a few drops of dilute sodium hydroxide were added. An intense yellow color was produced in the plant extract, which become colorless on addition of a few drops of dilute acid indicates the presence of flavanoids.

Test for Phenols

A small quantity of the extract was treated with 1% alcoholic ferric chloride solution. Formation of green indicates the presence of phenol.

Test for Sterols

The residue was dissolved in few drops of diluted acetic acid; 3ml of acetic anhydride was added followed by few drops of concentrated H_2SO_4 . Appearance of bluish green color shows the presence of sterol.

Test for Diterpenoids

5mg of the extract was dissolved in 2ml of 0.01% anhydrous stannic chloride in pure thinly chloride. A purple color formed then changed to deep red after few min and indicates the presence of diterpenoids.

GC-MS Analysis

GC-MS analysis was conducted using a GC Clarus 500 Perkin Elmer system with an Elite-5ms capillary column and helium as the carrier gas. The injection volume was 1.0 μL with a split ratio of 10:1, and the temperature ranged from 50°C to 280°C. Mass spectra were recorded at 70 eV with scans from 40 to 600 Da. Compound identification was performed using the NIST library, requiring a $\geq 95\%$ match for confirmation.

In silico analysis

The IRAK sequence was retrieved from NCBI and analyzed using PROSITE to identify receptor binding sites. Log P and Log S values for the ligand were calculated from its SMILES data in PubChem. Molecular structures of n-hexadecanoic acid and the receptor were obtained from PubChem and PDB, respectively. Docking analysis using Hex predicted the binding affinity, and the results were discussed.

RESULTS

Table 1: Analysis of secondary metabolites in the sample. Table 2: Chemical compounds identified in ethanol extract of leaves of *G.sylvestrae* through GC-MS Study. Figure 1: Receptor sequence submitted to Prosite tool. Figure 2: Binding sites are calculated for the receptor. Figure 3: Structure of n-hexadecanoic acid. Figure 4: Ligand n-hexadecanoic acid docked with receptor. Figure 5: Structure of sanitol alcohol. Figure 6: Ligand santoline docked with the receptor. Figure 7: Structure of cyclopropane. Figure 8: Ligand cyclopropane docked with the receptor. Table 3: Binding affinity for the docked models. Table 4: Log P and Log S for the ligands derived from plant sample

DISCUSSION

The plant sample was collected and the secondary metabolites were identified and it was represented in table 1. The secondary metabolites such as alkaloids, steroids, tannins, saponins, phenols, flavonoids and terpenoids were identified. These metabolites are identified using aqueous and ethanol extract. The presence of alkaloids and the absence of steroids were observed in both the extracts. Tannins and saponins are present in aqueous extract whereas it is absent in ethanol extract. The presence of flavanoids was observed in ethanol extract and it is absence in aqueous extract. The presence of phenols and diterpenoids were observed in both the extracts and the terpenoids were absence in aqueous and ethanol extracts. For effective absorption, drugs are expected to be in an aqueous solution at the absorption site (Savjani *et al.*, 2012). The plant sample *Gymnema sylvesterae* was collected and subjected to GCMS study for phytochemical analysis. There are number of phytochemicals were found in the sample and these compounds were consolidated in table 2. Among the phytochemicals, the compound such as n-hexadecanoic acid, alpha sanitol and cyclopropane has highest peak value 9.87, 9.06 and 6.00 respectively. Because of the highest peak values from the GCMS analysis, these ligands are selected for docking with the receptor. Molecular docking is an insilico technique for determining the interaction between receptors and ligands. The docking score or binding energy obtained during docking is thought to be a result of the ligand's binding affinity to the protein target. The protein Interleukin receptor associated kinase is responsible for diabetes mellitus and is thought to function as a receptor for the ligands n-hexadecanoic acid, santoline, and cyclopropane. The binding sites in the receptor are identified to determine the binding affinity while the receptor is docked with the ligand. The sequence of the receptor Interleukin receptor associated kinase can be obtained from a database and the binding site identified utilizing the prosite tool. Figure 1 depicts the sequence of the receptor submitted to the prosite tool. It could assist us predict the target's binding site with the receptor. Figure 2 indicates the number and location of binding sites on the receptor. The Interleukin receptor associated kinase receptor is having three hits including 2 patterns and 1 profile.

The positions of the binding sites in the receptor are 212-521,218-239,336-348. The position 218 and 226 is for NP_BIND and the proton acceptor site is present in the position 340. The ligands n-hexadecanoic acid, santoline and cyclopropane were binds with the receptor through these binding sites. The structure of the receptor was retrieved and displayed in Figure 3. Figure 4 shows that the structure of the ligand n-hexadecanoic acid. The receptor docked with the ligand n-hexadecanoic acid and it was represented in Figure 5. In the present study, docking of potentially active compounds were performed and their binding affinities were predicted. Figure 6 represents that the structure of the ligand sanitol which was retrieved from the database. The receptor docked with the ligand sanitol and it was represented in the Figure 7. Figure 8 shows that the structure of the ligand cyclopropane and it is docked with the receptor. The docked structure for the receptor and ligand was represented in the Figure 9. The observed docking scores were compared and it was very much similar to the previous studies. The docking results demonstrated that the compounds had a high binding affinity and interacted with the active site of the receptor. This strongly suggests that these chemicals may have contributed considerably to the reported hypoglycemic action. The docking parameters include Emax, Emin, Eave, and average energy. The docked structures' binding affinity was anticipated, and the findings were consolidated. The ligand n-hexadecanoic acid, sanitol and cyclopropane is having the binding affinity of 4.21, 1.20 and -1.34 respectively. Among the docked structures, n-hexadecanoic acid had the highest affinity for the receptor interleukin receptor associated kinase. The docking results demonstrated that the compounds

**Ramprasaath and Ramanathan**

had a high binding affinity and interacted with the active site of the receptor. This strongly suggests that these chemicals may have contributed considerably to the reported hypoglycemic action. The overall drug-likeness property quantitatively evaluates how closely the physicochemical and structural characteristics of compounds align with those of most well-established drugs (Ononamadu and Ibrahim, 2021). Log P and Log S values for ligands were analyzed using PubChem, with n-hexadecanoic acid showing the highest Log P value (5.21), indicating strong binding affinity and effectiveness against diabetes mellitus. A drug's lipophilicity measures its solubility in lipids or nonpolar solvents, significantly influencing its overall ADMET properties. This characteristic is crucial for drug absorption across cell membranes (Arnott and Planey, 2012). This suggests the potential as a promising therapeutic agent for diabetes, warranting further in vivo and in vitro studies for drug development.

CONCLUSION

Phytochemical compounds from *Gymnema sylvestre* were extracted via GC-MS and docked with the interleukin receptor-associated kinase to evaluate their binding affinity and physicochemical parameters. The ligand n-hexadecanoic acid exhibited strong binding affinity through hydrogen bonding and hydrophobic interactions with the receptor. Swiss target prediction identified potential targets, suggesting that the phytochemicals interact effectively with the receptor responsible for diabetes, supporting their potential as anti-diabetic agents and for further research into their mechanisms and applications. From these observations, it can be concluded that the results may help in understanding the mechanism of the molecule and could be used for further studies in the future.

ABSTRACT

Relay node selection in cooperative wireless sensor networks using fuzzy logic techniques involves intelligently choosing optimal relay nodes to enhance communication efficiency, reliability, and network performance. This approach leverages fuzzy logic principles to handle the inherent uncertainty and imprecision in wireless environments, ensuring more adaptive and effective decision-making for routing and data transmission. The limited energy of relay nodes remains a critical challenge in the design of cooperative communication systems for wireless sensor networks. To address this, we propose a novel relay node selection strategy grounded in fuzzy logic. In our approach, the residual energy of each node and the path loss to the destination node are used as key input parameters for determining the optimal relay. The fuzzy logic rules are designed to prioritize nodes with the lowest path loss and the highest residual energy, ensuring a more efficient and reliable selection process. By simultaneously considering both residual energy and path loss, our strategy achieves a significantly lower Bit Error Rate (BER) compared to existing methods, such as the random selection strategy and the maximum residual energy

**Nitin Kumar Jain et al.,**

strategy. In the random strategy, relay nodes are selected without consideration, while in the maximum energy strategy, the node with the highest remaining energy is always chosen. Simulation results further demonstrate that our fuzzy logic-based approach strikes a balance between Network Lifespan (NL) and energy consumption. It offers a fair trade-off between the two existing strategies, resulting in extended network longevity and more efficient energy use across the network.

Keywords: wireless sensor network, BER, network Lifespan, network throughput, residual energy.

INTRODUCTION

Wireless sensor networks (WSNs) are extensively utilized across a wide range of applications and services, including industrial automation, mining, healthcare, military operations, agriculture, and home automation [1]. However, communication within these networks often faces challenges due to the unreliability of wireless channels. Factors such as noise, signal fading, interference, reflections, and antenna misalignment can lead to distortion and degraded network performance. To mitigate these issues, several solutions have been proposed, such as cooperative communication, energy harvesting, and the use of multiple antennas. The design and implementation of a WSN must be tailored to the specific requirements of the application in question. In this paper, we focus on achieving reliable communication using cooperative communication techniques. In cooperative communication, an intermediate node, known as a relay node, is employed to regenerate and forward information between the source and destination nodes. This approach serves as an intermediate solution to balance both energy efficiency and throughput, offering a significant improvement in service quality, particularly in scenarios where there is a considerable distance between the source and destination. The role of the relay node is critical in ensuring reliable communication, as it enhances the overall performance of the WSN [2]. In this strategy, neighboring nodes share their antennas to create spatial diversity, allowing them to transmit packets on channels with the best available quality. By leveraging channel knowledge, nodes can transmit their neighbors' data on higher-quality channels, increasing link capacity while avoiding the instability of poor channels. Cluster head and relay selection is a key aspect of this communication strategy and is influenced by the specific constraints of the application [2-5]. A variety of relay selection techniques have been proposed, each designed with a different perspective, but the primary goal remains the same: to reduce the energy consumption at the relay node. Energy constraints are a major concern, as relay nodes often face limitations such as battery depletion or higher energy consumption rates than can be offset by energy harvesting. In this paper, we propose a cooperative communication strategy that utilizes fuzzy logic to select relay nodes. This approach aims to balance energy efficiency and communication reliability.

Related Work

The concept of cooperative diversity, first introduced by Laneman *et al.* [6], was developed to address the challenge of mitigating the detrimental effects of multipath fading in wireless networks. Multipath fading occurs when transmitted signals take multiple paths to the receiver due to reflections, scattering, and diffraction, often resulting in signal degradation and reduced communication reliability. Cooperative diversity leverages the collaboration of multiple nodes, operating across various layers of the network, to enhance signal robustness and improve overall system performance. To address the issue of spectral inefficiency in traditional cooperative diversity techniques, Laneman and Wornell [7] later introduced a space-time architecture. This method offered improved spectral efficiency while still achieving full diversity gain, surpassing previous approaches in performance. One of the major challenges in cooperative relaying schemes is excessive bandwidth utilization. To address this, Laneman *et al.* [8] introduced various relay selection algorithms, including fixed, selective, and incremental relaying techniques. They demonstrated that full diversity can be attained through proper relay selection, which not only enhances spectral efficiency but also reduces system complexity compared to conventional cooperative relaying systems. Building on earlier advancements in relay selection, Bletsas *et al.* [9] enhanced the concept by introducing an innovative best relay selection scheme that dynamically adapts to real-time channel conditions between R_i and the F. This adaptive

**Nitin Kumar Jain et al.,**

strategy not only improved the efficiency of the relay selection process but also addressed the challenge of optimizing communication paths. A key benefit of this approach was its ability to significantly reduce the number of communication channels required. Specifically, it streamlined the system to rely on just two channels: one direct communication link from the E to the F and another relayed link involving the E-Ri and Ri-F paths. This reduction in channel usage not only simplified system design but also improved spectral efficiency. In subsequent work, Bletsas *et al.* [10] expanded on this idea by introducing a distributed opportunistic relay selection scheme. This method focused on further minimizing cooperation overhead among users in systems employing amplify-and-forward and decode-and-forward relaying protocols. By decentralizing the relay selection process, the scheme effectively reduced the need for extensive coordination and signaling among nodes, thereby enhancing the overall scalability and practicality of cooperative wireless systems. These contributions have been instrumental in advancing the design and efficiency of relay-based communication networks. The adoption of cooperative relaying techniques proves highly beneficial in resource-constrained environments such as wireless sensor networks (WSNs), where optimizing system performance and energy efficiency is paramount. These networks often face significant challenges due to limited energy reserves and the need for reliable communication over long distances. To address these issues, Zarifi *et al.* [11] proposed a relay selection scheme specifically designed for distributed WSNs. Their approach focused on improving the average received signal strength at the F, commonly referred to as the access point, thereby enhancing communication reliability and network coverage.

Building on the need for energy-efficient solutions in cooperative WSNs, Ke *et al.* [12] developed a joint power allocation and relay selection algorithm designed to extend network lifespan. Their method, known as the Minimum Cost Criteria (MIC), employs a graphical optimization approach to identify the most suitable relay node. By balancing energy consumption with performance requirements, the MIC algorithm ensures efficient utilization of limited energy resources. This innovative technique integrates energy pricing to guide power allocation decisions, enabling a more sustainable and cost-effective operation of WSNs. Together, these advancements underscore the critical role of intelligent relay selection and power management in optimizing the functionality and longevity of WSNs in resource-limited settings. Notable advancements in the field also include the contributions of Kaiser *et al.* [13], who introduced a Neuro-Fuzzy-based approach for joint power allocation and relay selection in heterogeneous cooperative WSNs. Their strategy, tailored for systems employing the Amplify-and-Forward (AF) relaying scheme, leveraged the integration of neural networks and fuzzy logic to make intelligent, real-time decisions. This method enhanced the adaptability and efficiency of relay selection, particularly in complex and dynamic network environments. By simultaneously optimizing power allocation, their approach achieved a balance between energy consumption and communication performance, thereby improving the overall system reliability and extending the network's operational lifetime. Similarly, Yang *et al.* [14] proposed an energy-aware relay selection algorithm based on fuzzy logic principles. Their algorithm was designed to dynamically evaluate relay nodes based on multiple criteria, such as residual energy, channel quality, and transmission distance. By incorporating fuzzy logic into the decision-making process, the method addressed the inherent uncertainties in WSN environments, resulting in more robust and efficient relay selection. This approach significantly contributed to prolonging the network lifespan (NS) by ensuring energy-efficient operation, a critical factor for resource-constrained WSNs. Collectively, these contributions highlight the effectiveness of soft computing techniques in optimizing key aspects of cooperative WSN performance. In this research, we propose an analytical model for BER analysis in WSNs using a fuzzy-based relay selection scheme. The model aims to improve overall system performance by taking into account the residual energy of the nodes and the path loss between them. By optimizing relay selection based on these parameters, the proposed scheme enhances both communication reliability and energy efficiency, offering a promising solution for cooperative communication in wireless sensor networks.

Simulation Model

In a cooperative diversity scenario, we consider a network covering an area of 100×100 square meters, consisting of a source node (E), a destination node (F), and a set of relay nodes denoted as $\{R_1, R_2, \dots, R_M\}$, as depicted in Figure 1. In this scenario, the communication links between the E-to-F and R-to-F terminals operate in a half-duplex mode. This means that at any given time, a relay node can either receive data from the E or transmit data to the F, but it cannot

Nitin Kumar Jain et al.,

perform both functions simultaneously. Additionally, We consider a straightforward and practical communication setup where each node in the network is equipped with a single antenna. For the communication initial scenario, the direct communication channel between the E and F is assumed to be heavily corrupted, rendering direct transmission between them impossible. As a result, data transmission relies solely on the cooperative relays. The transmission from the E is split into two distinct phases:

1. Broadcast Phase: In this phase, the E broadcast the signal to all the nodes within its communication range.

2. Relaying Phase: During the second phase, the chosen relay nodes transmit the received signal to the F.

Let x represent a complex-valued data symbol drawn from an M-point constellation, which is derived from the BPSK modulation scheme. The data x is of length $1 \times N$, where N is the packet length. The signal transmitted from the E reaches both the F and R, and the received signal at the F and R can be expressed as follows [15]:

$$Y_{E,F} = \sqrt{P_a} \cdot x \cdot P_{GEF} H_{EF} + \eta_{EF} \quad (1)$$

$$Y_{E,R_i} = \sqrt{P_a} \cdot x \cdot P_{GERi} H_{ERi} + \eta_{ERi} \quad \text{for } i = 1, 2, \dots, n \quad (2)$$

In this cooperative communication model, the broadcast phase allows the source node to send information to multiple relay nodes simultaneously. These relay nodes, in turn, aid in the transmission during the relaying phase by regenerating the signal and forwarding it to the destination. The use of multiple relay nodes introduces spatial diversity, which helps in mitigating the effects of channel fading and improves the overall reliability of the communication system. Since the relays operate in half-duplex mode, the system efficiency is affected by the time division between receiving and transmitting operations. Nonetheless, this setup is effective in overcoming severe channel conditions, particularly when the direct path between the E and F is unavailable or unreliable, as is the case in the simulated scenario. The complexity of the system arises from factors such as relay selection, signal processing, and the dynamic nature of wireless channels. In the simulation, we evaluate the system's performance by examining key metrics such as BER and signal-to-noise ratio (SNR). The use of BPSK modulation ensures simplicity in the modulation process, while the focus on cooperative diversity allows for enhanced communication reliability in environments where direct transmission is impractical. This scenario highlights the importance of relay nodes in maintaining reliable communication links and reducing the adverse effects of corrupted channels. By leveraging cooperative diversity and careful relay selection, the system can achieve robust communication, even in challenging wireless environments. In this cooperative communication scenario, let H_{EF} and P_{GEF} represent the channel coefficient and path gain for the link between the E and F respectively. Similarly, H_{ERi} and P_{GERi} denote the channel coefficient and path gain for the link between the E and a given relay node R_i . Additionally, η_{EF} and η_{ERi} represent the additive white Gaussian noise (AWGN) with zero mean and variance N_0 for the E-to-F and E-to- R_i links, respectively. The total transmits power allocated for the broadcast phase is denoted by P_a . During the broadcast phase, the E transmits data to both the R_i and the F. After receiving the signal, the destination node computes the bit error rate (BER). If errors are detected, the algorithm proceeds to the relaying phase, where a relay node R_i forwards the data to the F. If no errors are detected, the algorithm terminates, assuming successful transmission.

In the relaying phase, the received signal at the destination from the relay node R_i is expressed as:

$$Y_{R_i,F} = \sqrt{P_r} \cdot x \cdot P_{GRiF} H_{R_iF} + \eta_{R_iF}$$

Where H_{RiF} is the channel coefficient between the relay node R_i and the destination node, and η_{RiF} represents the AWGN noise with zero mean and variance N_0 . The term P_r represents the Tx power of the R_i , which is influenced by the distance between the R_i and the F. For the AF cooperative scheme, the R_i amplifies the received signal using an amplification factor β , and the amplified signal is then forwarded to the F. The received signal at the F for the AF scheme is given by:

$$Y_{R_i,F} = \beta \cdot Y_{E,R_i} \cdot P_{GRiF} H_{R_iF} + \eta_{R_iF}$$

Nitin Kumar Jain et al.,

In this equation, Y_{E,R_i} represents the signal received by the R_i from the E , and the R_i amplifies it by the factor β before forwarding it to the F .

To determine the path loss and gain for each R_i , the distance between R_i and F is calculated using the following formula [16]:

$$\text{Dist}_{R_i F} = \sqrt{(X_{R_i} - X_F)^2 + (Y_{R_i} - Y_F)^2}$$

$$\text{Path Loss}(P_L) = 10 \cdot \alpha \cdot \log_{10}(\text{Dist}_{R_i F}) + C$$

$$\text{Path Gain}(P_G) = -(P_L)$$

Here, α is the path loss exponent, and C is a constant accounting for system losses.

In this system, it is assumed that the channel coefficients are known only at the F , not at the E . At the F , the signals received during the broadcast and relaying phases are combined using the Maximal Ratio Combining (MRC) scheme. The combined signal at the F is given by:

$$Y = w_1 * Y_{EF} + w_2 * Y_{R_i F}$$

Where w_1 and w_2 are weighting factors, or link weights, that are computed to maximize the strength of the combined signal. These weights are calculated as:

$$w_1 = \frac{\sqrt{P_a H_{EF}^*}}{N_0} \text{ and } w_2 = \frac{\sqrt{P_r H_{R_i F}^*}}{N_0}$$

Assuming that the average energy of the transmitted symbol x is normalized to unity, the instantaneous SNR at the F using MRC is expressed as:

$$\gamma = \frac{P_a * P_{GEF} * |H_{EF}|^2 + P_r * P_{GRI F} * |H_{R_i F}|^2}{N_0}$$

This equation indicates that the overall SNR at the F is a function of the combined contributions from both the direct link (E to F) and the relayed link (R_i to F), maximizing the overall signal strength and enhancing communication reliability.

Calculation of Residual Energy of the Nodes

The energy consumption of nodes in a WSN is primarily due to three factors: transmission energy, reception energy and sensing energy. The total energy consumed by a node when transmitting data depends on the amount of data being sent and the distance between the E and F . The energy consumption during transmission of x bits of data from node i to another node j is defined by two cases based on the distance between the nodes.

Transmission Energy Consumption

The total transmission energy (E_{te}) required to send x bit data from node i to another node j is given by the following equations, which account for different propagation models [17] depending on the distance between the nodes:

- **Free Space Model (distance (ds) less than threshold distance (ds_0)):** In this case, the energy consumption follows a free-space path loss model, and the energy is proportional to the square of the distance.
- **Multipath Model (ds greater than or equal to ds_0):** For longer distances, the multipath fading model applies, where energy consumption is proportional to the 4th power of the distance.

$$E_{te} = \begin{cases} x \cdot E_{el} + x \cdot \varepsilon_{fs} \cdot ds^2, & \text{if } ds < ds_0 \\ x \cdot E_{el} + x \cdot \varepsilon_{ap} \cdot ds^4, & \text{if } ds \geq ds_0 \end{cases}$$

Where:

- x is the number of bits being transmitted.

- E_{el} is the energy consumed by the electronic components of the node during transmission.
- ϵ_{fs} is the energy dissipated in the free-space model.
- ϵ_{ap} is the energy consumed in the multipath model.

The threshold distance ds_0 determines when the system switches from free-space to multipath propagation and is calculated as:

$$ds_0 = \sqrt{\epsilon_{fs} / \epsilon_{ap}}$$

Reception Energy Consumption

The energy consumption for receiving data is more straightforward, as it only depends on the number of bits received and the energy required by the node's electronic circuitry. The reception energy E_{rec} for receiving x bits of data is given by:

$$E_{rec} = x.E_{el}$$

Total Energy Consumption at the Relay Node:

In a cooperative communication scenario, R_i not only receive data but also forward it to the F. The total energy consumption at the j^{th} relay node includes the energy spent on both receiving and transmitting the data:

$$E_{j,tte} = \begin{cases} x.E_{el} + x.\epsilon_{fs}.ds^2 + x.E_{el}, & \text{if } ds < ds_0 \\ x.E_{el} + x.\epsilon_{ap}.ds^4 + x.E_{el}, & \text{if } ds \geq ds_0 \end{cases}$$

Thus, the total energy consumed at the R_i is the sum of the energy required for receiving and transmitting the data, with the distance between the R_i and the F playing a critical role in determining the transmission energy.

Residual Energy of Relay Node

The residual energy of the j^{th} relay node is the remaining energy after accounting for the total energy consumed during both receiving and forwarding the data. If the initial energy of the relay node is E_0 then the residual energy is given by:

$$E_{re} = E_0 - E_{j,tte}$$

This calculation is crucial in a cooperative communication system where energy efficiency is a key design criterion, especially in wireless sensor networks where nodes have limited battery capacity and are often deployed in environments where recharging or replacing batteries is not feasible. By evaluating the residual energy, it becomes possible to select the most energy-efficient relay nodes for data transmission, thereby extending the overall network lifetime. This energy consumption model provides a framework for understanding how energy is expended in wireless sensor networks, particularly in cooperative communication scenarios involving relay nodes. The model emphasizes the importance of distance between nodes and the choice of propagation models (free-space or multipath) in determining energy usage. Additionally, the residual energy calculation is critical for maintaining network performance over time by enabling intelligent relay node selection based on energy efficiency.

Proposed Relay Selection Scheme

The FIS operates in three primary stages:

Fuzzification

Fuzzification is a crucial step in fuzzy logic systems, where precise numerical input values, known as crisp inputs, are converted into fuzzy sets using predefined membership functions [18]. This transformation allows the system to handle uncertainties and approximate reasoning effectively. In the context of the proposed fuzzy-based relay selection scheme, the input parameters, specifically, the P_L and E_{re} of the nodes are modeled as linguistic variables. These linguistic variables are assigned suitable membership functions that categorize the inputs into degrees of membership across defined fuzzy sets. This process enables the fuzzy logic system to interpret and process the input

parameters in a way that aligns with real-world variability and imprecision. Figure 2 illustrates the FIS framework used the input variables (P_L and E_{re}) and the output variable DoS, which represents the relay selection decision. These functions play a pivotal role in translating the crisp data into fuzzy values, facilitating a more adaptive and intelligent selection of relay nodes in dynamic wireless sensor network environments.

- The input variable P_L is divided into three states: min, mid, and max.
- The input variable E_{re} is classified into three states: less, med, and ample.

The output variable, Degree of Selection (DoS), which indicates the quality of the relay node, is divided into five states: f1, f2, f3, f4, and f5.

Inference

Based on the membership function states for the inputs (P_L and E_{re}), a set of nine fuzzy rules is created, forming the core of the fuzzy system. These rules are presented in Table 1 in which f1 has the highest priority and f5 has lowest priority. Fuzzy logic is particularly beneficial when optimizing multiple, potentially conflicting goals. For instance, if P_L is given the highest priority during relay selection, the system will enhance BER performance, but this comes at the cost of network lifetime. Conversely, prioritizing E_{re} improves NL at the expense of BER performance. The fuzzy logic approach helps strike a balance between these two competing factors. In the context of RNCWSNFL the FIS calculates the combined effect of path loss (P_L) and residual energy ($E_{re}\%$) of each relay node. For each relay, a numerical score, denoted as $f(P_L, E_{re}\%)$, is computed, and the node with the highest score is selected as the relay.

The process of fuzzification maps the linguistic values of the input and output variables to their corresponding fuzzy sets. For example, F1 represents path loss and F2 represents E_{re} for each relay node, where:

$F1 = \{\text{min, mid, max}\}$

$F2 = \{\text{less, med, ample}\}$

These states are then mapped to the output fuzzy set $F = \{f1, f2, f3, f4, f5\}$, using a predefined set of if-then rules. A trapezoidal membership function is employed to describe these linguistic values as follows:

$$\text{trap}(y; A, M_1, M_2, B) = \begin{cases} \frac{y - A}{M_1 - A}, & \text{if } x \in [A, M_1] \\ 1, & \text{if } x \in [M_1, M_2] \\ \frac{B - x}{B - M_2}, & \text{if } x \in [M_2, B] \\ 0, & \text{otherwise,} \end{cases}$$

where A and B define the support, and M1 and M2 define the kernel of the trapezoidal function. Using this function, we can define the fuzzification values for F1 (P_L) and F2 (E_{re}).

$$\text{min} = \text{trap}(F_1; 0, 0, M - M/2, M) \quad \text{mid} = \text{trap}(F_1; M - M/2, M, M, M + M/2)$$

$$\text{max} = \text{trap}(F_1; M, M + M/2, \infty, \infty)$$

$$\text{less} = \text{trap}(F_2; 0, 0, 25, 50)$$

$$\text{med} = \text{trap}(F_2; 25, 50, 50, 75)$$

$$\text{ample} = \text{trap}(F_2; 50, 75, 100, 100)$$

Based on the combination of Y1 and Y2, the degree of membership for $f(P_L, E_{i, \text{residual}}\%)$ is defined within the specified range ($\mu(x) \in [0; 100]$) as follows:

$$f5 = \text{trap}(x; 0, 0, 0, 30), f4 = \text{trap}(x; 10, 30, 30, 50), f3 = \text{trap}(x; 30, 50, 50, 70), f2 = \text{trap}(x; 50, 70, 70, 90),$$

$$f1 = \text{trap}(x; 70, 100, 100, 100)$$

Defuzzification

In the defuzzification stage, the fuzzy set corresponding to the input variables produces a single numerical output. The value of the output depends on the type of membership function.

Nitin Kumar Jain *et al.*,

The final output of the fuzzy system is determined by computing the center of gravity (CoG) of the output membership function. The formula for CoG is:

$$\text{CoG} = \frac{\sum [y \cdot \mu(y)]}{\sum \mu(y)}$$

RESULT AND DISCUSSION

In this paper, we evaluate the performance of the proposed relay selection scheme by comparing it with two widely used approaches: the random relay selection method and the maximum residual energy-based relay selection algorithm. The simulation environment involves randomly deploying nodes over a 100x100m² area, where the nodes remain fixed after deployment for all three algorithms. The communication between nodes is modeled using a Nakagami fading channel, which effectively captures the multipath fading characteristics commonly observed in wireless environments. Each channel is assumed to include additive white Gaussian noise (AWGN) with a mean of 0 and a variance of 1, representing the random noise component affecting the signal during transmission. This setup ensures a realistic simulation of signal degradation due to channel impairments. All nodes in the network operate in half-duplex mode, meaning they can either transmit or receive data at any given time but cannot perform both functions simultaneously. This mode of operation reflects a practical constraint in most wireless communication systems, helping to simplify the design and reduce hardware complexity. Furthermore, the destination node, often referred to as the sink node, is positioned at a fixed location across all simulation scenarios. This static placement serves as a reference point for evaluating network performance, allowing a consistent framework to analyze the impact of different relay selection strategies and channel conditions on overall system behavior. Table 2 presents the parameters utilized in the simulation.

Bit Error Rate (BER)

The BER represents the probability of errors occurring during data transmission, making it a crucial metric for evaluating channel quality. Figure 3 shows the BER performance as the signal-to-noise ratio (SNR) increases. Since we assume constant noise, an increase in SNR indicates higher transmission power, which consequently lowers the BER. Among the three strategies, the proposed RNCWSNFL scheme demonstrates the lowest BER. This is because, in the proposed approach, P_L is considered a key parameter for relay selection, and minimizing P_L leads to fewer bit errors. In contrast, both the random and maximum residual energy strategies disregard P_L , resulting in higher BER. Specifically, the average BER values at a given SNR from Figure 3 are 12.55×10^{-2} for the Random Node Selection (RNS) strategy, 12.93×10^{-2} for the Residual Energy based Node Selection (RENS) strategy, and 11.05×10^{-2} for the proposed approach, showing the proposed algorithm's superior performance in reducing transmission errors.

Throughput is a crucial performance metric for evaluating the reliability and efficiency of a network. It measures the number of data packets successfully received by the base station over a series of rounds, serving as an indicator of how effectively the network is transmitting data under varying conditions. As the number of rounds increases, throughput provides insights into the network's ability to maintain consistent data delivery. In Figure 4, the comparison between the proposed scheme and the RNS and RENS strategies clearly demonstrates the superior performance of the proposed scheme, highlighting its enhanced efficiency and reliability in network throughput.

Network Lifespan

NL refers to the duration until the first node depletes its energy and dies. In Figure 5, we analyze NL as the number of nodes increases from 5 to 40. For these simulations, each relay node is initialized with 0.5 J of energy and the message length is set to 50 bits. Nodes are randomly deployed within a 100x100m² areas. As the number of nodes increases, the opportunity to select different relay nodes also increases, reducing the average number of transmissions per node and thereby lowering energy consumption. This leads to an overall increase in NL. Among the three strategies, the RENS method yields the longest NL because it minimizes per-node transmissions. The proposed algorithm also achieves a relatively high NL since it factors in the energy levels of nodes during relay

selection. In contrast, the RNS strategy results in the shortest NL due to inefficient node utilization. The average NL for different strategies with a 0.2J energy threshold are as follows:

- Maximum residual energy: 1.7438×10^4 seconds
- Fuzzy logic: 1.1905×10^4 seconds
- Random strategy: 0.5059×10^4 seconds

The distance of relay nodes from the destination also significantly affects network lifetime. Longer distances lead to higher energy consumption. Figure 6 shows NL as the average distance of relay nodes from the destination increases. For this simulation, we randomly generate network topologies with 20 relay nodes and set the energy threshold for node death at 0.2J. As the average distance increases, NL decreases due to higher energy requirements for longer-distance transmissions. The difference in NL between the RENS strategy and the proposed approach becomes negligible as the distance increases, whereas the RNS strategy consistently performs poorly with much shorter network In conclusion, the proposed relay selection algorithm consistently outperforms the RNS and RENS strategies across multiple performance metrics, including BER, network lifetime, and energy efficiency. By incorporating both path loss and residual energy into the relay selection process, the fuzzy logic approach offers a balanced and effective solution for enhancing wireless network performance.

CONCLUSION

Cooperative diversity techniques offer a promising solution to address the challenges of spectrum inefficiency in wireless communication systems. In this paper, we present a novel fuzzy-based relay selection algorithm tailored for cooperative communication. The proposed method leverages two key parameters P_L and E_{re} to compute the DoS for selecting the most suitable relay nodes that will cooperate with the source node during transmission. By utilizing fuzzy logic, the algorithm evaluates these parameters to make intelligent and dynamic relay selections, aiming to strike a balance between minimizing transmission errors and optimizing energy consumption. Unlike traditional relay selection methods that may prioritize either energy efficiency or transmission quality exclusively, our proposed approach integrates both considerations, providing a more holistic and adaptive solution. One of the primary benefits of this approach is its superior performance in terms of BER. Among the strategies evaluated, including RNS and RENS, the RNCWSNFL algorithm consistently achieves the lowest BER. This is largely because the method actively considers P_L , a critical factor that directly affects the signal quality. By selecting relay nodes with lower P_L , the system reduces transmission errors, improving overall communication reliability. Additionally, the proposed algorithm demonstrates an efficient balance between energy consumption and NL. In wireless networks, extending NL is crucial, especially in scenarios where nodes are battery-powered and energy resources are limited. While the RENS strategy may prioritize energy conservation by selecting nodes with higher residual energy, it often overlooks other vital factors, such as the distance to the destination or the quality of the communication link. On the other hand, RNS lacks the strategic planning necessary for efficient resource utilization. Our RNCWSNFL scheme addresses these limitations by incorporating both energy levels and communication quality metrics into the relay selection process. As a result, the algorithm not only conserves energy more effectively than random selection but also outperforms traditional strategies in prolonging NL. It achieves this without sacrificing transmission quality, offering a fair tradeoff between conserving energy and maintaining high-quality, error-free communication.

ABSTRACT

The present study "Customers' satisfaction towards an Electric Two wheeler", was conducted with the aim of determining the socio-demographic characteristics of customers and the various dimensions of customer satisfaction. An attempt was made to find the relationship between selected socio-demographic variables and the various dimensions of customer satisfaction in order to get meaningful inferences.

Descriptive research design was adopted.. The researcher used purposive sampling method for selecting 150 respondents. The information required for the study was directly collected from the customers by giving questionnaire. The data collected through the questionnaire were carefully analysed and processed by using, statistical techniques such as mean, median, t-test, f-test and chi-square analysed Karl Pearson's coefficient correlation. The tests yielded meaningful results. To overcome these deficiencies, suggestions like the improvement of services are to be made.

Keywords: Customer, Electronic Two Wheeler, Service, Product, Satisfaction

INTRODUCTION

Electric two-wheelers have the potential to enhance local air quality and lower greenhouse gas emissions compared to gasoline-powered models. They also offer a reduction in noise pollution, which can make them competitive in the market. However, they face some fundamental performance challenges, such as speed, range, and recharging time. Despite these issues, their lower operating costs can offset some of these performance drawbacks. In India, initial efforts to deploy electric two-wheelers have been hindered by reliability issues, affecting public perception of this emerging technology. The strong preference for gasoline two-wheelers persists, regardless of price or performance differences. To address these challenges, it is crucial for the electric two-wheeler industry, along with government and non-government organizations, to engage in proactive marketing and public awareness campaigns. Additionally, effective policies supporting electric two-wheelers should be paired with advancements in battery manufacturing and infrastructure to foster broader adoption.

Review of Literature

Nigam *et al.* (2023) the study is based on customer satisfaction towards Okinawa Electric bikes. It finishes up the factors affect the customer satisfaction are the brand name, alert and the motor power. More than 90 percent respondents are satisfied with the price of the bike, value for money, mileage and Maintenance. Sangeetha (2023) found that electric bikes are slow but consistently making their way into the two wheeler market. The availability of electric bikes has increased competition in this sector. Environmentally conscious customers recognize the need for pollution reduction. The level of awareness among Electric Bikes users is deemed revolutionary at this time because there is a need to replace the conventional system that pollutes the environment.

Objectives of The Study

- To study the satisfaction levels of customers of electric two-wheeler in Trichy city
- To study the various dimensions of the customer satisfaction
- To find the areas to be improved at the firm as perceived by the customer.
- To suggest suitable measures for improving the existing service. Research Design: Descriptive research design

Sampling : Purposive sampling method

Majority (41.3%) of the respondents are found to be in the age group of 21- 30 years, (23.3%) of the respondents are found to be in the age group of above 40 years, (20.7%) of the respondents are found to be in the age group of 31-40 years and (14.7%) of the respondents are found to be in the age group of up to 20 years. It was found that (26.7%) of the respondents have Rs. 5001-10000, (26%) of the respondents have Rs. up to 5000, (26%) of the respondents have no income and (21.3%) of the respondents have income above Rs. 10000. It was found that (42.7%) of the respondents are business people, (24.7%) of the respondents are students, (24%) of the respondents are professionals, (8.7%) of the respondents are in service. It was found that (71.3%) of the respondents service their bike in authorized service center and (28.7%) of the respondents service their bike in local mechanic shop. It was found that (89.3%) of the respondents maintain their bike as per maintenance schedule and (10.7%) of the respondents didn't maintain their bike as per maintenance schedule. Majority (56%) of the respondents perceive high level of product satisfaction and (44%) of the respondents perceive low level of product satisfaction. (50.7%) of the respondents perceive high level of service satisfaction and (49.3%) of the respondents perceive low level of service satisfaction. (52%) of the respondents perceive high level of overall customer satisfaction and (48%) of the respondents perceive low level of over all customer satisfaction. The above table that there is no significant difference between the type of family (Joint and Nuclear) with regard to the customer satisfaction in the dimensions of difference product satisfaction and service satisfaction. The above table that there is no significant difference between the marital status (Married and Unmarried) with regard to the customer satisfaction in the dimensions of product satisfaction and service satisfaction. It is evident from the above table that there is no significant difference among the various occupation of the respondents with regards to the various dimensions of customer satisfaction namely, product and service satisfaction.

**Aldrin et al.,**

It is evident from the above table that there is no significant difference among the various area of living of the respondents with regard to various dimensions of customer satisfaction namely products and service satisfaction. The above table that there is a significant association between clear explanation of features respondents and various dimensions of customer satisfaction namely product and service satisfaction.

- Majority 36.7% of the Respondents Suggest power is very good.
- Majority 36.7% of the Respondents Suggest Mileage is good.
- Majority 40.0% of the Respondents Suggest safety is good
- Majority 32.7% of the Respondents Suggest Braking is very good.
- Majority 36% of the Respondents Suggest Riding comfort is very good.
- Majority 33.3% of the Respondents Suggest Road grip is very good.
- Majority 40.7% of the Respondents Suggest Technology is very good.
- Majority 39.3% of the Respondents Suggest pick-up acceleration is very good.
- Majority 47.3% of the Respondents Suggest Availability of spares is very good
- Majority 46.7% of the Respondents Suggest Cost maintenance is good .
- Majority 35.3% of the Respondents Suggest Warranty is very good
- Majority 40.0% of the Respondents Suggest showroom reception is very good.
- Majority 38.0% of the Respondents Suggest timely delivery of service is good.
- Majority 40.0% of the Respondents Suggest Ambience of showroom is very good .
- Majority 41.3% of the Respondents Suggest turnout of staff is good.
- Majority 37.3% of the Respondents Suggest cost of spares is Average.
- Majority 38.0% of the Respondents Suggest Comprehension of customer is very good
- Majority 40.0% of the Respondents Suggest ease of finance option is good.
- Majority 38.0% of the Respondents Suggest Relationship with the customer is very good

There is a significant relationship among various dimensions of customers satisfaction namely product and service satisfaction.

Suggestions

Timely delivery of serviced vehicle may be affected in order to enhance customer satisfaction levels. Customer feedback reveals that serviced vehicles delivered are not delivered in a clean condition. This area needs to be addressed appropriately. Customer feedback reveals that defective performances of vehicle (if any) are rectified if and only if the customers bring these to the notice of service personnel. Service personnel need to diagnose defects even without customer information. This practice would enhance the trust and confidence in the service quality and satisfaction levels of the customers.

CONCLUSION

The conclusion of the study is nearly half of the respondents were satisfied with the product satisfaction and half of the respondents were satisfied with the service satisfaction.

ABSTRACT

Let $G = (V, E)$ be a connected graph. A subset D of V is called a dominating set of G if $N[D] = V$. The minimum cardinality of a dominating set of G is called the domination number of G and is denoted by $\gamma(G)$. A set $D \subseteq V(G)$ of a connected graph G is a tree hop dominating set of G , if for every v in $V(G) - D$, there exists $u \in D$ such that $d(u, v) = 2$ and $\langle D \rangle$ is a tree. The minimum cardinality of a tree hop dominating set is called tree hop domination number and is denoted by $\gamma_{th}(G)$. In this paper, tree hop number is found for some particular graphs and bounds of tree hop domination number are obtained.

Keywords: Domination number, hop domination number, tree domination number.

Mathematics Subject Classification: 05C69

INTRODUCTION

The graphs considered here are nontrivial, finite and undirected. The order and size of G are denoted by n and m

respectively. If $D \subseteq V$, then $N(D) = \bigcup_{v \in D} N(v)$ and $N[D] = N(D) \cup D$ where $N(v)$ is the set of vertices of G which are adjacent to v . The concept of domination in graphs was introduced by Ore[6]. A subset D of V is called a dominating set of G if $N[D] = V$. The minimum cardinality of a dominating set of G is called the domination number of G and is denoted by $\gamma(G)$. Xuegang Chen, Liang Sun and Alice McRae [7] introduced the concept of tree domination in graphs. A dominating set D of G is called a tree dominating set, if the induced subgraph $\langle D \rangle$ is a tree. The minimum cardinality of a tree dominating set of G is called the tree domination number of G and is denoted by

Muthammai and Chitiravalli

$\gamma_{tr}(G)$. S. K. Ayyaswamy et al. [1, 2] defined a new domination parameter called hop domination number of a graph. A set $D \subseteq V(G)$ of a connected graph G is a hop dominating set of G , if for every v in $V(G) - D$, there exists $u \in D$ such that $d(u, v) = 2$. The minimum cardinality of a hop dominating set is called hop domination number and is denoted by $\gamma_h(G)$.

The Cartesian product of two graphs G_1 and G_2 is the graph, denoted by $G_1 \times G_2$ with $V(G_1 \times G_2) = V(G_1) \times V(G_2)$ (where \times denotes the Cartesian product of sets) and two vertices $u = (u_1, u_2)$ and $v = (v_1, v_2)$ in $V(G_1 \times G_2)$ are adjacent in $G_1 \times G_2$ whenever $[u_1 = v_1 \text{ and } (u_2, v_2) \in E(G_2)]$ or $[u_2 = v_2 \text{ and } (u_1, v_1) \in E(G_1)]$. In this paper, tree hop number is found for some particular graphs and bounds of tree hop domination number are obtained.

2. TREE HOP DOMINATION IN SOME CONNECTED GRAPHS

In this section, tree hop domination number is defined and this number is found for some particular graphs.

Definition 2.1: A set $D \subseteq V(G)$ of a connected graph G is a tree hop dominating set of G , if for every $v \in V(G) - D$, there exists $u \in D$ such that $d(u, v) = 2$ and $\langle D \rangle$ is a tree. The minimum cardinality of a tree hop dominating set is called tree hop domination number and is denoted by $\gamma_{th}(G)$.

The tree hop domination number does not exist for some graphs. If this number does not exist for a given connected graph G , then $\gamma_{th}(G)$ is defined to be zero. A tree hop dominating set with cardinality $\gamma_{th}(G)$ is referred as a γ_{th} -set.

Example 2.1.1

In the graph G given in Figure 2.1, minimum tree hop dominating set is $\{v_6, v_7, v_8\}$ and $\gamma_{th}(G) = 3$.

Example 2.1.2

For the graphs given in Figure 2.2, tree hop dominating sets do not exist and $\gamma_{th}(G) = 0$.

Observation 2.1.1

Any tree hop dominating set is a hop dominating set. Therefore, $\gamma_h(G) \leq \gamma_{th}(G)$. This is illustrated by following examples.

Example 2.1.3

In the graph G given in Figure 2.3, the set $\{v_6, v_7\}$ is both a minimum hop dominating set and a minimum tree hop dominating set. Therefore, $\gamma_h(G) = \gamma_{th}(G) = 2$.

Example 2.1.4

In the graph G given in Figure 2.4, minimum hop dominating set is $\{v_5, v_6, v_8, v_9\}$ and $\gamma_h(G) = 4$ and minimum tree hop dominating set is $\{v_5, v_6, v_7, v_8, v_9\}$ and $\gamma_{th}(G) = 5$.

Therefore, $\gamma_h(G) < \gamma_{th}(G)$.

In the following, tree hop domination numbers of some standard graphs are found.

Theorem 2.1.1: For any path P_n on atleast six vertices, $\gamma_{th}(P_n) = n - 4$.

Proof:

Let v_1, v_2, \dots, v_n be the vertices of P_n with v_1 and v_n as pendant vertices and v_2 and v_{n-1} as supports. Let $D = \{v_i \in V(P_n) : d(v_i) = 2 \text{ and } v_i \text{ is not a support}\}$. Then $|D| = n - 4$ and $\langle D \rangle \cong P_{n-4}$. $d(v_1, v_3) = d(v_n, v_{n-2}) = d(v_2, v_4) = d(v_{n-1}, v_{n-3}) = 2$. For each vertex in $V(G) - D$, there exists a vertex in D at distance two. Therefore, D is a tree hop dominating set of G and is minimum and $\gamma_{th}(P_n) = |D| = n - 4$.

Remark 2.1.1:

(i) For $n = 3, 4$ and 5 , $\gamma_{th}(P_n) = 2$.

(ii) For the cycle on atleast six vertices, $\gamma_{th}(C_n) = n - 4$ and for $n = 4, 5$, $\gamma_{th}(C_n) = 2$. $\gamma_{th}(C_3) = 0$.

Muthammai and Chitiravalli

Theorem 2.1.2: For the complete bipartite graph $K_{r,s}$, $\gamma_{th}(K_{r,s}) = 2$, where $r, s \geq 2$.

Proof:

Let $[A, B]$ be the bipartition of $K_{r,s}$ and let $u \in A, v \in B$. Then the set $\{u, v\}$ is a tree hop dominating set of $K_{r,s}$. Therefore, $\gamma_{th}(K_{r,s}) \leq 2$. Also $2 = \gamma(K_{r,s}) \leq \gamma_{th}(K_{r,s})$.

Hence, $\gamma_{th}(K_{r,s}) = 2$.

Remark 2.1.2: $\gamma_{th}(K_{1,s}) = 3$, where $s \geq 3$.

Theorem 2.1.3: For the wheel W_n on at least seven vertices, $\gamma_{th}(W_n) = 3$.

Proof:

Let w be the central vertex of W_n and u and v be two vertices of W_n such that $N(u) \cap N(v) = \{w\}$. Then the set $\{u, v, w\}$ is a tree hop dominating set of W_n . Therefore, $\gamma_{th}(W_n) \leq 3$. Also, $3 = \gamma_{th}(W_n) \leq \gamma_{th}(W_n)$ and hence $\gamma_{th}(W_n) = 3$.

Remark 2.1.3:

(i) For $4 \leq n \leq 6$, $\gamma_{th}(W_n) = 0$.

(ii) For $n \geq 3$, $\gamma_{th}(K_n) = 0$.

Theorem 2.1.4: For $n \geq 4$, $\gamma_{th}(P_n \circ K_1) = n - 2$.

Proof:

Let v_1, v_2, \dots, v_n be the vertices of P_n with v_1 and v_n as pendant vertices and let u_i be the pendant vertex adjacent to v_i , $i = 1, 2, \dots, n$. Let $D = V(P_n) - \{v_1, v_n\}$. Then $|D| = n - 2$ and $\langle D \rangle \cong P_{n-2}$. For $i = 1, 2, \dots, n - 2$, $d(u_i, v_{i+1}) = 2$, $d(u_{n-1}, v_{n-2}) = d(u_n, v_{n-1}) = d(v_1, v_2) = d(v_n, v_{n-2}) = 2$. D is a minimum tree hop dominating set of $P_n \circ K_1$.

Therefore, $\gamma_{th}(P_n \circ K_1) = n - 2$.

Remark 2.1.4

(i) $\gamma_{th}(P_3 \circ K_1) = 2$

(ii) For $n \geq 4$, $\gamma_{th}(C_n \circ K_1) = n - 2$, $\gamma_{th}(C_3 \circ K_1) = 3$

Theorem 2.1.5: For $n \geq 4$, $\gamma_{th}(W_n \circ K_1) = 2$

Proof:

Let v be the central vertex of W_n and u be the pendant vertex adjacent to v .

Let $D = \{v, u\}$. Then $\langle D \rangle \cong K_2$. For $v_i \in V(C_{n-1})$, $d(v_i, u) = 2$ and $d(u_i, v) = 2$, where u_i is the pendant vertex adjacent to v_i . Then D is a minimum tree hop dominating set of $W_n \circ K_1$ and hence $\gamma_{th}(W_n \circ K_1) = 2$.

Remark 2.1.5

(i) Since any minimum tree hop dominating set of $K_{r,s}$ is also a minimum tree hop dominating set of $K_{r,s} \circ K_1$, $\gamma_{th}(K_{r,s}) = \gamma_{th}(K_{r,s} \circ K_1) = 2$.

(ii) $\gamma_{th}(K_{1,n} \circ K_1) = 2$, for $n \geq 2$.

Theorem 2.1.6: For $n \geq 6$, let $C_n^{(t)}$ be the one point union of t cycles of length n . Then $\gamma_{th}(C_n^{(t)}) = t(n - 5) + 1$.

Proof:

Let $v, v_i^{(1)}, v_i^{(2)}, \dots, v_i^{(n-1)}$ be the vertices of i th cycle in $C_n^{(t)}$ in order, $i = 1, 2, \dots, t$, where v is the common vertex.

Case 1. n is even

Let $D = \bigcup_{i=1}^t \{v_i^{((n/2)-1)}, v_i^{(n/2)}, v_i^{((n/2)+1)}, v_i^{((n/2)+2)}\}$ and let $D' = (V(C_n^{(t)}) - D) \cup \{v\}$. Then $\langle D' \rangle$ is a tree and is a one point union of t paths of length $((n/2) - 2)$ and t paths of length $((n/2) - 3)$. Also, for any vertex in $(V(C_n^{(t)}) - D')$, $d(v_i^{((n/2)-1)}, v_i^{((n/2)-3)}) = 2$, $d(v_i^{(n/2)}, v_i^{((n/2)-2)}) = d(v_i^{((n/2)+1)}, v_i^{((n/2)+3)}) = d(v_i^{((n/2)+2)}, v_i^{((n/2)+4)}) = 2$. Then D' is a tree hop dominating set of $C_n^{(t)}$ and is minimum. If not, if any vertex of $V(C_n^{(t)}) - D'$ is added with D' , then the hop dominating set will not be a tree.

Muthammai and Chitiravalli

Case 2. n is odd

Let $D = \bigcup_{i=1}^t \left\{ v_i \left(\frac{(n-3)}{2} \right), v_i \left(\frac{(n-1)}{2} \right), v_i \left(\frac{(n+1)}{2} \right), v_i \left(\frac{(n+3)}{2} \right) \right\}$ and let $D' = (V(C_n^{(t)}) - D) \cup \{v\}$. $\langle D' \rangle$ is a tree and is the one point union of $2t$ paths of length $((n-5)/2)$ each. Also, $d(v_i((n-3)/2), v_i((n-5)/2)) = d(v_i((n-1)/2), v_i((n-3)/2)) = d(v_i((n+1)/2), v_i((n+3)/2)) = d(v_i((n+3)/2), v_i((n+5)/2)) = 2$. Then D' is a tree hop dominating set of $C_n^{(t)}$ and is minimum.

Therefore, $\gamma_{th}(C_n^{(t)}) = |D'| = t(n-5) + 1, n \geq 6$.

Remark 2.1.6:

$$\gamma_{th}(C_n^{(t)}) = \begin{cases} 2, & \text{if } n = 4, 5 \\ 3, & \text{if } n = 3 \end{cases}$$

In the following, some graphs for which their tree hop domination number is 2 or 3 are given.

Observation 2.1.2:

- (i) If G is a triangular cactus graph T_p whose blocks are p triangles, then $\gamma_{th}(G) = 3$
- (ii) If $J_{m,n}$ is the Jelly Fish graph, then $\gamma_{th}(J_{m,n}) = 2$.
- (iii) For the Durer graph G , $\gamma_{th}(G) = 3$.
- (iv) The Helm graph H_n is the graph obtained from a n -wheel graph by adjoining a pendant edge at each vertex of the cycle. $\gamma_{th}(H_n) = 3$, for $n \geq 6$ and $\gamma_{th}(H_n) = n - 1$, if $n = 3, 4, 5$.
- (v) An (n, k) banana tree $B(n, k)$ is a graph obtained by connecting one leaf of each of n copies of an k -star graph with a single root that is distinct from all stars. Then, $\gamma_{th}(B(n, k)) = n + 1$.
- (vi) An (n, k) firecracker graph $F_{n,k}$ is a graph obtained by the concatenation of nk stars by linking one leaf from each. Then, $\gamma_{th}(F_{n,k}) = n$.
- (vii) The double star $S_{m,n}$ is a graph obtained by attaching m and n pendant edges at each of the pendant vertices of a path. If P_t be the path on t vertices, then $\gamma_{th}(S_{m,n}) = t - 2$, where $t \geq 4$.
- (viii) Let S_m be the star graph. For the Staked Book Graph $B_{n,m} = S_{m+1} \times P_n$, $\gamma_{th}(B_{n,m}) = n - 2$.

Example 2.1.5: Helm graph

In the graph G given in Figure 2.5, minimum tree hop dominating set is $\{v_6, v_7, v_8\}$ and $\gamma_{th}(G) = 3$.

Example 2.1.6: Banana tree

In the graph G given in Figure 2.6, minimum tree hop dominating set is $\{v_6, v_7, v_8\}$ and $\gamma_{th}(G) = 3$.

Example 5.1.7: Firecracker graph

In the graph G given in Figure 2.7, minimum tree hop dominating set is $\{v_1, v_2, v_3\}$ and $\gamma_{th}(G) = 3$.

Theorem 2.1.7: Let G and H be two connected graphs. If $G + H$ is the join of G and H , then $\gamma_{th}(G + H) \leq \min\{\gamma_{tr}(G), \gamma_{tr}(H)\}$.

Proof:

Let D be a minimum tree dominating set of G . Then $\langle D \rangle$ is a tree and D is also a hop dominating set of $G + H$, since for each vertex u in $V(G + H)$, there exists a vertex v in D such that $d(u, v) = 2$. Therefore, $\gamma_{th}(G + H) \leq \min\{\gamma_{tr}(G), \gamma_{tr}(H)\}$.

Theorem 2.1.8: Let G and H be two connected graphs and $|V(G)| = n$ and let D be a tree hop dominating set of G such that $|D| = 2$. If each vertex in $V(G) - D$ is adjacent to exactly one vertex in D , then $\gamma_{th}(G \circ H) = 2$, where $G \circ H$ is the corona of G and H .

**Proof:**

Let D be a tree hop dominating set of a connected graph G such that $|D| = 2$ and each vertex in $V(G) - D$ is adjacent to exactly one vertex in D . Let $D = \{v_1, v_2\} \subseteq V(G)$ and $\langle D \rangle \cong K_2$. Since D is hop dominating set of G , for each vertex u in $V(G) - D$, there exists a vertex v in D such that $d_G(v, u) = 2$. Let vertices of first and second copy of H are adjacent to v_1 and v_2 respectively. Let $u_i^{(1)}, u_i^{(2)}, \dots, u_i^{(m)}$ be the vertices of i^{th} copy of H , $i = 1, 2, \dots, n$. Then $d(u_i^{(1)}, v_2) = d(u_i^{(2)}, v_1) = 2$, for $j = 1, 2, \dots, m$. Since each vertex in $V(G) - D$ is adjacent to exactly one vertex in D , either $d(u_i^{(1)}, v_1) = 2$ (or) $d(u_i^{(2)}, v_2) = 2$, for $i = 3, 4, \dots, n$ and $j = 1, 2, \dots, m$. Therefore, D is tree hop dominating set of $G \circ H$ and D is minimum and hence $\gamma_{\text{th}}(G \circ H) = 2$. In the following, tree hop domination number in Total and Middle graphs of paths, cycles and stars are found.

Observation 2.1.3: For a graph G , any two adjacent vertices of G lie on a triangle in $T(G)$. Therefore, $\gamma_{\text{th}}(T(G)) \geq 3$.

$$\gamma_{\text{th}}(T(P_n)) = \begin{cases} 3, & \text{if } n = 3, 4, 5, 6 \\ n - 4, & \text{if } n \geq 7 \end{cases}$$

Theorem 2.1.9: For the path P_n on n vertices,

Proof:

Let $n \geq 7$ and let S be the set of all supports and pendant vertices of P_n . Then $V(P_n) - S$ is a tree hop dominating set of $T(P_n)$ and is minimum. Therefore, $\gamma_{\text{th}}(P_n) = |V(P_n) - S| = n - 4$. For $n = 3, 4, 5$ and 6 , $\gamma_{\text{th}}(P_n) = 3$.

As in Theorem 5.3.9., the following theorem can be proved.

$$\gamma_{\text{th}}(T(C_n)) = \begin{cases} 0, & \text{if } n = 3 \\ 3, & \text{if } n = 4, 5, 6 \\ n - 3 & \text{if } n \geq 7 \end{cases}$$

Theorem 2.1.10: For the cycle C_n on n vertices,

Theorem 2.1.11: For the star $K_{1,n}$ on $n+1$ vertices, $\gamma_{\text{th}}(T(K_{1,n})) = 3$, if $n \geq 3$.

Proof:

The set containing the central vertex and two vertices of $K_{1,n}$ is a tree hop dominating set of $T(K_{1,n})$ and $\gamma_{\text{th}}(T(K_{1,n})) \leq 3$. Since any two adjacent vertices $T(K_{1,n})$ lie on a triangle, $\gamma_{\text{th}}(T(K_{1,n})) \geq 3$. Therefore, $\gamma_{\text{th}}(T(K_{1,n})) = 3$.

Remark 2.1.7

$$\gamma_{\text{th}}(M(P_n)) = \gamma_{\text{th}}(M(C_n)) = \begin{cases} 2, & \text{if } n = 3 \\ 3, & \text{if } n = 4, 5 \\ n - 3 & \text{if } n \geq 6 \end{cases}$$

(a) $\gamma_{\text{th}}(M(K_{1,n})) = 3, n \geq 3$.

Theorem 2.1.12: Any tree hop dominating set with atleast three vertices of a connected graph G is also a tree hop dominating set of $T(G)$.

Proof:

Let D be a tree hop dominating set of G with $|D| \geq 3$. Then D hop dominates all the vertices of G in $T(G)$.

Remark 2.1.8.

Let G be a graph for which its line graph $L(G)$ is connected. Then any tree hop dominating set with atleast three vertices of $L(G)$ is also a tree hop dominating set of $M(G)$.

2.2. Bounds of Tree Hop Domination Number of Connected Graphs

In this section, bounds of tree hop domination number are obtained and the connected graphs for which the bounds are attained are characterized.

**Observation 2.2.1**

For any connected graph G having n vertices with $\gamma_{th}(G) > 0, 1 \leq \gamma_{th}(G) \leq n - 1$. If $\gamma_{th}(G) = 1$ and if D is a tree hop dominating set of G such that $|D| = 1$, then there exists no vertex u in D such that $d(v, u) = 2$, where $v \in D$. Therefore, $2 \leq \gamma_{th}(G) \leq n - 1$, if $\gamma_{th}(G) > 0$.

Theorem 2.2.1: Let G be a connected graph with at least three vertices. For every subset D of $V(G)$ with atleast two vertices, if either

- (i) there exists at least one vertex in $V(G) - D$ adjacent to all the vertices in D (or)
- (ii) $\langle D \rangle$ contains a cycle or $\langle D \rangle$ is disconnected.

Then $\gamma_{th}(G) = 0$.

Proof

Let D be a subset of $V(G)$ with at least two vertices. If (i) holds, then D is not a hop dominating set of G . If (ii) holds, then D is not a tree dominating set of G .

Therefore, $\gamma_{th}(G) = 0$. In the following, the connected graphs for which $\gamma_{th}(G) = n - 1$ and $n - 2$ are characterized.

Theorem 2.2.2: Let G be a connected graph with n ($n \geq 3$) vertices and $\gamma_{th}(G) > 0$. Then $\gamma_{th}(G) = n - 1$ if and only if G is isomorphic to P_3 .

Proof:

Let D be a tree hop dominating set of G such that $|D| = n - 1$. Then $\langle D \rangle$ is a tree on $(n - 1)$ vertices. Let $u \in V(G) - D$. Let D contains three vertices. Then $\langle D \rangle \cong P_3$ and $|V(G)| \geq 3$. Then u can be adjacent to one or two vertices of P_3 .

In that case, $\gamma_{th}(G) = 2 \neq n - 1$. Also, it can be proved that, if D contains atleast four vertices, then $\gamma_{th}(G) \leq n - 2$. Therefore, D contains exactly two vertices and $|V(G) - D| = 1$ and $\langle D \rangle \cong K_2$. If $G \cong C_3$, then $\gamma_{th}(G) = 0$. Hence, $G \cong P_3$.

Conversely, if $G \cong P_3$, then $\gamma_{th}(G) = 2 = n - 1$.

Theorem 2.2.3: Let G be a connected graph with n ($n \geq 4$) vertices and $\gamma_{th}(G) > 0$. Then $\gamma_{th}(G) = n - 2$ if and only if there exists a tree T in G on $n - 2$ vertices such that each vertex in $V(G) - T$ is adjacent to all the vertices in T other than a pendant vertex in T .

Proof:

Let T be a tree in G on $n - 2$ vertices such that each vertex in $V(G) - T$ is adjacent to all the vertices in T other than a pendant vertex in T . Let $u \in T$. If u is an internal vertex in T , then $T - \{u\}$ is disconnected. Let u be a pendant vertex in T , then $T - \{u\}$ is not a hop dominating set, since there exists a vertex in $V(G) - (T - \{u\})$ adjacent to all the vertices in $T - \{u\}$. Therefore, T is a tree hop dominating set of G and $\gamma_{th}(G) \leq |T| = n - 2$. Since for every vertex w in T , $T - \{w\}$ is not a hop dominating set and $\gamma_{th}(G) \geq n - 2$. Hence, $\gamma_{th}(G) = n - 2$.

Conversely, assume $\gamma_{th}(G) = n - 2$. Let D be a tree hop dominating set of G with $|D| = n - 2$. Then $\langle D \rangle$ is a tree on $n - 2$ vertices. Let $u \in V(G) - D$. If u is adjacent all the vertices in D , then $d(u, v) = 1$, for all $v \in D$. If u is adjacent to at most $n - 2$ vertices of D , then $\gamma_{th}(G) \leq n - 3$. If u is adjacent to all vertices of D other than an internal vertex of $V(\langle D \rangle)$, then $\gamma_{th}(G) \leq n - 3$. Therefore, u is adjacent to all the vertices of D other than a pendant vertex of $\langle D \rangle$.

Theorem 2.2.4: Let G be a connected graph with $\gamma_{th}(G) > 0$, which is self-centered with radius 2. Then $\gamma_{th}(G) = 2$.

Proof:

Choose two adjacent vertices v_1 and v_2 in G such that no vertex of G is adjacent to both v_1 and v_2 . Let $D = \{v_1, v_2\}$. Then $\langle D \rangle \cong K_2$. Since G is self-centered with radius 2, for each vertex w in $V(G) - D$, there exists at least one vertex in D such that $d(w, v_i) = 2$, $i = 1, 2$. Therefore, D is tree hop dominating set of G and $\gamma_{th}(G) \leq |D| = 2$. Since $|D| \geq 2$, $\gamma_{th}(G) = 2$.

Theorem 2.2.5: Let T be a tree of diameter atmost 5. Then $\gamma_{th}(T) = 2$.

Proof:

Let P_n be a longest path of length d in T . Then $d \leq 5$.

Let $d = 5$ and $V(P_5) = \{v_1, v_2, v_3, v_4, v_5, v_6\}$. Then $\{v_3, v_4\}$ is a tree hop dominating set of T . Let $d = 4$ and $V(P_4) = \{v_1, v_2, v_3, v_4, v_5\}$. Then $\{v_3, v_4\}$ is a tree hop dominating set of T . Therefore, $\gamma_{th}(T) = 2$.

Muthammai and Chitiravalli

Theorem 2.2.6: Let T be a tree on n vertices such that $\text{diam}(T) = d$. Then $\gamma_{\text{th}}(T) = d - 3$, $d \geq 6$.

Proof:

Let P be a longest path of length d of T , where $d \geq 6$. Let v_1, u_1 be pendant vertices and v_2, u_2 be its supports respectively. Then $V(P) - \{v_1, v_2, u_1, u_2\}$ is a tree hop dominating set of T . Therefore, $\gamma_{\text{th}}(T) \leq d + 1 - 4 = d - 3$, $d \geq 6$.

Theorem 2.2.7: Let G be a connected graph such that $\gamma_{\text{th}}(G) > 0$ and let u and v be any two adjacent vertices in G . Then $D = \{u, v\}$ is a tree hop dominating set of G if and only if

- (i) for any $w \in V(G) - D$, if $N(w) \cap D$ is non-empty, then w is adjacent to exactly one vertex in D .
- (ii) for any $w \in V(G) - D$, if $N(w) \cap D$ is empty, then either w and u (or) w and v (or) w, u and v have common neighbours in $V(G) - D$.

Proof:

Let $D = \{u, v\}$ be a tree hop dominating set of G . If (i) does not hold, w is adjacent to both u and v . If (ii) does not hold, then $d(w, u) \geq 3$ (or) $d(w, v) \geq 3$. Conversely, assume both (i) and (ii) hold. Let $w \in V(G) - D$ and $N(w) \cap D$ is non-empty. Let w be adjacent to u and not adjacent to v . Then $d(w, v) = 2$. Assume $N(w) \cap D$ is empty. Let w and u have a common neighbor, say x in $V(G) - D$. Then wxu is a geodesic path in G and $d(w, u) = 2$. Since $\langle D \rangle \cong K_2$, D is a tree hop dominating set of G .

Theorem 2.2.8: Let G be a connected graph such that $\gamma_{\text{th}}(G) > 0$. Any tree dominating set D of G having atleast three vertices is a tree hop dominating set of G if and only if no vertex in $V(G) - D$ is adjacent to all the vertices in D and for any vertex w in $V(G) - D$ which is not adjacent to u in D , $N(w) \cap N(u) \cap D$ is non-empty.

Proof:

Let D be a tree dominating set of G with $|D| \geq 3$. Assume D is also a tree hop dominating set of G . If a vertex w in $V(G) - D$ is adjacent to all the vertices in D , there exists no vertex v in D such that $d(w, v) = 2$. Therefore, no vertex in $V(G) - D$ is adjacent to all the vertices in D . If w in $V(G) - D$ is not adjacent to $u \in D$ and $N(w) \cap N(u) \cap D$ is empty, then $d(w, u) \geq 3$. Therefore, D is a tree hop dominating set of G . Conversely, assume no vertex in $V(G) - D$ is adjacent to all the vertices in D and for any vertex $w \in V(G) - D$ which is not adjacent to $u \in D$, $N(w) \cap N(u) \cap D$ is non - empty. Then there exists a vertex $v \in N(w) \cap N(u) \cap D$ and wvu is a geodesic path in G and $d(w, u) = 2$. Since $\langle D \rangle$ is a tree, D is a tree hop dominating set of G .

Theorem 2.2.9: Let G be a graph with radius 2 and let v be a vertex of G of eccentricity 2. If $\langle N(v) \rangle$ is totally disconnected, then $\gamma_{\text{th}}(G) \leq \deg(v) + 1$.

Proof:

Let $v \in V(G)$ be of eccentricity 2. Since $\langle N(v) \rangle$ is totally disconnected, $\langle N(v) \rangle \cong K_{1, \deg(v)}$. Let $D = N[v]$. Then $V(G) - D = N_2(v)$ and each vertex in $V(G) - D$ is at distance 2 from v . Therefore, D is a tree hop dominating set of G and $\gamma_{\text{th}}(G) \leq |D| = \deg(v) + 1$. In the following, tree hop domination numbers of connected cubic graphs are discussed.

Theorem 2.2.10: For all connected cubic graphs on six or eight vertices, $\gamma_{\text{th}}(G) = 2$.

Proof:

Let G be a connected cubic graph on six vertices and let u, v be two adjacent vertices in G . Let $D = \{u, v\}$. From the remaining four vertices, two vertices are adjacent to u and the other two vertices are adjacent to v . Therefore, each vertex in $V(G) - D$ is at distance 2 from u (or) v and hence D is tree hop dominating set of G . Let G be a graph on eight vertices and let $D = \{u, v\}$. Let u_1 and u_2 be adjacent to u and v_1 and v_2 be adjacent to v . Then, $d(u_i, v) = d(v_i, u) = 2$, for $i = 1, 2$. The remaining two vertices say, w_1 and w_2 are adjacent to one of u_i and v_i , $i = 1, 2$. Therefore, either $d(w_i, u) = 2$ (or) $d(w_i, v) = 2$ and hence $\gamma_{\text{th}}(G) = 2$.

2.3. Tree Hop Domination Number of Cartesian Product of Graphs

In this section, tree hop domination numbers of $P_n \times P_m$, $P_n \times C_m$ and $C_3 \times C_m$ are found.

Theorem 2.3.1: For $m \geq 4$, $\gamma_{\text{th}}(P_2 \times P_m) = m - 2$.

**Proof:**

Let $v_i^{(1)}, v_i^{(2)}, \dots, v_i^{(m)}$ be the vertices of i^{th} copy of P_m in $P_2 \times P_m$.

Let $D = \{v_1^{(2)}, v_1^{(3)}, \dots, v_1^{(m-1)}\} \subseteq V(P_2 \times P_m)$. Then, for $i = 1, 2, \dots, m-2$, $d(v_2^{(i)}, v_1^{(i+1)}) = 2$, $d(v_2^{(m-1)}, v_1^{(m-2)}) = d(v_1^{(m)}, v_1^{(m-2)}) = d(v_2^{(m)}, v_1^{(m-1)}) = d(v_1^{(1)}, v_1^{(3)}) = 2$ and $\langle D \rangle \cong P_{m-2}$. Therefore, D is a tree hop dominating set of $P_2 \times P_m$ and is minimum. Hence, $\gamma_{\text{th}}(P_2 \times P_m) = |D| = m-2$.

Example 2.3.1

In the graph $P_2 \times P_7$ given in Figure 2.5, minimum tree hop dominating set is $\{v_{21}, v_{31}, v_{41}, v_{51}, v_{61}\}$ and $\gamma_{\text{th}}(P_2 \times P_7) = 5$.

Theorem 2.3.2:

- (i) $\gamma_{\text{th}}(P_3 \times P_m) = m-2$, for $m \geq 4$.
- (ii) $\gamma_{\text{th}}(P_4 \times P_m) = \gamma_{\text{th}}(P_5 \times P_m) = m$, for $m \geq 6$.

Proof:

Let $v_i^{(1)}, v_i^{(2)}, \dots, v_i^{(m)}$ be the vertices of i^{th} copy of P_m in $P_n \times P_m$, for $n = 3, 4, 5$.

(i) For the graph $P_3 \times P_m$, the set $D_1 = \{v_2^{(2)}, v_2^{(3)}, \dots, v_2^{(m-1)}\}$ is a minimum tree hop dominating set of $P_3 \times P_m$.

Therefore, $\gamma_{\text{th}}(P_3 \times P_m) = |D_1| = m-2$, for $m \geq 4$.

(ii) For the graph $P_4 \times P_m$ and $P_5 \times P_m$, the set $D_2 = \{v_3^{(1)}, v_3^{(2)}, \dots, v_3^{(m)}\}$ is a minimum tree hop dominating set of both the graphs $P_4 \times P_m$ and $P_5 \times P_m$.

Therefore, $\gamma_{\text{th}}(P_4 \times P_m) = \gamma_{\text{th}}(P_5 \times P_m) = |D_2| = m$, for $m \geq 6$.

Remark 2.3.1:

- (i) $\gamma_{\text{th}}(P_2 \times P_3) = 2$
- (ii) $\gamma_{\text{th}}(P_4 \times P_m) = 4$, if $m = 4, 5$.
- (iii) $\gamma_{\text{th}}(P_5 \times P_5) = 5$.

Example 2.3.2:

In the graph $P_3 \times P_5$ given in Figure 2.6, minimum tree hop dominating set is $\{v_{22}, v_{32}, v_{42}\}$ and $\gamma_{\text{th}}(P_3 \times P_5) = 3$.

Theorem 2.3.3: For $m \geq 6$, $\gamma_{\text{th}}(P_6 \times P_m) = 2m$.

Proof:

Let $v_i^{(1)}, v_i^{(2)}, \dots, v_i^{(m)}$ be the vertices of i^{th} copy of P_m in $P_6 \times P_m$. Then the set

$$D = \left(\bigcup_{i=1}^m v_3^{(i)} \right) \cup \left(\bigcup_{i=1}^{m-1} v_5^{(i)} \right) \cup \left(\{v_4^{(i)}\} \right)$$

is a tree hop dominating set of $P_6 \times P_m$. Therefore, $\gamma_{\text{th}}(P_6 \times P_m) \leq |D| = 2m$.

Let D' be a tree hop dominating set of $P_6 \times P_m$. The vertex $v_3^{(i)}$ ($i = 1, 2, \dots, m$) is at distance 2 from $v_1^{(i)}$, $i = 1, 2, \dots, m$. Therefore, these m vertices are to be included in D' . The vertex $v_5^{(i)}$ is at distance 2 from at least one of the vertices $v_3^{(i)}$, $i = 1, 2, \dots, m-1$. These $m-1$ vertices and since $\langle D' \rangle$ is a tree, the vertex $v_4^{(1)}$ is to be included in D' . Therefore, D' must have at least $2m$ vertices and $\gamma_{\text{th}}(P_6 \times P_m) \geq 2m$. Hence, $\gamma_{\text{th}}(P_6 \times P_m) = 2m$.

Theorem 2.3.4: $\gamma_{\text{th}}(P_n \times P_m) = 2m + n - 6$, where $m \geq n$ and $7 \leq n \leq 10$.

Proof:

Let $v_i^{(1)}, v_i^{(2)}, \dots, v_i^{(m)}$ be the vertices of $P_m^{(i)}$ in $P_n \times P_m$.

Then $D = V(P_m^{(3)}) \cup V(P_m^{(m-2)}) \cup \{v_1^{(4)}, v_1^{(5)}, \dots, v_1^{(n-3)}\}$ is a minimum tree hop dominating set of $P_n \times P_m$, for $n = 7, 8, 9, 10$. Therefore, $\gamma_{\text{th}}(P_n \times P_m) = |D| = m + m + n - 6 = 2m + n - 6$. As above, the following can be proved.

Observation 2.3.1:

- (i) $\gamma_{\text{th}}(P_2 \times C_m) = m-2$, for $m \geq 4$ and $\gamma_{\text{th}}(P_2 \times C_3) = 2$.
- (ii) $\gamma_{\text{th}}(P_3 \times C_m) = m-2$, for $m \geq 4$.
- (iii) $\gamma_{\text{th}}(P_4 \times C_m) = m$, for $m \geq 6$, and $\gamma_{\text{th}}(P_4 \times C_m) = 4$, if $m = 4, 5$.

- (iv) $\gamma_{th}(P_5 \times C_m) = m$, for $m \geq 5$.
- (v) $\gamma_{th}(P_6 \times C_m) = 2m$, for $m \geq 6$.
- (vi) $\gamma_{th}(P_n \times C_m) = 2m + n - 6$, for $m \geq n$ and $7 \leq n \leq 10$.
- (vii) $\gamma_{th}(C_3 \times C_m) = m - 2$, for $m \geq 4$.
- (viii) $\gamma_{th}(C_3 \times C_3) = 2$.

Example 2.3.3:

In the graph $P_3 \times C_5$ given in Figure 2.7, minimum tree hop dominating set is $\{v_{22}, v_{32}, v_{42}\}$ and $\gamma_{th}(P_3 \times C_5) = 3$.

2.4. Tree Hop Domination Number and Connectivity of Graphs

In this section, an upper bound for the sum of the tree hop domination number and connectivity of a graph is found and the extremal graphs are obtained.

Theorem 2.4.1: For any connected graph G with n vertices, $\gamma_{th}(G) + \kappa(G) \leq 2n - 3$, $n \geq 3$.

Proof:

By Observation 2.2.1

$$\gamma_{th}(G) + \kappa(G) \leq n - 1 + \delta(G) \leq n - 1 + n - 1 \leq 2n - 2.$$

If $\gamma_{th}(G) + \kappa(G) = 2n - 2$, then the following cases are to be considered.

(i) $\gamma_{th}(G) = n$ and $\kappa(G) = n - 2$.

(ii) $\gamma_{th}(G) = n - 1$ and $\kappa(G) = n - 1$

Since $\gamma_{th}(G) \leq n - 1$ the case (ii) alone be considered. But $\gamma_{th}(G) = n - 1$ if and only if $G \cong P_3$ and $\kappa(P_3) = 1 \neq n - 1$. Therefore, there is no connected graph G with $\gamma_{th}(G) + \kappa(G) = 2n - 2$. Hence, $\gamma_{th}(G) + \kappa(G) \leq 2n - 3$, $n \geq 3$.

Theorem 2.4.2: Let G be a connected graph. Then $\gamma_{th}(G) + \kappa(G) = 2n - 3$ ($n \geq 3$) if and only if $G \cong P_3$.

Proof:

If $G \cong P_3$, then $\gamma_{th}(G) = 2$ and $\kappa(G) = 1$ and hence $\gamma_{th}(G) + \kappa(G) = 3 = 2n - 3$.

Conversely, assume $\gamma_{th}(G) + \kappa(G) = 2n - 3$, for $n \geq 3$. Then the following cases are to be considered.

(i) $\gamma_{th}(G) = n$ and $\kappa(G) = n - 3$

(ii) $\gamma_{th}(G) = n - 1$ and $\kappa(G) = n - 2$

(iii) $\gamma_{th}(G) = n - 2$ and $\kappa(G) = n - 1$.

Case 1. $\gamma_{th}(G) = n$ and $\kappa(G) = n - 3$.

Since for any connected graph G , $\gamma_{th}(G) \leq n - 1$, this case is not possible.

Case 2. $\gamma_{th}(G) = n - 1$ and $\kappa(G) = n - 2$

$\gamma_{th}(G) = n - 1$ if and only if $G \cong P_3$ and $\kappa(P_3) = 1 = n - 2$. Therefore $G \cong P_3$.

Case 3. $\gamma_{th}(G) = n - 2$ and $\kappa(G) = n - 1$.

If $\kappa(G) = n - 1$, then $G \cong K_n$, $n \geq 3$. But $\gamma_{th}(G) = 0$ for $G \cong K_n$, $n \geq 3$.

Therefore, $G \cong P_3$.

Theorem 2.5.3: Let G be a connected graph. Then $\gamma_{th}(G) + \kappa(G) = 2n - 4$ ($n \geq 4$) if and only if $G \cong K_4 - e$, C_4 .

Proof:

Assume $\gamma_{th}(G) + \kappa(G) = 2n - 4$, $n \geq 4$. Then the following cases are to be considered.

(i) $\gamma_{th}(G) = n$ and $\kappa(G) = n - 4$

(ii) $\gamma_{th}(G) = n - 1$ and $\kappa(G) = n - 3$

(iii) $\gamma_{th}(G) = n - 2$ and $\kappa(G) = n - 2$

(iv) $\gamma_{th}(G) = n - 3$ and $\kappa(G) = n - 1$

There is no connected graph G with $\gamma_{th}(G) = n$, $\kappa(G) = n - 4$ and $\gamma_{th}(G) = n - 1$, $\kappa(G) = n - 3$.

Case 1. $\gamma_{th}(G) = n - 2 = \kappa(G)$

Since $\kappa(G) \leq \delta(G)$, $\delta(G) \geq n - 2$.

(a) If $\delta(G) > n - 2$, then $G \cong K_n$, $n \geq 3$. But $\gamma_{th}(G) = 0$, for $G \cong K_n$, $n \geq 4$.

Muthammai and Chitiravalli

(b) Assume $\delta(G) = n - 2$. Then G is isomorphic to $K_n - Y$, where Y is a matching in K_n , $n \geq 3$ and $\gamma_{th}(G) \leq 2$. By observation 5.2.1, $\gamma_{th}(G) \geq 2$, for any connected graph G . Therefore, $\gamma_{th}(G) = 2$. $\gamma_{th}(G) = n - 2 \Rightarrow n = 4$. Therefore, $G \cong K_4 - e, C_4$.

Case 2. $\gamma_{th}(G) = n - 3$ and $\kappa(G) = n - 1$

If $\delta(G) = n - 1$, then $G \cong K_n$, $n \geq 3$. But $\gamma_{th}(K_n) = 0$, for $n \geq 4$.

Therefore, $G \cong K_4 - e, C_4$.

CONCLUSION

In this paper, we find the tree hop number and bounds for some graphs.

ABSTRACT

The Pancheshwer basin, which spans an area of 13,659.50 km² and is located along the international boundary between India and Nepal, was studied for its water balance using a analysis for semi-distributed hydrological model and the Soil and Water Assessment Tool (SWAT) model. The basin was divided into six smaller basins for the sake of this study. Further, the SWAT model was used to construct the land cover, slope, and soil classifications. We examined monthly discharge data from 1982 to 1986 to calibrate the model. Based on the goodness-of-fit statistics derived from a parameter sensitivity analysis, calibration and validation were improved. Finally, we evaluated the Pancheshwer basin's seasonal and annual water balance over the same time frame. These calculations utilized Latin hypercube sampling at the 2.5 % and 97.5 % levels of the cumulative distribution for an output variable influenced by parameter uncertainty propagation. This 95 % prediction uncertainty (PPU) represents the model's output in a stochastic calibration framework. It should be noted that the model output is not a single result but rather an envelope of feasible solutions that are defined by the 95 PPU and obtained from particular parameter

ranges. The findings indicate that the Pancheshwer Basin is a suitable candidate for the application of the SWAT CUP methodology.

Keywords: Hydrological modeling; SWAT model; Metrological data, Validation Calibration

INTRODUCTION

Water in the hydrological cycle is contained in almost equal amounts overall in all its forms; nevertheless, global water availability per person is quickly declining as a result of rising living standards and population growth. Utilizing the water resources that are available as efficiently as possible is therefore necessary. India is currently dealing with a number of difficult problems in the water sector, despite having great strides in the development of its water resources field since gaining its independence. For the watershed's forecasts to be considered reasonable, the hydrologic process parameters must be regulated during the calibration phase. Activities like stream flow, sedimentation, and nutrient transport should be changed sequentially because of the links among components from shared transport processes. [6]. Manual calibration can be laborious in situations where the model has a large number of uncertainties and complex hydrologic models are developed. To address that issue, numerous automated or semi-automated calibrating techniques were created. In SWAT CUP model uncertainty analysis and semi-automatic calibration have been incorporated into SWAT2009 [7]. An interface designed specifically for SWAT is called SWAT-CUP. A semi-automated method (SUF2) that combines sensitivity and uncertainty analysis with both automated and manual calibration is included in the decision-making framework offered by SWAT-CUP. The model calibration and validation were conducted with help of SUFI-2 technique. In order to provide light on potential solutions for issues pertaining to water resources, models of water resources depict physical, environmental, economic, and social processes [20]. In order to forecast hydrological variables, scientists from all around the world have been creating empirical or conceptual hydrological models for the past forty years. Physically-based models include simulation models, which simulate processes to evaluate various scenarios, and optimization models, which specify objectives and modify parameters to achieve them. Many water resource models reduce assumptions and parameterization in order to get around the spatial features of a problem. The main purpose of the Soil and Water Assessment Tools (SWAT) model. Several studies have examined the SWAT model's performance in predicting runoff and sediment outputs at daily, monthly, and annual periods. In addition to providing goodness-of-fit data, parameter sensitivity analysis aids in the improvement of calibration and uncertainty evaluations. For uncertainty analysis and calibration, the SUFI-2 program was utilized. This study used sensitivity analysis of water balance components in the Pancheshwer basin, India, under local conditions, to validate, assess, and calibrate the SWAT CUP model. The observed monthly discharge data from 1982 to 1986 served as the basis for calibration. Numerous statistical measures, such as the coefficient of determination, Nash-Sutcliffe coefficient, Index of Agreement, modified forms of the Index of Agreement and Nash-Sutcliffe coefficient, percent bias, d, and R^2 were used to check the model's performance. Positive results from these assessments showed satisfactory calibration and validation. The SUFI-2 method was applied to the sensitivity analysis.

Study Area

This study focuses on the Pancheshwer basin, which is situated between Nepal and Uttarakhand, India. It spans latitudes 29° 07' 30" to 29° 48' North and longitudes 79° 55' to 80° 35' East. It includes the Indian districts of Pithoragarh, Bageshwar, Almora, and Champawat, as well as the districts of Baitadi and Dharchula in Nepal. Of the 12,100 km² total drainage area of the basin, about 9,720 km² are in India while the rest 2,380 km² are in Nepal. The basin precipitation annually approximately 2000 mm, with the monsoon season, which runs from June to September, accounting for over 75% of the entire amount of precipitation. An estimated 1,620 mm of precipitation falls on average each year. The winter season usually starts in October and lasts through February. March marks the start of summer, which lasts until the end of May. Pre-feasibility report, 2015: Of the entire population in the area, 49.5 percent is working, and 50.5 percent resides in the villages and is dependent on others. Clay loam (42.44 %), glacial

loam (8.81 %), loam (9.46 %), and silty loam (39.29 %) make up the majority of the research region's soil, which spans an area of 5796.59 km², 1203.43 km², 1292.38 km², and 5366.99 km², respectively.

METHODOLOGY

Comparing observed data with the model's projected values is the process of model calibration. To produce forecasts that are reasonable in light of measured data, this procedure entails adjusting the model's input parameters. The following are the steps involved in manual calibration: (1) start the simulation; (2) compare the values that were observed and those that were simulated; (3) determine whether the results are acceptable; (4) if the results are not satisfactory, modify the input parameters within reasonable bounds using professional judgment; and (5) repeat the process until the best results are obtained. A semi-automated technique that combines sensitivity and uncertainty analyses with both automatic and human calibration is included into the SWAT-CUP framework. SUFI-2 was employed in the process of validating and calibrating the model.

SUFI 2 Running Procedure in The SWAT-CUP Model

SWAT-CUP implements the SUFI-2 calibration process by using multiple system files (exe) for user convenience. In a stochastic calibration approach, these 95PPUs are the model outputs. It is important to remember that we are dealing with an envelope of good solutions generated by some parameter ranges, not a single signal representing the model output. SUFI-2 first uses Latin Hypercube Sampling (LHS) to minimize the amount of multi-dimensional distribution samples required. The model receives input for SUFI-2 and updates successively for each set of parameters listed in par val.txt. The input files par inf.txt, observed.txt, par val.txt, and var file name.txt are necessary for the best possible simulation. The SUFI-2 objective fn.exe calculates the ideal simulation number and settings. The uncertainty measures that best reflect the current iteration's best simulation results are included in the Summary stat.txt file. These metrics include p-factor, r-factor, R², Nash-Sutcliffe (NS), modified R² (bR²), mean squared error (MSE), and sum of squares of residuals (SSQR). The pre-feasibility assessment for the Pancheshwer Dam project 2015 provided the sets of hydrological and metrological data. Monthly discharge statistics were obtained for 1962–1992 years. The SWAT hydrological model was calibrated using daily discharge data from 1982 to 1985, and the discharge data from 1986 to 1992 were used to validate the model. For the long-term SWAT project, which ran from 1979 to 2014, Global Weather Data provided daily recordings of temperature, relative humidity, rainfall, wind speed, and other meteorological factors. We re-projected the DEM, soil, and land use datasets using the coordinate system WGS_1984_UTM_ZONE_44N. Advanced Spaceborne Thermal Emission and Reflection (ASTER) elevation measurements were used to evaluate the topography of the basin. The Global Land Cover Facility provided cloud-free digital LANDSAT (TM) data with a spatial resolution of 30 m x 30 m. In March 1990, during the fall season, satellite data was gathered to construct a land use/cover map of the Manchester basin.

Sub Basin and HRU Definition

The Pancheshwer basin was determined to have a mean elevation of 3971.5 meters, with minimum and maximum altitudes of 144 and 7799 meters, respectively. By carefully selecting outlet sites that included observed discharge data, the research region was divided into six sub-basins (Figure 3) to facilitate model calibration and validation. Each sub-basin border designates the end of a reach, or the point at which all upstream flow data is collected and fed into the downstream sub-basin and reach. Once flow lines have been constructed, the model determines HRUs using additional physical layers. The model defined these distinct hydrological response units. In its maiden run, the model produced 434 HRUs.

RESULTS AND DISCUSSION

Model calibration & parameters

Several parameters are provided by model calibration, which can be modified by the user. Either manually or automatically, the model output can be adjusted to closely resemble the observed data. The outlet stream flow was

**Harish Kumar Dwivedi et al.,**

calibrated using SWAT-CUP. SWAT simulates water balance on a daily time series, and the calibration was conducted on monthly data using observed monthly runoff data from 1982 to 1986. The "model warm-up" phase was given the first three years (1979–1981) of the modeling era in order to realistically construct the initial conditions of internal hydrological components, such as groundwater storage and soil moisture content. For particular reaches, dispersed changes were made to SWAT's hydrology-affecting parameters. Depending on the parameter's nature, the parameters were changed either through replacement or by applying a relative modification. All parameter changes, however, were rigidly limited to the predetermined complete variable or parameters ranges during the calibration. Groundwater delay time, effective hydraulic conductivity of the principal stream alluvium, and other input variables were considered for lag coefficient and n value for the mainstream to calibrate the model. Table 1 offers a concise description of the data used for model calibration.

Simulation of discharge using calibrated SWAT model

Data on monthly stream flows that were observed were compared and the stream flow data simulated by the sub-basin outlets of the validated SWAT model. Figure 4 clearly shows observed discharge, although sometimes at different magnitudes. Overall, the monthly predictions during the simulation period were generally accurate. With the exception of months with very severe storms and hydrological circumstances [3]. Two things can be blamed for the discrepancy: (1) Throughout the early monsoon season, base flow was overestimated, and (2) a curve number (CN) assignment that is slightly lower. This can be explained by the fact that high-intensity rainfall typically takes place between August and September, when the soil is already saturated and produces a larger discharge. In the event that heavy rain falls quickly after a dry spell. The model's predicted discharge closely resembles the measured levels for rainfall events with uniform distribution. The sparser distribution of meteorological stations and data in those places, where more discharge is anticipated, may explain why the prediction of discharge in locations with higher altitudes is lower. Its importance becomes clear when climatic information is viewed as a hydrological model's key motivating factor [10]. The 1:1 line and the monthly observed and simulated discharge for the calibration period are shown in Figure 4. It is evident from the graph that the simulated values are uniformly distributed around the 1:1 line at lower measured discharge values. The simulated values, however, hardly ever surpass the 1:1 line for higher observed discharge values, suggesting that the algorithm has a propensity to underestimate higher discharge rates.

A Nash-Sutcliffe model efficiency rating of 0.76 indicates that it performed the best for both the observed and simulated discharge during calibration period. Furthermore, d1 and E have respective values of 0.94, 0.55, and 0.85. A score of 1 in this context denotes a perfect fit, whereas a value of 0 implies no association. Percent Bias (PBIAS) has an ideal value of 0, which denotes accurate model simulation. The PBIAS value in this instance was discovered to be 9.52, which is regarded as "very good." The RSR value, which measures model simulation performance, was found to be 0.494, indicating a "good" rating.

Sensitivity and uncertainty analysis

The sensitivity analysis assisted in determining which variables needed to be precisely assessed in order to provide precise forecasts of watershed yields. In SUFI-2, uncertainty is measured using the 95PPU (95th percentile uncertainty) band. The p-factor and the r-factor are two statistical indicators used to compare the 95PPU band and discharge data. The percentage of observed data that falls inside the 95PPU band, including errors, is represented by the p-factor. These data points fall within the simulation uncertainty of the model, indicating a satisfactory fit. A model simulation that perfectly captures uncertainty and aligns with the actual data would have a p-factor of 1 and an r-factor of 0. The r-factor was 0.59 and the p-factor was 0.73 according to SUFI-2.

Global sensitivity Analysis

SWAT-CUP supports both global and a time sensitivity analysis, as well as general sensitivity analysis. In Figure 3, showing values or relative changes against the goal function, dot plots are used to display the pattern of sampling points and parameter sensitivity. These dot plots specifically showcase the ten sensitive parameters. Dotty plots (Figure 6) were used to illustrate the sensitivity of the model parameters involved in calibrating the SWAT model. Sharp & distinct peaks observed in the plots indicate parameters with a higher likelihood, while diffuse peaks in the cumulative distributions signify less skilled parameters in discharge forecast for the Pancheshwar basin.

Model validation

A simulation's accuracy in reflecting observed data is evaluated during the validation process, taking into account the model's or simulation's intended uses. The calibrated tested data or model was using another set of measured data to determine its ability to anticipate effects of the different scenarios on the Pancheshwar basin's water balance. In the validation process, observed discharge data from the independent validation period, which ran from 1987 to 1992, were used. For large river basins, it is ideal to conduct a multi-site validation process based on pre-performed sensitivity analyses. This becomes particularly important when the model is intended for regional-scale applications or considering climate variability. For the validation period (1987-1992), Figure 4.5 graphically compares make out and simulate or reproduce monthly discharge data. The simulated peak values generally exhibit a close resemblance to the observed discharge peaks observed from August to September in the years 1989, 1990, 1991, and 1992. However, for lower discharge magnitudes, the model tends to underestimate the values during January to March 1986, November to February 1987, November to March 1988, and November to January 1989. Furthermore, Figure 5.6 depicts scatter grams comparing the simulated and observed discharges from 1987 to 1992. Table 4.7 contains summaries of actual and generated monthly discharge statistics for all years. The R^2 and ENS were estimated to be shows 0.89 and 0.88, respectively, during the model validation procedure from 1986 to 1992. According to these figures, there is a good degree of consistency between the simulated and data is wants to monthly discharges over the specified time frame. The Modified forms of the all values of d, E and d1 were all calculated and get to be 0.97, 0.71, and 0.91. The values of PBIAS were found to be 3.52, indicating a very good level of consistency in the data used for validation. Additionally, the RSR, which represents the RSR error to observed data's standard deviation ratio was calculated as 0.35, indicating a "very good rating" in terms of model performance. That statistical analysis in Table 4, model validation is rated as "very good." A sizable part of the observed values fell within the 95PPU boundaries, demonstrating that the SWAT model's related uncertainties were kept to acceptable levels. This calibrated model can therefore be used for studies of land use and land cover (LULC), planning and management of water resources, and determining how climate change affects stream flow in the research area, among other uses. Figure 5 shows the sensitivity of the model parameters for SWAT calibration using dot plots. When a parameter's peak is clear and abrupt, it is regarded as extremely likely; when it is broad and represented by cumulative distributions, it is considered insensitive and may have less predictive value for discharge in the Pancheshwar basin.

CONCLUSIONS

Soil depth, soil evaporation compensation factor, shallow aquifer water threshold depth (GWQ MN), accessible water capacity, and erratic rainfall patterns (CN) were the most sensitive characteristics of the Pancheshwar basin. The basin is more vulnerable to severe flooding result of these causes. Furthermore, during the monthly simulations, the model was calibrated to yield mean, standard deviation, and maximum values of 569.5, 533.11, and 1179, respectively. The simulated monthly discharge's calibrated values of 515.3, 550.95, and 1926 show satisfactory performance. These findings show that the Pancheshwar Basin's hydrology may be evaluated using the SWAT model. Sensitivity of parameters used in SWAT model calibration was shown using dot plots. A parameter can be regarded as having the highest likelihood when it has a clear, sharp peak. Similarly, a dispersed peak represented by cumulative distributions was employed to derive the insensitive parameters, which showed that the parameter had lower predictive power for discharge in the Pancheshwar basin. Further, the HRU water balance analysis makes it possible to locate specific places where management strategies to enhance water use could be proposed. The Pancheshwar Basin's mean value was 3971 meters, with the lowest and maximum altitudes being 144 and 7799 meters, respectively. By enhancing basin management, practices such as strip cropping and vegetative filter strips can effectively reduce runoff. The Pancheshwar basin, the research region, is somewhat underutilized regarding the development and usage of water resources, as this suggests.

ACKNOWLEDGEMENTS

I want to sincerely thank all of the authors that helped me out with the research and writing of this work. The authors express their gratitude to the reviewers for their insightful feedback, which helped to enhance the paper's quality. They also extend their sincere gratitude to the farmers in the study region. We appreciate your contributions to this project, everyone.

ABSTRACT

A rare and progressive form of cerebrovascular disease, terminal segment of the intracranial carotid artery and its major branches exhibit increasing stenosis, which is the hallmark of moyamoya disease, a long-term cerebrovascular occlusive illness. The immune system, genetics, and other variables are associated with the incidence of Moyamoya illness. The etiology and pathology of Moyamoya disease remain largely unknown. Moyamoya disease is by abnormal collateral blood vessels in the carotid artery in the brain and its branches, which form the circle of willis, as well as bilateral occlusion caused by developmental abnormalities.¹ we will discuss some case studies in this study and physiotherapy in Moyamoya disease will be the main topic of this short communication.

Keywords: The immune system, genetics, and other variables are associated with the incidence of Moyamoya illness.

INTRODUCTION

The non-atherosclerotic abnormality of structure known as Moyamoya disease is characterized by progressive narrowing or blockage of the intracranial carotid arteries and their proximal branches.[2] Asia has a greater

**Shiwangi Garg et al.,**

prevalence of Moya Moya disease than any other part of the world.[3] Incidence of moya moya disease is slightly higher in males than females.[2]The cause of this disease is still unknown.[4] Seizures, headaches, cognitive dysfunction, ischemic stroke, hemorrhagic stroke, and transient ischemic attack are some signs and symptoms of this disease.[5]Moya moya disease patients may experience a range of prognosis, including gradual, fulminant episodes, sporadic attacks, or abrupt neurological loss.[6] Hemodynamic alterations are brought on by recurrent ischemia of the brain and intracranial bleeding. Many vascular chemicals and cells, as well as molecules are associated with angiogenesis and vasculogenesis have been studied in the hunt for the pathophysiology of moya moya disease, according to clinical investigations, the damaged arteries do not exhibit inflammatory or arteriosclerotic variations that could obstruct them. Instead, a combination of lumen thrombosis and smooth muscle cell hyperplasia leads to vascular blockage.[7]

Aim of the study

The aim of this study is to discuss some studies and summarize the role of physiotherapy in Moya Moya Disease. At the age of 33, a patient was diagnosed with Moya Moya disease. The patient was assessed utilizing the Berg balance scale and One Min-Step test. To enhance motor function, physiotherapy intervention was carried out in accordance with the impairments. For eight weeks, the patient received an intense physical therapy regimen that comprised of functional and strengthening exercises, 5 days/week, 60-90 minutes. During the assessment, shoulder pain and disability index was used which highlighted the disabilities of arm, shoulder and hand. Shoulder instability was seen, along with a decreased range of motion and muscular power. The movement with mobilizing mulligan concept was applied three times a week to increase range of motion. Peripheral mechanics were directly impacted by movement and mobilization, which decreased the nociceptive mechanoreceptor activity and increased tactile and mechanoreceptor activation. Increased descending inhibition, the decoupling of pain and movements, and a decreased fear of movement are some of the indirect effects on central processes. With Moya Moya disease, physical therapy rehabilitation may enhance functional status and reduce impairment. After the eight-week regimen, there was a remarkable improvement in shoulder discomfort and shoulder muscular strength. The patient's was able to carry out activities of daily living pain-free.[4] The other case is of a 3.3 year old boy wherein a pediatric neurologist diagnosed the patient with Moya Moya syndrome, the child had not been able to hold his head upright for the last two years. It was reported that the youngster met all of the milestones and was apparently normal up until the age of eight and a half months. An upward stare and clenching of teeth accompanied the first convulsion, which lasted for three seconds. At nine and a half months and eleven months of age, respectively, there was a history of two further epileptic episodes. One plantar reflex was active in both cases. We saw that the infant had heightened reflexes in the upper as well as the lower body. Additionally, it was shown that there was an increase in tone in the lower and upper limb muscles. Three to four days a week, an entire period of 45 to 60 minutes were allotted for the therapy.

The intervention included visual stimulation, oral motor facilitation for three to five minutes, and neck holding, rolling, creeping, and weight bearing on hands for seven to ten minutes each. In addition to all of these workouts, walking on a treadmill was done for ten minutes.[8] Moyamoya illness may be a rare, progressive type of cerebrovascular disorder that starts as an obliterative vascular disease and develops to a compensating proliferating vasculopathy. It's caused by arteries becoming blocked inside the basal ganglia, which are located at the base of the brain. In 1969, Suzuki and Takaku first used the term Moyamoya (MM) to refer to the development of tiny collaterals that originate in the thalamus that travel through the basal ganglia as a result of progressive stenosis. Moyamoya disease is an artery disorder that can result in stroke in young patients. This is a long-term illness marked by prominent arterial collateral circulation, bilateral stenosis, and occlusion of the capillaries surrounding the Willis circle. The first record of it was found in Japan. Traditional angiographic results for stenosis is arterial collateral circulation that is prominent and the occlusion of the arteries that surround the circle of will's. The first record of its discovery was in Japan. The diagnosis of Willis's vessel occlusion or stenosis is made using traditional angiographic findings. In this article, I talk about a 9-year-old boy who was identified as weak at 6 months old. Three weeks before this admission, he experienced unrelenting slurred speech, drooping of the right side of his face, and head trauma from a tree fall. A computed tomography scan of the head and an electroencephalogram were utilized to evaluate

**Shiwangi Garg et al.,**

him. After the child's recovery, he was released from the hospital after four days. Continued medication, physical therapy led to a gradual improvement in the child's condition.[9]

CONCLUSION

This study concluded that physiotherapy intervention has a vital role in Moya Moya Disease most commonly to enhance motor functions and improve patient's quality of life, rehabilitative physical therapy may improve functional status and lessen disability. Ultimately, according to above case studies there was a noticeable improvement in shoulder soreness and shoulder muscle strength. The patient's capacity to perform daily activities without assistance was improved for their recovery from Moya Moya disease.

ABSTRACT

A field experiment was planned and conducted during 2022-23 at Horticulture Research Block, School of Agriculture Sciences, SGRRU, Dehradun, Uttarakhand. To investigate the "Efficacy of organic fertilizers and Biostimulant on growth and yield of Beet root (*Beta vulgaris* L.) cv. "Detroit Dark Red" grown in lower hills of Uttarakhand. The experiment was laid out in randomized block design with three replications and ten treatments. The treatments comprised following levels of different organic fertilizers with different concentrations viz. T₁ (Control), T₂ (Farm Yard manure @22t/ha), T₃ (Vermicompost @ 5t/ha), T₄ (Jeevamrutha @100%), T₅ (Biostimulant @3%), T₆ (FYM @22t/ha + Vermicompost @5t/ha), T₇ (Vermicompost @5t/ha + Jeevamrutha @100%), T₈ (FYM @22t/ha + Biostimulant @3%), T₉ (FYM @11 t/ha + Vermicompost @2.5 t/ha + Jeevamrutha @50% + Biostimulant @1.5%) and T₁₀ (FYM @22t/ha + Vermicompost @5t/ha + Jeevamrutha @100% + Biostimulant @3%). The sowing of crop variety Detroit Dark Red, was done on November 18, 2022. Observations and studies on various growth and yield characters were recorded using standard methods of measurements. Of all the organic treatments, T₁₀ of soil application with (FYM @22 t/ha + Vermicompost @5 t/ha + Jeevamrutha @100% + Biostimulant 3%) has shown the significant improvement in plant height (38.21cm), number of leaves per plant (38.21), diameter of root (7.60cm) and root yield (7.41kg/plot) than other treatments. The treatment T₉ recorded

92157

Shivani Saklani *et al.*,

maximum weight of root (120.07g) and root: shoot ratio (0.48). The treatment T₈, recorded maximum fresh weight of leaf (43.50g). However, treatment T₇ recorded maximum leaf length (24.46cm) and root yield (25.10 t/ha) at final harvest.

Keywords: Organic fertilizers, randomized, vermicompost, biostimulant, Jeevamrutha.

INTRODUCTION

Beetroot (*Beta vulgaris* L.) belongs to the family Chenopodiaceae, now reclassified as Amaranthaceae (Chadha, 2020), and possesses a chromosome count of $2n=18$. It is commonly called as beet, swiss chard, spinach beet, sea beet, garden beet, white beet, sugar beet, fodder beet and chukandar (in hindi). It is essentially a cool season root vegetable crop eaten all over the world. Like many modern vegetables, beetroot was first cultivated by the Roman. By the nineteenth century it held great commercial value when it was discovered that beets could be converted into sugar. (Dwivedi *et.al*; 2017). It's one of the world's ancient vegetables (Bangare *et.al*; 2022). Beta name come from Romans. It was not cultivated until 3rd century and not developed until 9th century by German and French breeders. According to 2021-2022 Statistical data, the total area under vegetables in India is 11.37 MHa with the production of 209.14 MT (NHB, 2023). In India, Maharashtra produces the maximum amounts of beetroots followed by Tamil Nadu, Karnataka, Punjab, Haryana, Uttar Pradesh, Arunachal Pradesh, Himachal Pradesh and West Bengal is increasing its production of beetroot gradually and many farmers are shifting from potatoes to beetroot due to increase in price and output. Beet root has higher concentration of biologically active ingredients like betalain, inorganic nitrates, carotenoids, polyphenols and folates as well as minerals and fiber also found in beets in good amounts. It also contains Vitamins (B₁, B₂, B₃, B₆ and B₁₂). All parts of this plant have different medicinal uses, such as anti-oxidant, anti- depressant and anti- microbial, anti- fungal and anti-inflammatory properties (Ceduet *et.al*; 2020). Beetroots are also rich in Vitamin C, A, E and K. Beetroot is a good tonic food for health, it has been known for its amazing, health benefits for almost every part of the body. The interest in red beetroot effects on human health has exploded during the past few decades. The roots and greens are great for women health and for those planning pregnancies. As it is rich source of folic acid essential for pregnant women to reduce risk of Spina bifida. Beetroot is one of the original superfoods and gaining popularity as a "New superfood", owing to recent studies that its juice improves the athletic performances, lowers blood pressure and increase blood flow. It has anti-inflammatory and anti- oxidant effects which scavenge free radical from the cells promoting cancer prevention by inhibiting the tumor cells proliferation, reducing the risk of cardiovascular diseases, and expelling kidney stones (Babarykin *et.al*; 2019).

Beetroot also helps in skin disorders, lowers cholesterol, gastric ulcers, constipation and anemia where high content of iron in beets regenerates and reactivates the red blood cells and supplies fresh oxygen to the body. Dried beetroots can be consumed directly in form of chips as a substitute to traditional snacks (Ingle *et.al*; 2017). Beetroot can be eaten raw, boiled steamed and roasted. It is grown for food uses like pickling, canning, salad, juice, jam etc. Beet powder is used as a coloring agent for many food products. Some frozen pizzas use beet powder for coloring in tomato sauce (Chauchan *et.al*; 2020). In Australia and New Zealand, it's a common practice to include beetroot pickle as a topping on burgers. Additionally, red beet is utilized in the production of rich red, Burgundy-style wines. Its versatility extends beyond culinary applications; beetroot serves as a natural colorant in the textile industry and is also valued as a source of medicinal herbs. Organic fertilizers refer to materials used as occurring process. The decline in soil quality is becoming a significant process of soil degradation. The optimizing organic fertilizer incorporation practices in crop land is essential to enhancing crop productivity and soil health (Zhou *et.al*; 2022). Organic fertilizers improve the soil structure, provide a wide range of plant nutrients, and add beneficial microorganism to the soil. Farmyard manure is explained as a perfect source of nutrients for plant growth as well as for soil microbiota. It is one of the efficient and effective organic manures. Vermicompost is described as "bio-oxidation and stabilization of organic material involving the joint action of earthworms and mesophilic micro-organisms. Earthworm and vermicompost can boost horticultural production without agrochemicals. Additionally,

Shivani Saklani *et al.*,

organic manures (viz. compost, vermicompost, poultry manure and farmyard manure) have the capacity to mobilize crop nutrients and improve crop productivity. Furthermore, the addition of dung, jaggery, urine, gramme flour and milk as constituents in organic inputs, which are rich in carbon and nitrogen may be the reason for the higher total microbial counts in the fermented liquid organic nutrient formulations (FLONFs), which include panchgavya, matkakhanda, jeevamrutha and beejamrit. Jeevamrutha includes two words “Jeeva” and “Amrutham” which is derived from Sanskrit and are the most used by Hindus. The word “Jeeva” means a living organism and the word “Amrutham” stands for an elixir of life which has the capability to extend the life of any living organism. (Sailaja *et al.*; 2019). Biostimulant i.e. “Plant biostimulants are substances and materials, with the exception of nutrients and pesticides, which, when applied to plant, seeds or growing substrates in specific formulations, have capacity to modify physiological process of plants in a way that provides potential benefits to growth, development and or stress responses” (Rouphael *et al.*; 2020). The decision to conduct the present experiment with organic fertilizers such as Jeevamrutha and biostimulants for beetroot cultivation in the low hills of Uttarakhand is driven by the scarcity of research in this area. Recognizing the lack of studies on the efficacy of these specific fertilizers on beetroot crops in your region, this experiment seeks to address this gap in knowledge. By investigating the impact of Jeevamrutha and biostimulants on beetroot cultivation in the unique environmental conditions of Uttarakhand's low hills, you aim to provide valuable insights that can benefit local farmers and contribute to sustainable agricultural practices in the region.

MATERIALS AND METHOD

The present research work was carried out at Horticulture Research Block, Department of Horticulture, School of Agricultural Sciences, Shri Guru Ram Rai University, Dehradun, Uttarakhand during the rabi season of 2022–23. The experiment was laid out in Randomized Block Design (RBD) and replicated thrice. Total ten treatments were tried namely T₁ (control), T₂ (Farm Yard manure @22t/ha), T₃ (Vermicompost @ 5t/ha), T₄ (Jeevamrutha @100%), T₅ (Biostimulant @3%), T₆ (FYM @22t/ha + Vermicompost @5t/ha), T₇ (Vermicompost @5t/ha + Jeevamrutha @100%), T₈ (FYM @22t/ha + Biostimulant @3%), T₉ (FYM @11 t/ha + Vermicompost @2.5 t/ha + Jeevamrutha @50% + Biostimulant @1.5%) and T₁₀ (FYM @22t/ha + Vermicompost @5t/ha +Jeevamrutha @100% + Biostimulant @3%). The soil of the research field was sandy loam in texture having pH of 7.12 with available nitrogen (220.04%), available phosphorus (9.1 kg ha⁻¹) and available potassium (18.1 kg ha). The Beetroot cultivar “Detroit Dark Red” was chosen for research purpose. Organic fertilizers i.e., Vermicompost, FYM, Jeevamrutha as well as Biostimulant were incorporated in experimental field as per the treatments at the time of final field preparation. The seed were sown on 18/11/2022. All the cultural practices were done at regular intervals as per the requirement of crop during the course of research work. During the experimentation, from each replication, randomly selected five plants were used for recording various observations on growth and yield characters during whole of the cropping period at 60, 90, 120 days after sowing and at final harvest. The obtained data were statistically analyzed with using standard statistical method as suggested by Gomez and Gomez (1996).

RESULT AND DISCUSSION

The various growth and yield characters were significantly influenced by different doses of organic fertilizers as compared to control during the course of investigation. The data presented in Table-1, 2 and 3 were showed that the significant improvement was noticed when applied different combinations of organic fertilizers as compared to control. The findings of the present investigation were recorded and are thoroughly discussed below:

Plant height (cm)

The observation data of plants height recorded at 60 DAS, 90 DAS, 120 DAS and at Final harvest was presented in Table 2 and Fig.1 revealed significant differences among the treatments. At 60 DAS, the maximum plant height (14.82 cm) was recorded in T₁₀ (FYM @ 22t/ha + Vermicompost @ 5t/ha + Jeevamrutha @ 100% + Biostimulant @ 3%) and the minimum plant height (8.43cm) was recorded in T₁ (control@100% soil). Whereas, plant height in T₂ (10.27cm), T₃

Shivani Saklani *et al.*,

(10.22cm) and T₄ (10.33cm) were at par with each other. The Plant height in T₅ (12.56cm) and T₇ (12.55cm) was also at par with each other. However significant difference was observed in treatment T₈ (FYM @ 22t/ha + BS@ 3%) for Plant height i.e., (13.54cm). At 90 DAS, the maximum plant height (27.28cm) was recorded in T₁₀ (FYM @ 22t/ha + Vermicompost @ 5t/ha + Jeevamrutha @ 100% + Biostimulant@ 3%) and the minimum plant height (16.17cm) was recorded in T₁ (control@100% soil). The significant difference was observed in plant height of T₂ (20.21cm) FYM @ 22t/ha, T₃ (19.27cm) VC @ 5t/ha and T₄ (18.17cm) JV @ 100%. At 120 DAS the maximum plant height (35.15cm) was recorded in T₁₀ with FYM @ 22t/ha + VC @ 5t/ha + JV @ 100% + BS@ 3% and minimum (25.55cm) was recorded in T₁ (control @100% soil). The significant difference was recorded with treatment T₆ (33.06 cm) FYM @ 22t/ha + VC @5t/ha, T₈ (31.12cm) FYM @ 22t/ha + BS@ 3% and T₉ (32.10cm) FYM @ 11t/ha + VC@ 2.5t/ha + JV @50% + BS@ 1.5%. The treatment T₃ (30.22cm) and T₄ (30.21cm) were at par with each other for plant height. At final harvest the maximum plant height was recorded in T₁₀ (38.2 cm) with FYM @ 22t/ha +VC @ 5t/ha + JV @ 100% + BS@ 3% and the minimum plant height (19.60cm) was recorded in T₁ (control @100% soil). However, the treatment T₆ (34.20) and T₉ (34.16) were at par with each other. This variation might be due to nitrogen being a major element has a profound effect on plant growth and development, and as a constituent of proteins and also its effect on production of plant hormones in plants. The findings are in agreement with (Jagadeesh *et.al*; 2018) in beet root.

Number of leaves per plant

The observation of number of leaves per plant, recorded at 60 DAS, 90 DAS, 120 DAS and at Final harvest was presented in Table 2 and Fig.2 revealed significant differences among the treatments. At 60 DAS, number of leaves per plant ranged from (2.23) to (3.13). The maximum number of leaves (3.13) was recorded in treatment T₅ with Biostimulant @ 3% and the minimum number of leaves per plant (2.23) was recorded in T₁ (control @100% soil). Whereas, the result of the treatment T₂ (2.33) and T₄ (2.33) shows the similar number of leaves per plant which was at par with treatment T₆ (2.30). At 90 DAS, the maximum number of leaves (6.40) was recorded in T₅ with Biostimulant @ 3% and the minimum number of leaves per plant (5.17) was recorded in T₁ (control @100%). Whereas, the result of the treatment T₇ (5.50) and T₉ (5.50) shows the similar Number of leaves per plant. At 120 DAS, the maximum number of leaves (10.40) was recorded in T₅ with Biostimulant @ 3% and T₁₀ (10.40) FYM @ 22t/ha + VC @ 5t/ha + JV @ 100% + BS@ 3%. The minimum number of leaves per plant (8.83) was recorded in T₁ (control @100% soil). However, significant difference was observed in treatment T₂ (FYM @ 22t/ha) for number of leaves per plant i.e., (6.60). This variation might be due to combined effect of all fertilizers. As the organic fertilizers contains high amount of nutrients which helps for proper growth and development of vegetative structures i.e. leaves. The more photosynthates production is directly correlated to higher leaves number per plant and availability of nutrients and sunshine. The results are in line with the findings of (Jagadeesh *et.al*; 2018) and (Hussain and Kerketta, 2023) in beet root.

Leaf length (cm)

The observation of leaf length (cm) recorded at 90 DAS, 120 DAS and at Final harvest was presented in Table 2 and Fig.3 revealed significant differences among the treatments. At 90 DAS, maximum leaf length (12.25cm) was recorded in treatment T₇ with VC @ 5t/ha + JV @ 100% and the minimum leaf length (7.34cm) was recorded with T₁ (control @100% soil). Whereas, leaf length in T₄ (10.25cm) and T₈ (10.23cm) were at par with each other. At 120 DAS, the maximum leaf length (18.33cm) was recorded in treatments T₇ with VC @ 5t/ha + JV @ 100% and the minimum leaf length (11.16cm) was recorded in T₁ (control @100% soil). At final harvest the maximum leaf length (25.46cm) was recorded in treatment T₇ with VC @ 5t/ha + JV @ 100% and the minimum leaf length (21.58cm) was recorded with T₁ (control @ 100% soil). However, significant difference was observed in treatment T₅ (Biostimulant @ 3%) for leaf length i.e., (22.95cm). This may be due to Vermicompost possessing plant growth hormones (e.g., indole acetic acid, gibberellins and cytokinin's) and other plant growth regulators which promote increased microbial activities by earthworms which significantly increased the growth of plants. The observations are also in agreement with the findings of (Maloisane and Kayombo, 2022) in beet root.

Leaf width (cm)

The observation of leaf width recorded at 90 DAS, 120 DAS and at Final harvest was presented in Table 2 and Fig.4 revealed significant differences among the treatments. At 90 DAS, the maximum leaf width (6.43cm) was recorded in

Shivani Saklani *et al.*,

T₅ with Biostimulant @ 3% and the minimum leaf width (3.39cm) was recorded in T₁ (control@ 100% soil). Whereas, leaf width in T₇ (5.39cm) and T₈ (5.35cm) were at par with each other. At 120 DAS, the maximum leaf width (13.51cm) was recorded in T₅ with Biostimulant @ 3% and the minimum leaf width (8.58cm) was recorded in T₁ (control@ 100% soil). However, significant difference was observed in treatment T₄ (JV@ 100%) for leaf width i.e., (9.26cm). At final harvest, the maximum leaf width (18.23cm) was recorded in T₅ with Biostimulant @ 3% and the minimum leaf width (13.10cm) was recorded in T₁ (control @ 100% soil). This may be due to an explanation for such activities by plant Biostimulants are the fact that they are made of up mixtures of low molecular weight forms of organic N (amino acids and oligopeptides) which are precursors for the biosynthesis of plant hormones that stimulate plant growth and development. The findings are also in agreement with the findings of (Jolayem *et al.*; 2021) in sugar beet.

Fresh weight of leaf (g)

The observation of fresh weight of leaf recorded at 90 DAS, 120 DAS and at Final harvest was presented in Table 3 and Fig.5 revealed significant differences among the treatments. At 90 DAS, the maximum fresh weight of leaf (1.55g) was recorded in T₇ with Vermicompost @ 5t/ha + Jeevamrutha @ 100% and the minimum fresh weight of leaf (0.22g) was recorded in T₃ Vermicompost @5t/ha. However, T₅ (1.21g) and T₈ (1.21g) shows similar fresh weight of leaf which was at par with treatment T₉ (1.22g). Whereas, significant difference was observed in treatment T₁ (0.73g) and T₃ (0.22g) for fresh weight of leaf. At 120 DAS, the maximum fresh weight of leaf (1.42g) was recorded in T₈ with FYM @ 22t/ha + Biostimulant @ 3% and the minimum fresh weight of leaf (0.70g) was recorded in T₂ with FYM @ 22t/ha. However, T₄ (1.34g), T₉ (1.33g) and T₁₀ (1.30g) were at par with each other. Whereas, significant difference was observed in treatment T₂ (0.70g) and T₆ (0.88g) for fresh weight of leaf. At final harvest the maximum fresh weight of leaf (43.50g) was recorded in T₈ with FYM @ 22t/ha + Biostimulant @ 3% and the minimum fresh weight of leaf (29.72g) was recorded in T₁ (control @100% soil). However, T₅ (42.94g), T₆ (40.77g), T₈ (43.50g) T₉ (43.45g) and T₁₀ (42.92g) were at par with each other. Whereas, significant difference was observed in T₁ (control @ 100%soil) for fresh weight of leaf i.e., (29.72g). This may be due to, the lower amount of water inside the leaves and decreased cell expansion resulting in dense biomass production of leaves and as plant weight directly contributes to yield per plant. The findings are in similar with the results of (Jahan *et al.*; 2019) in carrot.

Dry weight of leaf (g)

The observation of dry weight of leaf recorded at Final harvest was presented in Table 3 and Fig.6 revealed significant differences among the treatments. At Final harvest, dry weight of leaf ranged from 0.30g to 1.27g. The maximum dry weight of leaf (1.27g) was recorded in treatment T₅ with Biostimulant @ 3% and the minimum dry weight of leaf (0.30g) was recorded in treatment T₁₀ with FYM @ 22t/ha + Vermicompost @ 5t/ha + Jeevamrutha @ 100% + Biostimulant @ 3%. However, dry weight of leaf in treatment T₂ (0.76g) and T₇ (0.77g) were at par with each other. Whereas, significant difference was observed in treatment T₅ (1.27g) and T₉ (1.22g) for the dry weight of leaf. This might be due to the excellence of high level of organic fertilizers which produce better growth for beet root plants and shows higher dry weight of plant, The findings are in similar with the results of (Jahan *et al.*; 2019) in carrot.

Total Fresh weight of plant (g)

The observation of total fresh weight of plant (g), recorded at Final harvest was presented in Table 3 and Fig.7 revealed significant differences among the treatments. At Final harvest, total fresh weight ranged from 317.30g to 167.14g. The maximum total fresh weight of plant (317.30g) was recorded in treatment T₆ with FYM@ 22t/ha + Vermicompost @ 5t/ha and the minimum total fresh weight of plant (167.14g) was recorded in treatment T₁ with control @ 100%. However, total fresh weight of plant in treatment T₂ (247.99g), T₃ (235.02g) and T₈ (246.34g) were at par with each other. Whereas, significant difference was observed in treatment T₁ (167.14g) and T₄ (158.94g) for the total fresh weight of plant. This might be due to weight of plant directly depends on higher photosynthates produced that is stored in roots too. The findings are in similar with the results of (Hussain and Kerketta,2023) in beetroot.

Shivani Saklani *et al.*,**Total dry weight of plant (g)**

The observation of total dry weight of plant (g), recorded at Final harvest was presented in Table 3 and Fig.8 revealed significant differences among the treatments. At Final harvest, total dry weight ranged from 3.39g to 2.15g. The maximum total dry weight of plant (3.39g) was recorded in treatment T₇ with Vermicompost @ 5t/ha + Jeevamrutha @ 100% and the minimum total dry weight of plant (2.15g) was recorded in treatment T₁ with control @ 100%. However, treatment T₅ (2.26g) T₉ (2.26g) shows the similar dry weight of plant which was par with treatment T₃ (2.21g) and T₈ (2.25g). whereas, significant difference was observed in treatment T₁ (2.15g) for the total dry weight of plant. This might be due to since plants have a high composition of water and the level of water in a plant will depend on the amount of water in its environment weight of plant directly depends on higher photosynthates produced that is stored in roots too. The findings are in similar with the results of (Hussain and Kerketta, 2023) in beetroot.

Length of root (cm)

The observation of length of root (cm), recorded at Final harvest was presented in Table 3 and Fig.9 revealed significant differences among the treatments. At Final harvest length of root ranged from 9.26cm to 12.63cm. The maximum length of root (12.63cm) was recorded in treatment T₄ with Jeevamrutha @ 100% and the minimum length of root (9.26cm) was recorded in treatment T₁ with control @ 100%. However, treatment T₂ (10.46cm) T₃ (10.10cm) T₅ (10.85cm) was at par with each other. Whereas, the significant difference was observed in treatment T₁ (9.26cm) for the length of root. This might be due to higher content of phosphorous, nitrogen, calcium and micronutrients content in Jeevamrutha the nutrients solubilized in the soil, the subsequent accumulation of those nutrients have made them available to plants throughout their growth cycle, resulting in an increase in root characters due to Jeevamrutha application. The findings are in similar with the results of (Vibha *et.al*; 2022)

Diameter of root (cm)

The observation of diameter of root (cm), recorded at Final harvest was presented in Table 3 and Fig.10 revealed significant differences among the treatments. At Final harvest Diameter of root ranged from 7.60cm to 5.20cm. The maximum diameter of root (7.60cm) was recorded in treatment T₁₀ with FYM@ 22t/ha + Vermicompost 5t/ha + Jeevamrutha @ 100% + Biostimulant @ 3% and the minimum diameter of root (5.20cm) was recorded in treatment T₁ with control @ 100%. However, T₇ (7.14cm) T₈ (7.50cm) T₉ (7.16cm) and T₁₀ (7.60cm) was at par with each other. Whereas, significant difference was observed in treatment T₁ (5.20cm) and T₃ (5.36cm) for the diameter of root. The maximum diameter of root (7.60cm) was recorded in T₁₀ with FYM @ 22t/ha + Vermicompost @ 5t/ha + Jeevamrutha @ 100% + Biostimulant @ 3%. The minimum diameter of root was recorded in control T₁ (5.20cm). This may be due to the decrease in bulk density and increase in porosity and water holding capacity of the soil due to organic fertilizers sources might have contributed in increasing root diameter of the plants. The highest root diameter recorded may be attributed to enhanced cell division and quick cell multiplication. The enhancement in root diameter in beet root plant with application of vermicompost supply organic matter and beneficial microorganisms, improving soil structure and nutrient availability. The findings are similar with (Tiwari and Prasad, 2022) in beetroot.

Weight of root (g)

The observation of weight of root (g), recorded at Final harvest was presented in Table 3 and Fig.11 revealed significant differences among the treatments. At Final harvest weight of root ranged from 53.45g to 115.90g. The maximum weight of root (115.90g) was recorded in treatment T₁₀ with FYM@ 22t/ha + Vermicompost @ 5t/ha + Jeevamrutha @ 100% + Biostimulant @ 3% and the minimum weight of root (53.45g) was recorded in treatment T₁ with control @ 100%. However, treatment T₄ (80.82g) and T₈ (86.84g) at par with each other. This might be due to as organic fertilizers play a direct role in plant growth as a source of all necessary macro and micro-nutrients in available forms during mineralization, improving physical and physiological properties of soil. The similar findings have been reported by Kushwah (2020) in sugar beet.

**Root: Shoot ratio**

The observation of root:shoot ratio recorded at Final harvest was presented in Table 3 and Fig.11 revealed significant differences among the treatments. At Final harvest root: shoot ratio ranged from 0.24 to 0.48. The maximum root: shoot ratio (0.48cm) was recorded in treatment T₉ with FYM @ 11t/ha + Vermicompost 2.5t/ha + Jeevamrutha @50% + Biostimulant @1.5% and the minimum root: shoot ratio (0.24) was recorded in treatment T₂ with FYM@22t/ha and T₅ (0.24) BioStimulant @3%. However, of root:shoot ratio in treatment T₂ (0.24) and T₅ (0.24) was found similar along with T₄ (0.35cm) and T₈ (0.35) at par with each other. This might be due to that the root: shoot ratio provides insights on where the sugar beet allocates the most carbon in the current phase of its growth. The similar findings have been reported by (Hadiret.al; 2020) in sugar beet.

Root yield (kg/plot)

The observation root yield (kg/plot), recorded at Final harvest was presented in Table 3 and Fig.12 revealed significant differences among the treatments. At Final harvest, root yield (ranged from 2.67 to 7.41 kg/plot. The maximum root yield (7.41kg/plot) was recorded in treatment T₁₀ with FYM @ 22t/ha + Vermicompost @ 5t/ha + Jeevamrutha @ 100% + Biostimulant @ 3%. and the minimum root yield (2.67kg/plot) was recorded in treatment T₁ with control @ 100%. whereas, significant difference was observed in treatment T₄ (4.01kg/plot) for the root yield. This might be due to as it depends directly or even indirectly on earliness of plant along with plant height and number of leaves per plant too. It was seen in experimentation yield had direct positive correlation. These results are in close conformity with the findings of (Hussain and Kerketta, 2023) in beetroot.

Root yield (t/ha)

The observation root yield (t/ha), recorded at Final harvest was presented in Table 3 and Fig.13 revealed significant differences among the treatments. At Final harvest, root yield (t/ha) ranged from 8.91 to 25.10t/ha. The maximum root yield (25.10t/ha) was recorded in treatment T₇ with Vermicompost 5t/ha + Jeevamrutha @100% and the minimum root yield (8.91t/ha) was recorded in treatment T₁ with control @ 100%. However, the significant difference (8.91t/ha) and (9.92t/ha) was observed in treatment T₁ and T₂ for the root yield (t/ha). This might be due to higher root yield per plot and as it also depends directly or even indirectly on earliness of plant along with plant height and number of leaves per plant too. It was seen in experimentation yield had direct positive correlation. These findings are in close conformity with the results of Kushwah (2020) in beetroot.

CONCLUSION

On the basis of present investigation on “Efficacy of organic fertilizers and Biostimulant on growth and yield of Beet root (*Beta vulgaris* L.) cv. “Detroit Dark Red” grown in lower hills of Uttarakhand” it can be concluded that the treatment T₁₀ (FYM @ 22t/ha + Vermicompost @ 5t/ha + Jeevamrutha @ 100% + Biostimulant @ 3%) was recorded maximum plant height (cm), number of leaves per plant, diameter of root (cm) and root yield (kg/plot) in beetroot. Whereas, in the treatment T₉ maximum weight of root (g) and root:shoot ratio was recorded. However, maximum leaf length (cm) and root yield (t/ha) was recorded in the treatment T₇. Whereas, the treatment T₈, recorded maximum fresh weight of leaf (43.50g). The treatment T₆ recorded maximum Total fresh weight of plant (317.30g) and Total dry weight of plant (3.44g). The treatment T₅ recorded maximum leaf width (18.23cm) and dry weight of leaf (1.27g). The treatment T₄ recorded maximum length of root (12.63cm). The present investigation, shows that supplementation of FYM, Vermicompost along with Jeevamrutha and Biostimulant improved soil fertility status which resulted in higher yield performance. Therefore, it could be recommended under present agro-climatic conditions in order to obtain sustainably higher yield and quality of beetroot.

ABSTRACT

A novel Integrated c with $B_p N_n F$ -CoCoSo, $B_p N_n F$ -MOORA and $B_p N_n F$ -WASPAS method is presented in this study for medical diagnosis. Its objective is to improve the decision-making procedures in medical diagnosis by managing the unpredictability and complexity linked to medical symptoms and diagnoses. The fuzzy value in the system is defuzzified into crisp values utilizing the $CB_p N_n FCS$ (Converting bipolar nonagonal fuzzy data into crisp score) approach. Next, calculate the weight using the $B_p N_n F$ -PSI method, incorporating $B_p N_n F$ -CoCoSo, $B_p N_n F$ -MOORA and $B_p N_n F$ -WASPAS technologies. Utilising $B_p N_n F$ -MCDM methods and analysing symptom data from five patients with liver problems, determine the patient at a critical stage of the disease by examining the relationship between alternatives and criteria.

Keywords: MCDM, $B_p N_n F$ -PSI, $B_p N_n F$ -CoCoSo, $B_p N_n F$ -MOORA, $B_p N_n F$ -WASPAS

INTRODUCTION

Multi-Criteria Decision Making (MCDM) is a set of methods and processes used to evaluate and rank alternatives based on multiple, often conflicting criteria. It plays a crucial role in decision-making across various fields, such as engineering, healthcare, economics, and management. The primary aim of Multiple Criteria Decision Making (MCDM) is to aid decision-makers in choosing the optimal choice by methodically examining several criteria and

**Sivakumar and Sivakavitha**

their associated compromises. Multi-Criteria Decision Making (MCDM) is an essential field within decision theory that specifically deals with the assessment and selection of options that possess several, often contradictory evaluation criteria. Achieving an ideal result in real-world decision-making settings requires the careful balancing of several elements. Multi-Criteria Decision-Making (MCDM) is an essential procedure in the field of decision sciences, which entails the assessment and prioritization of various competing options according to several criteria. Conventional Multiple Criteria Decision Making (MCDM) methods frequently encounter difficulties associated with uncertainty and imprecision in existing data. In order to address the challenge of vagueness and ambiguity, Fuzzy Multiple Criteria Decision Making (MCDM) methods, such as Fuzzy Combined Compromise Solution (Fuzzy CoCoSo) and Fuzzy Multi-Objective Optimization by Ratio Analysis (Fuzzy MOORA), include fuzzy logic. The fuzzy Preference Selection Index (PSI) method is a multi-criteria decision-making technique that ranks alternatives by calculating a preference index based on the normalized performance of each criterion. It assigns weights to criteria and aggregates the values to determine the most preferred alternative, making it suitable for complex decision problems. The Fuzzy CoCoSo method is a recently developed technique that integrates the advantages of many compromise-based methods, enabling decision-makers to efficiently aggregate and rank alternatives. This approach utilizes fuzzy logic to address the issue of imprecision in criteria weights and performance ratings, therefore offering a decision-making framework that is more adaptable and realistic. Fuzzy CoCoSo improves the decision-making process by including fuzzy sets to better handle subjective and imprecise information commonly seen in complex situations. Fuzzy MOORA is an implementation of the conventional MOORA approach that integrates fuzzy logic to effectively handle uncertainty in the process of decision-making. This approach assesses several options by analysis of their performance ratios across several parameters, enabling a transparent comparison of the alternatives. Finite MOORA enhances the ranking procedure by using fuzzy sets, hence increasing its suitability for real-world scenarios characterized by ambiguous or incomplete data. Both the Fuzzy CoCoSo and Fuzzy MOORA algorithms offer robust frameworks for decision-making in uncertain scenarios, yielding more accurate and reliable outcomes in several practical domains such as engineering and healthcare.

Fuzzy Weighted Aggregated Sum Product Assessment (WASPAS) is a hybrid Multi-Criteria Decision-Making (MCDM) method that integrates fuzzy logic into the traditional WASPAS approach. By combining the Weighted Sum Model (WSM) and the Weighted Product Model (WPM) within a fuzzy framework, Fuzzy WASPAS allows decision-makers to handle uncertainty and imprecision in evaluating alternatives. In this method, performance values and criteria weights are expressed as fuzzy numbers, typically using linguistic terms like "low" or "high." The fuzzy decision matrix is normalized, and the final ranking of alternatives is obtained by calculating a combined score from the WSM and WPM components, with a parameter (λ) controlling the balance between the two. Fuzzy WASPAS is particularly useful in complex decision scenarios where exact data is not available, and subjective judgments need to be incorporated, making it applicable in fields such as healthcare, engineering, and environmental management. [1]Zadeh, L. (1965) Presented the fundamental notion of fuzzy sets, which established the basis for later fuzzy logic and decision-making models, impacting diverse applications in uncertainty modeling and decision support systems. [2]Opricovic, S., & Tzeng, G. H. (2003) Discussed defuzzification in a multi-criteria decision model, contributing to the operationalization of fuzzy numbers in decision-making, particularly in converting fuzzy inputs into crisp outputs. [3]Zhang, W. R., & Zhang, L. (2004) Developed YinYang bipolar fuzzy logic, providing a new dimension to traditional fuzzy logic by incorporating bipolarity, which is essential for complex decision-making scenarios involving positive and negative aspects. [4]Saraswat, S., & Digalwar, A. K. (2021) Applied a fuzzy multi-criteria decision-making approach combined with Shannon's entropy to evaluate energy alternatives, demonstrating the method's effectiveness in addressing sustainability issues in the energy sector. [5]Afrasiabi, A., Tavana, M., & Di Caprio, D. (2022) A comprehensive hybrid fuzzy MCDM model was introduced to facilitate sustainable and resilient supplier selection. This model demonstrates the utilization of fuzzy logic in supply chain management, specifically emphasizing sustainability and resilience. [6]Ezhilarasan, N., & Felix, A. (2023) Introduction of a bipolar trapezoidal fuzzy ARAS approach for the detection of TB comorbidities, demonstrating the incorporation of fuzzy logic in healthcare for the diagnosis of complicated diseases. [7]Akram, M., Shumaiza, N., & Alcántud, J. C. R. (2023) Explored MCDM methods with bipolar fuzzy sets, expanding the utility of bipolar fuzzy sets in decision-making processes by addressing both positive and negative criteria simultaneously. [8]Farooq, A., Nabeel, M., & Ali, G. (2023) Proposed

Sivakumar and Sivakavitha

novel applications of MCDM utilising cubic bipolar fuzzy models, emphasising their significance in medical and technical domains, namely for managing increased levels of uncertainty and complexity.[9]Chakraborty, S., et al. (2023) Conducted a comprehensive review of MCDM methods in healthcare, providing insights into the diverse applications of MCDM techniques, including fuzzy logic, in optimizing healthcare decisions. [10]Kursunoglu, N. (2024) Proposed a fuzzy MCDM framework for controlling methane explosions in coal mines, emphasizing the role of fuzzy logic in enhancing safety measures in high-risk environments. [11]Sampathkumar, S., et al. (2024) Utilising centroid and graded mean ranking techniques to analyse intuitionistic trapezoidal dense fuzzy sets in MCDM situations, particularly for robot selection, thereby enhancing the progress of fuzzy MCDM in the field of robotics. [12]Yu, J., et al. (2024) Utilized Fermatean fuzzy sets and the CoCoSo method for risk assessment in LNG storage tanks, demonstrating the effectiveness of fuzzy logic in risk management for industrial safety. [13]Natarajan, E., et al. (2024) Formulated a bipolar intuitionistic fuzzy decision-making model to choose efficient tuberculosis (TB) diagnosis techniques, demonstrating the capabilities of bipolar fuzzy logic in healthcare diagnostics.[14]Rasoanaivo, R. G., et al. (2024)

Introduced the CoCoFISo method, a new MCDM approach based on CoCoSo, providing an innovative solution for decision-making that integrates compromise and ideal solution concepts. [15]Jana, C., et al. (2024) Applied a hybrid MCDM method with a bipolar fuzzy approach to economic condition analysis, illustrating the applicability of bipolar fuzzy logic in economic decision-making. [16]Natarajan, E., & Augustin, F. (2024) Design and implemented a bipolar fuzzy decision-making system to evaluate the presence of high-risk coexisting TB in pregnant women. This system demonstrates the effectiveness of fuzzy logic in handling intricate healthcare situations. [17]Rong, Y., et al. (2024) Presenting a novel integrated group decision-making framework that incorporates MULTIMOORA-WASPAS with q-rung orthopair fuzzy information, this study contributes to the progress of fuzzy logic in collaborative decision-making settings. [18]Özlü, E. (2024)This study presents a new method for managing hesitation and bipolarity in decision-making processes by developing bipolar-valued complex hesitant fuzzy Dombi aggregating operators for MCDM issues. [19]Ali, G., et al. (2024) Extended the ELECTRE method for MCDM with spherical cubic fuzzy sets, demonstrating the method's capability to handle complex decision-making scenarios with multi-dimensional uncertainty.[20]Zhao, Z., et al. (2024)Presenting a decision support system that utilizes bipolar complicated fuzzy Hamy mean operators, this study demonstrates the incorporation of sophisticated fuzzy logic into decision support systems designed for intricate decision-making contexts. In this paper extended vision of Bipolar nonagonal fuzzy set in MCDM methods.This section 2 gives preliminaries definition for this paper. In Section 3, explain the proposed method $CB_p N_n FCS$ algorithm, proposed $B_p N_n F-PSI$, $B_p N_n F-CoCoSo$, $B_p N_n F-MOORA$ and $B_p N_n F-WASPAS$. In section 4, proposed integrating $B_p N_n F-PSI$ with $B_p N_n F-CoCoSo$, $B_p N_n F-MOORA$, $B_p N_n F-WASPAS$ method to solve medical diagnosis with numerical example in liver disorder.

2.Preliminaries

Definition 2.1. Definition of a fuzzy subset \mathcal{B} of the universal set $Z = \{z, \mu_{\mathcal{B}}(z) \mid z \in Z\}$, where $\mu_{\mathcal{B}}(z)$ is the membership function is a linear mapping $\mu_{\mathcal{B}}(z) : Z \rightarrow [0, 1]$.

Definition 2.2. A bipolar fuzzy set \mathcal{B}_p is a mathematical set defined by $\mathcal{B}_p = \{(z, \mu_{\mathcal{B}}^+(z), \mu_{\mathcal{B}}^-(z)) \mid z \in Z\}$, where $\mu_{\mathcal{B}}^+(z) : Z \rightarrow [0, 1]$ and $\mu_{\mathcal{B}}^-(z) : Z \rightarrow [-1, 0]$ Denote the positive and negative Membership Functions, correspondingly.

Definition 2.3. A \mathcal{B}_p is a bipolar fuzzy number defined on the real line \mathbb{R} , where its positive and negative Membership Functions must meet the following criteria:

- (i) \mathcal{B}_p is normal $\mu_{\mathcal{B}}^+(z) = 1, \mu_{\mathcal{B}}^-(z) = -1$.
- (ii) $\mu_{\mathcal{B}}^+(z), \mu_{\mathcal{B}}^-(z)$ are piecewise continuous.
- (iii) \mathcal{B}_p is convex $\mu_{\mathcal{B}}^+(\rho z_1 + (1 - \rho)z_2) \geq \min(\mu_{\mathcal{B}}^+(z_1), \mu_{\mathcal{B}}^+(z_2))$, for all $z_1, z_2 \in Z, \rho \in [0, 1]$.
- (iv) \mathcal{B}_p is concave $\mu_{\mathcal{B}}^-(\rho z_1 + (1 - \rho)z_2) \leq \max(\mu_{\mathcal{B}}^-(z_1), \mu_{\mathcal{B}}^-(z_2))$, for all $z_1, z_2 \in Z, \rho \in [-1, 0]$.

**Definition 2.4: Bipolar Nonagonal fuzzy number ($B_P N_n FN$)**

The $B_P N_n FN$ is defined as $\tilde{A}_{B_P N_n FN} = ((s_1^+, s_2^+, s_3^+, s_4^+, s_5^+, s_6^+, s_7^+, s_8^+, s_9^+)$

$(s_1^-, s_2^-, s_3^-, s_4^-, s_5^-, s_6^-, s_7^-, s_8^-, s_9^-))$ on the real line R then, the positive and negative membership of $B_P N_n FN$ are defined as

$$\mu_{\tilde{A}}^+(x) = \begin{cases} \zeta_1^+ \left(\frac{x-s_1^+}{s_2^+-s_1^+} \right) \text{ for } s_1^+ < x < s_2^+ \\ \zeta_1^+ + (\zeta_2^+ - \zeta_1^+) \left(\frac{x-s_2^+}{s_3^+-s_2^+} \right) \text{ for } s_2^+ < x < s_3^+ \\ \zeta_2^+ + (\zeta_3^+ - \zeta_2^+) \left(\frac{x-s_3^+}{s_4^+-s_3^+} \right) \text{ for } s_3^+ < x < s_4^+ \\ \zeta_3^+ + (1 - \zeta_3^+) \left(\frac{x-s_4^+}{s_5^+-s_4^+} \right) \text{ for } s_4^+ < x < s_5^+ \\ 1 \text{ for } x = s_5^+ \\ \zeta_3^+ + (1 - \zeta_3^+) \left(\frac{s_6^+-x}{s_6^+-s_5^+} \right) \text{ for } s_5^+ < x < s_6^+ \\ \zeta_2^+ + (\zeta_3^+ - \zeta_2^+) \left(\frac{s_7^+-x}{s_7^+-s_6^+} \right) \text{ for } s_6^+ < x < s_7^+ \\ \zeta_1^+ + (\zeta_2^+ - \zeta_1^+) \left(\frac{s_8^+-x}{s_8^+-s_7^+} \right) \text{ for } s_7^+ < x < s_8^+ \\ \zeta_1^+ \left(\frac{s_9^+-x}{s_9^+-s_8^+} \right) \text{ for } s_8^+ < x < s_9^+ \end{cases}$$

$$\mu_{\tilde{A}}^-(x) = \begin{cases} \zeta_1^- \left(\frac{x-s_1^-}{s_2^--s_1^-} \right) \text{ for } s_1^- < x < s_2^- \\ \zeta_1^- + (\zeta_2^- - \zeta_1^-) \left(\frac{x-s_2^-}{s_3^--s_2^-} \right) \text{ for } s_2^- < x < s_3^- \\ \zeta_2^- + (\zeta_3^- - \zeta_2^-) \left(\frac{x-s_3^-}{s_4^--s_3^-} \right) \text{ for } s_3^- < x < s_4^- \\ \zeta_3^- + (-1 - \zeta_3^-) \left(\frac{x-s_4^-}{s_5^--s_4^-} \right) \text{ for } s_4^- < x < s_5^- \\ -1 \text{ for } x = s_5^- \\ \zeta_3^- + (-1 - \zeta_3^-) \left(\frac{s_6^--x}{s_6^--s_5^-} \right) \text{ for } s_5^- < x < s_6^- \\ \zeta_2^- + (\zeta_3^- - \zeta_2^-) \left(\frac{s_7^--x}{s_7^--s_6^-} \right) \text{ for } s_6^- < x < s_7^- \\ \zeta_1^- + (\zeta_2^- - \zeta_1^-) \left(\frac{s_8^--x}{s_8^--s_7^-} \right) \text{ for } s_7^- < x < s_8^- \\ \zeta_1^- \left(\frac{s_9^--x}{s_9^--s_8^-} \right) \text{ for } s_8^- < x < s_9^- \end{cases}$$

Where $s_1^+ \leq s_2^+ \leq s_3^+ \leq s_4^+ \leq s_5^+ \leq s_6^+ \leq s_7^+ \leq s_8^+ \leq s_9^+$ and $s_1^- \leq s_2^- \leq s_3^- \leq s_4^- \leq s_5^- \leq s_6^- \leq s_7^- \leq s_8^- \leq s_9^-$.

Definition 2.5 Bipolar Nonagonal fuzzy arithmetic operation ($B_P N_n FN$):

Let $K = ((k_1^+, k_2^+, k_3^+, k_4^+, k_5^+, k_6^+, k_7^+, k_8^+, k_9^+), (k_1^-, k_2^-, k_3^-, k_4^-, k_5^-, k_6^-, k_7^-, k_8^-, k_9^-))$ and $V = ((v_1^+, v_2^+, v_3^+, v_4^+, v_5^+, v_6^+, v_7^+, v_8^+, v_9^+), (v_1^-, v_2^-, v_3^-, v_4^-, v_5^-, v_6^-, v_7^-, v_8^-, v_9^-))$ be two $B_P N_n FN$. Then, the arithmetic operation K and V are as follows,

$$\bullet (K+V) = \left(\begin{pmatrix} (k_1^+ + v_1^+), (k_2^+ + v_2^+), (k_3^+ + v_3^+), (k_4^+ + v_4^+), (k_5^+ + v_5^+), \\ (k_6^+ + v_6^+), (k_7^+ + v_7^+), (k_8^+ + v_8^+), (k_9^+ + v_9^+) \end{pmatrix}, \begin{pmatrix} (k_1^- + v_1^-), (k_2^- + v_2^-), (k_3^- + v_3^-), (k_4^- + v_4^-), (k_5^- + v_5^-), \\ (k_6^- + v_6^-), (k_7^- + v_7^-), (k_8^- + v_8^-), (k_9^- + v_9^-) \end{pmatrix} \right);$$

$$\bullet (K-V) = \left(\begin{pmatrix} (k_1^+ - v_1^+), (k_2^+ - v_2^+), (k_3^+ - v_3^+), (k_4^+ - v_4^+), (k_5^+ - v_5^+), \\ (k_6^+ - v_6^+), (k_7^+ - v_7^+), (k_8^+ - v_8^+), (k_9^+ - v_9^+) \end{pmatrix}, \begin{pmatrix} (k_1^- - v_1^-), (k_2^- - v_2^-), (k_3^- - v_3^-), (k_4^- - v_4^-), (k_5^- - v_5^-), \\ (k_6^- - v_6^-), (k_7^- - v_7^-), (k_8^- - v_8^-), (k_9^- - v_9^-) \end{pmatrix} \right);$$

$$\bullet (K^*V) = \left(\begin{array}{c} ((k_1^+ v_1^+), (k_2^+ v_2^+), (k_3^+ v_3^+), (k_4^+ v_4^+), (k_5^+ v_5^+), \\ (k_6^+ v_6^+), (k_7^+ v_7^+), (k_8^+ v_8^+), (k_9^+ v_9^+)) \\ ((k_1^- v_1^-), (k_2^- v_2^-), (k_3^- v_3^-), (k_4^- v_4^-), (k_5^- v_5^-), \\ (k_6^- v_6^-), (k_7^- v_7^-), (k_8^- v_8^-), (k_9^- v_9^-)) \end{array} \right)$$

$$\bullet (K/V) = \left(\begin{array}{c} ((k_1^+ / v_1^+), (k_2^+ / v_2^+), (k_3^+ / v_3^+), (k_4^+ / v_4^+), (k_5^+ / v_5^+), \\ (k_6^+ / v_6^+), (k_7^+ / v_7^+), (k_8^+ / v_8^+), (k_9^+ / v_9^+)) \\ ((k_1^- / v_1^-), (k_2^- / v_2^-), (k_3^- / v_3^-), (k_4^- / v_4^-), (k_5^- / v_5^-), \\ (k_6^- / v_6^-), (k_7^- / v_7^-), (k_8^- / v_8^-), (k_9^- / v_9^-)) \end{array} \right)$$

3. The Methodological approach

3.1. The proposed $CB_P N_n FCS$ algorithm

Defuzzification is the quantitative transformation of fuzzy or imprecise data into precise data. Fuzzy methods essentially include the transformation of a fuzzy number into a precise numerical value. The conventional methods for defuzzification include center of area, centre of sum, weighted average, and maximal techniques. The emerging technology is deficient in adequate bipolar fuzzy defuzzification methodology. The article[2] presents defuzzification methods for the Phase of Converting Fuzzy Data into Crisp Scores (CFCS). In this work, present the conversion of the technique into $CB_P N_n FCS$.

Step 1: Normalize each member of the $B_P N_n FN$.

$$\left(\begin{array}{c} k_{ij}^+ = \frac{k_{ij}^+ - \min(k_{ij}^+)}{\Delta_{min}^{max}}, l_{ij}^+ = \frac{l_{ij}^+ - \min(l_{ij}^+)}{\Delta_{min}^{max}}, m_{ij}^+ = \frac{m_{ij}^+ - \min(m_{ij}^+)}{\Delta_{min}^{max}}, \\ n_{ij}^+ = \frac{n_{ij}^+ - \min(n_{ij}^+)}{\Delta_{min}^{max}}, \\ o_{ij}^+ = \frac{o_{ij}^+ - \min(o_{ij}^+)}{\Delta_{min}^{max}}, p_{ij}^+ = \frac{p_{ij}^+ - \min(p_{ij}^+)}{\Delta_{min}^{max}}, q_{ij}^+ = \frac{q_{ij}^+ - \min(q_{ij}^+)}{\Delta_{min}^{max}}, \\ r_{ij}^+ = \frac{r_{ij}^+ - \min(r_{ij}^+)}{\Delta_{min}^{max}}, s_{ij}^+ = \frac{s_{ij}^+ - \min(s_{ij}^+)}{\Delta_{min}^{max}} \\ k_{ij}^- = \frac{k_{ij}^- - \min(k_{ij}^-)}{\Delta_{min}^{max}}, l_{ij}^- = \frac{l_{ij}^- - \min(l_{ij}^-)}{\Delta_{min}^{max}}, m_{ij}^- = \frac{m_{ij}^- - \min(m_{ij}^-)}{\Delta_{min}^{max}}, \\ n_{ij}^- = \frac{n_{ij}^- - \min(n_{ij}^-)}{\Delta_{min}^{max}}, \\ o_{ij}^- = \frac{o_{ij}^- - \min(o_{ij}^-)}{\Delta_{min}^{max}}, p_{ij}^- = \frac{p_{ij}^- - \min(p_{ij}^-)}{\Delta_{min}^{max}}, q_{ij}^- = \frac{q_{ij}^- - \min(q_{ij}^-)}{\Delta_{min}^{max}}, \\ r_{ij}^- = \frac{r_{ij}^- - \min(r_{ij}^-)}{\Delta_{min}^{max}}, s_{ij}^- = \frac{s_{ij}^- - \min(s_{ij}^-)}{\Delta_{min}^{max}} \end{array} \right)$$

Step 2: Calculate the left and right scores of $B_P N_n FN$.

$$\left(\begin{array}{c} le_1 t_{ij}^+ = \frac{l_{ij}^+}{1 + l_{ij}^+ - k_{ij}^+}, le_2 t_{ij}^+ = \frac{m_{ij}^+}{1 + m_{ij}^+ - l_{ij}^+}, le_3 t_{ij}^+ = \frac{n_{ij}^+}{1 + n_{ij}^+ - m_{ij}^+}, \\ le_4 t_{ij}^+ = \frac{o_{ij}^+}{1 + o_{ij}^+ - n_{ij}^+}, ri_1 t_{ij}^+ = \frac{p_{ij}^+}{1 + p_{ij}^+ - o_{ij}^+}, ri_2 t_{ij}^+ = \frac{q_{ij}^+}{1 + q_{ij}^+ - p_{ij}^+}, \\ ri_3 t_{ij}^+ = \frac{r_{ij}^+}{1 + r_{ij}^+ - q_{ij}^+}, ri_4 t_{ij}^+ = \frac{s_{ij}^+}{1 + s_{ij}^+ - r_{ij}^+} \end{array} \right)$$

$$\left(\begin{aligned} le_1 t_{ij}^- &= \frac{l_{ij}^-}{1+l_{ij}^- - k_{ij}^-}, le_2 t_{ij}^- = \frac{m_{ij}^-}{1+m_{ij}^- - l_{ij}^-}, le_3 t_{ij}^- = \frac{n_{ij}^-}{1+n_{ij}^- - m_{ij}^-}, \\ le_4 t_{ij}^- &= \frac{o_{ij}^-}{1+o_{ij}^- - n_{ij}^-}, ri_1 t_{ij}^- = \frac{p_{ij}^-}{1+p_{ij}^- - o_{ij}^-}, ri_2 t_{ij}^- = \frac{q_{ij}^-}{1+q_{ij}^- - p_{ij}^-}, \\ ri_3 t_{ij}^- &= \frac{r_{ij}^-}{1+r_{ij}^- - q_{ij}^-}, ri_4 t_{ij}^- = \frac{s_{ij}^-}{1+s_{ij}^- - r_{ij}^-} \end{aligned} \right)$$

Step 3(a): The total of the normalization scores should be calculated as follows:

$$\left(\begin{aligned} \beta_{ij1}^+ &= \frac{le_1 t_{ij}^+ (1 - le_1 t_{ij}^+) + (le_2 t_{ij}^+)^2}{1 - le_1 t_{ij}^+ + le_2 t_{ij}^+}, \beta_{ij2}^+ = \frac{le_2 t_{ij}^+ (1 - le_2 t_{ij}^+) + (le_3 t_{ij}^+)^2}{1 - le_2 t_{ij}^+ + le_3 t_{ij}^+}, \\ \beta_{ij3}^+ &= \frac{le_3 t_{ij}^+ (1 - le_3 t_{ij}^+) + (le_4 t_{ij}^+)^2}{1 - le_3 t_{ij}^+ + le_4 t_{ij}^+}, \beta_{ij4}^+ = \frac{le_4 t_{ij}^+ (1 - le_4 t_{ij}^+) + (ri_1 t_{ij}^+)^2}{1 - le_4 t_{ij}^+ + ri_1 t_{ij}^+}, \\ \beta_{ij5}^+ &= \frac{ri_1 t_{ij}^+ (1 - ri_1 t_{ij}^+) + (ri_2 t_{ij}^+)^2}{1 - ri_1 t_{ij}^+ + ri_2 t_{ij}^+}, \beta_{ij6}^+ = \frac{ri_2 t_{ij}^+ (1 - ri_2 t_{ij}^+) + (ri_3 t_{ij}^+)^2}{1 - ri_2 t_{ij}^+ + ri_3 t_{ij}^+}, \\ \beta_{ij7}^+ &= \frac{ri_3 t_{ij}^+ (1 - ri_3 t_{ij}^+) + (ri_4 t_{ij}^+)^2}{1 - ri_3 t_{ij}^+ + ri_4 t_{ij}^+} \end{aligned} \right)$$

$$\left(\begin{aligned} \beta_{ij1}^- &= \frac{le_1 t_{ij}^- (1 - le_1 t_{ij}^-) + (le_2 t_{ij}^-)^2}{1 - le_1 t_{ij}^- + le_2 t_{ij}^-}, \beta_{ij2}^- = \frac{le_2 t_{ij}^- (1 - le_2 t_{ij}^-) + (le_3 t_{ij}^-)^2}{1 - le_2 t_{ij}^- + le_3 t_{ij}^-}, \\ \beta_{ij3}^- &= \frac{le_3 t_{ij}^- (1 - le_3 t_{ij}^-) + (le_4 t_{ij}^-)^2}{1 - le_3 t_{ij}^- + le_4 t_{ij}^-}, \beta_{ij4}^- = \frac{le_4 t_{ij}^- (1 - le_4 t_{ij}^-) + (ri_1 t_{ij}^-)^2}{1 - le_4 t_{ij}^- + ri_1 t_{ij}^-}, \\ \beta_{ij5}^- &= \frac{ri_1 t_{ij}^- (1 - ri_1 t_{ij}^-) + (ri_2 t_{ij}^-)^2}{1 - ri_1 t_{ij}^- + ri_2 t_{ij}^-}, \beta_{ij6}^- = \frac{ri_2 t_{ij}^- (1 - ri_2 t_{ij}^-) + (ri_3 t_{ij}^-)^2}{1 - ri_2 t_{ij}^- + ri_3 t_{ij}^-}, \\ \beta_{ij7}^- &= \frac{ri_3 t_{ij}^- (1 - ri_3 t_{ij}^-) + (ri_4 t_{ij}^-)^2}{1 - ri_3 t_{ij}^- + ri_4 t_{ij}^-} \end{aligned} \right)$$

Step 3(b): The total of the normalization scores should be calculated as follows.

$$\left(\begin{aligned} \beta_{ij1@}^+ &= \frac{\beta_{ij1}^+ (1 - \beta_{ij1}^+) + (\beta_{ij2}^+)^2}{1 - \beta_{ij1}^+ + \beta_{ij2}^+}, \beta_{ij2@}^+ = \frac{\beta_{ij2}^+ (1 - \beta_{ij2}^+) + (\beta_{ij3}^+)^2}{1 - \beta_{ij2}^+ + \beta_{ij3}^+}, \\ \beta_{ij3@}^+ &= \frac{\beta_{ij3}^+ (1 - \beta_{ij3}^+) + (\beta_{ij4}^+)^2}{1 - \beta_{ij3}^+ + \beta_{ij4}^+}, \beta_{ij4@}^+ = \frac{\beta_{ij4}^+ (1 - \beta_{ij4}^+) + (\beta_{ij5}^+)^2}{1 - \beta_{ij4}^+ + \beta_{ij5}^+}, \\ \beta_{ij5@}^+ &= \frac{\beta_{ij5}^+ (1 - \beta_{ij5}^+) + (\beta_{ij6}^+)^2}{1 - \beta_{ij5}^+ + \beta_{ij6}^+}, \beta_{ij6@}^+ = \frac{\beta_{ij6}^+ (1 - \beta_{ij6}^+) + (\beta_{ij7}^+)^2}{1 - \beta_{ij6}^+ + \beta_{ij7}^+} \end{aligned} \right)$$

$$\left(\begin{aligned} \beta_{ij1@}^- &= \frac{\beta_{ij1}^- (1 - \beta_{ij1}^-) + (\beta_{ij2}^-)^2}{1 - \beta_{ij1}^- + \beta_{ij2}^-}, \beta_{ij2@}^- = \frac{\beta_{ij2}^- (1 - \beta_{ij2}^-) + (\beta_{ij3}^-)^2}{1 - \beta_{ij2}^- + \beta_{ij3}^-}, \\ \beta_{ij3@}^- &= \frac{\beta_{ij3}^- (1 - \beta_{ij3}^-) + (\beta_{ij4}^-)^2}{1 - \beta_{ij3}^- + \beta_{ij4}^-}, \beta_{ij4@}^- = \frac{\beta_{ij4}^- (1 - \beta_{ij4}^-) + (\beta_{ij5}^-)^2}{1 - \beta_{ij4}^- + \beta_{ij5}^-}, \\ \beta_{ij5@}^- &= \frac{\beta_{ij5}^- (1 - \beta_{ij5}^-) + (\beta_{ij6}^-)^2}{1 - \beta_{ij5}^- + \beta_{ij6}^-}, \beta_{ij6@}^- = \frac{\beta_{ij6}^- (1 - \beta_{ij6}^-) + (\beta_{ij7}^-)^2}{1 - \beta_{ij6}^- + \beta_{ij7}^-} \end{aligned} \right)$$

Step 3(c): The total of the normalization scores should be calculated as follows.

$$\left(\begin{array}{l} \beta_{ij1\#}^+ = \frac{\beta_{ij1\oplus}^+(1 - \beta_{ij1\oplus}^+) + (\beta_{ij2\oplus}^+)^2}{1 - \beta_{ij1\oplus}^+ + \beta_{ij2\oplus}^+}, \beta_{ij2\#}^+ = \frac{\beta_{ij2\oplus}^+(1 - \beta_{ij2\oplus}^+) + (\beta_{ij3\oplus}^+)^2}{1 - \beta_{ij2\oplus}^+ + \beta_{ij3\oplus}^+}, \\ \beta_{ij3\#}^+ = \frac{\beta_{ij3\oplus}^+(1 - \beta_{ij3\oplus}^+) + (\beta_{ij4\oplus}^+)^2}{1 - \beta_{ij3\oplus}^+ + \beta_{ij4\oplus}^+}, \beta_{ij4\#}^+ = \frac{\beta_{ij4\oplus}^+(1 - \beta_{ij4\oplus}^+) + (\beta_{ij5\oplus}^+)^2}{1 - \beta_{ij4\oplus}^+ + \beta_{ij5\oplus}^+}, \\ \beta_{ij5\#}^+ = \frac{\beta_{ij5\oplus}^+(1 - \beta_{ij5\oplus}^+) + (\beta_{ij6\oplus}^+)^2}{1 - \beta_{ij5\oplus}^+ + \beta_{ij6\oplus}^+} \\ \beta_{ij1\#}^- = \frac{\beta_{ij1\oplus}^-(1 - \beta_{ij1\oplus}^-) + (\beta_{ij2\oplus}^-)^2}{1 - \beta_{ij1\oplus}^- + \beta_{ij2\oplus}^-}, \beta_{ij2\#}^- = \frac{\beta_{ij2\oplus}^-(1 - \beta_{ij2\oplus}^-) + (\beta_{ij3\oplus}^-)^2}{1 - \beta_{ij2\oplus}^- + \beta_{ij3\oplus}^-}, \\ \beta_{ij3\#}^- = \frac{\beta_{ij3\oplus}^-(1 - \beta_{ij3\oplus}^-) + (\beta_{ij4\oplus}^-)^2}{1 - \beta_{ij3\oplus}^- + \beta_{ij4\oplus}^-}, \beta_{ij4\#}^- = \frac{\beta_{ij4\oplus}^-(1 - \beta_{ij4\oplus}^-) + (\beta_{ij5\oplus}^-)^2}{1 - \beta_{ij4\oplus}^- + \beta_{ij5\oplus}^-}, \\ \beta_{ij5\#}^- = \frac{\beta_{ij5\oplus}^-(1 - \beta_{ij5\oplus}^-) + (\beta_{ij6\oplus}^-)^2}{1 - \beta_{ij5\oplus}^- + \beta_{ij6\oplus}^-} \end{array} \right)$$

Step 3(d): The total of the normalization scores should be calculated as follows.

$$\left(\begin{array}{l} \beta_{ij1\$}^+ = \frac{\beta_{ij1\#}^+(1 - \beta_{ij1\#}^+) + (\beta_{ij2\$}^+)^2}{1 - \beta_{ij1\#}^+ + \beta_{ij2\$}^+}, \beta_{ij2\$}^+ = \frac{\beta_{ij2\#}^+(1 - \beta_{ij2\#}^+) + (\beta_{ij3\$}^+)^2}{1 - \beta_{ij2\#}^+ + \beta_{ij3\$}^+}, \\ \beta_{ij3\$}^+ = \frac{\beta_{ij3\#}^+(1 - \beta_{ij3\#}^+) + (\beta_{ij4\$}^+)^2}{1 - \beta_{ij3\#}^+ + \beta_{ij4\$}^+}, \beta_{ij4\$}^+ = \frac{\beta_{ij4\#}^+(1 - \beta_{ij4\#}^+) + (\beta_{ij5\$}^+)^2}{1 - \beta_{ij4\#}^+ + \beta_{ij5\$}^+}, \\ \beta_{ij1\$}^- = \frac{\beta_{ij1\#}^-(1 - \beta_{ij1\#}^-) + (\beta_{ij2\$}^-)^2}{1 - \beta_{ij1\#}^- + \beta_{ij2\$}^-}, \beta_{ij2\$}^- = \frac{\beta_{ij2\#}^-(1 - \beta_{ij2\#}^-) + (\beta_{ij3\$}^-)^2}{1 - \beta_{ij2\#}^- + \beta_{ij3\$}^-}, \\ \beta_{ij3\$}^- = \frac{\beta_{ij3\#}^-(1 - \beta_{ij3\#}^-) + (\beta_{ij4\$}^-)^2}{1 - \beta_{ij3\#}^- + \beta_{ij4\$}^-}, \beta_{ij4\$}^- = \frac{\beta_{ij4\#}^-(1 - \beta_{ij4\#}^-) + (\beta_{ij5\$}^-)^2}{1 - \beta_{ij4\#}^- + \beta_{ij5\$}^-} \end{array} \right)$$

Step 3(e): The total of the normalization scores should be calculated as follows.

$$\left(\begin{array}{l} \beta_{ij1\$}^+ = \frac{\beta_{ij1\$}^+(1 - \beta_{ij1\$}^+) + (\beta_{ij2\$}^+)^2}{1 - \beta_{ij1\$}^+ + \beta_{ij2\$}^+}, \beta_{ij2\$}^+ = \frac{\beta_{ij2\$}^+(1 - \beta_{ij2\$}^+) + (\beta_{ij3\$}^+)^2}{1 - \beta_{ij2\$}^+ + \beta_{ij3\$}^+}, \\ \beta_{ij3\$}^+ = \frac{\beta_{ij3\$}^+(1 - \beta_{ij3\$}^+) + (\beta_{ij4\$}^+)^2}{1 - \beta_{ij3\$}^+ + \beta_{ij4\$}^+} \\ \beta_{ij1\$}^- = \frac{\beta_{ij1\$}^-(1 - \beta_{ij1\$}^-) + (\beta_{ij2\$}^-)^2}{1 - \beta_{ij1\$}^- + \beta_{ij2\$}^-}, \beta_{ij2\$}^- = \frac{\beta_{ij2\$}^-(1 - \beta_{ij2\$}^-) + (\beta_{ij3\$}^-)^2}{1 - \beta_{ij2\$}^- + \beta_{ij3\$}^-}, \\ \beta_{ij3\$}^- = \frac{\beta_{ij3\$}^-(1 - \beta_{ij3\$}^-) + (\beta_{ij4\$}^-)^2}{1 - \beta_{ij3\$}^- + \beta_{ij4\$}^-} \end{array} \right)$$

Step 3(f): The total of the normalization scores should be calculated as follows.

$$\left(\begin{array}{l} \beta_{ij1\%}^+ = \frac{\beta_{ij1\$}^+(1 - \beta_{ij1\$}^+) + (\beta_{ij2\$}^+)^2}{1 - \beta_{ij1\$}^+ + \beta_{ij2\$}^+}, \beta_{ij2\%}^+ = \frac{\beta_{ij2\$}^+(1 - \beta_{ij2\$}^+) + (\beta_{ij3\$}^+)^2}{1 - \beta_{ij2\$}^+ + \beta_{ij3\$}^+}, \\ \beta_{ij1\%}^- = \frac{\beta_{ij1\$}^-(1 - \beta_{ij1\$}^-) + (\beta_{ij2\$}^-)^2}{1 - \beta_{ij1\$}^- + \beta_{ij2\$}^-}, \beta_{ij2\%}^- = \frac{\beta_{ij2\$}^-(1 - \beta_{ij2\$}^-) + (\beta_{ij3\$}^-)^2}{1 - \beta_{ij2\$}^- + \beta_{ij3\$}^-} \end{array} \right)$$

Step 3(g): The total of the normalization scores should be calculated as follows.

$$\left(\beta_{ij1\&}^+ = \frac{\beta_{ij1\%}^+(1 - \beta_{ij1\%}^+) + (\beta_{ij2\%}^+)^2}{1 - \beta_{ij1\%}^+ + \beta_{ij2\%}^+} \right) \left(\beta_{ij1\&}^- = \frac{\beta_{ij1\%}^-(1 - \beta_{ij1\%}^-) + (\beta_{ij2\%}^-)^2}{1 - \beta_{ij1\%}^- + \beta_{ij2\%}^-} \right)$$

Step 4: $B_p N_n F$ separating values.

$$(s_{ij}^+ = (\min(k_{ij}^+) + \beta_{ij1}^+ \times \Delta_{min}^{max})) (s_{ij}^- = (\min(k_{ij}^-) + \beta_{ij1}^- \times \Delta_{min}^{max}))$$

3.2 The proposed integration of $B_p N_n F$ -PSI with CoCoSo, MOORA, WASPAS

The methodologies that have been introduced simplify the examination of a particular subset of criteria and alternatives. Additionally, it provides versatile capabilities for managing both qualitative and quantitative data. The methodical assessment of all contradictory criteria is the focus of this investigation. The agreement among numerous options and criteria is demonstrated by the comprehensive validation of extensive data metrics.

3.2.1 Method $IB_p N_n F$ PSI-CoCoSo

The first proposed method consists of explicit steps like follows:

Step 1: Select from the available options and criteria. The suitable collection of options $\mathcal{P} = \{\mathcal{P}^1, \mathcal{P}^2, \dots, \mathcal{P}^m\}$ and criteria $\mathcal{S} = \{\mathcal{S}^1, \mathcal{S}^2, \dots, \mathcal{S}^n\}$ are formulated according to the opinions of the decision-makers $\mathcal{Q} = \{\mathcal{Q}^1, \mathcal{Q}^2, \dots, \mathcal{Q}^f\}$.

Step 2: The linguistic decision matrices are constructed from the perspective of the decision makers. The matrix clarifies the correlation between the different options and given criteria. The Linguistic converting scale was used to map the linguistic matrix into a bipolar nonagonal fuzzy matrix $B_p N_n FM$.

$$\mathcal{D}^M = [\mathcal{d}_{ij}^r] = \begin{pmatrix} \mathcal{d}_{11}^r & \dots & \mathcal{d}_{1n}^r \\ \vdots & \ddots & \vdots \\ \mathcal{d}_{m1}^r & \dots & \mathcal{d}_{mn}^r \end{pmatrix} \quad (1)$$

Where $\mathcal{D}^M = [\mathcal{d}_{ij}^r] = ((k_{ij}^+, l_{ij}^+, m_{ij}^+, n_{ij}^+, o_{ij}^+, p_{ij}^+, q_{ij}^+, r_{ij}^+, s_{ij}^+) (k_{ij}^-, l_{ij}^-, m_{ij}^-, n_{ij}^-, o_{ij}^-, p_{ij}^-, q_{ij}^-, r_{ij}^-, s_{ij}^-))$; where $i = 1, 2, \dots, m, j = 1, 2, \dots, n, r = 1, 2, \dots, f$.

Step 3: Construct the $B_p N_n FM$ results. The $B_p N_n FM$ are consolidated into a sole matrix, which integrates the performance of options and criteria from several decision matrices into a unified matrix.

$$\begin{aligned} k_{ij}^+ &= k_{ij}^- = \min(k_{ij}^r), l_{ij}^+ = l_{ij}^- = \min(l_{ij}^r), m_{ij}^+ = m_{ij}^- = \min(m_{ij}^r), n_{ij}^+ = n_{ij}^- = \min(n_{ij}^r), \\ o_{ij}^+ &= o_{ij}^- = \frac{1}{r}(o_{ij}^r), p_{ij}^+ = p_{ij}^- = \max(p_{ij}^r), q_{ij}^+ = q_{ij}^- = \max(q_{ij}^r), r_{ij}^+ = r_{ij}^- = \max(r_{ij}^r), \\ s_{ij}^+ &= s_{ij}^- = \max(s_{ij}^r) \end{aligned} \quad (2)$$

Step 4: Construct the defuzzified matrix using the proposed $CB_p N_n FCS$ algorithm, which is describe in subsection 3.1.

$$\mathfrak{N} = [n_{ij}] = \begin{pmatrix} n_{11} & \dots & n_{1n} \\ \vdots & \ddots & \vdots \\ n_{m1} & \dots & n_{mn} \end{pmatrix} \quad (3)$$

where $[n_{ij}] = (n_{ij}^+, n_{ij}^-); i = 1, 2, \dots, m, j = 1, 2, \dots, n$

Step 5: Normalization the bipolar decision matrix using the formula,

$$(\mathcal{E}_{ij}^+, \mathcal{E}_{ij}^-) = \left(\frac{e_{ij}^+}{e_{ij}^{+max}}, \frac{e_{ij}^-}{e_{ij}^{-max}} \right) \text{ for beneficial attribute. (4)}$$

$$(\mathcal{E}_{ij}^+, \mathcal{E}_{ij}^-) = \left(\frac{e_{ij}^{+min}}{e_{ij}^-}, \frac{e_{ij}^{-min}}{e_{ij}^-} \right) \text{ for non beneficial attribute. (5)}$$

where $i = 1, 2, \dots, m, j = 1, 2, \dots, n$,

Step 6: Compute bipolar preference variation value,

$$B^+ P v_j = \sum_{i=1}^N (\mathcal{E}_{ij}^+ - \mathcal{E}_j^+)^2 \quad (6)$$

where \mathcal{E}_j^+ is the mean of normalized value of attribute j and $\mathcal{E}_j^+ = \frac{1}{n} \sum_{i=1}^N \mathcal{E}_{ij}^+$

$$B^- P v_j = \sum_{i=1}^N (\mathcal{E}_{ij}^- - \mathcal{E}_j^-)^2 \quad (7)$$

where \mathcal{E}_j^- is the mean of normalized value of attribute j and $\mathcal{E}_j^- = \frac{1}{n} \sum_{i=1}^N \mathcal{E}_{ij}^-$

Step 7: Determine bipolar weight of overall preference ,

$$(\psi_j^+, \psi_j^-) = \left(\frac{Q_j^+}{\sum_{j=1}^m Q_j^+}, \frac{Q_j^-}{\sum_{j=1}^m Q_j^-} \right) \quad (8)$$

where $(Q_j^+, Q_j^-) = ((1 - B^+ P v_j), (1 - B^- P v_j))$

Step 8: Normalized the bipolar defuzzied matrix using the formula:

$$(c_{ij}^+, c_{ij}^-) = \left(\frac{z_{ij}^+ - \min z_{ij}^+}{\max z_{ij}^+ - \min z_{ij}^+}, \frac{z_{ij}^- - \min z_{ij}^-}{\max z_{ij}^- - \min z_{ij}^-} \right) \text{for beneficial attribute.} \quad (9)$$

$$(c_{ij}^+, c_{ij}^-) = \left(\frac{\max z_{ij}^+ - z_{ij}^+}{\max z_{ij}^+ - \min z_{ij}^+}, \frac{\max z_{ij}^- - z_{ij}^-}{\max z_{ij}^- - \min z_{ij}^-} \right) \text{for non beneficial attribute.} \quad (10)$$

Where $i = 1, 2, \dots, m, j = 1, 2, \dots, n$,

Step 9: The bipolar of the overall weighted comparability sequence and the bipolar of the power weight of the comparability sequences for each option are as follows (Z_i^+, Z_i^-) and (Y_i^+, Y_i^-) ,

$$(Z_i^+, Z_i^-) = (\sum_{j=1}^m \dot{W}_j c_{ij}^+, (\sum_{j=1}^m \dot{W}_j c_{ij}^-)) \quad (11)$$

$$(Y_i^+, Y_i^-) = (\sum_{j=1}^n c_{ij}^+ \dot{W}_j, (\sum_{j=1}^n c_{ij}^- \dot{W}_j)) \quad (12)$$

Where $i = 1, 2, \dots, m, j = 1, 2, \dots, n$,

Step 10: The relative weights of the options are calculated using the aggregation algorithms described below. In this stage, three bipolar appraisal score procedures are employed to establish relative weights for additional options, which are derived using Formulas (13)– (15):

$$(K_{ia}^+, K_{ia}^-) = \left(\frac{Y_i^+ + Z_i^+}{\sum_{j=1}^m (Y_j^+ + Z_j^+)}, \frac{Y_i^- + Z_i^-}{\sum_{j=1}^m (Y_j^- + Z_j^-)} \right) \quad (13)$$

$$(K_{ib}^+, K_{ib}^-) = \left(\frac{Z_i^+}{\min Z_i^+} + \frac{Y_i^+}{\min Y_i^+}, \frac{Z_i^-}{\min Z_i^-} + \frac{Y_i^-}{\min Y_i^-} \right) \quad (14)$$

$$(K_{ic}^+, K_{ic}^-) = \left(\frac{\lambda Z_i^+ + (1-\lambda) Y_i^+}{\lambda \max Z_i^+ + (1-\lambda) \max Y_i^+}, \frac{\lambda Z_i^- + (1-\lambda) Y_i^-}{\lambda \max Z_i^- + (1-\lambda) \max Y_i^-} \right) \quad 0 \leq \lambda \leq 1 \quad (15)$$

Step 11: To calculate the value (K_i^+, K_i^-) using the value (K_{ia}^+, K_{ia}^-) , (K_{ib}^+, K_{ib}^-) and (K_{ic}^+, K_{ic}^-)

$$(K_i^+, K_i^-) = \left(\left((K_{ia}^+ K_{ib}^+ K_{ic}^+)^{\frac{1}{3}} + \frac{1}{3} (K_{ia}^+ + K_{ib}^+ + K_{ic}^+) \right), \left((K_{ia}^- K_{ib}^- K_{ic}^-)^{\frac{1}{3}} + \frac{1}{3} (K_{ia}^- + K_{ib}^- + K_{ic}^-) \right) \right) \quad (16)$$

Step 12: The final score of each alternative is obtained using this Equation (17)

$$\mathcal{K}_i = \left(\frac{1 + K_i^+ K_i^-}{2} \right) \quad (17)$$

Establish the rank order of the options.

3.2.2 Method II: $B_p N_n F$ PSI-MOORA:

Using the first seven step are the same as section 3.2.1.

Step 8: Normalized bipolar decision matrix:

$$(X_{ij}^+, X_{ij}^-) = \left(\frac{x_{ij}^+}{(\sum_{j=1}^m x_{ij}^{+2})^{\frac{1}{2}}}, \frac{x_{ij}^-}{(\sum_{j=1}^m x_{ij}^{-2})^{\frac{1}{2}}} \right) \quad (18)$$

Where $(i = 1, 2, \dots, m, j = 1, 2, \dots, n)$.

Step 9: Compute the equation for bipolar estimate of assessment values.,

$$(\mathcal{A}_i^+, \mathcal{A}_i^-) = \left(\frac{\sum_{j=1}^l \psi_j^+ (X_{ij}^+) - \sum_{j=l+1}^n \psi_j^+ (X_{ij}^+)}{\sum_{j=1}^l \psi_j^- (X_{ij}^-) - \sum_{j=l+1}^n \psi_j^- (X_{ij}^-)} \right), j = 1, 2, \dots, n. \quad (19)$$

Step 10: Using this Equation, the ultimate score of each possibility is calculated.

$$\mathcal{A}_i = \left(\frac{1 + \mathcal{A}_i^+ - \mathcal{A}_i^-}{2} \right) \quad (20)$$

Establish the rank order of the options.

3.2.3 Method III: $B_P N_n F$ PSI -WASPAS:

Using the first seven step are the same as section 3.2.1.

Step 8: Determine the overall significance by calculating the bipolar total relative importance for weight sum model,

$$\left(\mathbb{Q}_i^{B_P^+ WSM}, \mathbb{Q}_i^{B_P^- WSM} \right) = \left(\sum_{j=1}^n \mathcal{W}_j^+ \mathbb{Q}_{ij}^+, \sum_{j=1}^n \mathcal{W}_j^- \mathbb{Q}_{ij}^- \right) \quad (21)$$

Step 9: Determine the overall significance by calculating the bipolar total relative importance for weight product model,

$$\left(\mathbb{Q}_i^{B_P^+ WPM}, \mathbb{Q}_i^{B_P^- WPM} \right) = \left(\prod_{j=1}^n \mathbb{Q}_{ij}^{+\mathcal{W}_j^+}, \prod_{j=1}^n \mathbb{Q}_{ij}^{-\mathcal{W}_j^-} \right) \quad (22)$$

Step 10: Calculate the bipolar preference score value obtained by below formula

$$\left(\mathbb{Q}_i^{B_P^+}, \mathbb{Q}_i^{B_P^-} \right) = \left(\frac{\left(\lambda \mathbb{Q}_i^{B_P^+ WSM} + (1 - \lambda) \mathbb{Q}_i^{B_P^+ WPM} \right)}{\left(\lambda \mathbb{Q}_i^{B_P^- WSM} + (1 - \lambda) \mathbb{Q}_i^{B_P^- WPM} \right)} \right) 0 \leq \lambda \leq 1 \quad (23)$$

Step 11: This Equation is used to determine the ultimate score of each possibility

$$\mathbb{Q}_i = \left(\frac{1 + \mathbb{Q}_i^{B_P^+} - \mathbb{Q}_i^{B_P^-}}{2} \right) \quad (24)$$

Establish the rank order of the options.

4. Illustration of medical diagnosis in liver problem using numerical data

This section focuses on the application of the $B_P N_n F$ PSI-CoCoSo, $B_P N_n F$ PSI-MOORA and $B_P N_n F$ PSI -WASPAS approach in the medical diagnosis of liver disorders. Liver-related diseases encompass a wide range of disorders that affect the structure or function of the liver, such as hepatitis, cirrhosis, fatty liver disease, and liver cancer. The model that utilizes the specified collection of linguistic values is chosen exclusively for the purpose of providing precise illustrations.

4.1 Method $B_P N_n F$ PSI-CoCoSo

Step 1: To identify patients in critical stages of liver disorders, five patients were chosen as alternatives: \mathcal{P}^1 =Patient 1; \mathcal{P}^2 = Patient 2; \mathcal{P}^3 =Patient 3; \mathcal{P}^4 =Patient 4; \mathcal{P}^5 =Patient 5. The options are evaluated based on a certain established set of criteria are \mathcal{S}^1 = Jaundice; \mathcal{S}^2 = Ascites; \mathcal{S}^3 = Hepatomegaly; \mathcal{S}^4 = Fatigue; \mathcal{S}^5 = Abnormal Liver Enzymes are recommended by decision makers $\mathcal{Q} = \{\mathcal{Q}^1, \mathcal{Q}^2, \mathcal{Q}^3\}$ and Fig 1. Alternatives and Criteria.

Step 2: The Linguistic converting scale was used to map the linguistic matrix into a bipolar nonagonal fuzzy matrix $B_P N_n FM$. Consolidate the $B_P N_n FM$ results into a single matrix, which integrates the performance of options and criteria from several decision matrices illustrated in the Equation (1) and (2). Table 1 represents the Linguistic decision matrices and Table 2 represents the linguistic variables $B_P N_n FN$.

Step 3: The $B_P N_n FM$ is transformed into a defuzzified matrix using $CB_P N_n FM$ algorithm, and the $B_P N_n FM$ is converted into a crisp number, the value give in table 3

Step 4: Normalized the bipolar defuzzified matrix using the formula (9) and (10). The bipolar of the overall weighted comparability sequence and the bipolar of the power weight of the comparability sequences for each option are as follows (Z_i^+, Z_i^-) and (Y_i^+, Y_i^-) using the equation (11) and (12). The bipolar weight is calculating the $B_P N_n F$ PSI using the equation (8) the value represents in table 4.

Sivakumar and Sivakavitha

Step 5: Bipolar aggregation of appraisal score strategies (13), (14) and (15) and $\lambda = 0.5$. Then get the value of (K_{ia}^+, K_{ia}^-) , (K_{ib}^+, K_{ib}^-) , (K_{ic}^+, K_{ic}^-) . We apply these values in equation (16) we find (K_i^+, K_i^-)

Step 6: To categorize the possibilities, organize them in order of descending based on their numerical values of Equation (17) and find the final outcome of $B_p N_n F$ PSI-CoCoSo are represented in Table 5.

4.2 Method II $B_p N_n F$ PSI-MOORA:

The first 3 steps are the same as the method I.

Step 4: Normalize bipolar decision matrix for $B_p N_n F$ PSI-MOORA method using the equation (18) and evaluate the equation for estimation of assessment values using the equation (19)

Step 5: To categorize the possibilities, organize them in order of descending based on their numerical values of Equation (20) and find the final outcome of $B_p N_n F$ PSI-MOORA. Table 6 represents ranking of $B_p N_n F$ PSI-MOORA and Figure 3 represents the final score of $B_p N_n F$ PSI-MOORA method.

4.3 Method III $B_p N_n F$ PSI-WASPAS:

The first 3 steps are the same as the method I.

Step 4: Normalize bipolar decision matrix for $B_p N_n F$ PSI-WASPAS and Determine the overall significance by calculating the bipolar total relative importance for weight sum model using the equation (21).

Step 5: Determine the overall significance by calculating the bipolar total relative importance for weight product model using the equation (22) and calculate the bipolar preference score value obtained using the equation (23).

Step 6: To categorize the possibilities, organize them in order of descending based on their numerical values of Equation (24) and find the final outcome of $B_p N_n F$ PSI-WASPAS. Table 7 represents ranking of $B_p N_n F$ PSI-WASPAS and Figure 4 represents the final score of $B_p N_n F$ PSI-WASPAS method.

CONCLUSION

The goal of this study is to develop an integrated $B_p N_n F$ -PSI with $B_p N_n F$ -CoCoSo and $B_p N_n F$ -MOORA and $B_p N_n F$ -WASPAS to investigate the symptoms of jaundice, ascites, hepatomegaly, fatigue, and abnormal liver enzymes in five individuals with liver disorders. Upon careful examination of the final outcome of the fuzzy integrated MCDM method approach, it has been determined that patient 1 is in a critical phase of liver disease. Further investigation is required to determine the most ideal and accurate results obtained from the test used for diagnosing liver disorders.

ABSTRACT

Dermatoglyphics, the study of the patterns of ridges on the fingers and palms, has been explored as a non-invasive method to predict genetic predispositions to various diseases, including periodontitis. Periodontitis is a multifactorial, inflammatory disease affecting the supporting structures of the teeth, leading to progressive destruction of the periodontal ligament and alveolar bone. Research suggests a potential correlation between dermatoglyphic patterns and susceptibility to periodontitis, as both are influenced by genetic factors. Dermatoglyphic markers, such as increased whorl patterns and altered ridge counts, have been observed more frequently in individuals with periodontitis, indicating a possible genetic predisposition. This study aims to establish the relationship between dermatoglyphics and periodontitis, emphasizing the potential of dermatoglyphic analysis as a predictive tool for early detection and risk assessment in periodontal disease. Though further studies are necessary to elucidate the genetic links and validate dermatoglyphics as a reliable biomarker for periodontitis.

Keywords: Research suggests a potential correlation between dermatoglyphic patterns and susceptibility to periodontitis, as both are influenced by genetic factors.

Niket Bhatt *et al.*,

INTRODUCTION

Periodontal disease is a chronic inflammatory disease that encompasses a range of inflammatory conditions affecting the supporting structures of the teeth. It progresses from gingivitis, a mild form of gum inflammation, to periodontitis, which can lead to tooth loss if untreated. Early detection and intervention are crucial for managing periodontal disease effectively. Dermatoglyphics is the scientific study of the patterns of ridges and lines seen on the skin of human palms, toes, fingers, and soles. The term is derived from the Greek word's "derma" meaning skin, and "glyph" meaning carving. These patterns, which include loops, whorls, and arches, are formed during fetal development and are unique to each individual, remaining unchanged throughout a person's life. Cummins and Midlo (1926) were the first to coin the term dermatoglyphics(1). Toward the close of the 19th century, Galton proposed a principle known as the "proof of no change," which asserts that a person's fingerprints remain constant throughout their life. (2). Due to their one of a kind nature, examining them can decide a number of parameters, which may well be supportive in diagnosing and treatment of inspected individuals(3). Hence, it is an critical apparatus in surveying the hereditary trait, testing of children with suspected hereditary clutters conjointly in forensics.

In 1892, Galton classified the basic fingerprint patterns of three types: arches, loops, and whorls.(4) Additionally, the palm of a human exhibits features such as the ATD angle, which is made of the lines connecting –

- A - the digital triradius
- T - the axial triradius
- D - axial triradius to the digital triradius

Other features include the H-loop, IV loop, and triradii, which are points where three ridge regions converge (5) Loops, the most common pattern, are characterized by ridges that enter from one side, create a loop, and exit from the same side. Whorls have circular or spiral patterns, while arches are the simplest, with ridges entering from one side and exiting from the opposite side without forming a loop. FIG :1Blood groups, primarily the ABO and Rh systems, are based on red blood cells and the presence of specific antigens. These antigens are genetically inherited and have been linked to various systemic conditions, including susceptibility to infections and certain diseases. Dermatoglyphics has gained attention in dentistry for its use in detecting oral diseases and disorders such as oral cancer, malocclusion, bruxism dental caries, tooth anomalies, cleft palate, cleft lip,periodontal disease, dental fluorosis, and for aiding forensic odontology in uncovering the truth. (6). Researchers have investigated the potential correlation between dermatoglyphic patterns, blood groups, and periodontal status. The hypothesis is that certain genetic markers reflected in dermatoglyphic patterns and blood groups might be associated with susceptibility to periodontal disease. The present short study was conducted to find a correlation between blood groups, dermatoglyphic patterns, and periodontal status.

Types of fingertip patterns

In 1892, Sir Francis Galton published his influential book, "Finger Prints," in which he introduced a system for classifying fingerprints based on the number of triradii, the points where three ridge lines converge. Galton's system identified three primary fingerprint patterns: arches, loops, and whorls. Arches, the simplest pattern, featuring ridges that enter from one side of the finger, rise in the center forming an arch, and exit on the opposite side without looping back. They do not contain any triradii. Loops are apropos to ridges that from one side of the finger, loop around, and exit on the same side from which they entered. Each loop pattern contains one triradius. Whorls are more complex patterns, with ridges that form circular or spiral shapes. Whorls typically have two triradii, one on either side of the pattern. Galton's work laid the foundation for the modern study of dermatoglyphics, providing a systematic approach to analyzing and classifying fingerprint patterns, which has since become a crucial tool in fields such as forensic science and personal identification. (7, 8). (Fig:2) Fig2: Galton's types of fingerprints and the lines indicating method for counting ridges. (9)

MATERIAL AND METHODS

This study was conducted in the outpatient periodontics department, involving 45 patients aged between 18 and 45 years. Participants were informed about the study details and provided their consent. The patients were categorized into three groups, each containing 15 individuals:

- Group I - Healthy control group
- Group II – Gingivitis Patients
- Group III - Chronic Periodontitis Patients

Exclusion criteria included the presence of systemic diseases and the absence of a digit. Periodontitis was evaluated using a probing pocket depth (PPD) of ≥ 5 mm and Russel's periodontal index. A comprehensive case history was recorded for each participant. During the investigation, the blood groups of all participants were determined through laboratory testing. Dermatoglyphic patterns were recorded using the standard ink method. Participants were instructed to clean their hands thoroughly to remove impurities, and spirit was used to eliminate any remaining oil and dirt. Duplicating ink was then applied to capture the fingerprints, which were subsequently examined with a magnifying lens. The patterns were classified into arches, loops, and whorls, and the periodontal status of each participant was recorded. It was found that among gingivitis, the highest prevalence was seen for whorl pattern with 43% (n=13) and lowest for loop pattern with 27% (n=08). Among periodontitis, the highest prevalence was seen for arch pattern with 47% (n=14) and lowest for whorl pattern with 23% (n=07). Among healthy controls, the highest prevalence was seen for arch pattern with 50% (n=15) and lowest for whorl pattern with 20% (n=06) ($p < 0.05^*$). (Table 1) Table 1: comparison between different patterns of thumb prints among patients with gingivitis, periodontitis and healthy controls. Among gingivitis patients with 30 thumb prints, A+ve, A-ve, B+ve, O+ve, O-ve and AB+ve were 0,6,18,4,0 and 2 respectively.

Among periodontitis patients with 30 thumb prints, A+ve, A-ve, B+ve, O+ve, O-ve and AB+ve were 10, 0, 12, 8, 0 and 0 respectively. Among healthy patients with 30 thumb prints, A+ve, A-ve, B+ve, O+ve, O-ve and AB+ve were 4,0,12,8,2 and 4 respectively. A statistically significant difference was observed between periodontal conditions and blood groups ($p < 0.05$). (Table 2 , Graph 1) Table 2 : comparison between periodontal status and blood groups Graph 1 : Comparison between periodontal status and blood groups On examination of gingivitis patients (n=15) with 30 thumb prints, loop, whorl and arch were 8, 13 and 9 respectively. On correlating this with various blood groups, it was found that for loop, A-ve, B+ve, AB+ve and O+ve the frequency observed were 2,4,2,0 while for whorl it was 2,2,0,9 and for arch it was 2,5,0 and 2. A significant difference was observed between thumb prints and blood groups ($p < 0.05$). (Table 3 ,Graph 2) Table 3 : Relationship between gingivitis ,Thumb prints and blood groups Graph 2 : Relationship between gingivitis ,Thumb prints and blood groups On examination of periodontitis patients (n=15) with 30 thumb prints, loop, whorl and arch were 9, 7 and 14 respectively. On correlating this with various blood groups, it was found that for loop, A+ve, B+ve and O+ve the frequency observed were 3,4, and 2 while for whorl it was 3,3, and 1 and for arch it was 4,7 and 3. A statistically non- significant difference was observed between thumb prints and blood groups ($p > 0.05$). (Table 4, Graph 3) Table 4: Relationship between periodontitis ,thumb prints and Blood groups Graph 3 : Relationship between periodontitis , thumb prints and Blood groups On examination of healthy patients (n=15) with 30 thumb prints, loop, whorl and arch were 9, 6 and 15 respectively. On correlating this with various blood groups, it was found that for loop, B+ve, O-ve, A+ve, AB+ve and O+ve the frequency observed were 3,1,1,1,3 while for whorl it was 1,0,3,2,0 and for arch it was 6,1,1,3,4. A statistically non- significant difference was observed between thumb prints and blood groups ($p > 0.05$). DISCUSSION

Dermatoglyphics, the study of the patterns of ridges on the fingers, palms, toes, and soles, has been considered as a potential diagnostic tool for various medical conditions due to its genetic basis. Blood groups, determined by the

**Niket Bhatt et al.,**

presence or absence of specific antigens on the surface of red blood cells, also have a genetic basis. The correlation between dermatoglyphics and blood groups and their potential use as diagnostic tools for periodontal status is an intriguing area of research. Therefore, the present study was conducted to find the association of periodontal status with ABO blood group and dermatoglyphics. Several studies have explored the relationship between dermatoglyphic patterns and periodontal disease, Kavitha *et al.* (2014)** conducted a study that found a significant association between specific dermatoglyphic patterns and periodontal disease. They observed that individuals with whorl patterns were more prone to periodontitis(10).Reddy *et al.* (2011) found that patients with periodontitis had a higher frequency of loops and arches compared to those without the disease, suggesting a potential genetic predisposition(11).The results of the present study showed higher frequency of Arches in periodontitis patients and higher frequency of Whorls in Gingivitis patients. Yilmaz *et al.* conducted a study in 1993 to examine the function of dermatoglyphics in periodontal disease. The study involved 70 patients, including 20 adults with periodontitis, 20 with early onset periodontitis cases, and 20 periodontally healthy patients. The study examined the quantitative and qualitative patterns of ridged skin. They verified that genetics plays a part in the etiopathogenesis of periodontal disorders. It was the first study in which role of dermatoglyphics in periodontal study was observed(12). Research has indicated potential links between blood groups and susceptibility to periodontal disease, Demir *et al.* (2007) found that individuals with blood group O had a higher prevalence of periodontitis compared to other blood groups(13). Nikolopoulos *et al.* (2012) reported that blood group B was associated with a higher risk of aggressive periodontitis(14). In the present study statistically significant difference was observed between periodontal conditions and blood groups. Blood group B had a higher prevalence of periodontitis as compared to the other blood groups.

CONCLUSION

The correlation of dermatoglyphics and blood groups with periodontal status holds a promising non-invasive diagnostic tool. However, more research is needed to establish these correlations and develop practical applications. If successful, this approach could enhance early detection and personalized treatment of periodontal disease, ultimately improving patient outcomes.

ABSTRACT

Since benzothiazole derivatives have a wide range of pharmacological activities, there has been a lot of interest in their development and research in recent years. It has been discovered that substances based on benzothiazoles are useful in the treatment of a number of illnesses, such as cancer, bacterial infections, depression, and cardiovascular disorders. There has been a lot of research done on the synthesis of benzothiazole derivatives, and various synthetic techniques have been developed to obtain these compounds. Antitumor, antibiotic, antifungal, antimicrobial, antidepressant, HIV-1 protease inhibitory, and antiarteriosclerosis properties are just a few of the many biological activities demonstrated by benzothiazole derivatives. Research into the pharmacological characteristics of benzothiazole derivatives is still an exciting field with the possibility of finding novel medications and treatments. An extensive summary of the synthesis and biological activities of benzothiazole and its derivatives is given in the current review. It is anticipated that this review will stimulate more study and development of benzothiazole-based compounds with improved pharmacological properties. It will also be a valuable resource for researchers in the fields of synthetic chemistry and drug discovery.

Keywords: Benzothiazole, Pharmacological activities, Heterocyclics.

INTRODUCTION

The wide range of physiological functions exhibited by heterocyclic compounds, like benzothiazole, makes them extremely important in organic chemistry and drug discovery.¹ A lot of research has been done on the possible biological activities of benzothiazole and its derivatives. A study on the muscle-relaxing potential of benzothiazole derivatives, specifically 2-aminobenzothiazoles, was conducted in the 1950s. Ever since, a variety of pharmacological actions, such as antibacterial, anti-inflammatory, analgesic, anticonvulsant, antidepressant, antiviral, anthelmintic, antioxidant, and anticancer properties, have been discovered in benzothiazole analogues. Benzothiazole analogues can be made in a number of ways. One popular method is the condensation process, which forms benzothiazole derivatives by reacting acyl chlorides, carboxylic acids, esters, nitriles, and o-aminothiophenols with substituted aldehydes. The cyclization of o-halothioformanilide by Pd/Cu/Mn/chloranil is another common technique. The creation of a wide range of benzothiazole derivatives with various structural variations and pharmacological effects has been made possible by these synthetic techniques. Benzothiazole compounds and their derivatives are still being studied for their potential uses and other characteristics.

Pharmacological Activities

Anticancer activity

To create novel lead compounds for the treatment of different types of cancer, a thorough investigation into the benzothiazole chain systems was carried out.^[1] A variant of 2-(4-aminophenyl) benzothiazole in which alkyl, hydroxy, cyano, and alkoxy groups have been substituted shown to possess anticancer properties in vitro. The compound containing –CH₃ substitution (1.a) exhibited highly effective development restriction or suppression towards cancers classified as ER+ (MCF-7 and BO) and ER- (MT-1 and MT-2).^[2,3]

The ability to combat cancer in MCF-7 and HeLa cell lines was discovered after a series of benzothiazole derivatives with a 2-thiourea substitution were synthesized.

Samiksha Kumbhare *et al.*,

The most effective activity was shown by molecules with derivatives of the thiourea-benzothiazole replaced with thiophene or morpholine, which enhanced apoptosis by activating the caspase-3 signaling. This research was based on studies conducted by two different research groups to investigate benzothiazole's interactions and the thiourea moiety upon the topoisomerases enzyme I and II.^[4] The same group of scientists synthesized the substituted 2-aminobenzothiazole's 4'-thiazolidinyl metabolites.

**Samiksha Kumbhare et al.,**

The moiety of 4-thiazolidinone was the basis for a previous investigation used for this study. [5,6] The antitumor efficaciousness of the synthesized compounds is examined in a number of cancerous cellular lines (tumors of the central nervous system, ovaries, kidney, lungs, colonic, leukemia, and chest tumors). 4-Chlorophenoxy-N-(4-methoxyphenyl)-acetamide demonstrated the most notable action against all of the cell lines.[7] This research revealed the importance of the hybridized design phase for a novel molecule involving benzothiazole derivatives for cancer treatment. "

Antibacterial Activity

synthesized, and its antifungal and antibacterial activity against *E. coli*, *S. aureus*, and *B. subtilis* was assessed. [8] It demonstrated antimicrobial properties and mild antifungal properties against *Candida albicans* and *Aspergillus niger*. proved to possess the strongest antimicrobial properties, and as a result, it was followed by additional substances that were very successful against all of the bacterial species that were looked at. The antimicrobial activities of *E. coli* dihydro-orotase were investigated in order to further evaluate the docking data obtained for antibiotic properties. Large H-bonding network formed by the basic ligand HDDP, HIS254, ARG20, ASN44, LEU222, ALA266, and HIS139. One H-bond forms along with the branch chains of LEU222 when the phenol grouping, which is present in the cavity containing HDDP, is introduced. [35] Likewise, resulted in the formation of an H-bond between the oxygen from the methoxy group and the internal chain of ALA266. Furthermore, the naphthalene ring also forms Hydrophobic contacts THR143, GLU141, and PRO105 are located close to the catalytic *E. coli* dihydro-orotase cavity.

It was somewhat effective against the tested strains of bacteria.[9] Not much research has been done on the antibacterial qualities of benzothiazole derivatives against bacteria and fungi that are infectious. Compound 11 methyl-benzothiazole interacts with CYS221, CYS256, and ARG258 branches chains in a significant way. A lower predicted docking score is caused by the loss of H-bonds when hydrogen is joined to the receptor during the few groups that could act as donors or receptors. Moreover, the transition state of the enzyme is impacted by stacking compound 11 with HIS254, which led to a decrease in activity.

Samiksha Kumbhare *et al.*,

The benzothiazole-based bactericidal agents were linked to different types of bacteria and act as enzyme inhibitors for essential bacterial cell activities such as DNA replication, cell differentiation, and the synthesis of cell walls or the biogenesis of required compounds.[10] Dihydroorotase inhibition has been the subject of numerous articles examining both Gram-ve and Gram+ bacterial species, demonstrating its utility as a target for the synthesis of antimicrobial medications.[11,12]

Antifungal Activity

A number of 4-(2'-substituted benzothiazoles and several 2-substituted benzothiazoles 5-mercapto-3-(modified)Analogues of -1,2,4-triazole were prepared and tested for their ability to inhibit *E. coli* and *S. aureus* bacteria as well as *C. albicans* and *A. niger* fungus.[13] For both activities, the majority of drugs showed positive results.

Antiviral Activity

HIV-1 protease was found to be inhibited by novel benzothiazole sulphonamides (compounds 15 and 16), with an IC₅₀ value of 1-3 nM.^[14] More powerful antiviral and HIV-1 protease inhibitors have been demonstrated for the carbamate equivalents. It was determined how effective the newly substituted 2-pyrimidylbenzothiazoles were against viruses by looking at their sulphonamide moiety, which is the amino compound located right at the C2 of the pyrimidine ring. Michael addition was used to combine guanidine or N-arylsulfonated guanidine with a number of yliden benzothiazole derivatives to create the novel ring structure.

Anti-inflammatory Activity

In order to treat inflammation, several novel benzothiazoles were prepared, including 2-(4'-butyl-3',5'-dimethylpyrazol-1'-yl)with 4-butyl-1-(6'-substituted-2'-benzothiazolyl) benzothiazoles with a 6-substitution. It was discovered that compound, 18 had a strong anti-inflammatory effect [15,16]

Benzothiazole-based anti-inflammatory medications were created and their potential to lower inflammation was evaluated using a novel 2-amino-benzothiazole derivative. When the 2-amino benzothiazole was substituted at positions 4 or 5 with an electron-withdrawing group, such as -Cl, -NO₂, or -OCH₃, it was found that the anti-inflammatory activity was significantly increased.[17]

Antitubercular Activity

It was found to possess significant *in vitro* antitubercular activity against *Mycobacterium tuberculosis*.

Samiksha Kumbhare et al.,

The antitubercular activity of 6-nitro-2-[4-formyl-3-(phenyl substituted) pyrazolyl] benzothiazoles against the H37RV strain of *Mycobacterium tuberculosis* was synthesized and examined. Benzothiazoles (compound 21) showed the most promising activity in antitubercular screens [18]

R = H, OH, Br, NO₂, OCH₃, OH, Cl, F, CH₃, di-OCH₃

The antimycobacterial activity of derivatives of adamantanyl benzothiazoles was demonstrated in an updated patent.[19,20] Among these, it was found to be isoniazid-equivalent, with a MIC₉₀ of 0.03 g/ml against H37Rv.

mycobacterium tuberculosis has shown good growth inhibition from the series, with a minimum inhibitory concentration of 224 nM. The MIC for the nitrofuranyl-benzothiazole hydrazones as an antitubercular medication was greater than 16 g/ml.

Samiksha Kumbhare *et al.*,**Anti-oxidant Activity**

A variety of compounds, including benzothiazole analogues and arylbenzimidazoles, including benzofuranhydrazones, benzimidazolidrazones, and indole-hydrazones, were synthesized and tested for their antitumor and antioxidant properties.^[21] Together with favorable photoprotective or antitumor activity profiles, these compounds demonstrated potent antioxidant properties. In particular, they showed an IC₅₀ of 9.7 µM against human melanoma cells, as well as 2 g/ml IC₅₀ levels against the investigated dermatophytes and good in vitro antioxidant activity in DPPH and FRAP tests.

Lead Compound

Antidiabetic Activity

Benzothiazole derivatives have been shown to have antidiabetic properties, and further application of the benzothiazole core may result in the creation of safe antidiabetic medications.^[22] One of the primary targets of the newest anti-diabetic drugs is the enzyme adenosine-5'-monophosphate activated protein kinase (AMPK). 2-(hydroxy-5-((Z)-((E)-((4,5-dimethyl-2-nitrophenyl)furan-2-yl)methylene)AMPK enzyme auto-inhibition is reduced by PT-1 (-4-oxothiazolidin-2-ylidene)benzoic acid. Several benzothiazoles with comparable structures made it easier for L6 myocytes to absorb glucose using an AMPK-dependent method. High glucose absorption speed was demonstrated by 2-(Benzo[d]thiazol-2-ylmethylthio)-6-ethoxybenzo[d]thiazol.^[23]

CONCLUSION

The variety of biological functions and synthetic routes of benzothiazoles are highlighted in the recent literature. Many biological activities are displayed by the benzothiazole core, such as antibacterial, anticancer, anti-inflammatory, antidepressant, and antidiabetic effects. Because of their inherent range of activities, benzothiazole derivatives have emerged as a promising field for the discovery of new lead molecules. The discovery of the aldose reductase inhibitor Zopolrestat has made it possible to investigate the potential medical uses of benzothiazoles. Certain benzothiazole derivatives have demonstrated activity that is either on par with or better than current standard drugs, suggesting that they have promise as therapeutic agents. This implies that products derived from benzothiazoles may be the basis of soon-to-be-marketed treatments.

ABSTRACT

A traditional Siddha herbo-mineral formulation called Bavana Kadukkai Mathirai (BVK) is thought to provide a host of health advantages, such as rejuvenation and disease prevention. This study uses *in-vitro* assays to assess BVK's antioxidant capacity. To evaluate BVK's capacity to scavenge free radicals, we used four distinct assays: DPPH, ABTS, Nitric Oxide, and Hydrogen Peroxide Radical Scavenging. The findings showed that antioxidant activity increased in all experiments in a dose-dependent manner. With 93.08% inhibition at 1 mg, BVK showed significant antioxidant activity in the DPPH assay, on par with common antioxidants as Trolox and ascorbic acid. Moderate antioxidant effects were found in the ABTS, Nitric Oxide, and Hydrogen Peroxide assays; at the maximum dose, BVK showed inhibition values of 78.09%, 31.91%, and 49.48%, respectively. These findings suggest that BVK has a lot of antioxidant potential, particularly in eliminating DPPH radicals, making it a viable natural antioxidant source. More research is required to learn more about its methods of action and possible therapeutic uses.

Keywords: Siddha medicine, Bavanakadukkai, Kayakarpam, Antioxidant, Internal Medicine.

INTRODUCTION

The Siddha medical system, which is well known in Southern India, offers a distinctive method of approaching health care by providing a comprehensive range of treatments and cures that are outlined throughout Siddha literature for a variety of disorders. Kayakarpam is one of these, and it is an important medication that tries to either increase longevity or avoid mortality. In Siddha terminology, the word "Kaya" refers to the body, and the word "Karpam" suggests a strength that is comparable to that of a stone. The Siddhar sage Thirumoolar, who believed that rejuvenation was a step towards salvation, underlined the fact that this therapy places an emphasis on rejuvenation and that it advocates for the purification of the soul through the preservation of the body. In the Siddha literature, 4,448 different disorders are discussed. These diseases treated using 32 different internal and 32 different external medicinal categories. Kayakarpam is a notable component of this system. In Siddha literature, particularly the Siddha Formulary of India, Part 1, the formulation known as Bavana Kadukkai is noted for its possible anti-aging and health advantages. This formulation is considered to be one of the notable Kayakarpam formulations. (1-2) Antioxidants are substances that protect cells from oxidative damage by neutralizing damaging free radicals. (3) As a result, they reduce the chance of developing chronic diseases. Because of their ability to scavenge free radicals at the biochemical level, these chemicals, which include vitamins C and E, beta-carotene, and polyphenols, play an important part in rejuvenating therapies. They contribute to the preservation of cellular health and delay the consequences of aging. (4-6) Biological free radicals are highly unstable molecules that have electrons available to react with various organic substrates such as lipids, proteins, and DNA might hasten the aging process and contribute to the development of chronic diseases. (7-8) The body possesses its antioxidant defenses, which consist of enzymes like glutathione peroxidase, catalase, and superoxide dismutase, among others. (9-10) On the other hand, environmental contaminants and lifestyle variables have the potential to overwhelm these systems, highlighting the significance of dietary antioxidants in the maintenance of cellular health and the support of the rejuvenative processes of the body, as Siddha medicine emphasizes. (11-13) This research was conducted to determine the antioxidant capacity of *Bavana Kadukkai Mathirai* by employing an in-vitro model and conducting several different assays.

MATERIALS AND METHODS

Collection and Authentication of Raw Drugs

The raw materials for Bavana Kadukkai were sourced from "Rajendra herbals in Thakkalai, Kanyakumari, Tamil Nadu, India" and were authenticated by a medicinal botanist and the Gunapadam faculty at the "National Institute of Siddha, Chennai."

Ingredients of *Bavanakadukkai Mathirai*

The ingredients of *Bavanakadukkai Mathirai*, as noted in Table 1

Purification

We weighed and purified the raw drug by removing sand, dust particles, small sticks, and other impurities (14-15).

Preparation of *Bavana Kadukkai*

Kadukkai was soaked in *kazhuneer* for three days, and this process was repeated twice with fresh *kazhuneer* over nine days. After soaking, the *Kadukkai* was washed with water, and the seeds were removed. The purified *Kadukkai* was allowed to dry. *Kadaluppu*, *Mor*, and the purified *Kadukkai* were placed in a mud pot and boiled until all the water evaporated. Nos. 5 to 11 ingredients were ground into a fine powder and mixed with the *Kadukkai* mixture. Lemon juice was added, and the mixture was left in sunlight to dry completely. This process was repeated with ginger juice until the *Kadukkai* reached the desired consistency, after which it was shaped into pills and stored in an airtight container.

Manivannan *et al.*,**Dosage**

1-2 pills, before food, 40 days.

Indication

Irumal (Cough), *Mantham* (Indigestion), *Vayittru noi* (Stomach pain) and *Vanthi* (Vomiting). Taking this medicine for 40 days will cure the following conditions: *Soolai* (Throbbing pain), *Vaayu*, *Gunmam* (Ulcer), *Moolam* (Hemorrhoids), *Iraippu* (Bronchial asthma), *Peelikam* (Splenomegaly), *Peenisam* (Sinusitis), *Veluppu noi* (Anaemia), *Suvai inami* (Ageusia), and *Oon veruppu* (Anorexia).

In Vitro Antioxidant Activity**Free radical scavenging ability by the use of a stable DPPH radical (1,1-diphenyl-2-picrilhydrazyl)**

The effect of given samples on DPPH radical was estimated according to the procedure described by Von Gadow *et al.* (1997). Two ml of a 6×10^{-5} M methanolic solution of DPPH were added to 50 μ L of the sample solution with different concentrations (2 μ L extract + 48 μ L water, 4 μ L extract + 46 μ L water, 6 μ L extract + 44 μ L water, 8 μ L extract + 42 μ L water, and 10 μ L extract + 40 μ L water). The decrease of absorbance at 515 nm was recorded in a spectrophotometer for 16 min at room temperature. The scavenging effect (decrease of absorbance at 515 nm) was plotted against the time and the percentage of DPPH radical scavenging ability of the sample was calculated from the absorbance value at the end of 16 min in duration as follows:

All determinations were performed in triplicate. The percentage inhibition of the DPPH radical by the samples was calculated according to the formula of Yen and Duh (1994).

$$IP = [(AC(0) - AA(t)) / AC(0)] \times 100$$

Where AC(0) is the absorbance of the control at t = 0 min, and AA(t) is the absorbance of the antioxidants at t = 16 min (16-18).

Free radical scavenging ability by the use of a stable ABTS radical cation 2,2'-azinobis-(3-ethylbenzothiazoline-6-sulfonic acid)

The ABTS radical cation decolorization assay (Re *et al.*, 1999) tested the free radical scavenging capacity of samples. ABTS was dissolved in water to get a 7 mM concentration. ABTS radical cation (ABTS^{•+}) was produced by reacting ABTS stock solution with 2.45 mM potassium persulphate (final concentration) and allowing the mixture to stand in the dark room temperature for 12-16 hrs before use. The free radical was stable for more than two days when stored in the dark room temperature. For the study of the test samples, the ABTS^{•+} solution was diluted with absolute ethanol to an absorbance of 0.700 (± 0.02) at 734 nm and equilibrated at 30°C. Reagent blank reading was taken (A₀). After the addition of 2.0 mL of diluted ABTS^{•+} solution (A_{734 nm} = 0.700 (± 0.02)) to 50 μ L of the test sample (20 mg/mL), the absorbance reading was taken at 30°C exactly 6 min after initial mixing (A_t). Appropriate solvent blanks were run in each assay. All determinations were carried out at least three times. The percentage inhibition of absorbance at 734 nm was calculated using the above formula and the decrease of the absorbance between A₀ and A_t.

$$PI = [(AC(0) - AA(t)) / AC(0)] \times 100$$

Where AC(0) is the absorbance of the control at t = 0 min; and AA(t) is the absorbance of the antioxidant at t = 6 min (19-21).

Hydrogen peroxide scavenging activity

The scavenging activity of hydrogen peroxide by the plant extract was estimated using the method of Ruch *et al.* (1989). Plant extract (4 ml) prepared in distilled water at various concentrations was mixed with 0.6 ml of 4 mM H₂O₂ solution prepared in phosphate buffer (0.1 M pH 7.4) and incubated for 10 min. The absorbance of the solution was taken at 230 nm against a blank solution containing the plant extract without H₂O₂. The reaction mix containing H₂O₂ radical without plant extract served as a control. The amount of hydrogen peroxide radical inhibited by the extract was calculated using the following equation:

$$H_2O_2 \text{ radical scavenging activity} = \{(Abs \text{ control} - Abs \text{ sample}) / (Abs \text{ control})\} \times 100$$

**Manivannan et al.,**

Where; Abs control is the absorbance of H₂O₂ radical; Abs sample is the absorbance of H₂O₂ radical + sample extract (22-24).

Nitric oxide scavenging activity

Nitric oxide generated from sodium nitroprusside in an aqueous solution at physiological pH was measured by the Griess reaction (Marcocci et al., 1994). The reaction mixture (3ml) containing sodium nitroprusside (10mm) in phosphate buffer saline and the test extract (10, 25, 50 and 100µg/ml) was incubated at 25°C for 150min after incubation 1.5ml of the reaction mixture was removed and 1.5ml of the Griess reagent (1% sulphanilamide, 2% orthophosphoric acid and 0.1% Naphthylmethyl diamine hydrochloride) was added. The absorbance of the chromophore formed was read at 546 nm. Percent inhibition of nitric oxide scavenging was calculated using the formula. Percentage Inhibition = (A of Control – A of Sample) / A of Control × 100. A- absorbance (25-26).

RESULT AND DISCUSSION

The antioxidant potential of the test drug BVK was evaluated using four different assays: DPPH, ABTS, Nitric oxide, and hydrogen Peroxide radical scavenging assays. The results were compared with standard antioxidants.

DPPH Assay

The DPPH radical scavenging assay results for BVK demonstrate a clear, concentration-dependent increase in antioxidant activity. The control sample showed an optical density (OD) of 0.621, corresponding to 0% inhibition. At 0.2 mg, the OD was reduced to 0.126, yielding 79.71% inhibition, and at 0.4 mg, the OD further decreased to 0.07, resulting in 88.73% inhibition. At 0.6 mg, the OD dropped to 0.061, with 90.18% inhibition, and at 0.8 mg and 1 mg, the ODs were 0.052 and 0.043, respectively, with inhibitions of 91.63% and 93.08%. These results indicate that BVK exhibits a significant dose-dependent increase in antioxidant activity, with the highest inhibition (93.08%) observed at 1 mg. When compared to well-established antioxidants like ascorbic acid and Trolox, BVK's performance is highly promising. Ascorbic acid, a well-known antioxidant, typically achieves DPPH inhibition in the range of 90-95% at similar concentrations, while Trolox, a synthetic analogue of vitamin E, generally demonstrates 85-95% inhibition. BVK's inhibition values, consistently close to or exceeding 90%, suggest that its antioxidant efficacy is comparable to or even superior to that of ascorbic acid and Trolox at equivalent concentrations. Additionally, BVK exhibited a significant antioxidant effect with an IC₅₀ value of 0.25 mg, which is comparable to ascorbic acid (IC₅₀ = 0.22 mg) and Trolox (IC₅₀ = 0.28 mg). The maximum inhibition of 93.08% at 1 mg was similar to ascorbic acid's 95.12% at the same concentration. The findings highlight that BVK could be a competitive antioxidant, offering free radical scavenging capabilities on par with or surpassing those of established standards like ascorbic acid and Trolox.

ABTS Assay

The ABTS radical cation Decolorization assay results for the test sample reveal a clear, dose-dependent increase in antioxidant activity with rising concentrations. The control sample showed an optical density (OD) of 0.703, corresponding to 0% inhibition. At 0.2 mg, the OD decreased to 0.501, resulting in 28.73% inhibition, while at 0.4 mg, the OD further decreased to 0.258, yielding 63.30% inhibition. At 0.6 mg, the OD was reduced to 0.201, producing 71.41% inhibition, and at 0.8 mg and 1 mg, the ODs were 0.189 and 0.154, leading to inhibitions of 73.12% and 78.09%, respectively. These results suggest a significant increase in antioxidant activity as the concentration of the sample rises. When compared to well-established antioxidants like ascorbic acid and Trolox, BVK's performance is notable. Ascorbic acid typically demonstrates ABTS radical scavenging activity in the range of 80-95%, with its efficacy improving at higher concentrations. Trolox, a synthetic analogue of vitamin E, shows similar strong ABTS scavenging activity, typically ranging from 75-90%, with its activity also increasing with concentration. BVK's maximum inhibition of 78.09% at 1 mg, while slightly lower than the performance of ascorbic acid (90-95%) and Trolox (85-90%), still indicates significant antioxidant potential. BVK exhibited moderate antioxidant activity, with an IC₅₀ value of 0.43 mg, which is slightly higher than that of ascorbic acid (IC₅₀ = 0.35 mg) and Trolox (IC₅₀ = 0.38 mg). The maximum inhibition of 78.09% at 1 mg was lower than ascorbic acid's 85.61% at the same concentration.

**Manivannan et al.,**

Although BVK's antioxidant activity appears slightly less potent than that of ascorbic acid and Trolox at equivalent concentrations, it remains a competitive antioxidant. These findings suggest that BVK holds promise as an effective free radical scavenger.

Nitric Oxide Assay

The nitric oxide (NO) scavenging assay results for the test sample demonstrate a dose-dependent increase in antioxidant activity with rising concentrations. The control sample had an optical density (OD) of 0.987, corresponding to 0% inhibition. At 0.2 mg, the OD decreased to 0.874, leading to 11.45% inhibition, and at 0.4 mg, the OD further decreased to 0.801, yielding 18.84% inhibition. At 0.6 mg, the OD dropped to 0.754, resulting in 23.61% inhibition, and at 0.8 mg and 1 mg, the ODs were 0.716 and 0.672, corresponding to 27.46% and 31.91% inhibition, respectively. These results indicate that the sample's ability to scavenge nitric oxide increases with concentration, with the highest inhibition of 31.91% observed at 1 mg. Although BVK demonstrated moderate antioxidant activity, with a maximum inhibition of 31.91% at 1 mg, its effectiveness was significantly lower compared to well-known antioxidants like ascorbic acid (85.61% inhibition at 1 mg) and Trolox (78.52% inhibition at 1 mg). This suggests that while BVK shows some capacity to scavenge nitric oxide, its potency is relatively weak compared to ascorbic acid and Trolox. It looks like BVK might work as an NO scavenger because the inhibition increases with higher concentrations. But more research is needed, and comparisons with other known NO scavengers are needed to fully understand how well it works.

Hydrogen Peroxide Assay

The hydrogen peroxide (H₂O₂) radical scavenging assay results for the test sample reveal a dose-dependent increase in antioxidant activity with rising concentrations. The control sample had an optical density (OD) of 0.097, corresponding to 0% inhibition. At 0.2 mg, the OD decreased to 0.078, resulting in 19.59% inhibition, and at 0.4 mg, the OD further decreased to 0.064, yielding 34.02% inhibition. At 0.6 mg, the OD dropped to 0.058, resulting in 40.21% inhibition. At 0.8 mg and 1 mg, the ODs were 0.054 and 0.049, corresponding to 44.33% and 49.48% inhibition, respectively. BVK exhibited moderate antioxidant activity, with a maximum inhibition of 49.48% at 1 mg, comparable to ascorbic acid (52.13% at 1 mg) and Trolox (50.21% at 1 mg). These results demonstrate that BVK's ability to scavenge hydrogen peroxide increases with concentration, reaching the highest inhibition of 49.48% at 1 mg. This indicates that BVK possesses moderate antioxidant activity in terms of hydrogen peroxide scavenging, with inhibition improving as the concentration increases. While BVK's performance is comparable to that of ascorbic acid and Trolox at 1 mg, further studies are necessary to assess its full potential relative to these well-established antioxidants. These findings suggest that BVK shows promise as a hydrogen peroxide scavenger, but additional investigation, particularly with a broader concentration range, would provide a clearer picture of its comparative efficacy. Although BVK's antioxidant activity was lower than that of standard antioxidants, its potential is notable, especially considering that it is a mixture of raw drugs, whereas ascorbic acid is a single, isolated compound.

CONCLUSION

The study highlights the antioxidant potential of the test drug BVK, revealing significant activity in the DPPH assay and moderate activity in the ABTS and hydrogen peroxide assays. However, its limited activity in the Nitric Oxide assay suggests that BVK may not be effective against all types of free radicals. Compared to standard antioxidants, BVK showed similar antioxidant activity in DPPH and hydrogen peroxide assays but lower activity in ABTS and nitric oxide assays. Further studies are necessary to elucidate the mechanisms of action and potential applications of BVK as an antioxidant agent.

ABSTRACT

We discussed the inverses of k -regular interval incline matrices as a generalization of k -regulars fuzzy matrices and regular (interval) incline. We obtain some properties of k -{3}, k -{4} and k -{3,4} regarding inverses of interval incline matrices (IIM).

Key words: Incline, inverses of k -regular, Fuzzy matrices

2020 Mathematical science Classification : 16Y60, 15B15

INTRODUCTION

Inclines are additively idempotent semirings in which products are less than or equal to either factor. An incline is a structure which has an associative, commutative addition and distributive multiplication Such that $x+x=x$, $x+xy=x$ and $y+xy=y$ for all $x, y \in L$. It has a semiring structure and partial order structure. An element a in an incline is said to be regular if a solution exists for the equation $axa=a$, and such a solution is called a generalized inverse (or g-inverse) of a . An incline L is regular if and only if every element of L is regular. Recently, Meenakshi and Anbalagan examined the regularity of incline elements [11] by using the incline axioms. A matrix $A \in L_{mn}$, (the set of $m \times n$ matrices over an incline L) is regular if and only if there exists $X \in L_{nm}$ such that $AXA=A$, and Such X is called a g-inverse of A . The concept of IVFM is introduced and developed by Shyamal and pal [9]. In [6] Meenakshi and Kaliraja have Studied the regular condition of IVFM. In [10] Meenakshi and Shakila banu have developed on regularity of incline matrices.

Ramasamy and Anbalagan

Our previous work [13] we have introduced IIM as a generalization of incline matrices and deals the g-inverse of IIM. Meenakshi and Poongodi [8] introduced the concept of k-regular interval valued fuzzy matrices and discussed the inverses associated with k-regular IVFM. A matrix $T (= [T_L, T_U]) \in L_n^I$, (the set of $n \times n$ interval incline matrices) is said to be right (left) k-regular if there exists $[X_L, X_U]([Y_L, Y_U]) \in L_n$, Such that $[T_L^k X_L T_L, T_U^k X_U T_U] = [T_L^k, T_U^k]$ ($[T_L Y_L T_L^k, T_U Y_U T_U^k] = [T_L^k, T_U^k]$), $[X_L, X_U]([Y_L, Y_U])$ is called a right (left) k-g inverse of $[T_L, T_U]$ where k is a positive integer $k > 1$. we have to development the concept of k-regularity of fuzzy matrices to the IVFM and the Corresponding inverses of k-regular interval incline matrices. In this paper we examined the k-regular interval incline matrices. We obtained some results regarding 1, 3, 4 - k-g- inverses of interval incline matrices. we deal with interval incline matrices (IIM) that is, matrices whose entries are intervals

PRELIMINARIES

In this section, some basic definitions and results needed are given.

Definition 2.1

The interval incline L^I is said to be commutative, if

$$[x_L y_L, x_U y_U] = [y_L x_L, y_U x_U], \quad \forall [x_L, x_U], [y_L, y_U] \in L^I$$

Definition 2.2

(L^I, \leq) is an interval incline with order relation " \leq " defined on L such that for $[x_L, x_U], [y_L, y_U] \in L^I$, $[x_L, x_U] \leq [y_L, y_U]$ if and only if $[x_L + y_L, x_U + y_U] = [y_L, y_U]$ if $[x_L, x_U] \leq [y_L, y_U]$ then y_L is said to dominate x_L (or) y_U is said to dominate x_U

Property 2.1

Interval incline L^I with order relation " \leq ", for

$$[x_L, x_U], [y_L, y_U] \in L^I, [x_L y_L, x_U y_U] \leq [x_L, x_U] \text{ and } [x_L y_L, x_U y_U] \leq [y_L, y_U]$$

Property 2.2

Interval incline L^I with order relation " \leq ", for

$$[x_L, x_U], [y_L, y_U] \in L^I, [x_L + y_L, x_U + y_U] \geq [x_L, x_U] \text{ and } [x_L + y_L, x_U + y_U] \geq [y_L, y_U]$$

Throughout this paper L^I denote the interval incline

Definition 2.3

An (interval) incline is a non empty Set L^I with binary operations addition and multiplication denoted by $(+, \cdot)$ and Satisfying the following (we usually dot \cdot for multiplications) for $a, b, c \in L^I$

- (i) $[a_L, a_U] + [b_L, b_U] = [b_L, b_U] + [a_L, a_U]$;
- (ii) $[a_L, a_U] + ([b_L, b_U] + [c_L, c_U]) = ([a_L, a_U] + [b_L, b_U]) + [c_L, c_U]$;
- (iii) $[a_L, a_U]([b_L, b_U] + [c_L, c_U]) = [a_L, a_U][b_L, b_U] + [a_L, a_U][c_L, c_U]$;
- (iv) $[a_L, a_U]([b_L, b_U][c_L, c_U]) = ([a_L, a_U][b_L, b_U])[c_L, c_U]$;
- (v) $([b_L, b_U] + [c_L, c_U])[a_L, a_U] = [b_L, b_U][a_L, a_U] + [c_L, c_U][a_L, a_U]$;
- (vi) $[a_L, a_U] + [a_L, a_U] = [a_L, a_U]$;
- (vii) $[a_L, a_U] + [a_L c_L, a_U c_U] = [a_L, a_U]$;
- (viii) $[c_L, c_U] + [a_L c_L, a_U c_U] = [c_L, c_U]$;

In an interval incline $(L^I, +, \cdot)$ acting a relation ' \leq ' described as on L^I .

Ramasamy and Anbalagan

Definition 2.4

For any interval incline matrices $A = [a_{ijL}, a_{ijU}]$ and $B = [b_{ijL}, b_{ijU}]$ in L_{mn} such that $A \leq B$ the Interval incline matrix $([A_L, A_U], [B_L, B_U]) = ([a_{ijL}, a_{ijU}], [b_{ijL}, b_{ijU}])$ is a Structure that ij^{th} entries is the limit incline with minimum threshold $[a_{ijL}, a_{ijU}]$ and maximum threshold $[b_{ijL}, b_{ijU}]$. In Specific for $A=B$, Interval incline matrix (IIM) $[A_L, A_U]$ is Simplified to the interval incline matrix A^{TM}_{Lmn} . For $A = [A_L, A_U] = [a_{ijL}, a_{ijU}]^{TM(IIM)_{m \times n}}$, clearly the interval incline matrix a_{ijL} and a_{ijU} $^{TM}_{Lmn}$ Such that $a_{ijL} \leq a_{ijU}$. Consequently, by these means Definition (2.4) A matrix can be inscribed as $A = [A_L, A_U] = [a_{ijL}, a_{ijU}]$ where a_{ijL} = lower limit, a_{ijU} = upper limit.

For $A = [a_{ijL}, a_{ijU}]$ and $B = [b_{ijL}, b_{ijU}]$ is of order $m \times n$ in addition represented by $A+B$ distinct as $[A_L, A_U] + [B_L, B_U] = [a_{ijL}, a_{ijU}] + [b_{ijL}, b_{ijU}] = [a_{ijL} + b_{ijL}, a_{ijU} + b_{ijU}]$

and their multiplication can be defined as,

$$[A_L, A_U][B_L, B_U] = [A_L B_L, A_U B_U] = \left(\begin{bmatrix} c_{ijL} & c_{ijU} \end{bmatrix} \right)$$

$$= \left[\sum_i a_{ikL} b_{kjL}, \sum_k a_{ikU} b_{kjU} \right] \text{ for } i = 1, 2, \dots, m \text{ and } j = 1, 2, \dots, p$$

where $A = [A_L, A_U]_{m \times n}$ and $B = [B_L, B_U]_{n \times p}$

their product denoted by $[AB] = [A_L B_L, A_U B_U]_{m \times p}$. $A \geq B$ iff $a_{ijL} \geq b_{ijL}$ and $a_{ijU} \geq b_{ijU}$ iff $A+B=A$ In Specific if $a_{ijL}=a_{ijU}$ and $b_{ijL}=b_{ijU}$, as a result, given equation gives the standard incline matrices.

Theorem 2.5

For $[X_L, X_U][Y_L, Y_U] \in (L^1)_n$, then

- $[R(X_L), R(X_U)] = [R(Y_L), R(Y_U)]$ and $[R(X_L^k), R(X_U^k)] = [R(Y_L^k), R(Y_U^k)]$ then $[X_L, X_U]$ is right k -regular IIM $\Leftrightarrow [Y_L, Y_U]$ is right k -regular IIM.
- $[C(X_L), C(X_U)] = [C(Y_L), C(Y_U)]$ and $[C(X_L^k), C(X_U^k)] = [C(Y_L^k), C(Y_U^k)]$ then $[X_L, X_U]$ is left k -regular IIM $\Leftrightarrow [Y_L, Y_U]$ is left k -regular IIM.

Lemma 2.6

For $X = [X_L, X_U] \in (IIM)_{mn}$ and $Y = [Y_L, Y_U] \in (IIM)_{np}$, the following hold.

- $X^T = [X_L^T, X_U^T]$
- $XY = [X_L Y_L, X_U Y_U]$

Lemma 2.7

For $X, Y \in (IIM)_{mn}$

- $[R(Y_L), R(Y_U)] \subseteq [R(X_L), R(X_U)] \Leftrightarrow [Y_L, Y_U] = [X_L A_L, X_U A_U]$ for some $A \in (IIM)_m$.
- $[C(Y_L), C(Y_U)] \subseteq [C(X_L), C(X_U)] \Leftrightarrow [Y_L, Y_U] = [X_L B_L, X_U B_U]$ for some $B \in (IIM)_m$.

Inverses of k -Regular Interval Incline Matrices

In this section, we shall introduce the concept of k -g inverses associated with a k -regular interval incline matrix as an extension of k -g inverses of a k -regular fuzzy matrix and as a k -regular IVFM.

Definition 3.1

A matrix $T = [T_L, T_U] \in (L^1)_{mn}$ is said to be right k -regular if there exists a matrix $Y = [Y_L, Y_U] \in (IIM)_{n \times m}$, such that $[T_L^k Y_L T_L, T_U^k Y_U T_U] = [T_L^k, T_U^k]$ for some positive integer $k > 1$. $[Y_L, Y_U]$ is called a Right k -g-inverse of $T = [T_L, T_U]$. Let $[T_L, T_U]_k\text{-}\{1_r\} = \{[Y_L, Y_U] / [T_L^k Y_L T_L, T_U^k Y_U T_U] = [T_L^k, T_U^k]\}$.

Definition 3.2

A interval incline matrix $[T_L, T_U] \in (IIM)_n$ is said to be left k -regular if there exist a interval matrix $[B_L, B_U] \in (IIM)_n$, Such that $[T_L B_L T_L^k, T_U B_U T_U^k] = [T_L^k, T_U^k]$ for some Positive integer $k > 1$. $[B_L, B_U]$ is called a left k -g inverse of $T = [T_L, T_U]$.

Ramasamy and Anbalagan

Let $[T_L, T_U]k-\{1_r\} = \{[B_L, B_U] / [T_L B_L T_L^k, T_U B_U T_U^k] = [T_L^k, T_U^k]\}$. In particular for a incline matrix $[T_L, T_U]$, that is $T_{ijL} = T_{ijU}$ then Definition (3.1) and Definition (3.2) reduce to right and left k -regular interval incline matrices respectively found in [14].

Definition 3.3

A interval incline matrix $[T_L, T_U] \in (IIM)_n$, is said to have a k -{3} inverse if there exists a interval matrix $[Y_L, Y_U] \in (IIM)_n$, such that $[(T_L^k Y_L)^T, (T_U^k Y_U)^T] = [(T_L^k Y_L), (T_U^k Y_U)]$, for some positive integer $k > 1$. $[Y_L, Y_U]$ is called the of k -{3} inverse $[T_L, T_U]$. Let $[T_L, T_U]k-\{3\} = \{[Y_L, Y_U] / [(T_L^k Y_L)^T, (T_U^k Y_U)^T] = [(T_L^k Y_L), (T_U^k Y_U)]\}$

Definitim 3.4

A interval incline matrix $[T_L, T_U] \in L_n$, is said to have a k -{4} inverse if there exists a interval matrix $Y = [Y_L, Y_U] \in (IIM)_n$, such that $[(Y_L T_L^k)^T, (Y_U T_U^k)^T] = [(Y_L T_L^k), (Y_U T_U^k)]$ for some positive integer $k > 1$. $[Y_L, Y_U]$ is called the of k -{4} inverse $[T_L, T_U]$. Let $[T_L, T_U]k-\{4\} = \{[Y_L, Y_U] / [(Y_L T_L^k)^T, (Y_U T_U^k)^T] = [(Y_L T_L^k), (Y_U T_U^k)]\}$

Remark 3.5

In perticular for $k=1$, Definition (3.3) and (3.4) reduces to set of {3} and {4} inverses respectively of a IIM and in the Case $T_L = T_U$ ($T_L \leq T_U$), Definition (3.3) and (3.4) reduces to the set of k -{3}, k -{4} inverses respectively of interval incline matrices.

Theorem 3.6

Let $T = [T_L, T_U] \in L_n$, then $[T_L, T_U]$ has a k -{3} inverse iff T_L and $T_U \in L_n$, have k -{3} inverses.

Proof

Let $T = [T_L, T_U] \in (IIM)_n$. Since $[T_L, T_U]$ has a k -{3} inverse, if there exists a interval matrix $[Y_L, Y_U] \in (IIM)_n$, Such that $[(T_L^k Y_L)^T, (T_U^k Y_U)^T] = [(T_L^k Y_L), (T_U^k Y_U)]$

Let $Y = [Y_L, Y_U]$, then by Lemma (2.6) (ii), $(T^k Y)^T = (T^k Y)$

$$\Leftrightarrow [T_L^k Y_L, T_U^k Y_U]^T = [T_L^k Y_L, T_U^k Y_U]$$

$$\Leftrightarrow [(T_L^k Y_L)^T, (T_U^k Y_U)^T] = [T_L^k Y_L, T_U^k Y_U]$$

$$\Leftrightarrow (T_L^k Y_L)^T = T_L^k Y_L \text{ and } (T_U^k Y_U)^T = T_U^k Y_U$$

Hence $[T_L, T_U] \in (IIM)_n$ has a k -{3} inverse iff T_L and $T_U \in L_n$, have k -{3} inverses.

Theorem 3.7

Let $T = [T_L, T_U] \in L_n$, then $[T_L, T_U]$ has a k -{4} inverse iff T_L and $T_U \in L_n$, have k -{4} inverses.

Proof

In similar manner of theorem (3.6) which can be proved.

Theorem 3.8

Let $[T_L, T_U] \in L_n$, and k be a positive integer $k > 1$, if

1. $[Y_L, Y_U] \in [T_L, T_U]k-\{1_i\}$ with $[\Re(Y_L), \Re(Y_U)] = [\Re(T_L^k Y_L), \Re(T_U^k Y_U)]$ then $[T_L, T_U] \in [Y_L, Y_U]k-\{1_i\}$
2. $[Y_L, Y_U] \in [T_L, T_U]k-\{1_i\}$ with $[C(Y_L), C(Y_U)] = [C(Y_L T_L^k), C(Y_U T_U^k)]$ then $[T_L, T_U] \in [Y_L, Y_U]k-\{1_r\}$

Proof

Since $[Y_L, Y_U] \in [T_L, T_U]k-\{1_i\}$ by Definition (3.2),

$$[(T_L^k Y_L T_L), (T_U^k Y_U T_U)] = [T_L^k, T_U^k]$$

$$\text{Since } [\cdot(Y_L), \cdot(Y_U)] = [\cdot(T_L^k Y_L), \cdot(T_U^k Y_U)]$$

by LemmY (2.7), $[Y_L, Y_U] = [B_L T_L^k Y_L, B_U T_U^k Y_U]$, for some $[B_L, B_U] \in (IIM)_n$

$$[Y_L T_L Y_L^k, Y_U T_U Y_U^k] = [B_L T_L^k Y_L T_L Y_L^k, B_U T_U^k Y_U T_U Y_U^k]$$

$$= [B_L T_L^k Y_L^k, B_U T_U^k Y_U^k]$$

$$= [B_L T_L^k Y_L Y_L^{k-1}, B_U T_U^k Y_U Y_U^{k-1}]$$

Ramasamy and Anbalagan

$$=[Y_L Y_L^{k-1}, Y_U Y_U^{k-1}]$$

$$=[Y_L^k, Y_U^k]$$

Hence $[T_L, T_U] \in [Y_L, Y_U]k-\{1\}$

(ii) Proof is similar to (i) and hence omitted.

Example:

$$T = \begin{pmatrix} [1,1] & [0.5,0.3] & [0,0] \\ [0.5,0.5] & [1,1] & [0.5,0.5] \\ [0.5,0.3] & [0.5,0.3] & [1,1] \end{pmatrix}$$

$$Y = \begin{pmatrix} [1,1] & [0,0] & [0,0] \\ [0.5,0.3] & [1,1] & [0.5,0.3] \\ [0,0] & [0,0] & [1,1] \end{pmatrix}$$

$$TYT = \begin{pmatrix} [1,1] & [0.5,0.3] & [0.5,0.3] \\ [0.5,0.5] & [1,1] & [0.5,0.5] \\ [0.5,0.3] & [0.5,0.3] & [1,1] \end{pmatrix}$$

$$= \begin{pmatrix} [1,1] & [0.5,0.3] & [0.5,0.3] \\ [0.5,0.5] & [1,1] & [0.5,0.5] \\ [0.5,0.3] & [0.5,0.3] & [1,1] \end{pmatrix} \neq T$$

$T^3 XT = T^3$. Hence T is 3-regular.

For $k=3$, $T^3 XT = T^3$ but $T^3 XT \neq T^3$

Hence, T is a right 3-g inverse but not a left 3-g-inverse.

Theorem 3.9

For $[T_L, T_U] \in L_n$, and for any $G=[G_L, G_U] \in (IIM)_n$ if $[T_L^k Y_L, T_U^k Y_U] = [T_L^k G_L, T_U^k G_U]$ where $[Y_L, Y_U]$ is a $k-\{1_r, 3\}$ inverse of $[T_L, T_U]$. then $G=[G_L, G_U]$ is a $k-\{1_r, 3\}$ inverse of $[T_L, T_U]$.

Proof

Since $[Y_L, Y_U]$ is a $k-\{1_r, 3\}$ inverse of $[T_L, T_U]$ by Definition (3.2) and (3.3) $[T_L^k Y_L T_L, T_U^k Y_U T_U] = [T_L^k, T_U^k]$ and $[(T_L^k Y_L)^T, (T_U^k Y_U)^T] = [(T_L^k Y_L), (T_U^k Y_U)]$ Post multiplying by $[T_L, T_U]$ on both sides of $[T_L^k Y_L, T_U^k Y_U] = [T_L^k G_L, T_U^k G_U]$

We get, $[T_L^k Y_L T_L, T_U^k Y_U T_U] = [T_L^k G_L T_L, T_U^k G_U T_U] = [T_L^k, T_U^k] = T^k$

Since $[T_L^k Y_L, T_U^k Y_U] = [T_L^k G_L, T_U^k G_U]$

$\Rightarrow [(T_L^k G_L)^T, (T_U^k G_U)^T] = [(T_L^k Y_L)^T, (T_U^k Y_U)^T] = [(T_L^k Y_L), (T_U^k Y_U)] = [T_L^k G_L, T_U^k G_U] = T^k G$

Hence $G=[G_L, G_U]$ is a $k-\{1_r, 3\}$ inverse of $[T_L, T_U]$.

Theorem 3.10

For $[Y_L, Y_U] \in (IIM)_n$, then for only $G=[G_L, G_U] \in (IIM)_n$ if $[(Y_L T^k_L), (Y_U T^k_U)] = [(G_L T^k_L), (G_U T^k_U)]$ where $[Y_L, Y_U]$ has a $k-\{1_i, 4\}$ inverse of $[T_L, T_U]$. then $G=[G_L, G_U]$ is a $k-\{1_i, 4\}$ inverse of $[T_L, T_U]$.

Proof

Proof is similar to that of theorem(3.9) and hence omitted.

Ramasamy and Anbalagan

Theorem 3.11

For $[T_L, T_U] \in L^n$, $[Y_L, Y_U]$ is a k - $\{1, 4\}$ inverse of $[T_L, T_U]$ and $[G_L, G_U]$ is a k - $\{1, 4\}$ inverse of $[T_L, T_U]$. then $[Y_L T^k_L, Y_U T^k_U] = [G_L T^k_L, G_U T^k_U]$

Proof

This can be proved in the similar manner as that of Theorem(3.10) and hence omitted.

In general, for an IIM $[T_L, T_U]$, there is no relation between k -regularity of $[T_L, T_U]$, $[T^k_L T_L, T^k_U T_U]$ and $[T_L T^k_L, T_U T^k_U]$. Hence the relation shall be discussed under certain conditions on their row spaces.

Theorem 3.12

For $[T_L, T_U] \in L^n$, with $[\square(T_L), \square(T_U)] = [\square(T^k_L T_L), \square(T^k_U T_U)]$ and $[\square(T^k_L), \square(T^k_U)] = [\square(T_L T^k_L)^k, \square(T_U T^k_U)^k]$ then $[T_L, T_U]$ is right k -regular $\Leftrightarrow [T^k_L T_L, T^k_U T_U]$ is right k -regular.

Proof

This follows from Theorem(2.5) by replacing $[Y_L, Y_U]$ by $[T_L T^k_L, T_U T^k_U]$.

Theorem 3.13

For $[T_L, T_U] \in L^n$, with $[C(T_L), C(T_U)] = [C(T_L T^k_L), C(T_U T^k_U)]$ and $[C(T^k_L), C(T^k_U)] = [C(T_L T^k_L)^k, C(T_U T^k_U)^k]$ then $[T_L, T_U]$ is left k -regular $\Leftrightarrow [T_L T^k_L, T_U T^k_U]$ is left k -regular.

Proof

This follows from Theorem(2.5) by replacing $[Y_L, Y_U]$ by $[T_L T^k_L, T_U T^k_U]$.

Theorem 3.14

For $[T_L, T_U] \in L^n$, if $[T^k_L T_L, T^k_U T_U]$ is a right k -regular and $[\square(T^k_L), \square(T^k_U)] \subseteq [\cdot(T^k_L T_L), \cdot(T^k_U T_U)]$ then $[T_L, T_U]$ has a k - $\{1, 3\}$ inverse. In particular for $k=1$, $[B_L, B_U] = [(T^k_L T_L)^{-1} T^k_L, (T^k_U T_U)^{-1} T^k_U]$ is a $\{1, 3\}$ inverse of $[T_L, T_U]$.

Proof

Since $[T^k_L T_L, T^k_U T_U]$ is a right k -regular IIM by Definition (3.1)

$[(T^k_L T_L)^k (T^k_L T_L)^{-1} (T^k_L T_L), (T^k_U T_U)^k (T^k_U T_U)^{-1} (T^k_U T_U)] = [(T^k_L T_L)^k, (T^k_U T_U)^k]$ for some right k -g inverse $[(T^k_L T_L)^{-1}, (T^k_U T_U)^{-1}]$ of $[T^k_L T_L, T^k_U T_U]$. Since $[\cdot(T^k_L), \cdot(T^k_U)] \subseteq [\cdot(T^k_L T_L)^k, \cdot(T^k_U T_U)^k]$, by Lemma (2.7),

$[T^k_L, T^k_U] = [Y_L, Y_U][\cdot(T^k_L T_L)^k, \cdot(T^k_U T_U)^k]$ for some $[Y_L, Y_U] \in (IIM)_n$ and take $[B_L, B_U] = [(T^k_L T_L)^{-1} T^k_L, (T^k_U T_U)^{-1} T^k_U]$ $[T^k_L B_L T_L, T^k_U B_U T_U] = [T^k_L (B_L T_L), T^k_U (B_U T_U)]$

$= [(Y_L (T^k_L T_L)^k (T^k_L T_L)^{-1} (T^k_L T_L)), (Y_U (T^k_U T_U)^k (T^k_U T_U)^{-1} (T^k_U T_U))]$

$= [Y_L, Y_U][((T^k_L T_L)^k (T^k_L T_L)^{-1} (T^k_L T_L)), ((T^k_U T_U)^k (T^k_U T_U)^{-1} (T^k_U T_U))]$

$= [Y_L, Y_U][((T^k_L T_L)^k), ((T^k_U T_U)^k)]$

$= [T^k_L, T^k_U]$ and take $Z = [Z_L, Z_U] = [(T^k_L T_L)^{-1} (T^k_L)^T, (T^k_U T_U)^{-1} (T^k_U)^T]$

$[T^k_L Z_L, T^k_U Z_U] = [(Y_L (T^k_L T_L)^k (T^k_L T_L)^{-1} (T^k_L)^T), (Y_U (T^k_U T_U)^k (T^k_U T_U)^{-1} (T^k_U)^T)]$

$= [Y_L, Y_U][((T^k_L T_L)^k (T^k_L T_L)^{-1} (T^k_L T_L)^k), ((T^k_U T_U)^k (T^k_U T_U)^{-1} (T^k_U T_U)^k)][Y_L, Y_U]^T$

$= [Y_L, Y_U][((T^k_L T_L)^k (T^k_L T_L)^{-1} (T^k_L T_L)^{k-1} T^k_L, (T^k_U T_U)^k (T^k_U T_U)^{-1} (T^k_U T_U)^{k-1} T^k_U) [Y_L, Y_U]^T$

$= [Y_L, Y_U][((T^k_L T_L)^k (T^k_L T_L)^{k-1}, (T^k_U T_U)^k (T^k_U T_U)^{k-1})][Y_L, Y_U]^T$

$= [(Y_L, Y_U)[((T^k_L T_L)^{2k-1}, (T^k_U T_U)^{2k-1})][Y_L, Y_U]^T$

$= [(T^k_L Z_L), (T^k_U Z_U)]^T [T^k_L Z_L, T^k_U Z_U] = [(T^k_L Z_L), (T^k_U Z_U)]^T$

Hence $[T_L, T_U]$ has a k - $\{1, 3\}$ inverse. In particular for $k=1$, $[B_L, B_U] = [(T^k_L T_L)^{-1} T^k_L, (T^k_U T_U)^{-1} T^k_U]$ is a $\{1, 3\}$ inverse of $[T_L, T_U]$.

Theorem 3.15

For $[T_L, T_U] \in (IIM)_n$, if $[T_L T^k_L, T_U T^k_U]$ is left k -regular IIM and

$[C(T^k_L), C(T^k_U)] \subseteq [C(T_L T^k_L)^k, C(T_U T^k_U)^k]$ then $[T_L, T_U]$ has a k - $\{1, 4\}$ inverse. In particular for $k=1$, $[Z_L, Z_U] = [T^k_L (T^k_L T_L)^{-1}, T^k_U (T^k_U T_U)^{-1}]$ is a $\{1, 4\}$ inverse of $[T_L, T_U]$.

Ramasamy and Anbalagan

Proof

Proof is similar to Theorem(3.14) and hence omitted.

Theorem 3.16

For $[T_L, T_U] \in (IIM)_n$, be a right k - regular IIM and $[\square(T^T_L T_L)^k, \square(T^T_U T_U)^k] \subseteq [\cdot(T^k_L), \cdot(T^k_U)]$ then $[T^T_L T_L, T^T_U T_U]$ has a k -{3} inverse.

Proof

Since $[T_L, T_U] \in (IIM)_n$, be a right k - regular IIM By Definition (3.1) $[T^T_L Y_L T_L, T^T_U Y_U T_U] = [T_L^k, T_U^k]$ for some right k - g inverse $[Y_L, Y_U] \in (IIM)_n$ of $[T_L, T_U]$. Since $[\cdot(T^T_L T_L)^k, \cdot(T^T_U T_U)^k] \subseteq [\cdot(T^k_L), \cdot(T^k_U)]$ by Lemma (2.7),

$$[(T^T_L T_L)^k, (T^T_U T_U)^k] = [Z_L T^k_L, Z_U T^k_U] \text{ for some } [Z_L, Z_U] \in (IIM)_n \text{ and take } [B_L, B_U] = [Y_L T_L, Y_U T_U] \quad [(T^T_L T_L)^k B_L, (T^T_U T_U)^k B_U] = [(Z_L T^k_L)(Y_L T_L), (Z_U T^k_U)(Y_U T_U)]$$

$$= [Z_L T^k_L Y_L T_L, Z_U T^k_U Y_U T_U]$$

$$= [Z_L T^k_L, Z_U T^k_U]$$

$$= [(T^T_L T_L)^k, (T^T_U T_U)^k]$$

$$= [((T^T_L T_L)^k, (T^T_U T_U)^k)]^T$$

$$= [((T^T_L T_L)^k B_L, (T^T_U T_U)^k B_U)]^T$$

Hence $[T^T_L T_L, T^T_U T_U]$ is a k -{3} inverse.

Theorem 3.17

Let $[T_L, T_U] \in (IIM)_n$, be a left k - regular IIM and $[C(T_L T^T_L)^k, C(T_U T^T_U)^k] \subseteq [C(T^k_L), C(T^k_U)]$ then $[T_L T^T_L, T_U T^T_U]$ has a k -{4} inverse.

Proof

This can be proved in the same manner as that of Theorem(3.16) and hence omitted.

Theorem 3.18

For $[T_L, T_U] \in (IIM)_n$, $[Y_L, Y_U]$ is a k -{1, 3} inverse of $[T_L, T_U]$. and $[G_L, G_U]$ is a k -{1, 4} inverse of $[T_L, T_U]$ then $[T_L^k Y_L, T_U^k Y_U] = [T_L^k G_L, T_U^k G_U]$.

Proof

Since $[Y_L, Y_U]$ is a k -{1, 3} inverse of $[T_L, T_U]$ By Definition (3.1) and (3.3)

$$[(T_L^k Y_L T_L), (T_U^k Y_U T_U)] = [T_L^k, T_U^k] \text{ and } [(T_L^k Y_L)^T, (T_U^k Y_U)^T] = [(T_L^k Y_L), (T_U^k Y_U)]$$

Since $G = [G_L, G_U]$ is a k -{1, 3} inverse of $[T_L, T_U]$, by Definition (3.1) and Remark (3.5),

$$[(T_L G_L T_L^k), (T_U G_U T_U^k)] = [T_L^k, T_U^k] \text{ and } [(T_L G_L)^T, (T_U G_U)^T] = [(T G)_L, (T G)_U]$$

$$\Rightarrow [T_L^k G_L, T_U^k G_U] = [(T_L^k Y_L T_L) G_L, (T_U^k Y_U T_U) G_U]$$

$$= [(T_L^k Y_L)(T_L G_L), (T_U^k Y_U)(T_U G_U)]$$

$$= [(T_L^k Y_L)^T, (T_U^k Y_U)^T] [(T_L G_L)^T, (T_U G_U)^T]$$

$$= [(Y_L^T (T_L^T)^k, Y_U^T (T_U^T)^k) [G_L^T T_L^T, G_U^T T_U^T]]$$

$$= [(Y_L^T, Y_U^T) [(T_L G_L T_L^k)^T, (T_U G_U T_U^k)^T]]$$

$$= [(Y_L^T, Y_U^T) [(T_L^k)^T, (T_U^k)^T]]$$

$$= [(T_L^k Y_L)^T, (T_U^k Y_U)^T]$$

$$= [(T_L^k Y_L), (T_U^k Y_U)]$$

$$= T^k Y$$

Hence the theorem.

Theorem 3.19

Let $T \in L_{m,n}$, be a regular interval incline matrix, then

$$[T_L^{(1,4)} T_L T_L^{(1,3)}, T_U^{(1,4)} T_U T_U^{(1,3)}] = [T_L^+, T_U^+].$$

**Proof**

Let $[Z_L, Z_U] = [T_L^{(1,4)}T_L T_L^{(1,3)}, T_U^{(1,4)}T_U T_U^{(1,3)}]$
 $(TZ) = [T_L Z_L, T_U Z_U] = [T_L(T_L^{(1,4)}T_L T_L^{(1,3)}), T_U(T_U^{(1,4)}T_U T_U^{(1,3)})]$
 $= [(T_L T_L^{(1,4)}T_L)T_L^{(1,3)}, (T_U T_U^{(1,4)}T_U)T_U^{(1,3)}]$
 $= [T_L T_L^{(1,3)}, T_U T_U^{(1,3)}]$
 $(TZ)^T = [(T_L Z_L)^T, (T_U Z_U)^T] = [(T_L T_L^{(1,3)})^T, (T_U T_U^{(1,3)})^T]$
 $= [T_L T_L^{(1,3)}, T_U T_U^{(1,3)}]$
 $= [T_L Z_L, T_U Z_U] (ZT) = [Z_L T_L, Z_U T_U] = [(T_L^{(1,4)}T_L T_L^{(1,3)})T_L, (T_U^{(1,4)}T_U T_U^{(1,3)})T_U]$
 $= [T_L^{(1,4)}(T_L T_L^{(1,3)}T_L), T_U^{(1,4)}(T_U T_U^{(1,3)}T_U)]$
 $= [T_L^{(1,4)}T_L, T_U^{(1,4)}T_U]$
 $(ZT)^T = [(Z_L T_L)^T, (Z_U T_U)^T] = [(T_L^{(1,4)}T_L)^T, (T_U^{(1,4)}T_U)^T]$
 $= [T_L^{(1,4)}T_L, T_U^{(1,4)}T_U] = [Z_L T_L, Z_U T_U]$
 Thus $Z = [Z_L, Z_U] = [T_L^{(1,4)}T_L T_L^{(1,3)}, T_U^{(1,4)}T_U T_U^{(1,3)}] = [T_L^+, T_U^+]$
 Hence the Theorem .

CONCLUSION

We have extended the concept of incline to interval incline matrices as a generalization of IVFM. Interval of inverses of k -regular interval incline matrices. Some definitions for an g inverse of interval incline matrix to be inverse were studied. g -inverse k - $\{1_r, 3, 4\}$, k - $\{1_r, 3, 4\}$ and $\{1_k, 3^k, 4^k\}$ was established and the group of inverse interval incline matrices was investigated of IIMS.

ABSTRACT

This research work focuses on the development of an economical technique for straightening 6mm Mild Steel bars. Currently, industries manually straighten commercial bars using a tedious and time-consuming hammering process. Automation is essential to improve efficiency. The construction industry relies on various wire products like stirrups, which are manufactured from coiled wire. The Manual Wire Straightening Cutting Stirrup Machine (MWSCSM) plays a vital role in the sequential operations of straightening, cutting, and shaping the wire into stirrups. The MWSCSM employs a stopper cutter head for wire cutting, limited by its length and feeding speed. Three power-driven vertical feed rolls facilitate the advancement of bar stock through horizontal and vertical rollers in different halves of the machine. During the process, autorotation and spring back effects were encountered. The autorotation issue is resolved with a three-roller standstill locking mechanism, enhancing straightening precision. Additionally, a parallel roller collocation scheme is introduced to eliminate auto-rotation, ensuring high-speed and scratch-free cold rolled deformed bars. To tackle the spring back effect, bidirectional loading is implemented, yielding improved results. The idler rolls are equipped with needle bearings, while the gear boxes are enclosed; housing hardened steel gears bathed in oil. As bar bending and stirrup making operations are essential in the construction industry, the usage of machines, whether manual, semi-automatic, or fully automatic, has become common in construction sites and workshops.

Keywords: Straightening Technique, Manual Wire Straightening Cutting Stirrup Machine (MWSCSM), Industrial Automation, Wire Products, Coil Form Straightening and Wire Rod Cutting

INTRODUCTION

The increasing demand in the construction industry for the development of bridges, buildings, and residential areas has highlighted the essential role of stirrups and bars in forming reinforcement structures, commonly known as shear reinforcement. These reinforcements are crucial for ensuring the structural integrity of buildings and other constructions, protecting them against failure caused by diagonal tension. Bar bending is a critical process in the construction industry, especially involving 6mm diameter bars used to create stirrups or bends. To meet the industry's demand for efficiency and cost-effectiveness, the Manual Wire Straightening Cutting Stirrup Machine (MWSCSM) has been ingeniously designed to reduce human efforts and increase productivity by minimizing the need for manual labor[1]. This versatile machine can extend wires from rolls or coils, straighten them, cut them to required lengths, and shape them manually into the desired stirrup size. The MWSCSM is equipped with a wide range of features to cater to diverse applications, and some models are specifically configured to handle various cold drawing wires and nonferrous metal wires, allowing for continuous cutting according to specific dimensional requirements[2]. The MWSCSM performs three fundamental processes: feeding, straightening, and cutting the wire. Its features encompass the ability to handle wires of different diameters, cater to various straightening needs, and offer cutting lengths tailored to individual project requirements. The machine incorporates standard feed rollers with gears to ensure efficient straightening and cutting operations.

Figure 1 illustrates the MWSCSM, demonstrating its ability to cut wires below 4mm in diameter, along with its corresponding working layout. In the building, construction, and maritime industries, round steel bars, particularly those with a minor diameter ($d \leq 6\text{mm}$), are extensively utilized [3,4]. The majority of these commercially available MS round bars do not contain any alloying elements and have a carbon content not exceeding 0.25%. While these bars can be used after straightening, traditional manual straightening techniques suffer from low productivity and cannot keep up with the demands of modern construction projects. To improve the straightening process for minor diameter bars, some researchers have introduced a parallel-roll straightening device that significantly enhances straightening speed. However, this device has its limitations, as it allows the bar to rotate during the straightening process, resulting in reduced straightening accuracy. To overcome these limitations, this research paper proposes a revolutionary roll-layout of an equivalent curvature standstill-locking cum bidirectional straightening system, designed to achieve higher accuracy in straightening these minor diameter bars [5,6]. The mechanism is carefully analyzed for deformation and stress distribution using advanced Finite Element Software ANSYS, ensuring the reliability and efficiency of the proposed straightening system. In conclusion, the construction industry's increasing demand for sturdy and reliable structures has driven the development of advanced technologies, such as the Manual Wire Straightening Cutting Stirrup Machine (MWSCSM).

This innovative machine, equipped with versatile features and capabilities, has significantly reduced human effort and increased productivity in the construction process. Furthermore, the proposed equivalent curvature standstill-locking cum bidirectional straightening system represents a breakthrough in straightening minor diameter bars with enhanced accuracy, contributing to the overall efficiency and quality of reinforcement structure formation in the construction industry. Upon reviewing the literature on the design and production of machinery and wire forming machines for various industrial applications, several researchers have focused on improving the efficiency and productivity of stirrup making machines. Anbumeenakshi et al. developed a mechanically powered hydraulic bending machine capable of producing multiple stirrups simultaneously. This machine, equipped with hydraulic systems, offers ease of use and can create different types of stirrups using fixtures with varying dimensions and geometries. While it can produce 20 pieces of stirrups in 15 minutes, the initial workpiece cutting and positioning require manual intervention [6]. Virani et al. highlight the significant role of labor in the construction of structures, particularly in tying together the horizontal and vertical rods in columns or beams to support the concrete. Traditionally, workers manually bend stirrups in square or trapezoidal shapes and tie them using tight wires. However, this process requires considerable human effort, and automation is essential to reduce construction lead time and increase the stirrup bending rate. To address this need, the authors propose the "Automated Stirrup

**Partha Protim Borthakur et al.,**

Bending Mechanism" (ASBM), which utilizes principles of hydraulics and electronics to enhance efficiency, reduce labor costs, and improve the accuracy of producing various sizes of stirrups [1,7,8]. Thokale et al. aimed to implement a cost-effective pneumatic rod bending machine at construction sites, enhancing stirrup productivity. Their design consists of pneumatic equipment, where the rod is bent by a pneumatic cylinder while being held in a fixture [9]. A significant advantage of this design is that the square-shaped stirrups can be continuously bent without the need for repositioning the rod in the machine [10]. Gujar et al. developed a unique approach using a Scotch Yoke Mechanism to convert the reciprocating motion of a pneumatic cylinder into rotary motion. When the motor feeds the rod, limit switches are activated, signaling the motor to stop quickly and activate the direction control valve, which operates the pneumatic cylinder and the Scotch yoke mechanism. This mechanism ensures efficient rod bending during stirrup forming, which continues until completion [11,12]. Waghmare et al. sought to improve stirrup making efficiency and production capacity by introducing a Human Powered Flywheel Motor (HPFM) system similar to a bicycle. In this system, a human spins a flywheel at approximately 600 RPM to store energy, which is then utilized in the stirrup making process to enhance production [13]. Vadaliya Darshit et al. focused on designing and constructing a high-production-rate machine that requires less manual labor while ensuring desired accuracy in stirrup manufacturing. Moreover, the studies discussed in the literature aim to address the challenges in stirrup making, such as labor-intensive processes and limited productivity. These innovative approaches offer potential solutions to improve efficiency, reduce manual effort, and increase the production capacity of stirrups in various industrial settings [14]. The primary objective of the research work is to reduce the reliance on human labor in the bar bending process. Traditional manual bar bending methods can be time-consuming, labor-intensive, and prone to errors. By introducing automation and advanced technologies, the aim is to streamline the bar bending operations and minimize the need for manual intervention. This will not only increase efficiency but also improve safety and the quality of reinforcement structures. Another key objective is to enhance productivity in the bar bending process [15]. Productivity is a crucial factor in construction projects, as the ability to produce a large number of accurately bent bars in a shorter timeframe directly impacts project timelines and cost-efficiency. By increasing productivity, construction companies can meet deadlines, take on larger projects, and remain competitive in the market. The objectives of this project focus on leveraging automation and advanced technologies to minimize human labor and maximize productivity in the bar bending process. By achieving these goals, the construction industry can optimize operations, improve efficiency, and deliver high-quality reinforcement structures more effectively [9].

MATERIALS AND METHODS

Several SPM (Special Purpose Machine) manufacturers are dedicated to achieving the same goal of enhancing productivity and reducing costs in the construction industry. While many have developed advanced machines, these tend to be expensive and often need to be imported. The aim of this project is to create an in-house, cost-effective machine. Similar to multi-forming machines, these machines also feature wire feeders in the form of rollers, which are connected to encoders through feeding rollers [15,16]. As depicted in the layout of the Manual Wire Straightening Cutting Stirrup Machine (MWSCSM), it consists of essential components such as the paying-off unit, feeding unit, straightening unit, and cutting head with a cut-off unit. In the paying-off unit, the wire can be supplied from a process such as a draw block or, more commonly, from a reel. The reel can be mounted on either a vertical or horizontal spindle. The vertical spindle is suitable for wires approximately 2 mm to 6 mm in diameter. In the feeding unit, the wire is typically fed using grooved feeding rolls or "pinch rolls." These rolls are powered and pinch or squeeze the material, pulling and/or pushing the wire through the machine. The feeding pressure on the rolls can be manually adjusted using cams or springs. Figure 2 illustrates the feed roller and its arrangement within the machine. The straightening process aims to eliminate and remove stresses induced into the material during its manufacture due to force and torque-related influences. This process is applicable to wire straightening, tube straightening, cable straightening, strip, and profile shape straightening. The roll straightener consists of a series of offset rolls that bend the wire beyond its elastic limit multiple times in two or more planes as the wire passes through. The rolls are adjustable, and the straightness achieved depends on the skill of the operator making the adjustments [17]. Following the straightening process is the "cutting off" or shearing process. Once the coiled wire is straightened, the machine

Partha Protim Borthakur *et al.*,

includes an extended measurable stopper where the required length of wire can be measured and cut using a strong blade attached vertically to the main frame via a spring. Finally, the cut wire or rod is shaped using guided blocks on the frame, with the help of a fulcrum, to achieve the desired shape of the stirrup [18].

MATERIALS

Mild Steel Square/Round Bars

Mild steel, also known as "low carbon steel," contains a low amount of carbon, typically ranging from 0.05% to 0.25% by weight. In contrast, higher carbon steels have carbon content between 0.30% and 2.0%. Common uses of mild steel include structural steel, signs, automobiles, furniture, decoration, wire, fencing, and nails [5].

Gears

Gears are utilized to transmit motion from one shaft to another or between a shaft and a slide by successively engaging their teeth. This process does not involve any intermediate links or connectors, as gears transmit motion through direct contact. The surfaces of the two interacting gears make tangential contact, allowing for either rolling or sliding motion along the tangent at the point of contact. In our project, gears are employed to transmit motion between the shaft and the DC generator[1,15].

Shafts

A shaft is a rotating machine element used to transmit power from one location to another. Power is delivered to the shaft by a tangential force, and the resultant torque (or twisting moment) generated within the shaft allows the power to be transferred to various machines connected to it[8]. Two significant types of shafts are crucial in this context: transmission shafts and machine shafts. Transmission shafts are responsible for transferring power from the source to machines that absorb power and carry machine parts like pulleys and gears, subjecting them to both twisting and bending forces. Machine shafts form an integral part of the machine itself, such as the crankshaft [3]. By selecting the appropriate material and design, shafts can efficiently perform their intended functions, ensuring the reliability and performance of mechanical systems.

Standard Sizes of Transmission Shafts

The standard sizes of transmission shafts are specified to meet various mechanical and structural requirements. These sizes are as follows:

- 25 mm to 60 mm in 5 mm increments,
- 60 mm to 110 mm in 10 mm increments,
- 110 mm to 140 mm in 15 mm increments,
- 140 mm to 500 mm in 20 mm increments.

Additionally, the standard lengths of these shafts are typically 5 meters, 6 meters, and 7 meters[3].

Stresses in Shafts

Shafts are subjected to various stresses during operation, including:

- **Stresses due to the transmission of torque:** These stresses, also known as torsional loads, are induced when the shaft transmits power from one component to another.
- **Bending stresses:** These can be either tensile or compressive and arise from forces acting upon machine elements like gears and pulleys, as well as from the weight of the shaft itself.
- **Stresses due to combined torsion and bending loads:** Shafts often experience simultaneous torsional and bending stresses, requiring careful design and material selection to ensure durability and performance [21-24].

Bearings

A bearing is a critical machine element that supports the motion of another component while allowing relative movement between the contact surfaces. It bears the load, reduces friction, and facilitates smooth and efficient

Partha Protim Borthakur *et al.*,

operation. Bearings come in various types and designs, tailored to specific applications and load requirements (Figure 3). Bearings play an essential role in enhancing the lifespan and reliability of machinery by ensuring smooth rotation and minimizing wear and tear. Selecting the appropriate shaft material and understanding the stresses involved are crucial for the design and performance of transmission shafts. Standardized shaft sizes and lengths ensure compatibility and ease of replacement across various applications. Bearings further enhance the functionality of shafts by providing necessary support and reducing friction, thereby ensuring smooth and reliable operation of mechanical systems. By adhering to these standards and considerations, engineers can design more efficient and durable transmission systems, ultimately leading to improved performance and longevity of machinery.

Roller (V-Grooved)

V-groove pulleys are efficient mechanical devices that facilitate power transmission between axles using a trapezoidal cross-section v-belt. This transmission solution ensures resistance against slipping and misalignment, enabling high-speed power transmission capabilities. The V-grooves, typically set at angles between 32° to 38°, can be measured using different-sized pins or discs. These pulleys incorporate precision ball bearings, lubricated for extended durability. The High-Speed Cartridge Assembly is compatible with any straightener and roller size or groove shape[1,15-20]. It incorporates two pre-loaded bearings, significantly enhancing straightener performance at high line speeds by reducing roller wobble (Figure 4).

Model Fabrication

A mechanical model refers to a physical representation or replica of a machine, system, or structure, designed to demonstrate its working principles and functions. Mechanical models play a crucial role in the design and development process, allowing engineers and designers to test and optimize their ideas before moving on to full-scale production. Additionally, mechanical models serve as valuable educational tools, enabling students and enthusiasts to grasp intricate engineering concepts and gain a hands-on understanding of how different machines and systems operate[20-24]

RESULTS AND CALCULATIONS

Observation and Analysis of Man-Hour Requirements in Production Methods

Traditional Method

An observation was conducted to determine the total man-hours required using the traditional method of production. The data revealed that:

- **Number of Workers:** 3 men
- **Total Components Produced:** 294 components per hour
- **Average Production Rate per Worker:** 98 components per hour per man

Present Machine-Assisted Method

The current method, which involves the use of a machine, showed the following results:

- **Number of Workers:** 2 men
- **Total Components Produced:** 480 components per hour
- **Average Production Rate per Worker:** 240 components per hour per man

Comparative Analysis

The comparison of these two methods indicates a significant improvement in productivity with the machine-assisted method. Here's the breakdown:

1. **Traditional Method Productivity:**
 - 3 men produce 294 components per hour.
 - Average productivity per man: 98 components per hour.
2. **Machine-Assisted Method Productivity:**

Partha Protim Borthakur et al.,

- 2 men produce 480 components per hour.
- Average productivity per man: 240 components per hour.

This efficiency ratio of approximately 2.45 indicates that each worker in the machine-assisted method is 2.45 times more productive compared to the traditional method. The significant increase in productivity implies that the manpower required in the traditional method can be substantially reduced when adopting the machine-assisted method. Specifically, the production capacity achieved by 3 men in the traditional method can now be achieved by fewer men using the present machine-assisted method, leading to:

- Reduced labor costs
- Increased overall efficiency
- Potential for reallocating labor to other tasks or reducing total workforce

By leveraging machine-assisted production, the organization can optimize its resources and improve its production capabilities effectively.

CONCLUSION

The results of this study show that presently rod bending and stirrups making operations are essential operations in the construction industry. Bar bending & the stirrup-making machine is a type of equipment that makes the bending and stirring of bars, pipes, and other similar structures. It is one of the most common forms of mechanical bending in the steel industry. It is found that many individuals are involved in this process, from erecting the machinery to the worker operating it. The comparison between the Traditional method and the Manual Wire Straightening Cutting Stirrup Machine clearly demonstrates the advantages of automation in construction processes. The manual method requires three workers to achieve a certain output, whereas the machine accomplishes the same amount of work with just one worker. This substantial reduction in labor requirements leads to increased efficiency and productivity in construction projects. By utilizing the Manual Wire Straightening Cutting Stirrup Machine, construction companies can optimize their workforce and allocate manpower more effectively. The freed-up workers can be assigned to other critical tasks, resulting in better resource utilization and faster project completion. Additionally, the machine's precision and consistent performance contribute to improved accuracy and quality of the stirrup production, which is crucial for ensuring the structural integrity of buildings and other constructions. In conclusion, the implementation of the Manual Wire Straightening Cutting Stirrup Machine offers significant benefits, including reduced labor costs, enhanced efficiency, and improved production capacity. As automation continues to revolutionize the construction industry, embracing advanced technologies like this machine can lead to better overall construction practices and outcomes.

ABSTRACT

The main purpose of this paper is to compare the behavior of two generalized half companion sequences comprising of Diophantine and special Diophantine triplets formed using Hex numbers of various ranks and the non-extendibility of such triplets to quadruples is proved using some theorems. This paper is an extended version of the paper[13] in which centered Triacontagonal number is replaced by Hex number and the comparison is made between two kinds of Dio-triples. To find the Diophantine triples, there is no specific method whereas the concept of Pellian equation is introduced for generating the triplets. The half companion sequences are constructed by Dio-triplets and special Dio-triplets using Hex numbers $Hex_r, Hex_{r+d}, Hex_{r-d}$ with distinct properties. The behavior of two such sequences are analyzed using MATLAB.

Keywords: Hex numbers, Dio-3 tuples, Special Dio-3 tuples, Non-Extendibility, perfect square.

MSC Code: 11B83, 11D99

INTRODUCTION

Diophantine equations are very famous among all Number theorist and have tremendous applications in the field of Cryptography and Network security. Many Diophantine equations are being solved by many researchers day to day. The concept of constructing the Diophantine triples and special Diophantine triples is a fascinating one. Diophantus

Shanmuga Priya and Janaki

of Alexandria discovered the set of numbers $q_1 = \frac{1}{16}, q_2 = \frac{33}{16}, q_3 = \frac{68}{16}, q_4 = \frac{105}{16}$ which satisfies the constraint $q_i q_j = S^2 - 1, \forall i, j = 1, 2, 3, 4$ where S denotes the rational number. Numerous studies have been conducted on the formation of an integer sequence. Any Diophantine triple, whose second largest element lies between the square and four times the square of the smallest one, can be uniquely extended to a Diophantine quadruple by attaching an element that is larger than the largest element in the triple, as demonstrated in the primary theorem proved by Cipu M, Filipin A, Fujita Y [1]. Park J [2] found the solution of Pellian equation which is developed by the $D(-1)$ triplets and he proved the extensibility of $D(-1)$ pair under some constraints using this previous result. Adzaga N, Filipin A, Jurasic A. [3] discovered that the set $\{2, b, c\}$ cannot be extended to irregular Dio-4 tuples for $2 < b < c$. But they accomplished some families of c 's which will depend on b 's. Adzaga N, Dujella A, Kreso D, Tadic P [4] established the result that there are infinite families of Dio-triples which are $D(n)$ -triples for two distinct as well as three distinct " n " with $n \neq 1$. Rihane SE, Luca F, Togbe A. [5] established that there are no Diophantine 4 tuples formed by pell numbers. Zhang and Grossman [6] established necessary and sufficient criteria for the existence of integer z' by taking into account the Diophantine triples $\{e_1, e_2, e_3\}$ such that $e_k e_j + z'^2 = c^2, j, k = 1, 2, 3$ and $\forall k \neq j$ where $z' \in \mathbb{Z}$. Basic and Filipin [7] discovered the extensibility of $D(4)$ pairings using a pellian equation; however, Earp – Lynch [8] extended their findings to differentiate between the solutions of pellian equations corresponding to $D(l^2)$ dio-3 tuples. Bonciocat NC, Cipu M, Mignotte M. [9] made an innovative study on Diophantine quadruples. With the additional requirement that $b_1 < b_2 < b_3$ with $b_1 = 3b_2$, Adedji KN, He B, Pinter A, Togbe A. [10] addressed the extensibility of the Diophantine 3-tuple $\{b_1, b_2, b_3\}$ and came at a the conclusion that a quadruple cannot be created from such a set. Additionally, they demonstrated the regularity of every Diophantine triple that contains the combination $\{b_1, 3b_2\}$ and found the same conclusion for $b_2 = 8b_1$. Saranya C, Janaki G. [11] established the half companion sequences of special Diophantine triplets that are formed using centered square numbers of ranks $n, n+1, n+2, n+3$ whereas Sangeetha V, Anupreethi T, Somanath M. [12] constructed the special Dio triples for various types of numbers of few ranks. The authors [13] deals with the centered Triacontagonal number. In this paper, the generalized half companion sequence of both Diophantine and special Diophantine triples using hex numbers of generalized ranks are established in the upcoming sections.

2. METHODOLOGY

Definition 2.1: A centered Hexagonal number, often known as a hex number is a figurate number which depicts a hexagon with a dot in the middle and all the other dots are arranged around the central dot in a hexagonal lattice. Hex_s denotes the hex numbers of rank $s \in \mathbb{N}$ and is given by

$$Hex_s = 3s^2 + 3s + 1$$

1, 7, 19, 37, 61, 91, 127, ... are first few hex numbers.

Definition 2.2: A sequence of integers (f_1, f_2, \dots, f_p) forms a Diophantine p -tuple with the property $D(\Lambda)$ if $f_i f_k + \Lambda = S^2, \forall j, k = 1, 2, \dots, p$ with $k \neq j$ and $s \in \mathbb{Z}$.

Definition 2.3: A three distinct set of polynomials $\{\kappa_1, \kappa_2, \kappa_3\}$ whose coefficients belong to \mathbb{Z} with the property $D(\Lambda)$ such that $\kappa_m \kappa_n + \kappa_m + \kappa_n + \Lambda = \Delta^2$ for all $m, n = 1, 2, 3$ and $m \neq n$, generate a special Dio-triplet. Note that ' Λ ' indicates a non-zero integer or a polynomial with integer coefficients. A Dio-3 tuple (a, b, c) is obtained from the pair (a, b) satisfying the property $D(\Lambda)$, where $a, b, c \in \mathbb{Z}$. On solving the system $ac + \Lambda = \pi_1^2, bc + \Lambda = \pi_2^2$ on applying the transformations $\pi_1 = u_1 + av_1, \pi_2 = u_1 + bv_1$, the pellian equation is resulted as $u_1^2 - abv_1^2 = \Lambda - 1$, where ab is not a perfect square and $\Lambda - 1 \neq 0$. Similarly, a special Dio-triplet (α, β, γ) is generated from a pair (α, β) that satisfies the property $D(\Lambda)$, where α, β, γ are polynomials. Solving the system of equations $\alpha\gamma + \alpha + \gamma + \Lambda = S_1^2, \beta\gamma + \beta + \gamma + \Lambda = S_2^2$ by utilizing the transformations $S_1 = \Pi + (\alpha + 1)\epsilon$ and $S_2 = \Pi + (\beta + 1)\epsilon$, the pellian equation $\Pi^2 - (\alpha + 1)(\beta + 1)\epsilon^2 = \Lambda - 1$ is produced, where $(\alpha + 1)(\beta + 1)$ is not a perfect square and $\Lambda - 1 \neq 0$.

2.1. Sequences of Dio-triplets

Case 1(A): For the ranks $r, r+d$

Suppose that η_1 and η_2 denotes the hex numbers of rank r and $r+d$, then

$$\eta_1 = \text{Hex}_r = 3r^2 + 3r + 1 \quad (1)$$

$$\eta_2 = \text{Hex}_{r+d} = 3r^2 + 6rd + 3d^2 + 3r + 3d + 1 \quad (2)$$

The value of $\eta_1\eta_2 + 3r^2d + 3rd^2 + 3rd + d^2 + d$ becomes a perfect square by using the property $D(3r^2d + 3rd^2 + 3rd + d^2 + d)$. In order to find $\eta_3 \in \mathbb{N}$ with the help of η_1 and η_2 , proceed by considering η_3 such that the following equations hold

$$\eta_1\eta_3 + 3r^2d + 3rd^2 + 3rd + d^2 + d = \pi_1^2 \quad (3)$$

$$\eta_2\eta_3 + 3r^2d + 3rd^2 + 3rd + d^2 + d = \pi_2^2 \quad (4)$$

where π_1 and π_2 are assumed as $\pi_1 = u_1 + \eta_1 v_1$, $\pi_2 = u_1 + \eta_2 v_1$.

Eliminating η_3 from (3) and (4) raises

$$u_1^2 = 3r^2d + 3rd^2 + 3rd + d^2 + d + \eta_1\eta_2v_1^2 \quad (5)$$

Replacing the values of η_1 and η_2 in (5) provides the initial solution

$$u_1 = 3r^2 + 3r + 3rd + 2d + 1, \quad v_1 = 1.$$

Also, π_1 is obtained as

$$\pi_1 = 6r^2 + 6r + 3rd + 2d + 2 \quad (6)$$

With the help of (1), (3) and (6), η_3 can be detected as

$$\eta_3 = 12r^2 + 12r + 12rd + 3d^2 + 7d + 4 \quad (7)$$

$$\Rightarrow \eta_3 = 2(\text{Hex}_r + \text{Hex}_{r+d}) - 3d^2 + d$$

Now, choose $\eta_4 \in \mathbb{N}$ which satisfies the equations

$$\eta_2\eta_4 + 3r^2d + 3rd^2 + 3rd + d^2 + d = \theta_1^2 \quad (8)$$

$$\eta_3\eta_4 + 3r^2d + 3rd^2 + 3rd + d^2 + d = \theta_2^2 \quad (9)$$

Take $\theta_1 = g_1 + \eta_2 h_1$ and $\theta_2 = g_1 + \eta_3 h_1$

Again on eliminating η_4 from (8) and (9), one may get

$$g_1^2 = 3r^2d + 3rd^2 + 3rd + d^2 + d + \eta_2\eta_3h_1^2 \quad (10)$$

(10) leads to the initial solution, $g_1 = 6r^2 + 6r + 3d^2 + 9rd + 5d + 2$, $h_1 = 1$

This provides $\theta_1 = 9r^2 + 15rd + 6d^2 + 9r + 8d + 3$

Substitution of the known values in (8) gives

$$\eta_4 = 27r^2 + 27r + 36rd + 12d^2 + 20d + 9 \quad (11)$$

$$\Rightarrow \eta_4 = 3\text{Hex}_r + 6\text{Hex}_{r+d} - 6d^2 + 2d$$

Consider $\eta_5 \in \mathbb{N}$ such that

$$\eta_3\eta_5 + 3r^2d + 3rd^2 + 3rd + d^2 + d = \alpha_1^2 \quad (12)$$

$$\eta_4\eta_5 + 3r^2d + 3rd^2 + 3rd + d^2 + d = \alpha_2^2 \quad (13)$$

with $\alpha_1 = m_1 + \eta_3 n_1$ and $\alpha_2 = m_1 + \eta_4 n_1$. Similarly, solving (12) and (13) will give rise to the initial solution $m_1 = 18r^2 + 18r + 21rd + 6d^2 + 12d + 6$, $n_1 = 1$ and this further provides the value of α_1 as follows

$$\alpha_1 = 30r^2 + 30r + 33rd + 9d^2 + 19d + 10$$

η_5 can be obtained from (12) as

$$\eta_5 = 75r^2 + 75r + 90rd + 27d^2 + 51d + 25 \quad (14)$$

(14) can also be represented as

$$\eta_5 = 10\text{Hex}_r + 15\text{Hex}_{r+d} - 18d^2 + 6d$$

\therefore The generalized half companion sequence of Dio-3 tuples involving Hex numbers of ranks r , $r+d$ obtained using the property $D(3r^2d + 3rd^2 + 3rd + d^2 + d)$ is accomplished as

$$\{(\text{Hex}_r, \text{Hex}_{r+d}, 2\text{Hex}_r + 2\text{Hex}_{r+d} - 3d^2 + d), (\text{Hex}_{r+d}, 2\text{Hex}_r + 2\text{Hex}_{r+d} - 3d^2 + d, 3\text{Hex}_r + 6\text{Hex}_{r+d} - 6d^2 + 2d), (2\text{Hex}_r + 2\text{Hex}_{r+d} - 3d^2 + d, 3\text{Hex}_r + 6\text{Hex}_{r+d} - 6d^2 + 2d, 10\text{Hex}_r + 15\text{Hex}_{r+d} - 18d^2 + 6d), \dots\}.$$

**Case 1(B): For the ranks $r-d, r+d$**

Assume ζ_1 and ζ_2 as

$$\zeta_1 = \text{Hex}_{r-d} = 3r^2 - 6rd + 3d^2 + 3r - 3d + 1 \quad (15)$$

$$\zeta_2 = \text{Hex}_{r+d} = 3r^2 + 6rd + 3d^2 + 3r + 3d + 1 \quad (16)$$

It is observed that $\zeta_1 \zeta_2 - 3d^2$ turns to a perfect square. Consider a positive ζ_3 that satisfy the following equations with the assumptions $\tau_1 = p_1 + \zeta_1 t_1$ and $\tau_2 = p_1 + \zeta_2 t_1$.

$$\zeta_1 \zeta_3 - 3d^2 = \tau_1^2 \quad (17)$$

$$\zeta_2 \zeta_3 - 3d^2 = \tau_2^2 \quad (18)$$

Eradication of ζ_3 from (17) and (18) helps in finding the foremost solution $p_1 = 3r^2 - 3d^2 + 3r + 1$, $t_1 = 1$ which will further give $\tau_1 = 6r^2 + 6r - 6rd - 3d + 2$. Replacing all the obtained values in (17), one may find ζ_3 as

$$\zeta_3 = 2(\text{Hex}_{r-d} + \text{Hex}_{r+d}) - 12d^2$$

By following the similar procedure as in case (i), the value of ζ_4, ζ_5 can be found as

$$\zeta_4 = 3\text{Hex}_{r-d} + 6\text{Hex}_{r+d} - 24d^2$$

$$\zeta_5 = 10\text{Hex}_{r-d} + 15\text{Hex}_{r+d} - 72d^2$$

Thus, for the hex numbers of ranks $r-d, r+d$, the half companion sequence of Dio-3 tuples is obtained as

$$\{(\text{Hex}_{r-d}, \text{Hex}_{r+d}, 2\text{Hex}_{r-d} + 2\text{Hex}_{r+d} - 12d^2), (\text{Hex}_{r+d}, 2\text{Hex}_{r-d} + 2\text{Hex}_{r+d} - 12d^2, 3\text{Hex}_{r-d} + 6\text{Hex}_{r+d} - 24d^2), (2\text{Hex}_{r-d} + 2\text{Hex}_{r+d} - 12d^2, 3\text{Hex}_{r-d} + 6\text{Hex}_{r+d} - 24d^2, 10\text{Hex}_{r-d} + 15\text{Hex}_{r+d} - 72d^2), \dots\}$$

2.2. Sequences of special Dio-triplets**Case 2(A): For the ranks $r, r+d$**

Consider the hex numbers of rank $r, r+d$ as in (1) and (2). It is clear that the quantity $\eta_1 \eta_2 + \eta_1 + \eta_2 + 1 - 2d^2 + 3r^2d + 3rd^2 + 3rd + 2d$ is a perfect square. To find $\eta'_3 \in \mathbb{Z}_+$ using η_1 and η_2 which satisfies the equations

$$\eta_1 \eta'_3 + \eta_1 + \eta'_3 + 1 - 2d^2 + 3r^2d + 3rd^2 + 3rd + 2d = l_1^2 \quad (19)$$

$$\eta_2 \eta'_3 + \eta_2 + \eta'_3 + 1 - 2d^2 + 3r^2d + 3rd^2 + 3rd + 2d = l_2^2 \quad (20)$$

where $l_1 = e_1 + (\eta_1 + 1)f_1$ and $l_2 = e_1 + (\eta_2 + 1)f_1$.

Solving (19) and (20) by the removal of ζ'_3 produces

$$e_1^2 = -2d^2 + 3r^2d + 3rd^2 + 3rd + 2d + (\eta_1 + 1)(\eta_2 + 1)f_1^2$$

On substituting (19) and (20), the above equation will give rise to the initial solution

$$e_1 = 3r^2 + 3r + 3rd + 2d + 2, f_1 = 1 \quad (21)$$

(21) gives $l_1 = 6r^2 + 6r + 3rd + 2d + 4$ and replacing all the obtained values in (19), η'_3 is resulted as

$$\eta'_3 = 12r^2 + 12rd + 12r + 3d^2 + 7d + 7 \quad (22)$$

$$\text{ie, } \eta'_3 = 2(\text{Hex}_r + \text{Hex}_{r+d}) - 3d^2 + d + 3$$

Assume $m_1 = v_1 + (\zeta_2 + 1)w_1$ and $m_2 = v_1 + (\zeta_3 + 1)w_1$. Select $\eta'_4 \in \mathbb{Z}_+$ such that

$$\eta_2 \eta'_4 + \eta_2 + \eta'_4 + 1 - 2d^2 + 3r^2d + 3rd^2 + 3rd + 2d = m_1^2 \quad (23)$$

$$\eta'_3 \eta'_4 + \eta'_3 + \eta'_4 + 1 - 2d^2 + 3r^2d + 3rd^2 + 3rd + 2d = m_2^2 \quad (24)$$

From (23) and (24), value of v_1^2 can be found which will provide the initial solution $v_1 = 6r^2 + 9rd + 6r + 3r^2 + 5d + 4$, $w_1 = 1$.

With the help of this solution, l_1^2 can be depicted and the value of η'_4 is obtained by the substitution of the all known values in (23) as

$$\eta'_4 = 27r^2 + 27r + 36rd + 12d^2 + 20d + 17 \quad (25)$$

$$\Rightarrow \eta'_4 = 3\text{Hex}_r + 6\text{Hex}_{r+d} - 6d^2 + 2d + 8$$

Similarly, $\eta'_5 \in \mathbb{Z}_+$ can be obtained by using η'_3 and η'_4 by following the same procedure as above. It is found that

$$\eta'_5 = 75r^2 + 75r + 90rd + 27d^2 + 51d + 49 \Rightarrow \eta'_5 = 10\text{Hex}_r + 15\text{Hex}_{r+d} - 18d^2 + 30d + 20$$

Shanmuga Priya and Janaki

Thus $\{(\eta_1, \eta_2, \eta_3), (\eta_2, \eta_3, \eta_4), (\eta_3, \eta_4, \eta_5), \dots\}$ forms the generalized half companion sequence of special Dio-triples generated by hex numbers.

Case 2(B): For the ranks $r-d, r+d$

Assume ζ_1, ζ_2 as in (15) and (16). It is clear that $\zeta_1\zeta_2 + \zeta_1 + \zeta_2 - 15d^2 + 1$ is a perfect square.

Hence, to find $\zeta'_3 \in \mathbb{N}$ such that the following equations hold with the supposition $C_1 = j_1 + (\zeta_1 + 1)q_1$ and $C_2 = j_1 + (\zeta_2 + 1)q_1$

$$\zeta'_3\zeta'_1 + \zeta'_1 + \zeta'_3 - 15d^2 + 1 = C_1^2 \quad (26)$$

$$\zeta'_3\zeta'_2 + \zeta'_2 + \zeta'_3 - 15d^2 + 1 = C_2^2 \quad (27)$$

Eradicating ζ'_3 from the above two equations and proceeding further as same in the previous cases, one may find the values of ζ'_3, ζ'_4 and ζ'_5 as follows

$$\zeta'_3 = 2(\text{Hex}_{r-d} + \text{Hex}_{r+d}) - 12d^2 + 3 \quad (28)$$

$$\zeta'_4 = 3\text{Hex}_{r-d} + 6\text{Hex}_{r+d} - 24d^2 + 8$$

$$\zeta'_5 = 10\text{Hex}_{r-d} + 15\text{Hex}_{r+d} - 72d^2 + 20$$

Hence,

$\{(\text{Hex}_{r-d}, \text{Hex}_{r+d}, 2(\text{Hex}_{r-d} + \text{Hex}_{r+d}) - 12d^2 + 3), (\text{Hex}_{r-d}, 2(\text{Hex}_{r-d} + \text{Hex}_{r+d}) - 12d^2 + 3, 3\text{Hex}_{r-d} + 6\text{Hex}_{r+d} - 24d^2 + 8), (2(\text{Hex}_{r-d} + \text{Hex}_{r+d}) - 12d^2 + 3, 3\text{Hex}_{r-d} + 6\text{Hex}_{r+d} - 24d^2 + 8, 10\text{Hex}_{r-d} + 15\text{Hex}_{r+d} - 72d^2 + 20), \dots\}$ represents the half companion sequence of special Dio-tuples containing hex numbers of rank $r-d$ and $r+d$.

RESULTS AND DISCUSSIONS

3.1 Theorems on Non-extendibility

Theorem 1:

Extendibility of Dio-3 tuples formed by $\text{Hex}_r, \text{Hex}_{r+d}$ to quadruples is impossible for all $r \in \mathbb{W}, d \in \mathbb{Z}$ with $d \neq 0$.

Proof:

Consider η_1, η_2, η_3 with same property $D(3r^2d + 3rd^2 + 3rd + d^2 + d)$ which are used as in (1), (2) and (7) of Case 1(A).

Assume $\Phi_1 = u_1 + \eta_1 v_1, \Phi_2 = u_1 + \eta_2 v_1, \Phi_3 = u_1 + \eta_3 v_1$ for which any $g \in \mathbb{Z}^+$ satisfies the following equations.

$$\eta_1 g + 3r^2d + 3rd^2 + 3rd + d^2 + d = \Phi_1^2 \quad (29)$$

$$\eta_2 g + 3r^2d + 3rd^2 + 3rd + d^2 + d = \Phi_2^2 \quad (30)$$

$$\eta_3 g + 3r^2d + 3rd^2 + 3rd + d^2 + d = \Phi_3^2 \quad (31)$$

Removal of 'g' from (29) and (31) provides the initial solution $u_1 = 6r^2 + 6r + 3rd + 2d + 2, v_1 = 1$. This will lead to find $\Phi_1 = 9r^2 + 9r + 3rd + 2d + 3$. From (29), it is clear that

$$g = 3d^2 + 11d + 27r^2 + 27r + 18rd + 9 \quad (32)$$

Using all the known values in (30),

$$\begin{aligned} \Phi_1^2 &= 9d^4 - 72rd^3 + 24d^3 + 198r^2d^2 + 105rd^2 - 2d^2 + 216r^3d \\ &\quad + 171r^2d + 27rd - 15d + 81r^4 + 162r^3 + 135r^2 + 54r + 9 \end{aligned} \quad (33)$$

The triple $\{\eta_1, \eta_2, \eta_3\}$ are extended to quadruple if Φ_1^2 is a perfect square. Suppose that $d < r$, then taking $d = r - 1$ (where $r \neq 1$ as $d \neq 0$) in (33) gives $\Phi_1^2 = 576r^4 - 402r^3 + 175r^2 + 85r + 7$ which is not a perfect square for all $r \neq 1$. For the case $d > r$, substitution of $d = r + 1$ in (33) provides $\Phi_1^2 = 576r^4 + 1326r^3 + 1081r^2 + 347r + 25 \neq$ Perfect square for all $r \in \mathbb{W}$. Suppose $r = d \neq 0$, then (33) becomes gives $\Phi_1^2 = 576r^4 + 462r^3 + 168r^2 + 39r + 9 \neq$ perfect square for all $r \in \mathbb{W}, d \in \mathbb{Z} - \{0\}$. This proves the theorem.

Corollary 1

Dio-3 tuples formed by $\text{Hex}_r, \text{Hex}_{r+d}$ can be extended to quadruples for all $r \in \mathbb{W}, d \in \mathbb{Z}$ with $d = 0$.

Shanmuga Priya and Janaki

Theorem 2

For all $r \in W$, $d \in Z$ with $d \neq 0$, Dio-3 tuples produced by $\text{Hex}_{r-d}, \text{Hex}_{r+d}$ are not extendable to quadruples.

Proof:

The proof of this theorem is same as Theorem 1.

Corollary 2:

Dio-3 tuples formed by the hex numbers $\text{Hex}_{r-d}, \text{Hex}_{r+d}$ can be extended to quadruples for any $r \in W$, with $d=0$.

Theorem 3:

Special Dio-3 tuples generated by the hex numbers $\text{Hex}_{r-d}, \text{Hex}_{r+d}$ cannot be extendable to quadruples for all $r \in W$, $d \in Z$ with $d \neq 0$.

Proof:

Let $(\zeta_1, \zeta_2, \zeta_3)$ be same as in (15), (16) and (28) with same property $D(-15d^2+1)$.

Assume $\Delta_1 = c_1 + \zeta_1 b_1, \Delta_2 = c_1 + \zeta_2 b_1, \Delta_3 = c_1 + \zeta_3 b_1$ such that any $h \in Z^+$ satisfies the equations.

$$\zeta_1 h + \zeta_1 + h - 15d^2 + 1 = \Delta_1^2 \quad (34)$$

$$\zeta_2 h + \zeta_2 + h - 15d^2 + 1 = \Delta_2^2 \quad (35)$$

$$\zeta_3 h + \zeta_3 + h - 15d^2 + 1 = \Delta_3^2 \quad (36)$$

The value of c_1^2 can be obtained on elimination of 'h' from (34) and (36)

$$c_1^2 = -15d^2 + (\zeta_1 + 1)(\zeta_3 + 1)b_1^2$$

The following initial solution can be depicted from the above equation by the substitution of (1) and (22)

$$c_1 = 6r^2 + 6r - 6rd - 3d + 4, b_1 = 1$$

Utilizing the above solution, one may get $\Delta_1 = 9r^2 + 9r - 12rd - 6d + 3d^2 + 6$. Replacement of all the obtained values in (34) results in finding 'h' as

$$h = 3r^2 - 18rd - 9d + 27r^2 + 27r + 17 \quad (37)$$

From (35),

$$\Delta_2^2 = 81r^4 + 162r^3 - 199r^2d^2 + 108r^3d - 18d^3 + 162r^2d^2 + 189r^2 - 36rd^3 - 18rd^2 + 108r + 9d^4 + 126rd + 81r^2d^2 + 18d^2 + 36d + 36 \quad (38)$$

Now, the special Dio triple $(\zeta_1, \zeta_2, \zeta_3)$ can be extended to quadruple only if Δ_2^2 is a perfect square. In order to verify, the following cases are taken into account.

Case (i): $d < r$. If $d = r - 1$ (where $r \neq 1$ as $d \neq 0$), then (38) becomes $\Delta_2^2 = 225r^4 + 126r^3 + 270r^2 - 90r + 45 \neq$ perfect square.

Case (ii): $d > r$. Suppose $d = r + 1$, (38) turns to $\Delta_2^2 = 225r^4 + 450r^3 + 414r^2 + 234r + 81 \neq$ perfect square.

Case (ii): $d = r \neq 0$. The value of Δ_2^2 in (38) leads to $\Delta_2^2 = 225r^4 + 228r^3 + 333r^2 + 144r + 36 \neq$ perfect square.

\therefore A special Dio-triplet formed by $\text{Hex}_{r-d}, \text{Hex}_{r+d}$ are not extendable to quadruples for all non-negative integer values of r and non-zero integer d .

Corollary 3

Special Dio-triple $(\zeta_1, \zeta_2, \zeta_3)$ can be extended to quadruples for any $r \in W$ with $d=0$.

Theorem 4

Let (η_1, η_2, η_3) be a special Dio-3 tuple generated by the hex numbers $\text{Hex}_r, \text{Hex}_{r+d}$. For all $r \in W$, $d \in Z$ with $d \neq 0$, (η_1, η_2, η_3) cannot be extended to quadruple and it is extendable for $d=0$.

Proof: The Proof of this theorem is similar to Theorem 3.

3.2 Pictorial Comparison

CONCLUSION

The generalized version of half companion sequence of Dio-3 tuples and special Dio-3 tuples are found by using Hex numbers of ranks $r, r+d$ and $r-d, r+d$. Non-extendibility to quadruples is proved for all values of $r \in \mathbb{W}, d \in \mathbb{Z} - \{0\}$. Also, the behaviour of the scattered plot of the Dio-triples and special Dio-triples are compared and one can analyze that for the ranks $r, r+d$, the path traced by scattered plot of the Dio-triples is exactly same as Special Dio-triples. Similarly, for the ranks $r-d, r+d$, the path traced is same for Dio-3 tuples and special Dio-3 tuples.

ABSTRACT

COVID 19 reaction responses challenged the health professions and systems around the globe. The role of the dental professionals in preventing the transmission and responding to its long-term impacts on dentistry is critically important. Hence the study was conducted post COVID outbreak. A cross sectional, questionnaire study was conducted among dentists of Karnataka using WHOQOL-BREF instrument. 750 dentists participated in the study mentioned that they had an anxiety of being infected with COVID – 19 by one or the other way during the outbreak & all most all the dentists mentioned that they faced the increased economic burden to update / modify the clinic for their & patients protection. 92% were dissatisfied by themselves & 24% expressed even personal relationships were affected& their quality of life was compromised. Outlining the immediate impact that the Covid-19 outbreak had on dental healthcare professionals looks heavier at some points on the profession but currently dentists have adapted to the changes and balancing the economic crisis.

Keywords: Covid-19 outbreak, Dental professionals, Impact on dentistry.

INTRODUCTION

Since the emergence of the novel coronavirus disease (COVID19) in Wuhan, China, all aspects of life have been influenced worldwide. The COVID-19 pandemic has spread in an exponential manner affecting millions of people worldwide and causing hundreds of thousands of deaths.[1] Many countries have shut down their teaching institutes, industries, sport activities, social gatherings, public events, and airports. Drastic measures such as individual self-quarantine and social distancing rules have been introduced in an attempt to control the spread of the infection.[2] As health care workers on the front line during the coronavirus (COVID-19) pandemic, dental practitioners are amongst those at risk due to their close contact with potentially infected individuals.[3,4] Droplets and aerosols that are generated during dental procedures by such as high speed handpieces, air-water syringes, and ultrasonic scaling produce a contaminated pathogenic environment during treatment of an infected person. Therefore, the risk of infection transmission within the dental team cannot be controlled through the standard protective measures of daily dental practice.[5] This categorization as high-risk professionals increased fear within the dental community. Regarding the rapid spread of the infection, WHO, Dental council of India announced specific guidelines to be implemented by dentists while during treating urgent and emergency cases, otherwise they stipulated the dental offices to be kept closed during the outbreak. This insisted for modification in clinical setting leading to increase demand for expensive aerosol controlling equipment such as the high efficiency particulate arrestor (HEPA).[1] The expense of these precautionary measures and limitations in the treatment of patients may have had serious economic impact on the dentistry field.[6-9] There are no studies which have assessed the levels of anxiety among dentists after the COVID-19 outbreak, their practice modifications to prevent its spread, or the financial impact on their current practice along with their quality of life. Therefore, the aim of the current study was to use a specially designed online-based questionnaire to assess the impact of the COVID-19 outbreak on dentists in terms of their anxiety, awareness and practice modification, and the financial implications along with QOL for their dental practice.

Aim and Objectives of Study

Aim

To assess anxiety, practice modification, economic impact with quality of life among dentists of Karnataka using WHOQOL-BREF instrument post COVID outbreak.

Objectives

- To assess the anxiety, awareness & practice modification and financial impact among dentists of Karnataka.
- To assess the QOL by using WHOQOL-BREF among dentists of Karnataka

MATERIALS AND METHODS

Study Design: Descriptive cross sectional online questionnaire study.

Study Setting: Dentists of Karnataka from Karnataka state dental registry.

Study Duration: 6 months

Source of Data: Data will be collected from the dentists through online.

Materials: Self administered Questionnaire & WHOQOL – BREF

Methods of Collection of Data

Google forms was created to include all the questions & sent to registered dentists from KSDC registry using social media, emails and only completed forms were included in the final analysis. All incomplete forms and those returned outside the required timeframe were excluded.

**Sample Size**

The total number of registered dentists, as officially found in KSDC registry on 26/08/2022, was 26,000. Sample size was determined according to the following formulas:

Sample size = (distribution of 50%)/[(margin of error%/ confidence level score)²]

Confidence level = 1.96 (for confidence level of 95%), margin of error = 0.05.

True sample = (sample size × population)/ (sample size + population – 1)

The calculated sample size was equal to 746 which were rounded equal to 750 dentists. Accordingly, the questionnaire link was sent via emails & social media.

Methodology

The questionnaire used for this study was composed of demographic/practice-related, closed end, and Likert five-point scale questions. The questionnaire has two parts, Part 1 contains 24 questions & these questions were divided into four sections: Section 1 - designed to collect demographic/practice-related variables of the respondents. Section 2, questions 1 to 6 - intended to assess the anxiety among dentists deriving from the COVID-19 infection. Section 3, questions 7 to 15 - designed to evaluate the practice modification about the precautions and infection-control measures for COVID-19 infection. Section 4, questions 16 to 24 - consisted of questions that explored the economic impact of COVID-19 on dental practice. Part 2 contains WHOQOL-BREF questionnaire having 20 questions which addresses four domains of QOL which are physical, psychological, social relationships, and environmental areas. The physical domain includes pain and discomfort facet, and it assesses the physical condition of a person and how it interferes with his/her daily life activities. The psychological domain examines how often a person experiences positive and negative perceptions and what impact they have on a person's daily functioning. The social domain addresses the personal relationships and social support a person has and their impact on his/her life. The environmental domain includes physical safety facet which examines if a person feels secure from any physical harms.

Statistical Analysis

Data was analyzed using the Statistical Package for Social Sciences (SPSS) version 22.0 statistical software. Descriptive statistics, Kappa statistics, Chi-square and ANOVA were used. The statistical significance was set at 5% level of significance ($p < 0.05$).

RESULT

Demographic distribution in the study shows gender & education wise distribution of study participants which was almost 1:1. General practitioners & specialists were almost equally distributed in the study. More than 90% of the participants are clinicians & all of them were private practitioners. (Table 1) Table 2 depicts anxiety, practice modification & economic impact on dentists during COVID outbreak. All participant dentists mentioned that they had an anxiety of being infected with COVID – 19 by a patient or co-worker & they were afraid to provide any treatment especially if a patient is coughing or suspected to be infected. They even mentioned to be anxious to talk in close proximity with patients as they may carry the infection back to family. This anxiousness was reported to be more when they heard about their co-worker or colleague being infected but all were updated with the WHO guidelines for cross-infection control for COVID – 19. All most all dentists mentioned that they asked every patient regarding the COVID history and checked temperature before treatment, increased the infection control procedure during the pandemic. All most all dentists got tested for COVID – 19 as a precautionary measure & knew whom to contact if they come across the infection. All routinely followed washing hands with soap & water /use of sanitizer before & after treatment of every patient which is reported to be continued till today. 78% of the dentists mentioned that their practice schedule was changed to make it safer for them & patient during the pandemic but still 81% of them reported that there was a drop in 25% of the patients. At the same time 62% of the dentists reported that they cancelled appointments for non – urgent cases as a part of precaution protocol. 80% of them mentioned they reduced staff numbers in their clinic & even the working days were reduced to 100% especially during the outbreak. All this

**Mythri et al.,**

lead to severe economic crisis for a dentist during the period but there was no financial compensation by either Government or Non-Government agencies. All most all the dentists faced the increased economic burden to update / modify the clinic for their & patients protection at the same time patient in flow was also reduced leading to difficulty to sustain during the phase. Table 3 depicts impact of COVID outbreak on quality of life of dentists which was measured using WHOQOL-BREF questionnaire. 49% of them answered their quality of life was bad, 92% were dissatisfied by themselves & 24% expressed even personal relationships were affected. 74% of them were neutral to mention whether they were satisfied by their health & to what extent the physical pain prevented them from what they need to do. 68% were dissatisfied by the conditions of their living place & about 95% of them had faced negative feelings such as bad mood, anxiety & depression at different frequencies but 62% of dentists mentioned they got support from their friends.

DISCUSSION

In the current study, the participant dentists mentioned the COVID-19 pandemic changed their career perspectives and almost all feared of getting exposure to COVID-19 while performing their profession this was similar to post graduate students perception from Turkey.[2] Acute anxiety levels of the students were recorded mild to highest which was similar to all current study participants.[2] A study conducted post COVID among Iraqi dentists showed more than 80% of participants reported anxiety of catching COVID-19 similar to the present study. The recorded anxiety level was higher amongst younger dentists and females which was common to both genders in current study. Awareness and practice levels among these dentists of precautions and infection-control measures associated with COVID-19 (100%) was found to be high similar to study conducted by Mahdee AF *et al.*[3] With respect to the economic impact, about 75% of practitioners, regardless of demographical variables, reported that their income had declined by about 50% similar to Iraqi dentists.[3] A comprehensive, cross-sectional survey conducted among 875 Polish dental practitioners showed 71.2% of dentists who responded to the questionnaire decided to suspend their clinical practice similar to dentists in the current study.[4] This may be due to respondents' perceptions of the risk of COVID-19 contraction and a general feeling of anxiety and uncertainty regarding the COVID-19 situation.[4] The quality of life (QOL) of dental professionals rated by participated dentists as good was only 19% which was more in the Eastern Province of Saudi Arabia (75%) which may be due to the support system present there. The social relationship domain was better similar to Nabras A *et al.*[1] The qualifications and years since graduation were important determinants of QOL among dental professionals which was noted in the current study as well. The quality of life (QoL) and limitations were experienced due to pandemic management-related measures during the first lockdown after the coronavirus outbreak. A study among Slovakian dentists showed worsening of QoL happened because of information overload and several pandemic-related limitations. The increase in economic burden can be due to reduced patient flow, restricted timings, infection risks in the work environment, obligatory safety measures, lack of staff and client concerns. Overall pandemic management has led to a considerable worsening of dentists' QOL in Iraq³ and Slovak dentists⁵ similar to dentists of Karnataka.

CONCLUSION

The healthcare providers are susceptible to occupational risks that can affect their quality of work through exposure to chemicals, radiations, physical, and psychosocial hazards. Therefore, the World Health Organization (WHO) selected healthcare providers as a priority group for the improvement in their workplace health and safety in the work plan 2009–2012. But, COVID - 19 laid many challenges for a dentist compromising their quality of life with increased economic burden. Hence, high quality dental care and patient satisfaction in turn requires physical and mental efforts of the dentist, and this makes QOL a vital concept in today's dental practice.

ABSTRACT

The oxidation of formic acid plays a pivotal role in advancing fuel cell technology, with Pt recognized as a potent electro catalyst for this reaction. However the persistent issue of CO poisoning on the Pt surface during the reaction has driven significant research efforts.CO adsorption on Pt catalyst hampers catalytic activity and efficiency. In this presentation, we delve into the challenge of CO poisoning and the strategies employed to mitigate its effects. The issue of CO poisoning on the catalyst surface can be reduced by incorporating a second metal, such as Ru, Sn, Pd, or Mo, alongside Pt. Among various bimetallic catalysts, Pt–Ru stands out as particularly effective in enhancing the kinetics of the formic acid oxidation reaction. This is largely because Ru promotes the generation of oxygen-containing species at lower potentials compared to Pt, which subsequently assists in oxidizing CO molecules on nearby sites, converting them into CO₂. To minimize the use of Pt, it is advisable to disperse it on an appropriate support in the form of nanoparticles. This dispersion increases the effective surface area of the Pt catalyst, thereby enhancing the efficiency of the methanol oxidation process. Conducting polymers can act as excellent scaffolds for the high dispersion and anchoring of metal nanoparticles, providing a large surface area and offering protection against catalyst fouling. Investigation of the electrocatalytic properties of the

**Jagadish Chandrabose et al.,**

PoPD-Pt-Runanocomposite electrode for formic acid oxidation using linear sweep and cyclic voltammetry. The Pt-Ru ion concentration ratios in the electrodeposition bath were varied as 1:0.25, 1:0.5, 1:1, 1:2, and 1:4. Scanning electron microscopy (SEM) results were used to determine the shape and particle size of the nanocomposites. The PoPD-Pt-Ru (1:1) film has the highest current among the PoPD-Pt-Runanocomposites that have been examined. Using the peak current information from the cyclic voltammetry the PoPD-Pt-Ru (1:1) nanocomposite shows the lowest level of surface poisoning. However, the reverse peak current magnitude, or the forward-to-reverse peak current ratio (I_f/I_r), serves as an indicator of the catalyst's performance. A higher (I_f/I_r) value corresponds to better catalytic activity. The stability and polarization statistics support the conclusions.

Keywords: Poly(o-phenylenediamine) , Electrocatalyst, Pt-Ru nanoparticles, Formic acid oxidation

INTRODUCTION

The continuous exploration of innovative electrocatalysts for the oxidation of formic acid remains of significant interest, primarily due to their vital role in enhancing fuel cell performance and advancing sustainable energy technologies. Among various electrocatalysts, Platinum (Pt) has been identified among the most effective catalysts for formic acid oxidation. Carbon monoxide (CO), an intermediate produced during the reaction, poisons the Platinum (Pt) surface, posing a serious threat to the formic acid oxidation process. The effectiveness of the catalyst is dramatically decreased by CO adsorption on Pt sites. To mitigate this issue, the incorporation of a secondary metal, such as ruthenium (Ru), tin (Sn), palladium (Pd), or molybdenum (Mo), into Pt-based catalysts has proven to be effective. Bimetallic catalysts, particularly Pt-Ru exhibits significant effectiveness in enhancing the kinetics of formic acid oxidation. This enhancement is attributed to Ru's ability to produce oxygen-containing species at lower potentials than Pt. These oxygen species aid in the oxidation of CO molecules on adjacent Pt sites, converting them into CO_2 , thereby mitigating surface poisoning. To enhance the execution of the catalyst, a strategy has been proposed to reduce the Pt content by dispersing it as nanoparticles on an appropriate support material. This dispersion strategy not only reduces the quantity of expensive Pt required but also increases the active surface area for catalysis, playing a crucial role in determining the efficiency of the reaction and improving the overall efficiency of the process. Conducting polymers, such as poly(o-phenylenediamine) (PoPD), are promising scaffolds for dispersing and anchoring metal nanoparticles. These polymers ensure continuous catalytic activity by offering a high surface area and shielding the catalyst from fouling.

Using cyclic voltammetry and linear sweep techniques, PoPD-Pt-Runanocomposite electrodes have undergone the subject of electrochemical research for the oxidation of formic acid. The ratio of Pt to Ru ions in the electrodeposition bath has been systematically varied (1:0.25, 1:0.5, 1:1, 1:2, and 1:4) to examine how the composition affects catalytic activity. The scanning electron microscopy (SEM) data reveal the morphology and particle diameter of the resulting nanocomposites. Among the various PoPD-Pt-Ru compositions, the PoPD-Pt-Ru (1:1) nanocomposite exhibits the highest forward peak current, indicating superior catalytic activity. The ratio of forward to reverse peak current (I_f/I_r) serves as a metric for evaluating catalyst performance, with higher values reflecting reduced surface poisoning and improved catalytic efficiency. Polarization and stability studies validate the PoPD-Pt-Ru (1:1) nanocomposite's superior capacity to minimize surface poisoning, as seen by the cyclic voltammetry data. In addition to its role in enhancing the kinetics of formic acid oxidation, Ru also influences the structural and electronic properties of the Pt catalyst. Furthermore to preventing CO poisoning, the contact between Pt and Ru fosters improved electron transport and formic acid adherence on the catalyst surface. Moreover, the utilization of conducting polymers as supports can significantly improve the stability and durability of the catalyst, making it more resistant to degradation during long-term operation. As Well As consequently, the efficiency of the electrocatalysts for HCOOH oxidation can

be greatly improved by adjusting the composition of Pt and Ru and using conducting polymers like PoPD as supports, opening the door to more effective fuel cell technologies.

Experimental section

After recrystallization from hot water *o*-phenylenediamine (s.d. fine) was employed Chloroplatinic acid ($\text{H}_2\text{PtCl}_6 \cdot 6\text{H}_2\text{O}$), sodium sulfate, ruthenium chloride ($\text{RuCl}_3 \cdot 3\text{H}_2\text{O}$) H_2SO_4 (s.d fine) of analar grade were utilized. The EG&G, PAR Model 263A Potentiostat/Galvanostat was used to conduct the electrochemical tests. Three electrode spaces were provided by a one-compartment cell. After polishing with fine-alumina, a glassy carbon electrode with an area of 0.07 cm^2 (Electro chemical analyser, USA) was employed, and it was sonicated in water for several minutes. The reference and counter electrodes consisted of a saturated calomel electrode (SCE) and a platinum foil (1 cm^2), respectively. Every electrochemical experiment was conducted in a N_2 environment. By cycling the potential at 50 mV s^{-1} between -250 and $1,050 \text{ mV}$ versus SCE, PoPD was electro deposited on glassy carbon electrode (GCE) from a nitrogen-purged aqueous electrolyte solution comprising $5 \times 10^{-2} \text{ M}$ monomer and $0.2 \text{ M Na}_2\text{SO}_4$ at pH 1. In every experiment, a thin film created using ten deposition cycles was employed. The following protocols are utilized to deposit Pt and Pt-Ru nanoparticles on PoPD film. The electro reduction $\text{H}_2\text{PtCl}_6 \cdot 2\text{H}_2\text{O}$ (2.4 mM) in $0.2 \text{ M Na}_2\text{SO}_4$ at pH 1 was used to load Platinum (Pt) on the PoPD film. The electrode that is produced is called PoPD -Pt. After being dissolved in $0.2 \text{ M Na}_2\text{SO}_4$, a solution comprising $2.4 \text{ mM H}_2\text{PtCl}_6 \cdot 2\text{H}_2\text{O}$ and $x\text{RuCl}_3 \cdot 3\text{H}_2\text{O}$ ($0.6 \text{ mM} < x \leq 6 \text{ mM}$) was used to electroplate the Pt–Ru nanoparticles on the PoPD. The Pt to Ru ion concentration ratio is indicated in parentheses for each of the following designations: (1:0.25), (1:0.5), (1:1), (1:2), and (1:4). Using a potentiostatic technique, Pt and Pt-Ru nanoparticles were electrodeposited at a selected potential of $+250 \text{ mV}$. Assuming 100% coulombic efficiency and considering Pt as the sole metal deposited, a charge of 200 mC cm^{-2} was employed, which corresponds to the deposition of $100 \mu\text{g cm}^{-2}$ of Pt. A scanning electron microscopy (SEM) (Shimadzu, 8400S) was utilized to ascertain the structure of PoPD film and its metal nanocomposites.

RESULTS AND DISCUSSION

Direct formic acid fuel cells represent a potentially transformative energy source for portable applications, primarily owing to the convenience of fuel transport and processing [1,2]. Even though adsorbed CO, an intermediate created during the electrochemical oxidation of formic acid, poisons Pt, it is still the favored electrocatalyst for this process. Ru's ability to convert CO into CO_2 can minimize CO adsorption at the Platinum (Pt) electrode surface [3]. This study compares the PoPD-Pt-Ru nanocomposite's electrocatalytic efficacy for formic acid oxidation to that of the PoPD-Pt nanocomposite.

The Electrocatalytic Properties of PoPD-Pt-Ru Nanocomposites: Synthesis of PoPD

PoPD's electrochemical synthesis and several technique-based characterization have been extensively documented in the literature [1, 2–6]. A small modification of the method is used in this study to obtain PoPD film on a Pt substrate [1]. The electrolyte is composed of $0.2 \text{ M Na}_2\text{SO}_4$ and $50 \text{ mM o-phenylenediamine}$, which has been brought to pH 1 by adding concentrated H_2SO_4 . By cycling the potential between -250 and $+1050 \text{ mV}$ at 50 mV s^{-1} for ten cycles, the PoPD is deposited on a glassy carbon electrode (GCE) disc (0.0314 cm^2) (Fig. 1.1). Monomer oxidation is shown by the big peak at $+620 \text{ mV}$ in the first cycle (inset Fig. 1.1). The creation of the PoPD film on the GCE surface can be determined by the emergence of a new redox pair at lower potentials with rising current amplitude during cycling.

The FT-IR spectrum of the PoPD polymer sample that was synthesized electrochemically is shown in Figure 1.2. As indicated in Table 1.1, The distinct bands are attributed to specific stretching and bending vibrations, with the data showing exceptional alignment with those reported in the literature by other authors for PoPD. [4, 5, 6, 7]. The appearance of a band at 840 cm^{-1} , which is suggestive of a 1,2,4,5-tetra-substituted benzene ring, is the notable finding. Scheme 1 depicts the ladder structure built up of phenazine rings that has been assigned to PoPD.

Preparation of PoPD-Pt-RuNanocomposite

The following procedures outline the methods for depositing Pt and Pt-Ru nanoparticles on PoPD film. At the PoPD-modified GCE (PoPD/GCE), Pt is loaded via electroreduction of 2.4 mM $\text{H}_2\text{PtCl}_6 \cdot 2\text{H}_2\text{O}$ in 0.2 M Na_2SO_4 at pH 1. Pt-Ru nanoparticles are electrodeposited on the PoPD/GCE using a solution containing $\text{RuCl}_3 \cdot 3\text{H}_2\text{O}$ ($0.6 \text{ mM} < x \leq 9.6 \text{ mM}$) and 2.4 mM $\text{H}_2\text{PtCl}_6 \cdot 2\text{H}_2\text{O}$ in 0.2 M Na_2SO_4 . A potentiostatic method is applied for the electrodeposition of Pt and Pt-Ru nanoparticles, with a preferred deposition potential of +250 mV. number can be seen by the numbers in the visual representation. First cycle shown in the inset. A charge of 200 mC cm^{-2} is applied, which, assuming 100% Coulombic efficiency and Pt as the only metal deposited, results in the deposition of $100 \mu\text{g cm}^{-2}$ of Pt. The Pt-to-Ru ion concentration ratio is indicated in parentheses for each of the nanocomposite electrodes, named as PoPD-Pt, PoPD-Pt-Ru (1:0.25), PoPD-Pt-Ru (1:0.5), PoPD-Pt-Ru (1:1), PoPD-Pt-Ru (1:2), and PoPD-Pt-Ru (1:4). The *i-t* curves for the potentiostatic deposition of Pt and Pt-Ru nanoparticles on PoPD/GCE, leveraging distinct concentration ratios of $\text{H}_2\text{P}_2\text{I}_6 \cdot 2\text{H}_2\text{O}$ and $\text{RuCl}_3 \cdot 3\text{H}_2\text{O}$, are shown in Figure 13. The *i-t* curve obtained in the $\text{H}_2\text{P}_2\text{I}_6 \cdot 2\text{H}_2\text{O}$ solution distinct drastically from those obtained in solutions containing both $\text{H}_2\text{P}_2\text{I}_6 \cdot 2\text{H}_2\text{O}$ and $\text{RuCl}_3 \cdot 3\text{H}_2\text{O}$ for a deposition charge of 200 mC cm^{-2} in that, for Pt-Ru deposition, the duration needed to pass a total charge varies according to the concentration of $\text{RuCl}_3 \cdot 3\text{H}_2\text{O}$ in the electrolyte, with approximately 1000 seconds required for Pt-only deposition. While the deposition sequences exhibited minor differences at Pt-to-Ru ion concentration ratios up to 1:1, a significant enhancement in steady-state currents was observed at concentration ratios of 1:2 and 1:4, suggesting that the deposition of Ru surpasses that of Pt.

Characterization of PoPD-Pt-RuNanocomposite

Figure 1.4 At a scan rate of 50 mV s^{-1} in 0.2 M Na_2SO_4 at pH 1, the cyclic voltammograms of the PoPD-Pt and PoPD-Pt-Ru nanocomposites are presented. Notably, the voltammogram of the PoPD-Pt-Ru (1:0) nanocomposite (Fig. 1.4 A) reveals distinctive peaks in the hydrogen region. The deposition of Pt particles on the layer of the PoPD film is demonstrated by distinct characteristics observed across several potential ranges: from -250 to +150 mV, within the double-layer charging region (+150 to +375 mV), and in the oxygen zone (+375 to +800 mV) [8]. These characteristics provide clear evidence of Pt particle presence on the PoPD film surface. In the nanocomposites with higher concentrations of ruthenium chloride (PoPD-Pt-Ru (1:1), PoPD-Pt-Ru (1:2), and PoPD-Pt-Ru (1:4)), the hydrogen adsorption-desorption peaks remain pronounced; however, the peak at -250 mV becomes indistinguishable. Moreover, increasing the Ru concentration causes a negative shift in the oxide reduction potential and broadens the double-layer charging regions. This behavior is likely a result of the formation of Ru-OH species on the catalyst surface, due to Ru's hydrophilic properties. These findings are consistent with earlier studies on Pt-Ru alloy electrodes. [9–12].

The Electrocatalytic Oxidation of Formic Acid: Insights and Advances

The electrocatalytic performance of PoPD-Pt and bimetallic PoPD-Pt-Ru nanocomposites in the formic acid oxidation was assessed using a 0.5 M formic acid solution in 0.2 M Na_2SO_4 at pH 1, utilizing cyclic voltammetry and chronoamperometry. Figure 1.5 A illustrates the cyclic voltammogram for the oxidation of formic acid on the PoPD-Pt electrode using a scan rate of 5 mV s^{-1} , revealing distinct peaks that correspond to formic acid oxidation in both the forward and reverse scans. Notably, two anodic peaks appear at +295 mV and +570 mV during the forward scan, which align with the characteristics associated with formic acid oxidation on Pt electrodes [13]. The initial peak at -290 mV signifies the direct oxidation pathway of formic acid to CO_2 , while the peak at +570 mV indicates the oxidation of CO species adsorbed on the Platinum (Pt) surface due to the non-faradaic dissociation of formic acid, representing the indirect pathway. During the reverse sweep, a crest at +323 mV further corroborates the direct oxidation of formic acid without CO poisoning across the catalyst surface. The tolerance of the catalyst to CO poisoning can be quantified by calculating the I_f/I_r ratio, which compares the crest current of the first forward peak (I_f) with that of the reverse peak (I_r). For the PoPD-Pt electrode, an I_f/I_r ratio of 0.2 indicates that CO adsorption initially poisons 80% of the catalytic surface. In contrast, the PoPD-Pt-Ru (1:0.25) electrode exhibits a markedly different voltammetric response, as depicted in Figure 1.5 B. Here, the anodic and cathodic scans reveal a single oxidation peak current for formic acid oxidation, with a cathodic peak potential of +544 mV, shifted relative to that of the PoPD-Pt electrode."

Jagadish Chandrabose *et al.*,

This clarifies the comparison between the peak potentials of formic acid oxidation and the PoPD-Pt electrode. The lack of a second peak at a more positive potential indicates diminished CO formation or adsorption during the electro-oxidation process. Moreover, the close similarity between the oxidation and reduction peak currents suggests a well-balanced electrochemical reaction, evidenced by an I_f/I_r ratio close to 0.9, reinforces the exceptional tolerance of this catalyst to CO adsorption, this suggests that the primary contribution to the voltammetric current arises from the direct oxidation of formic acid to CO_2 . The PoPD-Pt-Ru (1:1) film exhibits the greatest electrochemical response among the PoPD-Pt-Ru nanocomposites examined (Fig 1.6). In contrast, catalyst performance can be assessed by analyzing the magnitude of the reduction peak current or the ratio between the oxidation and reduction peak currents (I_f/I_r). A higher I_f/I_r ratio reflects improved catalytic activity. Based on cyclic voltammetry peak current data, the PoPD-Pt-Ru (1:1) nanocomposite shows the least surface poisoning, indicating superior catalytic efficiency. (Table 1.2).

Kinetic analysis

Kinetic analysis for formic acid oxidation made by Butler Volmer and Tafel equations. A brief introduction of both of these equations is given below.

Exchange current density (i_0)

Butler [14] originally laid out the notion of exchange current density in electrode kinetics. As early as 1938, Bowden and Agar listed the exchange current density in a review [15]. Papers by Eyring, Glasstone and Laidler [16], Rojter, Juza and Poluyn [17], and Dolin and Ershler [18] all cited exchange current in the early years. Dolin and Ershler [18] also invented the phrase "exchange current." The choice of the name 'exchange current' was very apt because there is an exchange between the electrode and the solution which can easily be demonstrated for a metal-amalgam and metal-ion electrode by labeling the metal in one other the phases by a radio tracer. When the amalgam contacts the metal ion solution, the tracer rapidly transitions to the other phase, assuming the exchange current is sufficiently high, despite the absence of any net current at the electrode/solution interface. The exchange current density is calculated by multiplying an electrochemical specific rate constant with a concentration term. Consequently, while i_0 is helpful in comparing the catalytic activity of various electrode materials (electrocatalyst) for a particular reaction, it will not aid in the mechanism determination. To empirically determine the exchange current density, the linear portion of the $\eta/\log i$ plot is extrapolated to the reversible potential, where η equals zero. Additionally, the isotope exchange rate can be employed for a direct measurement of i_{0i_0i0} ; however, due to the labor-intensive nature of this method, it is seldom utilized.

Tafel slope (b)

Tafel proposed a fundamental correlation between overpotential (η) and current density.

[19] in 1905 on the basis of experimental investigations on the hydrogen evolution reaction. This is known as Tafel equation

$$\eta = a - b \log i \quad (1.1)$$

The overpotential (η) is a key concept in electrochemistry, Defining the departure from equilibrium states in an electrochemical reaction. It is calculated as the difference between the actual potential (E) observed when a current passes through the electrode-electrolyte interface and the reversible potential (E_r), which is the theoretical potential under equilibrium when no current flows. This deviation arises due to various kinetic factors, such as activation barriers and concentration gradients that impede the ideal, reversible reaction pathway. In practical systems, overpotential is critical in determining the efficiency and rate of electrochemical processes, with higher overpotentials indicating greater energy losses.

$$\eta = E - E_r \quad (1.2)$$

The variable 'b' is known as Tafel slope

$$b = \pm \left(\frac{\delta \eta}{\delta \log i} \right)_{T, P, \mu} \quad (1.3)$$

Jagadish Chandrabose *et al.*,

The value of the variable 'b' is determined by the specific mechanism of electrode reactions, and experimentally measuring this Variable serves as a crucial method for analyzing and understanding the underlying reaction mechanism. The Tafel slope is obtained from the linear region of a plot of overpotential (η) versus the logarithm of the current ($\log i$). Each unique combination of chemical pathways and the rate-determining step produces a specific Tafel slope value, as indicated in Table 1.3. Nevertheless, various distinct processes often lead to the same Tafel slope (b) value. Therefore, slope by itself, like any other kinetic characteristic, cannot be utilized to ascertain a reaction's mechanism.

Determination of kinetic parameters

Transfer coefficient / symmetry factor

Electrochemical reactions possess the unique capability to regulate reaction rates across a broad range by merely altering the applied potential at the metal-electrolyte interface, without the need to change the temperature. This allows precise rate control under stable thermal conditions. The overpotential, representing the excess potential beyond the equilibrium value, is not fully efficient in driving the reaction. Only a fraction, denoted as α , contributes to accelerating the reaction in a specific direction, while the remaining portion does not directly influence the reaction's progress. This fraction, known as the transfer coefficient (α), possesses a unique value corresponding to each electrochemical reaction [20]. It serves as a crucial parameter in electrode kinetics, influencing the reaction dynamics. The transfer coefficient can be determined through various methodologies.

Tafel slope method

The classical approach remains, by far, the most dependable method for slow electron transfer reactions.. For anodic and cathodic reactions, α is obtained using equations

$$\frac{1}{b_c} = \frac{\alpha_c (nF)}{RT} \quad (1.4)$$

Here α_c is the transfer co-efficient for the cathodic reaction and

$$\frac{1}{b_a} = \frac{\alpha_a (nF)}{RT} \quad (1.5)$$

Here α_a is the transfer co-efficient for the anodic reaction

The above method can be applied for fast electrode process, provided mass transfer polarization effects are eliminated and Tafel slope free of such contribution is used. For this appropriate transients under galvanostatic, potentiationstatic or coulometric conditions must be obtained. By suitable extrapolation based on solution provided for mass transfer problems, the plot without mass transfer can be obtained and hence α . The transfer coefficient (α) can be determined experimentally using a straightforward approach. When the electrode reaction proceeds at a relatively slow rate and exhibits a low exchange current density, a steady-state potential can be established for a given applied current density, without the influence of diffusion, thus avoiding the generation of concentration overpotential. In these conditions, the flow of steady-state current density results solely in an activation overpotential, which is readily measurable. By applying a series of current densities, one can create plots of $\Delta\phi$ versus $\log i$ and η versus $\log i$. The slope of these plots, obtained under constant reaction concentrations, provides the value of α through established equation.

$$\frac{dE}{d \log i} = \frac{2.3 RT}{\alpha F} \quad (1.6)$$

Where α denotes transfer coefficient for the backward reaction.

$$\frac{dE}{d \log i} = \frac{2.3 RT}{\alpha F} \quad (1.7)$$

Where α denotes transfer co-efficient for the forward reaction.

For simple reaction, the transfer co-efficient alone may occasionally give some information regarding the mechanism of reaction.

Jagadish Chandrabose *et al.*,

Tafel plots, based on the linear sweep voltammetry data to extract the Tafel slopes and exchange current density (i_0) values for various electrodes, utilizing the following equation.[21].

$$\eta = a + b \log I \quad (1.8)$$

where

$$b = \frac{RT}{\alpha nF} = \frac{60 \text{ mV/dec}}{\alpha} \quad (1.9)$$

and α is the transfer coefficient which may be obtained using

$$\alpha = \frac{\gamma}{\nu} + q\beta \quad (1.10)$$

where γ is the number of steps preceding the rate determining step, ν is the stoichiometric coefficient (1 for the given mechanism), q equals 0 for chemical steps and 1 for electron transfer steps, and β is the symmetric factor, which is 0.5 for most systems of interest [22]. Figure 1.7 The Tafel plots related to the PoPD-Pt and PoPD-Pt-Ru nanocomposites are illustrated. For PoPD-Pt, a Tafel value of 118 mV/dec was observed, closely matching the theoretical value expected for the one-electron transfer reaction's rate-limiting step. (Eq. 1.1) [23]. The changes in the electrocatalyst surface properties likely explain the increase in Tafel slopes for the PoPD-Pt-Ru nanocomposite electrodes, which gradually rise from 118 to 168 mV/dec as the Ru content increases. This trend indicates a substantial impact of Ru concentration on the catalytic performance and effectiveness of the nanocomposites. In comparison, Tafel slopes for formic acid oxidation in bulk Pt-Ru alloys have been reported to range between 180 and 195 mV/dec, highlighting different catalytic mechanisms in these systems.[25]. The intercepts of the Tafel plots are instrumental in determining the exchange current density value (i_0). The i_0 values obtained at the PoPD-Pt-Ru electrodes are larger compared to that at the PoPD-Pt electrode. Among the PoPD-Pt-Ru electrodes, the exchange current density (i_0) rises steadily until it reaches the PoPD-Pt-Ru (1:1) electrode. Beyond this point, i_0 decreases with the further addition of ruthenium (Ru) content. The catalyst configuration of PoPD-Pt-Ru (1:1) achieves a peak exchange current density (i_0) of 42 $\mu\text{A}/\text{cm}^2$, indicating optimal electrocatalytic performance. In contrast, an increase in Ru content results in a lower (i_0), a pattern widely reported in the literature. This decline in catalytic activity is attributed to the incorporation of additional Ru atoms, which leads to a dilution of the available Pt surface sites necessary for effective catalysis. As Ru replaces Pt sites, the overall efficacy of the catalyst is compromised.[25]. The optimal composition of Pt and Ru nanoparticles dispersed on PoPD, which promotes rapid kinetics in the tested electrodes, can be ascribed to an elevated exchange current density, an increased If/Ir ratio, and superior electrocatalytic performance observed in the PoPD-Pt-Ru (1:1) configuration.

Stability

Chronoamperometric analysis was employed to evaluate the long-term durability of the PoPD-Pt-Ru (1:1) electrode in formic acid oxidation, as depicted in Fig. 1.8. Performed at +400 mV over a duration of three hours, the findings reveal that the PoPD-Pt-Ru (1:1) electrode demonstrates the slowest rate of current decay and sustains the highest current density throughout the testing period. Consequently, it can be inferred that the PoPD-Pt-Ru (1:1) electrode delivers superior electrocatalytic performance for formic acid oxidation compared to its PoPD-Pt counterpart.

CONCLUSION

This review thoroughly examines the electrocatalytic performance of electrochemically synthesized PoPD-Pt and PoPD-Pt-Ru materials for formic acid oxidation. The PoPD-Pt-Ru nanocomposites, synthesized via chronoamperometry, incorporate a constant platinum content while varying the ruthenium concentrations. Their catalytic performance in formic acid oxidation is rigorously analyzed. Among the catalysts explored, the PoPD-Pt-Ru (1:1) nanocomposite outperforms the others, exhibiting the least surface poisoning, highest current output, maximum exchange current density, and improved long-term stability.

ABSTRACT

Imeglimin hydrochloride, a novel therapeutic agent, was developed along with a new class of oral antidiabetic drugs known as the Glimins which is used to treat type 2 diabetes mellitus (T2DM). Its mode of action is unique in that it improves both insulin secretion from the pancreas and insulin sensitivity in peripheral tissues through its dual effect on mitochondrial function. This dual action provides a comprehensive strategy to glycemic management by addressing insulin resistance and reduced insulin secretion, two of the key pathophysiological components of type 2 diabetes. Clinical trials have demonstrated that Imeglimin is useful in reducing blood glucose levels, and its safety profile is comparable to that of other anti-diabetic drugs. In addition to its efficacy, its distinct mode of action makes it a viable option for combination therapy with other anti-diabetic drugs to help patients with type 2 diabetes attain ideal glucose control. The fact that Imeglimin hydrochloride has been approved in Japan highlights its potential as a treatment and provides avenues for further review and approval in other global markets. As the first drug in its class, Imeglimin hydrochloride offers patients with uncontrolled diabetes the chance for improved outcomes despite available treatment options. This is a promising development in the treatment of type 2 diabetes.

Keywords: Imeglimin hydrochloride, Blood glucose, type 2 diabetes mellitus, glimins, insulin, pancreatic beta cell.

INTRODUCTION

The most common symptom of type 2 diabetes mellitus is elevated blood glucose levels. Numerous micro vascular and macro vascular problems arise from poorly managed or untreated blood glucose levels. Numerous drugs are available to manage type 2 diabetes mellitus and stop the disease's progression in order to avoid these consequences. But the majority of drugs currently on the market only address a small number of the physiological abnormalities brought on by diabetes, and they may have unpleasant side effects that make taking the drug as prescribed unlikely [1]. A novel category of oral medications for diabetes, referred to as "glimins," encompasses Imeglimin, tetrahydro triazine, (Figure 1) and various other compounds. Its mechanism of action, which targets numerous pathways to give glycaemic control, is currently understood. The possibility of discovering it was facilitated through further chemical alteration of a primary compound and testing its effects in living organisms, specifically focusing on its ability to reduce high blood sugar levels in rodents. Imeglimin has proven to be effective in lowering blood sugar levels in both Japanese and Caucasian patients with type 2 diabetes (T2D) in real-world clinical settings. It has also shown generally positive safety and tolerability profiles and a low incidence of severe hypoglycaemia in a number of clinical trials involving combinations with metformin, dipeptidyl peptidase-4 inhibitors, insulin, and other drug classes. [2-5]. In June 2021, Japan approved the first use of Imeglimin for T2D patients. The pivotal phase III TIMES program's positive results, along with a wealth of preclinical and clinical information, provided the basis for the Japanese approval [6]. Imeglimin may be a safe and helpful supplement to other drugs that are often used to treat type 2 diabetes in addition to its usual side effects because it appears to function differently from other oral anti-diabetic medicines. Clinical studies have shown that Imeglimin is effective in reducing blood glucose levels when used alone or in conjunction with other antidiabetic medications. Moreover, its unique mechanism of action suggests a low risk of hypoglycaemia, a common concern with some diabetes medications. Additionally, studies have shown potential benefits beyond glycaemic control, such as improvements in markers of cardiovascular health and renal function. In clinical trials, Imeglimin has also shown a favourable safety profile, with most reported adverse effects being moderate and temporary. Its tolerability, coupled with its mechanism of action, positions Imeglimin as a promising option for patients with T2DM who may have contraindications or intolerance to existing therapies [7, 8].

Increased hepatic glucose synthesis and decreased peripheral glucose absorption by insulin-sensitive tissues, along with higher β -cell mortality and insufficient insulin production, are the two primary pathophysiological defects in type 2 diabetes. A gradual decrease of β -cell mass and function contributes to the deterioration of glycaemic management in type 2 diabetes, which is a progressive disease [9-11]. According to cross-sectional research, around 56% of individuals with type 2 diabetes have a HbA1c $\leq 7.0\%$. But when diabetes worsens over time, glycaemic control deteriorated even further, necessitating the inclusion of more intricate insulin regimens to keep 50% of patients at HbA1c $\leq 7.0\%$. Metformin is the sole pharmacological intervention recommended for people with type 2 diabetes, along with healthy daily habits, according to the American Diabetes Association and the European Association for the Study of Diabetes. An annual failure rate of 17% has been linked to metformin therapy; however, in patients who began taking the drug within three months of receiving a type 2 diabetes diagnosis, this rate dropped to 12%. Apart from the decline in glycaemic control, the current treatments include drawbacks such as weight gain, hypoglycaemia, cardiovascular problems, and contraindications that prevent their usage [12, 13].

Physicochemical Properties

Physicochemical properties show the drug profile of imeglimin hydrochloride. It includes molecular formula, molecular weight, IUPAC name of drug, density, vapour pressure, solubility, boiling point etc. These are used to identify the drug stability, efficacy, safety and toxicity. (Table 1)

Pharmacokinetic Properties

Pharmacokinetic properties describe how the body interacts with a drug, including absorption, distribution, metabolism, and excretion. These properties influence the drug's effectiveness and potential side effects, guiding dosing and administration. (Table 2)

**Vijayalakshmi et al.,****Mechanism of Action**

Imeglimin is a unique therapeutic intervention with promising potential as a novel antidiabetic agent due to its multifaceted mechanism of action. It appears that Imeglimin either mitigates or reverses the three main pathways linked to type 2 diabetes. Among them are:

Suppression of Hepatic Glucose Production

- Imeglimin inhibits glucose synthesis in isolated rat liver cells and liver slices.
- Concentration-dependent decrease in glucose production observed in isolated cells, ranging from 9% to 80%.
- Inhibition of glucose production in liver slices was also observed, with reductions ranging from 14% to 84%.
- Imeglimin molecular effects achieved by inhibiting PEPCK and G6Pase in separated rat hepatocytes and blocking lactic acidosis via mitochondrial-dependent route [19, 20].

Stimulation of Skeletal Muscle Glucose Uptake

- Effective in muscle cell cultures, increasing glucose uptake.
- Observed at 0.5 mol/L dose, 3.3-fold increase at maximal dose (2 mmol/L).
- Significant increase in glucose absorption in streptozotocin-diabetic rats' soleus and gastrocnemius muscles.
- Uptake returned to normal at 50 mg/kg and 100 mg/kg for diabetic rats.
- Potential pathways include increased phosphorylation of protein kinase B (Akt), expression of glucose transporter-4, and control of insulin receptor substrate phosphorylation [21, 22].

Impairment of Pancreatic β -cells

- Translational medicine study shows Imeglimin improves hyperglycemia reaction in T2D patients.
- Imeglimin increases HOMA- β score, a gauge of β -cell function, compared to placebo.
- Imeglimin reduces proinsulin/insulin ratio, indicating improved β -cell activity.
- Imeglimin prevents pancreatic β -cell apoptosis and glucose-induced β -cell death, preserving functional β -cell mass.
- In absence of cytokines, Imeglimin lowers basal apoptosis in rat pancreatic β -cells by 10%.
- In presence of cytokines, Imeglimin reduces apoptotic cell death by 37% and 25%.
- Imeglimin has strong protective effect against glucose-induced toxicity [23].

Additional Effects

- Imeglimin regulates mitochondrial function, reduces reactive oxygen species, and protects cells from apoptosis.
- Study shows improved cardiac performance and increased tissue perfusion in left ventricle.
- Improvements associated with reduced albuminuria, increased coronary artery endothelium-dependent relaxation, decreased ROS generation, and decreased renal interstitial fibrosis.
- Rates of tubular damage and interstitial inflammation remained unchanged [1, 24].

Medicinal Uses

It is mainly used in the treatment of type 2 diabetes mellitus. Imeglimin is intended to address certain glucose metabolism flaws. It's a member of the class of drugs known as dpp-4 inhibitors, sometimes known as gliptins. It helps your body produce more insulin after a meal and helps stop your body from releasing too much glucose, or sugar, into the bloodstream. It lowers your body's blood glucose levels in this way. By doing this, major diabetes problems like renal failure and blindness are less likely to occur. Increasing insulin sensitivity, lowering gluconeogenesis, boosting β -cell activity, boosting mitochondrial function, and lowering oxidative stress are some advantages of these pathways to enhance glucose homeostasis [25]. It functions in two ways: 1) it increases the amount of glucose-stimulated insulin secretion (gsis) and preserves cell mass; 2) it improves insulin action, which may include a decrease in the amount of glucose produced by the liver and an increase in insulin signalling in the muscle cells of the skeleton and liver [26].

Following are a few typical drug applications for the treatment of type 2 diabetes:

1. Oral antidiabetic medications
2. Insulin therapy

3. Combination therapy
4. Blood pressure and cholesterol
5. Lifestyle modifications [27]

ADVERSE DRUG REACTIONS

Imeglimin hydrochloride, also known as Imeglimin HCL, has the potential to cause negative effects like any medicine, albeit not everyone will. Imeglimin HCL adverse effects that could occur include:

1. Symptoms related to the digestive system: they may include bloating, diarrhoea, vomiting, and nausea. These are some of adverse effects that are most frequently observed [28].

2. Hypoglycaemia (low blood sugar): similar to related Antidiabetic drugs, Imeglimin HCL may occasionally result in hypoglycaemia, particularly when taken with insulin or other glucose-lowering treatments.

3. Allergic responses: Imeglimin HCL may occasionally cause allergic responses in people. These reactions can include rash, itching, swells, or trouble breathing. As soon as there are any indications of an allergic response, you should get medical help.

4. Headache: Imeglimin HCL may cause migraines in certain individuals [29].

5. Dizziness: some people who use Imeglimin HCL may experience light-headedness or drowsiness.

6. Elevated liver enzymes: Imeglimin HCL occasionally causes a rise in liver enzymes, which may be a sign of injury or damage to the liver. Throughout medication, liver function may need to be monitored [30].

7. Other side effects: joint discomfort, upper respiratory tract infections, and infections in the urinary tract are less frequent side effects that may occur.

Contraindications

Imeglimin hydrochloride, also known as Imeglimin HCL, has certain contraindications and may not be appropriate for all patients. A medicine should not be administered under certain circumstances or conditions, known as contraindications. Imeglimin HCL contraindications include the following:

1. Hypersensitivity: this drug should not be used by anyone who has been found to be allergic to Imeglimin HCL or either of its constituents [31].

2. Severe renal impairment: the kidneys are the main organs in the body that remove Imeglimin HCL. Imeglimin HCL should thus not be used by those with significant renal impairment (egfr < 30 ml/min/1.73 m²) because of the possibility of drug build-up and an elevated risk of side effects.

3. End-stage renal disease: since both the safety and effectiveness of Imeglimin HCL have not been demonstrated in this group of patients, it is not recommended for those with end-stage renal disease, also known as esrd, who need dialysis.

4. Breastfeeding and pregnancy: it is unknown if Imeglimin HCL is safe to use during these times. Therefore, until the possible benefits exceed the risks when done under the supervision of a healthcare provider, it ought to be avoided by pregnant or nursing women [32].

5. Paediatric demographic: because there is insufficient information about the safety and effectiveness of Imeglimin HCL in this demographic, it is not advised for use in kids and adolescents below the age of 18. [33].

6. Severe hepatic impairment: although the liver is the primary organ involved in the metabolism of Imeglimin HCL, taking it in people with hepatic impairment is usually not contraindicated. However, those who have profound liver damage may need to alter their dosage and exercise caution. People who are thinking about using Imeglimin HCL or who have been offered it should talk to their healthcare professional about their medical conditions, including any pre-existing diseases or medications they are currently taking. This makes it easier to make sure the drug is suitable and secure for their particular circumstance [34-36].

Drug Interactions

Drug-Drug Interactions: Imeglimin interacts with an anti-depressant (bupropion), drugs used to treat glaucoma, antibiotics (cephalexin, ciprofloxacin), anti-acidity drugs (cimetidine), heart condition drugs (digoxin), anti-epileptic drugs (topiramate, lamotrigine), and heart-related chest medicine (ranolazine) [37].

**Vijayalakshmi et al.,**

1. Hypoglycaemia Risk: Combining multiple antidiabetic medications, such as insulin, sulfonylureas (e.g., glipizide, glyburide), or meglitinides (e.g., repaglinide), can increase the risk of hypoglycaemia (low blood sugar).
2. Liver Enzyme Interactions: Certain Antidiabetic medications, like thiazolidinediones (e.g., pioglitazone), can affect liver enzyme levels and may interact with drugs metabolized by the liver [38].
3. Drug Interactions with Oral Antidiabetic Agents: Some medications can alter the effectiveness of oral antidiabetic agents, including metformin, DPP-4 inhibitors (e.g., sitagliptin), SGLT2 inhibitors (e.g., empagliflozin), or GLP-1 receptor agonists (e.g., liraglutide) [39].
4. Beta-blockers: Non-selective beta-blockers (e.g., propranolol) can mask the symptoms of hypoglycaemia, making it harder for individuals to recognize low blood sugar levels [40].
5. Corticosteroids: Corticosteroids can increase blood sugar levels and counteract the effects of antidiabetic medications [41].
6. Diuretics: Thiazide diuretics, such as hydrochlorothiazide, can increase blood sugar levels and may require adjustments to antidiabetic medication dosages [42].
7. Certain Antibiotics: Some antibiotics, particularly fluoroquinolones and macrolides, may affect blood sugar levels and require monitoring in individuals taking antidiabetic medications [43-44].

Marketed Formulation

The different solid-tablet dosage forms that are available from various pharmaceutical companies are listed here. The dosage, price, brand name, and company name are all included in each entry. These tablets are available in a variety of doses ranging from 500mg to 1000mg and are made by firms such as Zydus Life Science Limited, Lupin Ltd, Zydus Healthcare Ltd, La Renon Healthcare Pvt Ltd, Zuventus Healthcare Ltd, and Sumitomo Dainippon Pharma Co. Ltd. Prices differ between brands and dosages, giving customers options according to their requirements and financial constraints. (Table 3)

Clinical Studies

Clinical trials are investigations conducted on humans to evaluate a medicinal, surgical, or behavioral intervention. Researchers mostly use these studies to assess the safety and efficacy of novel treatments in humans. Clinical trials have been conducted for Imeglimin Hydrochloride, and the following table summarizes the information that has been obtained from the trials. (Table 4)

Analytical Methods For Imeglimin HCL

An analytical method is a procedure that employs a range of techniques to ascertain a sample's composition either quantitatively or qualitatively. Developed analytical methods can be used to identify, segregate, quantify, and obtain further information on the chemical components in medicinal compounds intended for commercial manufacture. The following are some of the analytical methods developed for Imeglimin Hydrochloride. (Table 5)

CONCLUSION

An investigational drug for type 2 diabetes shows promise in improving glycaemic control by targeting multiple pathways in glucose metabolism. Clinical trials have demonstrated its potential efficacy and safety profile. However, further research is needed to confirm its long-term benefits and establish its place in diabetes management protocols. Imeglimin HCL is an innovative oral anti-diabetic medication that helps patients with type 2 diabetes better manage their glucose metabolism by focusing on mitochondrial bioenergetics. Clinical trials have demonstrated encouraging outcomes as it efficiently lowers blood sugar levels and improves insulin sensitivity. In summary, Imeglimin HCL presents a novel strategy for diabetes management and exhibits promise as a useful supplement to the current range of care available to those with type 2 diabetes.

Table.1: Physicochemical Properties of Imeglimin HCL

Properties	Observations
Appearance	White to off-white colour powder [14]
Molecular formula	C ₆ H ₁₄ ClN ₅
Molecular weight	191.66 g/mol [15]
Molar Volume	119.6±7.0 cm ³ [14]
IUPAC Name	(4R)-6-N,6-N,4-trimethyl-1,4-dihydro-1,3,5-triazine-2,6-diamine:hydrochloride
Solubility	≥29.9 mg/ml in Dimethyl sulfoxide; ≥50.3 mg/ml in ethanol; ≥62.7 mg/ml in water
UV	239 nm (maximum)
PKa	10.21 [15]
Density	1.3±0.1 g/cm ³
Boiling Point	239.9±23.0 °C at 760 mmHg
Vapour Pressure	0.0±0.5 mmHg at 25°C
Polarizability	16.7±0.5 10 ⁻²⁴ cm ³
Surface Tension	44.7±7.0 dyne/cm [14]

Table.2: Pharmacokinetic Properties of Imeglimin HCL

Parameters	Description
Recommended dose	1000 -1500 mg twice daily [17]
C _{max}	After dosage, C _{max} was obtained within 1.5 and 4 hours.
T _{max}	3.5 hours.
t _{1/2}	13 hours.
Half life	10–20 h in healthy volunteers.
Protein binding	1.2%–6.4%
Bioavailability	Bioavailability of Imeglimin depends on dose like increasing drug doses with decreases in bioavailability and ranges between 20 to 50%.
Absorption	50 and 80 % of the Imeglimin absorbed in the gastrointestinal tract by passive and active transport. It is possible to extend absorption for up to four hours [16].
Distribution	It is distributed rapidly and extensively to the organ [18].
Metabolism	Both humans and animals have poor metabolisms [16]. It has a lack of ability to inhibit CYP450 [18].
Excretion	In urine and faeces, around 98% of the absorbed radioactive dose was eliminated as an unchanged compound [16].

Vijayalakshmi *et al.*,

Table.3: List of Marked Formulation of Imeglimin HCL

S. No	Type of dosage form	Brand name	Company name	Dose	Prize
1	Solid-Tablet	Imeglyn®500	Zydus life science limited	500mg	Rs.69
2	Solid-Tablet	Lupimeg 1000	Lupin Ltd	1000mg	Rs.150
3	Solid-Tablet	Imeglyn®1000	Zydus life science limited	1000mg	Rs.98
4	Solid-Tablet	Imeglyn SR 1000	Zydus Healthcare Ltd	1000mg	Rs.119

Table.4: Clinical Studies for Imeglimin HCL

S. No	Summary	Reference
1	Type of study: comparative studies Drugs used: Imeglimin, metformin and placebo Parameters observed: AUC (PG) and AUC (0-6h), FPG, and HbA1c. Result: Imeglimin showed effective in reducing AUC (PG), AUC (0-6h), FPG, and HbA1c as metformin.	45
2	Type of study: Combination type studies Drugs used: Imeglimin with metformin, Imeglimin with placebo Parameters observed: HbA1c and FPG Result: Imeglimin with metformin decreased HbA1c levels by 0.65% , compared Imeglimin with placebo decreased levels by 0.21%.	46
3	Type of study: Controlled study Drugs used: Imeglimin with Placebo Parameters observed: HbA1c , FPG Result: assessing the efficacy, safety and tolerability of Imeglimin.	47
4	Type of study: Controlled study Drugs used: Imeglimin with placebo Parameters observed: alanine aminotransferase (ALT) and gamma-glutamyl transferase (GGT), liver function test. Result: Significant decrease in ALT and GGT, thus showing improved liver function.	48
5	Type of study: Controlled study Drugs used : Imeglimin with placebo Parameters observed: HbA1c and FPG Result: Imeglimin shows sensitivity	49
6	Type of study: Comparative study Drugs used : Imeglimin with Placebo Parameters observed: HbA1c and GIT effects of different doses. Result: 500mg and 1000mg (BD) shows the expected results i.e. decreased in HbA1c and no GIT side effects. But 1500mg (BD) show slight increase in GIT side effects and dramatic reduction in HbA1c levels	50
7	Type of study: Controlled Study Drugs used : Imeglimin with placebo Parameters observed: HbA1c and FPG	51

Vijayalakshmi et al.,

	Result: Imeglimin shows reduce hba1c levels when compared with placebo	
8	<p>Type of study: Parallel group study</p> <p>Drugs used :Imeglimin , dipeptidyl peptidase-4 inhibitors, thiazolidinediones, alpha-glucosidase inhibitors, glinides , metformin , sodium-glucose transport protein 2 inhibitors , sulphonylureas , glucagon-like peptide 1 receptor agonists.</p> <p>Parameters observed: Mean HbA1c</p> <p>Result: Co-administration of Imeglimin and the other studied hypoglycaemic agents shows the following HbA1c: dipeptidyl peptidase-4 inhibitors (-0.92%), thiazolidinediones (-0.88%), alpha-glucosidase inhibitors (-0.85%), glinides (-0.70%), metformin (-0.67%), sodium-glucose transport protein 2 inhibitors (-0.57%), sulphonylureas (-0.56%), glucagon-like peptide 1 receptor agonists (-0.12%).</p>	52
9	<p>Type of study: Combination study</p> <p>Drugs used :Imeglimin and insulin, Placebo</p> <p>Parameters observed: HbA1c</p> <p>Result: Imeglimin with insulin shows 0.64% HbA1c and Placebo with insulin and followed by Imeglimin with insulin shows 0.54% HbA1c.</p>	53
10	<p>Type of study: Randomized study</p> <p>Drugs used :Imeglimin HCL, Metformin and placebo</p> <p>Parameters observed:Glucose area under the curve [AUC]) and 3 H-glucose tolerance test [OGTT]</p> <p>Result: The results revealed increase in insulin secretion was accompanied by an increase in beta cell glucose sensitivity</p>	54
11	<p>Type of study: Comparative study</p> <p>Drugs used :Imeglimin HCL, placebo</p> <p>Parameters observed: HbA1c</p> <p>Result: The results show the improved HbA1c in Japanese patients with type 2 diabetes compared to placebo and had a similar safety profile to placebo.</p>	55
12	<p>Type of study: Comparative study</p> <p>Drugs used :Imeglimin HCL (1000mg, monotherapy and oral combination therapy with α-glucosidase inhibitor, biguanide , dipeptidyl peptidase-4 inhibitor (DPP4-I), glinide , glucagon-like peptide-1 receptor agonist (GLP1-RA), sodium-glucose co-transporter-2 inhibitor , sulphonylurea or thiazolidinedione.</p> <p>Parameters observed: HbA1c</p> <p>Result:Imeglimin monotherapy reduced HbA1c by 0.46%; Imeglimin oral combination therapy reduced HbA1c by 0.56%-0.92%; and injectable GLP1-RA combination therapy reduced HbA1c by 0.12%. Patients who received a DPP4-I in addition to Imeglimin experienced the largest net HbA1c reduction (0.92%).</p>	56
13	<p>Type of study: Comparative randomized study</p> <p>Drugs used :Imeglimin HCL and placebo</p> <p>Parameters observed:glycated haemoglobin (HbA1c)</p> <p>Result: Imeglimin HCL shows significant decrease in mean hba1c of -0.60% compared to placebo.</p>	57
14	<p>Type of study: Meta- Analysis study</p> <p>Drugs used :Imeglimin HCL (1000mg BID)</p> <p>Parameters observed: HbA1c</p> <p>Result: The findings demonstrated that, in comparison to the placebo, Imeglimin 1000 mg BID considerably lowered HbA1c without causing any heterogeneity.</p>	58

Vijayalakshmi et al.,

Table.5: Analytical Methods for Imeglimin HCL

S. No	Summary	Reference
1	<p>Analytical Method: High performance liquid chromatography Phase : Reverse Phase Column : Hypersil ODS (150 mm X 4.6 mm), 5µm Mobile Phase: Buffer pH 3.0 and Methanol (75:25 v/v) Runtime: 5.0 min Wavelength: 234 nm</p> <p>The parameters observed are System suitability test, linearity range, accuracy, precision, intermediate precision (Ruggedness), method precision, robustness, specificity</p>	59
2	<p>Analytical Method: Ultra High-performance liquid chromatography Phase : Reverse Phase Column : Hypersil gold ODS end capped RP column (150 mm X 4.6 mm), 3µm Mobile Phase : Water and Acetonitrile (15:85 %v/v) Runtime: 10 min Wavelength: 240 nm</p> <p>The parameters observed are Specificity, linearity, precision, accuracy robustness, LOD and LOQ were determined for method validation.</p>	60
3	<p>Analytical Method: UV Visible Spectroscopy Solvent: Distilled Water Wavelength: 237 nm Absorbance: 0.488 Concentration : 10 µg/mL</p> <p>The parameters included are limit of detection, limit of quantification, linearity, accuracy, precision, and assay of marketed formulation Imeglimin hydrochloride.</p>	61
4	<p>Analytical Method: UV Visible Spectroscopy Solvent: Distilled Water Wavelength : 239 nm Absorbance range : 0.2225 to 1.3630 Concentration range : 2.5 - 15 µg/mL</p> <p>The Parameters observed are linearity, accuracy, precision, and ruggedness. The recovery studies and precision were found to be within limits.</p>	62
5	<p>Analytical method: Chiral Liquid Chromatography Tandem Mass Spectrometry. Mobile phase: Methanol and Acetonitrile Phase: Reverse Phase Column: Chiralpak IG-3 (100×4.6mm, 3 µm) Run time: 5 mins</p> <p>The parameters observed are the drug's (+) and (–) enantiomers had retention times of 2.876 and 4.325 minutes, respectively. The objective is to distinguish the enantiomers and create a quick, accurate, and economical technique for calculating the (+) and (–) enantiomers in its composition.</p>	63

ABSTRACT

The purpose of this paper is to define a new class of neutrosophic sets namely neutrosophic Λ_P -open sets and neutrosophic Λ_P -closed sets in neutrosophic topological space. We also discuss the properties of neutrosophic Λ_P -open sets and its relation with other existing neutrosophic sets. Also, we define some neutrosophic operators such as neutrosophic Λ_P -interior, neutrosophic Λ_P -closure, neutrosophic Λ_P -Frontier, neutrosophic Λ_P -Border and neutrosophic Λ_P -Exterior and study some of its properties.

Keywords: neutrosophic Λ_P -open, neutrosophic Λ_P -closed, neutrosophic Λ_P -interior, neutrosophic Λ_P -closure, neutrosophic Λ_P -Frontier, neutrosophic Λ_P -Border and neutrosophic Λ_P -Exterior.

INTRODUCTION

Mathematics is based on exact concepts and there is no vagueness for mathematical theories. Many theories can be considered as tools for dealing with uncertainties. However, all of these theories have their own difficulties. The notion of fuzzy sets has invaded almost all branches of mathematics since its introduction by Zadeh[18]. Fuzzy sets have applications in many fields such as information theory and control theory. He introduced this concept that each element has a degree of membership function. Later, in 1986, Atanassov[2] extended the intuitionistic fuzzy set as a generalization of fuzzy set with the degree of non-membership. Further there is a restriction that the sum of these two grades is less than or equal to unity. The neutrosophic sets which is characterized by truth membership function, indeterminacy membership function and falsity membership function was initiated by Smarandache[13] in 1998.

Reena and Karthika

Later A. Salama and Alblowi[12] studied the concept of neutrosophic topological space in 2012. The class of neutrosophic semi-open and neutrosophic semi-closed were discussed by P. Iswarya and K. Bageerathi[6] in 2016. The neutrosophic sets was extended to a new class of set namely generalized closed sets in neutrosophic topological space were introduced by R. Dhavaseelan and Saied Jafari[4]. Further many other properties have been defined on neutrosophic sets using the closure and interior operator and their topological properties have been studied. In intuitionistic fuzzy topology, the concept of frontier and border were studied by Athar Kharal[3] in 2014. Later P. Iswarya[7] and K. Bageerathi extended the concept of frontier in neutrosophic topological space. A. Vadivel[16] and C. John Sundar extended the border operator using neutrosophic sets. The purpose of this paper is to introduce a new class of open sets namely neutrosophic Λ_p -open sets and neutrosophic Λ_p -closed sets. We discuss the characterization and relation with other existing neutrosophic sets. Also, we study some operators using neutrosophic Λ_p -open sets such as neutrosophic Λ_p -interior, neutrosophic Λ_p -closure, neutrosophic Λ_p -Frontier, neutrosophic Λ_p -Border and neutrosophic Λ_p -Exterior.

2. Preliminaries

Definition 2.1:[12] Let U be a non-empty fixed set. A Neutrosophic set K is an object having the form $K = \{\langle u, \mu_K(u), \sigma_K(u), \gamma_K(u) \rangle : u \in U\}$ where $\mu_K(u)$, $\sigma_K(u)$ and $\gamma_K(u)$ represents the degree of membership, the degree of indeterminacy and the degree of non-membership respectively of each element $u \in U$ to the set U . A neutrosophic set $K = \{\langle u, \mu_K(u), \sigma_K(u), \gamma_K(u) \rangle : u \in U\}$ can be identified to an ordered triple $(\mu_K(u), \sigma_K(u), \gamma_K(u))$ in $[0,1]$ on U .

Definition 2.2:[12] Let U be a non-empty set and $K = \{\langle u, \mu_K(u), \sigma_K(u), \gamma_K(u) \rangle : u \in U\}$ and $M = \{\langle u, \mu_M(u), \sigma_M(u), \gamma_M(u) \rangle : u \in U\}$ are neutrosophic sets, then

- i. $K \subseteq M \Leftrightarrow \mu_K(u) \leq \mu_M(u), \sigma_K(u) \leq \sigma_M(u)$ and $\gamma_K(u) \geq \gamma_M(u) \forall u \in U$
- ii. $K \cup M = \{\langle u, \max(\mu_K(u), \mu_M(u)), \max(\sigma_K(u), \sigma_M(u)), \min(\gamma_K(u), \gamma_M(u)) \rangle : u \in U\}$
- iii. $K \cap M = \{\langle u, \min(\mu_K(u), \mu_M(u)), \min(\sigma_K(u), \sigma_M(u)), \max(\gamma_K(u), \gamma_M(u)) \rangle : u \in U\}$
- iv. $K^c = \{\langle u, (\gamma_K(u), 1 - \sigma_K(u), \mu_K(u)) \rangle : u \in U\}$
- v. $0_{N_{tr}} = \{\langle u, 0, 0, 1 \rangle : u \in U\}$ and $1_{N_{tr}} = \{\langle u, 1, 1, 0 \rangle : u \in U\}$

Definition 2.3:[12] A Neutrosophic topology on a non-empty set U is a family $\tau_{N_{tr}}$ of neutrosophic sets in U satisfying the following axioms:

- i. $0_{N_{tr}}, 1_{N_{tr}} \in \tau_{N_{tr}}$.
- ii. $K_1 \cap K_2 \in \tau_{N_{tr}}$ for any $K_1, K_2 \in \tau_{N_{tr}}$.
- iii. $\cup K_i \in \tau_{N_{tr}}$ for every $\{K_i : i \in I\} \subseteq \tau_{N_{tr}}$.

In this case the ordered pair $(U, \tau_{N_{tr}})$ is called a neutrosophic topological space $(N_{tr}TS)$. The members of $\tau_{N_{tr}}$ are neutrosophic open set $(N_{tr}O)$ and its complements are neutrosophic closed $(N_{tr}C)$.

Definition 2.4:[12] Let $(U, \tau_{N_{tr}})$ be a neutrosophic topological space and $K = \{\langle u, \mu_K(u), \sigma_K(u), \gamma_K(u) \rangle : u \in U\}$ be a neutrosophic set in U . Then the neutrosophic closure and neutrosophic interior of K are defined as

$$N_{tr}cl(K) = \cap \{X : X \text{ is } N_{tr}\text{-closed set in } U \text{ and } K \subseteq X\}$$

$$N_{tr}int(K) = \cup \{Y : Y \text{ is } N_{tr}\text{-open set in } U \text{ and } K \subseteq Y\}$$

Definition 2.5: A neutrosophic topological space $(U, \tau_{N_{tr}})$ is said to be neutrosophic locally indiscrete if every neutrosophic open set is neutrosophic closed.

Definition 2.6: A Neutrosophic set K of a neutrosophic topological space $(U, \tau_{N_{tr}})$ is

- i. **neutrosophic semi-open**[6] if there exists a neutrosophic open set E in U such that $E \subseteq K \subseteq N_{tr}cl(K)$.
- ii. **neutrosophic pre-open**[17] if $K \subseteq N_{tr}int(N_{tr}cl(K))$ and neutrosophic pre-closed $(N_{tr}PC)$ if $N_{tr}cl(N_{tr}int(K)) \subseteq K$.
- iii. **neutrosophic regular-open**[1] if $K = N_{tr}int(N_{tr}cl(K))$ and neutrosophic regular closed $(N_{tr}rC)$ if $K = N_{tr}cl(N_{tr}int(K))$.

Reena and Karthika

- iv. **neutrosophic α -open**[1] if $K \subseteq N_{tr}int(N_{tr}cl(N_{tr}int(K)))$ and neutrosophic α -closed($N_{tr}\alpha C$) if $N_{tr}cl(N_{tr}int(N_{tr}cl(K))) \subseteq K$.
- v. **neutrosophic β -open**[11] if $K \subseteq N_{tr}int(N_{tr}cl(N_{tr}int(K)))$ and neutrosophic β -closed($N_{tr}\beta C$) if $N_{tr}cl(int(N_{tr}cl(K))) \subseteq K$.
- vi. **neutrosophic δ -open**[15] if $K = N_{tr}\delta int(K)$ and neutrosophic δ -closed ($N_{tr}\delta C$) if $K = N_{tr}\delta cl(K)$.
- vii. **Neutrosophicb-open**[5] if $K \subseteq N_{tr}cl(N_{tr}int(K)) \cup N_{tr}int(N_{tr}cl(K))$ and neutrosophic b-closed if $N_{tr}cl(N_{tr}int(K)) \cap N_{tr}int(N_{tr}cl(K))$.

The class of all neutrosophic semi-open (respectively neutrosophic pre-open, neutrosophic regular-open, neutrosophic α -open, neutrosophic β -open, neutrosophic δ -open and neutrosophic b-open) sets are denoted by $NSO_{tr}(U, \tau_{N_{tr}})$ (respectively $N_{tr}PO(U, \tau_{N_{tr}})$, $N_{tr}RO(U, \tau_{N_{tr}})$, $N_{tr}\alpha O(U, \tau_{N_{tr}})$, $N_{tr}\beta O(U, \tau_{N_{tr}})$, $N_{tr}\delta O(U, \tau_{N_{tr}})$ and $N_{tr}bO(U, \tau_{N_{tr}})$).

Definition 2.7:[10] A neutrosophic set K of a neutrosophic topological space $(U, \tau_{N_{tr}})$ is said to be neutrosophicY-open if for every non-empty N_{tr} closed set $F \neq 1_{N_{tr}}$, $K \subseteq N_{tr}cl(N_{tr}int(KUF))$. The class of neutrosophicY-open sets is denoted by $N_{tr}YO(U, \tau_{N_{tr}})$.

Definition 2.8:[8] A neutrosophic set K of a neutrosophic topological space $(U, \tau_{N_{tr}})$ is said to be neutrosophic generalized b-closed ($N_{tr}gbC$) if $N_{tr}bcl(K) \subseteq H$ whenever $K \subseteq H$ and H is neutrosophic open in U .

Definition 2.9:[7] Let K be a neutrosophic subset of a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then the neutrosophic point $u_{a,b,c}$ is called neutrosophic frontier point of K if $u_{a,b,c} \in N_{tr}cl(K) \cap N_{tr}cl(K^c)$. The intersection of all the neutrosophic frontier points of K is called neutrosophic frontier of K and is denoted by $N_{tr}Fr(K)$. That is $N_{tr}Fr(K) = N_{tr}cl(K) \cap N_{tr}cl(K^c)$.

Definition 2.10:[16] Let K be a neutrosophic subset of a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then the Neutrosophic-Border of K is denoted as $N_{tr}Br(K)$ and is defined as $N_{tr}Br(K) = K - N_{tr}int(K)$. (Equivalently, $N_{tr}Br(K) = K \cap N_{tr}int(K)$).

Definition 2.11: Let K be a neutrosophic subset of a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then the Neutrosophic-Exterior of K is denoted as $N_{tr}Ext(K)$ and is defined as $N_{tr}Ext(K) = N_{tr}int(K^c)$.

Remark 2.12

- i. Every N_{tr} open set is N_{tr} -pre-open[14].
- ii. Every N_{tr} regular-open set is N_{tr} -open[1].
- iii. Every $N_{tr}\delta$ -open set is N_{tr} -open[13].

Theorem 2.13:[5] Let K be a neutrosophic set in a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then $N_{tr}pint(K) \subseteq K \cap N_{tr}int(N_{tr}cl(K))$.

3. Neutrosophic Λ_P -Open Sets

Definition 3.1: A neutrosophic set K of a neutrosophic topological space $(U, \tau_{N_{tr}})$ is said to be neutrosophic Λ_P -open if there exist a N_{tr} -pre-open set $E \neq 0_{N_{tr}}, 1_{N_{tr}}$ such that $K \subseteq N_{tr}cl(K \cap E)$. The class of neutrosophic Λ_P -open sets is denoted by $N_{tr}\Lambda_P O(U, \tau_{N_{tr}})$.

Example 3.2: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{< a, 0.5, 0.6, 0.3 > < b, 0.4, 0.2, 0.7 >\}$ and $M = \{< a, 0.5, 0.7, 0.6 > < b, 0.2, 0.4, 0.4 >\}$. Consider the collection $\mathcal{A} = \{A: A \subset M, A \not\subset M^c, M^c \not\subset A\}$ of neutrosophic sets in U . Then $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{A}, 1_{N_{tr}}\}$.

Reena and Karthika

Definition 3.3: A Neutrosophic set K of a neutrosophic topological space $(U, \tau_{N_{tr}})$ is said to be neutrosophicpre*-open if $K \subseteq N_{tr}int^*(N_{tr}cl(K))$.

Example 3.4: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.7, 0.6, 0.8 \rangle \langle b, 0.6, 0.8, 0.9 \rangle \}$ and $M = \{ \langle a, 0.6, 0.4, 0.9 \rangle \langle b, 0.2, 0.4, 0.4 \rangle \}$. Consider the collection $\mathcal{A} = \{A: M \subset A, M^C \subset A\}$ and $\mathcal{B} = \{A: B \subset M, B^C \subset M\}$ of neutrosophic sets in U . Then $N_{tr}P^*O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$.

Definition 3.5: A neutrosophic set K of a neutrosophic topological space $(U, \tau_{N_{tr}})$ is said to be neutrosophic Λ_P -open if there exist a N_{tr} pre*-open set $E \neq 0_{N_{tr}}, 1_{N_{tr}}$ such that $K \subseteq N_{tr}cl(K \cap E)$.

Example 3.6: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.7, 0.5, 0.1 \rangle \langle b, 0.3, 0.8, 0.1 \rangle \}$ and $M = \{ \langle a, 0.9, 0.7, 0.2 \rangle \langle b, 0.4, 0.8, 0.1 \rangle \}$. Consider the collection $\mathcal{A} = \{A: 0_{N_{tr}} \subset A \subset K^C\}$, $\mathcal{B} = \{B: K^C \subset B \subset K\}$, $\mathcal{C} = \{C: K \subset C \subset 1_{N_{tr}}\}$ and $\mathcal{D} = \{D: D \not\subset K^C; K^C \not\subset D; D \subset K\}$ of neutrosophic sets in U . Then $N_{tr}\Lambda_P^*O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, M^C, \mathcal{A}, \mathcal{B}, \mathcal{C}, \mathcal{D}, 1_{N_{tr}}\}$.

Theorem 3.7: Every N_{tr} pre-open is N_{tr} pre*-open.

Proof: Let K be a N_{tr} pre-open set in U . Then $K \subseteq N_{tr}int(N_{tr}cl(K)) \subseteq N_{tr}int^*(N_{tr}cl(K))$. Hence K is N_{tr} pre*-open.

Remark 3.8: In any neutrosophic topological space $(U, \tau_{N_{tr}})$, $0_{N_{tr}}$ and $1_{N_{tr}}$ are $N_{tr}\Lambda_P$ -open.

Theorem 3.9: The union of an arbitrary collection of $N_{tr}\Lambda_P$ -open sets is also $N_{tr}\Lambda_P$ -open.

Proof: Let $\{K_j: j \in J\}$ be a collection of $N_{tr}\Lambda_P$ -open sets. Then for each $j \in J$, K_j is a $N_{tr}\Lambda_P$ -open set which implies $K_j \subseteq N_{tr}cl(K_j \cap E)$. Now $\bigcup_{j \in J} K_j \subseteq \bigcup_{j \in J} N_{tr}cl(K_j \cap E) \subseteq N_{tr}cl(\bigcup_{j \in J} (K_j \cap E)) \subseteq N_{tr}cl(\bigcup_{j \in J} K_j \cap E)$. Thus $\bigcup_{j \in J} K_j \subseteq N_{tr}cl(\bigcup_{j \in J} K_j \cap E)$. Hence $\bigcup_{j \in J} K_j$ is a $N_{tr}\Lambda_P$ -open set.

Remark 3.10: The intersection of two $N_{tr}\Lambda_P$ -open sets need not be $N_{tr}\Lambda_P$ -open.

Example 3.13: Let $U = \{a, b\}$ and

$$K_1 = \{ \langle a, 0.5, 0.5, 0.4 \rangle \langle b, 0.4, 0.2, 0.6 \rangle \}$$

$$K_2 = \{ \langle a, 0.2, 0.3, 0.7 \rangle \langle b, 0.4, 0.1, 0.8 \rangle \}$$

$$K_3 = \{ \langle a, 0.4, 0.5, 0.5 \rangle \langle b, 0.3, 0.2, 0.8 \rangle \}$$

$$K_4 = \{ \langle a, 0.6, 0.6, 0.2 \rangle \langle b, 0.4, 0.2, 0.6 \rangle \}$$

$$K_5 = \{ \langle a, 0.5, 0.5, 0.4 \rangle \langle b, 0.8, 0.8, 0.3 \rangle \}$$

$$K_6 = \{ \langle a, 0.7, 0.7, 0.2 \rangle \langle b, 0.8, 0.9, 0.4 \rangle \}$$

$$K_7 = \{ \langle a, 0.2, 0.4, 0.6 \rangle \langle b, 0.6, 0.8, 0.4 \rangle \}$$

$$K_8 = \{ \langle a, 0.4, 0.7, 0.2 \rangle \langle b, 0.4, 0.7, 0.3 \rangle \}$$

$$K_9 = \{ \langle a, 0.2, 0.4, 0.6 \rangle \langle b, 0.4, 0.7, 0.4 \rangle \}$$
 be neutrosophic sets in U .

Then $\tau_{N_{tr}} = \{0_{N_{tr}}, K_1, K_2, K_3, K_4, K_5, 1_{N_{tr}}\}$ forms a neutrosophic topology on U . Here K_7 and K_8 are $N_{tr}\Lambda_P$ -open but their intersection K_9 is not $N_{tr}\Lambda_P$ -open.

Remark 3.11: The class of $N_{tr}\Lambda_P$ -open sets does not form a topology on U .

Theorem 3.12: A neutrosophic set K in a neutrosophic topological space $(U, \tau_{N_{tr}})$ is $N_{tr}\Lambda_P$ -open if and only if for every neutrosophic point $u_{a,b,c} \in K$, there exists a $N_{tr}\Lambda_P$ -open set $M_{u_{a,b,c}}$ such that $u_{a,b,c} \in M_{u_{a,b,c}} \subseteq K$.

Proof: If K is $N_{tr}\Lambda_P$ -open then we may consider $M_{u_{a,b,c}} = K$ for every $u_{a,b,c} \in K$. Conversely, assume that for every $u_{a,b,c} \in K$, there exists a $N_{tr}\Lambda_P$ -open set $M_{u_{a,b,c}}$ such that $u_{a,b,c} \in M_{u_{a,b,c}} \subseteq K$. Then, $K = \bigcup \{u_{a,b,c} : u_{a,b,c} \in K\} \subseteq \bigcup \{M_{u_{a,b,c}} : u_{a,b,c} \in K\} \subseteq K$. Hence, by theorem 3.9, $K = \bigcup \{M_{u_{a,b,c}} : u_{a,b,c} \in K\}$ is $N_{tr}\Lambda_P$ -open.

Theorem 3.13: Every N_{tr} -open set is $N_{tr}\Lambda_P$ -open.

Proof: Let K be a N_{tr} -open set in U . Then $K = N_{tr}int(K) = K \cap N_{tr}int(K) \subseteq N_{tr}cl(K \cap N_{tr}int(K))$. Take $E = N_{tr}int(K)$ then E is a N_{tr} -open set in U . By remark 2.12(i), E is N_{tr} pre-open. Thus $K \subseteq N_{tr}cl(K) \subseteq N_{tr}cl(K \cap E)$ for some N_{tr} pre-open set $E \neq 0_{N_{tr}}, 1_{N_{tr}}$. Hence K is $N_{tr}\Lambda_P$ -open.

Reena and Karthika

Remark 3.14: The converse of the above theorem need not be true.

Example 3.15: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.7, 0.6, 0.2 \rangle < b, 0.3, 0.8, 0.1 \rangle \}$ and $M = \{ \langle a, 0.8, 0.7, 0.1 \rangle < b, 0.4, 0.9, 0 \rangle \}$. Consider the collection $\mathcal{A} = \{A: K^C \subset A \subset K\}$ and $\mathcal{B} = \{B: K^C \subset B \not\subset K\}$ of neutrosophic sets in U . Then $N_{tr}O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{A}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$. Here the neutrosophic sets in \mathcal{B} are $N_{tr}\Lambda_P$ -open but not N_{tr} -open.

Theorem 3.16: Every N_{tr} regular-open set is $N_{tr}\Lambda_P$ -open.

Proof: Let K be a N_{tr} regular-open set in U . By remark 2.12(ii), and by theorem 3.13, K is $N_{tr}\Lambda_P$ -open.

Remark 3.17: The converse of the above theorem need not be true.

Example 3.18: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.7, 0.6, 0.8 \rangle < b, 0.6, 0.8, 0.9 \rangle \}$ and $M = \{ \langle a, 0.6, 0.4, 0.9 \rangle < b, 0.5, 0.7, 0.1 \rangle \}$. Consider the collection $\mathcal{A} = \{A: K \subset A; K^C \subset A\}$ and $\mathcal{B} = \{B: B \subset K; B \subset K^C\}$ of neutrosophic sets in U . Then $N_{tr}rO(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$. Here, K, M and the neutrosophic sets in \mathcal{A} and \mathcal{B} are $N_{tr}\Lambda_P$ -open but not N_{tr} regular-open.

Theorem 3.19: Every $N_{tr}\delta$ -open set is $N_{tr}\Lambda_P$ -open.

Proof: Let K be a $N_{tr}\delta$ -open set in U . By remark 2.12(iii) and by theorem 3.13, K is $N_{tr}\Lambda_P$ -open.

Remark 3.20: The converse of the above theorem need not be true.

Example 3.21: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.7, 0.6, 0.8 \rangle < b, 0.6, 0.8, 0.9 \rangle \}$ and $M = \{ \langle a, 0.6, 0.4, 0.9 \rangle < b, 0.5, 0.7, 0.1 \rangle \}$. Consider the collection $\mathcal{A} = \{A: K \subset A; K^C \subset A\}$ and $\mathcal{B} = \{B: B \subset K; B \subset K^C\}$ of neutrosophic sets in U . Then $N_{tr}\delta O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$. Here, K, M and the neutrosophic sets in \mathcal{A} and \mathcal{B} are $N_{tr}\Lambda_P$ -open but not $N_{tr}\delta$ -open.

Theorem 3.22: Every N_{tr} semi-open set is $N_{tr}\Lambda_P$ -open.

Proof: Let K be a N_{tr} semi-open set in U . By definition 2.6(i), there exists a N_{tr} open set $E \subseteq K \subseteq N_{tr}cl(E)$. Since $E \subseteq K$, $K \cap E = E$. Hence $K \subseteq N_{tr}cl(K \cap E)$. Hence by remark 2.9(i), K is $N_{tr}\Lambda_P$ -open.

Remark 3.23: The converse of the above theorem need not be true.

Example 3.24: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.7, 0.8, 0.9 \rangle < b, 0.7, 0.8, 0.9 \rangle \}$ and $M = \{ \langle a, 0.8, 0.9, 0.6 \rangle < b, 0.7, 0.8, 0.9 \rangle \}$. Consider the collection $\mathcal{A} = \{A: K \subset A; K^C \subset A\}$ and $\mathcal{B} = \{B: B \subset K; B \not\subset K^C; K^C \not\subset B\}$ of neutrosophic sets in U . Then $N_{tr}SO(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{B}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, M^C, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$. Here K^C, M^C and the neutrosophic sets in \mathcal{A} are $N_{tr}\Lambda_P$ -open but not N_{tr} semi-open.

Theorem 3.25: Every $N_{tr}\alpha$ -open set is $N_{tr}\Lambda_P$ -open.

Proof: Let K be a $N_{tr}\alpha$ -open set. Then $K \subseteq N_{tr}int(N_{tr}cl(N_{tr}int(K))) \subseteq N_{tr}cl(N_{tr}int(K))$. Thus K is N_{tr} semi-open. By theorem 3.21, K is $N_{tr}\Lambda_P$ -open.

Remark 3.26: The converse of the above theorem need not be true.

Example 3.27: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.3, 0.4, 0.9 \rangle < b, 0.4, 0.5, 0.8 \rangle \}$ and $M = \{ \langle a, 0.2, 0.3, 1 \rangle < b, 0.3, 0.4, 0.9 \rangle \}$. Consider the collection $\mathcal{A} = \{A: 0_{N_{tr}} \subset A \subset K\}$ and $\mathcal{B} = \{B: K \subset B \subset K^C\}$ of neutrosophic sets in U . Then $N_{tr}\alpha O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, M^C, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$. Here, K^C, M^C and the neutrosophic sets in \mathcal{A} and \mathcal{B} are $N_{tr}\Lambda_P$ -open but not $N_{tr}\alpha$ -open.

Theorem 3.28: Every $N_{tr}\Lambda_P$ -open set is $N_{tr}\Lambda_P^*$ -open.

Proof: Let K be a $N_{tr}\Lambda_P$ -open set in U . Then there exists a N_{tr} pre-open set $E \neq 0_{N_{tr}}, 1_{N_{tr}}$ such that $K \subseteq N_{tr}cl(K \cap E)$. Hence by theorem 3.7, K is $N_{tr}\Lambda_P^*$ -open.

Remark 3.29: The converse of the above theorem need not be true.

Example 3.30: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.7, 0.6, 0.8 \rangle < b, 0.6, 0.8, 0.9 \rangle \}$ and $M = \{ \langle a, 0.6, 0.4, 0.9 \rangle < b, 0.2, 0.4, 0.4 \rangle \}$. Consider the collection $\mathcal{A} = \{A: M \subset A, M^C \subset A\}$ and $\mathcal{B} = \{A: B \subset M, B^C \subset M\}$ of neutrosophic sets in U . Then

Reena and Karthika

$N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P^* O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$. Here K^C is $N_{tr}\Lambda_P^*$ -open but not $N_{tr}\Lambda_P$ -open.

Theorem 3.31: In any neutrosophic topological space $(U, \tau_{N_{tr}})$, $N_{tr}O(U, \tau_{N_{tr}}) \subseteq N_{tr}i\Lambda_P O(U, \tau_{N_{tr}}) \subseteq N_{tr}\Lambda_P^* O(U, \tau_{N_{tr}})$. That is the class of $N_{tr}\Lambda_P$ -open sets lie between N_{tr} -open sets and $N_{tr}\Lambda_P^*$ -open sets.

Proof: Proof follows from theorem 3.13 and theorem 3.28.

Remark 3.32: The concepts of N_{tr} b-open and $N_{tr}\Lambda_P$ -open are independent.

Example 3.33: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{< a, 0.4, 0.5, 0.6 > < b, 0.6, 0.3, 0.8 >\}$ and $M = \{< a, 0.3, 0.4, 0.7 > < b, 0.5, 0.2, 0.9 >\}$. Consider the collection $\mathcal{A} = \{A: K^C \subset A \subset 1_{N_{tr}}\}$ and $\mathcal{B} = \{B: K \subset B \not\subset K^C\}$ of neutrosophic sets in U . Then $N_{tr}bO(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, M^C, \mathcal{B}, 1_{N_{tr}}\}$. Here, the neutrosophic sets in \mathcal{A} are N_{tr} b-open but not $N_{tr}\Lambda_P$ -open and M^C is $N_{tr}\Lambda_P$ -open but not N_{tr} b-open.

Remark 3.34: The concepts of $N_{tr}Y$ -open and $N_{tr}\Lambda_P$ -open are independent.

Example 3.35: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{< a, 0.3, 0.4, 0.9 > < b, 0.4, 0.5, 0.8 >\}$ and $M = \{< a, 0.2, 0.3, 1 > < b, 0.3, 0.4, 0.9 >\}$. Consider the collection $\mathcal{A} = \{A: 0_{N_{tr}} \subset A \subset K\}$, $\mathcal{B} = \{B: K \subset B \subset K^C\}$, $\mathcal{C} = \{K^C \subset C \subset 1_{N_{tr}}\}$, $\mathcal{D} = \{D \not\subset K; K \not\subset D; D \subset K^C\}$, $\mathcal{E} = \{E \not\subset K; K \not\subset E; E \subset K^C\}$ and $\mathcal{F} = \{K \subset F \not\subset K^C\}$ of neutrosophic sets in U . Then $N_{tr}YO(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, \mathcal{A}, \mathcal{B}, \mathcal{C}, \mathcal{F}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, M^C, \mathcal{A}, \mathcal{D}, \mathcal{E}, \mathcal{F}, 1_{N_{tr}}\}$. Here, the neutrosophic sets in \mathcal{B} and \mathcal{C} are $N_{tr}Y$ -open but not $N_{tr}\Lambda_P$ -open and the neutrosophic sets in \mathcal{D}, \mathcal{E} and M^C are $N_{tr}\Lambda_P$ -open but not $N_{tr}Y$ -open.

Remark 3.36: The concepts of $N_{tr}gb$ -open and $N_{tr}\Lambda_P$ -open are independent.

Example 3.37: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, 1_{N_{tr}}\}$ where $K = \{< a, 0.5, 0.6, 0.3 > < b, 0.4, 0.2, 0.7 >\}$. Consider the collection $\mathcal{A} = \{A: A \subset K; A \subset K^C\}$ and $\mathcal{B} = \{B: B \subset K; B \subset K^C; K^C \not\subset B\}$, $\mathcal{C} = \{K \subset C; C \subset K^C; K^C \not\subset C\}$, $\mathcal{D} = \{K \not\subset D; D \not\subset K; K^C \subset D\}$, $\mathcal{E} = \{K \subset E; K^C \subset E\}$, $\mathcal{F} = \{F \not\subset K; K \not\subset F; F \subset K^C\}$ and $\mathcal{G} = \{G \not\subset K; K \not\subset G; G \subset K^C; K^C \not\subset G\}$ of neutrosophic sets in U . Then $N_{tr}gbO(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, \mathcal{B}, \mathcal{C}, \mathcal{D}, \mathcal{E}, \mathcal{G}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, K^C, \mathcal{A}, \mathcal{B}, \mathcal{C}, \mathcal{D}, \mathcal{E}, \mathcal{F}, 1_{N_{tr}}\}$. Here, the neutrosophic sets in \mathcal{G} are $N_{tr}gb$ -open but not $N_{tr}\Lambda_P$ -open and the neutrosophic sets in \mathcal{A}, \mathcal{F} and K^C are $N_{tr}\Lambda_P$ -open but not $N_{tr}gb$ -open.

Remark 3.38: The concepts of $N_{tr}\beta$ -open and $N_{tr}\Lambda_P$ -open are independent.

Example 3.39: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{< a, 0.4, 0.2, 0.7 > < b, 0.5, 0.6, 0.3 >\}$ and $M = \{< a, 0.2, 0.3, 1 > < b, 0.3, 0.4, 0.9 >\}$. Consider the collection $\mathcal{A} = \{A: A \subset K; A \subset K^C\}$ and $\mathcal{B} = \{B: B \subset K; B \subset K^C; K^C \not\subset B\}$, $\mathcal{C} = \{K \subset C; C \subset K^C; K^C \not\subset C\}$, $\mathcal{D} = \{K \not\subset D; D \not\subset K; K^C \subset D\}$, $\mathcal{E} = \{K \subset E; K^C \subset E\}$, $\mathcal{F} = \{F \not\subset K; K \not\subset F; F \subset K^C\}$ and $\mathcal{G} = \{G \not\subset K; K \not\subset G; G \subset K^C; K^C \not\subset G\}$ of neutrosophic sets in U . Then $N_{tr}\beta O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, M^C, \mathcal{A}, \mathcal{B}, \mathcal{C}, \mathcal{D}, \mathcal{E}, \mathcal{F}, \mathcal{G}, 1_{N_{tr}}\}$ and $N_{tr}\Lambda_P O(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, K^C, \mathcal{A}, \mathcal{B}, \mathcal{C}, \mathcal{E}, \mathcal{F}, 1_{N_{tr}}\}$. Here, the neutrosophic sets in \mathcal{D} and M^C are $N_{tr}\beta$ -open but not $N_{tr}\Lambda_P$ -open and the neutrosophic sets in \mathcal{F} are $N_{tr}\Lambda_P$ -open but not $N_{tr}\beta$ -open.

From the above discussion we have the following diagram:

Reena and Karthika

Theorem 3.40: Let K be a $N_{tr}\Lambda_P$ -open set and M be any neutrosophic set in U such that $K \subseteq M \subseteq N_{tr}cl(K)$. Then M is $N_{tr}\Lambda_P$ -open.

Proof: Since $K \subseteq M$, $K \cap E \subseteq M \cap E$ and hence $N_{tr}cl(K \cap E) \subseteq N_{tr}cl(M \cap E)$. Also, since $M \subseteq N_{tr}cl(K)$ and K is $N_{tr}\Lambda_P$ -open, $M \subseteq N_{tr}cl(N_{tr}cl(K \cap E)) \subseteq N_{tr}cl(K \cap E) \subseteq N_{tr}cl(M \cap E)$ for some N_{tr} -pre-open set $E \neq 0_{N_{tr}}, 1_{N_{tr}}$.

Theorem 3.41: If K is N_{tr} semi-open set and $K \subseteq E$, then $N_{tr}int(K)$ is $N_{tr}\Lambda_P$ -open.

Proof: Since K is N_{tr} semi-open and $K \subseteq E$, we have $K \subseteq N_{tr}cl(N_{tr}int(K))$ which implies $N_{tr}int(K) \subseteq N_{tr}int(N_{tr}cl(N_{tr}int(K))) \subseteq N_{tr}int(N_{tr}cl(N_{tr}int(K \cap E))) \subseteq N_{tr}cl((N_{tr}int(K)) \cap E)$ for some N_{tr} -pre-open set $E \neq 0_{N_{tr}}, 1_{N_{tr}}$. Hence $N_{tr}int(K)$ is $N_{tr}\Lambda_P$ -open.

Theorem 3.42: If $E = N_{tr}pint(K)$, then every $N_{tr}\Lambda_P$ -open set is $N_{tr}\beta$ -open.

Proof: Let K be a $N_{tr}\Lambda_P$ -open set and let $E = N_{tr}pint(K)$. Since K is $N_{tr}\Lambda_P$ -open, $K \subseteq N_{tr}cl(K \cap E) \subseteq N_{tr}cl(K \cap N_{tr}pint(K)) \subseteq N_{tr}cl(K \cap (K \cap N_{tr}int(N_{tr}cl(K)))) \subseteq N_{tr}cl(K \cap N_{tr}int(N_{tr}cl(K))) \subseteq N_{tr}cl(K) \cap N_{tr}cl(N_{tr}int(N_{tr}cl(K))) \subseteq N_{tr}cl(N_{tr}int(N_{tr}cl(K)))$. Thus $K \subseteq N_{tr}cl(N_{tr}int(N_{tr}cl(K)))$. Hence K is $N_{tr}\beta$ -open.

4. Neutrosophic Λ_P -Closed Sets

Definition 4.1: A neutrosophic set K of a neutrosophic topological space $(U, \tau_{N_{tr}})$ is said to be neutrosophic Λ_P -closed if there exist a N_{tr} -pre-closed set $F \neq 0_{N_{tr}}, 1_{N_{tr}}$ such that $N_{tr}int(K \cup F) \subseteq K$. The class of neutrosophic Λ_P -closed sets is denoted by $N_{tr}\Lambda_P C(U, \tau_{N_{tr}})$.

Example 4.2: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, M, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.4, 0.6, 0.8 \rangle, \langle b, 0.1, 0.3, 0.5 \rangle \}$ and $M = \{ \langle a, 0.5, 0.7, 0.6 \rangle, \langle b, 0.2, 0.4, 0.4 \rangle \}$. Consider the collection $\mathcal{A} = \{A: A \subset M; A \not\subset M^c; M^c \not\subset A\}$ and $\mathcal{B} = \{B: B \not\subset M; M \not\subset B^c; B \subset M^c\}$ of neutrosophic sets in U . Then $N_{tr}\Lambda_P C(U, \tau_{N_{tr}}) = \{0_{N_{tr}}, K, M, \mathcal{A}, \mathcal{B}, 1_{N_{tr}}\}$.

Theorem 4.3: In any neutrosophic topological space $(U, \tau_{N_{tr}})$,

- Every N_{tr} -closed set is $N_{tr}\Lambda_P$ -closed.
- Every N_{tr} regular-closed set is $N_{tr}\Lambda_P$ -closed.
- Every $N_{tr}\delta$ -closed set is $N_{tr}\Lambda_P$ -closed.
- Every N_{tr} semi-closed set is $N_{tr}\Lambda_P$ -closed.
- Every $N_{tr}\alpha$ -closed set is $N_{tr}\Lambda_P$ -closed.
- Every $N_{tr}\Lambda_P$ -closed set is $N_{tr}\Lambda_P^*$ -closed.

Proof: Proof is obvious.

Remark 4.4: The converse of each of the statements of the above theorem need not be true.

Remark 4.5:

- The union of any two $N_{tr}\Lambda_P$ -closed sets need not be $N_{tr}\Lambda_P$ -closed.
- The intersection of an arbitrary collection $N_{tr}\Lambda_P$ -closed set is $N_{tr}\Lambda_P$ -closed.
- The concepts of $N_{tr}\beta$ -closed and $N_{tr}\Lambda_P$ -closed are independent.
- The concepts of $N_{tr}\gamma$ -closed and $N_{tr}\Lambda_P$ -closed are independent.
- The concepts of $N_{tr}gb$ -closed and $N_{tr}\Lambda_P$ -closed are independent.
- The concepts of $N_{tr}\beta$ -closed and $N_{tr}\Lambda_P$ -closed are independent.
- The class of $N_{tr}\Lambda_P$ -closed sets lie between N_{tr} -closed sets and $N_{tr}\Lambda_P^*$ -closed sets.

5. Neutrosophic Λ_P -Operators

Definition 5.1: Let $(U, \tau_{N_{tr}})$ be a neutrosophic topological space and K be a neutrosophic set in U .

- The neutrosophic Λ_P -interior of K is the union of all $N_{tr}\Lambda_P$ -open sets contained in K . It is denoted by $N_{tr}\Lambda_P int(K)$.
- The neutrosophic Λ_P -closure of K is the intersection of all $N_{tr}\Lambda_P$ -closed sets containing K . It is denoted by $N_{tr}\Lambda_P cl(K)$.

Reena and Karthika

Remark 5.2:

- i. $N_{tr}\Lambda_P int(K)$ is the largest $N_{tr}\Lambda_P$ -open set contained in K .
- ii. $N_{tr}\Lambda_P cl(K)$ is the smallest $N_{tr}\Lambda_P$ -closed set containing K .

Theorem 5.3: Let K be a neutrosophic set of a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then,

- i. K is $N_{tr}\Lambda_P$ -open if and only if $N_{tr}\Lambda_P int(K) = K$.
- ii. K is $N_{tr}\Lambda_P$ -closed if and only if $N_{tr}\Lambda_P cl(K) = K$.

Proof:

- i. Suppose K is $N_{tr}\Lambda_P$ -open. Then by definition 5.1(i), it is obvious that $N_{tr}\Lambda_P int(K) = K$. Conversely, suppose $N_{tr}\Lambda_P int(K) = K$. Then, by remark 5.2(i), $N_{tr}\Lambda_P int(K)$ is $N_{tr}\Lambda_P$ -open and hence K is $N_{tr}\Lambda_P$ -open.
- ii. The proof is similar to (i).

Theorem 5.4: Let $(U, \tau_{N_{tr}})$ be a neutrosophic topological space and K, M be neutrosophic sets in U . Then

- i. $N_{tr}\Lambda_P int(0_{N_{tr}}) = 0_{N_{tr}}$ and $N_{tr}\Lambda_P int(1_{N_{tr}}) = 1_{N_{tr}}$
- ii. $K \subseteq M \Rightarrow N_{tr}\Lambda_P int(K) \subseteq N_{tr}\Lambda_P int(M)$
- iii. $N_{tr}\Lambda_P int(N_{tr}\Lambda_P int(K)) = N_{tr}\Lambda_P int(K)$
- iv. $N_{tr}\Lambda_P int(K \cup M) \supseteq N_{tr}\Lambda_P int(K) \cup N_{tr}\Lambda_P int(M)$
- v. $N_{tr}\Lambda_P int(K \cap M) \subseteq N_{tr}\Lambda_P int(K) \cap N_{tr}\Lambda_P int(M)$

Proof:

- i. $0_{N_{tr}}$ and $1_{N_{tr}}$ are $N_{tr}\Lambda_P$ -open sets. Hence by theorem 5.3(i), $N_{tr}\Lambda_P int(0_{N_{tr}}) = 0_{N_{tr}}$ and $N_{tr}\Lambda_P int(1_{N_{tr}}) = 1_{N_{tr}}$.
- ii. By remark 5.2(i) that $N_{tr}\Lambda_P int(K) \subseteq K$ and $N_{tr}\Lambda_P int(M) \subseteq M$. Now $N_{tr}\Lambda_P int(K) \subseteq K \subseteq M$ implies $N_{tr}\Lambda_P int(K) \subseteq M$. Since $N_{tr}\Lambda_P int(M)$ is the largest $N_{tr}\Lambda_P$ -open set contained in M , we have $N_{tr}\Lambda_P int(K) \subseteq N_{tr}\Lambda_P int(M)$.
- iii. By remark 5.2(i), $N_{tr}\Lambda_P int(K)$ is $N_{tr}\Lambda_P$ -open. Then by above theorem, $N_{tr}\Lambda_P int(N_{tr}\Lambda_P int(K)) = N_{tr}\Lambda_P int(K)$.
- iv. Since $K \subseteq K \cup M$, it follows from (iii) that $N_{tr}\Lambda_P int(K) \subseteq N_{tr}\Lambda_P int(K \cup M)$. Similarly, $N_{tr}\Lambda_P int(M) \subseteq N_{tr}\Lambda_P int(K \cup M)$. Thus $N_{tr}\Lambda_P int(K \cup M) \supseteq N_{tr}\Lambda_P int(K) \cup N_{tr}\Lambda_P int(M)$.
- v. Since $K \cap M \subseteq K$, it follows from (iii) that $N_{tr}\Lambda_P int(K \cap M) \subseteq N_{tr}\Lambda_P int(K)$. Similarly, $N_{tr}\Lambda_P int(K \cap M) \subseteq N_{tr}\Lambda_P int(M)$. Thus $N_{tr}\Lambda_P int(K \cap M) \subseteq N_{tr}\Lambda_P int(K) \cap N_{tr}\Lambda_P int(M)$.

Remark 5.5: The above theorem is true for neutrosophic Λ_P -closure.

Theorem 5.6: For any neutrosophic set K of a neutrosophic topological space $(U, \tau_{N_{tr}})$,

- i. $(N_{tr}\Lambda_P int(K))^C = N_{tr}\Lambda_P cl(K^C)$
- ii. $(N_{tr}\Lambda_P cl(K))^C = N_{tr}\Lambda_P int(K^C)$

Proof:

$$\begin{aligned} \text{i. } (N_{tr}\Lambda_P int(K))^C &= (\cup \{M: M \subseteq K \text{ and } M \in N_{tr}\Lambda_P O(U, \tau_{N_{tr}})\})^C \\ &= \cap \{M^C: K^C \subseteq M^C \text{ and } M^C \in N_{tr}\Lambda_P C(U, \tau_{N_{tr}})\} \\ &= N_{tr}\Lambda_P cl(K^C) \end{aligned}$$

- ii. The proof is similar to (i).

Definition 5.7: Let K be a neutrosophic subset of a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then the neutrosophic Λ_P -Frontier of K is defined as $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(K^C)$. Obviously $N_{tr}\Lambda_P Fr(K)$ is a $N_{tr}\Lambda_P$ -closed set in $(U, \tau_{N_{tr}})$.

Example 5.8: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, 1_{N_{tr}}\}$ where $K = \{ \langle a, 0.2, 0.4, 0.4 \rangle, \langle b, 0.8, 0.6, 0.6 \rangle \}$ and $K^C = \{ \langle a, 0.4, 0.6, 0.2 \rangle, \langle b, 0.6, 0.4, 0.8 \rangle \}$. Consider the collection $\mathcal{A} = \{A: A \subseteq K, A \not\subseteq K^C, K^C \not\subseteq A\}$ and $\mathcal{B} = \{B: K^C \subseteq B \not\subseteq K\}$ of neutrosophic sets in U . Then $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(K^C) = 1_{N_{tr}} \cap K^C = K^C$. Thus $N_{tr}\Lambda_P Fr(K) = \{ \langle a, 0.4, 0.6, 0.2 \rangle, \langle b, 0.6, 0.4, 0.8 \rangle \}$.

Definition 5.9: Let K be a neutrosophic subset of a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then the neutrosophic Λ_P -Border of K is denoted as $N_{tr}\Lambda_P Br(K)$ and is defined as $N_{tr}\Lambda_P Br(K) = K - N_{tr}\Lambda_P int(K)$. (Equivalently, $N_{tr}\Lambda_P Br(K) = K \cap N_{tr}\Lambda_P int(K)$).

Example 5.10: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, 1_{N_{tr}}\}$ where $K = \{< a, 0.3, 0.4, 0.9 > < b, 0.4, 0.5, 0.8 >\}$ and $K^c = \{< a, 0.9, 0.6, 0.3 > < b, 0.8, 0.5, 0.4 >\}$. Consider the collection $\mathcal{A} = \{A: K \subset A \subset K^c\}$ and $\mathcal{B} = \{B: K^c \subset B \subset 1_{N_{tr}}\}$ of neutrosophic sets in U . Then $N_{tr}\Lambda_P Br(K) = K \cap N_{tr}\Lambda_P int(K) = K \cap K = K$. Thus $N_{tr}\Lambda_P Br(K) = \{< a, 0.3, 0.4, 0.9 > < b, 0.4, 0.5, 0.8 >\}$.

Definition 5.11: Let K be a neutrosophic subset of a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then the neutrosophic Λ_P -Exterior of K is denoted as $N_{tr}\Lambda_P Ext(K)$ and is defined as $N_{tr}\Lambda_P Ext(K) = N_{tr}\Lambda_P int(K^c)$. (Equivalently, $N_{tr}\Lambda_P Ext(K) = K - N_{tr}\Lambda_P int(K)$).

Example 5.12: Let $U = \{a, b\}$ and $\tau_{N_{tr}} = \{0_{N_{tr}}, K, 1_{N_{tr}}\}$ where $K = \{< a, 0.5, 0.2, 0.9 > < b, 0.2, 0.4, 0.6 >\}$ and $K^c = \{< a, 0.9, 0.8, 0.5 > < b, 0.6, 0.6, 0.2 >\}$. Consider the collection $\mathcal{A} = \{A: K \subset A \not\subset K^c\}$ and $\mathcal{B} = \{B: K^c \subset B \subset 1_{N_{tr}}\}$ of neutrosophic sets in U . Then $N_{tr}\Lambda_P Ext(K) = N_{tr}\Lambda_P int(K^c) = \mathcal{B}$. Thus $N_{tr}\Lambda_P Ext(K) = \{< a, 0.3, 0.1, 1 > < b, 0.1, 0.3, 0.7 >\}$.

Theorem 5.13: Let K be a neutrosophic set of a neutrosophic topological space $(U, \tau_{N_{tr}})$. Then, $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) - N_{tr}\Lambda_P int(K)$.

Proof: Let K be a neutrosophic set in $(U, \tau_{N_{tr}})$. By definition 5.7, $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(K^c)$ and by theorem 5.6, $(N_{tr}\Lambda_P int(K))^c = N_{tr}\Lambda_P cl(K^c)$. Now $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) \cap (N_{tr}\Lambda_P int(K))^c$. Hence by known result $[A - B = A \cap B^c]$, $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) - N_{tr}\Lambda_P int(K)$.

Theorem 5.14: For a neutrosophic subset K of a neutrosophic topological space $(U, \tau_{N_{tr}})$, $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P Fr(K^c)$.

Proof: Let K be a neutrosophic subset in $(U, \tau_{N_{tr}})$. By definition 5.7, $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(K^c) = N_{tr}\Lambda_P cl(K^c) \cap N_{tr}\Lambda_P cl((K^c)^c) = N_{tr}\Lambda_P Fr(K^c)$. Hence $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P Fr(K^c)$.

Theorem 5.15: A neutrosophic subset K is $N_{tr}\Lambda_P$ -closed in $(U, \tau_{N_{tr}})$ if and only if $N_{tr}\Lambda_P Fr(K) \subseteq K$.

Proof: Let K be $N_{tr}\Lambda_P$ -closed in U . By definition 5.7, $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(K^c) \subseteq N_{tr}\Lambda_P cl(K)$. By theorem, $N_{tr}\Lambda_P cl(K) = K$. Hence $N_{tr}\Lambda_P Fr(K) \subseteq K$ if K is $N_{tr}\Lambda_P$ -closed in U . Conversely, let $N_{tr}\Lambda_P Fr(K) \subseteq K$. Then $N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(K^c) \subseteq K$. Since $N_{tr}\Lambda_P int(K) \subseteq K$. Thus $N_{tr}\Lambda_P cl(K) = K$. Hence K is $N_{tr}\Lambda_P$ -closed.

Theorem 5.16: Let K and M be neutrosophic subsets in the neutrosophic topological space $(U, \tau_{N_{tr}})$. Then $N_{tr}\Lambda_P Fr(K \cap M) \subseteq N_{tr}\Lambda_P Fr(K) \cup N_{tr}\Lambda_P Fr(M)$.

Proof: By definition 5.7,

$$\begin{aligned} N_{tr}\Lambda_P Fr(K \cap M) &= N_{tr}\Lambda_P cl(K \cap M) \cap N_{tr}\Lambda_P cl(K \cap M)^c \\ &\subseteq (N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(M)) \cap (N_{tr}\Lambda_P cl(K^c) \cup N_{tr}\Lambda_P cl(M^c)) \\ &= \{(N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(M)) \cap N_{tr}\Lambda_P cl(K^c)\} \cup \{(N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P cl(M)) \cap N_{tr}\Lambda_P cl(M^c)\} \\ &= (N_{tr}\Lambda_P Fr(K) \cap N_{tr}\Lambda_P cl(M)) \cup (N_{tr}\Lambda_P cl(K) \cap N_{tr}\Lambda_P Fr(M)) \end{aligned}$$

$$\subseteq N_{tr}\Lambda_P Fr(K) \cup N_{tr}\Lambda_P Fr(M).$$

Hence $N_{tr}\Lambda_P Fr(K \cap M) \subseteq N_{tr}\Lambda_P Fr(K) \cup N_{tr}\Lambda_P Fr(M)$.

Theorem 5.17: For neutrosophic subset K of $(U, \tau_{N_{tr}})$, $N_{tr}\Lambda_P Br(K) = K \cap N_{tr}\Lambda_P cl(K^c)$.

Proof: By definition 5.9, $N_{tr}\Lambda_P Br(K) = K - N_{tr}\Lambda_P int(K)$ which implies $N_{tr}\Lambda_P Br(K) = K - (N_{tr}\Lambda_P cl(K^c))^c = K \cap N_{tr}\Lambda_P cl(K^c)$.

Theorem 5.18: For a neutrosophic subset K of a neutrosophic topological space $(U, \tau_{N_{tr}})$, $N_{tr}\Lambda_P Br(K) \subseteq N_{tr}\Lambda_P Fr(K)$.

Proof: Since $K \subseteq N_{tr}\Lambda_P cl(K)$, $K - N_{tr}\Lambda_P int(K) \subseteq N_{tr}\Lambda_P cl(K) - N_{tr}\Lambda_P int(K)$. This implies, $N_{tr}\Lambda_P Br(K) \subseteq N_{tr}\Lambda_P Fr(K)$.

Theorem 5.19: If K is $N_{tr}\Lambda_P$ -closed set in $(U, \tau_{N_{tr}})$, then $N_{tr}\Lambda_P Br(K) = N_{tr}\Lambda_P Fr(K)$.

Reena and Karthika

Proof: Let K be a $N_{tr}\Lambda_P$ -closed. Then by theorem 5.3, $N_{tr}\Lambda_P cl(K) = K$. Now by theorem 5.13, $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P cl(K) - N_{tr}\Lambda_P int(K) = K - N_{tr}\Lambda_P int(K) = N_{tr}\Lambda_P Br(K)$. Hence $N_{tr}\Lambda_P Fr(K) = N_{tr}\Lambda_P Br(K)$.

Theorem 5.20: For a neutrosophic subset K of a neutrosophic topological space $(U, \tau_{N_{tr}})$, then $K = N_{tr}\Lambda_P int(K) \cup N_{tr}\Lambda_P Br(K)$.

Proof: Let $u_{a,b,c} \in K$.

Case (i): If $u_{a,b,c} \in N_{tr}\Lambda_P int(K)$, then the result is obvious.

Case (ii): If $u_{a,b,c} \notin N_{tr}\Lambda_P int(K)$, then by the definition 5.9, $u_{a,b,c} \in N_{tr}\Lambda_P Br(K)$. Hence $u_{a,b,c} \in N_{tr}\Lambda_P int(K) \cup N_{tr}\Lambda_P Br(K)$ and so $K \subseteq N_{tr}\Lambda_P int(K) \cup N_{tr}\Lambda_P Br(K)$. On the otherhand, $N_{tr}\Lambda_P int(K) \subseteq K$ and $N_{tr}\Lambda_P Br(K) \subseteq K$. Thus we have $N_{tr}\Lambda_P int(K) \cup N_{tr}\Lambda_P Br(K) \subseteq K$. Hence $K = N_{tr}\Lambda_P int(K) \cup N_{tr}\Lambda_P Br(K)$.

Theorem 5.21: For a neutrosophic subset K of $(U, \tau_{N_{tr}})$, $N_{tr}\Lambda_P int(K) \cap N_{tr}\Lambda_P Br(K) = 0_{N_{tr}}$.

Proof: Suppose $N_{tr}\Lambda_P int(K) \cap N_{tr}\Lambda_P Br(K) \neq 0_{N_{tr}}$. Let $u_{a,b,c} \in N_{tr}\Lambda_P int(K) \cap N_{tr}\Lambda_P Br(K)$. Then $u_{a,b,c} \in N_{tr}\Lambda_P int(K)$ and $u_{a,b,c} \in N_{tr}\Lambda_P Br(K)$. By definition 5.9, $u_{a,b,c} \in K$. But $u_{a,b,c} \in N_{tr}\Lambda_P int(K)$ which is a contradiction. Hence $N_{tr}\Lambda_P int(K) \cap N_{tr}\Lambda_P Br(K) = 0_{N_{tr}}$.

Theorem 5.22: For a neutrosophic subset K of $(U, \tau_{N_{tr}})$, K is $N_{tr}\Lambda_P$ -open if and only if $N_{tr}\Lambda_P Br(K) = 0_{N_{tr}}$.

Proof: Suppose K is $N_{tr}\Lambda_P$ -open. Then by theorem 5.3(i), $N_{tr}\Lambda_P int(K) = K$. Now $N_{tr}\Lambda_P Br(K) = K - N_{tr}\Lambda_P int(K) = K - K = 0_{N_{tr}}$.

Conversely, suppose $N_{tr}\Lambda_P Br(K) = 0_{N_{tr}}$ implies $K - N_{tr}\Lambda_P int(K) = 0_{N_{tr}}$. Thus $K = N_{tr}\Lambda_P int(K)$. By theorem 5.3(i), K is $N_{tr}\Lambda_P$ -open.

Theorem 5.23: For any neutrosophic subset K of $(U, \tau_{N_{tr}})$, the following conditions hold:

- i. $N_{tr}\Lambda_P Br(N_{tr}\Lambda_P int(K)) = 0_{N_{tr}}$.
- ii. $N_{tr}\Lambda_P int(N_{tr}\Lambda_P Br(K)) = 0_{N_{tr}}$.

Proof:

- i. By definition 5.9, $N_{tr}\Lambda_P Br(N_{tr}\Lambda_P int(K)) = N_{tr}\Lambda_P int(K) - N_{tr}\Lambda_P int(N_{tr}\Lambda_P int(K))$. By theorem 5.3(i), $N_{tr}\Lambda_P int(N_{tr}\Lambda_P int(K)) = N_{tr}\Lambda_P int(K)$. Hence $N_{tr}\Lambda_P Br(N_{tr}\Lambda_P int(K)) = 0_{N_{tr}}$.
- ii. Let $u_{a,b,c} \in N_{tr}\Lambda_P int(N_{tr}\Lambda_P Br(K))$. Since $N_{tr}\Lambda_P Br(K) \subseteq K$ which implies $N_{tr}\Lambda_P int(N_{tr}\Lambda_P Br(K)) \subseteq N_{tr}\Lambda_P int(K)$. Hence $u_{a,b,c} \in N_{tr}\Lambda_P int(K)$. Since $N_{tr}\Lambda_P int(N_{tr}\Lambda_P Br(K)) \subseteq N_{tr}\Lambda_P Br(K)$, $u_{a,b,c} \in N_{tr}\Lambda_P Br(K)$. Hence $u_{a,b,c} \in N_{tr}\Lambda_P int(K) \cap N_{tr}\Lambda_P Br(K)$, $u_{a,b,c} = 0_{N_{tr}}$.

Theorem 5.24: For a neutrosophic subset K of a neutrosophic topological space $(U, \tau_{N_{tr}})$,

- i. $N_{tr}\Lambda_P Ext(K) = (N_{tr}\Lambda_P cl(K))^c$.
- ii. $N_{tr}\Lambda_P Ext(K) = N_{tr}\Lambda_P Ext((N_{tr}\Lambda_P Er(K))^c)$.
- iii. $N_{tr}\Lambda_P Ext(N_{tr}\Lambda_P Ext(K)) \supseteq N_{tr}\Lambda_P int(K)$.
- iv. $N_{tr}\Lambda_P Ext(K \cup M) \subseteq N_{tr}\Lambda_P Ext(K) \cap N_{tr}\Lambda_P Ext(M)$.
- v. $N_{tr}\Lambda_P Ext(K \cap M) \supseteq N_{tr}\Lambda_P Ext(K) \cup N_{tr}\Lambda_P Ext(M)$.

Proof:

- i. We know that $1_{N_{tr}} - N_{tr}\Lambda_P cl(K) = N_{tr}\Lambda_P int(K^c)$, then $N_{tr}\Lambda_P Ext(K) = N_{tr}\Lambda_P int(K^c) = (N_{tr}\Lambda_P cl(K))^c$.
- ii. $N_{tr}\Lambda_P Ext((N_{tr}\Lambda_P Er(K))^c) = N_{tr}\Lambda_P Ext((N_{tr}\Lambda_P int(K^c))^c) = N_{tr}\Lambda_P int((N_{tr}\Lambda_P int(K^c))^c) = N_{tr}\Lambda_P int(N_{tr}\Lambda_P int(K^c)) = N_{tr}\Lambda_P int(K^c) = N_{tr}\Lambda_P Ext(K)$.
- iii. $N_{tr}\Lambda_P Ext(N_{tr}\Lambda_P Ext(K)) = N_{tr}\Lambda_P Ext(N_{tr}\Lambda_P int(K^c)) = N_{tr}\Lambda_P int((N_{tr}\Lambda_P int(K^c))^c) = N_{tr}\Lambda_P int(N_{tr}\Lambda_P cl(K)) \supseteq N_{tr}\Lambda_P int(K)$.
- iv. $N_{tr}\Lambda_P Ext(K \cup M) = N_{tr}\Lambda_P int((K \cup M)^c) = N_{tr}\Lambda_P int((K^c) \cap (M^c)) \subseteq N_{tr}\Lambda_P int(K^c) \cap N_{tr}\Lambda_P int(M^c) = N_{tr}\Lambda_P Ext(K) \cap N_{tr}\Lambda_P Ext(M)$.

Reena and Karthika

$$v. \quad N_{tr}\Lambda_P Ext(K \cap M) = N_{tr}\Lambda_P int(K \cap M)^c = N_{tr}\Lambda_P int((K^c) \cup (M^c)) \subseteq N_{tr}\Lambda_P int(K^c) \cup N_{tr}\Lambda_P int(M^c) = N_{tr}\Lambda_P Ext(K) \cup N_{tr}\Lambda_P Ext(M).$$

ABSTRACT

An autoimmune reaction results in hyper proliferative growths in Psoriasis vulgaris, the most common skin disorder. An inflammatory skin disease that produces redness and scaling, psoriasis produces inflammation in the skin. An overview of how a disease develops and progresses is related to the dysregulation of the innate immune system. A major area of nanotechnology that is growing rapidly is nanomaterials. In addition to reducing the time it takes, it eliminates the need for toxic chemicals. This study describes how silver nanoparticles (AgNPs) derived from a medicinal plant leaf extract can be used as a source of silver nanoparticles (AgNPs).

Keywords: Psoriasis Vulgaris, Autoimmune reaction, Hyper proliferative growths, Nanomaterials, Silver nanoparticles (AgNPs), Medicinal plant extract.

INTRODUCTION

Nanotechnology is an industry that is rapidly growing and is capable of creating nanoscale structures. Generally, nanoproducts are particles ranging in diameter from 1 to 100 nm and are created by the approach and synthesis of nanoparticles. Wet, dry, and computerized nanotechnology are all part of nanotechnology in living organisms. Membranes, organs, enzymes, and organelles are all part of wet nanotechnology. In dry nanotechnology, the production of inorganic materials like silicon and carbon is focused on surface science and physical and chemical properties. Computer nanotechnology involves modeling and simulating complex nanometre-scale structures [1]. To achieve optimal results, these three disciplines were integrated as shown in Figure 1. Nanoscale compounds have

92279

**Renganathan and Srinivasan**

properties that allow them to be applied to a wide range of applications, while also extending the field of research on nanoscale materials. Bioremediation, pharmaceuticals, diagnostics, consumer goods, pharmaceutical supplements, growth inhibitors for biofilms, and biosensors are a few of the industries that use it[2]. A nanoparticle (NP) is a particle that has a minimum size of 100 nanometers [3]. Since they're not simple molecules, NPs have three layers: (1) An emulsifier, metal ion, or polymer can stabilize the surface layer. (2) Physically and chemically, the shell layer differs from the core. (3) There is a core element within the NP, which could be considered its central component. [4]. Because of the absorption in the visible region, NPs' optical properties are affected by their size. The size, shape, and structure of materials determine their reactivity and durability. NPs containing heavy metals, such as lead, mercury, and tin, pose a variety of environmental hazards as they are difficult to degrade [5]. Nanotechnology and biotechnology are combining to increase the focus on developing medical materials [6].The production of nanoparticles has been carried out using various plant parts, including fruits, leaves, stems, seeds, flowers, roots, bark, and rhizomes[7]. The physical, chemical, and biological properties of nanoparticles of silver (AgNPs) have recently been thoroughly investigated. Studies are currently being conducted to determine if AgNPs can be used in clinical and industrial applications, as well as in the development of drugs [8, 9].A dynamic metal, silver has excellent biological properties because at low concentrations, it can inhibit fungal, bacterial, viral, and infectious infections, heal wounds, and fight inflammation [10, 11].Silver, an inorganic antibacterial agent that is non-toxic, eliminates 650 types of disease-causing microorganisms [12, 13].Despite their increasing use in medicine and everyday life, AgNPs remain the subject of limited biomedical and toxicological studies [14, 15]. Patients' quality of life is negatively impacted by psoriasis, a chronic inflammatory skin condition. Recent research has suggested that psoriasis is a systemic disease caused by an impaired immune system. Numerous environmental factors, genetic factors, and immunological mechanisms contribute to the pathogenesis of psoriasis, as do pro-inflammatory cytokines. Current medications cause serious side effects, have high remission rates, and are resistant to chemotherapy. There is a strong need to produce safer and more effective treatment approaches based on the current treatment approaches [16, 17]. Due to their significant preventive activity against psoriasis, the plants can open the door to new therapeutic approaches [18]. Using conventional therapeutic approaches against psoriasis, the purpose of this paper is to indicate worthwhile prospects. Reviewing the literature related to herbal medicines that can effectively treat psoriasis was our primary objective. Psoriasis pathophysiology was discussed, as well as how plant products modulate pathophysiology. There is a summary of the scientific evidence that demonstrates the effectiveness of medicinal plants in treating psoriasis, along with their underlying mechanism of action.

Approaches of Nanoparticle Production

Physical, chemical, and biological approaches are currently used to synthesize AgNPs. AgNPs can be synthesized biologically and exhibit chemical and physical synthesis solubility, lack qualities such as high yield and stability are more labour-intensive and riskier [19, 20].Metallic nanoparticles are formulated using top-down and bottom-up approaches, as shown in Figure 2. Nanoparticles are synthesized via mechanical/ball milling, chemical etching, laser ablation, sputtering, condensation, and arc discharge [20, 21]. Biopolymers, microbes, and herbal extracts are involved in the biosynthesis of nanoparticles. Herbal remedies and drugs derived from plants have been extensively studied since ancient times. 8000 natural antibiotics with potent biological activities have been isolated, characterized, synthesized, and discovered as a result of pharmacological screening of natural source compounds. To make nanoparticles, chemical and physical processes are involved, resulting in high costs and health hazards for the environment. Creating nanoparticles involves several chemicals and physical processes, which are expensive and hazardous to the environment. Further, nanomaterials formed aggregates instead of particles. Biological AgNPs have been formed by bacteria, fungi, and plants [19]. AgNPs can be synthesized using biomolecules without harming the environment. There is a wide range of medical applications that can benefit from controlling particle size and shape through biological methods. Reducing agents such as bacterial proteins or plant extracts can indeed be used to control nanoparticle size, shape, and monodispersity. Additionally, biochemical methods provide a variety of natural resources, reduce production time requirements, and ensure high productivity. It is more effective and has superior properties to use nanoparticles with smaller sizes and shorter shapes. There are some drawbacks to synthesizing AgNPs of different shapes and sizes despite their success.By using biological synthesis methods, nanoparticles can be

controlled more easily in size, shape, and dispersion. It is possible to optimize the synthesis methods, including precursor number, pH, temperature, and stabilizing and reducing agents.

Psoriasis vulgaris

Skin epithelial cells constantly grow, resulting in the growth of raised, inflamed plaques with psoriasis vulgaris. While accurate statistics are difficult to obtain, it is estimated that psoriasis affects 1 to 3% of people worldwide. The pathophysiology of the disease is heavily influenced by genetic and cellular factors. The symptomatic treatments that are used as well as those that modulate the immune system respond to these different targets, so treatment strategies vary accordingly. In addition to environmental factors such as smoking, seasonal changes, and infections, it has also been determined that certain drugs may cause the disease. Conventional treatment has a detrimental effect on the quality of life, resulting in a search for natural alternatives. Traditional systems of medicine for psoriasis have utilized several plants that might act as safer alternatives to conventional therapies [23].

Medicinal plants having anti-psoriatic activity

It is currently believed that changes in the environment trigger changes in immune-related genes that lead to psoriasis. A phytochemical's multifaceted action on psoriasis is described in this section.

Drug delivery system: Silver Nanoparticles

Several nanoparticles have gained considerable interest as a means of delivering drugs in a unique and advanced manner. The techniques used to provide specific therapeutic outcomes should be evaluated when distributing a pharmaceutical element to humans or animals. Several chemical units containing AgNPs were successfully combined to create a novel and effective drug delivery system that was capable of adapting to temperature and pH changes nanoscale-derived health care settings, highly contagious, and targeted at inflammation. [24]. In order to be effective, nanosystems for drug delivery must be simple to construct, easy to access, and highly reactive. A flexible drug concentration and discharging technology is also required to ensure effective drug delivery. In addition, its concentration should be lower than that of its main compounds, which should minimize its side effects [25]. As anticancer drugs can be carried by AgNPs either actively or passively, this area of research has attracted a lot of attention [26].

Silver nanoparticles for anti-psoriatic activity

Patient suffering, fatality, and substantial economic consequences may result from infections, which are serious therapeutic problems. It is difficult but necessary to control wound sprouting and clinical illness. Despite being the largest and most advanced organ in the body, the skin can be exposed to harmful environmental stimuli. When cutaneous wounds are created physically or chemically, they can severely impair skin function and even cause death, depending on the level of trauma [27, 28].

CONCLUSION

In the present study, we found that the plants showed bioactive properties that are beneficial to the treatment of psoriasis when used topically or as an adjuvant therapy. There are several notable anti-psoriatic properties associated

with silver nanoparticles, which are widely used in the medical industry to treat psoriasis. It is an economically, environmentally and economically efficient way of making nanoparticles using plant extracts, resulting in a more efficient work place, healthier communities, a less wasteful environment, and a safer product.

ABSTRACT

The study focuses on lactic acid bacteria, present in naturally fermented milk products in and near Davangere and have probiotic effects in the gastrointestinal tract. These products include curd made from cow, buffalo, sheep, goat milk and butter made from cow and buffalo milk. The task uses a natural fermentation technique with no artificial starting culture, as the lactic acid bacteria has native flora to ferment. Probiotic isolate is subjected to several activities to indicate potential probiotics. When the antibacterial activity was measured both before and after the pH was neutralized, it was found that *Escherichia coli*, *Staphylococcus aureus*, *Salmonella typhimurium*, and *Listeria monocytogenes* showed the greatest suppression of the food-borne pathogens. The probiotic isolates are exposed to varied pH values and salt concentrations at a predetermined incubation period. Some isolates tolerated low pH for up to eight hours, different concentrations of bile indicated lower bacterial growth as the bile concentration increased, and in the gastro intestine, the isolates naturally dropped vertically from the stomach to the intestinal state. All isolates reported positive β -galactosidase production and hydrophobicity of 78%. In our study, the isolates DGC-10 and DBB-9 demonstrated the highest probiotic potentials of all the isolates, indicating that the goat curd and buffalo butter samples have greater potential and can be commercially exploited as probiotic isolates for food products.

Keywords: antimicrobial activity, acid tolerance, hemolysis, lactic acid bacteria, naturally fermented milk.

INTRODUCTION

Probiotics, which are referred to as "living microorganisms," have been associated with positive health effects. Most of these bacteria benefit human health, performing several crucial physiologies. They aid in the digestion of food that our bodies can't break down on their own, they teach our immune systems to fight against invaders, they strengthen the lining of our intestines, and they may even affect the way we feel. In the digestive tract, probiotics work with our native microorganisms to generate compounds that benefit human health. Dietary supplements and various meals, particularly fermented dairy products like yoghurt and kefir, may include probiotics. To improve the acidity, texture, flavour, and aroma of food products and extend their shelf life, lactic acid bacteria (LAB) are frequently used [1]. Certain probiotic microorganisms, such as *Lactobacillus delbrueckii subsp. bulgaricus*, are known to provide a unique taste to food items due to their probiotic capabilities. The main sources of lactic acid bacteria are fermented food. This includes fermented vegetables, sour fruits and all dairy products. Although cow's milk is the kind of mammalian milk that is most often consumed globally, milk from other species, such as buffalo, sheep, goats, mares, camels, and yaks, may have had a greater historical and cultural impact in specific areas/countries [2]. One of the earliest fermented meals, naturally fermented milk products have been enjoyed by numerous ethnic tribes throughout the world since 6000 BCE [2]. The potential probiotic bacteria found in fermented milk products not only benefit the host's health but also offer substantial market worth in the food business [3]. Naturally fermented milk (NFM) products are popular throughout most of India [4], though their use varies considerably from area to region and community. Several dairy products, including milk, curd, and butter, have been cultured for lactic acid bacteria at Davangere. A popular fermented milk product from many ethnic backgrounds, curd is eaten across India. Butter is churning milk fat from curd into butter containing saturated fat, water, and milk proteins. This research aims to establish the potential role played by lactic acid bacteria isolated from fermented milk. The objective is to further help analyze comparative studies on various mammals, including cows, buffaloes, sheep, and goats. This work extends to identifying the most potential isolates based on various constraints.

MATERIALS AND METHODS

Collection of Sample

We collected 18 milk samples in and around the Davangere regions: Harihar, Honnali, Channagiri, Harapanahalli, Chitradurga, Hosadurga, Challakere, and Holalkere. We kept the cow, buffalo, sheep, and goat milk samples collected for fermentation naturally without adding any starter culture and made fermented milk products like curd and butter.

Characterization of LAB

The study used the pour plate method to characterize lactic acid bacteria from Davangere curd and butter from cow, buffalo, sheep, and goat milk samples. Samples were mixed with sterile saline, diluted to 10^{-1} to 10^{-8} , and plated on de Man Rogosa Sharpe agar (MRS) media. Mixed cultures were obtained and purified, and pure cultures were characterized by Gram staining.

Gram staining

Gram staining involves making a small colony smear on a glass slide and then smearing it with a crystal violet stain. The smear is washed with tap water, added Gram's Iodine, and soaked in 95% alcohol. The smear is then counterstained with safranin for a minute. The slide is then washed, drained, and air-dried before being examined under a microscope [5].

Catalase test

Bacteria identification using 3% hydrogen peroxide involves collecting a small organism from a well-isolated colony and placing it on a microscopic slide. Observing bubble formation. Positive reactions are indicated by effervescence, while catalase-negative responses are indicated by no bubble formation [6].

Bhavya et al.,

Oxidase test

A sterile plastic inoculating loop removes new growth from the agar plate. A clean oxidase disc is moistened with water, and colony growth is rubbed. If cytochrome oxidase is present, the colour changes from colourless to indigo blue within 10-20 seconds. Negative results indicate oxidase [7].

Gas (co₂) production from glucose

Carbon dioxide production from glucose was checked to determine homofermentative or heterofermentative lactic acid bacteria isolates—Inoculate cultures in 5 mL MRS broth and incubated at 37°C for 24 to 48 hrs. The gas accumulation in the inverted Durham tubes indicated positive results, while no gas production indicated negative effects [8].

Ammonia from arginine

The arginine hydrolysis test was conducted using the [8] method in MRS broth, detecting ammonia using Nessler's reagent, indicating dark orange.

Fermentation of sugars

Inoculate cultures in tubes with 4 ml MRS broth containing phenol red and different sugars were incubated at 37°C for 48 hrs. Acid production was measured by colour change from red to yellow. Various sugars were used: lactose, maltose, glucose, fructose, cellobiose, mannose, rhamnose, melezitose, raffinose, ribose, xylose, sucrose, arabinose, trehalose, melibiose, salicin, and mannitol [8].

Growth in different NaCl concentrations

Salt tolerance of LAB isolates was tested by inoculating culture in MRS broth with 2%, 4%, 6%, 8%, and 10% of NaCl and incubating for 48 hrs at 37°C. Cultures were observed for growth after incubation [9].

Growth at different temperatures

Lactic acid bacteria growth was measured at 37°C, 42°C, 55°C, 60°C, and 65°C temperatures using the methods of [8,9]. Inoculated tubes with culture plates were incubated at 37°C, and growth was observed after 48-72 hrs.

Growth at different pH

The study measured lactic acid bacteria growth at different pH levels using the method of [8]. MRS broth was adjusted to 3.5, 4.5, 5.5, 7.2, 8.2, and 9.2 pH using 1 N HCl and 10% NaOH. The broth was filter sterilized, inoculated with 24 hrs old culture, and incubated at 37°C for 48-72 hrs.

Screening Activities**Determination of the antibacterial activity of lactic acid bacteria by the agar well diffusion method**

The study tested the antimicrobial activity of presumptive lactic acid bacteria isolates against enterotoxigenic: *Escherichia coli*, *Staphylococcus aureus*, *Listeria monocytogenes*, and *Salmonella typhimurium*. These four pathogenic bacteria were previously isolated and identified (SDM Research Institute for Biomedical Sciences, Dharwad). Antimicrobial activity was evaluated by testing isolates on agar well diffusion plates. The indicator strain expanded on Mueller Hinton Agar, but the pathogen grew well on Brain Heart Infusion Agar. A 100 µl concentration of culture-free filtrate was used to fill the wells. The zone of inhibition was measured after incubating the plates at 37°C for 24 hrs [10].

Determination of antibacterial activity of lactic acid bacteria for the production of bacteriocin

Lactic acid bacteria can produce antibacterial compounds [11], and this study evaluated presumptive lactic acid bacteria isolates for their bacteriocin production. The LAB isolates were grown in MRS broth within a shaking incubator at 125 rpm at 37 °C for 48 hrs in anaerobic conditions (Remi- RS-24). The cultures were then collected into a centrifuge tube and centrifuged at 10000 g for 15 min at 4 °C (Remi-R8C) and were adjusted to pH 7.0 using 1M NaOH to exclude the antimicrobial effect of organic acid. The cell-free supernatant was filtered with a 0.2 µm

92286

Bhavya et al.,

membrane filter (Millipore) [12]. The antibacterial efficiency of the supernatant against foodborne pathogens was determined using the agar well diffusion method after the pH of the supernatant was neutralised. A 100 µL LAB culture-free filtrate was used to fill the wells. The zone of inhibition was measured after incubating the plates at 37°C for 24 hrs [10]. The LAB-producing zone of inhibition indicates the production of bacteriocin.

Determination of Acid tolerance

The [12] approach determined acid tolerance by placing various lactic acid bacteria isolates in MRS broth at several pH values (2 to 7). Growth was measured spectrophotometrically at 600nm for 4 to 48 hrs (Systronics-2202) and was tested after 16 hrs using a plating method.

Determination of Bile tolerance

We employed the procedure described in [13] to evaluate bile salt tolerance. We implanted lactic acid bacteria isolates into MRS broth containing 0.15%, 0.30%, and 0.45% bile salt to determine their tolerance to this compound. Incubate the culture broth for growth @37°C for 2 hrs. Growth in the broth was measured spectrophotometrically at 600nm and was tested using a plating method.

Determination of tolerance to stimulated Gastro-Intestinal conditions

A modified method was used to determine transit tolerance using simulated gastric juice [14]. Bacterial isolates were cultured overnight, suspended in 2ml of gastric juice. Spin at 200 rpm for 3 hours while incubating at 37°C. After inoculating the medium, centrifuge at 6000 rpm for 15 minutes, wash twice with phosphate buffer solution, and resuspend the pellet in intestinal fluid. The cells were incubated for three hours at 200 rpm at 37°C. Before and after the incubation period, total viable counts were conducted. The difference in colony counts was used to quantify the results.

Determination of antioxidant activity

The 2,2-Diphenyl-1-picrylhydrazyl (DPPH) radical scavenging assay [15] was used to evaluate the antioxidant activity of several strains of lactic acid bacteria. In this experiment, we used the cell-free supernatant by adding 2 ml of DPPH to 2 ml of cell-free supernatant and letting the combination sit for 30 minutes in the dark. The samples were analysed using 517 nm absorbance. Standards were prepared using a DPPH solution in ethanol, while blanks were prepared using pure ethanol.

The percentage of DPPH scavenging activity was used to describe the antioxidant activity:

$$\text{DPPH scavenging activity (\%)} = \frac{\text{Absorbance of blank} - \text{Absorbance of sample}}{\text{Absorbance of blank}} \times 100$$

Determination of β-galactosidase assay

All bacteria were inoculated into tubes containing O-nitrophenyl-beta-D-galactopyranoside (ONPG), and the production of a yellow colour indicated positive β galactosidase activity [16]. The LAB strains were cultured at 37°C in a new MRS broth overnight. At 6000 rpm for 10 minutes, we centrifuged 1 ml of culture broth. 1 ml saline was added to the pellet, vortex, Centrifuge @ 6000rpm at 40°C for 10 minutes. To the pellet, add 1.5ml of Z-buffer, vortex; place the tubes in a 30°C water bath for 2 minutes; add 0.2ml of ONPG to each tube, vortex, and Return to the 30°C shaker (Note the time). The reaction was stopped when the yellow colour developed. The OD values were measured at 420nm, 550nm, and 650nm for each cell suspension.

$$\text{Activity} = \frac{\text{OD}_{420} - (1.75 \times \text{OD}_{550})}{\text{OD}_{650} \times t \times v} \times \frac{1 \text{ n mol}}{0.0045 \text{ ml cm}} \times 1.7 \text{ ml}$$

Determination of Cell surface hydrophobicity assay

In-vitro assessment of microbial adhesion to xylene was performed [17] to approximate the strain's capacity to attach to epithelial cells. Colonize MRS broth with the samples and keep them at 37°C overnight. 3ml cell suspensions Centrifuged @ 6000 rpm for 10 minutes, Pellets resuspended in 10ml saline, Add xylene Vortexed vigorously for 2 minutes. After phase separation, aqueous phase optical density was measured spectrophotometrically @ 560nm.

**Bhavya et al.,**

$$\text{Percentage of Hydrophobicity (H \%)} = \frac{(A_0 - A_f)}{A_0} \times 100$$

A_f represents the optical density of the aqueous phase after adding xylene.

A_0 represents the optical density of the primary aqueous phase.

Determination of antibiotic sensitivity

The antibiotic sensitivity determination method involves inoculating presumptive lactic acid bacteria isolates onto plates and placing octodiscs. To grow the lactic acid bacteria we selected, we used 10 ml of fresh MRS broth and incubated it at 37°C for 48 hrs. To resuspend the pellets in saline, each isolate was centrifuged at 10000 rpm for 20 minutes. Agar plates are swabbed with a solution of pellets in saline and placed in an incubator at 37°C for 10 minutes. 24-hrs incubation at 37°C with antibiotic discs on the swabbed plates is recommended. Observe the zone of inhibition.

Hemolysis of blood Safety evaluation

Hemolytic activity was investigated [18]. The fresh cultures were streaked on the surface of the Sheep Blood Agar Plate; the plates were incubated at 37°C for 24 to 48 hrs. The plates were tested for hemolysis after incubation.

Molecular Identification

DNA Extraction

Based on probiotic attributes, the two isolates that showed the dominant character of LAB were selected from 12 LAB strains. The total genomic DNA of two representative strains of LAB was extracted from 2 ml samples of overnight cultures grown in MRS broth at 30°C according to the methods of [19].

16S rRNA Gene Sequencing

The 16S rRNA gene was amplified using PCR mixtures (25 µL) that contained 30–50 ng of template DNA, 1 µM of forward primer 27F, and 1 µM of reverse primer 1492R [20]. The amplification process was carried out using a PCR Master Mix (Promega) and a SimpliAmp™ Thermal Cycler (Thermo Fisher Scientific) according to standard protocol. The purity of the PCR amplicons was assessed using 1% agarose gel electrophoresis with 10 mg/mL of ethidium bromide present. The results were then examined using the Gel Doc System (Ultra-Violet Products Ltd.). The resulting sequencing files are in AB1 format, which may be seen with programmes like FinchTV. DNA datasets were compared using the BLAST (Basic Local Alignment Search Tool) programme to look for sequence similarities found in the NCBI database. The phylogenetic analysis using Molecular Evolutionary Genetics Analysis software (MEGA 11).

RESULTS

Davangere curd, buffalo butter, sheep butter, and goat butter were all found to have lactic acid bacteria (LAB).

Curd, made from cow, buffalo, sheep, and goat milk, and butter, made from cow and buffalo milk, were naturally fermented sources of lactic acid bacteria (LAB) in Davangere regions (Figure- 1). Sixty isolates were analysed for morphology; 43 were suspected to be LAB based on Gram's response, microscopic inspection, and catalase and oxidase assays. The isolates from the samples in the study were designated as DCC for cow curd, DBC for buffalo curd, DSC for sheep curd, DGC for goat curd, DCB for cow butter, and DBB for buffalo butter. Ten isolates were obtained from (DCC), consisting of (7 rods and 3 cocci). Ten isolates from (DBC) consisting of (3 rods, 6 cocci, and 1 yeast), ten isolates from (DCB) consisting of (7 rod, 3 cocci), ten isolates from (DBB) consisting of (6 rods, 4 cocci), ten isolates from (DSC) consisting of (4 rods, 5 cocci, 1 yeast), and ten from (DGC) consisting of (5 rods, 5 cocci) cultures. Microscopic examination of the isolates showed the predominance of gram-positive rods (54%) and cocci (43%), followed by yeast species (3%). The strains DCC-1, DCC-9, DBC-2, DBC-10, DCB-5, DCB-9, DBB-2, DBB-9, DSC-3, DSC-8, DGC-4, and DGC-10 were chosen for further study because they are gram-positive, non-motile, rod-shaped bacteria that are also catalase-negative and oxidase-negative.

Bhavya et al.,

Characterization of lactic acid bacteria (LAB) by phenotypic and biochemistry in Davangere dairy products: cow, buffalo, sheep, goat curd, and cow and buffalo butter.

The phenotypic characterisation of LAB in terms of individual samples is shown in (Tables 1) and (Figures 2, 3, and 4). From twelve isolates, three isolates produced CO₂; ten isolates showed the presence of ammonia. Several different types of sugars were tested, and it was shown that LAB isolates could ferment arabinose, dextrose, fructose, lactose, mannose, sucrose, and xylose. Twelve distinct isolates were tested at several conditions, including 37°C, 42°C, 55°C, 60°C, and 65°C temperatures, pH levels of 3.5, 4.5, 5.5, 7.2, 8.2, and 9.2, and salt concentrations of 2%, 4%, 6%, 8%, and 10%. The isolates that showed dominant growth at different salt concentrations are DGC-10 in (6%), DCC-1 in both (2% & 4%), DBB-9 in both (8% & 10%) and there is no growth in any isolate except DBB-9 in (10%). In different pH level the highest growth isolates are DBB-9 at pH-4.5, 5.5, & 9.2, DCC-9 at pH-7.2, DSC-3 at 3.5 and DBB-2 at pH-8.2. In different temperature highest growth taken by isolates are DBB-9 at 37°C, 60°C & 65°C, DGC-10 at 42°C & 60°C, and 65°C and DSC-8 at 55°C.

Screening of Presumptive LAB Isolates For Probiotic Attributes**Antimicrobial activity of the chosen LAB was tested using the agar well diffusion method**

The capacity to create antimicrobial compounds against pathogens aids in immune system regulation [19, 20], which is why lactic acid bacteria are so popular as probiotic strains [20]. Twelve different cultures were tested for their potential to prevent the growth of four types of food-borne pathogens: *Listeria monocytogenes*, *Salmonella typhimurium*, *Escherichia coli*, and *Staphylococcus aureus*. The LAB isolates' antibacterial activity results are shown in (Figure 5). The highest observed growth inhibition zone measured in this study was 20mm by DCB-9, DBB-9 against *S. aureus*, *S. typhimurium*, and *L.monocytogenes*. Seven isolates, DCC-9, DBC-2, DCB-5, DBB-9, DSC-3, DSC-8, and DGC-10, showed inhibition against all four foodborne pathogens. One isolate, DSC-8, did not show any inhibition against *E.coli*, while DBC-10 and DBB-two did not show inhibition against *S. aureus*. The isolates DCC-1 and DCB-9 did not show inhibition against *L.monocytogenes*. All the isolates had inhibitory activity against *S. typhimurium*. Previous research looked at how effective LAB strains were as antibiotics, and the results suggested they may be useful as probiotics.

Determination of the antimicrobial activity of lactic acid bacteria isolates for the production of bacteriocin

Antimicrobial substances such as organic acids, hydrogen peroxide, diacetyl, inhibitory enzymes, and bacteriocin may contribute to the efficacy of the strains tested to suppress infections [21]. Many chemicals with antibacterial activity may be produced by LAB, which is widely recognised. The current investigation assessed the potential to produce bacteriocins by the putative LAB isolates. This was achieved by adjusting the pH of the supernatant. Results shown in (Figure-6) show that only two isolates, DCC-9 and DBB-9, showed inhibition against all four tested pathogens. Four isolates (DBB-2, DSC-3, DSC-8, and DGC-10) showed inhibition against three pathogens, i.e., *S.aureus*, *S.typhimurium*, *L.monocytogenes* and did not establish any inhibition zone against *E.coli*. DCC-1 and DCB-9 showed antimicrobial activity against only *S.aureus* and *S.typhimurium*. Antimicrobial activity was detected against *Escherichia coli* and *Staphylococcus aureus* in isolates DBC-2 and DCB-5. Against infections, DGC-4 does not show much antibacterial action, indicating it does not create bacteriocin. Studies on *Escherichia coli*, *Staphylococcus aureus*, *Listeria monocytogenes*, and *Salmonella typhimurium* suggest that LAB in the NFM products may impact the lower survival of hazardous bacteria. The potential causes of the antibacterial activity of the cultures recovered from the various materials include their capacity to create one or more chemicals. Our study tested the antimicrobial activity before and after neutralizing the pH. In these reports, seven isolates (DCC-9, DBC-2, DCB-5, DBB-9, DSC-3, DSC-8, and DGC-10) showed antimicrobial activity against all the pathogens tested before neutralizing the pH of the supernatant. After neutralizing the pH of the supernatant, only two isolates (DCC-9 and DBB-9) had antimicrobial properties against all four foodborne pathogens. So, these isolates are considered to produce a very strong bacteriocin against the tested pathogens.

Studies on acid tolerance of the selected LAB isolates

To guarantee the survival and development of putative probiotics in the gastrointestinal tract, standard in vitro studies are required for their characterization. The rate of survival of the isolates was evaluated at various pH levels.

**Bhavya et al.,**

One of the most crucial features of a putative probiotic strain is its capacity to thrive at an acidic pH [22], an in vitro mimic of the human stomach [23]. The findings are shown in (Figure-7a-7l). Isolate growth rates were measured at 4h, 8h, 12h, 24h, and 48h intervals. There was no transition at pH 2 and 3, but most isolates exhibited optimal growth at pH 6 and 7, declining growth at pH 4 and 5. The twelve LAB isolates from different sources were assayed for acid tolerance. The highest tolerance was shown by four isolates, namely DBC-10, DCB-9, DBB-9, and DGC-10, which could withstand pH 2 - 7. The isolate showed optimal growth between pH 5 - 7 up to 12 hours of incubation. Isolates DCC-1, DCC-9, DBC-10, and DGC-4 No change was observed after 12 hours in pH-2-4. The seven isolates, DCC-1, DCC-9, DBC-10, DCB-5, DCB-9, DBB-9, and DGC-10, could withstand pH- 7 for up to 48 hrs. Isolates DBC-2, DBB-2, and DSC-8 were not able to survive highly acidic conditions and were not able to grow. These results indicate that the isolates (DBC-10, DCB-9, DBB-9, DGC-4, and DGC-10) could tolerate and survive low pH for up to 8 hours of incubation. Previous research has shown that LAB strains vary in their tolerance levels [24]. To investigate how different pH levels affected bacteria, the number of viable bacteria was counted using the plate count method. The viability of the isolates was evaluated after 16 hrs of incubation at different pHs, as shown in (Figure-8). All the isolates, Except for three isolates, DBC-2, DBB-2, and DGC-4, could tolerate and survive at higher pH. Results indicate that those strains unable to accept a pH of 2 could handle a higher pH.

Studies on bile tolerance of the selected LAB isolates

Probiotic bacteria candidates' ability to tolerate intestinal bile salt is important for their selection and survival in the GIT [25]. Research on the viability of LAB isolates in the presence of varying quantities of bile revealed that bacterial growth slowed with increasing bile concentrations. The effect of different bile concentrations is shown in (Figure 9). Isolate growth rates were measured at 2 hours. The results were similar for all the lactic isolates tested. The change was maximum in the experimental control, where bile was not supplemented. The cell viability of isolates varied at different bile concentrations (Figure 10). At 0.15% bile salt supplementation, isolate DCC-1 showed higher viability. At a bile concentration of 0.30% and 0.45%, the strain DBB-9 showed high viability, and only isolate DBC- 2 showed the lowest at all concentrations of bile than other isolates. In the present study, 0.3% and 0.45% bile concentrations showed higher viability in the isolate DCC-1 upto 2 hours. Previous studies [26] determined that the typical bile concentration is 0.3%, while the normal bile concentration for an individual is between 0.3% and 0.5%. The lipid bilayer and integral protein of bacterial cell membranes are hypothesised to be compromised by bile acids, disrupting cell homeostasis, releasing cytoplasmic material, and ultimately leading to cell death. Probiotic isolates that can thrive in high bile concentrations are much sought after.

Effect of gastrointestinal conditions on selected lactic acid bacteria

As probiotics, lactic acid bacteria should be able to thrive in the digestive system. Food takes around four hours to move through the small intestine. Recent publications [24] show that LABs had a greater survival rate in simulated stomach acid and intestinal juice than previously thought. Our LAB isolates showed survival rates of up to 99.69% and 84.94%, respectively. The twelve isolates were screened for their survival under simulated gastrointestinal conditions. Five isolates (DBC-10, DCB-9, DBB-2, and DSC-8) did not survive these conditions. Only six probiotic isolates survived the simulated gastrointestinal disorders. Different LAB isolates' susceptibilities to stomach and intestinal juice are shown in (Figure-11). Isolate DBB-9 showed the highest survival level, with 10.5% of cells surviving stimulated gastric conditions, and DCB-5 showed the lowest survival isolate, with 0.36% of cells surviving enabled gastric disorders. The highest decline in the viable counts of the isolates from simulated gastric conditions to intestinal conditions was in DCB-5. It was observed that the viability of the isolates diminished vertically from gastric ambience to the intestinal environment. Six probiotic isolates from the current study persisted under simulated gastrointestinal conditions. Isolates DCC-1, DCC-9, DBB-9, DSC-3, DGC-4, and DGC-10 showed the greatest increase in viability from stomach to intestinal conditions, suggesting they may have useful effects as probiotics.

Antioxidant activity

Free radical scavenging experiments were used to test the twelve isolates for antioxidant activity. Historically, the antioxidant properties of natural compounds were measured using the DPPH radicals. The ability of a food or organism to scavenge and destroy free radicals is known as its antioxidant capability. The ability to scavenge DPPH

radicals is a good indicator of antioxidant activity. Among the twelve selected isolates, the potent scavenging activity was shown by the DBB-9 isolate, which was up to 69%. The antioxidant activity of all the LAB isolates was >39%, apart from that of isolate DCB-5 (2.5%) and DCC-9 (2.9%). The result is shown in (Figure-12). 53.78% of DPPH free radicals were scavenged at the greatest level in the prior investigation [27].

β-galactosidase assay

Hydrolysis of the glucosidic lactose link is an important step in carbohydrate metabolism, and β-galactosidase plays a key role in this process [28]. It has been found that some of the strains recovered from fermented milk products had high levels of β-galactosidase activity. The production of β-galactosidase was confirmed in every single isolate. Isolate β-galactosidase activities ranged from 4.22 to 93.3%. The enzyme activity of β-galactosidase was most abundant in the isolates DGC-10 and DBB-9. (Figure-13) shows the outcomes of the test. β-galactosidase activity was also found in a prior investigation using isolates from NFM products [29]. In the present study, except for one isolate, all other isolates had positive results for β-galactosidase production. The isolate DGC-10 shows up to 93% of activity.

Cell surface hydrophobicity assay

A probiotic's capacity to adhere to intestinal cells is a crucial selection factor [30]. Probiotic strains' strong bond to xylene. Hydrophobicity ranged from 76.6 per cent to 3.34 per cent across all examined strains. Hydrophobic strains were defined as those having a hydrophobicity of 40% or above [31]. The hydrophobicity of isolate DGC-10 showed greater adhesion potentials determined by the MATH assay. The strain DGC-10 showed 77.6% affinity towards xylene. DBC-2, DBB-9, and DGC-10 showed above 40% affinity towards xylene. Only one isolate, DCC-1, showed the least association. The results are shown in (Figure 14) DGC-10, DBB-9, and DBC-2 were the most hydrophobic of the LAB strains tested in our research, with as important as high as 78%. In a previous study, the isolates from fermented foods had good hydrophobicity and showed 80% of hydrophobicity [29].

Determination of antibiotic sensitivity of LAB isolates

Since lactic acid bacteria (LAB) were deemed GRAS by the FDA, they have been widely employed in producing and consuming fermented foods without any reported health risks (USFDA). Food safety and public health concerns have been raised due to antibiotic resistance in LAB isolated from food [32]. The antibiotic susceptibilities of the LAB isolates were determined using a disc diffusion method. The following antibiotics were used: Ca = Ceftazidime, Cf = Ciprofloxacin, Ce = Cephalexime, Na = Nalidixic acid, Nf = Nitrofurantoin, Nx = Norfloxacin, Nt = Netillin, Of = Ofloxacin. The isolates differed in their sensitivity toward the antibiotics. The zone of inhibition (ZOI) in millimetres indicates the antibiotic sensitivity of the isolates (Figure-15). The highest growth inhibition was observed for DGC-4 against Cf and DGC-10 against Ce. All twelve isolates were susceptible to Cf, while Ca and Na were highly resistant to all isolates except for DCC-1, DBB-2, & DGC-10, which showed sensitivity against Ca. Only isolate DBB-2 showed sensitivity against Cf and further was resistant to all seven other antibiotics. The isolates DBC-2, DCB-5, DBB-2, and DSC-8 resisted Nx.

Hemolytic activity

The FAO/WHO guidelines for evaluating probiotics recommend safety. All the selected isolates showed no positive hemolysis activity so that they could be regarded as safe concerning non-hemolytic activity. In addition, probiotic candidates were not supposed to cause hemolysis in people or animals after ingestion. This led us to test the 12 LAB isolates for their hemolytic capabilities. None of them were hemolytic, consistent with prior research [24].

Molecular Identification

Total genomic DNA of 2 representative strains of LAB was extracted and amplified (Figure-16a – 16b) and identified by partial 16S rRNA, which gene sequencing compared with the NCBI database for their phylogenetic relationship using the software MEGA 11 (Figure-17). Based on molecular identification, the following species of LAB were identified from butter and curd of the Davangere district with percentage similarity of LAB, DBB-9 *Lactiplantibacillus plantarum* (96.64%), and DGC-10 *Lactobacillus fermentum* (98.46%) (Table

**Bhavya et al.,**

2). *Lactiplantibacillus plantarum* and *Lactobacillus fermentum* were reported from many fermented milk products from different countries [35]

CONCLUSION

This study looks into the probiotic capabilities of lactic acid bacteria isolated from fermented milk products made in the Davangere areas. Based on the difference in morphology, sixty colonies were isolated, of which forty-three were presumed to be LAB. Twelve LAB isolates were tested for phenotypic characterization and probiotic attributes. Of the twelve isolates, three produced CO₂; ten isolates showed the presence of ammonia, and it was found that LAB isolates fermented the sugars. The isolates DGC-10 & DBB-9 demonstrated good growth in salt concentration, pH, and temperature in their characterisation. All twelve LAB isolates tested positive for antimicrobial activity, with the best inhibition against *E. coli*, *S. aureus*, *S. typhimurium*, and *L. monocytogenes*. These LAB isolates were selected for further tests such as acid tolerance, bile tolerance, tolerance to gastrointestinal stimulation conditions, antioxidant activity, β -galactosidase assay, hydrophobicity, and sensitivity testing. In bile activity, DCC-1 & DBB-9 show both high and low viability at different concentrations, and the results for the gastrointestinal action the best was the DGC-10 isolate delivering 80% survival. These received additional testing for antioxidant efficacy. DBB-9, an isolate, demonstrated the highest activity, resulting in 70% of activity. Increased production of β -galactosidase enzyme activity was observed in the isolate DGC-10. The hydrophobicity of isolate DGC-10 showed greater adhesion potentials determined by the MATH assay. All twelve isolates were susceptible to Cf, while Ca and Na were highly resistant to all isolates except isolates DCC-1, DBB-9 & DGC-10. Therefore, DCC-1, DBB-9 & DGC-10 show the best probiotic attributes among all the isolates. In these, goat curd and buffalo butter samples show more potential. Themolecular identification was carried out by two isolates, DBB-9 & DGC-10. Both showed more potential compared with other isolates. The lactic acid bacteria that have been identified for DBB-9 are *Lactiplantibacillus plantarum* (Accession No.: CP028226) and DGC-10 *Lactobacillus fermentum* (Accession No.: KR604711), respectively. Future research for these isolates is promising and has economic potential as a probiotic food ingredient. The research confirmed that the bacteria obtained from naturally fermented milk were lactic acid bacteria with probiotic properties and have beneficial health effects. To validate their effectiveness in promoting human health, more research is needed.

ABSTRACT

This paper explores the use of machine learning (ML) and artificial intelligence (AI) in wildlife conservation. With traditional methods being limited by time and resources, AI and ML offer innovative solutions for monitoring endangered species and their habitats. These technologies are applied in various areas, including wildlife population monitoring using camera traps, drones, and satellites. Machine learning also plays a crucial role in detecting poaching activities, analyzing animal behavior, and improving species re-identification methods. The paper highlights how AI models are transforming conservation efforts by automating tasks, extracting insights from large datasets, and predicting trends. The authors also emphasize the potential for future research in refining these technologies to further enhance wildlife conservation strategies, improve model accuracy, and incorporate new sensor technologies for better-informed decision-making in protecting biodiversity.

Keywords: Wildlife conservation · Machine learning · Artificial intelligence · Species monitoring · Poaching detection

Diksha Das et al.,

INTRODUCTION

Nowadays, wildlife conservation is crucial because many species are at risk of disappearing forever due to human activities like habitat destruction and pollution. Wildlife conservation means protecting animals and their habitats from harm. It's important to act now to preserve wildlife for future generations to enjoy and to ensure the planet remains healthy and diverse. Wildlife conservation is changing a lot because of new technology called artificial intelligence (AI) and machine learning (ML). These powerful tools offer unprecedented capabilities to monitor, protect, and manage endangered species and their habitats. Traditional approaches to wildlife conservation have relied on manual data collection and analysis, often limited by time, resources, and accessibility. AI and ML are revolutionizing this process by automating tasks, extracting insights from vast amounts of data, and predicting future trends. Here are some of the key ways AI and ML are being used in wildlife conservation

Monitoring Wildlife Populations

The authors in [36], [40] propose AI/ML based algorithms that can analyze images from camera traps, drones, and satellites to identify and count individual animals, even in dense vegetation or vast landscapes and also can analyze audio recordings to identify different animal species based on their unique vocalizations. Different AI based algorithms can be used to identify individual animals based on unique physical features, such as their facial patterns or stripes.

Combating Poaching and Illegal Wildlife Trade

Artificial Intelligence (AI) plays a crucial role in advancing wildlife conservation efforts through predictive analytics, real-time detection, and habitat management. By analyzing historical data, AI models [42] can predict poaching hotspots and identify high-risk areas. This enables rangers to focus their patrols more effectively, reducing illegal activities and safeguarding vulnerable species. Moreover, AI algorithms can process live camera feeds to detect suspicious activities, such as poaching or illegal logging. These real-time insights allow for immediate intervention and the arrest of offenders, enhancing the efficiency of law enforcement in protected areas. AI also extends its capabilities to social media monitoring [11]. By analyzing online conversations, it can identify individuals or networks involved in the illegal trade of wildlife. This information helps disrupt these networks and prevent future trafficking, providing a proactive approach to combating wildlife crime. In terms of habitat management and conservation, AI has been shown to be instrumental [42] in monitoring changes in land use. By analyzing satellite imagery, AI can detect deforestation or habitat fragmentation and identify areas that require restoration. Conservationists can use this information to prioritize efforts and mitigate the adverse effects of human activities on wildlife habitats. Collectively, these applications of AI contribute to more effective and informed conservation strategies, ensuring the protection of biodiversity for future generations.

Literature Survey

Research work [37] explores the integration of machine learning (ML) in wildlife conservation, highlighting its growing impact on addressing critical challenges. Their study highlights notable applications such as species detection through image analysis, remote sensing to track animal movements, and predictive modeling for poaching, with deep learning algorithms driving improvements in accuracy and efficiency when handling large-scale ecological datasets. The authors in [31] highlight the importance of combining machine learning (ML) with domain-specific expertise to address challenges in wildlife conservation. Despite issues such as data biases, clarity, and ethical concerns, their study emphasizes the transformative potential of machine learning to advance monitoring, management, and preservation initiatives. For example, Carolina wren vocalizations were detected across more than 35,000 hours of passive acoustic monitoring data from Ithaca, New York. This approach enabled researchers to document the gradual recovery of the wren population after a harsh winter in 2015 [40]. Machine learning algorithms have also been employed to analyze the movements of savannah herbivores equipped with bio-logging devices. These algorithms help identify human threats and localize

**Diksha Das et al.,**

intruders within a range of 500 meters. Another study [35] introduces TRex, an image-based tracking software capable of monitoring the movement and posture of hundreds of individually recognized animals in real-time. Additionally, pose estimation tools such as DeepPoseKit and DeepLabCut have been developed to track the body positions of individual animals from video footage, including drone imagery. These tools also allow researchers to estimate 3D postures of animals in their natural habitats [35]. Figure 1 shows the examples of the research that use machine learning based systems in animal ecology. The use of various sensors has become common in animal ecology research. Many studies integrate data collected from multiple sensors at the same geographic site or across different locations to gain a more comprehensive understanding of ecological processes. For example, the Sentinel-2 satellite, developed by the European Space Agency (ESA), has been widely utilized, with image data often provided by the U.S. Geological Survey [35]. Table 1 depicts the details of the sensors used in the conservation of digital wildlife. Column I shows the name of various sensors. Column II shows the specific location of their use. Column III shows the type and Column IV shows the task performed by the sensors. Lastly, Column V shows the count of the sensors used. The sensors include iNaturalist, SAVMAP, Zooniverse, and iRecord, each contributing to different aspects of wildlife conservation efforts. Addo Elephant National Park in South Africa was selected as the study site for its diverse and dynamic environment, as well as its high elephant population [26]. The park spans 1,640 square kilometers, making it the third-largest national park in the country. For this study, elephants were observed primarily in the Main Camp area, particularly near the Hapoor Dam. The park provides a spectrally complex background due to its mix of open savannah and woodland. Elephants frequently move between these habitats and often seek shade under trees during the afternoon. Additionally, they exhibit unique behaviors such as covering themselves in mud to cool down and adopting various postures while foraging, playing, or sleeping. These behaviors, combined with their movement across diverse landscapes, result in constant variations in their appearance and shape. The park experiences year-round rainfall and has four distinct seasonal periods: early wet (October–December), late wet (January–March), early dry (April–June), and late dry (July–September) [1]. To build a comprehensive dataset, training and test images of elephants were collected across multiple seasons and years [10]. This strategy ensures the dataset captures the wide range of elephant behaviors, appearances, and environmental conditions. Table 2 provides a list of satellite images used to train and test a model to detect elephants. Here, Column I and II show the date of acquisition of the satellite images and name of the satellite used for capturing respectively.

Columns III, IV and V show the count of the images of elephants for training, validating and testing of machine learning models respectively. The data spans from 2014 to 2019, with varying numbers of labeled elephants across different images. Figure 2 shows an example of the satellite image of Addo Elephant Park at South Africa. Since the early 1990s, camera trapping has emerged as an important tool in wildlife conservation and research, enabling the study and monitoring of animal behavior and ecology [33]. The use of trail cameras has gained popularity due to their ability to meet the growing demands and specializations in wildlife management. Despite their advantages, traditional methods for analyzing camera trap data, such as manually classifying and reviewing images and videos—pose significant challenges. Without software assistance, this manual process can be time-consuming and labor-intensive, leading to a reduction in sampling intensity and potentially limiting the scope of research [2]. However, camera traps offer several key benefits in the field of wildlife research. They can be used for a wide range of applications, including studying species distribution, tracking disease transmission and vaccination efforts, estimating populations, monitoring nest predation, analyzing animal activity patterns, and assessing wildlife crossings and diet. Camera trapping is less invasive than many other methods, allows for consistent and simultaneous observation, and can be especially useful in studying elusive or aggressive species in dangerous or remote areas. Furthermore, this method provides photographic and video evidence, reduces observer bias, and is cost-effective. These features make camera trapping an indispensable tool in modern wildlife conservation efforts. Camera trapping has proven to be an efficient and effective method for remotely monitoring animal populations and obtaining real-time observations [3]. Historically, wildlife monitoring relied on traditional techniques such as visual or auditory surveys, track counts, scat analysis, detection dogs, driven counts, and physical trapping. While valuable, these methods often posed challenges in terms of accessibility, intrusiveness, and reliability. Camera traps, in contrast, offer unique advantages, particularly for

**Diksha Das et al.,**

monitoring wildlife in remote or hard-to-access areas. For example, they have been successfully employed to observe Florida Key deer on outer islands that were difficult for researchers to visit. In addition, camera traps are especially useful in scenarios where human presence might disturb wildlife, extended monitoring periods are required, or observations must be made in dangerous or isolated environments. The versatility of camera traps extends to situations where permanent verifiable data is needed or when their capabilities, such as night vision and motion detection, surpass those of the human eye. These advantages make camera trapping an indispensable tool for modern wildlife research and conservation efforts. The use of camera traps is based on the mark-recapture technique by using Petersen estimators. Camera traps have proven valuable in monitoring vaccine uptake by tracking the frequency of visits to bait sites and observing individual bait consumption [33]. Furthermore, these devices facilitate the study of disease transmission, both within and between species, by capturing behaviors such as direct contact (like, nuzzling) and indirect interactions (like, fecal-oral contact or shared site usage). Camera traps are widely used to estimate population abundance, a key aspect of wildlife monitoring and management. Traditional methods for population estimation include driven counts, strip counts, line transects, removal methods, and capture-mark-recapture techniques. Camera trapping integrates with the mark-recapture approach employing Petersen estimators to derive population size estimates [33]. Traditional methods for identifying nest predators rely on physical evidence, such as eggshell fragments, hair, scat, or tracks. However, these approaches are often subjective, time-consuming, and may overlook instances of predation by multiple predators. In addition, the human activity required to collect such evidence can alter nesting behavior or deter certain predators, compromising the research objectives. Camera traps have become a preferred tool for many researchers, as they offer detailed insights into predation events, predator identification, and the timing of predation [33].

Understanding the patterns of daily and seasonal activity of wildlife is crucial to understanding the ecology of species. Such activity data also help to examine interspecific and intraspecific interactions, as well as predator-prey dynamics [33]. While radio-tags are commonly used for this purpose due to their ability to provide large datasets remotely and in real time [16], this method can be invasive, costly, labor-intensive, and less feasible for studying elusive species. In contrast, camera trapping offers a non-invasive alternative for studying activity patterns. The time-stamped images captured by camera traps provide reliable data on activity and behavior. Studies have revealed that this method can produce more accurate estimates of kill rates compared to traditional techniques, offering valuable information on species diets [13]. Furthermore, monitoring wildlife activity patterns through camera traps can help mitigate human-wildlife conflicts and reduce wildlife damage. Figure 3 shows the examples of the detection and classification of wildlife species using machine learning approaches. Sentinel-2 imagery has been extensively utilized for studies in Antarctica, particularly focusing on the years 2016, 2018, and 2019 [29]. The imagery was accessed via ESA's Sentinel Playground, a cloud-based platform that allows efficient examination of large datasets using various band combinations. This platform eliminates the need for time-consuming data downloads, significantly streamlined the process of identifying emperor penguin colonies in Antarctica [4]. The review process involved manually examining Sentinel-2 images on a scale of 1 : 50, 000 (equivalent to the 500 m scale in Sentinel Playground) to detect small areas with brown pixels indicative of guano staining in penguin colonies. The combination of colors in the infrared band (8, 3, 2) was particularly useful due to the high contrast between guano and sea ice. To further enhance contrast, custom settings were applied (return [B080.8, B040.8, B03 * 0.8]). Furthermore, the combination of the SWIR band (12, 8A, 4) was used to confirm the presence of guano, taking advantage of its strong reflectivity in the short-wave infrared [6]. Targeted locations were reviewed using every available image with less than 50% cloud cover between August and December. For untargeted locations, fewer images were analyzed. Suspected colonies were verified by cross-referencing additional images from the archive, ensuring reliable identification. Targeted search parameters: The identification of undiscovered penguin colonies was guided by three key parameters derived from the distribution patterns of previously known colony locations. These colonies are generally spaced at regular intervals around the Antarctic continent, with an average separation distance of approximately 311 km[29].

**Diksha Das et al.,**

1. The search for undiscovered emperor penguin colonies focused on analyzing gaps in the circumpolar distribution of known colonies. Priority was given to regions with the largest gaps, particularly along the coastlines of major ice shelves and the northern Antarctic Peninsula, which are generally unsuitable for colony establishment. Two primary criteria were used to identify potential gaps: distances exceeding 500 km and those greater than 400 km [9].

2. Previous records and references have reported several suspected emperor penguin colonies; however, these colonies were never confirmed, likely due to their small size and the limitations of Landsat imagery with 30 m pixel resolution [18]. Recent advancements in very high-resolution (VHR) satellite imagery have enabled the confirmation of some of these colonies, including those at Shackleton Ice Shelf, Jason Peninsula, and Bowman Island.

3. Emperor penguin breeding sites can be classified into four distinct groups based on geographic features (as shown in Table 3) [23]. The targeted breeding locations include:

- Windward side of bays, headlands, glacier tongues, and ice shelves: This is the most common location for colonies, with over half of all known colonies (30 out of 54) showing a preference for this habitat.
- Land-fast ice within small island archipelagos: Five colonies, with an additional two conforming with group A, exhibit this characteristic.
- Semi-permanent ice creeks: Five colonies, primarily around Droning Maud Land, share this trait.

Estimating the population size of individual emperor penguin colonies using a single Sentinel-2 image presents significant challenges. To address this, multiple images were analyzed to assess the variability and extent of guano staining associated with the colonies [25]. While remote sensing has proven to be a valuable tool for population assessments in remote regions, previous studies using Very High-Resolution (VHR) satellite imagery have reported substantial variations in the quality of population counts. Table 3 presents information on the locations of newly discovered and rediscovered emperor penguin colonies. For each colony, it includes details such as the place name, latitude, longitude, habitat type, status (newly discovered or rediscovered), and the count of habitats. The data identifies a total of 11 colonies, comprising 5 rediscovered and 6 newly discovered sites. Estimating Very High Resolution (VHR) satellite image faces several challenges, including variations in image quality, sun angle, atmospheric conditions such as clouds, shadows from icebergs or ice walls, changes in the density and distribution of huddles, and the extent of guano staining [39]. These challenges also affect medium-resolution satellite imagery, such as that captured by Sentinel-2. Previous studies have relied on comparisons with the sizes of known colony populations to provide an initial assessment of new populations. The study underscores the need for higher-resolution imagery and more precise surveys to improve accuracy. Furthermore, due to the natural annual variability in colony populations, a comprehensive understanding of new populations may require analysis over several years using VHR satellite data. Three emperor penguin colonies, previously unconfirmed, were identified during the study [30]. However, these colonies were located several kilometers away from their initially reported positions. Specifically, the Yule Bay colony was 13 km west of its reported location, Karelin Bay was 11 km farther north, and Casey Bay was 50 km northwest but still within the boundaries of Casey Bay. These rediscovered colonies were described as small and difficult to distinguish, with only a few brown pixels (> 20) visible in the satellite imagery. Confirming the presence of colonies at Yule Bay and Karelin Bay required analysis of multiple satellite images. The estimated populations at these sites are thought to be small, likely comprising a few hundred birds or fewer at each location. Figure 4 illustrates examples of these colonies as observed in Sentinel-2 imagery. Additionally, the study reported the discovery of several new emperor penguin colonies [32]. Newly discovered (red circles) and re-discovered colonies (yellow squares), in relation to previously known colony locations (green triangles). The dark blue triangles are sites thought to be no longer extant [39]. The discovery of 11 additional emperor penguin colonies, a 20% increase in breeding sites, highlights the species' population dynamics. Despite this, their small size contributes only a 5–10% rise in the global population, with many colonies requiring multiple Sentinel-2 images for confirmation due to the 10-meter resolution limitation [29]. Offshore colonies, such as Ninnis Bank (180 km offshore), demonstrate adaptability

**Diksha Das et al.,**

to non-coastal habitats, persisting over two years [34]. However, smaller colonies face higher energy demands and exposure, raising concerns about their long-term viability [38]. The absence of previously known colonies, such as Lazarev Ice Shelf (last seen in 2014), suggests vulnerability to environmental changes, including early sea ice breakup [41]. Proximity to climate-affected regions indicates that an increasing proportion of the global population may face risks from climate change, emphasizing the need for sustained monitoring and research [43]. In wildlife conservation and animal ecology, managing large data streams is essential for accurate population estimates, understanding behaviors, and addressing threats like poaching. Machine learning (ML) and deep learning (DL) enable scaling studies globally, with notable successes using advanced sensors and ML tools, such as Wildlife Insights and DeepLabCut. Despite progress, there is significant scope for innovation in hybrid models and large-scale habitat distribution modeling, highlighting the need for interdisciplinary research to advance this field further.

METHODOLOGY

Training and validating the Convolutional Neural Network model

Convolutional Neural Networks (CNNs), a type of feed-forward neural network used to process large-scale images by leveraging their local and global features. For instance, authors in [15] trained a CNN to detect elephants in satellite imagery using a dataset comprising 188 sub-images from nine different sources. Their training set included 1,270 labeled instances of elephants, representing 1,125 unique individuals. This approach highlighted the effectiveness of CNNs in identifying and classifying objects in complex and diverse image datasets. As described in [12], Test Orthomosaic 1 was divided into 274 non-overlapping tiles, each measuring 800×600 pixels. These tiles were annotated with point labels using AIDE5 software. This dataset was used to measure the manual effort required for annotating birds by hand and to evaluate the performance of a machine learning model for bird detection. A deep Convolutional Neural Network (CNN) was utilized for bird detection. The convolution operation involves sliding filters of a predefined size over an image and calculating the dot product at each position. The values of these filters are adjustable parameters learned by the model through backpropagation. Convolution can also be applied selectively at every second position, reducing the output dimensions to half the width and height of the input [14]. Max pooling is another operation used for spatial downsampling, which helps the model become invariant to translations. Additional operations, such as instance normalization and Rectified Linear Unit (ReLU) activation, are applied after each convolutional layer to enhance the network's performance. In this work, the standard ResNet architecture was modified by replacing its final two layers with custom 1×1 convolution layers. These layers first reduce the output to 1024 channels and then map it to three specific classes, as indicated by the dotted rectangles. To train a high-capacity CNN with limited training data, a subset of image patches from five orthomosaics was randomly selected for each bird species. Users annotated a total of 600 points across three bird species [20], a task manageable within a reasonable timeframe. A target of 200 points per species was set to evaluate the feasibility of this approach. However, experiments with fewer points proved to be unreliable. As described in [21], we process each point individually (solid yellow) and identify all other ground truth points (dashed yellow) within an eight-grid-cell radius. Next, we draw a convex hull around the selected points and expand it using a 3×3 square filter. Figure 6 shows an example of detecting birds using CNN. As noted in [22], the model often misclassified birds located in the middle of flocks. To address this, prior knowledge was applied during post-processing using a Markov Random Field (MRF). MRFs use a graph structure to minimize global energy across its vertices and edges. Higher energy indicates predictions that conflict with the prior knowledge. Figure 7 shows the precision recall graphs obtained in [22] by using MRF for bird detection. The graphs show the total variation of the models trained on three sets of training patches (shaded) and the average performance (dashed). The left figure shows results with just NMS, and the right with NMS and a pairwise MRF on the predicted points.

RESULT

The CNN demonstrated in [17] an overall F2 score of 0.75, with better performance in heterogeneous areas (0.778) compared to homogeneous areas (0.73). This high accuracy closely aligns with human detection capabilities, highlighting the CNN's effectiveness across diverse landscapes. To evaluate the trained CNN model's applicability to new regions, it was tested without further training on a known elephant population in the Maasai Mara, Kenya [19]. In a 0.3 sq. km image, the model successfully identified 32 elephants, demonstrating its robustness and adaptability to different environments. Variations in animal poses and sizes can impact detection accuracy. To address this, models trained on images depicting wildlife in diverse poses and sizes were found to improve adaptability and performance across species [24]. The Sahelian Upwelling Marine Ecoregion provides critical habitats for seabird populations, though suitable breeding grounds are limited to a few locations along the West African coast [35]. Studying bird species in these areas is crucial for understanding ecosystem health and biodiversity [5]. Images of breeding colonies were captured using a DJI Phantom 4 Pro drone. The UAV survey team included a pilot and a visual observer who monitored bird behavior before and during the flight [7], [8]. Observations confirmed that birds were rarely disturbed by the UAV, ensuring minimal impact on their natural behavior. CNN performance varied across species. Caspian terns exhibited lower precision and significantly reduced recall, while gulls showed inconsistent results, with precision at high recall varying between 32% and 70% without using a Markov Random Field (MRF) [27]. Manual annotation involved five annotators labeling 274 patches, resulting in 21,066 point annotations over 20 days and 16 hours, averaging 1.19 seconds per annotation [28]. While CNNs effectively identified high-density flocks of royal terns, confusion with visually similar species, such as Caspian terns, remained a challenge. Machine learning applications led to the discovery of 11 previously unidentified emperor penguin colonies using the latest satellite imagery [29]. These colonies, located in the Peninsula Region, West Antarctica, and East Antarctica, include two on ice shelves and two offshore sites.

CONCLUSION AND FUTURE WORK

This research highlights the advancements in wildlife monitoring using machine learning techniques, particularly deep learning. Abundance mapping has significantly improved the estimation of animal populations through imaging sensors such as camera traps and drones. Individual animal re-identification, essential for long-term monitoring, has become more feasible with the use of machine learning and computer vision, offering efficient alternatives to traditional methods like DNA profiling. Additionally, animal synthesis and reconstruction using 3D modeling provides valuable insights into an animal's health and behavior. Reconstructing the environment in which animals live, through satellite remote sensing, is crucial for understanding wildlife behavior and conserving ecosystems. Looking ahead, future research can focus on improving models for animal detection, re-identification, and environmental reconstruction. Incorporating larger datasets, enhancing algorithm accuracy, and exploring new sensor technologies will further advance wildlife monitoring and contribute to better-informed conservation efforts.

ABSTRACT

Lignocellulolytic biocatalysts, including laccase, cellulase, and pectinase, have significant potential for the degradation of lignocellulosic biomass (LCB). Jute and banana are types of lignocellulosic biomass (LCBs) that possess significant value owing to their capacity to generate fibers. Nevertheless, certain constituents of these plants are utilized as waste material due to their substandard fiber, leading to a negative impact on the industry. The discarded fibers can undergo a biological process to convert them into useful fiber. A bacterial strain *Bacillus licheniformis* GD2 was isolated from the Sundarban mangrove ecosystem in West Bengal, India. This strain possessed the capacity to biosynthesize several proteins. The bacteria underwent 16S rRNA sequencing investigation to identify its genetic composition. The strain exhibited the ability to produce all three crucial lignocellulolytic enzymes, with the highest levels of cellulase and minimal activity of pectinase and laccase. The strain caused substantial mechanical alteration of the fibers, as seen by the changes in Young's modulus, and successfully removed color from toxic industrial dyes. This demonstrates the significant ability of the strain to utilize waste and restore the environment. The enhanced fiber quality was confirmed through the utilization of Fourier Transform Infrared Spectroscopy (FTIR) and Scanning Electron Microscopy (SEM). Molecular Evolutionary Genetics Analysis version 11 (MEGA 11) was used to establish microbial phylogenetic linkages.

Keywords: *Bacillus licheniformis* GD2, Cellulase, Dye decolorization, Fiber modification, FTIR, SEM

Somnath Das et al.,

INTRODUCTION

Lignocellulosic waste, a key component of renewable biomass, is enzymatically degraded by enzymes like laccase, cellulase, and pectinase. These enzymes decompose complex phenols and carbohydrates in plant cell walls into simpler substances, such as sugars and aromatic compounds, with applications in various sectors. They play significant roles in bioremediation, bioethanol production, wastewater treatment, pulp and paper manufacturing, animal feed, and textiles. They facilitate the degradation of hydrocarbons and pesticides in polluted environments, thereby restoring ecosystems and reducing biological oxygen demand (BOD) and chemical oxygen demand (COD) in wastewater before release into aquatic systems [1-3]. In bioethanol production, lignocellulolytic enzymes convert cellulose and hemicellulose into fermentable sugars. In the pulp and paper industry, they expedite delignification and bleaching, reducing the environmental impact of chemical processes. In animal feed, they enhance nutrient availability and digestibility by breaking down complex carbohydrates in feedstocks like maize stover and wheat straw. In textile industries, they are vital for bio-scouring and denim bleaching, removing impurities, improving dye absorption, and enhancing fabric quality. Lignocellulolytic enzymes provide sustainable methods for biomass utilization, waste management, and the production of renewable energy and bioproducts [4]. In South Asia, enzymatic treatments are employed to transform low-grade lignocellulosic biomass (LCB) into valuable products, highlighting the economic significance of jute and banana fiber production. Cellulases facilitate the degradation of cellulose in jute and banana fibers, resulting in improved softness, flexibility, and surface characteristics. These enhancements contribute to better adherence in composites and lower energy requirements for mechanical processing. Modified fibers find applications in textiles, environmentally sustainable packaging, and composite materials, potentially acquiring antibacterial, flame-resistant, and water-resistant characteristics. Enzymatic treatment offers sustainable solutions for processing fibers into higher-value products, reducing costs and improving economic viability [5-10]. *Bacillus licheniformis* GD2, a Gram-positive bacterium isolated from Sundarban mangroves, exhibits significant cellulase activity and demonstrates versatility in bioremediation applications. The enzymes, such as cellulases, proteases, lipases, and laccases, are utilized in textiles, food, pharmaceuticals, and biofuel production. Studies on characterization indicate that cellulase derived from *Bacillus licheniformis* GD2 exhibits distinctive features characteristic of both fungal and bacterial cellulase enzymes. Research indicates that it effectively decolorizes industrial dyes and bleaches denim, providing environmentally sustainable alternatives to conventional chemical methods. Research on the application of *Bacillus licheniformis* GD2 for the modification of high root-content fibers, such as jute and banana pseudo-stem waste, is limited. This research sought to enhance the quality of these fibers through the application of advanced techniques, including FTIR, SEM, Young's modulus, and statistical analysis.

MATERIAL AND METHODS

Sample Collection

Soil and liquid samples were collected from Bidyamandir, Sundarban mangrove forest of West Bengal, India (21.9889° N, 88.7552° E). The samples were delivered to the laboratory in sterile sample bottles and zipper packs within 24 hours of collection and were stored at 4°C for further analysis.

Isolation of lignocellulolytic bacteria

The study isolated native lignocellulolytic bacteria by serially diluting (10^{-1} to 10^{-9}) soil and water samples. Bacteria were counted after 24 hours incubation at 37°C on nutrient agar plates. After screening, single colonies were streak-plated and incubated for 24-48 hours at 30°C to 37°C. Microorganisms in cellulase-selective plates were used to form pure cultures, with few colonies found in laccase and pectinase selective media. Further experiments focused on cellulase production. Most screened isolates were stored on a cellulase-selective medium at 4°C.

Qualitative and quantitative analysis of cellulolytic bacteria

Bacterial colonies were verified on Carboxy Methyl Cellulose (CMC)-agar plates through two methodologies. Initially, 100 µl of overnight-grown culture was introduced to CMC-agar plates, which were then incubated at 37°C

Somnath Das et al.,

for 48 hours and subsequently stained with 1% Congo red. Following a 15-minute period, the stain was removed using 1 M NaCl and subsequently rinsed with distilled water [11]. Dyes (1% Congo red, malachite green, and methylene blue) were formed. In a 100 ml conical tube, 20 ml of sterile CMC selective liquid media (containing 200 µl of dye and 200 µl of a 24-hour culture) was taken. A 2 ml sample mixture was placed in a 2 ml Eppendorf tube centrifuged at 10,000 rpm for 8 minutes. The optical density of the supernatant was measured at 497 nm, 617 nm, and 668 nm wavelengths, for up to 6 hours and was repeated every 2 hours. Selective media was used as the spectrophotometer's blank. Every two hours, the dye decolorization percentage was calculated.

Cellulase assay and kinetic study

The total cellulase activity was determined by estimating the reducing sugar released from CMC using IUPAC-recommended methods. The CMCase assay involved 0.1 ml of crude enzyme and 0.2 ml of 1% CMC in 1.7 ml of 50 mM citric acid buffer. After 60 minutes of incubation, 3 ml of 3,5-dinitrosalicylic acid (DNS) was added to stop the reaction. The amount of sugar in the supernatant was determined at 540 nm [11].

The activity of the cellulase enzyme (U/ml) = $W \times 1000 / V \times t \times M$

Here, W = the amount of released glucose

M = the molecular weight of glucose.

V = Sample volume

t = Reaction Time

The cellulase was tested for substrate specificity using substrate CMC in 0.1 M phosphate buffer at pH 4.0 to 5.0. Standard substrate glucose (concentrations ranging from 0.1 mg/ml to 1 mg/ml) served as a standard curve for enzyme experiments.

Determination of released reducing sugar from jute and banana fiber waste

This study employed a novel strain to modify waste jute and banana fibers and analyzed biopolymer composition by quantifying reducing sugars over 0, 7, 14, and 21 days. Initially, 100 ml of nutrient broth was sterilized and divided into Falcon tubes, each containing 10 ml of broth. Banana and jute fiber waste (0.1 g each) were added to designated tubes, followed by 100 µl of cellulase-producing culture. Samples were incubated for 21 days at 37°C with reciprocal agitation at 120 rpm. The microbial biomass was evaluated on days 0, 7, 14, and 21 by measuring the weight of the biomass after it had been dried. The dry weight was determined by centrifuging 2 ml of treated sample at 8000 rpm for 10 minutes. The biomass was dried at incubation temperature, and dry weight was calculated by subtracting the empty Eppendorf tube weight from the total weight. Reducing sugar levels were determined using the DNS assay, referencing a glucose standard curve as described by Kriger et al., 2020. Statistical analysis (IBM SPSS 26) validated the relationship between microbial biomass and sugar release. Controls were included: a positive control (100 µl of 0.1% commercial cellulase) and a negative control (no microbial culture or enzyme). Results standardized the methodology and confirmed the strain's efficiency in fiber modification.

FTIR analysis of treated fibers and dye decolorization

The study used Fourier transform infrared spectroscopy (FTIR) to analyze chemical changes in treated dyes, jute, and banana waste fiber. After 21 days incubation with mangrove isolate, samples were centrifuged at 12,000 rpm for 10 minutes to separate bacterial cells. The dyes were treated for 6 hours, and a portion of the liquid was vacuum freeze-dried (using EYELA, FDU-1200) until stable. The dried sample was then used for FTIR analysis, measuring spectra in the 4000-400 cm⁻¹ region using a Perkin-Elmer Frontier FTIR spectrometer.

SEM analysis

ZEISS scanning electron microscope was used at 5.00 kV to examine the modification of jute and banana waste fiber surfaces due to a cellulolytic microbial strain. The fibers were cut into small pieces and coated with silver, then placed in the SEM chamber for detailed imaging at three different magnifications: 300X, 1000X, and 5000X.

**Somnath Das et al.,****Molecular characterization**

Bacterial genomic DNA was isolated using bacterial DNA isolation kit, and the purity and concentration were assessed using a Denovix DS-11 spectrophotometer. The 16S rDNA region was amplified with Bacterial 16S rDNA PCR kit Fast (800), using *E. coli* as a positive control. An 800 bp amplicon was amplified using 16S rDNA Primer Mix and TaKaRa Taq™ HS Fast Detect Premix, followed by column purification. Bidirectional cycle sequencing was performed using forward primers and reverse primers using a BDT V3.1 Cycle sequencing kit on an ABI 3730 Genetic Analyzer. Cellulase enzyme FASTA sequences of similar bacteria with cellulase activity and positive sugar-reducing capability were retrieved from the NCBI database. The cellulase enzyme sequence was aligned using the multiple-sequence alignment method with the other bacterial cellulase sequence (from the NCBI database) through the Muscle algorithm. The phylogenetic analysis was performed using MEGA 11. The phylogenetic tree was constructed using the neighbor-joining technique. The bootstrap method assessed the consistency of the phylogenetic tree [12-15].

Statistical analysis

For statistical analysis, IBM SPSS software (version 26.0) was employed. At 0.05 significance levels (2-tailed), the Pearson correlation test and the t-test were employed to analyze the correlations between pure bacterial biomass concentration, day, and generated reducing sugar.

Pathogenicity test

The microbial isolate underwent biosafety assessment by the blood agar test. A high-quality blood agar medium was sterilized using an autoclave. Two wells were created on the agar plates, and 100 µl of a 20% hemolysin buffer was combined with 100 µl of the overnight-cultured test sample. The mixture was introduced to a separate well and kept at 30°C for 24 hours. The criterion used to assess pathogenicity was the strain's ability to cause hemolysis, which is the process of red blood cell disintegration. Bacterial colonies' capacity to cause hemolysis when cultivated on blood agar is employed to categorize specific bacteria as pathogenic.

Young's modulus

Vernier microscopes use brass steel scales that measure small changes in a material. They have a machined cast iron base covered by a metal carriage, allowing the slide to be secured in any position using a clamping screw. A vertical slide is mounted on the horizontal carriage, and a rack and pinion microscope is included. The stage has a Perspex plate and achromatic lenses, and the slides can move 210mm horizontally and 160mm vertically. The stress and strain ratio obtained using the highest weight carried by the biologically treated fibers of a fixed diameter and length was used to determine Young's modulus (E) of both the jute and banana fiber. By employing a holder to suspend the maximum weight from the fiber, the stress was calculated by dividing the force by the fiber's surface area. Strain was determined by dividing the length change by the length. After obtaining the results for both stress and strain, their ratio was used to calculate each fiber's Young's modulus and gauge how much more stretchable each was. A traveling microscope was used for all measurements [16, 17].

RESULTS AND DISCUSSION**Qualitative and quantitative screening of the mangrove isolate**

Qualitative cellulase activity of a bacterial isolate was evaluated using the Congo red CMC agar plate assay, which showed a nonhomogeneous orange clear zone surrounding the well, signaling both the cellulase and dye-decolorizing activity of the enzyme. This is crucial for the release of fermentable sugar monomers from lignocellulosic biomass. The bacterial isolates showed high cellulolytic activity, making them potential candidates for further study in industrial sectors. The dye degradation assay assessed the enzyme's ability to decolorize three dyes: Congo red, malachite green, and methylene blue. The enzyme reduced malachite green by 40% after six hours, but the Congo-red breakdown percentage was low (approximately 4%), and no breakdown was observed for methylene blue. The results suggest that dye molecules are taken up by microbial surfaces and then degraded (Fig. S2A, C).

Somnath Das *et al.*,

Dye decolorization percentage = (initial time absorbance – final time absorbance)/initial time absorbance × 100

Pathogenicity test

The GD2 isolate showed less frequent formation of halo zones on blood agar media compared to the positive control. Beta-hemolysis was used as a positive control, but the bacterial hemolysis activity was lower. The strain could be beneficial for commercialization in banana and jute fiber processing to reduce waste fiber loss, increasing economic growth in textile and fiber industries. Implementing the bacteria may not be as damaging to the ecosystem (Fig. S. 2B).

Enzyme assay and kinetic study

GD2 isolates exhibited cellulase activity of 6.57 U/ml, comparable to the positive control of commercial cellulase (6.77 U/ml), indicating the presence of necessary genes for cellulase production. The calculation of cellulase activity is as follows: GD2 Cellulase enzyme activity (U/ml) = $W \cdot 1000 / V \cdot t$. $M = (142 \times 1000) / (2 \times 60 \times 180.156) = 6.56$ U/ml

Here, W - Amount of released glucose = 141.78 μ g

M - Molecular weight of the glucose = 180.156

V - Volume of the sample = 2 ml

t - Reaction time = 60 min

Cellulase kinetic parameters ($K_m = 2.9$ mM, $V_{max} = 714.3$ mmole/min) for breaking CMC were determined using Lineweaver–Burke plots (Fig. S5D).

FTIR analysis of dye decolorization and treated waste fibers:

The CR sample treated with GD2 showed spectral peaks in the 1100–1200 cm^{-1} range, corresponding to C-N bond stretching vibrations, and in the 2900–3000 cm^{-1} range for asymmetric CH_3 group vibrations. A peak in the 2300–2400 cm^{-1} range was linked to the symmetrical and asymmetrical stretching of the tertiary amine salt. The 1300–1400 cm^{-1} range identified a carbon-nitrogen bond stretching in an aromatic tertiary amine. Biodegradation by GD2 caused breakdown of aromatic rings in the 1600–1700 cm^{-1} region, related to C=C bond stretching. For MG dye, GD2 treatment revealed benzene ring peaks (1500–500 cm^{-1}), indicating mono- and para-disubstituted benzene rings, along with C-N bond stretching at 1100–1200 cm^{-1} . FTIR spectra of the dyes also exhibited N-H stretching vibrations of primary amines between 3200–3500 cm^{-1} , suggesting MG dye decomposition by GD2. The application of GD2 to jute and banana fibers, rich in roots, removed functional groups, improving fiber quality by eliminating lignin, enhancing its economic value. Both fibers exhibited C-H, CH_2/CH_3 , and C=O vibrations in the 1380–1450 cm^{-1} and 1680–1730 cm^{-1} regions, respectively, with C-H stretching observed between 2855–3120 cm^{-1} . Detailed spectral analysis is provided in Supplementary Tables 1 and 2 (Fig. S3A-D).

SEM analysis

Scanning electron microscopy (SEM) was used to analyze the surface morphologies of waste fibers during cellulase treatment. The control surface showed smooth, minimal irregularities. After enzyme application, both waste fibers appeared to reposition and loosen the dense cellulose polymer inner core (Fig. S4A-B).

Statistical analysis

On day 21, both jute and banana fiber treatments showed a modest decrease in sugar levels, indicating a stable phase. However, microbial biomass and sugar extraction continued to increase, signifying successful retting and improved fiber quality (Fig. S6A-C). The correlation coefficient test and t-test, via IBM SPSS 26 statistical software, revealed a significant association between the biomass concentration of the cellulase-producing strain GD2, the released reducing sugar, and the day. If the p-value is positive, both variables are rising along with the first. The utilization of the cellulose segment of the fiber and the sugar released from the inner part of the fiber allows the fiber to survive for 21 days, transforming waste into economically acceptable, lustrous, soft morphological fiber with a less cellulosic component, making it perfect for the textile industry (Fig. S6A-C).

**Somnath Das et al.,****Young's modulus of the fibers**

The study reveals that microbiologically treated fibers improved their stretchability and mechanical qualities, leading to increased economic worth and development of sustainable and non-toxic commercial goods. The results show that the fiber's Young's modulus increases in the presence of lignocellulosic substrate in nutrient broth, possibly due to the multiprotein production capability of GD2 (high cellulase, low laccase, and pectinase activity). Laccase and pectinase play a crucial role in increasing the Young's modulus value. Although all morphological and physical changes are visible after cellulase treatment, the mechanical strength is only shown to be affected by the triple enzyme effect or the dual effect of laccase and pectinase, which suppresses the effect of cellulase in some respects. This could lead to the production of new sustainable and non-toxic commercial goods from these raw materials.

Molecular characterization and phylogenetic study of GD2

The Gene-Tool software program was used to create a consensus sequence of the 16S rRNA gene. This sequence was compared with NCBI GenBank database sequences via BLAST analysis, with *Bacillus licheniformis* GD2 being the most similar (100%). The 16S rRNA nucleotide sequences of *Bacillus licheniformis* GD2 were compared to cellulase-producing bacterial sequences in the databases using multiple sequence alignment method. Ten distinct cellulase sequences from bacterial species were selected, based on their cellulase activity and ability to produce reducing sugars. The MEGA 11 program was used to run 1,000 bootstrapping operations. The phylogenetic tree was constructed using the neighbor-joining technique, with residues found to be essential in the development of bacterial cellulase sequences. The coherence of the phylogenetic tree was examined using bootstrap values. The best-fit value, which correlates with high similarity between related organisms, is 100%, with good similarity up to 90% support. Consistent match rates were observed between 50% and 70% (Fig. S7.) [12, 13].

CONCLUSION

The use of lignocellulosic biomass for recycling is a promising field due to its economic viability and negative environmental impacts. Mechanical conversion methods increase costs, making them impractical. To reduce manufacturing costs, improvements in technology and processing processes are essential. This study demonstrates the effectiveness of cellulase enzymes from the mangrove isolate *Bacillus licheniformis* GD2, showing remarkable efficacy in waste processing and reutilization sectors like dyeing, textiles, and fibers. The strain can alter the characteristics of jute and banana waste fibers and break down colors rapidly, as confirmed by FTIR analysis. The isolated mangrove strain has significant potential for industrial applications, potentially resulting in higher revenue for industries employing it. Metabolic engineering, synthetic biology, and systems biology can be used to modify monoculture or consortia-based applications to enhance the effective degradation of lignocellulosic biomass on a large scale. Computer-based genetic modification on lignocellulolytic enzymes can speed up the process, enhance dye removal, improve waste treatment, and optimize waste recycling.

Somnath Das et al.,

Fig. S7. Analyses of the phylogenetic tree: The evolutionary history was estimated using the neighbor-joining method. The bootstrap consensus tree calculated from 1000 iterations represents the evolutionary history of the species under study. For partitions replicated in fewer than 50% of bootstrap replicates, branch collapse occurs. The proportion of duplicate trees in which the related taxa clustered during the bootstrap test (1000 repetitions) is shown next to each branch. The maximum composite likelihood method was used to calculate the evolutionary distances expressed in base substitutions per site. This study focused on ten different nucleotide sequences. First+Second+Third+Noncoding codon locations were included. For each set of sequences, all uncertain sites were removed (pairwise deletion option). There were a total of 2468 positions in the final dataset. Evolutionary studies were performed with MEGA11. Other cellulase-producing strains from the NCBI database were compared with the GD2 strain. The supplementary files 1 contain all the FASTA sequences of the several cellulase-producing microbial strains that were compared to create the phylogenetic tree and GD2 strain's genetic characterization data respectively.

To Calculate Energy with Bond Energy of Chemical Graphs using Neutrosophic Labeling

ABSTRACT

The purpose of this work is to explore calculate the energy and bond energy of the chemical graphs with neutrosophic labeling as numerical examples. Deneutrosophication was applied to neutrosophic chemical graphs, which gives the crisp values with the solution. This paper demonstrates energy and bond energy of chemical graphs are almost equal, while the bond energy value is converted to kilowatt hour.

Keywords: Labeling, Neutrosophic Labeling, Energy, Bond energy, Chemical Graphs.

INTRODUCTION

The energy of a graph G as a chemical concept leading to HMO theory was introduced by Hückel in 1931 and developed into a mathematical interpretation many years later by Gutman in 1978. Chemical graphs, sometimes referred to as molecular graphs, are a method of employing graph theory to depict the structure of a chemical substance. They are an essential data structure for chemical structure representation in cheminformatics. Chemical graphs are graphs with atoms represented by vertices and chemical bonds represented by edges. The type of bond and the type of atom are used to identify the edges and vertices, respectively. The physical and biological characteristics of chemical substances are modelled using chemical graphs in cheminformatics and bioinformatics. In 2009, Chandrashekar Adiga and M. Smitha conducted research on the Maximum Degree Energy of a Graph [1]. Mohammad Reza Oboudi¹ conducted research on energy and Seidel energy of graphs in 2016 [5]. In 2019, S. Satham Hussain, R. Jahir Hussain, and Florentin Smarandache created a novel idea called neutrosophic fuzzy, which they applied to ambiguous graphs[6]. Florentin Smarandache

Logasoundarya and Vimala

introduced The Score, Accuracy, and Certainty Functions in 2020, which determine the Total Order on the Set of Neutrosophic Triplets (T, I, F) [2]. Kanika Mandal on Deneutrosophication by 2020 [3]. In 2023, Katja Zemljč and Petra Žigert Pleteršek presented a new term in chemical graph theory: Smoothness of Graph Energy in Chemical Graphs [4]. In this work we present the some innovative concepts are applied in chemical graphs and calculate the energy and bond energy of a Neutrosophic fuzzy labeling chemical graph applied Deneutrosophication of Neutrosophic fuzzy Labeling chemical graph.

Methods (Definition)**Definition 1.**

A neutrosophic graph $G^* = (V, \sigma, \mu)$ is said to be an neutrosophic labeling graph if $T1 : V \rightarrow [0, 1]$, $I1 : V \rightarrow [0, 1]$, $F1 : V \rightarrow [0, 1]$ and $T2 : V \times V \rightarrow [0, 1]$, $I2 : V \times V \rightarrow [0, 1]$, $F2 : V \times V \rightarrow [0, 1]$ is bijective such that truth-membership function, indeterminacy-membership function and falsity membership of the vertices and edges are distinct and for every edges (vi, vj) ,

- (i) $T2(vi, vj) \leq \min\{T1(vi), T1(vj)\}$,
- (ii) $I2(vi, vj) \leq \min\{I1(vi), I1(vj)\}$,
- (iii) $F2(vi, vj) \leq \max\{F1(vi), F1(vj)\}$, and $0 \leq T2(vi, vj) + I2(vi, vj) + F2(vi, vj) \leq 3$.

Definition 2.

Bond energy is the amount of energy needed to break a chemical bond between atoms in a molecule.

RESULTS AND DISCUSSION**To find the Energy and Bond energy of the following Chemical graphs.**

Let us take the neutrosophic labeling of the Cyclopentane chemical graph convert into the crisp values using Single-Valued Neutrosophic Score, Accuracy, and Certainty Functions. Particularly we choose certainty function

$$c : M \rightarrow [0, 1]$$

$$(T, I, F) = T$$

Then we have to find the Energy of a Neutrosophic Labeling Cyclopentane chemical Graph.

To find the Eigen values

$$A(C_p(G)) = \begin{bmatrix} 0 & 0.01 & 0 & 0 & 0.01 \\ 0.01 & 0 & 0.01 & 0 & 0 \\ 0 & 0.01 & 0 & 0.02 & 0 \\ 0 & 0 & 0.02 & 0 & 0.03 \\ 0.01 & 0 & 0 & 0.03 & 0 \end{bmatrix}$$

$$\det(A(C_p(G)) - \lambda I) = \begin{vmatrix} -\lambda & 0.01 & 0 & 0 & 0.01 \\ 0.01 & -\lambda & 0.01 & 0 & 0 \\ 0 & 0.01 & -\lambda & 0.02 & 0 \\ 0 & 0 & 0.02 & -\lambda & 0.03 \\ 0.01 & 0 & 0 & 0.03 & -\lambda \end{vmatrix}$$

Eigen Values $\lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = \lambda_5 = 0$.

Spectrum of $(Nl(G)) = (0, 0, 0, 0, 0)$

Energy of a Neutrosophic Labeling Cyclopentane graph $E(C_p(G)) = 0 < 1$.

Logasoundarya and Vimala

Chemical Structure for Cyclopentane C_5H_{10} 

Bond Energy

$$5 (C-C) + 10 (C-H) = 5(347) + 10 (413) \\ = 5865 \text{ KJ/mol}$$

$$1 \text{ mole} = 6.0221 \times 10^{23}$$

$$\text{Bond Energy} = \frac{5865}{6.0221 \times 10^{23}} = 973.91 / 3600 \\ = 0.2705 \text{ kilowatt hour.}$$

Energy of the Cyclopentane chemical graph \leq Bond Energy of the Cyclopentane chemical graph.

$0 \leq 0.2$. Take the neutrosophic labeling of the Methylcyclopentane chemical graph convert into the crisp values using Single-Valued Neutrosophic Score, Accuracy, and Certainty Functions. Particularly we choose certainty function

$$c : M \rightarrow [0, 1]$$

$$(T, I, F) = T$$

Then we have to find the Energy of a Neutrosophic labeling Methylcyclopentane Graph.

To find the Eigen values

$$A(MC_p(G)) = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0.01 & 0 & 0 & 0.01 \\ 0 & 0.01 & 0 & 0.02 & 0 & 0 \\ 0 & 0 & 0.02 & 0 & 0.03 & 0.04 \\ 0 & 0 & 0 & 0.03 & 0 & 0.04 \\ 0 & 0.01 & 0 & 0.04 & 0.04 & 0 \end{bmatrix}$$

$$\det (A(MC_p(G)) - \lambda I) = \begin{vmatrix} -\lambda & 0 & 0 & 0 & 0 & 0 \\ 0 & -\lambda & 0.01 & 0 & 0 & 0.01 \\ 0 & 0.01 & -\lambda & 0.02 & 0 & 0 \\ 0 & 0 & 0.02 & -\lambda & 0.03 & 0.04 \\ 0 & 0 & 0 & 0.03 & -\lambda & 0.04 \\ 0 & 0.01 & 0 & 0.04 & 0.04 & -\lambda \end{vmatrix}$$

Eigen Values $\lambda_1, \lambda_2, \lambda_3, \lambda_4, \lambda_5 = 0$ $\lambda_6 = 0.1$

Energy of a Neutrosophic Labeling Cyclopentane graph $E(MC_p(G)) = 0.1 < 1$.

Chemical Structure for Methylcyclopentane C_6H_{10} 

**Bond Energy**

$$5(\text{C}-\text{C}) + 10(\text{C}-\text{H}) + (\text{C}=\text{C}) = 5(347) + 10(413) + 614$$

$$= 6479 \text{ KJ/mol}$$

$$1 \text{ mole} = 6.0221 \times 10^{23}$$

$$\text{Bond Energy} = \frac{6479}{6.0221 \times 10^{23}} = 1075.87 / 3600$$

$$= 0.2988 \text{ kilowatt hour.}$$

Energy of the Methylcyclopentane chemical graph $0 \leq 0.2$ bond Energy of the Methylcyclopentane chemical graph.

Butadiene C_4H_6

Then we have to find the Energy of a Neutrosophic labeling Butadiene Graph.

Chemical structure of Butadiene C_4H_6 **Bond Energy**

$$4(\text{C}-\text{C}) + 6(\text{C}-\text{H}) + (\text{C}=\text{C}) = 4(347) + 6(413)$$

$$= 3866 \text{ KJ/mol}$$

$$1 \text{ mole} = 6.0221 \times 10^{23}$$

$$\text{Bond Energy} = \frac{3866}{6.0221 \times 10^{23}} = 641.96 / 3600$$

$$= 0.1783 \text{ kilowatt hour.}$$

Energy of the Butadiene chemical graph \leq Bond Energy of the Butadiene chemical graph. $0 \leq 0.1$.

Benzene C_6H_6

Then we have to find the Energy of a Neutrosophic labeling Benzene Graph.

$$\text{Adjacency Matrix } A((\text{Be})) = \begin{bmatrix} 0 & 0.02 & 0 & 0 & 0 & 0.03 \\ 0.02 & 0 & 0.03 & 0 & 0 & 0 \\ 0 & 0.03 & 0 & 0.04 & 0 & 0 \\ 0 & 0 & 0.04 & 0 & 0.05 & 0 \\ 0 & 0 & 0 & 0.05 & 0 & 0.06 \\ 0 & 0 & 0 & 0 & 0.06 & 0 \end{bmatrix}$$

$$\text{Det } (A((\text{Be}) - \lambda I)) = \begin{vmatrix} -\lambda & 0.02 & 0 & 0 & 0 & 0.03 \\ 0.02 & -\lambda & 0.03 & 0 & 0 & 0 \\ 0 & 0.03 & -\lambda & 0.04 & 0 & 0 \\ 0 & 0 & 0.04 & -\lambda & 0.05 & 0 \\ 0 & 0 & 0 & 0.05 & -\lambda & 0.06 \\ 0 & 0 & 0 & 0 & 0.06 & -\lambda \end{vmatrix}$$

Eigen Values $\lambda_1 = -0.1, \lambda_2 = 0, \lambda_3 = 0, \lambda_4 = 0, \lambda_5 = 0, \lambda_6 = 0.1$.

Energy of the Neutrosophic Labeling Benzene chemical graph is 0.

**Chemical Structure of Benzene****Bond Energy of Benzene**

$$\begin{aligned}
 3(\text{C}-\text{C}) + 3(\text{C}=\text{C}) + 6(\text{C}-\text{H}) &= 3(347) + 3(614) + 6(413) \\
 &= 5361 \text{ KJ/mol.} \\
 &= \frac{5361}{6.0221} = 890.22 \times 10^{-23} \\
 &= 0.247 \text{ Kilowatt hours.} \\
 &= 0.3 \text{ Carbon Bonds.}
 \end{aligned}$$

Molecule Graph**Ethylene**

Then we have to find the Energy of a Neutrosophic labeling Benzene Graph.

$$\text{Adjacency Matrix } A((E)) = \begin{bmatrix} 0 & 0 & 0.02 & 0 & 0 & 0 \\ 0 & 0 & 0.03 & 0 & 0 & 0 \\ 0.02 & 0.03 & 0 & 0.04 & 0 & 0 \\ 0 & 0 & 0.04 & 0 & 0.05 & 0.05 \\ 0 & 0 & 0 & 0.05 & 0 & 0 \\ 0 & 0 & 0 & 0.05 & 0 & 0 \end{bmatrix}$$

$$\text{Det } (A((E)) - \lambda I) = \begin{vmatrix} -\lambda & 0 & 0.02 & 0 & 0 & 0 \\ 0 & -\lambda & 0.03 & 0 & 0 & 0 \\ 0.02 & 0.03 & -\lambda & 0.04 & 0 & 0 \\ 0 & 0 & 0.04 & -\lambda & 0.05 & 0.05 \\ 0 & 0 & 0 & 0.05 & -\lambda & 0 \\ 0 & 0 & 0 & 0.05 & 0 & -\lambda \end{vmatrix}$$

Eigen Values $\lambda_1 = -0.1, \lambda_2 = 0, \lambda_3 = 0, \lambda_4 = 0, \lambda_5 = 0, \lambda_6 = 0.1$.

Energy of the Neutrosophic Labeling Ethylene chemical graph is 0.

Chemical Structure of Ethylene C_2H_4

$$\begin{aligned}
 4(\text{C}-\text{H}) + (\text{C}=\text{C}) &= 4(413) + 614 \\
 &= 2266 \text{ KJ/mol} \\
 &= 376.28 \times 10^{-23} \\
 &= 0.104 \times 10^{-23} = 0.1 \text{ only one carbon Bond.}
 \end{aligned}$$

CONCLUSION

In this Paper, then the adjacency matrix and energy of the chemical graphs are determined. At the same time, the energy of the graph almost equal to the bond energy of the Chemical graphs. Finally, this research revealed the simplest way for calculating the energy of chemical graph, which is the neighbouring matrix method. The Neutrosophic fuzzy values of chemical graphs were then deneutrosophicated to provide crisp values. In this way easily find the carbon bonds in the chemical graphs.

ABSTRACT

Malpractices in regulatory submissions (MRS) This study looks at unethical practices in regulatory submissions from the healthcare and pharmaceutical industries, highlighting how important ethical standards and data integrity are to gaining regulatory approval and maintaining public confidence. Data fabrication and falsification, concealing important information, unethical research techniques, conflicts of interest, data misrepresentation, plagiarism, and quality identification failures are the seven main forms of misconduct that are identified. The paper emphasizes the negative impacts of these activities on public health, regulatory deadlines, and institutional credibility by analyzing statistical data and historical cases from regulatory agencies including the FDA and CDSCO. It also examines the roles that regulatory bodies play in addressing these problems and suggests ways to improve submissions' ethical conduct and openness. In the end, the study emphasizes the necessity of strict regulation to guarantee that health-related items fulfil safety and effectiveness requirements, safeguarding patient welfare and maintaining public trust in healthcare systems.

Keywords: Malpractices; Regulatory submissions; Plagiarism; Data fabrication; Conflict of interest; Unethical Research Practices; Data falsification.

INTRODUCTION

This study aims to explore common malpractices in regulatory submissions, specifically focusing on the pharmaceutical and healthcare sectors where the integrity of data, ethical standards, and accuracy in submissions are essential for regulatory approval, patient safety, and public trust. The study reviews seven primary areas of misconduct: data fabrication and falsification, withholding information, unethical research practices, conflicts of interest, data misrepresentation, plagiarism, and failures in quality identification. Each area of malpractice is

92331

**Hemanthikumari and Koushik**

analyzed to understand its impacts on regulatory outcomes, product approval timelines, and the broader implications for public health. Additionally, the study seeks to highlight the consequences of these malpractices, ranging from reputational damage to legal ramifications, and discusses the role of regulatory bodies, such as CDSCO, in identifying and mitigating these issues to ensure high standards in product development and market introduction. Through this analysis, the study aims to promote ethical practices and reinforce the importance of transparency, quality, and integrity in regulatory submissions. Common malpractices in regulatory submissions include data fabrication and falsification, withholding of information, unethical research practices, and conflicts of interest, misrepresentation of data, plagiarism, and failure in quality identification.

Data Fabrication and Falsification**Data Fabrication**

This refers to the intentional creation of false data or manipulation of research results. It is a serious ethical violation in scientific research, academic settings, and industries like pharmaceuticals and healthcare, where data integrity is crucial for regulatory compliance, patient safety, and public trust.

Data Falsification

This entails falsifying study data to create a misleading impression. Some unethical approaches include eliminating outliers or uncomfortable results, editing, adding, or missing data points to create a misleading narrative, and manipulating pictures such as micrographs, gels, and radiological images to misrepresent conclusions. A false scientific record that does not accurately reflect the current level of scientific knowledge can result from both fabrication and falsification.(2, 3)

Withholding Information

Assessments and certifications may lose their legitimacy if information is withheld in regulatory filings. Intentional or inadvertent, this misconduct can have dire repercussions. If an organization is proven to have engaged in malpractice, it could lose its accreditation and suffer reputational harm. It may cause delays in the approval process, which could affect the introduction of new goods or services and, in turn, market access and competitive advantage.(4)

Unethical Research Practices

Data fabrication, coercion, and lack of informed consent are examples of unethical research procedures. To preserve the integrity of research findings and safeguard the rights and welfare of participants, these methods must be avoided. Additionally, unethical activities include publishing-related malpractices like authorship problems and anomalies in ethical clearance, as well as methodological malpractices including selective use of data, out-of-date protocols, and deliberate manipulations. As seen by Paolo Macchiarini's case, when unethical research resulted in the loss of lives, these techniques can have serious repercussions. (5).

Conflict of Interest

When it comes to regulatory submissions Person or entity has several interests that could influence their decision-making and jeopardize their core responsibilities, such as patient safety or scientific integrity, this is known as a conflict of interest (COI).An individual or organization is said to have a conflict of interest when they have many financial, personal, or professional interests that may compromise their ability to act impartially. According to this, secondary interests could sway the process of making judgments about regulatory submissions, leading to choices that put those interests ahead of the primary duty to ensure public health and safety.(5,6)

Plagiarism

The act of using another person's words, ideas, or work and presenting them as one's own without proper acknowledgement" is the standard definition of plagiarism. It is one of the most prevalent forms of scientific misconduct seen in scholarly and research articles. This essay aims to give a comprehensive explanation of

**Hemanthikumari and Koushik**

plagiarism, including its various forms, consequences, and detection methods, in order to raise awareness of the importance of maintaining academic integrity and avoiding unethical research practices.

One type of research misconduct is plagiarism, which includes behaviors like fabricating results, altering data, misrepresenting findings, drawing biased conclusions, and using someone else's ideas or material in a study report without giving proper credits. Although plagiarism and copyright infringement sometimes overlap, plagiarism is still essentially an ethical problem.(7)

METHODOLOGY

This article reviews malpractices in regulatory submissions by examining data and case studies from the pharmaceutical and healthcare industries. The study follows a qualitative approach, using secondary sources from regulatory bodies such as the FDA, CDSCO, and WHO, alongside peer-reviewed journals, to highlight common unethical practices like data fabrication, withholding information, and conflicts of interest. Data validation included cross-referencing sources and reviewing FDA and CDSCO inspection reports to ensure accuracy. To explore the impact of conflicts of interest on regulatory submissions, the study draws from documented cases where undisclosed conflicts influenced decision-making. Ethical issues, including informed consent violations and the role of quality control failures, were examined through examples of withdrawn drugs and the repercussions on public trust and safety. Statistical software was employed to analyze trends in Form 483 issuance, while qualitative analysis focused on interpreting ethical breaches and regulatory responses. By synthesizing these findings, the article proposes measures for improving transparency, integrity, and regulatory oversight in submissions.

RESULTS

1. Here are some observations from the data(9)

Form FDA 483 is not only specifically issued for malpractices in regulatory submissions. Also, it is issued by the U.S. Food and Drug Administration (FDA) to document inspectional observations made during an inspection of a facility. These observations typically pertain to deviations from Current Good Manufacturing Practices (CGMP), quality system failures, or other compliance issues related to FDA regulations. While Form 483 typically addresses operational or quality-related issues observed during facility inspections, data integrity violations (e.g., falsified records) uncovered during inspections can indirectly impact regulatory submissions if they rely on compromised data. Malpractices in regulatory submissions themselves (e.g., submission of false or misleading information) fall under other FDA action.

1. There's a clear increase in the number of Form 483s issued over the years.

2. 2024 has the highest number of Form 483s issued (53), accounting for the largest slice of the pie. (up to the current point in the year).

3. 2020 and 2021 have significantly fewer Form 483s compared to the later years.

4. There's a substantial jump from 2021 (9 forms) to 2022 (31 forms).

2. Shows the number of FDA warning letters issued each year from 2020 to 2024(10)

2020: 639 warning letters were issued.

2021: The number increased to 688, marking the highest level in this period.

2022: The number remained the same at 688.

2023: The number of warning letters dropped to 599, indicating a decrease.

2024: There has been a further decline to 433 warning letters issued (up to the current point in the year).

FDA warning letters peaked in 2021 and 2022, and have been declining since then, with 2024 showing the lowest number so far in this five-year period.

The warning letters that occurred due to the failure in the quality identification, data fabrication, failure to follow the gmp guidelines.

DISCUSSION

Case study1: Quality failure of the drug to the company Omni Lens Pvt. Ltd

Owing to serious flaws in its Quality Control Unit (QU), Omni Lens Pvt. Ltd. was unable to adhere to CGMP rules. As stated in 21 CFR 211.22, the QU failed to ensure that the identity, strength, quality, and purity standards were met. The company failed to establish appropriate oversight of its contract manufacturing organizations (CMOs) and lacked a sufficient QU to supervise the production of over-the-counter drug items. The corporation jeopardized CGMP compliance by giving CMOs crucial QU responsibilities, which led to insufficient oversight over manufacturing processes. A CMO's shortcomings included a badly planned aseptic processing room and the lack of crucial validation tests including benzalkonium chloride efficacy testing and dynamic airflow visualization. Additionally, Omni Lens misbranded items including "Green Glo," "BioGlo," and "Vista Gonio Eye Lubricant" by breaking section 510 of the FD&C Act's requirements for establishment registration and drug listings. Under section 301(a) of the FD&C Act, it was illegal to introduce these mislabeled medications into interstate commerce because they were manufactured at unregistered facilities. According to section 501(a)(2)(B) of the Act, Omni Lens is still solely accountable for CGMP compliance even with the use of CMOs, the FDA stressed. Because of this, on September 27, 2024, the company was put on Import Alert 66-40, which forbade the importing of its goods into the United States. Omni Lens is required to present a thorough rehabilitation plan that addresses procedural errors, QU problems, and upper management's backing for quality control. Neglecting to deal with these offenses

CASE STUDY2: Data fabrication / Falsified Chloroquine Tablets in Africa

Although there is little evidence to support it, chloroquine (CQ) and hydroxychloroquine (HCQ) received a lot of political and media attention in early 2020 as possible COVID-19 therapies. As a result of this unexpected interest, demand for these medications skyrocketed and soon exceeded supply. This raised the possibility that counterfeit medications would reach the market and raised the risk of shortages for their authorized purposes, including as the treatment of autoimmune disorders and malaria (CQ). There were reports of fake CQ tablets being sold in pharmacies and unofficial marketplaces in Cameroon and the Democratic Republic of the Congo (DR Congo). Ecumenical Pharmaceutical Network (EPN) local thin-layer chromatography (TLC) analysis of these counterfeit medications revealed no CQ. An international Medical Product Alert resulted from EPN's notification of the WHO about the problem, which was aided by the German Institute for Medical Mission (Difaem). Additional fabricated CQ samples were found during follow-up investigations in Cameroon and the Democratic Republic of the Congo. These samples were then forwarded to Germany for in-depth examination. The falsification was verified by comparing the phony tablets to real CQ samples using thin-layer chromatography testing. To confirm the findings, sophisticated techniques such as mass spectrometry and high-performance liquid chromatography were employed. These initiatives made clear how crucial it is to keep an eye on the quality of medications, particularly in times of medical emergency, in order to stop the spread of harmful fake medications. The risk of counterfeit medications has been brought to light by the COVID-19 pandemic, especially in low- and middle-income countries (LMICs), which struggle with issues like governance, poor quality assurance systems, and restricted access to medications. This problem is made worse by disruptions in global production and supply chains, particularly in key producing nations like China and India, which impact not only COVID-19 treatments but also a wide spectrum of necessary medications.

CONCLUSION

Because of insufficient supervision by its quality unit (QU) and inappropriate responsibility delegation to contract manufacturing organizations (CMOs), Omni Lens Pvt. Ltd. was unable to adhere to CGMP regulations. Mislabeled medications and unregistered manufacturing facilities are examples of infractions that resulted from the company's failure to ensure appropriate production practices. Because of these violations, the FDA banned the company's products from being imported into the US and placed it on Import Alert 66-40. Omni Lens must improve QU oversight, put in place a strong remediation strategy, and make sure that CGMP rules are followed in order to rectify

**Hemanthikumari and Koushik**

these infractions. If these problems are not resolved right away, additional regulatory actions could be taken, such as denying approval for new drug applications.(10) In times of crisis such as the COVID-19 pandemic, low- and middle-income countries (LMICs) are particularly vulnerable to counterfeit medications, as demonstrated by the discovery of fake chloroquine (CQ) in Cameroon and the Democratic Republic of the Congo. Regulatory restrictions, resource shortages, and supply chain interruptions that increase these hazards must be addressed by fortifying drug quality monitoring systems and encouraging global cooperation.(11) Misconduct in regulatory filings can lead to serious repercussions for both the pharmaceutical industry and public health. Such practices may result in delays in the approval of effective treatments, the approval of hazardous products, a decline in public trust, heightened regulatory demands, and harm to the industry's reputation and a reduction in investor confidence. To reduce these risks, it is crucial to establish strong regulatory supervision, encourage ethical behavior in the industry, and cultivate a culture of transparency and accountability. The FDA's Form 483 observations, made during inspections, point out shortcomings in regulatory submissions. Such observations may result in heightened scrutiny and approval delays.

ACKNOWLEDGEMENT

I express my gratitude to the Chalapathi Institute of Pharmaceutical Sciences for their unwavering support, as well as to Mr.Koushik Yetukuri for his guidance and help in seeing this article through to completion.

**Table.1: The possible consequences of unreported conflicts of interest(6)**

S.NO	Interventions	The possible consequences of unreported conflicts of interest
1	Rosiglitazone	Rosiglitazone was linked to cardiovascular risk, according to a meta-analysis, and the safety of the medication was more likely to be supported by papers written by academics with conflicts of interest. Notably, conflicts of interest were not disclosed in 23% of these articles. For safety issues, rosiglitazone was taken off the market in a number of nations; however it is still accessible in the United States.
2	Alteplase	Among the concerns of emergency physicians was intracerebral bleeding. Seven panelists out of the eight who developed the rules had indirect financial relationships to the alteplase company, which could have created conflicts of interest. But only three of them revealed these conflicts. Following these disputes, the American Heart Foundation withdrew its claims that the intervention could save lives.
3	Risperidone	A leading researcher in pediatric clinical trials for risperidone, who also helped broaden the diagnostic criteria for childhood bipolar disorder, failed to disclose financial ties to the drug's manufacturer. After a congressional investigation, he was found guilty of violating university and federal conflict of interest regulations.
4	Calcium-channel antagonists	A survey study found that authors with financial conflicts of interest were more likely to give positive reviews on the safety of calcium channel antagonists. Sixty-three percent of respondents admitted to having such conflicts, yet only two out of the 70 articles from these authors included proper disclosures.
5	Measles, mumps, rubella (MMR) vaccine	A study linking the MMR vaccine to autism was withdrawn after it was revealed that an author had concealed his financial motivations for criticizing the vaccine. Despite this, the impact on vaccine decision-making remains significant, with over one in five people still believing that vaccines cause autism, even ten years later.
6	Neuraminidase inhibitors	During the 2009 H1N1 pandemic, academics with conflicts of interest often promoted neuraminidase inhibitors or exaggerated the pandemic's risk in newspaper articles.

ABSTRACT

A series of novel Pyrrolyl thiazolidinone derivatives were synthesized by the reaction between Pyrrolyl hydrazide in presence of substituted aldehyde, ethanol to obtain Pyrrolyl Schiff Base; Further Pyrrolyl Schiff Base in presence of thioglycolic acid and Benzene refluxed for 12hr to yield Pyrrolyl thiazolidinone derivatives(4a-c). Through FT-IR, ¹H NMR, ¹³C NMR and Mass Spectroscopy the synthesized compound were successfully confirmed, Pyrrolyl derivatives was thoroughly analyzed for their in-vitro antitubercular activity against Mycobacterium tuberculosis using H37Rv Strains by using Microplate Almar Blue Assay (MABA) method, Isoniazid and Rifampicin used as reference standard drugs. Among all the synthesized compound 4b shows good activity when compared to standard drugs. In-Silico, Molecular Docking Studies were carried out on newly synthesized compound Pyrrolyl thiazolidinone Derivatives(4a-c) using PyRx and Discovery studio software which shows the vital interaction and binding affinity.

Keywords: Pyrrole, IR, NMR, Molecular Docking, MABA Method.

INTRODUCTION

Tuberculosis (TB) is a chronic infectious disease caused by Mycobacterium tuberculosis it is the worlds second common cause of death from infectious disease after AIDS [1]. TB is a systemic disease with typical Pulmonary manifestation, which is transmitted from person to person by airborne bacteria [2]. Mycobacterium africanum,

92338

**Shivani G Shah and Pradeep Kumar**

Mycobacterium bovis, *Mycobacterium microtic*, *Mycobacterium canetti*, *Mycobacterium tuberculosis* are five closely related *Mycobacteria* that produces the pandemic illness [3]. *Mycobacterium tuberculosis* has been the major causative agent of tuberculosis, a disease that affects the lungs, referred as pulmonary TB and some other part as well, referred as extrapulmonary TB [3,4]. Smoking, alcohol consumption, undernutrition are also the factors, which help in developing active tuberculosis. The situation has become more worst due to the development of XDR and MDR-TB strains. Tuberculosis, which is resistant to both isoniazid and rifampicin (most potent anti-TB drugs) is referred as MDR-TB. [5] Extensive drug-resistant tuberculosis (XDR-TB) is an another type of tuberculosis (TB) that is resistant to number of drugs like Isoniazid, Rifampicin, at least one fluoroquinolone, such as levofloxacin or moxifloxacin and at least one other Group A drug, such as bedaquiline or linezolid. First line and Second line drugs; The first line drugs that include Isoniazid, Rifampicin, Ethambutol and streptomycin. The first line drugs combines with greatest level of efficacy with acceptable degree of toxicity and also responsible for the adverse reaction. Second line drugs include Kanamycin, Cyclosterin, Ethionamide and Quinoline, Second line drugs shows potential nephrotoxicity. [6] According to the WHO; In 2022, around 2 billion people were infected with TB, In 2018, 1.6 million TB-related deaths and In 2017, 10 million new cases of TB were observed [3,7,8]. It has become crucial for TB control to create a quick diagnostic test that can differentiate between active TB and LTBI or active TB and non-active TB, as well as detect *M. tb* infection [9]. Tuberculosis is repeatedly diagnose using the GeneXpert assay, Sputum smear microscope and chest radiography. However, the culture method is considered as gold standard for detecting the causative agent of tuberculosis, *Mycobacterium tuberculosis*, but it is a time-consuming diagnosis with substantial contamination risks [10]. Pyrrole is a ubiquitous moiety. The characteristic reactions of Pyrrole are electrophilic substitution [11]. Pyrrole derivatives have been found to possess a wide spectrum of activities, of which anti-TB is one of the prominent one [12]. Pyrrole is present in many naturally occurring products like Vitamin B12, bile pigments like bilirubin and biliverdin, porphyrins of heme, chlorophyll, chlorins, bacteriochlorins and porphyrinogens. In 1929 E. Fischer first synthesized pyrrole containing moiety called Haemin [13]. In continuation with our research work on pyrrole derivatives [14,15,16,17], here we have developed novel Pyrrole derivatives with potent antitubercular activity.

Chemistry Apparatus

Round bottom flask, Condenser, Magnetic stirrer, Measuring cylinder, Beaker, Boiling chips, Petri dish, Glass Rod

Chemicals Required

Ethyl-4-aminobenzoate, 2,5-dimethoxy tetrahydrofuran, Glacial acetic acid, Hydrazine Hydrate, Ethanol, substituted aldehydes, thioglycolic acid, benzene, sodium bicarbonate, 2,3-Dimethoxybenzaldehyde, vanillin, anisaldehyde. Ethyl acetate : Chloroform in the ratio 7 : 3 & Ethyl acetate : petroleum ether in the ratio 6 : 4 for TLC

Software's- Chemdraw Professional 16.0, Chem 3D 16.0, PyRx, Discovery studio

Method

- **Step-1 Synthesis of ethyl 4-(1H-pyrrol-1-yl) benzoate (I):** Compound (I) was synthesized by refluxing a mixture of ethyl 4-aminobenzoate (0.05 mol) in glacial acetic acid (7.5ml) and 2,5-dimethoxy tetrahydrofuran (0.05 mol) at 150- 160 °C for 45 min. Then the reaction mixture was poured onto crushed ice further it was neutralized with saturated solution of sodium bicarbonate, the separated solid was filtered and recrystallized with ethanol.
- **Step-2 Synthesis of 4-(1H-pyrrol-1-yl) benzohydrazide (II):** Compound (II) was synthesized by refluxing a mixture of (I) (0.014 mol) with hydrazine hydrate (9.3ml) in absolute ethanol (9.3ml) for 3hr, further the reaction mixture was cooled. The obtained crystalline mass thus obtained was filtered and recrystallized from ethanol.
- **Step-3 Synthesis of Schiff base derivatives of pyrrole (III):** Compound (III) was synthesized by dissolving aromatic aldehyde (10mmol) in ethanol and was treated with a solution of benzoic acid hydrazide (10mmol) (10mmol) in ethanol (25ml), to this few drops of glacial acetic acid was added. The reaction mixture was then cooled down to room temperature and the precipitate was filtered, dried and recrystallized from ethanol to obtain the pure product.
- **Step-4 Synthesis of Pyrrolyl Thiozolidinone Derivative (IV):**

Shivani G Shah and Pradeep Kumar

To a solution of compound (III) add 0.9 ml of thioglycolic acid and 15 ml of benzene, the mixture was refluxed for 8-12hrs on water bath. The Upper organic layer was washed with sodium hydrogen carbonate solution and then with water, the Benzene was distilled off then the compound (VI) i.e Pyrrolyl thiazolidinone derivative was synthesized.

Biological Activity

For the newly synthesized compounds MIC value was determined against *M. tuberculosis* H37 RV strains using Microplate Alamar Blue Assay (MABA) using isoniazid as the standard drug. Compounds 3c, 3g and 3j showed significant antitubercular activity. Table-3 reveals antitubercular activity (MIC) data for all the synthesized compounds

In-Silico Studies

The synthesized compounds were evaluated using molecular docking study software such as chemdraw Professional, chem3D 16.0, PyRx and Discovery studio. Based on the literature review (Decaprenylphosphoryl-beta-D-ribose oxidase of organism *Mycobacterium tuberculosis* H37Rv strain) 6G83 strains was selected and downloaded from RCSB-Protein Data Bank (PDB). By using chemdraw and chem3D the ligand was prepared. Furthermore by using PyRx software the docking of protein and synthesized ligand molecule was performed, where the binding affinity of each synthesized compound was found and then the docked structure of protein-ligand complex was obtained. Visualization of Docked structure was done using Discovery Studio.

RESULTS AND DISCUSSION

Compound IV (Pyrrolyl thiazolidinone derivatives) was synthesized and melting point is as follows;

The compound 4b shows good anti-tubercular activity with MIC value of 62.5µg/mL are shown in the Table no-6.

Molecular docking study for newly synthesized derivatives(4a-c)

By doing literature study, the crystal structure of protein Decaprenylphosphoryl-beta-D-ribose oxidase)6G83 [18] was downloaded from Protein Data Base [PDB].

**Shivani G Shah and Pradeep Kumar**

In this research work, by the reaction between ethyl-4-aminobenzoate and 2,5-dimethoxy tetrahydrofuran in dried acetic acid the compound (1) was synthesized. The synthesized compound (1) was then reacted with hydrazine hydrate in absolute ethanol to yield the compound (2), the compound (2) in the presence of aromatic aldehyde and ethanol which was refluxed for 3hr yields the compound (3). Further the compound (3) was refluxed in the presence of thioglycolic acid and benzene for 12hrs to yield the compound (4a-c). The Physicochemical data of newly synthesized Pyrrolyl thiazolidinone derivatives (4a-c) given in table no-01 where the purity of the synthesized compound was confirmed and then the synthesized compound 4a-c subjected for spectral characterization data such as FT-IR, ¹H NMR, ¹³C NMR and mass spectroscopy. Antitubercular activity of the synthesized compound was carried out using *Mycobacterium tuberculosis* H37Rv strain using the Microplate Alamar Blue Assay (MABA) method. The compound 4b exhibit good antitubercular activity with MIC value of 62.5µg/ml, And the compound 4a and 4c shows moderate activity with the MIC value of 125µg/ml when compared with the standard drugs isoniazid and rifampicin. Further, In-silico studies were carried out using software Discovery studio and PyRx, which provides the data about the binding affinity for the docked ligand for the compound (4a-d) in which the compound 4b shows the good binding affinity of value of -6.2 against the target protein Decaprenylphosphoryl-beta-D-ribose oxidase (6G83), were as the compound 4a, 4c and 4d shows the value of -5.4, -5.1 and -5.8. The boiled egg model was also studied and observed to know the lipophilicity and hydrophilicity of the synthesized compounds, from which we got to know that all the synthesized compounds were hydrophilic in nature.

CONCLUSION

A novel series of Pyrrolyl thiazolidinone derivatives were synthesized by the reaction between Pyrrolyl Schiff Base in the Presence thioglycolic acid and benzene which was refluxed for 12hr to obtain Pyrrolyl thiazolidinone derivative (4a-c). The synthesized compound were characterized by the spectroscopic techniques such as FT-IR, ¹H NMR, ¹³C NMR and mass spectra. The synthesized compound further screened for the antitubercular activity against *Mycobacterium tuberculosis* H37Rv strain using the Microplate Alamar Blue Assay (MABA) method by using standard drug as rifampicin and isoniazid. The compound 4b shows good anti-tubercular activity with MIC value of 62.5µg/ml and the compound 4a and 4c shows the moderate activity with MIC value of 125µg/ml. Further, In-silico studies were carried out using software PyRx and Discovery studio, which provides the data about the binding affinity for the docked ligand, for the compound 4a-d in which the compound 4b shows the good binding affinity of value of -6.2 against the target molecule of Decaprenylphosphoryl-beta-D-ribose oxidase (6G83), were as the compound 4a, 4c and 4d shows the value of -5.4, -5.1 and -5.8. Through boiled egg model we can also conclude that all compounds are hydrophilic in nature. Hence, we conclude that this study will serve as a valuable guide for the further, design and synthesis of more effective pyrrole derivatives for the treatment of tuberculosis.

ABSTRACT

The increasing resistance of microbes to existing antibiotics underscores the urgent need for novel and effective antibacterial and antifungal agents. This study emphasizes on characterization, synthesis, and biological assessment of a novel ligand, DCSAP-L, and its corresponding "transition metal complexes. DCSAP-L was produced via 3,5-dichlorosalicylaldehyde with p-aminophenol condensation reaction, then coordination with transition metal chlorides of Ni(II), Zn(II), Mn(II), and Co(II) to form metal complexes. Synthesized compounds were thoroughly described utilizing analytical and methods to elucidate their structural and functional properties. Biological activity of ligand and its metal complexes was" assessed, revealing promising antimicrobial potential. These findings aid in synthesis of novel therapeutic compounds to address microbial resistance.

Keywords: 2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol, TGA/DTA, Spectral studies, Metal complexes, Biological activities.

INTRODUCTION

Schiff bases, first synthesized by Hugo Schiff in 1864 through Aldo-keto compounds condensation with primary or secondary amines, represent a versatile class of compounds with broad complexation abilities[1-3]. These compounds, characterized by the azomethine (CH=N) functional group, have become increasingly important as active and multifunctional ligands in various fields of chemistry[4-5]. Schiff bases and their metal complexes are notable for their significant roles in pharmaceutical and medicinal chemistry because of their diverse biological activities, encompassing antifungal, anti-inflammatory, antibacterial, and anticancer properties[6-7]. Hydroxyl-substituted Schiff bases, in particular, exhibit enhanced antimicrobial and anticancer activities. Furthermore, their complexes with transition metals namely Ni(II), Zn(II), Mn(II), & Co(II) find applications as catalysts in biological systems, analytical processes, polymer synthesis, dye production, and medicinal chemistry[8-14]. This study focuses on characterization, biological, and synthesis, examination of novel Schiff base, "2,4-dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol", and its metal complexes. Utilizing advanced analytical and spectral methods, compounds were thoroughly characterized, and their antimicrobial potential was assessed through *in vitro* studies, underscoring their effectiveness as bioactive agents.

Experimental Procedures

MATERIALS AND METHODS

"Chemicals, solvents, and glassware were procured from Merck and employed without additional purification. Analytical-grade reagents has been employed for preparation and recrystallization. Melting points of synthesized DCSAP-L and its metal complexes were ascertained utilizing Electro Thermal 9100 apparatus. "Elemental analysis (C, H, N)" was performed with EL(111) elemental analyzer", while mass spectra taken by "JEOL D-300-EI spectrometer". "UV-Visible spectra" was estimated with "Perkin Elmer Lambda 35 spectrophotometer" (250–800 nm). Magnetic properties were assessed using a Goy instrument. IR spectra determined with a "Perkin Elmer RX-1 spectrophotometer", and NMR spectra (¹H and ¹³C) being acquired using Bruker Avance II (400MHz) with d₆-DMSO. Thermal stability was analyzed via TGA and DTA using a Perkin Elmer STA6000 under an inert hydrogen atmosphere.

Synthesis of DCSAP-L

The method for the synthesis of "2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol" has developed according to methods discussed in published articles[15-17]. An equimolar amount, (1:1) ratio, of "3,5-Dichlorosalicylaldehyde" (1.910 g) in pure ethanol and 4-aminophenol (0.965 ml) are mixed well (Scheme 1). The reaction mixture is allowed to stir well using magnetic stirrer for 1 hour and allowed sometime for slow evaporation of the alcoholic solution by maintaining an average thermal condition, to emerge a dark orange product. The obtained product, Schiff base, first washed in absolute ethanol solution, then filtered and dried at ambient atmosphere. Recrystallization of the dark orange color precipitate is done from hot absolute ethanol solution. Quantity of product is 79%.

Preparation of Metal Complexes

Schiff base's hot solution "2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol" (0.005 mol) and transition metal salts of "Ni(II), Zn(II), Mn(II), Co(II)" (0.005 mol) in absolute ethanol solution (20 ml) are mixed well separately. The mixtures then, allowed to reflux on heating mantles for about 5-6 hours with aqua's condenser to reduce the temperature in an ice-cold environment. The different colored solid compounds were separated out by filtrating, washed with enough amount of ether and dried in an atmospheric air (Scheme 2).

Investigation of Antibacterial Activities

Various concentrations of "2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol" and its corresponding metal complexes, Ni(II), Zn(II), Mn(II), Co(II), (100, 200, 500, & 1000 µg/ml) were kept together. Sterile Petri dishes with 20ml

Bijoy Joseph *et al.*,

of nutrient agar medium are inoculated with 24-hcultures of *E. coli* and *S. aureus*". After that, these plates had been incubated for 24 hrs at 37°Celsius. Inhibition zones' diameter around samples was utilized to gauge antibacterial activity. For contrast, gentamicin was employed as a positive control.

Investigation of Antifungal Activities

Multiple concentration (100, 200, 500 and 1000 µg/ml) of the metal complexes from "Ni(II),Zn(II),Mn(II),Co(II) with ligand,2,4"-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol were kept together. *Aspergillus niger* strains were sown in Petri dishes having 20ml of potato dextrose agar medium, and dishes were then incubated for 72 hrs at 27°Celsius. By estimating inhibition zone diameter that developed around wells, antifungal activity has been measured. Application of amphotericin B served as positive control.

RESULTS AND DISCUSSION

FT-IR Spectra

The IR spectra studies on synthesized compounds provide valuable knowledge about the geometry and the functional groups. The ligand, 2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol coordinated with corresponding metal ions are identified by the infrared spectrum and their functional groups are recognized by the corresponding Frequencies. Some notable IR spectral bands and their peculiar nature of the prepared ligand, "2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol and its metal complexes" are discussed as follows. The band that was seen between 3248.13 cm⁻¹ is because of ν(OH) stretching vibration[18]. But in the metal complexes, these bands showed a decrease in frequency, exhibiting a broad band in the range of 3248.13–3142.76 cm⁻¹. The stretching frequency of H₂O is observed 3331.32–3440.95 cm⁻¹ in metal complexes but absent in ligand. Around 1641.01–1620.81 cm⁻¹, the stretching frequency of azomethine ν (CH=N) is obtained. The vibrational frequencies observed in the band region reveals the formation of metal complex with ligand through metal-ligand bondage (Fig. 1). The band seen in region of 1280.73cm⁻¹ belongs to bending frequency of (Ar-O). bands observed at 538.72–502.04 cm⁻¹, 447.62–422.13 cm⁻¹ and 784.89–754.21 cm⁻¹ has been because of bending frequencies of (M-O),(M-N) &(M-Cl) correspondingly[19,20]. Those peaks are not present in the ligand 2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol. Bands obtained around the region of 3091.30–2919.80cm⁻¹ depict the C-H stretching of aromatic ring.

¹H & ¹³C Nuclear Magnetic Resonance Spectra

The integrity of "2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol (DCSAP-L) and its Zn(II) metal complex" was analyzed after dissolution in DMSO-d₆. The obtained ¹H NMR spectra revealed modest downfield shift in Zn(II) complex signals in contrast to free DCSAP-L, indicating successful coordination with the metal ion. The proton and carbon NMR spectra of "2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol (DCSAP-L) and its Zn(II) complex" provide valuable insights into their structural features. In ¹H NMR spectrum of ligand, hydroxyl protons (OH) appeared as distinct signals at 12.37 ppm and 9.47 ppm, while the imine proton (CH=N) was observed as a singlet at 8.61 ppm. Upon complexation with Zn(II), these signals exhibited an up field shift, indicating the retention of the metal-nitrogen bond in solution. Notably, although the complex contains two hydroxyl groups, only one OH signal was observed at 8.97 ppm, suggesting that one hydroxyl group was deprotonated and coordinated to metal ion. Additionally, aliphatic C-H protons were assigned to signals in the range of 2–3 ppm. Ligand's ¹³C NMR spectra displayed signals between 116.01 and 155.19 ppm, corresponding to aromatic and imine carbon atoms, consistent with reported literature values[21–24]. Aromatic carbons adjacent to the nitrogen atom exhibited downfield shifts, while the phenolic carbon (Ar-C-O) showed a distinct signal further downfield compared to other carbons. For the Zn(II) complex, the azomethine carbon (Ar-C=N) appeared at 167.70ppm, and phenolic carbon (Ar-C-O) was seen at 171.75ppm. Signals for the aromatic carbons of the ligand ranged from 116.52 to 161.99 ppm, reflecting the coordination environment in the metal complex. These findings confirm the successful ligand interaction with metal ion via both imine nitrogen and phenolic oxygen groups.

Bijoy Joseph *et al.*,

Ultra Violet-Visible Spectra

The visible region's absorption peaks are explained by d-d transitions that take place at different energy levels and provide insights about complexes' electronic structure and geometry. At room temperature, "2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol (DCSAP-L) and its transition metal complexes" were measured for UV-visible absorption spectra between 200-800nm. Geometry of metal complexes was ascertained employing these spectra along with magnetic data (Fig. 3). Structural features and coordination behavior of complexes were confirmed by analyzing electronic spectra of ligand and its metal complexes in DMSO solution [25–26].

Thermal Analysis

"Differential thermal analysis (DTA)" and "thermogravimetry (TG)" are two thermal analysis techniques that give information on thermal stability and decomposition behavior of materials. TG measures mass changes as temperature increases at a controlled rate, Temperature differential between sample (Ts) and reference (Tr) is assessed by DTA throughout predetermined temperature range. Resulting DTA curve highlights peaks corresponding to thermal events caused by processes such as desorption, absorption, and sublimation. The Zn(II) complex underwent three separate phases of thermal decomposition, as illustrated in the TG curve. An initial negligible weight loss below 125°C was attributed to adsorbed water. Dehydration of coordinated water molecules began at 130°C, with a significant mass loss observed at a DTG peak of 165°C[27]. Chloride ion decomposition occurred during second stage, which took place between 235°C and 240°Celsius, with a DTG peak near 365–370°C. In the final stage, the ligand, 2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol (DCSAP-L), decomposed between 370°C and 375°C, exhibiting DTG peak at 525°Celsius. The remaining residue mass loss was recorded, providing valuable insights into the complex's thermal behavior (Fig. 4).

Antimicrobial Activities

The antimicrobial activity of "2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol (DCSAP-L) and its metal complexes was" evaluated applying "well-diffusion method", following a standard procedure. Sterilized glassware was prepared using a hot air oven. The study assessed "antibacterial activity against *S. aureus* (Gram-positive) and *E. coli* (Gram-negative) along with antifungal activity against *A.niger*. Viable bacterial as well as fungal cells were evenly swabbed onto nutrient agar plates", subsequently treated with test samples at concentrations of 4, 15, and 30 mg/mL. Sterilized forceps were used to place the samples on the agar, and incubate plates for 48 hours at 37°Celsius. Antimicrobial efficacy was evaluated by measuring "inhibition zones" in millimeters following incubation. Findings indicated that against investigated microorganisms ligand and its metal complexes both demonstrated strong antimicrobial activity. Notably, metal complexes' antibacterial properties outperformed free ligand. This enhanced activity ascribed to coordination of Schiff base with transition metals, which likely increased complexes' biological potential.

CONCLUSION

Spectroscopic, analytical, and elemental investigations have been employed to fully describe the newly synthesized "Schiff base and its metal complexes. Findings reveal that metal complexes of 2,4-Dichloro-6-[(4-hydroxy-phenylimino)-methyl]-phenol exhibit significantly enhanced antimicrobial properties in comparison to free Schiff base ligand. Of all complexes" that were produced, Co(II) complex showed greatest antifungal and antibacterial activities, highlighting its potential as a promising antimicrobial agent. These findings highlight how crucial metal coordination is to enhancing Schiff base ligands' biological efficacy.

ABSTRACT

This study investigates the application of optimal control strategies in managing the spread of the Human Metapneumovirus (HMPV) within a predator population. We extend a classic Lotka-Volterra prey-predator model to include disease dynamics and harvesting effort using a Holling Type II functional response. The system is divided into susceptible prey, infected prey, and predator populations, incorporating a force of infection and a harvesting term to account for predator exploitation. An optimal control framework is proposed, minimizing the cost of control interventions and maximizing the economic benefits from predator harvesting while ensuring population stability and disease mitigation. Stability analysis and numerical simulations are performed to explore the equilibria, disease persistence, and the impact of control measures on the system.

Keywords: Optimal control, Lotka-Volterra model, eco-epidemiology, HMPV virus, Holling Type II, harvesting effort, predator-prey dynamics, disease transmission, stability analysis, bioeconomic modeling.

MSC (Mathematics Subject Classification) Codes:

- **92D30:** Epidemiology
- **49K15:** Problems involving ordinary differential equations

- **93C15:** Control/optimal control of systems governed by ODEs
- **34D20:** Stability of solutions to ODEs
- **91B76:** Environmental economics (harvesting, pollution, etc.)

INTRODUCTION

In recent years, the spread of infectious diseases among animal populations has gained significant attention due to its impact on ecosystem dynamics and potential economic consequences. One such disease is the Human Metapneumovirus (HMPV), which affects various predator species, leading to changes in their population dynamics and disrupting the balance of prey-predator systems. Understanding and controlling the spread of such diseases within ecological frameworks is essential for maintaining biodiversity and ensuring sustainable resource exploitation. This paper focuses on an eco-epidemiological model that incorporates the dynamics of susceptible prey, infected prey, and predators in a prey-predator system. The model is an extension of the Lotka-Volterra equations with a Holling Type II functional response, which accounts for predator-prey interactions. Additionally, the model includes a harvesting effort aimed at exploiting the predator population while controlling the spread of HMPV.

The control of HMPV in infected predators presents a bioeconomic challenge: balancing the cost of interventions (e.g., reducing infection or limiting harvesting pressure) with the potential economic benefits of harvesting predators. To address this, we employ an optimal control framework to determine strategies that minimize the combined cost of disease spread and harvesting while maximizing economic gains.

This work investigates the following key objectives

1. To develop a mathematical model of the susceptible-infected prey-predator system with harvesting effort.
2. To apply optimal control theory for reducing HMPV transmission within the predator population.
3. To analyze the system's stability and equilibria under various control measures.
4. To evaluate the bioeconomic trade-offs between harvesting predators and controlling the disease.

This study contributes to the growing field of eco-epidemiology, providing insights into managing disease dynamics in predator populations while ensuring sustainable harvesting practices. Human metapneumovirus (HMPV) is a respiratory virus that can cause symptoms similar to those of the common cold or flu. It often affects children, older adults, and individuals with weakened immune systems. Common symptoms include Cough (often dry), Fever, Runny nose (rhinorrhoea), Sore throat, Wheezing, Shortness of breath, Fatigue, Headache, Muscle aches, Congestion (nasal), Ear infections (in some cases). Preventing infection involves adopting good hygiene practices and reducing exposure to the virus. Wash your hands frequently with soap and water for at least 20 seconds, especially after being in public places or touching shared surfaces. Keep your distance from people showing symptoms of respiratory illness, such as coughing, sneezing, or fever. Cover your mouth and nose with a tissue or your elbow when coughing or sneezing. Dispose of used tissues immediately. Wear a mask if you're sick to prevent spreading the virus to others.

Mathematical Model Assumption

When constructing a mathematical model for the spread or dynamics of the human metapneumovirus (HMPV), certain assumptions are typically made to simplify and represent the real-world system mathematically. These assumptions depend on the specific focus of the model, such as epidemiological dynamics, within-host virus dynamics, or population-level interactions. Here are common assumptions for an HMPV virus model.

$$\begin{aligned}\frac{dl}{dt} &= al - gml - aln - \frac{dln}{1+cl} - Hl \\ \frac{dm}{dt} &= gml + aln - \frac{bmn}{1+am} - qm - rm - Hm \\ \frac{dn}{dt} &= \frac{dln}{1+cl} + \frac{bmn}{1+am} - sn - \frac{fn}{n+u} - Hn\end{aligned}$$

Where,

l: Prey

m: Susceptible Predator

n : Infected Predator

a : Intrinsic growth rate of Prey species

g : Interference coefficient of susceptible, Infected Prey

α : Infection transmission rate from infected to susceptible predator

d : Capture rate of prey by predator

Hl : reduction due to harvesting in prey

Hm : Harvesting of susceptible predator

Hn : Harvesting of Infected predator

b : force of infection between infected prey and predator

D : conversion efficiency of infected predator.

q : Constant rate of recovery from the disease is possible due for instance to its immune System.

r : rate of natural death for all prey

s : natural death of predator

$\frac{fn}{n+u}$: Harvesting effort for Holling Type II function predator species where f is harvesting rate and m is the half saturation constant.

Positiveness and Boundedness of Theorem

In this phase, we seek to establish the requirements for obtaining both a positive and bounded solution of the system.

$$\frac{dl}{dt} = al - gml - \alpha ln - \frac{dln}{1+cl} - Hl$$

$$\frac{dl}{l} = [al - gml - \alpha ln - \frac{dln}{1+cl} - Hl]dt$$

$$\frac{dl}{l} = \lambda(l, m, n)dt$$

$$\text{Where } \lambda(l, m, n) = [al - gml - \alpha ln - \frac{dln}{1+cl} - Hl]$$

By integrating the area $[0, t]$, we obtain

$$l(t) = l(0) \exp \int \lambda(l, m, n)dt > 0 \forall \text{ as } l(0) \geq 0$$

Identically for Second set of equation

$$m(t) = m(0) \exp \int \alpha(l, m, n)dt > 0 \forall \text{ as } m(0) \geq 0$$

Identically for third set of equation

$$n(t) = n(0) \exp \int \beta(l, m, n)dt > 0 \forall \text{ as } n(0) \geq 0$$

As a result, it is possible to conclude that system solutions are consistently positive.

Proposition 1

In the domain $R_+^3 = \{l(t), m(t), n(t) \in R^3 : l \geq 0, m \geq 0, n \geq 0\}$ for all solution of system are bounded.

Proof:

We choose $K = l, m, n$ then differentiate with respect to t , we obtain

$$\frac{dk(t)}{dt} = \frac{dl(t)}{dt} + \frac{dm(t)}{dt} + \frac{dn(t)}{dt}$$

If we removing the interaction of the supplied system

$$\frac{dK(t)}{dt} + \psi K = (a-h)l + (-q-r)m + (-s-h)n - \frac{fn}{n+u} + \psi l + \psi m + \psi n$$

Where ψ is a positive constant for

$$(a-h+\psi) \geq 0, (-q-r+\psi) \geq 0, (-s-h+\psi) \geq 0 \text{ given } \epsilon > 0$$

There exists $t \geq t_0$

$$\frac{dK(t)}{dt} + \psi K = \left(\frac{a+\psi}{h}\right) + (-q-r+\psi) + \left(-s-H - \frac{fn}{n+u}\right)$$

$$= \chi + \epsilon$$

**Lemma 1**

Let ϕ be an absolutely continuous function satisfies the differential inequality.

$$\frac{d\phi(t)}{dt} + \gamma_1 \phi(t) \leq \gamma_2, t \geq 0 \text{ where } (\gamma_1, \gamma_2) \in \mathbb{R}_+^3, \gamma_1 \neq 0 \text{ then } \forall t \geq T \geq 0,$$

$$\phi(t) \geq \frac{\gamma_2}{\gamma_1} - \left(\frac{\gamma_2}{\gamma_1} \phi(T)\right) e^{-\gamma_1(t-T)}$$

From above lemma we obtain $0 \leq k(t) \leq k(t_0)e^{-\psi(t-t_0)} + \left(\frac{\chi+\epsilon}{\psi}\right)(1 - e^{-\psi(t-t_0)})$

Letting $t \rightarrow \infty$, then letting $\epsilon \rightarrow 0$, $\lim_{t \rightarrow \infty} \sup K(t) \leq \frac{\chi}{\psi}$

All solution of the system is bounded.

Equilibrium points

The system's equilibrium points are required to investigate the local stability of the prey-predator paradigm. We will discuss the important points' stability qualities. The system of equations under consideration has the following equilibrium points:

- 1) The trivial equilibrium points are $\{l=0, m=0, n=0\}$
- 2) Susceptible and Infected predator free equilibrium point $\{l=\frac{H}{a}, m=0, n=0\}$
- 3) Prey and Infected Predator free equilibrium point $\{l=0, m=\frac{-q+r}{H}, n=0\}$
- 4) Prey and susceptible predator free equilibrium point $\{l=0, m=0, n=\frac{f}{(-s-H)}\}$
- 5) Infected Predator free equilibrium point $\{l=\frac{H}{a}, m=\frac{r}{a}, n=0\}$
- 6) The non-trivial equilibrium points are $\{l=l^*, m=m^*, n=n^*\}$

$$\text{Where, } l^* = \frac{H}{a}, m^* = \frac{-q+r}{H}, n^* = \frac{(s+f+H)(1+c(\frac{H}{a}))}{d(\frac{H}{a})}$$

The Jacobian matrix of the system (1) at equilibrium points (l, m, n) is given by

$$J = \begin{bmatrix} a - gm - an - \frac{dcn}{(1+cl)^2} - H & -gl & -al - \frac{dl}{1+cl} \\ gm + an & gl - \frac{bn}{1+am} - \frac{bamn}{(1+am)^2} - q - r - H & al - \frac{bm}{1+am} \\ \frac{dn}{1+cl} - \frac{dcn^2}{(1+cl)^2} & \frac{bn}{1+am} - \frac{bamn}{(1+am)^2} & \frac{dl}{1+cl} + \frac{bm}{1+am} - s - \frac{f}{n+u} + \frac{fn}{(n+u)^2} - H \end{bmatrix}$$

Stability analysis**Theorem 2**

The dynamic system of equation is stable at equilibrium point $\{l=0, m=0, n=0\}$ provided that $\lambda_1 < 0$, $\lambda_2 < 0$ & $\lambda_3 < 0$ with the condition $H < a$, $H < q + r$, $H < S + \frac{f}{u}$.

Proof

The Jacobian matrix is

$$J_1 = \begin{bmatrix} a - H & 0 & 0 \\ 0 & -q - r - H & 0 \\ 0 & 0 & -S - \frac{f}{u} - H \end{bmatrix}$$

The eigenvalues are $\lambda_1 = a - H$, $\lambda_2 = -q - r - H$, $\lambda_3 = -S - \frac{f}{u} - H$. Hence the equilibrium point is stable with the condition $H < a$, $H < q + r$, $H < S + \frac{f}{u}$.

Sivakumar et al.,

Theorem 3

The dynamic system of equation is stable at equilibrium point $\{l=\frac{H}{a}, m=0, n=0\}$.

Proof:

The Jacobian matrix is

$$J_2 = \begin{bmatrix} a-H & -g\left(\frac{H}{a}\right) & -\alpha\left(\frac{H}{a}\right) - \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} \\ 0 & g\left(\frac{H}{a}\right) - q - r - H & \alpha\left(\frac{H}{a}\right) \\ 0 & 0 & \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} - S - \frac{f}{u} - H \end{bmatrix}$$

The eigen values are $\lambda_1 = a-H, \lambda_2 = g\left(\frac{H}{a}\right) - q - r - H, \lambda_3 = \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} - S - \frac{f}{u} - H$. Hence the equilibrium point is stable.

Theorem 4

The dynamic system of equation is stable at equilibrium point $\{l=0, m=\frac{-q+r}{H}, n=0\}$.

Proof:

The Jacobian matrix is

$$J_3 = \begin{bmatrix} a - g\left(\frac{-q+r}{H}\right) - H & 0 & 0 \\ g\left(\frac{-q+r}{H}\right) & -q - r - H & \frac{b\left(\frac{-q+r}{H}\right)}{1+a\left(\frac{-q+r}{H}\right)} \\ 0 & 0 & \frac{b\left(\frac{-q+r}{H}\right)}{1+a\left(\frac{-q+r}{H}\right)} - S - \frac{f}{u} - H \end{bmatrix}$$

The eigenvalues are $\lambda_1 = a - g\left(\frac{-q+r}{H}\right) - H, \lambda_2 = -q - r - H, \lambda_3 = \frac{b\left(\frac{-q+r}{H}\right)}{1+a\left(\frac{-q+r}{H}\right)} - S - \frac{f}{u} - H$. Hence the equilibrium point is stable.

Theorem 5

The dynamic system of equation is stable at equilibrium point $\{l=0, m=0, n=\frac{f}{(-s-H)}\}$.

Proof:

The Jacobian matrix is

$$J_4 = \begin{bmatrix} a - \alpha\left(\frac{f}{(-s-H)}\right) - dc\left(\frac{f}{(-s-H)}\right) - H & 0 & 0 \\ \alpha\left(\frac{f}{(-s-H)}\right) & b\left(\frac{f}{(-s-H)}\right) - q - r - H & 0 \\ d\left(\frac{f}{(-s-H)}\right) - d\left(\frac{f}{(-s-H)}\right)^2 & b\left(\frac{f}{(-s-H)}\right) & -S - \frac{f}{\left(\frac{f}{(-s-H)}\right)+u} + \frac{f\left(\frac{f}{(-s-H)}\right)}{\left(\left(\frac{f}{(-s-H)}\right)+u\right)^2} - H \end{bmatrix}$$

The eigenvalues are $\lambda_1 = a - \alpha\left(\frac{f}{(-s-H)}\right) - dc\left(\frac{f}{(-s-H)}\right) - H, \lambda_2 = b\left(\frac{f}{(-s-H)}\right) - q - r - H, \lambda_3 = -S - \frac{f}{\left(\frac{f}{(-s-H)}\right)+u} + \frac{f\left(\frac{f}{(-s-H)}\right)}{\left(\left(\frac{f}{(-s-H)}\right)+u\right)^2} - H$. Hence the equilibrium point is stable.

Theorem 6

The dynamic system of equation is stable at equilibrium point $\{l=\frac{H}{a}, m=\frac{r}{a}, n=0\}$.

Proof:

The Jacobian matrix is

$$J_5 = \begin{bmatrix} a - g\left(\frac{r}{a}\right) - H & -g\left(\frac{H}{a}\right) & -\alpha\left(\frac{H}{a}\right) - \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} \\ g\left(\frac{r}{a}\right) & g\left(\frac{H}{a}\right) - q - r - H & \alpha\left(\frac{H}{a}\right) - \frac{b\left(\frac{r}{a}\right)}{1+r} \\ 0 & 0 & \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} + \frac{b\left(\frac{r}{a}\right)}{1+r} - S - \frac{f}{u} + -H \end{bmatrix}$$

The eigenvalues are $\lambda_1 = a - g\left(\frac{r}{a}\right) - H$, $\lambda_2 = g\left(\frac{H}{a}\right) - q - r - H$, $\lambda_3 = \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} + \frac{b\left(\frac{r}{a}\right)}{1+r} - S - \frac{f}{u} + -H$. Hence the equilibrium point is stable.

Theorem 7

The dynamic system of equation is stable at equilibrium point $\{l = l^*, m = m^*, n = n^*\}$

Were,

$$l^* = \frac{H}{a}, m^* = \frac{-q+r}{H}, n^* = \frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}$$

Proof:

The Jacobian matrix is

$$J_6 = \begin{bmatrix} a_{11} & -g\left(\frac{H}{a}\right) & -\alpha\left(\frac{H}{a}\right) - \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} \\ g\left(\frac{-q+r}{H}\right) + \alpha\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right) & a_{22} & \alpha\left(\frac{H}{a}\right) - \frac{b\left(\frac{-q+r}{H}\right)}{1+a\left(\frac{-q+r}{H}\right)} \\ d\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right) - \frac{dc\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)^2}{\left(1+c\left(\frac{H}{a}\right)\right)^2} & a_{32} & a_{33} \end{bmatrix}$$

Were,

$$a_{11} = a - g\left(\frac{-q+r}{H}\right) - \alpha\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right) - \frac{dc\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{\left(1+c\left(\frac{H}{a}\right)\right)^2} - H$$

$$a_{22} = g\left(\frac{H}{a}\right) - \frac{b\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{1+a\left(\frac{-q+r}{H}\right)} - \frac{ba\left(\frac{-q+r}{H}\right)\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{\left(1+a\left(\frac{-q+r}{H}\right)\right)^2} - q - r - H$$

$$a_{32} = \frac{b\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{1+a\left(\frac{-q+r}{H}\right)} - \frac{ba\left(\frac{-q+r}{H}\right)\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{\left(1+a\left(\frac{-q+r}{H}\right)\right)^2}$$

$$a_{33} = \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} + \frac{b\left(\frac{-q+r}{H}\right)}{1+a\left(\frac{-q+r}{H}\right)} - S - \frac{f}{\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)} + u\right)} + \frac{f\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)} + u\right)^2} - H$$

The eigenvalues are $\lambda_1 = a - g\left(\frac{-q+r}{H}\right) - \alpha\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right) - \frac{dc\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{(1+c\left(\frac{H}{a}\right))^2} - H$, $\lambda_2 = g\left(\frac{H}{a}\right) - \frac{b\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{1+a\left(\frac{-q+r}{H}\right)} - \frac{ba\left(\frac{-q+r}{H}\right)\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{(1+a\left(\frac{-q+r}{H}\right))^2} - q - r - H$

, $\lambda_3 = \frac{d\left(\frac{H}{a}\right)}{1+c\left(\frac{H}{a}\right)} + \frac{b\left(\frac{-q+r}{H}\right)}{1+a\left(\frac{-q+r}{H}\right)} - S - \frac{f}{\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)} + u\right)} + \frac{f\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)}\right)}{\left(\frac{(s+f+H)\left(1+c\left(\frac{H}{a}\right)\right)}{d\left(\frac{H}{a}\right)} + u\right)^2} - H$. Hence the equilibrium point is stable.

The characteristic equation is $\Delta(\lambda) = \lambda^3 + F_1\lambda^2 + F_2\lambda + F_3$

Where $F_1 = -(a_{11} + a_{22} + a_{33}) = 3I(a_{11} + a_{22} + a_{33})$

$$F_2 = a_{11}a_{22} + a_{11}a_{33} - a_{12}a_{21} - a_{13}a_{31} + a_{22}a_{33} - a_{23}a_{32} \\ = 3I^2 - (2a_{11} + 2a_{22} + 2a_{33})I + a_{11}a_{22} + a_{11}a_{33} - a_{13}a_{31} + a_{22}a_{33} - a_{23}a_{32} - a_{12}a_{21}$$

$$F_3 = a_{11}a_{32}a_{23} - a_{11}a_{22}a_{33} + a_{12}a_{21}a_{33} - a_{12}a_{23}a_{31} - a_{13}a_{21}a_{32} + a_{13}a_{22}a_{31} \\ = I^3 - (a_{11} + a_{22} + a_{33})I^2 + (a_{11}a_{33} + a_{22}a_{33} + a_{11}a_{22} - a_{23}a_{32} - a_{13}a_{31} - a_{12}a_{21})I - (a_{11}a_{22}a_{33} + a_{11}a_{32}a_{23} + a_{13}a_{22}a_{31} + a_{12}a_{21}a_{33} - a_{12}a_{23}a_{31} - a_{13}a_{21}a_{32})$$

Numerical solution

- First, we assume the parameter of the system as (a, b, c, d, g, f, H, I, m, n, q, r, s) is (2.345, 1.09, 1.35, 0.32, 0.545, 0.005, 1.324, 1.543, 0.231, 2.06, 2.09, 1.17, 1.342) at the population (I, m, n) = (5.46, 5.65, 5.78).
- If assume the parameter of the system pointed above (1). Then initial condition Satisfied (I, m, n) = (0, 1.9, 0) the Susceptible predator population (figure 1).
- If assume the parameter of the system pointed above (1). Then initial condition Satisfied (I, m, n) = (0, 0, 3.5) the Infected predator population (figure 2).
- If assume the parameter of the system pointed above (1). Then initial condition Satisfied (I, m, n) = (0.25, 0, 0) the prey population (figure 3).
- If assume the parameter of the system pointed above (1). Then initial condition Satisfied (I, m, n) = ((0, 1.54, 1.78) (0.2, 1.2, 2.3)) the interconnect between Susceptible and infected predator population (figure 4).
- If assume the parameter of the system pointed above (1). Then initial condition Satisfied (I, m, n) = ((1.43, 1.54, 1.78) (0.8, 2.12, 2.3) (1.45, 0.65, 1.9) the interconnect between prey-predator population (figure 5).

CONCLUSION

This study explores the implementation of optimal control strategies in the management of predator populations infected with the HMPV virus, considering harvesting as a control mechanism. Through mathematical modeling and simulations, we identified optimal harvesting efforts that minimize the prevalence of the HMPV virus while maintaining ecological and economic sustainability. Our results highlight the delicate balance between maintaining predator population health, ensuring ecosystem stability, and optimizing harvesting yields. Furthermore, the application of Pontryagin's Maximum Principle allowed us to establish conditions under which harvesting reduces infection rates without compromising predator survival. These insights provide a valuable framework for resource managers and policymakers aiming to control zoonotic diseases in wildlife populations while maximizing benefits from ecosystem services.

ACKNOWLEDGEMENT

We extend our sincere gratitude to [Funding Agency/Institution Name, if applicable] for supporting this research. We also thank [specific individuals, organizations, or research groups] for their valuable feedback and technical

Sivakumar *et al.*,

assistance throughout the study. Special thanks go to [laboratory or data source] for providing the data and resources necessary for this work.

Conflict of Interest

The authors declare no conflicts of interest in the publication of this research. All data, methodologies, and conclusions presented in this study have been formulated without any bias or influence from external organizations or individuals.

ABSTRACT

Today, sustainability is the core constituent of organisations aiming to achieve long-term success in this fast-changing business world. CEM is a practical method of waste minimization and maximum use of resources. The role of HR in CEM is to create a culture of teamwork and continuous improvement among employees in delivering Customer Experience Management. There are certain changes that occur in the basis of change attractiveness and retention capacity on the one hand and decreases negative impacts on the environment, and so this calls for the implementation of Green HR practices. A major study comprising 276 participants affirms the strong link between the performance of CEM and Green HR practices promoting people-oriented initiatives toward sustainable growth. Results of this study offer practical guidance for firms wishing to harness their human resources toward making them environmentally friendly to heighten their efficiency in operations.

Keywords: Circular Economic Models (CEM), Sustainability, Circular Economy, Green HR, Innovation, Resource Efficiency, Organizational Growth

INTRODUCTION

In today's fast pace business environment sustainability has evolved from the periphery to the centre as a driver of innovation and organizational success. The most relevant consequences are the adoption of circular economic models into the business practices of companies, by design they focus on resource efficiency and waste reduction in their applications. Here, the HR department has become very important in this new trend. As part of the basis for people-focused processes that form a template of sustainable business models, it deals with Green HR, which brings sustainability into the fold of HR strategy, and its role in supporting circular economies so as to enhance environmental stewardship and operational efficiency.

The Role of HR in Fostering Circular Economies

Strategic Recruitment and Talent Management

The Human Resources department plays a basic role in the selection process to identify candidates with suitable competencies and to the commitment to sustainability. The human resources department is responsible for ensuring that the workforce shares the sustainability goals of the organization as it prefers candidates whose competencies are relevant to sustainability. According to Kramar (2014), it illustrates the role human resources can play in developing strategies of recruitment in terms of eco-competencies that can convert individuals into assets in the form of a circular economy. Green HR refers to sustainability integration in the strategies and practices of human resource management. Shah et al. (2021) found that integrated organizations in human resource functions for sustainability objectives are better in creating an environment with responsible employees toward environmental protection. Strategic integration through this may help develop a competent committed staff toward ecologically sustainable activity.

Employee Training and Development

Training programmes need to be sustainable for employees to acquire knowledge of environmentally friendly practices. This role is under Human Resources to design the training programs that enhance the knowledge and skills of employees concerning the sustainability of their work. According to Ehnert (2009), quality training in the use of sustainable practice allows the employees to integrate appropriate principles related to these practices into their daily work activities, which in turn encourages an organizational culture that accommodates circular initiatives. In ensuring that CEM achieves its success, there will be a need to hire people with the appropriate knowledge on sustainability. According to Cascio and Montealegre (2016), organizations that concentrate hiring people with eco-competencies apply circular practices more efficiently. Human resources can support newly hired people making positive implications toward the environment through adding inputs of sustainability in job descriptions and hiring activities.

Performance Management Systems

One of the ways that human resources can integrate sustainability into performance management in an organization is through using metrics that measure employees according to their contributions to sustainability objectives. Jackson and Seo discuss the relevance of tying performance measures to sustainable activities as well as rewarding environmentally friendly behaviors and outcomes, especially as detailed in the 2010 research. Linking these measures serves to encourage people but also underscores the organization's commitment to responsible environmental practices. The proper trainings for the employees support the culture of sustainability in business. The display of the eco-competency of personnel can be created through the trainings by focusing on sustainable practices. The training of a relevant and effective program helps individuals more profoundly understand the principles of the circular economy. Businesses strengthen the principles through the deployment of opportunity for employee seminars and courses focused on resource management, trash reduction, and specific recycling techniques. Transparency with metrics in Human Resources can link sustainability with performance management as the former entity gives an easily pursued approach in which the organization applies measurable methods for it to assess its employees and their efforts towards environmental cause. Dumont *et al.* (2017) further stated that Inside the company's door,

**Patcha Bhujanga Rao et al.,**

sustainable practices could be encouraged by rewarding employees who carry out environmentally conscious acts. It thus links employee engagement with the development of organizational performance towards sustainability.

Fostering an Innovative Culture

The Human Resource department is the most significant enabler in building an innovative culture where there is collaboration and creative problem-solving concerning sustainability issues among employees. The Human Resource department can help engender the establishment of creative solutions embracing the circular economy model (CEM) by encouraging a culture of continuous improvement. According to Govindan and Hasanagic, "sustainable supply chain management requires proper assistance from a constructive and supportive corporate culture.". Human resources can individually affect the attitude of an organization's culture for sustainable success in executing the sustainability initiatives. Human resources might encourage the employees to embrace sustainability as a value by making an environment conducive to cooperation, ingenuity, and continuous improvement (Benn et al., 2014). The cultural revolution embedded in this attitude is more useful for the implementation of circular economy principles.

Employee Engagement and Empowerment

Employees are made to feel committed to the organizational goals whenever they are given the opportunity to participate in activities related to sustainability. Human Resources can encourage employees to participate in environmentally friendly initiatives to make them feel responsible for those initiatives. According to Ellen MacArthur Foundation, 2013, everyone working in the company should have an opportunity to participate to make the circular economy principles work effectively and smoothly.

Communication and Change Management

Effective communication is the critical element that ensures there is a change to become sustainable. Human Resource possesses the ability to lead efforts towards clearly communicating to all employees why sustainability and circular economy are essential. Human Resource can help to overcome potential resistance to change while aligning corporate efforts toward common goals through clear communication and demonstration of how sustainability issues benefit the company. Communication plays an essential role in enhancing sustainability goals and motivating the staff to be on board. While implementing change management, the Human Resources may embrace the training of the organization on its sustainability goals as well as how it can also be incorporated in its achievement by the employees. As in Dumont et al., proper communication allows a space for the employees to contribute to achieving the sustainability goals.

Metrics and Evaluation

Human resource management departments need to develop measures that will assist them in evaluating the success of their sustainability projects. That is, the organization needs to measure how much their employees are engaged in implementing environmentally friendly practices and evaluate how the training program has affected the sustainability goals of the organization. Ehnert (2009) believes that the use of metrics can be utilized to understand whether the initiatives by human resources result in creating a more sustainable environment or not and should inform future strategies. Defining metrics can be an effective method to gauge the overall performance of sustainability initiatives. The HR department will track the participation of employees in green-related activities and evaluate the effectiveness training sessions have in the attainment of sustainability objectives. Shah et al. (2021) Defined measures aid in knowing how well human resource management is working to achieve sustainability objectives and help in planning even more effective future strategies.

Theories and Frameworks in Green HR and Circular Economy

Green human resources are supported by numerous theories and conceptual frameworks with their relationship with the circular economy.

**Patcha Bhujanga Rao *et al.*,****Resource-Based View (RBV)**

The Resource-Based View, first suggested by Barney in 1991, emphasizes that businesses can create sustainable competitive advantage through the management of valuable, rare, and distinctive resources. Work such as Hart and Dowell in 2011 has brought to light eco-competencies as strategic advantages. Reinforcing the skills of the employees in sustainable capabilities proves that the organization commits itself not only to sustainable practice and circularity but also sets its eco-competency asset in an increasingly competitive surroundings.

Sustainable HRM Framework

Ehnert (2009) and Kramar (2014) have contributed significantly to the establishment of the Sustainable Human Resource Management Framework since it focuses on the integration of sustainability in HRM practices. In recent studies, however, Jabbour *et al.* (2019) emphasized the need for alignment of human resource policy to the objectives of corporate sustainability. In this regard, an integrated approach assists in achieving a sustainable culture within the workforce on a large scale because the policies concerning HR must be in concert with the environment-friendly larger goals of an organization.

Circular Economy Model (CEM)

In recent sustainability discussions, the Circular Economy Model has gained much interest. Most scholars of present times, like Kirchgeorg *et al.* (2018), state that closed-loop systems need to be developed, where materials are regularly recycled, remanufactured, and reused. The last study by Govindan and Hasanagic (2018) exhibits how human resources could incorporate circularity into the culture of an organization. Human Resources plays an important role in the development of circular economies as they urge the involvement of employees with issues of sustainable development.

Triple Bottom Line (TBL)

The economic, social, and environmental dimensions of organizational performance have been accepted widely in the contexts of the Triple Bottom Line model, because contemporary scholarly work illustrates how human resources promote this balance and emphasizes responsible environmental stewardship mostly through employee welfare issues. This can open a path for companies developing a sustainable and socially conscious operating model.

Institutional Theory

This rediscovered interest in Institutional Theory in the sphere of sustainability attempts to understand the manner in which organisations react to external pressures. New research by Waddock and Googins (2019) reveals that human resources play a crucial role in aligning organizational practices with the statutory, normative, and cultural needs. Aligned to such means improves compliance and brings in a culture favoring sustainability initiatives, which is of high value to companies in dealing and making decisions in such an evolving regulatory framework on matters of sustainability.

Literature Review: Green HR Empowering Circular Economies Through People and Processes

Recently, the sustainability discourse has been very rich in the context of integrating Green Human Resources with Circular Economy Models. More and more businesses have come to realize that sustainable practices are not only ethically imperative but also ensure the long-term sustainability of the business ventures. Green human resource management forms an essential tool for infusing the ideals of ecological sustainability into the culture and practice of the workplace operations. Ehnert (2009) first addressed the sustainability of human resource management wherein this concept discussed the alignment of the functions of human resources with the sustainability objectives. Kramar (2014) extended this idea by explaining how adding sustainability into the HR strategy may add value to company performance. Recent studies also highlighted the strategic importance of human capital towards achieving sustainability goals. According to the Resource-Based View developed by Barney in 1991, human capital could be an important source for competitive advantage. Recent studies such as Jabbour *et al.* (2020) prove that Green HRM practices which support eco-competencies can make employees valuable assets in the course of achieving sustainability.

**Patcha Bhujanga Rao *et al.*,**

A relevant concept that surfaces here is the need for employee engagement. According to the views of Daily and Huang (2001), cultivating the sustainability culture boosts staff commitment, which is critical in the successful achievement of circular economy principles. Under this context, a new study by Dutta *et al.* (2019) shows that green human resource practices encourage collaboration, an essential factor for attainment under sustainability goals. For example, the contribution of training and development in arming employees with the necessary sustainable practices has been overstated. According to Renwick *et al.* (2013), firms that focus on green training programs experience increased employee engagement in sustainability practices. In this regard, training and development is essential to arm employees with necessary sustainable practices. According to Zafar *et al.* (2021) "Education, especially ongoing, transforms them toward their active involvement in sustainability projects". For example, much attention has recently been concentrated on considering how sustainability criteria can be integrated into performance management systems. Several studies conducted by different scholars, such as Govindan and Hasanagic (2018), indicated that the acknowledgment of efforts by employees toward sustainability may significantly increase employee motivation to consider environmental issues in their work. In this respect, a recent study by Jabbour *et al.* (2020) appears to corroborate the mentioned perspective, suggesting that high performance management is likely to enhance employees' involvement in the organisational initiatives aimed at sustainability. However, in this literature, the issues of resisting change and inadequate support of management are considered. In this respect, Jackson *et al.* 2012 and Sharma & Kumar 2018 consider such issues and emphasize the importance of strong organizational commitment to overcome them. Although there are many benefits of Green HR, such practices need to be tested for their effectiveness. Recent research has challenged empirical studies to establish explicit links between green human resource initiatives and organisational performance with regard to the practice of circular economies. The study done shows that Green HR significantly facilitates circular economies through strategic and people-centric practices. Integrate sustainability with a human resource strategy, and then the organization can develop a system that balances input and output, instilling a culture of environmental stewardship within it, thereby aiding in the improvement of the long-term performance of the organization. Problems that are longstanding require further investigation in longitudinal assessments of green human resource practices and what leadership does towards this end, and such would bring out much more valuable insights in how good implementation strategies work. This dynamic climate points towards organizational apparatuses that must continuously innovate themselves, creating a human resource strategy in line with the larger sustainability goals it espouses.

Case Studies in Sustainability and Human Resource Management

During the analysis of the intersection between human resource management (HRM) and sustainability, some businesses have distinguished themselves as pioneers in integrating sustainable practices into their business strategies. These organisations have effectively integrated sustainability into their human resource strategies and corporate cultures, as evidenced by the case studies provided below.

Unilever's Sustainable Living Plan

A Plan for Sustainable Living Initiated by Unilever, 2010 heralded the launch of the Sustainable Living Plan, designed to mitigate the company's environmental footprint while enhancing its societal effect. This initiative integrates corporate culture with sustainability by emphasising sustainable sourcing and waste reduction. The Human Resource Management function significantly contributes to fostering a culture dedicated to sustainability via the execution of specialist training and development programs. The findings suggest a significant correlation between human resource management practices and the outcomes of sustainability programs, indicating that this commitment has enhanced employee morale and boosted productivity (Unilever, 2010).

Interface Inc.

Interface Inc., a global pioneer in modular carpet production, has been committed to sustainability since the 1990s and aimed to have zero negative environmental effect by 2020. A culture of environmental responsibility has emerged due to the company's success in integrating sustainability into its human resource policy and employee engagement strategies. Research has revealed that Interface's commitment to sustainability has led to substantial cost

**Patcha Bhujanga Rao et al.,**

savings and innovation in product design. This illustrates that a robust commitment to sustainability may foster employee loyalty and satisfaction (Interface Inc., 2017).

Patagonia

Patagonia is renowned for its dedication to social responsibility and involvement in the environmental movement. The organisation promotes employee involvement in environmental initiatives by integrating sustainability into its business strategy. Patagonia's commitment to corporate social responsibility (CSR) not only strengthens the company's culture but also enhances employee satisfaction, as seen by this case study. The company's emphasis on employee involvement in environmental initiatives has resulted in notable levels of engagement, underscoring the benefits of aligning corporate principles with employee actions (Patagonia, 2018).

Siemens

Siemens is dedicated to reducing carbon emissions and advancing eco-friendly technologies throughout its operations, having initiated comprehensive sustainability initiatives to realise these objectives. The strategic significance of human resource management in advancing sustainability initiatives is evidenced by the alignment of HR practices with the firm's sustainability objectives. The integration of sustainability into Siemens' business strategy has led to heightened employee engagement and an improved corporate reputation (Siemens AG, 2016). These results illustrate the capacity of human resources to serve as a catalyst for sustainability efforts.

Walmart's Sustainability Index

The Sustainability Index was established by Walmart in 2009 to enhance transparency and reduce the environmental impact across its supply chain. Human resource management will significantly contribute by facilitating staff training on sustainability practices. This program aims to assess the sustainability of products and providers. The results indicate that educating employees on sustainability has led to enhanced operational efficiency and an improved corporate image, demonstrating how human resource management can advance sustainability within an organisation (Walmart, 2009). The case studies of Unilever's Sustainable Living Plan, Interface Inc., Patagonia, Siemens, and Walmart's Sustainability Index illustrate how effective human resource management strategies may enhance sustainability initiatives and increase employee engagement. By integrating sustainability into its core business strategy, Unilever fosters a culture of responsibility that empowers employees to contribute to social and environmental achievements. To promote a circular economy, Interface Inc. urges its employees to engage in innovative sustainability activities. This thus enhances job satisfaction and fosters a favourable reputation for the organisation. Patagonia is dedicated to environmental responsibility across its staff, driven by the company's objectives. The firm promotes its employees to champion sustainable practices, therefore strengthening their commitment to the brand. Siemens prioritises sustainability by offering training and development opportunities to its workers, therefore cultivating a workforce that is knowledgeable and committed to sustainable innovation. The final reason is that Walmart's Sustainability Index promotes employee engagement in supply chain transparency, therefore enhancing the company's image and providing a heightened feeling of purpose. The cumulative impact of these initiatives illustrates that aligning human resource management with sustainability objectives enhances the company's reputation while also fostering employee engagement and commitment to environmental stewardship.

Objectives

1. To examine the influence of Green HR practices on the successful implementation of Circular Economy Models.
2. To explore the role of employee engagement in promoting sustainability within CEM frameworks.
3. To identify the relationship between eco-friendly HR policies and organizational resource efficiency.
4. To assess the impact of Green HR initiatives on employee performance and innovation.
5. To propose strategies for enhancing Green HR to foster circular economies.

**Patcha Bhujanga Rao et al.,****Hypotheses**

1. **H01:** There is no significant relationship between Green HR practices and the implementation of CEM.
2. **H02:** Employee engagement in Green HR initiatives does not significantly influence organizational resource efficiency.
3. **H03:** Eco-friendly HR policies do not significantly impact employee innovation and performance.
4. **H04:** The integration of Green HR into organizational processes has no significant effect on the success of circular initiatives.
5. **H05:** There is no significant correlation between sustainability training programs and the reduction of waste in circular economies.

Primary Study

The baseline study involved 276 respondents cut across several industries and were undertaking sustainability activities. The following section is a summary of the demographic information, which includes gender, age, industry, and organizational status. This content is geared to better understand how demographic characteristics may impact the interpretation of Green HRM practices and CEM results. This information provides critical descriptive insight into the research population. Report: The data was collected through a survey as part of the research report

Key Insights

The survey has nearly equal male to female ratio, so it also holds gender parity, which may reflect gender-related views on green human resource strategies and the same set of concerns regarding sustainability. Analyzing the distribution of ages, it can be judged that there are more people belonging to the 31-40 years age group, thus amounting to 40.6% of the total; 27.2% belong to the age group of 20-30 years. It may be true that younger professionals will exercise more influence in the perception and adoption rates of green human resource management in the organisations due to the overall shifting of the generation towards increased environmental consciousness. The manufacturing sector accounts for 36.9%, followed by services at 32.2%, and information technology at 30.8%. Such vast industrial spread involved in this discussion allows the impact of Green HR across multiple industries to be measured. The largest number of middle-management job people indicates that those persons associated with the organizational decision-making are responsible for judging the green human resource policies. 45.2% of respondents fall in this category.

Data Collection Methods**Questionnaires and Interviews**

Questionnaires and interviews were used to collect data through standardized methodologies. Data collection mostly focused on green human resource practices, which include green recruiting, training, and performance management, and the CEM role these play. The richness of such methods ensures full enlightenment of the role that Green HR plays in organizational sustainability. The questionnaires helped in ascertaining the attitude of the respondents towards green human resources and their relevance to sustainability. Questions would be designed through a five-point Likert scale. Some of the questions would include those towards engagement in environmental-friendly activities and rating of the organization's effectiveness in CEM. The qualitative data obtained from interviews enriched the results drawn from the quantitative setup. The interviews provided a very deep insight into the employees' experience and viewpoint about green human resource strategy. Utilizing mixed methods in this study will enhance the reliability and comprehensiveness of findings on this topic, as it accounts for statistical trends and individuals' perspectives both simultaneously.

Analysis

The detailed analysis of survey results on Green Human Resource (HR) practices, focusing on the perceptions and attitudes of employees across multiple organizations. The analysis covers four key areas: Green Recruitment, Green Training, Green Performance Management, and Overall Perception of Green HR Practices. Data from a Likert-scale questionnaire was used to evaluate the effectiveness and integration of these practices within organizations. The results are presented through tables and interpretations, alongside hypothesis testing and comparative analyses.

**Patcha Bhujanga Rao et al.,**

Overall Perception of Green HR Practices: Mean Average is 3.48, which signifies that all the respondents have a positive general perception about the actions of Green HR in the organization. The lowest mean score came from Green Performance Management with 3.20. It therefore hints at the scope for its improvement in the integration of sustainability to be included in performance measurement. On all dimensions, a great deal of variation was reported in the answers. The smallest variation for Green Performance Management came as only 0.14, suggesting that consensus was greater on the specific issue.

Hypothesis Testing

The data indicate a significant positive association ($p < 0.05$) between Green Recruitment and organisational sustainability. This conclusion confirms that Green Recruitment significantly contributes to the company's sustainability initiatives. Findings of the study show a statistically significant positive correlation between Green Training and resource efficiency at $p < 0.05$ level. The study points out the role training plays in achieving organisational sustainability objectives. This has been reflected in the results, where there has been a significant positive relationship between Green Performance Management and employee creativity, with $p < 0.05$, indicating that incentivising sustainable practices may help enhance innovative behavior on Green HR Practices.

Interpretation

Strong positive correlations suggest that organizations prioritizing Green HR practices are more successful in implementing circular economy initiatives.

The results of mediation research suggest a significant mediation effect of employee engagement on the relationship between green human resource practices and organizational innovation. Employees engaged at work are going to enhance the effectiveness of green human resource efforts.

Findings from Hypothesis Testing**Hypothesis 1 (H1): Green Recruitment has a significant positive effect on organizational sustainability :**

The analysis indicates a coefficient of 0.45 for Green Recruitment, accompanied by a p-value of 0.001. This result confirms a significant positive effect on organizational sustainability.

Hypothesis 2 (H2): Green Training has a significant positive effect on resource efficiency:

The coefficient for Green Training is 0.38, with a p-value of 0.002, demonstrating a significant positive relationship with resource efficiency.

Hypothesis 3 (H3): Green Performance Management has a significant positive effect on employee innovation:

The coefficient for Green Performance Management is 0.30, with a p-value of 0.003. This finding indicates a significant positive effect on employee innovation.

Hypothesis 4 (H4): Employee engagement mediates the relationship between Green HR practices and organizational innovation:

The direct effect is measured at 0.40, while the indirect effect is 0.36, both with p-values less than 0.001. These results confirm that employee engagement significantly mediates the relationship between Green HR practices and organizational innovation.

Hypothesis 5 (H5): There is a significant positive correlation between Green HR practices and CEM success:

The correlation coefficients of 0.78, 0.72, and 0.68 for the respective variables indicate strong positive correlations, affirming a significant relationship between Green HR practices and CEM success.

CONCLUSION

Conclusion The results give strong evidence for all hypotheses that were tested. All the hypotheses have a p-value of less than 0.05, so we accept them separately. Green Recruitment is highly impactful on organizational sustainability initiatives. Green Training has been found to be highly effective at promoting efficiency in resource use. Furthermore, the findings also present the fact that Green Performance Management greatly impacts employee creativity in terms of rewards for environmentally friendly practices. Further, there is an indication from the p-values that the mediation between the variables is significant. This means that employee engagement has a positive effect enhancing the efficacy of green human resource policies on organizational innovation. Such results point to the need to integrate green human resource initiatives into organizational strategies to foster innovation and sustainability.

Implications to Society

It, therefore, shows that Green HR practices enhance sustainability and innovation within firms. This, therefore, yields big time societal benefits. The use of Green Recruitment adds increased dimensions of sustainability to organisations and encourages an eco-friendly workforce. Thus, the workforce can henceforth go a long way in illustrating increased environmental awareness, help in their communities, and developing social change. Green Training maximizes the efficiency of resources utilized to produce a good or service, thereby reducing waste and conserving resources. Improved operational methodologies can reduce footprints, which indirectly support the society by giving it a healthy environment. Green Performance Management also promotes sustainable innovation. In this case, the organization rewards employees for their environmentally friendly behaviors, encouraging creative solutions that are ecological and facilitating improved technologies and practices that benefit the interest of society. Finally, because employee engagement mediates these processes, a culture of involvement and commitment can enhance Green HR practices. An engaged employee tends to advocate for sustainability both within and beyond their organizations, thus leading to a greener future. Green HR practices improve organizations and society by encouraging a culture of sustainability that can strengthen environmental health and community resilience.

Future studies

Some other themes to be studied on Green HR practices in relation to sustainability and performance at the organizational level include: Longitudinal studies can provide a more potent uncovering of how the cumulative effects of Green HR activities take place over time to foster an in-depth appreciation of how such efforts might affect organizational culture as well as environmental consequence over a prolonged duration. Besides these, further research will be conducted by considering more industries and different geographic locations to give value to the findings based on applicability. Comparative analysis among sectors could disclose certain particular problems and best practices unique to other contexts, helpful in formulating sector-specific strategies for effective implementation of Green HR practice. Relations involving technology and Green Human Resource Management could be studied in future. Assessing the impact of digital tools and data analytics application on improving Green HR metrics such as hiring, training, and performance management may introduce some new ideas.

ABSTRACT

Solid lipid nanoparticles (SLNs) present a modern approach to overcome limitations in conventional drug delivery by facilitating controlled release, enhanced absorption, and improved bioavailability. With applications across both pharmaceuticals and nutraceuticals, SLNs stand out as transformative technology in these fields. Encapsulating bioactive herbal compounds within SLNs can notably boost their therapeutic effects, leading to more effective treatments. This review provides a comprehensive overview of SLN technology, focusing on its benefits and various preparation techniques, such as high-pressure homogenization, solvent evaporation, ultrasonication, microemulsion, solvent injection, double emulsion, and spray drying. It also examines essential methods for evaluating and characterizing SLNs and explores encapsulated molecules, including natural biomolecules, emphasizing the potential of SLNs to advance herbal medicine. The integration of SLN technology into product formulations opens new avenues for developing efficient, reliable, and clinically potent therapies. In summary, solid lipid nanoparticles represent a significant breakthrough in encapsulating and delivering bioactive substances, promising considerable advancements in pharmaceutical including herbal and nutraceutical development.

Keywords: Bioavailability, Controlled release, Homogenization, Solvent evaporation, Ultrasonication, Microemulsion.

INTRODUCTION

Solid lipid nanoparticles are submicron-sized particles composed of biocompatible and biodegradable lipids, which encapsulate active pharmaceutical ingredients, enhancing their delivery and effectiveness [1]. Developed in the early 1990s, SLNs have been regarded as promising drug carrier systems, particularly for providing a sustained release profile to incorporated active substances [2]. SLNs have become a hot topic in drug research due to their unique properties and potential to overcome limitations of conventional drug delivery methods. Here's a deeper dive into their significance in the current research landscape: They offer numerous advantages, including improved bioavailability, controlled release, and enhanced stability of therapeutic agents [3]. Solid lipid nanoparticles are nanoparticles mean diameter ranging approximately between 50 and 1000 nm by photon correlation spectroscopy (PCS). The general ingredients of SLNs include solid lipid, surfactant and water. The term lipid here is broadly defined and encompasses triglycerides (e.g., tristearin), partial glycerides, fatty acids (e.g., stearic acid), steroids (e.g., cholesterol), and waxes (e.g., cetyl palmitate). Various classes of surfactants, irrespective of charge and molecular weight, have been utilized to stabilize the lipid dispersion. SLNs offer better biocompatibility, because they are composed of lipids similar to physiological ones, resulting in reduced toxicity. Furthermore, SLNs are physico-chemically stable, easily producible on a large industrial scale, and have relatively low raw material and production costs [2]. This review delves into the current status of SLN technology in drug research, discussing their design, preparation, characterization, and application across various therapeutic areas. Herbal medicines have been a cornerstone of healthcare for centuries. However, the clinical efficacy of many herbal ingredients is often limited by poor solubility, stability, and bioavailability. Traditionally, herbal medicines have been formulated as tablets, capsules, and decoctions; however, these methods have not succeeded in enhancing the bioavailability of these medicines. Excitingly, nanotechnology has made significant progress in boosting the effectiveness of herbal medicines and overcoming biological barriers by improving their bioavailability [4]. Solid lipid nanoparticles provide a promising solution to these challenges, enhancing the delivery and therapeutic efficacy of herbal products. This review explores the advantages of SLN technology in the formulation of herbal products, highlighting its potential to revolutionize the field of herbal medicine.

Key advantages of SLNs

Biocompatibility and Biodegradability: SLNs are composed of lipids that are both biocompatible and biodegradable, ensuring no bio toxicity.

Organic Solvent-Free Production: SLNs can be produced without the use of organic solvents. So the chances of toxicity is minimised.

Controlled and Targeted Drug Delivery: SLNs facilitate both drug targeting and controlled drug release.

Enhanced Stability of Active Compounds: Incorporating active compounds into SLNs enhances their stability.

Encapsulation Versatility: SLNs can encapsulate both lipophilic and hydrophilic drugs.

Scalable Production: SLNs can be easily produced on a large scale.

Sterilization Capability: SLNs can be sterilized effectively [5]

Limitations of SLNs

Limited Drug Loading Capacity with Crystalline Lipids: The incorporation of crystalline lipids can restrict the amount of drug that can be loaded into SLNs.

Risk of Drug Leakage from Lipid Structures: Certain crystalline lipid modifications, particularly β -modifications, may lead to the leakage of encapsulated drugs.

Gelation During Storage: Over time, SLNs may transition to a gel-like state, potentially impacting their stability and usability.

Sree Janardhanan *et al.*,

Stability Issues from High Water Content: The presence of high water content (70–90%) in SLNs can create stability challenges.

Factors Affecting Drug Loading: The efficiency of drug loading into SLNs is influenced by various factors, including the interaction between the drug and the lipid matrix, the characteristics of the lipid used, and the solubility and distribution of the drug within the lipid [6].

Design

Structure and Composition: SLNs are typically composed of solid lipid cores stabilized by surfactants. The core can be made from a variety of lipids, such as triglycerides, partial glycerides, fatty acids, steroids, and waxes. The surfactants, which can be ionic or nonionic, stabilize the lipid core and prevent agglomeration [7].

Preparation of Solid Lipid Nanoparticles

The preparation of solid lipid nanoparticles (SLNs) involves several fundamental principles aimed at producing stable, biocompatible, and efficient drug delivery systems. These principles include the selection of appropriate lipid materials, surfactants, and preparation methods.

Selection of Lipid Materials

The core material for SLNs is typically composed of solid lipids that are biocompatible and biodegradable. These can include: Glycerylbehenate (Compritol), Glycerylpalmitostearate (Precirol), Stearic acid, Palmitic acid, Triglycerides [8].

Criteria for Lipid Selection

The selection of a solid lipid or lipid blend relevant to SLN generally depends on several factors:

- Solubility
- The ability to produce particles in the submicron range
- Biodegradability
- Biocompatibility
- Adequate drug carrying capacity
- Storage stability [2].

Selection of Surfactants

These are crucial for stabilizing the SLNs and preventing aggregation [9]. Common surfactants include: Polysorbates (e.g., Tween 80), Polyethylene glycols (PEG), Phospholipids (e.g., lecithin), Bile salts (e.g., sodium cholate) [10].

Criteria for Surfactant Selection

- Biocompatibility and low toxicity
- Ability to reduce interfacial tension between lipid and aqueous phases.
- Compatibility with the drug and lipid matrix [11].

SLN PREPARATION METHODS

Precursors

Emulsions serve as precursors for solid lipid particle preparation because lipids, which are solid at room temperature, can be heated 5-10 °C above their melting point to become liquid. This liquid lipid is then emulsified with water at the same temperature. The resulting hot emulsion is cooled to room temperature, causing the droplets to solidify into solid lipid particles. The size of the hot emulsion droplets determines whether nano- or microparticles are formed. Solid lipid nanoparticles (SLNs) can be produced from hot O/W nanoemulsions (with droplet sizes less than 1 µm) using the hot homogenization technique. This technique can be performed using various methods, including high-pressure homogenization, high-shear homogenization, and ultrasound homogenization [2].

High-Pressure Homogenization (HPH): This technique produces submicron particles through high shear stress and cavitation by forcing liquids at pressures between 100 and 2,000 bar through a narrow gap, causing the fluid to move rapidly over a short distance. This process can transform even high lipid concentrations into nanodispersions. SLNs can be produced using both hot and cold homogenization techniques, each starting with a preparatory step [9].

Hot Homogenization: In hot homogenization, temperatures above the lipid's melting point are used, making it similar to emulsification. An aqueous surfactant combines with the lipid and drug at the same elevated temperature. A high shear mixing device prepares a hot pre-emulsion, creating an oil-in-water type emulsion. This emulsion is then cooled, initiating lipid crystallization and forming SLNs. To produce optimal SLNs, 3-5 cycles of homogenization at pressures between 500 and 1,500 bar are required [12]. High-pressure homogenization is one of the most widely used methods for the preparation of SLNs.

Cold Homogenization: Cold homogenization was developed to overcome the significant drawbacks of the hot homogenization method, which include drug degradation due to high temperatures, drug distribution into the aqueous medium, and the complex process of nanoemulsion crystallization that leads to multiple changes and/or supercooled melts. Cold homogenization technology (CHT) helps prevent or reduce lipid melting, thereby limiting the degradation of hydrophilic drugs during the aqueous process. In cold high-pressure homogenization (HPH), the drug is first dissolved in molten lipids and then the mixture is rapidly cooled using liquid nitrogen or ice. This quick cooling allows for a homogeneous dispersion of the drug within the lipid matrix. The resulting lipid-drug mixtures are ground to a particle size (PS) of 50–100 μm using a ball mill or mortar. These lipid microparticles are then suspended in surfactant-containing cold aqueous solutions and further homogenized at cold temperatures (e.g., 0–4 $^{\circ}\text{C}$) typically over 5–10 cycles at 500 bar [13].

Microemulsions and SLN Production

Microemulsions come in three basic types: direct (O/W), reversed (W/O), and multiple (W/O/W and O/W/O). Hot microemulsions can serve as templates for solid lipid nanoparticle production. In this method, the oil phase consists of a solid lipid, liquefied above its melting point. SLNs can be produced by either diluting the hot microemulsion in cold water (microemulsion dilution technique) or simply cooling the hot microemulsion (microemulsion cooling technique). Due to their exceptional solubilization properties, microemulsions are increasingly recognized as potential drug delivery systems for active pharmaceutical ingredients (APIs) with poor water solubility. Furthermore, the excellent solubilization capacity of hot microemulsion precursors allows for effective drug loading within SLNs, particularly for drugs with poor water solubility [2].

Solvent Emulsification-Evaporation Method: The solvent emulsification-evaporation method, uses water-immiscible organic solvents like chloroform, cyclohexane, dichloromethane, and toluene to make solid lipid nanoparticles.

- Dissolving:** The drug and lipids are dissolved in an organic solvent or a mix of solvents.
- Emulsifying:** This solution is then mixed into an aqueous phase to create a dispersion of tiny particles.
- Evaporating:** The organic solvent is evaporated by mechanical stirring or using a rotary evaporator, causing the lipids to precipitate and form SLNs [14].

Solvent Emulsification-Diffusion Method: This method uses organic solvents that partially mix with water, such as methyl acetate, ethyl acetate, isopropyl acetate, benzyl alcohol, and butyl lactate.

Steps:

- Saturation:** The organic solvent and water are mutually saturated to reach thermodynamic equilibrium.
- Dissolution:** Lipids and drugs are dissolved in the water-saturated solvent.
- Emulsification:** This solution is emulsified in water containing a stabilizer, forming an oil-in-water (o/w) emulsion.

- d) **Dilution:** The emulsion is diluted with water (1:5 to 1:10 ratio), allowing the solvent to diffuse into the continuous phase.
- e) **Formation:** SLNs form as lipids precipitate. The solvent is removed by lyophilization or vacuum distillation [14].

Supercritical Fluid Extraction of Emulsions (SFEE): SFEE is a method to produce lipid nanosuspensions by extracting the organic solvent from oil-in-water (O/W) emulsions using supercritical fluids.

- a) **Preparation:** An O/W emulsion is created by dissolving lipid and drug in a volatile solvent like chloroform. This solution is then mixed into an aqueous phase containing a surfactant and passed through a high-pressure homogenizer to form fine emulsions with droplet sizes between 30–100 nm.
- b) **Extraction:** The O/W emulsions are fed into an extraction column from the top while supercritical CO₂, maintained at a constant pressure of 80 bar and a temperature of 35°C, is introduced from the bottom in a counter-current flow.
- c) **Process Conditions:** The pressure and temperature are carefully controlled to minimize the loss of lipids and drugs into the CO₂ phase while maximizing extraction efficiency. The entire process takes about two minutes, during which pure aqueous suspensions of SLNs are continuously collected from the bottom of the column.
- d) **Mechanism:** As the emulsion enters the supercritical CO₂ phase, the solvent is extracted into the CO₂, and CO₂ simultaneously enters the emulsion droplets. This causes the organic phase to expand, leading to the precipitation of the lipid-drug material as composite particles [2].

Spray Drying Method: The spray drying method is a cost-effective alternative to lyophilization for converting an aqueous SLN dispersion into a drug product. However, it can cause particle aggregation due to high temperatures, shear forces, and partial melting of particles [15].

Membrane Contactor Method: The membrane contactor technique is ideal for large-scale production of lipid nanoparticles due to its excellent scalability. It uses a straightforward apparatus to prepare solid lipid nanoparticles (SLNs) and allows for particle size control by carefully selecting process parameters like temperature and pressure.

Process Overview

- a) **Preparation:** The lipid phase, containing the drug, is melted, and the aqueous phase contains the surfactant.
- b) **Permeation:** The melted lipid phase is forced through a porous membrane under pressure, forming nanosized droplets.
- c) **Flow:** The aqueous phase flows tangentially within the membrane module, sweeping away the formed particles.
- d) **Solidification:** The aqueous phase is kept at the lipid melting temperature. SLNs form when the mixture is cooled to room temperature or maintained in a thermostatic bath [16].

Double Emulsion Method: The double emulsion method is used to produce SLNs for hydrophilic drugs and biomolecules like peptides and proteins. It's commonly used to incorporate insulin into SLNs.

Process Overview

- a. **First Emulsion:** Dissolve the drug and a stabilizer in an aqueous solution, then emulsify this mixture in a water-immiscible organic phase containing lipids or molten lipids.
- b. **Second Emulsion:** Disperse the primary water/oil (w/o) emulsion in an aqueous phase with a hydrophilic emulsifier to create a water/oil/water (w/o/w) emulsion.
- c. **Formation:** SLNs and NLCs form as the solvent evaporates, leading to lipid precipitation. The stabilizer helps prevent the drug from partitioning into the external water phase during this process [14].

High-Speed Stirring and Ultra-Sonication Methods: High-speed stirring (high-shear homogenization) and ultra-sonication are commonly used techniques for dispersing and producing SLNs. These methods are popular because they are simple and cost-effective.

Sree Janardhanan et al.,

Process:

a. High-Speed Stirring

- i. Lipids are melted above their melting points.
- ii. Drugs are dissolved or dispersed in the molten lipids.
- iii. An aqueous phase with surfactants (at the same temperature) is added to the drug-lipid mix.
- iv. The mixture is dispersed using a high-shear mixer, creating a hot oil/water (o/w) emulsion.
- v. SLNs form when the emulsion is cooled.

b. Ultra-Sonication:

- i. This process follows high-speed stirring and involves using sound waves to break droplets by forming, growing, and collapsing bubbles.
- ii. When used alone, ultra-sonication can result in a broad particle size distribution because the energy is not evenly transferred.
- iii. There are two main sonication techniques for lipid dispersion:
 - i. **Probe-Tip Sonication:**
 - o Requires high energy for lipid dispersion.
 - o The sonicator probe's tip can cause a local temperature increase, so the reaction vessel should be immersed in a water or ice bath to control the temperature.
 - o Up to 5% of the lipids can deesterify during sonication (up to 1 hour).
 - ii. **Bath Sonication:**
 - o Temperature control is easier compared to probe-tip sonication.
 - o The sonicated SLNs can be kept in a sterile vessel, separate from the probe, or in an inert atmosphere.
- c. **Combined Use:** High-speed stirring and ultra-sonication are often combined to produce SLNs with narrow particle size distributions.

Advantages: Easy to handle and do not require organic solvents. Suitable for widespread use.

Disadvantages: Potential metal contamination from ultra-sonication probes (can be mitigated by using bath sonication). Requires high surfactant concentrations while maintaining low total lipid concentrations [14,16,17].

Stabilization And Storage

Ensuring the SLNs remain stable over time by optimizing surfactant concentration, lipid composition, and storage conditions. SLNs should be stored at controlled temperatures to prevent aggregation and maintain their integrity.

Evaluation - Characterization of SLNS

Particle Size and Distribution

The size and distribution of SLNs are critical parameters influencing their biodistribution, cellular uptake, and drug release profile. Dynamic light scattering (DLS) and transmission electron microscopy (TEM) are commonly used for size characterization [19].

Surface Morphology and Electron Microscopy

Electron Microscopy (EM): EM techniques determine the overall morphology of nanoparticles. These techniques are crucial in pharmaceuticals for drug release modulation and targeting [15].

Scanning Electron Microscopy (SEM)

Process: Nanoparticles are dried into powder, sprinkled on a sample holder, and coated with a conductive metal (like gold or platinum) using a sputter coater.

Mechanism

A high-energy electron beam is used to produce signals from the sample surface, generating images such as X-ray maps, backscattered electron images, and secondary electron images. Electron rays can damage particles, so the sample must withstand vacuum conditions.

Advancements

Environmental SEM (ESEM) allows scanning samples in their natural state without modification, using a low-pressure gaseous environment and eliminating the need for conductive coatings. Field Emission SEM (FESEM) was used to determine the surface morphology of nanoparticles [19-20].

Transmission Electron Microscopy (TEM)

Process: Uses electrons transmitted through the sample to form images, providing higher resolution than SEM.

Capabilities: Can study nanoparticles' morphology and chemical information at atomic dimensions (<1 nm).

Mechanism: An electron beam passes through a thin sample foil, creating images based on unscattered and scattered electrons. The image's resolution depends on the distance ratio between the objective lens and the specimen. High-level vacuum and thin specimen sections are needed. Samples are prepared with a negative staining solution (e.g., phosphotungstic acid) and dried under a mercury lamp.

Uses: High-resolution TEM can analyze local microstructures, such as lattice fringes and defects, at an atomic scale [21].

Surface Charge (Zeta Potential)

Zeta potential helps predict how stable a nanodispersion will be. A high zeta potential means the nanoparticles repel each other strongly, preventing them from clumping together. Conversely, a low zeta potential means attraction between particles outweighs repulsion, leading to clumping. Generally, a zeta potential above 30 mV is considered good for stabilizing a nanodispersion [22-23].

Drug Loading and Encapsulation Efficiency: Drug encapsulation efficiency (EE) is crucial for evaluating how well a drug is encapsulated. It is calculated using the formula:

$$EE\% = \frac{\text{Amount of entrapped drug}}{\text{Amount of total drug}} \times 100$$

To determine the encapsulated drug amount, UV-vis spectrometry or high-performance liquid chromatography (HPLC) is commonly used. A dialysis membrane can remove unencapsulated drugs, or ultracentrifuging can separate them. There are two main methods to measure EE: the direct method measures the drug in the nanoparticles directly, while the indirect method measures the unencapsulated drug in the supernatant and calculates EE. The direct method is better for lipophilic drugs, and the indirect method is better for hydrophilic drugs. A high EE is desirable for drug delivery. Several factors affect EE, including the type, composition, and crystallinity of lipid materials, and drug solubility in both organic and aqueous phases [18,24].

In vitro Release Studies

It assesses the drug release profile from SLNs under simulated physiological conditions. These studies help predict the in vivo performance of the nanoparticles and are typically conducted using dialysis methods or diffusion cells [25-26].

Encapsulation of Different Molecules In SLNs

Solid Lipid Nanoparticles (SLNs) are a versatile drug delivery system that can be used to encapsulate a wide range of molecules, including synthetic drugs, peptides, proteins, nucleic acids and herbal drugs. SLNs can improve the solubility, stability, and bioavailability of these molecules. Here are some examples of molecules that have been encapsulated using SLN techniques:

**Synthetic Drugs**

SLNs have been used to encapsulate various types of drug molecules, including Anticancer drugs: Paclitaxel, Doxorubicin, Camptothecin [27-29]. Antifungal agents: Itraconazole, Fluconazole [30-31], Anti-inflammatory drugs: Ibuprofen, Celecoxib [32-33], Antiviral drugs: Acyclovir, Zidovudine [35], Anti-hypertensive drugs: Amlodipine, Valsartan, etc [36].

Peptides and Proteins

SLNs can help stabilize and deliver delicate peptides and proteins. Examples include: Insulin [37], Growth factors: Insulin-like growth factor-1 (IGF-1), transforming growth factor-beta (TGF- β) [38], Antibodies and antibody fragments [39].

Nucleic Acids

SLNs can be used for the delivery of nucleic acids, such as: Small interfering RNA (siRNA) [40], Plasmid DNA [41], Antisense oligonucleotides [42].

Vitamins and Nutraceuticals

SLNs can encapsulate various vitamins and nutraceuticals, including: Vitamin D [43], Coenzyme Q10 (CoQ10) [44].

Cosmetics: SLNs can also be used in cosmetic formulations to encapsulate cosmetic actives for skin care products, hair care products, and more [45].

SLN encapsulate Herbal formulations

Solid lipid nanoparticles have been used to encapsulate various herbal extracts for improved delivery and bioavailability. Here is a list of some herbal extracts that have been loaded into SLNs:

1. **Curcumin:** Curcumin, the active compound in turmeric, has been encapsulated in SLNs to enhance its stability and bioavailability [46].
2. **Resveratrol:** Resveratrol, found in grapes is known for its antioxidant properties and has been loaded into SLNs for better delivery [34].
3. **Quercetin:** Quercetin, a flavonoid present in various fruits and vegetables, has been incorporated into SLNs to improve its solubility and absorption [47].
4. **Ginkgo biloba:** Extracts from Ginkgo biloba leaves, which are used for cognitive health, have been encapsulated in SLNs for controlled release [48].
5. **Ginseng Extract:** Ginsenosides from ginseng, known for their adaptogenic properties, have been encapsulated in SLNs for enhanced bioavailability [49].
6. **Milk Thistle Extract:** Silymarin, extracted from milk thistle seeds and used for liver health, has been loaded into SLNs for improved delivery [50].
7. **Aloe Vera Extract:** Aloe vera gel extracts have been incorporated into SLNs for topical applications, such as skincare products [51].
8. **Ashwagandha Extract:** Withanolides from ashwagandha, an adaptogenic herb, have been encapsulated in SLNs for improved bioavailability [52].
9. **Ginger Extract:** Gingerol compounds from ginger have been loaded into SLNs for controlled release and targeted delivery [53].
10. **Bilberry Extract:** Anthocyanins from bilberry, used for eye health, have been encapsulated in SLNs for improved stability [54].
11. **Echinacea Extract:** Active compounds from Echinacea plants, known for their immune-boosting properties, have been incorporated into SLNs [55].
12. **Garlic Extract:** Allicin, the active compound in garlic, has been loaded into SLNs for improved delivery and reduced odour [56].
13. **Saw Palmetto Extract:** Extracts from saw palmetto berries, used for prostate health, have been encapsulated in SLNs [57].

DISCUSSION

Solid lipid nanoparticles offer a promising platform for the encapsulation and delivery of Pharmaceutical and herbal extracts, enhancing their stability, bioavailability, and therapeutic efficacy. The encapsulation of various herbal compounds within SLNs has been extensively explored, demonstrating the versatility and potential of this drug delivery system.

Enhanced Stability and Bioavailability:

Encapsulation of herbal extracts such as curcumin, resveratrol, and quercetin in SLNs has been shown to improve their stability and bioavailability. This is crucial for maximizing the therapeutic effects of these compounds, which are often limited by poor solubility and low absorption rates.

Controlled Release and Targeted Delivery:

SLNs offer the advantage of controlled release, allowing for sustained delivery of herbal compounds over time. Additionally, the ability to modify SLNs with targeting ligands enables the selective delivery of these compounds to specific tissues or cells, enhancing therapeutic outcomes while minimizing side effects. For example, ginger has been encapsulated in SLNs to achieve controlled and targeted drug delivery.

Diverse Applications:

The encapsulation of herbal extracts in SLNs has enabled diverse applications, ranging from oral supplements to topical formulations. For example, SLNs loaded with aloe vera gel extracts have been used in skincare products for their moisturizing and anti-inflammatory properties, while SLNs containing adaptogenic herbs like ashwagandha have been explored for stress management and cognitive health.

Potential Synergistic Effects:

Combining multiple herbal extracts within SLNs may lead to synergistic effects, enhancing the overall therapeutic potential of the formulation. For instance, formulations containing ginseng and ginkgo biloba extracts could synergistically improve cognitive function and memory retention.

CONCLUSION

Solid lipid nanoparticles represent a transformative approach in the delivery of several of pharmaceutical formulations offering solutions to the longstanding issues of poor solubility, stability, and bioavailability. The advantages of SLN technology enhanced bioavailability, controlled release, improved stability, biocompatibility, targeted delivery, and enhanced therapeutic efficacy make it a valuable tool in the development of effective formulations. With ongoing advancements in preparation techniques and a growing understanding of their interactions with biological systems, SLNs hold immense potential to enhance the efficacy of synthetic and herbal medicines by expand their therapeutic applications. Future research and development efforts should aim at overcoming the current challenges and exploring new frontiers in SLN technology for herbal product delivery.

ABSTRACT

This research aims to investigate the energy consumption patterns and the economic impact of cooking fuel usage in rural households of Madurai district. The study will assess the current status of lighting equipment and the penetration of electrical appliances in these households. By analyzing the factors influencing energy consumption and the economic burden associated with cooking fuel, the research seeks to identify potential strategies for energy efficiency and sustainable energy solutions. The findings will contribute to developing targeted interventions to reduce energy consumption, improve household finances, and promote environmental sustainability in rural Madurai.

Keywords: Rural Energy Consumption, Energy Efficiency, Cooking Fuel, Economic Impact, Sustainable Energy.

INTRODUCTION

Energy, the lifeblood of modern civilization, is essential for driving economic growth, improving living standards, and powering technological advancements. It is the capacity to perform work, whether in the form of radiation, heat, or motion. While humanity cannot create energy, we can harness and transform it from one form to another. However, this transformation is contingent upon the presence of matter. Energy, a fundamental resource, is indispensable for various human activities, including heating, cooling, lighting, cooking, industrial production, and transportation. It has become an integral part of daily life and plays a crucial role in the social and economic progress of nations. Despite its significance, the environmental, social, and economic impacts of energy consumption are often

Rajeswari and Karthikeyan

overlooked. Energy consumption, particularly in rural areas, has increased significantly with the growing reliance on energy-intensive appliances and devices. Rural households in Madurai, like many other regions, face substantial energy expenditure. This research aims to investigate the impact of energy consumption on these households, quantifying the economic burden associated with different energy uses. By understanding the current energy consumption patterns, we can identify potential areas for reduction and explore strategies to promote energy efficiency and sustainability in rural communities.

Review of Literature

Kablan's (2004) study utilized the Analytic Hierarchy Process (AHP) to prioritize energy conservation policy instruments in Jordan. The findings suggest that Regulation and Legislation (RL) is the most promising policy, followed by Fiscal and Financial Incentives (FFI), Pricing Policy (PP), and Training, Education, and Qualification (TEQ). RL was prioritized due to its potential to compel energy-intensive entities to adopt efficient practices. FFI was seen as a motivator for implementing energy conservation programs. While PP can rationalize energy use, it may negatively impact certain industries. TEQ, although beneficial, might not be fully utilized without strong incentives or regulations. R&D was ranked lowest due to resource constraints. Rajmohan and Weerahewa (2007) examined household energy consumption patterns across urban, rural, and estate sectors in Sri Lanka over time and income groups. The study tested the energy ladder hypothesis and estimated Engel functions using consumer finance and socioeconomic survey data from 1978-79 to 2003-04. The findings revealed that the energy ladder hypothesis holds true for Sri Lanka, indicating a shift towards modern fuels like LPG and electricity. Urban areas demonstrated a faster transition compared to rural areas. Budget elasticity analysis showed negative values for firewood and kerosene in urban and estate sectors, classifying them as inferior goods. Conversely, LPG and electricity exhibited positive budget elasticities, indicating their status as normal goods.

Objective

- To evaluate the penetration of electrical appliances in rural households.
- To assess the current status of lighting equipment usage in rural households.
- To analyse the Economic Impact of Cooking Fuel Consumption in Rural Areas.

METHODOLOGY

To understand current energy consumption patterns and identify key factors influencing them, a combination of primary and secondary data was utilized. The purpose and need for the study were explained to respondents to build trust and encourage their participation in providing necessary information. Personal interviews and unbiased observations were employed as the most suitable methods to establish rapport with respondents and collect the required data. Secondary data, such as the number of households in the study area, was obtained from the District Statistical Handbook of Madurai District. To calculate energy consumption in kWh the following formulae is used

$$\text{Energy Consumption by kWh} = \frac{\text{Number of Equipments} \times \text{Hours Usage} \times \text{Watts per Equipment}}{1000}$$

RESULTS AND DISCUSSION

This section delves into the economic impact of electrical appliance usage, lighting equipment, and cooking fuel consumption in rural households within the Madurai district. Table 1 presents the types of home appliances employed by households in the study area, along with their corresponding electricity consumption in both real and monetary terms. This table aims to assess the penetration of electrical appliances in rural households. It is understood from Table 1 that the electricity consumed by the 320 rural households using different home appliances is 742.10 units per day. Of this, the major share is taken by fans and TVs. Fans consume 262.15 units of electricity per day, while TVs consume 196.24 units. Next come grinders (64.15 units) and mixers (56.45 units). It is estimated that the

**Rajeswari and Karthikeyan**

amount spent per day on home appliances by the selected rural households is Rs. 1110.15, which translates to an annual expenditure of Rs. 405,204.75. This part discusses how the increased use of electrical equipment leads to higher electricity consumption. Table 2 presents the types of lighting equipment used by rural households in the study area and the corresponding energy consumption in both real and monetary terms. It is observed from Table 2 that, in the rural areas per day electricity consumption for lighting purposes alone by using different equipments is estimated as 234.99 units. Out of these 139.45 units are due to using incandescent lamps and 86.24 units are by using tube lights. The usage of CFLs and LED bulbs are lesser in rural areas. By monetary terms, 320 rural households using different lighting equipment consume Rs. 345.81 worth of electricity per day. This translates to a bi-monthly expenditure of Rs. 20,780.25 (per reading). Annually, these rural households spend Rs. 124,681.01 on electricity for lighting purposes. Given that most rural households rely on incandescent lamps and tube lights, which are less energy-efficient, this contributes to higher electricity consumption. To mitigate this issue, it is imperative to encourage the adoption of CFLs and LEDs, which can significantly reduce electricity consumption in both real and monetary terms. To determine the differences in cooking fuel needs between rural and urban households, the researcher aimed to identify and estimate these needs in both real and monetary terms. The results are presented in Table 3. It is evident from Table 3 that the major types of fuel consumed by the rural households for cooking is firewood and agricultural residue/waste, kerosene and LPG. Among these three, the usage of firewood and agricultural residue/waste plays a vital role. The majority of the rural people use firewood and agricultural residue/waste as cooking fuel. It is due to easy availability and low cost and sometimes free of cost. But they don't have the knowledge of internal smoke and its ill effects. The per day consumption of firewood and agricultural residue/waste is 549.61 kg. If we convert the value into monetary term, it is Rs. 2686.00 per day, Rs.161160.00 per month and Rs.980390 per year. The next dominant fuel used by the households for cooking is kerosene. The rural households use 72.61 litre of kerosene and its value is Rs.993.85 per day. Annually the rural households spent Rs.362755.25 for kerosene. For kerosene the people depend on ration shops because the price of kerosene in the open market is very high. LPG consumption in the rural area is low. The LPG consumption made for cooking purpose is 26.35 kg. per day. The money spent on it per day is Rs.1342.16 and per annum is Rs.49888.40 and so for cooking alone the rural sample households spent Rs.1833033.65 per annum totally.

CONCLUSION

The research undertaken to assess the energy consumption patterns and economic impact in rural households of Madurai district has yielded valuable insights. The study highlights the significant reliance on traditional fuels like firewood and agricultural residues, along with increasing dependence on electricity for lighting and appliance usage. The analysis revealed that a substantial portion of household expenditure is directed towards energy consumption, particularly for cooking and lighting purposes. This economic burden underscores the need for efficient energy utilization and the exploration of alternative, sustainable energy sources. The study has identified key factors influencing energy consumption patterns, including household size, income levels, and access to modern energy services. The findings emphasize the potential for energy efficiency improvements through the adoption of energy-efficient technologies, such as LED lighting, energy-efficient appliances, and improved cookstoves.

To promote sustainable energy practices, the following recommendations are proposed:

1. Policy Interventions:

- Implement supportive policies and incentives to promote the adoption of renewable energy technologies.
- Strengthen the rural electrification program to ensure reliable and affordable electricity access.
- Enact stringent regulations to control the use of polluting fuels and promote clean energy alternatives.

2. Awareness and Capacity Building:

- Conduct awareness campaigns to educate rural households about energy conservation and efficient energy use.
- Organize training programs to empower households to make informed decisions about energy choices.
- Facilitate skill development in the installation and maintenance of renewable energy systems.

Rajeswari and Karthikeyan

3. Financial Support

○ Provide subsidies and concessional loans to encourage the adoption of energy-efficient technologies and renewable energy systems.

○ Establish microfinance schemes to enable rural households to invest in energy-saving measures.

By implementing these recommendations, it is possible to reduce energy consumption, mitigate environmental impacts, and improve the overall well-being of rural households in Madurai district. Continued research and monitoring are essential to assess the effectiveness of these interventions and to adapt strategies to evolving needs and technological advancements.

ABSTRACT

The annual herbaceous plant *Colocasia esculenta* (L) Schott (Family: Araceae) has an extended past of utilization in old-style medication in many nations, particularly in tropical and subtropical areas. Aravi, Alukam, Kesavedantu, and Chamadumpa are some of its Indian names. The traditional Indian food system uses the plant's corm and leaves extensively as vegetables. The herb's medicinal properties, known since antiquity, have been utilised to treat numerous disorders like asthma, internal haemorrhages, arthritis, diarrhoea, nervous diseases, and issues with skin. Baldness and bodily aches are two common conditions treated with the juice of the *Colocasia esculenta* corm. The delicate roots and leaves are rich in vitamin C and carbohydrates. The components of this material are flavones, calcium, phosphorus, thiamine, riboflavin, niacin, lutein, apigenin, sapotoxin, and calcium oxalate. Phytochemical analysis also confirms the presence of alkaloids, saponins, terpenoids, oxalates, glycosides, phenols and flavonoids. *Colocasia esculenta* extracts include the pharmacologically active phytochemicals, flavonoids and triterpenoids, which are present in the plant's leaves and stems. This study focuses on the current phytopharmacological profile of *Colocasia esculenta* (L.) Schott. It includes antihepatotoxic, antimicrobial, antioxidant, antibacterial, anti-cancer, antifungal, hypolipidemic, anthelmintic, anti-inflammatory, and neuropharmacological properties. Future research should concentrate on *Colocasia esculenta* (L) Schott pharmacological properties, phytochemistry, clinical trials, and pharmacokinetics to maximise the species' therapeutic potential. To ensure that *Colocasia esculenta* has a viable clinical application, it will provide comprehensive knowledge of the plant.

Kushal et al.,

Keywords: *Colocasia esculenta* (CE) Linn, Araceae, phytopharmacological profile, clinical trials, pharmacokinetics.

INTRODUCTION

Plants are very important for human survival. All plant species, including ferns, seed plants, bryophytes, and mosses, that produce significant antibodies. Herbs have been used since the beginning of human civilization. India's vast forests are the rich natural resources provided to it. Natural medicine should be important for treatment, especially in rural areas of India.[1] Many of today's medicines are derived from these natural sources, many of which are named after the atmospheric environment. In order to prevent and treat various illnesses, almost 80% of people on the planet still only use traditional medicine. Medicinal herbs and extracts may cure liver, heart, nervous system, gastrointestinal tract, and metabolic disorders due to their various biological qualities. Numerous biological activities have been demonstrated by medicinal plants, herbs, and their preparations, including single molecules.[2] Taro is a multipurpose plant. This plant is mostly produced for its edible bulbs, which are a type of root vegetable also called taro.[3] Taro is a recurrent herbaceous wetland herb native to Asia, primarily found in tropical and subtropical climates. It goes by several names, including Arbi, Arvi, and Eddode. Taro is one of the main crops of the subfamily Araceae, also known as Aroideae.[4] Over 9,000 years ago, taro was cultivated.[5] This ancient crop from Southeast Asia is now an important crop throughout the Caribbean, Africa, Asia, and the Pacific.[6] Root crops like taro provide the majority of income for 500 million people, or 10% of the world's population.[7] Rice, cassava, sweet potatoes, and potatoes are less nutrient-dense than taro. Rubefacient and stimulating qualities can be found in the plant's leaf juice. Adenitis, haemorrhages, boils, and internal otalgia can also be treated with it [8]. Studies have indicated that taro leaves are a good source of calcium, phosphorus, iron, niacin, riboflavin, and thiamine. Edible fresh leaves of taro are rich in essential nutrients, dietary fibre, protein, and ascorbic acid [9]. This kind is more prevalent in Japan and China. Around the world, this plant may thrive in a range of settings, from flood plains to tropical rainforests. Taro, the world's ninth-most common food crop, originated in India. [10]

PROFILE OF PLANT

There are two other names for *Colocasia esculenta* Linn. (Family: Araceae): "*Arum esculentum* Linn" and "*Colocasia antiquorum* Schott.[11] Major root crop *Colocasia esculenta* Linn Schott is a member of the Araceae family, specifically the Aroideae subfamily.[12] Taro is an underground stem and monocotyledonous plant.[13] Taro is an herbaceous plant that reaches a height of one to two meters. The bottom part of the plant bears leaves, while the centre corm of the plant is located just below the soil's surface.[14]

Vernacular Names [15,16]

Marathi: Alu

Gujarati: Alavi, Patarveliya

Kannada: Kesavedantu

Malayalam: Chempu, Madantha, Chempakizhanna

Hindi: Arvi, Kachalu

English: Taro

Sanskrit: Alupam, Alukam

Tamil: Sempu

Bengali: Alti Kachu, Kachu

MORPHOLOGY

The herbaceous perennial *Colocasia esculenta* (L) Schott is known by the common name's cocoa and taro and is a tall herb that either has a robust, short caudex that concurrently bears flowers and leaves, or it is tuberous. The morphological characteristics of taro, including its corm, stolon, leaf, petiole, and flora, as well as other quantitative

**Kushal et al.,**

traits, can be used to describe the plant. According to Lebot et al. (2016), taro accessions from Southeast Asia and Oceania exhibited a high degree of morphological diversity.[17] The lamina peltate is either ovate-cordate or sagittate-cordate, and the simple leaves feature a thick petiole. Both the spadix and the appendix are significantly shorter than the petiole and inflorescence, respectively. The petiole is 15–35 centimetres shorter than the spathe and has a pale-yellow spathe, an oval-shaped, greenish tube, and a widely lanceolate, acuminate, convolute lamina that rarely expands extensively and curls slightly backwards while in bloom. Male inflorescences are tall and cylindrical, whereas female ones are tiny. Neuters are generally between them. Appendix: upright, subulate, abbreviate, elongate-conical, or fusiform. Male flowers are three to six-anded. Male inflorescence is long and cylindrical, and it typically stands in between the two female inflorescences, which are short. Female flowers have 3–4 gynous. Sulcate the oblong seeds. much albumen; embryo axile. An above-ground plant stem that is somewhat inflated at the base of the leaf sheaths emerges from a firm, tapered rhizome. Occasionally, stolons and suckers from tuberous rhizomes may be observed. Compared to the fertile zones, the sterile floral zone and the distal appendage are shorter. Fruit is a berry that has a fruiting cap made up of several densely packed seeds. Less than 2 mm long and ovoid to ellipsoid in shape, seeds have an abundance of endosperm. [18,19]

ETHNOMEDICAL USES

The whole plant has antibacterial, antifungal, hepatoprotective, hypoglycaemic, anti-lipid peroxidation, and anti-inflammatory properties. Leaf juice is utilised as a stimulant, appetizer, expectorant, otalgia, and astringent, as well as to maintain healthy mucous membranes, skin, and vision [19]. It is also used as a cancer remedy for the mouth and lungs. The leaf juice's hydroalcoholic extract has sedative, antidepressant, anxiolytic, and smooth muscle relaxant properties. Body pains and external baldness are treated with corm juice. It has internal uses as a laxative, anodyne, demulcent, and galactagogue. It is applied to pile treatment [20].

PHYTOCHEMISTRY

Flavonoids and triterpenoids dominate *Colocasia esculenta* leaf extracts' pharmacological activity. Leaf phytochemistry of *Colocasia esculenta* shows flavones, luteolin, apigenin, and anthocyanins [21]. *Colocasia esculenta* tubers contain 80% globulins. Taro corms contain 70–80% starch with small granules (dry weight basis). The tubers contain 1,380 to 2,397 mg/100g of amino acids, and raw and powdered taro are heavy in carbs [22]. "Alkaloids", "flavonoids", "glycosides", "phenols", "saponins", "steroids", and "tannins" were in *Colocasia esculenta* stem extract. Steroids, glycosides, and flavonoids were weakly detectable. Despite uncommon alkaloids, phenols, and saponins, tannins predominated. The *Colocasia esculenta* leaf flavonoid were extracted by Iwashina et al. UV spectral analysis found flavonoids. "Vicenin-2", "vitexin X"-O-glucoside, "luteolin 7-O-glucoside", "isoorientin", "isovitexin", and "orientin 7-O-glucoside" were the eight flavonoids [23].

REPORTED PHARMACOLOGIC ACTIONS

Hypoglycaemic action

The ethanol extract of *Colocasia esculenta* leaves has antidiabetic properties in an alloxan-induced diabetes mouse. To compare alloxan (120 mg/kg, i.p.)-induced diabetic rats with metformin 450 mg/kg, *Colocasia esculenta* ethanol extract was given orally at 100, 200, and 400 mg/kg. A hypoglycaemic impact from EECE peaked at 6 hours (120 mg/dl) but diminished after 24 hours. Blood glucose dropped at 4 hours (96 mg/dl). At 400 mg/kg on the 14th day of the subacute investigation, blood glucose decreased the greatest (174.34 mg/dl). EECE ceased weight loss. In rats with alloxan-induced diabetes, EECE (400 mg/kg) showed significant anti-hypoglycaemic activity [24].

Antioxidant activity

Aqueous extracts of *Colocasia esculenta* corms showed powerful antioxidant in addition to free radical scavenging capabilities. The extract was evaluated using seven different assays, including antioxidant activity against nitric oxide (NO), DPPH, and ABTS radicals, total flavonoid and phenolic content, complete flavanol content, and reduction of power calculation. *Colocasia esculenta* corm's antioxidant potential was mainly attributed to its phytoconstituents, which included tannins, saponins, flavonoids, steroids, carbohydrates, proteins, and glycosides [25].

Kushal et al.,

Antimicrobial activity

Colocasia esculenta, also referred to as taro, is a highly beneficial medicinal plant that Charaka describes as having anti-inflammatory properties. Using the diffusion agar method, an investigation stood conducted to determine the antimicrobial action of the *Colocasia esculenta* plant's methanol and chloroform extract. In order to evaluate and compare the zone of inhibition caused by methanol extract and chloroform at doses of 20, 10, 5, 2.5, 1.25, 0.625, and 0.3125 mg/ml against specific strains, tetracycline at doses of 5, 2.5, 0.625, 0.3125, 0.15625, and 0.078072 mg/ml was used as a reference antibiotic [26].

Hepatoprotective activity

The study examined the hepatoprotective and antihepatotoxic properties of *Colocasia esculenta* leaf juice against the hepatotoxins paracetamol using the in vitro liver slice technique. Hepatocyte damage results from the free radicals that these substances produce, which also damage cell organelles and induce oxidative stress. In the presence of paracetamol and CCL₄, the leaf juice's marker enzyme levels increased, suggesting hepatotoxicity. The integrity of the hepatocyte was indicated by the significant reduction in AST, ALT, and ALP leakage caused by the leaf juice of *Colocasia esculenta*. Study results that support the hepatoprotective and antihepatotoxic properties of *Colocasia esculenta* leaf juice were examined in vitro utilizing a rat liver slice model.[27]

Anthelmintic activity

Earthworms were used as test subjects for the anthelmintic qualities of *Colocasia esculenta* leaf extracts, both ethanolic and aqueous. In the 10–50 mg/ml concentration range, both extracts demonstrated dose-dependent anthelmintic efficacy. In addition to causing paralysis, the crude extracts of *Colocasia esculenta* killed the worms, especially when the concentration was higher. Compared to the water extract of *Colocasia esculenta*, the ethanol extracts show more effective paralysis and death time against the earthworm.[28]

Anti-inflammatory activity

Albino Wistar rats with pleurisy, granules generated by cotton pellets, and left hind paw oedema induced by carrageenan were used to investigate the anti-inflammatory properties of an ethanolic extract derived from the leaves of *Colocasia esculenta* Linn. Ethanol extract (100 mg/kg, p.o.) reduced carrageenan-induced paw edema. Cotton pellets reduced pleural exudates, leukocyte migration and granulation weight. Ethanolic extract significantly decreased inflammatory response compared to normal and untreated groups of controls ($p < 0.05$).[29]

Anti-Cancer activity

A *Colocasia esculenta* leaf ethanolic extract was tested for cytotoxicity and apoptosis in Pa-1 ovarian carcinoma cell lines. The cytotoxic and apoptotic effects were measured using MTT assays. The extract of leaves showed the highest cytotoxicity at 93.2 µg/mL, acting dose-dependently. In contrast to cisplatin, which caused 41.76% and 46.42% a process called Annexin V and PI late and early cells that were apoptotic also died. Pa-1 ovarian cancer cells may be susceptible to the ethanol extract's cytotoxicity as a possible therapeutic principle.[30]

Neuropharmacological activity

Leaf extracts from *Colocasia esculenta* were tested for neuropharmacological action in adult Wistar albino rats. The enhanced plus maize (EPM) group had greater anxiolytic effects and more open arms in comparison to the control group. Additionally, in Porsolt forced swimming test, the extracts demonstrated a dose-dependent reduction in immobility time. At doses of 50 and 100 mg/kg, i.p. the extracts significantly reduced the duration necessary for thiopental to induce sleep. This suggests that there could be neuropharmacological qualities to the plant.[31]

Antifungal activity

Colocasia esculenta's in vitro antifungal activity against two distinct fungus species was evaluated using the food poisoning approach. More antifungal activity was shown by the alcoholic leaf extract of *Colocasia esculenta* than by the water extract. The two species of *Alternaria solani* and *Alternaria ricini* were both completely eradicated by an

Kushal et al.,

alcoholic extraction of 25% *Colocasia esculenta*. Only aqueous leaf extract, when used at high quantities, inhibited the growth of fungal infections.[32]

Hypolipidemic activity

The research examined how aqueous extracts of *Colocasia esculenta* corms impacted hyperlipidaemic rats fed 25% fructose and P-407. The extract was contrasted to fenofibrate, a prominent hypolipidemic medication, for 15 and 21 days at 200 and 300 mg/kg. Triglycerides, LDL cholesterol, and VLDL cholesterol decreased significantly. The extract's efficacy was comparable to fenofibrate, suggesting *Colocasia esculenta* might be used to produce hypolipidemic drugs for the treatment of hyperlipidaemia and cardiovascular diseases.[34]

ABSTRACT

In this paper, a new approach of Fermatean picture fuzzy graph along with some of basic properties is introduced. The fermatean picture fuzzy graph, subgraph, regular graph, complete graph are defined and examples are given. A natural life problem with an effective algorithm to solve problem and examples are given.

Keywords: Fermatean picture fuzzy graph, Fermatean picture fuzzy subgraph, Fermatean regular picture fuzzy graph, Fermatean strong picture fuzzy graph, Fermatean complete picture fuzzy graph.

INTRODUCTION

In 1965, L.A.Zadeh introduced the idea of fuzzy sets [1] which gives the membership of an object in a given set. Zimmerman H.J., [3] developed Fuzzy Set Theory and its Applications. Intuitionist fuzzy graph and some of its basic properties were introduced by Dipesh Chakravarthy and Nirmal Kumar Mahapatra [2]. Definitions, theorems and examples of Complete fuzzy graph was introduced Talal AL- Hawary [4]. Tapan Senapati, Ronald R Yager, proposed Fermatean Fuzzy Sets [5]. S.Sangeetha, dealt with regular graph, complete graph and its applications [6]. Arjunan K and Subramani.C, [7] extended of Notes on Fuzzy Graph. Parvathy R and Karunambigai M.G, introduced the new definitions and examples Intuitionistic Fuzzy Graphs [8], Nagoor Gani, A. and Radha, K., On Regular Fuzzy Graphs [9].

Bhadmavadhi et al.,

S.Vijayalakshmi, S.Geetha, S.SahayaArockia Selvi, Complete Intuitionistic Fuzzy Graphs[10]. Nagoor Gani. A and Shajitha Begum.S,[11] Degree of a vertex, effective degree, neighbourgood degree, regular fuzzy graph, degree, order and size in intuitionistic fuzzy graphs,complete intuitionistic fuzzy graphs. S.Memis, some definitions and examples, properties of picture fuzzy sets[12].Assia Bakali.Mohamad Talia Said Broumi, R.Sundareswaran, M.Shanmugapriya,was introduced pythagorian fuzzy graph,Fermatean fuzzy gaph, Fermatean neutrosophic graphs, degree, size of Fermatean neutrosophic graphs definitions and examples[13].K.Lalitha and N.Buvaneswari, Some new results on Fermatean Fuzzy Sets using Implication[14], B.C.Coung, has put forward the concept of Picture Fuzzy Sets[15].In the Fermatean picture fuzzy sets ,the membership, neutral membership, non membership degrees are denoted by $\mu(x), \eta(x), \gamma(x)$ respectively.

Definition: 1.1

Let $G^* = (V, E)$ be a graph. A pair $G = (A, B)$ is called a fermatean picture fuzzy graph on G^* where $A = (\mu_{FPG1}, \eta_{FPG1}, \gamma_{FPG1})$ is a Fermatean Picture Fuzzy set on V and $B = (\mu_{FPG2}, \eta_{FPG2}, \gamma_{FPG2})$ is a Fermatean Picture Fuzzy set on $E \subseteq V \times V$ such that for each $uv \in E$.

$$\mu_{FPG2}(u, v) \leq \min \{ \mu_{FPG1}(u), \mu_{FPG1}(v) \}, \eta_{FPG2}(u, v) \leq \min \{ \eta_{FPG1}(u), \eta_{FPG1}(v) \}$$

$$\gamma_{FPG2}(u, v) \geq \max \{ \gamma_{FPG1}(u), \gamma_{FPG1}(v) \}.$$

Example

$$u(0.5, 0.6, 0.7) \quad (0.3, 0.5, 0.8) \quad (0.4, 0.55, 0.8) \quad v(0.4, 0.5, 0.8) \quad (0.4, 0.4, 0.85) \quad w(0.8, 0.8, 0.4)$$

Definition: 1.2

A Fermatean Picture Fuzzy graph $G = (A, B)$ is said to be Fermatean regular picture fuzzy graph if

$$\sum_{u \neq v} \mu_{FPG2}(u, v) = \text{Constant},$$

Example:

Figure.1 is also an example of Fermatean regular picture fuzzy graph.

Definition: 1.3

A Fermatean picture fuzzy graph $G = (A, B)$ is defined as Fermatean strong picture fuzzy graph is

$$\mu_{FPG2}(u, v) = \mu_{FPG1}(u) \wedge \mu_{FPG1}(v),$$

$$\eta_{FPG2}(u, v) = \eta_{FPG1}(u) \wedge \eta_{FPG1}(v),$$

$$\gamma_{FPG2}(u, v) = \gamma_{FPG1}(u) \wedge \gamma_{FPG1}(v).$$

Example:

$$X(0.5, 0.2, 0.5) \quad (0.2, 0.3, 0.5) \quad W(0.3, 0.5, 0.2)$$

$$U(0.8, 0.4, 0.2) \quad (0.3, 0.4, 0.2) \quad V(0.6, 0.6, 0.2)$$

Theorem: 1.4

Let $G = (A, B)$ be an Fermatean picture fuzzy graph with respect to the sets V and E . Let α_1, γ_1 and $\beta_1 \in [0, 1]$ and $\alpha \leq \alpha_1, \gamma \leq \gamma_1$, and $\beta \geq \beta_1$. Then $(A_{(\alpha_1, \gamma_1, \beta_1)}, B_{\alpha_1, \gamma_1, \beta_1})$ is an Fermatean Picture Fuzzy subgraph of $(A_{(\alpha, \gamma, \beta)}, B_{\alpha, \gamma, \beta})$.

Proof

G is a Fermatean Picture Fuzzy graph with respect to the sets V and E . Then for α_1, γ_1 and $\beta_1 \in [0, 1]$, $\alpha \leq \alpha_1, \gamma \leq \gamma_1$ and $\beta \geq \beta_1$ be given

$$\text{Now let } (x, \mu_{FPG1}(x), \eta_{FPG1}(x), \gamma_{FPG1}(x)) \in A_{(\alpha_1, \gamma_1, \beta_1)}.$$

$$\Rightarrow \mu_{FPG1}(x) \geq \alpha_1, \eta_{FPG1}(x) \geq \gamma_1, \gamma_{FPG1}(x) \leq \beta_1.$$

$$\Rightarrow \mu_{FPG1}(x) \geq \alpha, \eta_{FPG1}(x) \geq \gamma, \gamma_{FPG1}(x) \leq \beta.$$

$$[\text{Because } \alpha \leq \alpha_1, \gamma \leq \gamma_1, \beta \geq \beta_1]$$

$$\Rightarrow (x, \mu_{FPG1}(x), \eta_{FPG1}(x), \gamma_{FPG1}(x)) \in A_{(\alpha, \gamma, \beta)}.$$

$$\text{Therefore, } A_{(\alpha_1, \gamma_1, \beta_1)} \subseteq A_{(\alpha, \gamma, \beta)}.$$

Bhadvavadhi et al.,

Now, let $((x,y), \mu_{FPG1}(x,y), \eta_{FPG1}(x,y), \gamma_{FPG1}(x,y)) \in B_{(\alpha_1, \gamma_1, \beta_1)}$.

$\Rightarrow \mu_{FPG2}(x,y) \geq \alpha_1, \eta_{FPG2}(x,y) \geq \gamma_1$ and $\gamma_{FPG2}(x,y) \leq \beta_1$

$\Rightarrow \mu_{FPG2}(x,y) \geq \alpha, \eta_{FPG2}(x,y) \geq \gamma$ and $\gamma_{FPG2}(x,y) \leq \beta$, because

$[\alpha \leq \alpha_1, \gamma \leq \gamma_1, \beta \geq \beta_1]$

$\Rightarrow ((x,y), \mu_{FPG2}(x,y), \eta_{FPG2}(x,y), \gamma_{FPG2}(x,y)) \in B_{(\alpha, \gamma, \beta)}$.

Therefore, $B_{(\alpha_1, \gamma_1, \beta_1)} \subseteq B_{(\alpha, \gamma, \beta)}$.

Hence, $(A_{(\alpha_1, \gamma_1, \beta_1)}, B_{(\alpha_1, \gamma_1, \beta_1)})$ is a Fermatean Picture Fuzzy subgraph of $(A_{(\alpha, \gamma, \beta)}, B_{(\alpha, \gamma, \beta)})$.

Definition: 1.5

The Fermatean Picture Fuzzy graph $H=(C,D)$ is said to be Fermatean Picture fuzzy subgraph of $G=(A,B)$ if $C \subseteq A$ and $D \subseteq B$.

$v_1(0.6, 0.4, 0.2) \quad (0.5, 0.2, 0.3) \quad v_2(0.6, 0.4, 0.2)$

$v_4(0.7, 0.3, 0.4) \quad (0.4, 0.3, 0.4) \quad v_3(0.4, 0.6, 0.2)$

Fermatean Picture fuzzy graph of G.

$v_1(0.6, 0.4, 0.2) \quad v_2(0.5, 0.2, 0.3)$

$v_4(0.7, 0.3, 0.4) \quad (0.4, 0.3, 0.4) \quad v_3(0.4, 0.6, 0.2)$

Definition: 1.5

A Fermatean Picture fuzzy graph $G=(A,B)$ is defined as Fermatean Complete picture fuzzy graph if

$\mu_{FPG2}(U, V) = \eta_{FPG1}(U) \wedge \eta_{FPG1}(V)$,

$\eta_{FPG2}(U, V) = \eta_{FPG1}(U) \wedge \eta_{FPG1}(V), \gamma_{FPG2}(U, V) = \gamma_{FPG1}(U) \wedge \gamma_{FPG1}(V), U, V \in V$.

Note: Every Fermatean Complete picture fuzzy graph is a Fermatean strong picture fuzzy graph but not conversely.

Example:-

$X(0.5, 0.4, 0.2)(0.5, 0.4, 0.2) \quad w(0.6, 0.7, 0.2)$

$u(0.3, 0.5, 0.6)(0.3, 0.5, 0.6) \quad v(0.4, 0.5, 0.3)$

A fermatean complete picture fuzzy graph.

Theorem: 1.7

Let $H=(C, D)$ be an Fermatean picture fuzzy subgraph of $G=(A,B)$ and $\alpha, \gamma, \beta \in [0,1]$.

Then $H_{(\alpha, \gamma, \beta)}$ is an fermatean picture fuzzy subgroup of $G_{(\alpha, \gamma, \beta)}$.

Proof:

Let $H=(C, D)$ be an FBFSG of $G = (A, B)$ and $\alpha, \gamma, \beta \in [0, 1]$. Suppose $(x, \mu_c(x), \eta_c(x), \gamma_c(x)) \in C_{(\alpha, \gamma, \beta)}$.

$\Rightarrow \mu_c(x) \geq \alpha, \eta_c(x) \geq \gamma, \text{ and } \gamma_c(x) \leq \beta$

$\Rightarrow (x, \mu_c(x), \eta_c(x), \gamma_c(x)) \in A_{(\alpha, \gamma, \beta)}$

So $C_{(\alpha, \gamma, \beta)} \subseteq A_{(\alpha, \gamma, \beta)}$.

Again let, $((x,y), \mu_D(x,y), \eta_D(x,y), \gamma_D(x,y)) \in D_{(\alpha, \gamma, \beta)}$

Then $\mu_D(x,y) \geq \alpha, \eta_D(x,y) \geq \gamma, \gamma_D(x,y) \leq \beta$.

$((x,y), \mu_D(x,y), \eta_D(x,y), \gamma_D(x,y)) \in B_{(\alpha, \gamma, \beta)}, D_{(\alpha, \gamma, \beta)} \subseteq B_{(\alpha, \gamma, \beta)}$.

Hence $H_{(\alpha, \gamma, \beta)} = (C_{(\alpha, \gamma, \beta)}, D_{(\alpha, \gamma, \beta)})$ is an Fermatean picture fuzzy subgraph of $G_{(\alpha, \gamma, \beta)} = (A_{(\alpha, \gamma, \beta)}, B_{(\alpha, \gamma, \beta)})$.

Theorem: 1.8

Let $G=(A,B)$ be an Fermatean picture fuzzy graph with respect to the sets V and E . Let $\alpha, \gamma, \beta, \alpha_1, \gamma_1$ and $\beta_1 \in [0,1]$ and $\alpha \leq \alpha_1, \gamma \leq \gamma_1$ and $\beta \geq \beta_1$. then $(A(\alpha_1^+, \gamma_1^+, \beta_1^+), B(\alpha_1^+, \gamma_1^+, \beta_1^+))$ is an Fermatean picture fuzzy size graph of $(A(\alpha^+, \gamma^+, \beta^+), B(\alpha^+, \gamma^+, \beta^+))$.

Poof

G is an Fermatean picture fuzzy graph with respect to the sets V and E . Then for $\alpha, \gamma, \beta, \alpha_1, \gamma_1$ and $\beta_1 \in [0,1]$ and $\alpha \leq \alpha_1, \gamma \leq \gamma_1$ and $\beta \geq \beta_1$ be given

Now, Let $(x, \mu_A(x), \eta_A(x), \gamma_A(x)) \in A(\alpha_1^+, \gamma_1^+, \beta_1^+)$

$\Rightarrow \mu_A(x) > \alpha_1, \eta_A(x) > \gamma_1, \text{ and } \gamma_A(x) < \beta_1$

$\Rightarrow \mu_A(x) > \alpha_1 \geq \alpha, \eta_A(x) > \gamma_1 \geq \gamma, \gamma_A(x) < \beta_1 \leq \beta,$

$\Rightarrow (x, \mu_A(x), \eta_A(x), \gamma_A(x)) \in A(\alpha^+, \gamma^+, \beta^+)$

Therefore $A(\alpha_1^+, \gamma_1^+, \beta_1^+) \subseteq A(\alpha^+, \gamma^+, \beta^+)$.

Now, Let $((x,y), \mu_B(x,y), \eta_B(x,y), \gamma_B(x,y)) \in B(\alpha_1^+, \gamma_1^+, \beta_1^+)$.

$\Rightarrow \mu_B(x,y) > \alpha_1, \eta_B(x,y) > \gamma_1, \text{ and } \gamma_B(x,y) < \beta_1,$

$\Rightarrow \mu_B(x,y) > \alpha_1 \geq \alpha, \eta_B(x,y) > \gamma_1 \geq \gamma, \gamma_B(x,y) < \beta_1 \leq \beta,$

$\Rightarrow (x, \mu_B(x,y), \eta_B(x,y), \gamma_B(x,y)) \in B(\alpha^+, \gamma^+, \beta^+)$.

Therefore, $B(\alpha_1^+, \gamma_1^+, \beta_1^+) \subseteq B(\alpha^+, \gamma^+, \beta^+)$.

Hence $(A(\alpha_1^+, \gamma_1^+, \beta_1^+), B(\alpha_1^+, \gamma_1^+, \beta_1^+))$ is an Fermatean picture fuzzy size graph of $(A(\alpha^+, \gamma^+, \beta^+), B(\alpha^+, \gamma^+, \beta^+))$.

Theorem: 1.9

Let $H=(C, D)$ be an Fermatean picture fuzzy size graph of $G = (A, B)$ and $\alpha, \gamma, \beta \in [0,1]$. Then $H(\alpha^+, \gamma^+, \beta^+)$ is an Fermatean picture fuzzy size graph of $G(\alpha^+, \gamma^+, \beta^+)$.

Proof:

Let $H=(C,D)$ be an Fermatean picture fuzzy size graph of $G=(A,B)$ and $\alpha, \gamma, \beta \in [0,1]$. Suppose $(x, \mu_C(x), \eta_C(x), \gamma_C(x)) \in C(\alpha^+, \gamma^+, \beta^+)$.

$\mu_C(x) > \alpha, \eta_C(x) > \gamma, \gamma_C(x) < \beta.$

$(x, \mu_C(x), \eta_C(x), \gamma_C(x)) \in C(\alpha^+, \gamma^+, \beta^+)$.

$C(\alpha^+, \gamma^+, \beta^+) \subseteq A(\alpha^+, \gamma^+, \beta^+)$.

Again let, $((x,y), \mu_D(x,y), \eta_D(x,y), \gamma_D(x,y)) \in D(\alpha^+, \gamma^+, \beta^+)$.

$\mu_D(x,y) > \alpha, \eta_D(x,y) > \gamma, \gamma_D(x,y) < \beta.$

$((x,y), \mu_D(x,y), \eta_D(x,y), \gamma_D(x,y)) \in B(\alpha^+, \gamma^+, \beta^+)$.

$D(\alpha^+, \gamma^+, \beta^+) \subseteq B(\alpha^+, \gamma^+, \beta^+)$.

Hence $H(\alpha^+, \gamma^+, \beta^+) = (C(\alpha^+, \gamma^+, \beta^+), D(\alpha^+, \gamma^+, \beta^+))$

is an FPFSG of $G(\alpha^+, \gamma^+, \beta^+) = (A(\alpha^+, \gamma^+, \beta^+), B(\alpha^+, \gamma^+, \beta^+))$.

Definition: 1.10

Let $G=(A,B)$ be an Fermatean picture fuzzy graph with respect to the sets V and E . Then the degree of a vertex V is defined by $d(v) = (d_\mu(v), d_\eta(v), d_\gamma(v))$ where $d_\mu(v) = \sum_{u \neq v} \mu_2(v, u)$, $d_\eta(v) = \sum_{u \neq v} \eta_2(v, u)$, $d_\gamma(v) = \sum_{u \neq v} \gamma_2(v, u)$.

Definition: 1.11

The maximum degree of the FPFSG G is $\Delta(G) = (\Delta_\mu(v), \Delta_\eta(v), \Delta_\gamma(v))$ where $\Delta_\mu(G) = \bigvee \{d_\mu(v) : v \in V\}$, $\Delta_\eta(G) = \bigvee \{d_\eta(v) : v \in V\}$ and $\Delta_\gamma(G) = \bigvee \{d_\gamma(v) : v \in V\}$.

Definition: 1.12

The minimum degree of the FPFSG G is $\delta(G) = (\delta_\mu(v), \delta_\eta(v), \delta_\gamma(v))$ where $\delta_\mu(G) = \bigwedge \{d_\mu(v) : v \in V\}$, $\delta_\eta(G) = \bigwedge \{d_\eta(v) : v \in V\}$ and $\delta_\gamma(G) = \bigwedge \{d_\gamma(v) : v \in V\}$.

Definition: 1.13

Let $G=(A,B)$ be an Fermatean picture fuzzy graph then the order of FPFSG G is defined by $O(G) = (O_\mu(G), O_\eta(G), O_\gamma(G))$ where $O_\mu(G) = \sum_{v \in V} \mu_1(v)$, $O_\eta(G) = \sum_{v \in V} \eta_1(v)$, $O_\gamma(G) = \sum_{v \in V} \gamma_1(v)$.

Definition: 1.14

Let $G=(A,B)$ be an Fermatean picture fuzzy graph with respect to the sets V and E . Then the size FPFSG is defined by $S(G) = (S_\mu(G), S_\eta(G), S_\gamma(G))$ where $S_\mu(G) = \sum_{u \neq v} \mu_2(u, v)$, $S_\eta(G) = \sum_{u \neq v} \eta_2(u, v)$, $S_\gamma(G) = \sum_{u \neq v} \gamma_2(u, v)$.

**Theorem: 1.15**

Let $d(v)=(d_\mu(v), d_\eta(v), d_\gamma(v))$ be the degree of the vertex v of the FPFG $G=(A,B)$ and $S(G)=(S_\mu(G), S_\eta(G), S_\gamma(G))$ be its size, then $\sum_{vi \in V} d_{\mu_1}(v_i) = 2S_\mu(G)$, $\sum_{vi \in V} d_{\eta_1}(v_i) = 2S_\eta(G)$ and $\sum_{vi \in V} d_{\gamma_1}(v_i) = 2S_\gamma(G)$.

Proof

Let $G=(A,B)$ be an FPFG with respect to V and E , where $V=\{v_1, v_2, \dots, v_n\}$

Now, $d_\mu(v_i) = d_\mu(v_1) + d_\mu(v_2) + \dots + d_\mu(v_n)$,

$$= \mu_2(v_1, v_2) + \mu_2(v_1, v_3) + \mu_2(v_1, v_4) + \dots + \mu_2(v_1, v_n) + \dots + \mu_2(v_n, v_1) + \mu_2(v_n, v_2) + \dots + \mu_2(v_{n-1}, v_n),$$

$$= 2[\mu_2(v_1, v_2) + \mu_2(v_1, v_3) + \dots + \mu_2(v_1, v_n),$$

$$= 2\sum_{v_i \neq v_j} \mu_2(v_i, v_j),$$

$$= 2S_\mu(G).$$

$$\therefore \sum d_\mu(v_i) = 2S_\mu(G),$$

Similarly, we can prove

$$\therefore \sum d_\eta(v_i) = 2S_\eta(G),$$

$$\therefore \sum d_\gamma(v_i) = 2S_\gamma(G).$$

This completes the proof.

Example

Let us consider an FPFG G ,

For this FPFG G $d_\mu(v_1)=0.3, d_\mu(v_2)=0.3, d_\mu(v_3)=0.2, d_\mu(v_4)=0.4$ and $d_\eta(v_1)=0.3, d_\eta(v_2)=0.6, d_\eta(v_3)=0.4, d_\eta(v_4)=0.2$,

$d_\gamma(v_1)=1.4, d_\gamma(v_2)=2.2, d_\gamma(v_3)=1.5, d_\gamma(v_4)=2.5$.

So $\delta_\mu(G)=0.2, \delta_\eta(G)=0.2, \delta_\gamma(G)=1.4$,

$\Delta_\mu(G)=0.4, \Delta_\eta(G)=0.6, \Delta_\gamma(G)=2.5, S_\mu(G)=0.6, S_\eta(G)=0.4, S_\gamma(G)=3.8$.

Note:

$$0 \leq \delta_\mu(G) \leq \Delta_\mu(G), 0 \leq \delta_\eta(G) \leq \Delta_\eta(G), 0 \leq \delta_\gamma(G) \leq \Delta_\gamma(G).$$

Theorem: 1.16

Let G be any FPFG and P be the numbers of the Vertices. Then $\delta_\mu(G) \leq \frac{2S_\mu(G)}{p} \leq \Delta_\mu(G), \delta_\eta(G) \leq \frac{2S_\eta(G)}{p} \leq \Delta_\eta(G), \delta_\gamma(G) \leq \frac{2S_\gamma(G)}{p} \leq \Delta_\gamma(G)$.

Proof

Suppose $G=(A,B)$ be any FPFG and P be the number of vertices.

If every vertex has degree

$\delta(G)=(\delta_\mu(G), \delta_\eta(G), \delta_\gamma(G))$, then

$$\sum_{v \in V} d_\mu(v) = \sum_{v \in V} \delta_\mu(G) = P\delta_\mu(G),$$

$$\sum_{v \in V} d_\eta(v) = \sum_{v \in V} \delta_\eta(G) = P\delta_\eta(G) \text{ and}$$

$$\sum_{v \in V} d_\gamma(v) = \sum_{v \in V} \delta_\gamma(G) = P\delta_\gamma(G).$$

$\Delta(G)=(\Delta_\mu(G), \Delta_\eta(G), \Delta_\gamma(G))$ then,

$$\sum_{v \in V} d_\mu(v) = \sum_{v \in V} \Delta_\mu(G) = P\Delta_\mu(G),$$

$$\sum_{v \in V} d_\eta(v) = \sum_{v \in V} \Delta_\eta(G) = P\Delta_\eta(G) \text{ and}$$

$$\sum_{v \in V} d_\gamma(v) = \sum_{v \in V} \Delta_\gamma(G) = P\Delta_\gamma(G).$$

But, $\sum_{v \in V} \delta_\mu(G) \leq \sum_{v \in V} d_\mu(v) \leq \sum_{v \in V} \Delta_\mu(G)$;

$$\Rightarrow P\delta_\mu(G) \leq \sum_{v \in V} d_\mu(v) \leq P\Delta_\mu(G);$$

$$\text{ie, } \delta_\mu(G) \leq 2d_\mu(v) \leq \Delta_\mu(G),$$

Similarly $\delta_\eta(G) \leq 2d_\eta(v) \leq \Delta_\eta(G)$ and

$$\delta_\gamma(G) \leq 2d_\gamma(v) \leq \Delta_\gamma(G).$$

**Theorem: 1.16**

Let $G=(A,B)$ be an FPPG with respect to V and E with number of fuzzy vertices n , all of whose FPF vertices have degree (s_1, s_2, s_3) or (t_1, t_2, t_3) . If G has P vertices of degree (s_1, s_2, s_3) and $(n-p)$ vertices of degree (t_1, t_2, t_3) . Then $S_\mu(G) = \frac{P(s_1-t_1)+nt_1}{2}$, $S_\eta(G) = \frac{P(s_2-t_2)+nt_2}{2}$ and $S_\gamma(G) = \frac{P(s_3-t_3)+nt_3}{2}$.

Proof:

Let v_1 be the set of all fuzzy vertices with degree (s_1, s_2, s_3) and v_2 be the set of all vertices with degree (t_1, t_2, t_3) .

Then $\sum_{v \in V} d_\mu(v) = \sum_{v \in V_1} d_\mu(v) + \sum_{v \in V_2} d_\mu(v)$;

(or) $2S_\mu(G) = Ps_1 + (n-p)t_1$;

ie $S_\mu(G) = \frac{P(s_1-t_1)+nt_1}{2}$

Also $\sum_{v \in V} d_\eta(v) = \sum_{v \in V_1} d_\eta(v) + \sum_{v \in V_2} d_\eta(v)$;

$\sum_{v \in V} d_\gamma(v) = \sum_{v \in V_1} d_\gamma(v) + \sum_{v \in V_2} d_\gamma(v)$;

Or $2S_\eta(G) = Ps_2 + (n-p)t_2$;

$2S_\gamma(G) = Ps_3 + (n-p)t_3$;

$\therefore S_\mu(G) = \frac{P(s_1-t_1)+nt_1}{2}$

CONCLUSION

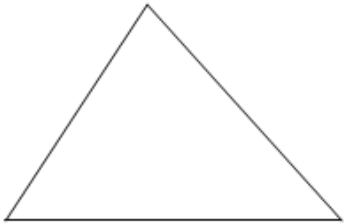

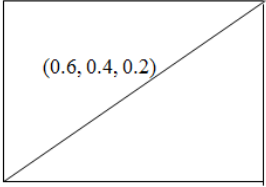

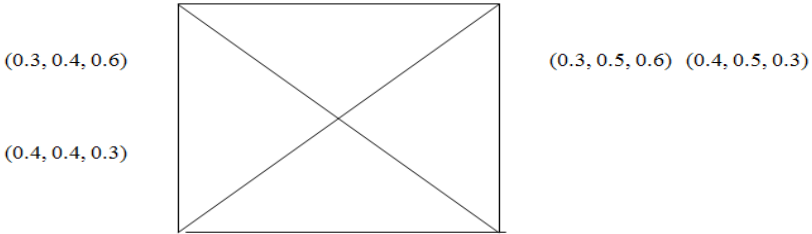

In this paper, the concept of fermatean picture fuzzy graph is introduced. The fermatean picture fuzzy graph, some new definitions, subgraph, regular graph, complete are defined and examples are given. A new approach of fermatean picture fuzzy graph some examples and properties established. A natural life problem with an effective algorithm to solve problem and examples are given. Further, order, degree, size, and total degree of FPPG are defined and some properties established.

ABSTRACT

To determine if the flexibility of patients with mechanical low back pain will improve after 6-weeks of static stretching program. We also determine the pain and disability of the patients. We used pre-test post-test comparative experimental study design. A total sample of 29 participants with mean age of 30.37 with tight hamstring and mechanical low back pain participated in the study. They were treated for 30 seconds of intervention, 5 days in a week for six weeks. According to the results presented in the preceding section, there is a significant improvement in all three outcome measures: Oswestry scores, NPRS scores, and hamstring tightness for data collected between the first and sixth weeks. After the sixth week, treatment was discontinued, and a follow-up was performed at the eighth week. When the data from the sixth and eighth weeks were compared, it was found that there is an increase in all the three outcome measures. As a result, it was determined that hamstring stretching treatment protocol reduces patients' low back pain, assists them in minimising hamstring muscle tightness, and improves their functional ability this study shows that static stretching, is effective in increasing hamstring flexibility of patients with mechanical low back pain there is significant improvement seen in hamstring muscle flexibility along with reduction in low back pain and improvement in functional disability

Keywords: Static stretching, flexibility, Extensibility, Low back pain and injury prevention.

INTRODUCTION

Stretching is used as part of physical fitness and rehabilitation program because it is thought to positively influence performance and injury prevention. Numerous studies [1, 3, 5,] have been conducted to investigate the effectiveness of stretching. Shortness and contracture of hamstring muscle may cause limitation in range of motion (ROM) that restricts the normal range of muscle. This potentially harmful condition may be managed with a stretching program, which may be positively influence an individual's functional capacity of daily living and decrease of injuries. . Knee extension range of motion from tight hamstring muscle has been linked to injuries such as hamstring tendonitis and hamstring strains. These patient often receive specific hamstring-stretching exercises as part of an overall rehabilitation programme Several studies have reported an immediate increase in knee extension ROM following the application of hamstring stretching exercises.[2,4,5] Flexibility has been defined as the ability of a muscle to lengthen and allow one joint (or more than one joint in a series.) to move through a range of motion². Increased flexibility is one of the basic concerns addressed in the day to day practice of physical therapy. It is a goal for any patient recovery from a period of immobilization or injury involving the connective tissue. Optimal flexibility is also desirable for participants in most athletic activity and normal day to day function. A shortened muscle may create imbalance at joints and faulty postural alignment that may lead to injury and joint dysfunction. Extensibility is defined as the ability to stretch a muscle tendon unit to its fullest length¹. Muscle contracture result in decreased extensibility joint motion. Physical therapists have used many different methods to maintain and increased joint motion and prevent deformity and dysfunction resulting from the muscle contracture. Research with clinical trials has long advocated the use of thermotherapy to increase flexibility in conjunction with a stretching program design to lengthen tissue. Lengthening the musculotendinous unit and supporting connective tissue increase the range of motion(ROM) through which a joint can move as well a the muscle ability to respond to stress placed upon it . [8.14,15,16]

Increased hamstring stiffness could be a possible contributing factor to low back injuries. Clinical observations have suggested that hamstring tightness influences lumbar pelvic rhythm. Movement restrictions or postural asymmetry likely lead to compensatory movement patterns of the lumbar spine, and subsequently to increased stress on the spinal soft tissues and an increased risk of low back pain (LBP). The literature reflects some interesting differences of opinion regarding flexibility training and consideration of static stretching as the gold standard. Some authors have questioned the importance of using static stretching to help reduce injuries and improve performance. Murphy made a compelling argument against the use of static stretching. Although static stretching is often used as part of pre-activity preparation, Murphy argued that the nature of static stretching is passive and does nothing to warm muscle. Murphy suggested a better opinion for maintaining or increasing flexibility of a muscle is through active contraction using dynamic range of motion, there by adding fourth type of stretching. Previous author[1] suggested that most of injuries occur in the eccentric phase of activity. Although early groups have examined dynamic range of motion, none have investigated the use of an eccentric agonist contraction to improve flexibility; eccentric training a muscle through a full range of motion theoretically could reduce injury rates and improve the performance of subject and flexibility. Russel *et al*[2] proved that in males ages 15-17 years old, hip flexion range of motion gains with eccentrically training were equal to those made by static stretching of hamstring muscle. Felipe Jose Jandre Reis *et al*, evaluated Influence of Hamstring Tightness in Pelvic, Lumbar and Trunk Range of Motion in Low Back Pain, and they found that : Participants with LBP showed restriction in the pelvis and TF(trunk flexion) range of motion, but had higher amplitudes in the lumbar spine during forward bending

METHODOLOGY

It is a comparative study. The study has pre-test, post-test experimental group design. Measurement was taken prior to and after respective treatment session at the end of 3rd, 6th and after 2 weeks of follow up on 8th week. There was one independent variable: static stretching and the dependent variable were active knee extension range of motion by 90-90 test, hamstring flexibility, pain and disability.

**Siddiqui Mohammed Aejaz and Amalkumar Bhattacharya****Subjects**

A sample of 29 subjects having mechanical low back pain with hamstring tightness with the mean age of 30.37 years participated in the study. All the subjects were recruited from physiotherapy clinic and health centres in Ahmedabad. To participate, the subjects needed to have tight hamstring muscles (inability to achieve 20° of active knee extension in 90-90 test) & mechanical low back pain. Exclusion criteria included hypermobility, Subject under medication (muscle relaxants), Skin disease, wounds, neurological problem, any circulatory problem or metal implants in the leg. All the subjects were informed the purpose and procedure of the study and an informed consent was taken from them prior to participation.

Instruments

A standard transparent full circle goniometer and a standard stop watch was used.

PROCEDURE

The study was done over 8 week's period with each subject receiving 1 treatment a day for 3 days a week for 6 weeks. Measurement was taken at pre-treatment on 1st day and post-treatment at the end of 3rd and 6th week. The hamstring range of motion of all the subjects were measured after 2 weeks of the last treatment session as a follow up measurement. This group was asked statically stretched for 30 seconds 3 days per week for 6 weeks using methods described by Bandy *et al*³ and Russel *et al*² Subjects performed the hamstring stretch by standing erect with the left foot planted on the floor and the toes pointing forward. The heel of the foot to be stretched placed on a plinth/chair with the toes directed toward the ceiling. The subject then flexed forward at the hip, maintaining the spine in a neutral position while reaching the arms forward. The knee remained fully extended. The subject continued to flex at the hip until a gentle stretch was felt in the posterior thigh. Once this position was achieved, the subject maintained this position for 30 seconds. (Figure.1) Terminal extension is determined as the point at which the researcher felt a firm resistance to the movement. Once terminal extension reached, the researcher holding the goniometer ensure proper alignment and the blinded goniometer is revealed to the assisting examiner for the measurement to be read and recorded. Zero degrees of knee extension were considered full hamstring muscle flexibility. No warm-up was allowed before data collection. Assessment: Pre-test measurements of hamstring flexibility were performed with 90-90 test. Subjects, who found suitable for the study, were requested to sign consent forms. A detailed subjective examination was done. Subjects were also evaluated with pain and disability by using NPRS and Oswestry Disability Index (ODI). This is also taken pre intervention on first day, and at the end of 3rd, 6th and 8th week.

Data Analysis

Means and SDs for all measurements were calculated. The Statistical Analyses was done by using the software: STATISTICAL PACKAGE FOR SOCIAL SCIENCE (SPSS VERSION 16.0) FOR WINDOWS.

RESULTS

A total of 29 subjects, 13 males and 16 females participated in the study. Mean age of the subjects were 30.37±10.41. In our study we have taken 90-90 test, nprs and ODI at pre-test and post week at the end of 3rd, 6th and 8th week. Mean and S.D for pre-test and post-test measurements were calculated for this group. Distribution of the data in the group was analysed by using TEST OF NORMALITY: SHAPIRO-WILK TEST. Level of significance was at 5% with confidence interval 95%. The data was not normally distributed, non-parametric test was applied. Mean and Standard Deviation were calculated for the numeric data. Wilcoxon sign test was applied for comparing the data. Knee extension range of motion between three group were compared at Pre-test (ROM 1), at the end of 3rd week (ROM 2), 6th week (ROM 3) and 8th week (ROM 4).(Table.1) Pre-test mean values for knee extension ROM for group was 139.62±8.92 and respectively (P= 0.001). At end of 3rd week mean values for knee extension ROM for this group was, 143.76±8.77. At the end of 6th week mean values for knee extension ROM for this was 149.00±8.73. At the end of 8th week mean values for knee extension ROM for this group was 145.45±9.06. Pre-test mean values NPRS for our

**Siddiqui Mohammed Aejaz and Amalkumar Bhattacharya**

group was 5.28 ± 1.60 , ($P = 0.001$). At end of 3rd week mean values for NPRS for this is 4.28 ± 1.58 , at the end of 6th week mean values for NPRS for this was 3.48 ± 1.43 . At the end of 8th week mean values for NPRS was 3.21 ± 1.61

Pre-test mean values for ODI for this group was 27.03 ± 9.47 ($P = 0.001$). At end of 3rd week mean values for ODI for this was 24.41 ± 8.97 . At the end of 6th week mean values for ODI for this was 21.86 ± 8.72 . At the end of 8th week mean value was 21.45 ± 8.52 . Since most of the variables are not normally distributed, so non-parametric test has been used for the analysis. Further comparing the range for the pre-test and post-test at the end of 8th week we found that final gain in our study was 5.83. So here we have found that significant difference in comparing to pre and post data.

When going for the NPRS and ODI scale we found the improving result in this group in pre and post data. Means there is significant different in within group analysis.

DISCUSSION

This study was aimed to document the effect of static stretching on hamstring tightness in those who have mechanical LBP. The current study's operational definition of hamstring tightness is a 20° knee-extension deficit with the hip at 90° in a supine lying position. The experimental study involved a total of 29 people. There were thirteen male participants and sixteen female participants. According to this study's operational definition, everyone had tight hamstrings. Flexibility is an important physiological component of fitness, and a lack of flexibility can lead to occupational inefficiency. Muscle tightness is a limiting factor for good physical performance and a significant intrinsic cause for sports injury. Tight hamstrings are an example of a muscle group that has a propensity to shorten. A tense hamstring increases the patellofemoral compressive force, which can cause low back discomfort. Radwan, Ahmed *et al* [22] conducted a study consisting of 72 participants with mechanical LBP including 41 females, 31 males. Hamstring length was detected indirectly using the Active Knee Extension method in the 90/90 position from supine. Thus it was found that persons with LBP had considerably more hamstring tightness than those without LBP. This leads to the conclusion that there is a link between hamstring tightness and LBP. According to the results presented in the preceding section, there is a significant improvement in all three outcome measures: Oswestry scores, NPRS scores, and hamstring tightness for data collected between the first and sixth weeks. After the sixth week, treatment was discontinued, and a follow-up was performed at the eighth week. When the data from the sixth and eighth weeks were compared, it was found that there is an increase in all the three outcome measures. As a result, it was determined that hamstring stretching treatment protocol reduces patients' low back pain, assists them in minimizing hamstring muscle tightness, and improves their functional ability while discontinuing the hamstring stretching treatment protocol increases low back pain and hamstring muscle tightness, as well as causes functional disability due to low back pain. Another study supported by Nelson RT, Bandy WD (2004)² consisting of 69 high school males with limited hamstring flexibility were recruited. Their objective was to determine if high-school-aged males' flexibility improved after a 6-week eccentric exercise programme. Furthermore, the changes in hamstring flexibility observed following the eccentric programme were compared to a 6-week static stretching programme and a control group (no stretching). They found that the gains made in range of motion of knee extension (indicating improvement in hamstring flexibility) with eccentric training were equal to those made by statically stretching the hamstring muscles. Thus, stretching programmes could be developed by therapists in the community as part of a workplace educational component. This would promote wellness, prevention, and treatment for mechanical LBP patients.²²

CONCLUSION

This study shows that static stretching, is effective in increasing hamstring flexibility of patients with mechanical low back pain there is significant improvement seen in hamstring muscle flexibility along with reduction in low back pain and improvement in functional disability This result suggests that there is further scope for the use of flexibility training in individual muscle group in a more functional type of activity and also work on patients with low back pain.

ABSTRACT

The study aimed to extract three different types of endophytic fungi, including *Lasiodiplodia parva*, *Mucor* sp., and *Fusarium oxysporum*, from *Tinospora cordifolia*. The antimicrobial properties of the fungal metabolites were tested against various human pathogens such as *Staphylococcus* sp., *Klebsiella* sp., *Pseudomonas* sp., and *E. coli*. Enzyme screening revealed that *Lasiodiplodia parva* generated protease, lipase, and amylase; *Mucor* sp. produced lipase and cellulase, and *Fusarium oxysporum* synthesized protease. Secondary metabolites of *Mucor* sp had the strongest antibacterial effect on *E. coli* (21 mm). *Fusarium oxysporum* and *Lasiodiplodia parva* both showed modest activity against *Staphylococcus* sp., each with a 14 mm inhibition zone.

Keywords: fungal endophytes, *Tinospora cordifolia*, secondary metabolites, antibacterial activity, Extracellular enzymes.

INTRODUCTION

The increase of world's population leads to changes in lifestyles, settlements, diets, and hygiene. Medicinal plants offer important compounds for medicines [1]. 80% of the world's population use herbal products for healthcare and immune support [2]. *Tinospora cordifolia*, (Guduchi), is an herbaceous vine from the *Menispermaceae* family native to India. It contains secondary metabolites such as palmatine, tinosporide, β -sitosterol, phenylpropanoids, norditerpene

Lakshmi Ajit et al.,

furan glycosides, diterpene furan glycosides, and phytoecdysones. These phytochemicals are used to treat dyspepsia, fevers, urinary diseases, antimicrobial, anticancer, antiperiodic, antispasmodic, antipyretic properties and anti-inflammatory [3]. Endophytic fungi, which produce compounds similar to those of their host plants, offer a great impact on drug development. This study emphasizes identifying fungal endophytes from *Tinospora cordifolia*, investigating their extracellular enzyme production and antibacterial activity against pathogenic bacteria.

MATERIALS AND METHODS

Isolation of Endophytic fungi

Tinospora cordifolia, collected from Kerala for its suitability to the tropical climate, and its root was surface-sterilized for the isolation of endophytic fungi, and Lactophenol cotton blue staining was used to determine morphological characteristics [4].

Molecular Identification

Genomic DNA was extracted using the method [5]. The nuclear ribosomal DNA region (18S rRNA) was amplified with universal primers ITS1 (5'-GGAAGTAAAGTCGTAACAAG-3') and ITS4 (5'-TCCTCCGCTTATTGATATAGC-3'). The resulting PCR products were visualized on a 1% agarose gel, and sequencing was performed using an ABI 3630 sequencer.

Screening of Extracellular Enzymes

Amylase activity was assessed using the method [6]. Protease activity was evaluated [7]. Lipolytic activity and cellulase activity both were also analyzed [8, 9].

Production of Secondary Metabolites and its Antimicrobial activity

The secondary metabolites were extracted [10], and their antibacterial activity was evaluated [11].

RESULT AND DISCUSSION

Isolation of Endophytic Fungi

Three endophytic fungi were isolated from the root of *Tinospora cordifolia*, labeled as TR1, TR2, and TR3 (Fig 1 & 2).

Morphological characteristics

TR1: Greenish-black, flat, circular colonies with a flat elevation.

TR2: White, circular colonies with a raised elevation.

TR3: Irregular colonies with an orange-red center, flat elevation, and filiform margin.

Molecular Identification

TR1 had 88% sequence identity to *Lasiodiplodia parva*, TR2 showed 96% identical matches to *Mucor sp.*, and TR3 had 97% similarity to *Fusarium oxysporum*. The consensus sequences were deposited in GenBank, and its accession numbers were PP593602 (TR1), PP593605 (TR2), and PP593607 (TR3) (Fig 3 & Table 1).

Screening of Extracellular Enzyme

Three endophytic fungal strains were isolated from the root of *Tinospora cordifolia* were screened for their extracellular enzyme activity such as amylase, lipase, protease, and cellulase. Both *Lasiodiplodia parva* and *Fusarium oxysporum* evidenced protease activity by clear zone around the colony upon the addition of saturated ammonium sulfate. All the three fungal isolates indicated a crystalline precipitate around the colony due to lipase activity upon the addition of Tween 20 (fig. 4). After the addition of iodine, *Lasiodiplodia parva* and *Fusarium oxysporum*, demonstrated amylase activity by a clear zone around the colony. Cellulase activity in *Mucor sp.*, and *Fusarium oxysporum* was confirmed by the presence of a clear zone by applying Congo red (fig 4). These results highlighted that endophytic

Lakshmi Ajit et al.,

fungal isolates can secrete different extracellular enzymes capable of degrading lipids, cellulose, proteins, and starch. This enzymatic activity suggests their potential applications in agriculture and the health care. Fungal enzymes are more stable compared to animals and plants, making them ideal for large-scale production [12].

Antibacterial Activity

Fusarium oxysporum revealed the highest activity against *Staphylococcus sp.* with a 14 mm inhibition zone, and 11 mm against *Klebsiella sp.* *Mucor sp.*, showed potent activity against *E. coli*, resulting in a 21 mm zone, while *Staphylococcus sp.* had an 8 mm zone. *Lasiodiplodia parva* also displayed strong activity against *Staphylococcus sp.* with a 14 mm inhibition zone and a 9 mm zone against *Pseudomonas sp.* The study highlighted the capability of endophytic fungi to produce natural compounds with inhibitory effects against human pathogens [13].

CONCLUSION

Tinospora cordifolia plant's root contains diverse endophytic fungi, such as *Lasiodiplodia parva*, *Mucor sp.*, and *Fusarium oxysporum*. These fungi proved to produce extracellular enzymes and secondary metabolites with therapeutic applications due to their antibacterial properties. Further research is essential to identify and analyze specific compound produced by these fungi.

ACKNOWLEDGEMENT

The authors thank The Management and The Principal of PSG College of Arts & Science, Coimbatore-14, for their benevolence in providing all the necessary facilities and support to carry out the research work.

ABSTRACT

Mass spectrometry, once considered an expensive and specialized technology, has now become a common tool in many clinical laboratories. It is the preferred technique for rapid sample analysis and is widely used in various applications. For example, HRMS is a popular method for analyzing new drugs, while MS/MS is used for the clinical study of amino acids in plasma and blood. Additionally, elemental analysis by ICP-MS is now widely used in clinical laboratories for the quantitation of toxic metals and trace elements in a wide range of samples. Mass spectrometry plays a significant role in human sport doping management, toxicology applications, drug analysis, and hazardous metal tests. The introduction of sophisticated MS platforms such as tandem mass spectrometry (MS/MS), time-of-flight (TOF), and Orbitrap systems has revolutionized the detection of a wide range of medications, metabolites, and toxins in complex biological matrices such as blood, urine, and tissue samples. These technologies assist both normal and emergency clinical applications by enabling precise quantification of chemicals at trace quantities, quick screening, and confirmatory testing. The advanced uses of MS in toxicology are explained in this review, with particular attention paid to different setups, approaches, and the clinical relevance of using MS in both standard and specialist toxicology labs.

Keywords: Mass spectrometry, ICP-MS, Clinical applications, Clinical toxicology, Forensic toxicology

Purna Nagasree *et al.*,

INTRODUCTION

In recent years, mass spectrometry (MS) once thought to be an extremely expensive and specialized technology for everyday use has become common place in many clinical laboratories. Technology advancements, the introduction of bench top systems, improved operational simplicity, lower capital requirements, and more user-friendly software systems have all contributed to this quick expansion. Mass spectrometry has become a very attractive platform for clinical practice due to recent developments. However, the implementation of this technology in many routine clinical laboratories is hindered by apprehension due to its complexity, relatively high capital investment, personnel training, and requirement for in-house method development and validation(1). The foundation of MS is in its capacity to impact charged particles' motion using electric and magnetic fields. As a result, charged particles can be separated according to their mass-to-charge (m/z) ratios. Mass spectrometry is a device that weighs molecules that have been transformed into ions. For an analysis to be performed by a mass spectrometer, the analytes must be ionized, or positively or negatively charged. Furthermore, any other charged or possibly ionizable substances present in the sample may act as an interference for the target analyte. Samples must be handled carefully before analysis, and sample preparation can range from "dilute and shoot" to a highly involved process. Extractions in the liquid-liquid or solid-phase are frequently employed(2). Although materials can be put straight into a mass spectrometer, the usual procedure for separation involves first isolating the desired chemicals from the matrix using gas or liquid chromatographic techniques. The chromatograph's effluent is ionized upon separation. The mass-to-charge ratio of the generated ions is used by the mass analyzer to separate them. In the end, the data analysis system reports the ions that have been "recorded" in the detector(3). Fig. 1 displays a schematic diagram of a general mass spectrometer. Mass spectrometry is the preferred technique when a rapid sample analysis is required. Chromatography-MS techniques differ largely at the sample introduction. The components of the MS instrumentation are the ion sources, detector, and mass analyzer. The problem of forensic analysis lies in the possibility of lowering the time and cost of analysis each sample. One of the primary analytical objectives of toxicology is to ascertain whether drug metabolites are present in biological samples or not. In this sense, the ambient ionization technique in conjunction with mass spectrometry has enabled full sample analysis without requiring extensive sample preparation. The idea of open-air surface examination directly under ambient circumstances is made possible by these technologies, which are particularly useful for surface investigation of materials avoiding many, if not all sample preparation steps typically required(4). High-Resolution Mass Spectrometry (HRMS) can distinguish between compounds with similar nominal masses and measure masses accurately, it is currently used extensively in conjunction with ambient mass spectrometry to provide full-scan MS and MS/MS data that can be used to search for any analyte without the need for sample pre-treatment. As a result, precise m/z values are provided which can be utilized to create chemical formulae with a mass accuracy of less than 5ppm. Since HRMS may be used in many configurations with interchangeable ionization sources and advanced data collecting capabilities, it is a popular method for analyzing new drugs(5). The categorization of ambient ionization mass spectrometry is based on the desorption technique, which will be covered in the upcoming commonly employed methods for analyzing drugs of abuse(6).

ESI Interface

As mentioned earlier, during an Electro spray Ionization (ESI) analysis, the mobile phase helps get the sample to the source. The LC capillary tip, which is surrounded by the drying gas stream (usually nitrogen at a flow rate of 5–15 ml min), is where the desolvation process begins. The Taylor cone is formed by eluent surface deformation in an electric field (potential differences between the heated capillary and the LC capillary tip can reach up to 5–8 kV). While skimmers capture neutral particles and other impurities, the stream of dry ions reaches the mass spectrometer due to another electric potential difference, this time between two ends of the heated capillary. Analyte ions are subsequently sent to the analyzer for quantification. Skimmers are crucial because they keep the instrument's differential pumping inside. In order to force in-source fragmentation, potentials between the heated capillary and skimmers can be adjusted. All ions will fragment in this way, hence pure material must be injected to prevent the formation of a complex mixture of fragmented ions originating from different molecules(7).

Purna Nagasree *et al.*,

APCI Connection to MS

APCI (Atmospheric Pressure Chemical Ionization) takes place when the charge transfer reactions that result in the production of ions in the vapour phase. With the exception of applying a high potential (corona discharge) to the spraying zone, which is the area between the MS inlet and the LC needle, this interface is constructed similarly to ESI. A setup like this generates an electric discharge that successfully ionizes the surrounding gas molecules and charges the mobile-phase species. These charges are then transferred to the analyte molecules via charge exchange or proton transfer. When analyzing small compounds that don't break down thermally, an APCI source is used. In comparison to standard ESI interfaces, it can handle larger flow rates (8).

APPI Interface

Photoirradiation is used to ionize the desolvated droplets, often with the aid of a krypton lamp (10eV). Photons are absorbed by analyte molecules, which then transform into ions when the supplied energy surpasses the species ionization potential. This process can be run in both positive and negative modes, just as ESI. Irradiation in the spraying zone is made possible by the connection of APPI (Atmospheric Pressure Photoionization) with the chromatographic column for the identification of molecules that are difficult to ionize, such as weakly polar or nonpolar analytes (9).

LC Connection to MALDI-MS

An example of an offline connection type would be connecting LC to MALDI-MS (Matrix Assisted Laser desorption/ionization – Mass Spectrometry). Once the spotter is attached to the LC capillary output, automation of the process is simple. Automatically handling the eluent and depositing fractions on the Matrix Assisted Laser desorption/ionization (MALDI) target plate is the function of the fraction collector, also referred to as the spotter. Tiny amounts of LC eluent usually 5–50 µl, can be accurately detected. Furthermore, matrix solution is automatically added. This makes it possible to prepare target plates without the operator's help. This interface allows for a very large sample capacity and allows for the observation of many target plates. The MS analysis might be shortened by spotting samples at different times. Piezoelectric spotters are also used to deliver much smaller nanoliter amounts (10). MS/MS is used in the clinical investigation of amino acids in blood and plasma using liquid secondary ionization, often known as fast ion bombardment (FIB). Manual sample introduction techniques were required in the initial study. Semi-automatic flow injection was created using FIB ionization to facilitate automated sample introduction and boost throughput (11). This method was somewhat challenging however, due to problems with sample retention on the probe tip and frequent capillary occlusion at the probe surface. The introduction of electrospray ionization greatly enhanced automated sample analysis and sample throughput. After successful validation processes used in clinical amino acid investigations or newborn screening, ESI-MS/MS has been demonstrated to be a rapid, accurate, and dependable method for high sample volume, fast throughput and amino acid assays (12).

Gas Chromatography Combined with Mass Spectrometry (GC-MS)

Since LC analysis is done in solution, ionization sources like pressure chemical ionization (APCI) and ESI can be connected online to the LC system. In contrast, the chromatographic apparatus requires an offline connection for the MALDI source. The solvent flow rate is the most crucial factor to consider. The basic norm is that sensitivity increases with decreasing flow rate. This means that although flow rates ranging from 0.1 to 1 ml/min can be used, flow rates as low as 100–500 nl/min provide the best sensitivity results. A nano ESI is connected for direct to MS in these situations (13). Inductively coupled plasma ionization (ICP), which is commonly used for metals determination using ICP-MS, and matrix aided laser desorption ionization (MALDI) which is used to ionize solid samples for MS analysis, are further ionization techniques for elemental analysis. Since MALDI techniques are not commonly utilized in toxicological applications they will not be used. Additionally the emphasis will be on the more popular EI, ESI, and ICP ionization techniques used for toxicological applications, even though modern GC-MS and LC-MS equipment can normally switch between EI/CI and ESI/APCI ionization methods, respectively (14). Among the advantages of LC-ICP-MS are its ability to measure numerous elements, metal speciation, and a wide dynamic range with precise and accurate trace metal readings. ICP-MS frequently has detection limits in the low ng/L range, which is useful for

Purna Nagasree *et al.*,

measuring trace elements or dangerous metal concentrations that are low. One significant disadvantage of ICP-MS applications for metals analysis is polyatomic interferences. These kinds of interferences happen when two or more atomic ions from the sample matrix units to produce molecules that have the same m/z as analytical targets. For example, argon plasma gas (40 Da) can be combined with a chloride ion (35 Da) or carbon (12 Da) from the biological matrix to produce argon chloride (75 Da) and ArC (52 Da) ions. ArCl and ArC have the same m/z as arsenic and chromium, two elements that are commonly included in harmful metal surveys employing ICP-MS. In order to increase specificity by reducing isobaric or polyatomic interferences, several collision/reaction cell applications for ICP-MS have been developed thus far. In order to counteract isobaric interferences from the plasma, quadrupole ICP-MS devices employ dynamic reaction cells (DRCs), which react a reactive gas with either the analyte (ion) of interest or an isobaric molecule (ion) to separate the two. Alternatively, the quadrupole may work as a collision cell in the presence of an inert gas. In this scenario, it will interact more favorably with polyatomic ions that have larger radius, lowering their kinetic energy and enabling kinetic energy discrimination (KED) to resolve polyatomic interferences from the target analyte. Polyatomic interferences can be broken up using collision-induced dissociation (CID) in a triple quadrupole ICP-MS/MS before MS detection, or they can be resolved using a higher resolution instrument (such as a double focusing sector ICP-MS) by precisely determining mass. The quantification of toxic metals and trace elements in a variety of samples, such as whole blood, serum, plasma, urine, and dry spots of these liquid samples (using laser ablation with ICP-MS), is now done in clinical laboratories due to the high specificity, sensitivity, and reproducibility of elemental analysis by ICP-MS. Samples must be collected in tubes free of metal in order to produce accurate results. Other sample types used in forensic toxicology include urine, hair, nails, tissue, and other forensic materials (15).

Clinical Toxicological Assay

Toxitude A1 (used for solid-phase extraction) and 5 ng/mL of deuterated (d_5) analogues were used as internal standards (IS) for the extraction of urine and blood. Following ten minutes of horizontal stirring and five minutes of centrifugation at 3500 rpm, the organic extract was poured into a glass tube and allowed to evaporate at room temperature while being gently blown dry with a mild airstream. After the fragments were put into glass vials, 250 mL of methanol was used to reconstitute them. The chromatographic system was injected with ten microliters using a partial loop injection mode (16). Hair extraction to remove fat residues from hair, ethanol was used once and dichloromethane was used twice for five minutes each time. As internal standards, the hair was cut into sections using scissors, and 20 mg of cleansed and chopped hair were treated with 100 pg/mg of deuterated amphetamines and analogues. Hair samples were digested with 1 M sodium hydroxide for 15 minutes at 80°C. Three milliliters of a hexane/ethyl acetate (2/1) combination were used for a ten-minute liquid-liquid extraction. After centrifugation, the organic layer was filtered through Polytetrafluoroethylene (PTFE) 0.2mm and allowed to evaporate at ambient temperature. Glass vials containing 100 mL of a 50/50 methanol/water solution were used to reconstituted the residues. The chromatographic apparatus was injected with ten microliters (17).

Drug analysis by GC-MS

Regular applications with the sensitivity and specificity of MS could be created by combining GC and MS. GC is an analytical separation technique that separates molecules into gas and stationary phases. It makes use of a gas mobile phase and a liquid or polymer stationary phase. The process usually involves high temperatures or temperature gradients (up to 350°C) to promote compound elution into the mobile gas phase. The analytes are separated into groups according on their column retention durations, and then they go into the gas phase of the MS for ionization. To help with MS detection, EI sources are frequently used. By employing the kinetic energy of a stream of high energy electrons (typically 70 eV) to extract electrons from analyte molecules at high temperatures, EI ionization produces a consistent fragmentation pattern from organic substances. As a result, extensive EI-GC-MS libraries have been developed for identification based on spectrum matching, and interlaboratory spectral comparisons benefit from EI-GC-MS data. These libraries greatly improve GC-MS based compound identification and supplement "in-house" produced libraries. EI-GC-MS is presently a very successful technique for the untargeted detection and quantification of tiny molecules with MS specificity due to this analytical advantage. EI-GC-MS is still used for broad unknown screening applications with nearly any kind of sample. Additionally, GC-MS is commonly used to validate

Purna Nagasree *et al.*,

IA positive results from drug screens in clinical toxicology. The correct functioning of GC-MS requires that the analytes be both heat stable and volatile. Therefore, in order to render the drugs sufficiently volatile for GC-MS analysis, some analytes need to be chemically derivatized. This limits GC-MS's ability to investigate a wide range of drugs and raises the costs and complexity of sample preparation procedures.

Clinical Applications of MS in Toxicological investigations

The diagnosis or definitive exclusion of an acute or chronic poisoning is crucial in clinical toxicology. Patients who are dependent on illegal substances, alcohol, or medications also need to be monitored closely. There are many different areas in forensic toxicology, and each has different requirements for the breadth and depth of screening. Broad-spectrum screening is recommended in the following areas: post-mortem toxicology, driving while intoxicated, child welfare, drug-facilitated crime, and investigation. Drug testing in the penal system, the workplace, and the military forces are among the settings focused on drugs of abuse. The same kinds of specimens used in clinical toxicology are also used in clinical forensic toxicology. But unlike clinical toxicology, the forensic environment places more value on analytical findings that can be supported in court. As such, a confirmation step ought to be conducted in conjunction with screening in forensic toxicology, either concurrently with the same analytical run or independently. Considering that someone who tests positive for an unlawful drug may face consequences, the treatment of drug-dependent individuals falls between the horizon of clinical and forensic toxicology. It is standard practice in post-mortem toxicology to use two distinct specimens and two distinct procedures. Because of the varied and frequently deteriorated character of the specimens as well as the wide variety of specimens accessible for investigation, applying analytical techniques in post-mortem toxicology is frequently more challenging than in other forms of forensic toxicology. It is important to thoroughly validate methods for the specific post-mortem specimen being used. In addition to blood, urine and vitreous humour can be useful specimens. In certain situations, solid tissues like the liver and the contents of the stomach can also be used(18). Uses for human sport doping management Early uses of TOFMS in doping control included quantitative measurements of β 2-agonists and qualitative specific analysis of steroids. Initially, TOFMS was applied to a single target analyte or a specific class of chemicals, as opposed to a variety of distinct compound kinds. The most popular ionization method is ESI because it works well with polar metabolites and a variety of target analytes, ranging in size from small to big molecules. Analysis of non-polar anabolic androgenic drugs has been done using APCI(19). As of right now, For use in toxicology, MS and its hyphenated applications (GC/LC/ICP-MS) are powerful analytical tools. Generally speaking, elemental analysis is carried out using ICP-MS for metals determination, non-volatile and heat-labile compounds are analyzed using LC-MS, and volatile and heat-stabilized compounds are studied using GC-MS. Because of the analytical versatility of MS methods which have exceptional specificity, sensitivity, dynamic range, and the ability to screen a vast number of unrelated substances. MS applications are crucial for toxicological evaluation of pharmaceuticals and toxins. In addition to specialized applications (like TDM and pain management) and screening applications (like drugs of abuse (DOA), forensic toxicology, environmental toxicology, and clinical toxicology), drug analysis is currently utilized in pharmacokinetic/pharmacodynamics (PK/PD) research. Here we concentrate on the capabilities and corresponding toxicity applications of GC-MS, LC-MS, ICP-MS, and MS/MS(20).

Applications of MS/MS and LC-MS

- A. The initial use of MS/MS was for the clinical investigation of amino acids in blood and plasma using liquid secondary ionization (fast ion bombardment, or FIB). Manual sample introduction techniques were required in the initial study. Semi-automatic flow injection was developed using FIB ionization to facilitate automated sample introduction and boost throughput. However, this method was somewhat time-consuming due to problems with sample retention on the probe tip and frequent capillary occlusion at the probe surface. The introduction of electrospray ionization greatly enhanced automated sample analysis and sample throughput. After successful validation processes used in clinical amino acid investigations or newborn screening, ESI-MS/MS has been demonstrated to be a dependable, quick, and accurate method for high sample volume, fast throughput, and amino acid assays (21).

Purna Nagasree *et al.*,

- B. One new use of protein profiling in proteomics and MS is the identification of bacterial isolates. Bacteria are isolated from unkind individuals, cultivated on agar plates for a night, and then cleaned. A 500 nL sample from one colony is cleaned and diluted. After that, a stainless steel target was placed on 500 ml of the diluted solution and an equivalent volume of sinapinic acid matrix, and MALDI-ToF analysis was performed. The top panel shows a spectrum of *Escherichia coli*, and the bottom panel shows a spectrum of *Staphylococcus aureus*. *S. aureus* was digested using lysozyme, which is seen in the spectrum as the big peak at 14000 Da. Even if most individual proteins or peptides are not found in these spectra, the profiles for each bacterial isolate are unique. This suggests that MS may be able to identify bacteria based on a distinct peptide pattern or fingerprint. The reproducibility of data indicates that research and development efforts are concentrated on creating fingerprint (interpretation) design and industrial high-throughput technologies. The FDA's analytical scientists are coordinating efforts to standardize protocols. The process of identifying tumor markers. Tumor marker identification and characterization represents another possible application of protein profiling in clinical laboratory settings. The following laboratory data were microdissected from a single patient's frozen tissue using laser capture micro dissection, normal breast epithelium, invasive ductal carcinoma of the breast, and metastatic ductal carcinoma. It is evident that the spectra of tumor cells differ from those of normal cells. This "fingerprint" acts as a quick identification tool for different kinds of tissue. It might be especially helpful in determining the original site of metastasized malignancies.
- C. MS is the best instrument for analyzing altered or peculiar nucleic acids, nucleosides, or nucleotides. These DNA components lend themselves very well to examination using electrospray ionization. Numerous techniques have been published for measuring nucleic acids particularly in the context of tumor marker urine. When it comes to oligonucleotide analyses, these little DNA fragments are a great indicator of disease-causing mutations. There are various more genetic uses of MS in clinical research that are more adequately and thoroughly addressed in other studies. New assays have been created for clinical illnesses.

GC-MS applications for toxicology

When compared to its LC-MS/MS counterpart, GC-MS does have a few advantages. These include: improved chromatographic resolution and peak capacity for efficient GC separation, a homogenous gas mobile phase (typically hydrogen or helium), precise electronic controls for temperature programming to optimize separation conditions, and the capacity to search EI-MS databases for library-based toxic compound identification. When paired with good MS sensitivity (1–10 µg/L) and specificity, GC-MS is a prominent tool for the general screening of unknown drugs or harmful compounds in doping control, environmental analysis, and clinical and forensic toxicology (22). In doping control, environmental analysis, and clinical and forensic toxicology, GC-MS is a widely used method for the general screening of unknown substances or hazardous compounds when combined with good MS sensitivity (1–10 µg/L) and specificity (22). Additionally, it is frequently employed in forensic investigations and clinical evaluations of toxidromes to conduct drug screenings for the purpose of identifying and quantifying poisons. GC-MS is commonly used to quantify a variety of medications, including barbiturates, opioids, stimulants, anaesthetics, anticonvulsants, antihistamines, anti-epileptic drugs, sedative hypnotics, and antihistamines. In environmental toxicology, GC-MS can be used to easily screen for a variety of hazardous compounds, including sulfur analysis in air, dioxins, dibenzofurans, organo-chlorine pesticides, herbicides, phenols, halogenated pesticides, chlorophenols in water and soil, or polycyclic aromatic hydrocarbons (PAH). One point to note is that for targeted drug screenings in clinical and forensic toxicology applications, the majority of toxicology laboratories with the financial means are gradually switching from GC-MS to LC-MS. Last but not least, because MS detection has a higher specificity than enzymatic spectrophotometric tests, GC-MS is occasionally used to identify and quantify volatile chemicals in bodily fluids including blood and urine, such as ethanol, methanol, acetone, isopropanol, and ethylene glycol(23).

ICP-MS applications in clinical toxicology

ICP-MS is commonly used for multi-analyte hazardous metal testing in whole blood, plasma, serum, and urine. Both acute and chronic metal exposure can generally be assessed using blood and urine analysis, and the results can be better understood by comparing them to reference values from other parts of the world. More recent applications of laser ablation in conjunction with dried blood or urine spots for multi-analyte metal analysis have been reported. The

Purna Nagasree *et al.*,

multi-analyte ICP-MS metal panels can include up to dozens of targets, including lead, mercury, arsenic, cobalt, chromium, manganese, molybdenum, nickel, titanium, aluminum, and silver. Because lead has negative effects on development, it is frequently examined in children. Exposures can also happen from older lead water pipes in buildings, paint that contains lead, or environmental buildup from gasoline that has historically contained tetraethyl lead. Eating carnivorous fish can expose oneself to mercury exposure because these species typically have high levels of mercury in them due to environmental contamination. There have also been reports of exposures to mineral mercury leaking from dental amalgams. To differentiate exposures from seafood and dental amalgams, mineral mercury is often measured in plasma and methylmercury (MeHg) in whole blood. Although arsenic has been used to deliberately poison people, contaminated ground water can also unintentionally expose people to the chemical. It has been demonstrated that individuals with different metal replacement joints or dental implants have toxic levels of cobalt, chromium, manganese, molybdenum, nickel, and titanium. In addition to being the focus of toxicological debates linked to vaccine side effects, aluminum is frequently measured in plasma to monitor hemodialysis patients. Although silver has long been employed as an efficient bactericide, excessive exposure to metal can cause argyria as well as neurologic, hematologic, renal, or hepatic involvement with blood silver hazardous levels, according to reports (24).

ICP-MS applications in forensic toxicology

Metal poisoning deaths are rare and frequently unexpected, blood testing for conventional metal poisons (such as arsenic and thallium) toxic heavy metals (such as arsenic, lead, cadmium, and mercury) other toxic metals (such as aluminum, chromium, cobalt, molybdenum, nickel, vanadium, or tungsten) or drugs (such as contrast media) is frequently performed in relation to all unexplained deaths. ICP-MS forensic metals analysis has the benefit of accepting sample types other than blood or urine. Forensic or clinical toxicology analyses a variety of samples including hair and nails by combining laser ablation with ICP-MS detection. Urine and blood typically indicate exposure during the previous few hours or days. Hair is a cumulative sign for longer-term exposure as opposed to blood or urine. One centimeter of hair can be used to check for a longer window of exposure because it can represent one month of exposure in clinical and forensic toxicology research. It is possible to differentiate between a single exposure and a chronic exposure by comparing blood or urine data with hair samples from a particular developmental stage. Additionally, nails can serve as a biomarker for forensic metals analysis using ICP-MS. During linear growth and thickening, blood components are integrated into nails, providing a three to five month window for detecting exposure to dangerous metals (25). Because nail collections are non-invasive and contain more disulfide groups, which aid in incorporating more metal content, they are a preferred matrix for metals analysis when hair is unavailable due to balding or other conditions (such as religious views). This allows for a longer window of detection. Lastly, when external contamination affects hair and nails and blood and urine are not available, or when biopsies of specific organs need to be checked for metal buildup, tissue and biopsies for metals analysis by ICP-MS become essential (26).

ICP-MS applications of hair, nails & tissues in clinical toxicology & forensic toxicology

Along with more conventional matrices like blood and urine, ICP-MS analysis of metals and metalloids applied to hair, nail, and tissue in clinical toxicology and forensic toxicology has been gradually rising. Since each centimeter of hair represents the exposure over the previous month, hair and nails are important cumulative biomarkers of long-term exposure, unlike blood or urine, which only reflect exposure over the previous few days or hours. This makes it possible to date exposure and is very helpful in interpreting results from forensic and clinical toxicology. In addition, the sample size is less and the hair and nail collection is non-invasive. Quantification of metal in tissues is another interesting application, especially in forensic circumstances where standard fluids like blood and urine are unavailable (27).

ICP-MS applications to hair

Arsenic in hair was the first instance of xenobiotic analysis in this matrix around the end of the 1800s. The metallic profile of hair as measured by ICP-MS is a special challenge because it indicates exposure to a broad panel of elements over a lengthy period of time, with each centimeter representing a month. Hair samples, which can be

Purna Nagasree *et al.*,

utilized to differentiate between a single exposure and continuous contact by segmenting the hair during a specified growth period, are required in addition to blood and urine tests. Moreover, hair can be an important clinical and forensic specimen when the metal content of normal biological materials, such as blood and urine, has been eliminated by natural processes. Cleaning procedures, sample digestion, analytical techniques (especially ICP-MS), the normal ranges of metals and metalloids in hair, and data interpretation are all included in the examination of hair. Hair metals and metalloids should be regularly cleaned with acetone and water, according to the International Atomic Energy Agency. To break down the organic matrix, an acid sample of roughly 20 mg is usually mineralized after the washing procedure. After that, an ICP-MS analysis is performed on the diluted solution. However, because of irreversible external contamination, metal/metalloid hair analysis is not recommended to monitor occupational professional exposure to elements. Recent thorough evaluations of hair analysis can be useful to complete this section. To record exposure to these elements, metals and metalloids in hair must be analyzed in addition to the routine usage of biological fluids such as blood and urine (28).

ICP-MS applications to nails

Because they have more disulfide chemical groups than hair, which let them retain more metals and metalloids, fingernails and toenails have some advantages over hair. In addition, nail development is more consistent than hair growth and is less impacted by hair-related cosmetics. Furthermore, since shoes shield toenails from the elements, hair is less susceptible to pollution from the outside world than toenails. One major disadvantage is that the section corresponding to a recent exposure is located in the matrix, making it challenging to access. Since elements are incorporated into nails through the nail bed during thickening growth and blood assimilation into the matrix during linear growth, the presence of elements in nail clippings is linked to a prior exposure of three to five months. There are a lot of published studies on this topic that use either single or multi elemental analysis. Certain series have compared the element concentrations in the same person's hair and nails, fingernails and toenails, and sometimes urine. These scientists concluded that for measuring element exposure overall, toenails in particular are better indicators than hair. In conclusion, nail collection is a non-invasive and intriguing substitute for hair, especially for bald individuals or those who are prohibited from having their nails sampled for religious purposes. In human toxicology, nail analysis can be viewed as an adjunct to hair analysis for tracking element exposure. Furthermore, a small 20 mg nail sample may be subjected to ICP-MS analysis (29).

ICP-MS applications to tissues

In addition to the typical matrices (blood and urine), hair and nails are important in clinical and forensic toxicology because they provide information on metal/metalloid exposure over a long period of time. Not to mention that hair and fingernails may be affected by outside pollutants. When blood and urine are absent from embalmed or decomposed cadavers, ICP-MS tissue analysis is actually the only technique available to identify a fatal outcome because of an element. In some cases, significant tissue concentrations are observed. Normal values for autopsy tissue and biopsy samples can be assessed using ICP-MS single or multi-elemental analysis. As with other biological matrices, the correctness of the results must be confirmed using certified material. In 2009, the 34elemental approach was described for evaluating normal tissue metal/metalloid concentrations in a range of tissues (brain, heart, kidney, liver, lung, and muscle) using 40 mg of tissue. Since the sample size may be reduced to 10 mg, biopsy samples can be subjected to multi elemental ICP-MS analysis (30). Table 1 shows a typical sample preparation for tissue, hair, nails, urine, plasma, or whole blood. To put it briefly, each sample uses a 0.3 ml volume of whole blood, plasma, or urine. Otherwise, pure nitric acid is used to digest 20 mg of tissue or 40 mg of nail or hair for an hour at 70°C. A portion of the digest solution is diluted in a dilution solution prior to analysis. Fingernails and toenails have certain advantages over hair because they contain more disulfide chemical groups, which enable them retain more metals and metalloids. Furthermore, nail development is less affected by traditional hair cosmetics and is more steady than hair growth. Additionally, compared to hair, toenails are less vulnerable to the damaging effects of external pollutants since they are protected by shoes. The section corresponding to a recent exposure is included in the matrix, which is a major disadvantage because it is not easily accessible. Because components are integrated into nails through the nail bed during thickening growth and by blood incorporation into the matrix during linear growth, their presence in nail clipping is linked to a prior exposure of three to five months. Finally, nail collection is noninvasive and provides an

Purna Nagasree et al.,

interesting alternative to hair, particularly when a person is bald or cannot be sampled due to religious beliefs. ICP-MS analysis may also be performed on a little 20 mg nail sample. Goullé JP et al. determined that 34 components in the fingernails and toenails of 50 healthy adults have a metallic character. The main results are shown in Table 2.

CONCLUSION

Mass Spectrometry is a very powerful technique in toxic substances identification, forensic analysis and in personalized medicine identification through pathology in clinical studies. MS tools like ICP-MS is used as advanced technique for identification of toxic metals in hair, nails and urine. ICP-MS is a sensitive technique where metals can be detected at very low concentration. This helps in patient monitoring and clinical diagnosis is made easy. In difficult situations including novel psychoactive drugs (NPS), undiscovered toxins, and therapeutic drug monitoring (TDM), MS-based toxicological techniques are very helpful. Additionally, by offering precise results with less sample preparation and quick turnaround times, MS improves the treatment of poisoning situations. Overall, mass spectrometry and its hyphenated applications are proving to be reliable, fast, and accurate analytical tools across various fields.

ACKNOWLEDGEMENTS

We express our deepest sense of gratitude to our chairman of Raghu college of pharmacy, sriKalidindi Raghu for providing necessary facilities

ABSTRACT

In a progressively interconnected world, the complex character of information is essential for fostering social growth in various societies. This study examines the importance of knowledge as a dynamic resource that impacts multiple aspects of societal development, including economic growth, educational achievement, and social equality. Through the analysis of case studies from various areas, we demonstrate how access to diverse information formats, namely digital, visual, and experiential, empowers individuals and communities to make informed decisions, stimulates creativity, and improves civic involvement. Additionally, we examine the obstacles presented by information inequality and the digital divide, which may impede equitable growth. This study emphasizes the need to foster inclusive information ecosystems that address many needs and viewpoints, hence enhancing comprehensive social development and resilience in a swiftly evolving global environment.

Keywords: Additionally, we examine the obstacles presented by information inequality and the digital divide, which may impede equitable growth.

INTRODUCTION

Information is an abstract concept that possesses the capacity to inform. The English term "information" is derived from the Middle French words *enformation* or *information*. The term 'information' is etymologically linked to the Latin word 'information,' which denotes conception, instruction, and creation (**Sheldon, 2024b**). Information is an abstract concept that denotes a facet capable of fulfilling an individual's inquiry. At its core, the information relates to the interpretation of anything that can be actualized. In the contemporary digital age, information is more accessible, potent, and plentiful than ever before. The Internet has transformed the acquisition, sharing, and dissemination of information, facilitating immediate global connectedness and the democratization of knowledge (**Baudry & Monperrus, 2015**). Currently, online platforms, search engines, and social media serve as primary sources of information for persons worldwide for effective utilization. The purpose of the study "Information in Multiple Facets and its Importance in Diverse Social Development" is probably to investigate the different aspects of information and how important it is for fostering empathy, creativity, and social cohesiveness in a variety of social contexts.

REVIEW OF RELATED LITERATURE

In the digital age, the idea of information has changed dramatically, impacting many aspects of social growth. Gaining knowledge about the ways in which information functions in various contexts can help one better understand how it promotes empathy, creativity, and social cohesiveness in a variety of cultures. **Shannon and Weaver (1949)** established the foundation for comprehending information as a quantifiable thing. They underscored the significance of clarity, precision, and pertinence in communication, which are essential for effective social advancement. **Vygotsky (1978)** asserts that social interactions and cultural settings influence the process of knowledge acquisition. This approach emphasizes the significance of many information sources in promoting community engagement and growth. Studies demonstrate that access to varied information fosters social cohesion by facilitating understanding and diminishing prejudices (**Putnam, 2000**). Communities with abundant informational resources are more adept at fostering constructive debate, resulting in enhanced social cohesion. Empathy is essential for social growth, and information can facilitate empathic reactions. Research by **Batson et al. (1997)** indicates that exposure to many narratives can improve sympathetic comprehension, therefore fostering social cohesion. The correlation between information and innovation is extensively recorded. **Nonaka and Takeuchi (1995)** contend that knowledge development is a social process that flourishes on varied information inputs. This is especially pertinent in multicultural environments where diverse viewpoints can result in unique solutions.

Comparative research elucidates the distinct methods by which other cultures employ information to promote social development. **Hofstede's (1980)** cultural aspects theory exemplifies the impact of cultural values on information processing and distribution. According to Collins English Dictionary, information is "1. an informing or being informed; esp., a telling or being told of something 2. something told; news; intelligence; word 3. knowledge acquired in any manner; facts; data; learning; lore 4. a person or agency answering questions as a service to others 5. in information theory and computer science, a precise measure of the information content of a message, measured in bits and ranging from zero when the entire message is known in advance to some maximum when nothing is known of its content 6. any data that can be stored in and retrieved from a computer". According to OED: Oxford English Dictionary, the historical English Dictionary, information is: "Knowledge communicated concerning some particular fact, subject, or event; that of which one is apprised or told; intelligence, news". According to Wikipedia, "Information is an abstract concept that refers to that which has the power to inform. At the most fundamental level, the information pertains to the interpretation (perhaps formally) of that which may be sensed or their abstractions". According to the Online Dictionary for Library and Information Science (ODLIS), Information is: "Data presented in a readily comprehensible form to which meaning has been attributed within the context of its use. In a more dynamic sense, the message is conveyed by the use of a medium of communication or expression. Whether a specific message is informative or not depends in part on the subjective perception of the person receiving it". "More concretely, all

**Rama Pal and Mohammad Nasir**

the facts, conclusions, ideas, and creative works of the human intellect and imagination that have been communicated, formally or informally, in any form”.

Objective of the Study

The research's core objectives can be classified into three essential domains. Each purpose seeks to investigate various aspects of how knowledge impacts social development throughout different cultures.

- To give a thorough explanation of the idea of information in all of its aspects and the role it plays in various stages of societal growth.
- To recognize the different aspects of knowledge and how they contribute to the development of empathy, creativity, and social cohesiveness.
- to investigate the ways in which various types of information can be used to improve empathy and social cohesiveness in communities.
- To predict possible results of employing knowledge across several domains to improve social cohesiveness and foster innovation in different contexts.

Data, Information, Knowledge, and Wisdom

Data must constantly be processed to render it meaningful. Consequently, data transforms into information, knowledge, and wisdom in succession. The Data-Information-Knowledge-Wisdom (DIKW) framework illustrates the progression from raw data to significant insights through successive phrases (Cotton, 2023).

- D for Data;
- I for Information;
- K for Knowledge; and
- W for Wisdom.

DIKW represents a sequential process characterized by a hierarchical paradigm, sometimes illustrated as a pyramidal structure with facts at the base and wisdom at the pinnacle.

Types of Information

Typically, there are four categories of information: Factual, Analytical, Subjective, and Objective.

Factual information

Information that is factual is linked to facts. Almanacs, manuals, handbooks, encyclopedias, and other reference books are the best source of factual knowledge. Interviews, recipes, instructions, news stories, conversions between various measurements, national and international events, historical documents, and more are examples of factual information.

Analytical information

By offering a higher degree of insight and interpretation, analytical information aids in our comprehension of the correct meaning and significance of factual information. Bar charts, pie charts, statistical analyses, tabular data presentation, statistical mathematics, graphical measures, and more are examples of analytical information.

Subjective information

Numerous sources, such as books, journals, websites, and book reviews, contain subjective information. This kind of information is distinguished by its dependence on accepted facts as well as by the inclusion of subjective viewpoints, unique experiences, and emotional states, all of which add to its intrinsically diverse and personal character. Such data, as opposed to just objective data, offers a more personalized and detailed perspective. Textual information, facts presented in significant main sources of information, experiences communicated, etc.

**Rama Pal and Mohammad Nasir****Objective information**

Facts on file, common reference books, directories, etc. are examples of sources of objective information. Objective information is documented to provide a thorough grasp of a topic. Information for instant reference, verified facts, evidence-based details, and other similar kinds are examples of objective information.

Types of Information Sources

To make it readily usable, information is produced in a variety of methods and recorded in a number of sources. We obtain our information from a variety of sources, including records, people, organizations, and the media. Every one of these information sources is essential for supplying insightful data. These resources are essential for both individuals and organizations because they foster well-informed decision-making, improve comprehension, and provide a comprehensive viewpoint on a range of topics.

Documentary Sources of Information

Information from documentary sources includes a wide variety of recorded recordings, regardless of their format or topic. These documentary sources are systematically divided into the following categories, according to library and information science experts:

Documentary sources, according to Dr. S. R. Ranganathan

Documentary sources of information fall into four different types, according to library science pioneer Dr. S. R. Ranganathan. These classifications, which show how information formats have changed over time and are based on their physical characteristics, consist of:

Conventional: Such as books, periodicals, maps, and atlases.

Non-Conventional: Including standards, specifications, patents, and data.

Neo-Conventional: Comprising audio recordings, visual materials, audio-visual content, and microforms.

Meta Documents: Encompassing documents created directly through technological means without human intervention.

Documentary Sources, According to W. Hanson

In an article titled "Introduction to Science Information Work," published in 1971 by ASLIB, W. Hanson, the former editor of the *Journal of Documentation*, categorized documentary sources of information into three distinct groups:

- **Primary Sources of Information**
- **Secondary Sources of Information**

Documentary Sources, According to Denis Joseph Grogan

D. J. Grogan, a renowned British information scientist and educator, categorized documentary information sources into three distinct groups:

- **Primary Sources**
- **Secondary Sources**
- **Tertiary Sources**

Primary- sources of information, according to Grogan

According to Grogan, primary sources of information are those in which the author presents original evidence, describes a new discovery, proposes a novel idea, or introduces new evidence related to previous claims. These primary sources include:

- Primary periodicals
- Patents
- Standards
- Research reports
- Dissertations and theses

**Rama Pal and Mohammad Nasir**

- Reprints
- Trade literature
- Influential books
- Personal documents such as letters, diaries, and papers
- Photographs
- Interviews and transcripts
- Government and historical records
- Newspaper articles and clippings

Secondary Sources of Information, According to Grogan

Grogan claims that secondary sources of knowledge are distinguished by their concentration on a particular topic via the examination and interpretation of primary sources. To produce a more readable format, these papers entail the selection, alteration, organization, and repackaging of original data (Admin, 2021). By offering summaries, reviews, or compilations based on the fundamental research contained in primary sources, secondary sources aim to make the material easier for the end user to find and use.

Tertiary- Sources of Information According to Grogan

Grogan defines tertiary sources of information as those that appear later in the research process and typically don't provide in-depth subject matter. These resources serve as tools to assist users in finding and accessing primary and secondary sources, with the primary goal of informing users about additional sources. Helping users locate and make efficient use of primary and secondary materials is the major function of tertiary sources (Teaching & Learning, University Libraries, n.d.). Bibliographies of bibliographies, yearbooks, directories, literature guides, organizational guides, and lists of active research are a few examples of tertiary sources.

Non-Documentary Sources of Information

Non-documentary sources of information are those which are not recorded in any form. The sources under this category are:

- i) Humans;
- ii) Organizations;
- iii) Mass media (other than print and cyber media); and
- iv) Cyber media.

Humans

Humans provide valuable information that has not been documented in any manner. Individuals, from specialists to ordinary citizens, serve as significant sources of information based on the type and quantity of information needed (Studocu, 2022.). The perspective of an expert is invariably significant. When a researcher faces an issue during their investigation and needs an immediate solution, consulting an expert can be quite beneficial.

Organizations

Organizations serve as significant sources of information. Organizations such as libraries, information centers, archives, academic institutions, research and development institutions, museums, publishing houses, and government agencies deliver accurate, reliable, and timely information within their respective domains (H. J. Singh, 2022). This type of information is not available elsewhere.

Mass media (other than print and cyber media)

The channels via which news, information, and broadcasts are effectively disseminated to the general public are referred to as mass media. Mass media, excluding print and digital platforms, such as television and radio, plays a significant role in the dissemination of effective information and is regarded as the most viable medium in contemporary society. The majority of individuals engage with and interact with these media.

**Rama Pal and Mohammad Nasir****Cybermedia**

In the modern digital environment, cybermedia is a crucial and essential source of information. Media related to online communication or cyberspace are termed cyber media. Interactive digital platforms, such as the Internet, differ from traditional channels like printed materials and television. Cyberspace is the electronic environment of computer networks where online information transmission occurs.

Value of Information in Society

The significance of information in society, particularly regarding library and information services, is substantial. These serve a crucial function in safeguarding and providing access to information, acting as reservoirs of knowledge and intellectual resources (Chatterjee, 2016). Several major characteristics that underscore the significance of information in society include the following.:

Access to knowledge

Libraries and information centers function as portals to extensive realms of information and knowledge. They curate a collection of books, journals, databases, and several other materials that encompass a broad spectrum of disciplines. By granting access to information, they enable individuals to acquire knowledge, investigate novel concepts, refine their abilities, and make educated judgments.

Empowering individuals

Access to knowledge is crucial for individual development, education, and empowerment. Consequently, libraries and information centres are vital for lifelong learning by providing comprehensive resources and services to individuals of all ages, economic statuses, and cultural or religious backgrounds. By fostering an inclusive environment, they enhance personal development throughout their life.

Bridging the digital divide

Libraries frequently offer public access to computers, digital materials, and the Internet. This addresses the digital divide, ensuring that persons without personal access to technology can nevertheless access online information and services. Libraries are essential in fostering digital literacy and ensuring equitable access for all members of society.

Promoting research and innovation

Libraries and information centres are essential institutions for academics, students, educators, and professionals across diverse disciplines. They grant access to academic journals, research databases, and additional resources, thereby promoting research and innovation. Libraries provide professional assistance, reference services, and interlibrary lending networks, linking customers to materials outside their local holdings.

Preserving cultural heritage

Libraries function as guardians of our cultural heritage, safeguarding books, manuscripts, archives, pictures, and other significant materials. Through the collection, archiving, and preservation of these resources, libraries guarantee that future generations will have access to historical records, literature, and cultural artifacts.

Community engagement

Libraries serve as community centres, fostering civic participation, social interaction, and cultural exchange. They provide a range of activities and events, including exhibitions, seminars, lectures, and book clubs, which cultivate a feeling of community and create opportunities for individuals to meet, learn, and exchange ideas.

Information Literacy

Libraries are essential in promoting information literacy by instructing users on how to discover, critically evaluate, and efficiently utilize information in many contexts. In the contemporary day, characterized by an overwhelming influx of information and widespread disinformation, libraries function as vital resources in assisting individuals to

**Rama Pal and Mohammad Nasir**

cultivate robust critical thinking abilities. They enable users to identify reliable sources, navigate intricate information environments, and make educated choices, thus contributing significantly to the development of an informed and reflective society. The significance of information in society, as advocated by libraries and information centers, is paramount. They contribute to research, the teaching-learning process, holistic human development, political cognition in a democracy, cultural preservation for future generations, and community development. They consistently promote the cultivation of an informed and knowledgeable society, empowering individuals to make informed decisions that contribute to their communities and society at large.

Barriers to Information Communication in Society

The primary obstacles in information communication include inadequate information handling skills, insufficient resources, time constraints, competing work pressures, lack of confidence, and absence of motivation and incentives, among other challenges. Obstacles to information communication can stem from multiple causes that impede the seamless exchange of information between persons or organizations (McLaughlin & McLaughlin, 1989). Several prevalent hurdles may be identified as follows:

Language barriers

Differences in language can affect effective communication, especially when individuals involved do not understand each other's languages. This barrier can be overcome through translation services or by the use of common languages.

Technological barriers

Restricted access to technological resources or reliance on obsolete infrastructure might impede information dissemination. Moreover, limited Internet access, sluggish Internet speeds resulting from inadequate capacity, absence of essential devices, and incompatible systems might hinder the flow of information.

Cultural and social barriers

Cultural disparities in norms, values, and social customs might influence communication. Misinterpretation of gestures, conventions, or traditions can result in misunderstandings or disputes. It is essential to acknowledge cultural sensitivity for the effective acceptance of communication methods.

Physical distance

Geographical distance is a problem for communication, particularly when persons or organizations are situated at considerable separations. Physical barriers, like time zones, extensive distances, and remote regions with inadequate infrastructure, impede timely and effective information sharing among users.

Lack of Information literacy

A lack of proficiency in accessing, assessing, and utilizing information might hinder successful communication. Many consumers are unfamiliar with navigating digital platforms for accessing online information and are not accustomed to utilizing the proper communication tools.

Information overload

In the contemporary digital era, the overwhelming amount of information might be challenging. There is an observable information explosion, occasionally resulting in duplications of the generated data. Information overload can impede efficient communication, since individuals may struggle to sift, analyse, and prioritise the available information.

Organizational barriers

Hierarchical structures, bureaucracy, and inadequate internal communication within organisations can obstruct the flow of information. Insufficient transparency, inefficient information dissemination procedures, or an inappropriate culture that may inhibit open communication.

**Rama Pal and Mohammad Nasir****Psychological barriers**

Personal characteristics such as bias, prejudice, and individual attitudes can impede successful communication. Preconceived conceptions, reluctance, resistance to change, or emotional turmoil might impede the open exchange of information. There are occasionally legitimate obligations to maintain confidentiality.

Digital divide

Another significant hurdle is the existence of a digital divide in society, resulting in unequal access to digital technologies, such as smartphones, tablets, laptops, and the Internet.

Regulatory barriers

Legislation and laws concerning data protection, privacy, patents, copyrights, and various forms of intellectual property rights (IPR) may impede information exchange. Consequently, adherence to rules and limitations regarding the transfer of specific information kinds can affect the unrestricted exchange of communication.

CONCLUSION

Information is an essential component of library and information science. Furthermore, library and information science is an essential field for facilitating access to, protecting, and efficiently managing information resources. Information denotes knowledge that has been systematically organized and processed, rendering it available via several mediums including books, journals, databases, and the Internet. This domain encompasses the procurement, categorization, preservation, and dissemination of information to suit the requirements of various users. Advancements in information technology (IT) have expanded the reach and accessibility of information through digital resources such as electronic journals, online databases, and e-books. Information is essential in our daily lives, with its need spanning all areas and specialties. Access to pertinent and precise information is crucial for personal growth as well as cultural, economic, educational, and scientific advancement, facilitating informed decision-making and the attainment of our enlightened objectives. Consequently, the demand for knowledge has intensified in the contemporary, rapidly evolving environment. Individuals and organizations require access to current research, trend analyses, and innovative concepts to maintain competitiveness and relevance. Visionaries and futurologists assert that we are entering an era predominantly characterized by the interchange of knowledge in trade.
