ABSTRACT

The advent of 3D printing has opened new avenues for the development of customized medical implants. Among biodegradable materials, Polylactic Acid (PLA) and starch-based composites have shown promise due to their biocompatibility and biodegradability. This study aims to investigate the mechanical performance of PLA, starch-based composites, and a PLA-starch composite in the context of medical implant applications. We focus on key mechanical properties, such as tensile strength, compressive strength, impact resistance, fatigue behavior, and biocompatibility, to assess their suitability for load-bearing and non-load-bearing applications. The results show that PLA excels in strength, while starch-based composites offer flexibility and enhanced biodegradability. The PLA-starch composite shows potential for intermediate applications where both biodegradability and strength are required.

Keywords: PLA, Starch-based composites, PLA-starch composite, 3D printing, Mechanical properties, Medical implants, Biocompatibility, Additive manufacturing, Tensile strength, Compressive strength.

INTRODUCTION

The additive manufacturing (AM) method called 3D printing, has gained significant attention in recent years due to its potential to create highly customizable and patient-specific medical implants.[1] The advantages of biodegradable materials such as Polylactic Acid (PLA) and starch-based composites are evident in applications where temporary

Logeshwaran Vellingiri and Arungandhi

implants, scaffolding for tissue engineering, and environmentally friendly materials are of high importance. PLA, a thermoplastic polymer, is derived from renewable resources such as corn starch and is known for its biocompatibility and biodegradability. [2] Similarly, starch-based composites, which incorporate natural starch materials, are gaining attention for their sustainability and potential as bio-based alternatives. However, the mechanical properties of these materials, particularly for load-bearing applications in medical implants, require thorough evaluation. In this study, we compare the properties of pure PLA, starch-based composites, and PLA-starch compositesa blend aimed at improving the performance of both materials by combining PLA's strength with starch's flexibility and biodegradability. [3]

MATERIALS AND METHODS

MATERIALS
Three distinct materials were prepared for 3D printing:

- PLA (Polylactic Acid): PLA filament was used as the base material due to its well-established mechanical properties and biodegradability.
- Starch-Based Composite: A polymer-starch blend was used, where corn starch was mixed with a biodegradable polymer (in a ratio optimized for mechanical performance), providing flexibility and improving biodegradability.
- PLA-Starch Composite: This composite material was created by blending PLA with a 50% concentration of starch, seeking to combine PLA's mechanical strength with the flexibility and biodegradability of starch.

Sample Preparation
Specimens for mechanical testing (tensile, compressive, and impact tests) were prepared using Fused Deposition Modelling (FDM) technology, which is commonly employed for 3D printing of polymer-based materials.

RESULTS

Tensile Strength
In table 1, PLA exhibited the highest tensile strength at 55.2 MPa, but its elongation at break was relatively low (6.5%), indicating higher stiffness and brittleness. Starch-based composites showed a tensile strength of 28.1 MPa, but elongation at break was significantly higher (12%), reflecting better flexibility. PLA-Starch composites displayed an intermediate performance, with 40.0 MPa tensile strength and 9.1% elongation, suggesting a good compromise between strength and flexibility.

Compressive Strength
In table 2, PLA demonstrated superior compressive strength (100 MPa), making it suitable for high-load applications, such as bone implants. PLA-Starch composites exhibited moderate compressive strength (72 MPa), providing a middle ground between PLA's high strength and starch's lower strength. Starch-based composites had the lowest compressive strength (45 MPa), limiting their suitability to non-load-bearing applications.

Impact Resistance
In table 3, PLA exhibited moderate resistance to impact, absorbing 0.36 J of energy before failure, suggesting it could withstand moderate shock loads. PLA-Starch composites showed improved impact resistance (0.26 J) compared to pure starch, highlighting a combination of strength and toughness. Starch-based composites exhibited the lowest impact resistance (0.17 J), indicating poor performance under shock loading conditions.

Fatigue Resistance
In table 4, PLA demonstrated the highest fatigue limit (30 MPa), making it suitable for long-term, cyclic loading in medical implants. PLA-Starch composites exhibited a fatigue limit of 22 MPa, indicating moderate resistance to

repetitive stresses. Starch-based composites showed a lower fatigue limit (15 MPa), suggesting that they are more suited for short-term or low-stress applications.

Water absorption
Water absorption was calculated using
WA(%) = Final weight (g) – Initial weight (g)/ Intial weight X 100
PLA exhibited the lowest water absorption, ensuring stability in moist environments. Starch-based composites showed higher water absorption due to their hydrophilic nature, making them less suitable for long-term applications.In Figure 1 it showsPLA-Starch composites demonstrated controlled water absorption, balancing biodegradability and mechanical integrity.

3D Printing and Medical Applications
In figure 2- Filaments (1.75 mm) were extruded for fused deposition modeling (FDM) 3D printing.PLA implants demonstrated superior mechanical integrity for high-load applications (e.g., bone implants).PLA-starch composites provided customizable degradation profiles for temporary implants.

Sterility and Biocompatibility
Endotoxin levels of the 3D-printed PLA implant were below the ISO 10993-11 standard (0.03 EU/mL).

Biodegradation
The 3D printed PLA (polylactic acid) implant is dissolved in PBS (phosphate buffered saline), for biodegradation in the hydrolysis process where the ester bonds in the PLA chain are broken down by water molecules, and obtained lactic acid monomers can be mobilized by our body microbial biome Starch-based composites degraded rapidly in soil, making them ideal for short-term applications. PLA-Starch composites exhibited moderate degradation rates, making them suitable for temporary medical implants.PLA degraded at a slower rate, ensuring longer functionality in biomedical applications.[6]

DISCUSSION

Mechanical and Thermal Properties
PLA exhibited superior tensile strength and thermal stability, making it ideal for load-bearing medical implants. The incorporation of starch into PLA improved flexibility, providing tuneable mechanical properties. The mechanical performance of PLA-starch composites depended on the PLA-to-starch ratio, with higher PLA content enhancing strength and higher starch content improving biodegradability. [7,8]

Biodegradability and Water Solubility
Starch-based composites degraded rapidly in moist environments, making them suitable for disposable medical applications. PLA-starch composites displayed controlled degradation, providing customized degradation profiles for temporary implants. Water solubility tests showed that starch-rich composites had higher dissolution rates, making them preferable for applications requiring quick disintegration. [9,10,11]

PLA in Medical Implants
PLA remains the preferred material for load-bearing implants due to its superior mechanical properties. PLA-starch composites offer an alternative for temporary scaffolds and biodegradable implants where flexibility and controlled degradation are required. The biocompatibility evaluation confirmed and ensuring their safety for medical applications. [12,13]

Logeshwaran Vellingiri and Arungandhi

CONCLUSION

This study evaluates the mechanical and biocompatibility properties of PLA, starch-based composites, and PLA-starch composites for potential medical implant applications. PLA remains the material of choice for load-bearing implants due to its strength and biocompatibility. However, PLA-starch composites offer an attractive alternative for biodegradable scaffolds and temporary implants, where both flexibility and biodegradability are key considerations.

Conflict of Interest Statement
The authors declare no conflicts of interest related to this research.

ABSTRACT

Different types of botanical pesticides are used in the management of insect pests since they are bio-degradable, eco-friendly, economical, leave behind lesser number of residues and do not favour resistance building and pest resurgence. Among plant based pesticides, oils are highly effective and a mixture of selected oils is ideal for managing pests. Oil from the seeds of *Azadirachta indica* (A. Juss) and *Croton tiglium* (L.) and the rind of *Anacardium occidentale* (L.) were extracted using petroleum ether and acetonitrile as solvents in Soxhlet extraction method.   The active principles of the three different oils were elucidated using GC-MS analysis. Comparison was made with GC-MS pattern for neem oil. The GC-MS analysis of neem oil, extracted in petroleum ether recorded about 13 peaks. Peak 1 indicated the presence of n-cetyl thiocyanate with a retention time of 10.32 minutes. At the retention time of 37.67 min, camphor was identified.

Keywords: *Azadirachta indica, Anacardium occidentale, Croton tiglium*, GCMS

INTRODUCTION

The large-scale use of chemical pesticides in agriculture and public health leads to adverse effects such as development of pesticide resistance, frequent pest out breaks, emergence of new pests, pollution and health hazards. In order to search for environmentally safe alternatives, scientists considered the pesticides of biological origin (bio-pesticides) in the place of synthetic insecticides. Replacement of synthetic insecticides by bio-rational insecticide is a universally acceptable and practicable approach worldwide. The use of plants, plant materials or crude plant extracts (botanical insecticides) for the protection of crops and stored products from insect pests is probably as old as crop protection itself (Thacker 2002). Throughout history, plant products have been successfully exploited as insecticides, insect repellents, and insect antifeedants (Rathi and Gopalakrishnan 2005). The pesticidal or insecticidal properties of plants depend on the chemical compounds or bioactive compounds that kill, repel, deter feeding instinct and behaviour and set obstacles in the oviposition of insects. Chemical constituents and biological properties of pesticides produced from natural products have been recently attracting the attention of many scientists to avoid the problems caused by synthetic compounds (Abou-Yousef *et al.*, 2010). Secondary chemicals produced by plants have a significant impact on insects. Insecticidal plant products are innumerable. Different parts of plants like leaves, stems, roots, fruits and seeds have insecticidal activities. Tissues from various botanical species have been used to protect commodities in the rural storage of grains. The dried fruits of *Capsicum* sp., the powdered roots of *Derris elliptica* (Wallich) Benth and the leaves and seeds of neem tree, *A.indica* have been variously used in the protection of stored agricultural products. The water extract of the root bark of *D.microcarpum* is coated over bags before grains are put in for storage while the dried leaves are placed inside the sacks before grains are introduced to act as an insect repellent (Hassan *et al.*, 2010). Neem tree is one of the pesticidal plants which have the property in almost all parts of the plant. The neem trees belonging to Meliaceae family have been the subject of botanical biocontrol research (Mondali *et al.*, 2009). The Meliaceae member, specifically *Azadirachta indica* A. Juss. (Indian neem tree), contains at least 35 biologically active principles, of which Nimbin and Azadirachtin (Pennington, 1981) are the most active insecticidal ingredients and are present predominantly in the seeds, leaves and other parts of the neem tree (Mulla and Su, 1999). Cahew nut shell liquid (*Anacardium occidentale* Linn.) is used for the control of insects like termites.

Croton tiglium Linn. seeds which are popularly used in the field of medicine, mainly as laxatives contain a number of insecticidal compounds also (Dictionary of Natural Products, 1982). Plant based oil pesticides are more viable than any other products. Generally, seeds are the rich source of oils than leaves, roots, flowers, barks and stems of plants. The active ingredients of neem plant are located in their maximum amounts in the seed and kernel (Vijayalakshmi *et al.*, 1995). Neem oil extracted from the seed kernel of neem plant has been widely used throughout the world for medicinal and agricultural purpose with emphasis on health use and use as an effective anti-germ product and insect repellent. The cashew tree (*Anacardium occidentale* L.) represents one of the major and cheapest sources of non-isoprenoid phenolic lipids, which have a variety of biological properties, as molluscicides, insecticides, fungicides, and anti-termite compounds. The Cashew Nut Shell Liquid (CNSL) is contained between the inner and outer shell (pericarp) in a honey comb matrix. CNSL is a unique natural source of Meta allayl phenols with a variable degree of unsaturation attached to the benzene ring (De Lima *et al.,* 2008). To know the quality and property of a formulated pesticide there is a need to study the chemical parameters, and its components that have insecticidal, ovicidal and repellency characteristics. This study was carried out to formulate a neem oil based pesticide, characterize its physic-chemical parameters and to analyze pesticidal components.

MATERIALS AND METHODS

Procurement of materials for oil formulation

Neem seeds (*A. indica)*, rind of cashew (*Anacardium occidentale* L.*)* and *Croton tiglium* L. seeds are the raw materials for the preparation of the oil pesticide. Neem oil was purchased from a nearby oil mill, neem seeds and cashew nuts with epicarp from the local market and the *C. tiglium* seeds from the local native Ayurvedic medical shop.

Preparation of materials for oil extraction

The cashew nuts and the *C. tiglium* seeds were sundried. The epicarp of the cashew nut was cut into small pieces after removing the nuts mechanically. The *C.tiglium* seeds were ground in an electric blender and the ground materials were stored in large plastic containers.

Extraction of oil by Soxhlet method

Exactly 50 g each of ground neem and *C. tiglium* seeds and grated cashew epicarp were weighed in a sensitive electronic balance and individually wrapped in white muslin cloth and tied with a twine. The packed materials were placed in a 1 lit Sohxlet extraction apparatus and the extraction was made at 60-80°C with petroleum ether and acetonitrile solvents separately. After extraction of the oil, the solvent was recovered using a rotary vacuum evaporator (Model: PBV-7D).

Preparation of plant oils for GC-MS analysis

1.0 ml of neem oil and triple oil were measured out and both oils were individually diluted with 5 ml of both, petroleum ether and acetonitrile solvents and filled in 15 ml screw capped bottles and closed tightly. Croton oil (1 ml) and cashew oil (1 ml) were also diluted in 5 ml petroleum ether solvent individually and filled in screw capped bottles.

GCMS analysis of the oil extraction

The oil samples were individually examined using GCMS analysis using Shimadzu GC-MS-QP 5050 A GC equipment. Software Class 5000 was used. The library of structures was from the searched library: Wiley 229. The LIB Column used was DB 5 with 0.53 mm ID and standard timing of 30 m on a 1.5 µm film. The carrier gas was Helium with a flow rate 1 ml/min. The ionization mode was set at EL (70 ev). The temperature was programmed to be at 40°C (static for 2 min.) up to 250°C (static for 7.5 min.). Both the detection and injector temperatures were 250°C. Identification of chemical compounds of the oils was achieved by using library searched data base Wiley 229 LIB and by comparing their retention indices and mass fragmentation patterns with those of the available references and with published data. The percentage composition of components of the volatiles was determined by computerized peak area measurements.

RESULTS

The GC-MS analysis of neem oil *(A. indica)* extracted in petroleum ether recorded about 13 peaks. Peak 1 indicated the presence of n-cetyl thiocyanate with a retention time of 10.32 minutes. Pentadecane and Nonadecane were observed with retention timings of 10.32 and 12.98 min. respectively. Acridine, 9, 10-dihydro-9, 9-dimethyl was observed in the 7th peak with 22.06 min. retention time. At the retention time of 37.67 min., camphor was identified (Table 1.1 and Fig. 1.1). Approximately, 10 peaks were identified in the GC-MS analysis of neem oil *(A. indica)* extracted in Acetonitrile solvent. Glycerin, Methanamine and Benzenamine N-phenyl were observed in the first, second and fifth peaks with retention timings of 4.86 and 16.33 min. The retention timing of 18.62 min. in the seventh peak indicated the presence of cis-coniferryl alcohol. Acridine, 9, 10-dihydro-9, 9- dimethyl and 1, 2-Benzenedicarbarcylic acid and bis (2-ethylhexyl) ester were recorded in the ninth and tenth peaks with a retention time of 22.05 and 31.50 min. respectively (Table 1.2 and Fig. 1.2). The GC-MS analysis of cashew oil *(A. occidentale)* extracted in petroleum ether revealed the presence of Nerolidol and 8, 11, 14-Eicosatrienoic acid with retention timings of 14.79 and 20.73 min. Acetic acid, phenol, 3-pentadecyl, Niobium, dichloro, 1, 2-Ethanediol, 1, 2-diphenyl-, Benzene, 1-(1, 1-dimethyl ethoxy) -4- ethyl and 1H-Imidazole, 1-2(2-propenyl) were identified in the subsequent peaks (Table 2 and Fig. 2). The GC-MS analysis of *C. tiglium* revealed 9 possible compounds with different retention timings. The compounds observed were Benzenamine, N-phenyl, Tetradecanoic acid, Benzoic acid, 7, 10-Hexadecadienoic acid, 2, 6-Adamantanedoane, 4-iodo, Ricinoleic acid and 1, 2-Benzene dicarboxylic acid (Table 3 and Fig. 3). About 10 peaks were detected in the GC-MS pattern of triple oil prepared by Soxhlet extraction with Acetonitrile. Ethanol 2-amino- was recorded in the first peak with a retention time (RT) 4.81 min. Nerolidol isomer

and Farnesol had a retention time of 14.81 min. Other probable chemical compounds recorded were Ricinoleic acid, 9-octadecenoic acid, Silane, Phenol, 4-mehtyl, and 1, 2-Benzenedicarboxylic acid (Table 4 and Fig. 4). The compounds identified in the first and second peaks associated with the GCMS analysis of triple oil prepared by solvent extraction with petroleum ether were Benzeneamine, N-nitroso-N-phenyl and 12-Nor-Caryophyll-5-EN-2-ON with RT values of 16.34 and 22.58 min. In the third peak, Camphor was detected with a RT of 23.02 min. The chemical compounds like 12, Hydroxy-9-octadecenoic acid, 1, 2-Benzenedicarbarxylic acid and Ricinoleic acid were observed at different RT intervals (Table 5 and Fig. 5).

DISCUSSION

In the present study, the oil used as an efficient pesticide was extracted by solvent extraction method. The chemical parameters of a pesticide determine the quality and insecticidal activity of the pesticide. The stability of the botanical pesticides depends upon the physical characteristics of that particular pesticide. Certain chemical compounds present in plant seed oils accelerate the pesticidal properties. These compounds repel the insects, prevent egg laying, hinder the feeding habit of insects, propel the death of insects and kill the eggs. Every plant has its own insecticidal properties due to such chemical compounds. The GC-MS analysis reveals the chemicals compounds present in the oil samples. Sivropoulou *et al.* (1997) have identified germacrene-D (15.85 percent), β-caryophyllene (12.35 percent), α-humelene (9.31 percent) and germecrene (6.19 percent) as major constituents in the essential oils of leaves of *Lantana camara* L. in South China. Dua *et al.* (2010) identified caryophyllene (16.37 percent), eucalyptal (10.75 percent), α-humelene (8.22 percent) and germecrene as major constituents in *L. camara*. Eucalyptol is the main constituent (15.57 percent) of essential oil of eucalyptus, which exhibit pesticidal activity (Adhikari *et al.,* 1992). Some compounds observed in the present study were reported by other authors in earlier studies. Farnesol was identified in the pesticide (triple oil) which was also reported by Duke (1992) who stated that Farnesol and germacrene-D have pesticidal activity. Farnesol is a natural organic compound which is an acyclic sesquiterpene alcohol found as a colourless liquid. Farnesol is present in many essential oils such as citronella, nerali, cyclamen, lemongrass, tuberose, musk, balsam and tolu. Farnesol is a natural pesticide for mites and is a pheromone for several other insects. The GC-MS analysis of petroleum ether extract of *C. tiglium* seeds revealed the presence of Benzoic acid, Ricinoleic acid, Benzene dicarboxylic acid, 2,6-Adamantanedione, Tetradecanoic acid and hexadecadienoic acid. The same compounds were reported by Saputera *et al.* (2006) in the GC-MS analysis of *C. tiglium* seeds.

Falodun *et al.* (2009) identified fatty acid derivatives, sesquiterpenes, hydrocarbons, caryophyllene, Hexadecanoic acid and tetradecanoic acid as major components while studying chemical composition of the leaf essential of *Pyrenacantha staudtii* Hutch and Dalz. Benzoic acid, Hexadecanoic acid, Eicosanoic acid, Docosanoic acid and Glycerol were reported in the GC-MS analysis of *Paeonia peregrina* Mill., and *Paeonia tenuifolia* L. (Ivanova *et al.,* 2002). More or less similar compounds were also noticed in the present study. Vuorela *et al.* (2004) identified a number of important compounds in the root extracts of *Senna italica* Mill. subsp. *arachoides* and these naturally derived compounds play a major role as lead structures for the development of synthetic analogues. Magano *et al.* (2008) reported that chrysophanic acid (1, 8-dihydroxy-3-methylanthraquinone) and hexadecanoic acid have been previously identified in plant based material with arthropocidal activities. Members of the genus *Senna* with high levels of chrysophanic acid are known to have antifungal, anti-bacterial and anti-mite properties. Aromatic and amino acids play an important role in life of insects. Aromatic acids may serve as egg-hatching factors for mosquitoes (He and Huang, 2011) and as insecticides and repellents (Mittal and Subbarao, 2003). Benzoic acid is an aromatic acid which was obtained in the GC-MS analysis of present study. The GC-MS analysis of neem oil showed the presence of Benzenedicarboxylic acid. Hassan *et al.* (2010) identified two components as carboxylic compounds, Hexanedioic acid, mono (2-ethylhexyl) ester and 1, 2-Benzene-dicarboxylic acid, mono (2-ethylhexyl) ester with mass 147 and 279 in the root bark extract of *Detarium microcarpum* Guill and Perr. These compounds already have synthetic analogues and the Hexanedioic acid, mono (2-ethyl-hexyl) ester compound acts as an acaricide (a substance that kills mites and ticks) for use in orchards and also as an inert ingredient in pesticides among other uses. Benzenedicarboxylic acid acts as an insect repellent. The GC-MS analysis of neem oil extracted in petroleum ether showed the presence of

Jeya *et al.*,

Pentadecane, Nonadecane, Tetracosane, Hexadecane, Octodecane, Hexacosane and Heptacosane. The same compounds were also reported by Siddiqui *et al.* (2002) in the GC-EIMS analysis of ethanolic extracts of fresh fruit coatings of *A. indica.* Imidazole was observed in the GC-MS analysis of *A. occidentale* oil. An imidazole derivative, KK-42 was considered as potent inhibitor of ecdysteroid biosynthesis of females of the meal worm, *Tenebrio molitor* (L.) (Amrani *et al.,* 2004). Pence (1965) reported that imidazole formulations were effective against a number of insects and related arthropods, including silver fish, cockroaches, termites, carabid beetles, bed bugs, fleas, flies, mosquitoes, ticks, spiders, phytophagous mites, fabric-feeding and stored-products insects. Camphor was identified as a compound in the petroleum ether extract of neem seed and the combined oil extract. E-Abd-El-Aziz *et al.* (2007) observed camphor in the GLC pattern of *Ocimum americanum* L. Eugenol caused 40 percent larval morality with 36.84 percent reduction in pupation. Camphor and gereniol were observed by Pande *et al.* (2010) in the gas chromatographic investigation of *Coriandrum sativum* L. Geranyl acetae, linalool, nerol and neral were the main components reported. Liu *et al.* (2010) reported the presence of camphor in the GC-MS analysis of *Artemisia mongolica* Fisch. ex Besser and stated that the plant has fumigant toxicity against *S. zeamais.* Nerolidol was observed in the GC-MS analysis of cashew oil and the pesticide (triple oil). Nerolidol, also known as peruviol, is a naturally occurring sesquiterpene found in the essential oils of many types of plants and flowers. The presence of nerolidol was reported by Tiwary *et al.* (2007) in the GC-MS analysis of *Zanthoxylum aramatum* (DC). Phenol, 3-pentadecyl was found in the GC-MS analysis of cashew oil extracted in petroleum ether. The same compound was also reported by Risfaheri *et al.* (2009) in HPLC analysis of cashew nut shell liquid. In earlier studies it was observed that phytochemicals have a major role in mosquito control programme (Palsson and Janeson, 1999). Gopieshkhanna and Kannabiran (2007) have reported that the carbohydrates, saponins, phytosterols, phenols, flavanoids and tannins in the plant extract show mosquito larvicidal activity.

CONCLUSIONS

Prolonged periods of chemical pesticide usage lead to pest resistance, health hazards and environmental pollution. Natural oil pesticide contains some pest control components. Neem oil had certain components which control pest activities. It prevents environmental hazards. The use of plants, plant materials or crude plant extracts (botanical insecticides) for the protection of crops and stored products from insect pests is probably as old as crop protection itself.

ABSTRACT

α-lactalbumin is a 14.2 kDa whey protein found in milk and is used as an important ingredient in infant formulas. It is involved in lactose synthesis and thus creates an osmotic "pressure" that helps in milk production. It has a high content of all essential and branched chain amino acids, especially tryptophan and leucine. Adding bovine α-lactalbumin to infant formula is recommended because it alters the infant's plasma amino acid pattern, similar to that of breastfed infants. α-lactalbumin has been shown to alleviate feeding-related gastrointestinal problems like regurgitation, abdominal discomfort and constipation in breastfed new-borns. Being rich in tryptophan, it serves as an ideal protein for infant formulas and confers several benefits to the neonate including enhanced immunity, prebiotic activity and higher absorption of trace elements. Recently, it was found that multimeric α-lactalbumin possesses a unique folding form known as the "molten globule state" that exhibits anti-inflammatory activity and increases apoptosis, possibly affecting mucosal cell renewal and proliferation.

Keywords: α-lactalbumin, bioactive peptide, infant formula, milk supplement, infant health

Roopa Prasad *et al.,*

INTRODUCTION

In human milk, α-lacalbumin (α-LA) accounts for 28% of its overall protein content, but in cow's milk, it makes up only 3%. Human and bovine α-LA proteins are quite similar, with 73.9% of their amino acid sequences being identical. The length of both α-LA variants is 123 amino acids. There is a deep split between the two domains. Concurrently, the cysteine bridge connecting residues 73 and 91 holds the two domains together and forms the Ca^{2+} binding loop. Additionally, 61-77 forms a significant disulfide bridge that joins the two domains. Overall, four disulfide bridges stabilise the α-LA structure. Since α-LA contains a high concentration of essential amino acids, it can be used in low-protein new-born formulae. Lowering formulas' protein content has been recommended as a preventive measure to minimize children's possibility of overweight and obesity, while further study is required on the long-term impact on body composition. α-LA can be added to baby formula to lower its total protein level and make it more similar to human milk with regard to of protein composition and concentration. α-LA can be added to new born formula to lower its total protein level and resemble it to breast milk in terms of protein concentration and consumption. It has also been demonstrated that the α-LA enriched low-protein formula increases the energy efficiency. Rosie, the first transgenic cow, was created in 1997. It comprises the gene for human α-LA. One litre of milk contained 2.4 grams of human α-LA.

Properties of α-lactalbumin
Native α-LA is structured with two main domains: a large α-helical domain and a smaller β-sheet domain, linked together by a calcium-binding loop (Fig.1). The α-helical domain includes three prominent α-helices (spanning residues 5-11, 23-24, and 86-98) and two brief 310 helices (residues 18-20 and 115-118). The β-sheet domain features a series of loops, a small three-stranded anti-parallel β-pleated sheet (comprising residues 41-44, 47-50, and 55-56), and a short 310 helix (with three residues per turn and an intra-chain hydrogen bond loop of 10 atoms; residues 77-80).

Physical properties
The well-known structure of α-LA is made up of four disulfide bridges and 123 amino acids. The isoelectric point lies between 4.2 and 4.5, and the molecular weight is 14178 Da. The two main types of α-LA are apo-state and holo-state. The first form is called the holo-state, and it is bound and folded by calcium. The apo-state, which occurs in acidic locations is associated with the unfolding of the β-sheet and the release of calcium ions.

Physiological properties
Upon α-LA's attachment to galactosyltransferase, galactose can be converted to N-acetyl glucosamine, and lactose can then be synthesized from glucose and uridyldiphosphate-galactose. (Fig.1) Galactosyltransferase can also facilitate synthesis of other disaccharides, but with α-LA as a regulatory unit, only lactose is being produced.[4]

Anticancer properties
Human α-LA that has been rendered lethal to tumour cells (HAMLET) is a very powerful apoptosis inducer. HAMLET has also been shown to have anticancer cytolytic action against a variety of human malignancies. Similar properties are seen to be exhibited by bovine α- LA (BAMLET).

Antimicrobial properties
α-LA interacts with lysozyme at the physiological pH found in human and bovine milk. This interaction enhances the antimicrobial effectiveness of the complex, making it more effective against both Gram-positive and Gram-negative bacteria.

Antiviral properties
Antiviral peptides have been discovered from α-Lactalbumin (α-La). By using proteolytic enzymes like trypsin (EC 3.4.21.4), chymotrypsin (EC 3.4.21.1), and pepsin, several peptide fragments with antiherpetic properties were isolated from α-LA. The development of the infant gut is influenced by various factors, including the nutrients and

Roopa Prasad *et al.,*

biologically active compounds present in milk. α-LA is thought to have a beneficial effect on gut development and immune health by releasing bioactive peptides in the small intestine. The small intestine breaks down α-LA and absorbs amino acids as individual molecules and tiny peptides. Breastfed infants' stools have no intact α-LA. Breastfeed infant's microbiomes are mediated by lactobacillus and, in particular, a variety of bifidobacterium species, whereas formula fed infant's microbiomes are more akin to adult makeup. It has been demonstrated that supplementing infant formulas with extra α-Lac has enhancing probiotic effects on the microbiota by encouraging the growth of specific bacterial species, namely *Bifidobacteriuminfantis* and *Bifidobacteriumbreve*, in a way that is comparable to breast milk. α-LA is readily available to infants, where it is broken down and absorbed. The resulting oligopeptides and amino acids have been demonstrated to enhance essential immune processes, including macrophage phagocytosis and the proliferation of Bifidobacteria. Prebiotic benefits of peptides from the digestion of the amino acid lactic acid. For example, three bioactive peptides from the peptide lactic acid are anti-microbial. Some peptides released from the digestion of α-LA have been shown to have anti-cancer, anti-bacterial, anti-hypertensive, anti-immunomodulatory, anti-opioid, mineral-binding and anti-oxidant effects. (Fig. 2) Additionally, it has been demonstrated that a few of the peptides produced by the hydrolysis of herpes simplex and HIV-1 virus by trypsin, chymotrypsin and pepsin may have particular antiviral properties. The gut microbiome plays a significant role in the long-term survival, growth, and development of premature newborns, according to recent studies. Similar to the benefits of breast-milk, suitable milk proteins may diversify the gut flora. By carrying out this, patients with NEC and/or sepsis would be less lightly to experience dysbiosis. Therefore, it has been proposed by researchers that creating infant formula with higher β-lactalbumin and lower β-lactoglobulin levels would produce an amino acid composition more akin to human milk and a plasma amino acid profile more like to breastfed infants. But by itself, cow's milk protein isn't a good source of nutrition for newborns. It can't be used as the only source of whey protein since, while having high concentrations of tryptophan and cysteine, it has incredibly low quantities of arginine. It is possible to more accurately match infant's amino acid requirements with carefully balanced combinations of regular bovine casein fractions and α-LA rich whey fractions, that are now economically accessible. As for comfort formulas, formula's enriched with α-LA has shown to be better adopted and endured by infants than regular formula.

α-lactalbumin and absorption of trace elements
Nearly all of the minerals and trace elements that are known to be necessary for human health are found in milk. These are frequently found in forms that the body can readily absorb and use, such as calcium and zinc, due to their high bioavailability. Trace amounts of metals, including Zn, Fe and Mg, can be bound by α-LA and then released throughout the gastrointestinal tract's absorbing mechanism. This is particularly crucial for the provision of micronutrients during an infant's feeding. Research on the production and characterization of this sort of interaction and such as the protein micronutrient Zn, is therefore essential from a scientific and industrial aspect. Zn is among the elements that are recognized as trans-metals. The molecular weight of Zn which is 65.38 units is the result of the combination of five isotopes: 64,66,67,68 and 70 amu. Given its chemical properties, it exhibits a dual valence state and acts as a reducing agent in biological fluids. In solution, the zinc ion becomes hydrated, leading to the formation of coordination complexes. One of the most significant micronutrient is Zinc ion, which is usually coordinated by six water molecules. It is necessary for preserving homeostasis, the immune system's efficient activity and growth, but taking too many supplements might have detrimental effects that are comparable to the body's inability to absorb certain elements. It is a catalytic component of many biological events and a cofactor of numerous enzymes. Therefore, consuming protein-Zn complexes can encourage an individual's healthy growth. Zn interacts with histidine, glutamic and aspartic acid, and other amino acid moieties to form complexes with α-LA. The protein surface has two types of binding sites. The first set is associated with a bond of approximately 104 to 105, while the second set corresponds to a bond around 103. In proportion to the molar ratio of zinc to protein, metal binds to protein progressively. In contrast to the standard protein form, the Zn-protein complex exhibits lower temperature stability, which increases it's susceptibility to proteolytic enzyme digestion and causes aggregation. The bovine α-LA composition and its constituent with Zn have been studied using circular dichroism and NMR. Only minor local structural alteration rather than significant structural alterations were caused by Zn's binding to the holo form. Using the Fourier Transform Infrared Spectroscopy (FT-IR) technique, single and relatively small structural modifications of the protein in the form of apo and holo resulting from binding with Zn were observed. During an infant's rapid

growth, an adequate amount of trace minerals, such as iron and zinc, is crucial. To make up for their decreased bioavailability, infant formulae frequently include trace mineral amounts that are higher than those in human milk. α-LA contains two calcium binding sites, one of which could be taken up by Fe or Zn. Research on young rhesus monkeys and humans suggest that α-LA could boost the absorption of Zn but not Fe. The presence of metal ions at α-LA's metal binding sites mostly affects its physical properties. α-LA is molten and globule-like when associated metal ions are absent. Zn^{2+} binding to the Ca^{2+} loaded protein reduces its stability and leads to aggregation, however metal ion binding, particularly Ca^{2+} binding, increases the stability of α-LA against heat,different denaturing agents and proteases. Additionally, α-La supports the growth of beneficial microorganisms like bifidobacteria, which lowers the gut pH and potentially improves mineral absorption. Most clinical studies on α-LA-enriched infant formulas have focused on evaluating the infants' growth, formula acceptance, and plasma amino acid levels following consumption.

α- lactalbumin and infant's immune response

Human milk contains α-LA in significant amounts (20–28% of total protein), suggesting its potential use in baby formulae. Giving formula enhanced with α-LA to babies has been shown to have positive impacts on the immune system and gut microbiota. By promoting the activity of cells involved in the immune response, α – LA aids in proper functioning of immune system. Additionally, they have antioxidant properties that protect cells from any damage.S everal studies carried out in 1980s showed that α-LA enhanced mice's immune system. It is unexpected to find no evidence of the immune-modulatory effects of α-LA in spite of these researches. The presence of an unknown peptide in hydrolysed α-LA has been shown to have impacts on both T- and B- lymphocyte activity from α-LA, an immune-modulatory tri-peptide, appears to work by attaching to the particular GLF receptors on human monocytes and macrophages to promote their adhesion and phagocytosis. Additionally a study using a different peptide (Try-Gly-Gly) from α-LA showed that this peptide stimulated human peripheral blood cells. α-domain - blue and β-domain - green. Tryptophan residues - blue and disulfide bridges - yellow. Residues involved in coordinating Zn^{2+} ions - red.(Eugene A. Permyakov , Lawrence J. Berliner, 2000).

α-lactalbumin and infant's brain development

Cysteine, an amino acid required to synthesis glutathione, is abundant in α- LA.[23] Strong antioxidant glutathione contributes to increased immunity. α- LA creates a strong complex that is harmless to normal cells but exhibits specific anti-tumour activity against malignant neoplastic cells, such as Caco-2, HepG-2, PC-3, and MCF-7 tumour cells. For an infant's growth and development, primarily the development of its brain, sleep is fundamental. Both melatonin and serotonin are recognized as important sleep regulators during life; however, since serotonin cannot pass the blood-brain barrier, it needs to be produced inside the brain. Tryptophan is a crucial amino acid in the synthesis of serotonin since it is a precursor to serotonin and can penetrate the blood-brain barrier. Tryptophan is usually seen as one of the most important limiting amino acids in proteins taken in our diet, and its plasma concentrations are used to assess protein quality in formulas given to babies. It is a key precursor for serotonin which performs diverse C.N.S functions including hunger control, sleep regulation, memory formation, learning process among others temperature regulation and moods and behaviour as well as the development of neural and synaptic connections. By lowering the total amount of proteins found in infant formula and increasing the proportion of α-LA, brain serotonin activity increases, cortisol level decrease and mood is enhanced among people who are susceptible to changes. Additionally this alteration enhances tryptophan plasma levels relative to those of other major neutral amino acids. Apart from its impact on the sleep-walk cycle and CNS, serotonin has also been found to be crucial forb gut motility and immunological function. Meanwhile, tryptophan plays regulatory roles in the gut.

Side effects of α-lactalbumin

A diet that is high in α-LA raises the ratio of tryptophan compared to other neutral amino acids, which could subsequently boost serotonin levels in the brain and cause complications. It can cause nausea, vomiting and abdominal pain. It can interact with certain medications, such as blood thinners and cause allergic reaction in some people. Additionally, it can increase the risk of the kidney stones and causes an imbalance in electrolytes. Therefore, the concentration of α-LA in infant milk formulas should be optimal so as to avoid any of these complications.

Bovine α-LA is a significant food allergen present in milk, notable for its stability due to its four disulfide bonds and calcium-binding properties. Incorporating bovine α-LA into infant formula has been suggested as a way to alter the plasma amino acid profile in infants. This modification might enable a reduction in the formula's overall protein content, potentially impacting growth.

CONCLUSION

Specific proteins included in infant formula, such as α-LA, which contains necessary amino acids, may enhance growth, immunological responses, and intestinal health in addition to improving the absorption of vital trace elements like Fe and Zn. α- LA has been linked to improved mineral binding, immune system modulation, apoptosis and suppression of tumours and altered gut microbiota in infants by fostering bifidobacteria and stifling the growth of possible pathogens, according via *in vitro* research and clinical trials. These benefits would be similar to those breast milk provides for formula-fed infants. An increasing body of research indicates that health, cognition, and the development of the brain and other organs depend on the bilateral interaction that occurs within the microbiota-gut-brain axis. Subsequent investigations must evaluate the precise impacts of α-LA on immune response, gut microbiota, and trace element levels and the accurate amounts of α-LA that has to be included in an infant formula. It is said that breastfeeding is the best option for a infant's growth and development. If this isn't feasible, complex mixtures - like ones that contain: α-LA offers a useful alternative.

ABSTRACT

Marine actinomycetes are commonly used to manufacture new medicinal compounds due to their enormous diversity, however, this is currently under investigation. In this study, we identified five marine actinomycetes from the mangrove rhizosphere soil of the Vellar estuary in Cuddalore, Tamil Nadu, India(VM 01, VM 02, VM 03, VM 04,). The isolates' morphological and physiochemical characteristics were identified. Streptococcus sp., Staphylococcussp., Escherichia coli, Klebsiella sp., were used as test organisms for primary screening for antimicrobial activity. All the isolates VM04, VM02, VM 03, and VM01were found to have antimicrobial activity with maximal zones of inhibition of 7mm, 6mm, and 8mm, 9mm for E.coli, and the four isolates were not shown less zone of inhibition against targeted pathogens. Among the four isolates, VM04 showed the highest zone of inhibition against pathogens. The outcome of these findings may be crucial for future investigations towards the invention of wide-ranging antibiotics for therapeutic applications.

Keywords: *Actinomycetes*, Biochemical characteristics, antimicrobial activity

INTRODUCTION

Mangroves, which grow in intertidal zones along tropical and subtropical coasts, are one of the world's most abundant ecosystems. The mangrove environment provides a rich supply of unique plants, bacteria, algae, and animals for the creation of biologically active compounds [[1]]. According to [[2]], the environments are defined by sandy or muddy soil with high salinity, a rather wide range, a high average temperature, and strong winds, mangrove soils create significant environments for the development of various microorganisms. The most prevalent microorganisms in mangroves are bacteria and fungi, which support the productivity of ecosystems by engaging them in important nutrient cycles [[3]]. Additionally, such bacteria can create bioactive metabolites that may be used for both industrial and therapeutic applications. Mangrove soil isolated fungi have been shown to generate medicinal substances including antimicrobials antiviral, antioxidants, and anticancer as well as industrial enzymes like lipase, cellulase, protease, and pectinase [[4]]. Actinomycetes are one of the major bacterial species that produce bioactive chemicals in mangrove soils. According to [[5]], actinomycetes are filamentous Gram-positive bacteria with morphology resembling fungi, a large genome of more than 8 Mbp, high G+C content, and biosynthetic gene clusters relevant to the production of secondary compounds. Actinomycetes that have been identified from mangrove sediments and soils have the potential to produce antibiotics, anticancer drugs, and antioxidants. Actinomycetes are known to be the primary manufacturers of antibiotics. Actinomycetes manufacture more than 80% of the antibiotics that are now in use, including tetracycline, macrolide, chloramphenicol, nucleosides, and polyenes [[6], [7], [8]]. Streptomyces species in particular are known to be the largest producers of antibiotics among them [[9]].In the current investigation, soil samples from the mangrove rhizosphere, which were obtained from several areas of the cellar estuary, were isolated and screened for actinomycetes that produce antimicrobials. Toanalyze and report the distribution of the antimicrobial activity of microorganisms gathered from sample locations, the present investigation is important.

MATERIALS AND METHODS

Sample collection
Using the purposive sampling technique, soil samples were taken from the Vellar estuary Mangrove, Parangipettai, and Cuddalore district at two separate places. Location I consisted of 10 sample points, while Location II consisted of 8 sample points. We collected 100 g of dirt from each sampling location. Using a soil boring, samples were obtained from 0 to 15 cm deep [[10]], and they were then placed in sterile plastic bags. The obtained sample was examined for physicochemical characteristics, such as soil pH (4–6.4), salinity (0–15%), temperature (27–28°C), humidity (70–82%), and temperature (27–28°C) [[11]].

soil sample preparation
For a week, soil samples were heated and dried to get rid of any undesired Gram-negative bacteria. samples that have been baked in an oven for 30 minutes at 65°C after being air-dried at ambient temperature, placed in an aluminum cup, then heated for another 30 minutes [[12], [13]].

Isolation of Actinomycetes
The soil samples were inoculated into Starch Casein Agar (SCA) medium supplemented with 0.1% chloramphenicol and 0.1% griseofulvin using the pour plate technique [[14]]. The soil samples were suspended in sterile distilled water (1:9 w/v). After that, the samples were kept at 27°C for 1-4 weeks [[12]].

Characterization and identification
The actinomycetes were identified using macroscopic and microscopic examinations, as well as physiological tests, as recommended by Bergey's Manual of Systematic Bacteriology, 2nd Edition, Vol 5, Actinomycetes, Part A.Macroscopic Characterization. Aerial mycelium, submerged mycelium, color, and diffusible pigments were all

detected in isolated actinomycetes. Microscopic inspection was carried out using a cover slip and the Gram-staining technique. The solidified starch casein agar medium plate had a sterile cover slip put into it at a 45° angle to the agar surface. Along the medium's surface where it meets the surface of the submerged cover slip, an actinomycete isolate was injected. For four days, it was incubated at 28 °C. Using sterile forceps, the cover slip was removed and put on a unique, clean glass slide, where it was then viewed using an oil immersion objective. [[15]].For each isolate, a loopful of a pure culture colony that had been incubating for about 7 days was placed in starch-casein broth and incubated at 28°C for 4 days. The culture suspension was employed for various protein consumption tests, catalase, and oxidase tests, and sugar utilization tests after the emergence of turbidity.

Antimicrobial activity test
Four actinomycetes isolates were chosen for antibacterial activity testing. The isolates were cultured for one week at 32°C in Nutrient Broth (NB medium). Crude antimicrobial compounds (CACs) were extracted from supernatants by centrifugation at 6000 rpm for 10 minutes. The disc diffusion technique was used to conduct an antibacterial test against *Staphylococcus aureus, Escherichia coli, Klebsiella sp.*, and*streptococcus sp.*,

RESULTS

Sampling sites
The Mangrove Centre Vellar estuary have *Rhizophora* and *Avicennia* species dominate the vegetation. Soil samples were taken from locations I (105 m from the sea) and II (40 m from the sea) for this investigation. (Table 1) shows the soil qualities that were sampled. Locations I and II were split into I-A and II-A, which have pH ranges of 5 to 6, and I-B and II-B, which have pH ranges of 4 to 8, which are relatively acidic.

Isolation of actinomycetes from mangrove Rhizosphere soil
There were four isolates of actinomycetes found at the sample site of location I, whereas none were found at location II (Table 2). It was discovered specifically by the VM02 isolate that actinomycetes could flourish in acidic soil. The four isolates differ in a variety of macroscopic and microscopic ways (Table 3). Figure 2 depicts the isolates' colony morphology, and Figure 3 displays the Gram-staining results. Different colony morphological characteristics may be seen in four isolates of actinomycetes (Table 3). Actinomycetes colonies often have microscopic features such as being tiny, dry, wrinkled, fibroma-like, or velvety on the surface. The VM04 isolate in this investigation was dry, the VM 03 isolate had a fibrotic surface, the VM02 isolate had a minor wrinkle, the VM 01 isolate had a smooth surface, and the VM 01 isolate also had a silky texture. Furthermore, VM 02 had grey aerial mycelium, VM 04 had white aerial mycelium, VM 01 had white aerial mycelium with filaments, and VM 03 had yellow aerial mycelium with scraper edges.

Screening of antimicrobial activity
Actinomycetes isolated from Vellar estuary mangrove soil may inhibit the development of *E. coli*, *streptococcus sp.,staphylococcus sp.,* and *klebseilla sp.*(Table 4). It might be related to the isolates' capacity to limit the development of Gram-negative and gram-positive bacteria. The VM04 isolate has the highest inhibition zone against *E. coli* (9 mm), whereas the VM 02 isolate has the smallest (6mm). The size of the clear zone in the initial screening test findings suggested that VM 04 had the greatest inhibitory zone. Inhibitory zone was compared positive control P1 – Streptomycin, P2- Ampicillin (Figure 3). The VM01 produce highest zone of inhibition 7mm, 4mm, 2mm,2mm against *E.coli, streptococcus sp., staphylococcus sp., and klebsiella sp.*, VM02 produces lowest zone of inhibition 3mm against *klebsiellasp.,and* VM04 Produce highest zone of inhibition 5mm against klebseilla .

Identification of the isolate with the greatest antibacterial activity
The VM 04 isolate had the largest inhibitory zone against all the pathogens and it shows it was studied further to discover its genus. Table 5 shows the results of the biochemical analysis of the VM 04 isolate. VM04 is a Gram-

positive with a grey aerial mycelium and a spiral-shaped spore chain that produces catalase. The VM04 isolate shared 92.8% of its physiological features with the Streptomyces genus [[16]].

DISCUSSION

The diversity of actinomycetes is significantly influenced by the physical and chemical properties of soil [[17]]. Actinomycetes are a source of bioactive compounds with antibacterial, antifungal, antiviral, and antiparasitic action, according to empirical evidence [[17]].According to [[18]], several actinomycetes that generate antimicrobial chemicals are aerobic chemoorganotrophic, contain oxidative metabolites, and draw energy from a variety of carbon sources. Actinomycetes may grow at their best at temperatures between 28 and 32 °C. Actinomycetes grow best at temperatures between 28 and 32 °C, according to [[19]].According to [[20]], actinomycetes may grow in the pH range of 4-5 and thrive in 6.5-8.0. The actinomycetes used in this investigation were found in soil that had a pH of 4. Location I, which had a pH of 4-6 and a salinity of 2%–15%, was able to effectively isolate four actinomycetes. At site II, which had 0% salinity and the same pH, there were no actinomycetes. It shows that actinomycetes' development is not solely influenced by pH. Environmental variables such as temperature, pH, salinity, dissolved oxygen, dissolved nitrate, dissolved nitrite, dissolved phosphate, and dissolved ammonia all had an impact on the density of actinomycetes. Environmental factors can potentially reduce the variety of actinomycetes in a given area. The existence and distribution of actinomycetes' habitat are influenced by the physical and chemical characteristics of the soil [[21]]. The majority of actinomycetes are found in wet and coastal soil. It is because actinomycetes may grow and reproduce under certain environmental circumstances. In biological applications including antibacterial, anticancer, antifungal, and enzyme makers, marine actinomyces play a significant part [[21]]. Actinomycetes cannot develop in several environmental circumstances, including excessive salinity, acidic environments, and extremely high temperatures. However, certain actinomycetes have been discovered in coastal soils, which may provide the proper environment and nutrients for their development. Under ideal climatic conditions, actinomycetes generate the best antibiotics [[8], [17]]. However, the salinities from both locations were not too high in this investigation, although just a few isolates were collected. Site I yielded four isolates (VM 01, VM 02, VM03, and VM04), but site II yielded none of the actinomycetes isolates. The soil at position II had an unpleasant odor and a light brown color that may make actinomycetes undesirable.In a prior investigation, [[22]] discovered 10 isolates of actinomycetes strains in mangrove sediments in Egypt's Red Sea. In addition, thirty actinomycetes have been isolated from Antarctica [[23]].

In comparison, [[24]] identified actinomycetes from Nipah worm pelleted feces and the digestive tract.   It demonstrates that actinomycetes may be isolated from a variety of habitats as long as the environment fits the nutritional demands of actinomycetes [[24]].Actinomycetes isolated from the vellar estuary's mangrove rhizosphere soil, Parangipettai, belonging to the *Streptomyces and Saccharopolyspora spp.* genera (Table 3) inhibited the development of *E. coli , S. aureus or K. pneumoniae, staphylococcus sp.,*. Previous research has shown that actinomycetes can limit the development of *Bacillus, Staphylococcus, E. coli, Klebsiella, and Pseudomonas* [[25]]. Streptomyces is one of the Actinomycetes genera that generates the most antibiotics. Streptomyces antibiotics are often streptomycin generated by *S.griceus,* which can inhibit most Gram-negative bacteria. *Streptomyces spp.* generates spectinomycin, which inhibits Mycobacterium TB growth. *S. fradiae* generates broad-spectrum antibiotics such as neomycin. *S. aurefaciens* produces tetracycline, which inhibits Gram-positive and Gram-negative bacteria with a broad range, including Rickettsia's. Gram-negative bacteria are inhibited by erythromycin, which is generated by S. erythroid. S. Venezuela chloramphenicol has a limited antibiotic range, whereas Streptomyces generates many more antibiotics. The genus Streptomyces produces around 60 different antibiotics.VM -04 was the isolate that generated crude antimicrobial compounds (CACs) with the greatest inhibition against *E. coli*. Overall, the actinomycetes isolated from the mangrove rhizosphere soil in Vellar Estuary Parangipettai show antibacterial activity against *E. coli*, according to this study. As a result, Streptomyces spp strain VM-04 might be developed as an antibacterial agent.

Kiruthiga *et al.,*

CONCLUSION

An effort was made to identify several strains of actinomycetes with antibacterial activity from the mangrove rhizosphere soil in the Vellar estuary, Parangipettai. There is currently a need to discover novel antimicrobial-producing strains since existing medications have failed owing to the development of resistance among microbes. The current study is also a little contribution to this requirement. Isolates that demonstrated broad-spectrum effectiveness against the test pathogens might be investigated as possible antibacterial chemical compounds.

ABSTRACT

The liverwort *Frullania monocera* has been collected in the Palani Hills of the Western Ghats for the first time. In India, it was earlier known only from Assam. The present discovery raises the number of *Frullania* species to 21 in the Western Ghats. A description, a photographic plate and a key to distinguish the typical species *F. monocera* from its variety *acutiloba* are provided.

Keywords: *Frullania acutiloba*, *F. monocera* var. *Acutiloba*, Misamari, Assam.

INTRODUCTION

Frullania Raddi has approximately 673 species world-wide (von Konrat *et al*. 2016; Sukkharak 2018). In India, so far 58 species and 14 infraspecific taxa have been reported (Singh *et al*. 2016). In the Western Ghats, so far 20 species have been reported (Daniels 2010; Daniels & Kariyappa 2019). While documenting the bryoflora of the Palani Hills in the Western Ghats, a material of *Frullania* was collected which after a detailed study was identified as *F. monocera* (Hook.f. & Taylor) Taylor. In India it was earlier known only from Misamari in Assam. Hence, the present record is an addition to the *Frullania* species of the Western

94332

Ghats thereby raising the number of species to 21. A description, a photographic plate and a key to distinguish the typical species *F. monocera* var. *monocera* from its variety *F. monocera* var. *acutiloba* are provided.

MATERIALS AND METHODS

Samples were collected after monsoon rains. Specimens were dissected and observed under an Olympus SZ51 binocular stereomicroscope and photographs of relevant parts were taken using an Olympus BX43 compound research microscope. Identification was made following monographs and recent publications and also by consultation. Collected specimens are housed at the Herbarium of Scott Christian College, Nagercoil (SCCN).

TAXONOMY

Frullania monocera (Hook.f. & Taylor) Taylor in Gottsche, Lindenb. & Nees, Syn. Hepat. 3: 418. 1845; S. Hatt., J. Hattori Bot. Lab. 45: 347, f. 18. 1979 & 47: 103. 1980; S. Hatt. & P.-j. Lin, J. Hattori Bot. Lab. 59: 139. 1985; Bapna & Kachroo, Hepatic. India 2: 173. 2000; D.K. Singh & al., Liverw. & Hornw. India: 90. 2016; Söderström *et al.*, Phytokeys 59: 281. 2016. *Jungermannia monocera* Hook.f. & Taylor, London J. Bot. 4: 89. 1845. **-** Type: Australia, Van Diemen's Land (= Tasmania), *Taylor s.n.* in hb. FH [00290606] (lectotype by Hentschel *et al*. 2015); in hb S, Herb. Lehman., sent 1847, Taylor [B143254]; in hb W, Lindenberg Hepat. 714a [W0259690]. *Frullania hampeana* Nees in Gottsche & al., Syn. Hepat.: 426. 1845; Verd., Ann. Bryol. Suppl. 1: 44. 1930; S. India: 22. 1994. *F. lanciloba* Steph., Sp. Hepat. 4: 404. 1910. *F. tortusa* Verd., Ann. Bryol. 2: 136. 1929. (Fig. 1) Plants dioicous, 8–13 mm long, dark green to brown. Stems irregularly pinnately branched, ca 0.18 × 0.16 mm in cross section, 8- or 9-celled across; cells homogenous, 14–20 × 15–25 μm, irregularly quadrate-hexagonal, thick-walled. Leaves imbricate, obliquely to wide–spreading, dorsally arching half to full stem-width beyond the farther edge of the stem, 0.08–0.13 × 0.07–0.12 mm, oblong-elliptic, rounded-appendiculate at base dorsally, slightly undulate, obtuse to broadly acute at apex; cells irregularly rounded–hexagonal, with distinct trigones and intermediate nodular thickenings; apical cells 10–16 × 12–20 μm; median cells 14–30 × 16–24 μm; basal cells 20–40 × 16–24 μm; oil bodies disintegrated; lobules 0.22–0.48 × 0.23–0.4 mm, explanate to galeate, with a piliferous beak which extends across and beyond the ventral margin of leaf; vertex widely–rounded; mouth wide. Styli 4–6-celled, setaceous, hyaline. Underleaves transversely to subtransversely inserted, 0.3–0.4 × 0.28–0.38 mm, obcuneate-obovate to obovate-rotundate, 2-lobed for 1/4 to 1/3 at apex, with a narrow to rounded sinus; lobes triangular to ovate, 2- or more-toothed at margin, attenuate-acute to piliferous at apex. Male inflorescence not seen. Female inflorescences terminal on stems or branches or lateral; bracts faintly concave, 0.8–1 × 0.74–0.8 mm, plano–convex, arched dorsally and rounded-appendiculate at base, undulate to slightly incurved at margin, apiculate at apex; lobules ovate-lanceolate, lobed and incurved at basal margin, long-acuminate at apex; bracteoles 0.7–1.1 × 0.4–0.8 mm, oblong-ovate, 2-lobed for more than half at apex; lobes lanceolate, one-toothed at margin, acuminate at apex. Perianth not seen.

Habitat
Corticolous on *Rhododendron* × *pulchrum* var. *phoeniceum* (Sweet) Rehder (Ericaceae), in a home-garden, ca 1000 m.

94333

Distribution
Australia, Bonin Islands, China, Indonesia, Japan, Malaysia, New Caledonia, Norfolk Island, New Zealand, Papua New Guinea, Sri Lanka, Tahiti, Taiwan, Thailand and India: Northeast India (Misamari in Assam) and Western Ghats of Tamil Nadu (Dindigul).

Specimens examined
Western Ghats: Tamil Nadu, Dindigul District, Palani Hills, Kodaikanal, ca 1000 m, $10^0 14'7.55''$ N, $77^0 29'32.4''$ E, 21.11.2022, *D.T.T. Daniels* 228 p.p. (SCCN).

Ecological notes
Frullania monocera was found as an epiphyte on *Rhododendron × pulchrum* var. *phoeniceum* (Sweet) Rehder (Ericaceae), in a home-garden, at an elevation of ca 1000 m.

DISCUSSION

Frullania monocera was originally described as *Jungermannia monocera* by Hooker and Taylor (1845) the type of which came from Australia. Taylor in Gottsche *et al.* (1845) transferred *Jungermannia monocera* under *Frullania* Raddi and made a new combination *F. monocera* (Hook.f. & Taylor) Taylor. Mitten (1861) described *Frullania acutiloba* from a collection made by Perrottet in Nilgiri Hills on the Western Ghats of Tamil Nadu. Hentschel *et al*. (2015) reduced *F. acutiloba* to a variety under *F. monocera* thereby making a new combination *F. monocera* (Hook.f. & Taylor) Taylor var. *acutiloba* (Mitt.) Hentschel & Konrat which was followed by Sukkharak (2018). Unfortunately, Hentschel *et al*. (2015) did not provide a reason for the renaming or any character that could be used to distinguish the different varieties. It was a purely formal classification without any justification. Hence, a key is provided here to distinguish between the two taxa.

Key to the varieties of *F. monocera*
1a. Leaf lobes widely incurved at apex; underleaf margin mostly entire or one-toothed on one
    side -- var. *acutiloba*
1b. Leaf lobes never incurved at apex; underleaf margin one- or more-toothed on both sides –
    -- var. *monocera*

Thus, *F. monocera* which is currently added to the *Frullania* species of the Western Ghats is *F. monocera* (Hook.f. & Taylor) Taylor var. *monocera*.

ABSTRACT

The present study investigates the effect of plant-based composite seed coatings on seed quality, germination, and plant growth. The prepared herbal composite made of using the plants such *Allium sativum,Zingiber officinale, Terminalia chebula,Cinnamomum albiflorum,Syzygium aromaticum* were found to significantly enhance various physical parameters, including shoot and root length on *Sorghum bicolor and Cicer arietinum*. The nontoxic herbal coatings enhanced the seed germination biochemical parameters such as carbohydrate, protein, Total fatty acids considerably. The prepared herbal composite which produced disease free seedling due to its phytochemical composition. The important phytochemicals such as alkaloids, flavonoids, are also reported to be present Additionally, the GC-MS analysis of one of the composite coatings revealed the presence of several bioactive compounds, such as copaene, caryophyllene, and alpha-caryophyllene. These compounds have been reported to possess insecticidal and antimicrobial properties, as well as potential benefits for plant growth and development. The findings of this research suggest that plant-based composite seed coatings can be a promising approach to improve seed quality, germination rates, and overall plant performance.

Keywords: Biofortified Composite, GC- MS Analysis, Physiological Parameters, Physical Parameters, Plant Growth, Antimicrobial Properties

INTRODUCTION

Agriculture is an important sector of Indian subcontinent. Farmers are more important for any nation. For any crop, the time from harvesting to sowing and seedling establishment is very crucial as seeds are exposed to a wide range of environmental stresses viz., biotic and abiotic stresses that can alter the quality aspects of seeds (Zinsmeister *et al.,* 2020, Zaheer et al., 2021). The judicious use of crop specific physical, physiological, chemical and biological agents could offer an attractive option for the development of sustainable good crop establishment, growth and productivity Seed enhancements are post-harvest treatments that improve the performance of seeds such as germination, seedling growth and facilitate the delivery of seeds and other planting materials required at the sowing. Seed priming is one of the most important physiological seed enhancement method. It is a hydration treatment of seeds which involves controlled imbibitions and induction of the pregermi native metabolism (activation), but radicle emergence is prevented (Kalaivani *et al.,* 2010). The hydration treatment is withdrawn before esiccation tolerance of the seed is lost (Bose *et al.,*2018). Seeds can be primed by soaking seeds in solutions up elemental with plant hormones or beneficial micro organisms for a specific period of time (Araújo *et al.,* 2016). The hydrated primed seeds can be reverted back to safe moisture content by drying for storage, distribution and planting. Seed priming is an easy and effective technique to get speedy and uniform emergence, high seedling vigour and higher yields of crops.

This controlled hydration technique stimulates metabolic processes during early phase of germination before protrusion of radicle (Araújo *et al.,* 2016). Higher rate of germination of primed seeds primarily happens because of reduction in the lag time of imbibition (Araújo *et al.,*2016), enzymatic activation, accumulation of germination enhancing metabolites (Hussain et al., 2015), metabolicre pair during imbibition and osmotic adjustment (Hussain *et al.* 2016). Seed quality plays an important role in crop production and lack of quality seed is one of the major hindrances in bridging the yield gap. Seed enhancement process involves pre-sowing hydration treatments or priming, hardening, coating technologies, seed conditioning and pregermination but excludes treatments for control of seed borne pathogens. In magneto priming, magnetic field is used as a non-invasive physical stimulant to improve seedling vigour and stress tolerance of the crop in the field. Nano priming can augment performance of seeds in many ways such as enhancing amylase activity, increasing soluble sugar content to support early seedlings growth, up-regulating the expression of aquaporin gene in germinating seeds, increased stress stolerance through lower ROS production, creation of nanopores for enhanced water uptake etc. This paper reviews the scope and relevance seed enhancement for sustainable agriculture with a special emphasis on recent advances in seed priming technologies. The factors that have an important contribution in the success of seed coating includes particle size distribution, porosity, water absorbing and holding capacity and extent of toxicity. So, it is desirable that precise distinguished coating agents and procedures can turn out to be relatively clear for improving seed quality and to obtain higher productivity (Ben-Jabeur *et al.,* 2021). In this connection the present study was carried out to prepare a seed coating with herbal powders as coatings using various methods. At present there are many chemicals are found in to perform the seed coating.

MATERIALS AND METHODS

The effect of composite the plants such *Allium sativum*, *Zingiber officinale*, *Terminalia chebula, Cinnamomum albiflorum,Syzygium aromaticum* were selected and coated on the seeds of study species *Cicer arietinum L.* and *Sorghum bicolor* Moench. The healthy plant parts were crushed and grounded using pestle and mortar the extracts were prepared using distilled water. The filterate was made through "whatman no.1" filter paper and the pure extract obtained taken as extract. the seeds were washed in sterile water. The seeds were soaked in extract in specific five treatments. The seeds were soaked and moistened with requisite amount of extract solution. Then the seeds were kept at one side and rolled in seed germination sheet. The seeds were moistened with distilled water and kept separately rolled germination sheet.the seeds with sheets kept in beaker containing water. Radicle emergence was considered as the criteria for seed germination. Germination count in each treatment was recorded. The shoot length, root length and plant length were calculated and interpreted accordingly (Asha Sinha and shrvan kumar,,2019).

Germination percentage(%)
Number of germinated seeds were recorded every 48 hours after initiation of germination until 10 days. (Deepak *et al.,*2020) Germination percentage = (no. of seed germinated /Total no. of seed sown)×100

Plant height at 20 days
Height of the selected plants was measured from the base of the plant upto the growing tip of the main stem with meter scale and expressed in centimeters..(Deepak *et al.,*2020)

Plant fresh weight
Twenty plants from each replication were uprooted at 22 DAS and their weight was measured with the help of balance machine and expressed in grams..(Deepak et al.,2020)

Total dry matter
Twenty plants from each replication were uprooted at 22 DAS and shade dried and their weight was measured with the help of balance machine and expressed in grams..(Deepak *et al.,*2020)

Preliminary phytochemical analysis:
The extracts were screened for presence of important phytochemical such as alkaloids, steroids, Terpenoids, Flavonoid, Coumarin, Saponins, Glycosides, Phenol and tannins by using standard methods.(Edeoga *et al.,* 2005,Harbone *et al.,* 1973,Yadav *et al.,* 2014Kokate *et al.,* 2000 Shreya *et al.,* 2013

Estimation of Chlorophyll Content
The contents of chlorophyll a, b and total chlorophyll were estimated on the foliar treated and non-treated leaves by Arnon, 1949.

Estimation of carbohydrate.
The estimation of carbohydrates from treated leaves using modified anthrone method. (Shekappa devindra,2015)

ESTIMATION OF PROTEIN BY BRADFORD METHOD
The protein content was estimated for treated and non - treated parts of the plants were made using Bradford method (Nicholas, 2002).

RESULTS AND DISCUSSION

Seed coating and layering is an innovative process to coat the seeds with a composite made of many substance including chemicals and other substances. For the present study an eco-friendly plant based biocomposite was prepared to coat the seeds aiming to control against the seed infection by pathogens. The seed composite is completely made of 5 different plant materials. The extracts including *Alliumsativum, Terminalia chebula, Syzygium aromaticum*, *Zingiber officinale* and *Cinnamomum sp.* were taken. All the extracts were mixed in a definite ratio and made into a composite. These composite were mixed with a little neem oil to facilitate the coating on seeds. This will increase the spread ability and coating ability of the composite. Table :-1 and 2 The composites made of five different plant extracts were tabulated. The composite ingredients were mixed at a definite ratio according to nature of the plant material. There are two methods were tried to coat the composite and evaluated the seed parameters in *Cicer arietinum L.* and *Sorghum bicolor Moench* on physical and biochemical behaviour of the seeds. The extracts were coated on the seeds in a wet condition and resulted to have 53 % germination in control. Subsequently the treated seeds were showed the fluctuations from 52% to 62% from W$_1$ and W$_2$ respectively in *Cicer arietinium*. On the other hand the Sorghum bicolor responded to have the maximum germination percentage of 88% in the W$_4$ composite. The study clearly exhibits that composites are very less influence over the germination physiology of the study crops. The result is in conformity with Ahmed *et al.,*(2014).He observed increased germination percentage in rice seeds, when

treated in neem extract(1:).Khatun *et al.,* (2010) also observed increased germination percentage in lentil seeds treated with neem leaf powder. Hasan *et al.,* (2015) found that extract of onion bulb and leaf extract of neem increased seed germination by decreasing the viral infection. The physical parameters like shoot length, root length, seedling fresh weight and dry weight were calculated using the method on the *Cicer arietinum* and *Sorghum bicolor*. The W_3 composite is highly influenced on 37.89 cm of shoot length and 34.94 cm of Root length and seedling weight is 26.14 and about 2.95 gm was reported for the biomass content of the plant on the dry weight basis of the seedling. The physical parameters of *Sorghum bicolor* as influenced by the various treatments on shoot length, root length, seedling weight and dry weight were tabulated in the table:- 6 the W_3 treatment influences the shoot length to 12.11cm and root length with 10.66cm in the W_5 treatment. These two treatments which supports the shoot and root length clearly opines with that W_3 and W_4 treatment supports shoot and root system biochemical pathways .Table:-5 and 6. The crop *Cicer arietinum* exhibit it's the 4.353 mg/g of total chlorophyll content in the composite treatment of W_4 on wet method. Table :-7 . The crop *Sorghum bicolor* at W_5 composite treatment was 5.132 mg/g when compared with other composite concentrations. The carbohydrate content was on various treatment were recorded in the table :-10. The W_1 composite wet coating supported the carbohydrate production in the crop of *Cicer arietinium* on the study period. Subsequently the protein content was also enhanced by the composite treatment as 0.321 mg/gm at W_3 composite treatment. When compared with control and other treatments. Seed coating is a finite process to preserve the seeds from infestation from pests and pathogens. Similarly the results were found to be more relevant with Deepak *et al.,* 2020 that seed priming with garlic reduce the infection rate and also enhances growth and yield of lentil. This may be due to the presence of Allicin. Similar results were reported by Vigneshwari (2002) reported that seeds hardened with brasssinolide 0.1 ppm had positive effect on drought resistance which was evident from its increased physiological and biochemical aspects of finger millet seeds that resulted in increased yield of seed. Many studies on the improvement of growth and yield due to pre sowing seed hardening are documented (Solaimalai and Subbarmanu, 2004 ; Meek and Oosterhugs , 2005).

The study was undertaken to evaluate the phytochemical constituents of the water extract to confirm the presence of bioactive compounds. The phytochemical test was conducted using third (T_3) extract of wet treatment method. In third treatment the root length, shoot length, fresh weight, dry weight and the protein content of the plant were increased. The water extract of T_3 showed the presence of glycosides , tannin , saponins , resin , steroids and phenols. The study ultimately evaluates the effect of herbal biocomposite on the seeds. The seedlings germination rate, root and shoot length, the biochemical parameters are considerably increased. Additionally the biocompositehas the presence of important phytochemicals which may protects the seeds from pathogenic organisms. The GCMS analysis also confirms the presence of important phytochemicals which may improve the seedling growth in many ways.With the above results it is confirmed that the prepared herbal biocompositewas one of the cost effective and ecofriendly approach in growth and development of crops. The GC-MS analysis of the herbal biocomposite extract revealed the presence of a diverse range of bioactive compounds, including phenolics, fatty acids, terpenes, and sterols. The major component identified was Phenol, 2-methoxy-3-(2-propenyl) (commonly known as eugenol), accounting for 40.76% of the total composition, known for its strong antimicrobial and antioxidant properties. Significant fatty acids such as 9-Octadecenoic acid (oleic acid) and n-Hexadecanoic acid (palmitic acid) were also detected in substantial amounts, contributing to seedling vigor and disease resistance. Terpenoids like Caryophyllene, Copaene, and Caryophyllene oxide were present, supporting plant defense mechanisms. The presence of gingerol, squalene, vitamin E, and stigmasterol indicates the antioxidant and growth-promoting potential of the composite. Minor components such as benzoic acid derivatives, hydrazides, and benzofurans further enhance the therapeutic and protective qualities of the extract. Overall, the phytochemical profile confirms the biocomposite's richness in compounds that promote seed health, growth, and protection against pathogens.

CONCLUSION

The present study highlights the potential of a plant-based herbal biocomposite as an effective seed coating material. The use of natural extracts from five medicinal plants combined with neem oil proved to be a sustainable approach to

enhance seed health and early seedling vigor. This eco-friendly method aims at preventing seed-borne infections and supporting initial plant development. Seed coating with herbal composites demonstrated positive effects on physical and biochemical parameters of the tested crops. Enhanced germination, shoot and root growth, as well as increased chlorophyll, carbohydrate, and protein levels, were observed. The treatment also indicated improved resistance to environmental stress and potential protection from pathogens. The phytochemical analysis confirmed the presence of several bioactive compounds in the extracts. These compounds likely contributed to improved plant growth and defense responses. This herbal coating method aligns with sustainable agriculture goals by reducing dependency on synthetic chemicals. It promotes environmentally conscious farming practices and offers a cost-effective alternative for seed treatment. Overall, the biocomposite serves as a valuable tool for improving crop performance.

ABSTRACT

Respiration is a vital process for energy production and can be targeted by inhibiting key enzymes involved in metabolism. Enzyme Isocitrate lyase (ICL) converts isocitrate into glyoxylate and succinate and, is crucial for fungal virulence, cellular penetration, and infection in humans. In this study, we aimed to identify a molecule that inhibits Isocitrate lyase using *in silico* methods. Multiple sequence alignment of Isocitrate lyase protein sequences from eleven selected organisms listed in Table2, whose ICL structure were available in PDB database, was performed using the T-Coffee web server.   3-D model of ICL for all eleven organisms was determined using Swiss-Modeler and secondary structure prediction was carried out with Biovia Discovery Visualizer tool. Based on literature survey, 17 different phytochemicals from nine medicinal plants were selected for molecular docking. Molecular docking of all selected phytochemicals was performed with Auto Dock 4.2.6 tool to obtain binding energies of ligand-receptor interactions. Phytochemical named Ishwarol showed improved binding energy than normal and control drug molecule taken for evaluation, and therefore can be considered as a lead molecule.

Keywords: Isocitrate lyase, Enzyme, glyoxylate cycle, Molecular docking, Phytochemicals, ADMET

INTRODUCTION

Isocitrate lyase (ICL) belongs to the family of Lyases enzyme, specifically the oxo-acid-lyases, which cleaves carbon-carbon bonds. Isocitrate lyase is an important enzyme in Glyoxylate cycle, which catalyzes the reversible cleavage of isocitrate into succinate and glyoxylate. The Glyoxylate cycle is found in archaea, bacteria, protists, plants, fungi and nematodes. The glyoxylate cycle bypass the CO_2-generating steps of the TCA cycle and allow the net assimilation of carbon from C_2 compounds, allowing micro-organisms to replenish the pool of TCA cycle intermediates necessary for gluconeogenesis and other biosynthetic processes [1]. In *Saccharomyces cerevisiae*, pyruvate carboxylase and the glyoxylate cycle have been experimentally identified to be the main anaplerotic routes during growth on glucose and ethanol [2]. The products, succinate and glyoxylate, in glyoxylate cycle are replenished to Tricarboxylic acid (TCA) cycle as intermediates, reviving TCA cycle [3]. An estimation of tuberculosis (TB) incidence reported by WHO states that a total of 10.6 million people get infected with TB in 2021 [4]. Icl1 and Icl2 are required for fatty acid catabolism and virulence in *Mycobacterium tuberculosis*. Deletion of both genes result in complete damage of intracellular replication and rapid elimination from the lungs, suggesting ICL role during infection [5]. *Rhodococcus equi,* a gram positive bacteria that mostly causes cavitary pneumonia and lung abscess, especially in immmuno-compromised hosts requires ICL for virulence and long term survival [6][7]. *Salmonella enterica* has shown that ICL is required for persistence during chronic infection, but not for acute lethal infection [8]. *Pseudomonas aeruginosa* which persists in the lungs of cystic fibrosis patients has shown constitutive upregulation of ICL gene leading to increase in hydrogen cyanide production, a potent inhibitor of cellular respiration [9].

Additionally upregulation of genes is shown in *P.aeruginosa* that are needed for replication: fatty acid and lipid metabolism, choline metabolism, nitrogen metabolism, amino acid degradation and the glyoxylate cycle [10]. Transcriptome analysis and molecular techniques done on *Paracoccidioides brasilinesis,* an agent of paracoccidioidomycosis, has reported upregulation of glyoxylate cycle genes during morphological transition [11][12][13]. *Penicillium marneffei*, a dimorphic fungus that cause disseminated disease in human immunodeficiency virus infected patients, showed higher expression levels of isocitrate lyase after macrophage internalization [14]. Glyoxylate cycle and their enzymes has also given an alternative carbon adaptation strategy that has been developed by many fungal species such as *Candida spp.* for survival and pathogenesis in hosts phagocytes such as macrophages that restricts pathogen's preferred carbon source, glucose [15]. Role of ICL in fungal pathogens causing various diseases in plants have also been reported [16][17][18]. A WHO report estimates that 450 000 incident cases of MDR/RR-TB (Multi-Drug Resistant/ Rifampicin-resistant) have occurred in 2021, an increase in 3.1% since 2020 [21]. Many pathogens have developed a mechanism to counter drugs and have become multi drug resistant or antibiotic resistant. Plant based phytochemicals shows an effective drug action against pathogens with least side effects. The potential drug candidates designed against ICLs with specific active site interact with hydrogen bond and thereby inhibit the activity of pathogenic ICLs, with no side effect on the host. Hence, we are interested in screening potential phytochemicals as drug molecules against ICLs and look into their effectiveness against pathogenic microbes. Hence present study focuses on in silico docking work on selected phytochemicals as lead molecules to check their binding affinities to modelled ICL protein in comparison to known antimicrobial drugs. This may help to come out with leads of next-generation drugs against virulent ICLs involved in infection and proliferation of many pathogens

METHODS

Selection and drug-likeness identification of phytochemicals for drug design
Selection of phytochemicals from medicinal plants for inhibitor design
Based on the review of research papers, 61 Indian medicinal plants belonging to 33 different families used in various disorders were screened and selected having antimicrobial properties [22]. List of phytochemicals selected is given in Table 1. All of the phytochemicals 3D structure were retrieved from PubChem database in Structure Data Format (SDF). The SDF files were converted to PDB files by the help of Open babel for further analysis. The chemical structures of synthetic inhibitors itaconate, nitropropionate and bromopyruvate were similarly processed as controls.

Siddharthsinh Parmar *et al.,*

Drug-likeness test of phytochemicals using ADMET Lab2.0
Absorption, distribution, metabolism, excretion and toxicity must be evaluated before drug design otherwise can lead to failure of drug development. Therefore drug likeness test of 17 phytochemicals and three controls were evaluated by input to ADMET Evaluation service given by ADMET Lab2.0 in SDF format files and various descriptors (LogP, Mol. Wt, nHA, nHD, nRot and Vol) values were obtained as mentioned in table 1[32]. The descriptors   refer to Lipinski rule of five which states that an active oral drug should qualify the following criteria: molecular weight should be less than 500 Da, log P should be < 5, H-bond acceptor should be < 10, H-bond donor should be < 5, number of rotatable bonds should be > 5 and additionally molecular volume for the compounds should be between 500 and 2000 [33].

Consensus generation,
phylogenetic tree construction and In-silico homology modelling of protein
Consensus sequence generation through MSA and phylogenetic tree construction
11 organisms belonging to kingdom fungi and bacteria having known structure for ICL were chosen for MSA (Multiple Sequence Alignment). Table 2 shows organisms name with the PDB ID. Protein sequences of ICL were retrieved directly by the T-Coffee server of EBI (European Bioinformatics Institute), when PDB format files of all ICL structures were given for MSA [34]. The following parameters were set. The output format was set to ClustalW and matrix as BLOSUM. Protein sequences were submitted to T-coffee web server for automatic generation of phylogenetic tree The consensus sequence generation was done in the Jalview software by inserting the link given on result viewers tab of T-Coffee website. [35].

In-silico **homology model construction**
Though 3D structure of ICLs were available at PDB database, we were in search for a common and representative ICL structure for all eleven organisms. As we have earlier generated a consensus sequence representing common sequence of ICL for all eleven organisms therefore consensus sequence was submitted to the Swiss modeller website [36] as the target sequence. A homology model of ICL was generated by modeller by searching identity of templates available in integrated database matching the target sequence.

Superimposition and Active site identification
Superimposition of similar proteins
The 3D structures of ICL and the model ICL protein must relate and show identical sequences conserving the physiochemical properties of the amino acid residues. Therefore to check whether the properties and structure is conserved or not, ICL was superimposed with the ICL of *Candida albicans* which showed highest similarity, with the help of Biovia Discovery Client software [37].

Active site identification
TIM-Barrel like motif of isocitrate lyase is the active site of the enzyme. Therefore, targeting the   active site in docking requires coordinates of residues involved in the formation of active site. The coordinates of 24 amino acids were retrieved from the PDB file format of model ICL monomer. Coordinates for X, Y, and Z axis were opted for all the 24 amino acids participating in the formation of TIM-Barrel. The coordinates were: X = -17.86, Y = 18.82, Z = 39.315.

Docking studies using Autodock 4.2.6
Preparation of receptor protein and ligands
The homology model of ICL is the receptor protein and the phytochemicals along with the three control drugs are the ligands binding to receptor. Previous to docking, polar hydrogens were added to the receptor and then assigned the partial atomic kollman charges using Autodock 4.2.6 [38]. 17 phytochemicals and three drugs taken for comparison, Gasteiger charges were added and rotatable bonds were determined. Autogrid 4.2.6 calculates various forces like electrostatic, Vander Waal, hydrogen bonding, and desolvation effects. Grids map was generated by creating a grid box having spacing adjusted to 0.636 Å to enable ligand binding. The grid dimension was adjusted to

Siddharthsinh Parmar *et al.,*

40X40X40 points. Autodock 4.2.6 uses GPF (Grid Parameter File) file to calculate grid points and perform docking. For each ligand binding to receptor, it was fitted into grid box and targeted docking was performed.

Docking modeled ICL with ligands

Autodock 4.2.6 was used to evaluate binding affinity of ligands and three synthetic drugs (nitropropionate, bromopyruvate and itaconate) to homology model of ICL enzyme. Docking energy of all phytochemical molecules and drugs, model ICL enzyme were evaluated by using empirical-free functions and Lamarckian genetic algorithm. While running autodock it calculates binding free energy based on different electrostatic, Vander Waal, hydrogen bonding, and desolvation effects. "flexible" ligand-docking mode and targeted docking was employed for each docking run. The docking files were further analyzed for results.

RESULTS

Phytochemical studies
Selection of phytochemical models for inhibitor design
There are many advantages and benefits associated with the use of medicinal plants, the main ones being their cost-effectiveness and global availability. Various medicinal plants have crucial phytochemicals possessing anti-microbial, anti-bacterial, anti- fungal, anti-nematocidal and anti-viral activity on pathogenic biomolecule. The phytochemicals selected from various medicinal plants have to qualify the drug- likeness test that is they have to follow the Lipinski rule of five for various parameters. The independent parameters for the 17 phytochemicals were determined using ADMET Lab 2.0 and represented in table 1. In general, an orally active drug should not have more than one violation of following descriptors: H-bond donors, H-bond acceptors, molecular weight and LogP. It has been observed that almost all 6 violators (Beta caryophyllene, Beta sitosterol, Cinnabarone, Friedelin, Lupeol, Ursolic acid) have logP > 5. The control drugs do not violate any parameter of Lipinski rule of five.

Consensus generation and phylogenetic tree construction,
In-silico **homology modelling of protein and Superimposition**
Consensus sequence generation and phylogenetic tree construction
Consensus sequences were generated from the result of multiple sequence alignment of eleven organisms by using Jalview. Jalview automatically calculates the number of conserved physio-chemical properties. Its calculation is based on the one used in the AMAS method of MSA [39]. A clear differentiation can be made between eukaryotic species (7EBC, 7EBE, 5E9F, 5E9H, 1DQU) and prokaryotic species (3I4E, 3LG3, 1IGW, 7CMX, 3P0X, 1F61). A cladogram, figure1, is generated by using distance based method, which performs Neighbor Joining algorithm. The tree shows that the ICL genes are conserved among the species.

Homology modeling studies
C.albicans structure was having 60.51% similarity with the consensus sequence and having a GMQE score of 0.81, indicating high quality of similarity among the two monomer. Thus a model was created. The structures of *C. albicans* monomer and model protein is shown in figure 2.1 and figure 2.2, respectively. Secondary structure of the model protein shown in Biovia Discovery visualiser processed by Kabsch and Lander method consist of 21 α-helices and 11 β-sheets.

Structure of Model monomer
The monomer of model protein (figure 2.1) consists of 559 residues long chains. The N-terminal region of the polypeptide chain starts with the residue Methionine. This leads into three consecutive helices (α1, α2, α3) that lie on the periphery of the molecule, where they pack against the main elements of domain I. The structure then starts to fold into a central parallel β sheet of nine strands, alternating generally with one or more helices (β1, β2, β3, β4, β6, β8, β9, β10 and β11). Thus overall fold is that of an $(\beta/\alpha)9$ β2 barrel which closely relates to TIM barrel. Beyond the last strand in the TIM barrel (β11) the chain folds into a series of α helices (α18- α21) forming an extension that leads

towards the C terminus. This fold is interrupted in only one place, immediately after β6 and gives rise to a second domain, domain II, which consists of approximately 100 consecutive amino acids (265-369) that form a peripheral head to the subunit. Domain II is a largely helical domain (α10- α14) that includes one short β-sheet motif. The TIM Barrel motif consists of β1, α3, α4, β2, α5, α6, α7, β3, α8, β4, α9, β6, α15, β9, α16, β10, α17 and β11

Superimposition of model ICL with *C.albicans*

Comparative studies are important in finding remote protein structure homologs. Comparative analyses between two proteins (Model protein and *C.albicans*, 7EBE) was performed by Biovia Discovery visualizer revealed RMSD value as 0.843. Superimposition results states a clear conservation of two structures. Figure 3 depicts the superimposition structures evaluated through sequence alignment of main chain atoms. The green shaded is model monomer and the orange shaded monomer is 7EBE.

Docking studies using Autodock 4.2.6:
Docking ICL with Phytochemicals

Targeted docking mode was applied to find the binding free energy as specific coordinates of the active site were available. 17 phytochemicals and three drug inhibiting ICL were docked with the model ICL for finding the best binding affinity energy. We have determined the binding-free energy as shown in table 3 which reflects the binding affinity of 17 phytochemicals and 3 control drugs to model ICL. The docking studies showed that out of seventeen phytochemicals, Ishwarol shows the highest binding affinity of 7.9 kcal/mol and vitexin with least among seventeen phytochemicals was -2. The docking results are classified into three categories based on the binding energy: **High, Normal, and Low**. The three controls taken during docking analysis showed binding energy between -4 to -4.34. Thus, it is ideal to consider binding energy in the range of -4 as normal range. Below -4 and above -4 is considered high and low binding energy results, respectively.

Docking Interactions of inhibitors with ICL

MSA and secondary structure prediction has helped us to know and confirm the conservation of active site. Three control drugs taken during research shows the H- bond interaction with Asn149 (α6), Gln152 (α6), Ile185 (near β3), Gly210 (β4), Ala212 (β4), Arg183 (β3), which are all part of the TIM-barrel like active site. The interactions with residues Gln152 and Ile185 are found common in all three control drugs. Out of the 17 phytochemicals autodock was able to find H-bond interactions with only nine phytochemicals. Although when interactions were searched by Biovia discovery visualizer, 11 phytochemicals were found to have H-bond interactions (table 3). The conclusion that can be drawn by comparing affinity energies and binding poses, that the ligands bind active site cleft better than prescribed drugs. The first five highest binding interactions of ICL with phytochemicals are shown in Figures 4-8.

DISCUSSION

The enzyme isocitrate lyase is an important protein playing role in the development and virulence of bacterial, fungal and protists infections in humans and plants mentioned earlier. The inhibition of glyoxylate cycle by inhibiting ICL offer an excellent platform for drug designing as ICL is totally absent in mammals. Hence, ICL is a valid target molecule for not only control and eradication of pathogenic microorganisms but also it may nullify the occurrence of multiple resistant strains. Here we considered the ICL structures of *Escherichia coli* and *Aspergillus nidulans* as our model structure for prokaryotic and eukaryotic organisms. The molecular weight of ICL varies between prokaryotic, 48 kDa and eukaryotic, 67 kDa. Comparison of sequences reveals that this difference is largely associated with an insertion of approximately 100 amino acid residues towards C-terminus of the enzyme in eukaryotic ICL. The homotetramer of *E.coli* and *A.nidulans* consist of four subunits : A, B, C, D. The eukaryotic ICL subunit is folded into two domains whereas the prokaryotic is folded into single domain. Both the organisms consist of TIM barrel like motif consisting of β-sheets alternating in between with one or more α-helices. This TIM-barrel like motif is considered as the active site of ICL.ICL is a homo tetramer requiring Mg^{2+} or Mn^{2+} and a thiol for its activity. During catalysis, isocitrate is deprotonated, forming succinate and glyoxylate. The subunit interfaces in the E. coli enzyme

are entirely analogous to those found in the *A.nidulans* ICL [19][20]. Glyoxylate binds ICL at the C-terminal end of TIM-barrel motif, consistent with the general location of active site in other enzymes with this fold [20]. *E. coli* ICL revealed a similar feature associated with the same piece of protein structure and occupying the same position as the glyoxylate in the *A. nidulans* ICL [19, 20]. MSA and superimposition works confirm the conservation of TIM barrel motif as active site in the ICL model monomer, which is the representative structure for all the organisms chosen for research as is derived from the consensus sequence generated after MSA. The bound state and unbound state between the receptor and ligand molecules are determined by the concept of free energy in docking studies using drug discovery tool AutoDock 4.2.6. The negative and low value of binding energy indicates strong binding affinity between receptor-ligand and that the ligand is in the most favourable conformation otherwise it shows unbound state. Targeted docking with specific coordinates was performed at the active site of model ICL protein. Ishwarol showed the highest binding affinity and better than the three control drugs. Thus, ICL inhibition opens the door to the development of next-generation drugs like ishwarol which would help to eradicate and control the pathogenic microorganisms causing diseases. Phytochemicals chosen from important medicinal plants from various literature sources for inhibition of ICL allows alternative lead to that resistant drugs besides having lower side effects. Selection of phytochemicals was made easier by the ADMET screening tool. The most advantage of this in-silico work is that it leads to screening more efficient anti-ICL leads.

CONCLUSION

The enzyme Isocitrate lyase has become a potential candidate to study functional mechanisms and design drug. It is mostly because the enzyme is not found in mammals, giving a chance to defeat various disease across world. Structural studies revealed that the active site is present in the TIM-barrel like domain of the ICL, and thus can become potential target for molecular docking. Also, our secondary structure comparisons has made deep insight to the helices and sheets conservation, proving the above statement, but still a lot work is to be done. Molecular docking studies of phytochemicals binding to Isocitrate lyase, a key enzyme of glyoxylate cycle can become lead molecules for future drug development. Our docking studies have confirmed a tight binding of phytochemicals to model protein active site. Phytochemicals have shown effective and better binding affinity with ICL during our research as that of the controls or synthetic drug does. Also, the binding energy of the most phytochemicals are strongly matching with that of the controls taken, indicating a positive result towards the development of novel drugs. Such phytochemicals can become leads to develop more drugs to treat diseases like tuberculosis. Still, we consider that the general structure has not been revealed completely and further research requires to target the active site of the enzyme effectively and accurately. Finally, we have given the overall view of the potential of phytochemicals in targeting receptor ICL. In the future it may be possible to have phytochemicals as oral drugs that we have cited in this research   paper.

ABSTRACT

Growth parameters of Bubblefin wrasse, *Halichoeres nigrescens* were estimated for the first time by using length frequency data using FiSAT software (several tools such as Powell-Wether all method, ELEFAN and von Bertalanffy growth estimates). Based on the progression of modes in the length-frequency data, these tools calculate the growth parameters such as asymptotic length ($L\infty$), growth coefficient (K) and t_0 (age at which fish would have had zero length). The maximum $L\infty$ values obtained in the present study are 157.50 mm for males and 154.88 mm for females. The t_0 values estimated for males and females were -0.1348 yr and -0.15631 yr, respectively. The estimated growth performance index (Ø') values for males and females of *H. nigrescens* were 4.041 and 3.938 respectively. The life span of both the sexes was found to be 8 years. These growth parameters can be used effectively in studying the population dynamics, stock assessment and ecological pathway (ECOPATH) for ecosystem-based management of these fishes.

Keywords: Wrasse, Growth parameters, Life span, Length-frequency data, Gulf of Mannar

INTRODUCTION

Fisheries research aims to predict how well stock performs at the fishery level and its relation to the various degrees of fishing effort undertaken (King, 2007). Fishes are the largest and most diverse group of vertebrates considered as an important protein source for the growing human population and play an essential role in ecosystem services (Vieira, 2023). Age estimation studies provide information on fish life history characteristics that is essential for effective fishery management of resources (Cailliet et al., 2001). Fish growth involves complex physiological process (catabolism and anabolism), which are related to gains through the feeding (food and energy consumption) and losses (faeces, excretion and heat production) at individual level (Wootton, 1998). Changes over time in somatic growth rates have been documented for many fish taxa (Thorson and Minte-Vera, 2016) under biological and environmental conditions for greater understanding. Age and growth studies can in no way be neglected while dealing with population dynamics, fishery scouting, fishery forecasts and fishery surveys (Chugnova, 1963). Inaccurate age determination will have impact on the accuracy of population dynamics and future management of the fishery and species (Campana, 2001), serious over exploitation or under exploitation of the stock of a species, often through underestimating true age and producing optimistic estimates of the rates of growth and mortality (Laiding and Pearson, 2003) is important for a fishery. As the fields of genomics and bioinformatics continue to evolve, researchers are actively exploring innovative avenues for the age and growth assessment of fish (Vieira, 2023), in order to select the mathematical model, the understanding of the study species on its size range, fishery, habitat, ecology is a must for one who is applying equilibrium yield models to the management of a fishery (Mohanraj, 2000). Studies on age and growth rate of marine teleosts from Indian waters are largely based on length frequency distribution and the length frequency method which is a useful tool for providing the much-needed information for improving the fishery and management decision process. Even though studies with otolith have been undertaken for the establishment of age in Indian marine fishes, management measure like harvest control rule and the establishment of Minimum Legal Size for a fishery is mostly undertaken through the mathematical based modelling involving the length frequency data (Teena et al., 2021; Sivadas et al., 2017). In age and growth studies mathematical functions have been used to describe growth curves (Beverton and Holt, 1957; Ricker, 1975; Weatherley and Gill, 1987). The von Bertalanffys growth equation is widely used for determining growth from length distributions. Several graphical and computer-based routines such as LFSA (Sparre, 1987), COMPLEAT ELEFAN (Gayanilo *et al*., 1989), MULTIFAN (Fournier *et al*., 1990), LFDA (Kirkwood *et al*., 2001) and FiSAT (Gayanilo and Pauly, 1997) are also available to analyze single and multiple length-frequency distributions.

The family Labridae (wrasses) is highly diverse, with approximately 600 species in 82 genera distributed worldwide in both coastal and offshore waters, in tropical, subtropical and temperate regions (West neat and Alfaro, 2005). Labrid fish is mostly associated with the reef ecosystem (Wainwright et al., 2002) in undertaking its ecological services which are important for the healthiness of the reef. The study species, *H.nigrescens* commonly called as bubblefin wrasses and in the domestic aquarium trade it is known as "common wrasse" mainly due to its high availability and the common species among the labroid fish diversity in the coral reef ecosystems of Gulf of Mannar. These species are incidentally caught from the coral reef trap fishery where the fishermen target on food fishes (Snappers, emperors, groupers, goatfish, parrot fish and grunts) associated with reef system. Target fishing like skin diving coupled with small mesh size gill net covering the reef area and disturbing the fish resulting in snagging, wedging and entangling is collected for marine aquarium trade (Murugan and Durgekar, 2012). The occurrence of *H. nigrescens* from the by catch bottom trawlers has been observed in the Gulf of Mannar waters. Since labrid fishes exhibiting the scrapping behavior in the reef system assessing its population status is very much important which is linked to the health of the reef ecosystem in maintaining the coral reef – macro algal complex interactions. Through literature survey it revealed that growth studies on wrasses are limited (Currey and Simpfendorfer, 2009). Labrid fishes exhibit the protogyny (sex reversal pattern) as the usual pathway in the reproductive strategy (Cowen, 1990; Fairclough, 2005; Gillanders, 1995; Nakazono and Kusen, 1991; Sadovy et al., 2003; Westneat, 2001). The population structure of protogynous hermaphrodites has typically more females at smaller and younger age classes and more males at larger and older age classes (Currey and Simpfendorfer, 2009). Studies on age growth for fishes belonging to

94358

the family Labridae has attracted researchers to undertake considerable research, which includes the examined the growth and reproduction of the wrasse, *Pseudolabrus celidotus* in New Zealand waters (Jones, 1980). Treasurer (1994) provided insight information on the distribution pattern, age and growth of wrasses *Ctenolabrus rupestris, Centrolabrus exoletus, Crenilabrus melops, Labrus bergyita,* and *L. mixtus* in the west coast of Scotland waters. Likewise, Gordoa *et al.,* (2000) analyzed the age and growth of four species of wrasses, *Labrus merula, Coris julis, Symphodus roissali* and *Symphodus tinca* from the north-western Mediterranean Sea. Welsford and Lyle (2005) estimated the growth rates for purple wrasse, *Notolabrus fucicola* inhabiting the east coast of Tasmanian waters. Vijayanand, (2006) evaluated the age and growth of *Thalassoma lunare* from Gulf of Mannar, Indian coastal waters.   In view of relevance of growth parameters for fisheries management, the interest and inquisitiveness in studies on growth in tropical fishes have amplified, since tropical fisheries is very much complex and productive. Information available on the age and growth of wrasses from Indian waters is very much limited. Therefore, the present study was undertaken to garner the biological information like the maximum size, age and growth parameters of *H.nigrescens* from Gulf of Mannar, Southeast coast of India based on length frequency data to calculate vital demographic dynamic factors and to estimate the stock of these fishes which are having a great demand in the marine aquarium trade in the domestic market.

MATERIALS AND METHODS

Study area and sample collection
Fish individuals were collected monthly coral reef fish trap from landing centers of Killakarai, Gulf of Mannar (11.9416° N to 79.8424° E) during January 2022 to December 2022; however, no sampling was done in May due to fishing holiday declared by the government. The fishes were identified following (Murugan and Namboothri, 2012) and the measurements were taken following the method suggested by Hubbs and Lagler (1964). The samples were brought to the laboratory and cleaned in tap water. Male and female individuals were identified by examining the gonads by cutting the body cavity. A total of 1285 specimens of *H. nigrescens* (males and females) total length (TL) ranging from 7.0cm to 14.9cm were analyzed. The length frequency data for males and females of each sampling were grouped in 5mm class intervals. The total length (TL) of each fish was measured from the anterior-most edge of the snout to the posterior-most edge of caudal fin to the nearest mm with a measuring board. Weight (W) was measured to the nearest 0.1 g by an electronic balance (Roy Electronic balance) after draining the water from the buckle cavity and wiping the moisture content on the body of fish. Fish with damaged caudal fin were discarded.

Age and growth estimation
Size frequency data were collected on a monthly basis and the obtained data has been classified into size classes and those data were subjected to the non-parametric method which passes through the greatest number of modes, giving estimates of L_∞ and K (Wetherall 1986). Powell-Wetherall method (Beverton and Holt 1956) was used to calculate the ratio of total mortality and growth coefficient (Z/K) as an initial estimate of asymptotic length (L_∞). Gulland and Holt plot (1959) was used to study the growth increment data to estimate $L\alpha$ and K. Length frequency data were then analyzed by Electronic Length Frequency Analysis (ELEFAN I) (Pauly 1980; Pauly 1983) using the appropriate routines in FiSAT II package for growth estimation. In this method the growth parameters, asymptotic length (L_∞) and growth coefficient (K) were estimated following the von Bertalanffy growth equation (Wetherall 1986):

$L_t = L_\infty [1 - e^{-K(t-t_0)}]$

Where L_t is the length at age t, L_∞ is the asymptotic length in cm, K is the growth coefficient and t_0 is the age at which fish would have had zero length if they had always grown according to the above equation. Parameters of L_∞ and K were computed from the ELEFAN I. The t_0 value from the length-frequency data cannot be estimated by ELEFAN, t_0 is estimated by substituting the L and K in the following equation:

log (t_0) -0.176+0.260 log L 1.0 log K

Growth performance index was calculated by the equation (Pauly & Munro 1984):

$\Phi = log_{10}K + 2log_{10}L_\infty$

Longevity was estimated from the following equation (Pauly 1983):

$t_{max} = 3/K + t_0$

RESULTS

The sub adults (7.6cm) were dominant during the month of June whereas the largest one was represented during the month of April (14.9cm). For males, the smallest sized group was represented during July (7.0 cm) and the largest during April (13.2 cm). Powell-Wetherall plots for the estimation of L_∞ and Z/K showed that the L_∞ values obtained for males and females were of *H. nigrescens* were 157.50mm and 153.54mm respectively. The alignment of points on the straight line was quite satisfactory with a good coefficient of correlation (0.999) (Fig. 2). The optimized growth parameters (L_∞ and K) and the goodness of fit index (Rn) obtained for males and females of *H. nigrescens* by ELEFAN I method in the FiSAT II package are given in Table 1. The non- seasonalized length frequency histograms of growth curves for males and females of *H. nigrescens* are shown in (Fig. 3). The automatic search routine in FiSAT II Package derived the L_∞ and 'K' values of 157.50 mm and 1.0 yr^{-1} for males and 154.88 mm and 1.0 yr^{-1} for females respectively, whereas the K-scan routines gave the values of 157.50 mm and 0.31 yr^{-1} for males and 154.88 mm and 0.45 yr^{-1} for females respectively. The growth parameters obtained for males and females of *H. nigrescens* by Appledoorn's method using the growth increment data proved that the asymptotic length obtained for males and females of *H. nigrescens* were 156.80 mm and 154.90 mm and the values of K were 0.31 and 0.46 yr^{-1} respectively (Fig. 4). The growth data obtained in the present study showed that the *H. nigrescens* have a life span of 8 years for males and 7+ years for females. The age at growth data showed that the males grow about 66mm (I year), 98mm (II year), 119mm (III year), 132mm (IV year), 140mm, 146mm (V year), 149mm (VI year), and 151mm (VII year) and 156mm (VIII year) for males. Similarly females grow 54 mm, 81 mm, 102 mm, 116mm, 127 mm, 138 mm, 151 mm and 158 mm during first, second, third, fourth, fifth, sixth, seventh and eighth years respectively (Table 3 and Fig.14 a and b) represents the growth curve of *H. nigrescens.* The t_0 values estimated for males and females were -0.1348 yr and -0.15631 yr, respectively.   The estimated growth performance index (Ø') values for males and females of   *H. nigrescens* were 4.041 and 3.938 respectively. Ø' value is index for comparing the growth performance of organisms in terms of their growth length.

DISCUSSION

Fisheries science and management rely heavily on accurate assessments of age and growth in fish populations (Vieira, 2023), for undertaking future management tools like harvest control rule, Minimum Legal Size for exploitation and defining conservation strategy for reef associated fishery. Stock evaluation has become a critical management technique for determining fish development and mortality in the wild (Jennings et al., 2001). Coral reefs are distinguished by their tremendous diversity and the ecosystem services they provide to the artisanal sector, food security, to combat climate change in the tropical nations are very high (Hughes et al., 2003; Spalding and Brown, 2015). Although all fisheries are multispecies and spatially heterogeneous, coral reef fisheries are an extreme in both respects (Medley et al., 1993). However, more than 80% of the shallow reefs worldwide are severely exploited because of the increasing demand for quality protein (Manikandan et al., 2014), since these shallow water resources are easily approachable to the traditional communities which the traditional gear (Murugan and Durgekar, 2012). Labrid fishes are not considered as food fishes in India, except Napolean wrasse (*Chelinus undulatus*), whereas huge demand for wrasses (bubble fin, checker board, queen, rainbow, bicolor, moon, peacock, cleaner, six bar etc.,) in the domestic market exits in India, because of such huge pressure is mainly due to Gulf of Mannar water is the only region which is facilitating reef fishes for the marine aquarium trade. Since traditional fishing like coral reef fish trap and gill net operated for ornamental reef fish collection, trammel net and bottom set gill nets are deployed in the reef and near to the reef ecosystem by the traditional fishing communities. Since the traditional fishing sectors are involved in fishing with different gears based on the seasonality, the information pertaining to the biology of these reef fishes is important for the establishment of conservation efforts and management plan for conserving the reef fishes in Gulf of Mannar waters. The results documented the age and the growth of *H. nigrescens* which has considerable proportion of the population along Gulf of Mannar region and which is consider as the dominant

species under the labroid fishes. In the present study, growth parameters L∞ and k values estimated by Powell-Wether all methods, Apple doorn's method and ELEFANI are comparable. The maximum L∞ values obtained in the present study are 157.50 mm for males and 154.88 mm for females. Ebisawa *et al.,* (2010) estimated the growth parameters of blackspot tuskfish *Choerodon shoenleinii* and he reported the L∞ = 68.1 (cm), k = 0.263, and t0 = -0.023 (year). Artüz (2005) estimated the age and growth parameters of the wrasse *Labrus bergylta* as L∞= 727.94 mm. k = 0.141 and t$_0$ = 1.35 mm. Pallaoro and Jardas (2003) estimated the maximum life span of *Symphodus tinca* as 13 years for males and 12 years for females. The present work also confirmed that *H. nigrescens* grows up to a size of 149mm and it has maximum life span of 8 years. Sayer, *et al.,* (1996a,b) estimated the maximum age and total length for goldsinny, *Ctenolabrus rupestris* as 20+ years and 159mm, for rock cook *Centrolabrus exoletus* it was estimated as 8+ years and 165mm and similarly for corkwing, *Crenilabrus melops* it was 6+years and 212mm. From the present study it is clear that *H. nigrescens* generally grow up to a size of 140 mm approximately and the maximum size group recorded during our study was 149 mm. The catabolic growth rate (K) was 0.310 for males and 0.450 for females. The present study also revealed that the growth rate was high during the first year and decreased during the second, third, fourth, fifth, sixth, seventh and eighth year. Studies on age and growth of wrasse fishes were limited and hence the present work was useful to highlight the age and growth parameters of *H. nigrescens*.

Vijayanand, (2006) estimated the length at age of *Thalosomma lunare* in Gulf of Mannar region by von Bertalanffy's growth equation and he reported that the length of this fish varies from up to 130.06mm (1 year) to 213.52mm (4 year). The maximum size recorded was 223mm. The length at age estimation of *H. nigrescens* by von Bertantalanffys growth estimation of females was found to vary from 54mm (I year) to 146 mm (VIII year) and similarly for males, the size ranged from 66mm (I year) to 151mm (VIII year). The growth parameters of *H. nigrescens* showed significant from the wrasse species of other regions, whereas variation in growth may be due to the ecological condition and food availability (Elizarov, 1965, Weatherley and Gill, 1987). Treasurer (1994) reported that the maximum life span of wrasse *Ctenolabrus rupestris* was 16 year, 9 year for *C. exoletus*, 5 year for *C. melops*, 15 year for *Labrus bergylta* and 11 year for *L. mixtus*. Growth was more rapid prior to maturation in all species. The von Bertalanffy growth model fitted data for *C. rupestris* and *C. excletus, C. rupestris* and *C. exoletus* showed that the males were significantly larger than females in most age groups. Even though *H. nigrescens* and *T. lunare* belongs to the same family and collected from same area and habitat, *H. nigrescens* showed slow growth performance with more life span (8 years) while *T. lunare* showed high growth performance with low life span (4+ years). *T. lunare* attained maturity at earlier stage and have accelerated growth because of its shortest life span (Vijayanand, 2006). According to Munday *et al.,* (2009), in protogynous sex-changing fishes, females are expected to compete for the opportunity to change sex following the loss of a dominant male and may exhibit growth and behavioural traits that help them to maintain their dominant status after sex. Age and growth information provided here for *H. nigrescens* for population existing in Gulf of Manar water will provide the insight information for policy makers and enforcement department in formulating conservation measures for reef fishes in a larger perspective.

India is a highly biodiverse nation with coral distributed on both sides of the coast, with huge diversity of marine ornamental reef fishes (Ajithkumar et al., 2011; Murugan and Namboothri, 2012). Although, nearly 400 species of marine ornamental fishes belonging to 175 genera and 50 families are known to occur in India's marine ecosystems (Ajithkumar et al., 2011; Murugan and Namboothri, 2012; Venkatramani et al., 2004). Despite these huge resources the marine aquarium fish trade did not prosper mainly due to required technology (sustainable catching techniques, transportation, disease control, water quality requirements), whereas the industry gained importance in the domestic level and as of now gaining popularity and becoming an important facet of the fisheries sector (Prakash et al., 2017). The main hindrance related to marine ornamental fish export is due to the limited assess to harvest reef fishes sustainability from reef patches of Laccadives and Andam and Nicobar waters which would have diversified the species diversity. The Gulf of Mannar Marine Biosphere Reserve (henceforth GOMMBR), on the south-east coast of India is the only coral reef region within the country that is meeting the demand for marine ornamental taxa for whatever trade is existing in India (Murugan and Durgekar, 2012; Prakash et al., 2017). India did not appear on the list of countries that export marine aquarium fish to the US (Rhyne et al., 2012), mainly due to lack of initiative from Marine Product Export Development Authority to trap the valuable resources which would have had a livelihood

upliftment to the traditional fishing communities. Collection of marine ornamental fishes always had the conflict with the state forest department of the Gulf of Mannar National Park, despite that collection of marine ornamental fishes happens from the Gulf of Mannar National Park region. In this situation enforcing of licensing policy (certification system) should be initiated with the help of local fishers who solely depend on collection of marine ornamental taxa for their livelihood (Murugan and Durgekar, 2012; Prakash et al., 2017; Nair and Kuriakose, 2014;). Banning the fishing of a fishery resource (renewable) in a particular area is not going to end in the fisheries sector and policy makers needs to think about sustainable utilization of the resource for conservation and livelihood support, because resource need to be utilized rather than protecting them under the umbrella of coral reef, since these resources are not available in the other areas. Hence, size -based limit could be extended to prevent the catch of large size fishes to ensure that adequate numbers of brooders are left on the reef (Wood, 2001), sustainable measures need to be developed and incorporated as part of the Gulf of Mannar Biosphere Reserve Management Plan, thus focusing on the improvement of the livelihood of fishermen, without addressing the livelihood issues conservation measures will not be achieved. Providing resolving fund at the village level can't be considered as an initiative for marine biodiversity conservation, if any livelihood developed through those initiative will be only considered as additional income to the community. The present study provides information about the age and growth of a common wrasse species which is found to occur in the Gulf of Mannar region. To improve the management of resources of exploited for the marine ornamental fish resources for aquarium trade, complete understanding on the individual species' life history (breeding, growth, recruitment etc.), and ecology is necessary (Prakash et al., 2017). Hence the present study is important to address the issues related to streamlining the marine ornamental fisheries for labroid group fishes.

ABSTRACT

Chlorogenic acid possesses diverse pharmacological and biochemical effects. Recent studies have explored its antidiabetic, anti-inflammatory and antioxidant effects in experimental animal models. However, the poor solubility nature of this compound has been associated with its low bioavailability and therapeutic efficacies. Thus, the present study synthesized chlorogenic acid loaded chitosan nanoparticles (CACNP) to improve its bioavailability and therapeutic effects. The present study investigated has the *in vitro* free radical scavenging efficacies of CACNP using a spectrum of *in vitro* free radical scavenging assays. Ion gelation method was employed to synthesize chlorogenic acid loaded chitosan nanoparticle. The size of the synthesized nanoparticles was analyzed using a zeta sizer, and their shape was investigated with scanning electron microscopy (SEM).The present study observed a significant ability of CACNP in scavenging DPPH, ABTS, hydroxyl, superoxide, hydrogen peroxide and nitric oxide radicals under *in vitro* conditions. The antioxidant potential of CACNP would help to study its antitumor efficacy in experimental animal models.

Keywords: Antioxidants, Chlorogenic acid, Chitosan, Free radicals.

INTRODUCTION

Reactive oxygen species (ROS), at physiological concentrations, have been involved in the stimulation of immune system, regulation of cell differentiation and proliferation as well in several cell signaling pathways. A second messenger role for ROS in certain signaling pathways have also been documented[1].Reactive oxygen species especially hydroxyl and superoxide radicals would try to become stable radicals through electron pairing with DNA, proteins and lipids[2].Most human diseases develop as a result of oxidative stress, a condition arises when imbalance occurs between oxidant and antioxidant status in the human body. Accumulation of ROS in the body can lead to several diseases including malignant neoplasm[3].Human antioxidant defense mechanism are, however, stimulated to alleviate the harmful effects of excessively generated ROS by donating electrons to ROS [4]. Antioxidants are substances that have vast ability to protect the cells from oxidative damage by donating electrons to the reactive oxygen species, thereby terminating free radical mediated cellular damage as well as damage to proteins and nucleic acids [3,4]. Natural antioxidants present in medicinal plants, herbs, fruits and vegetables would combat the deleterious effects of ROS by inhibiting the continuous abstraction of hydrogen as well as by preventing the chain initiation of lipid peroxidation [5]. Thus, high intake of natural antioxidants could protect the human body from oxidative stress mediated pathological diseases. Several studies warranted a search for substances with potent antioxidant effect from naturally occurring medicinal plants or herbs. Medicinal plants are focused to have a spectrum of bioactive principles such as flavonoids and polyphenols with multiple pharmacological effects including antioxidant property[6,7]. Chlorogenic acid, a bioactive phytoconstituents, is present in several plants, fruits and vegetables. Chlorogenic acid is present at higher concentrations in plants such as *Hibiscus sabdariffa* and *Calluna vulgaris*. It is also rich in spinach, sweet potatoes, berries, lettuce and apples[8]. A large number of studies reported its multiple pharmacological efficacies including hepatoprotective, antioxidant, anti-inflammatory and antitumor properties [9-11]. Neelakandan et al.[12]investigated the antitumor effectiveness of chlorogenic acid-loaded chitosan nanoparticles in an experimental model of skin carcinogenesis.Rui et al.[13] reported the *in vitro* superoxide and ABTS scavenging activities of chlorogenic acid-chitosan conjugates. Kavi Rajan *et al*. [14] revealed the DPPH radical scavenging efficacy of chlorogenic acid-chitosan nanoparticulate. This study evaluates the radical scavenging effect, DPPH, ABTS, hydroxyl, nitric oxide,superoxide and hydrogen peroxidepotential of CACNP under in vitro conditions.

MATERIALS AND METHODS

Chemicals
The biochemicals, and chemicals required for the present study were purchased from Hi Media Laboratories, India; Sigma-Aldrich Private Limited, India; and SD Fine Chemicals, India.

Synthesis and characterization of chlorogenic acid loaded chitosan nanoparticles
Ionic gelation approach proposed by Calvo et al. [15] was used to synthesize CACNP. The chitosan polymer was first dissolved in acetic acid and chlorogenic acid was then added to the chitosan solution in the ratio of 1:3. This mixture was stirred continuously for 60 minutes. To achieve the formation of nanoparticles, sodium tripolyphosphate (TPP) was added in a drop wise manner to the chitosan chlorogenic acid mixture in the ratio of 4:1 and stirred continuously for 60 minutes. The free chlorogenic acid and chlorogenic acid nanoparticles were separated using ultracentrifugation at 15,000 rpm for 45 to 60 minutes.The lyophilized nanoparticles were subsequently used to evaluate their in vitro free radical scavenging activity and effects.

Free radical scavenging assays
DPPH radicals
Blois [16]procedure was employed to examine the DPPH radical scavenging ability of CACNP. This method helps to assess the hydrogen atom donating ability of the test compound, which is assessed by its ability to decolorize methanolic DPPH (purple colour) to yellow colour. The ability of CACNP (10-50 µg/ml) in decolorizing the

94368

methanolic solution of DPPH was spectrophotometrically read at 517 nm. Ascorbic acid served as a comparative reference drug. The formula was utilized to calculate the percentage of DPPH radical scavenging effect. The procedure was repeated thrice for each concentration of the control and test samples.

$$\frac{\text{Control absorbance} - \text{Test absorbance}}{\text{Control absorbance}} \times 100$$

ABTS radicals
Miller et al. [17]method is used to assess the ABTS radical scavenging efficacy of CACNP. This method relies on the principle of generating the ABTS radical cation through the reaction between ABTS and potassium persulfate. This reaction generates a bluish green chromogen which was decolorized to ABTS by the antioxidant and was read at 734nm.

Superoxide radicals
The method of Nishikimi *et al.* [18] was employed to measure the superoxide radical scavenging potential of CACNP. In this method, the superoxide radical generated during NADH oxidation, which is present in the PMS/NADH (phenazine methosulfate - nicotinamide adenine dinucleotide) system, reduces nitroblue tetrazolium to form a purple color. The absorbance of this purple color is measured at 560 nm.

Hydroxyl radicals
This assay was conducted following the procedure of Halliwell et al. [19]. This method is based on the inhibition of 2-deoxyribose oxidation by hydroxyl radicals generated from the ferric chloride - ascorbic acid – ethylene diaminetetra acetic acid (EDTA) and hydrogen peroxide system.

Nitric oxide radicals
Ebrahimzadeh *et al.* [20] procedure was used to examine the nitric oxide scavenging efficacy of the CACNP. This method relies on the ability of the test compound to reduce the quantity of nitrite formed between oxygen and nitric oxide, which are generated from sodium nitropruside. The nitrite reacts with the Griess reagent and forms a red pink colour, which was read at 546nm.

Hydrogen peroxide decomposition
The hydrogen peroxide decomposition potential of CACNP was measured according to the procedure of Jayaprakasha *et al.*[21].This method evaluates the hydrogen peroxide scavenging efficacy of the test compound by examining the disappearance of hydrogen peroxide at 230 nm.

Statistical analysis
Graphical calculation was done to find out the IC $_{50}$ concentration of the test compounds. Student's t-test were utilized to find the statistical significance between the groups. The two groups are considered statistically significant at $p<0.05$.

RESULTS AND DISCUSSIONS

Particle size of nanoparticles
The present investigation observed a mean size of CACNP as 138.9 nm with polydispersity index (PDI) of 0.229. The particle size of the nanoparticles measured with the Zetasizer closely resembled the particle size observed in scanning electron microscopy measurements (137.14 nm).

In vitro free radical scavenging effect of CACNP

Free radical scavenging efficacy of CACNP was compared with the standard reference drug ascorbic acid by carrying out the spectrum of *in vitro* free radical scavenging assays. The DPPH scavenging activity of CACNP and ascorbic acid is presented in figure1. CACNP scavenges DPPH radicals effectively at an increasing concentration similar to that of ascorbic acidat each concentrations. The IC_{50} for the DPPH scavenging potential was found to be 36.2 µg/ml (CACNP) and 39.7 µg/ml (Ascorbic acid) respectively. Several in vitro antioxidant tests are accessible for evaluating the ROS scavenging capacity of test compounds. The DPPH radical scavenging assay is commonly used to assess the antioxidant properties of a test compound [22]. Ascorbic acid, butylated hydroxytoluene, and gallic acid are the most common reference antioxidants utilized in *in vitro* free radical scavenging assays to compare the antioxidant efficacy of the test compound. The antioxidant natures of these compounds are validated through their reducing capacity, preventing chain initiation of lipid peroxidation, eliminating hydrogen peroxide and scavenging ROS [22,23]. The present study noticed a potent DPPH radical scavenging ability of CACNP and the antioxidant efficacy was very much nearer to that of standard drug. The results thus show that chlorogenic acid has the vast potential to donate hydrogen to the DPPH radicals. The ABTS scavenging activity of CACNP and ascorbic acid is presented in figure 2. CACNP scavenges ABTS radicals effectively at an increasing concentration similar to that of ascorbic acid at each concentrations. The IC_{50} for the ABTS scavenging potential was found to be 26.2 µg/ml (CACNP) and 27.8 µg/ml (Ascorbic acid) respectively. ABTS assay measures the total antioxidant capacity of the test compound [23]. This method assesses the antioxidant efficacy of the test compounds by their ability to inhibit the generation of ABTS radicalcation. It has been reported that phenolic compounds showed a potent ABTS radical scavenging property[22,23]. CACNP has been found to have potent ABTS radical cation generation inhibitory effect due to their phenolic hydroxyl groups. The results of this study observed that CACNP has revealed a similar ABTS scavenging efficacy to that of standard drug. Therefore, the current study focused on evaluating the free radical scavenging capability of CACNP under in vitro conditions.

The superoxide scavenging activity of CACNP and ascorbic acid is presented in figure 3. CACNP scavenges superoxide radicals effectively at anincreasing concentration similar to that of ascorbic acid at each concentrations. The IC_{50} for the superoxide scavenging potential was found to be 21.4 µg/ml (CACNP) and 23.5 µg/ml (Ascorbic acid) respectively. Superoxide radical, a reduced form of oxygen, has been pointed out as a harmful radical that can able to cause severe oxidative damage to the biomolecules through the formation of hydroxyl radicals or hydrogen peroxide [22,24]. Oxidative damage to biomolecules has been recognized as the major pathological phenomenon in the development of several diseases [2]. The present observation revealed the dose dependent, in an increasing concentration, superoxide radical scavenging potential of CACNP, which mimics the scavenging efficacy of ascorbic acid. The study thus noticed an effective superoxide scavenging potential of CACNP under *in vitro* conditions. The hydroxyl scavenging activity of CACNP and ascorbic acid is presented in figure 4. CACNP scavenges hydroxyl radicals effectively at an increasing concentration similar to that of ascorbic acid at each concentrations. The IC_{50} for the hydroxyl scavenging potential was found to be 30.5 µg/ml (CACNP) and 32.2 µg/ml (Ascorbic acid) respectively. Hydroxyl radical accumulation has been regarded as a major threat to induce several damages to biomolecules especially to DNA, thereby resulting in several diseases including carcinogenesis [25]. In this study, hydroxyl radicals are effectively eliminated by CACNP under *in vitro* conditions and the scavenging efficacy was closer to that of ascorbic acid. The nitric oxide scavenging activity of CACNP and ascorbic acid is presented in figure 5. CACNP scavenges nitric oxide radicals effectively at an increasing concentration similar to that of ascorbic acid at each concentrations. The IC_{50} for the nitric oxide scavenging potential was found to be 17.3 µg/ml (CACNP) and 18.3µg/ml (Ascorbic acid) respectively. Nitric oxide has been reported to play a vital role in the cell signaling pathways of both normal physiological and in pathological conditions. Deregulation of nitric oxide production has been implicated in the oxidative stress mediated cell death, and DNA damage [25]. This study noticed that CACNP have the ability to effectively scavenge the nitric oxide radicals under *in vitro* conditions. The scavenging effect was increased as the dose of CACNP was enhanced and the nitric acid radical scavenging effect of CACNP was much comparable to that of ascorbic acid. The hydrogen peroxide scavenging activity of CACNP and ascorbic acid is presented in figure 6. CACNP scavenges hydrogen peroxide radicals effectively at an increasing concentration similar to that of ascorbic acid at each concentrations. The IC_{50} for the hydrogen peroxide scavenging potential was found to be 18.2 µg/ml

(CACNP) and 15.4 μg/ml (Ascorbic acid) respectively.Hydrogen peroxide is converted into hydroxyl radical in the presence of Fe^{2+} inside the cell and its accumulation has been documented as a potential threat to the cell and may prone to pathogenesis of carcinogenesis [23,25]. Its overproduction may cause protein damage by mediating oxidation of thiol groups. The present results showed a potent hydrogen peroxide elimination activity of CACNP under *in vitro* conditions and the effect was much similar to that of ascorbic acid. In the present study the antioxidant efficacy of the CACNP and ascorbic acid was examined with the help of DPPH, ABTS, hydroxyl, nitric oxide, and superoxide radical scavenging assays as well as with hydrogen peroxide decomposition potential under *in vitro* conditions. The present study observed that CACNP has a potent antioxidant property and its effect was much comparable or closer to that of ascorbic acid.

CONCLUSION

The present study thus reveals the antioxidant property of CACNP under *in vitro* conditions. Further studies will be conducted to explore the anticancer efficacy of CACNP using experimental animal model by analyzing spectrum of biomarkers related to carcinogenesis.

ABSTRACT

Casuarina equisetifolia belonging to the family *Casuarinaceae*, a tropical plant commonly called as horse tail in English, savukku marram in Tamil is used traditionally for the treatment of nervous disorders, acne, throat infections, stomach ulcer, constipation, cough, diabetes, diarrhea, dysentery, gonorrhea in Ayurveda. The plant is widely used in construction sites. This research focuses on isolating isoprenoids from the Bark Extracts. The 24 Noroleana 3,12 diene, Beta amyrone, 1,2 – Benzenedicarboxlyic acid, butyl-2-ethylhexy, Bis (2-ethylhexyl)phthalate and Lupeol were the bioactive components obtained in the preliminary analysis. 24 Noroleana 3,12 diene, Beta amyrone belonged to the isoprenoid group. The isoprenoids exhibit anti-inflammatory effect. The isoprenoids exhibit anti-inflammatory effect. The bark extracts contained phytochemicals like Flavonoids, Phenols, proteins, amino acids, resins, alkaloids, tannins, phytosterols and terpenoids. The extract exhibited anti-bacterial activity anti-oxidant activity of 0.0028%. The preliminary components were docked against TNF protein (PDB:4RSU) the binding energies were obtained. Beta amyrone exhibited binding energy of -7.1 and 24 Norolena 3,12 diene exhibited binding energy of -6.4. Both the components had exhibited binding energy higher than the binding energies of the anti-inflammatory drugs found in market like Diclofenac (-6.4) and Aspirin (-5.4). The refined extracts exhibited anti-inflammatory effect with IC_{50} being 84.72 for ethyl acetate extract and 108.41 for hexane extract. The components obtained were Palmitic acid TMS, Dihydrophytol TMS, Octadecanal, Heptadecanenitrile and Stearic acid TMS .These components were docked against TNF protein (PDB:4RSU).The compounds isolated exhibited ADME properties making it viable to be translated as an anti-inflammatory drug in future.

Keywords: *Casuarina equisetifolia*, Flavonoids, Terpenoids, Anti-Inflammatory Activity

INTRODUCTION

Casuarina equisetifolia L. (family - *Casuarinaceae*) is predominantly a monoecious species which distributed along the coastal region of Parangipettai, Southeast coast of India. It is commonly known as beach she-oak, coast she-oak, beefwood, common ironwood, Australian pine, whistling-pine and it's native to the tropical and subtropical coastlines of Australia, Southeast Asia, Malaysia, Melanesia, Polynesia and New Caledonia. This plant has the capability of growing in a wide range of soil conditions particularly on coastal and on limestone soils near the shore. It is a tall, fast-growing tree that can, in as little as 12 years, reach up to height of 20 m (66 ft.). *Casuarina sp.* is a versatile predominant plantation species in farm forestry, agroforestry and plantation forestry in India. This tree sp has an excellent nitrogen fixing ability with desirable characters such as bio shields, drought resistant, adaptability to varied edaphic conditions, resistance to blister bark disease and rehabilitating mine spoils and nutrient poor areas and therefore extensively planted along the coastal belts and inland regions of India[1]. Apart from these properties, the bark extracts of the plant exhibits anti-inflammatory property. Tumor Necrosis Factor (TNF-α) is a homotrimer protein comprising of 157 amino acids. It is known to be involved in the pathogenesis of some inflammatory and autoimmune diseases. Diseases like Rheumatoid arthritis doesn't have any curing medicine till date. The bioactive components isolated exhibited binding energies equivalent to the market drugs like Diclofenac and Aspirin. The physicochemical, pharmacokinetic and skin permeation ability were analyzed for the sample extracts. On enhancing it's nature it can be utilized as a viable drug to treat any inflammatory diseases[1].

MATERIALS & METHODS

Sample Properties
Casuarina equisetifolia is known to contain components like carbohydrates, alkaloids, proteins, glycosides, saponins, phenolics, flavonoids, tannins, steroids, gum, reducing sugars and triterpenoids. These phyto-components has the potential to exert pharmacological effects like antimicrobial, antioxidant, anti-inflammatory and many other pharmacological effects[2] .

Sample Extraction
The bark samples were obtained from the coastal side of Chennai. The samples were pounded into fine powder and then subjected to appropriate method of extraction in order to study about the bioactive component present in it. The samples were dissolved in Hexane, Acetone and Distilled Water for preliminary analysis and later in Ethyl Acetate and Hexane for final analysis

Peliminary Analysis: Phytochemical Analysis
The preliminary analysis were performed with the sample extracts prepared from acetone, hexane and distilled water as respective solvents. The method prescribed by Junaid R Shaik,MK Patil were performed to identify the phyto-components present in the seed sample. [3,7].

Antimicrobial Activity Analysis
The anti-microbial activity of the bark extracts were determined by the Agar Disc Diffusion method[4] The extracts were tested against Pseudomonas fluorescens, Bacillus coagulans and Trichoderma. The seed extracts of *Casuarina equisetifolia* (*Casuarinaceae*) showed the antibacterial and antifungal activity. This is indicative that plant based products can effectively be utilized as a source for antimicrobial compounds[5].

Antioxidant Activity Analysis
The bark extracts were subjected to anti-oxidant activity based on the method of *Phosphomolybdenum* Assay[6]]. *Phosphomolybdate* scavenging activity corresponding to high antioxidant potentials was shown by the extracts[8].

Bio-Active Compound Identification – GC MS
The bark of *C. equisetifolia* is a source of potential phytoconstituents exhibiting significantly various biological activities leading to the development of novel drug[9].

Thin Layer Chromatography & Column Chromatography
The preliminary bio active components belonged to the family of terpenoids. To further analyze and to isolate the bioactive component methods of thin layer chromatography and column chromatography were performed with the standard protocol.[10]

Anti-Inflammatory Assay
The further refined bark extracts exhibited anti-inflammatory effect, which was evaluated by the HRBC Membrane Stabilization Method.[13]).

Bio-Active Compound Identification – GC MS
Terpenes/terpenoids are known to posses anti-inflammatory effect. The refined bark extracts were analyzed with GCMS and the bio active components were obtained [12]

***In silico* Studies: Molecular Docking:**
The bioactive components obtained were docked against TNF protein (PDB:4RSU) and the binding energies were obtained. The samples exhibited anti-inflammatory effect[13].

Pharmacokinetic Studies
Pharmacokinetic properties were also tested for the identified phyto-compounds to evaluate the ADME properties. Pharmacokinetic properties of phyto-compounds were evaluated using Swiss ADME[14].

RESULTS AND DISCUSSIONS

The bark sample of *Casuarina equisetifolia* were dissolved in Hexane, Acetone and Distilled Water for preliminary analysis and later in Ethyl Acetate and Hexane for final analysis

Preliminary Analysis
The Phytochemical Analysis of bark of *Casuarina equisetifolia* in different organic solvents   Are summarized in table 1. Tannins,Phenolic compounds and proteins are predominantly occur in bark.Alkaloids and terpenes are observed in actone extract.

Anti-Microbial Activity
The maximum zone of inhibition was observed in the acetone extracts of the bark sample[16] .against *Pseudomonas fluorescence* and *Bacillus coagulans* as shown in figure2, The high antifungal activity was observed in the acetone extracts of the bark sample .against *Trichoderma* in different media.

Anti-Oxidant Activity
The acetone bark extract exhibited **0.0028%** anti-oxidant activity at a concentration of **28.0mg/L.**

Bio-Active Compound Identification – GC MS

The acetone extracts of the bark sample gave 100 peaks. The GC– MS analysis also revealed the occurrence of nearly 100 bioactive compounds. In the preliminary analysis, bio-active component a *pentacyclic triterpene* such as β-amyrin was obtained. It is also known for it's anti- inflammatory activity[15,17].

In silico Studies: Molecular Docking:

The bio-active components were docked against TNF protein (PDB:4RSU)-(fFig 4,5]) and the binding energies were obtained. Beta-amyrone was having a binding energy of -7.1 and the binding was found at (LEU105 THR106 GLY107 SER108 GLY109 GLY157 ALA159 THR161 ILE162 THR163 TYR167 ARG218 LEU220 ASP221 GLU222 ARG223 VAL225 ARG226). 24 Noroleana 3,12 diene was having a binding energy of -6.4 and the binding was found at (HIS97 THR99 GLY100 ALA101 ASN102 GLU115 LEU118 GLY119 LEU120 PHE122 TYR144 ARG228 ASP229 GLY230 THR231 TYR234).

ADME Analysis

The phyto-compounds obeyed the Lipinski rule and were found to be non-toxic. The XlogP3 value were ranging between 8 to 10 which is indicative of the compounds to be highly lipophilic in nature. This indicates higher rapid metabolic turnover, low solubility and negligible absorption in the intestine region. Based on the logS scale (insoluble < -10 < poorly < -6<moderately < -4 < soluble < -2 < very soluble <0<highly soluble) the compounds were found to be poorly soluble. The solubility is estimated based on the compound's molecular structure and molecular weight. Fractions of carbon sp3 hybridization were found to be higher than 0.25 which proves it to be efficient. The compounds had low HIA levels which is indicative that the potential of the compounds to be absorbed by the intestinal tract is less.(6) The compounds didn't have the potential to cross the BBB which can be considered for exerting lesser adverse effects in the region of central nervous system. The compounds are non substrates for PGP which indicates that the compounds are not affected by the efflux action of the Pgp, which in turn eliminates compounds from the cell. The compounds have the bioavailability of 0.55 which implies that the compounds adhere to Lipinski rule of five and have 55% probability of being bioavailable. The non- inhibitory action of these compounds against the enzymes specified indicates the compounds to be having high probability of being transformed and consequently being bioavailable upon oral administration. Since, both the compounds have skin permeation values ranging from -2.10 to -2.65, they have the skin permeation ability.

CONCLUSION

Casuarina equisetifolia a tree which was predominantly known for its salt tolerance level and generally used as a protection guard contains the potential to cure various incurable diseases. The plant is widely used in construction sites. The Beta amyrone and 24 Noroleana 3,12 diene were the bioactive components obtained in the preliminary analysis. These components belonged to the isoprenoid group. The isoprenoids exhibit anti-inflammatory effect. The bark extracts contained phytochemicals like Flavonoids, Phenols, proteins, amino acids, resins, alkaloids, tannins, phytosterols and terpenoids. The extract exhibited anti-bacterial activity anti-oxidant activity of 0.0028%. The preliminary components were docked against TNF protein (PDB:4RSU) the binding energies were obtained. Beta amyrone exhibited binding energy of -7.1 and 24 Norolena 3,12 diene exhibited binding energy of -6.4. Both the components had exhibited binding energy higher than the binding energies of the anti-inflammatory drugs found in market like Diclofenac (-6.4) and Aspirin (-5.4). The refined extracts exhibited anti-inflammatory effect with IC_{50} being 84.72 for ethyl acetate extract and 108.41 for hexane extract. The components obtained were Palmitic acid TMS, Dihydrophytol TMS, Octadecanal, Heptadecanenitrile and Stearic acid TMS .These components were docked against TNF protein (PDB:4RSU).The compounds isolated exhibited ADME properties making it viable to be translated as an anti-inflammatory drug in future.

ABSTRACT

Herbal cosmetics are composed entirely of herbs and shrubs; therefore there are no negative effects. Now a day the demand of herbal cosmetics in the world markets are growing and are inevitable gift of nature. There are a wide range of herbal cosmetics products to satisfy the needs of women (Semwal,N2021).In the current study, antimicrobial activity, formulation, and evaluation of herbal eye shadow cream is done using hydroethanolic extract of *Beta vulgaris* peel. *Beta vulgaris* peel extracts have shown strong antibacterial and antifungal activity. The focus of this study is to formulate an herbal eye shadow cream in *Beta vulgaris* peel.

Keywords: *Beta vulgaris* peel, antibacterial activity, antifungal activity, formulation of eye shadow cream, evaluation of eye shadow cream.

INTRODUCTION

Herbal cosmetics have an increasing demand in the world market and are in valuable gift of nature. There are wide range of herbal cosmetic products to satisfy beauty regimes, adding herbal in cosmetics is very safe for the skin. The word herbal is a symbol of safety in contrast to a synthetic one which has adverse effects on human health (Palle. & Dr. K.V.,2021).*Beta vulgaris* peel has nutraceutical potential, and can scavenge free radicals and inhibit microorganism activity (El-Beltagi, H. S *et al.*,2022). Eyeshadow is one of the decorative cosmetics that contains colour that is applied to the eyelids. Eyeshadows were generally blue, pink, dark red, silver, green, and brown. Natural dyes are derived

94381

from plants, animals, and microorganisms (Yuniaty*et al.,* 2023).Eyeshadows are formulated in the form of cream or gel, stick and powders, either pressed or loose (Shweta A. Rathod., *et al* 2023).Cream Eyeshadows are available as oil or water emulsions containing two phases; the oily phase contains oils, thickeners and emollients and the aqueous phase contains pigments, pearls, and preservatives (Shweta A. Rathod*., et al* 2023).

METHODOLOGY

The materials and methods used for the present study are discussed below;

COLLECTION OF PLANT MATERIAL
Beta vulgaris was collected from the local market of Kalapatti town, Coimbatore district, India.

EXTRACTION
Beta vulgaris was gently washed and peeled. It was then shade-dried and grounded into a fine powder. Taken 2 g of peel powder and mixed with 20ml of solvent in a ratio of 1:10, covered and left for 1 day and stirred occasionally, and filtered using Whatman No.1 filter paper (Suryani*et al.,*2022).The Hydro-alcoholic extract was stored in the refrigerator for further use(S Keser*et al.,* 2012).

ANTIMICROBIAL ACTIVITY
The antimicrobial activity of *Beta vulgaris* peel extracts was assessed against *Staphylococcus aureus, Staphylococcus epidermidis, and Candida albicans* using the AgarWell Diffusion method (Salamatullah*et al.,* 2021).

WELL DIFFUSION METHOD
Antibacterial activity was performed by the agar well diffusion method (Van der Watt *et al.,* 2001). The stock culture of bacteria *Staphylococcus aureus* and *Staphylococcus epidermidis* were received by inoculating in nutrient broth media and grown at 37 % for 18 hours. The agar plates of the above media were prepared. MHA plates were prepared by pouring 20ml of molten media into sterile petriplates. After the solidification of the media, bacterial inoculums were swabbed uniformly. The sterile paper discs were dipped into the required solvents and then placed in agar plates. Then 10-50 µl of plant extract was poured into the wells. After that, the plates were incubated at 37°C for 24 hours. The assay was carried into triplicates and control plates were also maintained. The Zone of inhibition was measured from the edge of the well to the zone in mm. The tested cell suspension was spread on the Muller-Hinton Agar platewell were put into the agar medium using sterile forceps. Plant extracts were poured intowells. Then plates were incubated at 37°c for about 24 hours and control was maintained. Zone of inhibition was measured from the clear zone in mm.

ANTIFUNGAL ACTIVITY
AGAR WELL DIFFUSION METHOD
The Agar well diffusion method is widely used to evaluate the antimicrobial activity of plants or microbial extracts (Mounyr Balouiri *et al.,* 2015). Antifungal activities of all the plant extracts were tested using the agar well diffusion method with slight modification (Varaprasad *et al.,* 2009). The stock culture of fungi *Candida albicans* was received by inoculating in nutrient broth media and grown at 37 % for 18 hours. The agar plates of the above media were prepared. Potato dextrose agar plates were prepared by pouring 20ml of molten media into sterile petriplates. After the solidification of the media, the fungal inoculum was swabbed uniformly. The sterile paper discs were dipped into the required solvents and then placed inagar plates. Then 20-40 µl of plant extract was poured into the wells. After that, the plates were incubated at 37°C for 24 hours. The Assay was carried into triplicates and control plates were also maintained. The Zone of inhibition was measured from the edge of the well to the zone in mm. The tested cell suspension was spread on a potato dextrose agar plate. Well were put into the agar medium using sterile forceps. Plant extracts were poured on to wells. Then plates were incubated at 37°c for about 24 hours and control was maintained. The Zone of inhibition was measured from the clear zone in mm.

FORMULATION OF HERBAL EYESHADOW CREAM
FORMULATION PROCESS
 The Eyeshadow Cream was formulated by weighing all the required herbal ingredients accurately by using a digital balance. First the beeswax and shea butter were melted together. Then the colour pigment and Arrow root powder (Binder) were sieved to form a fine uniform powder and to this mixture jojoba essential oil was added and heated. Both phases were mixed at the same temperature. Rose essential oil and edible glitters were added at 40°C.The creamy mixture was transferred into an empty eyeshadow container and left for 24 hours at room temperature (Ghongade*et al.,* 2021).

FORMULATION OF EYESHADOW CREAM

Table 1: Formulation of eyeshadow cream

Ingredients	Concentration of the components		
	A	B	C
Beta vulgaris peel powder	-	2g	4g
Jojoba oil	1 ml	1ml	1ml
Beeswax	1g	1g	1g
Shea butter	1.5g	1.5g	1.5g
Arrowroot powder	-	1g	1g
Rose essential oil	-	0.5ml	0.5ml
Edible glitter	-	0.5g	0.5g

A - Eyeshadow cream formulation as base
B - Eyeshadow formulation with concentration extract 2g
C – Eyeshadow formulation with concentration extract 4g

EVALUATION OF HERBAL EYESHADOW CREAM
ORGANOLEPTIC EVALUATION
The Formulated Eyeshadow cream was assessed for its organoleptic properties,such as colour, glossy and smooth texture, odour, and condition.

pH DETERMINATION
0.5g of Eyeshadow cream was taken and dispersed in 50 ml of distilled water and then pH was measured by using pH paper.

WASHABILITY
A small amount of cream was applied to the hand and it was then washed with tap water.

PERFUME STABILITY
The Eyeshadow cream formulation was tested after 30 days, to record thefragrance.

DISPERSION OF COLOUR PIGMENT
The homogenous dispersion of pearls and pigments is a critical parameter for quality eye makeup products. Pigments are used in higher concentrations for powder eye shadows and if any undispersed pigment is present that appears as streaks on application to the skin. Streakiness and colour uniformity are evaluated visually or by spectrophotometric and colorimetric techniques.

TRANSFER RESISTANCE
Transfer resistance of cosmetics refers to the ability of a product to resist abrasive removal. It is defined as resistance against transferring of product from skin to other surfaces like clothes, etc. The test transfer resistance is performed

by applying a known concentration of eye makeup product onto the backside of the handand allowed to set for a minute. Then, tissue paper is touched with slight pressure over the area for a minute without rubbing. The amount of makeup product transferred to tissue paper is analyzed visually.

WATER RESISTANCE

The water-resistant or waterproof properties of cream eyeshadows can be evaluated by applying a known concentration of the eye makeup product on the backside of the hand and is allowed to set for a minute. The hand is then immersed in water or held under running water again for a minute. The remaining amount left on the hand after removing the eye makeup product by water, is analyzed visually.

MICROBIAL GROWTH TEST

Well Diffusion method was used, were the prepared Eyeshadow creams were inoculated in a plate with the Muller-Hinton agar media and potato dextrose agar media, and a control was prepared by omitting the product. The plates were incubated for 24 hours at 37° C. Plates were taken out after the incubation time and checked for microbial growth.

RESULTS AND DISCUSSION

ANTIBACTERIAL ACTIVITY
AGAR WELL DIFFUSION METHOD

The Antibacterial potential of the extract of *Beta vulgaris* peel was assessed in the current study. The concentration of the samples were taken as 20 µl, 30 µl and 40 µl respectively. The highest antibacterial activity is seen at the highest concentration of 40 µl of the sample. The activity zone of inhibition increases with the increase in concentration of sample. The Zone of inhibition was found against, gram-positive bacteria. The maximum inhibitory concentration was shown against *Staphylococcus aureus* and the minimum zone of inhibition was shown against *Staphylococcus epidermidis*. The Hydro-ethanolic extracts of *Beta vulgaris* peel demonstrated the highest antibacterial potential against *Staphylococcus epidermidis* and *Staphylococcus aureus* is shown in the Figure 1 & 2

ANTIFUNGAL ACTIVITY
AGAR WELL DIFFUSION METHOD

The concentration of the sample was taken as 20 µl, 30 µl and 40 µl respectively. The highest antifungal activity is seen at the highest concentration of 40 µl of the sample. The activity that is zone of inhibition increases with the increase in the concentration of a sample. The Zone of inhibition was found against *Candida albicans*. Hydro-ethanolic extracts of *Beta vulgaris* peel demonstrated the highest anticandidal potential. The Hydro- ethanolic extract of *Beta vulgaris* peel against *Candida albicans* is shown in the Figure 3.
The antimicrobial activity of Hydro-ethanolic Beta vulgaris peel extract showed potential activity against gram positive bacteria and fungi.

FORMULATION OF HERBAL EYESHADOW CREAM
EVALUATION OF HERBAL EYESHADOW CREAM
SUMMARY AND CONCLUSION

In the present study,the hydro-ethanolic extracts of *Beta vulgaris* peel have shown high antimicrobial activity effective against gram positive bacteria and fungi by higher zone of inhibition. The formulation of herbal Eyeshadow cream using Beta vulgaris peel act as a natural colourant. The use of natural colour will provide a suitable alternative to synthetic colourants. The results of the evaluation test exhibited beneficial effects and the ingredients used in the preparation of Eye shadow cream are devoid of side effects and safe to use. Thus the herbal formulation was successfully prepared and evaluated by using herbal colour pigment from *Beta vulgaris* peel powder.

ABSTRACT

Lemon (*Citrus* spp.) is a globally cultivated fruit valued for its diverse culinary, nutritional and medicinal benefits. Various lemon species thrive in wild environments, cultivated orchards and homestead gardens. Rich in essential minerals such as potassium, magnesium, calcium, copper, zinc, manganese, sodium, and sulfur, lemons play a vital role in human nutrition. Despite their sour taste, they contain natural sugars like fructose, glucose, and sucrose, along with minor amounts of maltose and xylose. Their protein content is relatively low, but they are an excellent source of vitamin C and B-complex vitamins, including thiamine, niacin, vitamin B6, riboflavin, and pantothenic acid. Additionally, lemons are abundant in antioxidants, particularly flavonoids, limonoids, and phenols, which contribute to their health-promoting properties. This review provides an in-depth exploration of the nutritional and phytochemical composition of indigenous lemon varieties from Northeast India, emphasizing their antioxidant potential and possible therapeutic applications.

Keywords: Lemon, minerals, carbohydrates, proteins, vitamins, Antioxidants.

INTRODUCTION

Lemon plants belong to the family Rutaceae, genus *Citrus* encompassing small to medium-sized shrubs or trees having sharp axillary spines. According to Iwamasa (1976), the *Citrus* genus originated approximately thirty to forty million years ago in the vicinity of Assam, India. Lemon is a highly versatile fruit with both culinary and medicinal applications. It is primarily consumed fresh or as juice, providing a refreshing beverage option during hot summer days. In Norteast India, people also prepare pickles from lemon. Lemon juice is commonly paired with rice and curry

and features prominently in certain ethnic dishes. It is an ethnobotanically significant plant utilized by the local population for treating various ailments. For instance, tender leaves of *Golnemu* (*Citrus aurantifolia*) are used to treat diarrhoea (Borah *et al.,* 2006). Ripe fruits of *Bira jora* (*Citrus medica* Linn.) are employed for sore throats, coughs, asthma, and numerous other health concerns. *Citrus* extracts exhibit potent antioxidant activity and antiulcer properties, adding to their medicinal appeal (Nagaraju *et al.,* 2012). Beyond their nutritional value, *Citrus* fruits contain phenols, flavonoids, and limonoids, which have anti-carcinogenic (Rana *et al.,* 2017) anti-inflammatory, and anti-allergic properties (Manthey *et al.,* 2000). Moreover, they are recognized for their vitamin E (a-d Tocopherol) content, contributing to their overall health-promoting attributes (Newhall and Ting, 1965; Ting and Newhall, 1965).

Carbohydrate Content
Though lemon fruits are generally sour but they contain different types of sugar. Lemon fruits, like many other fruits, naturally contain sugars, primarily in the form of fructose, glucose, and sucrose (Namani *et al.,* 2018). Asencio *et al.* (2018) reported that the sugar content can vary slightly depending on the specific type and ripeness of the fruit. Fructose is a natural fruit sugar and is the most common type of sugar found in *Citrus* fruits. It has a sweet taste and is the primary sugar responsible for the sweet flavour of these fruits. Another simple sugar found in *Citrus* is glucose.Although less prevalent than fructose it still contributes to the overall sweetness of the fruit. Disaccharide like sucrose is also reported in the fruit juice. In addition, small amounts of other sugars, such as maltose and xylose are found in minor quantities. Suja *et al.* (2017), also reported the presence of primary metabolites such as carbohydrates and proteins in lemon.

Proteins
Lemons are low in protein(1.1 grams of protein per 100 grams) but contain certain proteins that support the functioning of the plant and may influence human health (Healthline, 2023). One such protein, ribosomal protein ClRPS9-2, interacts with the coat protein of the *Citrus yellow vein clearing virus* (CYVCV), suggesting a role in the plant's defense mechanisms (PMC, 2023). The characteristic sourness of lemon juice is influenced by two proton-pumping proteins highly expressed in the juice vesicles of very sour lemon varieties, increasing proton accumulation and acidity (Chemistry World, 2023).

Vitamins
Vitamin C, also known as ascorbic acid, is abundant in lemon juice. The concentration of vitamin C varies across different *Citrus* species, with lemon containing 34.67 mg/ 100 ml of juice (Kumar *et al.,* 2019). It is a powerful water-soluble antioxidant that plays a crucial role in neutralizing free radicals and regenerating other antioxidants in the body (Nagy, 1980). In a study conducted by Paul (2016), the vitamin C content of various *Citrus* fruits in the Dibrugarh district of Assam was analyzed. The study revealed that the *jora tenga* variety (*Citrus medica*) had the highest vitamin C content per 100 ml of juice, followed by the bira-jora variety (*Citrus medica*), and *kaji nemu* variety (*Citrus limon*).Lemons' vitamin C content is shaped by both soil composition and climate, flourishing with potassium and sunlight but diminishing with excess nitrogen, phosphorus, and heat. Apart from vitamin C they also contain notable amounts of B-complex vitamins, including thiamin, niacin, vitamin B6, riboflavin, and pantothenic acid (FAO, 1988). These vitamins support various physiological processes, such as energy metabolism, immune function, and the maintenance of healthy skin and tissues.

Mineral Content
Lemons are rich in mineral content. Almost all the vital elements like potassium, magnesium, calcium, potassium, copper, zinc, manganese, sodium are presentin it (Janati *et al.,* 2012). Lemon fruits are a good source of potassium, an important mineral that helps regulate blood pressure, fluid balance, and muscle contractions. Calcium though not as abundant as in dairy products, lemons contain some calcium, which is essential for healthy bones and teeth, as well as muscle function and nerve transmission. Lemons contain small amounts of magnesium, which is involved in hundreds of biochemical reactions in the body and is important for muscle and nerve function, blood sugar regulation, and bone health. Phosphorus is another mineral present, albeit in smaller amounts. It plays a role in bone health, energy metabolism, and various cellular processes. Copper is a trace mineral found in lemon. It is essential for

the formation of red blood cells, connective tissues, and the functioning of enzymes. While lemons are not particularly high in iron, they do contain some non-haem iron, which is less easily absorbed by the body compared to haem iron found in animal sources. Nonetheless, vitamin C in lemon can enhance the absorption of non-haem iron. Lemons also contain small amounts of zinc, which is necessary for immune function, wound healing, and DNA synthesis. Manganese is present in Lemon at low levels and is involved in bone formation, blood clotting, and the metabolism of amino acids, cholesterol, and carbohydrates. Sulphur is found in the form of sulphur-containing compounds in *Citrus* fruits, and it is essential for the structure of proteins and enzymes. The sodium content in lemon is negligible and can be useful to specific dietary conditions involving low sodium intake. These are the major minerals found in lemon but it should be noted that the mineral content can vary depending on the specific type of lemons and its growing conditions (Idamokoro *et al.,*2022 ; Czech *et al.*, 2020;Ichado *et al.*, 2020 ; Jiao *et al.*, 2023).

Antioxidants
According to Halliwell and Gutteridge (1989), antioxidants are substances that prevent oxidation even when present in small amounts.The body has a natural antioxidant defense system made up of enzymes like superoxide dismutase, catalase, and glutathione peroxidase, as well as non-enzymatic antioxidants like vitamins C and E, glutathione, and polyphenols. Lemons are rich in antioxidants and can help reduce oxidative stress and support health. They are rich sourcesof antioxidants, including flavonoids, limonoids, and polyphenols. **Flavonoids**, a diverse class of water soluble plant compounds, which have strong antioxidant and anti-inflammatory properties. The primary flavonoids in lemon juice are flavanones, flavones, and flavanols.

Flavanones
Flavanones are the most abundant flavonoids in lemons, contributing significantly to their antioxidant properties. The key flavanones present in lemons include eriodictyol, hesperetin, and naringenin. Eriodictyol is primarily found in lemon peels, with concentrations reaching up to 79.27 μg/g fresh weight (FW) (Zou *et al.*, 2016).Hesperetin is predominantly located in the peel (5.79 to 88.12 μg/g FW) but is also found in whole fruits (1.45 to 24.49 μg/g FW) and juice (0.83 to 4.71 μg/g FW). It is absent in the pulp and seeds (Zou *et al.*, 2016).Naringenin is mainly present in lemon peels and seeds, with its highest concentrations observed in certain cultivars (Zou *et al.*, 2016). In their glycosylated form, these flavanones exist as flavanone glycosides, which are more water-soluble and bioavailable.Neoeriocitrin (eriodictyol-7-rhamnoglucoside), eriocitrin (eriodictyol-7-rutinoside), and narirutin (naringenin-7-rutinoside) are the major flavanone glycosides in lemon (Miyake *et al.*, 1997b).Eriocitrin exhibits the strongest antioxidative activity among the flavonoid glycosides in lemon fruit, followed by neoeriocitrin and DGD (6,8-di-C-β-glucosyldiosmin) (Miyake *et al.*, 1997b).

Flavones
Flavones, another class of flavonoids, are present in lemons primarily as flavone glycosides. The key flavones found in lemons include apigenin and luteolin, which are known for their antioxidant and anti-inflammatory properties. Diosmin (diosmetin-7-rutinoside) is a flavone glycoside present in lemon peels and juice, contributing to its vascular-protective effects (González-Molina & Moren, 2012).6,8-di-C-β-glucosyldiosmin (DGD) and 6-C-β-glucosyldiosmin (GD) are C-glucosyl flavones found abundantly in lemons and limes but only in trace amounts in other *Citrus* fruits (Miyake *et al.*, 1997b; Pham *et al.*, 2022).

Flavanols
Flavanols, also known as flavan-3-ols, are present in lemons in smaller amounts. The major flavanols found in lemons include Kaempferol, Myricetin and Quercetin. These flavanols contribute to the overall antioxidant properties of lemons and may provide health benefits such as cardiovascular protection (González-Molina & Moren, 2012). The flavonoid content in lemon juice varies based on extraction methods. Miyake *et al.* (1997b) found that lemon juice obtained using an in-line extractor contained higher levels of eriocitrin and hesperidin compared to juice extracted manually. The increased pressure applied in mechanical extraction allows for greater incorporation of flavonoids from the pulp and albedo into the juice. This finding is commercially relevant as it suggests that optimizing extraction techniques can enhance the nutritional value of lemon juice.

Pranab Paul *et al.,*

Limonoids are highly oxygenated triterpenoid compounds found in lemon juice that exhibit potent antioxidant properties. These bioactive compounds have gained significant attention due to their potential health benefits, including anticancer, anti-inflammatory, and antimicrobial activities. The limonoids found in lemon are limonin, nomilin, nomilinic acid, obacunone, limonexic acid and ichangensin.

Limonin
Limonin is one of the most extensively studied limonoids in *Citrus* fruits. It has been reported to exhibit strong anticancer, antioxidant, and anti-inflammatory properties, making it a key component of lemon's bioactive profile (Manners, 2007; Roy & Saraf, 2006). Limonin's role in cancer prevention is particularly notable, as it has demonstrated the ability to inhibit tumorigenesis in various experimental models.

Nomilin
Nomilin is another prominent limonoid in lemons, recognized for its broad-spectrum bioactivity. Research has highlighted its anticancer and antiviral effects, suggesting its potential therapeutic applications (Manners, 2007; Roy & Saraf, 2006). Nomilin has been found to modulate immune responses and interfere with viral replication, further emphasizing its significance as a natural health-promoting compound.

Nomilinic Acid
Nomilinic acid, a derivative of nomilin, is known for its antioxidant and anti-inflammatory effects (Manners, 2007; Roy & Saraf, 2006). These properties contribute to its potential use in managing oxidative stress-related diseases. The presence of nomilinic acid in *Citrus* fruits reinforces the nutritional and medicinal value of lemons.

Obacunone
Obacunone is another bioactive limonoid found in lemons, with demonstrated anticancer and antimicrobial properties (Manners, 2007; Roy & Saraf, 2006). Studies have shown that obacunone can inhibit the proliferation of cancer cells and exhibit antibacterial effects, suggesting its potential role in developing natural therapeutic agents.

Limonexic Acid
Limonexic acid, primarily found in *Citrus* seeds, remains an area of ongoing research. While its specific biological activities are still under investigation, preliminary findings indicate that it may contribute to the overall health benefits of *Citrus* fruits (Manners, 2007). Further studies are needed to fully elucidate its physiological effects.

Ichangensin
Ichangensin is a lesser-known limonoid present in certain *Citrus* species. Although its precise health benefits have yet to be fully determined, it has been suggested to possess therapeutic properties (Manners, 2007).

Polyphenols present in lemon juice and peels play a crucial role in their antioxidant activity, offering various health benefits. The polyphenols found in lemons include phenolic acids such as chlorogenic acid, p-coumaric acid, ferulic acid, gallic acid, tannic acid, cinnamic acid, caffeic acid, and o-coumaric acid. Each of these compounds possesses unique health-promoting properties and contributes to the antioxidant capacity of lemons.

Chlorogenic Acid
Chlorogenic acid is one of the dominant phenolic acids found in both the peel and fruit of lemons. It is well known for its strong antioxidant properties, which help protect cells from oxidative stress and reduce the risk of chronic diseases (Czech *et al.*, 2021; Xi *et al.*, 2017). The presence of chlorogenic acid in lemons enhances their nutritional value and potential therapeutic applications.

p-Coumaric Acid
p-Coumaric acid is predominantly located in the albedo, the white inner layer of lemon peels. This polyphenol plays a crucial role in enhancing the antioxidant capacity of lemons, making them beneficial for overall health (Gabriele *et*

94391

al., 2024; Czech *et al.*, 2021). Due to its potent antioxidant effects, p-coumaric acid contributes to the fruit's ability to combat oxidative damage.

Ferulic Acid

Ferulic acid is distributed throughout different parts of the lemon fruit and is recognized for its significant antioxidant effects (Czech *et al.*, 2021; Singh *et al.*, 2014). This phenolic compound has been studied for its potential role in protecting against oxidative stress, inflammation, and age-related disorders.

Gallic Acid

Gallic acid, present in both the peel and fruit, is another vital polyphenol with strong antioxidant potential. It has been recognized for its ability to promote health by combating oxidative stress and reducing the risk of various chronic diseases (Xi *et al.*, 2017; Singh *et al.*, 2014). The presence of gallic acid enhances the overall bioactivity of lemon.

Tannic Acid

Tannic acid, primarily found in the pulp of lemons, is an important contributor to the fruit's antioxidant properties. It plays a role in neutralizing free radicals and has been studied for its health-promoting benefits (Singh *et al.*, 2014). The inclusion of tannic acid further supports the potential of lemons as a functional food.

Cinnamic Acid

Cinnamic acid is another polyphenol predominantly located in the pulp of lemons. This compound has been associated with various health benefits, including its antioxidant and anti-inflammatory effects (Singh *et al.*, 2014). The presence of cinnamic acid enhances the overall nutritional value of lemons.

Caffeic Acid

Caffeic acid is a dominant phenolic acid found in the peel and whole fruit of lemons. It is widely recognized for its strong antioxidant capacity and protective effects against oxidative stress (Xi *et al.*, 2017). Caffeic acid's presence in lemons contributes significantly to their health benefits and potential therapeutic uses.

o-Coumaric Acid

o-Coumaric acid, primarily present in the albedo and peel, plays a key role in enhancing the antioxidant properties of lemons. Its presence further supports the fruit's role as a natural source of beneficial polyphenols (Gabriele *et al.*, 2024). Lemon juice is a readily available and affordable source of antioxidants, making it an attractive addition to a balanced diet. It can be enjoyed on its own as a refreshing beverage or used as a flavour enhancer in various culinary preparations, such as salad dressings, marinades, and beverages. The potential health benefits of lemon juice's antioxidant activity are numerous. Regular consumption of lemon juice or incorporation of lemon juice into the diet may help reduce the risk of chronic diseases, enhance immune function, support cardiovascular health, and promote healthy aging. Northeast India particularly Assam being a hotspot of lemon diversity, a lot of work need to be done particularly the quantitative aspect of the nutraceutical and antioxidants. Also, extensive in vivo tests have to be carried out evaluating the antioxidant capacity of lemon extracts. Work can also be done to study lemon's free radical scavenging activity and its impact on oxidative stress markers.

CONCLUSION AND FUTURE PERSPECTIVES

Lemons, especially the indigenous varieties of Northeast India, are a powerhouse of essential nutrients and antioxidants, offering substantial health benefits. Their rich composition of vitamins, minerals and bioactive compounds makes them valuable not only as a dietary component but also for medicinal applications. However, despite their known benefits, much remains to be explored. Future research should focus on a deeper analysis of their phytochemical composition, bioavailability, and therapeutic potential. Additionally, extensive in vivo studies

Pranab Paul *et al.*,

are required to validate their antioxidant efficacy and potential applications in functional foods or nutraceutical formulations. By advancing our understanding of these citrus fruits, we can unlock their full potential for promoting human health and well-being.

ABSTRACT

Digitaria genus is the widely used for its medicinal and fodder since ages. It is originated in Asia but widely distributed in the tropical and temperate regions of all over the world like china, India and Africa etc. It is widely used in food preparations, cookies, crackers, Non-conventional food products, such as low bulk density weaning foods and high-fiber breakfast cereal, are being explored for their potential health benefits, animal fodder medicines and paper making. *Digitaria* genus are well known for having diverse secondary metabolite compositions that include cardiac glycosides, alkaloids, flavonoids, terpenoids, saponins, and phenolics. It is used to treat gonorrhea, including wound healing, malaria, yellow fever, hernias, liver diseases and flu. Secondary metabolites of this plant exhibit a wide range of pharmacological activities including antioxidant activity, anthelmintic activity, acaricidal activity, wound healing, antifungal activity,Methicillin-resistant *Staphylococcus aureus* activity, antibacterial activity, antiviral activity, antimutagenic activity, and cytotoxic activity etc. This study presents a comprehensive and up-to-date taxonomy, phytochemical composition, and pharmacological actions and offers a justification for additional bioprospecting of this plant. Due to the great therapeutic significance of this, clinical research is necessary.

Keywords: Phytochemical, Pharmacological, Antioxidant, Cytotoxicity

INTRODUCTION

Plants are the principal source of food and medicine. There has been a major function for plants in human lives from prehistoric times. People have been educated about their culinary and medicinal properties over the ages and across many cultures. Traditional herbal treatments provide primary healthcare for around 25% of the global population[1]. A noteworthy statistic is that, either directly or indirectly, 25% of contemporary pharmaceuticals are also derived from plants, indicating the robust basis for plant-based drug development. The natural resources of India, both plant and animal-based, have long been used as dietary supplements and therapeutic treatments. An estimated 250,000 higher plant species are thought to exist on Earth, of which around 70,000 are thought to have medicinal properties, according to the data now available. India is the 12th global hotspot for biodiversity, home to over 45,000 plant species[2].The prevalence of alternative medicinal systems like Siddha, Ayurveda, Unani, Naturopathy, and homeopathy, along with the abundance of flora and fauna in India, led to the official establishment of a very long, safe, and continuous usage of herbs[3].The term "*Digitaria*" comes from the Latin "*digitus*," which means "finger." This refers to the plant's appearance of spreading inflorescence branches. There are around 260 species of *Digitaria*, commonly mentioned to as "finger grass" [4].*Digitaria* is a monocotyledonous plant belongs to Poaceae family, originated in Asia but found throughout the world's tropical and temperate zones. Crabgrasses were among the first cereals to be farmed and it was cultivated for food in China, India, and Africa thousands of years ago, they are now considered relatively major grains in many parts of the world. The weedy *Digitaria* spp. are annual, perennial (in favourable condition) and germinate in late spring to late summer when temperature range between 20°C to 30°C [5].There are numerous species within *Digitaria,* which can be with or without stolons, rhizomes, erect or prostrate. The inflorescence structure of this genus varies in terms of spikelet scale length and spikelet indumentum type. *Digitaria* is a mesophytic or xerophytic plant that thrives well in open environments. *Digitaria* differ in terms of hair density and leaf morphology. *Digitaria*, often called crabgrass, yields an enormous quantity of seeds-up to 1,88,000 seeds may be produced by a single plant[6]. Primary metabolites are vital chemical substances that serve critical functions in human development. Phytochemicals are found in many parts of plants, such as the roots, stems, leaves, flowers, fruits, and seeds. The accumulation of bioactive phytochemicals, including primary and secondary metabolites, contributes to the pharmacological effects and potential therapeutic benefits of plants Alkaloids, flavonoids, saponins, terpenoids, steroids, glycosides, tannins, and volatile oils are only a few of the many secondary metabolites that are produced by plants[7,8]. Phytochemicals and pharmacologically active compounds make up secondary metabolites, which are important in the treatment of a number of diseases and have therapeutic potential.

Alkaloids, which possess analgesic, antispasmodic, antimalarial, and diuretic qualities; Terpenoids, with their anthelmintic, antibacterial, antiviral, anticancer, and antimalarial qualities; Glycosides, known for their antimicrobial and antifungal properties; It is believed that phenols and flavonoids have antibacterial, anti-allergic, and antioxidant qualities; saponins, on the other hand, have antiviral, anti-inflammatory, and plant defense capabilities[9].**(Fig.1).**Fonio is traditionally a helpful diet for those with diabetes or mothers after delivery[10].The edible seeds of *Digitaria sanguinalis* have been consumed as a grain throughout Germany, particularly in Poland, where it was given the nickname Polish millet. Iron, protein, B vitamins, calcium, potassium, and fiber may all be found in millets[11]. *Digitaria exilis* grain is generally eaten by humans as food, but it's also a good, nutritious meal that the poorest people can eat, as well as people who are celiacs[12].*Digitariaexilis* and *Digitariaiburua* (Iburu) are said to have been used for a very long time as a diabetic meal and to regulate blood sugar levels in the body in the northern portion of Nigeria. These plants may be used to make non-alcoholic and alcoholic drinks, as well as traditional dishes including thick and thin porridges and steam-cooked goods like couscous[13]. Additionally, it has been demonstrated that grains of *Digitaria exilis* lower the risk of stroke and heart disease[14].In previous studies,have all reported on the physiochemical properties, fatty acid, amino acid, and mineral element contents, as well as the antioxidant activities of *Digitariaexilis* grains[15,16].*Digitaria* has been shown in numerous reports to possess strong biological activities that affect the central nervous system, including analgesic, antiviral, anti-inflammatory, anticancer, and anthelmintic action[6]. *Digitaria* is the predominant C4 weed[6]. .*Digitaria abyssinica* plant has historically been used to treat a variety of ailments, including wound healing, malaria, yellow fever,

hernias, liver diseases, and flu[17,18].The Gonorrhea and candidiasis are two urinary tract illnesses that have historically been treated using *Digitaria abssinica* rhizomes in some regions of Kenya[19].The reduced leaf area ratio of *Digitaria ciliaris* suggests that it is more adept at converting solar energy into carbohydrates. *Digitaria ciliaris* develops more quickly in environments with abundant food and water because of its higher leaf count and accumulation of dry matter per plant[20]. This study provides detailed information on the pharmacological properties, phytoconstituents, and traditional applications of *Digitaria* spp. The structure-activity connection, potential mechanisms of action, and toxicity and safety features of this plant have also been attempted to be explained.

Botanical description

Taxonomy

There are 260 species of weeds and plants belong to the genus *Digitaria*[21].The *Digitaria* are members of Poaceae family. It goes by the names fonio, finger-grass, and crabgrass as well. Some are frequently regarded as lawn pests. They are slender, monocotyledonous annual and perennial grass, pasture, and fodder plants. *Digitaria*, whose name is derived from the Latin word *Digitus*, which means "finger," are identified by the tall inflorescences that resemble fingers. The *Digitaria* genus may grow up to 50 cm to 1 m in length. Its leaves are slender, flat blades that droop slightly from the stem and have a delicately corrugated edge. Prefoliation is rolled and alternates with the first leaves. Lamina is 2.5-3.5 mm length and 1.0-1.5 mm broad. It is oval and hairy. It is a membrane-bound ligule. The inflorescence is made up of one to three whorls that rise obliquely from the end of the stem and are formed of digitate, 2-11 thin spikes that are 6-11 cm long[22].In pairs, the spikelets are arranged. The first is short pedicellate (0.5 mm) and sterile, whereas the second is significantly more fruitful (2 mm). The roots have fibrils. accidental roots growing from the plant's lower nodes are present. The rectangular seed is present in the lemma and palea of the external flower and measures 2.5 to 3.3 mm in length[23].

Distribution

In addition to its native Asia, the *Digitaria* genus is found across the world's tropical and temperate zones, including China, India, Madagascar, and West Africa. It typically thrives on well-drained soils, in marshy areas, and in tropical rain forests. It is a plant that can grow on nutrient-poor and low fertility acidic and sandy soils without the need for fertilization and has the potential to help prevent problems such as erosion and desertification in areas with insufficient annual rainfall of 200-500 mm. The seeds germinate within a week after sowing. The grain is harvested after 60 to 120 days. Due to its short growth cycle, it is harvested during the critical famine season, which precedes the main food crops of the region . Due to low cultivation inputs, *Digitaria* can be harvested three times a year under favorable climatic conditions, making it an early food source[24].

Ethno-medicinal uses

Farmers claim that *Digitaria exilis*, often known as fonio, has certain therapeutic benefits. Blood clots from trauma and other injuries, as well as those that build up in the uterus during childbirth, can be treated or removed with it (12.3% of responders). In addition, 1.1% of respondents reported using fonio to cure stomachaches, 1.1% reported having asthma, 2.3% reported having dysentery, 2.3% reported having chickenpox, 5.7% reported having chronic diarrhoea, and 5.7% reported feeling unappealing. According to some, fonio is a beneficial diet for diabetics[25].

Phytochemical analysis

The genus *Digitaria* is a reservoir of phytocompounds since its individual phytocompounds may now be identified and isolated because to advancements in analytical methods. *Digitaria* contain naturally occurring, physiologically active substances known as phytochemicals. In addition to giving plants their color, flavor, and scent, phytochemicals also function as a plant's natural defense system and have the ability to ward off illness[26]. Alkaloids, saponins, anthraquinones, phlobatannins, volatile oils, alkaloids, flavonoids, terpenoids, tannins, flavones, hydroxycinnamic acids, steroids, and cardiac glycosides are some of the main phytochemicals present in the genus *Digitaria*[6].*The phytochemicals alkaloids, saponins, tannins, steroids, terpenoids, and flavonoids were present in Digitaria exilis but Phlobatannin and anthraquinone were not found*[10]. The 10 secondary metabolites found in *Digitariaexilis* (grain): alkaloids, flavonoids, saponins, anthraquinones, terpenoids, tannins, phlobatannins, phenolics, cardiac glycosides,

and cardenolides. Notably, steroids were absent[14]. Among these compounds, alkaloids were the most abundant (30.20 mg/ml), while phlobatannins were the least prevalent (0.22 mg/ml).Small quantities of alkaloids, saponins, steroids, trepenoid, flavonoid, and cardiac glycosides were detected by the phytochemical screening in *Digitaria exilis* (white flour) [10]. In *Digitaria exilis* (fonio) flour C-glycosylflavones were absent in the crude methanolic extract as determined by HPLC analysis. Amounting toclean grains containing 500 mg/kg, the total flavonoid content extracted from aqueous extracts was expressed as aglycone equivalents. Spectral and chromatographic examination of the purified extracts revealed that luteolin (L = 350 mg/kg) had 80% in free form and 20% bound as O-glycosylflavones, whereas apigenin (A = 150 mg/kg) had 10% present in free form and 90% bound as O-glycosylflavones [27]. Lypophilic compounds (fatty acids, fatty acid esters, and terpenes) were identified using the GC analysis of Fr2. The percentages of palmitic acid (29.86%), linolenic acid (19.95%), ethyl linolenoate (15.07%), and ethyl hexadecanoate (19.77%) are the main compounds identified in *Digitaria insularis*[28]. GC/MS analysis of the *Digitariaciliaris* flower absolute was used to identify 15 chemicals[23].These included the following: hexadecanoic acid (4.98%), multiflora-7,9(11)-dien-3β-ol (2.46%), pristinone (2.33%), cyclooctacosane (6.31%), stigmasterol (4.35%), sitostenone (7.77%), and linolenic acid (56.78%). Hexadecanoic acid, or palmitic acid, has been demonstrated to be a significant stimulant of fibroblast and keratinocyte proliferation[29,30].These findings raise the possibility that the absolute bloom of *Digitariaciliaris* may influence the mechanisms involved in skin wound healing.

Pharmacological activity

Different plant parts of *Digitaria* genus are predominantly used different types of food preparation, Cookies, crackers and breakfast cereal with good fiber content. Their low bulk density makes them suitable for use as food additives in a variety of non-traditional food items, such as weaning meals. One of the powerful medicinal plants utilized for healthcare purposes is the *Digitaria*genus, which is also used as a food additive[6]. The pharmacological effects of this compound are diverse and include anti-inflammatory, anti-bacterial, anti-fungal, anticandidal, anticancer, antiallergic, antihypertensive, antidiabetic, anti-inflammatory, central nervous system, analgesic, anthelmintic action and anesthetic activities, etc[6].Additionally, reports of its beneficial usage during diarrhea, gonorrhea, including wound healing, malaria, yellow fever, hernias, liver diseases and flu[17,19,18].In some parts of Kenya, *Digitaria abssinica* rhizomes have long been used to treat gonorrhea and candidiasis, two urinary tract diseases[19]..*Digitaria sanguinalis* possesses fractions and isolated compounds with potential as novel therapeutic agents due to their robust antimicrobial, anti-MRSA, antiviral, and cytotoxic activities[31].Several of *Digitaria's* primary phytochemical endeavors are characterized as under**(Table 1).**

Acaricidal Activity

The in vitro research has demonstrated the possibility of using medicinal plants, particularly plant extracts and their isolated *Digitariainsularis* components, to control ectoparasites in cattle. *Digitaria insularis* was used to test the active extracts' and fraction's anticholinesterase activity[28].The oviposition and larval hatchability, or reproductive characteristics, of *Rhipicephalus* (Boophilus) *microplus* females were found to be significantly affected by the in vitro acaricidal actions of *D. insularis*[28].The anti-tick properties of a plant of the genus *Digitaria* have been documented for the first time in scientific studies. According to the categorization, Fraction 2 may be categorized as a robust inhibitor (>50% inhibition), and 30%–50% inhibition) was seen in the HE and EA extracts.

Acaricidal Activitymechanism of action

Due to their ability to pass through the adult *Riphicephallus (Boophilus) microplus* cuticle and function inside the cells, the Fraction 2 components' high liposolubility probably increases their acaricidal efficacy. Higher liposolubility chemicals can more readily pass through the tick's epicuticle, which is the outermost layer of its cuticle and is mostly made of waxes and lipids[28].The capacity of the active extracts and fractions to inhibit acetylcholinesterase (ACHE) was evaluated in order to investigate potential correlations between the acaricidal impact and anticholinesterase activity. Pesticides including organophosphate and carbamate target this enzyme, and when it is inhibited, acetylcholine's excitatory effects are prolonged, resulting in The demise of the parasite and neuromuscular paralysis**(Fig.2).**

Wound healing

Living things will always sustain wounds; they are not preventable but are treatable. *Digitaria ciliaris* flower extract's ability to heal wounds in humans was studied by[23].It has been observed that the extract intervention has induced fibroblasts' production of collagen, keratinocytes' proliferation, wound contraction, and other essential processes. Skin wound healing and regeneration may be aided by *D. ciliaris* flower absolute. With regards to natural cosmetics or medications that try to speed up skin wound healing, *D. ciliaris* flower absolute is a promising option. The *D. ciliaris* flower's ability to promote wound healing in Synthetic human epidermal growth factor (purity > 97) was studied by[23].Utilizing a WST test, they evaluated the cytotoxicity of *D. ciliaris* absolute at various doses (0.1-100 µg/mL) in order to determine its effect on fibroblast and keratinocyte viability. The results show that *D. ciliaris* absolute did not, at any of the measured doses, show cytotoxic effects on HaCaT or CCD986sk cells.

Wound healing mechanism of *Digitaria* genus

Skin wound healing comprises three sequential stages: inflammation, proliferation, and remodeling [32]. This process involves intricate tissue regeneration events including matrix production, re-epithelialization, angiogenesis, cell migration, and proliferation [33]. *D. ciliaris* flower absolute was shown to have impacts on skin wound healing and associated processes in human fibroblasts and keratinocytes, including proliferation, migration, and collagen production. The absolute promoted proliferation in keratinocytes and fibroblasts, as well as fibroblast migration, without impacting cell viability. Additionally, fibroblasts rather than keratinocytes saw a selective increase in type I and type IV collagen formation. The floral absolute of *D. ciliaris* induced fibroblasts to phosphorylate extracellular signal-regulated kinase 1/2 and p38 mitogen-activated protein kinase**(Fig.3)**.

Antimicrocial activity

When prescribed medicines do not have the desired pharmacological effects, antibiotic resistance develops. Chemotherapeutic medications such as paclitaxel and adriamycin are a well-known example of this resistance. Globally, pathogenic microbes cause profound cellular and molecular alterations that are difficult to identify[34]. Antibiotic resistance in bacteria is on the rise, and this is a serious worldwide problem. As a result, herbal formulations are frequently used in the creation of novel medicinal agents due to their generally safe character. Researchers are therefore focusing on discovering novel antibiotics from natural sources that can penetrate bacterial cell membranes and inhibit their growth without causing adverse effects. The seven identified chemicals and active fractions of the alcohol extract from *Digitaria sanguinalis* aerial parts have antimicrobial activity[5].The investigated strains of bacteria and fungus, such as *Staphylococcus aureus, Bacillis subtilis, Escherichia coli, Pseudomonas aeruginosa, Aspergillus fumigates,* and *Candida albicans,* were significantly inhibited by the n-hexane and ethyl acetate fractions.
The n-hexane fraction included p-coumaric acid and p-hydroxybenzoic acid, while the ethyl acetate fraction contained β-sitosterol-3-O-β-glucoside and tricin-7-O-βD-glucopyranoside. which have been shown to have antimicrobial activity in the past, may be the cause of this [35].

Antimicrobial Activity Mechanism of action

The effective antibacterial inhibitory actions of phenolic compounds may be due to hydrogen bonding with vital proteins such as microbial enzymes or iron shortage [36]. Terpenes may have the capacity to break microbial membranes, which may account for their antibacterial activities, in contrast to lipophilic flavonoids [37].

Methicillin-resistant *Staphylococcus aureus* (MRSA) Activity

Study on the alcohol extract's active fractions from *Digitaria sanguinalis* aerial parts is the first to identify tricin, tricin-7-O-β-D-glucopyranoside, and β-sitosterol-3-O-βglucopyranose as having anti MRSA activity[31]..

Antifungal activity

The traditional usage of *Digitaria abyssinica* to treat *candidiasis* was confirmed that the rhizome preparations exhibited antifungal activity [38]. Antifungal activity against *Candida albicans* was demonstrated by the rhizome preparations of *Digitaria abyssinica*. the zone of inhibition at 500 mg/ml was 16.33 ± 0.82 mm, the microbial fuel cell (MFC) was 62.5 mg/ml, and the minimum inhibitory concentration (MIC) was 31.25 mg/ml.were the greatest antifungal activity

values for the aqueous extract. The aforementioned study provides support for the traditional usage of *D. abyssinica* rhizome aqueous and methanol extracts as a treatment for *candidiasis* by suggesting that they may exhibit antifungal activity against *C. albicans* [38].

Antibacterial Activity

The disc diffusion method was used to assess *Digitaria redicosa* antibacterial efficacy against foodborne pathogens by looking at the zone of inhibition[39].To evaluate the Silver nanoparticles inhibitory activity, the zone of inhibition was assessed following incubation[40]. For Silver nanoparticles, there was a small zone of inhibition at 80 µgml in *S. aureus*, whereas for *E. coli,* the activity started at 20 µg ml and increased as the Silver nanoparticles concentration increased. It was discovered that the silver nanoparticles' lowest inhibitory concentrations against *S. aureus* and *E. coli* were 50 µg/ml and 40 µg/ml, respectively.

Antibacterial Activity mechanism of action

Nanoparticles might readily infiltrate bacterial cells because of their small size. When compared to thin-layered Gram-negative bacteria, the inhibitory action of Gram-positive bacteria is much lower due to their thicker peptidoglycan[41].The Silver nanoparticles are expected to breach their inner barrier by causing the outer membrane to become less permeable, which will allow biological stuff to seep out. By causing harm to respiratory chain dehydrogenases, they stop bacteria from breathing and proliferating[42].**(Fig.4).**

Antimutagenic activity

Digitaria sanguinalis aqueous extract is an effective antimutagenic agent [43]. Additionally, the aqueous extract of *D. sanguinalis* inhibited methyl methanesulfonate (MMS)-induced mutations by decreasing the number of micronucleated polychromatic erythrocytes(MPCEs) in mice and the number of *S. Typhimurium* revertant bacterial colonies in a concentration-dependent manner. However, dosages of extracts alone often didn't reveal any significant changes towards the test organisms, however the higher concentration of the extract reduced the mutation generated by methyl methanesulfonate (MMS).

Antiviral Activity

Digitaria sanguinalis' aerial components were studied[31].Hepatitis A virus (HAV) and oral herpes simplex virus (HSV-1) were both significantly inhibited by the n-hexane and ethyl acetate fractions' antiviral activities because they included tricin in the n-hexane fraction and tricin 7-O-β-D-glucopyranoside inside the fraction of ethyl acetate. Tricine shown considerable inhibition of the genital herpes simplex virus (HAV, HSV-1, and HSV-2). This finding is consistent with research that has been published demonstrating tricin's antiviral efficacy against influenza viruses[44]. This study was first to exhibit tricin-7-O-β-D-glucopyranoside's antiviral properties and explore stigmasterol's antiviral properties. Strong antiviral activity was demonstrated by tricin-7-O-β-D-glucopyranoside against HAV and HSV-1[31]. This was the first investigation into the antiviral characteristics of isoorientin, β-sitosterol-3-O-glucoside, and p-hydroxybenzoic acid. P-hydroxybenzoic acid was shown to have weak antiviral activity against HSV-1 and HSV-2, isoorientin was found to have a mild impact against HAV, while β-sitosterol-3-O-glucoside had poor antiviral activity against HSV-1.

Cytotoxic Activity

Investigated the alcohol extract of *Digitaria sanguinalis* aerial parts' cytotoxicity in fractions of n-hexane, n-ethyl acetate, and n-butanol [31]. Three human tumor cell lines were investigated with the separated chemicals as well:typical fibroblasts (L929In addition) HepG-2, MCF-7, and HCT-116 cells related to colon, breast, and hepatocellular carcinoma are included. The n-hexane fraction included tricin and p-coumaric acid, while the ethyl acetate fraction contained β-sitosterol-3-O-βglucoside and tricin-7-O-β-D-glucopyranoside. These compounds may have contributed to the significant cytotoxic activity against the HepG-2 and MCF-7 cell lines.Significant cytotoxic effects were seen by P-coumaric acid on the HepG-2 and MCF-7 cell lines. This outcome is consistent with other research that shown the cytotoxicity of p-coumaric acid to neuroblastoma and H9c2 cadiomyoblasts [45]. Significant cytotoxic activity was shown by tricin and tricin-7-O-glucosid against HepG2 and MCF-7, supporting

earlier research on the robust cytotoxic action of these substances in vitro[46].As this chemical is known to have significant cytotoxic activity against the Caco-2 cell line, β-sitosterol3-O-glucoside once again showed strong cytotoxic effect, supporting earlier findings[47].A study revealed that β-sitosterol and its glycoside derivatives can impact several facets of tumor development, including the generation, stimulation, and induction of cancerous cells, in addition to impeding cell invasion and metastasis [48].

Anthelmintic Activity

An anthelmintic's effectiveness is guaranteed when its ability to fight parasites reaches or surpasses 90% [49]. Established criteria that indicate a plant extract with substantial anthelmintic potential if its EC50 is less than 6 mg/mL [50]. All extracts, including *D. insularis's* FR2 and FR3, had low EC50 values (0.27–0.96 mg/mL and EC90 0.6 and 1.3 mg/mL) demonstrated remarkable effectiveness against gastrointestinal nematode eggs taken into consideration[28].The conducted research that examined the anthelmintic efficacy of *D. insularis* leaf aqueous extract (138.75 mg/mL) using goat gastrointestinal nematodes in an in vitro coproculture assay[51].The variations in the extraction procedure and techniques may account for the disparity in the concentrations employed.

Antioxidant Activity

D. iburua had higher levels of phenolic compounds in the same amount of sample than did *D. exilis* [52]. The analysis on the proximate chemical composition of the grains delicately revealed this variance between the two fonio species [15]. The effective concentration of extract needed to scavenge 50% (EC50) of stable DPPH radicals is used to gauge how well fonio extracts can scavenge DPPH radicals. *D. iburua* accessions scavenged at a lower range of 0.278 to 0.816 mg/ml, whereas D. exilis accessions scavenged 50% of the DPPH radicals in the concentration range of 0.916 to 2.325 mg/mL [52]. Comparing the methanol extracts to the crude powder and water extracts, the best total flavonoid concentration (38.75 ± 9.76 mg quercetin equivalency/g dried weight) and total phenolic content (57.96 ± 6.84 mg gallic acid equivalency/g dried weight) were discovered. According to these results, grains of *Digitaria exilis* may have antioxidant qualities, which might explain why the grains are used in conventional medical systems [54].

Future Aspects Study

- **Pharmacological and Toxicological Testing Safety and Efficacy:** The safety and therapeutic efficacy of *Digitaria* species in humans must be guaranteed by pharmacological and toxicological investigations, despite the fact that numerous research emphasize their potential as medicines.
- **Ecological and Environmental Effects Sustainability and Conservation:** As interest in *Digitaria* species increases, questions may arise regarding how sustainable it is to collect these plants in the wild. Research on the best growth circumstances (temperature, soil type, etc.) for these plants can assist prevent environmental damage while guaranteeing a consistent supply for use in pharmaceuticals in the future.
- **The Development of Regulation and Intellectual Property Regulation of Herbal Medicine:** Regulatory agencies may need to develop particular frameworks for assessing and approving herbal remedies as interest in *Digitaria* species increases. Creating standards for safety testing, active ingredient standardization, and quality control is part of this.
- **Antimicrobial and Antibacterial Development:** Since bacteria such as Methicillin-resistant *Staphylococcus aureus* (MRSA) are causing antibiotic resistance, *Digitaria* species are a desirable source of new antimicrobial medicines. It may be possible to create new classes of antibiotics or adjuvants for already-approved ones by investigating the precise processes by which these plants work against bacteria (e.g., by interfering with the creation of cell walls or blocking the synthesis of proteins).

CONCLUSION

The phytochemical profiles and antibacterial qualities of several *Digitaria* species are examined in this review using a variety of extraction techniques. Alkaloids, flavonoids, terpenoids, saponins, phenolics, cardiac glycosides, and other secondary metabolites were found in a variety of species, including *D. sanguinalis, D. exilis, D. abbasyica, D. eriantha,*

*D. horizontalis, D. ciliaris s*and *D. insularis.* These substances showed strong antibacterial action, especially against infections like MRSA that are resistant to many drugs.The plant's acaricidal action and wound-healing capacity have been the main subjects of investigation, with supplementary studies examining its antibacterial, antioxidant, anti-MRSA, and antimutagenic qualities. In addition to its anthelmintic and acaricidal qualities, the present study emphasizes the plant's substantial medical potential in areas including wound healing, microbial infection prevention, antioxidant effects, and more. The plant may be used to treat a variety of illnesses, including as the flu, gonorrhea, wound healing, malaria, yellow fever, hernias, and liver diseases, according to ethnomedical research. The plant's acaricidal qualities and wound-healing capacity are its most researched features, followed by its antibacterial, antioxidant, anti-MRSA, and antimutagenic benefits. The study highlights *Digitaria* species as prospective candidates for the development of new antimicrobial treatments, given the growing concerns regarding antibiotic resistance. Nevertheless, pharmaceutical trials have not yet produced enough data to support these preventive advantages.

Conflicts of Interest: The authors have no conflicts of interest.

ABSTRACT

Female infertility, particularly Recurrent Implantation Failure (RIF), significantly impacts women's physical and emotional well-being. While conventional treatments like IVF have been successful for many, certain patient groups require complementary approaches to enhance reproductive outcomes. Panchakarma, an Ayurvedic therapy, offers a holistic approach that may enhance fertility when combined with conventional treatments. This study aimed to evaluate the efficacy of Panchakarma as an adjunct to IVF in improving pregnancy outcomes, body weight, endometrial thickness, and menstrual health in women with RIF. Twenty-five women with RIF were enrolled. Panchakarma therapy, including detoxification and nourishment protocols, was combined with IVF treatments. The primary outcome was clinical pregnancy, while secondary outcomes included changes in body weight, endometrial thickness, and menstrual health. Anti-Müllerian Hormone (AMH) levels and Doppler ultrasound findings for uterine blood flow were also assessed. Paired t-tests and chi-square tests were used for statistical analysis. A total of 76% of participants achieved a positive pregnancy outcome. The mean body weight significantly decreased from 73.8 kg to 68.5 kg (t = 2.29, p = 0.031). Endometrial thickness increased from 7.115 mm to 9.595 mm (t = 6.54, p = 9.10 × 10⁻⁷). Doppler ultrasound findings showed improved uterine blood flow and endometrial perfusion. AMH levels remained stable post-treatment, with no significant

changes (p = 0.82). Menstrual regularity and flow improved significantly following therapy. Panchakarma therapy, when combined with IVF, may significantly improve pregnancy outcomes, reduce body weight, increase endometrial thickness, and enhance uterine blood flow in women with RIF. Further studies are needed to confirm these findings and explore underlying mechanisms.

Keywords: Recurrent Implantation Failure (RIF), Panchakarma Therapy, In Vitro Fertilization (IVF), Endometrial Thickness, Menstrual Health, Uterine Blood Flow

INTRODUCTION

Female infertility is a major global health issue that affects millions of women and their physical, emotional, and social well-being(Ali et al. 2023). One of the most challenging types of infertility is Recurrent Implantation Failure (RIF)**,** a condition characterized by the inability to achieve a successful pregnancy after multiple attempts using assisted reproductive technologies (ART), such as in vitro fertilization (IVF)(Franasiak *et al.* 2021a). For women with RIF, this can lead to significant emotional and psychological strain along with the physical challenges of infertility treatment(Ni *et al.* 2021). Conventional treatments for Recurrent Implantation Failure (RIF), such as hormonal therapies, surgical procedures, and repeated ART cycles such as IVF, have played a pivotal role in helping many women achieve successful pregnancies(Ma, Gao, and Li 2023). These treatments have been widely used and are often the first line of treatment for infertility. However, certain groups of patients may not respond as effectively to conventional treatments alone. Factors such as age, underlying medical conditions, genetic predispositions, or specific infertility diagnoses can influence how well a patient responds to these interventions(Franasiak et al. 2021b). In these instances, the efficacy rates of conventional treatments may not achieve their maximum potential, and attaining desired reproductive outcomes can become increasingly complex. As a result, healthcare practitioners and patients are exploring additional modalities to enhance treatment effectiveness and improve overall fertility outcomes. This has led to increased interest in investigating complementary therapies that can be integrated with conventional approaches to optimize success(Cioroba *et al.* 2021).

Complementary therapies, when incorporated into traditional ART protocols, may address factors that conventional treatments alone may not fully mitigate(Yang *et al*. 2024). One such complementary approach garnering attention is Panchakarma, a traditional Ayurvedic purification therapy that aims to detoxify the body, restore dosha balance, and promote overall well-being (Suman and Bharathi 2021). When integrated with conventional ART treatments, Panchakarma may enhance reproductive health by supporting hormonal equilibrium, improving metabolic function, and fostering a more favorable environment for embryo implantation(Singh *et al*. 2022). By offering a holistic approach, Panchakarma may benefit patients who have not achieved success with conventional therapies alone by providing an additional avenue for improving fertility outcomes(Asmabi, Jithesh, and Govindan 2024). Panchakarma, a core therapeutic practice of Ayurveda, offers a holistic approach that aims to cleanse the body, balance doshas (biological energies), and promote overall health. Panchakarma includes five purification therapies:vamana (therapeutic vomiting), virechana(purgation), basti (medicated enema), nasya (nasal administration of medications), and raktamokshana (bloodletting). These therapies have been suggested to support fertility by improving the hormonal balance, reproductive health, and overall vitality. By enhancing blood circulation, detoxifying the body, and restoring internal balance, Panchakarma may create a more favorable environment for embryo implantation and pregnancy. This study aimed to evaluate the potential benefits of panchakarma as an adjunctive therapy to IVF in women with RIF. By combining the purification benefits of Panchakarma with the established IVF protocols, we aimed to investigate its effects on key factors such as endometrial thickness, ovarian reserve, hormonal balance, and overall reproductive health. Furthermore, we will assess its influence on pregnancy outcomes, including implantation success and pregnancy maintenance, to determine whether panchakarma can enhance the effectiveness of IVF treatment. This study provides evidence-based insights into the benefits of integrating Panchakarma with conventional IVF procedures. Our goal was to highlight

Nayana Patel *et al.,*

the therapeutic potential of combining these two approaches, offering women with RIF a more comprehensive and effective fertility treatment option.

METHODOLOGY

Ethical Approval
The study underwent ethical review and received approval from the Sat Kaival Hospital, Pvt. Ltd. Ethics Committee, with reference number SKHPL/EC/MARCH-24. This approval ensured that the research adhered to the requisite ethical guidelines and standards for conducting studies involving human subjects, prioritizing patient safety, and ethical integrity throughout the investigation.

Patient Selection Criteria
Inclusion Criteria
- Patients diagnosed with either primary or secondary infertility.
- Age range: 21-45 years old.
- Infertility stemming from the
  - Polycystic Ovarian Disease (PCOD)
  - Cervical conditions (cervicitis, erosion, or insufficient cervical mucus)
- Male partners with confirmed fertility.
- Medically cleared for participation in Virechana, Uttar Basti, and Basti therapies.
- Informed consent and willingness to complete the full month-long study.

Exclusion Criteria
- Infertility is related to surgical complications (including fibroids, cervical polyps, stenosis, or congenital anatomical abnormalities).
- Presence of severe infection or chronic systemic illness.
- Diagnosis of Malignancy.
- Complete blockage of the fallopian tubes.
- Infertility is also associated with peritoneal factors.

Procedure for Panchkarma
The Panchkarma therapeutic protocol was initiated with a preparatory phase (Poorvakarma), consisting of Snehana (internal oleation) with medicated substances to soften and dislodge toxins, followed by swedana (fermentation) to mobilize them further. Subsequently, primary purification procedures (Pradhanakarma) were implemented, including Virechana (therapeutic purgation) for toxin elimination through the gastrointestinal tract and Basti (medicated enema).Basti administrations comprised Anuvasana Basti (oil-based) for nourishment and lubrication, and Niruha Basti (decoction-based) for deeper cleansing. To directly address female reproductive health, Uttar Basti, which involves the administration of medicated substances into the reproductive tract, was used. Vaman (therapeutic emesis) was excluded because this procedure primarily addresses Kapha-Dosha imbalances. Finally, the Paschat Karma (rejuvenation) phase commenced, utilizing Samsarjana Krama (graduated dietary reintroduction) and Rasayana therapy (rejuvenating herbs and nutritional protocols) to restore normal physiological functions and promote overall well-being(Bhushan, Sharma, and Puri 2020).

Outcome Measures
The primary outcome measure was clinical pregnancy, which confirmed successful ovulation. The secondary outcomes focused on menstrual cycle dynamics (duration, regularity, flow, and associated symptoms), cervical mucus assessment (quality, consistency, and volume during the periovulatory phase), folliculogenesis monitoring via ultrasound (from approximately day 12 to day 18 or as clinically indicated), and ultrasound measurement of

endometrial thickness to evaluate implantation potential. Additionally, weight reduction and levels of Anti-Müllerian Hormone (AMH) and other relevant hormones such as progesterone and estradiol were assessed.

Statistical Analysis

Descriptive statistics were used to summarize the baseline characteristics and outcome measures within the Panchkarma treatment group. Paired t-tests (parametric data) and chi-square goodness-of-fit tests were used to evaluate pre- and post-treatment changes in continuous variables. Statistical significance was set at a p-value of <0.05.

RESULTS AND DISCUSSION

Pregnancy Outcome

The study demonstrated a promising success rate, with 19 of 25 participants (76%) achieving a positive pregnancy outcome. This included successful deliveries, ongoing pregnancies, and miscarriages, all of which reflected successful implantation and early pregnancy development following treatment. The 95% confidence interval for the success rate ranged from 59.26% to 92.74%, indicating that the true success rate in a broader population is likely to fall within this range.A chi-square goodness-of-fit test was conducted to evaluate whether the observed success rate significantly differed from the expected baseline of 50%.The test yielded a chi-square statistic of 6.76 and a p-value of 0.0093, suggesting that the observed success rate was significantly higher than the baseline. This result supports the potential efficacy of this treatment in improving pregnancy outcomes in women with Recurrent Implantation Failure (RIF).These findings provide a robust foundation for further research on the use of complementary therapies, such as Panchakarma, in conjunction with conventional IVF treatments, as the combination may lead to improved reproductive outcomes.

Reduction in Overall Body Weight

This study evaluated the effect of panchakarma therapy on body weight in patients with Recurrent Implantation Failure (RIF).A total of 25 patients were included in this analysis. The baseline mean weight was 73.8 kg (SD = 12.07 kg), which significantly decreased post-treatment to a mean weight of 68.5 kg (SD = 11.0 kg). The paired t-test revealed a significant reduction in weight, with a mean difference of 5.3 kg (t = 2.29, p = 0.031), indicating that panchakarma therapy had a positive effect on reducing body weight in these patients. This significant reduction in body weight suggests that panchakarma therapy may be an effective intervention for weight management in patients with RIF, potentially improving overall health and reproductive outcomes. A visual representation of the mean weights with standard deviations illustrated this significant change. These findings support the potential role of Panchakarma as a complementary therapy to manage body weight and enhance reproductive health. However, further studies with larger sample sizes and control groups are necessary to confirm these results and to elucidate the underlying mechanisms. Several factors may have contributed to the observed reduction in body weight. Panchakarma therapy involves a series of detoxification procedures, dietary regulations, and lifestyle modifications that collectively promote metabolic balance and reduce body fat. The emphasis of therapy on cleansing the body of toxins can enhance digestive efficiency and improve metabolic rates, leading to weight loss. Additionally, specific dietary restrictions and recommendations during Panchkarma therapy, which often include light and easily digestible foods, can contribute to a caloric deficit. The holistic approach of panchakarma, which combines physical, mental, and dietary interventions, likely plays a critical role in achieving sustainable weight reduction. Future research should explore these mechanisms in more detail to provide a comprehensive understanding of how panchkarma therapy influences body weight.

Effect on Endometrial Thickness

This study evaluated the effect of panchakarma therapy on endometrial thickness in patients with Recurrent Implantation Failure (RIF).A total of 25 patients were included in this analysis. The baseline mean endometrial thickness was 7.115 mm (SD = 1.90 mm), which significantly increased to a mean thickness of 9.595 mm (SD = 1.89 mm) post-treatment. The paired t-test revealed a significant increase in endometrial thickness, with a mean difference

of 2.48 mm (t = 6.54, p = 9.10 × 10^-7), indicating that Panchakarma therapy had a positive effect on improving endometrial thickness in these patients. Several factors may have contributed to the observed increase in endometrial thickness. Panchkarma therapy involves detoxification procedures, dietary regulation, and lifestyle modifications that promote overall reproductive health. Detoxification can improve metabolic function and nutrient absorption, whereas improved blood circulation enhances oxygen and nutrient delivery to the endometrial lining. Specific dietary recommendations provide essential nutrients for endometrial health and stress reduction practices such as meditation and yoga to balance hormones and reduce inflammation. These combined effects likely play a critical role in improving endometrial receptivity. Future research should explore these mechanisms in more detail to confirm the long-term benefits of panchkarma therapy.

AMH Levels

This study also examined the effect of Panchkarma therapy on Anti-Müllerian Hormone (AMH) levels.The cohort consisted of 25 patients with an initial mean AMH level of 3.583 pg/ml (SD = 1.96 pg/ml).Post-treatment, the mean AMH level increased slightly to 3.601 pg/ml (SD = 1.98 pg/ml), with the paired t-test indicating no significant change (t = -0.23, p = 0.82).These results suggest that Panchkarma therapy does not significantly affect AMH levels, which remained stable after treatment.AMH, a marker of ovarian reserve, tends to be stable over short periods, and the benefits of Panchkarma may not translate into immediate changes in AMH levels. Instead, the positive effects of therapy may be observed in other reproductive health parameters or overall hormonal balance over a longer period.

Changes in Menstrual History

This study evaluated the effect of Panchkarma therapy on the menstrual history of patients with Recurrent Implantation Failure (RIF).After undergoing Panchkarma therapy, all patients reported significant improvements in menstrual health, encompassing various aspects of their menstrual history.

Cycle Regularity

Prior to treatment, many patients experience irregular menstrual cycles, with intervals varying widely from one cycle to the next. Post-therapy, patients reported a notable shift towards regular menstrual cycles, with intervals stabilizing within the normal range of 21 to 35 days. This regularity indicates a balanced hormonal environment and an improved reproductive health.

Menstrual Flow

Patients also showed significant changes in the volume and duration of menstrual flow. Before treatment, several patients reported either heavy bleeding (menorrhagia) or scanty periods (oligomenorrhea). Following Panchkarma therapy, menstrual flow normalized, with most patients experiencing a balanced flow. Additionally, the duration of menstruation became more consistent, averaging between three and five days, which was within the normal range.

Color Doppler Ultrasound Findings After Panchkarma Therapy
Uterine Blood Flow
Baseline Assessment

Before Panchkarma therapy, the average pulsatility index (PI) and resistance index (RI) of the uterine arteries were measured at 3.2 ± 0.4 and 0.8 ± 0.1, respectively. These values indicate suboptimal blood flow, which may be associated with inadequate endometrial perfusion and poor uterine health.

Post-Treatment Evaluation

Following Panchkarma therapy, significant improvements were observed in the uterine blood flow. The average PI decreased to 2.5 ± 0.3, and the RI decreased to 0.6 ± 0.1. These reductions in PI and RI suggest an enhanced blood flow to the uterus, potentially supporting a more receptive endometrial lining.

Endometrial Perfusion
Baseline Assessment
Initial measurements of endometrial blood flow showed limited perfusion, with only 40% of patients displaying adequate endometrial vascularization. Doppler flow indices suggested restricted blood flow, with an average endometrial PI of 3.0 ± 0.4.

Post-treatment evaluation
After therapy, there was a significant increase in endometrial perfusion.The percentage of patients with adequate endometrial vascularization increased to 80%. The average endometrial PI decreased to 2.3 ± 0.3, indicating improved blood flow within the endometrial lining, which is crucial for implantation and menstrual health. Quantitative measures obtained from Color Doppler ultrasound demonstrated that Panchkarma therapy significantly enhanced blood flow to the uterus and ovaries, leading to improved endometrial perfusion and overall menstrual health. These vascular improvements likely contribute to the observed clinical benefits, including regularized menstrual cycles and reduced menstrual symptoms. Panchkarma therapy shows promise as an effective complementary treatment for improving menstrual health and addressing issues related to Recurrent Implantation Failure (RIF). Future studies should continue to explore these findings with larger sample sizes and longer follow-up periods to confirm the long-term benefits of panchkarma therapy.

CONCLUSION

This study demonstrates the potential benefits of panchakarma therapy as an adjunctive treatment for women with Recurrent Implantation Failure (RIF).The therapy significantly improved pregnancy outcomes with a success rate of 76%, along with notable reductions in body weight and increased endometrial thickness. Doppler ultrasound findings also showed enhanced uterine blood flow and endometrial perfusion, which contributed to better reproductive conditions. While AMH levels remained stable, the therapy positively affected menstrual regularity and flow. Overall, Panchakarma offers a promising complementary approach to conventional IVF to improve reproductive health and outcomes. Further research with larger sample sizes is needed to confirm these results and to explore the mechanisms involved.

ABSTRACT

The use of vegetable components for purposes other than food preparation has great potential for waste management and biomedical research. Their function in biological activities and post-culinary waste management, this study explores the pharmacological potential of vegetable pulp, peel, and entire forms. pharmacological activities are the prospect of transforming post-culinary waste into highly nutritious food additives or supplements. This waste can be recovered at a low cost and have a high value. These components' pharmacological profiles were studied, with an emphasis on their antioxidant properties by an extensive examination of the literature and experimental investigation. In order to identify each component's various biological functions, the study also investigates the extraction methods and bioactive substances that are present in each. According to the research, the Biochemical assay of *T. dioica* also estimated and found that in total and reducing sugar peel has the highest reading. And in starch peel is at the top in reading. For Quantitative analysis TFC and TPC is estimated.TFC of *Trichosanthes dioica* Roxb. in methanol solvent is 203.0±0.04mgQE/g in peel.TPC was 327.3±0.019 mgGAE/g in methanol solvent, when mixed in distil water the results are 278.6±0.013mgGAE/g. According to the result peel consist of enormous amount of flavonoid and phenolic content which can be used in pharmacological studies. IC_{50} value in peel 716.52 ppm in methanol and 14.76 ppm in aqueous solvent in DPPH. FRAP is recorded in range between 177 to 386 mM $FeSO_4$/g. So, it is crucial to use vegetable waste for medicinal purposes as a means of reducing waste and improving human health. This work explains about innovation in waste management and biomedical science by adding to the information on the use of vegetable by-products in pharmacological studies.

Keywords: Antioxidant, DPPH, Food waste management, Phytochemicals, *Trichosanthes dioica*.

INTRODUCTION

Food is very crucial for living beings. Food plays a vital role in providing energy from breaking down complex to simple food. Food production is growing exponentially, and waste management is becoming a major social concern. The more food is produced the more waste is generated. Waste food which is generated has to be managed properly. Food loss refers to the reduction in the mass of edible food (apart from seeds and inedible portions) during the portions of the supply chain that specifically result in food fit for human consumption, i.e., during the stages of production, postharvest, and processing. (Okawa, 2015). Food waste comprises leftover meal portions as well as trimmings from restaurants' and kitchens' food preparation. Food waste is mostly caused by suppliers, retailers, and consumers acting improperly and making poor decisions, which leads to the disposal of food that is still nutritionally sound and might have been eaten (Parfitt *et al.,* 2010). According to the Food and Agriculture Organization (FAO) of the United Nations, 32% of the total food produced in 2009 was lost (Gustafsson *et al.,* 2013). Approximately one-third of the world's food supply, or 1.3 billion tons of food at a cost of $1 trillion USD, is wasted annually, according to IFCO. There are two categories of food waste in the kitchen: qualitative losses and quantitative losses. Food losses attributed to superficially perceived quality in terms of colour, size, form, flavour, etc. are referred to as qualitative losses (Dsouza, 2020). The stiff cores, stems, leaves, husks, shells, peels, seeds, etc., may be among them are some of the wastes. According to Gowe (2015), Banana peel produce 2378 tonnes and mango peel and seed produces 6987 tonnes are produced. Food waste which is firstly observed in the home. According to Edjabou *et al.* (2016) Vegetable food waste made up 145 kg of the 434 kg gross total of residual home garbage in Denmark. The cucurbitaceae family is also known as vegetable family. that includes 800 species and 130 genera, according to Jeffrey (1980). Another name for it is cucurbits. According to Mukherjee *et al.* (2022), this family is well-known for its economic significance. It is made up of numerous vegetables that are typically utilized in kitchens and are referred to as kitchen garden crops (Chauhan et al., 2021). Cucurbits are important crops all throughout the world and are well known for their economic, cultural, and culinary worth (Rolnik & Olas, 2020). According to Robinson and Decker-Walters (1999), this family is generally very adaptive, has quick-growing vines and tendrils, and many produce comparatively larger fruits. Many fruits in the Cucurbit family have multiple uses: Many are eaten raw while they're young (summer squash, cucumber) or old (musk-melon, watermelon). They can be candied (ash gourd, pointed gourd, watermelon), baked (squash), or fried (bitter gourd). (Decker-Walters and Robinson, 1999).

Rich family nutrition and therapeutic properties are well known (Pandit and Hazra 2008). Cucurbitaceae fruits and vegetables have a large economic impact because they are used in so many different food products. Cucurbits can be used as a food source and in the beauty industry, among other things. Cucumber has cooling, calming, and healing properties, which make it a popular addition to skin care products, according to research by Rahman and others (2008). It's a typical component of natural soaps as well. Mature fruits of *Luffa aegyptiaca* have long been used as natural sponges because of their structure (Prabhu, 2021; Salehi *et al.,* 2019). During the cucurbit food production cycle, a lot of fruits and vegetables are intended for disposal. The bulk of this waste, according to Asif *et al.* (2017), is made up of peels, seeds, and fruits, which don't meet aesthetic standards but are nevertheless useful for the cosmetics industry because they contain antioxidants and polyphenols, which also have anti-inflammatory and anti-inflammatory properties. There are several ways to recycle a lot of fruit and vegetable waste, such as throwing it in the trash right away, drying it out to a stable condition (humidity 10%) for use as off-season feed, or using biotechnology to process it into superficial chemical peels. The leafy foods industry's byproducts include vinegar, citrus extract, and acidic corrosive. According to Kheedkar and Singh (2014), waste from plants that process wheat and potatoes into starch can develop into ethanol and other supplements. There are several waste products produced while treating foods that are cultivated in the ground, including fluids, molasses, seeds, and skins. These waste materials are a good source of carbohydrates, proteins, fibres, nutrients, and minerals. According to (Singh *et al.,* 2019), the waste may be utilized to create natural blooms by maturing. One of the healthiest fruits is the pomegranate, which has a high phenolic component content. Kaderides *et. al.,* (2021), from the extraction of pomegranate juice generates large amounts of byproducts, such seeds and peels, which pollute the environment and

Krunal Kansara *et al.,*

provide disposal issues. Pomegranate peel is a byproduct of the fruit juice processing business and makes up around 30% to 40% of the fruit component. It is significant source of flavonoids, particularly anthocyanins, tannins, and phenolic acids. Cuevas (1999) studied that the majority of fruits and vegetables are solely eaten in their flesh or pulp; however, research has shown that the seeds, peels, and other parts of the plant that are not often eaten contain substantial amounts of phytochemicals and important nutrients (Rudra and colleagues 2015). According to Gorinstein and colleagues (2001) and Soong and Barlow (2004), the phenolic concentrations in the peels of citrus fruits such as lemons, grapes, and oranges, as well as the seeds of avocados, jackfruits, longans, and mangoes, are almost 15% greater than those in the fruit pulp. The secondary metabolites of plants called phenolic compounds are responsible for sensory qualities and, among other things, improve the nutritional value of fruits and vegetables (Tomas-Barbera and others 2000; Lapornik and others 2005). According to Popa et al. (2008) and Ignat *et al.,* (2011), phenolic compounds are one of the biggest groups of bioactive substances with a variety of significant biological roles. In their basic structure, they have one or more aromatic rings and one or more hydroxyl groups (Balasundram *et al.,* 2006); some of them additionally show antioxidant activity. As per Gowe, (2015) table 2, shown that various phenolic compounds are mentioned from each of the fruits and vegetables according to their waste part. Guenther and other (2006) has been noted in recent years that 43.7% people are consuming more fruits and vegetables in their diets because they are more aware of their health benefits. A diet high in fruits and vegetables is directly associated with a lower incidence of degenerative diseases, including some forms of cancer, cardiovascular diseases, macular degeneration, aging, etc. Michels *et. al.,* (2000) studied that women who regularly consume 16-17 healthy food had 42% lower all-cause mortality than to those who consume 0-8 healthy foods. According to Kris-Etherton *et al.* (2002), a variety of bioactive substances, such as flavonoids, carotenoid, and other substances, have a number of anti-inflammatory qualities in addition to assisting in the reduction of malignant cells and the inhibition of carcinogenesis. Due to their shown biological activity and associated health advantages, several compounds included in meals known as phytochemicals or bioactive substances have been related to this effect (Liu and others 2003). Byproducts from fruits and vegetables can be used in a variety of ways, but one of the most significant uses is as food additives (Ayala-Zavala *et al.,* 2011). These consist of thickeners, colorants, flavourings, antioxidants, and antimicrobials.

MATERIALS AND METHODS

Collection and Preparation of Plant Materials

The sample is collected from the Kalupur vegetable market, Ahmedabad. The Peel, Pulp and Seed of a robust plant were obtained. The plant was on exhibit by Smit Bhavsar of Gujarat University's Botany department. Plants components and fruit were collected and stored in Whirl-Pak a standard sterilized bags for subsequent use. The peel, pulp, and seed of the plant were isolated from the fruit of the parent plant. In order to remove dirt and other contaminants, the harvested plant portion was carefully cleaned three times using tap water. The plant components were then ground into a powder using an electric mixer after being shade-dried for 72 hours at a moderate temperature.

Extract Preparation

After that, the slurry was sieved to produce fine extract. That will be used later, the extracted material was preserved on sterile petri dishes. Two solvents were chosen based on their polarity and employed to make the plant extract, which was made from the dried extract. The solvents that were selected were methanol and distilled water. Two methods are hot and cold extraction method. According to Nelly *et. al.,* (2008) we have used the traditional method in which the extract was create using a solvent. 100ml of two solvent methanol, and aqueous solution are taken. In which 50mg of plant extract were added. After then the Watman filter paper was taken to filter the produced extract. The solvent was allowed to evaporate in Petri dish for a full day before being refrigerated for later use. The samples are filtered, and extracts prepared in two different solvents – Methanol and Aqueous.

Biochemical Assay
Reducing and total sugar
The Nelson-Somogyi method (Nelson, 1944 and Somogyi, 1952) is used to estimate the reduction of sugar and total sugar. Test tubes are prepared in the triplicate and then 1ml volume of an aliquot was pipetted out of the sample (Peel, pulp, and seed). After that 1ml of Somogyi's copper reagent was added to this. Subsequently, the mixture was submerged in a boiling water bath and allowed to heat for 20 minutes. Nelson's Arseno-molybdate reagent (1.0 ml) was introduced and immediately mixed in with tap water after chilling, and the volume was increased to 10 ml with distilled water. Using a UV-VIS spectrophotometer, the colour intensity was determined at 620 nm from appropriate samples.

Starch
Starch is estimated according to Chinoy, 1939. To dissolve the starch, aqueous hydroxide is applied to the plant material when it is cool. When aqueous hydroxide interacts with Lugol's solution which is also known as iodine-potassium iodine, then a coloured complex is produced after incubating it for 10min. The developed color corresponds to the starch concentration, and a spectrophotometer set at 600 nm is used to measure the starch content.

Quantitative Analysis
Total Phenolic Content
The Folin-Ciocalteu technique (Zheng & Wang, 2001) was modified to quantify TPC of Pulp, peel and seed component extracts can be evaluated. Phenolic compounds of plants form the complex structure with oxidizing agents such as phosphomolybdate and develop the blue color. Dense color of solution records the higher content of phenols. Take 1ml extract of peel, pulp and seed each in different test tube. Add 10ml distilled water. And then Add 1.5ml F-C reagent in a triplicate via micropipette. Shake it well by covering it with aluminum foil paper. Incubate it for 5min in room temperature. Now add 4ml of 20% sodium carbonate solution. After that make a final volume up to 25ml with distilled water. Again, shake it well and incubate it for 30min at room temperature by covering it with aluminum foil. A Spectrophotometer is used to calculate the absorbance at 765nm. With gallic acid as standard, a calibration curve is created. The following formula can be used to calculate the quantity of phenolic content in an unknown plant sample.
Total Phenolic Content=GAE x V/ m
GAE= Galic acid equivalent (mg/ml), V= volume of plant extract

Total Flavonoid Content
TFC was investigated, as (Saeed *et. al.,* 2012). The aluminium chloride colorimetric method works on the basis that aluminium chloride forms acid-stable complex with flavones and flavanol's C-4 keto group and either C-3 or C-5 hydroxyl group (Kariyone & Matsuno 1953 & Naghski J *et. al.,* 1951). The extract was diluted to a 1.5 mg/mL concentration in methanol. Following that, add 1.5 mL of methanol to 0.5 mL of the sample solution (seed, peel, and pulp, respectively). Now, 0.1 mL of aluminium chloride (10% in methanol) and 0.1 mL of potassium acetate (1 M) were put to a test tube containing 10 mL of pure water and stirred. After thorough mixing, it was allowed to sit at room temperature for half an hour. In a spectrophotometer, the OD is measured at 415 nm. Consequently, the total flavonoid content was determined. With Quercetin as standard, a calibration curve is created. The flavonoid content of an unknown plant sample can be estimated using the following formula:
Total Flavonoid Content = QE x V/ m
QE=Quercetin equivalent(mg/ml), V=volume of plant extract

Antioxidant Analysis
FRAP
The standard method by Benzie and Strain (1996) utilized the ferric reducing activity test (FRAP) to determine the extracts' ability to reduce ferric iron. The sample extract and standard of 0.1 ml is taken in the test tube from the stock solution. Then 3ml The FRAP reagent was mixed and shake well. The mixture is placed for 30min during the

incubation period. Later the absorbance was recorded at 593 nm by using spectrophotometer. The standard curve was plotted using $FeSO_4 \cdot 7H_2O$ as standard, then result is recorded as mg Fe (II) equivalent/g extract.

DPPH

According to Magalhaes et al. (2006), the crude extract's capacity to scavenge free radicals was assessed. The 2,2-diphenyl-1-picrylhydrazyl (DPPH) test was used to measure the free radical scavenging activity. The methanol solvent was employed to dissolve the freeze-dried extracts. A 1 mg/1 ml stock solution was made. Dissolve the methanol into the plant extract (0.2, 0.4, 0.6, 0.8 ml and 1.0 ml) to get a final volume of 1 ml. Plant extracts were added to newly made DPPH solution in test tubes with aluminium foil seals. A series is made at various concentrations and left in the dark for 30 minutes. The absorbance of a UV-visible spectrophotometer is measured at 517 nm. The standard was ascorbic acid, a well-known antioxidant. As a blank, methanol was utilized, and the controlled sample maintained the same value without any plant extract. The measurement was made three times over. The absorbance value decline was contrasted with the positive control. The following formula was used to compute the inhibition ratio (%) and the IC_{50} values.
%inhibition = absorbance of control – absorbance of sample / absorbance of control X 100

RESULTS

Biochemical Analysis
Total and reducing sugar
The total sugar result ranged from 120 to 215mg/ml from the graph 1, indicating that Peel, seed, had modest trace of sugar then in Pulp in aqueous solvent when compared to standard. It was evident from Chandrasekhar *et. al.,* (1988) study that *T. dioica* possessed the ability to reduce blood sugar level. The outcome of reducing sugar content revealed that the peel had a lower level of glucose then the pulp and seed. When compared to a typical glucose standard, the *T. dioica* peel's aqueous extract revealed greatly reduced amount of glucose. Proks *et. al.,* (2002) reported that their study shown that insulin levels were lowered in type-2 diabetes model rats, with a drop of around 54% in blood insulin levels compared to the control group.

Starch
T. dioica starch content analysis shows that, when compared to a standard of glucose, the seed had the greatest starch content. *T. dioica* has trace levels of starch granules, according to Manda *et. al.,* (2018). He also added that the existence of compound starch is thought to give it a special quality.

Quantitative Analysis
Total Phenolic Content
From the regression equation from calibration curve of gallic acid, TPC content was obtained. According to these findings, TPC values were determined from two distinct extracts, with the methanol extract having a greater phenolic concentration then the aqueous solution. Peel from methanol extract had a greater content (327±0.019 µg/ml) than the Pulp and Seed sample. A study by Yadav *et. al.,* (2016) found that one of the Cucurbitaceae family, *C. pepo* (533.60±0.05) has higher phenolic content in methanol extract then all other cucurbit species. The result they obtained showed that the phenolic content of *T. dioica* was (118.82±1.11 mg/ml) higher than our fruit sample in aqueous extract.

Total Flavonoid Content
From the regression equation from calibration curve of quercetin, the TFC of methanol of different sample was expressed. According to these finding flavonoid content was quite similar in Seed (113±0.003 µg/ml) and Pulp (127±0.008 µg/ml) and higher in the Peel (203±0.004 µg/ml) of methanolic extract. According to Shrivastava *et. al.,* (2021) Total flavonoid content of methanolic extract of *T. dioica.* has recorded (219±58.573 µg/ml) in which was quite

higher than our finding. Quercetin does not dissolve in aqueous solution so only methanol extract's flavonoid content was recorded by the quercetin as standard.

Antioxidant Analysis
FRAP assay
As indicated by the result of FRAP assay in given table 3, significant differences were observed in Peel, pulp and seed. Ferric reducing antioxidant power based on the $FeSO_4$ absorbance and concentration and from the standard curve of it, results were range between 177 to 386 mM $FeSO_4$/g. The findings were quite similar in the aqueous solution then in methanol. According to Yadav *et. al.,* (2016) *T. dioica* FRAP value (936.14±13.34) obtained higher than our extract methanolic extract, as he recorded the whole fruit FRAP absorbance the finding was nearly similar in term of *T. dioica* whole fruit.

DPPH
The DPPH method is used to estimate the radial scavenging activity of antioxidant compound. IC_{50} value is obtained through a regression analysis that describes the concentration of a test solution that can reduce 50% free radical and represents antioxidant activity (Widyasanti *et. al.,* 2016). DPPH radical was expressed as IC_{50} value shown in table 4. The results of DPPH free radical scavenging power are shown in table 5. Among the three different ethanolic extract Pulp exhibited the highest value of DPPH scavenging activity test with IC_{50} 716ppm in peel then pulp and seed. Both in methanolic and aqueous extract. According to Singh *et. al.,* 2016 found that the antioxidant activity of Cucurbitaceae species were significantly higher in peel than pulps. According to the Li'aini, *et. al.* 2022 *Trichosanthes tricuspidate* Lour. IC_{50} value of peel was 78.029 ppm. The result of our finding is also similar to their findings.

CONCLUSION

These results highlight the important presence of different phytochemicals in every section of fruit, suggesting their possible use in areas other than conventional cooking. Remarkably, the peel extract showed a higher concentration of bioactive substances such as tannins, flavonoids and phenolics, indicating a potential use in the pharmaceutical and nutritional supplement sectors. The TPC values are resulting higher values from the peel part(327μg/ml) in compared to pulp(204μg/ml) and seed(13μg/ml). TFC values are also find higher in peel part (0.203 μg/ml). Additionally, the pulp and seed extracts showed strong antioxidant activity, suggesting possible use for them in products that promote health. Similarly, waste generated by a single hotel of a metro city New Delhi named Radisson Blu Plaza hotel generates about 27,000 kilogram of waste every month. Likewise, IFCO has mentioned in 2021, that around 2.5billion tons are food waste produced in every year. Around 45% of all fruits and vegetables are not eaten globally every year. That results 10% of the greenhouse gas emission caused by food lose which cause carbon dioxide and other greenhouse gases. The post culinary waste can be generated, and it can be generated around 936 billion USD globally every year. The private sector pledge by 2030 in line with UN sustainable goal target 12.3, which has predicted up to 50% reduction in food loss and waste by 2030. These finding highlight the significance of implementing a comprehensive waste management strategy that allows post culinary waste to be recycled for their fundamental nutritional and therapeutic qualities. By maximizing the values of agricultural byproducts, using this extract might offer economic benefits to reduce environmental problems related to trash disposal. This study is to find out and utilize agricultural byproducts' bioactive properties in order to promote sustainability and innovation across a range of sectors like Waste management, Economic opportunities, Innovation and Sustainability and Healthcare and pharmaceutical development.

ABSTRACT

Essential oil, widely produced by nature, these are complex mixture of volatile secondary metabolites. Its composition varies due to multiple factors, that can lead to misunderstanding regarding their efficacy, safety and remarkable pharmacological property. In continuation, present study explores the composition of volatile oil constituents of Rosa brunonii Linn.and was analyzed by GC and GCMS. Twenty-five compounds represent 99.7 % of the total oil. The main components of the oil were, Linalool acetate (53.6%), Linalool (9.6%), NN (m/z 91, 105, 117, 145, 79, 43,160) (7.3 %), (E)-8-Hydroxy geraniola (4.1%), Verbanol acetate or piperitol acetate? (3.7%), (Z)- 8-Hydroxygeraniola (3.6%), Geranyl acetate (2.2 %) and α-Terpineol (1.9 %). The oil was subjected for its antibacterial activity with four pathogenic bacterial strains i.e. Staphylococcus aureus, Escherichia coli, Bacillus subtilis and Pseudomonas aerugenosa, and found to be more active against Escherichia coli with 8 mm (zone of inhibition) activity.

INTRODUCTION

Rosa brunonii Linn.(Rosaseae) is known as Himalayan Musk Rose (Wild rose), Sewati (Kubjak) in Sanskrit and kujju, kunja and kujji in Hindi. Rosa brunonii is strong rambling shrubby plant approximately 5-10 m tall. Stem are dark brown, rough, exploiting in papery pieces [1][2] with stout prickles and imporipinnate 0.5-1.2 Cm long leaves. Flowers are white with a characteristic fragrance. Fruit is orange-red to brown in colour ovoid 1-1.5 Cm long, viccid, and may seeded. Rosa brunonii is wildly distributed in western Himalaya, Bhutan, Afghanistan, Europe, and China. It is commonly found in open places, pine-oak fresh edges at a height of 600-2000 m. there are some medicinal properties associated with this plant. Its roots are known as "Rajatarini" and said to be used as medicine in some eye diseases. Flowers and leaves are also used in the treatment of wounds and ophthalmic. Powdered of dried flowers is used in diarrhea. Flowers of Rosa brunonii are suitable substitute of Damask rosa for preparation of rosa water and attar. It is an important source of rose hips also [3][4]. The species of Rose extensively studies for essential oil composition seems to be *Rosa damascene* [5][12]. Surprisingly there is no any report on phytochemical investigation of *Rosa brunonii*. This prompted us to find out the detailed phytochemical investigation of *Rosa brunonii* wildly growing in Dhanolti region, Tehri Garhwal at an altitude of 1650 mtrs.

MATERIAL AND METHODS

The fresh plant material of *Rosa brunonii* (600 kg) was collected from the Dhanolti region of Tehri Garhwal and was Authenticated by Dr. J.K. Tiwari, Taxonomist, from the Department of Botany, HNB Garhwal University Srinagar Garhwal. The essential oil was extracted from the plant and was subjected to hydro distillation method for continuous 5-7 hrs., using Cleavenger type apparatus. The essential oil was obtained and further dried over anhydrous sodium sulphate. The GC-MS analysis of essential oil (0.2μl) was performed by using gas chromatograph HP 6890 with mass selective detector MS 5973 (Agilent Technologies, USA) which is fitted with a HP-5ms and fused with silica column (30 m × 0.25 mm; 0.25 μm film thickness), further with the electronic pressure control and split-splitless injector. Helium flow rate through this column was 1 ml/min in regular constant flow mode. The initial column temperature was 50^0C, rising with 250^0C at a rate 5^0C/min. The MS detector acquisition parameter was transfer line held at 260^0C and detector was held at 280^0C as well. Detection was executed in the full scan mode ranged from *m/z* 41 to 450.A hexane solution of C_8-C_{28}*n*-alkanes was also separated under the above-mentioned conditions, and their retention times was also determined. Linear temperature programmed retention indices (LTPRI) was also calculated from the results of the separation of essential oiland *n*-alkanes according to following equation:

LTPRI = $100(t_x - t_n)/ (t_{n+1} - t_n) + 100n,$

Where t_x, t_n and $t_{n+1}$are the retention times of component *x*as mentioned, and *n*-alkanes with the number of carbon atoms in the molecule *n* and *n+1*, respectively. After integration of the fraction of each component by which the total ion current (TIC) was calculated. Components of extracted essential oilwas identified with the help of an automatic system of processing data of GC-MS supplied by NIST mass spectra library. Identification was considered reliable if the calculated values of LTPRI confirmed the results of computer search at mass spectra library (LTPRI^{Calc} – LTPRI^{Lit} ≤ 5 index units), (LTPRI^{Lit}) [13] [14]. The essential oil of *Rosa brunonii* was also tested for antimicrobial activity by using agar disc diffusion method on solid media [15] [16]. Luria agar was used as basal medium for both *Escherchia coli* and *Bacillus subtilis*; and nutrient agar was used as basal medium for both *Pseudomonas aeroginosa, Staphylococcus aureus*. 5 gm of luria broth and 4 g of agar powder; 3.25 g of nutrient broth and 4 g of agar powder was weighed and 250 ml of water was also added separately. Then the mixture was heated to dissolve the components. Luria agar and nutrient agar were sterilized in an autoclave [17]. Luria agar and nutrient agar were poured in the sterile Petri plates. Mother culture of each organism was set up for 24 hrs. before the assays, in order to reach stationary phase of growth [18]. The tests was assessed by inoculating Petri dishes from the mother cultures which had been spread on the surface with 0.1 ml of each bacterium, with the aim of obtaining microorganism concentration of 10^5 colony forming units (CFU/ml) [19]. Sterile dilutions of essential oil was deposited on the sterile Whatmann filter paper No.1 discs (5mm disc diameter), which was subsequently placed in inoculated Petri plates. Therefore the Petri plates were than

Shyam Vir Singh *et al.,*

incubated at 37° C for24 hrs. The antibacterial activity was evaluated by measuring the diameter of zone of inhibition surrounding bacterial growth [20].

RESULTS AND DISCUSSION

Volatile oil extracted from *Rosa brunonii* was analyzed by GC and GC-MS. Twenty five compounds were identified by Retention Index, Relative Composition (Table-1). The major components were determined as Linalool acetate (53.6%), Linalool (9.6%), NN (m/z 91, 105, 117, 145, 79, 43,160)(7.3 %), (E)-8-Hydroxy geraniol[a] (4.1%), Verbanol acetate or piperitol acetate (3.7%), (Z)-8-Hydroxy geraniol[a] (3.6%), Geranyl acetate(2.2 %) and α-Terpineol (1.9 %).The present oil was found more or less similar with the other in respect of the presence of Geranyl acetate, Geraniol but differs in respect of α-Muurolene and (E)-γ-Himachalene, which is not reported. These variations in the chemical composition may be due to chemical races, geographical variations and other differences in maturity. The GC-MS and MS traces of essential oil of *Rosa brunonii*are given in Fig-1 and Fig.-2. The essential oil was identified as active agent against *Staphylococcus aureus*, *Escherichia coli* and *Bacillus subtilis*. It is most sensitive against *Escherichia coli* with 8mm zone of inhibition while is least sensitive against *Staphylococcus aureus* with 4mm of inhibition. Antibacterial activity of the oil was shown in Fig-3 (Table-2).

CONCLUSION

Essential oil of *Rosa brunonni Lin.* has so many potential as antibacterial agents. Many more medicinal plants have health benefits, including antimicrobial, antioxidant, and therapeutic properties. This investigation are very useful for further researchers.

ABSTRACT

In the current state of Indian agriculture, public extension cannot potentially supply more competent staff to fully satisfy the farmer's complicated need by reaching millions of farmers. Farmer's demands are increasingly more diverse, and the expertise necessary to satisfy them exceeds the capabilities of grass-root extension workers. These flaws or disadvantages are focused on the utilization of alternate ways of value addition and demand-driven information to the agricultural community. The utilization of current and rapid communication channels, such as ICTs, is critical for disseminating and creating knowledge about the latest farm technology among the rural masses. Major constraints encountered by the majority of respondents in using ICT services were fluctuating telecommunication network, erratic power supply, inability to understand the language of service provider, lack of practical knowledge about given new recommendation, inability to purchase recharge cards, high cost of multimedia mobile phones, high cost of telecommunication network services, and busy network of kisan Call Centre. The aim of this education is to bridge the gap. Think about it, most of the agriculture related information were transformed to farmers with the help of ICT. This study shed lights on the major constraints in accessing and utilizing ICT by farmer in Tirupathur district.

Keywords: ICT in Agriculture, Farmer Constraints, Communication Channels, Agricultural Information Dissemination, Agricultural Technology Adoption.

INTRODUCTION

Agriculture is a significant component of the Indian economy, accounting for over 17% of gross domestic product (GDP). Only earnest efforts in agricultural research and extension would be able to meet the rising demand for food grains. Despite the size of the Indian economy, agriculture lags behind in many ways, including weak market connectedness and fragmentation, inaccurate and delayed information to farmers, tiny land holdings, non-acceptance or limited adoption of modern technologies, and so on. It has become critical to investigate various methods of keeping our farmers up to speed on contemporary technology and important knowledge in order to maintain pace with the present technological era. ICT has the potential to change the Indian farming sector, benefiting all farmers, especially small landholders. Agriculture is the most significant sector, employing the bulk of the rural people in developing nations. ICT has the potential to transform all parts of our life, including knowledge distribution, social interaction, economic and commercial operations, political involvement, media, education, health, leisure, and entertainment. Through the creation of information-rich societies and the support of livelihood, ICT may play a vital role in eliminating rural and urban poverty and encouraging sustainable development. There are around 120 million farm holdings in India, with the number rising year after year. It offers at least one village extension staff per 800-1000 farm families, the field level extension personnel required is anticipated to be between 1.3 and 1.5 million, compared to the current availability of just approximately 0.1 million (1,00,000) personnel [1]. A supplemental service is a non-negotiable demand of the country's farmers with this level of interaction intensity; information needs are quickly increasing with the introduction of contemporary technology, hybrid seeds, and changing climatic circumstances. As a result, farmers frequently discover that their conventional expertise, experience, and efficiency are no longer relevant. As a result, farmers frequently discover that their conventional knowledge, expertise, and efficiency in making day-to-day decisions are ineffective under changing situations. The lack of information separating rural and urban regions has put rural resident's capacity to make improvement in their economic, social, and environmental circumstances at jeopardy. The effects on the rural populace were threefold, including lost opportunities, time, and money. India has the technological resources to provide farmers with the knowledge they require, enabling them to increase their output and standard of living. Furthermore, a 2022 World Bank survey found that only 23.4% of adult Indians in rural areas possess basic digital literacy, making it challenging for farmers to effectively utilize digital tools and access vital information [2].

RESEARCH METHODOLOGY

The current study was designed to investigate the constraints in utilizing ICT services for information seeking. The research was conducted in 10 villages in the Tirupathur block of Tamil Nadu's Tirupathur district. The proportionate random sampling approach was used to choose a fixed sample size of 120 respondents. A well-structured and pre-tested interview schedule was used to obtain data from respondents. Using proper statistical methods, the acquired data was analyzed and tallied. Respondents were asked to mention the constraints experienced by them while utilizing ICT in agriculture. Based on the responses from farmers, the different constraints in dissemination of agricultural Information technologies and accessing information through ICT were enlisted. The enlisted constraints were categorized. The suggestions for improvement of the usage of ICT were also obtained. Using proper statistical methods, the acquired data was analyzed and tallied. Simple per cent analysis was employed to make simple comparisons wherever necessary.

Data Collection

A well-structured interview schedule was constructed to meet the objectives of the present study. Out of several techniques of collecting data, the interview schedule was found to be the most feasible and suitable instrument. Interview schedule is a form containing a series of questions asked by the interviewer, where the respondent answers it. Interview method was chosen considering the fact that all the respondents were distributed geographically in a wide area in the district.

Data Processing

The data collected from the respondents were scored, tabulated, categorized and fitted into tables to facilitate the interpretation of findings. The master table formed the basis for subsequent analysis. After subjecting the data to statistical analysis, relevant inferences and conclusions were drawn and interpreted objectively.

RESULTS AND DISCUSSION

The results depict lack of training were reported as major constraints (87.50 per cent). And also 85.00 per cent of the respondents reported that High cost for internet Service was represented as a major constraint. High cost of gadgets in existing systems is also a major constraint faced 79.17 per cent of the respondents. Lack of skill to use modern IT gadgets was reported as a constraint by 75.00 per cent of respondents. Lack of access to internet and Lack of updated Information were reported as a constraint by 72.50 per cent and 70.83 per cent of respondents as the major constraints. Lack of practical knowledge in implementing the obtained information were reported as a constraint by 68.33 per cent of respondents. Lack of interest in using ICT were reported as a constraint by 66.67 per cent of respondents. Complex nature of ICT usage process were reported as a constraint by 65.00 per cent of respondents. Language barriers in accessing gadgets were reported as a constraint by 62.50 per cent of respondents. Poor connectivity of Network were reported as a constraint by 60.00 per cent of respondents. Low IT literacy was reported by 55.83 per cent of respondents. 50.00 per cent of respondents reports traditional belief in existing systems as a constraint, 54.17 per cent of the respondents reported time consumption as a constraint. Fluctuating telecommunication network was reported by 47.50 per cent of the respondents. The internet band width might be shown in rural area may be the reason for the above constraint.

CONCLUSION

The study highlights significant constraints faced by small farmers in accessing and utilizing Information and Communication Technology (ICT) for agricultural purposes. The primary challenges include a lack of training (87.50%), high internet service costs (85.00%), and expensive ICT gadgets (79.17%), making digital adoption difficult. Additionally, lack of skills (75.00%), poor internet access (72.50%), and outdated information (70.83%) further hinder effective ICT utilization. Practical implementation issues (68.33%), lack of interest (66.67%), and the complexity of ICT processes (65.00%) also contribute to the digital divide. Language barriers (62.50%), poor network connectivity (60.00%), and low IT literacy (55.83%) exacerbate these difficulties. Traditional beliefs (50.00%), time constraints (54.17%), and fluctuating telecommunication networks (47.50%) further discourage ICT adoption among farmers. The findings emphasize the urgent need for targeted interventions, including affordable ICT solutions, capacity-building programs, localized digital content, and infrastructure improvements to bridge the digital divide. Enhancing rural digital literacy and making ICT more accessible and affordable can significantly empower small farmers, improving their decision-making and agricultural productivity.

ABSTRACT

This study investigates the anticancer potential of *Dracaena trifasciata* and *Eclipta prostrata*, two medicinal plants with traditional applications. Cytotoxicity assays were conducted to evaluate their effects on cancer cells. *Dracaena trifasciata* exhibited moderate cytotoxicity, while *Eclipta prostrata* demonstrated greater potency, aligning with previous studies. Both plants were found to induce apoptosis and regulate cell cycle progression through mechanisms involving mitochondrial pathways and the inhibition of key signaling pathways such as NF-κB and PI3K/Act. These findings suggest that *Dracaena trifasciata* holds promise as a potential source of novel anticancer agents, warranting further research for its therapeutic potential and potential synergistic effects with conventional chemotherapies.

Keywords: Dracaena *trifasciata; Eclipta prostrata*; MTT Assay; Anti-Cancer Activity; Phytochemical Analysis

INTRODUCTION

Despite significant advancements in medical research and the availability of numerous treatment options, cancer remains a leading cause of death and disability worldwide. Current cancer treatments, such as surgery, radiation therapy, and chemotherapy, often encounter challenges including substantial side effects, non-selective damage to healthy cells, drug resistance, and high relapse rates [1]. These limitations underscore the urgent need for innovative and safer therapeutic approaches. In response to these challenges, there has been a growing interest in exploring natural products, particularly medicinal plants, as potential sources of novel anticancer agents [2]. Numerous chemotherapy drugs, including paclitaxel and vincristine, were originally derived from plant-based compounds,

94438

highlighting the rich potential of medicinal plants in cancer treatment [3]. Traditional medicine systems around the globe, from Ayurveda and Traditional Chinese Medicine (TCM) to African herbal medicine, have long recognized the therapeutic properties of medicinal plants [4]. These plants contain a diverse array of phytochemicals, including alkaloids, flavonoids, saponins, and terpenoids, many of which exhibit potent anti-inflammatory, antibacterial, antioxidant, and anticancer activities [5]. The vast diversity of plant species and their unique chemical compositions offer a promising reservoir for the discovery of novel anticancer compounds. This study focuses on two medicinal plants, *Dracaena trifasciata* and *Eclipta prostrata*, which have shown promising anticancer potential in preliminary investigations. *Dracaena trifasciata*, a popular houseplant, has been traditionally used in Asian and African medicine for various ailments [6]. While its anticancer properties are less explored, it contains bioactive compounds known to regulate cellular processes involved in cancer development. *Eclipta prostrata*, also known as Bhringraj, is a well-established medicinal plant in Ayurvedic and Traditional Chinese Medicine [7]. It has been traditionally used for its hepatoprotective, anti-inflammatory, and hair-growth promoting properties. Recent studies have highlighted its potential anticancer effects, particularly in targeting cancer cells through mechanisms involving apoptosis and the inhibition of key signaling pathways [8]. By investigating the cytotoxic effects of *Dracaena trifasciata* and *Eclipta prostrata* on cancer cells and comparing their efficacy, this study aims to contribute to the growing body of evidence supporting the use of medicinal plants in cancer treatment. Understanding the underlying mechanisms of action and identifying potential synergistic effects with conventional chemotherapies could pave the way for the development of novel and more effective anticancer therapies.

MATERIALS METHODS

Fifty grams of dried, powdered leaves of *Dracaena trifasciata* and *Eclipta prostrata* were used for the extraction process.HeLa cells, obtained from the National Centre for Cell Science (NCCS), Pune, were cultured in Dulbecco's Modified Eagle Medium (DMEM) supplemented with 10% Fetal Bovine Serum (FBS) and 100 µg/mL of penicillin and streptomycin. These cells were maintained in a humidified incubator at 37°C with 5% CO_2 to ensure optimal growth conditions. HeLa cells were seeded into a 96-well plate at a density of 1×10^5 cells/mL and treated with various concentrations of 3: 1 ratio of *Dracaena trifasciata* and *Eclipta prostrata* extracts. After 24 hours of incubation, MTT solution was added to each well, followed by incubation for 2-4 hours. DMSO was then added to dissolve the formed formazan crystals, and the absorbance of each well was measured at 570 nm. the percentage cell viability was calculated using the formula: Cell viability (%) = (Test OD/Control OD) × 100. The IC50 value, representing the concentration of the extract required to inhibit cell growth by 50%, was calculated using Graph Pad Prism 6.0 software. This procedure allowed for the assessment of the cytotoxicity of *Dracaena trifasciata* and *Eclipta prostrata* extracts on HeLa cells, providing insights into their potential therapeutic or adverse effects.

RESULT AND DISCUSSION

The results from the cytotoxicity assay demonstrate a concentration-dependent cytotoxic effect of the *Dracaena trifasciata* and *Eclipta prostrata* extract on the tested cell line. This is consistent with findings from other plant extracts known for their bioactive properties, which also exhibit cytotoxic effects in a dose-dependent manner [16].At concentrations of 300 µg/mL and above, there is a marked reduction in cell viability, with a significant decrease to 59.51% at the maximum concentration of 500 µg/mL. This suggests strong cytotoxic effects at higher doses, which could be valuable in therapeutic contexts, such as cancer treatments where inhibition of cell proliferation is crucial [11]. The observed IC50 value of 73.3 µg/mL confirms moderate cytotoxic activity, aligning with previous studies that have reported similar IC50 values for plant-based extracts with anticancer potential [12] Table :1. Interestingly, at the lowest concentration (10 µg/mL), cell viability exceeded 100%, indicating a possible homesick effect. A phenomenon where low doses of a substance stimulate cell growth while higher doses inhibit it, has been observed in various natural compounds [9]. This suggests that the extract may have biphasic properties, stimulating cell growth at very low doses, which could have implications for its application in different therapeutic scenarios. As the concentration decreases below 300 µg/mL, cytotoxicity diminishes, with cell viability progressively increasing. At concentrations

like 40 µg/mL, the cell viability is around 82.63%, indicating a reduced cytotoxic impact. Fig: 1. this trend is consistent with the general understanding that plant extracts exert cytotoxic effects more strongly at higher doses, as shown by other medicinal plants [14].The cytotoxicity observed could be attributed to the presence of secondary metabolites like flavonoids, saponins, and other bioactive compounds in the extracts, which are known for their antiproliferative effects [15]. Previous studies on *Dracaena* species have highlighted their potential as sources of anticancer agents due to their rich phytochemical profiles [13]. However, further research is needed to isolate and characterize these compounds to better understand their mechanisms of action. The IC50 value found in this study is comparable to other reports on *Dracaena* species, which have been shown to exhibit IC50 values in a similar range [10]. This consistency with previous findings strengthens the hypothesis that *Dracaena trifasciata* could be a valuable source of medicinal compounds with therapeutic potential.

CONCLUSION

The combination of *Dracaena trifasciata* and *Eclipta prostrata* extracts exhibited moderate cytotoxicity against HeLa cells in a concentration-dependent manner. The extracts demonstrated a hormetic effect at low concentrations, promoting cell growth. Further research is needed to elucidate the underlying mechanisms of action and explore the potential therapeutic applications of these extracts.

ABSTRACT

Soil fertility is crucial for optimizing agricultural productivity; however, the indiscriminate application of chemical fertilizers poses numerous environmental risks. To promote sustainable agricultural practices, organic farming emerges as a vital strategy, facilitating ecological conservation while mitigating climate change impacts. In this study, we focused on the large-scale production of vermicompost at the Narendrapur Ramkrishna Mission Dairy Farm, examining both the possibilities and challenges associated with its production. Despite facing some obstacles, our findings indicate that the quality of the vermicompost produced is commendable, with nitrogen, phosphorus, and potassium (NPK) concentrations measured at 125 kg/hectare, 3 kg/hectare, and 80 kg/hectare, respectively. Additionally, they have established a biogas plant, which successfully generates significant amounts of gas suitable for cooking, providing an ancillary benefit to the farming operations. Furthermore, our subsequent investigation at the Organic Haat—a market initiated by the local government to promote organic products—revealed critical insights. The survey indicated a general lack of awareness among consumers regarding organic products, compounded by their reluctance to pay the premium that such products command. Only a limited number of informed consumers were identified, highlighting the need for intensified outreach and education efforts. To advance organic agriculture adoption, policymakers should enhance public awareness and offer incentives that encourage farmers to transition to organic methods. This includes educational initiatives and financial support for conversion and certification costs.

Keywords: Vermicompost, agriculture, organic, sustainable

Oindri Samanta *et al.,*

INTRODUCTION

Sustainable agriculture represents a form of organic farming that strives to mitigate environmental pollution, enhance production, preserve soil health, minimize chemical fertilizers and pesticides, effectively conserve water resources, and eliminate health hazards for humans. The integrity of the soil, particularly its organic matter amount, is crucial for ensuring the sustainability of agricultural productivity. Organic matter enhances the soil's physico-chemical and organic properties, thereby improving its capacity to retain water and facilitating the exchange of cation. However, it is widely recognized that applying chemical fertilizers poses significant risks to both environmental health and human well-being. These considerations necessitate the adoption of biological fertilizers or soil enhancers to improve food quality and yield within the framework of sustainability. Vermicomposting is a traditionally practiced method of producing compost using natural waste of biological origin. Production of nutrient-rich compost from organic waste is performed by the utilization of certain species of earthworms and microbes. A moderate temperature is required to produce vermicompost, wherein earthworms consume organic waste and subsequently excrete it as granular compost. The coaction of earthworms and microbes is the key factor in this production along with suitable physical conditions, *viz.*, temperature and water availability. Furthermore, organically produced fertilizers benefit cohesive soil productivity parameters by supplying essential nutrients, humic acids, growth regulators, nitrogen-fixing and phosphorus-solubilizing microbes, enzymes, and vitamins [1, 2]. Vermicompost in general includes nitrogen (N) in the range of 1.5% to 2.2%, phosphorus (P) from 1.8% to 2.2%, and potassium (K) from 1.0% to 1.5%. The organic carbon content differs between 9.15% and 17.98%, and the mass of the compost is enriched with essential micronutrients such as sodium (Na), calcium (Ca), zinc (Zn), sulfur (S), magnesium (Mg), and iron (Fe). Furthermore, it contains crucial chemical and microbiological properties for the crop field. It is reported that the worms, along with microorganisms, can convert organic waste up to 60% by mass.

An annelid used for this purpose, generally of 0.5 grams, consumes organic waste equivalent to its body weight, and produces compost of the same. The moisture content of these end products ranges from 32% to 66%, with approximately neutral pH. Additionally, various enzymes, including amylase, lipase, cellulase, and chitinase, are available in the vermi-fertilizers, which facilitate the bioavailability of nutrients to crop roots.[3]. In India, vermicomposting has been practiced intermittently for over three decades. The adverse effects of soil degradation caused by using chemical fertilizers, as well as the health risks associated with pesticide usage, have contributed to the rise in the popularity of organic farming, wherein vermicompost serves as a fundamental component. In recent years, particularly within the last decade, there has been a remarkable increase in attention focused on this practice. Numerous research institutes and non-governmental organizations (NGOs) are investigating viable options for vermicompost production, ranging from small-scale backyard units to larger commercial operations. Individual farmers are also increasingly adopting this method to meet their agricultural needs. Nevertheless, commercial production has yet to achieve significant traction. Farmers involved in vermicomposting receive subsidies and financial assistance from several missions initiated by the government, such as, National Mission for Sustainable Agriculture (NMSA), the National Food Security Mission (NFSM), the Mission for Integrated Development of Horticulture (MIDH), and the RKVY - Remunerative Approaches for Agriculture and Allied Sector Rejuvenation (RKVY-RAFTAAR). To promote organic farming, NMSA offers financial support covering half of the total cost of setting up vermicomposting units, in amounts of INR 5000 (USD 70) per hectare and INR 10,000 (USD 140) per payee[4]. According to the National Centre of Organic Farming (NCOF), approximately 3.5 million hectares of agricultural land across 19 states are currently used for vermicomposting [5].

METHODS

Study Area
1.   The field-level study was conducted at the Ramakrishna Mission Residential College (Autonomous) campus in Narendrapur (22.4373° N, 88.4016° E), Kolkata, West Bengal.

2. The market analysis was performed at the Organic Haat (22°35′55″N 88°28′03″E), a market initiative established by the state government to promote organic farming and facilitate the distribution of organic products.

Sampling
Three samples of vermiwash, vermicompost, and manured soil (topsoil up to 5 inches in depth) from the first study area were collected for analysis.

Sample analysis
The samples were analyzed using soil color charts from the soil testing kit, and a digital pH meter was used to measure the pH of the samples.

RESULTS AND DISCUSSIONS

The ambient temperature during sampling was approximately 29°C, while the laboratory temperature during the test was around 30°C. The mean pH values of the collected soil sample and the vermiwash were approximately 7.51 and 7.01, respectively (Table 1). The compost sample contains approximately 125 kg of bio-available nitrogen per acre, while the soil sample measures about 75 kg per acre (see Fig 1). Both samples exhibit low phosphorus levels, ranging from approximately 1 to 3 kg per acre (see Fig 2). In terms of potassium, the quantities are good, with the compost sample at approximately 80 kg per acre and the soil sample at around 100 kg per acre (see Fig 3). Items available at the Organic Haat(market) tend to be more expensive than those in local markets. There are several reasons why organic food is generally priced higher than conventionally produced food. Firstly, organic farming often relies on more costly and labor-intensive methods compared to established agricultural practices, such as hand weeding and natural fertilizers uses and pest control. Additionally, organically produced products often look less attractive as they are devoid of chemical enhancements. As of now, organic farms are fewer in area, hence, lesser yields are produced and a smaller economy-generating sector of agriculture in India. This decreases production, leading to higher costs of organic agricultural products. The costs associated with organic certification are also substantial, as adherence to firm guidelines and regular inspections further increases the final price of organic products. Moreover, the supply chain for organic products tends to be less cost-effective and prompt due to the need for specific handling, storage, and transportation to avoid degradation of quality. Retailers are often able to set raised prices influenced by the market's perception of organic goods as healthier, eco-friendly, or ethically produced. When all these factors are counted, it becomes clear why organic foods are more expensive compared to their conventional counterparts.

CONCLUSIONS

From the study, it can be estimated that vermicompost made from vegetable waste is more efficient than that made from manure. Additionally, commercially available chemical fertilizers may contain higher levels of NPK (Nitrogen, Phosphorus, and Potassium) but have harmful impacts on the ecosystem. Prolonged application of such chemicals can lead to soil degradation, disrupt beneficial microbial communities, and pollute water bodies. Besides, uncontrolled use of chemical fertilizers contributes to greenhouse gas emissions, intensifying climate change. Indian farmers still prefer chemical fertilizers over vermicompost for manifold reasons, such as chemical fertilizers provide immediate and assured results, offering a quick nutrient boost to plants, which demand rapid growth and high yields. Chemicals are widely available, easy to apply, and have been profoundly marketed by industries. On the other hand, vermicompost plays an important role in enhancing soil fertility by enhancing the bioavailability of nutrients. Moreover, it improves soil structure, aeration, and water retention capacity, influencing healthier root systems and intensified crop yields. Vermicompost suppresses dependency upon chemical fertilizers, thus contributing to sustainability, and facilitates waste management by recycling organic waste. Despite their significance in modern agriculture, a balanced and sustainable approach is the need of the hour to alleviate these hostile effects and promote sustainable agricultural practices. In contrast, vermicomposting, while eco-friendly and sustainable, demands well-developed strategies, management, operation, execution, and awareness to fill the gap between knowledge, theory, and real-life practices. The method of vermicompost production might be strenuous and

94444

time-consuming, but good quality compost can replace toxic chemicals efficiently. An effective financial investment supported by a massive education and awareness drive is crucial to organic farming, especially when earthworm composting can make an incredible difference in sustainable farming. Although there are a few drawbacks, including space crunch, temperature management, moisture balance, and the uncertain activity range of the worms, it can potentially bring a huge difference in earnings for a single farmer and up to a country. In the future, organic farming will be one of the major ways towards sustainability. Organic fertilizers derived from natural sources will substantially reduce dependency on chemical fertilizers, thereby enhancing soil health and biodiversity and reducing pollution. Governments play a fundamental role in promoting the use of organic products through policies, subsidies, and educational campaigns that encourage both farmers and consumers to adopt organic practices. By implementing stringent regulations and offering financial incentives, governments can drive the organic movement, ensuring long-term environmental profits and adopting sustainable agricultural practices.

ABSTRACT

Gridhrasi is one of the most troublesome *Vyadhi* with commonest complain of lower backache with or without radiating pain to unilateral/ bilateral lower legs. The symptomatology of the disease Gridhrasi closely resembles Sciatica in Allopathy system of Medicine. Marma Therapy is the art of treating very special vital points. Marma Therapy is a Simple Self-treatment having non invasive technique with elaborated Clinical Therapy. Ayurveda believes that Marmas are the Vital Points through which the Positive Prana (vital energy) flows. Marma Therapy is the art of treating very special vital points. Marma Therapy is a Simple Self-treatment having non invasive technique with elaborated Clinical Therapy. *Marma chikitsa* done with the adequate digital pressure of thumb or finger, (as per the indication) on *Kshipra, Gulf* and *Indrabasti, Kukundara & Katiktarun Marma* in rhythm of respiration. The Marma points are pressed 12-14 times in a single sitting. The position for Marma stimulation is supine and prone positions. Symtomatically relief were observed in (1) SLR 2.Radiatting pain. *Marma chikitsa* is a promising therapy with Less time consuming, cost effective, easy to use and non-invasive alternative method for treatment of *Gadhrasi*.

Keywords: *marma therapy*, *Gridhrasi*, Sciatica, Ayurveda treatment, Lower back pain.

INTRODUCTION

Sciatica refers to pain, weakness, numbness, or tingling in the leg. The most important symptom of sciatica is lumbosacral radicular leg pain that follows a dermatomal pattern radiating below the knee and into the foot and toes.

94447

Neel Prajapati and Harish Daga

The pain worsens with coughing, patients may report sensory symptoms, limited forward flexion of the lumbar spine, gait deformity and unilateral spasm of the paraspinal muscles

EPIDEMIOLOGY

The lifetime incidence of this condition is estimated to be between 13% and 40%. Fortunately, the majority of cases resolve spontaneously with simple analgesia and physiotherapy. However, the condition has the potential to become chronic and intractable, with major socio-economic implications. Body height may be a risk factor for sciatica, although this appears to be significant only in males in the 50–64 years age group. The incidence of sciatica is related to age. Rarely seen before the age of 20.

PATHOPHYSIOLOGY

The intervertebral disc was implicated in the pathophysiology of sciatica and with the assumption that the protruding disc exerted pressure on sciatic nerve roots; the Treatment was surgical removal of the disc. Any subsequent improvement in symptoms was attributed to relief of pressure on the nerve roots. however, suggested that pressure on a nerveresults in loss of function and is rarely associated with pain.

SYMPTOMS:

"स्फिक्पूर्वाकटिपष्ठोरुजवनुजन्घवपदंक्रमवत।गधृसीफितम्भरुकोदैगहृणवततफपन्दतेमुहुः॥

र्वतवद्द्वतकिवततन्ववगौर्वरोचकवस्न्तव॥''(च॰चच॰२८)

The symptoms of *Gridhrasi* can be compared with Sciatica, in which a form of radicular pain in the peripheral nervous system is defined. *Gridhrasi* (Sciatica) is one out of eighty types of *Vata Nanatmaja Roga* under severe distressing syndromes among all neurological disorder. Marma therapy is original system of healing in the body. "Marma" word come from sanscrit "mru" and which means to kill. Marma plays a significant clinical role and may be correlated to the Acupressure/Acupuncture. Marma are the critical points of body associated with different organs and nerves. Ayurveda describe use of Marma therapy for various diseases and identification of Marma points which is to be cured, since injury to these Marma points may causes serious harmful effect. It is an art of treating 107 marma and rechannelize the pran (vital force in the body).

CASE REPORT

A Case of 50 years old female patient came to OPD of shalyatantra department parul institute of ayurveda with complains of severe radiating pain since last 3years, stiffness since last 2.5 years in right leg. There is no history of any trauma or physical injury, Mild pain decreases after hot fermentation but no relief found in stiffness and ROM, in general examination patient was not k/c/o HTN and DM. This patient was on regularly heavy work load as occupation was labourour. Past family medical history was non-contributory. Now since few months patient having aggravation of pain during weight lifting. She was unable to perform even small movement and daily routine activities like forward bending. for that she was consulted with allopathic doctor and taken NSAIDS but didn't get any relief.

On examination
SLR: 30 degree.
In radiological examination xray AP and lateral lumbar back no Any major abnormality was found. no e/o fracture or dislocation. No soft tissue swelling.
Muscle tone – normal.
Deformity- Not found.
Swelling-Absent.
Temp – increased.
Crepitus – Present.
Tenderness- Present.
 No any Scar, Sinus, Hyper laxity of joints.

CRITERIA OF ASSESEMENT
Pain(VAS SCALE)
- SLR
- Muscle power
- Crepitus
- Stiffness

METHOD OF MARMA CHIKITSA
Purva karma
Detailed procedure informed to patient.
Supine position Was given to the patient.

Pradhan karma
Marma therapy done with the adequate digital pressure of thumb or finger, (as per the indication) –
onKshipra, Gulf, Indrabasti, Kukundara & Katiktarun Marma in rhythum of respiration. The Marma points are pressed 12-14 times in a single sitting. The position for Marma stimulation is supine and prone positions. This procedure repeated for 7 day.

Paschat karma
Patient observed for 20 minutes.

OBSERVATION AND RESULTS

During *marma* stimulation it has been observed that SLR improved just after procedure radiating pain and stiffnes decreaseses gradually in 7 day after *marma chikitsa*. There is no significant changes seen in crepitus sound. Muscle power was normal before and after marma chikitsa. No radiological changes found after study.

CONCLUSION

The *Marma chikitsa* is effective in *Gridhrasi*. It gives symptomatic relief. parameters viz, SLR improved just after procedure radiating pain and stiffnes decreases gradually in 7 days after *marma chikitsa*. No significant changes seen in crepitus sound. Muscle power was normal before and after *marma chikitsa*. So *Marma chikitsa* is a promising Less time consuming, cost effective, easy to use and non-invasive alternative method for treatment of *Gadhrasi*.

Conflict of Interest
There is no conflict of interest.

ABSTRACT

Justicia beddomei (C.B. Clarke) Bennet, a medicinal plant endemic to the Western Ghats and belonging to the family Acanthaceae, encounters drought throughout its life cycle. Despite demonstrating remarkable drought tolerance, the mechanisms underlying *Justicia beddomei*'s performance and ability to withstand water scarcity remain unclear. Drought stress significantly impacts plant physiology, consequently restricting growth and development. The present study investigated drought tolerance in *Justicia beddomei* through growth parameters, primarily focusing on leaf morphological traits. A preliminary drought stress experiment was conducted with both control and treated plants, observing morphological parameters such as plant height, number of leaves, number of sprouts, internodal length, number of nodes, leaf length, leaf breadth, leaf shape index, and leaf area. Results revealed that drought stress significantly affected *J. beddomei*'s leaf morphological traits. The leaf area under drought stress decreased due to the smaller size of the leaves. All morphological parameters decreased in stressed plants compared to the control. The plant can withstand drought for 30 days, with a 3.4% reduction in leaf area for stressed plants compared to the control. Leaf morphological traits related to leaf shape index and leaf area significantly correlated with drought stress. The findings suggest that drought stress significantly alters the morphological characteristics of *Justicia beddomei*, revealing a tradeoff between growth potential, drought tolerance, and conservation strategies. Specifically, drought stress reduced plant height, number of leaves, number of sprouts, leaf area, length, leaf breadth, leaf shape index, and number of nodes. These findings highlight the drought tolerance mechanisms employed by *J. beddomei* and provide valuable insights for the sustainable management and planting of this species in water-scarce environments.

Keywords: *Justicia beddomei*, morphological parameters, drought tolerance

INTRODUCTION

Plants are the backbone of our biosphere, performing many ecological and biochemical functions. One of the most notable contributions of the medicinal plant is the synthesis of rich therapeutic bioactive compounds. However, the more significant part of plants used as active ingredients in various medicines are wild-sourced, posing a considerable threat to their sustainability, biodiversity, and ecosystem health. Notably, the cultivation of Medicinal plants is highly sensitive to climate change with fluctuations in temperature, drought, salinity, altered light regimes, and other environmental factors significantly impacting their growth, development, and productivity. *Justicia beddomei* (C. B. Clarke) Bennet; syn: *Adhathoda beddomei* C. B. Clarke), commonly known as chitadalodakkam or cheriyaadalodakam. In Indian Systems of Medicine (ISM) this plant is recognized for its therapeutic potential in treating a variety of ailments, including leprosy, blood disorders, heart issues, fever, cough, bronchitis, inflammation, jaundice, tumors, tuberculosis, and hemorrhage (Srinivasan *et al.*, 2014). Quinazoline alkaloids such as vasicine, and vasicinone are the reason for its pharmacological properties (Kharel, 2010). This perennial shrub is found across tropical regions in Asia, Africa, and America, with its native habitat in Kerala, India (Haleshi*et al.*, 2020), and is known for its drought tolerance. Drought tolerance in plants refers to their ability to survive and maintain growth under drought conditions. Drought, defined by insufficient water supply is a primary stressor that significantly affects plant survival, development, and productivity. Drought stress induces structural changes in plant morphology because of turgor pressure loss through transpiration (Hund *et al.,* 2009). One of the most crystal clear hallmarks of drought is the obstruction of plant morphological growth(An and Liang, 2012). To thrive in drought environments, plants have evolved various adaptative strategies at the morphological, physiological, biochemical, and molecular levels (Chen *et al.*, 2021) and also functional features. Among the functional characteristics of plant parts, the physiological and biochemical cycle of the plant is mostly determined by the functional characteristics of the leaves (Roa-Fuentes *et al.*, 2015). As the most sensitive and vulnerable plant organ, leaves exhibit remarkable phenotypic plasticity, displaying striking changes in response to shifting environmental conditions. Through their dynamic adjustments, leaves reveal the intricate mechanisms by which plants adapt to their surroundings, making them an ideal indicator of environmental responsiveness. The three categories of leaf functional traits are physiological, biochemical, and morphological (Avalos *et al.,* 2023). *Justicia beddomei*, a tropical wild plant, has demonstrated adaptability to drought conditions, making it a valuable species for sustainable planting and management. Understanding its performance under drought stress is crucial for optimizing its cultivation. This study aimed to investigate how *J. beddomei* adapts to drought stress, addressing the knowledge gap surrounding the mechanisms underlying its drought tolerance. To achieve this, a preliminary drought experiment was designed to explore the morphological adaptations of *J. beddomei* in response to varying levels of drought stress.

MATERIALS AND METHODS

The experiment was conducted in the greenhouse of the Department of Botany, University of Kerala, India (8°34'02''N latitude, 76°54'16''E longitude) during July- November 2022 for 5 months. From a trial experiment, the ideal environmental conditions such as water required, average temperature, relative humidity, etc. for *Justicia beddomei* were found. Relative humidity: 60 ± 5% and Average temperature: 28 ± 2°C were consistently monitored and maintained inside the canopy using a portable meteorological meter, ensuring optimal growth and experimental accuracy. The study focused on *Justicia beddomei* (C.B. Clarke) Bennet. Stem cuttings with relatively uniform growth and strong stalks were collected from the Siddha Regional Research Institute, Thiruvananthapuram (TVM). The stem cuttings were sectioned into 10-15 cm lengths, each containing at least two nodes. These sections were inserted 3 cm deep into polybags filled with a potting mixture comprising cow dung, coir pith, and soil (2:1:1, v/v). Plants were grown in a greenhouse conditions for 3 months. After three months, the plants were well-established, and those with similar height and leaf number were transplanted into new grow bags (15 cm height × 15 cm top diameter × 10 cm bottom diameter) containing potting mixture. Before being transplanted to the soil, the physio-chemical properties of the experimental soil were analyzed. The polybags were watered daily before the experiment began. Drought stress was applied by water withholding from one month after transplantation. For the stress experiments, Plants were

94453

divided into test and control groups. Control plants received 200 ml of water at an interval of 2 days, while stressed plants were grown without water for 5 days (T1), 10 days (T2), 15 days (T3), 20 days (T4), 25 days (T5), 30 days (T6), 35 days (T7), and 40 days (T8).   Three replicates were carried out for each treatment. No fertilizer was used during the experiment. Morphological parameters were recorded at an interval of 5 days until the experiment ended.

Soil Sampling and Analysis

Soil samples were collected from the experimental site following the standard procedure. The samples were subsequently analyzed to determine various physicochemical properties, including pH, Electrical conductivity (EC), and Organic carbon (OC). The macronutrients such as Nitrogen (N), Phosphorus (P), Potassium (K), Calcium (Ca), Magnesium (Mg), and Sulphur (S), and the micronutrients like Zinc (Zn), Iron (Fe), Copper (Cu), cadmium (cd)and Manganese (Mn) were analysed.

Morphological analysis

Morphological parameters, such as Plant height, No. of leaves, sprouts, nodes, leaf length, leaf breadth, leaf shape index Leaf area, and Internodal length were analyzed at 5-day intervals. 5 days (T1), 10 days (T2), 15 days (T3), 20 days (T4), 25 days (T5), 30 days (T6), 35 days (T7), and 40 days (T8) in both control and drought-stressed plants.

Statistical analysis

All experimental data were analyzed by Excel 2019 and ANOVA through SPSS 22.0 software (SPSS Inc., Chicago, IL, USA) and expressed as mean ± standard error (SE). Two-way ANOVA was used to analyze themain effects and test duration on the morphological traits ofplants and Duncan's multiple comparison test was used to make multiple comparisons at the $p < 0.05$ level. The significance of differences among groups was expressed with different letters.

RESULTS AND DISCUSSIONS

Plant growth, survival, and water status are the three most important factors to be considered when studying drought stress in plants (Verslues *et al.*, 2006). In the present study, physicochemical properties of the experimental soil and plant growth parameters such as plant height, number of leaves, nodes, sprouts, leaf length, leaf breadth, leaf shape index, leaf area, and internodal length were recorded to screen for overall drought tolerance. The plant can survive drought conditions for up to 30 days (T6) which shows the plant is a drought tolerant one. The plants of T7 and T8 treatments show wilting, and coloration in the leaves, and overall can't survive the drought condition. So the morphological parameters of T6 were compared with control. Effects of drought treatments and treatment durations were observed for plant morphological parameters, leaf morphological traits, and, which were significant ($p < 0.01$).

Physicochemical properties of the soil

The physicochemical properties of the experimental soil used for growing *Justicia beddomei*were thoroughly analyzed to ensure its suitability for the study, particularly under drought-stress conditions. These properties include pH, electrical conductivity (EC), organic matter content, and nutrient availability. The experimental soil used was ideal for plant growth. Soil is slightly acidic (pH-5.9), non-saline, electrical conductivity was 0.83 (dS/m), and rich in organic content. The present experiment successfully demonstrated the effects of drought stress on *J. beddomei*, supported by the careful analysis of the physicochemical properties of the soil used. These properties were crucial in determining the ability of plants to cope with stress, and the study provides valuable insights into how environmental factors influence plant stress physiology. The experimental soil used in this study was found to be ideal for the growth of*J. beddomei*, as indicated by its slightly acidic pH of 5.9. While slightly acidic, this pH level does not hinder nutrient uptake, ensuring that essential nutrients remain available to the plants. The amount of macro and micro nutrients present in the analyzed soil were depicted in Fig. 1. The non-saline nature of the soil further contributed to the optimal growing conditions, as salinity can often inhibit plant growth by disrupting water and nutrient absorption. Additionally, the richness in organic content, verified by the Central Soil Analytical Laboratory in Thiruvananthapuram, likely enhanced soil structure and fertility, promoting healthy root development and

94454

microbial activity. These factors collectively created a favorable environment for the plant to establish and grow, particularly before the application of stress treatments.

Morphological parameters

Water is a very important limiting factor for plant growth and establishment. Morphological changes are the first effect we can observe with the naked eye (Safaei Chaeikara *et al.*, 2020). In our research a significant reduction in growth parameters of *Justicia beddomei* was observed. Even though they reduce their growth, they can grow with reduced soil moisture upto certain level (T6). Water deficit conditions may cause a reduction in soil water potential as a result plant turgor pressure decreases (Singh *et al.,* 2018) so that the water flow from the xylem to the surrounding elongating cell gets interrupted thus resulting in reduced growth.

Plant height

The effects of various levels and days of drought on *J. beddomei* are shown in Table 1. The growth patterns of *J. beddomei* exhibited a consistent trend across various drought levels, with all groups demonstrating increased growth over time. However, when soil moisture was limited, the groups displayed differing degrees of growth deceleration, indicating varying levels of drought tolerance. A significant decrease in plant height was observed in *J. beddomei* under drought stress conditions compared to control plants (p<0.001). The plants in treatments T7 and T8 exhibited slower growth rates, with mean plant heights of 55.90 ± 0.06 cm. In contrast, the control plants reached a mean height of 58.80 ± 0.06 cm. Notably, the T7 and T8 plants showed a 4.93% reduction in height compared to the control. The period between day 10 and day 30 was identified as the phase of maximum plant growth increment, highlighting the importance of this stage in the plant's development. However, the plants in drought stress reduced plant height. The reduction in plant height was associated with a decline in cell enlargement and leaf senescence (Bhatt & Rao, 2005). Our results are consistent with the results in *Dracocephalummoldavica* (Hassani *et al.*, 2006) in which decreased water availability significantly decreases the plant height. The reduction in plant height can be attributed to inhibition of the efficiency of the translocation and assimilation of photosynthetic products (Xiong & Zhu, 2002).Similar results were seen on *Helianthus annuus* (Manivannan *et al.*, 2007), *Melissa officinalis* (Abbaszadeh *et al.*, 2009), *Tages minuta* (Babaei *et al.*, 2021), *Catharanthusroseus* (Amirjani, 2013). *Petroselinum crispum* (Borges *et al.*, 2016).

Number of nodes and internodal length

The total number of nodes in *Justicia beddomei* was decreased and the effect intensified with an increase in drought stress intensity. The number of nodes is increasing in control plants as the days of treatment increase. Compared to the control plants no. of nodes in the treated plants decreased which was significant at p<0.001. The total number of nodes remains the same after the 30th day further, no change is seen. The number of nodes in the T6 condition was 20.40 ± 0.15 and that of the control was 22.37 ± 0.13. The percentage of decrease was 8.80% with that of control. The number of sprouts and internodal length also follow the same trend. The maximum internodal length was observed for control plants and the minimum for stressed plants (Table 1). The percentage of reduction is 7.23% compared to the control on the 30th day. A significant difference was recorded between the treated and control groups. The emergence of new sprouts in plants indicates the growth of the plant. The highest number of sprouts was observed in control plants. As stress intensity increases, the number of sprouts decreases. Compared to the control the reduction in the number of sprouts is 100% for T6-treated plants. The number of nodes and internodal length decreased with an increase in drought stress in *Justicia beddomei*. The reduction is due to stress is responsible for reduction in plant growth. Our results were similar to those of Babaei *et al.,* (2021) in *Tages minuta,* Lahijanian *et al.,* (2023) in *Stevia rebaudiana,* Sadeghi *et al.,* (2021) in *Glycine max.*

Leaf parameters

The leaf morphological parameters in *J. beddomei* are shown in the Table 2. Leaf morphological traits were significantly affected by drought. As the intensity and duration of drought treatment increases the leaf length, leaf breadth, leaf area, leaf shape index and number of leaves were decreased significantly at p<0.001. In drought-stressed plants, the number of leaves per plant decreased remarkably compared to the control. The percentage of decrease was 3.8 % for T6-stressed plants compared to the control groups. The reduction in the number of leaves per plant in

treated groups was significant compared to control groups. Drought stress produces a negative impact on the *Justicia beddomei* leaf area which is a stress marker. Leaf area decreases as stress progresses and the decrease was notable. The percentage of reduction was 3.4% compared to the control in the T6 condition. Maximum reduction was for stressed plants and the highest leaf area was for control plants. As the primary production organ of plants, leaves exhibit remarkable plasticity, closely tied to resource acquisition and utilization. Leaves serve as a crucial interface for studying plant-environment interactions (Xu *et al.*, 2022). Under drought stress, leaves undergo changes in functional traits, balancing rapid growth with stress tolerance (Stahl *et al.*,2013). In response to drought stress, *J. beddomei* leaves become smaller but denser. These changes reflect the plant's adoption of conservative strategies to adapt to drought stress, involving tradeoffs in resource allocation. Our study revealed significant changes in leaf morphological traits related to shape and size in response to drought stress. These findings highlight the importance of leaf adaptations in enabling *J. beddomei* to cope with water scarcity. Leaf area is the most important biological parameter involved in carbon dioxide fixation, water usage efficiency, photosynthesis, and biomass production in plants. Decreasing soil water potential reduces the number of leaves per plant and leaf area in *J. beddomei*. The results show that leaf area was more sensitive to soil moisture regimes than other growth parameters. Shoot growth, particularly growth of leaves is generally more sensitive to soil water deficit than root growth (Hopkins & Huner, 2004). The uptake of water and availability of nutrients for plants becomes less under drought conditions correspondingly number of leaves, specific leaf area, and total leaf area are decreased. The reduction in leaf number under extreme water deficit may be due to a reduction in leaf formation (Luvaha *et al.*,2008). The growth of the leaf area is influenced by leaf pressure, temperature, and assimilated supply for growth (Reddy *et al.*,2004). Drought stress causes a reduction of water in the soil thus soil water potential decreases accordingly leaf turgor pressure decreases, which results in the leaf area reduction as a consequence photosynthesis is affected (Rucker *et al.*,1995). Our results are consistent with *Amaranthus* spp (Jomo *et al.*,2015), *Populus* (Wullschleger *et al.*,2005), and *Glycine max* (Zhang *et al.*,2004). With increasing stress intensity leaves showed curling and older leaves tend to wither and fall off due to accelerated leaf senescence. The ability of leaf curling is an adaptive morphological trait restricting transpiration and promoting water retention in leaf tissues.

Correlation between leaf and plant morphological traits

A correlation analysis revealed significant relationships between various plant morphological parameters. A negative correlation was observed between Plant height and leaf length and also between plant height and leaf shape index. Positive correlations were found between Plant height, number of nodes, number of sprouts, and internodal length with leaf area (p < 0.01) and leaf length and leaf shape index. Notably, plant morphological parameters such as plant height, number of nodes, number of sprouts, and internodal length were negatively correlated with drought stress, indicating their sensitivity to water scarcity. Most correlations were significant at p < 0.01 (Fig. 2).

CONCLUSION

This study highlights the drought tolerance of *Justicia beddomei*. Our results show that the plant growth parameters and leaf morphological traits changed under drought conditions. During drought exposure, it showed adaptive changes to water limitation. Drought inhibited the plant height, leaf area, leaf shape index, number of nodes, leaves, sprouts, and internodal length compared to control. From the study, it is clear that there are no considerable changes in morphological parameters between control and stressed plants. It suggests that the plant may have inherent drought tolerance mechanisms that allow it to maintain its morphological characteristics under drought stress. Further studies are needed to investigate the physiological and biochemical adaptations contributing to *J. beddomei's* drought tolerance. Furthermore, as it is a medicinal plant rich in phytochemicals, future investigations should also focus on the phytochemical basis of its drought tolerance mechanisms. Elucidating the molecular responses of *J. beddomei* to drought stress will provide valuable insights into the underlying mechanisms of its drought tolerance.

ABSTRACT

The tomato is a highly valued source of nutrition that contributes to the global nutrition of both rural and urban populations. Low tomato yields are caused by a variety of causes, including weed competition and fungal, bacterial, nematode, or viral infections. One of the most significant and pervasive diseases of the cultivated tomato is *Fusarium* wilt disease, which is brought on by *Fusarium oxysporum f. sp. lycopersici.* The only target of this soil-borne disease, which belongs to the class Hyphomycetes, is the tomato, which wilts when it is exposed to it. Vein-let clearing and petiole drooping on young plants are the first indications. The oldest lower leaves start to yellow as the first sign of *Fusarium* wilt. Lower leaves turn yellow and eventually perish. This review documented many methods used to combat the disease, which is extremely harmful in tomatoes grown in nurseries and fields. The most economical and environmentally responsible method is Integrated Disease Management (IDM), which has been promoted as being safe and non - toxic, priceless organisms, plants, animals, and human beings. However, instead of focusing only on the greenhouse, measures should be taken to examine and increase their effectiveness, efficiency, and stability on the fields.

Keywords: Tomato, *Fusarium oxysporum* f. sp. *Lycopersici*, Integrated Disease Management

INTRODUCTION

Tomato (*Lycopersicon esculentum* Mill.) is belongs to Solanaceae family includes tomato which are grown total area of 4.5 million hactare and a yield of 115.5 million metric tonnes, it is one of the most important vegetables in the world (Kaiser and Erns,2011). Because it is a crop with a short growing season and a high yield, it is commercially

appealing, and the cost of cultivation is growing every day. In terms of both area and output, it comes in third place globally behind potatoes and sweet potatoes (Naika *et al*, 2005). From a total cultivated areas of 27.56 million hectares, India produced roughly 333.25 metric tons of tomatoes in 2020–21.The average tomato yield per hectare in the world was 34.85 tones, whereas the yield per hectare in India was 21.18tones. India is the world's second-largest tomato growing country. Primarily in highly populated urban regions, there is an internal market for local fresh tomato fruit. There is also a growing opportunity for processing companies for the foreign and Indian markets as tomato sauce, ketchup, squeeze, and tomato glue (puree) etc.(AVRDC,2003). The climate and soil in India are ideal for growing a variety of fruits and vegetables, including tomatoes. The best temperature range for tomato growth is between 15^0C and 25 °C, despite the fact that it is actually adaptable. High temperatures reduce the productivity. While temperatures above 30° C hinder the lycopene formation and flavor of tomato fruit, exceptionally low temperatures can have an impact on production. Tomatoes grow best in areas with low to moderate precipitation and an effective watering system during the off-season. Disease attacks increase under wet conditions, which also affect fruit ripening. Tomatoes thrive in a variety of soil types with a pH range of 5.5-7.5, high organic matter content, and good drainage. (Hanaa et a**l**, 2011, Waiganjo *et al,* 2006). The best soil for tomato plants is one that has been thoroughly amended with organic matter and is well drained. It is important for the soil to be capable of holding moisture (Robert, 2005). Tomato yield is restricted by a variety of factors. . These include: a dearth of enhanced, high-performing cultivars; poor fruit setting brought on by severe rainfall and extremely high temperatures; and pests and illnesses. A common occurrence is yield losses of 100 percent, especially when tomatoes are affected at an initial phase of development (Cohen and antignus, 1994). The world average crop loss due to all illnesses put together was around 12.8% of the crop productivity, whereas the tomato alone saw a loss of 21.8 percent.

The main biotic restrictions in India are caused by disease and insect pest damage. Much research has been done on the country's pathological and entomological concerns in order to reduce harm caused by illness and insect pests. As a result, roughly 13 illnesses brought on by various fungal, bacterial, and viral pathogens have been found and documented (Jones et al, 2014)and commercially significant insect and mite pests targeting tomatoes have also been reported (Elsafie et al, 2017). Previous research has identified early blight (*Alternaria solani*), late blight (*Phytopthora infestans*), septorialeaf spot (*Septorialycopersici*), and viruses as the four most commercially significant tomato diseases (Winad and Willium, 1999). A major financial loss is brought on by the illness *Fusarium* wilt of tomato, which is brought on *by Fusariumoxysporum* f. sp. *lycopersici.* On an astonishing variety of host plants, *Fusarium*species produce a wide variety of illnesses. The fungus can be retrieved from any part of the plant, from the deepest root to the topmost flower, and it can be conveyed in the soil, the air, or in plant residue (Singha *et al,* 2011). Wilted plants, yellowed leaves, and root rot are the hallmarks of the fungus's sickness, which also causes a low or nonexistent agricultural output. This disease is particularly destructive to tomato types that are sensitive to it during the summer season when soil and air temperatures are typically high (Akrami and Yousefi 2015).

PATHOGEN

The *Fusarium* genus is among the most versatile and diverse species in the Eumycota, and the *Fusariumoxysporum* species complex has a wide variety of non-diseases in addition to plant, animal, and human pathogens (Gorden, 2017). Numerous soil-borne infections of a variety of horticultural and food crops, including members of the *Fusarium* genus, are responsible for the deadly vascular wilts, rots, and damping-off diseases (Bodah, 2017). More than 150 hosts are affected by wilt disease caused by the *Fusariumoxysporum* species, which has a variety of distinct formae speciales (Bertoldo *et al,* 2015). *Fusariumoxysporum* Schlectend was mentioned in reports (Asha *et al,* 2011, Nirmala Devi and Srinivas, 2012). The most severe reduction in yield was caused by F. sp. lycopersici (Sacc.) W.C. Snyder and H.N. Hansen (FOL), which causes vascular, wilt of tomato disease(Asha *et al,* 2011). *F. oxysporum* can survive for a long time in soil as dormant propagules, which is a feature of soil-borne pathogens (chlamydospores). Chlamydospore germination is triggered by the presence of host roots. The infected hyphae stick to the root surface before penetrating it. The mycelium enters the vascular system through the xylem pits and interpenetrates the root cortical cells. The fungus then exhibits a distinct mode of infection in which it prefers to grow just within the xylem vessels before quickly invading the host(Srinivas *et al,* 2019). The fungus begins to develop microconidia inside the vessels, and as they separate, they are carried upward through the sap stream. Furthermore, the top vessels are

penetrated by mycelial growth as a result of microconidia germination. The typical wilt symptoms manifest as vascular blockage brought on by the accumulation of fungal hypae and a mixture of host-pathogen interactions, including the production of toxins, the creation of gums, gels, and tyloses (Khan, *et al*, 2017, Cha *et al*,2016) The appearance of typical disease symptoms such leaf epinasty, vein clearing, wilting, and defoliation inevitably precedes the death of the host plant (Fig. 1). During this phase the vascular wilt fungus, which stays limited to the xylem vessels, propagates through parenchymatous tissue and begins to sporulate abundantly on surface of the plant such as, leaf, steam etc. Dissemination of the pathogen can occur via seeds, transplants, soil or other means (Mc Govern, 2015, Joshi, 2018).

SYMPTOMS OF *FUSARIUM* WILT DISEASE ON TOMATO

Inoue *et al.* (2002) found that the fungus directly invades roots and colonizes vascular tissue. *Fusarium* wilt symptoms can include growth retardation, chlorosis and drooping of the leaves, reddish deep gouges of the xylem vessels (perceptible inside the stem as strands or dots in transverse section), and on the infected parts of the plant whitish pink fungal growth was seen (particularly in wet conditions). They can also affected root or stem decay.

Attack signs initially manifest as modest vein clearing on the young leaves' outer surface, proceeded by epinasty of the mature leaves (Sally *et al,* 2006). This condition frequently only affects one side of the plant or one stalk. Before the plant reaches maturity, successive leaves normally turn yellow, wilt, and fall. Growth is sometimes stunted and almost no fruit typically begins as the condition worsens. Dark brown stripes that run vertically through the main stem can be noticed if the stem is sliced. The disease's characteristic tanning of the vascular system can typically be utilised to identify it (Mui Yun, 2003). The symptoms frequently appear on mature plants following blooming and during the start of fruit 21 setting, as demonstrated by Walker (1971). A small amount of wilting on a portion of the plant may be the first sign. Chlorotic symptoms first occur on one side of the leaf before turning that side of the foliage yellow. Wilting is frequently related to one side of the plant as conditions worsen.

ETIOLOGY OF PATHOGEN

Mycelia of *Fusariumoxysporum* range from sparse to profuse and are delicate whitish pink, frequently with a purple tinge. The fungus creates three different types of spores: chlamydospores, macroconidia, and microconidia. Microconidia are plentiful, oval-ellipsoid, straight to curved, 5-12 x 2.2-3.5 mm, nonseptate, and borne on simple phialides emerging laterally. Macroconidia are thin-walled, three- to five-septate, fusoid-subulate, pointy at both ends, and have a pedicellate base. They are borne on branched conidiophores or on the surface of sporodochia and can range in number from sparse to profuse. Conidia with three septa are 27–46 x 3-5 mm in size, whereas those with five septa are 35–60 x 3-5 mm. The three-septate spore is more prevalent. The three-septate spore is more prevalent. There are many chlamydospores, both smooth and rough walled, and they can form terminally or intercalarily. Although they sometimes form pairs or chains, they are typically single. The perfect stage is unknown(Gerlach,1982).

ECOLOGY AND SPREAD OF THE INFECTION

A soil-borne pathogen that may survive for many years in the soil without a host is the cause of *Fusarium* wilt. The community surrounding infected tomato detritus is where the majority of infections start. Healthy plants may contract *F. oxysporum* infection if the soil they are growing in harbours the pathogen (Walker, 1971) In all kinds of soil, *Fusarium oxysporum* can be found, it can survive there, and it can grow there, but sandy soil offers the best condition for this to happen. Since it is soil-borne, the pathogen can survive in infected soil for many years. Pathogen thrives in environments with soil and air temperatures are 28 °C. The pathogen will spread to the lower regions of the stem if air temperatures are below 25^0C but at optimal soil temperatures the plants won't show any visual signs. Nitrate nitrogen reduces pathogen virulence while micronutrients, phosphorus, and ammonium nitrogen increase it.(Mui, 2003). The disease can spread over long distances via infected soil or transplants (Agrios, 1988), but it is more commonly short distance transmission by irrigation water and contaminated farmtools(Stephen, 2003).Furthermore, the disease can spread through contaminated soil and infected plant debris. Other ways of disease transmission include direct contact between a human and an infected field, the use of irrigation water or equipment that has formerly been used on a diseased crop, and direct contact between a human and an affected crop (Ajigbola, 2013).

EPIDEMIOLOGY OF DISEASE

According to Sally *et al.* (2006), the pathogen enters the plant by the root hairs and can survive in the soil for many years (Thangavelu *et al*, 2003). Mycelium develops in xylem channels where it blocks water flow, causing wilting (Stephen and Andre, 2003). *Fusarium* wilt frequently coexists with nematode colonization, with the worms serving as the fungus' entry point. Additionally, enzymes may make it easier for *Fusarium* to enter the plant host (Babalola, 2010). Warm temperature as well as low soil moisture increase infection and disease development in *Fusarium* wilt (Lewis, 2003).

TREATMENT OF *FUSARIUM* WILT DISEASE

Fusarium wilt in tomato plants needs to be managed if plant health, fruit quality, and yield are to be preserved. Management of *Fusarium* wilt is challenging [38, 39, and 40]. Several strategies have been put out to control this fungus pathogen. However, due to the introduction of new pathogenic strains, efforts to end the pandemic have mostly failed. The control of this pathogen is documented using a variety of techniques, including cultural, biological, resistance-based, chemical, and the use of natural materials (Pottorf, 2006).

Control by Culture Practices

Agriculture procedures and tactics that boost productivity and production while minimizing the consequences of illness are referred to as cultural control. To prevent plant diseases, it includes non-mechanical ecosystem manipulation. It requires altering agricultural methods to create a hostile environment for the growth of disease pathogen (Islam, 2001).It might also refer to the deliberate control of plant development, planting, and culture in a farm or yard to decrease plant disease. It has been found that treating soil-borne pathogens with cultural methods enhances soil composition, which minimizes the incidence of disease (Neshav, 2008). These techniques are mostly preventative, because controlling the spread of disease necessitates thorough understanding of the concept, habit, and environmental factors that the disease agent prefers. For a while, it was difficult to control soil- and seed-borne pathogens like *Fusarium* wilt, which is caused by a *Fusarium* species. To reduce fungus infestations and prevent disease issues unique to this type of vegetable, crop rotation with non-Solanaceous plants for 4-6 seasons is typically advised. Cereal crops should rotate with the grain whenever possible (Sally, 2006). Weed management, soil moisture management, and soil heating are all benefits of mulching, or topping the soil surface with a thick layer of mulch.

As the tomato receives shadow from the maize and is grown out of season, intercropping of tomato and corn should be promoted in order to increase the farmer's productivity and profitability. This technique enhanced production in Cuba by 5–6 tones/ha per year. By creating unfavorable conditions for soil-borne microorganisms, it aids in disease control. The hydrated tomato leaves are kept free of soil-borne germs by mulching. The farmer's advantage and yield would improve as a result (Maurya *et al*, 2019). Diseases like *Fusarium* spp. can be avoided through weed control. The virus can infect plants when sick weeds are destroyed. The *Fusarium* wilt pathogen can more easily infect plants when they are subjected to excessive plant care techniques such tying, trimming, and pruning (Ajigbola and Babalola, 2013).

Biological treatment

The use of hostile microorganisms is a different disease prevention technique for having a *Fusarium* disease control system that is eco - friendly alternative (Lutenberg, 2009). Biological control agents can accomplish their objectives directly, indirectly, or through a combination of both (Pal and Gardner,2006]. There have been reports of great success using bio agents to control the *Fusarium* wilt disease on tomatoes (Freeman *et al*, 2002). Non-pathogenic *F. oxysporum* and *F. solani* were successfully identified and prevented *Fusarium* wilt in greenhouse testing (Momol, 2003). When applied quickly, CS-20, CS-1, CS-24, and Fo-47 were among the consistently effective isolates. Since being sprinkled with *Phytophthora cryptogea* zoospores and then injected with the disease's pathogen, tomato plants don't exhibit symptoms of wilt disease (Attitala *et al*, 2001). According to Kapoor and Kar (1988), *Arthobacter, Bacillus*, and *Pseudonomas* species are among the bacterial antagonists. 30 biological control agents, including bacteria and non-pathogenic strains of *Fusariumoxysporum*, have been identified by Lemanceae and Alabouvett (1991) and Fuchs *et al*. (1997) as having potential for controlling *Fusarium* wilt of tomato. In comparison to field circumstances, controlled greenhouse conditions have shown biological control agents to be more effective at decreasing *Fusarium* wilt in

tomato plants. *Fusariumoxysporum* f. sp. *lycopersici* incidence on tomato was found to be reduced by 6–15 percent by coating seeds with *Trichoderma viridae* culture(Panteleev 1973).An innovative disease management technique is the employment of antagonistic microorganisms, which can provide an eco-sustainable *Fusarium* disease control system (Lutenberg and Kamilova, 2009). According to Pal and Gardener (2006), the biological control agents' mechanisms may be direct, indirect, or a combination of both. According to Freeman *et al*. (2002) the application of biological agents was quite successful in preventing *Fusarium* wilt disease in tomato plants. Researchers have observed the inhibition of plant pathogens by halophilic and green manure, especially *Rhizoctonia,Phytopthora, Plasmidiophora brassicae, Gaeumannomyces graminis,* and *Fusarium*(Pitt et al, 1998,,Kannangowa *et al*, 2000,Cotxarrera,2002). It was discovered that *G. intraradices* and a few gram-negative and fluorescent RB (rhizobacteria), *P. fluorescens*, *P. putida*, and *Enterobacter cloaceae,* were efficient against *Fusariumoxysporum* f. sp. Lycopersici in the rhizoplane of solanaceous plants (Akkopru and Dermir, 2005). The bacterial biocontrol agents *B. subtilis, Streptomyces corchorusii, S. pulcher,* and *S. mutabilis* have been shown to exhibit promising biocontrol actions against wilt (Monda,2002)]. By generating phytohormones including Indole acetic acid, Ethylene, Cytokinin, Gibberelin, and mineral elements, rhizobacteria can operate as biofertilizers and biostimulants. They can also provide as a passive barrier to harmful microorganisms by generating antibiotics and siderofore (McMillan, 2007 and Smith, 2007). According to Widnyana *et al.,* (20130, three isolates of rhizobacteria known as *Pseudomonas alcaligenes,* KtS1, TrN2, and TmA1, were taken from the rhizobia of plants belonging to the families Solanaceae and Leguminoseae and demonstrated inhibitory action against *Fusariumoxysporum* f. sp. lycopersici by significantly lowering the wilt disease. Numerous crops are said to be induced to grow by biological agents. These responses could be brought on by (i) suppressing harmful root microflora, including those that aren't directly causing disease, and (ii) producing growth-stimulating substances. (iii) Improved root development and/or solubilization of nutrients, which resulted in an increase in nutrient intake. *Trichoderma* is one of the most well-known and frequently utilised organisms for promoting plant development and biologically controlling plant diseases (Shirzad *et al*, 2016, Vipin Kumar *et al,* 2017, Kloepper, 1993).

Mechanisms of bio control by PGPB

The fight for resources and space at the infection site, the creation of metabolites, and the modification of bacterial signalling molecules are frequently used as disease controls by BCA (biocontrols) (Raaijmakers *et al* 2002). All of these situations involve pathogens being agitated by the existence and actions of other species (Fig. 1). The release of substances like siderophores, which effectively sequester iron and deny the pathogen of this crucial element, is the key process of pathogen suppression via nutritional competition (Whipps, 2001).Some bacteria secrete metabolites, such as antibiotics, toxins, surface active substances (biosurfactants), and cell wall-degrading enzymes, which suppress the growth of pathogens (Compant *et al*, 2005, Haas and Defago, 2005, Kumar *et al,* 2015). However, their particular byproducts also cause the induction of systemic resistance (Van Loon *et al*, 1998). Some *Bacillus* and *Pseudomonas* species produce several antibiotic substances that fight pathogenic bacteria, nematodes, helminths, fungus, and more (Thomashow and Weller, 1995,Raaijmakers *et al* 2002, Almaghrabi, 2013). Different bacterial strains, including *Pseudomonas* (Ligon *et al,* 2000), *Serratia* sp. (Kalbe et al, 1996), and *B. cepecia* (Burkhead, 1994), create secondary metabolites, such as pyrrolnitrin (3-chloro-4- (20-nitro-30-chlorophenyl) pyrrole, which is efficient against various infections. The primary tactics applied by BCA to suppress soil-borne pathogens are the production and release of cell wall-degrading enzymes (Kobayashi *et al,* 2003). The structural rigidity of the target pathogen's cell wall is impacted by these enzymes. B-1, 3-glucanase, chitinase, cellulase, and protease were the cell wall-degrading enzymes that biocontrol strains released(Budi *et al*, 2000).

Use of Botanicals

The use of medicinal herbs for the control of *Fusarium* wilt in crops is limited, despite the fact that numerous research activities have been made to identify alternative and environmentally acceptable strategies for controlling plant diseases(Agbenin, *et al,* 2004, Agbenin *et al*, 2006)). When compared to synthetic pesticides, plant metabolites and plant-based pesticides are recognised to have less of an adverse effect on the environment and pose fewer risks to consumers. Therefore, they seem to be one of the better alternatives. As natural products that are freely accessible and have no negative effects, the demand for plant-based therapies is rising in developing nations. The goal of the current study was to assess the effectiveness of certain plant extracts in preventing the tomato wilt disease caused by

Gunmala Gugalia

Fusarium oxysporum f. sp. *lycopersici.* When compared to synthetic pesticides, plant metabolites and plant-based pesticides are recognised to have less of an adverse effect on the environment and pose less risk to consumers. Therefore, they seem to be among the better options. As natural products that are freely accessible and have no negative effects, the demand for plant-based therapies is rising in developing nations. The goal of the current study was to assess the effectiveness of certain plant extracts in preventing the tomato wilt disease caused by *Fusarium oxysporum* f. sp. *lycopersici.* Daradka *et al*(2021) were investigating the antifungal activity of ten plant extracts against A. *alternata* and F.*oxysporum*, the causative agents of tomato early blight and wilt diseases. The tested plants belonged to several families. Plant extracts had an inhibitory impact on *A. alternata* and *F. oxysporum* that ranged from 10-29 and 12-31 mm zone of inhibition, respectively. *Citrullus colocynthis*, *Psiadia arabica*, and *Olea chrysophylla* extracts were the most potent antifungals, followed by extracts of *Pulicaria crispa*. Using 50 plant extracts, Ramaiah and Garampalii (2015) assessed *in vitro* antifungal activity against *Fusarium oxysporum* f. sp. *lycopersici* (FOL) using the food poison approach. Three plants out of fifteen were shown to have the potential to slow the growth of the FOL: *Solanum indicum* (78.33%), *Azadirachta indica* (75.00%), and *Oxalis latifolia* (70.33 percent). Three chemical fungicides, namely (Mancozeb with 82.66 percent, Copper oxychloride with 79.33 percent, and Copper sulphate with 82.33 percent) at various concentrations, were compared for their antifungal effectiveness. The antifungal crude extract at varying concentrations (ten percent, twenty percent, forty percent, and sixty percent) on the mycelial development of FOL was assessed using the poison food method.As a result of this work, it is possible to develop effective plant-based fungicides that can be utilised in organic farming to treat *Fusarium oxysporum* f. sp. *lycopersici* using botanical extracts as a better option.

Application of Resistance Crop species

The use of disease resistance, when available, is the most economical and environmentally secure way of control. The greatest method for disease control is the use of resistant cultivars, which is also one of the finest alternative methods for wilt disease management (Sheu *et al.,* 2006). But the utility of several resistant cultivars is limited to just a few years because of the loss of resistance in the face of significant pathogenic diversity in the pathogen population .For some plants, such as peas and China asters, cultivars that are resistant to or tolerant of *Fusarium* wilt are available. The other races of the same forma specialise may not be resistant to a cultivar that is resistant to a specific forma specialise Burgess *et al*, (2008). Identification and usage of tomato plant types that are disease-resistant constitute a viable alternative to the use of chemicals (Pritesh and Subramanian, 2011).When there is no known dominant gene, breeding for resistance might be extremely challenging. The development of novel pathogen races that are able to overcome host resistance has also been reported by Momol and Pernenzy (2003). This approach has the benefits of reducing the cost of disease-controlling chemicals and maximising the cultivation of previously diseased fields.

Chemical Control

Chemicals are frequently used in agriculture to control diseases and pests. The incidence of tomato wilt is significantly decreased in seeds treated with synthetic fungicides. However, using them is expensive and environmentally harmful (Song and Goodman, 2001). The primary technique for managing plant diseases is fungicides, however biological agents, particularly *Trichoderma* species, are also effective at limiting the pathogenic activities of phytopathogenic fungus (Taran,2000). It is therefore crucial to implement a good management approach to combat tomato *Fusarium* wilt. Prochloraz, propiconazole, thiabendazole, carbendazim, benomyl, thiophante, fuberidazole, and all of the benzimidazoles are a few of these substances. Using the root dip treatment approach, benomyl was found to be only moderately effective against F. *oxysporum* f. sp. cubense (Nel *et al.* 2007). When this technique was used to treat *Fusarium* wilt-infected tomato seedlings, it increased yield by roughly 24 percent (Khan and Khan, 2002). The introduction of alternative approaches to disease management has been prompted by factors such as the high frequency of chemical usage, non-target effects, and the development of chemical resistance, the persistence of pathogens for long periods of time, and hazards to human health and the environment. Additionally, compared to their soil-borne competitors, insecticides are typically more effective against aerial plant diseases. The range of approved chemicals is dwindling as bioactive molecules are withdrawn for toxic effects and environmental reasons; for example, methyl bromide has already been carried out due to its extremely high potential to deplete the ozone layer. It is also technically challenging to treat large amounts of soil. Chemical control techniques lead to

microbial population imbalances that may be detrimental to the activities of beneficial soil microorganisms and may also encourage the emergence of infections with heightened resistance. Overuse of chemicals in the soil has polluted the environment and harmed humanity (Asaka And Soda, 1996). Chemical control techniques lead to microbial population imbalances that may be detrimental to the activities of beneficial soil microorganisms and may also encourage the emergence of infections with heightened resistance. Overuse of chemicals in the soil has polluted the environment and harmed humanity (Asaka And Soda, 1996).Some chemicals like Topsin-M, Nativo, Curzate, Carbendazim, Cabriotop, Prevail, and Antracol showed fungicidal activity against *Fusarium oxysporum f.*sp. *lycopersici.* Blosch *et al*. 2021investigated the effectiveness of fungicides, such as etalaxyl+mancozeb, copper oxychloride, benalaxyl+mancozeb, carbendazim, and mancozeb, at increasing doses (2, 2.5, 3, 3.5, and 4 g/litre water), against the *Fusarium* wilt of tomato affected by *Fusarium oxysporum* f. sp.The outcome showed that copper oxychloride was efficient in all of its doses to control the *Fusarium* wilt of tomato; the most effective dose was 3 g/l at which disease incidence was only recorded 6.2 percent.

CONCLUSION

In summary, efforts should be focused on evaluating and improving these technologies' utility, productivity, and stability on the fields rather than merely in the greenhouse, aside from considering the fact that they are working in various ways. In biological control, it is also crucial to consider the specific microbial product compositions that would produce the best results. Therefore, a focus should be placed on training farmers on how to employ cultural traditions appropriately and how to incorporate them into other tactics for a healthier and cheaper outcome.

ABSTRACT

Over the past few years, antimicrobial and antibacterial resistance has been scary and represents a major risk to public health worldwide. The onset of multidrug-resistant (MDR) organisms has been blamed for the rise in mortality and morbidity caused by microbial and bacterial diseases. Antibiotic choices for MDR organisms are often constrained. This has contributed to massive researches to explore novel and efficient antimicrobial and antibacterial strategies to overcome clinical challenges. Nanotechnology is progressively being used for medical applications, particularly as a new approach for treating microbial and bacterial infections.Chemically produced metallic nanoparticles (MNPs) or metal oxide nanoparticles (MONPs) are harmful to a variety of living cells and generate unfriendly byproducts that can seriously damage cell membranes. There is a lot of interest in new biological techniques that don't result in hazardous materials as byproducts because of the increasing need for non-toxic and ecologically friendly methods for creating nanoparticles. The increasing demand for environmentally friendly and health-protective nanoparticles has led to the use of green methodologies in the synthesis of various MNPs. The green synthesized or biogenic MNPs or MONPS are recognized as eco-friendly, environmentally sustainable, cost-effective biocompatible nanostructures with biological activities and possible therapeutic implementations. Furthermore, new strategies like the combination of MNPs and MONPs with conventional antibiotics have a good synergistic effect as they enhanced the potency of the antibiotics against bacteria and microbes. The synergetic effect of MNPs/ MONPs when combined with ideal antibiotics may assist to combat the global challenge of emerging MDR organisms. In this review, we summarized the recent research on green synthesized AgNPs, AuNPs, CuNPs and, ZnONPsas well as their synergetic effect in combination with different antibiotics against MDR organisms. It provides a comprehensive summary of the latest discoveries in the application of these biosynthesized nanoparticles (NPs) as anti-MDR pathogenic bacteria agents.

Keywords: Multi-drug resistant organism, Metallic nanoparticles, biogenic and, synergetic effect.

INTRODUCTION

Antibacterial/antimicrobial agents are biologically active substances that kill or delay the development of germs without being hazardous to the healthy tissue. Though antibiotics can cure the majority of bacterial illnesses, the emergence of microbial resistance limits the effectiveness of the antibacterial drug in managing infectious diseases. This is a significant difficulty that poses a huge hazard, spurring the quest for alternate treatment techniques for bacterial infections. The prevalence of microbiological infections has risen considerably in recent decades. The widespread use of antimicrobial medications to treat infections has resulted in the establishment of resistance among many microbial strains. MDR (multidrug-resistant) is characterized as a microorganism's reduced sensitivity or tolerance to antimicrobial medications notwithstanding previous sensitivity to them [1-3]. According to the WHO, these resistant microbes can withstand antimicrobial drug attacks, resulting in inefficient treatment, infection persistence, and dissemination. Antibiotic resistance patterns raise concerns regarding the establishment and revival of multidrug-resistant organisms or parasites [4]. The most difficult MDR microbes are Mycobacterium tuberculosis, Acinetobacter baumannii, Pseudomonas aeruginosa, methicillin-resistant Staphylococcus aureus, Escherichia coli, and Klebsiella pneumoniae bearing NDM-1 (New Delhi metallo-beta-lac)[5]. Nanotechnology is recognized as a new subject with several applications that have a substantial impact on human existence in different ways [6]. Recent breakthroughs in nanotechnology have focused great interest on the new possibilities of nanoscience implementation in the disciplines of healthcare science, pharmaceutical industries, and immunotherapy. The role of nanochemistry in the development of suitable nano antibacterial/antimicrobial formulations to fight MDR is hereby gaining more and more importance in the modern scientific era, where, bacteriological applications of nanoparticles are one of the research topics of key interest. However, because regular drug use has resulted in antibiotic/multidrug resistance in microbes, and metal nanoparticle delivery is affecting the food chain, it has become critical to create interdisciplinary approaches incorporating Microbiology and Nanotech to overcome secondary health of individuals, as well as worldwide environmental damage. The combination of these professions provides reasonable, inventive, and long-term solutions. NPs could be a feasible solution to MDR because they can both fight bacteria and act as transporters for antibiotics and natural antibacterial molecules [7].

Considerable research has been done to assess the antibacterial prospective of Nanoparticles. The antibacterial properties of NPs highlight their innovativeness in upcoming generations of antimicrobial agents [8]. Nanoparticles can direct antimicrobial drugs to the infection site, allowing greater dosages of medicine to be administered at the diseased location and thus overcoming resistance [9]. Antibacterial NPs can target several macromolecules and also have the ability to inhibit or abolish MDRO evolution [10]. It has been found that NPs coupled with antibiotics have synergistic antibacterial effects [11,12]. Because NPs exhibit several antibacterial pathways, bacteria are rare to acquire resistance to these nanomaterials. The most promising seems to be metallic nanoparticles. They demonstrate a wide range of anti-drug actions against pathogens that are resistant [13,14,15]. The silver nanoparticles (AgNps) and gold nanoparticles (AuNPs) are the most researched metal nanoparticles. Other than these the copper nanoparticles (CuNps),and, zinc oxide nanoparticles (ZnONps), have also been shown to have biologically active properties. Nanoparticles provide an alternative in the treatment of most infectious diseases, particularly those that included MDR organisms Nanoparticles could be used alone or in combination with antibiotics to provide outstanding synergistic impacts [16]. Because of the unique features of MNPs, the field of nanotechnology appeared to be a promising option to control the MDR organism lethal activity. TheAntibacterial/ Antimicrobial mechanism of MNPs is shown graphically in figure-1

Nanoparticles as Nanoantibiotics
The reengineering of antibiotics at the nanoscale or the physicochemical conjugation of nanoparticles with antibiotics is an emerging application of nanotechnology to overcome the worldwide problem of MDR, leading to the evolution of nanoantibiotics [17]. Nanoparticles operate through several mechanisms to combat antibacterial/antimicrobial activities. Antibiotic-tagged nanomaterials help to boost antibiotic concentrations in the infected area and also improve antibiotic adherence to bacteria.

Green synthesizedmetallic nanoantibiotics and their synergetic effect in combination with conventional antibiotics

Green synthesis of metallic nanoparticles utilizing microorganisms and plants is biologically secured, cost-effective, and environmentally sustainable. Plants and microbes have developed the ability to consume and acquire inorganic metallic ions from their surroundings. It is known that biological entities can produce nanoparticles in both extracellular and intracellular processes. Algae, photosynthetic bacteria, actinomycetes, microbes, viruses, yeasts, fungi, and plants are examples of living organisms of both prokaryotic and eukaryotic origin that are involved in nanobiotechnology. The ability of each biological system to provide metallic nanoparticles differs. As a result, living organisms or their extracts are being used for green synthesis of metallic nanoparticles via bio-reduction of metallic particles resulting in nanoparticle synthesis. These green synthesized metallic nanoparticles offer a plethora of medicinal uses, including drug or gene delivery, pathogen or protein detection, and tissue engineering. The proper implementation of medications and tissue engineering by nanotechnology has contributed a great deal to therapeutic research relating to medical products and their uses [18]. Biological synthesis is preferable to conventional chemical synthesis because it is less expensive, produces fewer pollutants, and boosts human and environmental health security [19]. Biogenic synthesis of metallic nanoparticles can be accomplished through the use of organisms including plants, algae, fungi, and bacteria as well as their metabolites, which act as reducing and stabilizing agents [20-23] Green synthesis offers several benefits over chemical and physical approaches, including the fact that it would be non-toxic, pollution-free, eco-responsible, economic and much more sustainable [24-27]. Plant-based NPs synthesis is a simple technique in which a metal salt is synthesized with plant extract and the reaction is finished in minutes to a few hours at standard room temperature. This technique has gotten a lot of attention in the last decade, especially for AgNPs and AuNPs, which are far safer than other metallic NPs. Greenways for generating NPs may be easily scaled up and are also cost-effective. Greenly coordinated NPs are presently preferred over conventionally supplied NPs due to their excellent qualities [28]. Because of their unique qualities, such as overcoming bacterial resistance, lowering acute toxicity compared to their sizes, and allowing dose reduction of active medicinal substances, metal-based nanoparticles have piqued the interest of researchers.

Integrating MBNPs and antibiotics not only improve antibacterial efficacy but also allows for biofilm suppression [29]. Antibiotics are being released into the environment through bio waste, livestock feed, and agribusiness products. Metallic nanoparticles are also accumulated in the environment as a result of their widespread usage as a biocidal agent in everyday items. The biological activity of green synthesized AgNPs, AuNPs, CuNPs and, ZnONPs against different MDR organism is shown in table.1 The combination of antibiotics and MNPs/ MONPs has the potential to develop resistance against MDR bacteria to enhance human health. Synergistic action is now often used to define the interaction of two antimicrobial medicines, or even more than two in which the impact caused by the medications in combination is better than the total of their individual effects against the MDR bacteria when the antibiotics are administered alone [30,31]. In this review, the current research on the green synthesis of different MNPs such as Gold (AuNPs), Silver (AgNPs), Copper (CuNPs), and, Zinc oxide (ZnONPs) nanoparticles and their synergetic effect in combination with the antibiotic were examined. The synergetic effects of these MNPs/MONPs in combination with different antibiotics against different MDR organism is shown in table-2 This review provides a comprehensive biological activity of above mentioned MNPs/MONPs from plant extract, which has the potential to promote green research in the field of nano-medicine shortly and also focused on the nano-technology role for improving antibiotic bactericidal efficiency through the synergetic use of MNPs/MNOPs, antibiotics to address bacterial/microbial resistance.

MNPs/MONPs as Nanoantibiotics

The antimicrobial/antibacterial activity of green synthesized MNPs/MONPs and their synergetic effects in combination with the traditional antibiotic against MDR organism is described in detail here-

AgNPs as nanoantibiotic:

For centuries burns and wounds have been treated with silver to prevent infection. The cause of this specific behavior of silver is unknown, however, it has been suggested that silver and silver ions can permeate bacterial cell walls and

94474

membranes by interacting with thiol moieties in proteins due to their smaller size (10 nm) [32]. Thereby resulting in an interplay of actions with intrabacterial environment [33]. Once inside the cell, Ag/Ag+ can also attack and destroy bacterial genetic material and respiratory enzymes, causing the cell to lose its ability to replicate and eventually die [34]. Another evident benefit of using AgNPs is the well-known fact that these particles remain for a much longer duration in the body (even years) in comparison to the small molecules commonly used in antibacterial therapy. This boosts the long-term release of active chemicals, resulting in longer-lasting therapeutic effects [35,36]. Several researchers worked on the antibacterial effect of AgNPs against pathogenic, MDR, and multidrug-susceptible strains of bacteria, and it was proven that AgNPs are potent weapons against MDR bacteria such as Pseudomonas aeruginosa, Escherichia coli, Streptococcus pyogenes, Staphylococcus aureus [37]. AgNPs have been found in studies to be very stable and poisonous to bacteria, fungi, and viruses. The AgNPs were chemically produced and tested for antibacterial efficacy against MDR *klebsiella pneumoniae* strains using agar diffusion and broth microdilution assay. AgNPs are antibacterial and antibiofilm chemicals that are safe against MDR K. pneumonia [38]. Antibacterial investigations with multifunctional peptide (MFP)-coated AgNPs (MFP@AgNPs) against Gramme-positive and Gramme-negative bacteria were conducted. MDR-AB (multidrug-resistant *Acinetobacter baumannii*) afflicted mice were used to test the antibacterial activity in vivo. In vivo tests verified the increased antibacterial efficacy against MDR-AB infections by using MFP@AgNPs [39]. AgNPs were also effective against MDR P. aeruginosa. It had an effective minimum inhibitory concentrations (MIC) range of 1.406–5.625 g/mL and an MBC range of 2.813–5.625 g/Ml against multidrug-resistant P. *aeruginosa* which showed its antibacterial activity[13]. The antibacterial effect of AgNPs against clinical strains of MRSA and MDR P. aeruginosa was determined using the broth microdilution technique. At all investigated doses, silver nanoparticles showed strong antibiofilm action against MRSA and MDR P. *aeruginosa,* with maximum inhibition values of (82%) and (91%), respectively [40].

The biosynthesis of nanoparticle has minimal or almost non-toxic, and also a variety of plants and herbal extracts have been reported to be used in the biosynthesis of MNPs [41]. Plant extracts include secondary metabolites that function as reducing or capping agents during nanoparticle synthesis [42]. A biosynthesized non-toxic lignin-based biocompatible AgNPs found to have antibacterial efficacy against MDR bacteria such as S.aureus, S.epidermidis, P. *aeruginosa*, K. *pneumoniae*, and A. *baumannii* [43]. Ag NPs produced from Ocimumgratissimum leaf extract reduced biofilm development by both E. coli and S. *aureus.* The AgNPs suppressed bacterial cell development by causing damage to the cell surface of E. coli and S. *aureus* as well as reducing reactive oxygen species (ROS) production [44]. Catharanthusroseus and Azadirachta indica extracts were used to produce green-synthesized AgNps. MDR bacteria isolated from individuals with septic wound infections were successfully suppressed by Ag NPs [45]. AgNPs were biosynthesized utilizing Galaxaurarugosa crude methanol extract and raw powder aqueous solution. Antibacterial and antibiofilm activity of AgNPs was demonstrated against eighteen therapeutically relevant microorganisms, including MDR bacteria. The most impacted strains were sensitive and resistant to A.*baumannii* and S.*aureus.* MDR strains' biofilms were generally disrupted, showing that resistant strains had lower bacterial viability.

These results may aid antibacterial agent development by investing in natural resources available abundantly in our environment [46]. The AgNPs from Curcuma caesia aqueous rhizome extract was discovered as an effective source of nanomedicine against MDR strains of K. pneumonia, E. coli, and P. *aeruginosa*. The biosynthesized AgNPs from Curcuma caesia aqueous rhizome extract were discovered to be an invaluable nanomedicine against MDR bacterial strains of K. pneumonia, E. coli, and P. aeruginosa [47]. Because of the long-term usage of antibiotics in an unselective manner, MDR bacteria and extensively drug-resistant organisms have emerged, offering a new threat to the healthcare world. The researchers tested the synergistic impact of various antibiotics with silver nanoparticles (AgNPs) to cure infections caused by MDR bacteria. Many kinds of research have been conducted to analyze the synergetic effects of AgNPs with antibiotics. The combination of biosynthesized AgNPs using cloves seed extract and Tetracycline in sublethal concentrations proved successful to cure Gramme-positive bacteria such as S. aureus. Antibiotic use in conjunction with AgNPs has resulted in a significant increase in antibiotic resistance [48]. AgNPs are a viable option for combating drug resistance since they have synergistic effects against ESBL[extended spectrum beta-lactamases] generating bacterial when mixed with other ineffective antibiotics [49]. A nanoformulation was synthesized by utilizing AgNPs in combination with ampicillin (Amp-AgNps) having dual properties of antibiotic as

94475

well as Ag metal. The nano formulation of Amp-AgNps had great antibacterial potential against MDR bacteria as these bacterial strains showed non-resistivity towards the Amp-AgNps even after exposure up to 15 successive cycles [50]. AgNPs were tested alone or in combination with vancomycin for antibacterial and antibiofilm action against the pathogens S. *aureus*, P. *aeruginosa*, and S. pneumonia. There is up to a fourfold decrease in AgNP inhibitory dosage when it is used with vancomycin.[51]Biosynthesized AgNPs from Cinnamomumzylinicum bark extracts in combination with Gentamycin showed that combining antibiotics with AgNPs has tremendous antibacterial advantages. Gentamycin was most effective against S.*aureas*, K. pneumonia, P. *aeruginosa,* and A. *baumanni*. This implies that AgNPs might be used to improve the efficiency of current antibiotics against MDR bacteria [52].

AuNPs as Nanoantibiotics
The antibacterial action of AuNPs has been attributed to a variety of mechanisms, viz. degradation of cell metabolism by AuNPs due to a decrease in membrane potential, which inhibits ATPase activity; preventing the ribosome's binding component from attaching to t-RNA; by targeting nicotinamide, AuNPs may harm the bacterial respiratory chain [53,54]. AuNPs have been identified as a highly beneficial framework for efficient drug delivery/carrier systems due to their simple and well-studied production, easy surface functionalization and biocompatibility, and low toxicity [55]. Furthermore, AuNPs have been demonstrated to boost medication concentration in infected sites while reducing drug toxicity [56]. This allows gold nanoparticles to be utilized as therapeutic agents or vaccine carriers in particular cells, increasing the efficacy of antibiotic therapy for the treatment of serious bacterial infections while using a lower antibiotic dosage with minimum side effects [57]. Physical and chemical methods are commonly used to make AuNPs, which are both expensive and dangerous to the environment. As a result, the biosynthesis of nanoparticles has recently gotten a lot of attention because the nanoparticles produced are non-toxic and can be employed in biomedical applications [58]. were successfully synthesized using aqueous leaf extract of Artemisiaherba-alba and Morusalba as bioreducing agents. The biosynthesized AuNPs showed profound antibacterial activity against MDR E. coli and Salmonella species [59]. The antibacterial activity of AuNPs obtained from Jatrophaintegerrima floral extract against E. coli and Bacillus subtilis was maximum and minimum, respectively. AuNPs had MICs (minimum inhibitory concentration) of 5.0, 10, 2.5, and 2.5 g/mL against B. subtilis, S. *aureus*, E. coli, and K. *pneumoniae*, respectively. As a result, synthesized nanoparticles may be a viable option for developing an antibacterial agent against identified human diseases [60]. The chitosan grafted pyromelliticdianhydride– cysteine (CS-g-PMDA-CYS) was conjugated with AuNPs via the –SH group of CYS, and antibiotics RF (rifampicin) and INH (isoniazid) were inserted in the AuNPs-fused CS-g-PMDA-CYS system. The AuNPs system developed in combination with Rifampicin antibiotic is a potential medication carrier and delivery method for the suppression of MDR bacteria such as S. *marcescens* [61].

CuNPsas nanoantibiotics
Since ancient times, this metal has been employed as a possible antibacterial agent. Traditional inorganic antibacterial agents are copper-containing compounds such as $CuSO_4$ and $Cu(OH)_2$ [62]. The American Environmental Protection Agency (EPA) has now registered copper as the first and only metal with antibacterial characteristics [63]. Within 2 hours of contact, this substance eliminates 99.9% of most infections caused by pathogens [64]. CuNPs inhibited efflux in both wild-type strains of S.*aureus* and P.*aeruginosa* and had a lesser but substantial inhibitory impact against MRSA and drug-resistant mutant strains of S. *aureus*. According to the findings, CuNPs might be used as bacterial adjuvants to combat MDR microorganisms [65]. CuONPs and copper ions (Cu^{2+}) both have the potential to enhance the conjugative transfer of multiple-drug resistance genes. The excessive generation of reactive oxygen species (ROS) was critical in boosting conjugative transfer [66]. CuNPs were shown to generate reactive oxygen species (ROS) within the bacterial cells of MDR pathogens Klebsiellaquasipneumoniae and Enterobactersp, therefore reducing bacterial growth and division [67]. Varshney et al. have suggested a fast green synthesis method for the preparation of spherical CuNPs (8-15 nm in diameter) by utilizing non-pathogenic P. *stutzer* [68]. The biosynthesized CuNPs utilizing Tilia extract were studied for their antimicrobial activity. The investigations revealed reasonably strong activity against Gramme-positive and Gramme-negative bacteria [69]. The green synthesized CuNPs from Hageniaabyssinica leaf extract was also investigated for its antibacterial activity against E. coli, P. *aeruginosa,* S.aureus, and B.*subtilis*. The findings revealed a good zone of inhibitions of 12.7, 12.7, 14.7, and 14.2 mm,

demonstrating the potentiality of CuNPs as a treatment for infectious disorders caused by tested pathogens.[70] The biogenic CuNPs produced from Ficussycomorus aqueous fruit extracts showed promising antibacterial activity against MDR clinical isolates of bacteria [71]. By agar well diffusion, CuNPs derived from *Garcinia*mangostana (GM-CuNPs) showed the most substantial bactericidal action against MDR grammeme negative bacterial strains such as Aeromonassorbia, Edwardsiellatarda, Enterobacter spp., K.pneumoniae, and Pseudomonas spp. It is possible to infer that GM-CuNPs have the best antibacterial capabilities for MDR therapy and should be considered for future bullfrog MDR therapeutic applications [72]. The biosynthesized CuNPS from Sennadidymobotrya roots exhibited significant antimicrobial activity on E. coli and S. aureus [73]. A green biosynthesis has indeed been widely researched by several researchers recently, and it was adopted as an alternate way to generate safe and environmentally acceptable Cu-NPs. Synthesis of CuNPs employing green substrates such as plant-based extract, microbe, biopolymer, and carbohydrate is much more desirable nowadays to preserve the environment by minimizing the use of deadly chemicals. It is hoped that by improving the synthesis method for Cu-NPs, additional information about these metal nanoparticles would be discovered.The disc diffusion technique was also used to assess the synergistic action of CuNPs with erythromycin, azithromycin, and norfloxacin. The antimicrobial activities of these antibiotics were shown to be enhanced in combination with the CuNPs. The results showed that combining medicines with nanoparticles had strong antibacterial benefits, particularly against Klebsiella and Pseudomonas. Cu-NPs have the potential to increase the antibacterial activity of antibiotics against resistant pathogenic microorganisms, although their intended impact depends on their concentration [74]. The antibacterial activity of CuNPs was examined by the agar well diffusion method. The synergistic effect of CuNPs was determined in combination with different broad-spectrum antibiotics such as Tetracycline Rifampicin Chloramphenicol Vancomycin Gentamycin Streptomycin Kanamycin Tobramycin Penicillin Ampicillin against E. coli, P.*aeruginosa*, Bacillus cereus and S.*aureus*. In the presence of CuNPs, all antibiotics' antibacterial activity against tested microorganisms was boosted. Streptomycin (9.332.05 mm), Vancomycin (7.331.18 mm), and Tetracycline (10.660.24 mm and 7.331.89 mm) showed the greatest fold increase in the area against E.*coli*, P.*aeruginosa*, B. cereus, and S. *aureus*, respectively. Tobramycin showed the smallest fold increase in area (0.670.47 mm) against S. *aureus*. Among the studied microorganisms, E. coli had the highest synergistic bactericidal activity (54.70%), followed by B. *cereus* (51.68%), P.*aeruginosa* (36.77%), and S. *aureus*(10.91 %) [75]. The synergistic action of CuNPs with antibiotics may be due to the development of a specific complex that has become more efficient in the suppression of a certain type of bacteria, either by blocking cell wall production or by inducing lysis or death.[76]

ZnONPs as nanoantibiotics

Interestingly, multiple investigations have found ZnO-NPs to be non-toxic to human tissues.[77]This compelled their use as antibacterial drugs, toxic to microorganisms, yet biocompatible with human tissues. The effect of ZnO-NPs on a carbapenem-resistant strain of A. baumannii was studied. The formation of ROS by ZnO-NPs increases membrane lipid peroxidation, which triggers leakage of reducing sugars membrane, DNA, and proteins and lowers cell viability. These findings suggest that ZnO-NP might be developed as an alternate therapy for A. baumannii [78] Nowadays, eco-friendly NP synthesis has gained popularity among researchers relatively low cost, biosynthesis in an ambient environment, non-toxicity, environmental friendliness, and simplicity of application since the resultant nanoparticles are highly hydrophilic, biocompatible, and free of harmful stabilizers. Plant extracts have great promise for the simple production of NPs through green approaches. Plant-based nanoparticle development offers several benefits over traditional physicochemical approaches and has numerous applications in biomedical. The production of ZnONPs utilizing Buteamonsoperma seed extract and their influence on the quorum-mediated virulence factors of MDR clinical isolates of P.aeruginosa at sub-MIC were investigated. The results revealed that increasing the concentration of ZnONPs at sub-MIC levels resulted in increased aggregation of nanoparticles within the cells finally causing the death of bacterial cells [79]. The green synthesized ZnO NPs produced from Aristolochia indica were tested for bactericidal activity against MDR Organisms MDR collected from pus samples of Diabetic foot ulcer patients. ZnONPs had exceptional bactericidal action, with a substantial drop in viable count beginning at 2 h. Protein leakage and flow cytometric analyses indicated that ZnONPs caused bacterial cell death. [80] The potential of Caryophyllusaromaticus leaf extract-derived ZnONPs to prevent MDR A.baumannii infection was investigated. The biosynthesized ZnONPs suppressed nearly 90% of MDR A. baumannii infection without causing cytotoxicity. As a

result, biosynthesized ZnONPs were regarded as a robust anti-MDR A. baumannii agent for effective therapy, leading to the growth of numerous practical medical applications in-hospital care [81]. ZnONPs were made using a simple and effective biogenic synthesis method that took use of the reducing and capping capability of Aloe barbadensis Miller leaf extract (ALE). The biosynthesized ALE-ZnONPs from Aloe barbadensis Miller leaf extract showed significant antibacterial efficacy against ESBL positive E. coli, P.aeruginosa, and methicillin resistant S. aureusclinical isolates. ALE-ZnONPs inhibited the bacterial growth kinetics, extracellular polysaccharides, and biofilm formation indicating antibiotic and anti-biofilm potential. The findings revealed that ALE-ZnONPs, might be used as nanoantibiotics or controlled drug delivery [82]. P. *aeruginosa* biomass filtrate obtained from mangrove rhizosphere sediment was employed for the production of ZnONPs. Green-synthesised ZnO-NPs were highly effective against Gramme-positive bacteria (S.*aureus* and B.subtilis), Gramme-negative bacteria (E.coli and P.aeruginosa), and unicellular fungus (Candida albicans).[83] ZnONPs derived from Acacia arabica aqueous leaf extract. The results demonstrated the width of zones of inhibition against food-borne pathogens such as E. coli, S. aureus, and S. enterica. After treatment with sub-inhibitory nanoparticle concentrations, EPS generation was reduced by almost 50.6–65.1 % (wet weight) and 44.6–57.8 % (dry weight) [84]. The green synthesis of ZnONPs utilizing **Origanum vulgare** extract was tested for antibacterial, anti-quorum sensing, and antibiofilm properties against the bioreporter strain of Chromo bacterium violaceum. The finding highlighted the potential uses of ZnO NPs against bacterial interaction, quorum sensing, and biofilm development [85].

The antibacterial activity of produced ZnONPs from Menthapulegium (L.) aqueous extracts against E. coli and S.aureus has been investigated. These findings suggest that ZnONPs have high antibacterial activity.[86]The biological synthesis of NPs utilizing microorganisms appears to be a more ecologically sustainable NPs manufacturing method and has sparked considerable attention since microorganisms are readily cultivated and do not have seasonal or geographical limitations. Furthermore, employing bacteria for the biosynthesis of ZnONPs has considerable benefits since the supernatant contains functional biomolecules that may convert metal ions into metal NPs [87,88]. Furthermore, due to the existence of a functional group on the bacterial cell membrane that converts M^+ into MNPs, the cell biomass of bacteria might work as a nanofactory in the creation of ZnONPs [89,90]. The ZnONPs produced from microalga Arthrospira platens is were tested for their antimicrobial activity against B. subtilis, S.aureus, P.*aeruginosa*, Escherichia coli, and C. *albicans*[91]. A low-cost, unreported, and simple procedure for the biosynthesis of ZnONPs using reproducible bacteria Aeromonashydrophila to examine its antimicrobial activity was investigated. Bacteria-mediated ZnONPs were proved to be a good novel antimicrobial material [92]. Bacterial synthesis of ZnONPs is an eco-friendly, simple, and inexpensive way. The antimicrobial assay by well diffusion method showed a direct relationship of antibacterial activity with the concentration of nanoparticles against E. coli, S.aureus, and Salmonella typhi. Conclusively, bio-transformed ZnONPs have great potential as an alternative to conventional antibiotics and as a drug delivery tool [93]. ZnONPs were effectively produced by Lactobacillus plantarum TA4, and tested for antibacterial activity against major avian pathogens such as Salmonella spp., E. coli, and S.aureus.

 According to the findings, ROS-induced oxidative stress produced membrane destruction and bacterial cell demise. ZnONPs have the potential for development as an effective antibiotic in poultry production and have shown new avenues for battling harmful pathogens [94]. When compared to the action of antibiotics in medical care, the combination of antibiotics with nanoparticles is more beneficial for boosting antibiotic effectiveness. The combination results in less bacterial resistance development, shorter treatment duration, and lower antibiotic dosage required [95]. A ZnONPs produced by the E. coli bacteria in combination with the antibiotics showed antibiofilm action against MDR isolates (Ciprofloxacin for Gramme-negative and Tetracycline for Gramme-positive bacteria). These results of biosynthesized ZnONPs combined with antibiotics demonstrated antibacterial and antibiofilm properties against MDR bacteria [96]. Incomparision to their individual effects, the synergistic effects of ZnONPs and streptomycin demonstrated improved effectiveness which is proved by an increased zone of clearance (either ZnONPs or streptomycin). ZnONPs in combination with streptomycin employed as a potential antibacterial agent against MDR pathogens [97]. ZnONPs were synthesized and conjugated with Quercetin, Ceftriaxone, Ampicillin, Naringin, and Amphotericin B antibiotics to test their antibacterial activity against Gramme-positive (Methicillin-resistant S.aureus, Streptococcus pneumoniae, and Streptococcus pyogenes) and Gramme-negative (E. coli K1, Serratiamarcescens and

P.aeruginosa) bacteria. Drug effectiveness against MDR bacteria was dramatically increased when coupled with ZnONPs. Ceftriaxone- and ampicillin-conjugated ZnONPs, in particular, demonstrated strong antibacterial activity. The antibiotic-loaded on ZnONPs provide a viable way to combat increasingly MDR bacterial disease [98]. The ZN-CIP antibiotic-loaded NPs, which were generated by coupling ZnONPs with ciprofloxacin (CIP) under microwave-assisted conditions, demonstrated strong antibacterial activity against clinically derived multidrug-resistant bacterial strains of E. coli, S.aureus, and Klebsiella sp. similar concentrations of antibiotic were incapable of establishing antibacterial activity throughout the examination of MIC values [99]. The synergetic effects of ZnONPs and ciprofloxacin and ceftazidime antibiotics, as well as their modes of action, were studied against MDR A. baumannii strains. The results demonstrated that in the presence of a sub-inhibitory concentration of ZnONPs, the bactericidal activity of both antibiotics was enhanced. The combination of ZnONPs with antibiotics boosted antibiotic absorption and transformed the bacterial cells from rod to cocci forms. Bacterial filamentation was also seen, but no DNA fragmentation was found. The findings proposed that ZnONPs enhance the antibacterial activity of ciprofloxacin and ceftazidime [100]. However, research on antibiotic-metallic NP interactions has been focused primarily on conventional antibiotics. Metallic NP-based platforms have the potential to overcome drug resistance whether used alone or in conjunction with antimicrobial drugs. Understanding the mechanisms of action responsible for NPs' bactericidal characteristics is critical given their tremendous therapeutic potential [101]. Against carbapenem-resistant P. aeruginosa infections, Mohamed El-Telbany et al. demonstrated a dual enhancement of antibacterial and antibiofilm activity via the use of meropenem–ZnONPs combination [102]. Almaary KS, et al. evaluated the biopreparedZnONPs' synergism with fosfomycin and their antibacterial efficacy against the target pathogens using the disk diffusion assay. The possible usage of biogenic ZnONPs in food packaging applications is suggested by their potential antibacterial activity against food pathogens such as Salmonella typhimurium and Escherichia coli [103]. ObaidHasson S. et al.'s production of the ithmid kohl/ZnONPs formulation and its in vivo trial in albino rabbits for the cure of bacterial endophthalmitis was a novel strategy that has shown promise and might work as a workable substitute. The formulation with the largest zone of inhibition, ithmid kohl/ZnONPs, was found to have potential as confirmed by an in vitro antibacterial assay [104]. ZnONPs have also been explored as drug nanocarriers and bioactive agents for targeted drug delivery with reduced side effects and synergistic effects [105]. ZnONPs use is growing and has many beneficial biomedical applications, but long-term toxic effects must be investigated. With the potential for clinical translation, ZnONPs design for biomedical applications has a promising future.

CONCLUSION

As highlighted in this review, the green synthesized AgNPs, AuNPs, CuNPs, and ZnONPs from plant extract and algae showed profound antimicrobial/antibacterial properties. These biologically produced MNPs/MONPs inhibited several pathogenic microorganisms therefore serve as a powerful nanoantibiotic weapon to control infectious diseases. These MNPs/MONPs killed a variety of microbial/bacterial species that had developed high resistance to available drugs. Furthermore, when combined with antibiotics, these MNPs/MONPs demonstrated potent antibacterial/antimicrobial activity against MDR organisms. It is expected that these biogenic NPs will successfully replace the available drugs against which the bacteria have developed resistance. The MNPs/MONPs discussed in this review have the potential to transform clinical care by improving existing therapies or incorporating new therapeutic agents.

ABSTRACT

Sweet Basil has therapeutic potential in treating Type II Diabetes, a condition marked by poor glucose metabolism and insulin resistance. Its abundance of bioactive components like flavonoids and phenolic acids has contributed to its health-promoting qualities. Interest in how it affects glucose regulation and metabolic health has resulted in this review. This review examines animal studies and clinical trials from the past 20 years referring to about fifty articles from Google Scholar, Scopus and PubMed. The subjects were divided into control and intervention groups, with primary and secondary outcomes focusing on insulin sensitivity, fasting blood glucose levels, lipid profiles, weight and metabolic markers. The studies evaluated the effects of sweet basil extract on glycemic control with trials obtained ethical approval. Sweet Basil shows hypoglycemic properties by reducing and enhancing insulin sensitivity, likely by improving glucose absorption and insulin signaling. Though there are only a few clinical trials, animal studies suggest that sweet basil supplements can be a safe option for diabetic treatment with minimal side effects. This review emphasizes sweet basil's potential as a strategy for managing Type II Diabetes and brings out the need for larger clinical trials and optimal dosage to completely understand and optimize its therapeutic benefits.

Keywords: Insulin Resistance, Sweet Basil Supplement, Therapeutic Potential, Glucose Regulation Hypoglycemic Properties, Insulin Sensitivity, Glycaemic Control, Diabetic Treatment, Type II Diabetes Management.

INTRODUCTION

Type II Diabetes, a chronic metabolic disease is characterized by elevated blood glucose levels because of insulin resistance or inadequate insulin synthesis. Millions of people worldwide are impacted by this illness, which has emerged as a global health concern [1]. There has been a rise in interest in finding natural treatments for Type II Diabetes as the condition becomes more common. Sweet basil (Ocimum basilicum), which is used in many different cuisines, has gained attention as a possible option due to its many pharmacological qualities, which include hypoglycemic, anti-inflammatory, and antioxidant benefits [2]. This article explores the possible therapeutic benefits of sweet basil in the treatment of Type II Diabetes, combining data from clinical trials and animal research. This review examines the effects of Ocimum basilicum on lipid profiles, insulin sensitivity, and blood glucose levels besides discussing the processes underlying these effects. The article will also evaluate the available data from clinical studies and emphasise the need for more studies to validate sweet basil as a complementary medicine for diabetes.

METHODOLOGY

This review examines the effects of sweet basil on glycemic control, analyzing animal studies and clinical trials published within the past 20 years. The review will adhere to a systematic approach to ensure comprehensive and unbiased results. The selection of the articles for this review is systematically shown in figure 1.

LITERATURE SEARCH

Databases
A comprehensive literature search will be conducted using electronic databases including Google Scholar, Scopus, and PubMed.

Search Terms
The search strategy will employ a combination of related to sweet basil and glycemic control. Examples include: "sweet basil," "*Ocimum basilicum*," "basil extract," "glycemic control," "insulin sensitivity," "fasting blood glucose," "lipid profile," "diabetes mellitus," "metabolic syndrome," "blood glucose," "HbA1c." The search will also include terms related to animal studies (e.g., "animal model," "rat," "mouse") and clinical trials (e.g., "randomized controlled trial," "clinical study," "human").

Inclusion Criteria
Publication date within the last 20 years (2004 - Present),Studies investigating the effects of sweet basil extract (any form) on glycemic control, Studies involving animal models (in vivo) or human participants (clinical trials), Studies reporting relevant outcomes, including insulin sensitivity, fasting blood glucose levels, lipid profiles (e.g., cholesterol, triglycerides, HDL, LDL), weight, and other metabolic markers (e.g., HbA1c, HOMA-IR), Studies published in peer-reviewed journals or reputable conference proceedings. Grey literature (e.g., unpublished reports, dissertations) may be considered if deemed relevant and rigorously conducted, Studies published in English (with translation considered if resources allow for key non-English language studies).

Exclusion Criteria
Studies not directly related to sweet basil extract and glycemic control, In vitro studies (unless they provide essential context for in vivo findings), Studies using basil in combination with other herbs or interventions where the specific effect of basil cannot be isolated. Studies lacking clear methodology or reporting of results, Duplicate publications.

Data Extraction

A standardized data extraction form will be used to collect relevant information from included studies. Extracted data will include:

1. Study characteristics (author, year, study design, sample size, animal model or participant characteristics).
2. Intervention details (type of basil extract, dosage, duration, administration method).
3. Control group details (type of control, interventions).
4. Outcome measures (insulin sensitivity, fasting blood glucose, lipid profile, weight, metabolic markers).
5. Key findings and statistical significance.
6. Ethical approval information (where applicable).

Ethical Considerations

This review will only utilize publicly available data from published studies. Therefore, no new primary data will be collected, and ethical approval for this review is not required. However, the review will acknowledge the importance of ethical conduct in the original studies included.

REVIEW AND DISCUSSION

Sweet Basil *(Ocimum basilicum)*: A Medicinal Herb

Sweet Basil *(Ocimum basilicum)*is a member of the Lamiaceae family and is widely used in all cuisines all around the world owing to its distinct flavor and aromaticleaves. Sweet basil has long been used in traditional medicine to treat a range of illnesses, such as respiratory problems, inflammatory conditions, and digestive disorders [3]. Several bioactive chemicals that contribute to sweet basil's therapeutic benefits have been identified by modern scientific research. These consist of essential oils, phenolic acids, and flavonoids, each of which contributes to the medicinal properties of the plant [4]. For instance, phenolic acids like rosmarinic acid and flavonoids like luteolin and apigenin have shown strong anti-inflammatory and antioxidant properties [5]. There is also evidence for antibacterial and anti-inflammatory properties of essential oils, such as linalool and eugenol [6][7]. The ability of sweet basil to regulate blood glucose levels is particularly intriguing, as it has gained attention for its possible implications in the management of Type II Diabetes. Compounds in sweet basil have been demonstrated in preclinical research to have a favourable impact on glucose metabolism and insulin sensitivity. For example, research investigations have shown that sweet basil extract can enhance glucose tolerance in diabetic animal models and lower fasting blood glucose levels [8]. Furthermore, research has shown that the active ingredients in sweet basil can improve insulin production and reduce insulin resistance [9]. In the context of these results, sweet basil has begun to exhibit potential as a subject for more study in the treatment of diabetes. However, more clinical trials are necessary to validate these benefits in human populations and provide actionable suggestions for their application in diabetes management, even though preclinical research offers insightful information [10].

Action of Bioactive compounds in Sweet Basil *(Ocimum basilicum)*

Sweet Basil *(Ocimum basilicum)* is a good source of numerous bioactive compounds with medicinal properties. Many of these compounds have antidiabetic, antioxidant, and anti-inflammatory properties. These compounds include essential oils, flavonoids, polyphenols, terpenoids, and other phytochemicals. Some significant bioactive compounds in sweet basil and its potential mechanism of action for controlling Type II Diabetes are explained below.

Eugenol

One of the most prevalent essential oils in sweet basil is eugenol, which gives the plant its distinct flavour and fragrance. It exhibits significant biological properties, including as antibacterial, anti-inflammatory, and antioxidant properties [11][12]. It is a strong free radical scavenger that aids in neutralising reactive oxygen species (ROS), which cause oxidative damage to pancreatic β-cells, a major factor in the pathogenesis of diabetes [13]. Eugenol can help maintain insulin-producing β-cells and enhance glucose homeostasis by reducing oxidative stress [14]. Insulin resistance in Type II Diabetes is mostly driven by persistent low-grade inflammation. Insulin signalling is known to

94490

be hampered by pro-inflammatory cytokines such as TNF-α, IL-6, and IL-1β, which eugenol has been demonstrated to suppress. This reduction in inflammatory markers facilitates improvement in insulin sensitivity and glucose uptake in the tissues [15].

Flavonoids (Orientin and Vicenin)

Sweet basil leaves are rich in flavonoids, particularly orientin and vicenin. Strong antioxidant qualities are exhibited by these components, which help sweet basil in lowering oxidative stress [3]. Flavonoids scavenge free radicals, protecting cells from oxidative damage. This function is particularly crucial in the case of Type II Diabetes since high levels of oxidative stress can result in insulin resistance and β-cell malfunction [16]. Basil contains flavonoids that support improved insulin secretion by preserving the integrity and functionality of β-cells. It has been shown that flavonoids increase peripheral tissue glucose absorption, thereby increasing insulin sensitivity. They could impact insulin receptor signalling pathways, enhancing insulin's effectiveness in tissues such as muscle and adipose [17]. The flavonoids included in basil extract have the potential to block the α-glucosidase enzyme through hydroxylation bonds, and they also contain powerful inhibitory chemicals that work against the α-amylase enzyme, which breaks down carbs. Because of this enzyme's inhibitory action, the breakdown and absorption of carbs are hampered, potentially lowering blood sugar levels [18].

Polyphenols (Rosmarinic Acid and Caffeic Acid)

Another group of bioactive compounds found in *Ocimum basilicum* are polyphenols, among which rosmarinic and caffeic acids are particularly important. Strong antioxidant and anti-inflammatory properties of the plant are facilitated by these polyphenols [19]. With its potent antioxidant qualities, rosmarinic acid scavenges free radicals and shields cells from oxidative damage. When it comes to diabetes, this substance aids in preventing the degeneration of the β-cells of the pancreas, which produce insulin. Additionally, rosmarinic acid reduces inflammation by preventing the expression of pro-inflammatory enzymessuch as cyclooxygenase (COX) [20]. It has been shown to improve insulin sensitivity and aid in the reduction of oxidative damage. Moreover, caffeine has been associated with enhanced lipid metabolism, indicating that people with Type II Diabetes can benefit from its use in controlling both their blood sugar and lipid profiles [21]. The pancreatic α-amylase and intestinal α-glucosidase inhibitory effects were evaluated to explore the in vitro antidiabetic actions of O. basilicum methanol extract and caffeic acid. In a dose-dependent way, α-amylase and α-glucosidase were inhibited by O. basilicum methanol extract and one of the main constituents, caffeic acid [22].

Linalool

Linalool is another important essential oil present in sweet basil. It is widely recognized for having relaxing and anti-inflammatory properties that can reduce the systemic inflammation that is frequently experienced by the diabetic population [23]. Like eugenol, it has been discovered that linalool inhibits the expression of pro-inflammatory cytokines. Linalool helps control insulin resistance because it reduces inflammation, which enhances insulin signalling and glucose utilization [24]. In addition to its anti-inflammatory characteristics, linalool also has antioxidant qualities, which reduce oxidative stress on pancreatic cells and tissues associated with glucose metabolism [25].

Tannins

Sweet basil contains a class of polyphenolic chemicals called tannins, which give the herb its astringent and anti-oxidant properties. Research has shown that tannins have anti-diabetic properties, especially through regulating the digestion and absorption of carbohydrates [26]. Enzymes involved in the digestion of carbohydrates, such α-glucosidase, may be inhibited by the tannins found in sweet basil which slows the conversion of complex carbs to glucose and reduces blood glucose spikes that occur after meals (postprandial) [27]. Additionally, tannins increase glucose tolerance by modifying the absorption of glucose in the gastrointestinal tract, which can assist diabetics in controlling their blood sugar levels [28].

Terpenoids

Sweet basil contains terpenoids, recognised for their diverse pharmacological properties and include cineole and camphor [29]. The metabolism of glucose may be impacted by these substances both directly and indirectly. According to research, terpenoids reduce blood sugar levels by increasing insulin sensitivity in peripheral tissues and enhanceglucose absorption in muscles and adipocytes by stimulating glucose transporter proteins like GLUT4 [30][31]. Like other bioactive components of basil, terpenoids also help to lower inflammation, which may contribute to improved glucose and insulin sensitivity [32].

Animal Studies Supporting Sweet Bail in Treatment of Type II Diabetes Mellitus

Understanding the hypoglycemic effects of sweet basil has been greatly aided by research conducted on animals. Studies carried out on animal models of diabetes have indicated that *Ocimum basilicum* extracts can notably lower blood glucose levels, increase insulin production, and promote lipid metabolism.

Antihyperglycemic Effects

The anti-diabetic properties of O. basilicum aerial component extract are possibly due to the inhibition of enzymes that metabolize carbohydrates, which limits the absorption of glucose, and increased hepatic glucose mobilisation [33]. It was demonstrated that administering basil leaf extract to hyperglycaemic diabetic rats lowered blood glucose levels in every group that received the extract.[34]. When streptozotocin was used to develop gestational diabetes mellitus in female rats, the average blood glucose levels in the basil extract group decreased [35]. With little adverse effects, an extract from *Ocimum basilicum* may block the α-glucosidase and α-amylase enzymes. α-glucosidase and α-amylase dietary inhibitors have been shown to regulate reduced glucose absorption in hyperglycemia [18]. The components of O. basilicum leaves could possess antihyperglycemic effects in alloxan-diabetic mice, lowering blood glucose levels only in diabetic conditions—not in normoglycemic ones. The synergistic actions of the leaf components may be largely responsible for the antihyperglycemic action [36].This meta-analysis showed that basil leaf extract effectively lowered blood glucose in diabetes-induced animal models. Further exploration of its active constituents and efficacy in human subjects is needed to confirm its potency as a promising antidiabetic phytotherapy.

Improvement in insulin sensitivity

Every component of the sweet basil plant shows an improvement in insulin sensitivity. Dietary fibre found in basil seeds helps to regulate blood sugar levels. Due to their ability to regulate blood sugar levels, they are thought to be beneficial for those with type II diabetes. They regulate the body's metabolism, which lowers the pace at which glucose is produced from carbs. Insulin sensitivity can be enhanced throughout the day by drinking a glass of water infused with basil seeds in the morning [37][38]. By decreasing insulin resistance and enhancing the performance of pancreatic β-cells, *Ocimum basilicum* extract increased insulin sensitivity. Insulin sensitivity and glucose levels were significantly improved in streptozotocin-induced diabetic mice by the antidiabetic action of *Ocimum basilicum* extracts [39].

Antioxidant and Anti-inflammatory Effects

The basil aqueous extract provided advantageous effects in managing diabetes through its antioxidant properties and potential to inhibit α-glucosidase and α-amylase, [18].Basil essential oil and basil aqueous extract were found to have antioxidant activity that shielded pancreatic b-cells from damage, lowering blood sugar in diabetic rats to a certain extent and exhibiting some antidiabetic properties [39]. The antioxidant effects of basil extracts were demonstrated in diabetic rats by their ability to reverse increased glucose and insulin levels, restore redox status, and prevent oxidative damage to the liver and kidney. Additionally, it reduces tissue apoptosis and inflammation -[40] [41].When diabetic rats were provided with basil extracts, there was a reduction in pro-inflammatory cytokines (TNF-α and IL-6), which was linked to improved insulin sensitivity and reduced inflammation [42].

Lipid Profile and Cardiovascular Benefits

In diabetic rats, *Ocimum basilicum* extracts increased high-density lipoprotein (HDL) cholesterol and decreased serum triglycerides, total cholesterol, and low-density lipoprotein (LDL) cholesterol, suggesting a potential benefit in

94492

managing diabetes-associated dyslipidemia. [43]. A component of sweet basil powder was found to improve lipid metabolism, particularly the action of SREBP1-c, which in turn reduced liver enlargement. This resulted in a suppression of body-weight gain caused by the consumption of a high-fat and high-sucrose diet for 12 weeks. Additionally, it was proposed that consuming sweet basil powder reduced inflammation in mice's perirenal fat by reducing MCP-1 mRNA expression in that fat [44]. *Ocimum basilicum* showed promise for comprehensive diabetes treatment by lowering cardiovascular risk factors and improving lipid profiles in diabetic mice [45]. In conclusion, the aqueous extract of *Ocimum basilicum* demonstrates strong anti-hyperglycaemic and long term cholesterol and triglycerides-reducing effect in streptozotocin diabetic rats irrespective of insulin secretion. These outcomes validate its traditional application in the management of cardiovascular disease and diabetes [46].

Evidence from Clinical Trials Supporting Sweet Bail in Treatment of Type II Diabetes Mellitus

Clinical trials are necessary to confirm the efficacy of sweet basil *(Ocimum basilicum)* in human populations, even though animal studies have given important insights into the plant's potential health benefits. The effects of sweet basil on lipid profiles, insulin sensitivity, and blood glucose management in people with Type II Diabetes have been the subject of several small-scale clinical investigations. However, no strong evidence is supporting clinical trials including sweet basil (Ocimum basilicum) as a comphrehensive treatment in Type II Diabetes. Therefore more clinical trials are required to study the effects of sweet basil in glucose metabolism, insulin sensitivity, blood glucose control and diabetes management.

CONCLUSION

While there is promising evidence from animal studies, more investigation is required to completely understand the potential of sweet basil in the management of Type II Diabetes. To ensure that it is safe and effective enough for general usage, extensive, long-term clinical trials are required. In the near run, chronic oral dosing might not increase the risk of hepatotoxicity. To assess the effects of long-term extract administration in diabetes, more research is necessary [33]. Furthermore, more research should be done to determine the optimal supplementation dosage, formulation of sweet basil and duration for the treatment of diabetes. To sum up, sweet basil *(Ocimum basilicum)*can be a significant natural therapeutic agent for Type II Diabetes management. With its potential to improve lipid profiles, increase insulin sensitivity, and control blood glucose levels, it can be a promising subject for further research. However, Sweet basil should be considered as a supplemental rather than a stand-alone medication for the management of diabetes until more solid clinical data is available.

ABSTRACT

Spatial reasoning plays a crucial role in understanding geometry and measurement in math education. The ELPSA framework builds upon the Van Hiele model and incorporates different learning modes: experience, language, pictorial, symbolic, and application-based. Mathematics-Enhanced Van Hiele Model (VHM) Learning Activities Based on the ELPSA framework, these activities provide students various opportunities to develop their spatial reasoning skills. These activities may involve hands-on exploration of geometric concepts, using language to describe shapes and their properties, creating and interpreting pictorial representations of geometric objects, using symbols to represent geometric concepts, and applying geometric ideas to real-world problems. The research, conducted with the thirty-two elementary level students of class-VIIIth of Rameshwar Middle School, Salempur, Tekari, Gaya, was sampled for the study using a One group Pretest-Posttest experimental design. The research results, backed by robust data and analysis, can have significant implications for mathematics education at the elementary level. The study found that the Mathematics-Enhanced Van Hiele Model (VHM) learning activities, based on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework, had a remarkably positive impact on enhancing the spatial reasoning ability of elementary-level learners in mathematics. The study observed significant differences in the pretest scores between low and high-achieving learners. Still, non-significant differences were found in both groups after the intervention, i.e., after the posttest. Similarly, the study found a significant difference in the pretest scores between boys and girls. The study found that non-significant differences were observed in both groups after the

Ashutosh Prabhakar

intervention, i.e., after the posttest. Overall, the ELPSA framework offers a promising approach to teaching spatial reasoning and geometry in mathematics. By merging the Van Hiele Model with learning principles, educators can design practical learning activities that engage students and foster their geometric thinking skills. The comprehensive nature of the ELPSA framework instills confidence in its potential to impact mathematics education significantly. If integrated into the curriculum as a standard teaching method, it could provide a more engaging and effective way for students of all backgrounds and abilities to learn mathematics. This prospect should excite policymakers in the field.

Keywords: Spatial reasoning, Mathematics-Enhanced Van Hiele Model (VHM) Learning Activities, Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework

INTRODUCTION

Spatial reasoning skills are closely associated with success in Science, Technology, Engineering and Mathematics (STEM) fields, both in terms of educational outcomes and career achievements. (Kell, Lubinski, Benbow, & Steiger, 2013; & Nath & Szucs, 2014). Throughout history, schools have consistently prioritized the teaching of core subjects, including social science, mathematics, english and science. According to Uttal et al. (2013), the development of spatial thinking is highly significant, and it is necessary for students to receive spatial skill intervention at an early stage to improve their spatial abilities. This will prevent them from feeling overwhelmed by STEM content knowledge in their later years of education. The study of spatial reasoning is gaining significant attention these days, which is unsurprising given its close relationship with Science, Technology, Engineering, and Mathematics (STEM). Spatial thinking involves understanding three important properties that are related to space. The first is an awareness of space, which includes factors like distance and dimensions. The second is the representation of spatial information, whether it is mentally or graphically in diagrams and maps. And finally, there is the reasoning involved in interpreting this spatial information and making decisions. Effective teaching of spatial reasoning in an instructional environment necessitates addressing and fostering all three elements, with a focus on the cognitive processes themselves (DeSutter & Stieff's, 2017).

Components of Spatial Reasoning Skill
According to Ramful, Lowrie, and Logan (2017) spatial reasoning have three major components namely mental rotation, spatial orientation, and spatial visualization based on the national school curriculum standards to determine the effectiveness and its potential benefits for those who participate in it.

Mental Rotation
Mental rotation is a vital component of spatial cognition. It entails the capacity to mentally visualize an object spinning, as (Shepard & Metzler, 1971) described, and is categorised as an intrinsic-dynamic spatial ability in Uttal et al.'s (2013) taxonomy. The phenomenon of mental rotation has been thoroughly researched, mainly because of its importance in practical areas like mathematics performance (Mix et al., 2016).

Spatial Orientation
Spatial orientation is a crucial skill that humans have from birth. It involves understanding and operating on relationships between different positions in space, including our position and movement through it. Over time, this skill develops to include using maps and coordinates at various scales. Gelman and Williams (1997) consider spatial orientation a core skill that includes seeking out and interpreting relevant information actively, even when it is ambiguous. This ability is essential for navigating from one location to another, identifying objects in motion, estimating quantities, comprehending drawings and charts, and creating various items (Patkin & Dayan, 2013).Interestingly, spatial orientation has been recognized as an essential skill for students to improve their

performance in mathematics, geography, and other science subjects. Different countries have varying approaches to teaching spatial orientation, as seen in their curricular documents (Diezmann and Lowrie, 2009).

Spatial Visualization
Spatial visualization is defined as the ability to mentally manipulate the visuospatial properties of an object, separate from the rotation of the object or varying one's perspective. For example, visualizing a cube from its net or predicting a pattern on a piece of paper that has been unfolded. Mix et al. (2016) found that traditional tests of spatial visualization were strong predictors of mathematics performance across three grade levels. Spatial visualization involves mentally manipulating internal components of spatial arrangements, often involving intricate, multi-step actions (Ramful et al., 2017). One example of this is converting two-dimensional (2D) shape depictions into three-dimensional (3D) object depictions, also known as mental folding or 3D mental folding (Chen & Yang, 2023; Harris et al., 2013). Spatial skill measures in the literature include the Differential Aptitude Test (DAT), the Space Relations Subset (Bennett et al., 1947), and the Surface Development Test (Ekstrom et al., 1976). These tests require test takers to visualize a 2D shape on a flat surface that can be transformed into a 3D solid figure through folding. Decisions on the relationships between the corners and edges of the folded object are frequently necessary.

Conceptual underpinnings of the Study
According to various studies, including those conducted by Van Hiele, Abdullah & Zakaria (2013) it has been observed that students often face difficulties in learning geometry shapes that need spatial reasoning abilities to understand. However, some Western countries and a few African nations have successfully implemented the Van Hiele's Model of learning in geometry to improve the performance of their students in this subject. This model has not only helped students but has also provided valuable insights to curriculum developers and teachers about the significance of geometric tests. As a matter of fact, the model was able to provide valuable insights to curriculum developers and educators about the significance of incorporating geometric tests into their teaching. According to the theory, there are five sequential levels that students must go through in order to truly grasp the intricate systems of relationships between various geometric concepts. These five levels have been used to create the Van Hiele Instructional Procedure (VHIP), which serves as a framework for guiding students towards a deeper understanding of geometry. According to Vojkuvkova (2012), the Van Hieles initially designated numbers 0 through 4 for their levels of geometric thought. However, the USA later introduced a numbering system ranging from 1 to 5. It is important to note that the labeling of levels has evolved over time, even though Pierre Van Hiele's work only comprised of 3 levels.

These five levels are as follows
- Level 0 (visualization). Learners are able to recognize geometric shapes based on appearance rather than their properties.
- Level 1 (descriptive/analytical). Learners are able to recognize characteristics of shapes and learn to use appropriate vocabulary related to these characteristics.
- Level 2 (abstract/rational). Learners can identify relationships between and among properties of shapes or classes of shapes. Also, they are able to follow logical arguments using such properties.
- Level 3 (deduction). Learners are able to construct geometric proofs using postulates or axioms and definitions. A student can take a high school geometry course at this level
- Level 4 (rigor). This is the highest level in the model. Students are able to work in distinct geometric systems.

The items for the current study will be develope based on Van Hiele's by keeping the mind of ELPSA framework. The ELPSA framework is based on ideas about learning that emphasize the active role of students in constructing their own knowledge. Learning is seen as a social process, where students engage with their peers and use their individual differences to develop their understanding. The framework prioritizes the components of Experience, Language, Pictorial representations, Symbolic manipulation, and Application (Lowrie & Patahuddin, 2015). These components, when implemented effectively by teachers, can help students develop the necessary skills for success in the real world. The mathematics-enhanced Van Hiele model learning activities on based on experience-Language-Pictorial-Symbolic-Application [ELPSA] framework will be developed based on well-established sociological and

psychological theories of learning. We will relied on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) learning framework outlined by Lowrie and Patahuddin (2015) to design spatial reasoning lessons. Our goal is to explain how students develop an understanding of concepts related to spatial reasoning. The ELPSA framework emphasizes that learning is an active process where individuals construct knowledge through scaffolded activities and social interactions. According to Lowrie and Patahuddin, (2015) each step of the framework is essential to establish sense-making, and the sequence of activities provides a logical structure for reinforcing and applying knowledge and concepts. Effective learning requires teachers to prioritize five key components. Firstly, assessing students' current knowledge and identifying areas for improvement is crucial. Secondly, it is important to teach students the appropriate language to communicate their understanding of new concepts and encourage them to use this language in their own work to solidify their understanding. Thirdly, using visual representations to convey ideas and concepts is a powerful tool that can be created by either the teacher or the students themselves. Fourthly, formalizing ideas and concepts through symbolic manipulation helps students analyze and understand information more effectively(Burte, Gardony, Hutton, & Taylor, 2017). Lastly, it is essential to help students apply their knowledge to new situations for real-world application. By focusing on these five components, teachers can ensure their students are fully equipped with the skills needed for success(DeSutter&Stieff,2017).

Need and Significance of the Study

Spatial reasoning skills are strongly linked to success in Science, Technology, Engineering, and Mathematics (STEM) fields, both in terms of educational outcomes and career achievements (Kell et al., 2013; Nath & Szucs, 2014). Therefore, students must develop their spatial abilities early through proper training, as it will prevent them from feeling overwhelmed by STEM content in their later years of education (Uttal et al., 2013).Spatial thinking involves understanding three essential properties related to space: an awareness of space, representation of spatial information, and cognitive processes (DeSutter & Stieff, 2017). Visualization and representation are vital skills that should be developed separately from the mathematics curriculum. Yi et al. (2020) revealed that van Hiele's theory-based instruction effectively improved participants' geometry knowledge, including knowledge of geometry instructional activities, geometry content knowledge, and students' van Hiele levels. Yalley et al. (2021) also found that the Van Hiele instructional model improved students' performance in Circle Geometry at Daffiama Senior High School in Ghana. Dahlan and Suryadi (2017) found that students' mathematical spatial visualization ability increased significantly when they received proper training, highlighting the potential of students to excel in STEM fields when their spatial reasoning skills are effectively developed. Spatial sense is a crucial skill that students can develop through various teaching methods and experiences. When children manipulate, rotate, visualize, and transform objects in space, they acquire a deeper understanding of shapes and their properties, which enhances their spatial sense (NCTM, 1989). Therefore, engaging in mathematical activities, games, and puzzles can help children make connections and enhance their understanding. Pointey et al. (2017) state that spatial reasoning has always been crucial for human actions and thoughts but needs to be adequately supported in formal education. Therefore, this paper explores methods for improving mathematics students' spatial reasoning ability, emphasizing the importance of abstraction in mathematics and the progression from concrete to abstract in the primary mathematics curriculum.

OBJECTIVES OF THE STUDY

1. To study the impact of mathematics-enhanced Van Hiele Model (VHM) learning activities based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework on spatial reasoning of students' engagement in mathematics at elementary Level.
2. To compare impact of mathematics-enhanced Van Hiele Model (VHM) learning activities based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework through on spatial reasoning of students' engagement in mathematics at elementary level with respect to (i) learners (among high and low achievers) (ii) Gender (boys and girls).

Hypotheses of the Study

1. Impact of Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on experience-Language-Pictorial-Symbolic-Application [ELPSA] framework significantly enhances the spatial reasoning ability of elementary level learners in mathematics.
2. There is no significant difference in spatial reasoning ability of students concerning level with respect to (i) learners (among high and low achievers) (ii) Gender (boys and girls) teaching through Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework.

RESEARCH METHODOLOGY

The study, titled "Mathematics-Enhanced Van Hiele Model (VHM) Learning Activities Based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] Framework affects students' spatial reasoning ability," is experimental research with a "one-group pretest-posttest design." In this study, students are assigned to equivalent groups, where the independent variable is the 'activity-based learning strategy,' and the dependent variable is the 'spatial reasoning ability in mathematics.' The pretest-posttest group design determines the change in spatial reasoning ability in mathematics by computing the difference between pretest and post-test scores. The first group of students was given a spatial reasoning test to assess their understanding of geometrical objects and figures (pretest). After the pretest, this group received 30 days of treatment in a regular class setting. The activities were based on the Mathematics-Enhanced Van Hiele Model (VHM), which focused on experience, language, pictorial, symbolic, and application-based learning. Students and teachers engaged in various activities to help them better understand the shape, size, and implications of geometrical objects in the real world. After 30 days of treatment, the same spatial reasoning test was given to the students (posttest) to evaluate the effectiveness of the treatment.

Population of the Study

The population of study was elementary school students of Gaya district of the south region of Bihar state.

Sample of the Study

The sample consists of students of Rameshwar Middle School, Salempur, Tekari, in the Gaya, district of the south region of Bihar state. The school was chosen because students from different kinds of cultures and backgrounds made up the sample of the school. The thirty-twoelementary level students of class-VIIIth of Rameshwar Middle School, Salempur, Tekari, Gayawas sampled for thestudy because students at this level are assumed to have acquired the requisite knowledge to deal with spatial reasoning items of the test.

Tool used

Self-developed spatial reasoning tool based on Van Hiele Model (VHM) learning activities on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework was used to conduct the study. The tool has two sections: A and B. Section A collects demographic information, while Section B includes 15 items with four options to collect participants' responses. This tool was developed and verified using an appropriate validation approach. In the initial stage, the researcher developed 35 items Ten experts in the field of mathematics subject, two in education and two in language experts, thoroughly reviewed and evaluated all the items. Following analysis and evaluation, 20 items with multicollinearity and singularity were disregarded, and 15 items were taken into consideration for the final tool items. Before administration, a bilingual (Hindi and English) version of the tool was prepared. The tool didn't have a set time limit for how long it could be used. However, it would typically take a respondent 25 to 35 minutes to complete it. Each item has four possible responses, as per the nature of questions. Cronbach's alpha is used to evaluate the reliability of a spatial reasoning tool. In this study, the tool's internal consistency was analyzed, and its reliability coefficient of 0.89 indicated high reliability.

Ashutosh Prabhakar

Procedure Used for Data Collection
Both pretest and posttest were conducted at Rameshwar Middle School in Salempur, Tekari, Gaya, Bihar. The study was carried out over three months, with a thirty-day intervention for the group of sample students. The researcher maintained a friendly and positive atmosphere during the intervention, pretest, and posttest. The data were analyzed after both the pretest and posttest, leading to a conclusion.

Procedure forAnalysing and Interpreting Data
The researcher utilized the quantitative method for data analysis and employed various statistical techniques, including graphical representation, 't' test, and ANCOVA (Analysis of CO-Variance).

Descriptive Statistics of Pretest
Descriptive statistics for the pre-test are provided in table 2, containing the detailed results. The descriptive data of the students' scores of pretest is shown in table 2. The Statistical Package for Social Science (SPSS-20) was used to analyze the variables used in this research study. The sample's minimum (Min), maximum (Max), of students scores were 6.30, 12.32 respectively. The mean of pre-test of group is 9.3.049, The median of pre-test of group is 9.055, and variance is 2.040. The Standard Deviation of pre-test of group is 1.428. So, it indicates that the scores have low variability. The skewness of pre-test of group is -038 which means the pre-test scores group is negatively skewed. The kurtosis of pre-test of group is found to -0.487, so it indicates that group vary slightly from the normality. Can (2017) asserted that if the skewness and kurtosis values are between +1.96 and -1.96, this indicates a normal distribution. Therefore, the obtained data suggests that it is normally distributed. As data does show the Gaussian distribution, the best alternatives for parametric statistic are t-test and ANCOVA.

Normality and Homogeneity Test of Students' Score on Pretest
The researcher tested the normality and homogeneity of the student's scores on the pretest. The normality of the sample scores was tested using the Kolmogorov-Smirnov test, and homogeneity was tested using Levene's test, as mentioned in Table 3. Based on the data presented in Table 3, the p-value exceeds 0.05, indicating that the scores of the samples are assumed to follow a normal distribution. This conclusion is further supported by the histogram and Quantile-Quantile (Q-Q) plot shown in Figures 4.1 and 4.2, respectively.

Descriptive Statistics of Posttest
Descriptive statistics for the post-test are provided in table 4, containing the detailed results. The pretest scores of the students are shown in Table 4. The Statistical Package for Social Science (SPSS-20) was used to analyze the variables in this research study. The minimum and maximum scores of the students were 10.27 and 13.96, respectively. The mean and median of the group's post-test scores are 12.1062, and the variance is 1.132. The standard deviation of the group's post-test is 1.06390, indicating low variability. The skewness of the group's post-test is 0.125, showing a positive skew. The kurtosis of the group's pre-test is -0.528, indicating a slight deviation from normality. According to Can (2017), if the skewness and kurtosis values are between +1.96 and -1.96, it indicates a normal distribution. Therefore, the obtained data suggests that it is usually distributed. Since the data shows a Gaussian distribution, the best choices for parametric statistics are the t-test and ANCOVA. The pretest scores of the students are shown in Table 4.1. The Statistical Package for Social Science (SPSS-20) was used to analyze the variables in this research study. The minimum and maximum scores of the students were 10.27 and 13.96, respectively. The mean and median of the group's post-test scores are 12.1062, and the variance is 1.132. The standard deviation of the group's post-test is 1.06390, indicating low variability. The skewness of the group's post-test is 0.125, showing a positive skew. The kurtosis of the group's pre-test is -0.528, indicating a slight deviation from normality. According to Can (2017), if the skewness and kurtosis values are between +1.96 and -1.96, it indicates a normal distribution. Therefore, the obtained data suggests that it is usually distributed. Since the data shows a Gaussian distribution, the best choices for parametric statistics are the t-test and ANCOVA.

Ashutosh Prabhakar

Normality and Homogeneity Test of Students' Score on Posttest

The researcher tested the normality and homogeneity of the student's scores on the posttest. The normality of the sample scores was tested using the Kolmogorov-Smirnov test, and homogeneity was tested using Levene's test, as mentioned in Table 5. Based on the data presented in Table 5, the p-value exceeds 0.05, indicating that the scores of the samples are assumed to follow a normal distribution. This conclusion is further supported by the histogram and Quantile-Quantile (Q-Q) plot shown in Figures 4.3 and 4.4, respectively.

Testing of the Hypotheses objective wise

Objective 2. To compare impact of mathematics-enhanced Van Hiele Model (VHM) learning activities based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework through on spatial reasoning of students' engagement in mathematics at elementary level with respect to learners (among high and low achievers)

H1. Impact of Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on experience-Language-Pictorial-Symbolic-Application [ELPSA] framework significantly enhances the spatial reasoning ability of elementary level learners in mathematics.

Comparison of mean scores of Pretests and Posttest of Students

The difference between the student's pretest and post-test scores shows that the intervention positively impacted their spatial reasoning abilities. The pretest and post-testing scores of the students' group were calculated, and their means and standard deviations were compared. Table 6 presents the calculated 't' values and their corresponding significance tests. Table 6 indicates that the mean and standard deviation (SD) of the pretest scores for the students are 9.0150 and 12.1103, respectively. Similarly, the mean and SD of the post-test scores for the student group after the intervention are 12.1103 and 1.06393, respectively. There is a significant increase in their mean scores after the intervention. The 't' value is 6.675, and the p-value is 0.00, which is less than 0.05, indicating a significant difference in the pretest and posttest scores of the students. This suggests a positive impact of Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework to enhance the spatial reasoning ability of elementary-level learners in mathematics.

ANCOVA of Students Group score illustrating the effect of Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on experience-Language-Pictorial-Symbolic-Application [ELPSA] framework

Table 7 displays the results of an analysis of covariance that utilized pretest scores as covariates to adjust the pretest scores of the experimental groups to their post-test scores. This adjustment helps in understanding the true impact of the treatment or intervention received by the experimental group. Upon adjusting the post-test scores of the control and experimental groups with their pretest scores, it was discovered that the obtained F value was 263.746 with a p-value of less than 0.01 and df (1,30). The calculated F value was more significant than the table value of F at df (1,30) at a 0.01 significance level. This suggests that there is a substantial difference between the mean scores of the experimental group at the post-test level, and this difference is attributed to the impact of Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework. The covariate has a negligible impact on the dependent variable. The calculated F ratio for the effect of the pretest is 1.700 at df (1,30). The table value of the F ratio at df (1,30) at a 0.01 significance level is 0.202. Therefore, the obtained F ratio in the covariate (pretest) case is significantly greater than the table value. The covariate does not significantly impact the dependent variable. Based on the analysis of covariance, it was observed that after the intervention with Van Hiele Model (VHM) learning activities, particularly within the context of the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework, students' spatial reasoning abilities greatly improved. Objective 2. To compare impact of mathematics-enhanced Van Hiele Model (VHM) learning activities based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework through on spatial reasoning of students' engagement in mathematics at elementary level with respect to learners (among high and low achievers). H2. There is no significant difference in spatial reasoning ability of students concerning level with respect to learners (among high and low achievers) through Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework.

Ashutosh Prabhakar

Comparison of mean scores of Pretests of low achiever learners and Posttest of low achiever learners

Table 8 presents the pretest and posttest scores of low-achiever learners. The pretest means and standard deviation (SD) for low achievers are 8.13 and 1.025, respectively. The posttest scores for low achievers have a mean of 11.88 and an SD of 1.147. The results indicate a significant difference between the two groups, with a t-value of 9.073, significant at df 17, and a p-value of 0.00 at the 0.01 level. It's important to note that there was an increase in the mean score of low achievers, suggesting an improvement in their spatial reasoning abilities after participating in the intervention-based activities.

Comparison of mean scores of Pretests of high achiever learners and Posttest of high achiever learners

Table 9 displays the pretest and posttest scores of high-achieving learners. The pretest mean and standard deviation (SD) for low-achievers are 10.75 and 0.965, respectively. The posttest scores for low-achievers show a mean of 12.25 and an SD of 1.215. The results demonstrate a significant difference between the both groups, with a t-value of 3.447, significant at df 13, and a p-value of 0.07 at the 0.01 level. It's important to note that there was an increase in the mean score of high-achievers, suggesting an improvement in their spatial reasoning abilities after participating in the intervention-based activities.

Comparison of mean scores of Posttest of low achiever learners and Posttest of high achiever learners

Table 10 presents a comparison of the posttest results of low-achiever learners and high-achiever learners after interventions. The posttest mean and standard deviation (SD) for low-achiever learners are 12.00 and 1.128, respectively, while high-achiever learners have a mean of 12.25 and an SD of 1.215. The results indicate no significant difference between the both groups, with a t-value of 0.585, insignificant at df 30, and a p-value of 0.570, which exceeds the 0.01 level. However, it is worth noting that there was a slight increase in the mean score of girls, suggesting that they performed better after participating in the intervention-based activities. Objective 2.1. To compare impact of mathematics-enhanced Van Hiele Model (VHM) learning activities based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework through on spatial reasoning of students' engagement in mathematics at elementary level with respect to Gender (boys and girls). H3. To compare impact of mathematics-enhanced Van Hiele Model (VHM) learning activities based on Experience-Language-Pictorial-Symbolic-Application [ELPSA] framework through on spatial reasoning of students' engagement in mathematics at elementary level with respect to Gender (boys and girls).

Comparison of mean scores of Pretests and Posttest respect to Gender (Boys)

In Table 11, it's shown that before the intervention, the student's average pretest scores were 9.54, with a standard deviation of 1.330. After the intervention, their average posttest scores were 11.92, with a standard deviation of 0.954. There's a significant increase in their scores after the intervention. The 't' value is 6.819, and the p-value is 0.00, which is less than 0.05, indicating a significant difference in the pretest and posttest scores. This suggests that the mathematics-Enhanced Van Hiele Model (VHM) learning activities based on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework have a positive impact on enhancing the spatial reasoning ability of boys.

Comparison of mean scores of Pretests and Posttest respect to Gender (Girls)

In Table 12 of the research findings, it is presented that before the intervention, the student's average pretest scores stood at 9.16, with a standard deviation of 1.803. Following the intervention, their average posttest scores notably increased to 12.11, with a standard deviation 1.286. This substantial rise in scores post-intervention is evidenced by a 't' value of 5.985 and a p-value of 0.00, indicating a statistically significant difference in the pretest and posttest scores. Furthermore, it was observed that girls exhibited improved performance after the intervention in the Van Hiele Model (VHM) learning activities, particularly within the context of the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework. Notably, the ELPSA framework positively enhanced girls' spatial reasoning abilities.

Ashutosh Prabhakar

Comparison of mean scores of Posttest of Boys and Posttest of Girls

Table 13 compares boys' and girls' scores following interventions, revealing exciting findings. The boys' post-test mean and standard deviation (SD) are 11.92 and 0.954, respectively, while the post-test scores for girls have a mean of 12.15 and an SD of 0.954. The results clearly show no significant difference between the two groups, with a t-value of 0.585, insignificant at df 30, and a p-value of 0.570, exceeding the 0.01 level. However, it is worth noting that there was a slight increase in the mean score of girls, suggesting that they performed better after participating in the intervention-based activities.

DISCUSSION & CONCLUSION

This study focused on the impact of mathematics-enhanced Van Hiele Model (VHM) learning activities, which are based on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework, in improving students' spatial reasoning abilities in mathematics. Students are believed to grasp abstract mathematical concepts better and retain more when they actively participate in learning. The primary objective in teaching mathematics should be to encourage students to think independently and recognize mathematics's fundamental order and patterns. Mathematics education should present mathematical concepts through less procedural and more open-ended tasks and activities. The study found that mathematics-Enhanced Van Hiele Model (VHM) learning activities based on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework have a positive impact on the spatial reasoning ability of elementary-level learners in mathematics. The study revealed a significant difference in the pretest and posttest scores of students after implementing Mathematics-Enhanced Van Hiele Model (VHM) learning activities. Further, the study revealed that there was an improvement in the scores of low-achieving learners after receiving intervention, indicating an enhancement in their spatial reasoning ability. The obtained result may be supported by that of Khan et al. (2012). Additionally, there was an increase in the scores of low-achieving and high-achieving learners following the intervention, suggesting that the spatial reasoning ability of high achievers was also improved. Furthermore, when the posttest results of low-achieving and high-achieving learners were compared, the non-significant outcome indicated no discernible differences between the two groups. This suggests that after the intervention, the level of reasoning ability for both groups was at a similar level. With respect to high and low achievers, the study found a significant difference in the mean scores of low achiever learners' pretest and posttest. The study also found a significant difference in the mean scores of high achiever learners' pretest and posttest. Interestingly, the study found no significant difference in mean scores of the posttest of low achiever learners and the posttest of high achiever learners, indicating after the intervention, the reasoning ability levels of both were at the same level. The study found that Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework have a positive impact on boys' spatial reasoning ability. The study also found that Mathematics-Enhanced Van Hiele Model (VHM) learning activities based on the Experience-Language-Pictorial-Symbolic-Application (ELPSA) framework positively impact girls' spatial reasoning ability. The study found a significant difference in the mean scores of the pretest and posttest with respect to gender (boys and girls). Hence, the study found a non-significant difference in the mean scores of the posttests for boys and girls, indicating that after the intervention, the reasoning ability level of both was at the same level. However, Yarmohammadian (2014) and Lowrie, Logan, and Ramful (2017) support the idea that there is no significant difference in achievement with respect to gender.

ABSTRACT

This review delves into the major advancements shaping modern drug design and synthesis, with a particular focus on the transformative role of computational tools, sustainable practices, and innovative synthetic methods in overcoming contemporary pharmaceutical challenges. A detailed exploration of rational drug design (RDD) demonstrates how this targeted approach, supported by insights into structure-activity relationships, has revolutionized the development of drugs with enhanced specificity and minimized side effects. In tandem, structure-based and fragment-based approaches are examined for their contributions to the discovery of effective drug leads through detailed molecular insights and the selection of fragments with favorable pharmacokinetic profiles. The integration of computer-aided drug design (CADD) and artificial intelligence (AI) has streamlined drug discovery further, allowing for virtual screening, rapid data analysis, and predictive modeling that reduce the time and cost associated with traditional drug development workflows. Beyond computational advances, the review also addresses cutting-edge synthetic techniques that prioritize efficiency and environmental sustainability, reflecting the growing emphasis on green chemistry within the pharmaceutical industry. Techniques such as high-throughput synthesis, microwave-assisted organic synthesis (MAOS), flow chemistry, and biocatalysts are highlighted for their ability to produce compounds more rapidly and with lower environmental impact than conventional methods. These approaches not only support the scalable

94510

Rama Prasad Padhy *et al.,*

production of pharmaceuticals but also align with global sustainability goals by minimizing hazardous waste and reducing energy consumption. The review culminates with a discussion on emerging trends in drug target identification, featuring case studies of successful drug designs that demonstrate the practical applications and impact of these methods. Looking ahead, the review outlines future directions for drug design and synthesis, emphasizing continued innovation in computational tools, synthetic methodologies, and sustainable practices to address evolving healthcare needs.

Keywords: Rational drug design, structure-based drug design, fragment-based drug design, computer-aided drug design, artificial intelligence, green chemistry, high-throughput synthesis, microwave-assisted organic synthesis, flow chemistry, biocatalysts, drug target identification, sustainability in pharmaceuticals.

INTRODUCTION

Medicinal chemistry in a broad meaning represents two basic aspects of pharmaceutical development, namely the drug design and synthesis of the new chemical compounds to be tested as potential drugs. Traditionally, drug discovery was a blind and more or less random process with some occasional discoveries made by accident and much groping in the dark. While it sometimes proved useful in developing inventive ideas, there was no planned way of implementing such a method; the development span almost always turned out to be unreasonably long. Over the years however the field grew with the introduction of concepts such as rational and computational approaches to drug discovery taking the process from a rather lucky find scenario to more systematic and scientific (Hughes et al., 2011; Schneider & Baringhaus, 2008). The quagmire has led to the development of structures in elements of desire thus improving precision and efficiency of therapeutic outcomes in the molecule. Among the various achievements in the recent advancements in the drug design, the use of high through- put screening or HTS can be regarded as one of the most important breakthroughs made. The speed enabled by the HTS technology lets researchers screen large numbers of compounds in a relatively short period of time and find out which of those compounds may interact with a specific target of interest. By this capability, the rigorous phase of drug discovery in the first instance has become much faster to enable the assessment of hundreds of thousands of compounds within the shortest time possible (Macarron *et al.,* 2011). These changes notwithstanding though, the cost of developing a drug remains high.

It has been postulated that investment in research and development of each molecule that makes it to the market is above $2 billion (DiMasi *et al.,* 2016). Due to these high costs, there are growing expectations of the industry to look for even better ways of discovering drugs. To overcome these challenges, inputs like computational modeling and machine learning have gained significance in drug development process. Computer-aided technologies make it possible to filter through increasingly large compounds libraries, estimating their interactions in the context of a biological system before they are synthesized in the lab, thus helping save the costly time and energy of the scientists and directing them to the best of the available compounds to work on. Machine learning helps in this process by being able to decipher certain physiological data d to establish certain trends as well as prognoses that would else wise would be hard to determine (Swinney & Anthony, 2011). Combined, these approaches are contributing to the rationalization of discovery efforts and the costs incurred, which could afford drug development. Besides technology trends, new trends have been recognized in chemin formatics for data analysis and compound selection. Cheminformatics enables researchers to process big data more stream linedly since it helps in the selection of drug prospects that are more likely to be successful in clinical trials (Brown & Superti-Furga, 2003). In tandem with these innovations, improved understanding of molecular biology disease processes has further strengthened patient treatments toward more specific and selective ones. Specialized scientists are already able to develop drugs and their specific molecular goals more concisely, which may in turn; make them more effective while causing fewer side effects (Paul *et al.,* 2010).The evolving landscape of molecular biology has further enriched the drug discovery field,

especially in terms of understanding the precise mechanisms underlying diseases. With a deeper comprehension of molecular pathways and genetic markers, scientists can develop targeted therapies that are designed to interact with specific proteins or cellular processes, leading to increased efficacy and reduced side effects. These targeted therapies represent a shift away from broad-spectrum drugs, focusing instead on precision medicine that tailors treatments to individual patient profiles and specific disease markers (Paul *et al.*, 2010). This focus on precision is part of a broader trend in healthcare, driven by the goal of personalizing treatment for maximum therapeutic benefit. The scope of drug discovery has expanded to address a more diverse range of health needs, particularly neglected diseases that have historically received limited attention due to low profitability. With increased awareness and global health initiatives, pharmaceutical research is now exploring diseases that disproportionately impact underserved populations, a development that signifies a shift toward more equitable health outcomes. This trend reflects a growing understanding within the pharmaceutical industry of the need to balance profitability with social responsibility (Lazo & Sharlow, 2016). By prioritizing neglected diseases, researchers are contributing to broader health equity, ensuring that medical advances benefit a wider demographic rather than remaining confined to high-revenue markets.

Emerging Trends in Drug Design

Emerging methods, enabling greater understanding of biological targets, have powered dramatic progress in drug design. These methods also enhance the ability to create drug which has more precise and could have less side effect and tailored efficacy to a particular illness. However, within these approaches, rational drug design (RDD), the integration of structural biology and molecular pharmacology to design drugs selective for intended biological targets, has over time become the cornerstone approach.

Rational drug design (RDD)

Rational drug design (RDD) is a means of intentional design of therapeutic molecules (i.e. drug molecules) made exiting on extensive knowledge of biological target(s) especially at molecular level. This is an approach based on structure activity (SAR), that is, how a compound's molecular structure relates to its biological activity. Learning these relationships allows scientists to design drugs which bind to one specific site on a target protein with great selectivity, increasing therapeutic efficacy and decreasing off target effects and side effects. *Morphy, and Rankovic, in their research (2007)* describe RDD application as successful when multiple ligands are used targeting specific disease pathways. HIV-1 protease inhibitors is a noticeable example of the application of this. In these inhibitors the active site of the HIV-1 protease enzyme was targeted with specific binding, a protein that is essential for viral replication. Because of this, HIV-1 protease inhibitors usefully block this enzyme in order to prevent the virus from multiplying and manage HIV/AIDS *(Morphy & Rankovic, 2007)*. *Ghosh et al. (2017)* show how this approach illustrates how RDD took the treatment of viral diseases to a new more targeted approach, where therapies interrupt the disease generating mechanism at a specific target. *Congreve et al. (2003)* also describe another significant development within RDD, that of fragment based drug discovery (FBDD) techniques. An application of FBDD positively involves the identification of small chemical fragments with favourable binding characteristics and pharmacokinetic properties that can then begin drug development. Such fragments conform to a 'rule of three,' that they should have a molecular weight less than 300 daltons and usually three or fewer hydrogen bond donors and three or fewer hydrogen bond acceptors. Once fragments have been optimized and combined to make more complex and better lead compounds (Congreve et al. 2003), they are available for further optimization. This provides a useful method for the generation of promising drug leads which conform to preferred pharmacokinetic parameters and which can be developed as full therapeutic agents. However, recent advances in structure-activity relationship (SAR) studies have further expanded the use of RDD by improving hit compounds into potent and highly selective lead candidates. SAR can be used to modify compounds to give them desirable pharmacological properties, such as potency, selectivity, and bioavailability. These refinements are emphasized by Bleicher *et al.* (2003) as SAR driven modifications can change initial hits (basic activity with a target) to leads with better therapeutic profiles. This optimization process is of particular importance in oncology and infectious disease where high specificity for diseased cells (or pathogens) is vital to limit damage to healthy cells (Bleicher *et al.,* 2003).

Rama Prasad Padhy *et al.,*

Its implementations in oncology for example, have birthed drugs that can annihilate the pathways of rancid cells without affecting the normal tissue of the patient. In the same way, in infectious diseases, the RDD driven compounds are planned to target the specific portion of the pathogen life cycle, or its pathogenicity factors, thus offering better attenuation of infections with less toxicity. In general, the possibility to design drugs with very high target selectivity has been one of the greatest achievements of RDD, especially when molecule understanding is progressing constantly, and new SAR approaches are being established. Rational drug design can be only considered as an effective strategy for modern medicinal chemistry where the detailed molecular and structure interplay between all components of rational drug design is elaborated through state of the art structural techniques to produce highly specific drugs with the improved therapeutic indices. It has made continuous improvement by using SAR, fragment based methods and due to all these RDD has remained an integral part of new drug discovery especially in areas like oncology, virology and infectious diseases.

Structure-Based Drug Design (SBDD)

Structure based drug designing (SBDD) is one of the revolutionary approaches of drug discovery that uses the specific three dimensional structural information of the target biological system to design them. The structural data recovered by sophisticated methods such as X-ray crystallography and nuclear magnetic resonance (NMR) spectroscopy allows the scientists for structural determination of proteins as well other biomolecules at the atomic level. This feature assists the researcher in finding features like binding domains, active sites, and allosteric sites into a protein. Consequently, SBDD enables the identification of the apt regions to design molecules with greatest propensity to accommodate the target protein while avoiding unwanted interactions that may lead to adverse effects *(Blundell et al., 2006).* SBDD uses several methods of which molecular docking is a key computational strategy that predicts the possible binding modes of small molecules, including drugs, with a selected protein. As mentioned earlier, molecular docking imitates the binding of a compound to the target and estimates the адентification number and its position in relation to the target compound. This approach along with the Virtual screening helps the identification of large sets of compounds against particular protein targets This along with Vehicle docking make it possible to screen a large compound database within a short span of time. Additional to time and cost saving, virtual screening also improves outcomes by focusing on the molecules most likely to lead to a successful compound, which saves time and resources for further experimental testing *(Jiménez et al., 2018).* Closely related, these approaches have widely been adopted into the pipeline of drug discovery, with highly enhancing impacts in the identification and optimization of lead compounds. Among all therapeutic areas, oncology has reaped considerable benefits from the use of SBDD. Protein structure information obtained from SBDD has assisted in cancer drug design through enabling the design of inhibitors that are specific to cancer targets. For instance, because structural differences have been established between kinases which are significant enzymes in cancer signaling, new kinase inhibitors have been designed with higher selectivity and binding probabilities *(Kuntz, 1992).* These inhibitors are intended to target on such irregular kinase activity to inhibit undesirable cell division while the normal cell functions remain unaffected. These efforts are important because traditional chemotherapy harms healthy cells and has side effects, which such targeted methods do not have. Yet another important contribution to the animated discussion of SBDD is its contribution towards the reduction of drug discovery cycle facilitated by virtual screening. *Jain, 2004* describes the role that virtual screening has played in expediting all aspects of lead compound discovery and optimization. Computational tools of virtual screening together with structural investigation make it possible to analyze thousands of compounds in less time than used in experimental approaches while only the most effective compounds are considered for advanced experiments. This not only cuts the discovery timeline but also brings better cost optimization to the method which makes it one of the most valuable tools in modern pharmacological studies.

Fragment-Based Drug Design (FBDD)

FBDD is a process through which target molecules are fragmented into smaller, easier to handle pieces in a quest to discover desirable drug leads. This approach enables the surveying of chemical space more effectively, and, in many cases, results in identification of novel therapeutics. It has been recognized that FBDD is especially suitable for targeting difficult proteins and it has recently been used in numerous fields such as antiviral and anticancer agents. The following sections expand on critical features of FBDD as described in the included papers.

Fragment Library Design

Fragment libraries and, as such, the core of Fragment Based Drug Design (FBDD) is, indeed, an influential aspect of their efficiency. An effective strategy of building a small library of variously functionalized small molecular weight compounds is critical for picking out several drug like compounds. It has been found that the use of an automated system, using KNIME software, is a successful approach in the creation of such libraries, while maintaining chemical space and 3D properties imperative for drug interaction and selectivity *(Dekker et al., 2023).* This variety of libraries helps the researchers scan a vast chemical space and find fragments that can then be optimized into good drug-like molecules. In addition, by targeting the underrepresented scaffolds, including cyclopropane, the enhanced diversity and physicochemical properties of these libraries can be achieved, giving drug design new opportunities (Dekker *et al.*, 2023).

During the Discovery Process of Antiviral Drugs

FBDD has proved beneficial for Antiviral target identification and has seen usage in the inhibitors of viral proteins. One particular example is related to the design of inhibitors which act against the Hepatitis B virus core protein. Through FBDD, researchers have explained that they are able to dissect and remanufacture new forms of existing antiviral drugs like Ciclopirox with higher binding affinities (Mohebbi *et al.,* 2023). Such an approach caused discovery of compounds with improved antiviral activity, which can be considered as a success factor. Furthermore, FBDD has been used in the generation of new molecules for the treatment of multiple strains of the corona virus. Thus, fragmenting and re-mixing known drugs allow obtaining molecules with higher binding to the target viral proteins and higher stability, which proves helpful in designing drugs for combatting the most complex viral diseases *(Benny et al. 2023).*

Fragment Decomposition Techniques

Disassembly of small molecules into smaller parts is an essential process in FBDD, and several strategies have been invented to facilitate it. One such biological process is MedChemFrag which enables one to dissect a molecule while maintaining its functional moieties. This preservation is important since particular non-covalent interactions should be retained if the drug has to effectively bind to its target *(Palyulin, 2023).* Since FBDD breaks molecules into functional fragments, which are then optimized, this approach enables enhanced identification of lead candidates to be optimized further. Thus, the preservation of functional integration during decomposition assists in preserving the energetic and selective potential of potential drugs.

Integration with Structure-Based Drug Design

FBDD does not only stand on its own but can be combined with other techniques in drug design including the Structure Based Drug design (SBDD). One of the promising integration is with Generative Flow Networks (GFlowNets) which enables us to sample over extremely large combinatorial spaces of drug like molecules. This integration hence makes it possible for researchers to put in place molecules that are a perfect fit in protein pockets hence improving the accuracy and efficiency of the drug designing *(Lee et al., 2024).* This concept of integrated approaches of FBDD with SBDD enhances the process of discovering toxicology agents, by mandating those hits, which have been designed to blend with the targets of structure data, giving the best probable prospects. However, some issues are still associated with fragment screening and optimization steps that significantly affect the overall efficiency of the approach, and, therefore, it is critical to have access to the high-quality fragment libraries as well as reliable computational tools to support this type of work.

Computer-Aided Drug Design (CADD)

Computer-Aided Drug Design (CADD) is a pivotal component in modern drug discovery, leveraging computational tools to enhance the efficiency and precision of developing new therapeutic agents. CADD encompasses a range of methodologies that facilitate the identification, optimization, and validation of potential drug candidates by simulating their interactions at the molecular level. This approach not only accelerates the drug discovery process but also reduces costs and improves the success rate of identifying viable drug candidates.

Rama Prasad Padhy *et al.,*

Applications and Methodologies

Computer Aided Drug Design (CADD) is an essential component of the process at the end of which potential lead compounds are identified. A good example is the study done in targeting Streptococcus pneumoniae through compounds extracted from Carica papaya *(Bhanu et al., 2024).* On this basis, CADD can contribute to the prediction of biologically active compounds that may be further developed into novel therapeutics. Further, it is also used in the design of Targeted Drug Delivery Systems (TDDS) at CADD. The 6bjectivee of these systems is to follow drugs specifically to the sites that need treatment thereby increasing the dosage effectiveness and reducing toxicity. CADD plays a central role in the computation of these drug delivery vehicles like polymeric micelles and nanoparticles which is a step that completes the creation of these systems *(Sribhavani et al. 2023).* The technique used in CADD such as the virtual screening, molecular docking, and structure based drug design enables the researcher to take rational approach towards biochemical interactions and mediate chemical entities to enhance their polish by turning them into drug like products *(Bassani & Moro, 2023).*

Tools and Techniques

CADD involved many computational approaches that are crucial for the prediction of the 3D structure of target proteins. Some of the techniques used are; Homology modeling, Threading and ab initio. For instance, in the study on schizophrenia homology modeling was applied in order to predict the 3D structure of the SP4 protein *(Hameed et al. 2023).* These tools allow for visual analysis of the structures, as well as for identification of probable locations of the drug binding. Furthermore, the Program including Anolea, ProCheck, and Errat are used to evaluate the accuracy of predicted structures. These tools precede molecular docking analysis by validating the models used in the subsequent analyses, which increases the reliability of the predictions *(Hameed et al. 2023).* The primary goal of this work is to develop optimal methods for predicting protein structures and their interactions with molecular targets in order to achieve higher efficiency in the design of active substances.

Benefits and Limitation

The incorporation of CADD into drug discovery workflows catapulted the entire process to a Gong because of the enhanced velocity at which potential drug targets are recognized. This has ensured that CADD become an essential tool in research, academic institutions, and industrial setting *(Bassani & Moro, 2023; Ece, 2023).* Since the procedure enables the forecasting of how different chemical entities will interact at a molecular level, CADD can be used to optimise samples in a short span of time which in turn speeds up the drug discovery process. Nevertheless, in implementing CADD, it comes along certain challenges as discussed next. High quality of the structural data turns into one of the primary tasks, based on the fact that the reliability of the predictions is directly proportional to the quality of input information. Additionally, the accurate prediction of the biological activity and toxicity of the drug candidates is still a challenging problem; therefore the application of CADD to its full potential in the drug discovery is prevented *(Bassani & Moro, 2023).* Despite the benefits gained on CADD, further research and development are still needed to address these challenges most especially on the enhancement of the fitness of the computational models and the development of new algorithm to boost the accomplishment of the predictions. The continued evolution of these platforms is required for optimizing the use of CADD in the advancement of new pharmaceuticals.

De Novo Drug Design

The field of new drug design is evolving with innovative approaches that leverage advanced computational techniques and novel biochemical strategies. These methods aim to address the limitations of traditional drug design, such as the finite availability of binding sites and the complexity of multifactorial diseases. The integration of artificial intelligence and pharmaco informatics is paving the way for more efficient and targeted drug discovery processes.

Novel Biochemical Strategies

A new concept regarding antiviral drugs implies changing the local conditions of the exterior of the virion. This approach appears to have great potential to prevent the viruses that cause HLs by relaxing spatial configurations in the viral proteins to the extent that they reduce their capability to bind with host receptors. This means that this

94515

strategy could provide a new effective approach in dealing with viral infections like influenza, and other virus diseases *(Mackenzie-Kludas et al., 2023)*.

Applications and Advances in Artificial intelligence and Machine Learning Technique in De Novo Drug Design
Specifically Machine learning also a branch of Artificial Intelligence (AI) is changing the way for drug design at a faster rate with much higher accuracy in predicting molecular interactions. One of them is the Joint Transformer model – an effective tool that unites the generative and predictive features to create the deep molecular drugs design. It can also be observed that this model considerably minimizes prediction errors relative to conventional SMILES-based de novo drug design. This means that the application of the proposed model for the generation of new compounds will be faster and more reliable as the generated compounds are likely to possess enhanced target properties *(Izdebski et al., 2023)*. Further, protein- anchored encoding and transfer learning techniques from the deep learning class are used to design ligands with high affinity to target proteins even when there is scarce data available, which in turn augments drug discovery *(Wang et al., 2023)*.

Addressing Complex Diseases
Such targets are being used frequently in the pharmacophoric design of therapies for intricate diseases such as Alzheimer's that beset a range of physiological systems. These tools assist in the detection of molecules that can modulate several biological processes at a time hence making them potential polypharmacological agents. This is especially crucial as there are multiple mechanisms that are involved in the development of disease like Alzheimer's. And using pharmacoinformatics, scientists can create drugs that match the complexity of such diseases and, therefore, can be more effective *(Arrue et al., 2022)*.

Fragment-Based and De Novo Approaches
A fusion of fragment-based and de novo methods creates an opportunity for the generation of novel molecules in underexplored or hard-to-drug regions. Using energy minima and molecular dynamic simulation this method ensures high binding affinities and pharmacokinetic properties of potential drug candidates. This shows that by combining both of these approaches it is possible to tailor the molecules and the characteristics of these molecules in a way that will the chances of the desired outcome in drug discovery. It advances new ways to selectively modulate other developing and hitherto overlooked drug targets *(Kulczyk & Koszytkowska-Stawińska, 2022)*. The advances introduced in this discussion underscore the possibility of extensive progress in the utilization of drug targeting. However, there exists some limitation, for instance the lack of validation of computational models and even the lack of incorporation of these models in the established drug development framework. Furthermore, diseases such as the Alzheimer's do not have any one cure or approach that can be followed in order to develop drugs, that is why drugs of all types, conventional and new generation, are needed.

Artificial Intelligence in Drug Design
Artificial Intelligence (AI) is revolutionizing drug design and optimization by significantly accelerating the drug discovery process. AI techniques, such as deep learning and machine learning, are being integrated into various stages of drug development, from target identification to lead optimization. These advancements promise to reduce the time and cost associated with traditional drug discovery methods. However, challenges such as data quality, model evaluation, and ethical considerations remain.

AI Techniques in Drug Design
AI has been on the frontline in introducing revolutionary approaches into drug design by increasing rate and speed of drug discovery. Perhaps the most well-known example is the application of transformer and many-objective optimization algorithms for creating new molecules that can efficiently bind to a particular protein of interest. These methods enable the search across greatly expanded chemical space, enhancing the probabilities for finding the prospective drug candidates with the required characteristics. Using sophisticated computational approaches as a tool, AI contributes toward designing drugs with high accuracy to those diseases and has become a key element in current drug development *(Aksamit et al., 2024)*. Another emerging AI methodology is the combination QSAR and

94516

QSPR, which processing molecular structure data in order to predict the biological activity and properties of chemical compounds. These, together with virtual screening, are effective means for searching large databases to find the lead compounds. Furthermore, new learning strategies, that is, neural network learning that is able to decipher intricate patterns directly from data, has been integrated into the drug discovery process to reduce possible human inaccuracies (Khan et al., 2024). In addition, machine learning algorithms combined with reinforcement learning and graph neural network (GNNs) are employed in de novo drug design, where new drug molecules have to be constructed from basic building blocks. These methods also assist in estimating other properties of the drug including solubility, toxicity, and bioavailability to a very large extent, hence faster the drug discovery process *(Qureshi et al., 2023).*

Challenges in AI-Assisted Drug Discovery

However, there are a number of effective barriers that have to be overcome to enhance these AI augmented drug discovery technologies. One major problem is the accuracy of the data that is used in training of such artificial intelligence systems. Some of the issues which are data-related include; bias, inconsistency, and high dimensions which affects the performance of AI systems. For example, When creating models, an imbalance in the data can cause issues in making generalizations about models and thus potentially impact drug predictions. Similarly, this brings about the improper organization of data and likewise brings about bad results to the organization of AI in drug discovery *(Ghislat et al., 2024).* The fourth key issue is the assessment of AI approaches and models, there are also further challenges to overcome in order to promote and integrate AI approaches. Several models are validated against benchmarks, or other datasets, which may in fact not be a good measure of the capacity of AI models in drug discovery applications. This limitation can lead to mismanagement of its abilities to even researchers and developers and draw wrong conclusions concerning a model real potential. Furthermore, given the dynamism in the field, it might be challenging to evaluate current more intricate nature of modern AI drug discovery tools using prior methods as GHISLAT and al. noted in 2024. Furthermore, issues relating to AI's ethical legitimacy in drug discovery and development – data protection, openness, and responsibility – have to be resolved. The use of AI should involve acceptable norms that check the impact that the technology can cause to society for it to benefit the society fully *(Khan et al., 2024).*

Bioinformatics and AI Integration

The coupling of bioinformatics with AI continues to shape the way in which newly identified drug targets are optimized and discovered. Bioinformatics is the study of 'biological information and includes the fields of genomics, proteomics and metabolomics and offers insights into the pathogenesis of diseases. Bioinformatics tools are fast and efficient when implemented along with AI, such that, there is enabling of the study of disease biology leading to the discovery of potential drug targets. By using technologies like machine learning to sort through genomic and proteomic data, researchers can identify which targets are most likely to respond to treatment much more quickly than drug discovery methods of the past *(Yin, 2024).* Also, the integrated use of AI in bioinformatics is becoming increasingly useful in extrapolating the metabolism and toxicity of drugs, which are major areas of concern in drug discovery. AI can predict how a drug will be metabolised in the body, and therefore assist in the design of molecules with improved pharmacokinetic properties hence less toxicity with improved efficiency of the compound. This integration of the application of AI in conjunction with the field of bioinformatics is therefore enabling researchers to enhance optimal drug candidates at concept stage, thereby enabling timely launch of new therapeutic products in the market *(Yin, 2024).* There are quite a number of compelling opportunities offered by AI and bioinformatics in catapulting the drug discovery process to another higher level but there are number of challenges especially on the aspects of data quality, model evaluation as well as ethical issues that need to be discussed so as to enable AI unlock its full potential in the drug design and optimization. To remove these barriers AI technologies could improve the efficiency, efficacy and cost of new drugs from drug discovery to patient care, thus has a huge potential to change the outlook of the health care industry.

Recent Advances in Synthetic Techniques

The developments in the past few decades have provided synthetic chemists with new ideas incorporating the tactic of green chemistry. These techniques are gradually becoming a fundamental strategy in drug synthesis with specific emphasis placed on environmental stewardship. Moreover, the incorporation of high-speed technologies has improved compound making and production to a high level, which has led to increased drug discovery. A breakdown of these advancements, and their possibilities and limitations is provided in detail below.

Green chemistry in drug synthesis

Green chemistry concerns itself with principles aimed at reduction of waste, use of less hazardous materials and enhanced efficiency of a chemical process. The use of microwave in drug synthesis has brought great improvement in method development and technology.

Sustainable Methodologies

New environment friendly strategies in green chemistry have helped to advance methods of drug synthesis by altering the conditions of the reactions and minimizing resource use. A specific case relates to the role of aqueous micellar conditions in the Sonogashira coupling process to increase the effectiveness of synthesizing the antimalarial drug candidate MMV688533. This method also not only increased the yields but also minimize the use of catalyst which is in complete conformity with the concept of green chemistry. Such progress shows that through experimentation, new reaction conditions can be developed which will provide both high performance and feasibility of environmentally friendly solutions (Tyler *et al.,* 2023).

Chiral Drug Synthesis

Green chemistry techniques have been particularly valuable in the synthesis of chiral drugs; these drugs are essential in pharmaceutical applications because each has unique biological activity. The major inputs used in the process have been minimized, through improved catalyst design and the use of less hazardous solvents. For example, Current investigators have designed new chiral catalysts which provide very high enantioselectivity despite using minimal wastes. All these developments are important for the pharmaceutical industry in particular where the need for synthesis of chiral drugs with high enantio selectivity and economy has been on the increase (Zhao *et al.*, 2024).

Emerging Technologies

Green chemistry has also adopted recent technologies like microfluidics and electrochemical synthesis in order to enhance green efficiency. Micro reactive systems, in which the conditions of the reactions can be fine-tuned on the microscopic level, have proved to offer a high solvents- saving efficiency and significantly shorter reaction times. Likewise, electrochemical synthesis also shows efficiency over the conventional methods where electricity is used to initiate the process of synthesis. These technologies illustrate the emerging trends being applied in an effort to make the synthesis of drugs friendlier to the environment as well as more efficient (Zhao *et al.,* 2024).

High-Throughput Synthesis

Other methods are also linked to green chemistry because high-throughput synthesis methods allow one to obtain large numbers of compounds. These methods are effective in the overall process of drug discovery because they provide a way for the economical generation of a large number of small molecules.

Combinatorial Chemistry

Combinatorial chemistry now enters the age of automation to produce an astonishing array of compound libraries. Building blocks allow researchers to arrange and rearrange a vast number of concepts or substances to soon create thousands of new chemical compounds. This approach is more advantageous in hit identification, specifically during the initial phases of compound discovery because the majority of the potential bioactive compounds need to be examined for possible therapeutic action. Subsequent improvement of these processes by automation has made combinatorial chemistry an indispensable weapon in the modern pharmacologist arsenal.

Large-Scale Applications
GLS high-throughput methods are also being used on a more extensive level to create chemical libraries containing wide variations in functional groups and structure. Indeed, such large libraries are more useful in the identification of leads in the drug discovery and development processes. Since it is possible to generate such libraries in a relatively economical fashion, the freedom to scan a far greater chemical library makes it more likely to discover successful drugs. These methodologies have also become imperative in pharmaceutical pipelines to supplant the time and costs related to traditional combined synthesis.

Microwave-Assisted Organic Synthesis (MAOS)
MAOS (Microwave Assisted Organic Synthesis) has developed as one of the most innovative approaches to organic synthesis especially in line with the developing pharmaceutical industry. This method improves the efficiency of the reaction by using microwave radiation; thus, it can be utilized to synthesize pharmacologically active molecules. Discovering that MAOS was capable of facilitating a decrease in reaction times by several orders of magnitude, the improvement in selectivity to desired products, and its compatibility with green chemistry, there can be no surprise that MAOS has been preferred in drug development. Overview of MAOS Below is the prospects of the technique, fields of application, and limitations inherent to MAOS.

Benefits of MAOS
The benefits of Microwave-Assisted Organic Synthesis arise from the solution that it offers to some of the challenges typically associated with the conventional synthesis processes – time, efficiency and environmental impacts.

1. **Reduced Reaction Times:** The most important feature of the MAOS process is the reduction of reaction times by orders of magnitude compared to conventional heating. Most of the non-chemical reactions can take hours up to days to complete because the heat transfer in non-chemical platforms is slow and irregular. MAOS on the other hand uses microwave radiation to directly induce the required change through radiation heating the molecules up and thereby increasing the rate at which the reaction takes place. For instance, reactions that can normally take h – several hours can be done in a matter of mn- minutes using this technique (Babu & Prasanthi, 2023). It does so not only to boost the efficiency of the research time but also to make high through-put synthesis a realistic ambition.
2. **Improved Efficiency:** MAOS frequently enables yields which are better than ordinary ways, as well as reactions that are less tainted. Microwaves heat the food uniformly and reduce formation of undesired products during cooking hence most of the input materials transform to the end product. This efficiency is even more desirable in drug synthesis because purity and yield are significant parameters that affect subsequent steps (Shu, 2023). Also, the decreased formation of by-product corresponds with the principle of green chemistry due to the effective use of reagents.
3. **Enhanced Selectivity:** Yet another very significant virtue of MAOS is selectivity improvement in the chemical reactions. It is thus easier for the biologist to fine tune the heating parameters and achieve the wanted reaction while minimizing side reactions that will distort the product. Selectivity is an essential aspect of this particular approach, especially in terms of developing drugs since the desired pharmacological action is generally linked with a specific molecular form (Damera *et al.,* 2023).

Utilization in Drug Synthesis
The pharmaceutical industry has received MAOS as a tool of synthesis of pharmacologically active molecules and heterocyclic compounds, which are the framework of many drugs.
1. **Synthesis of pharmacologically active molecules:** Heterocyclic compounds occupy a broad and important place in pharmaceutical chemistry and act as antibiotics and anticancer agents. MAOS has been shown to be especially useful in the synthesis of these molecules as it is far faster than conventional approaches. For instance, the preparation of nitrogen- and sulfur-containing heterocycles that are popular in the API structure has been accelerated by microwave-aides synthesis methods (Shu, 2023; Shalaby *et al.,* 2023).

2. **Alignment with Green Chemistry Principles:** Again, what makes MAOS unique is not only the general effectiveness that is offered, but also the efficiency that is ecologically friendly. The method minimises the utilization of excessive solvents as well as energy both which are critical to the environmental footprint of conventional chemical synthesis. Moreover, MAOS minimises the formation of undesired by-products and further augments MAOS's sustainability due to developing cleaner reactions with decreased chemical waste *(Frecentese et al., 2023)*. These green chemistry attributes make MAOS a preferred method for modern drug synthesis where sustainability is gradually gaining a standard.

Flow Chemistry in Drug Synthesis

Flow chemistry or continuous flow processing is a modern approach that displaces the model of batch synthesis. The basic controlling feature of flow chemistry is that the reaction occurs under a constant flow of reactants, but in a locked manner, and this offers better control in terms of safety as well as efficiency of the parameters.

Key Principles of Continuous Flow Reactions

Continuous Processing

Contrary to the batch reactions that are characterized by step-by-step, in static reactors, flow chemistry uses a continuous flow of reactants through the reactors. This system enables proper control of reaction parameters such as temperature, pressure and time and hence reactions occur in a better way. This method of control affords a decreased chance of side reactions and allows for a more consistent product quality. For instance, in processes with intermediates that are hazardous or highly reactive, Capaldo *et al.* (2023) conceptualized how continuous flow processes improve safety.

Scalability

Flow chemistry is particularly notable for its scalability, so the system will be relevant not only for laboratory experiments but also for industrial processes. This can be easily scaled up without any negative impacts on the overall activity and quality of the final product. Dent (2022) explained how complex APIS that require multiple steps and harsh conditions can be achieved in flow systems at relatively mild conditions, which is important for both purity and yield in drug manufacture, especially in view of the current highly stringent regulatory requirements for new drugs.

Automation

The incorporation of robotic systems in flow chemistry removes the complexity of processes such as screening and performing of reactions. The use of ancestral systems can facilitate real-time control and as such can allow the fast iterative exploration of reaction conditions. As other authors confirmed, automation increases the degree of replicability, especially in cases where multiple step procedures are involved and control is crucial.

Implementation in Multistep Synthesis

- One-Flow Synthesis: The latest development in flow chemistry has made it possible to perform continuous multi-step, which is referred to as one-flow synthesis. This approach also reduces the number of intermediate purification steps that are required, to a fraction of those required in traditional synthesis, which also mean greatly reduced reaction times. The authors Bloemendal *et al.,* (2020), have also shown that one-flow synthesis offered enhanced yields and shorter cycle times in production of multi-step APIs for diseases like viral infection and cancer.
- Diverse Applications: Continuous flow processes are very flexible and can be applied to most reactions including those occurring under extreme conditions. For instance, flow reactors apply in asymmetric synthesis of chiral drugs that are vital in treatments involving selected biological activities. According to Ötvös & Kappe (2021), continuous flow systems also provide a high degree of control over the rate and other conditions of the reactions, which is important for the high enantioselectivity needed in chiral drugs.

Click Chemistry in Drug Synthesis

The term click chemistry describes a conceptually elegant and modular strategy for the efficient and accurate construction of large and complex structures from readily available and easily functionalized components. Popular for its ease and effectiveness, this methodology is especially important in the assembly of drug conjugates and delivery platforms.

Concept of Click Chemistry

- **Modular Approach:** The basic rationale behind click chemistry is based on using reactions that are appended with high yield and that occur under conditions that are rather mild. Such reactions as azide-alkyne cycloadditions described above give a rather sound approach to the formation of molecular scaffolds. According to Capaldo *et al.* (2023), click chemistry is valuable for drug synthesis since it is quick and accurate to address people's needs.
- **Versatility:** Click chemistry is flexible and can be applied in a wide variety of cases related to the pharmaceutical industry. They are employed in drug conjugation where one or both drugs are connected to targeting molecules and in the construction of mulitpotent drug delivery systems. As Dent (2022) also pointed out, the modularity of click chemistry makes it possible to create new therapies, including ADCs and nanoparticles.

Applications in Drug Conjugation and Diagnostics

- **Targeted Delivery:** Among the numerous applications in which click chemistry has been greatly used is in the area of drug delivery. Thus, click chemistry makes it possible to enhance the selectivity of the drug action by attaching it to targeting moieties including antibodies or ligands. This approach minimizes adverse effect profiles and increases drug effectiveness. Ötvös & Kappe (2021) depicted how click reactions are employed in building ADCs that release cytotoxic cargo exclusively to cancer cells and sparing the healthy cells.
- **Diagnostic Tools:** In a similar manner, the modularity of click chemistry applies to diagnostics agents being built from modular components as well. These tools can be used to do baseline reactions against corresponding biomarkers to enhance specificity and or sensitivity of the diagnostic tests. Hardwick & Ahmed (2020) pointed out that click chemistry is employed for designing fluorescent probes and imaging agents to selectively detect disease biomolecules. However, both flow chemistry and click chemistry have issues with the need to be resolved in order to fully realise the potential they possess. While these methods are advantageous, they often need specialized tools and the associated equipment such micro reactors for flow chemistry and specialized reagents for click reactions, which may be out of reach of a small laboratory or even a company. Furthermore, as with most modern separation techniques, both techniques are highly generic and can be used for most kinds of chemical reactions; nevertheless, very complex or sensitive reactions may not benefit much from the techniques and may have to be performed traditionally. Additionally, the extension of flow chemistry reactions from the laboratory to production scale can be problematic, particularly for hot or quick responses; and size adaptation of click chemistry for the mass manufacturing of drugs deserves further study.

Biocatalysis in Synthesis

Enzyme mediated biocatalyst is has emerged as an indispensable technology in asymmetric synthesis with substantial advantages in generating value added emission free green chemistry products in pharmacy and agriculture. They are unique natural catalysts offering high selectivity in reactions to yield the chiral compound with precision and accuracy. These qualities make enzyme-based techniques particularly suitable for the applications in those cases where chiral compounds have to be built up to enantiopurity. The fact that enzymes work at low temperatures or under non-hazardous solvents are some of the reasons enzymatic activity has been widely embraced in green chemistry as a healthier option than regular chemical processes ever since 2024. This type of asymmetric synthesis has numerous benefits owing to the wide number of reactions that is can catalyse: optical and kinetic resolution. Both processes are essential in synthesis of enantiomerically pure compounds because some chiral pharmaceuticals cannot function as required when they exist in the wrong optical isomer form. Optical resolution,

for example, enables the separation of enantiomers while kinetic resolution entails a reaction on one enantiomer while leaving the other incorrupted (Garg *et al*., 2024). Also, the recent breakthrough discovered in artificial copper enzymes has augmented the prospects of biocatalysis since it suggests that stereochemical control in asymmetric reactions can also be attained. These artificial enzymes work at moderate reaction conditions, and this presents a viable solution in synthesizing chiral structures of high order with optimum yield (Shiri *et al.,* 2024). Another development in biocatalysis is the use of non-conventional fluids, including ionic liquids and supercritical fluids, together with photocatalysis. These changes have brought a drastic enhancement of the chiral amine manufacturing, which is important in the production of most drugs. Due to improving the reaction conditions, and the reaction rates, biocatalysis has attained higher concentration and enantiomeric excess and has then facilitated the use of these methods in industrial processes. For the purpose of environmental relevance, enzyme catalysis is in harmony with the concept of green chemistry. This is because the enzymatic reactions tend to be carried out under comparatively low energy conditions as compared to chemical substances; therefore decreasing the pollution of the environment by minimizing the formation of multiple by-products (Zhao, 2024). In addition, the combination of flow chemistry with biocatalysis can increase the sustainability of the reactions as it allows efficient flow reaction profiles, reduction in waste production and continuous synthesis that is more sustainable than batch synthesis (Garg et al., 2024). However, there are several limitations of biocatalysts: Substrates are limited only to compounds which can be handled by enzymes and enzyme stability is also a major issue. Enzymes may be sensitive to such properties as temperature, pH, and the use of solvents which make their action limited in industrial processes in the long run. Moreover, enzymes are highly selective in order that the wanted reaction takes place with minimum side reactions. Thus, the future research in enzyme engineering and optimization is required for the improvement in bio catalytic reactions. Biocatalysts is already able to provide products with high enantioselectivity, improve enzyme stability and enhance their tolerance to extreme reaction conditions, allowing a broad expansion of its application in essentially all branches of the chemical industry and becoming the foundation of environmentally friendly production (Albayati *et al.*, 2024). Thus the enzyme bio catalysis appears as a major paradigm shift in asymmetric synthesis providing higher efficiency, ecofriendly and selective transformations. Recent technologies like artificial enzymes, non- conventional media and flow chemistry have provided the new dimensions of the bio catalysis to produce the high value chiral compounds. Despite this, continuous progress in enzyme fine-tuning makes it possible to continue the growth of the bio catalysis application sphere in the pharmaceutical, agrochemical, and many other fields.

Trends in Drug Target Identification and Validation
The field of drug target identification and validation is evolving fast, mostly due to progressions in genomics, proteomics, and – new-age approaches to drug target identification that include the use of the venerable CRISPR-Cas9 system inter alia. These innovations are more effective in direction of new targets, this enhances the validation and therefore leading to enhanced therapeutic results. In the next section, we expand some of the significant trends shaping this progression in drug discovery.

Advancements in Genomics and Proteomics
- **High-Throughput Technologies:** New generation sequencing and other high through put technologies and proteomics are the some of the techniques that are changing the way targets for drugs are being discovered. These technologies allow researchers to work through large amount of biological data within significantly short span of time. For instance, the next-generation sequencing approach can detect genetic change or differential gene expression associated with several diseases. This ability can help to distinguish new targets that had been previously beyond the means to sense and distinguish which could help advance treatments (Hassan, 2023).
- **Human Genetics Integration:** The identification of novel drug targets is becoming more dependent on human genetics. Sites such as Open Targets link genetic data from big genomics projects to determine which of the predicted drug targets are worth researching. These platforms also afford the opportunity to determine which targets are most likely to produce therapeutic outcomes given diverse inputs of genomic, epigenomic and transcriptomic data. These combined considerations guarantee that the selected targets are not merely scientifically relevant but are valid for the disease process as well (McDonagh *et al.,* 2024).

CRISPR-Cas9 and Gene-Editing Technologies

- **Target Validation:** CRISPR-Cas9 technology has advanced mainly in drug target validation. This tool will help geneticists to modify the DNA of living organisms in a process that can permit targeting those genes with interest and noting the changes in their phenotypes. That is important for acknowledging or negation of involvement of specific gene in the disease pathways. Experiments which involve knocking out certain genes or activating particular genes in model organisms simply checks whether hitting on that gene will address the problem (Francis *et al.,* 2024).

- **Functional Genomics:** Functional genomics, the study of all aspects of gene and gene product function in the organism, is also facilitated by CRISPR-Cas9. This technology can be used for functional studies that validate the position of distinct genes in disease progression. For instance, with help of undermining modifications in the genes and then observing the impact of such alterations on particular disorders, researchers may offer improved and more solid proofs of a gene's link to a certain illness. This increases confidence in drug targets and increases the probability that developed therapies against the targets will work (Francis *et al.,* 2024).

Multi-Omics Approaches

- **Integrated Data Analysis:** Multi-omics are one of the most interesting areas of drug target identification that use genomic, transcriptomic, proteomic, and other "omics" data. By combining such diverse steps in disease, different datasets provide researchers with comprehensive approaches targeting the relevant biological systems. This approach used in the discovering of the molecules and pathways that can be targeted for therapeutic purposes. Multi-omics analysis can also show how the differing mechanisms work together in relation to disease, and enable the selection of more suitable targets (Du et al., 2024; Mukherjee *et al.,* 2024).

- **Machine Learning Applications:** Another development that is interesting is the integration of machine learning and multiple types of molecular data. The deep learning model can process large datasets from different sources and determine which other targets are most likely affect disease pathways. By training algorithms from genomics, transcriptomics, and proteomics datasets, researchers will increase the ability to accurately identify desired targets. This in turn helps increase the speed with which potential targets are pinpointed, and speeds the drug development cycle (Mukherjee *et al.,* 2024). Although technology advancements in this field provide lots of opportunities, there are yet many challenges involved in it. For example, diseases usually have complicated causes with multiple genes and environment, rendering a unique target difficult to identify. In addition, large volumes of data generated by high throughput technologies, multi omics analysis, gene editing demands robust computational tools and systems for proper analysis of data. However, there remains a considerable hurdle to develop these tools, along with overcoming the complexity of disease mechanisms. However, the combination of these technologies has completely overhauled the drug discovery process and as the technologies continue to evolve, they are poised to further optimise efficiency and precision in therapies. Thus, the future of drug target identification and validation has become more and more data driven, with genomics, proteomics, CRISPR/Cas-9, and machine learning at the root of how and when we will identify and validate drug targets that can completely change treatment strategies.

Challenges and Future Directions in Drug Discovery

The drug discovery field is dynamic and complex, and presents many challenges that must be met in order to ensure the optimal realization of its potential. It includes overcoming limits of existing approaches, dealing with regulatory and ethical considerations and explorations of new practices that can change drug development landscape. Systematic analysis and resolution of these issues would improve patient outcomes and shorten the drug development pipeline.

Limitations in Current Drug Design and Synthesis Methodologies
Outdated Methodologies in Traditional Drug Design

Conventional medicinal chemistry has utilized approaches that are now considered dated and does not make provision of maximal use of current technological development. For example, these methods often rely on a manual

approach or are time-consuming, and, therefore, less accurate than computational skills. These inefficiencies can hold up the identification of potential drug candidates especially in complex diseases where speed is of the essence (Flower, 2022).

Challenges in AI-Driven Drug Design

Officials and geeks celebrate AI as a revolutionary technique in drug discovery, but it comes with some problems. Although many chemical structures can be created within a short timeframe by using various AI algorithms, the approaches to synthesizing these molecules and analyzing their biological efficacy require significant amounts of time and money. These bottlenecks are explained by the fundamental weaknesses of AI tools that still rely on trial-and-error approaches to the experimental verification of designs (Liu *et al.,* 2023).

Inadequate Molecular Screening Metrics

This is normally the case since current molecular screening methods do not always give a list of the best drug candidates. For instance, normal screening often employs metrics that exclude important cutoffs such as drug likeness and molecule effectiveness. More sophisticated approaches for Mol Filter GAN have been developed to fill this gap, but their use demonstrates the absence of adequate filtering methods in drug discovery that require a smooth integration of AI.

Regulatory and Ethical Challenges Ethical Concerns in AI Integration

The rather swift adoption of AI solutions within the drug discovery processes raises major ethical issues. There is one crucial concern in the case of AI – where to get the enormous amount of data necessary to train these systems? At many times, this information also contains details about patients and there arise issues of privacy, consent, and ownership of the patients' data. Furthermore, as decision-making in healthcare is gradually shifted into AI more attention should be paid to the fairness, interpretability and accountability of algorithms (Khan et al., 2024).

Evolving Regulatory Frameworks

Current set up of laws and regulations is insufficient to measure up to the rates of change that is being exhibited by AI and other technology in bringing about changes in the drugs discovery process. For example, currently existing regulatory frameworks aimed at analyzing new drugs invented using standard methodologies are incompatible with approaches based on artificial intelligence since they do not allow determining their safety, effectiveness, and replicability. It was noted that today there is no regulation of AI technologies as such, and the number of rules and acts provided for their functioning is insignificant; however, considering the existing trends and risks, there is an urgent need for specialized legislation that would ensure the safety and compliance with ethical norms of specific AI technologies without hampering their development (Khan *et al.,* 2024).

Future Prospects in Drug Discovery
Personalized Medicine

A new type of new drug discovery is still in the future when drugs will be discovered to respond to the patient genotype, philosophy and conditions of living. It holds a lot of potential to enhance the efficiency of therapy dramatically by targeting those remedies that are unique to particular patient, rather than singular remedy for a disease. However, following the recent development of genomics and bioinformatics, researchers are now approaching this goal (Doytchinova, 2022).

Development of Multi-Target Therapies

Conventional drugs can treat only one disease pathway, and multi-target therapy is a concept of drugs that can engage many pathways at once. In this regard, these therapies can be significant, and especially, used in the treatment of various chronic diseases such as cancer and NDs since the single target is not enough in such cases. There is a clear informative significance of studies on hybrid molecules – the compounds containing different therapies together – in terms of increasing treatment potentialities (Doytchinova, 2022).

Rama Prasad Padhy *et al.,*

Importance of Interdisciplinary Collaborations Bridging Disciplines for Innovation

Given the complexity of problems that the field of drug discovery poses, cross-disciplinary collaborations is emerging as a common feature. Scientists join together from various disciplines for example in biology, chemistry, computation and engineering which make their problem solving to be more thorough. Such collaborations help to boost innovation and create the conditions for finding better approaches to research (Askr *et al.*, 2022).

Enhancing AI Integration Through Collaboration

To attest it, AI-supported drug discovery requires the integration of different fields of specialization. For instance, computational scientists can design and deploy AI instruments, but one needs the advice of a pharmacologist, chemist, and biologist to enhance augment such tools for pragmatic utilization. Cooperation guarantee that AI intangible assets are deployed, optimising their contributions to the advancement of drug discovery at the least compromise of scientific credibility (Askr *et al.*, 2022).

CONCLUSION

This field of drug design and synthesis has been experiencing remarkable growth or development and new trends and methods defining it are surmounting old problems the traditional methods. Themodern techniques of genomics, proteomics and multi-omics have enhanced the concept of target identification and validation to a certain extent. CRISPR-Cas9 and artificial intelligence are some of the technologies that have pushed the frontiers on precision medicine and / or hybrid molecules in the course of drug discovery. These developments do not only serve the purposes of enhancing drug development, in terms of effectiveness, speed, and cost, but also the potential of promoting patient needs that remain unmet in this area. However, there are huge obstacles still present today. These include possible limitations in existing approaches, ethical factors and regulatory concerns that serve to remind patients and researchers that the development of these advancements continues after their implementation. AI and machine learning by extension has proven pivotal in so many applications yesterday, today and in future but this comes with certain inherent challenges that can only be trained by integrating best practices concerning data reliability, security, and replicability. The findings acquired from the latest developments underscore the importance of the need to incorporate the production of a high interdisciplinary collaboration to eradicate those barriers. As a result of solving the emerging tensions between computational sciences, molecular biology, and clinical research, the pharmaceutical enterprises are in a position to open new channels. New investment in early research and embracing innovation imperative are critical to keep the trajectory moving forward and adapt to the challenges of present day drug development. Therefore, the future of the drug design and synthesis will be governed by the convergence of superior methods in coordination with sound ethical principles and legal requirements. As a result, this will spur novation in the production of the drug, while promoting the development of safe, effective, and affordable drugs for humanity.

ABSTRACT

Abnormal antibody formation against red blood cells (RBCs) in blood transfusion recipients is a significant clinical challenge, often leading to transfusion-related complications such as hemolytic transfusion reactions and delayed serological incompatibility. This comprehensive review aims to explore the mechanisms underlying alloantibody and autoantibody development in patients receiving blood transfusions. Alloimmunization occurs when the recipient's immune system recognizes donor RBC antigens as foreign, leading to the production of antibodies, particularly in individuals with multiple transfusions, such as those with sickle cell disease or thalassemia. Factors influencing antibody formation include antigenic differences, immunogenetic factors, and the frequency of transfusions. Autoantibody formation, though less common, is associated with underlying autoimmune disorders and can complicate serological testing and transfusion management. The identification of abnormal antibodies requires advanced laboratory techniques, including direct and indirect antiglobulin tests, and specialized panels to detect and differentiate between allo- and autoantibodies. This review also discusses the clinical

implications of these antibodies, emphasizing the importance of accurate identification and the use of compatible blood products to prevent adverse outcomes. Understanding the pathophysiology and diagnostic approaches to antibody formation is essential in improving transfusion safety and outcomes for patients who require repeated or chronic transfusions.

INTRODUCTION

Naturally occurring anti-A and anti-B antibodies are the most common red cell antibodies present in human serum or plasma. All other red cell antibodies are referred to as unexpected antibodies (1). The presence of these unexpected antibodies can lead to various adverse reactions during blood transfusions, including mild symptoms like fever and chills, and in severe cases, potentially life-threatening hemolytic transfusion reactions (2, 3). Antibody detection is a critical aspect of transfusion medicine, as it helps identify irregular or unexpected antibodies. The detection of these antibodies is essential because their presence is a major factor in the occurrence of hemolytic transfusion reactions, posing a serious risk to patient safety (4). Abnormal antibodies, often called irregular antibodies, are so named because their presence and type are not known until an antibody screening test is performed. This group encompasses most blood group antibodies, excluding ABO and certain P blood group antibodies. While some of these antibodies develop naturally, the majority are produced as part of the immune response following exposure to foreign antigens, such as those encountered during pregnancy or blood transfusions. These antibodies can lead to both acute and delayed hemolytic transfusion reactions, with numerous documented cases highlighting their potential severity (5, 6). The detection of alloantibodies is crucial for future transfusions as their presence can lead to hemolytic transfusion reactions, either acute or delayed, and can complicate the process of finding compatible blood units(7). Patients who receive multiple transfusions are at greater risk of developing alloantibodies due to repeated exposure to foreign antigens. This repeated exposure triggers an immune response, often becoming more pronounced after the second encounter, leading to a range of clinical consequences depending on the type of blood cells and antigens involved(8). Unexpected erythrocyte antibodies can belong to either the IgG or IgM class and can lead to agglutination, hemolysis, or sensitization of red blood cells. Clinically significant antibodies are mostly of the IgG type, which react at 37°C. In contrast, IgM antibodies show optimal reactivity at temperatures of 22°C or lower (9). Anti-erythrocyte antibodies are classified based on their clinical significance. Clinically significant antibodies include Rh (C, E, c, e), Kell (K, k, Ku), Duffy (Fya, Fyb, Fy3), Kidd (Jka, Jkb, Jk3), Diego (Dia, Dib, Wrb), and MNS (S, s). These antibodies are typically associated with adverse reactions in blood transfusions. Antibodies with variable clinical significance include MNS (U, Vw, Mur), Vel, Ge, Yta, and Hy, as their effects may differ depending on the context. Antibodies that are usually not considered clinically significant include Lutheran (Lua, Lub), Lewis (Lea, Leb), MNS (M, N), A1, P1, and Cw, as they rarely cause transfusion reactions. Lastly, there are antibodies with unconfirmed significance, such as Chido/Rodgers (Cha, Rga), JMH, Bg, Csa, and Xga, for which the clinical impact is not fully established (10).

Development of abnormal antibodies in transfused Recipients
Each year in the United States, more than 11 million red blood cell (RBC) transfusions are administered, making transfusion the most frequently performed procedure during hospital stays(11,12). Recent studies on transfusion thresholds have demonstrated that using restrictive hemoglobin levels is as safe, if not safer, compared to liberal thresholds for various patient groups and clinical situations. This evidence has contributed to a reduction in the number of RBC units transfused over the last ten years. Despite the overall decrease in transfusion rates, the development of alloantibodies against transfused blood products continues to pose a significant clinical challenge (13).When a patient requires a blood transfusion, red blood cell alloimmunization is typically identified. The patient's blood sample is typically examined for unexpected alloantibodies during pre-transfusion testing [14].The specificities

most commonly observed in alloimmunized patients in Western Europe and the United States are antibodies against antigens of the Rh and Kell blood group systems (15-18).Although every transfused red blood cell (RBC) unit contains hundreds of foreign RBC antigens, only a small percentage of recipients will develop detectable RBC alloantibodies. For an alloantibody to form, two key conditions must be met: one is the recipient must be exposed to a foreign RBC antigen, and second, the individual must have a specific HLA-binding motif that can present part of that foreign antigen. Various HLA types are capable of presenting different portions of RBC antigens that have been studied(19-26). Unlike human platelet glycoprotein antigen 1a (HPA-1a), which is closely linked to the HLA class II allele DRB3, RBC antigens are not restricted to a single HLA type for presentation(27).While all transfused RBC units contain foreign antigens and nearly all recipients have HLA-binding motifs capable of presenting parts of these antigens, additional factors influence who will form RBC alloantibodies. For example, it's estimated that over 99% of transfused individuals have the potential to develop at least two RBC alloantibodies due to mismatches between donor and recipient antigens and the prevalence of RBC antigens in the population. The likelihood of alloimmunization increases with the number of transfusions but eventually levels off once a person has been exposed to most of the "non-self" blood group antigens. Despite this potential, retrospective studies show that only 2% to 5% of the general populations receiving transfusions actually develop detectable RBC alloantibodies (28).

Clinical significance of abnormal antibodies

Depending on the circumstances, transfusion of red blood cells expressing an antigen that the recipient possesses alloantibodies against can have different clinical outcomes. For the duration of the transfusion recipient's life, some RBCs that appear to be incompatible may always circulate in them. Other RBCs, such as DHTRs, on the other hand, might be entirely eliminated a few days following the transfusion. The clinical team may notice a hemoglobin that returns to its Pretransfusion   level, a fever, or dark urine in DHTRs. RBC alloantibodies increase the risk of transfusion-related problems in some patient populations, especially those with sickle cell disease (SCD). In this patient population, DHTRs with bystander hemolysis (also called hyper hemolysis), which involves the destruction of both the patient's own and transfused red blood cells, are a very dangerous and potentially fatal consequence. (29-31). Anti-M is a commonly found antibody of the MNS blood group system, but anti-N is very uncommon. They have relatively little clinical significance and are only rarely linked to HDN or HTR (32).   In HDN, Lewis antibodies are rarely implicated. The widely mentioned high incidence of IgM type Lewis antibodies is not the main cause; rather, it is attributed to the inadequate expression of Lewis antigens on fetal cells. Nevertheless, moderate HDN cases have been linked to both anti-Lea and anti-Leb (33-34). Haemolytic disease of the fetus and the newborn (HDFN) is a condition in which the trans placental passage of maternal antibodies causes immune hemolysis of fetal/neonatal red blood cells by either anti-A and anti-B or unexpected immune antibodies that develop after sensitizing events like transfusion or pregnancy. Some of these antibodies may cross the placenta in pregnant women. (35)

Laboratory identification of abnormal antibodies

Antibody detection involves a number of procedures aimed to classify any autologous reactivity, evaluate the temperature for optimal antibody reactivity, and exclude and validate specific antibodies. Red blood cell antigen typing can also aid in antibody detection by identifying the RBC antibodies and the people who are most likely to produce them. Lastly, because it relies on the magnitude of the antibody inquiry needed, the time necessary to finish antibody identification varies greatly. (36)For routine alloantibody detection and identification, compatibility testing, and the direct antiglobulin test, the column agglutination technique was used with the ID-card LISS/coombs with six microtubes of the DiaMed-ID Microtyping System that contained polyspecific antihuman globulin AHG (rabbit anti-IgG and monoclonal anti-C3d) within the gel matrix(37). When the auto control and/or direct antiglobulin test (DAT) results were positive, the expected red cell antigens, such as E, e, Jka, Jkb, Fya, Fyb, Dia, and MNS7, were subsequently determined by red cell genotyping utilizing in-house multiplex PCR (38).To determine the specificity of antibodies, antibody identification was then carried out in CAT using a commercial 11-cell panel (Diapanel Biorad, Switzerland)(39). Traditionally, agglutination techniques in the tube are used for red cell antibody screening and identification. Newer detection methods, such different gel formats, have been created and authorized recently, are commercially available for use in blood banks, and are becoming more and more well-liked(40, 41)Gel techniques for

red cell antibody detection and compatibility testing have become a mature and well-understood technology since their introduction. It is suitable for the majority of blood type serology tests, is standardized, relatively easy to conduct, and, in contrast to tube methods, yields stable, transparent reactions that enhance result interpretation (42).

Causes and Risk Factors for Abnormal Antibody Development

Alloantibodies against one or more red cell (RBC) antigens may develop as a result of repeated blood transfusions, making subsequent transfusions more difficult (43). The recipient's immune response, antigen immunogenicity, and the quantity and frequency of transfusions all affect the likelihood of alloimmunization. There have also been reports on the impact of donor and recipient ethnic and antigenic pattern differences (44).The immune system of the recipient mediates many of the negative effects of blood transfusions. Typically, there are three stages in which this and other immune responses develop:

a.   The immune system recognizes foreign substances, called antigens.

b.   The antigen is processed by the immune system.

c.   To eliminate the antigen from the body, the immune system launches an attack (45).

Numerous autoimmune conditions, such as systemic lupus erythematosus, rheumatoid arthritis, primary biliary cirrhosis, multiple sclerosis, autoimmune hepatitis, drug-induced lupus, autoimmune thyroid disease, and type 1 diabetes, are characterized by the presence of autoantibodies. It is obvious that both the environment and genetics have a big impact on tolerance loss (46-54). The destruction of a person's own red blood cells (RBCs) due to the presence of autoantibodies that target them is known as autoimmune hemolytic anemia (AIHA) (55-62).Nearly all red blood cells have antigens that autoantibodies typically target, and a direct antiglobulin test (DAT) can help with the diagnosis(57).

Frequency of occurrence of abnormal antibodies in variety of population

Even after Rhesus (Rh) D prophylaxis was introduced fifty years ago, obstetricians and blood transfusionists still face the difficulty of red cell immunization during pregnancy. Anti-D prophylaxis had raised hopes that the last stages of life would be free of hemolytic disease of the fetus and newborn (HDFN) caused by D antigen incompatibility. In addition to the D antigen, other blood group antigens from the Rh system (C, c, E, e, and Cw) as well as other blood group systems have gained attention. Pregnancy-related alloimmunization has been thoroughly investigated in many parts of the world, and the prevalence has been reported to range between 0.4% and 2.7% globally (63-74).

3,577 multidimensional women were examined for the presence of alloantibodies during the study period. The most prevalent phenotype in relation to the two main blood group systems (ABO and Rh) was B positive. Which shows that 394 women (11.0%) were D antigen-negative and 3,183 women (88.9%) were D antigen-positive. The prevalence of alloimmunization was 1.2% overall (45/3,577), with 51 antibodies found in 45 patients. Compared to research conducted in the West, our study found that Rh-negative women had a significantly greater rate of alloimmunization. The absence of widespread and standardized anti-D immunoprophylaxis in India is the cause of this. Anti-D, which accounted for 78.4% of all alloantibodies in our study, is thus still the primary cause of alloimmunization in our nation(75). Patients with Chronic Renal Failure (CRF) who require frequent blood transfusions frequently have the problem of red blood cell alloimmunization (76).Alloantibody production is triggered by an immune reaction brought on by the recipient's and donors genetic differences.

The recipient's immune condition, the dosage, the mode of administration, and the immunogenicity of the antigen are other variables that affect the production of alloantibodies (77-79).Many studies have shown that people with chronic renal failure are susceptible to alloimmunization; one research by Mervat Mostafa Azab *et al.* found that 9.5% of patients who received numerous transfusions had this condition(80). However, Domen and Ramirez (81) reported a low rate of antibody production (6.1%) in the same group of patients, and Shukla et al. (82) reported an RBC alloimmunization rate of 9.8% in patients with chronic renal failure receiving hemodialysis. The study included 301 individuals in total, all of whom underwent antibody screening. This comprised 62 female patients and 239 male patients. With a mean age of 43.6 years, the patients ranged in age from 12 to 79. A total of 1636 transfusions were performed, with an average of 5.5 blood units per patient, ranging from 3 to 16. 51 out of 301 patients, or 16.9% of all patients, had alloantibodies found in them (83).Since blood transfusions quickly increase a patient's ability to carry

oxygen when they have symptomatic anemia, they may be life-saving in cases of chronic kidney disease (CKD). However, alloimmunization and transfusion-transmissible infections (TTI) are possible side effects, particularly in patients who have received many transfusions. Similar to other findings, there were more men with CKD in our sample than women (82).Because of this, the reported frequency of alloantibody generation varies greatly across the globe, ranging from 1.13% to 40.4% (84). This study's 3.1% alloimmunization risk falls within the literature's reported range of 0.5 to 5.9%(85-87). Out of 22,436 cases, 340 (1.52%) had positive results from unexpected antibody screening tests. Of the individuals who tested positive for unexpected antibodies, 243 had surgery(88).

Future direction and emerging research

For many years, patients with both acute and chronic anemia have been treated with red blood cell (RBC) transfusions. One of the most popular medical procedures carried out in the developed world nowadays is transfusion (89).Depending on the patient's clinical condition and short- and long-term prognosis, the decision to undertake a medical operation poses different challenges in terms of its risks and advantages Therefore, a planned strategy is advantageous to reduce side effects like erythrocyte alloimmunization.(90). The use of DNA-based molecular techniques in transfusion medicine has been made possible by the age of genomics. The majority of the genes controlling blood group systems have now been cloned and sequenced, and DNA technology has helped to understand the molecular basis of many common blood group antigens(91).Currently, DNA analysis can be used in a variety of clinical settings. Finding rare RhD blood group antigen variants, genotyping donors for specific antigens (like Dombrock) that are difficult to determine due to antisera unavailability or weak potency, identifying RHD type fetuses (like a fetus carried by a RhD negative mother) without invasive procedures, identifying which phenotypically antigen-negative patients can receive antigen-positive RBCs, type donors for antibody identification panels, type patients who have an antigen that is expressed weakly on RBCs, and resolving A, B, and RhD discrepancies are all made easier with its help. It has been used more recently to screen large numbers of donors for antigen-negative people(92, 93) In recent years, the use of monoclonal antibody (MoAb) therapy for hematologic malignancies has grown. The FDA authorized rituximab as the first monoclonal antibody in 1997 for the treatment of cancer(94).Since then, over 25 MoAbs have been used as treatments for hematological and solid disorders in clinical settings (95).MoAbs anti-CD38 and anti-CD47 are immunoglobulins that target highly expressed epitopes on platelets and red blood cells (RBCs). They have the potential to unchain hemolytic anemia and, as an off-target consequence, interfere with pre-transfusion compatibility testing (96).In the age of novel medications, monoclonal antibodies are becoming more and more common. One off-target impact of some MoAbs has been the emergence of interferences in pre-transfusion testing. Perhaps anti-CD38 and anti-CD47 are only the beginning (97). Initiatives in personalized medicine, also known as precision medicine, have expanded globally in recent years.One could argue that since the beginning of this life-saving medical procedure, transfusion medicine has been connecting donors and recipients (98)As a result, the majority of transfusion medicine research over the past 20 years has focused on (i) storage lesion and (ii) testing and prophylaxis for pathogen safety of all blood products. A number of mechanisms behind the so-called storage lesion have been clarified by this body of research, and clinical trials have raised concerns about whether the age of stored blood units is linked to inadequate clinical outcomes for transfusion patients (99,100).

DISCUSSION

Abnormal antibody development in transfused recipients remains a critical concern in transfusion medicine. The immune system's response to foreign antigens can lead to alloimmunization, resulting in adverse transfusion reactions and complications in future transfusions. The formation of these antibodies depends on multiple factors, including the recipient's immunogenicity, transfusion history, and the antigenic profile of transfused red blood cells (RBCs).Studies have shown that patients with chronic transfusion needs, such as those with sickle cell disease, thalassemia, and hematologic malignancies, are at a higher risk of alloimmunization. The identification of these antibodies is crucial to ensuring the provision of antigen-compatible blood, thereby minimizing hemolytic transfusion reactions. Conventional serological methods, such as the indirect antiglobulin test (IAT), remain the

cornerstone of antibody detection, but molecular techniques, including genotyping, have enhanced precision in identifying alloantibodies and predicting potential incompatibilities.The challenge of identifying clinically significant antibodies remains an ongoing issue, particularly in polytransfused patients who may develop multiple alloantibodies. The adoption of extended antigen matching strategies and prophylactic antigen screening in at-risk populations can mitigate the risks associated with alloimmunization. Moreover, emerging technologies, such as next-generation sequencing (NGS) and artificial intelligence-driven predictive models, are paving the way for more precise and individualized transfusion practices.

CONCLUSION

The development of abnormal antibodies in transfused recipients poses significant challenges to safe and effective transfusion therapy. The identification and management of these antibodies require a combination of serological, molecular, and clinical strategies to ensure optimal patient outcomes. While traditional methods remain valuable, technological advancements in immunohematology provide new avenues for improved antibody detection and transfusion compatibility. A multidisciplinary approach, including collaboration between transfusion medicine specialists, hematologists, and laboratory professionals, is essential for effective antibody identification and management. Future research should focus on refining predictive models for alloimmunization, expanding antigen-matching strategies, and integrating advanced molecular techniques to enhance transfusion safety. By implementing proactive screening measures and leveraging novel diagnostic tools, healthcare providers can reduce transfusion-related complications and improve patient care outcomes.

ABSTRACT

Gait intend detection is a vital aspect in the development of prosthetic device, particularly in identifying different gait phases and bringing out the difference in normal and transfemoral amputations. Various research has been performed to study of the gait intend and classification of those to enhance the application of prosthetic device. In the present work, electromyography (EMG) and inertial measurement unit (IMU) data are acquired from normal volunteers in the thigh muscles such as biceps femoris, rectus femoris, semitendinosus and vastus medialis. The acquired data are pre-processed and time-domain features were extracted. An analysis is done to study these anterior and posterior muscle functions that are significant with the gait phases. Using the features, Hidden Markov Model (HMM) and Long short term memory (LSTM) were employed to predict intended gait phases. This advanced approach holds great potential to significantly improve the user experience and overall quality of life for individuals with lower limb amputations.

Keywords: Transfemoral prosthesis, Electromyogram, inertial measurement unit (IMU) sensor, Hidden Markov model (HMM), Long Short Term Memory (LSTM)

Aravindhan *et al.,*

INTRODUCTION

The detection of gait intent in lower limbs is crucial for various applications, including prosthetics, rehabilitation, and robotics. Hidden Markov Models (HMMs) are widely used in this domain due to their capability to model temporal sequences. HMMs are frequently highlighted for their suitability in recognizing temporal patterns in gait sequences. Studies in [1] emphasize the model's effectiveness in capturing dynamic state transitions inherent in human gait cycles. This theme reflects the HMM's robustness in modeling spatiotemporal patterns, a critical requirement for reliable intent detection. Another significant theme is the integration of HMMs with advanced sensors, like inertial measurement units (IMUs) and electromyography (EMG). For instance, Vu & Huong in [2] reported improved accuracy in gait detection using a hybrid model combining HMMs with IMU data. This integration underscores the trend towards multimodal sensor fusion to enhance prediction accuracy.EMG signals are harnessed for understanding muscle activation patterns. Phinyomark *et al.* [3] highlight how combining EMG with machine learning enhances phase classification accuracy. Existing literature, including work by Hargrove et al. in [4], examines the application of HMMs for intent detection in powered prosthetics. There are numerous machine learning techniques performed to classify the gait phases [5, 6]. The adaptability of HMMs in machine learning environments is noted as a significant advantage for developing intuitive prosthetic control systems, enabling real-time response to user intent [7, 8].

METHOLODOLOGY

Experiemental setup
Data is collected to identify lower limb gait intent patterns from 20 healthy individuals aged 19 to 21, who were the intended group of volunteers. The activity of the thigh muscles is recorded using BIOPAC MP45 acquisition software, with a predetermined sample rate and frequency range, to capture EMG data in a controlled environment with minimal noise. The vastus medialis (channel-1), rectus femoris (channel-2), biceps femoris (channel-3) and semitendinosus (channel-4) were the four muscles from which EMG is recorded (Figure 1). For individuals with normal gait, EMG data is collected every 40 seconds which each gait cycle lasted for 5 seconds. Simultaneously, the IMU hardware interface calculated acceleration and gyroscope values [9, 10]. The current study introduces a method for gait intent detection by utilizing EMG (Electromyography) and IMU (Inertial Measurement Unit) features, focusing on analyzing both muscle activity and movement dynamics to identify a person's intended gait phase or action. As illustrated in Figure 2, the complete block diagram of the proposed methodology is presented. The acquired EMG signals are filtered using bandpass filter in the range 20-500 Hz and envelope is detected to extract time domain features. Fifteen time domain features such as average energy (ae), variance (var), standard deviation (sd), skewness (skew), interquartile value (iqav), mean absolute deviation (mad), mean absolute value (mav), variance of emg (jvar), root mean square (rms), enhanced mean absolute value (em), mean value of the square root (mvs), kurtosis (kurt), integrated emg (iemg), simple square integral (ssi) and absolute value of the summation of square root (avss) are extracted. The features help in analyzing the muscle activity in every gait phase. From the IMU, accelerometer and gyroscope values and their respective angle measurements were noted. Both EMG and IMU features are integrated and fed into machine learning models in order to train model for each gait phase. Out of 20 subjects, 15 subject data were used for training and the remaining were used in testing to predict gait.

CLASSIFIER
HIDDEN MARKOV MODEL(HMM)
Hidden Markov Models (HMMs) are mainly used in sequential detection that represent the probabilistic relationships between various phases of gait. In gait detection, the hidden states in an HMM correspond to different gait phases, such as heel strike, loading response, toe-off, terminal swing, pre-swing and terminal stance, each representing a specific phase of the gait cycle. The observed data, such as features extracted from EMG signals and IMU sensors, serve as inputs to the HMM, as depicted in block diagram Fig 3. These observations capture muscle activity and limb movements associated with each gait phase. The parameters of the Hidden Markov Model

94540

Aravindhan *et al.*,

(HMM)—such as the probabilities of starting in each state, the transition probabilities between different gait phases, and the emission probabilities that represent the chance of observing specific features given a gait phase—are determined using methods like the Baum-Welch algorithm. To forecast the most likely sequence of hidden states (gait phases) based on the observed data, the HMM employs the Viterbi algorithm, which finds the sequence of states that best explains the observed data. Additionally, by analyzing the sequence and transitions among gait phases, the HMM can Infer the user's gait intentions.

LONG SHORT TERM MEMORY (LSTM)

Long Short-Term Memory (LSTM) networks, which are a specific type of recurrent neural networks (RNNs), are particularly effective for tasks involving sequence prediction, such as recognizing and classifying gait intent. They excel in capturing the temporal patterns present in electromyography (EMG) and inertial measurement unit (IMU) data, which are crucial for detecting shifts between different gait phases, including stance and swing. The structure of the LSTM network includes several LSTM layers, as shown in Fig 4. Each layer contains units (cells) that process the input sequence one time step at a time. The cell state and hidden state are updated at each step to maintain information over time. The Cell State represents the "memory" of the LSTM, carrying information from previous time steps. Forget Gate decides what information to discard from the cell state. Input Gate determines which new information should be added to the cell state. Output Gate controls what information from the cell state is used to compute the hidden state and output. Output Layer after processing the entire sequence, the LSTM outputs a prediction for each time step or a classification for the entire sequence. This output represents the detected gait phase (e.g., stance, swing) or the overall gait pattern.

RESULTS AND DISCUSSION

A 3D stacked heatmap is a powerful visualization tool that can help in comparing various gait phases by providing a detailed and intuitive representation of how different muscle activities (from EMG data) and motion dynamics (from IMU data) vary across time. EMG from the vastus medialis, rectus femoris, biceps femoris, and semitendinosus muscles are recorded. Inertial data, such as acceleration and gyroscope values are recorded using IMUs placed on these muscles. Both EMG and IMU data are noted for six different gait phases, such as heel strike, loading response, toe-off, terminal swing, pre-swing and terminal stance. In the 3D stacked heatmap shown in figure 5, the X-axis represents gait phases for tracking how muscle activity and movement dynamics change throughout the entire gait cycle. Y-axis represents the different muscle locations (vastus medialis, rectus femoris, biceps femoris, semitendinosus). Z-axis represents different features or metrics derived from the EMG signals. Each cell in the heatmap is color-coded based on the intensity or magnitude of the metric being visualized and the values range between -1 and 1. From figure 5, it is observed that the vastus medialis showed higher activation during almost all the gait phases compared to other muscles. While the semitendonitis showed increased activity during the transition from stance to swing phase, vastus medialis and biceps femoris are activated comparatively less. This infers the significance of the muscles in each gait phase. Similarly, the vastus Medialis activated well for almost all the EMG features, whereas, the activation is signification for few of the EMG features in other muscles. IMU sensor values, specifically accelerometer and gyrometer readings, are highly beneficial in performing gait analysis. The combined data from accelerometers and gyrometers enable the precise identification of different gait phases, such as heel-strike, mid-stance, and toe-off. By analyzing the changes in acceleration and rotational velocity, specific moments within the gait cycle can be detected and studied, providing insights into how smoothly or effectively a person transitions between these phases. Table 1 refers the IMU sensor values in each gait phase. In gait analysis, which focuses on studying an individual's walking pattern, inertial measurement unit (IMU) sensors are employed to capture and integrate data on acceleration and angular velocity. This data is then visualized through graphs to analyze the dynamics of gait. The accelerometer readings capture the stimulus of gait phases, specifically stance and swing, over a 40-second duration (Figure 6). For the anterior muscles, such as the rectus femoris and vastus medialis, the accelerometer records values of ax, ay, and az. During the gait phase, the muscle movement speed ranges from -2.0 to 2.0. The x-axis acceleration varies between -0.5 and 1.0, while the y-axis acceleration typically falls between -1.5 and -

1.0. As muscle activation increases, the acceleration speed rises within the range of 1.0 to 1.5.Figure 7 illustrates the gyrometer readings that capture the stimulus of gait phases, specifically stance and swing, over a 40-second period. The gyrometer values for the anterior muscles, including the rectus femoris and vastus medialis, are represented along the axes ax, ay, and az. During these gait phases, the muscle movement speed ranges from -60 dB to 40 dB. The x-axis acceleration is recorded between 1 dB and 10 dB, while the y-axis acceleration typically falls between -60 dB and -50 dB. As muscle activation increases, the speed is observed to rise within the range of 1.0 to 1.5. Figure 8 presents the IMU sensor output for the accelerometer readings from the posterior muscles such as biceps femoris and semitendonitis. During the gait phase, the muscle movement speed along the x-axis acceleration ranges from -0.5 to 1.0, while the y-axis acceleration varies between -1.5 and -1.0. As muscle activation increases, the acceleration speed is observed to rise within the range of 1.0 to 1.5.Figure 9shows that during the gait phase, the muscle speed as measured by the gyrometer falls within specific ranges: the gyrometer x-axis values lie between 50 dB and 150 dB, the y-axis values range from 0 dB to 20 dB, and the z-axis values are between 0 dB and 10 dB.

Individuals participated in the study at their own walking speeds throughout the entire investigation. The methods examined are commonly used to detect gait events, but our co-simulation framework extends beyond a single family of algorithms. This framework is versatile and can be applied to explore additional gait event detection techniques, such as those based on Hidden-Markov Models (HMM), as well as more complex gait phase models that include additional phases. Across all stages of the 8-phase paradigm, the distribution of recognition errors remained largely consistent. Similarly, the LSTM classifier was utilized to predict gait patterns. Table 2 represents the accuracy of each classifier it has trained andtest with gait data. While this normal gait data is trained into these classifiers, the LSTM has performed with better accuracy. However, the assessment results demonstrate that the detection error events were unaffected by leveraging the contralateral side to facilitate gait event identification.

CONCLUSION

The identification of gait phases in the lower limbs will sustain the degree of gait cycle phases that meet predetermined criteria. To do this, the stages of machine learning mode are recognized. The models were tested using a 20% training dataset and a 70% validation dataset. The LSTM produced an accuracy score of 87.5%, whereas the classifier model produced a score of 85.3%. This strategy yields more precise lower limb gait phase detection findings.

ABSTRACT

Acid peptic disorders are one of the commonest disorders encountered in clinical practice, although not life threatening as other major illness. The symptoms can be distressing and cause discomfort to normal life. Diet habits including irregularity in food habits and rich food, junk food, smoking and alcohol also plays a major role in the causation of the disease in addition to psychological factors. According to Homoeopathy, it is the man who is sick and not his body and as a matter of fact he needs to be treated. It is here the concept of individualization comes into practice, where the physical as well as the mental characteristics of the individual is taken. This study has documented the prevalence, associated risk factors and the impact of this health issue along with homoeopathic constitutional medicine given to patient. An interventional single arm randomized study in the homoeopathic hospital to ascertain role of constitutional medicine in cases of acid peptic disorders was conducted by using of questionnaire. i.e., Acid peptic disorders. Total 35 patients with peptic ulcer disease were enrolled in the study. Majority of the patients were in 31-to-40-year age groups (48.6%). Mean age of the patients was 37.8years. Out of 35, 12 patients (54.0%) were female and 23 were male. Six patients (17.1%) were illiterate, 12 patients (34.2%) were educated up to secondary level. Total 27 patients (77.1%) were working in professional and semi-professional occupation and 4 patients (11.4 %) were unemployed. Socio economic status was categorised according modified Prasad's classification. Out of 35 patients, 10 (26.8%) and 10 patients (26.8 %) were belonged to lower middle and lower SE class respectively. Out of 35 patients, 19 and 5 patients were overweight and obese respectively. Only 18 patients (51.4 %) were getting sleep >8 hr / day. Total 6 patients were chronic smoker (> 14 a day) and 7 patients (20%) were heavy alcohol drinker. Out of 35 patients, 10 (29.0%) had marked improvement, 16 (46.0%) moderate improvement. Acid peptic disorders were observed in a person with high stress as a common health problem due to its prevalence, manageable nature and associated social psychological implications. After constitutional medicine

was given, out of 35 cases 29 cases were improved. 4 cases were not improved and 2 cases were withdrawn from the study. So it shows that Homoeopathic constitutional medicine has marked effect in APD.

Keywords: Acid-peptic disorders, constitution, Psychosomatic, Peptic ulcer, GERD, Gastritis, vagal hyper activity, food habits, neuro-endocrine, immunological, Individualisation

INTRODUCTION

Acid peptic disease by definition is a disorder of gastric and duodenal mucosal barrier due to hyper or hypo secretion of acid and pepsin into the gastric juice which result in destruction of mucosal and muscular layers of stomach and duodenum. Diet habits including irregularity in food habits and rich foods, smoking and alcohol also provides a major role in the causation of the disease in addition to psychological factors. Disease is an abnormal vital process, a changed condition of life, which is inimical to the true development of the individual & tends to organic dissolution [10]. Disease represents to us the reaction of the patient to the unfavorable environmental factors and this reaction manifests as signs and symptoms. The pattern of reaction is not only determined by factors that caused illness, but also by the constitution of the affected person [11]. This constitution is the resultant of the early environmental factors, right from the time of conception, acting on the hereditary factors which determined by genes [12]. This constitution is the resultant of the early environmental factors, right from the time of conception, acting on the hereditary factors which determined by genes [24]. Disease is thus a total response of an organism to adverse environmental factors, external or internal. It is conditioned by constitutional factors, inherited & acquired and it manifest itself in three spheres- emotional, intellectual and physical. This response is divided into:

a) **INDIVIDUAL RESPONSE** (characteristic symptom which denote the constitutional type)
b) **GROUP RESPONSE** (diagnostic symptoms)

The constant adaptation that required in the development of an emotionally well integrated personality may fail at various stages and this breakdown will be indicated by appropriate symptomatology. If these warning signs are not needed, then in course of time depending on the personalities different types of responses may follow.

Withdrawal response
some may, over a period of time show withdrawal from this world and create a world of their own. This is the Psychotic type of response.

Escape response
personalities which are not able to meet the demand made on them react through an escape mechanism. This constitutes the Psycho neurotic response.

Fighting response
some may fight back the challenges, which *show psycho-somatic pattern*, in which the autonomic nervous system and endocrine system play a leading role [24].

Dr. Hahnemann mentions about psychosomatic diseases in §225.
The mental aspect is primarily deranged and these conditions finding the body slightly yielding to the altered psychological conditions maintain the body in a disturbed condition and continue the psychopathological state of the patient. These are also continued in a vicious cycle by emotional cause, such as continued anxiety, worry, vexation, wrongs and the frequent occurrence of great fear and fright. Some studies have focused on a group of patients who show the personality habits of social withdrawal, suspiciousness, hostility and dependency. Their ulcers appear to develop when stress leads to increased cigar and alcohol consumption [3].

Management of Psychosomatic diseases according to Dr. Hahnemann [32, 25]

The treatment in such cases include:

1. By means of psychical remedies such as display of confidence, friendly exhortations, sensible advice
2. An appropriate diet and regimen.
3. A radical antipsoric treatment should be done in order to prevent recurrences.
4. As doctor Clarke has said, **"**When the mind is ill at ease the stomach cannot work as it ought, and the face grows haggard and lean and the muscles lax. Worry is one great cause of indigestion[27].
   - **Richard Hughes has said, "**We have irritated our gastric mucous membrane with alcohol and pungent condiments; we have over-heated it with scalding drinks or chilled it with ices. These are the confessions we have to make, if we are dyspeptic. No medication, however carefully chosen, will set the stomach right if these errors are persisted in; and on the other hand, if they be corrected, nature has great power of righting itself without further aid. The somewhat rigid dietary of early homoeopathic days probably played no small part in the success of the new treatment.. In all affections of the stomach, we must be dieticians first, drug-givers secondly only.
   - In sec 5- Useful to the physician in assisting him to cure are the particulars of the most probable exciting cause of the acute disease, as also the most significant points in the whole history of the chronic disease, to enable him to discover its fundamental cause, which is generally due to a chronic miasm. In these investigations, the ascertainable physical constitution of the patient (and intellectual character, his occupation, mode of living and habits, his social and domestic relations, his age, sexual function,. etc., are to be taken into consideration.
   - The last sentence of section 5 implies a distinctive approach to the study of disease conditions [32].
   - For the effective management of the case a homoeopathic physician will have to be well conversed with the diagnosis of disease, the patient as a person, and the remedy selected and administered on the law of similia [24].

MIASMATIC DIAGNOSIS OF VARIOUS FORM OF ACID-PEPTIC DISORDERS [48,49]

1. **NON-ULCERDYSPEPSIA: Psora is the predominant miasm in these cases because its only due to certain exciting causes**
2. **GASTRO-OESOPHAGEAL REFLUX DISEASE(GERD):**
3. **ACUTEGASTRITIS: Psora is the predominant miasm but in severe case it is complicated with syphilis.**
4. CHRONICGASTRITIS: Psora and tubercular miasm
5. PEPTIC ULCERDISEASE: Predominant miasm is psora in early stage of the disease then it gets converted to syphilis miasm when complication occurs. In some cases, when ulcers heal fibrosis of affected part takes place with loss of function, then the predominant miasm is sycosis.

CONSTITUTIONAL REMEDIES

Phosphorus, Nux vomica, Lycopodium, Natrum muriaticum, Kali carbonicum, Ignatia, Calcarea carb, Pulsatilla, sepia, Anacardium, Graphitis, Arsenicum album, Sulphur, Bryonia alba, Antimoniumcrudum, Abies nigra, Kali bichromicum, Carbo veg, Hydrastis canadensis, Muriaticum acidum, Robinia pseudacacia, Sulphuricumacidicum etc..

MATERIALS AND METHODS

Clinical study

The study will be carried out with detailed case study and follow up at Sainath Hospital attached to Ahmedabad Homoeopathic Medical College, Parul University, Ahmedabad.

Komal Patel and Heena Rawal

Case definition
Cases presenting with complaints of Acid peptic diseases, cases of age 18 to 60 years and both sexes will be taken in study.

Study design
Experimental Interventional study,35 cases satisfying the case definition, inclusion and exclusion criteria. The time duration Was of 12 months.

Study period
November 2023 to November 2024

Selection of samples
Randomized sampling will be done.
All cases will be selected according to inclusion criteria.

Inclusive criteria
1. The samples will be selected from both sexes & age group between 18 to 60 years.
2. The diagnostic criteria are mainly based on clinical history, presentation and examination findings.

Exclusion criteria
1. Ulcers secondary to burns, uraemia and drugs.
2. Cases complicated with gastric ulcer, haemorrhage, perforation, and gastric outlet obstruction.
3. Malignant conditions.
4. The patients who were unwilling to give consent to participate in the study

Data Collection
It will be done by individual history taking according to Homoeopathic principles. A self-designed self-assessed questionnaire consisting of socio demographic characteristics, travel history, co morbidity patterns, health seeking behaviors, and outcome of the treatment had been prepared in English and local language.

Data Analysis
Data will be collected by proper method and analysed & processed according to tabular format. Data was entered in MS excel and appropriate statistical tests were applied.

Criteria for follow-up
-   All the patients will be duly followed and details of the symptomatic changes will be recorded and prognosis will be studied for by using prepared questionnaires for assessment. (questionary for Acid-peptic disorders)
-   Follow up will differ from patient to patient.
-   Usually first follow up will be after 14 days interval. If necessary online or video call follow up weekly.

RESULT AND DISCUSSION

Considering the psychosomatic relationship in acid peptic diseases, a detailed history taking is necessary to obtain a psychological profile and constitutional prescription. Total 35 patients with peptic ulcer disease were enrolled in the study. Table 1 depicts Socio demographic profile of study participants. Majority of the patients were in 31-to-40-year age groups (48.6%). Mean age of the patients was37.8years. Out of 35, 12 patients (54.0%) were female and 23 were male. Six patients (17.1%) were illiterate, 12 patients (34.2%) were educated up to secondary level. Total 27 patients (77.1%) were working in professional and semi-professional occupation and 4 patients (11.4 %) were unemployed. Socio economic status was categorised according modified Prasad's classification. Out of 35 patients, 10 (26.8%) and

Komal Patel and Heena Rawal

10 patients (26.8 %) were belonged to lower middle and lower SE class respectively. Out of 35 patients, 19 and 5 patients were overweight and obese respectively. Only 18 patients (51.4 %) were getting sleep $\geq$8 hr / day. Total 6 patients were chronic smoker (> 14 a day) and 7 patients (20%) were heavy alcohol drinker. Assessment of improvement among participants was evaluated with questionary of acid peptic disorders. Out of 35 patients, 10 (29.0%) had marked improvement, 16 (46.0%) moderate improvement.

Ethical issue
Study protocol was approved through Institutional Ethical Committee. Written informed consent was taken from the participants and full confidentiality for the information provided was ensured.

CONCLUSION

Acid peptic disorders were observed in a person with high stress as a common health problem due to its prevalence, manageable nature and associated social psychological implications. During this study it was found that people working at professional level (intellectually high) were suffered more acid peptic disorders. After constitutional medicine was given, out of 35 cases 29 cases were improved. 4 cases were not improved and 2 cases were withdrawn from the study. Soit shows that Homoeopathic constitutional medicine has marked effect in APD.

ABSTRACT

The aim of this article is to use (1,2)*-(Λ, α)-closed sets in BTPS to study several results of contra-(1,2)*-(Λ, α)-continuous functions.

Keywords: (1,2)*-kernel, (1,2)*-Λ-set, (1,2)*-Λ$_\alpha$-set, (1,2)*-(Λ, α)-continuous, contra-(1,2)*-(Λ, α)-continuous.

INTRODUCTION

The idea of Λ-sets in topological spaces was first presented by Maki [10] in 1986. S. Jafari and A. M. Caldas [2] presented and studied the idea of "some properties of contra-β-continuous functions." Following Dontchev's [4] and Dontchev and Noiri's [5] research on the intriguing concepts of contra-continuity, Jafari and Noiri recently presented and examined the concepts of contra-α-continuity [5]. Study of (Λ,α)-closed sets were recently introduced by Caldas *et al.* [3]. The aim of this article is to use (1,2)*-(Λ, α)-closed sets in bitopological spaces to study some results of contra-(1,2)*-(Λ, α)-continuous functions.

PRELIMINARIES
Throughout this paper $(X, \tau_{1,2})$ or X will always denote bitopological spaces (briefly, BTPS).

Definition 2.1
Let $P \subseteq X$. If $P = I \cap J$, where $I \in \tau_1$ and $J \in \tau_2$, then P is called to be $\tau_{1,2}$-open [7].

Definition 2.2 [7]
Let $P \subseteq X$. Then
(i) $\tau_{1,2}$-cl(P) = $\cap$ {F : P $\subseteq$ F and F is $\tau_{1,2}$-cld}.
(ii) $\tau_{1,2}$-int(P) = $\cup$ {F : F $\subseteq$ P and F is $\tau_{1,2}$-open}.

Definition 2.3
Let $P \subseteq X$ is known as
(i)   (1,2)*-SO [12] if $P \subseteq \tau_{1,2}$-cl($\tau_{1,2}$-int(P));
(ii)   (1,2)*-PO [9] if $P \subseteq \tau_{1,2}$-int($\tau_{1,2}$-cl(P));
(iii)   (1,2)*-αO [15] if $P \subseteq \tau_{1,2}$-int($\tau_{1,2}$-cl($\tau_{1,2}$-int(P)));
(iv)   (1,2)*-βO [13] (= (1,2)*-SPO[14]) if $P \subseteq \tau_{1,2}$-cl($\tau_{1,2}$-int($\tau_{1,2}$-cl(P)));
(v)   regular (1,2)*-open [16] if $P = \tau_{1,2}$-int($\tau_{1,2}$-cl(P)).
The open sets complements are referred to as their corresponding closed sets.

Definition 2.4
Let $P \subseteq X$ is called
(i)   (1,2)*-g-cld [8] if $\tau_{1,2}$-cl(P) $\subseteq$ M whenever $P \subseteq M$ and M is $\tau_{1,2}$ -open;
(ii)   (1,2)*-αg-cld [6] if (1,2)*-αcl(P) $\subseteq$ M whenever $P \subseteq M$ and M is $\tau_{1,2}$-open in X.
(iii)   (1,2)*-λ-cld [1] if P = L $\cap$ D, where L is a (1,2)*-Λ-set and D is a $\tau_{1,2}$-cld.
The closed sets complements are referred to as their corresponding open sets.

Definition 2.5
A function f : (X, $\tau_{1,2}$) $\to$ (Y, $\sigma_{1,2}$) is said to be (1,2)*-continuous [11] (resp. (1,2)*-α-continuous [15]) if for each $\sigma_{1,2}$-open set U of Y, f^{-1}(U) is $\tau_{1,2}$-open (resp. (1,2))*-α-open) in Y.

Definition 2.6 [6]
A function f : (X, $\tau_{1,2}$) $\to$ (Y, $\sigma_{1,2}$) is said to be contra-(1,2)*-continuous (resp. contra-(1,2)*-α-continuous, contra-(1,2)*-g-continuous, contra-(1,2)*-αg-continuous, contra-(1,2)*-λ-continuous) if for each $\sigma_{1,2}$-open set U of Y, f^{-1}(U) is $\tau_{1,2}$-cld (resp. (1,2)*-α-cld, (1,2)*-g-cld, (1,2)*-αg-cld, (1,2)*-λ-cld) in X.

CONTRA-(1,2)*-(Λ, α)-CONTINUOUS FUNCTIONS
Definition 3.1
Let $P \subseteq X$ is known as (1,2)*-ker(P) = $\cap$ {M $\in \tau$: P $\subseteq$ M }.

Definition 3.2
Let $P \subseteq \mathbb{x}$ is called (1,2)*-(Λ, α)-cld if P = I $\cap$ J, where I is a (1,2)*-Λ_α-set and J is an (1,2)*-α-cld. The (1,2)*-(Λ, α)-cld complements is referred to as their corresponding (1,2)*-(Λ, α)-open. We set (1,2)*-(Λ, α)O(X, x)b = {U$\in$(1,2)*-(Λ, α)O(X): x$\in$U} and (1,2)*-(Λ, α)C(X, x) = {U $\in$ (1,2)*-(Λ, α)C(X) : x$\in$U}.

Definition 3.3
Let $P \subseteq X$ is known as (1,2)*-Λ_α-set if P = (1,2)*-Λ_α(P), where (1,2)*-Λ_α(P) = $\cap$ {G $\in$ (1,2)*-αO(X) | P $\subseteq$ G}.

Definition 3.4
A function f : (X, $\tau_{1,2}$) $\to$ (Y, $\sigma_{1,2}$) is said to be (1,2)*-(Λ, α)-continuous if the inverse image of every $\sigma_{1,2}$-cld in Y is (1,2)*-(Λ, α)-cld in X.

Definition 3.5

A function f : $(X, \tau_{1,2}) \to (Y, \sigma_{1,2})$ is said to be contra-$(1,2)^*$-(Λ, α)-continuous if for each $\sigma_{1,2}$-open U of Y, $f^{-1}(U)$ is $(1,2)^*$-(Λ, α)-cld in X.

Theorem 3.6

Let f : $(X, \tau_{1,2}) \to (Y, \sigma_{1,2})$ be a function, these conditions are interchangeable:

(i)   f is contra-$(1,2)^*$-(Λ, α)-continuous;

(ii)   the inverse image of each $\sigma_{1,2}$-cld in Y is $(1,2)^*$-(Λ, α)-open in X;

(iii) $\forall x \in X$ and every $\sigma_{1,2}$-cld V in Y containing f(x), $\exists$ $(1,2)^*$-(Λ, α)-open M of X s.t $x \in M$ and $f(M) \subseteq V$;

Proof

(i) $\Leftrightarrow$ (ii) By definition 3.5, we obtain the result.

(ii) $\Rightarrow$ (iii) Let $x \in X$ & V be a $\sigma_{1,2}$-cld $\supseteq$ f(x). By (ii), M = $f^{-1}(V)$ is $(1,2)^*$-(Λ, α)-open containing x s.t $f(M) \subseteq V$.

(iii) $\Rightarrow$ (i) Let $P \subseteq X$. Now $y \notin (1,2)^*$-ker(f(P)). Then $\exists$ $V \in (1,2)^*$-$(\Lambda, \alpha)C(Y, y)$ s.t $f(P) \cap V = \phi$. For any $x \in f^{-1}(V)$, by (iii) $\exists$ $M_x \in (1,2)^*$-$(\Lambda, \alpha)O(X, x)$ s.t $f(M_x) \subseteq V$. Then f $(P \cap M_x) \subseteq$ $f(P) \cap f(M_x) \subseteq f(P) \cap V = \phi$ and $P \cap M_x = \phi$. We have prove that $f^{-1}(V)$ is $(1,2)^*$-(Λ, α)-cld in X. Then f is f is contra-$(1,2)^*$-(Λ, α)-continuous.

Remark 3.7 [6]

1.   Every contra-$(1,2)^*$-α-continuity $\Rightarrow$ contra-$(1,2)^*$-αg-continuity.

2.   Every contra-$(1,2)^*$-continuity $\Rightarrow$ contra-$(1,2)^*$-α-continuity.

3.   Every contra-$(1,2)^*$-continuity $\Rightarrow$ contra-$(1,2)^*$-g-continuity.

4.   Every contra-$(1,2)^*$-continuity $\Rightarrow$ contra-$(1,2)^*$-λ-continuity.

Theorem 3.8

Every contra-$(1,2)^*$-λ-continuity is contra-$(1,2)^*$-(Λ, α)-continuity.

Proof

It is obvious, since each $(1, 2)^*$-λ-cld is $(1,2)^*$-(Λ, α)--cld.

Theorem 3.9

Show that contra-$(1,2)^*$-(Λ,α)-continuous & contra-$(1,2)^*$-g-continuous functions are independent.

Proof

It is obviously.

Remark 3.10

The following are our implications for the functions stated above.

contra-$(1,2)^*$-α-continuity ——— contra-$(1,2)^*$-αg-continuity

contra-$(1,2)^*$-continuity ——— contra-$(1,2)^*$-g-continuity

contra-$(1,2)^*$-λ-continuity ——— contra-$(1,2)^*$-(Λ, α)-continuity

94556

Remark 3.11

(i)   The below examples prove that contra-$(1,2)^*$-(Λ,α)-continuous & contra-$(1,2)^*$-g-continuous are independent.

(ii)   In the diagram above, none of the implications can be reversed.

Example 3.12

Let $X = Y = \{a_1, b_1, c_1\}$, $\tau_1 = \{\phi, X, \{a_1\}\}$, $\tau_2 = \{\phi, X, \{a_1, b_1\}\}$ with $\tau_{1,2} = \{\phi, X, \{a_1\}, \{a_1, b_1\}\}$ and $\sigma_1 = \{\phi, Y, \{b_1\}\}$, $\sigma_2 = \{\phi, Y, \{b_1, c_1\}\}$ with $\sigma_{1,2} = \{\phi, Y, \{b_1\}, \{b_1, c_1\}\}$. Then the identity function f : $(X, \tau_{1,2})$ → $(Y, \sigma_{1,2})$ is both contra-$(1,2)^*$-λ-continuous and contra-$(1,2)^*$-α-continuous but it is not contra-$(1,2)^*$-continuous.

Example 3.13

Let X, Y and $\tau_{1,2}$ be as in Ex: 3.14 and $\sigma_{1,2} = \{\phi, Y, \{c_1\}, \{a_1, c_1\}\}$. Then the identity function f : $(X, \tau_{1,2})$ → $(Y, \sigma_{1,2})$ is both contra-$(1,2)^*$-g-continuous and contra-$(1,2)^*$-αg-continuous but it is neither contra-$(1,2)^*$-continuous nor contra-$(1,2)^*$-α-continuous.

Example 3.14

Let X, Y, $\tau_{1,2}$ and $\sigma_{1,2}$ be as in Ex: 3.14. Then the identity function f : $(X, \tau_{1,2})$ → $(Y, \sigma_{1,2})$ is contra-$(1,2)^*$-αg-continuous but not contra-$(1,2)^*$-g-continuous.

Example 3.15

Let $X = Y = \{a_1, b_1, c_1\}$, $\tau_1 = \{\phi, X\}$, $\tau_2 = \{\phi, X, \{a_1, b_1\}\}$ with $\tau_{1,2} = \{\phi, X, \{a_1, b_1\}\}$ and $\sigma_1 = \{\phi, Y, \{c_1\}, \{a_1, b_1\}\}$, $\sigma_2 = \{\phi, Y, \{a_1, b_1\}\}$ with $\sigma_{1,2} = \{\phi, Y, \{c_1\}, \{a_1, b_1\}\}$. Then the identity function f : $(X, \tau_{1,2})$ → $(Y, \sigma_{1,2})$ is contra-$(1,2)^*$-(Λ, α)-continuous but not contra-$(1,2)^*$-g-continuous.

Example 3.16

Let X, Y and $\tau_{1,2}$ be as in Ex: 3.14 and $\sigma_{1,2} = \{\phi, Y, \{c_1\}, \{a_1, c_1\}\}$. Then the identity function f : $(X, \tau_{1,2})$ → $(Y, \sigma_{1,2})$ is contra-$(1,2)^*$-g-continuous but not contra-$(1,2)^*$-(Λ, α)-continuous.

Example 3.17

Let $X = Y = \{a_1, b_1, c_1\}$, $\tau_1 = \{\phi, X, \{a_1\}\}$, $\tau_2 = \{\phi, X\}$ with $\tau_{1,2} = \{\phi, X, \{a_1\}\}$ and $\sigma_1 = \{\phi, Y, \{b_1\}\}$, $\sigma_2 = \{\phi, Y, \{b_1, c_1\}\}$ with $\sigma_{1,2} = \{\phi, Y, \{b_1\}, \{b_1, c_1\}\}$.   Then the identity function f : $(X, \tau_{1,2})$ → $(Y, \sigma_{1,2})$ is contra-$(1,2)^*$-(Λ, α)-continuous but it is not contra-$(1,2)^*$-λ-continuous.

Lemma 3.18

Let $P \subseteq X$, these conditions are interchangeable:

(i)   P is $(1,2)^*$-(Λ, α)-cld.

(ii) $P = L \cap (1,2)^*$-αcl(P), where L is a $(1,2)^*$-Λ_α(P)-set.

(iii) $P = \Lambda_\alpha(P) \cap (1,2)^*$-$\alpha$cl(P).

Definition 3.19

Let $P \subseteq X$ is said to be a $(1,2)^*$-α-$T_{1/2}$ space if each singleton is $(1,2)^*$-α-open or $(1,2)^*$-α-cld.

Theorem 3.20

In X, these statements are interchangeable:

(i) X is a $(1,2)^*$-α-$T_{1/2}$ space.

(ii)   Each subset of X is $(1,2)^*$-(Λ, α)-cld.

Proof

(i) $\Rightarrow$(ii) Let $P \subseteq X$. Let P_1 be the collection of all $(1,2)^*$-α-open, singletons of $X \setminus P$ and let $P_2 = X \setminus (P \cup P_1)$. Set F = $\cap_{x \in A1} X \setminus \{x\}$ and L = $\cap_{x \in A2} X \setminus \{x\}$. Since F is $(1,2)^*$-α-cld and L is a $(1,2)^*$-Λ_α-set. We have, $P = F \cap L$. Then P is $(1,2)^*$-(Λ, α)-cld.

Poobathiraja *et al.,*

(ii) $\Rightarrow$ (i) Let $x \in X$. Claim that {x} is not (1,2)*-α-open. Then A = X \ {x} is not (1,2)*-α-cld and since P is (1,2)*-(Λ, α)-cld, then P is a (1,2)*-Λ_α-set, P = (1,2)*-Λ_α(P). We have X is the only superset of P, then P is $\tau_{1,2}$-open. Then {x} is $\tau_{1,2}$-cld and hence (1,2)*-α-cld.

Lemma 3.21

Let X be a (1,2)*-α-$T_{1/2}$ space and f : $(X, \tau_{1,2}) \to (Y, \sigma_{1,2})$ be a function. If f is contra-(1,2)*-α-continuous (respectively. contra-(1,2)*-g-continuous, contra-(1,2)*-αg-continuous, contra-(1,2)*-λ-continuous), then f is contra-(1,2)*- (Λ, α)-continuous.

Proof

It is obviously.

Theorem 3.22

If a function f : $(X, \tau_{1,2}) \to (Y, \sigma_{1,2})$ is contra-(1,2)*-(Λ, α)-continuous and Y is (1,2)*-regular, then f is (1,2)*-(Λ, α)-continuous.

Proof

Let $x \in X$ & V an $\sigma_{1,2}$-open of $Y \supseteq$ f(x). Here Y is (1,2)*-regular, $\exists$ an $\sigma_{1,2}$-open W in $Y \supseteq$ f(x) s.t $\tau_{1,2}$-cl(W) $\subseteq$ V. We have f is contra-(1,2)*-(Λ, α)-continuous, so by Theorem 3.6, $\exists$ U $\in$ (1,2)*-(Λ, α)O (X, x) s.t f(U) $\subseteq \tau_{1,2}$-cl(W). We have f(U) $\subseteq \tau_{1,2}$-cl(W) $\subseteq$ V. Then f is (1,2)*-(Λ, α)- continuous.

ABSTRACT

CAs are ubiquitous zinc metalloenzymes that catalyze the reversible hydration of carbon dioxide into bicarbonate with protons, and they have been critical to maintaining acid base balance, making gas exchange efficient, and regulation of ion transport. CAIs, originally invented for glaucoma management have become powerful therapeutic agents to treat a vast array of disease and disorders. CAIs are extensively applied in ophthalmology for reducing intraocular pressure through inhibition of fluid secretion within the eye. Apart from this, they are also used in neurological, renal, and on cological diseases. In the treatment of epilepsy, CAIs such as acetazolamide induce anticonvulsant effects through regulation of intracellular pH and neuronal excitability. In metabolic diseases such as mountain sickness, CAIs improve respiratory efficiency through reduction in blood pH and enhanced ventilation. Recent studies also detail the applications of CAIs, particularly in the treatment of cancer, where the isoforms of CA IX and CA XII, which are expressed highly in hypoxic tumor microenvironments, have been targeted in order to disrupt the survival and invasive capabilities of the tumor. Treatment of diseases such as osteoporosis, by regulating bone resorption, and obesity, by regulating fat metabolism, has also proved promising for CAIs. The development of isoform-selective inhibitors has permitted the use of targeted therapeutic strategy, minimizing off-target effects. Advances in structure-based drug design and high-throughput screening have facilitated discovery of novel CAIs with enhanced potency and specificity. CAIs are known to possess diverse therapeutic potential, especially in the context of understanding mechanisms of action, the current clinical implications, and future possibilities for treatment across a wide spectrum of disease. Diverse roles of carbonic anhydrase and its inhibitors can help lead the way toward innovative treatments for complex pathologies.

Keywords: Carbonic anhydrase inhibitors, versatile, glaucoma, anticonvulsant, metabolic disorders, isoforms.

Blessy Jacob and Sarita Karole

INTRODUCTION

Carbonic anhydrase (CA) is a zinc-containing metalloenzyme that catalyzes the reversible reaction between carbon dioxide (CO_2) and water to yield carbonic acid (H_2CO_3) that then decomposes into bicarbonate (HCO_3^-) and protons (H^+). This process is critical for maintaining acid-base homeostasis, fluid balance, and gas exchange in all tissues[1]. Isozymes and Tissue Distribution: There exist several carbonic anhydrase isozymes, each exhibiting tissue-specific localization and function[2]:

1. Cytosolic Isozymes (e.g., CA I, CA II, CA III, CA VII): Present in erythrocytes, kidneys, and muscles. CA II is the most active and is involved in renal acidification and bone resorption.
2. Membrane-bound Isozymes (e.g., CA IV, CA IX, CA XII, CA XIV): Present in the renal tubules, lungs, and gastrointestinal tract, these isozymes facilitate processes like bicarbonate reabsorption and secretion of hydrogen ions.
3. Mitochondrial Isozymes (e.g., CA VA, CA VB): These are present in the liver and take part in the synthesis of urea and gluconeogenesis.
4. Secreted Isozymes (e.g., CA VI): These are found in saliva and tears, where they help to maintain pH balance.The complex role of carbonic anhydrase and its inhibitors can be the stepping stone to innovative treatments for complex pathologies.

Carbonic anhydrase (CA) enzymes are vital for many physiological processes[3]
1. Maintaining Acid-Base Balance: CA helps regulate CO_2 and bicarbonate levels, ensuring proper pH in blood and tissues for cellular and enzymatic function.
2. Respiratory Gas Exchange: In the lungs, CA quickly converts CO_2 to bicarbonate and back, enabling efficient transport and exhalation of CO_2.
3. Renal Function: CA supports pH balance by aiding bicarbonate reabsorption and hydrogen ion secretion in the kidneys, contributing to urine acidification.
4. Fluid Secretion: CA facilitates the production of cerebrospinal fluid, aqueous humor in the eye, and gastric acid by regulating ion and water movement.
5. Bone Resorption: CA generates protons that osteoclasts use to break down bone matrix, playing a role in bone remodeling.

METABOLIC ROLES OF CARBONIC ANHYDRASE:
- Gluconeogenesis & Lipogenesis: By regulating pH, CA influences enzymes involved in glucose and fat metabolism, linking it to obesity and diabetes.
- Energy Production: CA supports mitochondrial energy production and buffering capacity, essential for cellular metabolism[4].

PATHOLOGICAL IMPLICATIONS: OF CARBONIC ANHYDRASE
- Metabolic Disorders: Dysregulated CA activity can lead to metabolic acidosis, insulin resistance, and obesity.
- Cancer: Overexpressed CA isoforms like CA IX create acidic tumor environments, aiding cancer growth and invasion.
- Neurological Disorders: Altered CA activity affects cerebrospinal fluid dynamics and is implicated in epilepsy and glaucoma.

RATIONALE FOR TARGETING CARBONIC ANHYDRASE IN METABOLIC DISEASES
Carbonic anhydrase plays a crucial role in metabolic regulation, making it a promising therapeutic target. Here's reason[5-7]:

Blessy Jacob and Sarita Karole

Acid-Base Balance

CA helps maintain pH by converting CO_2 to bicarbonate. Its inhibition can correct metabolic acidosis linked to diabetes, chronic kidney disease (CKD), and obesity, improving overall metabolic health.

Energy Metabolism & Weight Control

CA influences energy expenditure by activating brown fat, which burns calories through thermogenesis. It also regulates fat storage and breakdown, potentially reducing obesity and improving insulin sensitivity.

Glucose Regulation

CA affects enzymes involved in glucose metabolism, helping control blood sugar in type 2 diabetes. It may also improve insulin sensitivity by balancing pH in tissues.

Liver Health (NAFLD)

Targeting CA could reduce liver fat and inflammation, helping manage non-alcoholic fatty liver disease (NAFLD) and prevent its progression to more severe conditions.

Heart and Kidney Benefits

CA inhibitors act as diuretics, lowering blood pressure and managing fluid retention, common in obesity and diabetes. They also slow CKD progression by countering acidosis and improving metabolic profiles.

Anti-Inflammatory & Antioxidant Effects

CA inhibitors reduce oxidative stress and inflammation, key factors in metabolic diseases like obesity and diabetes.

Proven Safety

CA inhibitors like acetazolamide have been safely used for decades in glaucoma and altitude sickness, paving the way for their use in metabolic conditions. By targeting CA, therapies can tackle metabolic diseases from multiple angles—balancing pH, regulating energy, reducing inflammation, and improving organ function.

CARBONIC ANHYDRASE ENZYME INHIBITION

Carbonic anhydrase inhibitors (CAIs) are compounds that block the activity of carbonic anhydrase (CA) enzymes, affecting acid-base balance, ion transport, and metabolism. They are widely used to treat conditions like glaucoma, altitude sickness, and epilepsy, with emerging applications in metabolic disorders. CAIs primarily bind to the zinc ion at the enzyme's active site, disrupting its ability to convert CO_2 and water into bicarbonate and protons [8].

- Competitive Inhibition: Most CAIs, like acetazolamide, directly block the active site, preventing normal enzyme activity.
- Non-Competitive Inhibition: Some CAIs bind elsewhere, altering the enzyme's shape and reducing its function.

TYPES OF (CAIS) CARBONIC ANHYDRASE INHIBITORS

1. Sulfonamides: The most common class, including drugs like acetazolamide and dorzolamide, which bind directly to the enzyme's zinc ion.
2. Thioxothiazolidinones: Selective inhibitors for specific isozymes.
3. Coumarins: Indirect inhibitors that cause conformational changes in the enzyme.
4. Carboxylic Acids and Phenols: Less common inhibitors with unique mechanisms, often involving hydrogen bonding [9].

Targeting Specific Isozymes

Selective inhibition is key to therapeutic applications since CA isozymes have specialized roles in the body[10]:

- CA II: Found in red blood cells, kidneys, and eyes, its inhibition helps lower eye pressure in glaucoma and regulates kidney bicarbonate levels.
- CA IX and XII: Overexpressed in certain cancers, targeting these supports anti-tumor strategies.

- CA V: Found in mitochondria, its inhibition could regulate glucose metabolism and aid in managing metabolic diseases.

PHYSIOLOGICAL EFFECTS OF CARBONIC ANHYDRASE INHIBITION

- Obesity: CA inhibitors (CAIs) may activate brown adipose tissue (BAT), boosting energy expenditure and supporting weight loss. They also influence fat metabolism by altering acid-base balance, helping reduce fat storage.
- Diabetes: CAIs can regulate enzymes in glucose metabolism, improving blood sugar control. Their diuretic effect further benefits diabetic patients by lowering blood pressure, a common complication.
- NAFLD: By modulating lipid metabolism, CAIs may decrease liver fat, reduce inflammation, and combat oxidative stress, improving liver health and function[11].

CA INHIBITORS UNDER INVESTIGATION FOR METABOLIC EFFECTS

1. Acetazolamide: A well-known CA inhibitor, acetazolamide has been shown to induce metabolic acidosis, increase insulin sensitivity, and reduce liver glucose production in studies. However, its side effects, like diuresis and electrolyte imbalances, limit its long-term use for metabolic disorders.
2. Methazolamide & Dorzolamide: These CAIs are being explored for their more targeted effects and potential metabolic benefits, offering a better side effect profile than acetazolamide, making them promising candidates for further use[12].
3. Combining CAIs with other antihypertensive and diuretic agents could provide synergistic effects, improving blood pressure control and fluid management while addressing potential limitations of individual drugs. Ongoing research into isozyme-selective carbonic anhydrase inhibitors (CAIs) aims to improve treatment effectiveness while minimizing side effects. By combining CAIs with other therapies, researchers hope to achieve synergistic benefits for managing complex conditions. Developing isozyme-selective CAIs could lead to more targeted treatments, enhancing efficacy and reducing adverse effects.Tailoring CAI therapy based on individual patients' specific isozyme profiles may further improve outcomes. Identifying biomarkers linked to CA activity and response to CAIs could help personalize treatment, ensuring optimal therapy for each patient. Beyond current uses, CAIs might have potential for treating other metabolic disorders, including dyslipidemia and metabolic acidosis. Preliminary research also suggests they may offer benefits for neurological conditions, like Alzheimer's and Parkinson's, due to their impact on pH regulation and inflammation. Combining CAIs with anti-inflammatory or antioxidant agents could enhance their effectiveness for chronic diseases. Advances in drug delivery, such as nanoparticles or sustained-release formulations, may also improve their safety and targeting, ensuring optimal therapeutic effects. Incorporating CAIs into clinical practice could offer alternatives for patients who don't respond to standard treatments for conditions like hypertension, fluid overload, and metabolic diseases. However, careful monitoring for side effects like electrolyte imbalances is essential. Long-term clinical trials are needed to fully assess CAIs' efficacy, safety, and potential long-term side effects. Research into new CAI compounds with improved selectivity, potency, and safety profiles is crucial for expanding their use in medical practice. Additionally, evaluating their cost-effectiveness will be important for wider adoption.

CONCLUSION

The future of carbonic anhydrase inhibitors (CAIs) is promising, with advancements in personalized medicine, expanded uses, combination therapies, and innovative delivery systems. Clinical applications will provide better treatment options, though careful monitoring and patient education are essential. Research should focus on understanding CAIs' mechanisms, assessing long-term efficacy and safety, developing new compounds, and exploring combination treatments. Continued development will optimize CAIs' therapeutic potential, improving patient outcomes across various conditions.

ABSTRACT

Biomass burning substantially contributes to air pollution which releases gaseous pollutants such as carbon monoxide, nitric oxide, nitrogen dioxide, sulphur dioxide, and particulate matter ($PM_{2.5}$ and PM_{10}). These atmospheric pollutants adversely affect the environment and public health. Therefore, the sudden spikes in air quality during biomass burning were measured and the performance of a sensor-based real-time air quality monitoring device, polludrone, against a reference-grade Air Quality Monitoring Station (AQMS) was evaluated. The study result revealed that the Polludrone was more sensitive to local and transient changes in pollutants than the reference station, as it captured higher and more dynamic fluctuations. For gaseous pollutants, the Polludrone always recorded higher peaks, such as SO_2 at 202.08 $\mu g/m^3$ while the reference station recorded 22.38 $\mu g/m^3$ during the biomass burning event. For $PM_{2.5}$, Polludrone captured a peak concentration of 835.2 $\mu g/m^3$, whereas the reference station recorded a peak of 606.5 $\mu g/m^3$. The results reflect the ability of Polludrone to capture real-time variations and spatial heterogeneity in emissions during episodic events, emphasizing its utility for monitoring localized pollution sources. This highlights the significant potential of advanced sensor technologies for improving air quality monitoring systems, which can enhance public health responses to air pollution events.

Nirali Goswami *et al.,*

INTRODUCTION

Air pollution is defined as contamination of the atmosphere by harmful chemical, physical, or biological agents that exceed the natural capacity of the environment to disperse and dilute them [1].Globally, air pollution is a significant environmental concern owing to its detrimental effects on flora, fauna, and general ecological health [2]. The air pollutants are emitted from different sources, such as industrial, commercial, residential, domestic [3]and open burning, of biomass and domestic garbage. Biomass burning releases particulate matter (PM) directly, along with several gaseous pollutants such as nitrogen oxides (NOx), carbon monoxide (CO), methane (CH4), and volatile organic chemicals (VOCs)[4].The chemical range found in smoke from burnings differentiates it from traditional industrial pollution. A primary issue in comprehending the effects of biomass burning on air quality is the significant diversity in both the volume and content of emissions from one burning to another. Emissions can fluctuate on the basis of the quantity and fuel, meteorological conditions, and combustion circumstances. These variances result in significant ambiguities regarding the emissions from specific burnings. Upon emission, smoke experiences chemical changes in the atmosphere, modifying the composition of molecules and producing air pollutants [5], which results in various health impacts including eye irritation, chest pain or excessive breathlessness often preceding cardiac events, and increased fatigue [6]. Monitoring of air quality after biomass burning is vital for public health; it is also important to consider the limitations of existing monitoring networks and the need for equitable access to air quality information across different communities. Traditional urban air quality monitoring relies on expensive and stable monitoring devices[7].Despite their high cost, the distribution of these stations is often inadequate, even in developed countries [8]. This immediacy of air quality assessment is critical for issuing alerts and guiding public health decisions during burning events. Unlike reference stations, which typically report hourly averages once per day, real-time systems can provide continuous data streams, enabling timely responses to air quality changes [9]. Real-time systems also have the advantage of being able to monitor sudden changes in pollution levels, which can be crucial for protecting vulnerable populations such as children, elderly people, and individuals with respiratory conditions. By utilizing real-time air quality monitoring technology, authorities can better protect public health and improve overall air quality management strategies. This technology allows for more accurate and immediate interventions, ultimately leading to better health outcomes for communities. Additionally, real-time data can be used to track pollution sources and develop targeted mitigation efforts to reduce emissions. Overall, real-time air quality monitoring technology plays a vital role in ensuring public health and environmental sustainability. By identifying pollution sources and implementing effective interventions, authorities can work towards creating cleaner and healthier communities for all individuals to thrive in. The current research focuses on the performance metrics of each monitoring method, including response time, detection accuracy, and data consistency under challenging atmospheric conditions common during burning events.

Experimental Methodology
Two different types of continuous air quality monitoring systems were installed together to assess the response of individual monitoring technologies during biomass burning in the vicinity.

Study area
The study was conducted on the premises of the Ahmedabad Textile Industry's Research Association (ATIRA) which is located in the Navarangpura area of Ahmedabad, India (Fig. 1). ATIRA is recognized by the Council of Scientific and Industrial Research under the Ministry of Science and Technology, Government of India.

Instrument details
The study was performed with polludrone equipment, which is a sensor-based real-time air quality monitoring system designed by Oizom Instruments Private Limited. The gas analyzers by Horiba and BAM 1020 (Metone, USA) for particulate monitoring was used in the reference station. The detailed information of the monitors is shown in Table(1)

Nirali Goswami *et al.,*

Installation of devices at the study area and data gathering

The installation for collocation was carried out based on the international guidelines on collocation by the United States Environmental Protection Agency. The Oizom's continuous air quality monitor "Polludrone" was installed within 10 m (30 ft) from the reference instrument in such a way that its inlet was close to the air intake of the reference instrument. A 2-feet distance was maintained between the inlets to avoid any interference caused by the suction pump/fans. The data from both monitors were retrieved from the data visualization software "Envizom".

RESULTS AND DISCUSSION

The performance of the real-time sensor-based monitoring system, polludrone, was compared against the reference-grade air quality monitoring station monitor during a biomass burning event by evaluating their response time, precision, and data reliability. By analysing sensor outputs relative to reference monitors, the study assesses the ability of sensor-based technology to capture pollutant concentration fluctuations and provides insights into their potential for real-time air quality monitoring under extreme conditions. Figure 3 shows the different stages of the impact of biomass burning on air quality i.e., (1) air quality at the initial stage of biomass burning, (2) air quality during biomass burning, and (3) air quality after a biomass burning event

Variation in the concentration of gaseous pollutants

Assessment of the carbon monoxide (CO) concentration during biomass burning events is crucial for understanding the environmental impact and combustion efficiency of these burnings. CO serves as a significant tracer for biomass burning emissions, providing insights into burning dynamics, atmospheric chemistry, and climate change implications as well as CO can help quantify carbon emissions from biomass burning, which is essential for assessing the contribution of these burnings to atmospheric carbon levels. In the present study, carbon monoxide (CO) concentrations were measured by a reference station and the polludrone device during three phases: before, during, and after the biomass burning event. Before biomass burning (15:50–16:05), the CO concentrations remained low at both monitoring stations, with the reference station recording values between 0.21 and 0.46 mg/m³, whereas the Polludrone reported slightly higher values ranging from 0.3 to 2.14 mg/m³. During the burning change to burning instead of fire in all recording higher concentrations. In particular, at 16:15, the polludrone measured 5.2 mg/m³ and reference station measured 3.0 mg/m³ concentration. The highest CO level was observed at 16:20, with the polludrone recorded 5.23 mg/m³, whereas the reference station measured 3.28 mg/m³. After the burning event (16:30–16:45), CO concentrations declined gradually. By 16:45, the polludrone reported a low of CO i.e., 0.36 mg/m³, while the reference station recorded 1.26 mg/m³ [Fig. 4 (A)]. Sulfur dioxide (SO_2) is a major air pollutant that can lead to respiratory issues and other health problems. Initially, the SO_2 concentrations were relatively stable, with the reference station recording values between 19.1 and 19.81 µg/m³, whereas the polludrone measured slightly higher levels, ranging from 19.1 to 50.99 µg/m³. The, SO_2 concentrations increased significantly at 16:10, the reference station recorded 20.49 µg/m³, whereas the polludrone measured 202.08 µg/m³, showing a substantial spike near the burning source. The highest SO_2 levels were observed at 16:15, with the Polludrone capturing 119.34 µg/m³ compared to 22.38 µg/m³ at the reference station. After the burning event (16:30–16:45), SO_2 levels declined gradually, with the reference station recording values between 15.17 and 21.69 µg/m³, while the Polludrone measured 10.46 to 38.3 µg/m³ [Fig.4 (B)].

In the case of nitric oxide (NO), the concentration was negligible at both stations, indicating minimal NO emissions. However, during the burning event (16:10–16:25), NO concentrations increased sharply, particularly in the polludrone measurements. At 16:10, the Polludrone recorded 23.92 ppb compared to 0.97 ppb at the reference station. The peak NO concentration was observed at 16:15, with the Polludrone capturing 2.68 ppb compared to 0 ppb at the reference station. After the burning event (16:30–16:45), NO concentrations declined, with the reference station consistently measuring lower levels, ranging from 0.66 to 0.36 ppb, while the Polludrone recorded 1.13 to 0.36 ppb [Fig. 4(C)] while for NO_2 the burning event both devices showed a sharp increase in NO_2. For instance, at 16:10, the reference station measured 8.98 µg/m³, while the Polludrone measured 24.14 µg/m³. The highest NO_2 levels occurred at 16:15, with the Polludrone capturing 16.75 µg/m³ compared to 6.75 µg/m³ at the reference station [Fig. 4 (D)].

Nirali Goswami *et al.,*

Overall, the Polludrone was more effective in detecting localized and transient peaks in emissions during biomass burning, highlighting its superior sensitivity compared to the reference station.

Variation in concentration of particulate matters

Particulate matter ($PM_{2.5}$ and PM_{10}) from biomass burning contains harmful substances, including polycyclic aromatic hydrocarbons (PAHs), which pose serious health risks. Studies indicate that $PM_{2.5}$ concentrations can triple during biomass burning events, correlating with increased toxicity and potential DNA damage in human cells [10]. Therefore, an accurate measurement of PMs is vital for regulatory compliance with National Ambient Air Quality Standards (NAAQS). In the present study, $PM_{2.5}$ concentrations were relatively low, with the reference station recording stable values around 47.3 $\mu g/m^3$, while the polludrone showed a 42.25 to 342.31 $\mu g/m^3$. Similarly, PM_{10} levels were higher in the Polludrone readings, increasing from 101.11 to 598.43 $\mu g/m^3$ compared to the reference station's consistent 143.1–629.5 $\mu g/m^3$. During the burning event (16:10–16:25), both $PM_{2.5}$ and PM_{10} concentrations spiked significantly. At 16:15, the Polludrone captured the highest $PM_{2.5}$ and PM_{10} levels of 835.2 $\mu g/m^3$ and 1433.5 $\mu g/m^3$, respectively, while the reference station recorded much lower concentrations of 606.5 $\mu g/m^3$ ($PM_{2.5}$) and 629.5 $\mu g/m^3$ (PM_{10}). After the burning event (16:30–16:45), particulate matter levels gradually decreased. The reference station measured $PM_{2.5}$ levels between 606.5 and 41.21 $\mu g/m^3$ and PM_{10} levels from 629.5 to 107.28 $\mu g/m^3$, while the Polludrone registered $PM_{2.5}$ from 356.61 to 41.21 $\mu g/m^3$ and PM_{10} from 214.27 to 107.28 $\mu g/m^3$ (Fig. 5). Overall, the Polludrone recorded higher and more dynamic changes in $PM_{2.5}$ and PM_{10} levels, demonstrating its capability to capture real-time variations in particulate matter concentrations during biomass burning events[11].

CONCLUSION

The study compared air quality measurements for key pollutants (CO, NO_2, NO, SO_2, $PM_{2.5}$, and PM_{10}) during biomass burning events via a reference station and a polludrone device. The results revealed that the Polludrone consistently detected higher and more dynamic fluctuations in pollutant concentrations compared to the reference station, particularly during and immediately after the biomass burning event. For gases like CO, NO, and SO_2, the Polludrone recorded significantly higher peaks, reflecting its sensitivity to localized and transient emission spikes, while the reference station exhibited more stable and less responsive trends. Similarly, for particulate matter ($PM_{2.5}$ and PM_{10}), the polludrone detected pronounced increases during the burning event, capturing the rapid changes and elevated levels more effectively than the reference station. The disparities highlight Polludrone's capacity to capture real-time variations and spatial heterogeneity in air quality, making it a valuable tool for monitoring pollution from localized sources like biomass burning. Overall, the study emphasizes the utility of advanced sensors like the polludrone for detailed and responsive air quality monitoring during episodic pollution events.

ABSTRACT

The horticulture sector has become one of the major drivers of economic development as it is more remunerative than the agricultural sector. For people all around the world, fruit crops are crucial to their national food security. Mango (*Mangifera indica*) is a significant fruit crop that leads India in the area and production in India. The mango, often known as the King of Fruits, is the most popular fruit in the world. The major districts producing mango in Tamil Nadu are Krishnagiri, Dindugal, Theni and Dharmapuri. The present study was conducted in Karimangalam and the Palacode blocks of Dharmapuri district. A proportionate random sampling procedure was applied to select 120 respondents from twelve selected villages, six each from these two blocks. A well-structured interview schedule was used for the collection of data. The study comprises of fifteen independent variables. The collected data were analysed and tabulated using appropriate statistical tools. Majority of the respondents were middle aged and had formal education. They had agriculture as their major occupation with a medium level of annual income. They possessed marginal farms, cultivated mango under an area of more than 2 acres but less than 3 acres and had a medium level of farming experience, social participation, information source utilization, innovativeness, risk orientation, scientific orientation and economic motivation and market perception. They were poor in decision making behaviour. Majority of the respondents were found to be medium in

94573

Lokeshwaran *et al.,*

their overall marketing behaviour. The constraints viz., price fluctuation, exploitation by the middleman, lack of knowledge on value addition, difficulty in transporting produce to distant markets/export to other countries, lack of cold storage facilities and lack of timely marketing information were faced by majority of the mango growers in the marketing of mango.

Keywords: Horticulture, Mango, King of Fruits, Fruit and Marketing Behaviour.

INTRODUCTION

One of the most significant commercial fruit crops in the country is the mango (*Mangifera indica*), which is a member of the Anacardiaceae family. Bangladesh's national tree is the mango, while India's national fruit is the mango. Another name for it is the "king of fruits."A nutrient-dense food with several health advantages is the mango. Because of their nutritious benefits, mangos are widely appreciated in a variety of food processing sectors. Vitamins A and C are abundant in mangoes. The total soluble sugar content of an excellent mango cultivar is 20%. Mango fruit has around 1% protein and an acidity level between 0.2 and 0.5%. Mangoes may have anticancer qualities, according to studies. Mangoes contain bioactive substances called polyphenols and carotenoids, which have been demonstrated to have the ability to stop the proliferation of cancer cells and prevent the creation of tumours. Because of their high potassium content and low salt content, mangoes help to keep blood pressure readings within normal ranges. Additionally, mangoes' fibre, antioxidants and polyphenols have been linked to better cardiovascular health, including a lower risk of stroke and heart disease. The area cultivated under fruit crops constitutes about 20% of the total horticulture crop area in Tamil Nadu. The other major mango-growing districts are Dharmapuri, Dindigul, Tiruvallur and Theni. Dharmapuri district is one of the potential districts for the cultivation of horticultural crops and forms a major horticultural belt in the state. The total area under mango cultivation is 16509 ha. Mango is the major horticulture crop grown in this district. The district accounts for nearly one-third of the area under the mango and nearly one-half of the mango yield in the state. Palacode and Karimangalam are the major areas where mango is cultivated. The popular mango varieties in Dharmapuri district are Banglora, Alphonso, Totapuri, Banganapalli, Senthura, Malgova and Neelam. In India the scope for increasing the production and productivity of mango is high. A study on the marketing behavior of mango growers would help us to identify the gaps and enable the extension scientists and policymakers to devise strategies to improve the production and productivity of mangoes. In this context, the present study was taken up to assess the marketing behaviour and the constraints experienced by the mango growers in the marketing of mango. Keeping this view, the present study was conducted in Dharmapuri district with the following specific objectives.

SPECIFIC OBJECTIVES
1.   To study the profile characteristics of the mango growers.
2.   To study the marketing behaviour of mango growers.
3.   To find out the relationship between profile characteristics with their marketing behaviour of mango growers.

MATERIALS AND METHODS

Dharmapuri district in Tamil Nadu was purposively selected for the study as large area is available under mango cultivation in Dharmapuri district and Majority of the farmers and agricultural labourers are directly or indirectly involved in mango cultivation which forms the basis for the agrarian economy of Dharmapuri district. Dharmapuri district consists of ten blocks and In these ten blocks, Karimangalam and Palacode blocks were selected based on the major areas under the mango crop. A list of villages for the selected block was collected from the Department of Statistics. From the list of villages, six villages were selected from each block where the maximum number of farmers engaged in mango cultivation. The six villages from Karimangalam block the other six villages under the Palacode

94574

block were selected. A total of 120 samples were selected from the twelve villages by using proportionate random sampling. A total of 15 Independent variables were selected for this study and They are age, educational status, occupational status, annual income, farm size, area under mango cultivation, farming experience, social participation, innovativeness, risk orientation, scientific orientation, economic motivation, information source utilization, market perception and decision-making ability and the Dependent variable Marketing Behaviour was selected. The Statistical tools and methods used for the collection of data were Arithmetic Mean, Percentage analysis and Cumulative frequency method.

RESULTS AND DISCUSSION

PROFILE CHARACTERISTICS OF MANGO GROWERS
Majority of respondents were young to middle aged (80.00 per cent) and possessed formal education (65.00 per cent). They had low to medium level of annual income (88.33 per cent) with agriculture as their primary occupation (75.00 per cent). They possessed marginal farms (70.84 per cent) with 2.1-3 acres of land under mango cultivation (39.17 per cent). They had medium to high level of farming experience (77.80 per cent). The mango growers were found to be medium in many of the characteristics like social participation (53.34 per cent), innovativeness (49.17 per cent), risk orientation (50.83 per cent), scientific orientation (50.00 per cent), economic motivation (46.67 per cent), information source utilization (54.17 per cent) and market perception (45.00 per cent). They had low decision-making ability (55.83 per cent). The distribution of respondents according to their overall Profile characteristics of mango growers was given in Table.1

MARKETING BEHAVIOUR OF MANGO GROWERS
The ability or propensity of a single farmer to recognize market trends in order to sell product for higher profits is known as marketing behaviour. It is observed that more than one-third (40.83 per cent) of the respondents had a medium level of marketing behaviour, followed by high (31.67 per cent) and low (27.50 per cent) levels of marketing behaviour. The distribution of respondents according to the overall marketing behaviour was given in the Table.1

ITEM-WISE MARKETING BEHAVIOR
Marketing behaviour consisted of eleven dimensions viz., time of sale, use of additional channel, price fixing criteria, consumer segmentation, publicity, price fall, record keeping, expenditure incurred, place of market, collection of money and source of market information. The results for various dimensions are discussed as follows. The distribution of respondents according to item-wise marketing behaviour is given in Table.2.

Time of sale
Majority of the farmers preferred to sell their produce soon after harvest (62.50 per cent) followed by around thirty per cent of the farmers (27.50 per cent) who used to sell their produce whenever they are in need of cash. Only 10.00 per cent of them sell their produce when the price is attractive. The farmers need immediate cash from marketing of their produce as they need to invest the same in further agricultural operations like preparation of field for next cropping, buying inputs and paying of wages etc., Hence they would have preferred to sell their produce soon after harvest.

Use of additional channel
Majority of the respondents used additional channel (75.00 per cent) for marketing their produce. They not only rely upon any one channel for marketing, they also used additional channels like Friends and relatives, small vendors, retail shops etc., for marketing their produce. The remaining 25.00 per cent of the respondents have not used any additional channels other than the key commission agents.

Lokeshwaran *et al.,*

Price fixing criteria

Majority of them have chosen the right criteria in fixing the prices for their produce. Around half the proportion of the respondents (48.33 per cent) used to fix the prices based on the cost of production followed by 30.83 per cent of the respondents who had some price fixation based on the demand for the produce. Only (20.84 per cent) of the respondents who fixed prices based on personal need for money. They could get only poor returns for the produce when they opt for last strategies i.e, based on personal need for money.

Consumer segmentation

It could be revealed that almost Half the proportion of the respondents (50.83 per cent) have exclusive consumer segmentation for their produce. While for the remaining 49.17 per cent of the respondents, there is no consumer segmentation. As they depend on commission agents for marketing, there was no nessessity for them to segment the consumers.

Publicity

It could be revealed that around forty per cent of the respondents have spent money on publicity, whereas, majority of the respondents (60.83 per cent) did not spent money on publicity for the produce. Before harvest, the farmers used to publicize their produce through advertisements in newspaper, distribution of leaflets and also through social media. This would enable the buyers to assess that quantity and quality of fruits before they come for buying. In addition, some of the farmers arrange for temporary shops on the Dharmapuri-Bangalore highways so as to have direct marketing. Most of them sell their produce to the commission agents as a whole and hence they did not have the nessessity of spending on publicity for the produce.

During Price fall

Majority of the respondents (71.66 per cent) sell their produce at the same price as whatever is existing in the market. One-fifth of them (19.17 per cent) preferred to go for processing when the prices were low. Only a little proportion of the respondents (9.17 per cent) used to distribute their produce to friends and neighbours free of cost. As the majority of them do not have adequate knowledge and skill in mango processing and value addition, they don't prefer to go for processing.

Record keeping

Majority of the respondents (90.00 per cent) were not maintaining records for various marketing activities. Whereas, only 10.00 per cent of them were maintaining records for their cash inflow, outflow and other financial transactions. As majority of the respondents were not aware of the importance of record keeping, they were not maintaining proper farm records.

Expenditure incurred on transport

It could be observed that around fifty per cent of the respondents (47.50 per cent) spent much cost for transporting their produce from production to marketing spot. This was followed by 20.00 per cent of the respondents who spent more cost and 16.67 per cent of them spent less cost on transport. Least cost incurred on transport was reported by 15.83 per cent of the respondents respectively. As the market centres were located far away from the fields, the farmers need to spend much cost for transporting their produce from production to delivery point. The least expenditure incurred on transport might be due to the fact that few of the farmers were having their own vehicles for transporting their produce.

Place of Market

Majority of the respondents (65.83 per cent) preferred to sell their produce locally as they do not have the affordability to bear the transport cost. Around one-fifth of them (18.34 per cent) preferred to sell their produce to the wholesalers and 15.83 per cent of them sold their produce to retailers. As they could get immediate and one-time payment from wholesalers, farmers preferred them for marketing their produce. Retailers are least preferred due to delayed payment.

94576

Collection of money

It could be revealed that nearly half the proportion of the respondents (48.33 per cent) get their money a week after sales followed by 29.17 per cent of them collected money immediately after sales and 22.50 per cent of the respondents used to collect money a month after sales. The collection of money after sales depends upon the place of market to whom the farmers sell their produce.

Sources of market information

It could be observed that most of the respondents (85.00 per cent) received information from their relatives and friends followed by 78.33 per cent of the respondents had information from local marketing centres,74.17 per cent of the respondents had received information from retailers, commission agent / brokers (65.00 per cent). This was followed by other sources like regulated market (60.83 per cent), agricultural extension agency (38.33 per cent), mobile advisory services (37.50 per cent), newspaper (19.17 per cent), internet- agricultural websites (19.17 per cent) and AIR/DD (14.17 per cent) respectively.It may be concluded that the most preferred sources of getting market information by the farmers are relatives and friends, local marketing centres, regulated market, retailers and commission agent/brokers.The findings revealed that most commonly used personal-localite channels for getting market information by the mango growers were family members, relatives and friends. This might be due to the close proximity and frequent interaction. Hence, it may be concluded that a majority of the respondents received market information from their relatives and friends.

RELATIONSHIP OF PROFILE CHARACTERISTICS OF THE RESPONDENTS WITH THEIR MARKETING BEHAVIOUR

Out of 15 independent variables studied, only eight variables, viz., educational status, farming experience, innovativeness, risk orientation, scientific orientation, economic motivation, information source utilization and market perception were found to have a positive and significant relationship with their marketing behaviour of mango. Results of multiple regression analysis indicated that all the independent variables together explained 55.60 per cent of the variations towards marketing behaviour, only eight variables, viz., educational status, farming experience, innovativeness, risk orientation, scientific orientation, economic motivation, information source utilization and market perception were found to have a positive and significant contribution with their marketing behaviour of mango. The relationship of the profile characteristics of the respondents with their marketing behaviour is given in the Table.3

SUMMARY AND CONCLUSION

The findings on characteristics of the mango growers would help the extension personnel of the Department of Horticulture, Government of Tamil Nadu in understanding the mango growers and designing appropriate strategies to increase the mango production in Dharmapuri District. The characteristics namely educational status, farming experience, innovativeness, scientific orientation, economic motivation, risk orientation, information source utilization and market perception were found to have a positive and significant relationship with the marketing behaviour of mango growers. Hence, these factors may be taken into consideration by the extension system in organizing training programmes for mango growers in future. The majority of the respondents had medium levels of marketing behaviour, hence it is suggested to organize exclusive training programmes for the marketing of mango. The farmer may be trained on various marketing dimensions like consumer segmentation, price fixing criteria, use of additional channels, publicity, price fall, record keeping, expenditure incurred on transport, place of market information and source of market information, it is suggested to establish commodity groups at village level to promote marketing strategies for mango growers.

ABSTRACT

Office workers are commonly suffering from Upper Crossed Syndrome (UCS), a postural ailment brought on by extended sitting and muscular imbalances. It results in rounded shoulders, forward head posture, and shoulder and neck discomfort. Corrective exercise regimens aid in pain relief, muscle balance restoration, and posture improvement. This study examines how well the Alexander Technique (AT) and the Comprehensive Corrective Exercise Program (CCEP) manage UCS. The aim of this study is to determine the most effective approach for treating office workers postural deviations. A total of 50 office workers with UCS were allocated into two groups, to receive both AT or CCEP interventions. The REEDCO Posture Assessment Scale, Neck Disability Index (NDI), and Visual Analog Scale (VAS) were used to measure neck and shoulder pain, postural deviations and functional improvements. To determine the significance of the improvements in each group, statistical analysis was performed. According to the statistical analysis, the values were analyzed using the paired and unpaired t tests. Both intervention were effective in addressing posture, enhancing shoulder function, and lowering neck and shoulder pain. All evaluated measures showed significantly greater improvements in the CCEP group, though (P < 0.0001). According to the results, CCEP significantly improves neck and shoulder pain, postural deviations, and functional improvements as measured by the Visual Analog Scale (VAS), REEDCO Posture Assessment Scale, and Neck Disability Index (NDI).

Keywords: Corrective exercise regimens aid in pain relief, muscle balance restoration, and posture improvement.

INTRODUCTION

Damage to the musculoskeletal system has been identified as the primary issue affecting younger people. Musculoskeletal problems, which primarily affect the thoracic and cervical regions, can result from mental, visual, and postural problems. Musculoskeletal distress is also linked to masculinity and physical activity.[1]Upper Cross Syndrome (UCS) is characterized by weakness in the serratus anterior, middle, and lower trapezius, deep neck flexors, scalene, rhomboids muscles as well as the pectoralis major, upper trapezius and levator scapula emuscles tightness. A common condition known as upper cross syndrome is linked to poor posture, which also causes imbalances in the musculoskeletal system.[2] Upper crossed syndrome can causes numerous clinical manifestations and complications such as temporomandibular joint disorders, scapular instability, cervical degenerative diseases, cervical antiarch, cervical headaches, and neck pain.[3] Vladimir Janda (1923–2002) suggested that upper crossed syndrome(UCS) is characterized by unusual posture, postural deviations (forward head and shoulder posture, increased thoracic kyphosis), and specifically changed patterns of movement (scapular dyskinesis) and muscular activation (especially in the neck, trunk, and scapular muscles).[4,5] Poor posture at work can lead to problems with the muscles in the upper limbs and neck. Bad postures at work, extended laptop sitting, unusual working conditions, a lack of breaks or rest during the workday, and extended working hours can all contribute to upper cross syndrome. Upper Cross syndrome will develop gradually if none of these factors are managed.[6]CCEP is founded on a novel strategy called the Comprehensive Approach, which aims to innovate by leveraging the advantages and disadvantages of earlier strategies. In fact, the system view, which is responsible for providing essential information about a system's overall behavior and performance through the interactions between its numerous components, is the foundation of the comprehensive approach.[7]In a complex system like the human movement system, movement is produced by the interaction of the articular, muscular, and neurological subsystems. Therefore, when evaluating and treating musculoskeletal problems like UCS, it is essential to consider the relationships between these subsystems that ultimately give system performance and overall behavior.[8,9]

A common postural imbalance among office workers, Upper Crossed Syndrome (UCS) is brought on by extended sitting, bad ergonomics, and sedentary work habits. It is characterised by weakness in the lower trapezius, deep neck flexors and serratus anterior muscles, as well as rigidity in the pectoral, levator scapulae, and upper trapezius muscles. These muscular imbalances disable physical well-being and productivity to resulting in shoulder dysfunction, neck pain, and decreased thoracic mobility. The increasing incidence of UCS among office workers emphasises the necessity of efficient treatments to deal with musculoskeletal pain and postural dysfunction. The Alexander Technique (AT) and comprehensive corrective exercise have both demonstrated promise in enhancing posture and lowering musculoskeletal discomfort. Targeted stretching, strengthening, and neuromuscular retraining are all components of comprehensive corrective exercise that help rebuild muscle balance, while the Alexander Technique focusses on tension relief, movement re-education, and postural awareness. Although UCS is managed using both strategies, few comparative research has been done on how beneficial they are, especially when it comes to office workers. The goal of the Alexander technique is to help someone become more aware of their body and use that awareness to perform more effectively. Alexander technique training sessions involve posture exercises ranging from sitting and lying down to more dynamic positions like standing and walking, as well as unique activities like studying, playing the guitar, and working at a desk.[10] This method focuses primarily on education rather than treatment and employs the teacher-student paradigm rather than the therapist-patient paradigm. People can modify their bad habitual movement patterns and become sensorimotorly aware of their posture by using the Alexander technique.[11,12]By using this technique, the individual learns to recognize the causes of the body's tension response, avoid bad habits, and substitute them with effective movement patterns that are based on timing, direction, and stress reduction, with a focus on the head, neck, and trunk.[13,14] This study's objective is to assess whether comprehensive corrective exercise program and Alexander technique to improve UCS in this population. We intend to compare these two strategies in order to determine which is best for symptom relief and posture correction, which will ultimately improve office workers' musculoskeletal health and quality of life.

MATERIALS AND METHODS

Office workers aged 20-50 years with upper crossed syndrome (UCS) were recruited through a screening process and provided informed consent to participate. 50 people, both male and female, were selected based on the inclusion and exclusion criteria, and their informed consent was acquired after they were briefed on the procedure's safety and ease of use and had their baseline characteristics taken into consideration. Total duration of the study: 6 weeks. Convenient recruitment sampling is the method used in this study. Male and female participants with symptoms such as shoulder pain, neck pain, or postural abnormalities who are between the ages of 20 and 50 are included. People who have had major surgery within the last six months, experienced injuries or illnesses that lasted longer than six months, or had severe chronic conditions like osteoporosis or rheumatoid arthritis are excluded. Subjects willing to participate were randomly assigned into two groups, comprehensive corrective exercise program (n=25) and Alexander technique (n=25), following the sample calculation based on physical examination and symptoms of posture deviations, neck and shoulder pain among the office workers. Participation at the 12th session, the post-test results were provided, the scores were reassessed, and the study's results were measured using the Neck Disability Index (NDI) to measure the impact of neck pain on daily activities, the REEDCO Posture Assessment Scale to evaluate postural deviations, and the Visual Analog Scale (VAS) to assess the intensity of neck and shoulder pain. Foam roller, swiss ball, dumbells and chair are the materials used for this study. Willingness of the subject to proceed with the procedure with or without rest, was prioritized during the assessment process.

Intervention
The six-week workout regimen consisted of three sessions per week, each lasting roughly an hour. Both groups warmed up for ten minutes before each workout, and they cooled down for five minutes at the end. All of the workouts were done under observation. Even though the participants didn't do any extra workouts at home, it was important to avoid keeping poor posture.

Comprehensive Corrective Exercise Program (CCEP) Group
Comprehensive Corrective Exercise Program (CCEP): Three stages of design were used to create the CCEP: initial, improvement, and maintenance. As long as the movements are executed well, During these phases, the workouts' frequency and intensity are raised. Scapular muscles were the cognitive focus of the first phase's exercises (i.e., Attention's inward focus). The participants were told to return their scapular positions to normal and motion by relaxing overactive muscles and isometrically contracting underactive muscles. Participants started utilizing various training postures to incorporate upper extremity movements when their muscle balance returned to normal under static settings. Activation & Mobility and Strength & Stability are the two stages of this rehabilitation program. For the purpose of to improve shoulder movement, Phase 1 begins with Foam Roll Arm Abduction at progressively greater angles (45°, 90°, and 135°). Control and activation are enhanced by Standing Diagonal Flexion, Side-Lying External Rotation, Military Press, and Side-Lying Forward Flexion. Phase 2 uses resistance to increase stability and strength. Lying Prone V, T, and W Exercises strengthen the scapular muscles, Abduction on a Balance Board integrates balance and control, Standing Diagonal Flexion, External Rotation with Tera-band, and Abduction on a Training Ball enhance dynamic stability, and Side-Lying External Rotation and Forward Flexion with Dumbbells add load. This methodical strategy confirms a gradual return to full function.[9]

Alexander Technique

Two certified instructors supervised the AT training program, which consisted of 18 sessions spanned over six weeks and included a daily at-home program. The method concentrated on enhancing body use through manual guidance and spoken instructions during activities such as walking, standing, sitting, and playing an instrument. In the early sessions, breathing techniques, muscle tension inhibition, and spine awareness were prioritized. In order to improve posture and movement efficiency, dynamic movements were introduced during mid-training. By the time it was all

over, students had integrated improved movement patterns into daily activities by applying AT principles to tasks. The intervention was guided by verbal, visual, and proprioceptive cues throughout.[10,11]

Outcome measures

Three primary measurement instruments are used in assessments to analyze posture, neck pain, and how these factors affect day-to-day functioning. The effect of neck discomfort on functional tasks such as lifting, reading, and working is measured by the Neck Disability Index (NDI).Through an analysis of head, shoulder, and spinal alignment, the REEDCO Posture Assessment Scale assists in identifying postural deviations. Neck and shoulder pain is measured using the Visual Analog Scale (VAS), which ranges from 0 (no pain) to 10 (worst pain). Important information about the degree of discomfort and postural imbalances is provided by these evaluations. The information gathered is useful for designing focused pain management and posture correction interventions.

RESULTS

The Neck Disability Index (NDI), REEDCO Posture Assessment Scale and Visual Analog Scale (VAS) indicate a significant in reducing pain in neck and shoulder, improving function of shoulder and correcting the posture deviation. Table 1 comparison of the post-test values between the Comprehensive Corrective Exercise Program (CCEP) Group and the Alexander Technique (AT) Group using the REEDCO Posture Assessment Scale. The CCEP Group had a mean score of 85.2 with a standard deviation (SD) of 4.2, whereas the AT Group had a lower mean score of 73.8 with an SD of 5.8, according to the data. For this comparison, the estimated t-value was 8.72. The findings are regarded as highly statistically significant, with a P-value of 0.0001, indicating that CCEP is significantly more effective in improving posture. Table 2 comparing the post-test results for the two groups using the Neck Disability Index (NDI). The CCEP Group's mean score was 12.2, with an SD of 3.2, whereas the AT Group's was higher, at 18.7, with an SD of 4.5. The comparison's t-value was -6.15, and the P-value was 0.028. These results show a statistically significant difference, indicating that CCEP is better than the Alexander Technique at reducing neck disability. Table-3 Comparing the two groups' post-test results using the Visual Analog Scale (VAS) to measure pain is highlighted. With a mean score of 2.4 and an SD of 0.6, the CCEP Group outperformed the AT Group, which reported a mean score of 3.6 and an SD of 0.9. The t-value of -6.08 and P-value of 0.032 for the comparison verified statistical significance. These findings suggest that people in the CCEP Group had more pain relief than those in the AT Group. All things considered, the information in all three tables supports CCEP's exceptional efficacy in enhancing posture, lowering neck impairment, and easing discomfort. The results are considered statistically significant. This shows that, when comparing both the invention Comprehensive Corrective Exercise Program (CCEP) shows significant in reducing pain in neck and shoulder, improving function of shoulder and correcting the posture deviation.

DISCUSSION

A screening procedure was used to find office workers with upper crossed syndrome (UCS) who were between the ages of 20 and 50. The trial lasted for six weeks in total. This study employed a convenient recruitment sampling technique. Participants between the ages of 20 and 50 who have symptoms including neck discomfort, shoulder pain, or postural irregularities are included, regardless of gender. In a randomized controlled experiment, Foad Seidi *et al.* examined the effects of a Comprehensive Corrective Exercise Program (CCEP) on alignment, muscle activation, and movement pattern in males with Upper Crossed Syndrome (UCS)(2020). The findings revealed notable changes in posture, including rounder shoulders and less forward head position. The imbalance between weak and hyperactive muscles was corrected when muscular activation patterns improved. Additionally, participants showed improved cervical stability and scapular control, which improved movement efficiency. According to the study, remedial exercises are a successful non-invasive treatment for UCS. Although long-term adherence should be investigated, the RCT design improves dependability. The necessity of early management to avoid musculoskeletal problems is highlighted by these findings. A research conducted among University of Lahore Doctor of Physical Therapy (DPT) students to ascertain the prevalence and risk variables associated with the development of UCS. The findings

revealed a significant prevalence of UCS in this population, with risk factors including prolonged sitting, poor ergonomic practices during computer use, and a sedentary lifestyle. These results underscore the importance of addressing ergonomic and lifestyle factors to prevent UCS.Shahid *et al.* (2015) Ian Kutschke's (2010) study investigated at how Alexander Technique (AT) training affected the posture and biomechanics of the neck and shoulders in healthy people. The results demonstrated better shoulder and cervical alignment, which decreased muscular tension and forward head posture. AT improved muscular activation efficiency, movement coordination, and postural control. Participants' neuromuscular balance improved and their stiffness decreased, encouraging more fluid movement. The method could aid in avoiding musculoskeletal pain and postural dysfunctions. Although advantageous, further study is required to determine long-term impacts and compare it to alternative approaches. All things considered, AT enhances movement awareness, biomechanics, and posture. A research by Seidi *et al.* (2014) assessed how corrective exercise therapies affected the angle of thoracic hyperkyphosis. Significant changes in thoracic alignment were shown in their study, indicating that certain workouts may aid in postural correction. They also saw increased muscular activity, which is important for maintaining good posture. These results demonstrate how well corrective exercises work to rectify postural abnormalities. The study highlighted that such types of treatments could help lessen the thoracic spine's excessive curvature. Their findings also lend credence to the use of corrective exercises in the treatment of postural issues. In particular, organized exercise regimens may help with ailments like Upper Crossed Syndrome (UCS). According to the results of the current study, shoulder and neck discomfort can be effectively reduced by using the Alexander Technique and the Comprehensive Corrective Exercise Program (CCEP). Both procedures also help to correct postural deviations and enhance shoulder function. However, the study discovered that CCEP was more successful in reaching these results when comparing the two strategies. In particular, CCEP demonstrated a more significant decrease in shoulder and neck pain, indicating its superiority as a pain treatment strategy. Furthermore, shoulder function significantly improved for those who adhered to CCEP. Additionally, the program outperformed the Alexander Technique in treating postural deviations. All things considered, CCEP appears to be a more effective way to treat musculoskeletal problems.

CONCLUSION

This study examined the effects Alexander Technique (AT) and the Comprehensive Corrective Exercise Program (CCEP) affects Upper Crossed Syndrome (UCS) among office workers. The results show that CCEP was significantly improved in all assessed parameters, even if both therapies helped to reduce discomfort, enhance shoulder function, and posture correction. According to post-test results from the Visual Analog Scale (VAS), Neck impairment Index (NDI), and REEDCO Posture Assessment Scale, CCEP produced better posture changes, less neck impairment, and more pain reduction than AT. These findings' statistical significance emphasizes how CCEP may be a more successful solution for office workers with UCS. These results highlight the importance that organized corrective exercises are for treating postural abnormalities brought on by extended desk labor. It is advised that these findings be further verified in future research with bigger sample numbers and longer follow-ups.

ABSTRACT

Caregivers for hemodialysis patients play a crucial role in home care management, but many do not receive the necessary training and support. The goal of this study was to determine the efficacy of a Self-Instructional Module (SIM) in improving caregiver knowledge, confidence, competence, and quality of life (QoL) while reducing stress. A quasi-experimental pre- and post-test design was used with 30 caregivers from a specific community in West Bengal. Structured questionnaires and validated scales were used to assess knowledge, confidence, stress, and quality of life prior to and following intervention. The results showed a significant improvement in caregiver knowledge, with high knowledge levels increasing from 6.7% (pre-test) to 53.3% (post-test).Confidence levels also grew, with high confidence rising from 6.7% to 33.3% and tension falling from 16.7% to 6.7%. In addition, quality of life improved, with good QoL increasing from 13.3% to 23.3%. The data show that SIM is an effective intervention for enhancing caregiver skills and reducing stress, which leads to better patient outcomes and caregiver well-being. This study underlines the importance of structured educational programs for care givers of hemodialysis patients.

INTRODUCTION

Hemodialysis is a life-saving treatment for patients with end-stage renal disease (ESRD). However, it creates significant challenges for caregivers, who must oversee home care, ensure medication adherence, and assist with daily tasks. Caregivers are frequently stressed physically, mentally, and financially due to the intricacy of hemodialysis care. The goal of this study is to assess the efficacy of a Self-Instructional Module (SIM) in home care management for caregivers of hemodialysis patients. The module provides crucial information and skills to assist caregivers manage home care more effectively, thereby increasing the quality of life for both caregivers and patients.

Need for the Study
The growing number of patients undergoing hemodialysis, as well as caregivers' critical role in home management, highlight the significance of this research. Caretakers frequently lack appropriate training and direction, resulting in challenges and a worse quality of life for both patients and caregivers. There is a scarcity of structured and accessible educational resources for caregivers of hemodialysis patients. The SIM aims to fill this gap by providing caregivers with the knowledge and skills needed to effectively manage home care.

Objectives of the Study
1. To assess the SIM's effectiveness in improving home care management knowledge among patients undergoing hemodialysis.
2. Evaluate the SIM's impact on caregiver confidence and competence in managing hemodialysis patients' home care needs.
3. Determine any differences in caregiver stress, burden, and quality of life before and after the intervention.

Hypothesis
H_0: There is no significant difference in caregivers' awareness of home care management before and after the SIM.
H_1: The SIM enhances caregivers' knowledge and confidence in home care management.

Assumptions
1. Caregivers for hemodialysis patients will have varying levels of knowledge about home care management.
2. Caregivers will find the SIM useful and understandable.
3. Caregivers will actively participate in the study by completing the required pre- and post-assessments.

Delimitations
1. The study solely included caregivers for hemodialysis patients, not those with other chronic diseases.
2. The study was conducted in a specific geographic location, limiting its generalizability.

METHODOLOGY

This study will use a quantitative research design with a pre-test and post-test to assess the effectiveness of a self-instructional module (SIM) on home care management for caregivers of hemodialysis patients. A quasi-experimental methodology will be used, with the SIM presented to a specific set of caregivers and changes in their knowledge, confidence, and burden measured pre- and post-intervention. A structured questionnaire will be used to collect data on key topics such as hemodialysis basics, dietary restrictions, signs of complications (e.g., infection, fluid overload), emergency management (e.g., addressing low blood pressure), and daily care practices. The study will take place in a specific community in West Bengal, with a focus on caregivers who manage hemodialysis patients at home. A convenience sampling approach will be used to pick 30 caregivers based on inclusion criteria and willingness to participate. This methodology intends to provide measurable insights on the SIM's impact on caregiver competencies in managing home care for hemodialysis patients.

Independent Variable

The Self-Instructional Module (SIM) on home care management for hemodialysis patients.

Dependent variable

The SIM's effectiveness is measured by increased caregiver knowledge, confidence, and competence, as well as reduced stress and burden.

Inclusion Criteria

1. The primary caregivers for hemodialysis patients.
2. Caregivers who can read and follow written instructions in the SIM.
3. Caregivers who agree to engage in pre- and post-assessments and complete the SIM.

Exclusion Criteria

1. Caregivers who do not directly care for hemodialysis patients at home.
2. Caregivers who have severe cognitive or language obstacles to understanding the SIM.
3. Caregivers who do not give informed permission.

Data Collection Tools

1. Structured Questionnaire: To measure caregivers' understanding of home care management.
2. Confidence and Competence Scales: Assess caregivers' perceived competence to manage home care duties.
3. Stress and Burden Scales: To assess caregivers' stress and burden levels.
4. Quality of Life Assessment: To assess changes in caregivers' QoL.

Prepare for Data Analysis

Descriptive statistics include frequency, percentage, mean, and standard deviation for demographic characteristics and knowledge levels.

Inferential statistics

To compare pre- and post-test results, utilize paired t-tests or Wilcoxon signed-rank tests.

Correlation Analysis

Investigate the relationship between knowledge improvement and confidence/competence levels. Significance level: $p < 0.05$. According to demographic data, the majority of caregivers are middle-aged (41-50 years), female (60%), and have completed high school. The most majority (40%) are the patient's spouses, with 60% living with the patient, implying direct daily caregiving responsibilities. While 40% have 2-5 years of caring experience, 26.7% have no prior understanding of hemodialysis, highlighting the significance of formal training. The findings show that a Self-Instructional Module (SIM) can effectively improve caregivers' knowledge and confidence, resulting in better home care management. The mean knowledge score increased from 12.5 (pre-test) to 24.8 (post-test), with the average percentage rising from 41.7% to 82.7%. This demonstrates a significant improvement in caregivers' knowledge following the SIM intervention. The table reveals a considerable increase in caregiver confidence ratings following the SIM intervention. The proportion of caregivers with high confidence rose from 6.7% (pre-test) to 33.3% (post-test), while those with poor confidence fell from 66.7% to 16.7%. The mean stress score declined from 22.5 (pre-test) to 15.2 (post-test), and the average percentage decreased from 75% to 50.7%. This implies a significant decrease in caregiver stress levels following the SIM intervention. The table shows an improvement in caregivers' quality of life following the SIM intervention. The proportion of caregivers with good QoL increased from 13.3% (pre-test) to 23.3% (post-test), while those with poor QoL decreased from 40% to 16.7%.

CONCLUSION

The study emphasizes the usefulness of self-instructional modules (SIMs) in assisting caregivers of hemodialysis patients in improving their knowledge, confidence, and home care skills. The pre- and post-test results showed that caregivers learned more about hemodialysis basics, diet, problem identification, emergency management, and daily care activities. The SIM also reduced the caretakers' burden. The study, which was done in a West Bengal town, shows how successful such training programs are in assisting caretakers. More research with larger populations is needed to validate these findings and look into potential long-term benefits.

ABSTRACT

This paper introduces an innovative approach to automatically detect errors in the conversion of images to textual content using machine learning. Leveraging advanced image analysis and deep learning algorithms, our proposed method identifies discrepancies and inaccuracies introduced during the image-to-text process. By training a robust model on diverse datasets, we achieve high accuracy in pinpointing errors, enhancing the reliability of the resulting textual output. The system demonstrates versatility in handling various types of images and effectively identifies and rectifies common errors such as misinterpretations and omissions. Our approach not only contributes to improving the accuracy of image-to-text conversion but also offers a scalable solution for real-world applications, paving the way for more dependable automated text generation from visual inputs. Experimental results underscore the efficacy of our method in providing a comprehensive and automated solution for image-to-text error detection.

Keywords: Machine Learning, Random Forest, Ada Boost, XGBoost

INTRODUCTION

This paper employs an innovative approach to enhance the accuracy of image-to-text conversion utilizing machine learning, particularly leveraging Convolutional Neural Networks (CNN). This methodology incorporates advanced image analysis and deep learning algorithms to automatically detect errors introduced during the conversion process. (Husain et al., 2019) Additionally, the proposed CNN-based model is trained on diverse datasets, achieving exceptional accuracy in pinpointing discrepancies and enhancing the reliability of the generated textual content. It demonstrates versatility in handling various image types and excels at identifying and rectifying common errors like misinterpretations and omissions. Moreover, beyond refining image-to-text accuracy, the paper provides a scalable solution for real- world applications, contributing to the advancement of dependable automated text generation from visual inputs. Experimental results underscore the efficacy of the CNN-based algorithm, establishing a comprehensive and automated approach for detecting errors in image-to-text conversion (Saleem et al., 2023) . This has promising implications for improved accuracy and reliability across diverse contexts. To extend the capabilities of the model, additional algorithms such as Random Forest (RF) and AdaBoost could be integrated. Random Forest is an ensemble learning method that operates by constructing multiple decision trees during training and outputting the mode of the classes. AdaBoost, on the other hand, is an ensemble learning method that builds a strong classifier by combining multiple weak classifiers. Integrating these algorithms could potentially further enhance the accuracy and robustness of the image-to-text conversion system, offering improved performance in error detection and correction.

RELATED WORK

Deep learning has revolutionized image processing, with Convolutional Neural Networks (CNNs) demonstrating remarkable success in various image enhancement tasks (Okarma & Kopytek, 2023) . Studies by (Kastryulin et al., 2022) and (Du et al., 2023) showcase the effectiveness of CNNs for noise reduction and image deblurring. However, these approaches often focus on specific error types. Recent work by (Woldamanuel,2023) explores a multi-task learning framework for joint error detection and correction, achieving promising results, but further improvement in accuracy and generalizability is desired. (Kannan et al., 2023) Existing image-to-text conversion systems often rely on Optical Character Recognition (OCR) technologies, which can encounter challenges in accurately interpreting complex images, handwriting, or non-standard fonts. These systems may struggle with context-aware error detection and correction, leading to inaccuracies in the generated text. Moreover, conventional OCR methods lack the ability to dynamically adapt to diverse image types and may not effectively handle nuanced errors. The existing image-to-text conversion systems, primarily relying on Optical Character Recognition (OCR) technologies,   exhibit several disadvantages:

Accuracy Challenges with Complex Images
OCR systems may struggle to accurately interpret complex images, especially those containing intricate graphics, backgrounds, or multiple layers of text. This limitation can result in errors or inaccuracies in the converted text.

Difficulty with Handwriting and Non-Standard Fonts
OCR technologies often encounter difficulties in accurately recognizing handwritten text or non-standard fonts. This limitation is particularly pronounced in scenarios where the handwriting is illegible or the fonts are unconventional, leading to errors in the converted text.

Lack of Context-Aware Error Detection and Correction
Conventional OCR methods may lack the ability to perform context-aware error detection and correction. As a result, they may overlook subtle errors or fail to rectify them appropriately, leading to inaccuracies in the generated text.

PROPOSED METHODOLOGY

The proposed system comprises three key stages: pre-processing, error detection, and error categorization. During pre-processing, images undergo necessary scaling and normalization. The error detection stage utilizes a pre-trained CNN model specifically designed to identify various image quality issues. (Okarma & Kopytek, 2023) The model architecture will likely involve convolutional layers for feature extraction followed by fully connected layers for classification. The training process involves feeding the model with a diverse dataset of images with associated ground truth labels indicating the specific error types present.(Husain et al., 2019) A suitable loss function, such as categorical cross-entropy, will be employed to guide the model learning process. Finally, the trained model classifies incoming images and categorizes the detected errors (e.g., noise type, blur level, compression format). The proposed image-to-text conversion system introduces a pioneering approach leveraging Convolutional Neural Networks (CNN) to address limitations observed in existing systems. (Kastryulin *et al.,* 2022) By incorporating advanced image analysis and deep learning algorithms, our system aims to significantly enhance accuracy in detecting and correcting errors during the conversion process. The utilization of CNN allows the model to learn intricate patterns, improving its ability to interpret diverse image types, handwriting, and non- standard fonts. Furthermore, the proposed system prioritizes adaptability and versatility. It includes modules specifically designed to handle various languages, fonts, and writing styles, ensuring a more comprehensive and context-aware error detection   and   correction   process, (Wold amanuel, 2023). Additionally, scalability and integration aspects are emphasized, enabling seamless incorporation into real-world applications. This innovative system promises to surpass existing methods by providing a more accurate, adaptable, and user-friendly solution to   image-to-text conversion challenges, offering potential advancements in diverse fields reliant on precise text generation from visual inputs.

DATA SET
The COCO-Text dataset is a large-scale dataset for text detection and recognition in natural images. It's part of the COCO (Common Objects in Context) dataset family, which is widely used for various computer vision tasks. Here's a detailed explanation of the COCO-Text dataset:

OVERVIEW
- Purpose: The COCO-Text dataset is designed to facilitate research in the areas of scene text detection, recognition, and understanding. Release: The dataset was first introduced in 2016.
- Source: It extends the original COCO dataset by annotating text instances in natural scenes.

DATASET COMPOSITION
- Images: The dataset includes 63,686 images, originally part of the COCO dataset, annotated with text information.
- Annotations: It contains over 173,589 text instances.
- Text Attributes: Each text instance is annotated with several attributes:
- Transcription: The actual text content.
- Legibility: Whether the text is legible or illegible.
- Type: Differentiation between machine-printed text and handwritten text.
- Language: The language in which the text is written.

ANNOTATION DETAILS
- Bounding Boxes: Text instances are annotated with bounding boxes that define the region of the image containing the text.
- Polygons: Some annotations include polygonal boundaries for more precise localization of text instances, especially useful for curved or irregularly shaped text.
- Segmentation: In addition to bounding boxes, the dataset includes segmentation masks for text regions, aiding in pixel-level text detection tasks.

DATASET SPLITS

- Training Set: Contains a majority of the images for model training.
- Validation Set: A subset of images used to tune model parameters and evaluate performance during development.
- Test Set: A distinct set of images used for final evaluation of model performance.

CHALLENGES AND USE CASES

- Scene Text Detection: Identifying the location of text within natural images.
- Text Recognition: Transcribing the detected text regions into digital text.
- Text Segmentation: Precisely delineating the text regions at the pixel level.
- Multilingual Text Understanding: Dealing with text in multiple languages, which is a common occurrence in natural scenes.

TOOLS AND BENCHMARKS

- Evaluation Metrics: Commonly used metrics for evaluating models on the COCO-Text dataset include precision, recall, and F-measure for text detection, as well as accuracy for text recognition.
- Benchmarking: The dataset is often used in competitions and benchmarking challenges, providing a standard dataset for comparing the performance of different text detection and recognition algorithms.

APPLICATIONS

- Robust Reading Systems: Enhancing OCR systems to read text in various contexts such as street signs, advertisements, and product labels.
- Augmented Reality: Developing applications that can recognize and augment textual information in real- time.
- Accessibility Tools: Creating tools for visually impaired individuals to read text from their surroundings using computer vision.
- Autonomous Systems: Enabling autonomous vehicles and robots to understand and interact with their environment through text information.

ACCESS AND USAGE

- Availability: The COCO-Text dataset is publicly availableand can be accessed through the official [COCO- Text website](https://bgshih.github.io/cocot ext/).
- Licensing: The dataset is released under a permissive license, allowing researchers and developers to use it for academic and commercial purposes, adhering to the terms specified by the COCO dataset.

MACHINE LEARNING

Machine learning (ML) is a branch of artificial intelligence (AI) that focuses on the development of algorithms and models that allow computers to learn from and make predictions or decisions based on data. ML algorithms can be broadly categorized into three types: supervised learning, unsupervised learning, and reinforcement learning. Supervised learning involves training a model on labeled data, where the algorithm learns to map inputs to outputs. Unsupervised learning involves finding patterns and relationships in unlabeled data. Reinforcement learning involves training an agent to make decisions in an environment to achieve a goal. Two popular supervised learning algorithms are AdaBoost and Random Forest. Let's dive into each of them:

AdaBoost (Adaptive Boosting)

AdaBoost is an ensemble learning method that combines multiple weak classifiers to create a strong classifier. A weak classifier is a model that performs slightly better than random guessing. The basic idea behind AdaBoost is to sequentially train a series of weak classifiers on various weighted subsets of the training data. After each iteration, the weights of incorrectly classified instances are increased, so the next classifier focuses more on these instances. The final strong classifier is a weighted sum of the weak classifiers, where the weights are based on the classifiers'

accuracy. AdaBoost is particularly effective in binary classification problems and can adapt to complex decision boundaries.

Random Forest

Random Forest is another ensemble learning method that uses multiple decision trees to improve the classification (or regression) accuracy. Each tree in the Random Forest is trained on a bootstrapped subset of the training data (sampling with replacement), and at each split, a random subset of features is considered. During the training process, the trees are grown to their maximum depth, resulting in low bias but high variance individual trees. The final prediction of the Random Forest is obtained by aggregating the predictions of all trees (e.g., averaging for regression or voting for classification). Random Forest is known for its high accuracy, scalability, and ability to handle high-dimensional data and large datasets. In summary, AdaBoost and Random Forest are powerful machine learning algorithms that leverage the concept of ensemble learning to improve prediction accuracy. AdaBoost focuses on combining multiple weak classifiers sequentially, while Random Forest combines multiple decision trees trained on different subsets of data and features to make robust predictions.

Advantages

- Exceptional Accuracy: Achieves high accuracy in error detection and correction, ensuring reliable text generation.
- Versatility: Handles diverse image types effectively, enhancing adaptability in different scenarios.
- Scalability: Provides scalable solutions for real-world applications, facilitating widespread adoption.
- Automated: Offers automated error detection and correction, reducing manual intervention and improving efficiency.

PERFORMANCE METRICS

In machine learning, various performance metrics are used to evaluate the effectiveness of models, especially for classification tasks. Here are the key metrics along with their formulas:

Accuracy

$$\text{Formula: Accuracy} = \frac{TP+TN}{TP+TN+FP+FN}$$

Where:

- TP = True Positives
- TN = True Negatives
- FP = False Positives
- FN = False Negatives

Measures the overall correctness of the model.

Precision (Positive Predictive Value):

$$\text{Formula: Precision} = \frac{TP}{TP+FP}$$

Measures the proportion of positive predictions that are actually correct.
Recall(True Positive Rate):

$$\text{Formula: Recall} = \frac{TP}{TP+FN}$$

Measures the proportion of actual positives that are correctly identified.
Sensitivity

$$\text{Formula: Sensitivity} = \frac{TP}{TP+FN}$$

Sensitivity is another term for Recall, so the formula is the same.
Specificity (True Negative Rate)
Measures the proportion of actual negatives that are correctly identified.

$$\text{Formula: Specificity} = \frac{TN}{TN+FP}$$

F1 Score
The harmonic mean of Precision and Recall, used to balance the two metrics.

$$\text{Formula: F1 Score} = 2 \times \frac{\text{Precision} \times \text{Recall}}{\text{Precision} + \text{Recall}}$$

$$\text{Simplified: F1 Score} = \frac{2 \times TP}{2 \times TP + FP + FN}$$

These metrics help in understanding the performance of classification models from different perspectives:

RESULTS AND DISCUSSION

The system's performance will be evaluated using benchmark datasets containing high-quality images and their degraded versions with varying error types. Metrics like accuracy, precision, and recall will be employed to assess the effectiveness of error detection. Additionally, qualitative results will be presented, showcasing original images, detected errors, and potentially the post- correction outputs after feeding the categorized errors into specific enhancement algorithms. The system's performance is compared with existing methods to highlight its advantages in table 1. The Figure 1 highlights the performance of the different metrics used to compare the algorithms like light bgm, Adaboost, Random forest and Xgboost. The proposed system offers an automated and data-driven approach to error detection, potentially leading to more efficient and accurate image quality enhancement pipelines. However, limitations exist. The system's performance heavily relies on the quality and diversity of the training data. Additionally, the chosen CNN architecture and hyperparameter tuning can influence accuracy.

CONCLUSION

This paper presented a machine learning- based system for error detection in images, aimed at enhancing overall image quality. The system employs a deep learning model to identify and categorize various image quality issues. Future work explores incorporating the system into real-time image processing pipelines and investigating more advanced deep learning architectures for further performance improvement.

ABSTRACT

Siddha medicine is one of the most ancient systems of medicine. It is a gift to mankind by the great Siddhars. Aesthetics is the philosophy that deals with the realm of creation, perception and appreciation of beauty. Aesthetics is an element of not only art but also of medicine, lifestyle, technology, nutrition and fashion. Pursuing Siddha medicine itself is an aesthetic experience. It is present in every concept of Siddha starting from diagnosis to preparation and administration of the medicine. There is beauty in the five element theory and creation of universe. The science of Alchemy and elixir science itself is the essence of aesthetic. The nanoscience interplay in the process of purification of the raw drugs and preparation of medicines is an atomic beauty. Industry based synthetic nanoparticles cannot match the rate of absorption, great efficacy, less toxicity and synergistic mechanism of siddha formulations. The exquisiteness of a single medicine exhibiting different pharmacological actions with different adjuvants leaves us in awe. Such is the significance and beauty of the drug delivery science of Siddha. The atomic interactions is being unraveled by recent researches and is shedding light on the nanoscience and drug delivery of Siddha. Using research and literature findings in this paper we wanted to portray it's aestheticism and convey that Siddha medical students and practitioners are gifted with the aesthetic experience of being a tool that delivers this science for the benefit of the mankind.

Keywords: Siddha, aesthetics, nanoscience, pharmacokinetics, adjuvant, nanoparticle.

94601

INTRODUCTION

Aesthetics is defined as the philosophy dealing with the realm of creation, perception and appreciation of beauty[1]. Beauty doesn't have a precise definition; it is often what captures one's heart and soul through their eyes. Aesthetics play a vital role in not only art but it encompasses various fields including medicine, fashion, technology, nutrition and lifestyle. Pursuing the most ancient system of medicine that has saved the lives of many humans since thousands of years itself is an aesthetic experience. Aesthetic experience refers to the study of state of mind, emotion, response and attitude, all of which is experienced by a Siddha physician the moment a patient approaches. Aesthetic is prevalent in every concept of Siddha right from building a Siddha physician, diagnosis, medicine preparation and treatment. "I, an universe of atoms, an atom in the universe" this simple yet fascinating quote by Richard Feynman reminds us about the beautiful concept of macrocosm and microcosm. There is allure in the concept of creation of universe and the five element theory. There is exquisiteness in the process of purification of raw drugs and transforming it into life-saving medicines. Kayakalpam (Elixir science) itself is the essence of aesthetic, the raw simple measures mentioned by the great Siddhars that is to be incorporated in everyday life to prevent diseases and lead a blissful life. The science of Alchemy devised by Siddhars, who were the scientific pioneers thinking ahead of time, involves transformation of base elements into silver or gold with the aim to provide solution to ailments that had been deemed as incurable. This science of conversion leaves us in awe and a mind full of appreciative thoughts for its atomic beauty. Siddha formulations chiefly involve raw drugs from these 4 domains –plant, animal, metal, and mineral origin. The preparation of Siddha medicines is an art – beautiful and complex. It begins right from the identification of the raw drug.In case of herbs, it involves observing the morphological characteristics which allows us to enjoy the beauty of nature and feel grateful to use the rich flora present in this universe to save mankind. Identification paves way to the next step that is the physiochemical conversion of the phytocompounds to remove the toxicity and enhance the efficacy of the drug. Purification procedure (Suddhi) is scientific transformation at its peak. For Example, *Semecarpus anacardium* is a medicinal plant used in Siddha Medicines and is known for its anti-cancer property. It is compared to mercury owing to its significant therapeutic benefits.

It is a highly poisonous plant having irritant action. Recent research studies including LC-MS analysis have revealed that the concentration of Anacardic acid and other compounds, responsible for toxic effects was found to be reduced in the purified sample compared to the raw sample. Further research has proven that the anti-cancer activity was enhanced in the purified sample, thereby asserting the immense significance of the purification procedure[2]. The process of reducing the toxic phytoconstituents and enhancing the therapeutic action at the atomic level is an artistic masterpiece. Metallo-mineral preparations generally include metals, metallic-salts, minerals, gems and salts as the ingredients. Purification of raw metals usually involves various procedures dealing with few herbal extracts or animal products for a particular time period to obtain the desired chemical constituents network and structure to exhibit highly potent action without any toxic effects in the prescribed dose. Researchers have proven the significance behind purification methods and siddha nanoscience using techniques such as Fourier Transformed Infrared Spectroscopy, Scanning Electron Microscopy, Inductively Coupled Plasma Optical Emission Spectrometry and X-Ray Diffraction. FTIR is an analytical technique which detects the functional group present in the sample, aiding in the confirmation of active principles present[3]. SEM can be used to obtain information on particle size distribution. XRD is a useful technique to determine the elemental diffraction pattern[4]. ICP-OES is used for detection of trace metals and concentration of each element in the medicine[5].How were the divine Siddhars able to visualize the interactions taking place at the molecular level with no research advances? How was this possible centuries ago? How has it always been so accurate? These questions itself imply the beauty and strength of our ancient knowledge and science. In recent years, the Pharma Industry and Pharmaceutical Scientists have shifted their focus to developing nanoparticles from herbals as it is found to have higher permeability, targeted action and greater efficacy. However, the science of nanotechnology has always been the foundation of Siddha medicines. The evidence dates back several thousand years to one of the most ancient texts, "Thirumanthiram," in which the accurate size of an atom was mentioned by the great Siddhar

Thirumoolar as follows;

"Meviya seevan vadivadhu sollidil
kovin mayironru noorudan kooritu
meviya kooradhu aayiram aayinal
aaviyin kooru noorayira thondre"

A strand of cow's hair cut into 100 parts, one part of this is again cut into 1000 parts and then one part from this is further cut into 10000 parts. This text reveals that one part obtained from this is equivalent to the size of an atom[6].Nanoparticle based drug delivery has been the core of Siddha Medicines since centuries. The medications in Siddha are classified into two types – Internal and External. Parpam (Oxide form of metal/mineral), Guru (Philosopher's powder or Universal Powder capable of converting base metals to gold), Kattu (consolidation of metals and minerals into medicine), Chunnam (a caustic oxide preparation), Kuligai(a small pill), Chendhooram (sulfide form of metal/mineral) are some of the unique higher order internal medicines developed based on the principles of nanotechnology[7,8].Individually a metal is toxic in its raw state. However, after subjecting the metallic ingredient to purification and medicine preparation procedures it is converted into nanoparticles. Thus, higher order medicines are safe when taken in prescribed dose with the help of this ancient nanoscience. Preparation of Parpam is the classic graceful example of nanotechnology. The initial step being purification is followed by incineration/calcination, trituration, palletization and combustion (Pudam heating process). The process of calcination is of great significance from the perspective of nanotechnology as it is responsible for reducing the size of the particles aiding in efficient absorption. Trituration with specific herbal extracts enhances the therapeutic efficacy. This step is vital as it facilitates the homogenous mixing, causing various changes at the physiochemical level and chemical interactions at the particulate level. Later, the solid mass is converted into pellets, followed by drying, and is subjected to controlled combustion using cow dung cakes. The number and size of the cow dung cakes used is specific to a formulation. Controlled combustion with the help of cow dung cakes, which steadily increases and decreases the temperature, is a majestic phenomenon with fire and atoms interacting to deliver us the gift of Siddhars. Such is the precision of the medicine preparation procedure beautifully doing its role in the creation of a work of art that saves lives. Industry based synthetic nanoparticles and Siddha nanomedicines aren't the same. Synthetic nanoparticles can never match our formulations rate of absorption, high efficacy, low toxicity, synergy mechanism and the theory of single medicine multiple adjuvants.

Medicine preparation procedure also involves the concept of friend and foe. Synergistic drugs act as friends whereas antagonistic drugs act as foe to the chief raw drug. This concept is the base of the procedure called "Maaranam". It involves altering the atomic network of the chief drug by using the antagonist and then enhancing the action of the altered network using the synergistic drug. This process reminds us of the beautiful quote "Behind every atom of this world hides an infinite universe". Inside that infinite universe there is a plethora of potential and opportunities hidden which has been calculated and unleashed through the science of Siddha. The infinite potential of the infinite universe behind each atom has been resurrected to benefit the mankind. Siddha Pharmacokinetics itself is an amazing phenomenon of science and philosophy. As per Siddha system, the site of absorption of the drug depends upon the property of the compounds. Drugs which possess the property of cold, heavy or unctuous get absorbed in stomach. Medicines having dry, cold and light properties are absorbed at the colon[9]. After the administration of a drug, it is divided into two fractions – absorbable and excretable fractions. There is a common misconception that Siddha Metallo-mineral formulations affect renal system. However, that is not the case, the quantity of metal that can be absorbed and excreted by the body has been accurately calculated and kept in mind right from the preparation procedure. Absorbable fractions go through the seven body constituents, the first being blood, and are circulated throughout the body. Excretable fractions are properly eliminated from the body with no ill effects on the renal system when administered at the prescribed dose. Our formulations beautifully exhibits the phenomenon of single medicine multiple adjuvant theory which is lacking in the manufactured nanoparticles. A specific type of vehicle for drug transportation throughout the body is devised and called Anubanam (Adjuvant). Anubanam accompanies the drug and aids in its absorption, distribution and metabolism converting the drug into particles of smaller size. Individual based treatment regimen is the uniqueness of Siddha. Based on the principles of the humoral theory, five elements and six tastes, the treatment plan for an individual is amazingly crafted with the perfect adjuvant to balance

94603

the humors. Only in this system can we find the beauty of treatment, not for the disease but for the individual. A recent research study revealed based on the calculation of drug efficacy index of Poonaikaali Chooranam that it is capable of decreasing Vadham majorly but Pitham to a minor degree without any adjuvant. Whereas when administered along with the adjuvant milk it is capable of decreasing the altered Pitha Thodam to a good degree, indicating the importance of the adjuvant in drug delivery[10]. The interactions and interplay unfolding at the atomic level, despite being naked to the human eye, radiates beauty and awe to my eyes through its action and recent researchers proving it to the world. Such is the beauty of Siddha Science, which speaks for itself by endorsing aestheticism in every concept and every moment of this journey of being a Siddha physician, gifting this aesthetic experience to us -Siddha medical students and practitioners, who are the blessed tools delivering the fruits of this experience to the mankind.

ABSTRACT

The integration of smart homes with smart grids underscores the critical need for precise and timely predictions of energy consumption, essential for optimizing resource allocation and bolstering overall energy efficiency. This research work is an approach to enhance energy consumption predictions within smart homes by integrating time series forecasting capabilities of the Prophet algorithm with adaptive optimization techniques – ADAM (Adaptive Moment Estimation), SGD, ADAGRAD, and RMSPROP. Utilizing the Pecan dataset, the proposed hybridized model undergoes rigorous evaluation against traditional Prophet and baseline models. Metrics such as Mean Absolute Percentage Error (MAPE), Mean Absolute Error (MAE), and Root Mean Squared Error (RMSE) serve as comprehensive benchmarks for assessing the model's performance. The hybridized model demonstrates a notable enhancement in accuracy and efficiency in predicting energy consumption.

Keywords: Energy Consumption, Prophet, time series forecasting, optimization techniques.

INTRODUCTION

In recent years, the convergence of smart homes and smart grids has emerged as a transformative force in the realm of energy consumption and management [1]. The interconnection of these two technological domains presents a unique set of challenges and opportunities, chief among them being the imperative for accurate and timely

Zoraida and Jasmine Christina Magdalene

predictions of energy consumption. This pressing need stems from the desire to optimize resource allocation and elevate overall energy efficiency in the dynamically evolving landscape of modern living [2]. This introduction sets the stage for a comprehensive exploration of an innovative research endeavor that addresses the intricacies of energy prediction within smart homes by leveraging advanced computational methodologies. The contemporary push towards sustainable and intelligent living has fueled the rapid proliferation of smart homes equipped with an array of interconnected devices and systems. Looking ahead, as smart homes continue to evolve in tandem with advancements in smart grid technologies, the outcomes of this research hold promise for shaping the trajectory of energy consumption in the future. By providing a nuanced understanding of the challenges and opportunities in predicting energy consumption within smart homes, this study contributes to the broader discourse on the role of data science and computational modeling in the pursuit of sustainable and intelligent living [3]. These homes are not only embedded with cutting-edge technologies but are also integrated into larger smart grids that facilitate bidirectional communication between energy producers and consumers [4]. This synergy aims to create a responsive and adaptive energy ecosystem, where real-time data informs decisions at both the individual household and grid levels[5]. However, the seamless integration of smart homes into smart grids requires a nuanced understanding of energy consumption patterns and a reliable means of predicting future demands. Against this backdrop, the research at hand introduces a novel approach to enhance the accuracy of energy consumption predictions within smart homes. At its core is the integration of the Prophet algorithm, a powerful time series forecasting tool developed by Facebook, with adaptive optimization techniques – namely, ADAM, SGD, ADAGRAD, and RMSPROP [6], [7], [8],[9]. The Prophet algorithm, renowned for its efficacy in capturing daily patterns, seasonality, and holidays in time series data [10], forms the bedrock of the proposed hybridized model.

This algorithmic synergy is poised to tackle the dynamic and non-linear patterns inherent in smart home energy consumption, offering a promising solution to the challenges posed by the evolving nature of energy demand. To rigorously test the performance of the hybridized model, the study leverages the Pecan dataset – a comprehensive repository of historical energy consumption data derived from diverse appliances in a smart home [4]. This dataset, rich in its diversity and depth, provides a robust foundation for evaluating the proposed model against traditional Prophet and other baseline models. Importantly, the evaluation employs a suite of metrics, including Mean Absolute Percentage Error (MAPE), Mean Absolute Error (MAE)and Root Mean Squared Error (RMSE), ensuring a comprehensive and nuanced assessment of the model's predictive capabilities. The combination of Prophet with adaptive optimization algorithms brings a unique strength to the predictive modelling framework. Prophet's ability to capture patterns aligns seamlessly with the adaptability and efficiency offered by optimization algorithms [10], presenting a holistic solution to the multifaceted challenges posed by the dynamic and non-linear nature of smart home energy consumption. This hybridization is anticipated to not only elevate the accuracy of predictions but also enhance the efficiency of the learning process, ensuring that the model adapts dynamically to the evolving energy landscape within smart homes. As the research unfolds, it becomes evident that the proposed hybridized model demonstrates superior accuracy and efficiency in predicting energy consumption compared to traditional Prophet and baseline models [2]. The inclusion of adaptive optimization techniques proves instrumental in refining the model's parameters, addressing the complexities posed by the variability of energy patterns within smart homes. This enhancement in predictive accuracy holds profound implications for the optimization of energy resources, offering a valuable tool for both individual households and the overarching smart grid infrastructure. The broader significance of this research extends beyond the realms of predictive modelling and algorithmic innovation. In the era of smart living technologies, characterized by the proliferation of interconnected devices and the pursuit of sustainable practices [5], the findings of this study contribute to the ongoing evolution of energy management practices within smart homes. The emphasis on accuracy, efficiency, and adaptability in predicting energy consumption aligns with the overarching goals of fostering sustainable energy practices and optimizing resource utilization. The integration of computational models with real-world data represents a critical step towards achieving the potential of smart homes as active participants in a responsive and intelligent energy ecosystem. Ultimately, this research sets the stage for a more informed and efficient utilization of energy resources, fostering a harmonious integration of technology and sustainability in the contemporary landscape of smart living.

REVIEW OF LITERATURE

The intersection of smart homes and smart grids has emerged as a critical domain, emphasizing the need for accurate energy consumption predictions to optimize resource allocation and enhance overall energy efficiency. This literature review explores existing research on time series forecasting, the Prophet algorithm, adaptive optimization techniques, and the integration of these methodologies to predict energy consumption within smart homes. In order to increase the electrical energy's efficiency, [11] presents an optimization strategy for devices that use electricity.[12] have conducted studies to pinpoint the issues with energy management that arise when a house is automated.[13] highlights forecasting and clustering techniques, such GRU and LSTM, to improve PV management and save maintenance costs in already-existing MG systems.[14] uses machine learning techniques, such as BERT, to categorize spam emails with high accuracy. With an accuracy of 97.94%, the results show that the Bi-LSTM model performs better than the others, indicating its efficacy in spam identification.[15]In order to improve sEMG data, this study uses the Savitzky-Golay filter. To forecast missing data, hybrid neural networks that include LSTM and GRU are employed. The findings show that for both long and short datasets, the GRU-LSTM model had superior prediction accuracy, achieving 99.25% and 98.91%, respectively. The integration of time series forecasting algorithms with adaptive optimization techniques has been explored to address the limitations of standalone models. Recent research has applied hybrid models to enhance accuracy in energy consumption predictions, particularly within the context of smart homes [16].Rigorous evaluation is essential to assess the performance of predictive models accurately. Common metrics such as Mean Absolute Percentage Error (MAPE), Mean Absolute Error (MAE) and Root Mean Squared Error (RMSE) provide comprehensive benchmarks for comparing different models [17].The application of hybrid models extends beyond time series forecasting, with studies showcasing their effectiveness in optimizing energy management practices in various contexts, including industrial settings [18].

Despite advancements, challenges persist in accurately predicting energy consumption patterns, especially concerning the dynamic nature of smart home environments. Researchers have identified opportunities for further improvement, such as the incorporation of real-time data and advanced machine learning techniques [19]. As smart homes become more interconnected, the utilization of big data and machine learning in smart grids is gaining prominence. Research in this area explores how these technologies can enhance the efficiency and reliability of energy distribution [20].The proliferation of smart home devices raises concerns about data privacy and security. Studies have delved into the challenges associated with safeguarding sensitive information and ensuring the secure functioning of smart home ecosystems [21].Adding to this rich tapestry of literature, recent studies by Yuen et al. [22] investigated advanced machine learning techniques for energy forecasting in smart homes, emphasizing the role of ensemble methods in enhancing prediction accuracy. The study contributes valuable insights into the ongoing efforts to improve forecasting models in the context of smart homes. Furthermore, the work of Wang et al. [23] explored the application of explainable artificial intelligence (XAI) techniques in interpreting energy consumption patterns within smart homes. This line of research addresses the increasing importance of transparency and interpretability in predictive models, aligning with the broader goals of fostering user trust and understanding in smart home energy management systems. The literature reviewed underscores the multifaceted nature of energy consumption prediction within smart homes. The integration of the Prophet algorithm with adaptive optimization techniques presents a promising avenue for addressing the complexities associated with forecasting in dynamic environments. As smart homes continue to evolve, research in this field not only contributes to efficient resource management but also aligns with the overarching goal of promoting sustainability in smart living.

DESCRIPTION OF THE PROBLEM AND PROPOSED SOLUTION
Description of the problem
Accurate energy consumption forecasting is crucial for modern smart homes to maximize energy utilization, minimize environmental effects, and cut expenses. However, because household energy use is dynamic and influenced by several factors, including occupancy patterns, weather variations, and appliance usage, standard forecasting algorithms sometimes find it difficult to adjust. Higher carbon footprints, higher expenses and ineffective

Zoraida and Jasmine Christina Magdalene

energy management might result from an inability to accurately forecast energy demand. The difficulty is in creating a reliable forecast model that can adjust to shifting influencing factors in addition to capturing past trends of energy use. Decisions on energy management may be less than ideal if current models are unable to attain high accuracy and adaptability.

PROPOSED SOLUTION

This work suggests a hybridized forecasting model that blends adaptive optimization methods with the Prophet algorithm's advantages to overcome these difficulties. The following section clearly explains the methodology that is followed in this work.

METHODOLOGY OF THE PROPOSED WORK

The methodology employed in this study aims to enhance energy consumption predictions in smart homes through the integration of the Prophet algorithm with adaptive optimization techniques, including ADAM, SGD, ADAGRAD, and RMSPROP. The study leveraged the Pecan dataset, a comprehensive collection of historical energy consumption data from diverse smart home appliances, which encompassed the energy consumption of each appliance recorded every 15 minutes from the year 2012 to 2019. The framework of the study involves several key steps: This work has utilized the Pecan dataset, a rich repository of energy consumption data from various smart homes. The dataset covered the time span from 2012 to 2019, capturing detailed information on the energy consumed by each appliance in 15-minute intervals. This extensive temporal coverage provides a holistic view of energy consumption patterns over the years. As a next step, the Prophet algorithm is implemented as it is recognized for its proficiency in capturing daily patterns, seasonality, and holidays in time series data. Adaptive Optimization techniques such as ADAM, SGD, ADAGRAD and RMSPROP are integrated to enhance the adaptability and efficiency of the Prophet algorithm in handling dynamic and non-linear patterns in smart home energy consumption. In the next step, the hybridized model is trained using the integrated Prophet algorithm and optimization techniques on the detailed Pecan dataset. The dataset is divided into training and testing dataset in the proposition of 70 and 30 respectively. The training process aimed to optimize the model parameters for accurate and efficient predictions, considering the high-frequency energy consumption data recorded every 15 minutes. A suite of evaluation metrics, including Mean Absolute Percentage Error (MAPE), Mean Absolute Error (MAE), and Root Mean Squared Error (RMSE) are employed to assess the performance of the hybridized model. Developed baseline models, including traditional Prophet and potentially other existing models, for comparison purposes. These models served as benchmarks to gauge the improvement achieved by the proposed hybridized model, considering the granular 15-minute data.

A rigorous comparative analysis by evaluating the hybridized model against traditional Prophet and baseline models are conducted. This analysis provided insights into the accuracy and efficiency of energy consumption predictions, considering the high-frequency nature of the dataset. Ethical standards are adhered, including data privacy and confidentiality, throughout the study. Any potential biases in the dataset or model outputs were carefully considered and addressed. The practical implications of the study's findings on energy management practices within smart homes connected to smart grids were investigated. Examination was done on how accurate predictions could lead to more efficient resource utilization, potentially reducing overall energy costs and environmental impact. The broader implications for sustainable living and the integration of smart technologies into everyday life was also taken into consideration. By following this comprehensive methodology, the study aimed to provide a thorough assessment of the proposed hybridized model's ability to accurately predict energy consumption in smart homes. This approach, considering both the detailed and high-frequency nature of the dataset and ethical considerations, contributes valuable insights to the field of energy management practices within the context of smart grids and smart homes, with potential implications for sustainable and efficient living. This research work is implemented using Python.

Zoraida and Jasmine Christina Magdalene

Pseudocode

Constructing pseudocode for a comprehensive methodology involves outlining the procedural steps without adhering to a specific programming syntax. The following pseudocode provides an overview of the described methodology:

1. Load Pecan Dataset from 2012 to 2019 // Time-stamped energy consumption data for each appliance every 15 minutes
2. Initialize Prophet Algorithm
3. Initialize Adaptive Optimization Techniques (ADAM, SGD, ADAGRAD, RMSPROP)
4. Integrate Optimization Techniques with Prophet Algorithm
5. Split Dataset into Training and Testing Sets
6. Train Hybridized Model using Integrated Algorithm on Training Set
7. Initialize Evaluation Metrics (MAPE, MAE, MSE, RMSE)
8. Predict Energy Consumption on Testing Set
9. Calculate Evaluation Metrics for Hybridized Model
10. End of Pseudocode

RESULTS

The hybridized model, integrating the Prophet algorithm with adaptive optimization techniques (ADAM, SGD, ADAGRAD, and RMSPROP), demonstrated significant enhancements in accuracy and efficiency compared to traditional Prophet and baseline models. The predictions of energy consumption within smart homes exhibited improved alignment with actual consumption patterns, showcasing the efficacy of the proposed approach. The graphical representation of the actual data and prediction using prophet algorithm with various optimizer discussed above is shown in Fig 1. The evaluation metrics for different models predicting energy consumption within smart homes are presented in Table 1.

RMSE (Root Mean Squared Error)

The Prophet with SGD model exhibits the lowest RMSE at 0.145, indicating superior accuracy in predicting energy consumption. This result suggests that the model's predictions are closer to the actual values, minimizing the squared differences between them. Fig 2. Shows the graphical representation of RMSE that is obtained by combining prophet algorithm with optimization techniques like ADAM, SGD, ADAGRAD and RMSPROP.

MAE (Mean Absolute Error)

The graphical representation of the MAE of various models in shown in Fig 3. Prophet with SGD again outperforms the other models, yielding the lowest MAE of 0.307. This finding signifies the model's effectiveness in minimizing absolute errors, providing more precise estimates of energy consumption.

MAPE (Mean Absolute Percentage Error)

Prophet with ADAM achieves the lowest MAPE at 1.517%, indicating its capability to make predictions with the smallest percentage of errors relative to the actual values. This suggests that Prophet with ADAM offers accurate forecasts with minimal relative discrepancies. The values obtained for various models are shown in Fig 4.

DISCUSSION

The consistently low MSE and MAE values for Prophet with SGD underscore its dominance in accuracy among the models. This suggests that the integration of Stochastic Gradient Descent (SGD) optimization significantly enhances the model's predictive performance. Hence Prophet with SGD Dominates Accuracy. Prophet with ADAM can be taken when Precision is considered. Prophet with ADAM excels in achieving the lowest MAPE, emphasizing its precision in predicting energy consumption with minimal percentage errors. This characteristic is crucial for

94609

applications where relative accuracy is a priority. The choice between Prophet with SGD and Prophet with ADAM depends on the specific priorities of the application. If absolute accuracy is paramount, Prophet with SGD is preferred, while Prophet with ADAM is favoured for minimizing relative errors. The findings have practical implications for smart home energy management, emphasizing the significance of tailored model selection based on specific objectives. These results contribute to the ongoing advancements in predictive modelling techniques within the context of smart living technologies.In summary, the results demonstrate the effectiveness of incorporating advanced optimization algorithms, particularly SGD and ADAM, in enhancing the accuracy and precision of energy consumption predictions for smart homes.

CONCLUSION

In conclusion, the comparative evaluation of energy consumption prediction models within smart homes reveals compelling insights into their respective performances. Notably, models integrating adaptive optimization techniques, such as Prophet with SGD and Prophet with ADAM, surpass the traditional Prophet model in terms of Root Mean Squared Error (RMSE), Mean Absolute Error (MAE), and Mean Absolute Percentage Error (MAPE). Prophet with SGD stands out with the lowest RMSE and MAE values, indicating its exceptional accuracy in forecasting energy consumption. The incorporation of adaptive optimization algorithms consistently leads to a significant reduction in prediction errors, as evidenced by markedly lower MAPE values across all enhanced models compared to the baseline Prophet model. Prophet with ADAM, in particular, achieves the lowest MAPE, signifying its precision in predicting energy consumption with minimal percentage errors. These findings underscore the efficacy of leveraging adaptive optimization algorithms in conjunction with the Prophet algorithm, showcasing the potential for improved accuracy and efficiency in energy consumption predictions for smart homes. The results provide valuable guidance for practitioners and researchers seeking optimal models for smart home energy management, with Prophet with SGD demonstrating notable promise in minimizing prediction errors. As the smart home landscape continues to evolve, these findings contribute to advancing predictive modelling techniques and optimizing resource utilization within the realm of smart living.

ABSTRACT

Sandhigata vata (osteoarthritis (OA)) is one of the common conditions seen in elderly people. Prevalence of osteoarthritis in India is more about 22% to 39%. All were diagnosed case of Idiopathic kneeOA according to clinical guidelines of American college of Rheumatology(ACR). Patients having baseline knee pain more than 40mm on VAS. Patients have Grade1or 2in radiological findings according to Kellgren and Lawrence classification of osteoarthritis. On basis of ACR criteria and On the basis of radiographic finding. Local application of *Myostaal liniment* was done thrice or twice a day for90days. Therapy showed highly significant (P <0.001) beneficial effect on the clinical features and muscles strength. At baseline visit Right knee muscle strength was 8.200±2.159 which increased significantly to 11.300±2.943 and Left knee muscle strength was 8.250±2.358 which increased significantly to 10.680±2.721 on day 90. VAS pain score at baseline was 56.500±7.762, which reduced significantly to 25.000±9.220 on day 90. WOMAC combined score at baseline was 26.500±12.619, which reduced significantly to 7.100±7.816(73.20%) on day 90. WOMAC pain score at baseline was 6.400±3.353, which reduced significantly to 1.900±2.548 on day 90, while, WOMAC stiffness score at baseline was 1.600±1.562, which reduced significantly to 0.100±0.300on day 90. WOMAC difficulty score at baseline was 18.500±9.373, which reduced significantly to 5.100±5.147on day 90.   Reduced strength in the muscle groups

surrounding the knee is significant because it causes progressive of knee OA. This shows significant improvement in muscle strength by local application of *Myostaal liniment*.

INTRODUCTION

Osteoarthritis (OA) is a disorder characterized by progressive joint deterioration in which all the structures of a joint undergo pathological changes. The pathological sine qua non of OA is hyaline articular cartilage loss accompanied by increasing thickness and sclerosis of the subchondral bone plate, outgrowth of osteophytes at the joint margin, stretching of the articular capsule, and weakness of the muscles bridging the joint. There are numerous pathways that lead to OA, but the initial step is often joint injury in the setting of a failure of protective mechanisms.[1] In India, OA of knee is a common condition, with a prevalence between 22% to 39% that gradually increases with age [2] . Knee OA is believed to be a result of the failure of chondrocytes to maintain homeostasis between the synthesis and degradation of the extracellular matrix.[3] There are two types of therapy for knee osteoarthritis: non-surgical and surgical. When non-surgical treatments are no longer effective, surgical intervention is indicated. Non-surgical measures include nonsteroidal anti-inflammatory drugs (NSAIDs), COX-2 inhibitors, Glucosamine sulphate, moderate exercises which helps in strengthening the muscles and weight loss. [4] Surgical treatment options include osteotomy, unicompartmental knee arthroplasty (UKA), total knee arthroplasty (TKA) these are the   treatment of choice in severe cases when conservative therapy is ineffective.[5] *Janu Sandhigata Vata* is often compared with osteoarthritis (OA) of knee joint. *Sandhigatavata* is first described by *Acharya Charaka* as *Sandhigata Anila* with symptoms of *Shotha* (swelling) which on palpation feels like a bag filled with air and *Shula* (pain) on *Prasarana* and *Akunchana (extension and flexion)[6]*

Patients Information
Ten diagnosed patients of *Sandhigatavata* (osteoarthritis), affecting knee joints, according to the American college of Rheumatology (ACR)[7] were selected from the outpatient department (OPD) of *Kayachikitsa* between July 2022 to October 2022. Informed consent of the patients was obtained before commencing the study. The enrolled patients were advised to withdraw the use of NSAID's before starting the Ayurvedic treatment. However, in case of severe pain patients were asked to take tablet paracetamol 500 mg.

Clinical Findings
All were diagnosed case of Idiopathic kneeOA according to clinical guidelines of American college of Rheumatology(ACR). All patients had baseline knee pain more than 40mm on VAS. Patients have Grade1or 2in radiological findings according to Kellgren and Lawrence classification of osteoarthritis.

Timeline
Local application of *Myostaal liniment* was done thrice or twice a day for 90 days. The composition of *Myostaal liniment* is outlined in table 1.

Diagnostic assessment
Improvement in muscle strength was assessed in every follow up and after completion of treatment with Dynamometer. Pain assessment was done with visual analogue scale (VAS) score, for the assessment of stiffness, pain and activity use Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) score.[9]

Therapeutic Intervention
Local application of *Myostaal liniment* was done thrice or twice a day for 90 days

Follow-up and Outcomes

Total 10 patients were registered for study. And all patients had pain in both knee. In this study, seven patients were between 60 to 70 years of age while the remaining three were between 40 to 55 years of age. Among them 6 patients were male and 4 were female. Two patients were known cases of hypertension and one was type 2 diabetic. Both the patients were receiving medicines for the same. Majority of patients were having *Madhyama Koshtha (n = 6)* and were having regular bowel habit. All female patients had attained menopause. Muscle strength improved in all of the patients. At baseline the mean muscle strength of extensor muscles of Rt knee was 8.2 kg and 8.25 kg in Lt knee. It gradually improved and at the end of 90 days was 11.3 kg in Rt knee and 10.68kg in Lt knee. ($p < 0.05$) (table 2)   The maximum improvement in muscle strength was by 6 kg (92.30 percent as compared to baseline), while minimum improvement was by 2.5 kg(71.42 percent as compared to baseline). It was also observed that muscle strength started to show improvement after day 30, after starting the treatment. Additionally, every patients got relief from pain. At baseline mean VAS score value was 56.5 and at the end of 90 days the VAS score value decreased and reached 25.00(table 3). The maximum improvement was 83.33 percent as compared to baseline according to VAS score. On the basis of WOMAC scale, there was 70.31 percent improvement in pain,93.75 percent improvement in stiffness and 72.43 percent improvement noted in activities. The WOMAC scale demonstrated that relief from pain, stiffness, and difficulty performing activities had significant outcomes.(table 4) It was noted that all clinical aspects produced highly significant results even after 30 days of treatment (initial follow-up), but muscle strength showed a substantial result. In initial stage seven patients took ayurvedic medicine for pain relief for 3 to 4 days. During three month moreover 3 patients took allopathic analgesic medicine, among three patients one had fever and body pain for two days so he took allopathic medicine and other two patients took for knee pain.

DISCUSSION

The disease with the greatest incidence of the joints in people worldwide is osteoarthritis. Its pathophysiology is yet unknown, and it is not now reversible. Prevention is the greatest medicine for osteoarthritis of the knee.. In this study 70% patients were found in 61 - 70 years of age group. *Sandhigata Vata* starts at the age of 40 which is stage of *Madhya Vaya*. Occurrence of *Janu Sandhigatavata* is also found more prevalent in certain occupations such as heavy vehicle driving .[10] In *Prakruti* wise distribution shows that *Vata-Kapha* predominance was found in 60% of patients. In the current study, among the chief complaints *Sandhishula* (pain)was found in all cases. *Vata Dosha*, which is accountable for all forms of pain (*Shoola*), will aggravate in *Sandhigata Vata*. Other symptoms like *Akunchana Prasaranajanya Vedana* (pain during extension and flexion) & *Hantisandhigati* (restricted movement of joint) which are brought by aggravated *Vata Dosha* and *Kapha Kshaya*. In systematic review *Ayurvedic* managements have shown moderate to good evidence for reducing pain, functional impairment, and joint stiffness in *Janu Sandhigatvata*.[11] *Bahya Snehana* (external oil application)'s advantageous effects were also discovered and reported in *Janu sandhigatvata*.[12]. Reduced strength in the muscle groups surrounding the joints is significant because it causes a progressive loss of function.[13] And a tool that measures force is a dynamometer. To measure the power of specific muscles or muscle groups, handheld dynamometers are utilised. [14] There are several ways to increase muscle strength including exercise, massage, and protein supplements. Due to decreasing physical strength and co-existence other health ailments such as diabetes, hypertension, ischemic heart diseases etc. there is limitation to perform exercises or protein intake. Hence, in elderly age, massage is better suited over others. One of the ancient and very effective home remedy for pain management and increasing muscle strength is massage. Muscular architecture is the most crucial factor for muscle function[15] and massage therapy raised the muscle's EMG(electro myography) activity and changed the structure's surface.[16] Similar results are seen with massage therapy, which enhances proprioceptive function.[17] Solumiks Pharmaceuticals Limited produces the exclusive ayurvedic medicine known as *Myostaal Liniment. Myostaal liniment* has qualities that are anti-inflammatory, analgesic, anti-arthritic, and muscle relaxing. It has a well-balanced mixture of substances that are beneficial for osteoarthritis. In this study, highly substantial effects were discovered in both knee joints for muscle strength, *Sandhishula* (joint pain), *Sandhishotha* (inflammation of joint), *Sandhigraha* (restricted movement of joint), and *Sandhisphutana* (joint crepitus). *Myostaal liniment* contains *Mahanarayan Taila, Nirgundi Taila, Gandhapur Taila, Tailaparni Taila, Devadaru Taila,*and *Sarala. Taila*

94615

has opposite properties of *Vata* which are *Snigdha ,Guru, Mrudu*. Mahanarayan taila is ayurvedic medicated oil prepared using sesame oil as a base and processed in several medicinal herbs that improves strength of the muscles, bones and joints. It has about 58 ingredients.[18] *Mahanarayan Tail* shows significant effect on pain relief and muscle tone.[19]It has remarkable effect on inflammation also on the basis of in vitro study.[20] One of the *Vata* and *Shoolhar Taila* described in the *Charak Samhita* is *Nirgundi Taila*[21] *Nirgundi* root and bar extracts contain large amount of the alkaloid nishindine, which has anti-inflammatory and analgesic properties[22] Nirgundi taila is one of the vata and shoolahara taila explained in Charaka samhita. Nirgundi taila is one of the vata and shoolahara taila explained in Charaka samhita. Composition of *Ghandhapura Tail* (Wintergreen oil) are Methyl salicylate 99.5 %,Paraffin,Aldehyde or ketone Ester ,Secondary alcohol. It has analgesic effect and reduces inflammation by interacting with body mechanism.[23] According to *Ayurveda*, being an *Ushna Virya* herb, it pacifies *Vata*. *Tailaparni taila (Eucalyptus oil)* is an important *Vedanahar Dravya*. It has Ushna Virya and *Snigdha Guna*. Analgesic effects of essential oils of Eucalyptus was proven by animal study.[24] *Devadaru Tail* has also *Ushna* and *Snigdha* properties. Animal research has demonstrated the anti-inflammatory and analgesic effects of *Devadaru Tail*.[25] Experts from the IAFA (Institute of Applied Food Allergy) have also successfully demonstrated the anti-inflammatory and anti-allergic properties of *Devadaru*. Analgesic and anti-inflammatory activity of alcohol extracts of P. roxburghii bark has been shown in experimental animal models Analgesic and anti-inflammatory activity of alcohol extracts of *Sarala* (P. roxburghii) has been shown in experimental animal models.[26] It has *Ushna, Snigdha, Madhur* and *Katu* qualities that are also helpful to calm the *Vata*.

CONCLUSION

It can be concluded from the present study that *Sandhigatavata* is manageable by local application of *Myostaal liniment*. This demonstrates the treatment's consistent efficacy. Since *Sandhigatavata* is *Yapya* (manageable) in nature, this therapy must be used repeatedly. The management of *Sandhigatavata* is safe and successful with this therapy. In order to obtain more accurate results, the study's patient and objective parameters should be expanded.

ABSTRACT

The thermal radiation effects on the electrically conducting grey fluid's continuous laminar convective hydromagnetic flow over a rotating porous disk in a porous material are reviewed using an external uniform magnetic field and heat generation/absorption. When the disc is subjected to a perpendicular magnetic field, we expect a consistent suction over its surface. A nonlinear ordinary differential equation solution can be obtained by applying the suitable similarity transformation suggested by von Karman to the governing nonlinear partial differential equations. This includes heat transmission situations such as the Prescribed Surface Temperature (PST) and the Prescribed Heat Flux (PHF) events. The numerical solutions, derived from a fourth-order Runge-Kutta based shooting method, are graphically depicted using graphs. The Prandtl number, the quantity of heat produced or absorbed, the medium porosity, the suction parameter, the radiation parameter, and the impacts on fluid temperature and velocity are all well investigated in this domain. These effects are depicted using graphs. Tables illustrating the effects of different settings are provided for the Nusselt number and related skin-friction coefficients. Every result is consistent with the previously mentioned sources.

INTRODUCTION

Laminar spinning discs are extensively studied in a variety of applications, including rotors, turbines, jet engines, flywheels, cars, pumps, compressors, and many more. Takhar et al. [1] characterize the behavior of an axisymmetric body when it rotates within a forced flow field, the centrifugal force causes the fluid close to all over the surface to be propelled outward in a radial direction. The fluid flowing axially then takes the place of this fluid. As a result, the fluid's axial velocity is higher around a rotating body than it is around a stationary one. Increasing the axial velocity of the fluid improves its convective heat transfer from the body. Utilizing this idea, workable solutions for enhancing heat transmission have been created. Hickman [2] demonstrated, for instance, the usefulness of spinning condensers for spacecraft power plants and seawater distillation in a zero-gravity setting. Von Karman [3] introduced the original rotating disc problem, which is the one that scholars have researched the most in the literature. It concerns the motion of viscous flow caused by an endless rotating disc in which the fluid is at rest far from the disc. The problem's scope is then expanded to include a situation where the fluid is spinning as a solid body much above the disc, with suction or injection at the disc surface. Numerous researchers, including those listed in [4]–[7], have addressed the rotating disc and stability difficulties theoretically, numerically, and empirically. A brief overview of the body of open literature on this subject is provided below to help readers better comprehend the work done and its relationship to other works. According to Maleque and Sattar [8], a constant laminar convective flow with different properties is caused by a porous rotating disc. In a porous rotating disc flow, Turkyilmazoglu discussed the exact solutions for the incompressible viscous fluid [9]. Geothermal, industrial, and technological uses of magnetohydrodynamic viscous flows include magnetohydrodynamic (MHD) generators and accelerators, high temperature plasmas, cooling nuclear reactors, and liquid metal fluids. Consequently, there has been a surge of interest in measuring the impact of magnetic fields on heat transfer and flow in a variety of geometries.

Metals in liquid form, water mixed with a little amount of acid, and other fluids with electrically conductive properties are examples of these. Kafoussias and Nanousis [11] reported on the study of micropolar fluid MHD laminar boundary layer flow over a permeable wedge, whereas Watanabe and Pop [10] presented numerical results of MHD free convection flow over a wedge in the presence of a magnetic field. Yih [12] further on the previous work of Watanabe and Pop by taking into account the convection flow generated by MHD adjacent to a non-isothermal wedge while considering magnetic and viscous dissipations, stress, and effort. Attia and Hassan [13] looked studied hydromagnetic flow caused by a revolving disc. Over the last few years, many researchers have taken an interest in the topic of heat transport in porous materials. A great number of geophysical and industrial procedures, however, make use of porous media. The Darcy model is typically employed in situations where the velocity is low. The Darcy-Forchheimer drag force model is necessary in high-porosity regimes at higher velocities. Magnetohydrodynamic convection from rotating discs And other substances embedded in porous medium finds real-world use in gaseous diffusion boundary cooling, magnetic materials processing, filtration, energy systems, and centrifuges. There have been several excellent articles on hydromagnetic convection in porous media saturated with electrically conducting fluids. Rashad [14] examined how hydromagnetic free convection was affected by thermosphoretics and thermal radiation in a porous medium. There are several real-world applications for fluid flow across porous material boundaries, such as managing boundary layers and transpiration. The suction exerted through the surface is well known to be one of the mechanisms for stabilizing fluid flows. By postponing the separation, suction in fluid dynamics is relevant to many technical applications, such as rotating equipment, ships, and submarines. For aircraft wing laminar turbulent control, it is of utmost importance. Hassanien et al. [15] and [31] used a vertical flat plate embedded in a porous material to study the heat transfer characteristics of mixed convection flow. The comparable solutions for Hiemenz flow across porous surfaces are outlined by Chamkha and Khaled [16] in their explanation of hydromagnetic mixed convection heat and mass transport. Attia has lately studied heat transfer and constant flow over a revolving disc in a porous media [17] and [33]. Moreover, the fluid participating in radiative heat transfer may exhibit electrical conductivity due to ionization caused by elevated operating temperatures. Consequently, studying the effect of the magnetic field on such a flow is crucial because of its relevance in application domains where heat radiation and magnetohydrodynamics are coupled. A nuclear reactor

Umadevi *et al.,*

containment vessel uses a magnetic field to cool the first wall, which separates the hot plasma from the wall, and an electrical furnace uses a magnetic field to fuse metals. Problems in studying these phenomena have led to an incomplete understanding of how radiation affects the boundary layer flow of a radiating fluid surrounding a body. There are three main challenges to studying fluid radiation. Radiation is first absorbed and then emitted within and outside of a system during radiative heat transmission. Because of this, predicting fluid absorption is quite challenging. When it comes to absorbing and emitting fluids, wavelength is the main factor that affects their absorption coefficients. Incorporating a radiation component into the energy equation results in a nonlinear partial differential equation that presents significant processing difficulties. The influence of radiation on convective fluxes was extensively studied. Investigating the effect of radiation on the mixed convection flow of an optically dense incompressible fluid over a heated vertical plate that was kept at a constant surface temperature and free stream velocity, Hossain and Takhar [18] looked at this subject. Under the assumption of a suction boundary condition, Hossain and Pop [19] investigated how radiation affects the free convection of an optically dense viscous incompressible fluid along a heated inclined flat surface that is kept at a constant temperature inside a saturated porous medium. Abbas investigated how radiation affected MHD flow in a porous medium [20]. Using the differential approximation, Takhar et al. [21] studied gas dissipative radiative convection in a porous medium, which has applications in geothermal energy systems. For the purpose of solar collector dynamics, Chamkha [22] investigated how solar radiation affects the convection of porous media on a vertical surface. Using the Rosseland model, Mohammadein et al. [23] investigated the effects of radiative flux on free convection in porous substrates.

The rate of heat transmission from a heated surface can be significantly affected in some real-world scenarios by internal heat generation/absorption and thermal radiation [24] and [25]. For instance, in fluids, exothermic or endothermic chemical reactions can have an effect due to internal heat production and absorption [24] and [25]. Under the assumption of internal heat generation and absorption, the issue of hydromagnetic heat transfer over a continuously expanding surface was studied by Abo-Eldahab and Aziz [25]. Under the conditions of buoyancy, thermal radiation, and heat generation or absorption, Chamkha [26] studied the issue of constant hydromagnetic boundary layer flow using an accelerating semi-infinite porous surface. Moreover, Molla et al. [27] and [32] examined magnetohydrodynamic natural convection flows on a spherical surface that generate heat. Convective heat transfer is contingent upon the nature of the thermal boundary conditions imposed; generally, the boundary surface is exposed to either a specified temperature or a designated heat flow. Nonetheless, the wall heat flux is known in many issues, especially those that deal with cooling nuclear and electrical components. Predicting the wall temperature as the wall heat flow changes is one of the goals of heat transfer theory since overheating, burnout, and meltdown are significant challenges in these situations. Controlling this wall temperature dispersion is the design goal. In contrast to a surface with a predetermined wall temperature, the scenario of a regulated heat flux rate at a surface is easy to quantify in a laboratory and is frequently approximated in real-world applications. The convection inside the boundary layer of a porous regime of a spinning disc is studied in this context in relation to magnetic fields, heat production or absorption, and thermal radiation. In order to further involve the heat transfer community, the authors state that additional study is required in this area. In two ways, this effort seeks to improve upon the recent work in Ref. [13]. For the cases of prescribed surface temperature (PST) and prescribed heat flux (PHF), a closed heat-transfer analysis is given. We analyze the influence of thermal radiation on temperature distributions. Reference [28] indicates that numerous unique similarity temperature solutions have been identified for both PST and PHF scenarios. These solutions frequently serve as the foundation for initial estimations to address tangible physical issues. This study assumes the sheet's temperature exceeds that of the fluid. This endeavor seeks to quantitatively address the aforementioned nonlinear challenge.

Formulation of the Problem Mathematically

This research looks at the radiation and internal heat generation/absorption in a continuous, axially symmetric, incompressible flow of a homogeneous electrically conducting fluid around a cylindrical body immersed in a porous medium, with heat transfer mediated by a revolving porous disc. In the positive z-direction, the fluid is assumed to extend endlessly. As illustrated in Fig.I, let (r, ϕ, z) be the set of cylindrical polar coordinates. Furthermore, allow

the disc to rotate at a constant angular velocity Ω while being situated at z=0. As (r, ϕ, z) grows, the flow velocity components are (u, v, w). The rotating disc surface temperature T_w is maintained at a constant level. The free stream is sustained at a uniform temperature T_∞ and pressure P_∞ at a distance from the surface. It is assumed that the fluid is grey in color; it is Newtonian in nature and acts as a heat sink and radiator simultaneously. Assuming a low magnetic Reynolds number (Rm << 1), the external uniform magnetic field B_0 is orientatedperpendicular to the disk's surface. The speed of the electrically conducting fluid produces a negligible induced magnetic field. Additionally, across the whole range, a consistent suction is maintained across the surface of the disk.

By making these assumptions, the following equations can be expressed to describe the energy, flow in a laminar incompressible boundary layer: momentum, continuity,

$$\frac{\partial u}{\partial r} + \frac{u}{r} + \frac{\partial w}{\partial z} = 0, \tag{1}$$

$$u\frac{\partial u}{\partial r} - \frac{v^2}{r} + w\frac{\partial u}{\partial z} + \frac{1}{\rho}\frac{\partial p}{\partial r} = \nu\left(\frac{\partial^2 u}{\partial r^2} + \frac{1}{r}\frac{\partial u}{\partial r} - \frac{u}{r^2} + \frac{\partial^2 u}{\partial z^2}\right) - \frac{\sigma B_0^2}{\rho}u - \frac{\mu}{K}u, \tag{2}$$

$$u\frac{\partial v}{\partial r} + \frac{uv}{r} + w\frac{\partial v}{\partial z} = \nu\left(\frac{\partial^2 v}{\partial r^2} + \frac{1}{r}\frac{\partial v}{\partial r} - \frac{v}{r^2} + \frac{\partial^2 v}{\partial z^2}\right) - \frac{\sigma B_0^2}{\rho}v - \frac{\mu}{K}v, \tag{3}$$

$$u\frac{\partial w}{\partial r} + w\frac{\partial w}{\partial z} + \frac{1}{\rho}\frac{\partial p}{\partial z} = \nu\left(\frac{\partial^2 w}{\partial r^2} + \frac{1}{r}\frac{\partial w}{\partial r} + \frac{\partial^2 w}{\partial z^2}\right) - \frac{\mu}{K}w, \tag{4}$$

$$u\frac{\partial T}{\partial r} + w\frac{\partial T}{\partial z} = \frac{\kappa}{\rho C_p}\left(\frac{\partial^2 T}{\partial r^2} + \frac{1}{r}\frac{\partial T}{\partial r} + \frac{\partial^2 T}{\partial z^2}\right) - \frac{1}{\rho C_p}\frac{\partial q_r}{\partial z} + \frac{Q}{\rho C_p}(T - T_\infty), \tag{5}$$

The constraints that define the problem's perimeter are given by

$$
\left.
\begin{aligned}
&u = 0, \quad v = \Omega r, \quad w = w_0, \qquad \text{at } z = 0, \\
&T = T_w = T_\infty + D_1\left(\frac{r}{l}\right)^2 \quad \text{(PST-case) at } z = 0, \\
&-k\frac{\partial T}{\partial z} = q_w = D_2\left(\frac{r}{l}\right)^2 \quad \text{(PHF-case) at } z = 0, \\
&u \to 0, \ v \to 0, \ T \to T_\infty, \ p \to p_\infty \qquad \text{as } z \to \infty,
\end{aligned}
\right\} \tag{6}
$$

The characteristic length is denoted as l, whereas D_1 and D_2 represent constants. In this context, κ denotes heat conductivity, while $\nu = \mu/\varrho$ signifies the ambient fluid'skinematic viscosity. Additionally, σ refers to electrical conductivity, C_p represents specific heat at constant pressure, T indicates temperature, ϱ stands for fluid density, and K indicates the permeability of the porous medium. The expression $Q(T - T_\infty)$ denotes the quantity of heat generation or absorption per unit volume, where Q is a constant, and q_r signifies radiative heat flux. The Rosland approximation can be used to write radiation for a densely opaque layer.

$$q_r = -\frac{4\sigma^*}{3\kappa^*}\frac{\partial T^4}{\partial z}, \tag{7}$$

as the mean absorption coefficient and the Stefan-Boltzmann constant are represented by κ^* and σ^* respectively. The assumption is that the temperature changes in the flow are sufficiently large for the statement to be represented as a linear function of temperature T^4. This is achieved by expanding T^4 in a Taylor series around T_∞ excluding terms with higher-order variables. Thus

Umadevi *et al.,*

$$T^4 \cong 4T_\infty^3 T - 3T_\infty^4, \tag{8}$$

to (7) and (8), (5) becomes

$$u\frac{\partial T}{\partial r} + w\frac{\partial T}{\partial z} = \frac{k}{\rho C_p}\left(\frac{\partial^2 T}{\partial r^2} + \frac{1}{r}\frac{\partial T}{\partial r} + \frac{\partial^2 T}{\partial z^2}\right) - \frac{16\sigma^* T_\infty^3}{\rho C_p 3\kappa^*}\frac{\partial^2 T}{\partial z^2} + \frac{Q}{\rho C_p}(T - T_\infty), \tag{9}$$

Similarity Transformation

$$\eta = z(\Omega/v)^{\frac{1}{2}}, \quad u = \Omega r F(\eta), \quad v = \Omega r G(\eta),$$

$$w = (\Omega v)^{\frac{1}{2}} H(\eta), \quad p - p_\infty = 2\mu\Omega P(\eta) \quad \text{and}$$

$$T - T_\infty = \Delta T \theta(\eta) \qquad (PST - case) \tag{10}$$

$$T - T_\infty = \frac{D_2}{k}\left(\frac{r}{l}\right)^2 \sqrt{\frac{v}{\Omega}}\theta(\eta) \quad (PHF - case)$$

where v represents a constant fluid's kinematic viscosity and $\Delta T = T_w - T_\infty$.

Eqs. (1)-(3) and (9) in the instance, by simplifying,

$$2F + H' = 0, \tag{11}$$

$$F'' - HF' - F^2 + G^2 - (A + M)F = 0, \tag{12}$$

$$G'' - HG' - 2FG - (A + M)G = 0, \tag{13}$$

$$\text{and} \quad \frac{\theta''}{Pr}\left(1 + \frac{4}{3R_d}\right) - H\theta' + L\theta = 0. \quad \text{(for PST \& PHF cases)} \tag{14}$$

It is possible to rephrase the boundary conditions (6) as

$$F(0) = 0, \quad G(0) = 1, \quad H(0) = W_s,$$

$$\theta(0) = 1 \quad \text{(PST-case)},$$

$$\theta'(0) = -1 \quad \text{(PHF-case)}, \tag{15}$$

$$F(\infty) = G(\infty) = \theta(\infty) = p(\infty) = 0.$$

where $M = \dfrac{\sigma B_0^2}{\Omega\rho}$ stands for the magnetic parameter, $A = \dfrac{v}{\Omega K}$ denotes the parameter for porosity, $\mathrm{Pr} = \dfrac{\mu C_p}{\kappa}$

represents the Prandtl number, $R_d = \dfrac{\kappa^* \kappa}{4\sigma^* T_\infty^3}$ is a measure of radiation, $L = \dfrac{Q\rho C_p}{\Omega}$ stands for the coefficient of

heat generation or absorption and $W_s = \dfrac{w_s}{\sqrt{v\Omega}}$ represents a uniform suction parameter.

Umadevi *et al.,*

The no-slip requirement of viscous flow applies to the disk's surface, according to equation (15). As shown in Eqs. (15), all fluid velocities must disappear far from the disc surface, with the exception of the induced axial component. By applying the boundary conditions provided by equations (15) to the system of equations (11) through (14), the three components of the flow velocity can be ascertained. If necessary, the pressure distribution can be found using equation (4). The disparity in temperature between the wall and the fluid around it causes heat transmission [30]. According to continuity considerations, the temperature at the disk's surface must equal T in order for the energy problem to have boundary conditions. T goes to T_∞ a great separation from the disc, where T_w is the ambient fluid temperature.

The Newtonian formulas provide the Nusselt number and the skin friction coefficients:

$$\tau_t = \left[\mu\left(\frac{\partial v}{\partial z} + \frac{1}{r}\frac{\partial w}{\partial \phi}\right)\right]_{z=0} = \mu G' \Omega (Re)^{\frac{1}{2}},$$

$$\tau_r = \left[\mu\left(\frac{\partial u}{\partial z} + \frac{1}{r}\frac{\partial w}{\partial \phi}\right)\right]_{z=0} = \mu F' \Omega (Re)^{\frac{1}{2}},$$

Consequently, the tangential and radial skin frictions (both PST & PHF cases) are
given by

$$(Re)^{\frac{1}{2}} C_{f_t} = G'(0), \tag{16}$$

$$(Re)^{\frac{1}{2}} C_{f_r} = F'(0), \tag{17}$$

The rate of heat transmission for the PST instance is specified by

$$q = -\left(k\frac{\partial T}{\partial z}\right)_{z=0} = -k\Delta T \left(\frac{\Omega}{v}\right)^{\frac{1}{2}} \theta'(0), \tag{18}$$

Therefore,Nusselt number (Nu) is defined as

$$(Re)^{-\frac{1}{2}} Nu = -\theta'(0). \tag{19}$$

here $Re(= \Omega r^2 / v)$ denotes Reynolds number of rotation.

Numerical Approaches to Solving
Second-order, extremely non-linear boundary value problems are represented by equations (11)–(14). Consequently, the optimal numerical shooting method is developed by means of a fourth-order Runge-Kutta integration approach. The process begins with a preliminary estimate value, η, and continues with the use of a particular set of parameters to solve the problem and obtain F ′ (0),G ′ (0) & θ ′ (0) in the PST case and F ′(0),G ′ (0) & θ(0) in the PHF case, respectively. The numerical answer is obtained in this computation using a step size of 0.001 and five decimal accuracy criteria for convergence.

FINDINGS AND ANALYSIS

Thermal radiation, heat generation and absorption, and hydromagnetic convective flow of an electrically conducting grey fluid across a rotating porous disc in a porous media with an external uniform magnetic field are all addressed in the numerical solutions. Applying the shooting method with a fourth-order Runge-Kutta integration technique, the system of equations can be numerically solved. based on the conditions at the border (15) level, from (11) to (14).

Umadevi *et al.*,

An exhaustive understanding of its radial velocity F, tangential velocity G, axial velocity H, and temperature θ has been given by giving numerical values to the parameters encountered in the physical problem. Suction parameters take values - 1, -2, -3, & -4, while magnetic parameters take values 1, 2, 3, & 4 to be realistic. Prandtl number values are 0.71, 1, 2, & 7.03 (particularly for air, where Pr = 0.71 denotes 20o C and one atmospheric pressure); radiation parameter values are 1, 5, 10, 15, and heat generation/absorption parameter values are -0.2, -0.1, 0.1 & 0.2; and permeability parameter values are 0 (no porous medium), 0.5, 1.0 & 1.5 (high porous medium). For the example of PST & (Pr = 0.71, M = 0.0, A = 0.0, L = 0.0, Rd = 109),We have compared our radial skin friction, tangential skin friction, and Nusselt number to data that has already been published [29] in order to evaluate the accuracy of the numerical approach. Table 1 displays the results of the comparison, which show a good agreement. For specific values of different governing parameters, Table 2-13 shows how the Nusselt numbers −θ ′ (0) (in the PST example) and θ(0) (in the PHF case) behave, as well as the radial and tangential skin friction coefficients F ′ (0) and G ′ (0).

Both Tables 2 and 3 indicate that in the PST case, the rate of heat transfer −θ′(0) increases as the magnetic field parameter M grows, whereas in the PHF example, the surface temperature θ(0), tangential skin-friction G′(0), and radial skin-friction F′(0) drop. When the suction parameter Ws increases, the surface temperature θ(0) (PHF), tangential skin-friction G′(0), and radial skin-friction F′(0) all rise. However, the rate of heat transfer −θ′(0) (PST scenario) remains constant, as shown in Tables 4 and 5. A thicker velocity boundary layer, created by blowing, reduces the velocity gradient close to the surface, which is why this happens. As the porosity parameter A grows, the surface temperature θ(0) somewhat rises, the rate of heat transfer −θ′(0) slightly falls, and the radial and tangential skin-friction coefficients F′(0) and G′(0) greatly fall, as shown in Tables 6 and 7. For various values of Rd, Tables 8 and 9 show the Nusselt number −θ′(0) (in the PST example) and the surface temperature θ(0) (in the PHF case). Raising Rd causes a drop in surface temperature (PHF instance) and a rise in the Nusselt number (PST case). As the heat generation parameter L increases in the PHF scenario, the surface temperature θ(0) rises, whereas in the PST example, the Nusselt number Nu declines. Both Table 10 and Table 11 demonstrate this. These are inevitable results of the heat generation mechanism, which causes a layer of fluid to form close to the surface, which becomes hotter as time goes on. For various values of Pr, Tables 12 and 13 display the differences between the surface temperature θ(0) in the PHF instance and the Nusselt number −θ′(0) in the PST example. In the PHF case, surface temperature measurements drop significantly because the rate of heat transfer at the disc surface drops with increasing Prandtl number. The inverse trend holds true for the rate of heat transmission.

The boundary layer radial velocity profiles F(η) for different values of the magnetic parameter M, suction parameter Ws, and porous permeability parameter A are shown in Figures 1-3. As seen in Figure 1, a stronger z-direction (normal to the disc surface) applied magnetic field, as a result of an increase in M, reduces the radial velocity of the region due to an increase in hydromagnetic drag. Thus, radial velocity is demonstrated to reach its maximum close to the disc's surface and then quickly decay to zero. The radial velocity is quite low for large suction. Figure 2 also clearly shows that suction stabilizes the boundary layer. As shown in Figure 3, the radial velocity distribution becomes less as A increases. The reason behind this is that fluid velocity is reduced when a porous substance is present because flow resistance increases. Various values of M, Ws, and A are shown in Figures 4-6, which show the tangential velocity profiles G(η). The boundary layer thickness for an enforced suctioned porous medium decrease with increasing M. When a tangential flow velocity G is opposed to a magnetic field B, a tangential magnetic force is produced. As the result, the boundary layer thickness drops and tangential velocities drop across the board (Fig. 4). When the Lorentz force acts against the flow, it causes the azimuthal velocity to decelerate even more. The tangential velocity profile is illustrated by the effect of suction in Figure 5. At strong suction, the tangential velocity sinks off the surface at a quick pace. Along with that, as shown in Figure 6, the tangential velocity and boundary layer thickness also drop as A increases. Figures 7–9 display the steady state axial velocity profiles −H(η) for different values of M, Ws , and A. As Fig. 7 illustrates, the axial component of velocity obviously decreases as the magnetic parameter M rises. Let us now examine the application of a suction at the disk's surface Ws< 0. In addition to the pumping of the revolving disc caused by the fan, there is also additional pumping because of the suction. The amount of fluid extracted from the environment so rises. Two possible routes are now open to the inflowing fluid. The inflow can either continue through the disk's suction holes or reroute in a radial direction. Naturally, the least

difficult route will be selected. It gets easier and simpler to get out of the wall as the suction grows. Consequently, a greater and greater portion of the input enters the porous disc directly as Ws becomes more negative. Fig. 8 shows that H tends to be almost constant as a result. As illustrated in Figure 9, the axial velocity and raising the porosity parameter causes the boundary layer to thicken. Figures 10-21 display the results of the temperature changes under different M, Ws, A, Rd, L, and Pr values. Figures 10 and 11 illustrate the effects of the magnetic variable M on the temperature profiles of the boundary layers in the PST and PHF cases, respectively. It is interesting to observe that M improves the boundary layer temperature distribution, and the effect of the increasing magnetic variable is more noticeable near the wall. Both Figure 12 and Figure 13 show how the suction parameter affects the temperature profiles of the boundary layer. As soon as wall suction is applied (Ws< 0,) both the heat profiles and the thickness of the thermal boundary layer diminish. The effects of the porosity parameter A on the temperature θ, caused by the fluid's near-ambient temperature not reaching the disc surface, are shown in Figures 14 and 15, respectively, in the PST and PHF scenarios. The thickness and temperature of the thermal boundary layer do, therefore, grow in relation to M. Absence of fluid improves heat transmission at surfaces heated to around ambient temperature. For the PST scenario, Figure 16 shows the impact of the radiation parameter Rd on the temperature profile, and for the PHF case, Figure 17. Of course, Rd impacts the whole border layer. The fact that Rd minimizes the temperature distribution at the thermal boundary layer is curious. In the thermal boundary layer, a lower temperature profile value is indicated by an increase in Rd, since an increase in Rd reduces radiation. Fluid temperature drops when thermal boundary layer thickness decreases due to release of heat energy from the flow zone caused by an increase in the radiation parameter. Figure 18 showed how the boundary-layer temperature profiles for the PST case were affected by the heat source/sink parameter, L, and Figure 19 showed the same thing for the PHF case. It slows down the rate of heat transfer from the disk's surface and generates a heated layer adjacent to it, which is a heat source (L > 0). To the contrary, the presence of a heat sink (L < 0), sometimes called heat absorption, causes a chilly layer of fluid to form next to the disc surface, speeding up the removal of heat from the surface. For L = 0.1, 0.2, increasing the amount of thermal energy present in the flow regime leads to an increase in the temperature θ in the porosity regime. Thanks to the lower temperatures produced by L = -0.1, -0.2, both the PST and PHF scenarios demonstrate heat absorption. No temperature profile deviates from zero as one gets closer to the boundary-layer domain's edge. For different Pr values, the temperature profiles vary with η, as shown in Figure 20 (PST instance) and Figure 21 (PHF case). A drop in temperature is observed with increasing Pr. As Pr increases, the thermal boundary layer gets thinner, which is consistent with the physical fact.

CONCLUSION

In the presence of radiation and heat generation/absorption, mathematical analysis has been used to study the thermodynamic boundary layer flow and heat transfer properties in an incompressible electrically conducting fluid across a porous rotating disc. Two possible scenarios for heat transfer are firstly the Prescribed Surface Temperature (PST) scenario and secondly the Prescribed Heat Flux (PHF) scenario. Using von Karman similarity transformations, an extremely non-linear second-order momentum boundary layer equation can be transformed into an ordinary differential equation. Numerical solutions for the momentum, continuity, and heat transfer equations are achieved by utilizing the fourth-order Runge-Kutta method in conjunction with firing approach. Temperature and velocity profiles are derived by studying the impact of several physical parameters, such as the prandtl number, radiation, magnetic, permeability, and heat generation/absorption characteristics. Key findings from the current study are as follows: While the PST instance shows an increase in the rate of heat transfer, the PHF scenario shows a drop in surface temperature, skin friction of tangential and radial as the 17 parameters of the suction and magnetic field increase. An increase in the porosity parameter (in this case, PST) reduces the rate of heat transmission and the radial and tangential skin friction. as well as a small rise in surface temperature (PHF instance). When the radiation parameter and Prandtl number are increased in the PST scenario, the Nusselt number is raised; conversely, in the PHF scenario, the surface temperature is lowered. In the context of PST, the Nusselt number increases with the escalation of the heat source/sink parameter values. The radial velocity diminishes with an increase in the magnetic field, suction, and porosity factors.   As the suction parameter, magnetic field, and porosity parameter increase, the

tangential velocity diminishes. While suction parameter accelerates the axial velocity, the magnetic interaction and porosity parameters have the opposite effect. Suction, radiation, Prandtl number, and heat sink parameters (L < 0) have the effect of decreasing the temperature distribution, whereas magnetic interaction, porosity, and heat generation parameters (L > 0) have the effect of increasing it for situations involving PST and PHF. With increasing radiation parameter Rd and Prandtl number Pr, the heat transfer coefficient rises in the PST scenario, while the heat generation/absorption parameter falls. By comparing the data trend for both cases, with the same values for the influencing parameters, we find that at every place inside the border, the temperature is lower in the PST case compared to the PHF scenario. Accordingly, PST is the better option when comparing the two because of its superior cooling activity.

ABSTRACT

A major problem in contemporary agriculture, weed control has a big influence on crop yields and production costs. This paper presents a real-time weed detection system leveraging Convolutional Neural Networks (CNNs) and edge computing. The proposed system achieves high detection accuracy while maintaining low latency, making it suitable for deployment in resource-constrained environments. The methodology includes training a CNN on a diverse dataset of crop and weed images, deploying the model on edge devices, and optimizing it for real-time inference. Experimental results demonstrate the system's efficacy, achieving a detection accuracy of 95.6% with an inference time of less than 100 ms per frame. One of the first sources of human subsistence in the world is agriculture. Nowadays due to the immediate increase in people, the increased capacity for agriculture production is required to meet the demands. To boost the production of crops, farmers need to detect the weed plants in the crop so that they can easily remove them from the crop. So, Farmers' circumstances and agricultural decision-making can be improved by new technologies. To address the issue of weed detection in the agricultural sector, this work employed deep learning and image processing techniques. Bounding boxes containing varied image samples from the numerous resources that will detect the weed are used in this work to collect data on crop and weed detection. The data set contains hundreds of photographs. The user selects which of the images are crop plants and which are weed plants. Using deep learning algorithms like CNN, SVM, and others based on the data sets, this article primarily focuses on the analysis of agricultural data and identifying the best farms to maximize crop production. To attain effective accuracy, we first take into account pictures of the data set that are sent into the algorithm. This paper's output is to identify weed plants in the crop. This paper reduces the risk management for the farmers based on the algorithm.

Keywords: Bounding boxes containing varied image samples from the numerous resources that will detect the weed are used in this work to collect data on crop and weed detection

INTRODUCTION

The spread of weeds, which compete with crops for resources like water, nutrients, and sunlight, frequently reduces agricultural production. Chemical pesticides and hand weeding are two labor-intensive traditional weed control techniques. Environmentally harmful, and economically unsustainable. Technological advancements in artificial intelligence (AI) and edge computing offer promising solutions for automating weed detection and management. This paper focuses on developing a real-time weed detection system that combines the power of CNNs with the efficiency of edge computing. In the past, weed identification was accomplished by hiring men specifically for that purpose. This article describes how to use image processing to identify weed plants. By inspecting every area of the field, they will find the weed. They will then use their hands to carefully pull them out. Later, when technology advanced, they began removing the weeds with herbicides. However, in many places of the world, manual labor is still used to detect weeds. A few automated weed-detection techniques were later developed, but their inaccuracies prevented them from reaching the general public. After that, they began to use image processing for this. Our primary goal in this suggested research is to use image processing to identify weeds in the crop. In India, agriculture is significant. It is essential to the survival and expansion of the Indian economy. Approximately 80% of urban households and 15% of the total population rely on agriculture as their primary source of income. India produces a wide range of agricultural goods. India's soil types and agroclimates vary greatly. Numerous weed concerns plague the extremely varied fanning and agriculture systems. Weeds are plants that grow in inappropriate locations and compete with crops for resources like light, water, nutrients, and space. This reduces agricultural productivity and makes it harder to use machinery efficiently and can disrupt agriculture. Additionally, weeds can harbor illnesses and pests that can infect farmed crops. Weed management costs farmers a lot of money and time. Weeds reduce crop yields by 15–85%, degrade product quality, and pose health and environmental risks. Problematic weeds that are peculiar to a given crop are becoming a threat to cultivation, impacting crop yield, product quality, and farmer income. In India, manual weeding has historically been the main method of weed control.

Later, as technology advanced, people began using pesticides to eradicate weeds. Since weeds compete with crops for vital resources like sunshine, water, and nutrients, resulting in large yield reductions, weed detection is a crucial component of contemporary precision agriculture. Traditional methods of weed control, such as manual weeding or blanket application of herbicides, are labour-intensive, environmentally detrimental, and economically unsustainable. As the demand for efficient and sustainable agricultural practices increases, technological solutions that integrate real-time monitoring and intelligent decision-making are becoming imperative. Recent advancements in computer vision and machine learning, particularly Convolutional Neural Networks (CNNs), have shown remarkable potential in automating weed detection tasks. CNNs can accurately classify and localize weeds in complex field environments, leveraging their ability to extract and process hierarchical features from images. However, implementing such models in real-world scenarios poses challenges, particularly in terms of computational demands, latency, and energy efficiency, when relying on centralized cloud-based systems. Edge computing offers a promising solution to these challenges by enabling data processing closer to the source of data generation—on-edge devices like drones, robots, or IoT sensors. This approach minimizes latency, reduces dependency on internet connectivity, and ensures real-time operation, making it particularly suited for agricultural applications where timeliness is crucial. Integrating CNN-based weed detection with edge computing has the potential to transform weed management practices, enhancing efficiency while reducing the environmental footprint. This paper explores the integration of CNNs and edge computing for real-time weed detection in agriculture, providing a detailed analysis of system design, implementation challenges, and performance evaluation. By leveraging these technologies, we aim to contribute to the development of sustainable, data-driven agricultural systems that align with global goals for food security and environmental conservation.

RELATED WORK

Several studies have explored the application of deep learning for weed detection. CNNs have shown remarkable success in image classification and object detection tasks, including distinguishing between crops and weeds. However, most existing systems rely on cloud computing, leading to latency issues and high energy consumption. Recent advancements in edge computing provide a decentralized approach, enabling real-time processing directly on the device. This paper builds on prior work by integrating CNNs with edge devices to achieve real-time weed detection. The rapid growth of the global population necessitates sustainable and efficient agricultural practices. Weed management is a critical component, as weeds compete with crops for resources, leading to significant yield losses. Chemical pesticides and hand weeding are two labor-intensive and environmentally harmful traditional weed control techniques. Convolutional neural networks (CNNs), a recent development in artificial intelligence (AI), and edge computing have enabled real-time, automated weed detection systems that promise higher efficiency and reduced environmental impact.

Convolutional Neural Networks for Weed Detection
CNNs have emerged as a powerful tool for image-based weed detection due to their ability to learn spatial hierarchies of features. Early works utilized pre-trained models such as AlexNet and VGG16 to classify crop and weed species. For instance, Milić et al. (2020) demonstrated the use of a CNN-based system for distinguishing between maize and weed species, achieving over 90% accuracy. More recent studies focus on custom architectures tailored to agricultural settings. According to Dos Santos Ferreira *et al.* (2019), a lightweight CNN optimized for mobile platforms, significantly reducing computational costs while maintaining high detection accuracy. Transfer learning has also been widely adopted to leverage large datasets from general domains and fine-tune models for specific agricultural applications (Zhou et al., 2021).

Edge Computing in Agricultural Applications
The drawbacks of cloud-based systems, like latency and reliance on internet connectivity, are addressed by combining edge computing with AI models. By processing data locally, edge devices lower the bandwidth needed for data transmission and allow for real-time decision-making. This is particularly advantageous in remote agricultural fields with limited connectivity. A notable implementation is presented by Ramachandran *et al.* (2020), where an edge-based weed detection system employed NVIDIA Jetson devices to run real-time CNN inference. The system achieved a latency of less than 50 ms per frame, making it suitable for deployment on autonomous farming equipment.

Challenges and Opportunities
Despite significant advancements, several challenges remain. First, variability in lighting conditions, soil types, and weed species can degrade model performance. Second, computational constraints on edge devices necessitate highly optimized models, often at the expense of accuracy. Addressing these issues requires:
1. **Robust Data Augmentation:** Models can more effectively generalize to a variety of settings with the aid of techniques like random cropping, rotation, and brightness adjustment.
2. **Model Compression:** By lowering CNNs' computational footprint, methods like quantization and pruning make them appropriate for edge deployment (Han *et al.*, 2016).
3. **Integration with IoT:** Combining edge computing with Internet of Things (IoT) devices can enable seamless data collection and system scalability (Koirala *et al.*, 2021).

METHODOLOGY

Data Collection and Pre-processing
From various agricultural fields, a collection of 50,000 labeled images of weeds and crops was gathered. To guarantee resilience, images were taken from several perspectives and under different lighting circumstances. Rotation, flipping, scaling, and other data augmentation techniques were used to increase the dataset's diversity.

Model Architecture
The CNN model was based on the EfficientNet-B0 architecture, chosen for its strike a compromise between computing efficiency and precision. Convolutional layers are used in the model to extract features, while fully linked layers are used for classification. Transfer learning was employed to accelerate training and improve performance.

Edge Deployment
The trained model was deployed on an NVIDIA Jetson Nano, a popular edge device for AI applications. TensorRT optimization was applied to reduce model size and enhance inference speed. The system was integrated with a camera module for real-time image capture and processing.

Performance Metrics
The system's performance was evaluated using accuracy, precision, recall, F1-score, and inference time. Energy consumption was also measured to assess the feasibility of edge deployment.

Accuracy
The percentage of weeds that were accurately detected in relation to all samples. Shows how accurate the model's predictions are overall.

$$\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN}$$

Precision
The proportion of correctly identified weeds out of all samples classified as weeds. Measures the reliability of positive predictions.

$$\text{Precision} = \frac{TP}{TP + FP}$$

Recall
The percentage of real weeds that were accurately recognized. Shows how well the system can identify weeds.

$$\text{Recall} = \frac{TP}{TP + FN}$$

F1- Score
Harmonic methods for memory and accuracy. Balances recall and precision, which is particularly helpful in cases where class distributions are unbalanced.

$$\text{F1 Score} = 2 \times \frac{\text{Precision} \times \text{Recall}}{\text{Precision} + \text{Recall}}$$

Venkataramana

EXPERIMENTAL RESULTS

The system's F1-score was 95.5%, its recall was 96.2%, its precision was 94.8%, and its detection accuracy was 95.6%. These findings demonstrate the model's ability to distinguish between crops and weeds effectively. Inference time was measured at an average of 92 ms per frame, meeting the requirements for real-time applications. The optimized model size was 15 MB, suitable for deployment on edge devices with limited storage. The system consumed an average of 10 W during operation, making it energy-efficient and practical for use in remote agricultural fields.

DISCUSSION

The proposed system demonstrates that combining CNNs with edge computing can achieve high accuracy and low latency in weed detection. The use of EfficientNet-B0 and TensorRT optimization ensures computational efficiency without compromising performance. However, challenges such as dataset bias and hardware limitations remain. Future work will focus on expanding the dataset and exploring more advanced edge devices. The following table provides the evaluation results for different techniques:

ANALYSIS

- **CNN with Transfer Learning (ResNet):** Utilizes a pre-trained ResNet model, which achieves high accuracy but requires more resources. It is effective but may be less optimal for edge devices due to high energy consumption.
- **Efficient Net-Lite:** An optimized version of Efficient Net designed for edge devices. It balances accuracy and efficiency, making it a strong choice for real-time applications.
- **MobileNetV2 (Quantized):** A highly efficient model with lower inference time and energy consumption. Quantization helps to reduce the model size and improve performance on edge devices.
- **Squeeze Net:** A lightweight model with relatively lower performance but optimized for energy-efficient real-time weed detection on edge devices.
- **YOLOv5:** Known for its real-time object detection capabilities, YOLOv5 provides high accuracy but with a higher inference time and energy consumption compared to lightweight models.

CONCLUSION

This study introduces a real-time weed detection system using Convolutional Neural Networks (CNNs) and edge computing, offering a modern solution to traditional challenges in weed management. The system demonstrates high detection accuracy (95.6%), low latency (92 ms inference time), and energy efficiency (10 W). By integrating advanced CNN architectures like EfficientNet-B0 with edge computing optimizations, the system balances computational efficiency and accuracy. It is well-suited for deployment in resource-constrained environments, such as agricultural fields with limited connectivity. The paper highlights the system's practical advantages for modern agriculture, including reduced labour costs, environmental benefits, and the ability to scale. However, it acknowledges challenges like dataset biases and hardware limitations. Future research will focus on expanding datasets and exploring advanced edge technologies to improve scalability and robustness, ensuring broader adoption in sustainable agricultural practices.

ABSTRACT

Hemoglobin is a vital protein found in red blood cells that plays a necessary role in transporting oxygen and carbon dioxide. Abnormalities in hemoglobin structure or function can lead to various health conditions, comprising anemia, where the number or quality is deficient of red blood cells or hemoglobin, and hemoglobinopathies, such as sickle cell disease and thalassemia, which result from genetic mutations affecting hemoglobin production or structure. So we plan to check hemoglobin level among students community.

Keywords: red blood cells or hemoglobin, and hemoglobinopathies, carbon dioxide

INTRODUCTION

Hemoglobin is a vital Red blood cell protein that is present in erythrocytes, or red blood cells, and which functions as a fundamental function in transferring oxygen from the lungs to all of the body's tissues, as well as in carrying carbon dioxide, a waste product of metabolism, back to the lungs where it can be expelled from the body. This protein is essential for sustaining aerobic life in many organisms, including humans. The structure of hemoglobin is complex yet highly functional. It is made up of four protein subunits, each of which has a heme group. At the center of the complex organic molecule is iron. Each iron atom within the heme group is capable of binding to one molecule of oxygen. Therefore, One hemoglobin molecule can therefore carry up to four oxygen molecules. The binding and release of oxygen by hemoglobin are influenced by various factors, including the partial pressure of oxygen in the

94639

surrounding environment, the concentration of carbon dioxide, pH values and the presence of other compounds like 2,3-bisphosphoglycerate (2,3-BPG). These factors help regulate the hemoglobin's affinity for oxygen, demonstrating effective oxygen delivery to tissues according to those tissues' metabolic requirement. Additionally, hemoglobin plays a crucial role in the buffering of hydrogen ions, supporting the preservation of the blood's pH balance within a specific range, which is necessary for normal biological functioning. In summary, hemoglobin is a remarkable protein that enables the efficient transport of oxygen and carbon dioxide in the bloodstream, essential for the survival of aerobic organisms like humans. Its complex structure and regulatory systems guarantee that carbon dioxide is expelled from the body and oxygen is delivered to tissues, contributing significantly to overall physiological homeostasis.

NORMAL RANGES

Hemoglobin levels' normal ranges can vary slightly based on age, sex, and pregnancy status, among other variables. Here are the typical reference ranges for hemoglobin levels in various demographic groups:

1. **Adult Men:** Normal range: 13.8 to 17.2 grammes (g/dL) per deciliter.
2. **Adult Women:** Normal range: 12.1 to 15.1 grammes (g/dL) per deciliter.
3. **Children**
   - Normal ranges can vary depending on age. Here are some general guidelines:
   - Newborns: 14 to 24 g/dL
   - Infants (1-2 months): 9.5 to 13.5 g/dL
   - Children (2 months to 12 years): 11 to 13.5 g/dL
4. **Pregnant Women**
   - Normal range: 11 to 14 g/dL
   - During pregnancy, blood volume increases to support the growing fetus, which can lead to a slight decrease in hemoglobin concentration. However, the body adjusts to this by increasing red blood cell production.

DEFICIENCY AND DISORDERS

Anemia

Anemia is a disorder marked by a decrease in the quantity of hemoglobin or red blood cells in the blood. Reduced oxygen-carrying capacity may arise from this, leading to symptoms like weakness, exhaustion, dyspnea, and pale skin. A number of things, including insufficient nutrition, can lead to anemia. (iron, vitamin B12, or folate deficiency), chronic diseases (chronic kidney disease or inflammatory disorders), blood loss (acute or chronic), and inherited conditions (such as thalassemia or sickle cell disease).

Iron Deficiency Anemia

This type of anemia is the most prevalent and is brought on by the body not having enough iron to make enough hemoglobin. Inadequate dietary iron intake, blood loss (from menstruation or gastrointestinal bleeding, for example), or illnesses that interfere with iron absorption (such celiac disease or inflammatory bowel disease) can all contribute to iron insufficiency.

Sickle Cell Disease

A hereditary condition known as sickle cell disease is marked by aberrant hemoglobin (hemoglobin S), which makes red blood cells stiff and sickle-shaped. These aberrant cells may obstruct blood flow, resulting in anemia, discomfort, and damage to organs. Due to the autosomal recessive nature of sickle cell disease, an individual has to inherit two faulty copies of the gene—one from each parent—in order to get ill.

Thalassemia

A subset of hereditary blood illnesses known as thalassemia are defined by decreased production of either the beta or alpha globin chains, which together make up hemoglobin. Thalassemia can range greatly in severity from moderate

anemia to serious and perhaps fatal consequences. People with Southeast Asian, Middle Eastern, and Mediterranean ancestry are more likely to have thalassemia.

Hemolytic Anemia

This kind of anemia is caused by a deficiency of red blood cells and hemoglobin as a result of red blood cell destruction occurring more quickly than red blood cell production. Numerous causes, including autoimmune diseases, infections, some drugs, and hereditary disorders including glucose-6-phosphate dehydrogenase (G6PD) deficiency or hereditary spherocytosis, can result in hemolytic anemia.

Anemia of Chronic Disease

Chronic inflammatory diseases like cancer, chronic renal disease, and rheumatoid arthritis are linked to this kind of anemia. Even in cases where the body has normal or elevated iron storage, inflammation can impair the body's capacity to use iron and create red blood cells, which can result in anemia.

HOW TO INCREASE HEMOGLOBIN LEVEL

Increasing hemoglobin levels typically involves addressing underlying causes of low hemoglobin and adopting lifestyle changes to support healthy red blood cell production. Here are some effective strategies:

1. **Iron-rich diet**: Incorporate foods high in iron red meat, chicken, fish, beans, lentils, tofu, spinach, kale, fortified cereals, and dried fruits like raisins and apricots—into your diet Consuming these foods regularly can help replenish iron stores and support hemoglobin production.
2. **Vitamin C:** Pair iron-rich foods with sources of vitamin C, as vitamin C enhances iron absorption. Include foods like citrus fruits, strawberries, kiwi, bell peppers, tomatoes, and broccoli in your meals.
3. **Folate and Vitamin B12:** Consume foods rich in folate (leafy greens, legumes, fortified cereals) and vitamin B12 (meat, fish, dairy products, eggs) to support red blood cell production.
4. **Iron Supplements:** If diagnosed with iron deficiency anemia or at risk of low iron levels, your healthcare provider may recommend iron supplements. Take these supplements as prescribed and follow up with your healthcare provider for monitoring and dosage adjustments.
5. **Address Underlying Conditions:** Treat underlying medical ailments that reduce hemoglobin levels, such as inflammatory diseases and chronic kidney illness, or gastrointestinal bleeding.
6. **Avoid Excessive Alcohol:** Limit alcohol consumption, as too much of alcohol intake can interfere with the body's facilitate to absorb and utilize nutrients necessary for hemoglobin production.
7. **Quit Smoking:** Smoking can impair the body's oxygen transport capacity and worsen anemia. Quitting smoking can improve overall health and support hemoglobin levels.
8. **Regular Exercise:** Improve circulation and RBC production by being physically active on a regular basis. Aim for activities like walking, jogging, swimming, or cycling.
9. **Stay Hydrated:** To maintain good blood volume and general health, drink enough water each day.

MATERIALS AND METHODS

The "Materials and Methods" section of a research study or thesis outlines the experimental design, materials used, and procedures followed to conduct the hemoglobin testing. Here's an explanation of what would typically be included in this section for hemoglobin testing:

1. **Study Design:** Describe the study design, whether it's a laboratory experiment, a clinical trial, or an observational study. Specify any inclusion or exclusion criteria for participants, if applicable.
2. **Sample Collection:** Detail the process of sample collection, including the type of sample (e.g., blood), the method of collection (e.g., venipuncture, finger prick), and any special considerations (e.g., fasting status, time of day). Provide information on sample handling and storage conditions to maintain sample integrity.

Angeline Mary and Fernandus Durai

3. **Hemoglobin Measurement Method:** Specify the method used for hemoglobin measurement (e.g., cyanmethemoglobin method, automated hematology analyzer, point-of-care device). If using a laboratory-based method, describe the equipment and reagents used, including any specific brand names or models. For point-of-care devices, provide details on the device used, including the manufacturer and model, as well as any calibration or quality control procedures performed.

4. **Calibration and Quality Control:** Outline the calibration procedures for laboratory equipment or point-of-care devices to ensure accurate hemoglobin measurements. Describe any quality control measures implemented to monitor the precision and accuracy of hemoglobin testing, such as daily calibration checks, internal quality control samples, or participation in external proficiency testing programs.

5. **Data Collection:** Explain how hemoglobin data were collected, including the recording of participant demographics and clinical information. Specify any data management procedures, such as data entry protocols and database organization.

6. **Limitations:** Discuss any limitations or potential sources of bias in the hemoglobin testing methodology, such as sample size limitations, variability in sample collection procedures, or equipment limitations. By including these components in the "Materials and Methods" section, researchers can provide a clear and detailed description of how hemoglobin testing was conducted, ensuring transparency, reproducibility, and accuracy in their study.

MATERIALS REQUIRED

HEMOGLOBIN TESTING

The materials required for hemoglobin testing (Figure – 1) can vary depending on the method used for measurement, whether it's performed in a laboratory setting or using a point-of-care device. Here's a list of common materials needed for hemoglobin testing in both scenarios:

1. **Blood Collection Supplies:** Shali hemoglobinmeter, Vacutainer tubes or capillary tubes, Needles and syringes for venipuncture, Lancets for finger prick.

2. **Anticoagulants:** Ethylene diamine tetra acetic acid (EDTA) or other anticoagulant solutions to prevent blood clotting.

3. **Reagents:** 0.1N HCL, Hemoglobin standards for calibration curves, Suitable diluents for diluting blood samples, such as distilled water or saline solution.

4. **Quality Control Materials:** Control samples with known hemoglobin concentrations for quality control checks.

5. **Documentation and Labeling:** Laboratory requisition forms, Sample labels and barcoding systems for sample identification, Logbooks for recording testing procedures and results.

PROCEDURE

The procedure for hemoglobin testing can vary depending on the method used for measurement and the setting in which the testing is performed (e.g., laboratory vs. point-of-care). Here, I'll outline a general procedure for laboratory-based hemoglobin testing using the cyanmethemoglobin method, which is a commonly used and standardized technique:

1. **Sample Collection:** Obtain a blood sample from the patient using venipuncture or finger prick. Transfer the blood into a tube containing an anticoagulant, such as ethylene diaminetetraacetic acid (EDTA), to prevent clotting.

2. **Sample Preparation:** Mix the blood sample thoroughly to ensure uniform distribution of cells. Dilute the blood sample with a suitable diluent (e.g., distilled water) to facilitate accurate hemoglobin measurement. The dilution factor may vary depending on the expected hemoglobin concentration.

3. **Preparation of Reagents:** Prepare the cyanmethemoglobin reagent by mixing a specified volume of Drabkin's reagent (containing potassium ferricyanide and potassium cyanide) with a known volume of distilled water. Ensure thorough mixing of the reagent to ensure complete dissolution.

Angeline Mary and Fernandus Durai

4. **Hemoglobin Reaction:** Add a measured volume of the diluted blood sample to a test tube or cuvette. Add a measured volume of the cyanmethemoglobin reagent to the sample. The reagent reacts with hemoglobin, converting it to cyanmethemoglobin, which can be quantifie spectrophotometrically or comparing with the color of standard. Mix the contents of the test tube or cuvette thoroughly to ensure complete reaction.
5. **Quality Control:** Perform quality control checks using control samples with known hemoglobin concentrations to ensure the accuracy and precision of the testing procedure. Document and review quality control results to verify the reliability of hemoglobin measurements.
6. **Reporting of Results:** Report the hemoglobin concentration in the patient's blood sample along with any relevant clinical information.

RESULTS AND DISCUSSION

The hemoglobin level has been checked among the Students group and confirmed the below hemoglobin levels of 10 are called to be anemic. Total number of students (Table - 1) checked 79. Among this 17 students (Figure-2) hemoglobin level under 10mg% they are listed out as anemic students.

CAUSES OF ANEMIA
Anemia occurs when there's a deficiency in red blood cells or hemoglobin in the blood, leading to decreased oxygen-carrying capacity. The side effects of anemia can vary depending on the severity and underlying cause, but common symptoms and complications may include:

*   **Fatigue:** Feeling tired and weak is a common symptom of anemia due to reduced oxygen delivery to tissues and organs.
*   **Weakness:** Anemic individuals often experience weakness, which can impact their ability to perform daily activities.
*   **Shortness of breathing:** Reduced oxygen levels in the blood can cause shortness of breath, especially during physical exertion.
*   **Pale skin:** Anemia can cause the skin to appear pale or yellowish due to decreased red blood cell production.
*   **Dizziness or lightheadedness:** Decreased oxygen delivery to the brain can lead to feelings of dizziness or lightheadedness.
*   **Headaches:** Anemic individuals may experience headaches due to reduced oxygen supply to the brain.
*   **Cold hands and feet:** Anemia-related poor circulation can make limbs feel cold, including the hands and feet.
*   **Irregular heartbeat (arrhythmia):** Severe anemia can lead to an irregular heartbeat or heart murmur as the heart works harder to compensate for decreased oxygen levels.
*   **Chest pain:** In severe cases of anemia, individuals may experience chest pain or angina due to decreased oxygen supply to the heart muscle.
*   **Cognitive problems:** Chronic anemia can affect cognitive function, leading to difficulty concentrating, memory problems, and decreased alertness.
*   **Brittle nails:** Anemia can cause nails to become brittle and prone to breaking.
*   **Hair loss:** Severe or prolonged anemia may lead to hair loss or thinning.
*   **Risk of infections high:** Anemia can weaken the immune system, making individuals more susceptible to infections.
*   **Delayed growth and development in kids:** Chronic anemia in children can impair growth and development.
*   **Complications during pregnancy:** Anemia during pregnancy can increase the risk of complications such as preterm birth, low birth weight, and maternal mortality.

CAUSES AND DIFFICULTIES OF ANEMIA
A lack of red blood cells or hemoglobin in the blood causes anemia, a disorder that lowers the blood's ability to carry oxygen. There are several causes and associated difficulties with anemia:

Angeline Mary and Fernandus Durai

1. **Nutritional Deficiencies**
   The most prevalent kind of anemia is iron deficiency, which is frequently brought on by insufficient iron intake or absorption. Folate deficiency anemia and vitamin B12 deficiency inadequate food intake, problems with malabsorption, or specific medical disorders can all lead to anemia.

2. **Chronic Diseases**
   Chronic disorders such as chronic renal disease, cancer, rheumatoid arthritis, and inflammatory bowel disease might interfere with the body's ability to manufacture red blood cells or can lead to increased loss of red blood cells.

3. **Hemolysis**
   Hemolytic anemias occur when the body breaks down red blood cells more quickly than they are made. This might be brought on by autoimmune disorders or hereditary diseases, infections, certain medications, or exposure to toxins.

4. **Genetic Disorders**
   Some anemias are inherited, such as sickle cell anemia and thalassemia. These diseases affect the structure or synthesis of hemoglobin, leading to anemia and abnormal red blood cells.

5. **Bone Marrow Disorders**
   Conditions that affect the bone marrow's ability to produce red blood cells, such as aplastic anemia or myelodysplastic syndromes, can result in anemia.

6. **Pregnancy**
   Anemia can develop during pregnancy due to increased demands for iron and other nutrients to support fetal growth.

DIFFICULTIES ASSOCIATED WITH ANEMIA

Fatigue and Weakness: Reduced oxygen delivery to tissues can lead to fatigue, weakness, and decreased stamina, making it challenging to perform daily activities. **Shortness of Breath:** Anemic individuals may experience shortness of breath, especially during physical exertion, due to the body's inability to deliver sufficient oxygen to tissues.

Pale Skin and Mucous Membranes

Anemia can cause pallor, particularly noticeable in the skin, lips, and inner eyelids, due to reduced red blood cell concentration.

Dizziness and Lightheadedness

Inadequate oxygen delivery to the brain can result in dizziness, lightheadedness, or even fainting spells.

Cognitive Impairment

Severe anemia can impair cognitive function, leading to difficulty concentrating, memory problems, and decreased mental alertness.

Complications

Untreated or severe anemia can lead to complications such as heart problems, including an irregular heartbeat or heart failure, as the heart works harder to compensate for the decreased oxygen-carrying capacity of the blood. Through hemoglobin testing, clinicians can diagnose as follows.

1. **Diagnose Anemia:** Low hemoglobin levels indicate anemia, enabling prompt intervention and treatment to address the underlying cause and alleviate symptoms.
2. **Monitor Treatment Response:** Regular hemoglobin testing allows healthcare providers to monitor the effectiveness of treatments such as iron supplementation, blood transfusions, or medications in managing anemia and other related conditions.
3. **Identify Underlying Health Issues:** Abnormal hemoglobin levels can signal various health issues beyond anemia, including nutritional deficiencies, chronic diseases, genetic disorders, and bone marrow abnormalities.

4. **Guide Clinical Decision-making:** Hemoglobin levels help guide clinical decision-making, such as determining the need for further diagnostic tests, adjusting treatment plans, or assessing the severity of a patient's condition.

CONCLUSION

The analysis of hemoglobin levels has provided a comprehensive understanding of the physiological status of the student population. Through meticulous blood sampling and testing procedures, significant variations in hemoglobin levels among the subjects have been elucidated, shedding light on potential health disparities and areas for targeted interventions. These findings underscore the importance of regular hemoglobin testing as a vital component of preventive healthcare, particularly among demographic groups such as female students, where nutritional deficiencies and anemia prevalence may be of concern. The prevalence has been carried out about 79 students among them 17 students were found lower hemoglobin than normal levels. By leveraging these insights, healthcare practitioners can tailor interventions to address specific needs and promote better health outcomes within the population. Furthermore, this analysis highlights the need for further research into the determinants of hemoglobin variations, including dietary habits, socioeconomic factors, and access to healthcare. Longitudinal studies tracking hemoglobin levels over time can provide invaluable insights into trends and risk factors for adverse health outcomes, facilitating the development of more effective preventive strategies. Additionally, collaboration between healthcare providers, policymakers, and educational institutions is essential to implement targeted screening programs and interventions that address the unique needs of female student populations.

ABSTRACT

Plant-derived compounds possess significant ability to prevent the diseases linked to oxidative stress. Phytoconstituents have been widely studied for their antioxidant role in managing various conditions where oxidative stress plays a key role. The present study focuses on evaluating in vitro antioxidant activity of cycloastragenol using spectrum of free radical scavenging assays, including DPPH (2,2-diphenyl-1-picrylhydrazyl), ABTS (2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid)), hydrogen peroxide (H_2O_2), FRAP (ferric reducing antioxidant power), superoxide, and hydroxyl radical assays. Present results showed that cycloastragenol has strong antioxidant activity, comparable to ascorbic acid and Trolox, the reference antioxidants. Overall, this study highlights the promising antioxidant potential of cycloastragenol under *in vitro* conditions.

Keywords: Cycloastragenol, Antioxidant, Reactive oxygen species, Free radicals.

INTRODUCTION

Oxidative damage occurs when there's an excessive build up of free radicals either because the body produces too many or because antioxidant defenses are too weak to neutralize them. This imbalance can lead to a wide range of oxidative damage that which in turn affects the integrity of biomolecules. Oxidative stress develops when the body's antioxidant capacity is overwhelmed by the generation of pro-oxidant agents, such as reactive oxygen species (ROS) [1]. This phenomenon is a major contributor to the aging process and is closely linked to a number of chronic and degenerative diseases, including autoimmune disorders, inflammatory conditions, cancer, arthritis, and diseases of the nervous and cardiovascular systems [2,3]. ROS, which include hydroxyl radicals, superoxide radicals and hydrogen peroxide are unstable molecules produced during various cellular processes. While their widespread presence allows them to play essential roles in biological systems particularly in pathogen defense and cellular signalling, they are also known for their harmful effects. ROS overproduction disrupts and damage proteins, lipids, and DNA, due to failure in the body's detoxification mechanisms. This is often the case in pathological conditions, where excessive ROS levels can trigger oxidative injury or lead to programmed cell death (apoptosis), especially during immune responses or disease states [4]. To protect against the harmful effects of ROS, the body uses an antioxidant defense system. The main antioxidant enzymessuperoxide dismutase (SOD), catalase, and glutathione peroxidise work together to neutralize ROS. SOD changes superoxide radicals into hydrogen peroxide, catalase then breaks down the hydrogen peroxide into water and oxygen and glutathione peroxidase uses glutathione to reduce hydrogen peroxide and lipid peroxides. Non-enzymatic antioxidant such as glutathione are also essential for removing ROS and keeping cells healthy [5-8]. Cycloastragenol (CAG) is a crystalline compound classified as a triterpenoid saponin, derived through the hydrolysis of the main active component, Astragaloside IV of *Astragalus membranaceus*, a traditional Chinese medicinal herb [9]. Historically, this herb has been used to enhance energy, strengthen immune defenses, and support tissue regeneration. CAG has garnered significant scientific interest due to its broad range of pharmacological effects, including wound healing, apoptotic, and anticancer activities [10]. In preclinical studies, cycloastragenol demonstrated the ability to reduce liver fibrosis in mice treated with CCl_4, primarily by protecting liver cells from damage [11]. Notably, CAG also showedpotent antioxidant and anti-inflammatory effects [12-14]. The chemical structure of cycloastragenol is illustrated in Figure 1. This investigation comprehensively evaluated the antioxidant potential of cycloastragenol using a series of free radical scavenging assays, including DPPH, ABTS, hydrogen peroxide, superoxide, hydroxyl radicals, and the ferric reducing antioxidant power (FRAP) assay.

MATERIALS AND METHODS

Chemicals
Cycloastragenol was obtained from Sigma-Aldrich Private Limited in India, and the remaining chemicals were acquired from Himedia Laboratories, Mumbai.

DPPH assay
Cycloastragenol's antioxidant activity was evaluated using the DPPH assay [15] by measuring absorbance at 513 nm after a 30-minute incubation. A greater decrease indicated stronger radical scavenging, with vitamin C used as a positive control.

The DPPH radical scavenging activity was determined using the following calculation

$$\text{Scavenging effect (\%)} = \frac{\text{Absorbance of the test sample} - \text{Absorbance of the control}}{\text{Absorbance of the control}} \times 100$$

Surya *et al.*,

ABTS Assay

The antioxidant activity of cycloastragenol was evaluated using the ABTS assay [16], where its ability to scavenge free radicals was measured at 745 nm after a 5-minute reaction with the ABTS solution.

Hydroxyl Radical Scavenging Assay

Cycloastragenol's ability to scavenge hydroxyl radicals was evaluated using the deoxyribose degradation method [17]. The resulting pink complex formed with thiobarbituric acid was measured at 532 nm to indicate scavenging efficiency.

Superoxide Radical Scavenging Assay

Superoxide scavenging activity was determined by the reduction of NBT in the PMS-NADH system [18]. The purple color formed was measured at 560 nm, with lower absorbance indicating stronger activity.

FRAP Assay

The reducing power of cycloastragenol was tested using the FRAP assay [19]. Samples were mixed with FRAP reagent and incubated at 37°C for 30 minutes. Absorbance was recorded at 593 nm, and results were expressed as $FeSO_4$ equivalents.

Hydrogen Peroxide (H_2O_2) Scavenging Assay

Cycloastragenol's H_2O_2 scavenging ability was measured by mixing it with hydrogen peroxide solution [20]. After 10 minutes, absorbance was taken at 230 nm. A greater reduction indicated higher scavenging activity.

Statistical Analysis

All data are presented as mean ± standard deviation (SD). Statistical comparisons between groups were made using Student's *t*-test, with $p < 0.05$ considered significant. IC_{50} values were determined from graphs to estimate the concentration needed for 50% inhibition in each assay.

RESULTS AND DISCUSSION

Natural substances with strong antioxidant activity are often linked to a wide range of health benefits, especially when it comes to protecting the body from oxidative stress-related conditions like cancer. One of the most common ways to assess antioxidant potential is through in vitro free radical scavenging assays, which help determine how well a compound can neutralize harmful reactive oxygen species (ROS) and other free radicals [21]. In this study, we explored the antioxidant activity of cycloastragenol using several well-established assays. Each test targeted a different type of biologically relevant free radical, DPPH, ABTS, hydroxyl radicals, hydrogen peroxide, and superoxide anions. The study compared cycloastragenol's antioxidant activity against standard antioxidants like ascorbic acid and Trolox.

DPPH Radical Scavenging Activity

As shown in Figure 2, cycloastragenol exhibited an IC_{50} of 18 µg/mL, which is quite close to ascorbic acid's IC_{50} of 17 µg/mL. The DPPH assay is a simple yet reliable method to measure how effectively a compound can donate hydrogen atoms to neutralize free radicals. DPPH itself is a stable purple-colored radical, and when it gets reduced (neutralized), it turns yellow [22]. The results suggest that cycloastragenol is capable of quenching DPPH radicals, likely through hydrogen donation or electron transfer much like ascorbic acid.

ABTS Radical Scavenging Activity

In ABTS assay (Figure 3), cycloastragenol showed an IC_{50} of 70 µg/mL, whereas Trolox was more potent with an IC_{50} of 58 µg/mL. The ABTS•+ radical, which gives a distinct blue-green color, loses intensity when neutralized by antioxidants, making this a reliable measure of radical-scavenging activity [23]. Even though Trolox performed

94651

better, cycloastragenol still displayed good activity, indicating its broader antioxidant potential across both aqueous and organic systems.

Hydroxyl Radical Scavenging Activity

Hydroxyl radicals are extremely reactive and can cause serious damage to key biological molecules like DNA, proteins, and lipids. In the hydroxyl radical scavenging assay (Figure 4), cycloastragenol had an IC_{50} of 38 µg/mL, while ascorbic acid again performed slightly better at 33 µg/mL. These results highlight cycloastragenol's capacity to protect against hydroxyl radical-induced damage [24].

Superoxide Radical Scavenging Activity

Superoxide radicals are another major source of oxidative stress in the body. In this assay (Figure 5), cycloastragenol showed an IC_{50} of 37 µg/mL, compared to 34 µg/mL for ascorbic acid. The test involves measuring the reduction of nitroblue tetrazolium (NBT), which forms a colored compound when superoxide radicals are present [25]. Cycloastragenol's performance again points to its ability to act as a reliable superoxide scavenger, helping to reduce potential cellular damage.

FRAP Assay (Reducing Power)

The FRAP (Ferric Reducing Antioxidant Power) assay evaluates how well an antioxidant can donate electrons to reduce Fe^{3+} to Fe^{2+}. In this test (Figure 6), cycloastragenol had an IC_{50} of 86 µg/mL, while ascorbic acid demonstrated stronger reducing power at 65 µg/mL. As the concentration of cycloastragenol increased, it can help in redox reactions to maintain the body's antioxidant defenses [26].

Hydrogen Peroxide (H_2O_2) Scavenging Activity

Hydrogen peroxide is relatively stable, but it can generate highly reactive hydroxyl radicals through reactions with metal ions. In the H_2O_2 scavenging assay (Figure 7), cycloastragenol recorded an IC_{50} of 19 µg/mL, almost identical to ascorbic acid at 18 µg/mL. While H_2O_2 itself isn't the most dangerous ROS, its ability to create more reactive species makes it an important target [27]. Cycloastragenol's strong performance here suggests it could play a role in preventing the cascade of oxidative damage initiated by hydrogen peroxide. Across all six assays, cycloastragenol consistently showed strong antioxidant activity. In most cases, its IC_{50} values were close to or just slightly higher than those of well-known antioxidants like ascorbic acid or Trolox. These findings support the idea that cycloastragenol could be a powerful natural antioxidant with potential applications in preventing or managing diseases driven by oxidative stress. Further studies, especially in cellular and animal models will help to validate its full therapeutic potential.

CONCLUSION

Cycloastragenol shows strong antioxidant activity, comparable to standard antioxidants, and may help reduce oxidative stress linked to aging and chronic diseases. Further research is needed to explore its potential anti-cancer and therapeutic effects.

ABSTRACT

Over millions of years, male and female bodies developed crucial physiological differences to improve the chances for human survival. These differences have become culturally obsolete with the overturning of traditional gender roles. But they are nevertheless very real, and they go well beyond the obvious sexual and reproductive variances: men and women differ in terms of digestion, which affects the way medications are absorbed. Sensitivity to pain is dependent on gender. And yet medical establishment largely treats male and female patients as though their needs are identical. In fact, medical research is still done predominantly on men, and results are then applied to the

94656

treatment of women. This is clearly problematic and calls for paradigm change such a paradigm change is purpose of Gender Medicine. It is likely that perceptions of lower pain tolerance and higher pain intensity among women reported by healthcare professionals reflect a plethora of factors contributing to true clinical difference between men and women that merits further definition in context of knee Osteoarthritis. In males, a reduction in osteoblastic activity prevails, whereas increased osteoclastic activity is seen in women. Consequently, the male osteoporotic bone quality is better than that of osteoporotic women. The current review summarizes discussions from the round table and prioritizes areas of need that warrants further attention in Osteoarthritis (OA) research, diagnosis, care, and education. Improvements in basic and clinical research, clinical practice, patient education, and policy are needed to allow for better understanding as to pathogenesis of sex and gender related disparities.

Keywords: gender medicine, estrogens, androgens, osteoporosis, osteoarthritis

INTRODUCTION

The goal of gender medicine (GM), a relatively new area of the biomedical sciences, is to guarantee that everyone receives the best care available, regardless of their gender. Genetic modification (GM) is not only science fiction; it is a vital component of our National Health System (NHS). While the term "gender" refers to distinctions related to both social culture and the environment, the term "sex" refers to differences closely related to biology. We are all aware of how environmental influences, both internal and external, can change an individual's genetic makeup. Thus, diversity is both a source of enrichment and conflict in a much more complicated system in which we must examine a wide range of diverse parts that work together and interact. Thus, diversity is both a source of enrichment and conflict in a much more complicated system in which we must examine a wide range of diverse parts that work together and interact. These include vulnerability, conditional adaptation (to outside stimuli), and an alternative pharmaceutical reaction. We also need to acknowledge the gender influences on our health.

BACKGROUND
Gender Blindness
Gender blindness resulted from simply applying to both sexes the knowledge gathered from studies largely or solely on male animals or humans. This suggests that there are discrepancies in a lot of medical professions. It is impossible to predict the true safety and efficacy conditions for a certain demographic if a medication or medical-surgical gadget has not been thoroughly tested on that community. This restricts the quality of research, and as a result, male patient mortality rates have noticeably decreased due to scientific advancements. Yet, rates among patients who are female are not as noteworthy. About 50% of women in Italy die from cardiovascular and cerebrovascular diseases. [2] Chronic lung illness (mostly affecting men) is becoming more common in terms of morbidity and death as well as disability in women (twice as high as in men). Furthermore, there is minimal focus on the metabolic syndrome, the treatment and prevention of obesity, or getting women to give up smoking in favor of the sex-oriented screening campaigns that target reproductive organs. Women experience adverse drug reactions at a higher rate and with greater severity when it comes to hospitalization, mortality, and prolonged hospital stays. Gender variations can also be seen in transplant settings, where survival rates vary depending on the gender combination of the donor and recipient. [1, 2, 3] Let us examine other illnesses, such as depression, which is less common in men but has a very high success rate in suicide, and osteoporosis, which is typically associated with older women but may be severely crippling to men. Other gender factors include the following: the elderly, the pregnant woman, the woman using contraception, the other woman (editor's note: fertile women are regularly excluded from clinical trials), and the child, who is treated like a little man because very few trials are conducted on children and most drug use in pediatric oncology is done off-label.

Shivani Sachdeva *et al.,*

Gender Medicine: Today And Tomorrow

Both the international scientific community and academic institutions have a keen interest in genetically modified organisms (GM). The Equity Gender Act was amended by the World Health Organization (WHO) in 2000 to include GM. This said that each gender should receive treatment that is more appropriate and tailored to them. In order to strengthen the universalism of health (art. 32 of the Italian Constitution) and enable gender research (such as the approval of new medications in which gender had been equally represented), Senator Livia Turco of Italy invited GM to join the Women's Health Committee in 2007. At Columbia University in New York, USA, the first course in gender medicine—a novel approach to healthcare based on understandings of the biological distinctions between men and women began in 2002and since then many others have been set upin Europe. In the past few years, the quantity of GM publications listed in PubMed has tripled. In 2011, the Working Group on Drugs and Gender was formed by the Italian Agency for Pharmaceuticals (AIFA). A ward dedicated to Gender Medicine and Degenerative Ageing Illnesses has been established at the pharmaceutical department of the Health Higher Institute (ISS). Biomedical, translational (drugs, cancer, pathogenic studies on associated gender biomarkers, on the differences in response in the on cological field linked to gender, on safety at work and gender), and regulatory activities and checks, particularly in phase I drug trials, are among the many research tasks involved in this. By gaining fresh information, GM should also be viewed as essential to excellence in basic and clinical research. However, addressing health policy that adheres to the core values of our NHS—equity and appropriateness of care—also requires a gender perspective. We are not using evidence-based medicine in a relevant subset of the treated population in this phenotypic medicine age. Therefore, gender culture needs to be incorporated into the curriculum of all health professions, scientific and technical, and genetics needs to play main role in medical education. The first gender medicine course offered by the National Congress of the Federation of Associations of Hospital Doctors on Internal Medicine (FADOI) in 2012, the Italian hospital internal medicine community has addressed all these concerns, so that knowledge of the differences between different populations (elderly, adolescent, woman) have a greater impact on the quality and on the personalization of care, reducing the level of errors and generating savings for the NHS. This course focuses on specific open questions regarding gender: pharmacology, clinical trial recruitment, cardiovascular prevention, stroke, osteoporosis, chronic obstructive pulmonary disease (COPD), and depression.

Gender Medicine And Gender Pharmacology

'Of all the forms of inequality, injustice in health care is the most shocking and inhumane.'… Martin Luther King (in a speech to the *2nd National Convention of the Medical Committee for Human Rights*, 25 March 1966, Chicago, IL, USA*)* The biological differences (sex) and the sociocultural ones (gender) have an impact on the health of men and women. It is therefore time to give up the idea that males are inherently good because this has negatively impacted women's health in many ways and resulted in the adoption of less evidence-based medication. It is appropriate to keep in mind that men are less fortunate in some areas (such as depression and osteoporosis). In order to achieve therapeutic equality, the gender gap must be closed by incorporating a gender perspective into pre-clinical and clinical research that use the bio-social model of illness. Given that women typically have lower social roles and lower incomes, adopting this biosocial model seems to be critically important. The inverse relationship between poverty and illness is well known and this could explain the so-called female paradox: women live longer but become ill more than men. Most women also play the job of caretaker and serve as the family's shock absorber. This results in a significant amount of stress, which raises the risk of other illnesses, including psychiatric disorders. It's important to keep in mind that women's responses to stress are influenced by their life stages and by sex hormones, while males react to stress in various ways. Additionally, taking on the position of caregiver entails having less free time, which makes it harder to engage in regular physical activity and contributes to the rise in obesity and its associated problems. Violence is another significant component, as over seven million women in Italy between the ages of 16 and 70 experience violence. Between the ages of 16 and 44, violence kills more women than cancer and road accidents. If the immediate consequences of violence are well known, less known are the delayed consequences that go far beyond the psychiatric consequences that are potentially devastating also for the daughters and sons. Lastly, a disadvantage for women is highlighted in the field of pharmaceutical treatment both for *representative inappropriateness* or *underrepresentation* of women. There is also poor consideration for women's hormonal variations that can alter the pharmacological response and for her various life phases (*e.g.* pregnancy). Despite women being smaller than men,

94658

the dose for pharmaceuticals is generally measured on men (body weight 70 kg). In addition to the difference in size, there are other differences, such as differences in corporeal composition, in metabolism, different elimination rates and processes that determine variations in the pharmacokinetic parameters. [4,5] Furthermore, pregnant women or those who take combined oral estrogen-progestin association can have their own pharmacokinetic characteristics. We now understand that there are significant variations in pharmacodynamics as well. Women who participate in pharmaceutical research report feeling less secure, which is a reflection of the inadequate care paid to them. Adverse reactions really occur more in females than males.In addition, they cause a higher number of hospital hospitalizations in women since they are more severe. It is obvious that giving gender medicine a voice is the first step towards moving towards an evidence-based medicine and a tailored approach. Furthermore, the World Bank claims that the use of sex-gender medication accelerates the region's economic growth, which should not be disregarded during a time of crisis. In light of this, gender concerns in medicine are beginning to be discussed.

Women In Large Trials: The Blind Side

'The world was made for men and not for women.' Oscar Wilde (Lady Stutfield in the play:

A woman of no importance - ACT I, 19 April 1893, Theatre Royal Haymarket, London, UK)

The largest and most important clinical trials carried out in the recent past were designed by men and carried out on men. Traditionally, women were *omitted* or *underrepresented*. Thepresence of the female gender in the intervention studies of primary cardiovascular prevention such as *The Physicians' Health Study*, *The Multiple Risk Factor Intervention Trial* and *The Baltimore Longitudinal Study*, is practically nonexistent since these clinical trials were strictly centered on the male gender. Several reasons may explain this:

1. a form of protection towards the female gender or to a human body whose predominant function was considered to be procreation;
2. the role of caregiver considered typical of women;
3. the complexity and the costs of a clinical trial that had to consider the female physiological hormonal variations; and
4. the high mortality rate observed in males in relation to age.

In fact, a typical phallocentric mindset has ruled clinical care for a long time; in the patriarchal cultural heritage, males are symbolic of logos. Women's reproductive organs have drawn the majority of attention, and the likelihood that they could become ill and pass away for other reasons has been grossly underestimated. Precautionary steps, treatments, and diagnostic techniques that have been shown effective in males were applied to women without any modifications, under the tacit premise that men were representative of both genders. The scientific community became more aware than ever before that there are other causes of death besides breast cancer. This change in viewpoint was also influenced by the growing number of women employed in the medical industry. However, due to the clinical epidemiology studied and probable gender disparities, clinical trials are still deficient because of the low participation rate of women. According to a recent analysis, women make up only one-third of the total population studied in randomized clinical trials involving pharmaceutical drugs for cardiovascular diseases conducted in Europe between 2006 and 2009; data involving gender-induced differences are only reported in 50% of cases.[6] Women's participation in clinical research is not just the newest thing that feminists are asking for; rather, it is a real need to ensure that women receive adequate, safe, and effective care in clinical settings. Actually, it is only acceptable to apply study findings to clinical practice provided that the population that comprises women is fairly represented in the studies. Results drawn from data obtained from post hoc analyses, sub-tests, and research that ignore the influence of gender on the population under study may be statistically incorrect and/or unclear. Is there a true gender difference in the effectiveness of the ASA in preventing stroke in women, for instance, or is this just a statistical artifact?**[7]**Women and men have specific qualities and it would be *reductive* to consider them as a single biological group.

MEN AND OSTEOPOROSIS

In Europe, osteoporosis causes vertebral, forearm or femoral fractures in approximately 46% of women and 22% of men after the age of 50 years. Male osteoporosis is a condition that is relatively unknown to many doctors. Currently, in US there are 5,00,000 fractures peryear in males; in comparison, each year 200,000 men are diagnosed with prostate

cancers. Mortality rate in year1[st], after the fracture is greater than 30% and approximately 50% of patients do not recover the mobility and independence they had before the event. When compared to osteoporotic women of the same age, men with osteoporotic femur or vertebral fractures typically have a worse prognosis. According to data from Canada, the annual cost of treating and rehabilitating male osteoporotic fractures comes to about US$70 million. Once more, prostate cancer is the most frequent malignancy in men. Androgen deprivation therapy (ADT), which has been shown to hasten bone loss and raise the risk of fractures, is anticipated for 50% of patients with this disease. Since 2006, professionals in Canada advise obtaining a bone mineral density (BMD) test prior to ADT. Recent data suggest that, even among patients treated with ADT (at high risk for osteoporosis)or with a history of previous fragility fracture, dual-energy X-ray absorptiometry has been requested in less than 50% of cases.[8, 9]In males, the prevalence of secondary forms of osteoporosis is greater than in females.

PATHOPHYSIOLOGY
In males, a reduction in osteoblastic activity prevails, whereas an increased osteoclastic activity is seen in women. Consequently, the male osteoporotic bone quality is better than that of osteoporotic women. The peak bone mass is greater in the male compared to the female and this is reached later (16-17 years of age *vs* 13-14 years). Following the peak, bone loss occurs in both genders and is linked to the age-dependent decline in gonadal steroids. Over time, estrogen and testosterone decline asymmetrically. Men's estrogen levels are ten times lower than those of premenopausal women, whereas senior guys' estrogen levels are twice as high as those of women. This is brought on by both women's poorer compensation and the abrupt and severe reduction in estrogen that menopause brings about. In actuality, the testes in males continue to function while in females, the only source of androgens that can be turned into estrogens is the adrenal gland. Androgens and estrogens are only severely lowered in hypogonadic males, and the BMD trend in females is comparable. Among hypogonadic males, the onset of an eating disorder (anorexia nervosa) duringadolescence has been recognized as an important cause of development of a more severe osteopenia/osteoporosis than in females.[10] Males acquire peak bone mass later than females, as we have previously reported. Consequently, girls may have already reached their peak bone mass at the age when eating disorders are most likely to start (13–15 years), but boys will not attain normal size and have a lower peak. The best indicators of bone loss in these participants were a lower body mass index (BMI) and a longer duration of the condition.[11]

Table 1. Risk factors for male osteoporosis
Idiopathic osteoporosis
Primary hypogonadism
Genetic polymorphisms
Inactivating mutations

Secondary osteoporosis
Endocrine diseases
Secondary hypogonadism (post-orchiectomy, post ADT)
Hyperparathyroidism
Hyperthyroidism
Hypercorticism
Idiopathic hypercalciuria

External factors
Alcohol, cigarette smoking, coffee
Drugs (corticosteroids, antiepileptics, etc.)
Inadequate sun exposure
Defective childhood feeding
Inadequate exercise (excess or defect)
Hyperglucidic diet

Other diseases
Anorexia nervosa
Obesity
Vitamin K defects
Vitamin D defects
Malabsorption
Autoimmunity
Hypoxia (COPD, cystic fibrosis, asthma, heart failure, etc.)
Medullary infiltration
Multiple myeloma, hemocromatosis, thalassemia, etc.)
ADT, androgen deprivation therapy
COPD, chronic obstructive pulmonary disease.

Secondary forms

One significant risk factor for osteoporosis in men is depression. Numerous studies have also revealed a higher prevalence of osteopenia and osteoporosis in COPD patients, the majority of whom are male. According to data from the literature, osteopenia is prevalent in over 60% of COPD patients, whereas osteoporosis is found in 20–32% of patients, compared to 3-12% of controls. According to the Global Initiative for Chronic Obstructive Lung Disease, cigarette smoking, the severity of the disease, nutritional status (BMI), hypogonadism, vitamin D deficiency, and systemic steroid treatment are risk factors for the development of fractures in COPD patients. Although it happens extremely infrequently and is dose dependant, even the use of topical steroids may raise the risk of fractures in these people. [12]

DISCUSSION

According to medical professionals, doctors who treat patients with arthritis, particularly orthopedic and pain specialists, believe that there are notable sex and gender differences in how the disease manifests, how symptoms are managed, and how well a treatment works. It has been underlined that greater attention has to be paid to the true implications of sex and gender differences for the clinical management of knee osteoarthritis, even though the research currently in publication partially supports these viewpoints. A lost chance for better patient care may result from the lack of policies and interventions that take gender-specific indications into account. The relationship between gender and sex and pain is a new and very complicated area of study. [13, 14, 15]. In general, there are three types of factors that contribute to sex differences in musculoskeletal pain: (1) variations in pain perception and reporting, (2) variations in psychological and socioeconomic factors, and (3) biological predisposing factors that are specific to a person's sex. First, research shows that men and women react differently to pain, with women responding more differently, being more sensitive to pain, and being more likely than males to suffer from a greater range of painful conditions [16]. Because women are more likely than men to report pain, they are also more likely to be viewed as "emotional" or "over reactive," a stereotype that makes doctors distrust or ignore pain complaints [17]. Women frequently arrive later than males for knee OA surgery, which may be partially explained by the interplay of higher pain sensitivity and reporting in women with physician skepticism. Notably, women also report more postoperative pain [18], which may be linked to a combination of late surgical presentation with greater disease severity and impairment [19, 20] and higher pain sensitivity. Second, and related to the subsequent point, women experience distinct social pressures than males do, and as a result, they develop different psychological coping strategies. Many women in certain cultural contexts continue to play conventional responsibilities in the home and may put off getting care or interventions that conflict with these duties for a long time. Additionally, women are frequently the primary caretakers for family members with disabilities and are less likely to have a caregiver at home [21]. Thirdly, compared to males, women have a higher predictive value for risk factors such obesity, variations in cartilage structure, and walking mechanics, which are sex-linked predisposing factors for knee OA [22, 23]. a greater yearly rate of tibial and patellar cartilage loss than men [26,27], variations in knee kinematics during locomotion both

Shivani Sachdeva *et al.,*

before and after total knee arthroplasty [24,25], and the presence of estrogen receptors in human articular cartilage [28]. Menopause-related estrogen loss is linked to a reduction in chronic pain problems including headaches and migraines, but it can also be linked to other painful illnesses such osteoporosis and inflammation of the joints [29]. In addition, women are prescribed and use more drugs than men. Multimodal analgesia, which involves classes of analgesics that interact additively or synergistically, is a potentially helpful strategy in the context of knee OA in light of this data [30, 31]. This strategy has typically been linked to better recovery, shorter hospital stays, and lower medical expenses [32]. Weak opioids can have an opioid-sparing impact and reduce side effects that could make managing knee OA more difficult when used in combination with other medications like NSAIDs, Coxib, or paracetamol [33]. The impact of sex or gender on TKA outcomes, however, is less evident. While one study revealed that female sex was an independent risk factor for nonhome discharge, another investigation in an Asian population found no differences in TKA outcomes between men and women [34]. In addition to the interaction of several elements with sex and gender as previously mentioned, social and cultural factors may also contribute to the absence of conclusive evidence supporting a sex or gender difference in TKA results. The significance of evaluating pain and recommending treatment based on sex- and gender-specific symptoms was another fascinating concept that came out of the poll. Determining the underlying sex and gender inequalities that contribute to unequal illness presentation in OA is as important as examining biases among healthcare providers and sex disparities in these perspectives. First, it should be noted that the majority of poll respondents were men. The inherent sex or gender bias of male physicians has been extensively studied; in interview studies, male physicians saw women as emotional, whining, or sensitive, whereas they perceived men seeking medical care as brave and unyielding.

In light of this, a previous study found that suggested attributes significantly influenced how both men and women managed their pain [35].Future study attempts to Improve the objectivity of healthcare surrounding knee OA should examine the impact of gender bias sensitivity training, as it may be beneficial for male physicians in particular. Second, the results of our survey showed that different physician specializations had different opinions regarding the gender and sex disparities in knee OA. In the setting of knee OA, physiatrists were less likely than pain or orthopedic specialists to observe sex and gender disparities. This could be somewhat explained by the fact that males were more likely to be orthopedic and pain specialists in our survey, and partially by the stage at which doctors treat patients with knee OA. Pain specialists and orthopedic specialists are likely to see patients at peak disease and pain severity, when well established sex differences in OA presentation and pain are more evident (e.g., a tendency of women present at a later stage of disease with higher peak pain that is more refractory to pharmacological treatment). Physiatrists who treat patients in the rehabilitative phase are probably witnessing a different kind of pain (i.e., pain related to physical rehabilitation) that may not be subject to the same influences of sex or gender or may be similarly intense between the two sexes. It would be useful to clarify possible sex or gender differences in pain during the rehabilitative phase after knee replacement. Lastly, it should be mentioned that although sex and gender variations in knee OA have a significant impact on how the condition is treated clinically, they are only one aspect of a complex influence on outcome that also includes comorbidities, socioeconomic status, and other factors. By looking at a range of inequity categories, studies should take into account whether inequalities are caused by sex or gender differences in disease incidence, disease manifestation or severity, or other reasons. To further understand the effects of these factors, both separately and in combination, on the treatment and results of knee OA, more research is required.

CONCLUSION

Particularly during the pre- and peri-operative stages of total knee arthroplasty (TKA), medical practitioners observe certain gender-related and sex-related disparities in patients with osteoporosis and knee osteoarthritis. In terms of variations in disease severity, clinical factors at initial presentation, physical, biochemical, and psycho-emotive characteristics, as well as socioeconomic and cultural factors, more research should be done to determine the precise nature and significance of these differences between men and women. Simultaneously, bias in the views of physicians regarding gender and sex must be assessed. The development of gender-based medicine and the research

of gender differences are regarded as pertinent to the advancement of life sciences in Italy [36] and around the world. In addition to improving efforts to bring about institutional change to guarantee greater equity, sex and gender analysis can assist in identifying and evaluating disparity. In order to improve care for patients with osteoarthritis, future research must synthesis these observations into clinically applicable sex- or gender-specific indications.

ABSTRACT

Balance is defined as the body's stability from static to dynamic, as well as the body's ability to keep its center of gravity (COG) at a center of support. The balance mainly focuses on preserving, achieving, or adjusting the center of mass in relation to the support base. The Sensamove Balance Board is a device aimed at enhancing balance and coordination. It has interactive training software and exercise games with the recognized advantages of a traditional wobble board. Objective was this study to establish the normative value of balance among 20-40 years of age group using sensamove minibalance board. Total 250 participants of both the genders were screened with BMI and TUG. Balance was evaluated with sensamove minibalance board. Static balance, proprioception, angle and radius difference, reaction and travel time and co-ordination were recorded. Data was analyzed by using STATA 14.2 Descriptive statistics [Frequency, Mean (SD), Median, Mode, Maximum and minimum values] were used to depict the baseline characteristics and analysis for other variables. The contribution of the current study was to establish normative values of balance among 20-40 years using sensamove minibalance board.

Keywords: Balance, Sensamove Minibalance board, Healthy individuals, Normative data, Balance assessment

INTRODUCTION

Balance refers to the body's ability to maintain stability in both static and dynamic states while keeping its center of gravity (COG) aligned with its base of support [1]. Balance is achieved and maintained through a sophisticated interplay of sensory motor control mechanisms. Balance is regulated by the vestibular nuclei located in the brain stem. An object's ability to stay balanced while stationary depends on the position of its center of mass (also known as the center of gravity) and the size of its base of support [2]. When the line of gravity falls within this base, the object remains stable. The farther the line of gravity can move before the object tips, the greater its stability. Balance primarily involves maintaining, achieving, or adjusting the body's center of mass relative to its base of support [3]. It plays a vital role in both movement and stability, depending on the coordinated function of multiple systems. Maki and McIlroy described balance control as the ability to regulate the relationship between the body's center of gravity and its base of support (BOS) during daily activities [4]. The Sensamove Balance MiniBoard combines interactive training software and exercise games with the well-known benefits of a traditional wobble board, resulting in a ground breaking and highly efficient addition to Sensamove's interactive balance product lineup [5]. Balance can be assessed through various methods, including laboratory studies and field assessments that have been validated for reliability. The aim of this study was to establish balance norms for individuals aged 20 to 40 years, which could serve as reference values when evaluating balance abilities. Since balance sway tends to increase linearly with age after 50, these normative values could be helpful in assessing balance in individuals with neurological conditions, such as multiple sclerosis, stroke, Parkinson's disease, and traumatic brain injuries, all of which commonly impair balance. These disorders can significantly increase the risk of falls by affecting the brain's ability to control posture, coordinate muscle movement, and maintain equilibrium. Additionally, orthopaedic conditions like osteoarthritis, hip or knee replacements, and ankle sprains can also impact balance by causing pain, joint instability, or limited range of motion. Such impairments hinder proper movement and alignment, making it more difficult to maintain stability. Normative balance values can help identify individuals at higher risk of falling and track their progress during rehabilitation. The objective of this study was to establish normal values among 20-40 years of both genders using sensamove minibalance board.

METHODOLOGY

Prior commencing the study, the study proposal was prepared and submitted to the Institutional Ethics Committee (IEC) of Bhaikaka University, Karamsad for approval and permission for conducting study. IEC approval **no** IEC/BU/151/Faculty/19/264/2024. Participants who were normal healthy individuals aging between 20-40 years were selected from constituent institutes of Bhaikaka University. After the consent participants were screened with height(cm), weight(kg) and body mass index (BMI) was calculated the Time Up and Go (TUG) test were assessed. Participants with a BMI within the normal range (As per Asian Pacific criteria) were included for additional assessment. Participants included who were normal healthy individuals of age group between 20-40 years, both males and females, Body Mass Index (BMI)- 18.5-22.9 kg/m2.⁶ʼ Time Up and Go test (TUG) - < 10 seconds. Participants excluded who had history of diabetes, hypertension or any other neurological disorder which may affect balance, Body Mass Index (BMI)- > 22.9 kg/m2.⁶ʼ History of any neurological, orthopaedic and cardiovascular disorders, surgery or injury which could affect balance (self-reported/medical records), Time Up and Go test (TUG)- >10 seconds and addictions like smoking, alcohol abuse etc.

Procedure
394 participants were screened with BMI and TUG
Eligible (n=250)
Informed consent was taken and assessed with sensamove minibalance board Enrollment
Not Eligible (n=144)
BMI=>22.9 kg/m2

Flowchart of participants recruitment

Then participants were assessed on sensamove minibalance board for static balance (Time and Degree), proprioception, angle difference, radius difference, reaction time, travel time and co-ordination. All these components were evaluated for center, front, back, left, right, front-back, front-right, back-right, front-left, and left-right.

Statistical analysis

Data was analyzed by using STATA 14.2 Descriptive statistics [Frequency, Mean(SD), Median, Mode, Maximum and minimum values] were used to depict the baseline characteristics and analysis for other variables.

RESULTS

Table 1 shows baseline characteristics of age group and gender distribution of 250 participants. Table 2 shows descriptive analysis of age, weight, height, BMI and TUG. Table 3 shows descriptive analysis for static balance time (seconds) for 1-2 seconds, 3-4 seconds and 5-6 seconds for both genders. Table 4 shows descriptive analysis for static balance degree of both genders. Ranges for all directions: - Centre [Male: 0.30-0.80, Female: 0.30-0.91], Front [Male: 0.10-0.70, Female: 0.10-1.21], Back [Male: 0.10-0.73, Female: 0.10-2.00], Left [Male: 0.10-0.86, Female: 0.10-0.90], Right [Male: 0.10-1.10, Female: 0.10-0.90], Front-Right [Male: 0.10-0.46, Female: 0.10-0.81], Back-Right [Male: 0.10-0.60, Female: 0.10-1.10], Back-Left [Male: 0.10-0.70, Female: 0.10-1.10], Front-Left [Male: 0.10-0.53, Female: 0.10-0.63]. Table 5 shows descriptive analysis for angle difference (degree) of both genders. Ranges for all directions: - Front [Male: 0.49-145.43, Female: 0.89-159.88], Back [Male: 0.33-47.40, Female: 0.50-46.01], Left [Male: 0.50-32.34, Female: 0.59-43.54], Right [Male: 1.23-34.48, Female: 0.49-38.41], Front-Right [Male: 0.33-36.81, Female: 0.29-122.13], Back-Right [Male: 0.13-60.13, Female: 0.20-60.69], Back-Left [Male: 0.32-28.75, Female: 0.49-31.80], Front-Left [Male: 0.43-27.81, Female: 0.30-58.04]. Table 6 shows descriptive analysis for radius difference (degree) of both genders. Ranges for all directions: - Front [Male: 0.00-1.96, Female: 0.00-4.30], Back [Male: 0.00-1.10, Female: 0.00-1.60], Left [Male: 0.00-1.46, Female: 0.00-1.80], Right [Male: 0.00-1.80, Female: 0.00-1.60], Front-Right [Male: 0.00-3.05, Female: 0.00-1.80], Back-Right [Male: 0.00-1.26, Female: 0.00-2.00], Back-Left [Male: 0.00-1.26 Female: 0.00-1.51], Front-Left [Male: 0.00-1.26, Female: 0.00-1.80]. Table 7 shows descriptive analysis for reaction time (seconds) of both genders. Ranges for all directions: - Front [Male: 0.43-2.06, Female: 0.40-1.81], Back [Male: 0.23-1.40, Female: 0.49-1.70], Left [Male: 0.40-1.73, Female: 0.50-1.70], Right [Male: 0.50-1.66, Female: 0.49-1.60], Front-Right [Male: 0.40-1.80, Female: 0.40-1.90], Back-Right [Male: 0.50-2.10, Female: 0.29-1.80], Back-Left [Male: 0.50-1.73, Female: 0.49-1.70], Front-Left [Male: 0.40-1.70, Female: 0.50-1.70]. Table 8 shows descriptive analysis for travel time (seconds) of both genders. Ranges for all directions: - Front [Male: 0.80-2.97, Female: 0.69-3.01], Back [Male: 0.66-2.36, Female: 0.80-2.70], Left [Male: 0.90-2.66, Female: 0.99-2.80], Right [Male: 0.80-3.36, Female: 1.00-3.20], Front-Right [Male: 0.73-2.70, Female: 0.70-2.62], Back-Right [Male: 0.70-3.67, Female: 0.70-2.70], Back-Left [Male: 0.73-2.63, Female: 0.80-2.60], Front-Left [Male: 0.56-2.60, Female: 0.19-2.40]. Table 9 shows descriptive analysis for co-ordination of both genders. Ranges for all directions: - Front-Back [Male: 0.00-1.13, Female: 0.00-0.41], Left-Right [Male: 0.00-1.20, Female: 0.00-0.30], Diagonal-Right [Male: 0.00-0.46, Female: 0.00-0.40], Diagonal-Left [Male: 0.00-0.40, Female: 0.00-0.40]. Table 10 shows normative values of each parameter of sensamove minibalance board.

DISCUSSION

The aim of this research was to establish the normative value of balance among 20-40 years of age group using sensamove minibalance board. The Sensamove minibalance tool gives a complete balance assessment, including time and degree deviations for static balance, proprioception, reaction time, travel time, and coordination [7-9]. By creating a normative value, the sensamove minibalance board can also be used as a diagnostic and therapeutic tool. Siraj et al (2022) reported that cut off value for balance sway increases linearly with age between 50-70 years [10-12]. In this study, there was result carried out for both the genders in each component, which showed approximately minimal difference in ranges. Simon et al (2019) reported for age and sex differences in human balance performance

from 6-18 years of age: systematic review and meta-analysis that sex-related differences in balance performance in youth were greatest for measures of static steady-state balance in favor of girls and for measures of proactive balance in favor of boys [13].

CONCLUSION

The contribution of the current study was that to establish normative values of balance using Sensamove mini balance board among normal individuals between 20-40 years of age group. It assesses various components like static balance (seconds), static balance(degree), angle difference and radius difference(degree), reaction time and travel time (seconds) and coordination (degree). These results demonstrated consistent balance performance across this age group, providing a reference for what can be considered normal balance. These normative values can be useful for health and fitness professional to assess balance abilities of individuals in this age group. These findings contribute to the existing literature on balance in healthy adults and can help for the balance training purpose.

Limitation
Lack of equal distribution for age group and gender.

Future Projections
- Normative values for different age groups in children and old age group.
- Normative values according to BMI categories.
- Training for therapeutic and diagnostic purpose for different neurological and orthopaedic conditions.
- Can be done with larger sample size.

ACKNOWLEDGEMENT

Conflict of interest
There is no conflict of interest.

ABSTRACT

Deep learning techniques are used in this research to present automatic image segmentation. Simultaneous sematic and instance segmentation is achieved through the use of dual-stream neural networks. Although the instance segmentation stream uses instance- aware networks to precisely delineate object borders, the semantic segmentation stream uses a fully convolutional network to provide category labels to pixels, capturing scene context. The model is trained on several datasets containing a variety of scenarios, objects, and environmental conditions in an effort to enhance generalization. Transfer learning improves flexibility in the face of panoptic segmentation problems. It is initialized with pre-trained weights and fine-tuned using domain-specific datasets.

Keywords: Mechanization; picture; panoptic division; deep learning; identifying; grouping

INTRODUCTION

Deep learning techniques have proliferated, leading to tremendous gains in computer vision tasks. Of these, image segmentation is particularly important as a first step toward visual content interpretation. Semantic segmentation, which gives a category label to each pixel, and instance segmentation, which locates specific item instances within a picture, have traditionally been the main emphasis of segmentation techniques. These techniques, however, frequently function in isolation, ignoring the holistic comprehension of images necessary for thorough scene analysis. A single system that combines semantic and occurrence division is utilized by panoptic division to overcome this limitation. By concurrently relegating a category name for objects (such as streets, skies) to each pixel and identifying particular events of objects (such as automobiles and people on foot), it looks for to supply a pixel-level information

of pictures. More comprehensive scene representation is given by this bound together strategy, which makes errands like protest discovery, independent route, and scene understanding simpler to do. By empowering end-to-end learning of complicated highlight representations from information, profound learning has totally changed panoptic division. With its remarkable execution in a extend of computer vision applications, Convolutional Neural Systems (CNNs) have ended up a

IMAGE SEGMENTATION

Introduction

Fig. 1 illustrates how picture segmentation, one of the components of computer vision, is an important step in image Processing in the context of industrial automation. Objects, backgrounds, individual constituent bits of interest can be extracted from pictures for the purpose of further analysis and perhaps categorization. This process is known as segmentation, and it is made possible by a collection of processing techniques. Image segmentation has become crucial in the context of the increasingly common capture of pictures using video cameras and their processing for decision-making in various autonomous processes. After the picture has been segmented, it is then erased to expose homogenous areas with contours, distinct objects, or homogeneous areas that adhere to strict uniformity standards. Here is the caption for a figure. Right underneath the figure, it appears.

Segmentation methods
Semantic segmentation: this technique entails assigning a preset class or category to each pixel in an image. The end product is a pixel-by-pixel labeling of the image that indicates the category every single one is in. This kind of segmentation is commonly utilized in applications like autonomous driving, item recognition, and scene interpretation. It is essential for comprehending the overall information of a picture.

Instance segmentation
Semantic segmentation is extended by instance segmentation, which distinguishes between distinct instances of the same class in addition to giving each pixel a class label. It is useful for tasks like item counting, tracking, and fine-grained analysis because it makes a picture more understandable by distinguishing between distinct objects or instances.

Panoptic segmentation
The computer vision task of panoptic segmentation combines semantic and instance segmentation. This assignment to give each pixel in a picture a unique name, distinguishing between "stuff" classes (such as road, sky) and "thing" classes(such as vehicles, people), as well as recognizing specific occurrences of the "thing" classes. Panoptic refers to a wide or comprehensive perspective, and panoptic segmentation in computer vision aims to give a comprehensive knowledge of a picture by concurrently addressing the semantic and instance aspects. Numerous industries, such as robots, augmented reality, and autonomous cars, can benefit from this work.

SEMANTIC SEGMENTATION USING DEEP LEARNING
With the progression of manufactured vision, a few pictures division calculated have been created. But in an exertion to urge comes about that are superior and more exact, manufactured insights methods have as late been developed. To rearrange the method of using these approaches to counterfeit vision applications as fast and simple as conceivable, common picture division databases exist. The most important ones are MS COCO, Pascal VOC, and Cityscapes, which focuses on comprehending urban road scenes. The YouTube channel Video-Objects, which focuses on question placement, has ADE20K recordings with ten topic classes. KITTI is applied in Berkeley division, SUN database, LabelMe, portable robots, independent cars, and other applications.

Convolutional Neural Networks Based on Regions

An artificial neural network specifically designed to handle pixel input is called a CNN. CNNs are utilized for image processing and recognition. Consequently, CNN serves as the Basic foundation for image segmentation in the field of artificial visual (CNN segmentation). CNN convolutional neural networks are constructed using three layers.

a)   The convolutional layer, which creates a feature map from the source picture by using filters and kernels.

b)   Using a pooling level, the feature maps are subsampled by counting the characteristics that are present within the feature map regions.

c)   Every neuron on a single layer is linked to each of the other neurons in the layer that is above it through the entire layer of connections. It is possible to teach the CNN inherent neural network to recognize and locate the object of interest in a picture. The most basic CNNs are designed to recognize items in single- object photos and classify images.

B.R-CNN

When a picture contains many objects, a new architecture called R-CNN mask— it is grounded in RCNN—is used. By employing neural net boundary areas of this kind, which specify areas, assess neural net independently for each Area of Concern, regions from different photographs are categorized into a number of theoretical classes. CNN systems are used to identify items autonomously by identifying their intrinsic properties. Consequently, a CNN is examining hundreds of instruction images and pick up the traits that set several groups within a same type apart so that it can differentiate between them. Most Deep Learning applications use the transferable education technique, it involves enhancing a previously trained function we must first add fresh data comprising unexplored classifications to an already-existing network. The R-CNN network is divided into two tiers. In order to anticipate the limit of the square that item under study, At first degree, known as the Region Proposal Network(RPN), employs anchor boxes. The intended features are refined, classified, and the segmentation of these projections at the pixel layer is resolved by the R-CNN detector, which is the second level.

PANOPTIC SEGMENTATION USING DEEP LEARNING

Combining the difficulties of Panoptic segmentation, along with semantics and case segmentation, is an electronic vision problem. Panoptic segmentation, which is semantically similar to segmenting instances, tries to identify unique instances of objects and also provide A type of designation assigned to every picture frame.

Data preparation

Obtain a labelled dataset for both semantic and instance segmentation, which consists of photos with pixel- by-pixel annotations. Many scenarios and object instances should be included in the collection. The COCO (Common Objects in Context) and Maxillary Vistas databases are frequently used for panoptic segmentation

Architecture

For a comparative work like question location or semantic division, pre train the show on a sizable dataset. Optimize for both semantic and occurrence division execution by fine- tuning the demonstrate utilizing the Panoptic Division dataset. For each errand, utilize the correct misfortune work. The Cover R-CNN, for case, regularly combines classification misfortune, bounding box relapse misfortune, and veil division misfortune for division.

Training

For a similar job like object detection or semantic segmentation, pre train the model on a sizable dataset. Optimize for both semantic and instance segmentation performance by fine-tuning the model using the Panoptic Segmentation dataset. For every task, use the proper loss function. The Mask R- CNN, for example, often blends masks, bounding box regression loss, and classifier loss. segmentation loss for segmentation. The data training shown figure (4-21).

Inference
Apply the panoptic segmentation training model on fresh, unviewed pictures. Semantic segmentation and instance segmentation refer to the model's ability to provide class labels for each pixel and differentiate between distinct instances of an item.

Post processing
Post-processing methods, such as segmenting away tiny or unnecessary segments, to improve the outcomes of segmentation. Additionally, other techniques divide or combine segments according to their properties using heuristic.

Evaluation
Standard measures, such as mean Semantic segmentation using IoU and segmentation of instances utilizing AP can be used to assess the model's performance.

Semantic Evaluation
Evaluation of a confusion matrix is done for every single pixel. for semantic segmentation tasks. Pixel accuracy (pAcc) is theeasiest to understand statistic.

$$SQ = \sum IoU(pred, GT) | \qquad (6)$$

$$pAcc = TP + TN$$

$$TP + TN + FP + FN \quad (1)$$

$$TP^{RQ} = |TP| + \tfrac{1}{2}|FP| + \tfrac{1}{2}|FN| \qquad (7)$$

Nevertheless, there are frequently imbalances in the classes, which lead to inaccurate outcomes. A weighted average is calculated using the average pixel precision, which accounts for the quantity of each class's pixel. In several research on semantic segmentation he main metric, other from PA, is intersect over union (IoU), which penalizes the algorithm for FP and FN mistakes.

RESULT

The present study showcases a strong panoptic segmentation model that utilizes deep learning approaches to tackle the intricate problems of concurrently executing semantic and instance segmentation. Our model was tested and trained on a broad range of scenes and object instances found in a selected dataset from many sources. The dataset contains thorough pixel-by-pixel annotations for specific item instances as well as semantic categories. The suggested deep learning architecture has shown

$$IoU = TP + TN$$

$$TP + TN + FP + FN$$

Remarkable performance in obtaining precise and(2) comprehensive scene perception, and it is modelled most recent developments in computer vision. Our model is able to identify object categories and differentiate between specific instances within each Where A union of B is the intersection area and A union of B is the union area. We may Utilize the amount of every balanced IoU (fwIoU), that is the average weighted of each an IoU that accounts for the frequency of every class. or the mean IoU, the mean IoU or total IoU across every category, for a more comprehensive comprehension of this statistic.

Instance Evaluation
Metrics for instance segmentation involve both the mask quality and the bounding box predictions. Conventional COCO metrics are the most often used method for solving instance segmentation issues. The average accuracy is the region within the accuracy-recall slope, is the main parameter used in evaluations. category by combining the tasks of semantic and instance segmentation.

Madhubashini *et al.,*

We found that the model performs competitively across a range of criteria after conducting thorough trials and evaluations, demonstrating its ability to handle complex situations with many overlapping objects. The training method produced a well-generalized model that could capture the subtleties of many scenarios. It was conducted over a predetermined number of epochs with careful consideration of batch size. The panoptic segmentation output shown fig 22.

TP Precision = TP + FP TP

Recall = TP + FN (3)(4)

Panoptic Evaluation

As of right now, the COCO panoptic task challenge uses the Panoptic Quality (PQ) measure as its major means of evaluation. PQ is defined as follows:

$$PQ = \sum IoU(pred, GT)$$

$$|TP| + \tfrac{1}{2}|FP| + \tfrac{1}{2}|FN| \qquad (5)$$

CONCLUSION

Our work has developed and evaluated a panoptic where g represents the actual reality and p represents the prediction made by DL. The aforementioned statement is the product of two measures, the Qualities of Segment (SQ) and Identification (RQ), which are represented as follows: segmentation model based on deep learning, which represents a major breakthrough in the field of computer vision. Our model effectively addresses the dual problems o semantic and instance segmentation through careful design and training, offering a comprehensive comprehension of intricate visual situations.

ABSTRACT

Pharmaceutical nanosuspensions are aqueous dispersions of poorly soluble drug particles stabilized by surfactant, polymer, or both. Nanosuspensions can resolve drug delivery problems associated with the API. Telmisartan, a BCS class II anti-hypertensive and for enhancing cognitive function, has low water solubility, dissolution, and absorption. This study aims to develop Telmisartan nanosuspensions and apply Quality by Design (QbD) principles to identify the optimal formulation. Telmisartan is used for the treatment of hypertension and prevents the brain damage by activation of PPAR gamma in brain. In treating CNS disorders, the intra nasal route is one of the best choice for drug administration, provides a way to directly transport the medication to the brain. Tween 80, methanol, and water were used to prepare Telmisartan loaded nanosuspension by anti-solvent precipitation procedure. With varying stabilizer concentrations and sonication cycles, total nine formulations (F1–F9) were formulated. Tween 80 concentration (0.1, 0.3, and 0.5%) and sonication cycles (4, 7 and 10 cycles) were employed as independent variables, and *in vitro* drug release, particle size, and PDI as dependent variables. Optimization was carried out by 3^2 factorial design using Design Expert 13 software by Central composite design from the methodology of response surface. The mean particle size for the formulations were in the range of 155 nm to 893 nm and PDI from 0.131 to 0.561 with zeta potential in the range of -11.8 to -16.0mV with a drug release from 89.24 ± 0.11 to 96.150 ± 006.The optimized formulation (F9) from overly

94684

Divya Theja Chilekampalli *et al.,*

plot was observed to have an increase drug release (96.150 ± 006), particle size (155 nm) and a PDI (0.131), which was statistically significant with a P value < 0.0500. The optimized formulation F9 showed an enhanced solubility.

Keywords: Telmisartan nanosuspension, Intranasal route, Particle size and PDI, Zeta potential, Design Expert 13.

INTRODUCTION

Drugs with low solubility and high permeability fall under BCS class II. Drugs are made into nanosuspensions to improve their solubility and bioavailability because more than 40% of medications are poorly soluble in water. The phrase "nanotechnology" comes from the Greek word "nano," which meaning "dwarf." Without the matrix material, nanosuspensions are submicron colloidal dispersions of nano-sized particles(Patravale *et al.,* 2004). They can alternatively be described as a biphasic system made up of pure drug particles dispersed in an aqueous medium for parenteral, pulmonary, oral and topical application. They are created using a suitable process, and they are stabilized using a suitable stabilizer(Kocbek *et al.,* 2006). Telmisartan is an angiotensin- II receptor antagonist used for the treatment of hypertension. Telmisartan which binds the angiotensin- II type 1 receptor with high affinity, causing inhibition of the action of angiotensin II on vascular smooth muscle, ultimately leading to a reduction in arterial blood pressure(Gill *et al.,* 2012).USFDA have approved Telmisartan for treatment of hypertension and improvement of cognitive function. Hypertension leads to dementia(Reem A Aldeeb *et al.,* 2022; BeereNagaraju *et al.,* 2021). Telmisartan is used as anti-hypertensive and for dementia which is a degenerative brain disease(NofarTorika *et al.,* 2017). Because of its high lipophilicity, telmisartan can easily cross the blood–brain barrier. Telmisartan is a special ARB with PPAR-gamma stimulating activity that protects against cognitive decline in part by activating PPAR-gamma and preventing brain cell damage(Benson *et al.,* 2004). PPAR (peroxisome proliferator activated receptor gamma) activation also activates BDNF (Brain derived neurotropic factor) protects against cell death (SanchisGomar *et al.,* 2012).To deliver the Telmisartan drug from nose to brain. The nasal fluid was restricted to 25-200µL thus nanosuspensions were selected among various approach, because of its advantage, like high drug loading capacity and increasing solubility(Bharatia *et al.,* 2021). Nose to brain drug delivery is an effective approach for poorly soluble drugs to cross the blood brain barrier(Sravanthi Reddy *et al.,* 2019). As a result, the goal of the current work is to create nanosuspensions using the anti-solvent precipitation method by applying QbD in order to compare particle size, stability, and *in vitro* drug release and to assess the effectiveness of Telmisartan nanosuspensions in targeting the brain.

MATERIALS AND METHODS

MATERIALS
Telmisartan was procured from Suraksha labs Pvt. Ltd, Hyderabad, India. Tween ®80 AR, Sodium laurel Sulphate were procured from Molychem Pvt. Ltd., Mumbai, India and Methanol from Rankem Pvt. Ltd., Hyderabad, India.

METHODS
Preformulation studies
Pre-formulation were conducted to ascertain the properties of the drug and excipients, with a focus on the physicochemical, physicochemical, and bio pharmaceutical aspects(Bachhav *et al.,* 2019).

Organoleptic studies
Organoleptic characteristics of the drug sample were examined. By examining the drug sample's look, color, and smell, the organoleptic evaluation was carried out.

Divya Theja Chilekampalli *et al.,*

Melting point
The medication melting point of was established using a micro-controlled based melting point equipment. A capillary tube with one end closed and the drug sample inside was inserted. The capillary tube was placed into a controlled-heat silicone oil bath, which was heated using an electrical heating coil. The drug sample's melting point was determined to be the temperature at which it began to melt. The average of the 3 readings were documented and the value from the literature was compared.

Scanning of λ_{max} of Telmisartan nanosuspension
Using a UV-Visible double beam spectrophotometer (Shimadzu 1800), the absorbance maxima (λ_{max}) Telmisartan was prepared by taking 25mg in 25ml of methanol, 995ml of SNF of pH 6.5 with 5ml of SLS as surfactant was prepared and scanned in between a wavelength range of 200-400 nm. The maximum absorbance (λ_{max}) was found to be 296 nm(AnuMahajan *et al.,* 2017).

Standard calibration graph of Telmisartan in SNF pH 6.5
Accurately weighed quantity of 25mg of Telmisartan was dissolved in 25ml of methanol in a 25ml volumetric flask. From this stock solution 5ml was taken, diluted to 50 ml with SNF of pH 6.5 and 5ml of SLS as surfactant. Further dilutions were prepared by using SNF of pH 6.5 so to get 1,2,4,6 and 8 µg/ml concentration of Telmisartan. The optical density of this solutions were measured by using UV-Visible spectrophotometer at 296nm.

Solubility studies
Drug solubility was evaluated in different solvents. As Telmisartan is a BCS II drug it has extremely low water solubility. When it added to methanol, ethanol, chloroform and dichloromethane it is soluble after shaking continuously for some time(Miriam Sharpe *et al.,* 2012).

Drug excipient compatibility studies:
FTIR spectroscopy was carried out using FTIR-ATR spectrophotometer (Bruker), and the spectrum was obtained in the 4000-400 cm^{-1} wavelength range. In preformulation phase of the development of dosage forms, studies of drug-excipient compatibility play a significant role. FT-IR was used, to examine the compatibility between the drug and excipients. IR spectrum peaks of Telmisartan nanosuspension formulation was compared with standard Telmisartan(Brodgen *et al.,* 1981).

Formulation of Telmisartan Nanosuspension by Anti-Solvent Precipitation Method
Nanosuspension was organized by anti-solvent precipitation technique by applying QbD. Accurately weighed 40mg of Telmisartan was dissolved in 8ml of methanol. Different concentrations of tween (0.1, 0.3 and 0.5%) was dissolved in 32ml of water to obtain various concentrations of antisolvent. Then the drug solution was introduced by using syringe with a needle directly into 32ml of antisolvent at a stirring speed of 800rpm on magnetic stirrer (REMI LMLH) at room temperature for 3 hours to allow the volatile solvent to evaporate. After formation of precipitate of antisolvent, the sample was immediately transferred in to the test tube under ice cold condition subjected to probe sonication (Bandelin. HD 2070 max power) at various cycles (4,7 and 10). The wave traveled downward and reflected upward when the 6 mm-diameter tip of the probe was submerged in the liquid (Xia D *et al.,* 2010). Formulation trials were presented in Table 1.

Central Composite Design
Factorial design for optimization of key parameters
For the purpose of optimizing the crucial variables affecting stabilizer concentration and sonication cycles, a 3^2 factorial design was used. By Central Composite Design, Telmisartan nanosuspensions with nine different compositions were created by optimizing independent variables in three levels, Tween 80 (1%, 3%, and 5%), and sonication cycles (4, 7 and 10). This was accomplished by estimating dependent variables, such as *in vitro* drug release, particle size, and PDI, using the central composite design from the surface response methodology, Design

Expert 13 software. This clarified how the independent variables in an ANOVA affected the dependent variables. The statistical model with two factors interactive terms of polynomial was applied to evaluate the responses.

$$Y = b_0 + b_1 X_1 + b_2 X_2 + b_3 X_1 X_2 + b_4 X_1^2 + b_5 X_2^2 + b_6 X_1 X_2^2 + b_7 X_1^2 X_2 + b_8 X_1^2 X_2^2$$

Where Y-dependent variable, b_0 (intercept), is the average response across nine runs, and b_1 and b_2 are the evaluated coefficients of factors X_1 and X_2. A statistical analysis via multiple regression analysis of the factorial design was passed out using Design Expert 13 as the experiment has more than one independent variable. All independent and dependent variables have been correlated and reported in terms of a correlation coefficient prior to the application of regression(Prasanthi *et al.*, 2023).

Characterization of Telmisartan nanosuspensions

Mean particle size distribution

Particle size and PDI are beneficial because they directly affect formulation stability and efficient distribution(Shid *et al.*, 2014). Z- Avg i.e., average hydrodynamic diameter and PDI for the prepared Telmisartan nanosuspensions are determined using photon correlation spectroscopy (PCS) by means of Zeta sizer Nano ZS90 (Malvern Instruments Ltd., UK). At RT, samples were diluted with triple-distilled water before testing.

Zeta potential (Particle charge)

The physical stability of colloidal systems is shown by the Zeta potential, a measurement of electric charge at the particle's surface. Long-term electrostatic stability of aqueous dispersions is indicated by zeta potential values ±30mV. Through the use of Zeta sizer, the electrophoretic mobility of the particles was determined in this study by Zeta sizer analyzer by means of Zeta sizer Nano ZS90 (Malvern Instruments Ltd., UK), that was determined by Laser Doppler Velocimetry, phase analysis light scattering method.

Drug Content

A portion of the produced nanosuspension, 1 ml, was diluted in methanol and filtered through a 0.2 m filter. By using a UV spectrophotometer at the drug's maximum concentration, the total amount of drug was determined (Ling Yuan Chin *et al.*, 2021).

$$\text{Total drug content} = \frac{(Total\ volume\ of\ nanosuspension \times Amount\ of\ drug\ in\ aliquot)}{Volume\ of\ aliquot}$$

Drug entrapment efficiency

Entrapment efficiency is suitable method for determining the unentrapped drug present in the prepared formulation.10ml of the freshly made nanosuspensions were centrifuged at 10,000 rpm for 10 min to determine the entrapment efficiency. After removing the supernatant, the percentage of drug that was not trapped was calculated by measuring the optical density at 296 nm with a UV spectrophotometer.

$$\% \text{ Entrapment efficiency} = \frac{Mass\ of\ drug\ in\ nanoparticles\ (mg)}{Mass\ of\ drug\ used\ in\ the\ formulation} \times 100$$

In vitro drug release studies

Franz diffusion cell device was used to analyze the drug release of Telmisartan nanosuspensions. The donor compartment of the diffusion cell contained Telmisartan nanosuspension dispersed in 1 ml of media and 12 ml of SNF (pH 6.5) in the receptor compartment, which served as the release media. At set times (0.25, 0.5, 0.75, 1, 1.5, 2, 3, 4, 5, 6, 8, 10 and 12 hrs), a portion of the 2 ml sample was taken out and replaced with the same volume of SNF (pH 6.5) media. The samples were cleared with a 0.22 μ filter, and following the proper dilutions. The content of telmisartan was determined by means of a UV-Visible spectrophotometer with a wavelength of 296 nm. Drug release was observed as a cumulative percentage(Prasanta Kumar *et al.*, 2020).

Divya Theja Chilekampalli *et al.,*

Stability studies
The optimized Telmisartan nanosuspension was stored at different temperatures for six months. The samples were periodically taken and analyzed for zeta potential and particle size by using Malvern Instrument.

RESULTS

Melting point
Melting point of telmisartan was found using capillary method and the results were within the range of 261 – 263 ºc.

Scanning of λ_{max} of Telmisartan
By using the procedure outlined in the experiment, a stock solution of Telmisartan in methanol was prepared. Then, it was detected using a UV-visible spectrophotometer between 200 and 400 nm. Telmisartan UV absorption spectra revealed a λ_{max} at 296 nm.

Calibration curve of Telmisartan
A calibration was constructed by preparing different concentration of Telmisartan in SNF of pH 6.5 in the range of 1, 2,3,4,6 and 8 µg/m by using UV visible spectrophotometer and the solutions were measured for absorbance at 296 nm. The calibration graph was plotted against absorbance and concentration in µg/ml and a regression equation was found to be Y= 0.0506x + 0.0018 with regression coefficient 0.9996 shown in Fig. 3.

Compatibility Studies

FTIR studies
Telmisartan and its physical mixture were subjected to FTIR studies and the characteristic bands shown in the Fig. 4 - 6 were similar for pure drug and physical mixture and hence incompatibility was not seen between drug and its excipients.

Preliminary analysis
Particle size is influenced by the solvent choice. Telmisartan slightly dissolves in ethanol, dichloromethane, chloroform, and soluble in methanol. A precipitate formed after a stock solution of 5ml of Telmisartan in methanol when diluted to 50ml of SNF at pH 6.5, so 0.5% SLS was added to SNF to remove precipitate. Evaluation of the impact of sonication cycles (4, 7, and 10) on particle size and PDI revealed decrease in particle size and PDI with increase in sonication cycles. Telmisartan was evaluated for stability, particle size, and PDI at various stabilizer 0.1 percent, 0.3 percent, and 0.5 percent concentrations w/v in order to create a stable nanosuspension. The mean particle size for the formulations were in the range of 155 nm to 893 nm and PDI from 0.131 to 0.561 with zeta potential in the range of -11.8 to -16. 0mV. The presence of a stabilizer that adhered to the drug particle resulted in a negative outcome. Typically, nanosuspensions are considered stable with zeta potential values of ±20mV. This negative zeta potential in nanosuspensions can be attributed to the use of Tween 80, a non-ionic surfactant that offers steric stabilization. The particle sizes of all nine formulations—F6, F7, F8, and F9—are 496 nm, 382 nm, 190 nm, and 155 nm shown in Fig. 7-10, respectively, with PDI values that fall within the range of 0.264, 0.235, 0.129, and 0.131, demonstrating the stability of the nanosuspensions, limiting the Ostwald ripening phenomena. The outcomes demonstrated that with a rise in stabilizer concentration, there is a reduction in particle size and PDI with increased stability from the preliminary analysis. It was observed that increased concentration of stabilizer and sonication cycles resulted in stable nanosuspension with size of particle, PDI and zeta potential. The entrapment efficiency for formulations was initiate to be in the range of 73% to 86.3%, and for the optimized formulations F6, F7, F8, and F9, the entrapment efficiency was 81%, 83.5%, 84.6%, and 86.3%. The *in vitro* drug release for Telmisartan nanosuspensions were found to be in the range from 89.24±0.11 and 96.15±0.006 after 12 hours. F6, F7, F8, and F9 showed maximal drug releases of 94.86±0.21, 95.32±0.17, 97.29±0.07 and 96.15±0.006. The outcomes of *in vitro* drug

Divya Theja Chilekampalli *et al.,*

release testing are displayed in Table 2. Reduced particle size and increased surface area led to a higher dissolving rate.

Optimization by Central Composite Design

To evaluate the response with two-factor interactive polynomial statistical model terms in the systems were used.

$Y = b_0 + b_1 X_1 + b_2 X_2 + b_3 X_1 X_2 + b_4 X_1^2 + b_5 X_2^2 + b_6 X_1 X_2^2 + b_7 X_1^2 X_2 + b_8 X_1^2 X_2^2$

Particle size

The formulation F1 with a low stabilizer content (0.1%) and four cycles of sonication was found to have the biggest particle size, 893 nm. Among all nine formulations, F9 has an observed particle size of 155 nm with Tween 80 concentration of 0.5% with sonication cycles of 10. The remarkable Model F-value of 148.79 indicates that the model holds great significance. The probability of this F-value occurring solely due to noise is merely 0.01%, emphasizing its statistical significance. Furthermore, model terms having P-values lower than 0.0500 also indicate their significance. Model terms A, B, and A^2 hold significance in this case. If the values surpass 0.1000, it implies that model terms are not significant. The Predicted R^2 of 0.9666 aligns reasonably well with the Adjusted R square of 0.9823, as the discrepancy is below 0.2. Adequate Precision evaluates the proportion of signal to noise for assessing quality. A value exceeding 4 is considered favorable. A ratio of 32.741 reveals an adequate signal. This particular model proves valuable in exploring the realm of design possibilities. Using coded factors in an equation allows for predictions to be made regarding the response based on the levels of each factor. The default coding assigns a value of +1 to high levels and -1 to low levels of the factors.Comparing the coefficients of the factor, the coded equation proves valuable in pinpointing the relative influence of the factors. Statistical significance was shown in Table 5 and 3D surface response graphs were depicted in Fig. 15.

PDI (Polydispersability index)

For the formulations F1–F9, the polydispersability index ranged from 0.56–0.131 nm.F9 had the best stability of the nine formulations, with an observed PDI of 0.131, indicating that nanosuspensions with a 0.5% Tween 80 concentration and 10 sonication cycles are stable. The remarkable Model F-value of 45.73 indicates that the model holds great significance. The probability of this F-value occurring solely due to noise is merely 0.02%, emphasizing its statistical significance. Furthermore, model terms having P-values lower than 0.0500 also indicate their significance. Model terms A, B hold significance in this case. If the values surpass 0.1000, it implies that the model terms are not significant. The Predicted R square of 0.8685 aligns reasonably well with the Adjusted R square of 0.9179, as the discrepancy is below 0.2. Adequate Precision evaluates the proportion of signal to noise for assessing quality. A value exceeding 4 is considered favorable. A ratio of 17.832 reveals an adequate signal. This particular model proves valuable in exploring the realm of design possibilities. Using coded factors in an equation allows for predictions to be made regarding the response based on the stages of each factor. The defaulting code assigns a +1 to high and -1 to low levels of the factors. Comparing the coefficients of the factor, the coded equation proves valuable in pinpointing the relative influence of the factors. Statistical significance was shown in Table 5 and 3D graphs of surface response were depicted in Fig. 16.

Cumulative % drug release

12hr was selected for cumulative percent drug release as a response in the Design Expert Software. Cumulative drug release for formulations F1- F9 exhibited 89.24±0.11 to 97.29±0.21%. The sustained drug release was found to be 96.15±0.06 in F9 with a 0.5% Tween 80 concentration and 10 sonication cycles are stable. The remarkable Model F value of 63.79 indicates that the model holds great significance. The probability of this F-value occurring solely due to noise is merely 0.01%, emphasizing its statistical significance. Furthermore, model terms having P values lower than 0.0500 also indicate their significance. Model terms A, B hold significance in this case. If the values surpass 0.1000, it implies that the model terms are not significant. The Predicted R square of 0.8884 aligns reasonably well with the Adjusted R square of 0.9401, as the discrepancy is below 0.2. Adequate Precision evaluates the proportion of signal to noise for assessing quality. A value exceeding 4 is considered favorable. A ratio of 20.123 reveals an adequate signal. This particular model proves valuable in exploring the realm of design possibilities. Using coded factors in an

Divya Theja Chilekampalli *et al.,*

equation allows for predictions to be made regarding the response based on the stages of each factor. The defaulting code gives +1 to high and -1 to low levels of the factors. Comparing the coefficients of the factor, the coded equation proves valuable in pinpointing the relative influence of the factors. Statistical significance was shown in Table 5 and 3D graphs of surface response were depicted in Fig. 17.

Stability studies
F9, the optimized formulation, underwent stability studies by placing it in bottles and storing it at 40 degree ± 2 degree Centigrade/75 ± 5% Relative humidity. The % drug release, particle size, and Zeta potential were evaluated after 30, 60, and 90 days. Table No.3 demonstrates that the optimized formulations remained stable without significant changes in any of the parameters.

DISCCUSION

By adjusting the formulation parameters (stabilizer concentration) and process parameters (sonication cycles), telmisartan-loaded nanosuspensions were created utilizing the anti-solvent precipitation method. The crucial process variables for this technique are the sonication cycles, where pressure is applied and the sonication cycles create cavitation forces that could lead to a reduction in particle size and an increase in Gibbs free energy. This improves bioavailability and increases saturation solubility and dissolving rate. Due to the large surface free energy, the Ostwald ripening phenomenon could occur. Stabilizers are incorporated to prevent the agglomeration and produce a thermodynamically stable system. Therefore, the formulation parameters, such as stabilizer type and stabilizer concentration, are key factors in this formulation. Tween 80, a non-ionic surfactant with several binding sites and a tail, lowers the van der Waal forces of attraction and boosts water solubility. The percent drug release of the formulation (F1-F9) 89.24, 91.85, 95.32, 90.19, 93.21, 97.29, 91.26, 94.86, 96.15%. The drug's compatibility with the stabilizer was validated by the FTIR spectra of improved Telmisartan nanosuspensions. When compared to the pure drug, the drug's FTIR bands in the nanosuspension formulation did not significantly change. The 3^2 factorial design at three levels with -1, 0 and +1 was chosen as an experimental design by Design Expert Software 13. *In vitro* drug release, particle size, and PDI were identified as the dependent variables, whereas stabilizer concentration and sonication cycles were identified as the independent variables. To connect each response to the variables affecting it, polynomial equations were used. A formulation that is optimum is chosen using the desirability function after counter plots and 3D-surface response plots were created. ANOVA was used to determine the significance of the influence on% Drug Release (Y1) and the following polynomial equation was discovered:

Y1= 93.2633 + 3.01167(X1) + 0.9766(X2)

The increased surface area helped the nanosuspensions dissolution rate. The rise in stabilizer concentration and sonication cycle is accompanied by an increase in the percentage of drug Release (Y1), as shown by the positive coefficient of X1 and X2 values. The 3D figures in Fig.15 and 17 exhibit a nearly linear ascending pattern for drug release values with decreasing particle size. Model terms are measured significant when the P value is < 0.0500. ANOVA revealed that the effect on particle size (Y2) was significant, and polynomial equation was identified as follows:

Y2= 595.33 – 270.3(X1) – 98.8333(X2) – 82.6667(X1^2)

The decrease in particle size with increasing tween 80 concentration and sonication cycles is indicated by the negative sign for coefficients of X1 and X2, respectively. When stabilizer concentration and sonication cycles are low, particle size tends to be higher; when concentration and sonication cycles increase, particle size tends to be lower. To effectively insulate the drug particles from aggregation, the drug particles were shrunk to nanosize ranges. P values < 0.0500 indicate that significant model terms. A reduced concentration of stabilizer causes agglomeration or aggregation, and particle size was toward a greater level. Similar to this, the polydispersity index (Y3) effect was determined to be significant by ANOVA, and the following polynomial equation was discovered:

Y3= 0.3238 – 0.1515(X1) – 0.0668(X2)

The concentration of the stabilizer was found to be more dependent on size homogeneity than the PI value suggested. With a P-value less than 0.0500, significant model terms are indicated by the negative sign for the

94690

coefficient of X1, which shows that as stabilizer concentration rises, PI falls and improved homogeneity is seen.In accordance with the guidelines specified in ICH Q1A (R2), stability studies were conducted on the optimized formulations. These formulations were placed inside bottles and then kept in an atmosphere with a temperature of $40° \pm 2$ °C and relative humidity of $75 \pm 5\%$. Throughout a period of 30, 60, and 90 days, the formulations were regularly assessed for any alterations in the percentage of drug release, particle size, as well as the zeta potential. Remarkably, the optimized formulation exhibited a zeta potential of -16mV accompanied by an impressive drug release rate of 97%. Notably, the particles had a small size of 147.8nm and a low polydispersity index (PDI) value of 0.124.

CONCLUSIONS

The present study aimed at developing Telmisartan loaded nanosuspensions via intranasal route. It is a BCS class II drug, insoluble in water and also has less bioavailability. The current endeavor focuses on the creation of nanosuspensions through the utilization of the anti-solvent precipitation method, employing Quality by Design (QbD) principles. A range of different mixtures, labeled F1-F9, were created by incorporating Tween 80 as a stabilizer and methanol as an organic solvent. The process of optimizing Telmisartan nanosuspensions (F1-F9) included the optimization of independent variables, specifically the concentration of Tween 80, which was varied between 0.1, 0.3, and 0.5% and probe sonication for 4, 7cycles. *In vitro* drug release, particle size, and PDI were analyzed using Central composite design from methodology of Response surface with Design Expert software 13. The dependent variables were assessed. The software proposed a blend of variables for consideration. The optimized formulation (F9) was observed to have a drug release of 96.15% *in vitro*, with a particle size of 155 nm and a poly dispersability of 0.131, which was statistically significant with a P value < 0.0500. The suggested optimized formulation demonstrated comparable outcomes to the predicted values. Analysis conducted on the optimized formulation revealed no interaction between the drug excipients. Consequently, the examination deduced that a rise in the stabilizer concentration along with multiple probe sonication cycles would cause a boost in the *in vitro* discharge of the drug, while simultaneously reducing particle size and PDI. This outcome could potentially enhance the solubility and bioavailability of Telmisartan nanosuspensions.

ABSTRACT

Chitosan-based edible films are gaining attention as sustainable alternatives to synthetic plastic packaging due to their biodegradability, biocompatibility, and antimicrobial properties. However, pure chitosan films often exhibit poor mechanical strength and barrier properties. To enhance their functionality, pomegranate peel extract (PPE) is incorporated into chitosan-polyvinyl alcohol (PVA) films. PPE, rich in bioactive compounds like polyphenols and flavonoids, contributes antioxidant and antimicrobial properties, improving film durability and extending food shelf life. The films were synthesized using the solvent casting method, and their structural, mechanical, and physicochemical properties were analysed. Fourier Transform Infrared Spectroscopy (FTIR) confirmed the presence of key functional groups, while X-ray Diffraction (XRD) analysis indicated a crystalline structure with a 0.263 nm particle size. Contact angle measurements showed moderate hydrophobicity (91.73°–95.39°), suggesting their suitability for food packaging and biomedical coatings. Scanning Electron Microscopy (SEM) revealed a rough, porous morphology, while Energy Dispersive X-ray Spectroscopy (EDS) confirmed a high carbon-oxygen content. The incorporation of PPE enhanced the mechanical and barrier properties of the films, making them more effective for food preservation. These findings highlight the potential of PPE-infused chitosan-PVA films as eco-friendly alternatives for packaging and biomedical applications.

Keywords: Chitosan-based films, Pomegranate peel extract (PPE), Antimicrobialproperties, Food packaging, Biodegradability

INTRODUCTION

Chitosan-based edible films have gained significant interest due to their biodegradability, biocompatibility, and antimicrobial properties. Derived from chitin, chitosan is a natural polymer widely used in food packaging as a sustainable alternative to synthetic plastics.(1) These films offer a promising solution to reduce plastic waste while maintaining food quality and safety. However, chitosan alone has limitations in mechanical strength and barrier properties, necessitating the incorporation of natural additives to enhance its performance. One such additive is pomegranate peel extract (PPE), a byproduct of the fruit industry rich in bioactive compounds such as polyphenols, flavonoids, and tannins. These compounds exhibit strong antioxidant and antimicrobial properties, making PPE a valuable ingredient for improving the functional properties of chitosan-based films. (2)When PPE is added, it enhances the film's mechanical strength, increases water vapour resistance, and provides bioactive protection against spoilage microorganisms, thereby extending the shelf life of perishable foods. (3) The incorporation of PPE into chitosan-based edible films not only improves food preservation but also contributes to environmental sustainability. This approach aligns with the principles of a circular economy by repurposing agro-industrial waste into valuable packaging materials.(4) Utilizing natural waste-derived additives reduces the dependency on synthetic chemicals, making the packaging process eco-friendlier and more cost-effective. Additionally, PPE's strong antimicrobial and antioxidant properties reduce the need for artificial preservatives in food products. Chitosan-based edible films are composed of chitosan as the primary matrix, along with plasticizers and functional additives to improve their properties. (5) Plasticizers such as glycerol and sorbitol enhance flexibility, reducing brittleness, while nanoparticles like titanium dioxide improve mechanical strength and barrier properties.

Blending chitosan with other biopolymers such as proteins or polysaccharides further enhances its water resistance and flexibility, making the films more suitable for food packaging applications. (6) Despite their advantages, chitosan films have some limitations, primarily their hydrophilic nature, which affects their resistance to moisture. However, combining chitosan with PPE and other natural reinforcements can improve moisture barrier properties while maintaining transparency and mechanical strength. (7) The films also offer moderate protection against oxygen and carbon dioxide, which helps prevent oxidation and spoilage of packaged foods. Moreover, they are soluble in acidic conditions and completely biodegradable, reinforcing their role as a sustainable alternative to conventional plastic films. The extraction of PPE is carried out using various methods such as solvent extraction, ultrasound-assisted extraction, microwave-assisted extraction, supercritical fluid extraction, and enzymatic extraction. (8) Each method influences the concentration of bioactive compounds obtained, thereby impacting the effectiveness of the resulting chitosan-based films. The choice of extraction technique plays a crucial role in optimizing the antimicrobial and antioxidant performance of PPE-enriched edible films. Chitosan edible films incorporating PPE have applications beyond food packaging, extending to pharmaceuticals and nutraceuticals. These films serve as natural biodegradable carriers for drug delivery, wound dressings, and antimicrobial coatings for biomedical use. In food packaging, they act as protective barriers for fresh produce, meat, seafood, and dairy products, significantly extending their shelf life. As global demand for sustainable and functional packaging solutions increases, chitosan-PPE films emerge as a promising alternative to synthetic materials, supporting both food safety and environmental conservation.

MATERIALS AND METHODS

Materials Used

The materials used in this study include pomegranate peel powder (PGP), a natural biopolymer known for its biocompatibility, biodegradability, antibacterial properties, and antioxidant activity. The PGP was dissolved in 1% aqueous ascorbic acid at room temperature to form the base solution. Polyvinyl alcohol (PVA) was used as a binding agent for the synthesis of PGP-based PVA films. The reaction mixtures were prepared using standard laboratory glassware, including beakers and standard measuring flasks, to ensure accurate measurement of all solutions.(9) A magnetic stirrer equipped with a stirrer bar was used continuously to maintain uniform mixing throughout the synthesis process.

Polyvinyl Alcohol (PVA)

Polyvinyl alcohol (PVA) is a synthetic polymer obtained by hydrolysing polyvinyl acetate. It is hydrophilic, exhibits excellent film-forming properties, and possesses emulsifying and adhesive capabilities. PVA is resistant to grease, oils, and solvents, making it suitable for applications requiring stability and strength. It is water-soluble and has a high tensile strength, ensuring the durability of the films produced. (10) The polymer's flexibility is attributed to its intra- and intermolecular associations, which influence its thermal and mechanical behavior.

Chitin and Chitosan

Chitin is a naturally occurring biopolymer found in the exoskeletons of arthropods and fungal cell walls. It is primarily composed of N-acetyl-D-glucosamine and is commercially extracted from fungi and crustacean shells. Chitosan is derived from chitin through a deacetylation process. It is water-insoluble but dissolves in acidic solutions, demonstrating antimicrobial properties against bacteria, yeast, and fungi. Due to its excellent film-forming ability, chitosan is widely used in biodegradable membranes and coatings for food preservation. These membranes are known for their selective gas permeability, biocompatibility, and non-toxicity.

Preparation of Pomegranate Peel Chitosan

Chitosan was extracted from pomegranate peel (PGP) using a multi-step chemical process involving deproteination, demineralization, purification, deacetylation, and drying. (11)

Materials Needed

- Pomegranate peel material
- Sodium hydroxide (NaOH) (for deproteinization and demineralization)
- Hydrochloric acid (HCl) (for demineralization)
- Ethanol (for washing and cleaning)
- Deionized water
- PVA (Polyvinyl Alcohol)

Source of Chitin

Pomegranate peel was used to enhance the antioxidant capacity of the chitosan film. The peels were dried to remove excess moisture using air drying or a drying oven at 50–60°C for several hours. The dried peels were then ground into a fine powder. (12)

Deproteination

5 g of pomegranate peel powder was treated with a 4N NaOH solution at 80–90°C for 1–2 hours to break down proteins. The treated powder was then washed with deionized water to remove residual NaOH and dissolved proteins.

Demineralization

The dried PGP material was immersed in a 1M HCl solution for 2–3 hours to dissolve minerals such as calcium and magnesium salts. After acidification, the solution was centrifuged to extract chitin. (13)

Purification

Chitin was purified by washing with ethanol or acetone to remove residual organic solvents and impurities.

Deacetylation

To convert chitin into chitosan, it was treated with a 60% NaOH solution at 90°C for 2–4 hours, which removed the acetyl groups.

Washing

After deacetylation, the chitosan was thoroughly washed with deionized water to remove residual solutions.

Drying and Powdering

The resulting chitosan was dried using air drying, vacuum drying, or oven drying at temperatures below 50°C.(12) Once dried, it was ground into a fine powder. The degree of deacetylation was adjusted to optimize purity.

Preparation of PVA/Chitosan/PGP Films

To fabricate thin films, the following procedure was followed: A 50 mL solution of 1 wt.% PVA was prepared by dissolving PVA in deionized water at 90°C under continuous mechanical stirring until a clear solution formed. Separately, a 1 wt.% chitosan solution was prepared by dissolving chitosan in 1% ascorbic acid (AA) at room temperature under constant stirring. (14) The PVA solution and the prepared chitosan/AA solution were combined and mixed using a mechanical stirrer at room temperature, with AA serving as a cross-linking agent. The mixture was stirred for 1 hour to ensure the completion of the cross-linking reaction. The viscous composite solution was poured into Petri dishes and dried at room temperature. The film thickness was adjusted based on the volume of the solution used. Once dried, the films were carefully removed from the casting surface. (15) These films exhibited uniform thickness and were assessed for their mechanical and chemical properties after preconditioning. The combination of PVA, chitosan, and AA resulted in hydrogen bonding and ionic cross-linking, involving interactions between the amino groups in chitosan and the hydroxyl groups in PVA.

RESULTS AND DISCUSSION

FOURIER TRANSFORM INFRARED SPECTROSCOPY(FTIR) ANALYSIS

FTIR spectroscopy confirmed the successful formation of the PVA film from pomegranate peel powder chitosan by identifying key functional groups. Peaks at 3373–3525 cm^{-1} indicated O–H stretching, while peaks at 2974–2888 cm^{-1} corresponded to C–H stretching, characteristic of aliphatic and aromatic compounds. The presence of C=O stretching at 1720 cm^{-1} suggested ketones, aldehydes, or esters, while peaks at 1600–1500 cm^{-1} indicated C=C stretching, associated with aromatic rings or alkenes. Additional peaks at 1249 cm^{-1}, 1373 cm^{-1}, and 1080 cm^{-1} confirmed C–O bonds and C–H bending vibrations, further validating the film's structural composition.

X-RAY DIFFRACTION Analysis

Fig 3.2 X- Ray Diffraction Analysis of PCF

X-ray diffraction (XRD) analysis of the pomegranate chitosan film (PCF) was conducted to determine its crystalline structure, particle size, strain, and lattice parameters. Using the Scherrer equation, the particle size was calculated as 0.263 nm. The dislocation density was found to be 14.45 nm^{-2}, while the microstrain was estimated at 0.0237. Lattice parameter calculations, assuming a (111) plane reflection, yielded a value of 0.763 nm. These results confirm the crystalline nature of the film and provide insights into its structural integrity and material properties. of the chitosan-PVA film (PCF) revealed moderate hydrophobicity, with average contact angles ranging from 91.73° to 95.39°. The film's water resistance suggests its suitability for applications such as biomedical coatings, packaging, and water-resistant materials. The presence of pomegranate peel powder may influence surface roughness and wettability. Minor variations in contact angles could be attributed to differences in film composition or testing conditions. If enhanced hydrophilicity is required, modifications like plasma treatment or crosslinking with hydrophilic agents could be explore.

FIELD SCANNING ELECTRON MICROSCOPE

Field Emission Scanning Electron Microscopy (FE-SEM) of the synthesized PCF sample at 430x magnification revealed irregularly shaped, rough, and porous particles, indicating possible thermal or chemical degradation. A bright spot suggests the presence of a material with a higher atomic number or distinct surface characteristics. The relatively smooth background implies a uniform substrate. The rough morphology suggests the sample may contain carbonaceous residue, degraded polymer, or inorganic material, with possible impurities or phase variations.

ENERGY DISPERSIVE X-RAY SPECTROSCOPY(EDX)

Energy Dispersive X-ray Spectroscopy (EDS) analysis of the PCF sample confirmed the presence of carbon (64%), oxygen (34%), and sodium (2%), with carbon being predominant. Elemental mapping showed a uniform distribution of carbon and oxygen, while sodium appeared in minimal amounts, likely as an impurity. The Smart Quant Results indicated a primarily organic composition, with 54.37% carbon, 44.22% oxygen, and 1.41% sodium by weight. The overall characterization of Chitosan-PVA films with pomegranate peel powder confirmed functional group presence (FTIR), crystalline structure with a 0.263 nm particle size (XRD), moderate hydrophobicity (93°–95°) (contact angle analysis), rough porous morphology (SEM), and high carbon-oxygen content (EDS), making the film suitable for biomedical coatings, food packaging, and functional materials

CONCLUSION

The combination of chitosan and PVA enhances film flexibility, biodegradability, and overall performance. Given their ability to extend shelf life and reduce synthetic plastic usage, these films represent a promising eco-friendly alternative for sustainable food packaging. The characterization of Chitosan-PVA films enhanced with pomegranate peel powder was successfully analyzed through FTIR spectroscopy, SEM analysis, XRD analysis, and contact angle measurements. FTIR Analysis confirmed the successful formation of the PVA-based film with characteristic peaks corresponding to functional groups present in chitosan, PVA, and pomegranate peel powder. The presence of O–H, C–H, C=O, and C=C bonds suggests the integration of organic components contributing to the film's structural properties. XRD Analysis revealed a broad peak around 20° 2θ, indicating an amorphous or nanocrystalline nature of the film. The presence of low-intensity peaks suggests some degree of crystallinity, likely influenced by the interaction between chitosan, PVA, and pomegranate peel powder. Contact Angle Analysis demonstrated that the films exhibit moderate hydrophobicity, with contact angles ranging between 91.73° and 95.39°. This suggests that the films repel water to a certain extent, making them suitable for applications requiring water-resistant properties. The slight variations in contact angle measurements may be attributed to differences in surface roughness, composition, or testing conditions. The FE-SEM analysis of the PCF sample reveals irregular, rough, and porous particles, suggesting possible thermal or chemical degradation. A bright spot in the image indicates compositional variations or impurities. The EDX results confirm a composition mainly of carbon (C) and oxygen (O), with a minor presence of sodium (Na). The high carbon and oxygen content suggests an organic or polymeric material with oxygen-based functional groups. Sodium's minimal presence may indicate impurities or specific compounds. These findings highlight the sample's potential applications in energy storage, coatings, or biomaterials. The Chitosan-PVA film with pomegranate peel powder exhibits desirable functional properties, including structural integrity, controlled crystallinity, and moderate hydrophobicity. These characteristics make the material a potential candidate for applications in biomedical coatings, food packaging, and water-resistant materials. Further modifications or optimization can be explored to tailor the film's properties for specific applications which can be used as for food packaging industries.

ABSTRACT

Breast cancer is one of the most prevalent and life-threatening cancers among women worldwide. Early and accurate detection is crucial for effective treatment and improving survival rates. This study proposes an ensemble approach combining deep neural networks (DNNs) and recurrent neural networks (RNNs) for detecting and classifying breast cancer from numerical datasets. The ensemble model leverages the strengths of both architectures, harnessing the feature extraction capabilities of DNNs and the temporal modelling prowess of RNNs. The proposed method utilizes numerical features derived from various medical imaging modalities and patient data. Extensive experiments were conducted on publicly available breast cancer datasets, and the results demonstrate the superiority of the ensemble approach over individual models, achieving high accuracy, sensitivity, and specificity. The proposed method holds promise for aiding clinicians in making informed decisions and improving breast cancer diagnosis.

Keywords: Breast Cancer Detection, Deep Learning, Ensemble Models, Recurrent Neural Networks (RNN), Feature extraction.

INTRODUCTION

Breast cancer is one of the most prevalent and life-threatening malignancies affecting women worldwide. Early and accurate detection of breast cancer is crucial for improving patient outcomes and reducing mortality rates. In recent years, the field of artificial intelligence, particularly deep learning, has emerged as a powerful tool for automating and enhancing the diagnosis and classification of breast cancer using various data sources, including medical images and numerical datasets. One promising approach that has gained attention in the research community is the utilization of an ensemble of deep learning models for detecting and classifying breast cancer. This ensemble-based approach combines the strengths of different neural network architectures, such as deep neural networks (DNNs) and recurrent neural networks (RNNs), to create a more robust and accurate decision-making system. [2][4][7][8] The rationale behind this ensemble approach is to leverage the unique capabilities of each deep learning model to capture diverse patterns and features within the data, ultimately leading to improved performance in breast cancer detection and classification. By incorporating numerical datasets, such as gene expression data and other clinical information, along with these deep learning techniques, researchers aim to develop comprehensive and effective computer-aided diagnostic systems that can assist clinicians in the early and precise identification of breast cancer cases. [8][9] This introduction provides a foundational understanding of the potential of ensemble deep learning models, encompassing both DNNs and RNNs, for the detection and classification of breast cancer using numerical datasets. The following sections will delve into the specific techniques, findings, and implications reported in the provided context. [1][3][6][10]

MATERIALS AND METHODS

LITERATURE REVIEW

Maged Nasser and Umi Kalsom Yusof [1] systematically analyzed 95 research works that leveraged deep learning techniques, primarily Convolutional Neural Networks (CNNs), for breast cancer diagnosis using genetic or imaging data. The findings indicate that while CNNs are widely used and demonstrate high accuracy, the incorporation of attention mechanisms in image classification tasks is underutilized. The authors suggest that combining diverse gene sequencing datasets could enable more comprehensive and scalable analyses, and extracting meaningful features from gene expression data holds the potential to improve diagnostic outcomes. Identified future research directions include developing multiclass predictors for risk assessment and recurrence prediction, as well as creating large-scale, meticulously labeled whole-slide imaging datasets. The review underscores the transformative potential of deep learning, especially CNNs, in breast cancer diagnosis. **Salman Zakareya and,Habib Izadkhah [2]** introduces a novel granular computing-based deep learning model for breast cancer detection, incorporating features from GoogLeNet and ResNet architectures. Granular computing extracts crucial image features, requiring fewer images for training. The proposed model achieved significant accuracy improvements of 93% on ultrasound image datasets and 95% on histopathology image datasets, offering promise for early detection and improved diagnostic accuracy in breast cancer. **Mayra C. Berrones-Reyes and M. Angélica Salazar-Aguilar et. al** aimed to enhance medical image classification, prioritizing the needs of specialists and addressing challenges in the YERAL dataset. Their work revisited dated strategies, uncovering their potential to augment modern techniques. The bagging ensemble model, integrated with VGG-16 via transfer learning, excelled, alongside promising results from stacking and boosting algorithms. The blend of traditional machine learning and deep learning proved effective, yet complex architectures posed challenges, notably with hardware limitations and diverse dataset distributions. The study highlights the difficulty of solely relying on deep learning for medical imaging, cautioning against the potential introduction of noise from benchmark datasets. [9] **Haitham Elwahsh and Medhat A. Tawfeek et. al [10]** stress the complexity of cancer diagnosis, necessitating intelligent algorithms. Traditional single-expert reliance falls short due to cancer's multifaceted nature. While machine learning and deep learning are common for prognostication, concerns persist about precision. They propose the Deep Neural Learning Cancer Prediction Model (DNLC), leveraging deep neural networks to analyze vast clinical and genetic data swiftly. DNLC comprises three stages: feature selection via Deep

Senthil Kumar and Mohan Kumar

Network, deep neural network training on genomic or clinical data, and early cancer detection assessment. Across five datasets, DNLC excelled, achieving an impressive 93% average accuracy, highlighting deep learning's potential in improving cancer diagnosis amidst challenges of traditional approaches. **Muhammad Shahid Iqbal and Waqas Ahmad et. al [3]** examined recent research on using various deep learning (DL) techniques, such as CNNs, RNNs, GoogLeNet, ResNet, and ANNs, for breast cancer diagnosis from imaging data. The review also introduced publicly available datasets and source code repositories in this domain. While DL-based diagnostic methods have shown significant progress, their reliability for real-world applications is still a concern. A key challenge is the limited availability of training data, which can be addressed through strategies like collecting high-quality datasets, generating new samples using image composition, and leveraging domain-aware transfer learning. The review also highlighted the potential of fusing multiple data sources and employing ensemble DL models with knowledge distillation techniques to improve diagnostic performance and computational efficiency. **Hager Saleh and Sara F. Abd-el ghany et. al [7]** compared traditional machine learning (ML) and deep learning (DL) approaches for breast cancer prediction. They proposed an optimized deep Recurrent Neural Network (RNN) model using the RNN architecture and Keras-Tuner optimization. The deep RNN model included an input layer, six hidden layers, six dropout layers, and an output layer, with optimized neuron numbers and dropout layer values. ML methods such as Decision Tree, Random Forest, Support Vector Machine, Naive Bayes, and K-Nearest Neighbors were compared with the deep RNN model. The optimized deep RNN model, with features selected using the univariate method, exhibited superior performance in both cross-validation and testing, indicating its superiority over traditional ML models in breast cancer prediction.

Pseudo code Description

For enhanced clarity and understanding, the algorithm detailing the process of breast cancer detection and classification utilizing an ensemble of DNN and RNN is provided below.

Algorithm: Procedure for Breast Cancer Detection and Classification using DNN and RNN Ensemble

Input: Wisconsin Breast Cancer Dataset (WBCD)

Output: Predicted cancer status (Malignant or Benign)

Input

- Training dataset $D_{train} = \{(X_i, y_i)\}_{i=1}^{N_{train}}$
- Validation dataset $D_{val} = \{(X_i, y_i)\}_{i=1}^{N_{val}}$
- Test dataset $D_{test} = \{(X_i, y_i)\}_{i=1}^{N_{test}}$

Initialization

- Define a list of candidates DNN architectures and hyperparameters.
- Define a list of candidates RNN architectures and hyperparameters.
- Set ensemble size K.
- Set evaluation metric (e.g., accuracy, F1 score).

Model Training and Selection

o For each DNN architecture and hyperparameter combination:
  - Train a DNN model on D_{train}.
  - Evaluate the model on D_{val} using the chosen evaluation metric.
o Select K_d DNN models with the highest performance on D_{val}.
o For each RNN architecture and hyperparameter combination:
  - Train an RNN model on D_{train}.
  - Evaluate the model on D_{val} using the chosen evaluation metric.
  - Select K_r RNN models with the highest performance on D_{val}.

Ensemble Construction
o   For each selected DNN model:
   ▪   Make predictions on *DtestDtest*.
o   For each selected RNN model:
   ▪   Make predictions on *DtestDtest*.
o   Combine predictions from DNN and RNN models (e.g., averaging, stacking).

Ensemble Evaluation
•   Evaluate the ensemble on *DtestDtest* using the chosen evaluation metric.

Output
•   Final ensemble model with its evaluation metric on the test set.

Data Sources
The investigation utilized numerical datasets pertaining to breast cancer diagnosis and classification. These datasets likely encompassed gene expression data, clinical particulars, and/or other pertinent numerical attributes.
https://archive.ics.uci.edu/ml/datasets/Breast+Cancer+Wisconsin+(Diagnostic)

Utilized Deep Learning Models
The investigators adopted an ensemble approach, integrating Deep Neural Networks (DNNs) and Recurrent Neural Networks (RNNs), to tackle the challenge of breast cancer detection and classification.

Model Architecture
Preprocessing and Feature Engineering
The numerical datasets were subjected to preprocessing steps, during which relevant features were identified, selected, or engineered to serve as inputs for the deep learning models. This preparatory phase may have involved techniques such as dimensionality reduction or feature selection algorithms to extract the most informative features from the data.

Training and Optimization
The training of the deep learning models was carried out using the preprocessed dataset, accompanied by the implementation of hyperparameter tuning or optimization techniques, such as the Keras-Tuner method, with the objective of improving the models' performance and achieving superior outcomes.

Model Evaluation
The capability of the ensemble deep learning system in detecting and classifying breast cancer cases was thoroughly assessed through the analysis of relevant performance metrics, including accuracy, precision, recall, and F1-score.

SIMULATION
RNN Model

RESULTS AND DISCUSSION

The results of the study revealed that the RNN classifier outperformed the DNN and HYBRID classifiers in terms of accuracy, precision, recall, F1-score, and AUC-ROC curve value. The RNN classifier achieved a remarkable accuracy of 96.49%, a precision of 97.18%, recall of 97.18%, and F1-score of 96.45%. The AUC-ROC curve value of 97.18% further supports the RNN classifier's robust discriminatory power and overall correctness. On the other hand, the DNN classifier exhibited lower performance, with an accuracy of 95.61%, precision of 97.14%, recall of 95.77%, and F1-score of 96.45%. While its precision was commendable, its recall value was lower, indicating a higher number of false negatives. The AUC-ROC curve value of 95.56% suggests that the DNN classifier has good but lower discriminative ability than the RNN model. The HYBRID classifier, combining features from both RNN and DNN architectures, achieved a notable performance intermediate between the RNN and DNN classifiers. It attained an accuracy of 98.24%, precision of 98.59%, recall of 98.59%, and F1-score of 98.36%. The AUC-ROC curve value of 98.13% further highlights the hybrid strategy's potency in correctly identifying positive and negative instances with low error rates and excellent discriminative ability.

CONCLUSION

The above findings emphasize the versatility and significance of deep learning classifiers in diverse applications, and the importance of merging the unique strengths of distinct architectures to attain the ultimate performance level towards breast cancer detection.

ABSTRACT

Oxidative stress has been shown to play an important role in the development of a number of pathological events in human body. Natural antioxidants would be effective in protecting the human body from the oxidative damage by free radicals. Plants are a source of large amount of drugs belonging to different groups that are known to relieve various diseases including oxidative stress. *Tecoma stans*, commonly known as Yellow Trumpet bush or Yellow Bells, is a perennial shrub belonging to the family Bignoniaceae. Among the phytoconstituents found in Tecoma stans leaves are alkaloids, flavonoids, phenolic compounds, terpenoids, and tannins. These bioactive compounds exhibit various pharmacological activities, including antioxidant, anti-inflammatory, antimicrobial, and anticancer properties. The leaves of *Tecoma stans* were collected from lawns behind the college building, SGRS College of Pharmacy, Saswad Pune. A 500 g amount of plant material was extracted twice by percolation

Keywords: Plants are a source of large amount of drugs belonging to different groups that are known to relieve various diseases including oxidative stress

INTRODUCTION

Tecoma stans, commonly known as Yellow Trumpetbush or Yellow Bells, is a perennial shrub belonging to the family Bignoniaceae. Native to the Americas, particularly the southwestern United States, Mexico, and Central America, Tecoma stans is renowned for its ornamental beauty and medicinal properties. Among its various plant parts, leaves are of particular interest due to their rich reservoir of phytoconstituents, which are bioactive compounds responsible for its medicinal attributes [1,7,8]. The leaves of Tecoma stans are characterized by their lanceolate shape, with serrated edges and a glossy green hue. They grow in clusters along the stems, providing an attractive backdrop to the plant's showy flowers. While the flowers steal the spotlight with their visual appeal and fragrance, the leaves play a crucial role in the plant's physiology and ecological functions. [2] Among the phytoconstituents found in Tecoma stans leaves are alkaloids, flavonoids, phenolic compounds, terpenoids, and tannins. These bioactive compounds exhibit various pharmacological activities, including antioxidant, anti-inflammatory, antimicrobial, and anticancer properties. As such, extracts derived from Tecoma stans leaves have been used in traditional medicine for centuries to treat a range of ailments, from fevers and digestive disorders to skin conditions and respiratory infections. [11,6,4] In recent years, scientific research has focused on exploring the therapeutic potential of Tecoma stans leaves and their phytoconstituents, leading to a better understanding of their pharmacological mechanisms and potential applications in modern medicine. By unraveling the chemical composition and biological activities of these leaves, researchers aim to harness their medicinal properties for the development of novel drugs and natural remedies. [5,9,10]

MATERIALS & METHODS

Collection of Plant Material
Tecoma stans
The leaves of *Tecoma stans* were collected from lawns behind the college building, SGRS College of Pharmacy, Saswad Pune. The collected leaves were dried and grinded (coarse powder) for extraction of the crude drug.

Authentication
The plant was identified by Dr. H. S. Patil, Head of the Department of Botany, Vidya Pratishthan's Arts, Science & Commerce College, Vidyanagari, Baramati, Dist. Pune.

Method
The leaves were dried in the shade for 10–12 days. After complete drying, the leaves were pulverized to a coarse powder of 40 mesh size in a mechanical grinder.

Extraction of *Tecoma stans*
✓ **Solvent:** Hydroethanolic solution (50:50 v/v ethanol: water).
✓ **Method for extraction:** Percolation
✓ A 500 g amount of plant material was extracted twice by percolation using 5 L of 50% of Hydroethanolic solution (50:50 v/v ethanol: water). The resulting extracts were pulled together and concentrated using a Rotary evaporator at 60°C under pressure. The extract was freeze-dried to obtain the powdered form of the T. stans extracts (TSE). [3]

In Vitro Model – Antioxidant activity
(1-1-diphenyl-2-picryl-hydrazyl) DPPH Free Radical Scavenging Activity

The free radical DPPH is stable and commercially available. An antioxidant is a hydrogen donor.It measures substances that scavenge radicals. The process by which the antioxidant gives the DPPH its hydrogen. The disappearance of DPPH in test samples due to the antioxidant effect. DPPH exhibits a significant maximum absorption at 517 nm (purple). The color changes from purple to yellow as an antioxidant absorbs hydrogen. The relationship between antioxidant activity and absorbance is inverse. The reduction in UV absorption at 517 nm makes it simple to assess the antioxidant impact.

Procedure
Procedure for Preparation of DPPH Solution

To obtain a constant volume, DPPH (7.89 mg) was weighed and dissolved in 99.5% ethanol by filling 100 mL of a measuring cylinder with a stopper (0.2 mM DPPH). It has been observed empirically that a DPPH solution's absorbance decreases over time up to one hour after preparation. As a result, it was left in the dark for two hours to allow the absorbance to stabilize. After 2 hours, 800 µl M Tris-HCl buffer (pH 7.4) and 200 µl were added to a test tube or sampling tube, followed by 1 mL of the DPPH solution. The absorbance at 517 nm was measured after mixing. A mixed solution contains 1.2 mL of ethanol and 800 µl of Tris-HCl buffer which is used as blank.

DPPH assay procedure

A test tube was filled with 800 µl of 0.1 M Tris-HCl buffer (pH 7.4), 200 µl of an analytical sample solution, and 1 mL of the DPPH solution. The solution was mixed for 10 seconds right away using a test tube mixer. It was then kept in the dark at room temperature. The solution's absorbance at 517 nm was measured exactly 30 minutes after the DPPH solution was added. The blank was a mixture of 800 µl of Tris-HCl buffer and 1.2 mL of ethanol.

Calculation
Inhibition ratio (%) = [(Ac – As)/Ac] × 100

Where, As - absorbance at the addition of the analytical sample
Ac - absorbance at the addition of ethanol instead of the sample

Statistical analysis

Results will be expressed as mean + SEM. Statistical analysis was carried out by a one-way ANOVA test followed by "Dunnett's multiple comparison test."

RESULTS & DISCUSSION

(1-1-diphenyl-2-picryl-hydrazyl)DPPH Free Radical Scavenging Activity

Absorbance of DPPH at the addition of Ethanol instead of Sample was found to be 0.33, referred to as Ac. The scavenging effect increases significantly. The Radical scavenging activity of the sample at 50µg/ml shows 92.31% at absorbance 0.023. The IC$_{50}$ value of *Tecoma stans* was found to be 52.55 µg/ml which is calculated by using y = 0.4164x + 71.882equation. The IC 50 value is an inhibitory concentration of extract required to inhibit 50% of initial DPPH free radical.

CONCLUSION

The results of the antioxidant activity of the herbal plant showed that *Tecoma stans* showed significant antioxidant activity.

ABSTRACT

Web performance optimization is increasingly becoming critical in today's digital landscape. In the production environment web applications are expected to deliver content quickly and reliably to geographically dispersed users. This is because user experience and retention play a significant role in organizations with surging internet traffic. In this study, qualitative and quantitative analysis of website performance with and without CDN integration has been conducted for asset delivery. This research addresses the gap in the existing literature by providing an extensive performance-based analysis of CDN integration along with its limitations and benefits. This study aims to provide evidence-based insights and the real-world impact of CDN implementation using Key Performance Indicators (KPIs) like latency, memory usage and throughput across geographically diverse locations and network conditions. Moreover, the performance analysis has been conducted across three most popular browsers. It has been found that with the use of CDNs, the browser memory consumption significantly reduces which results in improved speed and hence improved user experience. It has also been found that the performance of frontend applications also depends on browser engine's policies. These findings will help organizations make web infrastructure-related decisions, optimization strategies for content delivery and for CDN service providers to refine their offerings.

Keywords: Website Performance Analysis, CDN

94719

Tamanna Shah and Payal Joshi

INTRODUCTION

Website performance has become a crucial determining factor for User Experience (UX) as it impacts customer retention and engagement. Surging global internet traffic is one of the reasons that pressurize quick content delivery, reliably to users who are spread amongst geographically diverse locations [14]. Content Delivery Networks (CDNs) are one of the most popular ways to optimize website performance over geographically diverse audiences. Apart from using CDNs for static assets, they are also currently being used in other use cases such as live video streaming. CDNs area flexible way to provide faster, qualitative content. However, it also has its limitations which other researchers have solved by proposing creative architectures, routing algorithms and caching policies that optimize CDNs. The aim of this study is to present a comparative analysis of website performance metrics between websites using CDN to provide image assets and CSS files and those without. Although past research uncovers various functionalities, architecture, and benefits of CDN services, there is a need for quantitative evidence based research that shows the real-world impact of CDN implementation across diverse scenarios and use cases. This will reveal information about how beneficial CDNs are for a website architecture to handle user requests across multiple geographical locations.

Understanding the benefits and potential limitations of using CDN is important for
- Decision-making during infrastructure design in Organizations
- Optimization of content delivery strategies for web developers
- Refinement of services offered by CDN service providers

The rest of the paper is organized as follows. The past researches based on CDNs and website performance are discussed in the Literature Review section. The research objectives, the specifics of developing the web application and the data collection methods and tools for the performance analysis are discussed in the Research Methodology section. The Analysis of the metrics from various tools in depth are elaborated in the Results and Findings section. The key insights gained from the study are discussed and highlighted in the Conclusion.

LITERATURE REVIEW/ RELATED WORK

The most common way to improve website performance is to deploy Content Delivery Networks (CDNs) [1]. CDNs strategically distribute content among replica servers in multiple locations (edge servers), allowing lower latency due to nearby content access, high data transfer rates, and lower costs. In practice, CDN only forwards requests for the replicated content to a replica server after replicating a highly selective set of material to these edge servers. Xu *et al.* [3] presented an early analysis on hybrid CDN-P2P architectures. To overcome both of their drawbacks and capitalise on the advantages of CDNs and hybrid mesh-based and multi-tree-based P2P networks. Yin et al. (2009) [2] implemented the hybrid architecture suggested by Xu *et al.* [3], where scalability was enhanced due to the P2P system. It was reliable and had better quality video-streaming due to CDNs, which P2P systems lacked. It also allowed them to implement Dynamic Resource Scaling, i.e., adjusting the number of users directly served by the CDN, which balanced the trade-offs between quality, CDN cost, and scalability. Krishnan et al. (2009) [4] found that simply connecting clients to the nearest server sometimes doesn't always optimise latency. Some clients experience delays. Queueing requests can nullify the benefits of proximity. It emphasised the need to consider other factors like routing and network conditions as an influencing factor when analysing the performance of websites with and without CDNs. Frank et al. (2013) [5] presented that amongst the various types of CDN providers, the collaboration between ISPs and CDNs enhances content delivery extensively. This addresses scalability challenges by leveraging new technologies. It explores the design and operation of CDN-ISP collaborations. They focused on two key strategies: informed end-user to server assignment and in-network server allocation. It demonstrated how a prototype system can increase CDN capacity on demand, improve coordination, reduce download times, and achieve traffic engineering objectives, proving to be beneficial to both ISPs and CDNs. Herbaut et al. (2016) [8] also presented a collaborative model where CDNs and ISPs share resources through a virtualised infrastructure. Which

94720

included specifically deploying virtual CDNs (vCDNs) using Network Function Virtualization (NFV) at the ISP edge. It had a game theory analysis applied to explore revenue sharing models for an efficient and fair collaboration framework for speedy content delivery. Frank (2014) also examined the merits of collaboration between Content Delivery Infrastructures (CDIs) and Internet Service Providers (ISPs). They proposed two major innovations including intra-network server allocation and informed user-server assignment. This provides flexibility allowing CDNs to adjust dynamically and better handle volatile demand while ISPs handle the traffic. Stocker et al. (2017) [6] presented a study in which the existing CDN ecosystem and its evolution were discussed. It also explored the evolution of CDNs since the 1990s, categorising different CDN types, and examining how server location decisions affect operations. It gave a detailed analysis of various CDN architectures and their strengths and weaknesses and highlighted the importance of server location and the growing complexity of CDNs, along with the impact on interconnection markets. Liang *et al.* (2014) [7] discussed the complexity that arises when combining HTTPS with CDN services. Here CDN acts as an intermediary between the client and the web server. It compromises the security mechanisms of HTTPS as the model shifts from two-party to three-party communication, especially when the CDN requires control over SSL certificates. They also presented potential solutions, including the use of name constraint certificates, and ultimately proposes an approach based on DNS-based Authentication of Named Entities (DANE). Wang *et al.* (2018) [9] proposed the concept regarding semi-federation of CDN, which optimises resource scheduling and usage across multiple CDNs without requiring full CDN interconnection (CDNI). As the use of multiple CDN providers among content providers (CPs) has been increasing. This is known as multi homing, due to which CDN vendors are forced to lower their prices. To address these issues, the concept of multi-CDN federation has been proposed. It allows independent CDNs to connect. However, implementation of CDN interconnection (CDNI) comes with its own set of challenges. Through CDN semi-federation, a robust optimisation algorithm adjusts traffic patterns from various CPs across different CDN Points of Presence (PoPs). Kirisame *et al.* (2022) [11] introduced a new framework for optimizing heap limits across multiple garbage-collected processes for balancing memory use and garbage collection time as manual tuning or live-size rules lead to inefficient memory allocation. This research proposed a 'square-root' heap limit rule to minimize memory that too without requirement of communication between heaps. Kulkarni *et al.* (2003) [12] addressed the high memory demands of CDN simulations and proposed a memory-efficient data structure for storing cache state for popular objects accurately, while using bloom filters for approximations of less frequently used objects. It minimised storage as well as errors significantly. It resulted in 10x reduction in memory usage required for CDN simulation with an error margin of 5-10% only. The paper by Qi, Ip, Leung, and Law [13] presents a structured framework for website performance evaluation, addressing the critical need for standardized assessment methodologies. It presents a three-dimensional approach by evaluating website performance based on Website Usefulness, Website Service Quality and Website Physical Accessibility. Its key considerations are aligning CDN implementation with specific website goals, balancing performance improvement with accessibility requirements and maintaining focus on content quality and user experience(Table 1.). These studies uncover and explore many dimensions of CDNs. However, they do not focus on the quantitative impact of CDNs on the website performance. In this study we will understand the impact of CDNs in web applications by using quantitative analysis by using various browser performance metrics.

METHODOLOGY

RESEARCH DESIGN

In this experimental study, comparison of two versions of the same web-application has been performed. Both the websites are based on a common e-commerce platform made with PHP, HTML, Java Script/j Query and CSS along with MySQL as the database. It had 35 static images as well as dynamic image upload feature, login/register page, and/remove from cart option (Table 2.).

- Website A: Implemented with CDN services. Tech Stack - PHP, HTML, j Query(CDN) and CSS(minified files CDN links) along with MySQL image resources using CDNs
- Website B: Implemented without CDN services. Tech Stack - PHP, HTML, Java Script and CSS along with MySQL

Tamanna Shah and Payal Joshi

RESEARCH OBJECTIVES

• Evaluate and compare key performance indicators (KPIs) and throughput between CDN-enabled and non-CDN-enabled websites.
• Analyse the impact of geographic location, network, and traffic conditions in both scenarios.
• Analyse memory usage/heap size by both websites on different browsers.
• To understand the best situations to use CDNs.

Website Deployment and Setup:
Both websites are designed to be identical in content, structure, and functionality, with the only difference being the CDN integration, hosted on the same server to ensure independent and fair analysis of performance. Both the websites were live for 55 days, ensuring stable and consistent observation and evaluation of performance. Details of the hosting and CDN platforms are as given below:
• Hosting platform: infinityfree.com
• CDN Integration Service: Cloudinary

Infinity Free is a free web hosting provider that helps in managing websites based on PHP and MySQL. It operates on a cloud-based infrastructure that ensure a high uptime, unlimited storage space, free sub domains, SSL and DNS services with many other tools providing effortless deployment. Cloudinary is a SaaS based media asset delivery platform that handles media upload, storage, optimization and delivery via CDN services. It has high performance media processing servers, free tier storage and supports dynamic asset URLs. The primary purpose of choosing this CDN provider was for the easy SDK integration with multiple tech stacks which generate dynamic media URLs after upload. However, Cloudinary has not publicly disclosed the exact number of edge servers, but they claim to utilize many strategically placed edge servers worldwide.

Performance Measurement Tools:
To measure website performance, the following tools were used to track key metrics:
• Memory tab in browser developer tools
• KeyCDN Performance Test
• GTMetrix
• Google Lighthouse
These tools provided quantitative results on performance, including load times, request handling, Largest Contentful Paint (LCP) and load times and overall page speed metrics for both websites. Data was collected from more than 8 countries around the world.

RESULTS AND FINDINGS

Memory Usage Analysis
The data from the Memory Tab of browser Developer Tools were compared for both Websites on the following browsers:
1.   Google Chrome
2.   Microsoft Edge
3.   Mozilla Firefox
In Google Chrome and Microsoft Edge browsers, Website A occupies less memory on load than Website B. In the test conducted on Microsoft Edge we can observe that the heap size of Website B is approximately 357% more storage than Website A (Fig. 1., Fig. 2.). Similarly, on Google Chrome the heap size of Website B is approximately 176% more than Website A (Fig. 3., Fig. 4., Table 3.). Whereas in Mozilla Firefox the results are contradictory, 91% (of the total memory) is used by Website A and Website B uses 88%, indicating an increase when using CDN. Website A has lesser JS events which are being called, in comparison to Website B indicating lesser requests. Using the CDN

increases the overall memory footprint by approximately 680 KB (36%) in Mozilla Firefox. This may be the effect of the change in browser engine as Google Chrome and Microsoft Edge are Chromium based while Firefox is Gecko based (Fig. 5, Fig. 6).

Key CDN Performance Report (Fig.7. Table 4.):

- **Status**

  Both Website A has HTTP status 200 (OK) in all cities, while Website B also has HTTP status OK in all cities other than Singapore, where an error was encountered.

- **DNS lookup time**

  Website A is faster than Website B in 3 cities, including Frankfurt, London and New York with a significant margin. Website B is slightly faster in the other 5 cities, including Amsterdam, San Francisco, Singapore, Sydney and Bangalore.

- **Connection Times**

  Connection times are almost consistent or slightly better with CDN. Frankfurt, London, and Sydney show minimal differences. Minor variations are seen in Amsterdam and San Francisco, where Website B has faster connection time but the difference is almost negligible. However, Singapore faced connection time out with Website B while with Website A it took 271.94 ms to connect.

- **Time to First Byte (TTFB)**

  Website A and B have very little differences in Frankfurt, Amster-dam, London and San Francisco Website B performs better. In New York, Sydney and Bangalore Website A is faster and in Singapore Website A loads whereas Website B encounters errors.

- Overall, we can observe that both websites show their strengths and weaknesses in different metrics and locations.

- Even though the difference is not much between most of the metrics, **at** certain places where Website B could not load at all, Website A has performed better. This suggests that a website with CDN is more reliable.

- **GTmetrix Comparison Report(Fig. 9. , Table 5.):**

Performance

Both websites generally have high-performance scores ranging from 92% to 100%. Website A generally performs better than Website B across most regions, the only exception being London where Website A is 98% and Web-site B is 100%.

Structure

The structure scores, range from 88% to 97%. London performs the best with Website B scoring 96% and Website A at 97% while Mumbai shows lowest scores at 88% for both websites. The structure is fairly similar across both websites, showing that the front-end optimization and consistent lay-outs.

Web Vitals

These metrics are used for determining the User Experience (UX).

- **LCP (Largest Content ful Paint)**

  LCP measures the time taken for the largest visible element to load. It is seen that Website A has a better LCP score across all locations. For Website A, LCP ranges from 652 ms in Vancouver to 1700 ms in Mumbai. Website B has faster LCP times in London (228 ms) but slower times in Mumbai (1600 ms). This indicates regional performance issues likely caused due to server proximity.

- **Total Blocking Time (TBT)**

  TBT measures how much time is spent blocking the main thread from user interaction. Both websites have excellent scores here, with minimal or no blocking across all regions. The highest blocking time recorded is 21 ms for Website A in Mumbai.

- **CLS (Cumulative Layout Shift)**

  CLS measures visual stability. Both websites have a 0 CLS, this indicates that there are no layout shift issues

Tamanna Shah and Payal Joshi

Performance Metrics(Fig.8.)

- **First Contentful Paint (FCP)**
  FCP measures how quickly the first piece of content is rendered. The times are fastest in London for both websites (798 ms and 228 ms for Website A and B, respectively). The slowest FCP times are seen in Mumbai for Website A (1700 ms) and Hong Kong (1700 ms for Website B).

- **Time to Interactive**
  TTI measures when the website becomes fully interactive. Website B is consistently fast across all regions, with times ranging from 228 ms to 1700 ms. Website A has slightly slower times, especially in Mumbai (2100 ms), but still acceptable in most cases.

- **Speed Index (ms)**
  This metric represents how quickly the content is visually populated. Website B has the fastest Speed Index in London (445 ms), indicating quick visual completion. Website A has a much lower speed index in 2 regions.

- In Hong Kong, Website A took 3200ms and Website B took 3700ms and in Vancouver, Website A took 1200ms and Website B took 2500ms.

- Hong Kong has the slowest times for both websites, suggesting that it takes longer for content to fully load visually there.

Browser timing metrics (Fig. 10.)

- **Redirect Timings:**
  No redirect times are reported across all regions in either website, suggesting no additional redirects, which is ideal for optimizing loading time.

- **Connection Duration**
  The Connection Duration refers to the time taken to establish a connection between the server and client. Website A has the fastest connection time in London (23 ms), while Mumbai has the longest (638 ms). Website B has slower connection times than Website A, except for Mumbai.

- **Backend Duration**
  Backend processing times are generally low across all locations, with the fastest being London (as low as 10 ms in Website B) and the slowest in Mumbai (248 ms in Website A). Website A is taking more time in all locations than Website B.Faster backend times indicate better server efficiency and quicker response to client requests.

- **Time to First Byte (TTFB)**
  The time taken for the first byte of data to reach the user is called TTFB. Website A has longer TTFB times in Mumbai (886 ms), indicating some server latency there, while London has the fastest TTFB (34 ms).

- Website B shows similar patterns, with the slowest TTFB in Mumbai (497 ms) and the fastest in London

- **DOM Interactive Time**
  DOM Interative Time measures the time the browser takes to first become interactive. Website A takes more time in all locations than Website B. Both websites show the best results in London, with the fastest DOM Interactive times there (760 ms for Website A, 174 ms for Website B). Mumbai and Hong Kong see the slowest DOM Interactive times, suggesting slower initial interactivity in those regions.

- **DOM Content Loaded Time**
  DOM Content Loaded Time refers to the total time taken by the browser, to make a DOM tree for a website and parse it.It has similar results to that of DOM interactive time with Website A being slower than Website B.

- **Onload Time**
  Onload time measures the time the browser takes for the pagetoload fully. Website A performs faster in Hong Kong and Mumbai while Website B is faster in Vancouver and London.

- London and Vancouver perform the best, with Website A and Website B both having onload times close to or under 2 seconds.

- Mumbai and Hong Kong show slower onload times, exceeding 2 seconds, which could negatively impact the user experience.

- **Fully Loaded Time**

Fully Loaded Time measures the time when the entire page, including additional scripts and resources, has fully loaded. Website A performs better than Website B in all locations. Website B performs fastest in London (3200 ms), while Website A is fastest in London at 3000 ms.

Mumbai shows the slowest fully loaded times for both websites, around 5100 ms for Website B and 4200 ms for Website A.

Google-Lighthouse Comparison Report (Fig. 11.):

- **Performance (%)**
  Website B consistently scores higher in performance across all locations compared to Website A. While Website A has a noticeable drop in performance in Surat (93%) compared to its performance in other locations (98%).
- **Accessibility (%), Best Practices (%), SEO (%)**
  Both websites have equal scores across all metrics and locations.
- **First Contentful Paint (ms)**
  Website B (400 ms). outperforms Website A (1300 ms) in both locations which is particularly noticeable in Surat, where Website B is significantly faster
- **Largest Contentful Paint (ms)**
  It shows similar trends to the First Contentful Paint where Website B is faster across all locations.
- **Total Blocking Time (ms)**
  Both websites have no Total Blocking Time across all locations, indicating efficient JavaScript execution.
- **Cumulative Layout Shift**
  Both websites have negligible shifts, although Website A shows slight variance in Surat (0.005) compared to other metrics.
- **Speed Index (ms)**
  Website B maintains a consistent speed, while Website A shows a higher Speed Index in Surat (1300 ms).
- **Initial Server Response Time (ms)**
  Website B has a better initial response time. It is 50 ms faster in Surat.
- **Avoid Multiple Page Redirects (ms):**
  Website B has fewer redirects than Website A.
- **Eliminate Render-Blocking Resources (ms)**
  Website B has next to none render blocking resources than Website A.
- **Enable Text Compression (KiB) & Serve Static Assets with Efficient Cache Policy:**
  The results are similar for both websiteswith minor differences.
- **Reduce Unused JavaScript (KiB) & Properly Size Images (KiB)**
  Website B is more optimized than Website A.

Key Findings.

Web applications with CDN integration generally perform better across most regions, particularly in terms of overall performance scores, connection durations, and fully loaded times, especially in areas like Vancouver, Mumbai, and Hong Kong. However, the difference is not significant. A website without CDN outperforms with a minimum margin in terms of LCP, TTI, and Speed Index, making it more optimized for a quicker and more interactive experience, here CDN advantages are less significant. According to Google Lighthouse reports CDN integration makes the web application slower in speed-related metrics like First Contentful Paint, Largest Contentful Paint, and Initial Server Response Time. While a CDN generally boosts performance it is only possible with proper server configuration, resource optimization, and efficient caching policies are crucial. In your case, Website B's better performance suggests it is better optimized in these areas compared to Website A with its CDN.

Influencing factors:

The factors below may influence the performance scores:

1.   The placement of edge servers
2.   Browser engine's policies

3. Network Speed
4. Server configuration

CONCLUSION

The web application performance analysis domain has to be revisited as CDNs become increasingly popular in the current era. The performance metrics play a major role in indicating the quality of a web application's performance, adding to a better User Experience. In this paper, the browser performance comparison between the web applications with and without CDNs revealed that the web applications with CDNs have lesser memory usage in the browser than those without CDNs. In the findings, it has also been observed that browser engines have different policies and strategies to manage websites with CDNs resulting in differences in performance. So with the integration of CDN, memory usage is majorly optimized in browsers but negligible differences are noted in speed-related metrics. The in-depth analysis also reveals that the benefits of CDN may be negligible when the external influencing factors such as CDN placement are not optimized and edge servers are not near enough. This study reveals that the key to unlocking CDN's full potential lies in a well-rounded approach that prioritizes proper server configuration and resource management. Adoption of such practices can lead to optimal performance in web applications and an enhanced user experience in web applications globally.

ABSTRACT

This research endeavor introduces a method for securely embedding a hidden image into the bit planes of a cover image using a suitable hashing technique. The process involves several steps: reading the cover image and hidden image, performing bit-plane slicing on the cover image, and calculating the correlation between the cover image's bit planes and the hidden image. The two least correlated bit planes are then selected for embedding. The hidden image is embedded into the chosen bit planes of the cover image using a specific embedding algorithm, ensuring that the hidden image remains concealed within the cover image while preserving the visual quality of the cover image. To enhance security, an encryption technique is applied using the selected bit planes. This encryption process modifies the cover image by combining the original pixel values with the embedded secret image information. In the extraction process, the original secret image is restored from the encrypted image. The extraction algorithm reverses the encryption process and retrieves the embedded secret image from the modified cover image. The performance of the embedding and extraction processes is evaluated using various metrics. The Peak Signal-to-Noise Ratio (PSNR) is calculated to assess the quality of the extracted secret image compared to the original secret image. Additionally, the Structural Similarity Index (SSIM) and Image Fidelity (IF) measures are computed to evaluate the similarity between the original and extracted images. The implemented technique offers a secure and efficient method for embedding and extracting secret images within cover images, ensuring data confidentiality and integrity. Experimental results demonstrate the efficacy of the proposed approach in preserving the hidden secret information while maintaining image quality. Steganography, the practice of concealing information within another form of data, plays pivotal role in protecting sensitive information from unauthorized access cannot be overstated. Unlike cryptography, which encrypts the contents of a message, steganography hides the presence of the

94733

Suparna Sarkar *et al.,*

message itself, relying on imperceptible alterations in digital data to conceal information. This research contributes to the advancement of steganographic techniques, enhancing their effectiveness and reliability in secure data transmission and storage.

Keywords: Bit Plane, encryption, decryption, SSIM, IF, PSNR

INTRODUCTION

Steganography techniques can be categorized into several types:

Image Steganography[1]
The hidden information is embedded within digital images. Techniques include modifying pixel values, least significant bit (LSB) embedding, and transforming the discrete cosine transform (DCT) coefficients.

Audio Steganography[2]
The hidden information is embedded within audio files. Techniques involve modifying audio samples, phase modulation, or frequency domain manipulation.

Video Steganography[3]
Similar to image steganography, but applied to video files. Hidden information can be embedded within the video frames or specific video features.

Text Steganography[4]
The hidden information is concealed within the structure or formatting of a text document. Techniques include using invisible ink, altering white spaces, or exploiting less noticeable characters.

EMBEDDING
Embedding [5]describes the procedure of hiding or inserting secret information within the pixels of an image. The objective is to make the modifications subtle and imperceptible to the human eye while preserving the visual quality of the image. There are various methods applied for embedding in image steganography:

Least Significant Bit (LSB) Embedding[6]
This method stands out as both ubiquitous and uncomplicated among prevailing research methodologies. It involves replacing the least significant bits of the pixel values with the bits of the secret message. Since the least significant bits contribute less to the overall pixel value, small changes in these bits are less noticeable to the human eye.

Pixel-Value Differencing (PVD)
PVD[7] techniques exploit the differences between adjacent pixel values to hide the secret message. The differences are modified according to the message bits to encode the information.

Spread Spectrum Techniques[8]
These techniques spread the secret message across multiple pixels or frequency components of an image. The idea is to distribute the message bits in a way that they are not concentrated in a specific region, making the hidden data more robust against detection.

Adaptive Steganography[9]

Adaptive techniques analyze the image content and adaptively adjust the embedding process to minimize the visual distortion caused by embedding. They consider the characteristics of the image, such as texture, edges, and smooth regions, to determine suitable embedding locations and strengths. It is imperative to emphasize the significance of the embedding procedure which should maintain a balance between the capacity of the hidden information and the visual efficiency of the image. Too much embedding may introduce visible artifacts, while too little may result in insufficient retention for the desired message.

EXTRACTION

Extraction[10] in image steganography decribes of retrieving the hidden information from a stego-image—the image that has the secret message embedded within it. Extraction is performed using a specific algorithm that reverses the embedding process and retrieves the encoded message. Here is a general overview of the extraction process for some common image steganography techniques:

Least Significant Bit (LSB) Embedding[11]

To extract the hidden message, the LSBs of the pixels in the stego-image are extracted. These extracted LSBs are then combined to reconstruct the encoded message. The count of LSBs to extract depends on the count of bits used to encode each message symbol.

Pixel-Value Differencing (PVD)[12]

PVD extraction involves analyzing the differences between adjacent pixel values in the stego-image. These differences are examined, and based on a predetermined encoding scheme, the hidden message is reconstructed.

Spread Spectrum Techniques[13]

Extraction in spread spectrum techniques involves reverse processing used during embedding.

Adaptive Steganography[14]

The extraction process usually involves analyzing the stego-image depending on the embedding criteria and recovering the hidden information accordingly. The extraction algorithm should be represented accurately retrieve the hidden message while minimizing false positives or false negatives. It should handle various scenarios, such as different image formats, embedding capacities. It's important to understand that extraction requires knowledge of the steganography method used and access to the appropriate extraction algorithm. Without this information, it could be challenging or even impossible to recover the hidden message from a stego-image.

BIT PLANE[15]

Pixel values are integers composed of bits. For example, values in a 256-level gray scale image are composed of 8 bits (one byte). Instead of emphasizing ranges of intensity levels as 0, we could emphasize how specific elements contribute to the overall appearance of the image. As Fig. 3.13 depicts, an 8-bit image can be viewed as consisting of eight one-bit planes, plane 1 encompasses the least significant bit of every pixel within the image, while plane 8 encompasses the most significant bits. Figure 1(a) displays an 8-bit grayscale image and Figs. 1(b) through (i) are its eight one-bit planes, with Fig. 1(b) corresponding to the highest-order bit. Regarding that the four higher-order bit planes, especially the first two, contain a substantial quantity of the visually-significant data. The lower-order planes contribute to more delicate intensity details in the image. The original image has a gray border whose intensity is 194. Notice that the corresponding borders of some of the bit planes are black (0), while others are white (1). To see why, consider a pixel in, say, the middle of the lower border of Fig. 1(a). The pixels that correspond to each other in bit planes, starting with the highest-order plane, have values 1 1 0 0 0 0 1 0, which is the binary representation of decimal 194. The original image's pixel value can likewise be reconstructed from its corresponding binary valued pixels in the bit planes by converting an 8-bit binary sequence to decimal. The binary representation of the 8th bit plane in an 8-bit image can be acquired through thresholding the input image with a transformation function that

Suparna Sarkar *et al.,*

maps to 0 intensity values between 0 and 127, and maps to 1 value between 128 and 255. The binary image in Fig. 1(b) was obtained in this manner. Breaking down an image into its bit planes serves the purpose of assessing the significance of each bit within the image. This aids in evaluating the effectiveness of the quantization process, particularly concerning the Peak Signal-to-Noise Ratio (PSNR). PSNR is a widely adopted metric for assessing the fidelity of a processed or reconstructed signal, commonly applied in image and video compression scenarios. It measures the extent of distortion or information loss incurred during compression by comparing the original signal against its compressed or reconstructed counterpart. Additionally, this decomposition technique proves valuable in image compression endeavors, where selectively using fewer bit planes in the reconstruction process is advantageous. For example, Fig. 2(a) displays an image rebuilt using bit planes 8 and 7 of the preceding decomposition. The reconstruction is completed by multiplying the pixels of the nth plane by the constant $2n-1$. This converts the nth significant binary bit to decimal. Each bit plane is multiplied by the corresponding constant, and all resulting planes are assembled to obtain the grayscale image. Thus, to obtain Fig. 2(a), we multiplied bit plane 8 by 128, bit plane 7 by 64, and added the two planes. While the primary characteristics of the initial image were recovered, the resulting image seems lacking in depth, particularly evident in the background. This outcome was anticipated, given that only four distinct intensity levels can be produced by two planes. Adding plane 6 to the reconstruction helped the situation, as Fig. 2(b) shows. Note that the background of this image has perceptible false contouring. This effect is reduced significantly by adding the 5th plane to the reconstruction, as Fig. 2(c) illustrates. Increasing the count of planes in the reconstruction wouldn't substantially enhance the visual quality of this image. Thus, we conclude that, in this example, storing the four highest-order bit planes would permit us to rebuild the initial picture with satisfactory clarity. Storing these four planes instead of the original image results in a 50% reduction in storage requirements.

Quality Parameters

Image quality (often Image quality Assessment, IQA) is an image attribute that gauges its perceived appearance of degradation. Imaging systems have the potential to introduce varying degrees of distortion or artifacts into the signal. - for example by transcoding-, which invades the subjectively experienced quality and quality of experience for the users.

PSNR

Peak Signal-to-Noise Ratio (PSNR)[16] is a metric commonly used to measure the quality of a reconstructed or processed signal, typically in the reference of image or video compression. It quantifies the level of distortion or loss that occurs during the compression process by balancing the original signal with the compressed or reconstructed version. PSNR is expressed in decibels (dB) and measures the ratio between the maximum possible power of a signal and the power of the noise introduced by the compression or processing. The higher the PSNR value, the lower the distortion and the better the quality of the reconstructed signal.

The formula for calculating PSNR is as follows:

$$PSNR = 10 * \log_{10}((MAX^2) / MSE)$$

Where:

- MAX represents the maximum possible pixel value of the signal (e.g., 255 for an 8-bit grayscale image or 65535 for a 16-bit grayscale image).
- MSE (Mean Squared Error) is the average squared difference between the original signal and the reconstructed or compressed signal, calculated over all the pixels or samples.

PSNR is usually used in image and video compression algorithms to count the fidelity of the reconstructed images or videos compared to the originals. It provides a quantitative measure of the perceptual quality of the compressed output and permits for comparisons among different compression techniques or parameter settings. However, it is significant to note that PSNR has limitations as a quality metric. It doesn't consistently align with human visual perception, particularly regarding highly compressed or low-quality images. Higher PSNR values do not always assure visually pleasing or accurate reconstructions, as it focuses on pixel-wise differences rather than perceptual characteristics.

SSIM

SSIM[17] stands for Structural Similarity Index Measure, and it is a broadly used metric for assessing the similarity between two images. Unlike metrics such as PSNR that focus solely on pixel-wise differences, SSIM takes into account both structural information and perceived changes in image quality. SSIM compares the structural components of the reference (original) image and the distorted (reconstructed, compressed, or processed) image. It measures three aspects of image quality: luminance similarity, contrast similarity, and structural similarity. These aspects capture human perception and provide a more accurate assessment of image quality. The SSIM index ranges from -1 to 1, with 1 indicating perfect similarity between the two images. A higher SSIM value indicates greater similarity and better quality between the reference and distorted images. The calculation of SSIM involves comparing local image patches or windows rather than individual pixels. The formula for SSIM is as follows:

SSIM (x, y) = (l (x, y) * c (x, y) * s (x, y))

Where:

- l (x, y) represents the luminance similarity, which measures the similarity of the average pixel intensities in the windows.
- c (x, y) represents the contrast similarity, which quantifies the similarity of the standard deviations of pixel intensities in the windows.
- s (x, y) represents the structural similarity, which evaluates the similarity of the covariance of pixel intensities in the windows.

The values of l (x, y), c (x, y), and s (x, y) range between 0 and 1, with 1 indicating perfect similarity. SSIM has been shown to better associate with the way humans perceive visually compared to metrics like PSNR. It is particularly useful for assessing the proficiency of compressed images, comparing different compression algorithms, or optimizing compression parameters. However, like any metric, SSIM has its limitations but it can be used alongside subjective evaluations to achieve a comprehensive assessment of image quality.

IF

Image fidelity[18] is a measure of the accuracy of the steganographed image. It is gained by the following formula and as can be observed has no units. Image fidelity is also the metering of the accuracy of the reconstructed sky brightness distribution. A related metric, dynamic range, is a measure of the degree to which imaging artifacts around strong sources are suppressed, which in turn implies a higher fidelity of the on-source reconstruction. With conventional external calibration methods, even under the best observing conditions, the achieved dynamic range will rarely exceed a few hundred.

Image fidelity Ratio = $1 - \left(\frac{1}{k} \sum_{k=1}^{K} \frac{\sum_{i,j=0}^{N-1}[C_k(i,j) - \hat{C}_k(i,j)]^2}{\sum_{i,j=0}^{N-1} C_k(i,j)^2} \right)$

The actual image will have a IF ratio of 1 which represents the ideal case. In practice this high a value is not obtainable. Thus we may conclude that IF ratio lies in the range [0, 1).

The Whole Process

Here's a step-by-step explanation of the process:

Reading the Images

The code reads two input images - a cover image and a secret image. Both images are in PGM format.

Bit-Plane Slicing

The cover image is split into 8-bit planes using bit-plane slicing. Each bit plane represents a different level of image detail. The bit planes are stored in the `bit` list.

Calculating Correlation

The code computes the absolute correlation coefficients for every bit plane. Correlation measures the statistical relationship between two sets of data. In this case, it measures the similarity between the cover image pixels and the pixels in each bit plane.

Selecting Bit Planes

The two-bit planes with the lowest and second lowest correlation values are opted for embedding the secret image. These bit planes are selected as they have less correlation with the cover image, which helps in hiding the secret image more effectively.

Embedding the Secret Image

The secret image is embedded into the selected bit planes. This is executed by replacing the least significant bits of the cover image pixels with the corresponding bits from the secret image. The pixels of the secret image are split into two sections, each corresponding to a chosen bit plane.

Encrypting the Image

The procedure of embedding the hidden image is referred to as encryption in this context. The code modifies the least significant bits of the cover image pixels according to the hidden image pixels, effectively hiding the secret image within the cover image.

Writing the Encrypted Image

The resulting encrypted image is written to a new file named "encrypted_image.pgm". The file format and header information from the cover image are used, followed by the modified pixel values.

Extracting the Secret Image

The extraction process involves reversing the encryption and extracting the hidden secret image from the encrypted image. This is accomplished by examining the least significant bits of the encrypted image pixels and reconstructing the secret image pixels.

Writing the Extracted Image

The extracted secret image is written to a new file named "extracted_image.pgm". Again, the file format and header information from the secret image are used, followed by the extracted pixel values.

Quality Evaluation

The code calculates various metrics to evaluate the quality and fidelity of the turned out secret image. These metrics include Peak Signal-to-Noise Ratio (PSNR), Structural Similarity Index (SSIM), and Information Fidelity (IF). PSNR calculates the difference between the original and extracted images depending on signal strength. SSIM compares the structural similarity between the images. IF quantifies the fidelity of the extracted image by comparing the pixel values. The aforementioned process enables the concealment of a secret image within another image through bit-plane manipulation. It provides methods for both embedding and extracting the secret image, as well as evaluating the fidelity of the extraction process using different metrics.

Algorithm

Depicting a general algorithm that captures the steps involved:

1. Read the cover image and the hidden image.
2. Perform bit-plane slicing on the cover image to obtain the individual bit planes.
3. Calculate the correlation coefficients for each bit plane to identify the two planes with the lowest and second lowest correlation values.
4. Incorporate the hidden image into the specified bit planes by substituting their least significant bits with the corresponding secret image bits.
5. Encrypt the image by modifying the cover image with the help of the modified bit planes.
6. Save the encrypted image within a file.
7. Extract the original secret image from the encrypted image.
8. Save the extracted secret image within a file.

9. Calculate the Peak Signal-to-Noise Ratio (PSNR) between the original secret image and extracted image.
10. Calculate the Structural Similarity Index (SSIM) between the original secret image and extracted image.
11. Calculate the Information Fidelity (IF) by comparing the pixel values of the original secret image and extracted image.
12. Display or save the calculated PSNR, SSIM, and IF values for evaluation purposes.

RESULTS

Motive
The motive of my project is to perform image steganography, which is a practice of hiding a secret image within another image while maintaining the visual appearance of the cover image. The project aims to embed a secret image into the least significant bits of the cover image using bit-plane slicing and encryption techniques. The motive behind this project could be:

Confidential Communication
The code enables the secure transmission of sensitive or confidential images by embedding them within innocuous cover images. It is useful in scenarios where privacy and secrecy are crucial, such as military, intelligence, or private communication.

Covert Data Storage
The project allows for the storage of secret information within seemingly harmless images. By concealing data within the cover image, it becomes difficult for unauthorized individuals to detect the presence of the hidden information, providing a form of covert data storage.

Steganography Research and Analysis
The project distributes as a practical implementation for studying and analyzing the effectiveness and robustness of the bit-plane slicing technique in image steganography. Researchers and students can avail this code to experiment with different images, asses the efficiency of the hidden image, and analyze the metrics such as PSNR, SSIM, and IF. Overall, the motive of the project is to provide a practical implementation of image steganography techniques, allowing for secure communication, covert data storage, and research exploration in the field of steganography.

Applications
The project involving image steganography using bit-plane slicing can have several applications in various domains. Here are a few suitable applications:

Secure Communication
The ability to hide secret messages or images within innocuous cover images can be utilized in secure communication channels. For example, intelligence agencies, government organizations, or businesses can employ this technique to securely transmit confidential information, such as classified documents, sensitive images, or encrypted messages.

Digital Watermarking
Image steganography can be implemented for digital watermarking, where an invisible mark or identifier is embedded into an image. This can be valuable in copyright protection, ensuring the legitimacy or confirming the ownership of digital content.

Covert Surveillance

Suparna Sarkar *et al.,*

In covert surveillance operations, steganography can be employed to hide images or videos within seemingly normal media files, such as photos or videos shared on social media platforms. This can enable undercover agents or investigators to transmit sensitive evidence or intelligence while maintaining their cover.

Data Hiding in Forensics

Steganography procedure can be implemented in digital forensics to conceal evidence or sensitive information within images, audio files, or videos.

RESEARCH AND EDUCATION

The project can serve as a valuable instrument for gaining insight into and studying image steganography techniques, algorithms, and evaluation metrics. Students, researchers, and academics can utilize this project to experiment with different images, evaluate the efficiency of hidden data, and explore the field of steganography. It is remarkable to note that while steganography has various legitimate applications, but it is misused for illicit purposes. It is crucial to ensure that the usage of steganography techniques complies with legal and ethical considerations.

CONCLUSION

In summary, the project focused on implementing image steganography with the help of bit-plane slicing. The code provided a practical approach to conceal a hidden image within a cover image while preserving the visual appearance of the cover image. By embedding the hidden image into the least significant bits of the cover image, the project aimed to achieve secure communication, covert data storage, and research exploration in the area of steganography. The project showcased the step-by-step process, including reading the cover and secret images, performing bit-plane slicing, calculating correlation coefficients, embedding the secret image, encrypting the image, and extracting the original secret image. Evaluation metrics such as Peak Signal-to-Noise Ratio (PSNR), Structural Similarity Index (SSIM), and Information Fidelity (IF) were calculated to assess the quality and fidelity of the protected image. The applications of this project are diverse and can be utilized in several domains. It can be employed for secure communication, where sensitive information needs to be transmitted discreetly. Digital watermarking, covert surveillance, and data hiding in forensics are additional areas where we can find practical application of this. Furthermore, the project serves as an educational tool, aiding students, researchers, and educators in understanding and exploring image steganography techniques. It is noted that while steganography can have legitimate applications, it should always be used responsibly and within legal and ethical boundaries. Proper consideration should be given to privacy, security, and applicable laws when employing steganography techniques.

ABSTRACT

The development of a bilingual Sentence Refiner is to improve accuracy and readability while translating from any language. The refiner solves common translation difficulties, for example improper grammar or a lack of cultural sensitivity by using advanced natural language processing. The study focuses on the cognitive benefits of bilingualism, which continues to inform how sentence complexity and interference might be handled by refiner design. This model is further iteratively improved using systematic testing and user feedback to be useful in different linguistic contexts. The paper even discusses cross lingual model editing implying the need of strong baseline methods to support and improve languages having different scripts. The work does not only contribute to advancing machine translations but more broadly towards cross lingual communication with implications for education, content creation, and global collaboration. Future directions include enhancing user interaction to continuously improve the refiner's performance, making it a vital tool for effective multilingual communication.

Keywords: Bilingual Sentence Refiner, Communication Enhancement, Natural Language Processing, Translation Quality Enhancement, Lethologica, Cross-Lingual Communication.

Megha S. Patel *et al.,*

INTRODUCTION

Effective communication in different languages is required, as communication between individuals and institutions often encounters linguistic barrier issues. Lethologica is one of the human phenomena wherein one suffers from the frustration of temporarily forgetting specific words needed for speaking or writing, especially if one is fluent in their native language. Apart from lethologica, it is incredible how far machine translation systems have come in filling the gaps despite their shortcomings in producing accurate translations into fluent speech. An estimated 33% of Indians are part of the Indian diaspora. Their presence can be seen in 129 out of the 190 countries listed as sovereign nations by the United Nations [1]. This calls for innovative solutions through the introduction of a bilingual sentence refiner, a machine learning model for the Gujarati language trained on large datasets with parallel texts. A bilingual sentence refiner is an essential tool for making translated text error-free by correcting grammatical mistakes, errors, increase fluency, and produce more natural expressions. Using patterns from both languages, English and Gujarati, this model enhances the translations produced by a machine translation system with the objective of increasing their accuracy, coherence and linguistically appropriate to the intended recipient. Utilizing advances in Natural Language Processing (NLP), the program promises an approach to surmount the language barrier and improve translational efficiency. In this paper, we introduce the concept of bilingual sentence refinement and clarify its technical architecture and algorithms. Thus, underpinning its functionality, we discuss the possible effects that such innovations could have on the qualitative improvement of translating text and explore broader implications for leveraging NLP-based solutions to counter linguistic barriers in professional contexts. In probing this, we aim to highlight the need for continuous advancements in machine translation and NLP for effective cross-lingual communication.

LITERATURE REVIEW

This literature review covers the studies that focus on NLP-based solutions offering bilingual sentence refinement. According to Rui Mao [2], large language models (LLMs) and pre-trained language models (PLMs) are yet to completely cover the critical area of semantic processing in computational linguistics. Concept extraction, named entity recognition, and word sense disambiguation are important tasks for semantic processing in human language and its interconnections. Dr. V. Geetha [3] talks about the development of natural language processing (NLP) from rule-based systems to deep learning models, giving various examples in various industries through applications in healthcare, finance, and entertainment. Nevertheless, there are challenges of bias and ambiguity that require further research to refine and optimize NLP systems. Chengwei Qin [4] claimed that LLMs share common zero-shot abilities, as was seen in ChatGPT, across several diverse NLP tasks. While excelling in reasoning-based tasks, the model struggles with sequence labelling tasks, further indicating that improved discourse and reasoning skills would help. Ruben D.I. van Genugten [5] developed an automatic system to assess the quality of autobiographical memories in natural language processing, thus making web-based research accessible to much wider audience. Masayasu Muraoka [6] explores the benefits of visual supervision in NLP through the Vokenization method for enhanced cross-lingual transfer learning, the results showed a significant improvement in performance of the model in the presence of a visual representation as far as this stood against the low resource availability of the languages. Zhizhong Chen [7] introduces the Cross-Lingual Arabic Information Retrieval system (CLAIRE) exploiting cross-lingual word embedding to ease retrieval tasks and prevent translation errors. Experiments indicate the efficacy of the model for handling Arabic-based retrieval tasks. V. Sharma [8] tackles challenges in Hindi cross-lingual information retrieval (CLIR), proposing Hybrid Word Translation Disambiguation (HWTD) and Semantic Morphological Variant Selection (SMVS). These techniques enhance translation accuracy and address morphological complexities. Jesus Perez-Martín [9] discusses cross-lingual information retrieval in e-commerce, for polysemous ambiguities, dialectal variations, and similar problems, using a neural machine translation system. This increases the accuracy of e-commerce search and sales in multilingual contexts; evidence for this is seen in a Walmart.com pilot experiment. Dr. Jatinderkumar Saini [10] focuses on addressing the peculiarities of translation of idiomatic expressions from Gujarati using a phrase-based, dictionary-driven approach with regional diachronic validation as a core focus identified task is maintaining

94745

the accuracy and avoiding regional discrepancies. Jiaan Wang [11] critically reviews cross-lingual summarization, categorizing datasets and procedures to plot out future research direction. This gives the reader the little foundation and insights about how globalization plays out in multilingual NLP tasks. Abdelsalam's [12] UPAL MULTIVEC model outperforms traditional QuEst++ and Referential Translation Machines in predicting and ranking sentence level post-editing effort for English-German in the WMT16 Quality Estimation Shared Task. Ergun Biçici's [13] translation ranking system enhances translation quality by focusing on high-PFI sentences, improving BLEU scores and correcting errors. The approach emphasizes the importance of targeted sentence retranslation. Niloofar Akhavan [14] believes that bilingual people benefit from the acquisition of two languages in terms of their cognitive control. However, real-time interference during parsing, as is the case in object-relative sentences, is not reduced by such cognitive control. The results of the experiment indicated that the bilinguals performed better in terms of interference management while processing complex sentences because they were subject to less interference from the intervening noun phrases. Bhagat Bhavesh [15] proposes a method combining Gated Recurrent Units and Bidirectional Transformers for Automatic Speech Recognition (ASR) in the language Gujarati, the language-specific issues are targeted at Word Error Rate (WER) reduction. Georgia Zellou [16] highlights the challenges of adapting ASR systems for low-resource languages like Tashlhiyt. Linguistically informed modifications improve performance, emphasizing the need for global access to speech technology. Study carried out by Portia N.Washington [17] based on bilingual sentence processing reveals how syntactic and semantic factors influence mixed-language comprehension, with proficiency being the most critical factor that affects the cross-linguistic representation. Afifah Khan Mohammed [18] translates transliterated text using BERT and the Google Translate API for high-precision language classification. The research supports content moderation and multilingual communication. Yutika Rajanak [19] discusses NLP-based text recognition techniques that assist in processing and understanding language for systems like Siri and Alexa. The development actively extended research in the application area of NLP.

Yian Li [20] introduced ULR (Universal Language Representation Learning) for unified vector representation across languages. This model showed high accuracy on word analogy tasks and recommended changes in how future training objectives would look like. Himanshu Beniwal's [21] Cross-Lingual Model Editing (XME) paradigm modifies facts across languages, addressing challenges in multilingual contexts. This approach highlights the need for continued development in XME techniques. Bice and Kroll (2021) [22] compare Heritage bilinguals with Monolinguals to examine individual experiences and cognitive abilities related to the effects of how grammatical processing in their native and second languages differs. They found that Heritage bilinguals could make some grammatical errors in L1 but scored better in L2. They also discovered that L1 comprehension in bilinguals was more heavily influenced by proficiency. Diego Bear's [23] research on endangered languages like Wolastoqey leverages vector representations for semantic clustering and word prediction. Transformer-based models outperform traditional methods, emphasizing their utility in low-resource settings. Schwartz's [24] findings indicate second language (L2) lexical processing in sentence contexts involves cognitive mechanisms. Low constraint sentences show both the languages have an influence on processing, but highly constrained phrases limit cognate facilitation. The findings indicate that context can minimize cross-linguistic lexical competition. Diego Bear's [25] research uses the Wolastoqey language to convert English into vectors for defining concepts. The findings show the methods of transformer-based models provide more significant gains than the ones achieved with specialized training or fine-tuning. Future directions of the project will involve sentence representations and dictionary definitions. Julian Just [26] discusses NLP's involvement in innovation by showing how methods improve trend forecasting and problem-solution matching. LLMs are going to be the game changers in AI-based innovation processes. Wannaphong Phatthiyaphaibun [27] has introduced PyThaiNLP, an open-source Thai language natural language processing library, which enhances call fulfillment, reduces wait times, and boosts customer retention. PyThaiNLP is used by VISAI for relation extraction, named entity recognition, and text classification. Xinlu Li's [28] framework for cross-lingual natural language understanding uses contrastive learning to improve in-vehicle communication systems, achieving superior intent and slot recognition. Chi Wei [29] proposes FSpell, a method addressing spelling errors in NLP systems. By preserving input details and minimizing computational demands, the model improves performance on Chinese Spelling Check tasks. Bill Yuchen Lin's [30] multilingual language models (ML-LMs) enhance common sense understanding using the Mickey Probe dataset. This approach demonstrates significant improvements in

Megha S. Patel *et al.,*

multilingual NLP performance. Yang et al. [31] introduce Teacher Sim, a monolingual embedding-based evaluation method for machine translation. The system improves translation quality and semantic alignment across multilingual contexts, outperforming baseline methods A possible method for resolving issues with cross-lingual communication is the bilingual sentence refiner. However, multilingual support, improved semantic and cultural context processing, and an enhanced user interface are required to meet present constraints in its evolution. Through the integration of sophisticated methods for mistake correction, semantic analysis, and low-resource language support, along with the enhancement of user interface functionalities, the system has the capacity to substantially advance the domain of cross-lingual communication and translation accuracy. The reviewed research provides a strong foundation for advancing the proposed bilingual sentence refiner. Key insights from various studies reveal several areas for future development:

- **Error Handling and Input Interference**
  The integration of advanced strategies to eliminate input faults might enhance the accuracy of sentence correction by the multilingual refiner in handling errors and interference from input, as noted by Wei et al. (2024). Error management and input interference will benefit from this. Eliminating errors and improving sentence processing would result from this.

- **Semantic Processing**
  Mao and his colleagues (2024) highlight the importance of deep semantic understanding in cross-lingual translations. The incorporation of these techniques which enhance the usability and ease of the translation will further enhance the system's capability to cope with casual expressions, cultural nuances and contextual interpretation.

- **Multilingual and Low-Resource Language Support**
  It is imperative to extend the support beyond Gujarati-English. Cross-lingual editing tools are essential for good multilingual communication, as demonstrated by research like that done by Beniwal and Singh (2024). The use and impact of the tool would rise with more language support.

- **Cultural Sensitivity and Contextual Refinement**
  Just (2024) emphasizes how important it is that translation technologies be suitable for different cultures. Making translations more culturally and contextually acceptable should be the aim of next advancements.

- **User Feedback and Learning Mechanism**
  Bhagat and Dua (2024) suggest that including feedback loops into the system can be advantageous in terms of user feedback and learning mechanisms. This would let the system to continuously enhance itself based on user interaction, increasing its precision and flexibility.

PROPOSED SYSTEM

Based on the analysis, the system architecture for the bilingual sentence refiner is proposed, as elucidated in Fig. 1. Brief explanation of each step of proposed system (Fig. 2) as following:

Step 1: User Interaction.
Individuals interact with the system through a user interface, which may take the form of a web-based application or an independent software program. They present bilingual sentences that they seek to refine. These sentences may exist in the source language, the target language, or a hybrid of both.

Step 2: Input Processing.
The input sentences are processed by the system, which may involve text normalization, language detection, and initial analysis.

Step 3: Translation and Analysis.
If required, the source sentences are translated into the target language using a translation engine or model. Both the source and translated sentences are analyzed for grammatical errors, syntax, style, tone, and cultural nuances.

Step 4: Refinement Generation.
Based on analysis, the system then comes out with suggestions on how to improve the sentences. This may involve grammatical corrections, rephrasing, or cultural adaptations.

Step 5: Suggestion Presentation.
The refined suggestions are presented to the user through the interface, along with the original sentences. Users can review and choose the recommendations they consider suitable for each of the sentences.

Step 6: User Interaction (Review and Selection).
The proposed refinements are presented to users and they can either take them as is, change them or reject the suggestions for each sentence. It also offers details on its own refinements or corrections.

Step 7: Refinement Feedback and Learning.
The system learns based upon these user interactions and decisions. The system evolves and refines the suggestions over time, according to user feedback.

Step 8: Final Output.
If the user is satisfied with those refined sentences then they can go ahead and get final set of Refined Bilingual Content.

RESULT AND DISCUSSION

The proposed research topic is about developing a bilingual sentence refiner, which is a machine learning model intended for the usage of enhancing text-translated quality. The following discussion addresses the possible impacts and consequences of this system within the context of cross-lingual communication and advancements in machine translation. Effective communication across languages is very important in fields such as business, academia, and diplomacy. Tackling common problems in machine translation included grammatical mistakes, inconsistency in syntax, and no cultural appropriation by the bilingual sentence refiner can increase the accuracy and fluency of translated text. Moreover, the conversation also covers wider aspects associated with the bilingual sentence refiner. In other domains, it can go well beyond the borders of modern machine translation systems, it has a potential to revolutionize inter-personal communication across many languages in numerous domains. For example, in an international corporation, accurate and culturally sensitive communications are keys to the business's prosperity, and polishing translation materials facilitates operation management and allows for good interpersonal relation among team members from different backgrounds. This is because developing a bilingual sentence refiner with its inclusion in machine settings has been considered the greatest innovation in the history of machines. Translation via NLP has had wide and numerous impacts in improving communication among languages. Still, this technology can improve further if the text to be translated is improved upon according to systematic user feedback incorporated into the system. Translations that demonstrate fluency and cultural sensitivity can facilitate significantly closer and more meaningful communication across languages and cultures.

CONCLUSION

The bilingual sentence refiner developed in the research is a big improvement in cross-lingual communication, which emphasizes raising translation accuracy and fluency. Its error correction and semantic analysis are greatly facilitated

94748

by sophisticated techniques and conquer existing limitations in translation quality. It goes beyond the issues of grammatical correctness, exploits differences in cultural values, and considers core competencies-based requirements both in correct communication and adequate use of the language. This includes making recommendations for alterations related to sentence-making: restatement and cultural tailoring so that translation becomes pertinent in context. Refiner influence is much beyond just accuracy and greatly contributes to much more substantial areas of machine translation, proper handling of complicated sentence structures also enables bilinguals to process sentences with less interference. In conclusion, the bilingual sentence refiner is a promising tool which it has the potential to better communicate and translate more accurately and fluently in the further development of computational linguistics, as well as supports a globally connected community.

FUTURE SCOPE

There are several promising directions for the further development of the bilingual sentence refiner. One of them is task-oriented training of bilingual embeddings and could improve the quality estimation and proficiency in translation. Moreover, large language models may be integrated with pre-trained language models, which can result in better semantic processing and overcome current challenges appearing in the field of computational linguistics. Further improvement could be made by enhancing the coverage of the system towards more languages support, particularly the under-resourced languages, these would significantly improve cross-language interactions. In the long term, by including user feedback and testing, the suggestions of the correction of grammar as well as cultural adaptation provided by the system would be optimized thus ensuring the correctness as well as the appropriateness for the given context of the translations. This development would significantly contribute to the advance in translation tools that are more complex, yet user-friendly.

Table 2. Summary of Reviewed Research Papers

Ref No.	Paper Year	Methodology/Techniques	Key Findings
2	2024	Survey of semantic processing techniques	• Highlighted deep semantic understanding for better translation quality. • Suggested improving cross-lingual communication using advanced semantic models.
3	2023	NLP applications in various domains	• Reviewed broad applications of NLP across different industries. • Highlighted the potential of NLP in enhancing language processing systems.
4	2023	ChatGPT for various NLP tasks	• Evaluated ChatGPT's ability to handle multiple NLP tasks. • Demonstrated its flexibility and limitations in cross-lingual contexts.
5	2024	NLP techniques for automated scoring	• Showed how NLP models can automate text scoring tasks. • Demonstrated potential for assessing complex language inputs.
6	2023	Transfer of large language models across different languages	• Highlighted visual supervision techniques for cross-lingual transfer. • Focused on improving low-resource language processing using large models.
7	2021	Retrieval of information across multiple languages	• Designed a cross-lingual information retrieval system specifically for Arabic. • Highlighted key challenges in cross-lingual search queries.
8	2021	Semantic morphological selection techniques	• Focused on addressing translation ambiguities for better retrieval. • Improved translation accuracy using morphological variant selection.
9	2023	Cross-lingual search optimization	• Addressed challenges in cross-lingual e-commerce search queries. • Utilized domain-specific fine-tuning for better results.
10	2016	Dictionary-based machine translation system	• Addressed challenges in translating idiomatic expressions. • Proposed a dictionary-based approach to improve translation accuracy.
11	2022	Cross-lingual summarization	• Provided a comprehensive review of cross-lingual

Megha S. Patel *et al.,*

		techniques	summarization methods. • Identified challenges in summarizing content across different languages.
12	2016	Bilingual embeddings and word alignment	• Demonstrated the use of embeddings for translation quality estimation. • Improved alignment methods to enhance translation accuracy.
13	2023	Sentence translation improvement analysis	• Identified key areas for improving sentence translation accuracy. • Suggested techniques to enhance cross-lingual sentence fluency.
14	2020	Cognitive regulation in bilingual sentence comprehension	• Investigated the influence of cognitive control on bilingual understanding. • Identified key factors influencing sentence processing in bilinguals.
15	2024	Improved ASR and spell correction algorithms	• Improved performance for Gujarati language ASR. • Demonstrated techniques for low-resource language processing.
16	2024	Cross-lingual ASR transfer	• Identified challenges in transferring speech models between languages. • Emphasized training with diverse datasets to improve accuracy.
17	2022	Bilingual sentence superiority effect analysis	• Investigated how proficiency impacts bilingual sentence comprehension. • Highlighted the importance of semantic knowledge in bilinguals.
18	2024	Language detection algorithms for transliterated text	• Developed effective language detection methods for transliterations. • Improved multilingual system performance with transliterated inputs.
19	2023	NLP for language detection	• Showcased efficient language detection techniques for cross-lingual systems. • Essential for improving multilingual communication tools.
20	2021	Pre-training for multilingual language models	• Improved universal language representations using pre-training techniques. • Suggested approaches to enhance multilingual model performance.
21	2024	Cross-lingual editing via multilingual models	• Demonstrated improvements in multilingual text editing. • Showed potential for broader cross-lingual applications in NLP.
22	2021	Grammatical processing in heritage bilinguals	• Analyzed how bilingual experience affects grammatical comprehension. • Highlighted individual differences in bilingual processing.
23	2023	Fine-tuning the RoBERTa model for languages with limited resources.	• Demonstrated advancements in sentence embeddings for languages with limited resources. • Highlighted the importance of bilingual dictionaries in the process of building embeddings.
24	2006	Bilingual lexical activation models	• Examined how bilinguals activate lexical items in

Megha S. Patel *et al.,*

			different contexts. • Provided insights into bilingual sentence processing.
25	2022	Bilingual dictionary for word representations	• Enhanced word representation for low-resource languages. • Utilized bilingual dictionaries to support rare language processing.
26	2024	NLP techniques for innovation search	• Explored the role of NLP in innovation processes. • Suggested NLP as a tool to drive non-human mediated innovation.
27	2023	Python-based NLP tools for Thai	• Developed tools for Thai language processing, applicable to low-resource languages. • Addressed challenges in building NLP tools for smaller languages.
28	2023	Cross-lingual natural language understanding for vehicles	• Developed a framework for cross-lingual NLU in in-vehicle dialogues. • Improved multilingual communication systems for automotive use.
29	2024	Fusion of spelling error correction algorithms	• Reduced input errors for better text processing accuracy. •Enhanced sentence refinement in multilingual applications.
30	2021	Commonsense reasoning in multilingual models	• Evaluated the commonsense reasoning abilities of multilingual models. • Proposed methods to enhance commonsense reasoning across languages.
31	2023	Cross-lingual translation evaluation	• Proposed using monolingual embeddings for translation quality evaluation. • Improved cross-lingual machine translation metrics.

ABSTRACT

Epilepsy, a common neurological disorder in children, often remains refractory to pharmacological treatments, prompting the exploration of alternative therapies such as the ketogenic diet (KD). The KD, characterized by a high-fat, low-carbohydrate composition, has shown promise in reducing seizure frequency in drug-resistant epilepsy. This diet's therapeutic effects are believed to be mediated through metabolic changes, including ketosis, and alterations in the gut microbiome. The gut microbiome, which influences the gut-brain axis, plays a significant role in neurological health, and its imbalance. Dysbiosis, is associated with various neurological disorders, including epilepsy. This review examines the interplay between the ketogenic diet and the gut microbiome in pediatric epilepsy. It highlights how the KD induces significant changes in gut microbiome composition, potentially contributing to its anti-seizure effects while also leading to dysbiosis. The review further explores the impact of this dysbiosis on gut health and overall well-being. Strategies to mitigate KD-induced dysbiosis are discussed, including the use of probiotics, prebiotics, dietary fiber, and synbiotics, as well as the importance of periodic monitoring of gut microbiome health. By understanding the complex interactions between the KD and the gut microbiome, this review aims to provide insights into optimizing therapeutic outcomes and

minimizing adverse effects in children undergoing KD therapy. Future research should focus on long-term effects and tailored interventions to address dysbiosis and enhance the overall efficacy of the ketogenic diet in managing epilepsy.

INTRODUCTION

Epilepsy is one of the most prevalent neurological disorders in children, characterized by recurrent, unprovoked seizures (Kossoff *et al.,* 2009). Despite advancements in pharmacotherapy, about 20-30% of children with epilepsy remain refractory to conventional treatments, leading to the exploration of alternative therapeutic approaches, including dietary interventions like the ketogenic diet (KD) (Freeman *et al.,* 2007). The ketogenic diet is a high-fat, low-carbohydrate, and adequate-protein diet that has been shown to effectively reduce seizure frequency in children with drug-resistant epilepsy (Rho, 2017). The therapeutic mechanism of KD is multifaceted, involving metabolic changes such as ketosis, modifications in neurotransmitter levels, and alterations in the gut microbiome (Cryan and Dinan, 2012). The gut microbiome, a complex community of microorganisms residing in the gastrointestinal tract, plays a crucial role in maintaining health and influencing the central nervous system through the gut-brain axis (Mulle *et al.,* 2013). Dysbiosis, an imbalance in the gut microbiome, has been implicated in various neurological disorders, including epilepsy (Olson et al., 2018). The KD can induce significant changes in the gut microbiome, which may contribute to its anti-epileptic effects (Ramezani and Raj 2014). However, these changes can also lead to dysbiosis, potentially affecting the overall health of pediatric patients on KD (Heijtz *et al.,* 2011). This review aims to explore the relationship between the gut microbiome and the ketogenic diet in children with epilepsy, discuss the potential impact of KD-induced dysbiosis, and strategies to mitigate this issue.

Article Search

This review was conducted by systematically searching the PubMed, Scopus, and Web of Science databases for relevant studies published between 2000 and 2024. The search terms included "ketogenic diet," "gut microbiome," "epilepsy," "children," and "dysbiosis." Articles were selected based on their relevance, with a focus on studies that examined the effects of the ketogenic diet on the gut microbiome in children with epilepsy and strategies to resolve dysbiosis. Studies that included other dietary interventions or adult populations were excluded. A total of 31 articles were reviewed in order to write this review paper. These articles were reviewed in detail, and data were extracted on the effects of the ketogenic diet on the gut microbiome, the relationship between gut dysbiosis and epilepsy, and methods to resolve dysbiosis in pediatric patients on the ketogenic diet.

The Gut Microbiome and Epilepsy

The gut microbiome plays a crucial role in regulating various bodily functions, including digestion, immune responses, and neurotransmitter production (St-Onge *et al.,* 2014). It is increasingly recognized that the gut-brain axis, a bidirectional communication system between the gastrointestinal tract and the central nervous system, is involved in the pathogenesis of epilepsy (Zhang *et al.,* 2020). Alterations in the gut microbiome composition, known as dysbiosis, have been observed in individuals with epilepsy, suggesting a potential link between gut health and seizure activity (Sousa *et al.,* 2022). Studies have shown that children with epilepsy exhibit a distinct gut microbiome profile compared to healthy controls, characterized by reduced microbial diversity and an altered abundance of specific bacterial taxa (Vieira et al., 2012). These changes may influence the production of short-chain fatty acids (SCFAs), neurotransmitters, and inflammatory mediators, which in turn can affect seizure susceptibility (Gopalkrishnan *et al.,* 2018). For instance, reduced levels of SCFAs, such as butyrate, have been associated with increased seizure activity in animal models (Xu *et al.,* 2021).

The Ketogenic Diet and the Gut Microbiome

The ketogenic diet has been shown to induce significant changes in the gut microbiome, which may contribute to its anti-epileptic effects (Zhang *et al.,* 2019). The high fat and low carbohydrate content of the KD can alter the composition of gut bacteria, leading to an increase in ketogenic and anti-inflammatory bacteria and a decrease in pathogenic bacteria (Li *et al.,* 2021) Several studies have reported that KD promotes the growth of beneficial bacteria, such as *Akkermansiamuciniphila* and *Parabacteroides*, which are associated with improved gut barrier function and anti-inflammatory effects (Hsu *et al.,* 2020). These changes in the gut microbiome may enhance the production of SCFAs and other metabolites that have neuroprotective properties, thereby reducing seizure frequency (Crittenden *et al.,* 2020). However, the KD can also lead to dysbiosis, characterized by a reduction in microbial diversity and an overgrowth of certain bacterial species (Riva *et al.,* 2021). For example, some studies have reported an increase in the abundance of pathogenic bacteria, such as *Escherichia coli* and *Clostridium spp.,* in children on the KD (Muegge *et al.,* 2011). This dysbiosis can have negative effects on gut health, potentially leading to gastrointestinal symptoms, inflammation, and an increased risk of infections (Vitetta *et al.,* 2020)

Resolving Dysbiosis in Children on Ketogenic Diet

Given the potential for KD-induced dysbiosis, it is important to consider strategies to maintain or restore a healthy gut microbiome in children with epilepsy on the ketogenic diet. Several approaches have been proposed in the literature to mitigate the negative effects of the KD on the gut microbiome:

➢ **Probiotics and Prebiotics:** Supplementation with probiotics and prebiotics can help restore a balanced gut microbiome by promoting the growth of beneficial bacteria and inhibiting pathogenic bacteria (Zhang et al., 2020). Probiotics, such as *Lactobacillus* and *Bifidobacterium* species, have been shown to improve gut health and reduce gastrointestinal symptoms in children on the KD (Lee *et al.,* 2022). Prebiotics, such as inulin and fructooligosaccharides, can enhance the production of SCFAs and support the growth of beneficial bacteria (D'Hyver *et al.,* 2021).

➢ **Dietary Fiber:** Increasing the intake of dietary fiber can help counteract the reduction in microbial diversity associated with the KD (Miskovitz *et al.,* 2021). Fiber acts as a substrate for fermentation by gut bacteria, leading to the production of SCFAs and other beneficial metabolites (Zhang *et al.,* 2022). Incorporating fiber-rich foods, such as vegetables and low-carbohydrate fruits, into the KD can support a healthy gut microbiome while maintaining the diet's therapeutic effects (Mahajan et al., 2023).

➢ **Synbiotics:** The use of synbiotics, a combination of probiotics and prebiotics, has been suggested as a more effective approach to restoring gut health in children on the KD (Xu *et al.,* 2022). Synbiotics can enhance the colonization of beneficial bacteria and improve gut barrier function, reducing the risk of dysbiosis and associated complications (Sandhu *et al.,* 2022).

➢ **Periodic Monitoring:** Regular monitoring of the gut microbiome in children on the KD can help identify early signs of dysbiosis and guide appropriate interventions (Wang *et al.,* 2022). This may include adjusting the diet, incorporating specific supplements, or using targeted probiotics based on the individual's gut microbiome profile (Wu *et al.,* 2023).

CONCLUSION

The ketogenic diet is an effective therapeutic option for children with drug-resistant epilepsy, with its benefits extending beyond seizure control to include potential neuroprotective effects mediated by changes in the gut microbiome. However, the diet's impact on the gut microbiome can lead to dysbiosis, which may have negative consequences for gut health and overall well-being. To optimize the therapeutic outcomes of the KD while minimizing the risk of dysbiosis, it is essential to adopt strategies that support a healthy gut microbiome. These strategies include the use of probiotics, prebiotics, synbiotics, and dietary fiber, as well as regular monitoring of gut health. Future research should focus on understanding the long-term effects of the KD on the gut microbiome and developing tailored interventions to prevent or resolve dysbiosis in pediatric patients.

ABSTRACT

Pregnancy and childbirth are significant events, requiring high-quality care to ensure the well-being of both mother and newborn. However, disrespect and abuse during hospital delivery are barriers to care and violate women's rights. Despite growing recognition of respectful maternity care as a fundamental right, there is a lack of standardized tools to assess RMC, particularly in India. This study aims to develop and validate the Respectful Maternity Care Assessment Tool for antenatal, intranatal, and postnatal care. This study will employ a sequential exploratory mixed-method design in three phases: (1) Qualitative phase—In-depth interviews with postnatal women, medical officers, and midwives to explore their experiences and perceptions of RMC. (2) Integration phase—Development of the tool by converting qualitative data into scale items, informed by a comprehensive literature review. (3) Quantitative phase— Psychometric testing of the tool, including expert validation using the Delphi technique, followed by field testing with 300 postnatal women for reliability and validity. The study will result in a validated RMC Assessment Tool to evaluate respectful maternity care across all stages of maternity services. This tool will help identify areas for improvement, contributing to better maternal care and supporting women's rights during childbirth.

Keywords: Respectful Maternity Care, Assessment Tool, Psychometric Testing, Maternal Health, Quality of Care, Human Rights.

Angelina Makwana and Sapna Patel

INTRODUCTION

Around the globe, pregnancy and childbirth are profound milestones carrying significant personal and social implications for women, families, and communities. Supporting women throughout this journey is crucial for the well-being of both mothers and newborns. Unfortunately, during childbirth and the subsequent postpartum period, these essential needs can often be overlooked, leading to potential marginalization. Simply focusing on reducing maternal and newborn morbidity and mortality is insufficient. Comprehensive care during this period must uphold fundamental human rights, such as respect, dignity, confidentiality, access to information and informed consent, the right to optimal health standards, and freedom from discrimination and any form of mistreatment [1]. The emphasis of policy attention is currently shifting to improving care quality due to rising rates of institutional delivery. During labor and delivery, women in medical facilities are subjected to mistreatment and disrespect, which is one aspect of low-quality care [2]. Disrespect and mistreatment experienced by women during institutional childbirth can discourage the utilization of maternity care services. Such negative experiences during labor and delivery not only impact women's willingness to seek future obstetric care at healthcare facilities but also infringe upon their fundamental rights [3-6]. Seven types of abuse and disrespect were distinguished by Browser and Hill in 2010.7 According to the first consensus document, "The Respectful Maternity Care Charter: The universal rights of childbearing women," published by the White Ribbon Alliance in 2011, dis-RMC is a human rights violation [1]. "Respectful maternity care (RMC) is a basic and universal right for all women who are pregnant. This involves respect for women's dignity, autonomy, empathy, privacy, confidentiality, feelings, choices and preferences, including companionship throughout maternity care and continuous care during labour and delivering. It assures that there is no damage and ill-treatment." Recommendations from the WHO [8]. The World Health Organization (WHO) outlined eight aspirational standards for quality maternal and newborn healthcare in its 2015 quality-of-care framework. Among these, effective communication, respect and dignity, and emotional support are essential for ensuring a positive childbirth experience. The remaining five standards focus on delivering evidence-based clinical care and are linked to key health system functions, including the availability of essential commodities, human resources, referral systems, and information management [9].

Women are abused and mistreated all throughout the world, according to recent research and systematic evaluations. The rate of mistreatment ranged from 15% to 98%, according to a comprehensive review[10]. According to a comprehensive review, 71.31% of Indians experience disrespect and abuse [11]. In research conducted in hospitals, the prevalence was 65.38%, while in community-based studies, it was 77.32% [11]. One factor preventing women from using maternity care services, which contributes to maternal mortality and morbidity, is the disrespect and maltreatment they endure during institutional birthing services. According to SRS (2016–18) data, Gujarat has a maternal mortality ratio (MMR) of 75, whereas India's MMR is 113 [12]. RMC is a problem that is often overlooked despite international attempts to improve the quality of maternal care [13]. Different cultures and geographical regions are the origins of RMC components. There aren't many tools available in India[14]. All phases of pregnancy, including the prenatal, intrapartum, and postpartum phases, are covered by RMC. A woman should always be treated with the same respect and has the right to seek therapy [1]. The drive to measure and enhance RMC may stall in the absence of standardized and validated instruments since it may be unclear what RMC is and how to best focus intervention efforts. In order to evaluate respectful maternity care, the current study is to create and validate the instrument.

MATERIALS AND METHODS

The study will be conducted using Sequential exploratory Mixed method Design. The methodology includes three phases: (1) Qualitative phase (2) Integration (3) Quantitative phase.

Angelina Makwana and Sapna Patel

Qualitative phase

The focus of this phase will be on development of the pool of items of tool for the Assessment of Respectful Maternity Care. In-depth interview will be conducted with the postnatal mothers' medical officers and Midwives. In-depth interviews will be conducted with postnatal women, medical officers and Midwives to explore their perceived experiences and implementation of Respectful Maternity Care. Postnatal women will be selected using an purposive sampling technique and data will be collected from selected private and public health centres in Anand district, Gujarat. Women who received pregnancy and childbirth services in these healthcare settings will be included, while those with complications related to pregnancy and childbirth will be excluded. Similarly medical officers and midwives who have been providing maternity services at the selected health centres for at least 6 months will be included. Data collection for postnatal mothers, medical officers and Midwives will use a researcher-developed semi-structured interview guide, validated by experts in obstetrics and qualitative research. Thematic analysis will be conducted using Braun and Clarke's (2006) six-step framework.

Integration

The integration phase will involve developing a tool by converting qualitative data into scale items. Qualitative data will be analysed to identify key themes, which will guide the construction of quantitative scale items. Integration will occur during data collection using a "connecting" strategy, ensuring the qualitative findings directly inform the scale development. The scale will be based on Item Response Theory and will consist of three subscales: Antenatal, Intranatal, and Postnatal. Each subscale will include dichotomous questions with response options of "Yes," "No," and "Uncertain." The item pool will be generated through a comprehensive literature review of instruments assessing Respectful Maternity Care and relevant national guidelines. Data triangulation from multiple sources, including the perceived experiences of postnatal women and the perceptions of healthcare workers (medical officers and midwives), will ensure the tool's comprehensiveness and validity.

Quantitative phase

This phase focuses on assessing the psychometric properties of the Respectful Maternity Care (RMC) Assessment tool. It includes two subphases.

Validation of the tool

A panel of 15 experts specializing in instrument development, midwifery, reproductive health, psychology, and obstetrics will be invited to review the scale items. They will evaluate aspects such as wording, grammar, item allocation, relevance, clarity, essentiality, and scaling. The Delphi technique will be employed in two rounds: the first round will focus on refining, eliminating, or adding items to ensure comprehensive domain coverage, while the second round will formally assess the content validity of the items and the scale. Both face validity and content validity will be examined during the process.

Assessment of Reliability of the tool

Drafted tool will be administered on the 300 postnatal women of selected health centers of Anand district, Gujarat. The inclusion and exclusion criteria will be same as of the qualitative phase. Basic item analysis, factor analysis and internal consistency analysis will be done.

DISCUSSION

The present study addresses a critical gap in the field of maternity care by focusing on the development and validation of the Respectful Maternity Care (RMC) Assessment Tool. Despite global initiatives aimed at improving maternal care quality, the concept of RMC remains underexplored, particularly in the Indian context. As the evidence on disrespect and abuse during childbirth has grown, its negative impact on women's health-seeking behaviors and overall maternal health outcomes is undeniable. A systematic review by Bohren et al. (2015) indicated that mistreatment during childbirth is a widespread issue, with the prevalence ranging from 15% to 98% globally.

Angelina Makwana and Sapna Patel

Similarly, studies conducted in India have reported a concerning prevalence of 71.31% (Ansari & Yeravdekar, 2020), underscoring the urgent need for systematic assessment and interventions. The qualitative phase of this study will provide valuable insights into the perceptions of women and healthcare providers regarding RMC, allowing for the creation of a comprehensive and culturally relevant tool. The integration of these qualitative findings with a robust literature review will ensure that the resulting scale is grounded in both theory and practice. Furthermore, expert validation through the Delphi technique will ensure the content validity of the tool, while field testing will assess its reliability. The results of this study will not only fill the existing gap in standardized tools for RMC assessment but also serve as a foundation for future research aimed at improving maternal care quality. By ensuring respect, dignity, and autonomy for women throughout the maternity care continuum, the tool will facilitate targeted interventions, contributing to better outcomes in maternal health. The implications of this study are significant, as it aims to enhance the quality of maternal care, a fundamental determinant of maternal and neonatal health. Furthermore, by aligning with global frameworks like the WHO's recommendations on maternal and newborn health, this tool will be instrumental in guiding healthcare providers and policymakers in improving respectful maternity care services, ensuring that every woman's rights are upheld during childbirth.

CONCLUSION

This study protocol details the development and psychometric testing of the Respectful Maternity Care (RMC) Assessment Tool. The tool will be used to evaluate the quality of Respectful Maternity Care across the antenatal, intranatal, and postnatal phases of pregnancy and childbirth. The aim is to ensure comprehensive, reliable assessment of RMC practices, contributing to improved maternal care.

ABSTRACT

Millions of individuals throughout the world suffer from neck discomfort, which is a common ailment. Numerous things, such as bad posture, injuries, strained muscles, and nerve damage, might contribute to it.[1] A person's capacity to carry out everyday tasks may be impacted by neck pain, which can range in severity from little discomfort to excruciating agony. In extreme situations, headaches, shoulder discomfort, and even tingling or numbness in the arms might result from neck pain [2]. Neck discomfort has a large financial impact since it can lead to incapacity, medical expenses, and lost productivity. A repetitive stress injury to the neck brought on by keeping your head forward for a lengthy amount of time is known as "text neck syndrome."[4] The cervical spine's curvature, as well as the muscles and ligaments supporting it, are all impacted by this position. These days, the agony of the contemporary day is another name for text neck syndrome. The American chiropractor Dr. Dean L. Fishman was the first to use the phrase "TEXT NECK."[3]The current ailment known as "text neck syndrome," or "tech neck," is defined by neck pain and discomfort brought on by extended use of electronic devices such computers, tablets, and smart phones [5]. Due to the increasing use of digital technology and the rising dependence on electronic gadgets in both personal and professional contexts, text neck syndrome has become much more common in recent years. The repeated and prolonged forward flexion of the neck when using electronic gadgets is the main cause of text neck. Muscle imbalances, tension, and discomfort result from this posture's excessive strain on the neck's muscles, ligaments, and tendons. Untreated text neck syndrome can eventually lead to osteoarthritis, degenerative disc disease, and herniated discs, among other structural alterations in the cervical spine. [1, 3] Physical therapy [4], painkillers [5], chiropractic adjustments [6], and occasionally surgery are all options for treating neck discomfort. This study's objective is to conduct a narrative evaluation of the data and publications pertaining to text neck syndrome and determine whether using a cell phone or other smart device significantly affects neck health. Text neck syndrome represents a significant public health concern in the digital age, with implications for individuals of all ages [7]. By understanding the prevalence, risk factors, and biomechanical implications of this condition, healthcare professionals can develop targeted interventions to promote neck health and mitigate the impact of excessive device use on

musculoskeletal health. [8.9] This study's objective is to conduct a narrative evaluation of the data and publications pertaining to text neck syndrome and determine whether using a cell phone or other smart device significantly affects neck health.

Keywords: Text Neck Syndrome, Neck Pain, Forward Head Posture, Smartphone Use, Adolescents

INTRODUCTION

Boolean operators are used to efficiently integrate terms in search queries, guaranteeing a thorough search. Search results are refined using filters based on language, research kind, and publication date. Selected publications' full texts are acquired for in-depth analysis and data extraction. In order to find any other sources, reference lists from pertinent publications are also manually searched. To find out more information or unpublished data, subject-matter experts may also be engaged From the above review we are able to confirm that the usage of smart phones and gadgets is one of the leading causes for the text neck. According to the authors above the text neck can lead to change in posture, severe neck pain, Muscle shortening and weakness of the muscle [9, 10]. The abundance of literature on text neck syndrome and its association with mobile device use underscores its significance as a modern health concern. Firstly, the prevalence of text neck syndrome varies across studies, reduce the risk of developing text neck syndrome. In terms of interventions, the literature emphasizes the importance of posture education and ergonomic adjustments to mitigate the risk of text neck syndrome. Recommendations include holding devices at eye level, using larger screens, and distributing device weight evenly between both hands. Additionally, rehabilitation protocols aimed at addressing muscular imbalances and promoting proper posture have shown promise in managing musculoskeletal disorders arising from handheld device use.

LITERATURE SEARCH

Several crucial measures were taken in order to perform a comprehensive literature search on Text Neck Syndrome, a widespread issue among students in the current period. In order to establish the foundation of the search, pertinent terms and phrases like "Text Neck Syndrome," "Students," "Adolescents," and "Global" are first recognized. To find pertinent publications, suitable databases such as PubMed/MEDLINE, Google Scholar, and Psyc INFO are then chosen. Boolean operators are used to efficiently integrate terms in search queries, guaranteeing a thorough search. Search results are refined using filters based on language, research kind, and publication date. Selected publications' full texts are acquired for in-depth analysis and data extraction. In order to find any other sources, reference lists from pertinent publications are also manually searched. To find out more information or unpublished data, subject-matter experts may also be engaged. To effectively arrange and manage citations throughout the procedure, reference management software is used. A thorough analysis of Text Neck Syndrome as a worldwide problem among students may be carried out by using this methodical methodology, which will yield important information about its incidence, effects, and possible solutions. The research will only include English-language publications that were published between 2013 and December 2023. This research considers studies published during the last ten years. The literature review is identified, analyzed, and carried out according to guidelines.

DISCUSSION

From the above review we are able to confirm that the usage of smart phones and gadgets is one of the leading causes for the text neck. According to the authors above the text neck can lead to change in posture, severe neck pain, Muscle shortening and weakness of the muscle [9, 10]. The abundance of literature on text neck syndrome and its association with mobile device use underscores its significance as a modern health concern. Firstly, the prevalence of text neck syndrome varies across studies, with reported rates ranging from mild to severe among college students, medical students, and young adults [11, 12]. This variability reflects the widespread impact of excessive smart phone and handheld device usage on neck health [13,14]. Secondly, risk factors contributing to text neck syndrome are

multifactorial and include prolonged neck flexion, frequent texting or gaming, and poor sitting posture [15,16]. Biomechanical studies reveal that prolonged device use leads to adverse changes in cervical and thoracic spine alignment, along with muscular imbalances and postural compensations. Furthermore, specific tasks such as texting with one hand or using thumb-dominant typing styles may exacerbate symptoms [17, 18]. Additionally, studies highlighted that gender predominance, with females often exhibiting higher rates of musculoskeletal symptoms, particularly in relation to smart phone addiction [19, 20].

CONCLUSION

By the practice of good Posture slouching or leaning forward can be avoided. By performing regular neck exercises especially stretching and strengthening improve flexibility. Simple exercises like chin tucks, neck rotations, and side stretches can be effective. The screen time has to be reduced and regular breaks have to be taken to avoid overuse. Care should be taken to ensure the workspace is ergonomically optimized like the height of chair, desk, and screen and should be set up to promote a neutral posture. By incorporating these habits into a regular routine, one can significantly reduce the risk of developing text neck syndrome. In terms of interventions, the literature emphasizes the importance of posture education and ergonomic adjustments to mitigate the risk of text neck syndrome. Recommendations include holding devices at eye level, using larger screens, and distributing device weight evenly between both hands. Additionally, rehabilitation protocols aimed at addressing muscular imbalances and promoting proper posture have shown promise in managing musculoskeletal disorders arising from handheld device use. However, despite the growing body of research on text neck syndrome, several gaps remain in our understanding of this phenomenon. For instance, while studies have identified risk factors and biomechanical implications, there is still limited evidence on the longitudinal effects of prolonged device use on neck health. Moreover, inconsistencies in study methodologies and outcome measures hinder the establishment of clear guidelines for prevention and management.

ABSTRACT

Adaptive Mobility Prediction (AMP) Algorithm is a method proposed to enhance the reliability and operational efficiency in routing protocol functioning in vehicular ad hoc networks (VANETs). This is where VANETs came to the fore in ASV. They presented certain reliability issues regarding the communication links, given the dynamics of the network where mobility of vehicles can affect it. This paper presents Adaptive Mobility Prediction (AMP), a new way to forecast the future location of nodes in a network. The AMP employs mobility prediction for enhancing the efficiency of data transfer, low-latency connection set-up, and route optimization. The solution proposed by us incorporates network conditions, as well as density, being able to change accordingly, and consequently achieving illumination of routing performance when compared with standard routing techniques. Simulation results show that the AMP algorithm significantly reduces route reconfigurations, data losses, and improves network throughput performance. With the help of AMP, it becomes a better and faster solution for real-time communications in VANETs with relatively higher dense vehicle traffic. This technique benefits autonomous vehicles, traffic management, and intelligent transport systems (ITS).

Keywords: Adaptive Mobility Prediction, AODV, ITS, Prediction, Traffic management, VANETs,

INTRODUCTION

Relative to ITS, VANETs are gradually gaining importance because of their ability to enable vehicles to communicate with the infrastructure including traffic signals and road signs or even other vehicles [1]. Such networks let us create safer roads, minimize traffic jams, and support real-time applications such as autonomous driving, navigation, and collision avoidance [2]. However, since vehicles traverse different areas, VANET design is not static but evolving at a very fast pace [3-8]. Specifically, VANETs in their nature and because of highly dynamic and an irregular topological communication scenario put into high risk those conventional wireless communication systems optimized for stationary or low mobility scenarios [9-12].Indeed, dependable and trouble-free routing solutions are expected out of these network systems, to enable the requisite communication between vehicles, as [13-18]these networks are expected to perform.oad signs, as well as with one another [1]. These networks allow us to make roads safer, reduce traffic congestion, and enable real-time communication for applications like autonomous driving, navigation, and collision avoidance [2]. Nonetheless, because vehicles are mobile, VANET design is dynamic and rapidly changing [3-8]. VANETs, due to their dynamic and irregular nature, pose a significant threat to traditional wireless communication systems designed for stationary or low-mobility situations [9-12]. Thus, effective routing systems are required to offer dependable and trouble-free communication between vehicles, ensuring that these networks operate as [13-18] intended. This is especially due to the highly dynamic nature of VANET shaping routing instability both in relation to vehicle locations and the overall network structure [19]. In Dynamic Source Routing (DSR) [20] and Conventional Ad-hoc On-demand Distance Vector (AODV) [21-23] systems, latency is high and there are frequent route breakages due to cars joining or leaving the communication range. These protocols fail to take into account VANET's characteristics, hence delaying transmission time, losing packets as well as valuable resources [25].

 Moreover, based on unexpected routing of these networks, passengers are likely experience dramatic degradation in data transmission performance especially in busy areas [26]. The above difficulties can be solved by the Adaptive Movement Prediction (AMP) method, in which the use of the predictive capabilities of the movement patterns of vehicles is allowed. Different from other routing algorithms which use only current data, the AMP algorithm predicts future motion by using past movements data of vehicles. Since it will determine where the vehicle will be after a certain time duration, the AMP algorithm can select the most accurate and fastest paths to transfer data. This not only reduces the number of failed paths but also the overhead in terms of resource cost, as well as latency-constrained reconfiguration and route discovery costs.   One major strength of the AMP technique is that it is can easily work under any traffic condition. The technology is developed to make constant changes in its predictions based on the actual movement of vehicles and weather conditions and traffic situation on the road. As the approach is intended works for different patterns of mobility and density of network, it can also be implemented in both urban and rural setting. The integration of mobility prediction into the routing algorithm significantly improves the network throughput, latency, and the reliability of the communication within the VANET system making the AMP algorithm a more efficient VANET routing computation. Some of the recent simulations and experiments giving evidence that the AMP algorithm is superior to existing routing protocols. AMP was faster than earlier systems in several test instances in terms of packet delivery ratio, end-to-end delay, and network performance. It is also possible to note that in conditions of considerable mobility of and even in rather severe environments , the function of the algorithm to predict motion of automobiles and to react toward real-life situations provides better stability and effectiveness to the medium that is used for information transfer. Intelligent Transport System (ITS) applications like Autonomous driving, traffic management and vehicle to vehicle communication are some of the areas where the proposed AMP algorithm can potentially enhance the reliability of communication in VANETs a lot.

LITERATURE REVIEW

Hu *et al.,* (2020) employed a probabilistic model to show the existence of likely superior forwarding nodes which may improve the transmission rate. Therefore, the authors proposed a TDMA system which choses the right forwarding node by employing the motion prediction so that the topology of the network in the next frame is predicted.

In Bentaleb, A., *et al.* (2020), chunked transmission encoding was employed and Automated Model for Prediction (AMP) was introduced with strategies for bandwidth computation as well as model selection for low latency live streaming. A set of bandwidth prediction models with application to a variety of network conditions was established by reviewing the statistical and computational intelligence techniques and presenting an approach for choosing prediction models on line. New Adaptive Beacon Time Synchronization (ABTS) approach was introduced by Ansere, J. A. *et al.* (2019) to enhance the temporal message synchronize. In this research, the ABTS algorithm was applied whereby the linked automobile nodes were synchronized to the optimal performance indicators including synchronization accuracy, beacon message transmitted, and energy consumption. Strategies for node selection were explained to be used by the vehicle nodes in interacting with the other related vehicles. This helped to greatly increase the transmission of beacon signals when consuming less power specific to time synchronization. The ARMR protocol by Arafat, M. Y., *et al.* (2024) was proposed as an Adaptive Reinforcement Learning (RL) Based Mobility Aware Routing protocol for heterogeneous Wireless Body Area Networks (WBAN). First time, a mobility aware routing technique named Link Lifetime Estimate (LLE) was developed. It predicted connection lifespan metric to give reliable and efficient transmission and that: LLE proved to be a good approximation of the time nodes were with in the transmission range of each other. By this method, the ARMS chose nodes with longer connection times based on the nodes' dependability. In addition, adaptive Q-learning technique was presented which made routing decision flexible and adaptive with changing networks. Wijesekara, P. A. D. S. N., *et al.* (2023) provided a unique hybrid routing strategy for Software Defined Vehicular Networks (SDVNs) that used network congestion to choose between two modes: the highest stable least delay mode and the highest stable shortest path mode. The car network communication channels was then divided into wired and wireless networks, the pending transmissions and the resulting network link entropy was then used to predict the availability, average degree of network traffic, and collision probability. Using the Machine Learning (ML) it was possible to identify the delays in one hop channel and wireless LLF. The major contribution of Abdelazeem, *et al.* (2024) was the proposed K-means clustering algorithm with Genetic Algorithms (GA) optimization for the generation of keys in Vehicular Ad Hoc Networks (VANET).

This strategy improved the critical uniqueness by enhancing the average Hamming distance and reduce the similarity. A rise in one of the key count variances shown that the distribution of key counts has become less skewed when there exist higher entropy, which means more randomness. The results presented here illustrate that while the improved clustering strategy lead to increased safety of important generation, it also handled problems that were once solved with standard methods. It was useful for VANETs in order to be able to respond to stringent security requirements while keeping operational and safety efficiencies. Sefati, S. S., *et al.* (2022) to reduce power consumption and lengthen the network's lifetime, two algorithms were used: out of which, the Low-Energy Adaptive Clustering Hierarchy (LEACH) and the Bat Algorithm (BA) have been reported in this paper. In the development of FANET load balancing and clutter selection policies, the main objective was on minimizing UAV power consumption. Ho, T. J., *et al.* (2024) investigated strong vehicle localization integrating Vehicular Ad-hoc Network under varying vehicle velocities for the LOS or the NLOS field where the statistics of NLOS error and its occurrence probability is unknown. To address this issue two approaches were offered based on MMA-SDP conceptualization and an Advanced Measurement Preprocessing (AMP) procedure. This AMP technique has reduced the impact of NLOS on the received raw range measurements from multiple base stations. Ahmad, W., *et al.* (2023) presented the localization mechanism via the Received Signal Strength (RSS) which can determine the position of the target vehicle accurately. This made the contact with Road Side Units (RSUs) and defined the position of the typical RSS by detecting signal within its reach. After detection of the RSS, the proposed RSS-based localization method successfully and accurately pinpointed the position of the vehicle. The suggested approach was generated from other neighboring RSUs and it had high signal to noise ratio. On determining the position of the vehicle, the Cramer Rao lower bound (CRLB) was evaluated for the particular vehicle.

Problem Identification
VANETs has high vehicle mobility, making the formation of the network very dynamic, which leads to frequently creation and breaking of communication links and topological changes. He also notes that conventional routing protocols like AODV/TR and Navigation & Roadmap Discovery (DSR) are challenging to sustain well-defined

Rajkumar and Pavithra Devi

pathways because automobiles frequently come and go in/out of the reception radius. For this reason, it leads to lost network bandwidth, missing packets, and delays especially among densely populated networks. Moreover, identification of traces, and altering them requires a lot of bandwidth and energy. These challenges overshadow the need to create an ideal system that has the ability to predict vehicle positions and change the flow of the actions.

MATERIALS AND METHODS

The Adaptive Mobility Prediction (AMP) algorithm uses a novel way to maximize routing in Vehicular Ad-hoc Networks (VANETs): it tries to forecast future automobile destinations. Basic routing protocols like AODV or DSR are not capable enough to build routes that are adaptable to the highly unpredictable and rapidly changing environment of VANET, due to which there is high packet loss and constant disruption. The AMP approach addresses this issue by using current speed of mobiles and past trajectory to develop mobility predictions. This enables the network to pre design reliable and steady path by passing and thereby reduce the need continuously to find a route and to disturb the transmission. The extent to which AMP algorithm can be adjusted where it has a strong suit is its flexibility. In contrast with fixed estimates from characterizing the technique by cars' passing, it rebalances its mobility predictions. It receives updates from the cars forming the network for factors including acceleration, speed and direction, and aligns its estimations to the new environment. Due to the continuous dynamic update, AMP is very responsive for handling the diverse traffic conditions such as congestion , barriers and accident that disturb the vehicular movement patterns. Precise prediction about movement paths of vehicles is beneficial for the algorithm to minimize route rearrangement time and to increase the forwarding of data packets which enhances the VANET communicating reliability. Algorithm 1 demonstrates the process performed in Adaptive Mobility Prediction. Here the procedure of initialization, moment predict, change of adjustments in mobility, correct the errors, repetition of prediction is done.

Algorithm 1: Adaptive Mobility Prediction (AMP) Algorithm
Input
For a mobile node, historical movement data such as coordinates, speed, direction over time is gathered. Step 1: Initialization 　　　　Prediction accuracy threshold is set Step 2: Prediction of moment The present velocity and movement direction is calculated. Speed (V) = Distance / Time. Direction (θ) = Angle of movement relative to the appropriate reference. Find the node's future position using the simple motion model. Step 3: Adjustment for Changes in Mobility The direction or speed is updated using the most recent observed values. Use a linear or piecewise linear approximation for changes in velocity. Step 4: Error Correction Velocity or direction is recalibrated based on recent movement behavior. Step 5: Repeat the Prediction Repeat the prediction process until the prediction window ends or the accuracy threshold is met. Output: The predicted future positions and the expected trajectory are provided for the mobile node.

Figure 1 describes the Adaptive Mobility Prediction algorithm. Input with data is fed into the algorithm, which leads to the steps like initialization, moment prediction, adjustment changes in mobility, correcting the errors and repetition of prediction. Finally, the output indicating the future positions for mobile nodes is obtained. The main strength of the AMP algorithm is its adaptability. Unlike set assumptions, the program updates its mobility projections in real time as vehicles pass. It modifies its forecasts based on real-time data obtained from the network's automobiles, taking into account acceleration, speed, and direction. The AMP algorithm is particularly adept at

dealing with traffic incidents including congestion, bottlenecks, and accidents, which can have a substantial impact on vehicle flow patterns. Its ability to respond in real time helps to reflect this. Because of their high accuracy vehicle movement prediction capabilities, the technology can improve data packet forwarding, increase communication reliability in VANETs, and reduce route reconfiguration times. We can forecast the vehicle's future position by using the formula

$$P_i(t+1) = P_i(t) + v_i(t) . \Delta t \qquad \text{---------- (1)}$$

$P_i(t+1)$: vehicle i's expected position at time $t+1$. $P_i(t)$: At time t, the present position of vehicle i. $v_i(t)$: the speed of vehicle i at the given time t. Δt represents the time from t to t+1. Using the speed and direction, the velocity is estimated as

$$v_i(t) = \sqrt{v_{ix}^2(t) + v_{iy}^2(t)} \qquad \text{------------- (2)}$$

Speed of vehicle i at time t is $v_i(t)$. Speed component in x direction at time t is $v_{ix}^2(t)$ whereas in y-direction, $v_{iy}^2(t)$ is the speed component at time t. The adjustment in AMP algorithm is as follows:

$$P_i(t+1) = P_i(t) + \big(v_i(t) + \delta\, v_i(t)\big). \Delta t \qquad \text{------------ (3)}$$

The Updated predicted position of vehicle i at time $t+1$ is $P_i(t+1)$. Pi(t) refers to the present position of vehicle i at time. The present velocity of vehicle i is $v_i(t)$. $\delta\, v_i(t)$ indicates the adjustment factor for vehicle velocity based on recent acceleration or deceleration. Δt points out the time interval between t and $t+1$. The Probability of route stability is calculated as:

$$S(t) = \frac{1}{1 + \lambda . d(t)} \qquad \text{---------- (4)}$$

Stability of the route at time t is represented as $S(t)$. λ is the constant factor that adjusts the influence of distance on route stability. The distance d (t) is created between two vehicles at time t, which impacts route stability.

RESULTS AND DISCUSSION

The proposed method has implemented by using NS2 simulation tool and the comparison study carried out with existing literature review methods like TDMA and ABTS. The performance metrics like throughput, energy, delay and PDR measured. Figure 2 represents the Throughput vs Packet Size graph illustrates how throughput (the rate at which data is transmitted) changes as the packet size increases for three protocols: ABTS, TDMA, and AMP. As the packet size grows, the throughput increases for all three protocols, but AMP shows the most significant improvement. ABTS exhibits a steady linear increase in throughput as the packet size increases, starting at 0.256 kbps and reaching 1.282 kbps. TDMA also shows an increase in throughput, but the growth is slower compared to ABTS. On the other hand, AMP achieves the highest throughput at all packet sizes, with a faster increase than both ABTS and TDMA, peaking at 2.083 kbps. This indicates that AMP offers the most efficient performance in terms of throughput, particularly as packet size increases, while ABTS and TDMA exhibit more modest improvements.

Energy level vs Number of node graph is illustrated in Figure 3.Engine energy consumes as the number of nodes in the network absorption data for ABTS, TDMA and AMP protocol. The results indicate that the number of nodes is directly proportional to energy consumption for all of the three protocols in linear trend fashion. ABTS is observed as using the highest energy in all node scenarios, ranging from 125 Joules for 10 nodes and 1250 Joules for 100 nodes. TDMA uses considerably less energy than ABTS and its rate of increase is less steep with an increased number of nodes. On the other hand, the results showed that the energy consumption of AMP has the least slope and therefore lies at the lowest, but the increase in energy usage is linear. The overall results obtained indicate that, on average, AMP protocol consumes the least energy which, in turn, is superior to the other protocols such as TDMA and ABTS.

The ABTS, TDMA and AMP protocols are compared in the figure 4 is the Time Delay vs Number of Nodes graph that depicts the variation in the time delay or latency of transmission with addition of more nodes in the network. When the number of nodes is raised, delay of all these three protocols also rises, but comparatively it is better in AMP than in TDMA or ABTS. ABTS begin with 0.1173ms for 10 nodes and end at 1.1737 ms for 100 nodes; this reveals an increase in latency when nodes are added. ABTS also experiences an enhanced delay to 0.7498 ms from an initial 0.07527 ms but at a slower rate than that of TDMA for the same numbers of nodes. Low time delay is again achieved by AMP which gradually increases as the number of nodes increases to a maximum of 0.606 ms out of the

initially plotted 0.0606 ms. This shows that AMP is the least greedy, offering the least amount of delay, or latency as the network expands as compared to the other protocols. Figure 5 shows that Packet Delivery Ratio (PDR) increases with increase in the increasing packet size Thus, Comparison between the three protocols (ABTS, TDMA, and AMP) for the percentage of packets delivered with varying packet size is depicted from figure 5. This means that with increased packet size the PDR stays up for all the protocols, which shows that most packets are delivered with flow control with no siginificant loss. ABTS rises from a first PDR of 96.2% at 50 kb to a second PDR of 99.24% at 250 kb. TDMA also has the similar trend, stands at 96.8% at the initial stage and 99.36% at later stage. In all PSI values, AMP delivers the best results regardless of the packet size with PDR ranging from 98.2% to a high of 99.64% slightly higher than both ABTS and TDMA. All three protocols have high packet delivery ratios and although all three protocols have reasonably high retention rates, AMP is slightly more reliable as packet size increases.

CONCLUSION

In Conclusion, the proposed technique named as Adaptive Mobility Prediction (AMP) has been really effective to optimize the ad hoc routing scenario for VANET. Real time vehicle movement is also integrated for mobility predictions which are useful for enhancing routing with consideration to changes in network architecture within the AMP. Especially, the efficiency of head forecaster in anticipating vehicles' movement and making prior adjustments for route enhances the performance level of network throughput, latency, and the communications quality where the risk of a route failure experience will be less. In addition, because of flexibility when addressing different types of traffic and real-time dynamics within a network; AMP is satisfactory for both rural and urban settings. The AMP algorithm provides a means of guaranteeing that efficient, reliable routing solutions in the dynamic environment of VANETs, primarily induced by the emergence of smart cities and self-driving cars, can be achieved and maintained at scale. It has real-time features that will transform intelligent transportation systems; traffic control; and collision prevention; thus, boosting the formation of vehicle webs.

ABSTRACT

Artificial intelligence (AI) has become a significant part of modern education, offering tools like adaptive learning systems, AI-powered tutoring, and automated grading that promise to enhance the learning experience. However, alongside these benefits, the integration of AI into educational environments has introduced a new concern: AI anxiety. This study aims to explore the phenomenon of AI anxiety among university students and examine its impact on the acceptance and use of AI-powered learning tools. Drawing on a quantitative approach, the research investigates how demographic factors such as gender, field of study, and prior exposure to AI tools influence levels of anxiety. Using a survey administered to 200 university students, the study measures AI anxiety based on concerns about privacy, data security, loss of teacher-student interaction, and the fear of AI replacing human educators. The analysis uses descriptive statistics, correlation, and regression techniques to assess the relationship between these factors and AI anxiety. "The results reveal significant differences in AI anxiety across various demographic groups, with students from non-STEM fields and female students exhibiting higher levels of anxiety compared to their STEM and male counterparts. Furthermore, the study finds that frequent use of AI-powered tools reduces anxiety, suggesting that familiarity with AI decreases fear and increases acceptance. This research contributes to the existing literature by offering empirical insights into the psychological barriers students face in adopting AI in education. It highlights the need for educational institutions and AI developers to consider these emotional responses when implementing AI technologies to ensure their effective integration. The study concludes with recommendations for reducing AI anxiety, such as increasing AI literacy and providing support systems to help students

navigate the evolving technological landscape in education. By addressing these concerns, the education sector can better harness the potential of AI while minimizing the negative psychological impacts on students.

INTRODUCTION

The integration of artificial intelligence (AI) in education is rapidly transforming how students learn and interact with educational content. AI-powered tools, such as adaptive learning systems, intelligent tutoring, and automated grading, have introduced personalized learning experiences that cater to individual student needs, enhancing the overall learning process. These technologies have proven to be effective in optimizing student performance and providing immediate feedback, making education more accessible and efficient. However, alongside these benefits, a new challenge has emerged: AI anxiety. This term refers to the apprehension, discomfort, or fear that students experience when interacting with AI systems in educational settings. AI anxiety is driven by various factors, including concerns about data privacy, the accuracy of AI assessments, loss of personal interaction with teachers, and the fear that AI may eventually replace human educators. As educational institutions increasingly adopt AI-powered tools, it is crucial to understand how students perceive these technologies and the psychological impact they may have(Ali, 2024). While the technical benefits of AI in education are well-documented, there is a significant gap in the literature regarding the emotional and psychological responses of students to these advancements. This study aims to explore the extent of AI anxiety among university students and investigate how it influences their acceptance and use of AI-powered learning tools. By examining demographic factors such as gender, academic discipline, and prior exposure to AI, this research seeks to identify patterns in AI anxiety and understand how different groups of students are affected. Furthermore, it aims to assess whether increased familiarity with AI tools reduces anxiety and promotes greater acceptance. Given the growing reliance on AI in education, addressing AI anxiety is critical to ensuring that students can fully benefit from these technological advancements. The findings of this study will contribute to the ongoing discourse on AI in education by offering insights into how educational institutions and AI developers can mitigate anxiety and improve student engagement with AI-powered tools. Ultimately, understanding and addressing AI anxiety will be key to harnessing the full potential of AI in education while minimizing its negative psychological effects on students.

Background of the Study
The Evolution of AI in Education:
Over the past decade, artificial intelligence (AI) has significantly transformed the education sector, introducing a wide range of technologies aimed at enhancing learning, improving accessibility, and providing support for teachers in delivering personalized education. These advancements have moved beyond traditional classroom settings, offering AI-based tutoring systems capable of adjusting content based on individual student progress and learning styles. AI-enabled assessments now provide instant feedback, helping students to track their learning outcomes and offering educators insights into student performance. Such systems allow for real-time data analysis that helps identify areas where students may be struggling and adjusts the learning materials accordingly(Wang, 2024). AI technologies have also been pivotal in creating adaptive learning environments that respond to the unique needs of each student, ensuring that educational content is tailored to their specific abilities and learning pace. This evolving landscape is redefining the roles of teachers and students alike, with AI acting as both an assistant and a supplement to traditional teaching methods. The growing reliance on AI to handle administrative tasks such as grading and lesson planning has further freed up educators to focus on more complex aspects of teaching, thereby increasing overall efficiency in the education system(Lee, 2024).

Global Adoption of AI Tools in Education

The global education sector has widely embraced AI technologies, with institutions ranging from primary schools to universities implementing AI-powered systems to enhance the learning experience. These tools are being used to foster greater student engagement, personalize learning paths, and streamline administrative tasks such as grading and scheduling. Studies indicate that the adoption of AI in education is projected to grow exponentially in the coming years, driven by the demand for more effective, data-driven teaching methods and learning platforms. Countries around the world are recognizing the potential of AI to bridge educational gaps by providing equal access to quality learning materials, particularly in underserved regions. AI-driven platforms are also enhancing online learning experiences, making education more flexible and accessible to students regardless of geographic location. Institutions of higher learning are increasingly turning to AI to offer more personalized education, from course recommendations based on learning patterns to predictive analytics that help universities identify students at risk of falling behind. As AI continues to evolve, its applications in education will expand, supporting both in-person and virtual learning environments and enabling educational systems to meet the diverse needs of learners worldwide.

Transformational Impact on Learning

AI's ability to transform traditional teaching methods into more dynamic, adaptive, and efficient models has been one of its most significant contributions to education. AI tools have made it possible to create personalized learning plans for students, which not only cater to individual learning speeds but also provide real-time feedback and progress tracking. This ensures that students receive the right level of challenge and support tailored to their learning needs. Moreover, AI-driven platforms enable early intervention strategies by identifying learning gaps and suggesting corrective measures before these gaps widen. These systems also facilitate a higher degree of engagement by making learning more interactive and tailored to the preferences of each student. However, while the benefits of AI in enhancing academic performance and engagement are clear, this transformation has introduced certain challenges, particularly regarding the psychological and technological impacts on students and educators. Students may experience anxiety or discomfort in interacting with AI, especially in contexts where AI systems replace or reduce human interaction. Additionally, concerns about data privacy, bias in AI algorithms, and the lack of human empathy in AI-driven tools pose challenges to their widespread adoption(P. S, 2023). Thus, while AI presents a powerful tool for educational enhancement, these challenges must be addressed to ensure its effective and ethical integration into the learning process.

Significance of the Study

The significance of this study lies in its implications for educational institutions, educators, AI developers, and policymakers. Understanding AI anxiety is crucial for institutions aiming to integrate AI-powered tools into learning environments. AI anxiety, fuelled by concerns about data privacy, loss of human interaction, and system reliability, can hinder successful AI adoption. Identifying these concerns allows institutions to create targeted interventions, such as workshops and orientation sessions, to familiarize students with AI technologies and reduce apprehension. Recognizing demographic patterns in AI anxiety(Kaya, 2022) can help tailor support services to different student populations, such as non-STEM students or specific age groups. For educators, understanding AI anxiety is essential to maintain student engagement. Students experiencing high anxiety may disengage or resist AI tools, reducing the effectiveness of these technologies. Educators can ease this anxiety by gradually integrating AI tools, explaining how they work, and emphasizing that AI complements, not replaces, human instruction. AI developers play a key role by designing user-friendly, transparent, and supportive systems that address common concerns like data privacy and decision-making opacity(Heike Felzmann, 2020). Collaboration between educators and developers can lead to AI tools that enhance learning while minimizing anxiety. From a policy perspective, the findings underscore the need for AI literacy programs in educational curricula. These programs would demystify AI, reduce student anxiety, and promote effective engagement with AI-powered tools. Policymakers should prioritize AI literacy and the ethical use of AI in education to foster a more positive relationship between students and AI technologies, ultimately improving the educational outcomes of AI integration.

Shalu and Nidhi Verma

AI in Education: A Historical Overview

The use of artificial intelligence (AI) in education has evolved significantly over the past few decades, beginning with basic automation tools and progressing to sophisticated systems capable of personalized learning. Early educational technologies, developed in the 1960s and 1970s, focused primarily on computer-assisted instruction (CAI), offering programmed learning and simple drill exercises aimed at reinforcing foundational skills. These early systems were limited in scope and lacked the adaptive capabilities present in modern AI technologies. By the 1990s, advancements in computational power and algorithms paved the way for intelligent tutoring systems (ITS), which provided more interactive learning experiences by simulating the decision-making processes of human tutors. These systems allowed for more personalized education, adjusting content delivery based on a student's performance and learning pace(An, 2021). The 21st century brought about the integration of machine learning and natural language processing into education, enabling more complex applications such as AI-based grading systems, virtual teaching assistants, and adaptive learning platforms. Today, AI is used not only to support personalized learning experiences but also to assist in administrative tasks, track student performance, and offer predictive analytics that help educators identify students at risk of falling behind. As AI continues to evolve, its role in education is becoming more pronounced, with emerging technologies such as learning analytics and AI-driven assessments promising to revolutionize how students learn and how educators teach.

Psychological Impacts of Technology in Education

The increasing use of technology in education has had profound psychological effects on both students and teachers. On one hand, technology has enhanced learning by providing greater access to educational resources, enabling more interactive learning environments, and fostering collaboration among students. Digital platforms and tools, such as virtual classrooms, online learning portals, and educational apps, have made it easier for students to learn at their own pace and access information from anywhere in the world. However, alongside these benefits, technology has also introduced psychological challenges, such as increased anxiety, cognitive overload, and a sense of depersonalization in the learning process. Students, particularly those who struggle with technology, may experience anxiety when navigating complex digital platforms or using unfamiliar tools. The constant influx of information and the need to multitask can lead to cognitive overload, reducing the effectiveness of learning and contributing to stress. Additionally, the shift from face-to-face interaction to technology-mediated communication can create feelings of isolation, as students may miss the personal connection with their teachers and peers. Teachers, too, face psychological pressures from the increasing demand to integrate technology into their teaching practices, often without adequate training or support. This can lead to resistance or burnout as they attempt to balance traditional teaching methods with new technological requirements. The psychological impacts of technology in education are multifaceted, requiring careful consideration of how best to support both students and teachers in this evolving landscape.

The Concept of AI Anxiety in Educational Settings

AI anxiety refers to the fear, discomfort, or unease that individuals experience when interacting with artificial intelligence systems, particularly in contexts where they feel their roles or abilities may be supplanted by machines(Yu-Min Wang, 2022). In educational settings, AI anxiety has emerged as a significant concern, especially as AI tools become more prevalent in classrooms, universities, and online learning environments. The concept of AI anxiety is rooted in a broader fear of technological advancement, where students and educators alike worry about the implications of relying on machines for tasks traditionally performed by humans. For students, AI anxiety may be triggered by concerns about data privacy, the accuracy of AI-driven assessments, or the fear that AI will eventually replace human teachers. This anxiety is often exacerbated by a lack of understanding of how AI systems work, leading to mistrust and resistance to using these tools(Artur Klingbeil, 2024). Instructors, on the other hand, may experience AI anxiety due to fears that their professional roles could be diminished or even replaced by AI technologies capable of automating instructional tasks such as grading or content delivery. Additionally, the perceived impersonal nature of AI, which lacks the empathy and emotional intelligence of human educators, can contribute to a sense of alienation among students, further fuelling their anxiety. Understanding the root causes of AI anxiety is critical for addressing this issue, as it can hinder the effective adoption and utilization of AI technologies in

education". By addressing these concerns, educators and AI developers can work towards creating more transparent, accessible, and supportive AI systems that alleviate anxiety and foster positive educational outcomes.

REVIEW OF LITERATURE

The table above summarizes recent studies exploring the impact of AI tools in education across various contexts. These studies reveal diverse perspectives on the adoption, perception, and effects of AI technologies on both students and educators. Common themes include AI's potential to enhance motivation, autonomy, and personalized learning experiences, as well as concerns related to creativity constraints, anxiety, and over-reliance on AI tools. Collectively, these findings underscore the need for informed decision-making, institutional support, and ethical considerations when integrating AI into educational settings.

Student Perceptions of AI: Opportunities and Challenges
Students' perceptions of AI in education are shaped by both the opportunities these technologies present and the challenges they introduce. "On the one hand, many students recognize the potential of AI to enhance their learning experience. AI-powered tools can offer personalized learning pathways, providing real-time feedback and adapting content based on individual performance. This can lead to more efficient learning, as students can focus on areas where they need improvement while progressing faster through subjects they excel in. AI can also facilitate access to education for students in remote or underserved areas, offering virtual tutors, AI-driven assessments, and automated content delivery systems that make learning more accessible. However, these opportunities are counterbalanced by significant challenges. Many students' express concerns about the role of AI in education, particularly regarding the replacement of human teachers with AI-driven systems(Firuz Kamalov, 2023). The lack of human interaction and empathy in AI tools is a major concern for students, who may feel that AI cannot provide the emotional support and understanding that a human teacher can offer(Clugston, 2024). Additionally, issues related to data privacy and security are prominent in students' perceptions of AI, as they worry about how their personal information and academic performance data may be used or misused by these technologies. The potential for algorithmic bias in AI systems, where automated assessments or recommendations may unfairly disadvantage certain groups of students, is another concern. These challenges highlight the complex relationship between students and AI in education, where the benefits of personalized, efficient learning are often tempered by concerns about the broader implications of AI integration.

Emergence of AI Anxiety in Educational Contexts
Definition of AI Anxiety
AI anxiety refers to the feelings of apprehension, discomfort, or fear that individuals may experience when interacting with artificial intelligence systems. Accordingly, AI anxiety refers to an overall affective response of anxiety or fear and feelings of agitation about out-of-control AI that inhibits an individual from interacting with AI (Johnson & Verdicchio, 2017). In educational settings, this anxiety can stem from several factors. For many students, a lack of understanding about how AI technologies work can create a sense of unease, especially when these tools are used to monitor performance or deliver feedback without human involvement. There is often a fear that AI may replace traditional human roles in education, such as teachers and instructors, which can lead to concerns about the quality of learning experiences. The idea of being evaluated or taught by a machine may feel impersonal and intimidating to students, exacerbating their anxiety. Additionally, some may worry about the potential misuse of AI in terms of privacy violations, where the data collected by these systems could be exploited without their consent. All of these concerns contribute to the overall experience of AI anxiety, which can hinder students from fully embracing the educational technologies meant to support their learning journey.

Psychological Reactions to AI
Despite the intended benefits of AI tools in education, such as improving learning efficiency and providing personalized support, many students experience psychological discomfort when interacting with these technologies.

Shalu and Nidhi Verma

Key contributors to AI anxiety include concerns over data privacy, security, and the potential for surveillance(Kyoungwon Seo, 2021). Students may fear that their personal information, learning habits, or academic performance data could be improperly accessed or misused by the AI systems that track their progress. The perceived lack of empathy in AI, as compared to human teachers, can also cause discomfort, as students may feel that AI lacks the emotional intelligence necessary to understand and respond to their individual needs. Additionally, the potential for algorithmic bias in AI-driven assessments or recommendations can further increase anxiety, as students may worry about being unfairly evaluated by systems that are not entirely impartial. Another major factor exacerbating AI anxiety is the depersonalization of education, where the human interaction that typically characterizes the learning process is replaced by automated systems. This shift can lead to feelings of isolation or alienation, particularly among students who value the human elements of teaching and learning.

Role of AI Anxiety in Adoption

AI anxiety plays a significant role in shaping how students perceive, adopt, and engage with AI-powered educational tools. Research indicates that students who experience higher levels of anxiety toward AI are less likely to use these technologies, even when they are designed to enhance learning outcomes(Fangchen Wen, 2024). This avoidance behavior can diminish the effectiveness of AI systems, as students may not take full advantage of personalized feedback, adaptive learning plans, or other features designed to improve academic performance. The reluctance to engage with AI tools can create barriers to the broader adoption of these technologies, as educational institutions may struggle to integrate AI into learning environments if students are resistant or fearful(Cecilia Ka Yuk Chan, 2023). Addressing AI anxiety is therefore crucial for maximizing the potential benefits of AI in education. By understanding the emotional responses that contribute to this anxiety, educators and developers can implement strategies to ease concerns and promote greater acceptance. This could involve increasing transparency around how AI systems work, offering training to help students become more familiar with these tools, and ensuring that AI complements rather than replaces human teachers. By reducing anxiety, institutions can create a more supportive environment that encourages students to embrace AI as an integral part of their educational experience.

METHODOLOGY

This study employs a quantitative research design, utilizing a structured Likert-scale questionnaire to gather data from university students (N=200) across various academic disciplines. The survey captures student's perceptions of AI-powered learning tools and measures levels of AI anxiety. Stratified random sampling ensures diversity in gender, age, and field of study. Data analysis involves descriptive statistics to summarize responses and explore patterns of agreement or disagreement, while correlation analysis identifies relationships between demographic variables and AI anxiety levels". This approach provides insights into how different student groups perceive and respond to AI tools in educational settings.

Data analysis
Demographics

The study sample consisted of 200 participants, with 43% identifying as male and 57% as female. "The age distribution showed that 42% of the respondents were between 18-21 years old, 33% were aged 22-25, 8% were in the 26-30 age group, and 17% were above 30. In terms of academic background, 38% of the participants were from STEM fields (Science, Technology, Engineering, Mathematics), 29% from Humanities, 18% from Social Sciences, and 15% from other fields of study. The year of study was also diverse, with 27% in their first year, 28% in their second year, 24% in their third year, and 21% in their final year. This distribution provides a balanced representation across gender, age, academic discipline, and year of study, ensuring comprehensive insights into the perceptions of AI-powered learning tools.

Section 2: Perceptions of AI in Education

The survey on the perceptions of AI-powered learning tools showed mixed views on their effectiveness. 24% of respondents believed that AI-powered tools improved the overall learning experience, while 29% agreed that they helped them learn more efficiently by providing personalized content. Trust in AI systems was reflected in 32% of respondents who trusted the feedback and assessments provided by AI-powered learning systems. 35% of students felt comfortable using AI tools to assist them in their studies, while 21% disagreed and 19% strongly disagreed. 36.5% agreed that AI tools provided timely feedback that helped improve academic performance", while fewer disagreed or strongly disagreed. "Finally, 37% agreed that AI-powered tools made learning more accessible to them, while 18% disagreed and 9.5% strongly disagreed.

Section 3: AI Anxiety among students

The study reveals a significant divide among participants regarding concerns and anxieties about AI-powered learning tools. Concerns were expressed about the amount of personal data collected by AI systems during studies, the potential replacement of human teachers in the future, and the anxiety of being evaluated by a machine. Concerns were also expressed about AI-driven assessments and the unease of AI tools making decisions about academic progress. The lack of empathy in AI systems was also a concern, with 37% of respondents agreeing and 14% strongly agreeing. A significant number of students experienced heightened anxiety when using AI tools, with 38% agreeing and 17.5% strongly agreeing. These results highlight that despite the benefits of AI tools, many students still have concerns about privacy, decision-making, and the emotional disconnect associated with AI in education. The study highlights the need for further research and understanding to better understand the complexities of AI in education.

Correlational Analysis

A Pearson product moment correlation was performed to find out the relationships between the variables in the study table above. The correlation analysis indicates a strong positive relationship between perceptions of AI in education and AI anxiety, with a Pearson correlation coefficient of 0.78. The significance value($p = 0.026$) confirms that this relationship is statistically significant, suggesting that increased perceptions of AI are associated with higher levels of AI anxiety among students. The present study demonstrates consistency with the findings of Zhang and Dafoe (2019) who reported a similar positive correlation between perceptions of AI and AI-related anxiety, particularly in educational and professional settings. Their research indicated that individuals with a greater understanding of AI's capabilities were more inclined to experience anxiety over its potential consequences, such as concerns about loss of autonomy and ethical implications. Another study by Holstein et al. (2020)found that while AI-based tools can be advantageous in education, they may also generate psychological obstacles for students. Students who view AI as a substitute for human instructors reported heightened levels of anxiety due to worries about the fairness, transparency, and personalization of these AI systems.

CONCLUSION

The paper emphasizes the difficulties of bringing AI-powered learning tools into education as well as their transforming capacity. These instruments raise questions about data privacy, trust in machine-driven evaluations, and the lack of human empathy even if they offer great benefits such tailored learning experiences, effective feedback, and more accessibility. The noted relationship between good opinions of artificial intelligence and increased worry emphasizes the complex and even contradictory sentiments students have about these technologies.While AI can offer valuable support in education, concerns around issues like privacy, job displacement, and the lack of human interaction must be carefully addressed. Students from disadvantaged backgrounds may face digital divides, limiting their access to AI-powered educational tools, ultimately widening existing inequalities(Milad Shahvaroughi Farahani, 2024). Ongoing efforts are needed to train AI models responsibly and monitor them to mitigate bias and ensure fairness (Mello et al., 2023a) (Mello et al., 2023b).

Further, the potential clash between using AI for data-informed decision-making and upholding moral values requires thoughtful consideration by educational leaders . Safeguarding student privacy, promoting equal access, ensuring model explain ability, and fostering ethical AI practices are crucial steps in harnessing the potential of AI in education while mitigating associated worries. As AI becomes more prevalent, continuous monitoring and proactive efforts to address these concerns will be vital in creating an inclusive, equitable, and ethically responsible AI-powered education system. These results highlight the need of focused interventions including open data policies, thorough AI literacy classes, and support mechanisms to properly handle student concerns. Developers and educational institutions must provide a human-centred approach top priority for integrating artificial intelligence into balance between innovation and student comfort and involvement. Reducing these psychological obstacles will help the industry to fully utilize artificial intelligence and provide conditions fit for education and personal development.

Year	Authors	Title	Main Focus	Methodology	Findings
2013	*David D. Luxton*	Artificial Intelligence in Psychological Practice: Current and Future Applications and	This article reviews developments in artificial intelligence (AI) technologies and their current and prospective	Qualitative analysis	The advancement of AI capabilities and their integration into psychological practice have significant implications that are

		Implications	applications in clinical psychological practice.		poised to reshape the mental health care landscape. (APA PsycINFO Database Record (c) 2016 APA, all rights reserved)
2019	*Baobao Zhang&Allan Dafoe*	Artificial Intelligence: American Attitudes and Trends	American attitudes and trends towards AI	Quantitative survey	Their research indicated that individuals with a greater understanding of AI's capabilities were more inclined to experience anxiety over its potential consequences, such as concerns about loss of autonomy and ethical implications.
2020	Ella Glikson & Anita Williams Woolley	Human Trust in Artificial Intelligence : review of empirical research	This review examines how AI diverges from other technologies and reviews the empirical research on factors influencing human trust in AI, which has been conducted across various disciplines over the past two decades.	Literature Review	This review offers several key insights into the factors that shape emotional trust across diverse AI representations. While existing studies have primarily examined emotional trust in relation to robotic and virtual AI, there is a dearth of research on emotional trust in embedded AI systems.
2023	Filipec & Woithe	Programme of Study: international management	Adoption, Perception, and impact of ChatGPT in higher education.	Constructivist-interpretivist approach, semi-structured interviews.	Highlights the need for informed decision-making and a balanced approach to AI in education
2023	Irfan et al.	Insights into Student Perceptions: Investigating AI Tool Usability in Irish Higher Education	Examines students' perceptions of AI tools at the University of Limerick.	Quantitative survey, 120 students	Identified strengths and shortcomings of AI tools in education, with students expressing hope and fear towards AI.
2023	Moybeka et al.	Artificial Intelligence and English Classroom: The Implications of AI Toward EFL Students' Motivation	Impact of AI on motivation among EFL students in AI-driven learning environments.	Mixed-methods: quantitative surveys, qualitative literature analysis	Revealed AI enhances intrinsic motivation, self-efficacy, and provides personalized learning experiences.

2023	Phan	Students' Perceptions of the AI Technology Application in English Writing Classes	Investigates students' perceptions of AI tools in English writing classes at Vietnam National University.	Quantitative study involving 100 students	Found AI writing tools accessible and adaptable, though challenges like technology anxiety were noted.
2023	Mursyid	Integrating AI-based Writing Tools to Enhance Students' Learning Process in Digital Writing	Investigated AI tools for improving academic writing	Case study and qualitative feedback from students	AI-based tools helped students with motivation and new learning experiences, but tools were underdeveloped for certain stages of writing.
2024	Huang et al.	Modelling Generative AI Acceptance, Perceived Teachers' Enthusiasm and Self-Efficacy	Examines the impact of AI acceptance, teachers' enthusiasm, and self-efficacy on EFL learners' well-being.	Quantitative modeling	Found that AI acceptance and teachers' enthusiasm positively predict well-being; self-efficacy mediates the effect.
2024	Kalra	Exploring Teachers' Perceptions Toward the Integration of AI Tools in the Language Classroom	Investigates English instructors' perceptions of AI integration in classrooms.	Qualitative interviews	Found widespread adoption of AI, but concerns over excessive reliance on AI tools were noted.
2024	Lin & Chen	AI-Integrated Educational Applications and College Students' Creativity and Academic Emotions	Impact of AI on students' creativity and academic emotions.	Survey-based study involving both students and teachers	Found that AI can constrain creativity and increase performance anxiety, but also stimulate engagement and creativity.
2024	Mambile & Mwogosi	Transforming Higher Education in Tanzania	Explores AI's potential in transforming higher education in Tanzania.	Qualitative analysis	Highlights ethical considerations and challenges to AI's successful implementation in education.
2024	Mohamed et al.	Empowering the Faculty of Education Students: Applying AI's Potential for Motivating Learning	Investigates the impact of AI on students' intrinsic motivation in education.	Mixed-methods research	Found that AI enhances autonomy and critical thinking but does not affect academic level.

2024	Muthmainnah	AI-CiciBot as Conversational Partners in EFL Education	Explores the use of AI-CiciBot to reduce speaking anxiety in Indonesian EFL students.	Quantitative analysis	Showed significant improvement in speaking skills and reduced anxiety.
2024	Ofosu-Ampong	Beyond the Hype: Exploring Faculty Perceptions and Acceptability of AI	Investigates lecturers' acceptance of AI in teaching practices.	Survey-based research	Found that 84% of lecturers are willing to use AI, with experience and institutional support influencing acceptance.
2024	Almohesh	AI Application (ChatGPT) and Saudi Arabian Primary School Students' Autonomy	Examines the impact of ChatGPT on Saudi Arabian primary students' autonomy in online classes.	Mixed-methods approach	Found that AI applications significantly influence student autonomy, with some potential negative consequences.
2024	Yetişensoy & Karaduman	The Effect of AI-Powered Chatbots in Social Studies Education	Explores the use of AI-powered chatbots in social studies education for 6th graders.	Experimental research with 78 students	Found higher post-test and permanency scores in the experimental group, but AI tools need further improvements.
2024	Saqr, R.R., Al-Somali, S.A., Sarhan, M.Y.	Exploring the Acceptance and User Satisfaction of AI-Driven e-Learning Platforms	Examined user acceptance of AI-driven e-learning platforms	Cross-sectional survey of Saudi university students	Significant influence of AI-based social learning networks on user satisfaction; perceived usefulness significantly impacted satisfaction.
2024	Usman Abubakar	AI in Pedagogical Practices: Challenges and Opportunities	Focused on student awareness and AI adoption challenges in education	Descriptive survey research design	Highlighted the need for improved AI awareness, training, and privacy concerns; moderate awareness of AI benefits.
2024	Slamet, Joko	Potential of ChatGPT as a Digital Language Learning Assistant: EFL Teachers' and Students' Perceptions	Investigated perceptions of EFL teachers and students using ChatGPT	Cross-sectional survey in East Java, Indonesia	Found benefits in personalized learning but noted concerns over accuracy and reliance on technology.
2024	Abubakar, U., Onasanya, S.A., Ibrahim, H.A.	Student Perspectives and Impact of AI Integration in Pedagogical Practices in Nigerian Tertiary Institutions	Evaluated AI integration in Nigerian universities	Survey of 421 undergraduate students	Moderate awareness of AI; significant benefits in learning but noted technical challenges and privacy concerns.

Shalu and Nidhi Verma

2024	Guo, Y., & Wang, Y.	Effectiveness of AI-powered Tools in EFL Learning	Assessed AI tools like Google Classroom for EFL learning	Mixed methods: surveys, interviews, observation of online classes	AI tools improved English proficiency, especially speaking skills, but challenges included technical issues and reduced human interaction.
2024	Biswas & Murray	The Influence of Education and Self-Perceived Tech Savviness on AI Reliance	Explores the role of education and tech-savviness in individual reliance on AI.	Quantitative analysis	Highlights the complex interplay between trust, convenience, and concerns about autonomy.

ABSTRACT

Developers creating Android applications employ data caching to boost app performance. Caching entails storing data temporarily, allowing faster retrieval for future access. When a mobile device experiences low activity, cached data, including potentially sensitive information, may persist on the device for an extended duration. This situation introduces a security vulnerability, especially when developers neglect to apply crucial security measures to protect users' sensitive data. While both the Android operating system and third-party tools offer methods to clear application caches, these often require manual action from the user. This document proposes a dynamic cache cleaning approach that actively eliminates idle cached data while also exploring alternative strategies to optimize cache management efficiency.

Keywords: Android, cache, efficiency, protection, storage

INTRODUCTION

While the functionalities of smartphones and tablets continue to evolve, society increasingly relies on them. Businesses frequently adapt their software programs to operate on mobile platforms such as iOS, Android, and Windows Mobile [1]. Several enterprises even depend entirely on mobile technology for day-to-day operations. However, as the user base expands and device capabilities improve, so do the associated risks. Numerous security experts have anticipated significant security breaches and privacy violations due to the vulnerabilities inherent in mobile devices. Using these devices for emailing, online transactions using credit cards, and the vulnerability of loss or theft container expose classified information to unauthorized access. This study focuses regarding Android

94796

Atanu Datta *et al.,*

operating system to illustrate aloofness threat associated with mobile apps and their storage approaches. Although the Android API provides assured future features innovators integrate into their set of symbols, there is no ensure that developers willad here to secure programming practices. Moreover, the issue arises of whether application developers should be accountable for user privacy. Cache serves as a tool to store data transparently, facilitating quicker access for future requests. Subsequent data requests are swiftly met by retrieving information from the solicitation cache split up, obviating the necessity to establish network connections or access distant servers to satisfy the entreaty. fleeting housing data in the local cache significantly enhances the attainment of Android applications, preventing the unnecessary retrieval of recently accessed information. during the time advantages of caching are evident, challenges stemming from improperly managed caches can indeed a device's efficiency, memory usage, and security. Although the Android operating system might automatically remove When internal storage space is limited, removing files from application caches, developers must still manage their application's cached files responsibly. Users [Source: https://www.linkedin.com/posts/tanue-quddus-741b04266_what-is-a-cache-system-in-telecommunications -activity-7193924013964902401-XI8G] may find that many of their applications exceed this recommended cache size when checking their Android mobile device's storage allocation for cached files. Notably, certain resource-intensive applications like web browsers are anticipated to exceed the recommended cache storage limit because of their frequent usage and versatility. The constitutional storage measurement of mobile devices, although continuously expanding, still pales in comparison to that of desktops or laptops. Consequently, internal storage is considered valuable and limited. Additionally, as cached files accumulate and occupy the already limited space within the device, it negatively affects the device's overall performance.

THREAT MODELS

As smartphones and tablets continue to advance, society's reliance on them grows. Companies often modify their software to run on mobile platforms like iOS, Android, and Windows Mobile, with some businesses fully dependent on mobile technology for daily operations. However, as the user base expands and devices become more capable, the associated risks also rise. Security experts have long predicted significant breaches and privacy issues due to vulnerabilities in mobile devices. Activities like emailing, conducting online transactions with credit cards, and the risk of loss or theft can expose sensitive information to unauthorized access. This study examines the Android operating system to highlight the data security risks related to mobile applications and their storage techniques. While the Android API offers features designed for future integration, it cannot guarantee that developers will always follow secure coding practices. Additionally, the question arises of whether application developers should bear responsibility for safeguarding user privacy. Caching is a technique used to store data locally, enabling faster access for future requests. When subsequent data requests occur, information is retrieved directly from the cache, eliminating the need for network connections or accessing remote servers. Temporarily storing data in the local cache can significantly improve the performance of Android applications by preventing redundant retrieval of frequently accessed information. Though the benefits of caching are clear, poor cache management can impact a device's efficiency, memory use, and security. While the Android operating system can automatically clear cached files when internal storage is low, developers are still responsible for managing their app's cache properly. Users often find that many apps exceed the recommended cache size when reviewing their device's storage usage. Resource-intensive apps, such as web browsers, are particularly prone to exceeding cache limits due to their frequent use and versatility. Despite continuous improvements in mobile device storage capacity, it still lags behind that of desktops and laptops. As a result, internal storage remains a scarce resource. When cached files accumulate excessively, occupying this limited space, the device's overall performance can degrade.

RELATED WORK

Numerous cache cleaning applications are accessible on Google's Play Store, simplifying the process of clearing app caches for users. These tools typically display a list of apps storing cached data, along with the corresponding storage space occupied on the device's internal memory. Clearing cached data through these applications can be done in two ways: by individually removing the cache for a specific app or by deleting all cached data across all apps with a single action. Although this cache cleaning approach provides a convenient method for users to free up storage more

quickly than using the default Android application manager, it still depends entirely on user interaction. While the Android operating system can automatically delete older cached files when internal storage becomes limited, outdated and possibly sensitive cached data may remain on devices with low activity. This occurs even with basic cache cleaners, which do not manage cached data without manual user involvement. Cache Cleaning T1, T2 takes 20 minutes interval shows percentage of memory usage by Machine MC1, MC2, MC3, MC4. Though asking users to clear caches with a single tap might seem simple for maintaining device performance, many smartphone users are unfamiliar with Android's technical aspects, including how cache clearing benefits device efficiency. Some cache cleaning apps, like App Cache Cleaner, offer automated cache clearing without direct user involvement. However, such tools often require users to set fixed intervals for cache deletion across all apps rather than dynamically determining when to clear cache on an app-by-app basis.

Dynamic Cache Cleaner Model

The idea behind a dynamic cache cleaner is to automatically delete outdated cached files without requiring user involvement. This method helps free up internal storage by operating as a background service, which enhances device performance. Additionally, it improves security by promptly and effectively removing potentially sensitive data. A dynamic cache cleaner evaluates two key factors: the device's idle time and application usage, recording relevant events for analysis. This section will explore these metrics and explain how they are used to determine the optimal moment for clearing an app's cache. Dynamic Cache Cleaning T1, T2 takes 20 minutes interval shows percentage of memory usage by Machine MC1, MC2, MC3, MC4.: Rather than a gradual process, cache cleaning is executed abruptly. When both the device and an application remain idle for a predefined period, the app's entire cache is removed from the device.

Device Idle Time

There are multiple techniques for monitoring an Android device's idle state. This model uses CPU load tracking to assess device activity. Other methods, such as monitoring the screen status (on or off), can interfere with additional dynamic components, which will be addressed later. By measuring CPU load, the system accounts for minor tasks like checking the time or reading an email or text message, allowing the dynamic cache cleaner to interpret the device as idle during such activities. This behavior improves cache cleaning efficiency, as constantly resetting the idle time tracker due to minor actions would reduce the cleaner's ability to clear application caches effectively. A device is considered in use when CPU usage exceeds 10%. However, most mobile devices can experience CPU spikes of up to 40% due to background processes running while the device is idle or when the screen is simply turned on. These brief spikes are ignored when surrounded by lower CPU activity, preserving the device's idle status. If a continuous CPU load above 15% is detected, short dips below this threshold do not change the device's active state. Additionally, balancing peaks during idle times and valleys during active use helps prevent the cache cleaner from overusing CPU resources. Though transitioning between idle and active states can create significant overhead, the background service monitoring device idle time operates with efficiency similar to Android's default alarm clock application.

METHODOLOGICAL ASPECTS

Figure 2 demonstrates the process followed by the dynamic cache cleaner concerning app usage and cache removal. The principle is simple: when an app with cached data is closed, the dynamic cache cleaner records the event. From there, one of two outcomes occurs: either the app is reopened, which prevents its cache from being cleared, or the app remains unused beyond its expiration period, triggering cache removal by the cleaner. The length of time an app can stay inactive before its cache is cleared depends on two key factors. The first is the device's idle time. If the device remains in active use, clearing an app's cache will take longer, even if the app itself has not been recently accessed. However, when the device enters an idle state—indicated by CPU usage dropping below 10%—the countdown for cache clearance begins to accelerate. A device idle for eight hours or longer will clear caches more aggressively compared to one that has only been idle for a short period. The second factor is the memory consumed by an app's

cache. Apps with larger cached data will be cleared sooner, as they are more likely to hold sensitive information. In contrast, apps with smaller caches may not be cleared as quickly since their minimal storage impact is unlikely to affect the device's performance.

Memory Consumption

The dynamic cache cleaner has minimal impact when the device is heavily used. Under such conditions, with all tested applications actively running, the available internal storage after four hours measured 2.65GB—just 0.29GB lower than the control scenario. This slight difference could be due to the cache cleaner's operation or random user activity. However, in the control scenario, setting the device aside and returning to it later, regardless of the time elapsed, showed cached storage remaining stable at 1.26GB. In contrast, with the dynamic cache cleaner active, application caches were fully cleared after 24 hours (the default idle setting). Figure 3 illustrates memory usage under heavy activity for four hours followed by ten hours of idle time. The dynamic cache cleaner effectively maintains lower cache levels compared to the control scenario, even during usage, emphasizing the importance of monitoring app-specific activity. If a particular app remains inactive for an extended period, its cache is automatically cleared. The cleaner's impact becomes even more noticeable during idle periods. Unlike the control setup where stale cache data remains until the device actively needs additional space, the dynamic cache cleaner continues clearing cache files during inactivity, making it more efficient. Figure 4 emphasizes the cleaner's core purpose during idle phases: removing unnecessary cached data that consumes storage, affects performance, and could potentially expose sensitive information.

Performance Impact

The size of cached data directly affects device performance. When an app's cache is empty, data retrieval from a web server takes longer. However, excessive cache accumulation can also degrade performance. Performance testing was conducted using Linpack for Android on single-threaded tasks. When no apps stored cached data, both scenarios averaged 2.28 seconds over 100 tests, indicating the cleaner's background services don't affect performance when idle. However, differences emerged after heavy use followed by idle time. As the cleaner began clearing cached data, the impact of excessive caching on performance became evident. With a total cache size of 0.5GB, performance improved compared to an empty cache. However, with 1GB of cached data, performance degraded, with average single-thread execution rising to 2.35 seconds. At 1.25GB, it increased further to 2.52 seconds, and at 1.83GB (the maximum cache size reached due to Android's automatic cleaning), the process took 3.09 seconds.

Similar patterns occurred during heavy usage with the dynamic cache cleaner running. However, after the device remained idle, performance improved as the cleaner removed caches, eventually restoring the single-thread test time to 2.28 seconds.

Security

The dynamic cache cleaner plays a significant role in maintaining device integrity. When an application caches sensitive information—generally discouraged as a programming practice—this data can persist on the device for extended periods, potentially even days, without an active cleaning mechanism. To evaluate the effectiveness of the dynamic cache cleaner, a test application was created to cache user-entered data. In the control experiment, this cached file remained on the device until Android's garbage collection cleared it to free up internal storage when necessary. Since Android uses a least-recently-used (LRU) algorithm, the file would only be deleted after all older cached files were removed. Under optimal conditions, where the sensitive file was the first cached and the device was heavily used, the file could be deleted in as little as 2 hours and 43 minutes. Comparable results were observed when the dynamic cleaner was enabled. However, if the device remained idle with the sensitive file cached and no dynamic cleaning mechanism was in place, the data could persist indefinitely until manually cleared by the user. With the dynamic cache cleaner active, the file would be deleted within 24 hours of idle time, provided the device remained powered on.

CONCLUSION

While caching undeniably benefits device performance, excessive caching can lead to significantly high memory consumption, which can negatively impact overall device efficiency. Furthermore, poor programming practices can sometimes result in the storage of sensitive information within cached data. In cases where neither the application nor the Android operating system actively clears such data, it can remain on the device for extended periods. Mobile caches have increasingly become targets for malicious attacks, leaving any sensitive data stored within an app's cache vulnerable to exploitation. The dynamic cache cleaner addresses these risks by enforcing a more proactive and efficient approach to garbage collection, ensuring stale cached files are removed more effectively.

ABSTRACT

To ensure that science concepts which comes under life sciences is of the highest quality, the misconceptions held by those entrusted with its delivery must be identified and addressed. Prospective science teachers, in the pursuit of their educational and professional journey, encounter a wide array of scientific concepts, some of which are intricate and counter-intuitive. It is not uncommon for these individuals to develop misconceptions, which are often rooted in their prior learning experiences, cultural influences, or incomplete understanding of complex topics. Unfortunately, if left unaddressed, these misconceptions can persist, leading to sub-optimal teaching practices and potentially influencing wrong concepts in the next generation's understanding of science. Eysenck in 1982 described misconceptions as "beliefs that are immune to counter-evidence." This definition highlights the persistent nature of misconceptions. Even when individuals are presented with information that contradicts their misconceptions, they may continue to hold onto their erroneous beliefs. Eysenck's perspective underscores the challenge of addressing and correcting misconceptions, as they can be resistant to change. By addressing misconceptions in the prospective science teachers, we can better equip them to provide accurate, engaging, and effective instruction in life science.

Keywords: This definition highlights the persistent nature of misconceptions.

NEED AND SIGNIFICANCE

The National Research Council (1997) said that misunderstandings are primarily a barrier to science education for pupils because they frequently prevent them from developing the accurate concepts that serve as the foundation for more advanced learning. This is comparable to King's (2010) revelation that misconceptions in the Earth Science textbook affect students' comprehension of scientific texts, making it harder for them to understand further information or knowledge as readers. Additionally, instructors may have misconceptions when teaching biology,

chemistry, or physics, which in turn causes misconceptions in the minds of the students (Bektas, 2017; Moodley & Gaigher, 2019). Misconceptions held by science teachers can hinder their effectiveness in the classroom which leads to the transfer of misconceptions. By identifying and rectifying these misconceptions early in their education and training, we can help break the cycle of inaccurate information being passed down to secondary-level students which will lead to more effective teaching methods, ultimately benefiting students' learning experiences and improving or enhancing the quality of science education.

OPERATIONAL DEFINITIONS OF KEY TERMS
Misconceptions
In the context of this study, misconceptions refer to inaccurate or incomplete beliefs held by prospective science teachers regarding specific concepts within physical science and life science taught at the secondary level. These misconceptions may arise from misunderstandings, prior learning experiences, or cultural factors.

Prospective Science Teachers
Prospective science teachers are individuals who are currently enrolled in teacher education programs with the intent of becoming secondary-level science educators.

Life Science Concepts
Life science concepts include biological and ecological principles and topics taught at the secondary level. This category encompasses subjects like genetics, ecology, physiology, evolution, and the structure and function of living organisms.

Secondary Level
The term "secondary level" refers to the educational stage typically attended by students comprising in grades 6 to 12, which is often high school or its equivalent in various educational systems worldwide. This study focuses on the misconceptions related to physical science and life science concepts within Secondary educational stage.

RESEARCH QUESTIONS

1. What are the common misconceptions held by prospective science teachers in the fields of life science at the secondary level?
2. What are the key factors or reasons contributing to the development and persistence of these misconceptions among prospective science teachers?
3. What effective remedies and strategies can be recommended for the removal of misconceptions among prospective science teachers to enhance their understanding and teaching of science concepts?

OBJECTIVES
1. To identify common misconceptions held by prospective science teachers in both life science
2. To find out reasons or factors of misconceptions among prospective life science teachers in secondary level
3. To suggest the remedies for the removal of misconceptions among prospective life science teachers in secondary level

REVIEW OF LITERATURE

Science teachers competence and knowledge have a significance impact on the education landscape, particularly those preparing students at the secondary level. Identifying and correcting prospective science teachers misconceptions is an important aspect of effective science education. This literature review examines existing research into the identification of misconceptions among prospective science teachers with a focus on the complex relationship between these misconceptions and concepts in life sciences. Kumandaş, B., Ateskan, A., & Lane, J. (2019)

said that biology misconceptions in the classroom should be recognized by teachers, and they should know how to correct them. In response, scientists and science educators have proposed and investigated practical strategies to stop and correct misconceptions. A thorough analysis of the literature helps determine which issues to address and why by providing researchers and educators with insights into trends, practices, and gaps in the research on misconceptions. The current study describes how Turkish researchers use a form to perform a content analysis of published research on misconceptions in Turkey. The investigation produced a meta-synthesis, or thematic content analysis, which listed and contrasted the goals, techniques, tools for gathering data, and conclusions of the chosen publications. By using this instrument and study techniques to discover trends and patterns in research on misconceptions, biology educators worldwide can improve the quality of instruction in their classrooms. In addition to being able to recognize biology misconceptions that have not received enough attention and require more research, researchers will acquire knowledge about successful techniques that have been employed to investigate misconceptions. (Ouch & Widiyatmoko, 2023) said Students' misconceptions are one of the things that make science teaching and learning challenging. The persistent misconceptions hinder the learning process for the students. Research on students' misconceptions has been conducted in large quantities, but it appears that the body of knowledge is still incomplete. Through a clear explanation of its position, drawback, and benefits for science teaching and learning, this review paper aims to contribute to a concise knowledge of students' misconceptions.

The article specifically tries to address the role of students' misconceptions in science teaching and learning as well as the major difficulties in incorporating students' misconceptions into teaching strategies, based on papers published in the 1990s. The results demonstrate how students' misconceptions impede their ability to learn as well as useful teaching techniques for dispelling them. Mufit et al. (2023) evaluate the Cognitive Conflict-Based Learning (CCBL) model's effectiveness in remediating misconceptions in physics. By activating preconceptions, presenting cognitive conflict, fostering collaborative exploration, and encouraging reflection, the CCBL model stimulates conceptual dissatisfaction and enhances students' confidence and knowledge in physics concepts. Das (2020) examines misconceptions in the use of brackets in arithmetic expressions among secondary-level students. Through document-based analysis, Das highlights the challenges associated with correctly utilizing brackets and emphasizes the importance of effective teaching strategies and curricula in addressing these misconceptions. Ageng Prayitno & Hidayati (2022) analyze students' misconceptions regarding general biology concepts using the Four-Tier Diagnostic Test (FTDT). The findings reveal prevalent misconceptions among students, underscoring the need for accurate information and effective learning models to prevent misconceptions in biology education. Behera (2019) investigates misconceptions in the shape of molecules among ninth-grade science students. Through action research, Behera identifies areas of difficulty and suggests strategies for addressing misconceptions, emphasizing the importance of deep learning and effective classroom evaluations. Karakaya et al. (2021) examine pre-service science teachers' conceptual perceptions and misconceptions about photosynthesis. Through focus groups and structured interviews, the study reveals significant misunderstandings among pre-service teachers, highlighting the need for improved science teacher education.

METHODOLOGY

This descriptive Survey study was done on students/prospective teachers/ pupil teachers who have science as a major teaching subject at Sharda University and Modern College of Professional Studies. Purposive cluster Sample selection process is used to select sample for this study which is B.Sc. B.Ed. and B.Ed. Students who are currently enrolled in 5th year of integrated programme and 2nd year of B.Ed. programme. The sample size(N) = 115 and FGD taken from 45 teachers in Delhi NCR

Tools
- Questionnaire will be developed to identify misconceptions on topics of biology.
- FOCUS GROUP discussion

Urvashi Sharma

Analysis and interpretation

When science classes in high schools fail to engage students, it is often because the instructors themselves have misconceptions. Misunderstandings like these can cause students a lot of trouble in the classroom. In order to address this critical issue, this data analysis section makes use of a survey administered to prospective science instructors. Through data analysis, we want to identify specific misunderstandings held by these prospective secondary school teachers regarding the core concepts taught in the life sciences. In order to guarantee that these future educators fully comprehend the scientific principles they will be instructing, our research will identify the specific areas of confusion and provide valuable recommendations for targeted treatments.

Biotic Factor in an Ecosystem

Soil pH is incorrectly identified as a biotic factor by the largest group (35.3%). Predators are correctly identified as a biotic factor by 29.3% of respondents. Temperature and water availability are abiotic factors but are incorrectly identified as biotic by 21.6% and 13.8% of respondents, respectively.

Abiotic Factor in an Ecosystem

Soil nutrients are correctly identified as an abiotic factor by the largest group (44.8%).
Predators, which are a biotic factor, are incorrectly identified as abiotic by 21.6% of respondents.
Producers and decomposers, both biotic factors, are incorrectly identified as abiotic by 17.2% and 16.4% of respondents, respectively.

Process of Nutrient and Energy Transfer in an Ecosystem

Energy pyramid is correctly identified as the term describing the process by which nutrients and energy are transferred from one trophic level to another by the largest group (41.4%). Decomposition (24.1%) and biomass (20.7%) are related concepts but do not directly describe the trophic transfer process. Trophic cascade (13.8%) is a related ecological concept but not the correct term for the process in question.

Movement of Molecules from High to Low Concentration

Diffusion is correctly identified as the term describing the movement of molecules from an area of high concentration to an area of low concentration by the largest group (33.6%).Osmosis, which is a specific type of diffusion through a semipermeable membrane, is incorrectly identified as the general term by 23.3% of respondents. Active transport (31.0%) and transpiration (12.1%) are related biological processes but do not describe the passive movement of molecules from high to low concentration. In conclusion, the charts indicate a mixed understanding of ecological and biological concepts among the respondents. While there is a correct identification of abiotic factors such as soil nutrients and the energy pyramid as a model for nutrient and energy transfer, there is also confusion between biotic and abiotic factors, as well as between different biological processes such as diffusion and osmosis. This suggests a need for clearer education on these topics to avoid misconceptions. The first chart asks, "What term describes the process by which plants lose water vapor through small openings in their leaves?" The majority of responses (47.4%) correctly identify "Transpiration" as the process. Other responses include "Osmosis" (25.0%), "Photosynthesis" (19.8%), and "Absorption" (7.8%). The second chart asks, "In plant biology, what structure is primarily responsible for the transport of water and nutrients from roots to leaves?" The correct answer, "Xylem," is chosen by the majority (50.9%). Other responses are "Phloem" (29.3%), "Stomata" (15.5%), and "Epidermis" (4.3%). The third chart asks, "What is the primary mechanism responsible for the movement of water molecules across a semipermeable membrane?" The responses are more varied, with "Diffusion" leading at 36.2%, followed by "Osmosis" (31.0%), "Active transport" (20.7%), and "Filtration" (12.1%). The correct answer is "Osmosis." The fourth chart asks, "Which of the following is a function of the human reproductive system?" The majority of responses correctly identify "Producing gametes" (64.7%) as a function. Other responses include "Maintaining" (14.7%), "Transporting nutrients to" (11.2%), and "Regulating body" (9.5%). In conclusion, the pie charts indicate that for the first and second questions, the majority of respondents correctly identified "Transpiration" and "Xylem" as the answers. For the third question, "Osmosis" should be the leading response, but "Diffusion" has the highest percentage. For the fourth question, the majority correctly identified "Producing gametes" as a function of the human reproductive system. The

94805

first pie chart is titled "Count of In the human reproductive system, what structure serves as the site of fertilization?" The chart shows the following distribution of answers:

Fallopian tube: 50.0%

Uterus: 21.6%

Ovary: 17.2%

Cervix: 11.2%

From this chart, we can summarize that the majority of respondents (50%) correctly identified the Fallopian tube as the site of fertilization in the human reproductive system. The other options received significantly fewer selections, with the uterus being the second most common incorrect answer.

The second pie chart is titled "Count of Which of the following is an example of an adaptation in plants?" The chart shows the following distribution of answers:

Growing long, sharp: 58.6%

Developing a thicker: 15.5%

Shedding leaves to: 13.8%

Migrating to a warmer: 12.1%

The summary for this chart is that the majority of respondents (58.6%) chose "Growing long, sharp" as an example of an adaptation in plants. It's not clear what the full context of each answer choice is due to the text being cut off, but based on the available information, "Growing long, sharp" was the most popular choice, indicating that respondents may associate this characteristic with plant adaptation. The other options were less frequently selected.

In conclusion, for the first chart, the Fallopian tube is correctly recognized as the site of fertilization by half of the respondents. For the second chart, "Growing long, sharp" is the predominant choice for an adaptation in plants, but without the full context of the answers, it's difficult to assess the accuracy of this response

Focus Group Discussion

The focus group comprised forty five educators in two sessions of 25 and 20 with diverse backgrounds and teaching experiences in secondary level science education.

Prevalence of Misconceptions

The majority of participants agreed that misconceptions are indeed common in fundamental principles of physical and natural sciences. They highlighted that misconceptions often stem from students' prior knowledge, limited exposure to accurate scientific information, and reliance on intuitive reasoning rather than scientific principles.

Removing Misconceptions

Participants emphasized the crucial role of teachers in identifying and addressing misconceptions. Strategies discussed included:

- Providing hands-on activities and experiments to engage students actively in the learning process.
- Encouraging critical thinking and inquiry-based learning to challenge and correct misconceptions.
- Utilizing multimedia resources and visual aids to illustrate complex concepts and promote deeper understanding.
- Incorporating formative assessments to gauge students' understanding and address misconceptions promptly.

Methodology for Removing Misconceptions

Regarding methodology for removing misconceptions, participants suggested the following approaches:

- Engaging students in collaborative learning activities such as group discussions and peer teaching to encourage knowledge sharing and collaborative problem-solving.
- Incorporating real-life examples and analogies to bridge the gap between abstract concepts and students' everyday experiences.
- Providing timely and constructive feedback to students to correct misconceptions and guide their learning effectively.

- Encouraging reflection and metacognitive awareness to help students recognize and rectify their own misconceptions.

Addressing Misconceptions in Biology

In biology, misconceptions regarding processes like osmosis, photosynthesis, and reproduction were noted, and educators emphasized the importance of fostering a deeper understanding through inquiry-based learning and practical demonstrations

MAJOR FINDINGS OF THE STUDY

Ecological and Biological Concepts: Biotic and Abiotic Factors: Respondents demonstrated confusion between biotic and abiotic factors in ecosystems, as well as misconceptions regarding their definitions. Energy Transfer in Ecosystems: While there was a good understanding of the term "energy pyramid," there were misconceptions regarding other aspects of nutrient and energy transfer in ecosystems. Molecular Movement and Reproductive Systems: While some respondents correctly identified concepts such as diffusion and the function of the human reproductive system, there were also misconceptions observed in these areas. Botanical and Physiological Concepts: Plant Physiology: Respondents generally showed a good understanding of concepts such as transpiration and xylem function, although there were some misconceptions observed. Biological Processes: While there were correct responses regarding biological processes like osmosis and gamete production, there were also misconceptions and incomplete understandings observed in these areas. Overall, the findings suggest a mixed understanding of scientific, electrical, chemical, ecological, biological, botanical, and physiological concepts among the respondents. While some concepts were well-understood by the majority, others showed a need for clearer education and remediation to address misconceptions and gaps in understanding.

Reasons for Misconceptions

Misconceptions may arise due to inadequate education, unclear presentation of concepts, or misunderstandings perpetuated by common misconceptions in society. In some cases, respondents may have been influenced by incomplete or ambiguous answer choices, leading them to select options that do not fully represent their understanding. Lack of reinforcement or exposure to accurate information, especially in complex scientific topics, can also contribute to misconceptions.

Remedies for Addressing Misconceptions

Clear and comprehensive education on scientific concepts is essential. This includes providing accurate information, addressing common misconceptions explicitly, and using varied teaching methods to accommodate different learning styles. Incorporating interactive activities, such as hands-on experiments, demonstrations, and discussions, can help reinforce understanding and clarify misconceptions. Teachers and educators should be trained to recognize and address misconceptions effectively. This may involve targeted interventions, such as diagnostic assessments, tailored instruction, and follow-up assessments to monitor progress. Providing ample opportunities for student engagement and feedback can foster a supportive learning environment where misconceptions can be addressed openly and constructively. Encouraging critical thinking and inquiry-based learning can empower students to question their own understanding, seek clarification, and refine their knowledge over time. Differentiated instruction, active learning will remove misconception.

CONCLUSION

By delving into both primary survey data and the wealth of knowledge gleaned from secondary sources, this research sheds light on the specific misconceptions that prospective science teachers grapple with in relation to fundamental physical and life science concepts. Analyzing these misconceptions through a dual lens proves to be particularly insightful. The survey data offers a direct window into the understanding of these future educators, pinpointing areas where their grasp of scientific principles might be shakyBy addressing these misconceptions head-

on, teacher education programs can be strategically designed to equip future educators with a rock-solid foundation in scientific knowledge. This not only empowers them to confidently and accurately transmit scientific understanding to their students but also equips them with the pedagogical tools to effectively identify and rectify prevalent misconceptions in the classroom. The focus group discussion shed light on the prevalence of misconceptions in fundamental principles of natural sciences among students and the critical role of educators in addressing these misconceptions. By employing effective teaching strategies, incorporating engaging activities, and providing targeted support, educators can facilitate meaningful learning experiences and promote accurate understanding of scientific concepts.

ABSTRACT

Prolonged digital screen time and inadequate sleep duration have been linked to musculoskeletal discomfort. This study investigates the association between digital screen usage, sleep patterns, and associated health complaints in a sample of adults. A cross-sectional survey was conducted among 118 adults using a structured questionnaire designed to capture detailed information on digital device usage, complains of the musculoskeletal discomfort, and psychological status. Data were analyzed descriptively, focusing on the frequency of complaints related to musculoskeletal pain, psychological stress, and sleep disturbances. Correlation analysis and cluster analysis were applied to find out if there were any significant correlations between different variables. The study revealed that 96.61% of participants used mobile phones as their primary device, with 42.37% spending 2–4 hours per day on screens. Common complaints included neck pain (67.80%) and fatigue (51.69%). Screen use was reported to affect psychological health in 48.31% of participants and physical health in 47.46%. Significant positive correlations were found between screen time and neck pain ($r = 0.43$), fatigue ($r = 0.51$), and psychological distress ($r = 0.35$). Sleep duration was negatively correlated with neck pain ($r = -0.29$), fatigue ($r = -0.41$), and wrist pain ($r = -0.36$). Prolonged digital screen time and inadequate sleep duration are associated with increased musculoskeletal discomfort and psychological distress. Balancing screen time and sleep is crucial for promoting overall well-being. These findings highlight the need for public health interventions to mitigate the negative effects of excessive screen time.

Keywords: Correlation, digital, health, mental, musculoskeletal, pain, psychological, screens.

Aparna Anil Bachkaniwala and Vivek Harsukhbhai Ramanandi

INTRODUCTION

The rapid advancement and widespread adoption of digital devices have revolutionized communication, entertainment, and information access. The widespread use of digital devices has led to a significant increase in sedentary behaviour and prolonged screen time. While these devices have become integral to daily life, there is growing concern about the potential negative health impacts associated with prolonged screen exposure. Previous studies have linked extended screen time to a variety of adverse outcomes, including musculoskeletal pain, disrupted sleep patterns, and increased psychological stress [1-3]. Digital devices, such as smartphones, laptops, and tablets, often require prolonged periods of static posture, which can lead to musculoskeletal discomfort, particularly in the neck, shoulders, and back. Moreover, exposure to blue light emitted by screens has been shown to interfere with circadian rhythms, thereby affecting sleep quality[4, 5]. Additionally, the overuse of digital devices has been associated with increased psychological stress, irritability, and mental fatigue [6-9]. Understanding the interrelationships between digital screen usage time, sleep patterns, and musculoskeletal discomfort is essential for developing effective prevention and intervention strategies.

RESEARCH QUESTIONS

- Is there a correlation between digital screen time and musculoskeletal discomfort?
- Is sleep duration associated with musculoskeletal discomfort?
- Can cluster analysis identify distinct groups based on screen time and sleep duration? This study aims to explore the relationship between digital screen use and its impact on sleep, physical health, and psychological well-being among a sample population. Understanding these associations is expected to provide critical information for developing guidelines to reduce screen-related health risks.

METHODS

An online cross-sectional survey was conducted to explore digital screen usage patterns among participants using Google Forms platform. A convenience sample of 118 adults (mean age: 32.6 ± 8.1 years) participated in the study. Participants were invited and included for the study if they were between age of 18-65 years, had been using any digital device regularly for >2 hours/day, and were able to provide informed consent. They were excluded if they had any pre-existing musculoskeletal conditions or sleep disorders unrelated to digital device usage, or were suffering from chronic medical disease or disorders which may affect participant's capacity to participate. A pre-validated structured online questionnaire was used to collect data on the following variables:

- Types of Digital Devices Used: Participants reported on their use of mobile phones, tablets, laptops, computers, televisions, and other devices.
- Average Daily Screen Time: Participants were asked to estimate their daily screen time over the past seven days, categorized as <2 hours, 2–4 hours, 4–6 hours, or >6 hours.
- Sleep Patterns: Data on average daily sleep over the past seven days were collected, with participants reporting sleep duration in hours.
- Perceived Effects of Digital Screen Use: Participants were asked to describe the perceived impact of screen use on their sleep, psychological health, and physical health.
- Common Physical Complaints: Participants reported physical complaints related to screen use, including pain in the neck, shoulders, upper back, lower back, wrists, and hands, as well as symptoms of tingling, numbness, and fatigue.
- Psychological Status: Participants were asked about their psychological well-being, with options including "normal," "fatigued," "irritated," "frustrated," and "sleepy." Surveys were distributed via email and social media; and included detailed description of study followed by informed consent. The survey responses were accepted over 6 weeks' duration.

Aparna Anil Bachkaniwala and Vivek Harsukhbhai Ramanandi

Data were analysed using Jamovi version 2.3.28 for Windows and Microsoft Office Excel for Windows. Descriptive statistics summarized demographic and survey data. Correlation analysis (Pearson's r) examined relationships between variables. Cluster analysis (K-means) identified distinct groups based on screen time and sleep duration [10].

RESULTS AND DISCUSSION

The study included 118 participants with mean age 32.6 ± 8.1 years. Following is the description of findings based upon descriptive statistics of the data received from survey (table-1). The findings of this study highlight the significant relationships between digital screen time, sleep duration, and musculoskeletal discomfort and psychological distress. The positive correlations between screen time and neck pain, fatigue, and psychological distress suggest that prolonged screen time may contribute to increased prevalence levels of these health outcomes. Here, we have discussed individual relationship in details as per the need based upon available literary evidence. Most of the participants reported using mobile phones (96.61%), making them the most frequently used device, followed by laptops (52.54%), tablets (8.47%) and televisions (3.39%). This finding reflects the increasing dominance of mobile technology in daily life.42.37% participants reported spending 2–4 hours per day on digital screens. However, 23.73% of participants reported using screens for more than 6 hours daily. The most frequently reported average sleep duration was 7 hours (40.68%), followed by 6 hours (22.88%). A small percentage of participants (3.39%) reported sleeping more than 8 hours per night. Participants reported that digital screen use negatively impacted their sleep (32.20%), psychological health (48.31%), and physical health (47.46%). The most common physical complaint was pain and aches, reported by 55.93% of participants. Fatigue was also prevalent, affecting 51.69% of participants. Numbness and tingling were less commonly reported but were still notable symptoms, particularly among those with higher screen times. Musculoskeletal complaints were common among participants, with the neck (67.80%) and hand/thumb/fingers (37.29%) being the most frequently affected areas. Table 2 shows the correlation analysis for the variables of interest. It shows strong positive correlation of screen time with neck pain (r=0.43), and fatigue (r=0.51). A moderate positive correlation (r=0.35) was reported between screen time and psychological status. Also, sleep duration demonstrated moderate negative correlation with screen time (r=-0.31), neck pain (r =-0.29), and strong negative correlation (r = -0.41) with fatigue.

Fatigue was found to have strong positive correlation with neck pain (r = 0.63), and psychological status (r = 0.58). The association between screen time and musculoskeletal discomfort is consistent with previous studies[1, 11-13]. Prolonged screen time often involves prolonged sitting, poor posture, and repetitive movements, increasing the risk of musculoskeletal injuries [1, 12, 14]. The high prevalence of neck pain (67.8%) and hand/thumb/finger pain (37.3%) in our sample supports this finding. Impact of screen type on physical and psychological health has been studies previously. The researchers have concluded that majority of times, use of mobile devices was found to be associated with increased risk of neck pain, thumb pain, and eye strain due to prolonged texting, browsing, and gaming [1, 15]. While studying computer users, it was reported that sedentary behaviour and decreased physical activity were associated with secondary development of obesity and cardiovascular disease [16]. In a few studies usage of tablets was reported to cause poor posture, shoulder pain, and decreased physical activity [11, 17]. Psychological effects were significant, with 28.81% of participants reporting feeling fatigued or tired, 19.49% reporting feelings of irritation, and 14.41% reporting feelings of sleepiness. The negative correlations between sleep duration and neck pain, fatigue, and wrist pain suggest that adequate sleep is essential for mitigating musculoskeletal discomfort. Sleep plays a crucial role in muscle recovery and repair. Exposure to screens before bedtime suppresses melatonin production, leading to delayed sleep onset, reduced sleep duration, and poor sleep quality. Increased screen time can also increase alertness and arousal, interfere with sleep-wake cycle, and lead to sleep fragmentation. Inadequate sleep duration may exacerbate muscle fatigue, leading to increased pain sensitivity. Additionally, poor sleep quality can contribute to mood disturbances, anxiety, and depression, further impacting overall well-being. The positive correlation of screen time with fatigue and psychological health was reported in this study. Eye strain, sedentary behaviour and sleep disturbances have been reported to significantly affecting the psychological health in previous

studies. Few studies have reported that higher screen usage can lead to anxiety and depression, social isolation and decreased social skills, cyber bullying and online harassment, addiction, and decreased attention span.

K-means clustering was done to identify patterns in the data. Table 3 depicts the clusters which emerged along with the characteristics. The cluster analysis revealed three distinct groups:

- **Cluster 1 (High Screen Time/Low Sleep):** This group reported higher levels of musculoskeletal discomfort, fatigue, and psychological distress.
- **Cluster 2 (Moderate Screen Time/Moderate Sleep):** This group demonstrated moderate levels of musculoskeletal discomfort and fatigue.
- **Cluster 3 (Low Screen Time/High Sleep):** This group reported lower levels of musculoskeletal discomfort and fatigue.

Limitations of present study include: limited causal inference due to cross-sectional design; risk of subject bias due to self-reported data; and limited ability to generalize the findings due to study's focus on a specific population. Beyond the findings presented in the study, it is important to consider the broader implications of these results. The increasing prevalence of digital device usage, particularly among young people, highlights the need for comprehensive strategies to address the potential negative health consequences. Educational campaigns for raising awareness about the potential health risks associated with excessive screen time and promoting healthy screen usage habits; workplace policies that encourage regular breaks, limit screen time during work hours, and promote ergonomic practices; school-based programs for educating students about the importance of balanced digital device usage, providing opportunities for physical activity, and promoting healthy sleep habits; community-based initiatives, such as organizing events and activities to encourage physical activity, limit screen time, and promote healthy lifestyle choices; and technological solutions like development of tools and apps that help individuals track and manage their screen time and sleep patterns can help to address the issues discussed above. While considering research implications for future, longitudinal studies to investigate the long-term effects of digital screen usage on health outcomes, including the development of chronic diseases; randomized controlled trials to evaluate the effectiveness of interventions aimed at reducing screen time and improving sleep habits, particularly in vulnerable populations (e.g., children, adolescents, older adults); studies exploring the impact of different types of digital devices (e.g., smart phones, tablets, computers) on health outcomes; and research on the role of blue light emitted from screens in disrupting sleep patterns and affecting mood are a few suggestions to advance the knowledge and enhance evidence database for broader applications.

CONCLUSION

In conclusion, this study provides valuable insights into the relationship between digital screen usage, inadequate sleep duration, and increased musculoskeletal discomfort and psychological distress. The findings emphasize the importance of balancing screen time and sleep to promote overall well-being. Further research and public health interventions are needed to address the growing health challenges associated with excessive digital device usage. Healthcare professionals should emphasize responsible digital device usage, physical activity, and sleep hygiene practices to promote overall well-being.

ABSTRACT

Quality is a multidimensional concept with patient satisfaction as one of the most important facets which mirrors the quality of services in a hospital setting. This study helps the hospitals to measure, monitor, and improve the quality of healthcare services in order to accomplish patient satisfaction. Patients' opinions of "how well" services meet their needs and expectations are also considered as a valid indicator to measure service quality. This will able to alert management to consider the perception of patients. This study helps to identify specific areas of excellence and weaknesses. This helps to prioritize areas of service weaknesses. Apart from intra organisational learning, If the hospitals know their competitors, it will help them to gain competitive advantage. When patient search for hospitals for medical treatment, they may have confusions like which hospital is best for what in terms of various service quality dimensions. Comparative study of hospitals may beneficial to patients to understand the hospital services in a better way. Thus, the researcher chose five multi specialty hospitals for study. Descriptive research design was used. Convenient sampling technique was used. Sample consists of 390 patients. Questionnaire was used for data collection.

Keywords: Quality of healthcare services, Service quality dimensions, Patient perception, Convenient sampling, Hospital comparison

94818

INTRODUCTION

Quality is associated to personal ethics and anticipations and there is no common definition for quality in the healthcare industry. In healthcare industry, service quality and patient satisfaction is receiving significant focus and this subject is considered in their deliberate forecasting process. Patients' perceptions about the services offered by particular health care organizations influence the reflection and success of the hospital and it also notably affects the patient behaviour in terms of their reliability and word-of-mouth. Quality of healthcare services is evidently necessary element of the healthcare industry as it straight deals with human being health and bears liability for their lives. Cost of poor quality is significantly higher within the healthcare industry. Quality in health care is not easy like any other service. Result of healthcare service depends not only on healthcare service providers but also on patients' support and their conformity to treatments. Service quality is primarily focused on meeting the customer's requirements and also how good the service delivered satisfies the customer's anticipation of it. Quality service is the important factor needed for a victorious business. In this consumer driven world, where competition is becoming tough day by day and crucial deadlines are common, one cannot imagine of business expansion without extraordinary consumer service. Quality customer service can promote business in numerous ways and by observing the significance of customer service can take way to offer consumers with an encouraging experience. Patient satisfaction is a most preferred outcome of health care and may even be an aspect of health status itself. A patient's feel of satisfaction or dissatisfaction is a result of quality hospital care in all of its dimensions. Whatever its strengths and limitations, patient satisfaction is an indicator that should be indispensable to the measurement of the quality of care in hospitals. Patient satisfaction is the patient reaction to his or her service experience. Patients do not appear to be suffered by morbidity and mortality statistics but more by personal stories of care. Patient perception of quality is evaluated through dimensions of what is personally valued and often they do not distinguish between the provider of the service and the service received. Being treated with respect and dignity and involvement in treatment decisions are intangible issues of patient satisfaction that are paramount issues for patients.

STATEMENT OF THE PROBLEM
Coimbatore is developing as a major healthcare hub in the nation and is expect to grow remarkably from what it is today. The annual growth rate would go up to a whopping Rs. 5,000 crores from Rs. 750 crores today, in a couple of years' time. There are around 750 hospitals in the city with an in-patient capacity of 5,000 beds   having the highest concentration of private hospitals in the State, next to Chennai. Large number of patients from other parts of the country and abroad as well prefer Coimbatore as their destination for health care. As the city boasts of specialisation in multiple fields, they come for a variety of surgeries and procedures ranging from heart operations to orthopaedic treatment. When patient prefers Coimbatore as their choice of medical treatment, they may have confusions like which hospital is best for what in terms of various service quality dimensions. If patient process knowledge over the quality of care rendered by different hospitals, they take better decision regarding their choice of health care. It is important for the hospitals to attract and retain their patients to utilize the maximum market potential. A patient would be satisfied if Hospitals are able to convince the patient of how the provided service is the optimal solution to the patient needs. However, this can be done only when the Hospital itself is sure of what the patient wants, which is possible by conducting research. Apart from intra-organizational learning, if the hospitals know their competitors, it will help them to gain competitive advantage. Since Coimbatore is a hospital saturated city, knowledge about the competitors would also be helpful for the hospitals to be a preferred hospital among the patients. Hence the researcher is interested to find out the service quality of chosen Multi specialty hospitals in Coimbatore to understand the quality of service offered in these hospitals and satisfaction of patients towards various factors in hospital.

OBJECTIVES OF THE STUDY
- To measure the service quality and patient satisfaction at Multi-Specialty Hospitals in Coimbatore City.
- To identify the factors which influence the level of patient satisfaction towards service provided by   Multi-Specialty Hospitals in Coimbatore city.

94819

- To rank the hospitals based on service quality dimensions

REVIEW OF LITERATURE

Review literature shows service Quality and patients satisfaction are influenced by individualized care, communication, waiting time, pain management, spending time with patient, professional competence, interpersonal aspects, physical and social environment, natural dimension, quality of rivals and every service quality dimension. Ramachandran. K. K assessed the relevance of service quality dimensions with passenger's satisfaction. Descriptive research design was used for the study and the primary data was collected by using convenience sampling method. The sample size for the study is 578. The collected data was analysed using ANOVA-1 "f" test. Results reveal a significant difference in passengers' perception of tangibles of different domestic airline companies in India. EmineKol, FatmaArıkan, Emineİlaslan, Muhammed AliAkıncı, Mehmet CumaKoçak (2017)determined the patient satisfaction levels as a quality indicator for the assessment of nursing care. This study was designed as a descriptive study with a sample size of 400 patients. 'The skilfulness of nurses' and respect for the patients' privacy' were recorded as the highest satisfaction items. the Efforts by nurses to make the patients feel at their home was given lowest scores. and 'the way the nurse comforted your relatives and friends'. Hui-PengLiew, Talbot Brooks (2017)conducted a study on satisfaction towards different attributes of inpatient care among Indonesian men and women's and how the ratings differ across clusters of individuals. Respondents are responsive to the type, cost, quality, and location of the inpatient care, though individuals in diverse groups connect different significance to the diverse attributes linked inpatient care. AppalayMeesala, Justin Paul (November 2016)revealed that reliability and responsiveness (not empathy, tangibility, and assurance) impact patients' satisfaction. Patient's satisfaction was directly related to patients' loyalty to the hospital. Marital status and age had no impact on the regression weights of the variables analyzed; however, it was found that to some extent gender does. Mien Li, Emily N K Angdnurs, Yionghuak Chan, Hong Guhe, KatriVehvilainen, Julkunen (2016)exposed that there was a high level of patient satisfaction linked with, pain management, waiting time and communication and advice given. RezartaKalaja, RediMyshketa, FrancescoScalera (2016) assessed the service quality in the regional hospitals of public sector. Patients are the key people in evaluating the quality. This study is based on a questionnaire completed by 200 hospitalized patients. The findings in specific reveal positive results towards quality services without significant differences between expectations and actual perceptions of patients.

RESEARCH FRAMEWORK

The study aims at describing the perception and satisfaction which prevails in the minds of the patients. Thus, Descriptive research design is used. The target population includes patients who were admitted in the selected hospitals as inpatients. Only multi-specialty hospitals which got NABH certification or applied for the same are selected for the study. According to the Sample size Calculator, the adequate sample required for the study is 385. With rounding off, the researcher has taken 390 samples. The actual number of patients available to respond is also infinite. So, non-probability convenient Sampling was used for the study. The data collected is Primary data through the questionnaire prepared by the researcher.

ANALYSIS AND INTERPRETATION
The study variables are examined using simple mean and standard deviation. The summated scores were obtained on the items that constitute each factor and level of mean and the standard deviation were used to study the service quality factors and overall service quality and patient satisfaction across the chosen hospitals in Coimbatore city. The results are presented in this part. To calculate mean and standard deviation, Values are allocated in SPSS as follows.
1 - Always/Strongly Agree/Highly Satisfied
2 – Usually/Agree/Satisfied
3 – Often/ Neutral

4 – Rarely/Disagree/Dissatisfied
5 – Never/Strongly Disagree/Highly Dissatisfied
Hence lower mean score indicates better-quality perception of a particular factor.

INFERENCE
Ramakrishna hospital was perceived top in all services quality dimensions except Assurance dimension. In Assurance dimension, GKNM was perceived top. KG hospital was perceived low in all service quality dimensions except Responsiveness. KMCH was perceived low in Responsiveness.

INFERENCE
GKNM is perceived best for General Medicine and cardiology, PSG is for Paediatrics, KG is for Respiratory medicine and Orthopaedics, KMCH is for Gastroenterology and Ramakrishna is for Obstetrics & Gynaecology.

INFERENCE
Ramakrishna hospital was perceived better by respondents followed by GKNM, PSG, KMCH and KG based on overall service quality dimension.

INFERENCE
Among seven chosen specialities, respondents are highly satisfied with paediatrician (comparison among specialities within their hospital) at GKNM, KMCH, PSG and Ramakrishna. Respondents are highly satisfied with orthopaedist at KG.

INFERENCE
Based on overall experience of respondents', respondents are highly satisfied with GKNM followed by Ramakrishna, PSG, KMCH and KG Hospitals.

INFERENCE
The above table shows the reasons why the respondents have chosen a particular hospital. The reasons are listed from highest to lowest based on the preference of respondents'. Reference given by the friends and relative is top reason to choose a hospital and Service provided by employees is least reason to choose a hospital. H_0: There is no significant relationship between hospital and reliable factors. H_a :There is significant relationship between hospital and reliable factors

INFERENCE
The above 4.2.1 indicates, p value is less than 0.05 (at 5% significance level) for the factors Doctor makes right diagnosis, Doctor is prescribing only necessary investigation and medicine, Doctor spends enough time to examine the patients and Hospital maintain patients' investigations reports and records accurately. So Null Hypothesis is rejected. It is concluded that, there is a significant association between Hospitals and the opinion of respondents to all above mentioned factors. p value is greater than 0.05 (at 5% significance level) for the factors Patients are attended according to appointment/scheduled time, Hospital delivery prompt service. So Null Hypothesis is accepted and it is concluded that there is no significant association between Hospitals and the opinion of respondents for these two factors.

INFERENCE
Table 4.8 indicates, all Assurance factors' p value is less than 0.05 (at 5% significance level). So Null Hypothesis is rejected. It is concluded that, there is a significant association between Hospitals and the opinion of respondents to all factors of Assurance dimension.

INFERENCE

Table 4.9 indicates, all Tangible factors' p value is less than 0.05 (at 5% significance level). So Null Hypothesis is rejected. It is concluded that, there is a significant association between Hospitals and the opinion of respondents to all factors of Tangibility dimension.   Table 4.10 indicates, all Empathy factors' p value is less than 0.05 (at 5% significance level) except for the factor "quality of service and cost of service are consistent with patient requirements. So, it is concluded that, there is a no significant association between hospitals and the opinion of respondents for the factor quality of service and cost of service are consistent with patient requirements, and there is significant association between Hospitals and opinion of respondents to other factors of Empathy dimension. Table 4.11 indicates, all Responsiveness factors' p value is less than 0.05 (at 5% significance level). So Null Hypothesis is rejected. It is concluded that, there is a significant association between Hospitals and the opinion of respondents to all factors of Responsiveness dimension.

DISCUSSION AND SUGGESTION

- Though all service quality dimensions and patient satisfaction factors got positive responses, the low positive responses are recorded for cost aspects. This may be because, almost 3/4   of respondents of this study spent medical expenses out of their pocket. So, health care professionals and government can upgrade the insurance schemes which cover every individual for all necessary ailments in more appropriate way. (Present Government insurance schemes are utilised by only a specific cater of people. So, measures can be taken to utilise insurance schemes by all cater of people.)Affordable treatment helps for sustainable development.

- All the hospitals are perceived highest in tangible dimension and least in empathy and responsiveness dimension. Empathy and responsiveness are most important factors for service industry particularly to hospitals. But hospitals concentrate more on tangible dimension of hospitals (Building, equipment and etc.). Hospitals should take all possible efforts to improve these dimensions. Development does not only mean physical development. Development has to be present in human aspects as well for sustainability.

- In almost all the hospitals, respondents are highly satisfied with paediatric doctors. So in Coimbatore, paediatricians' services are appreciable. All other specialty doctors can also adopt some unique approach to satisfy their patients.

- Though tangibility was perceived better in hospital, when it comes to reason to choose the hospital, only reference given by friends and relatives, Availability of doctors and goodwill of the hospital are the top reasons. Reasons related tangibility not recorded in top reasons. So hospitals need to concentrate in these areas to satisfy their customers.

- Hospitals can adopt collaborative approach rather competitive approach to serve better for their patients. Coimbatore is the preferred location for medical treatment next to Chennai in Tamil Nadu. So, each hospital can choose few specialities where they can super specialise in all aspects of service without any duplication with other hospitals. It will help patients to visit an appropriate hospital and get treatment without any further referrals. At the same time hospitals are also get benefits getting patients without spending much on marketing.This helps for sustainable development of all hospitals without disturbing their competitors.

- Almost all aspects of patient care GKNM and Ramakrishna hospital was perceived top among chosen hospitals. These two hospitals should be careful to maintain the same in an increasing competition and ever-changing expectation of patients.

CONCLUSION

Hospital is highly scientific and highly sensitive place. From this study, it is understanding hospitals focused much on tangibility dimension and less on Empathy and responsiveness dimension. Apart from medicines and machines, empathetic approach and responsiveness towards patients are of high importance in hospitals. Hospitals ultimate aim is to satisfy the patients. For satisfy the patients, hospitals should understand the exact requirement of patients. Patient satisfaction tactics are not easy, unless everyone in the hospital understand the requirements of patients and

Malleeswari

internalise the same. So, necessary arrangements should be done to satisfy the patients' requirements. This can be possibly done by approaching patients with simple human touch. Human aspects are necessary for sustainable development of hospitals.

ABSTRACT

Bhasma, a traditional Ayurvedic medicinal preparation, has been used for centuries to treat various ailments. Since metals and minerals are not bio-assimilable in their raw form, they are converted into Bhasma through a series of traditional Ayurvedic procedures. These procedures include Shodhana (purification), Bhavana (levigation), and Marana (incineration). The Puta method comprises preparation Bhavana, Chakrika (pellet) preparation, Sarava Samputa, and Putikarana. Traditionally, this process is carried out using heat generated by burning Gomaya (cow dung cakes). However, in this study, modern instruments such as Wet grinder, Muffle furnace, and pyrometer are employed. The primary objective of this study is to prepare Tamra Bhasma using modern equipment and pharmaceutical techniques**.** The preparation of Tamra Bhasma involves a series of procedures, starting from the procurement of raw materials to Shodhana, Bhavana, and Marana. The Bhavana process is facilitated using a Wet grinder, while the Marana process is carried out using a horizontal Muffle furnace. A Pyrometer is utilized to determine the temperature during the Marana process. The Bhasma prepared by using modern equipment like Wet Grinder, Muffle furnace have rendered the Bhasma sidhi lakshanas after three puta maintained at 500℃ each time. The present study demonstrates the preparation of Tamra Bhasma using

modern equipment such as a Wet grinder, Muffle furnace, and Pyrometer. This study highlights the potential of integrating traditional Ayurvedic practices with modern technology to produce high-quality Bhasma.

Keywords: Tamra, Wet grinder, Muffle furnace, Bhasma pareeksha

INTRODUCTION

Bhasma, a Sanskrit term meaning "ash" or "calcined powder," refers to a unique Ayurvedic medicinal preparation derived from metals, minerals, and gemstones. With a rich history spanning thousands of years, Bhasma has been an integral part of Ayurvedic therapeutics, offering a distinct approach to healthcare by harnessing the bioactive potential of inorganic substances. Through a complex process of purification, calcination, and transformation, Bhasma preparations are believed to acquire enhanced bioavailability, safety, and efficacy, making them a valuable adjunct to conventional Ayurvedic treatments. This ancient yet innovative paradigm has garnered significant attention in recent years, sparking scientific interest in exploring the pharmacological and therapeutic properties of Bhasma. The conversion of metals to Bhasma involves a series of pharmaceutical procedures, including Shodhana, Bhavana, and Marana. Traditionally, this process is carried out using the Puta method, which employs Gomaya(cow dung) as fuel. However, due to limitations such as the unavailability of Gomaya, labor-intensive processes, and difficulties in maintaining consistent temperatures, modern equipment has been adopted to overcome these challenges. This article aims to describe the preparation of Tamra Bhasma using modern equipment. Specifically, a wet grinder is employed for the Bhavana Samskara process, a horizontal muffle furnace is used for Marana, and a pyrometer is utilized to accurately determine the temperature.[1]

MATERIALS & METHODS

Materials[2]
Tamra Patra (copper sheets) were procured from a local market. Similarly, all the necessary ingredients required for the processes of Shodhana (purification) and Marana (incineration) were also sourced from the local market. The Tamra Patra were analyzed for their characteristic features (Grahya lakshanas) as described in classical Ayurvedic texts. These features included Ghanaghata-saha (The ability to withstand impact without breaking when struck with a hard object), Sachikkana (A smooth and glossy appearance), Vimala (Cleanliness), Japa-suma-prabha (A reddish hue reminiscent of hibiscus flowers), Mrudu (Softness)

Samanya Shodhana of Tamra[3]
Equipment/Requirements
*   Tamrapatra   - 250gms
*   TilaTaila   - Q.S
*   Takra   - Q.S
*   Gomutra   - Q.S
*   Aranala   - Q.S
*   Kulathakwatha   - Q.S
*   Gas stove
*   Iron laddle
*   Iron vessel

Procedure of samanya Shodhana

1. This process was carried out through Nirvapa Samskara. The specified quantity of Tamra Patra was taken in an iron vessel and heated over fire until it turned red hot. Once it changed color, it was quenched in **TilaTaila** (sesame oil) seven times.
2. The Tamra Patra was taken in an iron vessel and heated over fire until it turned red hot. Once it changed color, it was quenched in **Takra** (buttermilk) seven times.
3. The Tamra Patra was taken in an iron vessel and heated over fire until it turned red hot. Once it changed color, it was quenched in **Gomutra** (cow urine) seven times.

Kanji:[4]
Equipment/Requirements
- Rice - 1 part
- Water - 10 parts
- Steel vessel
- Iron Laddle
- Gas stove

Sandhana Paatradhupana
The Paatra (vessel) selected for the kanji preparation is cleaned properly and dried. Later ghritalepana is done all over the vessel. Then dhupana (fumigation) process is carried out using the drugs like guggulu, agaru and other krimighnadravyas.

Method of preparation of kanji
One part of rice was taken with 10 parts of water in a vessel and boiled until the rice was cooked well and became soft. Then, it was poured into the Sandhana Patra and fermented for 5 days before being used for Shodhana.

4. The Tamra Patra was taken in an iron vessel and heated over fire until it turned red hot. Once it changed color, it was quenched in fresh **Kanji** (fermented rice water) seven times.
5. The Tamra Patra was taken in an iron vessel and heated over fire until it turned red hot. Once it changed color, it was quenched in fresh **Kulatha Kwatha** seven times. **Note:** Fresh liquid was used each time for the quenching process

Visheshashodhana of tamra[5]
Equipment /Requirements
- Tamrapatra (which has undergone samanya shodhana)
- Gomutra
- Gas stove
- Vessel
- Iron laddle

Procedure of Visheshashodhana
Once the Samanya Shodhana of Tamra was completed, it was taken in a large vessel and a sufficient quantity of Gomutra (cow urine) was poured into it. The boiling process was then continued for 1 Yama (3 hours). Later, the Shodhita Tamra was collected.

Marana of tamra:[6]
Preparation of kajjali:[7]
Equal quantities of Shuddha Parada and Shuddha Gandhaka were taken in a clean Khalva Yantra and triturated until the Kajjali Siddha Lakshanas were obtained.

Procedure of Marana

1. The required amount of Shodhita Tamra was taken in a wet grinder and mixed with an equal quantity of Kajjali and the required amount of Nimbu Swarasa. The mixture was then ground for 45 minutes (attained a semi-solid consistency).
2. The ground material was made into Chakrikas (pellets) and left to dry. Once the pellets were dry, they were placed in a silica crucible, which was then covered with lid.
3. The crucible was placed in an electrical muffle furnace, maintaining a temperature of 500°C for one hour. A pyrometer was inserted into the muffle furnace to determine the temperature inside, and the gradual decrease in temperature was noted once the process was completed.
4. After Swangashita (self-cooling) the crucible was removed from the muffle furnace, carefully de-sealed, and the Bhasma was weighed. The color, taste, texture, and other characteristics of the Bhasma were observed and noted.
5. Two additional Puta (incineration) processes were performed, following the same procedure as mentioned above, with the temperature maintained at 500°C.
6. After the process of Marana, the TamraBhasma is taken into khalva yantra and pounded to make it into a fine powder.

RESULTS

Bhasma Sidhalakshanas: (After 3rd puta)
BhasmaPareeksha

1. **Nischandratva:[8]**
   Nischandratva is a specific parameter for Tamra Bhashma. A portion of the prepared Tamra Bhasma was rubbed between fingers and thumb, and the rubbed portion was examined in sunlight. The prepared samples of TamraB hasma (Fig. 17) were found to be Nischandra (Absence of shining particle).
2. **Rekha Poornatha:[9]**
   This test indicates the fineness of a Bhasma. The Bhasma was rubbed between the thumb and index finger. The particles of the Bhasma attained a state where they could settle in the ridges of the fingers. The prepared samples of Tamra Bhasma (Fig. 18) were found to be Rekha Poornatha.
3. **Nirdhoomatva: [10]**
   This test was performed to check for moisture, organic content, or sulfur in the Bhasma. A small quantity of the Bhasma was taken in a silica crucible and ignited. The ignition of the Bhasma was observed carefully, and the observations were noted. The prepared samples of Tamra Bhasma (Fig. 18) did not produce any fumes and were found to be Nirdhooma.
4. **Varitaratva:[11]**
   This test checks the lightness of the Bhasma. A small amount of the Bhasma was put over the jar containing water and observed. The prepared samples of Tamra Bhasma (Fig. 19) floated on the water and were found to be Varitara.
5. **Amla Dadhi Pareeksha:[12]**
   This test checks for the maturity of the Bhasma. The Bhasma was put over Dadhi and observed for color. There was absence of color in the curd (Fig. 20) even after 12hrs suggesting Pakwa Bhasma.
6. **Avami Pareeksha: [13]**
   This test is specific to Tamra Bhasma. The pinch Bhasma was consumed and observed for 1 hour. In The prepared sample of Tamra Bhasma there (Fig. 21) was absence of nausea and vomiting sensation. Graph: Showing observations regarding temperature during Marana samskara of Tamra Bhasma.

DISCUSSION

Samanya Shodhana of Tamra

The process of Shodhana was not carried out merely to remove impurities but also to perform 35 iterations of Nirvapa Samskara. This process transformed the Tamra into a brittle state, facilitating further processing.

Vishesha Shodhana of Tamra

VisheshaShodhana was performed through Pachana Samskara for 1 Yama (3 hours) using Gomutra. Although the exact quantity of Gomutra required was not specified, more than 700 ml was utilized during the process. As Gomutra evaporated during Pachana, additional quantities were added.

Marana of ShuddhaTamra

Following the Shodhana of Tamra Patra, it was obtained in the form of a coarse powder. To convert it into a fine powder, it was ground in a wet grinder by adding an equal quantity of Kajjali and the required amount of Nimbu Swarasa. Grinding was completed in approximately 45 minutes, resulting in a semi-solid like consistency. This indicated that the process was highly beneficial in preparing the Bhasma. The wet grinder also facilitated rapid conversion of the coarse powder into a paste-like form, compared to using a Khalva Yantra. As per classical texts, Gajaputa is recommended for Tamra Bhasma preparation. However, to avoid Adhika Paka (excessive heat), the temperature in the muffle furnace was maintained at 500°C. After administering three Puta at 500°C, the Bhasma was subjected to Bhasma Pareeksha to assess the Bhasma Siddhi Lakshanas. Throughout the procedure, the temperature was monitored using a pyrometer inserted into the muffle furnace. Temperature patterns were recorded from the beginning of the process until the peak temperature of 500°C was reached. After switching off the muffle furnace, the gradual decrease in temperature until it reached 30°C was also noted.

CONCLUSION

The present study demonstrates the preparation of Tamra Bhasma using modern equipment such as a Wet grinder, Muffle furnace, and Pyrometer (To determine temperature). The results obtained from the Bhasma Pareeksha confirmed that the prepared Tamra Bhasma possessed the desired characteristics and properties. In the preparation of Bhasma, the emphasis lies not on the number of Puta administered or the amount of Gomaya utilized, but rather on achieving the desired quality and Bhasma Siddhi Lakshanas. Our study demonstrates that identical Bhasma Siddhi Lakshanas can be obtained using modern instruments with just three Puta (as mentioned in the classics) at the temperature of 500℃, thereby instilling confidence in the adoption of contemporary approaches for Bhasma preparation in the present era.

ABSTRACT

Foundational Literacy and Numeracy (FLN) skills are the rudiments for learning. A special emphasis has been given in NEP 2020 for developing these skills. These skills are very significant for fulfilling the learning gaps of the children which otherwise can hinder their progress. According to the studies and official reports, a large no. of students doesn't have these basic skills and it is highlighted as the main reason of the poor performance of the children in higher grades. For enhancing these skills so many changes are expected to be done and out of them curricular changes are of the utmost importance. There is a need to adopt those assessment methods which can portray the real picture of the child and can track the progress of child continuously. The demand of the time is that teachers should adopt the teaching methods which can promote the joyful learning so that children can learn mathematical skills without any fear. There is also a need of reviewing the curriculum so that we can figure out the gaps that are preventing children from learning these skills. Training of teachers is also the major issue in this regard. This paper aims to explore all the significant factors that impact the FLN skills of the children and curricular expectations that are needed for developing the essential FLN skills among children.

Keywords: Assessment Methods, Basic Requirement, Curricular Expectations, Joyful Learning, Learning Gaps

Poonam Pandita *et al.,*

INTRODUCTION

The early childhood experiences are responsible for shaping the overall personality of the individual. The skills they acquire in the childhood period help them in their future learning. The experiences of young children are determined by the quality of inputs and instructions that they receive (OECD, 2015). The renowned philosopher Rousseau has defined the importance of teachers and educators in shaping the childhood experiences by stating that "Everything is good as it comes from the hand of the maker of the world but degenerates once it gets into the hands of man". This notion of Rousseau reflects that young children are capable of acquiring all the skills and knowledge but it is the responsibility of society (parents, teachers and administrators) to provide opportunities and rich environment to the children (Gianoutos, 2006). The positive interactions and experiences in the early childhood becomes stimulation for the advancement of significant early development areas such as Foundational literacy and numeracy (OECD, 2015). The early childhood education or preschool education is the Key tool for strengthening the experiences of the children and for the smooth transition into the formal schooling (Slaby et al.,). Early childhood education is viewed as a "magic bullet" for the social and economic development of the country (Farquhar & White, 2014). Foundational literacy not only refers to the acquisition of basic skills of reading and writing but it is also the ability to read, write and listen with comprehension and to identify, decode, produce and convey by utilizing printed material (Litster, 2013). According to Qadiri and Manhas (2009) the children literacy, numeracy skills and communication skills are largely determined by the quality of preschool education.

Foundational numeracy skills means the children should have basic competency in mathematics like they should be able to identify and discriminate between numbers, solve basic addition, subtraction and multiplication problems and they should be able to solve word problems by the end of grade third (Kumar & Behera 2022 and NIPUN BHARAT, 2O21). It is important to have these skills because it will help children to not only excel in academics but also in real life situations. These skills are the basis of all future learning as it provides strong base for it (Duncan et al., 2007 and UNESCO, The state of global learning poverty, 2022). These skills can help the individual in making decisions in a variety of situations and in solving practical problems. NEP 2020 has also emphasized the role of foundational numeracy and mathematical skills in child's lifelong learning and it is recommended by NEP 2020 to achieve this goal by 2025. It has also become a national mission. Some modifications are required to achieve this mission. There should not only be book learning but children should know how and where to apply the facts that are learnt from books. We can take an example, if one knows four multiplied by two is equals to eight but he doesn't know how to apply these concepts while he or she is solving real life problems. Then what is the benefit of this kind of learning. Here play way methods of teaching and other creative methods of teaching can play an important role. We need to teach mathematical skills to children by igniting their critical thinking and problem solving ability so that they can learn joyfully. Learning mathematical skills will also reduce the dropout rate because when one is not competent in these basic skills, it will affect their further learning and this also becomes a reason of drop out. So enhancing or improving the foundational numeracy and mathematical skills of children is very important as we know we all should have the knowledge of 3 R's. This is the foundation that gives the shape to the future achievements of the child and hence it should be achieved.

Importance of Strengthening the Foundational Skills

Early childhood is a very crucial stage of life (Yadav, 2021). It is the stage where maximum development takes place. At this stage child's learning takes place at a very faster speed and whatever children learn at this stage impacts their lifelong learning. The studies have reported that 85% of child intellect, personality and skill develop by age five, so children should be given opportunities to develop the rudimentary skills like literacy and numeracy in the early years of life (UNICEF Global report 2019 and NEP 2020). The failure in early childhood learning restricts children's futures by depriving them of the chance to realise their full potential and also widens learning disparities in the long run (UNICEF Global report 2019) We all know that a weak foundation can damage the whole building likewise a weak foundation of child's learning can damage the brain structure. Only learning of these skills is not enough but we should ensure that children must get mastery of these skills. It was found by ASER (Annual status of education

report 2019) that those who were better at cognitive tasks and mathematical skills are more likely to be better at other tasks as well. So it is thus very important to develop these skills of the child.

Objectives
For the present study, following objectives have been framed:
1. To discuss the factors that affects the FLN skills
2. To give some recommendations for developing the basic literacy and numeracy skills.

Factors that Affects the Foundational Literacy and Numeracy Skills
Foundational numeracy helps the children in various situations. It strengthens the critical thinking of the child which further helps him or her in various aspects of life. It helps the child to analyze everything from different perspectives. Present world demands good problem solvers and analytical thinkers. So it is very significant to strengthen the basic numeracy skills of the children. Likewise, foundational literacy helps the children to learn and understand all the subjects efficiently including mathematics and to achieve mastery over the content of higher grades. But there are various factors which become barriers in the way of development of these skills.

1. **Large Pupil Teacher Ratio:** It is also the major factor that impacts these essential skills. Generally in classrooms where a single   teacher have to deal with large no. of students specially when students belongs to socioeconomically disadvantaged groups, then it becomes difficult for the teacher to teach mathematical skills with examples and activities. Then he or she just tries to tell students that are written in the book. This is the reason why children have weak numeracy skills (NEP 2020 and Report on state of foundational literacy and numeracy in India, 2021)

2. **Rote Memorization:** Rote learning especially in case of mathematics is very harmful. If the teacher only assess that whether students are able to recall the tables and words or not. Then he or she will never get to know about the real mathematical skills of children because only recalling the facts will not guarantee that students can solve real life problems. The present evaluation system predominantly focuses to assess the knowledge and facts memorized by an individual. Thus, the present evaluation system also encourages the rote memorization among individuals. There is a need to adopt the assessment methods that can measure the learning of the individuals instead of facts that they have memorized (Yadav, 2021).

3. **Poor Health:** Good health is the basic factor on which our learning depends. If children are malnourished or physically weak, then they will not be able to learn any kind of skills properly (UNESCO, Education for All Global Monitoring Report 2007).

4. **Teacher Training:** The kind of input teacher gives to students accordingly he or she will get the output. If teachers teach mathematical skills through creative methods or by real life examples, then it will become easy for students to grasp the concepts. But it requires using multiple methods of teaching on the part of the teacher. If teachers have to tell students that six multiplied by two is equals to twelve. They should demonstrate this with the proper illustration. So, it requires to train teachers according to the demand of present scenario (National curriculum framework for foundational stage ,2022 Wimberly et al., 1978)

5. **Less Importance Given To Pre-Primary Stage of Education:** previously pre primary stage was the most ignored stage of education. It was not considered as an important stage. So no attention was paid on numeracy and mathematical skills of lower grades students. But yes NEP 2020 has considered it as a very important stage (NEP 2020).

6. **Not teaching through their local language:** we all know that children understand better when they are being taught through their first language or mother tongue. But in classrooms teachers generally use English or Hindi for teaching. Teachers should have the knowledge of local language where he or she is teaching so that he\she can make the learning more effective (Institute for competitiveness, Foundational literacy and numeracy report, 2023).

7. **Mathematical anxiety:** When teachers use complex methods of teaching especially at the foundational stage of child's learning, it can create mathematical anxiety among them. This is also the reason of weak foundational skills of the children (Pantoja et al., 2020).

8. **Poverty:** Due to poverty a large no. of children are unable to fulfill even their basic requirements, so it is difficult for them to achieve foundational numeracy and mathematical skills. Poverty affects the child in numerous ways and it is also the reason of malnourishment among children. So there should be some provisions for helping these children (Rao et al., 2021).

9. **Migration:** Migration is a major factor that affects child's learning. Due to migration a large no. of children are unable to complete their elementary education, consequently they lack in foundational skills (Nortvedt & Wiese, 2020).

Recommendations for developing the basic literacy and numeracy skills

Improving foundational literacy and numeracy skills in children is crucial for their overall academic success and lifelong learning. Here are some suggestions to help achieve this goal:

1. **Early Childhood Education:** Early childhood education serves as the foundation for a child's lifelong learning journey. Research highlights that high-quality preschool programs significantly impact children's school readiness, equipping them with essential cognitive and social skills. A well-structured early education program should emphasize interactive learning experiences that foster language development, numeracy, and problem-solving abilities. Instead of rote memorization, young learners benefit from hands-on activities, storytelling, music, and play-based learning that enhance their cognitive flexibility and creativity. Moreover, early childhood education plays a crucial role in bridging learning gaps, particularly for children from disadvantaged backgrounds. A nurturing preschool environment provides a level playing field, helping all children develop the skills necessary for academic success. Trained educators should focus on fostering curiosity, encouraging questions, and guiding children toward independent thinking. Parental involvement is equally crucial in early childhood education. When parents actively participate in their child's learning process—through reading together, engaging in interactive play, or reinforcing concepts at home—children tend to show improved language proficiency and cognitive growth. Additionally, modern educational technologies, such as interactive digital platforms, can complement traditional teaching methods by making learning more engaging. By ensuring that early education is high-quality, inclusive, and stimulating, educators and policymakers can enhance children's preparedness for primary school. Investing in well-structured early childhood programs ultimately leads to better academic outcomes, reduced dropout rates, and long-term cognitive benefits.

2. **Quality Teachers:** Teachers are the backbone of a strong education system, playing an instrumental role in shaping young minds and imparting foundational literacy and numeracy skills. Investing in well-trained, motivated, and skilled teachers is essential for ensuring high-quality education. Effective teaching goes beyond delivering lessons; it involves understanding diverse learning needs, implementing innovative instructional strategies, and fostering a positive classroom environment that encourages critical thinking and creativity. For teachers to be effective, continuous professional development is crucial. Training programs should equip educators with evidence-based pedagogical techniques, classroom management skills, and methods to engage students with different learning styles. Furthermore, mentorship programs and peer collaboration can help teachers refine their teaching approaches and stay updated with emerging educational trends. In addition to training, teacher motivation significantly impacts student learning outcomes. Competitive salaries, career growth opportunities, and a supportive school environment contribute to job satisfaction and enhance teacher performance. Recognizing and rewarding exceptional teachers through incentives or awards can further boost morale and commitment. Technology also plays a role in enhancing teacher effectiveness. Digital tools, such as interactive whiteboards, online teaching resources, and student performance tracking systems, can support teachers in designing personalized learning experiences. By integrating technology into teaching, educators can cater to diverse student needs more effectively. Ultimately, ensuring that teachers are well-prepared, adequately supported, and continuously trained leads to improved student engagement, better academic performance, and a stronger education system overall. High-quality teachers are not only facilitators of knowledge but also mentors who inspire a lifelong love for learning among students.

3. **Individualized Learning:** Every child is unique, possessing different learning styles, strengths, and challenges. A one-size-fits-all approach to education often fails to address the diverse needs of students. Instead, individualized learning, which tailors instruction to each child's pace and abilities, ensures that all learners

94844

Poonam Pandita *et al.,*

receive the support they need to succeed. By recognizing that children learn differently—some through visual aids, others through auditory explanations, and some through hands-on experiences—educators can design more effective teaching strategies. A key aspect of individualized learning is differentiated instruction, where teachers modify lesson plans, assignments, and activities to accommodate varying learning needs. For instance, small group activities allow educators to provide focused attention to students who require additional support, while more advanced learners can be challenged with higher-order thinking tasks. One-on-one tutoring or mentorship sessions further enhance personalized learning experiences by addressing specific gaps in understanding. Technology plays a pivotal role in facilitating individualized learning. Adaptive learning software and AI-driven educational platforms analyze students' progress and provide customized lessons suited to their proficiency levels. These tools help teachers monitor student development, identify weak areas, and adjust teaching strategies accordingly. Additionally, fostering a classroom culture that encourages self-paced learning empowers students to take ownership of their education. Allowing children to explore subjects at their comfort level reduces academic stress and boosts confidence. Schools should also involve parents in this process, ensuring learning continues beyond the classroom. By embracing individualized learning, educators can maximize student potential, promote deeper understanding, and create an inclusive environment where every child thrives. This approach not only enhances academic outcomes but also nurtures critical thinking, problem-solving skills, and a lifelong love for learning.

4. **Interactive Learning:** Interactive learning is a dynamic approach to education that actively engages students in the learning process rather than relying on passive instruction. It involves the use of hands-on activities, real-world applications, and digital tools to make learning more immersive and effective. When students participate actively—whether through experiments, role-playing, discussions, or educational games—they retain knowledge more effectively and develop essential problem-solving and critical-thinking skills. One of the most effective ways to implement interactive learning is through Gamification, where educational content is transformed into engaging challenges, quizzes, and simulations. Games like puzzles and storytelling activities reinforce key concepts while keeping children motivated. Digital learning platforms, such as interactive e-books and educational apps, further enhance engagement by providing audiovisual content that caters to different learning styles. Collaborative learning also plays a significant role in interactive education. Group activities, peer discussions, and project-based assignments encourage students to exchange ideas, learn from one another, and develop communication and teamwork skills. Encouraging inquiry-based learning—where students explore topics through questioning and investigation—fosters curiosity and deeper understanding. Moreover, interactive learning can be integrated into traditional classrooms by using hands-on teaching aids, such as models, flashcards, and manipulatives. Virtual reality (VR) and augmented reality (AR) technologies also offer immersive experiences that bring abstract concepts to life, making complex subjects easier to understand. By making learning an engaging, participatory process, interactive education enhances retention, boosts motivation, and fosters creativity. When students are actively involved in their learning journey, they develop a sense of ownership over their education, leading to improved academic performance and long-term success.

5. **Phonics and Reading Programs:** A strong foundation in reading is critical for academic success, and phonics-based reading programs are among the most effective methods for developing literacy skills in young learners. Phonics instruction focuses on teaching children the relationship between letters and sounds, enabling them to decode words systematically. This method helps students recognize patterns in language, improving their ability to read fluently and comprehend texts accurately. Phonics instruction should be structured, sequential, and interactive. It begins with teaching letter-sound correspondences, followed by blending sounds to form words and eventually reading complete sentences. Multi-sensory techniques, such as singing phonics songs, using flashcards, and engaging in word-building activities, enhance retention and make learning more enjoyable. Early exposure to phonics-based reading programs significantly improves vocabulary, spelling, and comprehension skills. Research indicates that children who receive systematic phonics instruction in their formative years demonstrate higher reading proficiency compared to those who rely solely on sight-word memorization. Schools should integrate phonics instruction into daily lessons to ensure consistent reinforcement of reading skills. Technology can further support phonics learning through interactive reading apps, digital storybooks, and AI-driven platforms that provide personalized reading exercises. These tools offer

Poonam Pandita *et al.*,

instant feedback, helping children correct mistakes and build confidence in their reading abilities. Parental involvement is equally crucial in reinforcing phonics skills at home. Reading aloud, encouraging storytelling, and practicing phonics games create a literacy-rich environment that nurtures a love for reading. By implementing strong phonics and reading programs, educators can lay a solid literacy foundation; ensuring children develop essential reading skills that will support their academic growth and lifelong learning journey.

6. **Storytelling: A Powerful Tool for Language Development:** Storytelling plays a crucial role in early childhood education, fostering both language development and cognitive skills. Encouraging reading and storytelling from a young age helps children build vocabulary, improve comprehension, and develop critical thinking abilities. When parents or educators read aloud to children, they expose them to new words, sentence structures, and storytelling techniques, which enrich their language skills. Additionally, when children are encouraged to narrate their own stories, they learn how to organize their thoughts, sequence events logically, and express emotions effectively. This practice also enhances their listening skills, as they pay close attention to details in order to recall and retell stories accurately. Beyond linguistic benefits, storytelling nurtures creativity and imagination. It allows children to explore different perspectives and understand the nuances of human emotions. Engaging stories introduce moral values, cultural traditions, and historical contexts, making learning a more holistic experience. Teachers and parents can use interactive storytelling methods, such as role-playing or puppet shows, to make stories more engaging. Encouraging children to create their own stories also boosts their confidence in communication. Furthermore, storytelling strengthens the bond between children and their caregivers. Reading together creates meaningful interactions that foster a love for books and lifelong learning. Digital storytelling tools, audiobooks, and visual storyboards can also enhance the experience, catering to different learning styles. In classrooms, integrating storytelling into subjects like science or history makes lessons more relatable and memorable. By making storytelling a regular activity, educators and parents can significantly enhance a child's linguistic and cognitive development, ultimately contributing to academic success.

7. **Math Manipulative: Enhancing Conceptual Understanding through Hands-On Learning:** Math manipulative are physical objects that help children grasp mathematical concepts through interactive, hands-on learning. These tools, such as counting beads, base-ten blocks, fraction tiles, and geometric shapes, provide a concrete representation of abstract mathematical ideas. Young learners often struggle with numerical concepts when taught through traditional rote memorization. Using manipulative bridges this gap by allowing children to visualize and physically manipulate numbers, making math more tangible and comprehensible. For example, counting beads help children understand basic arithmetic operations like addition and subtraction. Base-ten blocks illustrate place value concepts; while fraction tiles help students compare and contrast different fractions. Similarly, geometric shapes allow learners to explore spatial relationships, symmetry, and measurement. Through active engagement, children develop problem-solving skills and logical reasoning, essential components of mathematical proficiency. Math manipulative are beneficial for all learners, especially those who struggle with conventional teaching methods. By incorporating tactile learning, they cater to kinesthetic learners who grasp concepts more effectively through movement and hands-on experience. Furthermore, manipulative encourage exploration and discovery, allowing children to develop their own strategies for solving problems. This fosters a deeper understanding of mathematical principles rather than mere memorization of formulas. Teachers can integrate math manipulative into daily lessons by designing engaging activities that encourage collaboration and critical thinking. For instance, group tasks involving manipulative promote peer learning and discussion, enhancing mathematical communication skills. At home, parents can support their children's learning by using simple household items like buttons, sticks, or coins to practice math concepts in an enjoyable way. Overall, math manipulative serve as powerful educational tools that make mathematics accessible, engaging, and meaningful for young learners, laying a strong foundation for future success in the subject.

8. **Regular Assessments: A Key to Effective Learning and Timely Intervention:** Regular assessments play a vital role in ensuring students' academic progress by identifying their strengths and areas of difficulty. Assessments help educators track learning outcomes, adjust teaching strategies, and provide timely interventions for struggling students. When assessments are conducted periodically, teachers can pinpoint specific concepts that require reinforcement, ensuring that no child falls behind in their educational journey. There are various forms

of assessments, including formative and summative evaluations. Formative assessments, such as quizzes, observations, and informal discussions, provide ongoing feedback to both teachers and students. These assessments help educators adjust their instructional methods in real time, making learning more responsive to students' needs. Summative assessments, such as standardized tests and end-of-term exams, evaluate overall learning progress and determine whether students have achieved the desired learning outcomes. Both types of assessments are essential for developing a comprehensive understanding of a child's academic development. One of the key benefits of regular assessments is the early detection of learning difficulties. When educators identify gaps in understanding at an early stage, they can implement targeted interventions, such as personalized tutoring, peer support, or differentiated instruction. This proactive approach prevents learning gaps from widening over time. Additionally, regular assessments foster a growth mindset among students, encouraging them to view challenges as opportunities for improvement rather than failures. Parents also play a crucial role in assessment-driven learning. Schools should communicate assessment results with parents and provide guidance on how they can support their children's learning at home. When assessments are used as tools for learning rather than merely for grading, they create an environment of continuous improvement. By integrating regular assessments into the educational framework, schools can enhance student learning, boost confidence, and ensure academic success.

9. **Parental Involvement: A Foundation for Lifelong Learning:** Parental involvement is a critical factor in a child's academic success, as it fosters a supportive learning environment beyond the classroom. When parents actively engage in their children's education, they reinforce learning, boost motivation, and help build confidence. Research has consistently shown that children with involved parents tend to perform better academically, exhibit positive behavior, and develop a stronger love for learning. One of the most effective ways to enhance parental involvement is by providing parents with the necessary resources and guidance to support their children's education at home. Schools can organize workshops, send newsletters, or provide digital platforms that offer instructional materials, literacy activities, and educational games. Parents can assist with homework, engage in daily reading sessions, and encourage discussions about school topics, reinforcing classroom learning in a home setting. Beyond academics, parental involvement fosters emotional and social development. When children see their parents take an interest in their education, they develop a sense of responsibility and accountability toward their studies. Regular communication between parents and teachers helps create a cohesive learning experience, ensuring that children receive consistent support in both settings. Schools can encourage parental engagement through volunteer opportunities, parent-teacher conferences, and involvement in school activities. Technology also plays a role in enhancing parental involvement. Digital tools, such as educational apps and school communication platforms, allow parents to monitor their child's progress and stay informed about school events. By fostering strong parent-teacher partnerships, schools create a collaborative educational environment that benefits children's overall development. Encouraging active parental participation in learning builds a strong foundation for lifelong educational success.

10. **Peer Tutoring: Strengthening Learning through Collaboration:** Peer tutoring is an effective educational strategy in which students help each other learn by sharing knowledge and explaining concepts. This approach benefits both the tutor and the learner, as teaching reinforces understanding while receiving peer support builds confidence and motivation. When older or more advanced students assist their peers, they engage in deeper learning, develop communication skills, and strengthen their mastery of academic concepts. One of the major advantages of peer tutoring is that students often relate better to their peers than to teachers. A peer tutor can explain difficult concepts in a way that feels more accessible and relatable, making learning less intimidating. This method also creates a supportive and collaborative learning environment, where students feel comfortable asking questions without the fear of judgment. Additionally, struggling students benefit from receiving one-on-one attention, which may not always be possible in a large classroom setting. Teachers can structure peer tutoring programs in various ways, such as cross-age tutoring (where older students help younger ones) or same-age tutoring (where students of similar ages assist each other). Group-based peer tutoring also fosters teamwork and collective problem-solving skills. To ensure effectiveness, teachers should provide guidelines, set clear objectives, and monitor progress. Beyond academics, peer tutoring nurtures essential life skills such as leadership, empathy, and patience. Tutors gain confidence in their abilities as they

94847

help others, while learners develop resilience and a positive attitude toward learning. Schools and educators should encourage peer tutoring as a structured practice, making it an integral part of the learning process. By fostering a culture of shared learning, peer tutoring enhances academic achievement while promoting collaboration and mutual respect among students.

11. **Cross-Curricular Integration:** Cross-curricular integration is an effective approach to strengthening both literacy and numeracy skills by highlighting their interconnectedness. By embedding literacy into numeracy lessons and vice versa, students can develop a holistic understanding of these essential skills. For instance, reading a story that involves counting or mathematical problem-solving can enhance both comprehension and numerical abilities. A teacher can introduce a book about measuring ingredients in a recipe, prompting students to engage in hands-on math while practicing reading skills. Similarly, word problems in mathematics encourage students to interpret text, analyze numerical relationships, and apply reasoning to find solutions. This approach makes learning more meaningful and applicable to real-world situations. Additionally, cross-curricular integration can be expanded beyond reading and math to include science, social studies, and art. For example, a history lesson about trade routes can incorporate mathematical concepts such as distance, time, and cost calculations. When students recognize that literacy and numeracy are not isolated subjects but are deeply connected, their engagement and retention of knowledge improve. This method also promotes critical thinking and problem-solving, as students learn to apply multiple skill sets simultaneously. Teachers can use project-based learning and interdisciplinary activities to reinforce these connections, ensuring students see the practical value of literacy and numeracy across different subjects.

12. **Technology Integration:** The integration of technology in education offers numerous opportunities to enhance literacy and numeracy, but it must be used strategically to maximize its effectiveness. Digital tools such as interactive educational apps, online games, and virtual simulations can engage students and reinforce core skills. However, the use of technology should be purposeful, ensuring that digital resources align with clear learning objectives rather than serving as mere distractions. For example, adaptive learning platforms can personalize instruction, identifying students' strengths and weaknesses and providing tailored exercises to support their development. Similarly, e-books with interactive features can help young readers develop comprehension skills, while math apps can provide instant feedback on problem-solving. Teachers should integrate technology in moderation, balancing digital and traditional methods to prevent over-reliance on screens. Furthermore, technology can facilitate collaborative learning, allowing students to work together on projects, conduct research, and share ideas through online discussion platforms. Blended learning models, which combine in-person instruction with digital resources, can enhance student engagement and provide flexible learning opportunities. Additionally, teachers should be trained to evaluate and implement effective digital tools, ensuring they align with curriculum standards and pedagogical best practices. By leveraging technology wisely, educators can create dynamic learning experiences that support literacy and numeracy development while fostering digital literacy skills essential for the 21st century.

13. **Community Involvement:** Community involvement plays a crucial role in fostering literacy and numeracy development by expanding learning beyond the classroom. When local organizations, businesses, libraries, and families actively participate in education, students gain access to additional resources and support systems that enhance their learning experiences. Public libraries, for instance, can offer literacy programs, storytelling sessions, and book clubs that encourage children to develop reading habits. Similarly, local businesses can contribute by organizing financial literacy workshops or supporting numeracy-based activities such as budgeting exercises. Schools can collaborate with community centers to create mentorship programs where professionals guide students in real-world applications of math and literacy. Engaging families in educational initiatives, such as reading challenges and math-focused game nights, reinforces learning at home and strengthens the parent-child learning dynamic. Furthermore, community-led initiatives, such as volunteer tutoring programs and literacy festivals, provide students with diverse learning experiences that cater to different interests and abilities. Schools can also invite guest speakers from various fields to demonstrate how literacy and numeracy are essential in different careers, inspiring students to see the relevance of these skills in everyday life. Encouraging community engagement in education fosters a sense of collective responsibility,

making learning more accessible and culturally relevant. By integrating community support into literacy and numeracy programs, educators can create a more enriching and holistic learning environment for students.

14. **Teacher Professional Development:** Investing in teacher professional development is essential for ensuring high-quality instruction in literacy and numeracy. As educational practices evolve, teachers must continuously update their knowledge and skills to incorporate the latest research-based teaching strategies and technological advancements. Professional development programs equip educators with effective methodologies, such as differentiated instruction, data-driven decision-making and innovative assessment techniques, to address diverse student needs. Workshops, online courses, and peer collaboration opportunities allow teachers to refine their instructional approaches and integrate best practices into their classrooms. For example, training in phonics-based reading instruction can enhance literacy teaching, while hands-on workshops on problem-solving strategies can improve numeracy instruction. Additionally, professional development enables teachers to stay informed about emerging educational technologies, ensuring they use digital tools effectively to enhance student learning. Mentorship programs and collaborative learning communities within schools also provide teachers with ongoing support and opportunities to exchange ideas. When educators engage in continuous learning, they become more effective in adapting to curriculum changes, addressing student challenges, and fostering an engaging learning environment. School administrators should prioritize professional development by allocating time and resources for training sessions, ensuring that teachers remain confident and competent in their instructional practices. Ultimately, investing in teacher development leads to improved student outcomes, as well-trained educators are better equipped to nurture strong literacy and numeracy skills in their students.

15. **Flexible Learning Environments:** Creating flexible learning environments is essential to accommodate diverse learning styles and needs, ensuring that all students can effectively develop literacy and numeracy skills. A flexible learning environment goes beyond traditional classroom structures by incorporating various teaching methods, seating arrangements, and instructional materials that cater to different learners. For instance, some students may benefit from hands-on activities, while others may prefer visual or auditory learning strategies. Allowing students to engage with content in ways that suit their strengths enhances comprehension and retention. Flexible learning also includes incorporating movement into lessons, using group work, and providing quiet spaces for individual study. In literacy instruction, this might involve offering multiple formats of texts, such as audiobooks, graphic novels, and interactive reading materials, to accommodate different reading preferences. In numeracy education, manipulatives, digital tools, and real-world problem-solving tasks can provide varied approaches to understanding mathematical concepts. Technology also plays a role in creating adaptable learning environments, enabling personalized learning paths through digital platforms. Additionally, flexibility in assessment methods—such as allowing students to demonstrate understanding through presentations, projects, or written responses—ensures that diverse learners can showcase their knowledge effectively. Schools should also consider flexible scheduling options, such as blended learning or extended learning time, to support students who need additional help. By fostering a responsive and inclusive learning environment, educators can support all students in developing strong literacy and numeracy skills while promoting engagement and confidence in their learning journey.

16. **Inclusive Education:** Inclusive education ensures that all children, regardless of their abilities or learning differences, receive equal opportunities to access quality education. This approach acknowledges that students have diverse needs and learning styles, making it necessary to create adaptable and flexible teaching methods. Schools should provide individualized support systems, such as special educators, assistive technologies, and modified curricula, to accommodate students with disabilities or learning difficulties. Teacher training is crucial in equipping educators with the skills to recognize and address the unique needs of students. Moreover, fostering an inclusive classroom environment where students support each other can reduce stigma and encourage peer learning. Inclusive education benefits not only students with special needs but also their peers, as it promotes empathy, collaboration, and a broader understanding of different abilities. Governments and educational institutions must ensure the implementation of policies that uphold the rights of all children to receive education in mainstream schools whenever possible. In addition to infrastructural modifications, such as accessible classrooms and learning resources, schools should foster a culture of acceptance. Encouraging parental involvement and community participation in inclusive education initiatives can further strengthen the

learning experience. Ultimately, ensuring inclusivity in education leads to a more equitable society, where every child is given the opportunity to thrive academically and socially.

17. **Monitoring and Accountability:** A robust education system requires well-defined standards, continuous monitoring, and accountability mechanisms to ensure students receive a high-quality education. Schools, teachers, and policymakers must be held accountable for student performance through data-driven evaluations and transparent reporting. Regular assessments, both formative and summative, help track student progress and identify areas for improvement. Governments and education departments should establish independent monitoring bodies that assess schools' adherence to educational standards. Teacher evaluations should be conducted periodically, ensuring that educators are following best practices and implementing effective teaching strategies. Professional development programs should be in place to support teachers in areas where improvement is needed. Furthermore, parental engagement in school accountability can enhance oversight and encourage schools to maintain high standards. Technology can also play a role in monitoring student progress through digital assessments and data analytics, enabling educators to make informed decisions. A strong accountability framework should balance evaluation with support mechanisms, ensuring that teachers and schools receive the necessary resources to improve. Incentivizing good performance and addressing deficiencies proactively can lead to sustainable improvements. Public reporting of school performance can also drive healthy competition and encourage institutions to enhance their educational offerings. Ultimately, monitoring and accountability ensure that education systems remain dynamic, responsive, and committed to student success.

18. **Support for Struggling Students:** Students who struggle with foundational literacy and numeracy skills require timely and targeted support to prevent long-term academic difficulties. Early identification of learning gaps is crucial in addressing the needs of struggling students before they fall too far behind. Schools should implement intervention programs that provide additional instruction, tutoring, or mentoring to help students improve their skills. Teachers should be trained to recognize signs of learning difficulties and employ differentiated instruction techniques that cater to diverse learning needs. Personalized learning plans, which adapt teaching strategies to the specific needs of each student, can be effective in ensuring progress. Small-group instruction, peer tutoring, and remedial classes are additional strategies that can support struggling students. Emotional and psychological support is equally important, as students who struggle academically often experience low self-esteem or disengagement. Encouraging a positive learning environment that rewards effort rather than just outcomes can motivate students to persist in their studies. Schools should also involve parents in the support process by providing guidance on how to reinforce learning at home. Utilizing educational technology, such as adaptive learning platforms and interactive software, can help struggling students engage with subjects in a more personalized and accessible way. By prioritizing support for struggling students, education systems can reduce dropout rates, close achievement gaps, and ensure that all learners reach their full potential.

19. **Cultural Sensitivity:** Education systems should embrace and respect cultural and linguistic diversity to ensure an inclusive and meaningful learning experience for all students. Cultural sensitivity in education involves recognizing students' diverse backgrounds and incorporating their cultural experiences into the teaching process. Literacy and numeracy programs should be designed in ways that acknowledge and respect cultural differences, making learning relatable and engaging for students from various backgrounds. This can be achieved by using locally relevant examples, multilingual instruction, and culturally diverse teaching materials. Teachers should receive training on cultural competence to foster an inclusive classroom where all students feel valued and respected. Encouraging students to share their cultural experiences can enrich the learning environment and promote mutual understanding. Additionally, involving parents and community members in the educational process can help bridge cultural gaps and enhance student learning. Schools should also celebrate cultural festivals, traditions, and histories, allowing students to develop a sense of pride in their heritage. Language policies should support bilingual or multilingual education, especially in regions where multiple languages are spoken. Ensuring cultural sensitivity in education contributes to a more equitable system where all students, regardless of their cultural background, feel included and empowered to learn. Ultimately, a culturally responsive education fosters social cohesion and prepares students to thrive in a diverse world.

20. **Continuous Improvement:** Education systems must embrace a culture of continuous improvement to keep up with evolving learning needs, pedagogical advancements, and societal changes. Regular evaluation of teaching methods, curriculum, and learning materials ensures that students receive the best possible education. Schools and policymakers should use research-based approaches to refine instructional strategies, incorporating best practices from educational research. Feedback from teachers, students, and parents should be actively sought to identify areas for improvement. Professional development programs should be an ongoing effort, equipping educators with updated teaching techniques and skills. The integration of technology and innovative teaching tools should be regularly assessed to ensure they effectively enhance learning outcomes. Data-driven decision-making can help schools tailor instruction to student needs, making education more efficient and impactful. Continuous improvement also involves curriculum revisions that align with current educational and workforce demands, ensuring students acquire relevant skills. Collaboration between educators, researchers, and policymakers can accelerate the adoption of effective teaching strategies. Encouraging a mindset of lifelong learning among teachers and students fosters an adaptive and forward-thinking education system. Schools should also invest in infrastructure and resources that support evolving educational needs. Ultimately, continuous improvement in education leads to higher-quality instruction, better student outcomes, and a more resilient and future-ready education system. Improving foundational literacy and numeracy skills is a long-term endeavor, but it's one that has a profound impact on a child's future success. It requires the collaboration of educators, parents, communities, and policymakers.

CONCLUSION

At last we can say that enhancing a child's foundational literacy and numeracy skills is essential for their long-term academic success and overall learning development. These fundamental abilities serve as the building blocks for more advanced knowledge and skills, making early mastery crucial. However, achieving this objective requires a collaborative effort from all stakeholders involved in the child's education. This includes not only teachers but also parents, policymakers, community leaders, and educational institutions. Each has a role to play in creating a conducive environment that supports the child's learning journey. Additionally, there is a pressing need to rethink and reform various elements of the teaching and learning process to make it more effective. This includes updating pedagogical approaches, teaching methods, curriculum design, and assessment strategies. Traditional models may no longer suffice in addressing the diverse learning needs of children in today's rapidly evolving world. A more holistic and flexible approach is required to meet the unique needs of every learner. The National Education Policy (NEP) 2020 has put significant emphasis on Early Childhood Care and Education (ECCE) and provides a framework for improving foundational literacy and numeracy skills in children. The policy outlines several recommendations aimed at achieving these goals, ranging from curriculum reforms to improved teacher training. For these recommendations to make a tangible difference, they must be implemented effectively and comprehensively across the educational landscape. Only through a concerted and united effort will we be able to ensure that every child develops the foundational skills necessary for lifelong learning and success.

ABSTRACT

This paper reports the fabrication and characterization of thermally evaporated p-ZnTe/n-CdSe heterojunction diode. The heterojunction was characterized by current-voltage (I-V) and capacitance-voltage (C-V) measurements with the aid of digital microvoltmeter, picoammeter and digital LCR meter.The presence of high density recombination sites in the space charge region is confirmed by the ideality diode factor, which is predicted to be approximately 3.12. For the C-V characteristic curve, the barrier heights are found to be 1.07 eV, and for the I-V characteristic curve, they are 0.516 eV. The C-V curve shows that there are 1.3×10^{13} cm^{-3} interface states and that the built-in potential is 1 V.

Keywords: ZnTe; CdSe; heterojunction; barrier height; built-in-potential

INTRODUCTION

ZnTe presents itself as a potentially attractive material for a visible light-emitting diode due to its wide band gap of 2.26 eV [1]. Heteroepitaxy technology is useful in the creation of ZnTe junction devices since it is difficult to convert ZnTe into an n-type. The contact between ZnTe and CdSe can offer unique electronic features in a heterojunction diode due to its tiny lattice misfit [2], direct bandgap, and high absorption coefficient in the visible region for the constituent materials. A few applications for these properties include photodetectors, photovoltaics, and light-emitting diodes (LEDs) [3]. Different types of heterojunctions, including those utilising p-type ZnTe and n-type CdSe [4], CdS [5], ZnS and ZnSe [6], can also be made with II-VI compounds. Among the II-VI heterostructures, ZnTe/CdSe structure is unique in that it achieves a lattice match between two binary compounds in which there is no

Amutha and Suresh Kumar

commonality between the cation and the anion [7]. These findings implied that these materials could form a heterojunction, and this structure has been used as a window layer and absorber in opto-electronic devices. According to earlier research [8-11] on ZnTe/CdSe devices, appropriate deposition parameter controls are necessary to create customized CdSe and ZnTe films for devices. I-V, C-V, and spectral response measurements were used to characterize the p-n junctions that Kimmerle et al. [12] created using vacuum evaporation and wide bandgap II-VI compounds. An amorphous p-n junction made of doped amorphous silicon has been reported by Spear et al. [13] and Carlson and Wronkski [14]. Moore et al. [15] demonstrated that ZnTe and ZnSe can form a rectifying junction, but they were unable to determine the current mechanisms at play at the time. ZnTe-CdTe heterojunctions were fabricated by Pal et al. [16] using the hot wall method, and the photoelectrical properties, direct and reverse currents were examined. Atomic rearrangement at ZnTe/CdSe interfaces was investigated by Kemner et al. [17] using transmission electron microscopy, X-ray absorption fine-structure spectroscopy, and X-ray diffraction. This paper focuses on the I-V and C-V properties of the ZnTe/CdSe heterojunction structure that is thermally evaporated on glass substrates using aluminium electrodes.

Experimental Details

The p-ZnTe/n-CdSe heterojunction structures were formed on glass substrates with aluminium (Al) electrodes. Al (99.999% pure) obtained from Aldrich chemicals, USA, was evaporated at a pressure of 10-5 Torr from a helical tungsten filament to form the lower electrode. Zinc telluride (99.99% pure) obtained from Aldrich chemicals, USA was evaporated by the method of thermal evaporation. The powder of ZnTe placed in the molybdenum boat (200 amps) and gets heated with high current by energizing transformer. The transformer capable of supplying 150 amperes at 20 volts is used to provide the necessary current for heating the molybdenum source. Prior to evaporation, the evaporant material was carefully degassed at a lower temperature for about thirty minutes with the shutter closed. Deposition of the material (1500 Å thickness) over aluminium electrode was achieved by slowly varying the current under the pressure of about 10-5 Torr. A constant rate of evaporation 1Å/sec was maintained throughout the film preparation. A rotary drive was employed to maintain uniformity in film thickness. Thickness of the films was measured through quartz crystal monitor and verified by multiple beam interferometer (MBI) technique by forming Fizeau fringes. Cadmium Selenide (99.99 % pure, Aldrich chemicals, USA) film (1500 Å) was deposited over the ZnTe layer using the same method. Finally top aluminium electrode was deposited over CdSe layer to form p-n junction diodes with the structure Al/p-ZnTe/n-CdSe/Al. The I-V and C-V characteristics were obtained by making measurements with the aid of digital microvoltmeter, picoammeter and digital LCR meter.

RESULTS AND DISCUSSION

Current-Voltage (I-V) analysis

Fig. 1 shows the I-V characteristics of a ZnTe/CdSe heterojunction structure at room temperature. It is seen that its characteristics have a distinctly diode feature. I-V curve demonstrates that it is a rectifying device, which means that current flows through it more readily in one direction than the other. The heterojunction is a good diode because the forward current is significantly greater than the reverse current. In the forward bias region, the current increases exponentially with voltage. This is because the potential barrier at the p-n junction is lowered, allowing more charge carriers to flow across the junction. In the reverse bias region, the current is very small and remains relatively constant with voltage. This is because the potential barrier at the p-n junction is raised, preventing most charge carriers from flowing across the junction. For practical diodes, the current density – voltage relation is represented by the following equation [18],

$$J = J_O \, exp\left(\frac{qV}{nkT}\right)\left\{1 - exp\left(\frac{-qV}{kT}\right)\right\} \text{----- (1)}$$

where the ideality factor 'n' is roughly independent of voltage and greater than unity. The simpler version of equation (1) can be used for values of V greater than 3kT/q.

Amutha and Suresh Kumar

$$J = J_O \, exp\left(\frac{qV}{nkT}\right) \qquad\qquad \text{----- (2)}$$

Fig. 2 shows the variation of Ln J Vs Voltage plot for ZnTe/CdSe heterojunction in the forward direction. The ZnTe/CdSe heterojunction is a type II heterojunction, which means that the conduction band of the ZnTe is lower than the conduction band of the CdSe. When a voltage is applied to the heterojunction, the electrons in the ZnTe are excited into the conduction band of the CdSe. This creates an electron accumulation layer at the interface between the two materials. The electron accumulation layer increases the current density through the heterojunction. The inverse of the slope of the curve at forward bias gives the ideality factor (n). The ideality factor is a measure of how closely the heterojunction behaves to an ideal diode. The ideality factor for this heterojunction is calculated as 3.12 for room temperature. Similar value was obtained for ZnTe-CdS and Ge-GaAs heterojunctions [19,20]. This value indicates that the recombination generation in the depletion region. This ideality factor value indicates the prevailing in the current flow of emission-recombination mechanism in the Schockley-Noyce-Sah model [21]. According to this model when the direct bias is applied to p-n junction the charge carrier concentration in the space charge region is high also the junction has a high density of recombination centers, where p ≈ n is considerable [22]. The intercept on the y-axis can be used to determine the saturation current (J0) of the ZnTe/CdSe heterojunction. The saturation current is the current that flows through the heterojunction when the voltage is zero. Although the simple thermionic emission model is not strictly applicable to situations in which *n* is much larger than unity, it is used here for its intuitive value with the barrier height

$$\varphi_b = \left(\frac{kT}{q}\right) ln\left(\frac{J_O}{A^* T^2}\right) \qquad\qquad \text{----- (3)}$$

The height of ZnTe/CdSe barrier can be calculated by substituting the value of *Jo* in equation (3). The barrier height, determined from the saturation current in this heterojunction is 0.52 eV.

Capacitance – Voltage (C-V) analysis

Capacitance - Voltage measurements were made in order to study the characteristics of the ZnTe/CdSe junction. The capacitance of a reverse biased Schottky diode in a p-type semiconductor can be written as [23]

$$\frac{1}{C^2} = \left(\frac{2}{\varepsilon q N S^2}\right)(V_b - V - kT/q) \qquad\qquad \text{----- (4)}$$

Where *N* is space charge density, *Vb* the built-in potential, *V* the applied potential, *S* the surface area, *q* the electronic charge, *k* Boltzmann's constant, ε the permittivity. The C-2 versus *V* plot will provide *Vb* and *N* from the intercept and the slope, respectively. The barrier height of the Schottky diode, φ_b , is related to *Vb* by the following eqn. [23]:

$$\varphi_b = V_b + V_n \qquad\qquad \text{----- (5)}$$

Where $V_n = (kT/q)ln(N_c/N)$ and

$$N_c = 2(2\Pi m^* kT/h^2)^{3/2}.$$

Fig. 3 depicts the variation of 1/C2 with applied potential for ZnTe/CdSe heterojunction. The built-in potential is the voltage that is required to completely deplete the heterojunction. The built-in potential can be determined from the x-intercept of the 1/C2 vs voltage graph. The built in potential of the ZnTe/CdSe junction diode showing ideal behavior is obtained from the voltage intercept of a plot of 1/C2 Vs V. The intersection with the voltage axis resulted the built in potential value of 1 eV for this junction, which can be compare well with the earlier report [22]. The calculated values of total number of interface states (*N*), built-in potential (*Vb*) and barrier height (*φb*) are listed in the Table1.

CONCLUSION

The p-ZnTe/n-CdSe heterojuction was fabricated by thermal evaporation on glass substrate using aluminium electrodes. The ideality diode factor is calculated to be about 3.12 and it confirms the presence of high density recombination centers in space charge region. The barrier height is determined for both I-V and C-V characteristics curve as 0.516 and 1.07 eV respectively. From the C-V curve the built in potential is found to be 1 V and the calculated number of interface states is 1.3x1013 cm-3.

ABSTRACT

The prevalence of hypothyroidism in the developed world is about 4-5%. The prevalence of subclinical hypothyroidism in the developed world is about 4-15%. Hypothyroidism is a hypometabolic clinical state caused by insufficient thyroid hormone output for long period of time. Subclinical (mild) hypothyroidism - is characterized by mildly elevated TSH (< 10), but normal fT4 levels. According to Ayurvedic principles, the pathology of Subclinical Hypothyroidism is characterised by "*Dhatvagnimandya*". A 41 years old male patient came to Panchkarma OPD with the complain of Itching on whole body, Fatigue, Loss of appetite, Hoarsness of voice, Constipation and Cold Intolerance since 2 months. He had no earlier history of treatment. For above following comlpaint Ptient was advised *Kanchnar Gugglu, Amrita Gugglu, Kaklarakshak yog* and *Erandbhrist haritaki churn at night.* Patient came to *Panchkarma* OPD for follow up with TSH profile in normal range.

Keywords: *Agnimandya*, TSH, Hypometabolism, *Kanchnar Gugglu*

Pooja Kalal *et al.,*

INTRODUCTION

Hypothyroidism is caused by inadequate function of the thyroid gland itself called primary hypothyroidism or by not getting enough stimulation by thyroid stimulating hormones called secondary hypothyroidism. Primary hypothyroidism is caused by iodine deficiency, autoimmune disease, radiation therapy, drugs or thyroide surgery.[1]

Prevelance
The prevalence of hypothyroidism in the developed world is about 4-5%. The prevalence of subclinical hypothyroidism in the developed world is about 4-15%.[2]

Hypothyroidism is a hypometabolic clinical state caused by insufficient thyroid hormone output for long period of time. A rise in serum thyroid stimulating hormone (TSH) cocentration with normal serum fT4 and fT3 concentration (subclinical hypothyroid) is the first biochemical abnormality. It is later accompanied by a decrease in serum fT4 concentration, at this stage patients have symptoms and need medication.[3]

Subclinical (mild) hypothyroidism is characterized by mildly elevated TSH (< 10), but normal fT4 levels. TSH levels of 10 or more are typically considered true hypothyroidism and treated as such, even if the fT4 falls within the normal range.[4] According to Ayurvedic principles, the pathology of Subclinical Hypothyroidism is characterised by "*Agnimandya*" (low metabolic activity) at the cellular and systemic levels, which is equivalent to hypometabolism, or reduced caloric expenditure, in modern terms. Any level of *Agnimandya* brought on by *Kaphakara Nidana* (Kapha increasing causative factors) leads to increased *Dhatugata Mala Sanchaya* (cellular accumulation of excretory products), which in turn causes *Srotorodha* (microchannel blockage) and causes "*Dhatvagnimandya*" and causes physical and mental symptoms associated with Subclinical Hypothyroid, such as swelling, anaemia, constipation, cold intolerance, etc. Due to this *Agnimandya*, aberrant *Rasa Dhatu*, or semi-digested food, is formed, which is *Ama*. The symptoms of *Ama Lakshana* and Subclinical Hypothyroidism are comparable.[5] The theraprutic approach for *Dhatvagnimandhya* was there for foccused on *Kaphanashak Chikitsa*, *Srotoshodhan*, *Agnideepan*, and *Vatanuloman*.

CASE REPORT
A 41 years old male patient came to Panchkarma OPD with the complain of Itching on whole body, Fatigue, Loss of appetite, Hoarsness of voice, Constipation and Cold Intolerance since 2 months. He had no earlier history of treatment.

History of Past Illness
There is no history of diabetes, hypertension, cardiac issues, or any other complex diseases, nor is there any family history of thyroid disorders. The patient has a reduced appetite, sound sleep, with constipation.

General Examination
The patient was afebrile and pulse was 78/min, Respiratory Rate – 18/ min, BP –130/90 mmHg, Weight –70 kg.

Thyroid local Examination
On Inspection
Localized swelling - Absent
On palpation
Size – Normal, Shape – Normal, Localized temperature - Not Raised, Tenderness – Absent, Localized temperature - Absent

Investigation- dated on 12/12/2023 were following-
Thyroid Profile : T3 –1.34 ng/ml , T4 –7.9ug/dl , TSH –6.80 uIU/ml.

Pooja Kalal *et al.*,

Diagnostic Assesement

Disgnosis was made on the basis of chief complaint of patient and Laboratory investigation sach as T3, T4 and TSH. If the serum FT4 concentration is normal and the TSH is elevated but <10Mu/L then Thyroxine therapy is note recommended as routine tehrapy.[6]

MANAGEMENT

Patient has taken following medicine for duration of 2 months.

1. *Kanchnar Gugglu* – 2 BD
2. *Amrita Gugglu* – 2 BD
3. *Kaklarakshak yog* – 1 BD
4. *Erandbhrist haritaki churn* – 5 gm OD at night

RESULT

Changes in serum Thyroid profile are shown in Table 1.

DISCUSSION

According to Ayurveda *Agnimandya* is the underlying cause of hypothyroidism. Therefore, medications with the characteristics of *Deepana, Pachana, Lekhana, Srotoshodhan, Anulomana*, and *Kaphashamaka* are probably going to check the basic Pathophysiology of hypothyroidism or hypometabolism. This quality listed above are present in the *Kanchanar Guggul*'s ingredients. [7] The ingredients of **Kanchanara Guggulu** include *Guggulu, Pippali, Maricha, Sunthi, Amalaki, Bibhataki, Haritaki, Varuna, Tvak, Ela, and Tejpatra.* These ingredient help *relieeving Shotha* enhance *Agnideepan, Pachan, Tridoshahar, Anulomana, Chedana* and *Ruchya. Granthi Vikar* benefits from *Kanchanara* due to its *Anulomana* and *Kaphapitta Shamaka* properties. *Guggulu* with its *Tridoshahara* properties is connected to *Lekhana, Pachan,* and *Deepana karma.* It balances the *Agni,* help with *Srotosodhana,* and reduces both *Vata* and *kapha.*[8] **Amrita Guggulu** contains the ingredients *Amrita, Gugglu, Triphala, Varshabhu, Danti, Chitraka, Pippali, Shunthi, Guduchi, Twak, Vidang,* and *Trivrat.* The *Rookshana* properties of *Danti* (Baliospermum montanum), *Triphala* (Terminalia chebula Retz., Terminalia bellerica, Emblica officinalis), *Vidanga* (Embelia ribes), and *Guggulu* (Commiphora mukul) are thought to target the excess *Kapha Dosha* and *Medas.* Additionally, the *Tikshna* and *Ushna* qualities of ingredients like *Pippali, Shunthi, Vidanga,* and *Danti* enhance the formulation. *Guggulu* is specifically known for its beneficial effects on *Srotovishodhana.* [9] **Kaklarakshak yoga** helps the lymphatic system operate normally, balances the *Vata* and *Kapha Dosha,* and encourages the removal of inflammatory poisons. *Kaklarakshak Yoga* benefits with ingredients like *Shodita Gugglu, Kanchnar, Ashvagandha, Chitraka, Katuka* and *Guduchi.* As the patients was suffering from constitation also that's why **Erandbhrist Hritaki Churn** was also adviced. *Haritaki is Deepana, Pachana, Strotoshodhaka,* due to *Ushna Veerya* and *Laghu Guna,* performs the *Anulomana Karma* due to *Amla Rasa, Madhura Vipaka. Eranda Taila* is antagonistic to *Vata Dosha* due to its innate qualities and is also regarded as the best *Vata* pacifier and *Dhatuposhaka* (*Vayasthapaka, Rasayana, Vrushya*) has *Pakvashaya-Shodhaka* action. Thus, it accentuates the properties of *Haritaki* and formulation becomes more powerful in performing the function of *Anulomana* of *Apana Vata* and treating the hypothyroidism.[10]

CONCLUSION

Ayurveda attributes hypothyroidism to Agnimandya (low metabolic activity), leading to symptoms like swelling, anemia, constipation, and cold intolerance. The case study of a 41-year-old male with subclinical hypothyroidism demonstrated the efficacy of Ayurvedic treatments. Medications like Kanchnar Guggul, Amrita Guggul, Kaklarakshak Yog, and Erandbhrist Haritaki Churn, which possess Deepana, Pachana, and Srotoshodhan properties, were effective in managing symptoms and significantly reducing TSH levels from 6.80 uIU/ml to 1.25 uIU/ml.

ABSTRACT

The purpose of this study is to assess how MMV affects the anxiety and depressive-like behaviors that experimental animals exhibit when their mothers are separated. In this study, we use proven models such as brain oxidative indicators, EPM, LDB, antioxidants, and histological observation in conjunction with animal models to evaluate the efficacy of test drugs, i.e., in treating anxiety generated by mother separation stress in rats. The test -1 group received a low dose of MMV 50 mg/kg, while the test -2 group received an oral low dose of MMV 100 mg/kg. When MMV was taken orally, there was a noticeable and dose-dependent increase in both the amount of time spent in the light chamber and the number of entries. Furthermore, MMV exhibits a dose-dependent action that significantly shortens the immobility duration measured by FST. However, test drugs show a decrease in LPO levels at both doses. MMV, on the other hand, was discovered to boost the repair of GSH, SOD, and CAT levels. Based on the behavioral study, oxidative parameters, and histological observation data, MMV significantly improves anxiety and depression-like behavior in experimental rats that is brought on by mother separation.

INTRODUCTION

Anxiety and stress are prevalent psychological symptoms of contemporary society and lifestyles. In tiny amounts, tension and Anxiety is a positive thing; it may inspire and increase productivity. In contrast, it is unhealthy to experience too much stress or to respond strongly to it. Together with general poor health, it can cause certain psychological or physical illnesses including depression, cardiac issues, or infection. Anxiety and harmful behaviors are frequently the result of continuous and unremitting stress. A disorder of the central nervous system is anxiety (Kjernised KD *et al.,* 2004) (Weinberger DR *et al.,*2001).In n humans, anxiety is a typical emotional occurrence. (Cle´ment Y *et al.,* 2002) Anxiety is an uncomfortable emotional state that is linked to unease, discomfort, and worry or fear about certain definite or ambiguous future scenarios. (Gupta V, *et al.,* 2010) Usually a reaction to stress, anxiety is characterized by exhaustion, nausea, rapid heartbeat, and breathing difficulties. As the most prevalent mental disorder, One-eighth of people suffer from anxiety. And has grown in importance as a topic of study in the field of psychopharmacology in the last ten years. (Jung JW *et al.,* 2006)Anxiety and stress are prevalent psychological effects of contemporary society and way of life. Stress and anxiety can be beneficial in moderation because they can inspire and increase productivity. Still, Excessive stress or a strong reaction to stress is detrimental. In addition to overall ill health, it might result in some medical or psychological conditions including depression, cardiac issues, or infections. Stress that is ongoing and relentless often leads to anxiety and undesirable behaviors. Anxiety is a central nervous system illness. Anxiety characterized by an unpleasant emotional state, uneasiness, discomfort, and fear or concern about a specific or vague future event. (Gupta V *et al.,* 2014) Psychiatric disorders related to anxiety affect approximately 25 % for adult's individuals at some point in their lives. The frequency of the rates of anxiety disorders in men and women are 19.2% and 30.5%, respectively.

Among young people, anxiety disorders are remarkably common. Anxiety disorders were reported to be 15.4% prevalent in children between the ages of 7 and 11. Less than 14% of those with such psychiatric disorders, according to a survey, receive treatment. (Leon A, et., al 1997) Clinical conditions that fall under the category of anxiety disorders include phobias, post- traumatic stress disorder, panic disorder, generalized anxiety disorder, obsessive-compulsive disorder, and panic disorder. Anxiety condition related to separation (Gautam M *et al.,* 2007). The precise mechanism is not fully understood. In children, anxiety can be a common occurrence. When a baby is seven to nine months old, stranger anxiety starts (Munir, S.,*et al.,* 2019) Disrupted central nervous system modulation is thought to be the cause of anxiety symptoms and the disorders that follow. This disregulation manifests physically and emotionally as different degrees of heightened sympathetic arousal. (Kaplan, H. I., *et al.,* 1995) It has been suggested that a variety of neurotransmitter systems contribute to one or more of the involved modulatory processes. The majority typical noradrenergic and serotonergic systems of neurotransmitters are taken into account. Broadly speaking, it is believed that there is a correlation between an overactive noradrenergic system and an underactive serotonergic system Disregulation is the result of these systems' regulation and regulation By additional routes and neuronal circuits in different parts of the brain of both the emotional response to physiological arousal and its experience.(Ressler, K.J.,*et al.,* 2000) Many think that it developed as a result of high noradrenergic system activity and low serotonin system activity. The function of corticosteroid regulation and its connection to anxiety and fear symptoms have drawn some attention. Corticosteroids can alter the action of specific neural pathways, which can impact not just actions during stressful situations but likewise the mind's power. To process fear-inducing stimuli. That was widely believed. That cholecystokinin is a neurotransmitter that controls emotional states. Because these neurotransmitters are so carefully synchronized, modifications to one neurotransmitter system will always cause modifications to another, such as comprehensive feedback systems. Two inhibitory neurotransmitters that reduce the stress response are serotonin and GABA. These neurotransmitters have all emerged as key targets for medicinal substances. (Korte, S.M.*et al.,* 2001)

Ashish D. Tale *et al.,*

MATERIAL AND METHODS ANIMALS

Healthy female wistar Rat (200-250gm) body weight (6 animals per group) was used in this investigation. The animals were kept in well-ventilated polypropylene cages and maintained under the standard laboratory animal house condition (temp- 25± 2°c) and humidity (40- 60%) under a 12:12-h light-dark cycle (lights on at 6:00 a.m.), were used. Standard food pellet diet (Nutrivet Life science, Pune) and water ad libitum. The Ministry of Environment and Forests, the government of India, and the Committee for Control and Prevention of Cruelty to Animals Act, 1960 established regulations that the animals were kept in accordance with. . The experimental protocol was approved and sanctioned by the IAEC which having proposal number1865/23-24/P-12. All experimental procedure is carried out by the guidelines provided by CPCSEA New Delhi.

Experimental design
Drugs
Manasmitra Vatakam (p.o.), diazepam (i.p) the MMV was used in the dose of 50 and 100 mg/kg, p.o. as a low dose, and high dose, respectively. Diazepam was dissolved in 0.9% NaCl whereas MMV was dissolved in water.

Groups
Anxiety and depression like behavior caused by maternal separation for 14 days. All the rats except group- I, (NC and DC) were separated for 3 hours per day for 14 days in cage (Aguggia JP et al., 2013).At the day 3 light and dark box, open field test and the day 14 EPM, SPT, FST this behavior Parameter was taken From day 14 to 21 the animals was kept for undistribution period. PND 21 to PND 31 was weaning period. PND 31 to PND 52 the treatment was given. (Aguggia JP, et al., 2013) (Lorigooini Z et al., 2020) The standard group was given diazepam 1 mg/kg dissolved in 0.9 % NaCl and administered intraperitoneally (i. p.) (Orso R et al., 2020)The test -1 group was given the low dose of MMV 50 mg/kg it dissolved in distilled water and then injected orally the test -2 group were given the high dose of MMV 100 mg/kg, it dissolved in distilled water and then administered orally. (Wilson MA et al., 2004) On the day 53, 54, 55 the behavioral parameter likes EPM, OFT, light and dark box, FST, SPT. After the completion of study animals were sacrificed for biochemical parameters like GSH, LPO, Catalase and histopathological assay. (Thirunavukkaras SV *et al.,* 2012)

Experimental Design:
Behavioral Parameter Light and dark box
The Crawley and Goodwin two compartment exploratory models have been validated in terms of pharmacology, behavior, and physiology. The two compartment method balances the rat's innate curiosity about a new habitat against the unpleasant characteristics of an open field with intense light. The most accurate metric for determining anxiolytic activity appeared to be time spent in light areas or engaging in exploratory behavior. The light and dark box has two sections: the white-painted light region (27L x 27W x 27H cm) was lit by a 100 W desk lamp, while the black-painted dark area (18L x 27W x 27H cm) was used for lighting. To facilitate movement from one compartment to the other, a 7.5 x 7.5 cm tunnel was used to divide the two sections. The overall number of crosses between the bright and dark compartments. Time spent in bright part of compartment. Time spent in the dark part of cage. (Manisha, R. L. *et al.,* 2013)

Open field test
It is often used to observe experimental animals' independent behavior, inquisitive behavior, and stress in unfamiliar settings. This test was designed to assess rats' anxiety-like behaviors. To track locomotors activity, OFT employed square locomotors boxes (× W27.3 × H 20.3 cm). The animals were brought into the testing room a full day before the tests began in order to prevent the assessment of loco motor activity linked to anxiety or novelty. The time spent at the area's center during the test was recorded for five minutes. Every experiment was run during the active/dark phase. To capture and assess the movement of the rodents for this investigation, a video tracking system with MAZEMASTER software was used. Gently remove the subject rodents from the maze at the conclusion of the test

session and place them back in their home cage. Among the parameters noted are the overall distance traveled. (Akter S *et al* 2019)

Elevated plus maze
Every test was conducted outside of the colony chamber in a dimly lit space. Rats were kept in the test chamber for an hour before to the experimental test. The 40 x 7 open arms, two identically sized closed arms, and 10 cm-high side and end walls comprised the EPM device. The arms were joined by a 7 cm by 7 cm gap in the middle. Animal placed in the center of the apparatus with its head facing an open arm, and it was then left for three minutes. After that, the animal was removed and placed back in its original cage. The equipment was cleaned with a 10% chlorine bleach solution in between each test session. An animal was considered to be in an arm if it had all four paws on the central platform and on the central platform if it had at least two paws. The duration of open arms (OAT: (time in open arm/time in open + closed arm) and the quantity of open arm entries (OAE: (number of open arm entries/number of open + closed arm entries) were used to quantify anxiety. In addition, the total number of arm entries was counted to obtain a measure of spontaneous locomotors activity. (Khakpai, *et al* 2023).

Sucrose preference test
Another well-liked technique to look into alterations in rodents' positive emotional cues is the two-bottle choice test, which measures sucrose preference. We used the test to measure the anxiety and depression like behaviors in the investigational animals. To track each mouse's unique fluid consumption, each mouse was kept in a Plexiglas cage with a double- grommet ventilation system. The mice were given a 12-hour water and food fast before testing, and then they were given a 12-hour 1% sucrose solution to help them get used to it. After that, mice were placed in separate housing and allowed to select from two bottles (150 ml each of tap water or 1% sucrose solution). To prevent any adverse effects on preference, the positions of each bottle were switched after six hours. To calculate SP, use the formula SP (%) = sucrose intake (g) / (sucrose intake (g) + water intake (g)) × 100% (E. Vollmer L et al., 2013)

Force swimming test
To keep the rats' hind limbs from touching the tank floor, they were placed in a 44 cm high by 32 cm diameter plastic cylindrical tank that was 28 cm deep and filled with 22°C tap water each session of the pretest and test lasted a total of fifteen minutes in the same tank. To maintain the water as clean as possible, it was changed after two 15-minute or six 5- minute sessions, and waste was taken out of the device at the end of every session. Following the test or pretest stages, the investigational animals were towel-dried and warmed in their home cage using a heating pad for thirty minutes (Hédou G et al., 2001) **Biochemical Evaluation**

Preparation brain tissue homogenate
On the fifty-fifth day, the animals were rendered unconscious via intraperitoneal ketamine (100 mg/kg) anesthesia in order to collect their brains. After being removed, the brain was washed in an ice-cold isotonic tris-KCl solution. The weight of the brain was measured, and it was homogenized at 20°C in 7.4 pH phosphate buffer saline (PBS) before being centrifuged for 10 minutes at 2000 rpm. For the purpose of estimating the various tests, the supernatant was collected (Khurana K *et al.,* 2019).

Estimation of lipid peroxidase
0.1 milliliter homogenate, 1.5 milliliters of 20% (v/v) acetic acid (pH 3.5), 1.5 milliliters of 0.8% (w/v) thiobarbituric acid, and 0.2 milliliters of SDS (8.1% w/v) were added to a 4 milliliter assay mixture. Fill the tube with the mixture above, which was combined, heated to 95 °C for an hour on a water bath, cooled under tap water, and then 1 ml of distilled water was added. Pour in 5ml of the n-butanol and pyridine (15:1) mixture. For ten minutes, the mixture was centrifuged at 2200 rpm. The findings are given as nmol MDA/mg of protein. At 532 nm, the absorbance of the pink-colored, transparent supernatant was measured. (Abd El HA *et al.,*2012)

Estimation of glutathione level

Pick up 0.1 mL of the supernatant as a test sample. The supernatant was made less strong by adding 0.9 ml of phosphate (PO4) water. Put in 1 ml of TCA (20%).I let the mix sit for 20 minutes. After that, it was spun at 10,000 rpm for 10 minutes. 0.25 ml of the liquid was taken away. Use 0.75 ml of phosphate water to add. Also, add 2 ml of DTNB, which is 0.0006M in strength. Ten minutes were spent sitting. A spectrophotometer was used to measure absorbance at 412 nm. (Masella R, *et al* 2005)

Estimation of Catalase level

We measured the catalase (CAT) activity using the method outlined by Claiborne (1985). 0.05 ml of 10% supernatant make up the assay mixture. Add one milliliter of H2O2. To a final amount of 3 ml, add 1.95 ml of phosphate buffer (0.05 M, pH 7). Using a UV spectrophotometer, absorbance was measured at 240 nm (Bouayed J *et al.,* 2009).

Estimation of Superoxide dismutase's level

Take 0.1ml supernatant Add carbonate bicarbonate buffer (pH 9.7), Add epinephrine (1 ml) The absorbance was measured at 480 nm for 2 min (Reena N, *et al* 2012)

Histopathological examination

Once intracardiac perfusion with phosphate buffer formalin was completed, the brain tissue for histopathology was extracted. An area of a mouse brain was embedded in paraffin wax, sectioned into pieces with a thickness of 2–5 μm, and fixed with 10% (v/v) formalin. Eosin and hemotoxylin dye were used to stain the sections for histopathological analysis. (Brat D Jet al 2018)

Statistical analysis

All the values were expressed as mean ± SEM. Statistical comparisons were performed by two ways ANOVA followed by Tukey's multiple comparison tests and one way ANOVA Dunnetts multiple comparison using Graph Pad Prism version 5.0. ***P<0.01, ***P<0.01, ***P<0.001 was considered as significant compared to disease control.

RESULTS

Effect of different doses of MMV on maternal separation induced anxiety-like behaviors in the light and dark box.

As show in fig 2 (A) the disease control group decreased the time spent in light chamber (###P=0.0005) as compared to normal group. The different doses of MMV 50 & 100 mg was increased the time spent in light chamber (*** P= 0.0005, ***P=0.0002) as compared to disease control group. The standard group more significantly increased the time spent in light chamber (****P<0.0001). As show in fig 2 (B) The dose of MMV 100 mg/kg was more notably increased the no of entry in light chamber(****P <0.0001) as compared to disease control group. The standard group significantly increase the no of entry in light chamber (**P 0.0025) as compared to disease control group. Conversely MMV 50 mg/kg was failed to increase the no of entry in light chamber was found to be non significant. MMV administered orally was exhibited significant and dose dependent effect enhancement of time spent in light chamber as well as no. of entries in light chamber dose dependently.

Effect of different doses of MMV on maternal separation induced anxiety-like behaviors in the open field test.

As shown in fig 3 the disease control group decrease the total distance travelled (###P=0.0004) as compared to normal group. The MMV 100 mg/kg more significantly increase the total distance travelled, (****P<0.0001) as compared to disease control groups. Whereas the MMV 50 mg/kg significantly increase the total distance travelled, (***P= 0.0477). The Standard group also increase the total distance travelled. When MMV is taken orally, an open field test can show a significant and dose-dependent effect on the overall distance traveled.

Effect of different doses of MMV on maternal separation induced anxiety-like behaviors in Sucrose Preference Test

As shown in fig 4 the disease control group take the less sucrose intake (####P<0.0001) as compared to normal group. The MMV 100 mg /kg more significantly increase the sucrose intake,(****<0.0001) as compared to disease control group. Whereas, the MMV 50 mg/kg significantly increase the sucrose intake (**P= 0.0023) as compared to disease control group. The standard group show less effect as compared to test group. An exciting and remarkable dose-dependent effect on sucrose preference intake can be observed when MMV is administered, according to a sucrose preference test.

Effect of different doses of MMV on maternal separation induced anxiety-like behaviors in Force swimming test

As shown in fig 5 the results of the FST revealed that the disease control group increase immobility time (###P<0.0001) as compared to normal group. The MMV 100 mg/kg more significantly decrease the immobility time, (****P<0.0001) as compared to disease control group. Whereas, The MMV 50 mg/kg significantly decrease the immobility time,(***P=0.0007) as compared to disease control group. Similarly the standard group more significantly decreases the immobility time, (****P<0.0001) as compared to disease control group. In the force swimming test, MMV given orally can show a significant and dose- dependent impact that reduces immobility time.

Effect of different doses of MMV on maternal separation induced anxiety-like behaviors in the elevated plus maze.

As shown in fig 6 (A) the disease control group decrease the time spent in open arm (##P=0.0005) as compared to normal group. The MMV 100 mg/kg was more significantly increase time spent in open arm, (****P < 0.0001) as compared to disease control group. whereas the MMV 50 mg/kg significantly increase the time spent in open arm (*P= 0.0327) as compared to disease control group. Similarly the standard group significantly increase the time spent in open arm, (*P= 0.0284) as compared to disease control group. When MMV is taken orally, it can show a notable, dose-dependent effect that lengthens the amount of time spent in an open arm position in an elevated plus maze.

As shown in fig 6 (B) The MMV 100 mg/kg was more significantly increase no. of entry in open arm, (****P < 0.0001) as compared to disease control group .whereas the MMV 50 mg/kg significantly increase the time spent in open arm (***P= 0.0009) as compared to disease control group. The standard group significantly increase the no. of entry in open arm, (**P=0.0073) as compared to disease control group. Whenever MMV is administered, it can provide some noteworthy and remarkable effects. More precisely, it can selectively enhance the number of entries in the open arm of the elevated plus maze apparatus.

Effect of different doses of MMV on LPO level

According to figure 7 the disease control group increase the level of LPO (####P< 0.0001) as compared to normal group. The MMV 100 mg/kg was more significantly decrease the level of LPO, (****P < 0.0001) as compared to disease control group. Similarly The MMV 50 mg/kg was more significantly decrease the level of LPO,(****P < 0.0001) as compared to disease control group. The diazepam also more significantly decrease the level of LPO, (****P< 0.0001) as compared to disease control group. The LPO level was significantly reduced by the MMV when given at doses of 50 mg and 100 mg; in a similar vein, the LPO level was most significantly reduced by the 50 mg dose.

Effect of different doses of MMV on GSH level.

As shown in figure 8 the disease control group decrease the level of GSH (#### P<0.0001) as compared to normal group. MMV 100 mg/kg was more significantly increase the level of GSH, (****P < 0.0001) as compared to disease control group. Whereas MMV 50 mg/kg was significantly increase the level of GSH as compared (**P=0.0008) to disease control group. The diazepam increase the level of GSH (P =0.0067), as compared to disease control group.

Effect of different doses of MMV on Catalase level.

As shown in figure 9 the disease control decrease the Catalase level #### P=0.0001as compared to normal group. The MMV 50 &100 mg/kg was more significantly increase the level of catalase, (****P< 0.0001) as compared to disease

control group. Similarly the diazepam was more significantly increase the level of catalase, (****P< 0.0001) as compared to disease control group.

Effect of different doses of MMV on SOD level.
As shown in figure 10 the disease control decrease the SOD level (#### P=0.0001) as compared to normal group. The MMV 50 &100 mg/kg was more significantly increase the level of SOD, (****P< 0.0001) as compared to disease control group. Similarly the diazepam was more significantly increase the level of catalase, (****P< 0.0001) as compared to disease control group.

Histopathological Examination
Figure 11 (a) Normal group: Microscopy shows brain tissue neuronal architecture. An oval or spherical neuron. No cortical abnormalities were observed. Figure 11(b): Disease Control: group-Hippocampus neuron degeneration is visible in brain tissue. Figure 11(c): Standard: Microscopically, brain tissue exhibits normal neuron architecture. Round-to-oval neuron. There were no abnormalities. Figure 11 (d) Test 1: Microscopic brain tissue reveals normal neuron architecture. Round-to-oval neuron. No cortical abnormalities. Figure 11 (e) Test 2: Microscopic brain tissue indicates normal neuron architecture. Round-to-oval neuron. No cortical abnormalities. Based on the findings of the histological analysis, no statistically significant differences were observed across all groups when the amygdala and hippocampus regions were examined.

DISCUSSION

Anxiety disorders are the most frequent psychiatric disorders among diseases called mood disorders.(Villas Boas GR et al., 2020) Stress primarily affects the brain, which can subsequently result in the development of mental diseases associated to stress and cognitive difficulties. (Gregus A et al., 2005)(Wright RL, et al., 2006)Stress exposure has been linked to alterations in the brain's morphology, function, and neurology that are closely linked to stress disorders. (North CS, *et al.,* 2016) Consistent with earlier research, our findings also showed anatomical and functional alterations in a number of brain regions associated with the regulation of behavior and cognition, including as the amygdala.(Laugharne, C et al., 2016)cerebral cortex and hippocampal regions. Alongside these abnormalities in behavior and cognition, there were physiological changes as well, such as increased levels of the stress hormone corticosterone.(Meng L, *et al.,*2016) (Zhu X et al.,2017) Author also reported that induction of stress causes significant changes in the central nervous system (CNS) include brain and the spinal cord, and it also plays a crucial role in the body's response against stress, stress also caused on impact to the levels of various neurotransmitters in the CNS.

It include norepinephrine and dopamine, which mostly involved in attention, motivation, and regulation of mood and behavior in human and animals but it was usually found to be increase in response to stress. (Ulya T *et al.,* 2021) Whereas, serotonin level in brain, was found to be decreased during stress and which is primarily involved in the mood and behavior regulation. In addition to this, stress activates specific brain regions, including the amygdala and the prefrontal cortex. Moreover amygdala also plays an important role to regulate the anxiety and phobias in the animals and human. (Nefs G *et al.,* 2019)According to the previous studies, the prevalence of anxiety disorders was found to be a total of 34.2% of women reported having anxiety symptoms after giving birth. The prevalence was, in detail, 34.5% between one and twenty- four weeks after delivery and 30.8% after that point. (Campos AC, *et al.,* 2013) Based upon the prevalence rate as well as published data in concerned to maternal separation associated anxiety. Our protocol was frame object there was requirement of induction of anxiety using maternal separation model in the animal. As concerned with this framed approach we have reviewed the article and there were many studies which were conducted on laboratory animals subjected to separation stressors which significantly exhibit behavioral changes in relation to anxiety disorders. Moreover in earlier literatures authors were employed various stimuli to induce anxiety-like behavior in laboratory animals as like that of clinical anxiety and these are psychological and physical stress, neonatal isolation stress, stress induced by circadian rhythm, stress induced by noisy stimulus, low-temperature induced stress, restraint and immobilization stress, social defeat stress, chronic unpredictable stress,

Ashish D. Tale *et al.,*

electric foot-shock induced stress.(Sarkar D.*et al*.,2020) On other hand we have the second approach in our study that the selection of test drug for the treatment maternal separation induced anxiety. The No. of treatment are available in the market they did not give the satisfied result with maximum side effect. Author reported that synthetic drug have a lots of side effect by considering this current approach we had selected the MMV. A Polyherbal formulation containing Protein, tannins, phenols, flavonoids, saponins, amino acids, glycosides, and steroids are phytoconstituents found in MMV. The author reported that MMV changed a number of antioxidant parameters, showed potent anti-free radical activity, and might have an effect on the production and release of the neurotransmitter enzyme acetyl-cholinesterase. MMV a Polyherbal formulation containing about the 20 plant is a powerful memory enhancer and has therapeutic effects on the central nervous system. A previous literature indicates that MMV possesses antioxidant potential has wide application to neurological disorder. (Kusnecov AW *et al.*, 1994) Based on this current evidence, we designed an experimental design to investigate the effect of MMV on anxiety and depression like behavior in experimental animals. The study uses animal models to assess the effects of the formulation of MMVs on maternal separation stress-induced anxiety and depression like conditions. The aim of the study is to plan several steps, including the selection and purchase of animals and drugs, as well as the assessment of behavioral parameters with various tests such as light and dark box, OFT, SPT, FST, and EPM. Here we observed and evaluated behavioral changes such as time spent in the light chamber, no entry into the light chamber, total distance travelled, intake of sugar, immobility time, and time spent in the open arm, no entry into the open arm. In our study, we observed that the treatment group significantly increased the time spent and number of steps into the light chamber using the light and dark box. In addition, the OFT model is used, showing that the treatment group has increased the total distance traveled. In the SPT treatment group, the intake of sucrose in the animal increased. In FST, the treatment group decreased the time of immobilization compared to the disease control group. EPM also shows that the treatment group significantly increases the time spent and the absence of entry into the open arm. Although the behavioral study did not satisfy the mechanism and also fulfilled the objective of the protocol during the maternal separation animal goes through the oxidative stress so we use the oxidative parameter. We explored the effect of the MMV on antioxidant markers. To verify this, we examined the effects of MMV glutathione levels (GSH), lipid peroxidation (LPO), and catalase (CAT), superoxidation (SOD) demutase. The results obtained showed that chronic treatment with MMV significantly reduced LPO and increased the level of GSH, Catalase, and SOD.

CONCLUSION

The present study concluded that the anxiolytic and anti-depressant effect of MMV. MMV ameliorated behavioral deficits in maternal separation induced anxiety and depression like behavior. The Result of present study and main objective of this study was to critically evaluate the effect of test drug i.e. in the treatment anxiety and depression like behavior induced by maternal separation stress model in experimental animals. After induction of anxiety and depression by using maternal separation stress method in rat's different parameters in animals by using model such as EPM, LDB, brain oxidative markers, antioxidants along with histopathological observation. From the results obtained in behavioral study, oxidative parameters and histopathological analysis, it was concluded that MMV (100 mg/kg p.o.) possesses more significant activity in the experimental models of maternal separation induced anxiety and depression. More study need to be done to find out the mechanism along with factor and neurotransmitter evolve for the anxiolytic effect of MMV in experimental animals.

ABSTRACT

Due to unavoidable reasons, the demand for essential goods in the business sector is always changing. It has become quite difficult to choose the right method for profitable business. Business strategies are based on constant and fuzzy demands. Two types of constrains are considered to avoid the backorder cost. Combining the service level constrains with constant and type 2-fuzzy demand, the study compares the total cost and establishes the best stratergy. The model improves the quality of products and reduces the vendor`s setup cost. This model followed by the transportation discount policy for the hassle free delivery rate, depending on the number of transported products. The defuzzification method of type-2 fuzzy variable was developed by this study. Numerical examples and sensitivity analysis are also presented here.

Keywords: Supply chain management, Controllable lead time, type-2 Fuzzy set, interval approximation, Transportation discounts, Service level constraints.

INTRODUCTION

The number of defects may not be high, but any production process can yield perfect and faulty products. The supply-chain business process can be distributed by bad production. A combination of three different strategies-constant demand, fuzzy demand, and service level constraints makes a revolution for a supply chain management model. For a distribution free model, further investment for improved quality and a deduction in setup cost can improve the business process with a minimum total cost. The fuzzy method is used to compare the results of the different issues. The quality improvement policy involves asymmetric approaches for reducing and eliminating waste. The cost to setup the equipment for processing different goods among the supply chain members is incurred by the seller and buyer. The study shows a strategy, the quality of the products needs to be improved. The buyer distinguishes the delivery product from the rest by screening them. The vendor pays a holding and transportation cost for the returns of the faulty products. This model shows an increase in the number of transported products and a decrease in the transportation cost. The customers cannot afford to wait. They choose the other way around. The buyer invests in decreasing the time between the order delivery and delivery supplied to reduce the lead time crashing cost. The fuzzy concept considers the uncertain matter. The fuzzy concept can play a vital role in the smooth running of the business. Fuzzy demand over came many obstacles through research through research from profitable business directions [1]. Supply chain management is pushed by imperfect production. Controllable lead time and service level constraints can be overcome [2]. The unavoidable situation can be overcome by transportation cost and inspection policy [3]. Inspection errors and the return of faulty items are common for profitable cases from the buyer side [4]. Quality improvement and setup cost reduction are challenges for the vendor side [5-7]. A supply chain model developed here with service level constraints and different strategies to determine the best method of a smooth running business process. Decision making fuzzy relation equations, and pre-processing of data are some of the application of type-2 fuzzy sets [8]. No inventory model has been proposed in type-2 fuzzy environment, as an evidence of a literature review and to the best of my knowledge. The main goal of this research is to come up with a fuzzy inventory model. The present paper considers demand rate and ordering cost of time as interval type-2 fuzzy sets (IT2FSS) [9]. A new method of defuzzification of IT2FS is proposed and applied to the model. The mathematical model is analysed to find closed form formulae of order quantity and minimum delivery rate. The model is deduced from a comparative study with other model. The rest of the paper is in order. The proposed defuzzification method presented in section 2. The entire paper uses notations and assumptions in section 3. Section 4 describes mathematical modelling and section 5 gives the methodology to determine the solution. Section 6 has a numerical example and section 7 has a sensitivity analysis by changing the fuzzy parameters. After the discussion is concluded in section [8].

METHODOLOGY

This section provides a brief introduction to type-2 fuzzy set, and then proposes a new method of de-fuzzification.

Preliminaries
IT2FS : Let X R (real numbers) be a finite non-empty set, called universal set, and let Int ([0,1]) be the collection of all closed subintervals of [0, 1]. An IT2FS $\tilde{A}$ in X is defined as

$$\tilde{A} = \{(x, \mu_{\tilde{A}}(x) : x \in X, where \mu_{\tilde{A}} : X \rightarrow Int([0,1)]$$ is defined as

$\mu_{\tilde{A}}(x) = [\mu_{\tilde{A}}^{-}, \mu_{\tilde{A}}^{+}], 0 \leq \mu_{\tilde{A}}^{-} \leq \mu_{\tilde{A}}^{+} \leq 1,$ i.e., grade of membership of $x \in \tilde{A}$ is an interval $[\mu_{\tilde{A}}^{-}, \mu_{\tilde{A}}^{+}]$.

Interval type-2 trapezoidal fuzzy set (IT2TrFS)
An interval type-2 trapezoidal fuzzy set (IT2TrFS) is a IT2FS

Sumathi *et al.*,

$\tilde{A} = [\tilde{A}^L, \tilde{A}^U] = [(\tilde{a}_1^L, \tilde{a}_2^L, \tilde{a}_3^L, \tilde{a}_4^L; h_A^L), (\tilde{a}_1^U, \tilde{a}_2^U, \tilde{a}_3^U, \tilde{a}_4^U; h_A^U)]$, where $\tilde{A}^L$ and $\tilde{A}^U$ are generalized trapezoidal fuzzy members and $\tilde{A}^L \subseteq \tilde{A}^U$. $\tilde{A}^L$ and $\tilde{A}^U$ are defined by lower membership function(LMF) $\mu_{\tilde{A}}^L$ and upper membership function(UMF) $\mu_{\tilde{A}}^U$ as follows:

$$\mu_{\tilde{A}}^L = \begin{cases} h_A^L\left(\dfrac{x - a_1^L}{a_2^L - a_1^L}\right), a_1^L \le x \le a_2^L; \\ h_A^L, a_2^L \le x \le a_3^L; \\ h_A^L\left(\dfrac{a_4^L - x}{a_4^L - a_3^L}\right), a_3^L \le x \le a_4^L; \\ 0, otherwise; \end{cases}$$

$$\mu_{\tilde{A}}^U = \begin{cases} h_A^U\left(\dfrac{x - a_1^U}{a_2^U - a_1^U}\right), a_1^U \le x \le a_2^U; \\ h_A^U, a_2^U \le x \le a_3^U; \\ h_A^U\left(\dfrac{a_4^U - x}{a_4^U - a_3^U}\right), a_3^U \le x \le a_4^U; \\ 0, otherwise; \end{cases}$$

Interval approximation of IT2TrFS
Definition
The Interval approximation of IT2TrFS $\tilde{A}$ is defined as follows:

$$[A_\alpha^-, A_\alpha^+] = \left[\frac{1}{4}[(a_1^L + a_2^L)h_A^L + (a_1^U + a_2^U)h_A^U], \frac{1}{4}[(a_3^L + a_4^L)h_A^L + (a_3^U + a_4^U)h_A^U]\right].$$

Definition
Mean (defuzzified to a scalar) value of the interval opproximation of IT2TrFS $\tilde{A}$ is defined as

$$M(\tilde{A}) = \frac{A_\alpha^- + A_\alpha^+}{2}$$

$$= \frac{1}{8}\Big[(a_1^L + a_2^L + a_3^L + a_4^L)h_A^L + (a_1^U + a_2^U + a_3^U + a_4^U)h_A^U\Big].$$

Arithmetic operations on IT2TrFS
Let $\tilde{X} = [\tilde{X}^L, \tilde{X}^U] = [(\tilde{X}_1^L, \tilde{X}_2^L, \tilde{X}_3^L, \tilde{X}_4^L; h_X^L), (\tilde{X}_1^U, \tilde{X}_2^U, \tilde{X}_3^U, \tilde{X}_4^U; h_X^U)]$ and
$\tilde{Y} = [\tilde{Y}^L, \tilde{Y}^U] = [(\tilde{Y}_1^L, \tilde{Y}_2^L, \tilde{Y}_3^L, \tilde{Y}_4^L; h_Y^L), (\tilde{Y}_1^U, \tilde{Y}_2^U, \tilde{Y}_3^U, \tilde{Y}_4^U; h_Y^U)]$ be two non-negative IT2TrFSs; then arithmetic operations on these are defined as follows:

Sumathi *et al.,*

1.Addtion :
$$X \oplus Y = \left[(\tilde{X}_1^L + \tilde{Y}_1^L, \tilde{X}_2^L + \tilde{Y}_2^L, \tilde{X}_3^L + \tilde{Y}_3^L, \tilde{X}_4^L + \tilde{Y}_4^L; \min(h_X^L, h_Y^L)), (\tilde{X}_1^U + \tilde{Y}_1^U, \tilde{X}_2^U + \tilde{Y}_2^U, \tilde{X}_3^U + \tilde{Y}_3^U, \tilde{X}_4^U + \tilde{Y}_4^U; \min(h_X^U, h_Y^U)) \right].$$

2. Subtraction:
$$X \Theta Y = \left[(\tilde{X}_1^L - \tilde{Y}_4^L, \tilde{X}_2^L - \tilde{Y}_3^L, \tilde{X}_3^L - \tilde{Y}_2^L, \tilde{X}_4^L - \tilde{Y}_1^L; \min(h_X^L, h_Y^L)), (\tilde{X}_1^U - \tilde{Y}_4^U, \tilde{X}_2^U - \tilde{Y}_3^U, \tilde{X}_3^U - \tilde{Y}_2^U, \tilde{X}_4^U - \tilde{Y}_1^U; \min(h_X^U, h_Y^U)) \right].$$

3. Multiplication:
$$X \otimes Y = \left[(\tilde{X}_1^L \times \tilde{Y}_1^L, \tilde{X}_2^L \times \tilde{Y}_2^L, \tilde{X}_3^L \times \tilde{Y}_3^L, \tilde{X}_4^L \times \tilde{Y}_4^L; \min(h_X^L, h_Y^L)), (\tilde{X}_1^U \times \tilde{Y}_1^U, \tilde{X}_2^U \times \tilde{Y}_2^U, \tilde{X}_3^U \times \tilde{Y}_3^U, \tilde{X}_4^U \times \tilde{Y}_4^U; \min(h_X^U, h_Y^U)) \right].$$

4.Division:
$$X \oslash Y = \left[(\tilde{X}_1^L / \tilde{Y}_4^L, \tilde{X}_2^L / \tilde{Y}_3^L, \tilde{X}_3^L / \tilde{Y}_2^L, \tilde{X}_4^L / \tilde{Y}_1^L; \min(h_X^L, h_Y^L)), (\tilde{X}_1^U / \tilde{Y}_4^U, \tilde{X}_2^U / \tilde{Y}_3^U, \tilde{X}_3^U / \tilde{Y}_2^U, \tilde{X}_4^U / \tilde{Y}_1^U; \min(h_X^U, h_Y^U)) \right].$$

Where $\tilde{Y}_1^L, \tilde{Y}_2^L, \tilde{Y}_3^L, \tilde{Y}_4^L, \tilde{Y}_1^U, \tilde{Y}_2^U, \tilde{Y}_3^U \, and \, \tilde{Y}_4^U$ are positive real numbers.

5. Multiplication by a real number a:
$$a\tilde{X} = \begin{cases} [(a\tilde{X}_1^L, a\tilde{X}_2^L, a\tilde{X}_3^L, a\tilde{X}_4^L; h_X^L), (a\tilde{X}_1^U, a\tilde{X}_2^U, a\tilde{X}_3^U, a\tilde{X}_4^U; h_X^U)], if\, a \geq 0; \\ [(a\tilde{Y}_1^L, a\tilde{Y}_2^L, a\tilde{Y}_3^L, a\tilde{Y}_4^L; h_Y^L), (a\tilde{Y}_1^U, a\tilde{Y}_2^U, a\tilde{Y}_3^U, a\tilde{Y}_4^U; h_Y^U)], if\, a \leq 0. \end{cases}$$

6.Division by a real number a:
$$\tilde{X} / a = \begin{cases} [(\tilde{X}_1^L / a, \tilde{X}_2^L / a, \tilde{X}_3^L / a, \tilde{X}_4^L / a; h_X^L), (\tilde{X}_1^U / a, \tilde{X}_2^U / a, \tilde{X}_3^U / a, \tilde{X}_4^U / a; h_X^U)], if\, a > 0; \\ [(\tilde{Y}_1^L / a, \tilde{Y}_2^L / a, \tilde{Y}_3^L / a, \tilde{Y}_4^L / a; h_Y^L), (\tilde{Y}_1^U / a, \tilde{Y}_2^U / a, \tilde{Y}_3^U / a, \tilde{Y}_4^U / a; h_Y^U)], if\, a < 0. \end{cases}$$

NOTATIONS AND ASSUMPTIONS
The purpose of the problem along with symbols and hypothesis are described. At the first problem, purpose describes elaborately, then symbols of the mathematical model, and at the last part, assumping briefly describe.

Notations
The model structure is dependent on variables and parameters.
Input parameters
q order quantity
g probability of imperfect production
h setup cost for vendor
L length of the lead time
n number of shipments
t transportation cost
σ standard deviation of the demand
x retaining cost of good quality incurred by the vendor
y retaining cost of defective product incurred by the buyer
z retaining cost incurred by the vendor
r screening rate
f fraction of annual capital investment
b scaling parameter of the investment for improvement function
B scaling parameter of the investment for the setup cost reduction function
$g_\circ$ primary probability of defective production
$h_\circ$ initial cost of setup incurred by the vendor
d demand
a ordering cost
c compensation cost of the lead time
Φ fraction of defective products

k replacing cost of defective products
v screening cost
β the reciprocal of p
w fraction of customers demand
u_i minimum duration for lead time component
v_i normal duration for lead time component
m_i crasing cost
L_i length of the lead time with i^{th} components
p production rate
JTC(q) joint total cost

Assumptions
The model is formulated using assumption,
1. A supply chain management model is proposed with supply chain members vendor and buyer. The product demand and ordering cost is considered a type-2 fuzzy number. The vendor`s defective production is considered.
2. The p production and screening rate r was incurred by the vendor and buyer. The market demand for supply chain members must be greater than the production and screening rate r. The buyer inspects the produced lot with screening rate r, which shows the defects that are generally produced. It is assumed that the screening of the products is free of error.
3. This model takes service level constraints into account improved quality and stock out situation. The investment function of the improved quality products and setup cost reductiontechnique are used in logarithmic expressions.
4. A distribution-free approach is considered. The transportation discount policy is based on the quantity of the product. The crashing cost for lead time per cycle is considered.

$$c(L) = m_i (L_{i-a} - L) + \sum_{j=1}^{i-1} m_j (v_j - u_j), where L \in (L_i - L_{i-1})$$

5. The least market demand is equal to the number of perfect products $q(1+g)(1-g) \geq dq(1+g)/r$ which implies that $g \leq 1 - d/r$. The holding cost incurred by the buyer is considered for the perfect and defective products.

MODEL FORMULATION
The proposed model has supply chain management two members with capital investment for improved quality products and setup cost reduction under the service level constraints. The vendor has a production ratio of p. When the system is out of control, defective products are produced. A holding cost is incurred for the replacement of the faulty product. The buyer shows a stochastic demand even though the model shows the changes in the type-2 fuzzy demand.

Vendor´s model
The vendor`s production is based on stochastic and type-2 fuzzy demand. The capital investment for improving the quality of production high. The defective products can be replaced quickly. The time taken for the delivery and the time taken for the order are considered here to reduce the lead time, service level constraints. The vendor`s costs are considered as follows.

Vendor′s setup cost (VSC)

The vendor can use this cost to setup equipment to make different goods. It is the most expensive for a production inventory model and supply chain management. The production improves faster, when the setup is developed. The total setup investment cost is, VSC= $\dfrac{dh}{nq}$

Vendor′s quality improvement cost (VQIC)

Defective production is an essential factor for a production system, which gives uncertainty to a supply chain, when the top products are perfect, a production is reliable. The vendor invests capital in order to improve the quality of their products.ie) To make the system in-control. The cost is given as, VQIC= $fb \log \dfrac{g_o}{g}$

Vendor′s setup reduction cost (VSRC)

The production setup is the most important factor that affects the total cost of a supply chain. The model is developed by introducing a small cost that addresses the quality and quantity of the products, and the setup investment cost is reduced. A logarithmic function is used to express the cost. The cost is given as,

VSRC= $fB \log \dfrac{h_o}{h}$

Vendor′s holding cost (VHC)

The supply chain is strong because of the holding cost. This type of investment is used to store unsold products. The total supply chain costs are parallel to the ordering costs and shortage costs. The cost for holding the products, remodifying with an advertisement, and long-time replenishment are included in VHC. Vendors consider the holding cost to be the cost of holding the products until they are delivered to the buyer. The total cost of holding the product is, VHC = $\dfrac{zq}{2}[n(1-d\beta)-1+2d\beta]$

Vendor′s defective cost (VDC)

In a production supply chain model defective production is a common factor. The quality quantity of the product are reduced. The total cost is increased by defective products. When the machine is out of control, the invests in new products. The total cost for replacement is given as, VDC = kdg

Vendor total cost (VTC)

The total cost is incurred by a vendor

VCT = VSC+VQIC+VSRC+VHC+VDC

$$= \frac{dh}{nq} + fb \log \frac{g_o}{g} + fB \log \frac{h_o}{h} + \frac{zq}{2}[n(1-d\beta)-1+2d\beta] + kdg$$

BUYER′S MODEL

The buyer invests in the ordering cost and market transfer to receive the products from the vendor. The buyer invests in the holding cost for two different products. The buyer invests in the transportation and screening of the received products even after the defective products returned to the vendor for replacement.

The buyer costs are considered as follows:

Buyer′s ordering cost (BOC)

The moments are connected through the ordering cost. The buyer invests in the ordering cost to purchase the product from the vendor. There are different ways to place or order. To purchase the products from the vendor, the buyer invests in the ordering cost. The total ordering cost that the buyer invests is given as ,BOC= $\dfrac{da}{nq}$

Buyer′s lead time crashing cost (BLC)

The lead time is the gap between receiving an order and delivering it. The lead time is a vital factor in the customer demand and many researches considered it to be a negligible amount. The model considered the cost to reduce the time between ordering and delivery. The cost of lead time is given by, BLC = $\dfrac{dc}{q}$

Buyer′s perfect product holding cost (BPHC)

The vendor gives the products to the buyer and distinguishes them as perfect and defective products. They can sell the products immediately or stock them for a specific time. The products may become defective. The buyer invests in two types of costs to hold the products. The buyer invests in the quality of the product is given by, BPHC =

$$a\left[gq + \frac{g(1+g)dq}{2r}\right]$$

Buyer′s imperfect product holding cost (BIPHC)

The buyer losses are high due to the defect in the products. Most buyers return their products to the vendors, and the vendors accept them for the smooth running of the business. The buyer invests in different costs and returns the products to the vendor for a new one. Different stock holding cost can identify the perfect products, maintain the lead time, and fulfil the customer demand. The BIPHC is given by, BIPHC = $b\left[\dfrac{q}{2} + \dfrac{\sigma^2 L}{4(1-w)q} + \dfrac{g(1+g)dq}{2r}\right]$

Buyer′s screening cost (BSC)

The buyer separates the good and bad products through the screening cost. The market demand for the perfect product must be met. The capital is invested by the buyer for screening products. The buyer can investigate the quality of the products by investing a specific cost. The buyer can transfer the product to different places. The BSC is given as follows,

BSC = $vd(1+g)$

Buyer′s transportation cost (BTPC)

The buyer invests in transportation costs to get the product from the vendor to them. The vendor can return the product that are defective. The vendor and buyer supply-chain system depends on transportation to maintain customer demand. The buyer can use the BTPC to transport the products to the customer. Hence the BTPC is given as follows:

BTPC = dt

There are techniques that can be used to reduce the total cost of transportation. The transportation cost is related to demand when it is not constant.

Buyer total cost (BTC)

BTC = BOC+BLC+BPHC+BIPHC+BSC+BTPC

$$= \frac{da}{nq} + \frac{dc}{q} + x\left[gq - \frac{g(1+g)dq}{2r}\right] + y\left[\frac{q}{2} + \frac{\sigma^2 L}{4(1-w)q} + \frac{g(1+g)dq}{2r}\right] + vd(1+g) + dt$$

TOTAL COST OF THE SUPPLY CHAIN MANAGEMENT

The supply chain management has joint cost without a constraint and constant annual demand is given by,

JTC(q)= VTC +BTC

$$= \frac{dh}{nq} + fb\log\frac{g_o}{g} + fB\log\frac{h_o}{h} + \frac{zq}{2}[n(1-d\beta)-1+2d\beta] + kdg +$$

$$\frac{da}{nq} + \frac{dc}{q} + x\left[gq - \frac{g(1+g)dq}{2r}\right] + y\left[\frac{q}{2} + \frac{\sigma^2 L}{4(1-w)q} + \frac{g(1+g)dq}{2r}\right] + vd(1+g) + dt$$

The above eqn can be written as,

$$JTC(q) = \frac{dh}{nq} + \frac{zq}{2}[n(1-d\beta)-1+2d\beta] + \frac{da}{nq} + \frac{dc}{q} + x\left[gq - \frac{g(1+g)dq}{2r}\right] + y\left[\frac{q}{2} + \frac{\sigma^2 L}{4(1-w)q} + \frac{g(1+g)dq}{2r}\right] + L$$

Where, $L = fb\log\frac{g_o}{g} + fB\log\frac{h_o}{h} + kdg + vd(1+g) + dt$

SOLUTION METHODOLOGY

Crisp model

The classical method is used to solve the mathematical model.

At first, the joint total cost is partially differentiated and equated to zero.

i.e., $\frac{\partial JTC(q)}{\partial q} = 0$.

$$\frac{-1}{q^2}\left[\frac{dh}{n} + \frac{da}{n} + dc + \frac{y\sigma^2 L}{4(1-w)}\right] + \left[\frac{z}{2}[n(1-d\beta)-1+2d\beta] + xg - \frac{g(1+g)d}{2r} + \frac{y}{2} + \frac{yg(1+g)d}{2r}\right] = 0$$

Thus , the decision variable obtain the optimum results as follows,

$$q = \sqrt{\frac{d\left[\frac{h}{n} + \frac{a}{n} + c\right] + \frac{y\sigma^2 L}{4(1-w)}}{x\left[g - \frac{g(1+g)d}{2r}\right] + y\left[\frac{1}{2} + \frac{g(1+g)d}{2r}\right] + \frac{z}{2}[n(1-d\beta)-1+2d\beta]}}$$

and the second order partial derivatives are

$$\frac{\partial^2 JTC(q)}{\partial q^2} = \frac{2}{q^3}\left[\frac{dh}{n} + \frac{da}{n} + dc + \frac{y\sigma^2 L}{4(1-w)}\right] > 0.$$

Therefore, $\frac{\partial^2 JTC(q)}{\partial q^2}$ convex in q.

Fuzzy model

We now demand and ordering cost are IT2TrFSs, whose grade of membership are defined as follows:

$\tilde{d} = [\tilde{d}^L, \tilde{d}^U] = [(\tilde{d}_1^L, \tilde{d}_2^L, \tilde{d}_3^L, \tilde{d}_4^L; h_d^L), (\tilde{d}_1^U, \tilde{d}_2^U, \tilde{d}_3^U, \tilde{d}_4^U; h_d^U)]$ and $\tilde{a} = [\tilde{a}^L, \tilde{a}^U] = [(\tilde{a}_1^L, \tilde{a}_2^L, \tilde{a}_3^L, \tilde{a}_4^L; h_a^L)$

$,(\tilde{a}_1^U, \tilde{a}_2^U, \tilde{a}_3^U, \tilde{a}_4^U; h_a^U)]$ where $d_i^L \le d_{i+1}^L, d_i^U \le d_{i+1}^U, a_i^L \le a_{i+1}^L, a_i^U \le a_{i+1}^U, i = 1, 2, 3.$

$a_1^U \le a_1^L, a_4^L \le a_4^U, d_1^U \le d_1^L, d_4^L \le d_4^U, 0 \le a_1^L, a_4^U \le 1 and 0 < h_a^L \le h_a^U \le 1, 0 < h_d^L \le h_d^U \le 1.$ Arithmetic

operations defined in sec 2.1.4are used hereto calculate the fuzzy joint total cost as follows:

$$JT\tilde{C}(q) = \frac{dh}{nq} \Theta \frac{nd\beta zq}{2} \oplus \frac{2d\beta zq}{2} \oplus kdg \oplus \frac{da}{nq} \oplus \frac{dc}{q} \Theta \frac{xg(1+g)dq}{2r} \oplus \frac{yg(1+g)dq}{2r} \oplus vd(1+g) \oplus dt + R$$

Where, $R = fb\log\frac{g_o}{g} + fB\operatorname{og}\frac{h_o}{h} + \frac{zq}{2}(n-1) + xgq + \frac{yq}{2} + \frac{y\sigma^2 L}{4(1-w)q}$

Depending upon the values of $h_a^L, h_a^U, h_d^L \text{ and } h_d^U$, four cases arise: (1) $h_a^L \le h_d^L \le h_a^U \le h_d^U$, (2) $h_a^L \le h_d^L \le h_d^U \le h_a^U$, (3) $h_d^L \le h_a^L \le h_d^U \le h_a^U$, (4) $h_d^L \le h_a^L \le h_a^U \le h_d^U$. Hence the IT2TrFS profit function $JT\tilde{C}$ can be expressed as,

$$JT\tilde{C} = \begin{cases} [(JTC_1^L, JTC_2^L, JTC_3^L, JTC_4^L; h_a^L), (JTC_1^U, JTC_2^U, \\ JTC_3^U, JTC_4^U; h_a^U)], h_a^L \le h_d^L \le h_a^U \le h_d^U; \\ [(JTC_1^L, JTC_2^L, JTC_3^L, JTC_4^L; h_a^L), (JTC_1^U, JTC_2^U, \\ JTC_3^U, JTC_4^U; h_d^U)], h_a^L \le h_d^L \le h_d^U \le h_a^U; \\ [(JTC_1^L, JTC_2^L, JTC_3^L, JTC_4^L; h_d^L), (JTC_1^U, JTC_2^U, \\ JTC_3^U, JTC_4^U; h_d^U)], h_d^L \le h_a^L \le h_d^U \le h_a^U; \\ [(JTC_1^L, JTC_2^L, JTC_3^L, JTC_4^L; h_d^L), (JTC_1^U, JTC_2^U, \\ JTC_3^U, JTC_4^U; h_a^U)], h_d^L \le h_a^L \le h_a^U \le h_d^U \end{cases}$$

The defuzzified value of IT2TrFS profit function $JT\tilde{C}$ given as follows:

$$M(JT\tilde{C}) = \begin{cases} M(JT\tilde{C}_{h_a^L, h_a^U}), h_a^L \le h_d^L \le h_a^U \le h_d^U; \\ M(JT\tilde{C}_{h_a^L, h_d^U}), h_a^L \le h_d^L \le h_d^U \le h_a^U; \\ M(JT\tilde{C}_{h_d^L, h_d^U}), h_d^L \le h_a^L \le h_d^U \le h_a^U; \\ M(JT\tilde{C}_{h_d^L, h_a^U}), h_d^L \le h_a^L \le h_a^U \le h_d^U \end{cases}$$

Where for $m = h_a^L, h_d^L; n = h_a^U, h_d^U$

$$JT\tilde{C}(q) = R + \frac{1}{8}\left\{ \begin{aligned} &\left(\frac{h}{nq} + \frac{(2-n)\beta zq}{2} + kg + \frac{c}{q} + \frac{g(1+g)q}{2r}(y-x) + (1+g) + t\right)\left((d_1^L + d_2^L + d_3^L + d_4^L)m + (d_1^U + d_2^U + d_3^U + d_4^U)n\right) + \\ &\frac{1}{nq}\left((d_1^L a_1^L + d_2^L a_2^L + d_3^L a_3^L + d_4^L a_4^L)m + (d_1^U a_1^U + d_2^U a_2^U + d_3^U a^U + d_4^U a_4^U)n\right) \end{aligned} \right\}$$

The profit of the above given equation can be written as follows:

$$JT\tilde{C}(q) = R + \left(\frac{h}{nq} + \frac{(2-n)\beta zq}{2} + kg + \frac{c}{q} + \frac{g(1+g)q}{2r}(y-x) + (1+g) + t\right)(d^L m + d^U n) + \frac{1}{nq}(z^L m + z^U n)$$

Where,

Sumathi *et al.,*

$$d^L = \frac{d_1^L + d_2^L + d_3^L + d_4^L}{8},$$

$$d^U = \frac{d_1^U + d_2^U + d_3^U + d_4^U}{8},$$

$$z^L = \frac{d_1^L a_1^L + d_2^L a_2^L + d_3^L a_3^L + d_4^L a_4^L}{8},$$

$$z^U = \frac{d_1^U a_1^U + d_2^U a_2^U + d_3^U a^U + d_4^U a_4^U}{8}.$$

At first, the joint total cost is partially differentiated and equated to zero. i.e.,

$$\frac{-1}{q^2}\left[\left(\frac{h}{n}+c\right)\left(d^L m + d^U n\right) + \frac{1}{n}\left(z^L m + z^U n\right) + \frac{y\sigma^2 L}{4(1-w)}\right] + \left[\left(\frac{(2-n)\beta z}{2} + \frac{g(1+g)(y-x)}{2r}\right)\left(d^L m + d^U n\right) + \frac{z(n-1)}{2} + xg + \frac{y}{2}\right] = 0$$

We get, $\tilde{q} = \sqrt{\dfrac{\left[\left(\dfrac{h}{n}+c\right)\left(d^L m + d^U n\right) + \dfrac{1}{n}\left(z^L m + z^U n\right) + \dfrac{y\sigma^2 L}{4(1-w)}\right]}{\left[\left(\dfrac{(2-n)\beta z}{2} + \dfrac{g(1+g)(y-x)}{2r}\right)\left(d^L m + d^U n\right) + \dfrac{z(n-1)}{2} + xg + \dfrac{y}{2}\right]}}$

NUMERICAL EXPERIMENT
The numerical example validates the proposed model.

Example
The mathematical model is numerically tested to validate the theoretical solution. All data used are based on the industry visit and certain data are verified by Sarkar and Mahapatra [1]; the following input parameter values are considered here to illustrate the numerical example. d = 500 (units/year); σ = 7 ($/batch); β = 1/300 ($/unit); a = 50 ($/setup); h_o = 40 ($/setup); x = 6 ($/unit per year); y = 10 ($/unit per year); z = 4 ($/unit per year); v = 0.25 ($/unit); γ= 2152 (units/year); k = 20 ($/defective unit); b = 4000; B = 400; f = 0.1 ($/year); g_o = 0.08; w = 0.98; c = 28 ($/ order); and t = 0.20 ($/unit); g=0.037; h=20.75; L=3; n=3.

Crisp model
The results of the order quantity and joint total cost for crisp model is given as follows, q =86.47 , JTC(q) = $1766.5

Fuzzy model
The sensitivity table clearly shows that the transportation cost parameter is directly related to order quantity and the joint total cost. Graphical representation of the table 2 is given by,

CONCLUSION

This model demonstrated the most effective method for minimizing the overall supply chain expenses while considering type-2 fuzzy demand and service level limitations. This study additionally examined interval type-2 fuzzy ordering costs and suggested a technique to convert it into a precise value. The primary objective of this model was to achieve the lowest total cost by concurrently optimizing the decision variables. A numerical example is also provided to reinforce the mathematical formulation and approach. Ultimately, the sensitivity analysis reveals that type-2 fuzzy variable parameters have a considerable impact on the decision-making policy.

ABSTRACT

Statistical analysis plays a part in medical research, particularly in cancer studies, where finding the best model for survival data is vital. Recent research shows that adding parameters to classical distributions rarely improves their fit to such data. This work presents and explores the Weighted Kpenadidum Distribution (WKD), a unique two-parameter distribution meant to overcome this constraint. The proposed distribution's statistical and mathematical features, including the derivation of entropy, are extensively studied. This distribution also has its probability density function for order statistics determined. Parameters are estimated using the maximum likelihood estimation (MLE) approach. Furthermore, the model's efficacy is proven by applying it to real-world data sets and comparing its fit to that of a widely known distribution. The results highlight the potential of WKD to provide improved modeling of survival data in medical research.

Keywords: Weighted distribution, Reliability Analysis, Entropy, Order Statistics, Maximum likelihood Estimation.

INTRODUCTION

Over the last few years, statisticians have become familiar with various innovative statistical distributions. Developing new distributions often aims to address mathematical issues, real-world applications, or both. Weather

94890

modeling, insurance, risk management, finance, and survival data analysis all require the extension of classical distributions to a greater extent. Adding parameters to existing distributions increases their flexibility and usefulness for data analysis. Weighted distributions emerge naturally from stochastic processes and are documented using a weighting function. The length-biased distribution occurs when the weight is determined by the length of the unit of interest. Fisher (1934) proposed weighted distributions to represent ascertainment bias, and Rao (1965) generalized the concept to discrete distributions. Rao described scenarios in which observations follow stochastic models but do not correspond to their original distribution unless every observation has an equal chance of being recorded. If x is a random variable with a probability density function $f(x)$, and $w(x)$ is a weight function such that $0 \leq w(x) \leq 1$ the weighted probability density function $f_w(x)$ is given by

$$f_w(x) = \frac{w(x)f(x)}{E(w(x))}; x > 0$$

Where $w(x)$ is a normalizing constant ensuring the total probability equals unity. A notable special case is when $w(x) = x$ or $w(x) = x^c (\alpha > 0)$, leading to length-biased or size-biased distributions. These distributions are particularly useful for examining tail properties and improving goodness-of-fit studies. Numerous researchers have proposed innovative techniques for creating enhanced probability distributions, emphasizing their application in various domains. The significant contributions to the development and application of weighted distributions by various authors are, Hashempour and Alizadeh (2023) introduced the weighted half-logistic distribution and explored its properties and estimation methods. Helal *et al.* (2022): studied the statistical properties of the weighted shanker distribution. Chesneau *et al.* (2022): proposed a modified weighted exponential distribution with applications. Eyob *et al.* (2019): developed the weighted Quasi-Akash distribution. Elangovan and Anthony (2019): investigated the weighted om distribution for survival times. Atikankul *et al.* (2020): examined the length-biased weighted Lindley distribution. Hassan *et al.* (2019): proposed a new generalization of the Pranav distribution using weighted techniques. Shanker and Shukla (2017): presented the quasi-shanker distribution. The weighted Kpenadidum distribution, current research introduces a novel generalization of the Kpenadidum distribution, referred to as the weighted Kpenadidum distribution (WKD. This distribution adapts existing methodologies to analyse survival times, particularly in breast cancer datasets. Statistical properties for the examination of density and survival functions, hazard rate functions, and moments were identified. The model's parameters are estimated using maximum likelihood approaches. The WKD is proved to be more effective at fitting data than conventional distributions. The statistical programming language r was employed to conduct all analyses, demonstrating the practical applicability of the WKD model in survival data analysis.

WEIGHTED KPENADIDUM DISTRIBUTION

In this Section, we define the probability density function (pdf) and cumulative distribution function (cdf) of the weighted Kpenadidum distribution

$$f(x; \theta) = \frac{\theta^4}{2(\theta^4 + \theta + 6)}(2x^3 + x^2 + 2\theta)e^{-\theta x}; x > 0, \theta > 0 \qquad (1)$$

We have considered a random variable x with a probability density function f(x). Let w(x) be a non-negative weigh function, then the probability density function of the weighted random variable x_w is given by

$$f_w(x) = \frac{w(x)f(x)}{E(w(x))}; x > 0 \qquad (2)$$

Where w(x) is a non-negative weighted function and

$$E(w(x)) = \int w(x)f(x) < \infty, 0 < E(w(x)) < \infty$$

In this paper, we study the weighted Version of Kpenadidum distribution, taking w(x)= x^c to get the weighted Kpenadidum distribution , the probability density function (pdf) of the weighted version is given by

$$f_w(x) = \frac{x^c f(x)}{E(X^c)}$$

Where, $E(X^c) = \int_0^\infty x^c f(x)\, dx$

$$E(X^c) = \frac{2(c+3)^{'} + \theta(c+2)! + 2\theta^4 c!}{\theta^c \cdot 2(\theta^4 + \theta + 6)} \tag{3}$$

Substituting the value of equation (1) and (3) in equation (2), we get the probability density function (pdf) of weighted Kpenadidum distribution,

$$f_w(x,c,\theta) = \frac{\theta^{c+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!} x^c (2x^3 + x^2 + 2\theta)e^{-\theta x}; x > 0, \theta > 0, c > 0 \tag{4}$$

The cumulative distribution function (cdf) of the weighted Kpenadidum distribution is obtained as

$$F_w(x,c,0) = \int_0^x f_w(x,c,\theta)\,dx$$

$$= \int_0^\infty \frac{\theta^{C+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!} x^c (2x^3 + x^2 + 2\theta)e^{-\theta x}\,dx$$

On simplifying the integration by substation method and using incomplete gamma function, we get

$$F_w(x,c,\theta) = \frac{2\gamma(c+4,\theta x) + \theta\gamma(c+3,\theta x) + 2\theta^3\gamma(c+1)}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!} \tag{5}$$

RELIABILITY ANALYSIS

Survival function

The survival function of weighted K penadidum distribution (WKD) is given as by $S(x) = 1 - F_w(x; c, \theta)$

$$S(x) = 1 - \frac{\left(2\gamma(c+4,\theta x) + \theta\gamma(c+3,\theta x) + 2\theta^3\gamma(c+1)\right)}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)}$$

Hazard Rate Function

The hazard rate function is given by $h(x) = \frac{f_w(x;c,\theta)}{1 - F_w(x;c,\theta)}$ is an important measure for characterizing life phenomenon

$$h(x) = \frac{\theta^{c+4} x^c (2x^3 + x^2 + 2\theta)e^{-\theta x}}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!) - 2\gamma(c+4,\theta x) + \theta\gamma(c+3,\theta x) + 2\theta^3\gamma(c+1)}$$

Mills Ratio

$$\text{Mills Ratio} = \frac{1}{h_r(x)}$$

$$MR = \frac{2\gamma(c+4,\theta x) + \theta\gamma(c+3,\theta x) + 2\theta^3\gamma(c+1)}{\theta^{c+4} x^c (2x^3 + x^2 + 2\theta)e^{-\theta x}}$$

Mean Residual function

The mean Residual function of (WKD) is given by

$$M(x) = \frac{1}{s(x)} \int_x^\infty t \cdot f(t)\,dt$$

$$M(x) = \frac{1}{1 - \frac{2\gamma(c+4,\theta x) + \theta\gamma(c+3,\theta x) + 2\theta^3\gamma(c+1)}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)}} \times \int_0^\infty t \cdot \frac{\theta^{c+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!} t^c (2t^3 + t^2 + 2\theta)e^{-\theta t}\,dt$$

On simplifying the integration by substation method and using the upper incomplete gamma function, we get

$$M(x) = \frac{\left(2\Gamma(c+5,\theta x) + \theta\Gamma(c+4,\theta^x) + 2\theta^4\Gamma(c+2,\theta x)\right)}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!) - 2\gamma(c+4,\theta x) + \theta\gamma(c+3,\theta x) + 2\theta^3\gamma(c+1)} - x$$

STOCHASTIC ORDERING

Stochastic ordering is an important tool in finance and reliability theory to assess the comparative performance of the models. Let X and Y be two random variables with pdf, cdf, and reliability function $f(x; \theta, c), f(y; \theta, c), F(x; \theta, c), F(y; \theta, c), S(x) = 1 - F(x; \theta, c)$ and $S(y) = 1 - F(x; \theta, c)$ Then,

1. Mean residual life order denoted by $X \leq_{MRLO} Y, If\ m_x(x) \leq m_y(y), \forall x$
2. Hazard rate order denoted as $X \leq_{HRO} Y, If\ \frac{S_X(x)}{S_Y(y)}$ *is decreasing if* $x \geq 0$
3. Stochastic order denoted as $X \leq_{SO} Y, If\ S_X(x) \leq_{SO} S_Y(x),\ \forall x$
4. Likelihood ration order denoted as $X \leq_{LRO} Y, If\ \frac{f_X(x;\theta,c)}{f_Y(x;\theta,c)}$

Assume that X and Y are two independent random variables with pdf $f_X(x; \theta, c)$ and $f_Y(x; \lambda, \alpha)$ If $\theta < \lambda$ and $\alpha < c$

$$\Lambda = \frac{f_x(x; \theta, c)}{f_y(x; \lambda, \alpha)}$$

$$\Lambda = \frac{\left(\frac{\theta^{c+4} x^c (2x^3 + x^2 + 2\theta) e^{-\theta x}}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right)}{\left(\frac{\lambda^{\alpha+4} x^\alpha (2x^3 + x^2 + 2\lambda) e^{-\lambda x}}{2(\alpha+3)! + \lambda^2(\alpha+2)! + 2\lambda^4 \alpha!}\right)}$$

$$\Lambda = \frac{\theta^{c+4} 2(\alpha+3)! + \lambda^2(\alpha+2)! + 2\lambda^4 \alpha!}{\lambda^{\alpha+4} 2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!} \times \frac{x^c(2x^3 + x^2 + 2\theta)}{x^\alpha(2x^3 + x^2 + 2\lambda)} e^{(\lambda-\theta)x}$$

Thus,

$$\log(\Lambda) = log\left[\frac{\theta^{c+4} 2(\alpha+3)! + \lambda^2(\alpha+2)! + 2\lambda^4 \alpha!}{\lambda^{\alpha+4} 2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right] log[x^c(2x^3 + x^2 + 2\theta)] - log[x^\alpha(2x^3 + x^2 + 2\lambda)] + (\lambda - \theta)x$$

Differentiating to x we get,

$$\frac{\partial \log(\Lambda)}{\partial x} = \left[\frac{cx^{c-1}(6x^2 + 2x)}{x^c(2x^3 + x^2 + 2\theta)}\right] - \left[\frac{\alpha x^{\alpha-1}(6x^2 + 2x)}{x^\alpha(2x^3 + x^2 + 2\lambda)}\right] + (\lambda - \theta)$$

$$\frac{\partial \log(\Lambda)}{\partial x} < 0\ if\ \lambda < \theta, \alpha < c$$

Thus, $X \leq_{LRO} Y, X \leq_{HRO} Y, X \leq_{MRLO} Y, and\ X \leq_{SO} Y$

STATISTICAL PROPERTIES

Moments

If a random variable x has the pdf of (WKD) is given by (4), then the corresponding r^{th} moment is given by

$$\mu_r' = E(X^r) = \int_0^\infty x^r f(x; c, \theta)\, dx$$

$$E(X^r) = \frac{\theta^{c+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!} \int_0^\infty x^{c+r}(2x^3 + x^2 + 2\theta) e^{-\theta x}\, dx$$

$$E(X^r) = \frac{\theta^{c+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!} \left(\frac{2\Gamma(c+r+4)}{\theta^{c+r+4}} + \frac{\Gamma(c+r+3)}{\theta^{c+r+3}} + \frac{2\theta\Gamma(c+r+1)}{\theta^{c+r+1}}\right)$$

$$E(X^r) = \frac{2\Gamma(c+r+4) + \theta\Gamma(c+r+3) + 2\theta^4\Gamma(c+r+1)}{\theta^r(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)} \quad (6)$$

Where $\Gamma(\cdot)$ is the gamma function, the mean and variance can be obtained by substituting r = 1 and r = 2 in eqn. (6)

$$E(X) = \frac{2\Gamma(c+5) + \theta\Gamma(c+4) + 2\theta^4\Gamma(c+2)}{\theta(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)}$$

$$E(X^2) = \frac{2\Gamma(c+6) + \theta\Gamma(c+5) + 2\theta^4\Gamma(c+3)}{\theta^2(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)}$$

$$\text{Variance} = \frac{2\Gamma(c+6) + \theta\Gamma(c+5) + 2\theta^4\Gamma(c+3)}{\theta^2(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)}$$
$$- \left(\frac{2\Gamma(c+5) + \theta\Gamma(c+4) + 2\theta^4\Gamma(c+2)}{\theta(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)}\right)^2 \tag{7}$$

Harmonic Mean

The harmonic mean of the (WKD) is given by

$$H.M = E\left(\frac{1}{x}\right) = \int_0^\infty \frac{1}{x} f_w(x; c, \theta)\, dx$$

$$H.M = \frac{\theta^{c+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!} \int_0^\infty x^{c-1}(2x^3 + x^2 + 2\theta)e^{-\theta x}\, dx$$

After simplification we get,

$$H.M = \frac{\theta\big(2\Gamma(c+3) + \theta\Gamma(c+2) + 2\theta^4\Gamma(c)\big)}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!}$$

Moment Generating function and characteristic Function

If a random variable X has the pdf of (WKD) given by (4), the corresponding r^{th} Moment is given by

$$M_{X_w}(t) = E(e^{tx})$$

$$M_{X_w}(t) = \int_0^\infty e^{tx} f(x)\, dx$$

Using Taylor's Series

$$M_{X_w}(t) = \int_0^\infty \left[1 + tx + \frac{(tx)^2}{2!} + \cdots\right] f(x)\, dx$$

$$M_{X_w}(t) = \int_0^\infty \sum_{j=0}^\infty \frac{t^j}{j!} f(x)\, dx$$

$$M_{X_w}(t) = \sum_{J=0}^\infty \frac{t^j}{j!} \cdot \frac{2\Gamma(c+j+4) + \theta\Gamma(c+j+3) + 2\theta^4\Gamma(c+j+1)}{\theta^j(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)}$$

$$M_{X_w}(t) = \frac{1}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)} \sum_{J=0}^\infty \frac{t^j}{j!\,\theta^j} \cdot 2\Gamma(c+j+4) + \theta\Gamma(c+j+3) + 2\theta^4\Gamma(c+j+1)$$

Similarly, we can get the characteristic function of (WKD) can be obtained as

$$\phi_{X_W}(t) = M_{X_w}(it)$$

$$\phi_{X_W}(t) = \sum_{J=0}^\infty \frac{(it)^j}{j!} \mu_j'$$

$$\phi_{X_W}(t) = \frac{1}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)} \sum_{J=0}^\infty \frac{(it)^j}{j!\,\theta^j} \cdot 2\Gamma(c+j+4) + \theta\Gamma(c+j+3) + 2\theta^4\Gamma(c+j+1)$$

94894

Ordered Statistics

In this section, we derived a closed form for the pdf of the ith order statistic of the (WKD). Let $x_1, \ldots, x_n$ be ta simple random sample from weighted Kpenadidum distribution with c.d.f and pdf given by (4) and (5). Let $x_{(1:n)} \leq x_{(2:n)} \leq \cdots \leq x_{(n:n)}$ denote the order statistics obtained from this sample. We now give the probability density function of $x_{r:n}$, say $f_{r:n}(x)$ of $x_{r:n}, i = 1,2, \ldots, n$. The probability density function of the rth order statistics $x_{r:n}, r = 1,2, \ldots, n$ given by

$$f_{r:n}(x) = \frac{n!}{(r-1)!\,(n-r)!}[F(x;C,\theta)]^{r-1}[1 - F(x,c,\theta)^{n-r}f(x;C,\theta), \; x > 0$$

$$f_{r:n}(x) = \frac{n!}{(r-1)!\,(n-r)!}\left(\frac{(2\gamma(c+4,\theta\mu) + \theta\gamma(c+3,\theta\mu) + 2\theta^4\gamma(c+1,\theta\mu)}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right)^{r-1}$$
$$\times \left(1 - \frac{(2\gamma(c+4,\theta\mu) + \theta\gamma(c+3,\theta\mu) + 2\theta^4\gamma(c+1,\theta\mu)}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right)^{n-r}$$
$$\times \left(\frac{\theta^{c+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!}x^c(2x^3 + x^2 + 2\theta)e^{-\theta x}\right) (8)$$

The distribution of the minimum first-order Statistic $X_{(1)} = \min(x_1, x_2, \ldots, x_n)$ and the largest order of Statistics $X_{(n)} = \max(x_1, x_2, \ldots, x_n)$ can be computed by replacing r in the previous equation with 1 and n. so we get

$$f_{1:n}(x) = \frac{n\,\theta^{c+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!}x^c(2x^3 + x^2$$
$$+ 2\theta)e^{-\theta x}\left(1 - \frac{(2\gamma(c+4,\theta\mu) + \theta\gamma(c+3,\theta\mu) + 2\theta^4\gamma(c+1,\theta\mu)}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right)^{n-1}$$

$$f_{n:n}(x) = \frac{n\,\theta^{c+4}}{2(c+3)! + \theta(c+2)! + 2\theta^4 c!}x^c(2x^3 + x^2 + 2\theta)e^{-\theta x}\left(\frac{2\gamma(c+4,\theta\mu) + \theta\gamma(c+3,\theta\mu) + 2\theta^4\gamma(c+1,\theta\mu)}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right)^{n-1}$$

Likelihood Ratio Test

In this section, we derive the likelihood ratio test from the (WKD). Let $x_1, x_2, \ldots, x_n$ be a random Sample from the weighted Kpenadidum distribution.

Testing the hypothesis, we have the null and alternative hypothesis

$H_0: f(x) = f(x,\theta)$ against $H_1: f(x) = f_w(x;c,\theta)$

The following test statistic is used to test whether the random Sample of size n comes from the Kpenadidum distribution or the weighted Kpenadidum distribution.

$$\triangle = \frac{L_1}{L_2} = \prod_{i=1}^{n}\frac{f_w(x_i;c,\theta)}{f(x_i,\theta)}$$

$$\triangle = \prod_{i=1}^{n}\frac{\theta^c 2(\theta^4 + \theta + 6)x_i^c}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}$$

$$\triangle = \left(\frac{\theta^c 2(\theta^4 + \theta + 6)}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right)^n \prod_{i=1}^{n}x_i^c$$

We have rejected the null hypothesis

$$\triangle = \left(\frac{\theta^c 2(\theta^4 + \theta + 6)}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right)^n \prod_{i=1}^{n}x_i^c > k$$

Equivalently, we also reject the null hypothesis.

Where,

$$\triangle^* = \prod_{i=1}^{n}x_i^c > k\left(\frac{\theta^c 2(\theta^4 + \theta + 6)}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!}\right)^n$$

$$\triangle^* = \prod_{i=1}^{n}x_i^c > k^*$$

Where, $k^* = k \left(\frac{\theta^c 2(\theta^4 + \theta + 6)}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!} \right)$

For large sample N, 2 log A is distributed as Chi-square Variate with one-degree freedom. Thus, we reject the null hypothesis When the probability value is given by $P(\Delta^* > \alpha^*)$ where,

$\alpha^* = \prod_{i=1}^{n} x_i{}^c$ less than the level of significance and $\prod_{i=1}^{n} x_i{}^c$ is the observed value of the statistic Δ^*

Entropy

The entropy was first introduced by Renyi (1961). It describes how much information is used in many fields Such as statistics and engineering. Entropy is defined as a measure of uncertainty of the probability distribution of a random variable X as

Renyi Entropy

The entropy of a random variable x measures the variation of the uncertainty. The Renyi entropy is defined by

$$R_\gamma = \frac{1}{(1-\gamma)} \log \int_0^\infty (f(x; c, \theta))^\gamma \, dx, \qquad \gamma > 0, \gamma \neq 1$$

$$R_\gamma = \frac{1}{(1-\gamma)} \log \left(\frac{\theta^{c+4}}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!} \right)^\gamma \int_0^\infty x^{c\gamma} (2x^3 + x^2 + 2\theta)^\gamma e^{-\theta\gamma x} \, dx$$

Using binomial series expansion,

$$(a + b + c)^z = \sum_{i=0}^\infty \binom{z}{i} (a)^{z-i} (b+c)^i$$

$$(1 + z)^a = \sum_{j=0}^\infty \binom{a}{j} x^j$$

Then, the following power series expansion

$$a^z = \sum_{k=0}^\infty \frac{(\log(a))^k z^k}{k!}$$

$$R_\gamma = \frac{1}{(1-\gamma)} \log \frac{\left(\frac{\theta^{c+4}}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!} \right)^\gamma \sum_{i=0}^\gamma \sum_{j=0}^i \binom{\gamma}{i}\binom{i}{j} \theta^j 2^{j+\gamma-1}}{\frac{\Gamma(c\gamma - i - 2j + 3\gamma + 1)}{\theta\gamma^{(c\gamma - i - 2j + 3\gamma + 1)}}}$$

after simplification we get, $R_\gamma = \frac{1}{(1-\gamma)} \log \left(\frac{\theta^{c+4}}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!} \right)^\gamma \sum_{i=0}^\gamma \sum_{j=0}^i \sum_{k=0}^j \sum_{i=0}^{j+\gamma-1} \frac{(\log(\theta))^k j^k}{k!} \binom{\gamma}{i}\binom{i}{j}\binom{j+\gamma-1}{i}$

$\times \frac{\Gamma(c\gamma - i - 2j + 3\gamma + 1)}{\theta\gamma^{(c\gamma - i - 2j + 3\gamma + 1)}}$

Tsallis Entropy

The Boltzmann-Gibbs(B-G) statistical mechanics initiated by Tsallis have attracted a great deal of attention. This generalization of (B-G) statistics was proposed firstly by introducing the mathematical expression of Tsallis entropy (Tsallis, 1988) for a continuous random variable which is defined as

$$T_\gamma = \frac{1}{\gamma - 1} 1 - \int_0^\infty (f(x))^\gamma \, dx \, ; \gamma > 0, \gamma \neq 1$$

$$T_\gamma = \frac{1}{\gamma - 1} \left(1 - \int_0^\infty \left(\frac{\theta^{c+4}}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!} \right)^\gamma \, dx \right)$$

$$T_\gamma = \frac{1}{\gamma - 1} \left(1 - \left(\frac{\theta^{c+4}}{2(c+3)! + \theta^2(c+2)! + 2\theta^4 c!} \right)^\gamma \right) \int_0^\infty x^{c\gamma} (2x^3 + x^2 + 2\theta)^\gamma e^{-\theta\gamma x} \, dx$$

94896

Solving the integral we obtain

$$T_\gamma = \frac{1}{\gamma-1}\left(1 - \left(\frac{\theta^{C+4}}{2(c+3)!+\theta^2(c+2)!+2\theta^4 c!}\right)^\gamma \sum_{i=0}^{\gamma}\sum_{j=0}^{i}\sum_{k=0}^{j}\sum_{i=0}^{j+\gamma-1}\frac{(\log(\theta))^k j^k}{k!}\binom{\gamma}{i}\binom{i}{j}\binom{j+\gamma-1}{i}\right.$$
$$\left. \times \frac{\Gamma(c\gamma-i-2j+3\gamma+1)}{\theta\gamma^{(c\gamma-i-2j+3\gamma+1)}}\right)$$

Bonferroni And Lorenz Curves

The Bonferroni and Lorenz curves (Bonferroni, 1930) have applications not only in economics to study income and poverty, but also in other fields like reliability demography, insurance, and medicine. The Bonferroni curve B(P) and Lorenz curve L(P) are defined as,

$$B(P) = \frac{1}{P\mu}\int_0^q xf(x;c,\theta)\,dx$$

and

$$L(P) = \frac{1}{\mu}\int_0^q xf(x;c,\theta)\,dx$$

Where, $q = F^{-1}(P)$; $q \in [0,1]$, and $\mu = E(x)$

Using the proposed pdf, we get

$$B(P) = \frac{1}{P\left(\frac{2\Gamma(c+5)+\theta\Gamma(c+4)+2\theta^4\Gamma(c+4)}{\theta\,2(c+3)!+\theta^2(c+2)!+2\theta^4 c!}\right)} \times \int_0^q x\,\frac{\theta^{c+4}}{2(c+3)!+\theta^2(c+2)!+2\theta^4 c!}x^c(2x^3+x^2+2\theta)e^{-\theta x}\,dx$$

$$B(P) = \frac{\theta^{c+5}}{P\,2\Gamma(c+5)+\theta\Gamma(c+4)+2\theta^4\Gamma(c+4)}\int_0^q x^{c+1}(2x^3+x^2+2\theta)e^{-\theta x}e^{\theta x}\,dx$$

On simplifying the integration by substitution method and using incomplete gamma function we get

$$B(P) = \frac{\left(2\gamma(c+5,\theta q)+\theta(c+4,\theta q)+2\theta^4(c+2,\theta q)\right)}{P\,2\Gamma(c+5)+\theta\Gamma(c+4)+2\theta^4\Gamma(c+4)}$$

Where $L(P) = P\,B(P)$

$$L(P) = \frac{\left(2\gamma(c+5,\theta q)+\theta(c+4,\theta q)+2\theta^4(c+2,\theta q)\right)}{2\Gamma(c+5)+\theta\Gamma(c+4)+2\theta^4\Gamma(c+4)}$$

ESTIMATION OF PARAMETER

The Maximum Likelihood Estimation (MLE) and Fisher Information Matrix.

The maximum likelihood method is applied to obtain the estimation for the parameter of (WKD) with parameter θ and c the likelihood function is defined as

$$L(x;\theta,c) = \prod_{i=1}^{n} f(x_i;\theta,c)$$

$$= \prod_{i=1}^{n}\left(\frac{\theta^{c+4}}{2(c+3)!+\theta^2(c+2)!+2\theta^4 c!}x_i^c(2x_i^3+x_i^2+2\theta)e^{-\theta x_i}\right)$$

$$= \frac{\theta^{c+4}}{2(c+3)!+\theta^2(c+2)!+2\theta^4 c!}\prod_{i=1}^{n} x_i^c(2x_i^3+x_i^2+2\theta)e^{-\theta x_i}$$

Now, log-likelihood can be given as

$$\log L = n(c+4)\log(\theta) - n\log(2(c+3)!+\theta(c+2)!+2\theta^4 c!) + c\sum_{i=1}^{n}\log(x_i) + \sum_{i=1}^{n}\log(2x_i^3+x_i^2+2\theta - \theta\sum_{i=1}^{n} x_i\ (10)$$

94897

Differentiating the above equation (6) to θ and C partially, we get

$$\frac{\partial \log L}{\partial \theta} = n(c+4) - \frac{n((c+2)! + 8\theta^3 c!)}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)} + \sum_{i=1}^{n} \frac{2}{(2x_i^3 + x_i^2 + 2\theta)} - \sum_{i=1}^{n} x_i = 0 \quad (11)$$

$$\frac{\partial \log L}{\partial \theta} = n \log(\theta) - n \frac{(2\,\psi(c+3) + \theta\,\psi(c+2) + 2\theta^4 \psi c)}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)} + \sum_{i=1}^{n} x_i = 0 \qquad (12)$$

Where $\psi(.)$ is the digamma function.

Then, the maximum likelihood estimation of the unknown parameters can be obtained by equating the equations from (11) and (12). However, the equations cannot be solved analytically, thus we solved them numerically using R programming with some data sets.

To obtain a confidence interval we use the asymptotic normality results. We have that if $\hat{\lambda} - (\hat{\theta}, \hat{c})$ denotes the MLE of $\lambda = (\theta, c)_1 \sqrt{n}(\hat{\lambda} - \lambda) \to N(0, I^{-1}(\lambda))$

Where I (λ) is Fisher's information Matrix i.e.,

$$I(\lambda) = -\frac{1}{n} \begin{pmatrix} E\left(\frac{\partial^2 \log L}{\partial \theta^2}\right) & E\left(\frac{\partial^2 \log L}{\partial c \partial \theta}\right) \\ E\left(\frac{\partial^2 \log L}{\partial \theta \partial c}\right) & E\left(\frac{\partial^2 \log L}{\partial c^2}\right) \end{pmatrix}$$

Where

$$E\left(\frac{\partial^2 \log L}{\partial \theta^2}\right) = -n\frac{(c+4)}{\theta^2} - \frac{n(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)24\,\theta^4 c! - ((c+2)! + 8\theta^3 c!)}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)^2} + \sum_{i=1}^{n} \frac{4}{(2x_i^3 + x_i^2 + 2\theta)}$$

$$E\left(\frac{\partial^2 \log L}{\partial c \partial \theta}\right) = \frac{n}{\theta} + n\Bigg((2(c+3)! + \theta(c+2) + 2\theta^4 c!)\,\psi(c+2) + 8\theta^3 \psi(c)$$
$$- ((c+2)! + 8\theta^3 c!)\frac{(2\,\psi(c+3) + \theta\,\psi(c+2) + 2\theta^4 \psi c)}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)^2} \Bigg)$$

$$E\left(\frac{\partial^2 \log L}{\partial c^2}\right) = n(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)\binom{2\psi'(c+3) + \theta\psi'(c+2)}{+ 2\theta^4 \psi'(c)}4(c+3)^2!$$
$$+ \frac{4\theta(c+2)!(c+3)! + 8\theta^4(c+3)!\,c! + \theta^2(c+2)!^2 + 4\theta^5(c+2)!\,c! + 4\theta^8 c!^2}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)^2}$$

$$E\left(\frac{\partial^2 \log L}{\partial \theta \partial c}\right) = \frac{n}{\theta} + (2(c+3)! + \theta(c+2) + 2\theta^4 c!)\,\psi(c+2) + 8\theta^3 \psi(c))$$
$$- \frac{4(c+3)!^2 + 4\theta(c+2)!(c+3)! + 8\theta^4(c+3)!\,c! + \theta^2(c+2)!^2 + 4\theta^5(c+2)!\,c! + 4\theta^8 c!^2}{(2(c+3)! + \theta(c+2)! + 2\theta^4 c!)^2}$$

Where $\psi'(.)$ Is the first-order derivative of the digamma function. Since λ being unknown, we estimate $I^{-1}(\lambda)$ by $I^{-1}(\hat{\lambda})$ and this can be used to obtain an asymptotic confidence interval for θ, c.

APPLICATION TO REAL-LIFE DATA

In this section, the proposed weighted Kpenadidum distribution is applied to the real data sets. The secondary data has been taken from a private tertiary care hospital in Puducherry.

Dataset 1: Age distribution of the patients in years:

55, 58, 55, 58, 51, 65, 49, 50, 37, 47, 49, 56, 67, 68, 50, 55, 67, 44, 63, 55, 62, 51, 65, 47, 38, 69, 62, 36, 42, 66, 64, 46.

Dataset 2: Survival time (in months) of patients

63, 61, 58, 57, 55, 26, 5, 20, 54, 58, 30, 24, 35, 27, 47, 67, 70, 78, 39, 26, 65, 77, 49, 50, 27, 41, 65, 52, 48, 62, 38, 26.

We observe its flexibility over some well-known existing distributions. The results for the analysis in this present study were obtained using R software. We have also calculated the Akaike Information Criteria (AIC), Bayesian

Information Criteria (BIC), Akaike Information Criteria Corrected (AICC) and $-2\log L$ for the considered distributions to observe their fit. The distribution with the lowest values AIC, BIC, and AICC is regarded as the best. To compare the goodness of fit of the fitted distribution, the following criteria: Akaike Information Criteria (AIC), Bayesian Information Criteria (BIC), Akaike Information Criteria Corrected (AICC) and $-2\log L$.

AIC, BIC, AICC and $-2\log L$ can be evaluated by using the formula as follows.

$$AIC = 2k - 2\log L, BIC = k\log n - 2\log L \ and \ AICC = AIC + \frac{2k(k+1)}{(n-k-1)}$$

Where, k = number of parameters, n sample size and $-2\log L$ is the maximized value of the log-likelihood function. From Table 1 and Table 2, the (WKD) has the two-parameter distributions of the lowest AIC, BIC, and AICC value, thus making it fit better than the (Exponential, Lindley, and Shanker) distributions.

CONCLUSION

In this paper, the weighted Kpenadidum is a new distribution, extended in this study to model lifetime data. The suggested distribution's moments, entropy, order statistics, survival and hazard functions, and other statistical characteristics have all been investigated. Parameters for a weighted Kpenadidum distribution were inferred using the greatest likelihood technique. High accuracy is shown when the maximum likelihood technique has been used to estimate the parameters. Statistical distributions are essential in medical research, and their use can have a high impact on public health, especially in cancer research. The usefulness of this distribution is thus illustrated by applying it to certain real datasets that explain the survival of a small number of patients with breast cancer. The weighted Kpenadidum distribution outperforms other competing distributions according to several goodness-of-fit criteria. Compared to other well-known distributions, the weighted Kpenadidum distribution offers a better fit.

ABSTRACT

Because of the dire circumstances facing the planet's occupants and the continuation of life on it during the past 50 years, experts worldwide are gravely concerned about global warming. There are too many reasons why the problem exists. The unchecked release of greenhouse gases mainly carbon-dioxide (CO_2) is one of the primary drivers of global warming. This emission rate in India varies by region based on a number of factors, including population, economic growth, and industrialization. This research uses a 30-years data set from 1990 to 2020 in India in an attempt to develop a robust regression model of CO_2 emissions. When it comes to the accuracy and reliability of CO_2 emissions, Robust regression algorithms can perform better than any traditional modelling. By mitigating extreme values, these methods can provide a clearer understanding of the relationships between emissions and their predictors. A variety of Robust regression techniques can be used for our present model. However, we adopt a comprehensive approach that makes advantage of Python with stats models for M-Estimation and scikit-learn for Quantile Regression. Future emissions, the impact of various policies, and the dynamics of CO_2 sources and sinks may all be predicted by using our present model. After that, prediction of CO_2 has been done by applying the model from 2025-2035. During the analysis of the model, the model shows its own innovativeness.

INTRODUCTION

India is one of the world's most populous and rapidly developing countries, and its carbon dioxide emissions have been rising steadily over the past few decades [1,2,3]. As a major contributor to global greenhouse gas emissions, the need to understand and model CO_2 emissions in India has become critical for policy formulation, environmental planning, and sustainable development. Mathematical modeling can be a powerful tool to predict, analyze, and mitigate the environmental impacts of CO_2 emissions [4-9]. India is the third-largest emitter of CO_2 globally at present, with emissions primarily driven by fossil fuel combustion for energy, transportation, and industrial activities. According to recent data from the Global Carbon Project, India's CO_2 emissions surpassed 2.8 gigatonnes (Gt) in 2022, accounting for approximately 7% of global emissions. This rapid increase in emissions is linked to India's expanding energy demand, population growth, urbanization, and industrialization. While India has committed to reducing its carbon intensity (CO_2 emissions per unit of GDP) and increasing renewable energy deployment under its Nationally Determined Contributions (NDCs) for the Paris Agreement, achieving these targets presents considerable challenges. The energy sector in India, particularly coal-based power generation, remains the largest source of CO_2 emissions. In addition, the transportation sector, characterized by rapid urbanization and a reliance on fossil fuels, has seen an increasing contribution to national emissions. Industrial processes, particularly in cement, steel, and chemical industries, also significantly contribute to CO_2 output [10-12]. The combination of a growing economy, rising energy demand, and limited alternative energy infrastructure further complicates the reduction of emissions in the country. Mathematical models help to quantify and predict the relationship between various factors that contribute to CO_2 emissions along with the possible future emissions based on the models. The models can range from simple linear regression models to complex system dynamics models. Some of the prominent types of models used for CO_2 emissions in India are Linear Regression Models, Logarithmic Models, Environmental Kuznets Curve (EKC) Model, System Dynamics Models, Integrated Assessment Models (IAMs) etc. [13-20]. The process of calibrating and validating these models is crucial to ensure their accuracy and reliability. Calibration involves adjusting the model parameters so that the predicted emissions match historical data. This can be done using statistical methods such as least squares fitting or more advanced techniques like Bayesian inference. Validation, on the other hand, involves testing the model against out-of-sample data to ensure its predictive power. So, Mathematical modeling of CO_2 emissions in India offers a comprehensive approach to understanding and addressing the challenges posed by climate change. By using regression models, environmental Kuznets curves, system dynamics, and integrated assessment models, policymakers and researchers can gain insights into the complex relationship between economic growth, energy consumption, and emissions. The results from these models can guide India's transition towards a low-carbon economy, enabling sustainable development while mitigating the adverse impacts of climate change. Mathematical models, when used effectively, provide a foundation for evidence-based decision-making, helping India to balance development needs with environmental stewardship. In the present research work, robust regression method is used for the prediction of CO2 emission from 2025-2035 based on last thirty years data and encouraging results have been identified.

Mathematical modelling and Statistical analysis based on Robust Regression method
In order to simulate or create the set of suitable equations that depict the emission of carbon dioxide into the atmosphere, mathematical modelling for CO_2 emissions is essential. These models can be used to forecast future emissions, evaluate the effects of different policies, and comprehend the dynamics of sources and sinks of CO_2. With the use of the *Robust regression method*, we have created a mathematical model of India's carbon dioxide emissions in this current study. Robust regression techniques can outperform any traditional modelling in terms of CO_2 emission accuracy and dependability. Through the mitigation of extreme values, these techniques can offer a more lucid comprehension of the correlations between emissions and their predictors.

METHODOLOGY

Numerous robust regression methods are available for application, including

Nilangshu Acharya *et al.,*

(i)   **M-Estimation**: Use a loss function to lessen the significance of outliers. eg. Huber's M-estimator and Tukey's bi weight function.
(ii)   **Quantile Regression***:* The response variable's conditional quantiles, like the median, are modelled because they are less susceptible to outliers.
(iii)   **Least Absolute Deviations (LAD) Regression**: Reduces the total absolute deviations rather than the squared deviations, increasing its robust to outliers.
(iv)   In the present research investigation, a broad methodology is employed that uses Python with stats models for M-Estimation and scikit-learn for Quantile Regression.

Our present model
Modeling has been done based on the link between the year (independent variable) and both total CO_2 emissions and per capita emissions (dependent variables) utilizing Quantile Regression via M-Estimation on the available data (CO_2 emissions across the years). The conditional quantiles of the emissions (i.e., the higher or median quantiles) has been estimated using quantile regression.

Model Setup
In our model, y_i indicate the year CO_2 emissions (either the total or per person emissions), for year i, and X_i represents the year. Our goal is to model y_i for various quantiles as a function of X_i. The quantile regression equation for quantile τ may be expressed as: $Q_\tau(y_i / X_i) = \beta_0 + \beta_1 X_i$, where, $Q_\tau(y_i / X_i)$ be the conditional τ-th quantile of y_i given X_i; β_0, and β_1 represent the intercept and the slop respectively.

Quantile Regression Objective Function
The check loss function is used in quantile regression to estimate and is defined as follows: $\rho_\tau(u) = \tau.u.1(u \geq 0) + (1-\tau).(-u).1(u < 0)$, where $u = y_i - (\beta_0 + \beta_1 X_i)$ indicates the residual. Our object is to minimize the sum of these losses over all observations i.

Quantile Regression via M-Estimation
We minimize a robust loss function in M-estimation. One way to think about the check loss function in quantile regression is as a particular kind of M-estimator. The following goal is minimized:

$$\min \quad \sum_{i=1}^{n} \rho_\tau\left(y_i - (\beta_0 + \beta_1 X_i)\right)$$

Regarding every quantile τ, Through the solution of this minimization issue, β_0, β_1

we estimate β_0, and β_1.

Applying this to present Data: This model can be used to analyze CO_2 emissions per capita as well as overall in the dataset. Procedures for Quantile Regression Implementation be as follows:
(i)   Construct the data: Division of the data into x (years) and y (CO_2 emissions).
(ii)   **Quantile Regression Model:** Regarding every quantile of interest τ, set a quantile regression model with the help of an optimization ocedure that minimizes the check loss function.
(iii)   **Model different quantiles:** Use quantiles like 0.25 (lower quartile), 0.50 (median), 0.75 (upper quartile), etc.
(iv)   Review **the model:** Visualization is possible for the fitted quantiles to assess how well the model captures the trend.
Table 1 represents the real data, and predicated data for the CO_2 emissions in India during 1990 – 2020 along with the residual in each year indicating the deviation from real emission data.

94905

Nilangshu Acharya *et al.,*

Figure 1 describes a comparative study of the real data vs predicated data for the CO_2 emissions in India during 1990 – 2020 showing the trends of emission in both the cases. It has been observed from the Fig. that till the year 2018, though the emission is continuously increasing but after 2018, the trend is decreasing.

Analyzing the Outcome: From the Table 1, we can note down the following observations:

(i)   Quantile 0.50: The median trend in total CO_2 emissions over time is shown by the line for quantile 0.50.
(ii)   Quantile 0.25 and 0.75: The evolution of the lower and higher ranges of the CO_2 emissions distribution throughout time is captured by these quantiles. Quantile regression offers a thorough grasp of many distributional components and is resistant to outliers. By swapping out the dependant variable in the preceding steps, this method can also be used to calculate per capita CO_2 emissions.

Robust regression is characterized by the robust regression coefficients shown in Table 2. Robust regression is widely recognized for its increased resilience against outliers and assumptions broken, such as homoscedasticity and normality, when evaluating the significance of regression coefficients. To sum up, robust regression estimates coefficients in a manner akin to ordinary least squares (OLS), but with modifications that improve the dependability of significance tests when outliers or heteroscedasticity are present. Still, standard errors, t-values *(the coefficient estimate to standard error ratio)*, p-values (*The p-value, which is derived from the t-value, determines whether the coefficient differs from zero significantly)*, are used to interpret significance. The above two tables make it clear that the residuals, standard error, t-value, and p-value are all reasonably minimal when compared to the empirical and real data, demonstrating the high calibre of the suggested model for CO_2 emissions. Based on the present modelling, we can estimate the total kilotons of CO_2 emissions in India during 2025 - 2035 in Table 3 and also makes a graphical presentation in Figure. 2 for clear visualization.

CONCLUSION

The Robust Regression method proves to be a valuable tool for predicting CO_2 emissions in India, offering resilience against data irregularities and providing actionable insights. It emphasizes the need for urgent, multi-faceted approaches to mitigate emissions while balancing economic growth. As India strives to meet its climate commitments under global agreements such as the Paris Accord, such predictive models will be instrumental in monitoring progress and guiding sustainable development strategies. By integrating advanced methodologies and interdisciplinary data, India can chart a path toward a low-carbon future, contributing significantly to global climate goals.

ABSTRACT

Brainstem cavernomas are rare vascular malformations that can lead to severe neurological deficits following haemorrhage. Surgical removal of brain stem cavernomas result in severe neurological deficits due to their anatomical position. Specific physiotherapy intervention combined with Proprioceptive neuromuscular facilitation (PNF) stabilization exercises, Frenkel exercises, strength and endurance exercises have improved postural control, balance and coordination. This case report analyses the eight week targeted physiotherapy intervention following post excision of brainstem cavernoma.

Keywords: brainstem cavernoma, physiotherapy, PNF stabilization

INTRODUCTION

Cavernous malformation are intracranial vascular malformations which ranges from less than one-quarter inch to 4 inches. Brainstem cavernoma are vascular hamartomatous lesions made up of sinusoidal vascular spaces without cerebral parenchyma which accounts for between 18 and 22% of all intracranial vascular malformations [1]The clinical presentation of brainstem cavernomas can be varied depending on the location of the lesion which may be relatively asymptomatic or neurologically devasted. Cavernous malformations can be superficial or deep lesions where deep lesions have worse prognostic features. Deep lesions are seen in brainstem, cerebellar nuclei, thalamus, or basal ganglia. Brainstem cavernomas exhibit symptoms such as cranial nerve deficits, sensory abnormalities,

94910

motor abnormalities, headache, ataxia, vertigo, nausea, and disorientation [2] Early diagnosis of cavernous malformation is crucial for management which is usually diagnosed with imaging studies where Magnetic Resonance Imaging (MRI) is found to have higher specificity to diagnose both symptomatic and asymptomatic malformations as well as cavernomas location[3]. Surgical removal is the gold standard treatment for cavernous malformations which can be microsurgical resection or stereotactic radio surgery whereas asymptomatic cavernous malformations are conservatively managed by observing overtime and allowing them to progress naturally [4]. Brain stem cavernomas have 30 times greater risk of haemorrhage than non brainstem lesions due to their anatomical position and is more likely to cause severe neurological deficits making difficult in surgical removal and rehabilitation [5,6].Post operative outcome of brainstem cavernomas depends on the patient's preoperative condition whereas patients with good preoperative status have good post operative outcomes in 95% of patients [7].Motor recovery following excision of brainstem cavernoma is unique based on the individual deficits which is enhanced by various therapeutic interventions. This case report highlights the impairments of a patient with brainstem cavernoma excision in the acute period and effect of specific physiotherapy intervention strategies swithuch as PNF technique and Coordination exercises to bring about better motor recovery and functional independence.

CASE REPORT

A 28 year old male reported to Sri Ramachandra hospital with complaints of sudden onset of severe headache persistent for 4 days with same intensity for which he was admitted and found to have Pontine Cavernoma with hemorrhage. Patient had similar history in September 2023 with acute onset of slurred speech, double vision and minimal weakness of right upper and lower limb where CT scan showed acute intraparenchymal haemorrhage in pons and diagnosed with brainstem cavernoma and managed conservatively. He was on close monitoring of his neurological status and was under regular Physiotherapy which reverted him back to a near normal state. Now presently, sudden onset of headache in May 2024with increased intensity showed severe acute and chronic haemorrhages which was indicated for surgery. Patient underwent craniotomy with excision of cavernoma. Following surgery patient developed neurological deficits in right UL and LL for which he was referred for Physiotherapy

CLINICAL INVESTIGATIONS

Patient was diagnosed with Brain stem Cavernoma and Pre operative MRI Brain revealed hetero intense space occupying lesion involving pons and upper medulla extending into the left cerebellar peduncle. Mass effect in the form of effacement of fourth ventricle and cerebello pontine angle was seen.

CLINICAL FINDINGS

On observation in lying position, patient had adducted and internally rotated Rt shoulder, extended elbow and neutral wrist and hand position. He had adducted and externally rotated right hip with extended knee and plantar flexed ankle in lying position. Muscle consistency was firm on palpation and higher mental function examination showed that the patient was alert, comprehending, oriented to time place and person with good attention and memory. Motor examination showed diminished tendon jerks with near normal muscle tone and muscle strength of 4/5 in manual muscle testing. Patient was able to do isolated movements patterns with gross in coordination in upper and lower limb. Sitting balance was fair in feedforward and feed backward mode and Standing balance was poor. Outcome measures like Scale for the Assessment and Rating of Ataxia (SARA), Berg Balance scale (BBS) and Barthel Index were evaluated pre and post -intervention as shown in Table 2&3

PHYSIOTHERAPY INTERVENTION

Rehabilitation program consisted of General strength and Endurance exercises, PNF stabilization exercises, Frenkel Exercises, Balance and Gait training (Table 1). Frenkel's exercises was carried out with the principles of concentration, repetition and precision and PNF techniques of rhythmic stabilization in different positions to improve trunk stability were insisted. Postural control was improved in sitting, kneeling and standing with technique of PNF approximation. Exercises were progressively made more complex as the patient's abilities improved, with continuous verbal cues to maximize performance.

RESULTS

Scale for the assessment and rating of ataxia (SARA) showed significant improvement in coordination after eight weeks of intervention in all the components of SARA as shown in Table 2.Pre and post intervention scores of BBS showed a change of 29 point difference from 13 to 42. Functional independence measured with Barthel index showed a significant change as shown in Table3.

DISCUSSION

Brainstem cavernomas are vascular malformations characterized by abnormal, dilated blood vessels that form a cavernous structure within the brainstem. These lesions can disrupt normal brainstem function, leading to a range of neurological symptoms including motor deficits, sensory abnormalities and difficulties with coordination and speech [8].Our patient presented with post-surgical impairments in coordination, balance and gait. The intervention strategy incorporated a tailored rehabilitation program that combined with PNF rhythmic stabilization techniques to target the in coordination and imbalance. The Rhythmic stabilization, a technique of PNF with alternating isometric contraction without movement enhances the stability of both the trunk and the limbs addressing ataxic symptoms by improving neuromuscular control which was appreciated in our patient and findings was in concordance with the study done by Dionisio et al (2018) who showed improvement in trunk stability [9].PNF is found to facilitate the ability of performing the tasks than just improving the movements in specific directions which is supported by the study done by Kofotolis et al (2005) who showed that PNF training can alter fiber type and cross sectional area enhancing the performance [10].Improvements in coordinated movements could be attributed to Frenkel's exercises and reaching in functional positions which had improved the spatial and temporal aspects of movement which is in concordance with the study done by Adnan *et al* (2016) who showed that Frenkel Exercises decreased ataxia and improved the quality of movement [11]. Prognosis of our patient following cavernoma excision with eight weeks of intervention showed considerable change in SARA and Berg balance scale which transformed the individual from severe dependency to moderate dependency as measured with Barthel index.

CONCLUSION

We conclude that providing specific physiotherapy interventions of PNF stabilization exercise and Frenkel exercises with general strength and endurance exercises improves postural control, balance and coordination resulting in increased functional performance. The positive outcome of this patient encourages to plan and incorporate interventions based on specific techniques to attain better functional recovery.

ABSTRACT

In order to preserve and convey the ancient values, beliefs, practices, and conventions, the Santals developed collective leadership prior to their migration and settlement in Santal Parganas. When members strayed from standard procedures, this collective leadership also offered social control mechanisms. A historical analysis of Santal leadership and its practice at pivotal points in the social structure, together with demographic and socioeconomic characteristics. The collective action of a Santal community is performed by A full-fledged village council traditionally consists of seven administrative elders: The Village Headman: Manjhi, The Deputy Headman: Paranik, The Guardian of Morals: Jog-Manjhi, Assistant to Jog-Manjhi: Jog Paranik, A messenger (Godet), The village priest (Naeke) and his assistant (Kudamnaeke). These officials were chosen by the villagers at the time of a village's founding.

Keywords: Action, Collective, Community, Culture, Santal, Tribe

INTRODUCTION

The Santals are an ethnic tribal group who mostly inhabit the states of Jharkhand, Bihar, West Bengal, Odisha, Chatisgarh, and Assam. There is also a sizable Santal minority in neighboring Bangladesh and a small population in Nepal. Santals constitute the largest group among tribal communities. They belong to the Proto-Australoid race. The settlement of Medinipur known as Santal was first mentioned in Walter Hamilton's narrative (1820). He said that in the jungles lived an impoverished, oppressed class known as Santals. Some believe the term 'Santal' originated from 'Saont' or 'Samanta'. Once, an area of East Medinipur was known as 'Samantabhum' or 'Saont'. Most likely, they were the original inhabitants of this region. They also mentioned this place 'SantDisham' or 'SantDesh' in their mythology. 'Santal' means inhabitant of 'SantDesh'. The Santal tribe of India have a traditional tribal lifestyle. Forest trees and flora serve the basic needs of Santaltribe.The tribes are also engaged in fishing and cultivation. Theys are also skilled

94915

Rajesh Ekka

in the production of musical instruments, mats, baskets, and other crafts. The Santal tribe is divided mainly into twelve sects viz. Soren, Murmu, Mandi, Kisku, Hansda, Besra, Tudu, Baske, Hembrom, Pauria, Bedea and Choral. Each sect has a totem symbol of its own. Leadership is exercised at the village level by the village council and the administrative elders. The parganas and pargana councils serve as the main decision-making body between communities. The yearly hunt council serves as the highest court of appeal and decision-making at the regional level. The cultural norms linked with the village demonstrate that traditionally territorial tribal identities have been virtually exclusively concentrated on the village. The village boundary is frequently painstakingly delineated, used only by the local community, and (more often than not) administered completely by the village chief (Piang, 2015).

The village elders' council, which exercises collective leadership, governs not only village life but also how the inhabitants interact with the outside world. The headman represents justice and propriety. He is required to uphold the moral and legal traditions of his forefathers in both his personal behavior and his interactions with others. He opposes the current era's assimilationist tendencies as a defender of traditions. As a representation of justice, he stays away from arbitrary decisions and employs mediation to reach agreements and address anomalies. It would be impossible to preserve Santal society and identity without this efficient operation. According to long-standing Santal customs, the headman represents authority. Even when a young man takes over the role, his opinions are taken seriously and his opinions are given careful consideration. An examination of various Santal terms that the villagers use to address their headman can summarize their expectations of him. For instance, the term "MaranHor," which translates to "Big Man," is used to describe a Manjhi (village headman), suggesting both seniority and importance. He's also a "Bud AkilHor", which means a wise and knowledgeable man. He offers "solha", which means he offers sage advice; he is meant to be a "Ayuric" (leader), which is someone who is actively working toward goals rather than just serving as a passive counsellor. The ideas of significance, seniority, experience, wisdom, and active leadership are all woven throughout these ideas. As territorial assertion is increasingly considered as critical to maintaining cultural autonomy and assuring development, tribal identity frequently draws on myths and legends to justify the concept of an indigenous territorial homeland (Xaxa, 1999).

Medicine-Man, Charm-Doctor and Exorcist: Jan Guru or Ojha
The Ojha, also known as the Jan Guru, typically performs the roles of exorcist, charm-doctor, and medicine-man. Witches, sorcerers, and the malevolent effects of impersonal forces and powers are among the antisocial behaviors that the Ojha aims to uncover and combat. Being a clearly religious individual, he is supposed to possess unique abilities and knowledge that other tribal members do not, such as the ability to control evil spirits. As long as he doesn't use his power to hurt other Santal society members, it is considered beneficial. The Ojha is also a doctor who is extremely knowledgeable about the therapeutic qualities of everyday items and drugs. He also asserts that he is able to identify and address the root causes of illness and bad luck. He uses divination and self-possession by a spirit who discloses the nature, cause, and remedial procedures involved in healing the sick in order to support his claim. There is no public compensation for the Ojha'slabor, and his position is not inherited. Only after the individual is cured or the tragedy is eliminated does the specific household that hires him pay. Some anthropologists claim that this Ojha institution is a Hindu adaption. Not every community uses every one of these officials. The size of the village and the volume of requests for their services determine how many officials are really employed there. The headman ultimately determines the number of elders after consulting the village council. The nature of Santal leadership and power is explained by the relationships between the village officials. Village elders are neither subordinates or instruments of the headman's authority, while being answerable to both the headman and the village council, according to field observations and conversations with the leaders and populace. Each elder's responsibilities are typically carried out on their own, as is seen from the Santal custom. Village elders are appointed for life, unless the council determines that a person is either physically incapable of carrying out their responsibilities or morally reprehensible. Although it rarely happens, such tenure can allow these authorities to amass coercive or excessive influence over the locals. First of all, they don't organize into an administrative clique with the goal of gaining more authority. Second, any propensity toward the concentration of power in the hands of any one or a handful of administrative elders is thwarted by the regularity of council meetings and the ongoing efficacy of egalitarian expectations. Village life used to run smoothly under this traditional authority, and the villagers felt secure since they thought they were under the guidance that their forefathers had recommended. This style of Santal leadership has

changed significantly as a result of interactions with external cultures and the slow development of conventional leadership. The only places where traditional authority still operates as it did in the past are a few remote Santal settlements.

The Village Council: "KulhiDurup"
The Santals' traditional village government is so grassroots that the assembly of all the village's adult males eventually has the last say on decisions. Under the direction of the headman, the villagers themselves resolve conflicts, violations of the peace, divorce disputes, and social infractions in the village. Frequently, the Kulhi Durup serves as a sort of conciliation board. All guys are welcome to attend, talk, and usually have lengthy conversations. It is common to bring in good speakers to act as advocates. One Santal saying that emphasizes the value of hearing all sides of an argument is "you cannot cook a cake on side up." As a result, in every conflict, the people must hear both sides. Every head of the household serves as a judge at the Kulhi Durup. The adage "you cannot clap with one hand," which states that the headman cannot resolve a dispute by himself but that the entire village must help, perfectly captures the role of the villagers in decision-making. But the last word is always with the headman. His role as a facilitator at council sessions stems from his duty to preserve the customs of the forefathers. These "Hapramkoak Dustur" traditions serve as the foundation for decision-making. Decisions should ideally reflect a full grasp of the situation, but in practice, discussions frequently fall short of this level. To address some macro-level issues, the Santals created a subregional leadership system in addition to the village-level leadership practiced by the elders and the village council. Pargana is the name of this subregional organization. This organization is no longer in operation.

The Pargana Council
In order to handle inter-village connections, an authority had to be established early in Santal history. This inter-village group developed into the Pargana and its council during their migration and settlement in Damin-i-Koh. A group of villages that accept the jurisdiction of an inter-village council is known as a Pargana. A Pargana typically comprised of ten to twenty villages in a contiguous area, though the exact number of villages was not always consistent. The headmen and chosen delegates from each village in a Pargana made up the inter-village council. Although its rulings had a legislative effect by setting precedents for similar circumstances that later arose, the Pargana assembly functioned as a high court of last resort. Due to the novelty of the issue or a lack of community agreement, the Pargana assemblies typically addressed issues that the local council was unable to settle. A few disputes between the villages also made it to the assembly.

Parganait
One representative from each village was chosen by the Pargana council to be the Parganait. He inevitably rose to become the most prominent and powerful person in the ten to twenty communities. The ability to lead in the preservation of traditional values and possess a thorough understanding of ancestral customs were the most crucial selection criterion for the parganait. This was important since the Parganait was regularly asked to advise the local village councils and elders on Santal customs when issues arose from the difficulties of living in Damin-i-koh.

Desh-Manjhi
During the Pargana Council's deliberations, the Parganait received assistance from the Desh-Manjhi. He was chosen by the Pargana village headmen.

The Annual Hunt Council
The Lo Bir, also known as the Hunt Council, is the Santals' highest court of appeal, which meets once a year during the annual hunt or DisomSendra. The dirhi, or hunt superintendent, is in charge of the Lo Bir council. "High Court" and "Parliament" are the names Archer gives to this council. The tribe itself is the ultimate authority, even though the parganas and village headmen are in charge of day-to-day administration. The people must come together in order to exercise their sovereignty. The recognized method of bringing them together is the yearly hunt. Although these councils rarely produce significant changes, they do have the significant benefit of making the current legislation widely known and guaranteeing that the oral code is understood. Even in the most impoverished Santal,

they foster a sense of active democracy and give them the impression that the rules are their own, not imposed by others.

The Breakdown of Egalitarian Value

The collapse of the Santal egalitarian values has been aided by increased external connections with the dominant society. The caste system-based dominant society upholds the ideas of inferiority and inequity. The significance of this virtue has steadily been eroded by untouchability and other forms of social discrimination that are prevalent in the prevailing culture. The collapse of this value has also been exacerbated by the unfair treatment received in government offices, village markets, workplaces, and other public settings. The significance of this egalitarian value has likewise been significantly diminished by educated Santal leaders. With their newly gained social skills, knowledge, and abilities, educated Santals are attempting to improve their level of living relative to other Santals. Members of a homogeneous group are becoming more and more diverse as a result of this attempt to create a new status in Santal culture. The significance of egalitarian values in Santal culture has been undermined by their extent of influence and abrupt ascent to power without the approval of the ancestors' traditions. This egalitarian ideal has been undermined in part by the Block administration's establishment of development agencies.

Village Oneness (AtoSagai)

"Village oneness" (AtoSagai) is a second key concept that the Santals share. This unity can be observed in mixed villages where the Santals are a minority as well as in villages where they make up the majority. This sense of community unity gives Santals a sense of identity and security. They distinguish themselves from other ethnic groups by demonstrating their community unity. Their distinct values, traditions, and mores are safeguarded, preserved, and passed down through this unity. Additionally, this unity guarantees them a comfortable life and an ongoing web of social connections. Collective responsibility and communal rights are the foundation of village unity. The Santal tradition prioritizes the interests of the village over what can be regarded as individual rights whenever decisions about land use are made by the village headman and his council. The obligations known as "Santal" serve to restrain personal inclinations and financial incentives. Worship and festivals, personal rituals and ceremonies, group drinking customs, and agricultural and associated economic activities are some of the ways that the Santal community expresses its unity. Opportunities to foster village unity are constantly presented by these social and cultural forces. Santhals have a strong sense of unity. The yearning for their own grand tradition to unite all Santhali people has long existed and has only grown in recent years (Bandopadhyay, 2019).

Worship and Festivals

In addition to ensuring and fulfilling religious sentiments and goals, worship and festivals as community events offer numerous chances to establish and fortify social institutions and bonds. It is customary for all homes to participate in the village-wide worship of the village spirits, known as Jaher Bongas. Because of how crucial this local worship is to its unity, Santals from other villages—even if they are related—are not allowed to take part. No two villages have the same Jaher Spirits, even if the spirits of the sacred grove are the identical for all Santals residing in various villages. Only the residents of a specific hamlet are eligible to participate in this worship. Every big festival is attended by the entire village. The village assembly chooses when and how the festivities will be celebrated. Each household is expected to contribute a percentage of the supplies required for the feasts and worship ceremonies that make up the entire festival. Nothing is bought; the Godet (village messenger) and designated others go from house to house requesting complete cooperation. They gather everything for the entire village, including chosen leaves, straw mats, driedcowdung for fire, salt, rice, pulse, meat, and drink (Handi). The celebration of every worship and festival affirms the unity and oneness of the Santal village.

Individual Rites and Ceremonies

The turning points in the life-course of an individual Santal are the critical occasions of birth, initiation, marriage, and death. All of these life stages are issues that affect the entire community, not just the family. The families involved as well as the village as a whole benefit from the rites and ceremonies performed on these occasions. The birth of a child defiles and taints not only the specific home but the entire village. The Bongas (spirits) of the sacred grove are said to

94918

become defiled. No festival or any Bonga worship is held in the village until the purification ceremony is observed. In the same way, when a Santal dies, his house and the entire village become polluted. The village is bereft of its protective spirits, and the household is deprived of the care of its Orak Bongas (household spirits). No marriages, festivals, nor any public worship can be performed within the village until the funerary rites have been performed. Traditional festivals, such as performing arts and religious ceremonies, are becoming increasingly popular as a means of preserving cultural identity and promoting social solidarity (Barai, 2019).

Communal Drinking

Another social mechanism for strengthening and continuing village oneness is the social drinking, which is an essential part of every Santal worship, festival, ritual, hospitality, decision-making process. Discussing the alcoholic consumption pattern of tribes in general the tribal people drink for social integration and as a token of social solidarity and unity. Political parties and religious reformers have paid close attention to the negative aspects of drinking and its effects on the socioeconomic sectors.

Agriculture and Related Economic Practices

The Naeke (priest), on the behalf of the village community, decides upon a day and the time for invoking the JaherBonga and calling Maran Buru for winds and rain. At home each household offers sacrifices to the household (KhuntBongas) requests a rich harvest. The sowing is first conducted by the Naeke (Priest), followed by each lineage. In this phase, the agricultural activity first starts in the name of the community(JatiaPera) and is followed by every individual household. Agriculture especially paddy cultivation, is the chief source of livelihood of the Santals. Agriculture gives the full rhythm and measure of the seasonal sequence of the year. It is something more than just a means of livelihood: it is a whole way of life. It unites an entire family and a village in a single task. Agricultural practices and other related activities are conducted in unison, and for this, each individual has to make adjustment for this corporate endeavour.

Santal's Traditional Collective Marriages Rituals

The Santal society's traditional marriages rites are a powerful manifestation of its social structure, cultural identity, and values. These deeply meaningful rituals honor ancestors' customs and foster closer community bonds. The focus on community is central to Santal marriage rites. Not only do the bride and groom's family attend weddings, but the entire community does as well. This group participation emphasizes the value of mutual aid and social solidarity, reaffirming the idea that marriage is a connection that unites two families and their communities in addition to two individuals. A social fabric is strengthened and a sense of belonging is fostered by the active engagement of friends, family, and villages (Ghosh, 2018). The marriage ritual includes a variety of sacrifices to deities, which represent thanks and a plea for benefits. These sacrifices might range from food to cattle, demonstrating the Santals' reverence for their spiritual beliefs and ancestral traditions. By performing these rites, the couple requests heavenly favour for a fruitful and harmonious life together. This spiritual aspect of marriage highlights the interdependence between daily living and religious traditions in Santal culture. Santal marriages rely heavily on unique courtship customs. These techniques promote mutual agreement and family approval, which are critical components in developing harmonious partnerships. Traditionally, families discuss the match, emphasizing the value of family ties and compatibility. This emphasis on consent demonstrates a dedication to preserving domestic peace and social stability (Singh, 2020). Exchanging gifts, such as animals, money, or other assets, is an important part of Santal weddings. These presents serve several functions: they show respect between families, develop interpersonal relationships, and reflect the financial aspects of marriage. The exchange of presents can also indicate social rank, with the value of the gifts frequently reflecting families' standing in the community. This practice supports the notion that marriage is not only a personal relationship, but also a significant societal commitment. The bride and groom wear traditional clothes that have cultural significance. Their dress represents their heritage, representing pride in their identity and the move from single to married life. The outfit frequently contains brilliant colours and intricate designs, highlighting the workmanship and artistic expressions of the Santal. Celebratory dances and music are fundamental to Santal weddings, representing joy and cultural history. These performances are not only amusing, but also help to bring the community together in celebration, reinforcing cultural traditions and collective memory. Music and

94919

dancing communicate shared delight, emphasizing the necessity of social cohesiveness throughout key life events. Specific rites, such as tying the nuptial knot, represent the couple's commitment and loyalty. This act represents the binding aspect of marriage and the duties that go along with it. It highlights the idea that marriage is a lifetime commitment founded on love, trust, and mutual support. Following the wedding, practices such as visiting the bride's family strengthen kinship bonds and ensure continued support from both sides. These rituals emphasize the interdependence of families and the need for maintaining strong relationships after the wedding (Tribal Research Institute, 2021). Santal marriage ceremonies encompass a diverse range of cultural, spiritual, and social components. They help to establish communal relationships, honor ancestral customs, and reflect the ideals that define Santal identity. These rites allow the Santal people to commemorate individual partnerships while simultaneously reinforcing their collective heritage and communal integrity.

CONCLUSION

The collective action of Santal tribe necessarily entails the examination of the Santal culture system, its notions, values, beliefs and conventions. The influence of a culture is decisive when the community studied exists as a highly stratified and homogenous group. Historically the Santal people managed to persistently preserve their distinctive ethnic identity and homogenous character. Collective action of Santal tribe to a large extent influence and determine the personal and social characteristics of tribe. A Santal in his cultural setting first learns the values, expectations, and prohibitions of his community. A Santal develops a basis for establishing relationships with others by adopting the existing models of relationships that are available in the community. Therefore the collective actions of the community determine and order priorities and aspirations of the individual members of the community.

ABSTRACT

This research presents the design and evaluation of an IoT-based system for continuous monitoring and assessment of hair and scalp health. Traditional methods of hair care and diagnostics often lack real-time capabilities and fail to provide comprehensive data. To overcome these challenges, we developed a comb-shaped device equipped with capacitive and environmental sensors to measure key parameters like scalp moisture, temperature and humidity. The Internet of Things integration enables seamless data transmission to a cloud platform, facilitating real-time monitoring and long-term tracking of hair health. This system offers a non-intrusive, cost-effective solution for both personal and clinical use, delivering timely feedback and recommendations through remote access. The proposed IoT-based approach represents a significant advancement in hair care technology, offering enhanced personalization and efficiency in hair health management.

Keywords: Internet of Things (IoT), Scalp health monitoring, Wearable sensors, Arduino.

INTRODUCTION

Human hair, despite its reduced functional role, retains significant emotional and social importance. Its complex keratin-based structure offers strength and flexibility, with properties varying widely across different ethnic groups and individuals. Understanding these variations is essential for developing effective hair care solutions and technologies. Recent advancements in non-invasive technologies, such as capacitive imaging systems, have provided valuable insights into hair health and cosmetic conditions. These technologies allow for precise measurement and analysis of hair properties, offering critical data for clinical, cosmetic, and forensic applications. Accurate monitoring

94921

of scalp conditions, including temperature and moisture, is vital for maintaining a healthy scalp. This study introduces an IoT-based hair quality detection system—a comb-like device equipped with advanced sensors designed to measure scalp moisture, environmental conditions, dandruff, and hair roughness. By integrating capacitive imaging and various sensor technologies, such as humidity and temperature sensors, the device offers comprehensive data on scalp and hair health [1][2].The IoT integration enables continuous, real-time monitoring and data transmission to a cloud-based platform, allowing for remote access and long-term tracking of hair and scalp conditions. This innovative approach aims to enhance scalp health management by providing timely, personalized insights, ultimately contributing to more effective hair care solutions.

SYSTEM ARCHITECTURE
The IoT-Enabled Hair Health Analyzer measures hair and scalp parameters using multiple sensors connected to a microcontroller and integrated into an IoT platform for real-time analysis. The architecture comprises:

Sensor Layer
- **Capacitive Sensors**: Detect hair thickness and surface properties.
- **Photo-sensor (QRB1114):** Measures optical properties like reflectivity and texture of hair.
- **LM35 Temperature Sensor:** Monitors scalp temperature, detecting potential issues.
- **DHT11/DHT22 Sensor:** Tracks ambient temperature and humidity for environmental context.

Processing Layer
- **Arduino Nano:** Central processor that collects and normalizes sensor data, sending it to the IoT platform for analysis.

Communication Layer
- **Wireless Module (ESP8266/Bluetooth):** Facilitates real-time data transmission to the cloud or mobile devices.

IoT Platform Layer
- **Cloud Platform:** Stores, analyzes, and visualizes data, providing insights into scalp and hair health conditions.

User Interface Layer
- **Mobile/Web Application:** Displays real-time data and recommendations to users in a user-friendly interface.
- **Data Flow:**
    1. Sensors collect hair and scalp data.
    2. Arduino Nano processes and transmits data via a wireless module.
    3. IoT platform analyses and stores data.
    4. User interface displays results and insights in real-time. This streamlined system provides continuous, real-time monitoring of hair and scalp health for better care and early issue detection.

LM35/DHT Temperature Sensor
The LM35 is an analog temperature sensor commonly used in various temperature measurement applications. It provides accurate and linear temperature readings and is widely used in both academic and industrial projects.The DHT series (DHT11/DHT22) are digital temperature and humidity sensors commonly used in various environmental monitoring applications. These temperature sensors play an important role in the IoT-Enabled Hair Health Analyzer by providing accurate temperature readings [3][8].

LM35
This sensor delivers highly precise readings of the scalp's temperature. It is perfect for monitoring the scalp environment, as it can directly record the temperature in °C without any additional calibration. In the Hair Health Analyzing system, the LM35 helps in measuring the temperature of the scalp, which can give indications of hair

conditions like dryness, excess heat, or other scalp health issues. The collected data is then processed by the Arduino Nano to ensure real-time temperature monitoring, which adds valuable context to overall hair health diagnostics.

DHT11/DHT22
The DHT series sensors are used to measure both temperature and humidity, which makes them most appropriate for environmental data collection. The DHT11 is a basic sensor. It has a moderate accuracy, while the DHT22 provides higher precision. These sensors installed in the Hair Health Analyzer system are used to observe the ambient temperature and humidity around the scalp. These factors are directly related to the hair and scalp health. High humidity levels can lead to moisture buildup, while low levels may cause dryness, both conditions are harmful and play a major role in hair damage[4].

Photo-sensor
The QRB1114 is a reflective object sensor, commonly known as a photo-sensorthat is integral to systems requiring precise object detection or measurement, such as the IoT-Enabled Hair Health Analyzer. Optical properties of hair like hair thickness, surface texture and reflectivity are very important as per the point of view of hair health. For the assessment of optical properties of hair or to detect hair strands for quality analysis, the QRB1114 can be utilized in the Hair Health Analyzer system. This photo sensor is integrated with the Arduino Nano. The combination of these is used to detect variations in different optical properties. The values of these properties are recorded on the basis of the amount of IR light reflected back from the hair strands [4]. Then we process the collected data for the overall assessment of hair health. The infrared (IR) emitter and phototransistor are combined in a compact package. By measuring the reflected IR light, the combination detects the changes in different surface properties. The addition of the QRB1114 sensor increases the system's capability to capture **non-contact measurements**, providing accurate, real-time feedback at the same time it is energy-efficient and compact. It increases the precision of the analyser, particularly when applied in such situations where physical contact may affect the hair's natural properties or distort the readings [5].
.

Arduino-Nano
The Arduino-nano is an open-source microcontroller platform based on hardware and software. It is applied from simple to complex applications during building any electronics based project. The Arduino Nano is a compact, versatile microcontroller board that plays a Crucial role in IoT-based systems, like the IoT-Enabled Hair Health Analyzer[6]. In the Hair Health Analyzer system, the Arduino Nano serves as the controlling. It records data from various connected sensors like capacitive sensors used to detect hair thickness, DHT11/DHT22 for determination of humidity and temperature, and LM35used for scalp temperature measurements. It is equipped with an ATmega328P microcontroller, which makes it suitable for projects requiring a small footprint, low power consumption, and ease of use. Its features, such as multiple digital and analog pins, allow seamless integration with sensors and other components.

- The microcontroller processes this sensor data and sends it to an IoT platform or user interface for further analysis and visualization, contributing to real-time hair health diagnostics.
- The use of Arduino Nano makes the system easily programmable, reliable sensor communication, and a power-efficient operator, which are essential in portable IoT-enabled solutions.

METHODOLOGY

Sensor Calibration and Validation
Calibration: Each sensor (DHT11, LM35, RGB) is calibrated to ensure ac
- accuracy in data collection.
- **Validation:** Sensor data is validated against known standards to confirm reliability and precision.

Meenakshi Kashyap *et al.,*

Data Analysis Techniques

- **Descriptive Analytics:** Summarizes data to provide a snapshot of current environmental conditions and hair quality.
- **Predictive Analytics:** Utilizes machine learning algorithms (e.g., regression models, neural networks) to predict future hair quality trends based on historical data.
- **Prescriptive Analytics:** Provides actionable recommendations for users based on the analysis of sensor data.

PROPOSED SYSTEM

Hair quality is influenced by a variety of factors including environmental conditions, temperature, humidity, and aesthetic elements such as color and shine. The integration of Internet of Things (IoT) technology into hair care presents an opportunity to continuously monitor and analyze these factors to provide actionable insights for personal hair health management. This research proposes an IoT based system that utilize LM35/DHT sensors, along with RGB lighting, to create a comprehensive hair quality analysis framework.

Components used:

- **LM35/DHT Sensor**
  - **Purpose:** Measures ambient temperature.
  - **Function:** Monitors temperature variations affecting hair texture and strength.
  - **Integration:** Provides data on temperature extremes that can lead to hair damage, complementing the findings of Kumar *et al.* [2].
- **RGB Lighting Sensor**
  - **Purpose:** Analyzes hair color and shine.
  - **Function:** Evaluates aesthetic factors indicative of hair health.
  - **Integration:** Captures data on how light reflects off hair, aiding in the evaluation of color and shine as discussed by Sharma *et al.* [3].

The image is showing the sensor integration and the basic workflow for the IoT-Enabled Hair Health Analyzer. It clearly outlines how various system components interact to measure and analyse different factors for hair and scalp health. The detailed description is as follows:

System Workflow Description

1) **Hair Comb:** The process is initiated by using hair comb. The primary function of comb is to prepare the hair for analysis. It ensures that the hair is free of tangles or obstructions, which enables sensors to collect accurate data.
2) **Sensors:** The sensor array includes various sensors crucial for the evaluation of hair and scalp properties:
   a. **LM35 Temperature Sensor:** Detects any hair related issues by Measuring the scalp's temperature.
   b. **DHT11/DHT22 Sensor:** Used to Monitors the surrounding environment by measuring the ambient temperature and humidity levels, factors that can impact hair and scalp health.
   c. Capacitive Sensors: Detects the different physical characteristics of hair like thickness and surface properties.
d. **QRB1114 Photo sensor:** It is used to Analyze the optical properties of the hair, such as surface texture and reflectivity.
3) **Sensing Mechanism:** With the integrated sensor array, data pertaining to the condition of both the hair and scalp is sampled in real time using the sensing mechanism. The sensors, when used in combination, provide complete physical, thermal and environmental analysis of the health of the hair.
4) **Hair Health Analysis:** The received sensor data is utilized for further examination of the hair and scalp. This data is processed to develop insights on hair's condition, issues with the scalp, and other factors which may correlate to the health of the hair. These insights can be accessed through a mobile or web application for monitoring purposes.

Overall System Flow

The process starts with the user commencing their hair routine of combing their hair, then moves on to the collection of data through sensors regarding the user's scalp and hair. This is all captured in the final sensing step, which integrates all the collected information for further analysis on the user's health. This covers the information IoT systems provide on real time, effortless, and precise monitoring of one's hair and scalp injuries. The objective's integration of various sensors guarantees for the best results on the hair's health condition and gives the users opportunity to make the correct choice at the right moment.

Data Collection and Transmission

- **Real-Time Monitoring**
  - o Sensors continuously collect data on temperature, humidity, and hair color.
  - o Data is transmitted to a controller unit via networking protocols (e.g., MQTT or HTTP).
- **Data Processing**
  - o Collected data is processed using cloud-based analytics.

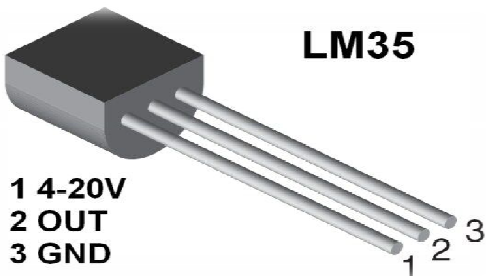
User Interface

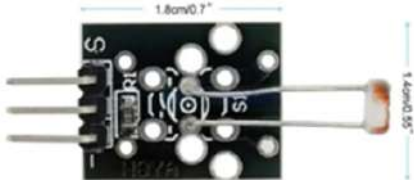
- **Mobile Application**
  - o Displays real-time data from sensors.
  - o Provides visual representations of environmental conditions and hair quality metrics.
  - o Offers personalized recommendations based on sensor data.
- **Alerts and Notifications**
  - o Users receive alerts when sensor data indicates potential issues (e.g., high/low humidity or temperature).
  - o Recommendations are provided to mitigate adverse conditions and improve hair health.

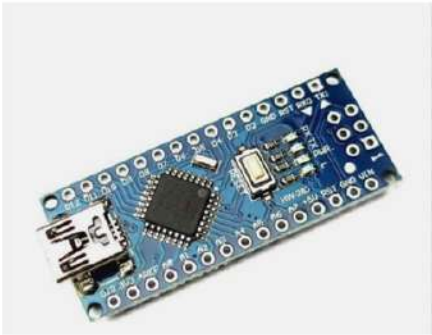
System Integration

- **IoT Connectivity:**
  - o Utilizes IoT platforms for data transmission and management.
  - o Ensures remote accessibility and control over the hair quality monitoring system.
- **Cloud Storage and Analysis:**
  - o Data is securely stored in the cloud.
  - o Cloud-based analytics processes large volumes of sensor data, enabling scalable and efficient analysis.

CONCLUSION

The incorporation of photo-sensors and temperature sensors in an IoT-based hair quality analysis system shows great promise in evolving technology within the personal care domain. These sensors capture real time information from the environment, such as temperature and humidity, which are critical for maintaining good health of the hair [5]. Studies emphasize the need for controlling these variables to avoid hair damage and ensure general well-being. Enhanced real-time data processing allows the system to automatically track and adapt to the changes in the environment, which optimizes the management of hair care practices. The inclusion of RGB lighting in conjunction with DHT11 and LM35 sensors further enriches the system by enabling the evaluation of aesthetic factors, including hair color and shine. This multifaceted approach not only assesses environmental influences but also provides insights into the visual quality of hair. The synergy between these technologies contributes to a comprehensive understanding of hair health, allowing for personalized recommendations and refined hair care routines [3]. Advancements in sensor technology and real-time analytics are pivotal in enhancing the accuracy and effectiveness of hair quality analysis. Future research is anticipated to focus on improving sensor precision and developing more sophisticated IoT-based systems [7]. These developments are expected to offer even more accurate and actionable insights, thereby expanding the capabilities of hair care management solutions. In summary, the proposed IoT-based hair quality analysis system represents a significant leap forward in personal care technology. By integrating DHT11






Meenakshi Kashyap *et al.,*

and LM35 sensors with RGB lighting, the system provides a holistic approach to monitoring and managing hair health. The combination of real-time data processing and personalized feedback empowers users to make informed decisions about their hair care routines, leading to improved hair quality and overall health. Future research will continue to advance sensor technologies and data analysis techniques, further enhancing the system's functionality and effectiveness.

ABSTRACT

Digital forensics, or the process of detecting, storing, evaluating, and presenting digital evidence, has become critical in combating cybercrime, data breaches, and other digital security challenges. As digital technologies evolve, forensic professionals face new obstacles when dealing with rising trends like cloud computing, the Internet of Things (IoT), cryptocurrency, and artificial intelligence. These technologies generate huge volumes of data, use advanced encryption methods, and build decentralized infrastructures, complicating forensic investigations. Because of the growing use of blockchain-based systems for criminal transactions, cryptocurrency forensics has emerged as a critical area of attention. Investigators must track and understand transactions, which, while publicly recorded, are frequently anonymized. Artificial intelligence and machine learning are being used to improve forensic processes by automating data analysis and anomaly detection, making forensic investigations faster and more accurate. This paper emphasizes the importance of improving forensic procedures to keep up with technological changes, provide strong Cyber security frameworks, and enhance law enforcement capabilities. Future directions include standardizing methodology, collaborating with legal systems to handle jurisdictional problems, and continuing to create AI-powered tools for effectively processing large amounts of data in digital forensics.

Keywords: Cyberattacks - Anti-forensics - Cyber dangers - Digital forensics.

Divya *et al.,*

INTRODUCTION

Digital forensics, an important part of information technology, is critical for detecting and mitigating cyber-attacks. This profession, which is closely tied to computer forensic science, requires rigorous techniques to gather, analyze, and archive digital evidence. This paper examines the complexities of digital forensics, shedding light on its components, procedures, and undeniable value in protecting digital data and systems. This paper looks into digital forensics' complexities, giving light to its components, procedures, and indisputable value in protecting digital data and systems. However, its societal impact is significantly higher. Digital forensics has been around since the 1980s, making it a relatively recent profession. Despite its relatively recent start, the field has come a long way. It has gradually evolved into a crucial component of law enforcement, cybersecurity, and court proceedings. Its establishment and success have benefited the entire community.

CYBERSECURITY: PROACTIVE DEFENCE

Proactive cybersecurity comprises looking for threats and discovering vulnerabilities in your security posture before an event or breach occurs. Thus, offensive cyber capabilities can be developed in partnership with industry and aided by the private sector; these activities are frequently conducted by nation-states.

Network Security Architecture

A security mastermind is responsible for relating and mollifying implicit cyber pitfalls to an association's network and systems. As part of their position, security engineers should produce a network and security armature that gives the visibility and control needed to describe and respond to cyber pitfalls in an association's systems. This includes contriving a strategy for locating security controls to maximize their value to the establishment. In digital forensics, network security architecture plays a critical role in ensuring that evidence is properly preserved, collected, and analyzed. It serves as the foundation for detecting, responding to, and investigating cyber incidents, allowing forensic investigators to trace back attacks and gain a comprehensive understanding of how they occurred.

Encryption and Data Protection:

Crypto is a serious subject that presents both obstacles and opportunity to digital forensics investigators. Investigators must find ways to decrypt or bypass encryption to access critical data, often using forensic tools or by obtaining decryption keys through legal processes. During the inquiry, digital forensic professionals deal with sensitive and confidential information. Protecting this information is critical to preventing hacking or leaks. Protecting the data entails keeping a clear chain of custody, documenting who has accessed the evidence, and verifying that it has not been changed.

DIGITAL FORENSICS: REACTIVE INVESTIGATION

Reactive investigation is the traditional or posthumous fashion to probe digital crimes after they've passed. This includes relating, conserving, collecting, assaying, and preparing the final report. This element gathers two feathers of substantiation.

- Active substantiation is the collection of all live(dynamic) substantiation that exists following an incident. Processes executed in memory are an illustration of this type of substantiation.
- Reactive collects all remaining stationary substantiation, similar to a hard drive image.

Data Analysis and Recovery

Data recovery is the process of rescuing, retrieving, or restoring data that is inaccessible, lost, corrupted, damaged, or formatted on storage media such as hard disks, USB drives, or memory cards. This process can be carried out on a variety of platforms, including computers, smartphones, and other digital devices. Data is raw information, and data analysis is the methodical process of analyzing and translating it into useful insights. In a data-driven environment, analysis entails using statistical, mathematical, or computational methods to uncover patterns, trends, and correlations from databases. It entails using numerous approaches and tools to extract useful insights from raw data, which aids in recognizing patterns, trends, and relationships within a dataset.

Evidence Collection and Preservation

Those in charge of obtaining and collecting evidence should prioritize evidence preservation. Both pre-collection and post-collection evidence are collected using the same techniques. Evidence that has not been adequately kept before gathering may be contaminated or destroyed. Before disturbing the scene to gather larger, heavier, or less delicate substantiation, an investigator should meticulously gather the most delicate substantiation first. An investigator should use sterile instruments akin to tweezers to gather evidence in an aseptic, meticulous, and precise manner.

Best Practices for Integrating Cyber Security and Digital Forensics

Safeguarding computer systems and data requires efficient integration of digital forensics and cyber security. This integration guarantees that systems are safe from assaults as well as the ability to efficiently collect and evaluate the evidence in the event of an incident.

Implemented Automated Tools and Processes

Automated forensic technologies, such as EnCase, FTK, and Autopsy, help investigators speed up the process by quickly producing forensic photos, retrieving lost data, and analysing massive amounts of digital evidence. Furthermore, automated techniques allow for speedier discovery of important evidence across large datasets, such as network logs and email archives, minimizing the time required for manual examination.

Fostering Collaboration between Security and Forensic Teams:

Collaboration between security and forensic teams is critical for successful incident response and threat mitigation. Organizations can promote regular communication and collaborative training sessions to ensure that both teams understand each other's roles and responsibilities, resulting in a more integrated approach to security incident management. Sharing tools and procedures can also increase investigative efficiency and overall security posture.

DIGITAL FORENSICS DOMAIN AND ITS IMPACT

As technology advances, so do the tools and procedures needed to meet the complex and diverse difficulties confronting digital forensic investigators. Working in digital forensics might involve a variety of jobs and obligations, depending on the profession in which they operate. Some of the most popular types of digital forensics are:

Network Forensics

The study of computer-to-computer communication on networks is called network forensics. It verifies the data that travels across computers. This facilitates the investigation of possible computer-related crimes. The primary task of network forensics is to locate and preserve digital evidence that can be utilized as evidence in court.

Computer Forensics

Computer forensics is a scientific process of inquiry and analysis used to collect evidence from digital devices, computer networks, and components suitable for presentation in a court of law or legal authority. Computer forensics combines law and computer science to collect and analyze data from computer systems, networks, wireless communications, and storage devices for admissible evidence in court.

Database Forensics

Database forensics is a branch of forensic science that specializes in preserving and analyzing artifacts from relational and non relational database platforms. This inquiry attempts to audit and test the database for correctness, as well as validate the behaviours of a certain database user.

Email Forensics

Email forensics is a subset of digital forensics that focuses on investigating emails to acquire evidence in cybercrime, fraud, and legal matters. Recent developments in the subject are driven by the need to resist sophisticated email-based threats including phishing, spoofing, and ransomware.

Divya *et al.,*

Cloud Forensics

Cloud forensics is rapidly expanding to meet the problems provided by increasingly complex cloud settings, as well as the demand for faster, more efficient, and legally compliant forensic investigations. Due to the worldwide nature of cloud services, legal and jurisdictional difficulties occur, therefore digital forensics professionals must be familiar with a wide range of data privacy legislation.

IMPROVING FORENSICS PROCEDURES:

Improving forensics procedures entails improving both the technological and procedural aspects of forensic investigations in order to get more accurate, efficient, and dependable results. This encompasses everything from evidence gathering to analysis and reporting.

➢ Create clear, established protocols for evidence gathering, management, and analysis. Ensure that these protocols are thoroughly recorded and easily accessible to all forensic personnel.
➢ Provide continual training for forensic specialists to ensure they are up to date on the newest processes and technologies. Conduct regular workshops and simulations to ensure that the protocols are understood.
➢ Maintain a strict chain of custody to document every person who handles the evidence. This guarantees that evidence is not compromised and that its integrity is maintained.

BEST CYBER SECURITY FRAMEWORK
(NIST) FRAMEWORK

NIST stands for National Institute of Standards and Technologies. The NIST CSF has been widely implemented due to its flexibility and applicability across sectors. The framework is constantly updated to reflect emerging threats and technology. The next generation of cyber security must concentrate on quantum risks as quantum computers become powerful enough to break traditional encryption methods.

Key Features
- Five fundamental functions: identification, protection, detection, response, and recovery.
- Designed for businesses of any size and industry.
- Integrates seamlessly with existing cybersecurity standards and best practices.

Future Applications

NIST's adaptability will help enterprises stay resilient against sophisticated threats such as ransom ware and AI-driven attacks.

Challenges

Addressing these issues through enhanced advice, automation, and integration with privacy and threat intelligence frameworks would assist firms in better managing future cyber security threats.

Core Program
Research, Development, and Specifications
- Security Mechanisms: protocols, cryptography, access control, auditing/logging, and applications.
- Maintain confidentiality.
- Integrity and Availability.

NIST Focus

Computer Security Division: Standards, Guidance, Tools and Metrics.
- The National Initiative for Cyber security Education provides cyber security outreach and education.
- Improving Critical Infrastructure Cyber security: An Executive Order.

CHALLENGES AND SOLUTIONS
Encryption and Data Access Challenges
Challenges

One of the most significant challenges to digital forensics is the widespread usage of strong encryption. Investigators may be unable to access data on encrypted devices or communications without the necessary decryption keys.

Solutions

One of the most significant challenges to digital forensics is the widespread usage of strong encryption. Investigators may be unable to access data on encrypted devices or communications without the necessary decryption keys.

Growing Volume of Data(Big Data Forensics)
Challenges

The volume of data collected today is staggering. With greater datasets and more complicated systems, digital forensics investigations frequently experience considerable delays and problems sifting pertinent data.

Solutions

- Automated Forensic Tools: AI-powered tools and machine learning algorithms are increasingly being utilized to more efficiently examine large datasets, allowing forensic investigators to filter out unnecessary material and focus on essential evidence.

Anti-Forensics Techniques
Challenges

Cybercriminals are increasingly using anti-forensic measures to conceal or destroy evidence, such as data obfuscation, steganography, file wiping, and malware payload encryption.

Solutions

Artificial intelligence for anti-forensics detection: Artificial intelligence can help detect trends and anomalies that suggest the usage of anti-forensics.

Complexities in Cloud Forensics
Challenges

Cloud forensics presents unique issues, such as shared infrastructures, multi-tenancy, and limited control over data. Traditional forensic techniques frequently fail when applied to the cloud.

Solutions

Cloud-optimized Forensic Tools: New forensic tools, such as Amazon's CloudTrail and Azure Monitor, are being developed expressly for cloud contexts. These tools improve logging and auditing capabilities, enabling more effective forensic investigations.

IoT and Embedded Device Forensics:
Challenges

Forensics of IoT and embedded devices poses a new challenge. These gadgets have limited processing power and storage, which makes evidence collecting and analysis more challenging. Many IoT devices also lack built-in logging and data retention capabilities.

Solutions

IoT forensic tools are being developed to retrieve data from embedded systems, including firmware memory dumps and sensor data. Researchers are working on lightweight approaches to collect and analyze forensic evidence from low-power devices.

CASE STUDIES
Healthcare Organization: Securing Patient Data and Forensics Analysis
Securing client information in healthcare businesses necessitates strong security controls, regulatory compliance, and proactive incident response plans. Forensic analysis is critical for investigating breaches, determining how patient data was compromised, and ensuring appropriate remediation.

Data Breach Evaluation
Forensics assists in determining the scope of the breach, such as how many patient records were exposed, whether the attackers had access to financial or insurance information, and whether sensitive medical data was affected.

CONCLUSION

Digital forensics is critical in modern criminal investigations, acting as a foundation for discovering and evaluating digital evidence in cybercrime, data breaches, and other digital offenses. As technology advances, the profession must constantly develop and adapt to solve the complexity brought on by breakthroughs such as cloud computing, IoT, cryptocurrencies, and AI. These technologies bring both obstacles and opportunities, requiring forensic professionals to create new tools and procedures for dealing with encrypted data, decentralized networks, and massive amounts of data. By encouraging innovation and collaboration among the technical, legal, and law enforcement sectors, digital forensics will remain a key the ever-changing digital landscape, this is a critical component in ensuring justice and combating future dangers.

FUTURE RESEARCH
The use of AI techniques in digital forensics has the potential to alter the industry by increasing inquiry efficiency, accuracy, and scope. As AI technology progresses, several major themes and advancements are expected to affect the future of digital forensics:

AI-TOOLS IN DIGITAL FORENSICS:
Advanced Pattern Recognition and Anomaly Detection
Description
AI will increasingly use sophisticated algorithms to find patterns and abnormalities in data that older approaches cannot detect.

Future Implications
Predictive Analytics: By identifying patterns and trends in massive datasets, AI can forecast possible criminal behaviour.

Enhanced Natural Language Processing (NLP):
Description
Future AI systems will use powerful NLP to understand, categorize, and analyse textual material.

Future Implications
Contextual Analysis: Better context comprehension will make it easier to analyze complex communications and locate useful information.

Standardizing Methodology
Increased Use of Blockchain Technology
Immutable Records: Blockchain technology will be utilized to establish immutable records of procedures and transactions, ensuring transparency and accountability in standardization initiatives.

Divya *et al.,*

Protection and ethical concern

Create standardized procedures for balancing privacy rights and forensic investigations, particularly in nations with strict data protection regulations.

Automated Forensic Tools and Validation

- **Current state:** Automated digital forensics technologies are widely employed, however there is a lack of uniformity in their implementation, testing and validation.
- **Future Research:** Create established benchmarks for forensic tools and ensure that they can be tested consistently in various situations.

ABSTRACT

Accurate modeling of stock market trends along with adequate generalization remains a fundamental requirement for market trend predictions. The proposed research implements AdamW optimizer integration with Long Short-Term Memory (LSTM) networks to confront the overfitting issues present in standard stock prediction systems. AdamW optimizer delivers weight decay separability from gradient updates which enables improved learning stability and generalization when it operates with LSTM. This research performs an extensive performance test among existing solutions like LSTM and AdamW and CNNs to examine network effectiveness for both overfitting reduction and stock prediction precision enhancement. The time-series data performance of LSTM remains effective yet it has high vulnerability to overfitting with small datasets even when using dropout regularization techniques. LSTM performance benefits from AdamW implementation because it enables better management of large parameter spaces. The visual performance of CNNs allows them to resist overfitting behaviors yet they need large quantities of data and augmentation techniques to be effective for stock predictions. The proposed hybrid solution delivers superior results by reaching better predictive accuracy together with reduced overfitting problems when used independently thus establishing itself as a promising stock prediction solution. This research presents evidence about how combining sophisticated optimizers with sequence models shows promise to boost market trend forecasts without encountering fitting problems.

Keywords: Stock Market Forecasting; Hybrid Approach; AdamW Optimizer; Long Short-Term Memory (LSTM); Overfitting Mitigation; Convolutional Neural Networks (CNNs)

INTRODUCTION

Stock market trend prediction remains a sophisticated challenge because of unpredictable market movements which has sparked widespread researcher and practitioner involvement. The fundamental patterns present within financial data frequently elude detection when using traditional forecasting systems based on technical analysis with statistical models. Set indicators used in these prediction approaches prove inadequate for adjusting to fast-market fluctuations. Machine learning (ML) algorithms serve as an emerging effective method which allows models to analyze extensive datasets and detect previously hidden patterns for enhancing forecasting accuracy. People now examine hybrid machine learning methods which combine optimization techniques with deep learning models to reduce overfitting. AdamW operates as an upgraded version of Adam which succeeds in controlling weight decay to stabilize training and strengthen generalization abilities. The integration between AdamW and LSTM networks provides an effective combined methodology that maintains accurate prediction and maintains model stability for stock market forecasting. The joint application controls overfitting while it optimally handles big parameter spaces to achieve effective results on new data samples. The hybrid approach of combining LSTM with AdamW enhances adaptive capabilities to market alterations which improves its forecasting abilities beyond standard forecasting systems. The developed research targets overfitting reduction and sequence learning optimization to create a resilient stock prediction system that improves its accuracy levels. The precise tools developed in this approach help traders make informed decisions that boost their likelihood of obtaining profitable investments. Financial market navigation and forecasting reliability improvement depend heavily on the use of intelligent algorithms according to this research's conclusion.

LITERATURE REVIEW

Overfitting poses a major challenge in machine learning, especially in predictive modeling, where a model performs well on training data but fails to generalize to new, unseen data. This problem is particularly evident when using complex models that have a high number of parameters. As machine learning methods like AdamW, LSTM, and CNN become more popular across different fields, their tendency to overfit necessitates specific strategies for mitigation. Each type of model has its own advantages and disadvantages, making it crucial to understand their behaviors in order to implement effective regularization techniques. Model architectures with optimization algorithms create major performance changes for deep learning systems. The wide adoption of AdamW and LSTM together with CNNs stems from their specific domain advantages. The assessment examines how these techniques perform and the ways overfitting occurs and the available mitigation strategies.

AdamW Optimization and Performance Evaluation
The implementation of decoupled weight decay in AdamW leads to better generalization along with accelerated convergence speed according to research findings [1]. Scientific research has demonstrated that this method effectively reduces overfitting during weight update procedures while performing image classification and NLP operations [2] [3]. Achieving the best possible outcome needs precise adjustment of all parameters [4].

LSTM in Sequential Data Processing
The ability of LSTM networks to handle sequence modeling with time-series forecasting comes from their solution of the vanishing gradient issue [5]. These networks excel better than regular recurrent networks yet developers need dropout and batch normalization to stop overfitting [6] [7]. The merging of LSTM networks with CNN approaches leads to effective models for both listening systems [8] along with stock market solution predictions.

CNNs in Feature Extraction and Overfitting Mitigation
Spatial features become easily accessible through CNNs which makes them necessary for computer vision applications [9]. Each hierarchical model level automatically learns features yet deep networks present the risk of

overfitting which requires overfitting reduction techniques including dropout along with batch normalization and data augmentation [10] [11]. The performance of EfficientNet and ResNet increases through their use of adaptive learning rate systems [12].

Comparative Analysis of Overfitting in AdamW, LSTM, and CNN
