Weight decay capabilities of AdamW help reduce overfitting but LSTMs need supplemental generalization elements [13]. Feature extraction through CNNs needs precise architectural adjustments since improper tuning leads to overfitting [14]. Using AdamW with CNNs or LSTMs strengthens model resilience which delivers better results to medical imaging along with financial forecasting systems [15]. To combat overfitting, various strategies are implemented across these models. Early stopping is a technique that halts training as soon as the model begins to overfit, thereby optimizing generalization. Cross-validation enhances model performance by testing it on different subsets of data, which helps reduce the likelihood of memorizing specific training examples. Dropout is another method that mitigates overfitting by randomly turning off units during training, while weight decay discourages large weights, further aiding in overfitting prevention for AdamW and CNNs. Data augmentation is also employed to artificially expand the training dataset, which fosters better generalization, especially for CNNs Through weight decay control AdamW achieves effective optimization but the sequential data processing and feature extraction capabilities belong to LSTM and CNN. Research paths for enhancing deep learning models now focus on implementing AdamW optimization together with CNNs or LSTMs as unified solutions. In summary, effectively managing overfitting across models such as AdamW, LSTM, and CNN is essential for enhancing their generalization capabilities. By using specific regularization methods like early stopping, dropout, weight decay, and data augmentation, along with investigating transfer learning, researchers can strengthen the reliability of stock prediction models. These approaches are crucial for creating dependable prediction systems that can tackle the complexities of financial markets and aid investors and traders in making better decisions.

INTELLIGENT STOCK PREDICTION: HYBRID MECHANISM OF ADAMW AND LSTM

In intelligent stock prediction, the combination of the AdamW optimizer with LSTM (Long Short-Term Memory) networks presents a robust solution for forecasting stock prices while mitigating overfitting. The hybrid approach enhances model performance by leveraging the strengths of both AdamW for effective optimization and LSTM for capturing temporal dependencies in stock market data. Below, we outline the algorithm, computational equations, and reasoning behind the hybrid approach.

Algorithm for Hybrid Approach of AdamW and LSTM

Data Preparation

- **Input:** Historical stock price data (open, close, high, low, volume) for a specified time range.
- **Output:** Preprocessed dataset with features such as moving averages, RSI, etc., used as input for the model.

Steps

Normalization: Normalize stock price data using Min-Max scaling to bring values between [0, 1].

$$Z_{norm} = \frac{Z - \min(Z)}{\max(Z) - \min(Z)} \quad \text{,,,(Eq.1)}$$

Feature Engineering

Compute additional features such as: Moving average (MA), Relative Strength Index (RSI), and Bollinger Bands.

Data Split

Split data into training, validation, and test sets.

Model Architecture

Input Layer: Input time-series data (e.g., stock prices and features).
LSTM Layers: Capture sequential patterns and temporal dependencies in stock prices.

Fully Connected Layers: After LSTM layers, a dense layer connects to the output layer.
Dropout Layer: Regularization technique to prevent overfitting by randomly dropping some units during training.
Output Layer: Predicts future stock prices or price change.

AdamW Optimizer

AdamW optimizes the parameters using the decoupled weight decay technique. Objective Function: Minimize the loss function with AdamW's adaptive learning rate.
The weight update rule for the AdamW optimizer is defined as:
$$\theta_t = \theta_{t-1} - \rho\left(\frac{g_t}{\sqrt{v_t}+\varepsilon} + \lambda.\theta_{t-1}\right) \,,,,(Eq.2)$$
θ_t is the parameter at time t.
g_t and v_t are the estimates of the first and second moments of the gradient
η is the learning rate
ϵ is a small constant to avoid division by zero,
λ is the weight decay parameter (regularization term).

LSTM Equation

LSTM networks consist of memory cells that maintain long-term dependencies. The LSTM equations are defined as:

Forget Gate

$$G_t = \sigma(W_G.[h_{t-1}, x_t] + b_G) \;\ldots(Eq.3)$$
where G_t represents the forget gate, σ is the sigmoid activation function, W_G is the weight matrix, h_{t-1} is the previous hidden state, and x_t is the current input.

Input Gate

$$I_t = \sigma(W_I.[h_{t-1}, x_t] + b_I) \;\ldots(Eq.4)$$
where I_t is the input gate controlling which values will be updated in the memory cell.

Cell State

$$C_t = G_t.C_{t-1} + I_t.\tanh(W_C.[h_{t-1}, x_t] + b_C) \;\ldots(Eq.5)$$
where C_t is the current cell state, which stores the information.

Output Gate

$$O_t = \sigma(W_O.[h_{t-1}, x_t] + b_O) \;\ldots(Eq.6)$$
where O_t is the output gate that regulates the output from the cell state.

Hidden State

$$H_t = O_t.\tanh(C_t) \;\ldots(Eq.7)$$
where H_t is the output hidden state at time t.

Loss Function

The loss function measures the discrepancy between the predicted and actual stock price. For regression tasks, Mean Squared Error (MSE) is commonly used:
$$MSE = \frac{1}{Z}\sum_{i=1}^{Z}(p_{true}^{(i)} - p_{pred}^{(i)})^2 \;\ldots(Eq.8)$$
where $p_{true}^{(i)}$ is the actual stock price and $p_{pred}^{(i)}$ is the predicted stock price.

Training Process

- **Forward Pass:** Input the stock price data through the LSTM layers and compute the predictions.
- **Back propagation:** Calculate the gradient of the loss function with respect to the model parameters and update the weights using AdamW optimization.

- **Epochs:** Repeat the process for multiple epochs until the model converges.

Regularization and Overfitting Prevention

- **Dropout:** Randomly drop a percentage of the LSTM units to prevent overfitting.
- **Early Stopping:** Monitor the validation loss and stop training when the loss starts to increase, signaling overfitting.
- **L2 Regularization:** Applied through AdamW optimizer to constrain large weight values.

Stock prediction becomes more accurate when the AdamW optimizer joins LSTM networks through hybrid application since this method controls overfitting effectively. Stock price predictions in volatile market conditions become achievable through the combination of AdamW regularization features with LSTM temporal learning abilities. Through the implementation of dropout combined with early stopping and L2 regularization the developed model shows good generalization abilities while avoiding overfitting which makes it an effective solution for smart stock prediction tasks.

PERFORMANCE ANALYSIS METRICS

Performance analysis metrics for stock price prediction assess model accuracy, efficiency, and reliability. Key metrics include MSE, training time, prediction accuracy, and overfitting measures.

Mean Squared Error (MSE):

- Measures the average squared difference between the predicted and actual stock prices.
- Lower MSE indicates better prediction accuracy.

Training Time

- The time taken by each model (LSTM, AdamW+LSTM, etc.) to converge.

Prediction Accuracy

- The percentage of predictions within a specified error margin (e.g., 5% error range).

Overfitting Measure

- Difference between training and validation error. A large gap indicates overfitting.

LSTM

The basic LSTM model demonstrates reasonable accuracy, but suffers from overfitting as seen in the gap between training and validation MSE.

AdamW + LSTM

The hybrid approach significantly reduces the MSE, showing improved prediction accuracy. The optimizer's regularization techniques help prevent overfitting, as reflected in the minimal training-validation gap.

AdamW and CNN

These traditional models have higher MSE and lower prediction accuracy compared to LSTM-based methods, highlighting the advantage of deep learning in stock prediction tasks. A performance analysis for the intelligent stock prediction hybrid mechanism based on AdamW and LSTM can be presented through both visual charts and analytical tabulated results to demonstrate performance measurement results. The analysis evaluates the hybrid model together with MSE results and prediction accuracy and training duration while comparing with simple LSTM along with traditional forecasting methods. The process to build the performance analysis chart follows these steps alongside the results tabulation procedure.

CONCLUSION AND FURTHER ENHANCEMENTS

This research demonstrates the efficacy of a hybrid mechanism combining the AdamW optimizer with Long Short-Term Memory (LSTM) networks for intelligent stock prediction. By integrating AdamW's robust regularization capabilities with the sequential modeling strengths of LSTM, the proposed model addresses common challenges such as overfitting and instability in traditional prediction models. The results indicate that this hybrid approach outperforms standalone models, including AdamW, LSTM, and CNN, in terms of accuracy and generalization, especially when faced with limited or noisy data. Through a careful combination of advanced optimizers and sequence modeling, the proposed model provides a more reliable and efficient solution for stock market forecasting. This hybrid mechanism achieves superior predictive performance, reducing overfitting and enhancing robustness, making it a promising tool for financial decision-making and risk management in an ever-changing market landscape. The hybrid AdamW-LSTM model can be enhanced with attention mechanisms, transfer learning, and ensemble learning for improved accuracy. Dynamic hyperparameter optimization further boosts performance, strengthening robustness and prediction capability.

Table-1: Overfitting Analysis

Model	Overfitting Characteristics	Mitigation Techniques
AdamW	- Prone to overfitting with inadequate regularization. - Overfitting can occur in highly complex models.	- Use weight decay to control complexity. - Adjust learning rate. - Apply early stopping or cross-validation.
LSTM	- Overfitting due to the large number of parameters. - Can memorize the sequence without generalizing.	- Use dropout to prevent memorization. - Apply L2 regularization. - Utilize early stopping.
CNN	- Overfitting in deeper networks with limited data. - High capacity networks may overfit the training data.	- Use dropout, batch normalization. - Data augmentation. - Implement early stopping or regularization techniques.

Table-2: Analysis of the performance of the proposed technique (AdamW+LSTM)

Model	MSE (Validation)	MSE (Test)	Training Time (Epochs)	Prediction Accuracy (%)	Overfitting Measure
LSTM	0.025	0.028	100	90%	0.003
AdamW	0.035	0.037	50	85%	0.002
CNN	0.04	0.042	60	83%	0.003
AdamW + LSTM	0.018	0.02	50	94%	0.002

Table-3: Analysis of Overfitting Risk

Model	Training Accuracy (%)	Test Accuracy (%)	Generalization Gap (%)	Overfitting Risk
LSTM	94	79	15	High
AdamW	92	88	4	Moderate
CNN	91	81	10	Moderate
AdamW + LSTM	96	90	4	Low

ABSTRACT

Agriculture is a cornerstone of India's economy, providing employment and sustenance for millions of people. As we move towards more advanced farming methods, the adoption of *smart farming* is becoming increasingly essential. This shift is driven by the need to overcome persistent challenges faced by farmers, particularly those related to plant diseases and harmful pests. Effective prediction and early detection of plant diseases are vital for minimizing crop losses and reducing the economic impact on farmers. By identifying diseases at an early stage, farmers can take preventive measures to protect their crops, thereby improving yield and profitability. In recent years, machine learning (ML) and artificial intelligence (AI) have emerged as powerful tools for disease prediction, offering potential solutions to these challenges. Various machine learning techniques have been explored for predicting plant diseases, but there is still much room for improvement. In this review paper, we will examine and compare the current systems for plant disease prediction and discuss future directions for research in this area, aiming to enhance the accuracy and efficiency of these technologies.

Keywords: Image processing, Plant disease detection, Classification, Leaf disease.

INTRODUCTION

A country's development is closely linked to its agriculture and business sectors. Agriculture is crucial as it provides food and raw materials for both humans and the food industry. Since food is a basic necessity, plant diseases become a significant challenge for farmers, potentially occurring at any stage between sowing and harvesting. These diseases can result in major crop losses and economic harm. Therefore, timely disease detection is critical in agriculture.

Deepak Awasthi *et al.,*

Researchers have conducted studies on various plant leaves, including those of tomatoes, potatoes, roses, beans, lemons, and bananas, to understand plant diseases. Machine learning has empowered researchers to enhance disease prediction, detection, and recognition systems. Traditional methods of detecting leaf diseases relied solely on human visual observation, which is limited in accuracy and efficiency. Machine learning, a subset of artificial intelligence, enables automated disease detection, improving the precision of these systems. In machine learning, models are trained with data, which can then be used to provide actionable insights. For plant disease detection, features such as leaf color, the number of damaged leaves, and the area affected by disease can be used for classification. To achieve optimal accuracy, researchers have examined various machine learning algorithms to identify diseases across different plant leaves. The process of detecting plant diseases through machine learning involves multiple steps: image acquisition, preprocessing, segmentation, feature extraction, and classification. Each of these stages plays an important role in ensuring accurate detection and diagnosis of plant diseases. [40-45]. Plants fulfill the essential needs of human as well as animals like food, shield, building material, ayurveda medicines, fuels, woods etc and also minimize the air pollution. Environment should be protected by the human from problems n caused by floods, fire, human development etc. Cultivation of plants is important as it gives us the different types of fruits, vegetables, grain, nuts and medicines. We need wood for the construction purpose, furniture, for making paper etc. Bio-fuel production can be done by the decaying of plant as it forms the fertilizer, also used for generating the electricity. The agriculture field deals with many difficulties the big one is losses in crop yield. It affects the economy of the country. Because of plant diseases the quality and also the quantity is being affected. There are many diseases in agricultural plants, if we can control it than we will control the production of wastage. Due to these reasons it will be good to detect diseases timely. Many different methods are there to check diseases are man base and technology base checking. Some diseases can be seen by human eyes. The plant diseases like pathogen, microorganisms which are living, bacterial problem, fungi infected plant, nematodes, viruses affected problems in plants cannot be easily detect by human eyes. We should use some technology. With the help of machine learning technique we will process the images of the plants and try to predict plant disease.

LITERATURE REVIEW

The growth of a country depends on its business and also agriculture. Agriculture provides food and raw materials to the human and food industry. Food is essential need of human and plant diseases are big issue for farmers, it can be happened any time between sowing and harvesting. Plant disease does huge loss of crop and economy. Hence disease detection plays an important role in agriculture. Traditional method for leaf disease detection only is empty eye observation by human. Machine learning can be used for detecting diseases on plants. Machine learning is one of the sub parts of Artificial Intelligence to work automatically or give instructions to do a particular work. In machine learning we have to train the data and fit that trained data into models that it will result in useful information to the human. So we can use machine learning to detect diseases in plants. For the classification we can use colors of leaves, damaged amount of leaves, and area of the unhealthy plant leaf. For best accuracy we overviewed different machine learning algorithms to identifying different plant leaves diseases. Here, we take some of the papers related to Plant leaf diseases detection using various advanced techniques and some of them shown below, Rakesh Kaundal *et. al.* [2006] authors concluded that support vector machine(SVM) based regression approach has led to a better description of the relationship between the environmental conditions and disease level. It could be useful for disease management. A comparison is done between the performance of conventional multiple regression, artificial neural network (back propagation neural network, generalized regression neural network) and support vector machine (SVM).[3] Bashir Sabah *et. al.*[2012] authors proposed disease detection in Malus domestica by the method K-mean clustering, texture and color analysis. Here texture and color features used which are generally appear in affected areas; for the classification and recognition of different agriculture.[8] Sushma *et.al.* (2012) proposed that early detection if disease will help farmers do not use harmful chemicals on plants. In this research first to segregate images then detect pests process quality can be reduced by proposed algorithm.[6] Kulkarni Anand H. *et. al.*[2012] author describes a methodology for early and accurately detect plant diseases by using the combination of textures, color and features to recognize those diseases. Here the proposed approach is to use neural network (ANN) and

diverse image processing techniques. The result of recognition rate is up to 91%.[7] DS Gaikwad *et.al.* (2016) author chooses pomegranate fruit for his examination, very colorful fruit. So using color problem empty eye can be detected. It is being affected very early because of its sweetness. Image processing in the disease detection methodology is used here.[13] Preetha *et.al.* (2016) proposed SVM algorithm for image processing, colors as an attribute in dataset. For classification of data photos author removed the morphological elements.[15] Fenghua Mei *et. al.* [2017] described a wheat disease automatic diagnosis system based on deep learning framework which is weekly supervised, i.e. deep multiple instance learning, which give result on plants image basis is detection of wheat diseases. Wheat Disease Database 2017 (WDD2017) is collected to verify the effectiveness of this system. The proposed system outperforms conventional CNN architectures on recognition accuracy under the same amount of parameters; it also specifies exact location for corresponding disease areas. The proposed system has been packed into a real time mobile app to provide support for agricultural disease diagnosis.[22] Andreas Kamilaris *et. al.*[2018], author discussed and perform a survey of 40 researches efforts that employ deep learning techniques, applied to various agricultural and food production challenges. To study the agricultural problems stated under each work, the specific models and frameworks employed the sources, nature and used dataset and overall performance achieved with help of used methods, comparison of deep learning with other techniques also done. It is stated that deep learning provides high accuracy by using image processing techniques.[25] Konstantinos P. Ferentinos *et. al.*[2018], author discussed about convolutional neural network models were developed to perform plant disease detection and diagnosis through deep learning methodologies using plants leaves images. Training of proposed models was done with the use of an open database of 87,848 images, containing 25 different plants in a set of 58 distinct classes of [plant, disease] combinations. Some models gets success 99.53% in detecting the corresponding combination [plant, disease]. High rate of success model is very usefull to early detection tool and also have possibilities of further expanded by researchers.[26] Budiarianto *et.al.* (2018) proposes Machine Learning techniques for recognition of disease in corn plant which is a main source of carbohydrate. CNN technique is used to improve plant disease. Researcher used different algorithms and use support vector machines (SVM), Decision Tree (DT), Random Forest (RF), and Naive Bayes (NB) to compare the results. By normal seeing of plant we can understand the problem like color difference. Different parameters are used for dataset attribute.[30]

Shima *et.al.* (2018) proposed that plant disease cause decrease in food production. For detection purpose machine learning techniques are used by many researchers like RF processes, SVM processes, K-means processes, CNN processes. The random forest algorithm does the classification. The aim of author is to detect the disease with random forest classifier. We have to convert RGB type images to an HSV types images.[27] Prem *et.al.* (2018) proposed that some symptoms are visible from the eyes are wilting, spot, powdery mildew, galls, and dryness. Different attributes are taken in dataset, different techniques are used and different plots like box plot, bar plot are performed. With the help of statistical tests the prediction is done on inbuilt dataset. Many techniques are compared and the accuracy is different from each sample dataset.[28] Sherly *et.al.* (2019) proposed there are different type's bacteria or fungus is responsible for many different plant diseases. It can be predict using algorithm of Machine Learning. Many researchers try many algorithms and get differ results. The classification of diseases is hard to done by algorithms. By CNN technique we can identify the mulberry plant disease.[31] Balwant J Gorad et al.(2019)gives a better disease prediction system for brinjal plant. K-means clustering used to split the data that is provided by the farmers. Farmers collect images from their phone, tablet, camera and other sources that is forwarded to the system and then system create dataset from that and periodically it is done and hence plants diseases predicted by the system.[35] Monalisa Saha *et al.* (2020) takes the tomato and potato plants leaves to predict plant diseases. They collect both plant leaves images from internet sites and some images they collect with their digital camera from farming places. In proposed system after clustering if we give it(cluster) in multiple SVM classes then it gives better results and the performance analysis is 99% and the individual algorithm efficiency like k-means gives 88.6% and SVM gives 91%. Hence the proposed system is better than k-means and SVM.[36] Sridevi Sakhamuri *et al.* (2020)describe that there are three types of plant leaves diseases so they collect the leaves and maintain dataset according disease type. They collect different plants leaves like jasmine, grape, apple, beans, rose etc. and used different methods to detect leaves disease and get different accuracy like with k-means algorithm the accuracy was 88.8%, through SVM 95% accuracy was achieved and through ANN it was 70% to 95% for different diseases.[37]

Krishnaswamy Rangarajan *et al.* (2020) proposed an automated disease diagnostic system for ten diseases of four crops (eggplant, hyacinth beans, lime, lady finger). Author used six pre-trained deep learning models for training and validation of created dataset.[38] Pranesh Kulkarni *et al.* (2021) had taken public dataset for their research in which healthy and unhealthy images of apple, corn, grapes, potato and tomato plants were included. For the classification they used Random Forest Classifier. They got 93% accuracy through the system they developed.[39] Sahil Thakur *et al.*(2021) authors develop the model with CNN to identify the plant diseases with image processing. They used plants like potato, grape, corn, apple etc. [40] Gianni Fenu *et al.*(2021) review the researches from past 10 years in which different plants and crops were used like cherry, coffee, barley, grape etc. and used methods were SVM, SVR, KNN, ANN and many. Author observed that researchers need high quality labeled data for their research work.[41] Kow shik *et al.* (2021) used Convolutional Neural Network and Deep Neural Network to detect plant diseases. Author detect similar diseases from different plants like banana, beans, jackfruit, lemon, mango etc. The proposed method with CNN and DNN is feasible for early plant disease detection.[42] Jayashri *et al.* (2021) review the existing image processing techniques for disease prediction of pomegranate. They used SVM, ANN, KNN and PNN classifier to detect bacterial, fungal and viral diseases in fruit. K-means clustering for image segmentation, Fuzzy c means gives highest accuracy. According to them very few diseases were covered in the existing system.[43] Punitha *et al.*(2021) reviewed many research papers on detection of plants disease using image processing techniques. For image processing they follow the procedure image acquisition, image pre-processing, image segmentation, feature extraction and disease classification. After comparison of many different models (which used SVM, ANN, KNN and other approaches on different plants) they found that SVM is most accurate method followed by ANN. [44]

CONCLUSION

Many research methods are there in deep learning to detect plant diseases in early stage. In existing methods SVM, ANN, CNN, KNN and other techniques are used. Effectiveness of each method may vary from one to another and it also depends on the dataset that how it is collected and trained. Plants used for research work are like tomato, potato, rice, beans, apple, pomegranate, maize etc. Plants disease detection research and applications is developing rapidly, still needed an application that works effectively for farmer of the nation of any region. Researchers should choose the crop or plant which is widely used for the human living like wheat, rice, potato etc. so that the productivity of that crop will be improved. Researchers should improve the quality of dataset they will use with the help of method of collecting data. We will take plants like we discuss earlier and will try to collect data (images) by self.

FUTURE DIRECTIONS

While the plant disease identification model based on machine learning and deep learning discussed in this paper can address environmental complexities and improve identification accuracy, there are still some issues to consider. For example, the algorithm requires repetitive iterative calculations, leading to longer processing times, which can delay the identification results. In future research, we aim to leverage neural networks to generate initial zero sets for different types of leaves. This approach will reduce the computational iterations required by certain algorithms, thus accelerating the training process and allowing for earlier termination of iterations. Based on the findings of this study, the potential future directions of research include: (i) The development of an advanced plant disease prediction system utilizing enhanced image processing techniques. (ii) A comparative analysis between existing prediction models and the newly proposed system, focusing on their effectiveness.

ABSTRACT

Skin aging is a multifactorial process characterized by oxidative stress, collagen degradation, and reduced skin elasticity, leading to wrinkle formation. Traditional anti-aging formulations, such as creams and serums, often suffer from limited penetration and require frequent application. Dermal patches offer a novel approach for sustained drug release and enhanced skin permeation. This study focuses on the formulation and evaluation of rutin-loaded anti-wrinkle dermal patches using polymeric matrices to improve drug stability, dermal absorption, and anti-aging efficacy. Rutin-loaded matrix-type dermal patches were prepared using polyvinyl alcohol (PVA), hydroxypropyl methylcellulose (HPMC), and ethyl cellulose (EC) via the solvent casting method. Plasticizers (glycerine, propylene glycol) and solvents (ethanol, acetone, chloroform) were optimized to achieve desired patch characteristics. Preformulation studies, including FTIR and DSC, confirmed drug-polymer compatibility. The patches were evaluated for thickness, weight variation, moisture uptake, folding endurance, drug content uniformity, in-vitro drug release (Franz diffusion cell), and skin permeation efficiency. Anti-wrinkle efficacy was assessed through collagen synthesis and antioxidant activity studies. The optimized formulation (F6) demonstrated uniform thickness (0.19 ± 0.2 mm), optimal folding endurance (11.5 ± 0.2), and sustained drug release (90.5% over 24 hours). FTIR and DSC studies confirmed the absence of significant drug-polymer interactions. In-vitro permeation studies indicated enhanced dermal absorption, while anti-wrinkle

94949

Zufisha Bakhtiar Ansari *et al.,*

efficacy studies revealed increased collagen production and reduced oxidative stress. The formulation exhibited excellent dermatological compatibility, ensuring safe topical application. The developed rutin-based dermal patches provide an effective and non-invasive alternative to conventional anti-aging treatments. Their sustained release profile, enhanced dermal penetration, and biocompatibility highlight their potential in anti-wrinkle therapy. Further studies, including clinical validation, are recommended to establish long-term efficacy and commercial viability.

Keywords: Rutin, anti-wrinkle, dermal patches, dermal delivery, collagen synthesis, matrix formulation, sustained release Introduction

INTRODUCTION

Skin Aging and the Role of Antioxidants
Aging is a complex, multifactorial process influenced by both intrinsic and extrinsic factors. Intrinsic aging, also known as chronological aging, is primarily governed by genetic and metabolic factors, leading to progressive structural and functional deterioration of the skin. Extrinsic aging, often referred to as photoaging, is influenced by environmental factors such as ultraviolet (UV) radiation, pollution, smoking, poor nutrition, and oxidative stress, which significantly accelerate skin damage and wrinkle formation (1). The skin's extracellular matrix (ECM) is primarily composed of collagen, elastin, and glycosaminoglycans, which provide structural integrity and hydration. As aging progresses, fibroblast activity decreases, leading to reduced collagen synthesis, loss of elasticity, and increased formation of wrinkles (2). Furthermore, oxidative stress induced by reactive oxygen species (ROS) plays a crucial role in degrading ECM proteins. UV radiation stimulates ROS production, leading to lipid peroxidation, DNA damage, and the upregulation of matrix metalloproteinases (MMPs), which degrade collagen and elastin fibers (3).
The skin has endogenous defense mechanisms, such as superoxide dismutase, catalase, and glutathione peroxidase, that neutralize oxidative stress. However, these mechanisms become less effective with age, necessitating exogenous antioxidant supplementation to mitigate oxidative damage and maintain skin integrity (4). Antioxidants, especially flavonoids, have gained considerable attention due to their ability to scavenge free radicals, inhibit MMPs, and stimulate collagen biosynthesis, making them promising agents for anti-aging therapies (5).

Rutin: A Potent Anti-Wrinkle Bioflavonoid
Rutin (quercetin-3-rutinoside) is a flavonoid glycoside found in various plant sources, including citrus fruits, buckwheat, and apples. It possesses strong antioxidant, anti-inflammatory, and anti-aging properties, making it an ideal candidate for dermatological formulations (6). Rutin exhibits several skin-beneficial properties:

Antioxidant effects
Rutin neutralizes ROS, reducing oxidative stress and preventing DNA damage (7).

Inhibition of matrix metalloproteinases (MMPs)
Rutin suppresses the activity of MMP-1, MMP-3, and MMP-9, preventing collagen degradation and preserving skin elasticity (8).

UV protection
Rutin exhibits photoprotective effects by reducing UV-induced erythema and protecting against solar radiation damage (9).

Anti-inflammatory action
Rutin inhibits inflammatory mediators such as TNF-α, IL-1β, and IL-6, reducing redness, irritation, and skin inflammation (10).

Zufisha Bakhtiar Ansari *et al.,*

Despite its significant dermatological benefits, rutin's poor aqueous solubility, low permeability, and limited bioavailability hinder its effectiveness in conventional topical formulations. This necessitates the development of advanced delivery systems that enhance its solubility, stability, and skin penetration (11).

Dermal Patches

A Novel Approach for Skin Rejuvenation Traditional topical formulations such as creams, gels, and ointments often suffer from limited drug penetration, low retention time, and inconsistent absorption (12). Dermal patches have emerged as an innovative alternative to overcome these challenges by providing controlled drug release, prolonged skin contact, and enhanced bioavailability (13). A matrix-type dermal patch consists of a drug-loaded polymeric film, where the drug is uniformly dispersed within a polymer matrix. Upon application to the skin, the drug diffuses from the matrix into the skin layers, bypassing the stratum corneum barrier and ensuring effective drug delivery (14). This controlled release mechanism improves drug stability, minimizes systemic side effects, and enhances therapeutic outcomes.

Key advantages of dermal patches over conventional formulations include

Sustained drug release, reducing the frequency of application and improving patient compliance (15). Enhanced drug penetration, leading to better bioavailability (16). Minimized drug loss, as the occlusive nature of patches prevents drug degradation due to environmental exposure (17).

Formulation Strategies for Enhanced Rutin Delivery

Given rutin's limited solubility and permeability, various formulation strategies have been explored to enhance its bioavailability and efficacy. The present study utilizes the following approaches:

Selection of Biocompatible Polymers

Polymers play a crucial role in drug dispersion, film formation, and controlled drug release. The following biodegradable polymers were selected for the formulation: Polyvinyl Alcohol (PVA): A water-soluble polymer known for its excellent film-forming properties and mechanical strength (18). Hydroxypropyl Methylcellulose

(HPMC)

A semi-synthetic polymer with bioadhesive properties, enhancing patch adherence to the skin (19).

Ethyl Cellulose (EC)

A hydrophobic polymer that modulates drug release and prevents excessive water absorption (20).

Use of Plasticizers for Patch Flexibility

Glycerine and Propylene Glycol were incorporated to enhance the flexibility, elasticity, and skin adhesion of the patches (21).

Optimization of Solvent System

Ethanol, Acetone, and Chloroform were used as solvents to improve polymer dissolution, enhance drug dispersion, and facilitate patch formation (22).

Buffer System for pH Stability

Disodium Hydrogen Phosphate, Potassium Dihydrogen Phosphate, and Sodium Hydroxide were used to maintain the pH stability of rutin, optimizing its solubility and drug release profile (23).

OBJECTIVE OF THE STUDY

This study focuses on the formulation and evaluation of Rutin-loaded dermal patches using a matrix-type polymeric system to achieve optimal anti-wrinkle and antioxidant efficacy. The specific objectives include: Developing an optimized dermal patch using a solvent-casting method.

Zufisha Bakhtiar Ansari *et al.,*

Characterizing the physicochemical properties of the patches, including thickness, folding endurance, tensile strength, and moisture content. Assessing *in-vitro* drug release to determine the kinetics and mechanism of drug diffusion.

MATERIALS AND METHODS

MATERIALS

Rutin was selected as the active pharmaceutical ingredient (API) due to its well-established antioxidant, anti-inflammatory, and anti-aging properties [24]. The polymers chosen for the dermal patch formulation were Hydroxypropyl Methylcellulose (HPMC) and Ethyl Cellulose (EC), which have been widely studied for their film-forming abilities and controlled drug release potential [25,26]. Glycerine and Propylene Glycol were employed as plasticizers to enhance film flexibility and mechanical strength [27]. The solvent system consisted of Ethanol, Acetone, and Chloroform, known for their ability to dissolve both hydrophilic and hydrophobic components, ensuring homogeneous polymer dispersion [28]. Buffer components, including Disodium Hydrogen Phosphate, Potassium Dihydrogen Phosphate, and Sodium Hydroxide, were used to maintain the pH stability of the formulation [29].

METHODS
Preparation of Rutin Dermal Patches
The rutin dermal patches were prepared using the solvent casting method, which is widely used in transdermal and dermal drug delivery systems due to its simplicity and ability to produce uniform films [30]. The steps involved were as follows:

Polymer Solution Preparation
Accurately weighed amounts of HPMC and EC were dissolved in a selected solvent system (ethanol, acetone, and chloroform).
The polymer concentration was varied in different formulations to study its effect on mechanical properties and drug release.

Incorporation of Active Ingredient and Plasticizers
Rutin was dissolved and uniformly dispersed within the polymer solution using magnetic stirring to ensure homogeneity. Plasticizers (glycerine and propylene glycol) were added to improve the flexibility and mechanical integrity of the patches.

Casting and Drying
The homogenous solution was poured into petri dishes and dried at room temperature under controlled conditions to prevent solvent evaporation defects. After complete drying, the films were carefully peeled and cut into uniform sizes for further evaluation.

Evaluation of Rutin Dermal Patches
The formulated patches underwent various physicochemical and mechanical evaluations to determine their suitability for dermal application. The results are summarized in Table 7.4.

Physical Appearance
The physical characteristics of the patches, including color, surface texture, and uniformity, were visually examined. All formulations exhibited a smooth, brown appearance, indicating homogenous rutin distribution within the polymeric matrix [31].

Zufisha Bakhtiar Ansari *et al.,*

Thickness Measurement

Patch thickness was determined using a digital micrometer screw gauge at different points of the film, and the mean value was recorded [32]. The thickness ranged from 0.16 ± 0.2 mm to 0.19 ± 0.2 mm, with F6 showing the highest thickness (0.19 ± 0.2 mm).

Weight Variation

Each patch was individually weighed using an analytical balance to assess uniformity in mass. Minimal variation in weight across different batches confirmed consistency in the formulation process [33].

Moisture Content and Moisture Uptake

The moisture content was determined by weighing patches before and after drying in a desiccator, while moisture uptake was evaluated by exposing them to a humid environment [34]. The results showed moisture content values ranging from 2.7 ± 0.6% to 4.5 ± 0.3%, and moisture uptake values between 2.4 ± 0.8% and 4.0 ± 0.4%, indicating moderate water absorption capacity.

Folding Endurance

The mechanical flexibility of the patches was assessed by folding them at the same spot repeatedly until they broke [35]. The results ranged from 113 ± 0.6 to 124 ± 0.5 folds, confirming excellent mechanical strength. The F6 formulation exhibited the highest folding endurance (113 ± 0.6).

Drug Content Uniformity

The rutin content in each patch was measured using UV-Vis spectrophotometry at 360 nm, and uniformity was expressed as a percentage [36]. The drug content across all formulations was within 98.2 ± 0.3% to 99.7 ± 0.3%, ensuring homogenous drug dispersion.

In-vitro Drug Release

In-vitro drug release studies were conducted using a Franz diffusion cell with phosphate buffer (pH 7.4) as the receptor medium [37]. Samples were withdrawn at regular intervals and analyzed using UV spectroscopy. Drug release varied among formulations, with F6 showing the highest drug release (90.5%), while other formulations exhibited release values between 72% and 88.4%.

Ex-vivo Permeation Studies

Ex-vivo permeation studies were performed using excised rat skin mounted on a Franz diffusion cell to assess rutin permeation through biological membranes [38]. Cumulative drug permeation was measured over 24 hours, and the results indicated sustained release patterns, with F6 demonstrating the most favorable permeation profile.

RESULTS AND DISCUSSION

Preformulation studies
Identification of drug
FTIR spectroscopy

FTIR study was performed on Rutin for determination of functional groups that will describe the identity. The sample used for FTIR and their results shown in Figure below for Rutin, PVA, HPMC and EC respectively. Interpretation of FTIR spectra of Rutin, PVA, HPMC and EC suggests that the observed peak list meets with that of the reference peak list (Fig 7.1, 7.2, 7.3, 7.4)

Zufisha Bakhtiar Ansari *et al.,*

UV Spectroscopy
Determination of lambda max
The absorption maximum of Rutin was measured by UV/Visible spectrophotometer and found to be 355 nm in methanol which was found to be very near to the reported value.

Melting Point
Melting point of the drug was found to be similar to the reported value which proved that the received drug samples meet the reported properties. Any impurity, if present, will cause variation in the melting point of a given drug substance. Reported melting point of Rutin is 195°C. When melting point of drug was carried out using capillary method drug starts to melt at 192°C and completely melted at 195°C. From the above test it was found that the sample drug complies with the standard test of Rutin.

Organoleptic Properties
Rutinis Greenish-yellow fine powder with characteristic odor.

Solubility
The solubility of Rutin was determined in different media. The results of the solubility of Rutin are given in table 7.1. From the solubility profile it can be concluded that the drug is very slightly soluble in water however soluble in methanol.

Partition coefficient
Partition coefficient values of Rutin were found to be at 7.04 (octanol/water). It indicates that it is preferentially soluble in octanol compared to water. This means that rutin is more lipophilic (fat-soluble) than hydrophilic (water-soluble). Specifically, for a partition coefficient of 7.04, the concentration of rutin in octanol is about 7.04 times higher than in water. This property is important for understanding how rutin might behave in biological systems, such as its ability to cross cell membranes, which are lipid bilayers. A higher partition coefficient suggests that rutin may have a better potential to be absorbed through cell membranes and interact with lipophilic (fat-based) structures, though its hydrophobicity could limit its water solubility and bioavailability.

Drug Excipients Compatibility Studies
This study was performed to determine any physical change in the drug when kept in contact with various excipients. From the above interpretation it is found that the major functional groups present in the reported structure of Rutin are also present in the FTIR of HPMC, EC and PVA, Observing the results of drug-carrier compatibility study, it was concluded that there was no physical incompatibility between drug and selected formulation excipients.

Preparation of calibration curve
Calibration curve of Rutin in methanol
Formulation of Dermal patches
Formulation table of dermal patches (by QbD software)
Evaluation of Rutin patches
The table provides detailed information on the formulation characteristics of various batches (F1 to F9) prepared using different concentrations of Hydroxypropyl Methylcellulose (HPMC) and Ethyl Cellulose (EC). The parameters analyzed include physical appearance, thickness, weight variation, moisture content, moisture uptake, folding endurance, drug content, and the percentage of drug release. Let's break down and analyze these results systematically:

Zufisha Bakhtiar Ansari *et al.,*

Physical Appearance and General Characteristics
All formulations exhibit a smooth, brown appearance, indicating consistency in the appearance and texture of the tablets across the batches. This uniformity could suggest that the excipients (HPMC and EC) are well-blended and provide stable formulations.

Thickness
The thickness of the formulations ranges from 0.16 mm to 0.19 mm, with F3 and F6 having the highest thickness (0.19 mm). These slight variations may be attributed to the different proportions of HPMC and EC used. The relatively consistent thickness across the formulations indicates good control over the manufacturing process, ensuring uniformity in the final product.

Weight Variation
The weight variation of the formulations is between 2.91±0.3 mg (F1) and 3.05±0.7 mg (F3). The weight variation remains relatively consistent, demonstrating that the formulations have been manufactured with good precision and are likely to be compliant with the quality control standards typically required for tablet dosage forms.

Moisture Content and Moisture Uptake
- Moisture Content: The moisture content ranges from 2.4% (F3) to 3.9% (F4). Moisture content is critical in tablet formulations, as it impacts the stability and integrity of the tablets. Generally, lower moisture content is preferable to avoid degradation or microbial growth, while excessive moisture could affect tablet dissolution and drug release.
- Moisture Uptake: This parameter measures how much moisture the tablet absorbs under certain conditions. Most formulations show a moisture uptake of around 21.47%, except for F6, which has a slightly lower uptake (18.29%). This could indicate that the balance of HPMC and EC in F6 contributes to lower moisture retention compared to the others, possibly enhancing stability.

Folding Endurance
Folding endurance reflects the mechanical strength and flexibility of the film or tablet. Higher folding endurance values indicate better resistance to cracking, which is vital for tablet durability. Formulations such as F4 (45.22 ± 0.4) stand out with significantly higher folding endurance, which could be attributed to the higher concentration of EC (100 mg). EC, known for its film-forming and protective properties, likely improves the mechanical properties of the tablet.

Drug Content
The drug content of the tablets remains consistent across formulations, with all formulations showing values close to the targeted drug content. The variation is minimal (11.2 ± 0.7 to 12.5 ± 0.8), indicating uniform distribution of the active pharmaceutical ingredient (API) in the tablets. This is crucial to ensure that each tablet delivers the correct dose to the patient.

Percentage Drug Release
- Drug Release Profile: The percentage of drug released varies across the formulations, with values ranging from 72% (F1) to 90.5% (F6). Formulation F6, containing 150 mg of HPMC and 50 mg of EC, shows the highest drug release (90.5%), which suggests that the combination of HPMC and EC in this formulation creates a more favorable environment for faster drug dissolution.
- Release Trends: Generally, formulations with higher HPMC concentrations (such as F3, F6, and F9) tend to release the drug more efficiently, with values nearing 90%. Formulations with higher EC concentrations, like F4 and F7, exhibit slightly slower drug release, indicating that EC could be controlling the release rate due to its hydrophobic nature, which tends to slow down the dissolution process.

Zufisha Bakhtiar Ansari *et al.,*

Observations and Insights

- Impact of HPMC and EC Concentrations: From the data, it can be observed that increasing the concentration of HPMC (from F1 to F9) leads to an increase in the percentage of drug released, particularly in formulations with 150 mg of HPMC. This suggests that HPMC plays a significant role in enhancing the dissolution rate of the drug. On the other hand, EC acts as a controlling agent for the release, as formulations with higher EC (like F4 and F7) tend to release the drug more slowly.
- Formulation F6: This formulation (150 mg HPMC, 50 mg EC) shows the best performance in terms of drug release (90.5%). The combination of higher HPMC content and lower EC content likely provides an optimal balance between drug release and stability. F6 could be considered as one of the most efficient formulations in this batch, offering fast drug release without compromising the stability of the tablet.
- Formulation F4: While F4 (100 mg HPMC, 100 mg EC) has a relatively high moisture content and folding endurance, the drug release is slightly lower (77%). The higher EC content here may slow down the drug release compared to formulations with less EC, which is consistent with the hydrophobic nature of EC.
- Other Formulations: The remaining formulations (F2, F3, F5, F7, F8) show moderate drug release profiles (between 76% and 84%), and the slight differences in drug release could be due to varying HPMC and EC concentrations. These formulations balance the stability and release rate of the drug but do not outperform F6 in terms of release.

CONCLUSION

Rutin, a flavonoid glycoside with known antioxidant and anti-inflammatory properties, was selected as the active ingredient for the preparation of dermal patches due to its potential therapeutic benefits for skin-related conditions. The identification and evaluation of Rutin were carried out through various characterization techniques to ensure its purity and suitability for patch formulation. Fourier Transform Infrared (FTIR) spectroscopy was employed to confirm the identity and purity of Rutin. The characteristic peaks observed in the FTIR spectra for Rutin at 3428 cm-1 (OH stretching), 2928 cm-1 (CH2 stretching), and 1487 cm-1 (C=O bending) are in alignment with the functional groups expected in Rutin's molecular structure. These peaks confirm the presence of hydroxyl, methylene, and carbonyl groups, respectively, which are consistent with the reported spectroscopic data for pure Rutin. The absence of any additional or unexpected peaks further suggests that the drug is pure and has not undergone any degradation or chemical transformation during the extraction process. The absorption maximum (λ_max) of Rutin was measured using a UV/Visible spectrophotometer in methanol and was found to be 355 nm, which is in close agreement with the reported value for Rutin. This confirms the reliability of the measurement and validates the purity of the compound. The absorbance peak at 355 nm serves as a reference for quantification of Rutin in the dermal patch formulation, enabling accurate dosage during patch preparation. The melting point of Rutin was determined using the capillary method and found to be 192°C to 195°C. This observed range is consistent with the known melting point of pure Rutin, which typically falls around 191-193°C. The close match further supports the purity of the compound and provides additional evidence that Rutin has retained its physical characteristics during the formulation process. The organoleptic evaluation of Rutin revealed that it is a greenish-yellow fine powder with a characteristic odor. This sensory characteristic is a useful quality control parameter, as it provides a visual and olfactory means of identifying Rutin in its raw form. The color and fine texture of the powder suggest good solubility potential, which is important for its formulation into dermal patches, where consistent drug release is essential for efficacy. The results from FTIR, UV/Visible spectroscopy, melting point determination, and organoleptic evaluation confirm that Rutin is pure, stable, and suitable for use as an active ingredient in dermal patch formulations. The accurate identification and characterization of Rutin are crucial steps in ensuring the quality, consistency, and efficacy of the final dosage form. These evaluations provide a solid foundation for further development and optimization of Rutin-based dermal patches for therapeutic use. Partition coefficient values of Rutin were found to be at 7.04 (octanol/water). It indicates that it is preferentially soluble in octanol compared to water. This means that rutin is more lipophilic(fat-soluble) than hydrophilic (water-soluble). Specifically, for a partition coefficient of 7.04, the concentration of rutin in octanol is about 7.04 times higher than in water.

Zufisha Bakhtiar Ansari *et al.,*

The solubility of Rutin in various solvents was evaluated to understand its potential for formulation in different drug delivery systems. The results show significant variation in Rutin's solubility across different solvents, highlighting its compatibility with both organic and aqueous systems. Methanol (55 mg/ml) stands out as the most suitable solvent, offering the highest solubility, which may be advantageous for preparing concentrated formulations or solutions for further processing. Dimethyl Formamide (25 mg/ml) and DMSO (20 mg/ml) also show high solubility, suggesting they can be useful for dissolving Rutin in more specialized or organic-based formulations, such as topical or injectable drug delivery systems. Ethanol (0.55 mg/ml) provides moderate solubility, which may limit its use for highly concentrated formulations but could still be useful in combination with other solvents for drug formulations. Water (0.125 mg/ml) exhibits the lowest solubility, which may pose challenges for formulations intended for aqueous-based delivery systems unless the solubility is enhanced by excipients or other solubilizing agents. PBS (pH 7.4) (16 mg/ml) demonstrates reasonable solubility and is ideal for formulations targeting physiological environments, such as dermal or transdermal patches, where the drug needs to be stable at body pH. These solubility profiles indicate that Rutin has a better affinity for organic solvents, but its moderate solubility in aqueous media like PBS suggests its potential for use in systems where drug release needs to be controlled in a physiological setting. Evaluation of Rutin patches was performed using various parameters, results revealed that on increasing the concentration of HPMC (from F1 to F9) leads to an increase in the percentage of drug released, particularly in formulations with 150 mg of HPMC. This suggests that HPMC plays a significant role in enhancing the dissolution rate of the drug. On the other hand, EC acts as a controlling agent for the release, as formulations with higher EC (like F4 and F7) tend to release the drug more slowly.

Formulation F6
This formulation (150 mg HPMC, 50 mg EC) shows the best performance in terms of drug release (90.5%). The combination of higher HPMC content and lower EC content likely provides an optimal balance between drug release and stability. F6 could be considered as one of the most efficient formulations in this batch, offering fast drug release without compromising the stability of the tablet.

Formulation F4
While F4 (100 mg HPMC, 100 mg EC) has a relatively high moisture content and folding endurance, the drug release is slightly lower (77%). The higher EC content here may slow down the drug release compared to formulations with less EC, which is consistent with the hydrophobic nature of EC. The remaining formulations (F2, F3, F5, F7, F8) show moderate drug release profiles (between 76% and 84%), and the slight differences in drug release could be due to varying HPMC and EC concentrations. These formulations balance the stability and release rate of the drug but do not outperform F6 in terms of release.

ABSTRACT

In Metabolic Syndrome (MetS), one finds a strong link between lifestyle and health issues of an individual. The goal of this study was to find the separate and combined impact of dietary and exercise intervention on subjects (n=89) with MetS in Punjabi community. The MetS patients were randomly assigned into experimental groups that received counseling ongroup I: diet, group II: exercise, group III diet and exercise for 90 days. Whilefourth group received one-time diet-exercise counseling. After intervention, they were assessed for anthropometric measurements, blood pressure and biochemical evaluation and compared with pretest results based on IDF (International Diabetes Federation) criterion for MetS. Diet and exercise intervention group presented the highest reduction: 50% in MetS, among all groups.; 21.7%.Diet intervention lowered body weight (p=0.002), BMI (p=0.002), and waist circumference (p<0.001). Exercise intervention lowered body weight (p<0.001), BMI (p<0.001), waist circumference (p=0.001). Combined diet-exercise intervention decreased body weight (p<0.001), BMI (p<0.001), and waist circumference (p<0.001). Reductions in systolic and diastolic blood pressure were seen in diet (p=0.006, p=0.013), exercise (p=0.008, p=0.043), and diet-exercise (p=0.02, p=0.003) groups. Biochemical improvements were seen in diet group's HDL-cholesterol (p<0.001), LDL-cholesterol (p=0.009); exercise group's triglycerides (p=0.04), HDL-cholesterol (p<0.001), LDL-cholesterol (p=0.005); diet-exercise group's HDL-cholesterol (p<0.001), LDL-cholesterol (p=0.039).

Keywords: metabolic syndrome, Punjabi community, diet, exercise.

INTRODUCTION

MetSis a combination of health problems bunched together share common cardio-metabolic risk factors including "abdominal obesity, dyslipidemia, hypertension, and type2 diabetes" (Aguilar-Salinas & Viveros-Ruiz, 2019).In MetS, one finds a profound relationship between lifestyle and pathology of an individual (Verma *et al.,* 2018). The most generally definition used in studies is given by IDF which agreed that a combination of three or more components of MetS must be present. The definition given by IDF states that "for a person to be defined as having the MetS they must have central obesity (defined as waist circumference with ethnicity specific values; for Indian males ≥90 cm and females≥80cm plus any two of the following four factors: raised triglycerides ≥ 50 mg/dL (1.7 mmol/L) or specific treatment for this lipid abnormality, reduced HDL cholesterol<40mg/dL (1.03mmol/L) in males, <50 mg/dL (1.29 mmol/L) in females, or specific treatment for this lipid abnormality, raised blood pressure: systolic BP≥130 or diastolic BP≥85mmHg, or treatment of previously diagnosed hypertension, raised Fasting Plasma Glucose (FPG)≥ 100 mg/dL (5.6 mmol/L), or previously diagnosed type 2 diabetes If above 5.6 mmol/L or 100 mg/dL, OGTT (Oral Glucose Tolerance Test) is strongly recommended but is not necessary to define presence of the syndrome" (IDF, 2005). Lifestyle and type of food consumed can have a lasting impact on the development of non-communicable diseases and MetS (Anderssen *et al.,* 2007). Culture and social activities followed by different communities all over the world is a major factor which influences the health of the people (Duggal, 2013). One such is the Punjabi community, which has a rich culture and may live an unhealthy lifestyle, especially in urban areas. The effect of lifestyle has been reported in studies making the Punjabi community a vulnerable group for non-communicable diseases and MetS. A study on the Punjabi community (Jaipur), had a high incidence of coronary risk factors indicating poor cardio-vascular health (Gupta *et al.,* 2004). In another research, alcohol consumption patterns were identified in the Punjabi community in which men had alcohol-use-related problems while women abstained from it (Weber, 1996). In a study conducted on the Punjabi Sikh community in Amritsar found the prevalence of MetS: 34.3% with a higher incidence in females (41.4%) in comparison to males (28.2%) (Singh et al., 2016). Prevalence of obesity and several other non-communicable diseases were also assessed in children and their parents of the Punjabi community linking genetics and lifestyle risk factors together (Sangha *et al.,* 2006). It's prevention and management in Punjabi community, a vulnerable group, call for awareness, promotion of healthy lifestyle and eating behavior.

The management of MetS lies in lifestyle changes including following healthy behavioral, dietary, and physical activity patterns as given in statement by Korean Society of Cardiometabolic Syndrome (Kim et al., 2022). Several studies have been done to understand the impact of lifestyle modification in community-based study but comparative studies like the present one clarifies different approaches to mitigate risk as depicted in figure 1. A hospital study in Ethiopia demonstrated that people with type2 diabetes are at an elevated risk for MetS calling for urgency for early intervention programs through diet and exercise discipline (Charkos *et al.,* 2023). Another investigation in a cluster randomized control trial adopted a comprehensive strategy to mitigate the risk of MetS, incorporating dietary regulation, heightened physical activity and exercise, self-assessment, problem-solving, and a training regimen (Chang et al., 2023). A substantial cohort investigation revealed that adopting a nutritious plant-based diet rich in fruits, vegetables, whole grains, and legumes, while minimizing intake of refined and processed sweets, salty and fatty foods, as well as animal-based products, is associated with a reduced risk of cardiovascular diseases, type 2 diabetes, and MetS. These findings underscore the efficacy of high-quality plant-based diets in preventing MetS and underscore the importance of incorporating them into dietary intervention programs (Vajdi, *et al.,* 2023). Recent reviews have highlighted the potential use of plant-based foods involving nutraceuticals extracted from plants like herbs, spices, condiments, fruits, and vegetables to manage MetS (Mohamed *et al.,* 2023). Physical activity has emerged as the primary preventive measure in recent research for addressing MetS and managing diabetes (Syeda et al., 2023). Consequently, the current study incorporates exercise, recognizing that dietary interventions alone may not yield substantial impact. The goal of this study was to find the separate and combined impact of dietary and exercise intervention on subjects (n=89) with MetS in Punjabi community.

Participants and Methods
Participation and Data Collection

The sample size was calculated by placing the significance criterion at 0.5 and power at 0.80, using a previous study (Bansal & Joshi, 2015) and a larger sample size of 500 subjects against the calculated was employed (Charan & Biswas, 2013). In total 48 sample's data was removed due to missing information and unwillingness to participate in the study. Stratified random sampling method was employed and the subjects were allocated into strata, grounded on geographical areas (districts of West Delhi), age, and sex based on population by religious community of NCT Delhi data (Open Government Data, 2020; Investopedia, 2022). The health camp was organized in Gurdwara of West Delhi districts- Punjabi Bagh, Patel Nagar, Rajouri Garden. The information requisite to socio-demographic characteristics, health status, physical activity score (Sharkey & Gaskill, 2009) and dietary record was collected through pre-tested questionnaire. The anthropometric data including height, weight, and waist circumference was measured using standard protocols (Casadei & Kiel, 2021). The systolic and diastolic blood pressure was measured by taking at least two consecutive readings (Ogedegbe & Pickering, 2010). The subjects with raised waist circumference were further screened and asked to complete 12 hours fasting, after which 5mL of blood sample was drawn by trained personnel intravenously. The analysis of blood sample was done to detect fasting blood glucose level and lipid profile in a standard laboratory using spectrophotometry and enzymatic kit method (Dingeon, 1975; McGowan et al., 1983; Burstein et al., 1970; Knopfholz *et al.,* 2014; Allain *et al.,* 1974). A signed informed consent was obtained prior to the initiation of screening from all the subjects willing to participate after brief explanation about the purpose of the study. The study was approved by institutional ethics committee, protocol number: Ph.D./2019/272 on date 22.04.2019, prior to the commencement of the study.

Intervention

Subjects diagnosed with MetS and interested to participate (89) were randomly allocated into four groups: diet, exercise, combined diet and exercise and control. The purpose of this experiment was to create awareness about the management of MetS to alleviate the effects of modifiable primary risk factors like obesity, low physical activity, and high carbohydrate/fat diet through the implementation of an intervention program. A pre-test, post-test experimental design with control was employed to evaluate the impact of the intervention program. The sub sample of 89 participants who met the criteria of MetS were enrolled in the intervention program and received a comprehensive intensive counseling once in every two weeks for a period of three months. The 89 participants were divided into four groups and the separate and shared effects of diet and exercise counseling for the risk factors of MetS were examined. Participants who showed genuine interest in the intervention were assigned into any one of the counseling activities of their choice.

Experimental Group I- Participants who received periodic intensive counseling on diet

The participants of group I had to go through a dietary intervention and an individualized nutritional follow up on a fortnightly basis. The educational sessions were designed to discuss changes in eating habits and impart nutritional guidelines to promote weight loss and to improve the nutritional status and lifestyle. A personalized written/soft copy calorie modified metabolic customized weekly diet plan, according to the participant's weight and height, and informed dietary habits. The macronutrient distribution involved up to 50-60% carbohydrates, about 15-20% proteins, and less than 30% fat in which <10% saturated fat, up to 10% polyunsaturated fat. At least 20 to 30g fiber was recommended in the daily diet. Dietary guidelines about cooking preparation methods, limiting fat consumption, cutting on salt, avoiding drinks and foods that may become hidden sources of sugars and limiting alcoholic beverages. In addition to this, alternatives when eating out like making healthy food choices were told to them. Corresponding to diagnosed symptoms of MetS, dietary restrictions were posed. A list of healthy foods was provided to guide them with food choices (Khanna et al., 2016, Zivkovic *et al.,* 2007).Recommendations for physical activity. A copy of the educational pamphlets.Explanation about benefits of optimal dietary habits and physical activity in alleviating the danger of MetS was provided. Interactive sessions with the investigator via phone call on the following aspects were also organized to educate the subjects. The dietary guidance was tailored and modified corresponding to their dietary patterns and metabolic profile. Participants were recommended to focus on eating vegetables, fruits, and fibres from whole grains and pulses/legumes.

Experimental Group Il- Participants who received periodic intensive counseling on exercise

The participants of this group were counseled on the benefits of physical activity and taught ways to increase their daily physical activity and to incorporate bodily movements into a habit. In this study, the term "physical activity" ("bodily movement that significantly increases energy expenditure") is interchanged with "exercise", that is a subcategory of physical activity performed with the purpose of improving physical fitness like in increasing cardiovascular strength and flexibility exercise (Colberg et al., 2010). Every subject in this group was advised to go for a "brisk walk for 60 minutes for 5 to 6 days in a week". The participants were left to decide how, where, and when would they walk. The participants were regularly contacted and asked to record the date and duration of each session. Altogether, this exercise corresponded to "an average of 150-300 minutes of physical activity/week" throughout the intervention period of 90 days as per WHO guidelines (WHO, 2020). In addition to this, participants were asked to do one type of sport/yoga/exercise of their choice daily for at least 30 minutes/day.

Experimental Group III- Participants who received periodic intensive nutrition and exercise

This group received a comprehensive intensive nutritional counseling that combined the guidelines imparted to subjects of Groups I and II**.**

Control Group- Participants who served as control group

At the beginning of the study, this group received only one time counseling. The participants in this group did not alter their diet or physical activity pattern for the period of three months. The counseling sessions were organized for all the experimental groups once in every two weeks for a period of three months (90 days). During the entire study period individual meetings via phone call at regular fortnightly intervals were conducted to reinforce the importance of eating habits modifications and regular physical activity and to answer any questions related to all the subjects prescribed dietary plan. Telephonic reminders and SMS alerts were given regularly to all the subjects asking them to attend the review sessions that served as astimulus to improve the participant's adherence to the intervention. Anthropometric measurements, blood pressure levels and all the biochemical parameters of the participants belonging to all the experimental and control groups were reassessed after the three-month period was over. Arrangements for blood and laboratory examinations were performed in the standard laboratory. The investigation team included the investigator, lab technician for collecting blood sample, and one trained personnel for assisting in data collection and taking anthropometric measurements.

Post Intervention

After the intervention period, the participants representing improvement in metabolic syndrome were awarded with a certificate of championship and asked to set up of community health group in the gurudwara premises to advocate the importance of diet and exercise by sharing guidelines, what they have learnt in the intervention program. Online community groups were made, and champions were asked to conduct monthly meetings with people to share their knowledge and resource materials provided to them that will motivate others to practice diet and exercise as a way of living. This has helped them to practice long term sustainability by 'learning by doing method community approach' and allowed self-intervention. Further, champions were asked to become health ambassadors of their community and incorporate special sessions on religious events and distribute healthy meals and refrain from fried/fatty/sugary foods as offerings during prayers.

Data Analysis

The data obtained was analyzed using SPSS ver. 20 software. A p value <0.05 was considered statistically significant. Continuous variables are presented as mean and standard deviation (SD). Categorical variables are presented as absolute, relative frequencies or prevalence. Students t-test and paired t-test were used as appropriate for testing statistical significance. The paired t-test was used to analyze different outcomes between intervention baseline and endpoint for variables.

Deepika Dhawan *et al.,*

RESULTS

Mean anthropometric measurements of the subjects across groups pre and post intervention. In group I, before diet intervention, the mean body weight was 84.2kg, BMI was 29.4kg/m² and waist circumference was 99.6cm. A marginal decline in mean body weight: 82.7kg, BMI: 28.9kg/m² and waist circumference: 97.4cm after diet intervention. The p values for body weight: 0.002, BMI: 0.002, waist circumference: p<0.001, representing a significant difference at p<0.05 in body weight, BMI, and waist circumference of subjects before and after diet intervention. In group II, before exercise intervention, the mean body weight was 79.1kg, BMI was 29.6kg/m² and waist circumference was 98.6cm. A marginal decline in average body weight: 77.6kg, BMI: 29.1kg/m² and waist circumference: 97.3cm after exercise intervention. The p values for body weight: p<0.001, BMI: p<0.001, waist circumference: 0.001, representing a significant difference at p<0.05 in body weight, BMI, and waist circumference of subjects before and after exercise intervention. In group III, before diet and exercise intervention, the mean body weight was 82.0kg, BMI was 30.0kg/m² and waist circumference was 100cm. A marginal decline in average body weight: 80.5kg, BMI: 29.4kg/m² and waist circumference: 99.5cm after diet and exercise intervention. The p values for body weight: p<0.001, BMI: p<0.001, waist circumference: p<0.001, representing significant difference at p<0.05 in body weight, BMI, and waist circumference of subjects before and after in diet and exercise group. In control group, before intervention period, the mean body weight was 82.9kg, BMI was 30.4kg/m² and waist circumference was 103cm. A marginal rise in average body weight: 83.0kg and BMI: 30.5kg/m² while no reduction in waist circumference: 103cm after the study period. The p values for body weight: 0.350, BMI: 0.300, waist circumference: 0.350, representing significant no difference at p<0.05 in body weight, BMI, and waist circumference of subjects as depicted in Table 1. There was significant reduction after intervention indicating that subjects benefited from intervention counseling in comparison to control group in body weight, BMI, and waist circumference. [1]

Significant at p<0.05; ²Not Significant; p value indicates significant difference in body weight for group I, II, III; in BMI for group I, II, III; in waist circumference for group I, II, III; control group shows no significant difference. A comparison of the mean reduction/increment and test of significance in the anthropometric measurements among the intervention groups at the completion of the study period. It was found that there was highest reduction in body weight in diet-exercise intervention group (-1.6kg), increment in control group (+0.13kg) as represented in Table 2. There was a reduction in BMI in diet-exercise intervention group (-0.58kg/m²) and increment in control group (+0.06kg/m²). While the highest reduction in waist circumference in diet group (-2.2cm) and lowest in control group (-0.11cm). [a, b, c] within a row, means without a common sub script differ p < 0.05; highest reduction in body weight in diet-exercise intervention group (-1.6kg) & increment in control group (+0.13kg); reduction in BMI in diet-exercise intervention group (-0.58kg/m²) & increment in control group (+0.06kg/m²); highest reduction in waist circumference in diet group (-2.2cm) & lowest in control group (-0.11cm). The mean systolic and diastolic blood pressure of the subjects across groups pre and post-intervention. In group I, before diet intervention, the mean systolic blood pressure was 140mmHg and diastolic blood pressure was 86.4mmHg. A marginal decline in average systolic blood pressure was 134mmHg and diastolic blood pressure was 82.8mmHg after diet intervention. The p value for systolic: 0.006 and diastolic: 0.013, former shows significant difference, while the later has no significant difference before and after intervention period. In group II, before exercise intervention, the mean systolic blood pressure was 125mmHg and diastolic blood pressure was 81.0mmHg. A marginal decline in average systolic blood pressure was 120mmHg and diastolic blood pressure was 78.4mmHg after exercise intervention. The p value for systolic: 0.008 and diastolic: 0.043, shows significant difference before and after intervention period. In group III, before diet and exercise intervention, the mean systolic blood pressure was 132mmHg and diastolic blood pressure was 82.6mmHg. A marginal decline in average systolic blood pressure was 128mmHg and diastolic blood pressure was 79.5mmHg after diet-exercise intervention. The p value for systolic: 0.02 and diastolic: 0.003, shows significant difference before and after intervention period. In control group, before study period, the mean systolic blood pressure was 135mmHg and diastolic blood pressure was 85.4mmHg. A marginal decline in average systolic blood pressure was 134mmHg and diastolic blood pressure was 80.8mmHg after study period. The p value for systolic: 0.295 and diastolic: 0.006, former shows no significant difference, while the later has significant difference before and after study period as represented

94967

in Table 3. [1]Significant at p<0.05; [2]Not Significant; p value indicates significant difference in systolic blood pressure for group I, II, III; in diastolic for group II, III, control; control group shows no significant difference for systolic; group I shows no significant difference for diastolic blood pressure. Table 4 represents a comparison of the mean reduction/increment and test of significance in the systolic and diastolic blood pressure among the intervention groups at the completion of the study period. It was found that there is highest reduction in systolic blood pressure in diet group (-6.0mmHg) and lowest in control group (-1.0mmHg). While highest reduction in diastolic blood pressure in control group (-4.6mmHg) and lowest in exercise group (-2.6mmHg). Table 4: Comparison of the mean reduction/increment and test of significance in the systolic and diastolic blood pressure among the intervention groups at the completion of the study period [a] within a row, means without a common subscript differ p < 0.05; highest reduction in systolic blood pressure in diet group (-6.0mmHg) & lowest in control group (-1.0mmHg); highest reduction in diastolic blood pressure in control group (-4.6mmHg) & lowest in exercise group (-2.6mmHg).

The mean biochemical profile of the subjects across groups pre and post diet intervention. In group I, before diet intervention, the mean fasting blood glucose was 93.3mg/dL, total triglycerides were 174mg/dL, HDL-cholesterol was 47.9mg/dL and LDL-cholesterol were 110mg/dL. A marginal decrease in mean fasting blood glucose 90.6mg/dL, total triglycerides 153mg/dL and LDL-cholesterol 104mg/dL and an increase in HDL-cholesterol was 50.5mg/dL after the diet intervention. The p value for fasting blood glucose: 0.186, triglycerides: 0.051, HDL-cholesterol: p<0.001and LDL-cholesterol: 0.009, significant at p<0.05. In group II, before exercise intervention, the mean fasting blood glucose was 103mg/dL, total triglycerides were 167mg/dL, HDL-cholesterol was 46.8mg/dL and LDL-cholesterol were 116mg/dL.

A marginal reduction in mean fasting blood glucose 99.8mg/dL, total triglycerides 159mg/dL and LDL-cholesterol 108mg/dL and an increase in HDL-cholesterol was 49.0mg/dL after the exercise intervention. The p value for fasting blood glucose: 0.06, triglycerides: 0.04, HDL-cholesterol: p<0.001 and LDL-cholesterol: 0.005, significant at p<0.05. In group III, before diet-exercise intervention, the mean fasting blood glucose was 122mg/dL, total triglycerides were 149mg/dL, HDL-cholesterol was 48.0mg/dL and LDL-cholesterol were 123mg/dL. A marginal decline in mean fasting blood glucose 106mg/dL, total triglycerides 147mg/dL and LDL-cholesterol 116mg/dL and an increase in HDL-cholesterol was 49.5mg/dL after the exercise intervention. The p value for fasting blood glucose:0.08, triglycerides: 0.324, HDL-cholesterol: 0.022 and LDL-cholesterol: 0.039, significant at p<0.05. In control group, before study period the mean fasting blood glucose was 109mg/dL, total triglycerides were 194mg/dL, HDL-cholesterol was 50.0mg/dL and LDL-cholesterol were 129mg/dL as represented in Table 5. A marginal decline in mean fasting blood glucose 105mg/dL, total triglycerides 182mg/dL and LDL-cholesterol 124mg/dL and a slight increase in HDL-cholesterol was 50.4mg/dL after the study period. The p value for fasting blood glucose:0.059, triglycerides: 0.019, HDL-cholesterol: 0.326 and LDL-cholesterol: 0.003, significant at p<0.05. [1]Significant at p<0.05; [2]Not Significant; p value indicates no significant difference in fasting blood glucose for group I, II, III & control; p value indicates significant difference in triglycerides for group II & control and no significant difference for group I & III; p value indicates significant difference in HDL-cholesterol for group I, II, III & no significant difference in control group; p value indicates significant difference in LDL-cholesterol for group I, II, III & control.

Table 6 represents a comparison of the mean reduction/increment and test of significance in the biochemical profile among the intervention groups at the completion of the study period. The highest reduction in fasting plasma glucose in diet-exercise intervention group (-16.0mg/dL) and lowest in diet group (-2.7mg/dL). The highest reduction in triglycerides in diet group (-21.0mg/dL) and lowest in diet-exercise (-2.0mg/dL). The highest increment in HDL cholesterol in diet group (+2.6mg/dL) and lowest in control group (+0.43mg/dL). While the highest reduction in LDL cholesterol was seen in exercise group (-8.0mg/dL) and lowest in control group (-5.9mg/dL). [a] within a row, means without a common subscript differ p < 0.05; highest reduction in fasting plasma glucose in diet-exercise intervention group (-16.0mg/dL) & lowest in diet group (-2.7mg/dL); highest reduction in triglycerides in diet group (-21.0mg/dL) & lowest in diet-exercise (-2.0mg/dL); highest increment in HDL cholesterol in diet group (+2.6mg/dL) & lowest in control group (+0.43mg/dL); highest reduction in LDL cholesterol was seen in exercise group (-8.0mg/dL) & lowest in control group (-5.9mg/dL). Table 7 represents the status of MetS after the intervention is over. It has been found that combined diet and exercise intervention group showed highest reduction in prevalence of MetS among diet, exercise, and control groups. Among 23 subjects, about 50% subjects did not suffer from MetS in diet and exercise group. The

94968

diet intervention group also performed well, as 45.5% subjects did not have MetS after the study period. While, in exercise intervention, 36.4% subjects did not have MetS. The control group had highest prevalence of MetS, as only 21.7% subjects did not have MetS after the completion of the study. Group III, combined diet and exercise intervention group showed highest reduction: 50% in MetS, among diet, exercise, and control groups.

DISCUSSION

The subjects diagnosed with MetS were allocated into experimental groups- Diet, Exercise, and Diet-Exercise Intervention and Control, and thus subjected to comparative pre and post intervention analysis. Lifestyle intervention programs comprising diet and exercise intervention have been found to be effective in improving components of MetS in randomized control trials (Joseph et al., 2019; Luo et al., 2013). Here too, it was observed that the effect of diet-exercise intervention was helpful in weight loss, reducing BMI and managing abdominal obesity much like the observations of Chen et al., 2006. In the present study, paired t-test for anthropometric measurements for diet, exercise, and diet-exercise groups showed significant difference among groups except for the control group. The individual risk factors of MetS showed significant improvements and the most reduction in body weight was seen in diet-exercise intervention group (-1.6kg) vis-a-vis increment in control group (+0.13kg). Consequently, a corresponding reduction in BMI was seen in diet-exercise intervention group (-0.58kg/m²) and an upswing in control group (+0.06kg/m²). The highest reduction in waist circumference was seen in diet group (-2.2cm) and lowest in control group (-0.11cm). Another study indicated that diet intervention becomes helpful in managing blood pressure levels and dyslipidemia (Aude et al., 2004). In this study too, a comparison of results of pre and post intervention study period, revealed a significant difference for separate diet and exercise groups for systolic blood pressure. However, diet-exercise and control group did not perform as well. While for diastolic blood pressure, significant difference was seen in diet-exercise and control groups, the separate diet and exercise group did not lower it as well. The highest reduction in systolic blood pressure was seen in diet group (-6.0mmHg) and lowest in control group (-1.0mmHg). On the contrary, the highest reduction in diastolic blood pressure was seen in control group (-4.6mmHg) and lowest in exercise group (-2.6mmHg).

Education based intervention programs based on lifestyle modification, especially focused on diet and physical activity become helpful in managing hyperglycemia and dyslipidemia. A systematic review conducted by Peiris et al., (2021) found that such behavior-changing programs possess beneficial effects on MetS. While in the present study, the biochemical parameters showed significant difference in diet group, for HDL and LDL cholesterol, but fasting blood glucose and triglycerides could not register significant difference. While in exercise group, a significant difference was observed for triglycerides, HDL, and LDL cholesterol, fasting blood glucose did not show significant difference. In diet-exercise intervention group, a significant difference was observed in HDL and LDL cholesterol, but not in fasting blood glucose and triglycerides that differed non significantly. In control group, a significant difference was observed for triglycerides and LDL cholesterol, but not for fasting blood glucose and HDL cholesterol. Thus, in this study on people of Punjabi community, benefits of intervention program were seen and when groups were compared an improvement was found mostly in diet and diet-exercise intervention groups where the highest reduction in fasting plasma glucose was seen in diet-exercise intervention group (-16.0mg/dL) and lowest in diet group (-2.7mg/dL). Further, the highest reduction in triglycerides was seen in diet group (-21.0mg/dL) and lowest in diet-exercise (-2.0mg/dL). Also, the highest increment in HDL cholesterol was seen in diet group (+2.6mg/dL) and lowest in control group (+0.43mg/dL). However, the highest reduction in LDL cholesterol was seen in exercise group (-8.0mg/dL) and lowest in control group (-5.9mg/dL).A recent investigation implemented a 13-week intervention focusing on a plant-based diet, revealing a correlation with weight reduction and elevated levels of HDL cholesterol. Both outcomes are crucial factors in addressing MetS and present study underscores the use of plant-based foods in diet regimen (McGrath & Fernandez, 2022). A meta-analysis done on a group of studies among diabetic population provided with diet-exercise intervention found energy and fat restriction with moderate aerobic exercises, a significant reduction in BMI, blood pressure, triglycerides, HDL cholesterol and blood sugar levels, when done for one year period (Appuhammy et al.,2014). In the current study, the prevalence of MetS was reduced the most in diet-

exercise group as 50% of subjects did not suffer from it after study period. While lowest reduction was seen in control group as 21.7% of subjects have not had MetS after study period. It may be concluded that diet-exercise intervention group showed better improvement in MetS in comparison to other groups. A similar study done on subjects with MetS revealed that the combined diet and exercise intervention showed better reduction in MetS in comparison to separate interventions. However, the period of study was one year, much longer than the present study (Anderssen et al., 2007). While the limitation of this study was that the intervention period could have been for a more considerabletime and include a long-term follow-up program to get a persistent benefit.Machine leaning models can be developed to predict sustainability trends in similar studies but require larger population dataset with periodic intervention records on the same group. The present study had small size and single time intervention that limits the possibility to check sustainability trends. In a recent study involving African women, findings demonstrated that the implementation of a diabetes prevention lifestyle intervention resulted in a significant reduction of 10.86% in the risk of developing MetS (Mamun, et al., 2020).A recent study utilized technology-based lifestyle interventions, and a better adherence was observed in the management of MetS, while present study also used technology based communication channels (Lee et al., 2022). A systematic review on diet and lifestyle modification intervention in randomized control trials concluded that such intervention programs are of great potential especially when done on relatively younger population wherein MetS is at the early stage and patients are asymptomatically ill.

Previous studies show that practical guidance, trust between the researcher and participants and, above all, regular consultations are crucial for reducing symptoms of MetS in patients. Such studies allow better intervention sustainability and lifelong learning in participants promoting healthy lifestyle and wellbeing. These intervention-based studies also offer better evidence to the health professionals and public health policy makers (Kataria et al., 2013). Another recent systematic review and meta-analysis compared diet, exercise, and combined intervention groups to review health outcomes relating overweight, obesity and lipid profiles found risk reduction, that too maximum in exercise group (Khalafi *et al.,* 2023). The study emphasizes the usefulness of combined diet and exercise interventions in managing MetS-related indicators and are coherent with previous research and is aligned with early-stage intervention and promotes lifelong learning. The findings of the study have direct applications, that give insights for healthcare practitioners and policy makers, as it offers practical strategies to improve health outcomes in vulnerable populations.   Community based intervention studies also have social implications on the population. The health camp organized in the Gurdwaras had a visible impact on the Punjabi community. They got benefitted from the health camps as their nutritional status was assessed. Besides, provision of on-the-spot verbal counseling, irrespective of presence or absence of MetS, helped them in clearing their doubts regarding diet and exercise modifications in their day-to-day life. The face-to-face feedback from the subjects also motivated other visitors to the Gurdwaras to actively participate in the study. While the subjects that received intensive counseling for three months also had a positive outlook towards lifestyle modification during the study as also in further follow-up after the completion of study period.

CONCLUSION

The multi-prolonged nature of MetS makes it a complex metabolic disease. It comprises risk factors that include raised waist circumference, blood pressure, triglycerides, fasting blood glucose, and low HDL cholesterol. Presence of abdominal obesity along with at least two other factors make the person qualify for being a victim of MetS. In the present study, abdominal obesity was found to be a predominant risk factor prevalent in the Punjabi community. The other risk factors had variable prevalence among the subjects. Most of the subjects seemed to have fallen prey to MetS due to imbalanced diet partaking owing to poor dietary habits. The low physical activity level has been a common behavioral denominator as many, if not all, did not follow a fitness regime. The subjects diagnosed with MetS when provided with behavior change intervention showed improvement in one or more components of MetS. The diet-exercise intervention proved more beneficial in reducing symptoms of MetS in comparison to diet or exercise intervention alone. Such interventions allow long-lasting effects on the community to manage MetS and the resultant non-communicable diseases with an augmented awareness level and its translation into improved dietary

and lifestyle practices. Building up of a resolve works wonders in transforming the hapless couch potatoes into shapely, healthy human beings.

ABSTRACT

The concept of complex interval-valued intuitionistic fuzzyset is extended by introducing primary complex interval-valued intuitionistic fuzzy *M*group using this concept primary complex interval-valued intuitionistic fuzzy *M* groupis defined. We also proved some results of the above are established.

Keywords: Complex fuzzy set, Complex intuitionistic fuzzy set, Complex interval-valued intuitionistic fuzzy set, Primary complex interval-valued intuitionistic fuzzy M group.

INTRODUCTION

Ever since an introduction of fuzzy set by L.A.Zadeh [9], the fuzzy concept has invaded almost all branches of mathematics. The concept of IFS and IVIFS was introduced by K.T.Atanassov[1,2] as a generalization of the notion of fuzzy set. K.Chakrabarthy, R.Biswas and S.Nanda [3] discussed union and intersection of IFS.G.Prasannavengeteswari, K.Gunasekaran and .S.Nandakumar [5] introduced the definition of Primary Interval-Valued Intuitionistic Fuzzy M Group (PIVIFMG). Yanhong Su, Zengtai Gong, Na Qin [8] introduced complex

94976

Kannan *et al.*,

interval-valued intuitionistic fuzzy sets using this idea we define Primary complex interval-valued Intuitionistic Fuzzy M Group and some results are established.

PRELIMINARIES

Definition: 2.1
Let X be a universal set. A complex fuzzy set A over X is formed by
$A = \{\langle x, \mu_A(x)\rangle : x \in X\}$, where the complex-valued membership function $\mu_A(x)$ has the form $r_A(x)e^{i\theta_{r_A}}$, where $i = \sqrt{-1}$
, $r_A \in [0,1]$ and $\theta_{r_A}(x)$ is real-valued. The value of $\mu_A(x)$ lies in a unit circle in the complex plane.

Definition: 2.2
A complex intuitionistic fuzzy set A of a non-empty set X is an object of the form $A = \{\langle x, \mu_A(x), \nu_A(x)\rangle : x \in X\}$, where the membership function $\mu_A(x) = r_A(x)e^{i\theta_{r_A}}$ and is defined as $\mu_A: X \to \{z \in C: |z| \leq 1\}$ and non-membership function $\nu_A(x) = k_A(x)e^{i\theta_{k_A}}$ and defined as $\nu_A: X \to \{z \in C: |z| \leq 1\}$, where C is set of complex numbers. These membership and non-membership function receive all degree of membership and non-membership from the unit disc on complex plane respectively, such that the sum of membership and non-membership values is also lies within unit disc of complex plane where $i = \sqrt{-1}$. $r_A(x), k_A(x), \theta_{r_A}$ and θ_{k_A} are real valued such that $0 \leq r_A(x) + k_A(x) \leq 1$ and $0 \leq \theta_{r_A} + \theta_{k_A} \leq 2\pi$.

Definition: 2.3
Let X be a universal set, A complex interval-valued intuitionistic fuzzy set defined on X is a set given by $A = \{\langle x, [\mu_A^-, \mu_A^+], [\nu_A^-, \nu_A^+]\rangle | x \in X\}$, where $\mu_A^-, \mu_A^+, \nu_A^-$ and ν_A^+ represent the degree of lower and upper bound of the membership and non-membership respectively, which are defined as $\mu_A^-(x) = z_1^- = r_A^-(x)e^{i\theta_{r_A}^-}$ and $\mu_A^+(x) = z_1^+ = r_A^+(x)e^{i\theta_{r_A}^+}$ such that $|z_1^-| \leq |z_1^+|$, while $\nu_A^-(x) = z_2^- = k_A^-(x)e^{i\theta_{k_A}^-}$ and $\nu_A^+(mxy) = z_2^+ = k_A^+(mxy)e^{i\theta_{k_A}^+}$ such that such that $|z_2^-| \leq |z_2^+|$. The amplitude terms are $r_A^-, r_A^+, k_A^-, k_A^+ \in [0,1]$ and satisfy the inequality $r_A^- \leq r_A^+, k_A^- \leq k_A^+$ and $r_A^+ + k_A^+ \leq 1$, $\forall x \in X$, other hand , the phase terms $\theta_{r_A}^-, \theta_{r_A}^+, \theta_{k_A}^-, \theta_{k_A}^+$ are real-valued which lie within the interval $[0,2\pi]$ and satisfy the inequality $\theta_{r_A}^- \leq \theta_{r_A}^+, \theta_{k_A}^- \leq \theta_{k_A}^+$ and $\theta_{r_A}^+ + \theta_{k_A}^+ \leq 2\pi$, $\forall x \in X$. Therefore, CIVIFS A defined on X can be represented as $A = \left\{\langle x, [r_A^-, r_A^+]e^{i[\theta_{r_A}^-, \theta_{r_A}^+]}, [k_A^-, k_A^+]e^{i[\theta_{k_A}^-, \theta_{k_A}^+]}\rangle | x \in X\right\}$.

Definition: 2.4
Let X be an M group and A is a complex interval-valued intuitionistic fuzzy subgroup of X, then A is called a primary complex interval-valued intuitionistic fuzzy M group of X. If for all $x, y \in X$ and $m \in M$, then either $\mu_A^+(mxy) = r_A^+(mxy)e^{i\theta_{r_A}^+} \leq r_A^+(x^p)|e^{i\theta}| = \mu_A^+(x^p)$ and $\nu_A^+(mxy) = k_A^+(mxy)e^{i\theta_{k_A}^+} \geq k_A^+(x^p)|e^{i\theta}| = \nu_A^+(x^p)$, for some $p \in Z_+$ or else $\mu_A^+(mxy) = r_A^+(mxy)e^{i\theta_{r_A}^+} \leq r_A^+(y^q)|e^{i\theta}| = \mu_A^+(y^q)$ and $\nu_A^+(mxy) = k_A^+(mxy)e^{i\theta_{k_A}^+} \geq k_A^+(y^q)|e^{i\theta}| = \nu_A^+(y^q)$, for some $q \in Z_+$ and either $\mu_A^-(mxy) = r_A^-(mxy)e^{i\theta_{r_A}^-} \geq r_A^-(x^p)|e^{-i\theta}| = \mu_A^-(x^p)$ and $\nu_A^-(mxy) = k_A^-(mxy)e^{i\theta_{k_A}^-} \leq k_A^-(x^p)|e^{-i\theta}| = \nu_A^-(x^p)$, for some $p \in Z_+$ or else $\mu_A^-(mxy) = r_A^-(mxy)e^{i\theta_{r_A}^-} \geq r_A^-(y^q)|e^{-i\theta}| = \mu_A^-(y^q)$ and $\nu_A^-(mxy) = k_A^-(mxy)e^{i\theta_{k_A}^-} \leq k_A^-(y^q)|e^{-i\theta}| = \nu_A^-(y^q)$, for some $q \in Z_+$. Where $r_A^-, r_A^+, k_A^-, k_A^+ \in [0,1]$ and satisfy $r_A^- \leq r_A^+, k_A^- \leq k_A^+, r_A^+ + k_A^+ \leq 1$, $\forall x \in X$. Other hand, $\theta_{r_A}^-, \theta_{r_A}^+, \theta_{k_A}^-, \theta_{k_A}^+$ are real-valued which lie within the interval $[0,2\pi]$ and satisfy $\theta_{r_A}^- \leq \theta_{r_A}^+, \theta_{k_A}^- \leq \theta_{k_A}^+$ and $\theta_{r_A}^+ + \theta_{k_A}^+ \leq 2\pi$.

Some results on primary complex interval-valued intuitionistic fuzzy M group
Theorem: 3.1
If A is a primary complex interval-valued intuitionistic fuzzy M group of X, then $\bar{\bar{A}} = A$ is a primary complex interval-valued intuitionistic fuzzy M group of X.

Proof:
Consider $x, y \in A$ and $m \in M$. Now

94977

$\mu_{\bar{A}}^+(mxy) = \nu_A^+(mxy)$

$= \mu_A^+(mxy)$

$= r_A^+(mxy)e^{i\theta_{r_A}^+}$

$\le r_A^+(x^p)|e^{i\theta}|$

$= \mu_A^+(x^p).$

Therefore, $\mu_{\bar{A}}^+(mxy) \le \mu_A^+(x^p)$, for some $p \in Z_+$. Consider

$\nu_{\bar{A}}^+(mxy) = \mu_A^+(mxy)$

$= \nu_A^+(mxy)$

$= k_A^+(mxy)e^{i\theta_{k_A}^+}$

$\ge k_A^+(x^p)|e^{i\theta}|$

$= \nu_A^+(x^p)$

Therefore, $\nu_{\bar{A}}^+(mxy) \ge \nu_A^+(x^p)$, for some $p \in Z_+$. Consider

$\mu_{\bar{A}}^-(mxy) = \nu_A^-(mxy)$

$= \mu_A^-(mxy)$

$= r_A^-(mxy)e^{i\theta_{r_A}^-}$

$\ge r_A^-(x^p)|e^{-i\theta}|$

$= \mu_A^-(x^p)$

Therefore, $\mu_{\bar{A}}^-(mxy) \ge \mu_A^-(x^p)$, for some $p \in Z_+$. Consider

$\nu_{\bar{A}}^-(mxy) = \mu_A^-(mxy)$

$= \nu_A^-(mxy)$

$= k_A^-(mxy)e^{i\theta_{k_A}^-}$

$\le k_A^-(x^p)|e^{-i\theta}|$

$= \nu_A^-(x^p)$

Therefore, $\nu_{\bar{A}}^-(mxy) \le \nu_A^-(x^p)$, for some $p \in Z_+$.

Therefore $\bar{\bar{A}} = A$ is a primary complex interval-valued intuitionistic fuzzy Mgroup of X.

Theorem:3.2

Intersection of any two primary complex interval-valued intuitionistic fuzzy Mgroup is again a primary complex interval-valued intuitionistic fuzzy M group.

Proof:

Let A and Bbe two primary complex interval-valued intuitionistic fuzzy M group of X.

Consider $x, y \in A$ and $x, y \in B$and $m \in M$.Now

$\mu_{A \cap B}^+(mxy) = \min\left(\mu_A^+(mxy), \mu_B^+(mxy)\right)$

$= \min\left(r_A^+(mxy)e^{i\theta_{r_A}^+}, r_B^+(mxy)e^{i\theta_{r_B}^+}\right)$

$\le \min\left(r_A^+(x^p)|e^{i\theta}|, r_B^+(x^p)|e^{i\theta}|\right)$

$= \min\left(\mu_A^+(x^p), \mu_B^+(x^p)\right)$

$= \mu_{A \cap B}^+(x^p).$

Therefore, $\mu_{A \cap B}^+(mxy) \le \mu_{A \cap B}^+(x^p)$, for some $p \in Z_+$. Consider

$\nu_{A \cap B}^+(mxy) = \max\left(\nu_A^+(mxy), \nu_B^+(mxy)\right)$

$= \max\left(k_A^+(mxy)e^{i\theta_{k_A}^+}, k_B^+(mxy)e^{i\theta_{k_B}^+}\right)$

$\ge \max\left(k_A^+(x^p)|e^{i\theta}|, k_B^+(x^p)|e^{i\theta}|\right)$

$= \max\left(\nu_A^+(x^p), \nu_B^+(x^p)\right)$

$= \nu_{A \cap B}^+(x^p).$

Therefore, $\nu_{A \cap B}^+(mxy) \ge \nu_{A \cap B}^+(x^p)$, for some $p \in Z_+$. Consider

$\mu_{A \cap B}^-(mxy) = \max\left(\mu_A^-(mxy), \mu_B^-(mxy)\right)$

$= \max\left(r_A^-(mxy)e^{i\theta_{r_A}^-}, r_B^-(mxy)e^{i\theta_{r_B}^-}\right)$

$\ge \max\left(r_A^-(x^p)|e^{-i\theta}|, r_B^-(x^p)|e^{-i\theta}|\right)$

$= \max\left(\mu_A^-(x^p), \mu_B^-(x^p)\right)$

$= \mu_{A \cap B}^-(x^p)$

Therefore, $\mu_{A \cap B}^-(mxy) \ge \mu_{A \cap B}^-(x^p)$, for some $p \in Z_+$. Consider

$v^-_{A\cap B}(mxy) = \min(v^-_A(mxy), v^-_B(mxy))$

$= \min(k^-_A(mxy)e^{i\theta^-_{k_A}}, k^-_B(mxy)e^{i\theta^-_{k_B}})$

$\leq \min(k^-_A(x^p)|e^{-i\theta}|, k^-_A(x^p)|e^{-i\theta}|)$

$= \min(v^-_A(x^p), v^-_B(x^p))$

$= v^-_{A\cap B}(x^p)$

Therefore, $v^-_{A\cap B}(mxy) \leq v^-_{A\cap B}(x^p)$, for some $p \in Z_+$.

Therefore, $A \cap B$ is a primary complex interval-valued intuitionistic fuzzy M group of X.

Theorem: 3.3

If A and B are primary complex interval-valued intuitionistic fuzzy M group, then $\overline{A} \cap \overline{B} = \overline{A \cup B}$ is also a primary complex interval- valued intuitionistic fuzzy M group.

Proof

Let A and B be two primary complex interval-valued intuitionistic fuzzy M group of X.

Consider $x, y \in A$ and $x, y \in B$ and $m \in M$.

Consider $\mu^+_{\overline{A}\cap\overline{B}}(mxy) = \min\left(\mu^+_{\overline{A}}(mxy), \mu^+_{\overline{B}}(mxy)\right)$

$= \min(v^+_A(mxy), v^+_B(mxy))$

$= \min(k^+_A(mxy)e^{i\theta^+_{k_A}}, k^+_B(mxy)e^{i\theta^+_{k_B}})$

$\leq \min(k^+_A(x^p)|e^{i\theta}|, k^+_B(x^p)|e^{i\theta}|)$

$= \min(v^+_A(x^p), v^+_B(x^p))$

$= v^+_{A\cup B}(x^p)$

$= \mu^+_{\overline{A\cup B}}(x^p)$

Therefore $\mu^+_{\overline{A}\cap\overline{B}}(mxy) \leq \mu^+_{\overline{A\cup B}}(x^p)$, for some $p \in Z_+$

Consider $v^+_{\overline{A}\cap\overline{B}}(mxy) = \max(v^+_{\overline{A}}(mxy), v^+_{\overline{B}}(mxy))$

$= \max(\mu^+_A(mxy), \mu^+_B(mxy))$

$= \max(r^+_A(mxy)e^{i\theta^+_{r_A}}, r^+_B(mxy)e^{i\theta^+_{r_B}})$

$\geq \max(r^+_A(x^p)|e^{i\theta}|, r^+_B(x^p)|e^{i\theta}|)$

$= \max(\mu^+_A(x^p), \mu^+_B(x^p))$

$= \mu^+_{A\cup B}(x^p)$

$= v^+_{\overline{A\cup B}}(x^p).$

Therefore $v^+_{\overline{A}\cap\overline{B}}(mxy) \geq v^+_{\overline{A\cup B}}(x^p)$, for some $p \in Z_+$

Consider $\mu^-_{\overline{A}\cap\overline{B}}(mxy) = \max\left(\mu^-_{\overline{A}}(mxy), \mu^-_{\overline{B}}(mxy)\right)$

$= \max(v^-_A(mxy), v^-_B(mxy))$

$= \max(k^-_A(mxy)e^{i\theta^-_{k_A}}, k^-_B(mxy)e^{i\theta^-_{k_B}})$

$\geq \max(k^-_A(x^p)|e^{-i\theta}|, k^-_B(x^p)|e^{-i\theta}|)$

$= \max(v^-_A(x^p), v^-_B(x^p))$

$= v^-_{A\cup B}(x^p)$

$= \mu^-_{\overline{A\cup B}}(x^p)$

Therefore $\mu^-_{\overline{A}\cap\overline{B}}(mxy) \geq \mu^-_{A\cup B}(x^p)$, for some $p \in Z_+$

Consider $v^-_{\overline{A}\cap\overline{B}}(mxy) = \min(v^-_{\overline{A}}(mxy), v^-_{\overline{B}}(mxy))$

$= \min(\mu^-_A(mxy), \mu^-_B(mxy))$

$= \min(r^-_A(mxy)e^{i\theta^-_{r_A}}, r^-_B(mxy)e^{i\theta^-_{r_B}})$

$\leq \min(r^-_A(x^p)|e^{-i\theta}|, r^-_B(x^p)|e^{-i\theta}|)$

$= \min(\mu^-_A(x^p), \mu^-_B(x^p))$

$= \mu^-_{A\cup B}(x^p)$

$= v^-_{\overline{A\cup B}}(x^p).$

Therefore $v^-_{\overline{A}\cap\overline{B}}(mxy) \leq v^-_{\overline{A\cup B}}(x^p)$, for some $p \in Z_+$

Therefore, $\overline{A} \cap \overline{B} = \overline{A \cup B}$ is a primary complex interval-valued intuitionistic fuzzy M group of X. □

Theorem: 3.4

If A and B are primary complex interval-valued intuitionistic fuzzy M group, then $\overline{A} \cup \overline{B} = \overline{A \cap B}$ is also a primary complex interval- valued intuitionistic fuzzy M group.

Proof

Let A and B be two primary complex interval-valued intuitionistic fuzzy M group of X.

Consider $x, y \in A$ and $x, y \in B$ and $m \in M$.

Consider $\mu^+_{\overline{A} \cup \overline{B}}(mxy) = \max\left(\mu^+_{\overline{A}}(mxy), \mu^+_{\overline{B}}(mxy)\right)$

$= \max(v^+_A(mxy), v^+_B(mxy))$

$= \max(k^+_A(mxy)e^{i\theta^+_{k_A}}, k^+_B(mxy)e^{i\theta^+_{k_B}})$

$\leq \max(k^+_A(x^p)|e^{i\theta}|, k^+_B(x^p)|e^{i\theta}|)$

$= \max(v^+_A(x^p), v^+_B(x^p))$

$= v^+_{A \cap B}(x^p)$

$= \mu^+_{\overline{A \cap B}}(x^p)$

Therefore $\mu^+_{\overline{A} \cup \overline{B}}(mxy) \leq \mu^+_{\overline{A \cap B}}(x^p)$, for some $p \in Z_+$

Consider $v^+_{\overline{A} \cup \overline{B}}(mxy) = \min(v^+_{\overline{A}}(mxy), v^+_{\overline{B}}(mxy))$

$= \min(\mu^+_A(mxy), \mu^+_B(mxy))$

$= \min(r^+_A(mxy)e^{i\theta^+_{r_A}}, r^+_B(mxy)e^{i\theta^+_{r_B}})$

$\geq \min(r^+_A(x^p)|e^{i\theta}|, r^+_B(x^p)|e^{i\theta}|)$

$= \min(\mu^+_A(x^p), \mu^+_B(x^p))$

$= \mu^+_{A \cap B}(x^p)$

$= v^+_{\overline{A \cap B}}(x^p).$

Therefore $v^+_{\overline{A} \cup \overline{B}}(mxy) \geq v^+_{\overline{A \cap B}}(x^p)$, for some $p \in Z_+$

Consider $\mu^-_{\overline{A} \cup \overline{B}}(mxy) = \min\left(\mu^-_{\overline{A}}(mxy), \mu^-_{\overline{B}}(mxy)\right)$

$= \min(v^-_A(mxy), v^-_B(mxy))$

$= \min(k^-_A(mxy)e^{i\theta^-_{k_A}}, k^-_B(mxy)e^{i\theta^-_{k_B}})$

$\geq \min(k^-_A(x^p)|e^{-i\theta}|, k^-_B(x^p)|e^{-i\theta}|)$

$= \min(v^-_A(x^p), v^-_B(x^p))$

$= v^-_{A \cap B}(x^p)$

$= \mu^-_{\overline{A \cap B}}(x^p)$

Therefore $\mu^-_{\overline{A} \cup \overline{B}}(mxy) \geq \mu^-_{\overline{A \cap B}}(x^p)$, for some $p \in Z_+$

Consider $v^-_{\overline{A} \cup \overline{B}}(mxy) = \max(v^-_{\overline{A}}(mxy), v^-_{\overline{B}}(mxy))$

$= \max(\mu^-_A(mxy), \mu^-_B(mxy))$

$= \max(r^-_A(mxy)e^{i\theta^-_{r_A}}, r^-_B(mxy)e^{i\theta^-_{r_B}})$

$\leq \max(r^-_A(x^p)|e^{-i\theta}|, r^-_B(x^p)|e^{-i\theta}|)$

$= \max(\mu^-_A(x^p), \mu^-_B(x^p))$

$= \mu^-_{A \cap B}(x^p)$

$= v^-_{\overline{A \cap B}}(x^p).$

Therefore $v^-_{\overline{A} \cup \overline{B}}(mxy) \leq v^-_{\overline{A \cap B}}(x^p)$, for some $p \in Z_+$

Therefore $\overline{A} \cup \overline{B} = \overline{A \cap B}$ is a primary complex interval-valued intuitionistic fuzzy M group of X.

Theorem: 3.5

If A is a primary complex interval-valued intuitionistic fuzzy M group of X, then $\Box A$ is also a primary complex interval-valued intuitionistic fuzzy M group of X.

Proof

Consider $x, y \in A$ and $m \in M$. Consider

$\mu^+_{\Box A}(mxy) = \mu^+_A(mxy)$

$= r^+_A(mxy)e^{i\theta^+_{r_A}}$

$\leq r_A^+(x^p)|e^{i\theta}|$

$= \mu_A^+(x^p)$

$= \mu_{\square A}^+(x^p)$

Therefore, $\mu_{\square A}^+(mxy) \leq \mu_{\square A}^+(x^p)$, for some $p \in Z_+$. Consider

$v_{\square A}^+(mxy) = 1 - \mu_A^+(mxy)$

$= 1 - {}^+()^+$

$\geq 1 - {}^+()||$

$= 1 - \mu_A^+()$

$= {}_{\square A}^+()$

Therefore, ${}_{\square A}^+() \geq {}_{\square A}^+()$, for some $\in {}_+$. Consider

$\mu_{\square A}^-() = {}^-()$

$= {}^-()^-$

$\geq {}^-()|{}^-|$

$= {}^-()$

$= \mu_{\square A}^-(x^p)$

Therefore, $\mu_{\square A}^-(mxy) \geq \mu_{\square A}^-(x^p)$, for some $p \in Z_+$. Consider

$v_{\square A}^-(mxy) = 1 - \mu_A^-(mxy)$

$= 1 - r_A^-(mxy)e^{i\theta_{r_A}^-}$

$\leq 1 - r_A^-(x^p)|e^{-i\theta}|$

$= 1 - \mu_A^-(x^p)$

$= v_{\square A}^-(x^p)$

Therefore, $v_{\square A}^-(mxy) \leq v_{\square A}^-(x^p)$, for some $p \in Z_+$.

Therefore, $\square A$ is a primary complex interval-valued intuitionistic fuzzy M group of X.

Theorem: 3.6

If A is a primary complex interval-valued intuitionistic fuzzy M group of X, then $\lozenge A$ is also a primary complex interval-valued intuitionistic fuzzy M group of X.

Proof

Consider $x, y \in A$ and $m \in M$. Consider

$\mu_{\lozenge A}^+(mxy) = 1 - v_A^+(mxy)$

$= 1 - k_A^+(mxy)e^{i\theta_{k_A}^+}$

$\leq 1 - k_A^+(x^p)|e^{i\theta}|$

$= 1 - v_A^+(x^p)$

$= \mu_{\lozenge A}^+(x^p)$.

Therefore, $\mu_{\lozenge A}^+(mxy) \leq \mu_{\lozenge A}^+(x^p)$, for some $p \in Z_+$. Consider

$v_{\lozenge A}^+(mxy) = v_A^+(mxy)$

$= k_A^+(mxy)e^{i\theta_{k_A}^+}$

$\geq k_A^+(x^p)|e^{i\theta}|$

$= v_A^+(x^p)$

$= v_{\lozenge A}^+(x^p)$

Therefore, $v_{\lozenge A}^+(mxy) \geq v_{\lozenge A}^+(x^p)$, for some $p \in Z_+$. Consider

$\mu_{\lozenge A}^-(mxy) = 1 - v_A^-(mxy)$

$= 1 - k_A^-(mxy)e^{i\theta_{k_A}^-}$

$\geq 1 - k_A^-(x^p)|e^{-i\theta}|$

$= 1 - v_A^-(x^p)$

$= \mu_{\lozenge A}^-(x^p)$

Therefore $\mu_{\lozenge A}^-(mxy) \geq \mu_{\lozenge A}^-(x^p)$, for some $p \in Z_+$. Consider

$v_{\lozenge A}^-(mxy) = v_A^-(mxy)$

Kannan *et al.,*

$$= k_A^-(mxy)e^{i\theta_{k_A}^-}$$
$$\leq k_A^-(x^p)|e^{-i\theta}|$$
$$= v_A^-(x^p)$$
$$= v_{\lozenge A}^-(x^p).$$

Therefore, $v_{\lozenge A}^-(mxy) \leq v_{\lozenge A}^-(x^p)$, for some $p \in Z_+$

Therefore, $\lozenge A$ is a primary complex interval-valued intuitionistic fuzzy M group of X.

CONCLUSION

In this paper the main idea of primary complex interval-valued intuitionistic fuzzyM group is a new algebraic structures of fuzzy algebra and it is used through the some results of the above. We believe that our ideas can also applied for other algebraic system.

ABSTRACT

This paper proposes a simple and effective method to solve the quadratic Diophantine equation of the form $au^2 + bv^2 = (a + b\alpha^2)^n$, whose solutions are positive integers, where n, a, α are positive integers and b is any positive non-square integer. The solution is obtained by an analytical method, and the answers are verified by using a python program.

Keywords: Quadratic Diophantine equation, Euler's formula, Polar form, Positive integer Solutions

INTRODUCTION

The concept of solving equations whose solutions are in integers is of very practical importance not only in the world of mathematics but also required for addressing social problems with meaningful solutions. Generally, equations whose solutions are in integers are termed as Diophantine Equations named after ancient Greek mathematician Diophantus. Solving Diophantine equations created great interest among mathematicians of all times. Diophantus himself has provided few techniques to solve Diophantine equations whose solutions involve practical usage. Euler

has done enormous work in solving Diophantine Equations and some of his techniques are used even today. Particularly his idea of using polar form of complex numbers in solving quadratic Diophantine Equations is quite remarkable and several mathematicians has adopted his techniques since then. For example, see **[1, 2]**.In this paper, we consider family of Quadratic Diophantine Equations and adopt the technique of choosing particular complex numbers to obtain the solutions. A Python coding is provided, in order to verify the results obtained.

Theorem 1

If n, a, α are positive integers, and if b is any positive non-square integer then the positive integer solutions u, v of the quadratic Diophantine equation of the form $au^2 + bv^2 = (a + b\alpha^2)^n$ are given by the following expressions

$$u = \frac{(a+b\alpha^2)^{\frac{n}{2}}}{\sqrt{a}} \sin\left\{ntan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\} \text{and } v = \frac{(a+b\alpha^2)^{\frac{n}{2}}}{\sqrt{b}} \cos\left\{ntan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\} \quad (1)$$

Proof

First, we will determine the polar form of the complex number $\alpha\sqrt{b} + i\sqrt{a}$.

Using Euler's Formula we can express $\alpha\sqrt{b} + i\sqrt{a} = r(cos\theta + isin\theta) = re^{i\theta}$

$rcos\theta = \alpha\sqrt{b};\ rsin\theta = \sqrt{a}$

$r^2 = a + b\alpha^2$

$r = \sqrt{a + b\alpha^2};\ \theta = tan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)$

$\left[\alpha\sqrt{b} + i\sqrt{a}\right]^n = r^n e^{in\theta}$

$\left[\alpha\sqrt{b} + i\sqrt{a}\right]^n = (a + b\alpha^2)^{\frac{n}{2}} exp\left\{i\,n\,tan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\}$

Let us consider

$\sqrt{b}v + i\sqrt{a}u = \left[\alpha\sqrt{b} + i\sqrt{a}\right]^n$

Then $\sqrt{b}v - i\sqrt{a}u = \left[\alpha\sqrt{b} - i\sqrt{a}\right]^n$

$(\sqrt{b}v + i\sqrt{a}u)(\sqrt{b}v - i\sqrt{a}u) = \left[\alpha\sqrt{b} + i\sqrt{a}\right]^n\left[\alpha\sqrt{b} - i\sqrt{a}\right]^n$

$au^2 + bv^2 = (a + b\alpha^2)^n$

Now,

$\sqrt{b}v + i\sqrt{a}u = \left[\alpha\sqrt{b} + i\sqrt{a}\right]^n = (a + b\alpha^2)^{\frac{n}{2}} exp\left\{in\,tan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\}$

$\sqrt{b}v + i\sqrt{a}u = (a + b\alpha^2)^{\frac{n}{2}} exp\left\{in\,tan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\}$

$\sqrt{b}v + i\sqrt{a}u = (a + b\alpha^2)^{\frac{n}{2}}\left[cos\left\{ntan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\} + isin\left\{ntan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\}\right]$

Equating the real and imaginary parts, we get

$$u = \frac{(a + b\alpha^2)^{\frac{n}{2}}}{\sqrt{a}} \sin\left\{ntan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\}$$

$$v = \frac{(a + b\alpha^2)^{\frac{n}{2}}}{\sqrt{b}} \cos\left\{ntan^{-1}\left(\frac{\sqrt{a}}{\alpha\sqrt{b}}\right)\right\}$$

This proves (1). If we now consider $(|u|, |v|)$, from above values, then we always obtain the positive integer solutions to the quadratic Diophantine equation $au^2 + bv^2 = (a + b\alpha^2)^n$. For knowing more details about solving Diophantine equations refer **[3 – 10]** We now present few examples to obtain solutions of certain quadratic Diophantine equations.

Consider the quadratic Diophantine equation $4u^2 + 5v^2 = 9^n$

Comparing the general equation we have,$a = 4, b = 5, \alpha = 1$

The solutions according to (1) in Theorem are given by

$$u = \frac{(9)^{\frac{n}{2}}}{\sqrt{4}} sin\left\{ntan^{-1}\left(\frac{\sqrt{4}}{\sqrt{5}}\right)\right\} = \frac{(9)^{\frac{n}{2}}}{2} sin\left\{ntan^{-1}\left(\frac{2}{\sqrt{5}}\right)\right\}$$

$$v = \frac{(9)^{\frac{n}{2}}}{\sqrt{5}} cos\left\{ntan^{-1}\left(\frac{\sqrt{4}}{\sqrt{5}}\right)\right\} = \frac{(9)^{\frac{n}{2}}}{\sqrt{5}} cos\left\{ntan^{-1}\left(\frac{2}{\sqrt{5}}\right)\right\}$$

When $n = 1$ then the corresponding positive integer solution is $(1,1)$
When $n = 2$ then the corresponding positive integer solution is $(3,3)$
When $n = 3$ then the corresponding positive integer solution is$(9,9),(11,7)$
When $n = 4$ then the corresponding positive integer solutions are$(27,27),(33,21)$
When $n = 5$ then the corresponding positive integer solutions are$(59,85),(81,81),(99,63)$

Consider the quadratic Diophantine equation $4u^2 + 5v^2 = 24^n$
Here $a = 4, b = 5, \alpha = 2$
The solutions according to (1) in Theorem are given by

$$u = \frac{(24)^{\frac{n}{2}}}{\sqrt{4}} sin\left\{ntan^{-1}\left(\frac{\sqrt{4}}{2\sqrt{5}}\right)\right\} = \frac{(24)^{\frac{n}{2}}}{2} sin\left\{ntan^{-1}\left(\frac{2}{2\sqrt{5}}\right)\right\}$$

$$v = \frac{(24)^{\frac{n}{2}}}{\sqrt{5}} cos\left\{ntan^{-1}\left(\frac{\sqrt{4}}{2\sqrt{5}}\right)\right\} = \frac{(24)^{\frac{n}{2}}}{\sqrt{5}} cos\left\{ntan^{-1}\left(\frac{2}{2\sqrt{5}}\right)\right\}$$

When $n = 1$ then the corresponding positive integer solution is $(1,2)$
-When $n = 2$ then the corresponding positive integer solutions are$(8,8),(12,0)$
When $n = 3$ then the corresponding positive integer solutions are$(24,48),(56,16)$
When $n = 4$ then the corresponding positive integer solutions are$(32,256),(192,92),(288,0)$

Consider the quadratic Diophantine equation $4u^2 + 3v^2 = 16^n$
Here $a = 4, b = 3, \alpha = 2$
The solutions according to (1) in Theorem are given by

$$u = \frac{(16)^{\frac{n}{2}}}{\sqrt{4}} sin\left\{ntan^{-1}\left(\frac{\sqrt{4}}{2\sqrt{3}}\right)\right\} = \frac{(16)^{\frac{n}{2}}}{2} sin\left\{ntan^{-1}\left(\frac{1}{\sqrt{3}}\right)\right\}$$

$$v = \frac{(16)^{\frac{n}{2}}}{\sqrt{3}} cos\left\{ntan^{-1}\left(\frac{\sqrt{4}}{2\sqrt{3}}\right)\right\} = \frac{(16)^{\frac{n}{2}}}{\sqrt{3}} cos\left\{ntan^{-1}\left(\frac{1}{\sqrt{3}}\right)\right\}$$

When $n = 1$ then the corresponding positive integer solutions are$(1,2),(2,0)$
When $n = 2$ then the corresponding positive solutions are$(4,8),(8,0)$
When $n = 3$ then the corresponding positive integer solutions are$(16,32),(32,0)$
When $n = 4$ then the corresponding positive integer solutions are$(64,128),(128,0)$
When $n = 5$ then the corresponding positive integer solutions are$(256,512),(512,0)$

Consider the quadratic Diophantine equation $17u^2 + 3v^2 = 29^n$
Here $a = 17, b = 3, \alpha = 2$
The solutions according to (1) in Theorem are given by

$$u = \frac{(29)^{\frac{n}{2}}}{\sqrt{17}} sin\left\{ntan^{-1}\left(\frac{\sqrt{17}}{2\sqrt{3}}\right)\right\} = \frac{(29)^{\frac{n}{2}}}{\sqrt{17}} sin\left\{ntan^{-1}\left(\frac{\sqrt{17}}{2\sqrt{3}}\right)\right\}$$

Radhakrishnan and Sivaraman

$$v = \frac{(29)^{\frac{n}{2}}}{\sqrt{3}} \cos\left\{ n\tan^{-1}\left(\frac{\sqrt{17}}{2\sqrt{3}}\right)\right\} = \frac{(29)^{\frac{n}{2}}}{\sqrt{3}} \cos\left\{ n\tan^{-1}\left(\frac{\sqrt{17}}{2\sqrt{3}}\right)\right\}$$

When $n = 1$ then the corresponding positive integer solution is $(1,2)$
When $n = 3$ then the corresponding positive integer solutions are $(19,78), (29,58)$
When $n = 5$ then the corresponding positive integer solutions are $(551,2262), (841,1682), (1031,902)$
We now provide the following coding of Python program to verify the solutions obtained above for the quadratic Diophantine equations considered.

Python program
```
a = int(input("enter the positive integer value of a:"))
l = int(input("enter the positive integer value of l:"))
n = int(input("enter the positive integer value of n:"))
b = int(input("enter the positive non-square integer value of b:"))
b1 = pow(b,1/2)
if b1 == int(b1):
  print("the number square positive integer")
  b = int(input("enter the positive non-square integer value of b:"))
else:
   print("the number is positive non square integer")
   print(a,b,l,n)
u = int(input("enter the positive integer value of u:"))
v = int(input("enter the positive integer value of v:"))
for k in range(0,n+1):
   for i in range(0, u+1):
     for j in range(0, v+1):
        L = (a * i * i)+(b * j * j)
        R= pow((a + b * l * l),k)
        if L==R:
           print(k)
           print(i,j)
```

CONCLUSION

Using Euler's formula and elementary complex analysis, we have proved a theorem for solving a particular family of quadratic Diophantine equations whose solutions are given in (1). We have considered four examples to justify our solutions and have presented a Python program to verify such results. It is interesting to note that for certain equations for given value of *n*, we have multiple solutions indicating the multi-valued property of complex valued functions. Moreover, for certain equations like in Example 4 of this paper, we could obtain solutions only for odd values of *n*, indicating that it has no solutions when *n* is even. Thus using (1) of the theorem proved in this paper, it is possible to determine positive integer solutions of several quadratic Diophantine equations satisfying the given type. These ideas can be adopted to solve other class of quadratic Diophantine equations by choosing appropriate complex numbers yielding required solutions.

ABSTRACT

The incorporation of technology in education has revolutionized conventional teaching methodologies, leading to the emergence of blended cooperative learning as a potent strategy for enhancing student outcomes. This approach combines the flexibility and interactivity of digital learning with the collaborative and social benefits of cooperative group work. Blended learning integrates conventional face-to-face instruction with online components, offering a customized approach learning that caters to diverse student needs. Cooperative learning, on the other hand, emphasizes structured group work where students collaborate to achieve shared academic goals, fostering critical thinking, communication, and teamwork skills. By merging these two approaches, blended cooperative learning creates a dynamic and inclusive learning environment that supports continuous engagement, both inside and outside the classroom. Research indicates that this strategy can significantly improve academic achievement among secondary school students by offering multiple avenues for engagement, promoting deeper understanding, and enhancing motivation. This study investigates how blended cooperative learning influences student outcomes, supported by empirical evidence that showcases its effectiveness as a current educational approach. As the educational landscape continues to evolve, blended cooperative learning stands out as a promising approach for fostering academic success in today's diverse and technologically driven classrooms.

Keywords: Blended Cooperative Learning; Education; Digital Learning; Academic Achievement; Inclusive Learning

INTRODUCTION

In the rapidly changing scenario of education, the combination of technology and cutting-edge teaching methods has emerged as a key trend increasingly important (Koehler et al., 2013). One such pedagogical approach that has gained significant traction is the combination of blended learning with cooperative learning, resulting in what is known as blended cooperative learning (Dziuban *et al.,* 2018). This strategy merges the best of both worlds: the flexibility and interactivity of digital learning with the collaborative and social benefits of group-based learning. By definition, blended learning merges conventional classroom instruction with digital learning components to create a unified educational experience (Dziuban *et al.,* 2018). This method allows for a more personalized learning journey, enabling students to learn at their own personal pace and revisit content as needed. The online aspect of blended learning offers a range of digital tools and resources, i.e. videos, quizzes, and interactive simulations, which can cater to diverse learning, styles (Dziuban *et al.,* 2018). Additionally, it provides opportunities for students to engage with content outside the constraints of the classroom, facilitating a more continuous learning experience. Cooperative learning, in contrast, is a structured form of group work where students work together to achieve mutual academic goals. This approach emphasizes interaction, communication, and mutual support among students (Gillies, 2023). In cooperative learning settings, students are often assigned roles within their groups, encouraging them to contribute actively and take responsibility for their own learning as well as the learning of their peers (Gillies, 2023). Research has shown that cooperative learning encourages the growth of critical thinking, boosts student motivation, and deepens their understanding of the subject (Siregar *et al.,* 2024). Furthermore, it supports students in building essential social skills like teamwork, effective communication, and conflict resolution, which are essential for success in both academic and professional settings (Gillies, 2023; Siregar *et al.,* 2024).

When these two approaches are combined, the result is a blended cooperative learning strategy that leverages the strengths of both methodologies to enhance student learning outcomes (Munoz et al., 2021; Siregar *et al.,* 2024). In this model, students engage in collaborative activities both in-person and online, allowing for a more vibrant and mutual learning experience. The digital tools and resources provided in the online component can be used to bolster and expand the collaborative task done in the classroom (Singh et al., 2023). For example, students might use online discussion forums to continue conversations started in class, or they might work together on a shared digital project using collaborative software. The influence of blended cooperative learning on academic success, particularly at the secondary school level, has been the subject of increasing research interest. Studies have shown that this approach can lead to improved student outcomes, including higher levels of engagement, better retention of information, and greater academic success (Hussain *et al.,* 2023). Moreover, the collaborative aspect of this approach motivates students to engage actively in their learning process, fostering increased motivation and a more profound comprehension of the material or content.When students work together in a cooperative setting, they are more likely to engage in meaningful discussions, ask questions, and challenge each other's ideas, leading to a richer learning experience(Singh et al., 2021). The online component of blended cooperative learning further enhances this by providing a platform for continuous collaboration and communication, even outside of the classroom (Okaz, 2015; Munoz et al., 2021). The integration of blended learning with cooperative learning represents a promising pedagogical strategy for improving the academic achievement of secondary school students. By combining the strengths of both approaches, blended cooperative learning offers a flexible, interactive, and collaborative learning environment that can address the varied requirements of today's learners (Okaz, 2015; Siregar *et al.,* 2024). This paper delves into the various ways in which blended cooperative learning can impact student outcomes, drawing on empirical evidence and theoretical insights to provide a comprehensive understanding of this innovative educational approach. As education continues to evolve in response to technological advancements and changing student needs, blended cooperative learning stands out as a powerful tool for enhancing student engagement and academic success.

METHODOLOGY

This review paper employs a qualitative methodology, systematically analyzing existing literature on blended cooperative learning to evaluate its impact on student outcomes. A comprehensive search of peer-reviewed articles, conference papers, and educational reports was conducted using databases such as ERIC, JSTOR, and Google Scholar, focusing on studies published in the last few decades. The selection criteria emphasized empirical research that demonstrates the effectiveness of blended cooperative learning in secondary education. Data extraction involved identifying key themes related to academic achievement, engagement, and skill development. The synthesis of findings aims to provide a cohesive understanding of how this approach enhances educational practices and student success.

Theoretical Foundations of Blended Cooperative Learning

Blended cooperative learning is rooted in the foundational principles of social constructivism and experiential learning, two theories that offer a robust framework for understanding the dynamics of this educational approach. Social constructivism, primarily developed by Lev Vygotsky, emphasizes the critical role of social interaction in the formation of knowledge (Valverde-Bersocoso & Fernandez-Sanchez, 2020; Li et al., 2024). Vygotsky theory posits that learning is inherently a social process, where individuals construct knowledge through collaborative dialogue and shared experiences. In the context of blended cooperative learning, this theory is operationalized by creating environments where students engage in collaborative activities, both in online settings and face-to-face interactions (Valverde-Bersocoso & Fernandez-Sanchez, 2020). These dual modes of engagement enable students to learn from one another, share diverse perspectives, and collectively build understanding, thereby enriching the learning experience. Experiential learning, as theorized by David Kolb, underscores the significance of learning through experience (Kolb, 1984). Kolb's model advocates for a cyclical process where learners engage in concrete experiences, reflect on these experiences, conceptualize the underlying principles, and then apply this knowledge in new situations. Blended cooperative learning aligns closely with this model by offering students opportunities to apply theoretical knowledge in practical, collaborative contexts (Dziuban, et al., 2018). The incorporation of digital tools in blended learning environments further strengthens the alignment with constructivist principles (Singh et al., 2023). These tools provide students with access to a wide array of resources and interactive platforms that support diverse learning styles. Moreover, the ability to receive immediate feedback, either from peers or instructors, fosters an iterative learning process where students can continuously refine their understanding. This blend of technology and collaboration not only increases student autonomy but also facilitates deeper engagement with complex concepts (Yang et al., 2021, Munoz et al., 2021). By working together, students can tackle challenging problems, reflect on different viewpoints, and gain a deeper and more sophisticated comprehension of the topic.

Blended Cooperative Learning Strategies

Blended cooperative learning strategies represent an innovative approach to education, integrating both online and offline interactions to enhance the learning experience. These strategies are intentionally designed to foster collaboration, critical thinking, and active participation among students. Here's a detailed exploration of some key blended cooperative learning strategies:

- **Flipped Classroom:** The flipped classroom model is a transformative approach that redefines the traditional classroom dynamic. Instead of using class time for direct instruction, students first encounter new material online, often through video lectures, readings, or interactive modules, before they attend the physical classroom. This shift allows classroom time to be utilized for more engaging, collaborative activities, such as group discussions, problem-solving exercises, and hands-on projects (Hussain et al., 2023). By encountering the material beforehand, students come prepared to delve deeper into the subject matter during face-to-face sessions, thus facilitating a more active and participatory learning environment. This method not only maximizes the use of class time but also helps in accommodating different learning styles, as students can learn at their own pace before engaging in group activities.

- **Jigsaw Method:** The jigsaw method is another powerful cooperative learning strategy that can be effectively implemented in a blended learning environment. In this approach, a topic is divided into several segments, and each student or group is tasked with mastering one specific segment. After becoming experts on their assigned portion, they then teach what they have learned to their peers. The blended aspect comes into play when students use online resources to research their topics, engage in digital collaboration, and prepare their presentations (Cochon-Drouet et al., 2023). For instance, students might use online discussion boards, shared documents, or video conferencing tools to collaborate and exchange ideas before presenting their findings in a face-to-face classroom setting. This method not only enhances understanding of the content but also develops communication, teamwork, and leadership skills.

- **Online Collaborative Projects:** Online collaborative projects are a cornerstone of blended learning, leveraging technology to facilitate group work. Tools such as Google Classroom, Microsoft Teams, or other collaborative platforms enable students to work together on assignments, even when they are not physically co-located (Hussain et al., 2023; Siregar et al., 2024). These platforms provide spaces for students to share resources, divide tasks, and provide feedback on each other's work, all within an organized and accessible digital environment. The asynchronous nature of these tools allows students to contribute at their own pace, making it easier to accommodate diverse learning speeds and schedules (Herrera-Pavo & Bolivar, 2021). Furthermore, online collaborative projects prepare students for the increasingly digital and collaborative nature of the modern workplace, equipping them with essential skills in communication, collaboration, and digital literacy.

- **Peer Tutoring and Peer Assessment:** Peer tutoring and assessment are integral to cooperative learning, offering students the opportunity to deepen their understanding by teaching others and critically evaluating their peers' work. In a blended learning environment, these activities can extend beyond the classroom through the use of online forums, discussion boards, and video conferencing tools (Toulia et al., 2021). Students can provide tutoring or feedback at any time, facilitating continuous learning and reflection. This approach encourages a deeper engagement with the subject matter, as students must not only understand the content themselves but also be able to explain it clearly to others. Additionally, peer assessment fosters critical thinking and self-reflection, as students learn to evaluate the quality of their own and others' work.

Empirical Evidence on the Impact of Blended Cooperative Learning

Blended cooperative learning has emerged as a powerful pedagogical approach, significantly impacting the academic achievement of secondary school students. The interactive effect of combining traditional face-to-face instruction with online collaborative activities fosters an environment conducive to deep learning and skill development (Dziuban *et al.*, 2018). Several studies have provided empirical evidence supporting the efficacy of this blended approach. Gillies (2023) conducted a pivotal study that highlighted the benefits of cooperative learning in a blended format. Their research revealed those students who participated in both online and offline cooperative learning activities outperformed their peers who were engaged in traditional, non-collaborative learning methods. The key to this success lies in the dual modality of instruction, which leverages the strengths of both in-person and digital interactions. In a face-to-face setting, students benefit from immediate feedback, personal interaction, and the shared social experience of learning together. Online, they have the flexibility to engage with content at their own pace, revisit complex concepts, and collaborate with peers in a more reflective manner. This combination was found to be particularly effective in enhancing students' comprehension of complex subjects, where multiple perspectives and iterative discussion are crucial for mastery. Similarly, Siregar *et al.* (2024) reported significant improvements in student engagement and motivation when cooperative learning was integrated into a blended learning environment. The online component offered flexibility, allowing students to access materials and collaborate at times that suited their individual needs. This flexibility, when paired with the social interaction inherent in cooperative learning, created a learning environment where students felt more in control of their educational journey. They were not only more engaged but also more motivated to participate actively. This increased motivation was found to correlate strongly with improved academic outcomes. Furthermore, Siregar *et al.* (2024) study emphasized the role of blended cooperative learning in developing critical thinking skills. Students were regularly challenged to analyze information critically, work collaboratively to solve problems, and apply their knowledge to real-world situations. This practical application of knowledge is a cornerstone of effective education, and blended cooperative learning provides a fertile

ground for its development. Kyndt *et al.* (2013) conducted a comprehensive meta-analysis that further underscores the positive impact of cooperative learning, especially within blended learning environments. Their analysis, which synthesized findings from numerous studies, concluded that cooperative learning strategies consistently led to higher academic performance. This was particularly evident in subjects requiring problem-solving and critical thinking. The collaborative nature of cooperative learning, combined with the diverse learning opportunities provided by a blended approach, enables students to engage with complex problems more effectively. They benefit from the collective intelligence of the group, while also having the opportunity to explore and refine their understanding individually.

Challenges and Considerations in Implementing Blended Cooperative Learning

Implementing blended cooperative learning, despite its potential benefits, presents a set of challenges that educators and institutions must carefully navigate. One of the most significant challenges lies in ensuring that all students have equitable access to the necessary technology and internet resources (Dziuban *et al.*, 2018). In a world where digital learning is increasingly essential, disparities in access can create a digital divide, leading to uneven academic outcomes. Students from socioeconomically disadvantaged backgrounds may struggle to keep pace with their peers, not because of a lack of ability, but due to a lack of resources. This inequity can undermine the very essence of cooperative learning, which thrives on equal participation and collaboration among students. Therefore, it is crucial for schools and policymakers to address these gaps by providing adequate resources and support to all students, ensuring that no one is left behind (Siregar *et al.*, 2024). Another significant challenge in the implementation of blended cooperative learning is the need for comprehensive teacher training and ongoing support. The shift to blended learning requires educators to be proficient not only in their subject matter but also in the use of digital tools and platforms that facilitate both online and offline learning. This dual proficiency is not inherently present in all educators, particularly those who may be less familiar with new technologies (Jean & Lee, 2023). As such, professional development programs that focus on the pedagogy of blended learning and the practical integration of technology into the classroom are essential. These programs should be designed to empower teachers with the skills and confidence needed to create effective and engaging collaborative activities.

Without proper training and support, teachers may struggle to implement blended cooperative learning effectively, potentially leading to suboptimal educational outcomes. Maintaining student engagement in a blended cooperative learning environment also poses a considerable challenge. The flexibility of online activities, while beneficial, can sometimes lead to reduced face-to-face interaction, which is a core element of cooperative learning (Kyndth *et al.*, 2013). The physical presence of peers and teachers often fosters a sense of community and accountability, which can be harder to achieve in an online setting. Therefore, educators must strike a careful balance between online and offline activities to keep students actively engaged. This balance is critical in maintaining the social dynamics that make cooperative learning effective, such as peer support, collaboration, and the shared responsibility for learning. Educators might need to employ innovative strategies, such as synchronous online sessions that mimic the interactivity of a physical classroom, or hybrid models that ensure regular in-person meetings to sustain the cooperative spirit (Jean & Lee, 2023. Additionally, the design and structure of blended cooperative learning activities require thoughtful consideration. The integration of online and offline components must be seamless, ensuring that both environments complement each other rather than operate in silos. Activities should be designed to leverage the strengths of each mode of learning—online tools can facilitate research, communication, and the sharing of resources, while face-to-face interactions can enhance critical discussions, problem-solving, and the building of interpersonal skills (Valverde-Bersocoso & Fernandez-Sanchez, 2020). Educators must be adept at creating assignments and projects that not only align with the learning objectives but also promote active participation from all students, regardless of their preferred learning mode.

Recommendations for Effective Implementation of Blended Cooperative Learning

To fully realize the potential of blended cooperative learning in enhancing academic achievement, a strategic approach is necessary. The following recommendations outline key strategies to ensure the successful implementation of this instructional model:

94992

- **Ensuring Equitable Access:** One of the primary concerns in implementing blended cooperative learning is ensuring that all students have equitable access to necessary resources. This includes not only digital devices such as laptops or tablets but also a reliable internet connection. Schools must take proactive measures to identify students who may lack access and provide the necessary support. This might involve partnerships with community organizations, local businesses, or government initiatives aimed at closing the digital divide. For example, schools could collaborate with local libraries or community centres to offer students free or low-cost internet access. Additionally, schools could work with local government or nonprofit organizations to secure funding for providing digital devices to students in need. By addressing these disparities, schools can ensure that every student has the opportunity to engage fully in blended cooperative learning activities.

- **Professional Development for Educators:** Teachers are the cornerstone of effective blended cooperative learning, and their proficiency with digital tools and blended learning strategies is critical. Ongoing professional development should be a priority, with a focus on equipping teachers with the skills necessary to design and implement blended learning activities that seamlessly integrate online and offline components. This training should emphasize the creation of cooperative learning activities that foster collaboration among students, both in-person and online. Moreover, professional development should be iterative and responsive to the evolving educational landscape, allowing teachers to continuously refine their instructional practices. Peer collaboration and sharing of best practices should also be encouraged, creating a community of educators who are collectively working to enhance their blended learning strategies.

- **Promoting Student-Centred Learning:** Blended cooperative learning should be structured to place students at the centre of the learning process, promoting autonomy, active engagement, and ownership of their learning journey. Teachers can achieve this by designing activities that allow for student choice and foster collaboration. For instance, students could be given options in how they approach a project or which digital tools they use, thereby catering to different learning styles and preferences. Furthermore, incorporating self-assessment and reflection into the learning journey allows students to assess their growth and pinpoint areas needing improvement. This student-focused strategy not only boosts motivation but also fosters critical thinking and problem-solving abilities, which are vital for achieving academic success.

- **Maintaining a Balanced Approach:** While the online components of blended cooperative learning offer flexibility and access to a wealth of resources, the importance of face-to-face interactions should not be underestimated. A balanced approach that combines both online and offline interactions is crucial for developing social skills and building a sense of community among students. In-person activities allow students to engage in meaningful discussions, build relationships, and develop communication skills that are essential in both academic and real-world settings. Teachers should design blended learning experiences that leverage the strengths of both online and offline interactions, ensuring that students benefit from a holistic learning experience.

- **Implementing Continuous Assessment and Feedback:** The integration of continuous assessment and feedback mechanisms is vital for monitoring student progress and adjusting instructional strategies in real-time. Digital tools can be highly effective in facilitating formative assessment, offering educators real-time data on student performance. This data allows teachers to identify learning gaps, provide targeted support, and make informed decisions about instructional adjustments. Regular feedback, both from teachers and peers, should be a core component of blended cooperative learning, as it helps students stay on track and fosters a growth mindset. Teachers should also encourage students to engage in self-assessment, promoting reflection on their learning and empowering them to take an active role in their academic development. By following these recommendations, educators can create a robust framework for blended cooperative learning that supports equitable access, empowers teachers, and centres students in the learning process, ultimately leading to improved academic outcomes.

CONCLUSION

Blended cooperative learning is a dynamic pedagogical strategy that harnesses the advantages of both online and traditional classroom settings to create a more holistic educational experience. This approach not only facilitates collaboration among students but also nurtures critical thinking and fosters greater independence in learning. The potential of blended cooperative learning to improve academic outcomes for secondary school students is significant, as it merges the interactive elements of group work with the flexibility and resources available through digital platforms. However, the success of blended cooperative learning hinges on several critical factors. Effective implementation demands meticulous planning to integrate both digital and in-person components seamlessly. Ensuring equitable access to technology is also crucial, as disparities in resources can undermine the benefits of this approach. Furthermore, educators must receive ongoing support and training to adapt to the evolving demands of blended learning environments and to guide students in making the most of these opportunities. As educational institutions increasingly adopt blended learning models, it is imperative to focus on creating learning experiences that are inclusive, collaborative, and centered around the needs and abilities of all students. By doing so, blended cooperative learning not only boosts academic success but also equips students for the collaborative and digital challenges of the future.

FURTHER RESEARCH

For further research, it is essential to explore into the specific mechanisms by which blended cooperative learning influences student outcomes. Future studies should focus on identifying the key factors that optimize the integration of digital tools and collaborative methods, such as the role of teacher facilitation, the nature of digital content, and group dynamics within cooperative settings. Additionally, research should explore how blended cooperative learning impacts diverse student populations, including those from varying socio-economic backgrounds and with different learning abilities. Comparative studies that examine blended cooperative learning across different subjects and educational levels would also offer meaningful perspectives on its adaptability and effectiveness. Lastly, the enduring impactsof blended cooperative learning on student motivation, engagement, and retention of knowledge should be a priority to determine its sustainability as an educational model in evolving technological and pedagogical landscapes.

ABSTRACT

In this article we have investigated the product eccentricity energy of graphs related to Bistar graph. With the idea of E_{PE} (Product Eccentricity Energy) we compute the density of antipyretic drugs.

Keywords: Product eccentricity matrix, product eccentricity energy, eigen values, Bistar graph, Antipyretic drugs.

INTRODUCTION

Graph theory is the department of discrete arithmetic, it is the thinking about the structures with their properties, objectives and their relations. It was initially helpful in solving a variety of mathematical issues, but when it was used in complex science, computer science, chemistry, and other fields, it occasionally expanded into new areas of mathematical analysis. The graphs considered in this article are simple, loop less and connected graphs. The eccentricity of a vertex is an important idea within this framework, as it evaluates the maximum distance between 2 vertices. The distance between two vertices a and b in $V(G)$ is the shortest $a - b$ path length in G. The eccentricity of the vertex evaluates the maximum distance from a specific vertex to any other vertex in the graph. Formally, it can be expressed as:
$\xi(b) = \max\{d(b,a)|\forall\, a \in V(G)\}$
The eccentricity matrix $\xi(G)$of a graph$G$ is obtained from the distance matrix of G by retaining the largest distances in each row and each column and leaving zeros in the remaining ones. The eccentricity energy of G is the sum of the

94996

Priya Karen and Arokia Lancy

absolute values of the eigenvalues of $\xi(G)$. Let G be a graph with n vertices and m edges. Denote the absolute eigen values of G as $\lambda_i, i = 1,2, \cdots n$ arranged in order that is not increasing as $|\lambda_1| \geq |\lambda_2| \geq \cdots \geq |\lambda_n|$. In 1978 Ivan Gutman [3] computed the energy of a graph G as $E(G) = \sum_{i=1}^{n} |\lambda_i|$. Li.X, Y. Shi and I. Gutman [4] introduced the energy of graph in 2012 in which the adjacency matrix of a graph $G$is defined as

$$a_{ij} = \begin{cases} 1 & if \ v_iv_j \in E \\ 0 & otherwise \end{cases}$$

Spectrum of the graph is denoted by

$$Spec(G) = \begin{bmatrix} \lambda_1 & \lambda_2 & \cdots & \lambda_n \\ m_1 & m_2 & \cdots & m_n \end{bmatrix}$$

Where $m_i's$ denote the multiplicities of the corresponding eigen value. The total of the absolute values of the adjacency matrix's eigenvalues equals the graph's energy. Later, in 2009, C. Adiga et al. [1] defined the graph's maximum degree energy, which is dependent on the related graph's maximum degree matrix. The maximum degree matrix is defined as

$$d_{ij} = \begin{cases} max\ \{d(v_i), d(v_j)\}, & if \ v_iv_j \in E \\ 0, & otheriwse \end{cases}$$

In 2016, Ahmed M. Naji et.al [2] defined the concept of maximum eccentricity matrix. Later, Mohammad Issa Sowaity and B.Sharada [5] in 2017 introduced the concept of sum-eccentricity energy of a graph in 2017. In 2025, Priya Karen S and Arokia Lancy A [6] introduced the concept of Product Eccentricity energy of graphs. The product eccentricity matrix of the graph G is denoted as $P_e(G)$, it is defined as

$$p_{ij} = \begin{cases} e(v_i).e(v_j) & if \ v_i \sim v_j \\ 0 & otherwise \end{cases}$$

The Characteristic polynomial of the product eccentricity matrix is defined by $|\eta I - P_e(G)|$ and the corresponding characteristic equation is $\eta I - P_e(G) = 0$.

$E_{PE}(G)$is defined as the sum of the absolute eigen values, $E_{PE}(G) = \sum_{i=1}^{n} |\eta_i|$

where, $\eta_1, \eta_2, \cdots \eta_n$ are the eigen values of the given product eccentricity matrix.

PRELIMINARIES

Definition 2.1. [3] A Bistar graph is the graph obtained by joining the center (apex) vertices of two copies of $K_{1,n}$by an edge and it is denoted by $B_{n,n}$.The vertex set of $B_{n,n}$ is $V(B_{n,n}) = \{a_1, a_2, \cdots, a_n, a, b, b_1, b_2, \cdots b_n\}$, where a, b are apex vertices and $a_1, a_2, \cdots, a_n, b_1, b_2, \cdots b_n$ are pendent vertices. The edge set of $B_{n,n}$ is $E(B_{n,n}) = \{aa_1, aa_2, \cdots, aa_n, bb_1, bb_2, \cdots bb_n\}$.

Definition 2.2 [8] Let G be a simple connected graph. Then the square graph of a graph G is denoted by G^2 and defined as the graph with the same vertex set as of G and two vertices are adjacent in G^2 if they are at a distance 1 or 2 in G.

Definition 2.3 [3] A shadow graph $D_2(G)$ of a connected graph G is constructed by taking two copies of G say G' and G'' and join each vertex b in to G' the neighbours of the corresponding vertex a' in G''

Definition 2.4 [7] A globe graph $Gl(n)$ is a graph obtained from two vertex that are isolated and are joined by n paths of length two.

PRODUCT ECCENTRICITY ENERGY OF BISTAR GRAPHS AND FEW BISTAR RELATED GRAPHS
Theorem 3.1
Let $n \in N$, $n \geq 1$, then $E_{PE}(B_{n,n}) = 8\sqrt{9n + 1}$, where $E_{PE}(B_{n,n})$ is the product eccentricity energy of the Bistar Graph $B_{n,n}$.

Proof. Consider the vertex set of the Bistar graph as $a_1, a_2. \cdots a_n, a, b, b_1, b_2, \cdots, b_n$.Number of vertices of the bistar graph =$2n + 2$and the number of edges of the bistar graph= $2n + 1$

Priya Karen and Arokia Lancy

The product eccentricity energy matrix $B_{n,n}$ of obtained is

$$P_e(B_{n,n}) = \begin{bmatrix} 0 & 0 & \cdots & \cdots & 0 & 6 & 0 & \cdots & \cdots & 0 & 0 \\ \vdots & \cdot & \cdot & \cdot & \vdots & \vdots & \vdots & \cdot & \cdot & \cdot & \vdots \\ \vdots & \cdot & \cdot & \cdot & \vdots & \vdots & \vdots & \cdot & \cdot & \cdot & \vdots \\ 0 & 0 & \cdots & \cdots & 0 & 6 & 0 & \cdots & \cdots & 0 & 0 \\ 6 & 6 & \cdots & \cdots & 6 & 0 & 4 & 0 & \cdots & \cdots & 0 \\ 0 & 0 & \cdots & \cdots & 0 & 4 & 0 & 6 & \cdots & \cdots & 6 \\ \vdots & \cdot & \cdot & \cdot & \vdots & 0 & 6 & 0 & \cdots & \cdots & 0 \\ \vdots & \cdot & \cdot & \cdot & \vdots & \vdots & \vdots & \vdots & \cdot & \cdot & \vdots \\ 0 & 0 & \cdots & \cdots & 0 & 0 & 6 & 0 & \cdots & \cdots & 0 \end{bmatrix}$$

Spectrum of the bistar graph is found as

$$P_e(B_{3,3}) = \begin{pmatrix} 0 & 1-\sqrt{9n+1} & 1+\sqrt{9n+1} & -1+\sqrt{9n+1} & -1-\sqrt{9n+1} \\ 2(n-1) & 1 & 1 & 1 & 1 \end{pmatrix}$$

Eigen values are $0,0,\cdots 0$ $(2(n-1)times), 2(1+\sqrt{9n+1})2(1-\sqrt{9n+1}), 2(-1+\sqrt{9n+1}), 2(-1-\sqrt{9n+1})$

$E_{PE}(B_{n,n}) = |0| + 2|1+\sqrt{9n+1}| + 2(1-\sqrt{9n+1}| + 2|(-1+\sqrt{9n+1})| + 2(-1-\sqrt{9n+1})|$

$E_{PE}(B_{n,n}) = 8(1+\sqrt{9n+1})$

Example 3.2. Product Eccentricity Energy of Bistar Graph $B_{3,3} = 8\sqrt{28} = 16\sqrt{7}$.

The Product Eccentricity matrix of the Bistar Graph $B_{3,3}$ is obtained as follows:

$$P_e(B_{n,n}) = \begin{bmatrix} 0 & 0 & 0 & 6 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 6 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 6 & 0 & 0 & 0 & 0 \\ 6 & 6 & 6 & 0 & 4 & 0 & 0 & 0 \\ 0 & 0 & 0 & 4 & 0 & 6 & 6 & 6 \\ 0 & 0 & 0 & 0 & 6 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 6 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 6 & 0 & 0 & 0 \end{bmatrix}$$

The characteristic polynomial of the above matrix is $\eta^4(\eta - 2)(2(\pm\eta \pm \sqrt{28}))$

The eigen values are $0,0,0,0,2(-1-\sqrt{28}), 2(-1+\sqrt{28}), 2(1-\sqrt{28}), 2(1+2\sqrt{28})$

Thus, the Product eccentricity energy of $B_{3,3} = 8\sqrt{28} = 16\sqrt{7}$.

Theorem 3.3:

Let $B_{n,n}^2$ be the square bistar graph where $n \in N, n \geq 1$. Then $E_{PE}(B_{n,n}^2) = (\sqrt{64n+1})+1$

Proof. Let the vertex set of $B_{n,n}^2$ be denoted as $a_1, a_2, \cdots a_n, a, b, b_1, b_2, \cdots, b_n$. Number of vertices of the bistar graph $=2n+2$ and the number of edges of the bistar graph $= 4n+1$

The product eccentricity energy matrix obtained is

$$P_e(B_{n,n}^2) = \begin{bmatrix} 0 & 0 & \cdots & \cdots & 0 & 2 & 2 & 0 & \cdots & 0 & 0 \\ \vdots & \cdot & \cdot & \cdot & \vdots & \vdots & \vdots & \cdot & \cdot & \cdot & \vdots \\ \vdots & \cdot & \cdot & \cdot & \vdots & \vdots & \vdots & \cdot & \cdot & \cdot & \vdots \\ 0 & 0 & \cdots & \cdots & 0 & 2 & 2 & \cdots & \cdots & 0 & 0 \\ 2 & \cdots & \cdots & \cdots & 2 & 0 & 1 & 2 & \cdots & \cdots & 2 \\ 2 & \cdots & \cdots & \cdots & 2 & 1 & 0 & 2 & \cdots & \cdots & 2 \\ 0 & \cdot & \cdot & \cdot & 0 & 2 & 2 & 0 & \cdots & \cdots & 0 \\ \vdots & \cdot & \cdot & \cdot & \vdots & \vdots & \vdots & \vdots & \cdot & \cdot & \vdots \\ \vdots & \cdot & \cdot & \cdot & \vdots & \vdots & \vdots & \vdots & \cdot & \cdot & \vdots \\ 0 & \cdots & \cdots & \cdots & 0 & 2 & 2 & 0 & \cdots & \cdots & 0 \end{bmatrix}$$

Spectrum of $P_e(B_{n,n}) = \begin{pmatrix} 0 & -1 & \frac{1}{2}+\sqrt{1+64n}+1 & \frac{1}{2}+\sqrt{1+64n}-1 \\ 2n-1 & 1 & 1 & 1 \end{pmatrix}$

Eigen values are $0,0,\cdots 0$ $((2n-1)times), -1, \frac{1}{2}+\sqrt{1+64n}+1, \frac{1}{2}+\sqrt{1+64n}-1$

Product Eccentricity energy of the Square Bistar Graph is $(\sqrt{64n+1}) + 1$

Priya Karen and Arokia Lancy

Example 3.4. Product Eccentricity Energy of Squar Bistar Graph $B_{3,3}^2 = 1 + \sqrt{129}$.

The Product Eccentricity Matrix of the Square Bistar Graph $B_{3,3}^2$ is obtained as

$$P_e\left(B_{3,3}^2\right) = \begin{bmatrix} 0 & 0 & 2 & 2 & 0 & 0 \\ 0 & 0 & 2 & 2 & 0 & 0 \\ 2 & 2 & 0 & 1 & 2 & 2 \\ 2 & 2 & 1 & 0 & 2 & 2 \\ 0 & 0 & 2 & 2 & 0 & 0 \\ 0 & 0 & 2 & 2 & 0 & 0 \end{bmatrix}$$

The characteristic polynomial of the above matrix is

$$\eta^3(\eta + 1)\left(\eta - \frac{1}{2}\left(1 - \sqrt{129}\right)\right)\left(\eta - \frac{1}{2}\left(1 - \sqrt{129}\right)\right)$$

The eigen values of the above matrix is $-1, 0, 0, 0, \frac{1}{2}\left(1 + \sqrt{129}\right), \frac{1}{2}\left(1 - \sqrt{129}\right)$

Thus, $E_{PE}\left(B_{3,3}^2\right) = 1 + \sqrt{129}$.

Theorem 3.5:

Let $GL(n)$ be a globe graph where $n \in N, n \geq 2$ then $E_{PE}(GL(n)) = 8\sqrt{2n}$.

Proof. Consider the vertex set of the globe graph as $a_1, a_2, a_3, \cdots a_n, a, b$. The number of vertices of the Globe graph $= n + 2$ and the number of edges of the Globe graph $= 2n$

The product eccentricity energy of the globe graph is obtained as

$$P_e\left(B_{n,n}^2\right) = \begin{bmatrix} 0 & 4 & \cdots & 4 & 0 \\ 4 & 0 & \cdots & 0 & 4 \\ \vdots & \vdots & . & \vdots & \vdots \\ 4 & 0 & \cdots & 0 & 4 \\ 0 & 4 & \cdots & 4 & 0 \end{bmatrix}$$

The characteristic polynomial of the globe graph is $\eta^n(\eta + 4\sqrt{2n})(\eta - 4\sqrt{2n})$

Spectrum of the globe graph is given below

$$\begin{pmatrix} 0 & 4\sqrt{2n} & -4\sqrt{2n} \\ n & 1 & 1 \end{pmatrix}$$

Product Eccentricity energy of the Globe Graph is $8\sqrt{2n}$.

Example 3.6. Product Eccentricity Energy of the Globe graph $GL(3) = 8\sqrt{6}$

The product eccentricity matrix of the above graph is given below

$$P_e(GL(3)) = \begin{bmatrix} 0 & 4 & 4 & 4 & 0 \\ 4 & 0 & 0 & 0 & 4 \\ 4 & 0 & 0 & 0 & 4 \\ 4 & 0 & 0 & 0 & 4 \\ 0 & 4 & 4 & 4 & 0 \end{bmatrix}$$

The characteristic polynomial of the globe graph is $-\eta^5 + 96\eta^3$. The eigen values are $-4\sqrt{6}, 4\sqrt{6}, 0, 0, 0$. Thus, the product eccentricity energy of the globe graph $GL(3) = 8\sqrt{6}$

PRODUCT ECCENTRICITY ENERGY OF ANTIPYRETIC DRUGS

Numerous graph-theoretical matrices are used in chemical graph theory and they are crucial for working with graphs numerically and as helpful tools for their algebraic representation. Here, we are interested in a specific family of graphs called molecular graphs, or graphs that show the chemical structure of molecules. They are made by switching out the atoms and bonds of the vertices and edges, respectively. Hydrogen atoms are typically disregarded. An object's density is one of the most important and easily measured physical properties. Among the many uses for which densities are commonly employed are the identification of pure substances as well as the description and estimation of the composition of different combinations. Antipyretics are one of the most frequently used agents in medicine. In this article, we compute the Product Eccentricity Energy of few commonly used antipyretics. Theoretical density and practical density are compared, practical density is obtained using

Priya Karen and Arokia Lancy

$$\frac{2\,E_{PE}(G)}{\sum_{i=1,i<j}^{n} e(v_i).e(v_j)}.$$

Product Eccentricity Energy of Naproxen:

Using Product Eccentricity Matrix where P_{ij} takes $e(v_i).e(v_j)$ when v_i and v_j are adjacent and 0 otherwise we obtain the below $P_e(Naproxen)$.

$$
\begin{bmatrix}
0 & 90 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
90 & 0 & 72 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 72 & 0 & 56 & 0 & 0 & 0 & 56 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 56 & 0 & 42 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 42 & 0 & 30 & 0 & 0 & 0 & 30 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 30 & 0 & 30 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 30 & 0 & 0 & 0 & 0 & 0 & 42 & 0 & 0 & 0 & 0 \\
0 & 0 & 56 & 0 & 0 & 0 & 0 & 0 & 42 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 42 & 0 & 30 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 30 & 0 & 0 & 0 & 30 & 0 & 30 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 30 & 0 & 42 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 42 & 0 & 0 & 0 & 42 & 0 & 56 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 56 & 0 & 72 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 72 & 0 & 90 & 90 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 90 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0
\end{bmatrix}
$$

The Eigen values obtained from the product eccentricity matrix are
$\pm 149.755, \pm 130.474, \pm 82.4659, \pm 70.1359, \pm 48.6843, \pm 38.7114, \pm 24.3653, 0,0.$

Using the eigen values obtained the product eccentricity energy calculated is **1089.1832**

$$Density \approx \frac{E_{PE}(G)}{\sum_{i=1,i<j}^{n} e(v_i).e(v_j)} \qquad = \frac{(1089.1832)}{900} = 1.210$$

$$Density \approx 1.2$$

Thus, the practical density obtained is approximately equal to the theoretical density.

RESULT

$$Density \approx \frac{E_{PE}(G)}{\sum_{i=1,i<j}^{n} e(v_i).e(v_j)}$$

CONCLUSION

Thus, in this article we have calculated the product eccentricity energy of few standard graphs that are related to bistar graph and computed the practical density of some antipyretic drugs.

ABSTRACT

Dandy-Walker syndrome (DWS) is a rare congenital malformation of the posterior fossa, characterized by cerebellar hypoplasia, cystic dilation of the fourth ventricle, and hydrocephalus. This case report presents a 5-month-old male infant, born to a consanguineous couple, with macrocephaly and diagnosed with Dandy-Walker phenotype complicated by severe supra-tentorial hydrocephalus. The child underwent a right ventriculoperitoneal (VP) shunt and a retro-cerebellar cystoperitoneal shunt placement. Postoperative recovery was initially stable; however, the child presented again with fever, reduced activity, and recurrent vomiting, raising concerns for shunt-related complications, including infection and obstruction. Despite antimicrobial therapy, persistent symptoms led to the identification of a shunt infection. Laboratory investigations revealed elevated cerebrospinal fluid (CSF) protein levels, mild anemia, and dilated ventricles on neuroimaging. The child was managed with broad-spectrum antibiotics, neurosurgical consultations, and supportive care. This case underscores the complex clinical course of DWS, highlighting the increased susceptibility to shunt infections and the need for vigilant monitoring post-surgery

Keywords: Dandy-Walker Syndrome, Shunt Infection, Hydrocephalus, Ventriculoperitoneal Shunt, Cerebellar Hypoplasia, Shunt Complications

INTRODUCTION

Dandy-Walker malformation (DWM) is a complex congenital anomaly characterized by structural abnormalities of the posterior fossa and cerebellum. This rare disorder has an estimated prevalence ranging between 1 in 10,000 and 30,000 live births. Hydrocephalus, a frequently encountered manifestation, is observed in nearly 80% of affected individuals, with DWM accounting for approximately 4% to 12% of hydrocephalic cases in neonates. The hallmark triad of DWM comprises partial or complete agenesis of the cerebellar vermis, expansion of the posterior fossa accompanied by superior displacement of the tentorium, transverse sinus, and torcular herophili, & cystic dilatation of the fourth ventricle. In addition to these defining features, DWM is often associated with other central nervous system anomalies, including ventriculomegaly, corpus callosum agenesis, holoprosencephaly, and encephalocele, further complicating its clinical presentation [1]. The precise etiology and pathogenesis of DWS remain incompletely elucidated. It is predominantly regarded as a multifactorial genetic disorder, arising from a complex interplay between genetic predisposition and environmental influences. Diagnosis of DWS is typically established through magnetic resonance imaging (MRI) or histopathological examination postnatally. However, in the prenatal setting, ultrasonography serves as the most reliable diagnostic modality. Anomalies indicative of DWS can often be detected during routine second-trimester ultrasound screening, facilitating early identification and potential intervention [2]. At present, no definitive cure exists for Dandy-Walker syndrome. Consequently, management strategies are primarily directed toward mitigating symptoms and addressing associated complications [3]. This report presents an in-depth case study of an infant diagnosed with Dandy-Walker malformation, status post-right ventriculoperitoneal shunt placement, who subsequently developed a shunt infection. The objective of this case study is to elucidate postoperative complications, highlight the clinical challenges encountered, and discuss the strategies employed for successful management.

CASE PRESENTATION

A 5-month-old male infant, born to a consanguineous couple as their first child at full term via LSCS, presented with a history of macrocephaly and was admitted for further evaluation. The child had a birth weight of 2 kg and cried immediately after birth with no perinatal complications. Upon examination, the infant was afebrile, maintaining room air saturation levels, and was hemodynamically stable. His heart rate was 132 bpm, blood pressure 102/44 mmHg, and respiratory rate 29 breaths/min. Chest auscultation revealed equal air entry bilaterally with normal heart sounds and no murmurs, while the abdomen was soft, and normal bowel sounds were noted with no organomegaly. Neurologically, the child was conscious and alert, with pupils bilaterally equal and reactive to light, intact extraocular movements, and a full pulsatile anterior fontanel. Muscle tone was normal, and the child demonstrated full motor power by moving all limbs against gravity. On admission, the infant weighed 6.5 kg, and his head circumference was 49 cm. Laboratory investigations were performed, and a plain MRI of the brain revealed characteristics of the Dandy-Walker phenotype. These included cerebellar hypoplasia, upward counter clockwise rotation of the vermis, cystic dilation of the fourth ventricle, and elevation of the torcula and tentorium. The posterior fossa was enlarged, the tegmento-vermian angle measured 42°, and there was a mild reduction in brainstem volume. Severe dilation of the lateral and third ventricles was also evident, with a bifrontal horn diameter of 78 mm, rounded temporal horns measuring 30 mm on the right and 28 mm on the left, and maximum atrial diameters of 38 mm on the right and 41 mm on the left. The third ventricle diameter was 20 mm, with no transpendymal edema present. Other findings included the separation of the fornix from the splenium and the lowering of the third ventricle floor. Both the corpus callosum and brainstem appeared stretched and thinned, with a reduction in periventricular white matter volume. Flow voids were intact. The child was diagnosed with Dandy-Walker phenotype and severe supratentorial hydrocephalus. After being admitted and kept NPO, intravenous fluids were administered, and surgical intervention was planned. The child underwent a right ventriculoperitoneal shunt (medium-pressure Chhabra shunt with Y connector) and a right retro-cerebellar cysto-peritoneal shunt. Following the surgery, the child was discharged in a stable neurological and hemodynamic state. However, 3 month later, the infant developed a fever and exhibited reduced activity. The child began experiencing episodes of vomiting, for which initial treatment was provided on an outpatient basis. Despite stabilizing briefly, the child was admitted for a prolonged 15-day stay due to ongoing

lethargy and recurrent vomiting. During this hospitalization, a neurosonography was performed, revealing moderate dilation of both the lateral and third ventricles, along with a dilated fourth ventricle. A residual posterior fossa cyst was noted, measuring 88 x 50 x 23 mm. CSF analysis showed a protein concentration of 200 mg/dL, glucose of 40 mg/dL, and 700 cells, of which 10% were polymorphonuclear leukocytes. Consequently, the child was commenced on vancomycin (200 mg in 30 mL over 1 hour, administered twice daily) and ceftriaxone (350 mg, twice daily) for a seven-day course before being transferred to our facility for advanced care. A 9-month-old male child, presents with the following anthropometric details: head circumference of 46.5 cm (75th to 90th percentile), height of 63 cm (<3rd percentile), and weight of 7 kg (<3rd percentile). The child was brought to the hospital by his mother with complaints of fever for one month and diminished activity, along with vomiting for the past 15 days. The child has a known history of Dandy-Walker malformation and underwent a right ventricular-peritoneal (VP) shunt placement. Since the procedure, the child's condition has been characterized by declining activity and vomiting, prompting an evaluation for suspected shunt-related complications such as shunt meningitis or blockage. The child was asymptomatic post-surgery, however, he began developing fever with an insidious onset, progressively worsening over the course of a month. The fever is intermittent and low-grade, typically aggravating at night but alleviated by medication. The fever is not associated with any rash or diaper rash. Dull activity and irritability were noted, with the child refusing food and showing a marked decrease in activity. Vomiting, which was projectile and non-bilious, contained milk and mucus and was alleviated by medication. There were no complaints of loose stools, respiratory distress, or changes in urinary output. The child did not report abdominal pain, seizures, or ear or eye discharge. There is no family history of similar conditions, and no other comorbidities were reported. Upon examination, the child appeared alert and febrile, with a visual large head circumference (46.5 cm), normal vital signs, and normal tone, power, and reflexes.

His blood glucose was 120 mg/dL, and a right VP shunt was in situ. The child's developmental quotient was noted to be 91%.Laboratory investigations, including a complete blood count, renal function tests, and liver function tests, were conducted as outlined in Table 1. Notably, the hemoglobin level was found to be low at 10.1 g/dL, accompanied by a mean corpuscular hemoglobin (MCH) of 21.4 pg. The fever profile yielded negative results for Widal and dengue. A sterile body fluid culture, including CSF, was sent for analysis, but no bacterial growth was detected in the culture. A neurosonography was performed, revealing dilation of the entire ventricular system. On Day 1 of hospitalization Intravenous vancomycin was administered at 60 mg/kg per day (105 mg in 20 cc, four times a day), and ceftriaxone at 100 mg/kg per day (350 mg in 20 cc, twice daily). Syrup levetiracetam was started at 20 mg/kg (0.7 ml, twice daily), and domperidone was administered at 0.2 mg/kg (1.4 ml, twice daily). Injection paracetamol was given at 10 mg/kg per day (7 ml, four times daily). Further treatment was provided as outlined in the treatment table 2. On day 2, a neurological opinion was sought. The physician noted spontaneous movements, positive reservoir filling, and a depressed anterior fontanelle. A CT brain scan and CSF workup were advised. By day 3, the child was fever-free, with improved activity and subsiding vomiting. The head circumference was measured at 47.5 cm. On day 5, the pediatrician referred the child to a neurosurgeon due to persistent increase in head circumference (46.5 cm to 47.5 cm) and CSF protein level of 134 mg/dL with a glucose levels of 64%, the pediatrician referred the child to a neurosurgeon. The CSF cell count revealed 3 cells/ cu mm, with 35% polymorphonuclear cells and 65% lymphocytes. A CT scan showed significant dilation of the entire ventricular system. Neurosurgical consultation recommended close monitoring for persistent vomiting, seizures, or a drop in Glasgow Coma Scale (GCS) score. Over the course of the next days, the child remained fever-free with improved activity. By Day 10, the diagnosis of Dandy-Walker syndrome with hydrocephalus and right VP shunt infection, complicated by mild anemia, was confirmed. On general examination, the child was active, afebrile, with a heart rate of 112 bpm, respiratory rate of 32 breaths/min, and a head circumference of 47.4 cm. The anterior fontanelle was flat. On Day 12, the child developed a rash, but there was no irritability, vomiting, or seizures. Dermatology consultation revealed a single well-defined erythematous plaque with raised borders over the left forearm and diffuse hyper pigmented patches with scaling over the pubic area. 1% clotrimazole cream was prescribed. By Days 13–15, the child remained active, afebrile, with a heart rate of 120 bpm and a respiratory rate of 28 breaths/min. Cardiovascular and respiratory examinations were normal. Abdominal examination was soft and non-tender. The child was discharged in stable condition with a prescription for syrup levetiracetam, syrup tonoferon, and instructions for complementary feeding.

DISCUSSION

Dandy–Walker syndrome (DWS) is a relatively uncommon congenital anomaly, with an incidence estimated at approximately one in every 25,000 live births. Epidemiological data indicate a higher prevalence of this condition among females compared to males [4]**.** Shunt-related infections represent a prevalent etiology of central nervous system (CNS) infections and constitute a critical complication associated with ventriculoperitoneal shunt (VPS) implantation. The incidence of VPS infections ranges between 5% and 22%. In the aftermath of such infections, patients often necessitate multiple surgical procedures, face the risk of profound neurological impairments, and experience an overall deterioration in clinical prognosis. Research by Yengo-Kahn AM et al. encompassed 210 patients aged 16 years. Among these, 19 individuals were diagnosed with Dandy–Walker syndrome, of whom 8 developed shunt infections while 11 did not. It was observed that 19.5% of all patients who experienced shunt infections also had Dandy–Walker syndrome, whereas only 6.5% of patients without shunt infections were affected by the same condition. This disparity suggests a statistically significant association between Dandy–Walker syndrome and an increased susceptibility to shunt infections (p = 0.013). Moreover, the prevalence of Dandy–Walker syndrome was considerably higher in patients with shunt infections (19.51%) compared to those without (6.51%). Although large-scale studies are absent in the current literature, it has been postulated that immunodeficiency associated with Dandy–Walker syndrome may contribute to this heightened risk. Among the infectious agents identified in patients with shunt infections, *Staphylococcus epidermidis* was the most commonly isolated pathogen [5]. Emerging evidence indicates that DWM arises from developmental anomalies affecting the roof of the rhomb encephalon, resulting in varying degrees of vermian hypoplasia and cystic dilation. This intricate malformation is believed to stem from two distinct pathophysiological mechanisms: the arrest of vermian development and the failure of fenestration of the fourth ventricle foramina, which leads to the persistence of an enlarged Blake's pouch and subsequent compression of the cerebellar vermis. Additionally, rare genetic mutations have been implicated in the etiology of DWM, involving genes such as *FOXC1* (located at 6p25.3), *ZIC1* and *ZIC4* (at 3q24), as well as *FGF17*, *LAMC1*, and *NID1*, highlighting the complex genetic underpinnings of this disorder [6].

The etiology of DWS remains incompletely understood; however, overlapping deletions in the 3q24q25.1 chromosomal region have been identified in a limited subset of patients. Within this deleted segment, heterozygous deficiencies of the *ZIC1* and *ZIC4* genes have been detected and are postulated to play a pivotal role in the pathogenesis of DWS, as evidenced by findings from mouse model studies [7]. In a study conducted by Yengo-Kahn AM et al., revealed that the most frequently reported symptom was nausea, vomiting, or poor feeding, observed in 37.7% of cases, closely followed by irritability in 37.1% of patients. On physical examination, a bulging fontanelle was noted in 44.3% of individuals, while an increase in head circumference was the most prevalent finding, present in 70.9% of cases. Notably, none of the patients exhibited new or worsening focal neurological deficits at presentation, and oculomotor abnormalities and episodes of apnea were relatively rare, occurring in only 4.6% and less than 5% of the cohort, respectively [8].In this case report, the patient presented with a one-month history of persistent fever accompanied by reduced activity levels, along with episodes of vomiting persisting for the past 15 days.Dandy–Walker malformation has been linked to neuropsychiatric disorders, including schizophrenia. A case report published by Tréhout M et al. documented a DWM-like condition in a patient with treatment-resistant schizophrenia, suggesting a potential association between structural cerebellar anomalies and the pathophysiology of certain psychiatric conditions[9]. Ultrasound serves as the cornerstone imaging technique for evaluating the fetal brain, enabling precise assessment of parameters such as head circumference, bilateral thalami, lateral ventricles, choroid plexus architecture, cavum septum pellucidum, cerebellum, cisterna magna dimensions, nuchal fold, and the spinal structure. In addition to these evaluations, ultrasound frequently aids in detecting CNSanomalies that are often linked with Dandy–Walker malformation. The routine measurement of cisterna magna during prenatal neurosonography can prompt suspicions of congenital posterior fossa malformations. Nevertheless, after the 20th week of gestation, magnetic resonance imaging (MRI) demonstrates superior diagnostic capability compared to ultrasound in identifying CNS abnormalities, owing to its enhanced resolution and detailed visualization of intracranial structures [4]. Several therapeutic approaches have been proposed for the management of Dandy–

Walker syndrome-associated hydrocephalus (DWSH). These include the placement of a ventriculoperitoneal shunt (VPS) and a cystoperitoneal shunt (CPS), both aimed at diverting cerebrospinal fluid to alleviate intracranial pressure. Additionally, more advanced techniques such as dual-compartment or "complex" shunting systems have been utilized to address both ventricular and cystic components simultaneously. Endoscopic third ventriculostomy (ETV), with or without adjunctive choroid plexus cauterization (CPC), has also emerged as an effective minimally invasive alternative, particularly in cases where traditional shunting may pose higher risks or complications. Procedural complications associated with shunt-based interventions were classified into several categories, with treatment failure attributed to specific underlying causes. These included shunt obstruction, which impedes cerebrospinal fluid flow, and infections that compromise shunt function. Mechanical issues such as catheter fractures, misplacement of the shunt system, and the need for additional proximal catheters were also identified as contributing factors. Furthermore, complications related to cerebrospinal fluid dynamics, such as over-drainage or under-drainage, were documented The study conducted a comparative analysis of shunt-based and ETV based primary treatments for Dandy–Walker syndrome-associated hydrocephalus. Findings indicated that both procedures demonstrate comparable safety profiles in terms of complication rates and the need for subsequent revisions. Despite this equivalence, ETV is frequently favored due to its potential to mitigate the risk of long-term shunt-related complications, offering a more durable solution in suitable candidates. Nonetheless, shunt-based interventions remain indispensable, particularly in high-risk infants with complex anatomical or clinical conditions, where ETV may be less effective or contraindicated [8].

CONCLUSION

Shunt-related infections, as demonstrated in this instance, represent serious complications that may result in enduring neurological impairments. Prompt recognition of clinical manifestations such as pyrexia, emesis, and heightened irritability is essential for early therapeutic intervention. This case underscores the increased susceptibility to shunt infections in individuals with DWS, potentially attributable to inherent immunological deficiencies. While ETV serves as a viable alternative in select cases, the necessity of shunt implantation remains paramount in managing intricate presentations of profound hydrocephalus. Additionally, this case accentuates the significance of prolonged surveillance to detect recurrent hydrocephalus, shunt dysfunction, or infectious complications. Optimal management necessitated a multidisciplinary approach, highlighting the critical roles of timely diagnosis, precise neurosurgical procedures, and pre-emptive strategies for complication control. Ultimately, holistic perioperative management, meticulous postoperative observation, and swift responses to emerging issues are pivotal in enhancing prognostic outcomes for DWS patients reliant on shunt systems.

ABSTRACT

This research paper examines Barbara Kingsolver's *Flight Behaviour* through the lens of climate change and ecological disruption, focusing on the symbolic role of the monarch butterfly in illustrating the effects of environmental shifts. The text portrays the altered migration patterns of monarch butterflies, a consequence of climate change, as a powerful metaphor for broader ecological instability. By analysing the relationship between the butterfly's disrupted migration and the novel's human characters, this paper explores themes of displacement, adaptation, and the interconnectedness of human and non-human life. The research highlights how Kingsolver uses the butterfly to reflect both the fragility of ecosystems and the urgent need for a collective response to climate change. Additionally, the paper investigates the role of science and knowledge in addressing environmental crises, the intersection of social inequality with ecological degradation, and the importance of integrating scientific and local perspectives. In a nutshell, the study argues that *Flight Behavior* not only raises awareness about the impact of climate change on ecosystems but also calls for a holistic approach to environmental action, emphasizing the collective responsibility of humanity to safeguard the future of the planet.

Keywords: Climate Change, Ecological Disruption, Monarch Butterfly, Barbara Kingsolver, Flight Behavior, Environmental Awareness, Migration Patterns

INTRODUCTION

Climate change has become one of the most urgent challenges of the 21st century, with far-reaching implications for the environment, society, and the global economy. The accelerating impacts of climate change—rising global

temperatures, extreme weather events, sea level rise, and biodiversity loss—are evidence of an increasingly unstable ecological balance. At the heart of this challenge lies the concept of the *ecological equation*, a term used to describe the complex and interconnected relationships between the earth's ecosystems, human activities, and the natural resources we rely upon. This research paper seeks to explore the dynamics of climate change through the lens of the ecological equation, examining how human-driven factors such as carbon emissions, deforestation, and industrialization disrupt the delicate balance of ecosystems. Climate change is one of the most pressing global issues of our time, and literature has become an important tool for exploring and raising awareness about its far-reaching consequences. One such literary work is Barbara Kingsolver's *Flight Behavior*, a novel that intricately intertwines themes of climate change, ecology, and the human experience. In this paper, the focus will be on how *Flight Behavior* uses the butterfly, specifically the monarch butterfly, as a central symbol to explore the ecological impact of climate change. The butterfly in the novel becomes an entry point for understanding the interconnectedness of the natural world and how shifting environmental conditions disrupt the delicate balance of ecosystems. As we face an uncertain future, it is critical to develop a comprehensive understanding of the ecological equation to guide global efforts toward environmental resilience, sustainable development, and climate justice. Through this investigation, the paper hopes to contribute to ongoing discussions about the urgent need for a collective global response to the climate crisis. The literature surrounding Flight Behaviour reveals the deep interconnections between climate change, butterfly migration, and human experience. Kingsolver's portrayal of altered butterfly flight behaviour serves as a powerful metaphor for the broader ecological disruptions caused by climate change. The novel prompts reflection on how human beings perceive and respond to environmental shifts, while also urging greater conservation efforts. The studies and research referenced in the review underscore the complexity of butterfly migration and flight behaviour in the face of a changing climate, highlighting the critical need for continued ecological research and action to preserve vulnerable species.

RESEARCH FOCUS

The primary aim of this research is to analyze how Flight Behavior reflects the ecological and climate change narrative through the symbolic use of butterflies, their migration patterns, and the implications these hold for both natural ecosystems and human societies. The central research questions could be:

- How does Kingsolver use the butterfly (specifically the monarch) to symbolize the broader ecological effects of climate change?
- In what ways does the novel highlight the disruption of natural cycles and ecological balance?
- How does the human experience, as portrayed in *Flight Behavior*, mirror the larger ecological and environmental crises signified by the butterflies' changing migration patterns?

Ecological and Climate Change Themes in *Flight Behavior*
In Barbara Kingsolver's *Flight Behavior*, the author weaves together a compelling narrative that explores the intersection of ecological systems and the very real consequences of climate change. The novel is set against the backdrop of a changing natural world, where the effects of global warming disrupt local ecosystems and alter the lives of the characters. The themes of ecological imbalance and climate change are not only central to the story's plot but also serve as a lens through which the broader societal implications of environmental degradation are examined.
Flight Behavior follows the life of Dellarobia Turnbow, a rural woman who, through her encounter with a mysterious migration of monarch butterflies, becomes aware of the deeper environmental crises unfolding around her. The arrival of the butterflies, which normally migrate in specific patterns, is disrupted due to changes in temperature and weather patterns caused by global warming. This disruption reflects the broader ecological themes present throughout the novel, where the natural world is portrayed as fragile and vulnerable to human impact. Kingsolver's novel is set in rural Appalachia, where the protagonist, Dellarobia Turnbow, comes across an astonishing sight: thousands of monarch butterflies swarming in the mountain woods. This unprecedented event signifies an ecological anomaly caused by climate change, as the butterflies have altered their migration patterns due to warmer temperatures. The migration of the monarchs, an event usually happening further south in Mexico, is disrupted by

changing climatic conditions, making it a symbol for broader ecological instability. In examining the ecological and climate change themes in *Flight Behavior*, this research paper will explore the novel's portrayal of human-environment interactions and the consequences of ecological disruption. By analyzing the characters' evolving understanding of climate change and the symbolic use of the monarch butterfly migration, the paper aims to illustrate how Kingsolver uses fiction to highlight the urgency of environmental action. Through its vivid depiction of the impacts of climate change on both a personal and global scale, *Flight Behavior* offers a thought-provoking commentary on the need for sustainable practices and collective responsibility in addressing the ecological challenges of our time.

The Butterfly as a Symbol of Ecological Disruption
Monarch butterflies are often used in literature and science to symbolize the fragility and resilience of ecosystems. In *Flight Behavior*, Kingsolver uses the butterfly's disrupted migration as a powerful metaphor for ecological systems that are increasingly being destabilized by climate change. In *Flight Behavior*, Barbara Kingsolver uses the monarch butterfly's disrupted migration as a powerful symbol to explore the theme of ecological disruption. The butterflies' dramatic shift in their traditional migratory path, which is caused by the effects of climate change, serves as a metaphor for the fragility of natural systems and the consequences of human-induced environmental changes. This symbolic use of the butterfly not only underscores the immediate impacts of climate change on wildlife but also reflects the broader, systemic disruptions in the delicate balance of ecosystems. The monarch butterfly, known for its incredible long-distance migration, becomes a central figure in the novel as it draws attention to the changing climate patterns that interfere with natural processes. Traditionally, monarch butterflies migrate from Canada and the northern United States to the warmer regions of Mexico. However, in *Flight Behavior*, the butterflies are found in a small Appalachian valley in Tennessee, far from their usual migratory path. This inexplicable shift in behavior symbolizes the larger environmental changes occurring globally, such as rising temperatures and altered weather patterns, which disrupt the established cycles of nature. The butterflies' arrival is initially perceived as a wonder, a spectacle of beauty. However, as the novel progresses, it becomes clear that their presence is not a natural phenomenon but a result of an environmental crisis. This shift in the butterflies' migration serves as a wake-up call for the protagonist, Dellarobia Turnbow, and the surrounding community, forcing them to confront the larger, less visible disruptions occurring in the natural world.

The butterflies' altered behavior parallels the internal transformations of the characters as they begin to realize the severity of climate change and the challenges posed by ecological collapse. In addition to symbolizing environmental disruption, the monarch butterflies also represent the intersection of personal and global concerns. Dellarobia's emotional and intellectual journey mirrors the butterfly's flight: both are caught between the past and future, between denial and acceptance of the overwhelming changes occurring around them. The symbolism of the butterfly, as something fragile yet capable of great journeys, highlights the urgency of addressing ecological disruptions before irreversible damage is done. This paper will examine the symbolic significance of the monarch butterfly in *Flight Behavior* as a reflection of ecological disruption, drawing connections between the butterfly's altered migration and the larger environmental crises caused by climate change. By analyzing the narrative and its characters' responses to the butterflies' presence, this study will explore how Kingsolver uses the symbolism of the butterfly to evoke both the beauty and the tragedy of ecological imbalance, urging readers to acknowledge the broader implications of environmental degradation. Ultimately, the butterfly in *Flight Behavior* serves as a potent reminder of the interconnectedness of all living things and the urgent need to restore ecological harmony before it is too late. The monarchs' unseasonal arrival in the Appalachian mountains illustrates the impact of temperature shifts on migratory patterns and ecosystems. Monarchs, as cold-blooded creatures, depend on specific climatic conditions to guide their migration. The disruption of their path underscores the irreversible changes happening in nature due to human-driven climate change. The butterflies' migration northward can also be seen as a metaphor for the human experience of displacement caused by environmental factors. As natural habitats become inhospitable, both human and non-human species are forced to adapt, relocate, or face extinction.

The Butterfly as a Reflection of Human Lives

As Dellarobia's story unfolds, her relationship with the butterflies deepens, and she begins to see them as a metaphor for her own struggles in life. Her personal transformation parallels the environmental transformation, as the butterflies' arrival becomes a catalyst for her own awakening to the broader social and environmental issues that affect her community.

- **Personal Awakening**: Dellarobia's encounter with the butterflies is a turning point that opens her eyes to the urgency of addressing climate change. She begins to understand that her personal life is interconnected with the global environmental crisis, echoing the butterfly's journey from a distant land to her community. This connection between the human and non-human reflects how climate change is not a distant issue but one that affects us all, regardless of our socio-economic status or location.

- **Human Ignorance and Denial**: At the start of the novel, many people in Dellarobia's community dismiss the butterflies' arrival as an anomaly or a sign of divine intervention. This reflects widespread denial and ignorance about climate change. As the novel progresses, Dellarobia moves from skepticism to recognition, mirroring the journey of many individuals and communities in grappling with the realities of climate change.

The Role of Science and Knowledge in Understanding Climate Change

Kingsolver also places a strong emphasis on the role of science in interpreting and understanding environmental phenomena. The scientist, Dr. Byron, who accompanies Dellarobia in her discovery of the butterflies, represents the scientific community's efforts to understand the effects of climate change on ecosystems. The understanding and response to climate change are heavily reliant on the development and dissemination of scientific knowledge. Over the past several decades, scientific advancements have not only provided us with empirical evidence of the global climate crisis but have also offered frameworks for understanding its causes, effects, and potential solutions. Climate change, as a global phenomenon, requires interdisciplinary scientific efforts ranging from atmospheric science to ecology, economics, and social sciences, in order to fully grasp its complexities and to inform policy and action. This research paper examines the critical role that science and knowledge play in understanding climate change, emphasizing the importance of scientific research, public education, and the role of science communication in shaping collective responses. One of the primary ways science contributes to our understanding of climate change is through the collection and analysis of data. Climate models, observational data, and simulations allow scientists to predict future climate scenarios, providing critical information for policymakers, governments, and industries to develop mitigation and adaptation strategies. The establishment of global institutions such as the Intergovernmental Panel on Climate Change (IPCC) has played a pivotal role in synthesizing scientific data and disseminating it in accessible formats to inform global climate negotiations and policy decisions. Through the IPCC's periodic assessment reports, the scientific community provides evidence-based projections about the impacts of climate change on ecosystems, biodiversity, human health, and the global economy. Additionally, scientific knowledge helps identify and analyze the causes of climate change, particularly the role of greenhouse gases, deforestation, and industrial practices. Understanding the human activities contributing to climate change is essential for creating policies that target reductions in emissions and the transition to sustainable practices. Scientific inquiry into renewable energy sources, carbon sequestration, and green technologies also offers solutions to combat climate change, making the advancement of science and technology essential in curbing the crisis. However, the role of science is not limited to technical knowledge; it also plays a vital role in addressing the social and political dimensions of climate change. Public understanding of climate science is critical to fostering collective action, yet misinformation and climate denial continue to challenge the efforts of scientists and environmentalists. Science communication, through both traditional media and newer platforms, helps bridge the gap between scientific expertise and public understanding. Clear, accessible, and accurate communication about climate change is crucial for empowering individuals, communities, and leaders to make informed decisions about how to act in the face of the climate crisis.

- **Scientific Observation and Climate Change**: Dr. Byron's research on the butterflies' migration and habitat shifts illustrates the ways in which scientific inquiry is essential to understanding and responding to ecological

disruptions. The detailed study of the butterflies' changing migration patterns helps to ground the novel's ecological message in scientific reality.

- **Integration of Local Knowledge and Science**: While Dr. Byron embodies the scientific approach, Dellarobia's intuitive understanding of the butterflies' significance highlights the importance of integrating local, experiential knowledge with scientific analysis. This blend of traditional wisdom and modern science is essential for understanding and addressing the complexities of climate change.

Climate Change, Rural America, and Ecological Equity

Kingsolver also addresses how climate change disproportionately impacts rural, working-class communities. In the novel, Dellarobia and her community are struggling with economic hardship, and the arrival of the butterflies becomes an opportunity to raise awareness about the intersection of social inequality and ecological degradation. Ecological equity is an emerging concept that explores the intersection of environmental sustainability and social justice, focusing on the fair distribution of ecological benefits and burdens across societies and generations. As the effects of environmental degradation, climate change, and resource depletion disproportionately impact marginalized and vulnerable communities, the concept of ecological equity becomes essential in understanding how both human and environmental needs must be balanced in pursuit of a just and sustainable future. The principle of sustainable development highlights the need to meet present needs without compromising the ability of future generations to meet their own needs. Intergenerational equity, a concept central to sustainable development, focuses on ensuring that ecological resources are preserved for the future, creating a fair relationship between current and future generations. Scholars like Hans Jonas and John Rawls have contributed to this theory, discussing the ethical obligations we have to protect environmental goods for the benefit of future generations. Intergenerational equity challenges the exploitation of natural resources for short-term gains and argues for policies that promote long-term environmental sustainability. Environmental justice theory examines how environmental degradation and the disproportionate exposure to environmental hazards impact marginalized communities based on race, class, and socioeconomic status. Rooted in the civil rights movement, environmental justice advocates for the fair distribution of environmental harms and benefits, ensuring that vulnerable populations are not unfairly burdened by environmental risks. The theory challenges the historical patterns of environmental exploitation that often affect low-income and minority communities, advocating for equitable access to clean air, water, and safe living conditions. Pioneers such as Robert Bullard and David Pellow have significantly contributed to this field, emphasizing that environmental policies should take into account the social and economic inequalities that shape ecological vulnerability. Ecological modernization theory focuses on the potential for economic development and environmental sustainability to coexist through technological innovation, policy reform, and market-driven solutions. While ecological modernization does not directly address social inequalities, it is relevant to the concept of ecological equity because it suggests that ecological challenges can be overcome through strategic investments in green technologies and sustainable practices. This theory, advanced by scholars like Joseph Huber and Martin Jänicke, offers an optimistic perspective on the role of technology and global cooperation in achieving ecological equity.

- **Environmental Justice**: The novel subtly critiques how the environmental crisis affects the most vulnerable communities first. Climate change exacerbates existing social inequalities, and the people in rural Appalachia—who often rely on industries like coal mining and agriculture—are particularly affected by both environmental degradation and economic shifts.
- **Rural vs. Urban Divide**: The novel underscores the tension between rural and urban perspectives on climate change, with the rural community in *Flight Behavior* initially skeptical about the scientific warnings and the broader political implications of climate change. The rural setting provides an opportunity to discuss how ecological shifts challenge traditional ways of life and force communities to confront difficult truths.

The Butterfly's Migration and the Future of the Planet

Ultimately, the butterfly's migration, interrupted by climate change, serves as a reminder of the planet's fragility and the interconnectedness of all living systems. As the butterflies navigate through changing climates, they also represent the future of all species, including humans, in a world increasingly shaped by human actions. Monarch

butterflies are known for their incredible long-distance migration, an event that has been occurring for generations. Their predictable seasonal movements—from Canada and the United States to the warm, specific areas of Mexico—have been a symbol of the earth's natural rhythms and ecological stability. In *Flight Behavior*, however, the butterflies' arrival in a rural Appalachian valley in Tennessee—far from their usual migratory path—signals the disruption of natural systems. This unnatural behavior is caused by rising temperatures and shifting climate patterns, underscoring the way that climate change alters not just human lives but the very migration and existence of species. The butterflies' altered migration, while initially interpreted as a mystical phenomenon, gradually becomes a symbol of environmental collapse. As the community members grapple with the implications of the butterflies' arrival, the narrative highlights how ecosystems are being forced to adapt or fail due to the changing climate. This disruption serves as a warning about the future of the planet and the vulnerable species that depend on stable, predictable environmental conditions. In this way, the butterfly migration in *Flight Behavior* acts as a microcosm for larger environmental challenges and the need for urgent action to preserve biodiversity.

The Disruption of Natural Cycles and Its Implications for the Planet

The butterflies' migration in *Flight Behavior* reflects how climate change is altering the delicate ecological cycles that sustain life on earth. The warming temperatures, resulting from human activities such as deforestation and the burning of fossil fuels, have thrown off seasonal patterns, affecting both flora and fauna. This shift in environmental conditions disrupts the intricate relationships between species, forcing them to adapt in ways that may be unsustainable in the long term. In the novel, the monarch butterflies' presence in the valley leads to intense local scrutiny and debate. As the community members, particularly the protagonist Dellarobia Turnbow, begin to understand the implications of the butterflies' altered path, they confront the reality of climate change and its potential to destabilize not only the environment but also their own livelihoods. This disruption of a familiar natural phenomenon serves as a stark reminder of how the planet's ecosystems are increasingly vulnerable to the consequences of human actions. The butterflies' migration thus symbolizes the fragility of life on earth and the urgent need for action to address environmental issues like climate change, resource depletion, and habitat destruction.

The Role of the Monarch Butterfly as a Harbinger of Change

In *Flight Behavior*, the monarch butterflies act as a harbinger of ecological change, both in their physical disruption of the migration route and in the broader implications they carry. The butterflies' presence challenges the community to recognize the environmental shifts happening around them, prompting a confrontation with the larger issues of climate change and ecological imbalance. For Dellarobia, the butterflies are a catalyst for personal transformation, pushing her to re-evaluate her understanding of the world and her place within it. The butterflies symbolize a crossroads for the planet—much like the pivotal moment humanity faces in the fight against climate change. Just as the butterflies are at a critical juncture in their migration, the earth is at a critical point in its climate trajectory. The migration's disruption calls attention to the urgency of environmental action and the importance of addressing climate change in a meaningful way before irreversible damage is done. The fate of the monarch butterfly is inextricably linked to the future of all species on the planet. This serves as a call for collective action and underscores the importance of addressing climate change in a holistic, globally coordinated way. Just as the monarchs cannot migrate alone, humanity must work together to address the environmental challenges that affect us all.

CONCLUSION

Barbara Kingsolver's *Flight Behavior* uses the migration of monarch butterflies as a powerful metaphor for the disruption caused by climate change. Through the lens of the butterfly, the novel explores themes of ecological instability, human displacement, and the urgent need for scientific and social intervention. The butterfly's altered migration symbolizes the larger ecological equation that humanity must address: the balance between human activities and the natural world is delicate, and as the novel suggests, the future of the planet depends on how we choose to act in response to climate change. This paper can further explore how Kingsolver's narrative bridges

scientific, ecological, and social perspectives on climate change, highlighting the complexity of the issue and the importance of both individual and collective responsibility. Through this lens, the butterfly's journey becomes not only a symbol of nature's beauty and fragility but also a reminder of the profound changes taking place in our world.Through the symbol of the monarch butterfly and its disrupted migration, *Flight Behaviour* provides a poignant commentary on the future of the planet in the face of climate change. The novel illustrates how ecological imbalances, as seen through the butterflies' migration, are not isolated incidents but are part of a larger, global issue affecting both human and non-human life. The butterfly's journey—once a symbol of natural harmony—is now a metaphor for ecological collapse and the loss of biodiversity that threatens the health of the planet. This research paper emphasises how Kingsolver uses the butterfly's migration to explore the broader environmental themes in the novel, stressing the importance of recognizing and responding to the ecological crises that shape the future of the planet. By understanding these disruptions, *Flight Behaviour* urges readers to consider the long-term consequences of inaction and the need for collective responsibility in securing a sustainable future for all living species.

ABSTRACT

Stress is a physical and psychological state in which the individual is forced to make adjustments. Due to family expectations, rivalry for scores and career choices student nurses have been found to be affected by academic, clinical, and financial stressors. Chanting the Om mantra on a regular basis can help with depression, anxiety, cardiovascular difficulties, stress, and a variety of other issues. Furthermore, nursing students might lessen their stress levels by repeating the Om mantra on a regular basis. Objective of the study was to evaluate the effect of Om chanting on decreasing stress level among nursing students. Method: True experimental research design was used to conduct the study.A total of seventy participants were gathered, and 35 were assigned at random to each of the experimental and control groups. The academic stress scale and sociodemographic data were part of the data gathering method. After receiving the intervention for five minutes each morning for 30 days in consecutive days, the experimental group's post-interventional stress level was measured. According to the pre-test data, a significant proportion of the experimental group's student nurses suffered from extreme stress. A change was noted in the post-test, nevertheless, as most student nurses in the experimental group showed only low signs of stress. Additionally, the pre-test data revealed that the control group was extremely stressed. Every nursing student in the control group showed signs of severe stress on the post-test. The mean post test result of experimental group was 25.54, while the non-interventional groups was 66.74. When comparing the experimental group to the control group, there was a substantial decrease in stress levels, as indicated by the mean difference between the two groups of 39.629 which was significant. The Mann-Whitney value of 2.000, p =.001). The null hypothesis was rejected and it was inferred that OM chanting was effectively in

95018

Rozeleen Parmar and Deepak Krishnamurthy

reducing the mean stress level score Reciting the Om mantra as a form of alternative health care is recommended for nursing students as a way to reduce stress and to energize their bodies, minds, and spirits.

INTRODUCTION

Stress is an unavoidable part of life that affects everyone on a daily basis [1][2]. The American Institute of Stress reveals that approximately 33% of individuals report experiencing severe stress. Furthermore, a staggering 77% of individual undergo stress that has a direct impact on their physical health. Additionally, 73% of individuals indicate that their mental health is adversely affected by stress, and 48 % people have problem of insomnia due to stress. Courses for professionals in health have been said to be extremely demanding and straining, necessitating extensive preparation and the capacity to cope with high-stress conditions [3][4]. Furthermore, stress can be a contributing factor to or exacerbate various mental and physical challenges commonly experienced by students, including headaches, fatigue, feelings of sadness, anxiety, and difficulties in managing tasks [5]. As per the World Health Organization (WHO), stress has been designated as the prevailing health epidemic of the 21st century [6]. Nursing is a noble profession, and students are stationed in clinical areas to provide services. It is critical to maintain a positive mental attitude when dealing with sick patients. Nurses work on the front lines in all health-care settings, and it takes hours and days of intensive training to become a skilled nurse, which begins on the first day of nursing school or college [7]. Medical students specializing in nursing face intensified strain during their training than students in other health disciplines [8]. Research conducted worldwide indicates that the occurrence of stress among students pursuing health professions falls within the range of 14.3% to 56% [9]. A New York University publication states that for 55% of students, academic stress is their main source of stress. Six out of ten college students claim to have experienced anxiety to the point that they have at least occasionally been unable to finish their coursework [10]. A descriptive study was done to find out stressed feelings, anxious thoughts, and depressive mood level in trainee nurses of BMCB Nursing College, Gujarat (2020).120 students in all were chosen using a practical sampling technique. A self-administered questionnaire that included the Beck Depression Inventory, State Anxiety Scale, and Perceived Stress Scale was used to collect the data. Each sample has a time limit of 20 minutes.

The results suggest that nursing students have a significant level of stress. Anxiety is moderate, and depression is present in a minimum number of nursing students [11]. In a study by Indira A et al to evaluate the extent of stress experienced by nursing students revealed that 15 students (25 %) had very mild stress, 22 students (36.7 %) had moderate stress, and 23 students (38.3 %) had severe stress. Statistically significant correlation is evident in stress levels and socio demographic characteristics including educational background of the parents, the monthly family earning, family structure, and consciousness of nursing [12]. This highlighted the significance of stress-relieving strategies in nursing schools, because trainee nurses encounter elevated levels of stress, it is necessary to reduce the stress among them by employing various types of coping mechanisms. Various research projects published over the past ten years suggest that practicing mindfulness practices can help to alleviate apprehension and depression, as well as promote calmness, all of which are beneficial to psychological and physical well-being [12].Om meditation can help people with low self-esteem if they practice it on a regular basis. The word 'Om' carries a cosmic positive vibe that aids in the creation of positive vibrations and a holy sensation. Om meditation is advantageous over other meditation techniques since it is simple to practice, takes less time, and does not require the assistance of an expert or teacher. The most essential benefit of all is that it assists you in getting rid of thoughts that hinder your thinking process[12].Scientific investigations on Om indicate that the cognitive repetition of Om leads to heightened physiological alertness and increased receptivity to sensory stimuli[13]. The literature by Dr. Anita Sharma & Reetudhwaj Singh on Chanting Slogans as an Effective Coping Strategy for Adolescents with Educational Stress emphasize that mantra chanting promotes a calm view on life. A tranquil mind is the most effective form of medical

coverage. The whole positive cycle begins with a well-rested mind. Meditation, in psychoanalytical terms, aids in the overcoming of neurotic tendencies and brings calm and happiness to the mind. The OM and Gayatri mantras stimulate brain cells, resulting in their activation and, as a result, improved concentration [14]. Based on the data, the researcher believes that stress among nursing students is a widespread issue, and that it is critical to provide them with appropriate guidance. Nursing students face a variety of challenges as they are required to use theoretical knowledge and develop critical thinking abilities in a professional setting. Research featured in the International Journal of Yoga indicates that engaging in Om chanting meditations could potentially deactivate the right amygdala, a brain region associated with negative emotions. Om chanting meditations may assist to alleviate negative thoughts, worry, and stress. It is critical at this moment to evaluate the amount of psychological pressure among Student nurses and address the issues. Because there has been few research dedicated to investigating the benefits of Om chanting in lowering stress among nursing learners. Consequently, the aim of this research was to evaluate the Effectuality of Om chanting in alleviating stress among nursing students.

MATERIALS AND METHODS

The methodology used in this investigation was quantitative. In this study, a True experimental research design was selected. The study focused on nursing students as the target population, and samples were recruited using a simple random sampling technique. The minimum sample size calculated was 68 so 70 participants were finally selected for the study. The entire study population was 70 (35 in each experimental and control group). Prior to intervention, stress was assessed using the standardized academic stress scale. Following a stress assessment, five minutes of Om chanting were given to experimental group for 30 consecutive days. No Om chanting was given to the control group. After the implementation of Om chanting, the stress levels in the treatment group and the non-intervention group were assessed using standardized academic stress scale. All participants in the study provided informed consent prior to their involvement in the research with the permission of the Institution's ethics committee.

Inclusion criteria
Individuals who are interested to take part in the research. Learners enrolled in the 1st and 2nd year of the B.Sc. Nursing program, irrespective of gender, who are present during the data collection period are eligible to take part in the study. Students experiencing moderate to severe stress level can also participate in the study.

Exclusion Criteria
Learners who are unwilling to take part in the research or are unavailable during the data collection period. Students who have any serious ailments, such as muscular disorders, heart conditions, asthma, color blindness, or sensory motor disabilities. Students who are scheduled to take an exam in the following two weeks were excluded from the study. The data was evaluated and interpreted in accordance with the study's objectives. For analysis, descriptive and inferential statistics were utilized. Frequency and percentage were used in descriptive statistics. The Wilcoxon test was used in inferential statistics to test the hypothesis at the 0.05 level of significance.

RESULTS

The data in table1 depicts that most of the participants in the experimental and control groups, 45.7% and 40%, respectively were in the 19-year-old age group, while most participants in the interventional group 77.1%, and the non-interventional group, 85.7%, were females, and 91.4% students in the treatment group and 71.4% students in the non-interventional group were Hindu. The majority of individuals in both the interventional group 31% and the non-interventional 27% stay with their families. In both the groups all the students 100% were single. Students from nuclear families make up 54.3% of the interventional group and 68.6% of the non-interventional group. The interventional and non-interventional groups both had 100% participants who received financial assistance from their parents. The majority of students in both treatment group 57.1% and control group 24 (68.6%) enjoy listening to music. Table 2 shows stress levels of nursing students in the interventional group assessed before and after the

95020

intervention. Pre-test showed 97.1% severe stress, 2.9% moderate stress, and none mild stress. Post-test showed no stress, 80 % mild stress, and 20 % moderate stress. After applying the Om chanting, no nursing students experienced significant stress. Table 3 shows the distribution of nursing students in the control group based on the level of stress. It was discovered that 97.1% of the 35 students in the pre-test had severe stress, whereas 2.9% had moderate stress level. In the post-test, all of the nursing students were experiencing significant stress Table 4 depicts that Wilcoxon test value 5.162 with p value 0.00 suggests that the experimental group of nursing students has a lower stress level. Table 5 data represents the level of stress in nursing students was different in interventional and non-interventional group. The mean difference of interventional and non-interventional group was 39.629 and obtained Man-Whitney value was 2.000 with p value .001, suggests that the amount of stress was substantially lowered in interventional group in comparison with non-interventional group.

DISCUSSION

OM chanting, often referred to as "Aum" or "Omkar," is a sacred and ancient practice originating from various Eastern spiritual traditions, including Hinduism, Buddhism, and Jainism. This powerful syllable is considered to be the universe's first sound and is believed to encompass the essence of creation, preservation, and transformation. In recent years, OM chanting has gained attention not solely due to its spiritual importance but also for its potential therapeutic advantages. This discussion delves into the existing research on OM chanting and its effects on mental, emotional, and physical well-being. OM chanting has been associated with reduced stress and anxiety levels. The rhythmic repetition of the sound is believed to induce a soothing influence on the mind., promoting relaxation and decreasing the production of stress hormones. Research has suggested that regular practice of OM chanting may contribute to overall stress management. The rhythmic and meditative nature of OM chanting may help improve concentration and focus. The practice requires sustained attention to the sound and vibration, potentially enhancing cognitive abilities over time. This aspect has drawn interest from educators and practitioners seeking ways to enhance learning and attention span. A student may experience numerous difficulties and tensions. Compared to their peers and coworkers enrolled in other programmes, student nurses are more likely to feel increased stress. The study acknowledges the elevated stress experienced by nursing students, which can impact their learning and overall well-being. Some stress is acceptable, but when it interferes with a student's education or personal life, it becomes a problem. According to research; nursing is a high-stress vocation in which nursing students experience difficult situations that frequently affects both their learning process and their health problems [15].

Before the intervention in the experimental group, 34 nursing students (97.1%) had severe stress, 1 (2.9%) had moderate stress, and none had mild stress and in the control group , it was found that out of the 35 students 34 (97.1%) experienced severe stress, and only one (2.9%) had moderate stress. This can be as a result of the student nurses' ignorance of stress management techniques. However after implementing the Om chanting in experimental group it was identified that among nursing students, 28 (80%) reported mild stress, 7 (20%) reported moderate stress, and the majority reported no stress at all. Grade competitiveness, a lack of time commitment, and problems with time management are just a few of the academic expectations that can cause stress. The requirement to adapt to new learning settings due to the need for continuous self-regulation and the development of superior cognitive abilities, as well as the complexity of the material that needs to be learned and the time and effort that go along with it. Adapting socially, specifically adjusting to campus life and being separated from friends and family is another category that causes stress. Last but not least, there are financial constraints and technological challenges. These results are consistent with prior research carried out by Nurs AP, Singh D, Chaturvedi M indicating that trainee nurses often face experiencing heightened stress level [16]. The study's recognition of this stress level emphasizes the importance of effective stress reduction strategies for nursing students to maintain their well-being and enhance their learning experiences. Similar results were observed in the research carried outby Das BN et al., where in student nurses shows elevated stress, highlighting the need for stress management programs and mentorship [17]. The implementation of OM Mantra Repetition and AnulomVilom Pranayama led to a reduction in stress levels among medical and nursing students. Those who actively participated in these practices exhibited noteworthy

enhancements in their physiological indicators [18]. Chanting mantras encourages a serene outlook on life. A refreshed mind is the best form of health insurance. A well-rested mind is the starting point of the entire positive cycle. According to psychoanalysis, meditation helps people overcome their neurotic tendencies and promotes mental peace and contentment. The OM and Gayatri mantras activate brain cells by stimulating them, which improves concentration [19]. Both yoga and meditation are beneficial for both physical and mental wellness. Om mantra chanting, which is basic and easy to do, also falls under the category of meditation. Research shows that Chanting the Om mantra increases the creation of some critical hormones, protein enzymes, and compounds that reduce stress [19] Currently, a lot of research describes the use of relaxation techniques including yoga, meditation, spiritual healing, reiki treatment, relaxation techniques, pet therapy, and others to relieve stress. The current findings revealed that the experimental group's nursing students are less stressed than the control group after implementing Om chanting. Stress levels differed among nursing students in both the interventional and non-interventional groups. Upon comparing the experimental group to the control group, a significant reduction in stress levels was observed, as indicated by the difference in mean between the two groups of 39.629 and the resultant Man-Whitney value of 2.000 with a p value of.001. These outcomes were equivalent to research conducted by Sharma A, Singh R to determine the beneficial effects of mantra chanting on reducing academic stress in teenagers and the study's findings indicated that reciting the Om and gayatri mantras can significantly reduce stress in adolescents[14]. Similar results were seen in a study conducted by Singh A that there were significant variations in the self-efficacy and wellbeing measures taken before and after the intervention. It was determined that goal meditation is beneficial in raising students' levels of self-efficacy and wellbeing [20]. OM chanting, with its centuries-old roots in spiritual and philosophical traditions, presents a unique avenue for exploring its therapeutic potential. While existing research has started to shed light on its effects on stress reduction, emotional well-being, and spiritual connection, further interdisciplinary studies that integrate psychology, neuroscience, and spiritual studies are needed. Such research could provide a more comprehensive understanding of OM chanting's influence on human health and well-being, both from a secular and spiritual perspective.

CONCLUSION

Om meditation can be introduced to nurses and students in clinical settings, as it's simple, time-saving, and requires no expert guidance. The study findings will help nurses become more aware of the value of chanting Om and how it might help them cope with stress. By educating nurses and students about non-pharmacological techniques, the study lessens the need for pharmacological management to treat stress-related health problems. To help medical professionals comprehend its advantages and enhance the psychological and physical wellness of mental patients, nurse management needs to set up an Om chanting continuing education program.

ABSTRACT

Worldwide, high-speed rail and road construction, as well as LRT and MRT projects, typically incorporate Full Span Box beams. High-speed rail lines are commonly built in isolated areas. Prefabricated full-span bridges (FSBGs) are some of the fastest ways to construct viaducts and bridges. The entire span is moved from FSBG's casting yard to the bridge site using a specially made multi-axle wheeled cart. Pre stressed concrete bridges can be built much more quickly, with lower labor costs, better quality, and at a lower cost thanks to high-speed bridge pre casting. Individual concrete components that were manufactured and installed one after the other have been used to construct a number of high-speed railway bridges. For two-track bridges, single-member pre stressed concrete box girders are a great option. Shinkansen technology is prefabricated using full-span post-tensioned concrete beams in the Indian high-speed rail project.

Keywords: LRT, MRT, Prefabricated Full-Span Bridges (Fsbgs), Precasting, Prestressed.

INTRODUCTION

Bridge spans of thirty to forty meters and a total girder mass of nine hundred to one hundred tons are typical for Indian high-speed rail projects. As part of the PSC Borders process, the complete bridge span is poured in the casting yard and transported to the bridge site on a specially made wheeled cart with many axles. PSC Borders uses a specially built bridge gantry to raise and transfer the whole pier span into its final place at the bridge site. Precasting allows for fast construction and consistent, high-quality casting operations in factory-like settings, as well as year-round erection in almost all weather conditions. Segment beams are not recommended for full spans since they initiate seven times faster. The largest PSC beams in the Indian construction industry are 40 meters long and weigh

95026

roughly 970 MT. 42 MT of steel and 390 Cum of concrete are used to cast 40 m of the order either all in one piece or without building joints. This project focuses on the construction of full-scale prefabricated facilities for high-speed railway cast yards for PSC box girders. In addition, the efficiency and interplay of the various specialized tools required to pour, hoist, transport, and position whole PSC box beams in the yard are explained.

The Project

The Mumbai – Ahmedabad High Speed Rail (MAHSR) Project, often known as the Bullet Train Project, is the first High Speed Rail (HSR) network to be constructed in India. The MAHSR Project line connects Ahmedabad, in Gujarat State, with Mumbai, in Maharashtra State, passing via the Union Territory of Dadra and Nagar Haveli. The 508 km long Mumbai-Ahmedabad High Speed Rail Corridor is split between the states of Maharashtra (156 km), Gujarat (348 km), and Dadra & Nagar Haveli (4 km)of the total 352 km, 325 km are being executed by L&T. The stretch is divided into 8 bundles from C1 to C8.

Project Features

Twenty-three casting yards are being built along the alignment to cast girders. Depending on the needs, each casting yard is situated close to the alignment and has a size ranging from 16 to 93 acres. A variety of facilities are developed in each casting yard, including batching plants, aggregate stacking areas, cement silos, labor camps, precast girder handling, rebar tying, rebar cage handling at jigs, shutter panel fixing and alignment, casting beds with hydraulically operated prefabricated molds, shutter panel concreting sequence, hutter panel de-moulding sequence, and so forth.

Post-tensioned Full Span Box Girder and any associated tasks falling under the purview of the technical specifications section. Thirty and forty meters are the most common girder beam spans; however, when there are constraints, smaller sections are divided. Using massive equipment such as lifting platforms, bridge carriers, control systems, and container carriers, these prefabricated beams are launched. Beams for launches are constructed and stacked at these launch yards to ensure a consistent supply. The container support conveys the box girder from the stack yard to the bridge gantry, where it is raised and placed on the pier deck bearing.

Major Equipment's Used in Casting Yard
Straddle Carrier

Straddle carrier is heavy haulage equipment that is used to lift, transport, and load the precast FSBG girders and FSBG girder reinforcement cage, shown in

FSBG Rebar Jig

The purpose of the FSBG Rebar Jig is to facilitate the construction of rebar cages. The Rebar Jig's design ensures that the necessary cover is maintained while the form and reinforcement are tied correctly. The rebar jig's connections can all be easily removed and moved because they are all bolted together.

FSBG Rebar Cage

In the rebar jig, the FSBG Rebar is built. The rebar cage has a 40-meter span and weighs between 42 and 45 MT (approximately). Fe500D TMT high strength deformed steel bars are utilized as reinforcement in pre-casting operations. The cage also includes various inserts and the PT duct profiling. The rebar jig fixes and sets the bursting reinforcements.

Pre-Cast Full Span Girder Moulds.

The ground support beam is elevated on the concrete foundation pedestals. There is room to place seismic stopper recesses, wedges, etc. in the soffit shutter. The soffit shutter has spaces on both ends for wedges to be installed in order to guarantee a level surface for mounting bearings.

The outer frame's

job is to hold up the FSLM girder's webs and overhanging section. For demoulding purposes, hydraulic jacks (10MT capacity) are offered.

95027

Movable Inner Forms

The bottom support beams, which are braced together, and each support beam is supported by 48mm dia. Inner shutter hauling must be done with an electrically powered rack and pinion system. During hauling, the spine beam shall be rolled over the wheels mounted on the supports. Once the spine beam is aligned to the position, the hydraulic jacks mounted in the spine beam shall be activated to align the inner shutter. After ensuing the alignment of inner shutters, the load bearing turn buckles are engaged to care of required concrete pressure. The hydraulic jacks shall be disengaged. Similarly, during demoulding, the hydraulic jacks (10MT cap.) are engaged. The turnbuckles are removed and placed on rack in the spine beam. Now, hydraulic jacks will be activated, and the shutters will be de-moulded to the required envelope. The vertical jacks (40 MT cap.) fixed to the support beams shall be activated to lower the entire spine beam along with top shutter panels. Once the demoulded to the required shape, the entire inner forms shall be pulled out using the drive assembly and parked in parking area.

HDPE Duct Placing

For varying FSBG element lengths, full length HDPE duct can be obtained. The pre-stressing ducts and HDPE tubing are positioned and fixed in the correct location using spacer bars in accordance with the design requirements, plans, and specifications. Welding or other strong fastening is required to keep the ducts welded to the spacer bars during the concreting process. In the Rebar Jig, PT Duct profiles are inspected and tested. All PT Duct Coupling (Coupler or Heat Shrink) will now be finished in the Rebar Jig since it offers simpler access and guarantees a high standard of quality. PT Stranding will now be finished before casting in order to ensure the safety of the PT Ducts. Installing fixtures must follow approved blueprints at all times.

FSLM Rebar Cage Transportation

A cage lifter must raise the reinforcement cage and place it within the casting mould after it has passed a successful reinforcing check, making sure it is held without distorting.
(Fig. 4). The cage must be lifted using a "strong back" (a stiff truss) and then placed in the mould using a straddle-carrier. However, we are employing two hydraulic cranes for the initial casting of the FSBG girder.

Survey Check

Survey towers must be placed properly in order to achieve full span box girder geometry control; complete station and auto level will be employed for this. Outside the casting area are survey towers whose purpose is to prevent straddle carriers from moving. Setting the girder center line is a prerequisite for beginning work on the entire span molding. It is the surveyor's responsibility to maintain the soffit position and level in accordance with the drawing's pre-calculated parameters. It is required to confirm and, if needed, modify the outside form level in compliance with the drawing criteria. Selecting the bulkhead's location and ensuring its verticality are essential. Following the reinforcement's installation, the exact duct location must be ensured and the duct profile must be maintained in compliance with specifications.

Camber Control &Measurement

Camber control is to be implemented in accordance with the Employer's Requirements (Technical Specification). Survey plates can be put into the girders to determine camber, or the IRS Bridge Manual Annexure 11/14 has measurement instructions. During the various stages of girder casting while post-tensioning, after the building or installation of accessories, upon delivery of the track contractor, during the static inspection (or at the completion), at any level the Engineer deems appropriate, the calculated camber will be compared to the actual camber measured on-site for each girder. Any significant difference between the theoretical and real camber values must be reported to the Engineer in Charge so that the proper course of action can be followed.

Case Study- Casting of FSBG span
Sequence of Activities

The number of storage platforms is decided by the delivery curing time, and the productivity of the pre-casting facility is matched to that of the erection lines. There might be more platforms with more standard spans and emergency platforms, and the size of the storage facility might grow to the point where stacking is required. Cage prefabrication in full-span reinforcing bar jigs is necessary due to time constraints and the availability of heavy lifters at the pre-casting factory. Bar jigs with reinforcement improve the organization's adaptability. In order to enhance cage handling and shorten the casting bed's cure time, the girders are usually constructed for post tensioning. Watertight plastic ducts are built and tested, the end bulkheads are fastened to the reinforcing bar jig in accordance with beam geometry, the tendon anchorages are fastened to the bulkheads, the remainder of the cage is assembled, and all embedded items are fastened to the cage. Strands are placed into the ducts throughout the casting and curing processes in order to lighten the cage during transfer into the casting bed and to divert activity from the critical passage. Before lifting, a stiffening truss, or strong back, is fastened to the cage to prevent warping. If a reinforcing bar jig produces a cage every four days, the casting line requires four jigs. Reinforcing bar jigs cost more expenditure, but separate cycle times for casting beds and reinforcing bar jigs increase girder production flexibility and reduce interference among carpenters, ironworkers and prestressing teams. Additional jigs can be mounted as necessary. After 12- to 18 hours of curing, partial post tensioning is used to make the girder self-supporting for transfer to the storage platform; post tensioning transfer often requires longer curing. Parallel casting lines are separated by runways for steel cage delivery and beam removal. The inner form is slid across the casting bed once the cage is delivered to shut the mould. To establish a maintenance area, the runways of the inner portal shutter can be extended at one end of the casting line. The post tensioning technique is used to stress the longitudinal and transverse tendons. The bottom slab has webs for post tensioning during storage, as well as anchored strands and parabolic ducts. Hydraulic jacks are used for initial post tensioning and pre stress transfer at one end of the casting line. The number of reinforcing bar jigs in a casting line is determined by the productivity of the casting beds and jigs. Depending on span dimensions and cross section type, a casting line can create one girder every day in a two- or three-day cycle. If a casting bed yields a girder every three days, then three casting beds are needed.

Concrete Placement – Bottom Soffit, Web, Top Deck/Slab

The approved concrete mix (M-50 Grade) is batched from the two on-site batching machines and transported by 6.0 m^3 transit mixers to the casting position. Two hours is the minimum retention time for the concrete mix. The full span-girder length and detail are used to estimate the actual quantity of concrete. The temperature of the concrete is maintained at 32 degrees Celsius while it is being placed. The casting of concrete will cease when the temperature rises over 32 degrees Celsius. To maintain the temperature of the concrete mix when the outside air temperature rises over 28 degrees Celsius, the following measures are taken: For mixing concrete, cooled water is used. Sprinkled water is applied to the aggregate, and temperature adjustments are made at batch level to ensure that the C/W ratio and concrete. To ensure that the C/W ratio and concrete temperature are not influenced, water is sprayed over the aggregate moisture content, and temperature adjustments are made at the batch level. The temperature differential in concrete is measured. A concrete slump of 170mm is excellent. In a smooth, continuous casting operation, the concrete casting will start at one segment and proceed to the other part. 54.0 m^3/hr is the constant pace at which the concrete is cast. This means that each car will take about 12.5 minutes. To place all concrete precisely where it is needed, tremie pipes, concrete boom pumps, and concrete hoppers are utilized. Layers of concrete are applied continuously, with a maximum thickness of 300 to 500 mm. Four tremie chutes of varying lengths are used to pour concrete into the webs, ensuring that it is deposited accurately and without segregation. Through a window hole, concrete is poured into the Upper Inner Mould Soffit. Four brand-new form vibrators have been put on the bulkhead. Through a window hole, concrete is poured into the Upper Inner Mould Soffit. Four brand-new form vibrators have been put on the bulkhead. Grease use is not permitted in the PT block out area. Using high pressure water blasting (3,000 psi), the building joints are prepared. The PT Block out uses Sika Rugger Soul - MH (Paint on application) to provide a good construction joint surface. Professional construction joint surfaces are created on the Top Deck by using Sika Rugger Soul - C (Spray application).Grease use is not permitted in the PT block out area. (Paint on application) to provide a good construction joint surface. Professional construction joint surfaces are created on the Top Deck by using Sika Rugger Soul - C (Spray application).

Pour Sequence

Layer .1. By Pump 1 Start of Bottom Soffit & Web Walls.
In the first layer, the diaphragm soffit is filled to a depth of approximately 500mm (50% depth), and this concrete will reach around 4.0m through the 1.50m diaphragm and into the transition soffit zone. Because the depth of the transition soffit is set to 300mm, it will be filled in the first step.

Layer .2. By Pump 1.
In the second layer, the diaphragm soffit is filled to a depth of roughly 583mm (100% depth), and this concrete will extend 6.0m through the 1.50m diaphragm and into the transition soffit zone, 2.0m longer than the layer.1. The new 2.0m soffit length will only be filled to a depth of 0.15m (50% of the standard soffit thickness).

Layer .3. By Pump 1.
The diaphragm web walls are filled to a depth of roughly 583 mm (50% of the total depth) in the third layer. This concrete now starts to extend 2.0 meters into the segment's average common area after passing through the diaphragm and transition zone. Compared to the preceding layer, this one will be 2.0 meters longer. To fill the new 2.0 m soffit length, the depth will be 0.15 m (50% of the conventional soffit thickness).

Layer .4. By Pump 1.
The fourth layer of concrete fills the diaphragm web walls to a depth of around 583 mm, or 100% depth. This concrete continues 4.0 meters into the average common section of the segment after passing through the diaphragm and transition zone. The layer that comes after it will be 2.0 meters longer. The fill level of the new 2.0 m soffit length will only reach 0.15 m, or 50% of the normal soffit thickness. At this point, the diaphragm's web walls are full. Currently, 85% of the web walls in the transition phase are built.

Layer .5. By Pump 1.
Beginning around 4.0 meters from the bulkhead—the final 15% of the transition web wall section—Layer 5 will stretch into the web walls of the common section and continue 6.0 meters into the segment's average common area. The layer that comes after it will be 2.0 meters longer. The fill level of the new 2.0 m soffit length will only reach 0.15 m, or 50% of the normal soffit thickness.

Strip .5. By Pump 2. Start of Top Deck.
Starting at the upper deck bulkhead, Strip 5 will extend each web / haunch section of the webs by around 450mm. After then, the pump will move to the segment's edge (left to right segment wing) and start filling a 2.0 m wide strip over the entire width of the segment.
 This 2.0 m wide strip is situated around 2.0 m behind the layer that pump 1 just deposited. inside the boundaries of the internet. The freshly laid concrete in the web wall does not directly overlap the upper deck, and there is no interference of any kind between the two pumps.

Layer .6 through 17. By Pump 1.
Pump 1 is used to lay a fresh layer that is 500 mm thick on top of the layer that was previously laid in layers 6–17. The lower soffit section is expanded by 2.0 meters on each layer until it reaches layer 17's second bulkhead. In the soffit section, the layer depth in the webs will vary from 0.15m to 0.30m and not exceed 500mm.

Layer .18, 19 & 20. By Pump 1.
The layers 18, 19, and 20 are the outcome of a process that is repeated, this time producing a 500 mm thick layer on top of the layer that pump 1 had previously deposited. Layer 17 used the diaphragm to cover the lower soffit region all the way to the bulkhead. As a result, layers 18, 19, and 20 will all end at the bulkhead, and these three extra layers

95030

will fill the web walls from the top of the web wall haunch to the inner soffit level. There will be no layer in the webs deeper than 500 mm. Pumping of concrete 1. It is currently on standby till pump 2 after completing its casting scope. has finished building the whole top deck.

Strip .6 through 24. By Pump 2.
For strips 6 through 24, a fresh strip that is about 450 mm deep is inserted into each web and haunch area of the webs. After then, the pump will move to the segment's edge (from the left to the right segment wing) and start filling a brand-new 2.0 m wide strip that spans the whole segment's width. This 2.0 m wide strip is situated around 2.0 m behind the layer that pump 1 just deposited. inside the boundaries of the internet. The freshly laid concrete in the web wall does not directly overlap the upper deck, and there is no interference of any kind between the two pumps.

Concrete Placement- Bottom Soffit
When necessary, these hopers and tremie chutes will be continuously pushed forward (when the requisite area's bottom soffit is full).The tremie chutes hang from the inner soffit and obstruct around 500mm of the bottom soffit reinforcement to keep the concrete from lowering more than 1,500mm if it is not controlled. Concrete Pump.1 will move concrete into the hoppers on the upper deck via the 250x250mm opening in the inner soffit. As the concrete pours, the smaller inner tremie chutes and bigger higher hoppers are moved forward. As the concrete pour continues, the steel cover plate is employed to halt the wind in the inner soffit and the larger upper hoppers and smaller inner tremie chutes are brought ahead.

Concrete Placement – Web Walls.
Large 600 mm-diameter hoppers with PVC pipe sleeves of various lengths are used to transfer the concrete into the webs. Layer 2 is finished with a long PVC sleeve that is 800mm above the bottom soffit. Layer 3 will be completed with a medium-sized PVC sleeve that rises approximately 1,500 mm above the bottom soffit. Layer 4 is completed with a 2,000mm-long PVC sleeve that reaches past the bottom soffit. As the concrete pour progresses, Pump 1 uses different PVC sleeve tubing to push the larger hoppers. These hopers and PVC sleeve tremie chutes will keep the concrete from segregating when it is poured into the web walls, densely packed diaphragm sections, and during post tensioning.

Concrete Placement – Compaction & Vibration.
There are several different kinds of vibrators used, such as surface screed vibrators, internal hand-held vibrators, and external form vibrators. When installing concrete, this set of vibrators ensures that the material is completely crushed throughout its depth and thickness. Based on the concrete slump, placement time, area, and reinforcement congestion, external vibrators are utilized in 20- to 1-minute bursts. In the diaphragm and at the bulkhead post tensioning anchorages, longer bursts might be needed. The maximum distance between hand-held internal vibrators is five times their diameter. This is done to make sure that the new and old layers are tightly compressed together. The hand-held vibrator will be gradually raised out of the concrete to allow air to escape. The hand-held vibrator typically takes 30 to 50 seconds to draw out; however, this might vary according on the concrete slump, installation time, placement area, and reinforcement congestion. In the diaphragm and at the bulkhead post tensioning anchorages, longer periods might be required. When concreting, the casting bed shed needs to be temporarily covered. To evaluate the compressive strength of the batch mix, concrete cubes of predetermined sizes and quantities must be cast for each batch of concrete. Nine cube samples will be cast for three, seven, and fifty-six days to determine their compressive strength.

Concrete Finishing & Profiling
To let air out, the hand-held vibrator will be progressively lifted out of the concrete. Depending on the concrete slump, installation time, placement area, and reinforcement congestion, the hand-held vibrator's drawing time can vary from 30 to 50 seconds. Longer times may be needed in the diaphragm and at the bulkhead after tensioning anchorages. The casting bed shed needs to be temporarily covered before concreting. For every batch of concrete,

concrete cubes of specified sizes and quantities must be cast in order to assess the compressive strength of the batch mix. To find their compressive strength, nine cube samples will be cast for three, seven, and fifty-six days.

Manual Hand Screeding

The accuracy of this 100% manual labour method of screeding is reliant on the experience and competence of the worker utilising the screed. This sort of screeding will be used for tiny areas where a manual vibrating screed or an automatic vibrating screed is not viable or practical.

Manual Vibrating Hand Screed

The manual vibrating screed is a combination of a vibrating, automatically leveling screed and a hand screed. The operator may perform one to three passes with the screed, depending on the concrete slump, the necessity for a smooth surface, and/or the gradient, slope, and cross fall of the concrete. Depending on the current power applied to the vibration system, the screed emits a tiny, high-frequency vibration that goes through the screed and penetrates the concrete between 10 and 125 mm. To ensure accuracy of the finished level, this screed can also be used with screed rails. To remove the screed rails and fill the recess they formed, more work is required. It is better not to use screed rails when using the manual vibrating screed. A skilled operator may yield precise levels and a high-quality surface finish with the manual vibrating hand screed. The drawing's specifications for the slope must be followed. This must be completed prior to the concrete's final setting time and verified with a level tube. To help finish, the slope should be handled gently and equipped with a float edge of the required length. Until the concrete retains sufficient stiffness to maintain the requisite profile gradient, the vibrating mechanism of the screed may be turned off, contingent on the required stiffness, plasticity, and profile gradient.

Hot Weather Concreting

Any time there is a high temperature and care need to be taken to ensure proper concrete handling, installation, and transportation, it is referred to as hot weather concreting. India is mostly a tropical country, with some areas experiencing unusually cold temperatures. Building concrete structures in both hot and cold climes presents certain particular obstacles, which one must be aware of. IS 7861 (Part I) and IS 7861 (Part II) outline the concreting process in such circumstances, including fast setting, early stiffening, and a rapid rate of cement hydration. mixing water evaporating quickly, Reduced relative humidity, increased shrinkage of plastic, shorter finishing times, water absorption from concrete by formwork and sub grade, Having trouble curing continuously and uninterruptedly water absorbed by the formwork and sub grade from the concrete, Challenges in maintaining constant and unbroken curing, Challenges in integrating air entrainment. It is necessary to thoroughly analyze the impact of the aforementioned circumstances on the manufacturing of high-quality concrete and to take precautions to ensure the concrete's strength and durability. It is essential that the temperature of the concrete be as low as possible in order to enhance its quality. An effort should be made to maintain the temperature of the concrete's constituents as low as feasible in order to achieve this condition.

The following precautions could be taken.
Aggregates
Aggregates should be stockpiled in shade. A sprinkling of water over the stockpile and the evaporation of this water will result in lowering the temperature of the aggregate. If possible heavy spraying of cold air over the aggregate just before it is batched is desirable.

Water
The temperature of the mixing water has the greatest effect on the temperature of concrete. In practice, the temperature of the water is easier to control than that of the other ingredients. Even though the weight of water used is lesser than the other ingredients, the use of cold mixing water will affect god reduction or concrete temperature, The effect of cold water at 5°C on concrete temperature. If the ambient temperature is very high, the use of cooled water may not fully effective. The use of ice may be made as a part of the mixing of water. Crushed ice can be in co-operated directly into the mixer.

It shall be ensured that ice crystals should be completely melted by the time mixing is completed.

Production and Delivery

In order to keep the temperature of the concrete below 40°C when it is placed, the temperature of the aggregates, water, and cement must all be kept as low as is reasonably possible. The use of chilled water might not be entirely successful in really hot weather. One possible application for ice is in water mixing. You can add crushed ice straight into the mixer. By the time mixing is finished, it must be guaranteed that the ice crystals have melted completely. For flooring where surface smoothness is the most important factor, covering the completed floor with wet gunny bags might not be the best option. It is imperative to start wet curing as soon as feasible. Ponding might begin after 24 hours if the concrete is sufficiently moistened. It is important to keep in mind that concrete should never be allowed to dry out. Water application shouldn't start before the cement has completely set at the same time. The ultimate set has not occurred just because some dry particles have appeared on the concrete's surface. As previously said, the ideal procedure is to put a moist coating to the concrete for a whole day, and then pond or spray water on it. It is preferable to perform the concrete operation in the evening during extremely hot days, allowing the freshly mixed concrete to undergo early hydration during comparatively chilly nights.

FSBG Mould De-moulding

After a three-day curing period in the casting bed, the de-moulding technique gets started. First the interior shutters and subsequently the outside shutters are demolded. Various stages of the FSBG Mould. The de-moulding procedure for inner shutters is as follows:

De-Moulding of Inner Frame

The de-moulding of the inner frame consists of four stages. The four stages are as below.

- Stage-1: Before commencing de-moulding, connecting of power pack to operate hydraulic system and disconnecting of mechanical turn buckles and then rotate the shutter by hydraulic power pack is done.
- Stage-2: Lower Panel of Inner Form is Released and Closed
- Stage-3: Lower Panel and Top Web Panel of Inner Form is Released and Closed
- Stage-4: Main Jack is Released, and Inner Form is Lowered on The Track Wheel

Mechanical strut A is lowerd so that the inner form is lowered on the track wheel. Once the inner form is lowered on the track wheel, it is easily pulled out of the newly cast FSBG Span.

De-Moulding of Outer Frame

The exterior frame cannot be demolded until the mechanical struts are released. The hinge arrangement on the outer mold leg makes it possible for it to tilt just enough to make it easy to remove the freshly cast FSBG Span. The outside mold is tilted using hydraulic jacks that are driven by a single power pack. The image below shows the de-mould status of the outside frame.

Post- Tensioning

After the initial curing period and removal of inner mould & outer moulds, the stressing is carried out as per Table 5.2, Volume-3 Employers requirements – Technical Specifications:

Transverse Stressing

i) Concrete Strength 42.5 N/mm2, or
ii) 7 days, whichever is later.

Longitudinal Stressing

i) Concrete Strength 50 N/mm2, or
ii) 7 days, whichever is later.

FSBG Girder Lifting & Transportation

After de-moulding, the FSBG girder and outer shutters must be moved to the stacking yard using a Straddle carrier. The FSBG girders will be placed in the stacking yard on pre-cast foundations. When laying the foundations, two-tiered FSBG girder stacking loads are taken into account. To avoid unanticipated shock during installation, keep the box girder over the Elastomeric pads that are placed above the pedestal.

FSBG Girder Finishing

After the FSBG girders are placed, the PT tendons must be grouted. While performing minor repairs, the approved method statement for concrete repair works must be adhered to. To verify the soundness of the cast element, a Wooden or Millet hammer must be used at the Engineer-specified spot on the FSBG.

Details of Innovative Materials and Technology

Ultrafine GGBS, GGBS received special permission. Initially, Micro silica was suggested as a replacement for the prohibited use of Ground Granulated Blast Furnace Slag (GGBS)/Fly Ash under Contract Clause (Volume 3).

- Due to the usage of OPC, shrinkage cracks were seen in box girders. Typically, a 12-degree Celsius boost in temperature is seen for every 100 kg of OPC.
- The MAHSR C6 Project requires a sizable amount of PSC Concrete—roughly 7 lakh cubic metres. Utilising GGBS enabled the production of more affordable, higher-quality concrete.
- When concreting with pure OPC, a high heat of hydration is seen. There are differences in temperature between the top and bottom fibres of concrete of up to 20.1 degrees Celsius.This causes heat stress, which finally results in fissures. With GGBS, the Heat of Hydration is reduced.

Advantage of using UGGBS

Other improved factors include delivery, quality, cost, productivity, and safety. The application of GGBS has allowed for the early availability of casting molds, which has ultimately resulted in the project's length being shortened. Previously, the required strength in the box girder for transverse stressing was 42.5 MPa, which was obtained after 5 days. However, this has now only taken 3 days. An enhancement in strength, coherence, workability, and finish. a shorter concrete cycle time, less shrinkage cracks, and other defects due to reduced heat of hydration. GGBS is around the same price as Micro silica. A shortened transverse stressing phase has made molds ready two days faster than previously, thus cutting down on the overall time needed to transport the completed product. Significant amounts of carbon dioxide (CO_2) are released throughout the cement-making process. This issue can be resolved by making use of substitute materials, such as ground granulated blast furnace slag (GGBS), which consume less energy and produce less carbon emissions. Ground granulated blast furnace slag (GGBS) is a byproduct of the steel industry. During manufacture, a tonne of GGBS typically produces 35 kg of CO_2, which is less than 4% of the carbon footprint of ordinary cement. GGBS is most commonly used in conjunction with ordinary cement. It will frequently replace 30 to 70 percent of cement on an equal-weight basis. Because of the benefits of using GGBS instead of Micro silica, the staff's workload at the site has lessened. Casting is finished more swiftly and with fewer errors.

CONCLUSION

The journal publication is based on the MAHSR-Project (Maharashtra High Speed Rail), a short project that used Pre-casting Full span Box Girder (FSBG) in the construction of High-Speed Rail infrastructures. When compared to nature, innovative technology demonstrated effective in the following areas during execution: productivity, quality, cost, on-time delivery, and safety (ESG - environmental, social, and governance). As a result, casting was finished more swiftly and with fewer errors, and the workload of workers on the job site was greatly decreased. Never before has a segment with a 40-meter span and a 1000-MT self-weight been designed and manufactured in India using state-of-the-art technology. The rebar cage fabrication, jig placement in the mold, longitudinal and transverse profiling, bulk head fixing, concrete, first stage prestressing, girder lifting, second stage stressing, grouting, and finally recess filling, transportation, and launch with GT, LG as it complete Process with involving all stake holders, which led to

the project's success, are the first steps towards the completion of pre-casting and erection of FSBG. The efficacy of the method and its capacity to provide excellent outcomes are demonstrated by the proper and effective application of work procedures and developed systems. All operations are tracked through cycle time throughout the Execution stage, and key parameters can be utilized as a guide to improve the performance of the FSBG-based project. The civil work completed by Larsen & Toubro in its capacity as an EPC Contractor for Production Procedures will aid in the early identification of production bottlenecks, improving the operating process and increasing productivity. These procedures have been used in similar construction projects involving resource requirement planning.

Table: 1 Curing Plan: The following process is used.

S.No	Day	Activity
1	*0-Day*	**Deck Top Slab & Soffit Top Slab:** a) After the concrete has first set, a curing chemical is sprayed over the soffit top slab and wet curing is applied to the deck top slab. b) For 24 hours, a polythene sheet containing wet hessian fabric is laid over the concrete surface of the deck slab.
2	*3rd Day*	Web inner surface, deck bottom, and bulkhead portion: a) On the third day, once the inner form has been extracted, a curing agent is applied to the inner surface of the web and the deck bottom. b) The soffit slab must be wet cured.
3	*6th Day*	**Deck Slab Outer Web & Cantilever Portion:** a) Water dripping methods through perforated tubes are used to cure once the outer shutter is removed.
4	*8th Day*	**Stacking bed :** a) Following the shifting of the Box girder at the stacking yard, the outer surface and soffit bottom are cured by the application of curing compound.
5		*The curing process lasts for 14 days*
6		After the concrete has reached a minimum strength of 15 MPA, the inner and outer moulds are removed.
7		After the concrete has reached the requisite strength, the PT tendons are inserted and stressing operations are performed. The FSBG girder is raised using the straddle carrier once it has been post-tensioned. The lifting points' specifics can be found in the corresponding drawings. It is then brought to the stacking area. The stacking yard is where the PT tendons are grouted.

ABSTRACT

The additive manufacturing (AM) landscape in medical devices has witnessed significant regulatory evolution, with the FDA clearing over 400 AM-related medical device submissions between 2020-2023, representing a 75% increase from the previous three-year period. The European Union's medical technology sector witnessed a remarkable growth in Additive Manufacturing (AM) device submissions, rising from 42 in 2017 to 203 by September 2023, representing a nearly fivefold increase with a consistent 83.3% clearance rate. Current regulatory frameworks, including FDA's Quality System Regulation (21 CFR 820), EU MDR 2017/745, and ISO 13485:2016, present unique challenges for AM implementation. Analysis of regulatory submissions reveals critical qualification and validation hurdles, with 62% of submissions requiring additional process validation data and 58% facing challenges in documenting material qualification. The European Medical Device Coordination Group (MDCG) reported that 70% of AM medical device manufacturers struggle with demonstrating consistent process control and validation according to EU MDR requirements. A comprehensive review of global regulatory submissions identifies three primary gaps between current AM capabilities and regulatory requirements: insufficient process validation protocols (affecting 67% of submissions), inadequate material traceability systems (noted in 55% of cases), and incomplete post-processing validation (documented in 73% of applications). This article proposes an integrated regulatory compliance framework aligned with FDA's "Technical Considerations for AM Medical Devices" and EU MDR Article 10, encompassing: (1) risk-based process validation aligned with ISO 14971:2019, (2) comprehensive material qualification protocols following

95039

Tejaswi and Koushik Yetukuri

ASTM F3303-20, and (3) structured quality management systems integration per ISO 13485:2016 requirements.

Keywords: Additive Manufacturing (AM); Medical Devices; Regulatory Compliance; Process Validation; Medical Device Submissions.

INTRODUCTION

Additive Manufacturing has transformed medical device production since its first applications in the 1990s, evolving from simple prototyping tools to manufacturing complex, patient-specific implants and devices [1]. The technology's journey began with basic plastic visualization models but rapidly advanced to produce functional titanium implants, custom surgical instruments, and anatomical models for surgical planning [2]. The introduction of technologies like Selective Laser Melting (SLM) and Electron Beam Melting (EBM) in the early 2000s marked a pivotal shift, enabling the production of complex metal components with mechanical properties suitable for medical applications [3]. The global medical device AM market has seen exponential growth, with applications spanning dental implants, orthopaedic devices, prosthetics, and surgical instruments [4]. Market research indicates that the medical AM sector reached approximately $1.7 billion in 2023, with projections suggesting a compound annual growth rate (CAGR) of 16.3% through 2028. Patient-specific implants represent the fastest-growing segment, driven by improved outcomes and reduced surgical times [5]. Notable success stories include customized cranial implants, spinal interbody fusion devices, and dental aligners, which now dominate their respective markets [6]. The regulatory framework for AM medical devices has matured significantly, with agencies like the FDA developing specialized guidance documents to address the unique challenges of additive manufacturing. European authorities have similarly evolved their approach, incorporating AM considerations into the Medical Device Regulation (MDR) implementation. These frameworks now address critical aspects such as design validation, process validation, and quality system requirements specific to AM technologies. Despite regulatory progress, manufacturers face several critical challenges in ensuring compliance of AM medical devices. Process validation remains complex due to the numerous variables affecting build quality, including powder characteristics, build parameters, and post-processing requirements. Material qualification and consistency across different machines and builds present ongoing challenges. Quality control systems must adapt to handle the unique aspects of AM, including in-process monitoring and non-destructive testing methods. Additionally, cyber security concerns related to digital file security and integrity have emerged as crucial considerations in the regulatory compliance landscape.

AM technologies in medical devices
The medical device industry increasingly relies on Additive Manufacturing (AM) due to its ability to create complex, patient-specific devices. Three primary AM technologies—Powder Bed Fusion (PBF), Material Extrusion, and Vat Photopolymerization—are commonly used in medical applications due to their distinct advantages.

Powder Bed Fusion (PBF)
Powder Bed Fusion encompasses several additive manufacturing technologies, including Selective Laser Sintering (SLS), Selective Laser Melting (SLM), and Electron Beam Melting (EBM). PBF works by selectively fusing layers of powder material with a high-energy source, like a laser or electron beam, to create a part with complex geometries and high strength. In medical applications, PBF is ideal for producing implants, dental devices, and orthopaedic tools. The use of titanium alloys in PBF enhances biocompatibility and osseointegration for load-bearing implants. This method also supports the creation of porous lattice structures that mimic bone properties, promoting natural bone in growth and strength [7].

Material Extrusion

Material Extrusion, also known as Fused Deposition Modelling (FDM), builds parts layer by layer by extruding a filament of thermoplastic material. While FDM is more accessible and cost-effective, it typically offers lower resolution compared to other AM methods, limiting its use in high-precision applications. However, it is widely used for producing surgical guides, custom anatomical models, and non-load-bearing implants. Common materials for FDM in medical applications include biocompatible thermoplastics such as polylactic acid (PLA), acrylonitrile butadiene styrene (ABS), and polyetheretherketone (PEEK). FDM's simplicity and cost-efficiency make it popular for creating prototypes, pre-surgical models, and personalized healthcare products [8].

Vat Photopolymerization

Vat Photopolymerization, which includes Stereolithography (SLA) and Digital Light Processing (DLP), uses a light source to cure liquid photopolymer resin into solid parts. This method produces high-resolution, smooth parts with excellent surface finishes, making it suitable for applications where aesthetics and precision are crucial. In the medical sector, vat photopolymerization is used to create dental devices, hearing aids, and surgical tools that require detailed design. SLA and DLP offer high accuracy but are limited by the material types—mostly restricted to photopolymers that require post-curing to reach desired mechanical and biocompatibility standards [7].

FDA requirements for additive manufacturing of medical devices

The U.S. Food and Drug Administration's regulatory framework for additively manufactured medical devices emphasizes comprehensive quality control and validation processes. According to the FDA's guidance document "Technical Considerations for Additive Manufactured Medical Devices" (2017), 510(k) submissions for AM devices must demonstrate substantial equivalence to predicate devices while addressing unique aspects of the AM process. The guidance specifically emphasizes that manufacturers must validate each step of their AM process, from design input to final testing (FDA, 2017, Section IV.B). Quality System Regulation (QSR) compliance, as outlined in 21 CFR Part 820, requires manufacturers to establish and maintain procedures for monitoring and controlling AM process parameters. This includes material controls, equipment qualification, and environmental monitoring systems [9]. Design controls for AM medical devices must follow a systematic approach as detailed in FDA's QSR framework. Recent case studies published in the International Journal of Medical Device Regulatory Affairs (Thompson et al., 2022) demonstrate how manufacturers successfully implemented design controls specific to AM processes, including software workflow validation, build parameter optimization, and post-processing specifications. The FDA emphasizes that process validation for AM devices must address three key aspects: installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ), with particular attention to the unique challenges of AM.

EU MDR requirements for additive manufacturing of medical devices

The European Union Medical Device Regulation (EU MDR 2017/745) introduces stringent requirements for AM medical devices. The CE marking process under MDR requires manufacturers to demonstrate compliance with General Safety and Performance Requirements (GSPRs) specifically relevant to AM technologies. Manufacturers are required to establish, document, implement, and maintain a risk management system for additive manufacturing processes, as specified in Article 10(4) of the European Union Medical Device Regulation (EU MDR 2017/745, Chapter I, Article 10). Technical documentation requirements, as outlined in Annexes II and III of the MDR, must include detailed information about AM process validation, material specifications, and quality control measures [10]. Clinical evaluation requirements under EU MDR demand robust evidence of safety and performance for AM devices. The European Commission's guidance document MDCG 2020-1 specifies that clinical evaluation reports must address specific aspects of AM technology, including long-term material stability and patient-specific variability. Post-market surveillance systems, as required by Article 83 of EU MDR, must be capable of collecting and analysing real-world performance data of AM devices, with particular attention to custom-made devices and patient-specific implants [11].

ISO 13485:2016 implementation for am medical devices

The implementation of ISO 13485:2016 in AM medical device manufacturing requires specific considerations for quality management systems. The standard's risk-based approach, as detailed in Clause 7, must be adapted to address AM-specific risks including material variability, process consistency, and build orientation effects (ISO 13485:2016, Section 7.5.6).

Harmonization of global requirements

The alignment of various regulatory requirements necessitates a comprehensive approach to quality management and validation. The International Medical Device Regulators Forum (IMDRF) has published guidance (IMDRF/GRRP WG/N47:2018) on harmonizing regulatory requirements for AM medical devices. This includes recommendations for consistent documentation practices, validation protocols, and quality system implementation across different regulatory jurisdictions. Each regulatory framework emphasizes the importance of comprehensive documentation, validated processes, and ongoing monitoring of AM medical device production. The integration of these requirements into manufacturing operations requires careful planning and systematic implementation of quality systems that address the unique aspects of AM technology while ensuring regulatory compliance across multiple jurisdictions.

Quality management system

The integration of Quality Management Systems (QMS) in Additive Manufacturing (AM) for medical devices necessitates compliance with multiple regulatory frameworks while maintaining technical precision in manufacturing processes. The FDA's Quality System Regulation (21 CFR Part 820) and EU MDR 2017/745 establish fundamental requirements for design and development controls specific to AM processes (Table 1).

MATERIALS AND METHODS

The methodology of this study was structured in three main phases to achieve a thorough analysis of compliance challenges in additive manufacturing (AM) for medical devices. Initially, the study was classified as both quantitative and qualitative, with quantitative analysis focusing on regulatory submission data and qualitative assessment examining compliance practices across various stages of the AM process. Key data sources were the FDA's medical device submission records from 2020 to 2023, EU Medical Device Regulation (MDR) conformity assessment reports, and implementation records from the Medical Device Coordination Group (MDCG), alongside reports from other international regulatory authorities. The study process began with clearly defined objectives, followed by systematic data collection and analysis, and concluded with an in-depth review to interpret results. This multi-step methodology provided a robust basis for evaluating the regulatory alignment of AM processes in medical devices, identifying specific areas where current practices fall short, and developing targeted strategies to enhance regulatory compliance across FDA, EU, and other international standards.

RESULTS

Regulatory landscape evolution in AM medical devices

The additive manufacturing (AM) landscape in medical devices has witnessed significant regulatory evolution over recent years. Analysis of the FDA database reveals a substantial increase in AM-related medical device submissions and clearances (FDA database) (Table 2, Figure 1). Between 2017-2019, the FDA cleared 230 AM medical device applications out of 270 total submissions, representing a clearance rate of 85.2%. However, this number has rapidly expanded in the subsequent 3-year period, with 310 clearances in 2020 (out of 365 submissions, 84.9% clearance rate), 350 clearances in 2021 (out of 412 submissions, 84.7% clearance rate), and 380 clearances in 2022 (out of 448 submissions, 84.8% clearance rate). The first 9 months of 2023 have already seen 290 clearances out of 342 total submissions, maintaining a consistent 84.8% clearance rate and suggesting a year-end projection well above the previous 3-year average. This rapid growth in regulatory clearances highlights the increasing adoption and maturity

95042

of AM technologies within the medical device industry. The data shows a 75% increase in AM medical device submissions and approvals between the 2017-2019 period (230 total clearances) and the 2020-2023 (Jan-Sep) timeframe (290 clearances), reflecting the significant regulatory evolution and acceptance of these innovative manufacturing techniques. However, this expanding regulatory landscape also brings with it new challenges in terms of compliance and quality assurance. Analysis of the regulatory submissions data reveals critical gaps between current AM capabilities and the evolving regulatory requirements, which must be addressed to ensure the continued growth and acceptance of these technologies in the medical device sector. The consistent clearance rate of around 84.8% suggests a stable yet rigorous evaluation process, balancing innovation with stringent safety and performance standards. The landscape of Additive Manufacturing (AM) medical device submissions in the European Union has demonstrated a remarkable trajectory of growth and consistency from 2017 to 2023 24-26. In 2017, the medical technology sector witnessed 42 initial AM device submissions, with 35 successfully cleared, representing an 83.3% clearance rate. This modest beginning set the stage for a progressive expansion. By 2018, the submission volume surged to 67 total submissions, of which 56 were cleared, maintaining a similar clearance rate of 83.6%. The subsequent years revealed a steady and robust growth pattern. In 2019, submissions increased to 89, with 74 devices receiving clearance, maintaining a clearance rate of 83.1%. The year 2020, despite global pandemic challenges, saw 112 submissions and 93 clearances, demonstrating the sector's resilience with a consistent 83.0% clearance rate. The innovation momentum continued to accelerate in 2021, with 145 total submissions and 121 successful clearances, reflecting an 83.4% approval rate. The trajectory of growth became even more pronounced in 2022, with 176 total submissions and 147 cleared devices, sustaining the 83.5% clearance rate. Notably, the partial data for 2023 (January to September) already shows 203 submissions, with 169 devices cleared, projecting an annual trend consistent with previous years and maintaining the stable 83.3% clearance rate. This represents a nearly fivefold increase in submissions from the 2017 baseline, indicating a significant and sustained expansion of Additive Manufacturing technologies in the medical device sector (Table 3, Figure 2).

Compliance challenges in AM medical devices

One of the primary compliance challenges lies in process validation. Specifically, 67% of submissions lacked adequate Installation Qualification (IQ) data, 65% were deficient in Operational Qualification (OQ) verification, and 71% failed to provide sufficient Performance Qualification (PQ) evidence. Frequently underspecified parameters included build temperature stability, laser power consistency, and gas flow uniformity, which were inadequately validated in 52%, 48%, and 55% of submissions, respectively (Table 4, Figure 3). Material qualification was another area with significant deficiencies, affecting 58% of submissions. Of these, 53% had insufficient raw material characterization data, 47% did not meet powder recycling validation requirements, and 61% lacked adequate material batch traceability. According to the European Medical Device Coordination Group (MDCG), a significant majority (70%) of additive manufacturing medical device manufacturers within the European Union encounter similar challenges when it comes to demonstrating consistent process control and validation in accordance with the Medical Device Regulation (MDR) 2017/745. Beyond process validation and material qualification, other areas requiring improvement include design control documentation (49% of submissions), risk management files (53%), and clinical evaluation data (45%). These gaps reveal that current AM capabilities often fall short of meeting the rigorous standards imposed by regulatory bodies like the FDA and EU. Addressing these challenges is crucial for manufacturers looking to maintain competitive advantage and ensure patient safety in a rapidly evolving AM landscape. Developing robust quality management systems and aligning process validation, material qualification, design controls, risk management, and clinical evaluation protocols with regulatory guidance will be essential to overcome these hurdles.

Gap analysis for AM medical device validation

The Gap Analysis by Category in Additive Manufacturing medical device validation reveals critical insights across multiple validation domains, with comprehensive data collected from 400 regulatory submissions between 2020-2023. Process Validation Protocols emerged as a significant concern, affecting 67% (268 cases) of total submissions, demonstrating high-impact deficiencies in parameter optimization, process monitoring systems, and control documentation. The key issues within process validation included insufficient design of experiments (DOE) for

95043

parameter optimization (found in 45% of cases), inadequate in-process monitoring protocols (identified in 52% of cases), and incomplete statistical validation methodologies (present in 38% of cases) (Table 5, Figure 4). Material Traceability Systems showed moderate but significant gaps, impacting 55% (220 cases) of submissions. The deficiencies in this category encompassed inadequate raw material qualification procedures (found in 40% of cases), incomplete supply chain documentation (affecting 35% of submissions), and insufficient material recycling validation protocols (present in 30% of cases). Notable challenges included the lack of standardized procedures for powder recyclability assessment (identified in 42% of affected cases) and inadequate documentation of material property variations across build cycles (found in 38% of cases). Post-processing Validation emerged as the most critical gap, affecting 73% (292 cases) of submissions, representing the highest percentage across all categories. This category revealed significant deficiencies in heat treatment validation (present in 48% of affected cases), surface finishing protocols (identified in 52% of cases), and cleaning validation procedures (found in 45% of cases). The data indicated that manufacturers particularly struggled with documenting the repeatability and reproducibility of post-processing operations (affecting 58% of these cases). Equipment Qualification gaps were identified in 48% (192 cases) of submissions, with primary deficiencies in calibration protocols (found in 35% of affected cases), preventive maintenance documentation (present in 42% of cases), and installation qualification procedures (identified in 38% of cases). The analysis revealed that manufacturers often struggled with establishing correlations between equipment parameters and final part quality (affecting 45% of these cases). Software Validation deficiencies were present in 42% (168 cases) of submissions, primarily involving inadequate validation of build preparation software (found in 38% of affected cases), insufficient documentation of parameter modification controls (present in 42% of cases), and incomplete validation of process monitoring software (identified in 35% of cases). The data showed particular challenges in validating software updates and modifications (affecting 48% of these cases).

Implementation framework
Process Validation Methodology
The process validation methodology follows a risk-based approach in alignment with FDA's "Technical Considerations for AM Medical Devices" and ISO 14971:2019 on risk management [20]. It encompasses key elements such as process mapping and characterization, Design of Experiments (DoE) for optimization, statistical process control techniques, and continuous monitoring and improvement as outlined in ASTM F3303-20 "Process Control Systems" [21]. This systematic approach ensures that critical process parameters are identified, controlled, and demonstrated to consistently produce devices that meet specified requirements.

Material Qualification Protocol
The material qualification protocol aligns with ISO/ASTM 52901:2022 "Requirements for purchased AM parts" [22]. It covers comprehensive characterization testing of physical, chemical, and mechanical properties of raw materials, assessment of biocompatibility and sterilization compatibility, as well as evaluation of lot-to-lot and supplier variability. Robust material traceability systems and requalification procedures are implemented to maintain consistent material quality throughout the product lifecycle.

Equipment Qualification Requirements
The equipment qualification requirements encompass Installation Qualification (IQ), Operational Qualification (OQ), and Performance Qualification (PQ) for critical process parameters. This includes evaluating power supply stability, laser beam characteristics, optical system alignment, build chamber atmosphere, filtration efficiency, build platform levelness, temperature uniformity, gas flow patterns, position accuracy, and z-axis precision. Preventive maintenance schedules and operator competency assessments are also established to ensure continued equipment performance.

Software Validation Approach
The validation process for software is conducted in accordance with IEC 62304, which is the standard that governs medical device software life cycle processes. It includes validation of design software for CAD file format, STL resolution, build file verification, version control, and data integrity checks. Process control software is assessed for

real-time monitoring capabilities, parameter control algorithms, statistical process control integration, and alarm management systems to ensure reliable and repeatable AM processes.

Documentation System Structure

The documentation system is structured to integrate with the overall Quality Management System (ISO 13485:2016), incorporating robust document control, electronic batch records, deviation handling, and data integrity safeguards. This comprehensive documentation framework ensures traceability, change management, and compliance with regulatory requirements throughout the product lifecycle.

Compliance strategies
Risk Management Approach

The risk management approach aligns with ISO 14971:2019 "Medical devices - Application of risk management to medical devices" [23]. It involves systematic identification, analysis, and mitigation of risks associated with AM processes, materials, equipment, and software. The risk management plan is integrated into the overall quality system to ensure continuous risk assessment and control.

Validation Master Plan

The validation master plan outlines the overall strategy for process validation, material qualification, equipment qualification, and software validation. It defines the scope, methodology, acceptance criteria, and responsibilities for each validation activity to ensure a cohesive and comprehensive approach to regulatory compliance.

Quality Control Procedures

Robust quality control procedures are implemented to monitor and maintain process capability, material consistency, equipment performance, and software functionality. These include in-process inspections, non-destructive testing, statistical process control, and corrective and preventive action systems to identify and address any deviations or non-conformances.

Documentation Requirements

Comprehensive documentation requirements are established to meet regulatory guidelines and ensure traceability throughout the product lifecycle. This includes design history files, device master records, validation reports, material qualification reports, equipment qualification records, and software validation documentation.

Training Protocols

Tailored training protocols are developed to ensure that all personnel involved in AM medical device manufacturing are competent in their respective roles. This includes training on process validation, material handling, equipment operation, software usage, quality system implementation, and regulatory compliance requirements.

CONCLUSION

The adoption of additive manufacturing (AM) in medical device production brings transformative potential to the industry, enabling personalized and complex device designs. However, aligning AM technologies with stringent regulatory requirements remains a significant challenge. As evidenced by increasing regulatory submissions and recurring validation deficiencies, the need for robust quality management systems and comprehensive validation protocols is essential. To achieve regulatory compliance, manufacturers must implement a systematic framework that integrates process validation, material qualification, equipment and software validation, and thorough documentation controls. By adhering to established standards such as ASTM F3303-20, ISO/ASTM 52901:2022, and ISO 13485:2016, AM manufacturers can meet the critical requirements set forth by the FDA, EU MDR, and other regulatory bodies. This alignment is essential not only for regulatory approval but also for ensuring product safety, efficacy, and consistency. Ultimately, the proactive adoption of these validation frameworks and quality controls will

enhance the AM medical device sector's reliability and competitiveness. With the continued evolution of AM technologies and regulatory guidance, manufacturers who prioritize compliance and quality assurance are better positioned to deliver innovative, patient-specific devices that meet global regulatory standards and improve healthcare outcomes.

Table 1. Quality Management System- Design and Development Controls for AM Medical Devices [13-19]

Category	Requirements	Specifications
Process Control Requirements and Specifications		
FDA Build Parameters	Layer Thickness Tolerance	±5µm for critical features
	Build Chamber Temperature Stability	±2°C
	Laser Power Consistency	±1% variation
	Scan Speed Precision	±0.1% of nominal value
	Gas Flow Uniformity	<0.5 m/s variation across build platform
EU MDR Requirements	Process Parameter Windows Validation	Demonstrate reproducibility within operating ranges
	Build Platform Qualification Protocols	Defined qualification protocols
	Layer-by-Layer Monitoring	Implement monitoring systems
	Environmental Control Specifications	Maintain controlled environment parameters
	Post-Processing Parameter Validation	Ensure validated post-processing conditions
Material Control Specifications		
Raw Material Specifications	Particle Size Distribution	D10, D50, D90 within ±5% of specification
	Chemical Composition	Compliance with USP Class VI or ISO 10993
	Moisture Content	<0.05% for metal powders
	Oxygen Content	<0.1% for reactive materials
	Flowability	Carr Index <15
Material Processing specifications	Storage Conditions	Temperature 20°C ±2°C, Humidity <30%
	Powder Recycling Validation	Maximum recycling cycles defined
	Cross-Contamination Controls	<0.1% foreign material
	Batch Segregation Protocols	Protocols for batch separation
	Material Tracking Systems	Traceability for each batch
Equipment Qualification Requirements		
Installation Qualification requirements	Power Supply Stability	±1% variation
	Laser Beam Characteristics	Power stability ±1%
	Optical System Alignment	<0.1mm deviation
	Build Chamber Atmosphere	O2 <0.1%
	Filtration System Efficiency	>99.97% for 0.3µm particles
	Build Platform Levelness	±0.1mm across platform

Tejaswi and Koushik Yetukuri

	Temperature Uniformity	±2°C across build area
	Gas Flow Patterns	Laminar flow verification

ABSTRACT

Fermented finger millet (*Eleusine coracana*), a traditional cereal, is valued for its nutritional richness and health benefits. This research aimed to isolate and characterize microorganisms from naturally fermented finger millet, focusing on identifying probiotic strains for functional food development. Microbial isolation was performed using *deMan Rogosa Sharpe* (MRS) agar, which supports the growth of beneficial lactic acid bacteria (LAB). The isolates underwent various tests to assess their probiotic potential, including biochemical and sugar fermentation tests. Advanced Bacterial Identification Software (ABIS) was utilized for accurate identification of the strains, analyzing both genetic and phenotypic attributes. This method enabled precise classification, streamlining the selection of strains with strong probiotic properties. The study identified LAB strains with significant probiotic traits, including resilience under gastric conditions and the ability to ferment multiple sugars. One strain, identified as *Companilactobacillus formosensis*, showed a high similarity index of 99%, confirming its potential as a robust probiotic strain.In addition to microbial characterization, the research included the development of a fermented finger millet-based prototype product, specifically probiotic-rich gummies. A sensory evaluation using a five-point hedonic scale assessed parameters such as taste, texture, aroma, and overall acceptability. The results demonstrated favorable consumer acceptance, especially among coffee-flavor enthusiasts, highlighting the product's potential as a functional food. The findings underscore the probiotic potential of fermented finger millet, offering a natural source for developing health-promoting foods and dietary supplements. By combining traditional fermentation methods with advanced identification technologies, this study highlights an innovative approach to harnessing beneficial

microorganisms from traditional food sources. Future research could explore antioxidant properties, nutritional profiling, and market comparisons to further enhance product viability and health benefits.

INTRODUCTION

Millets are a staple food and a rich source of micronutrients and phytochemicals, which also play a crucial role in antioxidant activity. Millets are important crops in semiarid and tropical regions of the world due to their resistance to pests and diseases, short growing season, and productivity under hardy and drought conditions when major cereals cannot be relied upon to provide sustainable yields (Devi et al., 2011[1]). *Eleusine coracana* (finger millet), widely cultivated in Africa and South Asia, commonly known as 'ragi', is an important millet crop cultivated for grain and fodder purposes that can be grown in varied agro-climatic conditions. Finger millet has high resistance to pests as well as diseases and grows in a short period of time. As they are rich with antioxidants, finger millets are used as nutraceuticals. Finger millet contains about 5–8% protein, 1–2% ether extractives, 65–75% carbohydrates, 15–20% dietary fiber, and 2.5–3.5% minerals . Probiotics are live microorganisms that, when administered in adequate amounts, confer a health benefit on the host . Probiotics have the ability to modify the structure of potential antigens, reduce their immunogenicity, reduce intestinal permeability and generation of proinflammatory cytokines that are high in the patients with a variety of allergic disorders . They directly modulate the immune system through the induction of anti-inflammatory cytokines or through increased production of secretory, which contribute to an exclusion of antigens from the intestinal mucosa . They prevent the adherence of the pathogenic bacteria to the host cells by strengthening the barrier effect of the intestinal mucosa and release of gut-protective metabolites (arginine, glutamine, short-chain fatty acids and conjugated linoleic acids).Lactic acid bacteria (LAB) is the predominant probiotic organism that plays a major role in fermentation. LAB is a morphologically Gram-positive, non-motile, and non-sporulating bacteria that is considered the normal microflora present in the gut of humans. Lactobacillus is acid tolerant, and has a mechanism to inhibit the growth of various pathogenic bacteria (Gram-positive and Gram-negative) and fungi through the production of lactic acid .Lactobacillus has a crucial role in improving digestive reactions, thereby eradicating digestive problems. Lactobacillus probiotics are known for several mechanisms to adhere to intestinal epithelial cells. This property is an important criterion for the colonization of Lactobacillus in the gastrointestinal tract . Fermentation is an ancient and culturally significant food preservation method in indigenous communities in Africa and developing countries. It enhances the nutritional value, digestibility, sensory characteristics, and functional qualities of raw products. Fermented foods and beverages are a major dietary component, with lactic acid bacteria (LAB) acting as probiotics, which can inhibit pathogens .Isolation of probiotic strains from fermented finger millet can be done using suitable media . They can be usually isolated using MRS (deMan, Rogosa, Sharpe) media.Biochemical tests are used for microbial identification based on differences in their biochemical activities exhibited by different types of bacteria. Bergey's Manual of Systematic Bacteriology helps us to identify bacterial species. The study identified isolates using morphological, phenotypic, and biochemical methods, examined cultures for Gram-staining, endospore tests, motility, and catalase tests, and determined carbohydrate fermentation profiles. Using advanced software ABIS, with help of above test results we can identify the most probable bacterial strain present in fermented finger millet.

MATERIALS AND METHODS

1kg of finger millet is collected from an Oushadhi department store in Thrissur. It was made into fine powder using a mixer grinder and the sample was stored in a poly zipper bag for further analysis.

- **Isolation of Lactic Acid Bacteria :** The fermented finger millet sample is serially diluted in Saline solution (0.85% NaCl in 100 ml distilled water) up to 10^6 dilutions.MRS agar was prepared for isolation by suspending 70g of MRS powder in 1000 ml of distilled water. The medium was boiled with constant stirring for 1 minute for uniform distribution of the medium. Sterilization is done(autoclave) at 121°C for 15 minutes, cool the medium before pouring. After solidifying the Fermented sample is inoculated and streaked on sterile plates and incubated at 37°C for 48h.

- **Gram Staining:** An inoculation loop is used to transfer a drop of suspended culture to the microscope slide. Culture is spread with an inoculation loop into a thin film. The slide is dried by heat fixed. Crystal violet stain, primary stain is added over the fixed culture. After 30 to 60 seconds, rinse the slide with a gentle stream of water to remove the excess crystal violet stain. The mordant, gram's iodine is added for 60 seconds and the slide is rinsed with running water. The decolorizer is added for 3 - 5 seconds and rinsed with water. The counterstain, safranin is added on the smear and after 40 to 60 seconds it is washed off with water and excess water is blotted with blotting paper.

- **Motility Test:** Take one cavity slide and clean the well with dry tissue paper. Apply small amount of petroleum jelly around the four corners of the cover glass. Gently shake the bacteria containing culture broth until it is evenly suspended. Then, using the wire inoculating loop, take a loopful of culture. Place the loopful of culture in the center of the cover glass. Hold the cavity slide in an inverted position, well down, over the cover glass; then press it down lightly. The petroleum jelly, which is applied around the corners of the cover glass will adhere to the cavity slide. Now turn the slide over. Place the slide on the microscope stage, cover slide on the top. Start examining the hanging drop with the low-power objective. It is more effective to observe from one edge of the drop, which will appear as a dark line. To get more clear focus, use high-dry and oil immersion objectives.

- **Endospore Staining**: Endospore staining is the staining process used to identify the presence of endospores in a bacterial sample,. Clean a slide. Put a drop of distilled water using an inoculation loop.Smear the bacteria in the drop of water. Allow it to air dry. Heat-fix the slide with gentle heat. Place the slide over a beaker or conical flask of steaming water. Flood the slide with malachite green dye and steam the slide for 3-5 minutes..Rinse the slide with water. Counter stain with safranin for 1 minute. Rinse the slide with water and tap dry. Blot gently. Dry the bottom of the slide before placing it on the stage of the microscope and view with the oil immersion lens.

BIOCHEMICAL TEST
- **Catalase Test:** This test helps in the detection of enzyme catalase in organisms. Into a clean slide, hydrogen peroxide is added into the bacteria.
- **Oxidase Test:** This test helps in the identification of enzyme oxidase in organisms. A strip of filter paper is soaked with a little freshly prepared 1% reagent. A tiny amount of culture is rubbed on the filter paper. After around 60 seconds, the results are observed.
- **Starch Hydrolysis**: Starch media is prepared and aseptically made a single line streak of the bacterial colony. Inverted the petri plate and kept in the incubator for 24 - 48 hours. After incubation the agar plates are covered with iodine solution. The result is observed.
- **Triple Sugar Iron Test** : TSI agar slants are prepared and with a straight inoculation needle, the isolated colonies are picked up. Inoculate the slant by first stabbing down to the bottom. Withdraw the needle and streak on the surface. The cap should be loosely kept and incubated at 37°C for 18 to 24 h. The result is observed.
- **Carbohydrate Fermentation Test :** The Carbohydrate fermentation of lactic acid bacteria was conducted in MRS broth and bromocresol purple. We used bromocresol green as the pH indicator in the Carbohydrate broth base. Dyes such as phenol red, bromothymol blue can also be used as pH indicators. 10 g of sugars Maltose, lactose, fructose, Galactose, Sucrose, glucose, and Mannitol were used. The media was autoclaved at 121°C for 15 minutes, before adding the sugars. The colony was inoculated from overnight incubated MRS medium and incubated at 37°C for 24-48h. The gas production can be detected by placing Durham's tube in an inverted

position before autoclaving the media (Efrizal et al., 2021[6]). The positive result can be identified by the color change of bromocresol green from green to yellow in acidic PH. (Funnekotter et al., 2023[7])

IMViC Test

IMViC Test, stands for Indole Methyl Red Voges-Proskauer Citrate Test, is done for the detection of bacterial species present in the sample. (Shoaib *et al.,* 2020[5])

- **Indole Test** :- Sub cultured microbes inoculated in the sterile peptone broth specialized for the Indole Test. Peptone broth constitutes 0.30g of Peptone and 0.15g of Sodium chloride in 30 ml of distilled water. After 24 - 48 hours of incubation, a few drops of Kovac's reagent were added to the medium. Result is observed
- **Methyl Red - Voges-Proskauer Test** :- The high medium utilized for MR - VP test is MR - VP broth in a composition of 0.85g in 50 ml of distilled water. Microbes which are subcultured were inoculated in MR - VP broth and incubated for 24 - 48 hours at 37°C.
- **MR Test** -After incubation, 8 - 10 drops of Methyl Red indicator were added to the medium. Kept the sample for 1 hour and no color change occured. This indicates the absence of glucose fermentation.
- **VP Test :** For VP test, 12 drops of Barritt's A reagent and 4 drops of Barritt's B reagent were added to the medium. Kept for 1 hour and yellow color stands for the absence of glucose fermentation.
- **Citrate Test :** Citrate Test is undergone in Simmon's Citrate Agar medium, in a composition of 0.72g agar in 30 ml distilled water. Bromothymol blue, a pH indicator (6.9 - 7.6), was added to the agar and kept for solidification. Subcultured organism inoculated in sterile agar and incubated for 24 - 48 hours. Green color appeared which shows the absence of citrate.

Product Development

A prototype of probiotic-rich fermented millet-based gummies was developed by using fermented millet (after 24h fermentation), jaggery instead of sugar, and china grass as solidifying agents as ingredients. Corn starch and gelatin are also preferred as solidifying agents. Coffee powder was used for flavoring purposes, other flavors also can also be used. The Gummies were frozen for 3-4 hours. The food characteristics such as taste, texture, and appearance were checked by using A five point Hedonic rating scale.

PREPARATION OF PRODUCT

1. Fermentation of ragi in water for a minimum of 4 hrs.
2. Into the saucepan add water and china grass. Only add the required amount of water as adding more will affect the solidifying action of china grass. Flame should be the minimum
3. After around 5 minutes or less the china grass has been dissolved in the water. Transfer it to a bowl.
4. Let the melted china grass to cool for around 5 minutes
5. Prepare a mixture of coffee powder and jaggery and dissolve it using a small amount of water.
6. Add the coffee-jaggery solution and fermented ragi into the bowl of melted china grass and mix it very well.
7. Transfer the mixture to the mould of choice and keep it in the refrigerator for 3 - 4 hrs.

RESULTS AND DISCUSSION

The isolated colonies are grown on the MRS media after 48 hrs. It has been seen that the formed colonies are mucoid, opaque, flat, entir**e,** Gram positive, rod shaped non-motile, non-sporulating bacilli Various biochemical tests have been done for the identification of the bacteria. In the catalase test performed there was no bubble formation which indicated that the organism is catalase negative. That means the organism is an anaerobe, or may be a facultative anaerobe that only ferments and does not respire using oxygen as a terminal electron acceptor.In the oxidase test, the results show a negative reaction by the absence of coloration. That means this organism does not produce oxidase. Organisms that are oxidase-negative may be anaerobic, aerobic, or facultative; the oxidase negative result just means that these organisms do not have the cytochrome c oxidase that oxidizes the test reagent. They may respire using other oxidases in electron transport. The result in the starch hydrolysis is seen as there is no starch that is hydrolyzed

as there is no clear zone. Hence it is a negative result. The negative results indicate that the organism is not able to produce DNase. The observed result of the Triple Sugar Iron test after 24 hr is that there is acid butt and acid slant (yellow butt, yellow slant): lactose and/or sucrose has been fermented. And there is no gas production which indicates the fermentation of lactose, and/or sucrose. In the IMViC Test, the Indole test for the detection of degradation of tryptophan, MR- VP test for the detection of glucose fermentation and the Citrate test for the Citrate present in the bacterial sample were observed by negative results. A negative result from an indole test indicates that the organism lacks tryptophanase. A negative result for both the Methyl Red (MR) and Voges-Proskauer (VP) tests indicates that a bacterial colony is unable to produce acid properly from glucose fermentation. This could be due to several reasons, including the organism not producing significant amounts of acidic or neutral end-products from glucose fermentation. A negative citrate test result for an organism means that there is no visible growth or only a trace amount of growth. Sugar fermentation is a metabolic process that occurs in an anaerobic condition to produce alcohol and acid. Sugar fermentation test enabled us to understand the carbohydrates fermentation ability of the isolated lactobacillus. The lactobacillus strain fermented all the tested sugars but not mannitol without any gas production by converting the green color of bromocresol green to yellow. The obtained result in ABIS tool is that the isolated strain of lactobacillus shows a similarity of 99% and a probability of 56.3% with *Companilactobacillus formosensis.* Characteristics of the product were obtained through scale analysis from 18 people. Appearance and texture have high scores. Coffee liking individuals liked the flavor and smell of the product whereas individuals who disliked coffee gave low scores. Through the overall survey it is understood that the product provides energy and refreshments to individuals especially coffee lovers. The product may be mostly liked by children.

CONCLUSION

The bacillus have been isolated in MRS medium. Identification and characterization were conducted by morphological analysis as well as biochemical methods.The isolated colonies were identified by ABIS online laboratory tool showing 99% of similarity with 56.3% probability on *Companilactobacillus formosensis*. Millet is a gluten-free grain that is widely consumed in various parts of the world, particularly in Asia and Africa. Lactic acid bacteria, such as *Companilactobacillus formosensis*, are commonly used in the fermentation of grains and other food products. In the context of millet, these bacteria can be utilized in fermentation processes to produce traditional fermented foods or beverages, such as: Fermented Millet Porridge: Lactic acid bacteria can be added to millet porridge to initiate fermentation, which can enhance the flavor, texture, and nutritional profile of the porridge. Millet-Based Fermented Beverages: Fermented millet beverages are popular in some cultures. Lactic acid bacteria can ferment the sugars present in millet, producing lactic acid and other compounds that contribute to the characteristic flavor and aroma of the beverage. Millet Bread: Lactic acid bacteria can also be used in the fermentation of millet-based bread or other baked goods. Fermentation not only enhances the flavor and texture of the bread but also improves its shelf life. Millet-based Fermented Condiments: Fermentation of millet can also be used to produce fermented condiments or sauces, which are commonly used to flavor various dishes. In addition to imparting flavor and enhancing nutritional value, fermentation with lactic acid bacteria can also contribute to food preservation by creating an acidic environment that inhibits the growth of harmful microorganisms. It's worth noting that specific fermentation processes and recipes may vary depending on cultural traditions and preferences. If you're interested in incorporating *Companilactobacillus formosensis* into millet-based fermentation processes, it's essential to ensure proper hygiene and fermentation conditions to achieve desired outcomes in terms of flavor, safety, and nutritional quality.

ABSTRACT

In recent years, everything in the globe is jam-packed with indeterminacy, the Neutrosophic becomes appear and create its place into research as an advancement/new avenue in the various fields. Generally Classical statistics is used based on the deterministic nature of information and based on its structure and its scale. In some circumstances, the quality characteristics may not be certain enough leading to vagueness or impreciseness situation. Accordingly, (FST)Fuzzy Set Theory takes its place to model the uncertainty in the manufacturing industries during the end of the last century. Due to exponential growth of data, an extension of Fuzzy, known as Neutrosophic Logic(NL) is in progression to overcome these uncertainties. Thus, NL taken its role in Quality Control (QC) through Acceptance Sampling Plans(ASPs) and Systems. The construction of plans and systems based on neutrosophic sets were already studied in the literature. This article furnishes the concept and designing of Modified Quick Switching System (QSS) based on Neutrosophic Poisson Distribution. The Modified QSS is designated as QSS-r (n; C_N, C_T) where r=2,3 and its characteristics functions of ASPs such as Probability of acceptance (P_a), Average Outgoing Quality (AOQ), Average Total Inspection (ATI) have also been analyzed using Neutrosophic Poisson as a baseline distribution and highlighted advantages with numerical illustrations.

Keywords: Modified QSS-r, OC, AOQ, ATI, SSP, FST, NL, Neutrosophic Poisson Distribution.

INTRODUCTION

In any manufacturing industry, it is mandatary to check the conformity of the produced items with the standard quality specifications. while undergoing the 100% inspection, the cost may be too high in inspecting or testing all the produced items for the quality standards. Accordingly, the acceptance sampling plans procedures is applied to decide the quality of the produced items in inspecting set of sample items. In this modernized and technocratic scenario some of the real case problems, the classical acceptance sampling plans are not applicable due to the indeterministic environment to assess the degree of association. FST is an efficient and popular approach to model the uncertainty and has also been successfully used in ASPs. In FST, the uncertainty modelling is built on the term Membership Function $(\mu(x))$ by using a continuous variable (x) inside $[0,1]$ interval in a space of (X). To overcome the indeterministic environment more effectively, NL one of the fuzzyextensions have been developed with three terms for membership(truthiness), non-membership(falsity) and indeterminacy. Neutrosophic Statistics is an extension of the Classical Statistics and deals with the set values data rather than crisp ones. Neutrosophic Statistics is considered as extension of Classical Statistics. In Classical Statistics, the data is very well known and formed by the crisp numbers whereas in case of Neutrosophic Statistics, the data contains some indeterminacy. The data may be ambiguous, vague, imprecise, incomplete and even unknown in Neutrosophic Statistics, alternate to crisp numbers applied in Classical Statistics, one can apply the sets in Neutrosophic Statistics.   NL provides better results in modelling the uncertainty depending on human factor. During the inspection cycle, the operator may be undecided in classifying the semi-defective item as defective or non-defective because of some reasons such as technical restrictions. The traditional FST assign the items to one of the two possible sets: defective or non-defective. This behaviour creates diverseness between real life and calculated results. In such cases, FST do not fit into it. The mentioned triple-term structure of NSs supports to model these kinds of uncertainties more adequately. In recent years, some studies have been carried out in the literature in the area of acceptance sampling using NSs with reference to SSP and DSPs. The chief formulations of Acceptance Sampling plans for Single Sampling were derived based on Neutrosophic Statistics. QSS proposed by Dodge in 1967 (mixture of ASPs with swapping rules is widely applicable and providing high level of protection and reduction in time and cost inspection) based on NSs is designed with the procedures, OC curves and tables based on NSs with numerical examples. The modifications in QSS proposed by Romboski in 1969 and designated the two modified systems as QSS-2(n; C_N, C_T) and QSS-3(n; C_N, C_T). Modified QSS is an advantageous system than QSS-1 due to the reasons that it gives an OC curve which is more discriminating than the OC curve of normal and tightened plans and ease in switching rules. The sample size of the Modified QSS is found to be lesser than QSS. To overcome the vagueness present in the data, the concept of Neutrosophic Statistics is applied in the paper to design Modified QSS based on Neutrosophic sets to reduce the sample size rather than existing plans and systems in the literature by using Poisson distribution as a baseline distribution.

REVIEW OF LITERATUE

QSS
QSS were originally proposed by Dodge (1967) and later investigated by Romboski (1969) and Govindaraju (1991). Based on Romboski's studies, Taylor (1992) designed QSS with the combination of Reduced and Tightened Sampling plans by comparing with   MILSTD 105E and compared the advantages of QSS(RT).

Fuzzy QSS
Uma and Nandhinidevi (2018) studied the determination of QSS using both fuzzy Binomial distribution and fuzzy Poisson distribution with OC curves of sample size tightening and acceptance number tightening. Nandhinidevi and Uma (2018) analysed fuzzy logic importance on QSS by attributes using the Poisson distribution. Uma, Nandhinidevi and Manjula (2020) studied the impact of fuzzy logic on Quick Switching Single Double sampling plan with the acceptance number tightening criteria.

Neutrosophic Acceptance Sampling Plans and Systems:

Aslam (2019) initiated to study in both attribute and variable Acceptance sampling plans and proposed a new attribute sampling plan by employing the Neutrosophic Interval method and theNeutrosophic Binomial distribution is utilized for computing the lot acceptance, rejection andindeterminate probabilities at various specified sample size and acceptance number parameters. Isik and kaya (2020a) developed the attribute single ASPs for Poisson distribution based on single-valued Neutrosophic sets and Isik and kaya (2020b) also study the double Acceptance Sampling Plans based on single-valued Neutrosophic sets using Binomial distribution. An inclusive representation of single and double Acceptance Sampling plans based on single-valued Neutrosophic sets using Binomial distribution and Poisson distribution is recommended by covering the two studies. Isik and kaya (2022d) formulated the characteristics functions of Acceptance Sampling plans – Average Outgoing Quality, Average Total Inspection, Average Sample Number by incorporating the three terms- truth, false and indeterminacy. Uma and Nandhitha (2022) reviewed the significance of Neutrosophic set on Acceptance Sampling plans (attribute and variable) in their study.Isik and kaya (2023) designed and analysed the single and double Acceptance Sampling Plans using the Binomial and Poisson distributions based on Interval Valued Neutrosophic sets. The Acceptance Sampling plans based on Interval Valued Neutrosophic sets   can increase the real case applicability of the problems encountered. Uma and Nandhitha (2023) have constructed and evaluated the Quick Switching System using Neutrosophic Poisson Distribution with OC curve and necessary tables are framed for various parameters. Uma and Nandhitha (2023) investigated the Quick Switching system using FSs and NSs and compared its efficiency.

NEUTROSOPHIC SETS

Type-1 fuzzy sets or classical fuzzy sets considers only the membership and only have µ(x) € [0,1] in the membership function. Since non-membership is states as 1-µ(x), type-1 fuzzy sets are only usable in complete information case. Intuitionistic sets (ISs) have functions for both membershipand non-membership. While µ(x) € [0,1] is membership function and ϑ(x) € [0,1] is non-membership function, the condition 0≤ µ(x)+ ϑ(x)≤ 1 is satisfied (Atanassov, 2003). If the sum of membership and non-membership values is less than 1, it means incomplete information (Wang *et al.*,2005). NSs are the generalized form of ISs. It handles membership (truthiness), non-memership (falsity) and indeterminacy cases independent from each other. This independency makes possible to use inconsistent data in modelling (Smarandache, 2005). (t, i, f) = (truthiness, indeterminacy, falsity)

$$\leq t + i + f \leq 3, \quad t,i,f \in [0,1] \tag{1}$$

Truthiness, indeterminacy and falsity values can be real numbers or interval-valued numbers. If these are interval-valued numbers, the set is named as interval Neutrosophic set and it is represented with three intervals. Summation of the biggest upper limits of these three intervals must between 0 and 3 (Wang et al., 2005). Representation of interval NSs is shown in Eq. (1):

$$x = \langle [Tx_L Tx_U],[Fx_L Fx_U],[Ix_L Ix_U]\rangle$$
$$T_x, I_x, F_x \in {}_{[0,1]}$$
$$\leq \sup{}_{T_x} + \sup F_x + \sup I_x \leq 3$$

MODIFIED QUICK SWITCHING SYSTEM QSS-r(n; C$_N$, C$_T$), r=2 And 3

Romboski (1969) designates the OC function of modified systems as follows:

$$\text{QSS-2: } P_a(p) = \frac{P_N P_T^2 + P_T(1-P_N)(1+P_T)}{P_T^2+(1-P_N)(1+P_T)} \tag{2}$$

$$\text{QSS-3: } P_a(p) = \frac{P_N P_T^3 + P_T(1-P_N)(1+P_T+P_T^2)}{P_T^3+(1-P_N)(1+P_T+P_T^2)} \tag{3}$$

Where P$_N$ and P$_T$ are the probability of accepting the lot using normal and tightened SSP using NL respectively. The conditions for application of these systems are same as that of QSS-1(n; C$_N$, C$_T$).

95064

OPERATING PROCEDURE

Step 1: Under Normal Inspection, take a random sample of size 'n' from the lot and count the number of non-conforming units(d)

i)   If d ≤ C_N, accept the lot and repeat Step 1 for the next lot.

ii) If d > C_T, reject the lot and go to Step 2.

Step 2: Under Tightened Inspection, take a random sample of size' n' from the next lot and count the number of non-conforming units(d)

i)   If d ≤ C_N, accept the lot and continue inspection using Step 2 until 'r' lots in succession are accepted. When 'r' lots in succession are accepted go to Step 1.

ii) If d > C_T, reject the lot and repeat Step 2 for the next lot.

MODIFIED QSS BASED ON NEUTROSOPHIC SETS FOR POISSON DISTRIBUTION

In this section, QSS with reference to SSP having certain plan parameters and Neutrosophic defection status is offered with Poisson distribution as a baseline distribution. Difference from classical acceptance sampling plans is considering the indeterminacy case as a defection status.

A: A Neutrosophic set for item defect such that A ={t,i,f}={(P(S),P(I),P(F)}

P(S): Non-defective probability

P(I): Indeterminacy probability

P(F): Defective probability

B: A Neutrosophic set for test result such that B ={t,i,f}={(P_a, P_i, P_r)}

Pa: Acceptance probability

Pi: Indeterminacy probability for the normal plan

Pr: Rejection probability for the normal plan

n: Sample size

N: Lot size

c: Number of maximum allowable defective item

I: Number of maximum allowable indeterminate item

d: Defective item count in a sample

i: Indeterminate item count in a sample

PERFORMANCE MEASURES

Formulation of single sampling plan based on Poisson distribution has two frequency values as defect frequency λ_F

= n.P(F) and indeterminacy frequency λ_I = n. P(I). If the neutrosophic set A has inconsistency, the probability values should be normalized by dividing each of them with total probability to make

t + I + f = 1. This normalization is offered by (Smarandache, 2014).

For single sampling plan, the Neutrosophic probability of acceptance is represented as 'P_a', the rejection probability is represented as 'P_r' and the indeterminacy probability is represented as 'P_i'.

$$P_a = \sum_{d=0}^{C_N} \frac{\lambda_F^d}{d!} \left[\sum_{i=o}^{min\ (I,n-d)} \frac{\lambda_I^i}{i!} e^{-(\lambda_I+\lambda_F)} \right] \tag{4}$$

$$P_r = \sum_{d=c_{N+1}}^{C_N} \frac{\lambda_F^d}{d!} \left[\sum_{i=o}^{n-d} \frac{\lambda_I^i}{i!} e^{-(\lambda_I+\lambda_F)} \right] \tag{5}$$

$$P_i = \sum_{i=I+1}^{n} \frac{\lambda_I^i}{i!} \left[\sum_{d=o}^{min\ (N,n-i)} \frac{\lambda_F^d}{d!} e^{-(\lambda_I+\lambda_F)} \right] \tag{6}$$

$P_{aN} + P_{rN} + P_{iN} = 1$ ………….. total probability

Therefore, the probability of acceptance P_a (p), probability of rejection P_r(p), probability of indeterminacy P_i(p)for QSS-2 and QSS-3 is calculated based on Eq. (2) and (3)Operating Characteristic (OC) is formed as a surface

95065

depending on P(F), P(I) and P_a. Figures below shows OC surface for QSS-2 and QSS-3 using Neutrosphic Poisson distribution having parameters n=30, C_N=2, C_T=1, I=2 for the probability pairs satisfying P(F) €[0.01,0.1] and P(I) € [0.01,0.1] .The obtained curves are found to be steeper than single sampling plan using Neutrosophic Poisson distribution and QSS using Neutrosophic Poisson distribution.

AOQ is calculated similar to ASPs but includes λ_F instead of λ. The AOQ is calculated as follows:

$$AOQ = P_a * P(F) = P_a * \frac{\lambda_F}{n} \tag{7}$$

During the calculation of ATI, one of the two different strategies can be followed. If the business requires high sensitivity in output quality, all the items are tested in case of indeterminacy. For this approach ATI $_{pessimistic}$ is calculated is shown in Eq. (17). If the business does not force to test all the items in case of indeterminacy, ATI $_{optimistic}$ is calculated as shown in Eq.(18).

$$ATI_{pessimistic} = n + (P_r + P_i)(N-n) \tag{8}$$
$$ATI_{optimistic} = n + (P_r)(N-n) \tag{9}$$

ILLUSTRATION

In this section, the proposed system is explained based on some numerical examples. In given data samples, the items have three defective states: defective, non-defective and indeterminate. For example, the inspected item can have a measure which is too close to the specification limit while the measurement is not sensitive enough depending on the technical restrictions.

If the classical ASPs are applied,

the risk avoider operators (labelling the indeterminate items as defective ones) can increase the cost for inspection process and risk-taking operator (labelling the indeterminate items as non-defective ones), which cause problems with the supplier or other departments. In both scenarios, there will be contrast between paper calculations and acceptance probability experienced in real cases. For this reason, NSs is applied by considering the three possible outcomes – acceptance, rejection and indeterminacy. To illustrate the application capability of the proposed system, an example scenario can be such that: A company supplies Stainless Steel pipes (SS pipes) to a supplier and applies ASPs for these SS pipes. SS pipes can have different types of defects such as surface defect, weld defect, dimensional defect and material defect. In this case, some pipes may have surface defect only in the middle portion of the pipe, while others may have it in the outer ring of the pipe. The operator may become undecided in some cases. The agreement is made between the company and supplier depending on a quality level. The supplier categorize an item non-defectiveness probability, an item indeterminacy probability and an item defectiveness probability for the incoming lots. The company can control the quality of the incoming SS pipes by applying special purpose Sampling System such as Modified QSS-2 & 3 ASPs based on NSs. A set of system parameters and mass quality characteristic combinations have been tested to analyze the outputs of proposed system better. The obtained results have been tabulated below

COMPARATIVE STUDY

In this section, the proposed system Modified QSS based on Neutrosophic sets is compared with the existing sampling systems under ClassicalPoisson distribution with respect to acceptance probability, rejection probability and indeterminacy probability. The selection of parameters involves same values for both sampling systems.The probability values are presented in Table 4 with sample size n=50 , acceptance numbers **C_N = 2 , C_T = 1 ,** indeterminacy I = 2. From table 3, it may be noted that the existing sampling plan under the classical statistics present the determined values for the specified parameters whereas the fuzzy logic present the value in the interval. But the Neutrosophic logic provides the value for acceptance probability, rejection probability and indeterminacy probability. In table 4, when n=50, C_N=2, C_T=1,I=2 is applied for the lot inspection, there is 24% chance that an experimenter faces indeterminacy regarding the lot sentencing. By comparing three, we infer that the classical statistics and fuzzy logic has only the decision of acceptance or rejection, also does not give information regarding the indeterminacy. Therefore, the neutrosophic statistics is considered to be more effective, and flexible under the

95066

uncertainty and indeterminacy scenario. According to the results, the summation of Pa, Pr, Pi for all the data sets is observed as equal to 1. This is an expected result because the probabilities were normalized at the beginning. Table 1 and 2 shows solutions for both consistent(P(S)+P(F)+P(I)=1) and inconsistent information (P(S)+P(F)+P(I) $\neq$ 1) cases. In table 1, if P(S), c and/or I increases, P_a increases but the relative greatness of P(S) over P(F) and P(I) has positive effect on P_a. N has no effect on Pa, Pr, Pi and AOQ while the plan parameters are not changing. However, AOQ is highly affected by the plan parameters n, c and I.Increase of N has apparent additive effect on ATI. ATI is also affected from the relative greatness of P(S) over P(F) and P(I). When the probability values P(S), P(F) and P(I) are changed, the difference between ATI $_{opt}$ and ATI $_{pes}$ is changed but the arithmetic average of ATI $_{opt}$ and ATI $_{pes}$ shifts at a small range. However, change of N shifts both ATI $_{opt}$ and ATI $_{pes}$ to bigger values.

CONCLUSION

In this article, construction and designing of modified quick switching system - QSS$_{NP}$ (n;C$_N$,C$_T$;I) with reference to single sampling plan using Neutrosophic Poisson distribution for various Neutrosophic quality characteristics such as OC curve, AOQ and ATI are studied. The mentioned Modified QSS$_{NP}$ are usfeul for situations where inspected items can have measures too close to specification limit while the measurement is not sensitive enough due to some constraints. They even represent the real life better by eliminating the negative effects of risk avoider operators on inspection cycle. As a future study, the paper can be extended to determine standard sampling plans including indeterminacy term.

ABSTRACT

Low back pain (LBP) is a common musculoskeletal disorder among educators, significantly affecting their health, productivity and quality of life. The teaching profession involves prolonged standing, poor posture, repetitive movements and high work-related stress, all of which contribute to the increasing prevalence of LBP. An extensive web-based search was done on various platforms, viz. PubMed, PubMed Central, Web of Science, Google Scholar, MEDLINE, Academia, etc., with the help of keywords used for searching data related with low back pain, occupational hazards, musculoskeletal disorder, prevalence, risk factors, academicians, teaching profession, etc. It was observed that significant proportion of educators experience chronic or recurrent LBP, with female teachers and those with longer teaching experience being more susceptible. The key contributing factors include prolonged static postures, inadequate workplace ergonomics, high workload, and stress. Further physical inactivity, obesity, and psychological stress exacerbate LBP. Preventive strategies such as ergonomic interventions, physical activity, posture correction, and stress management have shown effectiveness in reducing LBP symptoms. However, workplace policies supporting spinal health remain inadequate in many educational institutions. While addressing LBP in educators requires a multidisciplinary approach, including workplace ergonomics, physiotherapy and awareness campaigns should be considered as well as future research should focus on longitudinal studies to assess the long-term impact of preventive

95070

interventions. Implementing structured occupational health programs can improve teacher well-being and overall educational efficiency.

INTRODUCTION

Low back pain (LBP) is a widespread issue among workers in both developed and developing nations. As a significant global public health concern, LBP is one of the most common musculoskeletal disorders experienced in everyday life, with a lifetime prevalence of 84%. It often results in severe discomfort, expensive medical treatments, and lost work time [1,2]. LBP is characterized as pain occurring between the 12th rib and the lower gluteal folds, with or without radiating leg pain, and can stem from various causes [2]. It is generally classified into two types: "specific" and "non-specific" LBP. Non-specific LBP refers to pain without a clearly identifiable cause or pathology, whereas specific LBP arises from distinct pathological or physiological conditions, such as disc herniation, infection, inflammatory arthropathy, tumors, osteoporosis, or fractures [3]. Although LBP is not life-threatening, it remains a significant global health issue. It is frequently associated with restricted movement, often aggravated by physical activity and posture, and may also involve referred pain [4]. While several individual factors contribute to LBP, growing research highlights occupational exposure as a key risk factor. In fact, workplace-related factors are estimated to account for 37% of LBP cases worldwide [1]. Several factors contribute to the risk of developing lower back pain (LBP), including gender, age, lifestyle, and an individual's psychosocial profile. Work-related physical demands, social support, and pain perception also play a role. LBP can be aggravated by activities such as frequent heavy lifting, prolonged use of vibrating equipment, and leading a sedentary lifestyle. Additional contributing factors include weak abdominal muscles, obesity, smoking, increased lumbar lordosis, scoliosis, cardiovascular diseases, low socioeconomic status, and a high body mass index (BMI). Many of the modifiable risk factors for LBP are occupational in nature, such as poor posture, prolonged sitting, twisting, bending, stooping, and lifting heavy objects [5]. The World Health Organization (WHO) has identified lower back pain (LBP) as one of the top three occupational health concerns to be monitored through surveillance[6]. LBP has significant mental health impacts, including anxiety, depression, and insomnia, while its physical effects include reduced physical performance and a decline in overall health. Since LBP predominantly affects individuals of working age, it can hinder social participation and limit one's ability to perform job-related tasks. Due to its substantial direct and indirect effects on quality of life, workplace productivity, and absenteeism, LBP is recognized as the leading cause of musculoskeletal disability worldwide [7,8].

MATERIALS & METHODS

An extensive web-based search was done on various platforms, viz. PubMed, PubMed Central, Google Scholar, Web of Science, MEDLINE, Academia etc., were searched with the following keywords: work-related musculoskeletal disorders, low back pain, occupational hazards, musculoskeletal disorder, prevalence, risk factors, academicians, teaching profession and prevention strategies etc. All studies written in simple English comprising of any design or methodological quality were included.

RESULT &DISCUSSION

Low back pain (LBP) is a significant public health issue worldwide, affecting individuals across various professions. The teaching profession, in particular, has been identified as a high-risk group for developing LBP due to the nature of their work, which often involves prolonged standing, sitting, and repetitive movements. Teachers are often

required to maintain static postures for extended periods, such as standing while lecturing or sitting while grading papers. These activities can lead to musculoskeletal disorders (MSDs), with LBP being one of the most common complaints. Several studies have investigated the prevalence of LBP among teachers globally, revealing varying rates depending on the region and specific teaching environment: A study done by Hoy *et al*.(2018) explained that the global prevalence of LBP among teachers ranges from 50% to 70%. This high prevalence is attributed to the physical and psychological demands of the profession [9]. Another study done by Omokhodion *et al*.(2017) reported a prevalence rate of 68.5% among secondary school teachers in Southwest Nigeria [10]. A study done in China by Zhang et al.(2019) indicated a prevalence rate of 58.9% among primary and secondary school teachers. Another study done by Rugulies *et al*.(2016) found that 54.3% of school teachers in Europe experienced low back pain [11]. da Silva *et al*. (2018) explain that a Brazilian study found a prevalence rate of 66.7% among school teachers [12]. A study conducted by Gupta et al.(2018) states that higher secondary school teachers in Kanpur 27% experienced acute episodes of LBP, with an annual prevalence of 23.1%. Additionally, 58% of these teachers had minimal disability, 35.8% had moderate disability, and 5% had severe disability due to LBP [13]. A study conducted by Tsuboi *et al*. (2002) reported that the prevalence of lower back pain (LBP) among teachers in Japan was 20.4% in males and 23.2% in females. The higher prevalence of LBP compared to previously mentioned studies may be attributed to inadequate school facilities, low morale, poor socio-economic conditions, and a lack of awareness regarding strategies to manage and reduce excessive workloads in schools.

In the current study, 60.20% of female teachers experienced LBP compared to 39.39% of male teachers. This disparity is likely due to the cultural and social expectations placed on women, requiring them to handle most household responsibilities, leading to an increased workload and higher risk of LBP. Additionally, since women generally have a lower pain threshold than men, they are more likely to report experiencing pain [14]. As per Chakravarthy *et al*. (2020) study indicate that 51 instructors (63.7%) had lower back pain as a result of occupational hazards affecting their professional growth. Thirteen male teachers (16.25%) and sixty-seven female teachers (83.75%) of this group reported having LBP. Female teachers are more prone to experience LBP than their male counterparts [15]. Another study done by Swati suman *et al*. (2021) states that 41.10% of Odisha's secondary school teachers had LBP, with female teachers having a higher frequency than male educators. The contributing factors that negatively impact teacher's health and welfare, such as an excessive workload, sleep disturbances (particularly for female educators), extended standing in the classroom, and physical inactivity, can lead to lower back pain (LBP) [16]. A study done by Nilani (2014) explain that low back pain among primary school teachers due to excessive work load had reported the prevalence of LBP varies from 12% to 95% among school teachers, which is significantly greater than that of other professional categories. Teachers who participate in high-intensity sports and gymnastics programmes at their schools run a greater risk of suffering from acute and chronic lower back pain (LBP) injuries, which frequently leave them permanently disabled [17].

CONCLUSION

Low back pain is a significant occupational health issue for teachers, with a high prevalence and multifaceted risk factors. Preventive measures such as ergonomic adjustments, regular physical activity, posture awareness, and stress management can help reduce the risk of low back pain. Additionally, schools and policymakers should prioritize workplace ergonomics and health education to support teachers' long-term physical well-being. Addressing low back pain in the teaching profession is essential for improving both teacher performance and overall quality of education. Future research should focus on evaluating the effectiveness of preventive strategies and exploring the role of cultural and socioeconomic factors in low back pain among teachers.

ABSTRACT

Alzheimer's disease is an advancing neurodegenerative disorder, which prevails as the leading cause of dementia worldwide, imposing a considerable strain on individual caregivers and healthcare systems. Despite years of research, transformative therapeutic interventions and curative approaches are still undetermined. A comprehensive investigation of the pathophysiological mechanisms underlying Alzheimer's disease, including amyloid beta-plaque accumulation, tau protein, hyperphosphorylation, neuro inflammation, and oxidative stress. Currently adopted modalities such as cholinesterase inhibitors, amyloid targeting therapies, and anti-inflammatory agents are critically evaluated, emphasizing their mechanism of action and clinical limitations. The evolving neuroprotective strategies, the potential of repurposed drugs, and the challenges associated with early diagnosis and biomarker development. By improving the limitations of present treatment regimen and exploring innovative therapeutic techniques, highlighting the urgent need for pioneering treatments to counter disease progression and improve patient health outcomes.

Keywords: Alzheimer's disease, Aβ plaques, neurofibrillary tangles, Neuroinflammation, Oxidative Stress.

Arpan Ghosh *et al.,*

INTRODUCTION

Alzheimer's disease is a pervasive neurodegenerative disease, majorly detrimental to the elderly population. Being a consequential factor for notable amount of dementia cases, the need for widespread awareness and preventative actions still persists. The disruptive challenges faced by people afflicted with Alzheimer's disease are altered cognitive and behavioural functions, yet determining the importance of research, caregiving support, community engagement and health education. Despite its unfavourable impact on the learning abilities and daily functioning, AD lays an epicentre for interdisciplinary collaboration, innovation in treatment modalities and compassionate care practices focusing on promoting the life quality for the effected individuals and their caretakers.(1) Alzheimer's disease is a multiplex neurodegenerative disease, preying on the population of millions. People's age is conducive to its increased incidence, contributing to the challenges for families, communities and healthcare system. (2)Genetic factors and mutations of genes - APP, PSEN1, PSEN2 together with APOE gene variations significantly augment the progress of "late onset" Alzheimer's disease.(3)Being the leading form of dementia, generally, older people becomes the victim of Alzheimer's disease, substantially declining their cognitive abilities. Healthcare disparities, lifestyle choices and genetic predisposition also aids in prevalence variations.(2) Anticipatory measures are needed to be taken to create awareness about Alzheimer's disease in order to mitigate it's social, financial and healthcare burdens, promoting individualized approaches to its treatment and prevention.(4)

IMPORTANCE OF NEUROPROTECTIVE STRATEGIES IN AD:
In the treatment landscape of Alzheimer's disease (AD), focusing on neuroprotective strategies is paramount due to their potential to slow or halt the progression of cognitive decline and neuronal damage as shown in figure 1. While treatments like inhibitors targeting gamma- and beta-secretases, Ab vaccination, Cu–Zn chelators, cholesterol-lowering drugs, statins, and NSAIDs are anticipated, neuroprotective approaches offer promise by safeguarding neurons from degeneration and preserving cognitive function. These strategies aim not only to alleviate symptoms but also to address underlying mechanisms contributing to neuro degeneration, thus presenting a holistic approach towards managing AD and enhancing the quality of life for affected individuals.(5)we explore the current therapeutic approaches for Alzheimer's disease (AD) and their limitations; while also delving into the various mechanisms of action and the underlying pathophysiology and their associate risk factor are shown in figure 2. By examining existing treatments in relation to the disease's pathophysiological mechanisms, we aim to provide insights into the challenges of AD.

ALZHEIMER'S DISEASE PATHOPHYSIOLOGY
Brain cells and connections get less healthy and less able to work as Alzheimer's gets worse.(6) For neurons to send information to each other, which is a key part of how our brains work, we need to know how synapses work. Neuroinflammation, oxidative stress, and the growth of Aβ plaques and neurofibrillary tangles can all make it hard for neurons to talk to each other and for synapses to work right. The main signs of Alzheimer's are forgetting things and having trouble learning new things. People with Alzheimer's disease have nerve growth factor and other important chemicals outside of cells that are out of balance. It is very important for neurons to live and grow back, as well as for connections to form and stay in place. If this process is slowed down, nerve damage and loss of work can happen faster.(7)

Amyloid-beta plaques and neurofibrillary tangles
Aβ plaques and neurofibrillary tangles (NFTs) are two of the most well-known signs of Alzheimer's disease that can be found in the brain. AMYL beta proteins build up in the brain and form A² plaques. The amyloid precursor protein (APP) is cut in a way that makes this happen. These plaques get in the way of nerve cells doing their normal jobs. They are found in the brain between nerve cells.(8) A strange phosphorylation of tau protein leads to neurofibrillary tangles. In most cases, tau protein is very important for keeping neurons' cytoskeletons in good shape. In Alzheimer's disease, on the other hand, the tau protein gets too much phosphorylation and stops working properly, which causes

it to get stuck inside nerve cells Nerve cells are breaking down because of this mess, which makes the brain work less well.(9)

Neuroinflammation and oxidative stress

Neuroinflammation and toxic stress play a big role in how Alzheimer's disease develops. When Aβ plaques and neurofibrillary tangles build up, immune cells such as microglia and macrophages are activated. This leads to an inflammatory reaction. The inflammatory reaction causes more cell damage in the brain and might make Alzheimer's disease progress faster. Free radicals are unstable chemicals that hurt cells. This is called oxidative stress (10)It is a disease that can happen to someone. There is proof that people with Alzheimer's disease have more oxidative stress in their brains. Free radicals can do a lot of damage to important parts of cells, like DNA, proteins, and lipids. Damage like this can make neurons less effective and, over time, kill cells).(11) This oxidative stress also contributes to the production and buildup of amyloid beta and the abnormal phosphorylation of tau protein, both of which can speed up the development of Alzheimer's disease.

Neuronal damage and synaptic dysfunction: Deciphering the Consequences of Pathological Changes

As Alzheimer's gets worse, brain cells and synapses become less healthy and less able to work. Understanding how synapses work is important for how information gets sent between neurons, which is a key part of how our brains work. The buildup of Aβ plaques and neurofibrillary tangles, along with neuroinflammation and oxidative stress, can make it hard for neurons to talk to each other and for synapses to work properly.(12) The main signs of Alzheimer's disease are forgetfulness and trouble learning new things. Nerve growth factor and other important external signalling molecules are out of balance in people with Alzheimer's disease. This balance is very important for neurons to live and grow back, as well as for making and keeping synapses. (13)Any problem with this process can speed up nerve damage and loss of function.

MECHANISM AND THEIR TREATMENT APPROACHES OF ALZHIMERS DISEASE

Alzheimer's disease is a complex neurodegenerative disorder characterized by a multifaceted pathology involving neuroinflammation and oxidative stress. These two interrelated mechanisms play a crucial role in the development and progression of the disease, leading to neuronal dysfunction and eventual cognitive decline. Understanding the intricate relationship between neuroinflammation and oxidative stress is essential for developing effective therapeutic interventions and improving patient outcomes as mentioned in table 1, 2 and 3.(14)

CHALLENGES IN EXISTING TREATMENTS OF ALZHEIMER'S DISEASE:

Alzheimer's disease (AD) is a complicated neurological condition that presents numerous difficulties for caretakers and researchers alike.(28) Even while our understanding of the disease's cellular and molecular causes has advanced significantly, we still lack effective treatments to stop the disease's progression and their challenges in existing treatment shown in figure 3.(29) The lack of trustworthy biomarkers makes it difficult to diagnose AD, which is one of the main obstacles in the area. Furthermore, the majority of treatment strategies focus on amyloid-beta plaques and have produced unsatisfactory outcomes.(30) A rising body of research suggests that future treatments for AD should take into account repurposing already-approved medications to target a variety of disease processes and as mentioned in table 4 and 5.(31)

Challenges of approved medications: (35)

Donepezil

Elevated levels can occur in individuals with liver dysfunction, those who metabolize CYP2D6 slowly, and in those taking concurrent inhibitors of CYP2D6 or CYP3A4, such as sertraline.

Galantamine

Levels may rise in individuals with hepatic and renal impairment, as well as in those who metabolize CYP2D6 slowly.

Memantine

The Canadian package label suggests regular eye examinations because of the potential deterioration of corneal disease. Reduction in clearance occurs with alkaline urine and impairment of liver and renal functions.

Rivastigmine

Concurrent use with β blocker therapy should be avoided. Clearance rates are heightened among smokers and diminished in instances of liver and moderate renal impairment. However, in cases of severe renal impairment, clearance rates are elevated.(42)

CONCLUSION

Undoubtedly, it's evident that there's a clear necessity for enhanced drug therapies to combat Alzheimer's disease (AD). The exploration of novel symptomatic treatments holds profound importance due to the incapacitating nature of these symptoms for patients. While significant strides have been made in understanding the disease, effective interventions targeting its underlying mechanisms remain elusive. The progress has been made in slowing disease progression and managing symptoms, the quest for a definitive cure persists. The evolving landscape of Alzheimer's research underscores the importance of continued exploration, innovation, and collaborative efforts to ultimately enhance the quality of life for individuals affected by this devastating condition. Moving forward, continued research, collaboration, and innovation will be vital in advancing treatment modalities and ultimately improving outcomes for individuals affected by Alzheimer's disease.

Table 1: Mechanism of the Alzheimer's disease

Pathway	Mechanism	Impact on Alzheimer's
Neuroinflammation	Chronic activation of the immune system in the brain, leading to the release of pro-inflammatory cytokines and mediators.	Neuronal damage, synaptic dysfunction, and cognitive impairment. Exacerbates the formation of amyloid-beta plaques and neurofibrillary tangles. (14)
Oxidative Stress	Imbalance between the production of ROS and the body's antioxidant defense mechanisms.	Causes oxidative damage to cellular components which, leads to neuronal dysfunction and death. Impairs mitochondrial function and energy metabolism. (15)(16)
Amyloid-beta Accumulation	Aggregation and deposition of amyloid-beta peptides in the brain, forming insoluble plaques.	Initiates a cascade of events including synaptic dysfunction, neuroinflammation, and oxidative stress, ultimately contributing to neurodegeneration.
Tau Hyperphosphorylation	Abnormal hyperphosphorylation of the tau protein, leading to the formation of neurofibrillary tangles. (17)	Disrupts the normal function of tau, causing microtubule destabilization and neuronal dysfunction.(18)

Table 2: Different stages of mechanism of AD(19)

Early stage	Intermediate stage	Late stage
• In the early stages of Alzheimer's disease, neuroinflammation and oxidative stress begin to manifest, leading to the initial accumulation of amyloid-beta and hyperphosphorylation of tau protein.	• As the disease progresses, the self-perpetuating cycle of neuroinflammation and oxidative stress amplifies, further exacerbating the formation of amyloid-beta plaques and neurofibrillary tangles. This results in widespread neuronal dysfunction and synaptic loss.	• In the late stages of Alzheimer's, the cumulative effects of neuroinflammation, oxidative stress, and the accumulation of pathological proteins lead to extensive neurodegeneration and profound cognitive impairment. This ultimately culminates in the severe deterioration of the patient's mental and physical capabilities.

Table 3:Treatment Approaches

ABSTRACT

Biometric systems authenticate individuals based on unique physiological or behavioral traits for identification and access control, providing heightened security compared to traditional password- based methods. Automatic fingerprint recognition is widely employed for its reliability and uniqueness, yet fingerprint classification remains challenging in large- scale recognition systems due to variability, noise, and ambiguity. This paper presents a deep learning approach to fingerprint classification, utilizing the VGG16 model for feature extraction and classification. By employing precise algorithms, our method accelerates identification by reducing the number of comparisons needed during fingerprint retrieval. Our framework, tested on the FVC2004 DB1 database, demonstrates significant advancements in accuracy, highlighting deep learning's efficacy in enhancing biometric identification systems.

Keywords: Fingerprint categorization, neural networks, VGG16 model, structure, identification, distinct, deep neural networks (DNN).

INTRODUCTION

In recent years, the concept of personal identity has become increasingly crucial, prompting the widespread adoption of biometrics as a preferred method of authentication. Biometrics is hailed as the most secure and robust means of authentication, surpassing traditional methods such as passwords [8]. These systems employ advanced technologies to uniquely and efficiently identify individuals, presenting a viable alternative to conventional password-based

Prateek Nahar *et al.,*

approaches. A study reveals that users are opting for smartphone biometrics as a substitute for passwords due to its enhanced security features tailored for modern technologies. Biometrics operates as an automated validation method relying on physical or behavioral characteristics, including fingerprints, voice, face, iris, speaker recognition, keystroke dynamics, and signature verification [1]. Among these, fingerprint recognition stands out as a prominent biometric technology, renowned for its permanence and uniqueness in identity verification. Its applications range from access control with a limited user base to large-scale database searches for criminal investigations [2]. Fingerprint recognition techniques, particularly fingerprint minutiae-based methods, outperform traditional fingerprint pattern-based approaches by representing each fingerprint as feature vectors. These vectors efficiently filter through vast fingerprint databases to identify a match using automated matching algorithms. The success of a fingerprint recognition system hinges on its precision and efficiency, demanding discriminative and compact features. Most algorithms rely on minutiae's local structures for their discriminatory power and robustness. Recent research endeavors have delved into exploring the edges' structure to enhance recognition performance, primarily due to limitations encountered by minutiae-based algorithms in small areas containing few minutiae. This paper explores representing the structure of fingerprint edges using Deep Neural Networks (DNNs). DNNs excel in learning complex, high-dimensional, nonlinear mappings from extensive datasets, thereby ensuring the extracted features remain somewhat invariant to nonlinear distortions [3].

LITERATURE SURVEY

Conventional methods for finger-vein recognition rely on the extraction of vein patterns from input images or the enhancement of these images to extract surface features. However, inaccuracies in detecting these vein patterns can significantly undermine recognition accuracy. Moreover, selecting the optimal filter for surface feature extraction poses a considerable challenge due to the diverse characteristics inherent in different image databases. To tackle these issues effectively, this study proposes a novel finger-vein recognition approach based on convolutional neural networks (CNNs), designed to exhibit robustness across various database types and environmental conditions Through rigorous experimentation utilizing both proprietary finger-vein databases and the widely used SDUMLA-HMT finger-vein database, the proposed method showcases superior performance when compared to traditional techniques [4]. Furthermore, another significant endeavor investigates the impact of convolutional network depth on accuracy within the realm of large-scale image recognition. This study meticulously evaluates networks of increasing depth using architectures featuring small (3×3) convolution channels. Intriguingly, the findings reveal that substantial enhancements over existing configurations can be achieved by elevating the depth to 16–19 weight layers. Additionally, the study demonstrates the robust generalization capabilities of their representations across diverse datasets, thereby achieving state-of-the-art results. Notably, to foster further advancements in leveraging deep visual representations within computer vision, the authors have made two highly effective ConvNet models openly accessible [5]. Moreover, this paper introduces a groundbreaking framework termed collaborative and context-aware visual query answering (C2VQA) aimed at seamlessly integrating multi-modal data streams. This framework is intricately designed to address the specific challenges inherent in biometrics forensic integration (BFI), leveraging methodologies akin to Show and Tell models. By extending the principles of Visual Query Answering (VQA) and the Visual Turing Test (VTT), C2VQA bridges deep semantic analysis and joint embedding using sophisticated deep learning techniques. Its repertoire includes utilizing vector space as skip-grams and leveraging long-term dependencies via gated recurrent networks for context prediction. Furthermore, employing multi- task learning, including conformal prediction, enables enhanced control and meta-reasoning. Most notably, C2VQA adopts an interactive dialogue approach to rectify misinformation and uncertainty, thereby adeptly handling realistic VQA challenges prevalent in open-ended scenarios [6].

Prateek Nahar *et al.,*

Our Approach

OVERVIEW OF METHODOLOGY

Convolutional neural networks (CNNs) have emerged as powerful tools for image processing and object classification, particularly since 2012 when they began outperforming other machine learning techniques across various datasets. This success prompted the decision to construct a deep learning-based classifier. Given the limited availability of data to train the system from scratch, we employed several workaround strategies to develop robust classifiers. The macro-architecture of VGG16 can be seen in Figure 1. The name "VGG" originates from the Visual Geometry Group at Oxford University. Their seminal work emphasized the significance of network depth in the advancement of CNNs for image classification, advocating for the use of even relatively small 3x3 convolution filters. The VGG16 architecture comprises five blocks of convolutional layers: the first two blocks consist of 2 layers each, while the last three consist of three layers each. Each block is followed by a max-pooling layer of size 2x2, down sampling the input four times post-pooling. Subsequent to the fifth convolutional block, two fully- connected layers with 4096 neurons each are present, followed by a final fully- connected layer with 1000 neurons. ReLU activation is applied to neurons in each hidden layer, while Softmax activation is

employed for neurons in the last fully- connected layer.

Datasets and Implementation

The process described involves preparing a dataset for training and testing a Deep Neural Network (DNN), specifically the VGG16 model, for finger image classification. Here's a breakdown of the steps taken:

Data Collection and Organization

A set of 10 distinct finger images, representing the digits 0 through 9, was gathered. Each finger class comprises 8 unique images of the same finger, each exhibiting different impressions or variations. These images were then resized to a standardized dimension of 150x150 pixels to ensure uniformity in the dataset.

Data Augmentation

To augment the dataset and introduce variability, each of the 8 images within a class was duplicated. This resulted in a total of 480 images per class, multiplying the initial 8 images by 60 times (8 * 60 = 480).

Dataset Composition

The final dataset consists of 4800 images in total, with each finger class containing 480 images.
Out of these, 3840 images were allocated for training the DNN (VGG16 model), while the remaining 960 images were reserved for testing purposes.

Training and Testing Split

The dataset was divided into two subsets: a training set and a testing set. The training set, comprising 3840 images, was used to train the DNN, enabling it to learn the patterns and features necessary for finger image classification. The testing set, consisting of 960 images, was kept separate and used to evaluate the performance of the trained model.

Visualization

Figure 2 in the document likely illustrates a subset of images from the prepared dataset, showcasing examples of finger images belonging to different classes. These visualizations provide a glimpse into the diversity and variability present within the dataset, highlighting the different impressions and variations of each finger across the classes. Overall, this rigorous dataset preparation process ensures that the trained DNN model is exposed to a diverse range of finger images, facilitating robust learning and accurate classification of finger images based on their respective classes.

Working model of VGG16 for image classification
The VGG16 network architecture is widely used for image classification tasks and consists of multiple layers designed to process input images and produce classification results. Here's a detailed explanation of how the VGG16 model works:

Layer Architecture Overview
The VGG16 architecture, as depicted in Figure 3, comprises several layers organized in a sequential manner, resembling a multilayer feedforward process.
The input image is fed into the network, and it traverses through each layer successively until it reaches the output layer, where the final classification result is obtained.

Convolutional Layers and Down- Sampling
At the initial layer, VGG16 employs 3x3 convolutional filters with a stride of 2 to down-sample the input by a factor of two, similar to the effect of a pooling layer. This down-sampling operation reduces the spatial dimensions of the input while extracting relevant features. Following the initial layer, there are three consecutive blocks of convolutional layers before another down-sampling operation is performed using a similar convolutional layer without pooling. This pattern of down-sampling followed by convolutional layers continues for several layers deep within the network.

Final Layer and Classification
The final layer of the VGG16 network architecture is a global average pooling layer, which generates one thousand feature maps (for ImageNet datasets) and averages them to obtain a final output. The resulting output is a one-thousand- dimensional vector representing the likelihood scores for each class in the classification task. This vector is then fed into a softmax layer, which applies the softmax function to produce probability scores indicating the likelihood of the input image belonging to each class. The class with the highest probability score is selected as the predicted class for the input image.

Activation Function
Throughout the convolutional layers, the rectified linear unit (ReLU) activation function is used. ReLU introduces non-linearity into the network, enabling it to learn complex patterns and features from the input images.
$$f(y) = \max(y, 0)$$
In summary, the VGG16 architecture effectively processes input images through convolutional and pooling layers, extracting features and performing down- sampling operations to facilitate accurate image classification. The final classification result is obtained by passing the output through a softmax layer, with ReLU activation functions used for non- linear transformations within the network.

Experiments
In this section, we delve into the details of the datasets utilized in our analyses and outline the key aspects of our methodology. We begin by introducing the datasets employed and elucidate the rationale behind our chosen approach. Subsequently, we explore various metrics for evaluating performance and discuss different data preprocessing techniques. Finally, we conduct a comparative analysis with state- of-the-art methods and present our findings. Our approach involves leveraging Transfer Learning, a technique that entails borrowing knowledge acquired from a pre- trained network designed for image classification tasks. Specifically, we utilized the VGG16 network, which was originally trained on the FVC2004 dataset. This network exhibited strong performance, making it a suitable foundation for our classifiers. Additionally, we partitioned the FVC2004 dataset, comprising 4800 images, into distinct classes to facilitate classification tasks. The model training process can be divided into two main stages: feature extraction and model fine-tuning. During feature extraction, the VGG16 network is utilized to extract relevant features from the input images. Subsequently, the model is fine- tuned to adapt its parameters to the specific characteristics of our dataset. The proposed method employs 4800 images, each sized 150x150 pixels, for training. The total number of parameters involved in the training process, computed layer by layer, amounts to 15,781,194. Details

regarding the number of parameters and the output shape of each convolutional layer are presented in Table 1 for reference. By employing Transfer Learning with the VGG16 network and meticulously training our model, we aim to achieve superior classification performance and contribute to the advancement of image processing techniques.

Efficiency evaluation

The computational efficiency of feature extraction is assessed by implementing the proposed methodology using Python programming language with Tensorflow. This involves utilizing Python and Tensorflow to execute the feature extraction process efficiently, allowing for a thorough evaluation of the method's performance in terms of computational speed and resource utilization.

CONCLUSION

This paper utilizes the VGG16 framework as a foundational architecture to develop deep neural models for novel finger impression verification. Two key figures, Figure 4 and Figure 5, are presented to illustrate the training and testing performance of the VGG16 model. This figure depicts the accuracy of the VGG16 model during the training and testing phases. It provides insights into how well the model performs on both the training data (used for training the model) and the testing data (used for evaluating the model's generalization to unseen data). By comparing the training and testing accuracies, researchers can assess the model's ability to learn from the training data and make accurate predictions on new, unseen data. Figure 5 illustrates the loss (error) incurred by the VGG16 model during the training and testing phases. The loss metric quantifies the difference between the predicted outputs of the model and the actual labels in the dataset. A lower loss indicates better performance, as it suggests that the model's predictions are closer to the ground truth labels. By monitoring the training and testing loss over epochs,

researchers can evaluate the model's convergence and generalization ability.

Additional Insights

In this task, the authors note that no additional modification beyond adjusting the input image sizes was necessary. This suggests that the VGG16 framework, with its robust architecture, is capable of accommodating changes in input data without requiring extensive modifications to the model architecture. Moreover, the authors highlight the potential of utilizing powerful neural networks like VGG16 in broader authentication and verification efforts. They suggest that as deep neural networks continue to evolve, improvements in training speed, performance, and model flexibility can significantly enhance their applicability in image verification tasks and other domains. In summary, this paper demonstrates the effectiveness of the VGG16 framework for finger impression verification tasks and underscores the broader potential of deep neural networks in authentication and verification applications.

FUTURE WORK

The proposed strategy for fingerprint verification offers potential for extending to latent fingerprints, addressing challenges in forensic science. Leveraging partial fingerprint images and noise simulation enhances the model's ability to handle noisy data. Adapting the model to latent prints involves training on diverse datasets to extract relevant features despite noise and partial visibility. Further improvements can be achieved by exploring advanced neural network architectures like ResNet, DenseNet, or EfficientNet. Additionally, integrating specialized fingerprint recognition algorithms such as minutiae- based matching or ridge-based methods can enhance accuracy. Overall, extending the strategy to latent fingerprints promises to enhance forensic identification capabilities through improved accuracy and versatility.

ABSTRACT

In recent years, mental health issues have become a widespread concern, with many individuals experiencing the adverse effects of stress and burnout in their daily lives. The media and social networks have played a vital role in raising awareness and highlighting the impact of mental health issues on society. Despite the long-standing attention given to mental health, the priorities and resources dedicated to this issue have been worryingly low due to several concerns such as the cost of seeking medical consultation and trustworthiness of the medical professionals. Online platforms and discussion forums have emerged as a viable alternative to traditional medical consultation, providing guidance and support to those suffering from mental health issues. However, the usability and user experience of these online platforms are critical factors that determine user satisfaction and, ultimately, their effectiveness in promoting recovery. This study aims to investigate the impact of usability and user experience design on user satisfaction and identify ways to improve these factors. The study uses usability testing and heuristic evaluation as the primary methodologies to achieve these objectives.

Keywords: Usability, User Experience Design, Online Platforms, User Satisfaction, Heuristic Evaluation, Usability Testing

INTRODUCTION

The COVID-19 pandemic has had a significant impact on mental health. While early concerns about the virus focused on respiratory failure, new data suggests that the pandemic's effects are more widespread. Public health measures taken to curb the spread of COVID-19 disrupted daily life for many people around the world, leading to increased psychological difficulties. However, access to evidence-based therapies is limited, with only a small percentage of individuals with mental health issues having access to effective treatments. (Knapp and Wong, 2020). Despite the growing need for mental health support, the effectiveness of technology-driven interventions remains low due to usability concerns. Many mobile health websites are available, but few have undergone usability testing. Simply having a mental health application on a device does not guarantee its usage or efficacy in improving mental health. Collaboration among healthcare providers, technology developers, and mental health experts is vital to address limitations in technology-driven interventions. Online mental health interventions have the potential to provide accessible care to people in rural areas and those who prefer anonymity. However, these interventions face challenges related to usability, effectiveness, accessibility, cost, and availability. Furthermore, evidence suggests that people rarely use mental health applications for extended periods. (Christensen and Griffiths, 2002, Farrell and McKinnon, 2003). This study aims to identify areas of poor user experience in mental health websites and provide recommendations for improvement. One example of an independent mental health website is Psych Central, which is edited and authored by mental health experts. Psych Central has been recognized as one of the 50 Best Websites on the Internet and receives six million unique visitors monthly. Health line acquired Psych Central in 2020. The significance of user-centered and UX design has surged in recent decades, especially with the proliferation of computers in workplaces. UX design revolves around a user's emotions, preferences, perceptions, physical and psychological reactions, behaviours, and achievements before, during, and after engaging with websites or applications. A product's success often hinges on its user experience, a highly subjective, dynamic, and variable aspect. User experience is influenced by three main factors: the system, the user, and the usage context. Usability testing assesses system usability, gathering data and recommendations to enhance interfaces in software development. Usability refers to how easily and efficiently a website or web application can be used by individuals, even without prior internet experience. It aims to ensure that users can navigate and interact with a digital product without frustration. Key usability goals include clear information presentation, intuitive search functions, and adherence to established user mental models. User experience, on the other hand, takes a holistic approaches, considering users' thoughts, emotions, and perceptions throughout their interaction with a product. Improving usability can enhance user comfort while utilizing the site and increase site popularity, benefiting both users and service providers. (McLellan *et al.* 2012)

RELATED WORKS

A systematic approach to usability through testing ensures a better user experience. By observing users, we identify what works and what doesn't, leading to improved interface design. Usability testing is now integral throughout development, particularly for web applications. (Shneiderman and Plaisant, 2005).

Usability in websites

As per ISO standards, Usability encompasses effectiveness, efficiency, and user satisfaction in achieving specific goals. It involves a software product's capacity to be understood, learned, and appealing to users under specific circumstances. In 1993, Nielsen acknowledged the importance of usability, defining it as about learnability, efficiency, memorability, errors, and satisfaction (Nielsen, 1992b). To design useful websites, the first step is understanding the user's needs and characteristics. Web usability has its roots in research on user-centered design and human-computer interaction, and highly usable websites are those that are clear and intuitive to the user. Web design combines graphic design and usability engineering, which have differing ideas about what constitutes a successful user interface. (Lazar.et .al, 2006). An interface should not be created only for aesthetic appeal or for use by

people with disabilities. It would score significantly higher on usability tests if they were created using the three concepts of early attention on users, empirical measurement, and iterative design.

Usability in Mental Health sites

Usability is a critical aspect of human-computer interaction that determines the effectiveness of a user interface. It ensures that the product is user-friendly, efficient, and engaging. In the past, software developers focused on creating programs with the most functionality, but as more features were added, usability became a crucial problem. Poor usability causes the majority of development projects to fail, primarily due to the lack of user involvement and incomplete user needs assessment. Poor usability is a contributing factor to low engagement with mental health applications. A contributing element is the poor 18 usability of mental health applications (Torous *et al.* 2018). For instance, a usability test of four popular mood tracking applications found that more than 50% of individuals with depressive disorders encountered some level of difficulty and took an excessive amount of time to enter their mood as data into the site and eventually retrieve this data (Sarkar et al. 2016). Investigation into user's use of health applications included a nationwide survey. They found that the time needed to enter data (a usability issue) was the main deterrent to using applications, followed by losing interest and learning about hidden charges. (Krebs, P, Duncan, D.T., 2015). Therefore, both producers and users can benefit from good usability in terms of costs, support, competition, quality, training, support, satisfaction, productivity, reduce time, easiness, efficiency, effectiveness, and saving time.

Usability Testing and Evaluation Method

Usability testing is an essential tool for identifying usability issues in a website or product. Choosing the right testing method is crucial to determine a system's usability and pinpoint issues. (Shneiderman and Plaisant, 2005). User experience questionnaires are used to measure the subjective attitude of the user toward the test object (B. Laugwitz et al. 2008). There are different types of testing techniques, inquiry techniques, and inspection techniques, each adhering to a set of activities. Remote usability testing is an effective method used when usability specialists and test subjects are in different locations, offering the benefits of flexibility and cost savings. (Tom,2009). Heuristic evaluation can be used in the early stages of software development, while formal user testing can only be used after interface design has been implemented. SUS is a cross-sectional approach to examine how user profiles affect ratings for items that make use of one such instrument (S. McLellan, 2012). The ten ratings are added up to produce a broad indicator of perceived usability. There are five uplifting and five derogatory statements (A. Bangor *et al*. 2009).

PROPOSED METHODS

Usability tests and Heuristic evolution were adopted for the study. The facilitator, tasks, and participant are the main components in the majority of usability tests. The facilitator assigns tasks, observes behaviour, and provides feedback. Follow-up questions may be asked to gather more information. Usability testing involves real-life tasks for participants and can be either specific or open-ended depending on study objectives and testing type. The testing should involve a realistic user performing tasks created by the facilitator and providing feedback.

Task setup

Users were briefed about the test before conducting the test. Test was conducted in remote manner. The test was conducted with 10 participants between the age 20-40. Tool used for the user testing is 'User brain' an online platform. 'User brain recorder' will automatically starts the screen recording and audio recording. 'User brain manager' was used to analyze and interpret the data which were collected from the questionnaire. Facilitator conducted the test and observed the user's actions on the screen.

User Experience Questionnaire (UEQ)

The user experience questionnaire (UEQ) is a commonly used survey to gauge consumers' subjective opinions about the usability of products. The table below shows 6 scaling factors and their corresponding questionnaires.

System Usability Scale (SUS)

System Usability Scale (SUS) used to assess the usability of a wide range of web-based or technology-based applications in order to enhance them. It comprises a 10-item questionnaire with five possible responses—strongly agrees to strongly disagree—given to respondents. This is used to find out the overall usability level of the system which was taken for the study. This table can be used to gauge whether the application's usability is satisfactory or not.

Heuristic Evaluation

The process of heuristic evaluation involves specialists using general guidelines to assess the usability of user interfaces during independent walkthroughs and indicate problems. According to 10 heuristic principles the expert will inspect the site and give their report in a way to evaluate the user experience of the site. The interviewers' expertise and daily experience allowed them to give technical advice on usability and suggest improvements and provide valuable insights on cutting-edge market strategies.

RESULT ANALYSIS AND INTERPRETATION

Usability test was conducted with 10 participants such as 5 Male and 5 Female users to find out the user experience level of mental health sites. Tests were performed on desktop and mobile phones in asynchronous remote testing method and psych central website with 8 tasks. Test was on psych central website with 8 tasks. Test results were collected from all the participants and concluded the test with the help of theoretical frameworks like UEQ and SUS and feedback from the users. Every user in User testing successfully completed their task and responded to all questionnaire. In 10 participants 5 users were uses similar websites often, 2 of them uses sometimes, 1 user always uses similar websites, 1 user uses rarely and 1 usernever used a similar website.

User experience questionnaire

User Experience Questionnaire has 3 main scales. They are attractiveness, pragmatic quality, and hedonic quality. Pragmatic quality has three sub scales perspicuity, efficiency and dependability Hedonic quality has two sub scales Stimulation and Novelty. The items are scaled from -3 to +3. Thus, -3 represents the most negative answer, 0 a neutral answer, and +3 the most positive answer. According to the data interpretation on UEQ user satisfaction level is good which shows in figure1.

System Usability Scale

All values are scaled here from 0 to 4. Instead of changing the range of potential values from 0 to 40, this changes it to 0 to 100. Anything with a SUS score of 68 or higher wouldbe deemed above average, whereas anything with a score of 68 or lower would be considered below average.

Correlation Test

The strength of a relationship between two variables is measured by Correlation Analysis (CA). Correlation is significant at 0.05 level for all analysis.

According to the data interpretation on SUS user satisfaction level is 70%. According to the table designed by Bangor, the value of all design belongs to the acceptable category which is above 70. The gathered SUS score for this site was 70.5 which was considered too comes under interpretation acceptable. Majority of users feels that the system was easy to use. Users felt very confident while using the site. Most of the visitors feel that they needed to learn a lot of things before they could get going with this site. Visitors don't believe that most people would learn to use this site very quickly. Users thought that they need the support of a technical person to be able to use this system

Interpretation

The interface's usability and user experience are both fair to good. There are several functions and tasks that don't operate correctly or have a few minor problems. Users are generally happy with the UI, even though there are a few small usability issues.

CONCLUSION

According to the usability test and heuristic evolution employed in the study, Psych central's usability and UXD are above average. The interface includes problems with page clutter, inconsistent font sizes, and the usefulness of some buttons, according to data from focus groups and the heuristic evolution study. Users believe that the interface's usability is generally decent even when it has such issues. Users are fairly content with the system. There are so many studies needed on the mental health application and sites. This study has helped in understanding the user experience and the usability of the mental health site reference to psych central.

Table 1: UEQ Scaling Measures

scales	Questionnaires
Attractiveness	How does the product fare with customers?
Perspicuity	Is it simple to become accustomed to the product? How easy is it to utilize the system?
Efficiency	Can users do their duties with minimal effort?
Dependability	Does the user perceive themselves as in charge of the interaction?
Stimulation	Is using the product interesting and inspiring?
Novelty	Does the product exhibit creativity and innovation? Are customers interested in the product?

Table 2: Usability satisfaction level according to SUS

SUS SCORE	Interpretation
<50	Not Acceptable
50-70	Marginal
>70	Acceptable

Table 3: Mean values for the main scales of UEQ

SCALE	MEAN VALUE	INTERPRETATION
Attractiveness	1.016667	Above average
Pragmatic quality	0.941667	Below average
Hedonic quality	0.9375	Above average

Table 4: Mean values for the sub scales of UEQ

SUB SCALE	MEAN VALUE	INTERPRETATION
Attractiveness	1.016667	Above average
Perspicuity	0.75	Below average
Efficiency	1.25	Above average
Dependability	0.825	Below average
Stimulation	0.775	Above average
Novelty	1.1	Good

Table 5: Interpretation of Pearson Correlation Coefficients

Correlation coefficient (r)	Variable 1	Variable 2	Interpretation
0.678	Enjoyable	Efficiency	A high level of site efficiency leads to a more enjoyable user experience.
0.670	Friendly Level	Motivated Feel	A user's motivation to use a site increases when the site is perceived as user-friendly and easy to use.
.760	Understand ability	Efficiency Level	When the site is easy to understand, visitors find it efficient to use.
0.635	Efficiency Level	Secure Feel	Visitors perceive a site as efficient when it is secure
0.638	Organized Feel	Innovative Level	A well-organized site tends to be more innovative, while a disorganized site is often less innovative
-0.924	Expectation Meet Level	Boring Level	A site that fails to meet user expectations can become boring and lose user engagement
0.730	Expectation Meet Level	Interesting Level	A site is considered interesting to users when it meets their expectations, leading to satisfaction
0.692	Attractiveness	Stimulation	A good level of attractiveness in the site increases its

95096

			stimulation sub-scale, leading to increased motivation and interest for the user.
0.698	Efficiency	Perspicuity	Efficient sites increase the Perspicuity sub scale, making them easy and clear to understand for users

ABSTRACT

In this paper we apply a d-lucky labeling on some special graphs like tadpole graphs, sun graphs, lollipop graphs, friendship graphs and its generalizations. We prove that these graphs admit d-lucky labeling and also find a sharp bound for the d-lucky number for the same.

Keywords: Lucky labeling, d-lucky labeling, Tadpole Graph, Lollipop Graph, Sun Graph, Friendship Graph.

INTRODUCTION

In this paper, we consider all graphs are simple, undirected and connected. Moreover specifically we dealt with some special structured graphs like tadpoles, lollipops, friendship etc. The concept of labeling first introduced by A. Rosa [7] which means assignment of label to the vertices or edges or both subject to the conditions. It has many applications such as scheduling exams, sports, flight schedules etc. The idea of lucky labeling was first proposed by Czerwinski et.al in [2] and elaborates the concept of d-lucky labeling by Indira Rajasingh *et.al* in [1]. In this paper, we obtained sharp bound of d-lucky number for the friendship graph and its generalization, tadpole graph, fan graph is two and also found sharp bound for lollipop graph and sun graph.

d- lucky labeling
Definition 2.1:[1]
Let $l: V(G) \rightarrow N$ is a vertex labeling. If for each pair of incident vertices of u and v, $c(u) \neq c(v)$ holds where

Nilofer and Mohamed Rilwan

$c(u) = d(u) + \sum_{v \in N(u)} l(v)$, $c(v) = d(u) + \sum_{u \in N(v)} l(u)$,

Where d(u) represents the degree of u and $N(u)$ represents the open neighborhood of the vertex u in a graph, then the labeling l is a d-lucky labeling. A graph's d-lucky number is the smallest value of labeling required to label the graph.

Some special classes of graphs with $\eta_{dl}(G) = 2$

Definition 3.1:[4] A tadpole graph $T(p,q)$ is obtained from a cycle C_p and a path P_q by identifying a vertex to C_p to an end vertex of P_q.

Theorem 3.2: For a tadpole graph $T(p,q), p \geq 3, \eta_{dl}(T(p,q)) = 2$

Proof: Label the vertices of $T(p,q)$ as 1 and 2 alternatively, beginning with label 1 from left to right. The case p is even. Since $l(x) = 1$ and each member of $N(x)$ is labeled 2, we have $c(x) = \sum_{y \in N(x)} l(y) + d(x) = 6$. Since $l(y) = 2$ and each member of $N(y)$ is labeled 1, we have $c(y) = \sum_{x \in N(y)} l(x) + d(y) = 4$. Since the last vertex of C_p in $T(p,q)$ is labeled as 1, we have $c(x) = \sum_{y \in N(x)} l(y) + d(x) = 9$. Since label of the last vertex of T(p,q) is 1 or 2, then we have $c(y) = 3\ or\ 2$. Thus $c(x) \neq c(y)$. The case p is odd. Since the first and last vertices of C_p in $T(p,q)$ are labeled 1, we have $c(x) = \sum_{y \in N(x)} l(y) + d(x) = 5, c(y) = \sum_{x \in N(y)} l(x) + d(y) = 8$. Since $l(x) = 1$ and each neighbor vertex of x is labeled 2, we have $c(x) = \sum_{y \in N(x)} l(y) + d(x) = 6$. Since $l(y) = 2$ and each neighbor vertex of y is labeled 1, we have $c(y) = \sum_{x \in N(y)} l(x) + d(y) = 4$. Thus $c(x) \neq c(y)$. It is clear that d-lucky sum of adjacent vertices are distinct. Hence $\eta_{dl}(T(p,q)) = 2$. See figure 1 for d-lucky labeling of tadpole graph $T(6,9)$.

Definition 3.3:[4] A collection of p triangles with a common vertex makes up a friendship graph, it is denoted by f_p.

Theorem 3.4: The d-lucky number of friendship graph f_p is 2.

Proof: Let G be a friendship graph f_p. Label the common vertex 'a' of a graph G as 1 and label all the other vertices of a graph G as 1, 2 alternatively. Since $l(a) = 1$ and each neighbor vertex of x is labeled 1or 2, we have $c(a) = \sum_{y \in N(a)} l(y) + d(a) = 5p$. Since $l(x) = 1$ and each neighbor vertex of x is labeled 2, we have $c(x) = \sum_{y \in N(x)} l(y) + d(x) = 5$. Since $l(y) = 2$ and each neighbor vertex of y is labeled 1, we have $c(y) = \sum_{x \in N(y)} l(x) + d(y) = 4$. It is clear that no two adjacent vertices have the same d-lucky sum. Hence fan graph admits d-lucky labeling and η_{dl} (G) is 2. See figure 2 for d-lucky labeling of friendship graph f_6.

Definition 3.5:[4] The generalized friendship graph $f_{p,q}$ is a collection of p cycles (all of order q) meeting at a common vertex.

Theorem 3.6: For generalized friendship graph $f_{p,q}, \eta_{dl}(f_{p,q}) = 2$.

Proof: Let G be a generalized friendship graph $f_{p,q}$. Label the common vertex 'a' of a graph G as 1 and label all the other vertices of a graph G as 1 and 2 alternatively. If $l(a) = 1$ then we have $c(a) = \sum_{x \in N(a)} l(x) + d(a) = 5p$ When q is odd, $c(a) = 4p$ when q is even. Since $l(x) = 1$ and each neighbor vertex of x is labeled 1 or 2 then we observe that $c(x) = \sum_{y \in N(x)} l(y) + d(x) = 5$. Since $l(x) = 2$ and each neighbor vertex of y is labeled 1, we have $c(x) = \sum_{y \in N(x)} l(y) + d(x) = 4$. It is clear that d-lucky sum of all the vertices in a generalized friendship graph are pair wise distinct. Hence $\eta_{dl}(f_{p,q}) = 2$. See the figure 3 for d-lucky labeling of generalized friendship graph $f_{6,4}$.

Definition 3.7: [4] A fan graph F_k ($n \geq 2$) is obtained from $P_k = V_1 V_2 V_3 \dots V_k$ by joining a vertex u to every vertex of P_k.

Theorem 3.8: For a fan graph $F_k, \eta_{dl}(F_k) = 2$.

Nilofer and Mohamed Rilwan

Proof: Let $G = F_k$ be a fan graph. Label the vertices in G as 1 and 2 alternatively, beginning from the common vertex u. If $l(u) = 1$, by labeling of G the adjacent vertices of x are labeled as 1 and 2 alternatively, then we have $c(u) = \sum_{v\in N(u)} l(v) + d(u) = [5k/2]$ where $d(u) = k$. Consider x_i be the vertices of the path P_k. Since $l(x_1) = 2$ and each member of the open neighborhood $N(x_1)$ is labeled 1, we have $c(x_1) = 4$. For $2 \le i \le k-1$, If $l(x_i) = 1$ and each neighbor vertex of x_i is labeled 1 or 2 then we have $c(x_i) = 8$. Since $l(x_i) = 2$ and each neighbor vertex of x_i is labeled as 1, we have $c(x_i) = 6$. Suppose $l(x_k) = 1$, then we have $c(x_k) = 5$. Suppose $l(x_k) = 2$, we have $c(x_k) = 4$. It is clear that, no two adjacent vertices have the same d- lucky sum. Hence $\eta_{dl}(F_k) = 2$. See the figure 4 for d- lucky labeling of fan graph F_k.

Definition 3.9:[4] A Sun graph S_k is defined as the graph obtained from a cycle C_k by adding a pendant edge to every vertex in the cycle.

Theorem 3.10: For Sun graph S_k, $\eta_{dl}(S_k) = 2$.

Proof: Consider S_k be a sun graph. Assume the vertices in C_k of S_k be x_i and pendent vertex be y_i for $1 \le i \le k$.

Case 1: when k is even. Label the vertices in C_k of S_k as 1, 2 alternatively, starts with 1 from left to right and label the pendent vertices as 1. Since $(x_i) = 1$, each neighbor vertex of x_i is labeled 2 and pendent vertex is labeled 1, then we have $c(x_i) = \sum_{y\in N(x_i)} l(y) + d(x_i) = 8$ where $d(x_i) = 3$. Since $l(x_i) = 2$, each neighbor vertex of x_i is labeled 1 and pendent vertex is labeled 1, then we have $c(x_i) = \sum_{y\in N(x_i)} l(y) + d(x_i) = 6$ where $d(x_i) = 3$. If $l(y_i) = 1$, the adjacent vertex with y_i is labeled as 1 or 2 then we have $c(y_i) = 2$ or 3. Observe that, d- lucky sum of all the vertices in a sun graph are pair wise distinct. Hence $\eta_{dl}(S_k) = 2$ when k is even. See figure 5 for d-lucky labeling of sun graph S_4.

Case 2: when k is odd. Label the vertices in C_k of S_k as 1, 2 alternatively, starts from left to right and label the pendent vertices as 1. Let x_i be the vertex in C_k of S_k, $1 \le i \le k$. Since $l(x_1) = 1$, then we have $c(x_1) = 7$. If $l(x_i) = 1$ then we have $c(x_i) = 8, 2 \le i \le k$. If $l(x_i) = 2$ then we have $c(x_i) = 6, 2 \le i \le k-1$. Consider y_i be the pendent vertices of S_k. If the label of adjacent vertex of y_i is 1, $1 \le i \le k$, then we have $c(y_i) = 2$. If the label of adjacent vertex of y_i is 2, $1 \le i \le k$, then we have $c(y_i) = 3$. It is clear that, d- lucky sum of all the vertices in a sun graph are pair wise distinct. Hence $\eta_{dl}(S_k) = 2$ when k is odd. See figure 6 for d-lucky labeling of sun graph S_5.

Definition 3.11:[4] A lollipop graph $L(n,m)$ is obtained from a K_n and a path P_m by identifying a vertex of K_n to an end vertex of P_m.

Theorem 3.12: For a lollipop graph $L(n,m)$, η_{dl} (L(n,m)) = n-1.

Proof: Label the vertices of K_n in $L(n,m)$ excluding the last vertex of K_n in $L(n,m)$ from 1 to $n-1$ in the anticlockwise direction. Label the last vertex of K_n as 1 which is adjacent with the end vertex of P_m in $L(n,m)$. Let x_i be the vertex in K_n for $1 \le i \le n-1$. Since $l(x_i) = i$, we have $c(x_i) = \sum_{y\in N(x_i)} l(y) + d(x_i) = \frac{n^2+n-2i}{2}$ where $d(x_i) = n-1, for\ 1 \le i \le n-1$. Let x_n be the vertex of K_n. Since $l(x_n) = 1$, then we have $c(x_n) = \sum_{y\in N(x_n)} l(y) + d(x_n) = \frac{n^2+n}{n}$ where $d(x_n) = n$. Label the vertices of P_m in $L(n,m)$ as 1 and 2 alternatively, starts from left to right. Let x_j be the vertex of P_m in $L(n,m)$ where $n+1 \le j \le n+m$. Since $l(x_{n+1}) = 1$ and each neighbor vertex of P_m in $L(n,m)$ is labeled 1 and 2, then we have $c(x_{n+1}) = \sum_{y\in N(x_{n+1})} l(y) + d(x_{n+1}) = 5$ where $d(x_{n+1}) = 2$. If $l(x_j) = 1, n+2 \le j \le$ n+m-1,then we have $c(x_j) = \sum_{y\in N(x_j)} l(y) + d(x_j) = 6$ where $d(x_j) = 2$. If $l(x_j) = 2, n+2 \le j \le$ n+m-1,then we have $c(x_j) = \sum_{y\in N(x_j)} l(y) + d(x) = 4$ where $d(x_j) = 2$. Suppose $l(x_{n+m}) = 1$ and neighbor vertex of x is labeled 2, then we have $c(x_{n+m}) = \sum_{y\in N(x_{n+m})} l(y) + d(x_{n+m}) = 3$ where $d(x_{n+m}) = 1$. suppose $l(x_{n+m}) = 2$ and neighbor vertex of x is labeled 1, then

95100

Nilofer and Mohamed Rilwan

we have $c(x) = \sum_{y \in N(x)} l(y) + d(x) = 2 \, where \, d(x) = 1$. It is clear that d- lucky sum of adjacent vertices are distinct. Hence $\eta_{dl}(L(n,m)) = n - 1$.

CONCLUSION

In this research paper, we found the d-lucky number for the tadpole graph, lollipop graph, friendship graph, generalized friendship graph, sun graph and fan graph. In our next paper, We will give the d-lucky number for some non isomorphic connected graphs.

ABSTRACT

This case report highlights an interesting approach to treating tubal blockage. Tubal disease is responsible for 25-35% of female infertility[1]. Infertility is defined as the inability to conceive within one year of unprotected sexual activity. Approximately 8% to 10% of couples worldwide face infertility issues. The prevalence of infertility in India is about 15-20 million. One in six couples presenting to a health practitioner complains of infertility, and of these, 14% have a tubal factor. Tubal blockage may involve the proximal, distal, transient, or permanent occlusion of the tubes. The present study was carried out to evaluate the role of *Uttarbasti* in treating tubal blockage. In this case report, the patient suffered from tubal blockage, which led to infertility for seven years. For six years, she was on allopathic treatment but did not achieve any results, so she turned to *Ayurvedic* treatment. A detailed history revealed the involvement of vitiated *Kapha* and *Vata Dosha*, along with *Agnimandhya*. In *Ayurveda*, *Uttarbasti* is the ideal *Sthanika Chikitsa* for addressing tubal blockage. The patient was treated with classical *Vamana* followed by *Shamana Chikitsa* for three consecutive cycles, along with two cycles of *Uttarbasti*. After undergoing *Ayurvedic* interventions, including *Uttarbasti* and internal medicines, her post-treatment HSG report showed that both fallopian tubes were patent.

Keywords: Tubal blockage, Infertility, *Uttarabasti*, *Shodhana Karma*, *Shamana Aushadhis*.

INTRODUCTION

The most common causative factor of female infertility is tubal blockage. The causes of female infertility are classified into ovulatory factors, tubal factors, cervical factors, uterine factors, infection factors, and unexplained factors [2]. In *Ayurveda*, several *Acharyas* have compared *Artavavaha Srotas* with the fallopian tubes, including the ovary as well.

95103

Anjum M Mujawar *et al.,*

Sushruta Acharya has described their attachments based on the above-mentioned characteristics of *Artavavaha Srotas*, another description of the fallopian tube can be drawn from its attachment to the extra *Ashaya*, which is the *Garbhashaya* in females, as described by *Sharangadhara Acharya* [3]. According to some authors, the description of *Gavinis* in the *Atharvaveda* is also compared with the fallopian tubes, as evidenced by references in the context of conception. The fallopian tube being a part of the uterus is anatomically accepted as the site of fertilization. *Artavaha Srotas* are responsible for the formation of *Beeja* and for carrying the *Beejaroopa Artava* and injury to this *Srotas* can cause the following three features mentioned by *Sushruta Acharya, Vandhyatwa, Maithuna Asahishnata*, and *Artavanasha* [4]. Hence, the *Kshetra* stated by *Sushruta Acharya* can be considered the *Adhishthana* for the vitiation of the *Doshas*. In *Ayurveda* the understanding of tubal blockage differs significantly from contemporary medicine. The pathogenesis of this condition is defined as the accumulation and vitiation of *Doshas*. Therefore, approaching tubal infertility in *Ayurveda* involves identifying *Vandhyatva* [5] based on *Nidanas* (causes) and *Samprapti* (pathogenesis). *Charaka Acharya* provides a framework for understanding newly diagnosed diseases by considering *Prakriti* (*Doshas*, the root cause), *Adhishthana (Dushya,* the seat), and *Linga (Lakshanas*, the features). In the comprehensive treatment of female infertility, *Uttarabasti*[6] plays a crucial role by exerting both direct local action and systemic effects on the reproductive system. Recognizing the importance of *Uttarabasti*[7] in addressing female infertility, this case report aims to compile evidence-based clinical trials conducted at the Department of *Prasuti Tantra* and *Streeroga*, JSS *Ayurveda* Medical College and Hospital, Mysuru. The objective is to present these trials systematically, shedding light on the efficacy and benefits of *Uttarabasti* in treating tubal blockage.

CASE STUDY
Case Description
Chief complaints
A 32 year old married woman residing in Mandya reported the Prasuti tantra and Stree roga outpatient department (OPD) with the complaints of anxious to conceive even after trying for 7 years of unprotected intercourse with active marital life of 7 years.

History of Present illness
The patient gives the history of 7 years of active marital life and she is anxious to conceive after undergoing spontaneous abortion. As per the patient she conceived soon after 6 months of marriage, but was not able to continue the pregnancy because of spontaneous abortion during her 3rd month of pregnancy. For which she approached gynecologist and she was diagnosed with left tubal blockage and Right tube is patent. For which she underwent treatment but not get satisfactory result. So she approached our hospital for further management.

Family History
Mother has H/O HTN on medication. No any Family history of infertility or other major illness.

History of past illness
K/C/O- PCOS since 1 year, She had no H/O any thyroid dysfunction, diabetes mellitus and hypertension or any other major illness.

Surgical History
Not Significant

Personal History
- Appetite: Good
- Diet: mixed diet,
- Habit: the lady had no any habits.
- Micturition: 4 to 5 times / day
- Bowel: once / day.

Anjum M Mujawar *et al.,*

- Weight: 51 Kg
- BP: 120/80 mmHg

Occupation
Housewife

Married Life
The couple had a married life of 7 years. It was a non – consanguineous marriage.

Menstrual History
- Menarche :13 years
- LMP: 19/2/2022
- Interval: 22-24 days
- Duration of flow during cycles: 2- 3 days (2pads /day)
- Discomfort: No any discomfort.

Obstetric History
Nulliparous- P0 A1 L0 A1- Spontaneous abortion at 3 MOA after 3 Months of marriage.

Contraception History
Not significant

Ashtavidha Pariksha
- *Nadi:- Kaphavataja*, 78b/min
- *Mala*:- once a day
- *Mutra*:- 4-5 times in day time
- *Jivha:- Lipta*
- *Shabda:- Spashta*
- *Sparsha:- Mrudu, Anushna Sheeta*
- *Drik:- Prakruta*
- *Aakruti:- Madhyama.*

Dashavidha Pariksha
- *Prakruti:- Kaphavata*
- *Vikruti:- Kapha vata*
- *Sara:- Madhyama*
- *Samhanana:- Madhyama*
- *Pramana:- Madhyama*
- *Satmya:- Madhyama*
- *Satva:- Madhyama*
- *Aahara shakti:- Abhyavarana- Madhyama Jarana- Hina*
- *Vyayama shakti:- Hina*
- *Vaya:- Madhyama*

General Examination
- BP: 120/70 mmHg
- P.R: 82/min
- R.R: 20/min

- Temperature: Afebrile

Systemic Examination
- Cardiovascular System- S1, S2 heared
- Respiratory System- AEBE and clear
- Nervous System- conscious, well oriented to time, place, person
- Musculoskeletal System- NAD

Gynaecological Examination
- P/S: Cervix normal in position, healthy and no abnormal discharges found, no fouls smell.
- P/V: Uterus normal in size & position, mobile – Anteverted, anteflexed fornices free and no tenderness was present.

Investigation
- USG(2021) - Suggestive of B/L PCOS.
- AMH(11/03/22) - < 0.30 ng/ml.
- TSH (10/03/22) - 5.69 mIU/ml.
- FBS (10/03/22) - 94 mg/dl
- HSG (25/08/2021) - Beaded left tube with patent right tube

Chikitsa given
Present study was a single case study. *Shodhana* followed by *Shamana Chikitsa* was administered. *Shodhana Chikitsa* was done in following manner in the month of APRIL 2022.

Deepana – Pachana was done for five days as the patient had *Ama lakshana.*
1. Tab. *Agnitundi Vati*: 1-1-1   B/F for 5 days
2. Tab. *Chitrakadi Vati*: 1-1-1 B/F for 5 days

Snehapana was started from 5/04/22 to 8/04/22 with *Varunadi Ghrita*. After *Samyak Snigdha Lakshanas* were found, the patient was given **Sarvanga Abhaynaga** with *Mahanarayana Taila* and **Bashpa sweda** for 2 day and posted for *Vamana*. The patient had about 6 *Vegas* and had *Madhyama Shuddhi*. The patient was advised by **Samsarjana Krama** for 5 days. After the completion of *Samsarjana Krama*, she was given oral medications (**Shamana Chikitsa**) as follows:
1. *Mahanarayana Taila Nasya* 2 drops BD B/F alternate week.
2. Tab. *Pushpadhanva rasa* 2 BD A/F with warm water for 1 month.
3. *Sukumara Kashaya* 15ml BD A/F with warm water for 1 month.
4. *Phala sarpi* 30 ml OD B/F for 1 month.

Next follow up the patient visited after completion of her menstrual cycles, she was advised for **Uttarabasti** with **Mahanarayana Taila** for 3 days. *Uttarabasti* was done in the month of MAY 2022 with *Mahanarayana taila* for 3 consecutive days from 10/05/22 to 12/05/22. Adviced oral medications (**Shaman Chikitsa)** as follows:
1. Tab. Septilin 2 BD A/F
2. Tab. Folic acid 1OD A/F
3. Tab. *Pushpadhanva Rasa* 1 TID after food
4. Tab. Ovarin 1TID A/F
5. *Mahanarayana Taila Nasya* 2drops BD B/F

Anjum M Mujawar *et al.,*

Sukumara kashaya 10 ml TID A/F. All the Medications given for 1 month 2nd cycle of **Uttar basti** started from (26/05/2022 to 28/05/2022) with **Mahanarayana Taila.** *Shaman Aushadhis* advised

1. Tab Septilin 2 BD A/F
2. Tab *Pushpadhanva Rasa* 2 OD AF
3. Syp *Sukumara Kashaya* with 1 pinch of *Tankana Bhasma* 15ml BD AF
4. *Phalasarpi* 30ml OD B/F
5. *Mahanarayana Taila Nasya* 2drops BD B/F All medication given for 1 month

RESULT

On 17/06/2022 advised for HSG, on 22/6/22 patient came for follow up with HSG reports HSG report shows both fallopian tubes are normal in size and Normal peritoneal spillage of contrast media seen from both fallopian tubes Normal Hysterosalphingogram.

DISCUSSION

In Ayurveda the tubal blockage is understood as dominance of *Vata* with contributions from *Kapha,* the treatment would aim to pacify these *Doshas* and removes the obstruction. The fallopian tube being the "*Kshetra* for *Garbhadhan*" aligns with *Ayurvedic* principles of conception, where the fallopian tubes play a crucial role in transporting the egg and facilitating fertilization. It's fascinating how *Ayurveda* combines various treatment modalities, including *Shodhana* (purification or detoxification) and *Shamana* (pacification) to restore the health. This integrated approach addresses both the symptoms and the underlying imbalance *Doshas.* In this tubal blockage case, where *Kapha* obstruction is a significant factor, *Vaman* therapy works by eliminating the accumulated *Kapha* from the subtle channels. This clearance facilitates the opening of these channels, thereby alleviating the blockage. Additionally, by addressing the underlying imbalance in the *Doshas, Vaman* helps to pacify the aggravated *Kapha* and *Vata Dosha* as well. It's fascinating how *Vamana* therapy not only targets the physical symptoms but also influences the metabolic process and hormonal balance of the body. The regularization of the menstrual cycle and the boost in metabolism post-*Vamana* therapy are indicative of its holistic impact on the individual's well-being. *Uttara Basti* is a therapeutic procedure involving medicated *Ghrita* directly administration in to the intrauterine route which address issues like narrowing and blockages in the tubes, and gives strength to the internal reproductive organs. The drug use in this case is *Mahanarayan Taila* known for its properties to pacify both *Vata* and *Kapha Doshas* and also helps to alleviate aggravated *Apana Vata, Tila taila* present in the *Mahanarayana Taila* with its *Vyavayi* and *Vikasi* property enters in to the *Sukshma Srotas* and spread easily and pacifies the vitiated *Doshas. Yoni Pichu* with *Mahanarayana Taila* normalizes the vitiated *Vata* and *Kapha.* It also relieves the inflammation in the tubes with its *Shothahara* property. These formulations possess properties such as *Lekhaniya* (scraping) and *Vata-Kapha Shamaka* (balancing), which helps to remove blockage and restore the tubal functions.

CONCLUSION

Acharya Sushrutha has explained about *Garbhasambhava Samagri* i.e. *Rutu, Kshetra, Ambu, Beeja.* In this case report, *Kshetra* is affected as the fallopian tubes. The Doshas involvement in the tubal blockage is *Vata* and *Kapha. Sankocha* of the tubal lumen is caused by *Vata dosha* resulting in the narrowing of the tubes, and *Avarodha* of the lumen by *Kapha Dosha* resulting in the tubal blockage. *Shodhana* is the vital step in *Ayurvedic* management, *Vamana* helps in purifying the body, and due to its *Vyavayi, Vikasi, Ushna, Tikshna, Sukshma Guna* it removes the vitiated *Kapha Dosha.* *Uttara Basti* helps the medicated *Sneha* to reach the tubes and act on the narrowing and blockage directly. *Mahanarayan Taila,* with its *Vata* and *Kapha Hara* property, alleviates the aggravated *Apana Vata,* which is believed to be the root cause of *Yonivyapad. Tila Taila* present in *Mahanarayan Taila,* with its *Vyavayi* and *Vikasi* property, enters the minute channels and spreads easily which is result in the clearance of blockage.

ABSTRACT

Attention-Deficit Hyperactivity Disorder (ADHD) is a neuro developmental condition in children, characterized by symptoms such as inattention, hyperactivity, and impulsivity. These behaviours can lead to challenges in academic achievement, social interactions, and emotional well-being. Traditional treatments for ADHD often involve behavioural therapy and psycho stimulant medications, which can have side effects like irritability, sleep disturbances, and growth issues. Alternatively, Ayurveda offers different treatment approaches. Among these, *Mahapaishachika Ghrita* and *Shiropichu* with *Balaashwagandhalakshadi Taila* are being explored as potential remedies for ADHD. *Mahapaishachika Ghrita* is believed to reduce hyperactivity and increases attention span, supporting cognitive function, while *Shiropichu* may help promote mental balance and reduce hyperactivity. This study aims to evaluate the effectiveness of these Ayurveda treatments in managing the symptoms of ADHD. The present clinical trial is Planned to be conducted among 30 children aged between 3to 15years for a period of 6 weeks who have been diagnosed with ADHD and recruited from various centres in and around mysore, Karnataka. The effectiveness of the treatment will be evaluated using clinical features of unmada, *Ashtavibrama*( ) and standardized ADHD rating scale(SWAN rating scale) before, after treatment and after follow up The observations will be analysed based on the changes in the subjective and objective parameters used for assessing as described above will be evaluated by using appropriate statistical methods. The findings of the current study could offer a alternative and comprehensive approach to

95110

managing ADHD, fostering cognitive development, reduction in hyperactivity and overall growth with minimal side effects.

Keywords: Attention-deficit hyperactivity disorder (ADHD), *Unmada, Mahapaishachika Ghrita, Shiro-Pichu*

INTRODUCTION

Attention-Deficit Hyperactivity Disorder (ADHD) is the most common neurobehavioral disorder in childhood, and it is one of the most widespread chronic health conditions affecting school-aged children(1) In India, the prevalence of ADHD is reported to be around 11%, with higher rates observed in lower socio-economic groups(2). As per the studies in the year between 2009 and 2019, the prevalence of ADHD among children and adolescents ranges from 7.6% to 15%, with males experiencing higher rates (9.4%) compared to females (5.2%). The peak prevalence in males is seen between ages of 8-15year, while in females around 7-15 years(3). A study in Mysore conducted in 2014 found an overall ADHD prevalence of 14.4%, with subtypes including Inattentive (4.1%), Impulsive/Hyperactive (3.4%), and Combined (6.9%)(4). ADHD is characterized by symptoms of inattention, poor impulse control, and hyperactivity. Children with ADHD often face challenges such as academic underachievement, difficulty in forming relationships with family members and peers, also with low self-esteem(5). Although the precise cause of ADHD remains unknown, several factors are believed to contribute to its development. These factors include family history, as the disorder tends to run in families, and environmental exposures to toxins, such as lead or other heavy metals, which can negatively impact brain development. Developmental factors, including low birth weight, premature birth, or maternal exposure to toxins (such as alcohol, tobacco), or stress during pregnancy, may increase the risk of developing ADHD(6). In contemporary medicine, behavioural therapy, occupational therapy are commonly used as the first line of treatment for ADHD in school-aged children. These therapies are often combined with psycho-stimulant medications, which are designed to enhance the release and inhibit the reuptake of dopamine. This helps to improve attention span, concentration, and control impulsivity. However, psycho-stimulant medications do not contribute to academic performance and are associated with side effects such as sleep disturbances, irritability, growth inhibition(7,8) In Ayurveda, although there are no direct references of Attention-Deficit/Hyperactivity Disorder (ADHD), certain abnormal behavioral patterns are discussed under the concept of *Unmada*. Given the nature of the symptoms, ADHD can be correlated with *Unmada*, which is considered a disorder of the *Manovaha Srota* (mental channels) and is characterized by an imbalance of the *Raja* and *Tama* guna. In the *Vedana Adyaya, Acharya Kashyapa* describes symptoms of *Unmada* such as *Pralapa* (incoherent speech), *Vaichintya* (excessive thinking), and *Arati* (distress)(9). These disturbances lead to the vitiation of *Dhee* (intellect), *Dhriti* (courage), and *Smriti* (memory), contributing to abnormal behaviors like inattention, hyperactivity, and impulsivity.

The underlying cause of this condition is believed to be a disturbance in the *Vatadosha*, which impairs the integration of *Sharirika* (physical) and *Manasika* (mental) *dosha*. Therefore, treatment focuses on normalizing *Vata*, promoting *Brimhana* (nourishment) for the senses, and using *Medhya* (intelligence-enhancing) therapies(10). *Charak* recommends *Mahapaishachika Ghrita* for managing *Unmada*. It is believed to improve cognitive functions such as *Buddhi* (intellect), *Smrithi* (memory), and *Medha* (wisdom), and it is also beneficial for *Anga Vardhana* (growth and development) (11). *Ashta Vibhrama* refers to the eight forms of mental disturbances or derangements that can significantly impact an individual's cognitive and behavioral functions. These disturbances manifest in various ways, affecting the faculties of mind (*Manas*), intellect (*Buddhi*), emotions (*Bhakti*), character (*Sheela*), actions (*Cheshta*), and behavior (*Achara*). In conditions like ADHD, these disruptions are evident in the impaired thought processes, emotional responses, and social interactions. Children with ADHD may exhibit difficulties in social engagement, such as hyperactivity, inattention, Cognitive disruptions, such as indecision or improper sensory processing, may lead to a failure in distinguishing right from wrong or an inability to make appropriate choices. The disturbance in *Bhakti* may lead to erratic or excessive interests, while *Sheela Vibhrama* is seen in exaggerated or inappropriate

emotional responses like temper tantrums. *Cheshta Vibhrama* reflects in repetitive and compulsive behaviors, and *AcharaVibhrama* is evident in the inability to follow social norms or ethics, often seen in a lack of awareness of hygiene or improper dressing. Overall, these derangements create a disconnection from reality, social context, and self-awareness, resembling the features of *Unmada* (mental illness), thus playing a central role in the behavioral and cognitive challenges observed in ADHD. *Shiropichu* a form of *MurdhniTaila* therapy, is considered more effective than *Shiro Abhyanga* and less effective than *Shirodhara* and *ShiroBasti(12)*. As *Shirodhara* and *Basti* are less practical for use in children with ADHD as the children are more hyperactive and aggressive which makes it difficult to perform *Shirodhara* and *Shirobasti* in children, this study aims to evaluate the combined efficacy of *Mahapaishachika Ghrita* orally with *Shiropichu* using *Balashwagandalakshadi Taila(13)* in managing ADHD.

OBJECTIVES

The aim of this study is to create and validate a scale for evaluating *Ashta Vibhrama* in children diagnosed with *Unmada* (ADHD), assess the combined effectiveness of *Mahapaishachika Ghrita* orally and *Balashwagandalakshadi Taila Shiropichu* in addressing the clinical symptoms

METHODOLOGY

The study is a prospective, single armclinical trial. This trial has been approved by the Institutional Ethical Committee (JSSAMC/1533/2023-24) and duly registered in clinical trial registry of India (CTRI/2024/07/070527). The children and their parents were thoroughly informed verbally about the trial's objective, the nature of the pharmacological therapy, therapeutic procedures, follow-up, and any complications, as well as through written and informed assent. Patients of either gender, from the In Patient (IP) and Outdoor Patient (OP) department of Kaumarabhritya, JSS Ayurveda Medical College and Hospital, Mysuru, special health camps and other referrals were the source of the sample. The study includes children fulfilling the diagnostic and inclusion criteria which mentioned in table no.1 The study will involve a total sample size of 30 participants in the group, as it is a single-arm study. The participants will be evaluated primarily through the collection of medical, developmental, family, and socio cultural histories. The diagnosis of ADHD will be made according to the criteria outlined in the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), published by the American Psychiatric Association (APA) in 2013. The five criteria for diagnosing ADHD in children will include assessments of inattention, hyperactivity, and impulsivity, using appropriate questionnaires for diagnosis. Additionally, clinical features of *Unmada*, as described in the *Kashyapa Samhitha*, such as *Vaichithya* (mental instability), *Arati* (restlessness), will also be evaluated.

Criteria for assessment
The subjects will be assessed by subjective and objective parameters which are mentioned below;

For Subjective Parameters:
1. Clinical features of *Unmada* such as *Pralapa* (Delerium) and *Arathi* (Restlessness)(9)
   These will be graded as
   Grade 0-absent
   Grade 1- occasionally present
   Grade 2- Present
2. *Ashta Vibhrama*(eight forms of mental disturbances) viz Manas(mind), *Budhi* (intellect), *Samjna, Jnana, Sheela*(character*), Cheshta*(actions)and *Achara (*behavior*)Vibhrama* of *Unmada*gradings will be done

For Objective Parameters:
Scores of SWAN Rating scale (14).

Intervention
The trial drug *Mahapaishachika Ghrita and Balaashwagandhalakshadi Taila* will be procured / prepared from a GMP certified ayurveda pharmaceutical company Details of intervention and trial drug mentioned in table no.2

Follow up
All the patients will be assessed on the 0th day, 29th day and 42nd day, hence total duration of study 6 weeks

Statistical analysis
for Subjective criteria Wilcoxon signed rank or rank sum test and for Objective criteria Student t test and paired t test and appropriate non-parametric statistical test will be applied for analysis of the results.

DISCUSSION

ADHD is a well-established psychiatric condition that primarily impacts a child's ability to perform daily tasks. Individuals with ADHD typically exhibit behaviour such as excessive inattention, impulsivity, and hyperactivity, which are not aligned with their developmental stage (14). Current treatments for ADHD in contemporary medicine primarily include behavioural therapy and occupational therapy. However, these treatments often result in only minimal improvement in hyperactivity. Moreover, the symptoms can worsen significantly if the therapies are abruptly discontinued. This highlights a major drawback in the contemporary approach to treating ADHD. The primary method for addressing *Vata Dosha* typically includes *Snehana, Swedana*, and *Basti* among other therapies. However, this study primarily focuses on the incorporation of *Snehana* therapy for the treatment of ADHD. which includes both external and internal forms (16). In this study, external *Snehana* is administered through *Shiro Pichu* using *Bala Ashwagandha Lakshadi Taila*, while internal *Snehana* is provided with *Mahapaishachika Ghrita* (medicated ghee). *ShiroPichu* is a technique where a cloth or cotton pad is soaked in medicated oil and placed on the scalp, specifically over the Bregma, where rapid absorption at the cellular level is observed. This method is beneficial for strengthening the sensory faculties (*Indriya*).This procedure helps reduce cortisol levels while increasing serotonin production by stimulating melatonin secretion. As a result, it calms the child, promotes quality sleep, decreases hyperactivity, and improves attention span (17). The selected oil, *Bala Ashwagandha Lakshadi Taila*contains *Bala Ashwagandha Laksha* is particularly indicated for conditions like *Unmada*, making it an appropriate choice for this treatment (18)

Mahapaishachika Ghrita contains ingredients such as *Jatamamsi, Haritaki, Vacha*, and *Katuk*i, which are known for their *Ushna* (hot) potency and properties that balance *Vata* and *Kapha*, as well as their ability to purify the channels (*Sroto Shodana*)(19). The therapeutic benefits of *MahaPaishachika Ghrita*, Role of its ingredients in balancing *Vata* and *Kapha*.These properties help clear blockages in the channels, promoting better absorption of medicinal compounds. Additionally, as *Ghrita* is a lipophilic substance, it nourishes neuronal cells by crossing the blood-brain barrier and enhances neuroplasticity in brain cells. It also supports the secretion of dopamine-producing neurotransmitters, which act as mood stabilizers, improve attention span, and reduce hyperactivity. Additionally, the carminative effect of *Ghrita* helps in reducing *Ama* (toxins), a primary contributor to disease, and enhances the bioavailability of the medication, supporting overall therapeutic efficacy. The mode of action of *Shiropichu* in the treatment of *Unmada* (psychological disorders) can be understood through both local and systemic effects. Local effects involve the absorption of medicinal oils via the transdermal route, which depends on factors such as the type of oil, concentration, contact duration, and skin condition. Specifically, the scalp, due to its thinner skin, absorbs the oil more quickly, leading to enhanced absorption and therapeutic effects. The oil's components, including its ability to penetrate the skin and reach the blood vessels, help in improving circulation, particularly cerebral circulation, which is vital during times of stress. This local treatment directly impacts the psychological state by alleviating symptoms hyperactivity and inattention by stimulating the neurotransmitters like dopamine and serotonin, which are often caused by prolonged muscular contractions(20). Systemically, *Shiropichu* effect on the central nervous system (CNS) is linked to cellular absorption and circulation. The medicinal oil's properties,

including *Tikshana* (penetrating), *Vyavayi* (spreading), and *Sukshma* (subtle), enable it to quickly reach the *Manovaha Srotas* (mental channels) and influence the *Manasdosha* (mental imbalances), particularly *Raja* (passion) and *Tama* (inertia). As the oil interacts with these mental channels, it balances and corrects *Manasikavikaras* (mental disorders) through its *Bhrimhana* (nourishing), *Balya* (strengthening), *Vatashamana* (calming Vata), and *Medhya* (intelligence-enhancing) properties. Furthermore, Shiropichu's action on the *Tarpak Kapha, Sadhak Pitta*, and *Pran Vayu* helps regulate the mind-body balance, thus reducing symptoms of psychological distress, The therapeutic properties of the oil enable it to correct the vitiation of the mind and promote mental clarity and stability, making it an effective treatment for *Unmada.* Hence based upon above references the following study has been designed to understand the role of combined effect of *Shiro pichu* with *Bala Ashwagandha Laskhadi Taila* and intake of *Mahapaishachika Ghirta* in ADHD.

CONCLUSION

The primary objectives of the proposed clinical trial is to improve the child's functional independence and quality of life by alleviating the core symptoms of the disorder. Due to the nature of ADHD and its associated comorbidities, long-term treatment is often necessary, with gradual improvements observed after each course of therapy. Ongoing scientific research is required to further define *Ayurveda* role in managing these conditions.

ABSTRACT

Cervical Spondylosis is a degenerative disorder of the Cervical Spine, resulting in neck pain, stiffness, and limited mobility. The symptoms of Cervical Spondylosis can be clinically correlated with *Sagana Vatham* by Siddha point of view. To assess the effectiveness of non-invasive management of *Sakana Vatham* (Cervical Spondylosis) using Siddha *Varmam* manipulation and *Veera Poochu* (anointing). A 44 years old, male patient presented with complaints of chronic neck pain, stiffness, radiating pain and limited range of motion was reported on Ayothidoss Pandithar Hospital (Dept. of *Varma Maruthuvam*), National Institute of Siddha, Chennai. He was diagnosed as cervical Spondylosis. It was diagnosed by his symptoms, clinical examination, X-RAY finding and neck disability index score (NDI). He was administered for *Varmam* therapy consisting of manipulation of specific *Varma* points and external application of *Veera poochu*. The patient received two sessions per week for 48 Days (On 1st and 4th day of week). After Completion of seven weeks of the treatment, the patient got symptomatic relief and improved day to day activity, patient's neck pain and disability index score improved from pain score 22 to 17 and better recovery in radiating pain and range of motion. The observations infer that *Varmam* manipulation and external application of *Veera poochu* has significant benefits treatment for managing

95117

Sagana Vatham (Cervical Spondylosis). Further research is needed to determine the efficacy and safety of *Varmam* treatment in broader populations.

Keywords: Anointing, Cervical Spondylosis, Neck Disability Index Score, *Sagana Vatham*, Siddha, *Veera Poochu*

INTRODUCTION

Cervical Spondylosis (CS) is a wide-ranging term used to describe the degeneration of discs that occurs with age, affecting the cervical vertebral bone, facet joints, and other surrounding joints and their supporting soft tissues. This degeneration leads to more strain on the cervical spinal column, causing the formation of bony growths (osteophytes) and other degenerative alterations in the surrounding tissues include the facet joints, the posterior longitudinal ligament (PLL), and the ligamentum flavum [1]. The typical symptoms include individuals experiencing neck pain, which may also radiate to the arm. There is widespread tenderness in the neck area, and there is a restriction in all types of movements. Neurological symptoms are usually observed in one or two specific spinal nerve roots [2]. The levels most often impacted are C6-C7, with C5-C6 coming in second. Cervical Spondylosis that causes symptoms typically shows up as pain in the neck. In the overall population, the rate of neck pain at any given time can be anywhere from 0.4% to 41.5%, with the rate of new cases over a year varying from 4.8% to 79.5%, and the likelihood of experiencing it throughout life could be as great as 86.8%. According to the Global Burden of Disease 2015 study, low back and neck pain is the leading cause of years lived with disability (YLD) and the fourth highest cause of disability-adjusted life years (DALYs) [3-5]. According to the Siddha Medicine, *Sagana Vatham* is one of the *Vaatha* diseases mentioned by *SiddharYugi Munivar* in his *Yugi Vaithiya chinthamani*. The *Sagana Vatham* signs and symptoms can be clinically correlated with the Cervical Spondylosis [6]. *Varmam* represents a distinctive method of healing in Siddha medicine that targets specific energy centres, known as *Varmam* points, to enhance overall health and well-being. Through the application of accurate force at these specific anatomical locations, practitioners seek to encourage healing and equilibrium. What sets *Varmam* apart is its remarkable success in addressing a variety of health conditions, especially those related to the musculoskeletal and nervous systems. It is believed that the *Vaasi* energy is stored and activated at certain *Varmam* sites, and that it is essential to the body's normal functions. The precise activation of these points (*Mathirai Alavu* (pressure) – 1/4,1/2,3/4,1 *mathirai*) is believed to support the treatment of various ailments. People who have a deep grasp of applying *Varmam* consistently, through the examination of *Vatham, Pitham, Kabam*, are considered capable of effectively treating diseases [7]. *Poochu* is one among 32 types of external therapies. *Poochu* is called as liquid poultice or anointing. It is defined as the topical application of medicated oil or herbal juices, decoctions after warming the gently over affected region. It may be also prepared by dissolving the herbal powders or tablets into juices or oil and then used. Generally it is applied slowly on the affected areas and then gently smeared for few minutes or till the heat subsides. This procedure involves the purification, lubrication, local healing, analgesic and anti-inflammatory action. It also removes toxins through skin and dilating all body channels for the cleansing and improving peripheral circulation [8]. This current case report throws light upon the use of *Varmam* Manupulation and *Veera Poochu* in the management of *Sakana Vatham* (Cervical Spondylosis). This case report adheres to the CARE guidelines.

CASE PRESENTATION

A 44 years old married, male patient working as tailor, a non-smoker was consulted in the Outpatient Department (OPD) of *Ayothidoss Pandithar* Hospital (Department of *Varma Maruthuvam*), National Institute of Siddha, Chennai on April 23, 2022. With chief complaints of pain in the neck with stiffness, radiating to the both shoulders and arms and limited range of motion without any neurological deficit, pain aggravating on prolonged sitting, heavy lifting, forward and backward bending since last 1 year. He had no relevant family history of the disease. He has no comorbid illness like hypertension, diabetes mellitus, epilepsy and other illness. The patient was non-vegetarian and

had a good appetite and sleep. Patient had history of using the Allopathic Analgesic drug for managing the pain on and off since last 1 year.

Clinical Findings
The patient was clinically examined shows loss of cervical lordosis. During palpation at cervical spine there was Tenderness over C5- C6 and C6 – C7 Cervical and para spinal region and mild warmth present. Range of movement was examined, it showed deduced and pain while flexion (40°), while extension at 30°, painful and pain radiating to shoulders lateral movements (30°) and painful and restricted rotation (70°). Spurling test was positive pain radiating to shoulder and upper arm and Chin chest test also positive. X- Ray findings shows Anterior Osteophytes changes in C5-C6 and C6-C7 spine, Subtle reduction in intervertebral disc height at C5 –C6 and C6- C7 and Endplate sclerosis at C5, C6 and C7. On examination based on Siddha principles, it was observed that *Pithavadha Naadi* was predominant. Then by the assessment of *Mukutram*, in *Vatham – Viyanan* and *Samanan*, in *Pitham – Sathagam* and *Kabam – Santhigam* were affected.

Intervention
- 1st day - Purgation therapy (*Agathiyar kuzhambu* – 200 mg in the morning along with ginger juice)
- 2nd day - Medicational rest
- 3rd day onwards - *Varmam* Manipulation with External Application (*Veera Poochu*)
- (For the duration of the study, patients are asked to visit the hospital's OPD twice a week)

The patient went through purgation therapy as per the first line of treatment, administered with *Agathiyar kuzhambu* – 200 mg was given to the patient in the morning along with ginger juice. Every visit involved the use of *Varmam* Manipulation with External Application (*Veera Poochu*) to treat the patient, and the prognosis and clinical evaluation were documented as directed. Both before and after the treatment, scores on the Neck Disability Index (NDI) were obtained. Patients were instructed to follow up at the outpatient department (OPD) for an additional month following their treatment term.

Veera Poochu (Anointing)
Ingredients
- *Kombarakku (Coccuslacca)*
- *Chukku (Zingiber officinale)*
- *Velliparuthi* juice *(Pergulariadaemia)*

Method of preparation
Above mentioned ingredients have been powdered and grinded with *veliparuthi juice* and subjected to heat. It was applied over the cervical region [Figure 1 & 2].

Duration: 2 sitting per week for 48 Days (On 1st and 4th day of week) [9].
Varmam Procedure (Thalai Kazhuthu Thadaval)
After careful examination, the patient was treated with *Varmam* Therapy (*Thalai kazhuthu thadaval)* [Figure 1 & 2] [10]. It is carried out in accordance with the SOP that is referenced in the *Varmam* literature. Stimulated *Varmam* points and their locations were detailed in the Table 1.

Varmam method
Position: Sitting position , Site: Head and Neck, Pressure: ½ *Mathirai*, Duration: 15 Minutes.

Neck Disability Index Score (NDI)
The Neck Disability Index (NDI) is a widely used, self-reported questionnaire designed to assess the level of disability and pain experienced by individuals with neck disorders, such as Cervical Spondylosis which was developed by Vernon and Mior in 1991. It assesses different aspects of daily life that are impacted by neck pain, such as the intensity of the pain, personal care, lifting, reading, working, driving, sleeping, recreation, concentration, and

95119

headaches. Each item is assessed on a range of 0 (no disability) to 5 (complete disability), with a total score that can range from 0 to 50. A greater percentage is then calculated from the NDI score; higher values indicate a higher degree of disability [11].

An effective tool for assessing the level of neck discomfort and disability is the NDI. An effective diagnostic tool that can be used for:

- Assessing the severity of neck pain and disability
- Monitoring changes in symptoms over time
- Evaluating the effectiveness of treatments
- Facilitating communication between healthcare providers and patients

Here, NDI is used to measure the impact of *Varma* therapy with *Veera Poochu* on neck disability and pain, providing a standardized and validated outcome measure to quantify the treatment's effectiveness. NDI score before and after treatment was given in Table 2.

DISCUSSION

 The case report describes the Cervical Spondylosis presented with main complaints of Neck pain and stiffness, pain extending to the shoulders and arms and limited range of motion without any neurological deficit, pain aggravating on prolonged sitting, heavy lifting, bending since last 1 year. Clinical examination supports diagnosis and X- Ray findings anterior osteophytes changes in C5-C6 and C6-C7 spine, subtle reduction in cervical intervertebral disc height at C5 –C6 and C6- C7 and Endplate sclerosis at C5, C6 and C7. Prior to treatment, the Neck Disability Index Score was 24, but it decreased to 12 following treatment. The efficacy of *Varma* therapy with *Veera Poochu* external application in alleviating there is evidence of cervical spondylosis symptoms as the Neck Disability Index (NDI) scores have significantly decreased from 24 to 12. *Veera Poochu*, an external application in *Varma* therapy, has drugs *Kombarakku (Coccuslacca), Chukku (Zingiberofficinale)* [12-15] and *Velliparuthi juice (Pergularia daemia)* [16-18] possess anti-inflammatory, analgesic, and anti-spasmodic properties, making it an effective treatment for Cervical Spondylosis and other musculoskeletal conditions. The anti-inflammatory properties of *Veera Poochu* help reduce swelling and pain in the affected area, while its analgesic properties provide relief from pain and discomfort. Additionally, the anti-spasmodic properties of *Veera Poochu* help relax muscle spasms and improve mobility, further contributing to its therapeutic efficacy. This impressive development highlights the possibility of *Varma* therapy as a further therapeutic strategy for Cervical Spondylosis. The substantial reduction in NDI scores suggests that *Varma therapy* with *Veera Poochu* external application can effectively mitigate the debilitating effects of Cervical Spondylosis, enhancing the overall quality of life for individuals afflicted with this condition. In conclusion, *Varmam* therapy and *Veera poochu* have been revealed to effectively relieve pain and improves mobility with Cervical Spondylosis (*Sagana Vatham*) patient, as determined by the Neck Disability Index Scale (NDI). The treatment resulted in a significant decrease in disability scores, with no adverse reactions reported. This case study suggests that *Varmam* therapy combined with *Veera poochu* is a secure and efficient treatment option for managing Cervical Spondylosis (*Sagana Vatham*), offering promising results for pain relief and symptom management. Substantial large-scale researches are required to confirm the efficacy of Siddha treatment for this illness. Future clinical studies in larger populations are necessary to confirm the therapeutic effectiveness of *Varmam* and *Veera Poochu* in the treatment of Cervical Spondylosis.

PATIENT PERCEPTIVE

The patient expressed high satisfaction with the treatment, reporting an immense reduction in pain and an apparent improvement in his quality of life. He was deeply impressed with the effectiveness of the *Varmam* and *Poochu* (Anointing) treatment, which has greatly reduced the frequency of his pain episodes, allowing him to experience a marked enhancement in his overall well-being.

INFORMED CONSENT

Informed consent in written manner was obtained from the patient before treatment initiation.

Mangaleshwari Baskaran *et al.,*

ABSTRACT

The Indian Weather Data Analysis project analyses climate in different regions and cities of India using Data Science and Python. They're analyzing key weather factors — wind speed, humidity, precipitation— to detect trends and correlations. The project demonstrates how pandas is used for cleaning and organizing data, while confirming the accuracy of the data, correcting any missing or incorrect data. Weather trends are visualized by using Matplotlib which helps run the data interpretation. By means of thorough investigation, this paper aids in a step towards understanding Indian weather variability and its influence on decision-making process and meteorological research.

Keywords: Python, Pandas, Humidity, Data Visualizations, Weather Analysis, Data Science.

INTRODUCTION

India is such a vast and varied nation with varied topography that influences public health, urban growth, agriculture, and the general economy in great impact. In the meteorological branch, weather prediction has long been a difficult issue. Key to comprehending daily life as well as long-term development plans is variations in the weather, including temperature swings, monsoons and extreme occurrences [1,2]. Climate change has added to this: over the past few years we have seen irregular quantities of rainfall, rising temperatures, and increasing levels of

95125

Angira Banerjee *et al.,*

pollution, all of which directly affect weather analysis thus making it quite vital. The requirement for efficient climate monitoring and forecasting is further driven by the reports of notable climatic changes affecting different sectors made by the Indian Meteorological Department (IMD). Short-range rainfall forecast accuracy is crucial if one is to understand India's monsoon fluctuation. Comparatively the results of the Weather Research and Forecasting (WRF) model using data from the India Meteorological Department (IMD) allow one to evaluate rainfall distribution and discover systemic biases across different sites [4,5]. Using a dataset "Historical Weather Data for Indian Cities" from Kaggle, this sense we are looking at understanding weather trends for important Indian cities. The dataset has 77,1264 records and 28 columns covering the period from 2009 to 2019 free by any missing values. In particular, the study focuses on eight major cities—Pune, Mumbai, Delhi, Hyderabad, Jaipur, Kanpur, Nagpur and Bengaluru—to analyze differences in temperature, humidity, wind speed, cloud cover, precipitation and moon phase [6]. A detailed picture of these shown in Fig. 1, Using Python for data science, such as cleaning and visualization, this project will explore seasonal trends and regional climate variations, and highlight long term environmental effects. An in-depth study of daily variations in temperature, moisture and wind provides useful information for many industries. IPCC has predicted that in the future, India would experience more weather extremes, such as heat waves, floods, cyclones, drought, etc. [7]. In agriculture, for instance, know-how of precipitation trends assists in planning crop cycles and irrigation. The energy sector can use temperature data to forecast power demand, while public health authorities can use the joint trends in air quality and temperature during heat waves for mitigating health risks associated with heat waves[2,4,7].According to Rosenberger et al. (2002), weather is the most important factor influencing airplane operations, causing 70% to 80% of passenger delays and costing airlines hundreds of millions of dollars in lost revenue annually (Lan et al. 2006). Few studies have examined how climate change affects meteorological parameters that are relevant to aviation thus far (Williams and Joshi 2013).

Here, we measure the anticipated effect on aircraft performance of visibility and cloud cover [8,9,10]. Moreover, analysis of weather patterns is utilized in urban planning and disaster management to design resilient infrastructure and manage water resources effectively. This study combines techniques that requires data analysis, thus allowing for a much greater understanding of the climate situation of India. The results can help policymakers, environmental scientists, and businesses make better decisions, support sustainable development and improve disaster preparation [2,11]. This paper centers on one such innovative approach—The five main steps of weather data analysis are depicted in the flowchart. Data gathering and dataset loading are the first steps. Data preparation includes building a "city" column, standardising forms (such as 24-hour time), and merging data. Steps in the data cleaning process are looking for missing information, correcting data kinds, and deleting extraneous data—like 2020 rows. Examined in exploratory data analysis (EDA) include relationships (such as cloud cover relative to sun hours), trends (such as seasonal temperature swings), and anomalies (like extreme weather events). Finally, the visualisation stage creates graphs, emphasises discoveries, and pulls ideas from code explanations and observations. Data cleaning—which deals with missing values, data type adjustment, and outlier identification—comes next to guarantee data quality. Once the data has been cleansed, data merging is done to combine datasets as needed for an exhaustive study. Data analysis comes next, involving statistical computations and pattern analysis to uncover perceptive information. Programs include Matplotlib, Seaborn, and Plotly are used following analysis to visually present data in an understandable manner. Deeper into this study, we will investigate the methodology, dataset, evaluation, and consequences of this novel approach in the framework of India's Weather. The main contributions of the paper "Indian Weather Data Analysis" as follows [2]: Analysed comprehensively for comprehensive weather: Using extensive historical meteorological data, the study looks at temperature fluctuations, humidity levels, cloud cover, and precipitation patterns in a select few selected cities. These observations aid in forecasting climate trends and how they will affect different industries. Impact on Agriculture (Farming & Food Security): We evaluate the impact of weather factors including temperature, wind speed, and rainfall on crop output, irrigation requirements, and seasonal farming cycles. Predictive insights can help farmers in key agricultural hubs like Nagpur and Kanpur implement effective planting and harvesting plans.

Angira Banerjee *et al.,*

Flood Risk Assessment (Mumbai, Hyderabad, Bengaluru)
Because of the intense monsoons, cities like Bengaluru, Hyderabad, and Mumbai regularly experience urban floods. Our study provides practical insights for flood prevention and mitigation techniques by identifying drainage vulnerabilities and rainfall trends.

Transportation & Aviation (Mumbai, Bengaluru, Delhi)
Road safety, railway efficiency and aviation operations are all greatly impacted by weather conditions. The study provides information that helps aviation and transportation agencies enhance scheduling and safety protocols by examining Delhi's fog patterns, Mumbai's monsoon interruptions, and Jaipur's heat waves.

Urban Planning & Infrastructure Development (Jaipur, Pune, Bengaluru)
In expanding metropolises like Jaipur, Pune, and Bengaluru, issues including water management, urban heat islands, and declining air quality are major problems. In order to ensure sustainable infrastructure development and smart city projects, this study offers insights into climate-based planning.

Disaster Management
The study contributes to gaining knowledge about early warning for extreme weather events such as heatwaves, thunderstorms and flash floods. These findings can be used by disaster management organizations in Kanpur, Hyderabad, and Mumbai to improve their response and readiness plans.

Future Implications for Sustainability
This study lays the groundwork for real-time weather-based forecasting models by combining machine learning and predictive analytics. Cities will be better equipped to respond to the difficulties posed by climate change and increase their overall resilience if they have a better understanding of the historical climate trends in Pune, Mumbai, Delhi, Hyderabad, Jaipur, Kanpur, Nagpur, and Bengaluru.

RELATED WORKS

Many research has examined how important weather patterns are to important sectors, thereby providing insightful analysis of climate variability and its consequences. While Rajini Kanth *et al.* (2021) examined Indian weather datasets, exposing important tendencies for predictive analysis [1,2], Sheikh *et al.* (2021) analysed data mining techniques for weather forecasting. Essential data source for weather-related research, the Indian Meteorological Department (IMD) offers notable reports on climate changes [3]. While Bhomia *et al*. (2014) assessed the accuracy of the WRF model in projecting Indian monsoon rainfall [4,5], Tolani et al. (2019) performed a long-term statistical analysis of extreme weather occurrences, therefore supporting disaster risk management. The historical weather dataset of Kaggle has helped research on urban and regional weather patterns in Indian cities even more [6]. The 2021 study on flash flood hazards in desert cities by Hassan et al. [7] clarified urban resilience techniques. Aviation operations are much influenced by weather; hence this field of study is absolutely important. While Kulkarni et al. (2016) evaluated the economic losses caused by winter fog in New Delhi, therefore highlighting financial difficulties for the aviation industry, Gultepe (2021) examined the impacts of visibility, wind, and precipitation on aviation [8,9]. While Shaharban (2021) looked at the wider consequences of climate change for disaster management [10,11], Coffel and Horton (2020) investigated severe temperature effects on flying performance. This study builds on earlier works by using historical meteorological data and visualising tools to evaluate how weather affects urban design and aviation over main Indian cities. The results help to guide better decisions on reducing disruptions caused by weather and increasing aircraft safety.

Angira Banerjee *et al.,*

PROPOSED WORK

The intended endeavor would examine Indian meteorological data to tackle problems with temperature fluctuations, flood prediction, urban planning, aviation safety, disaster management, and agricultural sustainability throughout Pune, Mumbai, Delhi, Hyderabad, Jaipur, Kanpur, Nagpur, and Bengaluru. Many times, conventional methods of weather prediction fail to detect climatic patterns influencing many different sectors. This work presents a data-driven method using analytical and data visualizing techniques to understand weather trends and their implications. Using advanced visualization tools, our approach detects trends and connections in meteorological data. The primary components under analysis are the following:

- Changes in temperature (effects on urban heat islands and agriculture)
- Precipitation and humidity (effects on aviation and flash flood prediction)
- Wind patterns (impacting coastal operations and disaster management)
- Visibility and cloud cover are essential for urban planning and aviation.

PROPOSED ALGORITHM
Here is the proposed algorithm for finding different trends and patterns of weather elements in Indian weather using Data Analysis:

Algorithm for Indian Weather Data Analysis
Step 1: Data Collection
- Gather a comprehensive dataset containing features related to Indian weather.

Step 2: Data Preprocessing
- Handle missing values, outliers, and inconsistencies in the dataset.
- Combine and merge datasets.
- Standardized formats by converting them to 24-hour time, for example.
- Make "city" a new column.

Step 3: Data Cleaning
- Check for missing values and handle them.
- Correct data types (such as dates and times) that are inaccurate.
- Eliminate any irrelevant or insufficient information (such as old records).

Step 4: Exploratory Data Analysis (EDA)
- Examine correlations (such as humidity and cloud cover).
- Determine patterns, such as seasonal variations in temperature.
- Find irregularities, such as severe weather occurrences.

Step 5: Visualization
- Create graphs that help in understanding.
- Highlight the main findings obtained from the visualizations.
- Load the required visualization libraries.

Step 6: Insight Extraction
- Describe the coding approach.
- Write a summary of the EDA and visualization observations.
- Examine trends that impact various industries.

PSEUDO CODE
Here's a pseudo-code presentation of the proposed algorithm for finding different trends and patterns of weather elements in Indian weather using Data Analysis:

```
# Step 1: Data Collection
dataset = load_dataset()
# Step 2: Data Preparation
```

Angira Banerjee *et al.,*

```
# Merge and combine datasets
merged_data = indianweather_datasets(dataset)
# Standardize formats (e.g., convert to 24-hour time)
standardized_data = standardize_formats(merged_data)
# Create a new column 'city'
data_with_city = add_city_column(standardized_data)
# Step 3: Data Cleaning
# Check for missing values
cleaned_data = handle_missing_values(data_with_city)
# Adjust incorrect data types (e.g., dates, times)
formatted_data = adjust_data_types(cleaned_data)
# Remove incomplete or irrelevant data (e.g., outdated records)
filtered_data = remove_irrelevant_data(formatted_data)
# Step 4: Exploratory Data Analysis (EDA)
# Study relationships (e.g., cloud cover and humidity)
relationships = analyze_relationships(filtered_data)
# Identify trends (e.g., seasonal temperature changes)
trends = identify_trends(filtered_data)
# Detect anomalies (e.g., extreme weather events)
anomalies = detect_anomalies(filtered_data)
# Step 5: Visualization
# Create graphs for better understanding
visualizations = generate_graphs(filtered_data)
# Highlight key findings
highlighted_findings = highlight_key_findings(visualizations)
# Import necessary libraries (matplotlib,seaborn,plotly for further analysis)
import_visualization_libraries()
# Step 6: Insight Extraction
# Explain the code approach
explain_code_approach()
# Summarize observations from EDA and visualization
summary = summarize_observations()
end_process()
```

This pseudo-code outlines the main steps of the algorithm, from data collection, preprocessing, cleaning, exploratory analysis, visualization, and insight extraction are all covered in this outline of the meteorological data analysis process. Every stage guarantees organized data processing, significant pattern recognition, and efficient visualization for well-informed decision-making.

VISUALIZATION AND RESULT ANALYSIS

- Data visualization assists in exploring business insights to achieve business goals in the right direction. It helps to correlate the data from the visual representations or graphical representations. It allows for fast analysis and instantly digests critical metrics.
- It enables enterprises to stay on top of their game by discovering the latest trends through data visualization tools.

Angira Banerjee *et al.,*

This Visualization shows the trends in excessive heat for each city over the course of several months or years. It indicates possible heatwave periods by assisting in determining the times and locations of high heat index values. Which is helpful for organizing heat reduction initiatives and comprehending the seasonal effects of high temperatures. In this heatmap, Cities like Delhi and Kanpur regularly have higher heat indices, with Kanpur having the highest readings (e.g., 65 in 2010). This implies that some cities are subject to more intense heat waves than others. The comparatively constant heat index values in coastal towns like Mumbai (Bombay) are probably caused by tempering sea breezes. Because of its temperate environment, Bengaluru routinely has the lowest heat index values. Several important links are revealed by the Weather Factors Correlation Matrix. Max temperature has a slight negative correlation with humidity (-0.50) and a minimal effect on wind speed (-0.01), but it has large positive associations with min temperature (0.76), feels like temperature (0.73), heat index (0.73), and wind chill (0.80). The minimum temperature is positively correlated with wind chill (0.76), feels like temperature (0.81), and heat index (0.81). The correlation between variables such as wind chill, heat index, and feels like is nearly perfect (0.95 -- 1.00). While humidity has a moderately negative association (-0.51) with wind chill, it has poor connections with most other parameters. Overall, there is a substantial correlation between temperature and factors, but there are smaller correlations between temperature and humidity and wind speed.

The yearly precipitation levels in various cities over a number of years are depicted in this bar chart, which also shows geographical differences, seasonal variability, and rainfall trends. It assists in determining which years have extreme weather, evaluating how local precipitation is affected by climatic trends, and identifying changes in precipitation that might be a sign of urbanization or climate change. Bombay routinely receives the most precipitation in this dataset, with rainfall exceeding 1000 mm in 2010, 2011, and 2019. Rainfall is milder in cities like Hyderabad and Pune, and it has increased noticeably in 2019. On the other hand, as a result of regional climate variations, precipitation is lower in Kanpur and Jaipur. This research emphasizes the differences in precipitation between cities. With everything considered, these analyses emphasize how weather patterns and agriculture are closely related, affecting soil health, crop yield, and irrigation needs. Policymakers and farmers can lessen the negative effects of extreme weather by implementing targeted strategies like effective irrigation, drought-resistant crop varieties, and climate-resilient farming practices by understanding how temperature, precipitation, humidity, and wind patterns interact. Cities that experience heavy rainfall events—more than 50 mm in an hour—that can cause flash floodare shown in these visualizations. These occurrences put lives, infrastructure, and transportation at danger by overtaxing urban drainage systems. A clear comparison of precipitation is made possible by the bar chart. Levels, determining that Kanpur and Pune are the cities most at risk. These revelations highlight the necessity of early warning systems, improved drainage infrastructure, and focused flood mitigation. An annual analysis of the risks of flash floods (2009–2019) is given by the scatter plot.

From 2009 to 2014, flash floods were uncommon, however after 2015, the dangers significantly increased. Pune continuously has the highest rainfall, a sign of the increasing threats associated with climate change. To lessen the effects of future disasters, cities like Bombay, Kanpur, and Pune need to implement disaster management plans right away. From 2009 to 2019, this line graph shows airport disruptions brought on by poor visibility and heavy cloud cover. The most disruptions occurred in 2010, especially in Bengaluru, where there were more than 100 disruption days. During this time, there were also noticeable increases in other cities like Hyderabad and Pune. Disruptions generally declined starting in 2015, while Bengaluru continued to see more interruption days. In 2016, Pune had a discernible uptick. While cities like Delhi, Jaipur, and Kanpur consistently displayed minimal interruption, Bengaluru continues to be the most vulnerable, underscoring the need for investments in weather forecasting and infrastructure. Because airports in high-disruption zones may need better infrastructure, including sophisticated Instrument Landing Systems (ILS) and increased runway illumination, to reduce delays, these findings are essential for urban development. In order to reduce operational disruptions and guarantee smooth air travel, future airport placement and development plans should also take past weather patterns into account. For example: Based on the number of disruption days in different places, the bar chart illustrates airport interruptions in 2014 caused by poor visibility and heavy cloud cover. With over 30 days of disruptions, Bengaluru experienced the most, showing serious difficulties with flight operations. Following 10 to 15 days of delays, Pune and Nagpur demonstrated a moderate

level of susceptibility. Hyderabad and Bombay had five to ten days, indicating fewer frequent impacts. There were only minor inconveniences in Kanpur, Delhi, and Jaipur—less than five days.

CONCLUSION & FUTURE WORK

This study offers a thorough examination of Indian weather patterns and how they affect important industries including big city disaster management, urban planning, agriculture, and aviation. We have discovered noteworthy patterns in temperature fluctuations, precipitation, and extreme weather by applying sophisticated visualization tools. In the aviation industry, where visibility, wind speed, and precipitation are critical factors in flight safety and scheduling, these insights can help improve decision-making. The accuracy of weather effect estimates could be improved for future research by including predictive modelling techniques, such as machine learning algorithms. Furthermore, adding real-time satellite data and climate projections to the collection could enhance early warning systems for severe weather occurrences. Strategies for climate resilience can be strengthened even more by integrating AI-driven decision support tools for urban planners and aviation.

ABSTRACT

Postmenopausal women with lower back pain may suffer from a lack of estrogen, which causes bone and muscle weakness, especially in the spine. Proper care is crucial to improving their quality of life, and Pilates can effectively reduce pain. To find out how the Pilates method and aerobic activities affect postmenopausal women with lower back pain in terms of pain, functional status, and disability. Postmenopausal women over 50 experiencing lower back pain were selected based on the criteria for inclusion and exclusion and divided into two groups at random: the Pilates group and the Aerobic group. Both groups underwent conventional physiotherapy, with one also incorporating various aerobic exercises and the other adding Pilates exercises. Participants from both groups showed improvements in pain reduction, disability, and improvement in functional status between their pre- and post-exercise values ($p<0.0001$). There is also a significant variation in post-exercise results between the two groups ($p<0.0001$), indicating that Pilates exercises along with conventional physiotherapy are more effective than aerobic exercises with conventional physiotherapy. Pilates exercises show a significant decrease in pain (numerical pain rating scale), and disability (Rolland Morris disability questionnaire) and a significant increase in functional status (6-minute walk test). Thus, we concluded that Pilates exercises along with conventional physiotherapy were more effective than aerobic exercises with conventional physiotherapy at relieving pain, improving functional status, and reducing pain-related disability.

Keywords: women's health, low back pain, exercise, quality of life.

INTRODUCTION

Preface to post-menopausal lower back pain

Menopause is when the activity of ovarian follicles decreases, resulting in a permanent loss of the menstrual cycle, diagnosed after 12 consecutive months of amenorrhea.[1] Menopause marks the end of irregular menstrual cycles and the onset of menopausal symptoms, marking the final stage of women's reproductive life.[2] Night sweats, flashes of heat, dryness of the vagina, and disturbed sleep are common symptoms that women may experience during menopause. [3] This transition can cause various metabolic and cardiovascular risks. Therefore, it is a crucial opportunity to take preventive measures to reduce symptoms and improve quality of life. [4] Several studies have shown that women in the postmenopausal stage are more likely to experience musculoskeletal pain due to estrogen shortage, which weakens bones and muscles and deteriorates collagen, which is found in intervertebral discs and causes lower back pain. [5]

Prevalence of low back pain in post-menopausal women

According to an Indian study, 41.0 % of 5798 people above the age range of 18 and under 80 had LBP. The prevalence of lower back pain was higher in the midlife age group especially among women (44.1%) compared to men [6] The general quality of life remains good even if those with lower back pain are more likely to have substantial handicaps. [7] Chronic pain and lasting disability due to lower back pain is especially common among India's poor labourers, due to the physically stressful nature of their jobs.[8] As they were afraid of being in pain, women often avoided engaging their bodies. This creates a vicious cycle in which a sedentary quality of life encourages poor posture, bone loss, muscle weakness, and lower back discomfort.[9] Understanding low back pain impact on postmenopausal women's quality of life is crucial for effective healthcare. Back pain relief can be achieved through stretching, heat/cold therapy, general activity, and back exercise. [10]

Effective methods for treating low back pain

Lower back pain treatment methods include surgeries, medications, and non-medical interventions. Physical activity is a suitable treatment with minimal side effects, especially beneficial for postmenopausal women and the elderly. [11] Aerobic exercise enhances health and prevents lower back pain by minimizing spinal load without impairing lower back muscle function. Over-exertion will, however, reverse the effect, so there is a need to select workouts with balance [12] Aerobic exercise is shown effective and safe in the treatment of lower back pain, in terms of reducing pain and improving aerobic capacity, and it has significant effects on clinical outcomes. [13] Aerobic exercise therapy is better than electrotherapy or no treatment in improving short-term results in depression, pain, and disability in chronic lower back pain patients but, when assessed alone, can only make small alterations.[14]

Pilates as an alternative method

Studies have revealed that weaker muscles, including the multifidus and transverse abdominis, can result in decreased spinal stability and lower back pain. This study concentrates on deep trunk muscles, pelvic floor muscles, and core, highlighting the significance of pelvic muscles as the floor of the lower back. Pilates is a useful treatment for lower back pain, improving posture, core strength, flexibility, and overall well-being through coordination of movement and breathing.[15] The Pilates technique is a popular exercise form used by dance instructors and choreographers to prevent dance-related injuries and promote a safe post-rehabilitation. The traditional method of Pilates exercises can be demanding and needs to be modified for physiotherapeutic interventions.[16] Pilates form training is an effective practical therapy for lower back pain it addressing all relevant components and provides significant benefits such as improved functional capacity and a return to regular daily living. [17] Pilates exercises, performed on mats or specialized equipment, focus on deep breathing and concentration. Participants usually sit or lie, using gravity to stabilize their core. Many exercises have a flexion bias and do not involve weight-bearing.[18] Pilates mat work in various positions is employed to avoid tension in the joints and muscles. They increase the body's efficiency by conditioning lower trunk muscles, that stabilize the body. Exercising these and pelvic muscles has been found to alleviate low back pain.[19]

Sabitha and Senthil Kumar

MATERIAL AND METHODS

This study was focused on the comparison of the effectiveness of aerobic and Pilates exercises on postmenopausal women with lower back pain. The study was approved by ISRB 01/021/2023/ISRB/SR/SCPT. Eighty postmenopausal women aged between 50-60 participated in this lower back pain study. The study focuses on women with lower back pain who scored over 5 on the Numerical Pain Rating Scale and 40.0% on the Rolland Morris questionnaire. The research uses pain intensity, daily function, and aerobic activity tests to assess pain intensity and endurance. The study includes 50 participants in aerobic and Pilates groups, who undergo 15 minutes of conventional therapy of Interferential Currents (IFC) to reduce skin resistance, improve circulation, alleviate discomfort, restore neuro vegetative balance, and modulate sympathetic nervous system activity. The aim is to improve pain management and overall well-being.[25] For four weeks, this protocol was administered three days a week for 45 minutes a session. Data from the pre-test and post-test were collected to compare the results before and following the protocol regime after 4 weeks.

Aerobic exercise group
After performing conventional physiotherapy for 15 minutes participants were asked to perform a warm-up phase of slow walking before the brisk strolling. Slow walking entails moving slowly and observing movements by marking off the first 15 to 20 steps. Then, they were asked to perform brisk walking with a straight stance, aligned ankles, hips, and shoulders, and started with fast-paced walking. Brisk walking is a Moderate-intensity exercise usually increases heart rate and work of breathing, but you can still talk. The routine includes 30 minutes of brisk walking followed by a cool-down phase of slow walking for a total of 45 minutes. [14]

Pilates exercise group
After performing conventional physiotherapy for 15 minutes participants in this group were assigned to a Pilates mat exercise regime which was carried out for four weeks, three days a week under supervision of a Pilates instructor and a physiotherapist. Each session lasted for 30 minutes and the lumbar stretching as a warm-up and cool-down phase was included; the lumbar stretches consisted of a static stretch, which means holding the pose for 10 seconds and repeating it three times. The stretches involved standing forward, backward bends and side bends. The next stretch was the knee-to-chest in a standing position by flexing the hip. After warming up, they performed a series of Pilates exercises for 30 minutes. This session began with learning the six principles, which included breathing, concentration, control, precision, centre, and flow. They were then asked to perform arm and leg circles. These circles were performed for 3 repetitions and 5 sets. The second exercise was called the Neutral Spine exercise, where the three natural curves of the spine (cervical, thoracic, and lumbar) are maintained. The participant was informed to lay on their backs on a mat, with their knees bent and their feet resting on the ground and Arms should be kept by their sides and slowly push their lower back to the floor while focusing on their breathing pattern. They ought to stay in this posture for ten seconds and repeat 5 times. For the next exercise, they start by lying on their backs on the ground with both knees flexed and their feet flat. After exhaling they were asked to raise the pelvis and upper back gradually off the floor after performing a few pelvic tilts. They were instructed to hold this position for 10 seconds while inhaling, and while releasing their breath, they should slowly lower themselves back to the floor. Both their core and pelvic muscles are strengthened by this activity. During the leg kick exercise, the participants were laid on their stomachs with their foreheads resting on their hands and their legs touching the floor. They then tilted their pelvic bone downward, flexing their core, while bending their knees and keeping their thighs touching the floor. Finally, they were asked to point their toes. As for the next exercise, they were asked to assume a supine position with their legs fully extended and arms resting at their sides. They were instructed to inhale deeply and gradually flex one knee, drawing the leg towards the chest by grasping the ankle or thigh with a hand, while exhaling gently they should release the leg to its initial position. Repeat this sequence with the other leg, alternating for a total of 3 repetitions per leg. Then they performed the clamshell exercise. To begin, they should lie down on their side on the mat and bend their knees so that their thighs form a 90-degree angle with their body. They were instructed to make sure to rest their head on their arm to avoid straining their neck; they should keep their big toes together and start to slowly rotate their leg at the hip socket, allowing their top knee to open. While inhaling they were asked to open their

95136

knees as far as comfortably without disrupting their alignment and then exhale slowly and return their knee to the starting position. Aim for 5 reps of this exercise.[18]

RESULTS

The sample was 50 participants aged 50-55, 30 (60.0%) aged 50-55 and 20 (40.0%) aged 56-60. The BMI of the subjects was less than 18.5,6 (12.0%). Pre-test measurements were taken, and the two groups received a four-week intervention. Post-test measurements were taken, and paired and unpaired t-tests were conducted. Mean and standard deviation values were computed. The study was to determine the impact of physical therapy on weight control. Table 1, compare the values of the aerobic group before and after the intervention using the numerical pain rating scale to assess pain, the 6-minute walk test used to assess the functional status, and the Rolland Morris questionnaire used to assess disability. The pre-test and post-test values for pain revealed a mean of 6.88 and 5.2, The mean for the 6-minute walk test was 322.48 prior to the intervention and 326.76 subsequent, The Rolland Morris questionnaire values revealed a mean of 17.16 prior and 14.52 after the intervention. Table 2 present the Pilates group's pain, functional status, and disability before and after intervention. Pain was assessed by numerical pain rating scale, functional status by 6-minute walk test, and disability by Rolland Morris questionnaire. Outcome revealed a significant reduction of pain (mean 7.32 to 4.2), improved functional status (mean 327.72 to 347.36), and reduced disability (mean 16.56 to 10.4). The study compared the post-test scores of two groups: Pilates and aerobic. The aerobic group had a mean pain score of 5.2, while the Pilates group had a mean score of 4.2. The 6-minute walk test showed a difference between the two groups. The Rolland Morris questionnaire showed a difference between the aerobic and Pilates groups. The Pilates group showed a significant decrease in discomfort compared to the aerobic group. The functional status of the Pilates group improved significantly compared to the aerobic group. The Pilates group also had less impairment than the aerobic group, indicating that the Pilates group had better results.

DISCUSSION

Post-menopausal women mainly suffer from low back pain because of estrogen deficiency that may result in weaker muscles and bones, along with other symptoms such as hot flashes, night sweats, joint and back pain, chronic fatigue, anxiety, depression, and sleep disorders. These physical, psychological, and sexual problems need to be managed for their health and well-being. A study of aerobic exercise effectively treats chronic lower back pain, as evidenced by the reduction of pain scores in the Roland-Morris Disability Questionnaire, Oswestry Impairment Questionnaire, Hospitalization Anxiety and Depressive Scale, and McGill Pain Questionnaire, suggesting its potential benefits for physical and mental health. [20] Our study utilized the Numerical pain rating scale, a widely used and more reliable method, instead of the MC Gill Pain Questionnaire, Rolland Morris questionnaire, and Oswestry, to assess the benefits of aerobic activity. A recent systematic review indicates that Pilates may not be the only treatment for chronic lower back pain since proper recruitment of deep trunk muscles may be more effective. Furthermore, the mechanisms of muscle retraining and awareness promotion may be more effective in chronic lumbago management despite ongoing controversy regarding their effectiveness.[21] Pilates is effective for chronic low back pain, but most studies focus on deep trunk strengthening. Our research emphasizes the importance of core, pelvic floor muscles, and deep trunk muscles in managing low back pain. These muscles serve as a floor for the lower back, making Pilates a crucial tool for pain management. Lee CW *et al*. suggest that strengthening internal core muscles like the transverse abdominal, soleus, diaphragm, and multifidus can prevent recurring lower back pain, while Pilates workouts can reduce progressive muscle wasting by lowering pain and preventing idleness, thus preventing further pain. [22] The study suggests Pilates, a form of exercise that targets abdominal, core, and pelvic muscles, effectively reduces pain, but it neglects the importance of disability and functional status in individuals with lower back pain. Franks J et al said that Pilates may be useful by increasing core strength in the trunk, pelvic region, and abdomen which can help some persons with low back discomfort. When measuring muscle thickness using real-time ultra sonography, Pilates proved to be no less effective than other physical activities, workouts, or similar doses to strengthen the core muscles.

Sabitha and Senthil Kumar

[23] Pilates is a promising alternative to traditional physiotherapy for treating chronic physical stress-related lower back pain. It significantly reduces pain and continues even after a year by strengthening the diaphragm, hip flexors, glutes, and deep erector spinae, improving pain and posture.[24] Regarding these studies, most of the research had concentrated on the efficacy of aerobics or Pilates alone for the management of pain in the lower back stating that both exercises help in lowering the pain, with few comparisons between the two forms of exercise. This study compared pain, functional status, and disability in postmenopausal women as they were more prevalent in lower back pain, which was not concentrated in many studies. Lower back pain is a significant concern in the modern population, particularly in women during menopause. The lack of oestrogen during this phase weakens bones and muscles, leading to discomfort. This study focuses on postmenopausal women's lower back pain and compares aerobic and Pilates exercises. Results suggest that Pilates may provide additional benefits and potentially improve overall outcomes, such as pain, functional status, and disability in postmenopausal women with lower back pain. Therefore, Pilates exercises are more effective in reducing lower back symptoms than aerobic exercise.

ABSTRACT

To determine the added effect of Dharvyadi Dhoomapana in Kaphaja Pratishyaya. Single blind randomized comparative clinical study was adopted. In the clinical trial, 44 subjects fulfilling the diagnostic and inclusion criteria were selected and randomly assigned into 2 groups Group –A and Group-B, out of them 2 dropouts were from each group. The children in Group A were treated with Chitrakahareetaki avaleha 10gm, twice a day after food for 14 days with lukewarm water as Anupana along with Darvyadi dhoomapana 3 puffs once daily in morning for 7 days. The children in Group B were treated with Chitrakahareetaki avaleha alone with a dose 10gm, twice a day, after food with lukewarm water as Anupana for 14 days. The results obtained after the clinical trial was analyzed statistically and all the observations were subjected to creative discussions. Overall assessment of all the therapy was assessed based on the significance of the statistical test values in both subjective and objective parameters. Both the groups showed effect in reducing the symptoms at the level of p<0.05. Even though both the groups were found to be effective in reducing the symptoms based on objective and subjective parameters, but better effect was in Darvyadi dhoomapana along with Chitrakahareetaki Avaleha group when compared to the Chitrakahareetaki avaleha alone group.

Keywords: Kaphaja Pratishyaya, Chronic simple rhinitis, Darvyadi Dhoomapana, Chitrakahareetaki Avaleha.

INTRODUCTION

Kaphaja pratishyaya is one of the Urdvajathrugata vikara where Kapha and Vata are said to be the predominant doshas involved in the manifestation of this condition.[1] Chronic simple rhinitis is a very common contagious disease seen in all over the world causing much distress and discomfort to the people.[2] Chronic simple rhinitis affects people of all the ages. In prosperous societies 20-40% of children suffer from chronic simple rhinitis [3]. The symptoms of chronic simple rhinitis show resemblance with the Lakshanas of Pratishyaya explained in Ayurvedic classics [1]. Kaphaja Pratishyaya is one of the Vyadhi, which is characterized by Nasasrava, Nasavarodha, Nasakandu, Kshavathu, Gatragaurava and Kasa [4]. Acharya Sushruta explained that if Pratishyaya is not treated in time then it may lead to Dushta Pratishyaya, associated with deafness, blindness, anosmia, cough, loss of appetite and oedema etc [5]. Acharya Charaka explained that if the disease is not treated properly or neglected, it may cause complications like Kasa and Kshaya [6]. This fact itself shows that Pratishyaya has been major problem to the physicians since long back. Hence this study was carried out to evaluate the comparative effect of Chitrakahareethaki Avaleha[7] with and without Darvyadi Dhoomapana [8] in children.

AIM
To determine the added effect of Dharvyadi Dhoomapana in Kaphaja Pratishyaya

Source of data
The subjects diagnosed with Kapha Pratishyaya attending the out patient department of Kaumarabhritya, Alva's Ayurveda Medical College, Moodbidri, Karnataka, India.

Diagnostic Criteria
Diagnosis will be done on the basis of symptoms of Kaphaja Pratishyaya ie; Sirogaurava, Nasasrava, Nasakandu.

Inclusion criteria
Subjects between the ages 12-16 years were selected irrespective of sex, occupation and socio- economic status.

Exclusion criteria
- Subjects below 12 years and above 16 years.
- Subjects suffering from diseases other than Kaphaja Partishyaya like (Vata, Pitta, Rakta, Sannipataja Pratishyaya)
- Subjects suffering from rhinitis associated with Tonsillitis, Pharyngitis.
- Any Other systemic diseases were excluded.

Administration of Drug
Group- A
Treated with Darvyadi Dhoomapanam for 7 days, as well as Chitrakahareetaki Avaleha (10-gram bd with lukewarm water after food) internally for 14 days.

Group - B
Treated with Chitrakahareetaki Avaleha (10-gram bd with lukewarm water after food) internally for 14 days and Darvyadi dhoomavarti (Dose – 3 puffs/ once daily in morning) for 7 days

Assessment criteria
Response of the treatment will be assessed on the basis of subjective and objective parameters   before and after the treatment i.e., 7th and 14th day for both groups. Subjective parameters were Sirogaurava, Nasasrava, Galakandu, Nasakandu, Kasa, Aruchi whereas Objective parameters were Post nasal drip and Swollen turbinate.

Dhanya Raj *et al.,*

OBSERVATION AND RESULTS

The clinical study was conducted in 44 diagnosed children of Kaphaja Pratishyaya fulfilling the diagnosing and inclusion criteria and divided in to two equal groups i.e., Group 'A' and Group 'B'. In Group 'A' Chitrakahareetaki Avaleha along with Darvyadi Dhoomapanam were given and for Group 'B' Chitrakahareetaki Avaleha was given. The treatment was carried out for 14 days for both groups. 2 drop outs occurred from each group, may be due to the less palatability of the drug or inconvenience of the children to take Dhoomapana. 56.81% of the children were males while 43.19 % were females. 22.72% belonged to the age of 12 years. Maximum children were belonging to mixed diet habit (61.64%). Maximum liking was observed for Madhura (59%), Lavana (22.72%), Katu (3.52%) Rasa. Maximum number of children were having Vatakapha Prakruti (47.7%), Vata and Kapha are considered to be the predominant doshas in the pathogenesis of Pratishyaya. 36.36 % were having Pittakapha Prakruti.56.81% are having Mandagni, 34.09% were having Vishmagni, 9.09% were having Teekshagni and none of the children were having Samagni. 56.81% of the children belong to a moderate digestive power and 34.09% belongs to very poor digestive capacity. Madhyama koshta were found in 43.18 %, Krura koshta in 31.81% and Mridu koshta in 25% of children. Madhura rasa were found in 59%, Lavana rasa found in 22.72% children. 38.63% of the children were having thin discharge, thick discharge in 61.36%. Atisheetambu pana and Sheetajala snana 52.27% and 50% respectively were seen as prime aggravating factors.

Sirogaurava
In Group A, 47.3% were improved after complete treatment and 78.94% were cured at follow up. In Group B, 7.89% were improved after treatment and 15.7% at follow up. Result showed that both groups were effective in treating Kaphaja Pratishyaya but Group A was comparatively more effective than Group B.

Nasasrava
In Group A, 15% were improved after treatment and 60% were cured at follow up. In Group B, 4.1% were improved after treatment and 27% at follow up. Result showed that both groups were effective in treating Kaphaja pratishyaya but Group A was comparatively more effective than Group B.

Galakandu
In Group A, 35.71% were improved after treatment and 89.28% were cured at follow up. In Group B, 9.5% were improved after treatment and 9.5% at follow up. Result showed Group A was effective in treating Kaphaja pratishyaya when compared to Group B.

Nasakandu
In Group A, 80% were improved after treatment and 80% at follow up. In Group B 16.6% were improved after treatment and 33.3%were cured at follow up. Result showed that both groups were effective in treating Kaphaja pratishyaya but Group A was comparatively more effective than Group B.

Kasa
In Group A, 57.14% were improved after treatment and 71.42% were cured at follow up. In Group B, 57.14% were improved after treatment and 57.14% at follow up. Result showed that both groups were effective in treating Kaphaja pratishyaya but Group A was comparatively more effective than Group B.

Aruchi
In Group A, 57.14% were improved after treatment and 71.42% were cured at follow up. In Group B, 30.76% were improved after treatment and 46.15% were cured at follow up. Result showed that both groups were effective in treating Kaphaja pratishyaya but Group A was comparatively more effective than Group B.

Post nasal drip

In Group A, 29.4% were improved after treatment and 67.64% were cured at follow up. In Group B, 14.81% were improved after treatment and 18.51% were cured at follow up. Result showed that both groups were effective in treating Kaphaja pratishyaya but Group A was comparatively more effective than Group B.

Swollen turbinate

In Group A 57.1% were improved after treatment and 71.4% were cured at follow up. In Group B 0% result obtained after treatment and follow up. Result showed Group A was effective in treating swollen turbinate, Kaphaja pratishyaya and Group B has no effect in treating this symptom.

DISCUSSION

Group 'A' shows highly significant result in reducing the symptoms like Sirogaurava, Gala Kandu, Nasa Kandu with p value <0.001. Group 'A' shows significant result in reducing the symptoms like Post nasal drip and swollen turbinate with p value <0.05. Both the groups show equal effect in reducing the symptom Nasasrava, Kasa and Aruchi. The disease Kaphaja Pratishyaya is primarily produced due to vitiated Vata and Kapha which leads to Sirogaurava, Nasasrava, Galakandu, Nasakandu, Kasa, Aruchi etc. While selecting the drugs to treat, this should have the properties of alleviating Vata and Kapha.

Discussion on Overall Effect of the Therapies:

For Group A, out of 20 subjects, 8 children (40%) got complete reduction of symptoms, 6 children (30%) showed marked improvement, 4 children (20%) shows moderate improvement, while 2 children (10%) had mild improvement. Whereas, for Group B, 3 children (15%) showed complete reduction, 4 children (20%) marked improvement, 8 children (40%) shows moderate reduction, 4 children (20%) shows mild reduction while 1 subject (5%) was observed with no reduction.

Discussion on selection of the drug

The disease Kaphaja pratishyaya is primarily produced due to vitiated Vata and Kapha which leads to Sirogaurava, Nasasrava, Galakandu, Nasakandu, Kasa, Aruchi etc. While selecting the drugs to treat, this should have the properties of alleviating Vata and Kapha. Considering these points, Chitrakahareetaki avaleha and Darvyadi dhoomavarti was selected for the study. Both drugs were taken from Yogaratnakara, Nasaroga chikitsa.

Discussion on selection of treatment modality [9]

While treating the Kaphaja prathishyaya, special attention should be given to the stages of the disease because the treatment approach of Amavastha, Pakwavastha and Dushta stages are entirely different. The medicines used in each of these stages will also be different. Along with the medicines if Pathyapathya is also prescribed in the line of treatment for the disease, it will go long way to improve the quality of life and immunity. Following points need better consideration during the treatment fixation. Long standing nature of the disease, puts the subject in an immune compromised state. Subject will be in a physical and mental challenged condition due to the symptoms like watery nasal discharge, heaviness of the head, throat itching, nasal itching etc. Chronic simple rhinitis must be regarded as a serious condition; because it can impact negatively affects the quality of life as well as produce complications. Long-term drug administration and diet restriction make the subject weak. By considering all these factors it can be concluded that our approach should treat the disease condition, as well as promote the immunity, physical and mental health of the subject.

Discussion on mode of action of drugs

Chitrakahareetaki Avaleha[7]

The causative factor for the production of complete etiopathogenesis of the disease, Kaphaja pratishyaya are Agni, Dhatus, Doshas, Vyadikshamatwa sakthi etc. So the ultimate aim of the treatment should be correcting in all this

involved factors. The concept of Agni is important in Ayurveda. Disturbances of Agni results in Ama formation which by itself may culminate in various. To sketch the mode of action of a drug it is also imperative to look into the Rasapanchaka or the properties by which it acts, screening the Rasa of the ingredients of Chitraka Haritaki Avaleha that Katu, Tikta, Katu Vipaka subsides the Nasa Kandu, Nasasrava, Kasa, Gala kandu, Agnimandhya etc. The drugs which were predominant of its Madhura Rasa and Madhura Vipaka, Snigdha, and Guru guna also elevates Vata. Among the functions ascribed to Madhura Rasa are Brimhana, Jeevana and Balya. These properties are very much favorable for building up tissues and may increase the Vyadhikshamatva and alleviate disease by its Vatapitta hara property. The rasayana effect of Chitrakahareetaki Avaleha was not be evidenced may be due to the short duration of drug administration. The Gunas present in the ingredients of the selected drug are Laghu, Ruksha, Tikshana are elevating Nasasrava, Kasa etc symptoms. Whereas Snigdha and Guru gunas acts as Balya, Tarpana and Brimhana. Virya is dominated by Ushna which has been also mentioned to be causing Vatakapha Shamaka, Pachana, Deepana etc actions.Chitraka has the inherent basic properties to digest Ama and also is the drug of choice for Deepana and Pachana. Chitraka has Katu vipaka and Ushna veerya, these properties help in digesting the vitiated Kapha. Chitrakahareetaki Avaleha contain Dashamoola, is known to alleviate Kapha and Vata hara. The Guda is also having important actions like Vataghana, Balya, Vrishya etc. It also contains Tri-katu Pippali, Maricha, Sunti are having Vata Kapha hara Dipana and Pachana properties. Yava Kshara helps in the penetration of the medicine to the target site.

Discussion on Dhumapana

Dhumapana is an old age practice in Indian System of medicine. Acharya Susrutha has explained in detail about Dhumapana. Acharya Charaka mentioned Dhumapana in Charaka chikitsa 5th chapter. In Sarangadhara samhitha, appropriate age for Dhoomapana was mentioned, it can start from 12 year up to 80 years. In the present study, age was taken in between 12 to 16 years. In view of Acharya Charaka, for Kaphaja vikaras, Vairechaka dhoomapana is indicated. Similarly, the period when Kapha get vitiated is the time suited for Vairechanika Dhoomapana, by considering this Darvyadi dhoomapana was advised at morning time. Dhumapana itself is Ruksha and Tiksha in nature, it may probably reduce the symptoms Nasasrava, Sirogaurava. Dhumapana had an immediate and local action on the nasal mucosa, helps in relieving Galakandu and Nasa kandu. Use of Dhuma helps to subside the Kapha dosha and clears the srotasas of the Urdwajatru.

CONCLUSION

The effect of both therapies on the symptom of Kaphaja Pratishya was significant expect in swollen turbinate, it was found insignificant in Group B. However, the combined group has provided comparatively more significant, which shows that for complete cure of the symptoms of Kaphaja Pratishyaya both the internal and external medication are necessary. Both the group shows significant result, but better result was found in Group A when compared to Group B. Group A shows a significant reduction of symptoms on the 7th day of treatment, it shows the added effect of Darvyadi Dhoomavarti. Evaluating all the results of the study it can be concluded as, there is significant effect of Darvyadi Dhoomapanam with Chitrakahareetaki Avaleha over Chitrakahareetaki Avaleha alone in Kaphaja Pratishyaya.

ABSTRACT

The aim of navigating regulatory hurdles in medical devices is to ensure that these products meet the necessary safety, effectiveness, and quality standards required by regulatory bodies, while facilitating timely access to the market. This process involves complying with local and international regulations, adhering to rigorous testing and documentation requirements, and addressing any potential risks associated with device development, manufacturing, and use. Ultimately, the goal is to achieve regulatory approval efficiently without compromising patient safety or product performance, thereby enhancing innovation and trust in medical devices within healthcare systems. Comprehending these regulatory environments is crucial for businesses looking to effectively and securely introduce cutting-edge medical products to the market. Finally collected the total number of medical devices approved from the year of 2022 to 2024 in U.S and E.U and results are Given in the graphical representation.

Keywords: Regulatory Compliance, Medical Device Approval, FDA (Food and Drug Administration), CE Marking.

INTRODUCTION

Since there are several regulatory organizations across the world that monitor the marketing of medical devices, it is challenging to provide a universal meaning for the term[1]. Even while these organizations frequently work together

and debate the definition generally, there are minor variations in phrasing that hinder a worldwide standardization of the concept of a medical device; as a result, the proper definition of a medical device varies by location. Since the two have distinct regulatory requirements, it is common for the definition of a medical device to include a section that aims to distinguish between medical devices and pharmaceuticals.[2] In vitro diagnostics are frequently acknowledged as a subtype of medical devices in definitions, and accessories are classified as medical devices. Medical gadgets are crucial for clinical decision-making and for enhancing patient outcomes. As a result, important performance metrics and objectives are met, including the Sustainable Development Goal of the prosperity and health (SDG3). However, access to functioning, necessary medical equipment is restricted in low- and middle-income countries (LMICs) healthcare institutions. According to aresearch evaluating LMICs' access to necessary technology for safe birthing, [3]40% of medical equipment was non-functional when compared to high-income nations (HICs), where fewer than 1% of medical equipment is broken This discrepancy results from LMIC hospitals' reliance on imported equipment, of which 80% is donated, as well as inadequate maintenance and usage training. This, in turn, makes equipment unreliable for prompt illness diagnosis, prevention, monitoring, and treatment, exacerbating disparities in general health outcomes that lead to the high death rates in LMICs. Creating internal mechanisms in LMICs to lessen reliance on imported medical technology might help close this gap, particularly in dire circumstances like COVID 19. When COVID-19 was declared a worldwide pandemic in March 2020, a number of HICs prohibited the importation of vital medical supplies, including such as patient monitoring and mechanical ventilators making it impossible for many LMICs that mostly depend on imported medical equipment to effectively care for critically ill COVID-19 patients.[4] Medical devices are tools, machinery, implants, or other apparatus used for the diagnosis, treatment, monitoring, or prevention of medical diseases. They vary from basic instruments like bandages and thermometers to sophisticated technological advancements like robotic surgical systems, pacemakers, and MRI scanners. In addition to helping the medical community deliver better treatment, these technologies are essential for improving patient outcomes and healthcare efficiency. Health authorities oversee the safety, effectiveness, and quality of medical equipment, emphasizing that they adhere to strict guidelines for patient safety.

Stages of Processing Medical Devices IN U.S [5]

About 1,700 distinct generic device types have been classified by the Food and Drug Administration (FDA), which has categorized them into 16 medical specialties known as panels. Depending on the degree of regulation required to ensure the device's efficacy and safety, each of these generic device types is placed into one of three regulatory classes. The following are the three classes and the prerequisites for each:(figure 1). Among other things, the sort of premarketing submission or application needed for FDA authorization to commercialize your product depends on the class to which it belongs. A 510k will be needed for marketing if your device is categorized as Class I or II and is not exempt. The restrictions on exemptions apply to all devices that are categorized as exempt. 21 CFR addresses the limitations of device exemptions; Parts 862–892. Unless your device is a pre-amendments device (one that was on the market before the medical device amendments were passed in 1976), Class III devices must have a premarket approval application (PMA). or significantly comparable to such a device), thus PMAs have not been required. A 510k will be the path to market in that scenario. Device categorization is based on both indications for use and the device's intended usage. As calpel, for instance, is designed to cut issue. In addition, categorization is risk based, that is, the danger the device poses to the patient and/or the user is a key factor in the class it is allocated. Devices in Class I are the least dangerous, while those in Class III are the most dangerous. All device classes are subject to general controls, as previously mentioned. The fundamental standards of the Food, Drug, and Cosmetic (FD&C) industry are known as general controls. Act that apply to all medical devices, Class I, II, and III. (Table 1) Certain steps must be taken during the medical device development process to guarantee design control and ensure that the final product is both safe and effective. Consequently, this encompasses the full product development cycle, from risk management to manufacturing, clinical trials, and medical device design. [6] For instance, the FDA outlined five steps for processing medical devices in order to get them ready for sale. "The methods used in, and the facilities and controls used for, the design, manufacture, packaging, labelling, storage, installation, and servicing of all finished devices intended for human use" are governed by its quality system regulation (QSR), which is comprised of these steps.(Figure2,3,4)

Stages of Processing Medical Devices In EU:[8]

Equipment or goods designed for medical use are known as medical devices. To prove that they full fill regulatory standards to guarantee their safety and functionality, products must go through a conformance evaluation in the European Union (EU). Although they are subject to EU Member State regulation, the European Medicines Agency (EMA) is involved in the process. After a medical gadget passes a conformance evaluation, manufacturers are able to stamp it with the CE (Conformité Européenne) mark. An audit of the manufacturer's quality system and, depending on the kind of device, a study of the manufacturer's technical documentation regarding the device's performance and safety are often part of the conformance assessment. Accredited notified entities are designated by EU member states to carry out conformance evaluations. Before awarding a CE certificate for some high-risk items, notified authorities are required to seek the opinion of particular expert panels. EMA provides technical and scientific support to these expert committees. Before granting a CE certificate, the notified body may occasionally need to get a scientific opinion from EMA. For several types of medical devices, 0EMA has distinct regulatory obligations, including. (Table2)

Role of EMA; - [9]

The quality, safety, and effectiveness of marketing authorization applications evaluated through the centralized process, including the performance and safety of a medical device in connection with its usage with a pharmaceutical product, are all evaluated by EMA. The medical device may be a part of the pharmaceutical product, be purchased independently from it, or be co-packaged with it. (Figure-3)

METHODOLOGY

The regulatory procedures involved in the approval of medical devices in the US and the EU are examined in this study using a qualitative research methodology. The following crucial stages make up the methodology's structure:

LITERATURE REVIEW

To determine the main regulatory frameworks, rules, and requirements for medical device approval in the US and the EU, a thorough analysis of the body of available literature is carried out. In addition to examining scholarly papers, business reports, and legal texts that address regulatory needs and difficulties, this entails looking over official documents from the European Medicines Agency (EMA), the European Commission, and the U.S. Food and Drug Administration (FDA).

Comparison of Regulatory Processes

The approval procedures in the two areas are compared. Classification systems, submission types (such as 510(k), PMA in the US and CE marking in the EU), clinical evidence criteria, approval timescales, and post-market surveillance duties are some of the important elements that are the subject of this research. The study also looks at how the regulatory processes for high-risk and low-risk devices differ, as well as the effects of recent regulatory changes like the European Union's Medical Device Regulation (MDR) update and the U.S. FDA's breakthrough device designation.

Analysis of Case Studies

To highlight the practical difficulties faced by manufacturers, a number of case studies of recent medical device approvals in the US and the EU are examined. The purpose of these case studies is to draw attention to devices that encountered major regulatory obstacles, such as licensing delays, issues achieving clinical evidence criteria, or difficulties adhering to new rules. The case studies shed light on real-world problems, such as how to interpret regulatory guidelines and how changes to regulations affect the approval process.

Interviews with Industry Experts

Key players in the medical device sector, legal specialists, and regulatory affairs specialists participate in semi-structured interviews. The purpose of the interviews is to obtain professional opinions on the difficulties manufacturers have while negotiating regulatory obstacles and methods for guaranteeing adherence and accelerating approval. Perspectives on current developments in regulatory reform and the changing regulatory environment in both areas are also offered by the interviewees.

Data Synthesis and Analysis

The findings from the literature review, regulatory comparison, case studies, and interviews are synthesized to identify common themes, challenges, and opportunities for manufacturers in navigating the regulatory pathways for medical device approval. A framework is developed to guide companies in addressing key regulatory hurdles and optimizing their approval processes in both the U.S. and E.U.

Recommendations for Stakeholders

Based on the analysis, the study provides actionable recommendations for medical device manufacturers, regulatory agencies, and policymakers to improve the efficiency and clarity of the approval processes. This includes suggestions for streamlining submission processes, enhancing communication between regulatory bodies and manufacturers, and ensuring that the evolving regulatory requirements are met without compromising patient safety.

RESULTS

If u see the Below Graphes it mainly explains about how many drugs are approved and out of that how many are the medical devices in the year 2022 total drugs are 55 in that only 41 are the medical devices and in the year 2023 total drugs are 65 in that medical devices are 51 and whereas 2024 total drugs are 42 in that 25 are the medical devices (Figure 4,5,6,7) If u see the above Graph it explains about that how many medical devices are recalled from the 2022-2024 if you see in the year 2022 60medical devices are recalled and where as in the year 2023 63 medical devices are recalled and in the year of 2024 93 medical devices are recalled.

Outstanding challenges in medical device regulation in the US and Europe.[15]

Both the US and European systems face similar issues in effectively regulating medical devices. Ensuring public health and certifying effectiveness of high-risk technologies requires robust evidence and review systems, which is now a significant concern. Device regulation applies in both the United States and Europe. In the US, there are concerns that many high-risk gadgets are examined using less rigorous review methods.3 Over the past decade, just about 2% of medical devices have received PMA.21 According to a GAO study22, only 79% of Class III devices passed PMA from 2003 to 2007, with the rest going through the 510(k) procedure. Unlike PMA, 510(k) filings often do not require direct evidence of safety and effectiveness, and only a small percentage have clinical data (10-15%).23 Furthermore, devices deemed substantial. Devices that were previously cleared by the FDA do not require premarket approval, even if they were not evaluated for safety and effectiveness. recalled due of a significant safety flaw.24 In a study of high-risk recalls in the US, 71% were cleared through the 510(k) process, while the remaining 7% were excused from review.25 Quality difficulties are also present, in addition to the quantity of strong evidence. The FDA found that over 50% of 510(k) submissions had quality issues, such as incomplete or missing device descriptions and indications.

E.U Results

If u see the Below Graphes it mainly explains about how many drugs are approved and out of that how many are the medical devices in the year 2022 total drugs are in that only 50 are the medical devices and in the year 2023 total drugs are in that medical devices are 96 and whereas 2024 total drugs are in that 116 are the medical devices (Figure 8,9,10,11**)**

If u see the above Graph it explains about that how many medical devices are recalled from the 2022-2024 if you see in the year 2022 409 medical devices are recalled and where as in the year 2023 389 medical devices are recalled and in the year of 2024 291 medical devices are recalled.

Reasons for the Recall of medical devices in USA: [20]

Mighty Bliss Electric Heating Pads
Following consumer complaints of Mighty Bliss electric heating pads burning their skin, overheating, sparking, burning, or exhibiting other electrical issues, Whele LLC is recalling the device.

Lumen Central Venous Access and Pressure Injectable
The Arrow MAC Two-Lumen Central Venous Access Kits and the Arrow Pressure Injectable Arrowgard Blue Plus Three-Lumen Central Venous Catheter (CVC) Kits are being recalled by Teleflex and their subsidiary Arrow International, LLC due to the possibility of a cross-lumen leak brought on by improper connections between the top and bottom housings of the Micro Clave Clear Connectors that are part of the kits.

Omnipod DASH Insulin
Following reports of PDM battery problems, Insulet is recalling the Personal Diabetes Manager (PDM) from the Omnipod DASH Insulin Management System. These problems include: Swelling of batteries battery fluid leaks excessive heat that might be a fire hazard

Cordis US Corp Recalls INFINITI Angiographic
The INFINITI Angiographic Catheter is being recalled by Cordis US Corp. because some of the goods were sent to customers without being sterilized. The manufacturer intends for the INFINITI Angiographic Catheter to be sent sterile straight to a third-party distributor, who will then transport the device to final consumers, including hospitals.[21]

Incubator/Warmer Correction
The usage instructions for the Giraffe OmniBed and Giraffe OmniBed Care Station are being updated by GE HealthCare and its subsidiary Datex-Ohmeda Inc. in response to allegations that the warmer heater doors may fall loose due to improperly tightened screws. A High Priority alert is triggered and canopy movement is halted if doors come loose. Users risk damaging the doors and maybe having them collapse on the patient if they try to push the canopy to continue moving.

Chest Compression Device Recall
The RMU-2000 ARM XR Chest Compression Devices are being recalled by Defibtech, LLC because of a motor issue that might prevent compressions from continuing. Serious negative health effects, such as patient injuries, therapy delays, and death from a lack of compressions to move oxygen throughout the body, can result from using the impacted product.[22] One person has been reported injured, and one person has died.

Reasons for the Recall of medical devices in EU
Medical device recalls in the European Union (EU) can happen for a variety of reasons, with safety being the primary concern. Recalls are issued when a medical device is found to pose a risk to patient health or fails to meet regulatory standards. Below are some of the most common reasons for medical device recalls in the EU:
1. **Safety and Performance Issues:** Devices that fail to perform as intended or malfunction during use can lead to recalls. This could be due to design flaws, manufacturing defects, or problems with the materials used in the device. For example, infusion pumps that deliver incorrect dosages or pacemakers with battery malfunctions [23]

2. **Injury or death risks:** : Devices that cause injury, illness, or death due to defects or inadequate design. For example, faulty surgical instruments that break during procedures or implants that fail to properly integrate with the body.

3. **Sterility and Contamination Issues:** Medical devices that come into direct contact with patients (such as surgical instruments, catheters, or implants) must be sterile. If a device is found to be contaminated with bacteria, viruses, or other pathogens, it could lead to infections and other serious health issues [24]

4. **Labelling and Instructions for Use (IFU) Errors**
   Medical devices that have incorrect or incomplete labelling may lead to incorrect use or misinterpretation by healthcare professionals. For example, dosage information on drug delivery systems, or instructions for use of surgical devices, can lead to misuse.

5. **Unexpected Device Interactions:** Medical devices that interact with other equipment, such as diagnostic tools or monitoring systems, may be recalled if the interaction leads to failures or compromised patient safety. For example, a device might cause incorrect readings on patient monitors or fail to integrate with hospital networks[25]

CONCLUSION

Before medical devices may be sold, they must pass a rigorous and complicated approval process that guarantees their efficacy and safety. Although both the US and the EU have strict regulatory regimes, their methods, purviews, and specifications are different. The regulatory barriers to medical device approval in the US and the EU will be compared in this talk, with an emphasis on the main issues, variations, and new developments in each area. Manufacturers face numerous obstacles while navigating regulatory barriers for medical device approval in the US and the EU, ranging from the intricacy of the approval processes to the need for clinical evidence and post-market surveillance. Although ensuring safety and effectiveness is a goal shared by both areas, their methods vary in terms of procedures, specifications, and deadlines. To thrive in both cutthroat and heavily regulated sectors, producers must remain alert and flexible as both markets change to meet new technological advancements and regulatory requirements.

CONFLICT OF INTEREST
The authors have no potential conflict of interest regarding this Investigation.

ABSTRACT

This review paper reviews the natural language analysis and processing progresses made so far, based on recognition and sentiment extraction. Along with the increasing importance of user experience and human-computer interaction, being able to understand and then respond well to natural language has now become a necessity that has urged the development of diversified techniques and algorithms, namely syntactic and semantic analysis, machine learning, and deep learning. These approaches enable tasks such as entity recognition, sentiment and emotion extraction from text, and interpreting user intent. The paper also explores the challenges and constraints of natural language processing, including handling ambiguity and maintaining context sensitivity. In addition, it outlines the vast applications of natural language processing in sectors such as healthcare, finance, and social media. It briefly represents the state of natural language processing in terms of recognition and sentiment extraction and also touches the current challenges along with promising lines of research.

Keywords: Sentiment, Opinion, Data Analysis, Natural Language processing

Shaym Viththalani and Krunal Patel

INTRODUCTION

The growing significance of human-computer interaction has elevated natural language processing (NLP) to a prominent position in information technology. Natural Language Processing (NLP) is the computational modelling and analysis of human language, with various applications in machine translation, email spam detection, information extraction, summarization, medical uses, and question answering. This review paper focuses on NLP for recognition and sentiment extraction, which has captured the attention of academics, businesses, and governments. The paper examines the different phases and levels of NLP and its components, the development and history of NLP, and its current applications, including sentiment analysis. The technologies of machine translation and text summarization provide opportunities for people from different cultures and socioeconomic backgrounds to have access to education and information. NLP techniques are used in information extraction to help users find the information they need within the vast amount of data available on the internet. The paper also discusses the potential of opinion mining and sentiment analysis for businesses and governments to understand public opinion on products, government activities, and public discussions. The main objective of "Natural Language Processing (NLP)," a subfield of both linguistics and artificial intelligence, is to teach machines how to understand human-written language. The development of "natural language processing (NLP)" has as its major focus the simplification of the user experience and the fulfilment of a long-held desire of users to be able to communicate naturally to their computers. "NLP" was developed to assist those who do not have the time to become skilled in machine-specific language. This is due to the fact that not all users are fluent in this language. One way to look at a language is as a collection of symbols, while another way to look at it is as a set of rules. When information is sent by transmission or broadcast, frequently a mix of symbols is involved. The oppressive nature of norms has a negative impact on symbols. The two subfields of "Natural Language Processing," "Natural Language Comprehension" and "Natural Language Generation," each add to the creation of novel approaches to understanding and producing text. (Fig. 1). Phonology is the way sounds are produced; morphology, the formation of words; and semantics, meaning and use.

Pragmatics is the most important role in interpreting the syntax and meaning of sentences. Noam Chomsky is the most influential theoretical linguist, especially with respect to syntax. Syntax is broadly categorized into two main levels: speech recognition is at the top level, and natural language is at the bottom. Natural Language Processing includes co-reference resolution, discourse analysis, machine translation, morphological segmentation, named entity recognition, optical character recognition, and part-of-speech tagging among other tasks in the area of automated summarization. These tasks are for summarizing large volumes of text, named entities identification, grammatical element identification, and translating text from one language to another. The objective of natural language processing (NLP) is to modify a language model to suit the requirements of a particular program or system. NLP is a field that studies the algorithmic structure that enables the integration of language interpretation and output. Additionally, it has several applications in multilingual event detection [1]. To extract cross-lingual events from texts written in Gujarati, Hindi, English, Dutch, and Italian, a new modular technique is recommended. Separate pipelines for each language would be developed in this approach. The system incorporates some of the most advanced multilingual NLP features currently available, and each feature may be enabled or disabled independently. The pipeline combines fundamental NLP processing components with those for more complex tasks, such as connecting named entities across languages, labelling semantic roles, and normalizing time passage. These are some of the pipeline's responsibilities. Since the pipeline's design supports several languages, it can translate not just names but also dates, locations, and times, as well as the links between them. The output from each pipeline's processing is fed into a larger system designed to generate event-centric knowledge graphs. Each module in the pipeline works like a UNIX pipe: it takes data from the standard input, applies annotations to it, and then passes the annotated data to the standard output. Pipelines are created using a data-centric design that employs replaceable component parts. The architecture is modular, allowing it to be adaptable and flexible to a range of different configurations and distribution strategies. Researchers in the fields of computer science, linguistics, psychology, and philosophy have all expressed interest in "Natural Language Processing"; nevertheless, computer scientists are responsible for the majority of the work in this field. The contribution that "NLP" makes to our capability to grasp language is one of the most

95160

Shaym Viththalani and Krunal Patel

intriguing aspects of this field. The difficult task of teaching computers to understand human language is the focus of the branch of computer science known as natural language processing. One of the primary obstacles that natural language presents is ambiguity. This issue is often resolved at the syntactic level, with additional subtasks involving the investigation of existing words from a lexical and morphological perspective, as well as the creation of new terms. Reading the entire text is required in order to interpret any ambiguities, [2] regardless of whether they are contextual, semantic, or formal. In an effort to provide clarity to the situation, techniques including "Reducing Ambiguity," "Preserving Ambiguity," "Interactive Disambiguation," and "Weighing Ambiguity" may be used [2,3,4] Preserving ambiguity is one approach of reducing ambiguity that has been the subject of substantial research and is utilised by researchers. The objectives are analogous to the ones from the previous one; they span a wide range of ambiguity, and the technique for achieving them includes a statistical component implicitly.

NLP LEVELS
One of the most straightforward ways to explain natural language processing is by referring to its 'language levels.' Through the processes of content planning, sentence planning, and surface realisation, these stages help with text generation. The second illustration in Figure: The study of the meaning of language, the context of language, and the many different kinds of language is known as linguistics. The following are examples of words that are included in Natural Language Processing terminology:

Phonology
The classification of phonemes is the main subject of the branch of linguistics known as phonology. Phonology is the study of sound and language; the prefix phono- relates to the human voice, and the suffix -logy means "-logy" or "-logy." Lass (1998) argued that the term "phonology" should be used to refer more generally to the sounds of language, rather than just to the sub-field of language study; alternatively, "Phonetics is the branch of linguistics that studies how sounds work and how they are structured within a language." Phonology was defined in 1993 by Nikolai Trubetzkoy as "the study of sound as it relates to the language system." However, Lass (1998) argued that the term "phon", it covers the manner in which the sounds of each language are used to communicate meaning [5].

Lexical
The individual words that make up Lexical may be comprehended by both humans and machines that do natural language processing. One type of processing that enhances comprehension at the word level is the act of assigning a part-of-speech tag to each individual word. According to the setting in which they are located, words that are capable of being interpreted in a variety of ways are classified as belonging to particular parts of speech. Words with a single meaning can sometimes be used in the lexicon in place of more complicated semantic representations. The representation of an NLP system takes on a different form depending on the semantic theory that is used by the system.

Semantic
The widespread misconception that only the semantic level can convey meaning is incorrect; meaning may be communicated on all levels. Semantic processing is able to discern the many different meanings that may be attributed to a phrase by analysing the links that exist between the various words that make up the phrase. Words that may be understood in more than one way can profit from the semantic disambiguation that occurs during this level of processing, just as they do from the syntactic disambiguation that occurs during the syntactic level of processing. The word "file" has many diverse meanings, such as a binder for storing papers, a nail file for shaping fingernails, or a queue of individuals waiting in line. The dictionary report and the sentence context report both use the semantic level of the terms from the survey. [47] The majority of words have many accounts, but by analysing the context in which they are used, we may figure out which one is most suitable[6].

Morphology
One is able to dissect the meaning of a word into ever-more-granular components, which are known as morphemes. Morphemes are the driving force behind the field of morphology, also known as the study of how words function.

Shaym Viththalani and Krunal Patel

The word "precancellation," which consists of the prefix "pre," the root "cancella," and the ending "-tion," is an illustration of a morpheme. Because the term "morpheme" has a broad definition, it is feasible to break down any given word into the various morphemes that make it up in order to have a deeper understanding of the meaning of the word. The addition of the -ed ending to a verb gives the impression that the action it describes occurred at some point in the past. In the lexicon, morphemes are words that continue to have their own meaning even when they are not combined (e.g.: table, chair). Words that end in a grammatical morpheme (such as -ed, -ing, -est, -ly, and -ful) and words with specific suffixes are examples of lexical morphemes (eg. Worked, Consulting, Smallest, Likely, Use). Grammarians refer to the combination of these two morphemes as a "bound morpheme" (eg. -ed, -ing). Moreover, morphemes can be further separated into two other classes: bound morphemes and derivational morphemes.

Syntactic

To determine the syntax of a statement, we analyse it by breaking down this word by word. And now, at this step, a grammar and a parser become essential elements for the process. In general, this produces an annotated representation of the statement of structural relationships between the words as that has been processed so far; however, grammars have a limit. Some NLP applications do not need the parsing of full phrases. While prepositional phrase attachment and conjunction analysis are problems that remain unsolved, requests involving clausal and phrasal dependencies are now better processed. Syntax is crucial to convey meaning because it is an order- and dependency-sensitive. Meaning in most language families is structured through syntax. Consider, for example the phrases "The cat chased the mouse" and "The mouse chased the cat." Their linguistic structures differ only slightly, yet they mean completely opposite things.

Pragmatic

Pragmatics examines the use of language in context to comprehend a document's goal and elucidate how implicit meanings are derived from texts. It was vital to have a comprehensive comprehension of the global backdrop, as well as an awareness of the objectives, intents, and tactics that people had. The anaphoric "they" in the next two lines have both set very ambitious [17] objectives for themselves, but in order to accomplish those goals, the speakers will need to have a comprehensive knowledge of both local and international issues.

Discourse

Discourse-level natural language processing relies on units at the paragraph and essay level rather than the sentence-level units employed by syntax and semantics. These higher-level units are necessary for the processing system to function properly. This would suggest that it does not recognise texts with several sentences as a group of independent sentences. In contrast, the focus of attention in discourse is on the entire piece of writing, with the meaning being conveyed through the links that are made between the phrases. Resolution of anaphora and resolution of entities are two of the most common processes in the process. When a term is employed in a setting where it does not have a direct semantic counterpart, anaphora resolution includes replacing the term with the noun to which it refers [17]. Study of the Text and Recognition of the Conversation - Once the text and discourse's organisational structure are recognised, the text's sentence functions are rearranged to better accurately reflect the text.

NLP: HISTORY

Although while work on machine translation (also known as MT) had started in the late 1940s, the phrase "machine translation" didn't become common usage until much later. The research that was done at this time wasn't carried out in a vacuum. Although other languages, such Chinese, were employed, the two most common languages used for MT were Russian and English (Booth, 1967) [8]. According to a study published by ALPAC in 1966, the academic subfield of MT/NLP studies appeared to be in its latter stages of existence. Nonetheless, customers eventually received the finished product that was produced using some MT production systems [9]. At this point in time, research projects examining the possibilities offered by computers in the fields of linguistics and literature were already under progress. As early as 1960, artificial intelligence began to have a discernible impact on the Q-A systems [11] used in baseball. It was generally agreed upon that LUNAR [10] and Winograd SHRDLU, with their more

95162

sophisticated capacities to handle language and tasks, were the inevitable successors to these systems. It was widely considered that advancement was only conceivable in two domains: the Other significant system development projects that created database front ends include the ARPA Speech Understanding Research (SUR) project. The overall goal of these front-end [12] initiatives was to outperform LUNAR in terms of how large datasets were handled. Research on computational grammar theory blossomed in the early 1980s, along with research on logics for meaning and the capacity of knowledge to fit the user's ideas and intents, and other related fields of study. Towards the end of the decade, robust general-purpose sentence processors, including SRI's Core Language Engine [13] and Discourse Representation Theory [14], offered a way to deal with longer speeches within the parameters of grammatico-logical analysis. There were more residents there over the course of this time. A number of other beneficial materials, grammars, tools, and parsers are also made available, in addition to the Alvey Natural Language Tools 15. In addition to the issues discussed, the DARPA voice recognition and message understanding information extraction conferences were distinguished by their focus on rigorous evaluation, a practice that became prevalent in the 1990s. [16, 17] In addition to their work on discourse structure serving, [19] the team also did some research on user modeling, [18] which was one of the topics of the study piece. Concurrently, as McKeown [19] has shown, there are rhetorical schemas that can be utilised to generate material that is logically sound and successfully delivers its point. These schemas may be used to create content that is logically sound and effectively conveys its message. Other NLP research has brought to light a number of important challenges, two of which are word sense disambiguation [20] and statistically coloured probabilistic networks. These are only two instances of the pressing issues that have been brought to light. Both studies on natural language processing and lexicography pointed in this general direction. When statistical language processing first gained popularity in the 1990s, its practitioners consisted of a much wider range of individuals than only those who worked in the field of statistics. In addition to that, information extraction and automated summarization [21] were major focuses. The majority of current research has been on semi-supervised and unsupervised learning approaches.

TASKS THAT MATTER

Many academics made major contributions to the development of NLP by establishing a wide variety of approaches and tools pertaining to the field. NLP research has been productive due to the availability of useful techniques like as emotion detection, sentiment analysis, named entity recognition (NER), chunking, and POS tagging. Named entity recognition (NER), semantic role labelling, and named entity recognition are other strategies (NER). The sentiment analyser's [21] main duty is to solicit opinions from users about a particular topic. Sentiment analysis is the act of gathering words that are relevant to a particular topic, identifying general sentiments, and creating linkages between concepts. The two linguistic resources that are used in the sentiment analysis process are the sentiment lexicon and the sentiment pattern database. It accomplishes this by searching the articles for both positive and negative terms before attempting to calculate a score that is between -5 and +5. In addition to European languages, research is being done to create parts of speech taggers for Arabic, Sanskrit, [22] Hindi, [23], and other languages. It is very amazing how precisely words can be labelled and arranged into categories like nouns, adjectives, verbs, and so on. While most part-of-speech approaches work rather well in European languages, they are entirely useless in Asian and Middle Eastern languages. Those who tag Sanskrit parts of speech favour the treebank method in particular. Arabic basic phrases are automatically tokenized, part-of-speech tagged, and annotated using the Support Vector Machine (SVM) [24] technique. By identifying phrases that are syntactically linked, such as "Noun Phrase" and "Verb Phrase," shadow parsing is a sort of sentence segmentation that locates sentence pieces. The term "chunking" is also frequently used to describe this form of text fragmentation (NP or VP). To indicate whether a word is at the start of the chunk or in the middle, it is given either a Begin Chunk (B-NP) tag or an Inside Chunk (I-NP) tag. The CoNLL 2000 shared task is used frequently to evaluate chunking. The data required to assess Chunking may be obtained in CoNLL 2000. As a direct consequence of this, a few novel approaches have surfaced in the intervening time [25,26,27] and an F1 score of around 94.3 percent Words, point-of-sale labels, and many other identifiers are all features of these systems. When applied outside of an academic setting, where individuals are less likely to speak Standard English, Named Entity Recognition (NER) might be challenging to implement successfully. As a direct consequence of this, the performance of traditional NLP tools is substantially worse than usual. We are able to annotate words or tweets by constructing systems that have been trained on unlabeled data from inside the domain as well as data from outside the domain. It

95163

Shaym Viththalani and Krunal Patel

displays a considerable improvement when compared to natural language processing systems that are considered to be industry standard. With the exception of its ability to identify emotions in postings that have been written in a mix of two languages—in this case, English and any other language spoken in India—Emotion Detection [28] conducts operations that are analogous to those of sentiment analysis. By using emotional states, it is possible to group utterances into these six categories. They first ascertained the native tongue of the speaker in order to achieve this. This allowed them to identify the lexical category or sections of speech written in mixed script and to distinguish between terms with comparable implications in Hindi and English. SRL will assign a sentence a semantic function to aid in analysis. The Prop Bank [29] formalisation assigns a specific role to each word that acts as a verb's argument. A statement with several verbs may have many tags since the verb frame defines the specific arguments. State-of-the-art A system must first construct a parse tree, then decide which nodes correspond to the arguments of a specific verb, and then classify the nodes in the parse tree. The approach in Discovery: Events in social media 30 is graphical to analyse the social media feeds for real-world events, including the references to individuals, locations, and timestamps. Even with irrelevant noisy messages and highly inconsistent language in the posts, the model was able to accurately extract event records from these noisy data streams through a multi-message aggregation strategy. Yet a much wider scope of feature components could help make the results even more effective.

NLP: CURRENT SCENARIO
In the following paragraphs, we will talk about some of the most recent advancements in NLP projects that have been carried out by various companies:

[31] The Role that Natural Language Processing will have in the Future of Business Intelligence
Numerous companies in the business intelligence (BI) industry are working hard to catch up with the times by exerting significant efforts to make data analysis simpler and more user-friendly. Having said that, there is still a long way to go, one won't even require a graphical user interface in order to access the data when you're using BI. Mainly because the majority of inquiries asked on mobile devices these days are posed in the form of text or voice commands. You can get the forecast for tomorrow's weather on Google, for example, right now. We will soon be able to ask our own personal data, which will be portrayed by a chatbot, about current consumer sentiment as well as our evaluation of the company's brand in a week while we are out and about. Natural language processing, often known as NLP, is primarily concerned with converting human speech into computer code at this point in time. Yet as time passes, technology will improve to the point where the computer becomes better at "understanding" the request, at which point it will start giving answers rather than search results, especially with reference to the AI component. You should expect the data chatbot to ask you a question like, "How have revenues changed over the last three quarters?" at first. before handing you reams of information to read. But rather than just giving you numerical data, once it comprehends the semantic connections and implications of the question, it will be capable of executing the requisite filtering and formulation to provide an answer that is comprehensible to you. The Pilot, the first earbuds that translate between languages, has finally arrived
Soon, people speaking 15 distinct languages will be able to place orders for Pilot, the first smart earpiece to be sold everywhere in the world [32]. Waverly Labs' Pilot, according to Spring Smart, can now transliterate seven written appended languages in addition to the five spoken languages it previously supported (English, French, Italian, Portuguese, and Spanish). The Pilot's included earpiece uses Bluetooth to connect to the speech translation application. This programme translates spoken language using a number of different technologies, including [33] voice synthesis, [34] automatic speech recognition, [35] machine translation, language learning based on artificial intelligence, and machine translation. The user's second earpiece will provide them with the ability to hear a simultaneous translation of the speech. It is not even necessary for the users to communicate with one another; rather, they are free to carry on private chats with one another. Users may encounter a delay of a few seconds between speaking and having their words translated. Waverly Labs is working to eliminate this delay so that users do not have to wait as long. Pre-orders for the Pilot earpiece, which costs $249 and will be fulfilled in September, are being accepted right now. In addition to these functions, earbuds may play music, answer phone calls, and offer

95164

warnings. Link:https://www.indiegogo.com/projects/meet-the-pilot-smart-earpiece-language-translator-headphones-travel#/

Introduced by RAVN Systems, the GDPR Robot Facilitated by ACE

A software robot driven by RAVN ("Applied Cognitive Engine") has been released, according to the pros at RAVN Systems, a supplier of AI-based search and knowledge management solutions, and it is intended to make compliance with the [36] General Data Protection Regulation (GDPR) simpler. This software robot was created to simplify the GDPR-compliant data collection and processing of personal information. The Robot use artificial intelligence (AI) techniques to carry out thorough, automated analysis of data and documents contained in any corporate system subject to the General Data Protection Regulation (GDPR). Users may find, access, mark, classify, and report on data that complies with the GDPR's definition of highly sensitive information with ease. Users can search for personal information within documents, get updates of latest personal data that require attention, and generate reports of information recommended for destruction or protection. Users can also view feeds that highlight personal information that requires urgent attention. Data Subject Access Requests (DSARs) can be handled quickly and simply with the help of RAVN's GDPR Robot. Due of this, it is no longer necessary to employ a manual technique, which is frequently a time-consuming and unsuccessful strategy. "GDPR compliance is of universal paramountcy as it will exploit to any organisation that retain and handle data impacting EU individuals," claims Peter Wallqvist, chief security officer at RAVN Systems. "GDPR compliance is of utmost importance as it will exploit any organisation that owns and processes data pertaining to EU individuals," says the author. The Application of Natural Language Processing and Network Analysis to the Investigation of Medication Management and Therapy

An Introduction to Network Analysis and Natural Language Processing with a Focus on the Management of Pharmaceutical Treatment Creating a conceptual framework to analyse the impacts of various pharmaceutical treatment management procedures is what we mean when we use the word "research" (MTM). Both the MTM service model and the chronic care model were selected to serve as the parent theories for their respective models. The predominant subject of discussion in the abstracts of publications identified in Ovid Medline reviews is the administration of drugs for the treatment of chronic disorders (2000-2016). Using a Meta Map, we can draw out certain concepts from the abstracts, and then we can analyse the pair-wise co-occurrence of those concepts. The data is then used to create a graph of interconnected concepts, which is analysed to draw out important details for the developing conceptual framework. The framework is then developed. We examined the abstracts of 142 distinct publications [37]. Medication adherence, the component of pharmacological therapy that has drawn the most attention, has been related to the idea of patient-centered therapies with a focus on self-management. The revised model contains 65 concepts organised into 14 distinct structures. More research is required to modify and analyse the paradigm in order to ascertain whether it may be useful for a wide range of people and situations, especially those with low resources. Link: https://www.ncbi.nlm.nih.gov/pubmed/28269895?dopt=Abstract

Capital One has launched a chatbot called Eno, which is capable of understanding human language

Eno, a brand-new chatbot, has recently been made available by Capital One. Users are able to speak with one another through text using natural language thanks to Eno, which is a chatbot. According to Capital One, Eno is the first SMS chatbot developed by an American bank to assist natural language inquiries made by customers. Clients have the ability to connect with Eno through a text interface, during which they may ask inquiries regarding their money and other topics. By altering the environment, Eno gives the feeling that someone is communicating to you personally. According to Capital One's Vice President of Digital Product Development, Ken Dodelin, the business "kind of constructed a chatbot and didn't recognise it." To put it another way, this paves the door for a separate setting from which to launch chatbots in direct rivalry with those of other corporations. They feared that Facebook's access to user data would breach privacy rules in the United States, which are used to regulate financial firms. Each Facebook Page administrator can view all conversations with the bot, including word-for-word transcripts. False: If that were true,

95165

administrators would have unlimited access to their clients' financial data. Link:https://www.maco bserver.com/analysis/capital-one-natural-language-chatbot-eno/

ABSTRACT

Autism Spectrum Disorder (ASD) is a condition with rising prevalence, impacting individuals socially, emotionally, and academically. The growing number of cases, coupled with limited access to diagnosis and treatment, highlights the need for more efficient and widely available services. Many individuals with ASD face challenges in receiving proper care due to factors such as high costs, long wait times, and complex diagnostic processes. Recent advancements in artificial intelligence (AI) and machine learning (ML) offer promising solutions to these accessibility barriers. Research has demonstrated progress in utilizing MRI and EEG datasets to develop ML models for ASD diagnosis and the potential identification of biomarkers through supervised and unsupervised techniques. Additionally, AI algorithms capable of analyzing body language and physical behaviors may help assess ASD characteristics despite the disorder's heterogeneity. Beyond diagnosis, AI's adaptability holds potential for creating supportive tools to aid students with ASD in learning, emotional regulation, social communication, and adaptability. While further research is needed to confirm the effectiveness of these applications, many studies indicate significant promise in improving outcomes for children with ASD.

Keywords: Artificial Intelligence, Deep Learning, Machine Learning, ASD Diagnosis, ASD Treatment

Saroj Priyadharsini and Anbarasi

INTRODUCTION

Autism Spectrum Disorder (ASD) is a neurodevelopmental condition that encompasses a wide range of challenges, including difficulties with social skills, communication impairments, and rigid or restrictive behaviors [1]. These challenges often manifest in repetitive behaviors, difficulties in modulating speech volume, maintaining appropriate physical distance, and interpreting nonverbal cues such as gestures and facial expressions [2]. According to the Centers for Disease Control and Prevention (CDC), as of 2023, approximately 1 in 36 children (2.8%) aged 3–17 years in the United States have been diagnosed with ASD [2]. The symptoms of ASD vary depending on age, but in children, the disorder commonly leads to delayed development, affecting academic performance and social interactions compared to their neurotypical peers [3]. Furthermore, children with ASD frequently experience co-occurring developmental and psychiatric conditions, including a heightened risk of Attention-Deficit/Hyperactivity Disorder (ADHD), anxiety, depression, epilepsy, gastrointestinal issues, and sleep disorders [4]. The financial burden associated with ASD is significant, with the estimated lifetime costs averaging $1.4 million for individuals without intellectual disabilities and up to $2.4 million for those with intellectual disabilities [5,7]. Due to the wide range of symptoms and behaviors associated with Autism Spectrum Disorder (ASD), diagnosing the condition can be challenging, particularly in milder cases or when co-occurring conditions are present [6]. The heterogeneous nature of ASD further complicates diagnosis, as it encompasses a broad spectrum of individuals with varying presentations [6]. ASD diagnosis is often a costly and time-consuming process, with families frequently facing long waitlists before being evaluated by a professional [10]. As a result, many individuals remain undiagnosed until adulthood. Additionally, early misdiagnoses are common, with ASD sometimes being mistaken for conditions such as Attention-Deficit/Hyperactivity Disorder (ADHD), Obsessive-Compulsive Disorder (OCD), or Social Anxiety Disorder (SAD). Early diagnosis is critical, as it enables timely intervention and support for both the child and their family. In contrast, delayed diagnosis is associated with increased mental health challenges [8]. Research indicates that individuals diagnosed with ASD in adulthood are nearly three times more likely to report psychiatric conditions compared to those diagnosed in childhood [9]

Following an autism diagnosis, interventions are essential to enhance an individual's functioning and overall well-being. While no medications have been proven effective in addressing the core characteristics of Autism Spectrum Disorder (ASD), psychological and behavioral interventions, such as cognitive behavioral therapy (CBT) and behavioral modification strategies, have shown positive effects in improving symptoms and overall quality of life [1]. However, these interventions are often costly and not accessible to all individuals. In educational settings, children with ASD frequently lack access to specialized support, placing them at risk of falling behind academically. Data indicates that autistic students have lower high school graduation rates, with 26.4% failing to earn a diploma compared to 14% of their neurotypical peers. Additionally, a shortage of trained professionals limits the availability of critical services, and financial constraints may further prevent families from accessing necessary care [10]. Artificial Intelligence (AI) encompasses computer systems engineered to execute tasks that traditionally require human intelligence. A key subset of AI, Machine Learning (ML), focuses on developing algorithms and models capable of making predictions or decisions based on data, either with or without human intervention, and continuously improving through computational experience. AI and ML have been widely utilized in the diagnosis and management of various neurological and psychiatric conditions, including Alzheimer's disease, dementia, schizophrenia, multiple sclerosis, cancer, and other infectious and degenerative diseases. These technologies leverage unstructured data, such as medical imaging and genomic information, to predict, study, treat, and manage these conditions [11]. Deep Learning (DL), a specialized subset of ML, enables computers to process information similarly to the human brain, enhancing their ability to recognize complex patterns. In recent years, the application of AI, ML, and DL in the identification and assessment of mental health disorders has expanded significantly, demonstrating promising potential in improving diagnosis and treatment outcomes. This review explores the applications of artificial intelligence in diagnosing and treating Autism Spectrum Disorder in children.

Saroj Priyadharsini and Anbarasi

Diagnosis

Magnetic Resonance Imaging (MRI) is a non-invasive imaging technique used to study brain activity and structure. Functional MRI (fMRI) measures brain activity by detecting changes in blood flow, while structural MRI (sMRI) maps brain structures and captures contrast variations in brain tissue. Since the 1990s, MRI has been widely utilized for data collection and analysis in patients with mental disorders [12]. Machine Learning (ML) methods have shown efficacy in analyzing MRI datasets. By processing raw imaging data, ML and Deep Learning (DL) models can classify images, reducing the subjectivity inherent in traditional diagnostic assessments and identifying patterns that support clinical diagnosis [13]. Supervised learning, a key ML approach, trains models using labeled data with predefined outputs, whereas unsupervised learning analyzes unlabeled data to detect hidden patterns without predefined guidance [14]. Among supervised learning techniques, Support Vector Machines (SVMs) and Random Forests are commonly employed for classification, regression, and outlier detection tasks [18]. Structural MRI (sMRI) provides detailed information about brain structure and function, including cortical thickness, the volume of specific brain regions, and functional connectivity between different areas. In contrast, functional MRI (fMRI) captures correlation coefficients between the time courses of various brain regions, offering insights into brain activity patterns [15].

Using data from the National Database for Autism Research (NDAR), Dekhil et al. reported classification accuracies of 75% with fMRI data alone, 79% with sMRI data alone, and 81% when combining both features [15]. When utilizing both sMRI and fMRI data, the Random Forest algorithm achieved an 81% classification accuracy, while Support Vector Machines (SVM) attained a 71% accuracy rate [15]. Other applications of SVM on sMRI datasets have demonstrated varying accuracy levels, ranging from 45% to 94% across different ASD datasets [20]. Similarly, Liu et al. found that classification accuracies using different machine learning methods and fMRI data from multiple sources ranged between 48.3% and 97% [21]. Potential physical markers of Autism Spectrum Disorder (ASD) have been observed in the frontal, parietal, and limbic regions, as well as the basal ganglia and cerebellum. However, due to the heterogeneous nature of the disorder, these differences are highly variable and often unreliable as definitive diagnostic indicators [16]. Research suggests that subtle variations in brain anatomy exist, but ASD-related structural differences are not limited to a single morphological parameter; rather, they impact multiple cortical features [17].

Ecker et al. developed a model utilizing volumetric and geometric features at various spatial locations on the cortical surface to distinguish individuals with and without ASD. Their model incorporated features such as the average convexity or concavity of cortical folding patterns, mean radial curvature, metric distortion reflecting cortical folding degrees, cortical thickness, and pial area for measuring brain volume. By applying a Support Vector Machine (SVM) classifier, this study achieved an accuracy rate of 85% in differentiating ASD patients from control groups [17]. Resting-state functional connectivity (FC) has also been explored as a potential diagnostic biomarker for ASD. Zhao et al. proposed that high-order FC differs in individuals with ASD compared to traditional FC, suggesting its effectiveness as a diagnostic marker [22]. However, research on identifying reliable ASD biomarkers remains ongoing [21]. The establishment of the Autism Brain Imaging Data Exchange (ABIDE) database has significantly contributed to the advancement of machine learning models for the automated diagnosis of Autism Spectrum Disorder (ASD). Parikh et al. utilized personal characteristic data (PCD) from the ABIDE database, including age, sex, handedness, and three IQ measures, to develop predictive models. Among the various machine learning algorithms tested—such as decision trees, majority models, random forests, linear and nonlinear Support Vector Machines (SVMs), confidence models, logistic regression, k-nearest neighbors, and neural networks—both linear and nonlinear SVMs demonstrated the highest efficacy in terms of accuracy, sensitivity, specificity, and cost-effectiveness. The study highlighted the predictive power of PCD, achieving an accuracy of 61% [19]. Electroencephalography (EEG), a non-invasive and cost-effective method for recording brain activity, has also been explored for ASD diagnosis [23]. Although EEG readings can be unreliable when assessed solely by humans, various machine learning techniques have been applied to improve diagnostic accuracy. Tawhid et al. demonstrated that deep learning (DL) models could identify critical biomarkers for ASD diagnosis, achieving an impressive accuracy of 99.15% [24]. Similarly, Bosl et al. found that digital biomarkers extracted from EEG data could accurately predict ASD diagnostic outcomes in infants as young as three months and even estimate symptom severity, facilitating early detection with high accuracy [25]. However, many EEG-based studies are limited by small sample sizes and an overrepresentation of male subjects, which raises concerns about the validity and generalizability of their findings, particularly for female individuals

with ASD [26]. Additionally, researchers at the University of Geneva developed an artificial intelligence-based algorithm to analyze children's movements and identify potential ASD characteristics. Their model, trained on data from 68 typically developing children and 68 children with autism, achieved an accuracy of 80.9%, with prediction probabilities correlating positively with the severity of autism symptoms. The study assessed 27 behavioral traits, including gestures, immediate echolalia, vocal intonation, stereotyped language, spontaneous vocalizations, facial expressions, response to name, quality of social interactions, joint attention, and unusual sensory interests. Despite its promising results, the study faced limitations due to the broad nature of autistic traits. ASD cannot be diagnosed solely based on isolated behavioral acts, as it also involves impairments that may not manifest in physical traits [27]. The study introduces a novel medical diagnosis system leveraging Explainable Artificial Intelligence (XAI) for Autism Spectrum Disorder (ASD). The authors emphasize the importance of AI-driven decision-making that is not only accurate but also interpretable for clinicians, caregivers, and researchers. It utilizes decision tree and support vector machine (SVM) models, achieving 85% and 86% accuracy, respectively. Explainable AI techniques enhance transparency, aiding clinicians in understanding diagnostic decisions. The dataset includes 704 instances with 21 attributes related to behavioral and medical history. The study highlights the importance of interpretable AI in ASD diagnosis. Limitations include the need for diverse datasets and additional biomarkers. Future improvements involve expanding data sources and refining AI models. The research contributes to early ASD detection, improving patient outcomes [34]. AI technologies, particularly machine learning algorithms, are being utilized to analyze diverse data sources—such as behavioral patterns, neuroimaging, genetic information, and electronic health records—to enable early detection and personalized assessment of ASD. These algorithms have demonstrated high accuracy in distinguishing ASD from neurotypical development and other developmental disorders, facilitating timely interventions [35].

Treatment

AI and machine learning (ML) applications in Autism Spectrum Disorder (ASD) treatment primarily serve as supportive systems that enhance proven intervention methods, such as emotional regulation, individualized education services, and behavioral therapies [1]. Researchers have made advancements in emotion recognition and adaptive learning systems to help children with ASD navigate social conflicts [29]. Children with ASD frequently experience significant emotional difficulties and impaired cognitive flexibility, leading to heightened frustration that can hinder learning. Approximately 74% of children with ASD exhibit substantial emotional challenges, compared to just 18% of neurotypical children [30]. E-learning systems designed for emotional assistance rely on automatic emotion recognition and adaptive emotional regulation [29]. Various machine learning techniques, particularly support vector machines (SVMs) and artificial neural networks, are commonly employed for emotion detection. Observable indicators of emotional shifts include changes in facial expression, body posture, eye gaze, gestures, heart activity, muscle tension, perspiration, and brain activity [28]. These adaptive emotion recognition techniques can be leveraged to detect and respond to negative emotions, such as frustration, anxiety, and distress, thereby improving learning outcomes for children with ASD. Chu *et al*. proposed an AI-based adaptive learning model in which new students complete a pre-test to assess their learning styles, followed by an AI-driven learning path tailored to each individual. The model ensures that students remain engaged without experiencing excessive frustration. During the learning process, students' emotional states are monitored, and negative emotions are managed using regulation strategies based on James Gross' emotional regulation framework, which consists of five steps: situation selection, situation modification, attentional deployment, cognitive change, and response modulation [31]. The proposed emotional regulation strategies are categorized into three main areas:

- Response Modulation – A computer-aided program guides students in managing stress responses through techniques such as muscle relaxation, deep breathing, and positive imagery.
- Cognitive Change – The system suggests adaptive strategies, including social stories, self-instruction, and self-management, supported by video and audio instructions.
- Attentional Deployment – Educational games and graphic animations help redirect students' focus toward positive aspects of a situation while minimizing attention to negative stimuli.
- The emotion recognition component of this model was constructed using SVMs and achieved an overall recognition accuracy of 93.34%. Preliminary results indicate that the model significantly enhances learning

efficiency, student performance, and emotional regulation. However, larger-scale trials are needed to further validate its effectiveness [29].

Augmented reality (AR) has also emerged as a promising intervention method for ASD treatment. AR-based therapy has shown positive results, particularly when combined with cognitive behavioral therapy (CBT) for managing mental health conditions. The use of AR glasses and headsets in classroom-assisted learning has been effective in reducing irritability and rigid behaviors in children with ASD [32]. Unlike traditional interventions, AR offers an immersive and adaptable learning environment that can accommodate the diverse needs of children with ASD. Studies suggest that both children and parents respond positively to AR-assisted learning, as it enhances social interactions and improves the recognition of verbal and nonverbal cues. AR-based interventions hold great potential as a supplementary tool to traditional cognitive and behavioral therapies for children with ASD [33]. Beyond diagnostics, AI is also enhancing therapeutic interventions for individuals with ASD. Innovations include augmentative communication systems, virtual reality-based training, and robot-assisted therapies, all showing potential in improving social interactions and communication skills. For instance, AI-powered virtual reality (VR) therapy creates realistic social scenarios, allowing individuals with autism to practice social skills in a safe environment [35].

CONCLUSION

ASD is a complex and heterogeneous disorder with no singular approach to diagnosis or treatment. As a result, effective detection methods must account for the variability of the condition. AI and ML techniques show significant promise in enhancing ASD diagnosis and treatment. Research on ML and DL models demonstrates high accuracy and specificity in identifying ASD; however, many studies are constrained by small sample sizes, necessitating further validation to confirm their practical applicability. Despite these limitations, AI-driven advancements hold potential for refining diagnostic methods, identifying an ASD biomarker, and improving the accessibility and efficiency of diagnosis. Similarly, AI-based interventions, including adaptive learning, emotional regulation techniques, augmented reality and Virtual reality, offer innovative avenues for ASD treatment but require further exploration. Given the relatively recent integration of AI into ASD research, ongoing studies are crucial to strengthening these models and ensuring their effectiveness across the diverse ASD population.

ABSTRACT

Congenital ocular anomalies are a significant cause of childhood blindness and visual impairment worldwide. These conditions include a variety of disorders such as congenital cataracts, glaucoma, retinopathy of prematurity, and others that can lead to lifelong disability if not addressed early. Understanding the prevalence, causes, and management strategies for these anomalies is crucial for developing effective prevention and treatment programs. In most of the cases the cause of blindness in children is due to not getting proper treatment on time. This study aims to retrospectively analyze the prevalence and clinical presentations in pediatric populations. The study also seeks to identify gaps in current healthcare practices and propose measures to improve early detection and management of these conditions. A retrospective analysis was conducted by review of patients records from tertiary eye hospital. Data on demographic information, clinical presentations, diagnostic procedures, treatments, and outcomes were collected and analyzed. The study population include all anterior and posterior congenital anomalies of patient within the age group of 0-16 year. Patients with acquired ocular conditions and those without complete medical records were excluded from the study. Data were collected from the hospital's electronic medical records (EMR) system. A total of 592 patients in the age group of 0-16 years attended the ophthalmology outpatient department during the study period. Out of these, 100 patients were found to have congenital ocular disorders. As per the present study, the incidence rate of congenital ocular anomalies was found to be 16.89%.A prevalence of congenital anomalies can vary from region to region. In our study the most common congenital ocular anomaly was Naso-lacrimal duct obstruction (48.1%). Nystagmus was the second most common congenital ocular anomalies (12.96%) and cataract was the third most common congenital ocular anomalies (12.04%).

Khushi Kansal and Hiba Khan

Congenital ocular anomalies continue to pose a major public health challenge. This study highlights the need for improved prenatal care, early screening, and timely intervention to reduce the burden of these conditions. Public health strategies should focus on raising awareness, enhancing healthcare infrastructure, and training healthcare professionals to manage congenital ocular anomalies effectively. Further research is needed to explore genetic and environmental factors contributing to these disorders and to develop targeted preventive measures.

Keywords: Congenital, Ocular Anomalies, Early intervention, Congenital cataract, Congenital glaucoma

INTRODUCTION

Congenital ocular anomalies refer to eye defects that are present at birth, affecting vision and overall ocular health. These anomalies can range from structural abnormalities to functional defects. The impact of these conditions can be profound, often leading to significant vision impairment or blindness if not promptly diagnosed and treated.

The prevalence of congenital ocular anomalies varies globally due to differences in genetic factors, maternal health, and access to prenatal care. According to the World Health Organization (WHO), congenital anomalies are a significant cause of infant mortality and childhood blindness worldwide. Approximately 3 and 14 per 100,000 population live births globally are affected by severe ocular anomalies like anophthalmia and microphthalmia (WHO, 2020)(Verma *et al.*, 2007). In high-income countries, congenital cataracts occur in 1 to 6 per 10,000 live births, whereas in low- and middle-income countries, the prevalence is higher due to factors such as maternal infections, malnutrition, and inadequate prenatal care (Wu *et al.*, 2017). India, with its vast population and varying socioeconomic conditions, faces a considerable burden of congenital ocular anomalies (Murthy *et al.*, 2002). According to recent studies, the prevalence of congenital cataracts in India is estimated to be around 1 to 3 per 10,000 live births. Additionally, congenital glaucoma affects about 1 in 10,000 infants (Gogate *et al.*, 2011). The incidence of retinopathy of prematurity (ROP) is also rising due to increased survival rates of preterm infants, with estimates suggesting that around 20% of preterm infants are at risk of developing ROP (Vinekar *et al.*, 2007).Congenital ocular anomalies represent a significant cause of childhood vision impairment and blindness worldwide. These anomalies, which include a spectrum of structural and functional eye disorders present at birth, pose substantial challenges not only to affected individuals but also to their families and the broader healthcare system (Gilbert *et al.*, 2003). The early detection and management of these conditions are crucial in mitigating their impact and improving the quality of life for those affected.

Common Congenital Ocular Anomalies are
Nasolacrimal Duct Obstruction (NLDO)
Nasolacrimal duct obstruction is a condition where the tear duct fails to open properly, leading to tear overflow and recurrent eye infections (Vagge *et al.*, 2018).

Nystagmus
Nystagmus is characterized by involuntary, rapid eye movements, which can be congenital or acquired. Congenital nystagmus typically manifests within the first few months of life and can be associated with other visual impairments (Self *et al.*, 2020).

Congenital Cataract
Congenital cataract is the clouding of the eye's lens present at birth, which can lead to significant visual impairment if not treated promptly. It is a major cause of childhood blindness worldwide, with an incidence of 1-6 per 10,000 live births (Haargaard *et al.*, 2004).

Ptosis

Ptosis refers to the drooping of the upper eyelid and can be congenital or acquired. Congenital ptosis can obstruct vision and lead to amblyopia if not corrected early (Marenco *et al*., 2017).

Coloboma

Coloboma is a defect in the structure of the eye, such as the iris, retina, choroid, or optic disc. It occurs due to incomplete closure of the embryonic fissure during development and can result in vision impairment (Gregory-Evans *et al*., 2004).

Retinopathy of Prematurity (ROP)

ROP is a potentially blinding disorder affecting premature newborns that isdistinguished by abnormal blood vessel formation in the retina. The occurrence varies, with higher rates in countries with advanced neonatal care due to the improved survival rates for very preterm infants (Quinn *et al*., 2010).

Microcornea

Microcornea is an abnormality where the cornea is smaller than normal, which can affect vision. It is often associated with other ocular anomalies such as microphthalmos or coloboma (Lingam *et al*., 2021).

Microphthalmos

Microphthalmos is a condition where one or both eyes are abnormally small. It can be isolated or part of a syndrome and often leads to significant visual impairment (Harding *et* al., 2019).

Persistent Hyperplastic Primary Vitreous (PHPV)

PHPV is a developmental anomaly where the primary vitreous fails to regress and can cause cataracts, glaucoma, and retinal detachment. It requires early intervention to preserve vision (Pollard *et* al., 1997).

Retinitis Pigmentosa (RP)

RP is a group of genetic disorders causing retinal degeneration and progressive vision loss. Symptoms typically start in childhood with night blindness, followed by peripheral vision loss (Hartong *et* al., 2007).

Haemangioma

Ocular haemangiomas are benign vascular tumors that can affect the eyelid, orbit, or conjunctiva. They can cause astigmatism, amblyopia, or cosmetic concerns and may require treatment depending on the severity (Kowalska*et al*., 2021).

Congenital Glaucoma

Congenital glaucoma is characterized by increased intraocular pressure present at birth, leading to optic nerve damage and vision loss. Early diagnosis and surgical intervention are crucial for preserving vision (Papadopoulos *etal*., 2020). The early detection and management of these conditions are crucial in mitigating their impact and improving the quality of life for those affected. This study will acknowledge What are the common congenital ocular disorders observed in a tertiary eye care Centre, and what is their demographic and clinical profile? The purpose of this study is to raise awareness among healthcare practitioners, professionals, and patients about the critical importance of early detection and management of congenital ocular anomalies. Our findings will serve as a reference guide for the community, emphasizing the need for prompt and proactive measures in preventing childhood blindness. Additionally, this study aims to encourage community engagement and action towards reducing the burden of vision impairment in children. By examining the records of patients with congenital ocular anomalies, this study seeks to contribute to the body of knowledge in this field and provide evidence-based recommendations for improving early detection and management practices. Through increased awareness and education, we hope to empower healthcare professionals and the community to take decisive steps in combating childhood blindness, ultimately enhancing the lives of affected individuals and their families.

MATERIALS & METHODS

A retrospective analysis was conducted by review of patients records from tertiary eye hospital. Data on demographic information, clinical presentations, diagnostic procedures, treatments, and outcomes were collected and analyzed. The study population include all anterior and posterior congenital anomalies of patient within the age group of 0-16 year. Patients with acquired ocular conditions and those without complete medical records were excluded from the study. Data were collected from the hospital's electronic medical records (EMR) system. The collected data were entered into Microsoft Excel for analysis. A total of 592 patients in the age group of 0-16 years attended the ophthalmology outpatient department in a tertiary eye care hospital between January 2022 to December 2022.

RESULTS AND DISCUSSION

A total of 592 patients in the age group of 0-16 years attended the ophthalmology outpatient department during the study period. Out of these, 100 patients were found to have congenital ocular disorders. As per the present study, the incidence rate of congenital ocular anomalies was found to be 16.89%. There were 68 (68%) males and 32 (32%) females(Fig.1). Unilateral and bilateral involvement was seen in 60 (60%) and 40 (40%) cases. Bilateral involvement found in 28 males and 12 females and unilaterally, 40 males and 20 females were found with congenital ocular disorder(Fig.2)(Fig.3). Total 63 cases were in the 0-3 years age group, 13 cases in 4-7 years age group, 11 cases were in 8-12year age group and 13 cases were in 13-16year age group(Fig.4)(Table.1). Total 12 congenital ocular disorders were found. Out of these, NLDO in 52 cases (48.14%), congenital nystagmus in 14 cases (12.96%), congenital cataract in 13 cases (12.04%), congenital ptosis in 10 cases (9.26%), congenital coloboma in 6 cases (5.55%), ROP in 3 cases (2.78%), microphthalmos in 2 cases (1.85%), microcornea in 2 cases (1.85%), RP in 2 cases (1.85%), PHPV in 2 cases (1.85%), congenital glaucoma in 1 case (0.92%) and haemangioma in 1 case (0.92%)(Table.2). In 0-3 age group most, common congenital ocular disorder is NLDO, in 4-7 age group cataract in a greater number of cases, in 8-12 age group nystagmus were found is more cases, in 13-16 age group nystagmus were found in more cases(Fig.5). In this study, the associated ocular complications that occur in most of the cases are refractive error and squint(Table.3). Refractive error occurs in association with congenital cataract, nystagmus, retinopathy of prematurity and coloboma(Fig.6). Most cases of squint occur in association with congenital cataract and Nystagmus cases (Fig.7). Childhood blindness remains a significant global health problem. In order to develop control programs to prevent childhood blindness, it is necessary to identify important avoidable causes of visual impairment and blindness, and monitor changing pattern from time to time. Congenital eye disorders are important causes of childhood blindness (Garg*et al*.,2016). The incidence rate of congenital ocular disorders in the study was 16.89%. Most of the patients in the present study (63%) were in the 0-3 age group. Parag N Tupe and Sagar V Chaudhari in their study on the prevalence of congenital ocular anomalies have reported most of the patients in the 0-2 year's age group (Tupe *et al*., 2015). In the present study, the proportion of males (68%) affected was significantly higher than females (32%). The male to female ratio was 2.12:1. Pooja Dash et al.have reported a male to female ratio of 1.12:1 in their studyand unilateral and bilateral involvement in 71.4% and 28.6% of their cases (Dash et al., 2022). In our study unilateral involvement was noted in 60% cases, which was higher than bilateral cases (40%). In our study, 12 types of congenital anomalies were studies; congenital cataract, Coloboma, congenital glaucoma, haemangioma, microphthalmos, microcornea, nystagmus, NLDO, congenital ptosis, retinopathy of prematurity, retinitis pigmentosa, PHPV. Commonest congenital disorder in our study was found to be Naso-lacrimal duct obstruction (48.14%). In agreement Rakhi Jain et al. found Naso-lacrimal duct obstruction was most common congenital anomaly (65%) (Jain *et al*., 2022). In our study most cases of Naso-lacrimal duct obstruction were found in 0-3 year's age group (94.23%). Limitations of the present study include small sample size and absence of genetic studies. Genetic study could not be done because of its nonavailability in our setting.

CONCLUSION

A prevalence of congenital anomalies can vary from region to region. In our study the most common congenital ocular anomaly was Naso-lacrimal duct obstruction (48.1%). Nystagmus was the second most common congenital ocular anomalies (12.96%) and cataract was the third most common congenital ocular anomalies (12.04%). All cases with ocular abnormalities must need a proper clinical examination, proper knowledge of developmental pathogenesis of congenital ocular anomalies is important to diagnosed and treat them on time as early diagnosis is essential to ensure adequate management and preserve visual function. Some of the congenital disorders can be prevented by proper history taking during evaluation of the patients and just spreading awareness among community. The study's key conclusions underline the importance of: Early Detection and Intervention: Early diagnosis and timely treatment are critical in managing congenital ocular disorders and preventing irreversible vision loss. Routine neonatal and infant eye screenings should be implemented to identify and address these conditions promptly. Improved Prenatal Care: Enhancing prenatal care can reduce the incidence of congenital ocular anomalies. Maternal health education, nutrition, and management of infections during pregnancy are essential preventive measures. Genetic Counselling: Families with a history of ocular anomalies should seek genetic counselling to understand the risks and implications for future pregnancies. Newborn Screening: Implementing routine eye examinations for newborns can facilitate early detection and treatment of congenital anomalies. Access to Specialized Eye Care: Increasing access to specialized paediatric ophthalmology services, especially in low- and middle-income regions, is vital. Training healthcare providers in early detection and management techniques can significantly improve outcomes for affected children. Public Awareness and Education: Raising awareness about congenital ocular disorders among parents, caregivers, and healthcare professionals can lead to earlier recognition and intervention. Public health campaigns and community-based programs can play a significant role in educating the populace. Further Research: Continued research is necessary to understand the genetic and environmental factors contributing to these anomalies. Collaborative efforts between researchers, clinicians, and policymakers can help develop targeted strategies for prevention and treatment. Congenital ocular anomalies pose a significant challenge to paediatric vision health worldwide. Through awareness, early detection, and appropriate interventions, many of these conditions can be managed effectively, reducing the burden of childhood blindness and visual impairment. Findings of this study will help as a reference to the health care workers and clinicians to council and aware the people surrounding them.

ABSTRACT

In this paper we study the relation between amount of milk and fat of buffaloes as well as for cows. We carried out our survey in two compile center Ganesh Dudhsangh & Siddhnath Dudhsangh in village Erandoli and Aawalai respectively of sangli district. The main aim of paper is to study a relation between amount of milk and fat of buffaloes and cows. Secondary aim is to see which Edibles are more used and to check more efficiency of Edibles by using statistical analysis.

Keywords: Milk Fat, Efficiency of edibles, cow milk, buffalo milk, statistical analysis.

INTRODUCTION

Animal milk is used first as human food during the secondary Products revolution. India is bestowed with a largest livestock population in the world having a total bovine population of 304 million compared to the world's total bovine population of 1400 million. It accounts for 57.3% of the world's buffalo population and 14.7% of cow population [2]. India continues to be the largest producer of milk in the world and produces 13.1% of total milk produced in the world Hence, India has attained first in milk production in the world [8].This is not only placed country on the top in the world, but also represents sustained growth in the availability of milk & milk products for growing population of the country [6]. Dairy farming has been recognized as an important source of income and is more beneficial in comparison to crop production in India [5]. Milk production is predominantly the domain of small farmers in mixed farming system [4].The importance of dairy farming in lies not only in products but also it brings about significant changes in socio-economic structure of rural economy [7]. In India more than 90% farmers have

95187

Prakash R Chavan and Rahul H.Waliv

milk production business as a side-business. Almost everybody has at least one pet-animal in their house. so analysis of the problem is important of topic "Statistical study of milk production". Here we study the relation between amount of milk and fat of buffaloes as well as for cows [1].We carried outour survey in two compile center Ganesh Dudhsangh & Siddhnath Dudhsangh in village Erandoli and Aawalai respectively. The main aim of our project is to study a relation between amount of milk and fat of buffaloes and cows. Secondary aim is to see which Edibles are more used and to check more efficiency of Edibles.

OBJECTIVES
i.   To check relationship between milk and fat.
ii.   To study on an average milk of buffalo & cow are same or not.
iii. To check variation between amount of milk and its fat.
iv.   To study effect of edibles on milk production.

METHOD OF DATA COLLECTION
The aim of our paper is to study relation between amount of milk & fat of cow and bedfellow. We decide to collect all primary data from the farmers in the Erandoli & Aawalai village whose sub-business is milk production. We made questionaries' to collect all the necessary information. The related data & information is collected from farmers at the milk compile center in village Erandoli & Aawalai by using convenient sampling. In this survey we collect the information about an amount of milk and its fat & which edible are used for animals.

STATISTICAL ANALYSIS:
   ❖   Graphical representation
   ❖   karl pearsons Correlation coefficient
   ❖   Test of Significance for difference of two means
   ❖   The tests based on F- distribution

DIAGRAMMATIC REPRESENTATION
In village Erandoli, Pandharpuri and Desi Buffalo species are more preferred and Jarashi &Videsi Cow species are equally preferred.In village Aawalai, Desi Buffalo species are more preferred and Jarashi Cow species are more preferred. In village Erandoli, Cotton is 38% and Atta is 34% used as edibles to cow and buffalo.Also in Erandoli village the dry food and wet food are nearly equally used. In village Aawalai Cotton is 54% and Globule is 29% used as edibles to cow and buffalo.Also in Aawalai village the dry food and wet food are equally use

STATISTICAL TOOLS
TEST OF CORRELATION
Suppose (xi,yi), i=1,2,3,...............n. be n pairs of observation on variable X and Y then the Karl Pearson's Correlation Coefficient between X and Y is denoted by r and is defined as, the ratio of covariance between X and Y to the product of the standard deviation of X and standard deviation of Y. Hence, Karl Pearson's Correlation Coefficient between X and Y is given by,

$r = \frac{cov(x,y)}{\sqrt{var(x)*var(y)}}$

TEST SIGNIFICANCE FOR DIFFERENCE OF TWO POPULATION MEANS
Let $\bar{X}_1$ be mean of sample size n_1 from a population with mean μ_1 and variance σ_1^2(known) and $\bar{X}_2$ be mean of sample size n_2 from a population with mean μ_2 and varianceσ_2^2(known). Sample size n_1 and n_2 are large therefore sample mean $\bar{X}_1$ has asymptotically normal with mean μ_1 and variance $\frac{\sigma_1^2}{n_1}$.And sample mean $\bar{X}_2$has asymptotically normal with mean μ_2 and variance $\frac{\sigma_2^2}{n_2}$ i.e. $\{\bar{X}_1 \sim N (\mu_1,\frac{\sigma_1^2}{n_1})$ and $\bar{X}_2 \sim N (\mu_2,\frac{\sigma_2^2}{n_2})\}$ Let us suppose sample means $\bar{X}_1$ and $\bar{X}_2$ are independently normally distributed. Therefore, the difference of sample means, $(\bar{X}_1 - \bar{X}_2) \sim N (\mu_1 - \mu_2,\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2})$. Therefore, corresponding standard normal variate is

Prakash R Chavan and Rahul H.Waliv

$$Z = \frac{(\bar{X}_1 - \bar{X}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}} \sim N(0,1)$$

Here we have to test the hypothesis,

$H_0: \mu_1 = \mu_2$ (i.e. there is no significant difference between the population means)

Against,

$H_1: \mu_1 \neq \mu_2$ (two tailed alternative)

Under H_0 the test statistic is given by,

$$Z = \frac{(\bar{X}_1 - \bar{X}_2)}{\sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}} \sim N(0,1)$$

TEST BASED ON F –DISTRIBUTION

Let $x_1, x_2, \ldots x_{n1}$ and $y_1, y_2, \ldots y_{n2}$ be two independent random samples of sizes n_1 and n_2 drawn from the parent normal populations N (μ_1, σ_1^2) and N(μ_2, σ_2^2) respectively. We have to test the null hypothesis, $H_0: \sigma_1^2 = \sigma_2^2 = \sigma^2$(say) (i.e. Both the sample are drawn from the normal populations with the same variance σ^2). Against, The alternative hypothesis, $H_1: \sigma_1^2 > \sigma_2^2$ (right tailed alternative). Under the null hypothesis H_0, the test statistic is,

$F = \frac{S_x^2}{S_y^2} \sim F_{(n1-1, n2-1)d.f.}$

Where, $S^2_x = \frac{1}{n1-1}\sum_{i=1}^{n1}(x_i - \bar{x})^2$ $S^2_y = \frac{1}{n2-1}\sum_{j=1}^{n2}(y_i - \overline{y})^2$

STATISTICAL ANALYSIS
Correlation
Village:-Erandoli
Cow
The correlation between amount of milk and fat = - 0.191935

The correlation between amount of milk and fat are negatively correlated.

i.e. Hence the increases milk then decreases its fat.

Buffaloes
The correlation between amount of milk and fat = -0.02954

The correlation between amount of milk and fat are negatively correlated.

i.e. Hence the increases milk then decrease it's fat.

Village:-Aawalai
Cow
The correlation between amount of milk and fat = 0.3932

The correlation between amount of milk and fat are positively correlated.

i.e. Hence the increases milk then increases its fat.

Buffaloes
The correlation between amount of milk and fat = - 0.3369

The correlation between amount of milk and fat are negatively correlated.

i.e. Hence the increases milk then decrease its fat.

Ftab=	1.907087695

Conclusion
Fcal>Ftab

Reject H_0: then Milk of buffalo & cow are not homogeneous.

We have to test hypothesis,
H_0: Fat of buffalo & cow milk are homogeneous.Vs

H_1: Fat of buffalo & cow milk are not homogeneous.

Calculation: $F = \frac{S_x^2}{S_y^2} \sim F_{(n1-1,n2-1)d.f.}$

Fcal =	2.118176303
Ftab =	1.907087695

Conclusion:-Fcal>Ftab

Reject H_0, then Fat of buffalo & cow milk are not homogeneous.

MAJOR FINDING
- The Edibles cotton is mostly use.
- There is variability in milk production of Cow and Buffalo.
- On an average the milk production of Cow and Buffalo are not equal.
- There is variability between fat of buffalo's milk & fat of cow's milk.
- In village Erandoli the average effect of cotton & globule is same & for village Aawalai the average effect of cotton & globule is different.

SCOPE AND LIMITATIONS
Scope
This type of analysis also use for other villages as well as districts and state level. This type of analysis used for to suggest farmers which food or edibles are used for increase in milk production.

Limitations
We consider only two villages Erandoli and Aawalai. For the time limit we study only effect of food & edibles on milk production.

ABSTRACT

Rheumatoid arthritis (RA) is a chronic systemic illness that can lead to destructive polyarthritis, joint damage, and disability if not managed effectively. Diagnosis of RA typically involves a combination of laboratory tests and clinical evaluation of symptoms. However, overlapping features with other forms of arthritis can make early diagnosis challenging. Early detection and identification of RA are critical for improving patient care and outcomes. To improve the accuracy of RA diagnosis and analyze the influence of various clinical factors, the researcher utilized a hybrid approach combining k-means clustering and a genetic algorithm (KMGT). The methodology collected data on six key characteristics for each sample: age, sex, rheumatoid factor (RF), and anti-citrullinated peptide antibody (ACPA).

Keywords: To improve the accuracy of RA diagnosis and analyze the influence of various clinical factors, the researcher utilized a hybrid approach combining k-means clustering and a genetic algorithm (KMGT).

INTRODUCTION

Chronic inflammatory synovitis and consequent joint structure degradation are the causes of rheumatoid arthritis (RA), an multisystem autoimmune illness. Both environmental and genetic risk factors contribute to the genesis of this complicated illness [1]. Two laboratory markers—anti-cyclic citrullinated peptide (CCP) antibody and rheumatoid factor (RF)—are often used to diagnose RA. However, a patient might continue to get RA even if these indications are absent. However, the person may not have RA if one of the indications is positive. In a prior work, we shown that anti-CarP plus 14-3-3η protein are useful markers of RA the northern part of China, and that the detection

95195

efficiency is increased when coupled with RF and anti-CCP [2]. However, other criteria including gender and age are overlooked throughout the diagnosing procedure in beside either of the markers mentioned above. Furthermore, some RA patients do not fit the 2010 United States College of Rheumatology (ACR)/European Union of Rheumatology (EULAR, which stands) diagnostic criteria, which rheumatologists frequently utilize for diagnosis [3]. In order to increase the precision of RA diagnosis, we are thus actively searching for more efficient methods and other clinical markers. Artificial intelligence (also known as AI has advanced significantly in several scientific fields in the past few decades. In clinical contexts, computer programs analyze medical pictures more precisely than people [4]. The use of deep learning, a kind of computational intelligence, to interpret medical images has steadily grown. AI is commonly used to interpret MR imaging data and forecast early RA, for example. It is well recognized that in some sectors, computer analysis is more efficient than human researchers [5]. In the field of vision, deep learning has various uses and is crucial for evaluating imaging data from a variety of illnesses, including retinopathy, metastatic breast cancer, and melanoma. The latest tool available for longitudinal forecasting and application of data from electronic health records is recurrent neural networks, which are a subclass of deep learning [6]. Using various patient records to create AI-based models has demonstrated significant promise in raising diagnostic accuracy and producing positive therapeutic outcomes[7]. To determine whether a patient has RA, Fukae and colleagues converted lots of clinical data from patients into two-dimensional pictures and then fine-tuned convolutional neural networks (CNNs). The groundwork for using deep learning to diagnose RA has been established by this study [3]. Here, we integrated a deep learning ANN under our RA diagnosis, taking into account that our prior study omitted several generic variables (such age and gender) [2]. By re-training the network, we assessed the impact of various clinical parameters on the result. Due to historically unfavorable social and economic conditions in several regions of northern India, leading to an increase in rheumatic diseases as the population ages.

Diseases are more likely to occur as people age, which lowers their quality of life (QOL). There are substantial social and financial expenses associated with treating RA. The idea of health places emphasis on both general life happiness and the absence of sickness. According to the World Health Organization (WHO), quality of life (QOL) is a reflection of people's recognition of their social and cultural surroundings., reflects individuals' acknowledgment of their cultural and social contexts. Rheumatoid and osteoarthritis, particularly related to aging, rank second in the analysis of long-term diseases. Environmental and genetic variables are thought to interact in a complicated way, even if the precise origin of RA is yet unknown. Multiple joints are impacted by the chronic condition known as RA. Normally, the immune system creates antibodies to combat infections, but in RA sufferers, it unintentionally targets the joint tissues. Inflammation and the production of chemicals that break down bone structure, cartilage, ligaments, and muscles are the results of this immunological reaction. Joints are structures that may lose their natural alignment and form if therapy is delayed. Early detection and treatment of RA can significantly improve outcomes. Several clinical parameters, including Anti-CCP, RF, erythrocyte sedimentation rate (ESR), and swollen joint count (SJC), are crucial for identifying RA. In this paper, clustering techniques were used to analyze patient data and predict potential RA cases at an early stage, contributing to improved diagnostic accuracy and patient outcomes. Joint pain is the primary symptom of rheumatoid arthritis (RA), often accompanied by swelling and stiffness. This condition can also lead to general symptoms and inflammation in different parts of the body, which may develop gradually over several weeks or progress rapidly within a few days. Patients may experience flare-ups when symptoms worsen significantly. RA typically affects the smaller joints in the hands, fingers, feet, and toes, especially in the early stages. More than two-thirds of patients report fatigue, muscle weakness, and a loss of appetite. Other common symptoms include excessive sweating, weight loss, lethargy, low energy, and fever. These signs can make diagnosing rheumatic diseases challenging. Physicians rely on laboratory tests, physical examinations, and imaging to diagnose RA. The diagnostic process involves several steps and procedures, underscoring the importance of early detection help enhance standard of life as they age.

1. Before there is a noticeable improvement, stiffness around and within the joints lasts for at least an hour.
2. There are 14 potential joint regions that might be affected by arthritis, comprising either the left or the right PIP, wrist, ankle, elbow, knee, MTP, and MCP joints.
3. The MCP or PIP joints have to possess a minimum of one swollen joint.

4.   Symmetric arthritis is defined by constant discomfort in the same joint sites on the two sides of the body. Even if congruence is not perfect, bilateral participation by MCPs, PIPs, or MTPs is appropriate.

5.   Subcutaneous nodules located in the extensor regions, over bony prominences, or near joint areas are indicative of rheumatoid nodules.

6.   Another requirement is the existence of aberrant serum rheumatoid factor levels, which can be found using any trustworthy technique. Just under five percent in standard control groups show positive results.

7.   It is necessary to have radiographic proof of RA in the hand or wrist (posterior-anterior view) that clearly shows bone decalcification in the afflicted joints. Classification of osteoarthritis cannot be done only based on radiographic findings.

Subcutaneous nodules located in the extensor regions, over bony prominences, or near joint areas are indicative of rheumatoid nodules.

1.   The presence of abnormal levels of serum rheumatoid factor, detected by any reliable method, is another criterion. Positive results are found in fewer than 5% of normal control groups.

2.   Radiographic evidence of RA in the wrist or hand (posterior-anterior view), showing clear bony decalcification in the affected joints, is required. Radiographic features of osteoarthritis alone are insufficient for classification.

METHODOLOGY

In the proposed KMGT method, the initial values for the k-means algorithm are chosen through the use of a genetic algorithm. When predicting rheumatoid arthritis, it is vital to identify the most relevant features, as not all of them are necessary for diagnosing the disease. The genetic algorithm is applied to select the most significant factors for predicting rheumatoid arthritis. Once these key features are identified, they are input into the k-means algorithm for further analysis and prediction.

CLUSTERING

One machine learning method that is classified as unsupervised learning is clustering. Data points are grouped into clusters for this purpose. In contrast to supervised learning, which involves a teacher guiding the training procedure, unsupervised learning concentrates on grouping data according to the dataset's innate patterns. Finding logical categories where observations within an identical group are more comparable to one another than those that appear in other groups is the aim of clustering. Clusters are created by dividing the population into several groups according to similar and dissimilar the data points. Three primary clustering techniques exist. In order to minimize the variation between each cluster, the K-means clustering method separates the data set into 'k' clusters. Data is arranged into 'N' component factors in hierarchical clustering, which are then further divided into 'M' clusters, eventually producing nested clusters. Clustering is beneficial in a variety of domains and has varying degrees of usefulness. According to their similarities and differences, we divide data into various variables in cluster analysis. One of the most popular unsupervised learning methods is K-means clustering. Centroids are chosen, data points are categorized according to their location with these centroids, as well as the centroids are then recalculated to improve classification outcomes. The clustering method improves accuracy by decreasing the distance among the data points with the centroids, for example, by applying Euclidean distance.

K-Means Clustering Algorithm

Starting with process initialization, the K-Means algorithm chooses the total amount of clusters, represented by 'K'. 'K' centroids are subsequently picked at random; they do not have to be chosen from the dataset. The initial clusters are then formed by assigning each data point to the closest center. To provide more precise results, the centroids are computed again using the current clusters. Until there is no more reassignment, indicating that the clustering is stable, the procedure of redirecting data points to the nearby centroids along with recalculating centroids is repeated. After the clusters are completely built, the procedure comes to an end.

Genetic Algorithm

A search method used to address challenging optimization issues, the evolutionary algorithm is founded on the ideas of natural selection. The following elements are involved: A number of essential components make up the genetic algorithm. The first is a collection of chromosomes, each of which stands for a potential fix for the issue. Fitness-based selection follows, with those with greater fitness scores having a larger chance of being selected for reproduction. The crossover method, which aims to provide superior solutions by combining the genetic material of two chosen individuals to create children, comes next. Finally, to ensure genetic diversity and aid in the investigation of novel potential solutions, random mutation is used to create tiny, random alterations in the chromosomes. The algorithm starts out with an ensemble of "individuals," each of whom stands for a possible fix for an issue. The "chromosomes," which are gene sequences that are given a "fitness" value due to a fitness function, are programmed with these solutions. Crossover is the process of combining the genetic material of two individuals to create children, while individuals are chosen for procreation based on their fitness. The process keeps going until the best solution is discovered, and these children should be more fit even their parents.

RESULTS AND DISCUSSION

In this experiment, data from 140 rheumatoid arthritis patients were used. A total of 30 features were used to predict rheumatoid arthritis. Through the application of the genetic algorithm, only four features ESR, Anti-CCP, RF factor, and HLA were selected as the optimal features for predicting rheumatoid arthritis at an early stage. The last row represent the proposed method and shows good accuracy rate with 88.3%.

CONCLUSION

In this paper, the researcher presents a novel algorithm, KMGT, aimed at improving the accuracy of early detection of rheumatoid arthritis. The KMGT algorithm delivers better results than K-Means, particularly when managing noisy data. It reveals that rheumatoid arthritis can be predicted with only four essential features: ESR, Anti-CCP, HLA, and Rh factor. By enabling early diagnosis through these indicators, doctors can help save many lives and significantly enhance the quality of life for individuals affected by the disease.

ABSTRACT

Graphene-based metal composites have emerged as promising materials for gas sensor applications due to their unique combination of high electrical conductivity, large surface area, and enhanced catalytic properties. In this study, we synthesized and characterized graphene-metal composites, including pure graphene, graphene-copper (G-Cu), graphene-silver (G-Ag), and graphene-aluminium (G-Al), to evaluate their potential for gas sensing applications. The composites were prepared using a modified chemical reduction method and characterized through X-ray diffraction (XRD), scanning electron microscopy (SEM), and energy-dispersive X-ray spectroscopy (EDS), Fourier Transform Infrared Spectroscopy (FTIR), Raman spectroscopy and electrical characterisation. The structural and morphological analysis confirmed the successful mixture of metal nanoparticles within the graphene, resulting in improved surface activity and charge transfer properties. The electrical conductivity studies demonstrated that metal-doped graphene composites exhibit enhanced conductivity compared to pristine graphene, with G-Cu and G-Ag showing superior performance due to their high electron mobility. The results indicate that these composites have significant potential for developing high-performance gas sensors for environmental monitoring and industrial applications.

Keywords: Graphene, Composites, Graphene –Silver, Graphene –Copper, graphene-Aluminium

INTRODUCTION

Graphene, a single layer of carbon atoms arranged in a two-dimensional honeycomb lattice, has captured significant attention in material science due to its exceptional mechanical strength, high electrical conductivity, and remarkable thermal stability [1]. To further enhance its functional properties, researchers have developed graphene-based composites by integrating it with metals, such as copper, silver, and aluminium. These composites exhibit unique synergistic properties, making them promising candidates for applications in energy storage, catalysis, electronics, and structural materials [2]. Graphene oxide (GO), a precursor for graphene, plays a pivotal role in composite preparation due to its functionalized surface containing oxygen-rich groups. These groups facilitate chemical interactions with metal ions, enabling effective composite formation [3]. The preparation of graphene-metal composites typically involves processes like in situ chemical reduction, thermal methods, and electrochemical deposition, which ensure homogeneous dispersion of graphene within the metal matrix [4]. Graphene-copper composites are widely studied for their excellent thermal and electrical conductivity, along with enhanced mechanical properties, making them suitable for electronic components and heat dissipation systems.[5,6]. similarly, graphene-silver composites exhibit superior antibacterial properties and enhanced electrical performance, finding applications in sensors, conductive inks, and biomedical devices.[7,8] Graphene-aluminium composites[9] on the other hand, offer improved strength-to-weight ratios and corrosion resistance, making them ideal for aerospace and automotive applications. This report explores the preparation methodologies of graphene, graphene-copper, graphene-silver, and graphene-aluminium composites, along with their characterization. So far to our knowledge preparation of graphene metal oxide composites were reported on literature survey but graphene metal composites and the comparison studies are not reported so far with these combination. By investigating the structural, thermal, and mechanical properties of these materials, the study aims to provide insights into their potential applications and the optimization of fabrication techniques.

MATERIALS AND METHODS

Preparation of Graphene

The graphene precursor, the solid Solvothermal product, is usually made by heating 5 millilitres of ethanol and 2 grams of sodium in a 1:1 molar ratio in a sealed reactor tank at 220°C for 72 hours. Following a rapid pyrolysis of this material, 100 millilitres of deionized water are used to clear the residue. The suspended solid is then vacuum-filtered and dried in a vacuum oven set at 100°C for 24 hours. With a final yield of 0.1 g per 1 ml of ethanol, graphene typically yields ~0.5 g per Solvothermal process [10]

Synthesis of Metal nanoparticles
Copper Nanoparticles

Copper nanoparticles are formed via a chemical reduction process using copper (II) sulfate pentahydrate as the precursor salt and starch as the capping agent. Initially, 120 mL of a 1.2% starch solution and a 0.1 M solution of copper (II) sulfate pentahydrate were mixed together and rapidly stirred for half an hour. Then, 50 mL of a 0.2 M ascorbic acid solution was added, always stirring quickly. Then, for two hours at 80°C, 30 mL of a 1 M sodium hydroxide solution was added gradually while being continuously agitated. Throughout the process, the solution changed from yellow to ocher. During the process. After the reaction was complete, the solution was removed from the heat and let to settle overnight. To get rid of extra starch, the precipitates were filtered and rinsed three times with ethanol and deionized water after the supernatant was carefully disposed of. After drying at room temperature, the resulting ocher-colored precipitates were placed in a glass vial for additional examination [11].

Silver Nanoparticles

Using 1% trisodium citrate as a reducing agent, silver nanoparticles were created by heating an aqueous 0.01 M silver nitrate solution to a boiling point. Throughout this procedure, the solution was heated and well mixed. When exposed to 1% trisodium citrate, aqueous silver ions were decreased and changed colour from yellowish to pale

brown, signifying the creation of silver nanoparticles. Using a magnetic stirrer, the nanoparticle solution was agitated at 90°C for 20 minutes. The reaction mixture was centrifuged at 6000 rpm for 15 min. After being gathered, the pellet was rinsed three times with triple-distilled water and dried at 80°C in a hot air oven [12].

Aluminium nanoparticles
In the deionized water, citric acid was used to dissolve aluminum nitrate. The citrate/nitrate (C/N) molar ratio was 0.5. At 60°C, the mixture was constantly swirled for several hours until it became a yellowish sol. After that, the solution was heated to 80°C while being continuously stirred to form the translucent gel. The gel was baked for 12 hours at 90°C to dry it out. At 600°C, the dry gel was crushed and sintered [13].

Composite preparation
Graphene metal composite were prepared by the following way, prepared graphene and metals such as copper, silver and Aluminum nanoparticles were mixed by 1:1 weight ratio and used for further analysis.

RESULTS AND DISCUSSION

X-Ray Diffraction Analysis for Prepared composites
Figure 1 presents the XRD patterns of (a) graphene, (b) graphene-copper composite, (c) graphene-silver composite, and (d) graphene-aluminum composite. In Graphene (Figure 1a) shows the XRD pattern of graphene exhibits two characteristic peaks at approximately 26.5° (002) and 42.8° (100), corresponding to the interlayer spacing of graphitic carbon. The broad nature of the (002) peak suggests the presence of disordered or few-layered graphene, indicating a partially exfoliated structure[14]. Graphene-Copper Composite (Figure 1b) shows the XRD pattern of the graphene-copper composite reveals distinct peaks at 43.3° (111), 50.4° (200), and 74.1° (220), which correspond to the face-centered cubic (FCC) structure of copper. The absence of a strong graphene peak suggests effective dispersion of graphene within the copper matrix. [15] Graphene-Silver Composite (Figure 1c) shows the XRD spectrum of the graphene-silver composite shows peaks at 38.1° (111), 44.3° (200), 64.5° (220), and 77.4° (311), which correspond to the FCC structure of silver. The peak intensities indicate good crystallinity of silver nanoparticles in the composite. The broadening of peaks suggests a nanoscale particle size[16]. Graphene-Aluminum Composite (Figure 1d) shows the XRD pattern of the graphene-aluminum composite displays peaks at 38.4° (111), 44.7° (200), 65.2° (220), and 78.3° (311), characteristic of aluminum's FCC structure. The well-defined peaks indicate high crystallinity, while the absence of distinct graphene peaks suggests strong interaction between graphene and aluminium [17] The XRD analysis confirms the successful incorporation of graphene into copper, silver, and aluminum matrices. The characteristic metal peaks dominate the composite patterns, indicating a well-dispersed graphene phase within the metal matrix. The absence or broadening of the graphene peak suggests possible exfoliation or integration at the nanoscale, which can enhance mechanical, electrical, and thermal properties of the composites.

Scanning Electron micrograph (SEM) analysis
Figure 2 presents SEM images at low and high magnifications for (a, b) graphene, (c, d) graphene-copper composite, (e, f) graphene-silver composite, and (g, h) graphene-aluminium composite. The morphological characteristics of each sample are analysed as follows: Graphene (Figure 2a, 2b) shows the SEM images of graphene reveal a typical layered and wrinkled sheet-like morphology. The graphene layers appear loosely stacked with a high degree of exfoliation, indicating few-layered or multi-layered graphene. The crumpled structure enhances the surface area, which is beneficial for composite formation. Figure 2 shows the SEM images of low and high magnification of (a,b) Graphene (c,d) Graphene copper composite (e,f) graphene silver composite (g,h) graphene aluminum composite Graphene-Copper Composite (Figure 2c, 2d) shows in the graphene-copper composite, the graphene sheets are decorated with copper nanoparticles. The copper particles are dispersed along the graphene surface, with some areas exhibiting agglomeration. The uniform dispersion suggests strong interfacial interaction between graphene and copper, which could improve electrical and mechanical properties.

Graphene-Silver Composite (Figure 2e, 2f) shows the SEM images of the graphene-silver composite show a similar morphology to the copper composite, with silver nanoparticles attached to the graphene sheets. The particles appear more uniformly distributed across the graphene layers, likely due to strong nucleation sites on the graphene surface. The presence of silver nanoparticles enhances electrical conductivity and antimicrobial properties. Graphene-Aluminium Composite (Figure 2g, 2h) shows the graphene-aluminium composite exhibits a structure where aluminium nanoparticles are distributed along the graphene sheets. The aluminium particles tend to form spherical clusters, suggesting possible aggregation. However, the interaction with graphene is still evident, which can contribute to improved mechanical reinforcement in composite materials.

Energy Dispersive X-Ray Analysis (EDAX)
Figure 3 shows the EDAX images of (a) Graphene (b) Graphene copper composite (c) graphene silver composite (d) graphene aluminum composite Figure 3 presents the EDX spectra and elemental composition of (a) graphene, (b) graphene-copper composite, (c) graphene-silver composite, and (d) graphene-aluminum composite. The elemental distribution confirms the successful integration of metal nanoparticles into the graphene matrix. Graphene (Figure 3a) reveals that the EDX spectrum of graphene shows dominant peaks for carbon (C) and oxygen (O), with weight percentages of 75.43% and 24.09%, respectively. The presence of oxygen indicates partial oxidation, suggesting the material could be reduced graphene oxide (rGO). Small traces of silicon (Si) and chlorine (Cl) may be due to contamination from the synthesis or processing environment.Graphene-Copper Composite (Figure 3b) reveals that The EDX analysis of the graphene-copper composite shows peaks for carbon (C), oxygen (O), and copper (Cu). The copper content is significantly high (68.04% by weight), confirming the successful incorporation of copper into the graphene matrix. The reduction in carbon content (16.63%) compared to pure graphene suggests metal deposition on graphene sheets. Graphene-Silver Composite (Figure 3c) reveals that The EDX spectrum of the graphene-silver composite exhibits strong peaks for silver (Ag), carbon (C), and oxygen (O). The presence of 7.66% Ag by weight confirms the successful integration of silver nanoparticles onto the graphene surface. The high atomic percentage of silver (28.64%) suggests good dispersion of Ag particles within the composite, which can enhance electrical and antibacterial properties. Graphene-Aluminum Composite (Figure 3d) reveals that The EDX spectrum of the graphene-aluminum composite shows peaks corresponding to carbon (C), oxygen (O), and aluminum (Al). The aluminum content is 17.57% by weight, confirming the presence of aluminum particles in the composite. The relatively high oxygen percentage (18.06%) suggests possible oxidation of aluminum, forming aluminum oxide (Al_2O_3), which may influence the composite's mechanical and thermal properties. The EDX analysis confirms the successful incorporation of copper, silver, and aluminum into the graphene matrix.

Raman spectrum for prepared graphene and the composite
Figure 4 shows the Raman spectrum of (a) Graphene (b) Graphene copper composite (c) graphene silver composite (d) graphene aluminum composite The spectra in Figure 4 appear to be Raman spectra of various graphene-based materials, specifically graphene and graphene composites with different metals (copper, silver, and aluminum). D and G Bands: Fig (a) shows the Graphene raman spectrumThis spectrum likely represents pristine graphene or graphene with minimal defects. The G band(1583 cm-1) is prominent, and the D band(**1350 cm-1**) is relatively weak, suggesting a high degree of structural order. The "D" band is associated with defects or disorder in the graphene lattice. A more intense D band generally indicates higher levels of disorder. The "G" band is related to the in-plane vibrations of sp2-hybridized carbon atoms in the graphene sheet. Its position and intensity can provide information about the quality and structure of the graphene. 2D Band: There might be a weak "2D" band present in the spectra, typically around 2700 cm-1. This band is a second-order overtone of the D band and is sensitive to the number of graphene layers[18]. Fig(b) reveals the Graphene Copper Composite spectrum of Raman. The presence of a more intense D band compared to (a) indicates that the introduction of copper might have introduced some disorder into the graphene lattice. The G band is still visible, suggesting that the overall graphene structure remains intact. Graphene Silver Composite was shown in Fig (c) Similar to (b), the D band is more prominent in this spectrum compared to pristine graphene. This suggests that the interaction with silver might have induced some defects in the graphene structure. Graphene Aluminum Composite is shown in Fig(d) In this spectrum, the D band is even more

intense than in (b) and (c), suggesting a higher level of disorder in the graphene structure when combined with aluminum[19].

Electrical Characterization of graphene and graphene composite

Figure 5 shows the Electrical characterization of (a) Graphene (b) Graphene copper composite (c) graphene silver composite (d) graphene aluminum composite Figure 5 presents the variation of electrical resistance with applied voltage for (a) pure graphene, (b) graphene-copper composite, (c) graphene-silver composite, and (d) graphene-aluminium composite. The observed trends provide valuable insights into the electrical characteristics of these materials. Pure Graphene shown in (a) exhibits the highest resistance (1.3 to 8.2 micro ohm) among the tested samples. This increased resistance can be attributed to several factors, including grain boundaries, defects, and inter-layer contact resistance in the material. These structural imperfections hinder efficient electron transport, leading to relatively higher resistivity. Graphene-Silver Composite shown in (c) (2.1 to 23.7 micro ohm) among the composites, the graphene-silver composite demonstrates the lowest resistance, confirming the superior electrical conductivity of silver. The high conductivity of silver enhances charge carrier mobility within the graphene matrix, significantly reducing overall resistance. This suggests that silver integration effectively improves the electrical transport properties of the composite, making it a promising material for electronic applications requiring low resistance pathways. Graphene-Copper Composite (2.8 to 41.2 micro ohm) shown as fig (b) and Graphene-Aluminium Composite (3.1 to 53.5 micro ohm) shown in (d) the resistance of the graphene-copper composite is lower than that of the graphene-aluminium composite. Copper is known for its excellent electrical conductivity, second only to silver among commonly used metals. The improved conductivity in the graphene-copper composite indicates strong electron transport properties and reduced interfacial resistance. Conversely, aluminium, despite being a good conductor, exhibits relatively higher resistance, likely due to increased scattering of charge carriers and possible oxide layer formation at the interfaces.

CONCLUSION

In this study, we successfully synthesized and characterized graphene-metal composites, including pure graphene, graphene-copper (G-Cu), graphene-silver (G-Ag), and graphene-aluminium (G-Al), to evaluate their electrical properties and potential for gas sensing applications. The electrical characterization results demonstrated a significant enhancement in conductivity with metal incorporation. Among the composites, G-Ag exhibited the lowest resistance, indicating superior electrical conductivity due to the high charge carrier mobility of silver. The G-Cu composite also showed improved conductivity compared to pure graphene, confirming copper's effectiveness in enhancing electron transport. Conversely, the G-Al composite displayed relatively higher resistance than G-Ag and G-Cu, though still lower than pure graphene, suggesting moderate electrical enhancement. These findings suggest that metal integration effectively reduces interfacial resistance and improves charge carrier mobility in graphene-based materials. The structural and spectroscopic analyses confirmed the successful incorporation of metal elements into the graphene matrix. XRD patterns revealed the presence of characteristic peaks corresponding to graphene and metal phases, while SEM and EDS analyses provided insight into the morphology and elemental distribution. FTIR and Raman spectroscopy further validated the structural integrity of the composites, indicating minimal defects and strong interactions between graphene and metal particles. Overall, our findings suggest that graphene-metal composites, particularly G-Ag and G-Cu, exhibit promising electrical properties that could be leveraged for gas sensing applications. Future work will focus on optimizing synthesis parameters, exploring the gas sensing performance of these composites under different environmental conditions, and investigating their long-term stability and sensitivity toward various target gases.

ABSTRACT

Each year, millions of people suffer from a condition known as Upper Crossed Syndrome (UCS). Sedentary lifestyles, excessive hours working at a desk or computer, frequent texting, postural changes, and improper weightlifting techniques are common contributors to UCS. As we age, posture tends to decline: shoulders become more rounded, the head shifts forward (protracted), and the thoracic spine (upper back) becomes excessively curved. Over time, poor alignment and posture can result in abnormal tissue stress, leading to degenerative joint changes and chronic pain. Primary Objective: To compare the effectiveness of Active Release Technique (ART) combined with prescribed exercise versus prescribed exercise alone in improving range of motion (ROM) and muscular strength. Secondary Objective: To evaluate the independent effect of prescribed exercise on UCS. Participants who met the inclusion criteria provided informed consent after being thoroughly briefed on the procedure. Two intervention groups were established: Group A: Received prescribed exercise alone. Group B: Received ART in combination with prescribed exercise. The Student's t-test and paired t-test were used for statistical analysis. The following outcome measures were evaluated both before and after the interventions: Manual Muscle Testing (MMT), Neck Disability Index (NDI) Significant differences were observed for all dependent variables across both groups. However, Group B (ART combined with prescribed exercise) demonstrated statistically greater improvements compared to Group A. The findings suggest that Upper Crossed Syndrome can be effectively managed with a combination of Active Release Techniques and prescribed exercises, yielding maximum improvement in patients' conditions.

Keywords: Upper Crossed Syndrome, Neck muscles, Manual Muscle Testing, Neck Disability Index, Prescribed exercise.

INTRODUCTION

Posture is the way a person moves, sits, and walks and is individually unique. It is also defined as the spine being in a neutral position, with good posture being imperative for improved health. (1) Posture is an important function because it is involved in movements of daily life, such as standing, sitting, bending, and lying. Maintenance of posture involves muscles to contract, which enables the body to remain in both seated and standing positions. However, prolonged sitting or standing can have a detrimental effect on an individual's posture and lead to many postural abnormalities. (2) Each year, millions of people suffer from a condition known as Upper Crossed Syndrome. Sedentary lifestyles, excessive hours working at a desk or computer, texting, postural changes, and even improper weight lifting can lead to Upper cross syndrome. (3) As we grow older, our posture tends to decline: not only do the shoulders become more rounded, but the head becomes protracted forward and the thoracic spine (or upper back), is more curved. In time, faulty alignment and poor posture can add abnormal tissue stress, leading to degenerative joint changes and pain. Bad posture has also been linked to poor balance, as well as to decreases in gait and functional performance. (4) Upper Cross Syndrome is a condition that arises from a cyclical pattern of poor body mechanics. It is a problem that many people suffer from, but often don't identify. (5) Upper Crossed Syndrome occurs when there is a muscular imbalance in the neck, shoulder region, and upper to mid thoracic spine. (6)   It can lead to more serious problems such as early degenerative (arthritic) changes. Here shoulders become rounded, your head starts jutting forward, and all the muscles that hold you up against gravity get weak. This C-Posture is the result of this Upper Crossed Syndrome. These are common signs of Upper Crossed Syndrome. A posture that is prevalent with most people and leads to issues such as neck pain, muscle spasms, headaches, and may even cause numbness and tingling in the arms or hands. (7)   Upper cross syndrome is defined as "tightness of the upper trapezius, pectoralis major, and levator scapulae and weakness of the rhomboids, serratus anterior, middle and lower trapezius, and the deep neck flexors, especially the scalene muscles." (7) A lengthened muscle loses its ability to generate tension at a given length, resulting in weakness, and a shortened muscle loses its elasticity and becomes tight.(8)   This syndrome can cause a multitude of dysfunctions within the body including headaches, early degeneration of the cervical spine, and loss of the cervical curve. In 5 addition, Upper cross syndrome can cause an abnormal kyphotic thoracic spine and altered biomechanics of the glenohumeral joint. (9)   If Upper Crossed Syndrome is not dealt with, it can lead to a variety of pains and problems. They range from temporomandibular stress, neck pain, shoulder dysfunction, thoracic outlet syndrome, and inability to use the thorax normally in breathing. (10)   Active Release Techniques are used to treat inflammation of muscle (myofascitis), tendon (tendinosis), and ligament secondary to repetitive stress or frank injury. Over-used muscles (and other soft tissues) change in three important ways: acute conditions (pulls, tears, collisions, etc), accumulation of small tears (microtrauma), and lack of adequate oxygen (hypoxia). Active Release Technique is also used to evaluate the texture, tightness, and movement of muscles, fascia, tendons, and ligaments in your problem area. This method softens and stretches the scar tissue, resulting in an increased range of motion, increased strength, and improved circulation. Treatment of the involved muscle(s) also addresses neuritis/neuralgia which occurs when nerves become trapped or compressed by the affected muscles.(11)

METHODOLOGY

Study Design
This study employed a comparative design.

Source of Data
The participants were individuals recruited from the City Hospital Charitable Trust, Mangalore.

Definition of Study Subjects
The study included individuals aged between 20 to 50 years who were diagnosed with Upper Cross Syndrome.

Vandana V. Vyas

Inclusion Criteria
1. Male and female subjects aged between 20 to 50 years.
2. Diagnosed with acute pain associated with Upper Cross Syndrome.
3. Willingness to participate in the study.
4. No participation in any formal physical rehabilitation program.
5. Experience of mechanical neck pain.

Exclusion Criteria
1. History of surgeries in the cervical area.
2. Current use of analgesics and/or muscle relaxants.
3. Diagnosed thoracic scoliosis.
4. Known rotator cuff tear.
5. Pregnancy.
6. Unwillingness to participate in the study.

Study Sampling Design, Method, and Size
- Sampling Design: Probability convenience sampling.
- Method of Data Collection: Participants meeting the inclusion and exclusion criteria were recruited.
- Sample Size: A total of 30 subjects were included in the study.

Follow-Up and Assessments
1. Pre-Test Assessment: Pain and disability were evaluated on the first day before the intervention using manual muscle testing (MMT) and the Neck Disability Index (NDI). Range of motion (ROM) was assessed using goniometry.
2. Post-Test Assessment: Pain, disability, and range of motion were reevaluated on the last day of the treatment using the same tools (MMT, NDI, and goniometry).

Duration of Study
The study was conducted over a period of six months.

Intervention Procedures
Participant Selection and Screening
All participants were screened based on the inclusion and exclusion criteria. Participants were briefed on the purpose, nature, and intervention procedures of the study, and informed consent was obtained.

Group Allocation
Participants were randomly assigned to one of two groups
Group A (Control Group)
o Received prescribed exercises for 45 minutes per day, three times a week, for four weeks.
o The exercises included:
  ▪ Manual stretching of the upper trapezius, pectoralis major, and levator scapulae.
  ▪ Strengthening of the serratus anterior, rhomboids, middle and lower trapezius, and deep neck flexors.
o Each exercise was performed in 3 sets of 10 repetitions.

Group B (Experimental Group)
o Received the same prescribed exercises as Group A for 45 minutes per day, three times a week, for four weeks.
o In addition, participants underwent the Active Release Technique (ART) for 30 minutes on alternate weeks over the same four-week period.

Vandana V. Vyas

o   ART targeted the pectoralis major, levator scapulae, and upper trapezius bilaterally. After completing the four-week intervention, all participants were reevaluated for pain, range of motion (ROM), and disability using MMT, ROM, and the NDI.

RESULTS

Average improvement of neck disability index in control group is 8.46 and t value is 10.69 Average improvement of manual muscle testing in the experimental group is 12.33 and t value is 13.57

DISCUSSION

 In the present study age group that participated was between 20-50 years who had been evaluated with upper cross syndrome. Recent studies have shown the use of the active release technique in improving neck muscle strength and pain when used for a short duration. A lack of research is present to demonstrate the beneficial effects of the active release technique for a longer duration of time to achieve long-term effects of flexibility and range of motion of neck muscle. Hence this study shall be concentrated for a longer duration of time to achieve long-term effects of flexibility of neck muscle and improving posture. Results of these studies were directed toward active release technique with prescribed exercise to improve their upper cross syndrome in the present study

CONCLUSION

The treatment of upper cross syndrome with active release technique and prescribed exercises demonstrated the most significant improvements in patients' conditions. This study offers valuable insights into the most effective management approach for upper cross syndrome among computer professionals, with potential implications for optimizing the quality of care and enhancing the well-being of this occupational group. Active release technique with prescribed neck exercises can be promoted as a form of rehabilitation and daily training as a performance-enhancing program for various musculoskeletal neck injuries. Further studies can be done to find out the efficacy of these exercises in preventing recurrence rate.

LIMITATION OF THE STUDY
1. Age groups were selected 20 to 50 years.
2. Sample size was limited to 15 in each group.
3. Absence of an objective assessment scale.

CLINICAL IMPLICATIONS
The result of this study shows that Active release technique with prescribed neck exercises is effective than prescribed exercise alone in upper cross syndrome

ABSTRACT

This study presents a Susceptible-Exposed-Infected-Treatment (SEIT) model to describe the dynamics of disease transmission in a prey population by incorporation of treatment. The model includes compartments for susceptible, exposed, infected, and treated individuals. Differential equations are derived to capture the transitions between these states. The analysis focuses on finding equilibrium points and determining their stability. Numerical simulations are conducted to explore the impact of various parameters on disease dynamics and the effectiveness of treatment strategies. The results provide insights into disease control and management in ecological systems.

Keywords: SEIT model, Disease dynamics, Prey population, treatment and recovery, Epidemic modeling, Differential equations, Stability analysis, Numerical simulation, Ecological epidemiology, global stability, Hopf bifurcation, Harvesting.

INTRODUCTION

In the study of infectious diseases within ecological systems, the interaction between disease dynamics and population biology is of paramount importance. This paper focuses on the development and analysis of a Susceptible-Exposed-Infected-Treatment (SEIT) model to describe the spread of disease in a prey population, incorporating the effects of treatment on disease recovery. In natural ecosystems, prey populations are susceptible to

95218

infectious diseases that can significantly impact their dynamics and survival. Understanding the mechanisms of disease transmission and recovery is crucial for managing and conserving these populations. Traditional epidemiological models, such as the Susceptible-Infected-Recovered (SIR) and Susceptible-Exposed-Infected (SEI) models, provide foundational frameworks for studying disease dynamics. However, these models often overlook the impact of treatment and its role in disease management. The SEIT model introduced in this study extends the SEI framework by including a treatment compartment, where infected individuals can recover through medical intervention. This model divides the prey population into four compartments: susceptible (S), exposed (E), infected (I), and treated (T). Susceptible individuals can become exposed upon contact with infected individuals. Exposed individuals progress to the infected stage, during which they can either recover naturally, succumb to the disease, or receive treatment that leads to recovery. Treated individuals are considered recovered and are assumed to gain immunity, preventing them from returning to the susceptible state. The primary objectives of this study are to derive the differential equations governing the SEIT model, analyze the stability of equilibrium points, and conduct numerical simulations to investigate the impact of key parameters on disease dynamics. By understanding the interplay between disease transmission, progression, and treatment, we aim to provide insights into effective disease control strategies and their implications for the long-term sustainability of prey populations. This paper is structured as follows: Section 2 outlines the mathematical formulation of the SEIT model. Section 3 presents the equilibrium analysis and stability criteria. Section 4 discusses the results of numerical simulations, highlighting the effects of various parameters on the disease dynamics. Finally, Section 5 concludes with a summary of findings and potential directions for future research.

MATHEMATICAL MODEL FORMATION

$$\frac{ds}{dt} = as(t)\left(1 - \frac{s(t)}{k}\right) - \frac{cN(t)s(t)}{1 + N(t)} - \beta p(t)s(t) - \beta s(t)N(t)$$

$$\frac{dE}{dt} = \beta s(t)N(t) - \sigma E(t) - \delta E(t)$$

$$\frac{dN}{dt} = \frac{cN(t)s(t)}{1 + N(t)} - jN(t)p(t) - \delta N(t) - eN(t) + \sigma E(t)$$

$$\frac{dT}{dt} = vT(t) - fT(t) + \delta N(t) + \delta E(t)$$

$$\frac{dP}{dt} = \psi N(t)p(t) + \phi s(t)p(t) - hP(t)$$

With initial condition

S (0)>0, E (0)>0, N (0)>0, T (0)>0, P (0)>0.

we make the following assumptions to formulate the mathematical model assumption

S(t)→ Susceptible prey

E(t)→ Exposed prey

N(t)→ Infected prey

T(t)→ Treatment

P(t)→ predator

A → growth rate of susceptible prey

K → carrying capacity of susceptible prey

c→ interference coefficient of three prey species with type II functional response.

β, j→ force of infection of prey from predator

 e→ natural death rate of infected prey.

δ→ recovered rate of infected prey

σ→ rate at which exposed individuals progress to infectious rate

f→ relates death of infected prey under treatment

v→ growth rate of prey under treatment

ϕ, ψ→ conversion coefficient of predators from Susceptible, Exposed, and Infected prey populations

 h→ harvest effort of a predator.

This model has some assumptions which consist of the following
1. The Susceptible, Exposed, and Infected prey interaction occurs with Holling type II functional response.
2. We identify the number of Infected prey and give treatment for them.
3. The probability of an infected individual receiving treatment per unit of time does not change over time or with the size of the infected population.
4. Infected individual receives treatment, they are instantly moved to the treated (recovered) compartment.
5. Treated individuals are assumed to gain complete immunity to the disease. Therefore, individuals in the treated compartment do not revert to the susceptible, exposed, or infected states.
6. Treated individuals are considered non-infectious. They do not contribute to the transmission of the disease after receiving treatment.
7. Natural birth and death rates, as well as the rates of disease progression and natural recovery, are assumed to be constant over time.
8. It assumes that all infected individuals can receive treatment if they require it.

POSITIVITY AND BOUNDEDNESS OF THEOREM
In this section, we establish the conditions to get positive as well as bounded solutions of the system.

Positivity
Theorem 1
Every solution of system (1) with initial condition always exists in the interval $[0,\infty)$ and S (0)>0, E (0)>0, N (0)>0, T (0)>0, P (0)>0, for all t$\geq$ 0.

Proof
In the right-hand side of equation (1) is completely continuous and relates to local Lipschitzian on C, the condition (2) exists and is unique on $[0,\zeta), where$ $0 < \zeta \leq +\infty.$ from equation (1) and (2) we have

S(t)= S (0) exp $[\int_0^t \left\{a\left(1-\frac{s}{k}\right) - \frac{cN}{1+N} - \beta p - \beta N\right\}dt] > 0$

E(t)= E (0) exp $[\int_0^t \{\beta SN\}dt] > 0$

N(t)= N (0) exp $[\int_0^t \left\{\frac{cs}{1+N} - jp - \delta - e + \sigma E\right\}dt] > 0$

T(t)= T(0) exp$[\int_0^t \left\{v - f + \frac{\delta N}{T}\right\}dt] > 0$

P(t)= P(0) exp $[\int_0^t \{\psi N + \phi S - h\}dt] > 0$

Hence, we proved.

Boundedness
Theorem 2
Susceptible prey is always bounded above for a>0, K>0.

Proof
If S(0) =0 then the result is obvious, if S (0)>0, then S(t)>0 for all t on adding equation(1) we obtain

$\frac{ds}{dt} \leq a\left(1-\frac{S}{k}\right) \lim_{t\to\infty}(Sup\ s(t) \leq k)$

Theorem 3
Exposed prey, Infected prey, Treatment, and predator are bounded above.

Proof
If E(0)> 0, the results are obvious. We obtain the equation (1)
If E(0)> 0, then $\frac{dE}{dt} < 0$ if $d_1 E > 1, \frac{dN}{dt} < 0$ if $d_2 N > 1, \frac{dT}{dt} < 0$ if $d_3 T > 1, \frac{dp}{dt} < 0$ if $d_4 P > 1.$
Where $d_1 = \beta SN$, $d_2 = \delta + e, d_3 = v + f, and$ $d_4 = h.$

$\Rightarrow \lim_{t\to\infty}\left(Sup\ E(t)\le\frac{1}{d_1}\right),\ \lim_{t\to\infty}\left(Sup\ N(t)\le\frac{1}{d_2}\right),\ \lim_{t\to\infty}\left(Sup\ T(t)\le\frac{1}{d_3}\right),\ \lim_{t\to\infty}\left(Sup\ s(t)\le\frac{1}{d_4}\right)$

Theorem 4

The path of the equation (1) is bounded.

Proof

Define the function $\Omega = S + E + N + T + P$ *and* take its time derivative along the solution of (1) $\frac{d\Omega}{dt}=\frac{ds}{dt}+\frac{dE}{dt}+\frac{dN}{dt}+\frac{dT}{dt}+\frac{dP}{dt}$ since the parameters are non-negative and solutions initiating in R₊⁴ remain in the non-negative quadrant, then.

$\frac{d\Omega}{dt}+\rho\Omega \le as\left(1-\frac{S}{K}\right)-\beta SN - eN + vT - fT - hP + \rho S + \rho E + \rho N + \rho T + \rho P$

$=(\rho+a)S+(\rho+\beta)E+(\rho-e)N+\left(\frac{\rho+v}{f}\right)T+(\rho-h)P-\frac{as^2}{k}$

Where ρ is a non-negative constant for $\rho > e$ or $\rho > h$ *given* $\varepsilon > 0$ *there exists to such that* t 0n $t \ge t_0$.

$\frac{d\Omega}{dt}+\rho\Omega \le$ m+ε=min{=$(\rho+a),(\rho+\beta),(\rho-e),\left(\frac{\rho+v}{f}\right),(\rho-h)$}

Lemma.

Let φ be acontinuous function satisfying the differential inequality

$\frac{d\varphi(t)}{dt}+\alpha_1\varphi(t)\le\alpha_2, t\ge 0\ where(\alpha_1,\alpha_2)\epsilon R_+^3\ \alpha_1\ne 0$ then $\forall t\ge T\ge 0, \phi(t)\le\frac{\alpha_2}{\alpha_1}-\left(\frac{\alpha_2}{\alpha_1}\emptyset(t)\right)e^{\alpha_1(t-T)}$

From the above lemma $\Omega(t)\le\Omega(t_0)e^{-\rho(t-t_0)}+(\frac{m+\varepsilon}{\rho})(1-e^{-\rho(t-t_0)})$

Letting t→∞ *then letting* $\varepsilon\to 0$ $\lim_{t\to\infty}(\sup\Omega(t))\le\frac{m}{\rho}$

On the initial condition, the system (1) is bounded.

NONLINEAR SYSTEM AND STABILITY ANALYSIS

Equilibrium points:

The equilibrium points of the parametric model(1) are given by steady-state equation $\frac{ds}{dt}=\frac{dE}{dt}=\frac{dN}{dt}=\frac{dT}{dt}=\frac{dP}{dt}$.

The system has equilibrium points and after some algebraic calculations we get the trivial,axial, and non-trivial equilibrium points(table 1)

Analysis Stability and the existence of equilibrium point

The Jacobian matrix of the system (1) at equilibrium point E=(s(t), E(t), N(t), T(t), P(t)) is given by

$$J=\begin{bmatrix} a\left(1-\frac{2s}{k}\right)-\frac{cN}{1+N}-\beta P-\beta N & 0 & \frac{-cs}{(1+2)^2} & 0 & -\beta S \\ \beta N & -(\sigma+\delta) & \beta S & 0 & 0 \\ \frac{cN}{1+N} & \sigma & \frac{cS}{1+N}-\frac{CNS}{(1+N)^2}-jp-\delta-e & 0 & -jN \\ 0 & \delta & \delta & v-f & 0 \\ P\emptyset & 0 & P\psi & 0 & \Psi N+\Phi S-h \end{bmatrix}$$

Based on the condition of eigenvalues, the dynamical system (1) gets stable if all eigenvalues are non-positive in the case of real roots or non-positive real parts in the case of complex roots of the characteristic equation for the above Jacobian matrix. Otherwise, the system is unstable.

Theorem 5

Given the linearized system of equation (1) is trivial equilibrium point E1{S=0, E=0, N=0, T=0, P=0} is called a saddle point.

Proof

The Jacobian matrix is

$$J_1 = \begin{bmatrix} a & 0 & 0 & 0 & 0 \\ 0 & -(\sigma+\delta) & 0 & 0 & 0 \\ 0 & \sigma & -\delta-e & 0 & 0 \\ 0 & \delta & \delta & v-f & 0 \\ 0 & 0 & 0 & 0 & -h \end{bmatrix}$$

The eigen Values are $\lambda_1 = a, \lambda_2 = -(\sigma+\delta), \lambda_3 = -\delta-e, \lambda_4 = v-f, \lambda_5 = -h$

Hence the equilibrium point (1) is locally stable if $\lambda_1 = a > 0, \lambda_2 = -(\sigma+\delta) < 0, \lambda_3 = -\delta - e < 0, \lambda_4 = v - f < 0, \lambda_5 = -h<0$ is called a saddle point.

Theorem 6

Given the linearized system of equation (1) is exposed prey, infected prey, treatment and predator-free equilibrium point E2{S=K, E=0, N=0, T=0, P=0} is locally asymptotically stable.

Proof

The Jacobian matrix is

$$J_2 = \begin{bmatrix} -a & 0 & 0 & 0 & -\beta k \\ 0 & -(\sigma+\delta) & \beta k & 0 & 0 \\ 0 & \sigma & -\delta-e & 0 & 0 \\ 0 & \delta & \delta & v-f & 0 \\ 0 & 0 & 0 & 0 & K\Phi-h \end{bmatrix}$$

The eigen Values are $\lambda_1 = -a, \lambda_2 = -(\sigma+\delta), \lambda_3 = -\delta-e, \lambda_4 = v-f, \lambda_5 = K\phi-h$

Hence the equilibrium point(1) is locally stable if $\lambda_1 = -a < 0, \lambda_2 = -(\sigma+\delta) < 0, \lambda_3 = -\delta-e < 0, \lambda_4 = v-f < 0, \lambda_5 = K\phi-h<0$ with the condition $-(\sigma+\delta) > 0, = -\delta-e > 0, v > f \ and \ h > K\phi$.

Theorem 7

Given the linearized system of equation (1) is exposed prey, infected prey, and treatment- free equilibrium point E3 {S=$\frac{h}{\phi}$,E=0, N=0, T=0, P= $(\frac{-a(k\phi-h)}{k\beta\phi})$ } is locally asymptotically stable.

Proof:

The Jacobian matrix is

$$J_3 = \begin{bmatrix} a\left(1-\frac{2h}{K\phi}\right)-\beta\left(\frac{-a(k\phi-h)}{k\beta\phi}\right) & 0 & 0 & 0 & -\beta\frac{h}{\phi} \\ 0 & -(\sigma+\delta) & \beta\frac{h}{\phi} & 0 & 0 \\ 0 & \sigma & -j\left(\frac{-a(k\phi-h)}{k\beta\phi}\right)-\delta-e & 0 & 0 \\ 0 & \delta & \delta & v-f & 0 \\ \left(\frac{-a(k\phi-h)}{k\beta}\right) & 0 & 0 & 0 & 0 \end{bmatrix}$$

The eigen Values are $\lambda_1 = a\left(1-\frac{2h}{K\phi}\right)-\beta\left(\frac{-a(k\phi-h)}{k\beta\phi}\right), \lambda_2 = -(\sigma+\delta), \lambda_3 = -j\left(\frac{-a(k\phi-h)}{k\beta\phi}\right)-\delta-e, \lambda_4 = v-f, \lambda_5 = 0$

Hence the equilibrium point(1) is locally stable if $\lambda_1 = a\left(1-\frac{2h}{K\phi}\right)-\beta\left(\frac{-a(k\phi-h)}{k\beta\phi}\right) > 0, \lambda_2 = -(\sigma+\delta) < 0, \lambda_3 = -j\left(\frac{-a(k\phi-h)}{k\beta\phi}\right)-\delta-e > 0, \lambda_4 = v-f > 0, \lambda_5 = 0$.

Theorem 8

Given the linearized system of equation (1) is exposed prey, and treatment-free equilibrium point E4{S=K, E=0, N=$\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}$, T=0, P= $(\frac{-a(k\phi-h)}{k\beta\phi})$ } is locally asymptotically stable.

Proof

The Jacobian matrix is

$$J_3 = \begin{bmatrix} m_{11} & 0 & \dfrac{cK}{\left(1+\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2} & 0 & -\beta K \\[2ex] \beta\left(\dfrac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) & m_{22} & \beta K & 0 & 0 \\[2ex] \dfrac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)} & \sigma & m_{33} & 0 & -j\left(\dfrac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) \\[2ex] 0 & \delta & \delta & m_{44} & 0 \\[2ex] \left(\dfrac{-a(k\phi-h)}{k\beta}\right) & 0 & \psi\left(\dfrac{-a(k\phi-h)}{k\beta\phi}\right) & 0 & m_{55} \end{bmatrix}$$

Were

$$m_{11}=-a-\frac{\left(C\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{\left(1+\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}-\beta\left(\frac{-a(k\phi-h)}{k\beta\phi}\right)-\beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right),\ m_{22}=-(\sigma+\delta)$$

$$m_{33}=\frac{cK}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}+\frac{cK}{\left(1+\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2}-j\left(\frac{-a(k\phi-h)}{k\beta\phi}\right)-\delta-e,\ m_{44}=v-f$$

$$m_{55}=\psi\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)+K\phi-h.$$

The eigen values are

$$\lambda_1=-a-\frac{\left(C\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{\left(1+\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}-\beta\left(\frac{-a(k\phi-h)}{k\beta\phi}\right)-\beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)<0,\ \lambda_2=-(\sigma+\delta)<0,\ \lambda_3$$

$$=\frac{cK}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}+\frac{cK}{\left(1+\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2}-j\left(\frac{-a(k\phi-h)}{k\beta\phi}\right)-\delta-e<0,\ \lambda_4=v-f<0,$$

$$\lambda_5=\psi\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)+K\phi-h<0$$

Hence the equilibrium point (1) is locally asymptotically stable if
$\lambda_1<0,\lambda_2<0$ *with the condition* λ_3,λ_4 *and* λ_5 *have negative real parts.*

Theorem 9
Given the linearized system of equation (1) is exposed prey, infected prey, treatment and predator-free equilibrium point E5{S=$\frac{h}{\phi}$, $E=\frac{h}{\phi}\left(\frac{-a(k\phi-h)}{\phi(ck-\beta k)}\right)$, N=$\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}$, $T=0,P=0$}
is locally asymptotically stable.

Proof
The Jacobian matrix is

$$J_5 = \begin{bmatrix} m_{11} & 0 & \dfrac{c\frac{h}{\phi}}{\left(1+\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2} & 0 & -\beta\dfrac{h}{\phi} \\[2ex] \beta\left(\dfrac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) & m_{22} & \beta\dfrac{h}{\phi} & 0 & 0 \\[2ex] \dfrac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)} & \sigma & m_{33} & 0 & -j\left(\dfrac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) \\[2ex] 0 & \delta & \delta & m_{44} & 0 \\[2ex] 0 & 0 & 0 & 0 & m_{55} \end{bmatrix}$$

Were,

Sivakumar and Vijaya

$$m_{11} = a\left(1 - \frac{2h}{\phi}\right) - \left(\frac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1 + \left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)$$

$$m_{22} = -(\sigma + \delta)$$

$$m_{33} = \left(\frac{c\frac{h}{\phi}}{1 + \left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \left(\frac{c\frac{h}{\phi}}{1 + \left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2}\right) - \delta - e$$

$$m_{44} = v - f$$

$$m_{55} = \psi\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)$$

The eigenvalues are

$$\lambda_1 = a\left(1 - \frac{2h}{\phi}\right) - \left(\frac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1 + \left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) < 0, \lambda_2 = -(\sigma + \delta) < 0, \lambda_3$$

$$= \left(\frac{c\frac{h}{\phi}}{1 + \left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \left(\frac{c\frac{h}{\phi}}{1 + \left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2}\right) - \delta - e < 0, \lambda_4 = v - f < 0,$$

$$\lambda_5 = \psi\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) < 0$$

Hence the equilibrium point (1) is locally asymptotically stable if
$\lambda_1 < 0, \lambda_2 < 0$ *with the condition* λ_3, λ_4 *and* λ_5 *have negative real parts.*

Theorem 10

Given the linearized system of equation(1) is exposed prey, infected prey, treatment- free equilibrium point

E6{S=0,E=$\frac{h}{\phi}$ ($\frac{-a(k\phi-h)}{\phi(ck-\beta k)}$, $N = \frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}$, $T = \delta\frac{(\frac{2h}{\phi}(\frac{-a(k\phi-h)}{\beta(ck-\beta k)})}{v-f}$,P=0} is locally asymptotically stable.

Proof
The Jacobian matrix is

$$J_6 = \begin{bmatrix} m_{11} & 0 & 0 & 0 & 0 \\ \beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) & m_{22} & 0 & 0 & 0 \\ \frac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1 + \left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)} & \sigma & m_{33} & 0 & -j\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) \\ 0 & \delta & \delta & m_{44} & 0 \\ 0 & 0 & 0 & 0 & m_{55} \end{bmatrix}$$

Where,

$$m_{11} = a - \left(\frac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1 + \left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)$$

$$m_{22} = -(\sigma + \delta)$$

$$m_{33} = -\delta - e$$

$$m_{44} = v - f$$

$$m_{55} = \psi\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) - h$$

The eigenvalues

$$\lambda_1 = a - \left(\frac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) < 0, \lambda_2 = -(\sigma+\delta) < 0, \lambda_3 = -\delta - e < 0, \lambda_4 = v - f < 0,$$

$$\lambda_5 = \psi\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) - h < 0$$

Hence the equilibrium point (1) is locally asymptotically stable if
$\lambda_1 < 0, \lambda_2 < 0$ with the condition λ_3, λ_4 and λ_5 have negative real parts.

Theorem 11

Given the linearized system of equation(1) is predator-free equilibrium point E7$\{$ S=$\frac{h}{\phi}$, $E =$

$\frac{2h}{\phi^2}(\frac{-a(k\phi-h)}{\beta(ck-\beta k)})$, N=$\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}$, T=$\delta\frac{(\frac{2h}{\phi}(\frac{-a(k\phi-h)}{\beta(ck-\beta k)})}{v-f}$, $p = 0\}$ is locally asymptotically stable

Proof

The Jacobian matrix is

$$J_7 = \begin{bmatrix} m_{11} & 0 & \frac{c\frac{h}{\phi}}{\left(1+\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2} & 0 & -\beta\frac{h}{\phi} \\ \beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) & m_{22} & \beta\frac{h}{\phi} & 0 & 0 \\ \frac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)} & \sigma & m_{33} & 0 & -j\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) \\ 0 & \delta & \delta & m_{44} & 0 \\ 0 & 0 & 0 & 0 & m_{55} \end{bmatrix}$$

Were,

$$m_{11} = a\left(1-\frac{2h}{\phi}\right) - \left(\frac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)$$

$$m_{22} = -(\sigma+\delta)$$

$$m_{33} = \left(\frac{c\frac{h}{\phi}}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \left(\frac{c\frac{h}{\phi}}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2}\right) - \delta - e$$

$$m_{44} = v - f$$

$$m_{55} = \psi\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)$$

The eigenvalue is

$$\lambda_1 = a\left(1-\frac{2h}{\phi}\right) - \left(\frac{c\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \beta\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) < 0, \lambda_2 = -(\sigma+\delta) < 0, \lambda_3$$

$$= \left(\frac{c\frac{h}{\phi}}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)}\right) - \left(\frac{c\frac{h}{\phi}}{1+\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right)^2}\right) - \delta - e < 0, \lambda_4 = v - f < 0,$$

$$\lambda_5 = \psi\left(\frac{-a(k\phi-h)}{\beta\phi(ck-\beta k)}\right) < 0$$

Hence the equilibrium point (1) is locally asymptotically stable if
$\lambda_1 < 0, \lambda_2 < 0$ with the condition λ_3, λ_4 and λ_5 have negative real parts.

Sivakumar and Vijaya

Theorem 12

Given the linearized system of equation (1) is the interior equilibrium point E8{S=S*, E=E*,N=N*,T=T*,P=P*} is locally asymptotically stable

Proof:

$$J_8 = \begin{bmatrix} a\left(1-\frac{2s*}{k}\right)-\frac{cN*}{1+N*}-\beta P*-\beta N* & 0 & \frac{-cs*}{(1+N*)^2} & 0 & -\beta S* \\ \beta N* & -(\sigma+\delta) & \beta S* & 0 & 0 \\ \frac{cN*}{1+N}* & \sigma & \frac{CS*}{1+N*}-\frac{CN*S*}{(1+N*)^2}-jp*-\delta-e & 0 & -jN* \\ 0 & \delta & \delta & v-f & 0 \\ P*\emptyset & 0 & P*\psi & 0 & \Psi N*+\Phi S*-h \end{bmatrix}$$

The eigen value is

$$\lambda_1 = a\left(1-\frac{2s*}{k}\right)-\frac{cN*}{1+N*}-\beta P*-\beta N*<0, \lambda_2 = -(\sigma+\delta)<0, \lambda_3 = \frac{CS*}{1+N*}-\frac{CN*S*}{(1+N*)^2}-jp*-\delta-e<0, \lambda_4$$
$$=v-f<0,$$
$$\lambda_5 = \Psi N*+\Phi S*-h<0$$

The characteristic equation is $\Lambda_1(\lambda) = \lambda^5 + B_4\lambda^4 + B_3\lambda^3 + B_2\lambda^2 + B_1\lambda + B_0$

Were

$B_4 = 4I - (m_{11} + m_{22} + m_{22} + m_{44} + m_{55})$

$B_3 = -6I^2(m_{11} + m_{22} + m_{22} + m_{44} + m_{55})3I + m_{22}m_{33} + m_{22}m_{44} + m_{33}m_{44} - m_{11}m_{22} + m_{11}m_{33} + m_{11}m_{44} - m_{12}m_{22} + S*P*\beta\phi)$,

$B_2 = 4I^3 - (m_{11} + m_{22} + m_{22} + m_{44} + m_{55})3I^2 + (2m_{22}m_{33} + 2m_{22}m_{44} + 2m_{33}m_{44} - 2m_{11}m_{22} + 2m_{11}m_{33} + 2m_{11}m_{44} - 2m_{12}m_{22} + 2S*P*\beta\phi + m_{11}N^*P^*j\psi)I - (m_{22}m_{33}m_{44} + m_{22}m_{33}m_{11} + m_{22}m_{44}m_{11} - m_{33}m_{44}m_{11} + m_{12}m_{21}m_{33} + m_{12}m_{21}m_{44} + m_{11}N^*P^*j\phi + m_{12}N^*P^*j\phi + m_{21}S^*P^*\beta\psi - m_{22}S^*P^*\beta\phi - m_{33}S^*P^*\beta\phi$

$B_0 = I^4 - ((m_{11} + m_{22} + m_{22} + m_{44} + m_{55})I^3$
$+ (m_{11}m_{22} + m_{11}m_{33} + m_{11}m_{44} + m_{22}m_{33} + m_{33}m_{44} + N^*P^*j\psi - m_{12}m_{21})I^2$
$- (m_{11}m_{22}m_{33} + m_{11}m_{22}m_{44} + m_{11}m_{33}m_{44} + m_{22}m_{33}m_{44} + m_{11}N^*P^*j\psi$
$+ m_{33\ N^*P^*j\psi - m_{33}m_{12}m_{21} - m_{44}m_{12}}m_{21} - m_{12}N^*P^*j\phi)I + m_{11}m_{22}m_{33}m_{44} + m_{11}m_{33}n^*P^*j\psi$
$- m_{33}m_{44}m_{12}m_{21} - m_{12}m_{33}N^*P^*j\phi)$

By Routh Hurwitz criterion, all the eigen values of J7 have negative real parts.

If B₃>0

B₃B₂ >B₁

B₃B₂B₁> B₁²+ B₃²B₀

Therefore, the given system of the non linear. differential equation(1) is locally asymptotically stable around the non-negative equilibrium point {S=S*,E=E*,N=N*,T=T*,P=P*} if the conditions mentioned in the theorem holds.

Global stability analysis

We perform a global analysis of the system (1) around the non-negative equilibrium point G (S^*,E^*,N^*, T^*, P^*) of the coexistence. The following theorem of Lyapunov function Δ is considered.

Theorem 13

Let $\Delta = \frac{1}{2}(s-S^*)^2 + \frac{1}{2}\varsigma_1(E-E^*)^2 + \frac{1}{2}\varsigma_2(N-N^*)^2 + \frac{1}{2}\varsigma_3(T-T^*)^2 + \frac{1}{2}\varsigma_4(P-P^*)^2$

Where $\varsigma_1, \varsigma_2, \varsigma_3, \varsigma_4 > 0$ *are to be carefully chosen such that* $\Delta(G) = 0$ *then* G(S^*,E^*,N^*,T^*,P^*) *and* $\Delta = (S,E,N,T,P) > 0\ S, E, N, T, P|G$.

If the time derivative of Δ *is* $\frac{d\Delta}{dt} < 0, \forall, S, E, N, T, P \in \Gamma^+$ *tends to* $G*$ *of the system is Lyapunov stable and* $\frac{d\Delta}{dt} < 0\ S, E, N, T, P\epsilon\Gamma^+$ near implies thar G is globally stable.

Proof

$\frac{d\Delta}{dt}$ =(s-S^*)$\frac{ds}{dt}$ + $\varsigma_1(E-E^*)\frac{dE}{dt}$ + $\varsigma_2(N-N^*)\frac{dN}{dt}$ + $\varsigma_3(T-T^*)\frac{dT}{dt}$ + $\varsigma_4(P-P^*)\frac{dP}{dt}$

The above equation becomes

$\frac{d\Delta}{dt}$ =(s-S^*)$\{a\left(1-\frac{2s}{k}\right)-\frac{cN}{1+N}-\beta P-\beta N\}$(s-$S^*$) + $\varsigma_1(E-E^*)\{\beta SN\}(E-E^*)$ + $\varsigma_2(N-N^*)\{\frac{CS}{1+N}-\frac{CNS}{(1+N)^2}-jp-\delta-e\}(N-N^*)$ + $\varsigma_3(T-T^*)\left\{v-f+\frac{\delta N}{T}\right\}(T-T^*)$ + $\varsigma_4(P-P^*)\{\psi N+\phi S-h\}(P-P^*)$

By rearranging we obtain

$\frac{d\Delta}{dt}$ =(s-S^*)$\{a\left(1-\frac{2s}{k}\right)-\frac{cN}{1+N}-\beta P-\beta N\}$ + $\varsigma_1(E-E^*)\{\beta SN\}$ + $\varsigma_2(N-N^*)\{\frac{CS}{1+N}-\frac{CNS}{(1+N)^2}-jp-\delta-e\}$ + $\varsigma_3(T-T^*)\left\{v-f+\frac{\delta N}{T}\right\}$ + $\varsigma_4(P-P^*)\{\psi N+\phi S-h\}$

Thus, it is possible to set $\varsigma_1,\varsigma_2,\varsigma_3,\varsigma_4 > 0$ such that del> 0 is an endemic positive equilibrium point is globally stable. Therefore, it is pointed out the parameters play a key role in controlling the stability aspects of the system.

HOPF BIFURCATION

In this section, we examined the Hopf bifurcation around the interior equilibrium point E4. The parameter a is a basic representation of the growth rate of prey S and identified as a bifurcation parameter. Hopf bifurcation occurs when Jacobian matrix E4 has a pair of merely imaginary eigenvalues and the other eigenvalues have non-positive real parts and Re$[\frac{d\lambda}{da}]|_{a-a_0\neq0}$.Presume that the characteristic equation at the interior equilibrium point E4 is as follows:

$\lambda^5 + B_4\lambda^4 + B_3\lambda^3 + B_2\lambda^2 + B_1\lambda + B_0 \dots\dots\dots\dots\dots (3)$

For merely imaginary eigenvalues, the coefficients of characteristic polynomial (3) satisfy the following condition:

$B_3B_2B_1> B_3^2B_0+B_1^2$

Suppose $\pm i\omega$ *is a pair merely imaginary eigenvalues corresponding to* a_0. We solve from the characteristic equation (3) tends to a

$[4\lambda^3 + 3\lambda^2 B_3 + 2B_2\lambda + B_1]\frac{d\lambda}{da} + \left(\lambda^3\frac{dB_3}{da} + \lambda^2\frac{dB_2}{da} + \lambda\frac{dB_1}{da} + \frac{dB_0}{da}\right) = 0$

Hence

$\frac{d\lambda}{da}-\frac{\left(\lambda^3\frac{dB_3}{da}+\lambda^2\frac{dB_2}{da}+\lambda\frac{dB_1}{da}+\frac{dB_0}{da}\right)}{[4\lambda^3+3\lambda^2B_3+2B_2\lambda+B_1]}\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots(4)$

Substitute iω

$\frac{d\lambda}{da}|_{i\omega} = -\left(\frac{-i\omega^3\left(\lambda^3\frac{dB_3}{da} + \lambda^2\frac{dB_2}{da} + \lambda\frac{dB_1}{da} + \frac{dB_0}{da}\right)}{-4i\omega^3 - 3i\omega^2 B_3 - 2B_2 i\omega + B_1]}\right)$

Hence

Re$([\frac{d\lambda}{da}]|_{i\omega})$ = -$\left(\frac{|B_1-3\omega^2B_3|\left[\frac{dB_0}{da}\omega^2\frac{dB_2}{da}\right]+[2B_2\omega-4\omega^3]\left[\omega^3\frac{dB_3}{da}-\omega\frac{dB_1}{da}\right]}{|B_1-3\omega^2B_3||2B_2\omega-4\omega^3|}\right)$

Theorem 14:

Consider the bifurcation parameter as 'a' then system (1) sustains a Hopf bifurcation provided.

$(|B_1 - 3\omega^2 B_3|\left[\frac{dB_0}{da}\omega^2\frac{dB_2}{da}\right] + [2B_2\omega - 4\omega^3]\left[\omega^3\frac{dB_3}{da} - \omega\frac{dB_1}{da}\right]) \neq 0$

NUMERICAL RESULTS

The system of the nonlinear differential equation (1) for the numerical solution. In this section, we existing solutions under stability analysis.

1. First, we take the parameter of the system as (β,k,ψ,j,v,δ,c,f,φ,e,h,a) =
2. (1.05,1.25,0.23,0.545,0.005,1.236,1.450,0.212,2.024,2.05,2.11,1.07) at the population (S, E, N,T,P) = (10.25,10.36,10.46,10.06,10.13) The given system is asymptotically stable (Fig. 1).

3. If we take the parameter of the system as mentioned above in point (1). Then the initial condition satisfies (S,E,N,T,P)=(10.2,0,0,0,0) is the susceptible prey population (Fig 2).

4. If we take the parameter of the system as mentioned above in point (1). Then the initial condition satisfies (S,E,N,T,P)=(0,10.2,0,0,0) is the Exposed prey population (Fig 3).

5. If we take the parameter of the system as mentioned above in point (1). Then the initial condition satisfies (S,E,N,T,P)=(0,0,10.2,0,0) is the Infected prey population (Fig 4).

6. If we take the parameter of the system as mentioned above in point (1). Then the initial condition satisfies (S, E, N, T, P) = (1.2,0,0,0,1),(1.2,0,0,1.2)the contact rate of susceptible prey and predator population (Fig 5).

7. If we take the parameter of the system as mentioned above in point (1). Then the initial condition satisfies (S, E, N, T, P) = (0,1.2,0,0,1),(0,1.2,0,0,1.2) the contact rate of Exposed prey and predator population (Fig 6).

8. If we take the parameter of the system as mentioned above in point (1). Then the initial condition satisfies (S, E, N, T, P) = (0,0,1.2,0,1),(0,0,1.2,0,1.2) the contact rate of Infected prey and predator population (Fig 7).

9. If we take the parameter of the system as mentioned above in point (1). Then the initial condition satisfies (S, E, N, T, P) = (1.2,0.1, 1,1,1),(1.3,0.6,0.7,0.2,0.1), (1.2,0.6,1.7,0.1,0.1), (1.2,1.46,1.7,1.2,0.1) the contact rate of prey, Treatment and predator interaction (Fig 8).

DISCUSSION AND CONCLUSION

The Susceptible-Exposed-Infected-Treatment (SEIT) model provides a comprehensive framework for understanding the dynamics of disease transmission within a prey population, incorporating the impact of treatment on disease recovery. Treatment plays a crucial role in reducing the number of infected individuals within the prey population. The inclusion of a treatment class significantly alters the disease dynamics, leading to a decrease in the overall infection prevalence. This demonstrates the importance of medical intervention in managing wildlife diseases. The basic reproduction number was derived and analyzed to understand the conditions necessary for disease persistence or eradication. Our results indicate that reducing below one through treatment efforts can lead to the eventual eradication of the disease. The stability analysis of the model's equilibrium points shows that effective treatment can lead to a stable disease-free equilibrium. In the absence of sufficient treatment, the system may reach an endemic equilibrium where the disease persists at a constant level. The interaction between disease dynamics and prey-predator relationships is complex. Disease-induced mortality in the prey population can indirectly affect predator dynamics. Effective treatment not only benefits the prey population by reducing disease burden but also stabilizes the predator population by ensuring a steady prey supply. The findings underscore the importance of implementing treatment programs in wildlife populations to control disease outbreaks. This approach can prevent significant declines in prey populations, thereby maintaining ecological balance. Wildlife managers should consider incorporating regular health assessments and treatment interventions in their conservation strategies. SEIT model, highlighting the importance of treatment in managing disease dynamics and maintaining ecological stability.

ABSTRACT

Cosmetics have been in demand for incredibly long. Diurnal lip care cosmetics contain dangerous factors like heavy essences and preservatives, which makes them dangerous. Nowadays ladies are more serious about their beauty and for making face updates and seductive, lip care cosmetics and substantial powders are extensively used. Herbal lip attar gives attractiveness to lips by coloring and maintains its wimpy, promoting healthy lips. Lip redolence isn't gender-specific; men and women can use it. In the present day, the mature population uses Lip balm, numerous newer tones have also arrived in request to mileage products as per consumer demand. Most frequently, lip balm can get ingested; thus, it becomes obligatory for health controllers to authorize them cautiously. Lip balm can be used for coloring and moisturizing the lips. Herbal expression is a sign of safety, satisfaction, and surety as lower or no detriment to the druggies and so herbal Lip balm can be made without the colors being compromised. This lip balm is formulated according to scientific procedure and is estimated to be in standard conditions. *Basella Alba* fruits are high in nutritional value and are promising crops. The reddish-violet color of the fruit is due to the presence of betacyanin in them. Current cosmetic lip products are based on the use of toxic chemical ingredients with various adverse effects.

Keywords: Natural, Herbal, Colour, Ingredients, Lip balm, Formulation, Side effects, Safe.

INTRODUCTION

Lips, the visible body part at the mouth of humans and many animals, are soft and movable and serve as the opening for food intake and in the articulation of sound and speech. Coloring lips is practiced over the years since the ancient period. Some synthetic lip colorants, cheap and easy to make and obtain, can harm the lip skin. Also, lips do not contain any oil glands and therefore need hydration and protection in all seasons. In the present day, lip balm usage has increased and also the colour shades and other choices have been changed. More often, the applied lip balm is eaten away and ingested; therefore, it becomes mandatory for health regulators to approve them cautiously. Lip balms can be used for coloring and moisturizing the lips. Herbal, is a sign of safety, satisfaction, and surety of less or no harm to the users and so herbal lip balm can be made without the colors being compromised. *Basella Alba* fruits are high in nutritional value and are promising crops. The reddish- violet color of the fruit is due to the presence of betacyanin in them. Though the extracted color pigments are susceptible to light and air, their stability could be maintained by keeping them in low temperatures (≤14°C) and also devoid of light and air. These can then be a potent organic color pigment that can be used in cosmetic industries stating the stability conditions. Olive oil used for the formulation of this herbal pigmented lip balm is exploited for its blending properties with the waxes and imparting the lip balm to coat in a thin film. The beeswax could retain the moisture necessary to heal the dried chapped scaly lips and maintain their quality. The rose oil and almond essential oil were used to flavor the lip balm. Methylparaben was used to provide its soothing and preservative properties, including lip balm's antimicrobial and antifungal properties[1]**.**

Plant profile
Botanical name   : *Basella alba*
Family   : *Basellaceae*
Genus   : *Basella*
Species   : *Basella alba L*

MATERIAL AND METHOD

Basella Alba
The fruit was collected from the plant *Basella Alba*. The plant was authenticated by SIDDHA MEDICINAL PLANT GARDEN (Central Council for Research in Siddha)Ministry of Ayush, Govt. of India

FORMULATION
Weigh all of the ingredients in a porcelain dish. Melt the beeswax and cocoa butter in a water bath before placing porcelain dish 1 within. Melt the olive and almond oils in a water bath and place the porcelain dish 2 inside. Combine the contents of the ceramic dish. 2 can be put into porcelain dish 1 at 40°C and continually mixed. Add the *Basella Alba* fruit extract to the mixture. It can be used as both a colorant and an antioxidant. Almond oil includes vitamin E, which promotes cell growth and smoothness. Rose essential oil is used for flavoring. To produce the desired texture, the mixture was transferred from the water bath to the ice bath, hardened, and homogenized with a mortar and pestle. Finally, include methylparaben as a preservative. The compositions listed below were created using the approach provided. Testing the temperature of the softening process.

EVALUATION
MELTING POINT
The drug-containing capillary was dipped in liquid paraffin using melting point equipment with magnetic stirring. Melting was assessed visually and the melting point was reported[24].

SPREADABILITY

The spreadability test estimates the force required to apply lip balm. The parallel-plate method is commonly used to determine and quantify the spreadability of semisolid preparations. This procedure is simple and cost-effective. The steps taken in this evaluation are To evaluate spreadability, a sample was crushed between two glass slides and weight was added to the pan. The time it took for the upper glass slide to move across the lower slide was recorded.

G - Good: Lip balm is consistent, without fragmentation, and applies perfectly without deformation.

I - Intermediate: uniform; leaves few fragments; appropriate application; little deformation of the lip balm.

B - Bad: not uniform; leaves many fragments; difficult or inappropriate application, intense deformation of the lip balm[25][26].

pH

The pH of the lip balm was determined to investigate the possibility of any side effects. As an acidic or alkaline pH may irritate lips, it was determined to keep the pH of the formulation as close to neutral as possible. The pH measurement was studied by dissolving 1gm of sample into 100ml of water. The pH measurement was done by using a pH meter[11].

PERFUME STABILITY

After 30 days, the developed herbal lip balm was tested for aroma under normal storage circumstances of cool temperature [15].

SKIN IRRITATION TEST

The procedure involves applying a small amount of prepared substance to the dorsal surface of the left-hand skin for 10 minutes in volunteer applicants. The skin is inspected for signs of inflammation, rash, erythema, and edema.

SOLUBILITY

To determine the solubility of prepared herbal lip balm, it was dissolved in organic solvents such as ethanol and chloroform.

AGING STABILITY

The stability of the product was evaluated by storing at 400C for 1 hr. Then various parameters such as bleeding, crystallization of the surface, and ease of application were observed.[13]

RESULT

These results suggest that the Herbal Lipbalm formulation using Basella alba has the potential to provide long-lasting moisturizing and protection to the lips. (Table 1)

DISCUSSION

The present work is undertaken to formulate and evaluate herbal lip balm with the hope of minimizing the side effects of chemical colors. Plant pigments provide antioxidant properties along with the coloring property used in this herbal formulation, we have used both the properties of the Spinacia oleracea plant, and as the results obtained the formulated herbal lip balm has antioxidant properties. The antioxidant activity can be enhanced under stringent laboratory conditions as this formulation was done at the college pilot scale level. We may replace the chemical-based synthetic color and antioxidant with herbal-based preparations. The formulated herbal lip balm had efficient melting and molding capacity, successfully evaluated with various parameters. The color of the lip balm was pale pink. The pH of lip balm was found to be 5.42. Which was in the range of pH of the skin therefore it signified that it is compatible with the skin (lip) which was further confirmed by a skin irritation test done in a survey on voluntarily participated candidates. The melting point of lip balm was between 72℃ to 76℃. It confirmed that the formulated lip

balm might be stable at room temperature or even at comparatively high temperatures but below 72℃ and therefore melting temperature was acceptable. The surface anomalies were also not found. The force of application or spreadability was found even but further homogenization can be done for better results. The aging stability was also found smooth but for a shorter time and then the color further faded because stabilizer was not added. A solubility test was also performed and found soluble in chloroform. The skin irritation test showed no such sign of itching, irritation, redness, and inflammation. The overall work revealed that the formulated herbal lip balm was safe and compatible to the skin compared to previous studies. Further studies on the herbal lip balm can be done to enhance antioxidant properties and color stability at room temperature.[15]

CONCLUSION

The present work carried out the formulation and evaluation of herbal lip balms was aimed at formulating a lip balm using herbal ingredients with an idea to minimize the side effects that occur by using available chemical-based synthetic lip balms. The prepared formulation of lip balm was evaluated and it was found that the herbal lip balm, was based on consistency. Therefore, from the present investigation it was concluded that this formulated herbal lip balm provides a better option for anyone applying lip balm with minimal side effects and also has antioxidant properties which help for better health benefits. Further studies can be carried out based on the present study of formulation and evaluation of herbal lip balm using *Basella Alba* extract as follows:[13] To enhance the even texture and smoothness one can go for a better homogenizing method. To get the various shades in formulated herbal lip balm the amount of pigment can increase and decrease accordingly.

ABSTRACT

To determine the inverse semitotal domination number of some graphs derived from paths and cycles. Consider the problem of selecting two disjoint sets D_1 and D_2 of transmitting stations in which the distance between any two transmitting stations is 1 or 2, so that every station not belonging to D_1 has a link with at least one station in D_1 and similarly, for D_2, where $|D_1|$ and $|D_1 \cup D_2|$ are minimum among all pairs of disjoint sets of transmitting stations. In this paper we have determined the inverse semitotal domination number for snake related graphs, friendship graphs, comb graphs, broom graphs, firecracker graphs and twig graphs. The relationship with other graph theoretical parameters are also discussed. This study fills the research gap by examining the correlation between inverse domination number and semitotal domination number. Inverse semitotal dominating set provides a subordinate set for the respective semitotal dominating set.

Keywords: graphs, domination number, inverse semitotal domination number, graph theoretical parameters

Punitha Tharani and Joslin Amala

INTRODUCTION

The graphs considered here are simple, finite, nontrivial, undirected and without isolated vertices. The graph $G = (V, E)$ considered here have $n = |V|$ vertices and $m = |E|$ edges. A set D of vertices in a graph G is a dominating set if every vertex not in D is adjacent to at least one vertex in D. The domination number $\gamma(G)$ of G is the order of a smallest dominating set in G. Any dominating set with $\gamma(G)$ vertices is called a $\gamma(G)$ – set of G. The concept of inverse domination was introduced by V.R. Kulli and S.C. Sigarkanti[1]. Let D be a minimum dominating set of G. If $V - D$ contains a dominating set say D' then D' is called an inverse dominating set with respect to D. The inverse domination number $\gamma'(G)$ of G is the order of a smallest inverse dominating set in G. Any inverse dominating set with $\gamma'(G)$ vertices is called a $\gamma'(G)$ – set of G. The concept of semitotal domination was introduced by Wayne Goddard, Michael A. Henning and Charles A. McPillan[2]. A set D of vertices in a graph G with no isolated vertices to be a semitotal dominating set, abbreviated semi-TD-set, of G if it is a dominating set of G and every vertex in D is within distance 2 of another vertex of D. The semitotal domination number, denoted by $\gamma_{t2}(G)$, is the minimum cardinality of a semi-TD-set. Any semitotal dominating set with $\gamma_{t2}(G)$ vertices is called a $\gamma_{t2}(G)$ – set of G. Motivated by these two domination parameters inverse semitotal domination number was devised in the previous paper[3]. The devised set can be find in the complement of the minimum semitotal dominating set and it act as a subordinate set. In this paper we determine the inverse semitotal domination number of some graphs derived from paths and cycles and its relationship with other graph theoretical parameters are also discussed.

Exact values for some standard graphs[3]

i) For any path P_n of order $n \geq 4$, $\gamma'_{t2}(P_n) = \begin{cases} 2, & n = 4 \\ \left\lceil \frac{2(n+1)}{5} \right\rceil, & n > 4 \end{cases}$

ii) For any cycle C_n of order $n \geq 4$, $\gamma'_{t2}(C_n) = \left\lceil \frac{2n}{5} \right\rceil$

iii) For the complete graph K_n of order $n \geq 4$, $\gamma'_{t2}(K_n) = 2$

iv) For the complete bipartite graph $K_{m,n}$ where $m, n \geq 2$, $\gamma'_{t2}(K_{m,n}) = 2$

v) For the star graph $k_{1,n}$ where $n \geq 3$, $\gamma'_{t2}(K_{1,n})$ – set does not exist.

METHODS

Definition: Let D be a minimum semitotal dominating set of G. If $V - D$ contains a semitotal dominating set say D' then D' is called an inverse semitotal dominating set with respect to D. The minimum cardinality of an inverse semitotal dominating set of G is called the *inverse semitotal domination number* and is denoted by $\gamma'_{t2}(G)$. Any inverse semitotal dominating set with $\gamma'_{t2}(G)$ vertices is called a $\gamma'_{t2}(G)$ – set of G.

Example: For the graph G_1 in Figure 1, $D' = \{v_3, v_7\}$ forms a $\gamma'_{t2}(G_1)$ – set. Hence $\gamma'_{t2}(G_1) = 2$.

RESULTS AND DISCUSSION

Inverse semitotal domination number of some graphs derived from paths and cycles:
Here, we determine the inverse semitotal domination number of triangular snake graphs, alternate triangular snake graphs, friendship graphs, comb graphs, broom graphs, firecracker graphs and twig graphs.

Theorem: The inverse semitotal domination number for any triangular snake graph, where $n \geq 3$ is $\gamma'_{t2}(T_n) = \left\lceil \frac{n}{2} \right\rceil$.

Proof
Let $G = T_n$ be the triangular snake graph obtained from a path $\{v_i : 1 \leq i \leq n\}$ by joining v_i and v_{i+1} to a new vertex u_j for $1 \leq j \leq n - 1$. Let $V = \{v_i, u_j : 1 \leq i \leq n \text{ and } 1 \leq j \leq n - 1\}$ be a vertex set of the triangular snake graph. For $n = 3$, clearly $\gamma'_{t2}(T_n) = \left\lceil \frac{n}{2} \right\rceil$.

Punitha Tharani and Joslin Amala

Case (i) Suppose $n \geq 5$ is a positive odd integer.

It is clear that a $\gamma_{t2}(G) -$ set is $\left\{v_{2i} : 1 \leq i \leq \frac{n-1}{2}\right\}$. The corresponding $\gamma'_{t2}(G) -$ set is contained in the complement of the $\gamma_{t2}(G) -$ set. Let $D' = \left\{v_{2i-1} : 1 \leq i \leq \frac{n+1}{2}\right\}$ be a semitotal dominating set and no other semitotal dominating set in the complement of the $\gamma_{t2}(G) -$ set has cardinality less than the cardinality of D' which dominates the whole vertex set of T_n. Thus D' is the $\gamma'_{t2}(G) -$ set. Therefore, $\gamma'_{t2}(T_n) = \left\lceil \frac{n}{2} \right\rceil$.

Case (ii) Suppose $n \geq 4$ is a positive even integer.

It is clear that a $\gamma_{t2}(G) -$ set is $\left\{v_{2i} : 1 \leq i \leq \frac{n}{2}\right\}$. The corresponding $\gamma'_{t2}(G) -$ set is contained in the complement of the $\gamma_{t2}(G) -$ set. Let $D' = \left\{v_{2i-1} : 1 \leq i \leq \frac{n}{2}\right\}$ be a semitotal dominating set and no other semitotal dominating set in the complement of the $\gamma_{t2}(G) -$ set has cardinality less than the cardinality of D' which dominates the whole vertex set of T_n. Thus D' is $\gamma'_{t2}(G) -$ set. Therefore, $\gamma'_{t2}(T_n) = \left\lceil \frac{n}{2} \right\rceil$.

Theorem

The inverse semitotal domination number for any alternate triangular snake graphs, where, $n \geq 3$, for which the triangle starts from the first vertex is $\gamma'_{t2}(A(T_n)) = \left\lceil \frac{n}{2} \right\rceil$.

Proof

Let $G = A(T_n)$. Let $V = \left\{v_i, u_j : 1 \leq i \leq n \text{ and } 1 \leq j \leq \left\lceil \frac{n}{2} \right\rceil \right\}$ be the vertex set of the alternate triangular snake graph. The path vertices are labelled as $\{v_i : 1 \leq i \leq n\}$ and the new vertices adjacent to the edges of the path are labelled as $\left\{u_j : 1 \leq j \leq \left\lceil \frac{n}{2} \right\rceil \right\}$ where u_1 is adjacent to v_1 and v_2, u_2 is adjacent to v_3 and v_4, and so on. For $n = 3$, clearly $\gamma'_{t2}(A(T_n)) = \left\lceil \frac{n}{2} \right\rceil$.

Case (i) Suppose $n \geq 5$ is a positive odd integer.

It is clear that a $\gamma_{t2}(G) -$ set is $\left\{v_{2i} : 1 \leq i \leq \frac{n-1}{2}\right\}$. The corresponding $\gamma'_{t2}(G) -$ set is contained in the complement of the $\gamma_{t2}(G) -$ set. Let $D' = \left\{v_{2i-1} : 1 \leq i \leq \frac{n+1}{2}\right\}$ be a semitotal dominating set and no other semitotal dominating set in the complement of the $\gamma_{t2}(G) -$ set has cardinality less than the cardinality of D' which dominates the whole vertex set of $A(T_n)$. Thus D' is $\gamma'_{t2}(G) -$ set. Therefore, $\gamma'_{t2}(A(T_n)) = \left\lceil \frac{n}{2} \right\rceil$.

Case (ii) Suppose $n \geq 4$ is a positive even integer.

It is clear that a $\gamma_{t2}(G) -$ set is $\left\{v_{2i} : 1 \leq i \leq \frac{n}{2}\right\}$. The corresponding $\gamma'_{t2}(G) -$ set is contained in the complement of $\gamma_{t2}(G) -$ set. Let $D' = \left\{v_{2i-1} : 1 \leq i \leq \frac{n}{2}\right\}$ be a semitotal dominating set and no other semitotal dominating set in the complement of the $\gamma_{t2}(G) -$ set has cardinality less than the cardinality of D' which dominates the whole vertex set of $A(T_n)$. Thus D' is $\gamma'_{t2}(G) -$ set. Therefore, $\gamma'_{t2}(A(T_n)) = \left\lceil \frac{n}{2} \right\rceil$.

Theorem

The inverse semitotal domination number for any alternate triangular snake graphs, where $n \geq 3$, for which the triangle starts from the second vertex is

$$\gamma'_{t2}(A(T_n)) = \begin{cases} \frac{n}{2}, & \text{for } n = 4, 6, 8 \\ \left\lceil \frac{n}{2} \right\rceil, & \text{for odd } n \geq 3. \\ \frac{n}{2} + 1, & \text{even } n \geq 10 \end{cases}$$

Punitha Tharani and Joslin Amala

Proof:

Case (i) Suppose $n \geq 3$ is a positive odd integer.

Let $V = \left\{ v_i, u_j : 1 \leq i \leq n \text{ and } 1 \leq j \leq \left\lfloor \frac{n}{2} \right\rfloor \right\}$ be a vertex set of $A(T_n)$. The path vertices are labelled as $\{v_i : 1 \leq i \leq n\}$ and the new vertices adjacent to the edges of the path are labelled as $\left\{ u_j : 1 \leq j \leq \left\lfloor \frac{n}{2} \right\rfloor \right\}$ where u_1 is adjacent to v_2 and v_3, u_2 is adjacent to v_4 and v_5, and so on. For $n = 3$, obviously $\gamma'_{t2}(A(T_n)) = \left\lceil \frac{n}{2} \right\rceil$.

Subcase (i) Suppose $n = 5, 7$.

It is clear that a $\gamma_{t2}(A(T_n))$ – set is $\left\{ v_{2i} : 1 \leq i \leq \frac{n-1}{2} \right\}$ then the corresponding $\gamma'_{t2}(A(T_n))$ – set is $\left\{ v_{2i-1} : 1 \leq i \leq \frac{n+1}{2} \right\}$. Therefore, $\gamma'_{t2}(A(T_n)) = \left\lceil \frac{n}{2} \right\rceil$.

Subcase (ii) Suppose $n \geq 9$.

It is clear that a $\gamma_{t2}(A(T_n))$ – set is $\{v_2, v_4\} \cup \left\{ v_{2i-1} : 4 \leq i \leq \frac{n+1}{2} \right\}$. The corresponding $\gamma'_{t2}(A(T_n))$ – set is contained in the complement of $\gamma_{t2}(A(T_n))$ – set. Let $D' = \{v_1, v_3, v_5\} \cup \left\{ v_{2i} : 3 \leq i \leq \frac{n-1}{2} \right\}$ be a semitotal dominating set and no other semitotal dominating set in the complement of the $\gamma_{t2}(A(T_n))$ – set has cardinality less than the cardinality of D' which dominates the whole vertex set of $A(T_n)$. Thus D' is $\gamma'_{t2}(A(T_n))$ – set. Therefore, $\gamma'_{t2}(A(T_n)) = \left\lceil \frac{n}{2} \right\rceil$.

Case (ii) Suppose $n \geq 4$ is a positive even integer.

Let $V = \left\{ v_i, u_j : 1 \leq i \leq n \text{ and } 1 \leq j \leq \left\lfloor \frac{n-1}{2} \right\rfloor \right\}$ be a vertex set of the alternate triangular snake graph. The path vertices are labelled as $\{v_i : 1 \leq i \leq n\}$ and the new vertices added to the edges of the path are labelled as $\left\{ u_j : 1 \leq j \leq \left\lfloor \frac{n-1}{2} \right\rfloor \right\}$ where u_1 is adjacent to v_2 and v_3, u_2 is adjacent to v_4 and v_5, and so on.

Subcase (i) Suppose $n = 4, 6, 8$.

It is clear that a $\gamma_{t2}(A(T_n))$ – set is $\left\{ v_{2i} : 1 \leq i \leq \frac{n}{2} \right\}$ then the corresponding $\gamma'_{t2}(A(T_n))$ – set is $\left\{ v_{2i-1} : 1 \leq i \leq \frac{n}{2} \right\}$. Therefore, $\gamma'_{t2}(A(T_n)) = \frac{n}{2}$.

Subcase (ii) Suppose $n \geq 10$.

It is clear that a $\gamma_{t2}(A(T_n))$ – set is $\{v_2, v_4\} \cup \left\{ v_{2i-1} : 4 \leq i \leq \frac{n}{2} \right\}$. The corresponding $\gamma'_{t2}(A(T_n))$ – set is contained in the complement of the $\gamma_{t2}(A(T_n))$ – set. Let $D' = \{v_1, v_3, v_5\} \cup \left\{ v_{2i} : 3 \leq i \leq \frac{n}{2} \right\}$ be a semitotal dominating set and no other semitotal dominating set in the complement of the $\gamma_{t2}(A(T_n))$ – set has cardinality less than the cardinality of D' which dominates the whole vertex set of $A(T_n)$. Thus D' is $\gamma'_{t2}(A(T_n))$ – set. Therefore, $\gamma'_{t2}(A(T_n)) = \frac{n}{2} + 1$.

Theorem

The inverse semitotal domination number for the friendship graph, where $n \geq 2$, is $\gamma'_{t2}(F_n) = n$.

Proof

Let $G = F_n$ be the friendship graph formed by joining n copies of the cycle graph C_3 with a common vertex. Let $V = \{v_i : 1 \leq i \leq 2n + 1\}$ be a vertex set of the friendship graph. Let v_1 be the universal vertex of F_n. Since v_1 dominates the entire vertex set of the friendship graph, it must be included in the $\gamma_{t2}(G)$ – set. Hence $\{v_1, v_k\}$ for any $k \in i \neq 1$, forms $\gamma_{t2}(G)$ – set then the respective $\gamma'_{t2}(G)$ – set is contained in the complement of the $\gamma_{t2}(G)$ – set. Let $D' = \{v_i : \forall v_j \in D', v_i v_j \notin E \ 2 \leq i \leq 2n + 1\}$ be a semitotal dominating set and no other semitotal dominating set in the complement of $\gamma_{t2}(G)$ – set has cardinality less than the cardinality of D', which dominates the whole vertex set of F_n. Thus D' is $\gamma'_{t2}(G)$ – set. Therefore, $\gamma'_{t2}(F_n) = n$.

Theorem: The inverse semitotal domination number for the comb graph, where $n \geq 3$, is $\gamma'_{t2}(P_n^+) = n$.

Punitha Tharani and Joslin Amala

Proof

Let $G = P_n^+$ be the comb graph, where $P_n^+ = P_n \odot K_1$. Let $V = \{v_i, u_j : 1 \le i, j \le n\}$ be the vertex set of the comb graph, where $\{v_i : 1 \le i \le n\}$ corresponds to the path P_n and $\{u_i : 1 \le i \le n\}$ corresponds to the pendant vertices connected to each path vertex.

Case (i) Suppose $n \ge 3$ is a positive odd integer

Obviously, $\{v_{2i-1}, u_{2j} : 1 \le i \le \frac{n+1}{2}, \ 1 \le j \le \frac{n-1}{2}\}$ forms the $\gamma_{t2}(G)$ – set. Its complement set $\{v_{2i}, u_{2j-1} : 1 \le i \le \frac{n-1}{2}, \ 1 \le j \le \frac{n+1}{2}\}$ forms the $\gamma_{t2}'(G)$ – set with respect to $\gamma_{t2}(G)$ – set. Therefore, $\gamma_{t2}'(P_n^+) = n$.

Case (ii) Suppose $n \ge 4$ is a positive even integer

Obviously, $\{v_{2i-1}, u_{2j} : 1 \le i, j \le \frac{n}{2}\}$ forms the $\gamma_{t2}(G)$ – set. Its complement set $\{v_{2i}, u_{2j-1} : 1 \le i, j \le \frac{n}{2}\}$ forms the $\gamma_{t2}'(G)$ – set with respect to the $\gamma_{t2}(G)$ – set. Therefore, $\gamma_{t2}'(P_n^+) = n$.

Theorem: The inverse semitotal domination number for the broom graph, where $n \ge 5$ and $m \ge 3$, is $\gamma_{t2}'(B_{n,m}) = \left\lceil \frac{2m}{5} \right\rceil + (n - m)$.

Proof: Let $G = B_{n,m}$ be the broom graph has $n - m$ pendant vertices adjacent to either the origin or the terminus of the path P_m. Let $V = \{v_i, u_j : 1 \le i \le m, 1 \le j \le n - m\}$ be the vertex set of the broom graph where $\{v_i : 1 \le i \le m\}$ corresponds to the vertices of path P_m and $\{u_j : 1 \le j \le n - m\}$ corresponds to $(n - m)$ pendant vertices. We observe that a $\gamma_{t2}(G)$ – set is the $\gamma_{t2}'(P_m)$ – set of the path P_m of $B_{n,m}$. Then,

$\gamma_{t2}'(G)$ – set $= (\gamma_{t2}(P_m) - set) \cup \{u_j : 1 \le j \le n - m\}$

$\left| (\gamma_{t2}'(G) - set) \right| = |(\gamma_{t2}(P_m) - set)| + \left| \{u_j : 1 \le j \le n - m\} \right|$

$= \left\lceil \frac{2m}{5} \right\rceil + (n - m)$.

Theorem: The inverse semitotal domination number for the firecracker graph where $n \ge 2, k \ge 3$ is $\gamma_{t2}'(F_{n,k}) = \begin{cases} nk - 2n + 1 + \left\lceil \frac{n}{3} \right\rceil, & \text{if } n \equiv 0 (mod\ 3) \\ nk - 2n + \left\lceil \frac{n}{3} \right\rceil, & \text{otherwise} \end{cases}$.

Proof: Let $G = F_{n,k}$ be the firecracker graph obtained by the concatenation of nk-stars by linking one leaf from each. Let $V = \{v_i : 1 \le i \le nk\}$ be the vertex set of the firecracker graph. Consider the path P_n obtained by linking one leaf from each copies of k-stars, which are labelled as $\{v_i : 1 \le i \le n\}$. The remaining vertices adjacent to the path vertices are labelled as $\{v_i : n + 1 \le i \le 2n\}$ and the remaining pendant vertices are labelled as $\{v_i : 2n + 1 \le i \le nk\}$.

Clearly, the set $D = \gamma(P_n) - set \cup \{v_i : n + 1 \le i \le 2n\}$ forms the $\gamma_{t2}(G)$ – set. The corresponding $\gamma_{t2}'(G)$ – set is contained in the complement of the $\gamma_{t2}(G)$ – set.

Case (i) In $V \setminus D$, we observe that for $n \equiv 0 (mod\ 3)$

$\gamma_{t2}'(G)$ – set $= (\gamma'(P_n) - set) \cup \{v_i : 2n + 1 \le i \le nk\}$

$\left| (\gamma_{t2}'(G) - set) \right| = \left| (\gamma'(P_n) - set) \right| + |\{v_i : 2n + 1 \le i \le nk\}|$

$= \left(\left\lceil \frac{n}{3} \right\rceil + 1 \right) + nk - 2n$

Case (ii) In $V \setminus D$, we observe that for $n \not\equiv 0 (mod\ 3)$

$\gamma_{t2}'(G)$ – set $= (\gamma'(P_n) - set) \cup \{v_i : 2n + 1 \le i \le nk\}$

$\left| (\gamma_{t2}'(G) - set) \right| = \left| (\gamma'(P_n) - set) \right| + |\{v_i : 2n + 1 \le i \le nk\}|$

$= \left\lceil \frac{n}{3} \right\rceil + nk - 2n$

95242

Punitha Tharani and Joslin Amala

Theorem: The inverse semitotal domination number for the twig graph, where $m \geq 2$, is $\gamma_{t2}'(T_m) = 2m + 2$.

Proof: Let $G = T_m$ be the twig graph formed from a path P_n by attaching two pendant vertices to each internal vertices of the path. Let $V = \{v_i, u_j : 1 \leq i \leq n, 1 \leq j \leq 2m\}$ be the vertex set of the twig graph, where $\{v_i : 1 \leq i \leq n\}$ corresponds to P_n and $\{u_j : 1 \leq j \leq 2m\}$ corresponds to the pendant vertices added to each internal vertices of P_n. For $n \geq 4$ and $m \geq 2$, we observe that, $\{v_i : 2 \leq i \leq n-1\}$ forms the $\gamma_{t2}(G)$ – set. The complement of the $\gamma_{t2}(G)$ – set, which is $\{v_1, v_n\} \cup \{u_i : 1 \leq i \leq 2m\}$, forms the $\gamma_{t2}'(G)$ – set with respect to the $\gamma_{t2}(G)$ – set.
Therefore, $\gamma_{t2}'(T_m) = 2m + 2$.

RELATIONSHIP WITH GRAPH-THEORETICAL PARAMETERS

Theorem: For any connected graph G with $n \geq 4$, $\gamma_{t2}'(G) + \chi(G) \leq 2n - 2$ and the equality holds if and only if G is isomorphic to K_4.

Proof: It is clear from the definition that $\gamma_{t2}'(G) \leq n - 2$ and $\chi(G) \leq n$. Thus, $\gamma_{t2}'(G) + \chi(G) \leq n - 2 + n = 2n - 2$. Suppose G is isomorphic to K_4, then obviously, $\gamma_{t2}'(G) + \chi(G) = 2n - 2$. Conversely, let $\gamma_{t2}'(G) + \chi(G) = 2n - 2$, the only possible case is $\gamma_{t2}'(G) = n - 2$ and $\chi(G) = n$. If $\chi(G) = n$, then G is isomorphic to K_n. In K_n, $\gamma_{t2}'(G) = 2$, so that G is isomorphic to K_4.

Theorem: For any connected graph G with $n \geq 4$, $\gamma_{t2}'(G) + \Delta(G) \leq 2n - 3$ and the equality holds if and only if G is isomorphic to K_4.

Proof: It is clear from the definition that $\gamma_{t2}'(G) \leq n - 2$ and $\Delta(G) \leq n - 1$. Thus, $\gamma_{t2}'(G) + \Delta(G) \leq n - 2 + n - 1 = 2n - 3$. Suppose G is isomorphic to K_4, then obviously, $\gamma_{t2}'(G) + \Delta(G) = 2n - 3$. Conversely, let $\gamma_{t2}'(G) + \Delta(G) = 2n - 3$, the only possible case is $\gamma_{t2}'(G) = n - 2$ and $\Delta(G) = n - 1$. If $\Delta(G) = n - 1$, then G is isomorphic to K_n. In K_n, $\gamma_{t2}'(G) = 2$, so that G is isomorphic to K_4.

Theorem: For any connected graph G with $n \geq 4$, $\gamma_{t2}'(G) + \kappa(G) \leq 2n - 3$ and the equality holds if and only if G is isomorphic to K_4.

Proof: It is clear from the definition that $\gamma_{t2}'(G) \leq n - 2$ and $\kappa(G) \leq n - 1$. Thus, $\gamma_{t2}'(G) + \kappa(G) \leq n - 2 + n - 1 = 2n - 3$. Suppose G is isomorphic to K_4, then obviously, $\gamma_{t2}'(G) + \kappa(G) = 2n - 3$. Conversely, let $\gamma_{t2}'(G) + \kappa(G) = 2n - 3$, the only possible case is $\gamma_{t2}'(G) = n - 2$ and $\kappa(G) = n - 1$. If $\kappa(G) = n - 1$, then G is isomorphic to K_n. In K_n, $\gamma_{t2}'(G) = 2$, so that G is isomorphic to K_4.

CONCLUSION

In this paper we have determined the inverse semitotal domination number of some graphs derived from paths and cycles. We have also discussed its relationship with other graph theoretical parameters such as chromatic number of a graph, vertex connectivity and maximum degree of a graph and have shown the bound is sharp for the complete graph with four vertices. Further, the characterization of the graphs with this parameter can be investigated.

ABSTRACT

Nanoemulsions are highly promising for cosmetic and drug delivery applications due to their thermodynamic stability and small droplet size, which enhance skin penetration and drug solubility. Their benefits include reduced side effects, ease of production, and the ability to solubilize a wide range of active ingredients. However, challenges such as formulation limitations and skin barrier permeability still exist. The absorption rate of drugs through the skin depends on factors like the drug type and dose, the choice of surfactant, water content, and the presence of penetration enhancers. Several methods, including phase inversion, ultrasonication, microfluidization, and high-pressure homogenization, are used to prepare nanoemulsions. Despite some drawbacks, nanoemulsions provide an innovative approach to enhance both medication delivery and skincare formulations, making them a powerful tool in therapeutic and cosmetic products.

Keywords: Drug Delivery, Emulsion, Nanoemulsion, Transdermal, Topical

Sonali Subhash Hake *et al.,*

INTRODUCTION

Nanoemulsions

Emulsions are composed of two immiscible liquids that, because of an excess of free energy at the surface of the internal phase, produce a thermodynamically unstable system. Comparing nanoemulsions to regular emulsions, the former usually have a more consistent or narrow size distribution, Using droplet sizes between 10 and 100 nm [1]. Nanoemulsions are mixtures of oil, water, and surfactants or cosurfactants. They produce steady, evenly spaced droplets with dimensions in the nanometer range. For a variety of uses, including the food and pharmaceutical industries, this structure improves their stability and bioavailability [2]. Indeed, a kind of multiphase colloidal dispersion renowned for its stability and purity is called a nanoemulsion. They consist of microscopic droplets dispersed across an immiscible liquid. Their stability and transparency are enhanced by their tiny droplet size, which makes them appropriate for a variety of applications such as food, cosmetic, and drug delivery formulations [3].

Transdermal

The skin is thought to be a desirable organ for systemic (transdermal) and local (topical, dermal) administration of active compounds despite this permeability problem[4].The largest organ in the human body, it provides a wide, painless, and convenient interface for the application of medications and cosmetics. Cosmeceuticals play the vital role in skincare by offering targeted benefits like rejuvenation, moisturization, nourishment, and protection. Transdermal delivery further enhances these advantages, bypassing gastrointestinal issues and minimizing fluctuations in drug concentrations. It's a promising approach for effective skincare.

Types of nanoemulsions [5]

Three types of nanoemulsions are distinguished by their oil and water phases

1. Oil in water (o/w). The exterior aqueous phase of this system contains distributed internal phase oil droplets.
2. Water in oil (w/o): The water droplet from the internal phase of the nanoemulsion is distributed throughout the external oil phase in this system.
3. Bi-continuous: The system contains a nanoemulsion with a mixture of water and oil droplets.

Component of Nanoemulsion

1. Oil
2. Surfactant
3. Co- Surfactant
4. Aqueous phase

Oil

The choice of oil in a nanoemulsion is vital for high drug loading. The oil must dissolve the active ingredients and work well with other components to ensure effective distribution in the aqueous phase. Oils can be natural, synthetic, or semi-synthetic [6].

Surfactant

Surfactants reduce surface and interfacial tension, playing roles such as emulsifiers, foaming agents, wetting agents, detergents, and dispersants based on their hydrophilic-lipophilic balance (HLB). In nanoemulsions, hydrophilic surfactants (HLB > 10) stabilize oil-in-water (o/w) emulsions, while hydrophobic surfactants (HLB < 10) are used for water-in-oil (w/o) emulsions. Surfactant mixtures with varying HLB values can be used to create stable nanoemulsions when diluted with water [7].

Co-surfactant

These substances were used in the nanoemulsion formulation when the surfactant failed to reduce the interfacial tension that developed between water and oil. Additionally, by piercing a surfactant monolayer and upsetting its

95246

crystalline liquid phase, it added some fluidity to the interfacial tension of surfactants with high stiffness. Propylene glycol, poly glyceryl oleate, and PEG 400 are examples of co-surfactants[8].

Aqueous phase
Deionized water, with a neutral pH of 7 and no electrolytes, is commonly used as the aqueous phase in nanoemulsions. The characteristics of the aqueous phase, such as pH, electrolytes, and ionic concentration, influence nanoemulsion stability and droplet size[9].

Advantages of Nanoemulsion

1. Thermodynamically stable systems like nanoemulsions enable the system to self-emulsify, producing features that are not dependent on the method used.
2. They are the medication's super solvent. They can improve the bioavailability of poorly soluble pharmaceuticals and solubilise hydrophilic and lipophilic drugs.
3. The dispersed phase, which can be either hydrophilic or lipophilic (w/o or o/w nanoemulsions), might act like a possible reservoir for either type of medication.
4. The nano emulsion droplets' mean diameter is less than 0.1 m, filtering can be used to sterilise them.
5. It is possible to transport hydrophilic and lipophilic medicines in nanoemulsion[10].

Limitations of Nanoemulsion
1. Effective drug administration via the skin's rate-controlling barrier is a major difficulty in developing nanoemulsions as a topical medication delivery method.
2. The rheology characteristics of a nanoemulsion are crucial for medication delivery through the skin, even with formulations with small particle sizes[11].
3. The poor viscosity and spreadability of the nanoemulsion formulation make it inconvenient to utilize[12].

Factors Affecting Nanoemulsion-Enhanced Drug Permeation through the Skin
Amount of Drug
Nanoemulsions are highly effective for delivering both lipophilic and hydrophilic drugs due to their ability to absorb significant amounts of active ingredients. The concentration gradient created between the internal and external phases enhances the drug's thermodynamic properties, promoting its diffusion from the internal phase into the epidermal layers, thereby improving drug absorption and effectiveness [13].

Amount of Surfactant
The selection of surfactant is crucial in nanoemulsion synthesis, affecting skin penetration and drug solubilization. An ideal surfactant should have good solubilizing ability for the active ingredient and support oil nanoemulsification. Non-ionic surfactants are preferred over cationic and anionic ones, as they are gentler on the skin. While cationic and anionic surfactants can enhance skin suppleness and elasticity by binding water to the skin's surface, non-ionic surfactants are generally recommended for better skin compatibility[14].

Amount of Water
Drug penetration in a nanoemulsion system was found to be linearly correlated with water content [15]. Because the skin and the nanoemulsion system have different moisture contents, the drug molecules are driven strongly through the skin's layers [16]. Many researchers have also observed improved medication delivery as a result of hydration and an increase in water phase [17, 18]. Their exceptional mobility is due to both the small particle size but high droplet density of the nanoemulsions and the naturally occurring and continuously changing surfaces of the drug molecules [19].

Penetration Enhancers

Glycerides, fatty acids/alcohols, and vegetable oil are examples of lipids in the SC that have polarities similar to those of an oil lipid phase and can enhance skin penetration.For the purpose of treating arthritis, muscular soreness, and mild joint pain, topical camphor, menthol, and methyl salicylate were more effectively absorbed when fixed oils such soybean oil were used[20].Through interactions with the SC, these penetration enhancers create a reversible reduction in the skin's barrier characteristics [21, 22].

Techniques for Nanoemulsion Preparation
Techniques for high energy emulsification
High-pressure homogenizations

High-pressure homogenization creates nanoemulsions by forcing a mixture of oil and aqueous phases through a tiny hole under pressures of 500-5000 psi. This process generates very fine particles (as small as 1 nm) due to hydraulic shear and turbulence. A monomolecular layer of phospholipids separates the oil and water phases. The main downside is high energy consumption despite the rise in temperature during processing.

Microfludization

This special mixing technique makes use of a high-pressure positive displacement pump that runs between 500 and 20,000 psi. is seen in (fig 2). The phases are compelled to flow through tiny channels by this pressure. When the two phases are combined and forced through an interaction chamber, the coarse emulsion forms into a nanoemulsion. This is designed to flow via tiny passages [23, 24].

Ultrasonication

The process of creating nanoemulsion is covered in several research publications that try to use ultrasonic sound frequency to reduce droplet size. At system pressures higher than the ambient value indicated in (Fig. 3), another method is to use a constant amplitude sonotrode. An ultrasonic field's cavitation threshold is known to rise with increasing external pressure, which decreases the formation of bubbles. Since cavitation is the primary process of low-frequency power dissipation, significant variations in power density can be linked to changes in the navigational ultrasonic system. Additionally, a water jacket is used by the system to control the temperature to the required level [25].

Sonication

Kinetically stable nanoemulsions can be made by ultrasonic homogenization or sonication. When liquids containing surfactants and cosurfactants are brought into contact with the sonicator probe of an ultrasonic homogenizer, mechanical vibration, and cavitation are created. This delivers the necessary energy input to produce tiny droplets [26, 27]. With increasing ultrasonic homogenization time, power levels, and surfactant content, the dispersed phase particle size in sonicated nanoemulsions decreases[28]. Optimizing ultrasonic reaction chamber design, operating parameters, and product formulation (e.g., surfactant concentration and oil phase type and content) are necessary to achieve a dispersed phase droplet size of 20 nm [29].

Low-energy methods for emulsification
phase inversion method

To achieve fine dispersion, the emulsification process makes use of the chemical energy generated by these phase changes. Either altering the composition of the emulsion while keeping the temperature constant, or the opposite, causes the phase change. When Shinoda *et al.* initially calculated the phase inversion temperature, they concluded that a rise in temperature causes the polymer chain to break down, changing the chemical makeup of polyoxymethylene surfactants [30].

Solvent Evaporation Technique

To avoid particle aggregation and crystal formation, a high-speed stirrer is used to produce the pharmaceutical solution, which is subsequently emulsified in a different liquid that is not the prescription solvent. A precipitate of the drug may result from evaporating the solvent [31].

Hydrogel Technique

Such a technique is analogous to solvent evaporation. Drug anti-solvent and drug solvent are miscible, which is the only distinction between the two procedures. Higher shear force prevents Ostwald ripening and crystal formation [32].

Characterization of Nanoemulsions

Droplet size

Transmission electron microscopy (TEM) is used to study nanoparticle size and morphology. Samples are placed on a copper-carbon TEM grid, dried, and coated with gold before being examined under a scanning electron microscope at 20 kV. This process includes steps like air-drying, critical point drying, and sputter-coating for accurate analysis of stable emulsions [33].

Interfacial tension

Interfacial tension is used to study the characteristics and formulation of nanoemulsions. Ultralow interfacial tension is observed when the oil and aqueous phases are in equilibrium with the surfactant phase. This can be accurately measured using a spinning drop apparatus, which helps detect extremely low interfacial tension values [34].

Zeta potential

Zeta potential measures the particle charge, which is crucial for the stability of nanoemulsions. A high zeta potential (above 30 mV) indicates stability, as it prevents aggregation by maintaining strong repulsive forces between particles. A low zeta potential means flocculation occurs, with attraction outweighing repulsion. Factors like particle source, electrolyte content, pH, hydration, and particle shape influence zeta potential and the electrostatic stability of nanoemulsions [35].

Refractive index: The refractive index, which represents the isotropic quality of the formulation, is the net value of the nanoemulsion component parts. It is a method for determining if a formulation is transparent as well as for thermodynamic stability study of the sample [34]. It is clear that the formulation is transparent if the system's RI comparison is comparable to that of water. Using a refractor, the refractive index was determined [36].

Viscosity

Viscosity, which measures a fluid's resistance to flow, is an important characteristic of nanoemulsions. The Brookfield DV-II+ Pro viscometer is commonly used to measure viscosity by averaging three data points at a specific shear rate. Measurements are taken at various rpm values (0.5, 1, 2.5, and 5) after the mixture sits for five minutes at room temperature or a controlled temperature. Results typically show that as storage temperature decreases, the viscosity of the nanoemulsion increases. The readings from the viscometer's dial are noted to quantify this [37]. Mass/volume equals viscosity.

Entrapment efficiency

The encapsulation efficiency (% EE) of a drug in a nanoemulsion is calculated by assessing the amount of free (unentrapped) drug. The formula is:% EE = [(Amount of drug added - Free drug) / Amount of drug added] × 100this measures how much of the drug is successfully encapsulated in the formulation [34].

Marketed formulation on nanoemulsion [38]
Applications of Nanoemulsion [39, 40,41].
Nanoemulsion for oral route
Due to their slow rate of dissolution, poorly water-soluble medications have limited bioavailability; nevertheless, oral delivery of these pharmaceuticals by o/w nanoemulsion increases their solubility, absorption, and bioavailability.

Nanoemulsion for ophthalmic administration
Improved topical hydrophobic medication administration to the ocular is being investigated with oil in water emulsions. Lipophilic medication combined with ocular emulsions unquestionably offer a more favorable balance between enhancing ocular bioavailability and patient experience relief after applying topical medication on the eye. For example, indomethacin, piroxicam, and pilocarpine, cyclosporine.

Nanoemulsion for nasal route
Analysing the nose route concerning the parenteral and perioral routes, there are numerous advantages. For example, drug absorption is increased because the nasal mucosa and nanoemulsion droplet have more time to interact, bypassing the liver's initial metabolism.

Nanoemulsion for transdermal delivery
There are three possible entry points for the chemical into the epidermis layer: the stratum corneum, hair follicles, or sweat ducts. These routes limit the absorption of drugs and lower their bioavailability. To regulate medication redistribution across blood and lymph arteries and to enhance drug targeting.Nanoemulsion is a promising technology with advantages such as minimal preparation cost, good stability during storage, no organic solvent, and thermodynamic stability. It can also achieve systemic administration through skin pores.

Nanoemulsion in cosmetic
Nanoemulsion is thought to be an excellent vehicle for regulated cosmetic delivery and helps disperse active ingredients throughout the skin layer. Because micro emulsion causes sedimentation, creaming, and flocculation, nanoemulsion is employed in cosmetics.

Future Prospects and Emerging Research Areas:
Nanotechnology
This involves the use of extremely small particles or structures, such as nanofibers and microneedles, to enhance drug delivery through the skin. Drugs can be more effectively absorbed and released over time by using nanofibers to create a structure that resembles a mesh [42].
Polymeric Systems
Polymeric hydrogels and nanoparticles use materials that encircle the medication in a network. These systems both shield medications from deterioration and facilitate their more efficient skin absorption. Drugs can be encapsulated in polymeric nanoparticles, which allow for a controlled release and gradual release over time [51].

Lipid-Based Carriers
These lipid-based carriers, which include liposomes and solid lipid nanoparticles, enhance the solubility and stability of drugs that would otherwise be difficult to deliver. Solid lipid nanoparticles are minuscule solid lipid particles that have the ability to encapsulate medications, shielding them from external influences and ensuring a prolonged release [42].

Microneedle Arrays
These tiny needle arrays in the form of a grid penetrate the skin's outermost layer gently, forming microchannels. The distribution of medications straight into the skin's deeper layers is made easier by these microchannels. This method works well for deep administration of medications such as hormone therapies and immunizations since it is less intrusive and uncomfortable than standard injections [43].

Bio adhesive Formulations

These formulations include ingredients that stick to the skin for a long period, prolonging the time and improving the efficiency of medicine delivery. Bio-adhesive compounds make sure the medication stays on the skin longer, whichimproves absorption and permits a steady and regulated release [44].

CONCLUSION

Nanoemulsions, with their nanoscale droplet size and thermodynamic stability, offer great potential for improving the administration of topical and transdermal drugs, as well as in cosmetic formulations. They provide benefits like high drug solubility, ease of manufacture, and enhanced therapeutic efficacy with fewer side effects. However, challenges such as formulation limitations and skin barrier permeability need to be addressed. Drug penetration is influenced by factors like concentration, surfactant type, water content, and penetration enhancers. Various methods, including phase inversion, high-pressure homogenization, microfluidization, and ultrasonication, are used to prepare nanoemulsions. Despite some drawbacks, advances in penetration enhancement and formulation techniques are expanding the applications of nanoemulsions in medicine and skincare. More research is needed to optimize these systems and overcome current challenges.

ABSTRACT

Transportation and assignment models participate major task in logistics and make available procession organization for reducing cost and time, for superior service. In this paper a fuzzy Assignment Model for defuzzification by proposed method Measure mean ranking technique, its σ-cuts for linear and nonlinear orientation functions is used. The proposed Mean square ranking Assignment model is tested by considering an instance with three parameters as fuzzy cost, fuzzy time and fuzzy quality with universal LR triangular fuzzy numbers and a realistic data is tested with two parameters fuzzy cost and fuzzy time as indiscriminate LR triangular fuzzy numbers by a choice of cases. This method helps in transmission and implementing the individuals to mechanism effectively on one-one basis so that it increases the number of prospective bidders and it minimize the total fuzzy assignment cost and total fuzzy time.

Keywords: Fuzzy Assignment Problem - Measure Mean - Robust's – PERT - Centroid - ranking method - Hungarian method
MSC 2020 No : 47S40

INTRODUCTION

Assignment problem is used global in solving factual humanity tribulations. It the stages an essential responsibility in the manufacturing and is worn exceptionally frequently in solving problems of trade, organization discipline and it has numerous other applications. Therefore, the inadequate resources must be utilized competently such that the most favorable existing possessions can be assigned to the a large amount desirable responsibilities so as to maximize and minimize the revenue and outlay in that order. Multi-objective assignment problem with trapezoidal fuzzy number was described by Pramanik *et.al.,*[4]. Classify the modeling using fuzzy technique which was motivated by Mohan kumar *et.al.*[8,13,15]. Assignment problem using fuzzy method solved by including Kagade *et.al.,*[1,2,4,5]. Srinivasan *et.al.,*[7] recently obtained fuzzy assignment problem with various ranking methods. In this Paper, In order to acquire in the vicinity of optimal solution a novel method Hungarian's method algorithm is presented using measure mean ranking Assignment Model is proposed and a fuzzy Assignment Problem with three parameters fuzzy cost, fuzzy time and fuzzy quality are proposed to find an finest solution with total assignment minimum cost

Basic Results
In this topic deals with Fuzzy set, Fuzzy number, L-R fuzzy numbers, σ-cut of L-R fuzzy number, Hungarian method for solving fuzzy combinatorial optimization dilemma.

Fuzzy Set

Let $\widetilde{A}$ be the subset of X where, X is the universe of objects then traits function by

$$\mu_{\widetilde{A}} = \begin{cases} 1 \ if \ x \in \widetilde{A} \\ 0 \ if \ x \notin \widetilde{A} \end{cases}$$

The *fuzzy set* $\widetilde{A}$ will be the function $\mu_{\widetilde{A}} : X \to [0, 1]$, $\mu_{\widetilde{A}}$ is called the *integration function* which is a desirability on the unit interval that measures the degree to each $x \in \widetilde{A}$

Fuzzy number
A Fuzzy set defined on universal of real numbers R is said to be a *fuzzy number* has the following attributes:

(i). $\widetilde{A}$ is convex, $\mu_{\widetilde{A}}(\beta a + (1-\beta) b \beta) \geq \min imum(\mu_{\widetilde{A}}(a), \mu_{\widetilde{A}}(b)) \forall a,b \in R \ and \ 0 \leq \beta \leq 1$

(ii). $\widetilde{A}$ is normal, (i.e.) the integration function of $\widetilde{A}$ has at least one element x ∈ X whose Integration desirability is unity.

(iii). $\mu_{\widetilde{A}}$ is continuous except at a finite number of points in its domain.

(iv).   The duration or the expenses of the generalised fuzzy number is

$$\left[A_{ij} \right] A_{ij} = (A_{ij}^{(1)}, A_{ij}^{(2)} A_{ij}^{(3)} A_{ij}^{(4)} ; W_{ij})$$

Assignment and Allocation dilemma
One particular kind of transit challenge, which is also a resource allocation problem is the allocation dilemma. The challenge in this situation is how to divide up the n jobs that need to be completed by the n machines. There are several uses for this problem in allocation problems, where various entities are assigned to or allocated to other entities. When allocating various tasks to various machines, the goal is to choose the best allocation (distribution) that will reduce the overall cost or time required for the machines to complete all of the tasks. The assignment problem: The challenge, given n machines and n tasks, is to assign or allocate the machines and tasks so that each task is designated by precisely one machine, with each machine dedicated to a certain duty. The goal is to reduce the overall the expense or duration of assigning the ith work to the jth machine, which is indicated by the symbol [f_{ij}].

Fuzzy Combinatorial optimization dilemma

Let's suppose X assignments and X individuals available for performing these. On considering every person can complete every task, even though they may face challenges in terms of efficiency. The objective is to find the lowest possible cost for a task assigned to an individual, denoted by c_{ij}, in the scenario where i is the individual and j is the specific work. The focus is on minimizing the cost while ensuring optimal task allocation. The dilemma of dealing with a simple task and its associated expenses is resolved in the following manner. The combinatorial optimization dilemma can be expressed in geometrically as n x n cost associated with decision whose price will be real numbers as mentioned in the table. Below tabulation is formed by thorugh knowledge with prior methods in reference like Pascal Triangular Approach that holds as like below

$$P(A) = \frac{a + 2b + c}{4}$$

Sub interval average method that holds as like below

$$R(A^i) = \frac{(i+1)}{2x_i} \sum_{i=1}^{n} a_i = \frac{(i+1)}{2i(i+1)/2} \sum_{i=1}^{n} a_i$$

Magnitude Ranking that holds as like below

$$Mag(a,b,c) = \frac{1}{2} \left(\int_0^1 c + 3a - b \right) f(r) dr$$

Mathematical Representation of FAP

The fuzzy combinatorial optimization dilemma with cost matrix is modifying into mathematically representation is as follows:

Minimum $\tilde{w} = \sum_{i=1}^{n} \sum_{j=1}^{n} \tilde{c}_{ij} x_{ij}$

Subject to

$\sum_{j=1}^{n} x_{ij} = 1;$ s = 1, 2, 3, . . . n

$\sum_{i=1}^{n} x_{ij} = 1;$ q = 1, 2. 3, . . n

where $x_{ij} = \begin{cases} 1, & i \to j \\ 0, & \text{otherwise} \end{cases}$

Measure Mean Ranking Method

Steadily the concept for creating ranking for fuzzy numbers have been used widely with various implementation. Getting new tricks in this citation Measure Mean Ranking traits are implemented for sorting trapezoidal fuzzy numbers. Hence these technique deals with course of action to instruct fuzzy sets in which a sorting approach $\Re(\tilde{A})$ is calculated for the fuzzy numbers $\tilde{A} = (m, n, \alpha, \beta)_{LR}$ from its σ-level cut is $\tilde{A}_\sigma = [m - \alpha L^{-1}(\sigma), n + \beta R^{-1}(\sigma)]$ according to the formula

$M(\tilde{A}) = \frac{5(m - \alpha L^{-1}(\sigma)) + 4b + 3(n + \beta R^{-1}(\sigma))}{12}$

Robust's Ranking Method

Give a convex fuzzy number a, the Robust's sorting method is defined by $R(a) = \frac{1}{2} \int_0^1 (a_L, a^U) da,$ where (a_L, a^U) is the σ level cut of the fuzzy number a. The Robust's ranking index R(a) gives the desirability of the fuzzy number, it satisfies the magnitude and additive property.

$R(a) = \frac{1}{2} \int_0^1 (a_L, a^U) da$

Jayanthi *et al.,*

PERT Ranking Method

A project evaluation review technique procedure involves implementations like ordering fuzzy sets in which sorting approach P(Ã) is intended to triangular fuzzy number Ã = (m, n, α, β)$_{LR}$ from its σ-level cut is

Ã$_\sigma$ = [$m - \alpha L^{-1}(\sigma)$, $n + \beta R^{-1}(\sigma)$] look on to formula $P(\tilde{A}) = \frac{(m - \alpha L^{-1}(\sigma)) + 4b + (n + \beta R^{-1}(\sigma))}{6}$

Centroid Mean Ranking Method

The centroid mean sorting proceeds for ordering fuzzy sets wherein sorting approach C(Ã) is calculated for the fuzzy number Ã = (m, n, α, β)$_{LR}$ from its σ-level cut is Ã$_\sigma$ = [$m - \alpha L^{-1}(\sigma)$, $n + \beta R^{-1}(\sigma)$]look on to formula

$C(\tilde{A}) = \frac{(m - \alpha L^{-1}(\sigma)) + b + (n + \beta R^{-1}(\sigma))}{3}$

Numerical Example

A Selvarajan & Co., company has n tasks to be completed with n individuals. If every person can do every task, even though they may face difficulty in terms of efficiency, the intent is to get the least cost for the task assigned to the individual denoted by c$_{ij}$, where i is the individual and j is the allocated work. The cost Matrix are triangular fuzzy numbers as follows in the table The dilemma is to determine what is best validated so that the position's total sustained cost is as reduced as possible.

Solution

Given AP is balanced combinatorial optimization dilemma, since number of rows and columns are equal. The integration function of triangular fuzzy number is defined by

$$\mu_{\tilde{A}}(x) = \begin{cases} \begin{cases} L\left(\frac{m-x}{\alpha}\right), x \le m, \alpha > 0 \\ R\left(\frac{x-n}{\beta}\right), x \ge n, \beta > 0 \\ 1 \qquad otherwise \end{cases} \end{cases}$$

and L-R representation of [a b c] = [$m - \alpha L^{-1}(\sigma)$, $n + \beta R^{-1}(\sigma)$] is σ level cut of the fuzzy number. The trapezoidal fuzzy number is converted to trans number using Measure Mean ranking method. The beneficial substantiated schedule using method of Measure Mean ranking method is

Uma   →   Cooking = 23.83333

Selva   →   Dressing   = 42.16667

Raj   →   Managing   = 31.08333

Ram   →   Plumbing   = 33.75

Somu   →   Washing= 51.91667

Thus, the minimum beneficial substantiated cost is   = 182.75

The beneficial substantiated schedule using method of Robust's ranking method is

Uma   →   Cooking = 24.5

Selva   →   Dressing   = 42.5

Raj   →   Managing   = 31.25

Ram   →   Plumbing   = 34.25

Somu   →   Washing= 52.75

Thus, the minimum beneficial substantiated cost is   = 184.75

Now, the beneficial substantiated schedule using method of PERT ranking method is

Uma   →   Cooking = 24.33333

Selva   →   Dressing   = 42.33333

Raj   →   Managing   = 31.16667

Ram   →   Plumbing   = 34.16667

Somu   →   Washing= 51.16667

Thus, the minimum beneficial substantiated cost is = 184.16667

The beneficial substantiated schedule using method of Centroid ranking method is

Jayanthi *et al.,*

Uma	→	Cooking	= 24.66667
Selva	→	Dressing	= 42.66667
Raj	→	Managing	= 31.33333
Ram	→	Plumbing	= 34.33333
Somu	→	Washing	= 52.33333

Thus, the minimum beneficial substantiated cost is = 185.33333

The beneficial fuzzy substantiated schedule for the dilemma are the same among the three methods, but we proposed Measure Mean ranking method gives the trapezoidal fuzzy number's sorting significance, corresponding to most minimum cost for the dilemma compared to other two methods.

CONCLUSION

The substantiated triangular fuzzy numbers are used to classify fuzzy cost, which are regarded to be imprecise estimate the total cost. Moreover, the fuzzy combinatorial optimization dilemma technical has been transformed into the combinatorial optimization dilemma payoff cost using ranking function for fuzzy costs matrix and solves it by the Hungarian method

ABSTRACT

The article titled 'Phytoestrogens and Menopause: A Guide to Dietary Harmony' explores the benefits of incorporating phytoestrogen-rich foods into a woman's diet to alleviate symptoms associated with menopause. Menopause, occurring between ages 45 and 55, results in reduced estrogen levels, leading to symptoms like hot flashes, mood swings, night sweats, and increased risks of osteoporosis and cardiovascular disease. In Ayurvedic medicine, menopause is viewed as the "Vata" stage, where imbalances in Vata dosha can cause symptoms such as dryness, anxiety, and fluctuating energy levels. Ayurveda emphasizes balancing Vata through herbs like *Ashwagandha*, *Shatavari*, and Fenugreek, which are also considered dietary phytoestrogens that help support hormonal balance and overall well-being. Phytoestrogens, such as isoflavones, lignans, and coumestans, mimic estrogen and interact with estrogen receptors, offering a natural alternative to hormone replacement therapy (HRT). Foods like soy products, flaxseeds, legumes, and whole grains are beneficial for reducing hot flashes, supporting bone and heart health, improving mood, and enhancing skin and vaginal health. While beneficial, individual responses may vary based on gut microbiota and hormone-sensitive conditions. The article calls for more research into the long-term impacts of phytoestrogens and advocates for personalized dietary approaches under professional guidance. Overall, this combined approach offers a natural strategy for managing menopausal symptoms.

Keywords: Dietary approach, Estrogen receptors, Isoflavones, Legumes , Menopause**,** Osteoporosis , Phytoestrogen

INTRODUCTION

The menstrual cycle of a woman culminates in menopause, a natural biological event that typically occurs between the ages of 45 and 55. This transition is associated with a reduction in estrogen levels, leading to symptoms like mood swings, vaginal dryness, hot flashes, night sweats, and an increased risk of cardiovascular disease and osteoporosis, among others [1,2] . While hormone replacement therapy (HRT) is a widely used conventional treatment for these symptoms, natural approaches, such as dietary adjustments, are becoming increasingly popular [3]. The phytoestrogenic diet is one promising strategy, which entails eating foods high in phytoestrogens, which are substances obtained from plants that function similarly to estrogen in the body. Because they bind to estrogen receptors and provide a moderate estrogen-like effect, phytoestrogens may help reduce menopausal symptoms. This article investigates Phytoestrogens are compounds that occur naturally in many plant-based foods, such as fruits, vegetables, grains, legumes, and seeds. These substances share a similar chemical structure with estrogen, the hormone that governs various functions in a woman's body, especially during her reproductive years. As estrogen levels decline during menopause, phytoestrogens can aid in easing the effects of this hormonal shift by acting as a weaker, plant-derived substitute for estrogen.

MATERIALS AND METHODS

This article is a narrative literature review aimed at exploring the role of phytoestrogenic diets in managing menopause symptoms. The study involved collecting, analyzing, and synthesizing existing scientific literature without involving human participants or direct experimentation.

METHODOLOGY FOR LITERATURE SEARCH

A systematic search of peer-reviewed literature was conducted across multiple databases, including PubMed, Scopus, and Web of Science. Keywords and combinations used in the search included "phytoestrogens," "menopause," "dietary interventions for menopause," "isoflavones," "lignans," and "natural hormone replacement therapy." The search was restricted to articles published in English from 1990 to 2023 to ensure the inclusion of recent and relevant findings.

Inclusion and Exclusion Criteria Inclusion Criteria
1. Articles discussing the impact of dietary phytoestrogens on menopause-related symptoms such as hot flashes, night sweats, bone health, cardiovascular health, and mood.
2. Reviews, meta-analyses, and primary studies focused on the role of isoflavones, lignans, or coumestans.
3. Studies examining dietary sources such as soy products, flaxseeds, sesame seeds, and red clover.

Exclusion Criteria
1. Articles unrelated to phytoestrogens or menopause.
2. Studies focused on synthetic treatments or interventions unrelated to diet.
3. Non-peer-reviewed literature or articles lacking methodological clarity.

Data Collection and Synthesis
The selected articles were reviewed to extract relevant data on the types of phytoestrogens, their dietary sources, and their biological effects on menopause symptoms. Findings were categorized into themes, including hot flash management, cardiovascular health, bone density preservation, and mood regulation. Key mechanisms of action and gaps in the current understanding were also identified.

Saniya Meer and RitaMakim

MATERIALS

The review emphasized the dietary sources of phytoestrogens, including:
- Isoflavones: Found in soybeans, soy milk, tofu, and soy-based products.
- Lignans: Present in flaxseeds, sesame seeds, and whole grains.
- Coumestans : Found in red clover and alfalfa sprouts.

DISCUSSION

Types of Phytoestrogens

Phytoestrogens are categorized into three main types based on their chemical structure:
1. **Isoflavones**: Found primarily in soy products, isoflavones such as genistein and daidzein are the most well-studied and potent phytoestrogens [4,5]. Their chemical structure is similar to that of estrogen, enabling them to bind to estrogen receptors and exert estrogen-like effects.
2. **Lignans**: These are polyphenolic compounds found in seeds (especially flaxseeds and sesame seeds), whole grains, and some fruits and vegetables [6]. Lignans are metabolized by gut bacteria into enterolignans, which exhibit mild estrogenic activity.
3. **Coumestans**: A less common class of phytoestrogens, coumestans are found in red clover, alfalfa sprouts, and other legumes [7]. They are chemically similar to isoflavones and have estrogenic effects in the body.

Mechanism of Action

Phytoestrogens exert their effects by binding to estrogen receptors and mimicking the action of estrogen, though they do so at a much lower intensity. In some tissues, they can exert estrogenic effects, while in others, they can have an anti-estrogenic effect by competing with stronger endogenous estrogens. This dual mechanism can be advantageous, particularly for reducing the risk of hormone-dependent cancers like breast cancer. During menopause, the body's estrogen levels decline, and phytoestrogens can help alleviate symptoms by binding to estrogen receptors in cells, producing estrogen-like effects. There are two primary ways phytoestrogens act:
1. **Weak estrogenic effect**: When estrogen levels are low, phytoestrogens can bind to estrogen receptors and produce mild estrogen-like effects, helping to regulate hormonal balance and alleviate symptoms such as hot flashes, night sweats, and vaginal dryness.
2. **Anti-estrogenic effect**: In some tissues, phytoestrogens may compete with stronger forms of estrogen, potentially blocking their activity. This may reduce the risk of hormone-sensitive cancers, such as breast cancer, by lowering the effects of estrogen in these tissues

BENEFITS OF PHYTOESTROGENS IN MENOPAUSE

Reduction of Hot Flashes and Night Sweats

One of the most well-known and bothersome symptoms of menopause is the occurrence of hot flashes and night sweats. Phytoestrogens, particularly soy isoflavones (such as genistein and daidzein), have been shown to reduce the frequency and intensity of these symptoms. Research has demonstrated that women who consume soy-based products or supplements with isoflavones may experience a significant decrease in the occurrence of hot flashes compared to those who do not consume them.[8]

Support for Bone Health

Estrogen plays a critical role in maintaining bone density, and its decline during menopause can lead to a higher risk of osteoporosis. Phytoestrogens, especially lignans (found in flaxseeds and sesame seeds), can help improve bone health by promoting calcium absorption and reducing bone resorption. Studies suggest that consuming phytoestrogens may help slow down bone loss and even enhance bone mineral density in postmenopausal women.[9]

Heart Health Benefits
Menopause is often associated with an increased risk of cardiovascular disease due to the decline in estrogen, which has a protective effect on the heart. Phytoestrogens may help reduce cardiovascular risk factors by improving blood vessel function, reducing LDL cholesterol (bad cholesterol), and stabilizing blood pressure [10]. Some studies show that women who consume isoflavones or lignans may experience better heart health markers compared to those who don't.

Improved Mood and Emotional Well-being
During menopause, hormonal changes can lead to mood swings, irritability, anxiety, and even depression. Phytoestrogens may help regulate mood by balancing hormone levels and improving brain function. Research suggests that isoflavones may have a positive impact on reducing anxiety and mood swings [11]. Additionally, they may help in protecting against cognitive decline, which is a concern for many women during this time.

Vaginal Health and Dryness Relief
Vaginal dryness is a common symptom of menopause due to the decline in estrogen, leading to discomfort and pain during sexual activity. Phytoestrogens, particularly those found in soy and red clover, can help alleviate vaginal dryness by mimicking estrogen's effects on vaginal tissues, thus improving lubrication and reducing irritation.

Weight Management
Many women experience weight gain during menopause, partly due to hormonal changes. Phytoestrogens may help prevent fat accumulation and support **insulin sensitivity**. For instance, **flaxseeds**, which contain lignans, have been shown to have a beneficial impact on reducing belly fat and improving metabolic markers in menopausal women.

Improved Sleep Quality
Sleep disturbances, such as insomnia and poor sleep quality, are common during menopause due to hormonal fluctuations. The mild estrogen-like effects of phytoestrogens may help improve sleep patterns by reducing hot flashes and stabilizing mood, both of which can interfere with restful sleep.

Reduced Risk of Hormone-Dependent Cancers
Phytoestrogens can exert both **estrogenic** and **anti-estrogenic** effects depending on the tissue. In some cases, they may help protect against estrogen-dependent cancers, such as breast cancer.[12] By modulating estrogen levels in the body, phytoestrogens may lower the risk of hormone- sensitive cancers, making them a potential preventive option for some women.

Skin Health
Estrogen contributes to maintaining skin elasticity and moisture. As estrogen levels decline during menopause, women often notice changes in their skin, such as increased dryness and the appearance of wrinkles. Phytoestrogens may help by promoting collagen production, improving skin elasticity, and reducing the visible signs of aging.

Key Phytoestrogen-Rich Foods to Include in a Menopausal Diet

Soy Products
Soybeans and soy-based foods, such as tofu, tempeh, edamame, and soy milk, are the most significant sources of isoflavones (genistein and daidzein).

Flaxseeds
Flaxseeds are an excellent source of lignans, which can be converted into enterolignans by gut bacteria. Ground flaxseeds are the best way to maximize nutrient absorption. Flaxseeds also provide omega-3 fatty acids, which are beneficial for overall health.

95265

Sesame Seeds
Like flaxseeds, sesame seeds are rich in **lignans** and are easy to incorporate into your diet by adding them to salads, yogurt, or smoothies.

Legumes and Beans
Chickpeas, lentils, and other beans provide moderate amounts of phytoestrogens and are versatile in soups, stews, and salads.

Whole Grains
Whole grains such as oats, barley, quinoa, and wheat contain small amounts of lignans and help support overall health during menopause.

Berries
Certain berries like strawberries, raspberries, and blueberries are rich in phytoestrogens and antioxidants, which support the immune system and overall health.

Cruciferous Vegetables
Vegetables like broccoli, kale, Brussels sprouts, and cauliflower contain compounds that influence estrogen metabolism and can help balance estrogen levels in the body.

Red Clover and Alfalfa Sprouts
These sprouts are good sources of coumestans and are available as dietary supplements or can be consumed fresh in salads or sandwiches.

Apples and Carrots
Both apples and carrots contain modest amounts of phytoestrogens and can be easily incorporated into daily meals.

Other Vegetables
Other vegetables like spinach, tomatoes, and sweet potatoes contain lower levels of phytoestrogens but still contribute to an overall balanced diet.

List of Phytoestrogen-Rich Foods to Include in Your Diet
Ayurvedic Perspective On Menopause And Phytoestrogens
In Ayurveda, menopause is viewed as a natural transition in a woman's life, associated with the "Vata dosha" (air and space energy) imbalance. This phase is considered a time for nurturing and grounding the body and mind. Ayurvedic principles emphasize balancing hormones and reducing symptoms of menopause using natural remedies like herbs, phytoestrogens, and dietary changes. From an Ayurvedic perspective, phytoestrogens found in natural foods like soy, flaxseeds, and legumes align with the concept of "medhya rasayana" (nourishing and rejuvenating remedies for the body and mind). These plant-based compounds provide a gentle, natural way to support the body's transition through menopause, reducing symptoms like hot flashes, anxiety, and fatigue Ayurvedic principles emphasize balancing hormones and reducing symptoms of menopause using natural remedies like herbs, phytoestrogens, and dietary changes.

Ayurvedic Herbs and Foods as Phytoestrogen Sources
1.   *Shatavari* (*Asparagus racemosus*): Known as a rejuvenating herb for women, Shatavari is rich in phytoestrogens and helps balance hormones, reduce hot flashes, and support reproductive health [13]
2.   *Ashwagandha* (*Withania somnifera*): A potent adaptogen that reduces stress, alleviates mood swings, and supports better sleep during menopause [14]
3.   Flaxseeds (Alsi): Recommended in Ayurveda for their cooling properties and lignan content, flaxseeds help maintain hormonal balance and promote skin and bone health[15]

95266

4. Sesame Seeds (Til): Valued in Ayurveda for their warming and nourishing properties,
5. Fenugreek (Methi): A commonly used Ayurvedic herb that aids in balancing hormones and reducing menopausal discomforts. [16]. By combining the wisdom of Ayurveda with modern dietary strategies, women can experience a more balanced and harmonious transition during menopause.

LIMITATIONS AND CONSIDERATIONS

While phytoestrogens are generally safe and well-tolerated, there are a few important considerations. Women with hormone-sensitive conditions (e.g., breast cancer) should consult their healthcare provider before significantly increasing phytoestrogen consumption. Additionally, soy products, while beneficial for most, can interfere with thyroid function in women with thyroid disorders. Therefore, personalized dietary advice is essential. Furthermore, the effectiveness of a phytoestrogenic diet can vary depending on individual factors such as gut microbiota composition, which affects the metabolism of lignans into enterolignans. Not all individuals may experience the same level of benefit, and a varied diet with multiple sources of phytoestrogens is recommended.

CONCLUSION

The phytoestrogenic diet offers a promising natural approach to managing menopause symptoms. By incorporating foods rich in isoflavones, lignans, and coumestans, such as soy products, flaxseeds, legumes, and whole grains, women may experience relief from common menopausal symptoms like hot flashes, night sweats, and mood swings. Phytoestrogens may also help maintain bone health, support cardiovascular health, and aid in weight management during menopause. However, more research is needed to confirm their long-term benefits and to determine the best dietary strategies for individuals. Women considering this approach should consult with a healthcare professional to tailor a diet plan that fits their specific health needs.

ABSTRACT

The emerging field of applied science known as "Operational research" provides a solid foundational understanding of the decision science instruments used to create the collection. The reformulations are suitable to be solved within the frame work of conceptual and computational for solving Mixed-Integer Linear Programming (MILP) problems employing the decomposition principle. In this paper describes a methodology for the case mix problem in the medical sector, and to solve the huge integer optimality, an efficient solution approaches on Branch-and-Bound to decompose and reformulated. This paper work adopts the unit perspective and focuses on the allocation and utilization of resources, and introduces stimulation techniques to access the performance of capacity planning and enhance the ideal trade-off between resource efficiency and service. When works from the column generation perspective, the integer linear programming model can be formulated differently. In terms of the solution, numerical tests and the provided and contrasted computing findings show that the Branch-and-Bound technique works much better than the integer linear programming method, and decomposition on wards performs much better than decomposition on surgeons. Decompose constraints forward into surgeon groups and patient groups to determine the optimal case mix solution and corresponding resource and capacity allocation.

Keywords: Integer Linear Programming, Decomposition, Allocations, Branch-and-Bound, Reformulation, Patient case mix, Optimality Capacity Planning.

INTRODUCTION

In operations research, problems are dissected into fundamental components and then tackled through defined steps via mathematical analysis. Integer programming stands out as a potent tool in resolving numerous critical optimization challenges. Branch-and-bound emerges as a pivotal technique within this domain, offering a structured approach to problem-solving. This method involves breaking down optimization problems into smaller, manageable sub-problems and employing a bounding function to eliminate those sub-problems incapable of containing the optimal solution. Through iterative refinement and elimination, branch-and-bound efficiently navigates the solution space, ultimately converging towards the optimal solution. The case mix problem in the healthcare sector encompasses the intricate long- and medium-term decisions made at both the patient volume planning and control level, as well as at the resources planning and control level of production within a hospital. These decisions revolve around determining the number of patients with varying pathologies that can be effectively treated and the corresponding resource capacity requirements. Critical considerations involve navigating the trade-offs between the capacity provisioned and the diverse demands of patients across different departments within the hospital, emphasizing the need for strategic allocation and optimization of resources to ensure efficient and effective healthcare delivery.

MIXED INTEGER-BRANCH- AND-BOUND METHOD

It was first developed by A H Land and AG Doig. It can be used to solve all integer, mixed integer and zero-one integer programming problems. Given an IP problem, the LP problem obtained by ignoring all integer constraints on variables is said to be its LP relaxation.

IP Problem	LP Problem
Max z = $C^T x$ Subject to Ax $\leq$ b x $\geq$ 0 and integer	Max f(x) = $C^T x$ Subject to constraints Ax $\leq$ b x $\leq$ X^0 x $\geq X^L$ Where X^0 and X^L are the are the rates of upper and lower bound for the decision variable

It divides the feasible solution area into smaller areas until the optimal solution is reached. It does so by placing limits on the value of the objective function that allows for the sub problem to be prunned if the optimum solution was found. For the purpose of this study, the hospital is treated as a profit maximiser, given the rising economic pressures in the health care sector (OECD 2010). In short, based on the estimations of the amount of patients with a specific pathology that will be admitted to the hospital as well as based on financial contribution estimations, expected length of surgery, length of stay per pathology and knowledge of which surgeon group will be assigned to which ward for care of a patient with said pathology, it is necessary to determine for this study how many patients from each pathology group can be treated by the hospital in one year for the purpose of maximizing total contributions, as well as subsequently assigning operating rooms to groups of surgeons and allocating beds to each ward. In this research, we have a comprehensive study of case mix planning problem specifying within a hospital. Considering multiple resources with fixed capacities like operating rooms and beds, hospitals select the optimal patient case mix in order to maximize the resource efficiency (the total financial contribution). We build a mathematical model for the case mix problem and design efficient branch-and-price algorithms to solve integer program model optimally.

CASE-MIX PROBLEM STATEMENT

To respond to the rising pressures on health care sector, the hospital is presumed to be a profit maximizes. the expected financial contribution, the expected surgery time and the expected length of stay for each pathology, and the knowledge about which surgeon group and which ward a patient with a specific pathology will go to, it can be said that in this taxi cab problem the case mix research in this article is the quantity of patients which types can be managed at the hospital for the next year in order to maximize the total contributions, and accordingly determine on which surgeon groups an operating room is allocated and how many beds are allocated to each ward. This leads to the delivery of a 'best' patient case mix pattern of maximum profits and a time-phased distribution of resources.

Premalatha *et al.,*

In this paper, the health care provider (i.e., hospital) is assumed to be a profit maximise, which intends to select an optimal case generating maximum profits under the provided resource capacity and other certain constraints. It is assumed that there is reserved capacity for emergency patients at the hospital. Hence, only elective surgery cases are considered. Additionally, it is noteworthy that the "profit" is not limited to the financial contribution.

In addition, in order to build a mathematical model for the case mix problem, the required notations are defined below. The following observations and assumptions

1. Number of different hospital business units and act as independent unit. Other resources are not covered in this research.
2. In hospital unit consists of surgeon groups and ward with a constant number of beds to the patients in the entering unit.
3. Assumed to be Active days and Inactive days. The block length is defined as eight hours. Finally, it should be mentioned that the special surgery cases with a planned duration that is longer than the block length will be excluded from our discussion.
4. To assume, beds allocated to a ward are only reserved patients from the corresponding department. In contrast with the time-phased allocation of OR blocks, beds are assigned to each ward in a fixed pattern. Theoretically, a flexible bed allocation schedule that allows bed sharing will help to level the bed occupancy among various wards and thus boost the overall utilization of the bed capacity.
5. The first step is the surgeon group doing surgery on the patient. The second step is the OR time corresponding to patient in surgery duration. The third step is the number of days for patient occupies bed in the corresponding ward (LOS) and the fourth step is the reward of the treatment.
6. LOS represents the patient within one group with same parameters, but those from different groups differ from each other for at least one of the parameters.
7. In case mix problem assume the period consists of a cycle length of one week (repeated cycles). See Figure 1 for an illustration of the relationship among wards, surgeon groups and patient groups within a hospital.
8. Number of patients in patient group under surgery during a cycle period is constrained by different factors.
9. Surgeon capacity sets an upper limit for the maximum number of patients during the cycle. Thereby, for each patient group a numerical range is specified for the total number of patients that can get admitted during one cycle length.

S-Surgeon group
P-Patient group
Indices:
W=Set of Wards.
S = Set of Surgeon groups.
P = Set of Patient group.
D =Set of day with in a cycle.
A = Active days. (Active days=Monday to Friday & Inactive days = Saturday and Sunday)
S_W=Subset of surgeon groups whose patients are moved toward W after treatment.
P_W =Subset of patient groups P whose patient occupies the bed.
P_S= Subset of patient groups whose patients are operated on by surgeon group.
AP_d=Subset of Active days it applies patients P still occupy a bed on day.
P_p= Profit in patients of patient group.
d_p=Duration time in patients of patient group.
LB_p=Lower bound on number of patient P that treated per day a cycle.
UB_p=Upper bound on number of patient P that treated per day a cycle.
BD=Available beds.
BLOCK=Total number of available operating room block.
LEN = Assumed 480 minutes.
U_{pa} = The number of patients of patient group that receive surgery on active day.

Premalatha *et al.,*

V_w = The number of beds allocated to ward.

Z_{sa}=The number of OR blocks assigned to surgeon group S on active day.

Then, with the assumptions and notations given above, the case mix problem that aims at maximizing the overall hospital profits is formulated as an integer linear programming (ILP) model.

MATHEMATICAL FORMULATIONS

Maximize$\sum_{p\epsilon P} P_p \sum_{a\in A} E_{pa}$ (1)

Subject to constraints

$\sum_{w\in W} V_w \leq BS$ (2)

$\sum_{p\in P_w} \sum_{a\in A_{pd}} E_{pa} \leq F_w$ (3)

$\sum_{S\in S} G_{sa} \leq Bl$ (4)

$\sum_{p\in P_s} d_p E_{p_a} \leq z_{sa} l_G$ (5)

$LB_P \leq \sum_{a\in A} E_{p_a} \leq U_{B_P}$ (6)

$E_{p_a}, F_w, G_{sa} \in z^+$ (7)

Maximize the sum of the profits from treating all patients during one cycle.

Constraint (2) Allocation capacity of beds. Constraint (3)Daily bed used cannot exceed its limit. Constraint (4)Time phase Constraint (5) every surgeon group has assigned to patient on each active day. Constraint (6) each patient group as numerical range fixed as number of patient admitted on Active days. Constraint (7)Decision variable for non-negative integers. Generally the formulation results in a huge Integer program for hospital of regular size[eg: 25 depart]. The ILP Modeling produces l+5m+5n decision Variables, the formulated ILP model contain 1525 Integer variables. The new branching conditions will further constrain the master problem, which will be solved again. An integer solution to the master problem is known to be a lower bound and the optimal solution to the relaxed problem is a known upper 20 bound on the optimal objective value. The new ones will be checked against the best bounds, and will replace them if they are better. The loop of iteration continues until the branch-and-bound tree is completely traversed or the optimal upper bound == optimal lower bound.

DECOMPOSITION BASED REFORMULATION

Decomposition on wards means that a set of variablesU_{pa} for all active days a and for all patient group P whose patient are transferred to ward will be aggregated to form feasible column for each ward W

Decomposition based reformulation on wards

To represent these columns a new binary decision variables is introduced and define as follow

$C_{wk}=\begin{cases} 1; if\ column\ k\ is\ selected\ for\ w \\ 0; otherwise \end{cases}$

K =set of feasible column

Reformulated as follows

Max $\sum_{w\in W} \sum_{k\in K} p_{wk} C_{wk}$ (8)

Subject to constraint

$\sum_{w\in W} \sum_{k\in K} F_{wk} C_{wk} \leq BS$ (9)

$\sum_{w\in W} \sum_{k\in K} G_{wak} C_{wk} \leq BL$ (10)

$\sum_{k\in K} C_{w\ k}=1$ (11)

$C_{wk} \in \{0,1\} \quad w \in W, k \in K$ (12)

Reformulation of wards

Max $\sum_{p\in P_w} P_p \sum_{a\in A} E_{pak} - (\sum_{k\in K} F_{wk} C_{1w} + \sum_{a\in A} G_{wak}C_{2BL})$ (13)

Subject to constraints

$\sum_{p\in P_w} \sum_{a\in A_{pd}} E_{pak} \leq F_{wdk}$ (14)

95273

$$\sum_{p \ \in P_w} d_p E_{pak} \le G_{sak} \tag{15}$$

Decomposition based reformulation on surgeon group

If the decomposition is based on the surgeon groups, a set of variables U_{pa} for all active days a and for all patient groups p whose patients are operated on by surgeon groups are aggregated to form a column for surgeon group$s$. Similarly, a new binary decision variable is introduced to represent these columns:

$$C_{SK} = \begin{cases} 1; if \ column \ k \ is \ selected \ for \ S \\ \quad 0; otherwise \end{cases}$$

Reformulated as follows

$$Max \sum_{s \in S} \sum_{k \in K} P_{sk} C_{sk} \tag{16}$$

Subject to constraint

$$\sum_{w \in W} F_w \le BS \tag{17}$$
$$\sum_{s \in Sw} \sum_{k \in K} F_{sdk} C_{sk} \le F_w \tag{18}$$
$$\sum_{s \in S} \sum_{k \in K} G_{sak} C_{sk} \le BS \tag{19}$$
$$\sum_{k \in K} C_{sk} = 1 \tag{20}$$
$$C_{sk} \in \{0,1\} \tag{21}$$

Reformulation on surgeons

$$Max \sum_{p \in P_s} P_p \sum_{a \in A} E_{pak} - \left(\sum_{k \in K} F_{sk} C_{3w} + \sum_{a \in A} G_{sak} C_{4BL} \right) \tag{22}$$
$$\sum_{p \in P_s} \sum_{a \in A_{pd}} E_{pak} \le F_{sdk} \tag{23}$$
$$\sum_{p \in P_s} d_p E_{pak} \le G_{sak} \tag{24}$$

Decomposition on patient group

When the decomposition unit is set as the patient group, a set of variables for all active days and for a patient group are aggregated to form a feasible column for this patient group , which is expressed by the defined binary column variable

$$C_{PK} = \begin{cases} 1; if \ column \ k \ is \ selected \ for \ P \\ \quad 0; otherwise \end{cases}$$

Reformulated as follows

$$Max \sum_{p \in P} \sum_{k \in K} P_{pk} C_{pk} \tag{18}$$

Subject to constraints

$$\sum_{w \in W} V_w \le BS \tag{25}$$

$$\sum_{p \in P} \sum_{k \in K} V_{pdk} C_{pk} \le V_w \tag{26}$$

$$\sum_{s \in S} Z_{sa} \le BL \tag{27}$$

$$\sum_{p \in P} \sum_{k \in K} Z_{pak} C_{pk} \le Z_{sa} \tag{28}$$

$$\sum_{k \in K} C_{pk} = 1$$
$$C_{pk} \in \{0,1\} \tag{29}$$

Column Initialization

The generation of initial columns is combined with a problem feasibility in one Numerical Range (6) of patient admissions of each group is modified into the fixed lower bound in the original ILP model:

$$\sum_{a \in A} U_{pa} = LB_p, \forall p \in P$$

Clearly, the feasible solution of the reduced model is also feasible to the original ILP.

- If the reduced model has no feasible solution that is the given capacity cannot satisfy the minimum

requirement of patient admissions and thus the problem is infeasible.

- After fixing the number of admitted patients of each group to its lower bound.
- To find more initial columns, the admission volume for a certain patient group is relaxed to its upper bound (i.e., $\leq UB_p$), while the number of admitted patients for all other groups is kept at their lower bound.

Branching

we adopt the branching strategy based on the capacity assignment variables F_w and G_{wa} for the decomposition model onwards, or F_{sd} and G_{sa} for decomposition surgeon groups. If the solved optimal solution to the master ILP is not integral, there exist at least two fractional column variables related to one ward, for instance C_{wk} and C_{wk^1} at least one value of the capacity assignment variable F_w and G_{wa} different from each other in these two columns, (i.e.) $G_{wak} < G_{wak^1}$

The branching conditions

$G_{wa} \leq G_{wak}$ and $G_{wa} \geq G_{wak}+1$

Branching on the capacity assignment variables not only excludes the fractional optimal solution effectively, but also partitions the solution space into two branches more evenly.

Bounding

A complete computation process can be divided into two parts: searching for the optimal solution and proving its optimality. Applying bound a help the current node in the branch-and-bound tree possesses the potential to outperform the present best bound. To find Integer feasible solution and to provide lower bound on the optimal value.

Cut off Value

When solving the integer problems, a cut off value can be specified to help terminate the calculation earlier. If the objective value of the integer problem is recognized as impossible to exceed the cut off value of the integer problem is recognized as impossible to exceed the cut off value, then no need to continue searching for the optimal solution or any feasible solutions. The objective value can beat the cutoff value is often less time-consuming than to obtain an optimal or feasible solution.

Existing results

Stefan Weltge, Leo Liberti and Marco Lübbecke. (2018) this paper introduces a branch-and-price algorithm for solving mixed-integer linear programs with separable structure, highlighting the benefits of decomposition methods in addressing large-scale optimization problems. Andrea Lodi, AntonioFrangioni, and Michele Monaci. (2019) this paper presents a Dantzig-Wolfe decomposition approach for solving robust mixed-integer programming problems, demonstrating its applicability in addressing uncertainty in optimization models. W. S. Guerino, AlexandreSalles da Cunha, and Eduardo Uchoa. (2020) this paper proposes a branch-and-cut decomposition approach for solving the capacitated arc routing problem with time windows, showcasing advancements in solving complex routing problems using decomposition techniques

CONCLUSIONS

The ILP models start with a number of constraints with dummy data that involve no more than 5 parts. Without loss of generality, it is assumed that each part has three surgeon groups with handling 3 testing parameters. For each patient group, the lower bound on the number of patients admitted per cycle is set as one and upper bound is generated randomly from the discrete uniform distribution within the interval [3, 6]. Similarly, expected for surgeon duration [60,240] and the mean value credit as [12, 30]. In the presence of only one ward, to solved and obtains the optimal solution with proven optimality result. If number of wards are increases to 3, the computing process slow down to 49 seconds. Now the proposed Branch-and-Bound algorithm successfully exhibit their efficiency and

Premalatha *et al.,*

effectiveness to solve case-mix problem. First factor the number of sub problems to be solved at each round in surgeon group decompose method is three times more than ward decompose method. Second factor One relaxation efficiency is defined as the difference between the LP relaxation value and optimal value over the optimum the relaxation efficiency in surgeon group [5 to 10%], the decomposition of ward gives closer bound within 0.01%. To allowing a decomposition unit to access solution space to be explored even if the chance of finding the optimal or a feasible solution there is very small. Branched and bounded algorithm ends when all solutions are pruned or fixed. It only implemented one particular branch-and- bound method for a single (although reasonably generic) class of problems using a modelling language (CPLEX, GAMS, OPL, MPL, etc.) it is easy to make the computer solve the problem. In recent phase developed Machine Learning (MIL) algorithms could provide new tools for MIP computations, and lead it towards even flexible and sophisticated outcomes. In the case mix problem, the objective of maximize the total hospital profit and formulated as an integer linear program model to determine the obtained case mix solution and computational reformulated capacity allocation in Branch-and-Bound to extremely speedy and effective the tackling the case mix problem. This work adopts the unit perspective and focuses on the allocation and utilization of resources, and introduces stimulation techniques to access the performance of capacity planning and enhance the ideal trade-off between resource efficiency and service.

ABSTRACT

By 2025, the rapidly expanding Indian medical field is predicted to be worth $280 billion. India is among the top 20 countries in the world for medical device sales. By 2025, its present worth of $5.2 billion is predicted to rise to $50 billion. However, India still imports over 70% of its medical equipment and does not produce many of them domestically. Medical gadget manufacturing and monitoring are strictly regulated processes. There were no particular laws governing medical devices in India; instead, the Drugs and Cosmetics Act of 1940 governed them. The new Indian medical device laws, known as the Indian Medical Device Rules, 2017, were announced by the Central Drug Standard Control Organization to fill this loophole. These were modified in accordance with the requirements and became the Medical Devices (Amendment) Rules, 2020, which went into effect in April 2020. categorization, enrolment, manufacturing and import, branding, sales, and post-market obligations are just a few of the regulations that are covered by these standards. The regulations are a step in the right direction and cover the majority of the EU approval process, which requires that the devices are safe and fulfil their intended purpose. However, given the speed at which medical device technology is developing, there is a strong need for clarification and a revision of the current regulatory framework to harmonize standards and bring them into compliance with more sophisticated laws such as those of the EU.

Keywords: Medical devices, EU approval process, Amendments, sales, brand

INTRODUCTION

In the twenty-first century, India's healthcare system has seen substantial improvements. India has achieved an increase of ten percent in this area throughout the years, and it is anticipated that it will exceed $280 billion by 2025[1]. In contrast to the US, EU, China, and global average, which were $9403, $3613, $420, and $1061, respectively, India's per capita healthcare spending in 2016 was $75, which was insignificant. [2] The Indian healthcare market is currently valued at $128 billion and is projected to expand at a rate of 12% over the next four years. [3] In order to verify the safety, efficacy, and quality of medical devices used for disease diagnosis, avoidance, or medical care, medical device regulation is an essential component of the healthcare sector. In order to protect public health and keep up with advancements in medical technology, the regulatory environment for medical equipment is always changing. [4,5] Any apparatus, machinery, devices, or other like objects used to identify, treat, or prevent disease or other health issues in people are considered medical devices. These gadgets could be as simple as tongue depressors and thermometers or as complex as pacemakers, robotic surgical systems, and magnetic resonance imaging (MRI) equipment. Any tool, equipment, execute, machine, appliance, implant, in vitro reagent, software, material, or other comparable or related item that the manufacturer intends to be used, either alone or in combination, for a medical purpose is considered a medical device by the World Health Organization (WHO). [6] In India, almost 70% of medical equipment is brought in. [7] The disparity between manufacturing and imports offers medical device producers a significant chance to close this gap through domestic production and sales. The process of developing medical devices is now laborious and extremely complicated. One of the most structured procedures is approval, which is subject to strict regulations and oversight under the Medical Devices (Amendment) Rules, 2020 and the Indian Medical Device Rules (IMDR) 2017[8,9] categorization, authorization, manufacturing and import, labelling, sales, and post-market obligations are only a few of the regulations that are covered by these standards.

HISTORY

The first US medical device rules were put into effect in the early 20th century, marking the beginning of the background of medical device regulation. Since then, new laws and organization have been established to ensure the safety and effectiveness of medical devices, resulting in a substantial evolution in the regulation of these devices. A foundation for medical device regulation in the United States was established in 1976 by the Medical Device Amendments, which were created by the FDA. (10,11) The medical device regulatory environment of today is a dynamic, intricate structure involving numerous agencies and jurisdictions. The FDA is in charge of regulating medical devices in the US (12,13), whereas the European Medicines Agency (EMA) and the European Commission are in charge of this in Europe (14,15).

CURRENT REGULATORY FRAMEWORK

Ensuring that all goods on the market are high-quality, safe, and effective for both patients and physicians is the aim of the current medical device regulatory system. Pre-market assessment and clearance, post-market surveillance, and the required reporting of adverse events are all part of the regulatory process. To protect the public and keep up with the quick changes in the medical device sector, the regulatory framework governing these devices is always evolving. (16,17)

COUNTRY – SPECIFIC REGULATORY FRAMEWORKS UNITED STATES

The United States, the Federal Food, Drug, and Cosmetic Act governs medical devices in the United States. Prior to the medical device being marketed in the United States, the FDA must receive the marketing application and issue approval.[18] The FDA's Centre for Devices and Radiological Health (CDRH) is principally responsible for overseeing medical devices in the US before and after they are put on the market.[19] Medical devices are now categorized in the US using a risk-based system, which bases the categorization on the dangers of using the equipment.[18] Class I devices have the lowest danger, Class II devices have intermediate risk, and Class III devices have the highest risk[20].

Rohini Reddy *et al.,*

DEVICE CLASSIFICATION
CLASS I DEVICES

These are gadgets that don't pose a ridiculous risk of patient illness or harm. General controls, which include widely recognised standards for labelling, manufacture, post-market surveillance, and reporting, govern Class I devices. When there is a reasonable assurance that general controls alone will be adequate to ensure safety and efficacy, devices are given class I designation. Additionally, the FDA has been given countermeasures including recall prerogative and seizure. The majority of class I devices do not require formal FDA review prior to going on sale. The FDA does not conduct independent evaluations of these products, nor is it necessary to verify each one's efficacy and safety prior to release. Products in the class I category include, for instance, crutches, tongue depressors, and portable surgical tools. [21-23]

CLASS II DEVICES

Class II devices are higher-risk devices for which there is enough data to support special controls and for which ordinary controls alone are insufficient to ensure safety and efficacy. Since these devices are more likely to cause injury than class I devices, they are subject to additional regulations and extra controls, which the FDA may verify. Additionally, most class II devices require FDA approval of a 510(k) premarket notification procedure prior to release. The manufacturer of the medical device must provide evidence in the 510(k) procedure that the new device is equivalent to one that is legally sold. Few 510(k) applications require clinical data, despite the fact that this can usually be confirmed by bench and testing on animals alone. High-tech items like oxygen masks, tampons, pumps for infusion, surgical drapes, and heart monitors are typically included in this category of devices. [21, 22]

CLASS III DEVICES

Class III devices are either life-sustaining or life-supporting, or they are crucial in preventing human health deterioration. Heart valves, coronary stents, pacemakers, and other devices are examples of class III devices. Since they are thought to present the greatest risk of disease or harm, general and particular controls by themselves are not enough to prove safety and efficacy. As a result, the FDA must provide premarket clearance (PMA) for the majority of class III devices prior to their release. [21]

DEVICE APPROVAL

Class I devices have been authorized despite any clinical or pre-clinical studies due to their minimal risk and presumed safety and effectiveness. The 510(k)clearance procedure is used to approve Class II devices. Although pre-clinical data for these devices frequently show that they function as planned, clinical efficacy data are frequently unavailable. Premarket authorization is required for Class III devices (PMA). A modest safety trial and an investigational new device (IND) application are necessary for this phase. A potential clinical trial that compares the IND to the standard of care is a crucial component of the IND application. These studies might take years to finish, cost millions of US dollars, and are usually randomized. However, high-risk devices may be authorized under the 510(k)clearance process if they are judged to be roughly comparable to an existing device. The majority of device applications are handled via the 510(k) method, which processes 4,000 applications annually as opposed to less than 100 PMA applications.[24] Companies are motivated to have their devices deemed substantially equivalent and thus eligible for 510(k) clearance, as evidenced by the fact that the mean cost from concept to approval, as reported in an industry.

POST MARKET SURVEILLANCE

The Safe Medical Devices Act of 1990 established post-market surveillance, [27] requiring healthcare facilities to notify manufacturers and the FDA of serious injuries or deaths related to devices, and allowing the FDA to require device tracking, a post-market registry, or a clinical trial if necessary. The FDA receives between 80,000 and 120,000 adverse-event reports per year [24,28] Because the reporting system is optional for consumers and healthcare providers, adverse events are believed to be significantly under-reported. [29–31] Patients, providers, and other healthcare providers can report detrimental incidents via the FDA Med Watch reporting program, which receives about 5,000 reports annually, with nurses accounting for 25% of reports and physicians for only 8%. [24] Public

95282

Rohini Reddy *et al.,*

health advisories, health alerts, and product cancellations or removals may result from FDA investigations based on these monitoring systems. Allograft tissue is an intriguing class of materials frequently employed in orthopaedics. Section 361 of the Public Health Service Act defines these products, which is why they are called "361" products. These products are meant for homologous usage and have undergone minimum processing. They cannot contain a cell or tissue that might pose a safety risk when mixed with another tissue. They can't be mixed with another medication, gadget, tissue, or biologic agent. They are unable to function in a systemic manner and are dependent on living cells.[32] They are exempt from the PMA procedure if these requirements are satisfied. [33] As a result, independent post-market clinical studies typically include the only information on the clinical efficacy of these products. Because these goods can be licensed for use without efficacy evidence as long as they meet the previously mentioned conditions, manufacturers are not as motivated to look into efficacy. These goods are frequently utilised in orthopaedics, such as fresh osteochondral allografts, particulate juvenile articular cartilage allograft, allograft bone and demineralised bone matrix products, and tendon grafts for ligament restoration.

POLICIES IMPLEMENTED IN MEDICAL DEVICES REGULATION IN THE US

The interactions between pharmaceutical and medical device producers and government regulatory agencies are the focus of the regulatory affairs, or government affairs, area. The main government agency in charge of these companies in the US is the Food and Drug Administration (FDA). The FDA's Centre for Devices and Radiological Health (CDRH) regulates businesses that manufacture, repackage, relabel, and/or import medical devices sold in the United States. The evolution of regulatory affairs in the US has been impacted by a number of factors, including changes in governmental policy, technology improvements, and the complexity of the regulatory environment. In 1976, the pre-market approval (PMA) system was established. Similar to the PMA process for new drug applications, extensive testing is required to ensure that a device is safe and effective for its intended purpose, particularly for products that are vital to preserving human life or averting health harm. However, a second, less strict procedure designated as the 510(k) clause was developed in 1976 to facilitate the sale of later versions due to the large number of products existing on the market [34].

EUROPEAN UNION

In vitro diagnostic (IVD) and medical devices (MD) have proven crucial in saving lives and offering healthcare solutions for disease prediction, diagnosis, treatment, and prevention. Given the wide range of medical devices available on the market, a strong and open regulatory framework is required to enhance clinical safety and establish equitable market access for producers and medical practitioners. [37] On May 5, 2017, two new European regulations went into effect: Regulation (EU) 2017/745 on Medical Devices (MDR) and Regulation (EU) 2017/746 on In Vitro Diagnostic Medical Devices (IVDR). The three pertinent European institutions—the European Commission, the European Parliament, and the European Council—agreed on the legislation at the legislative level. After a phased transition period and an extra year's delay because of the global COVID-19 epidemic, the Medical Devices legislation is now completely applicable as of May 26, 2021. In order to facilitate a seamless transition and prevent market disruption, the In Vitro Diagnostics legislation will go into force in May 2022. They do not need to be converted into national legislation because they are immediately relevant in all EU member states as rules rather than directives. As a result, the MDR and IVDR will reduce interpretational differences throughout the EU market and provide national regulators with far greater authority and supervision over the medical device sector. [38] These new rules will regulate the production and transportation of medical equipment in the European Union. As a result, businesses must proactively adhere to these reforms; failing to do so may result in the loss of their operating licence. In order for the medical device sector to swiftly adjust to the new legislative environment, a new model must be created. In accordance with the new Biomedical Device regulations, this model must prioritise true unfulfilled clinical need in unique chronic situations in order to obtain rapid market access. [39]

DEVICE CLASSIFICATION

The European Union's system for classifying devices is comparable to the US FDA's.

CLASS I DEVICES
Devices classified as class I have a low risk of injury.

CLASS IIa DEVICE
Class IIa devices are those deemed relatively low risk to humans. Examples of class IIa devices include intravenous pumps and electronic wheel chairs.

CLASS IIb DEVICE
Class IIb devices pose a relatively high risk of harm to the human body.

CLASS III DEVICES
Class III gadgets are thought to pose the greatest risk of injury to patients and either require electricity to operate or put the patient's life in peril.

DEVICE APPROVAL
Class I devices in the European Union are authorised based on the manufacturer's declaration of conformance with fundamental requirements, such as good manufacturing procedures, appropriate labelling, and sufficient packing and storage, in a procedure akin to that of the USFDA system. Devices classified as Class IIa must be submitted to a notified entity. A literature review and pre-clinical data proving the device's intended function are typically required by the notified body for class IIa devices. However, the requirements are set by the particular notified body. Approval of class IIa devices typically takes one to three months. Both class III and class IIb, which include the majority of orthopaedic devices, call for application to a recognised body. Clinical and preclinical data demonstrating the device's efficacy and safety are included in these submissions. Clinical data demonstrating the device's performance and safety, as well as a study of related approved devices, are usually included in the supporting evidence. With historical control patients, the clinical trials are usually non-randomized single-arm case series. The particular standards for every device clearances in the European Union are set by the notified body engaged by the device producer in the approving nation.

POST MARKET SURVEILLANCE
Post-market safety surveillance is the responsibility of the appropriate officials in each of the EU's member states. It has been necessary since 2011 to include all adverse occurrences in the European Databank on Medical Devices (Eudamed). The manufacturers of authorised devices, the history of certifications granted, revoked, or rejected, and the device's current clinical studies are also listed by Eudamed. In the event that the device's long-term safety is uncertain, the notified authority may mandate that businesses do post-market research as a part of the CE mark certification.

POLICIES IMPLEMENTED IN MEDICAL DEVICES REGULATION IN THE EU
With assistance from important organisations like the Medical Device Coordination Group (MDCG) and the European Medicines Agency (EMA), the European Commission is in charge of regulating medical devices in the EU. These regulatory agencies are essential to guaranteeing that medical device laws are followed and applied consistently across all EU member states. In responsibility of the regulatory affairs in the EU, the EMA and the MDCG assist in the publication of EU medical device regulations and are responsible for monitoring the regulation of pharmaceuticals and medical devices, accordingly [40,41]. The MDCG is an organisation of professionals established in compliance with EU law to provide guidance and ensure that medical device laws are applied consistently across EU member states. Even aftercurrent medical device regulations have been examined, there is still a need to review the procedures for regulatory authorisation of medical equipment in the US and Europe [42–44].

COMPARISION OF THE REGULATORY SYSTEMS OF UNITED STATES AND THE EUROPEAN UNION
The regulatory systems in the US and the EU diverge from the very beginning. Concerns over patient safety in the 1970s in the US served as the impetus for the Medical Device Amendments of 1976 and the FDA's regulation of

95284

Rohini Reddy *et al.,*

devices. The EU market's unification, which sought to boost invention and manufacturing processes throughout Europe, served as the impetus for the Medical Device Directives. The EU approach requires device producers to collaborate with private notified entities, but the US FDA method mandates that businesses engage exclusively with the government regulatory body tasked with safeguarding the public's health. It has been questioned by some authors whether the notified organisations are more concerned with bringing technologies to market than with ensuring public health and safety. [45, 46-48] The EU system may be able to shepherd new gadgets to patients faster than the US system, which is the biggest obvious difference between the two systems. While the FDA's requirement for proof of efficacy necessitates extensive studies comparing patients treated with the medical device to the control group reflecting the current standard of treatment, the EU's requirement for demonstration of performance can be met with a single-arm case series. The Guard Wire (Medtronic) gadget is a great illustration of this distinction, while not being an orthopaedic device.[49] The company demonstrated the device's ability to aspirate embolic debris distal to an angioplasty treatment in a saphenous vein graft using a case series including 22 patients in order to obtain the CE mark. However, an 800-patient randomised, controlled clinical trial proving that the device's use decreased 30-day embolic consequences after saphenous vein graft angioplasty was necessary as evidence of efficacy for FDA approval. [50] No conclusive studies have shown that the USFDA method is better than the EU process, regardless its longer duration to market. Only a non-peer-reviewed research supported by Adva Med, a trade group that represents the medical device industry, compared recalls in the two systems. According to this data, between 2005 and 2009, there was little impact in device recalls between FDA-approved and EU-approved devices. [51] Before Eudamed was created in 2011, the European Union lacked a common reporting system for device recalls and safety-related incidents, which has hampered research on device safety. Heneghanet al. conducted a study in the United Kingdom [52].

CONCLUSION

This article presents a comparative examination of medical device legislation and regulations in a number of countries, highlighting significant differences in regulatory regimes across different countries. India and Africa have much looser regulatory frameworks, while the United States and Europe have the most stringent laws. The paper offers suggestions for developing nations to enhance their regulatory systems, such as establishing regulatory agencies and bolstering enforcement procedures, based on its research of case studies pertaining to medicaldevices. The need of medical device regulations is emphasized throughout the article, particularly In developing nations where access to dependable medical equipment is essential. It highlights the need for legislators and business professionals to collaborate and apply best practices in order to create a regulatory environment that encourages innovation while ensuring patient safety.

Table 1: Difference in Device Regulation in the United States and European Union

FACTOR	UNITED STATES	EUROPEAN UNION
Purpose/ Structure	The FDA is a government agency mandated to protect the public's health.	Notified bodies regulate device approval as private companies. Competent authorities are government agencies that regulate post market surveillance of safety and facilitate trade among countries of the European Union.
Centralization	The FDA regulates device approval and surveillance under one umbrella	More than 70 notified bodies regulate device approval separately. A competent authority in each of the countries of the European Union is tasked with device safety and surveillance.
Funding	Federal appropriations provide >80% of funding. User fees provide approximately 20% of funding.	Notified bodies are completely funded by contracts with device manufacturers. Finding of competent authorities varies by country.
Data requirement for approval	A device must prove to be safe and Efficacious through premarket authorization approval or prove to besubstantially equivalent to a predicate device through 510 (k) clearance.	Proof is required that the device can perform its intended function.
Premarket transparency	Proprietary limits exist on the sharing of information, but safety and approval data are shared through the FDA.	Approval decisions of the notified bodies are not made public.
Device surveillance	Reporting by manufacturers and healthcare institutions to the FDA is mandatory. Reporting by healthcare professionals and consumers is voluntary. The FDA can issue public health advisories, safety alerts, and product suspensions or withdrawals.	Manufacturers must submit adverse events to competent authorities. All adverse events have been required to be submitted to the European Databank on Medical Devices since 2011. Post market data are shared among competent authorities can issue adverse event reports and field safety notices or device recalls.

ABSTRACT

Solid waste is being utilized as a significant source of renewable energy. The Central Pollution Control Board (CPCB) reports that 152,749 tons of solid waste are processed, with 50% (79,956 tons) wastes are sent to treatment and 18% (29,427 tons) were sent to landfills. The rising volume of the organic fraction of municipal solid waste in urban areas presents a challenge for waste management but also offers a significant opportunity for sustainable agricultural practices. Compost is a nutrient rich organic material that results from the decomposition of organic waste. These organic materials typically include food residues, coffee grounds, tea bags and other biodegradable substances that are separated from the inorganic components like plastics and metals. The use of compost provides numerous advantages, including its application in agriculture, its odourless nature, and the absence of harmful microorganisms, all of which contribute to soil enrichment. Pellet is a compacted form of the organic materials found in municipal solid waste. In this study Organic Fraction of Municipal Solid Waste compost is converted into pellets. The Perungalathur site was selected for the collection of municipal solid waste, which was then processed using a two-stage composting method. The resulting mature compost was pelletized, and its properties were examined through scanning electron microscopy (SEM) analysis.

Keywords: Municipal solid waste, Pelletization, Pellet growing medium, Conventional medium, Organic fraction.

INTRODUCTION

As per the year of 2022, Central Pollution Control Board (CPCB) reports that 152,749 tons of solid waste are processed, with 50% (79,956 tons) wastes are sent to treatment and 18% (29,427 tons) were sent to landfills. The growing volume of organic waste poses management challenges but offers opportunities to convert it into valuable resources like compost, biogas. This project addresses the escalating environmental issues related to the use of synthetic fertilizers and the exhaustion of natural resources by investigating the potential of municipal solid waste (MSW) compost cum pellets as a sustainable growing medium for the agriculture. The organic fraction of municipal solid waste is converted into pellets and its physical properties are analysed by Scanning Electron Microscope. The primary goal of this initiative is to reduce the municipal solid waste and to use organic fractioned compost as an alternative growing medium for crop cultivation.

STUDY AREA
For waste collection and waste segregation process Tambaram, Perungalathur and Guduvanchery sites were selected. The bio degradable waste obtained from the Tambaram site is transferred to the Perungalathur site for the composting process. Fig.1 shows the Perungalathur site. In the Perungalathur site, 5.91 MT/ day of biodegradable wastes are collected and composted. The site was located at a latitude of 12.9007° and a longitude of 80.0815°.

MATERIALS AND METHODS

Collection of MSW and Separation of OFMSW
The collection of municipal solid waste refers to the systematic process of gathering everyday garbage from residential, commercial, institutional, and sometimes industrial sources within a municipality. Separation involves isolating biodegradable materials like food waste, plant residues, and other compostable substances from non-organic components such as plastics, metals, and glass. The separation can be done by manual sorting, mechanical sorting, optical separation, and electromagnetic separation. In this project, the separation of OFMSW was done by manual sorting. Fig.2 shows the manual sorting of OFMSW. This method involves human intervention to segregate different types of wastes. A total of 20 kg of municipal solid waste (MSW) is collected, of which17 kg consists of organic waste and 10 kg of compost was obtained. Manual sorting allows workers to carefully separate recyclable materials, improving recovery rates. Compared to expensive automated sorting systems, hand sorting requires minimal infrastructure and machinery. Lacking of proper safety and sanitation measures, unsafe working environments, slow process while compared to mechanized sorting systems, making it unsuitable for large waste volumes are the drawbacks of manual sorting method *Composting* Composting is a natural process that recycles organic materials into a nutrient-rich soil amendment. Compost is a mixture that consist of decayed organic matter which is used for fertilizing and conditioning the land. The several methods of composting are windrow composting, forced aeration systems, in-vessel systems, Two-stage composting, Vermi Composting. A two-stage composting method, combining semi-windrow and in-vessel techniques, was implemented for composting OFMSW in this study.Fig.3 shows the mature compost of municipal solid waste. The matured quality of compost will be obtained earlier while compared to the other methods of composting. Through the two-stage composting process the matured compost was obtained on the 30th day.

Organic Matter Analysis
The evaluation of compost quality was conducted through various parameters, including potential of hydrogen, NPK, carbon-to-nitrogen ratio, moisture content and total organic matter. Generally, completed composts have a pH range of 5.0 to 8.5. The pH was obtained at a range of 7. An optimal carbon-to-nitrogen (Carbon:Nitrogen) ratio ranging from 10:1 to 20:1 is essential to avoid nitrogen immobilization in plants. Maintaining appropriate moisture levels, typically between 40% and 85%, is essential for facilitating microbial activity in the composting process. The

obtained moisture content was between 50% and 60%. Through the ignition method, the organic matter was obtained at 60%.

Pelletization

The procedure for producing pellets from mature compost encompasses multiple stages that guarantee the compost is adequately prepared for palletization. This process initiates with composting, followed by mixing, moisture regulation, pelletizing, cooling, and drying. Introduce the prepared material into a pellet mill. As the material moves through a die, it experiences elevated pressure and temperature, resulting in its compression into pellets. The die features small openings that define the shape of the pellets, while a blade trims them to the specified length upon exit. Optimal conditioning temperatures are between 50°C and 90°C, with the majority of producers conditioning feed at approximately 78°C to 80°C. This process facilitates starch gelatinization and enhances the digestibility of nutrients such as starch, dry matter, and crude protein. Fig.4 shows the pellet balls.

SEM analysis

Scanning Electron Microscopy (SEM) analysis serves as an essential method for examining the microstructure and composition of pellets, especially in materials such as iron ore and biomass. This technique offers comprehensive insights into the physical characteristics and elemental makeup of pellets, which are critical for evaluating their quality and functionality. The application of SEM facilitates high-resolution imaging of the surface morphology of pellets, uncovering details including particle size and distribution, surface morphology, elemental composition, microstructure, moisture content, porosity and permeability, bulk density, cation exchange capacity and soil texture. Fig.5 shows the SEM analysis of pellet. Understanding these aspects is vital for determining how they affect the strength and performance of the pellets. A high-energy electron gun generates a beam of electrons. The electron beam interacts with the surface of the sample, causing the emission of secondary electrons, backscattered electrons, and X-rays, which are detected by various detectors. Different signals provide information on various properties: surface imaging, providing topographic information. It provides information about surface composition and atomic number contrast and elemental composition analysis. The detected signals are processed to form an image on a computer screen. The image's resolution depends on the electron beam's wavelength and the detectors used Spectrum graph provided in Fig.6 reveals a detailed elemental analysis of the pellet showing the presence of several elements such as Nitrogen, Phosphorus, Potassium, Magnesium, Chlorine, Carbon, Iridium, Oxygen, Calcium, Silicon, Sodium. The peaks at different energy levels on the x-axis (measured in keV) correspond to the presence of these elements in the sample. The counts on the y-axis indicate the relative abundance of each element. Higher peaks suggest a higher concentration of the corresponding element. From Table 1, A high carbon content of 20.2% in the pellets suggests a good source of organic material, which can enhance soil fertility and support microbial activity. A high oxygen content of 45.14% indicates that the material can support aerobic processes, crucial for healthy root development and nutrient cycling. Adequate nitrogen levels of 7.34% can promote vigorous plant growth, enhancing leaf and stem development. Potassium level of 2.38% enhances drought resistance, disease resistance, and overall plant vigor, contributing to better crop yields. The presence of calcium at the level of 9.29% suggests that the pellets can help improve root and shoot development, as well as overall plant health. Magnesium level of 0.80% in the pellets can support efficient photosynthesis and nutrient transport within the plant. Silicon level of 7.15% can improve structural integrity and stress tolerance in plants, making them more resilient. Using OFMSW pellets as a growing medium can be a sustainable and effective way to recycle organic waste while improving soil quality and crop yields.

CONCLUSION

The municipal solid waste pellets utilized as a growing medium for crops exhibit significant nutritional properties, as analyzed through Scanning Electron Microscopy. Their incorporation supports sustainable agricultural practices, applicable in both soil-based and soilless cultivation systems, while also improving soil fertility. Elemental analysis conducted through the scanning electron microscope (SEM) revealed a high availability of essential nutrients necessary for plant growth, which could enhance crop yield.

ABSTRACT

Diabetic foot ulcers (DFUs) are a leading cause of lower extremity amputations in diabetic patients, affecting up to 25% of diabetics. Chronic inflammation, oxidative stress, and reduced immune function contribute to delayed wound healing. Nutritional support is crucial for managing DFUs, as specific nutrients may influence inflammation, immune response, and tissue repair. A literature search was conducted using PubMed, Google Scholar, and ScienceDirect, reviewing observational studies, clinical trials, and meta-analyses published between 2015 and 2022. Total 16 articles has been reviewed in order to write this review paper. The focus was on the role of nutrition education in promoting wound healing in DFU patients. Essential nutrients such as antioxidants, vitamins (C, A, D, E), and minerals (zinc, selenium, manganese, copper) play a vital role in reducing inflammation and supporting wound healing. Deficiencies in these nutrients are common in DFU patients, hindering the healing process. Vitamin C is critical for collagen synthesis and immune function, while zinc supports immune response and tissue repair. Vitamin D, due to its influence on bone and immune function, has potential as an adjunct therapy for DFUs. Additionally, probiotics show promise in reducing inflammation and promoting faster healing. Adherence to recommended calorie and protein intake is crucial for wound recovery. Nutrition plays a

95296

Haseena Banu *et al.,*

key role in managing diabetic foot ulcers by reducing inflammation, supporting immune function, and promoting tissue repair. Educating DFU patients on the importance of balanced nutrition, including adequate intake of vitamins, minerals, and antioxidants, is essential for improving wound healing outcomes. Further research is needed to fully understand the synergistic effects of these nutrients in chronic wound management.

Keywords: Diabetes , Foot ulcer , High protein, Immuno-nutrients, Antioxidant.

INTRODUCTION

One of the most frequent reasons for lower extremity amputation in diabetic individuals is diabetic foot ulcers (DFU). A foot ulcer can occur in about 25% of diabetics, and 16% of DFUs can result in amputation if left untreated. A multitude of interactions between different cell types, extracellular matrix, and cytokine mediators occur during the intricate process of wound healing. As a normal physiological reaction to tissue damage, inflammation is necessary for both the healing process and wound cleaning. [1] Acute inflammatory responses occur in normal wounds for a brief period of time and end quickly because of negative feedback mechanisms. In chronic wounds, like DFUs, however, inflammatory responses are unable to control themselves, leading to chronic inflammation and a slowdown in the healing process. The over activity of inflammatory cells in DFU patients leads to an increased production of reactive oxygen species (ROS). This, in conjunction with the down regulation of anti-inflammatory proteins like interleukin 10 (IL10), will increase the inflammatory load. A high ROS concentration can exacerbate the healing process by degrading the extracellular matrix through the up regulation of matrix metalloproteinase (MMPs) expression and the generation of more free radicals.[1] Apart from the elevated generation of reactive oxygen species (ROS) in diabetes, there is a reduced capacity to eliminate them because to malfunctioning reducing complexes (glutathione), reducing enzymes (glutathione reductase), and reducing amino acids (cysteine). Diabetic patients have both hyperglycemia and hypoxia due to disturbed vasculature, which hinders the healing of wounds and reduces the function of neutrophils and macrophages, thereby raising the risk of infection. Furthermore, diabetic patients have a chronic, non-healing wound due to down-regulation of anti- inflammatory molecules like transforming growth factor-beta (TGF-β) and IL10, and up- regulation of pro inflammatory cytokines such as interleukin 1β (IL1β), interleukin 6 (IL6), and tumor necrosis factor-alpha (TNF-alpha).[1] Controlling infection and inflammation both inside and outside the wound site is therefore a key objective of DFU wound management. In DFU patients, IL6 and C-reactive protein (CRP) are two of the best markers of inflammation and wound healing. The levels of glucose and the chronicity of wounds are highly associated with IL6 expression. Another intriguing indicator of delayed wound healing and infection in DFU patients is a high quantity of IL6. In addition, in DFU patients, there is a correlation between the size of the wound and both IL6 and CRP. Weigelt *et al.*'s investigation revealed that blood levels of CRP and IL6 were considerably greater in patients with grade 3 DFUs (as defined by the University of Texas Wound Classification) than in those with grade 1 DFUs.[1] Micro and macro vascular problems arise from a collection of metabolic illnesses called diabetes mellitus that have long-term effects on numerous organs. One of the most frequent consequences of diabetes is diabetic foot ulcers, which are frequently challenging to cure. Multiple cell types, cytokine mediators, and the extracellular matrix interact in a variety of ways throughout the wound healing process. Sufficient blood flow and nourishment to the area of injured tissue could make this approach effective.[3]

Etiology

Diabetes mellitus patients are at risk for ulcers due to distal peripheral neuropathy, peripheral vascular disease, trauma, ulcer history, and/or amputation. Peripheral neuropathy comes in many forms, but distal-symmetric sensorimotor neuropathy and autonomic neuropathy are the two most commonly linked to diabetic foot. Because neuropathy reduces sensitivity all the way to total loss, minor injuries like burns, incorrect nail cutting, and insufficient footwear can result in ulcers. The neuropathic foot is malformed, the skin feels warm and dry to the touch, the plantar surface has hyperkeratosis, the veins are turgid, and there are arterial pulses. Changes in

autonomic neuropathy lead to abnormalities in capillary microcirculation regulation, including turgidity of the veins and the emergence of shunts between arterioles and veins.[3,2] DFUs negatively impact patients' quality of life, health, and socioeconomic well-being. Nutrition is crucial to avoid DFUs and improve clinical outcomes. Chronic wound patients consume more energy and nutrients, while uncontrolled diabetes leads to increased protein catabolism.[4] The aim of this review paper is to highlight the role of nutrition education in wound healing for patients with diabetic foot ulcers.

METHODOLOGY

A literature search was performed using databases PubMed, Medline, Google scholar, ScienceDirect, to locate peer-reviewed articles of observational studies, clinical trials and meta- analysis. Articles were reviewed for inclusion based on their relevance to this subject matter. 16 articals are reffered from the year of 2015 till the year 2022.

RESULTS

Role of nutrients

Antioxidant , vitamins and minerals, among other nutritional components, may be able to lower chronic inflammation and may even play a crucial role in the healing process of chronic wounds. Strong antioxidants like zinc, manganese, and copper, together with vitamins C, A, and E, have potent anti-inflammatory qualities. Therefore, it is essential to look into whether these nutrients can change the inflammatory status in order to turn diabetic wounds from chronic or non-healing to normal wounds. It has been discovered that DFU patients consume significantly fewer of the nutrients listed above. However, the idea that a combination of these essential nutrients reduces inflammation and facilitates wound healing in DFUs is not well-supported by the available data. Thus, additional study is needed to determine how well these nutrients function to treat inflammatory conditions linked to DFUs. [2] Apart from its requirement for the synthesis of collagen, ascorbic acid is also necessary for the proper operation of the immune system. A significant cause of amputations in patients with persistent foot ulcers is osteomyelitis. Thus, in the absence of skin integrity, inadequate vitamin C feeding may promote the development of osteomyelitis. Bone fractures were common among the sailors who perished from scurvy centuries ago. It's intriguing to consider the possibility that vitamin C deficiency could exacerbate osteomyelitis risk by hindering bone growth.[6] Selenium enhances MSCs' multipotency, anti-inflammatory properties, and proliferation, promoting pro-angiogenesis, inflammation inhibition, and wound healing in human umbilical vein endothelial cells and exosome groups[15].Zinc is a crucial micronutrient for human physiology, supporting immune system function, cell proliferation, growth, and membrane repair.

Deficiency can lead to skin lesions, weakened immunity, and poor wound healing[16]. Vitamins and minerals are necessary for biological metabolism, which includes wound healing.[7] Diabetes population with foot ulcers are more susceptible to vitamin D deficiency because of the patients reduced physical activity, which is commonly mistaken for time spent outside and, thus, sun exposure. The function of vitamin D in maintaining bone homeostasis is widely acknowledged. Nonetheless, there are numerous extra skeletal impacts of vitamin D signaling. These include the control of cell division and proliferation, vascular and metabolic characteristics, immune system and muscle function, skin differentiation, and reproduction[7].As an adjuvant treatment for diabetic foot ulcers, vitamin D supplements are helpful. It might lessen the stress brought on by diabetic foot ulcers and hasten the healing process[12]. The National Pressure Ulcer Advisory Panel (NPUAP) in the year 2019 standards were used to determine the daily calorie and protein requirements, which are 30–35 kcal/kg of body weight and 1.2–1.5 g/kg of body weight, respectively. The NPUAP guidelines for energy and protein intakes as well as the DRIs for micronutrient intakes were compared with the patient intakes[8]. Probiotics, which the International Scientific Association of Probiotics and Prebiotics defines as "live microorganisms which when administered in adequate amounts confer a health benefit on the host," are a newly developed therapeutic option for wound healing [9]. Probiotic supplements given intraoperatively to diabetic rats showed quicker skin healing, most likely as a result of decreased inflammatory

response, improved neovascularization, and higher type I collagen deposition. Probiotic supplementation also improves glycemic management and inhibits weight loss in animal models.[9]The most widely used probiotic supplements are strains from other bacterial species (Propionibacterium acidilactici, Lactococcus lactis, Leuconostoc mesenteroides, Bacillus subtilis, Streptococcus thermophilus), yeasts (Saccharomyces boulardii), and members of the Lactobacillus spp. and Bifidobacterium genera[9]. Applying honey and turmeric topically speeds up the healing of wounds and is both safe and economical[13].vitamin C (VitC) or ascorbic acid (AscA), a major antioxidant and cofactor for collagen formation, is quickly depleted. In human or murine sepsis, parenteral vitamin C treatment promotes anti-inflammatory and pro-resolution effects while suppressing pro-inflammatory responses[14]. Blood cells, parenchymal cells, extracellular matrix, and soluble mediators are all involved in the intricate, dynamic, and interacting process of wound healing. The three stages of wound healing— tissue creation, remodeling, and inflammation—occur over time.4 For millennia, people have understood the connection between wound healing and nutrition. It is well recognized that inadequate intake of macronutrients, particularly protein, has a negative impact on wound healing. Equally vital are micronutrients, which are crucial components of cellular metabolism. The immune system and wound healing are significantly influenced by a number of vitamins and minerals; zinc, vitamin C, and vitamin A are particularly crucial.[7]

DISCUSSION

DFUs have a detrimental impact on patients' and their families' quality of life as well as their health and socioeconomic well-being. In order to avoid DFUs and enhance their clinical outcomes, nutrition can be extremely important. Patients with chronic wounds have higher metabolic demands due to increased cellular activity and inflammation in the healing wound; as a result, they consume more energy and nutrients. Individuals with uncontrolled diabetes have been found to have increased protein catabolism and a negative nitrogen balance. Diabetes patients, particularly those who are overweight or obese, are generally recommended to follow low-calorie/low-carb diets to better control their glycemic indices and associated problems, despite their increased need for energy sources and essential nutrients during the healing process..[4] It has also been observed that patients with DFUs who are overweight or obese consume notably less calories and nutrients through their diet. Loss of subcutaneous tissue, muscle atrophy, and delayed wound healing can all be consequences of inadequate calorie intake. In order to improve wound healing in DFUs, a positive nitrogen balance must be promoted by an adequate protein intake supplemented by non-protein energy sources. Protein is responsible for cell proliferation, collagen, and connective tissue synthesis, as well as the antibody synthesis required for immune system function [4]. When it comes to managing diabetes and its consequences, nutrition therapy is essential. Inadequate nourishment before to or during the healing process might impede the speed of wound healing and reduce its strength. Since it is necessary for wound healing, protein is one of the most important macronutrients. All phases of the healing process, including fibroblast proliferation, collagen synthesis, angiogenesis, and immunological function, depend on it. [3]Diabetic foot ulcers (DFUs) are known to heal more slowly when M1/M2-type macrophages are dysregulated. Therefore, healing requires reestablishing the proper balance between these macrophage subtypes.[12]

CONCLUSION

For patients with diabetic foot ulcers, proper dietary treatment is essential. Healing results can be greatly enhanced by concentrating on consuming enough protein, getting enough micronutrients, and keeping blood glucose levels steady. To further adapt dietary recommendations and interventions to the specific needs of each patient, more research is required.

ABSTRACT

In this paper, Lattice Valued Picture Fuzzy Relations and their fundamental operations are defined. The properties of Lattice valued Picture Fuzzy Relations are investigated. Further, the composition of Lattice Valued Picture Fuzzy Relations are described with illustrations and their properties are examined.

Keywords: Picture Fuzzy Sets, Picture Fuzzy Relations, Lattice Valued Picture Fuzzy Sets, Lattice Valued Picture Fuzzy Relations, Composition of Lattice Valued Picture Fuzzy Relations

INTRODUCTION

Relations are beneficial for demonstrating correspondence between items. Mathematical theories have benefited greatly from crisp relations. Some issues, meanwhile, cannot be resolved by crisp relations. Thus, following the concept of the fuzzy set, Zadeh [7] further proposed defining fuzzy relations as an expansion of the classical relationships. Uncertainty cannot be modelled by fuzzy relations, although vagueness may. To overcome this, Intuitionistic fuzzy sets was defined by Atanassov [1]. Burillo and Bustince [2], [3] defined intuitionistic relations and discussed about their properties. Picture fuzzy relations were introduced by B.C. Cuong [4], who also investigated their characteristics. Tweena Evangelin P and A. Francina Shalini [6] defined Lattice Valued Picture Fuzzy Sets by inducing picture fuzzy sets to the theory of lattices. In Section 2, some basic definitions and properties have been presented. In Section 3, Lattice Valued Picture Fuzzy Relations and their basic operations are defined. In Section 4,

Tweena Evangelin and Francina Shalini

we define the composition of Lattice Valued Picture Fuzzy Relations and discuss their properties. The conclusion is given in Section 5.

PRELIMINARIES

Definition 2.1: *[5]* Let P be a non-empty ordered set. If $x \vee y$ and $x \wedge y$ exist for all $x, y \in P$, then P is called a lattice.

Definition 2.2: *[5]* We refer to a complemented and distributive lattice as a Boolean lattice.

Definition 2.3: *[4]* A picture fuzzy set $A = \{\langle \hat{a}, \mu_A(\hat{a}), \eta_A(\hat{a}), \nu_A(\hat{a})\rangle | \hat{a} \in \hat{X}\}$ where $\mu_A(\hat{a}), \eta_A(\hat{a}), \nu_A(\hat{a}) \in [0,1]$ are called the positive, neutral and negative membership degrees of $\hat{a}$ in $\hat{X}$ and satisfy the following condition: $\forall \hat{a} \in \hat{X}, \mu_A(\hat{a}) + \eta_A(\hat{a}) + \nu_A(\hat{a}) \leq 1$. Now $1 - (\mu_A(\hat{a}) + \eta_A(\hat{a}) + \nu_A(\hat{a}))$ could be called the degree of refusal membership of $\hat{a} \in \hat{X}$.

Definition 2.4: *[4]* A picture fuzzy relation is a picture fuzzy subset of $\hat{X} \times \hat{Y}$ (i.e)
$R = \{\langle (\hat{x}, \hat{y}), \mu_R(\hat{x}, \hat{y}), \iota_R(\hat{x}, \hat{y}), \vartheta_R(\hat{x}, \hat{y})\rangle | \hat{x} \in \hat{X}, \hat{y} \in \hat{Y}\}$ where $\mu_R: \hat{X} \times \hat{Y} \to [0,1]$, $\iota_R: \hat{X} \times \hat{Y} \to [0,1]$, $\vartheta_R: \hat{X} \times \hat{Y} \to [0,1]$ satisfy the condition $0 \leq \mu_R(\hat{x}, \hat{y}) + \iota_R(\hat{x}, \hat{y}) + \vartheta_R(\hat{x}, \hat{y}) \leq 1 \, \forall (\hat{x}, \hat{y}) \in \hat{X} \times \hat{Y}$. $PFR(\dot{U})$ is the set of all picture fuzzy relations in $\hat{X} \times \hat{Y}$.

Definition 2.5: *[6]* Consider the universe $\mathfrak{U}_1$ and a nontrivial complete boolean lattice $\mathcal{L}$. A Lattice Valued Picture Fuzzy Set (LVPFS) $\mathcal{A}_{\mathcal{L}} = \{\langle \dot{a}, \zeta_{\mathcal{A}_{\mathcal{L}}}(\dot{a}), \eta_{\mathcal{A}_{\mathcal{L}}}(\dot{a}), \vartheta_{\mathcal{A}_{\mathcal{L}}}(\dot{a})\rangle | \dot{a} \in \mathfrak{U}_1\}$ where $\zeta_{\mathcal{A}_{\mathcal{L}}}: \mathfrak{U}_1 \to \mathcal{L}$ is positive membership degree, $\eta_{\mathcal{A}_{\mathcal{L}}}: \mathfrak{U}_1 \to \mathcal{L}$ is neutral membership degree and $\vartheta_{\mathcal{A}_{\mathcal{L}}}: \mathfrak{U}_1 \to \mathcal{L}$ is negative membership degree.
$\pi_{\mathcal{A}_{\mathcal{L}}}(\dot{a}) = (\zeta_{\mathcal{A}_{\mathcal{L}}}(\dot{a}) \vee \eta_{\mathcal{A}_{\mathcal{L}}}(\dot{a}) \vee \vartheta_{\mathcal{A}_{\mathcal{L}}}(\dot{a}))'$ is the refusal membership degree of $\dot{a}$ in $\mathcal{A}_{\mathcal{L}}$. LVPFS $(\mathfrak{U}_1)$ represents set of Lattice Valued Picture Fuzzy Sets in $\mathfrak{U}_1$.

Definition 2.6: *[6]* Let $\mathcal{A}_{1_{\mathcal{L}}}, \mathcal{A}_{2_{\mathcal{L}}} \in$ LVPFS $(\mathfrak{U}_1)$. Then

i. $\mathcal{A}_{1_{\mathcal{L}}} \subseteq \mathcal{A}_{2_{\mathcal{L}}}$ iff $\zeta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \leq \zeta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}), \eta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \leq \eta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}), \vartheta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \geq \vartheta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})$.

ii. $\mathcal{A}_{\mathcal{L}}^{c} = \{\langle \dot{a}, \vartheta_{\mathcal{A}_{\mathcal{L}}}(\dot{a}), \eta_{\mathcal{A}_{\mathcal{L}}}(\dot{a}), \zeta_{\mathcal{A}_{\mathcal{L}}}(\dot{a})\rangle | \dot{a} \in \mathfrak{U}_1\}$

iii. $\mathcal{A}_{1_{\mathcal{L}}} \cup \mathcal{A}_{2_{\mathcal{L}}} = \{\langle \dot{a}, \zeta_{(\mathcal{A}_{1_{\mathcal{L}}} \cup \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}), \eta_{(\mathcal{A}_{1_{\mathcal{L}}} \cup \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}), \vartheta_{(\mathcal{A}_{1_{\mathcal{L}}} \cup \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})\rangle | \dot{a} \in \mathfrak{U}_1\}$ where

iv. $\zeta_{(\mathcal{A}_{1_{\mathcal{L}}} \cup \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}) = \zeta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \vee \zeta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})$, $\eta_{(\mathcal{A}_{1_{\mathcal{L}}} \cup \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}) = \eta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \wedge \eta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})$,

    $\vartheta_{(\mathcal{A}_{1_{\mathcal{L}}} \cup \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}) = \vartheta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \wedge \vartheta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})$.

v. $\mathcal{A}_{1_{\mathcal{L}}} \cap \mathcal{A}_{2_{\mathcal{L}}} = \{\langle \dot{a}, \zeta_{(\mathcal{A}_{1_{\mathcal{L}}} \cap \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}), \eta_{(\mathcal{A}_{1_{\mathcal{L}}} \cap \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}), \vartheta_{(\mathcal{A}_{1_{\mathcal{L}}} \cap \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})\rangle | \dot{a} \in \mathfrak{U}_1\}$ where

    $\zeta_{(\mathcal{A}_{1_{\mathcal{L}}} \cap \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}) = \zeta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \wedge \zeta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})$, $\eta_{(\mathcal{A}_{1_{\mathcal{L}}} \cap \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}) = \eta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \wedge \eta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})$, $\vartheta_{(\mathcal{A}_{1_{\mathcal{L}}} \cap \mathcal{A}_{2_{\mathcal{L}}})}(\dot{a}) = \vartheta_{(\mathcal{A}_{1_{\mathcal{L}}})}(\dot{a}) \vee \vartheta_{(\mathcal{A}_{2_{\mathcal{L}}})}(\dot{a})$.

LATTICE VALUED PICTURE FUZZY RELATIONS
Definition 3.1: A Lattice Valued Picture Fuzzy Relation (LVPFR) is defined as
$$R_{\mathcal{L}} = \{\langle (\hat{\kappa}_1, \hat{\kappa}_2), \zeta_{(R_{\mathcal{L}})}(\hat{\kappa}_1, \hat{\kappa}_2), \iota_{(R_{\mathcal{L}})}(\hat{\kappa}_1, \hat{\kappa}_2), \vartheta_{(R_{\mathcal{L}})}(\hat{\kappa}_1, \hat{\kappa}_2)\rangle | \hat{\kappa}_1 \in \mathfrak{U}_1, \hat{\kappa}_2 \in \mathfrak{U}_2\}$$
where $\zeta_{(R_{\mathcal{L}})}: \mathfrak{U}_1 \times \mathfrak{U}_2 \to \mathcal{L}$ is the positive membership degree, $\iota_{(R_{\mathcal{L}})}: \mathfrak{U}_1 \times \mathfrak{U}_2 \to \mathcal{L}$ is the neutral membership degree and $\vartheta_{(R_{\mathcal{L}})}: \mathfrak{U}_1 \times \mathfrak{U}_2 \to \mathcal{L}$ is the negative membership degree.
$\pi_{(R_{\mathcal{L}})}(\hat{\kappa}_1, \hat{\kappa}_2) = (\zeta_{(R_{\mathcal{L}})}(\hat{\kappa}_1, \hat{\kappa}_2) \vee \iota_{(R_{\mathcal{L}})}(\hat{\kappa}_1, \hat{\kappa}_2) \vee \vartheta_{(R_{\mathcal{L}})}(\hat{\kappa}_1, \hat{\kappa}_2))'$ is the refusal degree of $(\hat{\kappa}_1, \hat{\kappa}_2)$ in $R_{\mathcal{L}}$. The set of all Lattice Valued Picture Fuzzy Relations in $\mathfrak{U}_1 \times \mathfrak{U}_2$ is denoted by LVPFR $(\mathfrak{U}_1 \times \mathfrak{U}_2)$.

Example 3.2: Let $\mathfrak{U}_1 = \{\dot{p}_1, \dot{p}_2\}$ and $\mathfrak{U}_2 = \{\dot{m}_1, \dot{m}_2, m_3\}$ and the lattice $\mathcal{L}$ in figure 1.
$R_{1_{\mathcal{L}}} = \{\langle (\dot{p}_1, \dot{m}_1), 15, 1, 5\rangle, \langle (\dot{p}_1, \dot{m}_2), 5, 3, 15\rangle, \langle (\dot{p}_1, \dot{m}_3), 1, 15, 3\rangle, \langle (\dot{p}_2, \dot{m}_1), 3, 1, 15\rangle,$
$\langle (\dot{p}_2, \dot{m}_2), 15, 5, 1\rangle, \langle (\dot{p}_2, \dot{m}_3), 5, 1, 3\rangle\}$ is a LVPFR.

Tweena Evangelin and Francina Shalini

$[R_{\mathcal{L}}] = \begin{bmatrix} (15,1,5) & (5,3,15) & (1,15,3) \\ (3,1,15) & (15,5,1) & (5,1,3) \end{bmatrix}$

Definition 3.3: The complement of a LVPFR $R_{1_{\mathcal{L}}}$ is defined as

$\left(R_{1_{\mathcal{L}}}\right)^c = \{\langle(\hat{k}_1,\hat{k}_2),\zeta_{(R_{1_{\mathcal{L}}})^c}(\hat{k}_1,\hat{k}_2),\iota_{(R_{1_{\mathcal{L}}})^c}(\hat{k}_1,\hat{k}_2),\vartheta_{(R_{1_{\mathcal{L}}})^c}(\hat{k}_1,\hat{k}_2)\rangle | (\hat{k}_1,\hat{k}_2) \in \mho_1 \times \mho_2\}$ where

$\zeta_{(R_{1_{\mathcal{L}}})^c}(\hat{k}_1,\hat{k}_2) = \vartheta_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2),$

$\iota_{(R_{1_{\mathcal{L}}})^c}(\hat{k}_1,\hat{k}_2) = \iota_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2),$

$\vartheta_{(R_{1_{\mathcal{L}}})^c}(\hat{k}_1,\hat{k}_2) = \zeta_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2).$

Example 3.4: The complement of $R_{\mathcal{L}}$ in example 3.2 is

$\left[\left(R_{1_{\mathcal{L}}}\right)^c\right] = \begin{bmatrix} (5,1,15) & (15,3,5) & (3,15,1) \\ (15,1,3) & (1,5,15) & (3,1,5) \end{bmatrix}.$

Definition 3.5: Let $R_{1_{\mathcal{L}}}$ be a LVPFR from $\mho_1$ to $\mho_2$. The inverse of $R_{1_{\mathcal{L}}}$ is a LVPFR from $\mho_2$ to $\mho_1$ is defined as

$\left(R_{1_{\mathcal{L}}}\right)^{-1} = \{\langle(\hat{k}_2,\hat{k}_1),\zeta_{(R_{1_{\mathcal{L}}})^{-1}}(\hat{k}_2,\hat{k}_1),\iota_{(R_{1_{\mathcal{L}}})^{-1}}(\hat{k}_2,\hat{k}_1),\vartheta_{(R_{1_{\mathcal{L}}})^{-1}}(\hat{k}_2,\hat{k}_1)\rangle | (\hat{k}_2,\hat{k}_1) \in \mho_2 \times \mho_1\}$ where

$\zeta_{(R_{1_{\mathcal{L}}})^{-1}}(\hat{k}_2,\hat{k}_1) = \zeta_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2),$

$\iota_{(R_{1_{\mathcal{L}}})^{-1}}(\hat{k}_2,\hat{k}_1) = \iota_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2),$

$\vartheta_{(R_{1_{\mathcal{L}}})^{-1}}(\hat{k}_2,\hat{k}_1) = \vartheta_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2).$

Example 3.6: The inverse of $R_{1_{\mathcal{L}}}$ in example 3.2 is $\left[\left(R_{1_{\mathcal{L}}}\right)^{-1}\right] = \begin{bmatrix} (15,1,5) & (3,1,15) \\ (5,3,15) & (15,5,1) \\ (1,15,3) & (5,1,3) \end{bmatrix}.$

Definition 3.7: Let $R_{1_{\mathcal{L}}}$ and $R_{2_{\mathcal{L}}}$ be two LVPFRs from $\mho_1$ to $\mho_2$. Then, $R_{1_{\mathcal{L}}} \subseteq R_{2_{\mathcal{L}}}$ iff $\zeta_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2) \le \zeta_{R_{2_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2),\iota_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2) \le \iota_{R_{2_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2),\vartheta_{R_{1_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2) \ge \vartheta_{R_{2_{\mathcal{L}}}}(\hat{k}_1,\hat{k}_2)$
$\forall (\hat{k}_1,\hat{k}_2) \in \mho_1 \times \mho_2.$

Definition 3.8: Let $R_{1_{\mathcal{L}}}$ and $R_{2_{\mathcal{L}}}$ be two LVPFRs from $\mho_1$ to $\mho_2$. Then,

i. $R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}} = \left\{\langle(\hat{k}_1,\hat{k}_2),\zeta_{(R_{1_{\mathcal{L}} \cup R_{2_{\mathcal{L}}}})}(\hat{k}_1,\hat{k}_2),\iota_{(R_{1_{\mathcal{L}} \cup R_{2_{\mathcal{L}}}})}(\hat{k}_1,\hat{k}_2),\vartheta_{(R_{1_{\mathcal{L}} \cup R_{2_{\mathcal{L}}}})}(\hat{k}_1,\hat{k}_2)\rangle\right| (\hat{k}_1,\hat{k}_2) \in \mho_1 \times \mho_2\}$

where $\zeta_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2) = \zeta_{(R_{1_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2)\vee\zeta_{(R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2),$ $\iota_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2) = \iota_{(R_{1_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2)\wedge\iota_{(R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2),$
$\vartheta_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2) = \vartheta_{(R_{1_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2)\wedge\vartheta_{(R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2).$

ii. $R_{1_{\mathcal{L}}} \cap R_{2_{\mathcal{L}}} = \left\{\langle(\hat{k}_1,\hat{k}_2),\zeta_{(R_{1_{\mathcal{L}}}\cap R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2),\iota_{(R_{1_{\mathcal{L}}}\cap R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2),\vartheta_{(R_{1_{\mathcal{L}}}\cap R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2)\rangle\right| (\hat{k}_1,\hat{k}_2) \in \mho_1 \times \mho_2\}$

where $\zeta_{(R_{1_{\mathcal{L}}}\cap R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2) = \zeta_{(R_{1_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2)\wedge\zeta_{(R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2),$ $\iota_{(R_{1_{\mathcal{L}}}\cap R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2) = \iota_{(R_{1_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2)\wedge\iota_{(R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2),$
$\vartheta_{(R_{1_{\mathcal{L}}}\cap R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2) = \vartheta_{(R_{1_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2)\vee\vartheta_{(R_{2_{\mathcal{L}}})}(\hat{k}_1,\hat{k}_2).$

Example 3.9: Let $\mho_1 = \{\dot{p}_1,\dot{p}_2\}$ and $\mho_2 = \{\dot{m}_1,\dot{m}_2,m_3\}$ and the lattice $\mathcal{L}$ in figure 1.
$R_{1_{\mathcal{L}}} = \{\langle(\dot{p}_1,\dot{m}_1),15,1,5\rangle,\langle(\dot{p}_1,\dot{m}_2),5,3,15\rangle,\langle(\dot{p}_1,\dot{m}_3),1,15,3\rangle,\langle(\dot{p}_2,\dot{m}_1),3,1,15\rangle,\langle(\dot{p}_2,\dot{m}_2),15,5,1\rangle,\langle(\dot{p}_2,\dot{m}_3),5,1,3\rangle\},$
$R_{2_{\mathcal{L}}} = \{\langle(\dot{p}_1,\dot{m}_1),3,5,1\rangle,\langle(\dot{p}_1,\dot{m}_2),15,1,5\rangle,\langle(\dot{p}_1,\dot{m}_3),1,3,15\rangle,\langle(\dot{p}_2,\dot{m}_1),5,1,15\rangle,\langle(\dot{p}_2,\dot{m}_2),3,1,5\rangle,\langle(\dot{p}_2,\dot{m}_3),15,3,5\rangle\}$
be LVPFRs from $\mho_1$ to $\mho_2$.

$[R_{1_{\mathcal{L}}}] = \begin{bmatrix} (15,1,5) & (5,3,15) & (1,15,3) \\ (3,1,15) & (15,5,1) & (5,1,3) \end{bmatrix}$
$[R_{2_{\mathcal{L}}}] = \begin{bmatrix} (3,5,1) & (15,1,5) & (1,3,15) \\ (5,1,15) & (3,1,5) & (15,3,5) \end{bmatrix}$

Then, $\left[R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}}\right] = \begin{bmatrix} (15,1,1) & (15,1,5) & (1,3,3) \\ (15,1,15) & (15,1,1) & (15,1,1) \end{bmatrix}$

Tweena Evangelin and Francina Shalini

$$[R_{1_{\mathcal{L}}} \cap R_{2_{\mathcal{L}}}] = \begin{bmatrix} (3,1,5) & (5,1,15) & (1,3,15) \\ (1,1,15) & (3,1,5) & (5,1,15) \end{bmatrix}$$

Theorem 3.10: Let $R_{1_{\mathcal{L}}}, R_{2_{\mathcal{L}}} \in LVPFR(\mho_1 \times \mho_2)$. Then,

i. $\left(R_{1_{\mathcal{L}}}^{-1}\right)^{-1} = R_{1_{\mathcal{L}}}$

ii. $\left(\left(R_{1_{\mathcal{L}}}\right)^c\right)^{-1} = \left(\left(R_{1_{\mathcal{L}}}\right)^{-1}\right)^c$

iii. $R_{1_{\mathcal{L}}} \subseteq R_{2_{\mathcal{L}}} \Rightarrow \left(R_{1_{\mathcal{L}}}\right)^{-1} \subseteq \left(R_{2_{\mathcal{L}}}\right)^{-1}$

Proof: The proof is clear from the definitions.

Theorem 3.11: Let $R_{1_{\mathcal{L}}}, R_{2_{\mathcal{L}}}, R_{3_{\mathcal{L}}} \in LVPFR(\mho_1 \times \mho_2)$. Then,

i. $R_{1_{\mathcal{L}}} \supseteq R_{2_{\mathcal{L}}}$ and $R_{1_{\mathcal{L}}} \supseteq R_{3_{\mathcal{L}}} \Leftrightarrow R_{1_{\mathcal{L}}} \supseteq R_{2_{\mathcal{L}}} \cup R_{3_{\mathcal{L}}}$

ii. $R_{1_{\mathcal{L}}} \subseteq R_{2_{\mathcal{L}}}$ and $R_{1_{\mathcal{L}}} \subseteq R_{3_{\mathcal{L}}} \Leftrightarrow R_{1_{\mathcal{L}}} \subseteq R_{2_{\mathcal{L}}} \cap R_{3_{\mathcal{L}}}$

Proof

i. $R_{1_{\mathcal{L}}} \supseteq R_{2_{\mathcal{L}}} \Leftrightarrow \zeta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \zeta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2), \iota_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \iota_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2), \vartheta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \leq \vartheta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2)$

$R_{1_{\mathcal{L}}} \supseteq R_{3_{\mathcal{L}}} \Leftrightarrow \zeta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \zeta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2), \iota_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \iota_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2), \vartheta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \leq \vartheta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2)$
$\zeta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \zeta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2)$ and $\zeta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \zeta_{R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \Leftrightarrow \zeta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \zeta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \vee \zeta_{R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \zeta_{(R_{2_{\mathcal{L}}} \cup R_{3_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2)$
$\iota_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \iota_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2)$ and $\iota_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \iota_{R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \Leftrightarrow \iota_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \iota_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \vee \iota_{R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \iota_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge$
$\iota_{R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \geq \iota_{(R_{2_{\mathcal{L}}} \cup R_{3_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2) \, \vartheta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \leq \vartheta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2)$ and $\vartheta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \leq \vartheta_{R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \Leftrightarrow \vartheta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \leq \vartheta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge$
$\vartheta_{R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \leq \vartheta_{(R_{2_{\mathcal{L}}} \cup R_{3_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2)$ Thus, $R_{1_{\mathcal{L}}} \supseteq R_{2_{\mathcal{L}}}$ and $R_{1_{\mathcal{L}}} \supseteq R_{3_{\mathcal{L}}} \Leftrightarrow R_{1_{\mathcal{L}}} \supseteq R_{2_{\mathcal{L}}} \cup R_{3_{\mathcal{L}}}$.

ii. The proof is analogous to that of (i).

Theorem 3.12: Let $R_{1_{\mathcal{L}}}, R_{2_{\mathcal{L}}} \in LVPFR(\mho_1 \times \mho_2)$. Then,

i. $\left(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}}\right)^{-1} = \left(R_{1_{\mathcal{L}}}\right)^{-1} \cup \left(R_{2_{\mathcal{L}}}\right)^{-1}$

ii. $\left(R_{1_{\mathcal{L}}} \cap R_{2_{\mathcal{L}}}\right)^{-1} = \left(R_{1_{\mathcal{L}}}\right)^{-1} \cap \left(R_{2_{\mathcal{L}}}\right)^{-1}$

Proof:

i. $\zeta_{\left(\left(R_{1_{\mathcal{L}}}\right)^{-1} \cup \left(R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_2, \hat{\kappa}_1) = \zeta_{\left(R_{1_{\mathcal{L}}}\right)^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1) \vee \zeta_{\left(R_{2_{\mathcal{L}}}\right)^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1)$

$= \zeta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \vee \zeta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) = \zeta_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2) = \zeta_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1)$
$\iota_{\left(\left(R_{1_{\mathcal{L}}}\right)^{-1} \cup \left(R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_2, \hat{\kappa}_1) = \iota_{\left(R_{1_{\mathcal{L}}}\right)^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1) \wedge \iota_{\left(R_{2_{\mathcal{L}}}\right)^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1) = \iota_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \iota_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) = \iota_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2)$
$= \iota_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1)$
$\vartheta_{\left(\left(R_{1_{\mathcal{L}}}\right)^{-1} \cup \left(R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_2, \hat{\kappa}_1) = \vartheta_{\left(R_{1_{\mathcal{L}}}\right)^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1) \wedge \vartheta_{\left(R_{2_{\mathcal{L}}}\right)^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1) \quad = \vartheta_{R_{1_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \vartheta_{R_{2_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_2) \quad = \vartheta_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2) =$
$\vartheta_{(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}})^{-1}}(\hat{\kappa}_2, \hat{\kappa}_1)$ Thus, $\left(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}}\right)^{-1} = \left(R_{1_{\mathcal{L}}}\right)^{-1} \cup \left(R_{2_{\mathcal{L}}}\right)^{-1}$.

ii. The proof is analogous to that of (i).

COMPOSITION OF LATTICE VALUED PICTURE FUZZY RELATIONS

Definition 4.1: Consider $R_{1_{\mathcal{L}}} \in LVPFR(\mho_1 \times \mho_2)$ and $R_{2_{\mathcal{L}}} \in LVPFR(\mho_2 \times \mho_3)$. Then, the composition of $R_{1_{\mathcal{L}}}$ and $R_{2_{\mathcal{L}}}$ is a LVPFR from $\mho_1 \times \mho_3$ defined as
$R_{1_{\mathcal{L}}} \, o \, R_{2_{\mathcal{L}}} = \{\langle (\hat{\kappa}_1, \hat{\kappa}_3), \zeta_{(R_{1_{\mathcal{L}}} \, o \, R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_3), \iota_{(R_{1_{\mathcal{L}}} \, o \, R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_3), \vartheta_{(R_{1_{\mathcal{L}}} \, o \, R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_3) \rangle$

Tweena Evangelin and Francina Shalini

$|(\hat{\kappa}_1, \hat{\kappa}_3) \in \mho_1 \times \mho_3\}$

where $\zeta_{(R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_3) = \vee_{\hat{\kappa}_2 \in \mho_2}[\zeta_{(R_{1_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \zeta_{(R_{2_{\mathcal{L}}})}(\hat{\kappa}_2, \hat{\kappa}_3)]$,

$\iota_{(R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_3) = \wedge_{\hat{\kappa}_2 \in \mho_2}[\iota_{(R_{1_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \iota_{(R_{2_{\mathcal{L}}})}(\hat{\kappa}_2, \hat{\kappa}_3)]$,

$\vartheta_{(R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_3) = \wedge_{\hat{\kappa}_2 \in \mho_2}[\vartheta_{(R_{1_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2) \vee \vartheta_{(R_{2_{\mathcal{L}}})}(\hat{\kappa}_2, \hat{\kappa}_3)]$.

Example 4.2: Consider $\mho_1 = \{\dot{p}_1, \dot{p}_2\}$, $\mho_2 = \{\dot{m}_1, \dot{m}_2, m_3\}$, $\mho_3 = \{\dot{x}_1, \dot{x}_2\}$ and the lattice $\mathcal{L}$ in figure 1.

Let $R_{1_{\mathcal{L}}} = \{\langle(\dot{p}_1, \dot{m}_1), 15,3,1\rangle, \langle(\dot{p}_1, \dot{m}_2), 1,15,3\rangle, \langle(\dot{p}_2, \dot{m}_1), 3,15,5\rangle, \langle(\dot{p}_2, \dot{m}_2), 1,3,5\rangle\}$ and

$R_{2_{\mathcal{L}}} = \{\langle(\dot{m}_1, \dot{x}_1), 3,5,1\rangle, \langle(\dot{m}_1, \dot{x}_2), 15,3,5\rangle, \langle(\dot{m}_2, \dot{x}_1), 3,15,5\rangle, \langle(\dot{m}_2, \dot{x}_2), 1,3,15\rangle\}$

be LVPFRs from $\mho_1$ to $\mho_2$.

$$[R_{1_{\mathcal{L}}}] = \begin{bmatrix} (15,3,1) & (1,15,3) \\ (3,15,5) & (1,3,5) \end{bmatrix}$$

$$[R_{2_{\mathcal{L}}}] = \begin{bmatrix} (3,5,1) & (1,3,15) \\ (3,15,5) & (1,3,15) \end{bmatrix}$$

Then, $[R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}}] = \begin{bmatrix} (3,1,1) & (15,3,5) \\ (3,1,5) & (3,3,5) \end{bmatrix}$.

Theorem 4.3: If $R_{1_{\mathcal{L}}} \in LVPFR(\mho_1 \times \mho_2)$ and $R_{2_{\mathcal{L}}} \in LVPFR(\mho_2 \times \mho_3)$, then

$(R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}})^{-1} = (R_{2_{\mathcal{L}}})^{-1} o (R_{1_{\mathcal{L}}})^{-1}$.

Proof:

$\zeta_{((R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}})^{-1})}(\hat{\kappa}_3, \hat{\kappa}_1) = \zeta_{(R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_3)$

$$\zeta_{((R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}})^{-1})}(\hat{\kappa}_3, \hat{\kappa}_1) = \zeta_{(R_{1_{\mathcal{L}}} o R_{2_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_3)$$

$$= \vee_{\hat{\kappa}_2 \in \mho_2}[\zeta_{(R_{1_{\mathcal{L}}})}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \zeta_{(R_{2_{\mathcal{L}}})}(\hat{\kappa}_2, \hat{\kappa}_3)]$$

$$= \bigvee_{\hat{\kappa}_2 \in \mho_2}[\zeta_{((R_{1_{\mathcal{L}}})^{-1})}(\hat{\kappa}_2, \hat{\kappa}_1) \wedge \zeta_{((R_{2_{\mathcal{L}}})^{-1})}(\hat{\kappa}_3, \hat{\kappa}_2)]$$

$$= \bigvee_{\hat{\kappa}_2 \in \mho_2}[\zeta_{((R_{2_{\mathcal{L}}})^{-1})}(\hat{\kappa}_3, \hat{\kappa}_2) \wedge \zeta_{((R_{1_{\mathcal{L}}})^{-1})}(\hat{\kappa}_2, \hat{\kappa}_1)]$$

$$= \zeta_{((R_{2_{\mathcal{L}}})^{-1} o (R_{1_{\mathcal{L}}})^{-1})}(\hat{\kappa}_3, \hat{\kappa}_1)$$

Tweena Evangelin and Francina Shalini

$$\iota_{\left(\left(R_{1_{\mathcal{L}}} o\, R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_3, \hat{\kappa}_1) = \iota_{\left(R_{1_{\mathcal{L}}} o\, R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_3)$$

$$= \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}[\iota_{\left(R_{1_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \iota_{\left(R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)]$$

$$= \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}[\iota_{\left(\left(R_{1_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_2, \hat{\kappa}_1) \wedge \iota_{\left(\left(R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_3, \hat{\kappa}_2)]$$

$$= \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}[\iota_{\left(\left(R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_3, \hat{\kappa}_2) \wedge \iota_{\left(\left(R_{1_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_2, \hat{\kappa}_1)]$$

$$= \iota_{\left(\left(R_{2_{\mathcal{L}}}\right)^{-1} o\, \left(R_{1_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_3, \hat{\kappa}_1)$$

$$\vartheta_{\left(\left(R_{1_{\mathcal{L}}} o\, R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_3, \hat{\kappa}_1) = \vartheta_{\left(R_{1_{\mathcal{L}}} o\, R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_3)$$

$$= \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}[\vartheta_{\left(R_{1_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \vee \vartheta_{\left(R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)]$$

$$= \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}[\vartheta_{\left(\left(R_{1_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_2, \hat{\kappa}_1) \vee \vartheta_{\left(\left(R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_3, \hat{\kappa}_2)]$$

$$= \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}[\vartheta_{\left(\left(R_{2_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_3, \hat{\kappa}_2) \vee \vartheta_{\left(\left(R_{1_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_2, \hat{\kappa}_1)]$$

$$= \vartheta_{\left(\left(R_{2_{\mathcal{L}}}\right)^{-1} o\, \left(R_{1_{\mathcal{L}}}\right)^{-1}\right)}(\hat{\kappa}_3, \hat{\kappa}_1)$$

Thus, $\left(R_{1_{\mathcal{L}}} o\, R_{2_{\mathcal{L}}}\right)^{-1} = \left(R_{2_{\mathcal{L}}}\right)^{-1} o\, \left(R_{1_{\mathcal{L}}}\right)^{-1}$.

Theorem 4.4: Let $R_{1_{\mathcal{L}}}, R_{2_{\mathcal{L}}} \in LVPFR(\mathbb{U}_1 \times \mathbb{U}_2)$ and $R_{3_{\mathcal{L}}} \in LVPFR(\mathbb{U}_2 \times \mathbb{U}_3)$. Then

    i. $\left(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}}\right) o\, R_{3_{\mathcal{L}}} = \left(R_{1_{\mathcal{L}}} o\, R_{3_{\mathcal{L}}}\right) \cup \left(R_{2_{\mathcal{L}}} o\, R_{3_{\mathcal{L}}}\right)$

    ii. $\left(R_{1_{\mathcal{L}}} \cap R_{2_{\mathcal{L}}}\right) o\, R_{3_{\mathcal{L}}} = \left(R_{1_{\mathcal{L}}} o\, R_{3_{\mathcal{L}}}\right) \cap \left(R_{2_{\mathcal{L}}} o\, R_{3_{\mathcal{L}}}\right)$

Proof:

    i. $\zeta_{\left(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}}\right) o\, R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_3) = \bigvee_{\hat{\kappa}_2 \in \mathbb{U}_2}\left(\left(\zeta_{\left(R_{1_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \vee \zeta_{\left(R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2)\right) \wedge \zeta_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right)$

$$= \bigvee_{\hat{\kappa}_2 \in \mathbb{U}_2}\left(\left(\zeta_{\left(R_{1_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \zeta_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right) \vee \left(\zeta_{\left(R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \zeta_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right)\right)$$

$$= \bigvee_{\hat{\kappa}_2 \in \mathbb{U}_2}\left(\zeta_{\left(R_{1_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \zeta_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right) \vee \bigvee_{\hat{\kappa}_2 \in \mathbb{U}_2}\left(\zeta_{\left(R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \zeta_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right)$$

$$= \zeta_{\left(R_{1_{\mathcal{L}}} o\, R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_3) \vee \zeta_{\left(R_{2_{\mathcal{L}}} o\, R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_3)$$

$$\iota_{\left(R_{1_{\mathcal{L}}} \cup R_{2_{\mathcal{L}}}\right) o\, R_{3_{\mathcal{L}}}}(\hat{\kappa}_1, \hat{\kappa}_3) = \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}\left(\left(\iota_{\left(R_{1_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \iota_{\left(R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2)\right) \wedge \iota_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right)$$

$$= \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}\left(\left(\iota_{\left(R_{1_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \iota_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right) \wedge \left(\iota_{\left(R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \iota_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right)\right)$$

$$= \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}\left(\iota_{\left(R_{1_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \iota_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right) \wedge \bigwedge_{\hat{\kappa}_2 \in \mathbb{U}_2}\left(\iota_{\left(R_{2_{\mathcal{L}}}\right)}(\hat{\kappa}_1, \hat{\kappa}_2) \wedge \iota_{\left(R_{3_{\mathcal{L}}}\right)}(\hat{\kappa}_2, \hat{\kappa}_3)\right)$$

Tweena Evangelin and Francina Shalini

$$= \iota_{\left(R_{1_\ell} o\, R_{3_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_3) \wedge \iota_{\left(R_{2_\ell} o\, R_{3_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_3)$$

$$\vartheta_{\left(R_{1_\ell} \cup R_{2_\ell}\right) o\, R_{3_\ell}}(\hat{\kappa}_1,\hat{\kappa}_3) = \bigwedge_{\hat{\kappa}_2 \in U_2} \left(\left(\vartheta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \vartheta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \right) \vee \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \right)$$

$$= \wedge_{\hat{\kappa}_2 \in U_2} \left(\left(\vartheta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \vee \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \right) \wedge \left(\vartheta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \vee \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \right) \right)$$

$$= \bigwedge_{\hat{\kappa}_2 \in U_2} \left(\vartheta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \right) \wedge \bigwedge_{\hat{\kappa}_2 \in U_2} \left(\vartheta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \right)$$

$$= \vartheta_{\left(R_{1_\ell} o\, R_{3_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_3) \wedge \vartheta_{\left(R_{2_\ell} o\, R_{3_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_3)$$

ii.   The proof is analogous to that of (i).

Theorem 4.5: Consider $R_{1_\ell} \in LVPFR(U_1 \times U_2)$, $R_{2_\ell} \in LVPFR(U_2 \times U_3)$ and $R_{3_\ell} \in LVPFR(U_3 \times U_4)$. Then, $R_{1_\ell} o\, (R_{2_\ell} o\, R_{3_\ell}) = (R_{1_\ell} o\, R_{2_\ell}) o\, R_{3_\ell}$.

Proof:

$$\zeta_{R_{1_\ell} o\, \left(R_{2_\ell} o\, R_{3_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_4) = \bigvee_{\hat{\kappa}_3 \in U_3} \left(\zeta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\bigvee_{\hat{\kappa}_2 \in U_2} \left(\zeta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \wedge \zeta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right) \right)$$

$$= \vee_{\hat{\kappa}_3 \in U_3} \left(\vee_{\hat{\kappa}_2 \in U_2} \left(\zeta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\zeta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \wedge \zeta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right) \right)$$

$$= \vee_{\hat{\kappa}_2 \in U_2} \left(\left(\vee_{\hat{\kappa}_3 \in U_3} \left(\zeta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\zeta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \right) \right) \wedge \zeta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right)$$

$$= \vee_{\hat{\kappa}_2 \in U_2} \left(\zeta_{\left(R_{1_\ell} o\, R_{2_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_3) \wedge \zeta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right)$$

$$= \zeta_{\left(R_{1_\ell} o\, R_{2_\ell}\right) o\, R_{3_\ell}}(\hat{\kappa}_1,\hat{\kappa}_4)$$

$$\iota_{R_{1_\ell} o\, \left(R_{2_\ell} o\, R_{3_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_4) = \bigvee_{\hat{\kappa}_3 \in U_3} \left(\iota_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\bigvee_{\hat{\kappa}_2 \in U_2} \left(\iota_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \wedge \iota_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right) \right)$$

$$= \vee_{\hat{\kappa}_3 \in U_3} \left(\vee_{\hat{\kappa}_2 \in U_2} \left(\iota_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\iota_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \wedge \iota_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right) \right)$$

$$= \vee_{\hat{\kappa}_2 \in U_2} \left(\left(\vee_{\hat{\kappa}_3 \in U_3} \left(\iota_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\iota_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \right) \right) \wedge \iota_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right)$$

$$= \vee_{\hat{\kappa}_2 \in U_2} \left(\iota_{\left(R_{1_\ell} o\, R_{2_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_3) \wedge \iota_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right)$$

$$= \iota_{\left(R_{1_\ell} o\, R_{2_\ell}\right) o\, R_{3_\ell}}(\hat{\kappa}_1,\hat{\kappa}_4)$$

$$\vartheta_{R_{1_\ell} o\, \left(R_{2_\ell} o\, R_{3_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_4) = \bigvee_{\hat{\kappa}_3 \in U_3} \left(\vartheta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\bigvee_{\hat{\kappa}_2 \in U_2} \left(\vartheta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \wedge \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right) \right)$$

$$= \vee_{\hat{\kappa}_3 \in U_3} \left(\vee_{\hat{\kappa}_2 \in U_2} \left(\vartheta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\vartheta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \wedge \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right) \right)$$

$$= \vee_{\hat{\kappa}_2 \in U_2} \left(\left(\vee_{\hat{\kappa}_3 \in U_3} \left(\vartheta_{\left(R_{1_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_2) \wedge \left(\vartheta_{\left(R_{2_\ell}\right)}(\hat{\kappa}_2,\hat{\kappa}_3) \right) \right) \wedge \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right) \right)$$

$$= \vee_{\hat{\kappa}_2 \in U_2} \left(\vartheta_{\left(R_{1_\ell} o\, R_{2_\ell}\right)}(\hat{\kappa}_1,\hat{\kappa}_3) \wedge \vartheta_{\left(R_{3_\ell}\right)}(\hat{\kappa}_3,\hat{\kappa}_4) \right)$$

$$= \vartheta_{\left(R_{1_\ell} o\, R_{2_\ell}\right) o\, R_{3_\ell}}(\hat{\kappa}_1,\hat{\kappa}_4)$$

Thus, $R_{1_\ell} o\, (R_{2_\ell} o\, R_{3_\ell}) = (R_{1_\ell} o\, R_{2_\ell}) o\, R_{3_\ell}$.

CONCLUSION

In the current article, we have defined Lattice Valued Picture Fuzzy Relations and discussed their properties. The properties of composition of Lattice Valued Picture Fuzzy Relations have been studied. Using the concepts discussed in this study, future research can be done on problems related to decision-making.

ABSTRACT

This study examines the role of Human Resource (HR) management in promoting work-life balance among employees. It investigates how HR policies such as flexible work schedules, remote work, and wellness programs contribute to achieving a balance between work and personal life. Based on a survey of 110 employees, the research finds that such HR initiatives significantly enhance employee satisfaction and productivity. The study highlights the importance of effective communication of policies and personalized support, emphasizing HR's critical role in improving employee well-being and organizational performance. The findings suggest that organizations prioritizing work-life balance can foster a more engaged and productive workforce.

Keywords: Work-Life Balance, Human Resource Management, Employee Well-being, Flexible Work Policies, promoting work-life balance.

INTRODUCTION

Work-life balance is the state of managing personal life and work commitments effectively. In the current competitive landscape, it is essential for organizations to acknowledge the significance of employee well-being in order to maintain high levels of productivity and morale. Human Resource Management (HRM) plays a vital role in designing policies that support work-life balance initiatives. This study examines how HR functions contribute to maintaining a healthy work-life interface for employees. Key concerns include flexible scheduling, stress management, employee engagement, and wellness programs.

HR's role in promoting work-life balance

The Human Resources (HR) department plays a crucial role in creating a work environment that supports work-life balance. HR professionals implement policies, programs, and initiatives that help employees manage their professional and personal lives effectively. Some key HR strategies include:

1. Flexible Work Policies: HR introduces shift rotations, manageable work schedules, and remote work options where feasible.
2. Health and Wellness Initiatives: Providing access to medical check-ups, stress management programs, and wellness activities.
3. Employee Assistance Programs (EAPs): Offering counseling services and mental health support to employees.
4. Fair Leave Policies: Ensuring employees have adequate leave benefits, including paid time off, maternity/paternity leave, and emergency leave.
5. Workplace Culture and Engagement: Organizing team-building activities, celebrations, and open communication forums to foster a positive work environment.

NEED FOR THE STUDY

In the current fast-paced and demanding workplace, achieving a proper balance between professional duties and personal life has become more difficult for employees. High work demands, long hours, and continuous connectivity via digital devices often result in stress, burnout, and a decline in productivity.

Human Resource (HR) departments play a vital role in designing and implementing policies and practices that support employees in achieving work-life balance. The need for this study arises from the growing recognition that promoting work-life balance not only enhances employee well-being but also contributes to higher job satisfaction, improved employee retention, and organizational performance.

OBJECTIVES OF THE STUDY

- To gain a deeper understanding of the concept of work-life balance and its significance.
- To explore the role played by Human Resources in fostering work-life balance.
- To identify HR practices and policies aimed at supporting employees' personal and professional needs.
- To evaluate the effectiveness of these practices on employee satisfaction and productivity.
- To provide recommendations for improving work-life balance initiatives.

SCOPE OF THE STUDY

The study is limited to understanding the effectiveness of HR practices in promoting work-life balance within organizations. It focuses on the strategies adopted, the benefits observed by employees, and the organizational outcomes. While the study does not include industry-specific or company-specific data, it takes into account a general perspective applicable across various sectors. It is based on primary data collected from a sample size of 110 respondents.

A WELL-BALANCED WORK-LIFE DYNAMIC ENHANCES EMPLOYEE PRODUCTIVITY, SATISFACTION, AND OVERALL ORGANIZATIONAL SUCCESS

19th Century (1800s) – The Industrial Revolution

- Work-life balance was almost non-existent, with employees (including children)working long hours in factories.
- The focus was on maximizing production, and worker well-being was not a priority.
- Labor movements began advocating for better working conditions, leading to laws on working hours.

20th Century (1900s) – Labor Rights and Workplace Reforms

- 1920s-1930s: The concept of the 8-hour workday gained traction (e.g., Henry Ford introduced it in 1926).
- 1940s-1950s: The rise of corporate HR departments started addressing employee welfare.
- 1970s-1980s: The term "work-life balance" emerged as more women joined the workforce, leading to policies like maternity leave and flexible work schedules.

- 1990s: Companies began recognizing that employee well-being directly impacts productivity. HR started implementing employee assistance programs (EAPs), wellness initiatives, and family-friendly policies.

21st Century (2000s-Present) – Digital Age and Flexibility
- 2000s: Remote work and flexible schedules became more common with advancements in technology.
- 2010s: Mental health awareness increased, and HR played a significant role in promoting well-being programs.
- 2020s (Post-Pandemic Era): The COVID-19 pandemic accelerated the shift to remote and hybrid work. HR now focuses on flexible work arrangements, mental health support, and work-life integration to boost employee productivity and satisfaction.

CHALLENGES THAT EMPLOYEES FACE IN ACHIEVING WORK-LIFE BALANCE
While work-life balance is crucial for employee well-being, achieving it can be challenging due to several factors, including:
1. Long Work Hours: Numerous employees are expected to work extended periods of time, which can make it challenging for them to balance work and individual obligations.
2. Job Demands: Employees who work in high-stress or requesting jobs might find it trying to separate from work, bringing about work-related pressure, and trouble in overseeing individual responsibilities,
3. Lack of Flexible Work Arrangements: Employees who don't have the choice to work from home, work from home or work flexible hours might find it trying to balance work and individual obligations,
4. Job Insecurity: Employees who have an uncertain outlook on their jobs might focus on work over private obligations, prompting burnout and expanded pressure.
5. Personal Commitments: Individual responsibilities, like family obligations, really focusing on kids or older relatives, or seeking after schooling, can likewise make it trying for employees to balance work and individual life.
6. Technology: The accessibility of innovation, for example, cell phones and PCs has made it more straightforward for employees to work beyond conventional work hours, making it trying for employees to turn off from work.
7. Workplace Culture: Workplace culture that promotes long working hours and rewards those who work excessively can make it difficult for employees to maintain a work-life balance.

REVIEW OF LITERATURE

Numerous researchers have addressed the significance of work-life balance:
1. Greenhaus & Allen (2011) – Defined work-life balance as the level of satisfaction and good functioning at work and at home with minimum role conflict.
2. Clark (2000) – Proposed the Work/Family Border Theory which explains how individuals manage and negotiate the boundaries between work and family domains.
3. Friedman & Greenhaus (2000) – Highlighted the importance of organizational support in achieving balance.
4. Kossek et al. (2006) – Showed that flexible work arrangements significantly improve job satisfaction.
5. Hill et al. (2001) – Found that teleworking enhances work-life balance by reducing commuting stress.
6. Batt & Valcour (2003) – Suggested that supportive HR policies improve commitment and reduce turnover.
7. Allen (2001) – Found that managerial support is crucial in reducing work-family conflict.
8. Beauregard & Henry (2009) – Asserted that work-life balance practices positively impact organizational outcomes.
9. Byron (2005) – Conducted a meta-analysis showing that work-family conflict adversely affects job satisfaction.
10. Aryee et al. (2005) – Revealed that work-life balance programs enhance employee morale.

RESEARCH METHODOLOGY

- Research Design: Descriptive

- Sampling Technique: Simple Random Sampling
- Sample Size: 110 employees
- Data Collection Tool: Structured questionnaire using Likert scale (Strongly Agree to Strongly Disagree)Statistical Tools Used: Percentage analysis, t-test, U test, regression, correlation, F-test.

METHODS OF THE DATA COLLECTION

Primary Data Collection
Primary data refers to first-hand information collected directly from respondents. Since your study involves offline data collection, the methods used may include:

Questionnaires & Surveys
Structured or semi-structured questionnaires were used to collect responses directly from employees/customers.

Interviews
Face-to-face interviews helped gather detailed insights from respondents. Observations: Observing employee/customer behavior in real-time provided qualitative insights.

Secondary Data Collection
Secondary data refers to information that has already been collected and analyzed by other sources.

Company Reports & HR Policies
For understanding existing employee work-life balance initiatives.

Government Reports & Industry Studies
To compare industry trends and policies. Previous Research Papers & Articles: To support the findings with existing literature.

Sample Size
The study is conducted with a sample size of 102 respondents. This number was determined based on the feasibility of data collection and the need to obtain a representative sample of the population under study.

Sampling Technique
A sampling technique is the process used to select participants for the study. In this research, an appropriate method such as simple random sampling, stratified sampling, or convenience sampling is used, ensuring that the selected respondents accurately represent the target population.

Sampling Area
The sampling area refers to the geographical or organizational scope from which the respondents are selected. For this study, data was collected from employees to ensure relevant and valid findings.

Hypothesis
Main Hypothesis (H$_1$) and Null Hypothesis (H$_0$):
H$_0$ (Null Hypothesis)
HR policies and practices have no significant impact on employees' work-life balance, job satisfaction, or well-being.

H$_1$ (Alternative Hypothesis)
HR policies and practices significantly impact employees' work-life balance, leading to improved job satisfaction, reduced stress, and better personal well-being.

Sample Tests
DATA ANALYSIS AND INTERPRETATION
1.9.1 T-TEST
Null Hypothesis (H_0)
There is no significant difference in the average working hours per week between different genders.

Alternative Hypothesis (H_1)
There is a significant difference in the average working hours per week between different genders.

GENDER	69	41	0	0	0
DISTRIBUTION OF RESPOND BASED ON THEIR WORKING HOURS PER WEEK	0	110	0	0	0

X_1	X_1^2	X_2	X_2^2
69	4761	0	O
41	1681	110	12100
0	0	0	0
0	0	0	0
0	0	0	0
110	**6442**	**110**	**12100**

$N_1 = 2$

$\overline{X1} = \frac{\sum X_1}{N_1} \quad \overline{X2} = \frac{\sum X_2}{N_2}$

$\overline{X1} = \frac{110}{2} \quad \overline{X2} = \frac{110}{1}$

$= 55 \qquad\qquad = 110$

$S_1^2 = \sqrt{\frac{\sum X_1^2}{N_1} - \left(\frac{\sum X_1}{N_1}\right)^2}$

$= \sqrt{\frac{6442}{2} - \left(\frac{110}{2}\right)^2}$

$= \sqrt{3221 - 3025}$

$= \sqrt{196}$

$S_1^2 = 14$

$S_2^2 = \sqrt{\frac{\sum X_2^2}{N_2} - \left(\frac{\sum X_2}{N_2}\right)^2}$

$= \sqrt{12100 - 12100}$

$S_2^2 = 0$

$S = \sqrt{\frac{\sum S_1^2 N_1 + S_2^2 N_2}{N_1 + N_2 - 2}}$

$= \sqrt{\frac{14(2) + 0(1)}{2 + 1 - 2}}$

$= \sqrt{\frac{28}{1}} \quad = \sqrt{28}$

$S = 5.2915$

$t = \frac{\overline{X_1} - \overline{X_2}}{S\sqrt{\frac{1}{N_1} + \frac{1}{N_2}}}$

$= \frac{55 - 110}{5.2915\sqrt{\frac{1}{2} + \frac{1}{1}}}$

$= \frac{55}{5.2915\sqrt{1.5}} \quad = \frac{55}{20.4934}$

t = 2.6837

Degree of freedom = 2 + 1 - 2

= 1

6.314 > 2.6837

Tabulated value > calculated value .

CONCLUSION

Calculated value is greater then tabulated value. Therefore null hypothesis (H_0) is accepted. Hence, there is no significant difference in the average working hours per week between different genders.

U-TEST   ANALYSIS

Null Hypothesis (H_0)

There is no association between marital status and the requirement to work beyond regular hours frequently.

Alternative Hypothesis (H_1)

There is an association between marital status and the requirement to work beyond regular hours frequently.

11	1	35	6
0	-	15	2
0	-	17	3
N_1=3	R_1= 16	N_2 = 5	R_2 =20

N_1=3, R_1= 16 ,N_2 = 5 ,R_2 =20

U= $N_1(N_2) + N_1 \frac{(N_1+1)}{2} - R_1$

3(5) + $\frac{(3+1)}{2}$ - 16

U= 15+ $\frac{12}{2}$ - 16

= 21 - 16 = 5.

Var (U) $N_1 N_2 \frac{(N_1 + N_{2+1})}{2}$

= 3×5 $\frac{(3 + 5 + 1)}{12}$

=15× $\frac{9}{12}$ = 11.25

E (U) = $\frac{N_1 N_2}{2}$

= $\frac{3×5}{2}$ = $\frac{15}{2}$ = 7.5

Z = $\frac{U - E(U)}{\sqrt{Var\ U}}$

= $\frac{5-7.5}{\sqrt{11.25}}$

= $\frac{-2.5}{\sqrt{11.25}}$ = $\frac{-2.5}{3.35}$

Z = 0.755

Table Value = 0.4494

Calculated Value > Tabulated Value

95314

0.755 > 0.4494

CONCLUSION

Calculated value is greater then tabulated value. Therefore null hypothesis (H_0) is accepted. Hence, there is no significant difference in the average working hours per week between different genders.

CORRELATION ANALYSIS

Null Hypothesis (H_0)

There is no significant correlation between having dependents and the length of employment in the current company.

Alternative Hypothesis (H_1)

There is a significant correlation between having dependents and the length of employment in the current company.

MARITAL DEPENDENTS	72	38	0	0
SERVICE	10	33	29	38

$$r = \frac{n(\sum xy) - (\sum x)(\sum y)}{\sqrt{n(\sum x^2)(n\sum y^2 - (\sum y)^2)}}$$

X	Y	X²	Y²	XY
72	10	5184	100	720
38	33	1444	1089	1254
0	29	0	814	0
0	38	0	1444	0
110	**110**	**6028**	**3447**	**1974**

$$r = \frac{4 \times 1974 - 110 \times 110}{\sqrt{4 \times (6628) - (110)^2 \ \times (3447 - (110)^2}}$$

$$r = \frac{7896 - 12100}{\sqrt{4(6628 - 12100)(3447 - 12100)}}$$

$$r = \frac{4204}{4 \times (5472)(7627)}$$

$$= \frac{4204}{166.939776}$$

= 0.0002

CONCLUSION

The Coefficient of Correlation (r) is 0.0002. Since the degree of positive correlation is 0 to +0.25. Therefore, there is a very low degree of positive correlation.

REGRESSION ANALYSIS

Null Hypothesis (H_0)

Age group does not significantly predict stress due to work-life imbalance.

Alternative Hypothesis (H_1)

Age group significantly predicts stress due to work-life imbalance.

$$S_1 = \frac{\sum X^2}{N_{1-1}} \quad S_2 = \frac{\sum Y^2}{N_{2-1}}$$

$$S_{1^2} = \frac{5074}{3-1} \quad S_{2^2} = \frac{3396}{5-1}$$

$$S_{1^2} = \frac{5074}{2} \quad S_{2^2} = \frac{3396}{4}$$

$$S_{1^2} = 2537 \quad S_{2^2} = 849$$

$$F = \frac{2537}{849} = 2.9882$$

$V_{1=}$ N HIGH – 1 $V_{2=}$ N HIGH - 1

= 5-1 = 4   = 3-1 = 2

TABULATED VALUES = 6.94

2.9882 < 6.94

CONCLUSION

The calculated value is 2.9882 which is lesser than tabulated value.hence, null hypothesis (Ho) is accepted.

FINDINGS

- Majority of employees are satisfied with HR's role in promoting work-life balance.
- Flexibility in working hours ranks highest in effectiveness.
- Female employees report higher stress due to work-life imbalance.
- Awareness of HR policies significantly affects satisfaction.
- Strong correlation between HR support and employee retention.

SUGGESTIONS

- Introduce more flexible work arrangements (e.g., hybrid models).
- Increase awareness campaigns on existing HR policies.
- Provide specialized support for women, especially post-maternity.
- Conduct regular wellness programs and stress audits.
- Use technology to monitor and support employee work-life patterns.

CONCLUSION

This study reinforces the crucial role HR plays in enhancing work-life balance. With the right policies and consistent implementation, HR departments can significantly improve employee morale, reduce turnover, and promote a more productive work environment. Tailored interventions and proactive communication are key to sustaining these initiatives.

ABSTRACT

Crane mechanisms are critical components in various industrial applications, enabling the efficient lifting and transportation of heavy loads. This review examines contemporary advancements in crane mechanisms, reliability analysis, and optimization strategies. By synthesizing insights from multiple research papers, specific methodologies such as reliability block diagrams and metaheuristic optimization algorithms like Particle Swarm Optimization (PSO) are highlighted. Key findings include the superior performance of PSO in minimizing crane hook volume while maintaining load capacity and the critical role of project management tools in streamlining manufacturing workflows. Key gaps in current research are identified, such as the lack of standardized testing methods and the need for IoT integration, along with potential directions for future studies.

Keywords: Crane Mechanisms, Reliability Analysis, Optimization Strategies, Metaheuristic Algorithms, Structural Design

INTRODUCTION

Cranes are indispensable in modern industry, providing critical functionality in lifting, transporting, and placing heavy loads across construction sites, manufacturing plants, and logistics hubs. The evolution of crane mechanisms has paralleled the advancement of technology, incorporating sophisticated designs and control systems to enhance

95319

Rajeshkumar K. Detroja and Jigneshkumar J. Patel

safety, efficiency, and adaptability to varied tasks [1], [2], [5]. The complexity of crane systems arises from their multifunctional roles and the diverse environments in which they operate. For instance, bridge cranes and gantry cranes in industrial settings require precise load distribution and movement control, while mobile cranes deployed in construction must balance portability with lifting capacity. Each type of crane brings unique engineering challenges, including dynamic load handling, structural integrity, and operational safety [3], [4]. This review integrates findings from a wide array of studies to present a comprehensive overview of advancements in crane mechanisms. Key areas of focus include reliability analysis of crane components, optimization strategies for improving performance, and the integration of advanced project management methodologies. Special attention is given to recent innovations such as the application of metaheuristic algorithms for design optimization and the use of IoT technologies for real-time monitoring [6], [7]. By addressing the diverse challenges in crane operations—from mitigating component failures to enhancing material efficiency—this review aims to provide valuable insights for engineers, researchers, and industry professionals. The synthesis of existing research reveals gaps in knowledge and highlights opportunities for innovation, setting the stage for future advancements in this essential field of industrial engineering. Cranes play an essential role in industries such as construction, manufacturing, and logistics. The increasing complexity of crane systems demands robust mechanisms that are reliable, efficient, and optimized for specific applications. This review synthesizes findings from studies on various aspects of crane mechanisms, including reliability analysis, project management, and optimization methodologies, providing a comprehensive understanding of the field.

Overview of Crane Mechanisms

Crane mechanisms consist of several critical components, including lifting hooks, sheave blocks, ropes, and drum systems. The following subsections detail advancements in these components:

Lifting Mechanisms

Research emphasizes the reliability of crane lifting mechanisms to ensure safe operations. Structural configurations—ranging from single-rope systems to complex multi-component mechanisms—have been analyzed to minimize failure probabilities [8], [9]. These configurations include:

- **Single-Rope Systems**: These are simpler mechanisms often employed in smaller cranes, valued for their cost-effectiveness but limited in load capacity [10].
- **Multi-Rope Systems**: Designed for larger cranes, these configurations offer redundancy, enhancing reliability and safety by distributing the load across multiple ropes [11].
- **Integrated Safety Features**: Advanced configurations incorporate safety brakes and redundant supports, reducing the likelihood of catastrophic failures [12]. The choice of configuration significantly impacts operational safety, with more complex systems providing higher reliability but requiring more rigorous maintenance protocols.

Crane Hook Design

Optimization of crane hooks is a recurring theme, with studies employing metaheuristic algorithms such as Particle Swarm Optimization (PSO) and Harmony Search (HSA) to minimize volume while maintaining load capacity. This approach balances material efficiency and structural integrity [6], [13].

Reliability Block Diagrams

Reliability block diagrams (RBDs) are essential tools for analyzing the reliability of interconnected components. The study by Faltinová *et al.* (2018) demonstrated how RBDs can assess failure probabilities in different configurations, revealing critical points for design improvements [8].

Optimization Strategies in Crane Mechanisms

Optimization techniques have revolutionized the design and operation of crane systems. The following methods have been highlighted in the literature:

Rajeshkumar K. Detroja and Jigneshkumar J. Patel

Metaheuristic Algorithms

Ten metaheuristic algorithms, including PSO and Crow Search Algorithm (CSA), have been compared for their efficiency in optimizing crane hook designs (Nancy & Stephen, 2022). PSO showed superior performance in minimizing the crane hook's volume while meeting load requirements. Specifically, PSO's advantages include:

- **Computational Efficiency:** PSO converges faster compared to other algorithms by efficiently exploring and exploiting the search space.
- **Accuracy:** The algorithm maintains high precision in reaching near-optimal solutions, making it suitable for minimizing complex design variables like crane hook volume.
- **Simplicity:** PSO requires fewer parameters for tuning, reducing the complexity of implementation and improving usability across diverse optimization problems.
- **Adaptability:** It is robust in handling non-linear and multi-dimensional optimization tasks, as demonstrated in crane mechanism applications. These features collectively make PSO a preferred choice for crane design optimization. Ten metaheuristic algorithms, including PSO and Crow Search Algorithm (CSA), have been compared for their efficiency in optimizing crane hook designs (Nancy & Stephen, 2022). PSO showed superior performance in minimizing the crane hook's volume while meeting load requirements.

Project Management Applications

Chauhan et al. (2018) investigated project management tools, such as Critical Path Method (CPM), to streamline the manufacturing of Electrical Overhead Travelling (EOT) cranes. This study identified areas for improvement, such as reducing material transportation costs and optimizing production workflows.[3]

Reliability-Centered Maintenance

Reliability-centered maintenance (RCM) strategies focus on preemptive measures to reduce downtime and enhance system longevity. These approaches are critical in minimizing operational risks in crane mechanisms [1]

Challenges and Research Gaps

Despite significant advancements, several challenges persist in the field:

1. **Standardization:** Lack of standardized testing methods for evaluating the reliability of crane components. For instance, Faltinová *et al.* (2018) highlighted discrepancies in testing methodologies across different crane systems, leading to inconsistent reliability assessments. [1]
2. **Material Innovation:** Limited exploration of advanced materials for improving crane hook durability and reducing weight. A case study on composite materials for crane hooks showed promise in reducing wear and tear but requires further validation [2]
3. **Dynamic Load Analysis:** Insufficient studies on the real-time dynamic behavior of crane systems under varying load conditions. For example, a study on bridge cranes indicated that fluctuating loads could cause unexpected system fatigue, underscoring the need for dynamic simulations.
4. **Integration of IoT:** Few studies address the integration of IoT technologies for real-time monitoring and predictive maintenance. Chauhan et al. (2018) demonstrated the potential of IoT in reducing operational downtime by tracking component health, yet its adoption remains limited due to high implementation costs.[3] These examples highlight the pressing need for more focused research to address these challenges effectively.

Despite significant advancements, several challenges persist in the field:

1. **Standardization:** Lack of standardized testing methods for evaluating the reliability of crane components.
2. **Material Innovation:** Limited exploration of advanced materials for improving crane hook durability and reducing weight.
3. **Dynamic Load Analysis:** Insufficient studies on the real-time dynamic behavior of crane systems under varying load conditions.
4. **Integration of IoT:** Few studies address the integration of IoT technologies for real-time monitoring and predictive maintenance.

Future Directions

Future research should focus on:

1. **IoT Integration:** Developing smart crane systems equipped with sensors for real-time data analysis and predictive maintenance. For instance, IoT-enabled sensors could monitor load distribution, alert operators to potential faults, and optimize maintenance schedules based on real-time data trends, reducing operational downtime and enhancing safety.

2. **Material Science Innovations:** Exploring lightweight, high-strength materials to improve crane efficiency. Practical implementations might include using composites or alloys that offer higher tensile strength with reduced weight, thereby decreasing energy consumption and wear on components.

3. **Dynamic Simulations:** Employing advanced simulation techniques to study the impact of dynamic loads on crane mechanisms. Tools like finite element analysis (FEA) can model stress distribution under varying operational conditions, providing insights into potential design optimizations.

4. **Sustainability:** Investigating environmentally friendly manufacturing processes and materials. This could involve adopting green technologies such as low-emission manufacturing methods and recyclable materials, contributing to sustainable development in the industry.

Future research should focus on

1. **IoT Integration:** Developing smart crane systems equipped with sensors for real-time data analysis and predictive maintenance.

2. **Material Science Innovations:** Exploring lightweight, high-strength materials to improve crane efficiency.

3. **Dynamic Simulations:** Employing advanced simulation techniques to study the impact of dynamic loads on crane mechanisms.

4. **Sustainability:** Investigating environmentally friendly manufacturing processes and materials.

CONCLUSION

This review consolidates findings from diverse studies, providing insights into the current state and future potential of crane mechanisms and optimization strategies. By addressing existing challenges and adopting innovative methodologies, the reliability, efficiency, and sustainability of crane systems can be significantly enhanced.

ABSTRACT

The Indian pharmaceutical industry, now a global leader in generic medicines, owes much to Khwaja Abdul Hamied, founder of Cipla in 1935. Determined to break India's dependence on foreign drug manufacturers, Hamied championed affordable, indigenous medicine production. His vision extended beyond business—he actively influenced policy, research, and self-reliance in critical pharmaceuticals. Amidst colonial constraints, he advocated for scientific innovation and industrial autonomy, ensuring essential medicines reached the masses. Hamied's efforts laid the foundation for India's pharmaceutical self-sufficiency, inspiring future policies like the Patent Act of 1970, which prioritized public health over monopoly profits. His legacy endures in India's transformation into the "pharmacy of the world," supplying affordable drugs globally. By fostering indigenous research and development, he not only revolutionized the industry but also strengthened India's healthcare infrastructure, proving that scientific progress and social responsibility could go hand in hand.

Keywords: Khwaja Abdul Hamied, Indian pharmaceutical industry, Cipla, Indigenous drug production, Pharmaceutical self-reliance, Affordable medicines

INTRODUCTION

Colonial rule in India entrenched dependence on Western pharmaceutical companies, which monopolized drug manufacturing and restricted access to essential medicines. Lacking indigenous production, India was forced to import expensive drugs, rendering healthcare inaccessible to a significant portion of the population. This

95324

pharmaceutical dependence reinforced economic and medical vulnerabilities, leaving India reliant on foreign firms for life-saving treatments. Khwaja Abdul Hamied recognized this critical gap and founded Cipla in 1935 with a vision of pharmaceutical self-reliance. A chemist trained in Germany, Hamied combined scientific expertise, nationalist ideology, and entrepreneurial acumen to challenge foreign monopolies and establish an independent pharmaceutical industry. His efforts not only facilitated domestic drug production but also laid the foundation for India's emergence as a global leader in affordable medicine. This paper examines Hamied's pivotal role in dismantling colonial pharmaceutical dependence and fostering self-sufficiency. It explores his contributions to scientific research, policy advocacy, and indigenous drug manufacturing, which transformed India's healthcare landscape. By spearheading a movement for affordable and accessible medicines, Hamied's legacy endures in India's position as the "pharmacy of the world."

Colonial India and Pharmaceutical Dependence
During colonial rule, India lacked an indigenous pharmaceutical industry and relied heavily on Western drug **manufacturers**, who controlled production and pricing. British and European firms monopolized essential medicines, making them expensive and inaccessible to most Indians. The absence of domestic research and development further deepened this dependence, leaving the country vulnerable to public health crises and reinforcing economic subjugation through pharmaceutical imports.

British Monopoly on Pharmaceuticals
During British rule, India had no significant domestic pharmaceutical industry and remained heavily reliant on British and European drug manufacturers. These multinational corporations, including Glaxo, Burroughs Well come, and Bayer, monopolized drug production, ensuring that essential medicines remained costly and largely inaccessible to the Indian population. By leveraging restrictive patent laws, these firms eliminated competition, preventing local industries from developing independent manufacturing capabilities. The lack of indigenous pharmaceutical research and production exacerbated public health challenges, as life-saving drugs for diseases like malaria, tuberculosis, and cholera remained out of reach for millions. Additionally, colonial policies discouraged investment in local drug manufacturing, keeping India dependent on expensive imports. This pharmaceutical monopoly not only increased healthcare inequality but also reinforced India's economic subjugation. The pressing need for an independent pharmaceutical sector became evident, paving the way for reformers like Khwaja Abdul Hamied to challenge this colonial dependence.

The Absence of Indigenous Production
Unlike industrialized nations with well-established pharmaceutical sectors, colonial India faced significant structural barriers that hindered the development of an independent drug industry. The country lacked research infrastructure, domestic manufacturing capabilities, and policy support, forcing it to rely on expensive imports controlled by British and European firms. Restrictive patent laws further prevented Indian entrepreneurs from producing essential medicines, ensuring foreign monopolies remained unchallenged. This dependency was not merely an issue of economic exploitation but had devastating consequences for public health. Epidemics of malaria, tuberculosis, and cholera continued to ravage the population, with life-saving treatments priced beyond reach for most Indians. With no access to affordable medicine, mortality rates soared, and healthcare remained an unattainable luxury for the masses. Colonial pharmaceutical policies prioritized profit over public welfare, reinforcing India's medical and economic subjugation. The urgent need for self-reliance in drug manufacturing became evident, setting the stage for later reformers like Khwaja Abdul Hamied to challenge this dependence.

Khwaja Abdul Hamied: A Visionary of Pharmaceutical Independence
Scientific and Nationalist Ideals
Hamied, an accomplished chemist trained in Germany, returned to India with a vision to establish an indigenous pharmaceutical industry. Inspired by the Swadeshi movement, he believed that science should serve national interests, particularly in ensuring access to life-saving medicines. His dual identity as a scientist and nationalist positioned him as an ideal reformer.

Md Abu Katadah

Founding of Cipla (1935)

Khwaja Abdul Hamied's decision to establish a domestic pharmaceutical industry was driven by his strong belief in self-reliance and his frustration with India's dependence on foreign drug manufacturers. During British rule, India's pharmaceutical sector was entirely controlled by British and European multinational corporations, which not only kept medicine prices high but also restricted access to essential drugs. This monopoly ensured that most Indians, particularly the lower-income population, could not afford necessary treatments. Having pursued his doctoral studies in chemistry in Germany, Hamied was deeply influenced by the role of scientific research in national development. While studying under renowned chemist Carl Bosch, he recognized the importance of an independent pharmaceutical industry in ensuring healthcare accessibility. His time in Germany also exposed him to nationalist and anti-colonial movements, reinforcing his commitment to making India self-sufficient in medicine production. Upon returning to India, Hamied realized that pharmaceutical production in the country was practically nonexistent. The few existing firms were either distributors of foreign drugs or small-scale producers of basic medicinal compounds, incapable of competing with large multinational corporations. This gap in domestic drug manufacturing, combined with restrictive British policies, inspired Hamied to take bold action. He envisioned a scientifically advanced, independent Indian pharmaceutical company that could provide quality medicines at affordable prices.

Challenges in Establishing Cipla

In 1935**,** Hamied laid the foundation of Chemical, Industrial & Pharmaceutical Laboratories (Cipla) in Mumbai with the goal of manufacturing essential medicines domestically. However, this initiative was fraught with challenges.

1. **Financial Constraints:** Establishing a pharmaceutical company required significant capital investment, and financial institutions were reluctant to support indigenous businesses.British-controlled banks favored loans to European enterprises, making it difficult for Indian entrepreneurs to secure funding.Hamied had to rely on **personal savings, private investments, and contributions from nationalist supporters** who believed in his vision of self-reliance.

2. **Logistical and Technological Barriers:** The lack of domestic **pharmaceutical manufacturing expertise** meant that Cipla had to develop its own research and production capabilities from scratch.India did not have **modern laboratories, trained personnel, or access to advanced machinery**, forcing Cipla to import equipment at high costs.The British government imposed **import restrictions and tariffs** on essential raw materials, increasing the cost of production.

3. **Foreign Competition and Colonial Policies:**British and European firms, fearing competition, used their influence to prevent Cipla from obtaining manufacturing licenses.Hamied had to **negotiate with colonial authorities** to gain permission to produce specific drugs, a process designed to favor foreign companies.Cipla faced **intellectual property restrictions**, as many essential drugs were under patents held by Western firms.

Early Achievements and Breakthroughs

Despite numerous challenges, Khwaja Abdul Hamied remained resilient and determined, successfully establishing Cipla as a pioneering force in India's pharmaceutical industry. Securing resources, navigating colonial restrictions, and overcoming financial hurdles, he ensured that Cipla quickly became operational. Within a few years, the company made significant strides in domestic drug production, focusing on affordable, high-quality medicines for widespread diseases. Cipla developed innovative synthesis methods, bypassing foreign patents and reducing reliance on expensive imports. By prioritizing research and indigenous expertise, Hamied laid the foundation for India's pharmaceutical self-sufficiency, transforming Cipla into a key player in the country's healthcare revolution.

1. **Manufacturing Indigenous Medicines:** Cipla focused on producing drugs that were in high demand but remained largely inaccessible due to high import costs. The company developed alternative synthesis methods to manufacture essential medicines without violating British patents. Cipla successfully produced drugs for respiratory diseases, infections, and malaria**,** which were widespread in India.

2. **Investment in Research and Development (R&D):**Hamied prioritized scientific innovation, setting up one of India's first pharmaceutical research laboratories**.** He recruited and trained Indian scientists, fostering a culture

of domestic expertise in drug manufacturing. Cipla's early research efforts paved the way for future breakthroughs in medicine production.

3. **Policy Advocacy and Nationalist Support:** Hamied actively lobbied for policy changes that would promote indigenous drug manufacturing. He collaborated with nationalist leaders such as Mahatma Gandhi and Jawaharlal Nehru, who supported his vision of a self-reliant pharmaceutical industry. Cipla's success became a symbol of resistance against British economic dominance in India.

Policy Influence and the Path to Self-Reliance

The Patents Act of 1970

One of Hamied's lasting legacies was his contribution to India's patent policy. Before the 1970 reform, Indian companies could not legally produce patented drugs. This law enabled companies like Cipla to manufacture affordable, high-quality generics, paving the way for India's pharmaceutical dominance. The Patents Act of 1970 stands as a landmark policy that transformed India's pharmaceutical industry, enabling the country to become a global leader in generic drug production. Prior to 1970, India followed the patent laws inherited from the British colonial rule, specifically the Indian Patents and Designs Act of 1911. This system granted pharmaceutical companies product patents, giving them exclusive rights over their inventions for extended periods. As a result, multinational corporations (MNCs), mostly from Western countries, dominated the Indian pharmaceutical market, charging exorbitant prices for essential drugs. Due to these monopolistic practices, medicines remained inaccessible to a large segment of the Indian population, leading to concerns over public health and national self-sufficiency. Recognizing the need for change, the Indian government commissioned the Ayyangar Committee, led by Justice Rajagopala Ayyangar, to study the issue. The committee's findings highlighted the detrimental effects of the existing patent laws on India's healthcare sector and recommended a shift to process patents rather than product patents. This change would allow Indian companies to develop alternative methods to manufacture the same drugs without violating patents held by foreign corporations.

Impact of the Patents Act of 1970

The enactment of the Patents Act in 1970 marked a turning point for India's pharmaceutical industry. The law granted patents only for the process of manufacturing a drug, rather than the drug itself, significantly reducing the power of foreign pharmaceutical firms. This provision allowed Indian companies to reverse-engineer patented medicines and produce them at a fraction of the cost, making essential drugs more affordable and accessible. One of the primary beneficiaries of this law was Cipla, under the leadership of Dr. Yusuf Hamied. Cipla took full advantage of the new policy to develop and manufacture high-quality, low-cost generic medicines for various ailments, including life-threatening diseases such as tuberculosis, malaria, and HIV/AIDS. The company's efforts helped millions of people, not just in India but also in developing nations across Africa and Asia, who otherwise could not afford expensive patented medicines.

Expansion of Indigenous Drug Production

Cipla's success encouraged the establishment of public-sector pharmaceutical firms such as Hindustan Antibiotics Ltd. and Indian Drugs & Pharmaceuticals Ltd. This expansion played a crucial role in India's journey toward self-reliance in drug manufacturing. These government-backed enterprises not only ensured the widespread availability of essential medicines but also helped build the country's infrastructure for pharmaceutical research and development. The public-sector companies, in collaboration with private firms, contributed to the reduction of dependency on expensive imports and strengthened domestic production capabilities. As a result, India emerged as a key player in the global pharmaceutical market, producing high-quality, cost-effective medicines for both domestic and international consumption. The rise of indigenous drug production facilitated technological advancements, employment generation, and improved healthcare accessibility. Over the years, these developments positioned India as a world leader in affordable medicine production, reinforcing its reputation as the "pharmacy of the world."

Md Abu Katadah

Growth of the Generic Drug Industry

Today, India is a global leader in generic pharmaceuticals, supplying over 50% of global vaccine demand and 40% of U.S. generic drug imports. The groundwork laid by Hamied and the implementation of the Patents Act of 1970 allowed Indian pharmaceutical companies to emerge as competitive players in international markets. With a strong focus on research, development, and cost-effective production, India has built a robust pharmaceutical industry that continues to expand worldwide. Indian pharmaceutical giants such as Cipla, Sun Pharma, Dr. Reddy's Laboratories, and Lupin have established themselves as key exporters of generic medicines, meeting global healthcare needs at affordable prices. Their ability to manufacture high-quality generics while maintaining affordability has positioned India as an indispensable partner in global healthcare. Additionally, India's generic drug industry has played a crucial role in combating global health crises. During the COVID-19 pandemic, Indian pharmaceutical firms rapidly scaled up production of essential medicines and vaccines, ensuring their availability in both domestic and international markets. As demand for affordable healthcare solutions grows, India's generic drug industry remains at the forefront of addressing global medical challenges.

India's Emergence as the 'Pharmacy of the World

The Patents Act of 1970 laid the foundation for India's rise as a global pharmaceutical powerhouse. Freed from restrictive product patents, Indian pharmaceutical companies invested in research and development (R&D) to create cost-effective processes for drug manufacturing. By the 1990s, Indian firms such as Cipla, Ranbaxy, Dr. Reddy's, and Sun Pharma had established themselves as major players in the international generic drug market. India's ability to produce affordable generics became particularly crucial in the early 2000s during the global HIV/AIDS crisis. Under Hamied's leadership, Cipla introduced a cost-effective triple-combination antiretroviral therapy for HIV/AIDS at less than a dollar a day, making life-saving treatment accessible to millions in Africa and other developing regions. This move challenged the pricing policies of Western pharmaceutical giants and cemented India's reputation as the "pharmacy of the world."

Challenges and Revisions to the Patent Law

Despite the benefits of the Patents Act of 1970, pressure from the World Trade Organization (WTO) and international pharmaceutical companies led to significant amendments in 2005, bringing India's patent laws in line with global intellectual property standards. The amendment reinstated product patents for pharmaceuticals, biotechnology, and agrochemicals, limiting the ability of Indian companies to freely manufacture generic versions of patented drugs. However, provisions such as compulsory licensing and Section 3(d) of the amended Act still allow India to prioritize affordability and access to essential medicines, ensuring that the core principles of the 1970 reform continue to be upheld.

95328

Challenges and Future Prospects

Despite remarkable progress, the Indian pharmaceutical industry faces several challenges. Intellectual property rights (IPR) disputes remain a major concern, as international pressure mounts for stricter patent regulations. Additionally, regulatory barriers, both domestic and international, pose obstacles to market expansion. Competition from China, particularly in the supply of active pharmaceutical ingredients (APIs), further complicates growth prospects. To sustain its leadership in the global pharmaceutical industry, India must strengthen its research and development (R&D) capabilities, invest in innovative drug discovery, and refine industrial policies to support local manufacturers. Government initiatives to boost domestic API production and streamline regulatory frameworks will be critical. By addressing these challenges, India can continue to build on its legacy as the "pharmacy of the world" while ensuring accessibility and affordability in global healthcare.

CONCLUSION

Khwaja Abdul Hamied's vision, scientific acumen, and nationalist fervor played an instrumental role in breaking India's colonial dependence on pharmaceuticals. By founding Cipla, investing in R&D, and advocating for policy reforms, he laid the foundation for India's self-reliant pharmaceutical industry. His contributions extended beyond national boundaries, influencing global healthcare accessibility. As India continues to assert its position as the "pharmacy of the world,"Hamied's legacy remains a guiding force in ensuring that medicine remains a public good rather than a commercial monopoly.

ABSTRACT

Philip Roth, a renowned literary figure of the United States is a third-generation Jew immigrant settled at Newark, New Jersey to share a special affinity to the place where he grew up and evidently proved his connection by elucidating the presence of Newark as an indispensable backdrop pervasively in his novels. Being a third generational Jew in the land where Christianity reined its stronghold, we observe that the author who tries to establish a cultural aspect of Jews despite practiced Atheism, perhaps to showcase his social responsibility against the bias that was showered during his stay at Newark which has largely influenced his novels and is articulated effectively through blurring the boundaries of Fiction and Non-Fiction. It shall be noted that the elements of Diaspora can be identified prominently in the Novel *Indignation,* one of the books from the collection, *Nemeses,* where the young protagonist of nineteen, Marcus faces discomfort in multiple facets for being displaced in a different state Ohio, at Wines burg College to carry out his higher studies. The incidents that unfold in the college premises of Marcus and his encounter with the rigid norms of the institution narrates to substantiate the application of the elements of Diaspora in the novel mentioned. The Modern Viewpoint of Diaspora emphasizes basically the habitual voluntary settlement in a foreign land for different purposes, yet the convincible

degree of stability and connectivity will always remain an interrogative space for the immigrants to get it answered. In view of the aforementioned details, this paper attempts to deconstruct the features of Diaspora through the intrigue and the corresponding situations represented in the novel *Indignation* by Roth.

The term Diaspora is often traced under the umbrella of post-colonial theory, elucidating the critical situations of the migrants, mostly trans-locating from a third-world country to the land of their colonizers ("Postcolonial Concepts"). In the introductory chapter of *Diaspora theory and Transnationalism*, Himadri Lahiri sheds light on the fact that Diaspora and Transnationalism often stand as synonyms which apparently contributes to the debates revolving around 'roots' and 'routes'(3). In fact, the former was well received with a specific meaning with regard to its Jewish contextual dispersion from their historic homeland to many parts of the world signifying the oppression and the moral degradation that arose during the process of dispersion. (Safran 83). The word then gradually became relatable to the process of trans-migrations in general, as the condition of displacement was sensed widely amidst the population of the world. It shall be observed that people usually migrate either as a large scale of movement or dispersal of a particular group of people/Voluntary choices (Lahiri 2). The mass migration is evidently witnessed in the war zone countries like Iraq and Syria, where refugees move from severe hostile conditions to a better place to set up their second homeland. The latter focuses on the voluntary interest of the group of people to uplift their condition as a personal preference. We shall note an important pointer that the host country/nation would not always be hospitable to welcome their guests as it may stir the existing peace prevailing in their respective nations, mainly with regard to the manifestations of culture, ethnic and religious ideologies that the migrants carry along. An attempt was given by Himadri Lahri with the definition of Diaspora considering the existing contributions to the same. Diaspora is a social formation outside the nation of origin. It is a phenomenon involving uprooting, forced or voluntary, of a mass of people from the 'homeland' and their 're-rooting' in the host-land(s). Diasporic subjects usually have a strong nostalgia for the land they have left behind and for its culture(s), but at the same time may, consciously and/or unconsciously, tend to accumulate or assimilate to the dominant cultures of the new space (4).

At the outset of applying the elements of Diaspora in the novel *Indignation*, it shall be observed the young protagonist Marcus, steps voluntarily to attend Winesburg, a small liberal Arts and Engineering College at Ohio, after his freshman year from 'Robert Treat', a college at Newark, New Jersey. The Voluntary shift of place from his homeland to Winesburg which is apparently five hundred miles away, brings in a lot of suffocation to Marcus, possibly because of his skeptical attitude in not being flexible to the situation given, for which he cost his own life towards the end of the plot. The examination of the Diaspora theory, though, rejects intra-state shifts as migrants encounter little resistance with respect to their social/cultural identity (Lahiri 4), we find that the situations encountered by Marcus encapsulate the similar issues of the contest between cultural and religious identity with regard to his Jewish background from Newark. It is also said that his education stands as a priority to escape the unsound concerns and abuses from his father. This leads the readers to speculate the taste of verbal accusations and constant drudgery that his father Mr. Messner, inadvertently gave his son during the freshman year at Robert Treat college, which forced him to voluntarily decide on a college, apparently, far from home (Father) for his sophomore year to have peace and concentration in his studies as Marcus has had ambitions of becoming a successful lawyer. This Psychotic condition with his father arouse lately as he turned to be an overprotective shield to save his son from the possibilities of ruination mostly in his overthinking head through the influences of fellow men around him. Especially, with the instance, that shares the interest of Eddie Pearlgreen, a fellow of the same age as Marcus, who ended up in pool games and stealing cars. With reference to the spoilt activities of other fellows, Mr. Messner would usually ask a round of questions regarding Marcus' whereabouts of a day which annoys him so much as he would have had aboded the public library to work on his assignment paper. "So there you are," he announced. "Yeah, strange, isn't

95331

it? At home. I sleep here. I live here. I am your son, remember? "Are you? I've been everywhere looking for you." "Why? Why? Somebody, please, tell me why 'everywhere.'" "Because if anything were to happen to you if something were happen to you" "But nothing will happen. Dad, I am not this terror of the earth who plays pool, Eddie Pearlgreen! Nothing is going to happen"… "It's about the life, where the tiniest misstep can have tragic consequences." (12). Being a mature teen, Marcus made several attempts to solve the impending sensitive issue by talking on good terms with his father, but nothing actually worked but paved his way to enter Winesburg College. Little did he know that the constraint is pervasive and the virtue of tolerance is what he needed to acquire. Nevertheless, we observe that the shifting of place happens through a voluntary decision juxtaposed with the unpinning psychotic pressure from his father's baseless suspicions. Marcus, introduced to the new environment, was calm and determined to focus on his studies. He was let in a room to share it with three Jewish boys. Bertram Flusser was the notable one, as he was trying to make life, a challenging factor for his roommates. His tantrums are beyond one's control. Flusser is a man of music and he often plays Beethoven on his recorder only when his roommates are in sound sleep (21). Losing his temper, Marcus broke the recorder into pieces (23). This incident allowed Marcus to change his room as his mates were driving him nowhere but crazy. The shift in the room was notified to the Dean and corresponding documents were submitted to substantiate his decision which was approved by the officials. He was later partnered with Elwyn Ayers Jr., a third-year student inclined to take up his engineering major after his preliminary study. "Living with Elwyn was much like living alone. In his flat Ohio accent, he'd make a dry crack that would cut off conversation when I felt like taking a break from studying to talk for a few minutes" (30). However, Marcus was satisfied that he could finally concentrate on his purpose of aboding Winesburg for a couple of years. But things were not on good terms eventually with Elwyn, when he commented on Marcus's date Olivia, a 'cunt' (72) which enraged and spoilt the idea of continuing to stay with the third-year boy. This led him to seek residence at Neil Hall, the most detested room in the whole of Winesburg, almost living alone without a mate.

With the observations made with Marcus' attitude of resistance, it is evident to prove that the process of assimilation could not be derived from the narration. This leads us to a contesting platform to contemplate the factor of Home and how the protagonist conceived it. In fact, the place which Marcus claimed as his hometown, did not give him the space, he needed to breathe and that stood as a primary reason to shift his place to Winesburg. Thus, the definition of 'Home' and its spot of location shall be briefly discussed to understand the ideology behind the sense of belonging. Avtar Brah simplifies the conception of Home from two perspectives. One shall be a mythical state of desire, probably of a diasporic imagination, when there applies no chance of migrants returning to their geographical native land. "On the other hand, home is also a lived experience of a locality" (Brah 192). In the case of Marcus, he tries to figure the one which suits the rational conditions of living in an ideal place like home (his comfort area), but unfortunately, he could not spot one within the brief time that he shares on earth. Brah brings out an argument that "the question of home is intrinsically linked with the way in which processes of inclusion and exclusion operate and are subjectively experienced under given circumstances" (192). Marcus staunchly believed in the concept of Atheism and stood in his rational terms with people. He had a clarity that the existence of divine powers were distractions to human growth and he relied only on his effort and hard work to excel in his studies. In fact, the ideologies that Marcus adorned and imbibed were his comfort space and perhaps, that's the interior space he could identify as his home to rely on. Marcus and his thought on Atheism are strongly portrayed in the narration deeply influenced by the novelist Roth himself as he stood as an ardent atheist till his final breath. The heated conversation between the Dean of Winesburg and Marcus reveals the strong sketch of Marcus' character and his opinions allow the spectator to figure out his challenging spirit to assimilate in a foreign space that was bestowed on him. When questioned why he denies identifying himself as a Jew, he claims that he "Objected not because I was an observant Jew but because I was an ardent atheist" (80). Marcus, as we find was the man of his beliefs and would stand to his conventions at any cost. He believed in the irrelevance of mentioning his religion in his college application and never did. His father's profession was acknowledged just as Butchering but not tagged his religious name as a prefix,'Kosher'. "I'd be curious to know why you didn't write down 'Kosher, Marcus." "I didn't think that was relevant. If some entering student's father was a dermatologist or an orthopedist or an obstetrician, wouldn't he just write down 'Physician'? Or 'Doctor'? That's my guess anyway." (92). He continues with the argument that he had no intention to hide his religion but never felt the preference to practice one (93). Marcus enunciates the problem in a well-defined way while

asking about his problem of constant shifts to different rooms. He instinctively testifies his own behavior is "not the inability to adjust" but to keep himself away from the superfluous problems that are susceptible to distract him (98). Marcus makes his proclamations clear with proper substantiations and never left it a sweeping statement. While arguing against the religious practices, he quotes Bertrand Russell, a Nobel laureate, who is known for his famous essay titled "Why I Am Not a Christian" where he talks about different points of view like the first-cause argument, the argument from design, the moral argument for a deity and the argument for the remedying of injustice (102). "Religion he declares is based primarily and mainly on fear- fear of mysterious, fear of defeat, and the fear of death"(103). This greater influence on fighting against the concept of fear and upholding his ideologies on the pedestal apparently led him to fall from studies, ultimately in life. If at all, he adjusted or rather assimilated to the norms of the college, he would have sustained to become a powerful orator. He stood steadfast to be a resistance to the cultural norms of the college by denying to attend the Chapel under the prescribed curriculum, thus digging his own grave to perish in the Korean War, where he realized the loop of fatal circumstances to fight against. It was my job not to pluck the chickens but to eviscerate them. You silt the ass open a little bit and you stick your hand up and you grab the viscera and you pull them out. I hated that part. Nauseating and disgusting, but it had to be done. That's what I learned from my father and what I loved learning from him: that you do what you have to do. (5) Despite loving to learn the toughest lessons of adapting to the situation to fulfill one's duties, Marcus failed in following the same to land in the hands of death at an early age, nevertheless upheld his perceptions high in the plinth with an outstanding gesture. In the light of the discussion based on the novel *Indignation*, tracing the elements of Diaspora, it shall be attempted to claim that the factor of voluntary migration, resistance, and the endless loop of defining home was contested in the intrigue with reference to the character of Marcus and his ideas behind accustoming to the given context of living.

ABSTRACT

Biogas presents a feasible way to supply rural communities in developing nations with sustainable and clean energy. However, despite the Government of India's numerous policy attempts, gender-based barriers continue to hinder the mainstream adoption of biogas. The study examines the gender disparities in household leadership and biogas adoption in West Bengal, which are indicative of broader socio-cultural dynamics. This article examined the gender-based situation regarding the access to biogas installation in rural West Bengal from the various district using the Khadi and Village Industries Commission database among 2000 sample households. The findings indicate that women are the primary consumers of culinary energy; however, only 28% of biogas beneficiaries are female, while 72% are male. The fact that 99% of household chiefs are male further compounded this trend, indicating that women's involvement in energy decisions is still restricted by socio-cultural norms. Notably, district such as South 24 Parganas and Birbhum have extreme male dominance, while Nadia has more equitable adoption rates. Malda has more female installations, suggesting targeted initiatives may eliminate gender discrepancies. The greener energy transition supports Sustainable Development Goals (SDGs) 5 (gender equality) and 7 (clean energy). Women's biogas participation improves health (SDG 3), food security (SDG 2), and education (SDG 4). Thus it need to targeted policies must encourage women's biogas participation for fair benefits and sustainable energy to ensure that household energy users, particularly women, benefit equally from the shift to renewable energy sources, women must be more involved in decision-making in biogas adoption.

Keywords: Gender, Biogas, Rural, Sustainable Development Goals, India

INTRODUCTION

Sustainable development aims to eliminate poverty, promote well-being, and safeguard the planet by 2030 [1]. However, achieving Sustainable Development Goal (SDG) 7—'universal access to affordable, reliable, and modern energy services' remains an unmet challenge for over 2.4 billion people who still lack clean cooking energy [2]. In India, for example, the World Energy Outlook (2017) reports that approximately 819 million people rely on traditional biomass cookstoves for their daily cooking needs [3, 4]. This reliance on biomass fuel is widespread in many low-income countries, where transitioning from conventional fuels to modern, cleaner energy sources is a significant challenge. In these contexts, biomass fuel accounts for about 95% of total energy consumption [5]. Collecting and gathering fuel wood is a labour-intensive, time-consuming activity disproportionately carried out by women, which increases the burden on women, exacerbating gender inequality, particularly in developing countries. The heavy reliance on traditional fuel further deepens the gender divide, as it directly impacts women's health, time, and labour. Countries with fast-growing economies, such as China and India, have begun focusing on reducing the use of biomass and increasing access to renewable energy sources [6]. Thus, transitioning from traditional biomass to clean and efficient bioenergy or other renewable energy forms is vital to addressing energy poverty. This transition in developing and least-developed countries would improve energy access and reduce gender inequities by lessening the burden on women. Gender inequality exacerbates poverty, particularly for women, who face limited access to education, employment, and social equity. Women's involvement in achieving SDG 7 is crucial, as it has the potential to drive and sustain social change. Addressing energy poverty and promoting the adoption of new technologies can significantly improve women's quality of life and contribute to gender equality. Therefore, incorporating women's roles and perspectives in domestic energy use is essential for developing effective energy policies supporting social progress and sustainable development [7]. The paper helps to explore the role of women in climate change and the adoption of biogas in the rural areas of the eastern region of India.

Potential of biogas adoption in India
India has the second-largest population in the world, and over 65% of its people rely on agriculture for a living, in addition to the country's massive cattle population. As a result, the Food and Agriculture Organization (FAO) analysis calculated that India has the potential for land for crops that may provide the energy needed for their everyday cooking needs by generating a lot of agricultural wastes and animal manure, which would be especially useful for rural residents. One of the critical contemporary energy services that can contribute to the growth of a country's economy is biogas, a sustainable energy source. In 2020, 38% of installed energy capacity will come from renewable sources, making India the third-largest producer of renewable energy [8, 9]. In terms of renewable energy installations worldwide, India ranks fifth, according to the Ministry of New and Renewable Energy (MNRE) report [10, 11]. India hopes to have achieve 227GW of renewable energy, already more than the 175GW by 2022, which set as part of the Paris Agreement (Figure 1) [12, 13]. The biogas digester with anaerobic digestion actively contributes to achieving the SDGs and the Paris Agreement's aims by reducing greenhouse gas emissions and promoting sustainable agriculture and energy generation through waste management [14]. By 2030, the government wants to install 450GW of renewable energy [15, 16]. Hence, with 45 lakh added since 2012, India now has the second-largest installation of biogas plants worldwide, behind China [17]. India has set a goal to install 6.5 lakh biogas units nationwide as part of its 12[th]five-year plan [18]. India has the potential to install approximately 12 million household-type biogas plants, according to a recent estimation by the MNRE. However, only 4.75 million of the total potential biogas plants were installed as of March 31, 2014, by GoI [19, 20]. The estimated production of biogas in India in 2014-15 was approximately 20757 lakh cubic meters, which is equivalent to 6.6 crore domestic LPG cylinders (5% of total LPG consumption), accounts 2.53 lakh families benefitted through the production of biogas plants until 2015[21, 22]. Biogas is utilised by less than one percent of households in India for cooking purposes [23]. It will produce approximately 6.46 million cubic meters of biogas per day, equivalent to 70.90 million LPG cylinders and 8.20 million tonnes of biomass. It will reduce the annual carbon dioxide emissions by 615,000 tonnes [24]. India successfully installs 12 million family-sized biogas plants, it will reduce approximately 120 million tonnes of Carbon Dioxide (CO_2)annually [25]. In addition, it will be able to produce 8.75 billion cubic meters of biogas, which will generate

11.67 Gigawatt/hour of renewable energy for India by 2022 [26]. It also plays a critical role in enhancing soil fertility and reducing costs by substituting synthetic fertiliser with bio-fertilizer. This nutrient-rich organic fertiliser enhances crop yields and promotes sustainable agricultural production for an extended period [27, 28]. The implementation of biogas plants in Indian states has notable geographical variations, with certain states attaining high adoption rates and others falling behind because of infrastructure and socioeconomic obstacles. According to the total number of biogas plants in all Indian states as of June 30, 2020, there are notable regional differences in adoption (Figure 2). Maharashtra (924,111) is the highest, followed by Andhra Pradesh, Karnataka, Uttar Pradesh, and Gujarat, which have the most biogas plant installations [29], which is indicative of robust agricultural economies, large numbers of cattle, and efficient policy support for biogas energy. Although on a smaller scale, states like Odisha (271,809), Tamil Nadu, Punjab, and Kerala all exhibit significant improvements. States such as West Bengal (1,105), Manipur, and Jammu & Kashmir report fewer installations, probably because they relied on alternate energy sources, lack of knowledge, and land limits. India has installed a total of 5056159 biogas plants around overall states and union territories [30], demonstrating consistent development but also exposing inequalities impacted by geopolitical support, agricultural reliance, sociocultural influences, and geographical obstacles. In underperforming regions, especially in urban and geographically limited locations, our findings highlight the necessity of focused efforts to increase the adoption of biogas.

Women's movements in climate changing in Indian perspectives

Sustainable development requires collaborative efforts to construct a sustainable and resilient society. Renewable energy sources, including biogas, are necessary to mitigate pollution in India due to its substantial population and evolving energy requirements (7.9% from April 2016 to March 2017 and 8% from 2017-18) [31]. The primary factors that contribute to the transformation of the ecosystem are deforestation and the production of greenhouse gases as a result of the combustion of fuelwood. While the global average is 4.5 tonnes, India's per capita CO_2 emission is 1.8 tonnes [32]. India supported the Paris Agreement and committed to reducing the emissions intensity of its Gross domestic product (GDP) by 33-35% by 2030. Additionally, it will increase the capacity of fossil power to 40% from 28% in 2015 [33, 34]. Globally, 31% of geographical areas are covered by forest, according to the 2020 report of FAO and United Nations Environment Programme (UNEP) [35]. In India, the 2019 State of Forest Report estimated that 21.67% of geographical areas are covered by forest [36]. Singh and Gundimeda (2014) reported that the use of renewable energy sources has the potential to reduce 71 kg CO_2eq/Gigajoule biomass in India, thereby mitigating global warming [37]. According to the 2011 Forest Survey of India report, fuelwood meets the cooking and heating energy requirements of 40% of the world's population. Approximately 853.9 million people utilise firewood, and 199.6 million (23.4%) people collect biomass from forests [38].

Women who serve as change agents to advocate for environmental conservation and protection. On a global scale, numerous women's movements have emerged to protect the environment from the degradation of forests. The movement of women against deforestation is not only well-known in India, as well as worldwide. Amrita Bai, a Bishnoi woman from Khejarli village in Jodhpur, Rajasthan, was born on September 9, 1730. Amrita Bai and Bishnoi gave their lives to safeguard the khejari trees by hugging each tree from the soldiers of King Abhay Singh of Jodhpur. Amrita Bai and other Bishnoi villagers were among the 363 individuals who the soldiers murdered in the name of the sacred Khejarli during this movement. This movement resulted in the forest being dispersed on a large scale because the state declared the areas restricted and protected [39]. The Chipko Movement in 1972 in the Chamoli district of Uttar Pradesh provided the greatest inspiration. The movement was spearheaded by Chandi Prasad Bhatt and SunderlalBahuguna [40]. Bachchni Devi, Gauri Devi, and other women in the region are the foundation of this movement, as they are the most directly impacted by environmental deforestation. They are responsible for the protection of trees. Therefore, rural women took action to safeguard and preserve the environment and forests by embracing trees during the contractors' arrival in the region [41, 42]. The Chipko movement and the role of women became a significant historical eco-developmental movement worldwide. Women's involvement in this movement, which promoted ecofeminism in patriarchal societies, demonstrated solidarity in the struggle against environmental conservation [43]. The protection of natural resources from deforestation and ecological degradation has been a

critical component of numerous forest conservation movements in India, including the Appiko Movement (1983) and Jungle BachaoAndolan (1980s), which are led by local communities, particularly women [40]. Therefore, women are instrumental in developing policies that aim to safeguard against environmental exploitation and the exploitation of sustainable energy resources.

Gender issues in biogas adoption in India

Biomass is the primary source of cooking energy in India's rural areas, accounting for over 580 million people [44, 45]. Women and girls lacking fair access to modern energy services spend most of their time gathering fuel wood and cooking. As a result, the government has launched many efforts to encourage renewable energy, including biogas technology, which has significantly altered the energy sector while improving social fairness and well-being [46]. Biogas energy is connected to attaining sustainable development goals and human development by reducing poverty, empowering women, and encouraging sustainable modern energy for a less labour-intensive society that is more convenient and safer than traditional biomass [47-50]. One of the primary causes of low biogas technology adoption in developing nations' rural areas is gender disparity [51]. Access to better modern energy services significantly improves health, education, and livelihood opportunities by promoting gender equality [52]. According to the World Health Organization(WHO), 1.67 million people died in India in 2019, accounting for 17.8% of the country's total mortality [53]. Wassie and Adaramola discovered that biogas could replace solid biomass, such as 631.7 kg of fuel wood for cooking and 25 litres of kerosene for illumination each year [54]. Women spend up to 20 hours per week collecting fuel and 4 hours per day cooking with traditional biomass as part of their unpaid, unrecognised, and unaccounted-for care jobs, limiting their educational opportunities [55]. Women controlled the choice of family energy consumption. Thus, it is understandable that women-headed families are more likely to embrace biogas technology than male members [56–58]. However, one of the most important factors influencing the long-term viability of any development initiative is the lack of female participation. Women are one of India's most essential pillars of rural energy innovation, serving as change agents for climate mitigation and contemporary technology adaptation. In India, a lack of sufficient education and training for female household members is one of the most crucial issues in maintaining biogas digesters and their potential to improve economic prospects [59].

 Women contribute 17% of GDP in India, which is significantly lower than the global average of 37% [60]. Jagriti, an NGO in northern India, claims that their clean contemporary energy efforts have decreased the working strain by 10 hours and allowed them to participate in commercial activity [61]. In India, the use of biogas varies greatly by state; West Bengal has one of the lowest installations (1,105 plants as of June 30, 2020). Although this tendency is influenced by a number of variables, including land limitations, preferences for alternative energy sources, and governmental restrictions, and the gender gap in biogas adoption continues to be a significant but frequently disregarded obstacle. The lack of adoption of biogas in this region is further exacerbated by a lack of gender-sensitive legislation. In order to ensure fair access to clean cooking solutions and to support sustainable energy transitions, it is imperative that this gender gap be addressed. The adoption of biogas in rural India has been the subject of numerous research; however, the gender-based adoption of biogas and its impact on SDGs and climate change agents have received very little attention. Furthermore, research has yet to be conducted on the gender-based adoption of biogas in rural areas. The paper aims to describe the current situation in rural West Bengal regarding the gender component of biogas adoption and discuss the connections between gender and the influence of biogas adoption on reaching SDGs. The study aims to increase sustainable renewable energy access in rural regions by presenting a detailed picture of biogas adoption in rural areas and gender differences in promoting biogas without any gender-based burden.

STUDY AREA AND METHODOLOGY

West Bengal is an agricultural state located in eastern India. The state has more than 88,752 m2/km of geographical area. It is located between 21°20' to 27°32' N latitude and 85°50' to 89°52' E longitude (Figure 3). According to the 2011 Indian Census, the state is divided into 19 districts and 341 Community Development blocks. West Bengal is India's fourth most populated state, having a population of 9.13 million. Except for Kolkata, rural areas reside around 68% of

Anuradha Sarkar *et al.,*

the state's population. Rural areas have a higher sex ratio of 953 (944 in urban). The male population in rural areas is 51.22 percent, while females comprise 48.78 percent. West Bengal has the second-highest biogas density in rural India [62]. The West Bengal Renewable Energy Development Agency (WBREDA) is the state nodal agency for West Bengal under the Ministry of New and Renewable Energy, Government of India. This organisation strives to promote and improve renewable energy in West Bengal. WBREDA has set a target of 18000 domestic biogas plants by 2011, with approximately 11000 installed by December 2011 [63]. Thus, it is demonstrated that it is approximately 60%, indicating that biogas plant adoption is low in rural West Bengal. The Khadi and Village Industries Commission (KVIC) of West Bengal gathered the current data used in the paper between 2010 and 2011. The first study was conducted in 15 West Bengal districts, using 2000 homes as a sample that were registered in the KVIC database to establish a family-type 2 m³ biogas plant. The Socio Economic and Caste Censusreport and census data were also sources of secondary data.

RESULTS AND DISCUSSIONS

Gender Disparities in Household Headship
The data illustrates pronounced gender disparities in household leadership in West Bengal, indicating a significant male predominance in headship, a tendency that aligns with both state and national averages (Table 1). At the national level, 87% of households are headed by males, whilst 13% are headed by females. The East Zone, encompassing West Bengal, exhibits a marginally elevated proportion of male-headed households at 89%, while female-headed households constitute merely 11%. In West Bengal, 88% of households are male-headed, whilst 12% are female-headed. This overarching trend exhibits small variations among districts, revealing regional distinctions in gender roles pertaining to household leadership. Districts with a predominance of male-headed families include South Twenty-Four Parganas (91%) and PurbaMedinipur (91%), reflecting a traditional and patriarchal framework in these areas, whereby women possess a diminished role in home decision-making. On the other hand districts with a greater proportion of women-headed households include Darjeeling (17.4%), which has the highest percentage, followed by Barddhaman (14%) and Jalpaiguri (14%). This indicates that these districts may exhibit marginally more progressive social dynamics, or it may represent economic migratory trends, wherein males work away from home, leaving women to oversee houses. Although some districts exhibit increased percentages of women taking on home headship, suggesting changes in traditional gender norms, the data generally highlights the continuation of male-dominated household leadership throughout West Bengal.

Gender disparities in biogas adoption across households
The adoption of biogas in West Bengal highlights a stark gender imbalance, revealing that men dominate both participation and decision-making in this cleaner energy transition. The adoption of biogas technology in West Bengal reveals significant gender-based disparities, with men overwhelmingly benefiting from and controlling household energy decisions despite the direct impact on women's daily lives. Figure 4a-4b represents the percentages of gender wise adoption pattern of biogas plants in the rural west Bengal. The results of biogas adoption in rural areas of West Bengal show a significant gender disparity, with 72% of beneficiaries being male (1,432) and only 28% female (568). Additionally, among household heads, an overwhelming 99% are male (1,977), while just 1% are female (23). These gendered patterns of biogas adoption suggest that the benefits of clean energy access are not equitably distributed between men and women. The study finds that there has been a large gender gap between male and women which is one of the key factors of adoption of biogas plants in rural Bengal. These findings suggest that men dominate decision-making related to energy technology adoption, even though women, as the primary users of household cooking energy, are most directly affected by the introduction of cleaner technologies like biogas. The low participation of women as beneficiaries and household heads may be due to socio-cultural norms that restrict their involvement in household decisions and access to financial resources. This gender imbalance points to the need for targeted policies that promote women's engagement in energy programs, as they stand to benefit the most in terms of health and time savings from biogas adoption.

Household dynamics and member relationships

The gender-wise distribution of biogas adoption in West Bengal reveals that sons are the primary beneficiaries, with a notable but secondary involvement of wives, indicating a need for greater inclusion of women in household energy decision-making (Figure 5). The gender-wise analysis of biogas adoption in West Bengal, based on the relationship of beneficiaries to household members, shows that 58% of the beneficiaries are sons (1,163), 27% are wives (542), and only 15% are household heads (290). This distribution highlights that sons, who are often seen as future decision-makers or inheritors in rural households, are the primary adopters of biogas. The relatively high percentage of wives as beneficiaries (27%) suggests that women are increasingly benefiting from biogas, likely due to their primary role in cooking and managing household chores [64]. However, with only 15% of the household heads directly involved as beneficiaries, it appears that decision-making around biogas adoption may be influenced by younger male members, reflecting both generational shifts and traditional gender roles. This dynamic underscores the need for policies that involve women more actively in decision-making processes, ensuring that the people most affected by household energy use have a greater say in adopting clean energy solutions. In conclusion, while sons are the primary beneficiaries of biogas adoption in West Bengal, the significant involvement of wives shows progress toward including women in energy access. However, more focused efforts are needed to fully empower women in household energy decisions and ensure equitable benefits.

Gender wise biogas adoption in various district of West Bengal

The gender-wise distribution of biogas installations across West Bengal for the year 2011-12 highlights significant disparities in the adoption of this sustainable technology. The analysis reveals that, in most districts, the number of biogas units installed by males surpasses that installed by females. For instance, in North 24 Parganas, there were 265 male installations compared to 205 female installations, indicating a skewed preference or access among men. Similarly, districts such as South 24 Parganas and Birbhum exhibit substantial gaps, with males having 116 and 146 installations, respectively, compared to 14 and 24 for females. This trend suggests that women in these districts face barriers in accessing or adopting biogas technology. Conversely, Nadia stands out with a relatively balanced gender distribution of biogas installations, showing 115 installations for females and 128 for males, which reflects a more equitable adoption rate. In districts like Cooch Behar and Darjeeling, where overall installation numbers are low, the gender gap is less pronounced, although Cooch Behar has an equal number of installations for both genders, and Darjeeling shows a higher number for males. In districts with very low installation numbers such as Howrah and Medinipur (West), the disparity is particularly stark, with females having only 2 and 8 installations, respectively. Malda, however, presents a unique case where the number of installations for females (26) exceeds that for males (12), possibly due to targeted outreach or local initiatives. These findings underscore the need for focused interventions to address gender disparities in biogas adoption. Factors such as limited access, awareness, and socio-economic constraints likely contribute to these imbalances.

To promote equitable access to clean energy, it is crucial to implement strategies that enhance outreach and support for female beneficiaries, addressing the underlying barriers that inhibit their participation in sustainable technology adoption. The analysis of biogas adoption by gender across different districts in West Bengal for the year 2011-12 reveals significant disparities. The data shows that certain districts exhibit a high male-to-female ratio in biogas installations, with South 24 Parganas, Bankura, and Purulia demonstrating particularly pronounced male dominance. For instance, in South 24 Parganas, the ratio is approximately 8.29, indicating a substantial gap between male and female installations. Conversely, districts like Cooch Behar and Malda show either a balanced or female-dominant adoption rate, with Cooch Behar having equal numbers of male and female installations and Malda reflecting a higher number for females. Some districts, such as Howrah, present a low male-to-female ratio of 0.50, suggesting a relatively higher female adoption. Districts like Nadia, Medinipur (West), and Murshidabad exhibit moderate disparities, with male dominance still evident but less pronounced. These trends highlight geographical and socio-cultural variations affecting biogas adoption, suggesting that targeted outreach programs and support structures are needed to address gender disparities. Increasing female-focused initiatives and understanding local barriers can help in promoting more equitable access to biogas technology across the region. The Figure 6 clearly reveals a gender difference in terms of percent participation among West Bengal's several districts. Men make a far larger percentage

95339

Anuradha Sarkar *et al.,*

than women in several areas. For instance, districts such South 24 Parganas, Bankura, Birbhum, and Purulia show significant gender variations (between 71% and 85%) in favour of male participation. Conversely, districts like Cooch Behar exhibit no gender disparity; both men and women participate equally. Remarkably, in areas like Howrah and Malda, women outnumber men with negative gender ratios of -33% and -36%, respectively, suggesting greater female participation. This gender gap most likely reflects deeper social and cultural factors in rural West Bengal, particularly in light of the acceptance of technology like biogas digesters, which depend on active involvement of women to guarantee larger society advantages. These realisations could point to areas where more concentrated efforts are required to eliminate gender gaps, especially in projects connected to energy and agriculture.

Relationship with biogas adoption and gender equality in achieving SDGs

Ensuring gender equality is essential for the effective realisation of the Sustainable Development Goals (SDGs), especially by engaging women in households that implement biogas digesters. The implementation of biogas technology contributes to the goals of SDG 5, which focusses on promoting gender equality and empowering women and girls. Additionally, it meets the clean energy requirements in rural regions, in accordance with SDG 7, which aims to provide access to affordable, reliable, sustainable, and modern energy for everyone. The biogas produced from these digesters functions as a clean cooking fuel, greatly diminishing dependence on conventional fuels and yielding bio-slurry that serves as an organic fertiliser. This shift supports sustainable agriculture by reducing reliance on chemical fertilisers. Furthermore, societal gender biases result in a disproportionate impact of poverty on women, as emphasised by Piana (2006) [65]. The economic advantages of biogas systems, including lower expenses related to LPG and alternative fuels, have the potential to mitigate poverty in rural areas, thereby contributing to the goal of eradicating poverty in all its manifestations. Furthermore, the use of bio-fertilizers improves crop yield and food security, playing a crucial role in addressing SDG 1, which aims to eliminate hunger and promote food security and better nutrition [66]. The adoption of biogas also tackles health issues, especially indoor air pollution, which predominantly impacts women and children. Substituting conventional biomass fuels with biogas leads to a notable decrease in the harmful smoke produced by wood burning. This reduction plays a crucial role in diminishing the occurrence of respiratory diseases and aligns with the objectives of SDG 3, which focusses on ensuring healthy lives and promoting well-being for everyone [67]. Additionally, the time conserved from gathering fuelwood can be allocated to educational pursuits, fostering equitable quality education for women in alignment with SDG 4 [68]. This extra time could allow women to participate in income-generating activities, thereby fostering economic growth and promoting decent work opportunities (SDG 8) [69]. Engagement in biogas initiatives elevates women's societal standing and equips them to address gender-based violence, aligning with the goals of SDG 10 aimed at diminishing inequality both within and among nations [70]. Furthermore, biogas systems play a crucial role in reducing the environmental consequences of deforestation and greenhouse gas emissions, aligning with SDG 13, which highlights the need for immediate action to address climate change and its effects [71]. In the end, creating women's biogas user groups can serve as a community service project that promotes environmental stewardship and gender equality while also accelerating the shift from traditional to modern, sustainable lifestyles.

CONCLUSION

West Bengal's patriarchal family leadership and biogas adoption patterns show that men dominate decision-making. West Bengal's 88% male-headed families are dominated in regional and societal level. In South Twenty-Four Parganas and PurbaMedinipur, where 91% of families are led by men, gender norms limit women's household decisions. Darjeeling (17.4% female-headed households) may be changing due to economic considerations like male migration or societal dynamics. Biogas adoption statistics show a gender gap of 72% male and 28% female. Women, who use cooking fuel most, are excluded from decision-making, and 99% of biogas adopters are male-headed homes. Gender-based household energy decisions are reflected in the primary adopters, 58% sons and 27% spouses. Even though clean cooking solutions benefit women most, this trend shows their marginalisation from energy decisions. The data show that socio-cultural and economic constraints prohibit women from adopting biogas technology. Few districts, like Malda, have female adoption outnumber male adoption. The gender gap requires focused efforts to

Anuradha Sarkar *et al.,*

increase female energy decision-making and renewable energy access. To bridge these gaps, gender-sensitive policies and actions are needed. Health, economics, and sustainability can improve by empowering women in energy decisions. SDGs 5 (gender equality), 7 (clean energy), and 3 (excellent health and well-being) support biogas uptake. However, addressing gender energy access disparities and involving women, as key household energy consumers, in the shift to cleaner energy technologies will be necessary to achieve these goals. In conclusion, gender-based barriers must be removed and women must be fully involved in energy initiatives for biogas adoption in rural West Bengal to be fully realised. This will improve the lives of women and their families and help achieve poverty reduction, food security, and environmental sustainability.

ABSTRACT

Climate modification poses a major threat to agriculture, impacting food security, water resources, and rural livelihoods. Karnataka, India, with its reliance on rain-fed farming, is particularly vulnerable to climate variability. Irregular rainfall, prolonged droughts, rising temperatures, and extreme weather events increasingly affect crop yields and livestock health. This study analyses climate data from 2011 to 2020, highlighting rising temperatures and their effects on soil quality, groundwater levels, and agricultural productivity. Greenhouse gas emissions are identified as a key driver, influencing crop, livestock, and fisheries sectors. The paper explores adaptation and mitigation strategies such as efficient water management, crop diversification, soil conservation, and climate-resilient policies. It also emphasizes the role of technology remote sensing, precision farming, and AI-based weather forecasts in building agricultural resilience. Policy recommendations include enhanced government support, farmer education, and investment in climate-resilient infrastructure. The study offers treasured insights for developing sustainable, climate-adaptive agricultural practices in Karnataka.

Keywords: Climate change, agriculture, temperature variation, precipitation, adaptation strategies, mitigation, and food security.

INTRODUCTION

Climate change Involves long-term Shifts in global temperatures, rainfall patterns, and atmospheric situations, primarily caused by human activities such as burning fossil fuels, deforestation, and industrial emissions. These activities increase greenhouse gas levels, leading to rising temperatures and extreme weather events. Natural factors, including volcanic eruptions and solar radiation changes, also play a role in climate fluctuations. One of the most significant sectors affected by climate change is agriculture, as it is highly dependent on environmental conditions. Rising temperatures negatively impact crop production, particularly heat-sensitive crops like wheat, rice, and maize, reducing yields in many regions. While some areas may benefit from longer growing seasons, others experience significant agricultural losses due to excessive heat and unpredictable weather. Water scarcity is another major challenge, as increased evaporation leads to reduced soil moisture and frequent droughts, making irrigation more difficult. Additionally, changes in climate create favourable conditions for pests and crop diseases, leading to higher agricultural losses. Soil degradation is another consequence, with intense rainfall causing erosion and nutrient depletion, making it harder to sustain crop productivity. Extreme weather events, including storms, floods, and heat waves, further disrupt farming activities, damaging crops and infrastructure. Coastal agricultural regions are particularly vulnerable to rising sea levels, leading to saltwater intrusion and a reduction in arable land. Livestock farming also suffers as heat stress lowers productivity, reducing milk and meat yields, while poor pasture quality and limited water availability threaten animal health and reproduction. These challenges ultimately affect food security, leading to supply shortages and rising food prices. Small-scale farmers are especially vulnerable to economic instability, forcing some to abandon agriculture altogether. To mitigate these impacts, farmers and policymakers are adopting sustainable agricultural practices, such as conservation farming, agro forestry, and crop diversification. The development of drought-resistant and climate-resilient crop varieties is also crucial. Efficient water management techniques, including rainwater harvesting and drip irrigation, help optimize water use. Additionally, improved pest and disease control strategies, along with government policies and financial support, can enhance agricultural resilience. Addressing climate change through such adaptive measures is essential to ensuring global food security and the sustainability of agricultural systems. Climate change has emerged as a pressing environmental and socio-economic issue, with far-reaching consequences on agriculture.

Karnataka, predominantly rain-fed, experiences severe droughts, erratic rainfall, and increasing temperatures, all of which negatively affect crop yield and livestock production. Studies indicate that continued greenhouse gas emissions will exacerbate these effects, threatening food security and rural livelihoods. Agriculture is highly sensitive to climate variability, and any disruption in temperature and precipitation patterns directly impacts food production, soil fertility, and water availability. Karnataka, with 68% of its farmland dependent on monsoons, is particularly vulnerable to climate-induced stress. The state has witnessed a rise in extreme weather events, including prolonged dry spells, unseasonal rains, and flash floods, which have disrupted farming cycles and reduced productivity. The Intergovernmental Panel on Climate Change (IPCC) highlights that global temperatures have increased by more than 1°C since pre-industrial times, with projections indicating further warming. This trend has severe implications for Karnataka, where studies predict a temperature rise of 1.5–2°C by 2030. Additionally, the region's changing rainfall patterns threaten water security, with some districts experiencing a deficit while others face excess precipitation leading to floods. A decline in annual rainfall coupled with rising temperatures has also intensified groundwater depletion, increasing the risk of droughts and reducing irrigation potential. Beyond direct impacts on crops, climate change also influences livestock health, pest outbreaks, and soil degradation. The heat stress on cattle has led to decreased milk production, while rising temperatures have expanded the range of agricultural pests and diseases. Soil erosion, salinity, and loss of organic matter further degrade land quality, reducing its long-term productivity. Moreover, increased carbon dioxide levels can impact crop nutrition, leading to lower protein content in staple crops such as rice and wheat, affecting food security and nutrition. Economic consequences are also significant, as unpredictable weather patterns create instability in agricultural markets. Crop failures lead to income losses for farmers, increasing their reliance on government subsidies and alternative employment. Small and marginal farmers, who constitute a majority of Karnataka's agricultural workforce, are particularly vulnerable, facing challenges such

as rising input costs, declining yields, and financial insecurity. The socio-economic stress caused by climate change has also led to rural-to-urban migration, as farmers seek better livelihood opportunities in cities.This paper aims to analyse climate change projections, its historical impact on agriculture, and possible adaptation strategies to mitigate risks. It explores technological interventions, policy frameworks, and community-based resilience strategies that can help Karnataka's agricultural sector adapt to climate change while ensuring sustainable food production and rural livelihoods. Additionally, the study emphasizes the importance of government policies and international cooperation in fostering sustainable agricultural practices and climate resilience.

LITERATURE REVIEW

Venkateshwarlu, B. (2017): This study examines the effects of climate change on India's agricultural sector, highlighting that rising temperatures and irregular rainfall patterns have led to significant reductions in crop yields. Projections indicate that, without adaptation measures, rain fed rice yields could decrease by 20% by 2050 and 47% by 2080. Similarly, wheat yields may decline by 19.3% by 2050 and 40% by 2080. These reductions could result in approximately a 1.5% loss in India's GDP, emphasizing the need for adaptive farming techniques to counteract these challenges. **Economic Times Government (2024):** This report assesses the vulnerability of India's agricultural districts to climate change, categorizing 109 districts as 'very highly' vulnerable and 201 as 'highly' vulnerable. The study projects significant yield reductions in key crops by 2050 and 2080 if adaptation measures are not adopted. For instance, rainfed rice yields could decrease by 20% in 2050 and 47% in 2080, while wheat yields may decline by 19.3% in 2050 and 40% in 2080. The report underscores the importance of implementing climate-resilient agricultural practices to mitigate these impacts. **International Fund for Agricultural Development (2020):** This analysis explores the global economic consequences of climate change on agriculture, predicting that climate change could push 100 million people into poverty by 2030, with nearly half of these cases resulting from its impacts on agriculture. The report highlights that climate-induced agricultural decline exacerbates existing conflicts and has the potential to trigger new ones as resources become scarcer. The findings call for urgent investment in rural development to enhance resilience against climate-related challenges. **Economic Times Government (2024):** This report evaluates the vulnerability of India's agricultural districts to climate change, identifying 109 districts as 'very highly' vulnerable and 201 as 'highly' vulnerable. The assessment indicates that, without adaptation measures, rainfed rice yields could decrease by 20% by 2050 and 47% by 2080, while wheat yields may decline by 19.3% by 2050 and 40% by 2080. The report emphasizes the necessity of implementing climate-resilient agricultural practices to mitigate these adverse effects. **Down To Earth (2020):** This article discusses the global impact of climate change on agriculture, projecting that it could push 100 million people into poverty by 2030, with nearly half of these cases attributed to its effects on agriculture. The report highlights that climate-induced agricultural decline exacerbates existing conflicts and has the potential to trigger new ones as resources become scarcer. The findings underscore the urgency of investing in rural development to enhance resilience against climate-related challenges.

Reuters (2025): This article reports on a legal case where a Peruvian farmer is suing a German energy firm over its contribution to global greenhouse gas emissions, linking the company's emissions to the accelerated melting of local glaciers. The case highlights the broader implications of climate change on agriculture, as glacier melt water is crucial for irrigation in the region. The outcome of this case could set a legal precedent for holding polluting companies accountable for their environmental impact globally. **The Guardian (2025):** This article examines China's Loess Plateau project, an ambitious environmental initiative launched in 1999 to address severe soil erosion and loss of vegetation. The project implemented measures such as banning tree-cutting and overgrazing, providing grain and cash subsidies, and converting farmland to sustainable uses. As a result, vegetative cover increased by 25%, and soil erosion significantly reduced, demonstrating the effectiveness of large-scale environmental restoration efforts in mitigating the impacts of climate change on agriculture. **Choudhary, T. F., & Gupta, M. (2024):**this study examines the impact of climate change on crop production in india (1970-2020) using the panel ARDL method. It finds that long term increases in maximum temperature reduce crop yields, while higher carbon dioxide levels boost production and in short term maximum temperature and precipitation positively affect crop yields but minimum

temperature has a negative impact. The research highlights the need for adoptive strategies to address these complex climate effects. **Kuar, R., & Gautam, H. R. (2014):** This research explores the impact of climate change on agricultural productivity in India, emphasizing that temperature, sunlight, and water are critical drivers of crop growth. The study projects that wheat yields could decline by 5-10% with every 1°C increase in temperature, and overall crop yields might decrease by up to 30% in South Asia by the mid-21st century. Additionally, India could experience a 40% decline in agricultural productivity by the 2080s, highlighting the urgency for effective adaptation and mitigation strategies. **The Guardian (2025):** This article explores China's Loess Plateau project, Launched in 1999 to combat severe soil erosion and vegetation loss. key measures included restricting deforestation and overgrazing, offering subsidies and converting farmland to sustainable uses. **Reuters (2025):** This article reports on a legal case where a Peruvian farmer is suing a German energy firm over its contribution to global greenhouse gas emissions, linking the company's emissions to the accelerated melting of local glaciers. The case highlights the broader implications of climate change on agriculture, as glacier melt water is crucial for irrigation in the region. The outcome of this case could set a legal precedent for holding polluting companies accountable for their environmental impact globally. **Bellow, K. (2025):** This opinion piece discusses the intensifying effects of climate change, including rising temperatures leading to the melting of polar ice caps, sea-level rise, and freshwater scarcity. It emphasizes that higher temperatures increase evaporation, making water more scarce, which poses significant challenges for agriculture. The article calls for immediate action to conserve water through emission reductions, conservation efforts, and support for sustainable policies, underscoring that the planet's survival depends on decisions made today

METHODOLOGY

This study employs with a quantitative data to analyze the impact of climate change on agriculture in Karnataka. Secondary data is gathered from government reports, scientific studies, and climate knowledge portals, focusing on temperature trends, rainfall patterns, and agricultural productivity from 2011 to 2020. Statistical analysis is conducted to assess correlations between climatic variations and crop yields, soil conditions, and water availability. Geographic Information System (GIS) mapping is employed to visualize climate trends and identify vulnerable agricultural zones. Spatial analysis links climate variability with soil health, water availability, and crop productivity. Climate models and predictive analytics are used to forecast future scenarios and assess potential impacts on various farming systems The study also reviews national and state-level climate adaptation policies, analyzing government initiatives and agricultural programs to evaluate their effectiveness. Consultations with policymakers, experts, and extension officers help identify policy gaps and areas for improvement. By integrating empirical data, statistical modeling, and policy analysis, this research offers a comprehensive assessment of climate change impacts on agriculture in Karnataka. The findings aim to support evidence-based strategies for enhancing resilience, informing decisions by farmers, researchers, and policymakers.

NEED FOR THE STUDY
Given the increasing frequency of extreme weather events and their detrimental impact on agriculture, it is essential to understand the extent of climate change and devise appropriate coping mechanisms. This study provides critical insights into climate-induced agricultural challenges and suggests viable adaptation and mitigation strategies.

OBJECTIVES
1. To analyse the effect of climate change on agricultural productivity in Karnataka.
2. To examine temperature trends over the past decade.
3. To identify adaptation strategies that can enhance agricultural resilience.
4. To explore mitigation techniques that reduce climate risks

Impact of Climate Change
Climate change has far-reaching consequences for natural ecosystems, human livelihoods, and global resources. Some of the major impacts are:

Glacier Retreat

Most of the world's alpine glaciers are rapidly losing mass due to rising global temperatures. In glacier-fed regions, river flow may initially increase due to melting but will decline sharply as glaciers shrink.

Melting of glaciers and polar ice caps

Ice loss from Greenland and West Antarctica Projections indicate sea levels may rise between 0.8 and 2.4 meters by 2100, threatening low-lying nations like Bangladesh, the Maldives, Seychelles, and coastal areas worldwide.

Coral Bleaching

Increased sea temperatures stress corals, causing them to expel symbiotic algae and turn white—a process known as bleaching. Prolonged bleaching weakens coral reefs, making them more susceptible to mortality. In 1998, over 70% of corals in the Lakshadweep and Andaman-Nicobar Islands were affected by a major bleaching event.

Rising Sea Levels

Sea level rise is driven by three primary factors intensified by climate change: Thermal expansion of seawater as it absorbs heat (accounting for ~80% of global heat absorption)

Groundwater Depletion

Climate change affects groundwater both directly through altered precipitation patterns and indirectly via surface water interactions. Extended dry periods and increased evaporation contribute to declining groundwater tables.

Agricultural Disruption

Changes in climate disrupt crop cycles, reduce yields, shrink cultivable coastal land, and alter crop physiology. While higher temperatures may accelerate growth in some crops, they often reduce overall productivity, impacting farmer incomes and food security.

Extreme Weather Events

Global warming has intensified extreme temperatures, with hotter summers and colder winters. This results in more frequent and severe droughts, floods, hurricanes, and cyclones, threatening agriculture and infrastructure. Prolonged dry seasons, for example, have severely affected rice and maize production.

Spread of Pests and Diseases

Climate change is altering the geographic distribution of pests and diseases, pushing them toward higher altitudes and latitudes. This has led to increased outbreaks among both terrestrial and marine species, posing threats to biodiversity, agriculture, and public health.

Ocean Acidification

Rising CO_2 levels are increasing ocean acidity. When CO_2 dissolves in seawater, it forms carbonic acid, which disrupts marine ecosystems. According to the Global Biodiversity Outlook, ocean water is now 30% more acidic than it was before the industrial era, endangering marine life such as shellfish and corals.

Climate change impact on agriculture

Climate change has both positive and negative impacts on agriculture. While some effects may enhance productivity in specific conditions, the majority pose significant challenges to the sector. Key impacts include are:

Livestock (Animals)

Heat waves negatively affect livestock, especially cattle and buffaloes. Milk production may decline by 10–30% during the first lactation and by 5–20% in later stages. Heat stress can also delay growth, puberty, and reproductive maturity in crossbred animals.

Aquaculture (Fish)
Fish farming is disrupted by rising temperatures and changing water conditions. Shallow pond fish deaths, altered migration patterns, and shifts in breeding cycles are becoming more common due to temperature and seasonal variations.

Crop Yield
Warmer Temperatures: Increased heat may speed up crop growth but reduce yields, as crops mature faster, shortening the seed development phase. Elevated CO_2 Levels: Some crops (e.g., wheat and soybeans) may benefit from higher CO_2, with yield increases of up to 30%. However, crops like corn show limited gains (under 10%).

Extreme Weather
More frequent floods and droughts damage crops and reduce harvests. Pests, Weeds, and Diseases Warmer, wetter conditions and elevated CO_2 levels promote the growth of weeds, pests, and fungi, exposing crops to new threats and increasing the risk of infestations.

Seed Quality
Climatic stress during the growing season affects seed characteristics such as germination, viability, and appearance. Poor seed quality reduces crop yields and market value, threatening farmer income.

Nutritional Quality of Crops
Higher CO_2 levels have been shown to reduce the protein, iron, and zinc content of many staple crops, while increasing carbohydrate levels, negatively affecting food nutrition.

Soil Health
Climate change impacts soil composition, organic content, and structure. Reduced vegetation cover, intensified erosion, and sedimentation due to erratic rainfall and land-use changes degrade soil quality.

Water Resources
Agriculture, the largest consumer of surface water in India, faces mounting pressure from altered rainfall patterns, declining groundwater levels, melting glaciers, and increased evaporation, all of which stress the water supply system.

Crop Duration and Flowering
High temperatures during the flowering phase (anthesis) can drastically reduce seed formation. Even short heat spells (above 32–36°C) during this critical 1–3 day window can significantly lower crop yields.

TEMPERATURE CHANGE DUE TO CLIMATE CHANGE
Due to climate change, global temperatures are rising, with the planet's average surface temperature now about 1.1 degrees Celsius (1.9 degrees Fahrenheit) warmer than in the late 1800s, leading to more repeated and intense heat waves, droughts, and other extreme weather events.

Mean temperature of India and Karnataka from 2011 to 2020
From seeding to harvesting, the temperature is critical for crop growth. Climate change is hurting crop productivity in a variety of ways, including decreased agricultural product quality, the appearance of numerous insects and diseases in crops, and so on. The mean temperature of India and Karnataka from 2011 to 2020 is explained in Table No. 01 Source: https://climateknowledgeportal.worldbank.org/country/india The mean temperature of India and Karnataka is shown in Table No. from 2011 to 2020. The growth rate of India's mean temperature has been on a downward trend for the past six years but has been on a positive trend for three years, namely 2014, 2015, and 2016. India's mean temperature has ranged between -0.5964 and 1.5276 degrees Celsius. The growth rate of India's mean temperature has abruptly surged in 2016, with a 1.52672 increase over the previous year 2015. The maximum mean

temperature in Karnataka was 26.67 degrees Fahrenheit in 2019- and 26.16-degrees Fahrenheit in 2011. The trend of Karnataka's mean temperature growth rate is in the range of 0.87 to -0.7.

Minimum Temperature of India and Karnataka from 2011 to 2020
The coolest and hottest temperatures recorded in India and Karnataka are referred to as temperature. In agriculture, a uniform minimum temperature is necessary for growing various stages of crops and reaping the greatest yield for certain crops.

Minimum Temperature of India and Karnataka from 2011 to 2020
Source: https://climateknowledgeportal.worldbank.org/country/india
From 2011 to 2020, the minimum temperature in India and Karnataka is shown in the table. The growth rate of India's minimum temperature has been declining for the past six years, with values of -0.2644, -0.7953, -0.5163, -0.8303, -0.2616, -0.787 in 2012, 2013, 2017, 2018, 2019, and 2020, respectively. Karnataka had the greatest minimum temperature of 21.28 degrees in 2019 and the lowest minimum temperature of 20.78 degrees in 2011. The changing minimum temperature trends in India and Karnataka cause a great deal of disruption in agricultural farming techniques. The greatest temperature measured over a given period is referred to as the maximum temperature. It is a contentious term all across the world. It is a result of agricultural operations in many ways, such as soil and air moisture levels, crop cultivation cycle phases, crop cultivation of specific crops, and so on. From 2011 to 2020, the maximum temperature recorded in India and Karnataka is shown in the table. Maximum Temperature of India and Karnataka from 2011 to 2020 Source: https://climateknowledgeportal.worldbank.org/country/india. From 2011 to 2020, the maximum temperature recorded in India and Karnataka is depicted in the table. In 2016, the greatest temperature growth rate unexpectedly jumped to 1.2974. From 2017 to 2020, the growth rate of India's highest temperature has been on a downward trend. For the two years 2015 and 2016, the increase rate of maximum temperature in Karnataka was stagnant at 0.16.

Temperature Trends
Data analysis indicates a rise in Karnataka's average temperature between 2011 and 2020, impacting crop yields and livestock health.

Precipitation Patterns
Rainfall patterns have become increasingly erratic, leading to droughts and water scarcity in major agricultural zones.

Soil and Crop Productivity
Prolonged dry spells have led to soil degradation, reducing nutrient availability and affecting overall crop quality.

Livestock Impact
Heat stress has resulted in decreased milk production and affected cattle reproductive health.

RESULTS AND DISCUSSION

Impact on Temperature and Rainfall Patterns Data analysis from 2011 to 2020 indicates a steady rise in average temperatures across Karnataka, with some regions experiencing an increase of up to 2°C. Rainfall patterns have become more erratic, with some districts experiencing prolonged droughts, while others have recorded extreme precipitation events leading to floods. These changes have disrupted traditional agricultural cycles, reducing productivity and increasing uncertainty for farmers. Effects on Crop Yield and Soil Quality The rise in temperature and erratic rainfall has adversely affected crop yields, particularly staple crops such as rice, wheat, and maize. Increased heat stress has shortened growing seasons, leading to lower yields. Soil degradation due to excessive heat and reduced moisture retention has also been observed, resulting in declining soil fertility and increased dependency

on chemical fertilizers. Livestock and Fisheries Vulnerability Heat stress has negatively impacted livestock, leading to reduced milk production and lower reproductive efficiency in cattle. Additionally, water scarcity has affected the availability of quality fodder, leading to nutritional deficiencies. In fisheries, rising water temperatures have altered breeding cycles and fish population dynamics, impacting the livelihoods of communities dependent on aquaculture. Economic and Social Consequences Climate change has intensified financial instability among farmers, with declining yields leading to lower incomes and increased debt burdens. Small and marginal farmers are the most affected, as they have limited resources to adapt to changing conditions. Migration from rural to urban areas has increased as farming becomes less viable, leading to socio-economic imbalances in rural communities. Adaptation and Mitigation Strategies To combat the adverse effects of climate change on agriculture, farmers have adopted various adaptation strategies, Shifting to drought-resistant crop varieties, Implementing improved water conservation techniques, such as rainwater harvesting and micro-irrigation, Diversifying income sources through integrated farming systems and agro forestry, Using precision agriculture and AI-based weather forecasting to optimize resource utilization.

Policy Interventions and Recommendations

Government policies and programs aimed at building climate resilience in agriculture have had mixed results. While initiatives such as crop insurance schemes and climate-resilient seed distribution have provided some relief, their implementation and accessibility remain challenges. Strengthening agricultural extension services, enhancing farmer education on climate-smart practices, and increasing investments in sustainable infrastructure are essential for long-term adaptation.

SUGGESTIONS

Ways to decrease climate modification: Farmers are among the most vulnerable to climate change, facing escalating challenges while being expected to maintain or improve productivity. Its impact can be reduced through three key strategies: Monitoring, Mitigation, Adaptation

Monitoring

The process of watching and comprehending the atmosphere, ocean, and other components of the earth system is known as climate monitoring. This is accomplished through measuring and documenting temperature, wind speed, humidity, rainfall, pressure, and a variety of other variables, as well as forecasting the current and future global climate scenarios.

Mitigation

climate mitigation involves reducing greenhouse gas emission to slow climate changewithout it even with adaptation, the risks of severe and lasting impacts remain high early mitigation offers greater benefits than the risks it may pose.

Adaptation

it is a key strategy to cope with climate change, involving proactive steps to reduce harm and make use of potential opportunities. When planned early it can save lives and reduce the cost (European commission). The ability to do this effectively is called as adaptive capacity.

Adaptation to climate change in agriculture

Climate is a crucial factor directly affecting agricultural productivity. The effectiveness of adaptation strategies largely depends on the ability to respond to changing conditions. Farmers can adopt several adaptive approaches to manage the unpredictable impacts of climate change:

Rajini *et al.,*

Agro biodiversity

Greater genetic diversity in crops and ecosystems enhances resilience to climate stress. Drought-tolerant and stress-resistant crop varieties can help maintain productivity**.** Preserving genetic resources and diversifying farming systems such as integrating crops with livestock are proven methods to boost adaptability.

Localization over Globalization

For countries like India, where much of the population is rural, shifting toward localized farming systems can support sustainability. This involves optimizing local resources and modifying agronomic practices like crop selection, sowing schedules, input use, and irrigation techniques.

Agricultural Insurance

Expanding and improving insurance products helps farmers manage income risks from climate-related disruptions. Insurance provides financial protection against crop losses and enhances overall resilience.

Fertilizer and Nutrient Management

Efficient use of fertilizers reduces environmental stress and production risks. Adapting fertilizer practices can also lessen the negative impacts of climate change and improve soil health.

Drought Management

Droughts are a severe threat under climate change. Effective strategies include: Drought-tolerant crop varieties, Improved irrigation and water-use efficiency, Rainwater harvesting, Community-based adaptation initiatives

Land Use and Management

Long-term adaptation requires optimizing land use for new climate conditions. This includes adopting advanced technologies, improving land management, and enhancing water-use practices to sustain productivity.

Peri-Urban Irrigation with Treated Water

Urban wastewater, if properly treated, can be safely reused for irrigating peri-urban agriculture. This reduces water stress and supports urban food systems, provided contamination risks are managed.

Government interventions

Without complementary governance measures addressing legal, legislative, and institutional concerns, the technical intervention will be ineffective and unsustainable. Enhancing the value derived from freshwater resources necessitates the development of appropriate policy and management mechanisms. Strengthening governance, improving knowledge and information, collecting data, monitoring, and evaluation, boosting human and institutional capacity, and establishing integrated water resources management systems with the watershed as the management

1. **Water Management:** Rainwater harvesting and efficient irrigation systems should be implemented to combat water scarcity.
2. **Crop Diversification:** Farmers should shift to drought-resistant crop varieties to ensure stable yields under changing climatic conditions.
3. **Policy Interventions:** Government incentives for climate-smart agriculture can encourage the adoption of sustainable practices.
4. **Technological Innovations:** The use of AI and remote sensing tools can help farmers optimize irrigation and fertilizer application.

CONCLUSION

Climate change presents significant challenges to agriculture in Karnataka, influencing temperature, rainfall, soil conditions, and overall crop yield. The study highlights the urgent need for mitigation and adaptation measures to sustain agricultural productivity. Climate-resilient policies, technological advancements, and effective water management strategies can help farmers adapt to changing climatic conditions. Given the increasing severity of climate change, a multi-stakeholder approach is necessary to address these challenges. Government policies should focus on strengthening climate adaptation measures, including investment in research for drought-resistant crop varieties, improved irrigation techniques, and financial support for affected farmers. Strengthening early warning systems and weather forecasting will help farmers plan better and reduce risks associated with unpredictable climatic conditions. Furthermore, farmers need greater access to knowledge and resources that enable them to implement sustainable practices. Capacity-building programs, extension services, and financial incentives should be enhanced to encourage the adoption of climate-smart agriculture. Future research should focus on region-specific solutions to improve climate resilience in agriculture. Long-term studies on soil health, water conservation, and carbon sequestration in agriculture are essential to developing a sustainable framework for mitigating the impacts of climate change. Collaborative efforts between scientists, policymakers, and farming communities will be critical in ensuring food security and economic stability in the face of a changing climate.

ABSTRACT

An Interval Valued Fuzzy Graph G is supposed to be pseudo intrinsic bi-magic graph if it includes mock constant λ_m which is distinct from intrinsic super constant. This research article intends at introducing some kinds of pseudo intrinsic bi-magic graph like evenly divisible, disjoint, double & poly pseudo intrinsic bi-magic graph and further determining the strength of the above-mentioned graphs.

Keywords: Interval Valued Fuzzy Graph, Intrinsic constant; mock constant; pseudo intrinsic edge-magic; evenly divisible- double; disjoint & poly pseudo intrinsic edge-magic; strength.
Mathematical Classification Subject: 05C72,05C78.

INTRODUCTION

Graph theory is a very important tool to represent many real-world problems. Nowadays, graphs do not represent all the systems properly due to the uncertainty or haziness of the parameters of systems. For example, a social network may be represented as a graph where vertices represent accounts (persons, institutions, etc.) and edges represent the relation between the accounts. If the relations among accounts are to be measured as good or bad according to the frequency of contacts among the accounts, fuzziness should be added to representation. This and many other problems motivated to define fuzzy graphs. The first definition of a fuzzy graph was introduced by Kaufmann in 1973. Rosenfeld [14] first introduced the concept of fuzzy graphs. After that fuzzy graph theory becomes a vast research area. Applications of fuzzy graph include data mining, image segmentation, clustering, image capturing, networking, communication, planning, scheduling, etc. Crisp graph and fuzzy graph both are structurally similar. But when there is an uncertainty on vertices and/or edges then fuzzy graph has a separate importance. Since the world is full of uncertainty so the fuzzy graph occurs in many real-life situations. A fuzzy graph contains many

properties like crisp graph due to generalization of crisp graphs, but it diverges at many places. A crisp graph G is an order pair of vertex-set V and edge set E such that E ⊆ V × V. In addition, v = |V| is said to order and e = |E| is called size of the graph G respectively. In a crisp graph, a bijective function ℺ :V ∪ E → N that produced a unique positive integer (To each vertex and/or edge) is called a labelling [16]. Enomoto, H et al introduced the notion of magic graph that the labels vertices and edges are natural numbers from 1 to |V| +|E| such that sum of the labels of vertices and the edge between them must be constant in entire graph [8]. Numerous other authors have explored diverse types of different magic graphs [1], [9] & [15]. In 1987, Bhattacharya succeeded in developing the connectivity notions between fuzzy bridge and fuzzy cut nodes [7].The subject of edge magic labelling of graphs had its origin in the work of Kotzig and Rosa on what they called magic valuations of graphs [12]. These labelling are currently referred to as either edge magic labelling or edge-magic total labelling. Fuzzy graphs are generalization of graphs. In graphs two vertices are either related or not related to each other. Mathematically, the degree of relationship is either 0 or 1. In fuzzy graphs, the degree of relationship takes values from [0, 1]. A fuzzy graph has ability to solve uncertain problems in a wide range of fields. In [13], Nagoorgani et. al. introduced the concepts of fuzzy labelling graphs, fuzzy magic graphs. Ju and Wang gave the definition of interval valued fuzzy graph in [10]. Akram et al. [2–6] introduced many new concepts of bipolar fuzzy graphs, interval valued line fuzzy graphs, and strong intuitionistic fuzzy graphs. In this paper we have developed the concept of interval valued fuzzy pseudo intrinsic edge magic graphs using its composite strength. Also, we discussed some kinds of pseudo intrinsic edge magic graph like evenly divisible, disjoint, double & poly pseudo intrinsic edge-magic graph and further determining the strength of the above mentioned graphs.

PRELIMINARIES

Definition 2.1.
A **fuzzy graph** G=(A, B) is a pair of functions A:V →[0, 1] and B:VxV →[0, 1] where for all u, v∈V, we have B(u, v) ≤ Min{A(u), A(v)}

Definition 2.2.
By an **interval-valued fuzzy graph** G of a graph $G*$, we mean a pair $G = (A, B)$, where $A = [A_-, A_+]$ is an interval-valued fuzzy set on V and $B = [B_-, B_+]$ is an interval-valued fuzzy relation on E such that
$B_- (xy) ≤ \min (A_- (x), A_- (y))$,
$B_+ (xy) ≤ \min (B_+ (x), B_+(y))$, for all $xy \in E$. Throughout this paper, $G*$ is a crisp graph, and G is an interval-valued fuzzy graph.

Definition 2.3.
An interval $[\mu − \delta, \mu + \delta]$ is said to be an δ-neighborhood of any membership value for any δ satisfying the following conditions.
1. $\delta ≥ \min \{\mu_A (x), \mu_B(xy)\}$
2. $\delta ≤ 1 − \max \{ \mu_A (x), \mu_B(xy)\}$
3. $\delta ≥ or ≤ d(\mu(x), \mu(y))$ Where $d(\mu(x), \mu(y))=|\mu(x) − \mu(y)|$ and $\mu(x), \mu(y)$ are the membership of vertices or edges

Definition 2.4.
A path P is called a cycle if $V_1 = V_n$ for n ≥ 3, then a cycle is called a fuzzy cycle. If it contains more than one weakest arc.

Definition 2.5.
A bijection ω is a function from the set of all nodes and edges of to [0, 1] which assign each nodes $A^\omega(V_i)$, $A^\omega(V_j)$ and edges $B^\omega(V_i, V_j)$ a membership value such that $B^\omega(V_i, V_j) ≤ \text{Min}\{ A^\omega(V_i), A^\omega(V_j)\}$ for all $V_i, V_j \in V$ is called fuzzy labeling.

Definition 2.6.
A graph is said to be fuzzy labeling graph if it has a fuzzy labeling and it is denoted by G^ω.

Definition 2.7.
A fuzzy labeling graph G is said to be fuzzy perfect intrinsic labeling if f : A → [0 ,1] and f : B → [0 ,1] is bijective such that the membership values of edges are {z, 2 z 3 z, ..., ∈ Z} and vertices are {$(\varepsilon + 1)z$, $(\varepsilon + 2)z$, ...$(\varepsilon + \upsilon)z$} where $\varepsilon + \upsilon = N$ is the total number of vertices and edges and let z = 0.1 for N > 6.

Definition 2.8
The Bi-magic constant in an Interval Valued Fuzzy Perfect Intrinsic Bi-Magic Graph(IVFPIBMG) is said to be mock constant '$\lambda_m = [m- \ m+]$' if m- is equal to $_{A-}(x) + _{B-(xy)} + _{A-}(y)$ and m+ is equal to $_{A+}(x) + _{B+(xy)} + _{A+}(y)$ for some x ,y ∈ V with $\lambda_s \neq \lambda_w$.

Definition 2.9
An interval valued fuzzy graph is said to be an Interval Valued Fuzzy pseudo intrinsic Bi-magic graph if it contains a mock constant '$\lambda_m = [m- \ m+]$' which is denoted by '$G_{p} = [Gp- \ Gp+]$'

Theorem 2.10
Any fuzzy graph can be converted into an interval valued fuzzy labeling graph.

Interval Valued Fuzzy evenly divisible pseudo intrinsic edge bi-magic graph.
Definition 3.1
Let G be an interval valued fuzzy pseudo intrinsic edge bi-magic graph. If the mock constant 'λ_m' is evenly divisible then G is said to be evenly divisible.

Definition 3.2
Let G be an interval valued fuzzy pseudo intrinsic edge bi-magic graph. If the mock constant occurs twice that for all $\lambda_{mi} = \lambda_{mj}$ for all i≠j, then G is said to be a double interval valued fuzzy pseudo intrinsic edge bi-magic graph.

Definition 3.3
Let G be an interval valued fuzzy pseudo intrinsic edge bi-magic graph. If $\lambda_{mi} \neq \lambda_{mj}$ for all i≠j, then the graph G is said to be a disjoint interval valued fuzzy pseudo intrinsic edge bi-magic graph.

Definition 3.4
Let G be an interval valued fuzzy pseudo intrinsic edge bi-magic graph. If $\lambda_{mi} \neq \lambda_{mj} \neq \lambda_{mjk} \neq$…. for all i≠j≠k….. then G is said to be a poly pseudo interval valued fuzzy intrinsic edge bi-magic graph.

Theorem 3.5
An interval valued fuzzy cycle C_n is an evenly divisible pseudo intrinsic edge bi-magic graph for n= 4.
Proof: Let 'C_n' be an interval valued fuzzy cycle with even number of vertices. By our assumption, let n = 4
A-(v1)+A-(v1v2)+A-(v2) = 0.048+0.038+0.068=0.154= c-
A+(v1)+A+(v1v2)+A+(v2) = 0.052+0.042+0.072=0.166= c+
A-(v2)+A-(v2v3)+A-(v3) = 0.068+0.028+0.058=0.154= c-
A+(v2)+A+(v2v3)+A+(v3) = 0.072+0.032+0.062=0.166= c+
A-(v3)+A-(v3v4)+A-(v4) = 0.058+0.018+0.078=0.154= c-
A+(v3)+A+(v3v4)+A+(v4) = 0.062+0.022+0.082=0.164= c+
A-(v1)+A-(v1v4)+A-(v4) = 0.078+0.008+0.048=0.134= m-
A+(v1)+A+(v1v4)+A+(v4) = 0.082+0.012+0.052=0.146= m+
Here $\lambda_m = [m- \ m+]$ ' = [0.134 0.146] which is evenly divisible. By definition 3.1, the graph 'C_n' is an evenly divisible interval valued fuzzy pseudo intrinsic edge bi-magic graph.

Theorem 3.6:

A fuzzy cycle 'Cn' is a double pseudo intrinsic edge-magic graph for n=5.

Proof: Let 'Cn' be a fuzzy cycle with odd number of vertices. By our assumption, we consider   n = 5

A-(v1)+A-(v1v2)+A-(v2) = 0.098+0.008+0.58=0.164= c-
A+(v1)+A+(v1v2)+A+(v2) = 0.102+0.012+0.062=0.176= c+
A-(v2)+A-(v2v3)+A-(v3) = 0.058+0.038+0.068=0.164= c-
A+(v2)+A+(v2v3)+A+(v3) = 0.062+0.042+0.072=0.176= c+
A-(v3)+A-(v3v4)+A-(v4) = 0.068+0.018+0.078=0.164= c-
A+(v3)+A+(v3v4)+A+(v4) = 0.072+0.022+0.082=0.176= c+
A-(v4)+A-(v4v5)+A-(v5) = 0.078+0.048+0.088=0.214= m1-
A+(v4)+A+(v4v5)+A+(v5) = 0.082+0.052+0.092=0.226= m1+
A-(v5)+A-(v1v5)+A-(v1) = 0.088+0.028+0.098=0.214= m2-
A+(v5)+A+(v1v5)+A+(v1) = 0.092+0.032+0.102=0.226= m2+

Here, two mock constants occur $_{m1}$ = [m1- m1+] ´ = [0.214 0.226] &
$_{m2}$ = [m2- m2+] ´ = [0.214 0.226]

By definition 3.2, the given fuzzy cycle graph with five vertices is a double pseudo intrinsic edge- magic graph.

Theorem

A fuzzy n-pan graph is a disjoint pseudo intrinsic edge-magic graph for n = 5.

Proof

Let G be a fuzzy n-pan graph with n =5.
Apply fuzzy intrinsic edge- magic labelling, we get
A-(v1)+A-(v1v2)+A-(v2) = 0.108+0.008+0.098=0.214= m1-
A+(v1)+A+(v1v2)+A+(v2) = 0.112+0.012+0.102=0.226= m1+
A-(v2)+A-(v2v4)+A-(v4) = 0.098+0.018+0.118=0.234= c-
A+(v2)+A+(v2v4)+A+(v4) = 0.102+0.022+0.122=0.246= c+
A-(v3)+A-(v3v4)+A-(v4) = 0.118+0.028+0.088=0.234= c-
A+(v3)+A+(v3v4)+A+(v4) = 0.122+0.032+0.092=0.246= c+
A-(v4)+A-(v4v5)+A-(v5) = 0.118+0.038+0.078=0.234= c-
A+(v4)+A+(v4v5)+A+(v5) = 0.122+0.042+0.082=0.246= c+
A-(v5)+A-(v5v6)+A-(v6) = 0.078+0.048+0.068=0.194= m2-
A+(v5)+A+(v1v5)+A+(v1) = 0.082+0.052+0.072=0.206= m2+
A-(v1)+A-(v1v6)+A-(v6) = 0.068+0.058+0.108=0.234= c-
A+(v5)+A+(v1v5)+A+(v1) = 0.072+0.062+0.112=0.246= c+

Here, two mock constants occur $_{m1}$ = [m1- m1+] ´ = [0.214 0.226] &
$_{m2}$ = [m2- m2+] ´ = [0.194 0.206]

By definition 3.3, the given fuzzy n-pan graph is a disjoint pseudo intrinsic edge- magic graph.

Theorem 3.8

Every fuzzy perfect intrinsic edge-magic graph is not always a pseudo intrinsic edge-magic graph and vice-versa.

Strength of evenly divisible, double, disjoint & poly pseudo intrinsic edge-magic graph
Definition 4.1

Let E be a fuzzy evenly divisible pseudo intrinsic edge-magic graph. Then the strength of E is denoted by *αe* and is defined as the twice of the mock constant, *αe = 2 λm* .

Assessment 4.1.1

Evaluate the strength of fuzzy evenly divisible pseudo intrinsic edge-magic for cycle graph with n=4. By theorem 3.5, we get λ_m = [0.134, 146] and by above definition, strength of the given graph is α_e = 2 λ_m = 2[m- m+] =2[0.134, 0.146] = [0.268, 292] .

Definition 4.2

Let D be a fuzzy double pseudo intrinsic edge-magic graph. Then the strength of D is denoted by α_d and is defined as $\alpha_d = \lambda_m$, *($\lambda_m = \lambda$)* for all i and j.

Assessment 4.2.1

Evaluate the strength of fuzzy double pseudo intrinsic edge-magic for cycle graph with n=5. By theorem 3.6, we focused double pseudo intrinsic edge magic graph with two mock constants which are equal.
$\lambda_1 = \lambda_2$ = [0.214, 0.226] = λ_m
By above definition, Strength of the mentioned graph is
α_d = [0.214, 0.226], m1- m1+= [m2- m2+] for all i ≠ j.

Definition 4.3

Let T be a fuzzy disjoint pseudo intrinsic edge-magic graph. Then the strength of T is denoted by α_t and is defined as $\alpha_t = \lambda_{mi} + \lambda$ for all i ≠ j.

Assessment 4.3.1

Evaluate the strength of fuzzy disjoint pseudo intrinsic edge-magic for n-pan graph. By theorem 3.7, we discussed n-pan graph with n=5.
Here, $_{m1}$ = [m1- m1+] ´ = [0.214 0.226] & $_{m2}$ = [m2- m2+] ´ = [0.194 0.206]
 Through the above definition, strength of the above mentioned graph is
$\alpha_t = \lambda_m + \lambda j$
for all i ≠ j. = [0.214 0.226] +[0.194 0.206] = [0.214 + 0.194, 0.226+0.206]
α_t = [0.408, 0432]

Definition 4.4:

Let P be a fuzzy poly pseudo intrinsic edge-magic graph. Then the strength of T is denoted by α_p and is defined as $\alpha_p = \lambda m + \lambda + \lambda j k + ...$ *for all i ≠ j ≠ k ≠ ...*

CONCLUSION

The research article has taken the ideas like the evenly divisible, double, disjoint and poly pseudo intrinsic bi-magic interval valued fuzzy graphs. This paper has assessed the strength of concern graphs like fuzzy cycle with odd and even number of vertices & n-pan graph. In future, the attention would be on poly pseudo intrinsic bi-magic interval valued fuzzy graphs with additional examples.

ABSTRACT

In this study, different factors that affect job satisfaction are considered from personal attributes, motivational elements, and organizational aspects. To understand the dynamics of workplace contentment, the research is based on theoretical perspectives such as the Fulfilment Theory, Equity Theory, and Two-Factor Theory. A sample size of 130 employees was selected through random sampling method through a structured methodology using surveys, statistical analysis, correlation studies. Employees care about fair compensation, career growth, recognition, work life balance and a positive corporate culture and these are findings. Some people were generally content with most of these things, however, stress management, sick leave policies and more clearly defined career progression need improvement. It then bases its suggestions on how to multiply the career development initiatives, create a transparent recognition system, increase flexibility in the workplace and improve communication between employees and management. Turnover rates are lower and engagement is higher and the organization is more successful if there is a positive work environment.

Keywords: Employee Job Satisfaction, Workplace Engagement, Organizational Success, Career Growth, Work-Life Balance, Motivation, Compensation, Recognition, Job Security.

INTRODUCTION

This study investigates the determinants of employee satisfaction, the theories of how it works, and how it influences organizational performance. This research follows a structured approach to analyse the employee perspectives in order to identify the areas which contribute to workplace happiness and those which require intervention. With this understanding, organisations can develop better policies, create favourable working environment and implement strategies to promote employee engagement.It also importantly contributes to mental and emotional well-being on

account of which job satisfaction is important. The study also explores modern trends of job satisfaction, such as remote work, flexible schedule, wellness programs for employees, and the impact of technology on job roles. Nowadays, work environments are becoming more flexible, and organizations have to keep up with the changing needs of the employees and enhance job satisfaction levels. Through the application of theoretical frameworks, research findings, and practical recommendations, this study offers ideas on how organisations can create happier and more productive workforce that will benefit both the employees and employers. The understanding of the job satisfaction can enable organizations to be on a path towards sustainability by creating a culture of motivation, development, and wellbeing.

Definition and Meaning
Employee contentment and fulfilment in their work are often defined as job satisfaction. According to Robbins and Judge, it is a positive feeling about a job that results from an evaluation. Several important motivational theories, namely, Maslow's Hierarchy of Needs and Herzberg's Two-Factor Theory, focus on intrinsic and extrinsic factors that influence employee satisfaction.

Objectives of the Study
The purpose of this study is to examine the level of employee job satisfaction and factors that influence the workplace engagement, motivation and performance of employees. The aim of the study is to contribute useful ideas that will aid organizations in cultivating a motivated workforce, as well as increasing employee well-being and ultimately business success.

Theoretical Background of Job Satisfaction
Several theories have attempted to define and explain job satisfaction, helping organizations develop better workplace strategies.

Fulfilment Theory
It proposes that when employees' expectations around their roles and rewards match reality, they are satisfied. Those whose work rises to their aspirations enjoy high levels of job satisfaction; others find themselves discontent with a disconnect between their expectations and the reality of working conditions.

Discrepancy Theory
Discrepancy theory states that the level of satisfaction is determined by the discrepancy between what an employee believes they should be getting and what they are actually getting. As long as the rewards / benefits equal /exceed expectations, the employees are likely to be satisfied. But if they don't, disappointment develops.

Equity Theory
Employees, according to the equity theory, continuously measure their inputs and outputs to their coworkers. If they feel there's injustice—as in a situation where they put in the same level of effort but get paid less or are given lesser opportunities than others—they could feel dissatisfied. Particularly to keep motivation and engagement, a fair and transparent reward system is important.

Two-Factor Theory
Frederick Herzberg — a psychologist known for his two-factor, or motivator-hygiene theory of human behaviour. Hygiene factors to avoid dissatisfaction Motivation factors that contribute to satisfaction. Absence of hygiene factors leads to dissatisfaction, but their presence alone does not guarantee satisfaction without motivators present as well.

Factors Influencing on Job Satisfaction
Employee job satisfaction is shaped by an interplay of personal characteristics, motivational aspects, and organizational factors.

Personal Factors

Age also is a factor in career stability, and mid-career employees often report a higher satisfaction with their jobs than younger employees. Another factor that the people we spoke also attributed to positive job experiences is gender equality and workplace inclusivity. Educational levels impact expectations. Employees with advanced education demand clearer career paths and financial compensation. For instance, marital status may also affect satisfaction – employees with families tend to value workplace stability and benefits more.

Motivational Factors

Employee motivation is the internal drive to do something. Salary and benefits are among the most important motivational factors, as they help to maintain financial security and risk control. To improve engagement, career growth opportunities provide employees with clear development roadmaps. Recognition and praise uplift spirits, reaffirming a sense of accomplishment in employees. Flexible hours and remote working arrangements are good examples of work-life balance systems that allow employees to navigate the competing demands of work and home.

Organizational Factors

One of the most significant contributors to employee satisfaction is the work environment. Employees performing their jobs without added stress or physical discomfort is made possible by a safe and comfortable workplace. Corporate culture encourages collaboration, teamwork, and inclusion. Investing in performance management, training and development programs help employees grow.

METHODOLOGY AND RESEARCH DESIGN

The study is descriptive research by using structured surveys and statistical analysis of the employee job satisfaction. The study follows a systematic approach to achieve accuracy, reliability and meaningful insights.

RESEARCH DESIGN

The approach this research takes is quantitative, in order to understand how different factors affect job satisfaction. A broad perspective of employee's sentiments towards their workplace is incorporated into the design through structured survey methods, statistical analysis, and correlation studies.

Data Collection Methods

For this study data was collected from both primary and secondary source. Direct responses of employees through surveys and questionnaires is Primary Data. Secondary Data: Organizational reports, previous studies, academic literature and industry benchmarks.The questionnaire was administered to employees in a structured manner to ensure a broad range of perspectives. Career growth, salary satisfaction, job stress, workplace environment, work-life balance, medical benefits and recognition programs were the questions covered.

Sampling Size and Technique

130 employees, from all roles and experience level, were randomly sampled. This helps to ensure that the study includes a diverse range of people of different career stages and therefore findings are more representative.

Statistical Analysis Methods

The study also used several statistical techniques to interpret the responses and to gain meaningful insights.
- ❖ Correlation Analysis: Evaluated relationships between job satisfaction and work conditions.
- ❖ T-Test & U-Test: Found significant differences in satisfaction level of different employee groups.
- ❖ Predicted factors for Job Satisfaction through Regression Analysis.
- ❖ F-Test: Assessed variance in satisfaction across different demographics.

This combination of these methods led to comprehensive and accurate findings to help better understand the patterns in employee satisfaction.

Abarna

Data Analysis and Interpretation

The sample size was 130 employees from different levels of experience. Key findings include:

- Employees are predominantly mid-career professionals with 52% of them in the 35 - 50 age group.
- This suggests that there is a higher representation of men at 58%.
- 72% of employees were satisfied with work hours.
- Upto 76% have positively rated the opportunities to use skills.
- 67 % of employees found flexibility in work life balance.
- 85%of employees liked the existence of medical facilities.
- 66% of the employees were willing to recommend their workplace.

Statistical analysis also provided some insights into employee job satisfaction by implementing various techniques (Eg, correlation analysis, T-tests, U-tests, and F-tests) Here are some of the key statistics obtained from employees:

Correlation Analysis

Correlation is a statistical measure that describes the strength and direction of a relationship between two variables. This study aims to investigate the relationship between the number of working hours and the corresponding results achieved. Null Hypothesis (H_0): There is no significant correlation between working hours and job results. Alternative Hypothesis (H_1): There is a significant correlation between working hours and job results.

Working hours(x)	51	43	5	19	12
Results of job(y)	57	55	4	5	9

Solution

X	Y	X²	Y²	XY
51	57	2601	3249	2907
435	55	1849	3025	2365
5	4	25	16	20
19	5	361	25	95
12	9	144	81	108
∑X=130	∑Y=130	∑X² = 4980	∑Y²=6369	∑XY = 5495

n = 5

$$r = \frac{n\sum xy - \sum x \sum y}{\sqrt{(n\sum x^2 - (\sum x)^2)(n\sum y^2 - (\sum y)^2)}}$$

$$= \frac{5 \times 5495 - (130 \times 130)}{\sqrt{(5 \times 4980 - 130^2)(5 \times 6369 - 130^2)}}$$

$$= \frac{27475 - 16900}{\sqrt{(24900 - 16900)(31980 - 16900)}}$$

$$= \frac{10575}{\sqrt{(8000)(15080)}}$$

$$= \frac{10575}{\sqrt{120640000}}$$

$$= \frac{10575}{10988}$$

r = 0.963

CONCLUSION

The calculated correlation coefficient is r = 0.963, which is very close to +1. This indicates a very strong positive correlation between the number of working hours and job results.

T-Test Results

A t-test is a statistical method used to compare the means of two groups and determine whether the differences between them are significant or due to random chance.

Null Hypothesis (H_0): There is no significant correlation between career growth (X) and motivational factors (Y).

Alternative Hypothesis (H_1):There is a significant positive correlation between career growth (X) and motivational factors (Y).

Career growth (x)	42	32	22	19	15
Motivational Factors (y)	46	35	15	14	20

Solution

X	Y	X^2	Y^2
42	46	1764	2116
32	35	1024	1225
22	15	484	225
19	14	361	196
15	20	225	400
$\sum X=130$	$\sum Y=130$	$\sum X^2 = 3858$	$\sum Y^2= 4162$

Find the $\bar{X}_x$ and $\bar{X}_y$

$$\bar{X}_x = \frac{42 + 32 + 22 + 19 + 15}{5} = \frac{130}{5} = 26$$

$$\bar{X}_y = \frac{46 + 35 + 15 + 14 + 20}{5} = \frac{130}{5} = 26$$

$N_1 = 5$

$N_2 = 5$

Find the s_x^2 and s_y^2

$$s_x^2 = \sqrt{\frac{\Sigma x^2}{N_1} - \left(\frac{\Sigma x}{N_1}\right)^2}$$

$$= \sqrt{\frac{3858}{5} - \left(\frac{130}{5}\right)^2}$$

$$= \sqrt{\frac{3858}{5} - (26)^2}$$

$$= \sqrt{771.6 - 676}$$

$$= \sqrt{95.6}$$

$$= 9.777$$

$$s_y^2 = \sqrt{\frac{\Sigma y^2}{N_2} - \left(\frac{\Sigma y}{N_2}\right)^2}$$

$$= 0$$

Degree of freedom = r + c – 2

$$= 2 + 5 - 2$$

$$= 5$$

Table value = 2.015

CONCLUSION

Calculated Value <Table Value

0 < 2.015

the calculated value 0 is less than the table value 2.015, fail to reject the null hypothesis (H_0). This means that there is no significant difference in the data.

U-Test Results

The U test, also known as the Mann–Whitney U test, is a non-parametric statistical test used to determine whether there is a significant difference between two independent groups. The test works by ranking all the values from both groups together and then calculating a U statistic based on the sum of these ranks. This statistic is then used to determine whether the observed differences between the groups are statistically significant.

Null Hypothesis (H_0):There is no significant relationship between age and employee satisfaction with the sickleave policy.

Abarna

Alternative Hypothesis (H_1):There is a significant relationship between age and employee satisfaction with the sickleave policy.

Age (x)	21	68	41	-	-
Sick leave policy(y)	37	42	13	22	16

Solution

Find R_1 and R_2

Data: 21, 68, 41, 37, 42, 13, 22, 16

Data in ascending order: 13, 16, 21,22, 37, 41, 42, 68

Rank for data: 1,2,3,4,5,6,7,8

$R_1 = 3 + 6 + 8 = 17$

$R_2 = 1 + 2 + 4 + 5 + 7 = 19$

Find U_1 and U_2

$U_1 = R_1 - \dfrac{n_1(n_1+1)}{2}$

$= 17 - \dfrac{3(3+1)}{2}$

$= 17 - \dfrac{3(4)}{2}$

$= 17 - \dfrac{12}{2}$

$= 17 - 6$

$= 11$

$U_2 = R_2 - \dfrac{n_2(n_2+1)}{2}$

$= 19 - \dfrac{5(5+1)}{2}$

$= 19 - \dfrac{5(6)}{2}$

$= 19 - \dfrac{30}{2}$

$= 19 - 15$

$= 4$

$U = 4$

Find Table Value

$N_1 = 3$

$N_2 = 5$

Level of significance = 5% = 0.05

Table value = 0

CONCLUSION

Calculated value > table value

$4 > 0$

The calculated U value was found to be 4, which is greater than the table value of 0. Since the calculated value exceeds the critical value, the null hypothesis is rejected. This indicates that there is a statistically significant difference in the perception of the sick leave policy among employees of different age groups.

F-Test Results

F test can be defined as a test that uses the f test statistic to check whether the variances of two samples (or populations) are equal to the same value. To conduct an f test, the population should follow an f distribution and the

samples must be independent events. On conducting the hypothesis test, if the results of the f test are statistically significant then the null hypothesis can be rejected otherwise it cannot be rejected.

Null hypothesis (H_0): There is no significant different between understanding about job role and different experience level. Alternative hypothesis (H_1): There is significant different between understanding about job role and different experience level.

Experience(x)	37	46	29	18	-
Understanding about job role(y)	52	66	0	7	5

Solution

x	Y	x²	y²
37	52	1369	2704
46	66	2116	4356
29	0	841	0

$(3,4)$
Table value= 6.59

CONCLUSION

Calculated value < Table value
1.085<6.59
calculated F-value (1.085) is much smaller than the table value (6.59), this suggests no significant difference between the variances of the two groups being compared.

FINDINGS AND SUGGESTIONS

Findings
The study also provided some significant findings when it comes to employees' job satisfaction, showing strengths alongside areas in need of attention. Overall, a large portion of employees believe that they feel happy at work: feeling good about their job, working conditions, and corporate culture. They reported fair compensation, career growth, and recognition were also important drivers of motivation and long-term desire to stay with the organization. The first key observation is that employees feel engaged when they can use their skills and abilities effectively. Maximizing skills: 73 percent of all respondents said they were generally satisfied with their opportunities to apply their skills, but a significant minority indicated that their talents were being underused. Some said they had concerns about clarity around career development and promotions. Although a large proportion of employees enjoy training and development initiatives, there is room for improved career progression frameworks among this group as well. Meaning, employees have a tendency to like a work-life balance, where they have the flexibility to balance their work with their own life needs/commitments. However, a significant number of respondents reported work hours and leave policies could be better aligned with well-being. In the same vein, job-related stress issues continue to afflict some workers, with a small percent of employees stating in a recent survey that they were unhappy due to pressures of workload and presence of high expectations. Similarly, recognition and motivation were found to be important factors according to their relevance to satisfaction. Workers appreciate recognition for their work, and those who feel valued tend to report greater job satisfaction. On the flip side, some employees feel like their hard work does not get noticed and the presence of structured recognition programs would help. As far as motivators that employees think drive engagement, monetary incentives, promotions, and appreciation initiatives are the ones that seem to matter to them. Most employees also praise the presence of medical benefits and workplace safety, stating that they trust that their employer cares about their health and physical safety. Technology was available and worked well enough, but some employees wanted faster solutions for tech issues; Summary Overall, employees are happy with their job roles and work environment. However, satisfaction levels could improve with better stress management, visibility on career progression, work-life balance programs and recognition programs. Organizations that proactively respond to these challenges will likely experience increased employee engagement, productivity and retention over the long term.

Suggestions

- Career development plans should be structured by organisations.
- Well-deserved recognition based on merit creates motivation and enhances performance.
- Make Safety a Priority and Leverage Technology to Boost Satisfaction
- Improved work-life balance policies lead to decreased stress levels.

CONCLUSION

Organizational success is heavily driven by job satisfaction, and job satisfaction influences performance, productivity, and employee retention. The study shows that employees who feel valued, recognized, and supported are more engaged in their roles and as a result of that a healthier work environment and better efficiency. On the contrary, if a worker is dissatisfied, he can result in higher turnover rates, workplace conflicts, stress, low morale, etc. The findings suggest that employees are very keen on receiving fair compensation, career development, recognition and a good work culture. The impact of these areas on companies that prioritise them is in the direct impact on workforce motivation and commitment. A crucial role in increasing employee happiness are also job security, effective leadership, and well-established work life balance policies. Thus, to be able to continuously monitor employee satisfaction and to adjust the policies or to create the atmosphere conducive to the well-being of the employee, organizations can always keep an eye on the feedback mechanisms. Clear promotion pathways, performance based rewards and an effective workplace support system can help employees remain motivated and engaged. In the long term, employee satisfaction is all about loyalty, higher efficiency and a thriving organizational culture. Motivated workforce is the backbone of a business and organizations that invest in employee's well-being enjoy long term benefits in the form of higher job performance, better teamwork as well as sustained company growth.

ABSTRACT

The environment within intensive care units (ICUs) is critical, with surfaces being regularly touched by both healthcare workers and patients. This frequent contact turns these surfaces into potential sources of infection, posing significant risks to patient safety and health outcomes. A prospective study design was employed, focusing on identifying the variety and spread of bacterial contamination across different surfaces frequently handled by healthcare workers. The study involved collecting 600 swabs from various surfaces within the ICU & wards of a tertiary hospital. These surfaces included bed rails, bedside tables, medical equipment, and other commonly touched areas. It was found that a significant proportion, 38.01%, harbored pathogens. Among these, the bacterium Staphylococcus aureus was the most prevalent, particularly on aluminum surfaces. This is especially concerning because S. aureus can cause a variety of infections, from minor skin issues to serious, life-threatening diseases, particularly in people with weakened immune systems. We found high levels of bacterial contamination on frequently touched objects, including many potential pathogens and normal bacteria. S. aureus was the most found bacterium.

INTRODUCTION

Nosocomial infections refer to diseases acquired by patients while receiving medical care in a healthcare facility. These infections are associated with prolonged hospital stays and are a significant risk factor for increased infection rates, leading to serious health complications[1]. Healthcare-associated infections (HAIs) are significant global health challenges that impact millions of patients within healthcare systems worldwide. Literature has long acknowledged the occurrence and adverse consequences of HAIs. Unfortunately, the incidence of HAIs continues to rise at a concerning pace [2]. The rate of healthcare-associated infections (HAIs) in the combined hospitals was 250 cases per 100,000 acute occupied bed-days [3]. According to the International Nosocomial Infection Control Consortium, the prevalence of HAIs in India is about 9.06 infections per 1,000 ICU patient days [4]. The profound effects of healthcare-associated infections (HAIs) extend to hospital mortality, prolonged hospital stays, and additional medical expenses. A study had suggested that the contaminated environment plays an important role in the transfer of the infection as several pathogens persist in the environment. Health care associated infection is one of the common causes of mortality and morbidity among hospitalized patients[5-6]. The patient environment comprises the immediate area surrounding a patient that can be accessed by both the patient and healthcare workers (HCWs) during care. This includes spaces within curtains, equipment, medical devices, furniture, telephones, personal belongings, and bathrooms in acute care settings. In intensive care units (ICUs), the patient environment extends to the entire room or bed space, along with all items and equipment within it. In multi-bedroom setups, it specifically covers the area enclosed by an individual's curtain[6]. Many strains of bacteria have been reported to the area where frequently touched site and surface near-patient patients such as bed rails, tray tables, telephones, bedside tables, patient chairs, nurse call buttons, doorknobs, push plates, bed rails, faucet handles, and IV pole are highly contaminated. These surfaces, often referred to as high-touch surfaces, play a critical role in the transmission of infections within healthcare settings[7-8].Both Gram-positive and Gram-negative pathogens often contaminate hospital surfaces, with Staphylococcus aureus being among the most common. It can be found on floors and door handles even after disinfection and can spread through fomites, causing infections. Nosocomial pathogens like MRSA, VRE, Pseudomonas spp., and Acinetobacter spp. are notably stable in hospital environments[9].Cleaning and disinfection of hospital environment surfaces are common measures to prevent the transmission of bacteria. But many bacteria persist within an hour even after cleaning and disinfecting the surfaces[10].Microorganisms vary in their resistance to disinfectants, so agents must be chosen carefully for their effectiveness. The study aimed to assess bacterial contamination on frequently touched but often overlooked surfaces used by healthcare workers, patients, and visitors.

METHODOLOGY

This prospective study was conducted to evaluate the distribution of microbial flora on high-contact surfaces & determine the pattern of bacterial contamination according to surfaces material. The study was undertaken at CHARUSAT Healthcare and Research Foundation (CHRF), Anand ,Gujarat, India for five months. The hospital is a 200 bedded tertiary care hospital having medical ward , surgical ward &Intensive care unit providing variety of care to patient. The domestic staff performed daily routine cleaning wet mopping during the morning between 6am to 10 am and deep cleaning during the night between 9pm to 11pm times. Patient's bed side rails, Patient's bed remote control, Cardiac monitors , Patient's bedside table, Cardiac table, Treatment trolley, Ventilators are wiped twice a day with 70% Isopropyl alcohol swabs. But there is no practice to disinfect the Surfaces like, Door handles, Computer keyboard, Patient's cubicle curtains: facing towards the patient's side Light switches, Nurses chair arm, Nurses phone , Patient files, IV stand. To determine the pattern of bacterial contamination according to surface materials all inanimate surfaces are classified into Aluminum surface, Wooden Surface, Plastic surface, Paper surface, &Fabric surface

Glory Waghela *et al.,*

Specimen collection

A total of 600 samples were collected from various surfaces like Patient's bed side rails Patient's bed remote control, Patient's cubicle curtains, Patient's bedside table, Cardiac table Cardiac monitors, Door handles, Computer keyboard, Light switches, Nurses chair arm, Nurses phone, Treatment trolley, Patient files, IV stand, Ventilators. Most of these sites are accessible and commonly used by patients, visitors, and healthcare professionals. The sample was collected through Sterile swabs wet in distilled water were used for sample collection by rubbing over the test surface. The study included the most frequently occupied departments, such as the Intensive Care Unit and Medical and Surgical wards. Swabs used for sampling were approximately 1.5 cm long.

Microbiological Analysis

Swab sampling was done from each predetermined surface area. The swabs were cultured in Nutrient and chocolate agar contact plates (diameter- Petri) to identify the bacterial colony. All plates were incubated at 37degree C at 24 hours and 48 hours.

Ethical consideration:

There is no human participation in the present study hence ethical approval is not required.

RESULTS

Environmental sampling is essential for detecting microbial contamination in different settings, including healthcare facilities, laboratories, and public spaces. In this study, 600 surface samples were collected from various locations to evaluate bacterial contamination and identify potential pathogens. Microbiological analysis revealed bacterial growth in 229 samples (38.1%), showing that over one-third of the tested surfaces were contaminated. Meanwhile, 371 samples (61.83%) exhibited no bacterial growth under the given culture conditions (Table 1).Further testing of the 229 contaminated samples led to the successful isolation of 184 distinct bacterial strains

Bacterial Contamination and Distribution Across Surface Samples

The microbiological analysis of surface samples revealed a significant presence of bacterial contamination across various sites. Among the identified bacterial species, Staphylococcus aureus emerged as the most predominant bacterium, isolated from 14 distinct locations (Table 2). A detailed examination of S. aureus distribution indicated that the highest contamination was observed on door handles, where 26.7% (27/101) of the isolates were recovered. Other frequently contaminated surfaces included switch buttons (14%; 14/101), IV stands and bedside rails (12%; 12/101 each), and computer keyboards (9%; 9/101). These findings highlight the high-risk nature of frequently touched surfaces in facilitating microbial transmission.

Prevalence of Gram-Negative Bacteria

In addition to S. aureus, Gram-negative bacteria such as Acinetobacter species and Escherichia coli (E. coli) were also identified. Notably, light switches exhibited contamination with multiple bacterial species, including S. aureus, E. coli, Klebsiella pneumoniae (K. pneumoniae), Staphylococcus epidermidis (S. epidermidis), as well as bacteria belonging to the genera Enterococcus and Acinetobacter. The presence of these pathogens suggests that electrical switches serve as critical reservoirs for bacterial transmission, necessitating targeted cleaning interventions.

Surface Material and Bacterial Contamination

Further analysis of contamination patterns across different departmental surfaces indicated that *S. aureus* was the most frequently isolated bacterium on aluminum surfaces (Table 2). Additionally, both aluminum and plastic surfaces harbored a diverse range of bacterial species, underscoring the potential role of these materials in sustaining microbial growth. The widespread presence of bacteria on these surfaces highlights the need for strict infection control measures, including routine disinfection and improved hand hygiene compliance among healthcare workers and visitors.

DISCUSSION

Hospitals are environments where bacteria can easily spread, increasing the risk of infections, particularly among vulnerable patients. Some of the most problematic bacteria found in healthcare settings include Clostridium difficile, Klebsiella pneumoniae, Acinetobacter species, Escherichia coli, Enterobacter species, Pseudomonas aeruginosa, and Staphylococcus aureus. These pathogens often persist on environmental surfaces, making them potential sources of hospital-acquired infections (HAIs) (11). Contaminated surfaces don't just affect patients and healthcare workers— they can also contribute to the spread of bacteria into the broader community.

Contamination of Frequently Touched Surfaces
Hospital equipment and everyday objects that are frequently touched by healthcare workers, patients, and visitors often harbor bacteria. This study found that S. aureus was particularly prevalent on door handles, which are used constantly throughout the day. Among the sampled door handles, 26.7% (27 out of 101) were contaminated with S. aureus, highlighting the potential for bacterial transmission. A similar study by Saadi, Somia et al. found that 15.7% of door handles in hospital departments tested positive for S. aureus (12). Door handles are frequently touched, especially when staff members enter or leave a department or during shift changes. This study, conducted in active hospital wards and ICUs at CHARUSAT Hospital, observed that healthcare workers often wash their hands at the end of their shift before leaving their departments. However, they may unknowingly recontamination their hands by touching door handles when exiting. Interestingly, many do not wash their hands again after using the door handles, which can contribute to the spread of bacteria within the hospital and beyond. In addition to S. aureus, E. coli (4%) and Acinetobacter species (1%) were also found on door handles—both of which are known to cause hospital-acquired infections. This finding aligns with research by Oluwatoyin Bola Famojuro et al., who discovered E. coli (12.5%) and Acinetobacter species (4.2%) on door handles in Olabisi Onabanjo University Teaching Hospital (13).

IV Stands: A Hidden Reservoir of Bacteria
IV stands, which are frequently used by both healthcare workers and visitors, were also found to be contaminated. Out of 45 IV stand samples collected in this study, 27% (12 out of 45) tested positive for S. aureus. This contamination rate is lower than the findings of Dharm Raj Bhatta et al., who reported a much higher contamination rate of 58% (8 out of 14) (14). Since IV stands are regularly handled during patient care, they can serve as reservoirs for bacterial transmission. These results underscore the need for regular and thorough disinfection of IV stands to prevent the spread of infections.

Computer Keyboards as a Potential Source of Infection
Another major concern is the contamination of computer keyboards, which healthcare workers use daily to input patient data. Unlike smooth surfaces, keyboards have many crevices, making them difficult to clean and disinfect effectively. In this study, 20% (9 out of 45) of the collected keyboard samples tested positive for S. aureus. This finding is consistent with research by Ramphal et al., which showed that frequently touched hospital surfaces—such as floors, beds, furniture, doorknobs, and light switches—are often not adequately disinfected (15). Given the role of computer keyboards in daily hospital operations, regular cleaning with appropriate disinfectants is crucial to minimizing contamination.

Bacterial Persistence on Different Surface Materials
The study also examined bacterial contamination on various surface materials, including aluminum, polyester, plastic, and wood. It was found that S. aureus was most commonly detected on aluminum surfaces. This observation supports the findings of KH, Saka, AA, Akanbi, Obasa, Tope, Raheem, Ra, and Oshodi, Adebola, who reported that S. aureus remained the dominant pathogen on aluminum surfaces even after four hours (9). The ability of bacteria to persist on different materials suggests that specific cleaning protocols may be needed for different surfaces to ensure effective disinfection.

CONCLUSION

We concluded that the ICU surfaces are contaminated with staphylococcus aureus is found among frequent touched surface like Light switches, door handle, IV stand, computer keyboard and treatment trolley which is a potential source of illness and infection among ICU patients therefore effective hand hygiene, regular cleaning and disinfection should be focused on the highly bacterial contaminated surfaces or frequent touch surface.

ABSTRACT

By using DFT calculations, optimization, bond parameters, mulliken charges, electrostatic regions, global descriptive parameters and hyper conjugations with its stabilisation energies have been calculated for the titled compound. The titled compound has been prepared by microwave irradiation method to achieve less reaction time and good yield. IR and NMR spectra have been recorded for its confirmation of formation. The calculated parameters have been good agreement with literature values and the present molecule has been predicted as it may act as good NLO material due to its higher polarizabilities and dipole moments than standard NLO material (Urea). The ADMETox predictions have been carried out in order to compile its drug-liking behaviour followed by target predictions are screened.

Keywords: 1-(2,4-dichloro-5-fluorophenyl)ethenone, IR & NMR spectra, DFT calculation, Druglikeness and Target prediction

INTRODUCTION

Chalcones or 1,3-diarylprop-2-en-1-ones are versatile compounds in medicinal chemistry, known for their diverse biological activities [1], including antibacterial [2], antiviral [3] and anticancer [4] properties. Their synthesis often involves the Claisen-Schmidt condensation method, leading to various derivatives with enhanced efficacy. Recent

95383

studies utilize computational techniques like Density Functional Theory (DFT), molecular docking, and ADMET (Absorption, Distribution, Metabolism, Excretion, and Toxicity) analysis to explore their potential further. DFT calculations are employed to predict the electronic properties of chalcones, aiding in the design of more effective derivatives. Chalcones are a class of flavonoids characterized by a three-carbon α,β-unsaturated carbonyl system. They serve as precursors to flavonoids and are found in various plants, contributing to their medicinal properties. The most common method for synthesizing chalcones is the Claisen-Schmidt condensation, which involves the reaction of acetophenones with aldehydes. Chalcones exhibit significant antibacterial properties, making them potential candidates for developing new antibiotics. Some chalcone derivatives have shown effectiveness against viral infections, including those caused by HIV and influenza. IR and NMR spectra are used to identify and formation of chalcone moiety. These compounds generally predicted to show better ADMET properties leading to good drug-liking behaviour [5]. The molecular docking studies extended their biological potent in well manner due to its interactions with various enzymes. Molecular docking technique is used to evaluate the binding affinity of chalcones to various biological targets, providing insights into their mechanism of action.

MATERIAL AND METHODS

The compounds used in the synthesis of the present chalcone were purchased from Aldrich and used without purification. Melting point was determined on the ESICO microcontroller based melting point apparatus (230V) and is uncorrected. The IR spectra were taken on a JASCO FT/IR-4700 spectrometer. 1H and 13C-NMR were recorded on the Bruker Avance 400 MHz FT-NMR spectrometer in CDCl₃. We performed thin-layer chromatography using silica gel Merck 60 F-254.

Synthesis of (E)-3-(4-(benzyloxy)phenyl)-1-(2,4-dichloro-5-fluorophenyl)prop-2-en-1-one

The present compound was synthesized through a microwave-assisted technique, selected for its efficiency in terms of shorter reaction times and superior yield, as indicated by existing methods in the literature. To begin, 4-benzyloxybenzaldehyde and 1-(2,4-dichloro-5-fluorophenyl)ethanone were combined in equal proportions and dissolved in 20 mL of absolute ethanol, with a few drops of 10% NaOH solution added [6] (**Scheme 1)**. The reaction mixture was then exposed to microwave irradiation at 640 W for 2 minutes, and the reaction's progress was monitored by TLC. Following the completion of the reaction, the resulting product was poured into ice-cold water, filtered, and recrystallized from hot ethanol.

RESULTS AND DISCUSSION

IR spectral analysis
The intense peak at 1649.80 cm⁻¹ is due to νCO stretching. The carbonyl peak [7]was observed at a lower wave number than a normal ketone carbonyl peak in the infrared spectra due to the existence of a ketonic carbonyl group conjugated with the olefinic carbon-carbon double bond. The olefinic group (-C=C-) is observed at 1585.2 cm⁻¹. The aryl CH stretches are observed at 3064-2915cm⁻¹ and the bending vibration at 1090.55cm⁻¹indicated the CH=CH out of plane modes. The CH *in-plane* and *out of plane* modes are observed at 1120.44 cm⁻¹ and 735.71cm⁻¹. The stretching at 1249.65cm⁻¹ responds the C-O-C stretching.

NMR spectral analysis
The ¹H-NMR spectrum of titled compound is illustrated in Figs. 2 and 3. The NMR analysis was taken by dissolving the sample in CDCl₃ with TMS as an internal standard. The NMR spectrum confirms the present chalcone formation. The proton Hα appears as a doublet (δ 6.967 and J=16Hz) represent the hydrogen atom available next to the C=O in the 1 H-NMR spectra [8]. Another doublet at δ 7.537ppm with J=16Hz representing the adjacent H atom Hβ. These values correspond to the double-bond trans that is generally appeared in natural chalcones [7]. The δ value of Hα and Hβ is slightly shifted; this is due to the conjugation effect with the aromatic rings and C=O [9]. The proton shifts

95384

at 5.119ppm indicated the methylene protons. The three aromatic ring protons appear in different positions 6.992-7.540ppm. In the ^{13}C-NMR spectrum (Fig. 3), the C=O chemical shift appeared at 191.16ppm, relative to other carbon atoms due to environmental factor and increased electro negativity of the oxygen atom [10]. The methylene group was appeared at δ 70.17ppm.The carbon resonates at 123.19ppm responded to C_α and chemical shift value at 147.06ppm responded the C_β carbon of vinyl group. The chemical shift at 161.44ppm corresponded to high electronegative fluorinated carbon. All the remaining aryl carbons appeared at 115.46ppm to 136.22ppm in ^{13}C NMR spectra.

DFT analysis
Molecular geometry
The 4BPMP molecule was analyzed in the current examination using the density functional theory method with a B3LYP/6-311++G(d,p) basis set to build up different structural and chemical parameters. 4BPMP is a non-planer molecule with C1 point group symmetry, as predicted by the DFT analysis. Fig. 1 depicts the optimized molecular structure. The bond length (Table-1) for C=O (22O-19C) is 1.256 Å. This is typical for a double bond between carbon and oxygen in a carbonyl group, indicating a strong bond and a planar structure due to conjugation. The C=C bonds (e.g., 20C-21C at 1.355 Å and 4C-5C at 1.381 Å) are slightly longer than a typical C=C bond (usually around 1.33 Å), likely due to conjugation with the carbonyl and possibly the effects of steric hindrance and electronic interactions with substituents. The C-Cl bonds (e.g., 41Cl-6C at 1.804 Å) are longer than typical C-H or C-C bonds due to the larger atomic radius of chlorine and the presence of electro negativity. The C-F bond (3C-19C at 1.509 Å) is relatively short, reflecting the strong bond between carbon and fluorine, and the high electro negativity of fluorine, which pulls electron density towards itself. Bond lengths such as 2C-3C (1.401 Å) and 10C-11C (1.404 Å) reflect standard C-C single bonds. The length is slightly increased in conjugated systems like this, where the bond can be partially double-bonded due to electron delocalization. The bond angles around conjugated bonds like 4C-5C-6C (121°) and 1C-2C-3C (122°) reflect the sp² hybridization of carbon atoms, where bond angles are close to 120°, typical for trigonal planar geometry. The bond angles are largely influenced by sp² hybridization (around 120°), with slight deviations due to the presence of electronegative substituents (Cl, F, O). The conjugation between the carbonyl and vinyl groups tends to keep the molecule planar, aiding in efficient electron delocalization. The dihedral angle for19C-20C-21C-14C is calculated as 180° which indicates the E-conformation of themolecule.

FMO's Study
According to the Frontier Molecular Orbital (FMO) theory, the reactivity of molecules is primarily governed by the interaction between the Highest Occupied Molecular Orbital (HOMO) and the Lowest Unoccupied Molecular Orbital (LUMO) of the reacting species [11]. The energy of the HOMO (E_{HOMO}) is often associated with a molecule's ability to donate electrons. Molecules with higher E_{HOMO} values typically have a stronger tendency to donate electrons to an electron-accepting species with a lower LUMO energy [12]. The energy gap (ΔE) between the HOMO and LUMO is an important indicator of molecular reactivity, particularly in interactions with biological systems such as amino acid residues in proteins. A smaller ΔE indicates higher reactivity, which often correlates with an increased inhibition efficiency (IE). Molecules with smaller energy gaps are generally more polarizable and exhibit higher chemical reactivity, making them more likely to be classified as "soft" molecules with lower kinetic stability. As shown in Table-2, in our study, the compound under investigation displays a lower ΔE value, which suggests increased reactivity and a higher likelihood of interacting with biological systems. The pictorial representation of HOMO and LUMO are given in Figure-2. The global softness (σ) and absolute hardness (η) values for this molecule were calculated to be 0.563 eV and 1.777 eV, respectively. The chemical potential (π) of an electron relates to its ease of removal and is closely tied to the molecule's electronegativity. The global electrophilicity index provides insight into a molecule's ability to accept electrons, with values greater than 1.5 eV indicating strong electrophilic character. In this case, the global electrophilicity index of the investigated compound is 5.738 eV, suggesting that the molecule behaves as a strong electrophile. This finding supports the notion that the compound is likely to undergo nucleophilic attack, emphasizing its potential reactivity in biological interactions.

Dipole moments and hyperpolarizabilities

The organic NLO material demonstrates significant nonlinear optical (NLO) properties, primarily due to its high molecular hyperpolarizability, which is a crucial factor for considering it as a potential NLO material [13]. The NLO characteristics, including dipole moment, polarizability, and hyperpolarizability, were calculated for the present molecule using the DFT method. The results show values of 7.128 D, 25.540×10^{-24} esu, and 3.982×10^{-30} esu, respectively. These values, along with their tensor components, are provided in **Table-3**, based on the Gaussian output data. The calculated β values for the compound is ten times larger than those of Urea ($\beta = 0.31 \times 10^{-30}$ esu), which serves as a standard reference material for comparison [14]. In addition to the high β value, the calculated dipole moment (μ) and polarizability (α) further indicate that the grown crystal could be a promising candidate for future nonlinear optical applications.

Analysis of Mulliken charges

Mulliken population analysis is a method used to determine the distribution of electronic charges on individual atoms within a molecule, based on its molecular orbitals. This charge distribution can be valuable in understanding the formation of donor-acceptor pairs and charge transfer interactions within the molecule. The charge distribution for the chalcone compound under investigation is illustrated in Fig. 10 and summarized in Table-4. Mulliken charge calculations are a key aspect of quantum chemical analyses, helping to elucidate the electronic characteristics of the molecular system [15]. In the chalcone molecule, most carbon atoms carry positive charges, indicating their role as electron acceptors, while oxygen atoms generally exhibit negative charges, making them electron donors. The carbon atom at position C5 shows a particularly high positive charge as, likely due to its bonding with the electronegative fluorine atom (F42). Similarly, C11 also carries a higher positive charge, which can be attributed to its connection with the electronegative oxygen atom (O25). Notably, O25 has the most negative charge of all the atoms in the molecule, which is influenced by the presence of the electron-donating benzyl group attached to it. The column chart model of Mulliken charges of each atoms is given in Figure-3.

Molecular electrostatic potential

The molecular electrostatic potential (MEP) is a crucial tool for identifying regions susceptible to electrophilic and nucleophilic attacks based on the distribution of electrostatic potential. Positive electrostatic regions are typically associated with nucleophilic attack sites, while negative regions are more likely to attract electrophilic attacks. The electrostatic potential is visually represented using color-coding: blue indicates positive regions, red signifies negative regions, and green marks areas with zero potential [16-18]. The positive electrostatic potential increases in the sequence from red to yellow, green, light blue, and finally blue. As shown in Figure-4, the hydrogen atoms on the molecule's surface exhibit the highest positive electrostatic potential, making them favorable sites for nucleophilic attack. Conversely, the most negative electrostatic regions are found around the carbonyl oxygen (O1), the benzyloxy oxygen (O2), and within the phenyl and phenol rings, suggesting that these areas are prone to electrophilic attack. The carbonyl oxygen, in particular, shows a high electron density (represented by a denser red color), indicating its significant role in biological activity, likely through hydrogen bonding interactions with the target.

NBO analysis

NBO analysis provides a clear description of the stabilizing interactions between filled and unoccupied orbitals and destabilizing interactions between filled orbitals [19, 20]. The energy values for the interaction between the filled i and vacant orbital j, calculated by the second order perturbation theory have been tabulated in Table-5. The intramolecular hyper conjugative interaction of σ(N1-C2) distribute to σ * (C6-H21) resulting to a stabilization of 1.64KJ/mole. This enhanced further conjugate with antibonding orbital of π * (C7-O8) in which stabilization of 2.99KJ/mole. In the case of σ (C11-H26) orbital, the σ * (C2H15), (C12-H29) show stabilization energy of 17.17KJ/mole and 2.23KJ/mole respectively. The magnitude of charges transferred from O8 LP(1) (N1-C7) and O8 LP (2) (C7-N9) shows that stabilization energies are 1.83 KJ/mole and 26.14KJ/mole respectively. Similarly electron donating from N1 LP (1) to the antibonding (C2-C3) (C2-H16) (C6-H22) resulting stabilization of (~5KJ/mole) the same N1LP (1) with (C7-O8) leads to a strong stabilization of 62.5KJ/mole. This is the highest energy from all interaction. NBO (Natural Bond Orbital) analysis is a powerful tool used to understand the bonding interactions between atoms in a

95386

molecule. In the context of present compound, 2,4-dichloro-5-fluorophenyl-4-benzyloxy chalcones, NBO analysis can help in identifying the electron density interactions between donor (bonding) and acceptor (anti-bonding or lone pair) orbitals, along with their energy values. The interaction between C1-C2 (Bond) and Cl41 (anti-bonding), with an energy value of 20.67 kJ/mol, indicates a relatively weak interaction between the bonding orbital of C1-C2 and the anti-bonding orbital of Cl. Similarly, interactions such as C3-C4 (BD) and C19-O22 (BD*) with 55.65 kJ/mol show a stronger interaction, as expected from interactions involving a carbonyl oxygen. The values of E(2) (in kJ/mol) describe the energy associated with electron density delocalization between these orbitals. Higher values indicate more significant interactions that stabilize or destabilize the molecule. LP(2) on O22 (carbonyl oxygen) interacts with *BD(1)** (C3-C19) with an E(2) of 77.36 kJ/mol. This suggests significant electron delocalization, which is typical for conjugated systems with a carbonyl group. LP(2) on O25 (benzyloxy oxygen) interacts with *BD(2)** (C10-C11) with a much stronger E(2) value of 125.90 kJ/mol, indicating a very strong interaction that might enhance the conjugative stabilization of the molecule. The lone pairs on electronegative atoms like oxygen (from the carbonyl group or benzyloxy group) can engage in stabilizing interactions with electron-deficient centers, contributing to the molecule's overall stability. The carbonyl oxygen in chalcones often participates in strong electron-withdrawing effects and can interact with conjugated systems, enhancing the system's reactivity. Its interactions with bonding orbitals (C3-C19 and C19-O22) suggest a conjugative stabilization and influence on the electronic structure. The benzyloxy group also plays a role in stabilizing the structure via interactions with nearby bonds, particularly with C10-C11 (E(2) of 125.90 kJ/mol). This contributes to the conjugative delocalization that is often seen in chalcone derivatives, giving rise to enhanced stability and electronic properties. Chlorine and fluorine halogens participate in weaker interactions (compared to the oxygen atoms) but still affect the electron distribution in the molecule. Chlorine, with its larger atomic radius, shows weaker donor interactions, while fluorine contributes through electron-withdrawing effects due to its high electronegativity.

Drug-likeness and ADMET prediction

This chalcone's molecular weight suggests it is a moderately sized molecule, making it potentially suitable for drug development [21]. A LogP value of 6.6076 indicates the compound is highly lipophilic. While this may enhance membrane permeability, it could also lead to poor aqueous solubility, which is a challenge for bioavailability [22]. The presence of 6 rotatable bonds suggests some flexibility in the molecule, which is typical for many bioactive compounds [23]. Chalcone has 2 hydrogen bond acceptors and no donors, which is a favorable balance. Having hydrogen bond acceptors (but not donors) typically supports interactions with biological targets and improves solubility without causing excessive molecular rigidity [22].The chalcone shows promising bioavailability with good intestinal absorption [24] but poor skin permeability [25] and CNS penetration. The compound is metabolized by CYP3A4 and interacts with multiple cytochrome P450 enzymes [26], indicating potential for drug-drug interactions. Its cardiac safety could be a concern due to hERG II inhibition, and its relatively low water solubility and protein binding may influence its pharmacokinetics. Toxicity data suggest it is not mutagenic and has low acute toxicity in rodents [27], but further investigations are necessary for a comprehensive safety profile.

Target Prediction

The target prediction for 2',4'-dichloro-5'-fluorophenyl-4-benzyloxyphenylprop-2-en-1-one suggests several potential biological targets based on the probability values provided. Each target listed has a probability of 0.1133, indicating an approximately equal likelihood of interaction with the compound, based on the data provided. The present compound 2',4'-dichloro-5'-fluorophenyl-4-benzyloxyphenylprop-2-en-1-one shows potential interactions with a wide variety of targets, including, Oxidoreductases like MAOB and MAOA, which are involved in neurotransmitter regulation. It also hasinflammation-related targets such as COX-2 (PTGS2) and P2X7, which are involved in inflammatory pathways. GPCRs, including orexin receptors, cannabinoid receptors, and stress-related receptors like CRHR1. Another target of transporters like glycine transporter SLC6A9, influencing neurotransmission. It also targeted kinases and phosphodiesterases that regulate cellular signaling pathways. Each of these target classes may indicate that the compound could have therapeutic implications in areas like neurology, inflammation, pain management, and stress regulation. However, the relatively uniform probability (0.113) suggests that these

interactions are relatively equal and should be further explored with additional computational or experimental studies to confirm which targets the compound most strongly.

CONCLUSION

Present chalcone has been synthesised using microwave irradiation method to get higher yield with low time consumption. It has been characterized by IR and NMR spectra. Its DFT calculations have been calculated by B3LYP/6311++G(d,p) basis set with its optimized geometry. The obtained bond parameters are agreed with literature values. FMO study revealed that it has a low HOMO-LUMO gap as it is a soft molecule and can undergo chemical reactions easily and can expect better biological applications. Due to its higher electrophilicity index, strongly act as electrophile. NBO analysis proved its higher hyper conjugations within the molecule with higher stabilization energies cause its activeness. Due to its hyperpolarizability and dipole moments, can act as NLO material. MEP and Mulliken charges displayed its electron rich centre and individual charges. Computational drug likeness and target predictions say that the present molecule is suitable for several biological applications which interact some amino acid residues responded to antimicrobial, antidiabetic and anti-inflammatory tissues.

ABSTRACT

This is a bibliometric analysis of pose estimation methods in sports performance that examines 154 sources and 345 documents from 2006 through 2025. The binned time-series analysis showcases the year-on-year rise in research activity, with the authors summarizing the progress level as presented in Table 1, demonstrating the development of the pose estimation technologies. Major contributors are identified, including key journals including SENSORS and IEEE ACCESS, universities such as the University of Toronto. These pose estimation tools can be used in different sports to improve the analysis of performance, training and prevention of injuries. The authors also proposed recommendations to improve partnerships, increase as well as develop real-time models, enlarge datasets, implement wearables, augment open access and fund superior hardware to strengthen progress in this area.

Keywords: Pose estimation, Sports Sciences, Bibliometric Analysis, R studio.

INTRODUCTION

Pose estimation is one of the most important areas under computer vision which has been advancing tremendously in the past 10 years (Sreedev & Ramakrishnan, 2024), especially in terms of sports performance analysis. This technique predicts the coordinates of pose points on the human body using images or videos (Barla, 2021) and can be used to analyze movement on a more detailed level. By providing precise motion data, pose estimation has become a pivotal tool in sports science, enabling advancements in training protocols, injury prevention, and

95394

performance optimization (Rajesh & Janarthana, 2024). Typical works in this area have reported the ongoing, interdisciplinary research around pose estimation (Sreedev & Ramakrishnan, 2024), with applications in diverse domains, including, but not limited to human-computer interaction, animation and robotics. Across the field of science in sports, pose estimation technologies have played a pivotal role in delivering accurate assessments of joint angles alongside velocities and accelerations (Williams et al., 2021), which collectively contribute to improvement of athlete mechanics and development of customized training plans. For instance, Nakamura et al. (2022) showed the usage of pose estimation to analyze the dynamics of athletes in real time with feedback that could be used to improve performance. Deep learning has greatly contributed to the evolution of pose estimation approaches. CNNs, as summarized by Toshev and Szegedy (2014), have lead to significant improvements in accuracy and speed in solving pose estimation models. Real-time data analytics and feedback are critical for making adjustments on-the-go which is where these improvements make a difference. Additionally, pose estimation has further expanded into wearable and motion capture systems, which can offer detailed performance metrics (Pfister et al., 2015).

The world of sports in India is rife with a desire to use pose estimation for improving player performance. Research by Patel and Sharma (2022) and Reddy and Singh (2023) have outlined the niche opportunities and the potential in Indian sports space. Internationally, the rapid development of pose estimation can be closely tied to the construction of large annotated datasets, along with the emergence of advanced models, including the Cascaded Pyramid Network put forward by Chen et al. multi-person pose estimation, Generative Adversarial Nets (GANs) Framework (2018) The objective of this paper is to perform an extensive bibliometric analysis of pose estimation applied to sports performance research by using the Scopus database to explore the research scenery, leading contributors, and trends/patterns influencing the discipline over the years. This serves as an important reference point for researchers, practitioners, and policy makers interested in the potential developments and applications of pose estimation in sports science.

REVIEW OF LITERATURE

Pose Estimation
Pose estimation is one of the most basic task of computer vision which is to predict the locations of key points on human body from images or videos. And, because the scope of this technique, including human-computer interaction, sports performance measuring, animation, etc., it has become genuinely popular. Pose estimation aims to understand human body poses, movements, and behaviors that can express themselves in 2D or 3D (Samkari et al., 2023).

Traditional Methods
Traditional computer vision based methods were most commonly used in the early days of pose estimation, where we had hand crafted features and models that could detect/ localize joints in the body. Traditional methods like pictorial structure model used prior knowledge of human body and spatial relationships among parts (Gong et al., 2021). Geometric approaches are poorly centered in convenient geometric parameters related to pixels; hence, they cannot be optimally designed (Badiola-Bengoa & Mendez-Zorrilla, 2021), and traditional techniques faced difficulties in comprehending convolutional layers, blending comprehensive variants in pose, occlusions, and overlapping joints, and are not efficient for real-world applications.

Deep Learning Approaches
Deep learning revolutionized pose estimation and made it more dust and efficient. Convolutional Neural Networks (CNNs) provide the basis for most contemporary pose estimation models. One of the first to apply deep learning to human pose estimation was the DeepPose model (Toshev & Szegedy, 2014), which used CNNs to directly regress the locations of body joints from images (Toshev & Szegedy, 2014). Later models have expanded this initial framework, utilizing multi-stage architectures and taking advantage of large annotated datasets to improve performance (2018; Chen et al, 2018).

Applications in Sports Performance

Pose estimation has a wide range of applications in the analysis of sports performance. With accurate readings of the angles, velocities, and accelerations of relative joints, pose estimation systems allow for fine movement analysis in sports. It is important for optimizing practices, designing individualized training regimens, and avoiding injuries (Williams et al., 2021). For example, Nakamura et al. derived individual movement analysis in real-time by pose estimation to improve athletes' performance instantaneously (Nakamura et al., 2022).

Challenges and Future Directions

Despite continued improvements, pose estimation remains a challenging problem. However, occlusions, scale differences, and complex scene compositions can introduce challenges that hamper the accuracy of pose estimation models and variants. The computational complexity of deep learning models is also a barrier for real-time applications. Future work will probably address these issues with more robust models and advancing technology (Samkari et al, 2023). Pose estimation is an exciting application in the interface between sports science and technology. Deep learning based pose estimation models have shown great promise in this regard as they would continue to advance and become more accurate and efficient over time and may thus find even wider applications in various sports and other domains. This review summarizes the vast strides made in the field and the potential for future laboratory and clinical companies.

OBJECTIVES OF THE STUDY

1. To provide a comprehensive overview of the research landscape of pose estimation techniques in sports performance, identifying key trends, growth patterns, and the evolution of the field over time.
2. To recognize the most influential journals, and institutions, contributing to the advancement of pose estimation technologies in sports performance.
3. To explore the diverse applications of pose estimation tools across various sports, highlighting their impact on performance analysis, training, and injury prevention

METHODOLOGY

The study utilized the Scopus database for its comprehensive coverage of peer-reviewed literature. Initially, a keyword search using "Pose estimation" yielded 22,451 documents. To refine the search, the field was narrowed to sports, resulting in 1,245 documents. Further filtering based on document type included only articles (570 documents), excluding conference papers (617), reviews (27), book chapters (14), conference reviews (10), data papers (3), short surveys (2), retracted documents (1), and letters (1). Language criteria included only English documents (556), excluding Chinese (12), German (1), and Russian (1). Open access criteria included all open access documents (353), excluding gold (249), green (98), hybrid gold (41), and bronze (23). Finally, the publication stage was refined to include only final publications (345), excluding articles in press (8). The final dataset of 345 documents was exported in BibTeX format and analyzed using the Biblioshiny package in R Studio, a web interface for bibliometric analysis that allows for comprehensive analysis and visualization of bibliometric data. The analysis included descriptive analysis to provide an overview of publication trends, citation analysis to identify the most cited documents and influential authors, co-authorship analysis to explore collaboration patterns, keyword analysis to identify frequently used keywords and emerging research themes, and thematic mapping to visualize the evolution of research topics over time. This methodology outlines the systematic approach taken to filter and analyze the relevant literature on pose estimation techniques in sports performance research.

RESULTS

MAIN INFORMATION ABOUT THE DATA

To analyze pose estimation methods within sports performance research, we conducted a bibliometric analysis using Scopus from 2006 through 2025, with 154 sources including journals and books, and 345 documents. It is also

important to note here that the research output is growing at an annual rate of 3.72% where the mean of the documents featured in the dataset are 1.92 years meaning that the research is quite recent. The average number of citations per paper is 12.53, which indicates the quality of the research. A total of 2552 Keywords Plus and 1000 Author's Keywords were analyzed. 1327 authors contributed to these publications, and 15 of them have single-authored documents. There are 15 single-authored documents in total, and on average, each document has 4.55 co-authors, showcasing a high level of collaboration. Additionally, 26.67% of the documents involve international co-authorships, demonstrating significant global collaboration. Regarding document types, there are 342 articles and 3 documents labeled as 'article article', which might be a data entry error or a specific categorization. Overall, this analysis highlights the growth, collaboration, and impact of research on pose estimation techniques in sports performance, showing a steady increase in publications and a high level of international collaboration. The annual production data (Figure 1) for pose estimation techniques in sports performance research reveals a clear trend of increasing research activity over the years. From 2006 to around 2014, the number of articles published each year was relatively low and sporadic. However, starting from 2015 onwards, there is a noticeable increase in the number of articles published annually. The most significant growth can be observed from 2019 onwards, with 9 articles published in 2019, increasing to 26 in 2020, 39 in 2021, and surging to 69 in 2022. The peak was reached in 2023 with a total of 95 articles published. The data for 2024 and 2025 shows a slight decline with 86 and 2 articles respectively, which could be due to incomplete data collection for these years or other external factors. Overall, the trend indicates a growing interest and research activity in pose estimation techniques in sports performance over the past two decades. Bradford's Law (Table 1) states that journals in a field can be divided into a core set of journals that are most frequently cited and several other sets or zones with decreasing frequency of citations. In this analysis of the top 10 sources for pose estimation techniques in sports performance research, Zone 1 includes the top six sources: SENSORS (46 articles), IEEE ACCESS (23 articles), APPLIED SCIENCES (SWITZERLAND) (18 articles), SCIENTIFIC REPORTS (10 articles), COMPUTATIONAL INTELLIGENCE AND NEUROSCIENCE (9 articles), and SENSORS (SWITZERLAND) (9 articles). These sources collectively contribute to a cumulative frequency of 115 articles, indicating that these journals are the most influential and frequently cited in this research area.

Zone 2 includes the next four sources: JOURNAL OF BIOMECHANICS (8 articles), PLOS ONE (8 articles), COMPUTER VISION AND IMAGE UNDERSTANDING (6 articles), and ELECTRONICS (SWITZERLAND) (5 articles), contributing to a cumulative frequency of 27 articles. While still important, these journals are less frequently cited compared to those in Zone 1. Overall, the distribution of sources follows Bradford's Law, with a small number of journals in Zone 1 contributing to a large portion of the total articles published. This highlights the concentration of research output in a few key journals within the field of pose estimation techniques in sports performance research. The (Table 2) first 10 affiliations collaborating through pose estimation techniques in sports performance are led by University of Toronto with most produced articles (16). Next up is the University of Bath with 13 articles. However, seven articles have been published by Johns Hopkins University, and six articles have been contributed each by the Norwegian University of Science and Technology and the University of Antwerp. Such institutions include China University of Geosciences, Hanyang University, School of Health, Stanford University, University of British Columbia, — each with 5 articles published. The distribution indicates the contributions from a wide variety of institutions across various countries, demonstrating global interest and collaboration in advancing research on pose estimation techniques in sports performance. We expected this bibliometric analysis to give an overview regarding available pose estimation tools and their applications through various sports. These tools have proven versatile and efficient for improving performance, training, and avoiding injuries.

Basketball: Algorithms of human pose estimation for action prediction, overview of actions and localization of technical details.

- Race Walking: Fault detection using smartphone cameras.
- Volleyball: 3D pose refinement for spike analysis.
- Track and Field: Monocular 3D pose estimation from broadcasts.
- Rock Climbing: Move prediction systems.
- Resistance Training: Fatigue monitoring.
- Tennis: Sensor fusion and pose estimation for practice enhancement.

- Cycling: Pose estimation for fall modeling and surface area estimation.
- Baseball: 3D pitcher pose reconstruction.
- Running: Pose estimation for posture and tendon force prediction.
- Skiing: Keypoint detection and performance analysis.
- Golf: Swing analysis and performance prediction.
- Swimming: Underwater pose estimation.
- Badminton: Action analysis and trajectory simulation.
- Boxing: Pose estimation for upper extremity kinematics.
- Handball: Play classification and action tracking.
- Football (Soccer): Goalkeeper movement and penalty kick analysis.
- Martial Arts: Pose estimation for performance modeling.
- Dance: Pose estimation for movement tracking.
- Yoga: Pose estimation using deep learning.

The paper presents come cross-disciplinary work, as it discusses the versatility of pose estimation tools in different sports and activities on how they can give those involved headaches to gain an edge in whatever sport they participate in for performance, training, and injury prevention. This includes the increasing implementation of deep learning and computer vision in these tools, showcasing the current progressions in the field of sports science.

DISCUSSION

Insights with regards to pose estimation techniques: A bibliometric analysis in the context of sports performance research Notably, this work was greatly expanded upon from 2015 and saw a dramatic increase from 2019 to 2023 in the number of publications. Such an upward trend demonstrates the interest and investment that the sports science community is making into the area of pose estimation technologies. Towards a more unified approach to pose estimation from monocular images The analysis also illustrates the interdisciplinary nature of pose estimation, with potential applications spanning from sports to human-computer interaction, animation and robotics. The distribution of research output across a relatively small number of journals, as described by Bradford's Law, highlights the role of such journals as the capping points of influential work. The field is complemented by now important journals such as SENSORS, IEEE ACCESS, APPLIED SCIENCES (SWITZERLAND), among others. This global interest is also seen through the contributions of several, notable institutions such as the University of Toronto and the University of Bath. Pose estimation techniques have been broadly implemented in many common sports/activities, such as basketball, volleyball, tennis, swimming, etc. They have been useful to assist performance analysis, training and injury prevention. These tools illustrate the potential to revolutionise both performance analysis in sport.

CONCLUSION

The proposed research work gives a comprehensive overview of existing pose estimation methods and technologies used in human performance in sports and biofeedback. A large number of publications over time with a significant number of international collaborations reflect a thriving, expanding discipline. As the role of pose estimation technologies continues to grow, they are clearly becoming integral to helping athletes optimize performance, refine training programs and prevent injuries. The adoption of state-of-the-art technologies, including deep learning and computer vision, has made these tools even more accurate and applicable. In order to promote the field of pose estimation in sports performance, it is suggested to strengthen international and multi-disciplinary collaborations, as coalescing different specialties can help disseminate new innovative ideas. A challenge would be to suggest stronger and faster models to perform live pose estimation in the direct presence of problems as occlusions/changing size-body, or to reduce the time-response such to better respond to the demand of sports events. This will ensure that pose estimation models can perform across a range of sports and movements by expanding the diversity of annotated datasets. With the addition of pose estimation by integrating them with wearables it will pave way for detailed performance assessment for an athlete who will provide the coach with detailed insights on their

Sreedev *et al.,*

movements and techniques. More open-access papers will help to spread the message and to implicitly adopt pose estimation in sports science. Investing in sophisticated hardware including high-speed cameras and sensors will also improve data capture and analysis, facilitating the creation of more accurate, reliable pose estimation-facilitating tools. With these suggestions concerted to, the area can carry on to strong and making a significant donations to improve athletic effectiveness and the total improvement of sport science.

ABSTRACT

The frequency of diabetes mellitus, a chronic metabolic disease marked by persistent hyperglycemia, is rising alarmingly worldwide. Despite their effectiveness, conventional antidiabetic medicines frequently have drawbacks because of side effects, which highlights the need for alternative therapeutic techniques. With an emphasis on its function in regulating gut microbiota, this review investigates the anti-diabetic potential of Neeradimuthuvallathy Mezhugu (NM), a Siddha polyherbal and herbomineral combination. Recent studies have shown how important the gut microbiota is to the pathophysiology of diabetes, with microbial dysbiosis playing a role in insulin resistance, systemic inflammation, and altered glucose metabolism. With its varied phytochemical makeup, NM provides a comprehensive strategy for managing diabetes. Important components such as Withania somnifera, Hydnocarpus kurzii, and Semecarpus anacardium are abundant in bioactive substances such alkaloids, phenolic acids, and flavonoids, which have anti-inflammatory, hypoglycemic, and antioxidant qualities. These natural substances from the medicinal plants promote gut eubiosis by suppressing pathogenic species and promoting beneficial microbial populations, in addition to reducing hyperglycemia. This review summarizes the body of research to evaluate the potential of NM on insulin sensitivity and glucose metabolism and also to enhance the composition of the gut microbiota and its subsequent impacts. As a promising therapy for diabetic control, NM may also address microbial dysbiosis and promotes gut

health, providing insights into the complementary roles of modern microbiome science and traditional medicine.

Keywords: Diabetes, Siddha medicine, Neeradimuthuvallathy Mezhugu, Gut Microbiota, dysbiosis, eubiosis

INTRODUCTION

Diabetes is a chronic condition characterized by insufficient insulin production or ineffective insulin use, leading to elevated blood glucose levels (hyperglycemia). This disrupts glucose metabolism and causes long-term damage to organs and systems. A major non-communicable disease, diabetes is a leading cause of blindness, cardiovascular diseases, and strokes. Its prevalence has sharply increased, particularly in developing countries, with global cases rising from 108 million in 1980 to 422 million in 2014. In 2019, diabetes accounted for nearly 1.5 million deaths globally (WHO, 2021). (WHO, 2021) [1].

DIABETES - A GLOBAL SCENARIO
Diabetes prevalence has surged globally, affecting 463 million adults (9.3%) in 2019, with projections of 578 million (10.2%) by 2030 and 700 million (10.9%) by 2045. Over half (50.1%) of people with diabetes remain undiagnosed, highlighting the need for improved screening and awareness initiatives. [2]. Regional Variations shows that compared to lower rates in North America and the Caribbean (24.2%), the prevalence of undiagnosed diabetes is noticeably higher in regions like Southeast Asia (51.3%), the Western Pacific (52.8%), and Africa (53.6%) [3]. By 2045, diabetes cases are projected to rise by 46%, affecting 783 million people, or 1 in 8 individuals. Key drivers include urbanization, aging populations, reduced physical activity, and rising obesity rates, with type 2 diabetes accounting for over 90% of cases. [4]. Diabetes caused 1.6 million deaths in 2021, while other deaths were attributed to related illnesses such as kidney disease [5]. These figures emphasises the need for comprehensive public health initiatives to combat the global diabetes epidemic. The rising global prevalence of diabetes underscores the need to explore underlying factors beyond genetics and lifestyle, including the emerging role of gut microbiota in its pathophysiology. The primary aim of this review is to analyze the anti-diabetic efficacy of **Neeradimuthuvallathy Mezhugu (NM)** through the bioactive compounds present in its ingredients, thereby validating its effect in maintainging eubiosis among the gut microbiota. The formulation is a complex mixture of various medicinal plants, each known for their pharmacological effects, particularly in the treatment of diabetes. The review will explore the specific phytochemical compounds found in the key ingredients of NM and assess their potential role in combating hyperglycemia.

DIABETES AND GUT MICROBIOTA
The microorganisms present in the human gastrointestinal system are referred to as microbiota. Its makeup varies greatly during our lives and stabilizes somewhat as we get older. Diet, surroundings, medications and antibiotics taken, and the existence of illnesses all affect its structure [6], [7]. More than 100 trillion bacteria are thought to be present in a single person's gut microbiome, and the quantity varies depending on the part of the gastrointestinal tract, rising from the stomach to the colon [8]. Its estimated mass in an organism is between 1 and 3 kg, and its genetic material has 100 times more genes than the human genome [9], [10]. As previously stated, the makeup of microbiota is highly distinct, but in healthy people, the proportions are rather comparable, with *Firmicutes* accounting for 60% to 80% of the total, *Bacteroidetes* for 20% to 40%, and *Proteobacteria* and *Actinobacteria* for roughly 5% [8], [11]. Eubiosis is the condition in which helpful microorganisms coexist normally [12]. The existence of the microbiota–gut–brain axis, which refers to the two-way communication between the gut microbiota and the brain through the enteric nervous system (ENS), vagus nerve, immune system, neurotransmitters, short-chain fatty acids (SCFAs), and other mechanisms, makes it crucial for our functioning [13], [14]. A disturbance in the makeup and function of the intestinal microbiota is referred to as dysbiosis, and it impairs the body's ability to function [15]. Many recent

research indicates that certain compositional alterations in the gut microbiota may be linked to type 2 diabetes (T2DM). In one of the earliest investigations, Larsen et al. found that the microbiota of T2DM patients had much lower concentrations of the phylum *Firmicutes* and class *Clostridia* than the controls [16]. Microbial dysbiosis was confirmed in T2DM patients the metagenome-wide association study (MGWAS) by Qin et al., which involved 345 Chinese people with or without the disease [17]. Furthermore, studies propose that metformin, a commonly prescribed antidiabetic drug that is marked by a significant increase in the abundance of *Escherichia* species and a decrease in taxa linked to butyrate production, may have some role in changes in the gut microbiome composition in T2DM patients [18]. Studies have also shown that there are many molecular pathways by which dysbiosis contributes to the pathophysiology of type 2 diabetes. Through its effects on insulin sensitivity, inflammation, glucose and lipid metabolism, and gut permeability, the gut microbiota can influence the onset of diabetes. Branched-chain amino acids (BCAAs), bile acids, SCFAs, and LPSs are among the key regulators that can activate the aforementioned effects through a variety of signaling pathways. Recent research has shown the intricate connection between gut microbiota composition and metabolism, with changes in microbial communities linked to the onset and progression of diabetes. Gut microbiota-focused interventions are becoming more and more popular as a possible method of managing diabetes. A number of strategies are being researched to enhance metabolic health by favorably influencing the gut microbial ecology [19].

PHYTOCOMPOUNDS & GUT MICROBIOTA

Recent researches have proved that the phytochemicals present in medicinal plants medicinal systems, vegetables, fruits and natural food substances have a considerable role to play in the maintenance of eubiosis among the Gut Microbiota. The effects of particular flavones, such as chrysin, apigenin, baicalein, and luteolin on the intestinal microbiota were the subject of numerous human and animal investigations. The impact of pure apigenin on the concentrations of the single strain and community of human gut bacteria was investigated by Wang et al. (2017) [20]. In order to investigate the impact of apigenin on individual strains of intestinal bacteria, such as *Enterococcus caccae, Lactobacillus rhamnosus GG, Bifidobacterium catenulatum*, and *Bacteroides galacturonicus*, as well as a fecal inoculum, the growth profiles of the anaerobic bacteria were measured. The human large intestine was replicated in vitro. The results of that investigation demonstrated that, in contrast to other species studied, apigenin successfully inhibited the growth of *E. caccae* and the in vitro-cultured microbial community. Apigenin was found to reduce the ratio of *Bacteroidetes* to *Firmicutes*. The ability of citrus flavanones or citrus fruit-based food products to stimulate the production of short-chain fatty acids (SCFAs), reduce the number of harmful bacteria, and encourage the growth of beneficial microbes (like *Lactobacillus* and *Bifidobacterium* species) is the main focus of research looking at how these substances affect the modulation of gut microflora [21]. According to recent studies, quercetin administration altered the composition of the intestinal ecosystem by significantly increasing the abundance of beneficial *Lactobacillus, Bacteroides, Clostridium,* and *Bifidobacterium* while decreasing the proportion of Enterococcus and *Fusobacterium* [22, 23]. Anthocyanins have the ability to raise the frequency of beneficial bacteria, such as *Lactobacillus-Enterococcus spp. and Bifidobaterium spp.,* both in humans and in vitro [24, 25]. Curcumin treatment changes the composition and variety of intestinal microbiota and restores the function of the gut barrier in rats fed a high-fat diet, according to Feng et al. (2017) [26]. Animals treated with curcumin showed lower loads of pro-inflammatory enterococci and enterobacteria and higher proportions of anti-inflammatory *lactobacilli* and *bifidobacteria* [27]. It is reported in a study that Baicalin, one of the Flavanoids obtained from *Scutellaria baicalensis*, when administered orally in rats, is metabolized to baicalein and Oroxylin A in the intestine by the intestinal bacteria and thereby exhibiting its anti-inflammatory effects [28]. Building on the role of phytocompounds in modulating gut microbiota, these bioactive compounds serve as the foundation for traditional treatments like Siddha medicine in managing diabetes.

SIDDHA TREATMENT FOR DIABETES

Traditional and modern treatment approaches to manage diabetes primarily focuses on regulating blood glucose levels. Medications like metformin, sulfonylureas, and insulin therapy are commonly used. However, these treatments often come with side effects, including gastrointestinal disturbances, weight gain, and potential cardiovascular risks. Due to these challenges, there is a growing interest in exploring Traditional medicines and phytochemicals from natural sources for more effective and safer diabetes management. One such promising

Poorna Pushkala *et al.,*

Traditional treatment is the Siddha system of medicine, an ancient medicinal practise in South India, which emphasizes the use of natural herbs and compounds to treat various ailments, including diabetes. Siddha medicines are a blend of herbal ingredients that consists of a number of phytochemicals that safeguard the natural gut microbiota and promote the maintenance of gut eubiosis, supporting overall gut health. Siddha system of medicine consists of a number of medicines for various ailments including polyherbal and herbomineral formulations. 'Madhumegam' is the comparable condition for diabetes in Siddha. Many Siddha formulations such as Madhumega Chooranam, Aavarai Kudineer, Seenthil Chooranam, Abraga Chenduram, Naaval Kottai Chooranam have been the most in practise for diabetes management. Among them, Neeradimuthuvallathy Mezhugu (NM) has gained attention for its potential anti-diabetic properties. The drug Neeradimuthuvallathy Mezhugu (NM) is in practise for hundreds of years and one of its important indications is 'Madhumegam' (Diabetes). The reference for the study drug is taken from Siddha text 'Anubhoga Vaithiya Navaneetham' authored by Abdulla Saibu [29]. This formulation consists of a combination of plant and mineral ingredients, each contributing unique bioactive compounds with potential therapeutic effects.

INGREDIENTS OF NM

The chosen drug Neeradimuthuvallathy Mezhugu (NM) is a Herbomineral Siddha formulation constituting Herbal and Mineral drugs. NM's ingredients are listed in Table 1,and its herbal ingredients,which contain rich phytochemicals, are represented in Figure 1.

RESULTS

The Herbs included in the formulation NM, their phytochemical constituents, and their antidiabetic potential are listed in Table 2.

DISCUSSION

The symbiotic collective community of intestinal microorganisms, which includes bacteria, eukaryotes (primarily yeasts), viruses (primarily phages), archaea, and other microbial species, has developed over thousands of years of joint development and exhibits a complex and reciprocal relationship with humans and animals [93]. Approximately 1014 cells, mostly anaerobes such *Bacteroidetes, Firmicutes, Proteobacteria,* and *Actinobacteria,* are found in the human GI tract despite the existence of other microbial species [94], [95]. The phyla *Firmicutes* (Gram-positive) (such as *Lactobacillales, Clostridiales,* and *Ruminococcus* species) and Bacteroidetes (Gram-negative) (such as *Bacteroides* and *Prevotella* species) comprise over 90% of the microorganisms found in the Gastrointestinal tract of adults. A very small percentage is made up of facultative anaerobic bacteria and other phyla, such as *Actinobacteria* (Gram-positive, including *Bifidobacterium*), *Fusobacteria, Verrucomicrobia* (Gram-negative, including *Akkermansia muciniphila*), and *Proteobacteria* (Gram-negative) [96], [97], [98], [99], [100]. The phytochemical analysis of the ingredients in Neeradimuthuvallathy Mezhugu (NM) reveals a diverse range of compounds with proven anti-diabetic properties. These compounds, through their other pharmaceutical potential such as antioxidant, anti-inflammatory, and antimicrobial effects, contribute to the formulation's potential in managing diabetes. Neeradimuthuvallathy Mezhugu, a Siddha concoction made of medicinal herbs and minerals rich in phytochemicals, has promising anti-diabetic potential, according to the review. Its wide variety of bioactive substances, including flavonoids, alkaloids, and essential fatty acids, exhibit notable hypoglycemic, anti-inflammatory, and antioxidant properties. By addressing oxidative stress, insulin resistance, and hyperglycemia, these characteristics work together to improve its effectiveness in the comprehensive management of diabetes. Neeradimuthuvallathy Mezhugu (NM) represents a valuable alternative in diabetes management, offering insights into the potential of phytochemicals which may alter the composition of the gut microbiota and may become a crucial component of its effectiveness in addressing complex metabolic disorders. By restoring gut eubiosis through the aforementioned wide varieties of natural phytochemical rich ingredients, which is frequently disturbed in diabetes patients, the formulation may help lower inflammation and enhance metabolic processes. This link emphasizes how crucial the gut flora is to the control of

www.tnsroindia.org.in ©IJONS

diabetes and how traditional remedies like NM may promote gut health while treating metabolic diseases. Further exploration and validation of such Siddha formulations could contribute to safer, effective, and holistic therapeutic options for diabetes and other chronic conditions.

Table 1. Ingredients of Neeradimuthuvallathy Mezhugu (NM)

S.NO.	VERNACULAR NAME (TAMIL NAME)	BOTANICAL NAME
01	Serankottai	*Semicarpus anacardium*
02	Purified Neeradimuthu	*Hydnocarpus kurzii*
03	Parangipattai	*Smilax china*
04	Pirappan kizhangu	*Calamus rotang*
05	Karunseeragam	*Nigella sativa*
06	Seeragam	*Cuminum cyminum*
07	Vasambu	*Acorus calamus*
08	Sivanarvembu	*Indigofera aspalathoides*
09	Sanganver	*Azima tetracantha*
10	Karudan Kizhangu	*Corallocarpus epigaeus*

Poorna Pushkala *et al.,*

11	Amukkura Kizhangu	*Withania somnifera*
12	Vellarugu	*Enicostemma littorale*
13	Erukkanver	*Calotropis gigantean*
14	Athipattai	*Ficus racemosa*
15	Saranaiver	*Boerhaavia diffusa*
16	Milakaranai Ela	*Toddalia asiatica*
17	Veppam paruppu	*Azadiracta indica*
18	Vetpalai arishi	*Wrightia tinctoria*
19	Ellu	*Sesamum indicum*
20	Neeli samoolam	*Indigofera tinctoria*
21	Purified rasam	*Hydragyrum*
22	Purified Ganthagam	*Elemental Sulfur*
23	Purified thurusu	Copper Sulfate
24	Purified pal thuththam	Zinc Sulfate
25	Nei	*Bos indicus*

Table 2. Phytochemical constituents and Anti-diabetic potential of herbal ingredients of NM

S.No.	Plant Name	Phytochemical Composition	Medicinal Properties/Effects
01	*Semecarpus anacardium*	Bhilwanols, phenolic compounds, biflavonoids, sterols, glycosides. Anacardoside, semecarpetin, nallafl avanone, jeedifl avanone, semecarpufl avanone, gallufl avanone, anacardufl avone, mono-olefi n I, diolefi n II, bhilawanol-A, bhilawanol-B, amentoflavone tetrahydroamentoflavone semicarpol, anacardic acid, tetrahydrobustafl avone, O-trimethyl bifl avanone A1, O-trimethyl bifl avanone A2, O-tetramethyl bifl avanone A1, O-hexamethyl bichalcone A, O-dimethyl bifl avanone B, O-heptamethyl bichalcone B1, O-hexamethyl bichalcone B2, O-tetramethyl bifl avanone C., phenolics. [30]	Antidiabetic [31]
02	*Hydnocarpus kurzii*	Tannins, alkaloids, glycosides, terpenoidsFlavonoids (quercetin, kaempferol), a flavonolignan- Hydnocarpin, phenolic acids (gallic, ellagic), cyclopentenyl fatty acids, sterols[32], [33]	Antidiabetic [34]
03.	*Smilax china*	Steroids, flavonoids, alkaloids, terpenes, fatty esters and saponins [35]	Antidiabetic [36], [37]
04.	*Calamus rotang*	Gallic acid, alkaloids, and saponins carbohydrates, alkaloids, saponins, flavonoids, tannins, and phenolic compounds [38]	Antidiabetic [39]
05.	*Nigella sativa*	Thymoquinone (TQ), thymohydroquinone, thymol, carvacrol, Phellandrene, α-pinene, and β-pineneThymoquinone. thymoquinone, α-phellandrene, thymol, proteins, oleic acid, and carbohydrates, including palmitic acid, oleic acid, linoleic acid, and trans-anethole, Quinones, Phenolics[40], [41]	Antidiabetic [42]
06	*Cuminum cyminum*	Alkaloid, coumarin, anthraquinone, flavonoid, glycoside, protein, resin, saponin, tannin and steroid. alkaloids, coumarins, anthraquinones, flavonoids, glycoside, proteins, resins, saponins, tannins, steroids, dietary fibers, minerals, fats, vitamins, Organic acids, isoflavonoids, luteolin, and apigenin, Cuminaldehyde, cymene, cuminic alcohol (cuminol), γ-terpinene,	Antidiabetic [45]

Poorna Pushkala *et al.,*

		safranal, limonene, eugenol, β-myrcene, α-Phellandrene, β-Phellandrene, α- and β-pinene [43], [44]	
07	*Acorus calamus*	Glycosides, phenylpropanoids, sterols, triterpene glycosides, triterpenoid saponins, sesquiterpenoids, monoterpenes, and alkaloids [46], [47]	Antidiabetic [48]

ABSTRACT

This study presents a systematic review and meta-analysis of the most influential authors and publishers in academic literature, directed on technology and higher education. Using bibliometric analysis tools such as VOS viewer and SPSS, the study recognizes the top 10 authors and publishers with the utmost citation trends. A total of 712 terms were extracted from article titles, with a minimum occurrence threshold of 5 and a set threshold of 16. After filtering, 15 key terms were analysed to understand dominant research themes. The study also explores year-wise publication trends, revealing a consistent increase in scholarly output. Additionally, Principal Component Analysis (PCA) was employed to identify clusters of research themes, categorizing them into seven primary groups, including higher education institutions, artificial intelligence, technology adoption, student performance, and the impact of COVID-19 on education. The analysis provides valuable insights into emerging trends, dominant research contributors, and potential research gaps, offering a foundation for future studies. These findings are expected to guide researchers, policymakers, and educators in understanding scholarly impact and shaping future research directions in technology and higher education.

Keywords: Bibliometric Analysis, Meta-Analysis, VOS viewer, SPSS, Citation Analysis, Top Authors, Top Publishers, Technology, Higher Education, Research Trends

INTRODUCTION

Academic research impact is frequently measured through citation trends, reflecting the influence and reach of authors and publishers. This study aims to systematically analyze the most influential contributors in scholarly literature in the fields of technology and higher education using bibliometric tools such as VOS viewer and SPSS. By leveraging these analytical techniques, this study identifies key authors and publishers with the highest citation impact, offering a comprehensive overview of the leading research contributions. Additionally, this study examines year-wise publication trends to track the evolution of research activity in technology and higher education. A dataset of 200 research articles sourced from Scopus was analysed to determine patterns in scholarly output. Principal Component Analysis (PCA) was employed to categorize research themes into distinct clusters, revealing emerging trends and thematic interconnections. To deepen the investigation, meta-analysis and text mining techniques were applied to identify research gaps and potential areas for future exploration. By systematically mapping existing literature, this study highlights underexplored topics, methodological advancements, and opportunities for interdisciplinary research. The dataset shows an increasing trend in publications over recent years, indicating a growing interest in technology and higher education research. Meta-analysis is a statistical approach used to systematically collect and assess the findings of previous studies. In the context of this study, it helps identify key advancements and areas that require further research in higher education and technology. It involves the quantitative synthesis of results from multiple studies to assess their overall impact. Evaluating the diversity of research contributions across various studies. Enhancing the reliability of findings by integrating different academic insights. SPSS Tools for Meta-Analysis Effect Size Calculation Measures the impact of individual studies. Assesses variability among different studies. Publication Bias Assessment uses funnel plots to identify over- or underrepresented studies. SPSS for Bibliometric Analysis SPSS (Statistical Package for the Social Sciences) is a powerful tool for conducting statistical analysis in bibliometric research. It is useful for Analysing co-authorship networks and citation patterns. Identifying research clusters using Principal Component Analysis (PCA)**.**Applying factor analysis to categorize related research topics. Examining the relationship between citation impact and publication frequency through correlation analysis**.** VOS viewer for Bibliometric Visualization is a specialized software used to visualize bibliometric relationships. In this study, it is applied in the following ways mapping co-authorship networks to analyse collaboration patterns. Building citation networks to identify influential research articles. Detecting keyword co-occurrences to highlight major research topics. Examining institutional and regional collaborations in academic publishing. Bibliometric Analysis provides a quantitative assessment of research impact, focusing on Citation Analysis identifies the most influential authors, publications, and publishers. Co-Word Analysis Examines keyword relationships to detect research trends. Co-Authorship Analysis collaboration patterns among researchers

Year-Wise Publication Trend
This chart shows the year wise data of the author from 1995 to 2024, in this observation the number of publication remain low until 2015 and then its start increasing in 2016 with the number 09 authors from 2021 to 2023it remained stable around 21 author. In the year of 2024 drop to 4 authors, this trend shows growing interest after 2016with high

Top 10 Authors with Highest Citation Trends
C. Gouedard leads with the highest impact with 446 citation followed by S. Liu and V. Kuleto. All top 10 authors have over 130 citation, where its shows the strong influence and recognition in research area.

Top 10 Publishers with Highest Citation Trends
Sustainability (Switzerland) ranked first with 710 citation, where it's showing the highest impact among the publishers. Followed by the international journal of greenhouse gas control with 468 citation.

There are 712 terms available from the title. The threshold is 16, with a minimum occurrence of 5.

LITERATURE REVIEW

Nguyen, T., & Pham, H. (2025): This study analyses the role of mobile learning in promoting collaborative learning environments, highlighting its effectiveness in facilitating peer interaction and knowledge sharing. **Lee, K., & Park, S. (2025):** This research examines the challenges and opportunities of implementing mobile learning in higher education, providing a comprehensive analysis of technological, pedagogical, and institutional factors. **Garcia, P., & Martinez, R. (2025):** Exploring faculty perceptions of mobile learning, this study identifies key barriers and facilitators to the adoption of mobile technologies in university teaching. **Alyahya, M.A.**"E-Learning Experience in Higher Education amid COVID-19 **Pedraja-Rejas L** *et al.***(2024):** This systematic review explores the relationships between mobile learning, learning outcomes, and the development of critical thinking in university students, analysing empirical articles published between 2015 and May 2024. **Romero-Rodríguez,** *et al.***(2024):** This study presents a systematic literature review of mobile learning, discussing its potential to digitally transform teaching and learning processes in higher education. **Alrasheedi, M** *et al.***(2024):** An empirical study exploring management's perspective on critical success factors for mobile learning in higher education institutions, highlighting the significance of university commitment and change management practices.

Ali *et al.* **(2024):** This paper discusses the development of an intelligent mobile Outcome-Based Education (OBE) system in higher learning institutions, aiming to enhance teaching and learning performance monitoring. **Denoyelles** *et al.* **(2023):** This research analyzes the evolving landscape of students' mobile learning practices in higher education, highlighting the impact of the pandemic on mobile device usage for learning. **Wu, L., & Parker, B. (2021):** The Effectiveness of Flipped Classrooms: A Meta-Analysis of Higher Education Research. **Johnson P & Lee M (2023):** This study provides an in-depth analysis of artificial intelligence applications in higher education, emphasizing the impact of AI-driven tutoring systems on student learning outcomes and engagement levels. The findings reveal the potential of AI to personalize education and address learning gaps effectively. **Williams R & Chen L (2022):** Their research focuses on the role of gamification in digital learning environments within universities. The study found that incorporating game-based elements significantly enhances student motivation and knowledge retention. **Romero-Rodríguez** *et al.* **(2021):** This study presents a systematic literature review of mobile learning, discussing its potential to digitally transform teaching and learning processes in higher education. **Patel, R., & Anderson, C. (2022):** The Role of Big Data in Higher Education: A Bibliometric Analysis. **Martinez C & Roberts (2020):** This study explores the impact of virtual reality in STEM education, demonstrating how immersive technologies can improve conceptual understanding and practical skills in science and engineering disciplines.

Harris B & Stewart E (2019): Investigating the role of mobile learning in higher education, their research highlights the increasing adoption of smartphones and tablets as primary learning tools, promoting accessibility and flexibility in education. **Alrasheedi, M** *et al.***(2018):** An empirical study exploring management's perspective on critical success factors for mobile learning in higher education institutions, highlighting the significance of university commitment and change management practices. **Kim Y & Patel R (2018):** This paper analyzes the role of big data analytics in enhancing decision-making processes within universities, illustrating how institutions leverage data-driven insights to improve student success and institutional efficiency **Alrasheedi, M., &Capretz, L. F. (2018):** This meta-analysis identifies critical success factors affecting mobile learning adoption in higher education, emphasizing the importance of user-friendly application design and ubiquitous learning opportunities. **Sharma, M.** "Factors influencing cloud computing adoption for higher educational institutes in India: A fuzzy AHP approach **Mitchell, G., & Carter, S. (2018):** Personalized Learning in Higher Education: Research Trends and Future Directions. **Dawson, E., & Miller, N. (2019):** Internet of Things (IoT) in Universities: Research Mapping and Trends.

OBJECTIVES
1.   To analyse year-wise publication trends in technology and higher education.

2.   To identify the top 10 most influential authors based on citation counts.
3.   To determine the top 10 publishers with the highest citation trends.
4.   To explore research gaps using meta-analysis and text mining.

METHODOLOGY

This study employs a quantitative research design with a bibliometric and statistical approach to analyse trends in higher education selection influenced by technology and social media. The research integrates bibliometric analysis, statistical modeling, and meta-analysis to identify key patterns, relationships, and research gaps in the field. The study utilizes secondary data collected from the Scopus database, which is a widely recognized source for high-quality academic publications. The data collection process follows these steps: A total of 200 records were retrieved based on relevance to higher education selection, social media influence, and technological impact.

Filtering Criteria
Records were refined based on citation trends, publication details, and availability of author and publisher information.

Keyword and Author Thresholds
A minimum occurrence threshold was set at 2 for authors and 5 for terms in titles, ensuring that frequently occurring concepts and influential authors were prioritized in the analysis. The study applies a combination of bibliometric visualization, statistical analysis, and text mining techniques:

VOS viewer
Used to construct and visualize bibliometric networks, such as co-authorship, keyword co-occurrence, and citation relationships.

SPSS
Applied for descriptive statistical analysis and Principal Component Analysis (PCA) to identify key factors influencing higher education choices/

Meta-Analysis & Text Mining
Conducted to synthesize previous research findings and extract emerging themes, helping to identify future research gaps in the domain.

Data Collection
➢   The study retrieved 200 records from the Scopus database.
➢   Records were filtered based on citation trends, publication details, and availability of author and publisher information.
➢   A threshold of a minimum occurrence of 2 was set for authors and 5 for terms in titles.

Data Analysis Tools
✓   **VOS viewer**: Used for visualizing bibliometric networks.
✓   **SPSS**: Applied for statistical analysis and principal component analysis (PCA).
✓   **Meta-Analysis & Text Mining**: Employed to identify future research gaps.

RESULTS AND DISCUSSION

Principal Component Analysis (PCA) and Cluster Analysis
The PCA analysis identified the following key research clusters:

Cluster 1: Higher education institutions, performance.
Cluster 2: Challenges, COVID-19, and higher education.
Cluster 3: Case studies, higher education institutions.
Cluster 4: Adoption, factors, university research.
Cluster 5: Artificial intelligence, factors, and universities.
Cluster 6: Effects, students, technology.
Cluster 7: Research impact.

SUGGESTION

Clustering outcomes are highly sensitive to the threshold parameters set during the analysis. For instance, in hierarchical clustering, adjusting the similarity or distance threshold can significantly alter the number and composition of clusters. A lower threshold might produce more clusters by distinguishing smaller variations between data points, while a higher threshold could merge groups that may otherwise be distinct. In density-based clustering methods, such as DBSCAN, modifying parameters like the minimum number of points or the radius can lead to the identification of different cluster structures. Different statistical and machine learning software packages use distinct algorithms, optimization techniques, and default settings, which can impact clustering results. For example, SPSS, Python (Scikit-learn), and R might implement k-means clustering with slight variations in centroid initialization, convergence criteria, or distance calculations. Even when using the same clustering algorithm, the underlying mathematical computations or default parameters in one software might not align precisely with another, leading to variations in the number and structure of clusters. The choice of algorithm plays a crucial role in determining clustering patterns. K-means clustering, for example, assumes spherical clusters and requires pre-specification of the number of clusters, which can influence the results based on the chosen value. In contrast, hierarchical clustering does not require a pre-defined number of clusters but is sensitive to linkage methods (e.g., single-linkage vs. complete-linkage). Similarly, density-based clustering (DBSCAN) identifies clusters of varying densities but may struggle with detecting clusters of different shapes in high-dimensional data. Thus, selecting an appropriate clustering method based on the dataset's characteristics is essential to achieving meaningful results. The number of publications analysed in the study directly impacts the clustering outcomes. A larger dataset may reveal more distinct patterns, leading to a greater number of clusters, whereas a smaller dataset may result in fewer clusters due to limited variations. Additionally, the inclusion or exclusion of certain publications could shift the focus of the analysis, thereby changing how clusters are formed. Expanding the dataset over time or across different sources might introduce new themes or perspectives, further influencing clustering outcomes.

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

This study provides an insightful analysis of the most influential authors and publishers in research literature related to technology and higher education, based on citation trends and bibliometric analysis. By examining citation patterns, co-authorship networks, and publishing trends, the study identifies key contributors, leading institutions, and emerging areas of research within this domain. The findings highlight dominant scholars and institutions shaping the field, as well as notable shifts in research focus over time. The results from Principal Component Analysis (PCA) reveal distinct thematic clusters that define the current research landscape, indicating how different subfields within technology and higher education are evolving. These insights contribute to a better understanding of knowledge dissemination and scholarly impact in the field. Future research could delve deeper into unexplored areas by employing advanced text mining techniques such as natural language processing (NLP) and machine learning algorithms. Investigating research gaps and identifying underrepresented topics could help shape future scholarly discourse. Additionally, incorporating more advanced bibliometric indicators—such as co-citation analysis, keyword co-occurrence, and author collaboration networks—could provide a more comprehensive perspective on

global academic trends. Further exploration of interdisciplinary collaborations and cross-institutional research patterns may also enhance the understanding of how knowledge flows across different academic domains.

ABSTRACT

In recent days, the role played by Machine Learning (ML) algorithms is inevitable in the diagnosis and classification of various human diseases. It has shown encouraging results in early detection of any disease. Thyroid illness and Vitamin D Deficiency (VDD) are major global health issues and there is a great need to forecast their severity. Keeping this in mind, this work aimed to apply ML techniques/algorithms to predict the cause or impact of vitamin D on thyroid disorders [1]. The data for this study has been sourced from the UCI (UC Irvine Machine Learning Repository) data Repository. Two datasets, namely (i) 25OHD & TSH and (ii) Hypothyroid, were used in this investigation. The research attempts to detect vitamin D insufficiency and demonstrate its involvement in causing thyroid disease with the aid of more classifiers of ML and their comparative assessment. The analysis includes present classifiers such as Random Forest (RF), Support Vector Machine (SVM), and the Synergized Hybrid Random Vector Classifier (SHRVC) – the proposed hybrid classifier. A number of criteria, including F1-score, accuracy, sensitivity, specificity, and precision, are used to evaluate the effectiveness of these algorithms. The results show that with 98% accuracy for both datasets and by performing strongly for the trained and tested data, the proposed SHRVC classifier outperformed the SVM and RF classifiers.

Keywords: Vitamin D Deficiency (VDD), Hypothyroid, SVM, RF, SHRVC, Classification.

INTRODUCTION

One of the most threatening health issues of today is the deficiency of Vitamin D in which millions of individuals worldwide suffer. Researchers worldwide made some works and suggested a potential association among vitamin D deficiency and thyroid conditions, raising the probability that low vitamin D level may significantly affect thyroid health. This study thus focuses on applying the algorithms of ML to forecast the risk of vitamin D insufficiency and its impact on thyroid health using data, as there are currently no such predictive tools available for this purpose as far as the authors are concerned [2]. Vitamin D, a steroid hormone, has historically been associated with the metabolism of phosphorus and calcium. The discovery of its receptor's pleiotropic expression and the enzymes that play a role in its metabolism has prompted investigations into its additional functions. Numerous studies have explored vitamin D's impact on autoimmune diseases, particularly autoimmune disorder affecting the thyroid. Current findings predominantly highlight a connection between vitamin D deficiency and an increased risk of developing, or having higher antibody levels associated with, Hashimoto's thyroiditis, Graves' disease, and postpartum thyroiditis. However, some reports contradict these associations, making it challenging to reach a consensus [3]. It remains uncertain whether the above said connection represents a underlying mechanism, a causal link, or an outcome in the process of autoimmunity. Numerous studies examining the correlation among genetic variations in vitamin D and autoimmune thyroid illnesses have frequently yielded conflicting findings. However, recent research has revealed a significant inverse relationship involving thyroid-stimulating hormone (TSH) concentrations and 25-hydroxyvitamin D (25OHD) levels, intending to provide a possible for them. This finding recommends to state that the insufficient vitamin D levels might play a role in, or exacerbate thyroid-related conditions, emphasizing the importance of assessing the level of D vitamin status for the appropriate management and prevention of thyroiditis disorders [4]. The present study seeks to expand on these findings by using a machine learning model to forecast vitamin D insufficiency and investigate its influence on thyroid classification. Machine learning is an emerging trend that is promptly gaining momentum in the medical sector, particularly for disease prediction and classification. This study uses ML techniques for predicting vitamin D insufficiency and its impact on thyroid disorder classification. By analyzing a large dataset that includes TSH levels and 25OHD, the study aims to develop a model which will accurately predict the autoimmune disorder thyroiditis and highlight potential warning signs for medical professionals. The focus is on developing a classification model using these techniques to predict thyroid disease based on vitamin D deficiency and other relevant factors. Ultimately, the study aims to elucidate the complicated relationships among vitamin D deficiency and thyroid health, informing improved diagnostic and therapeutic strategies through advanced computational tools and comprehensive data analysis [5]. The current need of the medical industry to diagnose any disease at an earlier stage necessitate in developing self-regulating smart systems for it [6] and henceforth the present problem is not an exception for it. The prediction and classification with ML tools can be implemented by integrating the vast patient data available in the healthcare industry. The prevalence of certain diseases could be reduced and avoided in some cases by handling and effectively processing the extensive data available in the medical databases. This will enable healthcare professionals to more efficiently and rapidly predict illnesses and suggest diagnoses.

LITERATURE REVIEW

This paper highlights some literature reviews on thyroid disease prediction using various approaches and some literature reviews on various models forecasting numerous illnesses by efficiently applying ML techniques and the application of ML methods in health care sector, because as far as the knowledge of the authors are concerned, the presently taken problem of identifying the association of 25-OHD serum Vitamin D and the Thyroid Simulating Hormone (TSH) is a novel problem under Machine Learning Domain and hence there is no existing literature review specifically available for addressing this problem. This section reports a list of literatures on the problem of identifying the impact of vitamin D on thyroid and autoimmune diseases and the use of ML domains in healthcare sectors. A systematic review was carried out by Maciejewski et al [7] to elucidate the possible connection between thyroid cancer risk and gene variations related to Vitamin D. A comprehensive analysis of studies on the Calcitriol

95425

receptor polymorphisms was included in the review; however, the results were equivocal and did not provide compelling evidence that these genetic variants were linked to an elevated risk of thyroid cancer. On the other hand, correlations between particular SNPs(Single Nucleotide Polymorphism) in the VDR gene and a higher risk of medullary thyroid carcinoma (MTC) have been discovered. To confirm these results and get a deeper understanding of the involvement of Vitamin D-associated genes in the development and progression of thyroid malignancy the scientists have decided to look for additional research in this arena. Thyroid autoimmunity shown by Liu et al [8] to identify it's significant impact on embryo quality during in vitro fertilisation (IVF). Regardless of thyroid autoimmune illness, they also found a relationship between follicular concentrations of D_Vitamin & Nuclear receptor regulation of Vitamin_D3 in granulosa cells. Fluctuating vitamin D concentrations and thyroid activity throughout pregnancy were investigated by Wang et al [9]. The significance of sufficient D_Vitamin levels for thyroid health was demonstrated in accordance with their discovery of a positive link between optimal vitamin D levels and fT3 (Free Triiodothyronine), fT4 (Free Thyroxine) and TSH in the first and third trimesters, respectively. But, they concluded that further research is required, as the study's limitations were made clear.Chen et al [10] utilized machine learning techniques to predict cardiac conditions. After comparing several models such as DecisionTree, RandomForest, LightGBM, and LogisticRegression—they discovered LightGBM was the most successful, obtaining an accuracy of 76.9%. According to the study, ML possesses the capability to serve as an effective aid in healthcare for the early identification and therapy of cardiac disorders. LightGBM appears to have the greatest promise for enhanced prediction. Balaji *et al.* [11] explored MLT to predict liver disease, aiming to improve the accuracy of detection and the standard of healthcare. They utilized a collection of techniques including Classification Trees, ANNs, KNNs and support vector classifiers. The analysis discovered that different methods varied in several known factors namely, sensitivity, accuracy, and precision. But drawbacks such as poor performance on big datasets and difficulties gathering data in real time have also been pointed out. The results demonstrated the usefulness of the suggested algorithms to detect liver disease at an earlier stage. The effectiveness of ML approaches and autonomous pipelines in identifying Alzheimer's Disease (AD) was investigated by Shukla *et al* [12]. They discovered that these techniques classified classes into single and binary categories with above 95% accuracy. Preprocessing, multi-class categorization, registration, and other difficulties were also mentioned.

The study highlighted the promise of cutting-edge machine learning techniques by evaluating several biomarkers and classification strategies in addition to identifying efficient AD detection methods. Kadhim *et al* [13] investigated machine learning models with the goal of increasing diagnostic accuracy for early-stage COVID-19 prediction. They discovered that algorithms with high precision—98.0% to 99.5% accuracy rates—such as Random Forest and K-Nearest Neighbour can forecast COVID-19. Model performance was enhanced by strategies like the Synthetic_Minority_Over_Sampling_Technique (SMOTE) and Filter Based FSTs Kishore *et al* [14] carried out a work to evaluate various ML algortihms for predicting diabetes, using a range of these algorithms which are generally performed in ML arena. Among them, the RF algorithm achieved the maximum predictive precision for assessing diabetes risk levels, primarily due to its robust handling of complex data structures. The study also pointed out the limitations of other approaches, such as genetic programming and noted that alternative models like Artificial Neural Networks and Fuzzy-Based Systems were less effective compared to machine learning techniques in predicting diabetes. Raj *et al* [15] investigated machine learning algorithms that use medical history, age, gender, smoking behaviours and other characteristics and predicted lung cancer with 95% accuracy. Although they acknowledged the need for more validation in clinical settings, they emphasised their potential for early diagnosis. This study's purpose was to fine-tune ML models for clinical use and to discover important predictive features. Chen *et al* [16] predicted new-onset post-stroke depression (PSD) using XGBoost machine learning methods. Finding clinical characteristics for early diagnosis in high-risk individuals was the study's main goal. The models exhibited drawbacks, including different sensitivities and specificities, even if they were useful in identifying patients who were at risk. In order to build and validate machine learning models that potentially enhance clinical outcomes for stroke patients at risk of acquiring PSD, the authors emphasised the significance of real-world data. Peng *et al*. [17] devised an XGBH (eXtreme Gradient Boosting with Hybrid features) computational intelligence framework to improve the estimation of heart-related condition risks by concentrating on essential factors like age, arterial pressure, and lipid levels. The model demonstrated superior accuracy compared to traditional methods, allowing for earlier identification and

intervention for individuals at high risk. Future prospective studies across diverse populations are required to assess the framework's practicality and dependability in real-world medical environments. On viewing the various studies in the health care sector, it is clearly seen that the ML models could be effectively used for the identification or prediction problems in health care arena. With this insight, the authors have used the existing ML models and also developed new hybrid models for determining the impact of Vitamin D on Thyroid and autoimmune disorders.

PROPOSED APPROACH

This section describes the research approaches used to look at how thyroid illnesses are affected by vitamin D deficiency. The experimental strategy focuses on key risk variables and methods for predicting vitamin D deficiency and determining how it relates to thyroid conditions. Data is gathered at the start of the process using datasets from the UCI Machine Learning Repository.

Collection of Data

In this research, two open source datasets were used to examine the impact of several factors on thyroid health. There are 433 samples from both male and female respondents in the first dataset, which is referenced in [18]. There are nine components to it, including laboratory tests (such as 25-hydroxyvitamin D (25OHD) levels and thyroid-stimulating hormone (TSH) levels) and patient demographics (weight, height, sex, age, and season of data collection). Another one is taken from the UCI Machine Learning Repository available on Kaggle database [19]. This dataset includes 3,772 cases with 28 variables, including age and sex, medical history, and treatment status indicators such as taking thyroxine, querying thyroxine, and querying hypothyroid. It offers an extensive synopsis of thyroid-related variables, facilitating an in-depth examination and modeling of hypothyroidism.

Dataset and Attributes

Table – I provides an overview of key features in a medical dataset related to vitamin D (25OHD) and thyroid health (TSH). It includes patient demographics, such as a unique Patient identifier, Weight, Height, and BMI - which is calculated from height and weight. The dataset also includes sex (in which the value of 1 indicates male and 2 indicates female) and Age in years. Season represents the time of year during which data was collected. Important health indicators include 25OHD, measuring vitamin D levels, and TSH, indicating Thyroid-Stimulating Hormone levels, both of which are crucial for understanding thyroid function. Finally, the Classification feature is a binary target variable, with 0 indicating no disease and 1 indicating the presence of a disease, which is useful for disease prediction and classification The above dataset described in Table - II lists numerous characteristics from a medical dataset pertaining to thyroid conditions and therapies. It contains information on the patient's age (0 to 92 years) and sex (0 = female, 1 = male). The patient's condition and course of therapy with regard to their thyroid include whether they are taking antithyroid or thyroxine medication, whether they have had thyroid surgery, and whether they have had I131 treatment (radioactive iodine). It also contains markers of the patient's health, such as whether they are ill, pregnant, or suffering from psychological disorders, goitre, tumours, or hypopituitarism. The table includes detailed medical questions on thyroid conditions, including hyperthyroidism and hypothyroidism, as well as whether or not certain indicators or hormones, such TSH, T3, TT4, T4U, and the Free Thyroxine Index (FTI) were assessed. The use of lithium is also mentioned.

Data Pre-Processing

For the pre-processing of data, both 25OHD & TSH and hypothyroid datasets are loaded using pandas, and missing values indicated by '?' are replaced with NaN in order to standardize the handle the missing value of any data carefully. In 25OHD & TSH dataset, missing values in numerical columns such as 'Patient', 'Weight', 'Height', 'BMI', 'Age', '25OHD', and 'TSH' are replaced with the mean, while categorical columns like 'sex', 'season', and 'class' are filled with the most frequent value to maintain consistency. Similarly, in the hypothyroid dataset, missing values in numerical columns such as 'age', 'TSH', 'T3', 'TT4', 'T4U', and 'FTI' are replaced with the mean, and categorical columns such as 'sex', 'on thyroxine', and 'referral source' are filled with the mode. For both datasets, the features (X) – 'Patient', 'Weight', 'Height', 'BMI', 'Age', '25OHD', and 'TSH' for the 25OHD & TSH dataset, and those features which are represented in Table-II for the hypothyroid dataset – are separated from the target variable (y). The

95427

25OHD & TSH dataset uses 'class' as the target, while the hypothyroid dataset uses 'binary Class'. Categorical features in both X datasets are converted to numerical format using Label Encoder to ensure compatibility with machine learning algorithms. Finally, both datasets are divided into training and testing sets using an 80-20 split to prepare for model assessment.

Balancing the Dataset
Balancing the data addresses the challenge posed by imbalanced datasets, in which the performance of the model may be biased due to unequal distribution of classes. This study employed SMOTE approach to create mock examples of the minority class in the training set, resulting in a more balanced dataset. The SVM and Random Forest classifier were configured to adjust weights according to class frequencies, ensuring that the model adequately considered the minority class during training. Training on these balanced data enhances the model's capability to correctly forecast both categories, leading to fairer and more balanced outcomes. This method is applied to both the 25OHD, TSH and Hypothyroid datasets [20]. The figures illustrate the distribution of the target variables after applying re-sampling techniques to address the imbalanced datasets. The first figure, Fig. 1 shows the allocation of the "CLASSIFICATION" variable in the 25OHD & TSH dataset, and the second figure, Fig.2 shows the allocation of the "binary Class" variable in hypothyroid dataset. Both figures depict the frequencies of the target classes (0 and 1) after re-sampling, where SMOTE approach was employed to make stability over the dataset by generating synthetic examples of the underrepresented class. The even bars for both classes 0 and 1 in both figures indicate that after re-sampling, the datasets have equal numbers of samples for both classes, which resolves the issue of class imbalance. This balanced dataset ensures that ML models, like SVM, and Random Forest do not prefer the majority class and could effectively discover to predict both classes accurately, leading to improved and fairer model performance.

Histogram graph of the Dataset
A distribution chart of the dataset's features is employed to evaluate the data spread. This visualization helps to see if the values are evenly spread. As illustrated in the Figures, Fig. 3 and Fig. 4, the histogram shows that the data spread is uniformly Scattered [20]. The histograms display how features are spread out in the dataset, providing a brief summary of how the data is distributed. In Fig. 3, for the first dataset, the 'patient' which represents the ID of patients, showed a uniform distribution, 'weight' and 'BMI' followed a bell-shaped, normal pattern. 'Sex' and 'Height' exhibited clustered distributions and age was slightly skewed. '25OHD' and 'TSH' levels had skewed distributions and were concentrated around lower values. And in Fig. 4, for the 2nd dataset, binary features such as thyroxine, sick, and others show that most patients fall into the "no" category. Hormone levels such as TSH, T3, and FTI vary, with some concentrated and others spread. In both datasets, the target variables, 'Classification' and 'Binary Class' are binary, showing whether a condition is present or absent. This visualization helps in understanding the distribution, skewness, and balance of preprocessing.

MACHINE LEARNING
The capability to create systems that can learn from existing data is achieved with this subfield of AI. This could also make predictions about future events based on past experiences. The objective of ML is to build models by training them on a dataset to recognize patterns and make predictions. In this context, the present aim is to create and deploy a ML model that can predict thyroid illness based on levels of Vitamin D deficiency. The process involves using ML algorithms to uncover underlying trends within the data. The dataset has been preprocessed to address any missing values and ensure its cleanliness. The accuracy of the models is then evaluated by testing them on the dataset to assess their effectiveness in predicting thyroid disease [21].

SUPERVISED LEARNING
This is a category of ML in which algorithms are developed on extensive datasets containing input variables and their associated labeled outcomes. The system to infer patterns from the data and generate predictions or projections based on new unseen inputs. Supervised learning encompasses two main types: classification and regression. Classification entails forecasting categorical outputs, whereas regression emphasizes estimating continuous numerical values [21].

CLASSIFICATION

Classification is the method of splitting information among categories according to the relationships between different data values. In this case, categorization was used to predict thyroid issues based on the degree of vitamin D insufficiency. Although there are enormous techniques of ML available, the approach presented can utilize any of the following models or methodologies. This study employed widely-used classification algorithms listed earlier and also developed a novel synchronized hybrid random vector classifier (SHRVC) to forecast the objective [22].

Implemented Models

In implementation, three classification algorithms are used. They are as followed.

Support Vector Machine – SVM

It is a supervised learning method widely exploited for categorization processes. This generally operates with the process of identifying the finest decision boundary, or hyperplane plane, which distinguishes various classes in an n-dimensional space. The nearest points to this boundary are called support vectors, which give the algorithm their name. SVMs are extensively utilized in tasks like facial recognition, image identification, and text classification. In this study, SVM has been applied for its efficacy in handling high-dimensional data and preventing overfitting. The RBF kernel had been used to capture nonlinear patterns with hyperparameters optimized via grid search and cross-validation [23].

Random Forest Classifier

This classifier is considered as a combined learning strategy derived from decision tree structures, was employed for its capability to manage extensive datasets and high-dimensional feature spaces. It provides good accuracy and robustness against overfitting, owing to its inherent bagging approach. The model was optimized by tuning the quantity of trees and the utmost power for each tree through a randomized cross-validation search. For understanding the contributions of each feature to predict the model, feature importance had been analyzed [24].

Synergized Hybrid Random Vector Classifier (SHRVC)

The Synergized Hybrid Random Vector Classifier (SHRVC) integrates the strengths of SVM and RF to enhance classification accuracy as well as robustness. The process begins with feature transformation, where the dataset is mapped into a feature space learned by the SVM to improve class separability. This transformed feature space was then used to train a Random Forest model, capturing both linear and nonlinear relationships through its ensemble learning approach. Predictions from both the SVM and Random Forest were combined using a weighted voting scheme, where weights were assigned based on cross-validated performance scores to ensure that the final predictions leveraged the strengths of both models. To implement SHRVC, we initialized an SVM with probability estimates enabled and a Random Forest with 100 estimators, both set with a random state of 42 for reproducibility. These models were integrated into a hybrid setup by using a voting classifier with 'soft' voting. The SHRVC model was developed using the training dataset and estimated on the test dataset, with performance metrics including accuracy and a confusion matrix to evaluate the classification outcomes, including true positives, true negatives, false positives, and false negatives.

RESULTS AND DISCUSSION

In this comparative analysis, Python was chosen as the programming language for constructing the analytical model using the Jupyter Notebook within the Anaconda environment. This setup offers several advantages, including the ease of dataset exploration and effective pattern identification. This study involved evaluating a variety of classification algorithms in order to find the most effectual algorithm which can best suit to a given dataset. The UCI dataset containing health records was separated into two subsets: a training set and a test set. After isolating the dataset, data pre-processing had been done for the choice of preparing the data for data_analysis process. Prior to classification, feature-selection techniques were applied. Two hybrid feature selection methods, Corr Recursive

95429

Vinnarasi and Menaka

Feature Selection (CRFS) and RanChi Ensemble Selection (RCES), were used to identify important features from the serum 25OHD and TSH datasets and the hypothyroid dataset, respectively. Following feature selection, classification algorithms were applied to both the datasets. Existing algorithms used for this research work as mentioned earlier as well as the proposed hybrid classification model, Synergized Hybrid Random Vector Classifier (SHRVC) were used for carrying out the study. The outcomes of these evaluations are presented below:

Comparative Analysis of Existing and Proposed Hybrid Classifiers for both 25OHD & TSH and Hypothyroid Dataset

The following table, Table III and the figure Fig. 6 compare the performance metrics of three classifiers used on the 25OHD & TSH dataset. By obtaining the highest accuracy outcomes (0.98), sensitivity (0.97), specificity (1.00), precision (1.00), and F1-Score (0.99), SHRVC, when compared with all other algorithms out-performed well in terms of classification accuracy for both true positive and true negative instances. Though the Random Forest classifier falls somewhat behind the proposed SHRVC, the performance of it cannot be underestimated as it possesses the highest accuracy (0.97) and F1Score (0.98). Compared to the other two models, the SVM's performance is lower with an accuracy of 0.88 and an F1-Score of 0.88, indicating that it may be less effective. SHRVC achieves nearly perfect classification results overall, outperforming the existing classifiers. This comparison shows that SHRVC is the most successful classifier in this investigation, followed by Random Forest and SVM. Table IV displays a comparison of performance indicators for three classifiers discussed earlier on the Hypothyroid dataset. SVM scores were lower at 0.93, whereas Random Forest and SHRVC both obtained the greatest accuracy at 0.98. SVM scores poorly at 0.27 in terms of sensitivity; however, SHRVC performs well with a score of 0.84, demonstrating that it successfully identifies true-positive cases. In addition, SHRVC outperformed SVM (0.93) and Random Forest (0.95) in attaining perfect specificity (1.00). Moreover, SHRVC produces at 0.89, and Random Forest at 0.87, the F1-Score supports these results; SVM severely trails with a score of 0.41. In general, SHRVC is the best classifier for the hypothyroid dataset; it performs very well in terms of sensitivity and specificity, while SVM shows some significant drawbacks. The Figure, Fig. 7 compares the performance metrics of the three classifiers on the Hypothyroid dataset, focusing on the well-known four key metrics of any classifier. SVM, represented by the blue line, show signs of the poor performance in all metrics, particularly in sensitivity, where it scored significantly lower than the others. Random Forest, shown by the red line, performs consistently well, achieving strong scores in accuracy, specificity, and F1-Score, but does not excel in sensitivity compared to SHRVC. The SHRVC, represented by the green line, had the highest scores on the key metrics, indicating its better ability to classify instances effectively. Overall, the analysis Shows that SHRVC is the most effective classifier for the hypothyroid dataset, outperforming both SVM and Random Forest across most metrics.

CONLCUSION

The study concludes by highlighting the exceptional performance of the Synergized Hybrid Random Vector Classifier (SHRVC) across two important medical datasets, 25OHD & TSH and Hypothyroid, in comparison to conventional classifiers like SVM and Random Forest. On the 25OHD and TSH datasets, SHRVC consistently outperformed the other models, demonstrating its superior capacity for effectively distinguish between positive and negative cases. While SVM exhibited lower performance, particularly in identifying true positive instances, Random Forest performed well but did not match the comprehensive capabilities of SHRVC. The comprehensive analysis of SVM, Random Forest, and the Hybrid Classifier (SHRVC) clearly demonstrates that SHRVC consistently delivers more balanced and accurate results across both datasets. Its higher performance metrics on the 25OHD and TSH dataset emphasize its efficacy to find true positives and true negatives, while on the Hypothyroid dataset, it achieves the highest sensitivity and specificity, showcasing its robustness in detecting hypothyroid conditions. The results strongly suggest that Vitamin D levels are crucial in diagnosing and managing thyroid disorders, supporting the hypothesis that Vitamin D deficiency significantly contributes to thyroid disorder and other autoimmune diseases.

This study reinforces the importance of incorporating Vitamin D assessments into routine thyroid disease screening and management practices, as doing so could enhance diagnostic precision and improve patient outcomes.

Table – 1: Dataset for 25OHD &TSH

Feature	Description
Patient	Represents the patient identifier
Weight	The patient's weight
Height	The patient's height
BMI	Derived measurement based on an individual's height and weight.
Sex	Categorical variable representing gender, where 1 likely represents male and 2 represents female.
Age	The patient's age
Season	Likely a categorical variable representing different seasons
25OHD	Concentrations of 25-hydroxyvitamin D (25OHD), a marker of vitamin D status.
TSH	Thyroid-Stimulating Hormone (TSH) levels
Classification	A binary classification indicating the target variable, where 0 likely represents one class (non-disease) and 1 represents another (disease)

Table –2: Dataset for Hypothyroid

Feature	Description
Age	The patient's age in years (0 to 92).
Sex	The gender of the patient (0 = female, 1 = male).
On thyroxine	Whether the patient is on thyroxine treatment (0 = no, 1 = yes).
Query on thyroxine	A query or question regarding the patient being on thyroxine (0 = no, 1 = yes).
On antithyroid medication	Whether the patient is using antithyroid medication (0 = no, 1 = yes).
Sick	Indicates if the patient is currently sick (0 = no, 1 = yes).
Pregnant	Whether the patient is pregnant (0 = no, 1 = yes).

Thyroid surgery	Indicating if the patient has had thyroid surgery (0 = no, 1 = yes)
I131 treatment	Showing if the patient has undergone it (0 = no, 1 = yes).
Query hypothyroid	A query about whether the patient may have hypothyroidism (0 = no, 1 = yes).
Query hyperthyroid	A query about whether the patient may have hyperthyroidism (0 = no, 1 = yes).
Lithium	Whether the patient has been on lithium treatment (0 = no, 1 = yes).
Goitre	Whether the patient has goiter (0 = no, 1 = yes).
Tumor	Indicates if the patient has a tumor (0 = no, 1 = yes).
Hypopituitary	Whether the patient has hypopituitarism (0 = no, 1 = yes).
Psych	Whether the patient has any psychological disorders (0 = no, 1 = yes).
TSH measured	Indicates if Thyroid-Stimulating Hormone (TSH) was measured (0 = no, 1 = yes).
TSH	Thyroid-Stimulating Hormone level.
T3 measured	Indicates if Triiodothyronine (T3) was measured (0 = no, 1 = yes).
T3	Triiodothyronine hormone level.
TT4 measured	Indicates if Total Thyroxine (TT4) was measured (0 = no, 1 = yes).
TT4	Total Thyroxine hormone level.
T4U measured	Indicates if Thyroxine Utilization (T4U) was measured (0 = no, 1 = yes).
T4U	Thyroxine Utilization level.
FTI measured	Indicates if the Free Thyroxine Index (FTI) was measured (0 = no, 1 = yes).
FTI	Free Thyroxine Index, calculated from T4 and T3 uptake.
TBG measured	Indicates if Thyroxine-Binding Globulin (TBG) was measured (0 = no, 1 = yes).
Referral source	The source from which the patient was referred (categorical, coded from 0 to 4).
BinaryClass	The target variable indicating disease status (0 = no disease, 1 = disease).

Table -3: Comparison of performance metrics of Existing and Proposed Synergized Hybrid Random Vector Classifier (SHRVC) 25OHD &TSH

CLASSIFIER/PERFORMANCE METRICS	SVM	RAMDOM FOREST	SHRVC CLASSIFIER

ABSTRACT

Green nanotechnology provides eco-friendly strategies for nanoparticle synthesis. *Barleria longiflora* L.f., rich in phytochemicals, holds promise for antimicrobial and antidiabetic applications. To synthesize silver nanoparticles (AgNPs) using *B. longiflora* extract and assess their physicochemical characteristics and enzyme inhibitory potential. Shade-dried and acetone-defatted leaves were extracted with ethanol and water. AgNPs were synthesized using 1 mM silver nitrate under sunlight. Characterization was done via UV–Vis, FTIR, and SEM. Enzyme inhibition assays targeted α-amylase and β-glucosidase, with Acarbose as standard. UV–Vis and FTIR confirmed nanoparticle formation and capping. SEM showed crystalline morphology. The extract inhibited α-amylase (75.0%) and β-glucosidase (58.2%) in a dose-dependent manner, with IC_{50} values of 53.3 and 85 mg/mL, respectively. *B. longiflora*-based AgNPs represent a green and cost-effective synthesis route with moderate antidiabetic potential, supporting their use in biomedical applications.

Keywords: *Barleria longiflora*, silver nanoparticles, green synthesis, enzyme inhibition, antidiabetic, phytochemicals, nanobiotechnology

INTRODUCTION

Nanotechnology has emerged as a transformative field in recent years, largely due to the extraordinary physicochemical properties exhibited by nanoparticles ranging from 1 to 100 nm in size. These distinct attributes are influenced by pivotal factors such as particle dimension, morphology, and structural configuration, which have driven intensive scientific efforts to fine-tune these parameters for a wide array of applications [18]. Currently, there is a pronounced shift toward eco-conscious, non-toxic, reliable, and sustainable methodologies for engineering nanoparticles with precise size and shape, especially for biomedical purposes [11]. A broad spectrum of nonmaterial's originating from substances such as alginate, gold, magnesium, titanium, copper, zinc, and silver has been synthesized and systematically investigated for their functional potential [4]. Among various nanomaterials, silver nanoparticles (AgNPs) are particularly distinguished for their remarkable and adaptable surface plasmon resonance (SPR) characteristics, which contribute significantly to their versatility in biomedical and technological applications [19]. In comparison to other noble metal nanoparticles, silver nanoparticles (AgNPs) have been the focus of extensive research due to their diverse functional attributes, including potent antimicrobial, anticancer, antioxidant, and larvicidal effects, coupled with their economic viability. Additionally, AgNPs exhibit broad applicability across multiple domains such as biosensing, catalysis, and photovoltaic systems [2]. Traditionally, nanoparticles have been synthesized via chemical and physical methods, which are often associated with high production costs and the utilization of toxic reagents that can pose serious environmental and biological hazards [1]. This challenge has catalyzed the development of green synthesis strategies that employ biological systems including bacteria, fungi, yeast, actinomycetes, and particularly plant extracts to mediate the reduction of silver ions into silver nanoparticles (AgNPs). Although microbial routes enable both extracellular and intracellular nanoparticle formation, they often demand rigorous aseptic protocols, intensive labor, and substantial operational costs. In contrast, plant-mediated synthesis has gained traction as a viable and eco-friendly alternative, utilizing phytochemicals as natural reducing and stabilizing agents, while circumventing the need for elaborate microbial culture techniques [24]. Medicinal plants, especially those long utilized in traditional and alternative healing systems, are increasingly recognized as ideal bioresources for the eco-friendly synthesis of biocompatible metal nanoparticles [9]. Among these, the use of plant leaves presents a particularly simple, sustainable, and effective approach for nanoparticle fabrication. This underscores the necessity of advancing alternative green technologies that not only reduce dependency on hazardous chemicals but also capitalize on the inherent phytochemical richness of natural materials for the environmentally benign production of silver nanoparticles [15].

MATERIALS AND METHOD

Collection of Plant Material and Preparation of Extracts
Barleria longiflora L.f., belonging to the family Acanthaceae [31], was selected for this study due to its potential in the green synthesis of nanoparticles. Plant specimens were collected from Erattaimalai in the Tiruchirappalli District of Tamil Nadu, India. The species was taxonomically identified and authenticated by the Botanical Survey of India, Southern Regional Centre, Coimbatore, Tamil Nadu. The collected leaves were shade-dried to retain phytochemical constituents and subsequently ground into a coarse powder. The powdered material was initially defatted using acetone to eliminate non-polar components. This was followed by ethanol extraction, with the resulting solution concentrated via evaporation to yield a dry alcoholic extract. For aqueous extraction, the powdered leaves underwent cold maceration in distilled water for 24 hours, following the procedure described [23].

Preparation of Silver Nitrate Solution
Commercially obtained silver nitrate (molecular weight: 169.87 g/mol) was used to prepare a 1 mM solution. A precise amount of silver nitrate was accurately weighed and dissolved in distilled water to achieve the desired concentration.

Synthesis of Silver Nanoparticles

To 750 mL of the prepared 1 mM silver nitrate solution, 7.5 mL of *Barleria longiflora* plant extract was added in a clean conical flask. The mixture was exposed to direct sunlight with continuous shaking to initiate nanoparticle synthesis. A visible color change from light yellow to brown indicated the formation of silver nanoparticles. As the reaction progressed, the solution gradually became colorless, and nanoparticles were observed settling at the bottom of the flask.

Optimization of Nanoparticle Synthesis Parameters
UV–Visible Spectroscopy

The bioreduction of Ag^+ ions was monitored using UV–Vis spectral analysis. The absorption spectrum of the reaction mixture was recorded at room temperature using a U-3200 Hitachi spectrophotometer with a 1 nm resolution over the wavelength range of 200–800 nm.

Fourier-Transform Infrared Spectroscopy (FTIR)

For FTIR analysis, the silver nanoparticle solution was centrifuged at 10,000 rpm for 30 minutes. The pellet obtained was washed three times with 20 mL of deionized water to remove unbound proteins and other impurities. The purified sample was then dried, finely ground with KBr, and analyzed using a Shimadzu IR Affinity-1 spectrometer in diffuse reflectance mode at a resolution of 4 cm⁻¹.

Scanning Electron Microscopy (SEM)

At the peak of nanoparticle production, the reaction supernatant was air-dried, and the resulting nanoparticles were deposited onto glass substrates. Surface morphology and particle size were observed using a VEGA 3 TESCAN Scanning Electron Microscope, with micrographs captured focusing on aggregated nanoparticle clusters.

Inhibition of α-Amylase Enzyme

A 0.1% (w/v) starch solution was prepared by dissolving 0.1 g of potato starch in 100 mL of 16 mM sodium acetate buffer. The α-amylase enzyme solution was made by dissolving 27.5 mg of the enzyme in 100 mL of distilled water. The colorimetric reagent was prepared using sodium potassium tartrate combined with 96 mM 3,5-dinitrosalicylic acid (DNS) solution. Starch solution was added to control and test tubes containing the plant extract (leaf and rhizome formulations), followed by the addition of α-amylase under alkaline conditions at 25°C. The reaction was allowed to proceed for 3 minutes. Maltose formation was measured by the reduction of DNS to 3-amino-5-nitrosalicylic acid, and absorbance was recorded at 540 nm.

Inhibition of β-glucosidase Enzyme

β-Glucosidase inhibition was assessed by incubating 1 mL of a 2% (w/v) starch-based substrate (glucose, maltose, or sucrose) with 0.2 M phosphate buffer (pH 8.0) and varying concentrations of plant extract for 5 minutes at 37°C. The reaction was initiated by adding 1 mL of β-glucosidase enzyme (1 U/mL), followed by a 40-minute incubation at 35°C. The reaction was terminated by adding 2 mL of 6N HCl. The resulting color intensity was measured spectrophotometrically at 540 nm, following the method described [30].

.Inhibition % = Control- Test__ X 100

                 Control

RESULTS

Synthesis of Silver Nano Particle (SNPs)

During the biosynthesis of silver nanoparticles (SNPs) employing the leaf extract of *Barleria longiflora* and silver nitrate (AgNO₃), a distinct visual shift in color from pale yellow to deep brown was observed, signifying successful nanoparticle formation. The pH value exhibited a modest rise from 4.0 to 4.60, accompanied by a pronounced color intensity (+++), indicating robust synthesis activity. This rapid conversion, occurring within 20 minutes, affirmed the

effective generation of silver nanoparticles. The underlying mechanism driving this color transition is linked to surface plasmon resonance (SPR), an inherent optical behavior exhibited by silver nanoparticles in aqueous media [32].

UV-Visible Spectroscopy

The UV-VIS analysis of *Barleria longiflora* extract revealed two significant absorption peaks at wavelengths of 398.75 nm and 458.35 nm. The first peak at 398.75 nm exhibited an absorbance of 0.9427, indicating the presence of compounds that absorb in the near-visible region, likely flavonoids or phenolic compounds as well as to the stabilization of the resultant nanoparticles [27]. The second, more intense peak at 458.35 nm showed a higher absorbance of 1.1062, suggesting a stronger presence of chromophoric compounds, which may contribute to the plant's coloration and potential antioxidant activity [10]. These results indicate the presence of bioactive compounds in the extract, which may also play a role in the synthesis and stabilization of silver nanoparticles.

FT-IR Spectroscopy

The IR spectrum exhibits several characteristic absorption bands indicating the presence of multiple functional groups. A strong and broad band at 3445 cm^{-1}, along with a peak at 2927 cm^{-1}, corresponds to O–H stretching vibrations, which are indicative of alcohol groups, specifically pointing toward the presence of both primary and secondary alcohol functionalities likely from hydroxyl groups in plant metabolites [26]. A distinct absorption at 2094 cm^{-1} is attributed to N=C stretching, suggesting the presence of an isothiocyanate group [8]. Additionally, a peak at 1639 cm^{-1} represents C=C stretching, which is commonly associated with alkenes [29]. The band at 1412 cm^{-1} is due to S=O stretching, indicating the presence of a sulfate group [5]. A notable absorption at 1120 cm^{-1} corresponds to C–O stretching, supporting the identification of a secondary alcohol [25]. Finally, the absorption observed at 657 cm^{-1} is assigned to C–Br stretching, pointing toward the presence of a halo compound, as interpreted from FT-IR data [7].

Scanning Electron Microscopy (SEM)

The SEM revealed a high density of silver nanoparticles synthesized using *Barleria longiflora* extract, further confirming the successful formation of silver nanostructures. This analysis provided valuable information regarding the morphology and size of the nanoparticles. SEM results indicated that the particles exhibited a crystalline structure with an approximate size of 10 μm. Silver nanoparticles synthesized through this green approach have demonstrated significant toxicity against multidrug-resistant bacteria, highlighting their strong potential for biomedical applications. The current study presents a straightforward, rapid, and cost-effective method for producing silver nanoparticles. The use of such environmentally friendly nanomaterials in antimicrobial treatments, wound healing, and various medical and electronic fields underscores the promise of this green synthesis route for large-scale production of other inorganic nanomaterials.

α-Amylase Activity

The α-amylase inhibitory activity of *Barleria longiflora* extract was assessed at various concentrations (25, 50, 75, and 100 mg/mL) and compared with Acarbose, a standard pharmacological inhibitor. At 25 mg/mL, the extract showed an inhibition rate of 37.2%, marginally lower than Acarbose's 40.2%. With escalating concentrations, the extract exhibited a progressive and concentration-dependent increase in enzyme inhibition 46.8% at 50 mg/mL, 59.6% at 75 mg/mL, and 75.0% at 100 mg/mL. In contrast, Acarbose displayed a slightly higher inhibition across the same concentrations, registering 52.5%, 64.8%, and 76.9%, respectively. The IC$_{50}$ value, denoting the concentration required to inhibit 50% of enzymatic activity, was calculated as 53.3 mg/mL for the extract and 44.9 mg/mL for Acarbose, reaffirming the latter's greater potency. Nonetheless, *Barleria longiflora* exhibited a notable and consistent inhibitory pattern, underscoring its potential as a natural alpha-amylase inhibitor capable of delaying carbohydrate metabolism and mitigating postprandial hyperglycemia an essential mechanism in diabetes management.

β-Glucosidase Activity

The inhibitory efficacy of *Barleria longiflora* extract on β-glucosidase enzyme activity was assessed at incremental concentrations (25, 50, 75, and 100 mg) and benchmarked against Acarbose, a well-established antidiabetic reference

compound. At the lowest concentration of 25 mg, the extract achieved a 26.3% suppression of enzyme activity, slightly trailing Acarbose, which recorded a 30% inhibition. As the dosage increased, the plant extract demonstrated a clear dose-responsive enhancement in inhibitory capacity 35.9% at 50 mg, 42.7% at 75 mg, and peaking at 58.2% at 100 mg. Acarbose maintained superior inhibitory efficiency at each corresponding concentration (40%, 50%, and 60%, respectively). The half-maximal inhibitory concentration (IC_{50}) was calculated as 85 mg for the extract, compared to 75 mg for Acarbose, indicating the extract's comparatively lower potency. Nonetheless, the extract's consistent and progressive inhibition of β-glucosidase underscores its pharmacological promise as a plant-based adjunct for glycemic regulation and diabetes management.

DISCUSSION

The observed color change from yellowish to dark brown, correlated with the increase in absorbance at 458.35 nm, further supports the synthesis of silver nanoparticles in the extract. This color transition is attributed to the excitation of surface plasmon vibrations in the silver nanoparticles, a characteristic feature that occurs due to the collective oscillation of free electrons in the metal when exposed to light [23]. This shift in color, accompanied by the distinctive absorbance peaks, serves as a confirmation of the nanoparticle formation process and provides insight into the synthesis mechanism. The UV-VIS spectroscopic analysis, therefore, not only reveals the presence of bioactive compounds in the *Barleria longiflora* extract but also offers a simple yet effective means to monitor the synthesis and stability of metal nanoparticles in aqueous solutions. The combination of flavonoids, phenolic compounds, and silver nanoparticles in the plant extract further suggests that this approach may hold significant promise for various applications, including drug delivery, antimicrobial treatments, and antioxidant therapies. The FT-IR results provide substantial evidence of the role of various plant metabolites in the synthesis of silver nanoparticles. The presence of hydroxyl, isothiocyanate, alkene, sulfate, and alcohol groups suggests a complex interaction between the plant extract and silver ions, where bioactive compounds such as polyphenols, flavonoids, and alkaloids likely contribute to both the reduction of silver ions and the stabilization of nanoparticles. These compounds may form a protective layer around the nanoparticles, preventing aggregation and ensuring colloidal stability [6]. Moreover, the functional groups identified in the FT-IR spectrum indicate that the plant extract possesses significant chemical diversity, which may be leveraged in the synthesis of nanoparticles with enhanced bioactivity. Overall, the FT-IR analysis supports the conclusion that the *Barleria longiflora* leaf extract contains a variety of functional groups that not only participate in the reduction of silver ions but also play a crucial role in stabilizing the silver nanoparticles, making them suitable for a wide range of applications, including antimicrobial, anticancer, and drug delivery systems [20].

SEM analysis confirmed the successful green synthesis of silver nanoparticles (AgNPs) using *Barleria longiflora* extract, revealing a high density of crystalline nanostructures with an approximate size of 10 μm, likely due to aggregation. The morphology and size support the role of plant-derived phytochemicals as effective reducing and stabilizing agents [1, 16]. The synthesized AgNPs exhibited strong antibacterial activity against multidrug-resistant bacteria, indicating their potential for biomedical applications such as antimicrobial coatings and wound healing. These findings are consistent with previous studies highlighting the bactericidal mechanisms of AgNPs, including membrane disruption and ROS generation [22, 14]. This study demonstrates a simple, eco-friendly, and scalable method for AgNP production, promoting sustainable nanomaterial development for medical and environmental use. The *Barleria longiflora* extract demonstrated a clear, concentration-dependent inhibition of alpha-amylase activity, achieving 75.0% inhibition at 100 mg/mL. Although slightly less potent than the standard drug Acarbose (76.9% at 100 mg/mL), the extract's IC_{50} value (53.3 mg/mL) suggests moderate efficacy as a natural enzyme inhibitor, compared to Acarbose's 44.9 mg/mL. These findings indicate that the phytochemicals in *B. longiflora* likely flavonoids, tannins, and phenolic acids—interact with the active site of alpha-amylase, thereby delaying starch breakdown and glucose absorption [12]. This mechanism is vital for controlling postprandial blood glucose spikes, a key factor in managing type 2-diabetes. The extract's performance aligns with earlier studies on plant-based alpha-amylase inhibitors, such as those from *Salacia reticulata* and *Syzygium cumini*, which also showed dose-dependent

inhibition comparable to Acarbose [3, 28]. Importantly, natural inhibitors tend to have fewer gastrointestinal side effects than synthetic drugs, making *B. longiflora* a promising candidate for nutraceutical development or adjunct therapy. The *Barleria longiflora* extract demonstrated a dose-dependent inhibition of β-glucosidase activity, peaking at 58.2% inhibition at 100 mg/mL. Though slightly less potent than Acarbose (60% at the same concentration), the extract's consistent efficacy (IC_{50}: 85 mg/mL vs. Acarbose's 75 mg/mL) highlights its potential as a natural glycosidase inhibitor. This enzyme plays a key role in the hydrolysis of glycosidic bonds in disaccharides, facilitating glucose release. By inhibiting β-glucosidase, *B. longiflora* extract may help slow glucose absorption and attenuate postprandial hyperglycemia is a critical strategy in managing type 2 diabetes [17]. The inhibitory effects likely stem from phytoconstituents such as flavonoids and polyphenols, which are known to interact with glycosidase active sites [21]. Similar dose-responsive inhibition has been reported in other medicinal plants, including *Momordica charantia* and *Punica granatum*, supporting the role of natural inhibitors as safer alternatives or adjuncts to synthetic drugs [13].

CONCLUSION

This investigation successfully established a green, sustainable method for synthesizing silver nanoparticles utilizing *Barleria longiflora* leaf extract. The biosynthesis process proved to be efficient, economical, and environmentally benign. Structural and functional characterization through UV–Vis spectroscopy, FTIR, and SEM affirmed the formation, stability, and morphological traits of the nanoparticles. The plant-derived extract exhibited significant and concentration-dependent inhibition of α-amylase and β-glucosidase, indicating its potential as a natural antidiabetic agent. Although marginally less effective than Acarbose, the standard inhibitor, the consistent enzyme-suppressing activity of *B. longiflora* underscores its pharmacological relevance. Overall, the study supports the application of *B. longiflora*-mediated silver nanoparticles in therapeutic domains, particularly for glycemic control and microbial intervention. Future research involving in vivo analysis and clinical validation is warranted to further substantiate its biomedical utility.

ABSTRACT

Work-life balance and employee well-being are critical for the success of both the individual and the organization in today's competitive, fast-paced workplace. Workplace well-being relates to the mental, physical and emotional health of employees at their workplace. Taking care of these two areas leads to higher productivity, more motivated employees, and a higher job satisfaction. As such, this study aims to evaluate the state of workforce well-being/ work-life balance among chemical industry employees today. The research is based on a mix of survey responses and employee feedback. The qualitative and quantitative methods explore the influence of workplace policy, job pressure, mental health care and working time on employee well-being. It also outlines some of the major difficulties that employees encounter in achieving a balance between their occupational and personal life. The study's findings reveal that despite the perception of strong support for mental health and job security in workplaces, the overwhelming majority of workforces are suffering from work overload and a lack of flexibility. The majority of employees feel great about current wellness programs, but they want more options on how to use their time, including flexible hours and the ability to work remotely. Companies need to focus more on flexible work arrangements, mental health initiatives and career growth opportunities, the study said. But those steps can help professionals lower employee stress and job satisfaction while also building a healthier, happier workforce. Encouraging employee well-being and supporting work-life balance is good for workers and also reflects on the long-term well-being of organizations.

Keywords: The qualitative and quantitative methods explore the influence of workplace policy, job pressure, mental health care and working time on employee well-being.

COMPANY PROFILE

The study is based on chemical manufacturing and distribution company headquartered at Chennai, Tamil Nadu, India. Established in the early 1980s, the company has grown from a small distributor into a globally recognized

95446

player in the chemical industry. It serves a wide range of sectors including pharmaceuticals, agriculture, textiles and industrial solutions, delivering reliable and innovative chemical products to its customers. With a strong domestic and international presence, the company operates through multiple branches across India and key global locations. It supports thousands of clients with dedicated teams in logistics, technical services, and customer support, aiming to maintain high standards in product quality, safety, and environmental responsibility. Apart from industrial chemicals, the company has also launched a hygiene product line under its own brand, focusing on eco-friendly, non-toxic, and biodegradable cleaning solutions for personal and community use. These products certified for sustainability and are designed to meet modern hygiene needs while minimizing environmental impact. The organization's commitment to innovation, customer satisfaction, and employee well-being makes it a valuable case for studying workplace practices in the chemical sector.

REVIEW OF LITERATURE

Maslow's Hierarchy of Needs (1943): Abraham Maslow explained that for individuals to perform well, their basic needs such as safety, belongingness, and self-esteem must be fulfilled. In the workplace, this means organizations should ensure a healthy environment, recognition, and personal growth opportunities to improve employee well-being. **Greenhaus and Beutell (1985):** This study introduced the concept of work-family conflict, which occurs when responsibilities from work and home interfere with each other. It emphasized that poor work-life balance can lead to stress, low job satisfaction, and even health issues. **Guest's Model of Work-Life Balance (2002):** According to Guest, achieving balance depends on supportive organizational policies, employee attitudes, and job design. The model suggests that companies should focus on flexibility, career development, and stress-free environments to maintain employee satisfaction. **Demerouti et al. – Job Demands-Resources Model (2001):** This model explains how job demands (like workload) and job resources (like support and flexibility) influence employee stress and motivation. A good balance between the two helps improve both performance and well-being. **Seligman's PERMA Model (2011):** Applying this model in the workplace helps create a more supportive and engaging work culture that boosts employee happiness and productivity.

RESEARCH DESIGN

One strategy for methodically resolving research issues is research methodology. It directs the researcher to conduct the study in a scientific manner. It includes several phases that are often chosen by a researcher to examine his research issue and the reasoning behind it. The research approach comprises the reasoning behind the techniques.

DESIGN SAMPLE
Judgmental sampling is the sample design that is employed. With this approach, the researcher's judgment is used to choose the population's components, guaranteeing that only individuals who possess pertinent information and skills are incorporated into the research. Another name for this technique is as purposive sampling since the investigator carefully selects the most qualified respondent's ability to offer insightful information. The Work place well-being and work life balance research of this company, the participants are chosen according to their background, position, and participation in the use and execution of chemical manufacturing company.

THE SIZE OF THE SAMPLE
The sample size that satisfies the requirements of effectiveness, representativeness, dependability, and adaptability is referred to as an optimal sample. The sample size chosen for the research is 110 employees from different streams.

DATA COLLECTION TOOLS
Data Sources
- Primary data through surveys
- Secondary data from case studies and articles

CONDUCTED STUDY

Original Information

Original information gathered by researchers directly from their sources is referred to as primary data, origin of interest. This information is acquired using techniques like surveys, questionnaires, observations, tests, or interviews conducted especially for the ongoing investigation. Given that original data is gathered straight from the participants or phenomenon under investigation.   Primary data was gathered via a well-designed questionnaire.

Survey

For this, a questionnaire with 25 multiple-choice questions was created . The staff members of the company, were given the questionnaire.   Finding out more about "A study on Workplace well-being & Work life balance" was the goal.   In response to each question, the respondents expressed their opinions.

STATISTICAL TOOLS

Statistical techniques are used to analyze the data. The data gathered is analyzed using simple percentage analysis.
- Correlation-coefficient Analysis
- T-Test
- U-Test
- Regression
- F-Test

Hypotheses: 1 Age Group & Feeling Stressed at Work

(1&8) (H$_0$): There is no relationship between the age group and stress level at work.

(H$_1$): younger employees feel stressed more than the older employees at work.

Hypotheses: 2 Age Group & Awareness of wellness programs

(1&10) (H$_0$): There is no relation between the age group and wellness programs.

(H$_1$): Younger employees are more like to know about and use wellness programs.

Hypotheses: 3 Gender & Supervisor Support

(2&11) (H$_0$): There is no relationship between the gender and the supervisor support.

(H$_1$): Employees feel less supported by the supervisor for well-being.

Hypotheses: 4 Years in Organization & Feeling Valued

(4&14) (H$_0$): There is no relation between years in organization and feeling valued.

(H$_1$): Employees with more experienced in the organization feel more valued.

Hypotheses: 5 Age Group & Weekly Working Hours

(1&17) (H$_0$): There is no relationship between the age group and weekly working hours.

(H$_1$): Younger employees are work more hours each week than older employees.

CORRELATION CO-EFFICIENT

(1 & 8) Age Group & Feeling Stressed at Work

Hypothesis: There is a significant relationship between an employee's age group and their frequency of feeling stressed or overwhelmed at work.

Null Hypothesis(H0): There is no relationship between the age group and their feeling of stressed.

Alternative Hypothesis(H1): There is relationship between the age group and feeling overwhelmed at work.

Age group (x)	10	30	50	20
Feeling overwhelmed at work (y)	0	0	14	96

95448

Nandinipriya

x	y	x^2	y^2	xy
10	0	100	0	0
30	0	900	0	0
50	14	2500	196	700
20	96	400	9216	1920
$\Sigma X=110$	$\Sigma Y=110$	$\Sigma x^2=3900$	$\Sigma y^2=9412$	$\Sigma xy=2620$

$$r = \frac{n\sum xy - (\sum x)(\sum y)}{\sqrt{[n\sum x^2 - (\sum x)^2][n\sum y^2 - (\sum y)^2]}}$$

$$= \frac{4 \times 2620 - 110 \times 110}{\sqrt{[4 \times 3900 - 110^2][4 \times 9412 - 110^2]}}$$

$$= \frac{10480 - 12100}{\sqrt{[15600 - 12100][37648 - 12100]}}$$

$$= \frac{-1620}{\sqrt{[3500 - 25548]}}$$

$$= \frac{-1620}{\sqrt{89418000}}$$

= -0.1713

Since the correlation coefficient r=−0.1713, it indicates a weak negative correlation between the age group and feeling overwhelmed at work. This means that as age increases, the level of feeling overwhelmed at work slightly decreases, but the relationship is very weak.

U- TEST

(2 & 11) Gender & Supervisor Support for Well-Being

Hypothesis: There is a gender-based difference in the perception of supervisor support for mental health and well-being.

H0: There is no significant gender difference in the perception of supervisor support for mental health.

H1: Female employees perceive less support from their supervisors regarding mental health and well-being compared to male employees.

Gender	80	30
Mental health support	110	0

Dates: 80, 110, 30, 0

Ascending order: 0, 30, 80, 110

Rank: 1, 2, 3, 4

$R_1 = 2+3 = 5$

$R_2 = 1+4 = 5$

Find u_1 & u_2

$U_1 = R_1 - \frac{n_1(n_1+1)}{2}$

$= 5 - \frac{2(2+1)}{2}$

$= 5 - \frac{2(3)}{2}$

$= 5 - \frac{6}{2}$

$= 5 - 3$

$U_1 = 2$

$U_2 = R_2 - \frac{n_2(n_2+1)}{2}$

$5 - \frac{2(2+1)}{2}$

$5 - \frac{2(2+1)}{2}$

$5 - \frac{6}{2}$

$5 - 3$

$U_2 = 2$

Conclusion:

$N_1 = 2$

$N_2 = 2$

Level of significance = 5% = 0.05

Two – tailed test: this implies we're testing if the means are different ($u_1 \neq u_2$).

$u >$ table value.

$2 > 0$

H0 is rejected in favor of H1.

Regression

(4 & 14) Years in Organization & Feeling Valued at Work

Hypothesis: *Employees who have worked longer in an organization feel more valued and recognized for their contributions.*

H0: There is no significant relationship between years of service and feeling valued at work.

H1: Employees with more years in an organization report higher recognition and appreciation at work.

Years of working	12	14	48	10
contribution	110	0	0	0

$$bxy = \frac{n\sum xy - \Sigma \times \Sigma y}{n\Sigma x^2 - (\Sigma x)^2}$$

x	y	X^2	Y^2	xy
12	110	144	12100	1320
40	0	1600	0	0
48	0	2304	0	0
10	0	100	0	0
$\sum x = 110$	$\sum y = 110$	$\sum x^2 = 4148$	$\sum y^2 = 12100$	$\sum xy = 1320$

X on y   n = 4

$$bxy = \frac{N\Sigma xy - \Sigma x\Sigma y}{N\sum y^2 - (\sum y)^2}$$

$$= \frac{4(1320) - (110)(110)}{4(12100) - 110^2}$$

$$= \frac{5280 - 12100}{48400 - 12100}$$

$$= \frac{-6820}{36300}$$

$= -0.1879$

Y on x

$$bxy = \frac{n\sum xy - \Sigma \times \Sigma y}{n\Sigma x^2 - (\Sigma x)^2}$$

$$= \frac{2(1320) - (110)(110)}{2(4148) - (110)^2}$$

Nandinipriya

$$= \frac{2640 - 12100}{8296 - 12100}$$

$$= \frac{-9460}{-3804}$$

$$= 2.4869$$

bxy = -0.1879

byx = 2.4869

$$\bar{x} = \frac{\Sigma x}{n} \quad \bar{y} = \frac{\Sigma y}{n}$$

$$= \frac{110}{4} \qquad\qquad = \frac{110}{2}$$

$\bar{x}$= 27.5　　　　　$\bar{y}$= 55

Regression equation of x on y

$$x - \bar{x} = bxy(y - \bar{y})$$

$$x - 27.5 = 0.1879(y - 55)$$

$$x - 27.5 = -0.1879y + 10.3345$$

$$x = -0.1879y + 10.3345 + 27.5$$

x=-0.1879y + 37.8345

Regression equation of y on x

$$y - \bar{y} = byx(x - \bar{x})$$

$$y - 55 = 2.4869(x - 27.5)$$

$$y = 2.4869x - 68.3898 + 55$$

y=2.4869x − 13.3898

F-TEST
(1 & 17) Age Group & Average Weekly Work Hours
Hypothesis: *The number of hours an employee works per week varies significantly with age group.*
H0: There is no significant relationship between age group and average weekly work hours.
H1: Younger employees tend to work longer hours compared to older employees.

Age of respondents	10	30	50	20
Working hours per week	22	51	37	0

x	y	X²	Y²
10	22	100	484
30	51	900	2601
50	37	2500	1369
20	0	400	0

$$\overline{x_1} = \frac{\Sigma x}{n_1}$$

$$= \frac{110}{4} = 27.5$$

$$\overline{x_2} = \frac{\Sigma y}{n_2}$$

$$= \frac{110}{3} = 36.6$$

$$S_1^2 = \frac{\Sigma x^2}{n_2} - (\overline{x_1})^2$$

$$= \frac{3900}{4} - 110^2$$

$$= 975 - 12100$$

$$= -11,125$$

$$S_2^2 = \frac{\Sigma y^2}{n_2} - (\overline{x_2})^2$$

$$= \frac{4454}{3} - 110^2$$

$$= 1484.6 - 12100$$

$$= -10615.4$$

$$s_1^2 = \frac{n_1 s_1^2}{n - 1}$$

$$= \frac{4 \times -11,125}{4 - 1}$$

$$= \frac{-44500}{3}$$

$$= -14833.3$$

$$s_2^2 = \frac{n_2 s_2^2}{n - 1}$$

$$= \frac{3 \times -10615.4}{3 - 1}$$

$$= \frac{-31,846.2}{2}$$

$$= -15,923.1$$

$$F = \frac{S_1^2}{S_2^2}$$

$$= \frac{-14833.3}{-15923.1} = 0.9315$$

Degree of freedom
Degree of freedom for the numerator (df_1) = N2 – 1 = 3 – 1 = 2
Degree of freedom for the numerator (df_2) = N1 – 1 = 4 – 1 = 3
The critical F-value
Significance level of α = 0.05
The critical value for two tailed test with df_1 = 2 and df_2 = 3
Using a F distribution table the critical F- value is approximately 9.55
Compare the calculator f statistic (0.9315) to the critical F- value (9.55).
In this case, 0.9315 < 9.55

Conclusion
Since the calculator F statistic (0.9315) is less than the critical F- value (9.55), we failed to reject the null- hypothesis.

Nandinipriya

Findings
Analysis of the survey responses.
- Majority of the respondents were male 69%, showing that workforce in the sample is mainly male.
- 30-40 years age group employees are 38%, which is the largest age group in the survey.
- 40% of the employees are working in the middle level job roles.
- 44% of the employees have been working for 4 to 7 years in the organization.
- 87% of the respondents says they rarely feel stressed or overwhelmed at work.
- 49% of the employees work from the office and others in hybrid or remote basis.
- 78% of the employees rated their well-being at work as excellent.
- 100% of the employees said their company ha well-being policies.
- 71% of the employees says they don't have time for their personal activities.
- 69% of the employees feel valued and supported in the organization.
- 37% of the respondents says they feel motivated while others gave different opinions.
- 63% of the employees are satisfied with their leaves they receive and others are not.
- 46% of the respondents work for 40 to 50 hours per week, which is shows a high workload.
- 44% of the employees often work on weekends.
- 69% of the employees said they can disconnect from their work during their personal time.
- 100% of the respondents would recommend their company as a workplace that supports well-being and work-life balance.

Suggestions
Based on the survey findings, the following suggestions are recommended to enhance employee well-being and promote better work-life balance at the organization:
1. **Introduce Flexible Work Policies**
   - Flexible Work Hours: As 100% of employees reported that flexible work hours are not available, it is advisable to implement flexible timing options. This can include staggered shifts or adjusted start and end times.
   - Hybrid Work Model: Where feasible, adopt a hybrid model that allows employees to work partly from home. This approach can help reduce stress, save commuting time, and improve overall balance.
2. **Improve Employee Well-Being Initiatives**
   - Mental Health Support: Continue providing access to counseling and mental health programs, as already appreciated by employees. These initiatives should be promoted actively to ensure maximum utilization.
   - Decrease Work Overload: Take into account transferring duties to make more time for personal interests, as 71% of workers feel they don't have enough time for them.

3. Encourage a Culture of Positive Work
   - Encourage Downtime and pauses: To lower stress and boost productivity, encourage brief pauses while work.
   - Recognition Programs: To keep employees motivated and satisfied with their jobs, periodically recognize and reward them.
1. **Improve Leave Policies**
   - Reevaluate Leave Structure 37% of respondents are dissatisfied with leave policies, compared to 63% who are. Determine whether more leave for mental health or personal reasons can be implemented.

5. Expand Opportunities for Career Advancement
   - Training & Development: Provide educational opportunities to maintain staff engagement and lessen stress at work.
   - Internal Mobility: To make work interesting and rewarding, let employees try out various positions within the company.

CONCLUSION

The study on work-life balance and workplace well-being emphasizes how crucial it is to provide a flexible and encouraging work environment. According to the findings, there are important areas that require development, especially in work-life balance, flexibility, and personal time management, even though many employees have positive feelings about certain aspects, such as job security and workplace well-being policies. By implementing flexible work arrangements, professional advancement possibilities, mental health support, and a balanced workload, companies such as chemical manufacturing company's can improve employee happiness. In addition to enhancing worker well-being, addressing these issues will result in increased engagement, decreased stress, and increased productivity. A balanced workplace promotes job happiness, lowers burnout, and eventually helps the business succeed.

ABSTRACT

Medicinal plants are abundant in natural antioxidants capable of neutralizing reactive oxygen species (ROS). This research aims to investigate the ROS scavenging ability of 2,4,6-Octatrienoic acid through detailed *in vitro* analyses. The antioxidant properties of 2,4,6-Octatrienoic acid were thoroughly assessed using a diverse range of free radical scavenging methods, including DPPH (2,2-diphenyl-1-picrylhydrazyl), ABTS (2,2′-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid)), hydrogen peroxide (H_2O_2), superoxide, and hydroxyl radical assays, as well as the ferric reducing antioxidant power (FRAP) assay. The compound revealed strong antioxidant activity, exhibiting results similar to that of reference standard, ascorbic acid. These findings reveal the potential of 2,4,6-Octatrienoic acid as a promising candidate for further investigation into its anti-carcinogenic properties, with future validation recommended through experimental studies on suitable cell lines.

Keywords: 2,4,6-Octatrienoic acid, Antioxidant, Reactive oxygen species.

INTRODUCTION

Oxidative stress arises from a disturbance in the intricate equilibrium between the body's oxidative and antioxidative mechanisms, typically causing from anexcessive generation of ROS, whichin turn accumulates oxidative damage by-products, thereby initiating the progression of numerous diseases. The major contributors to this phenomenon are

95455

Sivasankaran *et al.*,

superoxide, hydrogen peroxide, and hydroxyl radicals, which actsas a central part in initiating oxidative stress [1]. The concentrations of ROS are precisely controlled, sustained at minimal levels, and balanced in a dynamic equilibrium under normal biological phenomenon. At these regulated levels, ROS serve an essential function as crucial signaling molecules, modulating cellular processes and governing various physiological activities. However, an overproduction of ROS that surpasses the cell's antioxidant defensesresults indisruptions of structure and function of cells, affecting critical biomolecules such as membranes, lipids, proteins, lipoproteins, and DNA [2]. Oxidative stress is thus serves as akey contributorin the development of numerous diseases, including cancer, cardiovascular and neurodegenerative disorders[3,4]. To counteract such deleterious effects, the body relies on an enzymatic and non-enzymatic mechanisms. Enzymes such as superoxide dismutase, glutathione peroxidase, and catalase are central to this defense, facilitating the breakdown of ROS into less reactive compounds [5,6]. Superoxide dismutase catalyzes the conversion of superoxide radicals into oxygen and hydrogen peroxide, while glutathione peroxidase reduces hydrogen peroxide to water and lipid peroxides to their respective alcohols, using reduced glutathione as a substrate. Catalase enhances this defense system by breaking down H_2O_2 into water and oxygen, especially when hydrogen peroxide is present at elevated concentrations. Non-enzymatic antioxidants, such as reduced glutathione itself, directly neutralize ROS, including hydroxyl radicals and singlet oxygen, thereby preventing cellular damage [7]. 2,4,6-Octatrienoic acid (Figure 1)is a notable bioactive compound of*Deschampsiaantarctica* (Antarctic hair grass), a resilient flowering plant native to the harsh Antarctic Peninsula [8]. *Deschampsiaantarctica* belongs to the Poaceae family and has evolved remarkable adaptations to endure extreme conditions, including freezing temperatures, high UV radiation, and severe winds. Among the bioactive compounds it synthesizes are polyunsaturated fatty acids, flavonoids, phenolic acids, and secondary metabolites like 2,4,6-octatrienoic acid. These compounds are pivotal for combating oxidative stress induced by UV radiation, which generates ROS in plant tissues [9,10]. The antioxidant activity of 2,4,6-Octatrienoic acid was comprehensively evaluated through a diverse range of free radical scavenging assays, including DPPH, ABTS, H_2O_2, superoxide, hydroxyl radicaland the FRAP assay.

MATERIALS AND METHODS

Chemicals
2,4,6-Octatrienoic acid was purchased from Sigma-Aldrich Private Limited in India, and the remaining chemicals were procured from Himedia Laboratories in Mumbai.

DPPH assay
The scavenging ability of 2,4,6-Octatrienoic acid for DPPH radicals was assessed by measuring the reduction in absorbance at 517 nm [11]. A 0.1 mM DPPH solution (333 µL) in methanol was combined with 1 mL of 2,4,6-Octatrienoic acid in Dimethyl sulfoxide (DMSO) at different concentrations. The mixture was shaken thoroughly and incubated at room temperature for 30 minutes. After incubation, the absorbance was recorded at 517 nm using a UV-visible spectrophotometer (Multiskan GO; Thermo Fisher Scientific). A decrease in absorbance of the reaction mixture correlated with a higher free radical scavenging activity.

DPPH radical scavenging activity was calculated as below

$$\text{Scavenging effect (\%)} = \frac{\text{Absorbance of control} - \text{Absorbance of test}}{\text{Absorbanceofcontrol}} \times 100$$

ABTS assay
The antioxidant efficacy of 2,4,6-Octatrienoic acid was evaluated using the ABTS radical scavenging method [12]. The ABTS solution was allowed to reach room temperature, and Trolox standards were prepared by diluting the stock solution with Assay Buffer. A dilution series was created, with assay buffer serving as the zero standard. Samples or Trolox standards, along with the 2,4,6-Octatrienoic acid working solution, were added to the assay plate. Following this, 100 µL of the ABTS solution was introduced, and the mixture was incubated for 5 minutes. The reaction was terminated by adding 50 µL of Stop Solution, and the absorbance was measured at 745 nm to evaluate the antioxidant activity.

$O_2{}^{\bullet-}$ scavenging activity

The assay established by Nishikimi et al., was revised to evaluate the superoxide radical scavenging potential of 2,4,6-Octatrienoic acid [13]. This assay utilizes a coupling reaction between phenazinemethosulfate and nicotinamide adenine dinucleotide to generate superoxide radicals, which then reduce nitroblue tetrazolium, resulting in the formation of a purple formazan. The formazan formed was measured spectrophotometrically at 560 nm to assess the scavenging activity.

$OH^{\bullet}$ scavenging assay

The potential of 2,4,6-Octatrienoic acid to scavenge hydroxyl radicals was assessed using the technique outlined by Halliwell et al., [14]. This method relies on the hydroxyl radical's capacity to degrade deoxyribose, resulting in the production of substances that react with thiobarbituric acid (TBA), resulting in a pink color. The absorbance of the formed complex was recorded at 532 nm to assess its radical scavenging potential.

H_2O_2 Assay

The hydrogen peroxide scavenging potential of 2,4,6-Octatrienoic acid and ascorbic acid was analyzed following the approach outlined by Jayaprakasha et al [15]. This method relies on monitoring the decline in H_2O_2 concentration by measuring absorbance at 230 nm. In this procedure, a 20 mM hydrogen peroxide solution was combined with different concentrations of 2,4,6-Octatrienoic acid or ascorbic acid and allowed to react for 10 minutes. The absorbance at 230 nm was then recorded to assess the extent of hydrogen peroxide degradation.

FRAP Assay

Reducing power of 2,4,6-Octatrienoic acid was assessed using FRAP Method [16]. The FRAP assay was performed by adding 0.2 mL of methanolic extract (at concentrations of 0.1, 0.5, 1, and 2 mg/mL) to 3.8 mL of FRAP reagent, which was prepared by mixing sodium acetate buffer, TPZT, and FeCl3. After incubation at 37°C for 30 minutes, absorbance was measured at 593 nm. Results were expressed as milligram equivalents of FeSO4 per milligram of dry weight, with a calibration line established using FeSO4 concentrations of 0.0025, 0.005, 0.01, and 0.02 mg/mL.

STATISTICAL ANALYSIS

The data were presented as mean ± SD. The Student's t-test was performed to assess the statistical variances among the groups at each concentration. A p-value below 0.05 was considered as statistically significant. The graphical method was utilized to find out the IC_{50} concentration.

RESULTS AND DISCUSSION

This study investigated the antioxidant efficacy of 2,4,6-Octatrienoic acid using a series of specific colorimetric assays. The scavenging efficacy of 2,4,6-Octatrienoic acid was evaluated and compared to the standard reference compounds, ascorbic acid and trolox, specifically for the ABTS assay. Figures 2–7 illustrate the comparative free radical scavenging effects of 2,4,6-Octatrienoic acid against ascorbic acid across multiple assays. For the DPPH radical assay, the IC_{50} value of 2,4,6-Octatrienoic acid was 24 µg/ml, in comparison to 23 µg/ml for ascorbic acid. In the ABTS assay, 2,4,6-Octatrienoic acid showed an IC_{50} of 60 µg/ml, while trolox demonstrated a stronger activity with an IC_{50} of 52 µg/ml. For superoxide radicals (O2-·), the IC_{50} of 2,4,6-Octatrienoic acid was 34 µg/ml, slightly weaker than the 28 µg/ml observed for ascorbic acid. Similarly, the hydroxyl radical scavenging activity yielded an IC_{50} of 38 µg/ml for 2,4,6-Octatrienoic acid and 35 µg/ml for ascorbic acid. Hydrogen peroxide scavenging revealed an IC_{50} of 44 µg/ml for 2,4,6-Octatrienoic acid, whereas ascorbic acid exhibited a more potent activity with an IC_{50} of 36 µg/ml. The reducing power assay indicated an IC_{50} of 74 µg/ml for 2,4,6-Octatrienoic acid compared to 60 µg/ml for ascorbic acid, with the activity increasing proportionally to the concentration. Overall, 2,4,6-Octatrienoic acid exhibited significant scavenging activity against free radicals and hydrogen peroxide, with its effectiveness increasing as the concentration was increased, although its effectiveness was consistently lower than that of the reference compound, ascorbic acid and trolox. *In vitro* free radical scavenging assays are indispensable tools for assessing the antioxidant potential of

medicinal plants and their bioactive constituents. These assays offer significant and precise insights into the ability of natural compounds to neutralize ROS and other free radicals, which play a significant role in oxidative stress-related diseases such as cancer, cardiovascular disorders, and neurodegenerative conditions [17]. Over the last decade, researchers globally have increasingly relied on these assay systems to systematically evaluate and compare the ability of natural products to act as antioxidants, thereby advancing the discovery of novel therapeutic agents. The antioxidant efficacy of 2,4,6-Octatrienoic acid was comprehensively evaluated using a diverse array of *in vitro* assays. This systematic approach allowed for the assessment of its ability to mitigate oxidative damage through neutralization of key radicals, including DPPH, ABTS, superoxide anions, hydroxyl radicals, and hydrogen peroxide. The findings of this study underscore the potential of 2,4,6-Octatrienoic acid as a bioactive compound with promising antioxidant properties, paving the way for further exploration of its therapeutic applications and mechanisms of action. In recent years, the DPPH assay has become a reliable method for evaluating the antioxidant potential of natural compounds under in vitro conditions [18]. This assay works by measuring the reduction of the stable DPPH radical, which has a deep violet color due to its broad absorption spectrum. When a hydrogen atom donor is introduced, the DPPH radical is reduced to its hydrazine form, causing a color change from violet to pale yellow, which is quantitatively assessed using UV-Vis spectroscopy. As a result, the DPPH assay serves as a tool for evaluating the antioxidant capacity of plant extracts and active constituents. In this study, 2,4,6-octatrienoic acid demonstrated strong DPPH radical scavenging activity, highlighting its potential as a promising antioxidant agent. The ABTS assay is widely recognized method for assessing antioxidant activity and to evaluate the antioxidant efficacy of both hydrophilic and lipophilic compounds. ABTS radicals were generated by reacting ABTS with potassium persulfate under dark conditions. The resulting stable radical solution was then diluted and used to determine the antioxidant efficacy of test compounds by measuring the reduction in absorbance at 734 nm [19]. The present results reveals the strong ABTS scavenging potential of 2,4,6-octatrienoic acid.

Superoxide radicals ($O_2^{\bullet-}$) are highly reactive and can convert into hydroxyl radicals ($OH^\bullet$), which cause extensive damage to DNA and other cellular components. This oxidative stress contributes to the progress of various diseases such as cancer and neurodegenerative disorders [17]. Antioxidants that scavenge superoxide radicals prevents cell damage and disease progression. The test compound's ability to scavenge superoxide radicals is evaluated by its capacity to facilitate the conversion of NBT into purple-colored NBT diformazan through the action of superoxide radicals [20]. The current study observed that 2,4,6-Octatrienoic acid exhibits a notable capacity to effectively scavenge superoxide radicals. This remarkable ability underscores its potential as a potent antioxidant capable of neutralizing superoxide radicals, thereby mitigating oxidative stress and its associated cellular damage. Hydroxyl radicals ($OH^\bullet$) are highly reactive ROS that damage proteins by breaking disulfide bonds, disrupting their structure and function. They also initiate lipid peroxidation in cell membranes, damaging unsaturated fatty acids and producing lipid peroxides [21]. This leads to changes in membrane fluidity and permeability, impairing cellular functions such as transport and signaling, which can contribute to diseases like cancer and neurodegenerative disorders. The present study found that 2,4,6-Octatrienoic acid demonstrated significant efficacy in scavenging hydroxyl radicals under *in vitro* conditions. This ability highlights its potential as a protective agent for cellular membranes, offering a defense against oxidative stress-induced damage. By neutralizing these highly reactive species, 2,4,6-Octatrienoic acid maintains the membrane integrity and cellular stability under oxidative conditions. Hydrogen peroxide (H_2O_2), a byproduct of normal cellular metabolism, becomes harmful when overproduced, leading to oxidative stress. It can be converted into highly reactive hydroxyl radicals ($OH^\bullet$) through Fenton's reaction, which causes significant damage to proteins and cell membranes. These hydroxyl radicals can alter protein structure, initiate lipid peroxidation, and disrupt membrane integrity, impairing cellular functions [22]. This oxidative damage is linked to the development of diseases such as cancer, neurodegenerative disorders, and cardiovascular conditions. Thus, controlling H_2O_2 levels is essential to prevent such diseases [23].The present study observed that 2,4,6-Octatrienoic acid demonstrated the capacity to effectively scavenge H_2O_2 under *in vitro* conditions, thereby protects ROS mediated cell damage. FRAP assay is widely utilized analytical procedure for quantifying the antioxidant ability of bioactive compounds andrelies on the reduction of Fe^{3+} to Fe^2, resulting in formation of a colored ferrous-tripyridyltriazine complex. The intensity of the resulting color, which directly correlates with the compound's reducing potential, is precisely quantified via spectrophotometric analysis at an optimal wavelength, ensuring high sensitivity and reproducibility[24].In the present investigation, 2,4,6-Octatrienoic

acid exhibited exceptional ferric-reducing capacity, underscoring its efficacy as a potent free radical scavenger. This remarkable activity highlights the compound's electron-donating ability, which is critical for neutralizing ROS and mitigating oxidative damage. The present study thus explores the promising *in vitro* free radical scavenging ability of 2,4,6-Octatrienoic acid. The antioxidant efficacy of 2,4,6-Octatrienoic acid was much comparable to that of ascorbic acid which suggests its capacity to mitigate oxidative stress.

CONCLUSION

The present findings explores2,4,6-Octatrienoic acid as a promising natural antioxidant. This antioxidant potential needs to be further evaluated in *in vitro* and *in vivo* experimental model to validate its effect on oxidative stress related disorders.

ABSTRACT

Oregano (*Origanum vulgare*) has been increasingly recognized for its significant antibiotic properties, offering promising alternatives to conventional antimicrobial agents. This review article examines the spectrum of antibiotic activity associated with oregano, focusing on its active constituents, particularly carvacrol and thymol, and their mechanisms of action, also several other benefits such as antifungal, anticancer, anti-oxidant, anti-parasitic therapeutic effects using oregano in the form of an essential oil, extract and powder. We analyse recent studies evaluating oregano's effectiveness against a range of pathogens, including both Gram-positive and Gram-negative bacteria, as well as its potential in combating antibiotic-resistant strains. The review also explores the safety profile, and potential synergistic effects of oregano oil with other antibiotics. By synthesizing current research, this article aims to provide a comprehensive overview of oregano's therapeutic potential, highlight areas for further investigation, and discuss its role in the broader context of antimicrobial resistance and natural product-based therapies.

INTRODUCTION

The increasing incidence of antibiotic-resistant bacteria has heightened the quest for alternative antimicrobial drugs that may successfully treat infections while halting the growth of resistance. In this context, natural materials have garnered a lot of attention as potential sources for novel antibiotics. Antibiotic resistance is one of the problems that have made it more challenging to effectively manage dangerous bacteria in recent years. The World Health Organization has recognized antimicrobial resistance (AMR) as a significant global public health concern. The overuse and/or abuse of antibiotics in veterinary medicine, animal agriculture, and human health is the cause of the sharp rise in AMR. As a result, studies on substitute agents have started, with one method including natural raw materials. Since germs are becoming more and more resistant to previously recommended medications, the creation of new medications seems to be the most important prerequisite for managing them at the time. [1, 2] Of them, oregano (*Origanum vulgare*) has emerged as a particularly intriguing candidate due to its well-established antibacterial properties. [3] Belonging to the Lamiaceae family, oregano has long been prized for its culinary and therapeutic uses. The main components that give the plant its antibacterial properties are thymol and carvacrol, two of its many bioactive chemicals. The effectiveness of these phenolic chemicals against viruses, bacteria, fungi, and other harmful microbes has been shown to be broad-spectrum. The natural essential oil derived from oregano plants contains terpinene, thymol, cymene, and carvacrol. [4] The compositional profile of essential oils from throughout the world has been determined by several investigations. Region, climate, growth type, extraction/analytical techniques, and vegetation time all affect the composition. [5, 6, 7]Artificial antioxidants such as butylated hydroxytoluene (BHT) and butylated hydroxyanisole (BHA) have been linked to some negative effects on food preservation. Natural extracts have been used more frequently in recent years because of their ability to enhance personal health and combat diseases, cancer, and atherosclerosis. Numerous research has examined the essential oil makeup of several aromatic and therapeutic crops. In [8], recent studies on the application of essential oils in animal nutrition have concentrated on how they may enhance growth performance, rumen fermentation, and nutrient absorption.

Oils, which are frequently obtained from plants, contain substances including phenols, terpenes, and aldehydes that may have bioactive qualities that affect metabolism, digestion, and the microbial balance of the rumen. [9, 10, 11, 12, 13] Recent research has provided insight into how oregano essential oil produces its antibiotic properties, with particular attention to how it may damage microbial cell membranes, disrupt enzyme activity, and impede bacterial quorum sensing. Since its components may provide an alternative or distinct approach to conventional antibiotics, oregano's potential to address the problem of antibiotic resistance has attracted more study attention. This article aims to provide a comprehensive evaluation of oregano's antibiotic properties along with several other characteristics, including a list of its active constituents, the degree of its antimicrobial activity, and its medicinal applications. Because of its well-established antibacterial and antifungal qualities, oregano essential oil is highly valued for use in food, agriculture, and animals. [14, 15] The fragrant perennial herb oregano (*Origanum vulgare*), which is a member of the Lamiaceae family of mints, is valued for both its flowering tops and its tasty dry leaves. Native to the hills of western Asia and the Mediterranean, oregano has migrated to parts of the US and Mexico. The herb is essential to Mediterranean cooking and has long been used to season a wide range of meals. For instance, Greek or Italian oregano is a culinary variety with a strong aroma and a warm, strong flavor. Oregano is a perennial plant that looks like a herb and has spherical, green leaves. Although it can occasionally be grown as a perennial for three to four years, oregano is usually planted as an annual in the colder northern regions. [16]

The Background of Oregano
Typical name: Oregano
Known in Latin as *Origanum vulgare*
Other names include European oregano, wild marjoram, and Spanish thyme.
Since oregano was first grown in Greece, the Greeks were the first to use it. They believed that this plant was created by the Goddess Aphrodite. She wanted it to symbolize happiness as it blossomed in her yard. The English term oregano comes from the Greek words oros, which means "mountain," and ganos, which means "joy," or "joy of the

mountains." Later, the Romans adopted oregano due to its flavor and ease of production. Their love for the plant helped make it popular throughout Europe and Northern Africa. In medicine throughout the Middle Ages, oregano was frequently used. To treat a range of ailments, such as rheumatism, toothaches, indigestion, and coughing fits, they would chew the oregano leaves. During this time, Oregano also visited China. It was also used for medicinal purposes in this area. The Chinese believed it helped with fever, vomiting, and stomach issues. Throughout the Elizabethan era, oregano was used for practically everything. It was used to encourage luck and good health. Spells for protection, peace, happiness, health, luck, and letting go of a loved one all included it. It was also worn while sleeping to give one telepathic dream. In the United States, oregano did not gain popularity until the conclusion of World War II. The herb was discovered by soldiers during the Italian Campaign and returned to the United States. Culinary Uses: Italian cookery is where oregano is most frequently used. It is a necessary ingredient in pizza sauces, tomato sauces, vegetable meals, and the seasoning of grilled meat. Oregano is a great substitute for marjoram or thyme if you don't have either in your spice cabinet.

Medicinal Uses

According to the ancient Greeks, oregano may also be used as a poison counter. Convulsions, dropsy, infections, and skin irritations were all treated with it. They also used it to counteract the effects of narcotic poisons. Oregano has been used to cure a variety of ailments, such as diarrhea, upset stomach, and nausea. Oregano is also used to treat arthritis and joint and muscle aches and discomfort because to its antibacterial and anti-inflammatory properties. [17] Oregano is one of the most valuable spices in the world in terms of trade. Oregano's name comes from the ancient Greek terms "Oros" and "Ganos," which mean "the beauty of the mountains," respectively. Oregano is the popular term for a wide-ranging taste and scent that characterizes a plant that is cultivated on its own all over the world. The primary source of oregano, a spice used all over the world, is more than 60 plant species. The Lamiaceae family comprises the majority of them. European oregano is used to season meat and meat-based products like sausages, as well as to season salads, stews, sauces, and soups. The leaves and essential oil (EO) are also used in culinary products, cosmetics, and alcoholic liqueurs. In addition to being considered therapeutic plants, oreganos from Mexico and India are mostly used as food flavourings. 39 species of the European genus *Origanum* are widely distributed in the Mediterranean area, according to Vokou and Kokkini (1993). Although O. *dictamnus* is native to the island of Crete in southern Greece, the species most frequently found there is *Origanum vulgare*. In calcareous soils, oregano plants, which are perennial herbs, grow well on their own. While *origanum* plants have numerous glands covering their aerial vegetative organs (stems, leaves, and bracts), their reproductive organs (calyces and corollas) contain fewer glands. The main components of oil, the monoterpenes carvacrol and thymol, are what give the essential oil released by these glands its unique scent. The *gynoecium* and stamens of the flowers have not been reported to contain glandular hairs (Padulosi, 1997). Several stems, erect or ascending, petiolate or subsessile leaves, and flowers arranged in loose or dense spikes that form a paniculate or corymbiform inflorescence are characteristics of Origanum species, which are subshrubs or perennial plants. Understanding the immense morphological and chemical variation of the genus *Origanum*, as well as the natural distribution of all its taxa, would enable full exploitation of this most promising crop. Aromatic plants, commonly known as herbs and spices, such as oregano, have a variety of bioactive compounds with strong antibacterial, antiparasitic, cytotoxic, and antioxidant qualities (Christaki et al., 2012; Giannenas et al., 2013; Sivropoulou *et al.*, 1996). Not only do they serve as a spice, but they are also commercially significant for human and animal nutrition. [18] Investigating and gathering *Origanum vulgare* accessions and populations is a crucial first step in preserving the species' genetic diversity. Leto and Salamone (1997) collected 214 biotypes from 24 places around the Mediterranean and conserved them for ex-situ conditions. The diverse morphologies of the biotypes demonstrated notable variance.

Pharmacognosy of *Oreganum vulgare*

Botanical characteristics

- Kingdom: Plantae
- Family: Lamiaceae
- Genus: Origanum
- Species: O. vulgare

Sakshi Pawar *et al.,*

Phytochemistry
- Essential oil (3.5%): carvacrol, thymol, p-cymene, y-terpinene
- Phenolic acids: rosmarinic, caffeic, quinic
- Flavonoids: luteolin, apigenin
- Terpenes: ursolic, oleanolic acid

Pharmacological activities
- Antimicrobial: antibacterial, antifungal, antiviral
- Anti-inflammatory
- Antiparasitic
- Wound healing
- Digestive aid
- Immune system support
- Anti-cancer properties

Parts used-
- Leaves
- Aerial parts
- Essential oil

Antioxidant activity

Oregano is a good source of natural antioxidants that might be used in the food and pharmaceutical sectors as a safer alternative to manufactured antioxidants. [19, 20] The DPPH method indicates that the oregano herb's essential oil has an antioxidant activity of about 60–70%. [21, 22] The stable DPPH radical is commonly used to evaluate the antioxidant activity of specific chemicals and extracts derived from plant material. We were able to observe a high degree of antioxidant activity at the reduction of free radicals (>71%) by using this approach. An OE fraction of carvacrol, terpinen-4-ol, and γ-terpinene was discovered by Olmedo et al. to have a similar high ability to scavenge free radicals (77.2%). The significant antioxidant activity of the essential oil isolated from O. vulgare L. ssp. Hirtum was confirmed using three different methods, including the DPPH method. [23, 24] High concentrations of thymol, carvacrol, or both are associated with the action of oregano essential oil. Because of the way the compounds are structured, carvacrol and thymol may both trap free radicals and produce stable forms that don't show radical activity. The active molecules in oregano have a lower reduction potential than free radicals because of their aromatic ring. Additionally, they have the ability to transfer hydrogen to the free radical from the aromatic ring's hydroxyl group, rendering it inactive. [25, 26] Oxidative stress, which happens when the body has too many free radicals and not enough antioxidants, can lead to aging-related disorders. The medicinal herb *Origanum vulgare*, sometimes referred to as oregano, is well-known for its antioxidant qualities and other health advantages. The study discovered that oregano retains more of its antioxidant activity when consumed in an encapsulated form as opposed to when taken as a split powder, indicating that the encapsulated form is more beneficial to health. [27]

The technique employed, the oil's content, and the particular characteristics of the antioxidants under investigation all affect how potent oregano essential oil is as an antioxidant. According to the research, oregano oil has potent antioxidant properties in various fractions, especially those that include thymol and carvacrol. This might make oregano oil a useful natural food additive that helps maintain food quality. This emphasizes how crucial it is to measure antioxidant activity at different doses in order to make precise judgments on their efficacy. [28] Foods and plants rich in polyphenols have received particular interest due to their many biological effects, particularly their antioxidant activity. Strong antioxidant activity has been demonstrated by the phenolic compounds found in *Oreganum vulgare*, most of which include phenolic moieties such 3,4-dihydroxyphenyl, 4-(b-D-glucopyranosyloxy) benzyl alcohol (gastrodin), and 3-(3,4-dihydroxyphenyl) lactic acid (danshensu). [29, 30, 31] 4-(3,4-Dihydroxybenzoyloxymethyl) phenyl-O-β-d-glucopyranoside (DBPG), a polyphenolic glycoside of *Origanum vulgare*, has been shown to have the capacity to scavenge 1,1-diphenyl-2-picrylhydrazyl (DPPH). [32]

Sakshi Pawar *et al.,*

Oregano oil is a possible substitute for the synthetic antioxidants now used in the industry because of its strong antioxidant qualities, which have been shown in several research conducted in recent years. [33, 34, 35, 36] Rosemary acid ester, found in oregano oils, has strong antioxidant qualities. Ruberto analyzed the components of oregano essential oils from four different Algerian regions and discovered that all four types of essential oils showed strong antioxidant qualities, even at very low concentrations [100 ppm (1 ppm=1 mg/L)].[37, 38, 39]

Anti-microbial activity
Studies on natural resources and essential oils have shown varied levels of antibacterial activity as a result of growing knowledge of the benefits of employing natural antimicrobials rather than manufactured ones. [40, 41, 42] The hunt for new antimicrobial agents has become essential due to the development of resistance to the already recognized antimicrobial compounds. There is a dearth of research on the production and antibacterial properties of economically important aromatic crops grown in the Western Himalayas. [43] Numerous dangerous bacteria, including both Gram-positive and Gram-negative species, have been demonstrated to be successfully killed by *origanum vulgare* essential oil, sometimes referred to as oregano oil. [44, 45] Two substances that make up a sizable amount of the oil, carvacrol and thymol, are primarily responsible for its antibacterial qualities. These substances cause the bacterial cell membranes to become more permeable, which results in the loss of vital ions and molecules and, eventually, the death of the bacteria.[46, 47, 48, 49]. Many active metabolites of Origanum, including as p-cymene, c-terpinene, thymol, and carvacrol, have antibacterial qualities. Thymol and carvacrol are the main components of oregano oil, and both have antibacterial qualities. [50, 51, 52] The main phenolic components of OEO are most suited to treat salmonella infections and can also successfully cure bacterial disorders in the digestive tracts of animals and poultry, especially those caused by intestinal Escherichia coli. Oregano essential oil can also help prevent coccidiosis. [53]

Antifungal activity
Storage molds known as Penicillium species are frequently isolated from stored goods. Their substrate moisture requirements are lower (13–18%), but their temperature requirements are higher. [54, 55]At an extract concentration of 2.5 mL/100 mL, the growth of P. *aurantiogriseum*, P. *glabrum*, and P. *brevicompactum* was completely inhibited throughout the course of 14 days of incubation. At the same dose, the growth of *Fusarium proliferatum*(81.71%), F. oxysporum(85.84%), F. *verticillioides*(86.50%), P. chrysogenum(86.2%), and F. *subglutinans* (88.85%) was suppressed. [56]

RESULT

There are several significant considerations when contrasting oregano as a therapeutic agent with traditional medications:

Spectrum of Activity
Conventional medications: Conventional medications often target specific bacteria or illnesses and have well-defined procedures. While certain antibiotics, like penicillin, target the production of bacterial cell walls, others, like ciprofloxacin, impede DNA gyrase. These drugs are often designed to effectively treat certain illnesses. [75]

Oregano
Oregano contains thymol, carvacrol, and other compounds that have broad-spectrum antibacterial properties. Among other pathogens, they are effective against bacteria, fungi, and viruses. This broad action can be advantageous for many illnesses.

Mechanism of Action
- Conventional drugs: The structures or functions of microbes are often the target of conventional drug mechanisms. However, these targeted pathways can sometimes lead to resistance as bacteria adapt.

- Oregano: Among other things, oregano disrupts microbial communication, degrades cell membranes, and suppresses enzyme function. These diverse activities may reduce the likelihood of resistance development.

Resistance Development
- Conventional drugs: One major problem is antibiotic resistance. Overuse and misuse cause resistant strains to evolve, making sickness treatment more difficult.
- Oregano: Although it is not impervious to resistance, its complex combination of active ingredients may offer a lower risk of resistance than single-target synthetic drugs. Research on oregano's ability to prevent resistance is ongoing.

Side Effects and Safety
Conventional medications: Conventional medications can have major side effects that vary from modest gastrointestinal issues to severe allergic responses or long-term health consequences. The safety profiles of the medication and the patient may differ.

Oregano
Oregano has fewer documented side effects and is generally considered safe when used as directed. However, excessive usage or high dosages may cause gastrointestinal upset or allergic responses in certain individuals.

Regulatory Status and Standardization
- **Conventional Drugs**: Health agencies, such as the FDA and EMA, have strict testing, regulation, and approval procedures for conventional drugs. Their efficacy, safety, and potency are standardized.
- **Oregano**: Since oregano is a natural product, its quality can differ according on the extraction process, plant source, and preparation methods. Less strict standardization may result in variations in safety and efficacy.

Applications
- **Conventional Drugs**: Based on substantial clinical research and data, they have set dosages, indications, and treatment procedures.
- **Oregano**: An herb used in cooking as well as medicine. Although promising, its therapeutic applications are not as well defined, and more research is needed to determine the best dosages and treatment plans.

Complementary Use
- **Conventional Drugs**: Frequently employed in medicine as first-line therapies.
- **Oregano**: Has the potential to improve overall therapeutic outcomes and lessen dependency on medications when taken in conjunction with traditional treatments. The focused efficacy and proven safety profiles of conventional medications are still not replaced by oregano, despite the fact that it presents a promising natural substitute with broad-spectrum activity and a possible decreased risk of resistance. More research is required to completely comprehend its significance in modern medicine, although its usage as a supplemental treatment may bring extra benefits.

CONCLUSION

With its active ingredients thymol and carvacrol and others, oregano makes a strong case for being a natural antibiotic with broad-spectrum effectiveness. Its prospective uses in the treatment of fungal and bacterial infections demonstrate its worth as a supplemental or alternative therapy in contemporary medicine. Oregano also demonstrates its effectiveness as an antiviral, anticancer, and antioxidant substitute for medications. Though encouraging, it is crucial to utilize it carefully and under professional supervision to optimize positive effects and reduce negative ones

ABSTRACT

Herbal cosmetics are the kind of preparations used to improve a person's appearance. The current study set out to create a herbal cream with the potential to lighten, nourish, and moisturize skin while treating a range of skin conditions. The composition of the herbal cosmetics is harmless and can be applied as a barrier to shield skin. There are around 24 herbal ingredients I have discovered in these preparations. It was found that the product was stable, showing no symptoms of phase separation or color change. The cream was made by fusion method by using borax, liquid paraffin, and bees wax. A number of criteria, including appearance, pH, viscosity, washability, spread ability, and greasiness, were assessed for the created cream. In addition, the composition was simple to wash and did not produce redness or irritation in the tests of irritancy. The composition contains a few well-known herbs with hidden medicinal benefits, including liquoricemyrobalan , ringworm senna, Bawchan seed, and asthma plant. While working in the formulation of herbal cream that I found the medicinal significance of these plants. Herbal cosmetics are becoming more and more popular worldwide, and they are priceless gifts from nature. With 24 distinct herbal plant elements, I attempted to create a versatile herbal cream as a result.

Keywords: Herbal Drugs, Mango butter, Ring worm senna, Herbal multipurpose cream, Evaluations.

INTRODUCTION

Cream is a semisolid dosage form that has one or more pharmaceutical ingredients dissolved or distributed throughout an appropriate base. It is a skin-application preparation. Compared to the ointment, they have a lighter body and softer substance. There are two kinds of creams: aqueous and oily. These aqueous creams are o/w emulsions [1]. These are useful bases since they are water-washable. Herbal formulations have always drawn a lot of attention [2]. The term "herbal cosmetics" refers to cosmetics made with herbal elements that exhibit desired physiological effects, such as healing, appearance smoothing, stimulating, and conditioning qualities. The market for herbal cosmetics is growing right now. The materials known as cosmetics were developed to be applied to the human body in order to cleanse, beautify, enhance attractiveness, and change appearance without modifying structures or functions of the body [2]. Because they are used regularly in daily life and do not have the adverse effects that are frequently associated with synthetic products, herbal cosmetics are considered to have inherent acceptance and efficacy. The hydrating and viscoelastic qualities for the skin are enhanced by the herbal cosmetics. The herbs are rich in phytoconstituents with inherent goodness to meet the various needs of the skin. The current study attempted to create an herbal cream with 27, medicinal herbs that will nourish, lighten, moisturize, and treat a range of skin conditions. The composition of herbal cosmetics is harmless and can be applied as a skin-protecting barrier [3]. The 27 medicinal herbs are shown in [Table: 1] [4-27].

MATERIALS AND METHODS

Collection of leaf Materials
Herbal leafs are collected by hand pricking method.(NEEM, TULSI, AMMAN PACHARISI, RINGWORM SENNA, PHYLLANTHUS).The leafs are cleaned. Broken leaves and earthy materials are removed.

Drying of Leaves
After collection, the leaves are dried under shade (or) indoor method by spreading them in a thin layer. Drying takes place about 7-10 days under shade. The shade drying is preferred to maintain or minimize loss of color and texture. Low temperature should be employed, in case of medicinal plant material containing volatile substance. Drying condition should be recorded. After drying, the leaves are grind to fine powder. The powder is sieved by using suitable sieve with finest sieve number.

Collection of flower
Chrysanthemum flower - collected by Hand pricking method.

Drying of flower
Chrysanthemum flower -dried under shade (or) by indoor method.

Some further drug collections: (BAWCHAN SEED, FENUGREEK and BLACK CARAWAY)
The above drugs are collected from local medical shops. They are in dried solid form. These drugs are grinded and convert to smallest particle. Then sieved under finest sieve number to get finest form of these drugs.

Collection and preparation of Aloe Vera gel
Remove 3-4 leaves at a time, choosing thick leaves from the outer section of the plant. Ensure the leaves are neatly and free of any mold or damage. Cut them close to the stem, most of the beneficial nutrients are found at the base of the leaves. Avoid the roots. Wash and dry the leaves. Trim the pricky edges with knife. Using a knife (or) your fingers, separate the interior gel from the outside of leaf. The interior gel is the part of aloe that should be used. Allow the yellow sap to drain from the leaf; that is aloe vera latex. Then remove the latex, because it causes some irritation

95477

effect. Cut the aloe into slices (or) cubes. And then put the slices (or) cubes in to blender or grinded well; to get the smooth gel; and collected it.

Method of preparation
Steps carried out in the preparation of multi-purpose skin cream were as follows. This skin cream   was prepared by FUSION METHOD[28]. Weigh accurately all the ingredients [as mentioned in Table: 2] separately for   oil and aqueous phase.

Preparation of oily phase
Take a china dish, in that Bees wax, Mango butter is melted, then to this add liquid paraffin and raise the temperature to 70^0 C. After that add the all ingredients and stir well.

Preparation of Aqueous phase
Take a beaker, dissolve the borax (weighed quantity) in the purified water, and add all the ingredients as weighed quantity. And heat the mixture; raise the temperature to 70^0C, and stir well. After the preparation of these two phases, they are placed in a separate container and covered with aluminum foil paper. Allow to stand for a week (7 days). During this period, the active constituents of the drugs get down into the appropriate phases. Because of this, the therapeutic activity of the formulation gets increased, and gives more beneficial results when it's applied, compare to normal method of preparation.

Mixing of phases
After a week, reheat the two phases separately up to the temperature 70^0C.And then, oil and aqueous phase was filtered by using muslin cloth separately. Then the aqueous extract was added to the oil phase in the 7:3 ratios. Stir well, it should be in uniform direction to avoid breaking of the emulsion, so care must be taken, and stir until to get the creamy texture.

ADDITION OF EXCIPIENTS
Other excipients (Jojoba oil, Almond oil, Amla oil, Rosemary oil, Grape seed oil, Carrot seed oil, and few drops of rose water) are added, at the temperature between 40^0C to 45^0C and stirred, until the cream has set. Stirring should be properly with even direction. Care must be taken to avoid excessive aeration as the preparation starts to thicken. Transfer the cream into well cleaned, dried container and close tightly to prevent dehydration.

EVALUATION OF CREAM [29]
1. **Physical properties**: The cream as observed for color, odour and appearance.
2. **Test for Thermal Stability:** Thermal stability of the formulation was determined by the humidity chamber controlled at 60-70% RH and 37 ± 1^0C.
3. **Determination of pH:** _ 5 ± 0.01 g of the Cream was weighed accurately in a 100 ml beaker. 45 ml of water was added & dispersed the Cream in it. The pH of the suspension was determined at 27^0C using the pH meter.
4. **Stability studies:** Stability testing of drug products begins as a part of drug discovery and ends with the demise of the compound or commercial product. To assess the drug and formulation stability, stability studies were done according to ICH guidelines. The stability studies were carried out as per ICH guidelines. The cream filled in bottle and kept in humidity chamber maintained at 30 ± 2^0C/65 ± 5%RH and 40 ± 2^0C/75 ± 5% RH for six months. At the end of studies, samples were analyzed for the physical properties and viscosity.
5. **Patch test:** About 1-3gm of material to be tested was placed on a piece of fabric or funnel and applied to the sensitive part of the skin e.g. skin behind ears. The cosmetic to be tested was applied to an area of 1sq.m of the skin. Control patches were also applied. The site of   patch is inspected after 24 hrs.
6. **Spreadability studies:** An important criteria for semisolids is that it posses good spreadability. Spreadability is a term expressed to denote the extent of area to which the cream readily spreads on application to the skin. The therapeutic efficacy of a formulation also depends on its spreading value. Samples were placed between two slides and crushed to a consistent thickness using a specific weight for a predetermined amount of time to

determine the prepared cream's spread ability. Spreadability was the measurement of the amount of time needed to divide the two slides. A shorter separation period between two slides indicated improved spreadability.

The spreadability was then calculated from the following formula

Spreadability = m ×l/t

m=weight tied to the upper slide

l=length of glass slide

t=time taken in seconds

7. **Test for microbial growth in herbal cream:** The formulated creams were inoculated on the plates of agar media by streak plate method and a control was prepared by omitting the cream. The plates were placed in to the incubator and are incubated at 37^0C for 24 hrs. After the incubation period, plates were taken out and check the microbial growth by comparing it with the control.

8. **Irritancy:** Mark the area ($1cm^2$) on the left-hand dorsal surface. Then the cream was applied to that area and the time noted. Then it is checked for irritancy, erythema, and edema if any for an interval up to 24 hr and reported.

9. **Dye test:** The test was done by mixing the cream with red dye the place the drop of cream was placed on a slide and covered with cover slip, observed under microscope. If the dispersion phase appears in red colored globules the cream was O/W type. If the continuous phase appears red color the cream was W/O type.

10. **Smear type:** The test was conducted after the application of cream on the skin the smear formed was oily or aqueous in nature.

11. **Removal:** The removal of the cream applied on skin was done by washing under tap water with minimal force to remove the cream.

RESULTS

The multipurpose herbal cream was prepared was shown in Figure.1 and evaluated. The evaluated parameters are given below.

1. **Physical properties ;** In this test, the cream was found to be of a pale green color and has characteristic odor and semi-solid creamy texture.[Table:3]

2. **Thermal stability and pH determination**: In this test, the thermal stability (at RH65% and 30±40^{0}C) was stable and no oil suspension. The pH of cream was found to be 6 to 8. [Table:4]

3. **Spread ability:** The spread ability of the herbal cream was compared with market cream. According to the results herbal cream (Spreadability-14.1, Time-15 sec) is more spreadable than market cream (Spreadability-13.7, Time-15 sec). [Table: 5]

4. **Irritancy test:** Mark the area (1cm) on left hand dorsal surface. Then the cream was applied to that area and the time was noted. No abnormal changes was found.[Table:6]

5. **Washability test:** Washability test was carried out by applying a small amount of cream on the hand and then washing it with tap water. The results was found to be easily washable.[Table:7]

6. **Accelerated stability studies:** The stability studies of various parameters like visual appearance, nature; pH of the cream was checked. The results were found to be no significant variation after 2, 4 and 6 months.

7. **Test for microbial growth in herbal cream:** Also this cream was tested for the presence of pathogenic micro-organisms by culturing it with agar medium. There was no signs of microbial growth after incubation period of 24 hrs at 37°C.[Table: 8]

8. **Dye test of herbal cream:** The test was done by mixing the cream with red dye then place the drop of cream was placed on a slide and covered with cover slip, observed under microscope. The result was found to be no reaction. Also smear and patch test was checked. The result was found to be no reaction .[Table: 9]

DISCUSSION

The multi-purpose herbal skin cream of natural crude drugs with the best properties and having nutritional value was prepared by simple method with less equipment and effect. The prepared herbal creams have anti-oxidant and anti-bacterial activity due to this, it retards aging, signs and pimple formation on the face. It was found that this type of formulation of the multipurpose herbal cream was not prepared earlier. Cream was formulated using natural ingredients and was evaluated. From the study, it can be concluded that this cream can be used as a multipurpose cream and the ingredients mixed can produce synergistic effect of the other.

Table 1: List of ingredients with its medicinal uses.

SI.NO	INGREDIENTS	ROLE
1.	Mango butter [4]	Active ingredients in skin care formulation & Active against UV sunlight rays and used as skin cream
2.	White bees wax [5]	Emollient, Emulsifier, Improvement of appearance, Consistency and Sensitivity to melting
3.	Liquid Paraffin [6]	Cleansing agent, Hydrating agent &Emollient
4.	Amman pacharisi powder [7]	Wound healing, Free radical, Scavenging, Anti-viral & Anti-microbial
5.	Tulsi powder [8]	Anti-oxidant, Anti-bacterial, Anti-viral & Anti-fungal
6.	Neem powder [9]	Treatment of eczema, Ringworm infection, Scabies & Psoriasis
7.	Bawchan seed powder [10]	Anti-bacterial, Anti-fungal, Anti-oxidant & Treat skin disease
8.	Ring worm senna Powder [11]	Astringent, Anti-bacterial, Fungicidal & Treat skin disease

9.	Nutmeg Seed powder [12]	Flavoring agent, Carminative & Anti spot
10.	Red Sandal powder [13]	Reduce or lighten pigmentation, Marks or scares. Anti- aging agent. Skin glowing, Control oiliness in face, Tighten the skin pores Anti-wrinkle property Prevent acne/pimples. Treatment of suntan and sun burns (Soothening).
11.	Turmeric powder [14]	Anti-microbial agent, Lightening agent & Moisturizer
12.	Wild turmeric powder [14]	Anti-acne, Anti-oxidant & Wound healing
13.	Chrysanthemum flower powder [15]	Anti-oxidants, Anti-wrinkle agents, Lightening and Whitening agents. UV filters sun screens Anti-bacterial activity & Anti-microbial action
14.	Fenugreek powder [16]	Anti-oxidant, Emollient, Skin healing, Whitening, Moisturizing, Skin smoothening & Anti-wrinkle effection
15.	Phyllanthus powder [17]	Anti-viral, Anti-bacterial Anti-microbial, Anti-oxidant & Astringent
16.	Myrobalan seed powder [18]	Anti-oxidant, Anti-cellular ageing, Astringent(melanin inhibition) & Depigmentation
17.	Black caraway powder [19]	Anti-aging, Anti-microbial, Anti-oxidant &Sun protection.
18.	Liquorice powder [20]	Anti- viral, Anti- bacterial, Skin whitening & Anti-oxidant.
19.	Aloe vera juice [21]	Moisturizing agent, Softening agent, Useful for healing & Provide UV protection.
20.	Jojoba oil [22]	Elasticity of the skin. Shortness of the surface lines and wrinkles. Skin became more elastic and smooth. This oil has a chemical composition similar to skin produces the sebum. It has moisturizing and soothing agent.
21.	Almond oil [23]	Anti-wrinkle, Moisturizer & Flavoring agent
22.	Amla oil [24]	Free radical assaying property, Prevent UV radiation on skin (photo aging) Impress elasticity of skin & Act against pimples
23.	Grape seed oil [25]	Clear greasy, Congested and acne skin while also helping the tissues get rid of cellulite & Drain acne excess retained wax.
24.	Carrot seed oil[26]	Anti-aging, Revitalizing, Rejuvenating. It promotes the formation of new cells and helps in reducing wrinkles. Natural toner and rejuvenator for skin.
25.	Rosemary oil [27]	Anti-microbial, Astringent, Antiseptic, Anti-oxidant, Hydrate and balance dry and oily skin, Eczema, Inflammation and acne
26.	Rose water [27]	Flavoring agent, Cooling agent & Emollient

Table.2: Ingredients and its Quantity for Formulation

SI.NO	INGREDIENTS	QUANTITY

ABSTRACT

In the economic empowerment of women in rural and semi-urban settings is examined in this study, with a particular emphasis on socioeconomic determinants that affect their financial independence and involvement in income-generating activities. It looks at government policies, education, skill development, microfinance, and resource access that are meant to increase women's economic chances. The study analyzes the effects of self-help groups, job efforts, and entrepreneurship using both qualitative and quantitative methods, such as surveys. The study also looks at how self-help groups, or SHGs, have affected women's socioeconomic advancement in India, emphasizing gains in social standing, income, and household decision-making.

Keywords: qualitative and quantitative methods, empowerment of women, business growth , skill development

INTRODUCTION

In the process of giving women the abilities, assets, chances, and rights to fully engage in economic activity, make their own financial decisions, and enhance their financial well-being is known as economic empowerment of women. It guarantees women equal access to financial services, entrepreneurship, education, work, and real estate, allowing them to support social and economic advancement.

95485

REVIEW OF LITERATURE

In the concept of microfinance and women empowerment is studied in many countries.

- **Ghosh, M., & Goswami, R:** It highlights improvements in household decision-making, increased income, and enhanced social status.
- **Ramya, L. P., & Kalluraya, P. S:** This review assesses various studies on SHGs and their impact on women's socio-economic empowerment, emphasizing poverty alleviation and financial inclusion.
- **Kanungo, R., & Agesty, M. P:**This case study investigates the role of SHGs in the economic empowerment of women in Ganjam District, Odisha, highlighting increased household income and active participation in decision-making processes.

NEED OF THE STUDY

Women in rural and semi-urban areas often face significant barriers to financial independence, including limited access to credit, lack of financial literacy, and socio-economic constraints. These challenges hinder their ability to start or expand businesses, invest in productive activities, and achieve long-term economic stability. Fusion Finance Limited, as a non-banking financial institution (NBFI), plays a crucial role in addressing these issues through targeted financial solutions.

SCOPE OF THE STUDY

The scope of this study includes:

Geographical Coverage

The study will focus on rural and semi-urban areas where Fusion Finance Limited operates.

Target Population

The study will examine women who have accessed financial services from Fusion Finance Limited.

Key Areas of Analysis

- Access to credit and financial services
- Impact on women's income and business growth
- Role of financial literacy and skill development
- Social and economic empowerment outcomes

OBJECTIVE OF THE STUDY

- To study the importance of fusion finance ltd in the economic empowernment of women in rural & semi-urban areas.
- To examine the process involved in fusion finance Ltd in the economic empowernment of women in rural & semi-urban areas.
- To analyse the methods used by fusion finance Ltd in the economic empowernment of women
- To study the different approaches of fusion finance Ltd in the economic empowernment of women
- To determine the benefits of fusion finance Ltd in the economic empowernment of women in rural & semi-urban areas.
- To study the roles of fusion finance Ltd in the economic empowernment of women.

LIMITATION OF THE STUDY

It is quite hard to manage the research work with the academics. The limitations of the study are:

- Time constraint is one of the major limitation so in depth research was not made   possible.
- Respondents were very busy in their work so they gave answers in a hurry.

- The sample size is only 75, so the opinion may not reflect the exact scenario.
- In this study the survey was conducted to only FFL customers in Parameswaranallur, at Chidambaram branch.

RESEARCH DESIGN

It aims to provide an accurate portrayal of the subject under investigation without attempting to establish causal relationships. The study is intended to analyse "THE ROLE OF FUSION FINANCE LTD IN THE ECONOMIC EMPOWERNMENTOF WOMEN IN RURAL & SEMI-URBAN AREAS" Hence, analytical study has been adopted.

RESEARCH APPROACH
The survey approach is used during the research. Separate structured Questionnaire was used for achieving the aim of the study.

SAMPLING TECHNIQUES
Convenience sampling is used for this study.

SAMPLE SIZE
This study was carried out through FFL customers in Parameswaranallur, at Chidambaram branch.

SOURCE OF DATA
The data was collected through:
- Primary sources
- Secondary sources

Questionnaire
A Questionnaire comprising of 30 questions with multiple choices was framed for this study. The questionnaire was distributed to FFL customer's in Chidambaram branch.

Secondary sources
- Internet
- Magazines
- Journals
- Published records

STATISTICAL TOOLS
Statistical tools used in this study
- Mean
- Regression
- Coefficient of correlation
- U-Test

MEAN
The mean, often referred to as the average, is a measure of central tendency in a set of data. **OBJECTIVES**
To find out mean of monthly income

STEP 1:

MONTHLY INCOME	MIDPOINT (x)	NO. OF RESPOONDENTS (f)	(fx)
Below 5000 INR	2500	47	117500

95487

Aswini and Geetha

5000 – 10000 INR	7500	13	97500
10000 – 20000 INR	15000	15	225000
Above 20000 INR	25000	0	0
TOTAL		**75**	**440000**

STEP 2:

$$\bar{x} = \frac{\sum fx}{N}$$

$$= \frac{440000}{75}$$

= 5866.67

CONCLUSION

The calculated value of mean is ₹5866.67

U – TEST

It assesses whether one group tends to have larger values than the other, without assuming a normal distribution of the data.

Null hypothesis (H_0)

There is no significant relationship between the transparency of hidden charges associated with the services provided by Fusion Finance Ltd Vs. would recommend the financial services of fusion finance to other women in the community.

The alternative hypothesis (H_1)

There is a significant relationship between the transparency of hidden charges associated with the services provided by Fusion Finance Ltd Vs. would recommend the financial services of fusion finance to other women in the community.

Transparency Of Hidden Charges	6	18	38	10	3
Recommend The Financial Services	30	18	15	7	5

STEP 1:

Transparency of Hidden Charges	Recommend The Financial Services
6	30
18	18
38	15
10	7
3	5

STPE 2:

Find the R_1 R_2

n_1 = 5, n_2 = 5

DATA = 6, 18, 38, 10, 3, 30, 18, 15, 7, 5

ASSENDING ORDER = 3, 5, 6, 7, 10, 15, 18, 18, 30, 38

R_1 = 1+3+5+7+10 = 26

R_2 = 2+4+6+8+9 = 29

Find U_1 U_2

$$U_1 = R_1 - \frac{n_1(n_1 + 1)}{2}$$

$$= 26 - \frac{5(5 + 1)}{2}$$

$$= 26 - \frac{5\,(4)}{2}$$

$$= 26 - \frac{20}{2}$$

$$= 26 - 10$$

$$= 16$$

$$U_2 = R_2 - \frac{n_2(n_2 + 1)}{2}$$

$$= 29 - \frac{5(5 + 1)}{2}$$

$$= 29 - \frac{5\,(4)}{2}$$

$$= 29 - \frac{20}{2}$$

$$= 29 - 10$$

$$= 19$$

$n_1 = 5$

$n_2 = 5$

Level of significant = 0.05

Two tailed U table value 2

Calculated value > Tabulated value

2 < 16

H1 is accepted.

CONCLUSION

Here is a **statistically significant relationship** between the transparency of hidden charges associated with the services provided by Fusion Finance Ltd and the respondents would recommend these financial services to others in the community.

CORRELATION OF COEFFICIENT

Correlation is used almost everywhere in statistics.

Null hypothesis (H_0)

There is no significant relationship between the interest rates and fees charged by Fusion Finance Ltd is comparatively less Vs. would recommend the financial services of fusion finance to other women in the community.

The alternative hypothesis (H_1)

There is significant relationship between the interest rates and fees charged by fusion finance ltd is comparatively less Vs. would recommend the financial services of Fusion Finance Ltd to other women in the community.

Interest Rates And Fees Charged	48	20	3	2	2
Recommend The Financial Services	30	18	15	7	5

Aswini and Geetha

STEP 1:

Interest Rates And Fees Charged (X)	Recommend The Financial Services(Y)	XY	X²	Y²
48	30	1440	2304	900
20	18	360	400	325
3	15	45	9	225
2	7	14	4	49
2	5	10	4	25
$\sum X = 75$	$\sum Y = 75$	$\sum XY = 1869$	$\sum X^2 = 2721$	$\sum Y^2 = 1524$

STEP2:

$$r = \frac{n(\sum xy) - (\sum x)(\sum y)}{\sqrt{[n \sum x^2 - (\sum x)^2][n \sum y^2 - (\sum y)^2]}}$$

$$r = \frac{5(1869) - (75)(75)}{\sqrt{[5(2721) - (75)^2][5(1524) - (75)^2]}}$$

$$r = \frac{9345 - 5625}{\sqrt{(13605 - 5625)(7620 - 5625)}}$$

$$r = \frac{3720}{(7980)(1995)}$$

$$r = \frac{3720}{\sqrt{15,920,100}}$$

$$r = \frac{3720}{3990}$$

$$r = 0.932$$

CONCLUSION

There is a very high degree of positive correlation of interest rates and fees charged by fusion finance ltd is comparatively less andwould recommend the financial services of fusion finance to other women in the community.

REGRESSION

It aims to estimate the strength and direction of the relationship, as well as predict the value of the dependent variable based on the values of the independent variables. The most common type of regression is linear regression, but there are other types such as logistic regression for binary outcomes and polynomial regression for nonlinear relationships.

Null hypothesis (H₀)

There is no significant relationship between participating in financial education and training programs offered by Fusion Finance Ltd Vs. able make better decisions about savings and investments.

The alternative hypothesis (H₁)

Aswini and Geetha

There is a significant relationship between participating in financial education and training programs offered by Fusion Finance Ltd Vs. able make better decisions about savings and investments.

Participating In Financial Education And Training Program	56	6	7	4	2
Make Better Decisions About Savings And Investments	9	14	36	9	7

STEP 1:

Participating In Financial Education And Training Program (X)	Make Better Decisions About Savings And Investments (Y)	X²	Y²	XY
56	9	3136	81	504
6	14	36	196	84
7	36	49	1296	252
4	9	16	81	36
2	7	4	49	14
$\sum x = 75$	$\sum y = 75$	$\sum x^2 = 3241$	$\sum y = 1703$	$\sum xy = 881$

STEP2:

$$\bar{x} = \frac{\sum x}{N}$$

$$= \frac{75}{5} = 15$$

$$\bar{y} = \frac{\sum y}{N}$$

$$= \frac{75}{5} = 15$$

Regression coefficient of X on Y

$$bxy = \frac{N\Sigma xy - (\sum x)(\sum y)}{N\Sigma y^2 - (\sum y)^2}$$

$$= \frac{5\,(881) - (75)(75)}{5\,(1703) - (75)^2}$$

$$= \frac{4405 - 5625}{8515 - 5625}$$

$$= \frac{1220}{2890}$$

Regression coefficient of X on Y= 0.42
Regression equation of X on Y
$$x - \bar{x} = bxy(y - \bar{y})$$
$X - 15 = 0.42\,(y - 15)$
$X - 15 = 0.42\,y - 6.3$
$x = 0.42y - 6.3 + 15$
x = 0.42y + 21.3

Regression coefficient of Y on X

$$byx = \frac{N\Sigma xy - (\sum x)(\sum y)}{N\Sigma x^2 - (\sum x)^2}$$

$$= \frac{5\,(881) - (75)(75)}{5\,(3241) - (75)^2}$$

$$= \frac{4405 - 5625}{16205 - 5625}$$
$$= \frac{1220}{10580}$$

Regression coefficient of Y on X= 0.11
Regression equation of Y on X
$\mathbf{y - \bar{y} = bxy(x - \bar{x})}$
$Y - 15 = 0.11\ (X - 15)$
$Y - 15 = 0.11\ X - 1.65$
$Y = 0.11\ X - 1.65 + 15$
$\mathbf{Y = 0.11\ X + 13.35}$

$$\sqrt{\boldsymbol{bxy}} \times \sqrt{\boldsymbol{byx}}$$
$= \sqrt{0.42} \times \sqrt{0.11}$
$= 0.64 \times 0.33$
$= \mathbf{0.2112}$

CONCLUSION
There **is a positive relationship** between participating in financial education and training programs offered by Fusion Finance Ltd and making better decisions about savings and investments and so H1 is accepted

FINDINGS
- The majority (64%) of the respondents are using micro loans.
- The study shows the services provided by Fusion Finance Ltd are highly satisfactory with a majority (36%) of the respondents have rated as strongly agree.
- The study indicated that the overall performance of Fusion Finance Ltd in meeting the financial needs and expectations are highly satisfactory with a majority (51%) of the respondents.
- The study observed that the information provided by Fusion Finance Ltd is clear and easy to understand with a majority (44%) of the respondents.
- The study reveals that the majority (50%) of the respondents have stated that, Fusion Finance Ltd provides fair and transparent terms and conditions.

SUGGESTIONS
Access to Education and Skill Development
Suggestions
- Expand vocational training programs tailored to local industries (e.g., agriculture, handicrafts, small-scale manufacturing).
- Encourage participation in entrepreneurship development programs, especially for women-led startups.

Financial Inclusion and Access to Credit
Suggestions
- Facilitate access to microfinance institutions, self-help groups (SHGs), and cooperative banks with low-interest loans.
- Provide training on financial planning, savings, and investment strategies.

CONCLUSION

Economic empowerment of women in rural and semi-urban areas is a key driver of sustainable development, poverty reduction, and gender equality. By providing women with access to education, financial resources, skill development, and employment opportunities, societies can achieve inclusive economic growth. This study highlights

that economic empowerment not only enhances women's financial independence but also strengthens families, communities, and national economies. Women who have control over resources and decision-making contributes to higher household incomes, improved education for children, better healthcare, and overall social progress. However, challenges such as lack of financial access, cultural barriers, inadequate infrastructure, and limited education still hinder women's full participation in economic activities. Addressing these issues through targeted policies, financial inclusion programs, entrepreneurship support, and legal reforms is essential for long-term success. To conclude with empowering women economically in rural and semi-urban areas is not just a matter of social justice but a strategic investment in economic development. Governments, NGOs, and private sectors must collaborate to create sustainable solutions that promote women's entrepreneurship, workforce participation, and financial stability. Ensuring women's active participation in the economy will lead to stronger, more resilient communities and a more equitable society.

ABSTRACT

There has been some recent interest in applying Intuitionistic Fuzzy Pseudo ideals in *d*-algebras. Motivated by this, in this paper we define the notion of intuitionistic fuzzy pseudo ideal, intuitionistic fuzzy *k*-pseudo ideal, intuitionistic fuzzy *c*-pseudo ideal, intuitionistic fuzzy complete *k*-pseudo ideal. We have introduced and illustrated several ideals that evaluate their relationship in a *d*-algebra. Related properties of them are investigated.

Keywords: *d* -algebra, IF pseudo ideal and IF complete pseudo ideal, IF *k*-pseudo ideal, IF *c*- pseudo ideal

INTRODUCTION

Y. Imai and K. Iseki [6,7] Introduced two classes of abstract algebras: **BCK**-algebras and **BCI**- algebras .It is known that the class of **BCK**-algebras is a proper subclass of the class of **BCI**-algebras. P. Bhattacharya, N.P. Mukherjee and L. A. Zadeh [12] are introduced fuzzy relations and fuzzy groups. In particular, Q. Zhang, E. H. Roh and Y. B. Jun [9] studied the fuzzy theory in BH-algebras. L.A. Zadeh [12] introduced notion of fuzzy sets and A. Rosenfeld [7] introduced the notion of fuzzy group. O.G. Xi [4,5] introduced the notion of fuzzyalgebras, after that studied Characterization of fuzzy subalgebras by their level subalgebras on **BCK**-algebras. In this paper we will describe

95494

some of the new types of IF-pseudo ideal, called (IF pseudo ideal, IF k-pseudo ideal, IF complete k-pseudo ideal) Also, we introduced and illustrated the proposition that defines the relationship among them in d-algebra.

PRELIMINARIES

Definition 2.1. [2,6, 7,8] An algebra $(X,*, \ 0)$ of type (2,0) is known as a BCK-algebra if
it satisfies the subsequent conditions:
1. $((\alpha * \beta) * (\alpha * \gamma)) * (\gamma * \beta) = 0$
2. $(\alpha * (\alpha * \beta)) * \beta = 0$
3. $\alpha * \alpha = 0$
4. $\alpha * \beta = 0, \beta * \alpha = 0 \Rightarrow \alpha = \beta$
5. $0 * \alpha = 0$ for all $\alpha, \beta, \gamma \in X$

Definition 2.3. [11] A nonempty set X with a consistent and a twofold operation $*$ is called a d - polynomial math in case it fulfills the taking after sayings.
1. $1.\alpha * \alpha = 0$
2. $0 * \alpha = 0$
3. $\alpha * \beta = 0, \beta * \alpha = 0 \Rightarrow \alpha = \beta$ for all $\alpha, \beta \in X$

Definition 2.4. Let X be a d -algebra. Define a binary relations ($" \ \leq \ "$) on X by taking $\alpha \leq \beta$ if and only if $\alpha * \beta \ = \ 0$. In this Case $(X, \leq)$ is a partially ordered.

Definition 2.5.[3]Let X be a d -algebra. A non-empty subset I of X is said to be a q-ideal of X if it satisfies
(I1) $0 \in I$
(I2) $\alpha * (\beta * \gamma) \in I$ and $y \in I$ imply $\alpha * z \in I$ for all $\alpha, \beta, \gamma \in X$.

Definition 2.6. A pseudo d -algebra is a non-empty set X with a constant 0 and two binary operations $*$ and $\circ$ satisaying the following axioms.
1. $1.\alpha * \alpha = \alpha \circ \alpha = 0$
2. $0 * \alpha = 0 \circ \alpha = 0$
3. $\alpha * \beta = \beta \circ \alpha = 0$, imply for each$\alpha, \beta \in X$.
Note that if $(X, * , 0)$ is a d -algebra, then letting $\alpha \circ \beta := \alpha * \beta$, produces a pseudo d -algebra $(X, *, \circ, \ 0)$. Hence, every d-algebra is a pseudo d-algebra in a natural way.

Definition 2.7 [1,10] An intuitionistic fuzzy set (IFS for short) A in a set N is object having the form a = $\{< n, \eta(n), \mu(n) >: n \in N \}$.

Some type of intuitionistic fuzzy pseudo ideal
In this section, IF complete pseudo ideal, IF $\mathcal{K}$ -pseudo ideal, IF c-pseudo ideal are defined and some properties have been discussed.

Definition 3.1. Let $\mathcal{N}$ be a pseudo d- algebra . An intuitionistic fuzzy set A of $\mathcal{N}$ is called an intuitionistic fuzzy pseudo ideal if it satisfies:
1. $\eta_A(0) \geq \eta_A(n) \ \forall \ n \in \mathcal{N},$
2. $\eta_A(n) \geq Min\{\eta_A(n * b), \eta\eta_A(n \odot b), \eta(b)\} \ , b \in \mathcal{N},$
3. $\mu_A(0) \leq \mu_A(n) \ \forall \ n \in \mathcal{N},$
4. $\mu_A(n) \leq Max\{\mu_A(n * b), \mu_A(n \odot b), \mu(b)\} \ , b \in \mathcal{N},$

Example 3.2. Let $\mathcal{N} = \{0, a, b, c\}$

*	0	a	b	c
0	0	0	0	0
a	a	0	0	0
b	b	b	o	a
c	c	c	0	0

⊙	0	a	b	c
0	0	0	0	0
a	a	0	0	0
b	b	c	o	c
c	c	c	0	0

Then $(\mathcal{N}, *, 0)$ and $(\mathcal{N}, \odot, 0)$ are not d-algebra since
$(b * a) * c = a \neq 0 = (b * c) * 0$ and $\big((b \odot a) \odot c = a \neq 0 = (b \odot c) \odot 0\big)$,
but $(\mathcal{N}, *, \odot, 0)$ is pseudo d- algebra.
Define the fuzzy set $\eta(m) = \begin{cases} 0.8 \ if \ n = 0, a \\ 0.6 \ if \ n = b, c \end{cases}$
Then η is a fuzzy pseudo ideal, *since* $\eta(0) \geq \eta(n) \ \forall \ n \in \mathcal{N}$ and
$\eta(n) = 0.6 \geq Min\{\eta(n * b), \eta(n \odot b), \eta(b)\} = 0.6 \ \forall n, b \in \mathcal{N}, \{0, a\} \ and \ \forall \ b \in \mathcal{N}$
While $\phi(n) = \begin{cases} 0.7 \ if \ n = 0, a, b \\ 0.5 \quad if \ n = c \end{cases}$ is not fuzzy pseudo ideal of $\mathcal{N}$,
Since $\phi(c) = 0.5 \ngeq Min\{\phi(c * 0), \phi(c * b), \phi(b)\} = 0.7$

$\eta_A(n) = \begin{cases} 0.8 \ if \ n = 0, a \\ 0.6 \ if \ n = b, c \end{cases} \mu_A(n) = \begin{cases} 0.2 \ if \ n = 0, a \\ 0.4 \ if \ n = b, c \end{cases}$

Then A is intuitionistic fuzzy pseudo ideal since,
$\eta_A(0) \geq \eta_A(n) \ \forall n \in \mathcal{N}$,
$\eta_A(b) = 0.6 \geq Min\{\eta_A(n * b), \eta A(n \odot b), \eta(b)\} = 0.6$, $\mu_A(0) \leq \mu_A(n) \ \forall n \in \mathcal{N}$,
$\mu_A(b) = 0.4 \leq Max\{\mu_A(n * b), \mu_A(n \odot b), \mu(b)\} = 0.4 \ \ \forall n \in \mathcal{N}, and \ \forall b \in \mathcal{N} \backslash \{0, a\}$

Definition 3. 3. Let I be a c-pseudo ideal of a pseudo d- algebra $(\mathcal{N}, *, \odot, 0)$. An intuitionistic fuzzy set A is called intuitionistic fuzzy complete pseudo ideal at I (briefly, IF c-pseudo ideal) if
1. $\eta_A(0) \geq \eta_A(n) \forall n \in \mathcal{N}$,
2. $\eta_A(n) \geq Min\{\eta_A(n * b), \eta_A(n \odot b), \eta(b)\}$, $n \in \mathcal{N}$, $b \in I$
3. $\mu_A(0) \leq \mu_A(n) \forall n \in \mathcal{N}$,
4. $\mu_A(n) \leq Max\{\mu_A(n * b), \mu_A(n \odot b), \mu(b)\}$, $n \in \mathcal{N}$, $b \in I$

Example 3.4. Let $\mathcal{N} = \{0, a, b, c\}$ be a set with the tables below

*	0	a	b	c
0	0	0	0	0
a	a	0	0	0
b	b	b	o	a
c	c	c	0	0

⊙	0	a	b	c
0	0	0	0	0
a	a	0	0	0
b	b	c	o	c
c	c	c	0	0

Then $(\mathcal{N}, *, \odot, 0)$ is a pseudo d-algebra, and the set -pseudo ideal of $\mathcal{N}$.
Let A be the intuitionistic fuzzy set defined on $\mathcal{N}$ defined by
$\eta_A(n) = \begin{cases} 0.5 \ if \ n = 0, a, c \\ \ \ 0.4 \ if \ n = b \end{cases} \mu_A(n) = \begin{cases} 0.5 \ if \ n = 0, a, c \\ \ \ 0.6 \ if \ n = b \end{cases}$
Then A is intuitionistic fuzzy c-ideal on $\mathcal{N}$, since it satisfied
$\eta_A(0) \geq \eta_A(n) \ \forall n \in \mathcal{N}$,
$\eta_A(b) = 0.4 \geq Min\{\eta_A(n * b),$
$\eta_A(n \odot b), \eta(b)\} = 0.4 \ \forall b \in I, \mu_A(0) \leq \mu_A(n) \ \forall n \in \mathcal{N}$,

Proposition 3.5. Every intuitionistic fuzzy pseudo ideal of a pseudo d-algebra is an intuitionistic fuzzy c-pseudo ideal.

95496

Proof. Suppose that I be a c-pseudo ideal and A is intuitionistic fuzzy pseudo ideal of a pseudo d-algebra $\mathcal{N}$ then by definition (2.8) we have,

1. $\eta_A(0) \geq \eta_A(n) \, \forall n \in \mathcal{N}$,
2. $\eta_A(n) \geq Min\{\eta_A(n * b), \eta_A(n \odot b), \eta(b)\}$, $n, b \in \mathcal{N}$,
3. $\mu_A(0) \leq \mu_A(n) \, \forall n \in \mathcal{N}$,
4. $\mu_A(n) \leq Max\{\mu_A(n * b), \mu_A(n \odot b), \mu(b)\}$, $n, b \in \mathcal{N}$

Since $\subseteq \mathcal{N}$, then

$\eta_A(n) \geq Min\{\eta_A(n * b), \eta_A(n \odot b), \eta(b)\} \, and$
$\mu_A(n) \leq Max\{\mu_A(n * b), \mu_A(n \odot b), \mu(b)\} \, \forall b \in I.$

Thus A is intuitionistic fuzzy c-pseudo ideal of $\mathcal{N}$.

Remark 3.6. The following example shows that the converse of proposition (3.5) is not true in general.

Example 3.7. In example (3.2), notice that A is intuitionistic fuzzy pseudo ideal because
$\eta_A(b) = 0.4 \not\geq Min\{\eta_A(b * c),$
$\eta_A(b \odot c), \eta(c)\} = 0.5$

Proposition 3.8. Let I be a c-pseudo ideal of a pseudo involuntary pseudo d-algebra $\mathcal{N}$. An intuitionistic fuzzy set A is intuitionistic fuzzy c-pseudo ideal if and only if satisfies:

1. $\eta_A(0) \geq \eta_A(n) \, \forall n \in \mathcal{N}$,
2. $\eta_A(n) \geq Min\{\eta_A(n^{**} * b), \eta A(n^* \odot b^\circ), \eta(b)\}$
3. $\eta_A(n^\circ) \geq Min\{\eta_A(n^* * b^\circ), \eta A(n^{\circ\circ} \odot b), \eta A(b)\} \forall, n, b \in \mathcal{N}$,
4. $\mu_A(0) \leq \mu_A(n) \, \forall n \in \mathcal{N}$,
5. $\mu_A(n) \leq Max\{\mu_A(n^{**} * b), \mu_A(n^* \odot b^\circ), \mu(b)\}$
$\mu_A(n^\circ) \leq Max\{\mu A(n^* * b^\circ), \mu_A(n \odot b), \mu A(b)\} \, \forall, n, b \in \mathcal{N}$

Proof. By definition (2.7) and definition (3.3)

Definition 3.9. An intuitionistic fuzzy set A in bounded pseudo d- algebra $(\mathcal{N}, *, \odot, 0)$ is called intuitionistic fuzzy $\mathcal{K}$-pseudo ideal, if

1. $\eta_A(0) \geq \eta_A(n) \, \forall n \in \mathcal{N}$,
2. $\eta_A(n^*) \geq Min\{\eta_A(n^* * b), \eta_A(n * b\circ), \eta_A(b)\}$
3. $\eta_A(n^\circ) \geq Min\{\eta_A(n^\circ \odot b), \eta_A(n \odot b^*), \eta_A(b)\} \forall, n, b \in \mathcal{N}$,
4. $\mu_A(0) \leq \mu_A(n) \, \forall n \in N$,
5. $\mu_A(n^*) \leq Max\{\mu_A(n^* * b), \mu_A(n * b^\circ), \mu(b)\}$
6. $\mu_A(n^\circ) \leq Max\{\mu_A(n^\circ \odot b), \mu_A(n \odot b^*), \mu_A(b)\} \, \forall, n, b \in \mathcal{N}$.

Example 3.10.
1. Every intuitionistic fuzzy constant in bounded pseudo d-algebra $\mathcal{N}$ is intuitionistic fuzzy $\mathcal{K}$ -pseudo ideal.
2. Let $\mathcal{N} = \{0, p, q, r, s\}$ be a set with the table below:

*	0	p	q	r	s
0	0	0	0	0	0
p	p	0	0	0	p
q	q	0	0	q	q
r	r	0	r	0	q
s	s	0	s	0	0

Nagamani *et al.,*

*	0	p	q	r	s
0	0	0	0	0	0
p	p	0	0	p	p
q	q	0	0	0	0
r	r	0	s	0	s
s	s	0	s	0	0

Then $(\mathcal{N},*,\odot,0)$ is bounded pseudo d-algebra with unit μ and define an intuitionistic fuzzy A by

$$\eta_A(n) = \begin{cases} 0.9 \ if \ n = 0,p \\ 0.3 \ if \ n = q,r,s \end{cases} \mu_A(n) = \begin{cases} 0.1 \ if \ n = 0,p \\ 0.7 \ if \ n = q,r,s \end{cases}$$

Then A is intuitionistic fuzzy $\mathcal{K}$ -ideal at I in $\mathcal{N}$, because

$\eta_A(0) \geq \eta_A(n) \ \forall \ n \in \mathcal{N}$,
$\eta_A(n^*) = 0.9 \geq Min\{\eta_A(n^* * b),\eta_A(n * b^\circ),\eta_A(b)\} \ is \ hold \ \forall \ n \in \mathcal{N} \ also \ \eta_A(n^\circ)$
$= 0.9 \geq Min\{\eta_A(n^\circ \odot b),\eta_A(n \odot b *),\eta_A(b)\} \ \forall, n, b \in \mathcal{N}$,
$\mu_A(0) \leq \mu_A(n) \ \forall \ n \in \mathcal{N}$,
$\mu_A(n^*) = 0.1 \leq Max\{\mu_A(n^* * b),\mu_A(n * b^\circ),\mu(b)\} \ and$
$\mu_A(n^\circ) = 0.1 \leq Max\{\mu_A(n^\circ \odot b),\mu_A(n \odot b^*),\mu_A(b)\} \ \forall, n, b \in \mathcal{N}$.

Proposition 3.11. Every intuitionistic fuzzy pseudo ideal of a bounded pseudo d-algebra is an intuitionistic fuzzy $\mathcal{K}$ -pseudo ideal

Proof. Let A be an intuitionistic fuzzy pseudo ideal of a bounded pseudo d-algebra then by definition (3.1) we have,

1. $\eta_A(0) \geq \eta_A(n) \ \forall \ n \in \mathcal{N}$
2. $\mu_A(0) \leq \mu_A(n) \ \forall \ n \in \mathcal{N}$
3. $\eta_A(n) \geq Min\{\eta_A(n * b),\eta_A(n * b),\eta_A(b)\} \ then$
$\eta_A(n^*) \geq Min\{\eta_A(n^* * b),\eta_A(n * b^\circ),\eta_A(b)\} \ \forall \ n \in \mathcal{N}$,
$= Min\{\eta_A(n^* * b),\eta_A(n * b^\circ),\eta_A(b)\} \forall n, b \in \mathcal{N}$,
$also \ \eta_A(n^\circ) \geq Min\{\eta_A(n^\circ \odot b),\eta_A(n \odot b^*),\eta_A(b)\}$
$= Min\{\eta_A(n^\circ \odot b),\eta_A(n \odot b^*),\eta_A(b)\} \forall n, b \in \mathcal{N}$,
4. $\mu_A(n) \leq Max\{\mu_A(n * b),\mu_A(n * b),\mu_A(b)\} \ then$
$\mu_A(n^*) \leq Max\{\mu_A(n^* * b),\mu_A(n *\odot b),\mu_A(b)\} \ \forall \ n \in N$
$= Max\{\mu_A(n^* * b),\mu_A(n * b^\circ),\mu_A(b)\} \forall n, b \in \mathcal{N}$,
$also \ \eta_A(n^\circ) \leq Max\{\eta_A(n^\circ * b),\mu_A(n^\circ \odot b),\mu_A(b)\}$
$= Max\{\mu_A(n^\circ \odot b),\mu_A(n \odot b^*),\mu_A(b)\} \forall n, b \in \mathcal{N}$,

Remark 3.12. In general, the converse of proposition (3.11) need not be true as shown in the following example.

Example 3.13. IN Example 3.10-2 A is intuitionistic fuzzy $\mathcal{K}$-pseudo ideal in $\mathcal{N}$, but not intuitionistic fuzzy pseudo ideal in $\mathcal{N}$, because
$\eta_A(q) = 0.3 \ngeq Min\{\eta_A(q * p),\eta_A(q \odot p),\eta_A(p)\} = 0$

Proposition 3.14. Every intuitionistic fuzzy $\mathcal{K}$-pseudo ideal in a pseudo involuntary pseudo d-algebra $\mathcal{N}$ is intuitionistic fuzzy pseudo ideal.

Proof. Assume that A be an intuitionistic fuzzy k-pseudo ideal of $\mathcal{N}$.

Since $\mathcal{N}$ is pseudo involuntary pseudo d-algebra, then
$\eta_A(n) = \eta_A(n^* *) \geq Min\{\eta_A(n^{**} * b),\eta_A(n^* * b \circ),\eta_A(b)\}$
$= Min\{\eta_A(n * b),\eta_A(n \odot b),\eta_A(b)\} \ and$
$\mu_A(n) = \mu_A(n^{**}) \leq Max\{\mu_A(n^{**} * b),\mu_A(n^* * b \circ),\mu_A(b)\}$
$= Max\{\mu_A(n * b),\mu_A(n \odot b),\mu_A(b)\} \ \forall n, b \in \mathcal{N}$

Proposition 3.15. Let A be intuitionistic fuzzy $\mathcal{K}$-pseudo ideal of a bounded pseudo d-algebra $\mathcal{N}$,then
1. $\eta_A(n^*) \geq \eta_A(e)$ and $\eta_A(n^\circ) \geq \eta_A(e), \forall\, n \in \mathcal{N}$
2. $\mu_A(n^*) \leq \mu_A(e)$ and $\mu_A(n^\circ) \leq \mu_A(e)$
3. If $n^* \leq b$, then $\eta_A(b) \geq \eta_A(n^*)$ also $\mu A(b) \leq \mu_A(n^*)$
4. If $n^\circ \leq b$, then $\eta_A(b) \geq \eta A(n^\circ)$ also $\mu A(b) \leq \mu_A(n^\circ)$

Proof.

1. Since $\boldsymbol{A}$ is intuitionistic fuzzy $\mathcal{K}$ -pseudo ideal, we have

$\eta_A(n^*) \geq Min\{\eta_A(n^* * e), \eta_A(e^\circ * n), \eta_A(e)\} = Min\{\eta_A(0), \eta_A(e)\} = \eta_A(e)$ and
$\eta_A(n^\circ) \geq Min\{\eta_A(m^\circ \odot e), \eta_A(e^* \odot n), \eta_A(e)\} = Min\{\eta_A(0), \eta_A(e)\} = \eta_A(e)$

2. Since A is intuitionistic fuzzy $\mathcal{K}$ -pseudo ideal, we have

$\mu_A(n^*) \leq M\,ax\{\mu_A(n^* * e), \mu_A(e^\circ * n), \mu_A(e)\} = M\,ax\{\mu_A(0), \mu_A(e)\} = \mu_A(e)$ and
$\mu_A(n^\circ) \leq M\,ax\{\mu_A(m^\circ \odot e), \mu_A(e^* \odot n), \mu_A(e)\} = M\,ax\{\mu_A(0), \mu_A(e)\} = \mu_A(e)$

3. If $m^* \leq b$ i.e $n^* * b = 0$ and $n^* \odot b = 0,$ then

$\eta_A(n^*) \geq Min\{\eta_A(n^* * b), \eta_A(b^\circ * n), \eta_A(b)\} \,\forall\, n, b \in \mathcal{N} = Min\{\eta_A(0), \eta_A(b)\} = \eta_A(b)$ (Since A is intuitionistic fuzzy k-pseudo ideal) and

$\mu_A(n^*) \leq M\,ax\{\mu_A(n^* * b), \mu_A(b^\circ * n), \mu_A(b)\} \,\forall\, n, b \in \mathcal{N} = M\,ax\{\mu_A(0), \mu_A(b)\} = \mu_A(b)$ (Since A is intuitionistic fuzzy k-pseudo ideal)

4. Is similar to the proof of (3)

ABSTRACT

The increasing population and transformation in consumption patterns have become major causes of environmental pollution. In most developing countries, there is no proper waste management, and municipal solid waste (MSW) is discarded openly on land instead of engineered sanitary landfills. The heterogeneous and unsorted MSW is a rich source of heavy metals. The metals enter the soil through waste which contains considerable proportions of discarded metal objects, plastic, batteries, etc. The current research aims to determine the heavy metal pollution in the soil around an MSW dumpsite in Jaipur, Rajasthan, India, and the associated risk. The results reveal that metals like Cu, Zn, Pb, Cd, and Fe were highest in the summer season and were found in the following order of abundance: Fe>Zn>Cu>Pb>Cr>Cd, and their concentration increased with the increasing soil depth. The contamination factor for most metals was low to moderate but was high for Zn in the summer season.

Keywords: Municipal solid waste, open dump, heavy metals, contamination factor, potential ecological risk index.

INTRODUCTION

The increasing population and transition in consumption patterns have become major causes of environmental pollution. Due to the scarcity of natural resources, our dependency on synthetic, non-biodegradable, and potentially toxic items is increasing, which have replaced natural, reusable, and eco-friendly products. The problem of foul air, land, and water associated with improper waste management is encountered in several parts of the world, especially in developing nations. A huge amount of solid waste is generated every year. According to a report published by

95500

Prama Esther Soloman and Pankaj Kumar Jain

the United Nations Environment Programme (2024), the generation of municipal solid waste (MSW) is projected to reach 3.8 billion tonnes by the year 2050 from 2.1 billion tonnes in 2023 [1].Efficient management and handling of large amounts of MSW is difficult due to its qualitative and quantitative characteristics. In most developing countries, systematic waste management practices are not followed, and unsegregated MSW is discarded openly on land without pre-treatment[2]. The leachate is produced in landfills and dumpsites as a byproduct of biochemical processes involved in the waste decomposition, precipitation, surface run-off, and moisture content of wastes [3]. This leachate travels in surrounding soil along the gradient and carries soluble minerals, toxins, metals, chemicals, etc., to underlying soil and groundwater causing pollution[4]. The heterogeneous and unsorted municipal solid waste contributes to a large variety of heavy metals due to significant proportions of discarded metal objects, plastic, batteries, electronic items, paper, etc. present in the waste[5]. Many studies have established a link between health problems and environmental pollution caused by open dumps. Evaluation of metals in areas surrounding the MSW dumpsites helps in the assessment of pollution of soil as well as groundwater resources and provides important information on anthropogenic sources of metals and potential risks to the people living in the vicinity of such areas [6]. Soil acts as a dynamic receptor and source of metal ions, which may subsequently enter the food chain through plants. The metal abundance and distribution depend upon the nature and amount of waste as well as the physico-chemical quality of the soil or sediment [6].Soil analysis concerning toxic metals due to anthropogenic sources gives an insight into the pollution level of an area, its transport in the different environmental components, and its potential hazards to living organisms. The current research work aims to (a) find the metal content in the soil around an unmanaged dumpsite in Jaipur city, Rajasthan, India(b) study the seasonal variation in concentration of selected heavy metals in the soil (c) evaluate the potential risk posed by the same.

Makuleke and Ngole-Jeme[7] studied the soil properties around an abandoned landfill in Zimbabwe and observed the following order of metals in terms of their concentration: Fe>Zn>Cu>Cr>Ni>Cd. The heavy metal concentration did not correlate with the soil properties, indicating their non-geogenic origin. A health risk assessment of MSW dumpsite in Nigeria showed the soil heavy metal concentration during the rainy season in the following order: Zn>Mn>Ni>Pb>Cd>Cr, and the following order in the dry season: Zn>Mn>Cd>Ni>Pb>Cr [8]. In a seasonal study conducted to find the soil metal content at a MSW dumpsite (Enugu, Nigeria),iron and lead had the highest concentrations out of the ten metals studied and most of the metals became nearly constant at a depth of 1m [9]. The heavy metal contamination in soil around an open dumpsite at Tiruchirappalli, Tamil Nadu, India was reported in the order: Mn>Pb>Cu>Cd [10]. A study was conducted to assess the physicochemical parameters and heavy metal contents of soil at a municipal solid waste dumpsite in Allahabad, Uttar Pradesh, India. The study showed the following order of metal abundance at the dumpsite: Pb>Zn>Fe>Ni>Cu>Cr>Cd [11]. In another study [12] done around a MSW dumpsite in Nigeria high organic carbon and nitrogen content were observed in the soil. The highest concentration was that of Fe, while Cd was below the detection limit. The surface soil was more likely to accumulate Zn than the subsurface soils, while copper was among the least mobile elements [12]. Several other studies stating the occurrence of heavy metals in the soil of MSW dumpsite are summarised in Table 1.

MATERIAL AND METHODS

Study area

Rajasthan is the largest state of India in terms of area and is located between 23º3′ and 30º12′ N latitude and 69º30′ and 78º17′ E longitude, covering an area of about 342,239 square km. Jaipur is the capital city of Rajasthan. The winter season commences in December and continues till February, followed by the summer season, which continues up to June. The summer season is hot and dry with temperature ranging between 40 °C and 47 °C, while the winters are very cold with the lowest temperature range of 4 °C and 9 °C. The average daily temperature in summer months is 30 °C. Heat waves are common in summer, while mist and fog are usual phenomena in the morning hours during winter. Monsoon season starts by the end of June till September, and Jaipur receives over 650 mm of rainfall on average. Jaipur district, with an area of 11,117.8 square km, has an average population density of 470 persons per sq. km. and comprises 47.6% rural and 52.4% urban population [13]. Around 1000 tons of municipal solid waste is

Prama Esther Soloman and Pankaj Kumar Jain

generated per day in Jaipur and is discarded in open dumpsites [14].Out of the three open dumpsites, one is located at Mathuradaspura village in Jamwa Ramgarh Tahsil, about 17 km away from Jaipur city [14]. An area of176 bigha has been allocated for the disposal of MSW and it receives 400-410 Tons per Day of unsorted MSW (Figure 1).

Sampling
Random soil samples were collected at different depths (0-15 cm and 15-30 cm) and varying distances from the dumpsite. A total of 36 samples were collected from 18 sites (16 from around the dumpsite and 2 from the core dumpsite area)from 0-15 and 15-30 cm depths, seasonally. Uniform sampling distance was difficult to maintain because of private ownership of land, construction activities, huge waste heaps, etc. The sampling site was cleared of dried leaves, plastic, and waste material and the appropriate amount of sample was collected with the help of an auger and trowel from different depths. The soil samples were tightly sealed and brought to the laboratory for analysis. Before analysis, the samples were dried in an oven at 30 °C for 24 hours.

Preparation of samples for metal analysis
Soil samples were disaggregated with the help of a pestle and mortar, screened through a 2mm sieve, and digested using the tri-acid mixture. Acid digestion involved the addition of HNO_3, H_2SO_4,and $HClO_4$ mixture (5:1:1 v/v/v) in 1 g dried soil sample[15] and heating at 80 ºC on a hot plate until 5–10 mL clear, transparent extract was left in the beaker. The digested samples were then cooled and filtered through Whatman No. 42 filter paper and the extract was made up to 100 mL with distilled water. The samples were then analyzed for selected metals using an atomic absorption spectrophotometer (Thermofisheri CE 3000 AA01134805 v1.30).

Soil contamination indices
The following soil pollution indices are used to find out the contamination level due to various heavy metals in the soil. These indices are calculated using different formulas as summarised in Table 2. These values obtained by these indices are grouped into various classes to depict the level of toxicity and for interpretation of the contamination levels. Contamination Factor (CF^i) is a measure to determine the contamination of a certain toxic substance in the environment [16]. The background values of the metals used in the present study were previously reported for sedimentary rocks [17][18]. The contamination degree(C_d) was proposed to facilitate the prevention of pollution [16]. C_d is the sum of the contamination factor of each sample and the degree of anthropogenic contamination is identified based on the classification of C_d in different levels. The potential contamination index (Cp)is an index to assess the soil contamination due to toxic substances by finding the ratio between the maximum concentration of any metal in soil and the mean background value of the same metal [19]. To determine the impact of contaminants on the ecology of an area, the potential ecological risk (E_r^i)is used. It involves the determination of the toxic effect of a contaminant on the biological systems. It is the product of the metal contamination factor and the toxic response factor of a particular metal and is different for all contaminants. The toxic response factor (T_r^i) values of 5, 1, 5, 30, and 2 are considered for Cu, Zn, Pb, Cd, and Cr, respectively [16].The E_r^i values are classified in five classes to explain the ecological risk imposed by heavy metal pollution. To find out the overall ecological impact of heavy metals, another index called the potential ecological risk index (RI or PERI) was devised [16]. This index helps evaluate the impact of toxic elements and the sensitivity of biological forms due to the presence of toxic elements in a contaminated area. The potential ecological risk (E_r^i) of an individual metal is the product of the toxic response factor (T_r^i) of individual metals and the contamination factor (CF^i) of that metal. The T_r^i value for the metals are already mentioned above. RI is divided into four classes to interpret the contamination due to metals.

RESULT AND DISCUSSION

Metals like Cd, Cu, Pb, and Fe are usually high in samples with high organic matter content since these metals tend to be retained in the organic phase of the soil [20][21]. The minimum, maximum, and average concentrations of metals are mentioned in Table 3 for pre-monsoon, monsoon, and post-monsoon seasons. The metal concentration in the current study was in the following order of abundance:

Fe>Zn>Cu>Pb>Cr>Cd in the pre-monsoon and post-monsoon seasons

Fe>Zn>Cu>Cr>Pb>Cd in monsoon season

The average metal values obtained in the current study compared with the soil standard [31],are depicted in Figure 2 (A-C). The average concentration of Cu, Zn, Pb and Cd exceeded the limits prescribed by Aggarwal [31] in all the seasons. However, the concentration of all metals was found to be very low compared to the limits set for organic compost [50]. The Cu concentration was much elevated in the current study, as also reported in other similar studies [25] [26]. However, lesser Cu content was reported in some studies [22][23][24] as compared to the results of the current study. Cu enters waste from the batteries, waste of pigments used in polymer processing [27]. It has been observed that just like other metals, the availability of Cu decreases with an increase in soil pH. The humic acids constituting a pertinent portion of the soil organic matter, get associated with Cu to form insoluble complexes and make it less available [28]. According to Lagerwerff et al. [29], the stability constant of metal chelate has the following order: Cu>Pb>Zn>Cd. Thus, an increase in the available Cu content in soil solution is much smaller than that for Zn. Due to its high density, Cu is less mobile and accumulates in topsoil layers, hence, low mobility and availability of Cu enhances its persistence in soil. Very high Cu content in soil may cause Cu toxicity by inducing an inhibitory and degenerative effect on soil microbes [30].

Higher Zn content was reported in the present study, as also obtained in other studies [32][33][34][35]. However, Zn content was much elevated in the current study as compared to the results obtained by [22][23][36], which may be due to the waste characteristics and composition. Elevated levels of Zn in the soil may be attributed to the dumping of pharmaceutical waste, expired medicines, galvanized metal scraps, old building waste, paints, inks, toner, and wood preservatives in the MSW dumpsites [9] [36]. High levels of Zn may induce phytotoxicity, reduce microbial biomass, and replace soil macronutrients like phosphorus [39]. The range of lead was higher in this study than reported by [8][24], while some other studies reported a higher mean value of lead than the current study in the waste dump soil [41] [9] [42]. Lead enters the waste through discarded batteries, oil, and grease from automobiles, cathode ray tubes, discarded paint materials, rubber products gasoline, etc. Excessive Pb in soil affects soil microflora and fauna, reducing its fertility. Pb is a toxic metal and even in less concentration, it disrupts the activities of enzymes (like catalase, urease, invertase, acid phosphatase, etc.), that severely affect the metabolic activities of organisms [37][43]. Pb also causes interference in the water balance and mineral and nutrient availability in plants. This leads to the depletion of available soil nutrients and reduces soil fertility [44].

The concentration of Cd was less in the current study as compared to the values obtained by [9] [34] [36] [45][46]. Jalali and Arfania[38] reported high Cd content in the upper soil layer, which agrees with the current study. Cd enters the waste from discarded batteries, stabilizers, preservatives, catalysts, ink, paints, printer and photocopier toner, plastics, adhesives, paper, stainless steel, tanned leather, fabrics, dysfunctional electrical equipment such as alloys[27]. Excessive amount of Cd in the soil also decreases nitrogen and sulphur availability and disrupt the functioning of enzymes like protease, urease, etc., ultimately obstructing the metabolism of soil microbes [33] [43]. The maximum level of Cr was higher than the levels given by Kabata-Pendias and Mukherjee (2007)[48]in pre-monsoon and monsoon seasons and also as reported by [8][34]. Plating of plastic moulding dies and surface finishing of plastic materials involves the use of Cr [49]. It also enters the dumpsite soil through discarded rechargeable batteries, stainless steel, fungicides, pesticides, dyes, paints, tanned leather, fabrics, dysfunctional electrical equipment, alloys, chrome pigment containers, and anticorrosive agents. The concentration of iron was maximum in the current study, as also obtained in some studies[51][8][42]. Elevated levels of iron in soil may be because of the presence of metallic scrap in solid waste, and its concentration usually decreases in the lower soil layer [52]. High iron content in soil may not categorically be related to MSW alone, however, some natural causes like local geology may also lead to elevated iron in soil.

Seasonal Variation in metal content

In the current study, the average concentration of all metals except Cr was highest in the pre-monsoon season, similar results were reported in several studies [53][9][54]. A study [55] also reported high metal content during the pre-monsoon season at a soil depth of 0-15 cm, while at a depth of 30–40 cm, the highest metal content was in the post-

Prama Esther Soloman and Pankaj Kumar Jain

monsoon season. Higher Pb content in the pre-monsoon season was also reported by Ihedioha et al. [8]. Metal content in soil is closely related to the soil pH, soil organic matter, characteristics of MSW, amount of rainfall, temperature, etc. The soil pH in the study area ranges between 7.76 and 8.37 (Figure 2D), and the mobility of metals in alkaline soil is low and increases in acidic soil. Cu, Cd, and Fe were least in the monsoon season, indicating metal retention in the summer season while increased mobility in the rainy season. Metals usually bind to the clay fraction of soil, hydrous oxides, organic matter, etc. Higher pH and low soil moisture in arid regions result in low decomposition of organic waste and consequently, low organic carbon content that reduces the mobility or leachability of metals [9][55]. Increased metal content in soil may affect microbial activity thus, inhibiting degradation of soil organic matter [56]. Decreased metal content in monsoon season may be due to runoff and leaching of metals from the waste. With the onset of the rains, the vegetation increases leading to a somewhat higher organic fraction in soil, a slight reduction in soil pH, and hence metal uptake by the plants. This may continue till the post-monsoon season for some metals like Zn, Pb, and Cr as their concentration was lowest in the post-monsoon season. However, due to a reduction in rainfall in the post-monsoon season some metals like Cu, Cd, and Fe again start to increase in soil. The concentration of all metals was below the limits as per the FCO [50], thus the dumpsite soil may be used for composting.

Vertical profile of metals
The studied metals readily accumulated in the surface layer as compared to the lower layers, which may be due to the capacity of metals to bind with the organic fraction of the soil, which is also concentrated in the surface layers. Metal availability and retention are controlled by high soil pH, low rainfall, and re-adsorption of heavy metals on the clay content of the soil and physicochemical properties of the soil [52]. The current study shows that the concentration of all metals was less in the lower layer than the surface layer. It has been observed that Cu and Zn are the least mobile trace elements [37] [38]. Cu might be retained in the soil through exchange and specific adsorption mechanisms [57]. In the current study, the Cr content decreased down the soil profile; nevertheless, a study [12] reported an increase in Cr content around MSW dumpsite soil down the soil profile. This indicates that Cr is less mobile in the current study. Pb content also declined with increasing soil depth, which is in line with results obtained by [37][45][53]. Usually, Cd does not accumulate in the topsoil, but due to anthropogenic activities, it tends to persist in the topsoil [47].The lower concentration of metals in the soil depth of 15-30 cm indicates reduced vertical mobility of metals.

Soil pollution Indices
The contamination factor (CF^i) of metals in the study area is summarized in Table 4. The CF^i of Zn in the pre-monsoon season was very high in the surface layer (since $CF^i > 6$) and considerable in the lower layer (since $1 < CF^i < 6$) but showed moderate contamination levels in the rest of the seasons. The highest CF^i value for Zn was obtained in the current study, as also reported by [26].The metals like Cu and Pb had moderate contamination levels in all seasons, but their continued entry in the soil through waste and consequent deposition may lead to a high contamination factor in the future. Cd, Cr, and Fe showed low contamination in the study area in all seasons. Proper segregation of waste at the source is necessary to reduce the concentration of heavy metals in the soil. The values of contamination degree (C_d) indicate that the area is moderately polluted in the pre-monsoon season as the values of contamination degrees are more than 6 (Table 5). However, the C_d values in the monsoon and post-monsoon seasons are less than 6, indicating a low metal retention in the soil and increased leachability. The potential contamination index (Cp)values of Cu, Zn, and Pb are much higher than 3, indicating severe contamination (Figure 3). This is because the maximum metal concentration in the vicinity of the dumpsite is much higher than the background concentration of these metals. The Cp values of Cd, Cr, and Fe are less than 1 in all seasons hence they show low contamination levels (Figure. 3B). Since the metal concentration in the current study was higher in the summer season Cp values are also high in the this season, but for Pb the Cp values were highest in the monsoon season and for Cr, it was highest in monsoon but only at 15-30 cm depth. The potential ecological risk (E_r^i) of the metals is detailed in Table4, while RI values in Table 5. All the values of E_r^i are below 40, indicating low ecological risk in the study area. The RI values are below 50, indicating low contamination due to the metals studied.

Prama Esther Soloman and Pankaj Kumar Jain

CONCLUSION

The pH of the soil samples was in the alkaline range. This indicates that the soil is affected by unsegregated municipal solid waste, which is in the methanogenic stage of decomposition. There is a clear sign that the municipal waste dumpsite is a potential source of metals in the soil. However, the high metal content in the soil does not indicates its bioavailability. The pollution indices indicate moderate pollution in the study area. The potential contamination index indicates high pollution due to metals like Cu, Zn, and Pb. The soil metal content in the arid regions behaves differently and must be taken into consideration along with the seasonal and geochemical properties of the disposal site. There is an urgent necessity for source separation and segregation of the solid waste into decomposable organic fraction and inorganic fraction that may be further treated or disposed of in a sustainable manner. The organic fraction in the waste may be used for the preparation of compost and may be used in agricultural lands in place of chemical fertilizers. The 'balance approach' should be put in place in which the amount of nutrients as well as the pollutants added in the soil are sufficient and not in excess to maintain soil fertility. Moreover, the open dumps must be replaced with well-engineered landfills because the MSW is a potential contributor of heavy metals in soil and aquifers in the long run.

Table 2: Soil contamination indices

S.No.	Soil Contamination Index	Formula	Contamination classes
1.	Contamination Factor (CF^i)	$CF = C_m/C_b$ C_m =mean metal concentration in sample	CF^i< 1:low; 1 <CF^i< 3: moderate; 3 <CF^i< 6: considerable;

Prama Esther Soloman and Pankaj Kumar Jain

		C_b=background value of the metal	CF^i> 6: very high.
2.	Contamination degree (C_d)	$C_d = \sum_{i=0}^{n} CF^i$ CF^i = contamination factor of each metal	C_d< 6: low contamination; 6 < C_d< 12: moderate contamination; 12 < C_d< 24: considerable contamination; C_d> 24: high contamination.
3.	Potential contamination index (Cp)	Cp= Metal$_{max}$/ Metal$_B$ Metal$_{max}$= maximum concentration of a metal in soil Metal$_B$= is the background value of that metal	Cp < 1: low contamination; 1 < Cp < 3: moderate contamination; Cp > 3: severe or very severe contamination.[17]
4.	Potential ecological risk (E_r^i)	$E_r^i= T_r^i \times CF^i$ T_r^i = toxic response factor for the metals CF^i = the contamination factor of metal	E_r^i<40: low ecological risk; 40<E_r^i<80: moderate ecological risk; 80<E_r^i<160: considerable ecological risk; 160<E_r^i<320: high ecological risk; 320<E_r^i: very high ecological risk.
5.	Potential Ecological Risk Index (RI)	$RI = \sum_{i=1}^{n} E_r^i = \sum_{i=1}^{n} T_r^i \times CF^i$ E_r^i= potential ecological risk of an individual metal T_r^i =the toxic response factor of individual metals CF^i =the contamination factor of that metal.	RI ≤ 50: Low contamination; 50 ≤ RI ≤ 100: moderate contamination; 100 ≤ RI ≤ 200: considerable contamination; RI > 200: high contamination.

ABSTRACT

This research examines the significant duties of the Human Resources (HR) department in facilitating or monitoring the health and safety of employee health and safety within the workplace. HR performs a fundamental duty in compliance with safety regulations, health programs, and facilitating a culture of well-being which leads to employee satisfaction and organizational productivity. This paper will discuss several approaches that HR has, such as risk assessments, developing policies, training programs and emergency preparedness, that support physical and mental health safety. The research will further explore the benefits and issues faced by HR departments in implementing workplace safety policies. A case study of HR's role at a manufacturing company serves to understand how HR practices and policies promote employee voluntary engagement in health & safety; prevent workplace accidents; while meeting the health & safety legal minimum standards. The research indicates, while HR plays an important role in creating a safe workplace and promoting employee health & well-being and employee engagement; HR is challenged by communication barriers within the organization; because of employees' health & safety concerns; competing priorities; and limited resources. This paper will provide recommendations to enhance HR health and safety practice to not only improve employee health & safety but record improved organizational health & successfully visible, employee health & productivity.

Keywords: Human Resources, Employee Health, Workplace Safety, Compliance, Wellbeing Initiatives.

INTRODUCTION

Human Resource (HR) is critical in driving employee health and safety in order to create an environment where employees feel secure, respected, and supported. As employee well-being becomes more prevalent, many HR departments have moved beyond just human resource administrative actions to be involved in the development and implementation of health and safety measures that contribute to organizational objectives and highlight both

95513

physical and psychological health. With HR departments leading in respect to occupational safety and health policies, training, changes and concerns regarding hazards, their work will undoubtedly impact the overall productivity and success of the organization. This study focuses on manufacturing company as the area to examine HR's role in the management of health and safety, based on the analysis of empirical data obtained from employees' response

Aims of the Study

- To ensure effective communication of health and safety policies to employees.
- To establish compliance with the relevant aspects of the Factories Act and safety regulations.
- To promote employee health through occupational health projects such as medical checkups and hygiene maintenance.
- To enhance the knowledge of risk management through risk assessment, training and emergency planning, and health surveillance.
- To respond to employee concerns about health and safety-taking actions where there is a concern, by applying methods to support interdepartmental collaboration.
- To determine employee health and safety satisfaction levels with the current HR responses.
- To suggest possible improvements based on employee feedback and best practices developed internationally.

Need for the Study

There is a growing realization that employee health/safety contributes to operational efficiency, human capital retention, and brand reputation. With an increase in industrial automation and strain becoming more acute in certain sectors like manufacturing, we need to examine how HR can continue to forge safer and more adaptable workspaces. Specifically, we want to examine how HR aligns its functions with the above advancements, not only in doing so legally, but as a means of engaging a fruitful workforce.

Scope of the Study

The study covers a myriad of HR roles related to safety, including but not limited to:

- Health and safety policy implementation
- Training and risk reduction strategies
- Legal Obligations
- Mental and physical wellness initiatives
- Evacuation preparation• Engagement of other departments
- Feedback and employee engagement

Essential Role of HR in Health and Safety

Employee health and safety are fundamentally important to organisations now (and in the future). The role of HR is essential in fostering a proactive safety culture by finding hazards and preventing harm. By taking all necessary precautions and professionally managing risk with regard to regulation, like as the Health and Safety at Work Act, organisations avoid large fines and penalties. One aspect of workplace wellness can also include psychological well-being, so making sure that workplace mental health is given attention valuation alongside workplace physical health. Therefore, HR is a holistic approach, even though Employee Health, Safety and Wellbeing are intertwined there are different treatment options depending on the issue that may arise. HR's involvement reduces employee accidents but enhances employee morale, resulting in more engaged and productive employees. When the two variables - employee engagement and productivity are perceived positively creates an organisational culture. Health and safety strategies as defined by HR were limited to policies formalised in law, not formalising adequate employee health and safety measures in action rather than just words.

Main Tasks of HR in Managing Workplace Health and Safety

Developing Policies and Claim Legal Compliance

HR need to develop all health and safety policies that are consistent with applicable national legislation, and the best example is the Health and Safety at Work Act which together with the Factories Act and statute & regulations of OSHA provide accountable responsibility to be able to create a framework to protect employees from harm within working conditions.

Risk Assessment and Safety Audits

Regular audits and inspections coordinated by HR teams assist in monitoring possible risks in the workplace. Identifying and eliminating hazards before they become full-blown accidents lowers the risk of accidental injuries in that workspace.

Employee Training and Awareness

HR plays an essential role in developing safety training activities. By participating in these training activities with their employees, employees become familiar with safety protocols, such as addressing an emergency, and also have regular training to remind them about practicing safe hazardous safety methods. Training activities also assist in safety refreshers, as well as educate employees to support safety practices.

Prospective Mental and Physical Wellness

HR has an essential role in an organization, as they can facilitate wellness programs including stress reduction classes or workshops, fitness challenges, and mental health options. HR is aware of both mental and physical wellness, thus making sure that they support employees holistically.

Crisis preparedness and risk mitigation

HR plays an important part in developing and maintaining effective emergency response strategies. HR prepares employees for potential crises leaving them better equipped to react through evacuation procedures, fire/emergency drills, and (intentionally executing procedures) which help mitigate misunderstandings when real emergencies occur.

Working synergistically with other departments

HR has a working relationship with various departments across the organization (operations, security, etc), which helps communicate all safety measures appropriate to each identified areas hazards. This relationship must be maintained to ensure safety measures are distributed appropriately throughout the organization and prohibiting hazards from being missed.

Policies Used to Manage Health and Safety

The development of a safe and healthy work environment requires a combination of preventive and reactive policies that are clear. In a manufacturing business, HR is responsible for converting legal requirements and safety expectations into enforceable policy that will actively protect employees day to day.

Workplace Safety Policy

In order to eliminate mechanical accidents, and to promote safety when operating, the company has developed strict rules regarding the use of equipment and standard to which the facility and machines must be maintained. Machinery is locked and fenced in, in order to reduce physical hazard; and high-risk equipment can only be operated by trained, and authorized personnel. Personal protective equipment is provided as required; including gloves, helmets, goggles, and respiratory masks; and signage is prominent. There is continuous monitoring of the physical environment with regard to light, ventilation and temperature.

Health Oriented Policy

Providing hygienic conditions and promoting the general well-being of employees will be a central commitment of the organization safety culture. There are drinking water stations placed at easy access points throughout departments, and areas are cleaned on a regular basis. Waste disposal systems are safely supported so that waste does not pose a contaminating hazard. For employees who are potentially exposed to chemicals or hazardous materials, planned medical checks will be organized to monitor their ongoing health.

Fire and Emergency Preparedness Plan

Preparedness is paramount in workplace safety. Fire extinguishers, smoke detectors and alarms are placed appropriately throughout the facility. Fire drills and educational sessions are scheduled regularly. Employees will be trained in emergency response measures to enable them to react as fast as possible without impending panic. Emergency signage will be posted prominently, and escape routes will be kept clear in the event of a hazard.

Risk Assessment in Workplace Safety

Human Resources and safety personnel conduct regular evaluations, to identify potential hazards in the workplace. Evaluations will lead to the creation of Standard Operating procedures (SOP's) for hazardous tasks or materials. All employees will receive relatively good training of hazard prevention. The goal is to establish a safety culture of proactive safety, identifying risks to resolution before they become an incident.

Employee Welfare Policies

The company has implemented welfare based programs to enhance comfort and care that fall outside the standard definition of safety. The workplace is equipped with additional amenities, including restrooms that are clean, canteens, and first-aid stations to enhance employee health. In addition, the organization has appropriate policies that stipulate working hours as well as rules that allow for overtime pay and sick leave options, and paid time off, according to labour law regulations. Overall, these efforts contribute to encouraging employee morale, while also contributing to long-term health and job satisfaction.

Incident Reporting and Response Mechanisms

Transparency and accountability are foundational components of the accident reporting system. Every time there is a workplace injury or near miss, it should be documented and reported through the standard procedures. Each event triggers a comprehensive investigation to discover why it occurred, and what corrective actions are required. Each process follows the cycle of continuous improvement, suggesting the probabilty of similar events occurring has been reduced.

Training and Safety Awareness Programs

Ongoing training is crucial to maintaining safe and effective work environments. Employees attend workshops/stand up meetings, that cover aspects of machine safety, ergonomics, chemical handling, and emergency procedures etc., on a regular basis. Although completely reliant on training, visual reminders are part of the workplace equipment; reminders (i.e. posters, safety charts or other digital notifications), are used to remind safe practice and maintain safety awareness throughout the day.

HR Strategies in Health and Safety Management

1. **Develop Health & Safety Policies:** Commit to developing policy in the realm of health and safety as concerning national safety standards while adding value to the workplace's goals.
2. **Continuous Education and Safety Programs:** Provide employees with terminology and safety protocols to keep them informed and prepared with the most current standards and procedures. The best way to accomplish this is through ongoing training sessions.
3. **Risk Management and Emergency Planning:** The company must make an effort to do regular hazard assessments and document those hazards. Emergency planning must also be documented and mutually agreed upon.

95516

4. **Employee Participation and Feedback:** The company should ask for direct observation of the health and safety program from employees and formally acknowledge concerns which may come forth.
5. **Wellness Programs:** Consider wellness initiatives that can be integrated into the culture of the workplace to include physical health (for example, fitness programs) and workforce mental health (for example, counselling service(s)).

Benefits and Disadvantages to Human Resources Involvement in Workplace Health and Safety
Benefits

- **Healthier Employees**: HR can accomplish an overall improved campus in relation to employee health; thus, less absenteeism, and likely improved job satisfaction.
- **Reduction in Workplace Accidents:** HR can greatly contribute to the decrease in workplace accidents through preventive ergonomics measures and regular training for workplace-related activities.
- **Adherence to legal requirements:** Following all safety laws minimizes any legal liability.
- **Improved Productivity:** When a worker feels safe and valued, their need for motivation and overall productivity should increase.
- **Employee trust and engagement:** A health and safety program that is implemented well can be the basis for trust from employees to HR.

Disadvantages

- **Communication Barriers**: Lack of safety policies communication can lead to confusion for employees or the potential for non-compliance.
- **Resources and Budget Limitations:** There may be times when HR cannot offer exemplary and comprehensive safety programs because of limitations in budget and resources.
- **Employee Pushback:** There may be resistance from employees, who might view new safety measures as additional red tape or inconvenience.
- **Inconsistent Monitoring:** Often, safety audits may not occur consistently over time, or there may not be consistent monitoring after the fact, which can lead to voids in maintaining safety or quality standards.
- **Compliance Issues Over Internal Cultural Change:** There may be times when HR is only complying with statutory requirements and regulations rather than undertaken to change any internal culture into a safety culture.

HR Responsibility for addressing workplace health challenges
Aside from the physical safety aspect of well-being of the employee, HR is also responsible for ensuring that employees' mental health concerns are addressed in the workplace too. Stress, burnout, and mental health challenges can greatly impact the employee's performance and overall quality of life in the workplace. HR can put programs in place such as stress management programs, mental health campaigns, and flexible workdays to ensure employees have the support and opportunities necessary for them to cope with their situation. Mental health is as important as an aspect of overall health as physical health in creating supportive and safe organizations.

Problems with HR Managing Employee Health and Safety
HR has a number of problems with managing health and safety and following through on effective health and safety management. For example:

- **HR's Budget:** Depending on the funding available to implement a health and safety program can be a clear obstacle to success as HR lacks adequate budgets to convey an effective policies organization wide.
- **HR Resistance**: Foes HR appreciate it when employees resist safety policies and do not engage within health and safety training programs
- HR have no effective communication; mostly HR has not communicated health and safety policies so the employee is confused, or does not understand the need for compliance.

LITERATURE REVIEW

1. Researchers Smith et al. (2023) highlighted that the coordination of HR practices with health and safety policy is critical for a safe and even effective, work environment. They suggested that it is vital for HR practitioners to develop policies that reflect the health and safety requirements of the workplace. Effective implementation of health and safety policies requires continuous engagement of the employee to ensure that workplace hazards are minimized.

2. Mendez & Ramirez (2024) highlighted the importance and effectiveness of the integration of daily HR operations and risk management practices. They established the connection showing the HR practitioners providing safety training, assess workplace hazards, and establishing a culture of safety - reduces the risk of accidents occurring.

3. Nguyen et al. (2023) analyze the influence workplace safety has on employees' mental health and the role played by human resources addressing mental health issues. They highlight human resources' job of considering both the physical and emotional safety of employees with regards to mental health by formulating safety procedures and protocols that promote employees' overall health, by implementing a holistic health outlook of workplace safety.

4. Wilson & Brown (2024) feel human resources cannot just offer training for employees regarding workplace safety. It is also important to keep feedback channels open between human resources and employees as this keeps employees engaged and shared experiences allow safety protocols and exercised policies to improve over time.

5. Thompson and Williams (2023) believe the role of HR is more than just satisfying the regulations around workplace safety. They argue the HR role should concentrate on health and safety policy making to ensure that workplace health and safety are long-term goals for future employees as part of their culture.

6. Roberts & Evans (2024) focus on the operational and financial benefits of HR-led workplace health and safety programs. Their findings show that organizations that introduced extensive programs for workplace safety measures performed better than their competition in terms of lost work hours, insurance premiums, and employees operating satisfactorily.

7. Nguyen & Patel (2023) examine HR's role in health campaigns and health awareness activities. They show that when HR steps outside of its normal boundaries with wellness activities, HR is able to better engage employees and build their level of involvement in maintaining a healthy lifestyle.

8. Huang & Zhao (2022) explore the role of HR in facilitating vaccination programs in the workplace. They show the ability of HR to educate employees on the impact of vaccinations in preventing the spread of transmissible diseases in the office.

9. Patel et al. (2024) support the involvement of HR in undertaking health risk assessments for employees working in a high-risk environment. They indicate that proactive risk assessments are fundamental to reducing the chances of accidents occurring in the workplace.

10. Morris & Grant (2023) indicate that HR's proactive actions in establishing health promotion programs facilitate a safer workplace. They state that when organizations adopt a holistic approach to employee well-being, these organizations experience fewer injuries and absenteeism.

Data Analysis and Interpretation
Method
The study used mixed-method research design:

Purpose
To evaluate the effectiveness of HR practices in the health and safety of workers at a manufacturing company.

Primary Data Collection
- Offline (questionnaire) surveys

- Observational visits to workstations

Secondary Data Sources
- Internal compliance reports of the company
- Safety and labour law frameworks (FCA)

Sampling
- Size: 102 respondents
- Scope: all departments employees located in the manufacturing facility.

T-Test: Gender and Health and Safety Protocols
- Null Hypothesis (H_0): There is no difference in mean perceptions of safety protocols based on gender.
- Calculated t = 6.3740
- Critical t = 2.015, df = 5
- Conclusion: Because t > 2.015 → Reject H_0
- Interpretation: Gender-based differences exist in the way employees perceive HR's communication of safety protocols.

Correlation: Qualification and HR Feedback
- r = -0.4555
- Interpretation: Weak negative correlation, meaning as qualification increases, the amount of positive capacity in HR feedback consideration redistributes to the negative side slightly.

F-Test: Qualification and Risk Management Perception
- F = 2.1016, Critical F = 6.59
- Conclusion: Because F < Critical F → Fail to reject H_0
- Interpretation: Qualification does not influence employee perceptions of how HR functions in monitoring and updating risk management practices.

Chi-Square Test: Department vs. HR
- χ^2 = 10.4642, df = 16
- Critical χ^2 = 26.296
- Conclusion: Because χ^2 < Critical χ^2 → Fail to reject H_0
- Interpretation: Employee departmental associations do not influence employee perceptions of HR working with departments.

Regression: Age and HR Feedback
- Equation (x on y): x = -0.9471y + 39.7208
- Equation (y on x): y = -0.855x + 37.8420 • Conclusion: Negative slope demonstrates a negative relationship.
- Interpretation: Older employees are less likely to feel that HR has incorporated their feedback when developing health-related initiatives.

Findings of this report
- The majority of employees are aware of the safety policies and training protocols in place.
- Safety drills and completed risk assessments are routinely practiced
- HR has mixed communication on updates with positive feedback reports. Some areas for improvement was in the area of chronic illness support, some outlines not being clearly shared with staff.
- Overall acceptable satisfaction of HR safety role, with room for improvement on inclusive follow-up on feedback.

Recommendations

1. To put into practice health and safety training or delivery regularly, with all employees aware of work risks and prevention
2. To set up communications channels for all health and safety concern reporting without any fear of adverse retaliation.
3. To regularly conduct safety assessments and audits of workplaces and risk assessments to identify hazards and controls to eliminate or reduce.
4. To encourage mental health awareness and access to counselling services / or wellness pathway.
5. To establish emergency plans with all staff informed of exit plans during emergencies.
6. To encourage a safety culture within your organization and develop rewards for employee's safe practises.
7. To observe and implement specific health and safety and other applicable laws, national and local requirements.
8. To provide ergonomic workspaces, breaks, and rest areas for employees to recover and recharge.
9. To work with the operations managers for each department to establish their health and safety protocol, based on operational risk level.

CONCLUSION

In summary, the findings of this research demonstrate the importance of human resources in creating and maintaining a safe and healthy workplace. Human resource departments do not simply fulfill legal obligations, they play an important role in creating a safety culture that considers physical safety and mental well-being for workers. High levels of employee satisfaction regarding HR-led initiatives such as safety training, health programs, and communication processes suggest that HR departments are having success in creating a culture of health and safety. Conversely, research findings clearly show that HR practitioners need to be aware of the various needs of workers because these needs depend on various demographic factors. HR practitioners must fill in the gaps where they exist such as providing support for chronic conditions, and providing more transparent and clearer lines of communication regarding health and safety policies and procedures. In conclusion, HR must take a proactive, inclusive, and cooperative approach to develop health and safety as part of a workplace culture because it can help protect workers, and ultimately can drive sustainable business success and growth.

ABSTRACT

The present article explores various methods and strategies to treat mouth ulcers. It describes the etiology and pathogenesis of mouth ulcer. It also highlights the association of mouth ulcers with underlying systemic and autoimmune diseases. A brief discussion regarding the significance of stomatological preparations and dosage forms to treat mouth ulcers has been made. Recent advancements in the field of novel drug delivery systems, to deliver drugs directly at the site of ulceration, are described in detail. Additionally, improved herbal remedies and possible drug repurposing are listed. The role of oral probiotics in maintaining proper oral health is discussed. Emerging treatments like laser therapy, ozone therapy, biologics and role of 3D- printing have been highlighted. The potential efforts of personalized medicine tailored to meet the needs of individual patient and oral biomarkers are noted. A comparative study of marketed products to treat oral ulcers is conducted in this article.

Keywords: Mouth Ulcers, Oral Health, Therapeutic Management, Biologics, Herbal Medicine

INTRODUCTION

Recurrent apthous stomatitis (RAS), commonly called as mouth ulcers, is a concern in dental health. It is an oral condition characterized by small, open sores or lesions on the mucous membrane of the oral cavity. These sores are non-contagious and appear as white to reddish inflamed spots and generally lack pus (1). Oral ulcer is the most common oral concern prevalent among the global population. It can be observed in people of all ages. About 20- 25%

of the global population is estimated to be affected by RAS, whereas more than 85- 90% of people are exposed to minor oral ulcers at regular intervals (2). The oral ulcers can be classified as acute and chronic ulcers. Acute oral ulcers do not last more than two weeks. Chronic and recurrent oral ulcers fail to heal and last for more than two weeks (3).

Etiology

The etiology of mouth ulcers has not been clearly defined. It is considered to be multifactorial, with contributing factors including stress, trauma, injury due to biting of the mucosal layer, spicy or highly acidic foods, genetic makeup, poorly fitted dental appliances etc. (1). It may be due to nutritional deficiencies of riboflavin, niacin, folic acid, cobalamin, ascorbic acid, iron and calcium (4). The erosion of the oral mucosal membrane may occur due to rough brushing, harsh dental care routine or damage caused on chewing, eating etc. The oral ulcers may develop as a result of underlying systemic diseases or medications administered to treat those diseases (5). STIs of the mouth involve the pathogenic action of varied microbes, thus resulting in the erosion of oromucosal membranes and cause oral ulcers (6).

Pathogenesis

The pathogenesis is complex, often involving the release of inflammatory mediators such as TNF-α and microbial infections. Gene mapping and possible gene alteration using GWAS showed the possible genes involved in oral ulceration (7). A Mendelian randomization study found out the possible connection between microbial taxa (*Holdemania, Oxalobacter, Ruminococcaceae)* of gut microbiota and mouth ulcers (8). Genetic polymorphisms of several alleles were identified and analyzed for determination of role of genetics in RAS (9). Recent advancements in exosome research have highlighted their pivotal role in oral health diagnostics through liquid biopsy of oral fluids like saliva. Exosomal markers like miR-21 and p53 proteins in saliva can predict the progression of pre-cancerous lesions to oral squamous cell carcinoma. These tools focus on the ability of exosomes to serve as non-invasive biomarkers for diagnosing and monitoring various oral diseases, including oral ulcers and oral cancers (10,11). Nanobiosensors have gained limelight in detection of biomolecules in saliva for possible oral concerns (12). Artificial intelligence- based models are being developed to diagnose and categorize oral ulcers, without any invasive techniques, and can aid dentists (13).

STOMATOLOGICAL PREPARATIONS

Stomatology ("*stoma*" means "mouth" or "hole") refers to the branch of dentistry associated with the study of mouth and its associated diseases. Stomatologicals refer to the drug substances or preparations used to prevent, treat or mitigate oral disorders (14). According to the Anatomical Therapeutic Chemical (ATC)/ Defined Daily Dose (DDD) Classification System, **'s**tomatological preparations' are classified under the code A01**,** which fall within Group A**,** designated for drugs related to the 'Alimentary Tract and Metabolism'. A01 is further classified as follows as shown in Table 1 (15). The ATC/ DDD system, which is endorsed by the WHO, standardizes drug classification (ATC) and measurement (DDD) for global drug utilization studies. This system is vital for drug auditing and monitoring healthcare outcomes. This enables consistent analysis of prescribing trends, promotes rational drug use, and supports access to essential medicines (15).

ASSOCIATION OF GENERAL HEALTH AND MOUTH ULCERATION
Mouth Ulcers due to Systemic and Autoimmune Disorders

Oral diseases have been linked to systemic diseases and autoimmune disorders, with a well-established relationship between their occurrence and the presence of systemic conditions (16,17). Oral ulcer can be a symptom of pernicious anaemia caused due to deficiency of Vitamin B$_{12}$ (18). Oral ulcers are the most common clinical manifestation of numerous systemic diseases (3). Individuals with cardiometabolic diseases often experience xerostomia, altered immune functioning and increased oxidative stress, thus are prone to mouth ulcers (19,20). STI- causing pathogens such as HPV, *Neisseria gonorrhoeae*, *Treponema pallidum,* HSV and *Chlamydia trachomatis* can cause systemic infections as well as manifest in terms of cold sores/ recurrent oral sores/ chancres, thus affecting the oral mucosal lining (21). Oral ulcers are associated with diseases such as rheumatoid arthritis, Behçet's disease, Crohn's disease, systemic

lupus erythrematosus, celiac disease, pemphigus vulgaris and oral lichens (22). Oral ulcers and lesions form the principal symptoms in Behçet's disease (23). Worsening of Crohn's disease results in formation of oral ulcers (24). Oral ulcers appear frequently in patients with SLE and is a criterion in classification of lupus (25).

Drug- Induced Oral Ulcers

Oral ulcers may develop due to the adverse effects of medications. NSAIDs are the most common medications which inhibit the release of prostaglandins which are essential for formation of the oromucosal lining (26). Chemotherapeutic agents such as methotrexate and 5- flurouracil are invariably associated with formation of mouth ulcers during treatment of cancer (27,28). Oral ulcers are seen as adverse effects of methotrexate when indicated as anti-neoplastic and anti-rheumatic agent (29). Mouth ulcer is a side effect of pantoprazole as it reduces the absorption of Vitamin B_{12} and causes its deficiency (30). Anti- hypertensives and anti- anginal drugs can lead to severe mouth ulcers (31,32). Hormonal therapy based on estradiol, tamoxifen- based treatment have been found to induce mouth ulcers (33). Bisphosphonates used to treat bone-related disorders can cause oral mucosal erosion and ulceration (34). Vidagliptin, a dipeptidyl peptidase-4 inhibitor used to treat diabetes mellitus, can induce oral ulcers in rare cases due to altered oral environment (35). Anti-depressants can trigger the ulceration in oral cavity (36). Table 2 summarizes different categories of medications with examples which are known to cause mouth ulcers as adverse effects. Necessary directions should be given by the medical practitioners to the patients during administration of these drugs.

RECENT ADVANCEMENTS IN TREATMENTS AND STRATEGIES

The conventional medications to treat mouth ulcers include topical anaesthetics, such as benzocaine, which acts as by blocking the nerve transmission and reduces the pain sensation (37). Mouthwashes containing chlorhexidine, dexamethasone are useful in relieving mouth ulcers (38). Oral cryotherapy is the easiest method to treat mouth ulcer during its initial stage (39). This section describes the current trends and advancements in formulations and delivery systems to treat mouth ulcers. Strategies through NDDS, herbal medicines, probiotics and nutraceuticals have been explored to treat mouth ulcers. Emerging drugs such as biologics, laser and ozone- based therapies have been described.

Novel Drug Delivery Systems

Novel drug delivery systems enable patient- targeted therapy for each individual. The dosage forms such as mucoadhesive films, buccal patches, oral wafers, oral dissolving strips, liposomes, nanotechnology- based preparations and hydrogel are gaining importance in prevention and treatment of oral ulcers (14). A Swedish startup called Mucort has developed an intra-oral patch that absorbs tissue fluid containing inflammatory mediators, bacteria, and pathogens involved in ulcer formation. The patch absorbs tissue fluid up to 20-25 times its original weight and turns into a biodegradable gel within 3 to 4 hours. It is designed to reduce inflammation, stimulate healing and offer a hygroscopic effect to support oral ulcer recovery (40). Dissolving microneedle patches loaded with combination of betamethasone sodium phosphate and betamethasone dipropionate (BSP-BDP) along with hyaluronic acid was reported to have therapeutic effect against mouth ulcers. BSP- BDP promotes cell proliferation whereas hyaluronic acid facilitates oral ulcer healing (41). Similarly, microneedle patches containing triamcinolone acetonide showed better bioavailability and physical properties when formulated with mesoporous polydopamine nanoparticles. It is a unique dressing for treating oral mucositis (42). Mucoadhesive gel, prepared using naturally obtained polynucleotides (from the fish tissues) and sodium hyaluronate, was explored as a novel approach in treating oral ulcer as a Class III CE0373 medical device. Polynucleotides restore the innervated oral tissues and hyaluronate promotes wound healing (43). Cuttlefish ink is reported to have antimicrobial, antioxidant, anti-ulcerogenic and anti-neoplastic properties (44). This natural bioactive ingredient was combined with nanoparticle-based biopolymer in treating oral ulcers developed in diabetic patients (45). Dexamethasone loaded into HPC- based oral dissolving films was found to regulate PI3K/Akt signalling pathway to produce anti oro-ulcerogenic action (46). Antimicrobial peptides- modified polycaprolactone- collagen nanosheets provide better adhesion and improve the healing of oral ulcers (47).

Yashaschandra *et al.,*

Herbal Remedies

There is an increased demand for herbal drugs for treating oral ulcers. Drugs such as aloe, guava, liquorice and turmeric have been reviewed for anti- oral ulcerogenic activity (48). Clinical trials have shown that extract of *Punica granatum* is rich in polyphenolic compounds and provides anti- inflammatory activity against oral ulcers (49). Polyherbal oral patches comprising extracts of areca nut, gambier and green betel leaf were found to reduce the diameter of oral lesions (50). Extract of *Moringa oleifera* was found to confer the wound healing property against oral ulcers (51). Clinical trials showed that oil pulling therapy using pumpkin seed oil was effective in reduction of RAS (52). Essential oils such as tea tree oil, clove oil, bergamot oil, rosemary oil can act as better excipients in improving therapeutic activity of stomatological preparations against oral ulcers (53). Nutraceuticals have to be tapped as preventive measures against mouth ulcers. These serve as sources of essential nutrients and help prevent deficiencies associated with induction of mouth ulcers. Legumes, green leafy vegetables, citrus fruits are excellent sources of folic acid (54). Deficiency of Vitamin B_{12} and niacin can be reduced by sufficient of intake of sea food, dairy products, eggs and meat (55). Products such as Becosules (capsules containing B-Complex & Vitamin C), Bioven Zinc (oral spray infused with Vitamin C can be indicated as supplements to prevent mouth ulcers (56,57)**.**

Probiotics

Probiotics have shown promising results in managing mouth ulcers (58)**.** They can be used as adjuvants to existing antibiotics to improve the healing rate of mouth ulcers (59)**.** A topical nano-formulation containing *Lactobacillus reuteri* was found to reduce the size of oral lesion and severity of pain (60)**.** Hydrogel composed of calcium alginate/ fucoidan and *Lactobacillus rhamnosus* showed good antimicrobial activity and oro-ulcer healing capacity (61)**.** An oleogel, composed of several probiotics of *Lactobacillus* species such as *L. rhamnosus, L. casei, L. fermentum and L. acidophilus,* showed the ability of skin repairing in wounds such as diabetes- induced oral ulcers (62). *Lactobacillus brevis* CD2 and *Bacillus clausii* was found to be effective in treating oral ulcers (63,64). A patented therapy shows that *α*- hydroxy organic acids (lactic acid, glycolic acid) or their salts can be used in treatment of mouth ulcers (65). Marketed product such as ORASORE® tablets are formulated using lactic acid bacteria along with nutrients such as niacinamide, folic acid and riboflavin (66).

Biologics

Biologics, such as monoclonal antibodies, have therapeutic effect against oral ulcers. The mouth ulcers occur as adverse effects when drugs are administered against underlying autoimmune diseases such as rheumatoid arthritis, Behçet's diseases, ulcerative colitis etc. Monoclonal antibodies have been established to treat oral mucosa- related diseases and produce anti-oral ulcer activity at optimal doses (67). A single infusion of infliximab was found to have positive results in treating refractory oral ulcers (68). Etanercept, a TNF inhibitor, was administered subcutaneously (25 mg, twice weekly) and found to be effective in treating oral ulcers (69). Ustekinumab is extensively used in treating oral ulcers and lesions (a classic symptom of Behçet's disease) by inhibition of IL-12 and IL-23 (70). Anakinra, an IL-1 inhibitor, is found to be useful in treating mucocutaneous lesions developed in oral cavity and genital region (71). Abatacept reduces the diameter of oral ulcers, count of PMNL and MNL, along with decreased migration of inflammatory cells, thus accelerating the rate of healing of oral ulcers (72). Potential connection between granulamatosis with polyangitis causes oral mucositis and vasculitis. Avacopan is a C5a- receptor inhibitor, targeted against ANCA- associated vasculitis, to combat oral lesions and ulcers (73). Canakinumab, a IL-1β blocker, is useful in treating mouth ulcer by minimizing the release of inflammatory mediators (74).

Miscellaneous Therapies

Studies have shown that photobiomodulation or low- level laser therapy as an effective adjunctive treatment against mouth ulcers, dental procedures and oral concerns (75,76). Low level laser therapy is a non- invasive and painless therapeutic intervention. It is significant due to properties such as biomodulation, disinfection of the oral sores and their recovery by stimulating new collagen synthesis (77). Clinical trials have shown that ozone therapy can be used as an unique solution against RAS. Delivery of ozone for about 60 seconds at the site of RAS was found to minimize the pain associated with oral ulcers (78). Ozonized olive oil was found to provide therapeutic effect to cure RAS (79).

Yashaschandra *et al.,*

Role of 3D- Printing

3D- printing of pharmaceuticals has been a boon in manufacturing of dosage forms tailored as per the patient requirements. It can be explored to produce chewable tablets, lozenges, orodispersible films, patches and semi-solid dosage forms to exclusively treat mouth ulcers. It provides an opportunity for multi-drug delivery along with personalized drug dosing. Dexamethasone acetate based buccal patches were prepared using fused deposition modeling - 3D-printing technology to treat RAS (80). Capsaicin, a naturally occurring alkaloid, is found to have analgesic, anaesthetic and anti-inflammatory properties (81). 3D- printed candy containing 0.05% capsaicin and 10% capsaicin- loaded ultrafine fiber film was found to have excellent healing properties against mouth ulcers (82,83).

Drug Repurposing

Drug repurposing has been successful in identifying drugs for treating mouth ulcers. Suramin, an antiparasitic drug used to treat African sleeping sickness, was found to be effective in treating oral mucositis (84). Thalidomide is an immunomodulator which acts by TNF-α suppression, opposes angiogenesis by reducing the expression of VEGF and inhibits the surge of pro-inflammatory mediators (85). This drug was found to be effective in treating oral ulcers, (developed as secondary infection), in HIV- affected patients. Amlexanox, an anti- inflammatory drug, previously used to treat asthma, showed effective response (as 5 % mucoadhesive paste) against mouth ulcers. However, it was discontinued in USA due to severe adverse effects. Efforts were made to develop amlexanox- loaded nanoliposomes for localized oromucosal delivery which was successful in minimizing the release of inflammatory cytokines associated with oral ulceration (86).

MARKETED PRODUCTS

The global market value of dental care products was valued around USD 35 billion in 2023 and is expected to reach USD 95 billion in 2032 (87). The estimated global market value of mouth ulcer treatment was valued at USD 1.5 billion in 2023 and expected to cross the USD 2.25 billion mark in 2030 at a CAGR of 3.5% (88). Some of the eminent global market players in the mouth ulcer treatment include 3M, Colgate- Palmolive, GSK, Blistex, Bristol Myers Squibb Company, Church & Dwight and Dental Herb etc. (89,90). Table 3 presents various marketed products available for therapeutic management of oral ulcers.

CONCLUSION

The management of mouth ulcers has evolved significantly, with numerous advancements aimed at improving both the effectiveness and patient experience of treatment. The growing understanding of the complex etiology and pathogenesis of oral ulcers, including the role of inflammatory mediators, infections, and systemic health conditions, has paved the way for more targeted therapies. Novel drug delivery systems have revolutionized treatment by allowing for precise, localized drug delivery with controlled release, minimizing systemic side effects and enhancing healing. The incorporation of herbal remedies, probiotics, laser therapy and biologics offers promising alternatives for inflammation reduction and healing. Despite these advancements, a comparative analysis of existing treatments reveals variability in efficacy, underscoring the need for continued innovation and individualized care. A multidisciplinary approach combining personalized medicine and improved patient education will be essential in providing effective and long-term solutions for mouth ulcer management. The future of treatment lies in optimizing these strategies to enhance therapeutic outcomes and improve patient quality of life.

Table 1: Classification of Stomatological Preparations

Subgroup	Class of Drugs
A01AA	Prophylactic agents, such as fluoride preparations, to prevent anti-caries.
A01AB	Anti-infectives, such as tetracyclines, to treat stomatitis and gingivitis.
A01AC	Corticosteroidal preparations such as triamcinolone, dexamethasone, prednisolone and hydrocortisone etc, for treating gingivitis and stomatitis.
A01AD	Miscellaneous agents used in dentistry.

Table 2: List of some of the drugs which can induce mouth ulcers (26- 36)

S. No.	Class of Medication	Examples
1.	NSAIDs	Ibuprofen, Piroxicam, Naproxen
2.	Anti-neoplastic	Methotrexate, 5- Flurouracil
3.	Anticonvulsants	Lamotrigine
4.	Antihypertensives	Bisoprolol, Propranolol
5.	Anti-anginal	Nicorandil
6.	Hormonal therapy	Tamoxifen-based therapy
7.	Bisphosphonates	Alendronate, Risendronate
8.	Anti-diabetics	Vildagliptin
9.	Anti-depressants	Nortryptyline
10.	Proton pump inhibitors	Pantoprazole

Table 3: List of some of the marketed products to treat oral ulcer

S.No.	Dosage Form	Brand Name	Comments	References
1	Gel	Orasore Smyle	It contains lignocaine hydrochloride and choline salicylate along with benzalkonium chloride, spearmint, fennel, glycerine. It is a polyherbal Ayurvedic product.	(91,92)

Yashaschandra *et al.,*

2	Tablet	Oracool	It contains folic acid, riboflavin, niacinamide and lactic acid bacteria.	(93)
3	Mouthwash	Orajel	It contains hydrogen peroxide and menthol. It acts as an oral debriding agent.	(94)
4	Drops	Rinsout	It is a polyherbal,, alcohol-containing, Homeopathic product, which comprises the extracts of *Calendula officinalis*, *Echinacea angustifolia* and *Hydrastis anadensis*	(95)
5	Paste	Tess Lexanox	It contains triamcinolone acetonide. It contains amlexanox.	(96) (97)
6	Patch	DenTek	It provides relief from oral sores by acting as a physical barrier. It also contains Vitamin E. It is a chemically tested stomatological preparation.	(98)
7	Oral dissolving discs	CankerMelts	It contains benzocaine, hyaluronic acid and cobalamin. These ingredients facilitate wound healing of oral wounds and ulcers	(99)
8	Lozenge	Tantum , Verde	These products contains benzydamine hydrochloride and treat inflammatory and irritatory conditions associated with mouth and throat.	(100)
9	Spray	GUM, AftaClear	These products are polyherbal and alcohol- free.	(101)
10	Pastilles	Iglu	It is a sugar-free dosage form which contains benzalkonium chloride and compound benzoin tincture.	(102)

ABSTRACT

This study employs the Combined Compromise Solution (COCOSO) method, integrated with the Cost benefit Analysis (CBA) approach, under Interval Value Intuitionistic Fuzzy Set (IFS) framework to analyse and rank the most remarkable Chola-period temples. The COCOSO-CBA method effectively handles multi-criteria decision-making (MCDM) by aggregating various evaluation criteria from expert opinions, while Interval value in intuitionistic fuzzy sets (IFS) incorporate uncertainty in expert judgments. The methodology involves defining criteria, assigning weights using the intuitionistic fuzzy set, and applying the expected value method to convert IVIFS values into crisp values. Finally, the temples are ranked based on the aggregated scores derived from the COCOSO-CBA method. The aim is to prioritize the finest temple that has withstood the test of time.

Keywords: Interval value in intuitionistic fuzzy sets (IFS), Expected Value Method, Combined Compromise Solution (COCOSO) method, Cost benefit Analysis (CBA).

Maria Jenifer and Mary Mejrullo Merlin

INTRODUCTION

The Chola period's is marvels of architecture and also a timeless example for creativeness and technical works process in construction. Selecting the best temple requires thoughtful examination of a few fundamental factors. For managing such intricate duties, Multi-Criteria Decision-Making (MCDM)[6] methodologies combine a qualitative and quantitative approach. This study applies the COCOSO-CBA method algorithm [5][6][10] in an interval value intuitionistic fuzzy set[1-3] with MCDM (multicriteria decision making). The Expected Value Method [11] methodology combines the advantages of weighted sum and compromise ranking methods to make the interval values clear. COCOSO, which was first presented by Yazdani et al. [10], balances various ranking techniques for effectively synthesize decision-making criteria to identify the most desirable options. In order to obtain a thorough ranking of criteria within the context of MCDM, the method employs three aggregation strategies: multiplicative utility, compromise ranking, and additive weighting. In assessing alternatives, CBA[4] is essential. CBA[11] offers a structured method for evaluating financial viability and overall benefits by quantifying trade-offs, value-driven benefits, and qualitative values to both positive and negative aspects. This allows decision-makers to evaluate an option's overall feasibility and desirability. This integration improves the accuracy of decisions, especially as it pertains to large-scale infrastructure development, cultural conservation, and historical architectural study.

Aim of the research /objective

- To provide a range of possible outcome, help the decision maker to understand uncertainty associate with expected value method in Fuzzy environment.
- With the integrated algorithm can provide a realistic representation of uncertain data in real life decision- making problem.

RESEARCH DESCRIPTION

The intricate architectural details of Chola's temple during the epic era are examined. identifying the best architecture by the architect or people lead to uncertainty where several areas of architecture are focused on the modern world. The probabilities and consequences of IVIFS 's uncertainty are can also manage the algorithm in decision making

APPROACH FOR COCOSO & CBA ALGORITHM

The Algorithm is framed for quantify ranking of chola architecture by combining Intuitionistic fuzzy set with COCOSO method and CBA method, method is outlined below [8,9].

Step1: For the expert Linguistic Variable, the alternative and criteria values were subsequently transformed into Interval value Intuitionistic Fuzzy values.

Step 2: fuzzy decision matrix evolved from the interval value intuitionistic fuzzy decision matrix[11].

$[a, b]\ [c, d] = [ac, bd]$

$$\frac{ac+bd}{2} \qquad \qquad \dots(2)$$

To perform stages 3, 4, and 5, the phyton code is utilized.

Step 3: To obtain precise values for the decision-making, the values in the matrix are normalized from the stage before them[6][5]

$$T_{eij} = \frac{x_{ij}-min\,x_{ij}}{max\,x_{ij}-min\,x_{ij}} \qquad \qquad \dots (3)$$

Step 4: The weight of the matrix's sum and power are determined using [6]

$$(T_s) = \sum_{j=1}^{n}(wj\ teij) \qquad \qquad \dots(4)$$

$$(T_p) = \sum_{j=1}^{n}(teij)^{wj} \qquad \qquad \dots(5)$$

for the comparability of alternative weights.

Step 5: Three strategies for accumulating assets

$$(P)_{i_1} = \frac{t_s + t_p}{\sum_{i=1}^{m}(t_s + t_p)} \qquad \qquad \dots(6)$$

$$(Q)_{i_2} = \frac{t_p}{t_p} + \frac{t_s}{t_p} \qquad \qquad \dots(7)$$

$$(R)_{i_3} = \frac{t_s + (1+\lambda)\,(t_p)}{max\ t_s\ +(1-max\ t_p)} \quad 0 \le \lambda \le 1 \quad for\ \lambda = 0.5 \qquad \dots(8)$$

Step 6: Organizing the choices according to the (k) Assessment

$$K = (P \times Q \times R)^{\frac{1}{3}} + \frac{1}{3}(\ P+Q+R) \qquad \qquad \dots(9)$$

Step 7: The score arrangements' systematic progression, the order in which the score arrangements are presented.

Step 8: Quantifying the sequence order by Cost Benefit Analysis method[11][4].

Maria Jenifer and Mary Mejrullo Merlin

IMPLEMENTING THE ALGORITHM FOR RANKING

The linguistics value of decision maker, the expert and IFS value are tabled. The value converts it into Ifs number using table1 and each attribute's IFS value has a crisp value i: e fuzzy decision matrix form, according to the expert the given Weight values are W1 = W2 = W3= W4= W5= 0.5 hence the weight age of the temple for millennium is constant Stated from the step3 the alternative (temples)as T be Brihadeshwara temple, Gangaikonda cholapuram, Åiravatesvara temple, Vijayalaya choleeswaram and their criteria as I where Architectural designs, Materials, Patterns, Visual and feel, Intricacies. [Table 2] The table to matrix form as:

$$\begin{bmatrix} 0.10 & 0.31 & 0.1 & 0.31 & 0.31 \\ 0.34 & 0.31 & 0.34 & 0.1 & 0.19 \\ 0.10 & 0.1 & 0.31 & 0.31 & 0.10 \\ 0.1 & 0.1 & 0.19 & 0.34 & 0.19 \end{bmatrix}_{4\times5}$$

By utilizing the phyton, these operations are accessible for Step 3,4&5 syntax for formulae is given below .
Step3:

```
for j in range(len(mat[0])):
    val=(mat[i][j]-find(mat,'min',j))/(find(mat,'max',j)-ind(mat,'min',j))
```
Matrix Multiplication :
```
for j in range(len(mat1[0])):
    vsum = vsum + (mat1[i][j]*mat2[0][j])
```
Power of Matrix :
```
if(operation == 'min'):
    val=min(val,mat[i][col])
  elif(operation == 'max'):
    val=max(val,mat[i][col])
for j in range(len(mat1[0])):
    val = (mat1[i][j]+mat2[i][j])/(findsum(mat1,j)+findsum(mat2,j))
    val = (mat1[i][j]/find(mat2,'min',j))+(mat2[i][j]/find(mat1,'min',j))
  for j in range(len(mat1[0])):
  val=((0.5*mat1[i][j])+(1.5*mat2[i][j]))/((0.5*find(mat1,'max',j))+(1-find(mat2,'max',j)))
```

Approaching on the beneficial criteria from step 3, the normalizes value is done.

Weight	0.5	0.5	0.5	0.5	0.5
Min	0.1	0.1	0.1	0.1	0.10
Max	0.0.34	0.31	0.34	0.34	0.31

$$t_{eij} = \begin{bmatrix} 0 & 1 & 0 & 0.8749 & 1 \\ 1 & 1 & 1 & 0 & 0.42857 \\ 1 & 0 & 0.8749 & 0.8749 & 0 \\ 0 & 0 & 0.3749 & 1 & 0.42857 \end{bmatrix}_{4\times5}$$

Python is used to run the code, and the results are provided below.

Sum of weight and the matrix $\begin{bmatrix} 1.4375 \\ 1.7143 \\ 1.3749 \\ 0.9017 \end{bmatrix}$

Product of the matrix and weight $\begin{bmatrix} 2.9354 \\ 3.6547 \\ 2.87072 \\ 2.2669 \end{bmatrix}$ here the given weights constant from the expert.The Score arrangements of the matrix are evaluated below, are ordered in ascending .from step5 &6.

RESULTS AND DISCUSSIONS

Cost benefit method, Benefit > cost , in case of these criteria has shaped the society with with benefits of 1.Human Devotions, 2. Cultural Identity, and 3. Architectural Ingenuity [8] here the temple is considered as centre of economic activities for education- arts and culture . The cost value is 100 per head [9]in above temple are hub of learning materials for scholars and philosophers it also has role of local art and craftmanship. Showcase the skills and growth of region. The 3 values made Brihadeshwara temple to stand firm – both in cost and benefits.

ABSTRACT

The workforce includes female employees. In addition to producing commodities and services, women are the main source of advancement for the human species. Women were only permitted to perform specific tasks in factories at first, thus their labour was not directly comparable to that of men. One of the district of Tirupur's traditional industries is the textile industry. The cotton is produced by the textile proprietors through a contract arrangement. Without taking into account factory regulations and working conditions, the contractors employ a large number of contract women workers. Since women make up the majority of the workforce in the textile business, textile owners are obliged to provide them with the necessities. Women workers start working in the cotton sector every day at eight in the morning and finish at the end of the day.

Keywords: Work Force, Contract, Working Conditions, Women Workers.

INTRODUCTION

The final emotion that a person has after completing a work is job satisfaction. A person's job will be fulfilling if it satisfies his dominant wants and is in line with his expectations and ideals. The emotion could be either pleasant or negative, contingent on the extent to which the need is met. Job satisfaction is not the same as morale or motivation. Motivation is the state of being willing to work. Contrarily, satisfaction denotes a happy emotional state. A overall attitude towards one's job and workplace is implied by morale. In contrast to job satisfaction, which is a personal experience, this phenomena is collective. Morale can be a source of satisfaction as well as a dimension that job satisfaction can have Predispositions known as attitudes cause a person to act in a specific manner. The other hand, job satisfaction is the final emotion that can impact behaviour in the future. So, a worker's overall attitude towards his work is what determines job happiness. A person's motivation to work is derived from their desire to work,

95538

Hemin Mon and Sathiskumar

which is referred to as job satisfaction. Here, it's never just about happiness, contentment, or fulfilment; it's always about the work.

OBJECTIVES OF THE STUDY
- To examine the views of women workers in the textile industry.
- To anlaysethe perception of women workers about the wages and economic benefits of the textile industry.
- To evaluation of the quality of life work performed bywomen workers in the textile industry in Tirupur district.

SCOPE OF THE STUDY
This study took a long time, many problems occurred, and it became a challenge for the researcher to complete the data collection. Collecting objective data takes a lot of time and care. However, the time and interest for many respondents was insufficient due to a lack of interest from their employers. Therefore, the study's conclusions are subject to inherent limitations in both primary and secondary data. In addition to these other restrictions are: 1. The results of this study are related to the textile sector in Tirupur district and cannot be generalized for the textile manufacturing sector as a whole.

STATEMENT OF THE PROBLEM
For this study, the term quality of work life refers to the values and attitudes in the life of each employee. "The purpose of work life" includes many factors, such as pay, promotion, opportunities for growth and continued safety, benefits, possible wages, safe and healthy work practices, management, personnel and supervision, nature of work, Social integration in work management, legal principles in work management, work and the whole area of life, and social interaction in in working life. Everyone has their own way of evaluating work life. Maintaining the health of the organization and the satisfaction of the employees from time to time is one of the main factors for the success of the organizations and the sustainability of the organizations.

The present study is descriptive. Data were collected using a questionnaire. The sample group for the study was textile industry workers in Tirupur city. Both primary and secondary data have been used in this study. Respondents were selected using a non-probability "Participation" sampling method. 500 employees were available to contact the petitioner for data collection.

RESEARCH METHODOLOGY

The present study is descriptive. Data were collected using a questionnaire. The sample group for the study was textile industry workers in Tirupur city. Both primary and secondary data have been used in this study.
Respondents were selected using a non-probability "Participation" sampling method. 500 employees were available to contact the petitioner for data collection.

DATA ANALYSIS AND INTERPRETATION
From the above table, it is seen that the level of satisfaction, varied between a minimum of 1to maximum of 5. The highest mean was found for wage (4.6171) followed by recognition of achievement (3.1240). The lowest mean was found for work load (2.9121).

FINDINGS OF THE STUDY
- Rewarding and celebrating achievements contributes to employee satisfaction.
- There is a relationship between employees' perceptions of job satisfaction with age, gender, marital status, education, family membership and family income.
- Respondents belonging to the age group between 20-25 years agree more about employee satisfaction as compared to respondents belonging to the age group 45-55 years.
- Unmarried respondents were more likely to agree about happiness than widowed respondents.
- Respondents who are educated to a higher level agree more favourably than uneducated respondents.

SUGGESTIONS

This means employees have a happier life and a better work life. Events should emphasize eating the right food at the right time, getting plenty of rest, deep sleep and exercise. Employees feel that these two things only increase their performance. Therefore, employers should pay attention to these two areas. Costs play an important role in determining QWL among all sectors of the textile industry. Employers must give fair and reasonable wages to their employees based on work, experience and cost of living.

CONCLUSION

It helps to improve the quality of work life and work efficiency and increase productivity. The purpose of this study is to understand the quality of work life in textile companies in Tirupur city. In this study, it has been found that out of eleven elements, only two related to the employer-employee relationship and stress management have a role in QWL, a good employee and both. Employees want to be satisfied with receiving fair compensation and recognition of achievements at work.

ABSTRACT

Crotalaria juncea whole Plant was evaluated for *in-vitro* antioxidant, anti-inflammatory and *in-vivo* anti-anemic activities in Anaemia Induced Rats. The whole plant extract exhibited significant biological activities when compared with standard reference drugs. The different methods adopted are of standard. *In-vitro* anti-oxidant activity was evaluated using DPPH and Reducing power assay, *in-vitro* anti-inflammatory activity was evaluated using Protein denaturation method and Human RBC standard methods. Anemia induction by Phenylhydrazine injection to Albino rats lead to significant decrease in Hemoglobin and Red Blood Cells, these decreased level significantly exalted with the treatment of *Crotalaria juncea* whole plant.

Keywords: *Crotalaria juncea*, anti-oxidant, anti-inflammatory, anti-anemic activities.

INTRODUCTION

Ayurveda is considered to be the most ancient medicinal system known to mankind [1]. Plants and their secondary metabolites derived may be the important source of Pharmaceutical drugs to exhibit physiological activity[2-8]. *Crotalaria juncea* commonly familiar as Sun hemp, abaundantly available in many parts of Andhra Pradesh, India. This whole plant is being used by many tribal community and also natives of forest areas of East Godavari district,

traditionally using this medicinal plant for the treatment of pain, as a blood purifier, astringent and for skin diseases [9-12].

MATERIALS AND METHODS

Collection of *Crotalaria juncea*
The whole plant was collected from different regions of Rampachodavaram, Maredumalli and Jaddangi forest of East Godavari region. The plant has been identified and approved by botanist Dr. T. Raghuram, Maharani College, Peddapuram. The Plant was dried under shade for 10 days and pulverized to coarse crude powder and stored in air tight container. The required amount of coarse powder was subjected to Soxhlet Extractor for continuous hot extraction with ethanol for 8 to 10 hours. Then the extract was filtered and the filtrate was evaporated to dryness

Chemicals and Apparatus
Chemicals used are of Analytical grade with standard Glassware.

In-vitro Antioxidant activity:[13-18]
(i)   **DPPH method:** Gallic acid was used as a reference standard while making 0.002% of DPPH in methanol to perform the free radical scavenging activity. With the aid of methanol, various quantities of Standard Gallic acid 2.5 ug/ml and *Crotalaria juncea* whole plant extract (100 and 200 ug/ml) were produced. One millilitre each of the extract and standard concentrations are combined with one millilitre of 0.002% DPPH. After 30 minutes in the dark, the produced combinations' OD at 517 nm was measured. Finally the % inhibition of DPPH activity is calculated from using the formula DPPH Scavenged (%) = [(Acontrol - A test)/Acontrol]x100

(ii)   **Reducing power Assay:** The standard agent Gallic acid (2.5 ug/ml) and different concentrations of the *Crotalaria juncea* whole plant extract (100 and 200ug/ml) were prepared using distilled water, 1% potassium ferricyanide, 10% trichloro acetic acid, 0.1% ferric chloride, and 0.2M phosphate buffer. As a point of reference, gallic acid was utilized. Subsequently, 1 millilitre of each concentration of the extract and standard were taken individually and combined with 1 millilitre of potassium ferricyanide and 0.2 millilitre of phosphate buffer (pH 6.6). For 20 minutes, incubate each of these samples at 500C. After that, add 1 millilitre of 10% trichloroacetic acid and centrifuge for 10 minutes at 2000 RPM. Next, drain the top layer (2.5 ml), and add 0.5 ml of freshly made ferric chloride along with 2.5 ml of distilled water. At 700 nm, measure the absorbance immediately.

In-vitro Anti-inflammatory activity:[19-22]
(i)   **Protein denaturation method:** Test solution, 0.5 ml consists of 0.45 ml of Bovine Serum Albumin (BSA) and 0.05ml of test sample of different concentrations [100 μg/ml and 200 μg/ml]. Test control solution, 0.5 ml consists of 0.45 ml of Bovine Serum Albumin (BSA) and 0.05ml of test sample of distilled water. Product control solution, 0.5 ml consists of 0.45 ml of distilled water and 0.05ml of test sample of different concentrations [100 μg/ml and 200 μg/ml]. Standard solution, 0.5 ml consists of 0.45 ml of Bovine Serum Albumin (BSA) and 0.05ml of test sample of different concentrations [10 μg/ml and 2.5 μg/ml of Diclofenac sodium]. All the above solutions were adjusted to pH 6.3 using 1N Hcl. The samples were incubated at 37°C for 20 mins and the temperature was increased to keep the samples 57°C for 3 mins. After cooling 2.5 ml of Phosphate buffer was added to the above solutions. The absorbance was measured using UV-Visible Spectrophotomter at 416 nm. The percentage inhibition of Protein denaturation was calculated.

Percentage inhibition   = 100 [OD of test solution – OD of Product control] x 100
of Protein denaturation   [OD of Test Control]

The control represents 100% Protein denaturation and the results are compared with standard Diclofenac sodium. Protein denaturation method is the most versatile method of *In vitro* Anti-inflammatory method which is used to assess the anti-inflammatory properties of *Crotalaria juncea* whole plant extract at 150 and 300 µg/ml concentrations.

(ii)   **Human RBC method:** *Human RBC Preparation [HRBC Suspension]* - An equivalent volume of sterilized Alsever's solution (2% Dextrose, 0.5% Sodium Citrate, 0.05% Citric Acid, and 0.42 % Sodium Chloride in water) was combined with freshly drawn whole human blood. After centrifuging the blood for 15 minutes at 3000 rpm, the packed cells were rinsed three times with iso-saline (0.85% at pH 7.2). The blood's volume was measured and then reconstituted using iso-saline in a 10% v/v suspension. One of the most adaptable techniques used for assessing in vitro anti-inflammatory activity is HRBC membrane stabilization.

In-vitro anti-anemic activity:[23-28]

Phenylhydrazine is a gifted sample used to induce anemia. Phenylhydrazine hydrochloride solution was produced in-situ, neutralized in 0.1 M Potassium phosphate buffer, filtered and maintained at a pH of 7.4. Anemia is induced by intra-peritoneal injection of Phenylhydrazine40mg/kg body weight in rats for two consecutive days. The Hemoglobin and Red Blood Cell count were tested before and after induction of Phenylhydrazine.

Method: The animals used approved by the Institutional Ethics Committee (IEC) with REG.NO. 1269/a/10/CPCSEA. Rats divided into four groups with 3 animals each(n=3). Group-I is Anemic control Phenylhydrazine[40mg/kg], Group-II received low dose of 200 mg/kg *Crotalaria juncea* whole plant extract twice daily, Group-III received high dose of 400 mg/kg *Crotalaria juncea* whole plant extract twice daily, Group-IV with standard drug receiving Ferrous ascorbate 10 mg/kg twice daily. Ferrous ascorbate and *Crotalaria juncea* plant extract where given orally from 3-21 days after 1st injection of Phenylhydrazine. On day 21, blood samples were collected from tailvein of rat and parameters like Hemoglobin and Red Blood Cell count were determined manually using traditional methods like Sahil's Hemoglobinometer (Acid Hematin Method) as well as Automated Hematology Analyser. [Operated Hematology Analyzer- Avecon Healthcare Pvt.Ltd]

FTRI Studies

The FTIR Spectra of the ethanolic whole plant extract of *Crotalaria juncea* was taken with "Bruker FTIR Spectrophotometer" and the spectra was recorded in the region of 3500 cm^{-1}to 600 cm^{-1}.The spectral data of the whole extract was presented in the Table-6. The absorption band at 3348.95 cm^{-1}and 1643 cm^{-1}indicating the presence of hydroxyl group and carboxyl group. It shows the evidence of chemical constituents like Phenols- Ferulic acid, Flavanoids like Quercetin, Triterpenoids like Ursolic acid in the plant extract.The band at 1082.67 and 1043.98 cm^{-1}indicates the presence of C-OH bond, while other peak at 2974 cm^{-1}and 2926 cm^{-1}indicates the presence of C-H bonds. The absorption band at 878 cm^{-1}due to the presence of C=CH group is Triterpenoids.

RESULTS AND DISCUSSION

In vitro antioxidant activity

(i)   **DPPH method:** Ethanolic whole plant extract of *Crotalaria juncea* was subjected to DPPPH Radical Scavenging Assay and the extract at a concentration of 100 µg/ml and 200 µg/ml showed maximum inhibition of 55.50 and 66.40% and the results were compared with standard drug Gallic acid 2.5 µg/ml produced maximum inhibition of 79%. The results are given in Table 1 and Figure 1.

(ii)   **Reducing Power Assay:** The two concentrations of *Crotalaria juncea* plant extract 100 and 200 µg/ml produced the absorbance which is compared with standard drug Gallic acid 2.5 µg/ml. The results are described in Table 2 and Figure 2.

In-vitro anti-inflammatory activity

(i)   **Protein denaturation method:** This method is very well accepted to evaluate *in-vitro* anti-inflammatory activity. The medicinal plant extract *Crotalaria juncea* at a concentration of 150 and 300 µg/ml produced maximum

95543

percentage of inhibition observed 34.50 and 52.20 and the results are compared with Standard Reference Drug Diclofenac Sodium which produced decent inhibition of 65.5 at 10 µg/ml concentration. The anti-inflammatory effect of the extract is concentration dependent. The results are mentioned in table 3 and Figure 3.

(ii) **Human RBC membrane stabilizing method:** This is very acceptable method to determine *in-vitro* anti-inflammatory action of *Crotalaria juncea* plant extract. When compared to the conventional anti-inflammatory medicine Diclofenac Sodium 10µg/ml, which generated 65.5%, the extract inhibited hypotonicity-induced membrane lysis to the amount of 38% and 60% at concentrations of 150 and 300 µg/ml. The activity is concentration dependent and the results are described in Table 4 and Figure 4.

Anti-anemic activity
Blood parameters- Hemoglobin and RBC
The Hemoglobin and RBC content in the experimental animals is very normal before injecting Phenylhydrazine to albino rats. There is a notable decline in Hemoglobin and Red Blood Cell count in experimental animals treated with Phenylhydrazine 40mg/kg showing hemoglobin levels 7.75 g/dl and Red blood cells 2.95 cells/mm^3. Reduced hemoglobin levels are caused due to decrease in red blood cell count. *Crotalaria juncea* extract with low dose 200 mg /kg and high dose 400 mg /kg significantly exalted the levels of hemoglobin and red blood cell to an appreciable extent of 4.5 and 5.90 cells/mm^{3}for RBC and 9.5 and 11.8 g/dl for hemoglobin. These parameters are compared with standard Ferrous Ascorbate treated group of animals 10 mg/kg body weight with 6.2 cells/mm^{3}of RBC and 12.85 g/dl of hemoglobin. The details of the obtained results where describe in Table 5and Figure 5.

CONCLUSION

The researchers made a sincere attempt to explore the pharmacological investigations of *Crotalaria juncea* whole plant for *in-vitro* anti-oxidant, anti-inflammatory and *in-vivo* anti-anemic activities. Based on the experimental work carried out significant results were obtained leading to favorable results. With the presence of triterpenoids, flavonoids and phenolic compounds identified from FTIR Spectra the researchers have concluded the biological activities like anti-oxidant and anti-inflammatory activity of *Crotalaria juncea.* Further, studies can be carried out and possible herbal formulation can replace the chemical drugs available in the market with cost effective and less side effects. The detailed analytical work to isolate the important phyto-constituents would be helpful to elucidate the possible mechanism for these pharmacological activities.

ABSTRACT

The present study set a spot light on extracellular pigment metabolite of *Aspergillus ustus* and assessing its antimicrobial, antioxidant, and cytotoxic efficacy. *A.ustus* yellow pigment exhibited significant antimicrobial activity by inhibiting all test bacterial pathogens. *Salmonella typhi* was most susceptible, with a maximum zone of inhibition of 20.96 ± 0.35 mm, 17.96 ± 0.15 mm, 11.16 ± 0.28 mm and 10.86 ± 0.23 mm at concentrations of 20, 10, 05 and 2.5 mg/mL respectively. At a concentration of 40 mg/mL yellow pigment of *A. ustus* displayed potential to inhibit test fungal pathogens such as *Aspergillus brasiliensis* (15.50 ± 0.20 mm), *Candida albicans* (20.00 ± 0.20 mm), *Claviceps purpurea* (18.46 ± 0.25 mm) and *Fusarium oxysporum* (18.53 ± 0.25 mm). The MIC values ranged from 6.25×10^2 to 2.5×10^3 µg/mL. The pigment of *A. ustus* exhibited significant antioxidant efficacy, i.e., DPPH+ (IC_{50} 398.99µg/mL), ABTS•+ (IC_{50} 205.6µg/mL), FRAP ranging from 0.088 to 0.733 and total antioxidant potential ranging from 0.068 to 1.24. *A. ustus* pigment affects the viability of HepG2 (IC_{50}174.89µg/mL) and A498 (IC_{50} Value 262.45µg/mL) and is less-toxic to HEK-293 normal cells. The research output recommends that, the yellow pigment of *Aspergillus ustus* can be useful scale-up for pharmaceutical and textile applications in future.

Keywords: Agar-well diffusion, Anticancer, Biological activity, MIC, Myco-pigment, Radical scavenging

INTRODUCTION

Colors are the mesmerizing glory of the world and they have been used for millennia to enhance the appearance of products such as foodstuffs, textiles, cosmetics, arts and creative works. Azodyes are chemically synthesized compounds that are widely used as colorants, but they have a negative impact on human health as well as on the environment. [1] Natural pigments are mainly attained from plants and microorganisms. Pigment production from microorganisms is more stable compared to plant-based pigments because of the availability of microbial cultivation skills. Due to the limitations of plant pigments, pigments of microbial origin gained more prominence. [2] Filamentous fungi are a fascinating source of natural pigments. Melanins, carotenoids, azaphilones, quinones, quinones, phenazines, indigo, violaceinand monascinare some of the pigments that fungi produce in a prolific manner.[3]Fungal pigments have tremendous benefits over other natural pigment sources and their synthetic counterparts, therefore increasing their demand and enabling novel investigation possibilities.[4]For the biosynthesis of fungal pigments mainly four pathways are responsible which comprises polyketide synthetic pathway, shikimate pathway, nitrogen-containing metabolite pathway and terpenoid synthetic pathway.[5]Fungal pigments such as melanin, quinones, flavins, ankaflavin, and azaphilones have therapeutic applications such as antimicrobial, antioxidant, and anticancer properties.[6]Thus, the industries are intent about the filamentous fungi from a broad range of habitats such as marine origin, soil, endophytic fungi from terrestrial and endo-lichenic fungus which can be easily grown in laboratory conditions and permissible for the industrial production.[7, 8]Certain *Aspergillus* species are well-known producers of aspergillin, asperenone, azaphilone pigments.[9] *Aspergillus ustus* is a saprobic fungus generally associated with the top soil. It produces various extracellular metabolites such as autocystins, austalides, sterigmatocystins, versi colourins and nidulol that possess antibacterial and other biological applications.[10]This research study embraces the cultivation of *A. ustus* in submerged fermentation for pigment production, the extraction of extracellular pigment that is yellow and the investigation of its bio-efficacies corresponding to its antimicrobial, antioxidant, and cytotoxic properties against cancer causing as well as normal cell lines.

MATERIAL AND METHODS

Cultivation and extraction of extracellular pigment from *Aspergillus ustus*
A. ustus was cultivated in submerged fermentation using potato dextrose broth (PDB) medium supplemented with sucrose (2%), sodium nitrate (1%), potassium phosphate (0.05%), tyrosine (0.5%) and pH 7. Starter culture (1:10 v/v) was inoculated to mass medium and incubated as stationary cultures for 21days. After incubation, the fully grown fungal biomass was separated from the culture broth; the grown-up culture was filtered through Whatman No. 1 filter paper. 95% methanol was added to the culture filtrate in the ratio of 1:1 and agitated on a rotary shaker for 30 min at 150 rpm and centrifuged at 5000 rpm for 15-20 minutes. The separated pigment phase was retrieved and n lyophilized. The dried pigment was used for further analysis [11].

Antimicrobial activity of yellow pigment of *A. ustus*
Test pathogenic microorganisms
The test bacterial cultures including *Escherichia coli* (MTCC 1559), *Enterococcus faecalis* (MTCC 439), *Klebsiella pneumonia* (MTCC 7028), *Pseudomonas aeruginosa* (MTCC 1934), *Staphylococcus aureus* (MTCC 902), *Salmonella typhi* (MTCC 734) and fungal cultures including *Aspergillus brasiliensis* (MTCC 1344), *Candida albicans* (MTCC 3272), *Claviceps purpurea* (MTCC 479), *Fusarium oxysporum* (ITCC 55) were procured from the Microbial Type Culture Collection (MTCC) center, Chandigarh and Indian Type Culture Collection (ITCC), New Delhi. The tests were performed as per the Clinical and Laboratory Standards Institute (CLSI) guidelines.

Agar cup diffusion assay
The 24-hour-old liquid bacterial cultures were consistently swab inoculated on sterile Mueller Hinton agar plates. Correspondingly, 72-hour-old test pathogenic fungal cultures were swab inoculated on sterile Sabouraud dextrose

Akarsh Subhakar *et al.,*

agar plates and aseptically, 6mm cups were punched using a sterile gel borer. 1 mg/mL of standard antibiotics such as ciprofloxacin (CPFX), streptomycin (STM), chloramphenicol (CPL) and 5 mg/mL of standard antifungals such as clotrimazole and fluconazole were prepared in sterile de-ionized water and used as positive controls, while 10% DMSO (dimethyl sulfoxide) was served as a negative control. 100 µL of different fractions of pigment, along with positive and negative controls, were incorporated into the labeled cups. The MHA plates were incubated for 24 hours at 37°C and SDA plates were incubated at 28 ± 2°C for 72 hours and after incubation, the zone of inhibition formed around the cups was measured.[12, 13]

Minimum inhibitory concentration (MIC) of yellow pigment of *A. ustus*
The antibacterial activity of the pigment against six test bacteria was confirmed by evaluating the MIC using a modified resazurin 96-well microtitre plate broth dilution assay. A two-fold serial dilution of pigment extract was made in a concentration range of 5000–10µg/mL in a sterile 96-well plate containing Mueller Hinton broth. Similarly, a two-fold serial dilution was also made for standard antibiotics such as ciprofloxacin (CPFX), streptomycin (STM) and chloramphenicol (CPL) in a concentration range of 1000–2µg/mL in separate microtitre plates. Test bacterial inocula were prepared i.e., 1.5×10^8 CFU/mL in accordance with 0.5 McFarland's standard. 10 µl of bacterial suspension was added to each well microtitre plates were incubated aseptically for 18–24 hours at 37°C. After incubation, 10µL of resazurin (0.015%) solution was dispensed to each well, and again, plates were incubated at 37°C for 3–4 hours and observed for the color change from alamar blue to pink. The lowest concentration, which does not display the color change, was considered the MIC value.[14, 15]

Antioxidant activity of yellow pigment of *A. ustus*
DPPH+ radical scavenging assay
The 1,1-Diphenyl-2-picrylhydracyl (DPPH⁺) radical scavenging activity was accomplished as described by with minor modifications[16]. In this assay, pigment extract was dissolved in methanol at concentrations ranging from 50 to 800µg/mL; similarly, ascorbic acid (the reference standard) was also prepared. To 1 mL of a varied concentration of pigment extract and ascorbic acid, 1 mL of DPPH radical solution (0.004% in methanol) was added. The reaction mixture tubes were then incubated at 37 °C for 30 minutes, followed by assessing the absorbance of the reaction assortment at 517 nm. The strength of the pigment to scavenge the DPPH radicals was determined by using the following equation:

DPPH radical scavenging activity (%) $= \frac{(A0 - A1)}{A0} \times 100$

Where, *A0* is absorbance of the control and *A1* is the absorbance of the tested sample.

ABTS•+ radical scavenging assay
To measure the ABTS•+ [2,2′-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid)] radical scavenging efficacy of pigment, 0.2 mL of methanol-dissolved pigment extract solution of various concentrations ranging from 50 to 800µg/mL was mixed with 1.8 mL of the ABTS radical solution. Ascorbic acid was used as a standard. The optical density of reaction mixtures was read at 734nm. The percentage of ABTS•⁺ free radicals scavenged were calculated using the following formula.[17, 18]

ABTS•⁺ radical scavenging activity (%) $= \frac{(A0 - A1)}{A0} \times 100$

Where, *A0* is absorbance of the control and *A1* is the absorbance of the tested sample.

Ferric reducing antioxidant power (FRAP) assay
The different concentrations (50–800µg/mL) of pigment extracts were added to this 2.5 mL of 0.2 M phosphate buffer (pH 6.6), and 2.5 mL of 1% potassium ferricyanide was added and agitated properly. The reaction mixture tubes were then incubated at 50°C for 20 minutes. After incubation, 2.5 mL of 10% trichloroacetic acid was added to the reaction mixture tubes and centrifuged at 3000 rpm for 10 minutes. Afterwards, 2.5 mL of the supernatant of the reaction mixture was combined with 2.5 mL of double-distilled water and 0.5 mL of 0.1% ferric chloride, and lastly, absorbance was read at a wavelength of 700nm. Ascorbic acid was served as a reference standard [19, 20].

Total antioxidant activity

1 mL of pigment concentration ranged from 50 to 800 μg/mL, was added with 2 mL of phospho-molybdenum reagent (4mM ammonium molybdate, 28 mM sodium phosphate and 0.6M sulphuric acid) and mixed vigorously and incubated at 95°C for one and a half hours. Then the tubes were air-conditioned and the absorbance was read at a wavelength of 695nm against methanol (blank). The total antioxidant potential of the pigment was expressed as the ascorbic acid equivalents.[21]

In-vitro cytotoxic Activity of yellow pigment of *A. ustus*
Collection and maintenance of cell lines

A498-human renal (kidney) adenocarcinoma, HepG2-human hepatocellular (liver) carcinoma and HEK-293-human non-malignant embryonic kidney (normal) cell lines were collected from the National Centre for Cell Science (NCCS), Pune, India. The cells were maintained in Minimum Essential Medium (MEM) with Non-Essential Amino Acids (NEAA) supplemented with 10% FBS (Fetal Bovine Serum) along with a 1% antibiotic-antimycotic solution in the atmosphere of 5% CO_2 and 18–20% O_2 at 37°C in the CO_2 incubator and sub-cultured for every 2 days.

MTT assay

The cytotoxicity of pigment extract was determined by the 3-(4, 5-dimethyl-2-thiazolyl)-2, 5-diphenyl-tetrazolium bromide (MTT) method. Accurately 200 μL of cell suspension was seeded in 96-well plate at the required cell density (2×10^4 cells per well) without the pigment extract and cells were allowed to grow for about 24 hours. After the cell reaches confluence, pigment extract was added in concentrations ranging from 12.5 to 200μg/mL and incubated at 37 °C in a 5% CO_2 atmosphere. Cisplatin was used as a standard. After incubation, the spent medium was removed aseptically and 10μL of the MTT reagent (final concentration of 0.5 mg/ml) was added to each well and covered to avoid exposure to light and it was again incubated for 4 hours. After incubation, 100μL of solubilization solution DMSO (dimethyl sulfoxide) was added into all the wells and gently stirred in a gyratory shaker. Then absorbance was measured at a wavelength of 570nm in an ELISA reader using DMSO as the blank. The percentage of cell viability will be calculated using the following formula.[22]

Cell viability (%) = [Abs. of treated cells/Abs. of untreated cells] x 100

RESULTS AND DISCUSSION

Cultivation and extraction of extracellular pigment of *A. ustus*

Submerged fermentation implies the process of growing microorganisms in broth media for the development and recovery of industrially important commercial products.[23]It accomplishes the voluminous advantages over solid-state fermentation, it is cost effective and produces high yield end products and preferred for the easy recovery of multifaceted extracellular metabolites.[24]The fungus exhibits intensive yellow extracellular pigment synthesis in PDB medium (Figure 1).

Antimicrobial activity of yellow pigment of *A. ustus*

The yellow pigment has the tendency to inhibit all the test bacterial pathogens, as illustrated in (Table 1) and (Figure 2). Among the test bacterial pathogens, *Salmonella typhi* was most susceptible, with a maximum zone of inhibition of 20.96±0.35mm, 17.96±0.15mm, 11.16±0.28mm and 10.86±0.23mm at concentrations of 20, 10, 05 and 2.5 mg/mL respectively. The pigment of *A. ustus* at a concentration of 40 mg/mL displayed potential to in hibit test fungal pathogens such as *Aspergillus brasiliensis* (15.50±0.20 mm), *Candida albicans* (20.00±0.20mm), *Claviceps purpurea* (18.46±0.25 mm) and *Fusarium oxysporum* (18.53±0.25 mm). The antifungal activity of the *A. ustus* pigment was documented in (Table 2) and (Figure 3).In previous studies, the *A. ustus* pigment has inhibitory effects on *Staphylococcus aureus*, *Escherichia coli*, *Bacillus subtilis*, and *Streptomyces longispororuber*, but not effective against pathogenic fungi. [25] Ramesh et al. reported that, carotenoids, melanin, monascus, riboflavin pigments and other pigments from microbial origin can inhibit various pathogens.[26]

Akarsh Subhakar *et al.,*

Minimum inhibitory concentration (MIC) of yellow pigment of *A. ustus*

MIC is the least concentration of the drug required to inhibit the growth of pathogens. The MIC value of the yellow pigment of *A. ustus* required for inhibiting the test bacterial pathogens ranged from 6.25×10^2 to 2.5×10^3 µg/mL. The overview of MIC values of pigment metabolite extract and standard antibiotics to inhibit test bacterial pathogens is accessible in Table 3. In preceding study, described that the pigment of *Penicillium canescens* was effective in inhibiting all the selected bacteria with MIC values ranging from 1.5×10^3 to 2.5×10^3 µg/mL.[27]

Antioxidant activity of yellow pigment of *A. ustus*

In the current study, the pigment extract exhibits concentration dependent $DPPH^+$ radical scavenging potential. The IC_{50} value is virtually equal to the radical scavenging efficiency. The IC_{50} value of *A. ustus* pigment was 398.99µg/mL and ascorbic acid was found to be 112.44µg/mL to scavenge $DPPH^+$ free radicals which are presented graphically in the Fig. 4 a&b. In earlier findings, reported that the free radical scavenging IC_{50} values of the pigment extracts of *P. multicolour*, *T. verruculosus*, *P. canescens*, *F. solani*, and *P. herquie*, was 2.27, 0.36, 0.28, 0.56, and 1.26 mg/mL (ascorbic acid equivalence) respectively. Contemporarily assessed the $ABTS^{•+}$ radical scavenging potential of *A. ustus* pigment and the result is incarnated graphically in Figure 5a & b. The IC_{50} value of pigment extract was 205.6µg/mL and ascorbic acid was found to be 22.8µg/ml to scavenge $ABTS^{•+}$ free radicals.[27] The IC_{50} value of yellow pigment extracted from *Bacillus* sp. to scavenge the $ABTS^{•+}$ radicals was found to be 75.125µg/mL. The ferric reducing power of *A. ustus* pigment ranged from 0.088 to 0.733 and that of ascorbic acid ranged from 0.551 to 1.985 [28]. The comprehensive result of the FRAP assay is graphically exemplified in Figure 6. The antioxidant potential of ascorbic acid is greater than that of the red biopigment of *Monascus purpureus*. [29] The total antioxidant potential of the *A. ustus* pigment ranged from 0.068 to 1.24 and ascorbic acid ranged from 0.251 to 2.985, which are graphically illustrated (Figure 7). The total antioxidant activity of yellow pigment extracted from *Bacillus* sp. was 21.45± 0.33mg of ascorbic acid equivalent [28].

In-vitro cytotoxic activity of yellow pigment of *A. ustus*

The percentage of cell viability was exemplified graphically in Fig. 8. *A. ustus* pigment showed a dose-dependent mode of cytotoxicity towards HepG2 and A498 cancer cells, with a decrease in cell viability as the concentration of yellow pigment increased. The pigment was very less toxic to the human non-malignant embryonic kidney (HEK-293) cell line with an IC_{50} value of 430.95µg/mL when compared to HepG2 and A498 cells. In HepG2 cells, the IC_{50} value of *A. ustus* pigment was observed to be 174.89µg/mL, while in A498 cells, the IC_{50} value of the pigment metabolite extract was 262.45µg/mL. In previous studies, the melanin pigment of *Penicillium citrinum* exhibited the inhibition of A549 (Lung cancer) cells in dose-dependent mode with significant IC_{50} value 65.49µg/mL [30]. Previous study discloses that, the green pigment of *Streptomyces tunisiensis* showed The IC_{50} values of 2.2 mg/mL, 1.1 mg/mL and 1.04 mg/mL against HepG-2, A549 and PAN1 (pancreas cancer cell line) correspondingly, while IC_{50} value towards Vero cells (normal cells) was 2 mg/mL which evidences its non-toxicity towards normal cells.[31]

CONCLUSION

The *in-vitro* biological studies of the yellow pigment of *A. ustus* reveal that it has a potential antimicrobial property and the study discloses the remarkable antioxidant efficacy by scavenging free radicals such as $DPPH^+$, $ABTS^{•+}$ and ferric ions and the total antioxidant activity. The yellow pigment of *A. ustus* also possesses anti-proliferative potential by affecting the viability of HepG2 (Hepatocellular carcinoma) and A498 (Lung cancer) cells and it is considerably very less toxic to normal cells, which is evidenced in this study by least affecting the HEK-293 (Human non-malignant embryonic kidney) normal cells. The yellow pigment of *A. ustus* is non-hazardous in nature and also a promising source for combating the negative impact of synthetic azodyes. Hence, the findings of this systematic study recommend that *A. ustus* can be useful for pharmaceutical and textile applications in the future.

ABSTRACT

Aging leads to muscle weakness and reduced quality of life (QoL), impacting independence. Resistance training is a potential solution, but its effects in India are underexplored. With India's growing elderly population, strategies to maintain strength and QoL are crucial. This study evaluates the effectiveness of resistance training in elderly individuals in Surat District. Eleven participants underwent a 6-week resistance training program (3 sessions/week) based on NSCA guidelines. Pre- and post-assessments included Manual Muscle Testing (MMT) and QoL evaluation. The Wilcoxon signed-rank test showed significant improvements in MMT ($Z = -6.415$, $p < 0.001$) and QoL scores ($Z = -5.801$, $p < 0.001$), with all participants benefiting. Resistance training significantly enhances muscle strength and QoL in the elderly. Larger studies are needed to confirm long-term benefits.

Keywords: Resistance training, Elderly, Muscle strength, Quality of life, Manual muscle testing.

INTRODUCTION

Aging and Muscle Decline
Aging is a natural process associated with physiological changes, including muscle mass and strength loss, known as sarcopenia. This decline leads to frailty, reduced functional capacity, and lower quality of life (QoL).[1] The World Health Organization (WHO) highlights physical inactivity as a major factor in functional decline among older adults.[2] Resistance training (RT) is an effective intervention to counteract these effects, enhancing muscle strength and functional capacity. Sarcopenia, which begins in the fourth decade and accelerates after 60, increases the risk of falls, fractures, and dependency.[3] It is primarily caused by reduced muscle fiber size and number due to hormonal

changes, inactivity, and poor nutrition. [4] Dynapenia, or muscle weakness, significantly impacts mobility and balance, further compromising independence.[5]

Importance of Resistance Training in the Elderly

RT involves muscle contractions against external resistance, promoting hypertrophy and neuromuscular adaptations. Unlike aerobic exercises, RT specifically improves muscle strength, which is essential for maintaining functional capacity.[6] Studies demonstrate that regular RT enhances muscle mass, strength, balance, and coordination, reducing fall risks and preserving independence.[7,8]A systematic review by Peterson et al. found that RT performed two to three times weekly leads to significant gains in muscle strength and endurance, translating into practical benefits for daily activities.[9]

Mechanisms Behind RT's Effectiveness

RT induces muscle hypertrophy through mechanical tension, muscle damage, and metabolic stress.[10] Mechanical tension from external loads stimulates muscle protein synthesis (MPS), promoting muscle growth. Muscle damage triggers repair mechanisms, further enhancing MPS.[11] Metabolic stress increases growth-promoting hormones such as testosterone and IGF-1, counteracting muscle atrophy. These mechanisms collectively improve muscle function, reducing age-related decline.[12,13]

Resistance Training and Quality of Life

QoL in older adults is influenced by physical, psychological, and social well-being. Functional decline negatively affects daily activities, emphasizing the importance of physical fitness.[14,15]RT improves physical health, self-esteem, and mental well-being, while also fostering social interactions.[16]A meta-analysis by Steib et al.[17,18] that strength training reduces depression and enhances overall life satisfaction. A study by Liu and Latham[19] found that elderly individuals with chronic diseases like arthritis who participated in RT reported decreased pain and improved function.

Resistance Training and Functional Outcomes

Functional capacity, essential for independent living, declines with aging. RT significantly improves walking speed, balance, and endurance, reducing fall risks.[20]Falls are a leading cause of morbidity and mortality, with the WHO identifying them as the second leading cause of accidental injury deaths globally.[21,22]RT strengthens muscles, improves coordination, and enhances balance.[23]A study by Fiatarone et al.[24]demonstrated that a 10-week RT program significantly improved muscle strength, walking speed, and stair-climbing ability, fostering independence and reducing caregiver reliance.

Barriers and Recommendations

Despite its benefits, RT is underutilized due to accessibility issues, injury fears, and misconceptions. [25]Many healthcare professionals do not emphasize RT's role in aging management. To promote participation, awareness campaigns, community programs, and access to trained professionals are essential. Individualized RT programs tailored to older adults' needs enhance safety and effectiveness.[26]

AIMS & OBJECTIVES OF THE STUDY
Aim
The aim of this study is to evaluate the effectiveness of resistance training on muscle strength, assessed using manual muscle testing (MMT), and its impact on the quality of life (QoL) among elderly individuals.

OBJECTIVES
1. To assess the baseline muscle strength of elderly individuals using manual muscle testing.
2. To implement a resistance training program specifically designed for elderly participants.

3. To evaluate changes in muscle strength after completing the resistance training program using manual muscle testing.
4. To assess the baseline quality of life of elderly participants using a validated QoL scale.
5. To measure the impact of resistance training on the quality of life after completing the program.
6. To determine the correlation between muscle strength improvements and enhancements in quality of life among the elderly.
7. To compare the effectiveness of resistance training across different age groups (65-74, 75-80) within the elderly population.
8. To investigate the long-term retention of muscle strength gains and QoL improvements three months after completing the resistance training program.

HYPOTHESIS
Null Hypothesis
- **H_0:** There is no significant effect of moderate to high intensity resistance training on Muscle strength among elderly within Surat district.
- **H_1:** There is no significant effect of moderate to high intensity resistance training on quality of life among elderly within Surat district.

Alternative Hypothesis
- **H_0:** There is a significant effect of moderate to high intensity resistance training on Muscle strength among elderly within Surat district.
- **H_1:** There is a significant effect of moderate to high intensity resistance training on quality of life among elderly within Surat district.

REVIEW OF LITERATURE

1. **Sundell (2011)** examined the effects of resistance training on sarcopenia in elderly individuals, showing that a 12-week program significantly increased muscle strength and improved physical function in adults aged 65 and older. The study highlighted resistance training's role in preventing frailty and maintaining independence.[16]
2. **Peterson et al. (2010)** conducted a meta-analysis on resistance training in older adults, finding that it led to a 30-50% increase in muscle mass and strength, regardless of age or initial fitness level. These findings emphasize resistance training's universal benefits for elderly populations.[17]
3. **Liu & Latham (2009)** studied elderly individuals with osteoarthritis, revealing that moderate-intensity resistance exercises over 10 weeks led to significant muscle strength gains, pain reduction, and improved functional independence.[18]
4. **Steib, Schoene, & Pfeifer (2010)** reviewed resistance training's effects on frail elderly individuals, concluding that it enhances muscle strength, balance, and fall prevention, contributing to safer movement and greater independence.[19]
5. **Fiatarone et al. (1990)** investigated high-intensity resistance training in frail nursing home residents (average age 90). Their study demonstrated that even the oldest individuals could significantly improve muscle strength and functional capacity, challenging misconceptions about aging and exercise.[20]
6. **Blake & Mo (2008)** explored the psychosocial benefits of resistance training, finding it reduced depression and anxiety while increasing social engagement and life satisfaction. Their study emphasized resistance training's role in enhancing mental well-being.[21]
7. **Westcott (2012)** reviewed the overall benefits of resistance training, highlighting its importance in preserving muscle mass, improving metabolic health, and maintaining functional independence in aging populations.[22]
8. **Bean et al. (2010)** conducted a randomized controlled trial on progressive resistance training in older adults with mobility limitations. Their study demonstrated significant improvements in lower body strength, gait

speed, and physical performance, directly enhancing QoL. These findings underscore the accessibility of resistance training for individuals with mobility challenges.[23]

METHODOLOGY

Study Design: Experimental Study
Study Population: Elderly People
Study Sample: Elderly People between the age group of 60-80 years
Sampling Technique: Convenient Sampling
Study Duration: 6 months
Sample Size: 11 participants
Study Setting: Two old age homes within Surat district

Selection Criteria
Inclusion Criteria
- Elderly People aged 60 to 80 years
- Both Male and Female
- Willing to participate and able to do exercise for a predetermined time duration
- Able to walk with or without an assistive device
- Ability to understand instructions and follow commands

Exclusion Criteria
- Participants currently enrolled in any other research study
- Participants advised by doctors not to perform exercises
- Participants diagnosed with significant medical or surgical conditions that may interfere with evaluation and intervention
- Individuals with known musculoskeletal conditions like Rheumatoid arthritis, osteoarthritis, or neurological conditions like Alzheimer's disease, Parkinson's disease that may interfere with intervention
- Individuals with known cognitive-behavioral problems like depression, anxiety, or insomnia
- Individuals with neuro-psychosomatic disorders like schizophrenia or delirium

Procedure
A total of 13 participants were screened for inclusion criteria, out of which 11 met the criteria and were recruited for the study. Their demographic data were recorded using an assessment proforma. Once recruited, participants were required to sign a written consent form after receiving a detailed explanation of the study.
Pre-outcome measures were assessed, including Manual Muscle Testing (MMT) for various muscle groups using the Oxford grading system and Quality of Life (QOL) assessment.

Muscle Groups Assessed
- Neck Extensors, Neck Flexors
- Shoulder Internal Rotators, External Rotators, Flexors, Extensors, Abductors (right & left)
- Elbow Flexors and Extensors (right & left)
- Wrist Flexors and Extensors (right & left)
- Trunk Flexors, Extensors, Lateral Flexors (right & left)
- Knee Flexors and Extensors (right & left)
- Ankle Dorsiflexors & Plantar Flexors (right & left)

Kinjal Priyesh Patel

Resisted Exercise Program

Experimental Group/ Resisted Exercise Group (Protocol)

- Exercises performed according to the National Strength and Conditioning Association position statement[27]
- **Frequency:** 3 days per week (non-consecutive days)
- **Sets:** 3 sets of 2 multi-joint exercises per major muscle group
- **Repetitions:** 12 reps per set
- **Intensity:** 65%-75% of 1RM (Moderate), progressing to 75%-80% (High) of 1RM as tolerated
- **Rest Periods:** 60 sec between exercises, 3 min between sets, and 48 hrs between sessions

Warm-Up (15 minutes)

- Neck Rolls, Shoulder Rolls, Arm Circles, Wrist Circles
- Hip Circles, Ankle Circles, Side Bends, Toe Touches, Marching in Place

Resistance Exercises (Using Resistance Bands):

1. Seated Rows
2. Shoulder Press
3. Bicep Curls
4. Triceps Extensions
5. Chest Press
6. Squats
7. Glute Bridge

Cool-Down Exercises

- Static Stretching (Calf, Quadriceps, Hamstrings, Shoulder)
- Standing Forward Bend
- Corpse Pose

The intervention lasted for 4 weeks, followed by a 2-week progression phase. Post-test measurements were taken at the end of the 6-week period, assessing MMT and QOL.

STATISTICAL METHODS

A total of 11 subjects aged 60-80 years participated in the study. Manual Muscle Testing (MMT) and Quality of Life (QOL) were assessed pre- and post-intervention following resistance training.

Statistical Tests

- The **Shapiro-Wilk test** was used to check normality. The data did not follow a normal distribution.
- **Descriptive analysis** was performed to determine the mean and standard deviation (SD) for MMT and QOL.
- As the data did not follow normality, the **Wilcoxon Signed-Rank Test** was used for paired sample comparisons (pre- and post-intervention within the group).

Statistical Software

- Data analysis was conducted using **SPSS version 25 (IBM)**.

Informed Consent

- Written consent was obtained from all participants included in the study.

RESULTS

The ranks table reveals that all differences between post-test and pre-test MMT scores were positive, with 11 positive ranks and no negative ranks observed. This consistent pattern indicates that in each case, the post-test MMT scores were higher than the pre-test scores, suggesting an improvement in the overall improvement of the large muscle groups following the intervention or treatment. The significant negative Z statistic (-6.415) provides further support for this finding, indicating a substantial improvement in MMT scores. Additionally, the p-value of .000 indicates strong evidence against the null hypothesis, reinforcing the conclusion that there is a significant difference between post-test and pre-test MMT scores thus accepting the alternative hypothesis. Hence, the Wilcoxon signed-rank test demonstrates a statistically significant enhancement in MMT scores after the treatment. The ranks table reveals that all differences between post-test and pre-test QOL scores were positive, with 11 positive ranks and no negative ranks observed. This consistent pattern suggests that in each case, the post-test QOL scores were higher than the pre-test scores, indicating an improvement after the intervention or treatment. The presence of ties (0 in total) indicates cases where the post-test and pre-test QOL scores were equal. The significant negative Z statistic (-5.801) provides further support for the improvement observed in QOL scores. Additionally, the p-value of .000 indicates strong evidence against the null hypothesis, reinforcing the conclusion that there is a significant difference between post-test and pre-test QOL scores. In summary, the Wilcoxon signed-rank test demonstrates a statistically significant enhancement in QOL scores after the intervention or treatment.

DISCUSSION

The results of this study indicate significant improvements in Manual Muscle Testing (MMT) scores and Quality of Life (QOL) scores among elderly individuals with age-related mobility limitations following the intervention. The Wilcoxon signed-rank tests demonstrated statistically significant differences in pre- and post-intervention scores, with p-values of .000 for both MMT and QOL, providing strong evidence against the null hypothesis. The absence of negative ranks in both tests highlights the consistent positive effect of the treatment across all participants.

Improvement in Muscle Strength
The improvement in MMT scores aligns with research on resistance training and neuromuscular rehabilitation in older adults. Resistance training counteracts sarcopenia and improves functional capacity. Studies by Fielding et al. (2011) demonstrated that structured resistance programs enhance muscle mass and strength, reducing frailty and fall risk. Similarly, the current study found universal improvements in MMT scores, suggesting the intervention effectively targeted age-related muscle decline. Scholtes et al. (2012) reported comparable results in elderly cohorts, where strength training improved lower limb function and balance, critical for maintaining independence. The absence of negative ranks in MMT scores underscores the intervention's broad applicability, even in participants with baseline weakness. These improvements may stem from enhanced neuromuscular recruitment and adaptations in motor unit activation, which remain trainable in older age. Verschuren et al. (2016) noted that combined resistance and balance training improves walking efficiency and reduces disability. While the current study focused on muscle strength, future research should integrate metrics like gait speed or timed-up-and-go tests to capture functional mobility gains.

Quality of Life Improvements
The significant improvement in QOL scores post-intervention reflects the multifaceted benefits of physical rehabilitation in elderly populations. QOL in older adults hinges on physical independence, social engagement, and mental health. Interventions addressing functional decline can mitigate isolation and depression, common in aging populations. Maher et al. (2013) found that physical activity programs improved self-reported QOL, correlating with increased autonomy and participation in daily activities. Similarly, this study's universal QOL improvements suggest that enhanced physical capacity fosters psychosocial well-being. The absence of negative ranks reinforces the intervention's consistency in promoting holistic health.

Comparison to Similar Studies

The findings align with research on multimodal interventions for elderly populations. Sherrington et al. (2019) demonstrated that exercise programs combining strength, balance, and functional training reduce fall risk and improve QOL. Studies on tai chi and low-impact aerobics highlight how structured physical activity enhances both physical and mental health. Pahor et al. (2014) emphasized that sustained physical activity delays disability onset in frail elderly individuals. While the current intervention was short-term, the results support integrating strength training into routine geriatric care to preserve independence.

CONCLUSION

This study demonstrates that targeted strength-based interventions significantly improve muscle strength and QOL in elderly individuals with mobility limitations. The results reinforce the importance of resistance training and physical rehabilitation in mitigating age-related decline. By addressing both physical and psychosocial needs, clinicians can enhance functional independence and overall well-being in older adults.

LIMITATIONS AND FUTURE DIRECTIONS

Limitations include a modest sample size (n=11), potentially affecting generalizability. Future studies should replicate findings in larger, more diverse elderly cohorts, including those with comorbidities like osteoporosis or dementia. The study did not assess functional outcomes such as balance, gait stability, or activities of daily living (ADLs), which are critical for elderly populations. Long-term follow-up is also needed to evaluate sustainability of gains, as age-related decline may necessitate ongoing intervention.

CLINICAL IMPLICATIONS

These findings advocate for integrating strength training into geriatric care protocols. Clinicians should prioritize interventions that preserve muscle mass and functional capacity, reducing fall risk and hospitalization. Additionally, holistic approaches combining physical rehabilitation with social engagement strategies (e.g., group exercises) may amplify QOL benefits. Tailoring programs to individual capacity and emphasizing safety (e.g., supervised sessions) will optimize outcomes for elderly patients.

ABSTRACT

A disease can be studied in multiple ways. The medical aspect generally acquires dominance while studying any illness. However, if it is combined or supported with multi-dimensional aspects comprising of factors which create and spread a disease, then the analysis becomes more relevant. In this, geographical setting and geographical factors creating disease epidemiology come to the fore front. The current study is a bibliometric examination on the aspect of natural and human-induced factors as researched in their multiple dimensions for the disease of malaria and its nature in space and time. The bibliometric method of study has gained immense significance in recent times and provides newer perspectives for present and future research. It tends to indicate the focal points of ongoing research, can highlight the gaps and missing points and is useful in scrutinising the interrelationship between the chosen aspects. Results indicate that the Scopus database has more publications on the topic and geographical aspects are observed in selected forms in publication databases of Scopus and Web of Science.

Keywords: epidemiology, malaria, bibliometric analysis, health, literature

INTRODUCTION

Disease epidemiology is the study of all the factors causing the presence or absence of a disease [1]. Malaria is a life threatening [2] tropical and subtropical disease [3] caused by 'parasites which are transmitted through the bites of infected female *Anopheles* mosquitoes [2].Malaria is a leading cause of mortality and morbidity in most of the developing countries. It is defined to be geographically 'very specific' [4] and preventable also [2]. In 2022, there were

95568

about 249 million malaria cases with 6,08,000 deaths in 85 countries [2]. The WHO African region had the maximum share of cases (95%) and maximum deaths were recorded here for children below 5 years of age (80%) [2]. Human and environmental factors operate simultaneously in impacting malaria epidemiology. Important mentions can be given as that of human mobility, rainfall, practices of storing water, and growing urbanisation [5]. It is also observed that the relationship between malaria and climate change is intense and a resultant change in temperature and rainfall can be held responsible for the altered spread of the disease [6]. In health studies, the concept of 'Health–Field' is applied to disease concerns which indicates a combination of - Human Biology, Environment, Lifestyle, and Health Care Systems [7]. In disease ecology studies, the disease ecology triad is emphasized to observe the disease in its totality which indicates that there is an intricate relationship between the disease causing agent, the factors and the prevailing environment, which operate on the disease [8] to create multiple causality. The intensity of malaria is seen to be determined by the ecological factors which support its spread rather than just the vectors which cause it [4]. Such analysis is a part of evolutionary epidemiology and is necessary to understand the basics of a disease which operate at the local level so as to contain it and avoid the losses [9]. Malaria risk mapping with the help of geo informatics is cited as contributory to the systematic study of the disease [10]. Besides, the geographical shifting of disease range and other associated concerns can be well examined through a spatio-temporal approach. This becomes more important in the context of climate change [11]. A geographical approach also seems important as despite numerous efforts, malaria remains a major issue in public health in many nations of the world. Geographic patterning, variations in the disease, and remote sensing techniques provide a unique and helpful method of analysis and disease control. Thus, geography plays an important role in malaria studies [9,12]. It is also noteworthy in this context that identifying the spatial and temporal 'hot spots' of malaria has become a significant approach. It is not only innovative but is an important approach in malaria studies [13]. A geographic database is also essential for a proper surveillance as it is largely missing in the case of this disease [14]. A detailed understanding on factors causing malaria is 'limited' and remains an 'important research topic'[15].

MATERIALS AND METHODOLOGY

Data for the current bibliometric study has been derived from Scopus and Web of Science databases. The analysis is supplemented with results derived from VOS Viewer software. The software is helpful in examining multiple bibliometric aspects. Bibliometric study is considered scientific in nature and provides a quantitative description of data [16].It is a popular and an intense methodology of describing the gradations of research in any field with information on trends in articles, publication sources, collaborations in research, geography of research, citations, publications, and other kinds of analysis which can also provide direction to further research [17]. The years of publication under consideration are till the latest available data for 2024* (*till July,24). Scopus database is seen as a distinct combination of abstracts and citations with scholarly information for numerous disciplines. It is the largest database of peer reviewed work ranging from various kinds of publications [18]. The WoS was previously known as Web of Knowledge and WoS since 2004. It is one of the two large databases providing bibliographic information and covers extensive disciplines across academia. Provided by Thomson Reuters, it has publication records from 1900 to the present. Considered as most trusted global citation data provider in the world with 1.9 billion cited works from 171 million records, the WoS Core Collection gives information on more than 115 years of highest quality research works. The WoS database was searched for the topic in 'All Databases' of the WoS website through Delhi University E-Library System.

RESULTS AND DISCUSSION

Result generated through the Scopus and WoS databases has been analysed here. Scopus generated 6,028 documents for the exact phrase search 'Malaria and Geography and Geographical'. WoS generated 301 publications for the exact phrase search 'Malaria and Geography'. This is an interesting finding as 'Malaria and Geography and Geographical' yielded only 46 publications in WoS. The bibliometric analysis is presented here in two parts:

Priyanka Puri and Parul Puri

Scopus database search results on 'Malaria and Geography'

The 6,028 documents were explored for different aspects of the disease and its epidemiology as per the published research works. The output very clearly exhibited that the number of publications were almost stagnant till mid 1990s, after which there was slight fluctuation in the number. A sudden spurt is visible after 1995 and an unprecedented increase can be observed in publications which focus on malaria and geography in some form. This can be seen in Fig.1. Maximum publications were in the form of articles with 1,406 articles which comprised of 66.6% of the total publications. Reviews and books were the next observed categories with around 11.6% of the publications. Conference papers occupied the 5th spot in this category which is indicative of a restricted number of publications in open forums. Another interesting fact is that maximum research on these topics was conducted beyond the geographical domain of the actual occurrence of the disease of malaria. In terms of Scopus publications, University of Oxford, followed by London School of Hygiene and Tropical Medicine did the maximum publications as can be seen in Fig.1. and Table 2. United States and and the United Kingdom had the maximum publications on the topic which is again a very significant observation as the publications again exhibit a non-geographical impact. A mix of developed and developing nations can be seen as the top most contributors to the study of malaria in its geographical dimensions as can be seen in Fig.2. The findings can be further examined for details. It becomes noteworthy to observe the intricacies of these publications with regard to subjects areas, keywords, co-authorships and other dimensions. The Scopus database is indicative that maximum publications on the topic were from the field of Medicine followed by Social Sciences. This indicates the focus of research in which it can be said that the social dimension of the disease is lesser a focus and the medical aspect has gained dominance. Co-authorship information is also a good indicator of research domains. In this regard, maximum co-authorship was observed between authors of the two topmost publishing nations- the USA and UK. This can be seen in Fig.3.United States stands out in terms of number of publications and co-authorship criteria. USA also exhibits a strong independent research focus yet is interconnected with other countries for publications on the topic.

A dense interconnected network of research is visible between the other focal countries notable among which are UK, China, Spain, Indonesia, and Costa Rica. Interestingly, countries for co-authorship are inclusive of the nations of Global North and South. Some of them the tropical ones where malaria occurrence is actually a pertinent concern due to their geographical factors of location and climate. Examples can be given as that of Equatorial Guinea, Chad and Congo. The software generated 231 countries with publications on the search topic. The next analysis is done for observing co-authorship of publications as per institutions. This is shown in Fig.4. A close network of authorship is visible from 2010 onwards with the University of Basel, University of Chinese Academy, London School of Hygiene and Tropical Medicine, Fogarty International Center and, the University of Oxford emerging as specific centers of co-authorship on the topic. This examination is extended to observe the dominant content in the title and abstract filed of the publications. Title fields examination was done with at least two occurrences of words, generated 14,548 words from which 2,770 were the top 60% words from which 1,396 were the largest connected. The results can be seen in Fig. 5. It indicates medical and geographical terminologies, but without a pattern and in close proximity. Geographical data, data science, landsat, geographically, systems approach, social geography, famine, risk area, extinction, uneven development, global burden, and global health can be given as some examples. Abstract field words on the topic are indicated in Fig.6. with the criteria of selection being that of 6 times occurrences of a word. It provided 1,06167 words in which the first 60% were taken as the automatic criteria. It generated 6,556 words and the result is shown in Fig.6. The abstract field in Fig.7. indicates distinct clustering of words. A few can be highlighted as- child, patient, book, parasite, disaster and gene. Majority of the words were from the medical field. Geographical observation generates settlement systems and NDVI at an end of the diagram. Fig.7. is indicative of keywords analysis. These were examined by adopting the criteria of at least a two time occurrence of a word in publications.

Priyanka Puri and Parul Puri

WoS database

The WoS database generated 301 publications on the topic 'Malaria and Geography'. The publication categories were again dominated by medical field followed by geography as can be seen in Table1. The further publication statistics can be seen in Fig.8. Publications statistics indicated that tropical medicine had the maximum count of 19.2% in publications followed by Infectious Diseases as the Web of Science Category. With an H-Index of 46, the 301 articles were cited 20,553 times. WoS categories for co-authorship as per institutions indicated the concentration of works around the London School of Hygiene and Tropical Medicine and the University of California. A strong concentration of institutions is visible with outreach observed between newer organisations within and outside the existing clusters. This can be deciphered from Fig.9. As per co-authorship, 94 countries were observed to provide the publications with 84 interconnected. This can be seen in Fig.9. The United States emerges as the major center of co-authorship on the topic since records are available (from 2014). It is also indicated that newer centres of publication are emerging as well. The London School of Hygiene and Tropical Medicine did the maximum publications followed by the University of San Francisco. Here, again USA and UK have maximum publications with close linkage. Publications from other countries are also observed but with co-authorship away from the main centres of publication as can be seen from Fig.10. and Fig.11. Observations on the title field indicated the trend from 2005 onwards in which a clustering can be observed also. Geography and malaria occupy the central position which indicates a geographical focus to studies and that the search generated terms related to the topic. In terms of geographical concerns pertaining to malaria epidemiology, sub- Sharan Africa, Africa, Burkina Faso, China, India and Brazil find a pertinent mention with geographical aspects of study being observed in terms- barrier, access, area, distribution, population and trend among others. Besides, some medical terminologies find a mention as well in the title field. Abstract examination indicated about 9,658 terms and with two occurrences criteria, 2365 terms were generated from which the information could be derived for 1,419 terms. The results are depicted in Fig.12. The abstract field is marked more by medical terminology in terms of occurrences observed.

CONCLUSIONS

The findings indicate that 'Articles' have the maximum number in type of publication category on the topic. Research on observing the interrelationship between geographical factors and malaria seems to be influenced by geographical considerations in some aspects. Medical research seems to dominate and a combination of developed and developing nations can be seen to be conducting it. Besides, Scopus has the maximum number of publications on the topic. This, if pursued further, can be more insightful in studying the social dimensions of the disease in its geographical setting. A holistic approach such as this can be then helpful in leading the studies to more logical conclusions rather than just finding medical solutions to them. It can also be helpful in reducing costs and providing more effective treatments.

ABSTRACT

The WHO estimates that globally 15% of individuals suffer from migraines. These are marked by painful headaches that often come with sensitivity to light, sickness, and throwing up. In *Ayurveda*, this condition links to *Ardhavabhedaka*, a type of *Shirashoola* noted. The key sign of *Ardhavabhedaka* is a strong headache on one side, resulting from an imbalance in the three *Doshas*. *Ayurveda* uses both *Shamana* and *Shodhana* treatments for this condition. This describes the *Ayurvedic* management of a 61-year-old female patient who had been suffering from severe unilateral headaches 4-5 times a week for the last ten years, with complaints of nausea and vomiting. Except for the use of Paracetmol-650, the patient did not have any significant past history or ongoing medications in her lifetime. Patient had complained of exertional dyspnoea and constipation. She was subjected to systematic observation and duly treated with a course of *Ayurvedic* drugs along with the *Virechana* procedure so as to balance the *Doshas.* The patient had a considerable reduction in migraine episodes. No migraine episodes were seen during the follow-up period that lasts for one-month post-treatment. Doubtless due to the efficacy of *Virechana* and pharmacological effects of the *Ayurvedic* medicines, the *Doshas* got back to their equilibrium, thus relieving the symptoms. The approach of treatment, that is *Virechana* with *Shamana Aushadhis* was effective in decreasing the frequency and intensity of migraine attacks in this case.

Keywords: *Ayurveda, Ardhavabhedaka,* migraine, headache, *Virechana, Shamana.*

Sachi Prajapati *et al.,*

INTRODUCTION

Migraine [1] is complex neurological disorder which presents with recurrent, severe headaches often associated with symptoms like nausea, vomiting, and photophobia [2] and phonophobia [3], though individual attacks in some forms of migraines might also involve transient visual disturbances. These attacks have great impact on quality of life, and may even result in disability and lowering productivity. Additional options in conventional medicine typically include relief of the symptoms with medication, which can be marginally effective and can carry unwanted side effects. According to *Ayurveda* the cause of Migraine is debilitated of *Dosha Kapha, Pittta* and *Vata.Sushruta Samhita* describes a specific condition known as "*Ardhavabhedaka,*"that resembles medical description of migraine, as the most characterized presentation of migraine identified with headache restricted to one side. [4] *Ayurveda* views the condition as primarily rooted in an imbalance of *Pitta Dosha* When *Pitta* is aggravated, it leads to inflammation, manifesting as intense, throbbing headaches typically on one side of the head. In addition to *Pitta* vitiation, *Vata Dosha* intensifies the symptoms. Key *Ayurvedic* factors contributing to migraines include *Pitta* vitiation, *Ama* [5] accumulation, and *Vata-Kapha* imbalance, all of which disrupt bodily equilibrium. *Ardhavabhedaka*in *Ayurveda* mirrors the characteristics of a migraine, with half-headed pain and severe discomfort. The key treatment is to rebalance the *Doshas* and particularly to reduce *Pitta* and leave *Ama*. One of the main therapies include *Virechana*-purgative procedure to eliminate these metabolic byproducts and *Pitta* from the body, thus promoting *Dosha* balance. This case study investigates the treatment of chronic migraines utilizing *Virechana* and internal *Shamana Aushadhis*. For this purpose, Integrated *Ayurveda* treatment helping to reduce symptoms and prevent recurrence appears more effective. This example depicts togetherness of evidence-based medicine and *Ayurveda* to treat migraines.

Case report
A 61-year-old female patient presented to the OPD with chief complaints of *KwachitaVameKwachiteDakshineShirashoola* (intermittent headache affecting either the right or left side of the head), *KwachiteChhardi* (occasional vomiting), *Hrullasa* (nausea), *Vibandha* (constipation), and *GamaneSwasakashtata* (difficulty in breathing during walking). These symptoms had persisted for the past 10 years, significantly affecting her daily life.

History of present illness
Prior to developing cephalalgia about ten years ago, the patient was in excellent health. These episodes happened once or twice a week at first, but they eventually rose to four-five times a week. Along with the headaches, there were sometimes emesis and nausea, which sometimes helped in relieving symptoms. She also mentioned experiencing phonophobia and photophobia when having headaches. The patient has suffered from chronic constipation for the past seven years and has become reliant on *Kayam Churna*, herbal laxative that she taken daily for the previous six years. Her symptoms have not significantly improved despite numerous interventions with allopathic medications. Exertional dyspnoea that the patient had about three years ago complicated her clinical picture even more. She brought these persistent problems to the OPD. Table no.1 showing the chief complains with timeline.

Personal History
Nutritional status: Properly Nourished
Bowel: Constipation, 1 time/2-3 days; Blackish and Hard Stool
Urine: 6-7/Day;1 time/Night(sometimes); Yellowish colour
Appetite: Normal
Sleep: 8 Hours/night; 1 Hour/Day time
Addiction: No any addiction
Built: Normal

Medication and Medical History
There is no history of regular medication use.
Occasionally takes Paracetamol 650 mg during headache episodes.

No history of diabetes mellitus/hypertension or any other major medical or surgical history.

Family History
No relevant family history found.

Systemic Examination
No abnormalities were noted. *Ashtavidha Pariksha*: Showing in Table no. 2.

Diagnosis
The diagnosis was established through clinical evaluation as *Ardhavabhedaka* (Migraine).

Therapeutic Intervention
Virechana[7] and the subsequent internal medication were planned based on the assessment of the *Rogabala* (Severity of Disease) and the *Aturabala*(patient's overall strength and capacity).

**Virechana*
For the normally built 61 years old woman suffering from *Pitta Dushti, Mridu Virechana* was performed. The treatment initiates with administration of *Trikatu* with*Grita*for Five days as *Deepan-Pachana.* Then next five days of *Snehapana* given with 30 ml of *Go-Ghrita* and increased gradually up to 140 ml. After *Snehapana*, the patient was treated with *Snehana* with *Mahanarayana Taila* for two days along with *Nirgundi Sweda*. After pre-procedure for *Virechana*, the patient was given *TrivrutadiAvaleha*[8] with *DrakshadiKwatha* as *Anupana*. As a result, patient had 14 *Vega.* After itslight diet was advised for the recovery. Throughout the procedure, the vital signs of the patient were monitored for safety and the response to treatment. Oral medication given to the patient mention in Table no.3

Diet
Advised normal diet, with a light schedule as much as possible, excluding oily, spicy, or junk foods.

Exercise
Meditation and P*ranayama-Bhramari* and *Anuloma Viloma* are specifically advised.

RESULT

Shamana Aushadhis(Internal Medicine) were prescribed to patient, following nearly 15 days of undergoing the *Virechana* treatment. She presented for follow-up after one month and revealed a tremendous response to the treatment. She experienced no migraine attacks during this period, with only one mild headache that resolved within an hour. Additionally, her chronic constipation improved, with regular bowel movements without *Kayam Churna*, which she had previously taken daily.She also noted a substantial improvement in her exertional dyspnoea, with a 40-50% reduction in breathing difficulty during walking. She stated a substantial improvement in overall quality of life, including improved mood and enhanced daily functioning. (Fig 1.)

DISCUSSION

A case study that demonstrated chronic migraine resistant to conventional allopathic treatments was presented by a 61-year-old female with a 10-year history of *Ardhavabhedaka* and its associated symptoms that included nausea, vomiting, photophobia, phonophobia, constipation, and exertional dyspnoea. In *Ayurveda*, migraine is understood to be from imbalances in *Tridosha*. Indigestion further accumulates *Ama*and shown the symptoms like constipation and nausea. Hence, the treatment following *Virechana* and *Shamana Aushadhis* for detoxifying the body and restitution of *Dosha* balance, brought considerable clinical benefits as an example of the therapeutic potential of *Ayurveda*. *Virechana* is the most essential in this treatment process because it rectifies *Pitta* and *Vata Doshas,* which are mainly the causes of

the patient's *Ardhavabhedaka* and symptoms with it. Being a purgative therapy, *Virechana* evacuates the excess amounts of *Pitta* and *Ama*, which are stored in the body mainly through the bowel. This detoxification clears the *Raktavaha Srotas*, and reducing all inflammation, by which migraines are often accompanied by intense, throbbing headaches. In this case, *Mridu Virechana* was used as considering the patient's age and constitution. *Virechana* balances *Pitta*which causing the migraine while bringing under control the imbalanced *Vata* to redress neurological symptoms such as photophobia and phonophobia. Chronic constipation alleviated with regular bowel movements without a laxative as *Trikatu* had properties of *Vatanulomana* and *Agni-Deepana*. *Snehapana* relieves chronic constipation by lubricating the gastrointestinal tract, softening stools, and pacifying aggravated *Vata* in the large intestine. Additionally, detoxification of the respiratory system and balancing of *Kapha* and *Vata Doshas* by *Virechana* have helped the patient relieve exertional dyspnoea better. This way the detoxifying and *Dosha*-balancing effect of *Virechana* had appreciably reduced all symptoms.

Probable mode of action

The patient's symptoms linked to *Tridosha* imbalance, were managed by pacifying *Pitta, Vata* and balancing *Kapha*. The combination of *AvipattikaraChurna* and *Kamadudha Rasa* would have reduced the *Pitta* which decreases the *Ushnata. Sudarshana Churna*pacifying *Pitta dosha*, promotes *Ama pachana*, and have analgesic and anti-inflammatory and bronchodilator action, derived from ingredients like *Guduchi* and *Haritaki.* Thereby reduce inflammation and also alleviate the dyspnoea.*Shirshuladi Vajra Rasa* contains *Yashada Bhasma*,which is known for its neuroprotective properties and helps in stabilizing nerve functioning. Also, adequate calcium is vital for nerve function, as it stabilizes neuronal membranes and modulates excitability. In migraine sufferers, heightened neuronal excitability can trigger attacks, highlighting the importance of proper calcium levels for prevention. *Shankha Bhasma*, a natural calcium source, aids in this process while also pacifying *Pitta Dosha,* effectively alleviating nausea and vomiting associated with migraines. *Hrullasa* and *Chhardi* clearly indicated the *Pitta* vitiation happening in the digestive system. Upward movement of *Ama* and *Pitta* irritates the *UdakavahaSrotas*, which causes vomiting. The use of *Deepana-Pachana* with *Trikatu* and *AjamodadiChurna*to enhance *Agni* and eliminate *Ama* from the body strengthened the treatment. It helped digest food well and increase the metabolic rate. *Vibandha* was associated to a *Pakvashaya* imbalance of *Vata*, resulting in dryness, constipation, and hard stool. Dependence on laxatives for a long period of time indicated her digestive system is weak. *Erandabhrushta Haritaki* providing a mild laxative effect, balancing *Vata*, adding bulk and lubrication to stools. The exertional dyspnoea in the patient was due to an imbalance of *Vata* and *Kapha*. The excess *Kapha* in the respiratory system caused obstruction in the *PranavahaSrotas* whereas aggravated *Vata* led to irregular breathing patterns. *PathyadiKwatha* were added with *Godanti Bhasma* to balance both *Kapha* and *Vata*. These drugs helped achieve easier breathing by removing the impediments present in the respiratory pathways, while *PathyadiKwatha* exhibited the property of calming the nervous system that relieved headache and shortness of breath on exertion. Apart from this, the patient demonstrated an excellent improvement in general well-being and morale. Such generalist treatment that even factored balancing the system as well as psychological health proved to be a vital determinant towards improving the quality of life of the patient. Among these, dietary and lifestyle changes with abstinence from spicy, oily, and junk food; meditation and Pranayama (like *Bhramari* and *Anuloma Viloma*) diminished mental stress and led to relaxation, whereas nasal drop of *Anu Taila Nasya* helped nourish the brain and hence reduce tension and hike the working of the nervous system, which led to mood stability along with overall emotional well-being.

CONCLUSION

This case regains *Dosha* balance through *Virechana* therapy, specific herbal interventions, and lifestyle changes, and the patient experiences fewer headaches, resolution of chronic constipation, and an overall sense of better well-being. This, in short, reaffirms the necessity of customized *Ayurveda* treatment in such complex cases to gain holistic well-being. Further research will amplify the emerging evidence in favour of integrating *Ayurveda* in mainstream health care.

ABSTRACT

Extensive usage and increasing accumulation of disposable face masks (made of polypropylene, other plastics and fibers) during and post-pandemic (Covid-19) has massively contributed to pollution in our environment. It is hence imperative to find an eco-friendly way for secured disposal and degradation of these used up plastic masks. The intention of this research was to determine the efficiency of soil microbes to degrade disposable masks by using Winogradsky's column method. Composite soil samples enriched with microbial consortium were collected from different locations such as the garden and dump yard region. Plastic containers (500 ml capacity soft drink bottles) were used to set up Winogradsky's column with soil samples covering 20% of the column while the balance 80% was filled with the minimal media (Bushnell Haas Broth) devoid of any hydrocarbon content. Multiple setups using garden soil (G, G_1, G_2, G_3, G_C) and dump yard soil (D, D_1, D_2, D_3, D_C) were prepared with suitable controls. The disposable masks were cut into small strips, weighed and placed onto the soil at the bottom of each bottle before covering with minimal media. The setup was allowed to incubate for over 100 days. After incubation, the strips were weighed and the percentage of weight loss was calculated. Since there was reduction in weight, the efficient microbes involved in degradation of disposable masks were isolated and identified by VITEK 2, providing insights into the specific bacterial species that can degrade the synthetic material used in masks. This research contributes to developing sustainable solutions for managing pandemic-related plastic waste through microbial degradation.

Keywords: Disposable mask, Winogradsky's column, Composite soil sample, Dump yard soil microflora.

INTRODUCTION

A novel coronavirus appeared in Wuhan, China, in December 2019 and became a global health crisis of unprecedented scale and impact. This outbreak, which came to be known as COVID-19, spurred a global increase in the use of personal protective equipment (PPE), especially disposable face masks. Such an exponential spread led the World Health Organization to term it a Public Health Emergency of International Concern on January 30, 2020. Finally, the WHO declared the COVID-19 outbreak a pandemic on March 11, 2020. Similar to the last decade's pandemic, H1N1 swine flu, the new viral strain, the COVID-19 pandemic, seemed even more of a significant public health threat. In response to this crisis, all countries implemented broad containment measures that included lockdowns, strict travel restrictions, physical distancing measures and isolation for those who exhibited symptoms. A universal mask-wearing mandate was also instituted globally to reduce the risk of direct viral transmission. The introduction of these methods proved to be helpful as a great bound decreased the transmission rate. Though these masks played a significant role in reducing the spread of the virus, their extensive use has resulted in an emerging environmental challenge of great concern (Oliveira et al., 2023). The global health crisis has led to a substantial increase in the consumption of plastic material, particularly with increased usage of personal protective equipment and hygiene products such as face masks, gloves and sanitizer bottles (de Sousa, 2021). Disposable face masks are complex multi-layer structures composed of synthetic polymers, namely polypropylene, polyurethane, polyacrylonitrile, polystyrene, polycarbonate, polyethylene and polyester. Their typical construction consists of three layers: an inner layer of soft fiber, a melt-blown filtering middle layer, and an outer non-woven water-resistant layer. These materials have been proven to have a high environmental persistence with estimated degradation times of approximately 450 years, thus giving rise to significant ecological risks, particularly through their fragmentation into micro- and nano-plastics that can infiltrate various ecosystems.

Among the various environmental issues associated with the continued uncontrolled use of plastics, waste management and pollution stand out as critical concerns (Moshood et al., 2022), necessitating the development of effective solutions to address plastic contamination (Altug and Erdogan, 2022). Recent research points to several microorganisms capable of degrading polyolefins and other synthetic polymers commonly found in face masks. The biodegradation process depends on the catalytic properties of microbial enzymes, which are used by microorganisms to transform organic compounds into simpler molecules, either carbon dioxide and water in aerobic conditions, or carbon dioxide, water and methane in anaerobic environments (Abda et al., 2022). Notable examples include *Rhodococcus ruber* C208, *Bacillus cereus* BF20 and *Pseudomonas* sp. AKS2, has demonstrated the ability to break down polyethylene, polypropylene, polystyrene, polyvinyl chloride, polyurethane and polyethylene terephthalate. Some microbial enzymes, for instance, laccase and manganese peroxidase, have been discovered with potential for degrading plastic wastes (Ru et al., 2020). The improper disposal of face masks represents a multivaried problem environmentally, which affects both terrestrial and aquatic ecosystems. While their role in public health protection is undisputed, particularly in healthcare settings and during disease outbreaks, face masks have environmental concerns that demand their sustainable disposal or degradation to address. This study investigates the potential of indigenous topsoil microflora in plastic mask degradation using a modified Winogradsky column approach. Sergei Winogradsky first developed this column in the late 19th century, which is essentially a dynamic microcosm for simulating the natural environmental condition and studying the interactions of microbial activity and their metabolic processes. This method will allow for the cultivation and observation of diverse microbial communities across different nutrient gradients, making it suitable for exploring bacterial degradation capabilities. Microbial communities from garden and dump-yard soil samples will be compared to identify and characterize efficient bacterial degraders capable of breaking down disposable face masks. This research contributes to the development of sustainable solutions for the overall management of plastic waste while advancing knowledge of synthetic polymer degradation mechanisms through microbes.

MATERIALS AND METHODS

Collection of soil sample
Topsoil samples were collected from two distinct locations namely, a garden environment with plastic contamination (Vadakkupattu, Chennai) (Figure 1) and a municipal dump yard filled with plastics (Pallikaranai, Chennai) (Figure 2) during the year January 2022.These sites were selected to compare microbial communities adapted to different levels of plastic exposure. The topsoil was specifically chosen due to its rich microbial diversity and its role as the primary contact layer for discarded face masks in the environment.

Preparation of plastic masks
Commercial disposable plastic face masks were purchased and processed for the degradation study. The dimensions of the masks were measured first and then the elastic straps and nose clips were removed to make flat and uniform surfaces. Two size categories were prepared: larger strips measuring 10 cm × 2.5 cm and smaller strips of 5 cm × 2 cm (Figure 3). All the mask pieces were weighed before experimentation to establish baseline measurements for degradation analysis.

Preparation of the column
The plastic bottles were cleaned and modified by cutting near the neck region. The topsoil collected from the garden was introduced into bottles labelled G, G_1, G_2, G_3, and G_C, filling 20% of the container volume. Face masks were strategically positioned with 50% soil embedment and 50% surface exposure. Longer mask segments were placed in G_1, G_2, and G_3, while shorter segments were inserted in G. Bushnell Haas broth was added to fill the remaining 80% volume. The containers were hermetically sealed with tape to prevent air infiltration and contamination. Similarly, dump yard topsoil was used to fill 20% of bottles labelled D, D_1, D_2, D_3, and D_C. Short mask segments were placed in D, while longer segments were inserted in D_1, D_2, D_3. The columns were then filled with broth to 80% capacity. Columns D and G underwent 150-day incubation, while the remaining columns were incubated for 100 days (Figure 4). Post-incubation, the setup was opened for further observation and studies (Figure 5 and 6).

Removal of mask from the column
After incubation period, the columns were unsealed aseptically. The mask strips were extracted from columns using sterile forceps and cleansed with sterile Bushnell Haas broth. After thorough drying (Figure 7), the strips were weighed. The degradation rate was measured by obtaining the percent weight loss using the following formula (Kangand Lian, 2015):

Weight loss % = $\left(\frac{w_i - w_f}{w_i}\right) \times 100$

where, w_i= Initial weight of the mask
w_f= Final weight of the mask

Isolation and identification of the bacterial degraders in the soil
Isolation of bacteria was done by inoculating 1g of soil samples from each column into 10 ml saline tubes to make master dilutions.Then they were diluted serially to 10^{-9} concentration and plated on nutrient media by spread plate technique. The bacterial colonies were counted after 24-hour incubation at room temperature. This procedure was replicated for all soil samples (G, G_1, G_2, G_3, D, D_1, D_2, D_3). The isolated colonies, potentially representing efficient plastic mask degraders from the soil microflora, were subcultured on nutrient agar plates to obtain pure cultures. After 24-hour room temperature incubation, the isolates were subjected to identification tests. Final confirmation of genus and species was conducted using VITEK 2 analysis.

RESULTS

Biodegradation Analysis Through Weight Loss Assessment

The experimental analysis revealed significant variations in the degradation patterns between different soil types and sample sizes. Maximum degradation efficiency was noted in the dump-yard soil sample (D) with 11.95% weight loss, while the second-highest was observed in the garden soil sample (G) with 11.28% after an incubation period of 150 days. A notable inverse correlation was observed between sample size and degradation rates, where larger samples exhibited substantially lower degradation percentages, ranging from 0.17% to 0.75%. The weight loss ratios for all experimental samples are summarized in Table 1.

Bacterial Species Identification and Distribution

Microbiological analysis of soil samples led to the isolation and identification of ten distinct bacterial species (Table 2). The bacterial consortium consisted of *Pasteurella pneumotropica*, multiple strains of *Staphylococcus lentus, Pseudomonas oryzihabitans, Aerococcus viridans, Pasteurella testudinis, Escherichia coli, Pantoea* spp., and *Sphingomonas paucimobilis.* This diverse microbial population indicates potential plastic-degrading organisms capable of thriving under their respective soil environments. The presence of multiple strains of *Staphylococcus lentus* suggests its significant role in the degradation process within these specific soil conditions.

DISCUSSION

The metabolic activities of soil microorganisms can be the reason for microbial degradation of plastic masks in topsoil. In the experimental setup, microbes were confined in columns with Bushnell Haas broth, a specialized medium lacking carbon sources typically used for hydrocarbon degradation studies. Thus, the enclosed plastic mask was the primary carbon source for the surviving microflora. Umamaheshwari *et al.,* (2013) demonstrated that microbes can degrade PET and PS foam buried in soil, cow dung, and sewage by cleaving polymer bonds, with FTIR spectroscopy confirming decomposition through the detection of stretching between constituent bonds like C=C, CH, OH, C-O, and C=O. Significant percent weight loss averages were observed for the dump yard topsoil microflora as compared to garden topsoil microflora, which indicates that the microbes found in the dump yard topsoil may be naturally more plastic degrading due to long-term exposure and adaptation to plastic-rich environments. This observation is found in accordance with Kamble et al., (2015), whereby they reported that garbage soil degraded faster than garden soil. Significant differences in weight loss percentages were noted between samples G and D versus $G_1, G_2, G_3, D_1, D_2,$ and D_3, which are due to the difference in incubation periods (150 days versus 100 days) and differences in total surface area. The data showed that as sample sizes increased, degradation rates decreased significantly. Larger samples showed minimal degradation, with rates falling between 0.17% and 0.75%. This inverse relationship between surface area and degradation rate, along with the direct correlation between incubation time and degradation efficiency, can be expressed as:

$$\frac{1}{total\ surface\ area} \propto Rate\ of\ microbial\ degradation \propto time\ for\ incubation$$

The study identified various bacterial isolates obtained by serial dilution and spread plate technique from soil sample Include *Pasteurella pneumotropica, Staphylococcus lentus, Pseudomonas oryzihabitans, Aerococcus viridans, Pasteurella testudinis, Escherichia coli, Pantoea* spp., and *Sphingomonas paucimobilis*, as verified by VITEK 2. While previous research has identified *Pseudomonas* sp., *Bacillus* sp., *Staphylococcus* sp., *Moraxella* sp., *Serratia* sp., and *Micrococcus* sp. as effective plastic degraders, this study revealed additional potential degraders including *Pasteurella* sp., *Aerococcus viridians, E.coli, Pantoea* sp., and *Sphingomonas* sp., in addition to common soil fungi like *Aspergillus* sp. Different microorganisms employ various mechanisms and enzymes to degrade plastics. Kathiresan (2003) reported that *Pseudomonas* could degrade 20.54% of polythene within a month but only 3.97% of hard plastic, thus showing that degradation rates are polymer-specific. Face masks, with their complex fiber composition and multiple layers, exhibit longer degradation times compared to thin-layered polythene. A six-month microcosm experiment by Knicker and Velasco-Molina (2022) at 25ºC indicated that mask components have different mean residence times (MRT) in soil,

with the center mask showing a 7-year MRT and other components ranging from 19 to 28 years. While confirming biodegradability, the extended persistence of masks in soil raises concerns about micro(nano)plastic release and potential threats to soil organisms (Kwak and An et al., 2021). Despite the relaxed mask mandates around the world, these products are still a staple in healthcare and are likely to re-emerge during future epidemics. A range of mitigation strategies have been suggested, including enhanced pandemic-related plastic waste management (Tripathi et al., 2020) and development of biodegradable alternatives (Silva et al., 2020; Silva et al., 2021; Nghiem et al., 2021).

CONCLUSION

The unprecedented increased use of single-use face masks as a result of the global pandemic has further catalyzed an increased need to develop efficient solutions for biodegradation. Advances in plastic waste management, biodegradation, and bioremediation are still progressing worldwide, including the degradation of plastic masks in natural environments occurring through multiple phases. These mechanisms vary with conditions such as microbial species, enzyme activity, and mechanisms of biodegradation as well as types of polymers and time. This study focuses on the assessment of plastic mask degradation utilizing indigenous topsoil microflora from different environments. The results depicted a higher degradation rate in dump yard topsoil microflora than in garden soil topsoil microflora due to differences in microbial communities adapted to different soil conditions. The identification of specific bacterial isolates revealed varying degradation capabilities among different species, suggesting potential for targeted biodegradation approaches. Future research directions should focus on the characterization of the enzymatic mechanisms of plastic degradation in isolated bacterial strains with special emphasis on the identification of specific enzymes within *Pasteurella*, *Staphylococcus* and *Pseudomonas* species. Improved culture conditions must be developed for enhanced degradation efficiency, molecular genetic studies to explain the pathways and gene transfer or modification. Scaling up the experimental design to simulate diverse environmental conditions, such as temperature, moisture and soil composition variations, will be important. Furthermore, studies on synergistic effects of co-culturing bacterial strains, detailed ecotoxicological assessments and practical bioremediation strategies will be crucial for translating laboratory findings into real-world waste management solutions. Such initiatives are vital not only for mitigating micro and nano plastic pollution but also for preserving natural resources for future generations. Furthermore, these efforts contribute to protecting human health, wildlife, and aquatic ecosystems by preventing microplastic infiltration into food chains and maintaining ecological equilibrium. The abundance and composition of contaminants released by face masks (microplastics, fibers, and chemical compounds) in pre- and post-pandemic scenarios must be given more attention. This demands the development of advanced methodological approaches to overcome current technical limitations in quantifying and characterizing minute microplastics, fibers, adsorbents and leachates. Such advancements would increase the environmental relevance of experimental conditions and provide more accurate assessments of ecological impacts.

ABSTRACT

The members of genus Evolvulus are widely used in Traditional, Folk and Ayurvedic systems of Medicine; of which two species are mostly found in India namely *Evolvulus nummularius and Evolvulus alsinoides* The aerial parts of these plants are picked and widely used by the tribal people. The present study aims to identify the bioactive compounds present in the extracts through GC/MS analysis. The majority of herbal treatments and the products derived from them were traditionally made from crude plant extracts, which are made up of a complex mixture of various phytochemical substances. These chemical substances/components characteristics vary greatly between species. An intriguing technique GC-MS method used for determining the concentration of certain active ingredients in herbs used in the food, pharmaceutical, cosmetic, and drug industries. In this work, we used gas chromatography and mass spectrometry (GC-MS) to identify the bioactive components in the whole plant methanolic extract of both *Evolvulus* species and compared with its.

Keywords: *Evolvulus nummularius and Evolvulus alsinoides, saponins, phytosterol, flavonoids*

INTRODUCTION

As more individuals attempt to use herbal therapies instead of allopathic ones due to their lower cost and lack of adverse effects, the use of medicinal plants is growing in popularity.[1]. In recent times, there has been a notable surge in scientific study and popularity of complementary and alternative medicine, particularly in relation to medicinal plants [2]. An extensive list of plants that have been used for a long time in traditional Chinese and Indian medicine have been screened and indexed, leading to the development of innovative medicines that may be used to

95590

Rekhram and Sandhya Rani Panda

treat a variety of human ailments, such as blood pressure, cancer, rheumatism, kapha, and pitha. The use of traditional medical systems, like Ayurveda, which were handed down through the generations by "Gurukula," depended on the intimate knowledge that the Guru imparted to his disciples over an extended period of time as he treated each patient on an individual basis. [3]. Early western medical practices were influenced by the botanical cures of antiquity. As per Ghimire et al., the capacity to preserve medicinal plants and their extended usage is essential for preserving human health and life [5]. Medicinal plants are the main source of life-saving drugs for the majority of people on Earth. Plants include secondary metabolites such as phenolic and flavonoid compounds, which often act as antioxidants with the ability to chelate metals and redox, according to Karimi and Jaafar. This makes plants an excellent source of antioxidants [6]. According to Galatid and Brien, Since they can reduce the quantity of free radicals in the body and slow down their rate of generation and lipid peroxidation, which can cause a number of diseases and ageing, antioxidants are chemical compounds that are extremely valuable to humans [7]. Many drugs that are discovered in plants contain secondary metabolites as their active ingredient [8].

Through *in vitro* regeneration, high-quality plant-based medication could be created [9].The continued use of products derived from plants to treat medical conditions has led to the establishment of several pharmacological laboratories [10]. Life-saving drugs are primarily derived from medicinal plants for the majority of individuals *Evolvulus nummularious* L. syn. *Convolvulus nummularius* L. is a perennial herb belonging to the Convolvulaceae family that thrives in the wastelands of northeastern India (Figure 1). Tiny funnel-shaped blooms are produced by it. Vermifuge and febrifuge properties are present in the herb[11].Since large quantities of *Evolvulus nummularius* L. are a highly helpful medicinal resource, in vitro cultivation is necessary for the current investigations. The herb is applied topically to wound healing, hysteria, convulsions, and mild sedatives. It contains several phytoconstituents, including alkaloids, saponins, phytosterol, flavonoids, tannins and phenolic compounds, carbohydrates, etc. [12].Studies on the pharmacological properties of *E. nummularius* L. have revealed that it has anti-helminthic properties and is good for burns, fever, cuts, wounds, and scorpion lacerations. The extraction method is simple, rapid, and inexpensive because it uses less solvent. Analysis of the extracted materials using the GC-MS approach is an interesting method for finding the concentration of certain active compounds in herbs used in food, cosmetic, medicinal, environmental, and forensic applications[13].It combines two analytical techniques to provide a single method for assessing mixtures of chemical compounds. Once the components of the mixture are separated by gas chromatography, each component is examined separately by mass spectroscopy. Chemical investigations reveal that cardenolides, pregnane glycosides, and volatile components are its main elements [14, 15].Significant in biological systems, long chain unsaturated fatty acids, which comprise most volatile components, are essential energy sources and structural building blocks of many beneficial compounds[16].Recent studies have looked more closely at fatty acids, and the results show that they have potent sedative and hypnotic effects [17].

Accordingly, the current study's goal was to evaluate the chemical constituents of *E.nummularius* L . methanolic whole plant extract. The Convolvulaceae family member *Evolvulus alsinoides* (Linn) is also known as Shankhpushpi / Vishnukranthi. Open, grassy areas are usually home to *E. alsinoides* L. Subtropical countries like Africa, India, and the Philippines are home to it. Known as miniature morning glory, *Evolvulus alsinoides* features tiny leaves and pale blue blooms. The fruits resemble thin capsules. This plant may be found in both deep soil and open grassland areas. India is home to two different species of *Evolvulus alsinoides*. Slender dwarf morning glory, or *Evolvulus alsinoides* L. var. angustifolius Torr., is one kind, while another type is *Evolvulus alsinoides* L. var. *debilis* (Kunth) van Ooststr. The parts of plants that are used medicinally are whole plants and leaves [22]. *Evolvulus alsinoides* Linn (Vishnukranthi) is used as a nootropic or brain-tonic in certain ancient medical systems, including Ayurveda and Unani. The plant is used to cure fever, cough, cold, azoospermia, adenitis, depression, and some ethnic races in India, Africa, and the Philippines [23]. Ayurveda states that Vishnukranthi is an essential part of Medhya Rasyana (nervine tonic) herbs, which help with neural regeneration and synaptic plasticity. Traditional applications include anticonvulsant, anthelmintic, sedative, memory improvement, antiepileptic, and anti-anxiety effects. Many other ailments, including as epilepsy, uterine hemorrhage, mental debility, and insanity, are also treated with the herb. In addition, it has antifungal, antibacterial, antiulcer, and anti-asthmatic qualities and is used as a brain and memory tonic [24]. Herbal remedies for brain tonic, vermifuge, antistress, antidepressant, anxiolytic, analgesic, neuroleptic, and anti-inflammatory

Rekhram and Sandhya Rani Panda

purposes include vishnukranti. Preclinical in vivo and in vitro investigations have demonstrated anti-amnesic, antistress (adaptogenic), antimicrobial, and gastroprotective effects [25].A brain tonic called vishnukranti is used to enhance mental performance. A common component of many Medhya formulations is vishukranti. Herbal medicines are employed as a traditional and alternative therapy; the study's particular goal is to repair declining cognitive capacities. Medicinal plants include secondary metabolites that have a variety of therapeutic properties. The medicinal plant's aid in inhibiting enzymes or delaying vital metabolic processes is what causes the biochemical effects. Herbal bioactives also hold potential for being rewarded for their acceptance, safety, and effectiveness. It has been determined that medicinal plants provide a reliable source of lead chemicals for the development of new medications [26]. In order to extract the accessible chemicals from the plant extract, Gas Chromatography-Mass Spectrometry (GC-MS) seeks to isolate different substances within a specific sample. Numerous secondary metabolites with strong antioxidant properties have been found in prior studies. Properties: vermifuge, antidepressant, anxiolytic, analgesic, neuroleptic, anti-inflammatory, antifungal, antiulcer, and antiasthmatic; anti-amnesic, antistress (adaptogenic), antibacterial, and gastroprotective; epilepsy; uterine hemorrhage; neurological debility; insanity [27]. Hence, our goal was to extract the phytochemicals from the methanolic extract of *Evolvulus alsinoides* Linn using GC-MS analysis. We are interested in the isolation and phytochemical assessment from this extract utilizing the GC-MS analytical approach.

MATERIALS AND METHODS

Collection of plant material

In the beginning, *Evolvulus nummularious* L. aerial parts were gathered from playgrounds, grasslands, and waste areas in the Durg region of Chhattisgarh, India. The area of District Durg is 22,38.36 square kilometers, and its coordinates are 20°54′ and 21°32′ north and 81°10′ and 81°36′ east. District Durg is situated at an elevation of 317 meters above sea level. In a space with enough ventilation, the plant leaves were then softly covered and let to dry. Once that was done, the dried leaves were ground into a powder and stored in an airtight, dry glass jar. the *Evolvulus alsinoides* plant was obtained in July 2022 from Sri Venkateswara University in the Chittoor District of Andhra Pradesh, India. The entire plant was recognized and verified by plant taxonomist Dr. K. Madhava Chetty (IAAT:337) of the Department of Botany, Tirupathi- Andhra pradesh, India [28].

Instrumentation

methanol is used to extract *Evolvulus nummularious* L. from plants. The whole plant extract was subjected to GC-MS analysis using Thermo MS DSQ II and Thermo GC-Trace Ultra Version: 5.0 equipment. DB 35 - MS Capillary Standard, a non-polar column with dimensions of 30 mm × 0.25 mm ID x 0.25 μm film, is one component of the device.

RESULT AND DISCUSSION

Gas chromatography-mass spectroscopy (GC – MS) analysis Aerial plant extract is analyzed using GC-MS. A low flow rate of 1.0 milliliters per minute is used for the carrier gas, helium. With the injector operating at 250 °C, the oven's temperature was adjusted as follows: The temperature was gradually increased from 60 °C for 15 minutes to 280°C for 3 minutes. The components were determined by comparing the NIST and Willey libraries' retention indices. The results were gathered, and the components were identified by comparing them to those in the computer library (Willey and NIST) that was attached to the GC-MS apparatus. The National Institute of Standards and Technology (NIST) Library describes the molecular weight, chemical formula, peak retention time, and other properties of the bioactive compounds found in the methanolic leaf extract of *Evolvulus nummularius* L. The GC-MS chromatogram showed several peaks (Figure 3). The methanolic leaf extract of *Evolvulus nummularius* L. yielded a total of sixteen organic components; Table 1 lists these components along with their retention periods and structures. Below is an identification of these phytoconstituents: Butanoic acid, 2-methyl-; 1,2-Cyclopentanedione; -hydroxy-2-methylbutyric acid; Maltol; 2-Methoxy-4-vinylphenol; Caryophyllene; Benzene propanoic acid, 3,5-bis(1,1-dimethyle;

d-Mannitol, 1,1'-O-1,16-hexadecanediylbis-; D-Friedoolean-14-en-3-one; Lup-20(29)-en-3-one; D-Friedoolean-14-en-3-ol; Lupeol; 13-Docosenamide, (Z)-; 2,6,10,15,19,23-Pentamethyl-2,6,18,22-tetraco; Vitamin E; 2,6,10,15,19,23-Pentamethyl-2,6,18,22-tetraco. Herbal remedies are used to create new pharmaceuticals. A vital part in preserving both individual and communal health, medicinal plants are the unofficial source of many contemporary drugs. In order to fight a variety of illnesses and disorders, they have supplied various components. Studying and extracting plant material has a big impact on developing, modernizing, and controlling the quality of herbal formulations. There are two additional advantages to researching therapeutic plants: determining plant toxicity and assisting in protecting humans and animals from naturally occurring toxins. Thus, the current work was carried out to identify the bioactive compounds contained in the methanolic extract of *Evolvulus nummularious* L. using gas chromatography and mass spectroscopy. It is a species with moderate distribution that is extensively found in India and may have inadvertently made its way to the tropical parts of the Old World. Small, spherical leaves grow on creeping stalks, and bracteoles are found at or at the base of the flower stalk. In the Species Plantarum 1:157(1793), Linnaeus named it convolvulus numularius. [18]. *E. nummularius's* anthelmintic activity against adult Pheretima posthuman earthworms from India was evaluated by Dash *et al.* in both aqueous and hydroalcoholic extracts [19]. In the methanolic extract of *Evolvulus nummularious* L., different bioactive phytochemical substances were identified with varying area and area%, according to GC-MS experiment (Figure 2), which also shows the concentration (peak area percentage), retention time (RT), molecular formula, and molecular weight (MW) of the active principles. 16 components with variable area and area% were discovered among the 146 components detected by GC-MS analysis. *Evolvulus nummularious* L.'s methanolic plant extract's identified component mass spectra were displayed in Figure 3. The whole plant, *Evolvulus nummularious* L., contains the aforementioned compounds, which are responsible for a variety of industrial and medicinal purposes, including anthelminthic, wound healing, weak sedative, anticonvulsant, anti-microbial, and treatment for hysteria and scorpion stings.. [20, 21].GCMS equipment was used to analyze the extract of *Evolvulus alsinoides.* A 30 Mt diameter, 0.25 mm ID, and 0.25 m film thickness TR 5MS capillary standard non-polar column was utilized in the GC-MS system. From the beginning, the mobile phase's flow rate was fixed at 1.0 mL/min. Temperature was increased in the gas chromatography section from 40°C to 250°C at a rate of 5°C/min using a 1 microliter injection volume. The results of the samples soaked in chloroform were analyzed across a mass spectrum of 50650 m/z12 using the Wiley Spectral library search tool. [10] figure 4: Gas chromatography-mass spectrum(GC-MS) analysis chromatogram of isolated compounds from *E.alsinoides* showing 5 distinctive peaks time and relative abundance plotted along x axis and y axis respectively

CONCLUSION

In recent decades, pharmacological research has been intensely focused on the basis of traditional medicinal herbs. The realization of the significance of medicinal plants as viable sources of cutting-edge therapeutic molecules and lead compounds for drug development has made this feasible. For a very long time, *Evolvulus nummularious* L. has been utilized in herbal therapy. As a result, 146 compounds were found in *Evolvulus nummularious* L. after bioactive components were identified using GC-MS analysis. *Evolvulus nummularious* L. may be a new potential source of therapeutic goods due to the presence of these phytochemicals and bioactive compounds, according to the study's findings. Ten compounds in all were found using the GC-MS technique; of these, five compounds demonstrated importance (having two peaks), and five of the compounds had more hits than the other nine; the resulting chromatogram was then displayed. We looked examined the pharmacodynamic aspects of the compounds with more hits. The availability of several compounds in the methanolic extract of *E. alpinoides* is shown in Table 1. These chemicals may have implications for the pharmacodynamics, pharmacokinetic potency, and overall physicochemical aspects of the extract. The chromatogram displays ten distinct chemicals. Still, based on the area and peak seen in the chromatogram, only five chemicals are primarily seen as productive. The pharmacological effects of the methanolic extract of *E.alsinoides* may be attributed to them. The results above demonstrate that *Evolvulus nummularius* (L.) has a higher number of phytochemicals in its methanolic extract than *Evolvulus alsinoides*, indicating a greater concentration of bioactive compounds and a possible source of therapeutic goods.The results above compared that

Evolvulus nummularius (L.) has a higher number of phytochemicals in its methanolic extract than *Evolvulus alsinoides*, indicating a greater concentration of bioactive compounds and a possible source of therapeutic goods.

ABSTRACT

This study analyzes how Generation Z (Gen Z) and Generation Y (Gen Y, also known as Millennials) have different perceptions of mutual fund investments. Understanding the differences in investment patterns of the two generational cohorts is essential to financial institutions because technology and economic factors influence investing preferences. This study explores some key questions including risk tolerance, investment preferences, attitudes towards mutual funds, and the relationship between digital platforms and investment decisions. After multivariate analysis of survey data from a diverse sample of Gen Z and Gen Y people, the study found significant differences in how these groups approach long-term financial planning and asset creation. The results suggest that Gen Z, for example, values digital access, sustainability and short-term profits in the same way that Gen Y values stability, long-term rewards and tax efficiency. These insights can assist financial companies in refining their products and strategies to meet the needs of younger investors. The contradicting findings indicate that targeted financial education and focused marketing are helpful in raising the participation of both generations in mutual fund investing.

Keywords: Generation Z, Gen Y, Millennials, Mutual Fund Investing, Risk Tolerance, Investment Preferences, Financial Behaviour, Digital Platforms, Sustainability, Financial Education, Wealth Management.

INTRODUCTION

Mutual fund investment is known to be one of the most important options that a person has in terms of obtaining wealth and maintaining the risk. Investor preference and behaviours are rather dynamic and varies along the financial market continuum. Generational differences are particularly pronounced, with different cohorts approaching their investments with their own unique attitudes, values and experiences. Factors such as the rise of digital financial platforms, increased focus on sustainability, and changing economic conditions are reshaping the investment preferences of various demographics, including with respect to mutual funds. Younger generations like Gen Z (people born between 1997 and 2012) and Gen Y, or Millennials, (people born between 1981 and 1996) make up large swaths of the current investing demographic. These groups are often considered tech-savvy the Gen Z's were born into a digital-first world while the Gen Y's were the first ones where the internet and online financial tools were widely available. Though similar in many respects, differences in investment preferences, risk tolerance, and/or financial literacy may help determine how these two groups choose to invest in Mutual Funds. This study aims to explore these inequities across generations in relation to mutual fund investing. The goal is to gain a deeper understanding of Generation Z and Gen Y's perspectives on mutual funds, along with their investment preferences and the factors that influence their decisions such as risk, long- versus short-term returns, and tax benefits. Through an analysis of these generational contrasts, the current study offers valuable insights into the evolving landscape of mutual fund investments, and recommends financial institutions on adapting their offerings to the specific needs of both generations. Based on survey data and an analysis of consumer behaviour, the study explores key drivers of mutual fund investment decisions while also offering potential opportunities for the financial sector to engage with young investors more effectively. This helps to shed more light on the role of generation in potentially more financially sound decision making.

REVIEW OF THE LITERATURE

When looking at the behavioural analysis of mutual fund investment behaviours, there are significant generational differences, particularly with Gen Z and Gen Y according to research studies financial literacy is essential to make investment decisions. Lusardi et al. (2010) who point out that millennials have often lower financial literacy, despite naturally being tech-savvy, which leads to their difference in employing mutual funds. According to Malmendier and Nagel (2011), when they analyze data up to 10/2023, they find that younger generations, those who are less affected (or do not remember) previous financial crises, like take more risk on their investments, while older generations, like Generation Y, are more risk-adverse. Also Baker and Nofsinger (2010) highlighted the age-risk taking behaviour curve where Gen Z is more drawn to mutual funds due to their accessibility and potential for long-term growth Gen Y however is more likely to seek out tax-favoured investments, yet with riskier undertones. We see this in Elliott (2020) who found that Gen Y like to invest in high-risk investments and tax breaks, compared to Statman (2017) who found that Millennials become envious of trends in the market and they make impulsive decisions, whereas Gen Z like to get their information from digital tools and financial advisors. The literature suggests that financial knowledge, risk tolerance and the digital ecosystem impact the investment behaviours of Gen Z and Gen Y to diverse degrees.

RESEARCH METHODOLOGY

The research methodology of this study is based on quantitative analyses of parameters like age, annual income, tax benefits, and risk perception of Gen Z and Gen Y mutual fund investments. Data were collected through surveys with 300 respondents, who were selected across a range of age groups, income levels, and occupations. The survey asked questions about views on mutual funds as a safe investment, the impact of tax breaks, the priority of short versus long-term gains and the impact of past performance on investment decisions. Statistical analyses (ANOVA, Chi-Square tests and Pearson correlation) were then performed to identify the correlations and differences for the

variables. The results are analysed at 95% confidence to ascertain the effect of the demographic features on mutual fund investment behaviour and decision-making.

DATA ANALYSIS

ANOVA
The perception of mutual funds as a safe investment option across the age groups of respondents.
Null Hypothesis (H_0)
There is no significant difference in the perception of mutual funds as a safe investment option across the age groups of respondents.

Alternative Hypothesis (H_1)
There is a significant difference in the perception of mutual funds as a safe investment option across the age groups of respondents.

Descriptives								
The Age group of the Respondents.								
	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Agree	173	2.78	1.462	.111	2.56	3.00	1	5
Strongly Agree	127	3.09	1.477	.131	2.84	3.35	1	5
Total	300	2.91	1.474	.085	2.75	3.08	1	5

ANOVA					
The Age group of the Respondents.					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	7.227	1	7.227	3.352	.068
Within Groups	642.519	298	2.156		
Total	649.747	299			

Interpretation
The ANOVA results indicate an F-value of 3.352 with a significance level (p-value) of 0.068, which is slightly above the conventional threshold of 0.05. This suggests that there is a statistically significant difference in the perception of mutual funds as a safe investment option across the age groups at a 95% confidence level. However, with a p-value close to the threshold, it is reasonable to explore whether other factors or a larger sample might reveal subtle differences. Positively, this near significance implies that perceptions across age groups are relatively aligned, which could simplify creating uniform marketing strategies for mutual funds targeting a diverse age demographic.

The annual income of respondents who prioritize short-term gains over long-term growth between the Agree and Strongly Agree groups.
Null Hypothesis (H_0)
There is no significant difference in the annual income of respondents who prioritize short-term gains over long-term growth between the "Agree" and "Strongly Agree" groups.

Alternative Hypothesis (H_1)
There is a significant difference in the annual income of respondents who prioritize short-term gains over long-term growth between the "Agree" and "Strongly Agree" groups.

Rajkumar and Sathish Kumar

Descriptives								
Annual Income of the Respondents.								
	N	**Mean**	**Std. Deviation**	**Std. Error**	**95% Confidence Interval for Mean**		**Minimum**	**Maximum**
					Lower Bound	**Upper Bound**		
Agree	158	2.47	1.110	.088	2.30	2.65	1	4
Strongly Agree	142	2.42	1.138	.096	2.23	2.61	1	4
Total	300	2.45	1.122	.065	2.32	2.58	1	4

ANOVA					
Annual Income of the Respondents.					
	Sum of Squares	**df**	**Mean Square**	**F**	**Sig.**
Between Groups	.203	1	.203	.161	.688
Within Groups	376.047	298	1.262		
Total	376.250	299			

Interpretation

Based on the ANOVA results, the p-value (Sig.) is 0.688, which is greater than the standard significance level of 0.05. This means we fail to reject the null hypothesis, indicating that there is a statistically significant difference in the annual income between the two groups. A positive interpretation of this finding could suggest that prioritizing short-term gains over long-term growth does not appear to significantly differentiate individuals' annual income levels. This could imply that other factors, rather than this specific investment attitude, play a more dominant role in determining income variations.

CORRELATION

The tax benefits play a crucial role in mutual fund investment decisions and the confidence in knowledge and understanding of mutual fund investments.

Null Hypothesis (H$_0$)

There is no significant relationship between the belief that tax benefits play a crucial role in mutual fund investment decisions and the confidence in knowledge and understanding of mutual fund investments ($\varrho = 0$).

Alternative Hypothesis (H$_1$)

There is a significant relationship between the belief that tax benefits play a crucial role in mutual fund investment decisions and the confidence in knowledge and understanding of mutual fund investments ($\varrho \neq 0$).

Descriptive Statistics			
	Mean	**Std. Deviation**	**N**
Tax benefits play a crucial role in my decision to invest in mutual funds.	4.47	.500	300
I am confident in my knowledge and understanding of mutual fund investments.	4.54	.499	300

Correlations		Tax benefits play a crucial role in my decision to invest in mutual funds.	I am confident in my knowledge and understanding of mutual fund investments.
Tax benefits play a crucial role in my decision to invest in mutual funds.	Pearson Correlation	1	.019
	Sig. (2-tailed)		.746

Rajkumar and Sathish Kumar

I am confident in my knowledge and understanding of mutual fund investments.	N	300	300
	Pearson Correlation	.019	1
	Sig. (2-tailed)	.746	
	N	300	300

Interpretation

The correlation analysis reveals a Pearson correlation coefficient of 0.019, with a p-value of 0.746. Since the p-value is greater than the significance level (typically 0.05), we fail to reject the null hypothesis, indicating a statistically significant relationship between the two variables. However, the mean scores (4.47 and 4.54, respectively) and low standard deviations suggest that respondents generally agree that tax benefits are important and feel confident in their mutual fund knowledge. This implies that while these factors might be directly correlated, both independently contribute positively to mutual fund investment behaviour.

Believing mutual funds are a safe investment option and the perception that the risk associated with mutual funds significantly impacts investment decisions.

Null Hypothesis (H$_0$)

There is no significant correlation between believing mutual funds are a safe investment option and the perception that the risk associated with mutual funds significantly impacts investment decisions ($\varrho = 0$).

Alternative Hypothesis (H$_1$)

There is a significant correlation between believing mutual funds are a safe investment option and the perception that the risk associated with mutual funds significantly impacts investment decisions ($\varrho \neq 0$).

Descriptive Statistics			
	Mean	**Std. Deviation**	**N**
I believe mutual funds are a safe investment option.	4.42	.495	300
The risk associated with mutual funds significantly impacts my decision to invest.	4.49	.501	300

Correlations		I believe mutual funds are a safe investment option.	The risk associated with mutual funds significantly impacts my decision to invest.
I believe mutual funds are a safe investment option.	Pearson Correlation	1	-.011
	Sig. (2-tailed)		.851
	N	300	300
The risk associated with mutual funds significantly impacts my decision to invest.	Pearson Correlation	-.011	1
	Sig. (2-tailed)	.851	
	N	300	300

Interpretation

The Pearson correlation coefficient (-0.011) indicates a negligible and negative relationship between the two variables. The p-value (0.851) is much greater than the conventional significance level (e.g., 0.05), suggesting that the observed correlation is statistically significant. Therefore, we fail to reject the null hypothesis and conclude that there is a meaningful relationship between these beliefs. Positively, this result implies that individual's perception of mutual fund safety may remain consistent regardless of their concerns about associated risks, highlighting a potential trust in mutual funds as a stable investment option.

Rajkumar and Sathish Kumar

The prioritization of short-term gains over long-term growth while investing and the consideration of the past performance of mutual funds a key factor before investing.

Null Hypothesis (H$_0$)

There is no significant correlation between the prioritization of short-term gains over long-term growth while investing and the consideration of the past performance of mutual funds as a key factor before investing.

Alternative Hypothesis (H$_1$)

There is a significant correlation between the prioritization of short-term gains over long-term growth while investing and the consideration of past performance of mutual funds as a key factor before investing.

Descriptive Statistics	Mean	Std. Deviation	N
I prioritize short-term gains over long-term growth while investing.	4.47	.500	300
I consider the past performance of mutual funds as a key factor before investing.	4.51	.501	300

Correlations		I prioritize short-term gains over long-term growth while investing.	I consider the past performance of mutual funds as a key factor before investing.
I prioritize short-term gains over long-term growth while investing.	Pearson Correlation	1	-.039
	Sig. (2-tailed)		.505
	N	300	300
I consider the past performance of mutual funds as a key factor before investing.	Pearson Correlation	-.039	1
	Sig. (2-tailed)	.505	
	N	300	300

Interpretation

The Pearson correlation coefficient of -0.039 indicates a very weak negative relationship between the two variables, which is not statistically significant (p-value = 0.505, greater than 0.05). Therefore, we fail to reject the null hypothesis, suggesting that there is a significant correlation between prioritizing short-term gains over long-term growth and considering past performance when investing in mutual funds. However, if the correlation had been positive, it would have implied that as one-factor increases, the other would also tend to increase, showing a direct relationship between the two behaviours.

CHI-SQUARE TEST

The age group of the respondents and their preference for investing in mutual funds over other investment options like stocks or fixed deposits.

Case Processing Summary	Cases					
	Valid		Missing		Total	
	N	Percent	N	Percent	N	Percent
The age group of the Respondents and I prefer investing in mutual funds over other investment options like stocks or fixed deposits.	300	100.0%	0	0.0%	300	100.0%

Null Hypothesis (H$_0$)

There is no significant association between the age group of the respondents and their preference for investing in mutual funds over other investment options like stocks or fixed deposits. In other words, the preference for mutual funds is independent of the age group.

95602

Rajkumar and Sathish Kumar

Alternative Hypothesis (H₁)

There is a significant association between the age group of the respondents and their preference for investing in mutual funds over other investment options. The preference for mutual funds is dependent on the age group.

The age group of the Respondents and I prefer investing in mutual funds over other investment options like stocks or fixed deposits. Crosstabulation					
			I prefer investing in mutual funds over other investment options like stocks or fixed deposits.		Total
			Agree	**Strongly Agree**	
The age group of the Respondents.	18-24	Count	42	35	77

Chi-Square Tests			
	Value	**df**	**Asymptotic Significance (2-sided)**
Pearson Chi-Square	6.394[a]	4	.172
Likelihood Ratio	6.495	4	.165
N of Valid Cases	300		
a. 0 cells (0.0%) have an expected count of less than 5. The minimum expected count is 23.52.			

Interpretation

The Pearson Chi-Square test results show a value of 6.394 with a p-value of 0.172, which is greater than the typical significance level of 0.05. This means that we fail to reject the null hypothesis. There is a statistically significant relationship between age group and the preference for mutual funds. Essentially, the preference for mutual funds across different age groups does differ in a meaningful way, indicating that individuals from all age groups have a similar inclination toward investing in mutual funds over other options like stocks or fixed deposits.

The occupation of the respondents and their likelihood to seek advice from financial experts before investing in mutual funds.

Case Processing Summary

Chi-Square Tests			
	Value	df	Asymptotic Significance (2-sided)
Pearson Chi-Square	3.824[a]	4	.430
Likelihood Ratio	3.841	4	.428
N of Valid Cases	300		
a. 0 cells (0.0%) have an expected count of less than 5. The minimum expected count is 27.32.			

Interpretation

The results of the Chi-square test show a Pearson Chi-Square value of 3.824 with an asymptotic significance of 0.430, which is greater than the 0.05 significance level. This means that we fail to reject the null hypothesis, indicating that there is a significant association between the occupation of the respondents and their tendency to seek financial advice before investing in mutual funds. Therefore, the occupation of individuals does appear to influence their likelihood of seeking expert financial guidance for investments in mutual funds.

95604

Rajkumar and Sathish Kumar

The annual income of the respondents and their agreement with the statement that tax benefits play a crucial role in their decision to invest in mutual funds.

Rajkumar and Sathish Kumar

Interpretation

Based on the Chi-Square test results, with a Pearson Chi-Square value of 0.981 and an asymptotic significance of 0.806, we fail to reject the null hypothesis. This suggests that there is a significant relationship between the annual income of the respondents and the importance they place on tax benefits when deciding to invest in mutual funds. The responses are independent of income categories, indicating that tax benefits are equally important for people across different income groups.

FINDINGS

The data also provides many positive findings that could be used to direct mutual fund marketing strategies. Firstly, belief about mutual funds being a risk worthy safe investment avenue is uniform across the age group. Moreover, even though incentivizing shorter-term returns over sustainable, longer-term growth does not seem to necessarily reflect the amount invested on an annual basis, it suggests that income by itself is not necessarily a key driver of investment decisions. The correlation study reveals that respondents respect tax benefits and are confident in their mutual fund knowledge, which demonstrates the need to teach investors about tax advantages. Lastly, the research indicates that individuals' degree of belief in mutual funds does not change with the risk, emphasizing mutual funds as a secure choice. Lastly, the affirmative nature of mutual funds across various demographic subsets implies that, overall, it is more probable that people would be able to obtain financial assistance, even if just for the sake of attempting to reach a wider audience.

SUGGESTIONS

The analysis of data shows that there is a scope of enhancing mutual fund marketing strategies by understanding that aspects like tax benefits, perceived security, and previous returns have a bearing on investment decisions across different age buckets, income brackets, and professional profiles. While certain qualifying criteria — annual income, as seen in the table above, as well as the relevance of tax benefits — show independence of other decisions, positive perceptions about mutual funds should help formulate targeted but nevertheless well-aimed marketing toward each demographic. In addition, as respondents report they trust those funds they claim to know, educational programs may enhance that confidence, and as a result make it easier to attract new investors. A wider approach of building trust and establishing mutual funds' position as a safe and worthwhile investment option is likely to resonate with several audiences.

CONCLUSION

The study presented in this paper demonstrates vital differences between two generations, Gen Z and Gen Y in general and mutual fund investment practices specifically. While mutual funds are viewed by both generations as a relatively safe option (moderate risk), their risk tolerance and expected returns are different for short-term and long term. Whereas Gen Z values long-term growth and relies heavily on digital resources and financial advice, Gen Y are more likely to seek higher risk investments and tax deductions. It indicated that even those in the young age groups have a constant overall confidence in mutual fund investments even though there are age differences. The report also highlights the impact of things like tax incentives, financial literacy and perceived safety on investment decisions. While tax breaks tend to be seen as beneficial across age and income brackets, respondents by annual income disagree—there is no real difference when it comes to prioritizing short-term over long-term profit. Furthermore, individuals' risk assessments of mutual funds were not determined by individuals' confidence in their investment knowledge, suggesting mutual funds are widely perceived as a sound investment decision. From a marketing perspective, the results suggest that financial institutions can profit from promoting mutual funds as a sound and safe investment vehicle, harnessing good attitudes among general demographics. The study further emphasizes the role of educational programs in increasing investor confidence, especially in communicating tax benefits and demystifying mutual fund investing. In conclusion, these findings present marketers at mutual funds with actionable insights on designing personalised marketing campaigns that cater to the specific needs and preferences of distinct

Rajkumar and Sathish Kumar

generations, as well as establishing credibility and promoting informed investment activities across the entire spectrums of demography.

ABSTRACT

Reinforced concrete stands as one of the most widely utilized materials in construction globally. However, it is particularly susceptible to deterioration, especially in coastal areas. Consequently, researchers worldwide are focusing their efforts on the development of alternative materials to address this issue. This has led to the incorporation of additive materials aimed at enhancing the quality of concrete. High Strength Concrete has garnered considerable interest from various industrial sectors, particularly in the realm of ready-mix concrete. This study presents a comprehensive experimental investigation into the strength and durability characteristics of high strength concrete that incorporates mineral admixtures. The research examines different proportions of mineral admixtures, specifically Glass Powder (GP at 10%, 20%, 30%, and 40%) and Metakaolin (MK at 5%, 10%, and 15%), which are partially substituted for Ordinary Portland Cement (OPC) in the concrete mix. Concrete, High Strength Concrete, Metakaolin, Glass Powder. Additionally, short-term durability tests, including Sorptivity and Water Absorption, were performed on cylindrical and cubic specimens. Beams measuring 1.2 m x 0.1 m x 0.15 m were also cast for both controlled and optimal mixes to evaluate the flexural behavior of the mineral admixture-enhanced concrete. The experimental findings indicate that substituting cement with 10% Glass Powder and 10% Metakaolin significantly enhances the strength, durability, and flexural properties of the concrete compared to the control mix.

Keywords: Cube specimens were cast in various combinations to assess the compressive strength of the concrete after a curing period of 28 days.

INTRODUCTION

Construction is seen as critical to a nation's development, especially in countries that are developing quickly. In order to build infrastructure, concrete is mostly used as primary source [1]. Every year, 40 billion tons of virgin fine and coarse aggregates are utilized in concrete worldwide, depleting the nation's natural resources [2]. Because of its greater versatility, ease of molding, and affordability, concrete is the most adaptable material. High strength concrete attracts researchers in the perspective mechanical and durability charecteristics. Mahsa Kamali et al,[3] examines the mechanical strength and durability behaviour of cementitious materials modified with two types of glass powders and class F fly ash at various levels of cement replacement. The findings from this study indicated that cementitious materials modified with glass powders showed an improvement in compressive and flexural strengths compared to the control concrete at late ages of curing. Addition of glass powders decreased alkali-silica reaction expansions of the modified cementitious materials when mixed with reactive sands and enhanced resistance to chloride permeability and electrical resistivity of cementitious materials. Elahi et al. [4], experimental investigation was carried out to evaluate the mechanical and durability properties of high performance concretes containing supplementary cementitious materials in both binary and ternary systems. Portland cement was replaced with fly ash up to 40%, silica fume up to 15% and GGBS up to a level of 70%. The results confirmed that silica fume performs better than other supplementary cementitious materials for the strength development and bulk resistivity. Eva Vejmelkova et al.[5] studied the parameters of high performance concrete (HPC) with metakaolin including basic physical characteristics, mechanical and fracture-mechanical properties, durability characteristics, thermal properties and chloride binding characteristics are measured. The experimental results show that the replacement of Portland cement by 10% of metakaolin leads to improvements. Widodo Kushartomo et al. [6], investigated the influence of glass powder in the mechanical behaviour of RPC. The mechanical behaviour is examined by the tests of 11 compressive strength, flexural strength and split tensile strength. The results indicated that the use of glass powder in this study was good enough to replace quartz powder in RPC. Dinakar et al.[7], studied the effect of incorporating metakaolin (MK) on the mechanical and durability properties of high strength concrete for a constant water/binder ratio of 0.3.MK with cement replacement of 5,10 and 15% were added and designed for target strength and slump of 90 MPa and 100 ± 25 mm. From the results, it was observed that 10 % replacement level was the optimum level in terms of Compressive strength. Sumrerng Rukzon [8], presents the use of ternary blend of Portland cement with two pozzolans in producing high-strength concrete. PortlandCement Type I (CT) was partially replaced with ground Bagasse Ash (BA), ground rice husk-bark ash (RB) 12 and Fly Ash (FA) at the dosage levels of 20% and 40% by weight of binder. Test results reveal that the resistance to chloride penetration of concrete improves substantially with partial replacement of CT with a blend of equal weight portion of FA and RB; or FA and BA and the improvement increases with an increase in the replacement level. Hassan EL-Chabib et al. [9] investigated the performance of high-strength flowable concrete (HSFC) made with binary, ternary, or quaternary binder and with up to 70% of Portland cement replaced by supplementary cementitious materials (SCMs). Results showed that HSFC made with high volume of SCMs and exposed to hot climate condition increases the compressive strength and reduces concrete permeability and free shrinkage compared to the control mixture in the same group and cured under similar curing conditions. G.Vijayakumar et al. [10], studied finely powdered waste glasses are used as a partial replacement of cement in concrete and compared it with conventional concrete. Consequently extensive research is on going into the use of cement replacements, using many waste materials and industrial by products.From the results obtained , it is found that glass powder can be used as cement replacement material upto particle size less than 75μm to prevent alkali silica reaction.

RESEARCH SIGNIFICANCE

From the reviewed paper, it is clearly noted that only limited studies are reported for high strength concrete using combined mineral admixtures. In this connection , this research work aims to evaluate the behaviour of high strength

concrete using metakaolin and glass powder as combined alternative for cement. The strength and durability charecters are evaluated and discussed.

MATERIAL PROPERTIES

The following materials were used in this investigation.
- Ordinary Portland cement of 53 grade
- Fine aggregate - Natural River Sand
- Coarse aggregate – Crushed granite
- Glass powder
- Metakaolin
- Potable water
- Superplasticizer – Fosroc SP 43

EXPERIMENTAL INVESTIGATION
Specimen Preparation
Concrete cube specimens of size 150 mm x 150 mm x 150 mm were cast to study the effect of Glass powder and Metakaolin on compressive strength of concrete at different ages. Cylindrical specimens of size 100 mm diameter and 50 mm height were cast to study durability characteristics such as Sorptivity (as per ASTM C1585) and water absorption porosity (as per ASTM C642). Chemical admixture is added in all the mixes as it gives better results and good workability. For testing compressive strength of control and ternary blend concrete, a total number of 24specimens were cast (age = 28 days) with different proportions of glass powder and metakaolin. Similarly 10 cylindrical specimens each for sorptivity and water absorption tests were cast. Beams of size 1200 mm x 100 mm x 150 mm were cast to find the load deflection behavior of HSC.Concrete were placed in the well lubricated mould and compacted and the specimens were left at room temperature for 24hrs and after that specimens were placed in curing tank till their testing ages.

TESTING OF SPECIMENS
Compressive strength test
The compressive strength test is the most common test conducted because most of the desirable characteristic properties of concrete and the structural design purpose are qualitatively related to compressive strength. All the specimens were cast in steel moulds and well compacted. Then they were cured and tested at different ages of concrete for 28 days to understand the effect of age of concrete.

Flexure Test
For finding flexural behaviour, tests were carried on 100 mm x 150 mm x 1200 mm beam prototypes at the age of 28 days using 1000kN capacity flexural strength testing machine. The test setup includes two point loading using a single point loading system by which the loads are transferred equally to the two points using a spreader beam and two rollers. Dial gauges are placed in the bottom of the beam at the mid-point to find the deflection. Demecs are placed on the surface of the beam to find the surface strain which are placed at a distance of 100mm from one another. The strains at these points are found using a mechanical strain gauge. The crack patterns are noted on both sides of the beams at particular intervals. The gauge length between the loading points are 333.33 mm and 100 mm are left on both sides of the beam at the supports. All the specimens were capped for uniform loading 15 prior testing. The control of load over the test was 10 kN/min. Automatic data acquisition system was used to record the load, strain and axial displacement which in turn connected to the computer.

RESULTS AND DISCUSSION

Compressive Strength

The compressive strength of concrete cubes were found at the age of 28 days. The cubes of size 150 mm x 150 mm x 150 mm were cast and tested at the age of 28 days in compressive testing machine. When age increases, the strength of the concrete gets increased irrespective of all mix combinations. Increase in the age of concrete increase in strength. At the age of 28 days, the control concrete yield 61.8Mpa.From the test results higher compressive strength for concrete was observed for mix GP (10%) with MK (10%) at age of 28 days. The compressive strength development is due to the pozzolanic reaction and filler effects of GP and MK. On the pozzolanic reaction, the GP and MK react with calcium hydroxide and produce more C-S-H gel. This gel is the source of strength of hardened concrete as it is the binder which binds the aggregate together. MK combines with the calcium hydroxide to produce additional cementing compounds, the material responsible for holding concrete together. Hence, less calcium hydroxide and more cementing compounds means stronger concrete. It has been observed during test on controlled specimens that the cracks are developed around coarse aggregates. However, in concrete with SF and MK, the interfacial zone becomes stronger, more homogeneous and dense. Hence, the cracks usually traverse the aggregates.

Flexure Test
Initial Crack Load
The first crack load for beams are cast with optimum mix of glass powder and metakaolin and these optimum value of GP and MK in a ternary combination shows the initial crack load. Replacement of mineral admixture gives high strength so it resist load maximum upto 37kN,38kN,40kN and after that loads it starts a first crack and continues till it attain a peak load.

Peak load
The ultimate load or Peak load for beams of control mix is 65kN , for optimum 1(GP 10% & MK 10%) and optimum 2 (GP 10% & MK 5%) are 64kN and 63.2kN.Itwas observed that the beams cast with Glass powder and Metakaolin showed similar load carrying capacities compared to control beam.

CONCLUSION

From the experimental results presented in this study, the following conclusions has can be drawn, From the literature, this scenario has been observed only in concrete produced with low water/cement ratio in conjunction with use of super plasticizer. The effect of metakaolin is to reduce the workability of HSC with greater reducing effects at high replacement levels. The influence of glass powder and metakaolin on the workability of HSC is slightly higher when compared to the normal strength concrete, which is to improve the workability. For each mineral admixtures (i.e) glass powder and metakaolin, the maximum long-term strength was obtained at replacements levels of GP 10% with MK 10% respectively. Terinary combination of Glasspowder and Metakaolin replaced with cement obtained maximum strength as per given grade of concrete control mix of cube obtained 100% of the grade of concrete M60. Finally concluded that by replacing mineral admixtures glass powder 10% and metakaolin 10% gives high strength of 61.6 N/mm2. Maximum compressive strength value is 12% more than the control concrete. The beam control mixes and optimal mixes (10%GP+10%MK) showed the initial crack and ultimate load. Hence glass powder and metakaolin as a mineral admixtures can be used to get the high strength concrete.

ABSTRACT

Funaria samples were collected from the Jalgaon area of Gautala Wildlife Sanctuary. Antibacterial effectiveness against both Gram-positive and Gram-negative bacteria was investigated in this study. The agar well diffusion method was used to measure the antibacterial activity. Statistical analysis was performed by combining Tukey's Honestly Significant Difference (HSD) test with one-way ANOVA. A significance level (α) of 0.05 is commonly employed .The difference between the means of the treatments was measured using the Q statistic. The means of the antibacterial activity for each species differed significantly according to the results of the one-way ANOVA test. This analysis's Tukey's HSD results offer crucial information on species-specific variations in antibacterial activity. Cefotaxime and aqueous extracts were consistently found to differ greatly.

INTRODUCTION

The second largest group of plants after angiosperms is bryophytes, the first land plant. They spanned the evolutionary divide between vascular plants and algae, including the plant families Bryophyta (mosses), Marchantiophyta (liverworts), and Anthocerotophyta (hornworts). Indian, European, North American, and Chinese traditional medicines have used bryophytes for the treatment of burns, bronchitis, tonsillitis, tympanitis, skin

95614

Deoyani Himmat Patil and Dilip U.Ahire

conditions, and cardiovascular issues (Khanam et al., 2011). Because of their phytochemical makeup, bryophytes have a wide range of biological activities, such as antibacterial, antioxidant, antitoxic, NO generation inhibitory and muscle-relaxing properties. Asakawa (2007) Native Americans, Chinese, and North Americans have long used a variety of bryophytes as herbal remedies. Some species of the Hypnaceae family, such as Mnium sp., Bryum sp., and Philonotis sp., have been used to relieve bum pain. Burned moss ash, combined with fat and honey, has been used as an ointment for cuts, wounds, and bums in the Himalayas (Pant et al. 1986). Mosses that cover the forest with moisture and temperature, prevent soil erosion, and offer seed beds include Funariahygrometrica, Atriam sp., and Pogonatum sp. The pigments of isolated bryophytes showed antibiotic qualities against gram-positive bacteria (Aureobacteriumliquefaciens, Arthrobacterglobiformis, Bacillus brevis, B. cirulans, and B. subtilis), according to a 2003 study by Wakuli et al.A review of the literature indicates that there is little proof of the antibacterial properties of bryophytes found in the Gautala wildlife sanctuary. The antibacterial efficacy of Funaria sp. extract against both Gram-positive and Gram-negative bacteria was the focus of this study.

MATERIAL AND METHOD

Sample collection and Preparation of plant powder
The Gautala Wildlife Reserve in the Jalgaon area is where the Funaria sample was collected. After gathering the plant pieces, they were cleaned with running tap water and autoclaved to remove any remaining dirt. An electronic grinder was used to crush fresh plant leaves after drying for ten days at room temperature. For later use, the dirt-free plant powder was stored in an airtight container at 4 °C (Mehra and De, 2017). The materials were dried and powdered into a fine powder.

Preparation of extracts
A finely ground sample (30 g) was extracted using ethanol and methanol in a Soxhlet extractor, and care was taken to not exceed the boiling point of the solvent. The extracts were filtered through Whatman filter paper No.1 and concentrated under reduced atmospheric pressure. The dry extracts were stored at -20°C. The extracts were dissolved in 5% dimethyl sulfoxide (DMSO) for further experiments.

Antimicrobial activity
Six different species of bacteria were used in this study to explore the effectiveness of the extract in inhibiting growth. The bacteria chosen for this study were both gram-positive and gram-negative bacteria. The six bacterial species used in this study were *Escherichia coli, Pseudomonas auriginosa, Lactobacillus sporogense, Bacillus cereus, Salmonella abony* and *Staphylococcus aurius.* The experiment method adopted for this inquiry was the agar well Diffusion Assay method, it was chosen since it was the easiest and the simplest approach to use.

Agar well Diffusion Assay method
The Agar well diffusion method outlined by Magaldi et al. (2004) was used. A sterile inoculation loop was used to disseminate 100µl of various bacterial cultures in sterile distilled water (SDW) onto the surface of an agar plate using a micropipette. Each culture plate had a hole created using a sterile cork borer. An extract of the various solvents (75µl) was then added. The culture plates were then incubated at 37 °C, and the results were observed after 24 h, depending on the bacterial growth. The clear zone around each well was measured in millimeters, indicating the activity of the extract against the bacterial strain. Each test was performed in triplicate and the mean was calculated.

Statistical analysis
One-way ANOVA was performed in conjunction with Tukey's Honestly Significant Difference (HSD). Typically, a significance level (α) of 0.05 is used. The Q statistic measures the difference between the means of treatments.

Deoyani Himmat Patil and Dilip U.Ahire

Formulate Hypotheses

- Null Hypothesis: There is no significant difference in antibacterial activity among the methanol extract, ethanol extract, aqueous extract, and antibiotic for each bacterial species.
- Alternative Hypothesis: There significant difference in antibacterial activity among methanol, ethanol, and aqueous extracts and antibiotics for at least one bacterial species.

Observation Table

RESULT AND DISCUSSION

ANOVA analysis of the study findings showed that the antibacterial activity of the tested therapies varied significantly (F = 3.423, P = 0.0427). The Aqueous Extract and Cefotaxime (control) were repeatedly found to vary significantly by post-hoc tests such as Tukey HSD, Scheffé, and Bonferroni-Holm. The Scheffé test produced a statistic of 3.4837 with a P-value of 0.0212, whereas the Tukey HSD test produced a Q-statistic of 4.9267 with a P-value of 0.0115. Similarly, with a P-value of 0.0141 and T-statistic of 3.4837, the Bonferroni-Holm test validated the significance. These findings suggest that compared to cefotaxime, the aqueous extract had noticeably less antibacterial activity. The findings of this study correspond with earlier research on the antibacterial activity of plant extracts and medications, such as cefotaxime. Third-generation cephalosporins, such as cefotaxime, are well-known for their broad-spectrum antibacterial activity. The results of this investigation, which showed that cefotaxime had the highest inhibition zones, were in line with those of Khan et al. (2020), who showed notable inhibition zones against pathogens, including Escherichia coli and Pseudomonas aeruginosa. Its strong antibacterial activity can be explained by its mode of action, which targets the formation of bacterial cell walls. In contrast, the aqueous extract exhibited a statistically significant difference (P < 0.05) in antibacterial activity when compared to cefotaxime. This conclusion is in line with the findings of Patil et al. (2018), who found that aqueous extracts had poor efficiency against bacteria, such as Salmonella and Staphylococcus aureus, because they were unable to extract non-polar bioactive chemicals. Additionally, there were no discernible differences between the methanol and ethanol extracts, which is consistent with Sharma and Verma's (2017) findings that both solvents are equally effective at extracting flavonoids, phenolics, and other bioactive substances. However, prior research has shown that organic solvent-based extracts generally have higher antibacterial activities than aqueous extracts. The findings of Singh et al. (2019), who emphasized that antibiotics, such as cefotaxime, routinely outperform crude or aqueous plant extracts, are supported by the substantial difference between the aqueous extract and cefotaxime (Scheffé P = 0.0212). To increase the effectiveness of plant-based formulations, Singh et al. underlined the necessity of further refinement techniques, such as fractionation or synergistic extract combination. Plant-based extracts have potential as substitutes for antimicrobials, despite having comparatively less activity than antibiotics. According to Kumar et al. (2021), medicinal plant extracts in methanol and ethanol showed encouraging antibacterial activity against bacteria, such as Bacillus cereus and Escherichia coli. These findings implied that improving the extraction process and targeting bioactive fractions could boost the effectiveness of plant-based antimicrobials. Overall, although cefotaxime was still the most successful treatment in this study, further research and development are necessary to fully explore and improve the potential of plant-based extracts for antimicrobial applications.

ABSTRACT

Tannery industries play a significant role in polluting an environment when its effluents are released into the water bodies like river, pond and lake etc. Many hazardous toxic metals, including arsenic, cobalt, uranium, nickel, copper, cadmium, lead, mercury and chromium are found in the tannery effluents. One of the extremely poisonous and cancerous toxic heavy metals is Chromium. The high level of toxicity seen in tannery leather wastes is commonly attributed to the containment of harmful substances such as heavy metals, organic contaminants, and dyes. These effluents have been found linked to significant dangers to human well-being, including cancer, and contamination of the environment. The emission of chromium compounds, aromatic amines, and other genotoxic substances, which can cause damage to nucleic acids such as DNA, mutations, and an increasing the risk for cancer in populations exposed to them, is primarily responsible for the carcinogenic potential of tanning leather waste. Different options are required since traditional methods of treatment are not always sufficient to fully mitigate the hazardous effects of these effluents. One environmentally acceptable and long-lasting way to deal with tannery effluent pollution involves microbial detoxifying via bioremediation. Many microorganisms, especially fungi and bacteria have shown the capacity of detoxification as well as break down complicated contaminants, changing dangerous substances into less harmful or harmless forms. These microorganisms have biochemical pathways that can decolorise colours, degrade cancerous chemicals, and lessen the harmful effects of chromium. Investigating bioremediation's potential

95619

John Joseph *et al.,*

not only shows potential for lessening the adverse impacts of tannery wastes to human wellbeing and environment, however, additionally advances the improvement of eco friendly as well as reasonably priced treatment facilities for wastewater. The summary highlights the possibility of bioremediation processes as a critical tactic in reducing the carcinogenic risks caused by tannery effluents and examines the microbiological processes involved with their decontamination.

Keywords: Tannery effluents, Carcinogenesis, Heavy metals, Bioremediation, Environmental challenges.

INTRODUCTION

Among the important challenges facing the globe today is environmental pollution, which is growing daily because of industrialisation and urbanisation. One of India's largest industries is the tanning sector (Srinath *et al.,* 2002). India has over 2,000 tanneries, with many small-scale units spread across states like West Bengal, Tamil Nadu, Maharashtra, and Uttar Pradesh. Vellore district alone hosts 548 tanneries, mainly in areas like Vaniyambadi, Ambur, and Ranipet. Effluents from tanning processes significantly contribute to environmental pollution and groundwater contamination (amala *et al.,* 2023). The tannery business is a significant environmental polluter and has a great potential to affect land and water due to the unintentional disposal of unprocessed effluent. A large amount of trash, both liquid and solid, is released into the environment by numerous companies. The textile and tannery industries are among the many that contribute significantly to the large-scale discharge of waste as effluent (Sarker *et al.,* 2013).The way that industry currently operates modifies the normal distribution of harmful substances and releasing new chemicals into the environment, which is made of by people and other living things. When metals that are heavy or micronutrients accumulate in soil at phytotoxic quantity, it can have detrimental effects on plants and even endanger human health (Mahatma Gandhi *et al.,* 2010). The features of tannery effluent differ significantly amongst tanneries based on factors including tannery size, kind of final product produced, quantity of water consumed, and chemicals used to perform the specific process (Alfredo *et al* 2007).Leather is a stable and putrescible commodity that is composed of animal hides as well as skin that is chemically tanned (Hayelom Dargo *et al.,*2014).One of the world's oldest industries is tanning. On recent times, tanning operations were set up to Satisfy the requirements of the people needs for instruments for music and leather shoes (Durai*et al.,* 2013). Poisonous both solid and liquid waste are contained in the tannery effluent until being released untreated. A lot of water and several chemical compounds that dissolve is utilised in the tanning process of leather (Shakir *et al.,* 2012).Significant quantities of trace metals, chromium, sulphides and carcinogenic organic matters may be found in the tannery waste (Landgrave *et al.,* 1995).Numerous pathogens and odorous liquids consisting of both acidic and alkaline liquors can be present in the tannery waste (Cooman *et al.,* 2003).

Contamination of the environment is considered as one of the greatest consequences that is affecting the today's world, that is getting harsher every day as an outcome of industrial activity (Tadesse *et al.,* 2017; Yadav*et al.,* 2020). Both treated and unprocessed effluents from different industries contain metal chelates and harmful metals (Ammann *et al.,* 2003). Among chemical pollutants, heavy metals can concentrate with the food chain and produce their toxic effects at points far removed from the beginning of the pollution point since they aren't biodegradable (Tilzer*et al.,* 1993).Considering one of the primary causes of pollution, the active release of tannery effluents into the water bodies have become an increasingly serious environmental concern (Bosinc *et al.,* 2000). To make leather appropriate for making many kinds of leather products, such as bag, shoe, wallet, and upholstery furniture, organ metallic salt of Dissimilar toxic metals, such as Cr, nickel, Pb are widely employed as colouring reagents as well as the mordants while on leather dyeing purposes and in other post-tanning and finishing processes (Mahdi *et al.,* 2021; Sivaram *et al.,*2019).In addition to being undesirable, fish that have been exposed to chemicals in surface and subsurface water are known to have several ailments that are transmitted by water, including dermatitis, nausea, bleeding, ulcers on skin and mucous membranes, nasal septal perforations, and extreme inflammation of the respiratory tract (Karim *et al.,* 1994). These metals eventually end up in the soil and water, where they may then move

to various plant tissues (stems, roots, leaves etc.) where some of them perform as essential micronutrients for growth of plants, as well as ultimately enter the human food chain if those plants are eaten (Ahmed *et al.,* 2017; Chen*et al.,* 2014). For the reason of evaluating the environment's safety and biodiversity, pollution from heavy metals surveillance is important.

Industrial Tannery Effluents

The leather manufacturing procedure generates various contaminants in the tannery effluents, which is a major challenge for the industry in terms of effluent disposal. One of the world's oldest industries is tanning. In earlier times, tanning operations were set up to meet the local need for musical instruments and leather footwear. Vegetable tanning and tanning with chrome are both commonly approved techniques for tanning raw hide or skin (Durai and Rajasimman *et al.,* 2011).Ten percent to hundreds of milligrams of chromium per litter can be found in the effluents of these sectors (Dermou *et al.,* 2005).The fabrics and tannery industries are among the many industries that contribute significantly to the massive amounts disposal of waste as effluent (Sarker *et al.,* 2013). One of the largest consumers of water and polluting entities, the textile industry contributes significantly to the production of effluent (Nemerow *et al.,* 1978). Since the tanning process involves turning raw hide or skin into leather, this sector of the economy has the potential for generating a lot of pollution (Ghoreishi *et al.,* 2003).Toxic heavy metal pollution from industrial effluent has a negative consequence on the wellbeing of individuals, animals, and other living things (Garg*et al.,* 2012). discharge of waste from tanneries into the environment, containing substantial quantities of organics and tannins, contaminates the soil and water and poses significant hazards to human well-being and aquatic organisms (Gibb*et al.,* 2000). Being one of the main sources of pollution, an intentional release of tannery effluents into sources of water is now an increasingly serious problem for the environment (Bosinc *et al.,* 2000).The tannery effluents that have contaminated the air, land, and water are associated with number of illnesses. Due to this fact that manufacturing leather frequently produces substantial quantities of toxic waste, the concentration of tanneries has an ability to cause an adverse impact on the environment and public health (Pastapure *et al.,* 2023).Because of the development of the tannery industry, pollutants released from leather tanning have become one of the primary industrial pollutant sources. (Rajamani *et al.,* 2018).Even though they function a significant role in the economic growth and employment in many nations, tannery has been recognised as a feasible contributor of pollution from toxic metals to the environment (Mondal *et al.,* 2020).Improvement of the finished top leather's waterproof qualities produced from cow hides from Bangladesh (Euro *et al.,* 2019). Basic chromium sulphate (BCS), an important chromium (Cr) salt, is used in significant amounts all through the tannery processing to give tanned leathers with excellent hydrothermal stability and other special characteristics (Ozkan *et al.,* 2019). Among the primary sectors that has grown globally, particularly in Turkey, Brazil, Bangladesh, China, India, and Pakistan, is tanning leather (Moktadir *et al.,* 2018).As the tannery industry developed, tannery effluents have grown into the primary sources of industrial pollutants (Rajamani *et al.,* 2018). Both water and solid waste are released into the environment by these kinds of companies in huge amounts. These businesses produce trash that contains both inorganic and organic materials that are extremely hazardous, carcinogenic, and mutagenic (Sarker *et al.,* 2013).In terms of exporting and producing leather, India is ranked third. In overall, Tamil Nadu, West Bengal, Uttar Pradesh, Andhra Pradesh, Karnataka, Punjab, Maharastra and Rajasthan belong to the countries with over 3000 tanneries installed (Chaudhary *et al.,* 2017).

Toxic heavy metals in tannery effluents

Heavy toxic metals such as Lead, Cd, Chromium and copper are frequently employed as colouring reagents as well as the mordants (Mahdi *et al.,* 2021;Sivaram *et al.,* 2019).When these heavy toxic metals get into contact with people or animals via water contamination, they may trigger bone disorders. These metals include Cr, Fe^{2+}, Zn^{2+}, Cu^{2+}, Ca^+, and Na^+ (Tamburlini *et al.,* 2002).It was found that as the tannery effluent percentage increased, so did the chromium level (Camargo *et al.,* 2003).Trivalent and hexavalent chromium are the two different forms of Chromium salt that result from the following reaction, which is why tannery companies employ it extensively when making animal products (Samrithi *et al.,* 2012).Basic chromium sulphate (BCS), an important chromium (Cr) salt, is utilised in significant amounts during the tanning process to give tanned leathers improved hydrothermal stability and other special qualities (Ozkan *et al.,* 2019).The chemical element chromium (Cr) is hard and shiny (Panda *et al.,* 2012).One of the most hazardous substances frequently discovered in tannery waste is chromium (Sultan *et al.,* 2005). Although

95621

chromium (Cr) can exist in any number of oxidation states, the Cr^{3+} and Cr^{6+} species are the most stable and have distinct chemical properties and biological consequences (Cervantes *et al.,* 2001).One of the most hazardous heavy metals releases into the environment through various kinds of industrial effluents is chromium, which is generated by the tanning of leather, electroplating, paints, pigments, and steel (Dermou *et al.,* 2005). Tannery wastewaters release significant quantities of various toxic heavy metals such as Cr, Cadmium, Cu, Nickel, lead, Ba, Arsenic and iron (H.I. Adel-Shafy *et al.,* 1995).In addition to causing pollution in the environment, certain toxic metals are considered as dangerous substances because they interfere with normal cellular functions, which can have anadverse effect on human wellbeing and plant materials (S. Sinha *et al.,* 2007; Xaba, *et al.,* 2018).According to Fu *et al.,* (1994), most of these effluents contain complicated mixes made up of inorganic compounds. These compounds include metals like Cr, Fe^{2+}, Zn^{2+}, Cu^{2+}, Ca^+, Na^+, and others, as well as anions like SO_4^{2-}, NO_3^-, and PO_4^{3-} that can be found in the effluents or trapped in the suspended matter (Bosinc *et al.,*2000).Phenomena like suspended solids (SS), chromium, sulphide, chemical oxygen demand, biochemical oxygen demand, etc. can be used to describe the pollution of tannery effluent (Buljan *et al.,* 2011).Furthermore, the tanning process has a major impact on the wastewater's pH, total suspended solids (TSS), chemical oxygen demand (COD), total dissolved solids (TDS), biological oxygen demand (BOD), concentrations of T Cr, Cr^{3+}, Cr^{6+}, Cl, sulphate, sulphide, and inorganic components. According to a report by the United Nations Industrial Development Organisation (UNIDO 2000), over 175 different chemicals are employed in every phase of the tannery, such as enzymes, Ca $(OH)_2$), (Cl),H_2SO_4), (T Cr), (CH_2O_2), (NH_4Cl), $((NH_4)_2SO_4)$, non-identical metallic salts, and organic compounds (Mannucci *et al.,*2010; Ali *et al.,* 2015). An element that exists naturally in gases, plants, volcanic dusts, rocks, animals and soil is chromium. It is found in +2 to +6 oxidation states, among others. The Cr^{6+} and Cr^{3+} forms are the most stable (Garg*et al.,* 2012). Some investigations revealed that toxic metals such as Cadmium, Arsenic have carcinogens or harmful impacts on people and the environment. Traditionally, chemical reduction, precipitation, exchange of ions, and absorption on coal, kaolinite, alum, fly ash and activated carbon are used for detoxification and eliminate Cr 6+ from the environment (Ohtake *et al.,* 1994).A number of physical and chemical processes are involved in the processing of leather from animal hides and skins, including   tanning, pickling, de-liming, skin degreasing, liming or unhairing, bating, and raw hides dyeing and skins using various chemicals, such as enzymes, lime, Cl, H_2So_4 ,HCOOH, ammonium salts, various metallic salts, and organic chemicals, among others (Ali *et al.,* 2015).Among the heavy elements found in tannery effluents include lead, arsenic, cadmium, cobalt, copper, selenium, mercury, and azo dyes. Hexavalent chromium (Cr (VI)) is believed as harmful metal that has the potential to disperse in universal solvent and permeate into the living cells and get associated with the proteins and nucleic acids (Samrithi *et al.,* 2012).

Effects of tannery effluents on soil and plant production
The term "environmental quality" describes the traits and qualities of the environment that have an impact on people and other animals. Based on the requirements of any number of species or people, it assesses the state of an environment. Tannery effluents are the most polluting of all industrial pollutants (Haque *et al.,* 2019). The Buriganga River is contaminated by sewage, oil, polymers, dead animals, residential trash, clinical waste, and mill and industrial waste. Environmentally friendly both liquid and solid tannery wastes are treated and dumped unprocessed onto the Buriganga River along with other connected rivers (Zahid *et al.,* 2006).In Bangladesh, the leather industry has long been concerned about the release of unprocessed waste from tanneries into water bodies. (Asaduzzaman *et al.,* 2016). Tanning processes damage the soil with dangerous heavy metals, and heavy metals build up in crops throughout cultivation. The substantial amount of hazardous metal-containing solid waste from the tannery industry is converted into protein concentration and supplied to hens (Islam *et al.,* 2014). High salinity was discovered when discharging effluents containing high quantities of sulphate, ammonia, chloride, sodium, chloride, total dissolved solids and nitrate. Due to an inadequate tanning procedure, pollutants exceeded the threshold level, making the incoming river water hazardous and unfit for animal and human consumption as well as the survival of fishes and other aquatic species. In addition, the use of polluted river water on agricultural purposes reduced soil fertility and created soil toxicity. Tannery effluents contained toxic metals and inorganic compounds, including Arsenic As, Mn, Zn,Pb,Cr, Cd and zinc (Zn). Among other uses, agriculture, poultry husbandry, and fishing operations were the principal ones that made use of tanning wastewaters. These procedures result in the buildup of toxic tannery effluents in human health, which leads to a range of ailments. Dhaka City Corporation

(DCC) has made reducing tannery wastewater a high priority. Many dangerous substances are released on to the soils as a result of tannery effluents not being treated. Plants that accumulate too much chromium may have decreased growth of plants, chlorophyll content, photosynthesis, enzyme activity, and even destruction of their mitochondria and chloroplasts. (Guilizzoni 1991). Salt stress inhibits the synthesis of enzymes necessary for seed germination or slows down metabolic processes (Ashraf *et al.,* 2002). The health of people and animals was negatively impacted by the carcinogenicity of Chromium, Lead and Cadmium in a number of ways. Therefore, authorities must move swiftly to stop the pollution of heavy metals (Rahaman *et al.,* 2016). Therefore, consuming these veggies grown in the research location must have negative effects on public health. Because of their fast growth and the way that metals and metalloids are transferred to their leafy parts, vegetables are more prone to toxic metals and metalloid contamination (Chang *et al.,* 2014). In all the nation's developed regions, soil contamination has grown to be a significant issue. It is widely acknowledged that soil serves as the primary repository for both inorganic and organic pollutants are discharged into the environment by industrial wastewater. Soil serves as a growing medium for many plants and animals, enabling them to grow and develop throughout time. When toxic metals or micronutrients are present in soil at phytotoxic amounts, it can have detrimental effects on plants and even endanger the health of humans. Excessive metal accumulation impacts the development of plants and their metabolism and causes an increase in reactive oxygen species generation. (Mahatma 2010). The other elements of habitats exposed to heavy metals and industrial effluents include vegetables. Growing in contaminated areas, they have the potential to absorb and accumulate harmful metal concentrations from tannery industries, such as Cr (VI) (Weigert1991).

Industries such as textile, tanning leather, electroplating, pigment and paint production, mining and fertilizer utilize a lot of chromium (Unal *et al.,* 2010; Ganguli and Tripathi, 2002). These businesses release Cr^{3+} and Cr^{6+} into the soil, surface waters, and vegetables along with waste effluent. profiles of soil most animals and plants depend on the soil as their development medium for ongoing development and expansion. Many times, the discharge of effluents from industries, particularly from tannery outflow, leads in the presence of pollutants of both organic and inorganic forms that negatively impact the ability of life to persist in the soil matrix. The main causes of contamination by heavy metals in the nearby agricultural soil that has been used for irrigation are the leather factories in Jajmau, Kanpur. If sludge is employed for Agricultural purposes, it can lead to the deposition of toxic heavy metals such as Cd, Zinc, Cr, Nickel, lead and Manganese in soil surfaces. It can also release these metals into underground water or soil solutions that are available for plant absorption because of the ability of the soil to store heavy toxic metals is reduced. When toxic metals or micronutrients are present in soil at phytotoxic amounts, it can have detrimental effects on plants and even endanger public health (Murugesan *et al.,* 2008). The soil's high chromium concentration is a result of agricultural lands being irrigated with effluent full of tannery effluents, which has a high chrome sulfate concentration (Mohd, 2008). Irrigation with a lot of wastewater Water has an impact on the development and yield of plants (Barman and Lal, 1994), and the food chain biomagnifies the buildup of hazardous heavy metals at various trophic levels. Tannery wastewater has phytotoxic effects and high heavy metal accumulation that stresses plants (salinity stress, for example, affects several metabolic processes and reduces the plant's ability to grow vegetatively and later for reproduction). It also negatively impacts respiration, photosynthesis, shortens the time it takes for germs to sprout, and inhibits mitotic activity (Camplin, 2001).

Effectsof Tannery Effluents on Poultry Feed Production and Livestock Production Sector
According to (Kanagaraj *et al.,* 2006 and Bari *et al.,* 2015), the most common solid wastes generated in tanning leather sectors were chrome shaving, fleshing, buffing waste and keratin, skin trimmings. The extent of Pb and cadmium (Cd) in chicken meals already have beyond Egyptian and WHO safe standards, reflecting the state of the local population's health. Analysis based on each research claims that the presence of heavy toxic metals in feedings affects bird, posing an illness to human beings who ingest chicken meats which is contaminated (Islam *et al.,* 2014). A balanced diet was created by combining several feed stocks with locally produced protein concentrates obtained from solid waste from tanneries. Two things were considered. The first was the level of heavy metals, which had decreased because of dilution in the finished diet. Where these protein concentrations were used to create chicken diets, though, didn't really matter. Conversely, these proteins were mixed with the feed staffs. The feed personnel may also contain metals that are toxic (Hossain *et al.,* 2007). (Tinni *et al.,* 2014) carried out an investigation on animal

husbandry in the location called Hazaribagh tanning leather place and found that the high levels of chemical deposition made it impossible for those who worked in production of live stocks to safeguard their animals on exposure from hazardous chemical. The illness claimed many animals' lives. It was discovered that the animal farm in that research zone was unnecessarily diminishing because of the discharge of harmful tannery effluents. In public spaces, solid garbage was disposed of and disposed of. Unplanned discharge of liquid waste occurs without treatment. Livestock also ate these toxic wastes, which caused them to contract several illnesses. The heavy metals in tannery effluent had an impact on the neurological system, liver, and kidneys. According to Verma *et al.,* 2018), chromosomal abnormality, embryotoxicity, and steroid genic dysfunction are the main causes of prolonged duration toxic metal exposure to the reproductive organs.

Effects of tannery effluents on fisheries production

Numerous research show that untreated tannery wastewaters damage aquatic resources and lower fish production when they are released into water bodies. Fish consumed parts of the tannery wastewater. Fish production was decreased by the unmanaged and unprocessed tannery effluent flow into open water bodies (Tinni *et al.,* 2014). Cr, Zn, Pb, Ni, Mn and Cd and were discovered to be contaminated in fish feed supplies in Hyderabad. All sample types had average chromium (Cr) concentrations that were much higher than the capital's maximum permittable level for tannery waste. If consumed by fish or fowl, tanniny feces can damage the liver, kidneys, and induce cancer (Akter *et al.,* 2020). Many studies have found that waste from tanneries undergo insufficient treatment before being released into bodies of water, which harms fish productivity and aquatic resources. One such study (Tinni *et al.,* 2014) found that effluents released from tanneries negatively impact on fishing economically. Fish production was lowered by the uncontrolled and unprocessed tannery wastewater being released into open reservoirs of water. The Buriganga River's physiochemistry was changed by these wastes (Tinni *et al.,* 2014). Waterquality is lowered by the existence of organic debris, sulphides and other hazardous substances in tannery effluents. The general aquatic environment and fish health are impacted by this pollution. Fish are extremely sensitive to hexavalent chromium (Cr (VI)). Survival and development rates are impacted by the physiological and biochemical alterations it brings about. Other aquatic animals and fishes cannot live in the water due to oxygen depletion caused by the elevated levels of organic matter from tannery wastewater (Dhanam *et al.,* 2013). Fish species may experience extreme stress from tanning effluents, which could result in significant mortality rates. Chronic exposure to toxic chemicals can diminish reproductive success and induce abnormalities in fish larvae. It can also affect metabolic processes. Fish metabolism is hampered by sub-lethal effluent concentrations, which affects development and reproduction. Fish tissues bioaccumulate heavy metals including lead and chromium, which can have harmful impacts further up in the food chains (Padmini *et al.,* 2008).

Effects of tannery effluents on human health

Being susceptible to Cr (VI) can cause various kinds of respiratory diseases, including allergies, oedema, itching, and irritation. Amongst the negative effects associated with Cr (VI) exposure include lung cancer, renal disease, and epidermal problems (Farag *et al.,* 2010). Carcinogenicity is determined by genetically induced changes in a cell's DNA as well as environmental variables. These involve lifestyle factors (diet, exercise, alcohol and tobacco use, etc.), naturally occurring exposures (radon gas, infectious agents, ultraviolet light.), and medical treatments (medications and radiations, such as hormone drugs, chemotherapy, immune system suppressors.). The nearby ecosystem and human well-being are put at risk by the toxic metals and harmful chemicals present in wastewater (Shakir *et al.,* 2012). Chromium is an important element but while over exposing, generates allergic dermatitis; ulceration in the mucous membranes, skin and nasal septum; increases opportunities of respiratory-tract cancer and genotoxic and cytotoxic implications and renal tubular necrosis (Flavio *et al.,*).Variety of bacteria resistant to chromium that were collected from dichromate-contaminated soils (Lu *et al.,* 1995). Workers in tanneries who are exposed to extend levels of radiation for prolonged duration of time—five months to fourteen years—pose a real risk of acquiring disorders linked to genetic adverse effects. The toxic effluents of Cr, H2S, Pb, Zn, Cd, and formaldehyde released by tannery are unknown to them. These pollutants can cause short-term illnesses like headaches, dizziness, allergic reaction irritation of the skin, eyes or lungs, poisoning of the kidney, liver or nervous system, or collapse due to oxygen deprivation; they could cause long-term illnesses like dermatitis, ulcers, bronchitis, genetic defects, and occupational

asthma (Rajendran 2010). Although numerous chemicals are exposed during the production process, some of which are being shown to be carcinogenic to individuals, the International Agency for Research on Cancer (IARC) claims that processing and tanning of leather cannot be classified as carcinogenic to humans. IARC monographs on assessment of individual carcinogenic risk (WHO 1987).Certain researchers have hypothesised that exposures to tanning industry products could lead to a range of distinct cancers, such as those of the pancreatic cancer, bladder cancer, lung cancer, kidney cancer, oral cavity, nose, and soft tissue sarcomas, in addition to skin conditions, dermatitis, ulcers, perforations of the nasal septum, and respiratory ailments. Previous study has indicated that workers in tanning industries might have been exposed to a variety of acknowledged or suspected occupational carcinogens, such as arsenic, Cr6+ salts, and organic solvents (Butyl acetate, toluene, benzene, ethanol, formaldehyde, acetone, acetoacetate) (Bonassi *et al.,* 1990) (Seniori Costantini *et al.,*1990; Montanaro *et al.,* 1997).These organisations produce trash that contains inorganic as well as organic substances that are highly dangerous, carcinogenic, and mutagenic (Sarker. B *et al.,* 2013).

Skin cancer
Workers who are directly exposed to leather colours and fats run a chance of developing skin cancer. In addition, melanoma and nonmelanoma skin cancer have been detected in some filling and decorating procedures. Recent research (Veyalkin *et al.,* 2006) found that women working in dyeing, stuffing, and decorating crafts showed a high mortality rate for melanoma and skin malignancies.

Pancreatic cancer
Chromium chemicals are responsible for of the high death rate from pancreatic cancer in women. Chromium III promotes the growth of pancreatic cancer, while azo dyes and/or formaldehyde can lead to DNA mutations (Ghadirian *et al.,* 1991; Di Menza *et al.,* 1992) (Vineis *et al.,* 1985).

Bladder cancer
Dyes based on benzene and aromatic amines were believed to be possibly carcinogenic. Tanners who had been exposed to benzidine-based dyes reported significant increases in premature death from bladder cancer, which improved with exposure time (Vineis *et al.,* 1985).

Bioremediation of tannery effluents using microbes
Tannery effluent treatment is a multi-step procedure that cleans wastewater prior it is released onto land, into a natural body of water, or to be recycled (Buljan *et al.,* 2011).The elimination of hazardous compounds from discharge has been extensively explored using Microorganisms involved fungus, bacteria, and algae. Cr^{6+} can be reduced to Cr^{3+} by most bacteria. (*Pseudomonas sp.,*) (Arellano *et al.,* 2004).Many chromium-reducing bacteria that have been identified and collected come from industrial effluents and soil wastewater that has been contaminated with chromium (McLean *et al.,* 2000).A strain from deep-sea sediment named *Lactobacillus paracase* was able to reduce chromium (VI) and remove azo colouring (Huang et al.,2015).Three processes—bioaccumulation, biosorption, and enzymatic reduction—allow microorganisms to interact with hazardous metals and facilitate their elimination or restoration (Srinath *et al.,* 2002). The detrimental effects and mobility of chromium pollutants in water and soil are reduced when chromium with hexavalent state is reduced to chromium with trivalent state(Kapoor *et al.,*2002).The capacity of bacteria to absorb chromium is 34.5 milligram per gram dry weight for *Bacillus circulans* and 32.0 milligram per gram dry weight for *Bacillus megaterium* (Srinath *et al.,* 1999).By forming a trivalent chromium precipitate, facultative anaerobic bacteria including *Aeromonas dechromatica*, *Pseudomonas chromatophila*, and *Pseudomonas dechromaticans* remove Cr (VI) from solution. An ability to reduce Cr6+ is extensive and has been documented in a variety of organisms, including *Pseudomonas ambigua, Pseudomonas fluorescens, Pseudomonas aeruginosa, Bacillus subtilis, Micrococcus roseus, Achromobacter eurydice, Bacillus cereus* and *Escherichia coli* (Sudha Nayar *et al.,* 1985) (Sumit Yadav *et al.,* 2005).Using flasks as batch reactors, S. Shakoori*et al.,* (2000) identified Gram-positive bacteria, resistant to dichromate, from tannery effluents (Shakoori *et al.,* 2000).The biological technique of treating wastewater is a crucial and simple process that uses biological materials, such as fungi and bacteria, to carry out the treatment process. Compared to physical-chemical treatments, biological treatment approaches are more economical.

Many microbes can degrade these contaminants in order to gain nutrients and energy for development (Metcalf *et al.,* 2003).Utilising anaerobic bacteria that thrives without the presence of oxygen, an anaerobic process typically much longer to remediate (Midha *et al.,* 2008).It has been observed that so many species, including *Escherichia coli, Bacillus sp.*, *Pseudomonas sp.* and *Flavobacterium sp.*, were effective at breaking down complex metals and other xenobiotics found in wastewater. The main constituents of tannery waste are protein and chromium. Many animals may get poisoned by metals. Thankfully, Microorganisms can beable to modify the mobility and reaction of Heavy metals. Microbes that influence the mobility and reactivity of metals and stop further metal contamination (Calormiris *et al.,*1984). The reduction of Cr6+ toCr3+, which is harmless, non soluble in H2O form of chromium, could be catalysed by Microorganisms selected from both Cr6+ deposited and non-contaminate soils and sedimentations. This shows the value of using a selection approach for nativeCr6+ reducing bacteria in a bioremediation process (Kapoor *et al.,* 1997).

CONCLUSION

The link between an industrial tannery effluent and the toxic heavy metals present in the effluents causing the serious environmental pollutions like land, soil and air and water pollutions due to discharge of unprocessed waste effluents into land, soil, air and water bodies like rivers, lakes and ponds respectively. This tannery effluents associated toxic heavy metals also causing the adverse effects on human beings such as skin irritation, DNA mutation, and certain types of cancer. To overcome all these problems, there are so many ways to degrade the toxic heavy metals from high harmful to less harmful. Among all the ways one of the efficient methods is Microbial bioremediation. By this method the toxic heavy metals particularly chromium is highly reduced. Bacteria and Fungi have the capacity to detoxify the dangerous heavy toxic metals. This biological method of detoxification is very easy and cost effective while comparing with the physical and chemical method of detoxification. This article briefly believes that the Microorganisms play a vital function in the protection of public health and an environment in all possible ways.

ABSTRACT

This study explores real-time business intelligence (RTBI) at a rubber tyres manufacturing company, focusing on its impact on decision-making and operational efficiency. With data-driven insights playing a crucial role in modern business, the research highlights how RTBI tools enhance productivity, reduce response times, and improve strategic planning. The study delves into the technological infrastructure, data integration processes, and analytical frameworks used, illustrating how RTBI provides real-time monitoring, predictive analytics, and performance optimization. Key findings indicate that effective RTBI implementation leads to improved supply chain management, customer satisfaction, and competitive advantage. Furthermore, the study discusses the challenges of adopting RTBI, such as data security, integration complexities, and employee adaptability, while providing recommendations for successful implementation. By leveraging RTBI, the company, can achieve its competitive advantage.

Keywords: Real-Time Business Intelligence (RTBI), Operational Efficiency, Data Analytics, Cost Reduction, Decision-Making

INTRODUCTION

Real-time business intelligence is an approach to data analytics that enables business users to get up-to-the-minute data by directly accessing operational systems or feeding business transactions into a real-time data warehouse and business intelligence (BI) system. The technologies that can be used to enable real-time BI includes data virtualization, data federation, enterprise information integration (EII), enterprise application integration (EAI)and service-oriented architectures (SOA). Complex event processing tools can be used to analyses data streams in real

time and either trigger automated actions or alert workers to patterns and trends. Real-time BI can help to support instant decision-making, which is necessary, for example, if a company sells clothing online. The company's website and representatives at the company's call Centre need to have the same up-to-the-minute data by directly accessing operational systems or feeding business transactions into a real-time data warehouse and business intelligence (BI) system, real-time business intelligence is a method of data analytics that gives business users access to the most recent information. In real time BI can assist in facilitating prompt decision-making, which is required, for instance, if Clothing is sold online by a corporation. The business's website and employees at the business call center must have the same current information. Real-time business intelligence is a method of data analytics that gives business users access to the most recent information. Real-time BI can be enabled by a number of technologies, such as data virtualization, data Enterprise Application Integration (EAI), Enterprise Information Integration (EII), and federations well as SOA (service-oriented architectures). Advanced technologies for event processing can be utilized to Real-time data stream analysis by either initiating automatic processes or notify employees of tendencies and patterns. In real time BI can assist in facilitating prompt decision-making.

REAL-TIME BUSINESS INTELLIGENCE
Software for real-time business intelligence transforms unstructured data into insights that a company may use to quickly obtain the information it needs. Businesses to employ real-time business intelligence technologies for identifying new business prospects and make better decisions. Additionally, intelligence is utilized to find business possibilities, identify cost-cutting initiatives, and respond swiftly when providing data and offer insightful analysis. Platforms for business intelligence can assist companies in achieving the following goals:
• Give people access to the greatest decision support system available.
• Enhance company plans and provide fast, concise information.
• Provide information for analysis and reporting.
• Find hidden behavioral patterns and new market opportunities.
• Boost operational effectiveness and business performance

REVIEW OF LITERATURE

In **2024, Dr. Maria Rodriguez** the function of technological innovation in real-time business intelligence (RTBI) is examined in this study. The authors investigate how RTBI is affected by cutting-edge technologies like blockchain, artificial intelligence (AI), and the Internet of Things (IoT). The research further highlights the opportunities and difficulties involved in putting these RTBI technology. RTBI is becoming a crucial part of corporate decision-making. But the necessity for real-time insights and the growing complexity of company data have presented RTBI with fresh difficulties. New technologies like blockchain, IoT, and AI provide fresh prospects for RTBI. **Ramirez-Aristzabal & Oliveira Moraes (2024)** A bibliometric study of BI research trends from 2014 to 2024 showed a move away from retrospective analytics and towards real-time decision making. After analyzing 2,442 research publications, they found that automation, AI integration, and real-time data processing are important new themes. They also draw attention to research voids, like the absence of cross-disciplinary cooperation between businesses The need for additional research on the acceptance of BI in the behavioral and cognitive sciences emerging markets. The results indicate that ethical considerations should be the main focus of future BI research. **Chebrolu (2025).** AI, data governance, and real-time analytics systems tailored to a particular sector. By automating data, artificial intelligence (AI) has revolutionized corporate intelligence, according to gathering, processing, and forecasting. Historical data was the foundation of traditional BI systems. However, AI-powered RTBI provides real-time information.

NEED OF THE STUDY
Assess RTBI's Effectiveness in that particular company
• Determine how RTBI improves operational efficiency, decision-making, and monitoring of performance.

Increase Cost Effectiveness and Business Operations
- Being aware of how RTBI reduces operational costs and streamlines procedures expenses, and improve the company's framework and overall effectiveness.

Assess How RTBI Affects Business Performance
- Researching the role that RTBI plays in important business indicators like productivity, the company's' operational agility and revenue growth.

SCOPE OF THE STUDY

Every employee in the company will have access to real-time business intelligence, which is integrated into numerous business processes. Even though there are numerous technologies that execute this idea; there are still a lot of obstacles to overcome. major obstacles such as process automation, semantics-based information fusion, and automated analytics have been described, along with some examples that demonstrate the viability of the vision. Technological advancements such as soft computing, intelligent data analysis, and the development of RTBI will heavily rely on ontologies. There are already indications that BI solutions are starting to evolve and shut the loop into RTBI programs. At the moment, it is noted that manufacturers of analytical tools are entering the space for commercial applications.

OBJECTIVES OF THE STUDY
- To identify about the Real time business intelligence in an organization located at, Kottayam.
- To estimate how implementation of RTBI system has helped the organization to reduce the mistakes of the future.
- To learn how implementation of RTBI system has helped the organization in taking better decisions for the future.
- To examine the role of RTBI in preventing production delays.
- To evaluate the challenges in implementing RTBI.
- To identify the adoption level of RTBI in manufacturing organizations.

LIMITATIONS TO THE STUDY
- There is limited access to sensitive data; the study is limited to that particular organization.
- Primary sources were used to gather the majority of the research's data. There is possibility of personal prejudice, hence the accuracy might not be accurate.
- Only a small number of respondents participated in this survey.
- Another limitation on the study was the short survey period.
- In-depth research was not feasible due to time constraints.
- The information supplied by the respondents served as the foundation for the study's conclusions.

RESEARCH DESIGN

One strategy for methodically resolving research issues is research methodology. It directs the researcher to conduct the study in a scientific manner. It includes several phases that are often chosen by a researcher to examine his research issue and the reasoning behind it. The research approach comprises the reasoning behind the techniques.

DESIGN SAMPLE

Judgmental sampling is the sample design that is employed. With this approach, the researcher's judgment is used to choose the population's components, guaranteeing that only individuals who possess pertinent information and skills are incorporated into the research. Another name for this technique is as purposive sampling since the

investigator carefully selects the most qualified respondent's ability to offer insightful information. Real-Time Business Intelligence (RTBI) research of this company, the participants are chosen according to their background, position, and participation in the use and execution of RTBI. Among the important attendees are IT specialists, RTBI is actively used by managers, decision-makers, and staff members, guaranteeing that the data gathered is significant and pertinent to the goals of the study.

THE SIZE OF THE SAMPLE

The sample size that satisfies the requirements of effectiveness, representativeness, dependability, and adaptability is referred to as an optimal sample. The sample size chosen for the research is 60 employees from different streams.

DATA COLLECTION TOOLS

Data Sources
- Primary data
- Secondary data

CONDUCTED STUDY

Original Information

Original information gathered by researchers directly from their sources is referred to as primary data, origin of interest. This information is acquired using techniques like surveys, questionnaires, measurements, observations, tests, or interviews conducted especially for the ongoing investigation. Given that original data is gathered straight from the participants or phenomenon under investigation. Primary data was gathered via a well-designed questionnaire.

Survey

For this, a questionnaire with 29 multiple-choice questions was created . The staff members of the company, were given the questionnaire. Finding out more about "A study on Real-Time Business Intelligence" was the goal. In response to each question, the respondents expressed their opinions.

STATISTICAL TOOLS

Statistical techniques are used to analyze the data. The data gathered is analyzed using simple percentage analysis.
- Regression
- The U-Test
- The correlation coefficient
- The mean deviation
- The variance coefficient

DATA ANALYSIS

Question Number	Survey Question	Key Findings	Statistical Analysis
1	Gender Distribution	82% Male, 18% Female respondents.	Simple Percentage Analysis
2	Age Distribution	Majority (28%) aged 35-44; 27% are 45+.	Percentage Distribution
3	Employment Type	60% Permanent, 27% Temporary, 13% Contract.	Percentage Calculation
4	Job Title	43% Managers, 35% Data Analysts, 22% Supervisors.	Bar Graphs & Pie Charts

5	Department of Work	40% work in IT/Analytics; 22% in Production.	Categorical Analysis
6	Monthly Income	42% earn ₹25K-₹35K; 23% earn ₹35K-₹50K.	Income Distribution Charts
7	Educational Qualification	53% hold Bachelor's Degree; 37% Master's Degree.	Education-Level Analysis
8	Years of Experience	43% have 1-5 years experience; 38% have 6-10 years.	Experience-Level Comparison
9	RTBI System Usage	100% confirmed company uses RTBI.	Binary Yes/No Analysis
10	Familiarity with RTBI	58% Very Familiar, 42% Somewhat Familiar.	Knowledge-Level Analysis
11	Need for Quick Decision-Making	100% need real-time decision-making.	Decision Speed Analysis
12	Types of Reports & Dashboards Used	53% use Summary Reports, 30% use Trend Analytics.	Report Type Classification
13	Success Measurement of BI Initiatives	42% measure BI success by ROI; 33% by Time Savings.	ROI vs Time Savings Comparison
14	Digital Transformation Level	70% have Full-Scale Digital Transformation.	Digital vs Traditional Business Model
15	RTBI Impact on Cost Reduction	88% believe RTBI helps in Cost Reduction.	Regression Analysis on Cost Reduction
16	Tools Used for Data Analysis	55% use Power BI, 35% use Excel.	Tool Preference Trend
17	Frequency of Real-Time Data Access	50% access data Daily, 30% Continuously.	Frequency vs Productivity Correlation
18	RTBI Influence on Production Targets	88% say RTBI improved Production Targets.	RTBI & Manufacturing Impact Study
19	Training on New Technologies	87% receive Regular Training on RTBI.	Training Effectiveness Graphs
20	Primary Business Objective for RTBI	40% use RTBI to Improve Efficiency.	Key RTBI Objectives Breakdown
21	Employee Involvement in RTBI Decisions	62% highly involved in RTBI decisions.	Decision-Making Correlation Analysis
22	Challenges in Using RTBI	42% face Complex Tools, 25% struggle with Change.	Challenges & Usability Trends
23	Reliability of IT Infrastructure	77% find IT Infrastructure Highly Reliable.	Reliability Scorecard Analysis
24	RTBI Impact on Manufacturing Effectiveness	88% say RTBI improves Manufacturing.	Manufacturing Efficiency Index
25	Usefulness of RTBI Alerts	80% find RTBI Alerts Useful.	Alert Response Effectiveness
26	Feedback Collection on RTBI Systems	Yes, company collects RTBI feedback.	Feedback Mechanism Efficiency
27	Capability of Handling Real-Time Data	83% say tools can handle Real-Time Data.	Real-Time Data Handling Index
28	Satisfaction with BI Capabilities	50% Highly Satisfied, 28% Satisfied with BI.	Satisfaction Level Distribution
29	Types of Decisions Requiring Real-Time Data	62% use real-time data for Operational Decisions.	Operational vs Strategic Decision Dependency

Jissa Sabu and Geetha

MEAN

The mean, often referred to as the average, is a measure of central tendency in a set of data. It is calculated by adding up all the values in the dataset and dividing by the total number of values.

OBJECTIVES

To find out mean of monthly income

STEP-1:

TABLE :1

MONTHLY INCOME	MIDPOINT(f)	NO. OF RESPONDRNTS(x)	f.x
Less than 15000	0	0	0
15000-25000	20000	13	260000
25000-35000	30000	25	750000
35000-50000	42500	14	595000
Above 50000	50000	8	400000

STEP-2:

$$\bar{x} = \frac{\sum fx}{N}$$

=260000+750000+595000+400000

$$= \frac{2005000}{60}$$

=₹33416.67

Conclusion

The calculated value of mean is ₹33416.67

U-TEST

The Mann-Whitney U test is a non-parametric statistical test used to determine whether there is a significant difference between the distributions of two independent groups. It assesses whether one group tends to have larger values than the other, without assuming a normal distribution of the data.

STEP-1: First, frame the null and alternative hypothesis.

The null hypothesis (H$_0$)

There is no relationship between the organisation using RTBI system Vs the RTBI provides insights to help in cost Reduction.

The alternative hypothesis(H$_1$)

There is a relationship between the organisation using RTBI system Vs the RTBI provides insights to help in cost Reduction.

STEP-2:

TABLE :2

Using RTBI (X)	Cost Reduction (Y)
60	53
0	7
∑X=60	∑Y=60

95636

Jissa Sabu and Geetha

$n_1=2$ $n_2=2$

Data:	60	0	53	7

Ascending order:	0	7	53	60

Rank:	1	2	3	4

$R_1=1+4=5$

$R_2=2+3=5$

$$U_1 = R_1 - \frac{n_1(n_1+1)}{2}$$

$$= \frac{5 - 2(2+1)}{2}$$

$$= \frac{5 - 2(3)}{2}$$

$$= 5 - \frac{6}{2}$$

$U_1 = 5 - 3 = 2$

$$U_2 = n_2 - \frac{n_2(n_2+1)}{2}$$

$$= \frac{5 - 2(2+1)}{2}$$

$$= \frac{5 - 2(3)}{2}$$

$$= 5 - \frac{6}{2}$$

$U_2 = 5 - 3 = 2$

STEP-3:
calculate the table value
n1=2 n2=2
level of significance=0.05
U= min $\{R_1, R_2\}$ =min $\{2,2\}$
table value =0
u >table value 2>0

CONCLUSION
Since the calculated value is greater than the tabulated value, soH1 is accepted, and thus there is a   positive relationship between the organisation currently using RTBI and the RTBI providing insight in cost Reduction.

CORRELATION OF COEFFICIENT
Correlation is used almost everywhere in statistics. Correlation illustrates the relationship between two or more variables. It is expressed in the form of a number that is known as the correlation coefficient. The linear correlation

95637

Jissa Sabu and Geetha

coefficient defines the degree of relation between two variables and is denoted by "r". It is also called a cross-correlation coefficient, as it predicts the relation between two quantities.

STEP-1

The null hypothesis (H_0): There is no significant relationship between the frequency of training on new technology and the improvement in production target.

The alternative hypothesis(H_1): There is significant relationship between the frequency of training on new technology and the improvement in production target.

STEP-2:

Calculate correlation coefficient

TABLE :3

Product target (x)	New technology training(y)	X^2	Y^2	XY
53	52	2809	2704	2756
7	8	49	64	56
0	0	0	0	0
$\sum X=60$	$\sum Y=60$	$\sum X^2=2858$	$\sum Y^2=2768$	$\sum XY=2812$

$$r = \frac{n\sum xy - \sum X \sum Y}{\sqrt{[n\sum x^2 - (\sum x)^2][n\sum y^2)(n\sum y^2 - (\sum y)^2]}}$$

$$r = \frac{3(2812) - (60)(60)}{\sqrt{[3(2858) - (60)^2][3(2768 - (60)^2]}}$$

$$= \frac{8436 - 3600}{(8574 - 3600)(8304 - 3600)}$$

$$= \frac{4836}{\sqrt{(4974)(4704)}}$$

$$= \frac{4836}{\sqrt{23397696}}$$

$$= \frac{4836}{4837}$$

r = 0.999

Hence the value of coefficient of correlation is 0.999.

CONCLUSION

The value of coefficient of correlation is 0. 999.Therefore, H1 is accepted. Thus, there is a very high positive correlation between the frequency of training on new technology and the improvement in production target.

REGRESSION

Regression analysis is a statistical method used to model the relationship between one dependent variable and one or more independent variables. It aims to estimate the strength and direction of the relationship, as well as predict the value of the dependent variable based on the values of the independent variables. The most common type of regression is linear regression, but there are other types such as logistic regression for binary outcomes and polynomial regression for non-linear relationships.

The null hypothesis (H₀): There is no significant relationship between the organisation using RTBI and RTBI has improved manufacturing effectively.

The alternative hypothesis(H₁): There is significant relationship between the organisation using RTBI and RTBI has improved manufacturing effectively.

Using RTBI system(x)	60	0	0
Manufacturing effectively(y)	58	0	2

STEP-1:
TABLE :4

X	Y	X²	Y²	XY
60	58	3600	3364	3480
0	0	0	0	0
0	2	0	4	0
$\sum X=60$	$\sum Y=60$	$\sum X^2=3600$	$\sum Y^2=3368$	$\sum XY=3480$

$$\bar{x} = \frac{\Sigma x}{N}$$

$$= \frac{60}{3} = 20$$

$$\bar{y} = \frac{\Sigma y}{N}$$

$$= \frac{60}{3} = 20$$

STEP-2:
Regression coefficient of x on y,

$$bxy = \frac{N\Sigma xy - (\Sigma x)(\Sigma y)}{N\Sigma y^2 - (y^2)}$$

$$= \frac{(3)3480 - (60)(60)}{(3)3368 - (60)^2}$$

$$= \frac{10440 - 3600}{10104 - 3600}$$

$$= \frac{6840}{6504}$$

=1.05

Regression coefficient of x on y,
$$X - X = bxy (Y - Y)$$
$$X - 20 = 1.05(Y - 20)$$
$$X - 20 = 1.05Y - 18.95$$
$$X = 1.05Y - 18.95 + 20$$

Regression coefficient of x on y,
$$X = 1.05Y + 38.95$$
Regression coefficient of Y on X,

$$byx = \frac{N\Sigma xy - (\Sigma x)(\Sigma y)}{N\Sigma x^2 - (x^2)}$$

$$= \frac{(3)3480 - (60)(60)}{(3)3600 - (60)^2}$$

$$= \frac{10440 - 3600}{18000 - 3600}$$

$$= \frac{6840}{14400}$$

=0.475

Regression coefficient of Yon X,

$$Y - Y = bxy\,(X - X)$$

$$Y - 20 = 0.475(x - 20)$$

$$y - 20 = 0.475x - 9.4$$

$$y = 0.475x - 9.4 + 20$$

Regression coefficient of Yon X,

$$y = 0.475x + 8.93$$

$$= \sqrt{bxy} \times \sqrt{byx}$$

$$= \sqrt{1.05} \times \sqrt{0.475}$$

=0.706

CONCLUSION

The coefficient of regression 0.706 Therefore there is a fair positive association between the organisation using RTBI and RTBI has improved manufacturing effectively.

FINDINGS

1. Increased Data correctness: RTBI has improved data reporting correctness and dependability.
2. Improved Decision-Making: Managers stated that their ability to make decisions quickly had increased by 30%.
3. Cost Reduction: By improving inventory control, RTBI assisted in a 15% decrease in operating expenses.
4. Employee Training Gaps: Although RTBI use is increasing, there are still issues with employee training.
5. Customer Satisfaction: Faster data-driven replies resulted in better service, according to 80% of customers.

SUGGESTIONS

1. Improved Training Programs: Hold frequent training sessions to increase staff adoption of RTBI.
2. Modernizing IT Infrastructure: To stop cyberattacks, bolster data security protocols.
3. Improved Integration: Make sure that RTBI and the current ERP systems integrate seamlessly.
4. Increase RTBI Usage: Use RTBI for customer relationship management (CRM) in addition to supply chain management.

CONCLUSION

According to the study's findings, the company's operational performance, cost effectiveness, and decision-making have all greatly benefited by Real-Time Business Intelligence (RTBI). The advantages of RTBI greatly exceed its drawbacks, even in the face of integration difficulties and training deficits. The company is able to fully utilize RTBI for sustained company success with ongoing investments in infrastructure and training.

ABSTRACT

Panchagavya, a traditional organic formulation derived from cow-based products, has emerged as a potent bio-stimulant with the potential to enhance crop growth and productivity. As an eco-friendly alternative to chemical fertilizers, it promotes sustainable agriculture by improving soil health, nutrient uptake, and plant vigor. The study investigated the impact of Panchagavya foliar sprays, integrated with varying levels of the recommended dose of fertilizers (RDF), on wheat growth and yield during the 2022–2023 and 2023–2024 cropping seasons. The highest plant height was observed at harvest with the application of 100% RDF + 3% Panchagavya (T16), reaching 87.19 cm in 2022 and 95.74 cm in 2023. T16 also demonstrated superior Crop Growth Rate (CGR) during 30–60 DAS, recording 0.398 g/day/m² in 2022 and 0.438 g/day/m² in 2023. From 90 DAS to harvest, CGR values further increased to 3.215 g/day/m² and 3.891 g/day/m² for 2022 and 2023, respectively. Relative Growth Rate (RGR) peaked in T16 with values of 0.066 and 0.072 (30–60 DAS), 0.081 and 0.095 (60–90 DAS), and 0.091 and 0.093 (90 DAS to harvest) across the two years. Similarly, dry weight in T16 improved from 24.71 g in the control to 29.17 g in 2022 and 32.44 g in 2023. The tiller count per hill was highest in T16, reaching 15.34 in 2023, while Leaf Area Index (LAI) increased from 3.42 (control) to 5.01 in the same year. Reproductive parameters also improved significantly under T16. The number of spikes reached 14.85 in 2023, and the test weight rose to 42.10 g in 2022 and 42.39 g in 2023, showcasing the consistent effectiveness of this treatment across both years. Statistical analysis confirmed the significance of RDF, Panchagavya concentrations, and their

95642

interactions, particularly in later growth stages ($p < 0.05$). The synergistic effects of Panchagavya and RDF, facilitated by enhanced nutrient uptake, enzymatic activity, and rhizospheric microbial populations, emphasize its potential to optimize wheat growth, yield, and quality while reducing dependency on inorganic fertilizers. These findings align with earlier studies demonstrating the efficacy of integrated nutrient management, offering a sustainable pathway for high-yield wheat production.

Keywords: Relative Growth Rate (RGR), Panchagavya, Integrated, Rhizospheric.

INTRODUCTION

Wheat (*Triticum aestivum* L.) is a primary cereal grain consumed globally as a staple food for humans, with its straw serving as a significant source of animal feed (USDA, 2024). It is the world's most widely cultivated crop and is the second most vital food crop in the developing world after rice, providing 20% of the daily protein intake and food calories for 4.5 billion people (Nirgude and Sonawane, 2017). India has shown remarkable growth in wheat production over the years, with the area under cultivation fluctuating between 29.3 to 32 million hectares and yields steadily improving from 2.88 tons/ha in 2015/2016 to 3.36 tons/ha in 2024/2025. In 2024/2025, wheat production is estimated at 107.12 million tons, marking a significant increase from 98.85 million tons in 2014/2015, reflecting a 3.9% increase from the 5-year average. This shows India's consistent growth in wheat production, supported by an expansion in cultivation area to 31.833 million hectares (FAS-USDA, 2024). It is primarily cultivated during the winter season (Rabi crop) in India, contributing substantially to the country's agricultural output (Reuters, 2024). Wheat is renowned for its diverse culinary uses, such as flour, pasta, pastries, and chapatis, providing a balanced nutritional profile due to its richness in vitamins, minerals, protein, and carbohydrates (World Population Review, 2024). Globally, major producers of wheat include China, India, Thailand, Indonesia, and the United States (World Population Review, 2024). However, intensive wheat cultivation practices have heavily relied on chemical fertilizers to maintain high yields. Excessive use of chemical fertilizers, though effective in increasing crop production, has significant environmental repercussions, including soil degradation, water contamination, and greenhouse gas emissions, which contribute to global climate change. Additionally, the greenhouse gases emitted during fertilizer application and soil treatment intensify the negative environmental impact of conventional wheat farming (Rahim *et al.,* 2024). Thus, while wheat production plays a critical role in ensuring global food security, it is crucial to explore and implement eco-friendly agricultural practices.

Organic farming, integrated pest management, and the use of bio-based fertilizers can offer sustainable alternatives, reducing the environmental impact and fostering long-term agricultural productivity. One promising approach is the use of *Panchagavya*, a traditional Indian organic fertilizer made from a mixture of cow dung, cow urine, milk, curd, ghee, and plant matter, which has been shown to improve the growth and quality of crops, including wheat. Research indicates that *Panchagavya* enhances soil health, increases plant resistance to diseases, and improves the nutritional quality of crops by promoting beneficial microbial activity in the soil (Janak *et al.,* 2024). By incorporating *Panchagavya*, farmers can reduce dependency on synthetic fertilizers while fostering long-term soil health and productivity. Further research into precision farming techniques and soil health management could optimize nutrient use efficiency, reducing dependency on chemical fertilizers and mitigating the adverse environmental effects associated with their excessive application (Rebouh *et al.,* 2023). The primary objective of this field experiment was to develop economically viable and sustainable nutrient management practices that enhance wheat crop yield while maintaining superior chapatti-making quality parameters under assured irrigated conditions. This research aims to address the critical need for balancing high agricultural productivity with environmental sustainability, particularly in the Dehradun Valley regions of the Western Himalayan zone, where wheat is a staple crop. In this context, the present study, was meticulously designed to evaluate the effects of integrated nutrient management practices. The study will investigate the impact of varying fertility levels and foliar applications of *Panchagavya*, a traditional organic formulation, on key aspects such as, Growth dynamics of bread wheat and Quality trait like test weight By

focusing on these parameters, the experiment aims to provide a holistic understanding of how organic and sustainable practices like *Panchagavya* foliar sprays can optimize wheat production. This research is expected to contribute to advancing eco-friendly agricultural practices, ensuring food security, and offering practical solutions for smallholder farmers in the Western Himalayan region and beyond.

MATERIALS AND METHODS

The present investigation was conducted during the Rabi seasons of 2022 and 2023 at the Department of Agronomy, Crop Research Centre block, S. G. R. R. University, Dehradun, India, situated at 30.3165° N latitude and 78.0322° E longitude. The experimental site experiences a climate that oscillates between semi-arid and semi-humid conditions. The field was meticulously prepared using a tractor-drawn disc plough, followed by harrowing, planking, and precise plot delineation as per the experimental layout. The study employed a 4×4 factorial randomized block design (RBD) with three replications, 16 treatments, 48 plots (each measuring 3 m × 2 m), a net cultivated area of 288 m² and a gross cultivated area of 539.5 m².The spacing adopted for planting was 22.5 cm × 5 cm, and the DBW-173 bread wheat variety was selected for this study. The seed rate applied was 100 kg/ha, and the recommended dose of fertilizer (RDF) comprised 120:60:40 kg/ha of N, P_2O_5, and K_2O. The Panchagavya solution was prepared following the method outlined by Somasundaram et al. (2003). The treatments consisted of combinations of four fertility levels and four concentrations of Panchagavya foliar spray. The fertility levels included F_0 (0% RDF), F_1 (50% RDF), F_2 (75% RDF), and F_3 (100% RDF). The Panchagavya foliar spray treatments comprised P_0 (0% foliar spray), P_1 (1% foliar spray at 30 and 60 days after sowing (DAS)), P_2 (2% foliar spray at 30 and 60 DAS), and P_3 (3% foliar spray at 30 and 60 DAS). The factorial combination of these treatments resulted in 16 specific treatment combinations: T_1 (Control), T_2 (1% foliar spray at 30 and 60 DAS), T_3 (2% foliar spray at 30 and 60 DAS), T_4 (3% foliar spray at 30 and 60 DAS), T_5 (50% RDF), T_6 (50% RDF + 1% foliar spray at 30 and 60 DAS), T_7 (50% RDF + 2% foliar spray at 30 and 60 DAS), T_8 (50% RDF + 3% foliar spray at 30 and 60 DAS), T_9 (75% RDF), T_{10} (75% RDF + 1% foliar spray at 30 and 60 DAS), T_{11} (75% RDF + 2% foliar spray at 30 and 60 DAS), T_{12} (75% RDF + 3% foliar spray at 30 and 60 DAS), T_{13} (100% RDF), T_{14} (100% RDF + 1% foliar spray at 30 and 60 DAS), T_{15} (100% RDF + 2% foliar spray at 30 and 60 DAS), and T_{16} (100% RDF + 3% foliar spray at 30 and 60 DAS). Data was collected at different crop growth stages i.e. at 30 DAS, 60 DAS, 90 DAS, and at harvest. During the course of the study, the following growth parameters were recorded to evaluate the effects of the treatments: plant height (cm), number of tillers per hill, plant dry weight (g), test weight (g), leaf area index (LAI), number of spikes per square meter, crop growth rate (CGR in g/m²/day), and relative growth rate (RGR in mg/g/day). The CGR and RGR was calculated by using the formula:

$$CGR = \frac{W_2 - W_1}{\rho\,(t_2 - t_1)} \qquad RGR = \frac{\log W_2 - \log W_1}{t_2 - t_1}$$

Where,

W_1= dry weight per unit area at t_1

W_2= dry weight per unit area at t_2

t_1= first sampling

t_2= second sampling

ρ= ground area on which W_1 and W_2 are recorded.

These observations facilitated a comprehensive understanding of the influence of fertility levels and Panchagavya foliar sprays on the growth and quality attributes of bread wheat.

RESULTS AND DISCUSSION

Plant height

The experimental findings revealed that the application of Panchagavya in conjunction with varying levels of recommended dose of fertilizer (RDF) had a significant impact on the growth parameters of wheat, particularly plant height. Data collected at different crop growth stages (30 DAS, 60 DAS, 90 DAS, and at harvest) over two years (2022-

23 and 2023-24) showed that treatments involving foliar sprays of Panchagavya at concentrations of 1%, 2%, and 3%, combined with RDF (50%, 75%, and 100%), consistently outperformed the control, with the most pronounced effects observed at later growth stages, particularly at 90 DAS and at harvest. The highest plant height was recorded in treatments involving 100% RDF combined with 3% Panchagavya foliar spray, followed closely by 75% RDF with 3% foliar spray (Figure 1). The positive influence of these treatments can be attributed to the synergistic effect of the bio-stimulant properties of Panchagavya and the nutrient supplementation provided by RDF. Statistical analysis indicated a highly significant effect of the treatments on plant growth, with the calculated F-values for Factor F (treatments) far exceeding the critical value, thus confirming the efficacy of the treatments. Additionally, the interaction between Panchagavya and RDF (Factor F × P) was found to be highly significant, suggesting that the combined application of these factors yielded superior growth. The low p-values and error mean square values further substantiated the robustness of the experimental design.

Crop growth rate

The impact of Panchagavya on the crop growth rate (g/day/m²) of wheat was assessed at various growth stages across the 2022-23 and 2023-24 cropping seasons under diverse treatment combinations. The study revealed a consistent and significant enhancement in crop growth rates with the combined application of Panchagavya foliar sprays (1%, 2%, and 3%) and varying levels of recommended dose of fertilizers (RDF). The 100% RDF + 3% Panchagavya treatment (T16) exhibited the highest growth rates across all growth phases, with values of 0.398 g/day/m² (2022) and 0.438 g/day/m² (2023) during 30-60 DAS, and 3.215 g/day/m² (2022) and 3.891 g/day/m² (2023) from 90 DAS to harvest (Figure 2). The synergistic interaction between Panchagavya and RDF was particularly pronounced in later growth stages, emphasizing its efficacy as a growth enhancer. Statistically, ANOVA confirmed highly significant effects ($p<0.01$) of Panchagavya concentration, RDF levels, and their interactions across both years. These results underscore the potential of Panchagavya to optimize growth even under reduced RDF levels, thereby reducing chemical input dependency. Enhanced crop growth in 2023 was attributed to favorable environmental conditions, aligning with previous research that highlighted the bio-stimulatory properties of Panchagavya, including the promotion of nutrient uptake and rhizosphere microbial activity, mediated by plant growth regulators like auxins and cytokinins.

Relative growth rate

The relative growth rate (RGR) of wheat during the 2022–2023 and 2023–2024 cropping seasons was significantly influenced by the integration of Panchagavya foliar sprays with varying levels of recommended dose of fertilizers (RDF). The treatment combining 3% Panchagavya with 100% RDF (T16) consistently recorded the highest RGR values: 0.066 and 0.072 (30–60 DAS), 0.081 and 0.095 (60–90 DAS), and 0.091 and 0.093 (90 DAS to harvest) in 2022 and 2023, respectively (Figure 3). These results highlight the synergistic role of Panchagavya in enhancing nutrient uptake and metabolic efficiency, thereby accelerating plant growth. Intermediate RGR improvements were observed in treatments with reduced RDF levels (50% and 75%) supplemented with Panchagavya (T6–T12), demonstrating its potential to partially substitute inorganic fertilizers. Statistical analysis (ANOVA) confirmed significant effects ($p < 0.05$) of Panchagavya concentration, RDF levels, and their interactions on RGR, particularly in later growth phases. The bio-stimulatory properties of Panchagavya, attributed to its nutrient-rich composition and hormonal constituents, align with earlier findings in pearl millet, further supporting its efficacy. These results indicate that integrating Panchagavya, especially at higher concentrations, can enhance RGR, contributing to sustainable crop production and reduced reliance on chemical fertilizers.

Dry weight

The integration of Panchagavya foliar sprays with recommended doses of fertilizers (RDF) significantly enhanced plant dry weight and height in wheat during the 2022-2023 and 2023-2024 cropping seasons. A progressive increase in dry weight was observed with higher concentrations of Panchagavya and RDF levels. In 2022, the control (T1) recorded a dry weight of 24.71 g, while T16 (100% RDF + 3% Panchagavya) achieved the maximum dry weight of 29.17 g. Similarly, in 2023, dry weight increased from 25.91 g in T1 to 32.44 g in T16. Plant height showed a direct correlation with dry weight, with T16 producing the tallest plants at harvest (87.19 cm in 2022 and 95.74 cm in 2023).

95645

Anjana Nautiyal and Moinuddin

Treatments with reduced RDF levels supplemented by Panchagavya also showed significant improvements. For instance, T12 (75% RDF + 3% Panchagavya) recorded dry weights of 27.94 g and 30.29 g, alongside plant heights of 85.24 cm and 94.99 cm in 2022 and 2023, respectively, highlighting Panchagavya's potential to complement reduced fertilizer inputs (Figure 4). Statistical analysis validated these findings, with highly significant F-values for RDF (Factor F) and Panchagavya (Factor P) across both years. Interaction effects (F × P) were particularly notable in 2022, emphasizing the synergistic role of bio-stimulants and inorganic nutrients. Enhanced photosynthetic efficiency, nutrient assimilation, and partitioning of assimilates likely contributed to the observed growth improvements. These results align with earlier studies demonstrating Panchagavya's role in enhancing enzymatic activity, rhizospheric microbial populations, and nutrient availability. This integrated approach offers a sustainable pathway to optimize wheat growth and yield while reducing chemical fertilizer dependency. Further research should investigate the molecular mechanisms driving these effects and assess long-term soil health impacts.

Number of tillers per hill, leaf area index, number of spikes and test weight
The application of Panchagavya at varying concentrations, combined with the Recommended Dose of Fertilizers (RDF), significantly influenced wheat growth and yield attributes during 2022–2024. Growth metrics, including tiller count per hill, leaf area index (LAI), spike number, and test weight, showed consistent improvements with increasing Panchagavya concentrations and RDF levels. The treatment T16 (100% RDF + 3% Panchagavya foliar spray) consistently outperformed others, recording the highest tiller count (15.34 tillers per hill in 2023) and LAI (5.01 in 2023), compared to the control (T1) with 9.05 tillers and an LAI of 3.42. Enhanced nutrient availability and bioactive compounds in Panchagavya likely stimulated physiological processes such as chlorophyll synthesis, cell division, and elongation, resulting in better canopy structure, photosynthetic efficiency, and biomass accumulation. Reproductive parameters also improved significantly, with the highest spike count (14.85 in 2023) observed in T16, reflecting better carbohydrate partitioning and nitrogen assimilation (Figure 5). Test weight, a critical yield and quality parameter, demonstrated strong positive correlations with tiller count and LAI. The maximum test weight was achieved in T16 (42.10 g in 2022 and 42.39 g in 2023), underscoring the role of improved vegetative growth and canopy architecture in enhancing grain quality (Figure 6). ANOVA results confirmed the significance of RDF and Panchagavya interactions, particularly in the second year, where tiller count (F = 9.965, p < 0.05) and test weight (F = 3.022, p < 0.05) showed notable interaction effects. This indicates a cumulative effect of soil enrichment and plant responsiveness to integrated treatments over time. These findings align with earlier studies on organic inputs and highlight the efficacy of integrated nutrient management practices in achieving sustainable, high-yield wheat production while maintaining grain quality.

The integration of organic manures and foliar applications has demonstrated a profound influence on the growth, yield, and quality parameters of various crops. Vishal and Shilpa (2021) and Velmurugan (2005), reported similar positive effects of Panchagavya on plant height and dry matter accumulation in various crops. Furthermore, the findings from this study emphasize the critical role of foliar feeding in enhancing plant growth, particularly during the reproductive stages, which may contribute to improved yield potential. Shashank *et al.* (2024), reported that vermicompost and Panchagavya applications significantly improved crop growth rates in pearl millet. Vishal and Shilpa (2021) reported that the application of 7.5 L Panchagavya in conjunction with 5 t/ha FYM resulted in superior yield attributes, notably spike length (10.42 cm), grains per spike (39.33), and test weight (42.63 g). This improvement in test weight, an essential quality indicator, underscores the enhanced nutrient assimilation and effective grain filling achieved through this integrated nutrient management approach. Among various treatments, T2 (FYM 25% + VC 75% + 2% Panchagavya spray) recorded the maximum plant height (78.21 cm), while T4 (FYM 25% + VC 75% + 2% Panchagavya + 5% Vermiwash spray) exhibited the highest performance in grains per spike (41.34), effective tillers per hill (5.11), test weight (37.32 g), grain yield (3.29 t/ha), and straw yield (4.51 t/ha) (Shiva Kumar et al., 2020). These findings illustrate the synergistic impact of vermicompost and Panchagavya on crop growth and productivity. The significant improvement in the test weight of wheat through the incorporation of Panchagavya, FYM, vermicompost, poultry manure, and green manure aligns with previous research (Sarath Chandra et al., 2019). Sandeep and Thomas (2018) attributed this to the enhanced availability and utilization of nutrients, fostering sustainable crop production. Similarly, Tolera Abera *et al.* (2018) highlighted that the judicious use of organic

manures positively impacts grain quality parameters. The efficacy of Panchagavya as a foliar application is evident in its ability to enhance physiological performance across diverse plant species. Veeranan et al. (2018) demonstrated that foliar sprays at varying concentrations (2%, 4%, 6%, and 8%) significantly improved growth parameters in *Ocimum sanctum*. Furthermore, Snega (2021) reported a substantial increase in growth when a 3% Panchagavya foliar spray was applied on the 1st, 3rd, and 5th days, with fenugreek plants exhibiting better responses than tomato plants. These findings suggest the potential of Panchagavya in modulating species-specific growth responses. These practices not only optimize nutrient assimilation and grain filling but also contribute to soil health and ecological sustainability. Further research on crop-specific responses and optimization of these organic inputs could pave the way for broader applications in organic and sustainable farming systems.

ABSTRACT

Apart from a physical disorder, PCOS has major psychological consequences. Women with PCOS are more susceptible to anxiety, depression, and diminished quality of life compared to women without the disorder. Based on a survey of PCOS sufferers, this paper looks at the interactions among several elements related to the condition. The circumstances that were comprised are age, marital status, geographic origin, symptoms duration of PCOS and its awareness. The results suggest a strong parallelism and offer a perception to help one analyze the correlation between these factors and PCOS. The findings point to possible relationships and offer insightful analysis to help one grasp how these elements affect PCOS. The findings indicate that PCOS is more prevalent in younger demographics, particularly among women aged 23 to 33, consistent with prior research on the identification of PCOS in sexually mature women. Married individuals exhibit a higher prevalence of PCOS, indicating potential hormonal and stress-related factors associated with reproductive health. Major symptoms of PCOS vary among the patients apart from some specific parameters such as hirsutism and irregular or delayed menses etc. The PCOS patients indicate a significant awareness regarding PCOS, might be due to first-hand experience. On the other hand, there remains a notable percentage of individuals who lack knowledge regarding its treatment and management. The explorations imply that marital status, geographic origin and lifestyle manners may affect the result of PCOS. So future studies should try to investigate these correlations and create focused treatments to meet the requirements of various age groups moved by PCOS.

Keywords: Hormonal Imbalance, Insulin Resistance, Infertility, Metabolic Syndrome, Depression

INTRODUCTION

Polycystic ovarian syndrome (PCOS) is a multifaceted endocrine condition affecting women of reproductive age worldwide. It is defined by several medical, hormonal nature and metabolism characteristics, such as irregular

95649

Janvika Varma *et al.,*

menstrual periods, elevated testosterone levels, resistant to insulin, and ovarian disorders resulting in the development of ovarian cysts. Polycystic ovarian syndrome (PCOS) affects 5% to 20% of women globally; however, the precise prevalence is unclear due to discrepancies in the diagnostic guidelines and the populations examined [1]. Polycystic ovarian syndrome (PCOS) is not solely a medical condition; it also has significant psychological implications. Women with PCOS exhibit a heightened vulnerability to depression, anxiety, and a reduced quality of life relative to women without the condition. The psychological effects of PCOS can be significant, impacting relationships with others, social life, and overall well-being. Studies demonstrate that women suffering with PCOS exhibit a higher susceptibility to sadness and anxiety than their counterparts without the condition. They are also predisposed to express low self-esteem, physical dissatisfaction, and diminished sexual satisfaction [2]. The psychological effects of PCOS might be ascribed to multiple variables. Initially, the physical manifestations of PCOS, including weight gain, sexual dysfunction, and acne, can lead individuals to experience self- consciousness and diminished self-esteem. Secondly, hormonal irregularities associated with PCOS might influence mood and emotional regulation. Elevated androgen levels may result in irritability and aggression, whereas diminished estrogen levels might induce feelings of depression and anxiety [3]. The consequences of PCOS on fertilization and reproduction can be a significant concern for affected women. Many women sufferings from PCOS experience infertility and may necessitate pharmacological intervention to achieve conception. This may lead to feelings of isolation, anxiety, and melancholy. This study aims to assess the impact of PCOS on women's health-related quality of life and to clarify the factors that lead to this effect. The analysis was performed by HRQoL. The HRQoL questionnaire accurately evaluates the impact of PCOS on the standard of life of affected individuals. The questionnaire examines various aspects of daily life that may be affected by PCOS, such as the ability to do daily activities, social interactions, and emotional well-being. The researchers aim to attain a thorough grasp of PCOS by investigating its effects on many facets of life. They also contend that this approach will facilitate the development of medicines aimed at improving the health of affected individuals.

METHODS

Researchers frequently undertake investigations to clarify the fundamental reasons for PCOS. A study was undertaken in Vadodara, India, to assess the impact of PCOS on the health- related quality of life (HRQoL) of those with the condition. The study included an entire group of 120 individuals, all of whom were diagnosed with PCOS. The volunteers were chosen from a diverse array of age groups, spanning from 15 to 50 years. The participants were subsequently requested to fill out a questionnaire regarding their HRQoL. Each participant's psychological, mental, physical, and behavioral well-being will be evaluated by a questionnaire concerning their health-related quality of life (HRQoL). The study seeks to elucidate the illness and guide the formulation of remedies to enhance health results for affected persons by analyzing the influence of PCOS on HRQoL.

Questionnaire
The researchers aim to collect data using the self-reported Health-Related Quality of Life Questionnaire for PCOS (HRQoL-PCOS) [4]. The Eating and Exercise Evaluation (EEE) questionnaire is a validated tool for assessing the impact of food and exercise practices on several aspects of psychological, physical, and behavioural functioning throughout time. The HRQoL questionnaire will be incorporated into the EEE to evaluate the impact of PCOS on individuals' health-related quality of life. The HRQoL questionnaire consists of 22 things evaluating 6 distinct categories. The criteria encompass year of birth (1 question), regional origin (1 question), marital status (1 question), age of first menses (1 question), symptoms (14 questions), and awareness (4 questions). These enquiries are employed to evaluate the bodily, emotional, and social welfare of the individuals. The data acquired from the HRQoL survey was examined, and a graph was generated using software to discern trends. The findings of this study significantly improved our understanding of the effects of PCOS on the standard of life of those affected and indirectly guided the formulation of strategies to optimize their health outcomes. The inquiries outlined in Table 1 were used as part of the framework for this research.

RESULT AND DISCUSSION

Correlation of age with PCOS

The collected data indicates that most respondents are aged between 15 and 49. This has 22 responses aged 18, 20 respondents aged 20, 8 replies aged 19, and 7 respondents aged 21. This delineates the existing understanding of the long-term health risks linked to PCOS in individuals of reproductive age [5]. Although women with PCOS have a heightened probability of cardio-metabolic risk factors, current research contends that there is insufficient evidence to claim that older women with PCOS face increased rates of cardiovascular disease and death [6]. A limited cohort of 09 respondents was 23 years old, and the number of respondents markedly diminishes with advancing age, yielding only 1-2 respondents between the ages of 33 and 49. The study advocates for comprehensive prospective cohort investigations to elucidate morbidity and mortality in aging women with PCOS [7]. This indicates that PCOS predominantly impacts individuals throughout puberty or fertile age. One in 15 women globally are impacted by this complicated endocrine disorder [8].

Impact of Geographic origin on PCOS

Urban and rural areas were the two categories that were used to classify the geographical origin of the 120 respondents. A significant proportion of the respondents, specifically 74.2%, or 90 of them, hail from urban areas, which are represented by blue. While this is going on, 25.8% of the respondents, which is indicated by red, come from rural geographical areas. It appears from this that girls living in metropolitan areas are more likely to have PCOS. Moreover, females in rural regions are less inclined to depend on labor-saving devices or vehicles for mobility, thereby aiding in the maintenance of an ideal body mass index.[14]

Association of marital status with PCOS

Of the 120 responses obtained, 74.2% of respondents, totaling 89 individuals, are unmarried. One-fourth of the respondents, equating to 25%, or 30 individuals, are married. This group presumably consists of adults in their mid-twenties or older, corresponding with the upper range of the age spectrum in the survey. A mere 0.8% of the population were either separated or divorced. This is a trivial proportion and signifies that the survey cohort has limited representation from persons who have experienced marital separation. This indicates that a substantial majority of patients, specifically three-fourths of the examined population, are unmarried. The research identified an association between marriage and PCOS, revealing a greater proportion of unmarried females within the PCOS cohort [9]. Marked disparities were noted between married and single PCOS patients concerning overall health (P<0.001), physical wellness (P<0.027), responsibilities stemming from medical conditions (P<0.006), activity restrictions due to psychological factors (P<0.002), distress (P<0.001), social functioning (P<0.001), energy/fatigue, and mental health [10]. Additional factors, including genetics, hormone imbalances, and lifestyle choices, may have a more substantial impact on the prevalence of PCOS in specific individuals [11]. Additionally, PCOS will not be the sole determinant influencing the social support of infertile females and their marital satisfaction [12]. The study's findings indicate that infertility may have greater implications for infertile women than polycystic ovarian syndrome (PCOS), but PCOS may negatively impact other facets of the life of individuals affected [13].

Correlation between starting age of menses and PCOS

As indicated by the information obtained from a survey that received a total of 120 replies, the ages at which respondents first experienced their menstrual periods were detailed. Based on whether the event took place "Before 16" or "After 16" years of age, the responses were divided into two distinct categories. Therefore, 78.3 percent of respondents (94 persons) confirmed that they had encountered the event prior to reaching the age of 16, while 21.7% of respondents (26 individuals) claimed having experienced the event after reaching the age of 16. It appears from this that most of the participants, which is approximately four out of five, experienced this occurrence prior to reaching the age of sixteen. This indicates that the onset occurred at an early age, which underscores the significance of early adolescence in this context. On the other hand, a lower proportion of people (about one in five) had it after

the age of 16, demonstrating that there is some diversity in the start. This suggests that the statistics are consistent with the well-established fact that a significant number of people who have polycystic ovary syndrome (PCOS) usually display symptoms at an early age, frequently around the time that they reach puberty. PCOS was found in 77.1% of subjects, with an average age spectrum of eighteen to twenty years during the evaluation period. [15]

PCOS specific parameters/conditions/symptoms
Irregular menses from start
According to the collected data on irregular menstruation, 66% of respondents (79 persons) affirmed "Yes," while 34% (41 individuals) responded "No." The variation in responses indicates that irregular menstruation may be a prevalent issue among the patients. This may signify underlying health concerns, lifestyle influences, or stress impacting menstrual regularity. This may indicate an increased knowledge of menstruation health among individuals, resulting in more people identifying and reporting anomalies.

Excess of body hair growth
Out of 120 patients, 75.8% (91 respondents) indicated "yes," whereas 24.2% (29 respondents) indicated "no" about the experience of excessive body hair growth. Most responders (exceeding 75%) indicate experiencing excessive body hair growth, suggesting that this condition may be prevalent among PCOS patients potentially facing hirsutism-related concerns. To ascertain a suitable course of action, it is imperative to comprehend the physiology of hirsuteness in PCOS and evaluate the level of the discomfort it inflicts on everyone. The customized therapy of hirsutism in women with PCOS would be influenced by the existence of biochemical complications and monthly irregularities [16].

Overweight or obesity
The pie chart illustrates the results of a poll regarding participants' self-perception of being overweight or obese. Among 120 responses, a majority, 69.2% or around 83 persons, said that they do not perceive themselves as overweight or obese. Conversely, 30.8%, around 37 persons, reported that they perceive themselves as overweight or obese. The observation that approximately one third of respondents were not overweight suggests that excess weight is not a definitive criterion for PCOS. Nonetheless, various pathways through which the onset of PCOS might obstruct sustained weight loss efforts and facilitate additional weight gain are present [17].

Excess of acne or sweaty palms
Acne is a common sign of elevated androgen levels in PCOS [18]. An inflammatory condition impacting the hair shafts and apocrine glands, noted in more than one-third of women with PCOS [19]. The pie chart depicts survey responses concerning excessive acne or sweaty hands, revealing that a majority, 70.8%, or approximately 85 persons, had no concerns with either condition. This indicates that the majority of responders do not encounter these conditions. Simultaneously, 29.2%, around 35 individuals, said that they have problems associated with either severe acne or hyperhidrosis of the palms. This signifies almost one in three individuals who harbor fears over these disorders. This suggests that most respondents do not regard these as significant issues, indicating that excessive acne or sweaty palms is not necessarily an indication of PCOS.

Numbness/tingling in hands or feet
The gathered replies reveal that 31.7% of respondents answered Yes, totalling 38 persons, while 68.3% said No, approximately 82 individuals. This indicates that the majority of responders (almost 70%) do not suffer numbness or tingling in their extremities, although approximately 30% do. This evidence indicates that experiencing numbness or tingling in the hands or feet is not necessarily associated with PCOS.

Insomnia or difficulty in sleep

In recent years, there have been reports of sleep disturbances in women with Polycystic Ovary Syndrome (PCOS). The majority of published studies focus on Obstructive Sleep Apnea (OSA). The Mann–Whitney U test revealed a statistically significant difference amongst women with and without PCOS. Excessive daytime sleepiness was observed in 7.4% of women with PCOS [20] The statistics suggest that 30% of participants reported experiencing insomnia or sleep difficulties, equating to 36 persons affected by sleep problems, representing approximately 1 in 3 respondents. Additionally, 70% of the individuals indicated that they do not suffer from insomnia or sleep disturbances. This pertains to 84 individuals, constituting the majority of the group—exceeding two-thirds—who are devoid of the specified ailment. Consequently, the research indicates that PCOS patients may not necessarily be experiencing sleeplessness**.**

Feeling hungry very often

The collected data reflects replies on frequent feelings of hunger. A majority of participants, 63.3%, or roughly 76 persons, indicated that they seldom experience hunger. This indicates that most respondents exhibit stable hunger patterns or that their current dietary intake adequately prevents frequent hunger. Simultaneously, 36.7%, around 44 persons, indicated that they frequently experience hunger. This constitutes a substantial segment of the sample, suggesting that over one-third of respondents encounter frequent hunger. Frequent hunger may result from several factors, including elevated metabolism, inadequate food, or inconsistent eating patterns. A substantial percentage of responders experiencing frequent hunger may suggest problems concerning dietary quality or eating habits. Moreover, persistent hunger may be affected by lifestyle factors such as elevated physical activity, stress, or underlying medical issues. The results indicates that patients with PCOS may not frequently experience hunger.

Period cramps

Of the 120 replies obtained, the majority, 76.7% or around 92 persons, indicated that they have menstrual cramps. This signifies that more than seventy-five percent of the participants frequently experience menstrual cramps, a prevalent concern for many individuals who menstruate. The elevated percentage indicates that menstrual cramps are a common issue, likely affecting everyday activities and overall well-being for a considerable number of responders. Conversely, a lesser proportion, 23.3%, or roughly 28 persons, indicated that they do not suffer from menstrual cramps. This group may either not suffer cramps or may have such mild symptoms that they deem them insignificant. The lack of cramps in this minority may result from several variables, including age, hormonal equilibrium, heredity, or the use of drugs such hormonal contraceptives that mitigate or eradicate cramping. This suggests that individuals with PCOS invariably experience menstrual cramps.

Delayed menses

Of the 120 responses about delayed menstruation, 80.8% indicated "Yes," denoting that they have a delay in their menstrual cycle, with their period occurring after 2 or 3 months. This may indicate potential underlying disorders such as oligomenorrhea, which could be affected by variables including hormone imbalances, stress, weight fluctuations, or other medical issues. 19.2% of the responders answered "No." This means that they do not endure prolonged menstrual cycles or delays in which their periods occur after 2 or 3 months. Their cycles probably occur within a more consistent timeframe. The incidence of PCOS, dysmenorrhea, menorrhagia, amenorrhoea, polymenorrhea, hypomenorrhea, and unpredictable periods among individuals with prior diagnosis was found to be 49.13%, 52.60%, 12.17%, 0.43%, 7.82%, 2.17%, and 32.17%, respectively [21].

Serious mood swings

Symptoms of PCOS can substantially impair your standard of life and induce considerable stress, adversely impacting one's mental wellness and sexual health. Symptoms of fear, such as palpitations, dyspnea, and tension, may be attributed to several somatic disorders [22]. Of the 120 responses obtained, a significant majority, 53.3% or around 64 individuals, indicated suffering severe mood fluctuations. This signifies that over fifty percent of the participants experience considerable emotional variability. Significant mood fluctuations may be attributed to multiple sources, including hormone alterations, stress, mental health disorders, or external influences such as

95653

lifestyle and environmental stimuli. Conversely, 46.7%, around 56 individuals, reported that they do not suffer significant mood swings. Concurrently, individuals from this group may exhibit enhanced emotional regulation stability. They may also have subtle emotional fluctuations that they do not recognize as significant mood swings. This study indicates that individuals with PCOS predominantly experience significant mood changes.

Lack of self confidence

A study on women with PCOS demonstrated that diminished self-worth and negative body image perception contribute to heightened anxiety levels [23]. Alterations in appearance and sexual responsiveness influence self-confidence in these women [24]. In reference to 120 responses collected, 63.3% which is approx. 76 people out of 120 answered "No" indicating that they do not feel a lack of self-confidence. This group forms a clear majority, representing almost two-thirds of the respondents. On the other hand, 36.7%, approximately 44 people out of 120 answered "Yes," meaning they do feel a lack of self- confidence. This smaller group is still significant, comprising more than one-third of the total respondents. The fact that 63.3% of respondents feel confident is a positive indicator. This suggests that most individuals in the surveyed group have a healthy sense of self-assurance. Whereas the noteworthy minority, 36.7% who reported feeling a lack of self-confidence is still a significant portion as it implies that a considerable number of people in this group may be experiencing issues related to self-esteem or self-doubt, which could impact their performance in various aspects of life. Henceforth, it can be noted that all PCOS patients may not suffer from lack of self-confidence but one third of them would face the issue.

Heavy flow

Of the 120 responses, 40% indicated 'yes,' signifying that 48 individuals experience excessive menstrual flow. Meanwhile, 60% of the respondents, totaling 72 individuals, indicated that they do not have excessive menstrual flow. This distribution indicates that excessive menstrual flow is a considerable concern for one-third of the examined population, whilst others experience a more standard or lighter flow. So, some of the individuals with PCOS exhibited notable oligomenorrhea, characterized by successive vaginal bleeding lasting a minimum of six weeks, alongside significantly elevated insulin resistance levels. This suggests that clinically apparent menstrual disturbance may predict insulin sensitivity in cases of PCOS [25]. This signifies that heavy menstrual flow is not necessarily associated with PCOS.

Specific diet

From a total of 120 responses, 94.2% (113 respondents) affirmed that they adhere to a specific diet recommended by a healthcare professional or nutritionist, such as a low-fat or oil-free diet. 5.8% (7 respondents) indicated "no," signifying that they do not adhere to a specific suggested diet. This indicates that a significant majority of respondents (94.2%) adhere to dietary restrictions or special prescribed diets, likely owing to health concerns or dietary requirements. Conversely, quite a small fraction (5.8%) of participants do not comply with designated diet regimens. Consequently, the majority of PCOS patients adhere to a specialized diet that excludes fats and oils.

Any other disease/condition

According to the collected data, 70% of the 120 respondents, totalling 84 individuals, affirmed they possess at least one of the specified health conditions (e.g., diabetes, thyroid disorders, or hypertension). Meanwhile, 20.8% of respondents, totalling 25 participants, are uncertain regarding the presence of any of the specified circumstances. This may indicate insufficient routine health examinations, limited access to medical information, or a lack of symptom awareness. Conversely, around 9.2% of respondents, or 11 out of 120 participants, said that they do not suffer from any of the specified diseases or ailments. This signifies that a substantial majority of individuals (70%) contributes to a designated focus group for additional examination. A significant proportion of participants (20.8%) are uncertain regarding their health status, potentially reflecting deficiencies in health literacy, access to medical resources, or preventive healthcare within this demographic. Conversely, a minor fraction (9.2%) expresses confidence in the absence of serious health conditions, suggesting either a generally healthy cohort or possible

underreporting of undiagnosed ailments. This signifies that a great deal of individuals with PCOS are affected by additional diseases or conditions, such diabetes, thyroid disorders, or hypertension. Polycystic Ovary Syndrome (PCOS) arises from multiple contributing causes, including diabetes, obesity, and other hormonal imbalances [26]. For instance, Hispanic women demonstrate increased susceptibility to metabolic syndrome (MetS) and type 2 diabetes mellitus (T2DM), whereas women of African origin with polycystic ovarian syndrome (PCOS) are more likely to encounter risk factors linked to hypertension and cardiovascular disease (CVD). [27]. This signifies the importance of considering the impacts of mental disorders and substance use in the management of PCOS, particularly for those already grappling with the complex and multifaceted nature of the illness [28].

Awareness of PCOS

The results obtained pertain to the data collected about PCOS awareness. A quick diagnosis can effectively prevent the serious repercussions of PCOS, provided that new patients possess a comprehensive grasp of the condition [29]. The initial inquiry pertained to the complete form of the acronym 'PCOS,' with 75.8% of respondents, approximately 91 individuals, demonstrating awareness that PCOS denotes "Poly Cystic Ovarian Syndrome." Conversely, 24.2% of respondents, around 29 individuals, were unaware of the entire form of PCOS. The second question pertained to the organ impacted in PCOS. 83.3% of participants, totalling 100 individuals, were aware that the ovary is the organ impacted by PCOS, whereas 16.7%, representing 20 participants, were uninformed about the organ affected by PCOS. The subsequent question asked if PCOD or PCOS may be managed with diet or physical activity. The findings reveal that 77.5%, equating to 93 participants, confirmed that PCOD or PCOS may be managed with diet or exercise. Meanwhile, 22.5%, or 27 individuals, stated that PCOD or PCOS cannot be treated via diet or exercise. The fourth and last inquiry sought to ascertain whether PCOD or PCOS is treatable. According to the results, 62.5%, equating to 75 individuals, affirmed PCOD or PCOS can be managed with dietary modifications or physical activity. Of the remaining 37.5%, which amounts to 45 individuals, stated that PCOD or PCOS is not treatable. The survey examined 120 patients, revealing a substantial understanding among respondents on PCOS, with most accurately knowing its entire name and the organ involved. Nonetheless, a significant proportion of people remain uninformed of these features. Moreover, although numerous participants assert that PCOS may be managed via diet and exercise, there exists a divergence of view regarding its curability, underscoring the necessity for enhanced education and knowledge of the illness. Given the challenges in identifying PCOS, it is reasonable to expect that treatment is fraught with uncertainty [30].

CONCLUSION

This paper delineates the results of a survey examining the relationship between age, marital status, geographic origin, length of PCOS symptoms, and awareness of the frequency and understanding of Polycystic Ovary Syndrome (PCOS). The findings highlight several substantial correlations and provide critical insights into the impact of these variables on PCOS. The age distribution of participants indicates a higher prevalence of PCOS in younger demographics, consistent with prior studies that show PCOS is commonly detected in women of childbearing age. The geographic origin suggests that girls in urban regions are more susceptible to PCOS than those in rural areas. Ultimately, it may be attributable to lifestyle factors, like inadequate nutrition and insufficient physical activity.Marital status indicates a greater incidence of PCOS in married persons, potentially correlated with hormonal fluctuations related to reproductive health, stress, and accessibility to healthcare. The length of PCOS varies across individuals, with a considerable proportion receiving a recent diagnosis, while others having experienced the disorder for a moderate period. The survey results illuminate the awareness of PCOS. There exists a considerable level of information and understanding regarding the specific aspects of PCOS, including its definition and the bodily systems it impacts. Patients diagnosed with PCOS exhibit a superior comprehension of the disorder, presumably shaped by personal experiences or associations with PCOS. This study elucidates the relationships among age, marital status, duration of PCOS, and awareness of PCOS in relation to its prevalence and comprehension. The results underscore the significance of early identification, knowledge, and management of

PCOS, especially in younger populations. Additional study is required to thoroughly investigate these associations and formulate specific strategies to address the specific needs of different age demographics affected with PCOS.

ABSTRACT

Phytochemicals and antioxidants present in spices exhibit multifunctional biological activity with ethnopharmacological properties. The encapsulation process can successfully entrap these bioactive constituents by shielding them from oxidation and enhancing their stability. In recent years, encapsulation has been essential for developing functional foods, which provide innovative solutions for nutrient delivery, preservation, and sensory enhancement. The Phytochemicals from Black cardamom and Black cumin were extracted using the Soxhlet extraction technique, one of the most effective methods for better yield. The encapsulated phytochemicals will be analyzed for physicochemical parameters such as bulk density, moisture content, hygroscopicity, powder yield, encapsulation efficiency, dissolution characteristics, and color analysis are essential to ensure product quality and performance. The study's findings show that the encapsulated phytochemicals have favorable physicochemical properties, including moisture ($10.01 \pm 0.14\%$), bulk density (0.56 ± 0.07 g/ml), encapsulation efficiency (77.8 ± 2.08 %), hygroscopicity (25.57 ± 0.58 %), dissolution test (22.48 ± 1.37sec), and powder yield % (43.39 ± 0.64) and color parameters such as L* (67.03 ± 0.15), a* (3.51 ± 0.01), and b* (23.46 ± 0.15) respectively. It can be concluded from the research findings that the encapsulated phytochemicals have favorable physicochemical properties that ensure better delivery of bioactive compounds in food products.

Keywords: Black cardamom, Black cumin, Encapsulation, Physicochemical properties, Soxhlet extraction, Spray drying.

INTRODUCTION

The spices provide exotic flavor to the Indian foods. The *Amomumsublatum*is known as Black cardamom which is used in various cuisines. It has a sweet aroma and bioactive compounds that cure various illnesses such as cardiovascular, diabetes, oxidative stress, and inflammation. Several studies have shown that the phytochemical compounds present in black cardamom such as polyphenols, alkaloids, and tannins, it is considerably high in flavonoids. The Black Cardamom is cultivated in Sikkim, West Bengal[1].The cardamom phytochemical screening was of high importance in discovering and developing new therapeutic agents with enhanced efficiency. Cardamom contains powerful antioxidants, and research suggests that dietary antioxidants are more effective than pure compounds in preventing oxidative stress-related diseases [2]. The black cumin, also known as *Nigella sativa*, is renowned for its culinary uses and historically valued in traditional medicine. Black cumin is known for its various traditional uses and medicinal properties, which include antioxidant, anti-inflammatory, immunomodulatory, anticancer, antimicrobial, and cardioprotective effects. Black cumin seed essential oils contain thymoquinone, thymol, and nigellicine are responsible for the pharmacological effects and therapeutic benefits. The phytochemical composition of the black cumin varies based on the growing region, and maturity stage. The different classes of phytochemicals present in the black cumin seeds are terpenes and terpenoids, phytosterols, alkaloids, tocopherols, and polyphenols. Black cumin has shown immune stimulatory functions. The extract has been shown to stimulate phagocytic activities in the immune system [3]. The beneficial health-promoting properties of phytochemicals have been reported in recent years, including antioxidative, antimicrobial, gastrointestinal protective (anti-ulcer), anti-hypercholesterolemic, anti-platelet aggregation, and anti-hypertensive activities[4].The Phytochemicals present in Black cardamom and Black cumin were found to be a potent source of antioxidants, which prevent oxidative stress caused due to the production of free radicals in the body[5].Although spice extracts have been documented to enhance the health-promoting properties of foods, their incorporation can also alter the aroma and flavor profile of the final product, potentially reducing its acceptability. To address this issue, encapsulation of herb and spice extracts is often employed to mask the strong aromas of the enriched food [6].

In previous years the advanced extraction technique has been employed to obtain phytochemicals from the food components. The extracted photochemical can be delivered using various vehicles one such is the Encapsulation technique.The first product containing encapsulated materials was formulated in the year 1954 [7].The encapsulation techniques are used to protect bioactive compounds such as vitamins, pigments, and flavorings from the environment [8]. This will increase the stability and shelf life of the products [7]. The active compounds of the spices are entrapped inside a thin polymeric coating and the polymer coating acts as a protective film for the core material, this process involves entrapping volatile substances within a protective wall material. This enables their easy incorporation into various food formulations. The biodegradable wall materials generally used for encapsulation arelipids, proteins, and polysaccharides. Spray drying is one of the most commonly used techniques for the encapsulation process. It employs drying technology which is commonly used in the pharmaceutical and food industries. Bioactive compounds such as proteins, enzymes, pigments, flavors, and vitamins are encapsulated using the spray drying method. Encapsulation is a technique that is gaining importance in the food industry to enhance the production of nutritious food products. However, the Photochemical present in the spices are susceptible to oxidation or degradation. To prevent this, the Encapsulation technique has been used to entrap the active compounds inside a wall material. Photochemical have various health benefits which can be retained or protected using Encapsulation, increasing the availability of bioactive compounds [9]. Hence, the current study attempts to encapsulate Photochemical from Black cardamom and Black cumin. Furthermore, various physicochemical properties such as Bulk density, Hygroscopicity, Encapsulation efficiency, Powder yield, Color parameters, Dissolution test, and Moisture content of the encapsulated photochemical were assessed. The main objectives of the study:

1.   To extract the phytochemicals from black cardamom and black cumin employing soxhlet extraction.
2.   To encapsulate the phytochemicals using spray drying technique.
3.   To evaluate the physicochemical properties of the encapsulated phytochemicals.

Vijaya Vahini and Sneha

MATERIALS AND METHODS

Selection and Procurement of Ingredients

The ingredients used in this study are locally available and offer potential health benefits. The phytochemicals extracted from black cardamom and black cumin were obtained from a local supermarket. Additionally, chemicals such as maltodextrin, polysaccharides, ethanol, and saturated sodium sulfate (Na_2SO_4) were sourced from Market.

Extraction of Phytochemicals from Black Cardamom and Black Cumin

The extraction of phytochemicals from black cardamom and black cumin was performed using the Soxhlet extraction method as outlined by Rasul in 2018 [10]. These ingredients were ground into a fine powder and then placed in a thimble, which was positioned in the Soxhlet apparatus for the extraction process. The apparatus was filled with an organic solvent, specifically ethanol, and the extraction lasted for three hours. Finally, the phytochemical compounds extracted from the black cardamom and black cumin were collected.

Encapsulation of Phytochemicals from Black Cardamom and Black Cumin by Spray Drying Technique

Spray drying is a dehydration process widely used to protect active compounds. It involves converting a fluid feed—such as an emulsion, dispersion, or solution—into powder form using hot drying gas. The encapsulation process through spray drying was conducted using a tall-type spray dryer. The steps for the spray drying technique used in this research include homogenization, atomization, evaporation, and product separation [11].This encapsulation process entails the addition of both core and wall materials. In the current study, the core material was derived from phytochemicals, while the wall material used was maltodextrin. The experiment utilized the spray drying technique while considering factors such as temperature, equipment time, and feed rate before finalizing the procedure. These factors significantly influence the outcome of the final product in the spray drying process. The fluid feeds are atomized through contact with dry hot air. The spray drying operates within an inlet temperature range of 150 to 250 °C and an outlet temperature between 50 and 80 °C [12].In this study, the tall-type spray dryer was maintained at an inlet temperature of 139 °C and an outlet temperature of 1 °C. The extracted phytochemicals from black cardamom and black cumin were homogenized; using 25 ml of the extracted phytochemical solution extracted from Black cardamom and Black cumin were combined with 50 ml of wall material. To prepare the wall material, 15 g of maltodextrin was mixed with a polysaccharide and then dissolved. The homogenization process involved mixing the extracted phytochemicals with the wall material, which was homogenized at 4,200 rpm for 15 minutes. After homogenization, the solutions were spray-dried, where hot air was applied to dry the particles. Finally, the dried encapsulated phytochemical powder was collected.

Evaluation of Physicochemical Properties of the Encapsulated Phytochemicals

The physicochemical properties of encapsulated phytochemicals from black cardamom and black cumin were analyzed, focusing on bulk density, moisture content, hygroscopicity, powder yield, encapsulation efficiency, dissolution rate, and color. Bulk density was measured according to Goula and Adamopoulos (2005) [13] by adding 2 grams of the sample to a 10 mL graduated cylinder and tapping it to determine the mass-to-volume ratio. Moisture content was assessed by employing the AOAC (2000) method, where 3 grams of the sample were dried in an oven at 105°C for 3 hours, and the weight difference was recorded. Encapsulation efficiency was evaluated by applying spectroscopic or chromatographic methods[14]. Hygroscopicity was determined by placing 2 grams of the sample in airtight Petri dishes at 25°C with saturated Na_2SO_4 (81% relative humidity) for one week, after which the moisture content was measured as grams per 100 grams of dry solids [15]. For the dissolution test, 50 mg of dried sample powder was combined with 1 mL of distilled water, and the time taken for dissolution was recorded [16]. The powder yield was calculated from the mass of the spray-dried powder relative to the original excipients. Color parameters were measured using a Hunter Lab colorimeter based on the CIE L*a*b color scales [17].

Statistical Analysis
The data obtained from the Physicochemical properties such as Moisture, Hygroscopicity, Powder yield, encapsulation efficiency, Color, Dissolution test, and Bulk density were subjected to statistical analysis mean, and standard deviation. In which the value of individual items in the series is obtained from the arithmetic average. The data was coded and determined.

RESULTS AND DISCUSSION

Physicochemical Properties of the Encapsulated Phytochemicals from Black Cardamom and Black Cumin
The Encapsulated Phytochemicals from Black cardamom and Black cumin were assessed for their physicochemical parameters such as Moisture, Hygroscopicity, Powder yield, encapsulation efficiency, Color, Dissolution test, and Bulk density, and the results obtained were depicted in Table 1 and explained below with relevant literature review.

MOISTURE CONTENT
The moisture content of a product refers to the amount of moisture or wetness present in it. This parameter indicates the level of wetness in a sample. The study of moisture content in powdered products is related to their stability, oxidation, and flow ability [18]. The moisture content of the encapsulated phytochemical powders was found to be 10.01 ± 0.14%, as shown in Table 1. This result aligns with the findings of Thumthanaruk *et al.*, 2021[19] which reported moisture content ranging from 9.89% to 10.86% of encapsulated β-carotene and lycopene, and Gothainayagi, 2020 [20] who found that the moisture content of encapsulated Nigella sativa oil ranged from 3.00% to 3.76%. It was also observed that the moisture content increased with a higher concentration of wall materials. The disparity in the result could be due to the difference in wall material used.

BULK DENSITY
Bulk density is a crucial factor in determining the characteristics of packaging for powdered products [21]. The bulk density of a product is primarily influenced by factors such as particle size, core material, and wall material. The bulk density of encapsulated phytochemicals derived from black cardamom and black cumin was found to be 0.56 ± 0.07 g/ml. This finding is supported by recent research by Noghabi and Molaveisi (2023) [22], who reported a bulk density of 0.28 ± 0.01 g/ml for encapsulated cinnamon essential oil. The differences observed between the results can be attributed to variations in the wall materials, raw ingredients, and encapsulation techniques used.

ENCAPSULATION EFFICIENCY
Encapsulation Efficiency (EE) is a crucial parameter in the production of food powders through spray drying, as it relates to feed properties and drying conditions. The results of the current investigation show that the EE of the encapsulated phytochemicals from black cardamom and black cumin was found to be 77.8 ± 2.08%. Previous studies have reported similar encapsulation efficiencies using various encapsulation techniques and wall materials. According to Carneiro et al. (2013) [23], using a lower amount of wall material results in higher encapsulation efficiency and greater product stability. Their study indicated that the encapsulation efficiency of two wall material combinations (maltodextrin and whey protein concentrate) varied from 62.3% to 95.7%. Another study by Kobo et al. (2022) [24] found that the encapsulation of phytochemicals from passion fruit peel achieved a high EE, ranging from 82.64% to 87.18%. The encapsulation efficiency observed in the current study is consistent with the findings of Nurhadi et al. (2024) [25], who reported a similar EE of 78% for the encapsulation of black pepper. The similarities in these results can be attributed to the use of maltodextrin as a wall material in the encapsulation process, as the choice of wall material significantly influences the encapsulation efficiency of the final product.

HYGROSCOPICITY
Hygroscopicity plays a crucial role in determining the storage stability of powders. It refers to the tendency of a product to absorb moisture from the environment. The hygroscopicity of the samples will be differed based on the wall material where, the sample produced with maltodextrin exhibited the lowest hygroscopicity, while gum Arabic

displayed the highest hygroscopicity. From the current investigation, the hygroscopicity of encapsulated phytochemicals from black cardamom and black cumin was found to be 25.57 ± 0.58%. Research by Repajić et al. (2024)[26] reported that the hygroscopicity of encapsulated fennel powders varied between 8.26% and 17.51%, showing differences compared to the current investigation. Similar findings were reported by Botrel *et al.* (2012) [27] and Felix et al. (2017) [28], where the hygroscopicity of encapsulated oregano and cinnamon powders ranged from 22.30% to 26.27% and 22.9% to 42.21%, respectively. It is important to note that hygroscopicity values tend to increase inversely with higher moisture content. Furthermore, an increase in the concentration of wall material also results in greater hygroscopicity of the encapsulated powder.

DISSOLUTION TEST

The dissolution test measures the time required for a powder to completely dissolve in water. In this study, the dissolution time for encapsulated phytochemicals from black cumin and black cardamom was recorded at 22.48 ± 1.37 seconds. According to Quek *et al.* (2007)[29] reported a similar dissolution time of 25 seconds for encapsulated anthocyanins. The results indicate that the dissolution time is related to the moisture content of the encapsulated powder. It can be concluded that as the moisture content of the powder increases, the dissolution time decreases.

POWDER YIELD

The powder yield, or recovery, refers to the amount of product obtained during the spray drying process. In this study, the analysis of the powder yield for the encapsulated phytochemical showed a yield of 43.39 ± 0.64%. This finding is consistent with research conducted by Bhandari (1997) [30], which reported that the powder yield of encapsulated fennel essential oil ranged from 58.43% to 74.84%. Additionally, the results are supported by findings from Goëlo *et al.* (2020) [31], who found that the powder yield of encapsulated curcumin, using a polysaccharide-based wall material (maltodextrin), ranged from 47.30% to 60.60%. The differences in these yields can be attributed to factors such as the wall material ratio, spray drying temperature, and the specific types of wall materials used.

COLOR ANALYSIS

The color parameters of a food product can influence its acceptability among consumers. In this study, the color parameters L*, a*, and b* were analyzed for encapsulated phytochemicals derived from black cardamom and black cumin. The results are presented in Table 2, where the L* value indicates lightness, a* represents the position on the red-green axis, and b* reflects yellowness. The study found the values for L*, a*, and b* to be 67.0, 3.5, and 23.3, respectively. These findings align with research conducted by Nurhadi et al. (2024) [25], which reported similar L*, a*, and b* values for encapsulated black pepper essential oil, recorded as 75.58, 3.2, and 36.04, respectively. The high L* value suggests that the encapsulated sample has a light color. The a* value, which is slightly positive, indicates a tendency towards the red side of the spectrum. This is likely due to the use of black cardamom and black cumin, ingredients that are typically darker in color. Additionally, the positive b* value suggests that the encapsulated powder has a yellowish tone, attributed to the natural pigments found in the seeds or phytochemicals, as well as the use of maltodextrin as a wall material.

CONCLUSION

In summary, spices typically contain a sufficient amount of phytochemicals that exhibit potent antioxidant activity and offer protective benefits against cancer and other metabolic syndromes. This study focuses on encapsulating bioactive compounds from black cardamom and black cumin using a spray drying technique. The phytochemicals from both black cardamom and black cumin were extracted using the Soxhlet method and then encapsulated. The encapsulated phytochemicals demonstrated effective physicochemical properties, making them suitable for incorporation into food products. The results indicate that the encapsulated phytochemicals from black cardamom and black cumin possess favorable physicochemical characteristics, contributing to a higher quality of the encapsulates. Specifically, the moisture content of the encapsulated powder was higher, while the dissolution time was shorter compared to previous studies. This difference was attributed to the greater concentration of wall material

used in the encapsulation process. Additionally, the lightness of the color parameters for the encapsulated phytochemicals was superior to those reported in earlier studies. The variations in the physicochemical properties of the encapsulated phytochemicals compared to other encapsulated powders were due to differences in both the type of wall material and its concentration. Overall, this investigation concludes that the encapsulated phytochemicals from black cardamom and black cumin can be utilized by food industries for incorporation into various food products. Food products containing these encapsulated phytochemicals can benefit individuals of all ages by enhancing antioxidant scavenging activity.

ABSTRACT

Pharmacovigilance (Pv) is a crucial component in ensuring drug safety by identifying, evaluating, and preventing adverse drug reactions (ADRs). Established by the World Health Organization (WHO) following the thalidomide tragedy, the Pv system includes global networks like the Uppsala Monitoring Centre and national programs such as the Pharmacovigilance Programme of India (PvPI). Despite its importance, underreporting remains a significant challenge, particularly in developing countries. This study aims to assess and compare the Knowledge, Attitude, and Perception (KAP) of Pharmacovigilance among undergraduate and postgraduate pharmacy students in India. Conducted at KLE College of Pharmacy, Vidyanagar, Hubballi, this cross-sectional study used a self-designed questionnaire to evaluate KAP on Pharmacovigilance among 517 students. The study spanned six months and received ethical approval from the Institutional Ethical Committee. The questionnaire, comprising 15 items across three domains, was administered as pre- test and post-intervention responses were assessed to trace out the changes in KAP. Statistical analysis included t-tests for comparing mean scores. Significant improvements were observed in KAP scores for both undergraduate and postgraduate students' post-intervention. Undergraduates showed notable gains in all domains, with knowledge increasing from 23.58% to 84.87% in the "Good" category. Postgraduates also improved, though they started with higher baseline scores. Statistical significance was noted with p-values <0.05 in all domains. The educational intervention significantly enhanced KAP regarding Pharmacovigilance among pharmacy students. Both undergraduates and postgraduates benefited, with undergraduates showing more pronounced improvements. These findings highlight the effectiveness of targeted educational initiatives in improving drug safety awareness and practice.

Keywords: Pharmacovigilance, Adverse Drug Reactions, Pharmacy Education, Knowledge, Attitude, Perception

INTRODUCTION

The research and practices associated with the identification, evaluation, comprehension, and avoidance of side effects or any drug-related issues are collectively referred to as Pharmacovigilance (Pv) by the World Health Organization (WHO) [1]. Following the thalidomide tragedy in Germany in 1961, the WHO launched this initiative as an international drug monitoring system [2]. The WHO's framework emphasizes the importance of gathering data on adverse drug reactions (ADRs) through various methods, including spontaneous reporting and intensive monitoring [3]. In order to address safety concerns that could have an international impact on populations, Pv plays a critical role in public health by exposing adverse drugs events that were previously unknown and thereby leading to a global Pv network namely; The Uppsala Monitoring Centre which is a WHO Collaborating Center that makes it easier to share Adverse Drug Reactions and improve drug safety surveillance [4].Launched in 2010, The Pharmacovigilance Programme of India (PvPI) which operates under Central Drugs Standard Control Organization (CDSCO) with the Indian Pharmacopoeia Commission (IPC) serving as the National Coordination Centre (NCC) for the program has been actively involved in monitoring and reporting of ADRs across India [5,6]. In developing countries like India, the load of ADRs is expected to be even more because of the prominent existence of self-medication, contaminated medication and bogus medications [7]. However, the main obstacle to the program's successful execution is underreporting, which is widespread in India and many other nations across the world [8]. In the meantime, it has been shown that in developed nations, the quantity and quality of ADR complaints increased when pharmacists reported the events [9]. Pharmacists are a vital part of PvPI due to their comprehensive knowledge of drugs and their position in the many tiers of the healthcare system. Because most significant adverse medication reactions occur in hospitals, hospital pharmacists play a crucial role in healthcare. The phenomenal growth of the clinical research and pharmaceutical industries in India has led to the expansion of PvPI [10]. As mentioned, the future professional pharmacy graduates will play an important role in monitoring and reporting ADRs it is important to evaluate Knowledge, Attitude and Perception (KAP) of Pv between UG and PG students. Rigorous identification of the differences in KAP factors will help in designing targeted educational interventions aimed at enhancing Pv training across different levels of Pharmacy education.

MATERIALS AND METHODS

Study site
This study was carried out at KLE College of Pharmacy, Vidyanagar, Hubballi.

Study design
A cross-sectional study utilizing a self-designed questionnaire was conducted to assess the knowledge, attitude, and perception of Pharmcovigilance among undergraduate and postgraduate students at KLE College of Pharmacy, Vidyanagar, Hubballi.

Ethical Approval
Ethical approval for the study was obtained from the Institutional Ethical Committee of KLE College of Pharmacy, Hubballi, with the approval number IEC No. KLECOPH/IEC/2023-24/01.

Study period
The research was conducted over a span of six months at KLE College of Pharmacy, Vidyanagar, Hubballi, Karnataka.

Study criteria
Inclusion Criteria: The study included students enrolled in undergraduate and postgraduate programs at KLE College of Pharmacy, Hubballi.

Shamita Shyam Sail *et al.,*

Exclusion Criteria: Participants involved in the pilot study and students who were unwilling to participate were excluded from the study.

Study Procedure

The faculty from the Department of Pharmacy Practice developed a set of 15 questionnaires, as outlined in Table 2, to evaluate three domains: Knowledge, Attitude, and Perception of Pharmacovigilance. The questionnaires were structured into five questions for each domain. The Knowledge domain was assessed using a dichotomous format (coded as 'Yes' = 1 and 'No' = 0), whereas the Attitude and Perception domains were evaluated using a 5-point Likert scale. The internal consistency of the questionnaires was tested among 19 participants during a pilot survey using IBM SPSS 27.0, yielding a Cronbach's alpha (α) of 0.874, indicating strong internal reliability. Initially, a pre-test was administered, followed by a brief educational session covering definitions, objectives, regulatory bodies, history, ADR reporting forms etc. The same set of 15 questions was then re-administered to participants via Google Forms, and the responses were recorded for the post-test.

Statistical Analysis

The collected data were inputted into a Microsoft Excel spreadsheet. Continuous data were expressed as mean ± standard deviation. Differences between undergraduate and postgraduate pharmacy students were assessed using the t-test. Appropriate descriptive and inferential statistical analyses were performed using Excel and SPSS version 27.

RESULTS

Table 1: Demographics details of UG and PG students. The demographic profile of the study's participants includes 57.25% females and 42.74% males. Age-wise, the largest group is 21 years old (20.88%), followed by 19 years (18.76%) and 20 years (15.66%). Undergraduates make up 75.43% of the sample, while postgraduates account for 24.37%. Most participants come from families with a non-medical background (87.23%), whereas those with a medical background constitute 12.7%. In terms of socioeconomic status, 28.82% of participants belong to the lower class (earning less than 1 lakh Rupees per year), and 27.65% are in the lower middle class (earning between 2 to 5 lakh Rupees per year). The upper lower class has 11.41%, the upper middle class 25.14%, and the upper class 6.96%. Regarding residence, 65.37% live in urban areas, while 34.62% reside in rural areas. Table 2: Questionnaire used in the study Table 3: T-Test Analysis of Knowledge scores in undergraduates and postgraduates regarding PvPI. This table presents the comparison of mean scores and standard deviations (Mean ± SD) in knowledge, attitude, and perception (KAP domains) between undergraduate and postgraduate students, both before (pre-test) and after (post-test) an intervention. It also includes p-values indicating the statistical significance of the differences observed. The study assessed the impact of an intervention on the knowledge, attitude, and perception (KAP) of undergraduates and postgraduates. In the Knowledge domain, undergraduates showed a significant improvement, with their mean score increasing from 1.91±1.807 in the pre-test to 4.40±1.223 in the post-test. Postgraduates also improved from 4.44±1.005 to 4.92±0.370. Both changes were highly significant, with a p-value of less than 0.001. In the Attitude domain, undergraduates' mean scores increased from 19.22±3.294 to 21.11±2.738, while postgraduates' scores rose from 21.72±2.651 to 22.69±2.213. The improvement was statistically significant for both groups, but the post-intervention comparison yielded a p-value of 0.018, indicating a smaller, though still significant, difference. For Perception, the mean score for undergraduates increased from 18.54±3.106 to 20.90±2.931, and for postgraduates from 21.21±2.660 to 22.63±2.313. These improvements were also statistically significant, with p-values of 0.047 for the pre-test comparison and 0.038 for the post-test comparison. The results demonstrate that the intervention significantly enhanced KAP scores in both undergraduates and postgraduates, with postgraduates generally starting at a higher baseline and maintaining a stronger performance overall. Table 4: Scoring and categorization of KAP domains. In our study, the scoring system evaluates three domains: Knowledge, Attitude, and Perception. For the Knowledge domain, participants answer Yes/No questions, where "Yes" scores 1 point and "No" scores 0 points. Scores are categorized as Poor (0-2 points), Moderate (3 points), or Good (4-5 points). The Attitude and Perception domains use a 5-point Likert scale (SA, A, N, D, SD) with corresponding scores of 5 to 1 points. These scores are categorized as Poor (0-16

95672

points), Moderate (17-18 points), or Good (19-25 points). This system helps to clearly differentiate participant responses across the three domains. Table 5: Comparison of KAP factors between undergraduates and postgraduates . Figure 1: Good responses between UG and PG The study evaluated the knowledge, attitude, and perception (KAP) of undergraduates and postgraduates before and after an intervention. Among undergraduates, there was a substantial improvement in the "Good" category post-intervention across all domains. Specifically, the percentage of students with good knowledge increased from 23.58% to 84.87%, while those with good attitudes rose from 64.10% to 89.23%, and those with good practices from 52.30% to 84.35%. Correspondingly, the "Poor" category saw a significant decrease, with the most notable reductions in knowledge (from 61.79% to 8.46%) and practice (from 29.48% to 5.64%). For postgraduates, who initially performed better, the intervention still led to notable improvements. The percentage of students with good knowledge increased from 86.50% to 98.41%, and those with good practices from 86.50% to 97.61%. The "Poor" category was nearly eradicated, especially in knowledge, which dropped from 5.55% to 0.79%. The results indicate that the intervention was effective in enhancing the KAP among both undergraduate and postgraduate students, with more pronounced effects observed in the undergraduate group.

DISCUSSION

Our study assessed and compared the knowledge, attitude, and perception of 517 pharmacy students, including both undergraduates (UG) and postgraduates (PG), revealing significant improvements across all domains after an educational intervention. These findings align with those of a similar study conducted among 225 pharmacy students in South India by Reddy VL et al., where both studies observed large gains in knowledge and positive shifts in attitudes towards pharmacovigilance post-intervention. However, our study uniquely highlighted that PGs began with a higher baseline knowledge, a factor not addressed in the South Indian study. Moreover, our focused comparison between UGs and PGs provided more detailed insights, though both studies acknowledged limitations in generalizability due to sample size. This shows the effectiveness of educational interventions in enhancing pharmacovigilance awareness [11]. The MBBS students had a considerably greater baseline knowledge than the other groups, according to study conducted by Byndoor Y et al., which evaluated the attitudes and knowledge of 340 healthcare students from various fields like nursing, physiotherapy, dentistry, and master's in medical science. While our research including 517 pharmacy students, demonstrated post-intervention significant increases in knowledge in 2 groups namely UG and PG. The need for improved pharmacovigilance education was underlined in both research; however, our study concentrated on the effects of an educational intervention, whereas this one highlighted the differences in baseline knowledge across disciplines. The results obtained highlight the necessity of an extensive pharmacovigilance program while the generalizability of both research is restricted because of their student-focused sample designs [12]. Our study and the study done by Melo et al., reveal both similarities and differences in the knowledge, attitude, and perception, practice regarding pharmacovigilance. In their study it shows that knowledge is crucial, with our study demonstrating significant improvement in KAP scores post-intervention among undergraduates and postgraduates, while their study indicates a moderate level of knowledge with varied application. Our study highlights effective educational intervention, improving attitudes and perceptions significantly, whereas Melo et al., study shows mixed attitudes towards reporting adverse drug events (ADEs) and challenges in applying knowledge despite high levels of knowledge reported [13]. Comparing our study with Kharkar and Bowalekar reveals notable differences in ADR reporting practices. Our study demonstrates that an intervention significantly enhances knowledge, attitude, and perception regarding pharmacovigilance among undergraduates and postgraduates. In contrast, the Kharkar and Bowalekar study highlights a disconnect between awareness and actual ADR reporting among medical practitioners in India, despite high levels of knowledge and positive attitudes towards ADR centres. This disparity underlines the importance of not only improving education and perception but also addressing practical barriers to ensure effective ADR reporting. Both studies stress the need for comprehensive strategies to reduce differences and resolve the gap between awareness and actionable practices, perception in pharmacovigilance [14].

CONCLUSION

The study effectively demonstrated the positive impact of the intervention on improving the knowledge, attitude, and perception (KAP) regarding Pharmacovigilance among both undergraduate and postgraduate students. Significant improvements were observed across all KAP domains post-intervention, with undergraduates showing more pronounced gains, particularly in the transition from poor to good knowledge and perception. Postgraduates, who started with a higher baseline, also benefited from the intervention, further solidifying their understanding and attitudes towards Pharmacovigilance. The results underscore the necessity of targeted educational initiatives to enhance the competency of pharmacy students in PvPI, thereby fostering a more vigilant and informed healthcare workforce. The study highlights the potential of educational interventions in bridging knowledge gaps and fostering positive attitudes and perceptions essential for the effective reporting and management of adverse drug reactions (ADRs).

Conflict of interest
The authors declare that there are no conflicts of interest.

ABSTRACT

Nowadays the popularity of antioxidants is increasing owing to their activity in the scavenging of free radicals and possessing various health-beneficial properties. Fruits and vegetables being good sources of these antioxidants are consumed in generous quantities by people. In major cases, only the flesh part of the fruits, and vegetables are consumed; but peel, and seeds are discarded as waste. However, several studies have suggested that these discarded materials contain an even higher number of antioxidants than those fruits. Oranges are one of those fruits that are consumed worldwide in different forms but peels and seeds are thrown away. That's why the present study mainly focuses on an analysis of phytochemical compounds and free radical scavenging activity of aqueous and isopropanol extracts of orange peels. The data of this study shows that the total phenolic content of the aqueous extract of orange peel (57.3 mg/GAE/g) is higher compared to the isopropanol extract (35.3 mg/GAE/g). The total flavonoid content of the aqueous extract of orange peel has also been found higher (147.01mg/QE/g) than the isopropanol extract (259.85 mg/QE/g). The orange peel of both extracts exhibits a significant amount of antioxidant activity. So, it may be concluded that the inclusion of orange peel in the daily dietary regime may contribute to the prevention of various metabolic and oxidative stress-related diseases rather than discarding it as waste.

Keywords: Orange peel, aqueous and isopropanol extract, bioactive compounds, antioxidant activity, biowaste utilisation

INTRODUCTION

Antioxidants are natural and man-made substances that are found in a variety of foods which plays a key role in the prevention of oxidative damageto thehuman body. There is currently considerable interest in the evaluation of natural cancer prevention agents and radical scavengers derived from plant materials that are rich in polyphenolic compounds[1]. Oranges are consumed by people all around the world because of their pulpy and juicy flavour. It belongs to the Rutaceae family, which includes several different species. In several regions of India, Citrus reticulata, are sometimes known as mandarin oranges or sweet oranges. Oranges have a considerable amount of vitamin C and antioxidants, making them very nutrient-dense foods [2].Oranges account for 60% of all citrus food item production worldwide. A significant fraction of those products contribute to large-scale juice extraction and produce enormous amounts of residue; primarily peels. Generally, peels or seeds of fruits and vegetables have not received much attention due to their astringent taste. However, many times they have been shown those leftovers have a combination of an abundance of nutrients and bioactive compounds[3]. In the past few years, industrial wastes have been getting attention; especially for those residuals that contain bioactive compounds from the used raw plant material and orange peels are one of them. Biologically active substances with favourable health effects and more natural ingredients have recently become more popular among customers [4].Few studies exhibited that orange has numerous active phytochemicals and bioactive compounds such as Neohesperidin, Naringin, Hesperidin, Narirutin, Limonene, Citrol, Anthocyacin, Beta-cryptoxanthin, Cryptoxanthin, Zeaxanthin and Rutin, Eriocitrin, Homocysteine Polymethoxylted flavones; Tangeritin and Nobiletin, Citacridone, Citabrsine and Noradrenaline [5].A variety of food products with substantial functional and nutraceutical potential can be formulated using bioactive components that are prevalent in fruit by-products and have significant health advantages [6]. It has been proven that these compounds have many health-beneficial activities by lowering the chance of developing cardiovascular illnesses and oxidative stress-related diseases. It also exhibits anti-inflammatory, anti-hypertensive, hypolipidemic, and anti-carcinogenic properties[7].The peel of this citrus fruit is widely used as an essential oil due to its antifungal and antioxidant properties. Similarly, the seeds of citrus fruits also contain a good amount of polyphenols[8]. For polyphenolic extraction, many techniques have been used with methanol, ethanol, or isopropanol. Studies based on methanolic extraction have been proven to give the maximum yield of antioxidants as compared to other solvents. There is another extraction medium (isopropanol) that is used for the safest incorporation of these polyphenolic compounds tofulfil dietary needs. That's why in the present study, for extraction of phenolic compounds; two solvents(aqueous and isopropanol)were preferred for their better acceptability in foods and least hazards to human health.The main aim of this experiment was to extract and evaluate the antioxidant profile and total phenolic content, total flavonoid content, and DPPH scavenging activity of orange peel in aqueous and solvent medium.

MATERIALS AND METHODS

Sample collection
Fresh mandarin/Darjeeling oranges purchased from the supermarket of Kolkata, West Bengal. The oranges were washed thoroughly with water and dried with a kitchen towel. Peels were then removed, cut into thin slices, and dried in the hot air oven till all the moisture was removed. They were then grinded into a fine powder, sieved with a strainer and stored in the refrigerator in a glass jar.

Preparation of Sample Extract
1. **Aqueous extract:** 7.5g of powder dissolved in 100 ml of water placed on a magnetic stirrer for 2 hours. The solution was then centrifuged to obtain a clear fluid which was poured in a glass jar and stored in the freezer.
2. **Isopropanol extract:** 7.5g of sample dissolved in 100ml distilled water for 2 hours, centrifuged and stored in the freezer.

Sanjukta Kar *et al.,*

Chemicals used

All the chemicals and solvents were of analytical grade. Sodium carbonate (Na_2CO_3), Folin-Ciocalteu's reagent), gallic acid (trihydroxy benzoic acid), Sodium hydroxide (NaOH), Ethanol (C_2H_6O), Sodium phosphate (Na_3PO_4), Ammonium molybdate [$(NH_4)_6Mo7O24$], Quercetin ($C_{15}H_{10}O_7$), 2,2-diphenyl-1-picrylhydrazyl (DPPH).

Apparatus used

Electronic weighing machine, Muffle furnace, Hot air oven, UV-Visible spectrophotometer (Labtronics, Model: LT-2201), Centrifuge, Test tubes, Conical flask with stopper, Beaker, Vortex mixer, Micropipette, Measuring cylinder.

Quantitative Determination of Physico-chemical Properties

Total moisture content

Moisture content was evaluated using the AOAC standard [9]. The peels were thinly sliced and weighed before drying them in the hot air oven at a temperature of 60℃ for 5 h. Peels were weighed after every 30minutes; until 2 consecutive similar readings were obtained. It took approximately 3 days for the peels to dry completely. The following formula was used to calculate the moisture content.

$$\text{Moisture \% by weight} = \frac{\text{initial weight of sample} - \text{final weight of sample}}{\text{initial weight of sample}} \times 100 \tag{1}$$

Total ash content

The ash content was determined using the AOAC standard[9]. The dried peels were grounded into a fine powder. 10g of the powder was measured in a crucible and placed inside a muffle furnace for 5 hours at a temperature of 600℃ till it turned into ash. The following formula was used for calculating the ash content of orange peels.

$$\text{Ash \% by weight} = \frac{\text{final weight of sample}}{\text{initial weight of sample}} \times 100 \tag{2}$$

Quantitative Estimation of Phytochemicals

i. **Total phenolic content:** The total phenolic content (TPC) was determined according to the method of Park JH et al. [2]. 50 µl of the sample was mixed with 9.5 ml of distilled water. Then 0.5 ml of Folin-Ciocalteu's reagent was added to it. The mixture was mixed with the help of a vortex mixture. 2.5 ml of 20% sodium carbonate solution was added. The contents were then once again mixed with the help of a vortex mixer. It was then kept in the dark for 40 minutes at room temperature, and the absorbance was determined at 725 nm wavelength in a UV-visible spectrophotometer (Labtronics, Model: LT-2201). TPC was expressed in terms of mg of gallic acid equivalents (GAE) per gram of dry sample (mg GAE/g).

ii. **Total flavonoid content:** The flavonoid content was determined with the method of (Zhishen J et al. [10]. 100 µl of sample was mixed with 4 ml of distilled water then 0.3 ml of 5% sodium nitrite (NaNO2) was added and allowed to stand for 5 minutes. Then 0.3 ml of 10% aluminium chloride (AlCl3) was added and allowed to stand for another 6 minutes followed by the addition of 1 ml of 1(M) sodium hydroxide (NaOH). The final volume was adjusted to 10 ml with the addition of distilled water. The absorbance was determined at 510 nm wavelength in a UV-visible spectrophotometer (Labtronics, Model: LT-2201). Quercetin was used in different concentrations as the standard for the standard curve. The total flavonoid content was calculated in mg quercetin equivalents per g of dried sample (mg QE/g).

Quantitative Determination of In vitro Antioxidant Activity:

i. **DPPH Scavenging activity:** The free radical scavenging activity of orange peel extracts was determined using the 2, 2-diphenyl-1- picrylhydrazyl (DPPH) radical as described by Ali et al. [11]. DPPH solution was prepared by mixing 0.002g of DPPH in 50ml ethanol. The standard curve was plotted taking ascorbic acid in place of the sample once and then taking gallic acid as another replacement of the sample. Various dilutions were prepared to obtain the standard curve. 50µl of sample was taken along with 2.5ml of DPPH solution and kept in the dark for 20minutes. The absorbance of the mixture was measured at 517 nm in a UV-visible spectrophotometer (Labtronics, Model: LT-2201). DPPH radical scavenging activity was calculated by the given formula.

% of inhibition of DPPH activity $= \frac{\text{absorbance of control} - \text{absorbance of sample}}{\text{absorbance of control}} \times 100$ (3)

ii. **Total antioxidant activity (phosphomolybdate assay):** The TAC was measured according to the method of Prieto P et al. [12]. The molybdate reagent solution was prepared using, 4.704 ml of sulphuric acid (H2SO4), 0.392 g of ammonium molybdate, and 0.288 g of sodium phosphate and the remaining volume was made up to 80ml using distilled water. 100 µl sample was mixed with 3 ml of molybdate reagent in a glass test tube. The mixture was capped and incubated for 90 minutes at 80ºC. The samples were cooled at room temperature and the absorbance was measured at 695nm. Ascorbic acid was used in different concentrations as the standard for the curve. Phosphomolybdate assay was expressed as mg of ascorbic acid equivalents (AAE) per gram of dry sample (mg AAE/g).

Statistical Analysis
All the data are expressed as mean ± SD by SPSS.

RESULTS AND DISCUSSIONS

Quantitative Estimation of Physio-chemical Properties of Orange Peel Extracts
Note: All data are expressed as Mean± SD, (n=3)
The moisture and ash content of orange peel can be seen in **Table 1**. The moisture content of fresh orange peels wasfound to be 69.9%, which is considered high on account of perishability. Food products accommodating moisture of more than 55% are considered highly perishable and have a shelf life of a maximum of 2 days when stored in the refrigerator. Moisture content corresponds to the water content in food materials, which is a source of bacterial growth leading to spoilage. Orange peels contain a good amount of moisture; hence it is always better to dry them before incorporating them in any food item to retain their freshness[13]. The Ash content of dried orange peels is 2.16%, depicting the total insoluble ash percentage of the peels. The ash percentage represents the mineral content of any food sample; hence inclusion of orange peels in food items also gives a boost to its mineral content[14].

Quantitative Estimation of Phytochemicals and Antioxidant Properties of Orange Peel Extracts
Plant phenolics are one of the main groups of phytochemical compounds that work as primary antioxidants or free radical scavengers[15]. Plant polyphenols are very effective such as singlet oxygen scavengers, reducing agents and hydrogen atom donors [16]. They also have various therapeutic properties. In the present study, the total phenolic content of fresh orange peels was found to be 57.3±0.62 mg GAE/g in aqueous medium, whereas it varies when the extraction medium is changed. In isopropanol extract the TPC value stands less; compared to the aqueous extract to be 35.3±0.49 mg GAE/g. The gallic acid standard curve equation (y = 2.284x + 0.3324, R^2 = 0.9761) **(Figure 2)** was used to determine the total phenolic content of orange peel extracts. Few studies stated that the sweet orange peel has the highest phenolic content with a value of 1035.6 mg GAE/ 100 g of dry weight followed by peels of mandarin, bitter orange, navel orange and lemon which were 870, 800.4, 740.4 and 601.2 mg GAE/ 100 g of dry weight respectively[17]. Flavonoids are known secondary metabolites that are present in plants[18]. Flavonoids have numerous pharmacological activities such as neuroprotective, anti-ulcer, spasmolytic, anti-depressant, anti-bacterial, anti-hypertensive, anti-diabetic, anti-inflammatory and anti-cancer [19]. In this study, the total flavonoid content of orange peels was 147.01 mg QE/g in aqueous extract. Orange peels being high in flavonoids, in solvent extraction give the complete flavonoid content which is much higher than in aqueous extract. In isopropanol, the TFC is 259.85 mg QE/g, which is more than double as compared to aqueous extract. The total flavonoid content was calculated by the standard curve equation of quercetin (y = 0.1469x – 0.0213, R^2= 0.9638). Another study shows that the sweet orange peel has a total flavonoid content of 402 mg quercetin equivalent/ 100 g of dry weight followed by peels of mandarin, bitter orange, navel orange and lemon [17]. To evaluate the in vitro antioxidant activity of any substance DPPH radical scavenging activity is one of the most popular, simple and convenient ways [20]. The present study shows that theDPPH scavenging activity as per the % of inhibition of orange peels in the aqueous extract was found to be 89.68 %. The antioxidant quenching activity in isopropanol extract was observed to be94.04 %. Therefore, the solvent extract has a higher scavenging property of free radicals compared to the aqueous extract of orange peel.

Sanjukta Kar *et al.*,

The total antioxidant capacity (TAC) was evaluated based on the reduction of Mo(VI) to Mo(V) by the extract and subsequent formation of green phosphate/Mo(V) complex at acid pH. It evaluates both water-soluble and fat-soluble antioxidants [21]. In the present study, the total antioxidant activity in terms of ascorbic acid standard of fresh orange peels in aqueous extract was found to be 199.76 mg AAE/g, whereas; the solvent medium exhibited 173.77 mg AAE/g. The total antioxidant capacity was calculated by the standard curve equation of ascorbic acid (y = 1.3852x – 0.0503, R^2= 0.9956). **Table 3** shows the phytochemical screening of different parts of the orange. Here, for orange peel, terpenoids are absent. The table shows that orange peels do not show the presence of terpenoids in either of its extracts. The seeds are rich in all the phytochemical compounds including the anti-nutrient, tannin.

CONCLUSION

In this experiment, the bioactive assay of orange peels was determined in both aqueous and solvent medium. It was closely observed that orange peels are high in nutrients and instead of discarding them as waste, we can incorporate them in our diet. Citrus peels are proven to be a good source of pectin and dietary fibre[23]. The utilization of biowaste's nutrient content in food is a new advance in today's food industry. Orange peel powder is extensively used in bakery products to elevate their nutrient profile. The medical benefits of oranges are well known around the world; however, the anti-cancerous, antihypertensive properties of orange peels are coming to light with recent studies. Hereby, we conclude that orange peels are highly nutritious and should be incorporated into our daily diet.

ABSTRACT

A methodology by which doctors can diagnose injury and dissect images from several imaging modalities is known as multi-modal image fusion. A variety of imaging methods can be used to diagnose diseases, namely Computed Tomography, Magnetic Resonance Imaging, Positron Emission Tomography, and Single Photon Emission Tomography. These techniques facilitate the diagnosis of infections by specific details information about the infected area. The observational constraints of these methods make them incapable of providing complete information. The purpose of image fusion is to maintain data from source images at every pixel position in order to enhance the processing capability of the fused image. It facilitates physicians in diagnosing diseases more effectively by providing an intuitive understanding of data contained in multiple images. This article aims to provide an detailed literature review of distinct fusion methods. The objective of this article is to present an in-depth literature review on distinct image fusion methods.

Keywords: Image fusion, discrete wavelet transform (DWT), symlet, coiflet, Dmeyer, and biorthogonal.

INTRODUCTION

Medical investigation is the methodology of sorting out the infection from an individual's shreds of evidence and signs. The information required for analysis is regularly gathered from a set of history and actual assessments of the person. Medical diagnosis aims at grouping a person's condition into divided and recognized classifications which gives choices about treatment and depiction to be made. A single diagnostic strategy is not sufficient to provide significant information about a specific disease. Hence, doctors avail another diagnostic strategy to provide sufficient information about a particular disease. This in turn necessitates to examine two distinct images. The complementary information from two distinct images is amalgamated at the software level. The amalgamated image provides complete information about individual image data available . The end output image is commonly known as the fused image. The fused image facilitates doctors to diagnose diseases more efficiently than individual diagnostic strategies. CT scans can image solid structures like bones and implants, but soft tissues cannot be seen clearly with CT scans. Soft tissue can be visualized with high resolution with Magnetic Resonance Imaging (MRI), but they are not effective when capturing bone structures. CT image shows anatomical features like bone and some delicate tissue details, but the PET image shows information about the organic chemistry that occurs inside our body. In simpler words, CT informs about the structure of bones, whereas PET informs about the science of materials in our body. As cancer is both structural and biochemical, both CT and PET imaging technologies provide information about what's going on inside our bodies. It will be hard for a physician who wants to visualize the information from images from diverse modalities. There is a need for multimodal techniques for fusing medical images to provide fusion images with complementary information obtained from a variety of modalities by Q.Zuo *et al* .[2]. As depicted in Figure 1, the source images are first processed by reducing, resizing and manipulating their mor- phology. The processed are then stripped into high- and low-frequency components. Finally, inverse transformation is done for reconstructing the fused image. Three levels of integration are possible with images: pixel, feature, and decision. PCA [4] and IHS [5] can pre- serve all the spatial information while lowering computational complexity worked by Nie Rencan *et al.*[6].

However, these strategies result in colour distortion and a loss of contrast. This makes them ineligible for medical image analysis. Due to its excellent performance in extracting features, the multiscale transform (MST) technique is popular in fusion techniques for medical images [7]. There are two key approaches in the transform domain: pyramid-based and wavelet-based. Pyramid methods include Laplacian , Gaussian , Contrast and Morphological Pyramids. There is no choice of space direction in these ways, which leads to blocking and numerous artifacts. The wavelet transform captures information in three directions (horizontal, vertical, and diagonal) that can be used to determine edges and texture regions. Medical diagnosis is all about carefully piecing together clues from a patient's symptoms, medical history, and physical exams to determine what's going wrong. However, no single test or imaging technique can tell the full story of a disease. Doctors often need to look at multiple scans to get a clearer picture. This is where multimodal image fusion comes in—it combines different types of medical images to create a more detailed and informative view. Each imaging method has its strengths and weaknesses. CT scans are great for seeing bones and solid structures but don't show soft tissues well. MRI scans provide clear images of soft tissues but aren't ideal for capturing bones. PET scans reveal biochemical and metabolic activity but lack precise anatomical details. For complex diseases like cancer, which involve both structural and functional changes, doctors need to see everything in one place. Instead of flipping back and forth between different scans, multimodal fusion brings all the important details into a single, enhanced image. This fused image makes it easier for doctors to diagnose illnesses, plan treatments, and track how well a patient is responding to therapy. It helps them see the big picture, making medical decisions more accurate and effective. In a world where early and precise diagnosis can save lives, multimodal image fusion is becoming an essential tool in modern healthcare. This paper summarizes the contributions presented as follows:

- An in-depth look at fusion of multimodal images in biomedical research.
- Existing fusion strategies are based on deep learning and traditional methods are discusssed in detail
- In depth methods, frameworks, research methods, datasets, problems and perspectives have been presented.

- A brief conclusion detailing potential future research directions A thorough literature assessment of significant image fusion techniques using Wavelet Transform is presented in Section 2. In Section 3 and section 4, image fusion strategies employing NSCT and Neuro-fuzzy approaches have been analysed. The potential future scope and conclusion is provided in Section 6.

RELATED WORK

Medical imaging is the process of providing optical representations of the interior parts of the body so that medical intervention can be performed. To diagnose disease effectively, it reveals all the essential information related to intrinsic structures hidden behind the skin and bones. Several researches are being conducted to improve the performance of image fusion strategies using different algorithms. Image fusion strategies have been studied by some authors to improve their performance[8]. A few have attempted to reduce the distortion of data in the fused image. The neural parameters used in image fusion algorithms can also be optimized to improve their performance. To foster research ideas in imaging fusion strategies, a detailed literature review has been conducted.

WAVELET TRANSFORM (WT)
A deep learning network based on wavelet transform has been developed by Xiang *et al* [10]. for enhancing low-light images. A frequency pyramid is constructed using an optimal wavelet decomposition coefficient to build a low-frequency restoration subnet and a high-frequency reconstruction subnet. The proposed method yields better quantitative and qualitative results, particularly in real-life and complex low-light scenarios. R. Sharma *et al.* [11] have proposed a wavelet packet transform based on structural and metabolic image fusion. In a non-iterative random vector functional link (RVFL) model, features from multiple layers are extracted using an eight- layer trained CNN. To mitigate outliers, RVFL uses the s-membership fuzzy function acts as an activation function. RVFL calculates the final decision after averaging the outputs of each customized RVFL classifier. An ADNI dataset is used for experiments, and classification is made based on CN vs. AD vs. MCI. Guofen Wang *et.al.* [12] have developed a gradient-enriched decomposition algorithm based on functional and anatomical image fusion (2022). To separate the integrated image into the base, the local average of the intensity and the texture layers, the GED model is enlarged to a three-layer decomposition using different coefficients and direc- tions. The proposed strategy consumes lesser time and produces less noise than traditional image fusion techniques. The local values of l2 and the largest single value are used as the integrated weights for the local electronic layers. The texture layer combination weights are generated by combining the local mean l1 with the largest single value. Experimental outcomes demonstrate that the proposed strategy produced better colors and clear edge details. Qing Zuo *et al.*[13] suggested a multi-fusion framework for automatic fusion of multi-modal images based on classifier-based feature synthesis . Feature classifier, multi-cascade fusion decoder, and pre-trained autoe ncoder based on dense connections comprise the proposed methodology. For fusion of high and low frequency coefficients a parameter-adaptive pulse-coupled neural network and I1 weighted methodology have been implemented. A new multi-cascade composite encoder has been developed in the full decoding process to selectively combine large data from multiple methods. The author has confirmed the effectiveness of the proposed strategy by successfully classify- ing brain diseases. Comparing the suggested methods with advanced approches, it shows the suggested method to be more efficient and quality-focused. Using the Synchronized-Anisotropic Diffusion Equation, R. Zhu *et al.*[14] have developed a unique multi-modality medical image fusion method. The source images are modified using S-ADE model followed by fusion using the absolute maximum fusion rule. The fused output is reconstructed using conjunction of sequential layers. The effectiveness of the proposed approach is evident from qualitative and quantitative analysis.

NON SUBSAMPLED CONTOURLET TRANSFORM (NSCT)
Depending on the network's capacity to extract deep semantic features at various scales, Yu Sang *et al.* [16] developed cascaded multiscale residual blocks for extracting multi-receptive field ratio features from CT images. Prior knowledge of learning process can be obtained by using the NSCT strategy to integrate high and low frequency components which enables the network to learn the features texture and hold more information than spatial domain

information. Mayukhmala Jana *et al.* [17] have proposed Fuzzy C-Means (FCM) clustering method for improving the subtle features found in MRI images, which aids in identifying the brain regions that are impacted. NSCT technique has been utilized to decompose the source images into different sub-bands. Singular Value Decomposition (SVD) and simple averaging techniques methodology have been utilized to integrate information about amplitude and phase spectra. The proposed methodology extracts essential information from each colour plane of PET/SPECT, integrating them with MRI in the process. Experimental outcomes demonstrate that the resultant image yields better outcomes with regard to subjective and objective analysis. Zhiqin Zhu *et al.* [18] have developed a technique that employed Phase congruency and local Laplacian energy for fusing multimodality images. Low-frequency and high frequency sub-bands were fused using a Laplacian energy- based fusion rule and phase congruency fusion rule. PC has been implemented to produce informative, in-depth information. PC measures the resolution of an image in a dimensionless manner. Studies have shown that the proposed method yields better results both qualitatively and quantitatively. Weiwei Kong *et al.*[19] have developed a novel framework for non-subsampled image fusion drew on local differ- ence (LD). To disintegrate the source images into distinct sub-bands, non-subsampled approaches were initially used. After integrating the images, the local difference (LD) operator was used. Based on the comparative analysis, the pro- posed strategy is more effective than non-subsampled Contourlet transforms and non-subsampled Shearlet transforms. In experiments, the proposed method improved the information in the image, which enhanced the diagnosis' accuracy.

NEURO FUZZY TECHNIQUES

Wang *et al.* [21] developed a distinct image fusion and denoising technique to address blurring, unclean denoising, gradient loss, and colour distortion issues. Initially, decomposition model based on weighted Schatten p-norm and hybrid variation-sparse representation have been developed. The structural layers and feature coefficient maps are employed with appropriate fusion criteria. Experimental results illustrate that the proposed image fusion strategy successfully eliminates noise while preserving gradient information without introducing colour distortion. Chengchao Wang *et al.* [22] have proposed a multimodality fusion information gate architecture (IGNFusion), which governs each encoder's feature-level contribution level to the decoder. SMSCAFM also integrates saliency information from multiple sources with complementary information. An extensive study using ten categories of mul-timodal images produced more significant results than existing state-of-the-art approaches for CT, MR-T1, and PET, MR-T2 combinations. Wanwan Huang *et al.* [23] have introduced a two-level adaptive network for medical image fusion that addresses the issues in existing image fusion strategies and provides a unified fusion framework . Dynamic meta-learning methods were developed specifically to overcome the heterogeneous problem of the fusion of multi-focus images into medical images by dynamic convolution decomposition (DCD). Finally, a multimodal fusion method that combines features of different aspects via a dynamic attention a dynamic channel fusion mechanism. To evaluate the model, the transfer multifocus deep network has been evaluated qualitatively and quantitatively. In this article, Yu Liu *et al.* [24] have developed a Convolutional Neural Network (CNN) technique for combining multimodal MRI volumetric data. To improve feature learning, an attention-based multimodal feature fusion module (MMFF) has been proposed. With regard of both visual quality and objective assessment, the suggested method outperforms fuison methods 3-D and 2-D medical image.

This strategy is tested for its efficacy by enriching the source modalities, and it is inferred that the segmentation accuracy is improved when the input modalities are enriched. In this paper, Vijayarajan Rajangam *et al*.[25] present a multimodal composite image representing the details of the two images within the same ROI. This method involves generating robust fusion weights from input image matrices by individually weighting the matrices. Co-occurrence matrix-mean techniques can be used to extract texture features. Spatial domain fusion is implemented using weight maps. Junwei Duan *et al*.[26] describe a region-based multimodal image fusion system utilizes super pixel segmentation and an optimization technique. Super pixel LSC is used to segment the resulting image and generate super pixel labels to efficiently synthesize the homogeneous regions and preserve the information of the image. GA technique is utilized to provide an accurate decision map. Super pixel LSC is used to segment the resulting image and generate super pixel labels to efficiently synthesize the homogeneous regions and preserve all the image information. A method reached from Gabor representation of multi-CNN combination and fuzzy neural network has

been proposed by Lifang Wang *et al.*[27] to address the limitations of the existing techniques multimodal medical image fusion, which include their inability to fully characterise the complex textures and edge information of the lesion in the fused image. The proposed strategy employs Gabor filter banks with various ratios and directions to first distinguish the CT and MR image sets into different Gabor representation pairs. Each pair of Gabor representations is fed to a trained G-CNN for initial fusion, and finally a fuzzy neural network is used to integrate multiple G-CNN outputs to form the final fused image. Experimental outcomes demonstrated that GCNN integrated clear edge information and rich texture features into complete fused image, improving the quality of multimodal medical image fusion and assisting physicians on problem diagnosis. Yong Yang *et al.*[28] have proposed a new MMIF method based on weighted local energy matching measurement (WLEMM) and increased spatial frequency for achieving a balance between computational loss and fusion quality (SF).For disintegrating input images into its base component and saliency part, a decomposition matrix is first trained by utilizing the latent low-rank representation . A unique fusion rule, called WLEMM has been used to fuse the corresponding pixels of the base and saliency parts. The fused image is then produced by merging saliency and fused base portion. The graph tells a clear story of progress in different techniques over time. Traditional and Hybrid Fusion methods start with a steady rise but soon fall behind as more advanced approaches take the lead. The Graph Neural Network shows promising growth, while Wavelet Transformation, Neuro-Fuzzy Technique, and Nonsubsampled Contourlet Transform (NSCT) make impressive leaps forward. Towards the end, NSCT emerges as the strongest performer, proving its effectiveness. This pattern highlights how newer, smarter techniques are transforming the field, leaving older methods struggling to keep up.

Technology Foundation of Multimodal Fusion

In various disciplines, information about the same phenomenon is often acquired through different types of detectors, under varying conditions, or across multiple experiments and subjects. Each of these acquisition methods is referred to as a "modality." Due to the complexity and richness of natural phenomena, it is rare that a single modality provides a complete understanding of the phenomenon of interest. The growing availability of multiple modalities reporting on the same system introduces new opportunities but also raises important questions that go beyond the use of each modality individually. These challenges are common across numerous fields of study. This paper addresses two key questions: "Why do we need data fusion?" and "How do we perform it?" The necessity of data fusion is illustrated with examples from various scientific and technological domains, followed by a mathematical framework that highlights some of the benefits of integrating data from different sources. To answer the second question, the concept of "diversity" is introduced as a crucial factor. Several data-driven approaches, particularly those based on matrix and tensor decompositions, are discussed, emphasizing how these methods account for diversity across datasets. The aim of this paper is to provide readers, regardless of their field of origin, with a comprehensive overview of the vastness of the field of data fusion, along with the prospects and opportunities it offers for advancing technology and research. A Gandhi *et al.*[29]have contributed notably to these advancements.

They focused on refining MSA fusion methods by adapting them to handle the complexities of multimodal data more effectively, while also addressing challenges such as variability in modality combinations and improving model generalization. Their research has further expanded the scope of MSA by introducing innovative ways to account for context and speaker-independent features, which significantly enhance the robustness of sentiment analysis model. zao *et al.* [30] have proposed a deep learning-based fusion model that combines optical and infrared images to improve object detectability under varying lighting conditions. Their approach demonstrated enhanced feature representation by leveraging the complementary nature of multimodal data. Similarly, Wang et al. introduced a hierarchical fusion network that integrates spatial and spectral features, significantly improving small object detection performance in remote sensing imagery. Li *et al.*[31] focused on multi-scale feature extraction techniques to improve the detection of small objects in high-resolution satellite images. Their study highlighted the importance of adaptive feature fusion strategies to enhance object visibility and classification accuracy. Additionally, McKenny *et al.*[32] developed an attention-based multimodal fusion framework that dynamically weights different modalities based on their relevance, achieving robust detection performance across diverse environmental conditions. In contrast to these methods, Han et al. [33] proposed a differential multimodal fusion algorithm, MMFD et, which

95690

introduces a multi-branch feature extraction structure to better adapt to small objects. Their approach incorporates a Multimodal Difference Complement Module (MDCM) to enhance sensitivity to inter-modality differences, addressing the challenges of low-light detection. Furthermore, their High-Level Feature Split Hybrid Module (HFSHM) improves feature integration, significantly boosting detection accuracy. Experimental results on the VEDAI and Drone Vehicle datasets demonstrated a 14.7% and 11.1% improvement in average precision over baseline models, surpassing traditional and state-of-the-art multimodal detection algorithms. Wang *et al.* [34] proposed a demand prediction model based on historical sales trends and customer purchase behaviors, leveraging time-series analysis to improve flash sale forecasting. Their study highlighted the challenges posed by fluctuating consumer demand and the impact of external factors such as seasonal trends and marketing campaigns. Similarly, Zhu et al. [35] introduced a deep learning-based revenue prediction framework that incorporated social media sentiment analysis and customer engagement metrics to enhance forecasting accuracy. Multimodal learning has emerged as a powerful approach in revenue prediction, particularly in e-commerce. Zheng *et al.* [36] developed a multimodal sales forecasting system that integrated product descriptions, customer reviews, and sales data using a hybrid neural network. Their research demonstrated the effectiveness of combining structured and unstructured data for improved prediction performance. Guelib *et al.* [37] further extended this approach by employing attention-based fusion techniques to integrate textual and visual features from product listings, enabling a more holistic revenue forecasting model. Building on these advancements, Dong *et al.* [38] proposed the Panoramic Sales Insight (PSI) framework, a multimodal revenue forecasting model specifically designed for flash sales. PSI leverages a text–image fusion module that combines product descriptions and images using BERT for text feature extraction and ViT for visual feature extraction. Additionally, Fumeus is employed for review keyword extraction, further refining sales insights. Through controlled experiments and ablation analysis, PSI demonstrated superior performance, confirming its robustness and effectiveness in revenue forecasting for fast fashion retailers such as Shein.

Application of Multimodal Fusion

Multimodal image fusion has a wide range of applications across various fields, significantly improving decision-making and analysis. In medical imaging, it enhances disease diagnosis by combining modalities like MRI, CT, and PET to provide a clearer, more comprehensive view of internal structures and metabolic activity. This is especially useful for detecting tumors, neurological disorders, and cardiovascular diseases. In remote sensing, fusion techniques integrate data from optical, infrared, and radar imagery, improving land use analysis, disaster monitoring, and environmental studie. Surveillance and security benefit from multimodal fusion by combining visible and thermal imaging, allowing better object detection in low-light conditions. In autonomous driving, fused data from LiDAR, radar, and cameras improve object recognition and navigation, ensuring safer and more efficient vehicle control. Additionally, e-commerce utilizes multimodal fusion for revenue forecasting, integrating text and image features to predict consumer trends. By com- bining diverse data sources, multimodal fusion enhances accuracy, efficiency, and insights across multiple domains, making it a crucial tool in modern technology. Multimodal biomedical data fusion has gained increasing attention as researchers strive to integrate diverse data sources for more accurate and meaningful insights in medical and healthcare applications. Various studies have ex- plored different fusion methodologies, focusing on deep learning-based approaches to effectively combine multiple biomedical modalities. Duan *et al.* [39] proposed a hybrid fusion model that integrates genomic, imaging, and clinical data to enhance disease prediction and personalized treatment. Their approach demonstrated that incorporating multimodal data significantly improves diagnostic accuracy compared to single-modal models. Similarly, Cui *et al.* [40] developed a deep learning framework that utilizes attention mechanisms to prioritize essential features across modalities, leading to improved biomarker discovery for conditions like cancer and neurodegenerative diseases. Li ,J *et al.* [41] introduced a hierarchical fusion strategy that combines electronic health records (EHR), medical images, and physiological signals, categorizing fusion at pixel, feature, and decision levels. Their study emphasized the importance of feature-level fusion in capturing complex biomedical relationships. Meanwhile, Chen et al. explored cross-modal transfer learning to address data scarcity in multimodal biomedical fusion, demonstrating its potential in rare disease diagnosis. Building upon these advancements, Azam *et al.* [42] conducted a comprehensive investigation into deep learning- driven multimodal biomedical data fusion. Their study systematically categorized fusion techniques into three distinct levels and evaluated their applicability in various biomedical domains.

Indhumathi *et al.,*

Additionally, their work examined the challenges introduced by emerging technologies, such as generative models and large language models, highlighting their impact on multimodal biomedical data integration. Despite significant progress, multimodal biomedical data fusion remains a complex field with unresolved theoretical challenges. Existing studies underscore the need for robust fusion frameworks capable of handling data heterogeneity, ensuring interpretability, and addressing scalability concerns. The integration of cutting-edge technologies continues to shape the future of this field, driving advancements in precision medicine, early disease detection, and healthcare decision-making. This Diagram shows how data from sMRI and PET scans is used to better understand and classify medical conditions. First, the images are processed into feature matrices, which organize the important details. Then, relationships between these features are analyzed, and their structure is mapped out using graphs. A model is built by combining these relationships and structures, allowing it to focus on the most important features. From there, the model identifies specific brain regions that are most relevant and uses them for classification, such as diagnosing a disease. By combining data from both sMRI and PET scans, this process helps improve accuracy and provides deeper insights into brain health.

Innovations and Emerging Trends in Multimodal Fusion

Innovations in multimodal fusion are transforming how we integrate and interpret diverse data sources, especially in fields like healthcare, remote sensing, and artificial intelligence. Advanced deep learning techniques, such as attention mechanisms and transformer models, now enable more precise fusion of text, images, and signals, enhancing decision-making and predictive accuracy. In medicine, combining genomic data, imaging, and patient records is improving early disease detection and personalized treatment. Meanwhile, real-time fusion in autonomous systems and surveillance is making AI-driven technologies smarter and more adaptive. As emerging technologies like generative AI and large language models continue to evolve, multimodal fusion is becoming more efficient, scalable, and capable of extracting deeper insights from complex datasets. In medical AI, Hermisi *et al.* [43] proposed a multimodal deep learning framework for clinical decision support, integrating medical imaging, electronic health records (EHR), and genomic data. Their study demonstrated that multimodal fusion significantly enhances diagnostic accuracy compared to single-modal models. Similarly. Liu *et al*. [44] developed a fusion-based approach for medical image analysis, leveraging deep neural networks to align and co-learn from different modalities, improving early disease detection. Tran *et al.* [45] explored multimodal representation learning, addressing challenges such as alignment and translation between heterogeneous medical datasets. Gandhi et al. further extended this research by investigating principled assessments and the practical implementation of multimodal ML models, emphasizing their role in clinical workflows and interactions with healthcare providers. In the domain of autonomous driving, Hu *et al.* [46] emphasized the importance of multimodal fusion for 3D object detection, integrating data from LiDAR, cameras, and radar to improve perception accuracy. Trivedi *et al.* [47] introduced a CNN-Transformer hybrid approach for sensor fusion, focusing on overcoming challenges such as occlusions and varying object scales in complex driving environments. Faye *et al.* [48] examined autonomy datasets and fusion-based perception models, demonstrating that multimodal integration enhances real-time object detection and vehicle navigation. Faye *et al.* [49] reviewed CNN and Transformer-based models for sensor fusion, highlighting how these techniques address issues such as object occlusion and varying scales in 3D environments. Their research underscored the necessity of diverse sensors for robust autonomous vehicle operation, detailing the strengths and limitations of different sensor modalities.

CONCLUSION AND FUTURE SCOPE

With the leap in technologies and strategies involving image fusion, there is a possibility to extract more vital information by fusing more than two images. For instance, fusing of three images such as MRI, CT and PET can greatly benefit in detecting anomalies concerning brain tumours. Future work in this area will focus on integrating the data sets from three different modalities—CT, PET, and MRI—using the bi orthogonal 1.1 wavelet function. By combining different imaging modalities, it will be possible to produce a single image with information on metabolic activity, functional anatomy, and more. This will help doctors find infections like Corona, brain tumors, and lung

cancer earlier [50]. Multimodal image fusion is a powerful tool that's transforming the way doctors diagnose and treat patients. By combining different types of scans like CT, MRI, and PET, doctors get a much clearer and more complete view of a patient's condition. This helps them spot problems earlier and make more accurate diagnoses. For instance, when it comes to cancer, fusion images give doctors important information about the size, location, and activity of tumors, allowing them to create more precise treatment plans. Real-time fusion also helps track how well treatments are working, letting doctors adjust strategies as needed [51]. One of the key benefits of multimodal fusion is that it reduces the chances of misdiagnosis. When doctors use multiple imaging methods, they can cross-check results, ensuring they don't miss anything important. This also leads to more personalized care, as doctors can tailor treatments to the specific needs of each patient. Fusion images are so detailed that, in many cases, doctors can make diagnoses without needing invasive procedures like biopsies, which reduces risk and speeds up decision-making. In surgery, multimodal fusion helps doctors navigate with greater precision, preserving vital areas while removing tumors or damaged tissue. Advances in AI and machine learning are also improving the fusion process, making it faster and more accurate by picking up on patterns that might be missed by the human eye. This is especially useful in neuroimaging, where combining MRI, PET, and fMRI can provide a comprehensive understanding of brain activity, helping diagnose conditions like Alzheimer's or Parkinson's earlier. While the technology can be resource-intensive, it has the potential to save costs by reducing the need for extra tests or procedures. Plus, it enables earlier detection of diseases like cancer or infections, which is crucial for successful treatment. As multimodal fusion continues to evolve, it opens up new possibilities for research, offering deeper insights into how diseases progress and interact with treatments, ultimately leading to better patient care.

Table 1: Comparison of WT, NSCT, and Fuzzy-Based Techniques

Technique	Strengths	Weaknesses	Best Applications
Wavelet Transform (WT)	Multi-resolution, frequency-based, good for detail preservation	Shift-sensitive, lacks directional details	Medical Imaging, Remote Sensing
Non-Subsampled Contourlet Transform (NSCT)	Better edge and texture preservation, shift-invariant	High computational cost	Texture-rich Image Fusion, Medical Imaging
Fuzzy-Based Techniques	Handles uncertainty, adaptable, rule-based decision making	Requires fine tuning of membership functions	Uncertain Data Fusion, Infrared & Visible Image Fusion

ABSTRACT

In the fast-evolving automotive industry, maintaining a balance between professional and personal life has become a significant concern due to tight deadlines, extended shifts, and high-performance expectations. This research investigates the challenges associated with work-life balance in the automotive domain and examines organizational strategies aimed at improving employee well-being. This study examines the challenges and solutions for achieving work-life balance within the industry, focusing on organizational policies, employee experiences, and technological advancements that impact workplace well-being. By prioritizing human-centric work practices, automotive companies can foster a sustainable and engaged workforce while maintaining operational efficiency.

Keywords: Work-life balance, automotive industry, employee well-being, organizational policies, productivity.

INTRODUCTION

In modern work environments, particularly in high-demand industries like automotive manufacturing and services is becoming increasingly difficult. Such conditions can negatively affect employees' physical and mental well-being, leading to reduced job satisfaction and organizational commitment. These factors often strain employees, affecting their productivity and overall well-being.

DEFINITION
Employees in the industry face intense workloads, leading to fatigue and reduced personal time.Work-life balance is all about equally balancing personal time and professional responsibility.

RESEARCH PROBLEM

Despite the growing awareness of work-life balance, employees in the automotive sector continue to struggle with excessive workloads, limited flexibility, and stress. Organizational policies may exist, but their effectiveness in promoting balance remains inconsistent. This study investigates the factors contributing to work-life imbalance and explores potential solutions to create a more supportive work environment.

OBJECTIVE AND SIGNIFICANCE OF THE STUDY

- Provide strategic **recommendations** for improvement
- **Reduction in Turnover and Absenteeism**: To minimizes burnout, reducing turnover rates and absenteeism, which in turn lowers recruitment and training costs for the organization.
- **Fostering Innovation and Creativity**: Employees with manageable workloads and sufficient rest are more likely to engage in creative Skills.

LITERATURE REVIEW

It provides context for your study by highlighting what has already been explored, identifying trends, gaps, and inconsistencies in previous studies, and establishing how your work will contribute to or differ from past research.
Goyal & Agrawal (2015) examined work-life balance policies in the banking sector, emphasizing the need for employee wellness initiatives to improve productivity. **Singh (2013)** discussed role stress theory and the negative work-family interactions affecting employees, shifting focus toward positive work-life experiences. **Murthy & Shastri (2015)** explored how parenting responsibilities, marital conflicts, and role guilt contribute to work-life imbalance in corporate settings. **Lazar (2010)** emphasized that businesses benefit from effective work-life balance practices, improving employee retention and productivity. These studies provide insights into how work-life balance affects employee performance, stress management, and workplace satisfaction. While there is extensive literature on the general topic of work-life balance, there is limited research specifically addressing its challenges within the **automotive industry**, particularly in an Indian context.

GAPS IN EXISTING RESEARCH
1. **Industry based Analysis** – This study focuses on Wolk life-balance in automotive sector which is an specific industry while most of the study focus on the general corporate work life balance.
2. **India-Specific Insights** – While global studies exist, few **analyze cultural and societal expectations affecting work-life balance** within India's automotive workforce.
   This study can address these gaps by providing **sector-specific insights**, analyzing **Indian workforce experiences**.

RESEARCH METHODOLOGY

Methods
This study employs both **quantitative and qualitative** research methodologies to assess work-life balance within the automotive sector. The data is gathered through **structured surveys**. The survey includes **Likert-scale questions**, providing measurable insights into employees' perceptions of workload management, organizational policies, and personal well-being.

Sample, Procedures, and Tools Used
- **Sampling Technique:** A **voluntary response sampling method** is used, through a **Google Form**.
- **Data Collection Tools:** Survey response were stored digitally, and compiled for analysi. Microsoft Excel Tool is used for the data analysis, interpretation and visualization.

- **Analysis Framework: Visualization tools**, including charts and graphs, are used to present results clearly.

DATA ANALYSIS & INTERPRETATION
SURVEY QUESTIONS
The study includes **32 questions** focused on different aspects.

Demographics (Age, Gender, Educational Background, Job Level, Department, Years with the Company).
1. **Time Management and Workload** (Managing workload within regular hours, realistic expectations, working beyond regular hours, completing tasks on time).
2. **Personal Well-being and Health** (Work stress, time for hobbies/physical activity, balance between work and health, company value for employee well-being).

KEY FINDINGS

- **Age Group:** Majority of respondents are **25-34 years old with** (34.5%), followed by **those under 25 (29.1%)**.
- **Workload Management:51% agree** they can manage workload within regular hours, while **21% are neutral**.
- **Company Support:39% agree** that their employer provides flexibility, but **34% remain neutral**, suggesting mixed perceptions.
- **Well-being:35% agree** they maintain a balance between work and health, but **29% are neutral**.
- **Leadership Support:36% remain neutral** on leadership support, indicating a need for clearer support from management.
- **Work Stress Impact:34% of employee has agree** that job demands overwhelm them.
- **Impact on Personal Life:31% agree** that their job negatively affects personal relationships, revealing concerns over work-life balance.

STATISTICAL ANALYSIS
The study employs various statistical tests to analyze work-life balance factors:
1. **Chi-Square Test** – Examines relationships between **job level and employer's encouragement for breaks** (Result: No significant correlation).
2. **F-Test** – Evaluates **age and the need to work beyond regular hours** (Result: No significant variance).
3. **T-Test** – **gender differences in work stress**
Result: No significant difference.

CHI-SQUARE ANALYSIS
HYPOTHESIS:
To Find a Significant Relationship Between Job Level and Regular Break Encouragement

- **Null Hypothesis (H$_0$):**Job Level does not have significant relationship in regular Break Encouragement.
- **Alternative Hypothesis (H$_1$):**Job Level does have significant relationship in regular Break Encouragement.
- Contingency table:

Job Level	S.A	A	N	D	S.D	Total
Entry-level	6	11	11	4	1	33
Mid-level	7	13	13	5	2	41
Senior-level	5	9	9	4	1	28
Executive	1	3	3	1	0	8
Total	20	36	35	14	5	110

Calculate the Expected Frequencies

$$E = \frac{(Row\ total) \times (Column\ total)}{(Grand\ total)}$$

Expected Frequencies Table

Job Level	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
Entry-level	6	10.8	10.5	4.2	1.5
Mid-level	7.45	13.45	13.05	5.2	1.86
Senior-level	5.09	9.09	8.93	3.56	1.27
Executive	1.45	2.62	2.55	1.02	0.36

O	E	O-E	(O-E)²	(O-E)² /E
6	6	0	0	0
11	10.8	0.2	0.04	0.0037
11	10.5	0.5	0.25	0.0238
4	4.2	-0.2	0.4	0.0952
1	1.5	-0.5	0.25	0.1667
7	7.45	-0.45	0.2025	0.0272
13	13.45	-0.45	0.2025	0.0151
13	13.05	-0.05	0.0025	0.0155
5	5.2	-0.5	0.25	0.0481
2	1.86	0.14	0.574	0.3086
5	5.09	-0.09	0.0081	0.0016
9	9.09	-0.09	0.0081	0.0009
9	8.95	0.05	0.0025	0.0003
4	3.56	0.44	0.1936	0.0544
1	1.27	-0.27	0.0729	0.0574
1	1.45	-0.45	0.2025	0.1397
3	2.62	0.38	0.1444	0.0551
3	2.55	0.45	0.2025	0.0794
1	1.02	-0.02	0.02	0.0392
0	0.36	-0.36	0.1296	0.36
				$\frac{\sum(O-E)^2}{E}$ = 1.4919

Calculate the Total Chi-Square Statistic

$\chi2 = \frac{\sum(O-E)^2}{E}$

$\chi2$ = 1.4919

The critical value for the Chi-Square distribution is approximately **21.026**.

CONCLUSION

Job Level does not have significant relationship in regular Break Encouragement.

F-TEST ANALYSIS
HYPOTHESES

Age and Working Beyond Regular Hours

- **Null Hypothesis (H0):** Age has no significant relationship with the feeling of needing to work beyond regular hours to meet deadlines.
- **Alternative Hypothesis (H1):** There is no significant relationship between Age and needing to work beyond regular hours to meet deadlines.

X1	X2
38	38

20	13
13	39
7	15
32	5

X1	X12	X2	X22
38	1444	38	1444
20	400	13	169
13	169	39	1521
7	49	15	225
32	1024	5	25

$n_1 = 5$

$n_2 = 5$

The Sample Variances

Variance of Age ($s_1{}^2$)

$s_1{}^2 = \sum x_1{}^2/(n_1-1)$

$s_1{}^2 = 3086/ (5-1)$

$s_1{}^2 = 3086/4$

$s_1{}^2 = 771.5$

Variance of Working beyond regular hours ($s_2{}^2$)

$s_2{}^2 = \sum x_2{}^2/(n_2-1)$

$s_2{}^2 = 3384/ (5-1)$

$s_2{}^2 = 3384/4$

$s_2{}^2 = 846$

The F-statistic

$F = s_2{}^2/ s_1{}^2$ (since $s_2{}^2 > s_1{}^2$)

F=846/771.5

   = 1.0966

Significance level of α=0.05.

The critical F-value for a two-tailed test with df_1=4 and df_2=4.

Using an F-distribution table the critical F-value is approximately 6.39.

In this case, 1.0966 < 6.39.

CONCLUSION

Since the calculated F-statistic (1.0966) is less than the critical F-value (6.39), we **fail to reject the null hypothesis**. Therefore, there is not enough evidence to conclude that the variances of the two populations (age and working beyond regular hours) are significantly different at the 0.05 significance level.

T-TEST ANALYSIS

HYPOTHESES

H0 (Null Hypothesis): Gender has no significant relationship with Stress levels Interfering with personal Life.

H1 (Alternative Hypothesis): There is a significant relationship between Gender and Stress levels Interfering with personal Life.

62	4225	26	676
45	2025	17	289
0	0	37	1369
0	0	22	484
0	0	8	64

$\sum x_1 = 110$

$\sum x_1^2 = 6250$

$\sum x_2 = 110$

$\sum x_2^2 = 2882$

$N_1 = 2$

$N_2 = 5$

Mean

$\bar{x_1} = \sum x_1 / N_1$

$= \frac{110}{2}$

$= 55$

$\bar{x_2} = \sum x_2 / N_2$

$s_1^2 = \sqrt{\frac{\sum x_1^2}{N_1} - \left[\frac{\sum x_1}{N_1}\right]^2}$

$s_1^2 = \sqrt{\frac{6250}{2} - \left[\frac{110}{2}\right]^2}$

$s_1^2 = \sqrt{3125 - 3025}$

$s_1^2 = \sqrt{100}$

$s_1^2 = 10$

$s_2^2 = \sqrt{\frac{\sum x_2^2}{N_2} - \left[\frac{\sum x_2}{N_2}\right]^2}$

$s_2^2 = \sqrt{\frac{2882}{5} - \left[\frac{110}{5}\right]^2}$

$s_2^2 = \sqrt{576 - 484}$

$s_2^2 = \sqrt{92}$

$s_2^2 = 9.59$

Calculate the t-statistic

Formula:

$$S = \sqrt{\frac{s_1^2 \, N_1 + s_2^2 \, N_2}{N_1 - N_2 - 2}}$$

$$S = \sqrt{\frac{(10)(2) + (9059)(5)}{2 + 5 - 2}}$$

$$S = \sqrt{\frac{20 + 47.96}{5}}$$

$$S = \sqrt{\frac{67.96}{5}}$$

$$S = \sqrt{13.592}$$

$$t = \frac{\bar{x}_1 - \bar{x}_2}{s\sqrt{\frac{1}{N_1} + \frac{1}{N_2}}}$$

$$t = \frac{55 - 22}{3.6867\sqrt{\frac{1}{2} + \frac{1}{5}}}$$

$$= \frac{33}{3.6867 + \sqrt{0.5 + 0.2}}$$

$$= \frac{33}{3.6867 + \sqrt{0.7}}$$

$$= \frac{33}{3.6867(0.8366)}$$

$$= \frac{33}{3.0843}$$

Calculated t-value = 10.6993

Compare t-statistic and Critical t-value

10.6993 > 2.015

CONCLUSION

Gender has no significant influence on the perception of whether stress levels related to work interfere with personal time or family life.

CORRELATION ANALYSIS

HYPOTHESES

Years with the Company and Work-Life Balance

Null Hypothesis (H0): There is no significant relationship between Years with the Company and Work-Life Balance.

Alternative Hypothesis (H$_1$): Years of experience with the company have a significant relationship with employees' perception of whether the company culture supports a healthy work-life balance. Employees with longer tenure may experience different levels of work flexibility, expectations, or company support compared to newer employees.

∑x = 110	∑y = 110	∑x² =3070	∑y2 = 2830	∑xy = 2627

$$r = \frac{5(2627) - (110)(110)}{\sqrt{[5(3070) - (110)^2[5(2830) - (110)^2]}}$$

$$= \frac{13135 - 12100}{\sqrt{[15350 - 12100][14150 - 12100]}}$$

$$= \frac{1035}{\sqrt{(3250)(2050)}}$$

$$= \frac{1035}{\sqrt{6662500}}$$

$$= \frac{1035}{2581.1819}$$

$$r = 0.4010$$

CONCLUSION

The degree of positive correlation in this sum is between +0.25 and 0.5.

It is most likely low degree of correlation.

LINEAR REGRESSION ANALYSIS

HYPOTHESES

Job Level and Time for Task Completion

Null Hypothesis (H0): Job level has no significant relationship with employees' perception of being given enough time to complete tasks without feeling rushed.

Alternative Hypothesis (H₁): There is asignificant relationship between Job Level and Time for Task Completion.

Variables:

- Independent Variable (Predictor): Job Level (x)
- Dependent Variable (Outcome): Time to Complete (y)

Data:

Job Level (x)	Time to Complete (y)
33	36
8	14
41	33
28	19
0	8

Linear Regression Model:

x	y	X²	Y²	xy
33	36	1089	1296	1188
8	14	64	196	112
41	33	1681	1089	1353
28	19	784	361	532
0	8	0	64	0

$\sum x = 110$

$\sum y = 110$

$\sum x^2 = 3618$

$\sum y^2 = 3006$

$\sum xy = 3185$

$n = 5$

Regression coefficient of x on y

$$bxy = \frac{n\sum xy - (\sum x)(\sum y)}{n\sum y^2 - (\sum y)^2}$$

$$= \frac{5(3185) - (110)(110)}{5(3006) - (110)^2}$$

$$= \frac{15925 - 12100}{15030 - 12100}$$

$$= \frac{3825}{2930}$$

$bxy = 1.3055$

Regression coefficient of y on x

$$byx = \frac{n\sum xy - (\sum x)(\sum y)}{n\sum x^2 - (\sum x)^2}$$

$$= \frac{5(3185) - (110)(110)}{5(3618) - (110)^2}$$

$$= \frac{15925 - 12100}{18090 - 12100}$$

$$= \frac{3825}{5990}$$

$byx = 0.6386$

Regression equation formula

x-x̄=bxy (y-ȳ)

y- ȳ=bxy (x-x̄)

$\bar{x} = \frac{\sum x}{n}$ $\bar{y} = \frac{\sum y}{n}$

Regression equation of x on y

x-22=1.3055(y-22)

x-22=1.3055y-28.721

x=1.3055y-28.721+22

95706

x =1.3055y – 6.721

x =1.3055y – 6.721

Regression coefficient of y on x

y- ȳ=bxy (x-x̄)

y-22=0.6386(x-22)

y-22=0.6386x-14.0492

y=0.6386x-14.0492+22

y =0.6386x+7.9508

Regression coefficient of y on x

y =0.6386x+7.9508

CONCLUSION
Job level has a moderate impact on time flexibility.

DISCUSSION AND FINDINGS

The findings from this study align with several prior studies on work-life balance. For instance:
- **Lazar (2010)** highlighted the broader benefits of work-life balance, such as better talent retention and operational efficiency, which the study confirms through employee perceptions of workplace culture and leadership support.
- **Holly & Mohnen (2012)** found that extended working hours negatively impact personal life.which aligns with this study's observation that many respondents feel overwhelmed by job demands.

CONCLUSION

The overall study confirms that work-life balance plays a critical role in employee satisfaction, productivity, overall workplace harmony.By addressing these concerns and organizations create a culture that values both professional success and personal fulfillment.

ABSTRACT

The current work aims to formulate and evaluate Triticum aestivum leaves extract as a topical herbal gel. Wheat grass gel was developed in the present work to treat skin conditions including psoriasis, eczema and anti-aging. Xanthan gum, guar gum, Carbopol 940 were utilised as gelling agents in the wheatgrass gel formulation. Three formulations of wheat grass topical gel were prepared and evaluated for physical appearance, skin irritation, spread ability, pH and extrudability. Using a hydrogen peroxide scavenging assay, the topical antioxidant activity of the wheat grass methanolic extract was assessed by Hydrogen peroxide scavenging assay. The gel formulations showed homogeneity and a green appearance. Spreadability tests revealed easy application with minimal shear force. The gels exhibited a viscosity ranging from 1120 to 3570 centipoise. Wheat grass meth anolic extract at $60\mu g/ml$ concentration exhibited IC_{50} value of 64.6and standard Quercetin exhibited at the same concentration IC_{50} value of87.09 thus indicating significant *in-vitro* antioxidant activity.

Keywords: Wheat grass, Topical gel, Quercetin, Anti-oxidant

95708

INTRODUCTION

Gels are characterized by a network of interconnected molecules dispersed within a liquid solvent, forming a semi-solid structure, gels can be createdfrom a wide range of sources, including as synthetic polymers, biopolymers, nanoparticles, and even biological molecules like proteins and DNA [1,2].The formation of gels typically involves the process of gelation, where individual molecules or particles assemble into a three-dimensional network, trapping the solvent within its structure [3]. Gels are non-sticky, require less energy to formulate, stable and they have greater potential as a drug delivery system for topical application than ointments [4]. The majority of medications available as gels are used to treat pain and inflammation mostly as either non-narcotics like salicylates and corticosteroids like hydrocortisoneor narcotics like opioids. [5]. The greatest edible cereal-grass crop in the world is wheat (Triticum species), belonging to the Gramineae (Poaceae) family.[6] The leaves are long and narrow, with one or both surfaces being glabrous or hairy, and the stem is tufted, erect or semi-erect to prostrate, and typically hollow with thin walls [7-8].

Classification of gels
Gels can be categorized according to their physical characteristics, rheological characteristics, solvent type, and colloidal phases.[9]

Structure and Formation
Gels are produced through the process of gelation which can be initiated by temperature, pH, solvent composition or the addition of gelling agents, resulting in network structures that are linear, branched, or cross-linked. Transmission electron microscopy on super critically dried gels confirms that the networks are porous [10,11]. Entropic effects govern the elastic behavior of organic gels, and the network can undergo significant volumetric changes [12].

Properties
Gels have unusual mechanical properties, including elasticity, stiffness, and visco elastic behaviour. A gel is a composite made up of a liquid and a solid; the mechanical response of the gel is determined by the characteristics of each phase as well as how they interact.[13]Gels exhibit shear-thinning action, allowing them to flow more easily under tension but swiftly returning to their gel-like quality once stress is removed. Gels' mechanical properties can be modified by modifying parameters including gelling agent concentration, cross-linking, and solvent type.

Applications
- Cosmetics
- Bio technology
- Food industry
- Tissue engineering
- Environmental remediation
- Personal care products
- Art conservation

These applications highlight the versatility of gels across different industries, from healthcare to food, and from research to everyday consumer products[14]

Herbal gels
Herbal gel is a plant-based preparation. Gels are used topically for a variety of functions, including protecting, antiseptic, and antibacterial properties. Examples include *Berberis aristata, Azadirachtaindica, Curcuma longa and Rubia cordifolia.*[15]The aim of the study is to prepare and characterize Wheat grass topical gel for anti-aging, psoriasis, and to prove its antioxidant efficacy. Antioxidant activity is considered important for managing psoriasis because research indicates that psoriasis is associated with increased oxidative stress, meaning an imbalance between free

Mamatha Kola *et al.,*

radicals, antioxidants and therefore, boosting antioxidant levels could potentially help alleviate symptoms by mitigating inflammation and skin damage

Estimation of antioxidant activity

Common tests used to measure antioxidant activity include DPPH (Diphenyl-1-picrylhydrazyl) radical scavenging assay, ABTS assay, Folin-Ciocalteu reagent etc., all rely on spectro photometric methods for quantifying the reduction of free radicals in a sample. The scavenging assay for hydrogen peroxide gauges the capacity of a substance to scavenge hydrogen peroxide (H_2O_2).The rate of H_2O_2 consumption is measured in an incubation system that contains H_2O_2 and a scavenger.

Oxidative stress in psoriasis

Studies show that psoriasis patients have elevated reactive oxygen species levels and reduced activity of antioxidant enzymes.

Potential benefits of antioxidants

By neutralizing free radicals, antioxidants can help in reducing inflammation, improves skin barrier functionand slow the progression of psoriatic lesions.

Dietary and topical antioxidants

Some research suggests that incorporating antioxidant-rich foods in the diet and applying topical antioxidant treatments could be beneficial for psoriasis patients. Wheat grass is utilised for anti-aging properties it has antioxidants to combat oxidative stress and neutralizes free radicals. These compounds help protecting skin cells from UV radiation and pollution, which contribute to premature aging. Wheatgrass is rich in chlorophyll, which helps in detoxification and enhances overall skin health. Topical application or Regular consumption of wheatgrass promotes youthful appearance and reduces wrinkles.

MATERIALS AND METHODS

Wheat grass was grown in the laboratory by purchasing high quality of sharbati wheat grain from local market. Carbopol-940, Guar gum and xanthan gum were acquired from Mumbai's Research Lab Fine Chem Industries. Every other chemical that were utilized were of analytical quality.

Wheat grass Cultivation

Required quantities of raw wheat grains were submerged in water over night and next day they were dried under sun in plastic trays, sand was sprinkled on them as a thin layer and covered to aid darkness to sprout faster and the other day, water was sprinkled again and covered, this process was repeated until sprouting was seen. Later the sprouting was watered and grown for a period of 8 days and harvested on 9th day.[16]

Preparation of wheat grass extract

The wheat grass was collected after eight days of sprouting and allowed to dry in the shade for four days in dark, well-ventilated rooms. The dried wheatgrass was ground up. The crushed wheatgrass was mixed with methanol, macerated for a week, and then filtered out in phases to achieve extraction. To get rid of the methanol, the extract was dried at 35 °C. The process of sequential extraction was also used. Crushed wheatgrass was exhausted in successive extraction by repeatedly adding little amounts of petroleum ether and filtration. Petroleum ether was eliminated by evaporating the filtrate, and any remaining material was exhausted by repeatedly adding acetone and then washing with water. [17]

Method for formulation of wheat grass gel:

Step 1: Preparation of gel base using various gelling agents.

Mamatha Kola *et al.,*

The gel was formulated by weighing the necessary amount of gelling agents. The weighed amounts were taken in to a beaker and placed on a magnetic stirrer. The Carbopol 940 dispersion was forcefully mixed at 300rpm,the necessary quantity of methyl paraben was added as a preservative and distributed throughout the mixture. After covering the beaker with aluminum foil, it was allowed to mix approximately for fifteen minutes. Additionally, the mixture was homogenized for five minutes using a low-speed homogenizer. After the polymer was fully added and thoroughly mixed, 1% sodium hydroxide solution was added to bring the pH down to 7, at which gels started to form on their own. The required quantities of glycerine, colorants, and perfume (eucalyptus oil) were added to this gel. The gel was left to solidify at room temperature.[17]

Step 2: Preparation of Wheat grass powder co-solvent mixture
The required quantity of wheatgrass extract obtained from successive extractions was dissolved in a 1:1 co-solvent mixture of propylene glycol and alcohol

Step 3: Incorporation of wheat grass powder mixture into gel base.
The required amount of co-solvent mixture of wheatgrass extract was added to the gel bases and forcefully stirred to achieve a homogeneous mixture.

Evaluation of wheat grass topical gel:
- **Appearance of wheatgrass gel:** The appearance of the gel was observed visually against dark and bright background.
- **pH measurement:** A digital pH meter was used to measure the pH of 1% wheat grass gel.
- **Homogeneity**: The consistency of the contents is assessed visually.
- **Spread ability:** Gel was placed in between two slides**.** A weight of 100 gm was placed on the top of the two slides for 1 min. to provide a uniform film of the gel between the slides. After 1 min. the distance of spreaded gel was noted. Spread ability (S) was calculated by S = M.L/T, Where, **M** is the weight (g) tied to the upper glass slide, **L** is the length (cm) moved on the glass slide and T is the time.
- **Viscosity**: Viscosity of the prepared gels was measured using Brookfield viscometer (Brookfield Viscometer V6.5 RV) at 25°C ± 2°C at the rpm [18]**.**
- **Extrudability:** After the gels were filled into a collapsible tube, extrude ability was assessed. The tubes were filled with gel and sealed at the ends, their weights were noted. The tubes were clamped between two glass sides and a 500g weight was placed over the slides, the cap was taken off. To calculate the percentage of extruded gel, the collected gel was weighed.[19]

In-vitro **anti-oxidant studies**
Assay for scavenging hydrogen peroxide radicals: The Ruch et al. 1989 method can be used to determine the test substance capacity to scavenge hydrogen peroxide. 40 mM hydrogen peroxide was prepared using 50 mM phosphate buffer (pH 7.4). Hydrogen peroxide concentration was determined using a spectrophotometer by measuring absorbance at 230 nm. Wheat grass extract (test) was mixed with distilled water and various concentrations(10–60 ug/ml) were prepared. After 10 minutes, the absorbance at 230 nm was measured using phosphate buffer as blank solution. Quercitin was used as a positive control. The calculation for the percentage of hydrogen peroxide scavenging is displayed below.

$\% \ Scavenged \ H2O2 \ = \ Ai - At / \ Ai \ \times 100$

Where At is the test absorbance and Ai is the control absorbance. The concentration of a medicine or molecule required to 50% inhibit a specific biological or biochemical process is known as the IC_{50} value, or half-maximal inhibitory concentration. Plotting the concentration on the x-axis and the hydrogen peroxide inhibition percentage on the y-axis allowed for the comparison of the standard and test IC_{50} values. IC_{50} can be calculated by fitting with the following equation

$Y = a \times X + b$

$IC_{50} = (0.5 - b)/a$

RESULTS AND DISCUSSION

The appearance of gel is green in colour and pH is observed from range of 6.8to 7.0 which confirms compatibility with skin. Viscosity of gel is in between range of 1120 centipoise to 3570 centipoise which results in a good consistency on application to the skin. Spread ability of gel is in range 2.0 to 2.3 which shows good penetration on skin. Extrudability of the gel is also observed in good range.

In-vitro anti-oxidant activity

In-vitro anti-oxidant activity of wheatgrass extract was performed and the obtained values are mentioned under table.2 % Inhibition of test was compared with standard. The %Inhibition exhibited by the test is 64.6 at 60µg/ml where as the standard exhibited 87.09 at 60µg/ml. which indicates significant antioxidant activity of wheat grass gel.

CONCLUSION

Wheat grass topical gels (WG1, WG2, WG3) were prepared utilizing various polymers such as Carbopol 940, xanthan gum and guar gum. The gels were examined for homogeneity, viscosity, spreadability, texture, extrudability, pH, odor, appearance and the antioxidant qualities of the generated gels were also examined. All the formulations were greenish in colour and had a pH of 6-7 (skin pH), indicating that they were suitable for topical use. The viscosity ranged from 1100-3670 Cp, which is considered acceptable. The anti-oxidant activity of wheatgrass extract was investigated, and the IC_{50} values of wheatgrass extract and standard quercetin were found to be 34.3 and 45.6, respectively. Wheatgrass extract's IC_{50} results indicate that it has antioxidative properties.

Table.1: Advantages and Disadvantages of Gels

ADVANTAGES	DISADVANTAGES
•**Controlled Release:** Gels can gently release active substances, such as medications or minerals, over time to provide long-term therapeutic or nutritional benefits. •**Ease of Application:** Gels have a smooth and spreadable consistency, making them simple to apply to surfaces or mix into formulations like creams or lotions. •**Versatility:** Gels may be adjusted to specific requirements by modifying their composition, making them appropriate for a variety of uses in food, cosmetics, and pharmaceutical sectors. •**Stability:** Gels can help formulations remain stable by preventing ingredient separation and ensuring homogeneity over time, resulting in a longer shelf life and higher product quality •**Selective Permeability:** Some gels have selective permeability, which allows some chemicals to pass while inhibiting others.	•**Drying Out**: Water-based gels can dry out over time, particularly if exposed to air or stored in insufficient containers, resulting in changes in texture, efficacy, and shelf life. •**Potential Residue**: Some gels may leave residue or tackiness after application, which might be undesirable in some formulas, such as personal care items or adhesives. •**Brittleness:** Some gel formulations, particularly those containing cross-linked polymer can become brittle or lose elasticity with time, decreasing their efficacy in applications requiring flexibility /durability. •**High Cost:** Developing and manufacturing specialty gels can be expensive, especially if they need unique components or procedures, limiting their widespread use in certain industries

ABSTRACT

Maintaining public health requires efficient monitoring techniques for air quality, which is a crucial component of environmental health. This research focuses on the multivariate control charts, namely Multivariate Exponentially Weighted Moving Average (MEWMA) and Hotelling T² to the air pollutant data. The MEWMA control chart is effective in determining shifts in the mean vector of multivariate data. The Hotelling T² control chart is used to monitor changes in the dispersion and correlation structure of multivariate data. The data was split into two groups by the use of factor analysis. Next, the study employs Average Run Length (ARL) calculations to assess the performance of these control charts. The analysis reveals that the MEWMA control chart demonstrates superior detection capabilities for out-of-control data points within each variable group compared to the Hotelling T² control chart. Then the process capability index of both groups is more than 1, which indicates the process goes well in all the variable groups although some points are out of control. In this research study, the effectiveness of MEWMA and Hotelling T² control charts on air pollution data is determined. The findings provide valuable guidance for practitioners seeking robust methods to ensure timely detection of air quality variations and facilitate informed decision-making for pollution control and public health management.

Keywords: MEWMA, Hotelling T², Air data, multivariate control charts

INTRODUCTION

According to the recent report by the [19] India's capital, Delhi is the fourth largest pollutant city in the world. The Eight main components of air pollution are surface ozone (O_3), nitrogen dioxide (NO_2), sulphur dioxide (SO_2), carbon monoxide (CO), and particulate matter (PM), which comprises PM 2.5 and PM 10, Ammonia (NH3), nitrogen oxides (NO_x). Of the eight, the main contributors to the major air pollution are CO, PM 2.5, and PM 10. In India, the vehicle sector is 20–35% of the PM2.5 pollution in the nation [11]. The utilization of industrial facilities, coal-fired power plants, and fuels made from biomass all contribute to the decline in air quality. All of these substances have the potential to induce several health issues, including stroke, neurological diseases, lung cancer, and heart disease. Therefore, managing the region's air quality requires careful attention [7]. According to earlier research [8], there was a rather strong relationship between PM 2.5, PM 10, and CO. However the analysis of the air quality is done on an individual basis. Even if there is a statistical association between the two, analyzing the concentration independently may result in a less accurate estimate. As a result, a statistical process control strategy was utilized in this work to analyze the air quality. Multivariate control chart [3] is a prominent process control technique that allows for the simultaneous control of two or more parameters. It is the application of several powerful tools to solve problems and enhance quality control in healthcare sectors by lowering variability. The multivariate control graph is one of these instruments that are most frequently employed in industries for statistical procedures, also used in healthcare, finance, etc. Few articles employ multivariate control charts, which used in a variety of fields, to determine which are effective for public healthcare. This study aims to fit the multivariate control charts to the air pollutant data. Several methods, including factor analysis, KMO, Bartletts, and correlation, are employed to categorize the parameters of air quality data. Two methods of multivariate control charts were selected for this data. The traditional Hotelling T^2 chart [5] is the most widely used control chart in worldwide to observe the process's mean vector. Every data set or value in this chart is entered separately, and the only thing that determines how each point relates to the others is the chart. Even though it is incredibly efficient, there are other tools available for multivariate analysis. There are situations when this chart can be improved upon by using another kind of multivariate control chart. MEWMA [1] is the extension of EWMA. Both control charts are used to identify the variability in the process and also described the assumptions of control charts in detail. The main goal of this paper is to evaluate each control chart's performance and identify which one is best at identifying process variability in air pollutant data.

Multivariate Control Charts
The dimensions of the outcomes of processes for several variables are used to create multivariate charts, and they are typically displayed by rational subgroups, which are related subgroups found in the literature [13]. There are situations where using single control charts for every factor independently makes sense when managing two or more quality attributes at once. However, employing this approach may result in incorrect findings if the combined probability of occurrence of Type I Errors (false alarms) and the relationship structure between the important p variables are not taken into consideration [18]. There are two stages involved in creating multivariate control charts. Obtaining an appropriate representation of the data is the first step (phase I), which is usually a retrospective analysis of the information to identify the control limits. Phase II – is to monitor the process. One of the variables used to measure control chart effectiveness is ARL. The average amount of samples under control is shown by ARL_0. The average number of samples outside of control is indicated by ARL_1 [6]. The MEWMA and Hotelling T^2 control charts are the most often used multivariate statistical control charts. These charts are responsive to even the smallest, most frequent variations in the process. In particular, the study aims to determine whether there is a statistically significant difference between the Hotelling T^2 chart and MEWMA's threshold of sensitivity when it comes to identifying minute variations in the mean vector. Every variable in this study will have its condition observed and managed. Afterwards, the ARL values were used to assess the performance of the MEWMA control chart and the Hotelling T^2 control chart. The best-performing multivariate control chart will be chosen.

MATERIALS AND METHODS

Hotelling T² Control Chart

In 1947, Harold Hotelling introduced a single chart for multivariate observations. He developed the procedure based on the statistical distance, t-statistic value and determined statistic value is called as Hotelling's T² statistic. It is used to recognize shifts in the mean of more than one interrelated variable. The data can be in subgroups or individual observations. It has a two phases. Phase-I is used to identify the outliers and mean shifts in the observations and Phase-II is used to determine the shifts present at the new observations. Let X be a randomly distributed with p-variate of size m, and N be the normal density function of X, represented by the notation $X_i \sim N_p(\mu, \Sigma)$ where i = 1, 2, 3…m. As a result, the matrix (Equation1) is determined. The sample number is indicated by the notation m, and the quality features is indicated by the notation p.

$$X = \begin{bmatrix} X_{11} & X_{12} \cdots & X_{1p} \\ \vdots & \vdots & \vdots \\ X_{m1} & X_{m2} \cdots & X_{mp} \end{bmatrix} \qquad (1)$$

i.   The initial step is to find out the $\bar{X}$ as a sample mean and S as a sample covariance matrix
ii. The second step is to calculate the values of T². The value of T² is given by:
$$T^2 = (x - \overline{x})S^{-1}(x - \overline{x}) \qquad (2)$$
iii. The next step is Upper control limit (UCL) calculation:
$$UCL = \frac{(m-1)^2}{m} \beta_{\alpha \frac{p}{2}(m-p-1)/2} \qquad (3)$$
iv. Multivariate charts are utilized to ascertain whether the process is under control upon sampling additional observations. The T² statistic for the retrospective T² control chart is defined by the sample mean vector X and sample covariance matrix S, which were obtained during the follow-up period.

Multivariate Exponentially Weighted Moving Average

Lowry introduced the Multivariate EWMA chart. An obvious progression of the EWMA is the MEWMA
$$Z_j = RX_1 + (1-R)Z_{j-1} \qquad (4)$$
With the value $Z_0 = \mu = 0$ and R=diag $(r_1 \ldots r_p)$ for $0 < r_j \le 1$, j=1, 2, 3…p. This chart has weighted value with particular case is denoted by r, while the number of observed quality characteristics is represented by p.

$$\begin{bmatrix} Z_{11} \\ \vdots \\ Z_{pi} \end{bmatrix} = \begin{bmatrix} r_1 & 0 & 0 \\ \vdots & \vdots & \vdots \\ 0 & 0 & r_p \end{bmatrix}\begin{bmatrix} \bar{x}_{1i} \\ \vdots \\ \bar{x}_{pi} \end{bmatrix} + \left(\begin{bmatrix} 1 & 0 & 0 \\ \vdots & \vdots & \vdots \\ 0 & 0 & 1 \end{bmatrix} - \begin{bmatrix} r_1 & 0 & 0 \\ \vdots & \vdots & \vdots \\ 0 & 0 & r_p \end{bmatrix}\right)\begin{bmatrix} Z_{1(i-1)} \\ \vdots \\ Z_{p(i-1)} \end{bmatrix} \qquad (5)$$

In the MEWMA control chart generated by the test statistics, if it is assumed that the multivariate xi with n = 1, 2, 3… is similarly independent and normally distributed, then $X_i \sim N_p(\mu, \Sigma)$ represents the mean vector of the controlled process, and $\sum$ is the covariance matrix. The test statistics value
$$Q_i^2 = Z' \textstyle\sum_{Zi}^{-1} Z_i \qquad (6)$$
If $Q_i^2 = Z' \sum_{Zi}^{-1} Z_i > H$ then it might be considered out of control. Since the value of Q_i^2 is always positive, then the value H is the upper limit and 0 is the lower limit of the control chart of MEWMA based ARL value. When p attributes have the same weight r, then the ARL is not only dependent on the centre parameter provided by the Mahalanobis distance. Because of this, the performance of this chart may be evaluated in relation to other charts.

Performance of Multivariate Control Charts

Statistical performance indicator is used to evaluate and compare various multivariate control chart types. The most popular statistical metric for evaluating the efficacy of a control chart and contrasting it with other chart types is the standard number of data collected until an unstable signal (ARL) is detected. The ARL parameter accounts for both Type I and Type II error probabilities. When we assume a process is uncontrollable when it is not, we make a Type I error. Type II errors occur when we are unable to identify the out of control positions. Consequently, it is standard procedure to evaluate the parameters of a control chart by looking at the ARL's performance. ARL values indicate

95718

whether a process is under control or out of control. Since the majority of the variable has correlation, accurate identification of ARL values is not achievable. Nonetheless, there are a number of ways to obtain the right parameters for calculating the control chart's performance. The methodological aspects described below For this study, the secondary data were collected from the public sector Central Pollution Control Board (CPCB), which is the official portal of the Government of India. The data contains one month hourly based data of Chennai city, It contain air pollutant variables like surface ozone (O_3), nitrogen dioxide (NO_2), sulphur dioxide (SO_2), carbon monoxide (CO), and particulate matter (PM), which comprises PM 2.5 and PM 10, Ammonia (NH_3),nitrogen oxides (NO_x).

RESULTS AND DISCUSSION

The outcome of the analysis for every variable group will comprise the data processing result. Table 1 displays the descriptive statistics results for each variable. Fig 2 and 3 represents autocorrelation and normality test results. These two assumptions important to fit a control charts, because the presence of autocorrelation can make the chart into false alarm. From Fig 2 normality result are adequate for the formation of chart. According to Montgomery 2009, the small departure from normality doesn't affect the results of control charts. By using factor analysis, the factors can be grouped into two groups. Table 2 shows the result of factor analysis. This table demonstrates the values of total, variance percentage and cumulative percentage in order. Therefore the first group was consists of first four variables and the second group consists remaining four variables. Kaiser-Meyer-Olkin test is the measure of sampling adequacy; it shows the proportion of variance. Bartlett's test result describes the correlation matrix is identity or not. From the Table 3, Bartlett's test was significant and the value of KMO is a 0.6 which is adequate. The Table 4 shows the result of the Pearson correlations and Bartlett's test for each group. Strong correlations were found within each group of variables, according to the results of the Bartlett's test and Pearson correlation for each set of variables.

Table 5 shows the result of ARL for MEWMA and Hotelling T^2 control chart. As indicated in Table 5, the MEWMA chart's sensitivity in identifying small variations in the process's mean vector is compared with that of the Hotelling T^2 charts for the identical parameters. For the Group 1 λ=0.2 H=12.72 of MEWMA control chart is the best compared to Hotelling T^2. For the group 2, λ=0.1 H=12.72 of MEWMA control chart is better than Hotelling T^2. From the Fig 4 and 5, each and every outcome demonstrated that the MEWMA control chart is more sensitive in identifying even the smallest mean movements than the Hotelling T^2 control chart. As a result, the MEWMA control chart will be a more effective tool for data on air pollutants. The computation of the multivariate capability procedure is the final phase. The computation's outcome showed that Group-1 multivariate capability process was 1.378, whereas group 2's multivariate capability process was 1.006. Each and every multivariate capacity process value has a value greater than 1. This indicates that even while both control charts show good process capability and all processes are operating smoothly, it is still necessary to regularly monitor the process to ensure that it remains stable.

CONCLUSION

This research aims to detect effective control charts by comparing both multivariate control charts. For this research, data regarding air pollution in Chennai city for one month was chosen. It included information on an hourly basis. Most of the data are derived from eight pollutant variables. By the use of factor analysis, the two groups were formed. The first group contains PM 2.5, PM 10, NO_2, and NH_3 and the second group contains SO_2, CO, Ozone, and NO_x. When it's crucial to identify even the smallest changes in a process's characteristics, the MEWMA charts are an alternative to the Hotelling T^2 chart. These charts are more sensitive than the Hotelling T^2 chart to identify even a slight shift in the process mean vector, enabling quicker intervention in such circumstances. They also perform better in terms of ARL. Hence, both groups' process capability index is more than 1, indicating that while certain points are out of control, overall the process performs well across all variable groups. The findings of this investigation indicate that the MEWMA chart is a highly effective statistical instrument for overseeing air pollutants that possess numerous quality attributes. MEWMA control charts are more efficient in detecting variability than the Hotelling T^2 control

charts. The results offer significant direction to practitioners looking for reliable techniques to guarantee quick identification of changes in air quality and support informed decisions for managing public health and pollution.

ABSTRACT

In today's digital era, due to the advent of internet technology, humongous reviews and opinions are being shared regarding any products and services in forms of audio, video and text on the social media platforms. This necessitates the need for analyzing such vast number of untapped reviews. This evolving field of Multimodal Sentiment Analysis (MSA) interprets sentiments conveyed in forms of multimodal data like audios, images with captions, memes, videos, physiological signals and combination of them. Research in textual data sentiment analysis dominates, which limits the potential wealth of information in other modalities. This study explores multimodal sentiment analysis which spans across the field of artificial intelligence, natural language processing, deep learning, decision science and cognitive science. Multimodal fusion is at the center of multimodal sentiment analysis which fuses verbal and non-verbal cues for speaker intent inference. An extensive set of experiments is conducted for comparison of seven different multimodal fusion techniques. Experiments done on two popular datasets named CMU-MOSI, CMU-MOSEI. Diverse neural network architectures like attention-based architectures, memory-based architectures, and recurrent components-based architecture, etc. are implemented and compared for their efficacy for task of multimodal sentiment analysis.

Keywords: Sentiment Analysis, Affective Computing, Multimodal Fusion, Opinion Mining, Multimodal Sentiment Analysis

INTRODUCTION

Human language which is not only a mere word and it also extends to gestures, vocal nuances, and intonations. This makes an overall human communication a complex thing. This multimodal nature of human language poses a challenge for machines to effectively mimic the human communication. These language cues can be effortlessly interpreted by the humans but teaching machines this skill unlocks potential applications in field of affective computing, human-machine interaction. To understand the human language, verbal and nonverbal cues, which vary dynamically across contexts need to be processed effectively. Enabling machines to comprehend linguistic utterances within diverse nonverbal settings is crucial challenge. Modeling of intramodal dynamics (within a specific modality) and intermodal dynamics (across multiple modalities) is at center of research in field of multimodal affective computing. Intramodal dynamics involves interactions within a single modality, like words within a sentence. While crossmodal dynamics involve interactions between different modalities, exemplified by a smile and a loud voice accompanying a positive word. Recent trends lean towards more intricate models, incorporating attention, memory, and recurrent components for multimodal embedding learning. The current digital landscape is an exponential influx of text interlaced with diverse opinions and nuances. In this era of the World Wide Web, understanding and interpreting sentiments in multimodal context yield substantial power, especially for companies vested in gauging public sentiment for their products and services [1]. As sentiment play critical role in shaping decisions, brand perception and user interactions, there is intense surge for sentiment analysis in commercial and research interest [2]. However, the evolving nature of sentiment analysis has its own set of challenges, particularly in multimodal context [3,4]. Not only limited to English language, existing sentiment analysis frameworks capture sentiments embedded in diverse and also mix-mode languages [5]. Researchers have to traverse paths of knowledge transfer from resource-rich to resource-poor modalities in multimodal terrain [6,7].

Existing approaches, ranging from leveraging English lexical resources like SentiWordNet to employing machine translation systems for cross-modal analysis, confront bottlenecks in resource scarcity and fidelity in translation [8]. Though there is remarkable progress in constructing multimodal sentiment analysis frameworks and tools, the lack of resources is a crucial challenge [9]. Another study by [10] delves into the realm of multimodal sentiment analysis, embarking on a comprehensive journey through state-of-the-art fusion techniques. Through meticulous experimentation and benchmarking on common datasets, we evaluate and compare seven techniques, shedding light on their efficacy and shortcomings. By providing a comprehensive evaluation, we aim to illuminate the true essence and practical utility of these approaches, elucidating their tangible contributions beyond reported results. Existing reviews in the field provide insightful categorization of modality fusion strategies and identify overarching challenges. This study specifically focuses on empirical evaluations across different multimodal fusion approaches for multimodal sentiment analysis. It bridges the gap by conducting a detailed empirical study across various cutting-edge fusion techniques used in multimodal sentiment analysis. We replicate and analyse the latest seven alternative fusion approaches on two well-known datasets for multimodal sentiment and emotion research. The remaining sections of this paper are organised as follows. The detailed process flow for Multimodal Sentiment Analysis is presented first. This is followed by a brief overview of the datasets used for implementation. Next, different fusion techniques using multiple modalities are discussed. Various evaluation metrics are then outlined. Finally, result analysis is presented, followed by the conclusion.

MSA PROCESS FLOW
MSA analyses many modalities, including video , images with captions, images ,text and audio to acquire a better interpretation opinions and emotions conveyed in a given situation. Fig.1 represents step by step process flow for MSA. The in-depth breakdown of the micro steps for each phase:
- **Data Acquisition:** Source diverse data types from various platforms (social media, repositories, multimedia sources) using APIs, web scraping, or accessing existing datasets. Extract metadata (timestamps, user details, descriptive tags) from images or videos to enrich the dataset.

Ankita Nevil Gandhi and Kinjal Ujas Adhvaryu

- **Modality Separation:** Segregate collected information into distinct categories: Isolate textual content from the dataset. Extract images and visual content separately. Separate audio and video segments for subsequent analysis.
- **Pre-processing:** Treat each modality specifically: Textual data undergoes tokenization, stop word removal, and character handling. Images are resized or filtered. Audio/video content might be converted to text through speech-to-text algorithms or undergo feature extraction from audio signals.
- **Feature Extraction:** Derive specific features from each modality: Textual features (TF-IDF, word embeddings, BERT embeddings). Image features (pre-trained CNN models, histograms of oriented gradients - HOG). Audio/video features (MFCCs, pre-trained models for video frames).
- **Multimodal Fusion:** Extracted features from different modalities are then fused using various fusion techniques like early or late fusion, graph-based fusion, self-attention mechanisms, or multimodal neural networks.
- **Classification:** Appropriate classifiers are used to classify sentiment using fused features. Model is trained on integrated multimodal features. Accuracy (Binary and 5-class), F1-score, MAE and Corr are evaluation matrices which are used to validate and assess model performance to gauge sentiment efficacy.

DATASETS USED
We conduct empirical assessments on various fusion methods for multimodal sentiment analysis using two popular datasets, CMU Multimodal Opinion-level Sentiment Intensity (CMU-MOSI) [11] and CMU Multimodal Opinion Sentiment and Emotion Intensity (CMU-MOSEI) [12]. Step by step process for custom dataset generation is depicted in Fig.2.

CMU-MOSI
The CMU-MOSI [11] dataset, compiled in 2016, encompasses 93 videos sourced from YouTube. These videos, covering a variety of topics and genres, underwent meticulous annotation by 89 expert annotators. Across the 93 videos, a total of 2,199 unique segments were labeled for sentiments and emotions in English. The dataset includes multimodal features extracted from audio (including pitch and intensity), video (facial expressions and gestures), and textual elements (analyses of sentiment). Alignment techniques ensured synchronization of these modalities with the corresponding timestamps in the videos.

CMU-MOSEI
The CMU-MOSEI [12] dataset, compiled in 2018, comprises 3,228 videos sourced from YouTube, featuring diverse topics and discussions. These videos engaged 22,777 unique segments, annotated by 1,000 expert annotators, predominantly in English. Wide variety of topics are covered by MOSEI which includes debates (2.9%), consulting (1.8%) and majorly covers reviews (16.2%). Annotations on sentiments were rated on a scale from -3 to +3. The dataset offers multimodal features extracted from audio, video, and text modalities. These modalities underwent alignment techniques to synchronize with timestamps.

MULTIMODAL FUSION MODELS
In this section, we evaluated and outlined seven different multimodal fusion architectures on which comparative study done. We have implemented a diverse set of graph networks based, attention mechanisms based, memory networks based and tensor fusion networks-based models using unified PyTorch framework. Fusion models include early fusion (ef_lstm) [13], memory fusion (mfn) [14], graph network fusion graph_mfn [12], mfm [15], bert_mag [16], attention -based fusion (mult)[17] and mmim[18]. The models for this study were chosen based on their representative diversity across various fusion paradigms typically utilised in MSA.All these models have their implementations on GitHub by their respective authors. From scratch, we replicated all the models.

EF_LSTM

EF_LSTM [13] integrates knowledge from several modalities using an Early Fusion technique. It has assessed a trimodal model then bimodal and finally unimodal model. The trimodal model achieves best performance. This method emphasizes on a 6-class emotional classification based on regression. Features from three modalities—linguistic, visual, and acoustic—are concatenated at the input level to produce an input vector for a Deep Neural Network (DNN). Operating by combining linguistic, visual, and audio elements at each timestamp, EF-LSTM generates a multimodal representation at the sentence level. The last hidden state finishes in the output sentiment by sequential processing across two fully-connected layers.

MFN

Operating on multi view sequential learning, the Memory Fusion Network (MFN) [14] integrates cross-view interactions with view-specific ones. It summarises these interactions throughout time using a Multi-view Gated Memory. MFN derives expected feature values by computing predicted visual and audio characteristics within the word utterance time interval. Three unimodal LSTMs are used to update the memory cells concurrently. The last memory cell generates multimodal sentence representation concurrently with unimodal LSTMs' last hidden states. Two fully-connected layers sequential processing this representation generates the output emotion.

Graph MFN

With dynamic fusion structures to improve modality interaction and interpretability, the Graph Memory Fusion Network (Graph-MFN) [12] marks a development over MFN. Set of parallel LSTMs representing certain modality makes up multimodal fusion network. To highlight cross-modal dynamics, coefficients are assigned by the dynamic fusion graph component. Furthermore, stored in the Multiview Gated Memory component are multimodal fusion process output. Graph-MFN improves interpretability in comparison to its predecessor, MFN by dynamically changing fusion structures to enable modal interaction.

MFM

Powerful and strong, the Multimodal Factorisation Model (MFM) [15] is excellent in learning both multimodal-discriminative and modality-specific generative components. It reconstructs missing modalities by combining these elements, therefore offsetting lost information by means of independent components. Over multimodal datasets, the model's discriminative factor produces either competitive or state-of-the-art outcomes. Especially, the modality-specific generating factors allow data production based on factorized variables. This enables missing modalities and richer understanding of the complex relationships inside multimodal learning systems.

Bert Mag

Especially in relation to aligned data, the Multimodal Adaptation Gate for Bert (MAG-BERT) [16] represents a development over RAVEN [21]. It modifies BERT and XLNet to accommodate the presence of vision and sound modalities by inserting a Multimodal Adaptation Gate (MAG) at different layers within the BERT core. MAG use this representation to dynamically update lexical representations in the pre-trained transformer model. It views nonverbal behaviour as a vector with trajectory and amplitude. This enhancement increases the alignment and integration of multimodal information inside the BERT framework. It boosts its adaptability and performance with aligned data.

Mult

By use of directive paired cross-modal attention, the Multimodal Transformer (MulT) [17] increases the capacity of multimodal transformer design. By means of this special attention mechanism, information from one modality can be translated to another. It resolves intrinsic difficulties including non-aligned data resulting from different sampling rates and handling long-range relationships between modalities. MulT does this by using directional pairwise cross-modally attention. It enables interactions between multimodal sequences spanning several time steps. This novel method improves the capacity of the model to detect complex interactions and dependencies inside multimodal data by facilitating the latent adaption of information streams between modalities.

Ankita Nevil Gandhi and Kinjal Ujas Adhvaryu

MMIM

Within unimodal input pairs and between the resulting multimodal fusion and individual unimodal inputs, the Multimodal Information Maximizing (MMIM) [18] method hierarchically maximizes Mutual Information (MI). Emphasizing MI in both inter-modality and fusion phases helps MMIM to guarantee that task-related information is maintained all along the multimodal fusion process. This approach intends to maximize the information flow among several modalities while preserving and improving task-related knowledge during the fusion of multimodal data.

EVALUATION METRICS

To evaluate effectiveness on MOSI and MOSEI, a set of evaluation metrics commonly used in previous studies [19,20] were employed. These include binary accuracy (acc_2), F1 score (F1_score), multiclass accuracy for five classes (acc_5), Mean Absolute Error (MAE), Correlation (Corr). Binary Accuracy (acc_2) measures the percentage of correctly classified samples in a binary classification setting. F1_Score is the harmonic mean of precision and recall, balancing false positives and false negatives. acc_5 represents the percentage of correctly predicted samples among the 5 predicted classes. MAE measures the average absolute difference between predicted and actual sentiment scores. Corr is the relationship between model predictions and regression ground truth. Higher values indicate superior performance across all metrics except for MAE. For MAE, lower the values better the performance.

RESULT ANALYSIS AND FUTURE DIRECTIONS

In dissecting the outcomes of our comprehensive evaluation, we scrutinized the performance of seven cutting-edge fusion models in multimodal sentiment analysis across the MOSI and MOSEI datasets. Performance metrics for MOSI dataset is shown in Table II and performance metrics for MOSEI dataset is shown in Table III. The tabulated results present the performance metrics for various models evaluated on the MOSI and MOSEI datasets. Each metric provides insight into the efficacy of various fusion strategies in multimodal sentiment analysis. Moreover, the comparison with original results, represented in a bar chart, highlights any deviations or improvements observed in our evaluation compared to the original findings. Fig. 3 represents comparative analysis on MOSI dataset with original implementation values. MOSEI dataset comparative analysis ins shown in Fig.4. Fig.5 shows MOSI and MOSEI dataset comparative analysis. It contributes to the ongoing research in this domain, offering valuable insights into the performance variations and strengths of these state-of-the-art techniques on diverse multimodal datasets. This empirical evaluation sheds light on the efficacy of these fusion models in understanding and analyzing multimodal. This comparative investigation establishes the groundwork for future progress in the field of multimodal sentiment analysis. It also contributes for better understanding of human expressions across different modalities in digital communication. For future model comparisons, it is essential to document computational efficiency, training time, inference speed, and hardware requirements to assess performance trade-offs and scalability across different architectures. Bias analysis can also be conducted on more diverse, real-world datasets to assess generalizability of the models.

CONCLUSION

In our extensive comparison of cutting-edge multimodal human language analysis methods, we explored the effectiveness and efficiency of these models across two pivotal multimodal affect recognition datasets. Our thorough investigation uncovered crucial elements within multimodal language models, revealing insights into their performance intricacies. We found that attention mechanism approaches outperformed others in sentiment analysis and emotion recognition tasks, despite their higher computational requirements. Components adapt at capturing crossmodal interactions, integrating context, and leveraging linguistic modalities significantly enhanced performance. Looking ahead, we aim to delve into conversational video sentiment analysis, capitalizing on the benefits of utterance context in understanding human language nuances. Exploring sentiment in dynamic conversational settings presents an exciting avenue for future research.

ABSTRACT

For dealing with many types of uncertainties, various methods have been introduced in linear fractional programming method. To find the optimality of an objective function, we have approached a new problem which is known as fully fuzzy linear fractional programming problem. In this paper a comparative analysis has been done by solving fully fuzzy fractional programming problem with Graphical method, Crammer's rule and denominator objective restriction method for determining the optimal results. In such type of problems, the given objective function is in the form of fuzzy fractional programming which is later converted into three crisp linear fractional problems. The denominator objective restriction method and graphical method are the standard methods for finding the accuracy of the optimal values of fully fuzzy linear fractional programming. Therefore, here we have also used crammer's rule for confirming the accuracy of the optimum result.

Keywords: Linear fractional programming, graphical method, denominator objective restriction method, fully fuzzy linear fractional programming, crammer's rule, triangular fuzzy numbers, membership function, inequalities, optimization, linear programming, optimal solution.

95733

INTRODUCTION

Basically linear fractional programming problem is an important sub part of mathematical optimization. A linear fractional programming problem is defined as the ratio of two linear functions subject to linear constraints along with non-negative restrictions. Using concept of simultaneous equations technique for solution of linear fractional programming problem is quite an interesting way for finding the optimum result, such as firstly convert the objective function of LFP into standard linear programming problem then use the system of simultaneous equations and finally by using echelon form find out extreme points and the maximised or minimised values. Since there are various methods for finding the optimum solutions of LFP in this paper we have used crammer's rule and this technique has been proved quite interesting and easy to understand for finding the optimum results. Graphical Method, Crammer's Rule by matrix method and Denominator Objective Restriction Method is used for attaining fuzzy optimal solution of fully fuzzy linear fractional programming problem (FFLFP). For obtaining optimal outputs, problem is divided into three parts, which is called: crisp linear fractional programming problem, with all conditions of bounded variable constraint. Whereas these three crisp fractional problems are solved differently which gives fuzzy optimum result/ values. In other words, we can say this method totally depends on those three crisp problems and also has easy structure for solving problems. Linear fractional programming plays a remarkable role in real life areas, such as:

- Production Planning.
- Financial Sector.
- Health Care. Etc

And by the above statements good use of LFP in real life applications was very clear therefore. There were many methods developed and still exits, for solving these fractional problems but not practically applicable because of their certain limitations in determining the optimal results of fully fuzzy linear fractional programming problems with all the fuzzy parameters. Hence, graphical method, crammer's method and denominator objective restriction method has been proved better method which can be easily applicable for solving the traditional linear fractional programming **problem** and it can efficiently solve the fully fuzzy linear fractional programming problem.

Definition A: Fuzzy Set.
Let X is the universe of discourse, it's elements are represented by x. Then the fuzzy set A is stated as the ordered pair: $A = \{x, \mu_A(x) | x \in X\}$

Definition B: Triangular Fuzzy Number.
The triplet (m_1, m_2, m_3) is called as triangular fuzzy number, and in this triplet "m_1" is the smallest value, "m_2" is the most probable value and "m_3" is the largest possible value in any of the fuzzy event.

NUMERICAL EXAMPLE AND RESULTS

Example
Production Planning: Let a Ball Bearing company produces two kinds of products A and B which gives the profit of (2, 1, 1) and (4, 2, 2) rupees with the fixed cost (1, 1, 1) rupees per unit respectively. Although the cost of single unit is (5, 1, 1) and (2, 1, 1) rupees respectively, and it is considered that the confirmed (fixed) cost is (1, 1, 1) rupees added to the cost function due to the certain conditions in the process of production. It is considered that product A and product B is about (1, 1, 1) units per pound and (5, 2, 2) units per pound respectively, the raw material is restricted to (5, 4, 4) pounds, Man- hours per unit required for product A is (5, 2, 2) hours per unit and for product B is (2, 1, 1) hours per unit but, the total Man- hours (10, 2, 2)hours are available daily and time required for product A is (2, 1, 1) min per unit and for product B is (4, 1, 1) minutes per unit but, total time required is (8, 1, 1) minutes per unit. To maximize the total profit, find out how many products A and products B must be created or produced?

$$maximize(Z_1, Z_2, Z_3) = \frac{(2,1,1)\tilde{x}_1 \oplus (4,2,2)\tilde{x}_2 \oplus (1,1,1)}{(5,1,1)\tilde{x}_1 \oplus (2,1,1)\tilde{x}_2 \oplus (1,1,1)}$$

Subject to constraints:

$(1,1,1)\tilde{x}_1 \oplus (5,2,2)\tilde{x}_2 \leq (5,4,4)$

$(5,2,2)\tilde{x}_1 \oplus (2,1,1)\tilde{x}_2 \leq (10,2,2)$

$(2,1,1)\tilde{x}_1 \oplus (4,1,1)\tilde{x}_2 \leq (8,1,1)$

$x_1 \geq 0, \qquad x_2 \geq 0$

Solution: Convert the given LFP problem into three crisp fractional programming problem:

UPPER LEVEL PROBLEM

$Maximize\ Z_1 = \dfrac{x_1 + 2x_2 + 1}{x_1 + x_2 + 1}$

Subject to: $x_1 + 2x_2 \leq 4$

$2x_1 + x_2 \leq 2$

$x_1 + x_2 \leq 1$

$x_1 \geq 0, \qquad x_2 \geq 0$

MIDDLE LEVEL PROBLEM

$Maximize\ Z_2 = \dfrac{y_1 + 2y_2 + 1}{y_1 + y_2 + 1}$

Subject to: $y_1 + 2y_2 \leq 4$

$2y_1 + y_2 \leq 2$

$y_1 + y_2 \leq 1$

$y_1 \geq 0, \qquad y_2 \geq 0$

LOWER LEVEL PROBLEM

$Maximize\ Z_3 = \dfrac{2t_1 + 4t_2 + 1}{2t_1 + 2t_2 + 1}$

Subject to: $t_1 + 5t_2 \leq 5$

$5t_1 + 2t_2 \leq 10$

$2t_1 + 4t_2 \leq 8$

$t_1 \geq 0, \qquad t_2 \geq 0$

By Graphical Method
MIDDLE LEVEL PROBLEM

$Maximize\ Z_2 = \dfrac{y_1 + 2y_2 + 1}{y_1 + y_2 + 1}$

Subject to: $y_1 + 2y_2 \leq 4$

$2y_1 + y_2 \leq 2$

$y_1 + y_2 \leq 1$

$y_1 \geq 0, \qquad y_2 \geq 0$

Focus point is calculated by solving the equations of $L(y)$ and $S(y)$ separately,

$L(y) = y_1 + 2y_2 + 1$

$S(y) = y_1 + y_2 + 1$

Hence for $L(y)$ we get (0, -1/2) and (-1, 0) similarly for $S(y)$ we get (0, -1) and (-1, 0)

By solving the constraints, we get extreme points

$y_1 + 2y_2 = 4$, gives (0, 2) and (4, 0)

$2y_1 + y_2 = 2$, gives (0, 2) and (1, 0)

$y_1 + y_2 = 1$, gives (0, 1) and (1, 0)

Now the graph will be plotted as follows

The feasible region is ABC with A $(0,0)$, B $(1,0)$, C $(0,1)$ and $Z_{max} = 1.5$ at C.

Akshika Verma *et al.,*

UPPER LEVEL PROBLEM

$$Maximize \ Z_1 = \frac{x_1 + 2x_2 + 1}{x_1 + x_2 + 1}$$

Subject to: $x_1 + 2x_2 \leq 4$

$2x_1 + x_2 \leq 2$

$x_1 + x_2 \leq 1$

$x_1 \geq 0, \qquad x_2 \geq 0$

Focus point is calculated by solving the equations of $L(x)$ and $S(x)$ separately,

$L(x) = x_1 + 2x_2 + 1$

$S(x) = x_1 + x_2 + 1$

Hence for $L(x)$ we get (0, -1/2) and (-1, 0) similarly for $S(x)$ we get (0, -1) and (-1, 0)

By solving the constraints, we get extreme points

$x_1 + 2x_2 = 4$, gives (0, 2) and (4, 0)

$2x_1 + x_2 = 2$, gives (0, 2) and (1, 0)

$x_1 + x_2 = 1$, gives (0, 1) and (1, 0)

Now the graph will be plotted as follows

The feasible region is ABC with A $(0, 0)$, B $(1, 0)$, C $(0, 1)$ and $Z_{max} = 1.5$ at C.

LOWER LEVEL PROBLEM

$$Maximize \ Z_3 = \frac{2t_1 + 4t_2 + 1}{2t_1 + 2t_2 + 1}$$

Subject to: $t_1 + 5t_2 \leq 5$

$5t_1 + 2t_2 \leq 10$

$2t_1 + t_2 \leq 8$

$t_1 \geq 0, \qquad t_2 \geq 0$

Focus point is calculated by solving the equations of $L(t)$ and $S(t)$ separately,

$L(x) = 2t_1 + 4t_2 + 1$

$S(x) = 2t_1 + 2t_2 + 1$

Hence for $L(t)$ we get (0, -1/4) and (-1/2, 0) similarly for $S(t)$ we get (0, -1/2) and (-1/2, 0)

By solving the constraints, we get extreme points

$t_1 + 5t_2 = 5$, gives (0, 1) and (5, 0)

$5t_1 + 2t_2 = 10$, gives (0, 5) and (2, 0)

$2t_1 + t_2 = 8$, gives (0, 2) and (4, 0)

Now the graph will be plotted as follows

The feasible region is ABCD with A $(0, 0)$, B $(2, 0)$, C $(1.7, 0.6)$ and D$(0, 1)$ and $Z_{max} = 1.2$ at C.

By Matrix Method (Crammer's Rule)
MIDDLE LEVEL PROBLEM

$Maximize \ Z_2 = \frac{y_1 + 2y_2 + 1}{y_1 + y_2 + 1}$.........(A)

Subject to: $y_1 + 2y_2 \leq 4$......(1)

$2y_1 + y_2 \leq 2$.......(2)

$y_1 + y_2 \leq 1$........(3)

$y_1 \geq 0, \qquad y_2 \geq 0$

Using equation (1) and (2) $\begin{bmatrix} 1 & 2 & \vdots & 4 \\ 2 & 1 & \vdots & 2 \end{bmatrix}$ D $= \begin{vmatrix} 1 & 2 \\ 2 & 1 \end{vmatrix} = -3$

$D_{y_1} = \begin{vmatrix} 4 & 2 \\ 2 & 1 \end{vmatrix} = 0$; $y_1 = \frac{D_{y_1}}{D} = 0$ $D_{y_2} = \begin{vmatrix} 1 & 4 \\ 2 & 2 \end{vmatrix} = 6$; $y_2 = \frac{D_{y_2}}{D} = 2$

$$Z_{max} = 1.5$$

Using equation (1) and (3) $\begin{bmatrix} 1 & 2 & \vdots & 4 \\ 1 & 1 & \vdots & 1 \end{bmatrix}$ D $= \begin{vmatrix} 1 & 2 \\ 1 & 1 \end{vmatrix} = -1$

$D_{y_1} = \begin{vmatrix} 4 & 2 \\ 1 & 1 \end{vmatrix} = 2$; $y_1 = \frac{D_{y_1}}{D} = -2$ $D_{y_2} = \begin{vmatrix} 1 & 4 \\ 1 & 1 \end{vmatrix} = -3$; $y_2 = \frac{D_{y_2}}{D} = 3$

$Z_{max} = 2.5$, since the extreme points cannot be negative, therefore the above solution cannot be optimum.

Akshika Verma *et al.,*

Using equation (2) and (3) $\begin{bmatrix} 2 & 1 & : & 2 \\ 1 & 1 & : & 1 \end{bmatrix}$D= $\begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} = 1$

$D_{y_1} = \begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} = 1$; $y_1 = \dfrac{D_{y_1}}{D} = 1$ $D_{y_2} = \begin{vmatrix} 2 & 2 \\ 1 & 1 \end{vmatrix} = 0$; $y_2 = \dfrac{D_{y_2}}{D} = 0$

$$Z_{max} = 1$$

From all the optimum results maximum value is $Z_{max} = 1.5$ in Middle Level Problem.

UPPER LEVEL PROBLEM

$Maximize\ Z_1 = \dfrac{x_1 + 2x_2 + 1}{x_1 + x_2 + 1}$ …………(B)

Subject to: $x_1 + 2x_2 \leq 4$ ………..(1)

$2x_1 + x_2 \leq 2$ ………....(2)

$x_1 + x_2 \leq 1$ ………....(3)

$x_1 \geq 0, \qquad x_2 \geq 0$

Using equation (1) and (2) $\begin{bmatrix} 1 & 2 & : & 4 \\ 2 & 1 & : & 2 \end{bmatrix}$D= $\begin{vmatrix} 1 & 2 \\ 2 & 1 \end{vmatrix} = -3$

$D_{x_1} = \begin{vmatrix} 4 & 2 \\ 2 & 1 \end{vmatrix} = 0$; $x_1 = \dfrac{D_{x_1}}{D} = 0$ $D_{x_2} = \begin{vmatrix} 1 & 4 \\ 2 & 2 \end{vmatrix} = 6$; $x_2 = \dfrac{D_{x_2}}{D} = 2$

$$Z_{max} = 1.5$$

Using equation (1) and (3) $\begin{bmatrix} 1 & 2 & : & 4 \\ 1 & 1 & : & 1 \end{bmatrix}$D= $\begin{vmatrix} 1 & 2 \\ 1 & 1 \end{vmatrix} = -1$

$D_{x_1} = \begin{vmatrix} 4 & 2 \\ 1 & 1 \end{vmatrix} = 2$; $x_1 = \dfrac{D_{x_1}}{D} = -2$ $D_{x_2} = \begin{vmatrix} 1 & 4 \\ 1 & 1 \end{vmatrix} = -3$; $x_2 = \dfrac{D_{x_2}}{D} = 3$

$Z_{max} = 2.5$, since the extreme points cannot be negative, therefore the above solution cannot be optimum.

Using equation (2) and (3) $\begin{bmatrix} 2 & 1 & : & 2 \\ 1 & 1 & : & 1 \end{bmatrix}$D= $\begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} = 1$

$D_{x_1} = \begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} = 1$; $x_1 = \dfrac{D_{x_1}}{D} = 1$ $D_{x_2} = \begin{vmatrix} 2 & 2 \\ 1 & 1 \end{vmatrix} = 0$; $x_2 = \dfrac{D_{x_2}}{D} = 0$

$$Z_{max} = 1$$

From all the optimum results maximum value is $Z_{max} = 1.5$ in Upper Level Problem.

LOWER LEVEL PROBLEM

$Maximize\ Z_3 = \dfrac{2t_1 + 4t_2 + 1}{2t_1 + 2t_2 + 1}$ …………..(C)

Subject to: $t_1 + 5t_2 \leq 5$ ………(1)

$5t_1 + 2t_2 \leq 10$ ……(2)

$2t_1 + t_2 \leq 8$ ………(3)

$t_1 \geq 0, \qquad t_2 \geq 0$

Using equation (1) and (2) $\begin{bmatrix} 1 & 5 & : & 5 \\ 5 & 2 & : & 10 \end{bmatrix}$D= $\begin{vmatrix} 1 & 5 \\ 5 & 2 \end{vmatrix} = -23$

$D_{t_1} = \begin{vmatrix} 5 & 5 \\ 10 & 2 \end{vmatrix} = -40$; $t_1 = \dfrac{D_{t_1}}{D} = 1.7$ $D_{t_2} = \begin{vmatrix} 1 & 5 \\ 5 & 10 \end{vmatrix} = -15$; $t_2 = \dfrac{D_{t_2}}{D} = 0.6$

$$Z_{max} = 1.2$$

Using equation (1) and (3) $\begin{bmatrix} 1 & 5 & : & 5 \\ 2 & 4 & : & 8 \end{bmatrix}$D= $\begin{vmatrix} 1 & 5 \\ 2 & 4 \end{vmatrix} = -6$

$D_{t_1} = \begin{vmatrix} 5 & 5 \\ 8 & 4 \end{vmatrix} = -20$; $t_1 = \dfrac{D_{t_1}}{D} = 3.3$ $D_{t_2} = \begin{vmatrix} 1 & 5 \\ 2 & 8 \end{vmatrix} = -2$; $t_2 = \dfrac{D_{t_2}}{D} = 0.3$

$$Z_{max} = 1.07$$

Using equation (2) and (3) $\begin{bmatrix} 5 & 2 & : & 10 \\ 2 & 4 & : & 8 \end{bmatrix}$D= $\begin{vmatrix} 5 & 2 \\ 2 & 4 \end{vmatrix} = 16$

$D_{t_1} = \begin{vmatrix} 10 & 2 \\ 8 & 4 \end{vmatrix} = 24$; $y_1 = \dfrac{D_{t_1}}{D} = 1.5$ $D_{t_2} = \begin{vmatrix} 5 & 10 \\ 2 & 8 \end{vmatrix} = 20$; $t_2 = \dfrac{D_{t_2}}{D} = 1.2$

$$Z_{max} = 1.2$$

From all the optimum results maximum value is $Z_{max} = 1.2$ in Lower Level Problem.

Akshika Verma *et al.,*

By Denominator Objective Restriction Method
MIDDLE LEVEL PROBLEM

$Maximize\ Z_2 = \frac{y_1 + 2y_2 + 1}{y_1 + y_2 + 1}$.........(A)

Subject to: $\qquad y_1 + 2y_2 \leq 4$……(1)

$2y_1 + y_2 \leq 2$…….(2)

$y_1 + y_2 \leq 1$……..(3)

$y_1 \geq 0, \qquad y_2 \geq 0$

	C_j		1	2	0	0	0	Min

0	S_2	1	1	0	0	1	-1	
2	x_2	1	1	1	0	0	1	
$Z_j - C_j$			1	0	0	0	2	

C_j			1	1	0	0	0	Min
C_B	B_V	X_B	x_1	x_2	S_1	S_2	S_3	Ratio
0	S_1	4	1	2	1	0	0	2
0	S_2	2	2	1	0	1	0	2
0	S_3	1	1	1	0	0	1	1
$Z_j - C_j$			-1	-1	0	0	0	

C_j			1	1	0	0	0	Min
C_B	B_V	X_B	x_1	x_2	S_1	S_2	S_3	Ratio
0	S_1	2	-1	0	1	0	-2	
0	S_2	1	1	0	0	1	-1	
2	x_2	1	1	1	0	0	1	
$Z_j - C_j$			1	1	0	0	2	

In both the cases $(x_1, x_2) = (0,1)$ maximum value is $Z_{max} = 1.5$ in Upper Level Problem.

LOWER LEVEL PROBLEM

$Maximize\ Z_3 = \frac{2t_1 + 4t_2 + 1}{2t_1 + 2t_2 + 1}$ ....(C)

Subject to: $t_1 + 5t_2 \leq 5$.........(1)

$5t_1 + 2t_2 \leq 10$......(2)

$2t_1 + 4t_2 \leq 8$.........(3)

$t_1 \geq 0, \qquad t_2 \geq 0$

C_j			2	4	0	0	0	Min
C_B	B_V	X_B	t_1	t_2	S_1	S_2	S_3	Ratio
0	S_1	5	1	5	1	0	0	2
0	S_2	10	5	2	0	1	0	2
0	S_3	8	2	4	0	0	1	1
$Z_j - C_j$			-2	-4	0	0	0	

And so on hence we get,

In both the cases $(t_1, t_2) = (1.7, 0.6)$ maximum value is $Z_{max} = 1.2$ in Lower Level Problem

Akshika Verma *et al.,*

CONCLUSION

This paper has used graphical method, denominator objective restriction method and crammers method to find the maximum or minimum value of fully fuzzy fuzzy fractional programming problem. It has also been observed that after comparison with the results of other method, the obtained results are similar. It is found that the proposed method is quite simple and easy to implement, comparative to other algorithms.

ABSTRACT

The study on a "Performance Appraisal System" at ABC Private Limited, investigates on how the appraisal system is effective and how the appraisal influences the employee performance, motivation and job satisfaction. Nowadays, businesses are adopting data-driven strategies to refine their operations. The research analyzes various appraisal techniques which involves both traditional and modern methods such as 360-degree feedback and objective-based evaluations. The research methodology involves both qualitative and quantitative data which are collected from a diverse group within the organization. It also highlights the significance of fairness, transparency and constructive feedback provided from the performance appraisal system helps the employees to become high-performers and motivated professionals.

Keywords: Performance appraisal system, Employee performance, Motivation, Job satisfaction, Constructive feedback.

INTRODUCTION

In today's dynamic world, Organizations are constantly evolving to meet the growing demands of a competitive business environment. Performance appraisal system plays a crucial role in an organization, which helps in managing and evaluating employee's performance and also aligns the individual goals with the organizational objectives. The Performance appraisal is a component of performance management which deals with managing the workforce. It is a formalized process through which the employee's work performance is evaluated and the rewards or recognitions are provided based on the evaluation. The performance appraisal helps the organizations to identify the strengths and the areas for improvement of their employees and also helps to set future goals based on the past

95742

trends. These appraisals are conducted annually or semi-annually which involves both qualitative and quantitative measures of the work performance of the employees. A well-designed appraisal system promotes fairness, transparency, provides a clear criteria and reduces biases. Adopting to an appraisal system helps to customize the needs of both the employer and employee which is the key to maintain an effective workforce in the organization.

PERFROMANCE APPRAISAL SYSTEM:
MEANING
The term "Performance Appraisal" refers to the regular review of an employee's job performance and his/her overall contribution to a company. It is also known as Annual Review, Employee Appraisal, Performance Review, Performance Evaluation. It is a systematic and formal process used by organizations to evaluate and measure the performance of their employees based on several performance appraisal factors. The process typically involves:
- Setting performance standards.
- Collecting and analyzing information on individual employee performance.
- Providing feedback and addressing poor performance if necessary.

DEFINITION
According to Randall S. Schuler, "Performance appraisal is referred as a formal, structured system used to measure and evaluate an employee's job-related behavior and outcomes. The goal is to identify how and why an employee is currently performing, and how they can perform more effectively in the future, ultimately benefiting the employee, the organization, and society".

AIM OF THE STUDY
This study aims to evaluate the effectiveness of the current appraisal system within an organization. It seeks to identify the factors influencing employee performance, motivation and job satisfaction. The research aims to provide recommendations for optimizing the appraisal system to enhance the overall organizational growth and employee development.

NEED OF THE STUDY
In today's changing environment, organizations may need an effective performance appraisal system to assess and improve the performance of the employees. This study explores the importance of the system in enhancing the productivity, fostering growth, and aligning individual goals with the organizational objective to ensure long-term success.
By evaluating existing performance appraisal systems, the study provides insights into the best practices and recommendations for improving the systems, ensuring that they align with the current organizational trends and requirements.

SCOPE OF THE STUDY
- The study examines various evaluation processes and methods that are used to assess employee performance, analyzing their evaluation and applications.
- It explores the impact of performance appraisal on employee motivation, job satisfaction, productivity and overall organizational performance.
- It identifies the challenges faced in implementing the appraisal and highlights the areas for improvement.
- It highlights the role of performance appraisals in employee development, productivity enhancement and aligning individual goals with organizational objectives.

OBJECTIVES OF THE STUDY:
- To identify the individual factors influencing employee performance as measured by the performance appraisal system.
- To assess the impact of performance appraisal on employee motivation and job satisfaction.
- To evaluate the alignment of performance appraisal methods with the organizational goals and objectives.

- To provide recommendations for enhancing the effectiveness of performance appraisal systems.

CHARACTERISTICS OF PEFROAMCE APPRAISAL SYSTEM
Clear Objective
The system should include a well-defined goal such as providing clear criteria, identifying the training needs, making informed-decisions.

Standardization
It ensures that the appraisal system evaluates the employee's performance consistently across all employees within the organization.

Comprehensive
It should assess various aspects of work performance of the employees such as skills, knowledge, behavior, goals achieved and overall contribution to the organization.

Feedback Mechanism
The appraisal should provide a regular and constructive feedback to the employees about their strengths and the areas for improvement.

Documentation
The detailed records of the previous appraisals held such as the criteria used, feedback provided, performance ratings and the decisions that are made should be recorded.

Legal & Ethical Considerations
The appraisal system should comply with both the labor laws and ethical standards ensuring that the decisions made are not discriminated against any employees.

INDIVIDUAL FACTORS INFLUENCING PERFORMANCE APPRAISAL SYSTEM:
Individual factors that affect the performance appraisal system includes individual's behavior or characteristics that influences on how an employee is assessed. Understanding these factors are essential for ensuring accuracy and fair evaluation results. Some of the individual factors include:
- Punctuality.
- Accountability.
- Time management.
- Quality and Quantity of work.
- Teamwork.
- Leadership capabilities.
- Communication abilities.
- Skills and Job expertise.

IMPACT OF PERFORMANCE APPRAISAL SYSTEM ON MOTIVATION AND JOB SATISFACTION:
The appraisal system is used to assess and guide the employees. When the system is well-designed and implemented properly, it can help the employees by boosting morale, enhancing job satisfaction and employee motivation. If not then it may lead to stress, anxiety and dissatisfaction. Understanding both the positive and negative impacts are essential for improving the workforce performance.

Positive Impacts
Clear career path and growth opportunity
By appraisal, employee can identify the strength and areas for improvement and some appraisal methods also provide more insights about the career or growth opportunity.

Improves communication

Open dialogue conversation between the employer and employee may foster trust and better relationship between them.

Promotes motivation and satisfaction

When the feedback is provided on a regular basis, it helps the employees to grow their skills and knowledge which increases motivation and job satisfaction.

Negative Impacts

Stress or anxiety

Employee may feel stress or anxiety due to the consequences of poor appraisal which may lead to lower their motivation and fells dissatisfied.

Biased and unclear evaluation criteria

When the criteria are vague or not clear, the employees may feel demotivated or not fairly judged.

Unrealistic goals

When the goals are too high or not aligned with the role may lead to dissatisfaction and lowers the employee motivation.

Feedback

When the feedback provided is nor regular and constructive, employees may feel confused leads to discouraged or disengaged.

METHODS OF PERFORMANCE APPRAISAL SYSTEM

Performance appraisal system plays a crucial role in decisions regarding promotion, demotion, suspension, training etc., Traditional methods of performance appraisal are more basic methods of appraisal which focuses on the evaluation of the employee's past actions and behavior. These methods may be subjectivity and tend to biases in the evaluation of the employee. Whereas Modern methods of performance appraisal are most advanced techniques that not only assess the past performance of the employee, it also considers the future potential, competencies and development needs of the employees. These methods are data-driven, employee-focused and less prone to biases. Modern methods also include the self-assessment of the employees and peer reviews for providing continuous feedback for the employees.

TRADITIONAL METHODS	MODERN METHODS
Graphic Rating Scale (GRS) Critical Incident Method Essay Method Ranking Method Forced Distribution Method	360-Degree Feedback Management by Objective (MBO) Behaviorally Anchored Rating Scale Self-Assessment Continuous feedback

REVIEW OF LITERATURE

- **Dr. M Dhanabhakyam and Fahad KP (2025)**
  This study analyzes the impact of performance appraisal system on employee morale in private sector banks in Kerala, the results shows that effective appraisals boosts job satisfaction and commitment. Conducted with 244 employees, it reveals that rating strategies influence morale.

- **Alwizan Mohd Ron, Ahmad Shahrul Nizam Isha (2025)**
  This study explores the role of ethical leadership in performance appraisal system which focuses on ESG criteria and highlights the gaps on state-owned agencies in Sabah. It examines how the ethical leadership affects organizational performance and ESG sustainability, this study advice for further research to enhance appraisal system and their impact on the ESG initiatives.

- **Christopher Ogola (2025)**
  The researcher investigates the role of goal theory in performance appraisal and finding that there is a positive relationship between the appraisals and employee performance. It also highlights the factors such as sector, organizational size and sample type that influence the relationship.

- **Zewdu, Teshome (2024)**
  It investigates perception of employees on the performance appraisal system at Adanech Argaw Timer and Plank Manufacturing Company. It reveals that the employees feel dissatisfied due to its subjectivity and non-participatory nature. The appraisal system also has some issues such as errors, biases and evaluator incompetency. It recommends to adopt to a best industry practices, standardizing tools and overall system for the development of the employee in the organization.

RESEARCH METHODOLOGY

Research methodology refers to the system approach used by researcher to collect, analyze and interpret data in order to answer a research question or to solve a problem. It involves the techniques, processes and the tools used to gather data, the methods used to analyze it.

RESEARCH DESIGN

A research design is the overall plan or structure that outlines the methodology, data collection techniques, sampling techniques and data analysis methods to be used in a study. For the performance appraisal system, **Descriptive research design** is used which focuses on understanding the effectiveness, challenges and employee perception related to the appraisal within an organization.

RESEARCH APPROACH

1. **Qualitative:** It involves exploring the perception of both employees and managers regarding the performance appraisal system through interview.
2. **Quantitative:** It focuses on collecting numerical data from a structured questionnaire to access the effectiveness and fairness of the system.

Data Collection Methods
  i. **Primary data:** The data was collected through a structured questionnaire which was directly collected from the employees in the organization.
 ii. **Secondary Data:** The data was collected from the existing reports and documents within the organization. It offers a deeper understanding of the concept of performance appraisal system. It includes:
  - Internal Reports.
  - Company Policies and Guidelines.
  - Existing Literature.

Sampling Technique
This study involves **Stratified random sampling** technique to ensure that participants from diverse roles, departments and experience levels were included.

Sample Size

The study was conducted with a sample size of **96** participants including both the employees and managers within the organization and the targeted population size was **243**.

Sampling Area

The data was collected from different departments at **"ABC PRIVATE LIMITED"** to ensure that a comprehensive analysis of the performance appraisal system was held.

STATISTICAL TOOL USED

It refers to the techniques that are used to collect, analyze, interpret and present data to identify the patterns, relationship and trends. These tools helps to draw conclusion and make decisions based on the data that are provided by the respondents. The statistical tool used in the study are:

- Chi-Square test.
- Karl Pearson's coefficient of correlation.
- F – test.
- Regression.
- Mann-Whitney U – test.

CHI-SQUARE TEST

Null Hypothesis (H_0): There is no association between the experience of the respondents and the appraisal system which helps in identifying and addressing performance gaps effectively.

2	0.9	1.1	1.21	1.3
				$\sum \dfrac{(O_i - E_i)^2}{E_i}$ = **11.69**

$$\chi^2 = \frac{\Sigma(O_i - E_i)^2}{E_i}$$

χ^2 =11.69 (Calculated Value)

Degrees of freedom, df = (C-1) (R-1)

= (5-1) (4-1)

df = 12

At a significance level of α = 0.05 and degrees of freedom df = 12, the critical value for the Chi-Square distribution is approximately 21.026.

Calculated value < Tabulated value (11.69 < 21.026)

Therefore, Null hypothesis (H0) is accepted.

CONCLUSION

The Calculated value is 11.69 which is lesser than the tabulated value (21.026), so the null hypothesis (H0) is accepted. Hence, there is no association between the experience of the respondents and the appraisal system which helps in identifying and addressing performance gaps effectively.

CORRELATION

Null Hypothesis (H0): There is no significant relationship between the performance ratings conducted periodically and the performance rating is helpful for managers to provide employee counselling.

Performance ratings conducted periodically	56	32	4	2	2
Performance rating is helpful for managers to provide employee counselling	38	45	6	5	2

FORMULA

$$r = \frac{N\ (\sum XY) - (\sum X)(\sum Y)}{\sqrt{N\Sigma X^2 - (\Sigma X)^2} - \sqrt{N\Sigma Y^2 - (\Sigma Y)^2}}$$

Where, r = Coefficient of Correlation

N= Number of pair of observations

X and Y =Individual data values for the two variables

$\sum X$= Sum of the X values

$\sum Y$= Sum of the Y values

ΣX^2= Sum of the squared x values

ΣY^2= Sum of the squared Y values

$\sum XY$= Sum of the product of the X and Y values

X	Y	X²	Y²	XY
56	38	3136	1444	2128
32	45	1024	2025	1440
4	6	16	36	24
2	5	4	25	10
2	2	4	4	4
∑X = 96	∑Y = 96	∑X² = 4184	∑Y² = 3534	∑XY = 3606

$$r = \frac{N\ (\sum XY) - (\sum X)(\sum Y)}{\sqrt{N\Sigma X^2 - (\Sigma X)^2} - \sqrt{N\Sigma Y^2 - (\Sigma Y)^2}}$$

$$r = \frac{5\ (3606) - (96)(96)}{\sqrt{5\ (4184) - (96)^2}\sqrt{5\ (3534) - (96)^2}}$$

$$= \frac{8814}{9948.07}$$

r = 0.886

CONCLUSION

The coefficient of correlation (r) is 0.886. Since the fairly high degree of positive correlation is between +0.75 and +0.9. Therefore, there is a fairly high degree of positive correlation between the performance ratings conducted periodically and the performance rating is helpful for managers to provide employee counselling.

F – TEST

Null Hypothesis (H$_0$): There is no significant relationship between the performance goals set are challenging to attain and the age of the respondents.

Performance goals set are challenging to attain	43	53	0	0	0
Age	9	29	36	17	5

FORMULA

$$F = \frac{S_1^2}{S_2^2}$$

$$S_1{}^2 = \frac{\sum X^2}{N_1 - 1}\ ,\ \ S_2{}^2 = \frac{\Sigma Y^2}{N_2 - 1}$$

Where, $S_1{}^2$ and $S_2{}^2$ = Sample Variances

$\sum X^2$ = Sum of X values

$\sum Y^2$ = Sum of Y values

N_1 and N_2 = Number of observations of group 1 and 2.

X	X²	Y	Y²
43	1849	9	81
53	2809	29	841
0	0	36	1296
0	0	17	289
0	0	5	25
∑X = 96	∑X² = 4658	∑Y = 96	∑Y² = 2532

$\bar{X} = \frac{96}{2} = 48$, $\bar{Y} = \frac{96}{5} = 19.2$

$S_1^2 = \frac{\sum X^2}{N_1 - 1} = 4658$

$S_2^2 = \frac{\sum Y^2}{N_2 - 1}$

$= \frac{2532}{4}$

$S_2^2 = 633$

$F = \frac{S_1^2}{S_2^2}$

$= \frac{4658}{633}$

F = 7.36   (Calculated Value)

Degrees of freedom (df)

Degrees of freedom for the numerator, $df_1 = N_1 - 1$

$= 2 - 1$

$df_1 = 1$

Degrees of freedom for the denominator, $df_2 = N_2 - 1$

$= 5 - 1$

$df_2 = 4$

The critical value of the F-test for the two-tailed with degrees of freedom (1, 4) and significance level of $\alpha = 0.05$. The table value for the F-test is $t_{0.05} = 7.71$

Calculated value < Tabulated value (7.36 < 7.71)

Therefore, Null hypothesis (H_0) is accepted.

CONCLUSION

The calculated value is 7.36 which is lesser than the tabulated value (7.71). Therefore, null hypothesis (H_0) is accepted. Hence, there is no significant relationship between the performance goals set are challenging to attain and the age of the respondents.

REGRESSION

Null Hypothesis (H_0): There is no significant relationship between the performance ratings conducted periodically and the performance appraisal system encourages constructive feedback from both managers / HOD's and peers.

The performance ratings conducted periodically	56	32	4	2	2
The performance appraisal system encourages constructive feedback from both managers / HOD's and peers	47	31	13	3	2

FORMULA

Y = a + bX

$b = \dfrac{N \sum XY - (\sum X)(\sum Y)}{N \sum X^2 - (\sum X)^2}$

Where,   b = Slope of the line

a = Y-intercept of the line

X = Values of the first data set

Y = Values of the second data set

X	Y	X²	Y²	XY
56	47	3136	2209	2632
32	31	1024	961	992
4	13	16	169	52
2	3	4	9	6
2	2	4	4	4
∑X = 96	∑Y = 96	∑X² = 4184	∑Y² = 3352	∑XY = 3686

Regression co-efficient of X on Y:

$b = \dfrac{N (\sum XY) - (\sum X)(\sum Y)}{N \sum Y^2 - (\sum Y)^2}$

$= \dfrac{5 (3686) - (96)(96)}{5 (3352) - (96)^2}$

$= \dfrac{9214}{7544}$

$b_{XY} = 1.221$

Regression equation of X on Y:

X - $\overline{X}$ = b_{XY} (Y - $\overline{Y}$)

X – 19.2 = 1.221 (Y – 19.2)

X = 1.221 Y – 4.243

Regression co-efficient of Y on X:

$b = \dfrac{N (\sum XY) - (\sum X)(\sum Y)}{N \sum X^2 - (\sum X)^2}$

$= \dfrac{5 (3686) - (96)(96)}{5 (4184) - (96)^2}$

$= \dfrac{9214}{11704}$

$b_{YX} = 0.787$

Regression equation of Y on X:

Y - $\overline{Y}$ = b_{XY} (X - $\overline{X}$)

Y – 19.2 = 0.787 (X – 19.2)

Y = 0.787 X – 4.09

Degree of Association = $\sqrt{bxy} \cdot \sqrt{byx}$

$= \sqrt{1.221}\sqrt{0.787}$

Degree of Association = 0.980

CONCLUSION

The coefficient of regression is 0.980. Therefore, there is a very high degree of positive association between the variables. Hence, the performance ratings are conducted periodically to ensure consistent evaluation and improvement. The appraisal system encourages constructive feedback from both the managers/HOD's and peers, fostering a comprehensive assessment of employee performance.

MANN-WHITNEY U – TEST

Null Hypothesis (H_0): There is no significant difference between the performance appraisal system encouraging constructive feedback from both managers / HOD's and peers Vs The feedback provided during the appraisal is effective and leads to improvement.

The performance appraisal system encourages constructive feedback from both managers / HOD's and peers	47	31	13	3	2
The feedback provided during the appraisal is effective and leads to improvement	31	57	5	3	-

Formula

$U = \min \{U_1, U_2\}$

$U_1 = R_1 - \frac{n_1(n_1+1)}{2}$, $U_2 = R_2 - \frac{n_2(n_2+1)}{2}$

R = Ranks of the group

N = Number of observations

X	R_1	Y	R_2
47	8	31	6.5
31	6.5	57	9
13	5	5	4
3	2.5	3	2.5
2	1	-	-
$\sum X = 96$	$\sum R_1 = 23$	$\sum X = 96$	$\sum R_2 = 22$

$n_1 = 5$, $n_2 = 4$

$U_1 = R_1 - \frac{n_1(n_1+1)}{2}$

$= 23 - 15$

$U_1 = 8$

$U_2 = R_2 - \frac{n_2(n_2+1)}{2}$

$= 22 - 10$

$U_2 = 12$

$U = \min \{U_1, U_2\} = \min \{8, 12\}$

$U = 8$

$n_1 = 5$, $n_2 = 4$

Table Value = 1

Calculated Value > Tabulated Value   (8 > 1)

CONCLUSION

The Calculated value is 8 which is greater than the Tabulated Value (1), therefore null hypothesis (H_0) is accepted. Hence, there is no significant difference between the performance appraisal system encouraging constructive feedback from both managers / HOD's and peers Vs The feedback provided during the appraisal is effective and leads to improvement.

LIMITATIONS OF THE STUDY

- The Study involves a small group of employees or a specific organization, which may not fully represent a boarder perspective of industry trends.
- Subjectivity in employee feedback results in biased assessments which will affect the fairness and precision of the appraisal.
- Due to the time constraint it was not possible to fully explore the long-term impacts or to gather sufficient data to make conclusions.
- The study is restricted by limited access to internal records of the organization.
- The traditional appraisal system often relies on the top-down feedback method which results in a limited view on the employee's performance.

FINDINGS

The major findings of the study include:

- The majority of respondents around 51% have agreed that the performance appraisal system is fair and unbiased. Also 49% of the respondents have agreed that the performance evaluations are conducted consistently across all employees.
- A significant number of respondents (48%) have strongly agreed that the appraisal system helps in identifying and addressing performance gaps effectively.
- Majority of 58% of the respondents have strongly agreed that the performance ratings are conducted periodically.
- The majority of 49% of the respondents have strongly agreed that the appraisal system encourages constructive feedback from both managers/HOD's and peers.
- A significant number of respondents around 59% have agreed that the feedback provided during the appraisal was effective and leads to improvement.
- Around 43% of the respondents have agreed that they are satisfied with the overall appraisal system of their company.

SUGGESSTIONS

- Conduct regular training sessions for the managers that helps them to deliver the feedback to their employees in a manner that is clear, unbiased and respectful.
- Considering the employee's self-assessment during the appraisal process.
- Adopting to a performance management software to automate the appraisal process.
- Shifting to a competitive achievement ranking system and intangible contributions.
- Provide equal importance for both traditional and modern methods of appraisal.

CONCLUSION

Performance appraisal system is an essential tool for monitoring employee's work performance and providing effective feedbacks about their performances. It helps to recognize talents and also provide training and development programs for the underperformer. However, the study finds certain challenges such as subjectivity, lack of consistency and more delayed feedback which reduces the effectiveness of the appraisal system. To overcome these challenges, it is better to adopt to a performance management software which helps to enhance the appraisal process. The software offers various features such as real-time feedback, automated evaluation, tracking performance, goal alignment etc., These software helps to increase the accuracy and consistency and also ensures the fairness and transparency in the performance appraisal process. By integrating technology into the formal performance appraisal system, businesses can support the employee's growth which leads to improve employee performance and overall organizational success.

ABSTRACT

The efficient use of energy can be widely referred to as energy conservation. Energy conservation refers to the reduction or abolition of wasteful or undesirable energy use. It is possible to complete a task by using less energy or none at all. Energy efficiency has a significant potential to promote economic growth and lower greenhouse gas emissions (GHGs) globally. India started implementing energy-saving measures more than 20 years ago, and since then, It has produced a precise framework of policies to encourage energy conservation. All individuals can save energy by minimizing the time they spend using fans, lights, heaters, and other electrical devices in their daily lives. The National Energy Savings Campaign can greatly benefit from this easy and efficient method of energy conservation. It should go without saying that employing renewable energy sources, such as biomass, wind, and solar, would boost the economy and lower greenhouse gas emissions. In 2019, India's economy was the fifth largest in the world; by 2025, it aims to rank third. India will keep moving forward to reach a USD 5 trillion economy by 2025 while also making sure environmental repercussions are kept to a minimum.

Keywords: Energy conservation, GDP, Climate Change, Demand side management, Smart automation

INTRODUCTION

The coal, oil, and natural gas power industries are responsible for one-third of the world's greenhouse gas emissions. It is crucial to provide cleaner and more dependable electricity in order to improve people's quality of life [1]. India's present attempts at economic expansion are contributing to an increase in its energy requirements. An essential precondition for a nation's economic growth is the availability of ever-increasing energy [2]. The National Energy Plan [NEP] was developed by the Ministry of Power (MoP) to supply energy throughout the country [3].It includes a thorough ten-year action plan. In order to ensure that citizens are granted power in an economical and effective manner, it has also developed a second strategy. According to the World Resource Institute Report 2017 [4, 5], India ranks fourth globally in terms of carbon emissions, behind the US (14.36%), China (26.83%), and the EU (9.66%). Nearly 6.65% of the world's carbon emissions come from India. Climate change has the potential to alter the planet's natural equilibrium. Intended Nationally Determined Contributions (INDCs) have been made to the Paris Agreement and the United Nations Framework Convention on Climate Change (UNFCCC).By keeping the increase in global temperature to well below 2 °C, the latter has sought to achieve success [6, 7]. Global electricity demand is expected to peak around 2030, according to the World Energy Council [8]. India imports expensive fossil fuels and is one of the biggest users of coal worldwide [8]. India has pledged to participate in a number of global programs designed to reduce the emission intensity of the GDP (Gross Domestic Product). India has made considerable efforts to carry out the cuts it has committed to, despite the fact that they are not legally required, while considering the overall impact on the Indian economy. To reach the targeted level of emissions intensity reduction, India will have to employ energy efficiency (EE) and renewable energy sources [9].India has accomplished a lot in the last few years. Thanks to the nation's extensive efforts, electricity is now available to over 700 million people. India has increased support for renewable energy industries, particularly solar PV, and energy awareness campaigns like the Ujala initiative in Gujarat that encourage the use of LEDs instead of high power rated bulbs. India, which has 1.4 billion people, is one of the fastest-growing major economies in the world. The future of the world's energy markets lies in India. In recent years, the Indian government has made great strides in expanding access to cooking and clean energy.

It has also deployed a large amount of renewable electricity, especially solar energy, and successfully implemented several energy market reforms [10]. India's increasing energy needs lead to increased supply and demand volatility. On the supply side, more electricity is being produced using renewable resources like solar photovoltaics and wind. Almost 31% of Indians live in cities, which is related to demand in terms of the living conditions of all demographic groups. According to projections, this figure will rise to 40% in 2030 and 50% in 2050. Buildings' share of air conditioning loads will more than double, which will greatly raise daily electricity consumption at its peak [11]. Environmental contamination is currently a major worldwide concern. The damaging emissions from internal combustion engines are one of the primary causes of air pollution. Globally, there is a strong push to promote electric vehicles (EVs) in an effort to mitigate the effects of emissions from fossil fuels and solve environmental issues. Electric-powered trains can cut emissions, enhance fuel safety, and minimize urban air pollution, making them a viable alternative for transportation. People are being encouraged by the government to use electric automobiles. According to the future prediction evaluation projected, EV charging will account for 5 to 7 percent of the total electricity demand by 2030. Demographics, the importance of the manufacturing sector, future GDP growth rates, and the electrification of services like cooking and transportation by trains, electric cars, etc are some of the factors that affect the demand for electricity. India now has 395 GW of installed electricity producing capacity, and the country will need 1275.534 TWh in 2020–2021. By 2030, the total amount of electricity consumed had increased to 2074 TWh (low GDP growth, high efficiency), 2785 TWh (high GDP growth, low efficiency), and 2338 TWh (at 6.2 percent CAGR)[12,13]. In 2019–20 and 2020–21, India's real electrical energy requirements were 12,91,010 MU and 12,75,534 MU, respectively. According to study and econometric projections, the world's total daily power consumption would be close to 6510 million units by 2030.India has set a goal to reduce its emission intensities by 33–55% by 2030. It also plans to use renewable energy sources to meet half of its energy needs by that year and drastically cut its carbon emissions. By 2030, India's non-fossil energy capacity is predicted to increase to 500 GW,

more than doubling the nation's current grid power capacity. By 2030, 60% of India's power generation capacity would be free of fossil fuels if the target were met. In 2022, only roughly 27% of India's energy needs will be satisfied by renewable sources; by 2030, that number will rise to 50%. India needs a robust policy for energy conservation and the use of renewable energy sources in order to accomplish the aforementioned objective. Energy efficiency is one of the most crucial strategies for achieving the emission reduction targets. This study has looked at how energy conservation contributes to energy security [14], [15].

INDIA POWER SECTOR AT GLANCE

In the fiscal year 2020–21, 11,41,941 million units of electricity were consumed in India, which currently has 395 GW of installed power generation capacity. With an installed power capacity of 395.07 GW, India is the world's second-largest consumer and third-largest producer of electricity as of January 2022. Additional encouragement will come from per-capita usage, population growth, and increased electrification. In 2022, power consumption is anticipated to reach 1,894.7 TWH [16]. India has a large amount of power-generating capacity, but its infrastructure for the supply, transmission, and distribution of fuel is insufficient. In India, the average thermal power plant load factor is less than 60% compared to the required 85%. Figure 1 depicts the rise of installed power generation capacity. India has experienced tremendous growth in electricity production, with coal-fired power plants accounting for the majority of the increase—approximately 55% of total non-renewable energy production. India has made significant financial investments to increase solar energy production. On the other hand, 0.16 gigawatts (GW) of solar energy capacity were installed in 2010.India has improved its ability to generate renewable energy, as evidenced by its renewable energy initiative. Figure 2 shows that in 2022, coal power generation overtook wind, gas, and nuclear power generation, and solar energy generation came in second. India's installed power generation capacity is broken down by source in Table 1. In an attempt to support green energy, India has set targets to generate 500 GW of electricity from renewable sources by 2030 and 175 GW by 2022. As of 31 March 2022, the nation had deployed 53 GW of solar power. As of 31 March 2021[9], Gujarat's installed solar power generation capacity was 4,430 MW, making it one of India's most solar-developed states[16],[17]. In 2021–2022, 1356 billion units (BU) of thermal, hydro, nuclear, and imported power are to be produced. It indicates a roughly 9.83% increase over the actual generation of 1234.608 BU in the previous year (2020–21). The generation for 2020–21 was 1234 BU, which represents a negative growth of roughly 1.29% when compared to the 1250 BU generated during 2019–20 [9]. India's electrical industry reflects the nation's rapidly growing economy, increasing exports, improving infrastructure, and rising household incomes. Furthermore, the recent coal problem has created anxiety because thermal power plants, which rely on coal, generate more than 60% of the country's electricity. For the country's economy to grow in such a situation, efficient use of energy resources and their conservation are essential.

Gujarat State Electricity Demand and Supply First

Gujarat is a state in western India, ranking sixth in terms of land and ninth in terms of population. Over the past several years, Gujarat's energy sector has experienced substantial expansion. The main sources of electricity production are coal-fired power plants, gas, hydro, nuclear, and renewable energy sources. It is one of the first states in India to increase its capacity for solar production. According to table 2, 59% of Gujarat's total power generation capacity—40939 MW—comes from coal-based power plants, while about 38%—especially solar PV power plants—comes from renewable sources [18]. Table 2 displays the state of Gujarat's real generation capacity from various sources. It reveals that Gujarat produces 10% of the nation's entire demand, with approximately 40% of that energy going towards renewable sources.

Progress in install capacity of Gujarat

The State's installed capacity for electricity generation expanded from 315 MW in 1960–1961 to 40939 MW in 2021–2022. In the State of Gujarat, 1852 kWH of power were consumed per person in 2021. Figure 4 depicts advancement in Gujarat state. The overall installed capacity for electricity generation in January 2018 was 33.35 GW; of this, around 46% of the power came from coal-fired thermal power plants, while the remaining 24% came from renewable energy sources. As stated in Table 3, 37% of the power generated as of January 2022 came from renewable sources as a result of government actions in favour of such sources and particularly successful subsidies for solar roof top and ground

95757

mount solar PV plants, Gujarat's total generation capacity is 41.59 GW, with 15.51 GW or so coming from renewable energy sources [18]. The progress made by Gujarat state's power generation capacity is shown in the table. The sector of renewable energy generation is the state government's primary focus.

Growth of electricity demand in India and future forecasting

India's population is still growing, and the rising standards of living in many developing nations will increase the demand for energy resources. In all, developing nations, led by China and India, are responsible for more than 70% of the rise in energy demand. Products that require energy are more readily available as a result of new technology. People want more consumer goods as wealth is created and lifestyles change. Both the production and use of consumer goods require energy. With 17.7% of the world's population, India is the most populous country in the world and the second most populous in the world overall. Figure 5 shows that 35.0% of India's population resides in cities, and the country's population is expanding at a rate of roughly 1.02% [19]. Despite having 395 GW of installed capacity, India's electricity demand in 2020–2021 was 1275.534 TWH, as shown in Figure 6. Through 2030, an intermediate total power demand figure of 2338 TWH 6.2 percent CAGR(Compound annual growth rate) may be reached, ranging from 2074 TWH (for low GDP, high efficiency) to 2785 TWH (for high GDP, low efficiency). Figure 7 illustrates the sector-by-sector use of electric energy in India in 2021. The sector that consumed the most energy in India in 2021, at 41%, was the industrial sector. With 26%, the residential sector came in second. One percent of India's total electricity consumption was used for traction and railroads [20].

Electricity supply position of INDIA

Any nation's infrastructure has an impact on its potential for growth, with power infrastructure ranking as the most crucial factor in economic expansion. India's continuous urbanization and development will result in high electricity demand. Power availability was 11,37,149 MU in 2021–2022 while demand was 11,41,941 MU, resulting in a power shortfall of -4,792 MU. Figure 8 illustrates how the gap is closing day by day and how consumers are receiving dependable electricity supply. Table 4 displays the demand and supply for electricity year over year, as well as the reduction of the capacity increase gap from the financial year 2015–16 to the current one [21].

India GDP growth and Electricity Demand

Figure 9 illustrates the connection between economic growth and energy consumption in India and other countries. It shows that industrialized nations use a lot of electricity (measured in kWH) and have high GDPs per capita. India is a developing country that will eventually have to meet massive electrical demands as it continues to industrialize and urbanize. At the moment, the nation's per capita electricity consumption is 1200 kWH, while developed countries such as Singapore and Japan use over 5000 kWH [22]. By 2024–2025, India hopes to reach $5 trillion in GDP and become a major player in the world economy. Figure 10 illustrates how India's per capita power consumption rose from 800 kWH in 2012 to roughly 1200 kWH today. At that point, India's economy would rank third globally. India is a developing country with 395 GW of installed capacity for electricity generation and a demand of 1275 TWH for 2020–2021. With a median value of 2338 TWH (at 6.2 percent CAGR), the total amount of electricity consumed by 2030 may rise to a range of 2075 TWH (at high GDP and low efficiency) to 2785 TWH (at high GDP and low efficiency) [23].

Breaking Myths and barriers while promoting knowledge

Below mentioned steps can be taken for breaking Myths and barriers while promoting knowledge.

- Increase awareness of the practical advantages provided by adopting additional green technology to stimulate trade.
- Innovation and quality must be linked to energy efficiency
- Encourage all households to adopt environmentally friendly practises through standardisation and commonplace actions. It's crucial to get through the obstacles of ignorance and resistance to change.
- A collaborative and coordinated effort among all participants, encouraging energy-wise habits.
- Assisting residents in comprehending their home's energy use patterns

- Encourage the installation of smart metres, which would also encourage measures and regulations that would improve energy efficiency.
- Innovative financial models should be supported for increased market penetration and awareness.
- Citizens should be given micro-details on enhancing energy efficiency to provide them a global perspective and the nation's part in improving energy economics (Gross Domestic Product) and reducing emissions.
- Residents who behave sustainably to encourage energy efficiency improvements that inspire other citizens should be emulated.
- Respect the opinions of people who can have a big impact on the energy economy.
- Promote energy-saving initiatives by showing out actual tools, if you can.
- Set up banner and slogan contests at the school level to advance energy efficiency.

For Conservation of Energy following points can be considered for implementation.

1. Lights, fans, and other equipment should be turned off in rooms, workplaces, and other places of this nature while no one is present.
2. Lighting systems that use less energy should be replaced with more energy-efficient systems, such as led lights.
3. Use the task lighting principle as needed
4. Switch to flat-screen LCD monitors from CRT displays.
5. Encourage the adoption of solar-powered water pumps and lighting systems.
6. Invest in equipment with the Energy Star label and requirements.
7. To save energy, use the right use of motion sensors.
8. Make use of and encourage the use of energy-efficient motors, transformers, water pumps, and irrigation systems.
9. Educate yourself about the technological progress in this field and the principles of cost economics, as well as others.
10. Make use of and promote solar water heaters, solar PV generation, and solar cookers.

Instrument used to create public awareness on energy conservation and efficiency is as follows.

1. Outreach programs
2. Online resources creation
3. Social media(Blogs, web pages)
4. Public hoardings
5. Print media
6. TV/Radio advertisements

Energy Saving at schools and colleges in brief is beautifully illustrated in below mentioned picture. Using smart automation techniques to make life more comfortable and use less energy With the help of your smartphone, smart home automation systems enable you to easily control the lighting, media, video surveillance, weather, security, and much more. No matter where you are in the globe, it provides access and confidence so you may devote yourself totally to your priorities. Your home automation system's added benefit will surely be a decrease in the amount of energy used throughout the house. Changing your home's systems lowers your energy costs and consumption. They also give you the opportunity to lessen your carbon footprint, which is a terrific approach to take charge of climate change. Huge monthly savings can be made by carefully planning your lighting, temperature, shades, and ceiling fans, as well as by using the "all-closed" electronics command.

Government policies to Enhance Energy Conservation
Given that peak demand is expected to rise by almost 7% annually and that India's electricity demand is expected to increase by about 4% annually over the next ten years, it is clear that energy efficiency and demand shift will be essential in creating a cost-effective energy system for India. It will be necessary for states and municipalities to

develop their own Energy Efficiency Action Plans with particular goals, like energy-efficient cooling. As well as new building materials like steel, cement and bricks, new energy-efficient building standards are also being created. The steel industry may need to utilise hydrogen to produce green steel for export when Europe launches its massive green procurement projects. I am persuaded that in order to create solutions tailored to India's needs that are both affordable and implementable by millions of people, current international experience needs to be combined with Indian inventiveness and innovation. To influence effective and significant policies and create a healthy ecosystem for successful implementation, AEEE(Alliance for an Energy Efficient Economy) serves as a platform for bringing together key energy players, including industry, government, civil society, and professionals, in a constructive dialogue. This will transform the market for energy efficiency solutions and includes innovative business models and easy access to capital.

National Climate Change Action Plan

India's GDP will have an emission intensity that is 33–35% lower than it was in 2005. These national initiatives may be accelerated with assistance from wealthier nations, enabling India to achieve its goals more quickly. By emphasising the connection between poverty and growth, the Action Plan adopts an innovative approach to reducing stress caused by climate change.

The National Mission for Enhanced Energy Efficiency (NMEEE)

The NMEEE seeks to develop market-based mechanisms that will boost the cost-effectiveness of energy efficiency improvements. The way forward for achieving this goal is to transition to cleaner fuels, create technological advancements that are commercially viable, improve capacity construction, and so forth. The mission's efforts are coordinated by the Bureau of Energy Efficiency (BEE). The Ministry of Power has given Rs. 100 crores in grant-in-aid for the fiscal years 2019–20 and 2020–21. Additionally, the BEE receives money through bilateral cooperation activities as well as from labelling programmes through labelling fees. The mission's scope, impact, and funding are broken down below.

The National Mission on Sustainable Habitat (NMSH)

The strategy to make cities more sustainable includes adapting public transportation systems, creating energy-efficient buildings, and enhancing solid waste management. This Mission is focused on recycling and urban waste management; the expansion of the energy-conservation building code, which addresses the design of new and large commercial buildings to minimize their energy demand; and improved urban planning and a modal shift to public transportation, which develops long-term transport plans to support the growth of medium- and small-sized cities to ensure efficient and practical public transportation. The Ministry of Housing and Urban Affairs is principally responsible for the National Mission on Sustainable Habitat (MoHUA). Through the implementation of sector-specific interventions, the core objectives of NMSH have been met by the current Union Government's flagship AMRUT (formerly the Jawaharlal Nehru National Urban Renewal Mission), Swachh Bharat Mission (Urban), Smart Cities Mission, and Urban Transport Programme. For the past 20 years, India has prioritized energy efficiency and launched a number of initiatives in this field. Efficiency will continue to be a top priority in light of the favorable outcomes. The ultimate objective is to promote energy efficiency through a combination of market enablers and policy.

Indian Ministries' Energy Efficiency and Climate Change Initiatives

In order to launch energy efficiency and conservation initiatives, India passed the Energy Conservation Act of 2001. The Act's multiple components are regulated by the Bureau of Energy Efficiency, which was founded. The nodal ministry in charge of the nation's energy efficiency is the Ministry of Power. In addition, other ministries, such as those in the fields of industries, aviation, agriculture, research, and technology, have identified projects that will increase energy efficiency using funds from their budgets.

Mokariya *et al.,*

Central and State Level Agencies – Overview

State and federal governments have crucial responsibilities in regulating and running the electricity industry. Fig. 12 depicts the importance of various parties in the formulation of laws and regulations. The Ministry of Power and the Ministry of New & Renewable Energy (MNRE) are responsible for developing, implementing, and regulating policies at the national level, while state-level policies are governed by the state's power or energy departments.

Energy Efficiency in Buildings

The use of ECBC (Energy Conservation building code) 2017 in the construction of new commercial buildings is expected to reduce India's energy consumption by half by 2030. This results in a reduction of 250 million tons of CO2 emissions and savings of 35,000 crore INR. Two changes to the code were made in April 2018 and November 2019 in response to market feedback and technical committee approval. In order to increase domestic energy efficiency, the "Energy Efficiency Label for Residential Buildings" was created in February 2019. The labelling programme has the potential to save 388 billion units (BU) of energy by 2030. This code applies to all residential buildings on lots larger than 200 square meters (Sq.m.).For the purpose of energy consumption monitoring.

Energy Efficiency in the Transport Sector

By 2029–2015, India's diesel demand is predicted to quadruple to 163 Mt. Among other things, this will raise pollution and make it more expensive for the government to import petroleum. By increasing vehicle economy, it is essential to take steps to reduce the consumption of petroleum products. BEE has already announced corporate average fuel efficiency norms for light-duty and passenger vehicles. On July 16, 2019, S.O. finalised and unveiled the first phase of Fuel Economy Standards for Light and Medium Commercial Vehicles with Gross Vehicle Weights of 3.5 to 12 Tonnes. Implementation of these guidelines is expected to save 0.06 MMT of fuel each year and 0.25 MMT of fuel over three years. 17 Tyres have been highlighted as a significant component of a vehicle with the ability to save gasoline.

Standards and Labelling Scheme

The purpose of the Standards and Labelling (S&L) program is to enable consumers to make informed decisions about energy conservation. S&L, also referred to as the Star Rating system, is being used in the appliance sector. Appliances must meet minimum energy efficiency standards set by this initiative, with a score of 5 representing the most energy-efficient. The updated energy consumption standards for self-ballasted LED bulbs and air conditioners were released in October 2019.

Municipal Demand Side Management Scheme

The Standards and Labelling (S&L) programme was started with the intention of enabling customers to make educated decisions on energy conservation. Implementation of S&L, commonly known as the Star Rating scheme, is taking place in the appliance industry. According to this effort, appliances must meet minimum energy performance standards that are ranked from 1 to 5, with 5 being the highest energy-efficient level. In October 2019, the updated energy consumption guidelines for air conditioners and self-ballasted LED bulbs were announced. In order to tap into India's enormous potential for energy and water cost savings, the Municipal Energy Efficiency Programme (MEEP) is being put into place in collaboration with the Atal Mission for Rejuvenation and Urban Transformation (AMRUT). By March 2020, agreements had been reached with 390 ULB in 22 states and 3 union territories. Across the various ULBs, investment grade energy audits (IGEA) are being done.

Innovation in energy conservation and management
Digitalization

The power sector change is significantly accelerated by digitalization, which makes it possible to manage vast volumes of data and optimize ever-more complicated systems. Digitalization in the power industry generally involves turning data into value. Decentralization and electrification, two major innovation trends, have advanced, which has increased the significance of digitalization in the power sector. Increased small-scale renewable energy installations, particularly rooftop solar photovoltaic (PV) coupled to the distribution grid, is driving decentralization.

Large numbers of new loads, including electric automobiles, heat pumps, and electric boilers, are required for the electrification of transportation as well as the heating and cooling of buildings. thorough examination of three different digital technology categories: blockchain, artificial intelligence (AI), and the internet of things (IoT).

Energy as a Service

Some futuristic depictions of the energy system center on DERs, which are monitored by a mix of AI and IoT. These elements are part of energy-as-a-service solutions, along with blockchain and the increasing number of energy prosumers. EaaS (energy as a service solution) enables the shift from selling electricity to selling services like production optimization, control, and consumption tracking. Local energy production and storage increases overall energy efficiency and enables greater grid access.

Energy trading platform

Energy trading is made possible by the EaaS platforms created by the Indian business KPay. Pay-as-you-go solar, home appliances, pumps, and agricultural equipment are all available on their platform. By weighing the unique advantages of each model, customers can choose from three different payment options: pay-per-use, pay-per-time, and pay-per-amp.

AI Powered building Energy Services

The US-based company Iota offers EaaS that combines a variety of energy-saving techniques with its Bright AI smart building software. Demand response, lighting, HVAC, and renewable energy use are all included in the solution's energy management optimization. By ensuring savings, this EaaS technique lowers risk and speeds up the implementation of an optimization strategy. Because the technology is independent of the analytics and communications platform, capital expenditures are also decreased.

Distributed Energy Resources.

Distributed energy resources allow for the production of power or heat wherever it is needed. Energy transmission losses and expenses are eliminated in the absence of a network. This suggests that a large number of consumers generate energy for their personal use before transferring any excess to the shared network. This idea states that small and medium-sized power plants function as distributed energy generators. Additionally, it lowers the cost of producing energy and makes the most of the capacity that already exists.

Vehicle to Grid

Depending on demand, electric vehicles (EVs) in a "vehicle-to-grid" system either lower their rate of charging or return electricity to the grid. It is possible to use EV batteries as an energy storage asset if they eventually return energy to the grid via charging stations. EV charging is less expensive when demand is low, allowing the network to withstand heavy loads. V2G solutions serve as adaptable and convenient buffers, which may shorten the length of a power outage.

Virtual Energy Networks

In order to accomplish simultaneous energy balance, the Slovak startup Fuergy builds virtual energy networks of actual energy grids using AI-powered energy sharing systems. The company produces superchargers that are compatible with the existing grid. They provide electric vehicle charging and V2G capabilities to reduce energy costs and prolong battery life. By leveraging the battery capacity of grid-connected electric vehicles, their approach lowers energy fluctuations and costs for building and vehicle owners.

Power to X

Globally, it is becoming more and more crucial to reduce greenhouse gas emissions through the use of renewable energy sources and energy efficiency upgrades. In the industry, power-to-X technologies for electricity conversion, energy storage, and reconversion pathways are becoming more popular. Startups and new PtX technologies transform energy and carbon dioxide (CO_2) into new resources and products with a variety of additional uses.

CONCLUSION

By educating the public and dispelling common fallacies about energy saving, we can promote energy conservation. Energy economics must effectively express the technological advancements in energy automation and its use. Government policies should apply to residents of both urban and rural areas. The use of renewable energy and government initiatives related to it should be pushed in society, and programs related to energy innovation and research with awareness programs should be promoted in schools and colleges. With these actions, the nation will increase its energy security while also boosting GDP, cutting emissions, and improving citizen living conditions.

ABSTRACT

Social networking sites as one of the famous platforms for every person all over the world to connect, communicate, participate and share their thoughts, photos, videos, audios, feelings, and information through instant messaging. Personality traits imply people's characteristics and patterns of ideas, behaviours, thoughts, and feelings. Social networking sites are a popular mode of communication at Pondicherry University. This present study finds the relationship between social networking sites and personality traits in post-graduation students. To observe the use of social networking sites in the study of the behaviour of students to predict their personality characteristics, i.e., introvert and extrovert traits. The basic theme of this study is to determine an individual's personality characteristics. The sample consisted of 250 students who use different types of social networking sites. The finding of this paper is to find out the number of introvert and extrovert students, motives of the usage of social networking sites, students awareness, SNWS in the teaching-learning process, effect of usage of social networking sites in postgraduate students.

Keywords: Social Networking Sites, Personality Traits, Introverts, Extroverts.

95768

INTRODUCTION

Nowadays, social networking sites are one of the well-known and most prominent communication tools for people's (Zaidieh, 2012). Social networking sites as one of the famous platforms for every person all over the world to connect, communicate, participate and share their thoughts, photos, videos, audios, feelings, and information's through instant messaging. Social networking sites like Facebook, WhatsApp, YouTube, Myspace, Instagram, LinkedIn etc., are online platforms that allow to connect and interact with others (boyd & Ellison, 2007; Correa et al., 2010; Pornsakulvanich, 2017). The various social networking sites are described as social, for the reason they allow communication and bound relationships with friends and colleagues and become stronger between members of different sites like Facebook WhatsApp in the internet space (Zaidieh, 2012). "Personality is the dynamic organization within the individual of those psychological systems that determine his unique adjustment to his environment" (Allport, 1948). Every person's personality development is a continuous process in multiple ways until death. A person's personality is pushed by examining inherited and combined personality traits during their entire life (Malik et al., 2021).Therefore, the finding of personality traits states that the majority of the male extrovert students maximum as compared to female extrovert students. On the other hand, the majority of the male introvert student's maximum as compared to female introvert students. The significant finding of this study is to find out the number of introvert and extrovert students, social networking sites in the teaching-learning process, awareness of undergraduate students, the motive of the students, and effect of usage of SNWS in postgraduate students.

Social Networking Sites (SNWS)
Social networking sites are one of the famous web-based platforms that permit individuals to create their personal profile within a framework, send a request for accepting communication and connections with each other and view their information quickly (boyd & Ellison, 2007; Karakoyun, 2019). Social networking is divided into two elements, i.e. social and networking. The social site is concerned about the power of the collective, the dynamic networks and the knowledge and absurdity of the crowd. In contrast, the networking site involves connecting and communicating with others. Therefore, social networking means a tool, utility, or device for connecting with people (Kocak *et al.,* 2020; Cohen, 2009). Social networking sites are generally bi-directional communication platforms, but some do not. The one-directional communication is sometimes labelled as followers or fans, but most sites call these followers as well. The bi-directional ties are very famous because communication is done in both ways (Bicen & Cavus, 2010; boyd & Ellison, 2007). Social networking sites are among the famous tool provided by the internet. As per the Digital 2024 October Global Statshot Report, it was revealed that around 5.52 billion people were user's internet, and about 5.22 billion people were users of social networking sites throughout the world.

Personality Traits
Carl Jung established a theory of personality that every person is born with an inborn set of traits that influence how they interact or participate in the world. In this theory of personality he describe introversion and extroversion. Social network sites reflects the concept of Personality Traits like introvert and extrovert trait (Chen & Roberts, 2019). Introvert personality is generally known as a shy people who prefer their feeling, thought, dream, knowledge and talents. While extrovert personality is in contrast to introvert and more outward activities oriented. Furthermore, extrovert students are more expressive than introvert students (De Goma & Moneva, 2020). Personality traits imply people's characteristics pattern of ideas, behaviors, thoughts, and feelings. Personality Traits are based on the contains of Five Factor Model that divide personality into five dimensions i.e. Extraversion, Neuroticism, Agreeableness, Openness to experiences and Conscientiousness. (Correa *et al.,* 2010; Dodoo & Wen, 2021; Ehrenberg *et al.,* 2008; Gosling *et al.,* 2003; Pornsakulvanich, 2017). Every aspect is bipolar such as introversion vs. extroversion and summaries more specific views e.g., sociability, which includes more specific attributes like talkativeness and outgoingness(Correa et al., 2010; Gosling et al., 2003). Personality traits are shared by totality of all human structure such as Id, ego, superego, conscious and unconscious (Atabek, 2019).

Saiful Alam and Kausar Reza

Social Networking Sites users Personality Traits

SNWS have extended the lives of university students throughout the world. University learners utilize social networking areas to convey their documents, thoughts, and feelings, receive news, images, and videos and keep in touch with friends and family making them the best communication medium for today's digitally aware university students (Koranteng *et al.*, 2019; Tafesse, 2020).Personality is an ultimate visionary of many behavioral results, whereas traits refer to keeping in the way individuals act, think, and feel (Dodoo & Wen, 2021; Kocak *et al.*, 2020). Personality concern a certain combination of attitudinal, emotional and behavioral response and many experimenters have tried to discover a group of traits that define an individual's personality. Personality traits have an essential mark on the way people commit in social networking sites (Maria Balmaceda *et al.*, 2014).

Need and Significant of the Study

Social networking sites maximum opportunities for communication, interaction, socializing, sharing knowledge and the teaching-learning process. Subsequently, most of the users started using social networking sites to update their ideas, knowledge, sharing images, audio, video and messages. They allow users to create their profiles, connect, interact, and collaborate (Alwagait et al., 2015; Kocak *et al.*, 2020; Malik *et al.,* 2021).The basic theme of this study is to determine an individual's personality characteristics. Personality is the sum of qualities or characteristics taken from individuals' distinctive features (Malik et al., 2021). A bulk of study based on the role of personality traits as a visionary of uses social networking sites on the Big Five-Personality theory, which indicates that individual personality differences can be categorized into five aspects, i.e. neuroticism, agreeableness, extraversion, openness to experience and conscientiousness (Chen & Roberts, 2019; Correa *et al.,* 2010; Dodoo & Wen, 2021; Malik *et al.*, 2021; Maria Balmaceda *et al.*, 2014; Pornsakulvanich, 2017; Yang, 2019). This present study finds the relationship between social networking sites and personality traits in post-graduation students. To observe the use of social networking sites on the study of the behavior of post-graduation students to predict their personality characteristics such as introvert and extrovert traits (Malik *et al.*, 2021).

OBJECTIVES OF THE STUDY

1. To identify the number of introverts and extroverts in the sample of the study.
2. To study the motives of the usage of social networking sites among the postgraduate students.
3. To study the awareness of postgraduate students pertaining to the usage of social networking sites.
4. To find out the usage of social networking sites in teaching and learning process among the post graduate students.
5. To study the effect of usage of social networking sites among the postgraduate students.

METHODOLOGY

Survey Research Design under Descriptive Research Method has been used.

Population

In the present study, the target population consists of students studying in various departments / schools of Pondicherry University, Pondicherry.

Sampling Technique

Disproportionate Stratified Sampling technique was adopted to select the sample out of the population. Percentage analysis was used for data collection**.**

Saiful Alam and Kausar Reza

Sample of the Study
The sample of this study consisted of 250 postgraduate students studying in various schools or faculties, of Pondicherry University. Out of 250 students, male students were 151 and female students were 99.

Research Instruments used for Data Collection
A self-created questionnaire was used for the current investigation and collection of data. The questionnaire was scrutinized and validated by the friends, experts and supervisor. The tool was so developed to translate the objectives of the study in to specific statements, the responses to which will provide the necessary data and explore the area defined by the objectives of the present study.

Analysis of Data
The information gathered by questionnaire was examined by academic specialist, especially the School of Education, Pondicherry University. With the aid of excel was used to tabulate and methodically analysis the data, performing various operations such as translating the data into percentages and interpreted accordance with the study objectives.

ANALYSIS OF DATA AND INTERPRETATION OF RESULTS
Objective :To identify the number of Introverts and Extroverts in the sample of the study
The following table 2 and figure 1 show the number and percentage of introvert and extrovert in the sample distribution of Postgraduate Students pertaining to Gender. In above table 41.60% male and 30% female students were found to be extrovert. Additionally, the chart also reveals that 9.60% of female students and 18.80% of male students were introverted.

Objective: To study the motives of the Usage of Social Networking Sites among the Postgraduate Students.
The following tables show the number and percentage of extrovert and introvert students motivated the usage of social networking sites by postgraduate students. From the above table, SNWS was seen as a socializing tool by 18.43% of extrovert male students, compared to 22.9% of extrovert female students. Additionally, this study showed that 31.84% of extrovert female students agreed with male students that SNWS is a medium of enjoyment, compared to 39.66% of extrovert male students. This objective showed that, extrovert male students are 30.16% more supportive of learning than extrovert female students, who are 28.49% more supportive. Additionally, 14.52% of male extrovert students and 16.20 percent of female extrovert students expressed satisfaction with SNWS as a research medium. Therefore, the study's conclusions showed that the majority of students utilized SNWS entertainment.

According to the table 4,, SNWS was seen as a socializing tool by 26.76% of introverted male students and 11.26% of introverted female students. The research also showed that 25.35% of introverted female students agreed with male students that SNWS is a good source of entertainment, compared to 47.88% of introverted male students. Additionally, this goal showed that introverted male students are 47.88% more supportive of learning than introverted female students (25.35%). SNWS was favored as a research medium by 19.71% of male introvert students and 11.26% of female introvert students. Thus, the findings of the study revealed that majority of the students used for entertainment.

Objective: To study the awareness of Postgraduate Students pertaining to Usages of Social Networking Sites.
Extroverts Male and Female
The table number 5 found that 27.93% extrovert male students visit social networking sites with some specific purpose in mind, in contrast to 30.17% extrovert female students. Additionally, 24.58% extrovert male respondents have no specific purpose to use multiple SNWS and 17.32% extrovert female respondents have no purpose to visit social networking sites in their mind. Therefore, the result of the study shows that the majority of the extrovert students have specific purpose to use multiple social networking sites.

95771

Introverts Male and Female
From the above table 5, 29.57%of introvert male students visits social networking sites with some specific purpose in mind, in comparison to 23.94% introvert female students. Additionally, 36.61% of introvert male respondents has no specific purpose to use multiple social networking sites and 9.85% of introvert female respondents also have no specific purpose to use multiple SNWS. Therefore the introvert students have certain specific purpose to use multiple social networking sites.

Extroverts Male and Female
From the table number 6, it was found that 31.84% of extrovert male sample have more Friends on SNWS than in real life in contrast to 17.87% extrovert female sample. Additionally, 26.25% of extrovert male respondents did not have more friends on SNWS than in real life, and 24.02% of extrovert female respondents did not male more friends on SNWS than in real life. Thus, the majority of the extrovert students make more friends on SNWS than in real life.

Introverts Male and Female
from the table 7, 23.94% male introvert students have more friends on SNWS than in real life in comparison to 12.67% introvert female students. Additionally, found that 42.25% of introvert male and 21.12% introvert female respondents did not have enough friends in SNWS but enough friends in real life situation.

Objective: To find out the Usage of Social Networking Sites in Teaching and Learning Process among the Postgraduate Students.
Extroverts Male and Female
By analyzing the data, it was revealed that 15.08% male extrovert students chose 'always' option of using SNWS in teaching-learning process as contract to 10.05% extrovert female students. Additionally, 5.58% extrovert male respondents and 1.11% female students supported 'never' option of SNWS in teaching-learning process. Additionally, 37.43% extrovert male respondents and 30.72% female respondents 'sometimes' as their choice of SNWS in teaching-learning process. So, result of the study is that the extrovert students use SNWS sometimes for teaching- learning process.

Introverts Male and Female
From the table number 7, 28.16% male introvert sample pick 'always' option for use of SNWS in teaching-learning process in contrast to 14.08% introvert female sample. Additionally, 5.63% of introvert male respondents' opinion to 'never 'use of SNWS in teaching-learning process and 0.0% of introvert female respondents. It was also found that 32.39% of introvert male respondents' to like 'sometimes' usage of SNWS in teaching-learning process and 19.71% of introvert female respondents also use of SNWS in teaching-learning process. Thus, result of the study showed that introvert students used of SNWS in teaching-learning process only 'sometimes'.

Extroverts Male and Female
By analyzing the from the table 8 data, 15.08% male extrovert students mentioned 'negative effect' of SNWS use on grades and performance in studies in contrast to 10.05% extrovert female students. It was found that 12.29% of extrovert male respondents' felt that there is 'no effect' of SNWS use on grades and performance in studies in comparison to 14.52% of extrovert female respondents. Additionally, 30.72% of extrovert male respondents' found 'positive effect 'of SNWS use on grades and performance in studies and 17.31% of extrovert female respondents found 'positive effect' of SNWS use on grades and performance in studies. Thus, the findings of the study revealed that majority of the extrovert students felt that there is 'positive effect' of SNWS use on grades and performance in studies.

Introverts Male and Female
From the table number 8, it was found that 8.45% of introvert male students mentioned 'negative effect' of SNWS use on grades and performance in studies in comparison to 4.22% introvert female sample. It was found that 18.30% of extrovert male respondents' felt that there is 'no effect' of SNWS use on grades and performance in studies in

comparison to 12.67% of extrovert female respondents. Additionally, 39.43% of extrovert male respondents' found 'positive effect 'of SNWS use on grades and performance in studies and 16.90% of extrovert female respondents found 'positive effect' of SNWS use on grades and performance in studies. Thus, the findings of the study revealed that majority of the extrovert students felt that there is 'positive effect' of SNWS use on grades and performance in studies.

Extroverts Male and Female
The table number 9 indicated that 40.78% of Male & 29.05% of Female extrovert students chose WhatsApp as the most appropriate SNWS for teaching-learning process. The findings revealed that 22.90% Male & 21.78% Female extrovert students identified YouTube as an important SNWS for teaching-learning process. It was also found that 18.43% Male & 7.26% Female extrovert students favored to use Facebook as the most appropriate SNWS for teaching-learning process. The data also shows that 11.73% Male & 7.26% Female extrovert students find Instagram as the most appropriate SNWS for teaching-learning process. The data analysis also brought to light that only 7.82% Male & 2.23% Female extrovert students find Twitter as appropriate for teaching-learning process. The findings of the study exposed that majority of the extrovert students preferred WhatsApp as the most appropriate SNWS for teaching-learning process.

Introverts Male and Female
The table number 10 indicated indicated that 49.29% of Male & 28.16% of Female introvert students chose WhatsApp as the most appropriate SNWS for teaching-learning process. The findings revealed that 22.53% Male & 19.71% Female introvert students identified YouTube as an important most appropriate SNWS for teaching-learning process. It was also found that 25.35% Male & 8.45% Female introvert students favored to use Facebook as the most appropriate SNWS for teaching-learning process. The data show that 19.71% Male & 8.45% Female introvert students find Instagram as the most appropriate SNWS for teaching-learning process. The data analysis also brought to light that only 8.45% Male & 4.22% Female introvert students find Twitter as appropriate for teaching-learning process. The findings of the study exposed that majority of the introvert students preferred WhatsApp as the most appropriate SNWS for teaching-learning process.

Objective: To study the effect of Usage of Social Networking Sites among the Postgraduate Students.
Extroverts Male and Female
The table number 11 found that found that 29.61% extrovert male students were ignoring homework/ daily activities due to usage of SNWS, in comparison to 18.99% extrovert female sample. It was also found that 28.49% extrovert male respondents were not ignoring homework/ daily activities because of SNWS while 22.90% extrovert female respondents were not ignoring homework/ daily activities because of SNWS. So, from the finding we can conclude that the majority of the student's especially male extroverts were ignoring homework/ daily activities because of using SNWS. While female extroverts were not ignoring homework / daily activities due to SNWS.

Introverts Male and Female
From the table number 11, it was found that 42.25% of introvert male sample are ignoring homework/ daily activities due to usage of SNWS, in comparison to 18.30% introvert female sample. It was also found that 23.94% of introvert male respondents did not ignore homework/ daily activities due to usage of SNWS and 15.49% of introvert female respondents also ignore homework/ daily activities due to use of SNWS. Thus, the finding shows that most of the introvert students are ignoring homework/ daily activities due to usage of SNWS.

Extroverts Male and Female
By analyzing the data, from the table number 12, 29.05% of extrovert male students are staying up late at night due to usage of SNWS in comparison to 16.76% extrovert female sample. It was also found that 29.05% of extrovert male respondents did not Staying up late at night due to usage of SNWS and 25.14% of extrovert female respondents also staying up late at night due to usage of SNWS. Thus, the findings of the study revealed that female extrovert students did not stay late night while male extrovert students show no pattern.

Introverts Male and Female

From the table number 12, it was found that 38.02% of introvert male sample are staying up late at night due to usage of SNWS, in comparison to 14.08% of introvert female sample. It was also found that 28.16% of introvert male respondents did not Staying up late at night due to usage of SNWS, and 19.71% of introvert female respondents also staying up late at night due to usage of SNWS. Thus, the findings of the study explored that majority of the introvert students are staying up late at night due to usage of SNWS.

CONCLUSION

With technological advancements worldwide, Higher Education Institutions benefit from digitalization, i.e. 'social networking sites'. The SNWS are the well-liked platforms and significantly used by one's higher education students. The students primarily use SNWS in their mobiles, which helps them to search for information, exchange notes or ideas, communicate with teachers, students and colleagues and share knowledge (Vrontis *et al.,* 2015). According to the findings of this study, social networking sites are beneficial to the majority of postgraduate students. The popularity of social networking sites like WhatsApp, Facebook, YouTube, Twitter, and LinkedIn was high. Among various types of SNWS, WhatsApp, Facebook and YouTube were usually the most used. In terms of search engine usage, it was discovered that majority of students use Google as their preferred search engine. Maximum postgraduate students use the WhatsApp site for the teaching-learning process. The survey discovered that SNWS had attracted many postgraduate students towards it. Students primarily used SNWS to communicate with classmates and maintain contact with friends. This investigation has revealed that although multiple students find their SNWS memberships necessary in their daily life, they are also familiar with its negative implication on their educational achievement.

ABSTRACT

Dysmenorrhea is the most common Gynecological disease in adolescent women with a prevalence of 60% to 93%. Primary dysmenorrhea refers to pain that is not associated with any identifiable pelvic pathology. It is characterized by pain in the lower abdomen that radiate to the thighs and lower back. Associated problems include nausea, vomiting, mood swings, headache, fatigue, constipation etc. Dysmenorrhea can be corelated with *Udavartini Yonivyapad* in Ayurveda. *Apana Vata Dushti* is considered as main cause for *Udavartini Yonivyapad*. *Hingu is Vatashamaka*, *Shoola Prashamana*, *Agnivardana* and *Vatanulomana* properties, mentioned in *Charaka Sutrasthana Annapanavidhi*[4]. *Yoga* means the control of thought waves in the mind.[5] *Yoga* is part of an ideal lifestyle for maintaining good health, balancing body and mind through   yoga techniques such as asanas and it is also cost-effective treatment without side effects that can be practiced daily at their home. A Total of 60 subjects diagnosed with Primary Dysmenorrhea were selected from out- patient department (OPD) . Subjects who fulfill inclusion and diagnostic criteria were categorized into two groups each having 30 Subjects. Group A**:** Subjects were administered with *Shodhitha Hingu* capsules taken daily in empty stomach (morning) for 30 days. Group B: Subjects were administered with *Shodhitha Hingu* capsules along with *Yogasanas* daily morning for 30 days. The data were collected on 0th, 30th, 60th and 90th day of intervention. The obtained data were analyzed statistically. Overall, within the group in Group-A and Group-B there was significant difference between before and after treatment in all the variables with p<0.05. When two groups were compared all the variables shown statistically significant difference between two groups (p<0.05) and the mean difference of group B was more than group A. Therefore, Group B has more

95779

statistically significant result in the prevention of Dysmenorrhea. In the present study both the groups have shown statistically significant results. But Group B was statistically more significant when compared to Group A in the management of *Primary Dysmenorrhea*

INTRODUCTION

God created woman in such a way that she has the capacity twice that of a man in taking food, four times that of a man in taking decisions with her subtle intelligence, six times that of a man in exertional work and eight times that of a man in getting her desires full filled. This *Subhashita* conveys dynamic charisma of women in dealing her social life [1]. The adolescents are the promising stars of a nation; hence their physical and psychological health is important for a brilliant future. Menstruation is one of the important events in the life of adolescent girls. It is also important indicator of women's reproductive health also [2]. The menstrual cycle is a sequence of events that occurs once in a month in a sexually mature female. Painful menstruation is called as dysmenorrheal [3] which is most common in adolescent girls. More than 70% of teenagers are suffering from dysmenorrhoea [4]. Higher incidences of dysmenorrhea among adolescent girls are common due to stressful life style, depression, anxiety, intake of junk foods, lack of exercise, tight exam schedules, and influence of social media [5]. Dysmenorrhea classified as primary dysmenorrhea and secondary dysmenorrheal [6]. Primary dysmenorrhea is defined as pain which begins in association with menstrual bleeding [7]. Secondary dysmenorrhea means painful menstruation with pelvic pathology [8]. Associated symptoms of dysmenorrhea include nausea, vomiting. diarrhea, stress, anxiety and depression [9]. Prevalence is highly variable, underestimated and at the same time difficult to determine, because a few affected women seek medical treatment, despite the distress experienced, as many consider the pain to be a normal part of the menstrual cycle rather than a disorder (Wong, 2010) [10]. Many cases thus remain un documented (Gould, 1998; Jones, 2004; Chen et al., 2006; Daley,2008) [11]. Due to the different definitions of the condition, and the lack of standard methods for assessing severity of dysmenorrhea, prevalence estimates vary between 45 and 95% of menstruating women (Jamieson and Steege, 1996; Proctor and Farquhar, 2006; Unsal *et al.,* 2010) [12], with very severe primary dysmenorrhea estimated to affect 10–25% of women of reproductive age (Andersch and Milsom, 1982; Dawood, 1987; Sundell *et al.*,1990; Hofmeyr, 1996) [13]. As per WHO records prevalence was 38.1% in 2005 [14]. In India young adults 17-24 years with higher prevalence range of 84.2% in 2015 [15]. In Mangalore district of Karnataka state, 89.96% suffering from physical and 55.71% are from psychological premenstrual symptoms [16].

 Another report says in India 79.67% suffer from mild form of dysmenorrhea and 37% suffer regularly from severe dysmenorrhea or pain that prevent them from ensuing day-to-day activities [17]. Dysmenorrhea itself is not life threatening, but is found to have a profound impact on the daily activities and may result in missing work or school, inability to participate in sports or other activities [18]. Thereby, it may accentuate the emotional distress because of the pain. Pain is body's most important alarm system. It is characterized by fluctuating, spasmodic menstrual cramps sometimes referred to as "labor-like" pains [19] that begin only a few hours before or with the onset of menstrual flow, the symptoms of primary dysmenorrhea last only 2–3 days [20]. Dysmenorrhea is not merely a disorder noticeable during menstruation, particularly with regard to pain processing and the perception of pain [21]. It is feasible that recurrent menstrual pain not only associated with central sensitization, but also may predispose women with primary dysmenorrhea to other chronic painful conditions [22]. Limiting the noxious input into the CNS of dysmenorrhea women therefore seems imperative to prevent the possible development of central sensitization, as well as any potential progression of repetitive dysmenorrhea into other chronic pain conditions [23]. *Vata* is responsible for pain. Among the five types of *Vayu*, *Apana Vayu* is given prime importance in gynecological disorders [24]. *Udavartha*, is a gynecological condition caused by impairment of *Apana Vayu*, which has similarities with the symptoms of primary dysmenorrheal [25]. Both conditions have pain as their main symptom. The treatment choosen in the modern system of medicine, such as analgesics, antispasmodics, NSAIDs,[26] anti-prostaglandin drugs and sedatives, can cause complications such as nausea, breast tenderness and intermenstrual bleeding, dizziness,

drowsiness, hearing and vision disorders. The treatment chosen in classical texts include *snehana, swedana* and *basthi* are very difficult for monthly prevention of *udavartha*. Considering the above problems, a better alternative treatment is proposed. In Ayurvedic texts, *Acharyas* have mentioned *Shodhitha Hingu* [27], *Tila kwatha, Sapthasara kwatha* etc. for the treatment of *vathaja yoni rogas* like *udavartha*. *Shodhitha Hingu* is *Vatashamaka, Shoola Prashamana, Agnivardana* and *Vatanulomana* [28] *so* useful in reducing the physical discomfort during menstruation and the psychological discomfort of primary dysmenorrhea can be addressed with yoga. Yoga is a part of an ideal lifestyle and it harmonizes the body with the mind through the means of various yoga techniques like *Asanas. Yogaasanas* like *pavanamukthasana, Bhujangasana, Bhadrasana* effectively targets the affected area of the body by providing long- lasting and immediate relief from the menstrual pain [29]. Yoga being safe, cost effective coupled with high standards of preventive and curative efficacy, can be recommended to all teenagers [30] *Shodhitha Hingu* & *Pavanamukthasana, Bhujangasana, Bhadrasana* were selected on the basis of *vatashamaka, yonishoola prashamana* and *vataanulomana* properties. The high incidence of the ailment and elevated degree of distress it creates in adolescents and also the limited success of modern medicines, with added disadvantages of side effects has been potential contributory factor in taking up this study.

Objectives of the study
- To assess the effect of *Shodhita Hingu* in Dysmenorrhea.
- To assess the effect of selected *Yogasanas* along with *Shodhita Hingu* in Dysmenorrhea
- To compare the effect of *Shodhita Hingu and* selected *Yogasanas* along with *Shodhita Hingu* in the prevention of Dysmenorrhea.

MATERIALS AND METHODOLOGY

The study was registered in CTRI with No-CTRI/2023/08/057139
Source of data: Female patients who were diagnosed to be suffering from Primary Dysmenorrhea and came under the inclusion criteria were selected from the OPD and IPD, as well as from medical camps and other referrals.

Study design
Randomized open labelled interventional comparative clinical study.

Sample size
60 female subjects diagnosed with Primary Dysmenorrhea were allocated into 2 groups. Group A- 30 subjects and Group B -30 subjects.

Selection criteria
The subjects who fulfill the inclusion criteria and complying with informed consent were selected.

Diagnostic criteria
Subjects fulfilling any 2 of the following diagnostic criteria were selected for the study, irrespective of associated symptoms.
1. Painful menstruation which begins before one or two days of menstruation with onset of menstruation and lasting for 24 to 48 hours.
2. Painful menstruation with pain in the lower abdomen and supra-pubic region.
3. Painful menstruation which is radiating to the thigh and lower back. Associated symptoms such as headache, nausea, Vomiting, altered bowel habits, giddiness etc. *Prathyathma Lakshanas* of *Udavarthini Yonivyapad-Rajah Kricchrata* (Painful menstruation)

Inclusion criteria
Subjects fulfilling the diagnostic criteria.**,** Age between 18-28 years**,** Known case of Dysmenorrhea for 4 consecutive cycles **and** Subjects with regular menstrual cycles.

Exclusion criteria
Known case of Secondary Dysmenorrhea, Subjects on hormonal therapy **and** Subjects who are not willing to do *Yoga*

Assessment criteria
Subjects were assessed on 0th day, 30th day, 60th day and 90th day by using following scales: Assessment was done on subjective parameters before and after the treatment based on, Onset of pain, Site of pain, Severity of Pain, Duration of pain and Visual analogue Scale (VAS Scale). Along with associated complaints like Nausea, Headache, Vomiting, Diarrhoea, Constipation

Method of collection of data
A special perform a was prepared with all points of history taking, signs and symptoms. The data were collected on 0th day, 30th day, 60th day and 90th day of intervention. The Collected data were analyzed using SPSS Software Version 21.0

Intervention
Group A - After taking informed consent, *Shodhitha Hingu* was told to take everyday morning in empty stomach or with first bolus of food. Dose:250mg
Group B - Along with *Shodhitha Hingu* subjects were advised to practice *yogasanas* for 30 days. *Pawanamuktasana, Bhadrasana, Bhujangasana* were thought to the subjects to practice throughout the 30 days of intervention period.

HINGU SHODHANA
The *hingu* has been fried in ghee(q.s) until it gets solid and dry [145]
***Yogasanas* practiced in this study -** *PAVANA MUKTHASANA*-The name comes from the Sanskrit words Pavana means wind, Muktha means relieve and Asana means posture. It massages the abdomen and digestive organs and is thus very effective in Apana *Vayu Vaigunya* and constipation by massaging the pelvic muscles and reproductive organs.

BADRASANA
Bhadra means gracious and blessed according to *Hatayoga Pradeepika* and *Gheranda Samhita* this asana will destroy all diseases, relieves fatigue and tones Reproductive organs.

BHUJANGASANA
This asana is also called as the Serpent-posture. This always increases the bodily heat, destroys all   diseases, and by the practice of this posture the serpent-Goddess (the *Kundalini* force) awakes. When the subject got menstruation the medication and *yogasana* practice was stopped.

RESULTS

The collected data was entered into Microsoft Excel sheet and then it was entered in SPSS Version 21.0.0 for statistical analysis. For the assessment of results, parameters such as VAS Score, duration of pain, nausea, vomiting, headache, diarrhea, constipation, onset of pain, and severity of pain were considered. Evaluations were conducted across four intervals: from Day 0 to Day 30 (intervention period), Day 30 to Day 60, Day 60 to Day 90, and a cumulative assessment from Day 0 to Day 90. The assessments on Days 60 and 90 served as follow-up evaluations.

Comparisons within a group

The Wilcoxon signed rank test was applied to compare any two sessions within the same group. It assessed whether there was a significant difference between these sessions.

Comparisons between groups

The Mann Whitney U Test was applied to compare data between different groups. It assessed whether there was a significant difference between these groups.

Representation and Significance

Observational data was visually represented using Bar Charts. The trend of each variable over time was illustrated using Line Diagrams. The Level of Significance was established as $p<0.001$ and $p<0.01$ to indicate statistically highly significant (H.S) results, $p<0.05$ to indicate significant results and $p>0.05$ to indicate non-significant (N.S) results.

Comparison in between the groups

Mann Whitney U Test to Compare between Groups of Variables on 30th Day

Table no 1 suggest that there were no statistically significant differences between Group A and Group B on the 30th day for any of the parameters assessed.

Mann Whitney U Test to Compare between Groups of Variables on 60th Day

Table no 2 shows significant differences between Group A and Group B were found on the 60th day for VAS Score, Duration of Pain, Diarrhea, Onset of Pain, and Severity of Pain, while other parameters showed no significant differences.

Mann Whitney U Test to Compare between Groups of Variables on 90th Day

Table no 3 represents significant differences between Group A and Group B were observed on the 90th day for VAS Score, Duration of Pain, Headache, Onset of Pain, and Severity of Pain, while other parameters showed no significant differences.

Overall Mean Change Assessment for Group A and Group B (table 4)

Group A demonstrated substantial improvements across multiple parameters from the 0th to the 30th day, with notable reductions in pain, nausea, vomiting, and constipation. The most significant change in the initial period was observed in nausea and vomiting, with reductions of 95.52% and 92.50%, respectively. Pain-related parameters like VAS score, duration of pain, and severity of pain also showed significant reductions, with changes of 58.82%, 82.13%, and 80.42%, respectively. However, after the 30th day, the improvement slowed down, with some parameters like VAS score and severity of pain showing no further change by the 90th day. A minor increase in headache (17.64%) was observed, and there was a modest improvement in diarrhoea (30.0%) by the end of the study.

Group B showed slightly better results in several parameters during the initial period, such as a 67.15% reduction in VAS score and 87.72% in headache by the 30th day. Nausea and vomiting were completely resolved by the 30th day, with a 100% improvement. Group B also exhibited sustained improvements across the study duration in key parameters like VAS score, duration of pain, headache, and diarrhoea. Even though the pace of improvement slowed between the 60th and 90th days, Group B continued to show consistent changes, especially in pain parameters and digestive symptoms. For instance, there was still a 46.52% reduction in the VAS score, 77.19% in headache, and 78.33% in diarrhoea by the 90th day.

DISCUSSION

In present study subjects were happy to practice only 3 *asanas* rather practicing so many numbers of *asanas* and *pranayamas* as there in previous studies. so, we can consider that this protocol is more convenient to the subjects to carry out *yogasana* practice for longer duration in their busy schedule also. Majority of the subjects were use to take analgesics (Tab. Meftal spas-for pain) during this treatment they completely reduced taking analgesics. *Hingu* helped them in reducing pain. *Pitta prakriti* predominant subjects experienced slight burning sensation after intake of medication.It may be due to the *ushna, theekshna* property of *Hingu* . Studies were conducted on some ayurvedic formulations like *Hinguvachadi churna, Rajapravarthini vati* where *hingu* is one of the components the probable mode of action in their study has mentioned that *Hingu* has *Shoolahara* and *Vatanulomana* property which helps in normalizing the function of *Apana vata,* which is main causative factor of *Udawartini*. *Hingu* has anti-flatulent and digestive properties & counteracts spasmodic disorders and may probably supress the secretion of progesterone hormone as the gum resin contains the coumarins, 5-hydroxy-umbelliprenin, as safoetidin etc [31] Studies have proved that the yogasanas are helpful in Dysmenorrhea by improving blood supply to pelvic and abdomen area, and also improves quality of life in females [32] The Probable mode of action of Hingu in Primary Dysmenorrhea are *Ruksha, Sheeta and Shushkaaharas, anashana, adhyashana, vishamashana*etc will lead to improper formation of *rasadhatu* and ultimately *Artavadushti* which resulting in *Kashtartava*/*Udawarthini* [33]. Whatever may be the *nidhana,* finally leads to *vilomagathi* of *Apana vayu,* leads to *vilomagathi*of *rajas* that cause discharging of menstrual blood with difficulty which leading to pain. So, the time of administration of *Hingu* was selected as before food, because *Vagbhata* has mentioned "*Apane vigune annadhou*" [34] *Shodhithahingu*acts on all the 3 *doshas.* (*Hingu-vatakaphahara*) It is purified with *Gritha* (*Pittahara*) Prostaglandins play a key role in the generation of inflammatory response. Their biosynthesis is significantly increased in inflamed tissue and they contribute to the development of the cardinal signs and symptoms of acute inflammation leading to pain during menstruation . hingu acts as Anti-inflammatory drug as it pocesses α-pinene; azulene; β-pinene; ferulic-acid; isopimpinellin; luteolin; umbelliferone [35]Hingu also processes Anti prostaglandine chemical- umbelliferone [36] Mainly affected *dosha* in *Udawartini yonivyapath* is *Vata,* [37] *Hingu* processes *vatahara, anulomana* properties it corrects *gathi*of *vata*and helps in easy flow of menstrual blood and reduces pain. *Hingu* was purified and made *Shuddha* by frying it with *Ghrita* [38]. *Shuddha Hingu (*purified*Ferulaasafoetida Linn*) was selected in this study because *Shuddha Hingu*pocesses beneficial property such as *Artavajanaka* (inducing menstruation)[39]. Ferutinin is one among the components of *Hingu*that has phytoestrogenic property [40].

Charaka has explained the qualities of *Hingu*as "*Hingu shola prashamanam vidhyaath paachanam rochanam*", since the gum resin of Ferulaasafoetida Linn, was helpful in reducing the colicky pain (*Shoolaprashamanam*), carminative (*Paachana*) and also palatable (*Rochana*) [41. *Hingu* helps in serotonin modulation by influencing serotonin levels regulates nausea and vomiting [42]. Deepana-*pachana* action of *hingu* also helps in this condition. Improves digestion, absorption and assimilation of nutrients by digesting Ama reduces inflammation. *Hingu* also processes anti spasmodic property as it contains chemical like Azulene; ferulic-acid; luteolin; umbelliferone; valeric-acid α-terpineol; azulene; β-pinene helps in reducing painful menstruation [43]. Acc to *Raja Nighantu Hingu* is *Vibandha nashana* hence, it helps in relieving constipation [44]. The Probable mode of action of *Yogasanas* are Dysmenorrhea often significantly reduces the quality of women's life. Yogasanas helps to Reduces stress and anxiety [45]. Myometrial hyperactivity, decreased uterine blood flow, and tissue ischemia are all caused by an increase in vasoactive prostanoids, which can result in pain or dysmenorrhea throughout the menstrual cycle. It is well known that yoga and pelvic asanas enhance blood flow in the pelvic area, which helps to alleviate bodily pain [46]. Further yoga poses also promote the release of beta-endorphins, which have analgesic properties [47]. In addition the research has demonstrated that yoga poses can assist regulate healthy bodily functions by releasing hormones such as cortisol, glucose, plasma's renin, epinephrine, and norepinephrine into the bloodstream. Numerous yoga interventions have used the voluntary breathing control strategy to reduce autonomic reactivity [48]. In addition, yoga reduces sympathetic activity through the hypothalamic-pituitary-adrenal axis, which is a significant factor in pain management. In addition to relieving pain associated with dysmenorrhea, deep breathing and prolonged exhalation relax the body's skeletal muscles, particularly those in the pelvic regionand also contribute to pain

reduction [49] in dysmenorrhea. Research indicates that *yogasana* practice positively affects the control of alpha brain waves, which are involved in pain alleviation, relaxation, and serotonin release [50] Yoga poses assist control weight and improve physical fitness since one long-term study found that being overweight was a one of the risk factors for both the possibility of experiencing dysmenorrhea and the duration of suffering [51]. Reduced dysmenorrhea and a healthy menstrual cycle have been linked to improved body circulation and sound physical and mental health [52]. Yoga postures are reasonable and may be performed at home as a kind of exercise to enhance one's quality of life and support menstruation health [53]. In this condition, *Yogasanas* has three different effects: it increases flexibility, promotes relaxation, and balances the actions of the sympathetic and parasympathetic nerve systems. In addition to increasing blood flow to the pelvic organs, these asanas also enhances oxygen flow, which relieves muscle hypoxia, one of the main causes of cramps in primary dysmenorrhea. The soothing impact of *pavanamukthasana, bhadrasana* and *bhujangasana* on the mind can be attributed to a decrease in both internal and external environmental cues as well as a general decrease in brain activation. Depression and anxiety are reduced as a result. *Pavanamukthasana, bhadrasana* and *bhujangasana* practice increases muscular strength and flexibility, which facilitates diaphragmatic breathing, which relieves tension in the body and mind [54]. A different strategy for treating menstrual cramps must address the underlying issue and effectively relieve discomfort. Reducing stress can help us avoid holding tension in our pelvis and low back, which can exacerbate period cramps. Looking for aggravating elements in diet, lifestyle, and emotional environment allows us to properly focus on a holistic approach, as we are dealing with a functional problem rather than a disease state that is producing pain. In order to prevent menstrual cramps, dietary concepts stress eating a healthy diet that eliminates junk food and saturated fats and increases whole grains, fruits, and vegetables, which give a variety of nutrients. The uterus's blood flow and metabolism will increase during active stretching activity, which may be useful in the decrease of Dysmenorrheal symptoms [55].

CONCLUSION

Shodhitha Hingu along with selected *Yogasanas* are effective in relieving the pain in dysmenorrhea and prevention of dysmenorrhea episodes.

ABSTRACT

Stroke is a prevalent neurological condition that significantly impacts individuals' functional abilities, particularly their balance and mobility. Stroke often results in significant impairment of proprioception, which is the sensation of body position and movement in space, leading to difficulties with motor coordination and balance. Physiotherapists play a pivotal role in the rehabilitation of community-dwelling stroke patients, employing outcome measures to assess and monitor treatment efficacy. This research examines physiotherapists' attitudes towards using the Berg Balance Scale in rehabilitating stroke patients in Kamrup, Assam. It highlights the importance of standardized outcome measures in stroke rehab. This research aims to identify the physiotherapists' demographic factors that influence the use of the Berg Balance Scale (BBS) and provide recommendations to improve the implementation of standardized outcome measures in stroke rehabilitation practices in Kamrup, Assam.

Keywords: Balance, Berg Balance Scale (BBS),Community, Outcome measure, Stroke,

INTRODUCTION

Impairments and varied limitations in motor, sensory, mental, perceptual, and linguistic functions are evident following a stroke. Stroke is the second leading cause of death and a major contributor to disability worldwide [1].In India, the Indian Global Burden of Disease Study 1990-2019 estimated that stroke was the largest contributor to disability adjusted life years (DALYs), and a chief contributor to deaths caused by neurological disorders [2] . Balance

95791

Trishna Saikia Baruah and Pratap Chandra Sarma

impairment is a common consequence of a stroke, greatly impeding individuals' engagement in daily activities, social interactions, leisure pursuits, and their ability to resume work[3]To continue being physically engaged in life, balancing function must be maintained .Among the variables contributing to balance distortion in these patients are a decline in muscular strength and proprioception, an increase in postural oscillation, and an increased load on non-paretic extremities [4,5].The Berg Balance Scale (BBS) is one of the most widely used and recognized balance measures[6,7,8] The BBS is a 14-item measure that uses direct performance observation to objectively evaluate older person in community-dwelling adults for their balance and fall risk. The scale requires 10 to 20 minutes to complete and measures the patient's ability to maintain balance—either statically or while performing various functional movements—for a specified duration of time [9,10]. The items are scored from 0 to 4, with a score of 0 representing an inability to complete the task and a score of 4 representing independent item completion. A global score is calculated out of 56 possible points. Scores of 0 to 20 represent balance impairment, 21 to 40 represent acceptable balance, and 41 to 56 represent good balance [3]. Since a patient's gait and ability to execute ADLs independently are most affected by their lack of postural control, prompt and effective therapy intervention is necessary. Van der Putten et al. (1999) pointed out that measuring the outcome of health care is a "central component of determining therapeutic effectiveness"

Aim of the study

The use of standardized outcome measures in rehabilitating community-dwelling stroke patients is important**.** This study aims to explore the opinions of practicing physiotherapists on the using of the BBS for the rehabilitation of community-dwelling stroke patients. Although there have been limited reviews on this topic, no similar studies have been conducted in Kamrup, Assam.

The purposes of this study

The study's findings aimed to inform evidence-based practice guidelines and support the standardization of balance assessment protocols for stroke patients in the region. It sought to explore the frequency and contexts in which physiotherapists in Kamrup utilized the BBS for community-dwelling stroke patients, including variations in usage influenced by demographic factors.

METHODOLOGY

Study Design and Setting

This cross sectional study was conducted in Kamrup, Assam, over a three-month period from October 2022 to December 2022, utilizing a purposive sampling technique. Ethical approval was obtained from the Ethical Committee of Assam down town University (AdtU/Ethics/PhD Scholar/2021/063). The study employed a mixed-methods approach, combining quantitative surveys with qualitative interviews to collect comprehensive data on BBS usage. Physiotherapists from various healthcare settings in Kamrup were recruited to participate, ensuring a diverse representation of clinical experiences.

Participants

A purposive sampling technique was used to select participants, consisting of 104 physiotherapists, out of which 65 met the inclusion criteria. The study included practicing physiotherapists in Kamrup who are actively engaged in the rehabilitation of stroke patients. Excluded from the study were physiotherapy interns and those not currently involved in treating stroke patients.

Data Measurement

This study used a set of validated self-administered questionnaire with two sections. The first section gathered socio-demographic information of physiotherapists, while the second section addressed research questions regarding the Berg Balance Scale (BBS). The questionnaire was validated through a pilot study of 5 senior physiotherapists(2

Trishna Saikia Baruah and Pratap Chandra Sarma

Academician and 3 Clinician) in Assam, who demonstrated high reliability with a Cronbach's alpha coefficient of 0.786 and a Content Validity Index (r=0.38).

Data Collection Procedure

Data were collected using a Google Form questionnaire, which facilitated efficient data collection due to its online format. The questionnaire was disseminated through email, WhatsApp numbers, and physiotherapist WhatsApp groups to reach the targeted sample. Physiotherapists were encouraged to respond at their convenience, ensuring a broad and diverse participation among the targeted physiotherapy professionals in the specified region. Most respondents (41) strongly agreed with the statement that BBS was the mostly used standardized Scale to assess balance in Stroke patients by Physiotherapists, while 23 agreed, and only 1 remained neutral. Gender distribution indicates that a higher percentage of females (65% Agree, 61% Strongly Agree) favour the BBS compared to males (35% Agree, 39% Strongly Agree). Age-wise, younger physiotherapists (≤30 years) predominantly agreed (61%) and strongly agreed (44%), whereas those aged 31-35 showed a higher strong agreement (41%). Educational qualifications reveal that postgraduates (PG) most strongly agreed (51%), while PhD/PhD scholars and undergraduates (UG) showed varied agreement levels. Professional settings reflect a significant presence of teaching institute professionals who both agreed (65%) and strongly agreed (56%). In terms of practice location, urban settings had the highest agreement (65% Agree, 61% Strongly Agree). Experience in treating stroke patients varied, with a notable strong agreement among those with more than five years of experience (34%). The p-values indicate no significant statistical differences across these characteristics (p-values ranging from 0.16 to 0.57). Gender distribution shows no significant difference in preferences between females and males (p = 0.91), indicating similar levels of agreement across genders. However, age groups (p = 0.043) exhibit statistically significant differences in preferences. Physiotherapists aged 31-35 years show lower agreement compared to those aged <=30 and 36-40 years, suggesting varying preferences based on age. Educational qualifications (p = 0.89) demonstrate uniform preferences across PhD/PhD scholars, PG, and UG categories, indicating that educational background does not significantly influence the preference for using BBS.

Similarly, professional setting (p = 0.27) and practice locations (p = 0.25) show no significant differences in preferences across various settings and locations. Experience in treating stroke populations (p = 0.38) also reveals no significant differences in preferences across different experience levels, suggesting that varying levels of experience do not significantly impact the preference for using BBS as a balance measurement tool. Overall, the data suggests a general consensus among physiotherapists that the Berg Balance Scale is preferred for measuring balance in stroke patients, with consistent preferences across different demographic categories surveyed. These findings highlight the scale's perceived utility and acceptance across diverse age groups and professional backgrounds within the field of physiotherapy. Gender distribution shows a trend towards higher agreement levels among females compared to males, though this difference is not statistically significant (p = 0.26). Age groups (p = 0.24) exhibit varied perceptions without statistical significance, indicating consistent views across different age brackets. Educational qualifications (p = 0.36) demonstrate varied perceptions across PhD/PhD scholars, PG, and UG categories, with slightly higher agreement levels among PG and PhD/PhD scholars. Professional setting (p = 0.43) and practice locations (p = 0.32) also show varied perceptions across different settings and locations, with higher agreement levels generally observed in teaching institutes and urban areas. Experience in treating stroke populations (p = 0.89) reveals no significant differences in perceptions across different experience levels, suggesting that varying levels of experience do not significantly influence the perceived effectiveness of BBS in differentiating static and dynamic stability in stroke patients. Overall, the data suggests a strong consensus among physiotherapists that the Berg Balance Scale is effective in differentiating static and dynamic stability in stroke patients, with consistent perceptions across different demographic and professional categories surveyed. These findings underscore the scale's perceived utility and integration into clinical practice across diverse settings within the field of physiotherapy. Gender distribution shows a trend towards higher agreement levels among both females and males, with no statistically significant difference (p = 0.80). Age groups (p = 0.79) exhibit varied perceptions without statistical significance, indicating consistent views across different age brackets. Educational qualifications (p = 0.89) demonstrate uniform perceptions across PhD/PhD scholars, PG, and UG categories, suggesting that educational background does not significantly influence opinions on the effectiveness of BBS in identifying balance issues in stroke patients. Professional setting (p = 0.71) and practice

95793

Trishna Saikia Baruah and Pratap Chandra Sarma

locations (p = 0.93) also show no significant differences in perceptions across various settings and locations. Experience in treating stroke populations (p = 0.57) reveals no significant differences in perceptions across different experience levels, indicating that varying levels of experience do not significantly impact the perceived effectiveness of BBS in assessing balance issues. Overall, the data suggests a strong consensus among physiotherapists that the Berg Balance Scale is effective in assessing and identifying specific balance issues in stroke patients, with consistent perceptions across different demographic and professional categories surveyed. These findings highlight the scale's perceived utility and integration into clinical practice across diverse settings and experience levels within the field of physiotherapy. Gender distribution shows a balanced perception between females and males, with no statistically significant difference (p = 0.78). Age groups (p = 0.52) exhibit varied perceptions without statistical significance, indicating consistent views across different age brackets. Educational qualifications (p = 0.64) demonstrate uniform perceptions across PhD/PhD scholars, PG, and UG categories, suggesting that educational background does not significantly affect opinions on the usefulness of BBS in setting treatment goals. Similarly, professional setting (p = 0.81) and practice locations (p = 0.76) show no significant differences in perceptions across various settings and locations, with urban areas showing slightly higher agreement levels. Experience in treating stroke populations (p = 0.53) reveals no significant differences in perceptions across different experience levels, suggesting that varying levels of experience do not significantly influence the perceived utility of BBS in treatment planning.

Overall, the data suggests a strong consensus among physiotherapists that the Berg Balance Scale is effective in helping to set balance-based treatment goals for stroke patients, with consistent perceptions across different demographic and professional categories surveyed. These findings underscore the scale's perceived utility and integration into clinical practice across diverse settings and experience levels within the field of physiotherapy. Gender distribution shows a trend towards higher agreement levels among both females and males, with no statistically significant difference noted (p = 0.66). Age groups (p > 0.99) exhibit varied perceptions across different age brackets, but without statistical significance, indicating consistent views across age groups. Educational qualifications (p = 0.81) display uniform perceptions across PhD/PhD scholars, PG, and UG categories, suggesting that educational background does not significantly influence perceptions of BBS accessibility and feasibility. Professional settings (p = 0.68) indicate high agreement levels among physiotherapists in teaching institutes, with varying responses in other settings such as hospitals and home care settings. Practice locations (p = 0.80) show consistent perceptions across urban, suburban, and rural areas, with urban locations indicating higher agreement levels. Experience in treating stroke populations (p = 0.57) reveals no significant differences in perceptions across different experience levels. Overall, the data suggests that physiotherapists generally perceive the Berg Balance Scale as more accessible and feasible for assessing balance in community-dwelling stroke patients compared to those in clinic and hospital settings, with consistent views across various demographic and professional categories surveyed.

Variations observed in different settings highlight potential considerations in choosing assessment tools based on practice context. Gender distribution shows a notable difference in responses, with a higher proportion of females agreeing or strongly agreeing compared to males, although this difference approaches statistical significance (p = 0.055). Age groups exhibit varied perceptions without statistical significance (p = 0.27), with younger respondents showing slightly higher agreement levels. Educational qualifications (p = 0.13) demonstrate some variation in perceptions across PhD/PhD scholars, PG, and UG categories, with higher agreement among those with higher educational attainment. Professional setting (p = 0.21) indicates that physiotherapists in teaching institutes generally agree or strongly agree with the scale's utility, with some variability among settings such as hospitals and clinics. Practice locations (p = 0.11) display mixed responses across urban, suburban, and rural areas, with urban locations showing higher agreement levels. Experience in treating stroke populations (p = 0.85) shows no significant differences in perceptions across different experience levels. Overall, the data suggests that the Berg Balance Scale is predominantly perceived as a commonly used and valuable tool among physiotherapists, with varying degrees of agreement across different demographic and professional categories. The differences observed hint at potential influences of gender, educational background, and practice setting on perceptions towards the scale's usefulness in assessing stroke patients' balance prognosis. Gender distribution indicates a trend towards agreement and strong agreement among both females and males, with a slight skew towards higher agreement among females, although

Trishna Saikia Baruah and Pratap Chandra Sarma

this difference is not statistically significant (p = 0.15). Age groups (p = 0.84) and educational qualifications (p = 0.30) show no significant differences in perceptions, with consistent responses across different age brackets and educational levels. In terms of professional setting (p = 0.15), physiotherapists in teaching institutes and various healthcare settings generally find the BBS scoring and grading system easy to use, although there are some variations across settings such as hospitals and clinics. Practice locations (p = 0.38) exhibit similar perceptions across urban, suburban, and rural areas, indicating a uniform perception of the scale's usability. Experience in treating stroke populations (p = 0.67) shows varied responses across different experience levels, with no statistically significant differences noted in perceptions of the BBS scoring and grading system. Overall, the data suggests that a majority of physiotherapists find the scoring and grading of the Berg Balance Scale to be straightforward and feasible across various demographic and professional categories surveyed, with minor variations among different settings and experience levels. Gender distribution shows a majority agreeing or strongly agreeing that patients sometimes do not wish to execute all BBS components, with no statistically significant difference between genders (p = 0.73). Age groups also display varied responses without significant variation (p = 0.56), indicating consistent attitudes across different age brackets. Educational qualifications exhibit a similar trend (p = 0.73), with respondents across PhD/PhD scholars, PG, and UG categories showing agreement or strong agreement.

Regarding professional setting (p = 0.80), responses vary slightly among different settings such as teaching institutes, hospitals, clinics, and home care, but without statistical significance. Practice locations (p = 0.74) like urban, suburban, and rural areas also show consistent attitudes towards the statement. Experience in treating stroke populations (p = 0.63) reveals varied responses across different experience levels, with no statistically significant differences noted. Overall, the data suggests a general consensus among respondents that patients occasionally decline to perform all components of the BBS, with these attitudes consistent across various demographic and professional categories surveyed. Gender distribution shows that females constitute a slightly higher proportion in the "Agree" and "Strongly Agree" categories compared to males, although the differences are not statistically significant (p = 0.76). Age distribution across categories indicates no significant differences (p = 0.98), with a fairly even spread among age groups. Educational qualifications also show no significant variation (p = 0.84), with similar responses across different levels of education. In terms of professional setting (p > 0.99), responses are evenly distributed across various settings including teaching institutes, government hospitals, and private practices. Similarly, practice locations (p > 0.99) such as urban, suburban, and rural areas show no significant differences in responses. Experience in treating stroke populations (p = 0.84) reveals varied responses across different experience levels, with no statistically significant differences noted. Overall, the data suggests that attitudes towards the Berg Balance Scale are consistent across various demographic and professional categories surveyed, indicating a generally uniform perception of its time-consuming nature among respondents.

RESULTS

The survey results demonstrate a strong consensus among physiotherapists regarding the efficacy and utility of the Berg Balance Scale (BBS) for assessing balance in stroke patients. A significant majority of respondents, regardless of gender, age, educational background, or professional setting, endorsed the BBS as the primary standardized tool for balance assessment. A significant majority of respondents endorsed the BBS, with 41 strongly agreeing and 23 agreeing, indicating its widespread acceptance across the profession. Notably, the consensus is evident across various demographic categories, such as gender, age, and professional settings. In gender Disparities females displayed higher levels of agreement compared to males, these differences were not statistically significant (p = 0.26). This suggests a generally consistent perception of the BBS across genders. Significant age-related disparities were observed (p = 0.043), particularly among those aged 31-35, who exhibited less agreement than younger (≤30) and older professionals (36-40). This implies that age may influence perceptions of the BBS's effectiveness. Analysis showed little variation in preferences based on educational qualifications (p = 0.89). Postgraduates were more likely to strongly agree with the BBS's usefulness, but overall, educational level did not significantly impact opinions on its effectiveness. No significant differences were noted in preferences across different professional environments (p =

0.27) or levels of experience (p = 0.38). This indicates that practitioners, regardless of their work setting or years of experience, generally perceive the BBS similarly. Overall, respondents viewed the BBS as an effective tool for identifying balance issues and setting treatment goals for stroke patients, with uniform perceptions across demographic categories (e.g., urban vs. rural practitioners).Most physiotherapists found the scoring and grading of the BBS to be user-friendly, with minor variations noted in different healthcare settings. This highlights the tool's practicality in clinical practice. These findings offer extensive insights into the diverse perceptions and utilization of the Berg Balance Scale among physiotherapists in stroke rehabilitation.

DISCUSSION

The Berg Balance Scale (BBS) is a valuable tool for assessing balance in stroke patients, as evidenced by the significant insights provided in the literature. The study's findings indicate that the BBS is widely used and preferred by physiotherapists in stroke rehabilitation, as it allows for the evaluation of static and dynamic stability, the identification of balance issues, and the prognosis of balance in stroke patients. While some aspects, such as setting balance-based treatment goals and scoring/grading, did not show statistical significance, the study highlights the challenges and nuances faced by physiotherapists in using the BBS. The demographic variables provide information on the characteristics of the physiotherapists who participated in the study. The Berg Balance Scale (BBS) is a tool which can evaluate balance for individuals with various Disabilities (Down 2015). A study examined the BBS's effectiveness in stroke patients, creating a key form and identifying nine levels to categorize patients based on their balance and can effectively measure and track changes in a patient's balance over time ultimately assisting in their rehabilitation [11] .The findings can support the adoption of evidence-based practices among physiotherapists, encouraging the use of validated tools like the BBS. This alignment with evidence-based practice can enhance the credibility and effectiveness of physiotherapy practices..The findings of the present study indicate a statistically significant association between gender and the use of the BBS Scale in stroke patients, suggesting that gender may play a role in the choice of balance assessment tool (p=0.039).The study revealed a significant association between practice location and the preference for using the BBS as a balance measurement tool in stroke patients (p=0.030).When addressing research questions, physiotherapists often choose to use the Berg Balance Scale (BBS) to measure balance in stroke patients. The BBS is a widely recognized scale that effectively differentiates between static and dynamic stability in stroke patients. This preference for the BBS is supported by a study conducted by Fabio La Porta and Serena (2012)[12], which found that the BBS-12 has high internal validity and reliability as a measurement tool for balance impairment resulting from any neurological disease etiology.

Education affects BBS use in stroke patients (p=0.005) and aligns with Hunt et al. (1998)[13], who emphasized education's impact on clinical decision-making. Various educational backgrounds among physiotherapists may lead to differing BBS suitability perspectives, highlighting the need for targeted educational interventions to standardize practices across diverse groups. The research found that the BBS is accessible and feasible for use across diverse demographic groups and various physiotherapist backgrounds, as no significant associations were identified between demographic variables and the perceived accessibility and feasibility of using the BBS. Concerning the research questions about the Berg Balance Scale (BBS), the focus is on its specific role in assessing and identifying balance issues in stroke patients, as well as its contribution to establishing balance-based treatment goals for these patients. The significance correlation observed between professional settings and the utilization of the Berg Balance Scale (BBS) as a frequently employed tool by physiotherapists to evaluate the balance prognosis of stroke patients which aligns with previous study conducted by Reyes P et .al(2020)[14,18]. In addressing the research question, it is noted that the scoring and grading of the Berg Balance Scale (BBS) are perceived as accessible and comprehensible by physiotherapists. The non-significant correlation identified between the number of daily treatment cases and the perceived ease and feasibility of employing BBS scoring and grading corresponds with the insights from the study conducted by Robinson et al. (2019) [15,19] which emphasized the impact of workload considerations on rehabilitation practice. In addressing the research question, it was noted that patients may occasionally exhibit non-compliance with all components of the Berg Balance Scale (BBS) during a comprehensive assessment. The study

Trishna Saikia Baruah and Pratap Chandra Sarma

revealed non-significant association between the practice location and patients' willingness to perform all BBS components. The geographical context and cultural factors tied to practice locations may play a role in shaping patients' attitudes toward undergoing thorough balance assessments, necessitating further exploration. Conclusively, concerning the research question on the Berg Balance Scale (BBS) being a time-consuming assessment scale, a non-significance association was found between gender and the perception of the BBS as a time-consuming tool. Duncan and Murray (2012) [16, 21] reviewed the barriers and facilitators to routine outcome measurement for allied health professionals in practice. Successful integration of routine outcome measurement requires targeted actions at the individual therapist, team, and organizational levels within healthcare organizations. In earlier research studies, identified challenges in the findings emphasizing the practical and patient-related concerns expressed by participants regarding outcome measurement in clinical practice[17].The gait and balance performance measures have been found to be sensitive to changes in interventions for preventing fall [20] .In a prospective context, employing a reliable clinical outcome measure for balance enhances a physical therapist's ability to predict fall risks and assists in establishing goals for fall prevention and overall balance improvement. The empirical evidence indicates that the BBS is a suitable tool to screen for the risk of falls and shows good predictability when used with the appropriate criteria and applied to those with neuromuscular disease. In the field of rehabilitating community-dwelling stroke patients, the importance of standardized outcome measures is evident. However, a notable literature gap persists, particularly concerning the impact of demographic variables on physiotherapists' utilization of the Berg Balance Scale (BBS) within Kamrup's context. To fill this gap, the study aimed to investigate the perspectives of practicing physiotherapists on the advantages and obstacles related to the utilization of the BBS in the rehabilitation of stroke patients residing in the community within this specific region. The scarcity of literature reviews and the absence of analogous studies in Kamrup, Assam, up to the present date underscore the novelty and significance of this research. This investigation substantially contributes to understanding the factors influencing physiotherapists' use of the BBS in stroke rehabilitation within this specific geographical context. The findings not only enrich the current knowledge base but also offer valuable insights guiding strategies for the effective implementation of standardized outcome measures in stroke rehabilitation within the region. These outcomes carry potential implications for shaping future interventions, developing targeted training programs, and shaping policies aimed at optimizing the application of standardized outcome measures in stroke rehabilitation within the Kamrup region.

LIMITATIONS

The study's constraints encompass several key areas. While it offers valuable insights into how physiotherapists perceive and utilize the Berg Balance Scale in stroke rehabilitation, the cross-sectional nature of the research limits the ability to establish causal relationships. A longitudinal approach would yield a more thorough understanding of these dynamics. To address these limitations, future studies should consider employing diverse research methods and including a wider range of participants. This approach would enhance the study's applicability and relevance across different settings.

CONCLUSION

This study examines the perceptions, implementations, and challenges related to the use of the Berg Balance Scale (BBS) as an outcome measure for community-dwelling stroke patients by physiotherapists in the Kamrup. The analysis of respondents' opinions provides valuable insights into the factors influencing the use of BBS and its feasibility in different demographic context. The overall findings suggest that BBS can be a valuable assessment tool for stroke patients, accessible and feasible across various demographic groups and some. This study contributes valuable insights into the factors that may influence the choice of the Berg Balance Scale as an outcome measure for stroke patients and can facilitate more effective and patient-centric rehabilitation strategies, benefiting the stroke population in the region. Further research are needed to gain more knowledge in this study and to explore additional factors that may influence the utilization of BBS in clinical practice.

ABSTRACT

Autism spectrum disorder (ASD) is a group of neurodevelopmental disorders marked by impairments with social interaction, and the presence of repetitive, and restrictive patterns of behaviour. Based on clinical characteristics, ASD can be correlated with *Unmad* mentioned in *Ayurveda* classics. In clinical practice, there is a paucity of standard treatment protocols and effective care for the prevention of ASD. The present case report discusses a 3-year-old male patient who presented with fever, aggressive behaviour, hyperactivity, sing song, repetitive action of receiving call and saying hello, poor eye contact, no communication, no social skills, poor speech, and sleep disturbances reported at *Kaumarbhritya* outpatient department. Diagnosis of ASD was established using the Indian Scale for Assessment of Autism (ISAA) test manual. Deepana pachana with *Chitrakadi vati, Abhyanga* with *BalashwagandhaTaila*and *Nasya* with *Brahmi Ghrita* along with other internal medications, Tab Smrutisagar rasa (125mg), *Saraswataristha, Vacha, Yastimadhu, Shatavari, Aswagandha, Gududchi, Sankhapushpiplant, Brahmi ghrita* was given. Remarkable improvement was noted in overall ISAA scores as well as clinical improvement noted in poor eye contact, hyperactivity, and peer relationship. "Child Sleep Habit Questionnaire (CSHQ)" was used to assess the child's sleep pattern and improvement was noted. No adverse effects were reported during the treatment period and follow-up.

Keywords: Autism spectrum disorder, *Ayurveda*, case report, *Nasya, Unmada*

INTRODUCTION

Autism spectrum disorder (ASD) is a neuro developmental disorder that is marked by impairments with social interaction and the presence of repetitive and restrictive patterns of behaviour.[1]The prevalence estimates of autism spectrum disorders (ASD) are 62/10,000.[2] The incidence of ASD prevalence rate of ASD is 1.5%. The number of cases is increasing significantly. [3,4] All psychosocial abnormalities were seen in ASD having similarity with disease *Kaphaja-Vataj Unmada* described in Ayurveda, with the signs to prefer to live in one place, prefers alone time, do not like to socialize, prefer not to speak or communicate, motor mannerism, frequent self-stimulating emotions, and imitation or repetition of sounds or words (Echolalia). *Manas* (mind), *Budhi* (intellect), *Samnja* (consciousness), *Gyana* (knowledge), *Smriti* (memory), *Bhakthi* (desire), *Shila* (manners), *Chesta* (behaviour), and *Achara* (conduct) are affected in *Unmada*. [5] Cardinal clinical features of *Unamda* are described as *Dhivibhrama* [6] (perverted intellect), *Satvapariplavach* [6] (psychic agitation), *Peryakula Drishti* [6] (restlessness in eyes), *Adheerata* [6] (impatience), *Abadhvakyatam*[6] (incoherent speech), and *Hridaya shunyata* [6] (blockage of thought) shows similarity with ASD. The exact pathology of ASD is unknown to date, whereas several factors have been involved in the pathogenesis of autism disorders.[7] *Nidana* (cause) of *Unmada* [8]is intake of *Viruddh* (incompatible), *Dushta* (contaminated), and *Ashuchi* (unclean) food, *Vishama chesta* (adopting difficult posture), *Manoabhighaata*(mental trauma), and *Pragharshanam Devgurudwijanam* (possession by spiritssuch as gods, teachers, and brahmanas). Genetic and environmental factors that affect, the developing brain influence it. Even though there is not a single, overarching etiology for ASD yet, continuing research is expanding our knowledge of various etiologic processes that could be involved in this condition. In addition, attention deficit hyperactivity disorder (ADHD), anxiety, mood disorders, obsessive-compulsive disorder, and other disruptive behaviour disorders frequently co-occur with ASD. As the disease is newly emerged and there is no direct corelation of known etiologies in terms of Ayurveda, additionally the available literatures and case studies along with the case reports suggesting no unanimous statement on the management of disease protocol. In our case study we tried to elaborate the importance of Ayurveda treatment on reducing the features of ASD on the basis of ISAA scale. Which highlights the role of Ayurveda in mainstreaming these therapies with modern protocols. The present case study will discuss a 3-year-old male patient with ASD and the management of the condition with Ayurveda interventions. Reporting is as per CARE guidelines (https://www.care-statement.org/).

Case Report
Patient Information
A 3-year-old male patient reported at *Kaumarbhritya (KB)* outpatient department (OPD) on 17th January 2024, with complaints of with fever, aggressive behaviour, hyperactivity, repetitive singing song, repetitive action of receiving call and saying hello, poor eye contact, no communication, no social skills, poor speech, and sleep disturbances and constipated bowel**.**
Antenatal history
mother's age at the time of birth was 37 years, No history of abortion. Mother was healthy during antenatal period. Birth history: normal full-term vaginal delivery at the hospital. The baby cried immediately after birth, with no history of foetal distress, and the birth weight was 2.75 kg. There was no history of seizures, pathological jaundice, hypoglycaemia, meningitis, etc. No family history of such a condition was found.

Clinical findings and diagnostic assessment
The appearance of patient seemed to be irritated along with repetitive behaviour, hyperactivity, lack of social communication, poor eye contact, and not fixing his gaze on a particular item/person. The patient was conscious but not well-oriented of time, place, or person. He was inattentive and had a lack of concentration. Memory is good. Gross motor development was achieved on time. Fine motor, social and communication, and language and speech development of the patient were delayed. The speech was not clear. The neuromuscular examination was normal. Cardiovascular, respiratory, and abdominal examination was normal, Physical growth for the age is normal. The appetite was reduced, and sleep was disturbed. On performing *Ashtavidha Sthan Pariksha* (eight folds examinations of

the patients), it was observed that the patient's *Nad*i (-pulse) was *Vata-Kaphaja*, pulse rate was 94/min, Mala (-bowel) was *Samanya* (normal), *Mutra* (urine) was *Samanya* (normal) and pale in color, Jihwa (tongue) was *Nirama* (uncoated), *Shabda* (voice) was *Aspashta* (unclear), *Sparsha* (touch/Skin) was *Ruksha* (Dry), *Drika* (eye) was *Samanya* [normal], and *Akruti* (body built) was *Samanya* (Normal). Indian Scale for Assessment of Autism (ISAA) rest manual [9]was used to diagnose the condition**.** Other assessment scales i.e., Child Sleep Habit Questionnaire (CSHQ) was used to assess the sleep pattern of the child.[10].

Timeline

The patient was well before2 years of age, after that parent started noticing the child having poor eye contact, inappropriate speech, communication and social milestones delaying, and solitary play activities, and also getting hyperactive. The patient also has sleep disturbances and constipated bowel (on/off) for the past 1 year. As per the parents, the patient was diagnosed with autism before but no documentation was available. The patient was taking Ayurveda treatment from our OPD since March 2021 and did not take any other treatment from elsewhere, earlier. *Deepana-Pachana* (digestion and metabolism-enhancing) and *Medhya* (intellect enhancer) medicines were prescribed. Mild improvement in eye contact, decreased hyperactivity, mild improvement in speech were noticed, but not much improvement in other complaints was observed. The patient did proper follow-up during that treatment. The patient was reassessed and the baseline assessment was done using the "ISAA test manual" on January 17, 2024. The patient was diagnosed with a moderate level of autism. The course of treatment was then modified.

- January 2021 (OPD base treatment due to COVID-19)
- January 17,2024 (Assessment was done pre-treatment)
- January 18, 2024 (Internal medication, Abhayanga, Nasya at Hospital)
- February 19, 2024 (Internal medication, Abhayanga, Nasya at Home)
- April 05, 2024 (Post treatment Assessment)

Therapeutic interventions

Baseline assessment was done on January 17, 2024, using the "ISAA" to diagnose the level of autism which was around 96, the "CSHQ" to assess the sleep behaviour of the patient. *Smrutisagararasa* (125mg) 1 BD, *saraswataristha* 10ml BD, *Vacha +Yastimadhu+Shatavari +Aswagandha +Guduchi+Shankhpuspi (*5 gm each in powder form[divided it equally into 60 parts (near about 0.5 gram in each part) Given this combination of medicine in form of *Phanta*[50 ml (1 part)] evening (OD), with honey.*Brahmi ghrita* 5ml orally for 1 week followed by *Brahmi ghrita Nasya* for 21 days. *Abhyanga* (massage) with*Bala Ashwagandha Taila*and *Pratimarsha Nasya*with *Brahmi ghrita* was done From January 17, 2024, to February 18, 2024, *Abhyanga* (massage) and *Nasya* were done at the *Panchakarma* unit of the *KB* department. Internal medications remained the same. From February 19, 2024, Abhyanga (massage) and Pratimarsha Nasya were advised to be done at home. Internal medications remained the same. on April 05, 2024, assessment (after treatment) was done using the same scale and tools i.e. ISAA,CSHQ [table 3,4]

Follow-up and outcomes

The treatment regimen was properly followed at the KB Panchakarma unit as well as at home except for the *Phanta* preparation which was missed a20-21timesdue to palatability issues. A good response to treatment was noticed. Autism level decreased to mild level. The sleep behaviour pattern of the patient also [Tables 4].

DISCUSSION

The patient presented with fever, aggressive behaviour, hyperactivity, repetitive singing song, repetitive action of receiving call and saying hello, poor eye contact, no communication, no social skills, poor speech, and sleep disturbances and constipated bowel**.** As there is no standard treatment for ASD, Ayurveda therapy has been carried out to manage this condition and is presented in this case report. *Chitrakadi Vati* was given for *Deepana-Pachana* before starting the main medications and procedure as the child had complaints of reduced appetite and constipation. The appetite was improved and constipation was relieved. There was no adverse effect observed. *Smrutisagar Rasa* is

95811

processed with *Vacha* (*Acorus calamus*), *Brahm*i (*Bacopa monnieri*), and *Jyotishmati* (*Celastrus paniculatus*), which help prevent memory impairment and oxidative stressand prevent deposition of amyloid-β plaque in the brain[11-14]Working memory is important for reasoning and guidance of decision making and behavior. It temporarily holds the information available for processing. Working memory and reference memory are the two variables that report the physiological status of the brain and this suggest the increase in the behavioural parameters which again proves that *Saraswataarishta* has the ability to sustain memory and promote learning and memory performance [15] Acharya Charaka described four Medhya *Rasayanas* e.g., *Mandukparni Swarasa, YashtimadhuChurna, Guduchi Swarasa*, and *Shankhapushpi Kalka* for improving the intelligence.[16] These drugs can be used singly or in combinations [17]*Vacha (Acorus calamus Linn.) Churna was prescribed for vak-shudhhi (Speech enhancer) by Acharya Vaghbhata.*[18] *Vacha*is Medhya, *Deepana, Sangyasthapaka, and Vaathara* (improves memory, improves digestion, increases *retention power, and cures Vata disorders)*[19]Vacha is known to calm nerves and helps improve a person's memory. Being similar to a nerve tonic it helps a person to relax and rid one's self off stress and depression. [20] *Yastimadhu* was prescribed as the roots and rhizomes of Glycyrrhiza glabra is efficient brain tonic; it increases the circulation into the CNS system [21] Liquorice of *yastimadhu* has significant action on memory enhancing activity [22] Methanolic extract of *A. racemosus* has shownsignificant antidepressant activity[23*] Ashwagandha* has been historically used in traditional Ayurvedic medicine for memory enhancement and improvement in cognition[24,25] possibly by acting as a GABA mimetic [26], a cholinomimetic [27]*Guduch*i has neuro-protective activity, learning and memory enhancing activity [28] antioxidant activity [29, 30]*Guduchi* helps in cognitive enrichment by increase production of acetylcholine, which enhances choline. [31] *Shankhapushpi* is also effective in anxiety, neurosis, insomnia, cerebral abnormalities and serve as effective nervine tonic.[32] *Shankhapushpi* enhances memory function due to its Antioxidant and Acetyl cholinesterase Inhibitory Properties [33] Autistic children lack the feeling of affection or a desire to interact with others.[34] In Unmad, the higher mental functionality altered and distorted reality perception.[35] *Ghrita* is considered applicable for the treatment in combination with single drug and other nootropic drug and mood stabilizing drugs.

The DHA, an omega 3 long chain polyunsaturated fatty acid is abundant in ghee which is seen in brain cells [36]. The Ingredients of Brahmi *Ghrita* [37] which increased Mental Stability, increased Concentration. Improves Intelligence, improves learning skills & speech, improves skin texture, increases cheerfulness, removes depression & stress in unmad [38] Thus molecules in the circulation gain access to brain ISF (interstitial fluid) via only one of the two mechanisms: (1) lipid-mediated free diffusion through the BBB or (2) carrier- or receptor-mediated transport (RMT) through the BBB. Ghee being a lipid in nature is rapidly cross the BBB and make the drug available in the CNS.[39] The study has internal medication and Panchakarma in the management of ASD.While performing the procedure, it consists of three parts: *Poorva Karma, Pradhana Karma*, and *Paschat Karma*. Almost all studies follow the treatment principle [40] of *Unmada* in ASD, according to the line of management patients suffering from *Unmada* should be administered *Pradeha* (thick ointment), *Utsadana* (anointing), *Abhyanga* (massage), *Dhuma* (fumigation), and intake of *Ghrita* to arouse mind, intellect, memory, and consciousness. *Tikshna Nasya* (irritant snuffing) and *Anjana* (collyrium) should also be used. Here, study have included *Abhyanga* [41-43] as a therapeutic procedure for ASD. The study suggests children with ASD have impairments in muscle strength in comparison to healthy peers.[44] *Abhyanga* [45] comes under *Poorva Karma* it improves blood supply to muscles, activates the skin's sensory nerve endings, and reduces muscle fatigue and pain.[45] Abhyanga (massage) is useful in reducing subjective stress.[47]. It has been shown anxiety, enhanced performance of alertness and also reduces subclinical depression.[48]Massage has been used in an effort of improve symptoms, disease progression, and quality of life. Considering the dominance of *Vata Dosha* in this condition, *Bala ashwagandha taila* was used for *Abhyanga* (Massage) to alleviate the *Vata Dosha*. The nose is said to be the path of the brain. *Nasya* administered through the nostrils reaches up to*Sringataka Marma*, spreads all over *Urdhvajatru*, an deliminates the deep-seated *Dosas.*The dose of *Nasya* was calculated using the child's index finger where we soaked the finger into the *Sneha* i.e., *Brahmi Ghrita* Considering the *Sneha Nasya* dose mentioned by *Acharya Sushruta* in *Chikitsa Sthana,* as 4 *Bindu(Heena),*[49]we took *Heena matra* for *Nasya* considering the irritability and age in this case which was equivalent to 0.8 ml. *Ghrita* gave a remarkable improvement in the patient. Using the CHSQ some sort of improvement was observed like goes to bed at same time, falls asleep in own bed, falls asleep in 20 min, sleeps the right amount and sleeps same amount each day. The ISAA score pre-treatment assessment was 96 which came down to 84 post-treatment assessment. Social relationship and reciprocity score came down from 31 to

24. Emotional responsiveness score from 10 to 8. Speech-language and communication treatment, BT-Beforecommunication from 20 to 19. Behavior patterns from 20to 18. Sensory aspects from 7 to 7. Cognitive componentfrom 8 to 8. There seemed not much improvement inthe speech-language and communication domain. Clinicalimprovement in eye contact, peer relationship, and a decreasein hyperactivity were also observed in the child. CSHQ wasused to assess the sleep pattern, it has been found that a sort of improvementwas noticed in the sleep patternof the patient. No adverse effects were reported during the treatment period and follow-up.

CONCLUSION

The present case report has shown a good response of Ayurveda Panchakarma and oral drugs in the child with autism. Behavior interventions and occupational therapies are the mainstays of conventional therapies in ASD management. Ayurveda therapy can play an important role in this domain and it is proposed through this case report that if Ayurveda therapy is given along with behavior therapy and occupational therapy, additional benefits can be expected in children with ASDs.

Table : 1 Anthropometry measurements

SR. NO	DIMENSION	ANTHROPOMETRY MEASUREMENTS
1	Height	95 cm
2	Weight	15.8 kg
3	Mid upper arm circumference	17.5 cm
4	Head circumference	51 cm
5	Chest circumference	55 cm

Table 2: Therapeutic intervention medication

Serial number	Intervention	Dose	Frequency	Timing	Duration
1.	*Chitrakadi vati*	250 mg	Twice a day	Before meal	5 days
2.	Tab *Smrutisagar Rasa*	125 mg	Twice a day	After meal	4 months
3.	*Saraswataaristha*	10ml	Twice a day	After meal	4 months
4.	*Vacha +Yastimadhu+Shatavari + Aswagandha+ Guduchi+Shankhpuspiphanta* preparation	50 ml	Twice a day	After meal	2 months
5.	*Brahmi Ghrita*	5ml	Once a day	Empty stomach	1 week
6.	*Panchakarma* procedures At panchakarma unit KB department *Bala Aswagandha taila* followed by P*ratimarsha Nasya*with *Brahmi Ghrita*2 drops in each nostril 21 days in each month At home *Bala Aswagandha Taila*followed by *pratimarsha Nasya*with *Brahmi Ghrita*2 drops in each nostril for 21days in each month. **NOTE:** (Standard operative procedure was explained to parents in detail)	*Sarvanga Abhyanga Sarvanga Abhyanga*	Once a day for 15 min OD	Morning (9:00 A.M - 10:00 A.M) Morning (9:00 A.M - 10:00 A.M)	1 month 21 days 2 months

Table 3: Indian Scale or Assessment of Autism Test Manual

Domain	Number of questions	BT	AT	% Relief	Significance Level
Social relationship and reciprocity	9	31	24	22%	S
Emotional responsiveness	5	10	8	20	NS
Speech-language and communication	9	20	19	5	NS
Behaviour patterns	7	20	18	10	NS
Sensory aspects	6	7	6	14	NS
Cognitive component	4	8	7	12	S
Total score		96	84	12	NS

AT-After treatment, BT- Before Treatment

Table 4: children's sleep habits questionnaire (abbreviated)

Domain	BT	AT	% relief
1. Bedtime resistance			
Goes to bed at same time R*	2	3	33%
Falls asleep in own bed R*	1	3	66%
Falls asleep in others bed	2	1	50%
Needs parent in room to sleep	3	3	0%
Struggles at bedtime	2	1	50%
Afraid of sleeping alone	3	1	66%
2. Sleep-onset delay	1	3	66%
Falls asleep in 20 min R*			
3. Sleep duration			
Sleeps too little	3	1	33%
Sleeps the right amount R*	1	3	33%
Sleeps same amount each day R*	1	3	33%
4. Sleep anxiety			
Needs parent in room to sleep	3	3	0%
Afraid of sleeping in the dark	3	1	66%
Afraid of sleeping alone	3	3	0%
Trouble sleeping away	3	1	66%
5. Night walking's	2	1	50%
Moves to others bed in night	2	1	50%
Awakes once during night	3	1	66
Awakes more than once	3	1	
6. Parasomnias			
Wets the bed at night	2	1	50%
Talks during sleep	1	1	0%
Restlessness and moves a lot	1	1	0%
Sleep walks	1	1	0%
Grinds teeth during sleep	1	1	0%
Awakens screaming, sweating	1	1	0%
Alarmed by scary dream	1	1	
7. Sleep disordered breathing	1	1	0%
Snores loudly	1	1	0%
Stops breathing	1	1	0%
Snorts and gasps	1	1	0%
8. Daytime sleepiness	3	1	33%
Wakes by himself R*	2	1	50%
Wakes up in negative mood	1	1	0%
Others wake child	3	1	66%
Hard time getting out of bed	2	1	50%
Takes a long time to be alert	3	1	66%
Seems tired	2	1	50%
Sleeps while watching TV	1	1	0%
Sleeps while riding in car	1	1	0%
